**Subject:** RE: Am. Oversight v. HHS/FDA 20-cv-947 Final Draft Vaughn Segments
**Date:** Thursday, March 13, 2025 at 3:29:30 PM Eastern Daylight Time
**From:** Holland, Liam C. (CIV)
**To:** Emma Lewis
**CC:** FOIA, AO Records
**Attachments:** image001.jpg

Good Afternoon Emma,

I just sent a link to a box.com file sharing folder to you, FOIA@americanoversight.org, and records@americanoversight.org. That folder includes a complete production set for FDA records in this case as well as revised Vaughn segments from many of the earlier segments FDA had produced. This should conclude FDA's draft *Vaughn* production.

Let me know if you have any questions.

Best,
Liam

**Subject:** Am. Oversight v. HHS/FDA 20-cv-947 Final Draft Vaughn Segments

Good Morning Emma,

Please see attached for the final two draft *Vaughn* segments from FDA in this matter. The JSR indicated that the agency anticipated these would be produced by 2/28. The delay is my fault—I misunderstood a communication from FDA.

FDA is going to get you a complete bates-stamped production set in the next couple of weeks—they're also re-reviewing some of the initial draft *Vaughn* segments, which may have a handful of pagination issues and other minor errors.

Thanks,
Liam

**Subject:** JSR Due Today--Am. Oversight v. HHS/FDA 20-cv-947

Good Afternoon Emma,

I hope all is well with you. We have a JSR due today in this matter. Please see attached for a draft. Let me know if this is acceptable to file with your signature, or if you have any edits or comments.

Thanks,
Liam

AMERICAN OVERSIGHT

Hi all – please see the attached PR from ASPR. Asking for concurrent clearance given the short turnaround and the reference to multiple products – vaccines, diagnostics, and therapeutics. CDRH -copying Heather Agler through the IMG, as well as Uwe and Kim since this references the EUA. Also, ccing Jennifer Ross from OCET and Toby Lowe (CDRH) given reference to EUA.

All,

Thanks for your patience as we worked through a number of rapid-fire tasks today. I've attached the following documents for your review:

1)Therapeutics one pager
2)Vaccines one pager
3)Diagnostics one pager
4)Two overview slides: talking points and graphic

Please add information that is missing and return the documents by 0900 tomorrow (Wednesday). I'll adjudicate comments and make edits once I receive input from each Agency. I understand that all need to go through ASPR and NIAID clearance tomorrow.

Thanks again for your input and your patience as we polished these documents as much as possible today.

Best,
Christy

**Subject:** White House Request-Due COB tomorrow (Tuesday)

All,

We have received a request from the White House Task Force. We need to provide the S1 with three one-pagers, one each for diagnostics, vaccines, and therapeutics. ASPR also wants a single slide showing product development for all three, close collaboration between agencies, etc. we will also put together a slightly longer deck with more detail around the one-pagers.

I've asked Rosemary to coordinate the diagnostic one-pager.

BARDA will take the pen on the one pager, but we are going to have pieces coming in from DoD and NIAID. The attached word document is a very rough outline. Below is what we are thinking in terms of specifics:

(b) (5)

AMERICAN OVERSIGHT

(b) (5)

I recognize the challenge in this approach, but just do not see a better approach with the time we have. I need the first draft of the one pagers by about noon tomorrow, so we can start dropping in pieces and working on the flow. I've copied Hilary so she can weigh in with any thoughts.

(b) (5)

For all of these, we're going for bullet format, lots of white space.

We can chat tomorrow a.m., but I wanted to get this out to you tonight in case some of you had time/wanted to get a jump.

Thanks.

Robert

**Importance:** High

Hi Uwe,

AMERICAN OVERSIGHT

Attached are the following for the CDC 2019-Novel Coronavirus Real-Time RT-PCR Diagnostic Panel Emergency Use Authorization submission:

- CDC 2019 Novel Coronavirus Real-Time RT-PCR Diagnostic Panel EUA Request Letter
- EUA Template CDC 2019-nCoV Real_Time RT-PCR Diagnostic Panel Executive Summary
- Appendix A_CDC 2019-nCoV Real_Time RT-PCR Diagnostic Panel Fact Sheet for Healthcare Providers
- Appendix B_CDC 2019-nCoV Real_Time RT-PCR Diagnostic Panel Fact Sheet for Patients
- Appendix C_CDC 2019-nCoV Real_Time RT-PCR Diagnostic Panel Vial_Control Vial_Package Labeling_Final
- Appendix D_CDC 2019-nCoV Real_Time RT-PCR Diagnostic Panel Product Information Sheet
- Appendix E_CDC 2019-nCoV Real_Time RT-PCR Diagnostic Panel Instructions for Use
- Appendix F_CDC_2019-nCoV Real_Time RT-PCR Diagnostic Panel Verification Requirements
- Appendix G_CDC_2019-nCoV Real_Time RT-PCR Diagnostic Panel Analytical Performance Data
- Appendix H_ CDC_2019-nCoV Real_Time RT-PCR Diagnostic Panel Sequence Alignment and In Silico Analysis
- Appendix I_ CDC_2019-nCoV Real_Time RT-PCR Diagnostic Panel Clinical Performance Data

We cannot thank you enough for all of your assistance with this. We cannot do our jobs without you.

Best regards,
Julie

Hi all – please see below and attached. I have made some minor tweaks already in the attached. Thank you!
**EXPEDITED REVIEW. Comments due TODAY at 1:00PM Feb. 5, 2020 (apologies for the tight turnaround)**

**All: For your review and input.**

**Title:** Information for Healthcare Facilities Concerning Coronavirus Illness

**Agency/Office:** CMS

**Subject/Description:** The Centers for Medicare & Medicaid Services (CMS) is committed to the protection of patients and residents from the spread of infectious disease. Every Medicare participating facility in the Nation's health care system must adhere to standards for infection prevention and control in order to provide safe, high quality care. As concerns arise with the emerging Coronavirus threat, CMS encourages all healthcare facilities to carefully review the information provided by our partners at The Centers for Disease Control and Prevention.

**DATE:** **February 5, 2020**

**TO:** State Survey Agency Directors

**FROM:** Director
Quality, Safety & Oversight Group

**SUBJECT:** Notification to Surveyors of the Authorization for Emergency Use of the **CDC 2019-Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel** Assay and Guidance for Authorized Laboratories

**Memorandum Summary**

- The Centers for Medicare & Medicaid Services (CMS) is providing guidance to surveyors in regards to the authorization for emergency use of the Centers for Disease Control (CDC)'s 2019-Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel assay and the deployment into CDC qualified, and, certified laboratories under the Clinical Laboratory Improvement Amendments of 1988 (CLIA) to perform high complexity tests).
- Assays that have been issued an Emergency Use Authorization (EUA) by the United States Food and Drug Administration (FDA) remain subject CLIA regulations.
- The CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel assay and the corresponding protocols have been developed by the CDC for use by CDC qualified laboratories and the assay has been issued an EUA from the FDA.
- Upon receipt of the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel assay and corresponding Manufacturer's Instructions (MI), CDC qualified laboratories will verify assay performance specifications in their laboratory per the manufacturer's instructions.
- CMS is also providing guidance for surveyors to notify their CMS Location if they discover a laboratory using an assay without an EUA that is testing for the same agent for which the emergency has been declared, or a modified EUA assay. The CMS Location will notify CMS Baltimore.

## Background

The FDA Emergency Use Authorization (EUA) of Medical Products and Related Authorities Guidance for Industry and Other Stakeholders document describes key legal authorities to sustain and strengthen national preparedness for public health, military, and domestic emergencies involving chemical, biological, radiological, and nuclear (CBRN) agents,

AMERICAN OVERSIGHT

including emerging infectious disease threats. The rapid development and deployment of emergency assays is afforded through the EUA authority under Section 564 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 360bbb-3). This permits the FDA Commissioner to authorize the emergency use of an unapproved medical product or an unapproved use of an approved medical product for certain emergency circumstances, if certain criteria are met, after there is a determination and the Secretary of Health and Human Services (HHS) issues a declaration that circumstances exist justifying the authorization of emergency use of the medical product. The EUA remains in effect until the emergency declaration is terminated or until the FDA revokes the authorization. The emergency use of an assay under an EUA must be consistent with the terms of the Letter of Authorization, including the Scope and Conditions of Authorization.

As of December 31, 2019, active 2019-Novel Coronavirus (2019-nCoV) transmission has occurred in Wuhan City, Hubei Province, China. At that time, there were no FDA approved/cleared tests available that could detect and/or diagnose 2019-nCoV in clinical specimens in the United States. CDC recently developed a test for the detection of 2019-nCoV infections in humans and was authorized for emergency under an EUA by FDA on February 4, 2020.

**Discussion**

The CDC 2019-nCoV Real-Time Reverse Transcriptase Polymerase Chain Reaction (rRT-PCR) assay is a molecular in vitro diagnostic test that aids in the detection of 2019-nCoV and is based on widely used nucleic acid amplification technology. The product contains oligonucleotide primers and dual-labeled hydrolysis probes and control material used in rRT-PCR for the in vitro presumptive qualitative detection of 2019-nCoV RNA in upper and lower respiratory specimens.

CMS has coordinated with the CDC to ensure the establishment of performance verification specifications for assays developed and tested by CDC. Subsequent assay performance verification on site at each CDC qualified laboratory is required. Inclusion as a CDC qualified laboratory, as defined in the assay's Manufacturer's Instructions (MI) for use, is not automatic, and members must demonstrate certain capabilities and capacities, and meet established agent-specific performance standards. The CDC assay's manufacturer instructions requires at least one set of assay verification results from each laboratory. CMS encourages laboratories to further evaluate assay performance while testing continues and more patient samples with known results become available.

Assays that have been authorized for emergency use by the FDA remain subject to the CLIA regulations.

Laboratories must follow any and all manufacturer's instructions.

AMERICAN OVERSIGHT

**Verification of Performance Specifications**

Upon receipt of the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel and corresponding Manufacturer's Instructions for Use (MI), CDC qualified laboratories will verify the assay performance specifications as per the Manufacturer's Instructions.

**Resources**

For guidance regarding the verification of performance specifications for EUA assays, please refer to [ HYPERLINK "%20https:/www.cms.gov/Medicare/Provider-Enrollment-and-Certification/SurveyCertificationGenInfo/Policy-and-Memos-to-States-and-Regions-Items/QSO18-19-CLIA.html?DLPage=2&DLEntries=10&DLSort=3&DLSortDir=descending" ].

For a complete list of all assays authorized for use under EUA, please refer to the FDA link [ HYPERLINK "https://www.fda.gov/medical-devices/emergency-situations-medical-devices/emergency-use-authorizations" ]

**Laboratory Use of Assays Without FDA Emergency Use Authorization**

Surveyors should determine if the laboratory is using an assay that has been authorized for emergency use by the FDA. Surveyors should notify their CMS Location if they discover a laboratory using an assay without an EUA that is testing for the same agent for which an emergency has been declared, or a modified EUA assay. The CMS Location will notify CMS Baltimore.

**Contact:** Questions related to this policy memorandum may be submitted to: [ HYPERLINK "mailto:LabExcellence@cms.hhs.gov" ].

**Effective Date:** Immediately. This policy should be communicated with all survey and certification staff, their managers and the State/CMS Locations training coordinators within 30 days of this memorandum.

**Subject:** RE: Intended use wording

Hi Kim,

We are only a few days out from our initial authorization, but we are ready to discuss study design for amendments. We are currently working on the virus LoD studies as discussed, but we'd like to discuss plans to demonstrate equivalency with nucleic acid extraction platforms. We are proposing the following:

1. Extraction Platform Limit of Detection Equivalency

The LOD performance equivalency between Qiagen EZ1 Advanced XL and the Roche MagNA Pure 96 and Roche MagNA Pure 24 instruments will be demonstrated. Perform testing of 3-fold dilution serial dilutions of 2019 novel coronavirus in lysis buffer containing Human Specimen Control using an authorized extraction and the new extraction method(s) in parallel. Each dilution will be tested in a minimum of 5 extraction replicates. The extracted samples will be tested with the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel. The acceptance criteria for LOD equivalency should be defined as demonstrating 100% positivity (5 out of 5 replicates) for each primer/probe set at either the same endpoint LOD concentration or within a 3-fold dilution of each other.

2. Extraction Platform Clinical Specimen Equivalency

Clinical specimens (10 positive, 10 negative) will be extracted with the MagNA Pure 24 and MagNA Pure 96 and tested with the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel. The acceptance criteria for equivalency should be defined as generating 100% concurrent results with those generated with the Qiagen EZ1 Advanced XL.

Do you have time either at 9:30am or after 3pm tomorrow to discuss?

Thank you again,
Julie

Dear Julie, Steve and Steve,

We just wanted to follow-up on some of the outstanding items/questions from yesterday's Telcon:

**For Current EUA Package:**

1) (b) (5) [redacted]

**For Future EUA Amendments:**

1) Condition of authorization – (b) (5) [redacted]

2) (b) (5) [redacted]

3) (b) (5) [redacted] (b) (5) [redacted]

If we missed anything let us know. FYI, the Fact sheets had some edits from OCET and OCC so we are working through those and hope to have them to you tomorrow (sorry for the delay) – we will also update based on out intended use discussion today. Authorization letter and contact fact sheet are also being worked on and we hope to share them with you ASAP.

Any questions, let us know

Best regards
Kim

**Subject:** [WARNING : MESSAGE ENCRYPTED] RE: Intended use wording

Hi Kim and Li,

I am attaching the clinical line item data sheet, password protected. I'll send a separate email with that. We will actually more data to add to this tomorrow. I've arranged the data by case but removed names. I've identified the positive cases by location. As Julie explained, the additional N gene assays (N4 and N5 in the file) were initially run with all specimen testing, but eventually the testing only included the N1 through N3 assays that we're including in the EUA request.

Also attached are the LoD and Exclusivity testing performed for the CLIA validation with the N1, N2, N3 assays. I've included the results for the additional N gene assays N4 and N5. In these summaries.

Regards,
Steve

All,

Thanks for your patience as we worked through a number of rapid-fire tasks today. I've attached the following documents for your review:

1) Therapeutics one pager
2) Vaccines one pager
3) Diagnostics one pager
4) Two overview slides: talking points and graphic

Please add information that is missing and return the documents by 0900 tomorrow (Wednesday). I'll adjudicate comments and make edits once I receive input from each Agency. I understand that all need to go through ASPR and NIAID clearance tomorrow.

Thanks again for your input and your patience as we polished these documents as much as possible today.

Best,
Christy

**Subject:** White House Request-Due COB tomorrow (Tuesday)

All,

We have received a request from the White House Task Force. We need to provide the S1 with three one-pagers, one each for diagnostics, vaccines, and therapeutics. ASPR also wants a single slide showing product development for all three, close collaboration between agencies, etc. we will also put together a slightly longer deck with more detail around the one-pagers.

I've asked Rosemary to coordinate the diagnostic one-pager.

BARDA will take the pen on the one pager, but we are going to have pieces coming in from DoD and NIAID. The attached word document is a very rough outline. Below is what we are thinking in terms of specifics:

(b) (5)

I recognize the challenge in this approach, but just do not see a better approach with the time we have. I need the first draft of the one pagers by about noon tomorrow, so we can start dropping in pieces and working on the flow. I've copied Hilary so she can weigh in with any thoughts.

(b) (5)

AMERICAN OVERSIGHT

For all of these, we're going for bullet format, lots of white space.

We can chat tomorrow a.m., but I wanted to get this out to you tonight in case some of you had time/wanted to get a jump.

Thanks.

Robert

**Subject:** RE: Limit of detection study data

Fantastic! Thank you all so much.

A few questions/issues:

- Should I put February 4 on the EUA template for the declaration?
- We will need to put a document number and revision number on the instructions for use. I will send a version tonight but will send a final word document tomorrow morning with those numbers.
- Hard copies and a CDC will be sent tomorrow morning.

I'll be putting this together right now so feel free to call or email for anything else 404-579-7398

Dear Julie,

AMERICAN OVERSIGHT

Please find attached DMD edits to the documents you sent last night.

1) Appendix E Instructions for use: We went through the Instructions for Use with OCET, OCC and DMD this morning and had some minor edits that are highlighted in green.
2) Cover Letter: minor suggestion for CDC consideration
3) EUA template: minor edits – tracked changes – some to match edits made in the instructions for use
4) HCP Fact Sheet: Edits acceptable with the exception of including (b) (4), (b) (5)

I also have FDA responses to CDC comments in the Letter of Authorization – does CDC want to see them?

Let us know if you need a call to discuss – hope the LoD study data is going okay.

Best regards
Kim

**Subject:** RE: CDC qualified laboratories

Dear Julie,

Thanks for the attaching the CDC comments in the LOA – we are discussing them internally with OCET and OCC tomorrow AM.

We discussed internally your question about defining "qualified laboratory" and think it is best to include similar wording to what you proposed somewhere in the instructions for use. One thought would be in:

## Summary and Explanation

An outbreak of pneumonia of unknown etiology in Wuhan City, Hubei Province, China was initially reported to WHO on December 31, 2019. Chinese authorities identified a novel coronavirus (2019-nCoV), which has resulted in thousands of confirmed human infections in multiple provinces throughout China and exported cases in several Southeast Asian countries and more recently the United States. Cases of severe illness and some deaths have been reported.

The CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel is a molecular *in vitro* diagnostic test that aids in the detection and diagnosis 2019-nCoV and is based on widely used nucleic acid amplification technology. The product contains oligonucleotide primers and dual-labeled hydrolysis probes (TaqMan®) and control material used in rRT-PCR for the *in vitro* qualitative detection of 2019-nCoV RNA in respiratory specimens.

The term "qualified laboratories" refers to laboratories in which all users, analysts, and any person reporting results from use of this device should be trained to perform and interpret the results from this procedure by a competent instructor prior to use. CDC will limit the distribution of this device to only those users who have successfully completed a training course provided by CDC instructors or designees.

If CDC agree just let us know. Also we thought (b) (4), (b) (5) .

In addition, please note that there may be additional comments from OCET/OCC on the Instructions for Use – and I still need to double check that the Conditions of Authorization for Laboratories Section in the IFU matches the Letter of Authorization wording once I finalize with OCET/OCC tomorrow.

Best regards
Kim

**Subject:** CDC qualified laboratories
**Importance:** High

Hi all,

We are getting a lot of questions regarding what the term "qualified laboratory" means. We do not want to change the intended use but recommend that we put some additional language in our documents to clarify. The Influenza Division uses language such as this: All users, analysts, and any person reporting results from use of this device should be trained to perform and interpret the results from this procedure by a competent instructor prior to use. CDC Influenza Division will limit the distribution of this device to only those users who have successfully completed a training course provided by CDC instructors or designees.

My question is: how can we edit the language above to include in our EUA and in which documents should include this language?

I'm also attaching feedback from our Office of General Counsel on the authorization letter. We haven't been through full clearance yet here but thought we should share this now in case there are any issues.

Thanks,
Julie

AMERICAN OVERSIGHT

<Ellen.Flannery@fda.hhs.gov>; Shuren, Jeff <Jeff.Shuren@fda.hhs.gov>
**Subject:** RE: Request for enforcement discretion
**Importance:** High

Dear Dr. Kuhnert-Tallman,

On February 4, 2020, the Centers for Disease Control and Prevention (CDC) received an Emergency Use Authorization (EUA) for the CDC's 2019-Novel Coronavirus (2019-nCoV) Real-Time Reverse Transcriptase (RT)-PCR Diagnostic Panel for the presumptive qualitative detection of nucleic acid from the 2019-nCoV in upper and lower respiratory specimens (such as nasopharyngeal or oropharyngeal swabs, sputum, lower respiratory tract aspirates, bronchoalveolar lavage, and nasopharyngeal wash/aspirate or nasal aspirate) collected from individuals who meet CDC criteria for 2019-nCoV testing.

On February 15, 2020, CDC submitted to FDA a request for enforcement discretion from FDA for the testing of asymptomatic U.S. citizens from the Diamond Princess cruise ship using the FDA-authorized CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel. Asymptomatic individuals do not meet CDC's current Person Under Investigation (PUI) definition or testing criteria. CDC has stated that testing will be conducted at CDC's headquarters in Atlanta, GA. Specimens are expected to arrive at CDC for testing during this holiday weekend.

Our understanding of the facts and the public health concerns at issue here are that there is currently no other test available to respond to this emergency, significant public health concerns are presented by the infectious disease, and the proposed testing may help to prevent the spread of the infectious disease. Based on this understanding, at this time, FDA does not intend to object to the use of this test as described above, with the following conditions: that the testing will be conducted only at CDC's headquarters in Atlanta, GA, that CDC will submit data to FDA on the number of asymptomatic cases identified as being positive during the testing, and that CDC will act promptly to submit an application for a new EUA or a request to modify its existing EUA to include testing of asymptomatic individuals at CDC's headquarters in Atlanta, GA.

Regards,

**CDC 2019 Novel Coronavirus (nCoV) Real-Time RT-PCR Diagnostic Panel**

Dear Dr. Hahn,

Please find enclosed the Centers for Disease Control and Prevention's (CDC) formal request for Emergency Use Authorization (EUA) regarding the distribution and use of the CDC 2019 Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel for detection of the 2019 Novel Coronavirus. Due to the exigent nature of this request, an electronic copy of the official submission of this EUA request is also being concurrently provided to Dr. Uwe Scherf, Director, Division of Microbiology Devices, Center for Devices and Radiological Health (CDRH) via e-mail on February 3, 2020.

CDC is closely monitoring the outbreak of respiratory illness caused by 2019-nCoV that was first detected in Wuhan City, Hubei Province, China and which continues to expand. As of January 31, 2020, there were 9,817 cases of confirmed 2019-nCoV in 22 locations with six confirmed cases of 2019-nCoV in the United States, including one confirmed instance of person-to-person transmission. On January 31, 2020, Health and Human Services Secretary Alex M. Azar II declared a public health emergency for the United States to aid the nation's healthcare community in responding to 2019-nCoV. As CDC continues to investigate this outbreak and work with state, local, and territorial health departments to support investigation of suspect cases, the use of the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel in qualified laboratories designated by CDC within the United States is imperative.

At this time, there are no adequate, approved (cleared), and available alternative diagnostic tools that can detect the 2019-nCoV during the acute phase of infection in the United States. Therefore, CDC requests this EUA to allow use of the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel to expand testing capabilities within the U.S. public health system by providing a rapid diagnostic tool to qualified laboratories for the detection of RNA from 2019-nCoV in clinical specimens during the public health emergency. Deployment of the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel meets an unmet need of providing qualified laboratories a rapid diagnostic tool for evaluation of specimens from patients in the acute phase of infection during this public health emergency.

The CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel is intended for use on an Applied Biosystems (ABI) 7500 Fast Dx Real-Time PCR Instrument, in conjunction with clinical and

AMERICAN OVERSIGHT

epidemiological information. The assay will be used for the qualitative detection of 2019 Novel Coronavirus RNA only by qualified laboratories.

Please find enclosed an Executive Summary, Fact Sheet for Healthcare Providers, Fact Sheet for Patients, the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel package insert and manufacturer's labeling.

If you have any questions regarding this submission, please contact:

Julie Villanueva, Ph.D.
Laboratory Preparedness and Response Branch Chief
Division of Preparedness and Emerging Infections
National Center for Emerging and Zoonotic Infectious Diseases
Centers for Disease Control and Prevention

# FACT SHEET FOR HEALTHCARE PROVIDERS

**CDC - 2019-nCoV Real-Time RT-PCR Diagnostic Panel** **February x, 2020**

**2019 Novel Coronavirus (2019-nCoV)**

This Fact Sheet informs you of the significant known and potential risks and benefits of the emergency use of the Centers for Disease Control and Prevention (CDC) 2019-nCoV Real-Time RT-PCR Diagnostic Panel.

Testing is to be conducted on specimens from people who meet CDC criteria for 2019-nCoV testing, available at CDC's webpage, *Information for Healthcare Professionals* (see links provided in "Where can I go for updates and more information" section). The CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel should be ordered only to presumptively detect 2019-nCoV infection. If outside the U.S., testing should follow appropriate public health authority consultation and/or guidance for the diagnosis and reporting of 2019-nCoV infection. All information and guidance, including for 2019-nCoV laboratory testing, may change as more data is gathered on this virus. Please check the CDC's 2019 Novel Coronavirus, webpage (see links provided in "Where can I go for updates and more information" section) regularly for the most current information.

**All patients whose specimens are tested with this assay will receive the Fact Sheet for Patients: CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel**

**What are the symptoms of 2019-nCoV?**
Most patients with confirmed 2019-nCoV infection have developed fever and/or symptoms of acute respiratory illness (e.g., cough, difficulty breathing). However, limited information is currently available to characterize the full spectrum of clinical illness associated with 2019-nCoV infection. Based on what is known about MERS-CoV and SARS-CoV, signs and symptoms may appear any time from 2 to 14 days after exposure to 2019-nCoV virus. The median incubation period is unknown at this time.

Public health officials have identified cases of 2019-nCoV infection in the United States, which may pose risks for public health. To date most reported cases of 2019-nCoV infection outside of China have been directly or indirectly linked through residence in or travel to Wuhan City, China. There also are reports of human to human transmission through close contact with an individual confirmed to be ill with 2019-nCoV in countries outside China. Please check the CDC webpage for the most up to date information.

**This test is to be performed only using respiratory specimens collected from individuals who meet CDC criteria for 2019-nCoV testing.**

**What do I need to know about 2019-nCoV testing?**
Current information on 2019-nCoV infection for healthcare providers, including case definitions and infection control, is available at CDC's webpage, *Information for Healthcare Professionals* (see links provided in "Where can I go for updates and more information" section).

- The CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel can be used to test upper and lower respiratory specimens (such as nasopharyngeal or oropharyngeal swabs, bronchoalveolar lavage, sputum, lower respiratory tract aspirate, nasopharyngeal wash/aspirate or nasal aspirate).
- The CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel should be ordered for the presumptive detection of 2019-nCoV in individuals who meet CDC criteria for 2019-nCoV testing.
- The CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel is authorized for use in laboratories designated by CDC as qualified, and in the U.S., certified under CLIA to perform high complexity tests.

Specimens should be collected with appropriate infection control precautions following CDC *Guideline for Isolation Precautions: Preventing Transmission of Infectious Agents in Healthcare Settings (2007).*

Use appropriate personal protective equipment when collecting and handling specimens from individuals

**Report Adverse events,** including problems with test performance or results, to MedWatch by submitting the online FDA Form 3500 ([ HYPERLINK "https://www.accessdata.fda.gov/scripts/medwatch/index.cfm?action=reporting.home" ]~~https://www.accessdata.fda.gov/scripts/medwatch/index.cfm?action=reporting.home~~) or by calling **1-800-FDA-1088**

AMERICAN OVERSIGHT

suspected of being infected with 2019-nCoV as outlined in the CDC *Interim Laboratory Biosafety Guidelines for Handling and Processing Specimens Associated with 2019 Novel Coronavirus (2019-nCoV)*. These specimens are only shipped for analysis to laboratories designated by CDC as qualified for analysis. For additional information, refer to CDC *Interim Guidelines for Collecting, Handling, and Testing Clinical Specimens from Patients Under Investigation (PUIs) for 2019 Novel Coronavirus (2019-nCoV) (*see links provided in "Where can I go for updates and more information" section).

**What does it mean if the specimen tests positive for 2019-nCoV?**
A positive test result for 2019-nCoV indicates that RNA from 2019-nCoV was detected, and the patient is presumptively infected with 2019-nCoV and presumed to be contagious. Laboratory test results should always be considered in the context of clinical observations and epidemiological data in making a final diagnosis and patient management decisions. Patient management should follow current CDC guidelines.

The CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel has been designed to minimize the likelihood of false positive test results. However, in the event of a false positive result, risks to patients could include the following: a recommendation for isolation of the patient, monitoring of household or other close contacts for symptoms, patient isolation that might limit contact with family or friends and may increase contact with other potentially 2019-nCoV infected patients, limits in the ability to work, the delayed diagnosis and treatment for the true infection causing the symptoms, unnecessary prescription of a treatment or therapy, or other unintended adverse effects.

All laboratories using this test must follow the standard confirmatory testing and reporting guidelines according to their appropriate public health authorities.

**What does it mean if the specimen tests negative for 2019-nCoV?**
A negative test result for this test means that 2019-nCoV RNA was not present in the specimen above the limit of detection. However, a negative result does not rule out 2019-nCoV infection and should not be used as the sole basis for treatment or patient management decisions. A negative result does not exclude the possibility of 2019-nCoV infection.

When diagnostic testing is negative, the possibility of a false negative result should be considered in the context of a patient's recent exposures and the presence of clinical signs and symptoms consistent with 2019-nCoV infection. The possibility of a false negative result should especially be considered if the patient's recent exposures or clinical presentation indicate that 2019-nCoV infection is likely, and diagnostic tests for other causes of illness (e.g., other respiratory illness) are negative. If 2019-nCoV infection is still suspected based on exposure history together with other clinical findings, re-testing should be considered in consultation with public health authorities.

Risks to a patient of a false negative include: delayed or lack of supportive treatment, lack of monitoring of infected individuals and their household or other close contacts for symptoms resulting in increased risk of spread of 2019-nCoV within the community, or other unintended adverse events.

**What is an EUA?**
The United States (U.S.) FDA has made this test available under an emergency access mechanism called an Emergency Use Authorization (EUA). The EUA is supported by the Secretary of Health and Human Service's (HHS's) declaration that circumstances exist to justify the use of in vitro diagnostics (IVDs) under EUA for the detection and/or diagnosis of 2019-nCoV.

An IVD made available under an EUA has not undergone the same type of review as an FDA-approved or cleared IVD. However, based on the totality of scientific evidence available, it is reasonable to believe that this IVD may be effective in the detection of 2019-nCoV.

The EUA for this test is in effect for the duration of the 2019-nCoV emergency, unless terminated or revoked (after which the test may no longer be used). An FDA

AMERICAN OVERSIGHT

approved or cleared IVD should be used instead of an IVD under EUA, when applicable and available.

# FACT SHEET FOR PATIENTS

## CDC - 2019-nCoV Real-Time RT-PCR Diagnostic Panel

Febuary x, 202

2019 Novel Coronavirus (2019-nCoV)

You are being given this Fact Sheet because your sample(s) were tested for the 2019 novel coronavirus (2019-nCoV) using the Centers for Disease Control and Prevention (CDC) 2019-nCoV Real-Time RT-PCR Diagnostic Panel. Testing was done because you meet CDC criteria for 2019-nCoV testing.

This Fact Sheet contains information to help you understand the risks and benefits of using this test for the diagnosis of 2019-nCoV infection. After reading this Fact Sheet, if you have questions or would like to discuss the information provided, please talk to your healthcare provider.

- **For the most up to date information on 2019-nCoV please visit the CDC 2019 Novel Coronavirus webpage:**

- [ HYPERLINK "https://www.cdc.gov/nCoV" ]

**What is 2019-nCoV Infection?**
2019-nCoV infection is caused by the 2019-nCoV. The 2019-nCoV infection can cause mild to severe respiratory illness in humans and was recently idenitifed in Wuhan, China. Limited information is available to characterize the spectrum of clinical illness associated with 2019-nCoV. 2019-nCoV likely spreads to others when a person shows signs or symptoms of being sick (e.g., fever, coughing, sneezing, difficulty breathing, etc.).

**What is the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel?**
The test is designed to detect 2019-nCoV in respiratory specimens, for example nasal or oral swabs.

**Why was my sample tested?**
Your sample(s) were tested because your healthcare provider believes you may have been exposed to 2019-nCoV based on your signs and symptoms (e.g., fever, cough, difficulty breathing), and because:

- You live in or have recently traveled to a place where transmission of 2019-nCoV is known to occur, and/or
- Because you have been in close contact with an individual suspected of or confirmed to have 2019-nCoV infection.

The sample(s) collected from you were tested to help find out whether you may be infected with 2019-nCoV.

**What are the known and potential risks and benefits of the test?**
Potential risks include:

- Possible discomfort or other complications that can happen during sample collection.
- Risk that the test result is incorrect (see below for more information).

Potential benefits include:

- The results, along with other information, can help your healthcare provider make informed recommendations about your care.
- The results of this test may help limit the spread of 2019-nCoV to your family and others in your community.

**What does it mean if I have a positive 2019-nCoV test result?**
If you have a positive test result, it is very likely that you are infected with 2019-nCoV. Therefore, it is also likely that you may be placed in isolation to avoid spreading

**Where can I go for updates and more information?** The most up-to-date information on 2019-nCoV is available at the CDC General webpage: [ HYPERLINK "https://www.cdc.gov/nCoV" ]. In addition, please also contact your healthcare provider with any questions/concerns.

AMERICAN OVERSIGHT

the virus to others. There is a very small chance that this test can give a positive result that is wrong (a false positive result). However, your healthcare provider will work with you to determine how best to care for you based on the test results along with other factors of your medical history, such as symptoms, possible exposures, and geographic location of places you have recently traveled.

**What does it mean if I have a negative test result?**
A negative test result means that 2019-nCoV was not found in your sample. For 2019-nCoV, a negative test result for a sample collected while a person has symptoms usually means that 2019-nCoV did not cause your recent illness.

It is possible for this test to give a negative result that is incorrect (false negative) in some people with 2019-nCoV infection, meaning you could possibly still have an infection with 2019-nCoV even though the test is negative. Therefore, while a negative test most likely means you do not have 2019-nCoV infection, your healthcare provider will consider the test result together with all other aspects of your medical history (such as symptoms, possible exposures, and geographical location of places you have recently traveled) in deciding how to care for you.

It is important that you work with your healthcare provider to help you understand the next steps you should take.

**Is this test FDA-approved or cleared?**
No. This test is not yet approved or cleared by the United States (U.S.) FDA. When there are no FDA-approved or cleared tests available, and other criteria are met, FDA can make tests available under an emergency access mechanism called an Emergency Use Authorization (EUA). The EUA for this test is supported by the Secretary of Health and Human Service's (HHS's) declaration that circumstances exist to justify the use of in vitro diagnostics under EUA for the detection and/or diagnosis of 2019-nCoV. This EUA will remain in effect (meaning this test can be used) for the duration of the 2019-nCoV emergency, unless it is terminated or revoked by FDA (after which the test may no longer be used).

**Where can I go for updates and more information?** The most up-to-date information on 2019-nCoV is available at the CDC General webpage: [ HYPERLINK "https://www.cdc.gov/nCoV" ]. In addition, please also contact your healthcare provider with any questions/concerns.

AMERICAN OVERSIGHT

## Intended Use

The CDC 2019-Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel is a real-time RT-PCR test intended for the presumptive qualitative detection of nucleic acid from the 2019-nCoV in upper and lower respiratory specimens (such as nasopharyngeal or oropharyngeal swabs, sputum, lower respiratory tract aspirates, bronchoalveolar lavage, and nasopharyngeal wash/aspirate or nasal aspirate) collected from individuals who meet CDC criteria for 2019-nCoV testing. Testing is limited to qualified laboratories designated by CDC and, in the United States, certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA), 42 U.S.C. § 263a, to perform high complexity tests.

Results are for the presumptive identification of 2019-nCoV RNA. The 2019-nCoV RNA is generally detectable in upper and lower respiratory specimens during infection. Positive results are indicative of active infection with 2019-nCoV but do not rule out bacterial infection or co-infection with other viruses. The agent detected may not be the definite cause of disease. Laboratories within the United States and its territories are required to report all positive results to the appropriate public health authorities.

Negative results do not preclude 2019-nCoV infection and should not be used as the sole basis for treatment or other patient management decisions. Negative results must be combined with clinical observations, patient history, and epidemiological information.

Testing with the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel is intended for use by trained laboratory personnel who are proficient in performing real-time RT-PCR assays. The CDC 2019-Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel is only for use under a Food and Drug Administration's Emergency Use Authorization.

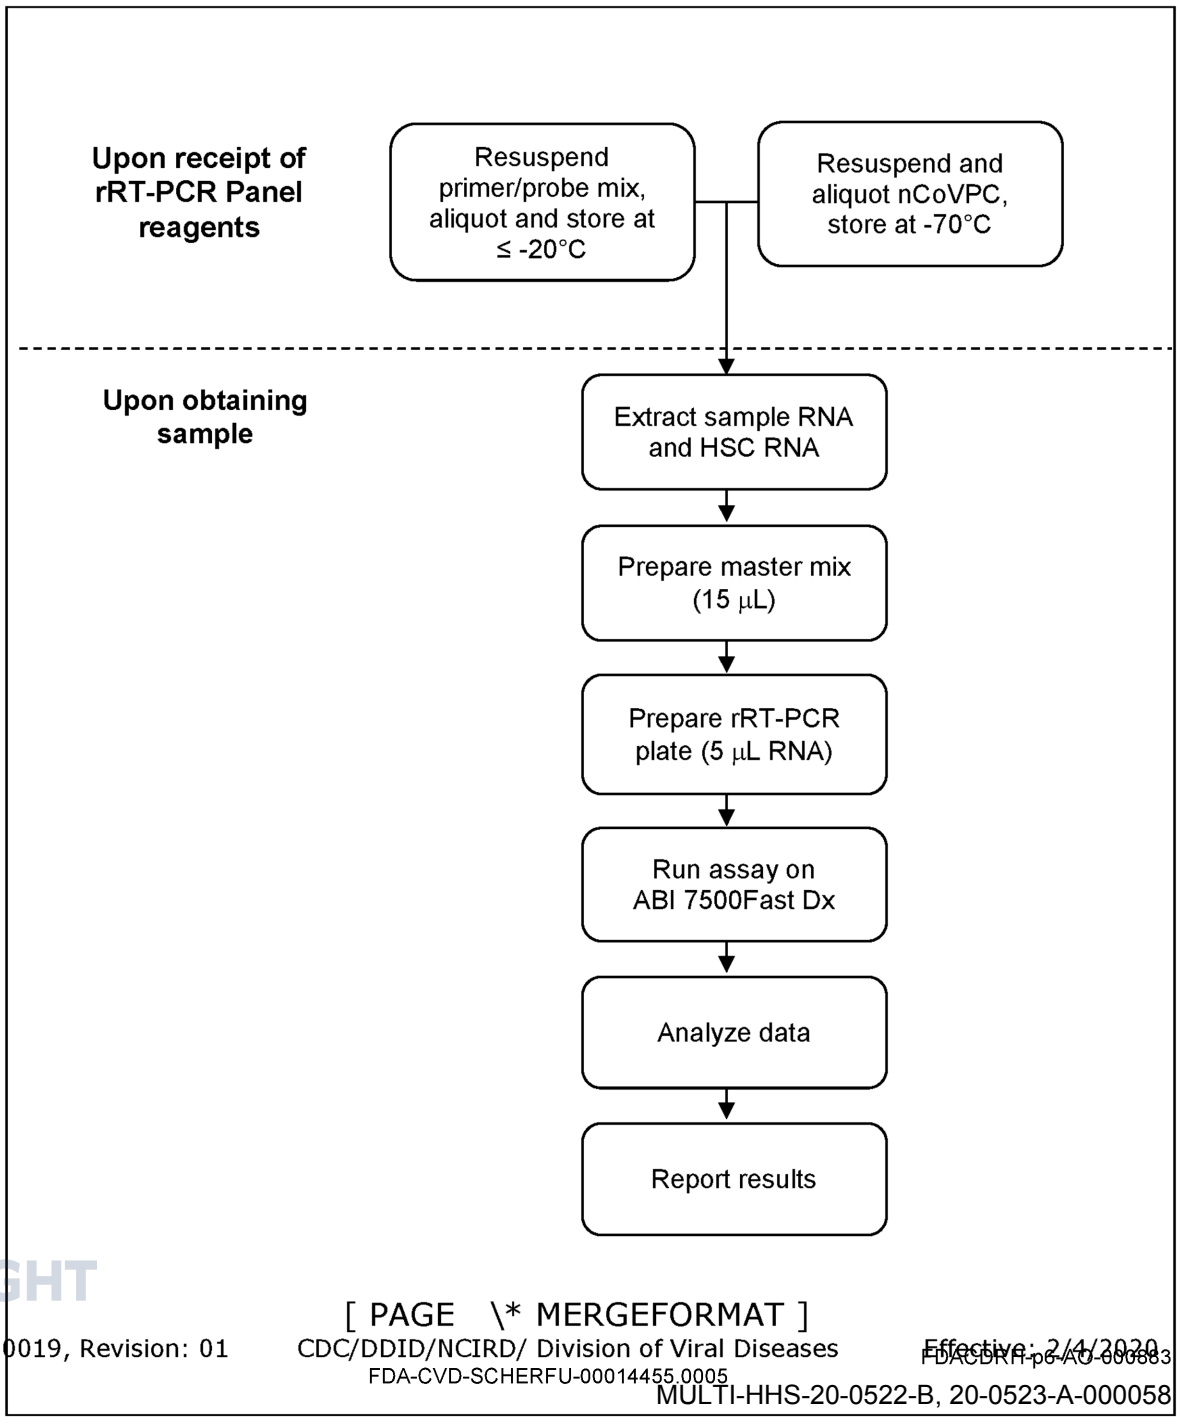
## Summary and Explanation

An outbreak of pneumonia of unknown etiology in Wuhan City, Hubei Province, China was initially reported to WHO on December 31, 2019. Chinese authorities identified a novel coronavirus (2019-nCoV), which has resulted in thousands of confirmed human infections in multiple provinces throughout China and exported cases in several Southeast Asian countries and more recently the United States. Cases of severe illness and some deaths have been reported.

The CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel is a molecular *in vitro* diagnostic test that aids in the detection and diagnosis 2019-nCoV and is based on widely used nucleic acid amplification technology. The product contains oligonucleotide primers and dual-labeled hydrolysis probes (TaqMan®) and control material used in rRT-PCR for the *in vitro* qualitative detection of 2019-nCoV RNA in respiratory specimens.

The term "qualified laboratories" refers to laboratories in which all users, analysts, and any person reporting results from use of this device should be trained to perform and interpret the results from this procedure by a competent instructor prior to use. CDC will limit the distribution of this device to laboratories whose users have successfully completed a training course provided by CDC instructors or designees.

## Principles of the Procedure



The oligonucleotide primers and probes for detection of 2019-nCoV were selected from regions of the virus nucleocapsid (N) gene. The panel is designed for both universal detection of SARS-like coronaviruses (one primer/probe set) as well as specific detection of the 2019-nCoV (two primer/probe sets). An additional primer/probe set to detect the human RNase P gene (RP) in control samples and clinical specimens is also included in the panel.

AMERICAN OVERSIGHT

RNA isolated and purified from upper and lower respiratory specimens is reverse transcribed to cDNA and subsequently amplified in the Applied Biosystems 7500 Fast Dx Real-Time PCR Instrument with SDS version 1.4 software. In the process, the probe anneals to a specific target sequence located between the forward and reverse primers. During the extension phase of the PCR cycle, the 5′ nuclease activity of Taq polymerase degrades the probe, causing the reporter dye to separate from the quencher dye, generating a fluorescent signal. With each cycle, additional reporter dye molecules are cleaved from their respective probes, increasing the fluorescence intensity. Fluorescence intensity is monitored at each PCR cycle by Applied Biosystems 7500 Fast Dx Real-Time PCR System with SDS version 1.4 software.

Detection of viral RNA not only aids in the diagnosis of illness but also provides epidemiological and surveillance information.

## Summary of Preparation and Testing Process

AMERICAN OVERSIGHT

## Equipment and Consumables Required (But Not Provided)

- Vortex mixer
- Microcentrifuge
- Micropipettes (2 or 10 µL, 200 µL and 1000 µL)
- Multichannel micropipettes (5-50 µl)
- Racks for 1.5 mL microcentrifuge tubes
- 2 x 96-well -20°C cold blocks
- 7500 Fast Dx Real-Time PCR Systems with SDS 1.4 software (Applied Biosystems; catalog #446985 or #4406984)
- Extraction systems (instruments): QIAGEN EZ1 Advanced XL
- Molecular grade water, nuclease-free
- 10% bleach (1:10 dilution of commercial 5.25-6.0% hypochlorite bleach)
- DNA*Zap*™ (Ambion, cat. #AM9890) or equivalent
- RNAse AwayTM (Fisher Scientific; cat. #21-236-21) or equivalent
- Disposable powder-free gloves and surgical gowns
- Aerosol barrier pipette tips
- 1.5 mL microcentrifuge tubes (DNase/RNase free)
- 0.2 mL PCR reaction plates (Applied Biosystems; catalog #4346906 or #4366932)
- MicroAmp Optical 8-cap Strips (Applied Biosystems; catalog #4323032)

## Warnings and Precautions

- For *in vitro* diagnostic use (IVD).
- For emergency use only.
- Follow standard precautions. All patient specimens and positive controls should be considered potentially infectious and handled accordingly.
- Do not eat, drink, smoke, apply cosmetics or handle contact lenses in areas where reagents and human specimens are handled.
- Handle all specimens as if infectious using safe laboratory procedures. Refer to Interim Laboratory Biosafety Guidelines for Handling and Processing Specimens Associated with 2019-nCoV [ HYPERLINK "https://www.cdc.gov/coronavirus/2019-nCoV/lab-biosafety-guidelines.html" ].
- Specimen processing should be performed in accordance with national biological safety regulations.
- If infection with 2019-nCoV is suspected based on current clinical and epidemiological screening criteria recommended by public health authorities, specimens should be collected with appropriate infection control precautions.
- Performance characteristics have been determined with human upper respiratory specimens and lower respiratory tract specimens from human patients with signs and symptoms of respiratory infection.
- Perform all manipulations of live virus samples within a Class II (or higher) biological safety cabinet (BSC).

AMERICAN OVERSIGHT

- Use personal protective equipment such as (but not limited to) gloves, eye protection, and lab coats when handling kit reagents while performing this assay and handling materials including samples, reagents, pipettes, and other equipment and reagents.
- Amplification technologies such as PCR are sensitive to accidental introduction of PCR product from previous amplifications reactions. Incorrect results could occur if either the clinical specimen or the real-time reagents used in the amplification step become contaminated by accidental introduction of amplification product (amplicon). Workflow in the laboratory should proceed in a unidirectional manner.
    - Maintain separate areas for assay setup and handling of nucleic acids.
    - Always check the expiration date prior to use. Do not use expired reagent. Do not substitute or mix reagent from different kit lots or from other manufacturers.
    - Change aerosol barrier pipette tips between all manual liquid transfers.
    - During preparation of samples, compliance with good laboratory techniques is essential to minimize the risk of cross-contamination between samples, and the inadvertent introduction of nucleases into samples during and after the extraction procedure. Proper aseptic technique should always be used when working with nucleic acids.
    - Maintain separate, dedicated equipment (e.g., pipettes, microcentrifuges) and supplies (e.g., microcentrifuge tubes, pipette tips) for assay setup and handling of extracted nucleic acids.
    - Wear a clean lab coat and powder-free disposable gloves (not previously worn) when setting up assays.
    - Change gloves between samples and whenever contamination is suspected.
    - Keep reagent and reaction tubes capped or covered as much as possible.
    - Primers, probes (including aliquots), and enzyme master mix must be thawed and maintained on cold block at all times during preparation and use.
    - Work surfaces, pipettes, and centrifuges should be cleaned and decontaminated with cleaning products such as 10% bleach, "DNA*Zap*™" or "RNase AWAY®" to minimize risk of nucleic acid contamination. Residual bleach should be removed using 70% ethanol.
- RNA should be maintained on cold block or on ice during preparation and use to ensure stability.
- Dispose of unused kit reagents and human specimens according to local, state, and federal regulations.

## Reagent Storage, Handling, and Stability

- Store all dried primers and probes and the positive control, nCoVPC, at 2-8°C until re-hydrated for use. Store liquid HSC control materials at ≤ -20°C.
- Always check the expiration date prior to use. Do not use expired reagents.
- Protect fluorogenic probes from light.
- Primers, probes (including aliquots), and enzyme master mix must be thawed and kept on a cold block at all times during preparation and use.
- Do not refreeze probes.
- Controls and aliquots of controls must be thawed and kept on ice at all times during preparation and use.

AMERICAN OVERSIGHT

MULTI-HHS-20-0522-B, 20-0523-A-000062

## Specimen Collection, Handling, and Storage

Inadequate or inappropriate specimen collection, storage, and transport are likely to yield false test results. Training in specimen collection is highly recommended due to the importance of specimen quality. CLSI MM13-A may be referenced as an appropriate resource.

- Collecting the Specimen
  - Refer to Interim Guidelines for Collecting, Handling, and Testing Clinical Specimens from Patients Under Investigation (PUIs) for 2019 Novel Coronavirus (2019-nCoV) [ HYPERLINK "https://www.cdc.gov/coronavirus/2019-nCoV/guidelines-clinical-specimens.html" ]
  - Follow specimen collection devices manufacturer instructions for proper collection methods.
  - Swab specimens should be collected using only swabs with a synthetic tip, such as nylon or Dacron®, and an aluminum or plastic shaft. Calcium alginate swabs are unacceptable and cotton swabs with wooden shafts are not recommended. Place swabs immediately into sterile tubes containing 2-3 ml of viral transport media. NP and OP specimens should be kept in separate vials.
- Transporting Specimens
  - Specimens must be packaged, shipped, and transported according to the current edition of the International Air Transport Association (IATA) Dangerous Goods Regulation. Follow shipping regulations for UN 3373 Biological Substance, Category B when sending potential 2019-nCoV specimens. Store specimens at 2-8°C and ship overnight to CDC on ice pack. If a specimen is frozen at -70°C or lower, ship overnight to CDC on dry ice.
- Storing Specimens
  - Specimens can be stored at 2-8°C for up to 72 hours after collection.
  - If a delay in extraction is expected, store specimens at -70°C or lower.
  - Extracted nucleic acid should be stored at -70°C or lower.

## Specimen Referral to CDC

Referring a specimen to the CDC

- Ship all specimens overnight to CDC.
- Ship frozen specimens on dry ice and non-frozen specimens on cold packs.
- Refer to the International Air Transport Association (IATA - [ HYPERLINK "http://www.iata.org" ]) for requirements for shipment of human or potentially infectious biological specimens. Follow shipping regulations for UN 3373 Biological Substance, Category B when sending potential 2019-nCoV specimens.
- Prior to shipping, notify CDC Division of Viral Diseases (see contact information below) that you are sending specimens.

FDA-CVD-SCHERFU-00014455.0005
MULTI-HHS-20-0522-B, 20-0523-A-000063

- Send all samples to the following recipient:

Centers for Disease Control and Prevention
c/o STATT
Attention: Dr. Stephen Lindstrom (Unit 84)
1600 Clifton Rd., Atlanta, GA 30329-4027
Phone: (404) 639-1587

**The emergency contact number for CDC Emergency Operations Center (EOC) is 770-488-7100.**

## Reagent and Controls Preparation

### Primer and Probe Preparation:

1) Upon receipt, store dried primers and probes at 2-8°C.
2) Precautions: These reagents should only be handled in a clean area and stored at appropriate temperatures (see below) in the dark. Freeze-thaw cycles should be avoided. Maintain cold when thawed.
3) Using aseptic technique, suspend dried reagents in 1.5 mL of nuclease-free water (50X working concentration) and allow to rehydrate for 15 min at room temperature in the dark.
4) Mix gently and aliquot primers/probe in 300 µL volumes into 5 pre-labeled tubes. Store a single aliquot of primers/probe at 2-8°C in the dark. Do not refreeze (stable for up to 4 months). Store remaining aliquots at ≤ -20°C in a non-frost-free freezer.

### 2019-nCoV Positive Control (nCoVPC) Preparation:

1) Precautions: This reagent should be handled with caution in a dedicated nucleic acid handling area to prevent possible contamination. Freeze-thaw cycles should be avoided. Maintain on ice when thawed.
2) Resuspend dried reagent in each tube in 1 mL of nuclease-free water to achieve the proper concentration. Make single use aliquots (approximately 30 µL) and store at ≤ -70°C.
3) Thaw a single aliquot of diluted positive control for each experiment and hold on ice until adding to plate. Discard any unused portion of the aliquot.

### Human Specimen Control (HSC) (not provided)

1) Human Specimen Control (HSC) must be extracted and processed with each specimen extraction run.
2) Refer to the Human Specimen Control (HSC) package insert for instructions for use.

### No Template Control (NTC) (not provided)

1) Sterile, nuclease-free water
2) Aliquot in small volumes
3) Used to check for contamination during specimen extraction and/or plate set-up

AMERICAN OVERSIGHT

# General Preparation

## Equipment Preparation

Clean and decontaminate all work surfaces, pipettes, centrifuges, and other equipment prior to use. Decontamination agents should be used including 5% bleach, 70% ethanol, and *DNAzap*™ or *RNase AWAY*® to minimize the risk of nucleic acid contamination.

# Nucleic Acid extraction

Performance of the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel is dependent upon the amount and quality of template RNA purified from human specimens. The following commercially available RNA extraction kits and procedures have been qualified and validated for recovery and purity of RNA for use with the panel:

## Qiagen QIAamp® DSP Viral RNA Mini Kit

Recommendation(s): Utilize 100 µL of sample and elute with 100 µL of buffer or utilize 140 µL of sample and elute with 140 µL of buffer.

## Qiagen EZ1 Advanced XL

Kit: Qiagen EZ1 DSP Virus Kit and Buffer AVL (supplied separately) for offboard lysis
Card: EZ1 Advanced XL DSP Virus Card
Recommendation(s): Add 120 µL of sample to 280 µL of pre-aliquoted Buffer AVL (total input sample volume is 400 µL). Proceed with the extraction on the EZ1 Advanced XL. Elution volume is 120 µL.

Manufacturer's recommended procedures (except as noted in recommendations above) are to be followed for sample extraction. HSC must be included in each extraction batch.

***Disclaimer: Names of vendors or manufacturers are provided as examples of suitable product sources. Inclusion does not imply endorsement by the Centers for Disease Control and Prevention.***

# Assay Set Up

## Reaction Master Mix and Plate Set Up

Note: Plate set-up configuration can vary with the number of specimens and work day organization. NTCs and nCoVPCs must be included in each run.

1) In the reagent set-up room clean hood, place rRT-PCR buffer, enzyme, and primer/probes on ice or cold-block. Keep cold during preparation and use.
2) Thaw 4X Reaction Mix prior to use.
3) Mix buffer, enzyme, and primer/probes by inversion 5 times.
4) Centrifuge buffer and primers/probes for 5 seconds to collect contents at the bottom of the tube, and then place the tube in a cold rack.
5) Label one 1.5 mL microcentrifuge tube for each primer/probe set.
6) Determine the number of reactions (N) to set up per assay. It is necessary to make excess reaction mix for the NTC, nCoVPC, HSC (if included in the RT-PCR run), and RP reactions and for pipetting error. Use the following guide to determine N:

AMERICAN OVERSIGHT

FDACDRH-p6-AG-000890
FDA-CVD-SCHERFU-00014455.0005
MULTI-HHS-20-0522-B, 20-0523-A-000065

- If number of samples (n) including controls equals 1 through 14, then N = n + 1
- If number of samples (n) including controls is 15 or greater, then N = n + 2

7) For each primer/probe set, calculate the amount of each reagent to be added for each reaction mixture (N = # of reactions).

**TaqPath™ 1-Step RT-qPCR Master Mix**

| Step # | Reagent | Vol. of Reagent Added per Reaction |
|---|---|---|
| 1 | Nuclease-free Water | N x 8.5 µL |
| 2 | Combined Primer/Probe Mix | N x 1.5 µL |
| 3 | TaqPath™ 1-Step RT-qPCR Master Mix (4x) | N x 5.0 µL |
| | **Total Volume** | **N x 15.0 µL** |

8) Dispense reagents into each respective labeled 1.5 mL microcentrifuge tube. After addition of the reagents, mix reaction mixtures by pipetting up and down. ***Do not vortex***.
9) Centrifuge for 5 seconds to collect contents at the bottom of the tube, and then place the tube in a cold rack.
10) Set up reaction strip tubes or plates in a 96-well cooler rack.
11) Dispense 15 µL of each master mix into the appropriate wells going across the row as shown below (**Figure 1**):

**Figure 1: Example of Reaction Master Mix Plate Set-Up**

| | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| A | N1 | N1 | N1 | N1 | N1 | N1 | N1 | N1 | N1 | N1 | N1 | N1 |
| B | N2 | N2 | N2 | N2 | N2 | N2 | N2 | N2 | N2 | N2 | N2 | N2 |
| C | N3 | N3 | N3 | N3 | N3 | N3 | N3 | N3 | N3 | N3 | N3 | N3 |
| D | RP | RP | RP | RP | RP | RP | RP | RP | RP | RP | RP | RP |
| E | | | | | | | | | | | | |
| F | | | | | | | | | | | | |
| G | | | | | | | | | | | | |
| H | | | | | | | | | | | | |

12) Prior to moving to the nucleic acid handling area, prepare the No Template Control (NTC) reactions for column #1 in the assay preparation area.
13) Pipette 5 µL of nuclease-free water into the NTC sample wells (**Figure 2**, column 1). Securely cap NTC wells before proceeding.
14) Cover the entire reaction plate and move the reaction plate to the specimen nucleic acid handling area.

AMERICAN OVERSIGHT

FDACDRH-p6-AG-000891
FDA-CVD-SCHERFU-00014455.0005
MULTI-HHS-20-0522-B, 20-0523-A-000066

**Nucleic Acid Template Addition**

1) Gently vortex nucleic acid sample tubes for approximately 5 seconds.
2) Centrifuge for 5 seconds to collect contents at the bottom of the tube, and then place the tube in a cold rack.
3) After centrifugation, place extracted nucleic acid sample tubes in the cold rack.
4) Samples should be added to columns 2-11 (column 1 and 12 are for controls) to the specific assay that is being tested as illustrated in **Figure 2**. Carefully pipette 5.0 µL of the first sample into all the wells labeled for that sample (i.e. Sample "S1" down column #2). *Keep other sample wells covered during addition. Change tips after each addition.*
5) Securely cap the column to which the sample has been added to prevent cross contamination and to ensure sample tracking.
6) Change gloves often and when necessary to avoid contamination.
7) Repeat steps #3 and #4 for the remaining samples.
8) If necessary, add 5 µL of Human Specimen Control (HSC) extracted sample to the HSC wells (**Figure 2**, column 11). Securely cap wells after addition. NOTE: Per CLIA regulations, HSC must be tested at least once per day.
9) Cover the entire reaction plate and move the reaction plate to the positive template control handling area.

**Assay Control Addition**

1) Pipette 5 µL of nCoVPC RNA to the sample wells of column 12 (**Figure 2**). Securely cap wells after addition of the control RNA.

***NOTE:*** *If using 8-tube strips, label the TAB of each strip to indicate sample position.* ***DO NOT LABEL THE TOPS OF THE REACTION TUBES!***

*2)* Briefly centrifuge reaction tube strips for 10-15 seconds. After centrifugation return to cold rack.

***NOTE****: If using 96-well plates, centrifuge plates for 30 seconds at 500 x g, 4°C.*

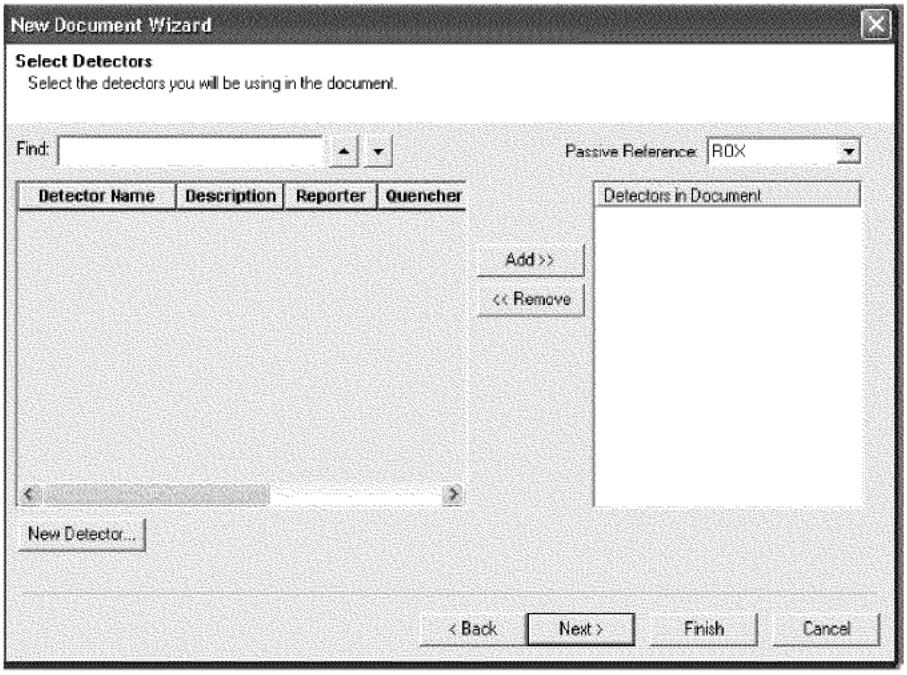
# Create a Run Template on the Applied Biosystems 7500 Fast Dx Real-time PCR Instrument (Required if no template exists)

If the template already exists on your instrument, please proceed to the **RUNNING A TEST** section.

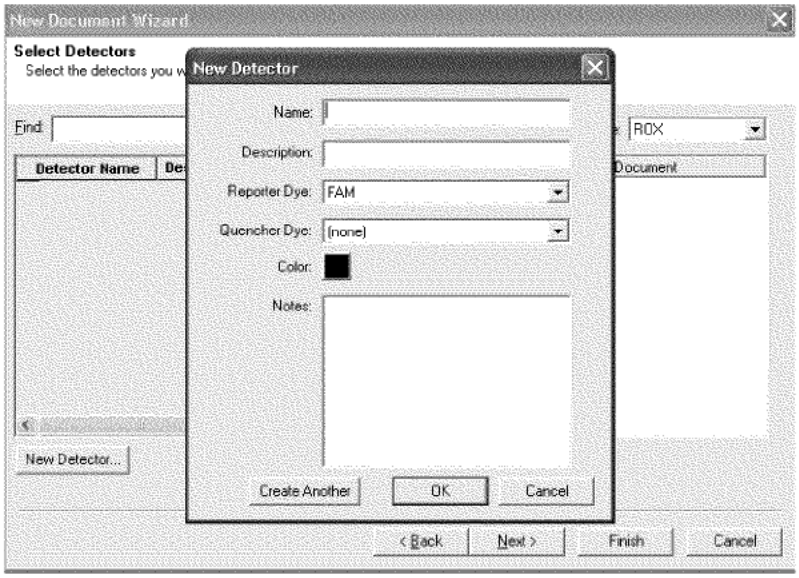
1) Launch the Applied Biosystems 7500 Fast Dx Real-time PCR Instrument by double clicking on the Applied Biosystems 7500 Fast Dx System icon on the desktop.
2) A new window should appear, select **Create New Document** from the menu.

**Figure 3. New Document Wizard Window**



3) The **New Document Wizard** screen in **Figure 3** will appear. Select:
   a. Assay: **Standard Curve (Absolute Quantitation)**
   b. Container: **96-Well Clear**
   c. Template: **Blank Document**
   d. Run Mode: **Standard 7500**
   e. Operator: ***Your Name***
   f. Comments: **SDS v1.4**
   g. Plate Name: ***Your Choice***
4) After making selections click **Next** at the bottom of the window.

AMERICAN OVERSIGHT

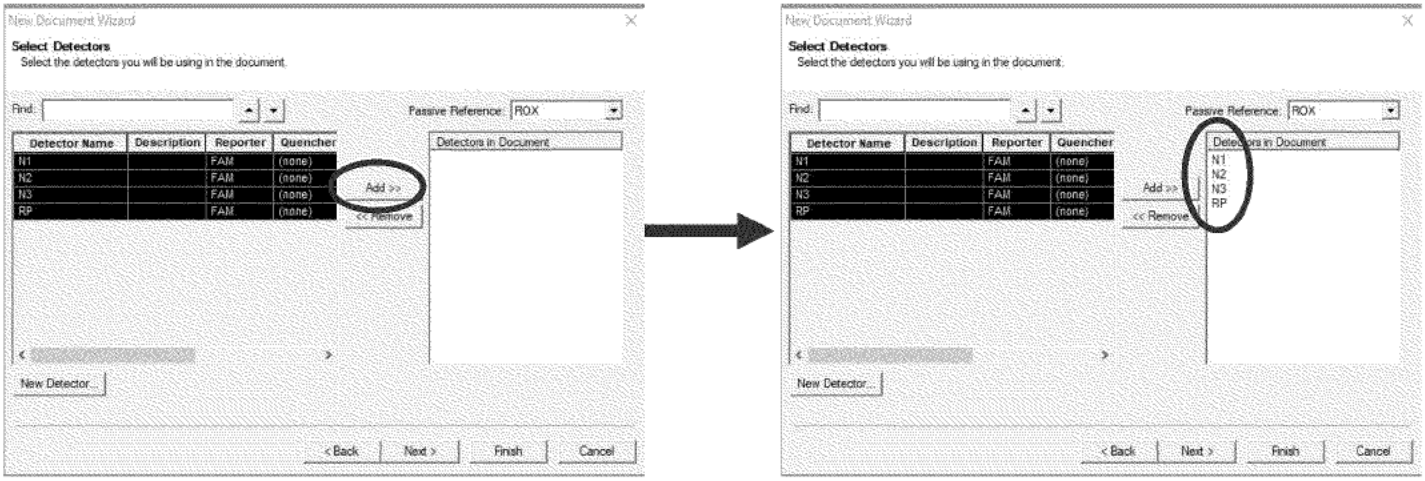


FDACDRH-p6-AO-000693
FDA-CVD-SCHERFU-00014455.0005
MULTI-HHS-20-0522-B, 20-0523-A-000068

**Figure 4. Creating New Detectors**

5) After selecting next, the ***Select Detectors*** screen (**Figure 4**) will appear.
6) Click the **New Detector** button (see **Figure 4**).
7) The **New Detector** window will appear (**Figure 5**). A new detector will need to be defined for each primer and probe set. Creating these detectors will enable you to analyze each primer and probe set individually at the end of the reaction.

**Figure 5. New Detector Window**



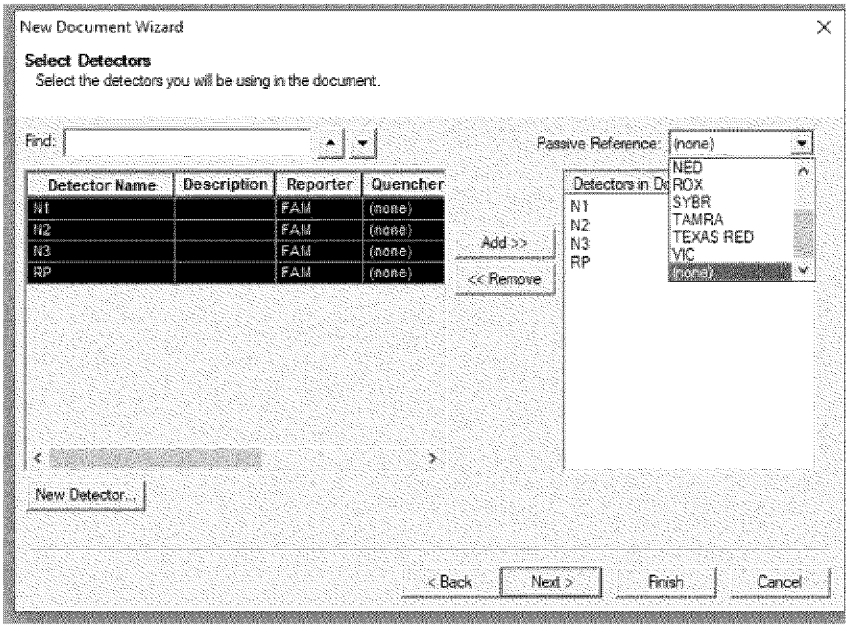
AMERICAN OVERSIGHT

8) Start by creating the N1 Detector. Include the following:
    a. Name: **N1**
    b. Description: *leave blank*
    c. Reporter Dye: **FAM**
    d. Quencher Dye: **(none)**
    e. Color: *to change the color of the detector indicator do the following:*
        ⇒ Click on the color square to reveal the color chart
        ⇒ Select a color by clicking on one of the squares
        ⇒ After selecting a color click **OK** to return to the New Detector screen
    f. Click the **OK** button of the New Detector screen to return to the screen shown in **Figure 4**.
9) Repeat step 6-8 for each target in the panel.

| Name | Reporter Dye | Quencher Dye |
|---|---|---|
| N1 | FAM | (none) |
| N2 | FAM | (none) |
| N3 | FAM | (none) |
| RP | FAM | (none) |

10) After each Detector is added, the **Detector Name**, **Description**, **Reporter** and **Quencher** fields will become populated in the **Select Detectors** screen (**Figure 6**).
11) Before proceeding, the newly created detectors must be added to the document. To add the new detectors to the document, click **ADD** (see **Figure 6**). Detector names will appear on the right hand side of the **Select Detectors** window (**Figure 6**).

**Figure 6. Adding New Detectors to Document**



12) Once all detectors have been added, select **(none)** for **Passive Reference** at the top right hand drop down menu (**Figure 7**).

AMERICAN OVERSIGHT

FDA-CVD-SCHERFU-00014455 0005
FDACDRH-pb-AO-000095
MULTI-HHS-20-0522-B, 20-0523-A-000070

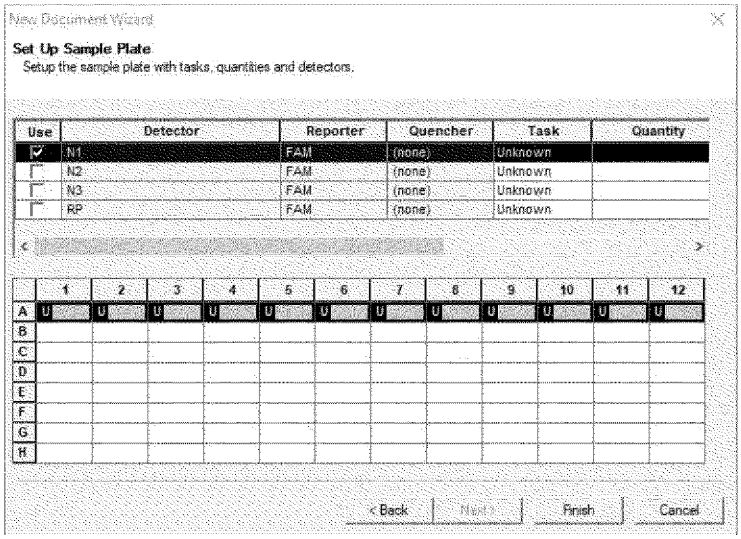


**Figure 7. Select Passive Reference**

**Passive reference should be set to "(none)" as described above.**

13) Click **Next** at the bottom of the **Select Detectors** window to proceed to the **Set Up Sample Plate** window (**Figure 8**).
14) In the **Set Up Sample Plate** window (**Figure 8**), use your mouse to select row A from the lower portion of the window, in the spreadsheet (see **Figure 8**).
15) In the top portion of the window, select detector **N1**. A check will appear next to the detector you have selected (**Figure 8**). You will also notice the row in the spreadsheet will be populated with a colored "U" icon to indicate which detector you've selected.
16) Repeat step 14-15 for each detector that will be used in the assay.

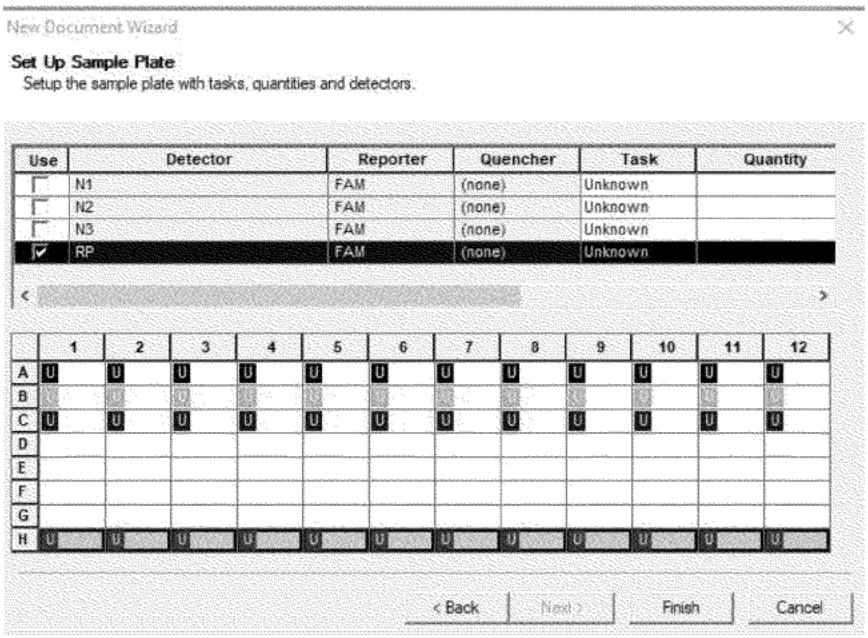

**Figure 8. Sample Plate Set-up**

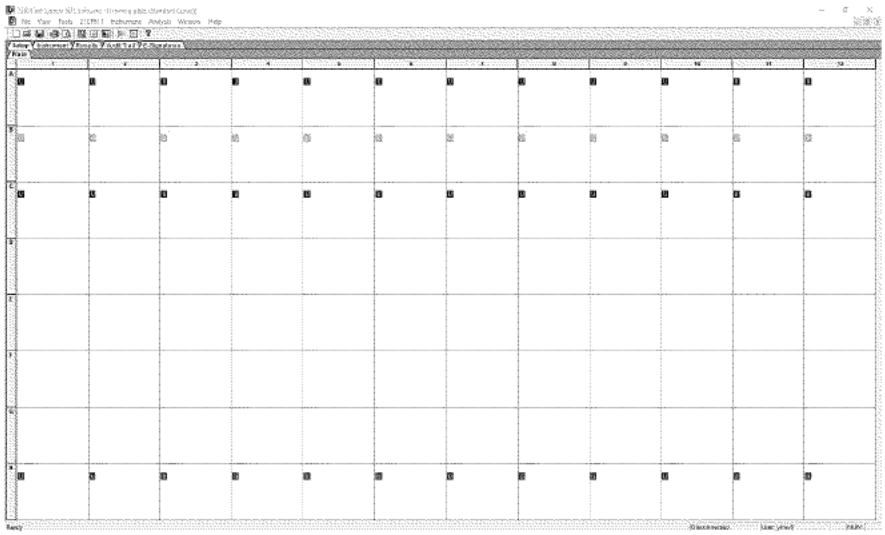
AMERICAN OVERSIGHT



17) Select **Finish** after detectors have been assigned to their respective rows. (**Figure 9**).

**Figure 9. Finished Plate Set-up**

18) After clicking "Finish", there will be a brief pause allowing the Applied Biosystems 7500 Fast Dx to initialize. This initialization is followed by a clicking noise. ***Note: The machine must be turned on for initialization.***
19) After initialization, the **Plate** tab of the Setup (**Figure 10)** will appear.
20) Each well of the plate should contain colored U icons that correspond with the detector labels that were previously chosen. To confirm detector assignments, select **Tools** from the file menu, then select **Detector Manager.**

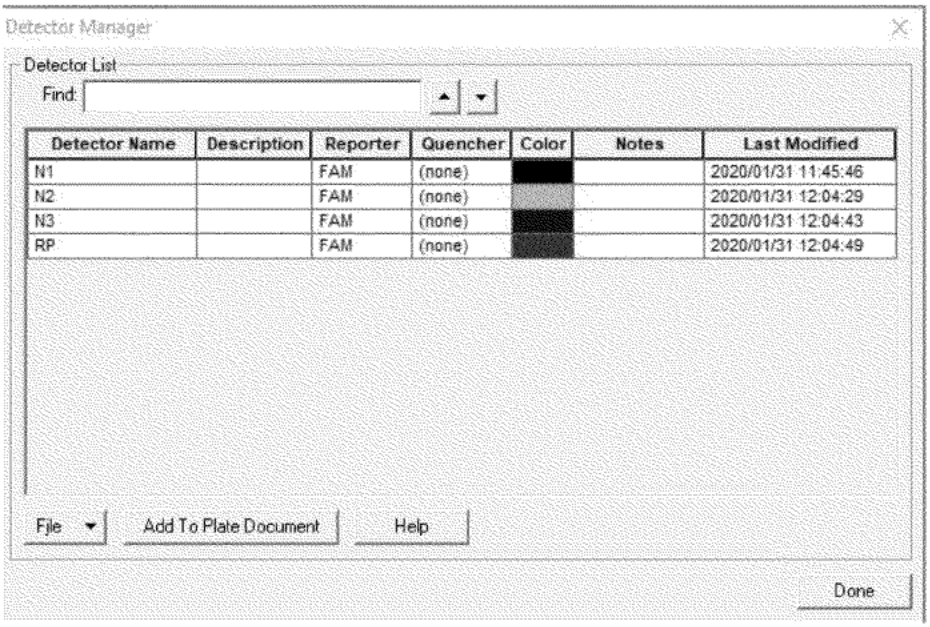


**Figure 10. Plate Set-up Window**

AMERICAN OVERSIGHT

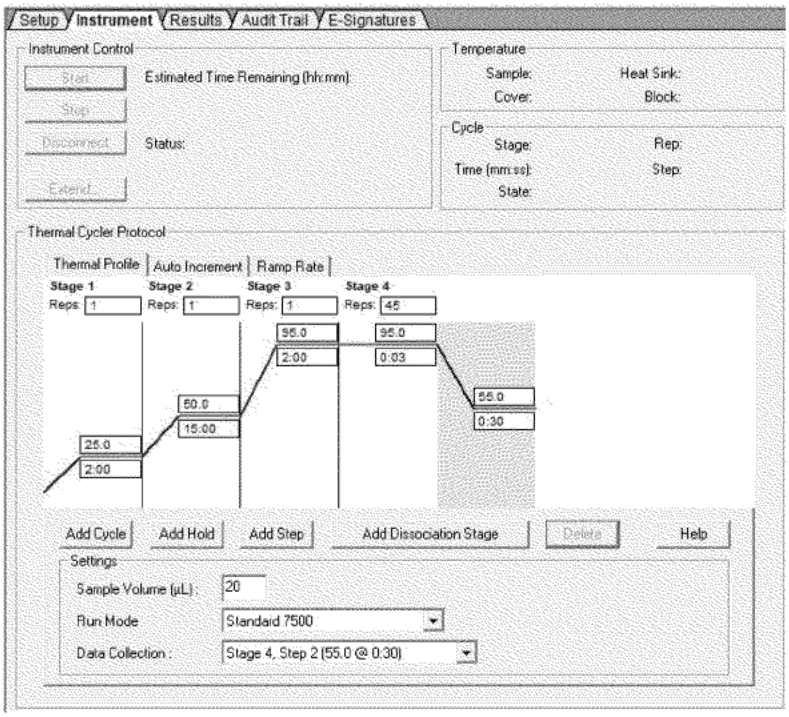
21) The Detector Manager window will appear (**Figure 11**).

**Figure 11. Detector Manager Window**

22) Confirm all detectors are included and that each target has a **Reporter** set to **FAM** and the **Quencher** is set to **(none)**.
23) If all detectors are present, select **Done**. The detector information has been created and assigned to wells on the plate.

## Defining the Instrument Settings

1) After detectors have been created and assigned, proceed to instrument set up.
2) Select the **Instrument** tab to define thermal cycling conditions.
3) Modify the thermal cycling conditions as follows (**Figure 12**):



**TaqPath™ 1-Step RT-qPCR Master Mix, CG (ThermoFisher)**

a. In Stage 1, Set to 2 min at **25°C**; **1 Rep**.
b. In Stage 2, Set to 15 min at **50°C**; **1 Rep**.
c. In Stage 3, Set to 2 min at **95°C, 1 Rep.**
d. In Stage 4, Step 1 set to **3 sec** at **95°C**.
e. In Stage 4, Step 2 set to **30 sec** at **55.0°C.**
f. In Stage 4, Reps should be set to **45.**
g. Under **Settings** (**Figure 12**), bottom left-hand box, change volume to 20 µL.
h. Under **Settings**, **Run Mode** selection should be **Standard 7500**.
**i.** Step 2 of Stage 4 should be highlighted in yellow to indicate data collection (see **Figure 12**).

AMERICAN OVERSIGHT

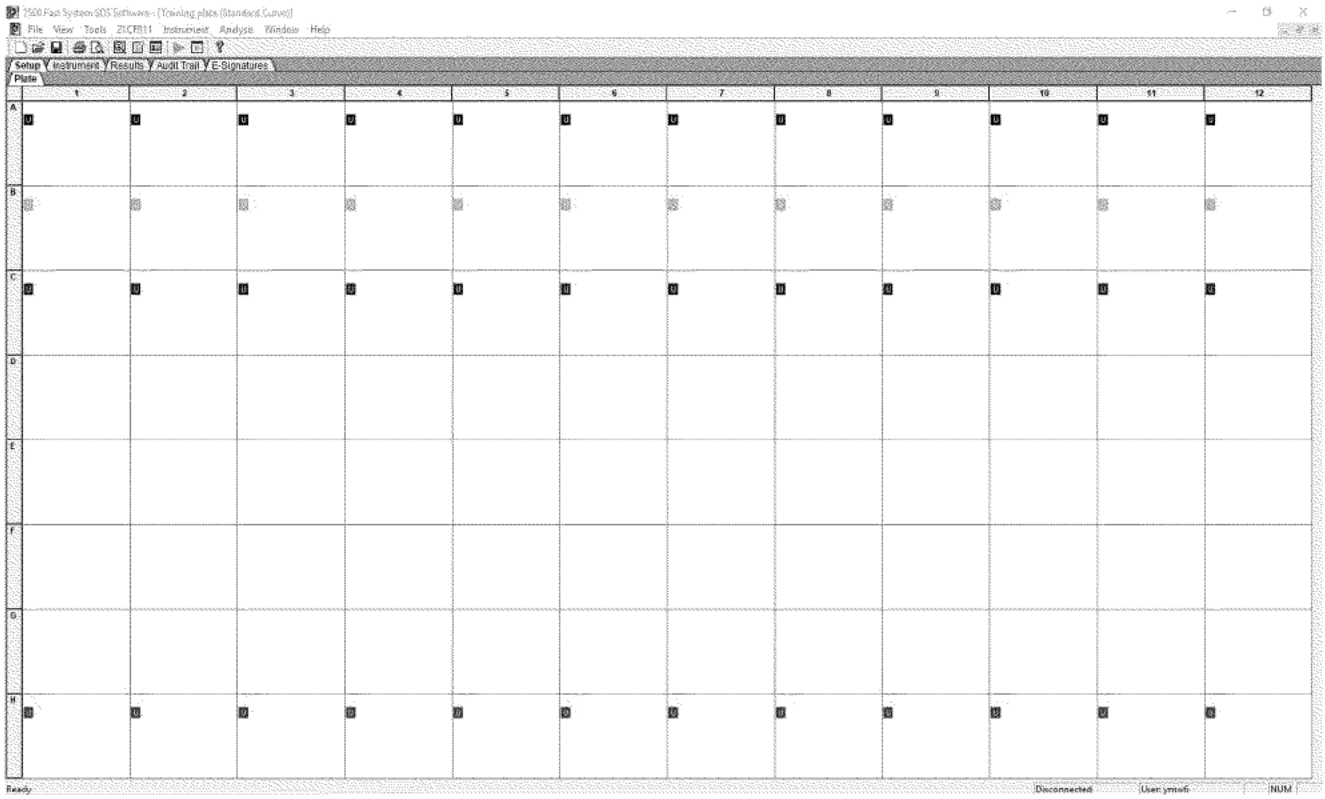
MULTI-HHS-20-0522-B, 20-0523-A-000073

**Figure 12. Instrument Window**

4) After making changes to the **Instrument** tab, the template file is ready to be saved. To save the template, select **File** from the top menu, then select **Save As**.
5) Save the template as **2019-nCoV TaqPath** as appropriate in the desktop folder labeled "***ABI Run Templates***" (*you must create this folder*). Save as type should be SDS Templates (*.sdt) (**Figure 13**).

**Figure 13. Saving Template**

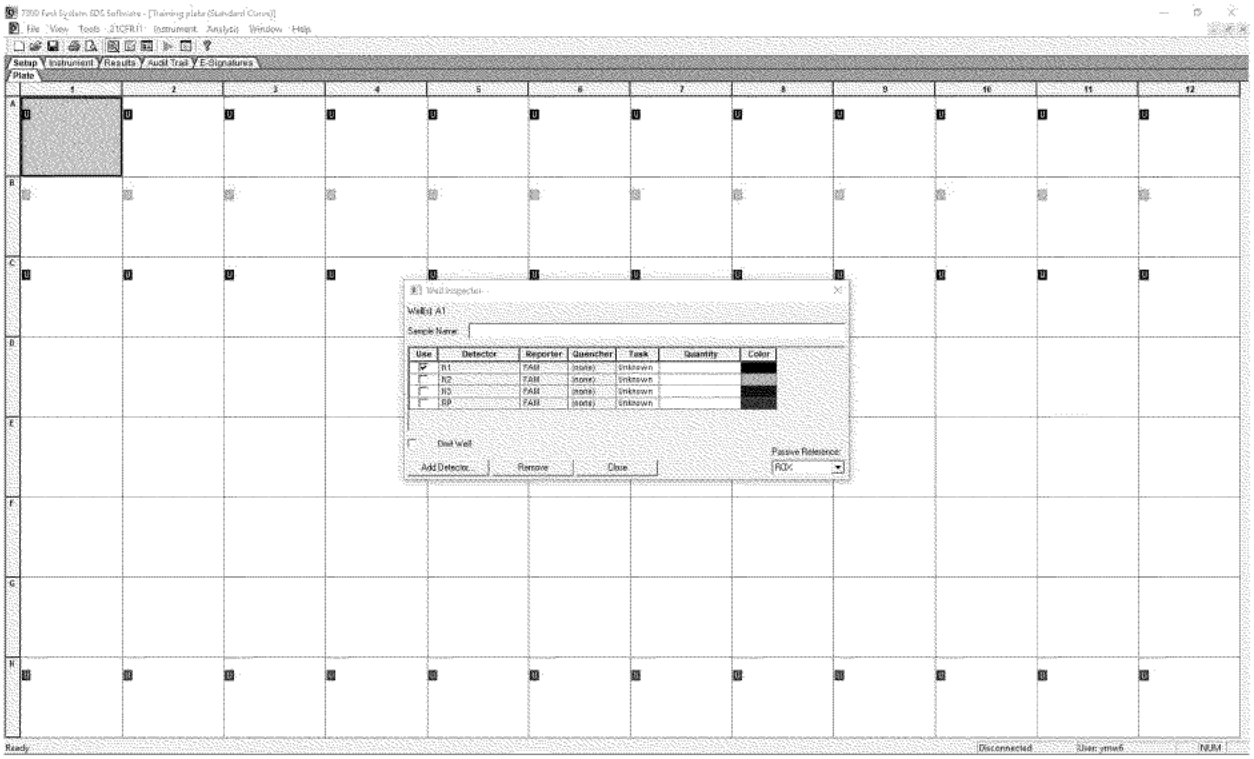


AMERICAN OVERSIGHT

## Running a Test

1) Turn on the ABI 7500 Fast Dx Real-Time PCR Instrument.
2) Launch the Applied Biosystems 7500 Fast Dx Real-time PCR System by double clicking on the 7500 Fast Dx System icon on the desktop.
3) A new window should appear, select **Open Existing Document** from the menu.
4) Navigate to select your ABI Run Template folder from the desktop.
5) Double click on the appropriate template file **(2019-nCoV TaqPath)**
6) There will be a brief pause allowing the Applied Biosystems 7500 Fast Dx Real-Time PCR Instrument to initialize. This initialization is followed by a clicking noise. ***Note: The machine must be turned on for initialization.***

**Figure 14. Plate Set-up Window**



7) After the instrument initializes, a plate map will appear (**Figure 14**). The detectors and controls should already be labeled as they were assigned in the original template.
8) Click the **Well Inspector** icon  from the top menu.
9) Highlight specimen wells of interest on the plate map.
10) Type sample identifiers to **Sample Name** box in the **Well Inspector** window (**Figure 15**).

AMERICAN OVERSIGHT

FDACDRH-p6-AO-000900
FDA-CVD-SCHERFU-00014455 0005
MULTI-HHS-20-0522-B, 20-0523-A-000075

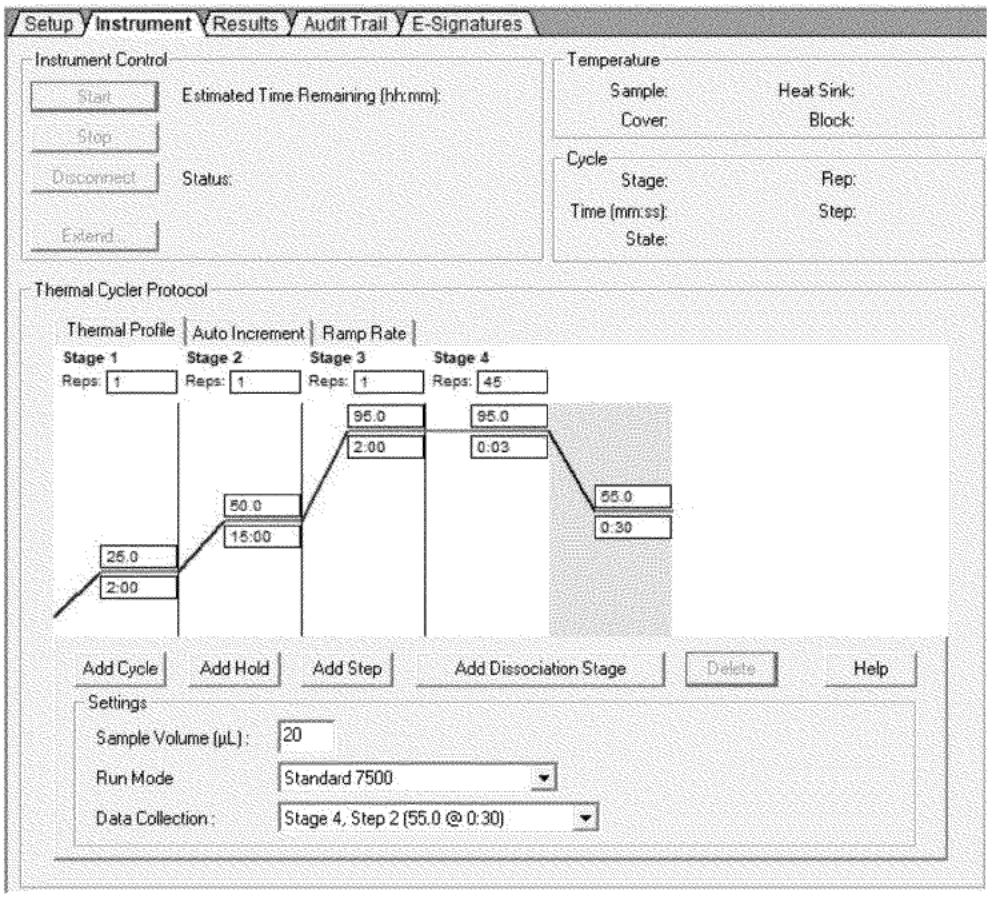


**Figure 15. Labeling Wells**

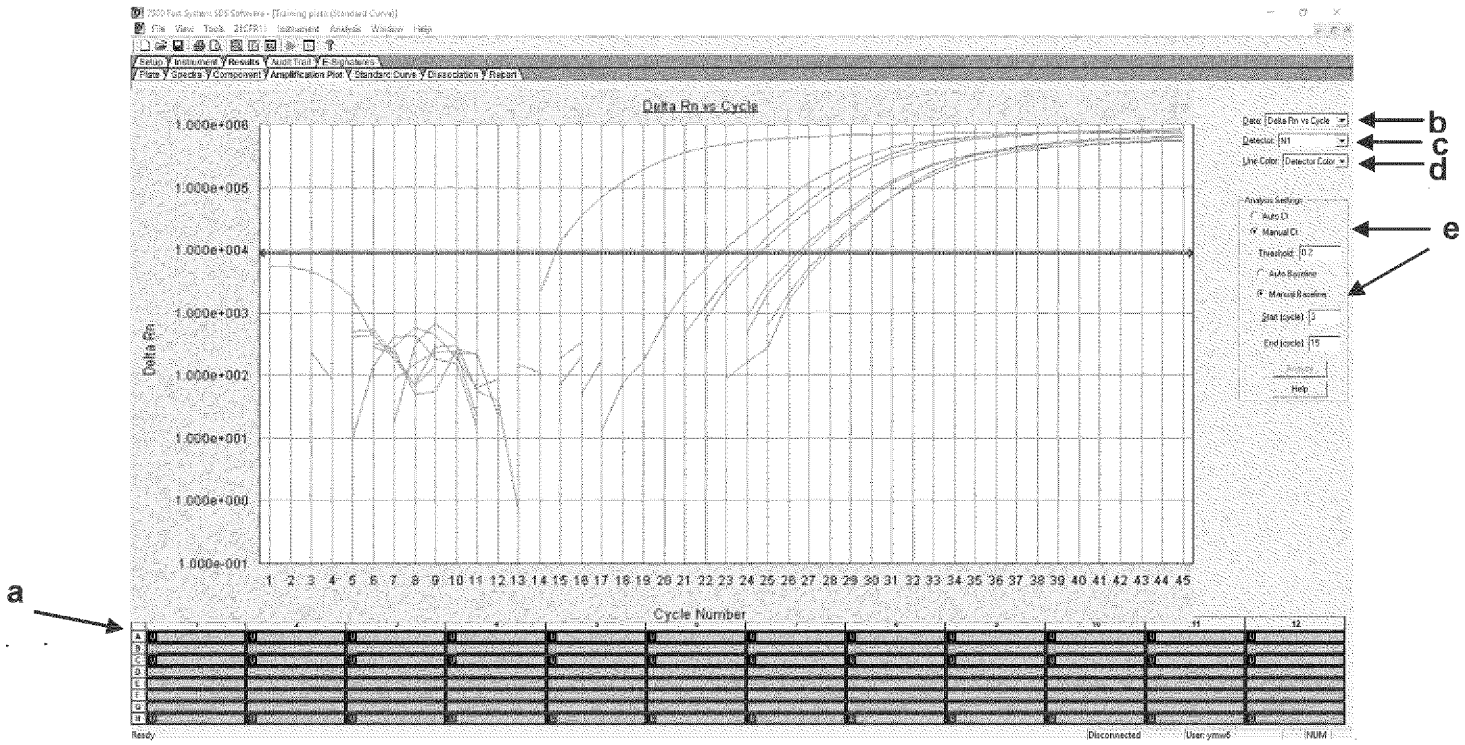
11) Repeat steps 9-10 until all sample identifiers are added to the plate setup.
12) Once all specimen and control identifiers are added click the **Close** button on the **Well Inspector** window to return to the **Plate** set up tab.
13) Click the **Instrument** tab at the upper left corner.
14) The reaction conditions, volumes, and type of 7500 reaction should already be loaded. (**Figure 16**).

AMERICAN OVERSIGHT

**Figure 16. Instrument Settings**



15) Ensure settings are correct (refer to the *Defining Instrument Settings*).
16) Before proceeding, the run file must be saved; from the main menu, select **File,** then **Save As**. Save in appropriate run folder designation.
17) Load the plate into the plate holder in the instrument. Ensure that the plate is properly aligned in the holder.
18) Once the run file is saved, click the **Start** button. *Note: The run should take approximately 1hr and 20 minutes to complete.*

## Data Analysis

1) After the run has completed, select the **Results** tab at the upper left corner of the software.
2) Select the **Amplification Plot** tab to view the raw data (**Figure 17**).

AMERICAN OVERSIGHT

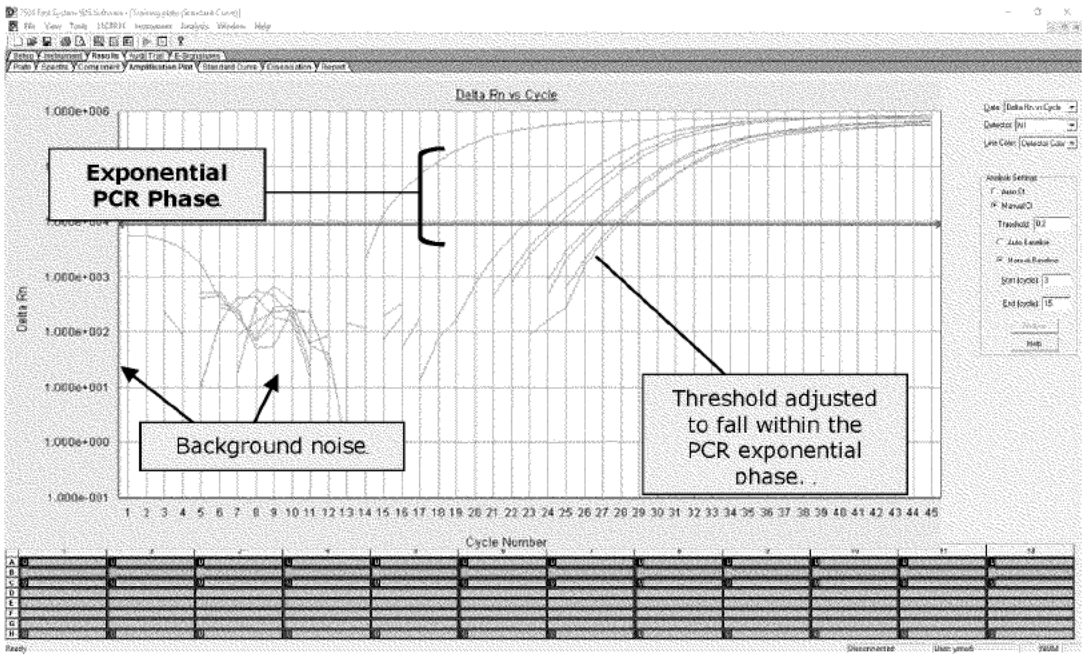


**Figure 17. Amplification Plot Window**

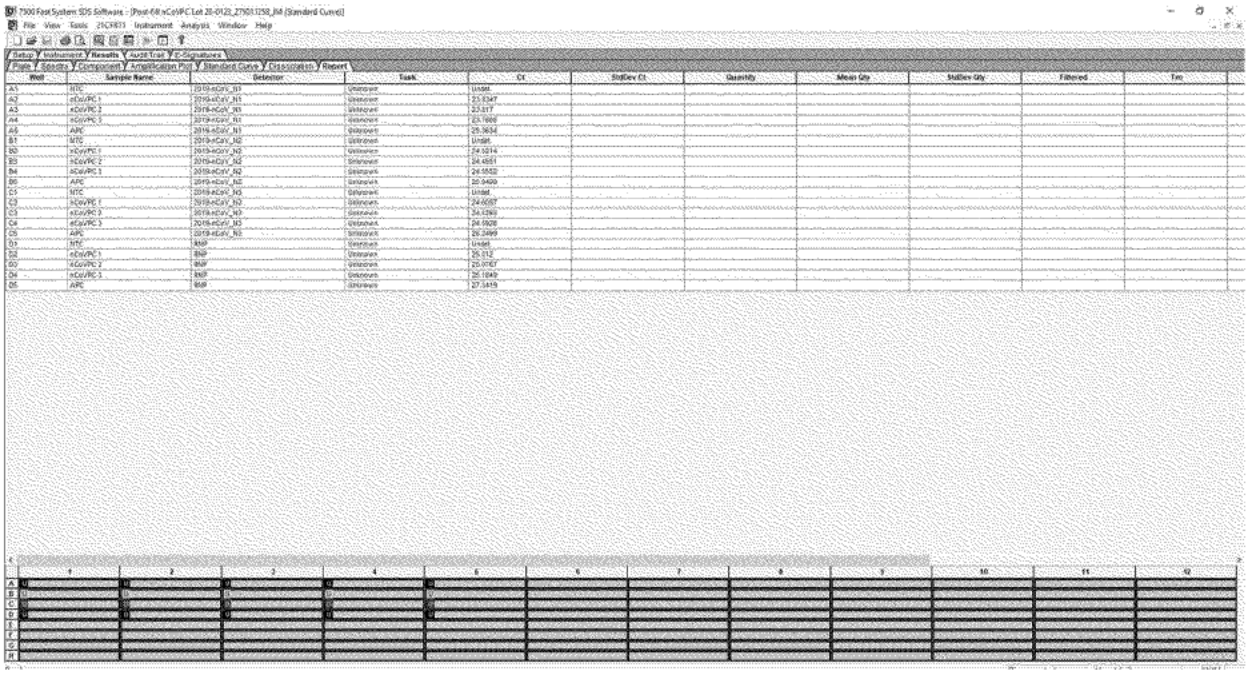
3) Start by highlighting all the samples from the run; to do this, click on the upper left hand box **(a)** of the sample wells (**Figure 17**). All the growth curves should appear on the graph.
4) On the right hand side of the window **(b)**, the **Data** drop down selection should be set to **Delta Rn vs. Cycle**.
5) Select **N1** from **(c)**, the **Detector** drop down menu, using the downward arrow.
    a. Please note that each detector is analyzed individually to reflect different performance profiles of each primer and probe set.
6) In the **Line Color** drop down **(d)**, **Detector Color** should be selected.
7) Under **Analysis Settings** select **Manual Ct (e)**.
    **b.** Do not change the **Manual Baseline** default numbers.
8) Using the mouse, click and drag the red threshold line until it lies within the exponential phase of the fluorescence curves and above any background signal **(Figure 18)**.



AMERICAN OVERSIGHT

**Figure 18. Amplification Plot**

9) Click the **Analyze** button in the lower right corner of the window. The red threshold line will turn to green, indicating the data has been analyzed.
10) Repeat steps 5-9 to analyze results generated for each set of markers (i.e. N1, N2, N3, etc).
11) Save analysis file by selecting **File** then **Save As** from the main menu.
12) After completing analysis for each of the markers, select the **Report** tab above the graph to display the Ct values (**Figure 19**). To filter report by sample name in ascending or descending order, simply click on **Sample Name** in the table.

**Figure 19. Report**

AMERICAN OVERSIGHT

FDACDRH-p6-AO-000904

## Interpretation of Results and Reporting

**Expected Performance of Controls Included in the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel**

| Control Type | External Control Name | Used to Monitor | 2019 nCoV_N1 | 2019 nCoV_N2 | 2019 nCoV_N3 | RP | Expected Ct Values |
|---|---|---|---|---|---|---|---|
| Positive | nCoVPC | Substantial reagent failure including primer and probe integrity | + | + | + | + | < 40.00 Ct |
| Negative | NTC | Reagent and/or environmental contamination | - | - | - | - | None detected |
| Extraction | HSC | Failure in lysis and extraction procedure, potential contamination during extraction | - | - | - | + | < 40.00 Ct |

**If any of the above controls do not exhibit the expected performance as described, the assay may have been set up and/or executed improperly, or reagent or equipment malfunction could have occurred. Invalidate the run and re-test.**

**RNase P (Extraction Control)**

- All clinical samples should exhibit fluorescence growth curves in the RNase P reaction that cross the threshold line within 40.00 cycles (< 40.00 Ct), thus indicating the presence of the human RNase P gene. Failure to detect RNase P in any clinical specimens may indicate:
  - Improper extraction of nucleic acid from clinical materials resulting in loss of RNA and/or RNA degradation.
  - Absence of sufficient human cellular material due to poor collection or loss of specimen integrity.
  - Improper assay set up and execution.
  - Reagent or equipment malfunction.
- If the RP assay does not produce a positive result for human clinical specimens, interpret as follows:
  - If the 2019-nCoV N1, N2 and N3 are positive even in the absence of a positive RP, the result should be considered valid. It is possible, that some samples may fail to exhibit RNase P growth curves due to low cell numbers in the original clinical sample. A negative RP signal does not preclude the presence of 2019-nCoV virus RNA in a clinical specimen.

AMERICAN OVERSIGHT

- If all 2019-nCoV markers AND RNase P are negative for the specimen, the result should be considered invalid for the specimen. If residual specimen is available, repeat the extraction procedure and repeat the test. If all markers remain negative after re-test, report the results as invalid and a new specimen should be collected if possible.

**2019-nCoV Markers (N1, N2 and N3)**

- When all controls exhibit the expected performance, a specimen is considered negative if all 2019-nCoV marker (N1, N2, N3) cycle threshold growth curves DO NOT cross the threshold line within 40.00 cycles (< 40.00 Ct) AND the RNase P growth curve DOES cross the threshold line within 40.00 cycles (< 40.00 Ct).
- When all controls exhibit the expected performance, a specimen is considered presumptive positive for 2019-nCoV if all markers (N1, N2, N3) cycle threshold growth curve crosses the threshold line within 40.00 cycles (< 40.00 Ct) The RNase P may or may not be positive as described above, but the 2019-nCoV result is still valid.
- When all controls exhibit the expected performance and the growth curves for the 2019-nCoV markers (N1, N2, N3) AND the RNase P marker DO NOT cross the cycle threshold growth curve within 40.00 cycles (< 40.00 Ct), the result is invalid. The extracted RNA from the specimen should be re-tested. If residual RNA is not available, re-extract RNA from residual specimen and re-test. If the re-tested sample is negative for all markers and RNase P, the result is invalid and a new collection of specimen from the patient should be considered.
- When all controls exhibit the expected performance and the cycle threshold growth curve for any one or two markers (N1, N2, N3) (but not all three markers) crosses the threshold line within 40.00 cycles (< 40.00 Ct) the result is inconclusive. Repeat extraction and rRT-PCR.
- If HSC is positive for N1, N2, or N3, then contamination may have occurred during extraction or sample processing. Re-extract specimens and HSC and re-test.

AMERICAN OVERSIGHT

# 2019-nCoV rRT-PCR Diagnostic Panel Results Interpretation Guide

The table below lists the expected results for the 2019-nCoV rRT-PCR Diagnostic Panel. If results are obtained that do not follow these guidelines, re-extract and re-test the sample. If repeat testing yields similar results, contact CDC for consultation and possible specimen referral. See pages 8 and 31 for referral and contact information.

| 2019 nCoV_N1 | 2019 nCoV_N2 | 2019 nCoV_N3 | RP | Result Interpretation[a] | Report | Actions |
|---|---|---|---|---|---|---|
| + | + | + | ± | 2019-nCoV detected | Presumptive positive 2019-nCoV | Report results to CDC and sender. Contact CDC immediately for instructions for transfer of the specimen to CDC for additional testing and further guidance. |
| If only one, or two, of the three targets is positive | | | ± | Inconclusive Result | Inconclusive | Repeat extraction and rRT-PCR. If the repeated result remains inconclusive, contact CDC immediately for instructions for transfer of the specimen to CDC for additional testing and further guidance. |
| - | - | - | + | 2019-nCoV not detected | Not Detected | Report results to sender. Consider testing for other respiratory viruses.[b] |
| - | - | - | - | Invalid Result | Invalid | Repeat extraction and rRT-PCR. If the repeated result remains invalid, consider collecting a new specimen from the patient. |

**[a]Laboratories should report their diagnostic result as appropriate and in compliance with their specific reporting system.**

**[b]Optimum specimen types and timing for peak viral levels during infections caused by 2019-nCoV have not been determined. Collection of multiple specimens from the same patient may be necessary to detect the virus.**

## Quality Control

- Quality control requirements must be performed in conformance with local, state, and federal regulations or accreditation requirements and the user's laboratory's standard quality control procedures. For further guidance on appropriate quality control practices, refer to 42 CFR 493.1256.
- Quality control procedures are intended to monitor reagent and assay performance.
- Test all positive controls prior to running diagnostic samples with each new kit lot to ensure all reagents and kit components are working properly.
- Good laboratory practice (cGLP) recommends including a positive extraction control in each nucleic acid isolation batch.
- Although HSC is not included with the 2019-nCov rRT-PCR Diagnostic Panel, the HSC extraction control must proceed through nucleic acid isolation per batch of specimens to be tested.
- Always include a negative control (NTC), and the appropriate positive control (nCoVPC) in each amplification and detection run. All clinical samples should be tested for human RNAse P gene to control for specimen quality and extraction.

## Limitations

- All users, analysts, and any person reporting diagnostic results should be trained to perform this procedure by a competent instructor. They should demonstrate their ability to perform the test and interpret the results prior to performing the assay independently. CDC Division of Viral Diseases will limit the distribution of this device to only those users who have successfully completed training provided by CDC instructors or designees.
- Performance of the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel has only been established in upper and lower respiratory specimens (such as nasopharyngeal or oropharyngeal swabs, sputum, lower respiratory tract aspirates, bronchoalveolar lavage, and nasopharyngeal wash/aspirate or nasal aspirate).
- Negative results do not preclude 2019-nCoV infection and should not be used as the sole basis for treatment or other patient management decisions. Optimum specimen types and timing for peak viral levels during infections caused by 2019-nCoV have not been determined. Collection of multiple specimens (types and time points) from the same patient may be necessary to detect the virus.
- A false negative result may occur if a specimen is improperly collected, transported or handled. False negative results may also occur if amplification inhibitors are present in the specimen or if inadequate numbers of organisms are present in the specimen.
- Positive and negative predictive values are highly dependent on prevalence. False negative test results are more likely when prevalence of disease is high. False positive test results are more likely when prevalence is moderate to low.
- Do not use any reagent past the expiration date.
- If the virus mutates in the rRT-PCR target region, 2019-nCoV may not be detected or may be detected less predictably. Inhibitors or other types of interference may produce a false negative result. An interference study evaluating the effect of common cold medications was not performed.
- Test performance can be affected because the epidemiology and clinical spectrum of infection caused by 2019-nCoV is not fully known. For example, clinicians and laboratories may not know the optimum types of specimens to collect, and when during the course of infection these specimens are most likely to contain levels of viral RNA that can be readily detected.

AMERICAN OVERSIGHT

- Detection of viral RNA may not indicate the presence of infectious virus or that 2019-nCoV is the causative agent for clinical symptoms.
- The performance of this test has not been established for monitoring treatment of 2019-nCoV infection.
- The performance of this test has not been established for screening of blood or blood products for the presence of 2019-nCoV.
- This test cannot rule out diseases caused by other bacterial or viral pathogens.

## Conditions of Authorization for the Laboratory

The CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel Letter of Authorization, along with the authorized Fact Sheet for Healthcare Providers, the authorized Fact Sheet for Patients and authorized labeling are available on the FDA website: [ HYPERLINK "https://www.fda.gov/MedicalDevices/Safety/EmergencySituations/ucm161496.htm" ]
Use of the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel must follow the procedures outlined in these manufacturer's Instructions for Use and the conditions of authorization outlined in the Letter of Authorization. Deviations from the procedures outlined are not permitted under the Emergency Use Authorization (EUA). To assist clinical laboratories running the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel, the relevant Conditions of Authorization are listed verbatim below, and are required to be met by laboratories performing the EUA test.

- Authorized laboratories[1] will include with reports of the results of the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel, all authorized Fact Sheets. Under exigent circumstances, other appropriate methods for disseminating these Fact Sheets may be used, which may include mass media.

- Authorized laboratories will perform the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel as outlined in the CDC 2019-Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel Instructions for Use. Deviations from the authorized procedures, including the authorized RT-PCR instruments, authorized extraction methods, authorized clinical specimen types, authorized control materials, authorized other ancillary reagents and authorized materials required to perform the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel are not permitted.

- Authorized laboratories will have a process in place for reporting test results to healthcare providers and relevant public health authorities, as appropriate.

- Authorized laboratories will collect information on the performance of the test and report to DMD/OHT7-OIR/OPEQ/CDRH (via email: CDRH-EUA-Reporting@fda.hhs.gov) and CDC ([ HYPERLINK "mailto:respvirus@cdc.gov" ]) any suspected occurrence of false positive or false negative results and significant deviations from the established performance characteristics of the test of which they become aware.

[1]Authorized Laboratories: For ease of reference, the Letter of Authorization refers to "qualified laboratories designated by CDC and, in the United States, certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA), 42 U.S.C. § 263a, to perform high complexity tests" as "authorized laboratories."

FDA-CVD-SCHERFU-00014455.0005
MULTI-HHS-20-0522-B, 20-0523-A-000084

- All laboratory personnel using the test must be appropriately trained in RT-PCR techniques and use appropriate laboratory and personal protective equipment when handling this kit and use the test in accordance with the authorized labeling.

- CDC and authorized laboratories will ensure that any records associated with this EUA are maintained until otherwise notified by FDA. Such records will be made available to FDA for inspection upon request.

AMERICAN OVERSIGHT

# Performance Characteristics

## ***Analytical Performance:***

*Limit of Detection (LoD):*

LoD studies determine the lowest detectable concentration of 2019-nCoV at which approximately 95% of all (true positive) replicates test positive. The LoD was determined by limiting dilution studies using characterized samples.

The analytical sensitivity of the rRT-PCR assays contained in the CDC 2019 Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel were determined in Limit of Detection studies. Since no quantified virus isolates of the 2019-nCoV are currently available, assays designed for detection of the 2019-nCoV RNA were tested with characterized stocks of in vitro transcribed full length RNA (N gene; GenBank accession: MN908947.2) of known titer (RNA copies/µL) spiked into a diluent consisting of a suspension of human A549 cells and viral transport medium (VTM) to mimic clinical specimen. Samples were extracted using the QIAGEN EZ1 Advanced XL instrument and EZ1 DSP Virus Kit (Cat# 62724) and manually with the QIAGEN DSP Viral RNA Mini Kit (Cat# 61904). Real-Time RT-PCR assays were performed using the ThemoFisher Scientific TaqPath™ 1-Step RT-qPCR Master Mix, CG (Cat# A15299) on the Applied Biosystems™ 7500 Fast Dx Real-Time PCR Instrument according to the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel instructions for use.

A preliminary LoD for each assay was determined testing triplicate samples of RNA purified using each extraction method. The approximate LoD was identified by extracting and testing 10-fold serial dilutions of characterized stocks of in vitro transcribed full-length RNA. A confirmation of the LoD was determined using 3-fold serial dilution RNA samples with 20 extracted replicates. The LoD was determined as the lowest concentration where ≥ 95% (19/20) of the replicates were positive.

FDA Sensitivity Evaluation: The analytical sensitivity of the test will be further assessed by evaluating an FDA-recommended reference material using an FDA developed protocol if applicable and/or when available.

*In Silico Analysis of Primer and Probe Sequences:*

An alignment was performed with the oligonucleotide primer and probe sequences of the CDC 2019 nCoV Real-Time RT-PCR Diagnostic Panel with all publicly available nucleic acid sequences for 2019-nCoV in GenBank as of February 1, 2020 to demonstrate the predicted inclusivity of the CDC 2019 nCoV Real-Time RT-PCR Diagnostic panel. All the alignments show 100% identity of the CDC panel to the available 2019-nCoV sequences with the exception of one nucleotide mismatch with the N1 forward primer in one deposited sequence. Similarly, a single mismatch is observed in the alignment of the N3 probe. The risk assessment of these single mismatches resulting in a significant loss in reactivity, and false negative result, is low due to the design of the primers and probes with melting temperatures > 60°C and run conditions of the assay with annealing temperature at 55°C to tolerate one to two mismatches. The alignment of the 2019-nCoV_N3 assay includes additional sequences for SARS, MERS, and other Bat coronaviruses to show that other than SARS viruses, the alignment shows low identities and would not predict significant reactivity.

*Specificity/Exclusivity Testing: In Silico Analysis*

BLASTn analysis queries of the 2019-nCoV rRT-PCR assays primers and probes were performed against public domain nucleotide sequences. The database search parameters were as follows: 1) The nucleotide collection consists of GenBank+EMBL+DDBJ+PDB+RefSeq sequences, but excludes EST, STS, GSS, WGS, TSA, patent sequences as well as phase 0, 1, and 2 HTGS sequences and sequences longer than 100Mb; 2) The database is non-redundant. Identical sequences have been merged into one entry, while preserving the accession, GI, title and taxonomy information for each entry; 3) Database was updated on 10/03/2019; 4) The search

AMERICAN OVERSIGHT

parameters automatically adjust for short input sequences and the expect threshold is 1000; 5) The match and mismatch scores are 1 and -3, respectively; 6) The penalty to create and extend a gap in an alignment is 5 and 2 respectively.

2019-nCoV_N1 Assay:
Probe sequence of 2019-nCoV rRT-PCR assay N1 showed high sequence homology with SARS coronavirus and Bat SARS-like coronavirus genome. However, forward and reverse primers showed no sequence homology with SARS coronavirus and Bat SARS-like coronavirus genome. Combining primers and probe, there is no significant homologies with human genome, other coronaviruses or human microflora that would predict potential false positive rRT-PCR results.

2019-nCoV_N2 Assay:
The forward primer sequence of 2019-nCoV rRT-PCR assay N2 showed high sequence homology to Bat SARS-like coronaviruses. The reverse primer and probe sequences showed no significant homology with human genome, other coronaviruses or human microflora. Combining primers and probe, there is no prediction of potential false positive rRT-PCR results.

2019-nCoV_N3 Assay:
Analysis of the forward and reverse primer and probe sequences of 2019-nCoV rRT-PCR assay N3 showed significant homology only to human SARS coronavirus and bat SARS coronavirus. No significant homology with human genome, other coronaviruses or human microflora was observed. that would predict potential false positive rRT-PCR results.

In summary, the 2019-nCoV rRT-PCR assay N1 and N2, designed for the specific detection of 2019-nCoV, showed no significant combined homologies with human genome, other coronaviruses, or human microflora that would predict potential false positive rRT-PCR results.

The 2019-nCoV rRT-PCR assay N3 was designed for universal detection of 2019-nCoV, human SARS coronavirus and bat SARS coronavirus. The 2019-nCoV rRT-PCR assay 3 showed no significant combined homologies with human genome, other human coronaviruses other than human SARS coronavirus or human microflora that would predict potential false positive rRT-PCR results.

In addition to the *in silico* analysis, several organisms were extracted and tested with the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel to demonstrate analytical specificity and exclusivity. Studies were performed with nucleic acids extracted using the QIAGEN EZ1 Advanced XL instrument and EZ1 DSP Virus Kit. Nucleic acids were extracted from high titer preparations (typically $\geq 10^5$ PFU/mL or $\geq 10^6$ CFU/mL). Testing was performed using the ThemoFisher Scientific TaqPath™ 1-Step RT-qPCR Master Mix, CG on the Applied Biosystems™ 7500 Fast Dx Real-Time PCR instrument. The data demonstrate that the expected results are obtained for each organism when tested with the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel.

*Endogenous Interference Substances Studies*:

The CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel uses conventional well-established nucleic acid extraction methods and based on our experience with CDC's other EUA assays, including the CDC Novel Coronavirus 2012 Real-time RT-PCR Assay for the presumptive detection of Middle East Respiratory Syndrome Coronavirus (MERS-CoV) and the CDC Human Influenza Virus Real-Time RT-PCR Diagnostic Panel-Influenza A/H7 (Eurasian Lineage) Assay for the presumptive detection of novel influenza A (H7N9) virus that are both intended for use with a number of respiratory specimens, we do not anticipate interference from common endogenous substances.

*Specimen Stability and Fresh-frozen Testing:*

To increase the likelihood of detecting infection, CDC recommends collection of three specimen types, lower respiratory and upper respiratory specimens for testing. If possible, additional specimen types (e.g., stool, urine) should be collected and should be stored initially until decision is made by CDC whether additional specimen sources should be tested. Specimens should be collected as soon as possible once a PUI is identified regardless of symptom onset. Maintain proper infection control when collecting specimens. Store specimens at 2-8°C and ship overnight to CDC on ice pack. Label each specimen container with the patient's ID number (e.g., medical record number), unique specimen ID (e.g., laboratory requisition number), specimen type (e.g., nasal swabs) and the date the sample was collected. Complete a CDC Form 50.34 for each specimen submitted.

AMERICAN OVERSIGHT

***Clinical Performance:***

As of January 27, 2020, CDC has tested 253 respiratory specimens from 102 persons under investigation (PUI) in the U.S. using the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel. Specimen types include buccal swab, nasal washes, nasopharyngeal swab, oral swab, sputum, and oropharyngeal (throat) swab.

**Table 8: Summary of CDC 2019-Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel Data Generated by Testing Human Respiratory Specimens Collected from PUI Subjects in the U.S.**

| Specimen Type | Number of Specimens | CDC 2019-nCoV Panel Positive | CDC 2019-nCoV Panel Negative | CDC 2019-nCoV Panel Inconclusive |
|---|---|---|---|---|
| Buccal Swab | 4 | 1 | 3 | 0 |
| Nasal Wash | 2 | 0 | 2 | 0 |
| Nasopharyngeal Swab | 103 | 5 | 98 | 0 |
| Oral Swab | 52 | 5 | 47 | 0 |
| Sputum | 50 | 5 | 45 | 0 |
| Swab[1] | 13 | 0 | 13 | 0 |
| Oropharyngeal (Throat) Swab | 29 | 2 | 27 | 0 |
| Total | 253 | 18 | 235 | 0 |

[1]Actual swab type information was missing from these upper respiratory tract specimens.

For 85 of the 102 PUI subjects, multiple respiratory specimens were collected from each subject and tested by the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel. A single respiratory specimen was collected and tested for each of the 17 remaining PUI subjects. Respiratory specimens for 97 of the 102 PUI subjects tested negative by the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel. Most but not all of the specimens collected from the five remaining PUI subjects tested positive by the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel. The positive results were further investigated and confirmed by genetic sequencing. Longitudinal specimens were collected from two of the five confirmed 2019-nCoV positive patients and tested using the CDC 2019-nCoV Panel. For three of the five confirmed 2019-nCoV positive patients all samples collected tested positive by the CDC 2019-nCoV Panel. For the two remaining confirmed 2019-nCoV positive patients, upper and lower respiratory tract specimens were collected and tested from the first patient at one time point only, and from the second patient longitudinally over three time points. One buccal swab and one sputum specimen from the first patient tested positive by the CDC 2019-nCoV Panel, one nasopharyngeal swab specimen collected on the same day tested negative. For the second patient, one oral swab, one nasopharyngeal swab and one sputum specimen collected approximately eight days post onset of symptoms tested positive by the CDC 2019-nCoV Panel. While one sputum specimen collected approximately 10 days post symptoms onset tested positive, two oral swabs and two nasopharyngeal swabs collected on the same day tested negative. Approximately 12 days post onset of symptoms, one sputum specimen and one oral swab specimen from the second patient tested positive, but two nasopharyngeal swabs taken on the same day were negative.

AMERICAN OVERSIGHT

During the early phase of the testing, a total of 117 respiratory specimens collected from 46 PUI subjects were also tested with two analytically validated real-time RT-PCR assays that target separate and independent regions of the nucleocapsid protein gene of the 2019-nCoV, N4 and N5 assays. The nucleocapsid protein gene targets for the N4 and N5 assays are different and independent from the nucleocapsid protein gene targets for the three RT-PCR assays included in the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel, N1, N2, and N3. Any positive result from the N4 and/or the N5 assay was further investigated by genetic sequencing.

The performance of the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel was estimated against a composite comparator. A specimen was considered comparator negative if both the N4 and the N5 assays were negative. A specimen was considered comparator positive when the N4 and/or the N5 assay generated a positive result, and the comparator positive result(s) were further investigated and confirmed to be 2019-nCoV RNA positive by genetic sequencing.

**Table 9: Percent Agreement of the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel with the Composite Comparator**

| **CDC 2019-nCoV Panel Result** | **Composite Comparator Result** | |
|---|---|---|
| | Positive | Negative |
| Positive | 13[1] | 0 |
| Inconclusive | 0 | 0 |
| Negative | 0 | 104 |

[1]Composite comparator results were available for 13 of 18 CDC 2019-nCoV Panel positive specimens only.

Positive percent agreement = 13/13 = 100% (95% CI: 77.2% - 100%)
Negative percent agreement = 104/104 = 100% (95% CI: 96.4% - 100%)

## Disposal

Dispose of hazardous or biologically contaminated materials according to the practices of your institution.

**EXPIRATION DATE:**

**INTENDED USE**
The CDC 2019-Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel is a real-time RT-PCR test intended for the presumptive qualitative detection of nucleic acid from the 2019-nCoV in upper and lower respiratory specimens (such as nasopharyngeal or oropharyngeal swabs, sputum, lower respiratory tract aspirates, bronchoalveolar lavage, and nasopharyngeal wash/aspirate or nasal aspirate) collected from individuals who meet CDC criteria for 2019-nCoV testing. Testing is limited to qualified laboratories designated by CDC and, in the United States, certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA), 42 U.S.C. § 263a, to perform high complexity tests.

Results are for the presumptive identification of 2019-nCoV RNA. The 2019-nCoV RNA is generally detectable in upper and lower respiratory specimens during infection. Positive results are indicative of active infection with 2019-nCoV but do not rule out bacterial infection or co-infection with other viruses. The agent detected may not be the definite cause of disease. Laboratories within the United States and its territories are required to report all positive results to the appropriate public health authorities.

Negative results do not preclude 2019-nCoV infection and should not be used as the sole basis for treatment or other patient management decisions. Negative results must be combined with clinical observations, patient history, and epidemiological information.

Testing with the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel is intended for use by trained laboratory personnel who are proficient in performing real-time RT-PCR assays. The CDC 2019-Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel is only for use under a Food and Drug Administration's Emergency Use Authorization .

**PACKAGE CONTENTS**

| PACKAGING | COMPONENT | PART NUMBER | COMPONENT LOT NUMBER | VIALS PER KIT | QUANTITY /VIAL | STATE |
|---|---|---|---|---|---|---|
| Oligonucleotide Box | 2019-nCoV_N1 Combined Primer/Probe Mix | RV202001 | | 1 | 22.5 nmol | Dried |
| | 2019-nCoV_N2 Combined Primer/Probe Mix | RV202002 | | 1 | 22.5 nmol | Dried |
| | 2019-nCoV_N3 Combined Primer/Probe Mix | RV202003 | | 1 | 22.5 nmol | Dried |
| | RP Combined Primer/Probe Mix | RV202004 | | 1 | 22.5 nmol | Dried |
| Control Box | nCoVPC 2019-nCoV Positive Control (non-infectious) | RV202005 | | 4 | 1 x $10^4$ copies/µL | Dried |

**STORAGE INSTRUCTIONS**
Upon receipt, store at 2-8°C. Refer to the CDC 2019-Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel Instructions for Use before opening and preparing reagents for use.

**PROCEDURE/INTERPRETATION/LIMITATIONS**
Users should refer to the **CDC 2019-Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel Instructions for Use** posted on the FDA website for all IVD products used under Emergency Use Authorization, http://www.fda.gov/MedicalDevices/Safety/EmergencySituations/ucm161496.htm.

# CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel – Verification Requirements

Please consult the following guidance from CMS regarding Emergency Use Authorized diagnostic tests: https://www.cms.gov/Medicare/Provider-Enrollment-and-Certification/SurveyCertificationGenInfo/Policy-and-Memos-to-States-and-Regions-Items/QSO18-19-CLIA

## INTENDED USE

The CDC 2019-Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel is a real-time RT-PCR test intended for the presumptive qualitative detection of nucleic acid from the 2019-nCoV in upper and lower respiratory specimens (such as nasopharyngeal or oropharyngeal swabs, sputum, lower respiratory tract aspirates, bronchoalveolar lavage, and nasopharyngeal wash/aspirate or nasal aspirate) collected from individuals who meet CDC criteria for 2019-nCoV testing. Testing is limited to qualified laboratories designated by CDC and, in the United States, certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA), 42 U.S.C. § 263a, to perform high complexity tests.

Results are for the presumptive identification of 2019-nCoV RNA. The 2019-nCoV RNA is generally detectable in upper and lower respiratory specimens during infection. Positive results are indicative of active infection with 2019-nCoV but do not rule out bacterial infection or co-infection with other viruses. The agent detected may not be the definite cause of disease. Laboratories within the United States and its territories are required to report all positive results to the appropriate public health authorities.

Negative results do not preclude 2019-nCoV infection and should not be used as the sole basis for treatment or other patient management decisions. Negative results must be combined with clinical observations, patient history, and epidemiological information.

Testing with the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel is intended for use by trained laboratory personnel who are proficient in performing real-time RT-PCR assays. The CDC 2019-Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel is only for use under a Food and Drug Administration's Emergency Use Authorization.

## REQUIRED MATERIALS

The 2019 novel coronavirus positive control (nCoVPC) is provided with the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel and should be prepared according to the instructions for use. The nCoVPC consists of an RNA transcript of the 2019-nCoV N gene as well as human RNase P gene segment. nCoVPC will yield a positive result with the following primer and probe sets: 2019-nCoV_N1, 2019-nCoV_N2, 2019-nCoV_N3 and RP.

Approximately 2 mL of an upper respiratory specimen (e.g. nasopharyngeal swabs (NPS) in transport media) will be needed for testing. Specimens may be pooled if less than 2mL of one specimen is available.

Refer to CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel package insert (manufacturer instructions) for additional reagents, materials, and instructions.

## PRECAUTIONS

This reagent should be handled in an approved BSL-2 handling area to avoid contamination of laboratory equipment and reagents that could cause false positive results. This product is an RNA transcript and is non-infectious. However, the nCoVPC should be handled in accordance with Good Laboratory Practices.

Store reagent at appropriate temperatures (see below) and hold on ice when thawed.

Please use standard precautions when handling respiratory specimens.

AMERICAN OVERSIGHT

# CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel – Verification Requirements

****** DO NOT DISCARD: Important product-specific information ******

## INSTRUCTIONS FOR PREPARING SAMPLES BEFORE EXTRACTION WITH THE QIAmp DSP VIRAL RNA MINI KIT

- Refer to the 2019-nCoV Real-Time RT-PCR Diagnostic Panel instructions for use for reconstitution of the materials for use. RNA should be kept cold during preparation and use.
- Make a 1/10 dilution of nCoVPC in by adding 5 µL of nCoVPC into 45 µL of nuclease-free water or 10 mM Tris
- Aliquot 560 µL of lysis buffer into each of nine tubes labeled 1-9.
- Add 140 µL of upper respiratory specimen (e.g. NPS in viral transport media) into each of the nine labeled tubes with lysis buffer
- To prepare samples at a moderate concentration, spike 14 µL of undiluted nCoVPC (rehydrated as described in the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel instructions for use) into each tube labeled 1-3 containing lysis buffer and specimen
- To prepare samples at a low concentration, spike 14 µL of 1/10 dilution of nCoVPC into each tube labeled 4-6 containing lysis buffer and specimen
- To prepare negative samples, spike 14 µL of nuclease-free water into each tube labeled 7-9 containing lysis buffer and specimen
- Perform extractions of all nine samples according to the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel instructions for use

## INSTRUCTIONS FOR PREPARING SAMPLES BEFORE EXTRACTION WITH THE QIAGEN EZ1 ADVANCED XL

- Refer to the 2019-nCoV Real-Time RT-PCR Diagnostic Panel instructions for use for reconstitution of the materials for use. RNA should be kept cold during preparation and use.
- Make a 1/10 dilution of nCoVPC in by adding 5 µL of nCoVPC into 45 µL of nuclease-free water or 10 mM Tris
- Aliquot 280 µL of lysis buffer into each of nine tubes labeled 1-9.
- Add 120 µL of upper respiratory specimen (e.g. NPS in viral transport media) into each of the nine labeled tubes with lysis buffer
- To prepare samples at a moderate concentration, spike 12 µL of undiluted nCoVPC (rehydrated as described in the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel instructions for use) into each tube labeled 1-3 containing lysis buffer and specimen
- To prepare samples at a low concentration, spike 12 µL of 1/10 dilution of nCoVPC into each tube labeled 4-6 containing lysis buffer and specimen
- To prepare negative samples, spike 12 µL of nuclease-free water into each tube labeled 7-9 containing lysis buffer and specimen
- Perform extractions of all nine samples according to the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel instructions for use

## PROCEDURE

Follow the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel instructions for use for testing the 9 extracted samples at least once.

## EXPECTED RESULTS

Moderate nCoVPC samples should be presumptive positive for 2019-nCoV.
Low nCoVPC samples should be presumptive positive for 2019-nCoV.
Negative upper respiratory samples should be negative for 2019-nCoV.

≥ 90% of test results should be in agreement with the expected results. If test results are less than 90% in agreement with expected results, contact CDC at respvirus@cdc.gov.

## QUESTIONS

Please send questions or comments by email to respvirus@cdc.gov.

## DISTRIBUTION:

Distributed to qualified laboratories designated by Centers for Disease Control and Prevention, 1600 Clifton Road, Atlanta, GA, 30329 USA

Dear Julie,

Please find attached DMD edits to the documents you sent last night.

1) Appendix E Instructions for use: We went through the Instructions for Use with OCET, OCC and DMD this morning and had some minor edits that are highlighted in green.
2) Cover Letter: minor suggestion for CDC consideration
3) EUA template: minor edits – tracked changes – some to match edits made in the instructions for use
4) HCP Fact Sheet: Edits acceptable with the exception of including (b) (4), (b) (5)

I also have FDA responses to CDC comments in the Letter of Authorization – does CDC want to see them?

Let us know if you need a call to discuss – hope the LoD study data is going okay.

Best regards
Kim

**Subject:** RE: CDC qualified laboratories

Dear Julie,

Thanks for the attaching the CDC comments in the LOA – we are discussing them internally with OCET and OCC tomorrow AM.

We discussed internally your question about defining "qualified laboratory" and think it is best to include similar wording to what you proposed somewhere in the instructions for use. One thought would be in:

## Summary and Explanation

An outbreak of pneumonia of unknown etiology in Wuhan City, Hubei Province, China was initially reported to WHO on December 31, 2019. Chinese authorities identified a novel coronavirus (2019-nCoV), which has resulted in thousands of confirmed human infections in multiple provinces throughout China and exported cases in several Southeast Asian countries and more recently the United States. Cases of severe illness and some deaths have been reported.

The CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel is a molecular *in vitro* diagnostic test that aids in the detection and diagnosis 2019-nCoV and is based on widely used nucleic acid amplification technology. The product contains

AMERICAN OVERSIGHT

oligonucleotide primers and dual-labeled hydrolysis probes (TaqMan®) and control material used in rRT-PCR for the *in vitro* qualitative detection of 2019-nCoV RNA in respiratory specimens.

The term "qualified laboratories" refers to laboratories in which all users, analysts, and any person reporting results from use of this device should be trained to perform and interpret the results from this procedure by a competent instructor prior to use. CDC will limit the distribution of this device to only those users who have successfully completed a training course provided by CDC instructors or designees.

If CDC agree just let us know. Also we thought(b) (4), (b) (5) .

In addition, please note that there may be additional comments from OCET/OCC on the Instructions for Use – and I still need to double check that the Conditions of Authorization for Laboratories Section in the IFU matches the Letter of Authorization wording once I finalize with OCET/OCC tomorrow.

Best regards
Kim

**Subject:** CDC qualified laboratories
**Importance:** High

Hi all,

We are getting a lot of questions regarding what the term "qualified laboratory" means. We do not want to change the intended use but recommend that we put some additional language in our documents to clarify. The Influenza Division uses language such as this: All users, analysts, and any person reporting results from use of this device should be trained to perform and interpret the results from this procedure by a competent instructor prior to use. CDC Influenza Division will limit the distribution of this device to only those users who have successfully completed a training course provided by CDC instructors or designees.

AMI OVERSIGHT

My question is: how can we edit the language above to include in our EUA and in which documents should include this language?

I'm also attaching feedback from our Office of General Counsel on the authorization letter. We haven't been through full clearance yet here but thought we should share this now in case there are any issues.

Thanks,
Julie

**Subject:** RE: CDC qualified laboratories

Dear Julie,

Thanks for the attaching the CDC comments in the LOA – we are discussing them internally with OCET and OCC tomorrow AM.

We discussed internally your question about defining "qualified laboratory" and think it is best to include similar wording to what you proposed somewhere in the instructions for use. One thought would be in:

## Summary and Explanation

An outbreak of pneumonia of unknown etiology in Wuhan City, Hubei Province, China was initially reported to WHO on December 31, 2019. Chinese authorities identified a novel coronavirus (2019-nCoV), which has resulted in thousands of confirmed human infections in multiple provinces throughout China and exported cases in several Southeast Asian countries and more recently the United States. Cases of severe illness and some deaths have been reported.

The CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel is a molecular *in vitro* diagnostic test that aids in the detection and diagnosis 2019-nCoV and is based on widely used nucleic acid amplification technology. The product contains oligonucleotide primers and dual-labeled hydrolysis probes (TaqMan®) and control material used in rRT-PCR for the *in vitro* qualitative detection of 2019-nCoV RNA in respiratory specimens.

The term "qualified laboratories" refers to laboratories in which all users, analysts, and any person reporting results from use of this device should be trained to perform and interpret the results from this procedure by a competent instructor prior to use. CDC will limit the distribution of this device to only those users who have successfully completed a training course provided by CDC instructors or designees.

If CDC agree just let us know. Also we thought (b) (4), (b) (5)

In addition, please note that there may be additional comments from OCET/OCC on the Instructions for Use – and I still need to double check that the Conditions of Authorization for Laboratories Section in the IFU matches the Letter of Authorization wording once I finalize with OCET/OCC tomorrow.

Best regards
Kim

**Subject:** CDC qualified laboratories
**Importance:** High

Hi all,

We are getting a lot of questions regarding what the term "qualified laboratory" means. We do not want to change the intended use but recommend that we put some additional language in our documents to clarify. The Influenza Division uses language such as this: All users, analysts, and any person reporting results from use of this device should be trained to perform and interpret the results from this procedure by a competent instructor prior to use. CDC Influenza Division will limit the distribution of this device to only those users who have successfully completed a training course provided by CDC instructors or designees.

My question is: how can we edit the language above to include in our EUA and in which documents should include this language?

I'm also attaching feedback from our Office of General Counsel on the authorization letter. We haven't been through full clearance yet here but thought we should share this now in case there are any issues.

Thanks,
Julie

**Subject:** CDC 2019-Novel Coronavirus Real-Time RT-PCR Diagnostic Panel discussion Feb 10

Dear Uwe, Kim, Li, and Tamara,

Thank you for meeting with us today regarding the reporting of approximately 10 laboratories of sporadic aberrant reactivity in the negative controls (HSC and/or NTC) of the N3 assay of the CDC 2019-Novel Coronavirus Real-Time RT-PCR Diagnostic Panel. We appreciate your feedback on our options for resolving this issue. Because we have had no reports of other problems with other assays in the Panel, we feel that our best option for immediate resolution is to manufacture a new primer/probe set for the N3 assay as a component replacement.

Please let us know if you concur with this approach. Again thank you for your continued collaboration.

Best regards,
Julie

Dear Julie,

AMERICAN OVERSIGHT

Please find attached DMD edits to the documents you sent last night.

1) Appendix E Instructions for use: We went through the Instructions for Use with OCET, OCC and DMD this morning and had some minor edits that are highlighted in green.
2) Cover Letter: minor suggestion for CDC consideration
3) EUA template: minor edits – tracked changes – some to match edits made in the instructions for use
4) HCP Fact Sheet: Edits acceptable with the exception of including (b) (4), (b) (5)

I also have FDA responses to CDC comments in the Letter of Authorization – does CDC want to see them?

Let us know if you need a call to discuss – hope the LoD study data is going okay.

Best regards
Kim

**Subject:** RE: CDC qualified laboratories

Dear Julie,

Thanks for the attaching the CDC comments in the LOA – we are discussing them internally with OCET and OCC tomorrow AM.

We discussed internally your question about defining "qualified laboratory" and think it is best to include similar wording to what you proposed somewhere in the instructions for use. One thought would be in:

## Summary and Explanation

An outbreak of pneumonia of unknown etiology in Wuhan City, Hubei Province, China was initially reported to WHO on December 31, 2019. Chinese authorities identified a novel coronavirus (2019-nCoV), which has resulted in thousands of confirmed human infections in multiple provinces throughout China and exported cases in several Southeast Asian countries and more recently the United States. Cases of severe illness and some deaths have been reported.

The CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel is a molecular *in vitro* diagnostic test that aids in the detection and diagnosis 2019-nCoV and is based on widely used nucleic acid amplification technology. The product contains oligonucleotide primers and dual-labeled hydrolysis probes (TaqMan®) and control material used in rRT-PCR for the *in vitro* qualitative detection of 2019-nCoV RNA in respiratory specimens.

The term "qualified laboratories" refers to laboratories in which all users, analysts, and any person reporting results from use of this device should be trained to perform and interpret the results from this procedure by a competent instructor prior to use. CDC will limit the distribution of this device to only those users who have successfully completed a training course provided by CDC instructors or designees.

If CDC agree just let us know. (b) (4), (b) (5) – see yellow highlight.

In addition, please note that there may be additional comments from OCET/OCC on the Instructions for Use – and I still need to double check that the Conditions of Authorization for Laboratories Section in the IFU matches the Letter of Authorization wording once I finalize with OCET/OCC tomorrow.

Best regards
Kim

**Subject:** CDC qualified laboratories
**Importance:** High

Hi all,

We are getting a lot of questions regarding what the term "qualified laboratory" means. We do not want to change the intended use but recommend that we put some additional language in our documents to clarify. The Influenza Division uses language such as this: All users, analysts, and any person reporting results from use of this device should be trained to perform and interpret the results from this procedure by a competent instructor prior to use. CDC Influenza Division will limit the distribution of this device to only those users who have successfully completed a training course provided by CDC instructors or designees.

My question is: how can we edit the language above to include in our EUA and in which documents should include this language?

I'm also attaching feedback from our Office of General Counsel on the authorization letter. We haven't been through full clearance yet here but thought we should share this now in case there are any issues.

Thanks,
Julie

Hi Peter –

Would you see if DMD can have someone sit in to hear the Corona virus update and discuss FDA's side if there are questions?

Thanks

Courtney

AMERICAN OVERSIGHT

Good morning Jennifer – CDC would like to include the following to the agenda for Wednesday's call:

- April CLIAC agenda – will send an updated agenda prior to the meeting
- Updates on 2019-nCoV response

If there is time, we would also like to hear any relevant details from CMS related to their recent reorganization and how it might have affected the CLIA staff.

Thank

Dear Julie, Steve and Steve,

We just wanted to follow-up on some of the outstanding items/questions from yesterday's Telcon:

**For Current EUA Package:**

1) (b) (5)

**For Future EUA Amendments:**

1) Condition of authorization – (b) (5)

2) (b) (5)

3) (b) (5) (5)

If we missed anything let us know. FYI, the Fact sheets had some edits from OCET and OCC so we are working through those and hope to have them to you tomorrow (sorry for the delay) – we will also update based on out intended use

AMERICAN OVERSIGHT

discussion today. Authorization letter and contact fact sheet are also being worked on and we hope to share them with you ASAP.

Any questions, let us know

Best regards
Kim

**Subject:** [WARNING : MESSAGE ENCRYPTED] RE: Intended use wording

Hi Kim and Li,

I am attaching the clinical line item data sheet, password protected. I'll send a separate email with that. We will actually more data to add to this tomorrow. I've arranged the data by case but removed names. I've identified the positive cases by location. As Julie explained, the additional N gene assays (N4 and N5 in the file) were initially run with all specimen testing, but eventually the testing only included the N1 through N3 assays that we're including in the EUA request.

Also attached are the LoD and Exclusivity testing performed for the CLIA validation with the N1, N2, N3 assays. I've included the results for the additional N gene assays N4 and N5. In these summaries.

Regards,
Steve

**Subject:** RE: CoV Dx FDA/developer needs discussion

Dear Dx Team,
I have updated information from BEI regarding the possible availability of COVID-2019 genomic RNA and inactivated viruses. Keeping our fingers crossed - it looks as though these reagents may become available in the next 4-6 weeks.

| BEI catalog # | Reagent | Quantity | Estimated time |
|---|---|---|---|
| NR-52281 | Novel Coronavirus 2019-nCoV/USA-WA1/2020 (culture) | 150 | Available now, pending QC tests |

AMERICAN OVERSIGHT

| | | | |
|---|---|---|---|
| NR-52285 | Genomic RNA, 2019-nCoV/USA-WA1/2020 | 200 | Available as BSL-2 product# on 21 Feb 2020 with pending QC testing; after full QC the product will be available mid-March* |
| NR-52286 | Heat inactivated, 2019-nCoV/USA-WA1/2020 | 100 | late March* |
| NR-52287 | Irradiated infected cell lysate, 2019-nCoV/USA-WA1/2020 | 400 | early April* |

* Includes safety testing of reagent (4 weeks duration, 2 passages each for 14 days).
#For native viral RNA product release as BSL-2 product after a 7-days of safety testing. The safety test will continue for the 4-week duration for release as BSL-1 product.

I'm still waiting for information from WRCEVA.
Thanks,
Maureen

**Importance:** High

Hi all – please see the attached PR from ASPR. Asking for concurrent clearance given the short turnaround and the reference to multiple products – vaccines, diagnostics, and therapeutics. CDRH -copying Heather Agler through the IMG, as well as Uwe and Kim since this references the EUA. Also, ccing Jennifer Ross from OCET and Toby Lowe (CDRH) given reference to EUA.

**Reply-To:** champ@lists.amp.org

From my personal experience in epicenter in China, since the beginning of this outbreak, hundreds of testing devices for SARS-CoV-2 have been generated and submitted to China FDA for clearance. Till yesterday, 11 devices have received "EUA" in China. Although there are multiple reasons, it seemed that most of them have not working as expected so far.

While we are eager to have diagnostic devices ready for the COVID-19, I think necessary standards and guidelines are still needed to regulate/QC these devices. I think AMP can surely help FDA and ourselves on this.

> Dear AMP Colleagues,
> In order to help with combating the COVID-19 outbreak, the clinical microbiology laboratories around the country are eager to prepare for testing the virus. However, FDA has very strict rules for pre-EUA approval and stringent validation policy which requires using the virus or the viral RNA that are not readily available to most clinical laboratories. A more available DNA plasmids that can be used as reference materials for the test validation are not endorsed by FDA currently.
>
> There is a huge frustration in the medical community right now and we are all asking: "what is preventing us from doing the laboratory-developed test (LDT) for COVID-19?". I hope we could join together to request FDA to change its stand and understand that this is a crisis and the virus would not wait for us. As the precious time window of preparedness is narrowing down, if the clinical laboratories are still restricted from doing the LDT for COVID-19, then we are not going to win this battle as a society!

On Fri, Feb 28, 2020 at 3:19 PM CHAMP Discussion; on behalf of Mary Williams <champ@lists.amp.org> wrote:

Dear CHAMP Community,

AMP is actively monitoring the latest developments related to the coronavirus disease (COVID-19) outbreak. With a predicted pervasive impact on the public, this outbreak underscores the urgent need for deployment of high-quality Laboratory Developed Testing Procedures (LDPs) and the involvement of appropriately trained and qualified laboratory professionals. We support and send our best wishes to our members across the globe who are working tirelessly to serve the public.

AMP is also committed to sharing our expertise with stakeholders and the broader laboratory community. We have more than 1,200 members in our Infectious Diseases Subdivision, most of whom have roles in the development and performance of accurate and reliable testing procedures; correct test utilization; professional interpretation; and/or communication of test results and their application to patient management.

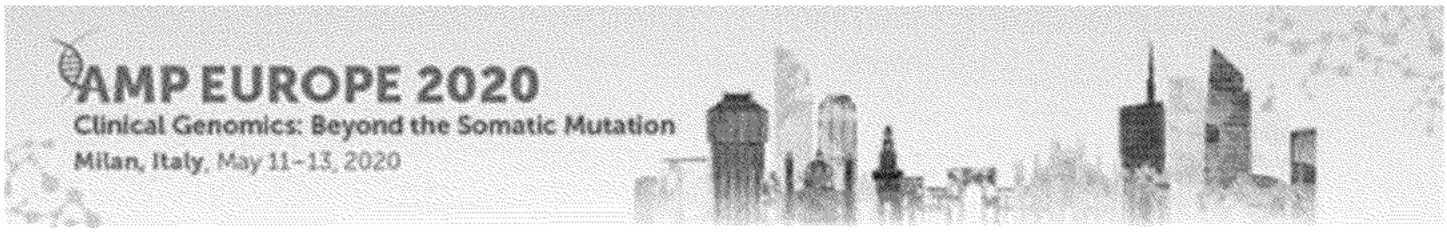
I would like to give you an update regarding what advocacy we are doing to address test implementation challenges here in the U.S. Since turnaround times for these tests are critical for both patient care and surveillance, high complexity, CLIA-certified laboratories satisfying appropriate BSL requirements must have the ability to use the CDC's test kit and/or develop and validate their own LDPs to provide immediate and local patient care and to partner with public health laboratories in their mission to help contain the outbreak. AMP is actively advocating for this now and coordinating efforts and responses with several other professional organizations. Our advocacy team also plans to discuss this with congressional staff on Monday morning.

**We need your input to inform our advocacy efforts!**
If your lab is working on validating assays to detect SARS-CoV-2, please send an email to policy@amp.org with information on your experiences regarding any challenges you are encountering.

**The AMP Infectious Diseases Subdivision Leadership is here to provide guidance and support!**
If you have specific questions for our ID subdivision leadership, please email amp@amp.org and we will pass them along. We are very grateful to ID Subdivision Chair Dr. Frederick (Rick) Nolte and the entire subdivision leadership team, who have been very engaged and stand ready to assist in our endeavors.

If you were not able to attend the webinar organized by the ID representatives to our Training & Education Committee, Drs. Erin Graf and Gerald Capraro and featuring excellent presentations by Dr. Capraro and Dr. James Versalovic, you can access it for free at http://educate.amp.org/store/seminar/seminar.php?seminar=152504. As a service to the broader community, we have made this webinar and continuing education credits free to all so please feel free to distribute the webinar URL to your non-member colleagues.

We will continue to provide updates as we have additional information.



Regards,
Mary

Jeff,
Suggestion for email to OCE below:

Dear OCE,

As the federal government works to address the public health emergency for COVID-19, I wanted to take a moment to thank you for your significant contributions to this effort.

On Friday morning you came to the office expecting a normal work day followed by a weekend away from work. By noon Friday it became clear that we would need to roll out a novel policy for COVID-19 testing later that evening. You dropped everything to develop and implement a comprehensive and strategic communications roll-out. Late Friday night the roll-out was bumped to Saturday morning, so you just kept working. Also late Friday we received a new EUA request for a COVID-19 test, which lead to a second major roll-out late Saturday night and additional comms Sunday morning. You just kept working. These two significant weekend roll-outs would typically take weeks to plan, but with your hard work they were executed in a day, and executed well. Thank you for dropping your other work and personal plans to make this possible.

Our work is not done. We are planning a webinar for tomorrow and there will be additional EUA authorizations with little advance notice to come. I know you will continue to rise to the occasion. Thank you for your ongoing extraordinary efforts to meet the public health needs in this emergency.

I know it has been a long road and it is far from over but we, our country, and our global neighbors will get through this, together.

Jeff

AMERICAN OVERSIGHT

Hi Dan, Thanks for the quick call this morning. A simple email to the FDA/me stating "Yes, The New York State Wadsworth Center can reference the data in the CDC's 2019 nCoV EUA application" is sufficient for the FDA's

review purposes that should lead to a quick EUA authorization for Wadworth's EUA, as early as this afternoon. Therefore, this is obviously an urgent matter.

Best,

*Tim*

Hi Dan and Wendi,

This right of reference is important to get this and additional assays based on the CDC through the EUA process quickly. The other two companies we discussed today will be similar.

I believe a simple email stating "Yes, The New York State Wadsworth Center can reference the data in the CDC 2019 nCoV EUA application".

Hope this helps.

Thanks in advance!

**Subject:** NYS Wadsworth Center COVID-19 Test
**Importance:** High

Wendi, Dan, Laura,

NYS Wadsworth Center submitted an EUA request to us this afternoon for a test that uses the CDC protocol but only for N1/N2 (consistent with the CDC test currently subject to enforcement discretion). To support their EUA, Wadsworth conducted a bridging study that demonstrates performance similar to CDC's N1/N2 test. We know their performance is comparable because we have seen CDC's data but Wadsworth has not. **Would CDC allow Wadsworth to have a right of reference to its data, under which does not get access to the data but can reference it in support of their EUA?** Wadsworth has one more test to perform, which if it looks good, we would otherwise grant the EUA.

Thanks,

Uwe

Uwe,

That's terrific. Can you/someone on your team please ask them, and subsequent notifiers, how many specimens/patients they can test per week and if that is their maximum capacity or if they can increase their weekly throughput?

Jeff

Jeff, Tim and Don,

We just got the 1st notification under the accelerated EUA program that UW will start testing patients for SARS-CoV-2 at 8 am tomorrow morning.

We confirmed the receipt of this request in our mailbox and an acknowledgment email went out.

Best, Uwe

Jill,

I wanted to let you know that today we announced a policy that would allow appropriate laboratories that are certified to perform high-complexity testing consistent with requirements under CLIA develop, validate, and use SARS-CoV-2 tests if they notify FDA and submit an EUA request within 15 days of the notification. Other conditions are described in the guidance we posted on our website today. Our intent is to more quickly increase the national capability for testing while assuring accurate and reliable tests are being used.

Because you have already notified us, you can proceed with patient testing. Please see the guidance for additional details. If you have any questions or there is anything we can do to help, I, Uwe, or Tim would be happy to discuss. (Kim is currently out of the office.)

Our press release and guidance can be found at the following:
https://www.fda.gov/news-events/press-announcements/coronavirus-covid-19-update-fda-issues-new-policy-help-expedite-availability-diagnostics

https://www.fda.gov/regulatory-information/search-fda-guidance-documents/policy-diagnostics-testing-laboratories-certified-perform-high-complexity-testing-under-clia-prior

Dr. Hahn,

I am attaching a letter from the American Association for Clinical Chemistry requesting that the Food and Drug Administration (FDA) exercise its enforcement discretion to permit qualified laboratories to use laboratory developed tests to detect SARS-CoV-2 and diagnose COVID-19. We appreciate your consideration of our request.

Sincerely

Vincent Stine, PhD
Senior Director, Government & Global Affairs

(b) (5)

The bottom line is that the 40 or more labs can proceed to test now (actually as of yesterday when we granted ED but CDC had to finalize and send them new instructions).

And, as an aside, we told CDC they could do it. It's their lab folks who had to warm up to the idea so any hold up was not on our end.

**Subject:** Azar says 40 public health labs can test for coronavirus

**Azar says 40 public health labs can test for coronavirus**

By Adam Cancryn

02/27/2020 10:59 AM EST

HHS Secretary Alex Azar told lawmakers today that at least 40 public health laboratories can now test for the coronavirus, weeks after the initial version of a CDC-developed diagnostic proved faulty.

Those labs can now use the diagnostic after the FDA approved a process that involves just two of the test kit's original three steps.

"FDA authorized the use of those tests using just the first and second step to provide a definitive diagnostic," Azar told the House Ways and Means Committee. FDA has not yet posted notice of the authorization on its website.

Azar added that HHS expects 93 labs around the country to be able to conduct their own coronavirus tests by Monday, using either the CDC's diagnostic or a private-sector alternative that could be available as early as tomorrow.

The CDC has conducted more than 3,600 screenings so far, and there is currently no backlog. But the delayed rollout of tests to public health labs around the country has raised concerns that the coronavirus could be spreading undetected, slowing the federal and state response.

The agency is investigating a coronavirus case in California that involves a person with no known links to existing cases and no history of travel to China.

In the meantime, the federal government is also working on developing a separate diagnostic that could be distributed to hospitals, Azar said, calling it the "next step" in the response but declining to offer a specific timeline.

**Subject:** Minimal Criteria for test validation

Jeff and Tim,

The minimal criteria acceptable to validate the test to be developed by the target laboratories are listed below. We foresee that it will take 3-4 days for a CLIA-certified, high-complexity laboratory to complete these evaluations.

**Subject:** RE: Question

Hi Jeff,

I just reconfirmed the Coronavirus labs doing testing here at the CDC that also did the bulk of the key manufacturing for the first distributed lot sent to the PHLs is a CLIA lab and the surge lab here at the CDC is also a CLIA lab though under a different certificate.

Neither of these labs are being used for manufacturing Coronavirus kits going forward. The primers and probes are still being made in the Oligo lab here the CDC but then all subsequent manufacturing is being done at IDT in Iowa. I believe the CDC will continue to use this manufacturing process for some time.

In addition, just for clarity, the CDC has contracted with IDT and Biosearch to make GMP kits from the ground up including the primers and probes manufactured at these companies.

Best,

External E-mail

AdvaMinute

Give us a minute. We'll give you MedTech!

Good Morning, AdvaMed Nation—

Since the onset of the coronavirus (COVID-19) outbreak, at least 31 **AdvaMed member companies have donated medical products worth approximately $26.8 million and made cash donations worth $4.1 million** to the China Red Cross Foundation and other medical institutions, such as hospitals and clinics in Hubei Province. Donations and the medtech community's work will only grow in the coming weeks as the threat continues to elevate.

In a press release issued this morning, AdvaMed President and CEO Scott Whitaker

AMERICAN OVERSIGHT

said:

"At AdvaMed, we help industry and government work together to solve problems on behalf of the patients we serve, and that collaboration has never been more important than it is now in the face of this global health emergency. We're doing everything we can to help stop the spread of the coronavirus. For the medtech industry, that means donating key medical technologies, providing on-the-ground medical support, and developing new diagnostics, treatments, and vaccines. For AdvaMed, it means connecting industry to public officials and those who are on the front lines fighting this disease. The medical technology community has always stepped up during times of crisis, and AdvaMed is proud of the tremendous work and charity the industry has committed so far."

## AdvaMed Working With Key U.S. Government Agencies

AdvaMed has been working daily with key U.S. government agencies – including HHS, FDA, CDC, and ASPR – and the Chinese government to identify ways the industry can help ensure that providers and patients have access to the medical technologies they need to prevent, diagnose, and treat the coronavirus. This close coordination has facilitated information sharing; anticipated, identified, and reconciled supply-chain challenges; and prompted strategic product and capital donations.

## Coronavirus Task Force

The association has also assembled a coronavirus task force focused on personnel, transportation, and supply, among other needs. The task force meets regularly to receive government, industry, and member-company status updates, and to coordinate industry response. AdvaMed has also distributed to its membership a list of personal protective equipment (PPEs) identified by the Chinese government as essential to the emergency response (e.g., protective clothing, masks, gloves, and gowns; non-contact infrared thermometers; etc.), and is partnering with authorities to increase access to those medtech products.

## Member Company Response Effort

Below is a collection of some of the efforts undertaken recently by AdvaMed member companies:

**3M** is continuing to increase the production of respirators at their facilities around the

AMERICAN OVERSIGHT

globe. 3M has also donated respirators, surgical masks, and hand sanitizer to affected areas in China. View the press release here.

**Bayer** is donating medicine and money with a total value of approximately EUR 1.5 million. View the press release here.

**BD** has donated medical devices such as catheters, syringes, sharps, blood collection tubes, and flush products valued at approximately $300,000 to the local Red Cross in Wuhan. In addition, BD has donated $50,000 that will be used to supply personal protective equipment (PPE) to frontline health workers. Read more here.

**Cepheid** is developing an automated molecular test for the qualitative detection of COVID-19 with the ability to deliver point-of-care results in about 30 minutes. View the press release here.

**Danaher Corporation:** Five Danaher operating companies donated RMB 10 million ($1.4 million) of diagnostic equipment, reagents and other products to hospitals in Wuhan, China to combat COVID-19. Included in the donation is: Beckman Coulter Diagnostics' hematology analyzers, Beckman Coulter Life Sciences' flow cytometers, Radiometer's blood gas analyzers, Cepheid's Xpert® Xpress Flu/RSV assay, and Hach's UV-Vis spectrometers.

**GE** Healthcare CEO Kieran Murphy shared here that the company has prioritized and fulfilled hundreds of medical technology installations – including CT, ultrasound, digital x-ray, respirators and patient monitors – in China and other impacted regions. Additionally, GE Healthcare has donated $2.8 million worth of medical equipment in Wuhan, and has accelerated its global supply chain to help cut production times for its new Revolution Maxima CT from around one week to only three days. More details here.

**Johnson & Johnson** has donated one million surgical masks to China and $1 million RMB to the Chinese Red Cross Foundation. They have also donated thermometers, respirators, an electrosurgical generator, 50,000 bottles of isopropyl alcohol, and PPE including goggles and protective suits. Additionally, Johnson & Johnson is diligently working with partners around the globe to develop a vaccine. Read more here.

**Medtronic** and the Medtronic Foundation are committing $1.5 million to coronavirus relief efforts across the globe. Product donations to Wuhan Huoshenshan Hospital

AMERICAN OVERSIGHT

include ventilators, respiratory filters, pulse oximeters, sensors, and centrifugal blood pump systems. View the press release here.

**Olympus** installed endoscope systems into the Wuhan Huo Shen Shan Hospital within 10 days to treat infected patients. In addition to monetary donations to the Red Cross Society of China Huanggang, Olympus has donated 15 sets of laryngoscopes to the China Social Welfare Foundation, and 25 biological microscopes to the Chinese Center for Disease Control and Prevention, totaling approximately $500,000 in donations.

**QIAGEN** has sent the first group of 200 QIAstat-Dx cartridges for syndromic detection of respiratory pathogens – including COVID-19 –to China; they're now being validated at four hospitals. This comes as an evaluation was also successfully completed at the Bichat-Claude Bernard Hospital in Paris. The use of QIAstat-Dx is increasingly important for detection of the COVID-19 infections, as well as to provide differential diagnostics involving the more than 20 other respiratory pathogens included in this syndromic test.

**ResMed** CEO Mick Farrell stated that the company has sent more than 100 ventilators from ResMed's facility near Shanghai to Wuhan. He also stated they will send hundreds more ventilators and thousands of masks. Read more here.

**Roche** is working with Chinese health authorities and the government to ensure people can access screening and healthcare. Roche is also working to support the government and local health officials and hospitals in Hubei Province in dealing with the coronavirus. Recently, Roche has donated diagnostic tests, medical supplies, and financial support for the affected region. View the press release here.

**Varian** has donated 1 million RMB to the China Red Cross. View the press release here.

**For more information, contact Jim Jeffries.**

**Subject**: Great Job!

Dear OHT7,

As the federal government works to address the public health emergency for COVID-19, I wanted to take a moment to thank you for your significant contributions to this effort. For the past two months, DMD has been actively encouraging and supporting development and validation of diagnostics. This includes significant outreach to developers with molecular capabilities, development of a template for EUA submission, interactions with over 75 individual developers, review and authorization of CDC's assay, resolving problems as they arise, and, over the course of the past 24 hours, developing and publishing of a final guidance on policy for this specific emergency. It has been a truly herculean effort.

The guidance titled Policy for Diagnostics Testing in Laboratories Certified to Perform High Complexity Testing under CLIA prior to Emergency Use Authorization for Coronavirus Disease-2019 during the Public Health Emergency was posted on our website this morning along with an updated COVID-19 EUA template. This policy allows labs to develop, validate and run LDTs for COVID-19 during this emergency, provided certain criteria are met:

- Tests should meet validation criteria described in the guidance before clinical use
- Labs should notify FDA when clinical use of a validated test begins
- Labs should confirm the first 5 positive and negative samples with an EUA authorized test (likely in another lab)
- Test reports should indicate the test has been validated but that independent review by FDA is not yet complete
- Labs should submit an EUA within 15 days of initiating testing
- If any specimens fail confirmatory testing or if FDA is unable to authorize the EUA, labs should stop testing and issue corrected test reports indicating prior results may not be valid

DMD was instrumental in development of reasonable guardrails around the limited enforcement discretion in this policy.

Our work, particularly that of DMD, is not done. In fact many of you are still working now, even after many late nights and long weekends of EUA review work. We will need to continue reviewing EUA requests as quickly as possible for the foreseeable future. DMD has an incredible track record and I know you will continue to rise to the occasion. I also wanted to acknowledge the entire office, as I know OHT7 works as a team to support one another.

Thank you for your ongoing extraordinary efforts to meet the public health needs in this emergency.

I know it has been a long road and it is far from over but we, our country, and our global neighbors will get through this, together.

Jeff

Yes, I'll make sure both Dr. Stine and Lindsay Baden (per Elizabeth's message) receive the outreach invites.

Elizabeth and I just discussed including Lindsay Baden on both the media and stakeholder invites. Let me know if you have any concerns with that approach.

Alicia

Dr. Hahn,

I am attaching a letter from the American Association for Clinical Chemistry requesting that the Food and Drug Administration (FDA) exercise its enforcement discretion to permit qualified laboratories to use laboratory developed tests to detect SARS-CoV-2 and diagnose COVID-19. We appreciate your consideration of our request.

Sincerely

Hi Jeff,

There was some concern in speaking with Scott just now that based on a CDC call yesterday that some labs may destroy their existing kits and we want to stop that immediately.

The call with all the PHLs will be at 3 pm today. Scott would still like to keep the 4:30 pm call.

Best,
*Tim*

**Subject:** CDC's 2019-Novel Coronavirus (2019-nCoV) Real-Time Reverse Transcriptase (RT)-PCR Diagnostic Panel - Regulatory Discretion

Dear Wendi,

On February 4, 2020, the Centers for Disease Control and Prevention (CDC) received an Emergency Use Authorization (EUA) for the CDC's 2019-Novel Coronavirus (2019-nCoV) Real-Time Reverse Transcriptase (RT)-PCR Diagnostic Panel for the presumptive qualitative detection of nucleic acid from the 2019-nCoV in upper and lower respiratory specimens (such as nasopharyngeal or oropharyngeal swabs, sputum, lower respiratory tract aspirates, bronchoalveolar lavage, and nasopharyngeal wash/aspirate or nasal aspirate) collected from individuals who meet CDC criteria for 2019-nCoV testing.

On February 24, 2020, CDRH/FDA was informed that enforcement discretion from FDA was needed for the following:

1. CDC qualified laboratories to perform testing using only the already distributed N1 and N2 (and not N3) primers of CDC's 2019-Novel Coronavirus (2019-nCoV) Real-Time Reverse Transcriptase (RT)-PCR Diagnostic Panel, upon verification of those primers by the laboratory, until such time as they receive and verify new primers that will be supplied by CDC and/or Integrated DNA Technologies (IDT) and begin performing testing with them. CDC would also distribute and these laboratories would use new result interpretation instructions that FDA has reviewed but has not yet authorized as part of an EUA, for performing testing with only the N1 and N2 primers. CDC requests this enforcement discretion to address the manufacturing issues that have been identified with certain N3 primers and to avoid significant delays in testing given increased testing demands. CDC and IDT, a CDC-identified third-party manufacturer, are preparing new lots and kits for the new primers, but it will take some time to complete quality control testing and to send these primers to the CDC qualified laboratories.

2. CDC qualified laboratories to test individuals who meet COVID-19 clinical and/or epidemiological criteria using the authorized test and the two primer test (as set forth above). This enforcement discretion is being requested to address growing concerns of community transmission of COVID-19, and would be until authorization of a new or amended EUA for this use.

CDC has generated data indicating that testing using the N1 and N2 primers of the CDC's 2019-Novel Coronavirus (2019-nCoV) Real-Time Reverse Transcriptase (RT)-PCR Diagnostic Panel may be effective in the detection of SARS-CoV-2, and CDC and FDA have worked interactively in connection with FDA's review of the data. At this time, there are no adequate, approved, and available alternative tools that can detect SARS-CoV-2.

Our understanding of the facts and the public health concerns at issue here are: that there is currently no other test available to detect SARS-CoV-2 to respond to this emergency; significant public health concerns are

AMERICAN OVERSIGHT

presented by the infectious disease; and the proposed testing may help to prevent the spread of the infectious disease COVID-19. Based on this understanding, at this time, FDA does not intend to object to the use of this test as described above, with the conditions that presumptive positives and inconclusive results will be confirmed by testing at the CDC headquarters in Atlanta, GA, and that CDC will act promptly to submit a new or amended EUA to authorize the testing described above.

Sincerely,
Ellen

**Subject:** NYS Wadsworth

Wadsworth sent us their EUA this afternoon. (b) (5) [redacted]

In addition, Wadsworth (b) (4), (b) (5) [redacted] That testing is premised on their ability to reference the CDC's data. We've asked if they would give a right of reference to Wadsworth as this is important not just for Wadsworth but some other test developers, as well. We asked that, if CDC agrees, they just email us that "The New York State Wadsworth Center can reference the data in the CDC 2019 nCoV EUA application".

We'll follow up but if we do not hear back from them tomorrow morning I may ask you to reach out to Redfield. This should be a no-brainer.

**Subject:** Re: 2019 nCoV

Hi Tim
So great to hear from you.
We have our submission number after a few exchanges with the agency via email on our validation design. I am copying Dr. Brian Krueger. He and I can be available and welcome your help.

On Feb 24, 2020, at 4:37 PM, Stenzel, Timothy <Timothy.Stenzel@fda.hhs.gov> wrote:

Hi Marcia,

I am told LabCorp is developing an assay. Could you put me in touch with the correct R&D leader to discuss? We want to do anything we can to help speed the development of an EUA.

Thanks in advance!

Best,
*Tim*

**RE:** Request for Pre-Emergency Use Authorization (Pre-EUA) of the [*Name of the Assay*]

**Dear Dr. Scherf,**

[***Name of the Company***] is submitting a Pre-Emergency Use (Pre-EUA) for the [***Name of the Medical Device Product***] so we can obtain feedback from FDA concerning the studies and/or testing outlined in our Pre-Emergency Use Authorization (Pre-EUA) submission package.

The [***Name of the Medical Device Product***] is [***brief description of the device***] and [***intended use***].

Attached to this letter is the first draft of our device EUA Interactive Review Template for FDA review as a Pre-EUA. One hard copy of the signed EUA Cover Letter and one electronic copy are enclosed. Also, these documents have been sent to you via email.

In case you should have any questions regarding the information provided and/or need additional information/data from us please contact me immediately either via email [_____] or phone [_____].

Sincerely,

[***Name***]

AMERICAN OVERSIGHT

# EMERGENCY USE AUTHORIZATION (EUA)

## EUA INTERACTIVE REVIEW TEMPLATE FOR MOLECULAR-BASED SINGLE TARGET TESTS FOR 2019 NOVEL CORONAVIRUS (2019-nCoV)

## GENERAL INFORMATION ABOUT THIS TEMPLATE

- Text highlighted in yellow ***[Text]*** should be completed by the IVD developer (sponsor) as applicable to their specific test. Text in **bold** outlines the Food and Drug Administration (FDA) suggestions and clarifications for the sponsors' consideration when completing the required information in a specific section.

- This is a EUA interactive review template for Pre-EUA/EUA submissions concerning molecular-based single target tests for detection of 2019 Novel Coronavirus (2019-nCoV), Wuhan, China. If you are developing a multiplex molecular-based assay for the detection and differentiation of nucleic acids from a panel of microorganisms, please review Appendix A for FDA recommendations.

- This is a EUA interactive review template for Pre-EUA/EUA submissions and not a guidance document. The template is subject to change as we learn more about the 2019-nCoV disease and its risk-benefit profile. Recipients will receive notice and updated templates as they become available.

- This EUA interactive review template is an FDA internal document and any proprietary information provided within the template and during the interactive review process will remain confidential as it does in a regular FDA premarket submission.

- Feedback provided by FDA during the interactive review of your pre-EUA/EUA is subject to change as we learn more about the 2019-nCoV disease and the risk-benefit profile evolves to address unmet public health needs.

- Prior to a potential authorization FDA will require developers of molecular-based tests to assess traceability of their test to an FDA-recommended reference material panel if available at the time. Specific details about the traceability study and the FDA-recommended reference material panel will be provided by the Lead Reviewer assigned to the Pre-EUA submission once the analytical and clinical evaluation data has been reviewed and found to be acceptable.

- Please be reminded that tests for the detection of 2019-nCoV or 2019-nCoV infection must not be distributed and/or used for clinical diagnoses without premarket clearance, approval, or EUA by the FDA. Clinical samples for 2019-nCoV testing should be sent to the appropriate public health laboratories until the IVD device subject of this Pre-EUA submission has received authorization from the FDA.

- Clinical specimens may be required to support the EUA request. Furthermore, please note that applicable regulations for human subject protection do apply under the

AMERICAN OVERSIGHT

EUA. Please refer to the Clinical Evaluation section of this document for more details.

- If authorized, the EUA means that this 2019-nCoV IVD is temporarily authorized for use until the public health emergency is terminated or the EUA is revoked by the FDA.

    - FDA recommends that you consider registration and listing your EUA product once you have been issued an EUA. If this is problematic, please notify the Agency during your Pre-EUA.
    - The EUA is not a pathway to permanent marketing of your device. Therefore, we strongly recommend that you consider, in addition to an EUA, a traditional premarket submission for your IVD so that your device can still be legally marketed after termination of the emergency declaration. We recommend that you identify as soon as possible in the Pre-EUA review process any consideration of moving your product forward towards De Novo/510(k) clearance. If so some of our feedback to you may take such a long-term goal into consideration in order to prevent additional testing where it may not be needed. Therefore, please consider submitting a Pre-Submission to inquire what studies would be required for a premarket approval/ clearance of your 2019-nCoV IVD. Details on how to submit a Pre-Submission to the Agency are outlined in the FDA guidance document: *Requests for Feedback and Meetings for Medical Device Submissions: The Q-Submission Program.* [ HYPERLINK "https://www.fda.gov/regulatory-information/search-fda-guidance-documents/requests-feedback-and-meetings-medical-device-submissions-q-submission-program" ]

## A. EXECUTIVE SUMMARY (as of X/XX/20XX)

## B. PURPOSE FOR SUBMISSION

Emergency Use Authorization (EUA) request for distribution and/or use of the ***[test name]*** to ***[indicate labs, if applicable]*** for the *in vitro* qualitative detection of RNA from the 2019-nCoV in ***[add all claimed specimen types, e.g., nasopharyngeal/oropharyngeal swabs, sputa, BAL, stool, and serum, etc.]*** from patients who meet CDC 2019-nCoV clinical criteria (e.g., signs and symptoms associated with 2019-nCoV infection) and CDC novel coronavirus epidemiological criteria (e.g., history of residence in or travel to a geographic region with active 2019-nCoV transmission at the time of travel, or other epidemiologic criteria for which 2019-nCoV testing may be indicated) to aid in the diagnosis of 2019-nCoV infection.

## C. MEASURAND

AMERICAN OVERSIGHT

Specific nucleic acid sequences from the genome of the 2019-nCoV **[*please specify the targeted gene(s) of the pathogen*]**.

## D. APPLICANT

***[Official name, address and contact information of applicant]***

## E. PROPRIETARY AND ESTABLISHED NAMES

Proprietary Name - ***[test name]***
Established Name - ***[test name]***

## F. REGULATORY INFORMATION

***Approval/Clearance Status:***
The ***[test name]*** test is not cleared, CLIA waived, approved, or subject to an approved investigational device exemption.

***Product Code:***
[XXX – FDA will complete]

## G. PROPOSED INTENDED USE

***1) Intended Use:***
**The proposed IU will be finalized based on the data and recommendations from Public Health authorities at the time of authorization – example text is provided below for a qualitative molecular test that detects organism RNA but may be adapted according to the specific emergency situation addressed by the device.**

[***Test name***] is a [***specify test technology such as, real-time RT-PCR test***] intended for the qualitative detection of nucleic acid from the 2019-nCoV in [***describe all the specimen types***] from individuals meeting CDC 2019-nCoV clinical criteria (e.g., clinical signs and symptoms associated with 2019-nCoV infection) in conjunction with CDC 2019-nCoV epidemiological criteria (e.g., history of residence in or travel to a geographic region with active 2019-nCoV transmission at the time of travel, or other epidemiologic criteria for which 2019-nCoV testing may be indicated). Testing is limited to [***laboratories - certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA), 42 U.S.C. §263a, to perform high complexity tests, or by similarly qualified non-U.S. laboratories***].

Results are for the identification of 2019-nCoV RNA. The 2019-nCoV RNA is generally detectable in **[*name specimen type*]** during the acute phase of infection. Positive results

AMERICAN OVERSIGHT

are indicative of active infection. Laboratories within the United States and its territories are required to report all positive results to the appropriate public health authorities.

Negative results do not preclude 2019-nCoV infection and should not be used as the sole basis for patient management decisions. Negative results must be combined with clinical observations, patient history, and epidemiological information.

The ***[test name]*** is intended for use by **[*include intended user, e.g., trained clinical laboratory personnel specifically instructed and trained in the techniques of real-time PCR and in vitro diagnostic procedures*]**. The ***[test name]*** is only for use under the Food and Drug Administration's Emergency Use Authorization.

***2) Special Conditions for Use Statements:***

For prescription use only
For in vitro diagnostic use only

***3) Special Instrument Requirements:***

The ***[test name]*** test is to be used with the [***list all RT-PCR Instruments, software requirements, automated extraction instruments***].

## H. DEVICE DESCRIPTION AND TEST PRINCIPLE

**Example text has been added under each of the sub-headings below for a fluorescence based rRT-PCR test for detection of organism RNA. If a different test principle is used by the test for the detection of a specific analyte please modify the description accordingly to capture the salient points in each of the sub-headings below. Please note that for new investigative technologies FDA may request additional detailed information so we can adequately assess the risks and benefits associated with the device.**

***1) Product Overview/Test Principle:***

**Describe the technology of the test and how this technology works to identify the measurand, the instruments employed/required to perform the test from sample collection to result (include all claimed extraction and PCR detection instruments), and the specimen types for which you claim to have specific performance characteristics as described below. If applicable, list all primer and probe sets and briefly describe what they detect. Please include the nucleic acid sequences for all primers and probes used in the test. Please indicate if the test uses biotin-Streptavidin/avidin chemistry in any of the steps for coupling reagents. Please note that an alignment with available reference genomes for different strains of the target pathogen is requested as part of the inclusivity evaluation (Section N).**

The ***[test name]*** is a real-time reverse transcription polymerase chain reaction (rRT - PCR) test. The 2019-nCoV primer and probe set(s) is designed to detect RNA from

AMERICAN OVERSIGHT

the 2019-nCoV in ***[list all the specimens]*** from patients who meet CDC 2019-nCoV clinical criteria (e.g., signs and symptoms associated 2019-nCoV infection) in conjunction with CDC 2019-nCoV epidemiological criteria (e.g., history of residence in or travel to a geographic region with active 2019-nCoV transmission at the time of travel, or other epidemiologic criteria for which 2019-nCoV testing may be indicated).

2) ***Description of Test Steps:***

**List and describe in detail all the steps of the test sequentially from specimen collection to detection.**

Nucleic acids are isolated and purified from ***[specimens]*** using ***[please describe the method(s) of extraction (please specify the specimen input volume for extraction and/or test, the nucleic acid elution volume and whether isolation/purification is manual and/or automated)].*** The purified nucleic acid is reverse transcribed using ***[enzyme mix/kits – please specify the input volume of purified nucleic acid added to the rRT-PCR reaction mix]*** into cDNA which is then subsequently amplified in ***[please describe the instrument(s) and enzyme mix]***. In the process, the probe anneals to a specific target sequence located between the forward and reverse primers. During the extension phase of the PCR cycle, the 5' nuclease activity of Taq polymerase degrades the probe, causing the reporter dye to separate from the quencher dye, generating a fluorescent signal. With each cycle, additional reporter dye molecules are cleaved from their respective probes, increasing the fluorescence intensity. Fluorescence intensity is monitored at each PCR cycle by ***[please describe the detection instrument(s)]***.

3) ***Control Material(s) to be Used with [test name]:***

**List all control materials (provided with the test kit and/or required but not provided with the test kit and describe what they are, how they are expected to work, where in the testing process they are used, and the frequency of use. If a control is commercially available, provide supplier's name and catalog number or other identifier; if your device relies on external controls that are manufactured by a third party please note that these controls should also be validated within your analytical and clinical studies described below in Section (N).**

Controls that will be provided with the test kit include:

a) A "no template" (negative) control is needed to ***[describe need]*** and is used ***[describe use – please also specify frequency of use]***

b) A positive template control is needed to ***[describe need]*** and is used ***[describe use – please specify the concentration of the positive control relative to the LoD of your test (note that ideally the positive control concentration should be such that it is close to the LoD of your test) and also specify frequency of use]***

AMERICAN OVERSIGHT

c) An extraction control ***[describe control]*** is needed to ***[describe need]*** and is used ***[describe use – please also specify frequency of use].*** **Please note that if the no template control and positive control, are taken through the entire sample processing procedure, including the extraction, then a separate extraction control is not required**.

d) An internal control ***[describe control]*** is needed to ***[describe need]*** and is used ***[describe use]***.

Controls that are required but not provided with the test kit include ***[describe control – provide recommended sources of the control materials – either a separate control kit for purchase that you the applicant develops or a control material that can be purchased from a third party].*** This/these control(s) is/are needed to ***[describe need]*** and is used ***[describe use – please also specify frequency of use]***.

**Please note that any control recommended to be used with your device (provided with the kit or not) needs to be validated in the context of your analytical and clinical study (i.e., you will need to run these controls as part of your studies). In instances where control material is not readily available through 3rd party vendors (which is often the case at the beginning of an outbreak) FDA may request that you include suitable control material with your device. Please note that external control materials are considered particularly important in the context of EUA devices because often GMP requirements for the manufacture of the EUA device are waived in emergency situations and reagent stability studies are limited. Hence the external controls offer some assurance of EUA test performance in the hands of the end user.**

## I. INTERPRETATION OF RESULTS

All test controls should be examined prior to interpretation of patient results. If the controls are not valid, the patient results cannot be interpreted. **Please describe if a Ct cutoff is used as part of your testing algorithm and/or if the end user is required to review fluorescent curves for weakly positive samples before final interpretation. Although not typical for molecular-based tests, if the test result involves the use of an algorithm/calculation, for example a ratio value, when determining the final patient test result, please include a detailed description and any additional calibration materials that may be required.**

1) ***[Test name] Controls – Positive, Negative and Internal***

**Describe in detail the expected results generated, including acceptance criteria, for all the controls described in detail in Section H above. Describe the measured values (if applicable) for valid and invalid controls and outline the recommended actions the laboratory should take in the event of an invalid control result.**

AMERICAN OVERSIGHT

2) ***Examination and Interpretation of Patient Specimen Results:***

**Describe when clinical specimen test results should be assessed and outline the criteria for test validity**. **Example text**: Assessment of clinical specimen test results should be performed after the positive and negative controls have been examined and determined to be valid and acceptable. If the controls are not valid, the patient results cannot be interpreted.

**Clearly indicate how to interpret numeric test values (if applicable) as positive or negative for presence of the 2019-nCoV. Indicate if the end user is required to review fluorescent curves for weakly positive samples before final interpretation and how to identify indeterminate/inconclusive results (if they exist) results and how the user should resolve them, e.g. if repeat testing may be required.**

**When applicable, provide a table clearly describing the possible combinations of test result values for each primer/probe set, and how they should be combined into a final interpretation of the result for your test. If the test produces result that will be used as part of a CDC recommended testing algorithm, please indicate what follow-up testing/process should be conducted, if applicable.**

## J. PRODUCT MANUFACTURING

**Please note that if you are developing a test for use at a single site (i.e., a laboratory developed test LDT), some of the information requested in this section may not be applicable. Please contact FDA for additional guidance for an emergency use LDT.**

The ***[test name]*** has been validated using only the components referenced in this submission and shall not be changed without prior concurrence from the FDA.

*1)* ***Overview of Manufacturing and Distribution:***

The product will be manufactured at [***manufacturer's name and FDA registration number (if applicable) or laboratory name if an LDT***] by [***manufacturer name, or laboratory name if an LDT***] personnel consistent with practices for the production of **[*types of devices*]** based on [***type of quality system****]. Material manufactured by [***manufacturer's name, or laboratory name if an LDT***] may be bottled and kitted by [***packager name***] manufacturing facility.

***Under the Emergency Use Authorization (EUA) most of the 21 CFR 820 Quality System Regulation (QSR) requirements can be waived for the duration of the EUA. FDA expects that developers follow comparable practices as much as possible and may consider previous compliance history when determining whether or not to waive certain QSR requirements for a specific product. Please note adverse events, as per 21 CFR Part 803, have to be reported for authorized devices (see Section R).**

AMERICAN OVERSIGHT

The current manufacturing capabilities include the ability to manufacture approximately **[*please insert the approximate number of units/products that can currently be manufactured per week at the manufacturing facility*]** products per week, however in the event of a surge in demand this could be increased to **[*please insert the approximate maximum number of units/products that could potentially be manufactured per week at the manufacturing facility if there was a surge in demand*]** product per week within a **[*please specify in weeks/months the expected timeframe required to increase product production if required*]** timeframe.

The product will be distributed by **[*please describe the distribution plan for the product and list all current distributors*]**.

2) ***Components Included with the Test***

Components manufactured by [***manufacturer's name and FDA registration number (if applicable)***] and supplied with the test include:
**List all components and reagents provided for your test, including a description of the primers and probes, volumes, concentrations, quantities, buffer components, etc.**

3) ***Components Required But Not Included with the Test***

Components required but not included with the test:
**List all components and reagents not included with the test that must be supplied by the user to perform the test, with specific supplier names and catalog numbers or other identifiers for obtaining these components and reagents. Please include here all specific consumables that were validated for use with your device, that are not interchangeable with other products and that are needed to guarantee device performance as established in the EUA validation studies listed in Section N below.**

4) ***Testing Capabilities***

**Briefly describe current sample throughput capacity, total time required to perform the test (from clinical specimen collection, specimen transport to result), and number of tests that can be performed per instrument run and per day.**

5) ***Reagent Stability:***

**Briefly describe stability test plan for *[test name]* reagents and include any accelerated stability information if available. Please note that reagent stability studies do not need to be completed at the time of EUA issuance, however the study design should be agreed upon during interactive review and the stability studies started immediately following authorization, if not before. When designing your stability study, we have some general recommendations that are outlined in Appendix B, for your consideration.**

AMERICAN OVERSIGHT

## K. PERFORMANCE EVALUATION

**If you plan to claim multiple target analytes to aid in differential diagnosis or you plan to claim multiple RT-PCR instruments and/or extraction methods, please refer to Appendix A and C, respectively, more information. Please note that any omission of a requested study in this document should be documented and justified.**

### *1) Analytical Sensitivity:*

a) *Limit of Detection (LoD):* **You should determine the LoD of the device utilizing the entire test system from sample preparation to detection for each clinical matrix claimed. Please note that claims for additional anticoagulants, for blood specimens, can be supported by a matrix equivalency study as outlined in Section N, subsection 3 below. The LoD is determined using dilutions of live propagated and titered 2019-nCoV stocks (CFU/mL or PFU/mL) spiked into a relevant clinical matrix. If wild-type virus is not available at the time of your validation studies, please contact FDA to discuss a potential alternative. Please note that if available please also provide Genomic Equivalent Copies (GEC)/mL units for the stock solutions used and include an explanation on how they were determined. Please note that LoD studies should be performed with live organisms, as described above. If you plan to use inactivated organism in your LoD determination you should describe how the material was inactivated and perform a study to determine whether the inactivation process impacted the LoD of the device.**

**First a tentative LoD must be established through limiting dilutions of the prepared material with 3-5 replicate measurements. Please note for all the analytical studies described in Section N that require replicate testing, one replicate equates to one independent extraction and PCR detection. Once a tentative LoD is established, the LoD should be confirmed by preparing at least 20 additional replicates at the LoD concentration and demonstrating that the organism was detected with a minimum 95% positivity (19/20). If this confirmatory study achieves a positivity of 100%, then a lower concentration needs to be tested (with 20 replicates) until <100% positivity is obtained.**

**Please use the following format when submitting LoD information and data:**

LoD studies determine the lowest detectable concentration of 2019-nCoV at which approximately 95% of all (true positive) replicates test positive. The LoD was determined by limiting dilution studies using characterized samples.

**List/describe the following in this section:**

- **Titers and strains of the 2019-nCoV stocks used for the LoD study and describe how the organism stocks were prepared and how the titers were determined.**

AMERICAN OVERSIGHT

- **The dilution factor and number of serial dilutions of the characterized 2019-nCoV that were tested to determine the LoD for each primer and probe set.**
- **The nucleic acid extraction/purification method.**
- **The real time PCR instrument.**

Serial dilutions of the characterized 2019-nCoV were then tested in **[*number of replicates (i.e., recommend that sample is extracted independently three-five times and each extraction tested once)*]** replicates. The lowest concentration at which all [***number of replicates***] replicates were positive was treated as the tentative LoD for each test. The LoD of each test was then confirmed by testing [***number of replicates (at least 20 recommended)***] with concentrations at the tentative limit of detection. The final LoD of each test was determined to be the lowest concentration resulting in positive detection of [***number of positive replicates (at least 19 out of 20 replicates)***]. [***Include analysis of LoD results, indicating the final LoD for each test***]

**Tentative LoD: [*Please provide a summary of the data for each strain tested]* example table 2019-nCoV stocks is provided below:**

| 2019-nCoV Strain Tested | Stock 2019-nCoV Titer | Serial 10-Fold Dilution Factor | Concentration in Dilution Tested [Include Units] | Replicate 1 $C_t$ | Replicate 2 $C_t$ | Replicate 3 $C_t$ | Replicate 4 $C_t$ | Replicate 5 $C_t$ | Call Rate | Lowest Concentration with Uniform Positivity per Analyte | Limit of Detection (LoD) per Virus Strain |
|---|---|---|---|---|---|---|---|---|---|---|---|
| ***Example:*** *[analyte]* | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |

b) FDA Sensitivity Evaluation: The analytical sensitivity of the test has to be further assessed by evaluating an FDA-recommended reference material using an FDA developed protocol if applicable and/or when available. Details will be provided during the Pre-EUA interactive review.

c) *Reactivity/Inclusivity:* Reactivity of the ***[test name]*** was evaluated for additional isolates of 2019-nCoV.

**Reactivity: *[test name]* example table below**

| 2019-nCoV Strain/Isolate | Source/Sample Type* | Concentration | Ct** |
|---|---|---|---|
| | | | |
| | | | |
| | | | |

AMERICAN OVERSIGHT

| | | | |
|---|---|---|---|
| | | | |

***Please list source of material used for wet testing and sample type tested (i.e., organism – live or inactivated, purified nucleic acid – whole genome etc.).**
**** If your technology does not produce Ct values, please include instead the signal output for your specific device technology.**

**At a minimum, the strain used in your LoD evaluation should be listed here (multiple isolates of the same 2019-nCoV strain that was used for the LoD studies can also be included if available). If additional isolates are not available at the time of your validation studies, please discuss with FDA. Each isolate should be tested at or near the LoD (no more than 3x LOD) of the test, spiked into clinical matrix utilizing the entire test system, including extraction. If you plan to claim more than one type of clinical matrix, we recommend that you perform this study in the most challenging clinical matrix, testing a minimum of 3 replicates. In addition, the wet testing should be accompanied by extensive inclusivity *in silico* analysis of the test primer and probes with all known strains/isolates (past/present) of 2019-nCoV (including the strain/isolate used for wet testing).**

## 2) *Analytical Specificity:*

a) *Cross-Reactivity:* Cross-reactivity of the ***[test name]*** was evaluated using both *in silico* analysis and by testing whole organisms **[*pathogen*]** (concentration) or purified nucleic acid from other ***[describe organisms]*** (concentration/reaction).

**Cross-Reactivity: *[test name]* example table for wet tested organisms below**

| Virus/Bacteria/Parasite | Strain | Source/ Sample type | Concentration | Ct Values* |
|---|---|---|---|---|
| | | | | |
| | | | | |
| | | | | |

***If your technology does not produce Ct values, please include instead the signal output for your specific device technology.**

**Cross-reactivity studies are preformed to demonstrate that the test does not react with related pathogens, high prevalence disease agents and normal or pathogenic flora that are reasonably likely to be encountered in the clinical specimen. The FDA Tables 1 and 2, below are intended to recommend simulate testing of patients having infections with organisms which cause similar symptoms to those observed at the onset of 2019-nCoV infection. The FDA Tables also include other organisms and strains which have significant genetic similarity and therefore a higher likelihood of cross-reacting with 2019-nCoV specific reagents. Also included in the FDA Tables are recommended unclaimed organisms/strains which are likely to be endemic to the currently affected area should be included in cross-reactivity testing since these organisms/strains will be an important aspect of the differential diagnosis of 2019-nCoV infection.**

AMERICAN OVERSIGHT

**FDA Table 1 Cross-Reactivity: List of Organisms to be wet-tested and analyzed *in silico* (for tests detecting 2019-nCoV) in respiratory material or blood specimens**

| Other high priority pathogens from the same genetic family | High priority organisms likely in the circulating area |
|---|---|
| Human coronavirus 229E | Adenovirus (e.g. C1 Ad. 71) |
| Human coronavirus OC43 | Human Metapneumovirus (hMPV) |
| Human coronavirus HKU1 | Parainfluenza virus 1-4 |
| Human coronavirus NL63 | Influenza A |
| SARS-coronavirus | Influenza B |

***In silico*** **analysis should be performed on all potentially cross-reactive organisms outlined in the FDA Tables 1 and 2 above. You should provide the result summary of the *in silico* blast analysis (tabular format) evaluating whether there is any significant amplification of non-target sequences that could either result is cross-reactivity or potentially interfere with the detectability of the actual target analyte. As such we are asking that you provide individual blast results (non-truncated alignments) for each of the primers and probes used in your device with potential cross-reacting organisms. Please provide for our review the percent sequence homology for each organism relative to the target analyte primers/probes in your test. Please use the example table below when presenting the results of *in silico* analysis in your submission:**

**Results of *In Silico* Analysis**

| Pathogen | Strain | GenBank Acc# | % Homology Test FP (i.e. 0-100%) | % Homology Test RP | % Homology Test Probe |

| | | | | | |
| | | | | | |

**The analysis should include multiple representative strains from GenBank for each organism. If *in silico* analysis reveals other potential cross-reactants (i.e., ≥80% homology between one of your primers or the probe to any of the sequences of listed potential cross reactants), you should carefully review the alignments and determine based on the positions of the homologous stretches and mismatches if additional cross-reactivity and/or interference (please refer to item b below – microbial interference studies) wet testing will be required to rule out cross-reactivity or interference of that organism that may affect the performance of your device. In these circumstances if wet-testing is omitted you should include an explanation as to why *in silico* generated data is not clinically relevant (irrelevant isolate, location/extent of match within primer/probe, etc.), or why the performance of your test would not be impacted.**

**Organisms in FDA Table 1 should be wet tested in addition to the *in silico* analysis. Omissions from wet-testing should be discussed with FDA and supported by a well-documented justification that includes a due diligence attempt to obtain the live or inactivated organisms (and/or purified nucleic acid – which is acceptable for cross reactivity evaluation for an EUA).**

AMERICAN OVERSIGHT

**The wet testing evaluation should reflect test specimens prepared at the highest clinically relevant level of organism (i.e., a minimum of $10^6$ CFU/ml or higher for bacteria and $10^5$ $TCID_{50}$/mL or PFU/ml or higher for viruses) and should be tested with a minimum of three replicates per organism test specimen. Test specimens can be prepared by spiking cultured isolates/inactivated organisms/ purified nucleic acids (whole genome) into negative clinical matrix and determining cross reactivity based on triplicate replicates. If you plan to claim more than one type of clinical matrix, please note that if significant differences in LoD are observed for the different clinical matrices this may warrant this study being performed in more than one clinical matrix.**

**If you plan to claim non-blood or non-respiratory clinical specimen types for diagnostic use with your device, e.g., stool specimens, etc., please consult FDA for more information on additional organisms that may be recommended for cross-reactivity testing, common examples are provided below for stool specimens (FDA Table 3):**

**FDA Table 3: Organisms to be analyzed for non-blood clinical specimens:**

| **Stool** |
|---|
| *Escherichia coli* |
| *Lactobacillus* |
| *Bacillus* spp. |
| *Clostridium* Spp. |
| *Enterobacter* |
| *Enterococcus* |
| Fusobacterium |
| Bacteroidetes |
| Bifidobacterium |
| Ruminococcus |
| |

b) *Microbial Interference Studies:* **If *in silico* analysis reveals ≥ 80% homology between the cross-reactivity microorganisms and your test primers/ probe(s), we recommend that you either perform (1) a microbial interference study with 2019-nCoV and the microorganisms that your test primers/ probe(s) have homology to, (2) as an alternative to the microbial interference study, you may provide justification as to why (e.g., amount of primer(s)/ probe(s) included in your master mix) the performance of your test would not be impacted by the presence of a causative agent of a clinically significant co-infection, or (3) explain why the *in silico* results are clinically irrelevant. In the case of the microbial interference study, interference should be evaluated using samples spiked at a low 2019-nCoV concentration, at 3x LoD, and a high interferent level (either microorganisms or nucleic acids purified from them), to represent the worst-case scenario, with a minimum of 3 replicates. If you plan to claim more than**

AMERICAN OVERSIGHT

**one type of blood clinical matrix, please note that if significant differences in LoD are observed for the different clinical matrices this may warrant this study being performed in more than one clinical matrix. If the LoDs are similar in the blood clinical matrices the study should be performed in the most challenging matrix, i.e., whole blood. In addition, if you are claiming blood and non-blood clinical specimens you may be required to perform this study in more than one clinical matrix. If interference is observed at the level tested, an additional titration study should be performed to determine the highest microorganism interferent level the 2019-nCoV test can tolerate.**

**c)** *Endogenous Interference Substances Studies*: **The extent of testing for endogenous interference substances depends on the matrix that is claimed for the device as well as on the technology of the device, e.g., if a nucleic extraction procedure is performed prior to testing or not. For EUA we do not typically ask for interference studies for tests that use conventional PCR and/or well-established extraction methods prior to testing (e.g., Boom method and column-based extraction methods).**

**For extraction procedures that are new or for nucleic acid-based technologies that are different from conventional PCR (e.g., various isothermal methods), we expect testing of potential interferents. The impact of interfering substances should be evaluated over the expected clinical range of the potentially interfering substance. Potential sources of endogenous interference include, but are not limited to, the ones listed in the tables below. It is important to note that the evaluation of interference and the generation of false negative results should be done using samples containing the analyte at or near the LoD and should not exceed 3x LoD. You should test a minimum of 3 replicates per substance. If you plan to claim more than one type of clinical matrix, please note that if significant differences in LoD are observed between the different clinical matrices this may warrant this study being performed in more than one clinical matrix. Biotin interference poses a risk to laboratory tests that incorporate the free biotin-streptavidin capture method. Therefore, please review this safety communication [ HYPERLINK "https://www.fda.gov/medical-devices/safety-communications/fda-warns-biotin-may-interfere-lab-tests-fda-safety-communication" ] and the following [ HYPERLINK "onenote:http://sharepoint.fda.gov/orgs/CDRH-IVD/Orgs/DMD/DMD%20OneNotes/Language/Analytical%20Studies/Interference.one" \l "DRAFT%20guidance%20-%20Testing%20for%20Biotin%20Interference%20in%20In%20Vitro%20Diagnostic%20Devices&section-id={39D67316-5AE2-4791-958F-9387D384D6FA}&page-id={9298F00C-7C39-43CB-9EBA-29E5BC08BB6E}&end" ] ([ HYPERLINK "http://sharepoint.fda.gov/orgs/CDRH-IVD/Orgs/DMD/_layouts/OneNote.aspx?id=%2Forgs%2FCDRH-IVD%2FOrgs%2FDMD%2FDMD%20OneNotes%2FLanguage&wd=target%28Analytical%20Studies%2FInterference.one%7C39D67316-5AE2-4791-958F-**

AMERICAN OVERSIGHT

**9387D384D6FA%2FDRAFT%20guidance%20-%20Testing%20for%20Biotin%20Interference%20in%20In%20Vitro%7C9298F00C-7C39-43CB-9EBA-29E5BC08BB6E%2F%29" ]) to determine if biotin interference testing may be warranted for your device. We also recommend you consult with FDA prior to initiating biotin interference testing, if applicable.**

**The tables below indicate the potentially interfering substances that may be found in blood and respiratory specimens. For other non-blood specimen types, such as stool, the list of substances could be expanded – please consult with FDA.**

**Interfering Substances: *[test name]* Example table below for evaluation of interfering substances for the ability to generate false *positive* results:**

| Potential Interfering Substance | Concentration | Results (Detected X/3) |
|---|---|---|
| **Respiratory Specimens** | | |
| Mucin: bovine submaxillary gland, type I-S | | |
| Blood (human) | | |
| Nasal sprays or drops | | |
| Nasal corticosteroids | | |
| Nasal gel | | |
| FluMist | | |
| Homeopathic allergy relief medicine | | |
| Throat lozenges, oral anesthetic and analgesic | | |
| Anti-viral drugs | | |
| Antibiotic, nasal ointment | | |
| Antibacterial, systemic | | |
| **Blood Specimens** | | |
| Hemoglobin | 10 mg/mL* | |
| Bilirubin Conjugated | 0.4 mg/mL* | |
| Bilirubin Unconjugated | 0.4 mg/mL* | |
| Serum proteins (e.g., Human Serum Albumin) | 60 mg/mL* | |
| Triglycerides | 15 mg/mL* | |
| Cholesterol | 4 mg/mL* | |
| Human Anti-mouse Antibody (HAMA) | 800 ng/mL* | |
| Rheumatoid Factor | 2000 IU/mL* | |

*Taken from the recently-updated 3rd edition of CLSI guideline EP07, Interference Testing in Clinical Chemistry (Section 3.4.2) which now defers to CLSI EP37, Supplemental Tables for Interference Testing in Clinical Chemistry for the recommended concentrations for testing common endogenous substances (Table 2) and have subsequently updated a number of the recommended testing concentrations.

**Interfering Substances: *[test name]* Example table below for evaluation of interfering substances for the ability to generate false *negative* results:**

AMERICAN OVERSIGHT

| Potential Interfering Substance | Concentration* | Viral Strain Level (In multiples of LoD) | Results (Detected X/3) |
|---|---|---|---|
| **Respiratory Specimens** | | | |
| Mucin: bovine submaxillary gland, type I-S | | | |
| Blood (human) | | | |
| Nasal sprays or drops | | | |
| Nasal corticosteroids | | | |
| Nasal gel | | | |
| FluMist | | | |
| Homeopathic allergy relief medicine | | | |
| Throat lozenges, oral anesthetic and analgesic | | | |
| Anti-viral drugs | | | |
| Antibiotic, nasal ointment | | | |
| Antibacterial, systemic | | | |

*Taken from the recently-updated 3rd edition of CLSI guideline EP07, Interference Testing in Clinical Chemistry (Section 3.4.2) which now defers to CLSI EP37, Supplemental Tables for Interference Testing in Clinical Chemistry for the recommended concentrations for testing common endogenous substances (Table 2) and have subsequently updated a number of the recommended testing concentrations.

### 3) *Matrix Equivalency (if applicable):*

**A matrix equivalency study may be used to support certain specimen type claims that were not evaluated during the clinical study (e.g., serum versus plasma, use of different anticoagulants, use of difference swab types or viral transport media, etc.). Please note that LoD and clinical specificity studies are required for all claimed matrices. The matrix in which the clinical studies are conducted is the comparator. All other matrices are to be shown to be equivalent to the comparator matrix. We request a minimum of 40 paired samples each obtained from individual persons; negative (10 samples), low positive (1.5-2xLoD, 20 samples), and moderate positive (5-10xLoD, 10 samples) samples should be tested. Positive samples are prepared by spiking paired negative clinical matrix with the same amount of target analyte. Please note that individual (and not pooled) samples should be used in this study.**

AMERICAN OVERSIGHT

4) ***Comparative Limit of Detection (LoD) of the Test vs. the Comparator Method:***

**A comparative LoD study may be required to support use of a comparator method in your clinical evaluation that has not been validated with a specific specimen type. The comparative LoD study should be conducted testing the same dilution series using both, your test and the comparator you chose in parallel (to dilution endpoints for both tests), 3-5 replicates per dilution level are sufficient for this study.**

5) ***Specimen Stability and Fresh-frozen Testing:***

**A specimen stability study may be required to support specimen stability claims in the instructions for use outside of those typically outlined in CSLI standards. A fresh/frozen and/or freeze/thaw study may be required to support the use of frozen specimens if they are used as part of the clinical evaluation. Please consult with FDA concerning an appropriate study design prior to initiating any studies.**

6) ***Clinical Evaluation:***

**This section should describe the clinical study used to evaluate the performance of your test. Please note that the exact requirements for the clinical evaluation will be very dependent on, access to 2019-nCoV disease clinical specimens at the time of the studies and the nature of the emergency. Our general clinical study evaluation recommendations for respiratory and serum clinical specimens are outlined below. If you are interested in claiming additional specimen types, for example, stool, please contact FDA for current recommendations. Please note these clinical study recommendations may be subject to change as we continue to learn about the 2019-nCoV disease or as the risk benefit analysis changes.**

**The clinical performance in general should be evaluated for each unique claimed clinical specimen type - with the exception of claims that can be supported by a matrix equivalency study (outlined in Section 3 above). The performance characteristics should ideally be established using a clinical study with a limited number of prospective samples. If a prospective study is not feasible, an acceptable alternative would be to test retrospectively collected 2019-nCoV nucleic acid negative and positive specimens from patients, accompanied by some basic information such as, the specimen collection date, date of onset of symptoms (if present/known), tests used to identify 2019-nCoV nucleic acid positive specimens, etc. Depending on the nature of the disease, if no prospective or retrospective specimens are**

AMERICAN OVERSIGHT

**available at the time of your pre-EUA submission for the 2019-nCoV disease we may accept a fully contrived clinical evaluation. The clinical evaluation should be comprised of a minimum of 100 negative individually collected specimens and 50 individual positive specimens (prospective, retrospective and/or contrived). Use of pooled specimens are not acceptable for the clinical evaluation of your test. Please see FDA Table 5 for more details. Please note that if a fully contrived clinical study is used to support your Pre-EUA submission, additional clinical testing of a limited number of natural clinical positive specimens and potentially negative specimens from the endemic region, if available, may be required at the time when this Pre-EUA transitions to an EUA as a result of an Emergency declaration for 2019-nCoV disease.**

AMERICAN OVERSIGHT

## FDA Table 5: Clinical study Recommendations:

| Details | Study Including Prospective/ Retrospective Specimens | Fully Contrived Sample Study |
|---|---|---|
| Minimum Number of Positive Specimens | 50<br><br>The number of natural (prospective/retrospective) positive clinical specimens should be at least 25 (collected from symptomatic patients in the 2019-nCoV disease endemic region(s)) and, if necessary, may be supplemented with contrived samples to generate the total of 50 positive specimens. Contrived samples should be prepared as described in the fully contrived sample study column. | 50<br><br>The contrived positive samples should be made in individual negative clinical matrix collected from subjects from a non-endemic population (pooled matrix is not acceptable for the clinical evaluation). Please note that the negative clinical matrix used for spiking should be confirmed negative by your test device prior to spiking. Half of the contrived positive samples can be prepared by spiking the 2019-nCoV at LoD and the remaining contrived positive samples should cover the range of the test up to and not higher than 5 x LoD.<br><br>Negative respiratory specimens: Can be archived/retrospective samples collected from US patients with signs and symptoms of respiratory infection.<br><br>Negative blood specimens: Can be collected from healthy subjects from non-endemic areas. |
| Minimum Number of Negative Specimens | 100<br><br>Note: In general, for EUA the 100 individual negative samples can be collected from; (1) archived/retrospective samples collected from US patients with signs and symptoms of respiratory infection for respiratory specimens, and (2) healthy subjects from non-endemic areas for blood specimens, that are "expected 2019-nCoV disease negative". Note these negative specimens can be used to also prepare any contrived positive specimens used in support of the clinical evaluation of the test.<br><br>Please note this recommendation is dependent on the current outbreak situation and is subject to change as we learn more about the 2019-nCoV disease/outbreak. If the outbreak situation for 2019-nCoV disease is primarily outside of the continental U.S. (OUS) it may be beneficial to consider collecting negative specimens that represent 50% endemic and 50% non-endemic regions. If negative specimens are collected from the endemic region of the 2019-nCoV disease these should be tested with the same comparator chosen for the positive specimens (more details provided below). For non-endemic collected specimens you can compare to the expected "negative" result. | |
| Recommended Comparator Method | Positive: Positive percent agreement should be calculated in comparison to a EUA PCR test (please see the following website for the most recent list of FDA authorized 2019-nCoV | Positive: Compare to expected result.<br><br>Negative: See Minimum Number of Negative Specimens row |

AMERICAN OVERSIGHT

| | | |
|---|---|---|
| for percent agreement performance calculations | tests: [ HYPERLINK "https://www.fda.gov/MedicalDevices/Safety/EmergencySituations/ucm161496.htm" ]. If no EUA test available at the time of your EUA submission, please consult with FDA about your choice of comparator method – which ideally should be a well validated PCR test with comparable sensitivity to your subject device. Please note that a well validated PCR test should include evaluation of the tests LoD, inclusivity, exclusivity, interference and any clinical testing.<br><br>Negative: See Minimum Number of Negative Specimens row | |
| Comparator Method Note 1 | Please note when using natural clinical specimens, the comparator method must be validated for the specimen type claimed – if not you should perform a Comparative Limit of Detection (LoD) of the Test vs. the Comparator Method study, as explained above (Section 4), to support its use as a comparator method in your clinical study. | N/A |
| Comparator Method Note 2 | Any occurrences of false results should be investigated with an additional validated PCR test and/or targeted sequencing, and the results of the discordant analysis can be footnoted in your final performance table but cannot be used to change the final performance calculations. | |
| Natural Clinical Specimens IRB/Informed Consent Note | For clinical specimens collected to support the EUA request, please note that sample collection needs to adhere to all applicable rules of human subject protection; as such, sample collection needs IRB approval, which includes review of the informed consent forms. Samples need to be collected with informed consent. If leftover de-identified samples are used, FDA exercises enforcement discretion regarding the informed consent requirement if the specimen collection meets the criteria described in the FDA Guidance on Informed Consent for In Vitro Diagnostic Device Studies Using Leftover Human Specimens that are Not Individually Identifiable ([ HYPERLINK "http://www.fda.gov/cdrh/oivd/guidance/1588.pdf" ]).<br>**Note that IRB approval is still required even if leftover de-identified samples are used in your study.** | |
| Additional Studies Warning | N/A | If fully contrived samples were used in your Pre-EUA submission, additional testing of natural clinical specimens may be requested, if available, to support transition of the Pre-EUA to EUA as a result of an Emergency declaration. |
| Testing Approach Note 1 | Please note all clinical specimens (natural and contrived) should be evaluated in accordance with your proposed diagnostic algorithm, including retesting when appropriate. We understand the limited nature of natural specimens may preclude retesting. In instances were retesting is indicated but not performed, for the purposed of performance evaluation, initial results will be analyzed for performance and equivocal/indeterminate results count against your final performance. | |
| Testing Approach Note 2 | Specimens should be tested in a blinded fashion, e.g., positive and negative samples should be mixed and blinded to the end user, end user should also be blinded to the results of any comparator method testing. | |

AMERICAN OVERSIGHT

**When you describe your clinical study please indicate/include:**

- **How the specimens were generated/collect/sourced**
- **If the study was fully prospective, mix of prospective, retrospective and/or contrived or fully contrived**
- **The rationale for the concentrations/specimens selected (if using contrived or 3-party sourced specimens)**
- **The total number of specimens tested**
- **The specimen types (clinical matrix)**
- **A summary of the study results**

**In the case of real-time PCR tests, please provide the line data in an Excel file as part of the Pre-EUA submission for each specimen (please indicate for each specimen if it was prospective, retrospective or contrived and the clinical matrix it represents); the data should include the $C_T$ values (for the specimen and the controls) and call/result for your device and, in the case of the natural clinical specimens, the comparator method results should be included as well.**

## L. UNMET NEED ADDRESSED BY THE PRODUCT

**This section will be finalized by FDA based on the state of the emergency at the time of authorization and based on recommendations from Public Health authorities at that time. Example text is provided below but may be adapted according to the specific emergency situation that is addressed by the device and the need at the specific time of the outbreak.**

[Outline background of pathogen, disease and current outbreak]

[Outline details of the disease such as the following:

- likely sources of transmission
- likely symptoms – if any
- Prevalence of symptomatic disease (what fraction of infection results in symptomatic disease)]

Laboratories in the United States are in need of diagnostic tools for use in the 2019-nCoV emergency for rapid diagnosis of acute 2019-nCoV infection.

A public health emergency has been declared by the Secretary of Health and Human Services (HHS) on [Month Day, YEAR] justifying the authorization of emergency use of *in vitro* diagnostic tests for detection of 2019-nCoV and/or diagnosis of 2019-nCoV infection.

The ***[test name]*** can augment clinically important laboratory evidence for individuals with active infection. The 2019-nCoV nucleic acid is generally detectable in [name

AMERICAN OVERSIGHT

specimen type] during the acute phase of infection (approximately [7] days following onset of symptoms, if present) [and possibly for longer in other specimen types].

Under emergency use authorization (EUA), ***[applicant name]*** plans to distribute the test or accept sample for testing with the ***[test name]*** for the detection of nucleic acid from 2019-nCoV in clinical specimens collected from individuals meeting CDC's 2019-nCoV clinical and/or epidemiological criteria. This EUA request for the ***[test name]*** is intended to expand domestic readiness within the United States and its territories by expanding diagnostic testing capabilities for 2019-nCoV during public health emergency.

FDA consulted with subject matter experts within HHS on the public health needs for diagnostic devices to detect 2019-nCoV nucleic acid. It is FDA's conclusion that there currently exists a public health need for such devices, i.e., that there is no adequate, approved (cleared), and available alternative to the ***[test name]*** for 2019-nCoV detection during the public health emergency.

## M. APPROVED/CLEARED ALTERNATIVE PRODUCTS

Currently no methods for the detection of the 2019-nCoV have been approved/ cleared by FDA.

## N. RISKS AND BENEFITS:

**The Risks and Benefits section should be updated according to your specific device, some example language is given below but should be tailored to the device and the disease.**

Risks

The ***[test name]*** has been designed to minimize the likelihood of false test results. However, should false results occur, they may present risks to patients:

- False positive result:
  - A false positive 2019-nCoV result could [***update based on the pathogen***].
  - A false positive result in the context of the current public health emergency could lead to misallocation of resources used for surveillance and prevention.
  - A false positive result could delay correct diagnosis and initiation of appropriate treatment for the actual cause of patient illness.
- False negative result:
  - Although a negative result does not rule out 2019-nCoV infection, a false negative has the potential to result in initiation of inappropriate treatment and a delay in correct diagnosis.
  - A false negative result can trigger a waste of health care resources, as additional evaluations are pursued in the effort to establish the true diagnosis.
  - A false negative results can contribute to further spread of the disease.

Benefits

AMERICAN OVERSIGHT

The primary benefit of distributing the ***[test name]*** for clinical use is that it provides a relatively fast diagnostic method for symptomatic patients, which enables faster intervention.

- True positive test results provide support for the diagnosis of a 2019-nCoV infection. The results can be used in conjunction with clinical and epidemiological information to guide patient management.
- Distribution of the factsheets can help healthcare professionals and the public learn more about 2019-nCoV disease and how to avoid acquiring it.

Risk Assessment

- Negative results may not preclude a 2019-nCoV infection. It is emphasized that the ***[test name]*** should not be used as the sole basis for treatment or other patient management decisions. The clinical features of the illness and the type and risk of exposure must be considered pivotal to making patient management decisions. A negative test should not be interpreted as definitive, if other aspects of the patient's clinical presentation or recent epidemiologic exposures indicate such is likely, and diagnostic tests for other diseases are negative.
- False negative results due to failure of PCR are minimized by the presence of controls that monitor nucleic acid extraction and PCR efficiency.
- Risk of patient discomfort or harm during sample collection is minimal.

Risk-Benefit Assessment

The risks posed by use of the ***[test name]*** are mitigated by:

- Use of the ***[test name]*** in conjunction with other laboratory, epidemiological, and clinical evaluation tools
- Distribution of Healthcare Provider and Patient fact sheets.
- Post-market studies/reporting or conditions of Authorization.

Based on these factors, the potential benefits from the use of the ***[test name]*** are expected to outweigh the risks.

## O. FACT SHEET FOR HEALTHCARE PROVIDERS AND PATIENTS:

**Include proposed Fact Sheets for Patients and Healthcare Providers**

## P. INSTRUCTIONS FOR USE/ PROPOSED LABELING/PACKAGE INSERT:

**Include Instructions for Use, Box Labels, Vial Labels and any other proposed labeling.**

## Q. RECORD KEEPING AND REPORTING INFORMATION TO FDA:

AMERICAN OVERSIGHT

[***Manufacturer name***] will track adverse events and report to FDA under 21 CFR Part 803. A website is available to report on adverse events, and this website is referenced in the Fact Sheet for Health Care providers as well as through the [***Manufacturer name***] Product Support website: [***Include link to Website***]. Each report of an adverse event will be processed according to [***Manufacturer name]***'s Non-Conformance Reporting Requirements, and Medical Device Reports will be filed with the FDA as required. Through a process of inventory control, [***Manufacturer name]*** will also maintain records of device usage/purchase. [***Manufacturer name]*** will collect information on the performance of the test, and report to FDA any suspected occurrence of false positive or false negative results of which [***Manufacturer name]*** becomes aware. [***Manufacturer name]*** will maintain records associated with this EUA and ensure these records are maintained until notified by FDA. Such records will be made available to FDA for inspection upon request.

## R. ADMINISTRATIVE INFORMATION:

**Interactive Review Log:** Please use the table below to document interactive review with FDA and include interactions initiated by either FDA or yourself

| **Date** | **Type of Interaction** (phone/ email/ formal submission-DCC) | **Brief Description** (e.g., questions asked/ feedback from FDA received / any word documents included) |
|---|---|---|
| [X] | [X] | [X] |
| | | |
| | | |

## S. FDA ADMINISTRATIVE INFORMATION:

**This section will be finalized by the FDA Lead Reviewer upon completion of the review process and documents the interactive review of this submission and any conclusions resulting from the interactive review.**

1) **Summary of Interactive Review – Lead Reviewer to use this section to highlight any major issues solved during interactive review.**
2) **Final Conclusions for Interactive Review -** It is FDA's conclusion that there currently exists a public health need for such devices, i.e., that there is no adequate, approved (cleared), and available alternative to the ***[test name]*** for [pathogen] detection during the public health emergency. **Conclusion should include an outline the unique features of the device compared to currently issued EUA's under the declaration, if applicable.**
3) **Upon competition of this section the Lead Reviewer should also sign this document and save the file as the final Decision Memorandum.**

AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

## APPENDIX A – Multiplex Panels Under EUA:

An emergency declaration by the HHS Secretary is typically specific for a pathogen/disease (i.e., there is a publicly declared health emergency involving a particular etiologic agent). Therefore, the EUA pathway is only applicable for testing patients with signs/symptoms/risk of exposure for that single agent in a given emergency. FDA has occasionally allowed limited additional target pathogens to be claimed for EUA devices, but panel members must be relevant to the event/disease outbreak subject of the specific emergency declaration. When determining whether to issue an EUA for a multiplex panel FDA takes into consideration the utility of the test (multiplex pathogen detection as an aid in differential diagnosis), clearance/approval status of IVDs for the other panel members, whether the proposed Intended Use fits within the HHS emergency declaration and the how the multiplex panel would fit into current public health authority patient testing algorithm recommendations. We recommend you contact FDA for specific feedback if you plan to claim multiple target analytes as part of your EUA test. If it is determined that a multiplex test is beneficial to the emergency response, please note that analytical and clinical evaluations for each of the target analytes will be required.

## APPENDIX B – General Study Design Recommendations for Reagent Stability:

- For EUAs you may follow the current FDA recognized CLSI Standard EP25 – Evaluation of Stability of In Vitro Diagnostic Reagents; Approved Guideline when evaluating the suitability of stability study designs. If you are planning to pursue a De Novo/510(k) for your device we recommend discussing in more detail your stability design to facilitate potential use of the EUA data in your regular premarket submission.
- Please note that use of only the positive controls is not acceptable for reagent stability evaluation because controls are usually formulated at a moderate positive level. For all the stability evaluations in addition to your external positive and negative controls and the no-template control you should include for the EUA evaluation at least one sample, that should be prepared by spiking negative clinical matrix at an analyte concentration of 3-5xLoD.
- If you are claiming multiple blood clinical specimen types in which similar LoDs are determined, you should use the most challenging clinical matrix for this study.
- Please note we typically recommend your stability study design includes the evaluation of at least 5 replicates. You should also evaluate, if available, 3 different lots of reagents.
- You should design your study to provide data for a timeframe that is about 10% longer than the one to be claimed – for example; a claim of 18 months should be supported by stability data out to 20 months and a claim of 7 days should include stability data out to 8 days.
- FDA considers 15-30°C to represent room temperature conditions. Ideally you should evaluate stability at both 15°C and 30°C, however, for the purposes of the EUA evaluation at 30°C is acceptable as the worse-case scenario.
- Shelf-Life Stability- Unopened kit:
    - You should evaluate real-time kit stability studies with unopened kits stored at the claimed storage temperature for your test.

AMERICAN OVERSIGHT

  - Accelerated stability evaluations for unopened kits is acceptable for EUA submissions while the real-time studies are on-going. However, please note real-time stability data is required to support regular pre-market submissions and for the final claim of an EUA.
- Shipping Stability - Unopened kit: Study should evaluate the anticipated handling and shipping times and temperatures expected for unopened kits.
- In-use/Opened Kit Stability: Depending on your device your stability study design should also support in-use stability of the kit reagents once the kit has been opened, e.g., storage at 2-8 $^{o}$C for 7 days. This includes on board stability once reagents have been placed on the instrument (if applicable).
- Inverted stability (if applicable): Study should support inverted stability for of kits.
- Freeze-thaw Stability: If you recommend aliquoting the reagents to meet the end-users needs following the initial thaw this recommendation should be supported by a freeze-thaw stability study, including the specific number of allowed freeze-thaw cycles.
- FDA analysis recommendations for real time stability studies are as follows:
  - Baseline of the study (t=0 of stability study) should not exceed a month from bottling
  - Clear baselines should be described (e.g., a month from bottling) for each stability claim under each study
  - Claims should be determined based on regression analysis. Any %change (%shift) from time zero (baseline) should be calculated between the target claim and the zero-time as (Ttest-Tbaseline)/ Tbaseline*100 with 95%CI using the regression equation obtained from plotting the mean values. When formulating your acceptance criteria for evaluating the shift from baseline you should consider the reproducibility of your device. However, generally, that the shift at the target claim due to storage cannot exceed 10-15%. The target stability is the next to last tested point that was within +/- 10% of time zero.
  - Acceptance criterion may be different, depending on the test samples analyte concentration distribution in the intended use population and the risk, in other words, the impact of false results to public health.

**APPENDIX C – Claiming Multiple Instruments and/or Extraction Methods:**

If you wish to claim multiple instruments and/or extraction methods for use with your test, please review the study recommendations provided below and contact FDA for any additional feedback. Please note that these analytical and clinical evaluation recommendations are based on the assumption that the elution volumes from the extraction methods and PCR volumes on the different RT-PCR instruments are identical.

- Limit of Detection (LoD): Please note that these studies should be repeated for each clinical matrix claimed in the Intended Use. Pick one RT-PCR instrument and determine the tentative LoD (using 5 replicates in 10-fold dilution) followed by the confirmatory LoD (20 replicates spiked at tentative LoD) for each extraction method on the chosen instrument. Note: If you detect 20/20 replicates in your confirmatory LOD study you should test the next lower concentration, using a 3-fold dilution, until

AMERICAN OVERSIGHT

you achieve a hit rate of <20/20.

- If the different extraction methods yield the same LoD (≤3xLOD) on the RT-PCR instrument chosen for initial testing, pick one extraction method for further LoD determination on the remaining RT-PCR instruments and follow the recommendations below.
- If the extraction methods do not yield the same LoD on the chosen RT-PCR instrument, please choose the extraction method with the worst LoD for further comparison of the LoD on all RT-PCR instruments.

For all other RT-PCR instruments you should use the following adaptive LoD study design:

- Please perform a refined tentative LoD study with 5 replicates at 0.5x, 1x, and 1.5 to 2x LoD. If you detect 4/5 replicates as positive at all the tested levels, you need to include the next higher concentration (i.e., 3x LoD). If you obtain 5/5 replicates at 0.5x LoD, you need to test the next lower concentration (i.e., 0.25x LoD). You will test in this manner until you find the lowest concentration that gives you 5/5 positive results for the tested RT-PCR instrument. This concentration should be used for a confirmatory LoD study for the given RT-PCR instrument using 20 replicates.

Final reported LoD: Please list all RT-PCR instruments with their respective LoDs if different LoDs are obtained. LoDs are considered comparable if they are between 1-3xLoD. These studies should be repeated for each clinical matrix claimed in the Intended Use.

- Interference Substances Studies (if applicable): Pick one extraction method and RT-PCR instrument combination, preferably the one with the worst overall LoD (if one or more of the RT-PCR instruments has a different LoD).

- Inclusivity Testing: For the inclusivity testing, pick one extraction method and RT-PCR instrument combination, preferably the one with the worst overall LoD (if one or more of the RT-PCR instruments has a different LoD).

- Exclusivity Testing: For exclusivity, you can perform this study using any extraction/instrument combination.

- Clinical study: If equivalency of the RT-PCR instruments is shown in an LoD study that tests and confirms that the LoD is the same or very similar for all of the RT-PCR instruments (between 2-3xLoD), then you can pick one RT-PCR instrument for your clinical study provided that the RT-PCR instruments in question are known to FDA for other *in vitro* diagnostic devices. If you find that one or more RT-PCR instruments machines has/have a different LoD, you should pick the extraction method / RT-PCR instrument combination with the worst LoD.

Note, if there are differences in the extraction input volume, extraction elution volume

AMERICAN OVERSIGHT

and PCR input volume (extracted nucleic acid) then the LoD should be confirmed, for each.

**Subject:** RE: Pre-EUA IVD template request

Dear Jill,

Thank you very much for reaching out to us about the test you have validated at Wadsworth Center, NYS Department of Health it was very nice to chat with you. As discussed please find attached the current EUA Interactive Review Template draft for molecular-based assays for the detection of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) [formally - 2019-novel coronavirus (2019-nCoV)]. I suggest the first step is to populate this draft template with the validation information and data that you currently have about your device and sent it back to us for review as a Pre-EUA submission (to be sent to the Document Control Center). The Pre-EUA review is an interactive process, so we will provide feedback after receiving and reviewing the information provided. The draft review template is a shared "work-in-progress" document which you will populate with information and data as obtained and which we will review and provide feedback to you. **Please make sure to capture in the EUA review template that you performed the validation using the SIGMA primer/probes sets, sensitivity was evaluated with the positive control material provided in the CDC EUA test kit and that validation studies were performed used the commercial primer/probe materials using the CDC EUA Protocol (please be sure to include information the extraction method and instrument used).**

AMERICAN OVERSIGHT

I have also attached a draft cover letter you can use to submit your Pre-EUA for detection of SARS-CoV-2 to FDA (it includes the address for the Document Control Center). Please include in your Pre-EUA submission package:

- The populated EUA Review Template draft
- FDA Form 3514 (https://www.fda.gov/downloads/AboutFDA/ReportsManualsForms/Forms/UCM080872.pdf) - under Section A (type of submission) please check "other" and specify Pre-EUA; please also complete Sections B, C, F and G. For G please use the information provided in this link: https://www.accessdata.fda.gov/scripts/cdrh/cfdocs/cfPCD/classification.cfm?id=3669.

One hard copy of the signed EUA Cover Letter and one electronic copy (CD or thumb drive) of you Pre-EUA submission package should be enclosed in your Pre-EUA submission package mailed to FDA (recommend FedEx). In addition to mailing your Pre-EUA package to FDA we also request that you submit the package to the review division via electronic mail (including the EUA Review Template in MS word) to myself Kim.Sapsford@fda.hhs.gov, as well as carbon copying (cc:) the following email addresses:

- Division Director: Dr Uwe Scherf, email address: Uwe.Scherf@fda.hhs.gov;
- Branch Chief: Dr Tamara Feldblyum, email address: Tamara.Feldblyum@fda.hhs.gov

Please let me know if you have ANY questions I am happy to assist if you are not sure about certain sections in the template.

Best regards

Kim

AMERICAN OVERSIGHT

AMERICAN SOCIETY FOR MICROBIOLOGY

February 28, 2020

The Honorable Stephen M. Hahn, MD
Commissioner
U.S. Food and Drug Administration
10903 New Hampshire Ave.
Silver Spring, MD 20993

Dear Commissioner Hahn:

On behalf of the American Society for Microbiology (ASM), we are writing to express concerns about the effects that current regulations under the FDA Emergency Use Authorization (EUA) are having on the use of diagnostic tests by clinical laboratories. Specifically, under the current EUA in place as a result of the COVID-19 outbreak, laboratory developed tests (LDTs) created outside the CDC and public health labs may not be performed in clinical settings.

We respectfully ask that you consider adjustments to the regulations to allow clinical laboratories to have access to the test assay from CDC **in addition to** the public health laboratories. Clinical laboratories follow a rigorous process for validation and implementation of laboratory-developed tests. If this pathway was considered during an outbreak, it would allow for a more rapid response to implementation of diagnostic testing. Many clinical laboratories have already validated high-complexity LDTs for SARS-CoV-2 and could begin testing tomorrow, but cannot do so due to the FDA EUA process. Testing is overseen by board-certified doctoral-level directors of clinical laboratories that are routinely inspected and certified to perform CLIA high-complexity testing. While we appreciate that the intent of the EUA is to safeguard the public and ensure tests are safe and effective early in outbreaks, the EUA process is proving a hindrance to rapid identification of potential COVID-19 infections. If we have tests that are safe and effective that cannot be used, this can put people at risk.

The regulatory process under the EUA is significantly more stringent than that required for other viral tests in CLIA-certified clinical laboratories. The current CDC test for COVID-19 remains the only test available with EUA status, and it has not been made available to hospital laboratories. This creates undue pressure on both the CDC and state public health labs to rapidly scale manufacturing and clinical testing. As a result, turnaround time may slow, which will present significant challenges should the number of infected individuals, or suspected infections, dramatically increase here in the United States.

Because COVID19 poses a major threat to the public health of the United States, diagnostic testing for the virus causing COVID19 (SARS-CoV-2) is an essential component of our nation's response to the current outbreak. In this situation, rapid identification of cases is critical. This is due to several factors, including the need to make appropriate patient management decisions and the need to curb further spread of the disease. The widespread availability of diagnostic testing enables rapid identification of infected individuals so they can be quickly isolated to prevent onward transmission of the virus and protect healthcare personnel. Furthermore, when patient is considered a "suspect" COVID-19 case, the healthcare providers and laboratories often manage the case differently than they normally would. This could include deferring or not performing certain procedures, which would have normally been done to diagnose, treat, or stabilize a patient. This alteration of the normal protocol is done to keep healthcare

AMERICAN OVERSIGHT

and laboratory staff safe, and to help prevent the spread of disease. However, it can have a negative impact on the patient's outcome.

ASM's membership includes clinical microbiologists working in all laboratory settings, from community hospitals, to academic medical centers, to public health labs, all of whom are on the front lines in addressing COVID-19 and other infectious diseases at the point of care. We recognize that this is a complex, rapidly evolving situation. While we believe the policies are well-intentioned, the regulations are creating significant barriers to patient care at this time.

We appreciate your consideration of our concerns, and we look forward to working with you to address these challenges with an eye toward the long-term, including considering what legislative changes may be necessary to improve our response to a future outbreak. If we can be of further assistance, please contact Allen Segal, ASM Director of Public Policy and Advocacy, at asegal@asmusa.org or 202-942-9294.

Sincerely,

Robin Patel, MD

Dear Dr. Hahn, Dr. Abernethy, and Dr. Shuren,

The American Society for Microbiology is one of the largest professional societies dedicated to the life sciences and is composed of 30,000 scientists and health practitioners, including clinical microbiologists and laboratory professionals. ASM's mission is to promote and advance the microbial sciences. We thank you for your leadership during this COVID-19 outbreak.

Attached is a letter from our leadership expressing our concerns about challenges that the current EUA is presenting to clinical labs and their ability to test for the virus. We appreciate your consideration of our views, and we look forward to working with you.

Best,

Mary Lee Watts, MPH, RD

AMERICAN OVERSIGHT

NEW YORK STATE OF OPPORTUNITY. Department of Health

**ANDREW M. CUOMO**
Governor

**HOWARD A. ZUCKER, M.D., J.D.**
Commissioner

**SALLY DRESLIN, M.S., R.N.**
Executive Deputy Commissioner

February 25, 2020

Stephen M. Hahn, M.D.
Commissioner of Food and Drugs
Food and Drug Administration
10903 New Hampshire Avenue
Silver Spring, MD 20993-0002

Dear Commissioner Hahn,

As the New York State Commissioner of Health, I am very concerned that the lack of diagnostic testing outside of the labs of the Centers for Disease Control and Prevention places New York in an unacceptably vulnerable situation in light of the COVID-19 outbreak that is rapidly expanding to several other countries including South Korea, Iran and Italy. While CDC has worked diligently to provide select public health labs with the testing kits to allow for expanded lab capacity, we are now several weeks into the response, and manufacturing problems continue. While CDC works to provide a diagnostic assay to public health labs under the current Emergency Use Authorization (EUA), New York State has independently worked to develop and validate a diagnostic assay using the CDC protocol.

To address the current urgent situation, I am hereby requesting that FDA approve the New York State Public Health Laboratory, Wadsworth Center, and the New York City Public Health Laboratory to implement their own laboratory developed test (LDT) for the detection of the COVID-19 virus, SARS-CoV2, outside of the current EUA process. Wadsworth Center and the NYC Public Health Laboratory have already developed and validated a test, modeled after the CDC test, (b) (4)

Upon FDA approval, Wadsworth Center and the NYC Public Health Laboratory can quickly begin testing all specimens from persons under investigation in New York State and potentially other states in the northeast region in order to be responsive to the rapidly escalating public health crisis. In their role as reference laboratories, Wadsworth Center and the NYC Public Health Laboratory already have a tremendous amount of experience in the development and implementation of LDTs for the molecular detection of a wide range of microbial pathogens. Wadsworth Center is also an approved third-party reviewer for FDA for laboratory developed tests. In addition, LDTs developed for offering in New York State, including at Wadsworth Center and the NYC Public Health Laboratory, must be reviewed and approved by New York's Clinical Laboratory Evaluation Program, CLEP, before they can be implemented in the laboratory.

AMERICAN OVERSIGHT

New York State and New York City are eager to expand testing capacity to allow for sentinel surveillance and potentially testing of an expanded group of individuals with symptoms and a travel history to recently impacted countries. I look forward to discussing this request with you and your staff as soon as possible.

Sincerely,

Howard Zucker M.D.

Howard A. Zucker, M.D., J.D.
Commissioner of Health

**Subject:** IDT provides 2019-nCoV Kits that include the CDC 2019-nCoV/SARS-CoV-2 published assays in individual tubes

Tim, Ellen, Jeff,

Based on the attached information it looks like that the CDC primer is commercially available at IDT Integrated Technology:

# 2019-nCoV CDC qPCR Probe Assays

IDT provides 2019-nCoV Kits that include the CDC 2019-nCoV/SARS-CoV-2 published assays in individual tubes. Three of the primer/probe sets in this panel target different locations on the 2019-nCoV/SARS-CoV-2 Nucleocapsid gene (N-gene). These 3 primer/probe sets must be run concurrently with the internal control (4th assay), which targets the human RNase P gene. Altogether, there are 4 qPCR assays per patient sample.

Components are premixed to the CDC recommended working concentration and delivered in IDTE, pH 7.5. Stocked kits are available in 3 reaction sizes of 50, 100, and 500 reactions, with custom sizes available (see section below. Kits are shipped within 1–2 business days at ambient temperature.

**Subject:** IDT's 2019-Novel Coronavirus (2019-nCoV) Real-Time Reverse Transcriptase (RT)-PCR Diagnostic Panel - Regulatory Discretion

Dear Wendi,

Integrated DNA Technologies (IDT) developed a 2019-Novel Coronavirus (2019-nCoV) Real-Time Reverse Transcriptase (RT)-PCR Diagnostic Panel for the presumptive qualitative detection of nucleic acid from the 2019-nCoV in upper and lower respiratory specimens (such as nasopharyngeal or oropharyngeal swabs, sputum, lower respiratory tract aspirates, bronchoalveolar lavage, and nasopharyngeal wash/aspirate or nasal aspirate) using the CDC protocol and N1, N2, and N3 primers. CDC has generated data indicating that this panel may be effective in the detection of SARS-CoV-2, and CDC and FDA have worked interactively in connection with FDA's review of the data.

Given our understanding of the facts and the public health concerns at issue here: that there is currently limited national testing capability to detect SARS-CoV-2 to respond to this emergency; significant public health concerns are presented by the infectious disease; and the proposed testing may help to prevent the spread of the infectious disease COVID-19. Based on this understanding, at this time, FDA does not intend to object to the distribution of 2019-nCoV Kit to laboratories, once each lot is qualified by the CDC, with the condition that CDC will act promptly to submit a new or amended EUA to authorize the testing described above.

Jeff

**Subject:** Language consideration for expedited EUA process
**Importance:** High

Dear Drs. Stenzel and Jernigan,

We appreciate your work on rolling out an expedited approach for laboratories interested in pursuing Emergency Use Authorization of tests developed in their laboratories. We think this is an important step in expanding testing capacity in the United States. We would like to put forward two points for you to consider as you are developing guidance on this process in case they have not already been considered.

1. Please consider including language on requiring rapid notification of positive results to public health agencies to assure appropriate public health steps are taken to mitigate spread of disease.
2. Consider limiting use of EUA assays made available through the expedited EUA process to individuals who meet CDC criteria for testing, as has been required in other public health emergencies.

We applaud your efforts to identify pathways to expand testing capacity more quickly and look forward to working with you on how to move forward.

Jill,

I wanted to let you know that today we announced a policy that would allow appropriate laboratories that are certified to perform high-complexity testing consistent with requirements under CLIA develop, validate, and use SARS-CoV-2 tests if they notify FDA and submit an EUA request within 15 days of the notification. Other conditions are described in the

AMERICAN OVERSIGHT

guidance we posted on our website today. Our intent is to more quickly increase the national capability for testing while assuring accurate and reliable tests are being used.

Because you have already notified us, you can proceed with patient testing. Please see the guidance for additional details. If you have any questions or there is anything we can do to help, I, Uwe, or Tim would be happy to discuss. (Kim is currently out of the office.)

Our press release and guidance can be found at the following:

Jeff,

From the data we have the South Korea device is not an established technology and is not sensitive. The same technology came in for Ebola and Zika and we did not authorize this deceive at the time either.

Could not connect the German companies due to the time zone or Co-Diagnostics yet, but got the following feedback for the rapid diagnostic test:

Charles is collaborating with Mammoth Biosciences (Jennifer Doudna) to develop a SARS-CoV-2 diagnostic assay using a CRISPR-based diagnostic platform. (Link to white paper)

- The assay has been validated with IVT material (CDC positive control; N gene fragment) and 2 patient samples
- The assay can use extracted RNA as input or direct from specimen (currently focused on NP swabs)
- Assay relies on an isothermal amplification (RT-LAMP) of template (using CDC and WHO primers and validated protocols) followed by CRISPR/Cas12 mediated detection (indirect fluorescent reporter)
- Targets:
  - N-gene (SARS-CoV-2 specific)
  - E-gene (SARS-CoV, bat-SARS-like-CoV, and SARS-CoV-2 coronavirus)
  - Human RNase P (human sample control)
- Detection currently uses a visually read lateral flow strip with 30 minute sample to result
- Also developing a higher throughput format (96-well fluorescent plate read) also working to develop into a cartridge format
- LoD (b) (4) copies stated on the phone, but the white paper states (b) (4) copies/ul input vs. CDC 5-15 copies
- Working with California Department of Public Health
- They appear to be focused on POCT

AMERICAN OVERSIGHT

- ***Current limiting factor is access to patient samples, extracted viral RNA, or inactivated virus
- FDA offered to provide extracted viral RNA

**Subject:** RE: Public health labs press FDA to allow homegrown coronavirus tests

Updated story:

Public health laboratories urged the FDA on Monday to permit them to create their own tests for the coronavirus, after problems with a diagnostic developed by CDC prevented its widespread rollout.

FDA typically allows "laboratory developed tests" — which are designed, manufactured and used within a single lab — to be used without close regulatory scrutiny. But the agency requires labs to submit such tests for review during health emergencies to prevent harm from false or misleading results from compounding a crisis. The coronavirus does not appear to be an exception.

"No test should be used without being validated," FDA spokesperson Stephanie Caccomo said. "In the context of a public health emergency, false results can lead to significant adverse public health consequences."

The FDA has traditionally shied away from allowing the use of LDTs in emergency situations. In 2016, the agency sent a letter to two Houston hospitals that created an LDT to rapidly detect the Zika virus, expressing concern that the agency had not reviewed the "high-risk" test.

AMERICAN OVERSIGHT

But Association of Public Health Laboratories Executive Director Scott Becker said that the coronavirus requires a different approach. The virus is spreading in multiple countries, and the CDC's efforts to expand testing capability beyond its labs have run into trouble.

Only five state and local public health labs — in California, Nebraska, Illinois, Nevada and Tennessee — have verified the CDC diagnostic for use since the FDA approved it on an emergency basis on Feb. 4, he said.

APHL hopes to work with FDA to develop a policy that allows some labs to market a LDT without submitting it for FDA review, Becker told POLITICO — adding that it doesn't make sense for more than 100 labs to file individual emergency use authority applications.

"We believe a more expeditious route is needed at this time," Becker and Grace Kubin, director of the Laboratory Services Section at the Texas Department of State Health Services, wrote to FDA Commissioner Stephen Hahn on Monday.

"What we're suggesting is that public health labs be viewed as a group to do this," Becker told POLITICO. "It isn't every lab on their own — we would want to do this in a network sort of fashion. We could also enable confirmation at another public health laboratory to ensure confidence."

The letter says that labs could work together towards a standard protocol, purchase reagents and supplies from a common source and recommend a minimum standard approach for validating test results.

Caccomo says that the FDA is working with more than 70 test developers on products for the virus. The agency can complete reviews for such tests in as little as one day, she added — ensuring that it is effective and meets the minimum standards for emergency use.

The FDA said the statute's emergency provisions "establish a lower bar to market compared to conventional premarket pathways — namely that the test may be effective — but still requires a sufficient level of validation even in the context of the emergency."

Some major hospitals are also starting to develop LDTs for coronavirus screening, but are concerned that FDA rules do not permit them to actually start testing patients, according to Michael Mina, associate medical director of molecular diagnostics at Brigham and Women's Hospital.

"We're actually trying to get our test up and running, even though we don't know if we'll be able to use it," Mina said. "I know that Mass General Hospital is also thinking about doing something very similar. I presume all the major academic hospitals are at least considering it."

The American Clinical Laboratory Association, which represents large commercial labs like LabCorp and Quest Diagnostics, declined to comment on whether LDTs should be used to help increase the country's capacity to screen for the coronavirus. Historically, the lab industry trade lobby has maintained LDTs are not medical devices and subject to FDA regulation.

I just spoke to David—he's going to add this part of what we sent him back into the story:

AMERICAN OVERSIGHT

The EUA provisions of the statute establish a lower bar to market compared to conventional premarket pathways – namely that the test may be effective - but still requires a sufficient level of validation even in the context of the emergency

**Subject:** FW: Public health labs press FDA to allow homegrown coronavirus tests
**Importance:** High

FYI – here is the piece from POLITICO below re public health labs and COVID-19 tests. I've highlighted several items of note. I've also attached the letter from APHL to FDA for anyone who has not seen it yet. APHL is advocating for enforcement discretion and that public health laboratories work together on utilizing a standard protocol, purchasing reagents from a common source, utilizing a standard validation panel, etc.

Note that the Grace Kubin, the Director of the Laboratory Services Section of the Texas Department of State Health Service, has cosigned with the CEO of APHL.

Also note that Brigham and Women's is saying they, Mass General, and other hospitals are developing tests but FDA's rules will not permit testing.

Best,

Jennifer

**Public health labs press FDA to allow homegrown coronavirus tests**

By David Lim

02/24/2020 07:15 PM EST

Public health laboratories urged the FDA on Monday to permit them to create their own tests for the coronavirus, after problems with a diagnostic developed by CDC prevented its widespread rollout.

FDA typically allows "laboratory developed tests" — which are designed, manufactured and used within a single lab — to be used without close regulatory scrutiny. But the agency requires labs to submit such tests for review during health emergencies to prevent harm from false or misleading results from compounding a crisis. The coronavirus does not appear to be an exception.

"No test should be used without being validated," FDA spokesperson Stephanie Caccomo said. "In the context of a public health emergency, false results can lead to significant adverse public health consequences."

The FDA has traditionally shied away from allowing the use of LDTs in emergency situations. In 2016, the agency sent a letter to two Houston hospitals that created an LDT to rapidly detect the Zika virus, expressing concern that the agency had not reviewed the "high-risk" test.

But Association of Public Health Laboratories Executive Director Scott Becker said that the coronavirus requires a different approach. The virus is spreading in multiple countries, and the CDC's efforts to expand testing capability beyond its labs have run into trouble.

Only five state and local public health labs — in California, Nebraska, Illinois, Nevada and Tennessee — have verified the CDC diagnostic for use since the FDA approved it on an emergency basis on Feb. 4, he said.

APHL hopes to work with FDA to develop a policy that allows some labs to market a LDT without submitting it for FDA review, Becker told POLITICO — adding that it doesn't make sense for more than 100 labs to file individual emergency use authority applications.

"We believe a more expeditious route is needed at this time," Becker and Grace Kubin, director of the Laboratory Services Section at the Texas Department of State Health Services, wrote to FDA Commissioner Stephen Hahn on Monday.

" What we're suggesting is that public health labs be viewed as a group to do this," Becker told POLITICO. "It isn't every lab on their own — we would want to do this in a network sort of fashion. We could also enable confirmation at another public health laboratory to ensure confidence."

The letter says that labs could work together towards a standard protocol, purchase reagents and supplies from a common source and recommend a minimum standard approach for validating test results.

Caccomo says that the FDA is working with more than 70 test developers on products for the virus. The agency

AMERICAN OVERSIGHT

can complete reviews for such tests in as little as one day, she added — ensuring that it is effective and meets the minimum standards for emergency use.

Some major hospitals are also starting to develop LDTs for coronavirus screening, but are concerned that FDA rules do not permit them to actually start testing patients, according to Michael Mina, associate medical director of molecular diagnostics at Brigham and Women's Hospital.

"We're actually trying to get our test up and running, even though we don't know if we'll be able to use it," Mina said. "I know that Mass General Hospital is also thinking about doing something very similar. I presume all the major academic hospitals are at least considering it."

The American Clinical Laboratory Association, which represents large commercial labs like LabCorp and Quest Diagnostics, declined to comment on whether LDTs should be used to help increase the country's capacity to screen for the coronavirus. Historically, the lab industry trade lobby has maintained LDTs are not medical devices and subject to FDA regulation.

**Subject:** RE: NYS Wadsworth Center COVID-19 Test

Hi Dan, Thanks for the quick call this morning. A simple email to the FDA/me stating "Yes, The New York State Wadsworth Center can reference the data in the CDC's 2019 nCoV EUA application" is sufficient for the FDA's review purposes that should lead to a quick EUA authorization for Wadworth's EUA, as early as this afternoon. Therefore, this is obviously an urgent matter.

Best,

**Subject:** RE: NYS Wadsworth Center COVID-19 Test

Hi Dan and Wendi,

This right of reference is important to get this and additional assays based on the CDC through the EUA process quickly. The other two companies we discussed today will be similar.

I believe a simple email stating "Yes, The New York State Wadsworth Center can reference the data in the CDC 2019 nCoV EUA application".

Hope this helps.

Thanks in advance!

Best,
Tim

**Subject:** NYS Wadsworth Center COVID-19 Test
**Importance:** High

Wendi, Dan, Laura,

NYS Wadsworth Center submitted an EUA request to us this afternoon for a test that uses the CDC protocol but only for N1/N2 (consistent with the CDC test currently subject to enforcement discretion). To support their EUA, Wadsworth conducted a bridging study that demonstrates performance similar to CDC's N1/N2 test. We know their performance is comparable because we have seen CDC's data but Wadsworth has not. **Would CDC allow Wadsworth to have a right of reference to its data, under which does not get access to the data but can reference it in support of their EUA?** Wadsworth has one more test to perform, which if it looks good, we would otherwise grant the EUA.

Thanks,
Uwe

Peter,

Thank you for the heads up. It's up to the company as to what it wants to say about developing/validating a test. You are welcome to say that you have been work with the FDA.

On that note, is there anything you need from us or anything we can do for Thermo Fisher to facilitate development/validation/EUA for a COVID-19 diagnostic?

Best regards,

Jeff

AMERICAN OVERSIGHT

# EMERGENCY USE AUTHORIZATION (EUA)

## EUA INTERACTIVE REVIEW TEMPLATE FOR MOLECULAR-BASED SINGLE TARGET TESTS FOR 2019 NOVEL CORONAVIRUS (2019-nCoV)

## GENERAL INFORMATION ABOUT THIS TEMPLATE

- Text highlighted in yellow *[Text]* should be completed by the IVD developer (sponsor) as applicable to their specific test. Text in **bold** outlines the Food and Drug Administration (FDA) suggestions and clarifications for the sponsors' consideration when completing the required information in a specific section.

- This is a EUA interactive review template for Pre-EUA/EUA submissions concerning molecular-based single target tests for detection of 2019 Novel Coronavirus (2019-nCoV), Wuhan, China. If you are developing a multiplex molecular-based assay for the detection and differentiation of nucleic acids from a panel of microorganisms, please review Appendix A for FDA recommendations.

- This is a EUA interactive review template for Pre-EUA/EUA submissions and not a guidance document. The template is subject to change as we learn more about the 2019-nCoV disease and its risk-benefit profile. Recipients will receive notice and updated templates as they become available.

- This EUA interactive review template is an FDA internal document and any proprietary information provided within the template and during the interactive review process will remain confidential as it does in a regular FDA premarket submission.

- Feedback provided by FDA during the interactive review of your pre-EUA/EUA is subject to change as we learn more about the 2019-nCoV disease and the risk-benefit profile evolves to address unmet public health needs.

- Prior to a potential authorization FDA will require developers of molecular-based tests to assess traceability of their test to an FDA-recommended reference material panel if available at the time. Specific details about the traceability study and the FDA-recommended reference material panel will be provided by the Lead Reviewer assigned to the Pre-EUA submission once the analytical and clinical evaluation data has been reviewed and found to be acceptable.

- Please be reminded that tests for the detection of 2019-nCoV or 2019-nCoV infection must not be distributed and/or used for clinical diagnoses without premarket clearance, approval, or EUA by the FDA. Clinical samples for 2019-nCoV testing should be sent to the appropriate public health laboratories until the IVD device subject of this Pre-EUA submission has received authorization from the FDA.

- Clinical specimens may be required to support the EUA request. Furthermore, please note that applicable regulations for human subject protection do apply under the

AMERICAN OVERSIGHT

EUA. Please refer to the Clinical Evaluation section of this document for more details.

- If authorized, the EUA means that this 2019-nCoV IVD is temporarily authorized for use until the public health emergency is terminated or the EUA is revoked by the FDA.

    - FDA recommends that you consider registration and listing your EUA product once you have been issued an EUA. If this is problematic, please notify the Agency during your Pre-EUA.
    - The EUA is not a pathway to permanent marketing of your device. Therefore, we strongly recommend that you consider, in addition to an EUA, a traditional premarket submission for your IVD so that your device can still be legally marketed after termination of the emergency declaration. We recommend that you identify as soon as possible in the Pre-EUA review process any consideration of moving your product forward towards De Novo/510(k) clearance. If so some of our feedback to you may take such a long-term goal into consideration in order to prevent additional testing where it may not be needed. Therefore, please consider submitting a Pre-Submission to inquire what studies would be required for a premarket approval/ clearance of your 2019-nCoV IVD. Details on how to submit a Pre-Submission to the Agency are outlined in the FDA guidance document: *Requests for Feedback and Meetings for Medical Device Submissions: The Q-Submission Program.* https://www.fda.gov/regulatory-information/search-fda-guidance-documents/requests-feedback-and-meetings-medical-device-submissions-q-submission-program

## A. EXECUTIVE SUMMARY (as of X/XX/20XX)

## B. PURPOSE FOR SUBMISSION

Emergency Use Authorization (EUA) request for distribution and/or use of the ***[test name]*** to ***[indicate labs, if applicable]*** for the *in vitro* qualitative detection of RNA from the 2019-nCoV in ***[add all claimed specimen types, e.g., nasopharyngeal/oropharyngeal swabs, sputa, BAL, stool, and serum, etc.]*** from patients who meet CDC 2019-nCoV clinical criteria (e.g., signs and symptoms associated with 2019-nCoV infection) and CDC novel coronavirus epidemiological criteria (e.g., history of residence in or travel to a geographic region with active 2019-nCoV transmission at the time of travel, or other epidemiologic criteria for which 2019-nCoV testing may be indicated) to aid in the diagnosis of 2019-nCoV infection.

## C. MEASURAND

AMERICAN OVERSIGHT

Specific nucleic acid sequences from the genome of the 2019-nCoV **[*please specify the targeted gene(s) of the pathogen*]**.

## D. APPLICANT

***[Official name, address and contact information of applicant]***

## E. PROPRIETARY AND ESTABLISHED NAMES

Proprietary Name - ***[test name]***
Established Name - ***[test name]***

## F. REGULATORY INFORMATION

***Approval/Clearance Status:***
The ***[test name]*** test is not cleared, CLIA waived, approved, or subject to an approved investigational device exemption.

***Product Code:***
[XXX – FDA will complete]

## G. PROPOSED INTENDED USE

***1) Intended Use:***
**The proposed IU will be finalized based on the data and recommendations from Public Health authorities at the time of authorization – example text is provided below for a qualitative molecular test that detects organism RNA but may be adapted according to the specific emergency situation addressed by the device.**

[***Test name***] is a [***specify test technology such as, real-time RT-PCR test***] intended for the qualitative detection of nucleic acid from the 2019-nCoV in [***describe all the specimen types***] from individuals meeting CDC 2019-nCoV clinical criteria (e.g., clinical signs and symptoms associated with 2019-nCoV infection) in conjunction with CDC 2019-nCoV epidemiological criteria (e.g., history of residence in or travel to a geographic region with active 2019-nCoV transmission at the time of travel, or other epidemiologic criteria for which 2019-nCoV testing may be indicated). Testing is limited to [***laboratories - certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA), 42 U.S.C. §263a, to perform high complexity tests, or by similarly qualified non-U.S. laboratories***].

Results are for the identification of 2019-nCoV RNA. The 2019-nCoV RNA is generally detectable in **[*name specimen type*]** during the acute phase of infection. Positive results

AMERICAN OVERSIGHT

are indicative of active infection. Laboratories within the United States and its territories are required to report all positive results to the appropriate public health authorities.

Negative results do not preclude 2019-nCoV infection and should not be used as the sole basis for patient management decisions. Negative results must be combined with clinical observations, patient history, and epidemiological information.

The ***[test name]*** is intended for use by **[*include intended user, e.g., trained clinical laboratory personnel specifically instructed and trained in the techniques of real-time PCR and in vitro diagnostic procedures*]**. The ***[test name]*** is only for use under the Food and Drug Administration's Emergency Use Authorization.

***2) Special Conditions for Use Statements:***

For prescription use only
For in vitro diagnostic use only

***3) Special Instrument Requirements:***

The ***[test name]*** test is to be used with the [***list all RT-PCR Instruments, software requirements, automated extraction instruments***].

## H. DEVICE DESCRIPTION AND TEST PRINCIPLE

**Example text has been added under each of the sub-headings below for a fluorescence based rRT-PCR test for detection of organism RNA. If a different test principle is used by the test for the detection of a specific analyte please modify the description accordingly to capture the salient points in each of the sub-headings below. Please note that for new investigative technologies FDA may request additional detailed information so we can adequately assess the risks and benefits associated with the device.**

***1) Product Overview/Test Principle:***

**Describe the technology of the test and how this technology works to identify the measurand, the instruments employed/required to perform the test from sample collection to result (include all claimed extraction and PCR detection instruments), and the specimen types for which you claim to have specific performance characteristics as described below. If applicable, list all primer and probe sets and briefly describe what they detect. Please include the nucleic acid sequences for all primers and probes used in the test. Please indicate if the test uses biotin-Streptavidin/avidin chemistry in any of the steps for coupling reagents. Please note that an alignment with available reference genomes for different strains of the target pathogen is requested as part of the inclusivity evaluation (Section N).**

The ***[test name]*** is a real-time reverse transcription polymerase chain reaction (rRT - PCR) test. The 2019-nCoV primer and probe set(s) is designed to detect RNA from

AMERICAN OVERSIGHT

the 2019-nCoV in ***[list all the specimens]*** from patients who meet CDC 2019-nCoV clinical criteria (e.g., signs and symptoms associated 2019-nCoV infection) in conjunction with CDC 2019-nCoV epidemiological criteria (e.g., history of residence in or travel to a geographic region with active 2019-nCoV transmission at the time of travel, or other epidemiologic criteria for which 2019-nCoV testing may be indicated).

2) ***Description of Test Steps:***

**List and describe in detail all the steps of the test sequentially from specimen collection to detection.**

Nucleic acids are isolated and purified from ***[specimens]*** using ***[please describe the method(s) of extraction (please specify the specimen input volume for extraction and/or test, the nucleic acid elution volume and whether isolation/purification is manual and/or automated)].*** The purified nucleic acid is reverse transcribed using ***[enzyme mix/kits – please specify the input volume of purified nucleic acid added to the rRT-PCR reaction mix]*** into cDNA which is then subsequently amplified in ***[please describe the instrument(s) and enzyme mix]***. In the process, the probe anneals to a specific target sequence located between the forward and reverse primers. During the extension phase of the PCR cycle, the 5' nuclease activity of Taq polymerase degrades the probe, causing the reporter dye to separate from the quencher dye, generating a fluorescent signal. With each cycle, additional reporter dye molecules are cleaved from their respective probes, increasing the fluorescence intensity. Fluorescence intensity is monitored at each PCR cycle by ***[please describe the detection instrument(s)]***.

3) ***Control Material(s) to be Used with [test name]:***

**List all control materials (provided with the test kit and/or required but not provided with the test kit and describe what they are, how they are expected to work, where in the testing process they are used, and the frequency of use. If a control is commercially available, provide supplier's name and catalog number or other identifier; if your device relies on external controls that are manufactured by a third party please note that these controls should also be validated within your analytical and clinical studies described below in Section (N).**

Controls that will be provided with the test kit include:

a) A "no template" (negative) control is needed to ***[describe need]*** and is used ***[describe use – please also specify frequency of use]***

b) A positive template control is needed to ***[describe need]*** and is used ***[describe use – please specify the concentration of the positive control relative to the LoD of your test (note that ideally the positive control concentration should be such that it is close to the LoD of your test) and also specify frequency of use]***

AMERICAN OVERSIGHT

c) An extraction control ***[describe control]*** is needed to ***[describe need]*** and is used ***[describe use – please also specify frequency of use].*** **Please note that if the no template control and positive control, are taken through the entire sample processing procedure, including the extraction, then a separate extraction control is not required**.

d) An internal control ***[describe control]*** is needed to ***[describe need]*** and is used ***[describe use]***.

Controls that are required but not provided with the test kit include ***[describe control – provide recommended sources of the control materials – either a separate control kit for purchase that you the applicant develops or a control material that can be purchased from a third party].*** This/these control(s) is/are needed to ***[describe need]*** and is used ***[describe use – please also specify frequency of use]***.

**Please note that any control recommended to be used with your device (provided with the kit or not) needs to be validated in the context of your analytical and clinical study (i.e., you will need to run these controls as part of your studies). In instances where control material is not readily available through 3rd party vendors (which is often the case at the beginning of an outbreak) FDA may request that you include suitable control material with your device. Please note that external control materials are considered particularly important in the context of EUA devices because often GMP requirements for the manufacture of the EUA device are waived in emergency situations and reagent stability studies are limited. Hence the external controls offer some assurance of EUA test performance in the hands of the end user.**

## I. INTERPRETATION OF RESULTS

All test controls should be examined prior to interpretation of patient results. If the controls are not valid, the patient results cannot be interpreted. **Please describe if a Ct cutoff is used as part of your testing algorithm and/or if the end user is required to review fluorescent curves for weakly positive samples before final interpretation. Although not typical for molecular-based tests, if the test result involves the use of an algorithm/calculation, for example a ratio value, when determining the final patient test result, please include a detailed description and any additional calibration materials that may be required.**

1) ***[Test name] Controls – Positive, Negative and Internal***

**Describe in detail the expected results generated, including acceptance criteria, for all the controls described in detail in Section H above. Describe the measured values (if applicable) for valid and invalid controls and outline the recommended actions the laboratory should take in the event of an invalid control result.**

AMERICAN OVERSIGHT

2) ***Examination and Interpretation of Patient Specimen Results:***

**Describe when clinical specimen test results should be assessed and outline the criteria for test validity**. **Example text**: Assessment of clinical specimen test results should be performed after the positive and negative controls have been examined and determined to be valid and acceptable. If the controls are not valid, the patient results cannot be interpreted.

**Clearly indicate how to interpret numeric test values (if applicable) as positive or negative for presence of the 2019-nCoV. Indicate if the end user is required to review fluorescent curves for weakly positive samples before final interpretation and how to identify indeterminate/inconclusive results (if they exist) results and how the user should resolve them, e.g. if repeat testing may be required.**

**When applicable, provide a table clearly describing the possible combinations of test result values for each primer/probe set, and how they should be combined into a final interpretation of the result for your test. If the test produces result that will be used as part of a CDC recommended testing algorithm, please indicate what follow-up testing/process should be conducted, if applicable.**

## J. PRODUCT MANUFACTURING

**Please note that if you are developing a test for use at a single site (i.e., a laboratory developed test LDT), some of the information requested in this section may not be applicable. Please contact FDA for additional guidance for an emergency use LDT.**

The ***[test name]*** has been validated using only the components referenced in this submission and shall not be changed without prior concurrence from the FDA.

*1)* ***Overview of Manufacturing and Distribution:***

The product will be manufactured at [***manufacturer's name and FDA registration number (if applicable) or laboratory name if an LDT***] by [***manufacturer name, or laboratory name if an LDT***] personnel consistent with practices for the production of **[*types of devices*]** based on [***type of quality system****]. Material manufactured by [***manufacturer's name, or laboratory name if an LDT***] may be bottled and kitted by [***packager name***] manufacturing facility.

***Under the Emergency Use Authorization (EUA) most of the 21 CFR 820 Quality System Regulation (QSR) requirements can be waived for the duration of the EUA. FDA expects that developers follow comparable practices as much as possible and may consider previous compliance history when determining whether or not to waive certain QSR requirements for a specific product. Please note adverse events, as per 21 CFR Part 803, have to be reported for authorized devices (see Section R).**

AMERICAN OVERSIGHT

The current manufacturing capabilities include the ability to manufacture approximately **[*please insert the approximate number of units/products that can currently be manufactured per week at the manufacturing facility*]** products per week, however in the event of a surge in demand this could be increased to **[*please insert the approximate maximum number of units/products that could potentially be manufactured per week at the manufacturing facility if there was a surge in demand*]** product per week within a **[*please specify in weeks/months the expected timeframe required to increase product production if required*]** timeframe.

The product will be distributed by **[*please describe the distribution plan for the product and list all current distributors*]**.

2) ***Components Included with the Test***

Components manufactured by [***manufacturer's name and FDA registration number (if applicable)***] and supplied with the test include:
**List all components and reagents provided for your test, including a description of the primers and probes, volumes, concentrations, quantities, buffer components, etc.**

3) ***Components Required But Not Included with the Test***

Components required but not included with the test:
**List all components and reagents not included with the test that must be supplied by the user to perform the test, with specific supplier names and catalog numbers or other identifiers for obtaining these components and reagents. Please include here all specific consumables that were validated for use with your device, that are not interchangeable with other products and that are needed to guarantee device performance as established in the EUA validation studies listed in Section N below.**

4) ***Testing Capabilities***

**Briefly describe current sample throughput capacity, total time required to perform the test (from clinical specimen collection, specimen transport to result), and number of tests that can be performed per instrument run and per day.**

5) ***Reagent Stability:***

**Briefly describe stability test plan for *[test name]* reagents and include any accelerated stability information if available. Please note that reagent stability studies do not need to be completed at the time of EUA issuance, however the study design should be agreed upon during interactive review and the stability studies started immediately following authorization, if not before. When designing your stability study, we have some general recommendations that are outlined in Appendix B, for your consideration.**

AMERICAN OVERSIGHT

## K. PERFORMANCE EVALUATION

**If you plan to claim multiple target analytes to aid in differential diagnosis or you plan to claim multiple RT-PCR instruments and/or extraction methods, please refer to Appendix A and C, respectively, more information. Please note that any omission of a requested study in this document should be documented and justified.**

### *1) Analytical Sensitivity:*

a) *Limit of Detection (LoD):* **You should determine the LoD of the device utilizing the entire test system from sample preparation to detection for each clinical matrix claimed. Please note that claims for additional anticoagulants, for blood specimens, can be supported by a matrix equivalency study as outlined in Section N, subsection 3 below. The LoD is determined using dilutions of live propagated and titered 2019-nCoV stocks (CFU/mL or PFU/mL) spiked into a relevant clinical matrix. If wild-type virus is not available at the time of your validation studies, please contact FDA to discuss a potential alternative. Please note that if available please also provide Genomic Equivalent Copies (GEC)/mL units for the stock solutions used and include an explanation on how they were determined. Please note that LoD studies should be performed with live organisms, as described above. If you plan to use inactivated organism in your LoD determination you should describe how the material was inactivated and perform a study to determine whether the inactivation process impacted the LoD of the device.**

**First a tentative LoD must be established through limiting dilutions of the prepared material with 3-5 replicate measurements. Please note for all the analytical studies described in Section N that require replicate testing, one replicate equates to one independent extraction and PCR detection. Once a tentative LoD is established, the LoD should be confirmed by preparing at least 20 additional replicates at the LoD concentration and demonstrating that the organism was detected with a minimum 95% positivity (19/20). If this confirmatory study achieves a positivity of 100%, then a lower concentration needs to be tested (with 20 replicates) until <100% positivity is obtained.**

**Please use the following format when submitting LoD information and data:**

LoD studies determine the lowest detectable concentration of 2019-nCoV at which approximately 95% of all (true positive) replicates test positive. The LoD was determined by limiting dilution studies using characterized samples.

**List/describe the following in this section:**

- **Titers and strains of the 2019-nCoV stocks used for the LoD study and describe how the organism stocks were prepared and how the titers were determined.**

AMERICAN OVERSIGHT

- **The dilution factor and number of serial dilutions of the characterized 2019-nCoV that were tested to determine the LoD for each primer and probe set.**
- **The nucleic acid extraction/purification method.**
- **The real time PCR instrument.**

Serial dilutions of the characterized 2019-nCoV were then tested in **[*number of replicates (i.e., recommend that sample is extracted independently three-five times and each extraction tested once)*]** replicates. The lowest concentration at which all [***number of replicates***] replicates were positive was treated as the tentative LoD for each test. The LoD of each test was then confirmed by testing [***number of replicates (at least 20 recommended)***] with concentrations at the tentative limit of detection. The final LoD of each test was determined to be the lowest concentration resulting in positive detection of [***number of positive replicates (at least 19 out of 20 replicates)***]. [***Include analysis of LoD results, indicating the final LoD for each test***]

**Tentative LoD: [*Please provide a summary of the data for each strain tested]* example table 2019-nCoV stocks is provided below:**

| 2019-nCoV Strain Tested | Stock 2019-nCoV Titer | Serial 10-Fold Dilution Factor | Concentration in Dilution Tested [Include Units] | Replicate 1 $C_t$ | Replicate 2 $C_t$ | Replicate 3 $C_t$ | Replicate 4 $C_t$ | Replicate 5 $C_t$ | Call Rate | Lowest Concentration with Uniform Positivity per Analyte | Limit of Detection (LoD) per Virus Strain |
|---|---|---|---|---|---|---|---|---|---|---|---|
| ***Example:*** *[analyte]* | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |

b) FDA Sensitivity Evaluation: The analytical sensitivity of the test has to be further assessed by evaluating an FDA-recommended reference material using an FDA developed protocol if applicable and/or when available. Details will be provided during the Pre-EUA interactive review.

c) *Reactivity/Inclusivity:* Reactivity of the ***[test name]*** was evaluated for additional isolates of 2019-nCoV.

**Reactivity: *[test name]* example table below**

| 2019-nCoV Strain/Isolate | Source/Sample Type* | Concentration | Ct** |
|---|---|---|---|
| | | | |
| | | | |
| | | | |

AMERICAN OVERSIGHT

| | | | |
|---|---|---|---|
| | | | |

***Please list source of material used for wet testing and sample type tested (i.e., organism – live or inactivated, purified nucleic acid – whole genome etc.).**
**** If your technology does not produce Ct values, please include instead the signal output for your specific device technology.**

**At a minimum, the strain used in your LoD evaluation should be listed here (multiple isolates of the same 2019-nCoV strain that was used for the LoD studies can also be included if available). If additional isolates are not available at the time of your validation studies, please discuss with FDA. Each isolate should be tested at or near the LoD (no more than 3x LOD) of the test, spiked into clinical matrix utilizing the entire test system, including extraction. If you plan to claim more than one type of clinical matrix, we recommend that you perform this study in the most challenging clinical matrix, testing a minimum of 3 replicates. In addition, the wet testing should be accompanied by extensive inclusivity *in silico* analysis of the test primer and probes with all known strains/isolates (past/present) of 2019-nCoV (including the strain/isolate used for wet testing).**

## 2) *Analytical Specificity:*

a) *Cross-Reactivity:* Cross-reactivity of the ***[test name]*** was evaluated using both *in silico* analysis and by testing whole organisms **[*pathogen*]** (concentration) or purified nucleic acid from other ***[describe organisms]*** (concentration/reaction).

**Cross-Reactivity: *[test name]* example table for wet tested organisms below**

| Virus/Bacteria/Parasite | Strain | Source/ Sample type | Concentration | Ct Values* |
|---|---|---|---|---|
| | | | | |
| | | | | |
| | | | | |

***If your technology does not produce Ct values, please include instead the signal output for your specific device technology.**

**Cross-reactivity studies are preformed to demonstrate that the test does not react with related pathogens, high prevalence disease agents and normal or pathogenic flora that are reasonably likely to be encountered in the clinical specimen. The FDA Tables 1 and 2, below are intended to recommend simulate testing of patients having infections with organisms which cause similar symptoms to those observed at the onset of 2019-nCoV infection. The FDA Tables also include other organisms and strains which have significant genetic similarity and therefore a higher likelihood of cross-reacting with 2019-nCoV specific reagents. Also included in the FDA Tables are recommended unclaimed organisms/strains which are likely to be endemic to the currently affected area should be included in cross-reactivity testing since these organisms/strains will be an important aspect of the differential diagnosis of 2019-nCoV infection.**

AMERICAN OVERSIGHT

**FDA Table 1 Cross-Reactivity: List of Organisms to be wet-tested and analyzed *in silico* (for tests detecting 2019-nCoV) in respiratory material or blood specimens**

| Other high priority pathogens from the same genetic family | High priority organisms likely in the circulating area |
|---|---|
| Human coronavirus 229E | Adenovirus (e.g. C1 Ad. 71) |
| Human coronavirus OC43 | Human Metapneumovirus (hMPV) |
| Human coronavirus HKU1 | Parainfluenza virus 1-4 |
| Human coronavirus NL63 | Influenza A |
| SARS-coronavirus | Influenza B |
| MERS-coronavirus | Enterovirus (e.g. EV68) |
| | Respiratory syncytial virus |
| | Rhinovirus |
| | *Chlamydia pneumonia* |
| | *Haemophilus influenzae* |
| | *Legionella pneumophila* |
| | *Mycobacterium tuberculosis* |
| | *Streptococus pneumonia* |
| | *Streptococcus pyogenes* |
| | *Bordetella pertussis* |
| | *Mycoplasma pneumoniae* |
| | *Pneumocystis jirovecii* (PJP) |
| | Pooled human nasal wash - *to represent diverse microbial flora in the human respiratory tract* |
| | |

**FDA Table 2 Cross-Reactivity: List of Organisms to be analyzed *in silico* (for tests detecting 2019-nCoV) in respiratory material or blood specimens:**

| Other high priority pathogens from the same genetic family | High priority organisms, including organisms commonly found in the clinical matrix |
|---|---|
| | Influenza C |
| | Parechovirus |
| | *Candida albicans* |
| | *Corynebacterium diphtheriae* |
| | *Legionella non-pneumophila* |
| | *Bacillus anthracis* (Anthrax) |
| | *Moraxella catarrhalis* |
| | *Neisseria elongate and meningitidis* |
| | *Pseudomonas aeruginosa* |
| | *Staphylococcus epidermis* |
| | *Staphylococcus salivarius* |
| | *Leptospirosis* |

AMERICAN OVERSIGHT

| | |
|---|---|
| | *Chlamydia psittaci* |
| | *Coxiella burnetii (Q-Fever)* |
| | *Streptococcus aureus* |
| | |

***In silico*** **analysis should be performed on all potentially cross-reactive organisms outlined in the FDA Tables 1 and 2 above. You should provide the result summary of the *in silico* blast analysis (tabular format) evaluating whether there is any significant amplification of non-target sequences that could either result is cross-reactivity or potentially interfere with the detectability of the actual target analyte. As such we are asking that you provide individual blast results (non-truncated alignments) for each of the primers and probes used in your device with potential cross-reacting organisms. Please provide for our review the percent sequence homology for each organism relative to the target analyte primers/probes in your test. Please use the example table below when presenting the results of *in silico* analysis in your submission:**

**Results of *In Silico* Analysis**

| Pathogen | Strain | GenBank Acc# | % Homology Test FP (i.e. 0-100%) | % Homology Test RP | % Homology Test Probe |
|---|---|---|---|---|---|
| | | | | | |
| | | | | | |

**The analysis should include multiple representative strains from GenBank for each organism. If *in silico* analysis reveals other potential cross-reactants (i.e., ≥80% homology between one of your primers or the probe to any of the sequences of listed potential cross reactants), you should carefully review the alignments and determine based on the positions of the homologous stretches and mismatches if additional cross-reactivity and/or interference (please refer to item b below – microbial interference studies) wet testing will be required to rule out cross-reactivity or interference of that organism that may affect the performance of your device. In these circumstances if wet-testing is omitted you should include an explanation as to why *in silico* generated data is not clinically relevant (irrelevant isolate, location/extent of match within primer/probe, etc.), or why the performance of your test would not be impacted.**

**Organisms in FDA Table 1 should be wet tested in addition to the *in silico* analysis. Omissions from wet-testing should be discussed with FDA and supported by a well-documented justification that includes a due diligence attempt to obtain the live or inactivated organisms (and/or purified nucleic acid – which is acceptable for cross reactivity evaluation for an EUA).**

AMERICAN OVERSIGHT

**The wet testing evaluation should reflect test specimens prepared at the highest clinically relevant level of organism (i.e., a minimum of $10^6$ CFU/ml or higher for bacteria and $10^5$ $TCID_{50}$/mL or PFU/ml or higher for viruses) and should be tested with a minimum of three replicates per organism test specimen. Test specimens can be prepared by spiking cultured isolates/inactivated organisms/ purified nucleic acids (whole genome) into negative clinical matrix and determining cross reactivity based on triplicate replicates. If you plan to claim more than one type of clinical matrix, please note that if significant differences in LoD are observed for the different clinical matrices this may warrant this study being performed in more than one clinical matrix.**

**If you plan to claim non-blood or non-respiratory clinical specimen types for diagnostic use with your device, e.g., stool specimens, etc., please consult FDA for more information on additional organisms that may be recommended for cross-reactivity testing, common examples are provided below for stool specimens (FDA Table 3):**

**FDA Table 3: Organisms to be analyzed for non-blood clinical specimens:**

| **Stool** |
|---|
| *Escherichia coli* |
| *Lactobacillus* |
| *Bacillus* spp. |
| *Clostridium* Spp. |
| *Enterobacter* |
| *Enterococcus* |
| Fusobacterium |
| Bacteroidetes |
| Bifidobacterium |
| Ruminococcus |
| |

b) *Microbial Interference Studies:* **If *in silico* analysis reveals ≥ 80% homology between the cross-reactivity microorganisms and your test primers/ probe(s), we recommend that you either perform (1) a microbial interference study with 2019-nCoV and the microorganisms that your test primers/ probe(s) have homology to, (2) as an alternative to the microbial interference study, you may provide justification as to why (e.g., amount of primer(s)/ probe(s) included in your master mix) the performance of your test would not be impacted by the presence of a causative agent of a clinically significant co-infection, or (3) explain why the *in silico* results are clinically irrelevant. In the case of the microbial interference study, interference should be evaluated using samples spiked at a low 2019-nCoV concentration, at 3x LoD, and a high interferent level (either microorganisms or nucleic acids purified from them), to represent the worst-case scenario, with a minimum of 3 replicates. If you plan to claim more than**

AMERICAN OVERSIGHT

**one type of blood clinical matrix, please note that if significant differences in LoD are observed for the different clinical matrices this may warrant this study being performed in more than one clinical matrix. If the LoDs are similar in the blood clinical matrices the study should be performed in the most challenging matrix, i.e., whole blood. In addition, if you are claiming blood and non-blood clinical specimens you may be required to perform this study in more than one clinical matrix. If interference is observed at the level tested, an additional titration study should be performed to determine the highest microorganism interferent level the 2019-nCoV test can tolerate.**

**c)** *Endogenous Interference Substances Studies*: **The extent of testing for endogenous interference substances depends on the matrix that is claimed for the device as well as on the technology of the device, e.g., if a nucleic extraction procedure is performed prior to testing or not. For EUA we do not typically ask for interference studies for tests that use conventional PCR and/or well-established extraction methods prior to testing (e.g., Boom method and column-based extraction methods).**

**For extraction procedures that are new or for nucleic acid-based technologies that are different from conventional PCR (e.g., various isothermal methods), we expect testing of potential interferents. The impact of interfering substances should be evaluated over the expected clinical range of the potentially interfering substance. Potential sources of endogenous interference include, but are not limited to, the ones listed in the tables below. It is important to note that the evaluation of interference and the generation of false negative results should be done using samples containing the analyte at or near the LoD and should not exceed 3x LoD. You should test a minimum of 3 replicates per substance. If you plan to claim more than one type of clinical matrix, please note that if significant differences in LoD are observed between the different clinical matrices this may warrant this study being performed in more than one clinical matrix. Biotin interference poses a risk to laboratory tests that incorporate the free biotin-streptavidin capture method. Therefore, please review this safety communication https://www.fda.gov/medical-devices/safety-communications/fda-warns-biotin-may-interfere-lab-tests-fda-safety-communication and the following DRAFT guidance - Testing for Biotin Interference in In Vitro Diagnostic Devices (Web view) to determine if biotin interference testing may be warranted for your device. We also recommend you consult with FDA prior to initiating biotin interference testing, if applicable.**

**The tables below indicate the potentially interfering substances that may be found in blood and respiratory specimens. For other non-blood specimen types, such as stool, the list of substances could be expanded – please consult with FDA.**

**Interfering Substances: *[test name]* Example table below for evaluation of interfering substances for the ability to generate false *positive* results:**

AMERICAN OVERSIGHT

| Potential Interfering Substance | Concentration | Results (Detected X/3) |
|---|---|---|
| **Respiratory Specimens** | | |
| Mucin: bovine submaxillary gland, type I-S | | |
| Blood (human) | | |
| Nasal sprays or drops | | |
| Nasal corticosteroids | | |
| Nasal gel | | |
| FluMist | | |
| Homeopathic allergy relief medicine | | |
| Throat lozenges, oral anesthetic and analgesic | | |
| Anti-viral drugs | | |
| Antibiotic, nasal ointment | | |
| Antibacterial, systemic | | |
| **Blood Specimens** | | |
| Hemoglobin | 10 mg/mL* | |
| Bilirubin Conjugated | 0.4 mg/mL* | |
| Bilirubin Unconjugated | 0.4 mg/mL* | |
| Serum proteins (e.g., Human Serum Albumin) | 60 mg/mL* | |
| Triglycerides | 15 mg/mL* | |
| Cholesterol | 4 mg/mL* | |
| Human Anti-mouse Antibody (HAMA) | 800 ng/mL* | |
| Rheumatoid Factor | 2000 IU/mL* | |

*Taken from the recently-updated 3rd edition of CLSI guideline EP07, Interference Testing in Clinical Chemistry (Section 3.4.2) which now defers to CLSI EP37, Supplemental Tables for Interference Testing in Clinical Chemistry for the recommended concentrations for testing common endogenous substances (Table 2) and have subsequently updated a number of the recommended testing concentrations.

**Interfering Substances: *[test name]* Example table below for evaluation of interfering substances for the ability to generate false *negative* results:**

| Potential Interfering Substance | Concentration* | Viral Strain Level (In multiples of LoD) | Results (Detected X/3) |

*Taken from the recently-updated 3rd edition of CLSI guideline EP07, Interference Testing in Clinical Chemistry (Section 3.4.2) which now defers to CLSI EP37, Supplemental Tables for Interference Testing in Clinical Chemistry for the recommended concentrations for testing common endogenous substances (Table 2) and have subsequently updated a number of the recommended testing concentrations.

### 3) *Matrix Equivalency (if applicable):*

**A matrix equivalency study may be used to support certain specimen type claims that were not evaluated during the clinical study (e.g., serum versus plasma, use of different anticoagulants, use of difference swab types or viral transport media, etc.). Please note that LoD and clinical specificity studies are required for all claimed matrices. The matrix in which the clinical studies are conducted is the comparator. All other matrices are to be shown to be equivalent to the comparator matrix. We request a minimum of 40 paired samples each obtained from individual persons; negative (10 samples), low positive (1.5-2xLoD, 20 samples), and moderate positive (5-10xLoD, 10 samples) samples should be tested. Positive samples are prepared by spiking paired negative clinical matrix with the same amount of target analyte. Please note that individual (and not pooled) samples should be used in this study.**

### 4) *Comparative Limit of Detection (LoD) of the Test vs. the Comparator Method:*

**A comparative LoD study may be required to support use of a comparator method in your clinical evaluation that has not been validated with a specific specimen type. The comparative LoD study should be conducted testing the same dilution series using both, your test and the comparator you chose in parallel (to dilution endpoints for both tests), 3-5 replicates per dilution level are sufficient for this study.**

AMERICAN OVERSIGHT

5) ***Specimen Stability and Fresh-frozen Testing:***

**A specimen stability study may be required to support specimen stability claims in the instructions for use outside of those typically outlined in CSLI standards. A fresh/frozen and/or freeze/thaw study may be required to support the use of frozen specimens if they are used as part of the clinical evaluation. Please consult with FDA concerning an appropriate study design prior to initiating any studies.**

6) ***Clinical Evaluation:***

**This section should describe the clinical study used to evaluate the performance of your test. Please note that the exact requirements for the clinical evaluation will be very dependent on, access to 2019-nCoV disease clinical specimens at the time of the studies and the nature of the emergency. Our general clinical study evaluation recommendations for respiratory and serum clinical specimens are outlined below. If you are interested in claiming additional specimen types, for example, stool, please contact FDA for current recommendations. Please note these clinical study recommendations may be subject to change as we continue to learn about the 2019-nCoV disease or as the risk benefit analysis changes.**

**The clinical performance in general should be evaluated for each unique claimed clinical specimen type - with the exception of claims that can be supported by a matrix equivalency study (outlined in Section 3 above). The performance characteristics should ideally be established using a clinical study with a limited number of prospective samples. If a prospective study is not feasible, an acceptable alternative would be to test retrospectively collected 2019-nCoV nucleic acid negative and positive specimens from patients, accompanied by some basic information such as, the specimen collection date, date of onset of symptoms (if present/known), tests used to identify 2019-nCoV nucleic acid positive specimens, etc. Depending on the nature of the disease, if no prospective or retrospective specimens are available at the time of your pre-EUA submission for the 2019-nCoV disease we may accept a fully contrived clinical evaluation. The clinical evaluation should be comprised of a minimum of 100 negative individually collected specimens and 50 individual positive specimens (prospective, retrospective and/or contrived). Use of pooled specimens are not acceptable for the clinical evaluation of your test. Please see FDA Table 5 for more details. Please note that if a fully contrived clinical study is used to support your Pre-EUA submission, additional clinical testing of a limited number of natural clinical positive specimens and potentially negative specimens from the endemic region, if available, may be required at the time when this Pre-EUA transitions to an EUA as a result of an Emergency declaration for 2019-nCoV disease.**

AMERICAN OVERSIGHT

## FDA Table 5: Clinical study Recommendations:

| Details | Study Including Prospective/ Retrospective Specimens | Fully Contrived Sample Study |
|---|---|---|
| Minimum Number of Positive Specimens | 50<br><br>The number of natural (prospective/retrospective) positive clinical specimens should be at least 25 (collected from symptomatic patients in the 2019-nCoV disease endemic region(s)) and, if necessary, may be supplemented with contrived samples to generate the total of 50 positive specimens. Contrived samples should be prepared as described in the fully contrived sample study column. | 50<br><br>The contrived positive samples should be made in individual negative clinical matrix collected from subjects from a non-endemic population (pooled matrix is not acceptable for the clinical evaluation). Please note that the negative clinical matrix used for spiking should be confirmed negative by your test device prior to spiking. Half of the contrived positive samples can be prepared by spiking the 2019-nCoV at LoD and the remaining contrived positive samples should cover the range of the test up to and not higher than 5 x LoD.<br><br>Negative respiratory specimens: Can be archived/retrospective samples collected from US patients with signs and symptoms of respiratory infection.<br><br>Negative blood specimens: Can be collected from healthy subjects from non-endemic areas. |
| Minimum Number of Negative Specimens | 100<br><br>Note: In general, for EUA the 100 individual negative samples can be collected from; (1) archived/retrospective samples collected from US patients with signs and symptoms of respiratory infection for respiratory specimens, and (2) healthy subjects from non-endemic areas for blood specimens, that are "expected 2019-nCoV disease negative". Note these negative specimens can be used to also prepare any contrived positive specimens used in support of the clinical evaluation of the test.<br><br>Please note this recommendation is dependent on the current outbreak situation and is subject to change as we learn more about the 2019-nCoV disease/outbreak. If the outbreak situation for 2019-nCoV disease is primarily outside of the continental U.S. (OUS) it may be beneficial to consider collecting negative specimens that represent 50% endemic and 50% non-endemic regions. If negative specimens are collected from the endemic region of the 2019-nCoV disease these should be tested with the same comparator chosen for the positive specimens (more details provided below). For non-endemic collected specimens you can compare to the expected "negative" result. | |
| Recommended Comparator Method | Positive: Positive percent agreement should be calculated in comparison to a EUA PCR test (please see the following website for the most recent list of FDA authorized 2019-nCoV | Positive: Compare to expected result.<br><br>Negative: See Minimum Number of Negative Specimens row |

AMERICAN OVERSIGHT

| | | |
|---|---|---|
| for percent agreement performance calculations | tests: https://www.fda.gov/MedicalDevices/Safety/EmergencySituations/ucm161496.htm. If no EUA test available at the time of your EUA submission, please consult with FDA about your choice of comparator method – which ideally should be a well validated PCR test with comparable sensitivity to your subject device. Please note that a well validated PCR test should include evaluation of the tests LoD, inclusivity, exclusivity, interference and any clinical testing.<br><br>Negative: See Minimum Number of Negative Specimens row | |
| Comparator Method Note 1 | Please note when using natural clinical specimens, the comparator method must be validated for the specimen type claimed – if not you should perform a Comparative Limit of Detection (LoD) of the Test vs. the Comparator Method study, as explained above (Section 4), to support its use as a comparator method in your clinical study. | N/A |
| Comparator Method Note 2 | Any occurrences of false results should be investigated with an additional validated PCR test and/or targeted sequencing, and the results of the discordant analysis can be footnoted in your final performance table but cannot be used to change the final performance calculations. | |
| Natural Clinical Specimens IRB/Informed Consent Note | For clinical specimens collected to support the EUA request, please note that sample collection needs to adhere to all applicable rules of human subject protection; as such, sample collection needs IRB approval, which includes review of the informed consent forms. Samples need to be collected with informed consent. If leftover de-identified samples are used, FDA exercises enforcement discretion regarding the informed consent requirement if the specimen collection meets the criteria described in the FDA Guidance on Informed Consent for In Vitro Diagnostic Device Studies Using Leftover Human Specimens that are Not Individually Identifiable (http://www.fda.gov/cdrh/oivd/guidance/1588.pdf).<br>**Note that IRB approval is still required even if leftover de-identified samples are used in your study.** | |
| Additional Studies Warning | N/A | If fully contrived samples were used in your Pre-EUA submission, additional testing of natural clinical specimens may be requested, if available, to support transition of the Pre-EUA to EUA as a result of an Emergency declaration. |
| Testing Approach Note 1 | Please note all clinical specimens (natural and contrived) should be evaluated in accordance with your proposed diagnostic algorithm, including retesting when appropriate. We understand the limited nature of natural specimens may preclude retesting. In instances were retesting is indicated but not performed, for the purposed of performance evaluation, initial results will be analyzed for performance and equivocal/indeterminate results count against your final performance. | |
| Testing Approach Note 2 | Specimens should be tested in a blinded fashion, e.g., positive and negative samples should be mixed and blinded to the end user, end user should also be blinded to the results of any comparator method testing. | |

AMERICAN OVERSIGHT

**When you describe your clinical study please indicate/include:**

- **How the specimens were generated/collect/sourced**
- **If the study was fully prospective, mix of prospective, retrospective and/or contrived or fully contrived**
- **The rationale for the concentrations/specimens selected (if using contrived or 3-party sourced specimens)**
- **The total number of specimens tested**
- **The specimen types (clinical matrix)**
- **A summary of the study results**

**In the case of real-time PCR tests, please provide the line data in an Excel file as part of the Pre-EUA submission for each specimen (please indicate for each specimen if it was prospective, retrospective or contrived and the clinical matrix it represents); the data should include the $C_T$ values (for the specimen and the controls) and call/result for your device and, in the case of the natural clinical specimens, the comparator method results should be included as well.**

## L. UNMET NEED ADDRESSED BY THE PRODUCT

**This section will be finalized by FDA based on the state of the emergency at the time of authorization and based on recommendations from Public Health authorities at that time. Example text is provided below but may be adapted according to the specific emergency situation that is addressed by the device and the need at the specific time of the outbreak.**

[Outline background of pathogen, disease and current outbreak]

[Outline details of the disease such as the following:

- likely sources of transmission
- likely symptoms – if any
- Prevalence of symptomatic disease (what fraction of infection results in symptomatic disease)]

Laboratories in the United States are in need of diagnostic tools for use in the 2019-nCoV emergency for rapid diagnosis of acute 2019-nCoV infection.

A public health emergency has been declared by the Secretary of Health and Human Services (HHS) on [Month Day, YEAR] justifying the authorization of emergency use of *in vitro* diagnostic tests for detection of 2019-nCoV and/or diagnosis of 2019-nCoV infection.

The ***[test name]*** can augment clinically important laboratory evidence for individuals with active infection. The 2019-nCoV nucleic acid is generally detectable in [name

AMERICAN OVERSIGHT

specimen type] during the acute phase of infection (approximately [7] days following onset of symptoms, if present) [and possibly for longer in other specimen types].

Under emergency use authorization (EUA), ***[applicant name]*** plans to distribute the test or accept sample for testing with the ***[test name]*** for the detection of nucleic acid from 2019-nCoV in clinical specimens collected from individuals meeting CDC's 2019-nCoV clinical and/or epidemiological criteria. This EUA request for the ***[test name]*** is intended to expand domestic readiness within the United States and its territories by expanding diagnostic testing capabilities for 2019-nCoV during public health emergency.

FDA consulted with subject matter experts within HHS on the public health needs for diagnostic devices to detect 2019-nCoV nucleic acid. It is FDA's conclusion that there currently exists a public health need for such devices, i.e., that there is no adequate, approved (cleared), and available alternative to the ***[test name]*** for 2019-nCoV detection during the public health emergency.

## M. APPROVED/CLEARED ALTERNATIVE PRODUCTS

Currently no methods for the detection of the 2019-nCoV have been approved/ cleared by FDA.

## N. RISKS AND BENEFITS:

**The Risks and Benefits section should be updated according to your specific device, some example language is given below but should be tailored to the device and the disease.**

Risks

The ***[test name]*** has been designed to minimize the likelihood of false test results. However, should false results occur, they may present risks to patients:

- False positive result:
  - A false positive 2019-nCoV result could [***update based on the pathogen***].
  - A false positive result in the context of the current public health emergency could lead to misallocation of resources used for surveillance and prevention.
  - A false positive result could delay correct diagnosis and initiation of appropriate treatment for the actual cause of patient illness.
- False negative result:
  - Although a negative result does not rule out 2019-nCoV infection, a false negative has the potential to result in initiation of inappropriate treatment and a delay in correct diagnosis.
  - A false negative result can trigger a waste of health care resources, as additional evaluations are pursued in the effort to establish the true diagnosis.
  - A false negative results can contribute to further spread of the disease.

Benefits

AMERICAN OVERSIGHT

The primary benefit of distributing the ***[test name]*** for clinical use is that it provides a relatively fast diagnostic method for symptomatic patients, which enables faster intervention.

- True positive test results provide support for the diagnosis of a 2019-nCoV infection. The results can be used in conjunction with clinical and epidemiological information to guide patient management.
- Distribution of the factsheets can help healthcare professionals and the public learn more about 2019-nCoV disease and how to avoid acquiring it.

Risk Assessment

- Negative results may not preclude a 2019-nCoV infection. It is emphasized that the ***[test name]*** should not be used as the sole basis for treatment or other patient management decisions. The clinical features of the illness and the type and risk of exposure must be considered pivotal to making patient management decisions. A negative test should not be interpreted as definitive, if other aspects of the patient's clinical presentation or recent epidemiologic exposures indicate such is likely, and diagnostic tests for other diseases are negative.
- False negative results due to failure of PCR are minimized by the presence of controls that monitor nucleic acid extraction and PCR efficiency.
- Risk of patient discomfort or harm during sample collection is minimal.

Risk-Benefit Assessment

The risks posed by use of the ***[test name]*** are mitigated by:

- Use of the ***[test name]*** in conjunction with other laboratory, epidemiological, and clinical evaluation tools
- Distribution of Healthcare Provider and Patient fact sheets.
- Post-market studies/reporting or conditions of Authorization.

Based on these factors, the potential benefits from the use of the ***[test name]*** are expected to outweigh the risks.

## O. FACT SHEET FOR HEALTHCARE PROVIDERS AND PATIENTS:

**Include proposed Fact Sheets for Patients and Healthcare Providers**

## P. INSTRUCTIONS FOR USE/ PROPOSED LABELING/PACKAGE INSERT:

**Include Instructions for Use, Box Labels, Vial Labels and any other proposed labeling.**

## Q. RECORD KEEPING AND REPORTING INFORMATION TO FDA:

AMERICAN OVERSIGHT

[***Manufacturer name***] will track adverse events and report to FDA under 21 CFR Part 803. A website is available to report on adverse events, and this website is referenced in the Fact Sheet for Health Care providers as well as through the [***Manufacturer name***] Product Support website: [***Include link to Website***]. Each report of an adverse event will be processed according to [***Manufacturer name]***'s Non-Conformance Reporting Requirements, and Medical Device Reports will be filed with the FDA as required. Through a process of inventory control, [***Manufacturer name]*** will also maintain records of device usage/purchase. [***Manufacturer name]*** will collect information on the performance of the test, and report to FDA any suspected occurrence of false positive or false negative results of which [***Manufacturer name]*** becomes aware. [***Manufacturer name]*** will maintain records associated with this EUA and ensure these records are maintained until notified by FDA. Such records will be made available to FDA for inspection upon request.

## R. ADMINISTRATIVE INFORMATION:

**Interactive Review Log:** Please use the table below to document interactive review with FDA and include interactions initiated by either FDA or yourself

| **Date** | **Type of Interaction** (phone/ email/ formal submission-DCC) | **Brief Description** (e.g., questions asked/ feedback from FDA received / any word documents included) |
|---|---|---|
| [X] | [X] | [X] |
| | | |
| | | |

## S. FDA ADMINISTRATIVE INFORMATION:

**This section will be finalized by the FDA Lead Reviewer upon completion of the review process and documents the interactive review of this submission and any conclusions resulting from the interactive review.**

1) **Summary of Interactive Review – Lead Reviewer to use this section to highlight any major issues solved during interactive review.**
2) **Final Conclusions for Interactive Review -** It is FDA's conclusion that there currently exists a public health need for such devices, i.e., that there is no adequate, approved (cleared), and available alternative to the ***[test name]*** for [pathogen] detection during the public health emergency. **Conclusion should include an outline the unique features of the device compared to currently issued EUA's under the declaration, if applicable.**
3) **Upon competition of this section the Lead Reviewer should also sign this document and save the file as the final Decision Memorandum.**

AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

## APPENDIX A – Multiplex Panels Under EUA:

An emergency declaration by the HHS Secretary is typically specific for a pathogen/disease (i.e., there is a publicly declared health emergency involving a particular etiologic agent). Therefore, the EUA pathway is only applicable for testing patients with signs/symptoms/risk of exposure for that single agent in a given emergency. FDA has occasionally allowed limited additional target pathogens to be claimed for EUA devices, but panel members must be relevant to the event/disease outbreak subject of the specific emergency declaration. When determining whether to issue an EUA for a multiplex panel FDA takes into consideration the utility of the test (multiplex pathogen detection as an aid in differential diagnosis), clearance/approval status of IVDs for the other panel members, whether the proposed Intended Use fits within the HHS emergency declaration and the how the multiplex panel would fit into current public health authority patient testing algorithm recommendations. We recommend you contact FDA for specific feedback if you plan to claim multiple target analytes as part of your EUA test. If it is determined that a multiplex test is beneficial to the emergency response, please note that analytical and clinical evaluations for each of the target analytes will be required.

## APPENDIX B – General Study Design Recommendations for Reagent Stability:

- For EUAs you may follow the current FDA recognized CLSI Standard EP25 – Evaluation of Stability of In Vitro Diagnostic Reagents; Approved Guideline when evaluating the suitability of stability study designs. If you are planning to pursue a De Novo/510(k) for your device we recommend discussing in more detail your stability design to facilitate potential use of the EUA data in your regular premarket submission.
- Please note that use of only the positive controls is not acceptable for reagent stability evaluation because controls are usually formulated at a moderate positive level. For all the stability evaluations in addition to your external positive and negative controls and the no-template control you should include for the EUA evaluation at least one sample, that should be prepared by spiking negative clinical matrix at an analyte concentration of 3-5xLoD.
- If you are claiming multiple blood clinical specimen types in which similar LoDs are determined, you should use the most challenging clinical matrix for this study.
- Please note we typically recommend your stability study design includes the evaluation of at least 5 replicates. You should also evaluate, if available, 3 different lots of reagents.
- You should design your study to provide data for a timeframe that is about 10% longer than the one to be claimed – for example; a claim of 18 months should be supported by stability data out to 20 months and a claim of 7 days should include stability data out to 8 days.
- FDA considers 15-30°C to represent room temperature conditions. Ideally you should evaluate stability at both 15°C and 30°C, however, for the purposes of the EUA evaluation at 30°C is acceptable as the worse-case scenario.
- Shelf-Life Stability- Unopened kit:
    - You should evaluate real-time kit stability studies with unopened kits stored at the claimed storage temperature for your test.

AMERICAN OVERSIGHT

  - Accelerated stability evaluations for unopened kits is acceptable for EUA submissions while the real-time studies are on-going. However, please note real-time stability data is required to support regular pre-market submissions and for the final claim of an EUA.
- Shipping Stability - Unopened kit: Study should evaluate the anticipated handling and shipping times and temperatures expected for unopened kits.
- In-use/Opened Kit Stability: Depending on your device your stability study design should also support in-use stability of the kit reagents once the kit has been opened, e.g., storage at 2-8 $^{o}$C for 7 days. This includes on board stability once reagents have been placed on the instrument (if applicable).
- Inverted stability (if applicable): Study should support inverted stability for of kits.
- Freeze-thaw Stability: If you recommend aliquoting the reagents to meet the end-users needs following the initial thaw this recommendation should be supported by a freeze-thaw stability study, including the specific number of allowed freeze-thaw cycles.
- FDA analysis recommendations for real time stability studies are as follows:
  - Baseline of the study (t=0 of stability study) should not exceed a month from bottling
  - Clear baselines should be described (e.g., a month from bottling) for each stability claim under each study
  - Claims should be determined based on regression analysis. Any %change (%shift) from time zero (baseline) should be calculated between the target claim and the zero-time as (Ttest-Tbaseline)/ Tbaseline*100 with 95%CI using the regression equation obtained from plotting the mean values. When formulating your acceptance criteria for evaluating the shift from baseline you should consider the reproducibility of your device. However, generally, that the shift at the target claim due to storage cannot exceed 10-15%. The target stability is the next to last tested point that was within +/- 10% of time zero.
  - Acceptance criterion may be different, depending on the test samples analyte concentration distribution in the intended use population and the risk, in other words, the impact of false results to public health.

**APPENDIX C – Claiming Multiple Instruments and/or Extraction Methods:**

If you wish to claim multiple instruments and/or extraction methods for use with your test, please review the study recommendations provided below and contact FDA for any additional feedback. Please note that these analytical and clinical evaluation recommendations are based on the assumption that the elution volumes from the extraction methods and PCR volumes on the different RT-PCR instruments are identical.

- Limit of Detection (LoD): Please note that these studies should be repeated for each clinical matrix claimed in the Intended Use. Pick one RT-PCR instrument and determine the tentative LoD (using 5 replicates in 10-fold dilution) followed by the confirmatory LoD (20 replicates spiked at tentative LoD) for each extraction method on the chosen instrument. Note: If you detect 20/20 replicates in your confirmatory LOD study you should test the next lower concentration, using a 3-fold dilution, until

AMERICAN OVERSIGHT

you achieve a hit rate of <20/20.

- If the different extraction methods yield the same LoD (≤3xLOD) on the RT-PCR instrument chosen for initial testing, pick one extraction method for further LoD determination on the remaining RT-PCR instruments and follow the recommendations below.
- If the extraction methods do not yield the same LoD on the chosen RT-PCR instrument, please choose the extraction method with the worst LoD for further comparison of the LoD on all RT-PCR instruments.

For all other RT-PCR instruments you should use the following adaptive LoD study design:

- Please perform a refined tentative LoD study with 5 replicates at 0.5x, 1x, and 1.5 to 2x LoD. If you detect 4/5 replicates as positive at all the tested levels, you need to include the next higher concentration (i.e., 3x LoD). If you obtain 5/5 replicates at 0.5x LoD, you need to test the next lower concentration (i.e., 0.25x LoD). You will test in this manner until you find the lowest concentration that gives you 5/5 positive results for the tested RT-PCR instrument. This concentration should be used for a confirmatory LoD study for the given RT-PCR instrument using 20 replicates.

Final reported LoD: Please list all RT-PCR instruments with their respective LoDs if different LoDs are obtained. LoDs are considered comparable if they are between 1-3xLoD. These studies should be repeated for each clinical matrix claimed in the Intended Use.

- Interference Substances Studies (if applicable): Pick one extraction method and RT-PCR instrument combination, preferably the one with the worst overall LoD (if one or more of the RT-PCR instruments has a different LoD).

- Inclusivity Testing: For the inclusivity testing, pick one extraction method and RT-PCR instrument combination, preferably the one with the worst overall LoD (if one or more of the RT-PCR instruments has a different LoD).

- Exclusivity Testing: For exclusivity, you can perform this study using any extraction/instrument combination.

- Clinical study: If equivalency of the RT-PCR instruments is shown in an LoD study that tests and confirms that the LoD is the same or very similar for all of the RT-PCR instruments (between 2-3xLoD), then you can pick one RT-PCR instrument for your clinical study provided that the RT-PCR instruments in question are known to FDA for other *in vitro* diagnostic devices. If you find that one or more RT-PCR instruments machines has/have a different LoD, you should pick the extraction method / RT-PCR instrument combination with the worst LoD.

Note, if there are differences in the extraction input volume, extraction elution volume

AMERICAN OVERSIGHT

and PCR input volume (extracted nucleic acid) then the LoD should be confirmed, for each.

**Subject:** RE: Pre-EUA IVD template request

Dear Jill,

Thank you very much for reaching out to us about the test you have validated at Wadsworth Center, NYS Department of Health it was very nice to chat with you. As discussed please find attached the current EUA Interactive Review Template draft for molecular-based assays for the detection of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) [formally - 2019-novel coronavirus (2019-nCoV)]. I suggest the first step is to populate this draft template with the validation information and data that you currently have about your device and sent it back to us for review as a Pre-EUA submission (to be sent to the Document Control Center). The Pre-EUA review is an interactive process, so we will provide feedback after receiving and reviewing the information provided. The draft review template is a shared "work-in-progress" document which you will populate with information and data as obtained and which we will review and provide feedback to you. **Please make sure to capture in the EUA review template that you performed the validation using the SIGMA primer/probes sets, sensitivity was evaluated with the positive control material provided in the CDC EUA test kit and that validation studies were performed used the commercial primer/probe materials using the CDC EUA Protocol (please be sure to include information the extraction method and instrument used).**

I have also attached a draft cover letter you can use to submit your Pre-EUA for detection of SARS-CoV-2 to FDA (it includes the address for the Document Control Center). Please include in your Pre-EUA submission package:

- The populated EUA Review Template draft
- FDA Form 3514 (https://www.fda.gov/downloads/AboutFDA/ReportsManualsForms/Forms/UCM080872.pdf) - under Section A (type of submission) please check "other" and specify Pre-EUA; please also complete Sections B, C, F and G. For G please use the information provided in this link: https://www.accessdata.fda.gov/scripts/cdrh/cfdocs/cfPCD/classification.cfm?id=3669.

One hard copy of the signed EUA Cover Letter and one electronic copy (CD or thumb drive) of you Pre-EUA submission package should be enclosed in your Pre-EUA submission package mailed to FDA (recommend FedEx). In addition to mailing your Pre-EUA package to FDA we also request that you submit the package to the review division via electronic mail (including the EUA Review Template in MS word) to myself Kim.Sapsford@fda.hhs.gov, as well as carbon copying (cc:) the following email addresses:

- Division Director: Dr Uwe Scherf, email address: Uwe.Scherf@fda.hhs.gov;
- Branch Chief: Dr Tamara Feldblyum, email address: Tamara.Feldblyum@fda.hhs.gov

Please let me know if you have ANY questions I am happy to assist if you are not sure about certain sections in the template.
Best regards
Kim

**Subject:** NYS Wadsworth Center COVID-19 Test
**Importance:** High

Wendi, Dan, Laura,

NYS Wadsworth Center submitted an EUA request to us this afternoon for a test that uses the CDC protocol but only for N1/N2 (consistent with the CDC test currently subject to enforcement discretion). To support their EUA, Wadsworth conducted a bridging study that demonstrates performance similar to CDC's N1/N2 test. We know their performance is comparable because we have seen CDC's data but Wadsworth has not. **Would CDC allow Wadsworth to have a right of reference to its data, under which does not get access to the data but can reference it in support of their EUA?** Wadsworth has one more test to perform, which if it looks good, we would otherwise grant the EUA.

Thanks,
Uwe

**Subject**: FW: Coronavirus testing: 3 Marylanders meet CDC criteria for testing

Stephanie,

Sharing the below news report saying there are now three individuals in Maryland who have met CDC criteria for testing for COVID-19. It may generate questions from staff. I don't know if any internal comms for the Agency are being planned or contemplated but wanted to make sure folks were aware, if not already.

Jeff

3 Marylanders meet CDC criteria for testing of coronavirus

WBAL
Updated: 10:00 AM EST Feb 28, 2020

Lowell Melser

News Reporter, Meteorologist

REISTERSTOWN, Md. –
Three Marylanders have met the Centers for Disease Control and Prevention criteria for testing of the coronavirus.

Gov. Larry Hogan announced two cases met the criteria for testing Thursday.

A state Health Department spokesman confirmed Friday that a third Maryland resident has met criteria for CDC testing for the novel coronavirus.

State health officials said the samples are being flown to the CDC in Atlanta for testing.

Two other cases that were tested earlier in the year came back negative.

In an all-hands on deck news conference Thursday, the governor and state emergency officials addressed the concerns over coronavirus and how it might affect Marylanders.

The governor and state health officials made it clear that Maryland is currently considered a "low-level risk." Hogan said there is no immediate health threat in Maryland but that the state is taking every precaution to address the coronavirus.

"While we are hoping for the best, we are also actively planning for the worst," Hogan said.

The governor said he spoke with Vice President Mike Pence before Thursday afternoon's news conference. Pence was put in charge by the president to oversee the preparedness around the country.

Hogan also met with his top cabinet officials and state agency officials, and will do so in the coming days and weeks.

The state will be putting surveillance protocols in place with daily briefings from the CDC. State health officials said they are also able to use their labs to test for coronavirus -- that just needs to be cleared by the CDC.

AMERICAN OVERSIGHT

State officials are also telling people to start preparing just in case they need to be quarantined at home for a short or long period of time.

The governor said he will add $10 million in a supplemental budget for emergency preparedness and preventable measures.

Marylanders can also call 211 for more information.

**Subject:** Two items re COVID-19 Hill Briefing

Jeff,

Below is the information we provided to OC re EUAs for IVDs. Other than any updates between now and tomorrow, do you need additional details re IVDs?

Diagnostic Tests

- Granted 1 Emergency Use Authorization (EUA), to the CDC, as of 2/21/20
- This test was developed and validated within about a month.

- CDC submitted validation data interactively throughout the process and the EUA package was submitted to FDA on 2/3/2020; on 2/4/2020, FDA issued an EUA to enable emergency use of the test.

- Provided the EUA template to 70 developers of diagnostics for this outbreak as of 2/21/20
- 13 developers have submitted pre-EUA documents for FDA feedback as of 2/21/20

**Subject:** COVID-19 Test Update

The IDT N1/N2 primers/probes plus CDC developed control were shipped today to 7 public health labs for verification. If all goes well a total of 50 kits (including the first 7) of the newly made primers/probes plus control will be shipped to public health labs; goal is by (b) (5) . Since public labs who verified the original N1 and N2 probes for the CDC test can use the current test and reagents, CDC will decide which other public health labs should receive the newly manufactured reagents. The IDT test, which is the same as the CDC test but manufactured by IDT, passed the QC assessment. A decision will be made in the morning whether the (b) (5) CDC agreed to keep this test under its EUA, which still need to be reauthorized but there is no hold up on IDT shipping out tests.

We hammered out the high level details for the one pager. Fine tuning the language. CDRH is working on the validation criteria, which won't need to be in the one-pager but need to have before communicating with the labs and the public.

**Subject:** FW: AdvaMinute | Coronavirus Update

Give us a minute. We'll give you MedTech!

Good Morning, AdvaMed Nation—

Since the onset of the coronavirus (COVID-19) outbreak, at least 31 **AdvaMed member companies have donated medical products worth approximately $26.8 million and made cash donations worth $4.1 million** to the China Red Cross Foundation and other medical institutions, such as hospitals and clinics in Hubei Province. Donations

AMERICAN OVERSIGHT

and the medtech community's work will only grow in the coming weeks as the threat continues to elevate.

In a press release issued this morning, AdvaMed President and CEO Scott Whitaker said:

"At AdvaMed, we help industry and government work together to solve problems on behalf of the patients we serve, and that collaboration has never been more important than it is now in the face of this global health emergency. We're doing everything we can to help stop the spread of the coronavirus. For the medtech industry, that means donating key medical technologies, providing on-the-ground medical support, and developing new diagnostics, treatments, and vaccines. For AdvaMed, it means connecting industry to public officials and those who are on the front lines fighting this disease. The medical technology community has always stepped up during times of crisis, and AdvaMed is proud of the tremendous work and charity the industry has committed so far."

## AdvaMed Working With Key U.S. Government Agencies

AdvaMed has been working daily with key U.S. government agencies – including HHS, FDA, CDC, and ASPR – and the Chinese government to identify ways the industry can help ensure that providers and patients have access to the medical technologies they need to prevent, diagnose, and treat the coronavirus. This close coordination has facilitated information sharing; anticipated, identified, and reconciled supply-chain challenges; and prompted strategic product and capital donations.

## Coronavirus Task Force

The association has also assembled a coronavirus task force focused on personnel, transportation, and supply, among other needs. The task force meets regularly to receive government, industry, and member-company status updates, and to coordinate industry response. AdvaMed has also distributed to its membership a list of personal protective equipment (PPEs) identified by the Chinese government as essential to the emergency response (e.g., protective clothing, masks, gloves, and gowns; non-contact infrared thermometers; etc.), and is partnering with authorities to increase access to those medtech products.

## Member Company Response Effort

AMERICAN OVERSIGHT

Below is a collection of some of the efforts undertaken recently by AdvaMed member companies:

**3M** is continuing to increase the production of respirators at their facilities around the globe. 3M has also donated respirators, surgical masks, and hand sanitizer to affected areas in China. View the press release here.

**Bayer** is donating medicine and money with a total value of approximately EUR 1.5 million. View the press release here.

**BD** has donated medical devices such as catheters, syringes, sharps, blood collection tubes, and flush products valued at approximately $300,000 to the local Red Cross in Wuhan. In addition, BD has donated $50,000 that will be used to supply personal protective equipment (PPE) to frontline health workers. Read more here.

**Cepheid** is developing an automated molecular test for the qualitative detection of COVID-19 with the ability to deliver point-of-care results in about 30 minutes. View the press release here.

**Danaher Corporation:** Five Danaher operating companies donated RMB 10 million ($1.4 million) of diagnostic equipment, reagents and other products to hospitals in Wuhan, China to combat COVID-19. Included in the donation is: Beckman Coulter Diagnostics' hematology analyzers, Beckman Coulter Life Sciences' flow cytometers, Radiometer's blood gas analyzers, Cepheid's Xpert® Xpress Flu/RSV assay, and Hach's UV-Vis spectrometers.

**GE** Healthcare CEO Kieran Murphy shared here that the company has prioritized and fulfilled hundreds of medical technology installations – including CT, ultrasound, digital x-ray, respirators and patient monitors – in China and other impacted regions. Additionally, GE Healthcare has donated $2.8 million worth of medical equipment in Wuhan, and has accelerated its global supply chain to help cut production times for its new Revolution Maxima CT from around one week to only three days. More details here.

**Johnson & Johnson** has donated one million surgical masks to China and $1 million RMB to the Chinese Red Cross Foundation. They have also donated thermometers, respirators, an electrosurgical generator, 50,000 bottles of isopropyl alcohol, and PPE including goggles and protective suits. Additionally, Johnson & Johnson is diligently

AMERICAN OVERSIGHT

working with partners around the globe to develop a vaccine. Read more here.

**Medtronic** and the Medtronic Foundation are committing $1.5 million to coronavirus relief efforts across the globe. Product donations to Wuhan Huoshenshan Hospital include ventilators, respiratory filters, pulse oximeters, sensors, and centrifugal blood pump systems. View the press release here.

**Olympus** installed endoscope systems into the Wuhan Huo Shen Shan Hospital within 10 days to treat infected patients. In addition to monetary donations to the Red Cross Society of China Huanggang, Olympus has donated 15 sets of laryngoscopes to the China Social Welfare Foundation, and 25 biological microscopes to the Chinese Center for Disease Control and Prevention, totaling approximately $500,000 in donations.

**QIAGEN** has sent the first group of 200 QIAstat-Dx cartridges for syndromic detection of respiratory pathogens – including COVID-19 –to China; they're now being validated at four hospitals. This comes as an evaluation was also successfully completed at the Bichat-Claude Bernard Hospital in Paris. The use of QIAstat-Dx is increasingly important for detection of the COVID-19 infections, as well as to provide differential diagnostics involving the more than 20 other respiratory pathogens included in this syndromic test.

**ResMed** CEO Mick Farrell stated that the company has sent more than 100 ventilators from ResMed's facility near Shanghai to Wuhan. He also stated they will send hundreds more ventilators and thousands of masks. Read more here.

**Roche** is working with Chinese health authorities and the government to ensure people can access screening and healthcare. Roche is also working to support the government and local health officials and hospitals in Hubei Province in dealing with the coronavirus. Recently, Roche has donated diagnostic tests, medical supplies, and financial support for the affected region. View the press release here.

**Varian** has donated 1 million RMB to the China Red Cross. View the press release here.

**For more information, contact Jim Jeffries.**

U.S. FOOD & DRUG ADMINISTRATION

February 26, 2020

Grace Kubin, Ph.D.
Director, Laboratory Services Section
Texas Department of State Health Services
1100 West 49th Street
Austin, TX 78756

Scott J. Becker, MS
Chief Executive Officer
Association of Public Health Laboratories
8515 Georgia Avenue, Suite 700
Silver Spring, MD 20910

Dear Dr. Kubin and Mr. Becker,

Thank you for your letter to the Food and Drug Administration (FDA or the Agency). FDA appreciates the critical role of state and local public health laboratories in our nation's response to public health emergencies, as well as the severity of the current situation with the 2019 novel coronavirus disease (COVID-19).

In the context of a public health emergency, false diagnostic test results can lead to significant adverse public health consequences—not only serious implications for individual patient care but also serious implications for the analyses of disease progression and for public health decision-making. The Emergency Use Authorization (EUA) statutory provisions in the Federal Food, Drug, and Cosmetic Act (FD&C Act) help ensure that FDA has appropriate oversight over the emergency use of certain unapproved products, as well as over unapproved uses of approved products, including diagnostic tests, regardless of who makes them. In certain emergency circumstances, FDA may issue an EUA if it determines, among other things, that the product "may be effective" in the diagnosis, treatment, or prevention of a disease or condition and that the known and potential benefits of the product, when used to diagnose, prevent, or treat the identified disease or condition, outweigh the known and potential risks of the product.

In your letter, you propose developing and implementing a laboratory-developed test for COVID-19 that could be used across multiple public health laboratories with a standard protocol, common sources of reagents, and a standard validation panel and approach. You claim that such a test could be reviewed and, with supporting validation, authorized under a single EUA for use across multiple public health laboratories. In fact, FDA has developed a template to streamline the process to facilitate the protocol that you propose while ensuring FDA's appropriate oversight. Enclosed please find a template to help guide your development and validation of this protocol.

AMERICAN OVERSIGHT

U.S. Food & Drug Administration
10903 New Hampshire Avenue
Silver Spring, MD 20993
www.fda.gov

FDA welcomes the review of submissions of diagnostic test information on a rolling basis and is committed to a prompt and interactive review of them. Once you have developed your protocol, the Agency will coordinate closely with the Association of Public Health Laboratories (APHL) to facilitate access to appropriate materials for validation of your test protocol. In past experiences with these rolling reviews, FDA has been able to authorize tests for public health emergencies within as little as 1 day upon receipt of the complete validation. The Agency would be happy to talk with you about options for the timely availability of such tests.

The Agency is currently supporting over 70 developers in the diagnostic space, including some public health laboratories, and FDA looks forward to collaboration with APHL and/or additional member laboratories as well. We welcome dialogue on opportunities to support the development and implementation of validated tests for COVID-19.

Sincerely,

Stephen M. Hahn, M.D.
Commissioner of Food and Drugs

**Subject:** enforcement discretion request for COVID-19 for PHLs final.pdf

Dear Commissioner Hahn,

On behalf of our nation's state and local public health laboratories (PHLs), we are writing to urge you to consider enforcement discretion to allow this select group of governmental laboratories the ability to create and implement a laboratory developed test (LDT) for the detection of SARS-CoV-2 (COVID-19). We recognize the gravity of the current COVID-19 situation across the globe and wish to have greater diagnostic capability for both surveillance and for patient diagnosis across the United States, hence this extraordinary and rare request. The letter attached details our request.

Please contact me for any follow up or questions you may have at 301-526-5704 or scott.becker@aphl.org

Sincerely,

Scott Becker

Dear Julie and CDC Team,

Just wanted to give you the authorized copies of your documents – FYI. They should be posted on our website hopefully soon – I will update you as soon as I hear. Please note that there was a minor edit made to the HCP fact sheet during final review at the Commissioners Office so please use the documents attached going forward. The Final Label package document includes the IFU, Product Information Sheet and Verification requirements in 1 -bundle – no changes were made to these.

Congratulations again, and thank you

Best regards
Kim

**Subject:** RE: Urgent - CONGRATULATIONS! CDC 2019-Novel Coronavirus Real-Time RT-PCR Diagnostic Panel Emergency Use Authorization submission

Dear Julie and CDC Team,

Just wanted to give you the authorized copies of your documents – FYI. They should be posted on our website hopefully soon – I will update you as soon as I hear. Please note that there was a minor edit made to the HCP fact sheet during final review at the Commissioners Office so please use the documents attached going forward. The Final Label package document includes the IFU, Product Information Sheet and Verification requirements in 1 -bundle – no changes were made to these.

Congratulations again, and thank you

Best regards
Kim

Dear Julie, Steve, and Steve,

CONGRATULATIONS! Your EUA has just been authorized by FDA! Please see attached the signed letter!

This is an incredible accomplishment! You can be extremely proud of your accomplishments and contributions to public health.

It has been an absolute pleasure to work with you.

Very kind regards,
Uwe

Julie,

I confirm that FDA received the hard copies of your EUA submissions. Marcella Odle just handed it over to me and, we are taking it to the document center now.

Thanks for getting it to us so quickly.

Best, Uwe

Hi Kim - we tried to have the hard copies delivered today but it was rejected. Long story short, Marcella Odle from my team is in Silver Spring for an APHL meeting and has the package. How do we arrange delivery to the doc control center?

Thanks,
Julie

Dear Julie and CDC Team,

Just wanted to give you the authorized copies of your documents – FYI. They should be posted on our website hopefully soon – I will update you as soon as I hear. Please note that there was a minor edit made to the HCP fact sheet during final review at the Commissioners Office so please use the documents attached going forward. The Final Label package document includes the IFU, Product Information Sheet and Verification requirements in 1 -bundle – no changes were made to these.

Congratulations again, and thank you

Best regards
Kim

**Subject:** CDC 2019-Novel Coronavirus Real-Time RT-PCR Diagnostic Panel Emergency Use Authorization submission
**Importance:** High

Hi Uwe,

Attached are the following for the CDC 2019-Novel Coronavirus Real-Time RT-PCR Diagnostic Panel Emergency Use Authorization submission:

- CDC 2019 Novel Coronavirus Real-Time RT-PCR Diagnostic Panel EUA Request Letter
- EUA Template CDC 2019-nCoV Real_Time RT-PCR Diagnostic Panel Executive Summary
- Appendix A_CDC 2019-nCoV Real_Time RT-PCR Diagnostic Panel Fact Sheet for Healthcare Providers
- Appendix B_CDC 2019-nCoV Real_Time RT-PCR Diagnostic Panel Fact Sheet for Patients
- Appendix C_CDC 2019-nCoV Real_Time RT-PCR Diagnostic Panel Vial_Control Vial_Package Labeling_Final
- Appendix D_CDC 2019-nCoV Real_Time RT-PCR Diagnostic Panel Product Information Sheet
- Appendix E_CDC 2019-nCoV Real_Time RT-PCR Diagnostic Panel Instructions for Use
- Appendix F_CDC_2019-nCoV Real_Time RT-PCR Diagnostic Panel Verification Requirements
- Appendix G_CDC_2019-nCoV Real_Time RT-PCR Diagnostic Panel Analytical Performance Data
- Appendix H_ CDC_2019-nCoV Real_Time RT-PCR Diagnostic Panel Sequence Alignment and In Silico Analysis
- Appendix I_ CDC_2019-nCoV Real_Time RT-PCR Diagnostic Panel Clinical Performance Data

We cannot thank you enough for all of your assistance with this. We cannot do our jobs without you.

Best regards,
Julie

**Subject**: RE: Request for enforcement discretion

Wendi,

We have worked through your request with the FDA attorneys. Given the limitations you describe and under the specific circumstances for which the testing will be performed, we will forgo requiring that CDC submit an application for a new EUA or a request to modify its existing EUA to include testing of asymptomatic individuals at CDC's headquarters in Atlanta, GA.

Kind regards,

Jeff

**Subject:** RE: Request for enforcement discretion
**Importance:** High

Dear Dr. Kuhnert-Tallman,

On February 4, 2020, the Centers for Disease Control and Prevention (CDC) received an Emergency Use Authorization (EUA) for the CDC's 2019-Novel Coronavirus (2019-nCoV) Real-Time Reverse Transcriptase (RT)-PCR Diagnostic Panel for the presumptive qualitative detection of nucleic acid from the 2019-nCoV in upper and lower respiratory specimens (such as nasopharyngeal or oropharyngeal swabs, sputum, lower respiratory tract aspirates, bronchoalveolar lavage, and nasopharyngeal wash/aspirate or nasal aspirate) collected from individuals who meet CDC criteria for 2019-nCoV testing.

On February 15, 2020, CDC submitted to FDA a request for enforcement discretion from FDA for the testing of asymptomatic U.S. citizens from the Diamond Princess cruise ship using the FDA-authorized CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel. Asymptomatic individuals do not meet CDC's current Person Under Investigation (PUI) definition or testing criteria. CDC has stated that testing will be conducted at CDC's headquarters in Atlanta, GA. Specimens are expected to arrive at CDC for testing during this holiday weekend.

Our understanding of the facts and the public health concerns at issue here are that there is currently no other test available to respond to this emergency, significant public health concerns are presented by the infectious disease, and the proposed testing may help to prevent the spread of the infectious disease. Based on this understanding, at this time, FDA does not intend to object to the use of this test as described above, with the following conditions: (b) (5)

Good afternoon Dr. Scherf,

CDC has been instructed to test all U. S. passengers returning to the United States from the Diamond Princess cruise ship, currently docked in Japan. These passengers are asymptomatic, thus they do not meet CDC's current Person Under Investigation (PUI) definition or testing criteria. (b) (5) [redacted]

Hello Uwe,
We would like to share with you our bulk QC data summary for oligo sets N1, N2 and RP for your review. (b) (5)

Please be aware there are two tab in the excel file.
Please let us know if you have questions.
Do you and your colleagues have a time tomorrow that you would like to arrange a call to discuss?
Thank you very much.
Steve

**Subject:** RE: Cut-off change

HI Julie,

Thanks for the update. Based on FDA's internal discussion this morning we have the following additional information request:

1. The number of national and international laboratories which have received the CDC test panel.
2. Provide an update on:
   - The number of labs that have successfully verified the CDC test panel.
   - The number of labs that observed N-3 false positive results in the negative control material and therefore could not verify the assay.
   - The number of labs that observed N-1 false positive results in the negative control material.
3. Clarify whether the false positive results for N-3 and N-1 occurred in the same laboratory or were reported from different laboratories.

AMERICAN OVERSIGHT

4. Clarify whether CDC have received any signal of false positive results for the N-2 components from any of the laboratories.
5. In regards to manufacturing sites:
   - Provide the name(s) and address(es) of all manufactory site(s) of test components used for the CDC test panel run at CDC headquarters in Atlanta.
   - Provide the name(s) and address(es) of all manufactory site(s) of test components used for the CDC issued EUA test panel distributed nationally and internationally.
   - Provide the name(s) and address(es) of manufactory site(s) that CDC intends to use for manufacturing future EUA test panel lots.

Thanks,
Uwe

**Subject:** RE: Request for enforcement discretion
**Importance:** High

Dear Dr. Kuhnert-Tallman,

On February 4, 2020, the Centers for Disease Control and Prevention (CDC) received an Emergency Use Authorization (EUA) for the CDC's 2019-Novel Coronavirus (2019-nCoV) Real-Time Reverse Transcriptase (RT)-PCR Diagnostic Panel for the presumptive qualitative detection of nucleic acid from the 2019-nCoV in upper and lower respiratory specimens (such as nasopharyngeal or oropharyngeal swabs, sputum, lower respiratory tract aspirates, bronchoalveolar lavage, and nasopharyngeal wash/aspirate or nasal aspirate) collected from individuals who meet CDC criteria for 2019-nCoV testing.

On February 15, 2020, CDC submitted to FDA a request for enforcement discretion from FDA for the testing of asymptomatic U.S. citizens from the Diamond Princess cruise ship using the FDA-authorized CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel. Asymptomatic individuals do not meet CDC's current Person Under Investigation (PUI) definition or testing criteria. CDC has stated that testing will be conducted at CDC's headquarters in Atlanta, GA. Specimens are expected to arrive at CDC for testing during this holiday weekend.

Our understanding of the facts and the public health concerns at issue here are that there is currently no other test available to respond to this emergency, significant public health concerns are presented by the infectious disease, and the proposed testing may help to prevent the spread of the infectious disease. Based on this understanding, at this time, FDA does not intend to object to the use of this test as described above, with the following conditions: (b) (5)

AMERICAN OVERSIGHT

Good afternoon Dr. Scherf,

CDC has been instructed to test all U. S. passengers returning to the United States from the Diamond Princess cruise ship, currently docked in Japan. These passengers are asymptomatic, thus they do not meet CDC's current Person Under Investigation (PUI) definition or testing criteria. (b) (5)

Laura Rose, Regulatory Affairs Activity Lead for OLSS, is the primary point of contact at CDC to facilitate communications about this request. She may be reached at 404-639-1084 or LERose@cdc.gov.

Warm regards,
Wendi

**Subject:** RE: N95 decon and reuse -- preparatory to 3M call
**Importance:** High

Jeff,
First, we are aware of the 2006 IOM Report and recommendations. Yesterday, I mentioned the work product that the HHS OpDivs put out under PHEMCE in 2015 as part of a year long coordinated effort through the RPD WorkGroup, that CDRH and OCET participated in on behalf of FDA. I am attaching that full chapter here as it should be serving as a foundational reference document and guidance for COVID19. This was a well thought out effort that included FDA, CDC,

AMERICAN OVERSIGHT

NIOSH, OSHA, ASPR, BARDA, VA modeled primarily om influenza pandemic. CDC's guidances to healthcare workers and general public today for COVID 19 draw upon this important document (b) (5)
(b) (5)

I'm selecting specific sections and highlighting them below as important background for your HHS discussion since the use objective for the intended wearer of N95 respirators (known as filtering face piece respirators or FFRs) in pandemic scenarios needs to be clearly distinguished from use of masks by potentially infected individual(s) to limit transmission.

See these sections:

(b) (5)

Regarding making the most of a single disposable N95 respirator, we included discussion of 'extended use' and 'reuse'. Yesterday, I used with you the term 'reuse' by a single healthcare worker somewhat loosely, intending 'extended use'.

**Subject:** Fwd: N95 decon and reuse -- preparatory to 3M call

Suzanne,

Please see below about the IOM's finding. I thought you mentioned that a disposable N95 could be reused if used by the same individual (although that would not stop that individual from infecting others)?

FYI — I'll be on a call with HHS, CDC, and possibly 3M at 1 PM (although that may get pushed to 2 PM) to discuss use of standard N95s.

Jeff

**Subject:** RE: Request for enforcement discretion

OCC has cleared us for enforcement discretion. They did not modify my draft language. Below is the language for Uwe to use to respond to CDC, which includes the change to Uwe's language about the data we are requesting.

On February 4, 2020, the Centers for Disease Control and Prevention (CDC) received an Emergency Use Authorization (EUA) for the CDC's 2019-Novel Coronavirus (2019-nCoV) Real-Time Reverse Transcriptase (RT)-PCR Diagnostic Panel for the presumptive qualitative detection of nucleic acid from the 2019-nCoV in upper and lower respiratory specimens (such as nasopharyngeal or oropharyngeal swabs, sputum, lower respiratory tract aspirates, bronchoalveolar lavage, and nasopharyngeal wash/aspirate or nasal aspirate) collected from individuals who meet CDC criteria for 2019-nCoV testing.

On February 15, 2020, CDC submitted to FDA a request for enforcement discretion from FDA for the testing of asymptomatic U.S. citizens from the Diamond Princess cruise ship using the FDA-authorized CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel. Asymptomatic individuals do not meet CDC's current Person Under Investigation (PUI) definition or testing criteria. CDC has stated that testing will be conducted at CDC's headquarters in Atlanta, GA. Specimens are expected to arrive at CDC for testing during this holiday weekend.

Our understanding of the facts and the public health concerns at issue here are that there is currently no other test available to respond to this emergency, significant public health concerns are presented by the infectious disease, and the proposed testing may help to prevent the spread of the infectious disease. Based on this understanding, at this time, FDA does not intend to object to the use of this test as described above, with the following conditions: that the testing will be conducted only at CDC's headquarters in Atlanta, GA, that CDC will submit data to FDA on the number of asymptomatic cases identified as being positive during the testing, and that CDC will act promptly to submit an application for a new EUA or a request to modify its existing EUA to include testing of asymptomatic individuals at CDC's headquarters in Atlanta, GA.

**Subject:** FW: Request for enforcement discretion
**Importance:** High

Jeff and Ellen,

See below the official request from CDC.

As stated in my previous email, based on our knowledge of the device, DMD would not have objections allowing CDC to test asymptomatic individuals using the 2019-nCoV Real-Time RT-PCR Diagnostic Panel kit to test all U. S. passengers returning to the United States from the Diamond Princess cruise ship. Provided that testing be conducted at CDC's headquarters in Atlanta, GA.

Ellen, per my phone conversation with Jeff, he agrees but would like your input on FDA's intend to not object to the use of the 2019-Novel Coronavirus (2019-nCoV). Please let me know if your thoughts on CDC's request.

**Subject:** RE: Cut-off change - Number of public health labs that verified CDC panel for use

Hi Jeff,

Yes, they are. We expect more updates perhaps later today. We are exploring under a new EUA, could we allow the (b)(5) labs that only failed N3 to move forward with existing reagents using N1 and N2 only.

I have received a very warm welcome.

I have met with the Lab Task in the EOC lead by Wendi, I attending the daily briefing attended by Dr. Redfield, then went to see Steve and Julie in the Coronavirus testing lab. I am going to meet with the chief of staff, the surveillance lead and the Coronavirus Incidence Manager later today.

I have requested a tour of the core lab that does the manufacturing, hopefully today but latest tomorrow.

The briefing went well, I shared last night's ED green light on the Surveillance testing program and today's FDA response to the Surveillance EUA. Dr. Redfield and the rest were very pleased with both developments and thanked us.

Thanks!

Best,

Steve and Julie,

Do you have any updates on the labs that successfully validated your assay and are ready to run clinical samples? Did any lab respond?

Thanks,
Uwe

**Subject:** RE: Cut-off change - Number of public health labs that verified CDC panel for use

Hi Uwe,
Notifications that CDC received from public health laboratories regarding the reactivity of the N1 and N3 assay as well as those that notified CDC of successful verification are below:

(b) (5) notified CDC of issues with N3 assay
(b) (5) notified CDC of issues with N1 assay (these labs are included in those that also saw issues with N3)
(b) (5) reported that they successfully verified the test in their laboratories

We are reaching out to labs today to notify CDC if they have successfully verified the test and will update if this number changes.

Thank you very much.
Steve

Hi Uwe,
I just wanted to follow up with you to let you know that we are now working to compile the numbers we have and will get these to you shortly. Also, we will be sending a request to all labs that have received the reagents to please notify CDC if they successfully verified the test in their lab, so the number of verified labs may change from the numbers we initially report to you.
Thank you very much.
Steve

**Importance:** High

Julie & Steve,

AMERICAN OVERSIGHT

As requested earlier, please clarify the number of labs that have successfully verified the CDC test panel for use asap.

You communicated earlier that (b) (5) labs received your test and that (b) (5) PHL informed you that they could not verify the test.

The question is in the context of a statement by APHL today that only 3 out of 100 public health labs have verified the CDC test for use. Can you confirm that?
"Only three of the more than 100 public health labs across the country have verified the CDC test for use, according to the Association of Public Health Laboratories.'

See article below:

The article also states, according to CDC, that CDC will distribute a second test and will need it approved by the FDA first.

- Please clarify what that means: Are we talking about the new lot that is being manufactured or the change in cut-off?

Thanks,
Uwe

**Problems with CDC coronavirus test delay expanded US screening**

By David Lim

02/20/2020 05:03 PM EST

Problems with a coronavirus test developed by the CDC have delayed the Trump administration's efforts to expand screening to state and local public health labs, more than two weeks after the FDA granted permission to distribute the CDC test nationwide.

Only three of the more than 100 public health labs across the country have verified the CDC test for use, according to the Association of Public Health Laboratories.

The delay has also hampered CDC's plan to screen samples collected by its national flu-surveillance network for the coronavirus, according to Peter Kyriacopoulos, APHL's senior director of public policy. CDC hopes to use public health labs in Chicago, New York City, Los Angeles, San Francisco and Seattle to screen samples that test negative for the flu and other common respiratory viruses for the coronavirus.

CDC confirmed the problems with the coronavirus test, and with using its flu-surveillance network to screen for the virus. But the agency declined to answer further questions on the matter.

The delay in establishing additional screening capacity could impede the U.S. government's ability to detect scattered cases before they snowball into larger outbreaks, former FDA Commissioner Scott Gottlieb told POLITICO.

"By that point, it may be harder to contain spread, and we'll be forced to rely on mitigation tactics to just limit the impact of the virus," he said.

More than 75,000 cases of coronavirus infection have been confirmed globally as of Thursday, and more than 2,100 people have died, according to the World Health Organization. The vast majority of cases are in China, where the virus first emerged, although countries such as Japan, South Korea and Iran are also battling local outbreaks.

In the United States, efforts to expand use of the CDC test have struggled after one of the three reagents upon which the test depends delivered inconclusive results during quality checks, said Kelly Wroblewski, APHL's director of infectious diseases. Samples that test positive at any of the three labs are still being sent to CDC for retesting.

CDC has not told public health labs when it will distribute a second version of the diagnostic test, Wroblewski said. That has left many labs struggling to decide if it is worth continuing to pursue verification of the current

AMERICAN OVERSIGHT

version, because they will have to go through the process again once the CDC revises its testing procedure, she added.

Nancy Messonnier, director of the CDC's National Center for Immunization and Respiratory Diseases, told reporters on Feb. 14 that the public health agency is reformulating the original test and is moving quickly to get the revised version to labs. FDA would have to authorize any changes to the coronavirus test before the CDC could distribute a new one.

But concerns about money also threaten the rollout of state and local coronavirus testing. Over the weekend, more than 20 Senate Democrats called for additional cash after Trump administration officials told senators during a Feb. 12 briefing that HHS would soon exhaust existing funding for its response to the virus.

"We strongly urge the administration to transmit an emergency supplemental request that ensures it can and will fully reimburse states for the costs they are incurring as part of this response," the senators wrote in a letter to HHS Secretary Alex Azar and OMB Director Mick Mulvaney.

The diagnostic test can cost up to $250 to run, depending on procedures and volume of tests a lab performs, according to Wroblewski. But it is unclear who is paying for personnel costs and other items such as personal protective gear, machines to extract RNA and sample transportation, according to APHL.

"This is a national-level response, so we would hope the federal government would have an interest in supporting a national-level response," Kyriacopoulos said. "Labs are much more interested in beginning to get the work done. But figuring out how to pay for it is not far behind."

**Subject:** RE: Cut-off change

HI Julie,

Thanks for the update. Based on FDA's internal discussion this morning we have the following additional information request:

1. The number of national and international laboratories which have received the CDC test panel.
2. Provide an update on:
   - The number of labs that have successfully verified the CDC test panel.
   - The number of labs that observed N-3 false positive results in the negative control material and therefore could not verify the assay.
   - The number of labs that observed N-1 false positive results in the negative control material.
3. Clarify whether the false positive results for N-3 and N-1 occurred in the same laboratory or were reported from different laboratories.
4. Clarify whether CDC have received any signal of false positive results for the N-2 components from any of the laboratories.
5. In regards to manufacturing sites:
   - Provide the name(s) and address(es) of all manufactory site(s) of test components used for the CDC test panel run at CDC headquarters in Atlanta.
   - Provide the name(s) and address(es) of all manufactory site(s) of test components used for the CDC issued EUA test panel distributed nationally and internationally.

AMERICAN OVERSIGHT

- Provide the name(s) and address(es) of manufactory site(s) that CDC intends to use for manufacturing future EUA test panel lots.

Thanks,
Uwe

**Subject:** RE: Request for enforcement discretion
**Importance:** High

Dear Dr. Kuhnert-Tallman,

On February 4, 2020, the Centers for Disease Control and Prevention (CDC) received an Emergency Use Authorization (EUA) for the CDC's 2019-Novel Coronavirus (2019-nCoV) Real-Time Reverse Transcriptase (RT)-PCR Diagnostic Panel for the presumptive qualitative detection of nucleic acid from the 2019-nCoV in upper and lower respiratory specimens (such as nasopharyngeal or oropharyngeal swabs, sputum, lower respiratory tract aspirates, bronchoalveolar lavage, and nasopharyngeal wash/aspirate or nasal aspirate) collected from individuals who meet CDC criteria for 2019-nCoV testing.

AMERICA'S
OVERSIGHT

On February 15, 2020, CDC submitted to FDA a request for enforcement discretion from FDA for the testing of asymptomatic U.S. citizens from the Diamond Princess cruise ship using the FDA-authorized CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel. Asymptomatic individuals do not meet CDC's current Person Under Investigation (PUI) definition or testing criteria. CDC has stated that testing will be conducted at CDC's headquarters in Atlanta, GA. Specimens are expected to arrive at CDC for testing during this holiday weekend.

Our understanding of the facts and the public health concerns at issue here are that there is currently no other test available to respond to this emergency, significant public health concerns are presented by the infectious disease, and the proposed testing may help to prevent the spread of the infectious disease. Based on this understanding, at this time, FDA does not intend to object to the use of this test as described above, with the following conditions: (b) (5) [redacted]

AMERICAN OVERSIGHT

CDC submitted their request for a new cut-off this evening. The CDRH team finished their review. (b) (5) [redacted] The team and CDC will discuss on a phone call that will take place tomorrow, likely at 1 or 2 PM, during which we anticipate CDC will provide verbal feedback to the CDRH team's questions.

And I would add, as Ellen noted before, the EUA application is supposed to identify all manufacturing sites, the controls they will use, and their GMP status. If possible, it would be helpful to pull that information tomorrow.

Uwe,

Thank you, and understood. I'll give the Commissioner's Office an update, as well.

On a related note, I looked at the instructions that CDC provided to the public health labs under the EUA and it identifies CDC as the manufacturer. They do not identify a contract manufacturer, at least in that document. Maybe in material submitted to support the original EUA they identify an entity other than CDC as the manufacturer of the primers and probes CDC uses when testing is performed at their headquarters.

Jeff,

No, they have not send anything yet. I spoke with Steve Lindstrom at 4 PM again, they are discussing their internal data before they send it to us.

My team needs to see the proposal before we can agree on any cut-off change. We discussed a concept of testing 2 different specimen types and working out the details tonight.

We will need to have a conference call with CDC to come to an agreement which will realistically happen tomorrow. I will you keep you posted at every step.

**Subject:** RE: Request for enforcement discretion
**Importance:** High

Dear Dr. Kuhnert-Tallman,

On February 4, 2020, the Centers for Disease Control and Prevention (CDC) received an Emergency Use Authorization (EUA) for the CDC's 2019-Novel Coronavirus (2019-nCoV) Real-Time Reverse Transcriptase (RT)-PCR Diagnostic Panel for the presumptive qualitative detection of nucleic acid from the 2019-nCoV in upper and lower respiratory specimens (such as nasopharyngeal or oropharyngeal swabs, sputum, lower respiratory tract aspirates, bronchoalveolar lavage, and nasopharyngeal wash/aspirate or nasal aspirate) collected from individuals who meet CDC criteria for 2019-nCoV testing.

On February 15, 2020, CDC submitted to FDA a request for enforcement discretion from FDA for the testing of asymptomatic U.S. citizens from the Diamond Princess cruise ship using the FDA-authorized CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel. Asymptomatic individuals do not meet CDC's current Person Under Investigation (PUI) definition or testing criteria. CDC has stated that testing will be conducted at CDC's headquarters in Atlanta, GA. Specimens are expected to arrive at CDC for testing during this holiday weekend.

Our understanding of the facts and the public health concerns at issue here are that there is currently no other test available to respond to this emergency, significant public health concerns are presented by the infectious disease, and the proposed testing may help to prevent the spread of the infectious disease. Based on this understanding, at this time, FDA does not intend to object to the use of this test as described above, with the following conditions: (b) (5) [redacted]

**Subject:** Request for enforcement discretion

Good afternoon Dr. Scherf,

CDC has been instructed to test all U. S. passengers returning to the United States from the Diamond Princess cruise ship, currently docked in Japan. These passengers are asymptomatic, thus they do not meet CDC's current Person Under Investigation (PUI) definition or testing criteria. CDC respectfully requests enforcement discretion from FDA for the testing of asymptomatic U.S. citizens from the Diamond Princess cruise ship using the FDA-authorized 2019-nCoV Real-Time RT-PCR Diagnostic Panel. Testing will be conducted at CDC's headquarters in Atlanta, GA. Specimens are expected to arrive at CDC for testing during this holiday weekend.

Laura Rose, Regulatory Affairs Activity Lead for OLSS, is the primary point of contact at CDC to facilitate communications about this request. She may be reached at 404-639-1084 or LERose@cdc.gov.

Warm regards,
Wendi

Bill, Jeff,
I confirm this belongs to DMD. We had similar (b) (4) [redacted] for the Zika outbreak and will find out how those request were handled. It is likely not to git the EUA approach since the emergency declaration was specifically for the detection of nCoV. DMD will follow up with a phone call to the sponsor.

AMERICAN OVERSIGHT

http://www.moa.gov.cn/gk/yjgl_1/yqfb/202002/t20200201_6336498.htm

The Information Office of the Ministry of Agriculture and Rural Affairs released on February 1 that a poultry H5N1 subtype highly pathogenic bird flu outbreak occurred in Shuangqing District, Shaoyang City, Hunan Province.

On February 1st, the Ministry of Agriculture and Rural Affairs received a report from the China Animal Epidemic Prevention and Control Center. After confirmed by the National Avian Influenza Reference Laboratory, the H5N1 subtype highly pathogenic avian influenza epidemic occurred in broiler chickens raised by a farmer in Shuangqing District, Shaoyang City. The number of broiler chickens kept by the farmers was 7,850, and 4,500 died. After the epidemic occurred, the local government did a good job in handling the epidemic situation in accordance with the requirements of relevant plans and technical specifications for prevention and control. 17,828 poultry have been culled, and all the sick and culled poultry have been harmlessly treated.

# China reports outbreak of deadly bird flu among chickens in Hunan province, close to coronavirus epicentre of Wuhan

- **Bird flu outbreak in Hunan province, which lies on the southern border of Hubei province, the epicentre of the coronavirus outbreak**
- **Bird flu is much deadlier than either Sars or the coronavirus, but as of yet no human cases have been reported in this outbreak**

Cissy Zhou
Published: 2:29am, 2 Feb, 2020

China has reported an outbreak of the deadly H5N1 bird flu in Hunan province, which lies on the southern border of Hubei province, the epicentre of the rapidly spreading coronavirus.
"The outbreak occurred in a farm in the Shuangqing district of Shaoyang city. The farm has 7,850 chickens, and 4,500 of the chickens have died from the contagion. Local authorities have culled 17,828 poultry after the outbreak," according to a statement by China's Ministry of Agriculture and Rural Affairs on Saturday. No human cases of the Hunan H5N1 virus have been reported.
The Hunan H5N1 outbreak comes even as the Chinese authorities continue to scramble to contain the spread of the novel coronavirus, further stretching the nation's already heavily strained resources needed to combat the health threats.

The deadly coronavirus infection had claimed 300 lives in China as of Sunday. So far, no deaths have been reported outside the country. The virus has sickened more than 14,000 in China and about 140 overseas so far. The H5N1 avian flu virus, often called bird flu, causes severe respiratory disease in birds and is contagious to humans. The virus was first detected in 1996 in geese in China and is especially deadly for poultry. It is possible, but difficult, to transmit bird flu from person to person, according to the World Health Organisation (WHO).

According to the US Centres for Disease Control and Prevention, "Most human infections with avian influenza viruses ... have occurred after prolonged and close contact with infected birds.
"Rare human-to-human spread with this virus has occurred, but it has not been sustained and no community spread of this virus has ever been identified."
However, bird flu is highly deadly to humans who contract it, with a mortality rate of more than 50 per cent in cases over the last 15 years, which is much deadlier to humans than either Sars (a 10 per cent mortality rate) or the novel coronavirus (a 2 per cent mortality rate in the outbreak so far).

From 2003 to 2019, WHO reported a total of 861 confirmed human cases of H5N1 worldwide, of whom 455 have died. In China, 53 human cases of bird flu infections have been reported in the past 16 years, with 31 having died. In recent days, more than a dozen countries have evacuated their citizens from Hubei province's Wuhan – the epicentre of the coronavirus outbreak – or are in the processing of doing so.

AMERICAN OVERSIGHT

http://www.moa.gov.cn/gk/yjgl_1/yqfb/202002/t20200201_6336498.htm

The Information Office of the Ministry of Agriculture and Rural Affairs released on February 1 that a poultry H5N1 subtype highly pathogenic bird flu outbreak occurred in Shuangqing District, Shaoyang City, Hunan Province.

On February 1st, the Ministry of Agriculture and Rural Affairs received a report from the China Animal Epidemic Prevention and Control Center. After confirmed by the National Avian Influenza Reference Laboratory, the H5N1 subtype highly pathogenic avian influenza epidemic occurred in broiler chickens raised by a farmer in Shuangqing District, Shaoyang City. The number of broiler chickens kept by the farmers was 7,850, and 4,500 died. After the epidemic occurred, the local government did a good job in handling the epidemic situation in accordance with the requirements of relevant plans and technical specifications for prevention and control. 17,828 poultry have been culled, and all the sick and culled poultry have been harmlessly treated.

# China reports outbreak of deadly bird flu among chickens in Hunan province, close to coronavirus epicentre of Wuhan

- **Bird flu outbreak in Hunan province, which lies on the southern border of Hubei province, the epicentre of the coronavirus outbreak**
- **Bird flu is much deadlier than either Sars or the coronavirus, but as of yet no human cases have been reported in this outbreak**

Cissy Zhou
Published: 2:29am, 2 Feb, 2020

China has reported an outbreak of the deadly H5N1 bird flu in Hunan province, which lies on the southern border of Hubei province, the epicentre of the rapidly spreading coronavirus.
"The outbreak occurred in a farm in the Shuangqing district of Shaoyang city. The farm has 7,850 chickens, and 4,500 of the chickens have died from the contagion. Local authorities have culled 17,828 poultry after the outbreak," according to a statement by China's Ministry of Agriculture and Rural Affairs on Saturday. No human cases of the Hunan H5N1 virus have been reported.
The Hunan H5N1 outbreak comes even as the Chinese authorities continue to scramble to contain the spread of the novel coronavirus, further stretching the nation's already heavily strained resources needed to combat the health threats.

The deadly coronavirus infection had claimed 300 lives in China as of Sunday. So far, no deaths have been reported outside the country. The virus has sickened more than 14,000 in China and about 140 overseas so far. The H5N1 avian flu virus, often called bird flu, causes severe respiratory disease in birds and is contagious to humans. The virus was first detected in 1996 in geese in China and is especially deadly for poultry. It is possible, but difficult, to transmit bird flu from person to person, according to the World Health Organisation (WHO).

According to the US Centres for Disease Control and Prevention, "Most human infections with avian influenza viruses ... have occurred after prolonged and close contact with infected birds.
"Rare human-to-human spread with this virus has occurred, but it has not been sustained and no community spread of this virus has ever been identified."
However, bird flu is highly deadly to humans who contract it, with a mortality rate of more than 50 per cent in cases over the last 15 years, which is much deadlier to humans than either Sars (a 10 per cent mortality rate) or the novel coronavirus (a 2 per cent mortality rate in the outbreak so far).

From 2003 to 2019, WHO reported a total of 861 confirmed human cases of H5N1 worldwide, of whom 455 have died. In China, 53 human cases of bird flu infections have been reported in the past 16 years, with 31 having died. In recent days, more than a dozen countries have evacuated their citizens from Hubei province's Wuhan – the epicentre of the coronavirus outbreak – or are in the processing of doing so.

Jeff, Ellen,
Have either of you heard any updates from the commissioners office regarding agency conversations with HHS or CDC on (b) (5) ? I ask because a CDC official who has been on our calls this past year reached out to Tim (below) to schedule a visit to WO next week to discuss a handful of topics including (b) (5) . I don't want to overstep if conversations are taking place at the agency level. Do you have enough insight to advise on how to handle this or would you like me to reach out to Anna/Keagan? I did ask Lauren Paulos and she said there is an IOS meeting this week.

Hi Elizabeth,

It would be great to pull you in to at least get your guidance on this. The CDC is looking to enhance the relationship with the FDA. As you know, Alberto had developed a close relationship with the CDC that was quite broad. And it seems like there were no significant other senior FDA leaders who had that same relationship. See suggested topics and people to include below.

Pulling a meeting together that is this deep and broad in 2 weeks is likely challenging. (b) (5)

I am fine managing this, if you want.

Thanks!

**Subject:** Coronavirus testing equipment and materials

Dear Drs. Hahn and Stenzel,

The commitment of the Food and Drug Administration to the safety and well-being of all Americans is critical to the work that we do every day at the New York City Department of Health and Mental Hygiene, and is especially important in the context of a public health emergency.

The reliability and accuracy of clinical tests is a basic need in health care and public health. In the current 2019-novel coronavirus (nCoV) public health emergency, public health action that will impact the lives of many will be taken based on the result of a single laboratory diagnostic test, and it is therefore critical that the test be as close to 100% accurate, 100% of the time as possible.

We commend the collaboration between the FDA, the Centers for Disease Control and Prevention (CDC), and the Centers for Medicare and Medicaid Services (CMS) to streamline the development, validation, and authorization of clinical tests that meet regulatory requirements in the rapidly evolving setting of an infectious disease public health emergency. The efficiency of this process is being put to the test in this emergency.

We ask that the evaluation and subsequent Emergency Use Authorization of the CDC-developed diagnostic assay for the detection of 2019-nCoV infection be moved forward as quickly as possible. It is critical that local jurisdictions, including New York City, have access to this test locally to support the rapid and accurate evaluation of patients under investigation (PUI) for 2019-nCoV infection. In New York City, the test result for every PUI will have implications for the health of all New Yorkers. It is imperative that testing be available locally to decrease the time to get a result into the hands of clinicians caring for the patient and the public health officials that need to enact public health interventions to stop the spread of this virus in NYC, and across the country.

As always, thank you for your commitment to the health and safety of New Yorkers and all Americans.

Sincerely,

Raul Perea-Henze, MD, MPH
Deputy Mayor for Health & Human Services
City of New York

**Subject:** RE: Regulatory discretion - Need to confirm process and next steps
**Importance:** High

Dear Anita,

FDA and CDC have been working interactively together on CDC's request for an Emergency Use Authorization (EUA) for its 2019-Novel Coronavirus (2019-nCoV) Real-Time Reverse Transcriptase (RT)-PCR Diagnostic Panel for the presumptive qualitative detection of nucleic acid from the 2019-nCoV in upper and lower respiratory specimens. At this time, there is no *in vitro* diagnostic test approved, cleared or authorized for such use.

On January 30th, CDC notified FDA that it would like to distribute the test to certain laboratories so that they can use the test prior to issuance of an EUA. This would help to address the significant public health concerns raised by the infectious disease at this early stage, and may help to prevent the spread of the infectious disease by addressing the high testing demands currently being faced by CDC.

We understand that CDC would like to distribute the 2019-nCoV Real-Time RT-PCR Diagnostic Panel kit, and any components, to laboratories designated by CDC as qualified and, in the United States, such laboratories will be certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA), 42 U.S.C. § 263a, to perform high complexity tests. We also understand that CDC will ask each of the state laboratories to send positive samples and (b) (5) negative samples to CDC for further validation testing.

Based on our understanding of the facts and the public health concerns at issue here – specifically, that there is currently no other test available to respond to this emergency and that CDC is actively pursuing EUA authorization – at this time, FDA does not intend to object to the distribution and use of this test as described above. We ask that you

AMERICAN OVERSIGHT

please send the name and address of the specific laboratory(ies) that will be performing testing to the FDA/CDRH MCM Team Lead, Kim Sapsford (Kim.Sapsford@fda.hhs.gov) and the Director of the Division of Microbiology Devices, Uwe Scherf (Uwe.Scherf@fda.hhs.gov).

Kind regards,
Uwe

**Subject:** RE: Regulatory discretion - Need to confirm process and next steps

Dear Uwe,
We greatly appreciate FDA's rapid review of CDC's request. CDC will send the name and address of the specific laboratory(ies) that will be performing testing to the FDA/CDRH MCM Team Lead, Kim Sapsford once locations are confirmed.

We will notify our lab team of the note below and let you know if there are any additional questions.
Thanks again -
Best,
Anita

AMERICAN OVERSIGHT

Dear Anita,

FDA and CDC have been working interactively together on CDC's request for an Emergency Use Authorization (EUA) for its 2019-Novel Coronavirus (2019-nCoV) Real-Time Reverse Transcriptase (RT)-PCR Diagnostic Panel for the presumptive qualitative detection of nucleic acid from the 2019-nCoV in upper and lower respiratory specimens. At this time, there is no *in vitro* diagnostic test approved, cleared or authorized for such use.

On January 30th, CDC notified FDA that it would like to distribute the test to certain laboratories so that they can use the test prior to issuance of an EUA. This would help to address the significant public health concerns raised by the infectious disease at this early stage, and may help to prevent the spread of the infectious disease by addressing the high testing demands currently being faced by CDC.

We understand that CDC would like to distribute the 2019-nCoV Real-Time RT-PCR Diagnostic Panel kit, and any components, to laboratories designated by CDC as qualified and, in the United States, such laboratories will be certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA), 42 U.S.C. § 263a, to perform high complexity tests. We also understand that CDC will ask each of the state laboratories to send positive samples and (b) (5) negative samples to CDC for further validation testing.

Based on our understanding of the facts and the public health concerns at issue here – specifically, that there is currently no other test available to respond to this emergency and that CDC is actively pursuing EUA authorization – at this time, FDA does not intend to object to the distribution and use of this test as described above. We ask that you please send the name and address of the specific laboratory(ies) that will be performing testing to the FDA/CDRH MCM Team Lead, Kim Sapsford (Kim.Sapsford@fda.hhs.gov) and the Director of the Division of Microbiology Devices, Uwe Scherf (Uwe.Scherf@fda.hhs.gov).

Kind regards,
Uwe

**Subject**: 2/54/20 6 AM update

Jeff, Elizabeth, Ellen, Bill and Tim:

2/25/20 6 AM update:

**Status of activities on diagnostics:**

- 2/24/20 CDC proposed to change wording the intended use of their EUA from:
  - The CDC 2019-Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel is a real-time RT-PCR test intended for the presumptive qualitative detection of nucleic acid from the 2019-nCoV in upper and lower respiratory specimens (such as nasopharyngeal or oropharyngeal swabs, sputum, lower respiratory tract aspirates, bronchoalveolar lavage, and nasopharyngeal wash/aspirate or nasal aspirate) collected from individuals **who meet CDC criteria for 2019-nCoV testing**

  - To:

(b) (5) [redacted]

**Also, CDC communicate that they will move forward with changing their assay to a N1+N2 only assay.**
**CDC's intention is to have both changes done with one submission.**

AMERICAN OVERSIGHT

- CDC will provide additional confirmation testing had been conducted by CDC on presumptive positive samples. FDA will rely this additional information for the statistical justification included in the benefit-risk assessment for CDC to exclude using the N3 primer/probeset as part of their assay moving forward.

- A total of 75 IVD Developers have requested and received EUA review template

***RE:*** *Request for Emergency Use Authorization (EUA) Interactive Review of the New York SARS-CoV-2 Real-time Reverse Transcriptase (RT)-PCR Diagnostic Panel*

Dear Dr. Scherf,

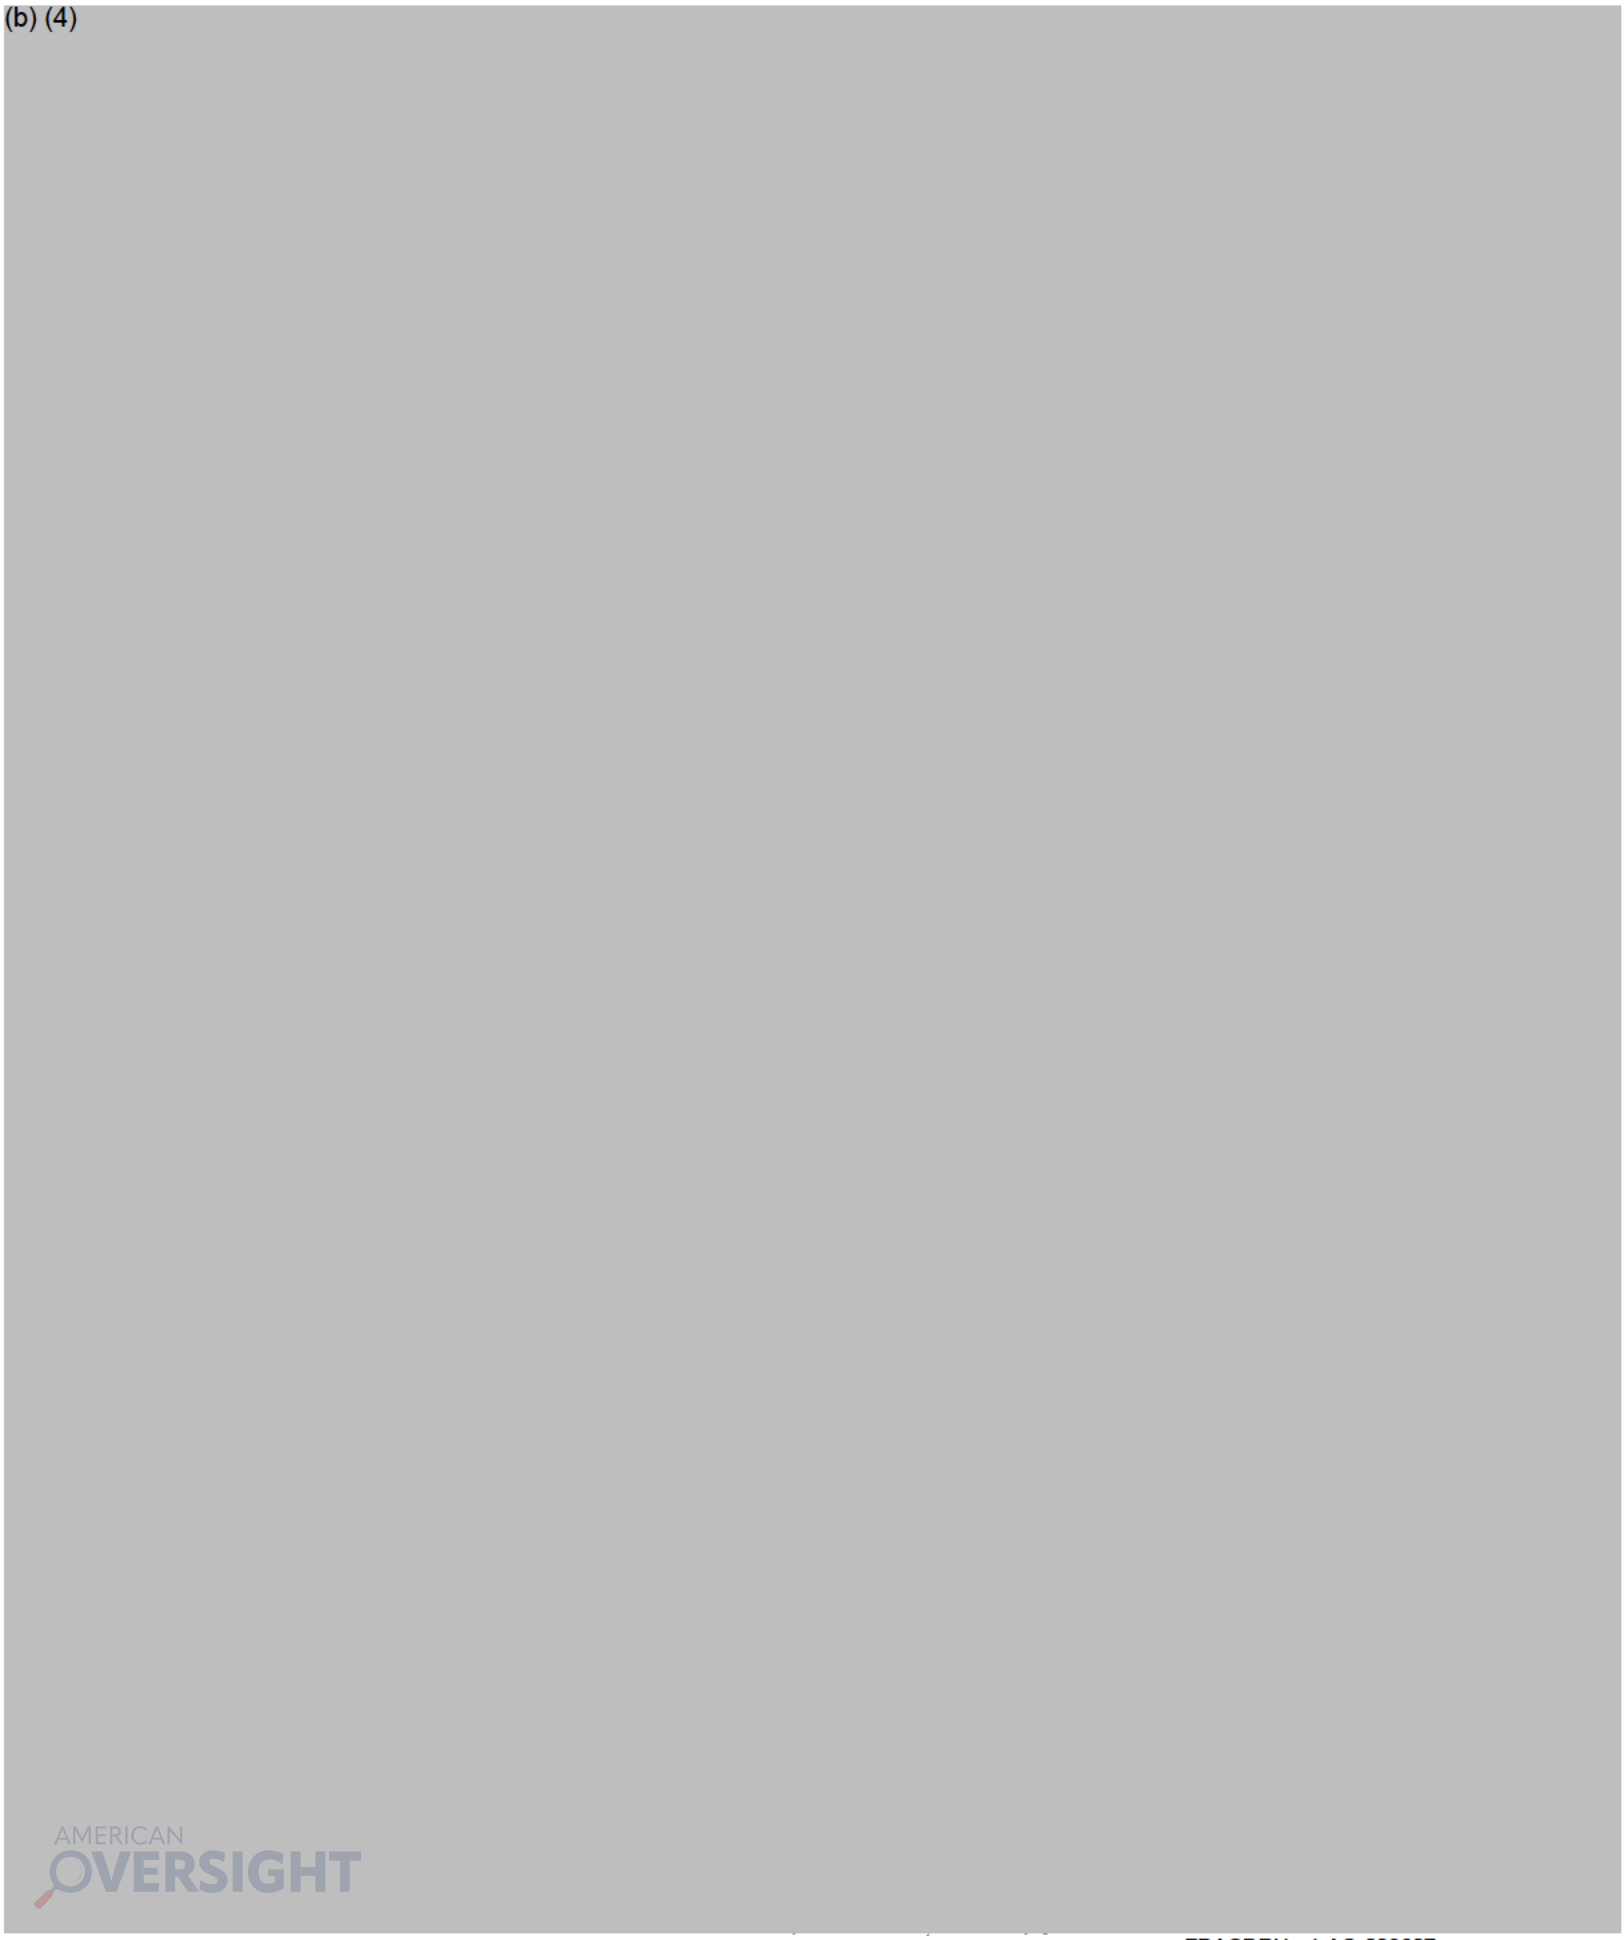
The Wadsworth Center, NYSDOH is submitting an Emergency Use Authorization (EUA) interactive review for a SARS-CoV-2 diagnostic assay, so that we can obtain feedback from the FDA concerning the studies and/or testing outlined in our EUA submission package.

The SARS-CoV-2 diagnostic assay in the submission is based on using the CDC protocol, including oligo sequences, instruments and cycling conditions. Changes from the CDC protocol include the use of commercially purchased primers and probes and intended use is limited to the Wadsworth Center and potentially the New York City public health laboratory, if they perform the appropriate validation as required by the FDA.

In addition to this letter, also attached in this initial submission email, is the first draft of our completed EUA Interactive Review template for FDA review.

In case you should have any questions regarding the information provided and/or need additional information or data from us, please contact me immediately either via email at jill.taylor@health.ny.gov or phone at 518-474-3157.

Sincerely,



Jill Taylor, Ph.D.
Director, Wadsworth Center

**Subject**: RE: confirmatory testing

Li,

You are absolutely correct. After this initial "confirmation" period, all positives are still presumptive, and should be confirmed by state and public health authorities and/or CDC.

Uwe

Subject: FW: confirmatory testing

Hi all,

Are all test positives still presumptive and needed to be confirmed by CDC or local public health labs? If yes, my understanding regarding the new guidance regarding LDTs is that first 5 positive and 5 negative specimens need to be confirmed by another EUA test. It could be any EUA tests, not necessary the CDC EUA test performed at the CDC or public health labs. After this initial "confirmation" period, all positives are still presumptive, and should be confirmed by state and public health authorities and/or CDC.

Please confirm my understanding.

Thanks,
Li

Subject: confirmatory testing

Hi Li,

One more piece of clarification. The FDA guidance now asks for the first five negative and positive specimens to be submitted for confirmatory testing. I can't find the specific language now, but I was under the impression that you wanted all positive results confirmed by state and public health authorities and/or CDC.

(b) (4)
(b) (4) Are we supposed to forward all positives onto public health for confirmatory testing?

Best wishes,
Alex

**Request for Emergency Use Authorization of the New York SARS-CoV-2 Real-time Reverse Transcriptase (RT)-PCR Diagnostic Panel**

Dear Dr. Scherf,

The Wadsworth Center, New York State Department of Health is submitting the New York SARS-CoV-2 Real-time Reverse Transcriptase (RT)-PCR Diagnostic Panel for consideration under Emergency Use Authorization (EUA).

The New York SARS-CoV-2 Real-time Reverse Transcriptase (RT)-PCR Diagnostic Panel is a real-time RT-PCR test, intended for the presumptive qualitative detection of nucleic acid from SARS-CoV-2 in upper and lower respiratory tract specimens from individuals who meet CDC COVID-19 clinical and/or epidemiological criteria. Testing is limited to the Wadsworth Center, New York State Department of Public Health, and the New York City Department of Health and Mental Hygiene, Public Health Laboratories.

On the basis of the information submitted in this document, Wadsworth Center believes that the potential benefits from the use of the New York SARS-CoV-2 Real-time Reverse Transcriptase (RT)-PCR Diagnostic Panel are expected to outweigh the risks, concludes that the test meets all the key criteria for an emergency use authorization, and therefore requests for an EUA.

In case you should have any questions regarding the information provided and/or need additional information/data from us please contact me immediately either via email at Jill.Taylor@health.ny.gov or phone at (518) 474 3157.

Sincerely,

Jill Taylor, PhD
Director, Wadsworth Center

Dear Jennifer, Liz, Dennis, Marcy and Michael,

Please find attached the formal EUA request package for the New York SARS-CoV-2 Real-time Reverse Transcriptase (RT)-PCR Diagnostic Panel with the following documents for OCET and OCC's review and clearance:

1) Wadsworth Center, New York State Department of Health Cover Letter - pdf
2) Draft EUA Letter of Authorization – with some notes for OCET/OCC – MS word
3) CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel HCP Fact Sheet – MS word
4) CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel Patient Fact Sheet – MS word

AMERICAN OVERSIGHT

5) DMD EUA Lead Memo for CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel – MS word

CDRH considers these documents as cleared.

Thank you so much for your collaboration and help getting this second EUA for 2019-nCoV authorized so expeditiously!

Best regards,
Uwe

Hi Alex,

Just to clarify, we are currently working on a pre-EUA (PEUA200009). After we work out all the issues, you will then submit an official EUA request package. Based on the new FDA guidance on LDTs yesterday, you can offer the UW LDT for patient testing as soon as you complete the validation of the LDT. You should then submit an official EUA request within 15 days of offering the LDT for patient testing.

I will review your updated template (hopefully with validation data) as soon as possible and provide you with feedback as we continue to work on pre-EUA200009. But based on the new FDA guidance on LDTs yesterday, this continued preEUA process should not delay patient testing using the UW test once you determine that all validations are completed.

Thanks,
Li

AMERICAN OVERSIGHT

# EMERGENCY USE AUTHORIZATION (EUA)

## EUA INTERACTIVE REVIEW TEMPLATE FOR MOLECULAR-BASED SINGLE TARGET TESTS FOR 2019 NOVEL CORONAVIRUS (2019-nCoV)

## GENERAL INFORMATION ABOUT THIS TEMPLATE

- Text highlighted in yellow ***[Text]*** should be completed by the IVD developer (sponsor) as applicable to their specific test. Text in **bold** outlines the Food and Drug Administration (FDA) suggestions and clarifications for the sponsors' consideration when completing the required information in a specific section.

- This is a EUA interactive review template for Pre-EUA/EUA submissions concerning molecular-based single target tests for detection of 2019 Novel Coronavirus (2019-nCoV), Wuhan, China. If you are developing a multiplex molecular-based assay for the detection and differentiation of nucleic acids from a panel of microorganisms, please review Appendix A for FDA recommendations.

- This is a EUA interactive review template for Pre-EUA/EUA submissions and not a guidance document. The template is subject to change as we learn more about the 2019-nCoV disease and its risk-benefit profile. Recipients will receive notice and updated templates as they become available.

- This EUA interactive review template is an FDA internal document and any proprietary information provided within the template and during the interactive review process will remain confidential as it does in a regular FDA premarket submission.

- Feedback provided by FDA during the interactive review of your pre-EUA/EUA is subject to change as we learn more about the 2019-nCoV disease and the risk-benefit profile evolves to address unmet public health needs.

- Prior to a potential authorization FDA will require developers of molecular-based tests to assess traceability of their test to an FDA-recommended reference material panel if available at the time. Specific details about the traceability study and the FDA-recommended reference material panel will be provided by the Lead Reviewer assigned to the Pre-EUA submission once the analytical and clinical evaluation data has been reviewed and found to be acceptable.

- Please be reminded that tests for the detection of 2019-nCoV or 2019-nCoV infection must not be distributed and/or used for clinical diagnoses without premarket clearance, approval, or EUA by the FDA. Clinical samples for 2019-nCoV testing should be sent to the appropriate public health laboratories until the IVD device subject of this Pre-EUA submission has received authorization from the FDA.

- Clinical specimens may be required to support the EUA request. Furthermore, please note that applicable regulations for human subject protection do apply under the

AMERICAN OVERSIGHT

EUA. Please refer to the Clinical Evaluation section of this document for more details.

- If authorized, the EUA means that this 2019-nCoV IVD is temporarily authorized for use until the public health emergency is terminated or the EUA is revoked by the FDA.

    - FDA recommends that you consider registration and listing your EUA product once you have been issued an EUA. If this is problematic, please notify the Agency during your Pre-EUA.
    - The EUA is not a pathway to permanent marketing of your device. Therefore, we strongly recommend that you consider, in addition to an EUA, a traditional premarket submission for your IVD so that your device can still be legally marketed after termination of the emergency declaration. We recommend that you identify as soon as possible in the Pre-EUA review process any consideration of moving your product forward towards De Novo/510(k) clearance. If so some of our feedback to you may take such a long-term goal into consideration in order to prevent additional testing where it may not be needed. Therefore, please consider submitting a Pre-Submission to inquire what studies would be required for a premarket approval/ clearance of your 2019-nCoV IVD. Details on how to submit a Pre-Submission to the Agency are outlined in the FDA guidance document: *Requests for Feedback and Meetings for Medical Device Submissions: The Q-Submission Program.* https://www.fda.gov/regulatory-information/search-fda-guidance-documents/requests-feedback-and-meetings-medical-device-submissions-q-submission-program

## A. EXECUTIVE SUMMARY (as of X/XX/20XX)

## B. PURPOSE FOR SUBMISSION

Emergency Use Authorization (EUA) request for distribution and/or use of the ***[test name]*** to ***[indicate labs, if applicable]*** for the *in vitro* qualitative detection of RNA from the 2019-nCoV in ***[add all claimed specimen types, e.g., nasopharyngeal/oropharyngeal swabs, sputa, BAL, stool, and serum, etc.]*** from patients who meet CDC 2019-nCoV clinical criteria (e.g., signs and symptoms associated with 2019-nCoV infection) and CDC novel coronavirus epidemiological criteria (e.g., history of residence in or travel to a geographic region with active 2019-nCoV transmission at the time of travel, or other epidemiologic criteria for which 2019-nCoV testing may be indicated) to aid in the diagnosis of 2019-nCoV infection.

## C. MEASURAND

AMERICAN OVERSIGHT

Specific nucleic acid sequences from the genome of the 2019-nCoV **[*please specify the targeted gene(s) of the pathogen*]**.

## D. APPLICANT

***[Official name, address and contact information of applicant]***

## E. PROPRIETARY AND ESTABLISHED NAMES

Proprietary Name - ***[test name]***
Established Name - ***[test name]***

## F. REGULATORY INFORMATION

***Approval/Clearance Status:***
The ***[test name]*** test is not cleared, CLIA waived, approved, or subject to an approved investigational device exemption.

***Product Code:***
[XXX – FDA will complete]

## G. PROPOSED INTENDED USE

***1) Intended Use:***
**The proposed IU will be finalized based on the data and recommendations from Public Health authorities at the time of authorization – example text is provided below for a qualitative molecular test that detects organism RNA but may be adapted according to the specific emergency situation addressed by the device.**

[***Test name***] is a [***specify test technology such as, real-time RT-PCR test***] intended for the qualitative detection of nucleic acid from the 2019-nCoV in [***describe all the specimen types***] from individuals meeting CDC 2019-nCoV clinical criteria (e.g., clinical signs and symptoms associated with 2019-nCoV infection) in conjunction with CDC 2019-nCoV epidemiological criteria (e.g., history of residence in or travel to a geographic region with active 2019-nCoV transmission at the time of travel, or other epidemiologic criteria for which 2019-nCoV testing may be indicated). Testing is limited to [***laboratories - certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA), 42 U.S.C. §263a, to perform high complexity tests, or by similarly qualified non-U.S. laboratories***].

Results are for the identification of 2019-nCoV RNA. The 2019-nCoV RNA is generally detectable in **[*name specimen type*]** during the acute phase of infection. Positive results

AMERICAN OVERSIGHT

are indicative of active infection. Laboratories within the United States and its territories are required to report all positive results to the appropriate public health authorities.

Negative results do not preclude 2019-nCoV infection and should not be used as the sole basis for patient management decisions. Negative results must be combined with clinical observations, patient history, and epidemiological information.

The ***[test name]*** is intended for use by **[*include intended user, e.g., trained clinical laboratory personnel specifically instructed and trained in the techniques of real-time PCR and in vitro diagnostic procedures*]**. The ***[test name]*** is only for use under the Food and Drug Administration's Emergency Use Authorization.

***2) Special Conditions for Use Statements:***

For prescription use only
For in vitro diagnostic use only

***3) Special Instrument Requirements:***

The ***[test name]*** test is to be used with the [***list all RT-PCR Instruments, software requirements, automated extraction instruments***].

## H. DEVICE DESCRIPTION AND TEST PRINCIPLE

**Example text has been added under each of the sub-headings below for a fluorescence based rRT-PCR test for detection of organism RNA. If a different test principle is used by the test for the detection of a specific analyte please modify the description accordingly to capture the salient points in each of the sub-headings below. Please note that for new investigative technologies FDA may request additional detailed information so we can adequately assess the risks and benefits associated with the device.**

***1) Product Overview/Test Principle:***

**Describe the technology of the test and how this technology works to identify the measurand, the instruments employed/required to perform the test from sample collection to result (include all claimed extraction and PCR detection instruments), and the specimen types for which you claim to have specific performance characteristics as described below. If applicable, list all primer and probe sets and briefly describe what they detect. Please include the nucleic acid sequences for all primers and probes used in the test. Please indicate if the test uses biotin-Streptavidin/avidin chemistry in any of the steps for coupling reagents. Please note that an alignment with available reference genomes for different strains of the target pathogen is requested as part of the inclusivity evaluation (Section N).**

The ***[test name]*** is a real-time reverse transcription polymerase chain reaction (rRT - PCR) test. The 2019-nCoV primer and probe set(s) is designed to detect RNA from

AMERICAN OVERSIGHT

the 2019-nCoV in ***[list all the specimens]*** from patients who meet CDC 2019-nCoV clinical criteria (e.g., signs and symptoms associated 2019-nCoV infection) in conjunction with CDC 2019-nCoV epidemiological criteria (e.g., history of residence in or travel to a geographic region with active 2019-nCoV transmission at the time of travel, or other epidemiologic criteria for which 2019-nCoV testing may be indicated).

2) ***Description of Test Steps:***

**List and describe in detail all the steps of the test sequentially from specimen collection to detection.**

Nucleic acids are isolated and purified from ***[specimens]*** using ***[please describe the method(s) of extraction (please specify the specimen input volume for extraction and/or test, the nucleic acid elution volume and whether isolation/purification is manual and/or automated)].*** The purified nucleic acid is reverse transcribed using ***[enzyme mix/kits – please specify the input volume of purified nucleic acid added to the rRT-PCR reaction mix]*** into cDNA which is then subsequently amplified in ***[please describe the instrument(s) and enzyme mix]***. In the process, the probe anneals to a specific target sequence located between the forward and reverse primers. During the extension phase of the PCR cycle, the 5' nuclease activity of Taq polymerase degrades the probe, causing the reporter dye to separate from the quencher dye, generating a fluorescent signal. With each cycle, additional reporter dye molecules are cleaved from their respective probes, increasing the fluorescence intensity. Fluorescence intensity is monitored at each PCR cycle by ***[please describe the detection instrument(s)]***.

3) ***Control Material(s) to be Used with [test name]:***

**List all control materials (provided with the test kit and/or required but not provided with the test kit and describe what they are, how they are expected to work, where in the testing process they are used, and the frequency of use. If a control is commercially available, provide supplier's name and catalog number or other identifier; if your device relies on external controls that are manufactured by a third party please note that these controls should also be validated within your analytical and clinical studies described below in Section (N).**

Controls that will be provided with the test kit include:

a) A "no template" (negative) control is needed to ***[describe need]*** and is used ***[describe use – please also specify frequency of use]***

b) A positive template control is needed to ***[describe need]*** and is used ***[describe use – please specify the concentration of the positive control relative to the LoD of your test (note that ideally the positive control concentration should be such that it is close to the LoD of your test) and also specify frequency of use]***

AMERICAN OVERSIGHT

c) An extraction control ***[describe control]*** is needed to ***[describe need]*** and is used ***[describe use – please also specify frequency of use].*** **Please note that if the no template control and positive control, are taken through the entire sample processing procedure, including the extraction, then a separate extraction control is not required**.

d) An internal control ***[describe control]*** is needed to ***[describe need]*** and is used ***[describe use]***.

Controls that are required but not provided with the test kit include ***[describe control – provide recommended sources of the control materials – either a separate control kit for purchase that you the applicant develops or a control material that can be purchased from a third party].*** This/these control(s) is/are needed to ***[describe need]*** and is used ***[describe use – please also specify frequency of use]***.

**Please note that any control recommended to be used with your device (provided with the kit or not) needs to be validated in the context of your analytical and clinical study (i.e., you will need to run these controls as part of your studies). In instances where control material is not readily available through 3rd party vendors (which is often the case at the beginning of an outbreak) FDA may request that you include suitable control material with your device. Please note that external control materials are considered particularly important in the context of EUA devices because often GMP requirements for the manufacture of the EUA device are waived in emergency situations and reagent stability studies are limited. Hence the external controls offer some assurance of EUA test performance in the hands of the end user.**

## I. INTERPRETATION OF RESULTS

All test controls should be examined prior to interpretation of patient results. If the controls are not valid, the patient results cannot be interpreted. **Please describe if a Ct cutoff is used as part of your testing algorithm and/or if the end user is required to review fluorescent curves for weakly positive samples before final interpretation. Although not typical for molecular-based tests, if the test result involves the use of an algorithm/calculation, for example a ratio value, when determining the final patient test result, please include a detailed description and any additional calibration materials that may be required.**

1) ***[Test name] Controls – Positive, Negative and Internal***

**Describe in detail the expected results generated, including acceptance criteria, for all the controls described in detail in Section H above. Describe the measured values (if applicable) for valid and invalid controls and outline the recommended actions the laboratory should take in the event of an invalid control result.**

AMERICAN OVERSIGHT

2) ***Examination and Interpretation of Patient Specimen Results:***

**Describe when clinical specimen test results should be assessed and outline the criteria for test validity**. **Example text**: Assessment of clinical specimen test results should be performed after the positive and negative controls have been examined and determined to be valid and acceptable. If the controls are not valid, the patient results cannot be interpreted.

**Clearly indicate how to interpret numeric test values (if applicable) as positive or negative for presence of the 2019-nCoV. Indicate if the end user is required to review fluorescent curves for weakly positive samples before final interpretation and how to identify indeterminate/inconclusive results (if they exist) results and how the user should resolve them, e.g. if repeat testing may be required.**

**When applicable, provide a table clearly describing the possible combinations of test result values for each primer/probe set, and how they should be combined into a final interpretation of the result for your test. If the test produces result that will be used as part of a CDC recommended testing algorithm, please indicate what follow-up testing/process should be conducted, if applicable.**

## J. PRODUCT MANUFACTURING

**Please note that if you are developing a test for use at a single site (i.e., a laboratory developed test LDT), some of the information requested in this section may not be applicable. Please contact FDA for additional guidance for an emergency use LDT.**

The ***[test name]*** has been validated using only the components referenced in this submission and shall not be changed without prior concurrence from the FDA.

*1)* ***Overview of Manufacturing and Distribution:***

The product will be manufactured at [***manufacturer's name and FDA registration number (if applicable) or laboratory name if an LDT***] by [***manufacturer name, or laboratory name if an LDT***] personnel consistent with practices for the production of **[*types of devices*]** based on [***type of quality system****]. Material manufactured by [***manufacturer's name, or laboratory name if an LDT***] may be bottled and kitted by [***packager name***] manufacturing facility.

***Under the Emergency Use Authorization (EUA) most of the 21 CFR 820 Quality System Regulation (QSR) requirements can be waived for the duration of the EUA. FDA expects that developers follow comparable practices as much as possible and may consider previous compliance history when determining whether or not to waive certain QSR requirements for a specific product. Please note adverse events, as per 21 CFR Part 803, have to be reported for authorized devices (see Section R).**

AMERICAN OVERSIGHT

The current manufacturing capabilities include the ability to manufacture approximately **[*please insert the approximate number of units/products that can currently be manufactured per week at the manufacturing facility*]** products per week, however in the event of a surge in demand this could be increased to **[*please insert the approximate maximum number of units/products that could potentially be manufactured per week at the manufacturing facility if there was a surge in demand*]** product per week within a **[*please specify in weeks/months the expected timeframe required to increase product production if required*]** timeframe.

The product will be distributed by **[*please describe the distribution plan for the product and list all current distributors*]**.

2) ***Components Included with the Test***

Components manufactured by [***manufacturer's name and FDA registration number (if applicable)***] and supplied with the test include:
**List all components and reagents provided for your test, including a description of the primers and probes, volumes, concentrations, quantities, buffer components, etc.**

3) ***Components Required But Not Included with the Test***

Components required but not included with the test:
**List all components and reagents not included with the test that must be supplied by the user to perform the test, with specific supplier names and catalog numbers or other identifiers for obtaining these components and reagents. Please include here all specific consumables that were validated for use with your device, that are not interchangeable with other products and that are needed to guarantee device performance as established in the EUA validation studies listed in Section N below.**

4) ***Testing Capabilities***

**Briefly describe current sample throughput capacity, total time required to perform the test (from clinical specimen collection, specimen transport to result), and number of tests that can be performed per instrument run and per day.**

5) ***Reagent Stability:***

**Briefly describe stability test plan for *[test name]* reagents and include any accelerated stability information if available. Please note that reagent stability studies do not need to be completed at the time of EUA issuance, however the study design should be agreed upon during interactive review and the stability studies started immediately following authorization, if not before. When designing your stability study, we have some general recommendations that are outlined in Appendix B, for your consideration.**

AMERICAN OVERSIGHT

## K. PERFORMANCE EVALUATION

**If you plan to claim multiple target analytes to aid in differential diagnosis or you plan to claim multiple RT-PCR instruments and/or extraction methods, please refer to Appendix A and C, respectively, more information. Please note that any omission of a requested study in this document should be documented and justified.**

### *1) Analytical Sensitivity:*

a) *Limit of Detection (LoD):* **You should determine the LoD of the device utilizing the entire test system from sample preparation to detection for each clinical matrix claimed. Please note that claims for additional anticoagulants, for blood specimens, can be supported by a matrix equivalency study as outlined in Section N, subsection 3 below. The LoD is determined using dilutions of live propagated and titered 2019-nCoV stocks (CFU/mL or PFU/mL) spiked into a relevant clinical matrix. If wild-type virus is not available at the time of your validation studies, please contact FDA to discuss a potential alternative. Please note that if available please also provide Genomic Equivalent Copies (GEC)/mL units for the stock solutions used and include an explanation on how they were determined. Please note that LoD studies should be performed with live organisms, as described above. If you plan to use inactivated organism in your LoD determination you should describe how the material was inactivated and perform a study to determine whether the inactivation process impacted the LoD of the device.**

**First a tentative LoD must be established through limiting dilutions of the prepared material with 3-5 replicate measurements. Please note for all the analytical studies described in Section N that require replicate testing, one replicate equates to one independent extraction and PCR detection. Once a tentative LoD is established, the LoD should be confirmed by preparing at least 20 additional replicates at the LoD concentration and demonstrating that the organism was detected with a minimum 95% positivity (19/20). If this confirmatory study achieves a positivity of 100%, then a lower concentration needs to be tested (with 20 replicates) until <100% positivity is obtained.**

**Please use the following format when submitting LoD information and data:**

LoD studies determine the lowest detectable concentration of 2019-nCoV at which approximately 95% of all (true positive) replicates test positive. The LoD was determined by limiting dilution studies using characterized samples.

**List/describe the following in this section:**

- **Titers and strains of the 2019-nCoV stocks used for the LoD study and describe how the organism stocks were prepared and how the titers were determined.**

AMERICAN OVERSIGHT

- **The dilution factor and number of serial dilutions of the characterized 2019-nCoV that were tested to determine the LoD for each primer and probe set.**
- **The nucleic acid extraction/purification method.**
- **The real time PCR instrument.**

Serial dilutions of the characterized 2019-nCoV were then tested in **[*number of replicates (i.e., recommend that sample is extracted independently three-five times and each extraction tested once)*]** replicates. The lowest concentration at which all [***number of replicates***] replicates were positive was treated as the tentative LoD for each test. The LoD of each test was then confirmed by testing [***number of replicates (at least 20 recommended)***] with concentrations at the tentative limit of detection. The final LoD of each test was determined to be the lowest concentration resulting in positive detection of [***number of positive replicates (at least 19 out of 20 replicates)***]. [***Include analysis of LoD results, indicating the final LoD for each test***]

**Tentative LoD: [*Please provide a summary of the data for each strain tested]* example table 2019-nCoV stocks is provided below:**

| 2019-nCoV Strain Tested | Stock 2019-nCoV Titer | Serial 10-Fold Dilution Factor | Concentration in Dilution Tested [Include Units] | Replicate 1 $C_t$ | Replicate 2 $C_t$ | Replicate 3 $C_t$ | Replicate 4 $C_t$ | Replicate 5 $C_t$ | Call Rate | Lowest Concentration with Uniform Positivity per Analyte | Limit of Detection (LoD) per Virus Strain |
|---|---|---|---|---|---|---|---|---|---|---|---|
| ***Example:*** *[analyte]* | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |

b) FDA Sensitivity Evaluation: The analytical sensitivity of the test has to be further assessed by evaluating an FDA-recommended reference material using an FDA developed protocol if applicable and/or when available. Details will be provided during the Pre-EUA interactive review.

c) *Reactivity/Inclusivity:* Reactivity of the ***[test name]*** was evaluated for additional isolates of 2019-nCoV.

**Reactivity: *[test name]* example table below**

| 2019-nCoV Strain/Isolate | Source/Sample Type* | Concentration | Ct** |
|---|---|---|---|
| | | | |
| | | | |
| | | | |

AMERICAN OVERSIGHT

| | | | |
|---|---|---|---|
| | | | |

***Please list source of material used for wet testing and sample type tested (i.e., organism – live or inactivated, purified nucleic acid – whole genome etc.).**
**** If your technology does not produce Ct values, please include instead the signal output for your specific device technology.**

**At a minimum, the strain used in your LoD evaluation should be listed here (multiple isolates of the same 2019-nCoV strain that was used for the LoD studies can also be included if available). If additional isolates are not available at the time of your validation studies, please discuss with FDA. Each isolate should be tested at or near the LoD (no more than 3x LOD) of the test, spiked into clinical matrix utilizing the entire test system, including extraction. If you plan to claim more than one type of clinical matrix, we recommend that you perform this study in the most challenging clinical matrix, testing a minimum of 3 replicates. In addition, the wet testing should be accompanied by extensive inclusivity *in silico* analysis of the test primer and probes with all known strains/isolates (past/present) of 2019-nCoV (including the strain/isolate used for wet testing).**

## 2) *Analytical Specificity:*

a) *Cross-Reactivity:* Cross-reactivity of the ***[test name]*** was evaluated using both *in silico* analysis and by testing whole organisms **[*pathogen*]** (concentration) or purified nucleic acid from other ***[describe organisms]*** (concentration/reaction).

**Cross-Reactivity: *[test name]* example table for wet tested organisms below**

| Virus/Bacteria/Parasite | Strain | Source/ Sample type | Concentration | Ct Values* |
|---|---|---|---|---|
| | | | | |
| | | | | |
| | | | | |

***If your technology does not produce Ct values, please include instead the signal output for your specific device technology.**

**Cross-reactivity studies are preformed to demonstrate that the test does not react with related pathogens, high prevalence disease agents and normal or pathogenic flora that are reasonably likely to be encountered in the clinical specimen. The FDA Tables 1 and 2, below are intended to recommend simulate testing of patients having infections with organisms which cause similar symptoms to those observed at the onset of 2019-nCoV infection. The FDA Tables also include other organisms and strains which have significant genetic similarity and therefore a higher likelihood of cross-reacting with 2019-nCoV specific reagents. Also included in the FDA Tables are recommended unclaimed organisms/strains which are likely to be endemic to the currently affected area should be included in cross-reactivity testing since these organisms/strains will be an important aspect of the differential diagnosis of 2019-nCoV infection.**

AMERICAN OVERSIGHT

**FDA Table 1 Cross-Reactivity: List of Organisms to be wet-tested and analyzed *in silico* (for tests detecting 2019-nCoV) in respiratory material or blood specimens**

| Other high priority pathogens from the same genetic family | High priority organisms likely in the circulating area |
|---|---|
| Human coronavirus 229E | Adenovirus (e.g. C1 Ad. 71) |
| Human coronavirus OC43 | Human Metapneumovirus (hMPV) |
| Human coronavirus HKU1 | Parainfluenza virus 1-4 |
| Human coronavirus NL63 | Influenza A |
| SARS-coronavirus | Influenza B |
| MERS-coronavirus | Enterovirus (e.g. EV68) |
| | Respiratory syncytial virus |
| | Rhinovirus |
| | *Chlamydia pneumonia* |
| | *Haemophilus influenzae* |
| | *Legionella pneumophila* |
| | *Mycobacterium tuberculosis* |
| | *Streptococus pneumonia* |
| | *Streptococcus pyogenes* |
| | *Bordetella pertussis* |
| | *Mycoplasma pneumoniae* |
| | *Pneumocystis jirovecii* (PJP) |
| | Pooled human nasal wash - *to represent diverse microbial flora in the human respiratory tract* |
| | |

**FDA Table 2 Cross-Reactivity: List of Organisms to be analyzed *in silico* (for tests detecting 2019-nCoV) in respiratory material or blood specimens:**

| Other high priority pathogens from the same genetic family | High priority organisms, including organisms commonly found in the clinical matrix |
|---|---|
| | Influenza C |
| | Parechovirus |
| | *Candida albicans* |
| | *Corynebacterium diphtheriae* |
| | *Legionella non-pneumophila* |
| | *Bacillus anthracis* (Anthrax) |
| | *Moraxella catarrhalis* |
| | *Neisseria elongate and meningitidis* |
| | *Pseudomonas aeruginosa* |
| | *Staphylococcus epidermis* |
| | *Staphylococcus salivarius* |
| | *Leptospirosis* |

AMERICAN OVERSIGHT

| | |
|---|---|
| | *Chlamydia psittaci* |
| | *Coxiella burnetii (Q-Fever)* |
| | *Streptococcus aureus* |
| | |

***In silico*** **analysis should be performed on all potentially cross-reactive organisms outlined in the FDA Tables 1 and 2 above. You should provide the result summary of the** ***in silico*** **blast analysis (tabular format) evaluating whether there is any significant amplification of non-target sequences that could either result is cross-reactivity or potentially interfere with the detectability of the actual target analyte. As such we are asking that you provide individual blast results (non-truncated alignments) for each of the primers and probes used in your device with potential cross-reacting organisms. Please provide for our review the percent sequence homology for each organism relative to the target analyte primers/probes in your test. Please use the example table below when presenting the results of** ***in silico*** **analysis in your submission:**

**Results of *In Silico* Analysis**

| Pathogen | Strain | GenBank Acc# | % Homology Test FP (i.e. 0-100%) | % Homology Test RP | % Homology Test Probe |
|---|---|---|---|---|---|
| | | | | | |
| | | | | | |

**The analysis should include multiple representative strains from GenBank for each organism. If** ***in silico*** **analysis reveals other potential cross-reactants (i.e., ≥80% homology between one of your primers or the probe to any of the sequences of listed potential cross reactants), you should carefully review the alignments and determine based on the positions of the homologous stretches and mismatches if additional cross-reactivity and/or interference (please refer to item b below – microbial interference studies) wet testing will be required to rule out cross-reactivity or interference of that organism that may affect the performance of your device. In these circumstances if wet-testing is omitted you should include an explanation as to why** ***in silico*** **generated data is not clinically relevant (irrelevant isolate, location/extent of match within primer/probe, etc.), or why the performance of your test would not be impacted.**

**Organisms in FDA Table 1 should be wet tested in addition to the** ***in silico*** **analysis. Omissions from wet-testing should be discussed with FDA and supported by a well-documented justification that includes a due diligence attempt to obtain the live or inactivated organisms (and/or purified nucleic acid – which is acceptable for cross reactivity evaluation for an EUA).**

AMERICAN OVERSIGHT

**The wet testing evaluation should reflect test specimens prepared at the highest clinically relevant level of organism (i.e., a minimum of $10^6$ CFU/ml or higher for bacteria and $10^5$ $TCID_{50}$/mL or PFU/ml or higher for viruses) and should be tested with a minimum of three replicates per organism test specimen. Test specimens can be prepared by spiking cultured isolates/inactivated organisms/ purified nucleic acids (whole genome) into negative clinical matrix and determining cross reactivity based on triplicate replicates. If you plan to claim more than one type of clinical matrix, please note that if significant differences in LoD are observed for the different clinical matrices this may warrant this study being performed in more than one clinical matrix.**

**If you plan to claim non-blood or non-respiratory clinical specimen types for diagnostic use with your device, e.g., stool specimens, etc., please consult FDA for more information on additional organisms that may be recommended for cross-reactivity testing, common examples are provided below for stool specimens (FDA Table 3):**

**FDA Table 3: Organisms to be analyzed for non-blood clinical specimens:**

| **Stool** |
|---|
| *Escherichia coli* |
| *Lactobacillus* |
| *Bacillus* spp. |
| *Clostridium* Spp. |
| *Enterobacter* |
| *Enterococcus* |
| Fusobacterium |
| Bacteroidetes |
| Bifidobacterium |
| Ruminococcus |
| |

b) *Microbial Interference Studies:* **If *in silico* analysis reveals ≥ 80% homology between the cross-reactivity microorganisms and your test primers/ probe(s), we recommend that you either perform (1) a microbial interference study with 2019-nCoV and the microorganisms that your test primers/ probe(s) have homology to, (2) as an alternative to the microbial interference study, you may provide justification as to why (e.g., amount of primer(s)/ probe(s) included in your master mix) the performance of your test would not be impacted by the presence of a causative agent of a clinically significant co-infection, or (3) explain why the *in silico* results are clinically irrelevant. In the case of the microbial interference study, interference should be evaluated using samples spiked at a low 2019-nCoV concentration, at 3x LoD, and a high interferent level (either microorganisms or nucleic acids purified from them), to represent the worst-case scenario, with a minimum of 3 replicates. If you plan to claim more than**

AMERICAN OVERSIGHT

**one type of blood clinical matrix, please note that if significant differences in LoD are observed for the different clinical matrices this may warrant this study being performed in more than one clinical matrix. If the LoDs are similar in the blood clinical matrices the study should be performed in the most challenging matrix, i.e., whole blood. In addition, if you are claiming blood and non-blood clinical specimens you may be required to perform this study in more than one clinical matrix. If interference is observed at the level tested, an additional titration study should be performed to determine the highest microorganism interferent level the 2019-nCoV test can tolerate.**

**c)** *Endogenous Interference Substances Studies*: **The extent of testing for endogenous interference substances depends on the matrix that is claimed for the device as well as on the technology of the device, e.g., if a nucleic extraction procedure is performed prior to testing or not. For EUA we do not typically ask for interference studies for tests that use conventional PCR and/or well-established extraction methods prior to testing (e.g., Boom method and column-based extraction methods).**

**For extraction procedures that are new or for nucleic acid-based technologies that are different from conventional PCR (e.g., various isothermal methods), we expect testing of potential interferents. The impact of interfering substances should be evaluated over the expected clinical range of the potentially interfering substance. Potential sources of endogenous interference include, but are not limited to, the ones listed in the tables below. It is important to note that the evaluation of interference and the generation of false negative results should be done using samples containing the analyte at or near the LoD and should not exceed 3x LoD. You should test a minimum of 3 replicates per substance. If you plan to claim more than one type of clinical matrix, please note that if significant differences in LoD are observed between the different clinical matrices this may warrant this study being performed in more than one clinical matrix. Biotin interference poses a risk to laboratory tests that incorporate the free biotin-streptavidin capture method. Therefore, please review this safety communication https://www.fda.gov/medical-devices/safety-communications/fda-warns-biotin-may-interfere-lab-tests-fda-safety-communication and the following DRAFT guidance - Testing for Biotin Interference in In Vitro Diagnostic Devices (Web view) to determine if biotin interference testing may be warranted for your device. We also recommend you consult with FDA prior to initiating biotin interference testing, if applicable.**

**The tables below indicate the potentially interfering substances that may be found in blood and respiratory specimens. For other non-blood specimen types, such as stool, the list of substances could be expanded – please consult with FDA.**

**Interfering Substances: *[test name]* Example table below for evaluation of interfering substances for the ability to generate false *positive* results:**

AMERICAN OVERSIGHT

| Potential Interfering Substance | Concentration | Results (Detected X/3) |
|---|---|---|
| **Respiratory Specimens** | | |
| Mucin: bovine submaxillary gland, type I-S | | |
| Blood (human) | | |
| Nasal sprays or drops | | |
| Nasal corticosteroids | | |

### 3) *Matrix Equivalency (if applicable):*

**A matrix equivalency study may be used to support certain specimen type claims that were not evaluated during the clinical study (e.g., serum versus plasma, use of different anticoagulants, use of difference swab types or viral transport media, etc.). Please note that LoD and clinical specificity studies are required for all claimed matrices. The matrix in which the clinical studies are conducted is the comparator. All other matrices are to be shown to be equivalent to the comparator matrix. We request a minimum of 40 paired samples each obtained from individual persons; negative (10 samples), low positive (1.5-2xLoD, 20 samples), and moderate positive (5-10xLoD, 10 samples) samples should be tested. Positive samples are prepared by spiking paired negative clinical matrix with the same amount of target analyte. Please note that individual (and not pooled) samples should be used in this study.**

### 4) *Comparative Limit of Detection (LoD) of the Test vs. the Comparator Method:*

**A comparative LoD study may be required to support use of a comparator method in your clinical evaluation that has not been validated with a specific specimen type. The comparative LoD study should be conducted testing the same dilution series using both, your test and the comparator you chose in parallel (to dilution endpoints for both tests), 3-5 replicates per dilution level are sufficient for this study.**

AMERICAN OVERSIGHT

5) ***Specimen Stability and Fresh-frozen Testing:***

**A specimen stability study may be required to support specimen stability claims in the instructions for use outside of those typically outlined in CSLI standards. A fresh/frozen and/or freeze/thaw study may be required to support the use of frozen specimens if they are used as part of the clinical evaluation. Please consult with FDA concerning an appropriate study design prior to initiating any studies.**

6) ***Clinical Evaluation:***

**This section should describe the clinical study used to evaluate the performance of your test. Please note that the exact requirements for the clinical evaluation will be very dependent on, access to 2019-nCoV disease clinical specimens at the time of the studies and the nature of the emergency. Our general clinical study evaluation recommendations for respiratory and serum clinical specimens are outlined below. If you are interested in claiming additional specimen types, for example, stool, please contact FDA for current recommendations. Please note these clinical study recommendations may be subject to change as we continue to learn about the 2019-nCoV disease or as the risk benefit analysis changes.**

**The clinical performance in general should be evaluated for each unique claimed clinical specimen type - with the exception of claims that can be supported by a matrix equivalency study (outlined in Section 3 above). The performance characteristics should ideally be established using a clinical study with a limited number of prospective samples. If a prospective study is not feasible, an acceptable alternative would be to test retrospectively collected 2019-nCoV nucleic acid negative and positive specimens from patients, accompanied by some basic information such as, the specimen collection date, date of onset of symptoms (if present/known), tests used to identify 2019-nCoV nucleic acid positive specimens, etc. Depending on the nature of the disease, if no prospective or retrospective specimens are available at the time of your pre-EUA submission for the 2019-nCoV disease we may accept a fully contrived clinical evaluation. The clinical evaluation should be comprised of a minimum of 100 negative individually collected specimens and 50 individual positive specimens (prospective, retrospective and/or contrived). Use of pooled specimens are not acceptable for the clinical evaluation of your test. Please see FDA Table 5 for more details. Please note that if a fully contrived clinical study is used to support your Pre-EUA submission, additional clinical testing of a limited number of natural clinical positive specimens and potentially negative specimens from the endemic region, if available, may be required at the time when this Pre-EUA transitions to an EUA as a result of an Emergency declaration for 2019-nCoV disease.**

AMERICAN OVERSIGHT

## FDA Table 5: Clinical study Recommendations:

| Details | Study Including Prospective/ Retrospective Specimens | Fully Contrived Sample Study |
|---|---|---|
| Minimum Number of Positive Specimens | 50<br><br>The number of natural (prospective/retrospective) positive clinical specimens should be at least 25 (collected from symptomatic patients in the 2019-nCoV disease endemic region(s)) and, if necessary, may be supplemented with contrived samples to generate the total of 50 positive specimens. Contrived samples should be prepared as described in the fully contrived sample study column. | 50<br><br>The contrived positive samples should be made in individual negative clinical matrix collected from subjects from a non-endemic population (pooled matrix is not acceptable for the clinical evaluation). Please note that the negative clinical matrix used for spiking should be confirmed negative by your test device prior to spiking. Half of the contrived positive samples can be prepared by spiking the 2019-nCoV at LoD and the remaining contrived positive samples should cover the range of the test up to and not higher than 5 x LoD.<br><br>Negative respiratory specimens: Can be archived/retrospective samples collected from US patients with signs and symptoms of respiratory infection.<br><br>Negative blood specimens: Can be collected from healthy subjects from non-endemic areas. |
| Minimum Number of Negative Specimens | 100<br><br>Note: In general, for EUA the 100 individual negative samples can be collected from; (1) archived/retrospective samples collected from US patients with signs and symptoms of respiratory infection for respiratory specimens, and (2) healthy subjects from non-endemic areas for blood specimens, that are "expected 2019-nCoV disease negative". Note these negative specimens can be used to also prepare any contrived positive specimens used in support of the clinical evaluation of the test.<br><br>Please note this recommendation is dependent on the current outbreak situation and is subject to change as we learn more about the 2019-nCoV disease/outbreak. If the outbreak situation for 2019-nCoV disease is primarily outside of the continental U.S. (OUS) it may be beneficial to consider collecting negative specimens that represent 50% endemic and 50% non-endemic regions. If negative specimens are collected from the endemic region of the 2019-nCoV disease these should be tested with the same comparator chosen for the positive specimens (more details provided below). For non-endemic collected specimens you can compare to the expected "negative" result. | |
| Recommended Comparator Method | Positive: Positive percent agreement should be calculated in comparison to a EUA PCR test (please see the following website for the most recent list of FDA authorized 2019-nCoV | Positive: Compare to expected result.<br><br>Negative: See Minimum Number of Negative Specimens row |

AMERICAN OVERSIGHT

| | | |
|---|---|---|
| for percent agreement performance calculations | tests: https://www.fda.gov/MedicalDevices/Safety/EmergencySituations/ucm161496.htm. If no EUA test available at the time of your EUA submission, please consult with FDA about your choice of comparator method – which ideally should be a well validated PCR test with comparable sensitivity to your subject device. Please note that a well validated PCR test should include evaluation of the tests LoD, inclusivity, exclusivity, interference and any clinical testing.<br><br>Negative: See Minimum Number of Negative Specimens row | |
| Comparator Method Note 1 | Please note when using natural clinical specimens, the comparator method must be validated for the specimen type claimed – if not you should perform a Comparative Limit of Detection (LoD) of the Test vs. the Comparator Method study, as explained above (Section 4), to support its use as a comparator method in your clinical study. | N/A |
| Comparator Method Note 2 | Any occurrences of false results should be investigated with an additional validated PCR test and/or targeted sequencing, and the results of the discordant analysis can be footnoted in your final performance table but cannot be used to change the final performance calculations. | |
| Natural Clinical Specimens IRB/Informed Consent Note | For clinical specimens collected to support the EUA request, please note that sample collection needs to adhere to all applicable rules of human subject protection; as such, sample collection needs IRB approval, which includes review of the informed consent forms. Samples need to be collected with informed consent. If leftover de-identified samples are used, FDA exercises enforcement discretion regarding the informed consent requirement if the specimen collection meets the criteria described in the FDA Guidance on Informed Consent for In Vitro Diagnostic Device Studies Using Leftover Human Specimens that are Not Individually Identifiable (http://www.fda.gov/cdrh/oivd/guidance/1588.pdf).<br>**Note that IRB approval is still required even if leftover de-identified samples are used in your study.** | |
| Additional Studies Warning | N/A | If fully contrived samples were used in your Pre-EUA submission, additional testing of natural clinical specimens may be requested, if available, to support transition of the Pre-EUA to EUA as a result of an Emergency declaration. |
| Testing Approach Note 1 | Please note all clinical specimens (natural and contrived) should be evaluated in accordance with your proposed diagnostic algorithm, including retesting when appropriate. We understand the limited nature of natural specimens may preclude retesting. In instances were retesting is indicated but not performed, for the purposed of performance evaluation, initial results will be analyzed for performance and equivocal/indeterminate results count against your final performance. | |
| Testing Approach Note 2 | Specimens should be tested in a blinded fashion, e.g., positive and negative samples should be mixed and blinded to the end user, end user should also be blinded to the results of any comparator method testing. | |

AMERICAN OVERSIGHT

**When you describe your clinical study please indicate/include:**

- **How the specimens were generated/collect/sourced**
- **If the study was fully prospective, mix of prospective, retrospective and/or contrived or fully contrived**
- **The rationale for the concentrations/specimens selected (if using contrived or 3-party sourced specimens)**
- **The total number of specimens tested**
- **The specimen types (clinical matrix)**
- **A summary of the study results**

**In the case of real-time PCR tests, please provide the line data in an Excel file as part of the Pre-EUA submission for each specimen (please indicate for each specimen if it was prospective, retrospective or contrived and the clinical matrix it represents); the data should include the $C_T$ values (for the specimen and the controls) and call/result for your device and, in the case of the natural clinical specimens, the comparator method results should be included as well.**

## L. UNMET NEED ADDRESSED BY THE PRODUCT

**This section will be finalized by FDA based on the state of the emergency at the time of authorization and based on recommendations from Public Health authorities at that time. Example text is provided below but may be adapted according to the specific emergency situation that is addressed by the device and the need at the specific time of the outbreak.**

[Outline background of pathogen, disease and current outbreak]

[Outline details of the disease such as the following:

- likely sources of transmission
- likely symptoms – if any
- Prevalence of symptomatic disease (what fraction of infection results in symptomatic disease)]

Laboratories in the United States are in need of diagnostic tools for use in the 2019-nCoV emergency for rapid diagnosis of acute 2019-nCoV infection.

A public health emergency has been declared by the Secretary of Health and Human Services (HHS) on [Month Day, YEAR] justifying the authorization of emergency use of *in vitro* diagnostic tests for detection of 2019-nCoV and/or diagnosis of 2019-nCoV infection.

The ***[test name]*** can augment clinically important laboratory evidence for individuals with active infection. The 2019-nCoV nucleic acid is generally detectable in [name

AMERICAN OVERSIGHT

specimen type] during the acute phase of infection (approximately [7] days following onset of symptoms, if present) [and possibly for longer in other specimen types].

Under emergency use authorization (EUA), ***[applicant name]*** plans to distribute the test or accept sample for testing with the ***[test name]*** for the detection of nucleic acid from 2019-nCoV in clinical specimens collected from individuals meeting CDC's 2019-nCoV clinical and/or epidemiological criteria. This EUA request for the ***[test name]*** is intended to expand domestic readiness within the United States and its territories by expanding diagnostic testing capabilities for 2019-nCoV during public health emergency.

FDA consulted with subject matter experts within HHS on the public health needs for diagnostic devices to detect 2019-nCoV nucleic acid. It is FDA's conclusion that there currently exists a public health need for such devices, i.e., that there is no adequate, approved (cleared), and available alternative to the ***[test name]*** for 2019-nCoV detection during the public health emergency.

## M. APPROVED/CLEARED ALTERNATIVE PRODUCTS

Currently no methods for the detection of the 2019-nCoV have been approved/ cleared by FDA.

## N. RISKS AND BENEFITS:

**The Risks and Benefits section should be updated according to your specific device, some example language is given below but should be tailored to the device and the disease.**

Risks

The ***[test name]*** has been designed to minimize the likelihood of false test results. However, should false results occur, they may present risks to patients:

- False positive result:
  - A false positive 2019-nCoV result could [***update based on the pathogen***].
  - A false positive result in the context of the current public health emergency could lead to misallocation of resources used for surveillance and prevention.
  - A false positive result could delay correct diagnosis and initiation of appropriate treatment for the actual cause of patient illness.
- False negative result:
  - Although a negative result does not rule out 2019-nCoV infection, a false negative has the potential to result in initiation of inappropriate treatment and a delay in correct diagnosis.
  - A false negative result can trigger a waste of health care resources, as additional evaluations are pursued in the effort to establish the true diagnosis.
  - A false negative results can contribute to further spread of the disease.

Benefits

AMERICAN OVERSIGHT

The primary benefit of distributing the ***[test name]*** for clinical use is that it provides a relatively fast diagnostic method for symptomatic patients, which enables faster intervention.

- True positive test results provide support for the diagnosis of a 2019-nCoV infection. The results can be used in conjunction with clinical and epidemiological information to guide patient management.
- Distribution of the factsheets can help healthcare professionals and the public learn more about 2019-nCoV disease and how to avoid acquiring it.

Risk Assessment

- Negative results may not preclude a 2019-nCoV infection. It is emphasized that the ***[test name]*** should not be used as the sole basis for treatment or other patient management decisions. The clinical features of the illness and the type and risk of exposure must be considered pivotal to making patient management decisions. A negative test should not be interpreted as definitive, if other aspects of the patient's clinical presentation or recent epidemiologic exposures indicate such is likely, and diagnostic tests for other diseases are negative.
- False negative results due to failure of PCR are minimized by the presence of controls that monitor nucleic acid extraction and PCR efficiency.
- Risk of patient discomfort or harm during sample collection is minimal.

Risk-Benefit Assessment

The risks posed by use of the ***[test name]*** are mitigated by:

- Use of the ***[test name]*** in conjunction with other laboratory, epidemiological, and clinical evaluation tools
- Distribution of Healthcare Provider and Patient fact sheets.
- Post-market studies/reporting or conditions of Authorization.

Based on these factors, the potential benefits from the use of the ***[test name]*** are expected to outweigh the risks.

## O. FACT SHEET FOR HEALTHCARE PROVIDERS AND PATIENTS:

**Include proposed Fact Sheets for Patients and Healthcare Providers**

## P. INSTRUCTIONS FOR USE/ PROPOSED LABELING/PACKAGE INSERT:

**Include Instructions for Use, Box Labels, Vial Labels and any other proposed labeling.**

## Q. RECORD KEEPING AND REPORTING INFORMATION TO FDA:

AMERICAN OVERSIGHT

[***Manufacturer name***] will track adverse events and report to FDA under 21 CFR Part 803. A website is available to report on adverse events, and this website is referenced in the Fact Sheet for Health Care providers as well as through the [***Manufacturer name***] Product Support website: [***Include link to Website***]. Each report of an adverse event will be processed according to [***Manufacturer name]***'s Non-Conformance Reporting Requirements, and Medical Device Reports will be filed with the FDA as required. Through a process of inventory control, [***Manufacturer name]*** will also maintain records of device usage/purchase. [***Manufacturer name]*** will collect information on the performance of the test, and report to FDA any suspected occurrence of false positive or false negative results of which [***Manufacturer name]*** becomes aware. [***Manufacturer name]*** will maintain records associated with this EUA and ensure these records are maintained until notified by FDA. Such records will be made available to FDA for inspection upon request.

## R. ADMINISTRATIVE INFORMATION:

**Interactive Review Log:** Please use the table below to document interactive review with FDA and include interactions initiated by either FDA or yourself

| **Date** | **Type of Interaction** (phone/ email/ formal submission-DCC) | **Brief Description** (e.g., questions asked/ feedback from FDA received / any word documents included) |
|---|---|---|
| [X] | [X] | [X] |
| | | |
| | | |

## S. FDA ADMINISTRATIVE INFORMATION:

**This section will be finalized by the FDA Lead Reviewer upon completion of the review process and documents the interactive review of this submission and any conclusions resulting from the interactive review.**

1) **Summary of Interactive Review – Lead Reviewer to use this section to highlight any major issues solved during interactive review.**
2) **Final Conclusions for Interactive Review -** It is FDA's conclusion that there currently exists a public health need for such devices, i.e., that there is no adequate, approved (cleared), and available alternative to the ***[test name]*** for [pathogen] detection during the public health emergency. **Conclusion should include an outline the unique features of the device compared to currently issued EUA's under the declaration, if applicable.**
3) **Upon competition of this section the Lead Reviewer should also sign this document and save the file as the final Decision Memorandum.**

AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

## APPENDIX A – Multiplex Panels Under EUA:

An emergency declaration by the HHS Secretary is typically specific for a pathogen/disease (i.e., there is a publicly declared health emergency involving a particular etiologic agent). Therefore, the EUA pathway is only applicable for testing patients with signs/symptoms/risk of exposure for that single agent in a given emergency. FDA has occasionally allowed limited additional target pathogens to be claimed for EUA devices, but panel members must be relevant to the event/disease outbreak subject of the specific emergency declaration. When determining whether to issue an EUA for a multiplex panel FDA takes into consideration the utility of the test (multiplex pathogen detection as an aid in differential diagnosis), clearance/approval status of IVDs for the other panel members, whether the proposed Intended Use fits within the HHS emergency declaration and the how the multiplex panel would fit into current public health authority patient testing algorithm recommendations. We recommend you contact FDA for specific feedback if you plan to claim multiple target analytes as part of your EUA test. If it is determined that a multiplex test is beneficial to the emergency response, please note that analytical and clinical evaluations for each of the target analytes will be required.

## APPENDIX B – General Study Design Recommendations for Reagent Stability:

- For EUAs you may follow the current FDA recognized CLSI Standard EP25 – Evaluation of Stability of In Vitro Diagnostic Reagents; Approved Guideline when evaluating the suitability of stability study designs. If you are planning to pursue a De Novo/510(k) for your device we recommend discussing in more detail your stability design to facilitate potential use of the EUA data in your regular premarket submission.
- Please note that use of only the positive controls is not acceptable for reagent stability evaluation because controls are usually formulated at a moderate positive level. For all the stability evaluations in addition to your external positive and negative controls and the no-template control you should include for the EUA evaluation at least one sample, that should be prepared by spiking negative clinical matrix at an analyte concentration of 3-5xLoD.
- If you are claiming multiple blood clinical specimen types in which similar LoDs are determined, you should use the most challenging clinical matrix for this study.
- Please note we typically recommend your stability study design includes the evaluation of at least 5 replicates. You should also evaluate, if available, 3 different lots of reagents.
- You should design your study to provide data for a timeframe that is about 10% longer than the one to be claimed – for example; a claim of 18 months should be supported by stability data out to 20 months and a claim of 7 days should include stability data out to 8 days.
- FDA considers 15-30°C to represent room temperature conditions. Ideally you should evaluate stability at both 15°C and 30°C, however, for the purposes of the EUA evaluation at 30°C is acceptable as the worse-case scenario.
- Shelf-Life Stability- Unopened kit:
    - You should evaluate real-time kit stability studies with unopened kits stored at the claimed storage temperature for your test.

AMERICAN OVERSIGHT

  - Accelerated stability evaluations for unopened kits is acceptable for EUA submissions while the real-time studies are on-going. However, please note real-time stability data is required to support regular pre-market submissions and for the final claim of an EUA.
- Shipping Stability - Unopened kit: Study should evaluate the anticipated handling and shipping times and temperatures expected for unopened kits.
- In-use/Opened Kit Stability: Depending on your device your stability study design should also support in-use stability of the kit reagents once the kit has been opened, e.g., storage at 2-8 $^{o}$C for 7 days. This includes on board stability once reagents have been placed on the instrument (if applicable).
- Inverted stability (if applicable): Study should support inverted stability for of kits.
- Freeze-thaw Stability: If you recommend aliquoting the reagents to meet the end-users needs following the initial thaw this recommendation should be supported by a freeze-thaw stability study, including the specific number of allowed freeze-thaw cycles.
- FDA analysis recommendations for real time stability studies are as follows:
  - Baseline of the study (t=0 of stability study) should not exceed a month from bottling
  - Clear baselines should be described (e.g., a month from bottling) for each stability claim under each study
  - Claims should be determined based on regression analysis. Any %change (%shift) from time zero (baseline) should be calculated between the target claim and the zero-time as (Ttest-Tbaseline)/ Tbaseline*100 with 95%CI using the regression equation obtained from plotting the mean values. When formulating your acceptance criteria for evaluating the shift from baseline you should consider the reproducibility of your device. However, generally, that the shift at the target claim due to storage cannot exceed 10-15%. The target stability is the next to last tested point that was within +/- 10% of time zero.
  - Acceptance criterion may be different, depending on the test samples analyte concentration distribution in the intended use population and the risk, in other words, the impact of false results to public health.

**APPENDIX C – Claiming Multiple Instruments and/or Extraction Methods:**

If you wish to claim multiple instruments and/or extraction methods for use with your test, please review the study recommendations provided below and contact FDA for any additional feedback. Please note that these analytical and clinical evaluation recommendations are based on the assumption that the elution volumes from the extraction methods and PCR volumes on the different RT-PCR instruments are identical.

- Limit of Detection (LoD): Please note that these studies should be repeated for each clinical matrix claimed in the Intended Use. Pick one RT-PCR instrument and determine the tentative LoD (using 5 replicates in 10-fold dilution) followed by the confirmatory LoD (20 replicates spiked at tentative LoD) for each extraction method on the chosen instrument. Note: If you detect 20/20 replicates in your confirmatory LOD study you should test the next lower concentration, using a 3-fold dilution, until

AMERICAN OVERSIGHT

you achieve a hit rate of <20/20.

- If the different extraction methods yield the same LoD (≤3xLOD) on the RT-PCR instrument chosen for initial testing, pick one extraction method for further LoD determination on the remaining RT-PCR instruments and follow the recommendations below.
- If the extraction methods do not yield the same LoD on the chosen RT-PCR instrument, please choose the extraction method with the worst LoD for further comparison of the LoD on all RT-PCR instruments.

For all other RT-PCR instruments you should use the following adaptive LoD study design:

- Please perform a refined tentative LoD study with 5 replicates at 0.5x, 1x, and 1.5 to 2x LoD. If you detect 4/5 replicates as positive at all the tested levels, you need to include the next higher concentration (i.e., 3x LoD). If you obtain 5/5 replicates at 0.5x LoD, you need to test the next lower concentration (i.e., 0.25x LoD). You will test in this manner until you find the lowest concentration that gives you 5/5 positive results for the tested RT-PCR instrument. This concentration should be used for a confirmatory LoD study for the given RT-PCR instrument using 20 replicates.

Final reported LoD: Please list all RT-PCR instruments with their respective LoDs if different LoDs are obtained. LoDs are considered comparable if they are between 1-3xLoD. These studies should be repeated for each clinical matrix claimed in the Intended Use.

- Interference Substances Studies (if applicable): Pick one extraction method and RT-PCR instrument combination, preferably the one with the worst overall LoD (if one or more of the RT-PCR instruments has a different LoD).

- Inclusivity Testing: For the inclusivity testing, pick one extraction method and RT-PCR instrument combination, preferably the one with the worst overall LoD (if one or more of the RT-PCR instruments has a different LoD).

- Exclusivity Testing: For exclusivity, you can perform this study using any extraction/instrument combination.

- Clinical study: If equivalency of the RT-PCR instruments is shown in an LoD study that tests and confirms that the LoD is the same or very similar for all of the RT-PCR instruments (between 2-3xLoD), then you can pick one RT-PCR instrument for your clinical study provided that the RT-PCR instruments in question are known to FDA for other *in vitro* diagnostic devices. If you find that one or more RT-PCR instruments machines has/have a different LoD, you should pick the extraction method / RT-PCR instrument combination with the worst LoD.

Note, if there are differences in the extraction input volume, extraction elution volume

AMERICAN OVERSIGHT

and PCR input volume (extracted nucleic acid) then the LoD should be confirmed, for each.

AMERICAN OVERSIGHT

**Subject:** Minimum criteria

1. Analytical Evaluation

a. LoD using viral genomic RNA or inactivated virus preferably in clinical matrix. Testing limiting dilution serious of 3 replicates and confirmation with 20 replicates from the extraction to result in most challenging matrix or if not obtainable contrived clinical matrix. Acceptance criteria 19/20.

b. Inclusivity (in silico analysis of primers and probe to demonstrate that the assay can detect all currently known SARS-CoV-2). Acceptance criteria: identifying 100% of published SARS-CoV-2 sequences.

c. Cross-reactivity (in silico analysis of primers and probe to potentially detect cross reactant of organisms that are usually present in respiratory specimens e.g., Flu, coronavirus 229E etc ). We also request laboratory testing of microorganisms that showed potentially cross reacting in in silico analysis (i.e., >80% homology between one of your primers or probes to any of the sequences of organisms usually present in respiratory specimens)

2. Clinical Evaluation – Contrived clinical study: You should test 40 negative and 40 positive contrived clinical samples. The samples should be prepared by spiking SARS-CoV2 viral RNA or inactivated virus into individual clinical upper and lower respiratory specimens collected from patients with signs and symptoms of respiratory infection. 80% of the samples can be upper respiratory specimens. Left-over archived specimens may be used to prepare the mock clinical samples, the majority can be upper respiratory specimens. Half (20) of the contrived positive samples should be prepared by spiking the SARS-CoV2 at 1X – 2x LoD and the remaining contrived positive samples should span the testing range of your assay and not higher than 5x LoD. Acceptance criteria: 95% for 1X – 2x LoD, 100% 5x LoD and negative specimens.

**Subject**: Minimal Criteria for test validation

Jeff and Tim,

The minimal criteria acceptable to validate the test to be developed by the target laboratories are listed below. We foresee that it will take 3-4 days for a CLIA-certified, high-complexity laboratory to complete these evaluations.
For item 1. a. below, Genomic RNA manufactured by UTMB, provided to us by NIAID/NIH or BEI is available for testing.

1. Analytical Evaluation

a. LoD using viral genomic RNA or inactivated virus preferably in clinical matrix. Testing limiting dilution serious of 3 replicates and confirmation with 20 replicates from the extraction to result in most challenging matrix or if not obtainable contrived clinical matrix. Acceptance criteria 19/20.

b. Inclusivity (in silico analysis of primers and probe to demonstrate that the assay can detect all currently known SARS-CoV-2). Acceptance criteria: identifying 100% of published SARS-CoV-2 sequences.

c. Cross-reactivity (in silico analysis of primers and probe to potentially detect cross reactant of organisms that are usually present in respiratory specimens e.g., Flu, coronavirus 229E etc ). We also request laboratory testing of microorganisms that showed potentially cross reacting in in silico analysis (i.e., >80% homology between one of your primers or probes to any of the sequences of organisms usually present in respiratory specimens)

2. Clinical Evaluation – Contrived clinical study: You should test 50 negative and 50 positive contrived clinical samples. The samples should be prepared by spiking SARS-CoV2 viral RNA or inactivated virus into individual clinical upper and lower respiratory specimens collected from patients with signs and symptoms of respiratory infection. 80% of the samples can be upper respiratory specimens. Left-over archived specimens may be used to prepare the mock clinical samples, the majority can be upper respiratory specimens. Half (25) of the contrived positive samples should be prepared by spiking the SARS-CoV2 at 1X – 2x LoD and the remaining contrived positive samples should span the testing range of your assay and not higher than 5x LoD. Acceptance criteria: 95% for 1X – 2x LoD, 100% 5x LoD and negative specimens.

Let me know if you have any questions.

Uwe

They can already do testing after validation with the new policy. So they will be happy.

They received the viral RNA and is generating testing data. (b) (5)
(b) (5) The new FDA guidance regarding LDTs allows them to offer the test, and then submit an EUA right? What guidance should we give to them? What if they submit he EUA tomorrow?
Li

Hi Alex,

(b) (4)

With regard to the FDA new guidance, it allows CLIA high complexity labs to develop, validate, and offer an LDT under the current emergency without first submitting and obtaining an EUA. The lab should submit an EUA within 15 days of offering the test though.

Li

Brian and Marcia,

We have a courier who can ship material to you today. Important next step:
Can you receive material on Sunday? If yes
Where would it need to be shipped to.

I copied Rosemary Humes, she ahs close contact to BEI and has facilitated the process.

Uwe

Dear Jeff, Tim and Wendi,

A quick update from Thermo Fisher's efforts on COVID-19.

We plan to submit the EUA pre-sub to Uwe between 7-8pm EST tonight.
Let me know when we could expect a response in order to keep moving.

Also :

1. We have received (b)(4) nd are initiating our contrived samples
2. We are working our controls strategy with our internal resources
3. We have currently manufactured (b)(4) eactions of the EUA assay for testing purposes. We will have a (b)(4) reaction size kits.
4. We have or will be sending kits to (b)(4) or testing.

Let me know what else you may need.

Best,
Peter

# EMERGENCY USE AUTHORIZATION (EUA)

## EUA INTERACTIVE REVIEW TEMPLATE FOR MOLECULAR-BASED SINGLE TARGET TESTS FOR 2019 NOVEL CORONAVIRUS (2019-nCoV)

## GENERAL INFORMATION ABOUT THIS TEMPLATE

- Text highlighted in yellow *[Text]* should be completed by the IVD developer (sponsor) as applicable to their specific test. Text in **bold** outlines the Food and Drug Administration (FDA) suggestions and clarifications for the sponsors' consideration when completing the required information in a specific section.

- This is a EUA interactive review template for Pre-EUA/EUA submissions concerning molecular-based single target tests for detection of 2019 Novel Coronavirus (2019-nCoV), Wuhan, China. If you are developing a multiplex molecular-based assay for the detection and differentiation of nucleic acids from a panel of microorganisms, please review Appendix A for FDA recommendations.

- This is a EUA interactive review template for Pre-EUA/EUA submissions and not a guidance document. The template is subject to change as we learn more about the 2019-nCoV disease and its risk-benefit profile. Recipients will receive notice and updated templates as they become available.

- This EUA interactive review template is an FDA internal document and any proprietary information provided within the template and during the interactive review process will remain confidential as it does in a regular FDA premarket submission.

- Feedback provided by FDA during the interactive review of your pre-EUA/EUA is subject to change as we learn more about the 2019-nCoV disease and the risk-benefit profile evolves to address unmet public health needs.

- Prior to a potential authorization FDA will require developers of molecular-based tests to assess traceability of their test to an FDA-recommended reference material panel if available at the time. Specific details about the traceability study and the FDA-recommended reference material panel will be provided by the Lead Reviewer assigned to the Pre-EUA submission once the analytical and clinical evaluation data has been reviewed and found to be acceptable.

- Please be reminded that tests for the detection of 2019-nCoV or 2019-nCoV infection must not be distributed and/or used for clinical diagnoses without premarket clearance, approval, or EUA by the FDA. Clinical samples for 2019-nCoV testing should be sent to the appropriate public health laboratories until the IVD device subject of this Pre-EUA submission has received authorization from the FDA.

- Clinical specimens may be required to support the EUA request. Furthermore, please note that applicable regulations for human subject protection do apply under the

AMERICAN OVERSIGHT

EUA. Please refer to the Clinical Evaluation section of this document for more details.

- If authorized, the EUA means that this 2019-nCoV IVD is temporarily authorized for use until the public health emergency is terminated or the EUA is revoked by the FDA.

    - FDA recommends that you consider registration and listing your EUA product once you have been issued an EUA. If this is problematic, please notify the Agency during your Pre-EUA.
    - The EUA is not a pathway to permanent marketing of your device. Therefore, we strongly recommend that you consider, in addition to an EUA, a traditional premarket submission for your IVD so that your device can still be legally marketed after termination of the emergency declaration. We recommend that you identify as soon as possible in the Pre-EUA review process any consideration of moving your product forward towards De Novo/510(k) clearance. If so some of our feedback to you may take such a long-term goal into consideration in order to prevent additional testing where it may not be needed. Therefore, please consider submitting a Pre-Submission to inquire what studies would be required for a premarket approval/ clearance of your 2019-nCoV IVD. Details on how to submit a Pre-Submission to the Agency are outlined in the FDA guidance document: *Requests for Feedback and Meetings for Medical Device Submissions: The Q-Submission Program.* [ HYPERLINK "https://www.fda.gov/regulatory-information/search-fda-guidance-documents/requests-feedback-and-meetings-medical-device-submissions-q-submission-program" ]

## A. EXECUTIVE SUMMARY (as of X/XX/20XX)

## B. PURPOSE FOR SUBMISSION

Emergency Use Authorization (EUA) request for distribution and/or use of the ***[test name]*** to ***[indicate labs, if applicable]*** for the *in vitro* qualitative detection of RNA from the 2019-nCoV in ***[add all claimed specimen types, e.g., nasopharyngeal/oropharyngeal swabs, sputa, BAL, stool, and serum, etc.]*** from patients who meet CDC 2019-nCoV clinical criteria (e.g., signs and symptoms associated with 2019-nCoV infection) and CDC novel coronavirus epidemiological criteria (e.g., history of residence in or travel to a geographic region with active 2019-nCoV transmission at the time of travel, or other epidemiologic criteria for which 2019-nCoV testing may be indicated) to aid in the diagnosis of 2019-nCoV infection.

## C. MEASURAND

AMERICAN OVERSIGHT

Specific nucleic acid sequences from the genome of the 2019-nCoV **[*please specify the targeted gene(s) of the pathogen*]**.

## D. APPLICANT

***[Official name, address and contact information of applicant]***

## E. PROPRIETARY AND ESTABLISHED NAMES

Proprietary Name - ***[test name]***
Established Name - ***[test name]***

## F. REGULATORY INFORMATION

***Approval/Clearance Status:***
The ***[test name]*** test is not cleared, CLIA waived, approved, or subject to an approved investigational device exemption.

***Product Code:***
[XXX – FDA will complete]

## G. PROPOSED INTENDED USE

***1) Intended Use:***
**The proposed IU will be finalized based on the data and recommendations from Public Health authorities at the time of authorization – example text is provided below for a qualitative molecular test that detects organism RNA but may be adapted according to the specific emergency situation addressed by the device.**

[***Test name***] is a [***specify test technology such as, real-time RT-PCR test***] intended for the qualitative detection of nucleic acid from the 2019-nCoV in [***describe all the specimen types***] from individuals meeting CDC 2019-nCoV clinical criteria (e.g., clinical signs and symptoms associated with 2019-nCoV infection) in conjunction with CDC 2019-nCoV epidemiological criteria (e.g., history of residence in or travel to a geographic region with active 2019-nCoV transmission at the time of travel, or other epidemiologic criteria for which 2019-nCoV testing may be indicated). Testing is limited to [***laboratories - certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA), 42 U.S.C. §263a, to perform high complexity tests, or by similarly qualified non-U.S. laboratories***].

Results are for the identification of 2019-nCoV RNA. The 2019-nCoV RNA is generally detectable in **[*name specimen type*]** during the acute phase of infection. Positive results

AMERICAN OVERSIGHT

are indicative of active infection. Laboratories within the United States and its territories are required to report all positive results to the appropriate public health authorities.

Negative results do not preclude 2019-nCoV infection and should not be used as the sole basis for patient management decisions. Negative results must be combined with clinical observations, patient history, and epidemiological information.

The ***[test name]*** is intended for use by **[*include intended user, e.g., trained clinical laboratory personnel specifically instructed and trained in the techniques of real-time PCR and in vitro diagnostic procedures*]**. The ***[test name]*** is only for use under the Food and Drug Administration's Emergency Use Authorization.

***2) Special Conditions for Use Statements:***

For prescription use only
For in vitro diagnostic use only

***3) Special Instrument Requirements:***

The ***[test name]*** test is to be used with the [***list all RT-PCR Instruments, software requirements, automated extraction instruments***].

## H. DEVICE DESCRIPTION AND TEST PRINCIPLE

**Example text has been added under each of the sub-headings below for a fluorescence based rRT-PCR test for detection of organism RNA. If a different test principle is used by the test for the detection of a specific analyte please modify the description accordingly to capture the salient points in each of the sub-headings below. Please note that for new investigative technologies FDA may request additional detailed information so we can adequately assess the risks and benefits associated with the device.**

***1) Product Overview/Test Principle:***

**Describe the technology of the test and how this technology works to identify the measurand, the instruments employed/required to perform the test from sample collection to result (include all claimed extraction and PCR detection instruments), and the specimen types for which you claim to have specific performance characteristics as described below. If applicable, list all primer and probe sets and briefly describe what they detect. Please include the nucleic acid sequences for all primers and probes used in the test. Please indicate if the test uses biotin-Streptavidin/avidin chemistry in any of the steps for coupling reagents. Please note that an alignment with available reference genomes for different strains of the target pathogen is requested as part of the inclusivity evaluation (Section N).**

The ***[test name]*** is a real-time reverse transcription polymerase chain reaction (rRT - PCR) test. The 2019-nCoV primer and probe set(s) is designed to detect RNA from

AMERICAN OVERSIGHT

the 2019-nCoV in ***[list all the specimens]*** from patients who meet CDC 2019-nCoV clinical criteria (e.g., signs and symptoms associated 2019-nCoV infection) in conjunction with CDC 2019-nCoV epidemiological criteria (e.g., history of residence in or travel to a geographic region with active 2019-nCoV transmission at the time of travel, or other epidemiologic criteria for which 2019-nCoV testing may be indicated).

2) ***Description of Test Steps:***

**List and describe in detail all the steps of the test sequentially from specimen collection to detection.**

Nucleic acids are isolated and purified from ***[specimens]*** using ***[please describe the method(s) of extraction (please specify the specimen input volume for extraction and/or test, the nucleic acid elution volume and whether isolation/purification is manual and/or automated)].*** The purified nucleic acid is reverse transcribed using ***[enzyme mix/kits – please specify the input volume of purified nucleic acid added to the rRT-PCR reaction mix]*** into cDNA which is then subsequently amplified in ***[please describe the instrument(s) and enzyme mix]***. In the process, the probe anneals to a specific target sequence located between the forward and reverse primers. During the extension phase of the PCR cycle, the 5' nuclease activity of Taq polymerase degrades the probe, causing the reporter dye to separate from the quencher dye, generating a fluorescent signal. With each cycle, additional reporter dye molecules are cleaved from their respective probes, increasing the fluorescence intensity. Fluorescence intensity is monitored at each PCR cycle by ***[please describe the detection instrument(s)]***.

3) ***Control Material(s) to be Used with [test name]:***

**List all control materials (provided with the test kit and/or required but not provided with the test kit and describe what they are, how they are expected to work, where in the testing process they are used, and the frequency of use. If a control is commercially available, provide supplier's name and catalog number or other identifier; if your device relies on external controls that are manufactured by a third party please note that these controls should also be validated within your analytical and clinical studies described below in Section (N).**

Controls that will be provided with the test kit include:

a) A "no template" (negative) control is needed to ***[describe need]*** and is used ***[describe use – please also specify frequency of use]***

b) A positive template control is needed to ***[describe need]*** and is used ***[describe use – please specify the concentration of the positive control relative to the LoD of your test (note that ideally the positive control concentration should be such that it is close to the LoD of your test) and also specify frequency of use]***

AMERICAN OVERSIGHT

c) An extraction control ***[describe control]*** is needed to ***[describe need]*** and is used ***[describe use – please also specify frequency of use].*** **Please note that if the no template control and positive control, are taken through the entire sample processing procedure, including the extraction, then a separate extraction control is not required**.

d) An internal control ***[describe control]*** is needed to ***[describe need]*** and is used ***[describe use]***.

Controls that are required but not provided with the test kit include ***[describe control – provide recommended sources of the control materials – either a separate control kit for purchase that you the applicant develops or a control material that can be purchased from a third party].*** This/these control(s) is/are needed to ***[describe need]*** and is used ***[describe use – please also specify frequency of use]***.

**Please note that any control recommended to be used with your device (provided with the kit or not) needs to be validated in the context of your analytical and clinical study (i.e., you will need to run these controls as part of your studies). In instances where control material is not readily available through 3rd party vendors (which is often the case at the beginning of an outbreak) FDA may request that you include suitable control material with your device. Please note that external control materials are considered particularly important in the context of EUA devices because often GMP requirements for the manufacture of the EUA device are waived in emergency situations and reagent stability studies are limited. Hence the external controls offer some assurance of EUA test performance in the hands of the end user.**

## I. INTERPRETATION OF RESULTS

All test controls should be examined prior to interpretation of patient results. If the controls are not valid, the patient results cannot be interpreted. **Please describe if a Ct cutoff is used as part of your testing algorithm and/or if the end user is required to review fluorescent curves for weakly positive samples before final interpretation. Although not typical for molecular-based tests, if the test result involves the use of an algorithm/calculation, for example a ratio value, when determining the final patient test result, please include a detailed description and any additional calibration materials that may be required.**

1) ***[Test name] Controls – Positive, Negative and Internal***

**Describe in detail the expected results generated, including acceptance criteria, for all the controls described in detail in Section H above. Describe the measured values (if applicable) for valid and invalid controls and outline the recommended actions the laboratory should take in the event of an invalid control result.**

AMERICAN OVERSIGHT

2) ***Examination and Interpretation of Patient Specimen Results:***

**Describe when clinical specimen test results should be assessed and outline the criteria for test validity**. **Example text**: Assessment of clinical specimen test results should be performed after the positive and negative controls have been examined and determined to be valid and acceptable. If the controls are not valid, the patient results cannot be interpreted.

**Clearly indicate how to interpret numeric test values (if applicable) as positive or negative for presence of the 2019-nCoV. Indicate if the end user is required to review fluorescent curves for weakly positive samples before final interpretation and how to identify indeterminate/inconclusive results (if they exist) results and how the user should resolve them, e.g. if repeat testing may be required.**

**When applicable, provide a table clearly describing the possible combinations of test result values for each primer/probe set, and how they should be combined into a final interpretation of the result for your test. If the test produces result that will be used as part of a CDC recommended testing algorithm, please indicate what follow-up testing/process should be conducted, if applicable.**

## J. PRODUCT MANUFACTURING

**Please note that if you are developing a test for use at a single site (i.e., a laboratory developed test LDT), some of the information requested in this section may not be applicable. Please contact FDA for additional guidance for an emergency use LDT.**

The ***[test name]*** has been validated using only the components referenced in this submission and shall not be changed without prior concurrence from the FDA.

*1)* ***Overview of Manufacturing and Distribution:***

The product will be manufactured at [***manufacturer's name and FDA registration number (if applicable) or laboratory name if an LDT***] by [***manufacturer name, or laboratory name if an LDT***] personnel consistent with practices for the production of **[*types of devices*]** based on [***type of quality system****]. Material manufactured by [***manufacturer's name, or laboratory name if an LDT***] may be bottled and kitted by [***packager name***] manufacturing facility.

***Under the Emergency Use Authorization (EUA) most of the 21 CFR 820 Quality System Regulation (QSR) requirements can be waived for the duration of the EUA. FDA expects that developers follow comparable practices as much as possible and may consider previous compliance history when determining whether or not to waive certain QSR requirements for a specific product. Please note adverse events, as per 21 CFR Part 803, have to be reported for authorized devices (see Section R).**

AMERICAN OVERSIGHT

The current manufacturing capabilities include the ability to manufacture approximately **[*please insert the approximate number of units/products that can currently be manufactured per week at the manufacturing facility*]** products per week, however in the event of a surge in demand this could be increased to **[*please insert the approximate maximum number of units/products that could potentially be manufactured per week at the manufacturing facility if there was a surge in demand*]** product per week within a **[*please specify in weeks/months the expected timeframe required to increase product production if required*]** timeframe.

The product will be distributed by **[*please describe the distribution plan for the product and list all current distributors*]**.

2) ***Components Included with the Test***

Components manufactured by [***manufacturer's name and FDA registration number (if applicable)***] and supplied with the test include:

**List all components and reagents provided for your test, including a description of the primers and probes, volumes, concentrations, quantities, buffer components, etc.**

3) ***Components Required But Not Included with the Test***

Components required but not included with the test:

**List all components and reagents not included with the test that must be supplied by the user to perform the test, with specific supplier names and catalog numbers or other identifiers for obtaining these components and reagents. Please include here all specific consumables that were validated for use with your device, that are not interchangeable with other products and that are needed to guarantee device performance as established in the EUA validation studies listed in Section N below.**

4) ***Testing Capabilities***

**Briefly describe current sample throughput capacity, total time required to perform the test (from clinical specimen collection, specimen transport to result), and number of tests that can be performed per instrument run and per day.**

5) ***Reagent Stability:***

**Briefly describe stability test plan for *[test name]* reagents and include any accelerated stability information if available. Please note that reagent stability studies do not need to be completed at the time of EUA issuance, however the study design should be agreed upon during interactive review and the stability studies started immediately following authorization, if not before. When designing your stability study, we have some general recommendations that are outlined in Appendix B, for your consideration.**

AMERICAN OVERSIGHT

## K. PERFORMANCE EVALUATION

**If you plan to claim multiple target analytes to aid in differential diagnosis or you plan to claim multiple RT-PCR instruments and/or extraction methods, please refer to Appendix A and C, respectively, more information. Please note that any omission of a requested study in this document should be documented and justified.**

### *1) Analytical Sensitivity:*

a) *Limit of Detection (LoD):* **You should determine the LoD of the device utilizing the entire test system from sample preparation to detection for each clinical matrix claimed. Please note that claims for additional anticoagulants, for blood specimens, can be supported by a matrix equivalency study as outlined in Section N, subsection 3 below. The LoD is determined using dilutions of live propagated and titered 2019-nCoV stocks (CFU/mL or PFU/mL) spiked into a relevant clinical matrix. If wild-type virus is not available at the time of your validation studies, please contact FDA to discuss a potential alternative. Please note that if available please also provide Genomic Equivalent Copies (GEC)/mL units for the stock solutions used and include an explanation on how they were determined. Please note that LoD studies should be performed with live organisms, as described above. If you plan to use inactivated organism in your LoD determination you should describe how the material was inactivated and perform a study to determine whether the inactivation process impacted the LoD of the device.**

**First a tentative LoD must be established through limiting dilutions of the prepared material with 3-5 replicate measurements. Please note for all the analytical studies described in Section N that require replicate testing, one replicate equates to one independent extraction and PCR detection. Once a tentative LoD is established, the LoD should be confirmed by preparing at least 20 additional replicates at the LoD concentration and demonstrating that the organism was detected with a minimum 95% positivity (19/20). If this confirmatory study achieves a positivity of 100%, then a lower concentration needs to be tested (with 20 replicates) until <100% positivity is obtained.**

**Please use the following format when submitting LoD information and data:**

LoD studies determine the lowest detectable concentration of 2019-nCoV at which approximately 95% of all (true positive) replicates test positive. The LoD was determined by limiting dilution studies using characterized samples.

**List/describe the following in this section:**

- **Titers and strains of the 2019-nCoV stocks used for the LoD study and describe how the organism stocks were prepared and how the titers were determined.**

AMERICAN OVERSIGHT

- **The dilution factor and number of serial dilutions of the characterized 2019-nCoV that were tested to determine the LoD for each primer and probe set.**
- **The nucleic acid extraction/purification method.**
- **The real time PCR instrument.**

Serial dilutions of the characterized 2019-nCoV were then tested in **[*number of replicates (i.e., recommend that sample is extracted independently three-five times and each extraction tested once)*]** replicates. The lowest concentration at which all [*number of replicates*] replicates were positive was treated as the tentative LoD for each test. The LoD of each test was then confirmed by testing [*number of replicates (at least 20 recommended)*] with concentrations at the tentative limit of detection. The final LoD of each test was determined to be the lowest concentration resulting in positive detection of [*number of positive replicates (at least 19 out of 20 replicates)*]. [*Include analysis of LoD results, indicating the final LoD for each test*]

**Tentative LoD: [*Please provide a summary of the data for each strain tested]* example table 2019-nCoV stocks is provided below:**

| 2019-nCoV Strain Tested | Stock 2019-nCoV Titer | Serial 10-Fold Dilution Factor | Concentration in Dilution Tested [Include Units] | Replicate 1 $C_t$ | Replicate 2 $C_t$ | Replicate 3 $C_t$ | Replicate 4 $C_t$ | Replicate 5 $C_t$ | Call Rate | Lowest Concentration with Uniform Positivity per Analyte | Limit of Detection (LoD) per Virus Strain |
|---|---|---|---|---|---|---|---|---|---|---|---|
| *Example: [analyte]* | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |

b) FDA Sensitivity Evaluation: The analytical sensitivity of the test has to be further assessed by evaluating an FDA-recommended reference material using an FDA developed protocol if applicable and/or when available. Details will be provided during the Pre-EUA interactive review.

c) *Reactivity/Inclusivity:* Reactivity of the ***[test name]*** was evaluated for additional isolates of 2019-nCoV.

**Reactivity: *[test name]* example table below**

| 2019-nCoV Strain/Isolate | Source/Sample Type* | Concentration | Ct** |
|---|---|---|---|
| | | | |
| | | | |
| | | | |

AMERICAN OVERSIGHT

| | | | |
|---|---|---|---|
| | | | |

***Please list source of material used for wet testing and sample type tested (i.e., organism – live or inactivated, purified nucleic acid – whole genome etc.).**
**** If your technology does not produce Ct values, please include instead the signal output for your specific device technology.**

**At a minimum, the strain used in your LoD evaluation should be listed here (multiple isolates of the same 2019-nCoV strain that was used for the LoD studies can also be included if available). If additional isolates are not available at the time of your validation studies, please discuss with FDA. Each isolate should be tested at or near the LoD (no more than 3x LOD) of the test, spiked into clinical matrix utilizing the entire test system, including extraction. If you plan to claim more than one type of clinical matrix, we recommend that you perform this study in the most challenging clinical matrix, testing a minimum of 3 replicates. In addition, the wet testing should be accompanied by extensive inclusivity *in silico* analysis of the test primer and probes with all known strains/isolates (past/present) of 2019-nCoV (including the strain/isolate used for wet testing).**

## 2) *Analytical Specificity:*

a) *Cross-Reactivity:* Cross-reactivity of the ***[test name]*** was evaluated using both *in silico* analysis and by testing whole organisms **[*pathogen*]** (concentration) or purified nucleic acid from other ***[describe organisms]*** (concentration/reaction).

**Cross-Reactivity: *[test name]* example table for wet tested organisms below**

| Virus/Bacteria/Parasite | Strain | Source/ Sample type | Concentration | Ct Values* |
|---|---|---|---|---|
| | | | | |
| | | | | |
| | | | | |

***If your technology does not produce Ct values, please include instead the signal output for your specific device technology.**

**Cross-reactivity studies are preformed to demonstrate that the test does not react with related pathogens, high prevalence disease agents and normal or pathogenic flora that are reasonably likely to be encountered in the clinical specimen. The FDA Tables 1 and 2, below are intended to recommend simulate testing of patients having infections with organisms which cause similar symptoms to those observed at the onset of 2019-nCoV infection. The FDA Tables also include other organisms and strains which have significant genetic similarity and therefore a higher likelihood of cross-reacting with 2019-nCoV specific reagents. Also included in the FDA Tables are recommended unclaimed organisms/strains which are likely to be endemic to the currently affected area should be included in cross-reactivity testing since these organisms/strains will be an important aspect of the differential diagnosis of 2019-nCoV infection.**

AMERICAN OVERSIGHT

**FDA Table 1 Cross-Reactivity: List of Organisms to be wet-tested and analyzed *in silico* (for tests detecting 2019-nCoV) in respiratory material or blood specimens**

| Other high priority pathogens from the same genetic family | High priority organisms likely in the circulating area |
|---|---|
| Human coronavirus 229E | Adenovirus (e.g. C1 Ad. 71) |
| Human coronavirus OC43 | Human Metapneumovirus (hMPV) |
| Human coronavirus HKU1 | Parainfluenza virus 1-4 |
| Human coronavirus NL63 | Influenza A |
| SARS-coronavirus | Influenza B |
| MERS-coronavirus | Enterovirus (e.g. EV68) |
| | Respiratory syncytial virus |
| | Rhinovirus |
| | *Chlamydia pneumonia* |
| | *Haemophilus influenzae* |
| | *Legionella pneumophila* |
| | *Mycobacterium tuberculosis* |
| | *Streptococus pneumonia* |
| | *Streptococcus pyogenes* |
| | *Bordetella pertussis* |
| | *Mycoplasma pneumoniae* |
| | *Pneumocystis jirovecii* (PJP) |
| | Pooled human nasal wash - *to represent diverse microbial flora in the human respiratory tract* |
| | |

**FDA Table 2 Cross-Reactivity: List of Organisms to be analyzed *in silico* (for tests detecting 2019-nCoV) in respiratory material or blood specimens:**

| Other high priority pathogens from the same genetic family | High priority organisms, including organisms commonly found in the clinical matrix |
|---|---|
| | Influenza C |
| | Parechovirus |
| | *Candida albicans* |
| | *Corynebacterium diphtheriae* |
| | *Legionella non-pneumophila* |
| | *Bacillus anthracis* (Anthrax) |
| | *Moraxella catarrhalis* |
| | *Neisseria elongate and meningitidis* |
| | *Pseudomonas aeruginosa* |
| | *Staphylococcus epidermis* |
| | *Staphylococcus salivarius* |
| | *Leptospirosis* |

AMERICAN OVERSIGHT

| | |
|---|---|
| | *Chlamydia psittaci* |
| | *Coxiella burnetii (Q-Fever)* |
| | *Streptococcus aureus* |
| | |

***In silico*** **analysis should be performed on all potentially cross-reactive organisms outlined in the FDA Tables 1 and 2 above. You should provide the result summary of the *in silico* blast analysis (tabular format) evaluating whether there is any significant amplification of non-target sequences that could either result is cross-reactivity or potentially interfere with the detectability of the actual target analyte. As such we are asking that you provide individual blast results (non-truncated alignments) for each of the primers and probes used in your device with potential cross-reacting organisms. Please provide for our review the percent sequence homology for each organism relative to the target analyte primers/probes in your test. Please use the example table below when presenting the results of *in silico* analysis in your submission:**

**Results of *In Silico* Analysis**

| Pathogen | Strain | GenBank Acc# | % Homology Test FP (i.e. 0-100%) | % Homology Test RP | % Homology Test Probe |
|---|---|---|---|---|---|
| | | | | | |
| | | | | | |

**The analysis should include multiple representative strains from GenBank for each organism. If *in silico* analysis reveals other potential cross-reactants (i.e., ≥80% homology between one of your primers or the probe to any of the sequences of listed potential cross reactants), you should carefully review the alignments and determine based on the positions of the homologous stretches and mismatches if additional cross-reactivity and/or interference (please refer to item b below – microbial interference studies) wet testing will be required to rule out cross-reactivity or interference of that organism that may affect the performance of your device. In these circumstances if wet-testing is omitted you should include an explanation as to why *in silico* generated data is not clinically relevant (irrelevant isolate, location/extent of match within primer/probe, etc.), or why the performance of your test would not be impacted.**

**Organisms in FDA Table 1 should be wet tested in addition to the *in silico* analysis. Omissions from wet-testing should be discussed with FDA and supported by a well-documented justification that includes a due diligence attempt to obtain the live or inactivated organisms (and/or purified nucleic acid – which is acceptable for cross reactivity evaluation for an EUA).**

AMERICAN OVERSIGHT

**The wet testing evaluation should reflect test specimens prepared at the highest clinically relevant level of organism (i.e., a minimum of $10^6$ CFU/ml or higher for bacteria and $10^5$ $TCID_{50}$/mL or PFU/ml or higher for viruses) and should be tested with a minimum of three replicates per organism test specimen. Test specimens can be prepared by spiking cultured isolates/inactivated organisms/ purified nucleic acids (whole genome) into negative clinical matrix and determining cross reactivity based on triplicate replicates. If you plan to claim more than one type of clinical matrix, please note that if significant differences in LoD are observed for the different clinical matrices this may warrant this study being performed in more than one clinical matrix.**

**If you plan to claim non-blood or non-respiratory clinical specimen types for diagnostic use with your device, e.g., stool specimens, etc., please consult FDA for more information on additional organisms that may be recommended for cross-reactivity testing, common examples are provided below for stool specimens (FDA Table 3):**

**FDA Table 3: Organisms to be analyzed for non-blood clinical specimens:**

| **Stool** |
|---|
| *Escherichia coli* |
| *Lactobacillus* |
| *Bacillus* spp. |
| *Clostridium* Spp. |
| *Enterobacter* |
| *Enterococcus* |
| Fusobacterium |
| Bacteroidetes |
| Bifidobacterium |
| Ruminococcus |
| |

b) *Microbial Interference Studies:* **If *in silico* analysis reveals ≥ 80% homology between the cross-reactivity microorganisms and your test primers/ probe(s), we recommend that you either perform (1) a microbial interference study with 2019-nCoV and the microorganisms that your test primers/ probe(s) have homology to, (2) as an alternative to the microbial interference study, you may provide justification as to why (e.g., amount of primer(s)/ probe(s) included in your master mix) the performance of your test would not be impacted by the presence of a causative agent of a clinically significant co-infection, or (3) explain why the *in silico* results are clinically irrelevant. In the case of the microbial interference study, interference should be evaluated using samples spiked at a low 2019-nCoV concentration, at 3x LoD, and a high interferent level (either microorganisms or nucleic acids purified from them), to represent the worst-case scenario, with a minimum of 3 replicates. If you plan to claim more than**

AMERICAN OVERSIGHT

**one type of blood clinical matrix, please note that if significant differences in LoD are observed for the different clinical matrices this may warrant this study being performed in more than one clinical matrix. If the LoDs are similar in the blood clinical matrices the study should be performed in the most challenging matrix, i.e., whole blood. In addition, if you are claiming blood and non-blood clinical specimens you may be required to perform this study in more than one clinical matrix. If interference is observed at the level tested, an additional titration study should be performed to determine the highest microorganism interferent level the 2019-nCoV test can tolerate.**

**c)** *Endogenous Interference Substances Studies*: **The extent of testing for endogenous interference substances depends on the matrix that is claimed for the device as well as on the technology of the device, e.g., if a nucleic extraction procedure is performed prior to testing or not. For EUA we do not typically ask for interference studies for tests that use conventional PCR and/or well-established extraction methods prior to testing (e.g., Boom method and column-based extraction methods).**

**For extraction procedures that are new or for nucleic acid-based technologies that are different from conventional PCR (e.g., various isothermal methods), we expect testing of potential interferents. The impact of interfering substances should be evaluated over the expected clinical range of the potentially interfering substance. Potential sources of endogenous interference include, but are not limited to, the ones listed in the tables below. It is important to note that the evaluation of interference and the generation of false negative results should be done using samples containing the analyte at or near the LoD and should not exceed 3x LoD. You should test a minimum of 3 replicates per substance. If you plan to claim more than one type of clinical matrix, please note that if significant differences in LoD are observed between the different clinical matrices this may warrant this study being performed in more than one clinical matrix. Biotin interference poses a risk to laboratory tests that incorporate the free biotin-streptavidin capture method. Therefore, please review this safety communication [ HYPERLINK "https://www.fda.gov/medical-devices/safety-communications/fda-warns-biotin-may-interfere-lab-tests-fda-safety-communication" ] and the following [ HYPERLINK "onenote:http://sharepoint.fda.gov/orgs/CDRH-IVD/Orgs/DMD/DMD%20OneNotes/Language/Analytical%20Studies/Interference.one" \l "DRAFT%20guidance%20-%20Testing%20for%20Biotin%20Interference%20in%20In%20Vitro%20Diagnostic%20Devices&section-id={39D67316-5AE2-4791-958F-9387D384D6FA}&page-id={9298F00C-7C39-43CB-9EBA-29E5BC08BB6E}&end" ] ([ HYPERLINK "http://sharepoint.fda.gov/orgs/CDRH-IVD/Orgs/DMD/_layouts/OneNote.aspx?id=%2Forgs%2FCDRH-IVD%2FOrgs%2FDMD%2FDMD%20OneNotes%2FLanguage&wd=target%28Analytical%20Studies%2FInterference.one%7C39D67316-5AE2-4791-958F-**

AMERICAN OVERSIGHT

**9387D384D6FA%2FDRAFT%20guidance%20-%20Testing%20for%20Biotin%20Interference%20in%20In%20Vitro%7C9298F00C-7C39-43CB-9EBA-29E5BC08BB6E%2F%29" ]) to determine if biotin interference testing may be warranted for your device. We also recommend you consult with FDA prior to initiating biotin interference testing, if applicable.**

**The tables below indicate the potentially interfering substances that may be found in blood and respiratory specimens. For other non-blood specimen types, such as stool, the list of substances could be expanded – please consult with FDA.**

**Interfering Substances: *[test name]* Example table below for evaluation of interfering substances for the ability to generate false *positive* results:**

| Potential Interfering Substance | Concentration | Results (Detected X/3) |
|---|---|---|
| **Respiratory Specimens** | | |
| Mucin: bovine submaxillary gland, type I-S | | |
| Blood (human) | | |
| Nasal sprays or drops | | |
| Nasal corticosteroids | | |
| Nasal gel | | |
| FluMist | | |
| Homeopathic allergy relief medicine | | |
| Throat lozenges, oral anesthetic and analgesic | | |
| Anti-viral drugs | | |
| Antibiotic, nasal ointment | | |
| Antibacterial, systemic | | |
| **Blood Specimens** | | |
| Hemoglobin | 10 mg/mL* | |
| Bilirubin Conjugated | 0.4 mg/mL* | |
| Bilirubin Unconjugated | 0.4 mg/mL* | |
| Serum proteins (e.g., Human Serum Albumin) | 60 mg/mL* | |
| Triglycerides | 15 mg/mL* | |
| Cholesterol | 4 mg/mL* | |
| Human Anti-mouse Antibody (HAMA) | 800 ng/mL* | |
| Rheumatoid Factor | 2000 IU/mL* | |

*Taken from the recently-updated 3rd edition of CLSI guideline EP07, Interference Testing in Clinical Chemistry (Section 3.4.2) which now defers to CLSI EP37, Supplemental Tables for Interference Testing in Clinical Chemistry for the recommended concentrations for testing common endogenous substances (Table 2) and have subsequently updated a number of the recommended testing concentrations.

**Interfering Substances: *[test name]* Example table below for evaluation of interfering substances for the ability to generate false *negative* results:**

AMERICAN OVERSIGHT

| Potential Interfering Substance | Concentration* | Viral Strain Level (In multiples of LoD) | Results (Detected X/3) |

### 3) *Matrix Equivalency (if applicable):*

**A matrix equivalency study may be used to support certain specimen type claims that were not evaluated during the clinical study (e.g., serum versus plasma, use of different anticoagulants, use of difference swab types or viral transport media, etc.). Please note that LoD and clinical specificity studies are required for all claimed matrices. The matrix in which the clinical studies are conducted is the comparator. All other matrices are to be shown to be equivalent to the comparator matrix. We request a minimum of 40 paired samples each obtained from individual persons; negative (10 samples), low positive (1.5-2xLoD, 20 samples), and moderate positive (5-10xLoD, 10 samples) samples should be tested. Positive samples are prepared by spiking paired negative clinical matrix with the same amount of target analyte. Please note that individual (and not pooled) samples should be used in this study.**

AMERICAN OVERSIGHT

4) ***Comparative Limit of Detection (LoD) of the Test vs. the Comparator Method:***

**A comparative LoD study may be required to support use of a comparator method in your clinical evaluation that has not been validated with a specific specimen type. The comparative LoD study should be conducted testing the same dilution series using both, your test and the comparator you chose in parallel (to dilution endpoints for both tests), 3-5 replicates per dilution level are sufficient for this study.**

5) ***Specimen Stability and Fresh-frozen Testing:***

**A specimen stability study may be required to support specimen stability claims in the instructions for use outside of those typically outlined in CSLI standards. A fresh/frozen and/or freeze/thaw study may be required to support the use of frozen specimens if they are used as part of the clinical evaluation. Please consult with FDA concerning an appropriate study design prior to initiating any studies.**

6) ***Clinical Evaluation:***

**This section should describe the clinical study used to evaluate the performance of your test. Please note that the exact requirements for the clinical evaluation will be very dependent on, access to 2019-nCoV disease clinical specimens at the time of the studies and the nature of the emergency. Our general clinical study evaluation recommendations for respiratory and serum clinical specimens are outlined below. If you are interested in claiming additional specimen types, for example, stool, please contact FDA for current recommendations. Please note these clinical study recommendations may be subject to change as we continue to learn about the 2019-nCoV disease or as the risk benefit analysis changes.**

**The clinical performance in general should be evaluated for each unique claimed clinical specimen type - with the exception of claims that can be supported by a matrix equivalency study (outlined in Section 3 above). The performance characteristics should ideally be established using a clinical study with a limited number of prospective samples. If a prospective study is not feasible, an acceptable alternative would be to test retrospectively collected 2019-nCoV nucleic acid negative and positive specimens from patients, accompanied by some basic information such as, the specimen collection date, date of onset of symptoms (if present/known), tests used to identify 2019-nCoV nucleic acid positive specimens, etc. Depending on the nature of the disease, if no prospective or retrospective specimens are**

AMERICAN OVERSIGHT

**available at the time of your pre-EUA submission for the 2019-nCoV disease we may accept a fully contrived clinical evaluation. The clinical evaluation should be comprised of a minimum of 100 negative individually collected specimens and 50 individual positive specimens (prospective, retrospective and/or contrived). Use of pooled specimens are not acceptable for the clinical evaluation of your test. Please see FDA Table 5 for more details. Please note that if a fully contrived clinical study is used to support your Pre-EUA submission, additional clinical testing of a limited number of natural clinical positive specimens and potentially negative specimens from the endemic region, if available, may be required at the time when this Pre-EUA transitions to an EUA as a result of an Emergency declaration for 2019-nCoV disease.**

AMERICAN OVERSIGHT

## FDA Table 5: Clinical study Recommendations:

| Details | Study Including Prospective/ Retrospective Specimens | Fully Contrived Sample Study |
|---|---|---|
| Minimum Number of Positive Specimens | 50<br><br>The number of natural (prospective/retrospective) positive clinical specimens should be at least 25 (collected from symptomatic patients in the 2019-nCoV disease endemic region(s)) and, if necessary, may be supplemented with contrived samples to generate the total of 50 positive specimens. Contrived samples should be prepared as described in the fully contrived sample study column. | 50<br><br>The contrived positive samples should be made in individual negative clinical matrix collected from subjects from a non-endemic population (pooled matrix is not acceptable for the clinical evaluation). Please note that the negative clinical matrix used for spiking should be confirmed negative by your test device prior to spiking. Half of the contrived positive samples can be prepared by spiking the 2019-nCoV at LoD and the remaining contrived positive samples should cover the range of the test up to and not higher than 5 x LoD.<br><br>Negative respiratory specimens: Can be archived/retrospective samples collected from US patients with signs and symptoms of respiratory infection.<br><br>Negative blood specimens: Can be collected from healthy subjects from non-endemic areas. |
| Minimum Number of Negative Specimens | 100<br><br>Note: In general, for EUA the 100 individual negative samples can be collected from; (1) archived/retrospective samples collected from US patients with signs and symptoms of respiratory infection for respiratory specimens, and (2) healthy subjects from non-endemic areas for blood specimens, that are "expected 2019-nCoV disease negative". Note these negative specimens can be used to also prepare any contrived positive specimens used in support of the clinical evaluation of the test.<br><br>Please note this recommendation is dependent on the current outbreak situation and is subject to change as we learn more about the 2019-nCoV disease/outbreak. If the outbreak situation for 2019-nCoV disease is primarily outside of the continental U.S. (OUS) it may be beneficial to consider collecting negative specimens that represent 50% endemic and 50% non-endemic regions. If negative specimens are collected from the endemic region of the 2019-nCoV disease these should be tested with the same comparator chosen for the positive specimens (more details provided below). For non-endemic collected specimens you can compare to the expected "negative" result. | |
| Recommended Comparator Method | Positive: Positive percent agreement should be calculated in comparison to a EUA PCR test (please see the following website for the most recent list of FDA authorized 2019-nCoV | Positive: Compare to expected result.<br><br>Negative: See Minimum Number of Negative Specimens row |

AMERICAN OVERSIGHT

| | | |
|---|---|---|
| for percent agreement performance calculations | tests: [ HYPERLINK "https://www.fda.gov/MedicalDevices/Safety/EmergencySituations/ucm161496.htm" ]. If no EUA test available at the time of your EUA submission, please consult with FDA about your choice of comparator method – which ideally should be a well validated PCR test with comparable sensitivity to your subject device. Please note that a well validated PCR test should include evaluation of the tests LoD, inclusivity, exclusivity, interference and any clinical testing.<br><br>Negative: See Minimum Number of Negative Specimens row | |
| Comparator Method Note 1 | Please note when using natural clinical specimens, the comparator method must be validated for the specimen type claimed – if not you should perform a Comparative Limit of Detection (LoD) of the Test vs. the Comparator Method study, as explained above (Section 4), to support its use as a comparator method in your clinical study. | N/A |
| Comparator Method Note 2 | Any occurrences of false results should be investigated with an additional validated PCR test and/or targeted sequencing, and the results of the discordant analysis can be footnoted in your final performance table but cannot be used to change the final performance calculations. | |
| Natural Clinical Specimens IRB/Informed Consent Note | For clinical specimens collected to support the EUA request, please note that sample collection needs to adhere to all applicable rules of human subject protection; as such, sample collection needs IRB approval, which includes review of the informed consent forms. Samples need to be collected with informed consent. If leftover de-identified samples are used, FDA exercises enforcement discretion regarding the informed consent requirement if the specimen collection meets the criteria described in the FDA Guidance on Informed Consent for In Vitro Diagnostic Device Studies Using Leftover Human Specimens that are Not Individually Identifiable ([ HYPERLINK "http://www.fda.gov/cdrh/oivd/guidance/1588.pdf" ]).<br>**Note that IRB approval is still required even if leftover de-identified samples are used in your study.** | |
| Additional Studies Warning | N/A | If fully contrived samples were used in your Pre-EUA submission, additional testing of natural clinical specimens may be requested, if available, to support transition of the Pre-EUA to EUA as a result of an Emergency declaration. |
| Testing Approach Note 1 | Please note all clinical specimens (natural and contrived) should be evaluated in accordance with your proposed diagnostic algorithm, including retesting when appropriate. We understand the limited nature of natural specimens may preclude retesting. In instances were retesting is indicated but not performed, for the purposed of performance evaluation, initial results will be analyzed for performance and equivocal/indeterminate results count against your final performance. | |
| Testing Approach Note 2 | Specimens should be tested in a blinded fashion, e.g., positive and negative samples should be mixed and blinded to the end user, end user should also be blinded to the results of any comparator method testing. | |

AMERICAN OVERSIGHT

**When you describe your clinical study please indicate/include:**

- **How the specimens were generated/collect/sourced**
- **If the study was fully prospective, mix of prospective, retrospective and/or contrived or fully contrived**
- **The rationale for the concentrations/specimens selected (if using contrived or 3-party sourced specimens)**
- **The total number of specimens tested**
- **The specimen types (clinical matrix)**
- **A summary of the study results**

**In the case of real-time PCR tests, please provide the line data in an Excel file as part of the Pre-EUA submission for each specimen (please indicate for each specimen if it was prospective, retrospective or contrived and the clinical matrix it represents); the data should include the $C_T$ values (for the specimen and the controls) and call/result for your device and, in the case of the natural clinical specimens, the comparator method results should be included as well.**

## L. UNMET NEED ADDRESSED BY THE PRODUCT

**This section will be finalized by FDA based on the state of the emergency at the time of authorization and based on recommendations from Public Health authorities at that time. Example text is provided below but may be adapted according to the specific emergency situation that is addressed by the device and the need at the specific time of the outbreak.**

[Outline background of pathogen, disease and current outbreak]

[Outline details of the disease such as the following:

- likely sources of transmission
- likely symptoms – if any
- Prevalence of symptomatic disease (what fraction of infection results in symptomatic disease)]

Laboratories in the United States are in need of diagnostic tools for use in the 2019-nCoV emergency for rapid diagnosis of acute 2019-nCoV infection.

A public health emergency has been declared by the Secretary of Health and Human Services (HHS) on [Month Day, YEAR] justifying the authorization of emergency use of *in vitro* diagnostic tests for detection of 2019-nCoV and/or diagnosis of 2019-nCoV infection.

The ***[test name]*** can augment clinically important laboratory evidence for individuals with active infection. The 2019-nCoV nucleic acid is generally detectable in [name

AMERICAN OVERSIGHT

specimen type] during the acute phase of infection (approximately [7] days following onset of symptoms, if present) [and possibly for longer in other specimen types].

Under emergency use authorization (EUA), ***[applicant name]*** plans to distribute the test or accept sample for testing with the ***[test name]*** for the detection of nucleic acid from 2019-nCoV in clinical specimens collected from individuals meeting CDC's 2019-nCoV clinical and/or epidemiological criteria. This EUA request for the ***[test name]*** is intended to expand domestic readiness within the United States and its territories by expanding diagnostic testing capabilities for 2019-nCoV during public health emergency.

FDA consulted with subject matter experts within HHS on the public health needs for diagnostic devices to detect 2019-nCoV nucleic acid. It is FDA's conclusion that there currently exists a public health need for such devices, i.e., that there is no adequate, approved (cleared), and available alternative to the ***[test name]*** for 2019-nCoV detection during the public health emergency.

## M. APPROVED/CLEARED ALTERNATIVE PRODUCTS

Currently no methods for the detection of the 2019-nCoV have been approved/ cleared by FDA.

## N. RISKS AND BENEFITS:

**The Risks and Benefits section should be updated according to your specific device, some example language is given below but should be tailored to the device and the disease.**

Risks

The ***[test name]*** has been designed to minimize the likelihood of false test results. However, should false results occur, they may present risks to patients:

- False positive result:
  - A false positive 2019-nCoV result could [***update based on the pathogen***].
  - A false positive result in the context of the current public health emergency could lead to misallocation of resources used for surveillance and prevention.
  - A false positive result could delay correct diagnosis and initiation of appropriate treatment for the actual cause of patient illness.
- False negative result:
  - Although a negative result does not rule out 2019-nCoV infection, a false negative has the potential to result in initiation of inappropriate treatment and a delay in correct diagnosis.
  - A false negative result can trigger a waste of health care resources, as additional evaluations are pursued in the effort to establish the true diagnosis.
  - A false negative results can contribute to further spread of the disease.

Benefits

AMERICAN OVERSIGHT

The primary benefit of distributing the ***[test name]*** for clinical use is that it provides a relatively fast diagnostic method for symptomatic patients, which enables faster intervention.

- True positive test results provide support for the diagnosis of a 2019-nCoV infection. The results can be used in conjunction with clinical and epidemiological information to guide patient management.
- Distribution of the factsheets can help healthcare professionals and the public learn more about 2019-nCoV disease and how to avoid acquiring it.

Risk Assessment

- Negative results may not preclude a 2019-nCoV infection. It is emphasized that the ***[test name]*** should not be used as the sole basis for treatment or other patient management decisions. The clinical features of the illness and the type and risk of exposure must be considered pivotal to making patient management decisions. A negative test should not be interpreted as definitive, if other aspects of the patient's clinical presentation or recent epidemiologic exposures indicate such is likely, and diagnostic tests for other diseases are negative.
- False negative results due to failure of PCR are minimized by the presence of controls that monitor nucleic acid extraction and PCR efficiency.
- Risk of patient discomfort or harm during sample collection is minimal.

Risk-Benefit Assessment

The risks posed by use of the ***[test name]*** are mitigated by:

- Use of the ***[test name]*** in conjunction with other laboratory, epidemiological, and clinical evaluation tools
- Distribution of Healthcare Provider and Patient fact sheets.
- Post-market studies/reporting or conditions of Authorization.

Based on these factors, the potential benefits from the use of the ***[test name]*** are expected to outweigh the risks.

## O. FACT SHEET FOR HEALTHCARE PROVIDERS AND PATIENTS:

**Include proposed Fact Sheets for Patients and Healthcare Providers**

## P. INSTRUCTIONS FOR USE/ PROPOSED LABELING/PACKAGE INSERT:

**Include Instructions for Use, Box Labels, Vial Labels and any other proposed labeling.**

## Q. RECORD KEEPING AND REPORTING INFORMATION TO FDA:

AMERICAN OVERSIGHT

[***Manufacturer name***] will track adverse events and report to FDA under 21 CFR Part 803. A website is available to report on adverse events, and this website is referenced in the Fact Sheet for Health Care providers as well as through the [***Manufacturer name***] Product Support website: [***Include link to Website***]. Each report of an adverse event will be processed according to [***Manufacturer name]***'s Non-Conformance Reporting Requirements, and Medical Device Reports will be filed with the FDA as required. Through a process of inventory control, [***Manufacturer name]*** will also maintain records of device usage/purchase. [***Manufacturer name]*** will collect information on the performance of the test, and report to FDA any suspected occurrence of false positive or false negative results of which [***Manufacturer name]*** becomes aware. [***Manufacturer name]*** will maintain records associated with this EUA and ensure these records are maintained until notified by FDA. Such records will be made available to FDA for inspection upon request.

## R. ADMINISTRATIVE INFORMATION:

**Interactive Review Log:** Please use the table below to document interactive review with FDA and include interactions initiated by either FDA or yourself

| **Date** | **Type of Interaction** (phone/ email/ formal submission-DCC) | **Brief Description** (e.g., questions asked/ feedback from FDA received / any word documents included) |
|---|---|---|
| [X] | [X] | [X] |
| | | |
| | | |

## S. FDA ADMINISTRATIVE INFORMATION:

**This section will be finalized by the FDA Lead Reviewer upon completion of the review process and documents the interactive review of this submission and any conclusions resulting from the interactive review.**

1) **Summary of Interactive Review – Lead Reviewer to use this section to highlight any major issues solved during interactive review.**
2) **Final Conclusions for Interactive Review -** It is FDA's conclusion that there currently exists a public health need for such devices, i.e., that there is no adequate, approved (cleared), and available alternative to the ***[test name]*** for [pathogen] detection during the public health emergency. **Conclusion should include an outline the unique features of the device compared to currently issued EUA's under the declaration, if applicable.**
3) **Upon competition of this section the Lead Reviewer should also sign this document and save the file as the final Decision Memorandum.**

AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

## APPENDIX A – Multiplex Panels Under EUA:

An emergency declaration by the HHS Secretary is typically specific for a pathogen/disease (i.e., there is a publicly declared health emergency involving a particular etiologic agent). Therefore, the EUA pathway is only applicable for testing patients with signs/symptoms/risk of exposure for that single agent in a given emergency. FDA has occasionally allowed limited additional target pathogens to be claimed for EUA devices, but panel members must be relevant to the event/disease outbreak subject of the specific emergency declaration. When determining whether to issue an EUA for a multiplex panel FDA takes into consideration the utility of the test (multiplex pathogen detection as an aid in differential diagnosis), clearance/approval status of IVDs for the other panel members, whether the proposed Intended Use fits within the HHS emergency declaration and the how the multiplex panel would fit into current public health authority patient testing algorithm recommendations. We recommend you contact FDA for specific feedback if you plan to claim multiple target analytes as part of your EUA test. If it is determined that a multiplex test is beneficial to the emergency response, please note that analytical and clinical evaluations for each of the target analytes will be required.

## APPENDIX B – General Study Design Recommendations for Reagent Stability:

- For EUAs you may follow the current FDA recognized CLSI Standard EP25 – Evaluation of Stability of In Vitro Diagnostic Reagents; Approved Guideline when evaluating the suitability of stability study designs. If you are planning to pursue a De Novo/510(k) for your device we recommend discussing in more detail your stability design to facilitate potential use of the EUA data in your regular premarket submission.
- Please note that use of only the positive controls is not acceptable for reagent stability evaluation because controls are usually formulated at a moderate positive level. For all the stability evaluations in addition to your external positive and negative controls and the no-template control you should include for the EUA evaluation at least one sample, that should be prepared by spiking negative clinical matrix at an analyte concentration of 3-5xLoD.
- If you are claiming multiple blood clinical specimen types in which similar LoDs are determined, you should use the most challenging clinical matrix for this study.
- Please note we typically recommend your stability study design includes the evaluation of at least 5 replicates. You should also evaluate, if available, 3 different lots of reagents.
- You should design your study to provide data for a timeframe that is about 10% longer than the one to be claimed – for example; a claim of 18 months should be supported by stability data out to 20 months and a claim of 7 days should include stability data out to 8 days.
- FDA considers 15-30°C to represent room temperature conditions. Ideally you should evaluate stability at both 15°C and 30°C, however, for the purposes of the EUA evaluation at 30°C is acceptable as the worse-case scenario.
- Shelf-Life Stability- Unopened kit:
    - You should evaluate real-time kit stability studies with unopened kits stored at the claimed storage temperature for your test.

AMERICAN OVERSIGHT

  - Accelerated stability evaluations for unopened kits is acceptable for EUA submissions while the real-time studies are on-going. However, please note real-time stability data is required to support regular pre-market submissions and for the final claim of an EUA.
- Shipping Stability - Unopened kit: Study should evaluate the anticipated handling and shipping times and temperatures expected for unopened kits.
- In-use/Opened Kit Stability: Depending on your device your stability study design should also support in-use stability of the kit reagents once the kit has been opened, e.g., storage at 2-8 $^{o}$C for 7 days. This includes on board stability once reagents have been placed on the instrument (if applicable).
- Inverted stability (if applicable): Study should support inverted stability for of kits.
- Freeze-thaw Stability: If you recommend aliquoting the reagents to meet the end-users needs following the initial thaw this recommendation should be supported by a freeze-thaw stability study, including the specific number of allowed freeze-thaw cycles.
- FDA analysis recommendations for real time stability studies are as follows:
  - Baseline of the study (t=0 of stability study) should not exceed a month from bottling
  - Clear baselines should be described (e.g., a month from bottling) for each stability claim under each study
  - Claims should be determined based on regression analysis. Any %change (%shift) from time zero (baseline) should be calculated between the target claim and the zero-time as (Ttest-Tbaseline)/ Tbaseline*100 with 95%CI using the regression equation obtained from plotting the mean values. When formulating your acceptance criteria for evaluating the shift from baseline you should consider the reproducibility of your device. However, generally, that the shift at the target claim due to storage cannot exceed 10-15%. The target stability is the next to last tested point that was within +/- 10% of time zero.
  - Acceptance criterion may be different, depending on the test samples analyte concentration distribution in the intended use population and the risk, in other words, the impact of false results to public health.

**APPENDIX C – Claiming Multiple Instruments and/or Extraction Methods:**

If you wish to claim multiple instruments and/or extraction methods for use with your test, please review the study recommendations provided below and contact FDA for any additional feedback. Please note that these analytical and clinical evaluation recommendations are based on the assumption that the elution volumes from the extraction methods and PCR volumes on the different RT-PCR instruments are identical.

- Limit of Detection (LoD): Please note that these studies should be repeated for each clinical matrix claimed in the Intended Use. Pick one RT-PCR instrument and determine the tentative LoD (using 5 replicates in 10-fold dilution) followed by the confirmatory LoD (20 replicates spiked at tentative LoD) for each extraction method on the chosen instrument. Note: If you detect 20/20 replicates in your confirmatory LOD study you should test the next lower concentration, using a 3-fold dilution, until

AMERICAN OVERSIGHT

you achieve a hit rate of <20/20.

- If the different extraction methods yield the same LoD (≤3xLOD) on the RT-PCR instrument chosen for initial testing, pick one extraction method for further LoD determination on the remaining RT-PCR instruments and follow the recommendations below.
- If the extraction methods do not yield the same LoD on the chosen RT-PCR instrument, please choose the extraction method with the worst LoD for further comparison of the LoD on all RT-PCR instruments.

For all other RT-PCR instruments you should use the following adaptive LoD study design:

- Please perform a refined tentative LoD study with 5 replicates at 0.5x, 1x, and 1.5 to 2x LoD. If you detect 4/5 replicates as positive at all the tested levels, you need to include the next higher concentration (i.e., 3x LoD). If you obtain 5/5 replicates at 0.5x LoD, you need to test the next lower concentration (i.e., 0.25x LoD). You will test in this manner until you find the lowest concentration that gives you 5/5 positive results for the tested RT-PCR instrument. This concentration should be used for a confirmatory LoD study for the given RT-PCR instrument using 20 replicates.

Final reported LoD: Please list all RT-PCR instruments with their respective LoDs if different LoDs are obtained. LoDs are considered comparable if they are between 1-3xLoD. These studies should be repeated for each clinical matrix claimed in the Intended Use.

- Interference Substances Studies (if applicable): Pick one extraction method and RT-PCR instrument combination, preferably the one with the worst overall LoD (if one or more of the RT-PCR instruments has a different LoD).

- Inclusivity Testing: For the inclusivity testing, pick one extraction method and RT-PCR instrument combination, preferably the one with the worst overall LoD (if one or more of the RT-PCR instruments has a different LoD).

- Exclusivity Testing: For exclusivity, you can perform this study using any extraction/instrument combination.

- Clinical study: If equivalency of the RT-PCR instruments is shown in an LoD study that tests and confirms that the LoD is the same or very similar for all of the RT-PCR instruments (between 2-3xLoD), then you can pick one RT-PCR instrument for your clinical study provided that the RT-PCR instruments in question are known to FDA for other *in vitro* diagnostic devices. If you find that one or more RT-PCR instruments machines has/have a different LoD, you should pick the extraction method / RT-PCR instrument combination with the worst LoD.

Note, if there are differences in the extraction input volume, extraction elution volume

AMERICAN OVERSIGHT

and PCR input volume (extracted nucleic acid) then the LoD should be confirmed, for each.

**Subject:** RE: Pre-EUA IVD template request

Dear Jill,

Thank you very much for reaching out to us about the test you have validated at Wadsworth Center, NYS Department of Health it was very nice to chat with you. As discussed please find attached the current EUA Interactive Review Template draft for molecular-based assays for the detection of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) [formally - 2019-novel coronavirus (2019-nCoV)]. I suggest the first step is to populate this draft template with the validation information and data that you currently have about your device and sent it back to us for review as a Pre-EUA submission (to be sent to the Document Control Center). The Pre-EUA review is an interactive process, so we will provide feedback after receiving and reviewing the information provided. The draft review template is a shared "work-in-progress" document which you will populate with information and data as obtained and which we will review and provide feedback to you. **Please make sure to capture in the EUA review template that you performed the validation using the (b) (4) primer/probes sets, sensitivity was evaluated with the positive control material provided in the CDC EUA test kit and that validation studies were performed used the commercial primer/probe materials using the CDC EUA Protocol (please be sure to include information the extraction method and instrument used).**

I have also attached a draft cover letter you can use to submit your Pre-EUA for detection of SARS-CoV-2 to FDA (it includes the address for the Document Control Center). Please include in your Pre-EUA submission package:

- The populated EUA Review Template draft
- FDA Form 3514 (https://www.fda.gov/downloads/AboutFDA/ReportsManualsForms/Forms/UCM080872.pdf) - under Section A (type of submission) please check "other" and specify Pre-EUA; please also complete Sections B, C, F and G. For G please use the information provided in this link: https://www.accessdata.fda.gov/scripts/cdrh/cfdocs/cfPCD/classification.cfm?id=3669.

One hard copy of the signed EUA Cover Letter and one electronic copy (CD or thumb drive) of you Pre-EUA submission package should be enclosed in your Pre-EUA submission package mailed to FDA (recommend FedEx). In addition to mailing your Pre-EUA package to FDA we also request that you submit the package to the review division via electronic mail (including the EUA Review Template in MS word) to myself Kim.Sapsford@fda.hhs.gov, as well as carbon copying (cc:) the following email addresses:

- Division Director: Dr Uwe Scherf, email address: Uwe.Scherf@fda.hhs.gov;
- Branch Chief: Dr Tamara Feldblyum, email address: Tamara.Feldblyum@fda.hhs.gov

Please let me know if you have ANY questions I am happy to assist if you are not sure about certain sections in the template.
Best regards
Kim

**Subject:** Pre-EUA IVD template request

At your earliest convenience, I wish to request a copy of the most recent EUA review template relevant to an assay for the SARS-CoV-2 pathogen.
The IVD that we will submit is completely based on the CDC protocol released to public health laboratories earlier in February except that the Wadsworth Center, New York State's public health laboratory has used commercially-derived primers and probes in place of the reagents provided by the CDC.
Thank you,

Dear Jill,

Thank you for your questions. Since we know the issues around the CDC assay – if New York would like to include the N3 manufactured by either (b)(4) we will certainly consider that.

GMP can be waived for EUA so this is not a concern.

I would recommend submitting today, please call Uwe or Tamara if you have any questions as I will be out of the office for most of the day:

Hello Kim,
We are having an internal discussion at Wadsworth on strategy and need some advice please.
I am also copying this email to Dr. Jen Rakeman who directs the NYC lab as the answers will affect her strategy also.

(b)(4)

Could you advise whether it is essential that we use primers and probes that are made under GMP conditions.

Thank you for your patience with us as we learn the FDA process.
Best wishes
Jill and Colleagues.

Dear Drs. Taylor and St. George,

It is a pleasure to inform you that your submission for the New York SARS-CoV-2 Real-time Reverse Transcriptase (RT)-PCR Diagnostic Panel has been issued an Emergency Use Authorization.

Attached please find the electronic version of the signed letter. Please confirm the receipt of the letter.

Congratulations, it has been a pleasure to work with you and your team.

Kind regards,
Uwe Scherf

**Subject:** RE: language

Here also the language for the conditions of authorization:

A. Authorized laboratories will include with reports of the results of the New York SARS-CoV-2 Real-time RT-PCR Diagnostic Panel, all authorized Fact Sheets. Under exigent circumstances, other appropriate methods for disseminating these Fact Sheets may be used, which may include mass media.

B. Authorized laboratories will perform the New York SARS-CoV-2 Real-time RT-PCR Diagnostic Panel as outlined in the New York SARS-CoV-2 Real-time RT-PCR Diagnostic Panel Instructions for Use. Deviations from the authorized procedures, including the authorized RT-PCR instruments, authorized extraction methods, authorized clinical specimen types, authorized control materials, authorized other ancillary reagents and authorized materials required to perform the New York SARS-CoV-2 Real-time RT-PCR Diagnostic Panel are not permitted.

C. Authorized laboratories will have a process in place for reporting test results to healthcare providers and relevant public health authorities, as appropriate.

D. Authorized laboratories will collect information on the performance of the test and report to DMD/OHT7-OIR/OPEQ/CDRH (via email: CDRH-EUA-Reporting@fda.hhs.gov) and Wadsworth Center NYSDOH (Include contact email@xx.xxv) any suspected occurrence of false positive or false negative results and significant deviations from the established performance characteristics of the test of which they become aware.

E. All laboratory personnel using the test must be appropriately trained in RT-PCR techniques and use appropriate laboratory and personal protective equipment when handling this kit, and use the test in accordance with the authorized labeling.

**Subject:** RE: IDT Technologies - Draft IFU and Draft EUA Letter

Ok. Thanks. I started updating the IDT IFU based on my conversation with you. Only missing section is the performance section. I am attaching it as the most recent IFU version (Just in case things change throughout the day).
I will go to my kids tournament then WITHOUT taking my computer. Call me if you need me; I will check emails around 7 pm when I am back.

Best

Silke and Kim,

I just got different direction because CDC is willing to work this out. There is NO need to work on these document now.

I will touch base with you when we have restrategized

Thanks,
Uwe

Kim.
I just had a call with Uwe. He wants the Documents finished this weekend. I will work on it but need to know the following:
(b) (4), (b) (5)

AMERICAN OVERSIGHT

(b) (4), (b) (5)

Again, if IDT sends us anything this weekend. Here are my numbers: (b)(6) cell, best for today) and (b)(6) (b)(6) home, better for most of tomorrow!)

Also, it would be good if I can get a contact at IDT for any questions.

Best
Silke

Kim.

Please find attached the Draft Authorization Letter and the DRAFT IFU for IDT as far as it is possible to complete them. I will do the EUA template on Monday.

I marked in yellow or with a comment everything that IDT needs to verify or that requires updating based on future information – a lot of things are unknown at this point.
(b) (5)

We can discuss next week.

Hope you can enjoy the weekend with your parents.

# Policy for Diagnostics Testing in Laboratories Certified to Perform High Complexity Testing under CLIA prior to Emergency Use Authorization for Coronavirus Disease-2019 during the Public Health Emergency: Immediately in Effect Guidance

Timothy Stenzel, MD, PhD
Director, OHT7: Office of In Vitro Diagnostics and Radiological Health
Office of Product Evaluation and Quality

Center for Devices and Radiological Health

March 2, 2020

AMERICAN OVERSIGHT

# Agenda

- Background
- Summary of Immediately In Effect Guidance
- Questions and Answers

AMERICAN OVERSIGHT

# Objective

- Explain policy for molecular diagnostics testing in high-complexity Clinical Laboratory Improvement Amendments (CLIA)-certified laboratories prior to emergency use authorization for coronavirus disease-2019 (COVID-19) during the public health emergency.

4

AMERICAN OVERSIGHT

# Background

- Guidance issued February 29, 2020 describes a policy regarding certain ~~enabling~~ laboratories ~~to~~ immediately usinge ~~tests~~ they developed and validated in order to achieve more rapid testing capacity in the U.S.
- To address the COVID-19 public health emergency, the FDA has determined that prior public participation for this guidance is not feasible or appropriate and ~~is~~ issueding this guidance without prior public comment.
- This guidance document is immediately in effect, but it remains subject to comment in accordance with the FDA's good guidance practices.

5

AMERICAN OVERSIGHT

# Scope

- The new policy is limited to:
  - Laboratories certified to perform high complexity testing, consistent with the requirements under the Clinical Laboratory Improvement Amendments (CLIA)
  - Molecular diagnostics for SARS-CoV-2
  - The duration of the current public health emergency declaration for SARS-CoV-2
- The new policy does NOT impact:
  - Requirements under the Clinical Laboratory Improvement Amendments (CLIA)
  - CDC recommendations for who should be tested

AMERICAN OVERSIGHT

# Policy

The guidance includes recommendations regarding:

- Validating newly developed SARS-CoV-2 tests prior to clinical use
- Notifying FDA when clinical use of a validated test begins
- Confirming the first 5 positive and negative samples with an EUA authorized test
- Indicating in test reports that the test has been validated but independent review by FDA is not yet complete
- Submiting an EUA within 15 days of initiating testing
- Steps to take if any specimens fail confirmatory testing or if FDA is unable to authorize the EUA~~, stop testing and issuinge corrected test reports indicating prior results may not be valid~~

7

(b)(5) internal deliberative

AMERICAN OVERSIGHT

# Test Validation

- The guidance includes recommendations regarding the ~~Validation should meet~~ minimal testing to be performed for validation ~~recommendations outlined in the guidance for~~:
  - Limit of Detection (LoD)
  - Clinical Evaluation
  - Inclusivity
  - Cross-Reactivity

- Limited viral materials are available
  - FDA, BARDA, and CDC prioritize and coordinate shipments to labs when ready to validate

AMERICAN OVERSIGHT

# Limit of Detection

- Generally defined as the lowest concentration at which 19/20 replicates are positive

- Methods:
  - Recommend testing dilution series with 3 replicates per concentration (range finding) and
  - confirming final concentration with 20 replicates (around initially identified LoD only)

- Samples:
  - pooled negative clinicals samples or artificial matrix
  - if multiple specimen types are intended, ~~evaluate~~ most challenging should be evaluated (e.g., sputum)

9

AMERICAN OVERSIGHT

# Clinical Evaluation

- Recommend testing at least 30 contrived reactive specimens and 30 non-reactive specimens
  - Contrived reactive specimens can be created by spiking viral RNA or inactivated virus into leftover clinical specimens
  - Twenty (20) of the contrived specimens should be spiked at a concentration of 1x-2x LoD, with the remainder of specimens spanning the assay testing range.

- FDA generally defines acceptable performance:
  - 95% agreement at 1x-2x LoD and
  - 100% agreement at all other concentrations and for negative specimens

10

AMERICAN OVERSIGHT

# Inclusivity

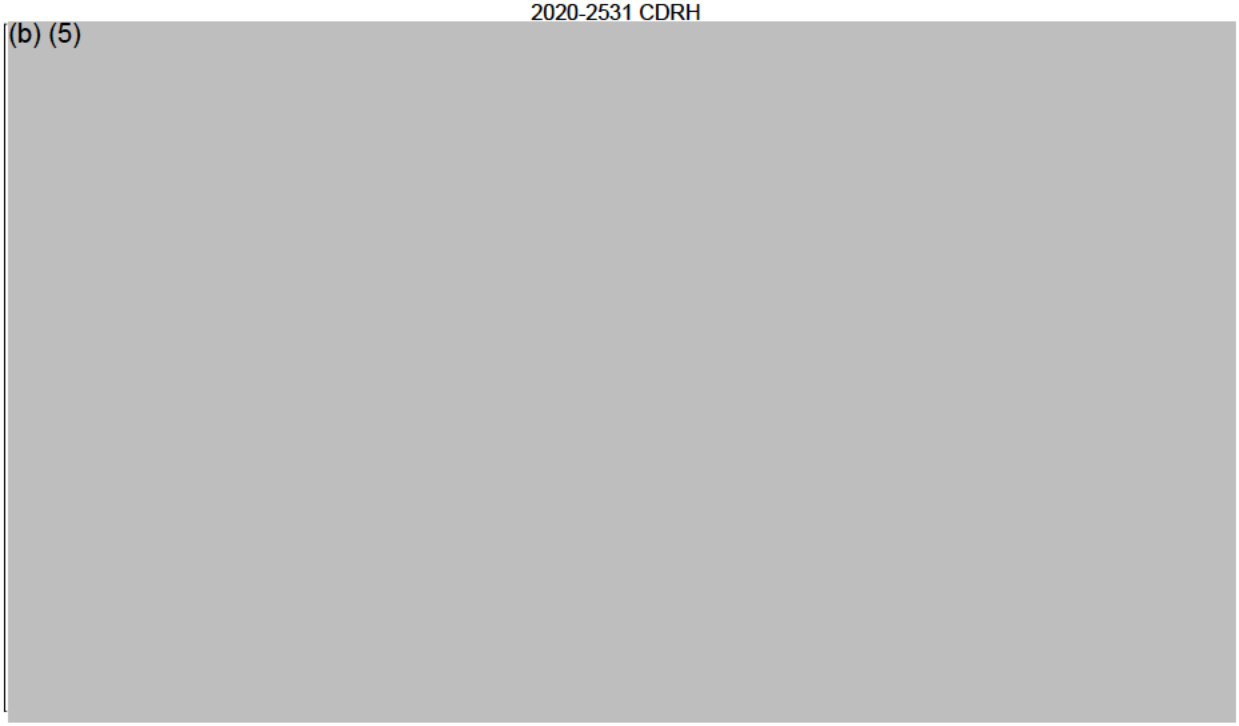
- Recommend conducting an *in silico* analysis of the percent identity matches against publicly available SARS-CoV-2 sequences that can be detected by the proposed molecular assay.
- 100% of published SARS-CoV-2 sequences should be detectable with the selected primers and probes

AMERICAN OVERSIGHT

# Cross-Reactivity

- Recommend conducting an *in silico* analysis of the assay primer and probes compared to common respiratory flora and other viral pathogens ~~is sufficient~~
- There should be >80% homology between one of the primers/probes and any sequence present in the targeted microorganism
- Recommend following recognized laboratory procedures for any additional cross-reactivity testing in the context of the sample types intended for testing

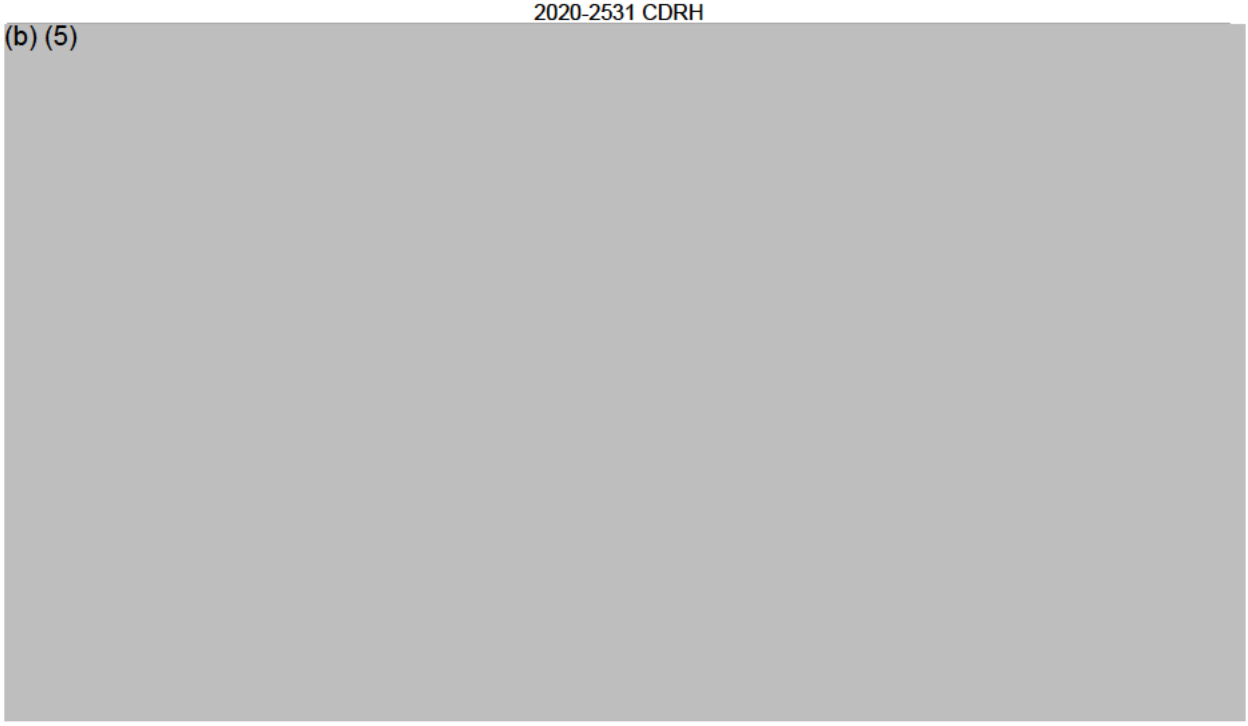
AMERICAN OVERSIGHT



# Status of EUA Tests

- CDC EUA authorization Feb 4, 2020
  - Covers CDC-qualified IDT 2019-nCoV Kit Lot#0000500383
  - Additional IDT lots undergoing qualification by CDC
- NYS Wadsworth Center EUA Authorization Feb 29, 2020
- CDC, FDA and BARDA are working with multiple IVD manufacturers and laboratories to enable additional EUA authorizations as soon as possible; monitor at:
  https://www.fda.gov/medical-devices/emergency-situations-medical-devices/emergency-use-authorizations#coronavirus2019

13



AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

(b) (5)

AMERICAN OVERSIGHT

# Submissions to FDA

- **Notification** of clinical use of a validated test should be directed to CDRH-EUA-Templates@fda.hhs.gov and should include:
  - name of the laboratory
  - name of the lab director
  - address
  - contact person

- **EUA** should be submitted within 15 days of initiating clinical testing to OIR-Operations@fda.hhs.gov and should include:
  - Form 3514 available at: https://www.fda.gov/downloads/AboutFDA/ReportsManualsForms/Forms/UCM080872.pdf
  - Completed EUA template available at: https://www.fda.gov/media/135658/download

16

Mention: Under normal circumstances, an EUA should be mailed to our document control center. Due to the extenuating circumstances, we will waive this requirement and accept submissions via email.

Tim, just following up to see if you can respond to Marcy's question on the IDT qualified kits? See slide 13 where she asked: (b) (5) let's discuss.

Uwe and Tim, do you have any technical concerns with the other edits? If not I will proceed to clean the deck so Jeff can share with the Commissioner's office before tomorrow.

Thanks Elizabeth! I included some suggested edits (in red on the slides, and in the comments for 1 slide) in the attached. I tried to explain my thinking in comment bubbles, but happy to discuss further if you have any questions/concerns.

# Policy for Diagnostics Testing in Laboratories Certified to Perform High Complexity Testing under CLIA prior to Emergency Use Authorization for Coronavirus Disease-2019 during the Public Health Emergency: Immediately in Effect Guidance

Timothy Stenzel, MD, PhD
Director, OHT7: Office of In Vitro Diagnostics and Radiological Health
Office of Product Evaluation and Quality

Center for Devices and Radiological Health

March 2, 2020

AMERICAN OVERSIGHT

# Agenda

- Background
- Summary of Immediately In Effect Guidance
- Questions and Answers

AMERICAN OVERSIGHT

# Objective

- Explain policy for molecular diagnostics testing in high-complexity Clinical Laboratory Improvement Amendments (CLIA)-certified laboratories prior to emergency use authorization for coronavirus disease-2019 (COVID-19) during the public health emergency.

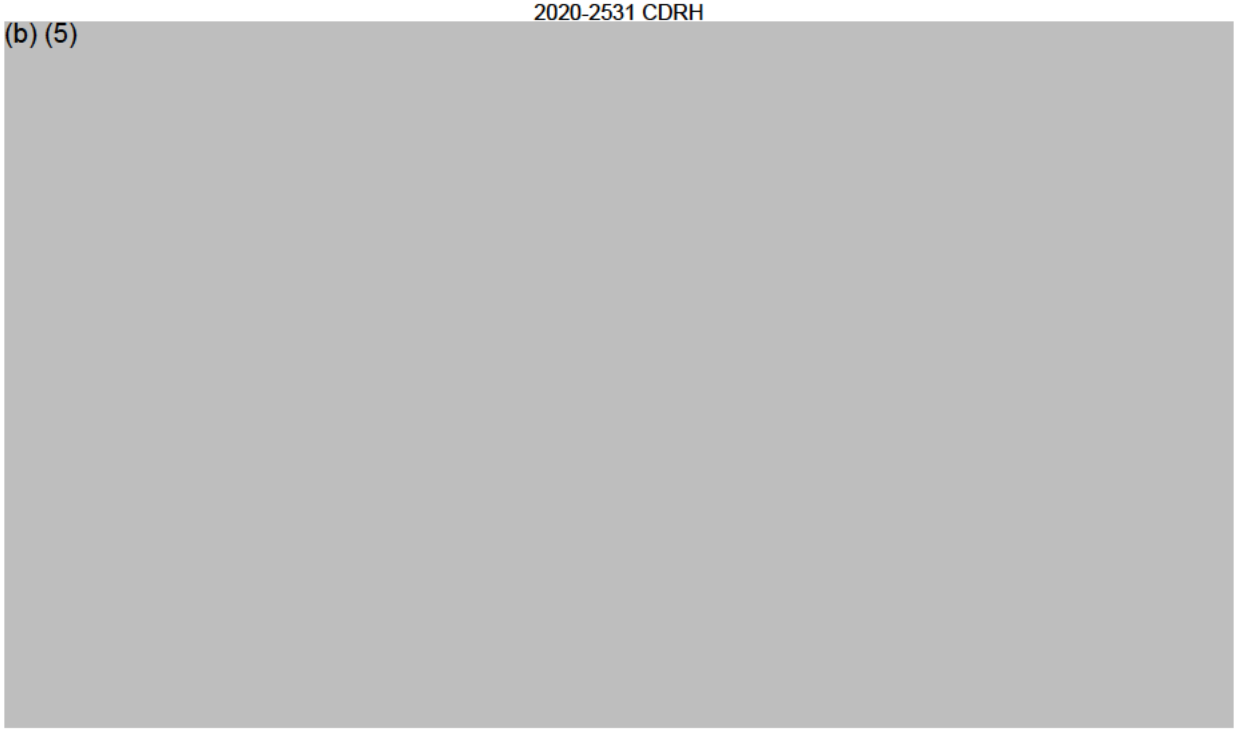
AMERICAN OVERSIGHT

# Background

- Guidance issued February 29, 2020 describes a policy enabling laboratories to immediately use tests they developed and validated in order to achieve more rapid testing capacity in the U.S.
- To address the COVID-19 public health emergency, the FDA has determined that prior public participation for this guidance is not feasible or appropriate and is issuing this guidance without prior public comment.
- This guidance document is immediately in effect, but it remains subject to comment in accordance with the FDA's good guidance practices.

5

AMERICAN OVERSIGHT



# Scope

- The new policy is limited to:
  - Laboratories certified to perform high complexity testing, consistent with the requirements under the Clinical Laboratory Improvement Amendments (CLIA)
  - Molecular diagnostics for SARS-CoV-2 ~~COVID-19~~
  - The duration of the current public health emergency declaration for SARS-CoV-2 ~~COVID-19~~
- The new policy does NOT impact:
  - Requirements under the Clinical Laboratory Improvement Amendments (CLIA)
  - CDC recommendations for who should be tested

AMERICAN OVERSIGHT

(b) (5)

AMERICAN OVERSIGHT

# Policy

- Labs should complete validation of newly developed SARS-CoV-2 ~~COVID-19~~ tests prior to clinical use
- Labs should notify FDA when clinical use of a validated test begins
- Labs should confirm the first 5 positive and negative samples with an EUA authorized test
- Test reports should indicate the test has been validated but independent review by FDA is not yet complete
- Labs should submit an EUA within 15 days of initiating testing
- If any specimens fail confirmatory testing or if FDA is unable to authorize the EUA, labs should stop testing and issue corrected test reports indicating prior results may not be valid

8

(b) (5)

AMERICAN OVERSIGHT

# Policy

Validation should meet minimal recommendations outlined in the guidance for:

- Limit of Detection (LoD)
- Clinical Evaluation
- Inclusivity
- Cross-Reactivity

AMERICAN OVERSIGHT

# Limit of Detection

- Defined as the lowest concentration at which 19/20 replicates are positive
- Methods:
  - test dilution series with 3 replicates per concentration (range finding)
  - confirm final concentration with 20 replicates (around initially identified LoD only)
- Samples:
  - may use contrived samples (i.e., spiking RNA or inactivated virus into artificial or real clinical matrix)
  - if multiple specimen types are intended, evaluate most challenging (e.g., sputum)

10

AMERICAN OVERSIGHT

# Clinical Evaluation

- Test at least 30 contrived reactive specimens and 30 non-reactive specimens
  - Contrived reactive specimens can be created by spiking viral RNA or inactivated virus into leftover clinical specimens
  - Twenty (20) of the contrived specimens should be spiked at a concentration of 1x-2x LoD, with the remainder of specimens spanning the assay testing range.

- Acceptable performance:
  - 95% agreement at 1x-2x LoD and
  - 100% agreement at all other concentrations and for negative specimens

11

AMERICAN OVERSIGHT

# Inclusivity

- Conduct an *in silico* analysis of the percent identity matches against publicly available SARS-CoV-2 sequences that can be detected by the proposed molecular assay.
- 100% of published SARS-CoV-2 sequences should be detectable with the selected primers and probes

AMERICAN OVERSIGHT

# Cross-Reactivity

- Conduct an *in silico* analysis of the assay primer and probes compared to common respiratory flora and other viral pathogens is sufficient
- There should be >80% homology between one of the primers/probes and any sequence present in the targeted microorganism
- Follow recognized laboratory procedures for any additional cross-reactivity testing in the context of the sample types intended for testing

AMERICAN OVERSIGHT

# Additional Updates

- NYS Wadsworth Center rec'd EUA Authorization for their LDT 29FEB2020.

(b) (5)

- IDT 2019-nCoV Kit Lot#0000500383 has been lot qualified by the CDC under the CDC's EUA authorization and is available for distribution. Stay tuned for additional IDT lots to be qualified as they become available.
- The CDC, FDA and BARDA are working with multiple other IVD manufacturers and Laboratories enable additional EUA authorizations as soon as possible, so stay tuned. We will make this information known.
- (b) (5)

14

AMERICAN OVERSIGHT

## Submissions to FDA

- **Notification** of clinical use of a validated test should be directed to CDRH-EUA-Templates@fda.hhs.gov and should include:
  - name of the laboratory
  - name of the lab director
  - address
  - contact person

- **EUA** should be submitted within 15 days of initiating clinical testing to OIR-Operations@fda.hhs.gov and should include:
  - Form 3514 available at: https://www.fda.gov/downloads/AboutFDA/ReportsManualsForms/Forms/UCM080872.pdf
  - Completed EUA template available at: https://www.fda.gov/media/135658/download

15

Mention: Under normal circumstances, an EUA should be mailed to our document control center. Due to the extenuating circumstances, we will waive this requirement and accept submissions via email.

AMERICAN OVERSIGHT

# Resources

AMERICAN OVERSIGHT

# Questions?

For questions on the guidance and accelerated EUA template, or if you wish to consider use an alternative specimen type, contact the Division of Microbiology devices at (301) 348-1778 or: CDRH-EUA-Templates@fda.hhs.gov.

Division of Industry and Consumer Education: DICE@fda.hhs.gov

EH note: I would take out DICE since our audience is labs; not industry or consumers. I think we just want the labs going straight to the EUA mailbox and should not confuse them with too many places to go

Elizabeth,

They look good. I wouldn't include the CDC criteria in Tim's presentation. Dan is welcome to use slides if he wants to discuss the CDC criteria after Tim finishes his presentation.

I agree they need to go to OCC and then shared with OC. I can share them with OC once OCC finishes their review.

**Subject:** RE: RUO Logix Smart 2019-nCoV Kit

Mr. Benson,

AMERICAN OVERSIGHT

Thank you for providing your proposal to address our concerns. We agree to the proposed solution. It will be acceptable if you added the statement for the News releases in question and any future News releases discussing your CE-IVD product. In review of the updated website information for the CE-IVD COVID-19 product and the RUO product, it appears that you have added appropriate statements clarifying that the CE-IVD product is for export only and not available for sale in the U.S. and the RUO product contains the required "For research use only. Not for use in diagnostic procedures" statement as required by 21CFR809.10(c)(2)(i).

If these actions are implemented, it would adequately address our remaining concerns regarding your firm's statements labeling for the Logix Smart 2019-nCoV Kit product.

We again thank you for your cooperation in addressing these concerns and we look forward to your pre-EUA submission for your test.

Sincerely,

**Leroy N. Hwang, Ph.D.**

**Subject:** Re: RUO Logix Smart 2019-nCoV Kit

Dear Dr. Hwang,

Would it be acceptable if we edited the releases in question to include the following verbiage, above the Company disclaimer for each release?:

*The Logix Smart™ 2019-nCoV kit is for Research Use Only. Not for use in diagnostic procedures.*

*This product is for export only and not available for sale in the U.S.*

AMERICAN OVERSIGHT

The page for our CE-IVD COVID-19 product is now live on the website, which hopefully helps to clarify that there are two distinct products (the RUO and the IVD) and to eliminate confusion. This page also does state "This product is for export only and is not for sale in the United States."

Thank you for taking the time to reach out. If you can confirm that the disclaimer as described above will work, Cecilia will add it into our Corrective Action report and the changes will be made immediately.

Best regards,

**Andrew Benson | Head of Corporate Communications**

**Subject:** Re: RUO Logix Smart 2019-nCoV Kit

Dr. Hwang,

I'm sorry to hear that the FDA still has concerns about the previous press releases.
We have been trying our best to be in compliance with the federal regulations.
We also understand that there is a lot of misunderstanding in the general public nowadays than in the normal operations of the IVD industry.
The review process for updates to the website has become more lengthy with the newly implemented process.
Please, allow us some time to discuss internally and provide a more accurate answer to the raised concerns.
I'll be able to provide the answer and hopefully have all corrective actions completed by Friday.

Sincerely,

**Cecilia Hutchins | Head of Regulatory Affairs**

**Subject:** RUO Logix Smart 2019-nCoV Kit

Ms. Hutchins,

In review of the information provided, we still have some remaining concerns with regards to News Releases that are still accessible through your firm's website. Specifically, the February 6, 2020, and February 10, 2020 News releases that were highlighted previously are still accessible and still contain statements which are of concern to FDA. We realize that these statements were made in the past, prior to FDA communication with your firm, so the statements made by representatives of your company cannot be changed. However, we would request that you either remove reference to the previous news releases from your firm's website, or add a disclaimer statement to include as part of those previous news releases that the products are for Research Use Only (in the U.S.) and Not for use in diagnostic procedures.

From our review of the updated information on your firm's website, it also appears that Co-Diagnostics has recently (February 24, 2020) announced CE-IVD mark for the Logix Smart COVID-19 Test. So as to prevent confusion from U.S. customers, we would also recommend that you clearly indicate that this product is available for Export only and not currently available in the U.S. We would request that you add this disclaimer

AMERICAN OVERSIGHT

statement to future press releases or statements regarding the CE-IVD product until a EUA is granted for the U.S.

We request that you provide an updated list of planned corrective actions to address these remaining issues to us by Friday, February 28, 2020. If you would like to discuss specific proposals for wording for your updates, we would be happy to review through email or discuss over the phone.

We thank you for your cooperation in addressing these concerns and we look forward to your pre-EUA submission for your test. Please let me know if you have any questions regarding this communication.

Sincerely,

**Leroy N. Hwang, Ph.D.**

**Subject**: RE: Communications Rollout: COVID-19 Guidance, EUA Template and Granting NYS EUA

Dear Monica,

The signed Emergency Authorization Letter for New York SARS-CoV-2 Real-time Reverse Transcriptase (RT)-PCR Diagnostic Panel package has just been send to Wadsworth Center.

Dr. Kristen St. George has confirmed the receipt of the letter.

Thanks you all for your incredible work getting this done today.

Kind regards,

Uwe

Elizabeth,

They look good. I wouldn't include the CDC criteria in Tim's presentation. Dan is welcome to use slides if he wants to discuss the CDC criteria after Tim finishes his presentation.

I agree they need to go to OCC and then shared with OC. I can share them with OC once OCC finishes their review.

**Subject**: RE: Two pre-EUA questions....advice please

Dear Jill,

Please submit your submission as an EUA rather than an pre-EUIA request to the following mailbox OIR-Operations@fda.hhs.gov to assure a smooth process.

Please include in your EUA submission package:

- The populated EUA Review Template draft (MS Word Document)
- FDA Form 3514 (https://www.fda.gov/downloads/AboutFDA/ReportsManualsForms/Forms/UCM080872.pdf [fda.gov]) - under Section A (type of submission) please check "other" and specify Pre-EUA; please also complete Sections B, C, F and G. For G please use the information provided in this link: https://www.accessdata.fda.gov/scripts/cdrh/cfdocs/cfPCD/classification.cfm?id=3671

Please submit your EUA package to FDA via electronic mail (including the EUA Review Template in MS word) to Kim.Sapsford@fda.hhs.gov, as well as carbon copying (cc:) the following email addresses:

- Division Director: Dr Uwe Scherf, email address: Uwe.Scherf@fda.hhs.gov;
- Branch Chief: Dr Tamara Feldblyum, email address: Tamara.Feldblyum@fda.hhs.gov
- OIR-Operations@fda.hhs.gov – This will ensure that you can skip the step of mailing your submission to us and still get it logged into our system.

Thanks,
Uwe

Dear Jill,

Thank you for your questions. Since we know the issues around the CDC assay – if New York would like to include the N3 manufactured by either (b) (4) we will certainly consider that.

GMP can be waived for EUA so this is not a concern.

I would recommend submitting today, please call Uwe or Tamara if you have any questions as I will be out of the office for most of the day.

**Subject:** FW: requesting SARS-CoV-2 genetic material

ScienCell contacted (b) (4) for the virus material after our email. They copied me on their latest conversation with (b) (4)

I know ScienCell is on our priority list as they have CDC like assay for commercial distribution. Does (b) (4) have companies names from us? It appears so from their email , please see below.

Can we help ScienCell to receive the material for their validation studies.

Best,
Himani

Dr. Hwang,

I'm sorry to hear that the FDA still has concerns about the previous press releases.
We have been trying our best to be in compliance with the federal regulations.
We also understand that there is a lot of misunderstanding in the general public nowadays than in the normal operations of the IVD industry.
The review process for updates to the website has become more lengthy with the newly implemented process.
Please, allow us some time to discuss internally and provide a more accurate answer to the raised concerns.
I'll be able to provide the answer and hopefully have all corrective actions completed by Friday.

Sincerely,

**Cecilia Hutchins | Head of Regulatory Affairs**

**Subject:** RUO Logix Smart 2019-nCoV Kit

Ms. Hutchins,

AMERICAN OVERSIGHT

In review of the information provided, we still have some remaining concerns with regards to News Releases that are still accessible through your firm's website. Specifically, the February 6, 2020, and February 10, 2020 News releases that were highlighted previously are still accessible and still contain statements which are of concern to FDA. We realize that these statements were made in the past, prior to FDA communication with your firm, so the statements made by representatives of your company cannot be changed. However, we would request that you either remove reference to the previous news releases from your firm's website, or add a disclaimer statement to include as part of those previous news releases that the products are for Research Use Only (in the U.S.) and Not for use in diagnostic procedures.

From our review of the updated information on your firm's website, it also appears that Co-Diagnostics has recently (February 24, 2020) announced CE-IVD mark for the Logix Smart COVID-19 Test. So as to prevent confusion from U.S. customers, we would also recommend that you clearly indicate that this product is available for Export only and not currently available in the U.S. We would request that you add this disclaimer statement to future press releases or statements regarding the CE-IVD product until a EUA is granted for the U.S.

We request that you provide an updated list of planned corrective actions to address these remaining issues to us by Friday, February 28, 2020. If you would like to discuss specific proposals for wording for your updates, we would be happy to review through email or discuss over the phone.

We thank you for your cooperation in addressing these concerns and we look forward to your pre-EUA submission for your test. Please let me know if you have any questions regarding this communication.

Sincerely,

**Leroy N. Hwang, Ph.D.**

Dear Leroy,

Thank you for bringing these issues to us, as we discussed in the teleconference, our intentions were never to violate the federal regulations.
We'll take the following actions:

- Work on the corrective actions immediately to fix and clarify the discussed concerns.
- Plan the necessary actions to prevent this issue from happening in the future.

We'll submit the list of corrective and preventive actions as soon as possible and before Friday, the 14th.
Again, I would like to thank you for bringing this issue to our attention, as a startup and small company we have a serious commitment to improving our processes and compliance with the federal regulations. This feedback exchange is very valuable to us.

Sincerely,

**Cecilia Hutchins | Regulatory Liaison**

**Cc:** Scherf, Uwe <Uwe.Scherf@fda.hhs.gov>; Sapsford, Kim E <Kim.Sapsford@fda.hhs.gov>; Thornton, Keith <Keith.Thornton@fda.hhs.gov>
**Subject:** RE: RUO Logix Smart 2019-nCoV Kit - request for teleconference

Cecilia and Chad,

Please find below the summary of today's (02/11/2020) teleconference.

FDA acknowledges that Co-Diagnostics have requested the Pre-EUA template (on 2/1/2020) and are working with the premarket review team. But as indicated in the email your firm has received from FDA with the EUA template:
"Please be reminded that in the U.S. a test for the detection of 2019-nCoV or to diagnose 2019-nCoV infection must not be distributed and/or used for clinical diagnosis without premarket clearance, approval, or EUA by the FDA."

In review of the Website information regarding the RUO Logix Smart 2019-nCoV Kit product and News releases on your firm's website, FDA has identified a number of concerns with regards to the statements made with respect to this product, which appear inconsistent with Research Use Only (RUO) products. As a reminder, **Per 21CFR809.10(c)(i)** - For a product in the laboratory research phase of development, and not represented as an effective in vitro diagnostic product, all labeling bears the statement, prominently placed: **"For Research Use Only. Not for use in diagnostic procedures."**

For more information regarding RUO products, please find the link to the FDA guidance on this subject.
https://www.fda.gov/media/87374/download

Specific concerns include:

Website for the RUO Logix Smart 2019-nCoV Kit product states –

- current features – "CoPrimer technology has shown enhanced specificity when compared to other products on the market." – specificity implies a performance claim.
- current features – "Components are sold for Research Use Only to appropriate customers, to meet the needs of the emergency market." – inconsistent with research use only and implies use for screening/diagnosis
- Intended Use – "The kit is available for Research Use Only and is not licensed for diagnostic procedures." - Inconsistent with 809.10(c)(i) which requires labeling bear the following statement, prominently placed, "**For Research Use Only. Not for use in diagnostic procedures.**"

News release (2/6/2020) statements -

- "(RUO) CoPrimer test for the 2019-nCoV coronavirus is ready for sale to appropriate laboratories, hospitals, and institutions in need of a solution to the current coronavirus epidemic." – implies use for diagnostic/screening purposes, not laboratory research.
- "Co-Diagnostics believes that the test's unique design will provide enhanced accuracy when detecting the presence of the coronavirus, including improved specificity over tests designed on a different platform." – specificity/performance claim.

AMERICA OVERSIGHT

- "Increased specificity is one of the hallmarks of tests build using our patented CoPrimer platform." – performance claim.
- "Sales and shipments of products will be fulfilled…to customers who have the capacity to utilize RUO to slow the spread of this epidemic." – suggests use for diagnostic/screening purposes.

News release (2/10/2020) statements –

- "Co-Diagnostics, Inc.…announced today sales of its screening test designed to identify the presence of the novel coronavirus. – implies use for screening purposes.
- "We are pleased to be able to offer a product to this market that excels in being both sensitive and specific, the two benchmarks for accuracy in molecular diagnostics." – performance claims and implies use for diagnostic purposes.
- "We believe the way that Co-Diagnostics can be most helpful in this ongoing situation is by providing diagnostic solutions that are affordable and accessible in any market in the world." – Implies diagnostic use for RUO.
- "Doing so also provides a compelling proof-of-concept that the Company's unique process and patented technology could quickly and efficiently be applied to address the diagnostic needs associated with other emergencies, including potential mutations of the coronavirus." – implies diagnostic use

As clarified on the call, although some of the statements made are not specifically citing the RUO Logix Smart 2019-nCoV Kit product, when statements are made in association with a press release regarding the product or associated with the product on your firm's website, it links the claim to use of the RUO product.

We request that your firm take immediate corrective action to resolve these identified concerns and identify actions to avoid future issues with regards to the RUO Logix Smart 2019-nCoV coronavirus product and its labeling. We ask that you provide a list of planned actions to address these concerns by Friday, February 14, 2020.

Please also note that under the current HHS EUA declaration, LDTs should not be used for clinical diagnoses without FDA's approval, clearance, or authorization during an emergency declaration. For more information, please find links to information regarding EUA below. **https://www.fda.gov/emergency-preparedness-and-response/mcm-legal-regulatory-and-policy-framework/information-laboratories-implementing-ivd-tests-under-eua**

Please let me know if you have any questions.

Sincerely,

**Leroy N. Hwang, Ph.D.**

Dear Dr. Plante,

We have developed a SARS-CoV-2 CRISPR-Cas12 based assay to diagnose COVID-19 infection in 30 minutes. We are looking to obtain quantified viral RNA to use in spiking studies in support of an FDA EUA application (please see correspondence below). Can you send us some quantified viral RNA? We urgently need additional diagnostic tests for COVID-19 especially given the recent cases of community transmission here in California.

I can be reached anytime at (b) (6) cell / text) or (b) (6) (pager).

Thanks for your consideration.

Best regards,
Charles

**Subject: RE: SARS-CoV-2-CRISPR diagnostic assay white paper**

Hi Charles,

I have the following updated information for the Pre-EUA template and sources of extracted viral RNA. If you have trouble acquiring the material please let us know:

Due to the limited availability of CDC reagents for the detection of SARS-CoV2 (2019-nCoV) and the growing need for testing suspected cases of the COVID-19, FDA revised the study designs required to support an EUA submission for tests intended for the detection of SARS-CoV2.
The current minimum requirements for demonstrating the performance of the new assays are:

1. Analytical Sensitivity (LoD) using viral genomic RNA or inactivated virus preferably in clinical matrix as described in the EUA Template (if BSL-3 facilities are available live virus can also be used in this study). If viral genomic RNA is used in the LoD study, the clinical or simulated matrix should be mixed with the lysis buffer from the extraction kit validated for use with your test prior to the addition of RNA to mitigate the risk of RNA degradation in clinical or simulated matrix. The sample to lysis buffer ratio should be the same as when extracting and purifying nucleic acids from clinical specimens. The volume of the initial viral genomic RNA dilutions used to build the contrived specimens for testing should be kept as low as possible to maximumly preserve the characteristics of the natural clinical specimen matrixes. If lysis buffer is not used for your assay, then other methods to prevent RNA degradation may be helpful (e.g., use of RNasin). For the initial dilution of viral genomic RNA, the diluent should be able to maintain RNA stability e.g., using certified RNase-free consumables and reagents, carrier RNA or tRNA, etc.

2. Reactivity/Inclusivity as described in the EUA Template

3. Analytical Specificity studies as described in the EUA Template

4. Matrix Equivalency Study (if applicable)

5. Comparative LoD of your comparator assay if testing natural clinical samples as described in the EUA Template

6. Specimen stability and fresh vs. frozen studies (if applicable)

7. Clinical Evaluation – Contrived clinical study: You should test 50 negative and 50 positive contrived clinical samples. The samples should be prepared by spiking SARS-CoV2 viral RNA or inactivated virus into individual clinical specimens collected from patients with signs and symptoms of respiratory infection (if BSL-3 facilities are available live virus can also be used to prepare contrived clinical samples). Left-over archived specimens may be used to prepare the mock clinical samples. Half (25) of the contrived positive samples should be prepared by spiking the SARS-CoV2 at 1X – 2x LoD and the remaining contrived positive samples should span the testing range of your assay and not higher than 5x LoD. Consider mixing the clinical matrix with the lysis buffer from the extraction kit validated for use with your test prior to the addition of viral RNA to mitigate the risk of RNA degradation. The sample to lysis buffer ratio should be the same as when extracting and purifying nucleic acids from clinical specimens. The volume of the initial viral genomic RNA

AMERICAN OVERSIGHT

dilutions used to build the contrived clinical specimens for testing should be kept as low as possible to maximumly preserve the characteristics of the natural clinical specimen matrix.

Don,

Here the numbers to track for the Wadsworth EUA. If you DPOM can take care of these tracking that will free the burden of the reviewer tremendously.

Current capacity at the Wadsworth Center for SARS-CoV-2 real-time RT-PCR testing is (b)(4) specimens per week.

We will be working in the coming weeks to enhance that with some additional automation, with the goal to increase capacity to (b)(4) per week. That is our capacity for influenza testing.

Thanks, Uwe

**Subject**: RE: the EUA submission from Wadsworth for the New York SARS-CoV-2 Real-time Reverse Transcriptase (RT)-PCR Diagnostic Panel

Jennifer, Liz, Claire and Marcy,

I am very sorry but I am sure you were expecting this.
This is highest priority for CDRH, and the Center is expecting to authorized the EUA not later than tomorrow.

The review team has started and will work on this later into the night.

Best,
Uwe

**Subject:** RE: applicant name

Jeff,

Here the number:

- Current testing capacity: (b)(4) pecimens per day at our regular staffing levels (on their LC)
- Could increase this to (b)(4) samples per day with 24 hour testing.
- With our Roche MP96s, they believe they can perform (b)(4) per day; we begin validation now

**Subject:** RE: LabCorp update

Dear Federal Colleagues, This is an unacceptable situation that labs and developers who have a test or assay ready to validate cannot obtain the needed and seemingly available material from either BEI or UTMB to finish their validations so they can submit for EUA authorization. I have multiple complaints for developers about both BEI and UTMB.

My cell is (b) (6)

Can we resolve this today?

**Subject:** LabCorp update

UTMB did not ship the virus to us this week. The UTMB lab did not receive the countersigned document from UTMB legal. I followed up with UTMB and received no reply. We ordered aliquots of the virus from BEI Friday morning but were told that despite us already being cleared in the system, COVID-19 is a special request and requires approval from NIAID and signatures on a separate form if they approve. We will be ready to knock out the validation in a handful of days once we receive the viral material. We're hoping this all gets resolved early next week but I will keep you posted.

# ACCELERATED EMERGENCY USE AUTHORIZATION TEMPLATE FOR SARS-COV-2 (covid-19) MOLECULAR TESTING OF RESPIRATORY SPECIMENS IN CLIA CERTIFIED HIGH-COMPLEXITY LABORATORIES

GENERAL INFORMATION ABOUT THIS TEMPLATE

- This template is only for use by CLIA certified high-complexity laboratories with experience developing molecular diagnostics for viral pathogens. Use of the template is applicable only for testing of respiratory specimens, e.g., nasopharyngeal, sputum, and BAL specimens.
- Text highlighted in yellow [Text] should be completed by the laboratory/sponsor. The remaining text should be unchanged. Text in italic bold outlines Food and Drug Administration (FDA) suggestions and clarifications.
- If authorized, the EUA means that this SARS-CoV-2 IVD is temporarily authorized for use until further notice, the public health emergency is terminated or the EUA is revoked by the FDA. Additional recommendations regarding Emergency Use Authorization may be communicated as additional information regarding SARS-CoV-2 emerges.
- This template must be completed and submitted within 15 business days of FDA notification following Interim FDA Guidance available at http://www.fda.gov/xxxx.
- If you need additional information completing this form or wish to consider use an alternative specimen type, please contact the Division of Microbiology devices at (301) 348-1778 or email. XXXX@fda.hhs.gov

## A. PURPOSE FOR SUBMISSION

Emergency Use Authorization (EUA) request for use of a SARS-CoV-2 molecular diagnostic test to be performed for the in vitro qualitative detection of RNA from the SARS-CoV-2 in respiratory samples from patients as recommended for testing by public health authority guidelines. The test will be performed in CLIA certified high-complexity laboratories. Additional testing and confirmation procedures should be performed in consultation with public health and/or other authorities to whom reporting is required.

Positive results should also be reported in accordance with local, state, and federal regulations.

## B. MEASURAND

Specific nucleic acid sequences from the genome of the SARS-CoV-2 ***[please specify the targeted gene(s) of the pathogen; assays with more than one target are recommended].***

AMERICAN OVERSIGHT

## C. LABORATORY/SPONSOR

***[Official name, address and contact information of applicant and all locations where specimen testing will be performed***

## D. REGULATORY INFORMATION

***Approval/Clearance Status:***

The SARS-CoV-2 assay test is not cleared, CLIA waived, approved, or subject to an approved investigational device exemption.

## E. PROPOSED INTENDED USE

***1) Intended Use:***

The SARS-CoV-2 assay is a [***specify test technology such as, real-time RT-PCR test***] intended for the qualitative detection of nucleic acid from the SARS-CoV-2 in respiratory specimens from individuals. Testing is limited Clinical Laboratory Improvement Amendments of 1988 (CLIA), 42 U.S.C. §263a certified high-complexity laboratories with FDA Emergency Use Authorization FDA for performing SARS-CoV-2 testing.

Results are for the identification of SARS-CoV-2 RNA. The SARS-CoV-2 RNA is generally detectable in respiratory specimens during the acute phase of infection. Positive results are indicative of active infection. Laboratories within the United States and its territories are required to report all positive results to the appropriate public health authorities.

Negative results do not preclude SARS-CoV-2 infection and should not be used as the sole basis for patient management decisions. Negative results must be combined with clinical observations, patient history, and epidemiological information.

The assay is intended for use by CLIA certified high-complexity laboratories with experience in developing molecular diagnostics and is authorized under the Food and Drug Administration's Emergency Use Authorization.

## F. DEVICE DESCRIPTION AND TEST PRINCIPLE

***[Example text has been added under each of the sub-headings below for a fluorescence based rRT-PCR test for detection of organism RNA. If a different test principle is used by the test for the detection of a specific analyte please modify the description accordingly to capture the salient points in each of the sub-headings below. Please note the accelerated template is intended for use only with existing, well-established technologies.]***

AMERICAN OVERSIGHT

1) ***Product Overview/Test Principle:***

The assay is a real-time reverse transcription polymerase chain reaction (rRT -PCR) test. The SARS-CoV-2 primer and probe set(s) is designed to detect RNA from the SARS-CoV-2 in respiratory specimens from patients as recommended for testing by public health authority guidelines.

2) ***Description of Test Steps:***

**Please describe in abbreviated form the steps for performing your assay in sequential order as a numbered list, including extraction methods. This should include the names of the instruments used in your assay, e.g., ABI 7500. A copy of your laboratory procedure would be acceptable and can be appended to this form.**

3) ***Control Material(s) to be Used:***

**Please describe the assay controls to be performed in the laboratory, including the following:**

- **The positive control; ideally the positive control will be used to confirm performance near the test LoD. If a template control is used, please describe in general terms the sequence used.**
- **The extraction control.**
- **The internal control, if present.**

**Your description should also include the frequency that controls will be performed.**

4) ***Assay results and interpretation***

**Please describe the results of your assay procedure, e.g., reactive (positive/detected), non-reactive (negative/non-detected), or Invalid (no result reported)**

## J. PRODUCT MANUFACTURING

Please note that Under the Emergency Use Authorization (EUA) most of the 21 CFR 820 Quality System Regulation (QSR) requirements can be waived for the duration of the EUA. FDA expects that the high-complexity laboratories performing these tests follow comparable practices as much as possible and may consider previous compliance history when determining whether or not to waive certain QSR requirements for a specific product. Please note adverse events, as per 21 CFR Part 803, have to be reported for authorized devices.

AMERICAN OVERSIGHT

## K. PERFORMANCE EVALUATION

The following validation studies should be performed as during your assay development:

1) ***(Limit of Detection (LoD) (analytical sensitivity):***

***[Laboratories should document the limit of detection (LoD) of their SARS-CoV-2 assay. It is acceptable to spike RNA or inactivated virus into artificial or real clinical matrix (e.g., BAL fluid, sputum, etc.) for LoD determination.***

***It is recommended that laboratories should test a 2-3 fold dilution series of three replicates per concentration, and then confirm the final concentration with 20 replicates. FDA defines LoD as the lowest concentration at which 19/20 replicates are positive. If multiple clinical matrices are intended for clinical testing, laboratories should submit the results from the most challenging clinical matrix to FDA. For example, if testing respiratory specimens (e.g., sputum, BAL, nasopharyngeal (NP) swabs, etc.), only results from sputum need to be reported in the EUA application. If needed, we recommend that you follow the most current version of the CLSI standard, Evaluation of Detection Capability for Clinical Laboratory Measurement Procedures (CLSI EP17)]***

**[Please describe in abbreviated form your LoD study, the specific material used (e.g., live viral stocks, in vitro transcripts, etc.), and the LoD (with appropriate units) for your assay]**

2) ***Inclusivity (analytical sensitivity):***

***[Laboratories should document the results of an inclusivity study that demonstrates the strains of SAR-CoV-2 that can be detected by the proposed molecular assay. It is acceptable to conduct an in silico analysis of published SARS-CoV-2 sequences using the assay's primers and probes. FDA anticipates that 100% of published SAR-CoV-2 sequences will be detectable with the selected primers and probes.]***

**[Please describe in abbreviated form your Inclusivity study and confirm that there was 100% detection of all SARS-CoV-2 strains.}**

3) ***Cross-reactivity (analytical specificity)***

***[At a minimum, an in silico analysis of the assay primer and probes compared to common respiratory flora and other viral pathogens is sufficient for initial clinical use. FDA defines in silico cross-reactivity as greater than 80% homology between one of the primers/probes and any sequence present in the targeted microorganism. Laboratories should follow recognized laboratory procedures in the context of the sample types intended for testing for any additional cross-reactivity testing.]***

AMERICAN OVERSIGHT

**Recommended List of Organisms to be analyzed *in silico* or by Direct Testing***

| Other high priority pathogens from the same genetic family | High priority organisms likely in circulating areas |
|---|---|
| **Human coronavirus 229E** | **Adenovirus (e.g. C1 Ad. 71)** |
| **Human coronavirus OC43** | **Human Metapneumovirus (hMPV)** |
| **Human coronavirus HKU1** | **Parainfluenza virus 1-4** |
| **Human coronavirus NL63** | **Influenza A & B** |
| **SARS-coronavirus** | **Enterovirus (e.g. EV68)** |
| **MERS-coronavirus** | **Respiratory syncytial virus** |
| | **Rhinovirus** |
| | ***Chlamydia pneumoniae*** |
| | ***Haemophilus influenzae*** |
| | ***Legionella pneumophila*** |
| | ***Mycobacterium tuberculosis*** |
| | ***Streptococcus pneumoniae*** |
| | ***Streptococcus pyogenes*** |
| | ***Bordetella pertussis*** |
| | ***Mycoplasma pneumoniae*** |
| | ***Pneumocystis iroveci* (PJP)** |
| | **Pooled human nasal wash – *to represent diverse microbial flora in the human respiratory tract*** |
| | ***Candida albicans*** |
| | ***Pseudomonas aeruginosa*** |
| | ***Staphylococcus epidermis*** |
| | ***Staphylococcus salivarius*** |

* For direct testing, concentrations of $10^6$ CFU/ml or higher for bacteria and $10^5$ pfu/ml or higher for viruses is recommended.].

**[Please describe in abbreviated form your cross-reactivity study and list the microorganisms tested, indicating whether this was performed either in *in silico* or wet testing. Organisms recommended for testing are listed in the table above]**

***4) Clinical Evaluation:***

***[In the absence of known positive samples available for testing, laboratories should confirm the performance of their assay with a series of contrived clinical specimens by testing a minimum of ~~50~~ 30 contrived reactive specimens and ~~50~~ 30 non-reactive specimens. Contrived reactive specimens can be created by spiking RNA or inactivated virus into leftover clinical specimens; the majority of these specimens can be leftover upper respiratory specimens such as NP swabs, sputum, etc. ~~Half~~ Twenty of the contrived clinical specimens should be spiked at a concentration of 1x-2x LoD, with the remainder of specimens spanning the assay testing range. FDA defines the acceptance criteria for the performance as 95% agreement at 1x-2x LoD, and 100% agreement at all other concentrations and for negative specimens.***

AMERICAN OVERSIGHT

**[Please describe in abbreviated form the procedure and results from clinical performance testing]**

## O. INFORMATION FOR HEALTHCARE PROVIDERS AND PATIENTS:

**Please describe or provide copies of materials intended for use by providers or patients for interpreting results.**

## Q. RECORD KEEPING AND REPORTING INFORMATION TO FDA:

The laboratory will track adverse events and report to FDA under 21 CFR Part 803. A website is available to report on adverse events, and this website is referenced in the Fact Sheet for Health Care providers. The laboratory will maintain will information on the performance of the test, and report to FDA any suspected change in performance of which they become aware. The laboratory will maintain records associated with this EUA and ensure these records are maintained until notified by FDA. Such records will be made available to FDA for inspection upon request.

AMERICAN OVERSIGHT

## S. FDA ADMINISTRATIVE INFORMATION:

**This section will be finalized by the FDA Reviewer upon completion of the review process. This will document any interactions of communications with the laboratory. the interactive review of this submission and any conclusions resulting from the interactive review.**

***Product Code:***

Hi Alex,

Just to clarify, we are currently working on a pre-EUA (PEUA200009). After we work out all the issues, you will then submit an official EUA request package. Based on the new FDA guidance on LDTs yesterday, you can offer the UW LDT for patient testing as soon as you complete the validation of the LDT. You should then submit an official EUA request within 15 days of offering the LDT for patient testing.

AMERICAN OVERSIGHT

I will review your updated template (hopefully with validation data) as soon as possible and provide you with feedback as we continue to work on pre-EUA200009. But based on the new FDA guidance on LDTs yesterday, this continued preEUA process should not delay patient testing using the UW test once you determine that all validations are completed.

Thanks,
Li

Uwe,

That's terrific. Can you/someone on your team please ask them, and subsequent notifiers, how many specimens/patients they can test per week and if that is their maximum capacity or if they can increase their weekly throughput?

Jeff

Jeff, Tim and Don,

We just got the 1st notification under the accelerated EUA program that UW will start testing patients for SARS-CoV-2 at 8 am tomorrow morning.

We confirmed the receipt of this request in our mailbox and an acknowledgment email went out.

Best, Uwe

Tim, Uwe, and Kim,

Good evening. Apologies for adding to your long to-do list, though I think this should be pretty straightforward. We are putting together some QA for the calls with the Hill tomorrow, and there are a few attached for which it would be helpful to have OIR review and respond as appropriate. If you are unable to address any of these, just let me know.

Our goal is to send to Jeff and the team this evening before 8 pm if possible, though I understand everyone is crashing on multiple related things.

Please do let me know if anyone has questions.

Best,

Jennifer

Jeff, Elizabeth, Ellen, Bill and Tim:

2/25/20 6 AM update:

**Status of activities on diagnostics:**

- 2/24/20 CDC proposed to change wording the intended use of their EUA from:
  - The CDC 2019-Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel is a real-time RT-PCR test intended for the presumptive qualitative detection of nucleic acid from the 2019-nCoV in upper and lower respiratory specimens (such as nasopharyngeal or oropharyngeal swabs, sputum, lower respiratory tract aspirates, bronchoalveolar lavage, and nasopharyngeal wash/aspirate or nasal aspirate) collected from individuals **who meet CDC criteria for 2019-nCoV testing**
  - To:

AMERICAN OVERSIGHT

(b) (5)

**Also, CDC communicate that they will move forward with changing their assay to a N1+N2 only assay. CDC's intention is to have both changes done with one submission.**

- CDC will provide additional confirmation testing had been conducted by CDC on presumptive positive samples. FDA will rely this additional information for the statistical justification included in the benefit-risk assessment for CDC to exclude using the N3 primer/probeset as part of their assay moving forward.

- A total of 75 IVD Developers have requested and received EUA review template

AMERICAN OVERSIGHT

HHS just asked us to provide some TPs to FDA, CDC, ASPR for VP/Secretary to use tomorrow in TV interviews. I've pulled out the relevant FDA Qs. TPs look ok?

AMERICAN OVERSIGHT

Hi Tim,

I didn't get a chance to put together email for Uwe after our call last night. I am OOO today, but Rodney Wallace, my boss, was called to Sec Azar's office this morning about the new proposed LDT pathway. He was given this document, and told to call some companies to see what they needed.

I just spoke with Uwe, and he indicated that the requirements for commercial developers haven't changed, this is just for clinical labs.

(b) (5)

Other questions best for phone.

I am available until 12:45, and after 2:15. (b) (6)

Thanks,

Rosemary

**Subject:** RE: IDT Kit CoA, Lot number, inventory, etc

Thank you Claire, Yes, that is the lot we received. Since the new lot of (b) (4) kits is from the same mix formulation event we may not have to do function QC on it.

CDC, Do we want to sequester these (b) (4) kits?

Thanks!

Best,
Tim

**Subject:** RE: IDT Kit CoA, Lot number, inventory, etc

Hi Tim,

I believe your order was kit lot (b) (4) (but please confirm). I've attached the COA above for your review.

I've put a hold on the existing inventory ((b) (4) kits) of the same kit lot you tested for 2019-nCoV Kit, (b) (4) rxn product.

Later today, we will have another (b) (4) units of the 2019-nCoV Kit, (b) (4) rxn kits from the same mix formulation event that I can dedicate to your team if you see fit. These will have different aliquot and kit lot numbers due to batch numbers in our ERP systems, but were from the same bulk formulation event.

We also have more builds coming behind the one described above but will be from a new mix formulation (all still from the same original synthesis.)

Thanks,

AMERICAN OVERSIGHT

**Subject:** IDT Kit CoA, Lot number, inventory, etc

Hi Claire and Roman,

Can we get the CoA for the lot you sent? Copy all on this email?

I am still trying to get the lot number.

Can you give us the current inventory of the (b) (4) reaction kits. Hopefully they are all sequestered. Stay tuned for our QC results and next steps.

We greatly appreciate your help!

Thanks!

Best,

**Subject:** RE: Revisiting use of existing CDC kits at PHL labs for N1 + N2 only

Hi Tim,
These are over in the QC lab. We can get the information this morning.
One note, the CoA for these kits was posted on the IDT website, but now has been pulled along with the product from the IDT website. It would be useful to have IDT provide the CoA for the kit lot that was pulled from their website.
Thanks
Steve

Hi Rosemary,

I defer to Jeff. Do you have a list of companies that have RUO assays for 2019 nCoV today on their shelves that can ship?

Thanks!

Best,
*Tim*

**Subject:** Questions

Hi Tim,
I didn't get a chance to put together email for Uwe after our call last night. I am OOO today, but Rodney Wallace, my boss, was called to Sec Azar's office this morning about the new proposed LDT pathway. He was given this document, and told to call some companies to see what they needed.
I just spoke with Uwe, and he indicated that the requirements for commercial developers haven't changed, this is just for clinical labs.

**Subject:** RE: SEATTLE Flu Study Lab Result
**Importance:** High

Hi Tim, et al. at CDC and Mark, et al. at SFS – Jeff Duchin (Chief Health Officer at Public Health Seattle-King County) asked me to follow up with you about the outcome of our discussion earlier today (9 PT/12 ET) about Seattle Flu Study testing for SARS-CoV-2.

At the end of the call, Tim said he would get back to Mark within the hour, but we haven't heard anything on our end.

Could someone please send a summary of where things stand and specifically
- what the current guidance is about SFS continued testing of samples for nCoV (retrospective and prospective)
- if testing continues, what is the flow of information to public health / re-contacting patients with results
- any other relevant info (e.g., was the lot of the kit SFS used to confirm their initial positive the same lot that CDC had QC'd?)

Thank you,

Karen Cowgill, PhD, MSc *(she/her)*

**Subject:** SEATTLE Flu Study Lab Result

Wendy,

Thanks for helping us navigate with FDA colleagues what we can say/do in response to a potential positive test result from the SFS research assay. Helen Chu and Jan Englund are the SFS researchers that can provide the details of the test method and other relevant information. I'm also copying Scott Lindquist, the WA State DOH communicable disease epidemiologist and Karen Cowgill who works on surveillance with us. It probably would be good to have a call early tomorrow Pacific time (7:30) but Helen and Jan should schedule the time with you.

Very much appreciate your help.

Jeff

**Subject:** Questions

Hi Tim,
I didn't get a chance to put together email for Uwe after our call last night. I am OOO today, but Rodney Wallace, my boss, was called to Sec Azar's office this morning about the new proposed LDT pathway. He was given this document, and told to call some companies to see what they needed.
I just spoke with Uwe, and he indicated that the requirements for commercial developers haven't changed, this is just for clinical labs.

(b) (5)

Other questions best for phone.
I am available until 12:45, and after 2:15. (b) (6)
Thanks,
Rosemary

**Subject**: RE: Product equivalence template
**Attachments**: DRAFT Letter to PHLs - Acceptable Materials.docx

Thanks Laura! We will likely need to add the lot number to the equivalence letter. Can't think of anything else at the moment.

I hope you don't mind that I have copied Jeff and Uwe.

Jeff and Uwe, This letter is being drafted to send to PHLs that have already bought the same lot of IDT RUO kits that is currently being QC'd here at the CDC. If it passes QC we want to send this letter to APHL and their labs to let them know they can immediately begin using this kit lot from IDT.

It may also I guess be used when we have IDT send kits to the labs we specify.

Thanks!

Best,
*Tim*

**Additional Acceptable Materials**
**CDC 2019 Novel Coronavirus (nCoV) Real-Time RT-PCR Diagnostic Panel (EUA200001)**

Dear Public Health Partner,

CDC has identified, in consultation with FDA, products that are equivalent to and may be used in place of certain materials required for performance of the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel. Please see the table below:

| CDC Product | Equivalent Product |
|---|---|
| CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel<br>Cat# 2019-nCoVEUA-01<br>(Box 1: Primers and Probes) | [Insert name, manufacturer and catalog#] |
| Component 1: 2019-nCoV_N1 (Part #RV202001) | [Insert component name and part #] |
| Component 2: 2019-nCoV_N2 (Part #RV202002) | |
| Component 3: RP (Part #RV202004) | |

Product equivalency was determined through functional testing of the materials at CDC.

If you have any questions regarding this communication, please contact:

CDC EOC Laboratory Task Force
eocevent177@cdc.gov

Sincerely,

Centers for Disease Control and Prevention

Tim,

CDC will have someone participate. Can you participate by phone if I'm Atlanta or in person if back in town? Keagan just pinged me.

**Subject:** FW: ACLA Annual Meeting, Role of Commercial Labs in Coronavirus Testing

Please see the request from Julie Khani at the beginning of this email trail. Is this something you and Dan might consider doing together by videoconference, if you are still in Atlanta next week? If you are here I'd have you go in person but you should stay at CDC as long as is necessary (and as long as you are willing).

Jeff

It's a hotel ballroom. I could look into videoconferencing?

Also, just FYI, I reached out to Danielle Steele on this as well, re both FDA and CDC participation.

AMERICAN OVERSIGHT

Hi Keagan. As you may be aware, next week Commissioner Hahn has graciously agreed to speak at the ACLA annual meeting. The meeting is on March 4th at the Grand Hyatt in DC and he is scheduled to speak from 9:00-9:15. Elizabeth Hillebrenner is also speaking on a panel at 11:00am to discuss diagnostics generally. Meeting agenda available here.

I am reaching out because in addition to Commissioner Hahn's remarks, I think the ACLA meeting would provide an excellent opportunity for the FDA to address the diagnostics community about the Coronavirus. I've extended the same invitation to the CDC. There will be approximately 200 people in attendance at the meeting, including CEOs and senior leadership from companies such as LabCorp, Quest, Mayo Clinic Laboratories, Hologic, and Siemens. ACLA and several member companies have a weekly call with the CDC, and the FDA has participated on some of the calls. We have shared information with the CDC about lab capacity and other information, in the event that public health labs are unable to handle testing needs, and surge capacity is necessary.

While these calls have been helpful, numerous questions remain about the availability of the CDC assay to commercial labs, the FDA EUA process, and other issues. I'd be happy to modify the agenda to allow time for a representative from the FDA, CDC, or both, to provide an update an answer questions.

I know the situation is changing quickly, and I can only imagine how busy it is at the FDA. But, as a lot of the key players in the diagnostics community will be together at our meeting next week, I wanted to extend the opportunity.

My office and mobile numbers are below if you have questions or if you would like to discuss.

Thanks.

Julie

**Importance:** High

Hi Tim, et al. at CDC and Mark, et al. at SFS – Jeff Duchin (Chief Health Officer at Public Health Seattle-King County) asked me to follow up with you about the outcome of our discussion earlier today (9 PT/12 ET) about Seattle Flu Study testing for SARS-CoV-2.

At the end of the call, Tim said he would get back to Mark within the hour, but we haven't heard anything on our end.

Could someone please send a summary of where things stand and specifically
- what the current guidance is about SFS continued testing of samples for nCoV (retrospective and prospective)
- if testing continues, what is the flow of information to public health / re-contacting patients with results
- any other relevant info (e.g., was the lot of the kit SFS used to confirm their initial positive the same lot that CDC had QC'd?)

Thank you,

**Subject:** SEATTLE Flu Study Lab Result

Wendy,

Thanks for helping us navigate with FDA colleagues what we can say/do in response to a potential positive test result from the SFS research assay. Helen Chu and Jan Englund are the SFS researchers that can provide the details of the test method and other relevant information. I'm also copying Scott Lindquist, the WA State DOH communicable disease epidemiologist and Karen Cowgill who works on surveillance with us. It probably would be good to have a call early tomorrow Pacific time (7:30) but Helen and Jan should schedule the time with you.

Very much appreciate your help.

Hi Marcia and Brian, Got a question for you. Given that once you have completed validation and notified the FDA you can begin testing and then submit your package within 15 days. What will your weekly testing capacity be?

It is short notice but can you get me this information in about 1 hour – by 8:30 pm?

Best,

**Subject:** FW: Qiagen

Hi Uwe,
FYSA- As discussed , we are being asked about U.S. status everytime a company makes a press announcement about the availability of their test outside the US. This one from Qiagen raised a bunch of questions last night.

FEB 26 2020

# QIAGEN announces worldwide shipments of QIAstat-Dx test kits for SARS-CoV-2

**• QIAstat-Dx Respiratory 2019-nCoV Panel rapidly differentiates novel coronavirus from 21 other pathogens implicated in serious respiratory syndromes**

**• Panel being tested at four hospitals in China after initial evaluation on clinical samples by a leading Paris hospital**

**• Adds to QIAGEN's portfolio of molecular testing solutions to aid in global public health emergency**

**Hilden, Germany, and Germantown, Maryland, February 26, 2020** – QIAGEN (NYSE: QGEN; Frankfurt Prime Standard: QIA) today announced it has shipped its newly developed QIAstat-Dx Respiratory Panel 2019-nCoV test kit to four hospitals in China for evaluation. The new kit detects the novel coronavirus SARS-CoV-2 and adds rapid Sample to Insight syndromic

AMERICAN OVERSIGHT

testing to QIAGEN's portfolio of molecular testing solutions in the public health emergency. QIAGEN is also in the process of shipping QIAstat-Dx testing kits to public health institutions in other regions, including Europe, South-East Asia, and the Middle East.

Since January QIAGEN has been providing instruments and consumables to support detection of the virus in China and other markets. Official protocols for SARS-CoV-2 detection include QIAGEN extraction kits, reagents and instruments for real-time polymerase chain reaction (RT-PCR) workflows. Customers also are deploying QIAsymphony modular instruments and NeuMoDx integrated PCR systems to automate higher-throughput processing of their laboratory-developed tests for SARS-CoV-2.

"Our dedicated task force has moved very fast to develop and make available the QIAstat-Dx respiratory panel with SARS-CoV-2 detection. We are partnering closely with authorities and customers around the world to bring rapid, accurate diagnosis to the fight against this deadly infectious disease," said Thierry Bernard, Interim CEO of QIAGEN and Senior Vice President, Head of the Molecular Diagnostics Business Area. "As we have in past health crises such as SARS and the swine flu, QIAGEN is working hard to deliver better, faster testing solutions for hospitals and public health institutions to aid in the effort to monitor and bring the outbreak under control. Our employees' extraordinary response embodies QIAGEN's core mission to make improvements in life possible."

The QIAstat-Dx system was introduced in Europe in 2018 as a CE-product and cleared by the Food and Drug Administration (FDA) in the United States in mid-2019. It enables fast, cost-effective and easy-to-use syndromic testing with novel Sample to Insight workflows. The system streamlines molecular testing from end to end. A technician simply loads a clinical sample (such as a swab) into a single-use QIAstat-Dx cartridge and places it in the analyzer. QIAGEN chemistries for sample processing and analysis are built in, and the QIAstat-Dx instrument delivers results in about one hour.

**New QIAstat-Dx testing solution for SARS-CoV-2**

The QIAstat-Dx Respiratory 2019-nCoV Panel is a new version of the existing QIAstat-Dx Respiratory Panel for differential analysis of 21 viral and bacterial pathogens in respiratory syndromes. Once the SARS-CoV-2 genome was sequenced in January, QIAGEN developed two highly sensitive assays to detect SARS-CoV-2 targeting Orb1ab and the E gene. The addition of these targets provides parallel tools for combined detection of the novel coronavirus with increased sensitivity.

The expanded QIAstat-Dx panel is currently being evaluated at the Bichat-Claude Bernard Hospital in Paris. "After more than a year of experience using the existing QIAstat-Dx Respiratory Panel to evaluate patients coming into our Emergency Department with respiratory syndromes, we are evaluating the new panel with SARS-CoV-2 against RT-PCR testing using WHO recommended protocols. The QIAstat-Dx solution can provide results in about one hour, with high sensitivity and specificity and minimal hands-on time for hospital or laboratory personnel," said Dr. Benoit Visseaux, Associate Professor of Virology at Bichat-Claude Bernard Hospital in Paris.

Amid the rapidly evolving response to the coronavirus outbreak, the regulatory status of the QIAstat-Dx Respiratory Panel will vary by location. QIAGEN will apply for emergency authorization for marketing of the new panel from the U.S., the Korean KCDC/MFDS, and FDA and China's National Medical Products Administration (NMPA); the panel will be available with CE-IVD marking in Europe and other markets.

**Multiple other QIAGEN testing solutions for SARS-CoV-2**

AMERICAN OVERSIGHT

QIAGEN has moved quickly on several fronts to provide molecular testing solutions to researchers working to counter the international threat from the SARS-CoV-2 virus. Building on its strong position and experience in molecular testing for infectious diseases, QIAGEN is providing a variety of solutions:

- Enabling laboratory-developed tests (LDTs) – extraction kits, PCR enzymes and instruments, supporting in-house testing by laboratories and public health institutions. CDC guidelines for RT-PCR testing list QIAGEN's EZ1 DSP Virus kits, which run on EZ1 Advanced workstations, and QIAamp DSP Viral RNA Mini kits, which can be automated on QIAcube instruments. Chinese authorities and the Berlin Charitè protocol also include QIAGEN consumables.
- Mid- and high-throughput automation – QIAsymphony modular systems for sample preparation and PCR analysis, as well as NeuMoDx 96 and 288 systems for fully integrated PCR analysis, enabling customers to implement higher-throughput solutions for laboratory-developed RT-PCR tests. QIAGEN recently started placing NeuMoDx systems in China, for use in with LDTs in SARS-CoV-2 testing.
- Additional real-time PCR tests – two new RT-PCR tests for detection of SARS-CoV-2 have been developed at QIAGEN sites in China and the United States and will be available for Research Use Only. The company is investigating potential emergency use options for the automated PCR-based test solutions.

Further information can be also found here

**About QIAGEN**

QIAGEN N.V., a Netherlands-based holding company, is the leading global provider of Sample to Insight solutions that enable customers to gain valuable molecular insights from samples containing the building blocks of life. Our sample technologies isolate and process DNA, RNA and proteins from blood, tissue and other materials. Assay technologies make these biomolecules visible and ready for analysis. Bioinformatics software and knowledge bases interpret data to report relevant, actionable insights. Automation solutions tie these together in seamless and cost-effective workflows. QIAGEN provides solutions to more than 500,000 customers around the world in Molecular Diagnostics (human healthcare) and Life Sciences (academia, pharma R&D and industrial applications, primarily forensics). As of December 31, 2019, QIAGEN employed approximately 5,100 people in over 35 locations worldwide. Further information can be found athttp://www.qiagen.com.

**Importance:** High

Hi Marcia and Brian, Got a question for you. Given that once you have completed validation and notified the FDA you can begin testing and then submit your package within 15 days. What will your weekly testing capacity be?

It is short notice but can you get me this information in about 1 hour – by 8:30 pm?

Best,
*Tim*

AMERICAN OVERSIGHT

<wdk1@cdc.gov>
**Subject:** RE: Must haves this morning

Steve, I just spoke with Tim and he urgently needs for you to provide the enhanced QC procedure requested below. He needs to share this with APHL as FDA has granted permission for the PHLs to order the IDT kits, follow this enhanced QC process and then use the kits to perform routine testing. What he needs is a summary of how your lab performed the QC that you presented to us this morning. If you do not have a procedure then we would like to see, at a minimum, the document that you showed us this morning with the data removed. This is needed urgently within the next hour if possible.

Thanks, wendi

**Subject:** RE: Revisiting use of (b) (5)

UPDATE:
CDC primers/probes for N1, N2 and RP were received from IDT today. Undergoing QC testing now. RP were mislabeled as N4. Other labels for RP provided by IDT for relabeling also do not meet spec provided. QA review commencing and relabeling of RP tubes will proceed.

IDT Primer/probe kits received at room temp. All reagents provided as wet. Package insert attached referring users to the CDC website for RUO protocol however oligo concentrations to not agree with CDC protocol. Looks like references to kit have been removed from IDT website so specs are not clear. Are these ZEN probes as I was last informed? We can share our ZEN qualified that was performed as per FDA guidance.

Please let us know what the current plan is.
Thanks.
Steve

Tim

I am sure you are likely aware of this – but we do have a current contract with the LRN group of the CDC. 75D30119A04957

The Coronavirus is listed as one of the assays on this contract.

As part of the submission we added the following to accommodate an outbreak event.

(b) (4)

EXTERNAL EMAIL

Today we met with Russell Herbert and Darren Cook and it was mentioned that a temporary licensing might be able to be granted to IDT to help manufacture kits for the nCoV response. The FDA and CDC are working on this and we urgently need to discuss with the appropriate people at LGC to try and make this happen.

You may respond anytime day or night to Tim at (b) (6)

Thank you so much for your help with this!!

**Subject:** APHL Letter for FDA

Dear Wendi and Ren:

I am writing to let you know that the APHL Board of Directors approved sending a letter urging the FDA Commissioner to consider enforcement discretion to allow governmental public health laboratories the ability to create and implement a laboratory developed test (LDT) for the detection of SARS-CoV-2 (COVID-19). In the letter we state that to the extent possible, public health laboratories could work together to:

- Utilize a standard protocol or use a limited set of protocols
- Purchase reagents including primers and probes from a common source
- Utilize a standard validation panel
- Recommend a minimum standard validation approach
- Enable confirmation at another PHL while cases remain sporadic. It is also possible to consider the use of LRN advanced labs to serve as a confirmatory lab if resources are available to do so.

We recognize that not all PHL's will develop and implement an LDT. If PHL's decided against the use of an LDT for whatever reason, they could: 1) wait for the availability of the new CDC replacement kit, 2) coordinate with a PHL that has developed an LDT (this is not uncommon for PHLs to work together), or 3) use a commercially available assay once approved by FDA under an EUA.

We recognize the gravity of the current COVID-19 situation across the globe and wish to have greater diagnostic capability for both surveillance and for patient diagnosis across the United States, hence this extraordinary and rare request.

We will let you know the outcome of our communication with FDA, which is attached. The letter was sent to the FDA Commissioner, copy to his chief of staff; Dr. Redfield, copy to Dr. Jernigan.

Sincerely,

Scott Becker

AMERICAN OVERSIGHT

APHL ASSOCIATION OF PUBLIC HEALTH LABORATORIES

February 24, 2020

Stephen M. Hahn, MD
Commissioner of Food and Drugs
Food and Drug Administration
10903 New Hampshire Avenue
Silver Spring, MD 20993-0002

Dear Commissioner Hahn,

On behalf of our nation's state and local public health laboratories (PHLs), we are writing to urge you to consider enforcement discretion to allow this select group of governmental laboratories the ability to create and implement a laboratory developed test (LDT) for the detection of SARS-CoV-2 (COVID-19). We recognize the gravity of the current COVID-19 situation across the globe and wish to have greater diagnostic capability for both surveillance and for patient diagnosis across the United States, hence this extraordinary and rare request.

While we appreciate the many efforts underway at CDC to provide a diagnostic assay to our member labs under the Emergency Use Authorization (EUA), this has proven challenging and we find ourselves in a situation that requires a quicker local response. We are now many weeks into the response with still no diagnostic or surveillance test available outside of CDC for the vast majority of our member laboratories. While we understand that the EUA process is open to PHLs, we believe a more expeditious route is needed at this time.

To the extent possible, public health laboratories could work together to:

- Utilize a standard protocol or use a limited set of protocols
- Purchase reagents including primers and probes from a common source
- Utilize a standard validation panel
- Recommend a minimum standard validation approach
- Enable confirmation at another PHL while cases remain sporadic. It is also possible to consider the use of LRN advanced labs to serve as a confirmatory lab if resources are available to do so.

We recognize that not all PHL's will develop and implement an LDT. If PHL's decided against the use of an LDT for whatever reason, they could: 1) wait for the availability of the new CDC replacement kit, 2) coordinate with a PHL that has developed an LDT (this is not uncommon for PHLs to work together), or 3) use a commercially available assay once approved by FDA under an EUA.

We look forward to discussing this request with you and your staff as soon as possible. If you have questions, please contact Scott Becker at 301-526-5704 or via email at scott.becker@aphl.org.

Sincerely,

Grace Kubin

**Subject:** RE: CDC Coronavirus assay question.

Very interesting, Tim. Ren help guide you to the answer, which could include Wendi. (b) (5) [redacted]

In a "response" (where we activate the EOC for an emergency), we (CDC) must go through the EOC for all questions and answers, and not to programs. You cannot be expected to figure that out.

Ren, with Mr. Clark's help, can navigate the question from FDA, CSELS, to the response. Ren's division of laboratory system is the CDC focal point for all clinical laboratories at CDC.

Dr. Wendi Kuhnert is the senior laboratory advisor to the Deputy Director for Infectious Diseases, which overseas the three infectious disease centers. More importantly in this instance, Wendi is one of three deputy incident managers in the response. Lab Task Force is covered under her.

AMERICAN OVERSIGHT

Also do note that FDA has a liaison to the response, I think. Mr. Clark will let you know who that is (if you don't know), and take a reinforcing approach through the FDA liaison, who at a minimum should be kept in the loop.

Looking forward to see you later this week.

Best, Michael

**Subject:** APHL Letter for FDA

Dear Wendi and Ren:

I am writing to let you know that the APHL Board of Directors approved sending a letter urging the FDA Commissioner to consider enforcement discretion to allow governmental public health laboratories the ability to create and implement a laboratory developed test (LDT) for the detection of SARS-CoV-2 (COVID-19). In the letter we state that to the extent possible, public health laboratories could work together to:

- Utilize a standard protocol or use a limited set of protocols
- Purchase reagents including primers and probes from a common source
- Utilize a standard validation panel
- Recommend a minimum standard validation approach
- Enable confirmation at another PHL while cases remain sporadic. It is also possible to consider the use of LRN advanced labs to serve as a confirmatory lab if resources are available to do so.

We recognize that not all PHL's will develop and implement an LDT. If PHL's decided against the use of an LDT for whatever reason, they could: 1) wait for the availability of the new CDC replacement kit, 2) coordinate with a PHL that has developed an LDT (this is not uncommon for PHLs to work together), or 3) use a commercially available assay once approved by FDA under an EUA.

We recognize the gravity of the current COVID-19 situation across the globe and wish to have greater diagnostic capability for both surveillance and for patient diagnosis across the United States, hence this extraordinary and rare request.

We will let you know the outcome of our communication with FDA, which is attached. The letter was sent to the FDA Commissioner, copy to his chief of staff; Dr. Redfield, copy to Dr. Jernigan.

Sincerely,

Scott Becker

**Subject:** RE: Cut-off change - Number of public health labs that verified CDC panel for use

Hi Uwe,
Notifications that CDC received from public health laboratories regarding the reactivity of the N1 and N3 assay as well as those that notified CDC of successful verification are below:

36 labs notified CDC of issues with N3 assay
6 labs notified CDC of issues with N1 assay (these labs are included in those that also saw issues with N3)
7 labs reported that they successfully verified the test in their laboratories

We are reaching out to labs today to notify CDC if they have successfully verified the test and will update if this number changes.

Thank you very much.
Steve

**Subject:** RE: Cut-off change - Number of public health labs that verified CDC panel for use
**Importance:** High

Julie & Steve,

As requested earlier, please clarify the number of labs that have successfully verified the CDC test panel for use asap. You communicated earlier that ~110 labs received your test and that (b) (5) HL informed you that they could not verify the test.

The question is in the context of a statement by APHL today that only 3 out of 100 public health labs have verified the CDC test for use. Can you confirm that?
"Only three of the more than 100 public health labs across the country have verified the CDC test for use, according to the Association of Public Health Laboratories.'

See article below:

The article also states, according to CDC, that CDC will distribute a second test and will need it approved by the FDA first.

- Please clarify what that means: Are we talking about the new lot that is being manufactured or the change in cut-off?

Thanks,
Uwe

**Problems with CDC coronavirus test delay expanded US screening**

By David Lim

02/20/2020 05:03 PM EST

Problems with a coronavirus test developed by the CDC have delayed the Trump administration's efforts to expand screening to state and local public health labs, more than two weeks after the FDA granted permission to distribute the CDC test nationwide.

Only three of the more than 100 public health labs across the country have verified the CDC test for use, according to the Association of Public Health Laboratories.

The delay has also hampered CDC's plan to screen samples collected by its national flu-surveillance network for the coronavirus, according to Peter Kyriacopoulos, APHL's senior director of public policy. CDC hopes to use public health labs in Chicago, New York City, Los Angeles, San Francisco and Seattle to screen samples that test negative for the flu and other common respiratory viruses for the coronavirus.

CDC confirmed the problems with the coronavirus test, and with using its flu-surveillance network to screen for the virus. But the agency declined to answer further questions on the matter.

AMERICAN OVERSIGHT

The delay in establishing additional screening capacity could impede the U.S. government's ability to detect scattered cases before they snowball into larger outbreaks, former FDA Commissioner Scott Gottlieb told POLITICO.

"By that point, it may be harder to contain spread, and we'll be forced to rely on mitigation tactics to just limit the impact of the virus," he said.

More than 75,000 cases of coronavirus infection have been confirmed globally as of Thursday, and more than 2,100 people have died, according to the World Health Organization. The vast majority of cases are in China, where the virus first emerged, although countries such as Japan, South Korea and Iran are also battling local outbreaks.

In the United States, efforts to expand use of the CDC test have struggled after one of the three reagents upon which the test depends delivered inconclusive results during quality checks, said Kelly Wroblewski, APHL's director of infectious diseases. Samples that test positive at any of the three labs are still being sent to CDC for retesting.

CDC has not told public health labs when it will distribute a second version of the diagnostic test, Wroblewski said. That has left many labs struggling to decide if it is worth continuing to pursue verification of the current version, because they will have to go through the process again once the CDC revises its testing procedure, she added.

Nancy Messonnier, director of the CDC's National Center for Immunization and Respiratory Diseases, told reporters on Feb. 14 that the public health agency is reformulating the original test and is moving quickly to get the revised version to labs. FDA would have to authorize any changes to the coronavirus test before the CDC could distribute a new one.

But concerns about money also threaten the rollout of state and local coronavirus testing. Over the weekend, more than 20 Senate Democrats called for additional cash after Trump administration officials told senators during a Feb. 12 briefing that HHS would soon exhaust existing funding for its response to the virus.

"We strongly urge the administration to transmit an emergency supplemental request that ensures it can and will fully reimburse states for the costs they are incurring as part of this response," the senators wrote in a letter to HHS Secretary Alex Azar and OMB Director Mick Mulvaney.

The diagnostic test can cost up to $250 to run, depending on procedures and volume of tests a lab performs, according to Wroblewski. But it is unclear who is paying for personnel costs and other items such as personal protective gear, machines to extract RNA and sample transportation, according to APHL.

"This is a national-level response, so we would hope the federal government would have an interest in supporting a national-level response," Kyriacopoulos said. "Labs are much more interested in beginning to get the work done. But figuring out how to pay for it is not far behind."

Hi Uwe,
Notifications that CDC received from public health laboratories regarding the reactivity of the N1 and N3 assay as well as those that notified CDC of successful verification are below:

36 labs notified CDC of issues with N3 assay
6 labs notified CDC of issues with N1 assay (these labs are included in those that also saw issues with N3)
7 labs reported that they successfully verified the test in their laboratories

We are reaching out to labs today to notify CDC if they have successfully verified the test and will update if this number changes.

Thank you very much.
Steve

**Subject:** RE: Cut-off change - Number of public health labs that verified CDC panel for use
**Importance:** High

Julie & Steve,

As requested earlier, please clarify the number of labs that have successfully verified the CDC test panel for use asap. You communicated earlier that ~110 labs received your test and that (b) (5) HL informed you that they could not verify the test.

The question is in the context of a statement by APHL today that only 3 out of 100 public health labs have verified the CDC test for use. Can you confirm that?
"Only three of the more than 100 public health labs across the country have verified the CDC test for use, according to the Association of Public Health Laboratories.'

See article below:

The article also states, according to CDC, that CDC will distribute a second test and will need it approved by the FDA first.

- Please clarify what that means: Are we talking about the new lot that is being manufactured or the change in cut-off?

Thanks,
Uwe

**Problems with CDC coronavirus test delay expanded US screening**

By David Lim

02/20/2020 05:03 PM EST

Problems with a coronavirus test developed by the CDC have delayed the Trump administration's efforts to expand screening to state and local public health labs, more than two weeks after the FDA granted permission to distribute the CDC test nationwide.

Only three of the more than 100 public health labs across the country have verified the CDC test for use, according to the Association of Public Health Laboratories.

The delay has also hampered CDC's plan to screen samples collected by its national flu-surveillance network for the coronavirus, according to Peter Kyriacopoulos, APHL's senior director of public policy. CDC hopes to

AMERICAN OVERSIGHT

use public health labs in Chicago, New York City, Los Angeles, San Francisco and Seattle to screen samples that test negative for the flu and other common respiratory viruses for the coronavirus.

CDC confirmed the problems with the coronavirus test, and with using its flu-surveillance network to screen for the virus. But the agency declined to answer further questions on the matter.

The delay in establishing additional screening capacity could impede the U.S. government's ability to detect scattered cases before they snowball into larger outbreaks, former FDA Commissioner Scott Gottlieb told POLITICO.

"By that point, it may be harder to contain spread, and we'll be forced to rely on mitigation tactics to just limit the impact of the virus," he said.

More than 75,000 cases of coronavirus infection have been confirmed globally as of Thursday, and more than 2,100 people have died, according to the World Health Organization. The vast majority of cases are in China, where the virus first emerged, although countries such as Japan, South Korea and Iran are also battling local outbreaks.

In the United States, efforts to expand use of the CDC test have struggled after one of the three reagents upon which the test depends delivered inconclusive results during quality checks, said Kelly Wroblewski, APHL's director of infectious diseases. Samples that test positive at any of the three labs are still being sent to CDC for retesting.

CDC has not told public health labs when it will distribute a second version of the diagnostic test, Wroblewski said. That has left many labs struggling to decide if it is worth continuing to pursue verification of the current version, because they will have to go through the process again once the CDC revises its testing procedure, she added.

Nancy Messonnier, director of the CDC's National Center for Immunization and Respiratory Diseases, told reporters on Feb. 14 that the public health agency is reformulating the original test and is moving quickly to get the revised version to labs. FDA would have to authorize any changes to the coronavirus test before the CDC could distribute a new one.

But concerns about money also threaten the rollout of state and local coronavirus testing. Over the weekend, more than 20 Senate Democrats called for additional cash after Trump administration officials told senators during a Feb. 12 briefing that HHS would soon exhaust existing funding for its response to the virus.

"We strongly urge the administration to transmit an emergency supplemental request that ensures it can and will fully reimburse states for the costs they are incurring as part of this response," the senators wrote in a letter to HHS Secretary Alex Azar and OMB Director Mick Mulvaney.

The diagnostic test can cost up to $250 to run, depending on procedures and volume of tests a lab performs, according to Wroblewski. But it is unclear who is paying for personnel costs and other items such as personal protective gear, machines to extract RNA and sample transportation, according to APHL.

"This is a national-level response, so we would hope the federal government would have an interest in supporting a national-level response," Kyriacopoulos said. "Labs are much more interested in beginning to get the work done. But figuring out how to pay for it is not far behind."

**Cc:** Scherf, Uwe <Uwe.Scherf@fda.hhs.gov>
**Subject:** RE: Cut-off change

Hi Uwe,

We will meet as a team to review data later this morning. We hope to get you something in writing as soon as possible.

There are laboratories that have not had any problems and are testing. We will need to work to find more detailed information for you.

Thanks,
Julie

**Subject:** Cut-off change
**Importance:** High

AMERICAN OVERSIGHT

Steve & Julie,

I know everyone is working very hard to finalize the proposal for cut-off change in for your assay. Do you have any update on when we could expect to receive the request and any data

On a second note, could you please clarify one issue for me: it is my understanding that public health and the state labs that didn't have any problems with their verification are proceeding with testing, is that correct?

Thank you for your feedback.

Uwe

Hi Uwe,

Your edits look good to me. Bringing others in for their information on the status and that we expect to receive the new package in the next day or two and we are focused on turning it around as soon as possible, even beginning work on the current draft that we have.

Thanks!

Best,
*Tim*

Hello Uwe,
We would like to share with you our bulk QC data summary for oligo sets N1, N2 and RP for your review. We continue to manufacture N3 and will forward as soon as that data is reviewed.
Please be aware there are two tab in the excel file.
Please let us know if you have questions.
Do you and your colleagues have a time tomorrow that you would like to arrange a call to discuss?
Thank you very much.
Steve

Hi Uwe,
For clarification the CDC 2019-Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel consists of two separate boxes. Box #1 contains the primers and probes as described below:

(b) (5)

Also as requested, please find attached the QC testing process of primer/probe reagents at bulk and post-fill analysis.

We hope this helps to clarify the data presented and addresses your request.
Thank you very much.
Steve

**Subject:** RE: Cut-off change - lot release testing criteria

Dear Uwe,

Since the deployment of the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel to domestic public health laboratories, CDC has received a reports regarding sporadic aberrant reactivity resulting in false positive results with Ct values in the high 30s. This reactivity is more often reported with the N3 assay component of the test, and to a lesser extent with the N1 assay.

This reactivity has not been observed at CDC throughout the validation testing as presented in the EUA submission, nor has it been observed with any testing of hundreds of clinical specimens from PUI cases. (b) (5)

**Subject:** RE: Cut-off change - Number of public health labs that verified CDC panel for use

Julie & Steve,

As requested earlier, please clarify the number of labs that have successfully verified the CDC test panel for use asap. You communicated earlier that ~110 labs received your test and that (b) (5) HL informed you that they could not verify the test.

The question is in the context of a statement by APHL today that only 3 out of 100 public health labs have verified the CDC test for use. Can you confirm that?
"Only three of the more than 100 public health labs across the country have verified the CDC test for use, according to the Association of Public Health Laboratories.'

See article below:

The article also states, according to CDC, that CDC will distribute a second test and will need it approved by the FDA first.

- Please clarify what that means: Are we talking about the new lot that is being manufactured or the change in cut-off?

Thanks,
Uwe

AMERICAN OVERSIGHT

**Problems with CDC coronavirus test delay expanded US screening**

By David Lim

02/20/2020 05:03 PM EST

Problems with a coronavirus test developed by the CDC have delayed the Trump administration's efforts to expand screening to state and local public health labs, more than two weeks after the FDA granted permission to distribute the CDC test nationwide.

Only three of the more than 100 public health labs across the country have verified the CDC test for use, according to the Association of Public Health Laboratories.

The delay has also hampered CDC's plan to screen samples collected by its national flu-surveillance network for the coronavirus, according to Peter Kyriacopoulos, APHL's senior director of public policy. CDC hopes to use public health labs in Chicago, New York City, Los Angeles, San Francisco and Seattle to screen samples that test negative for the flu and other common respiratory viruses for the coronavirus.

CDC confirmed the problems with the coronavirus test, and with using its flu-surveillance network to screen for the virus. But the agency declined to answer further questions on the matter.

The delay in establishing additional screening capacity could impede the U.S. government's ability to detect scattered cases before they snowball into larger outbreaks, former FDA Commissioner Scott Gottlieb told POLITICO.

"By that point, it may be harder to contain spread, and we'll be forced to rely on mitigation tactics to just limit the impact of the virus," he said.

More than 75,000 cases of coronavirus infection have been confirmed globally as of Thursday, and more than 2,100 people have died, according to the World Health Organization. The vast majority of cases are in China, where the virus first emerged, although countries such as Japan, South Korea and Iran are also battling local outbreaks.

In the United States, efforts to expand use of the CDC test have struggled after one of the three reagents upon which the test depends delivered inconclusive results during quality checks, said Kelly Wroblewski, APHL's director of infectious diseases. Samples that test positive at any of the three labs are still being sent to CDC for retesting.

CDC has not told public health labs when it will distribute a second version of the diagnostic test, Wroblewski said. That has left many labs struggling to decide if it is worth continuing to pursue verification of the current version, because they will have to go through the process again once the CDC revises its testing procedure, she added.

Nancy Messonnier, director of the CDC's National Center for Immunization and Respiratory Diseases, told reporters on Feb. 14 that the public health agency is reformulating the original test and is moving quickly to get the revised version to labs. FDA would have to authorize any changes to the coronavirus test before the CDC could distribute a new one.

But concerns about money also threaten the rollout of state and local coronavirus testing. Over the weekend, more than 20 Senate Democrats called for additional cash after Trump administration officials told senators during a Feb. 12 briefing that HHS would soon exhaust existing funding for its response to the virus.

"We strongly urge the administration to transmit an emergency supplemental request that ensures it can and will fully reimburse states for the costs they are incurring as part of this response," the senators wrote in a letter to HHS Secretary Alex Azar and OMB Director Mick Mulvaney.

The diagnostic test can cost up to $250 to run, depending on procedures and volume of tests a lab performs, according to Wroblewski. But it is unclear who is paying for personnel costs and other items such as personal protective gear, machines to extract RNA and sample transportation, according to APHL.

"This is a national-level response, so we would hope the federal government would have an interest in supporting a national-level response," Kyriacopoulos said. "Labs are much more interested in beginning to get the work done. But figuring out how to pay for it is not far behind."

**Subject:** Follow Up

Hi Wendi,

Thanks to you and Steve for the late evening calls yesterday. It was very helpful to understand the current situation and ways to move forward. And we were excited to hear the good news this afternoon on the clean QC testing outcomes for the new lots of N1 and N2.

It has been suggested that having me visit the CDC as soon as possible, over the weekend even if work is being done over the weekend, would help the communication and coordination during this emergency including all the activities with getting new lots out to the PHL labs and the follow on EUAs and supplements, etc. I have booked my flight and hotel for Sunday afternoon. I can arrive tomorrow if there is work being done at CDC over the weekend. Is there anything I need to do aside from show up?

I am looking for ways to help. I don't want to interfere in any way. I am hoping I can simply join response meetings to be a resource and FDA contact.

Many thanks in advance!

Best,
*Tim*

**Subject:** RE: CDC Coronavirus assay question.

Very interesting, Tim. Ren help guide you to the answer, which could include Wendi (b) (5) [redacted]

In a "response" (where we activate the EOC for an emergency), we (CDC) must go through the EOC for all questions and answers, and not to programs. You cannot be expected to figure that out.

Ren, with Mr. Clark's help, can navigate the question from FDA, CSELS, to the response. Ren's division of laboratory system is the CDC focal point for all clinical laboratories at CDC.

AMERICAN OVERSIGHT

Dr. Wendi Kuhnert is the senior laboratory advisor to the Deputy Director for Infectious Diseases, which overseas the three infectious disease centers. More importantly in this instance, Wendi is one of three deputy incident managers in the response. Lab Task Force is covered under her.

Also do note that FDA has a liaison to the response, I think. Mr. Clark will let you know who that is (if you don't know), and take a reinforcing approach through the FDA liaison, who at a minimum should be kept in the loop.

Looking forward to see you later this week.

Best, Michael

**Subject:** CDC Coronavirus assay question.

Hi Michael,

I have a question for the CDC and don't know who to ask and am hoping you can help.

(b) (5)

[redacted]

We are getting EUA developers who are saying they will be using the CDC primers and probes in their assays and wanted to check on this as well.

Thanks!

Best,
*Tim*

**Subject:** RE: Cut-off change - Number of public health labs that verified CDC panel for use

Julie & Steve,

As requested earlier, please clarify the number of labs that have successfully verified the CDC test panel for use asap. You communicated earlier that ~110 labs received your test and that (b) (5) APHL informed you that they could not verify the test.

The question is in the context of a statement by APHL today that only 3 out of 100 public health labs have verified the CDC test for use. Can you confirm that?
"Only three of the more than 100 public health labs across the country have verified the CDC test for use, according to the Association of Public Health Laboratories.'

See article below:

The article also states, according to CDC, that CDC will distribute a second test and will need it approved by the FDA first.

- Please clarify what that means: Are we talking about the new lot that is being manufactured or the change in cut-off?

Thanks,
Uwe

**Problems with CDC coronavirus test delay expanded US screening**

By David Lim

02/20/2020 05:03 PM EST

Problems with a coronavirus test developed by the CDC have delayed the Trump administration's efforts to expand screening to state and local public health labs, more than two weeks after the FDA granted permission to distribute the CDC test nationwide.

Only three of the more than 100 public health labs across the country have verified the CDC test for use, according to the Association of Public Health Laboratories.

The delay has also hampered CDC's plan to screen samples collected by its national flu-surveillance network for the coronavirus, according to Peter Kyriacopoulos, APHL's senior director of public policy. CDC hopes to

AMERICAN OVERSIGHT

use public health labs in Chicago, New York City, Los Angeles, San Francisco and Seattle to screen samples that test negative for the flu and other common respiratory viruses for the coronavirus.

CDC confirmed the problems with the coronavirus test, and with using its flu-surveillance network to screen for the virus. But the agency declined to answer further questions on the matter.

The delay in establishing additional screening capacity could impede the U.S. government's ability to detect scattered cases before they snowball into larger outbreaks, former FDA Commissioner Scott Gottlieb told POLITICO.

"By that point, it may be harder to contain spread, and we'll be forced to rely on mitigation tactics to just limit the impact of the virus," he said.

More than 75,000 cases of coronavirus infection have been confirmed globally as of Thursday, and more than 2,100 people have died, according to the World Health Organization. The vast majority of cases are in China, where the virus first emerged, although countries such as Japan, South Korea and Iran are also battling local outbreaks.

In the United States, efforts to expand use of the CDC test have struggled after one of the three reagents upon which the test depends delivered inconclusive results during quality checks, said Kelly Wroblewski, APHL's director of infectious diseases. Samples that test positive at any of the three labs are still being sent to CDC for retesting.

CDC has not told public health labs when it will distribute a second version of the diagnostic test, Wroblewski said. That has left many labs struggling to decide if it is worth continuing to pursue verification of the current version, because they will have to go through the process again once the CDC revises its testing procedure, she added.

Nancy Messonnier, director of the CDC's National Center for Immunization and Respiratory Diseases, told reporters on Feb. 14 that the public health agency is reformulating the original test and is moving quickly to get the revised version to labs. FDA would have to authorize any changes to the coronavirus test before the CDC could distribute a new one.

But concerns about money also threaten the rollout of state and local coronavirus testing. Over the weekend, more than 20 Senate Democrats called for additional cash after Trump administration officials told senators during a Feb. 12 briefing that HHS would soon exhaust existing funding for its response to the virus.

"We strongly urge the administration to transmit an emergency supplemental request that ensures it can and will fully reimburse states for the costs they are incurring as part of this response," the senators wrote in a letter to HHS Secretary Alex Azar and OMB Director Mick Mulvaney.

The diagnostic test can cost up to $250 to run, depending on procedures and volume of tests a lab performs, according to Wroblewski. But it is unclear who is paying for personnel costs and other items such as personal protective gear, machines to extract RNA and sample transportation, according to APHL.

"This is a national-level response, so we would hope the federal government would have an interest in supporting a national-level response," Kyriacopoulos said. "Labs are much more interested in beginning to get the work done. But figuring out how to pay for it is not far behind."

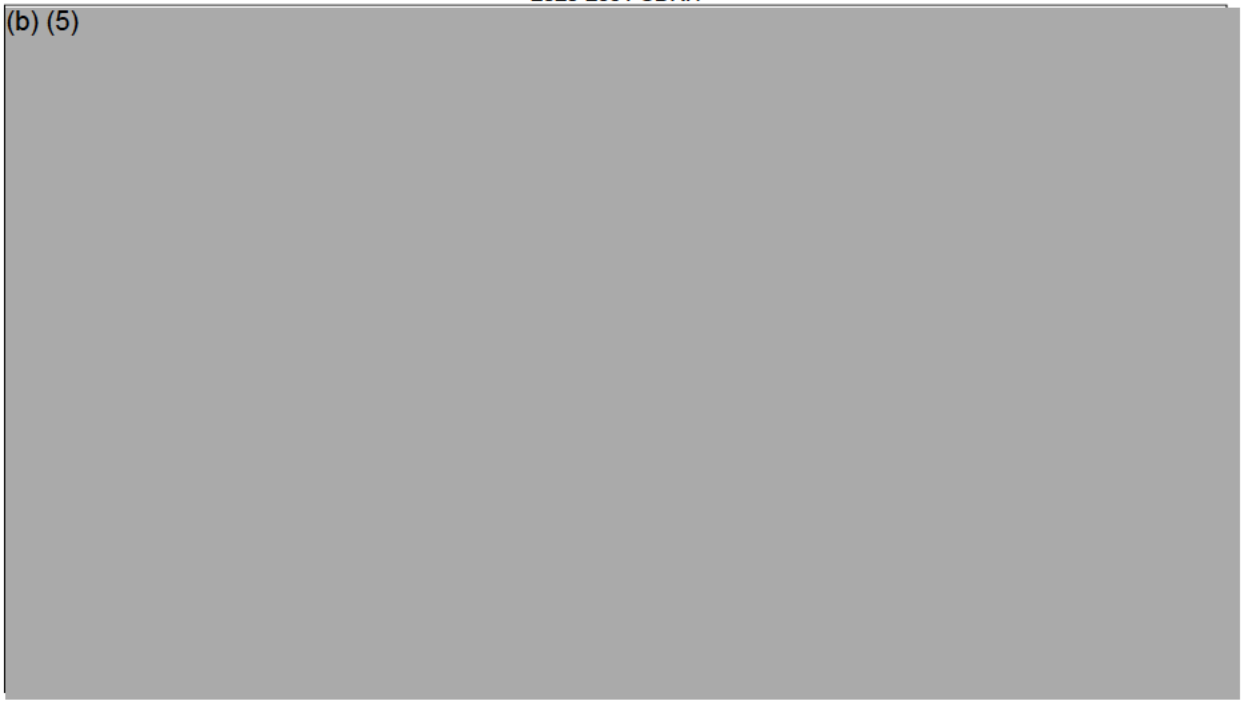
**Subject:** For review by 11am Tuesday: Dx development POC talking points and landscapes

Diagnostics WG members,
Following up from earlier email. Thanks to all who were avaible to discuss/provide feedback today.
1. Slide deck: Need to deliver "POC" slide deck by noon Tuesday, please send comments by 11am. Continuing to try to address pressure for POC diagnostics. Trying once again to take approach of what we CAN do, what we believe is best approach. Please take a look, let me know if there is anything that is wrong, or missing. Especially slide 3 – any companies we should add? Slide 5 – are overall timelines reasonable – think big picture/best case.
2. Talking points – if all agree with these, we can jointly use, rework for individual agency messages but provide overall consensus message up to leadership. All suggestions for better ways to communicate are welcome. (b) (5)

[redacted]



Again, many thanks for all the support.

**Subject:** RE: CDC Coronavirus assay question.

Very interesting, Tim. Ren help guide you to the answer, which could include Wendi. (b) (5) [redacted]

In a "response" (where we activate the EOC for an emergency), we (CDC) must go through the EOC for all questions and answers, and not to programs. You cannot be expected to figure that out.

AMERICAN OVERSIGHT

Ren, with Mr. Clark's help, can navigate the question from FDA, CSELS, to the response. Ren's division of laboratory system is the CDC focal point for all clinical laboratories at CDC.

Dr. Wendi Kuhnert is the senior laboratory advisor to the Deputy Director for Infectious Diseases, which overseas the three infectious disease centers. More importantly in this instance, Wendi is one of three deputy incident managers in the response. Lab Task Force is covered under her.

Also do note that FDA has a liaison to the response, I think. Mr. Clark will let you know who that is (if you don't know), and take a reinforcing approach through the FDA liaison, who at a minimum should be kept in the loop.

Looking forward to see you later this week.

Best, Michael

**To:** Kuhnert-Tallman, Wendi (CDC/DDID/OD); Salerno, Reynolds (CDC/DDPHSS/CSELS/DLS)
**Subject:** APHL Letter for FDA

Dear Wendi and Ren:

I am writing to let you know that the APHL Board of Directors approved sending a letter urging the FDA Commissioner to consider enforcement discretion to allow governmental public health laboratories the ability to create and implement a laboratory developed test (LDT) for the detection of SARS-CoV-2 (COVID-19). In the letter we state that to the extent possible, public health laboratories could work together to:

- Utilize a standard protocol or use a limited set of protocols
- Purchase reagents including primers and probes from a common source
- Utilize a standard validation panel
- Recommend a minimum standard validation approach
- Enable confirmation at another PHL while cases remain sporadic. It is also possible to consider the use of LRN advanced labs to serve as a confirmatory lab if resources are available to do so.

We recognize that not all PHL's will develop and implement an LDT. If PHL's decided against the use of an LDT for whatever reason, they could: 1) wait for the availability of the new CDC replacement kit, 2) coordinate with a PHL that has developed an LDT (this is not uncommon for PHLs to work together), or 3) use a commercially available assay once approved by FDA under an EUA.

We recognize the gravity of the current COVID-19 situation across the globe and wish to have greater diagnostic capability for both surveillance and for patient diagnosis across the United States, hence this extraordinary and rare request.

We will let you know the outcome of our communication with FDA, which is attached. The letter was sent to the FDA Commissioner, copy to his chief of staff; Dr. Redfield, copy to Dr. Jernigan.

Sincerely,

Scott Becker

**Subject:** RE: Coronavirus and MERS culturing

Tim,

Let us know if you would like us to set-up a meeting to review logistics and develop a tentative timeline, as Mayra suggested.

As noted by others, CBER certainly recognizes that this is a high priority, and our scientists and safety officers have been giving this a great deal of attention. However, even with all that, it has taken time to get all the safety pieces lined up, such as the occ health program, appropriate training of staff, developing the protocols and manuals, and finally the IBC review and approval this week. We are eager to get the work started once we have all the appropriate safeguards in place.

AMERICAN OVERSIGHT

Thanks,

Carolyn

**Subject:** RE: Coronavirus and MERS culturing

Dear Tim,

As I mentioned to Uwe yesterday, the idea was to handle the COVID-19 materials for the CDRH devices as we did for Zika. CBER has the laboratories and knowledge to propagate the virus. DMD will be able to design the panel that will best challenge the sensitivity and specificity of the devices we are getting in house. Therefore, after Tony grows and inactivates the BSL-3 stocks, I would be preparing the dilutions of the viral stocks with David's help to formulate the final panel. In addition, I was also the one receiving at CDRH the orders, distributing the panels when available to the companies, as well as receiving the results of the testing. This strategy allowed DMD to have knowledge of the progress companies where doing with the panel testing and compile all the results for the EUA devices.

The preparation of the panel will take some time as the virus strains need still to be grown (and as Tony said the BSL-3 just got validated to work with COVID-19), inactivated, titrated, and the panel will have to be prepared with different dilutions that could satisfy the sensitivity observed in our devices.

I proposed a meeting with CBER for next week, now that that the BSL-3 and the funds are available since 2/21/2020, to set up a timeline for the next steps.

Regards,

Mayra

**Subject:** RE: Coronavirus and MERS culturing

AMERICAN OVERSIGHT

Dear Tim,

I am adding Drs. Carolyn Wilson, Mayra Garcia from CDRH and David McGivern to this email chain for communication purpose. Dr. Wilson is the director of office of research at CBER who oversees all 2019-nCoV activities. Dr. McGivern at the Office of Blood Research and Review at CBER will work with Mayra at CDRH to generate reference standards for industry to use.

My group is to propagate virus and then work with David's group to establish conditions for heat-inactivation of the virus. We have just received the approval to conduct the work, but there are a few house-keeping items that we need to take care of before we can start the work.

I would leave to Dr. Wilson, Mayra and Dr. McGivern to speak on the part regarding dialogues with industries.

Best,

Tony

Hi Pillai,

Great to meet you today! I wanted to reach out and have copied Jeff to find out more details about the coronavirus and mers cultures. We have a number of test developers who cannot complete validation of their EUA assays until they have at least mock samples made with virus to test.

How soon will virus be available?
Can we connect developers with someone here at the agency so they can coordinate access?

Thanks!

Best,
*Tim*

**Subject:** DRAFT CDC EUA Request for Sentinel Surveillance Activities

AMERICAN OVERSIGHT

Good morning Kim and Uwe,

Please find attached a draft EUA request submission for the use of the FDA-authorized CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel in sentinel surveillance activities. We would appreciate your review of this draft submission to ensure it contains the information and wording request necessary to support FDA's planned issuance of a second letter of authorization for the diagnostic panel to support this critical epidemiologic activity.

Please do not hesitate to reach out with questions, ideas, recommendations as you review the attached. I look forward to hearing from you.

Warm regards,

Laura

**Cc:** Stenzel, Timothy; Flannery, Ellen
**Subject:** Update on EUA for CDC "surveillance"
**When:** Thursday, February 20, 2020 8:30 AM-9:00 AM (UTC-05:00) Eastern Time (US & Canada).
**Where:** webex

CDC says they will submit a new EUA referencing the data in their first EUA in a day or two.
Protocol attached.
It would be good to touch base to ensure we are all on the same page for next steps.

Maybe we would also be able to discuss a little about the draft letter of authorization:

This letter is in response to your request that the Food and Drug Administration (FDA) issue an Emergency Use Authorization (EUA) for emergency use of the Centers for Disease Control and Prevention (CDC) 2019-Novel Coronavirus (2019-nCoV) Real-Time Reverse Transcriptase (RT)-PCR Diagnostic Panel for the presumptive qualitative detection of nucleic acid from the SARS-CoV-2 (formerly 2019-nCoV) in nasopharyngeal (NP) or oropharyngeal (OP) respiratory specimens collected from individuals consented or notified prior to sample collection that SARS-CoV-2 testing would be performed if specimens are negative for influenza and other respiratory pathogens in order to determine if unrecognized community transmission of SARS-CoV-2 is occurring, pursuant to Section 564 of the Federal Food, Drug, and Cosmetic Act (the Act) (21 U.S.C. §360bbb-3). Testing is limited to qualified laboratories designated by CDC to conduct testing according to protocol xxx and, in the United States, certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA), 42 U.S.C. § 263a, to perform high complexity tests.

Please see the request from Julie Khani at the beginning of this email trail. Is this something you and Dan might consider doing together by videoconference, if you are still in Atlanta next week? If you are here I'd have you go in person but you should stay at CDC as long as is necessary (and as long as you are willing).

Jeff

**Subject:** ACLA Annual Meeting, Role of Commercial Labs in Coronavirus Testing

Hi Keagan. As you may be aware, next week Commissioner Hahn has graciously agreed to speak at the ACLA annual meeting. The meeting is on March 4th at the Grand Hyatt in DC and he is scheduled to speak from 9:00-9:15. Elizabeth Hillebrenner is also speaking on a panel at 11:00am to discuss diagnostics generally. Meeting agenda available here.

I am reaching out because in addition to Commissioner Hahn's remarks, I think the ACLA meeting would provide an excellent opportunity for the FDA to address the diagnostics community about the Coronavirus. I've extended the same invitation to the CDC. There will be approximately 200 people in attendance at the meeting, including CEOs and senior leadership from companies such as LabCorp, Quest, Mayo Clinic Laboratories, Hologic, and Siemens. ACLA and several member companies have a weekly call with the CDC, and the FDA has participated on some of the calls. We have shared information with the CDC about lab capacity and other information, in the event that public health labs are unable to handle testing needs, and surge capacity is necessary.

While these calls have been helpful, numerous questions remain about the availability of the CDC assay to commercial labs, the FDA EUA process, and other issues. I'd be happy to modify the agenda to allow time for a representative from the FDA, CDC, or both, to provide an update an answer questions.

I know the situation is changing quickly, and I can only imagine how busy it is at the FDA. But, as a lot of the key players in the diagnostics community will be together at our meeting next week, I wanted to extend the opportunity.

My office and mobile numbers are below if you have questions or if you would like to discuss.

Thanks.

Julie

Dear Uwe,

It was great to meet you, Kim and Myra during the FDA meeting recently.
As you see from communication between Louise and Myra, we are trying to close the remaining open issues for our DPP Zika IgM System and submit the 510K this week if we get final comments from Myra.
We appreciate all the support we have received from the FDA team during the interactive review of our submission and look forward to completing this project as soon as possible.

AMERICAN OVERSIGHT

Also, as we briefly discussed during the meeting, we look forward to working with your team in the next project, such as a DPP COVID-19. We are currently (b)(4) (b) (4) (b) (4) and we would like to discuss it with you our proposal for a possible FDA-EUA as soon we are ready.

Best regards

Javan

Hi Mayra,

Easy enough for me to make the edits on the two documents you sent back.

I am attaching the corrected Section 9.

The remaining outstanding items, as I understand, is the clinical section and the software section as I have not heard feedback on the later as of yet.

Please advise. We are aiming to submit the ecopy by week's end. I have completed the 510K Summary and Executive summary based on the last draft of the clinical section.

They are also attached here. The IFU has also been written based on the already completed sections.

Best,

**Louise Muscat Sigismondi, Ph.D.| Regulatory Affairs Director of Research & Development**

**Subject:** Update on EUA for CDC "surveillance"

CDC says they will submit a new EUA referencing the data in their first EUA in a day or two.
Protocol attached.
It would be good to touch base to ensure we are all on the same page for next steps.

Maybe we would also be able to discuss a little about the draft letter of authorization:

This letter is in response to your request that the Food and Drug Administration (FDA) issue an Emergency Use Authorization (EUA) for emergency use of the Centers for Disease Control and Prevention (CDC) 2019-Novel Coronavirus (2019-nCoV) Real-Time Reverse Transcriptase (RT)-PCR Diagnostic Panel for the presumptive qualitative detection of nucleic acid from the SARS-CoV-2 (formerly 2019-nCoV) in nasopharyngeal (NP) or oropharyngeal (OP) respiratory specimens collected from individuals consented or notified prior to sample collection that SARS-CoV-2 testing would be performed if specimens are negative for influenza and other respiratory pathogens in order to determine if unrecognized community transmission of SARS-CoV-2 is occurring, pursuant to Section 564 of the Federal Food, Drug, and Cosmetic Act (the Act) (21 U.S.C. §360bbb-3). Testing is limited to qualified laboratories designated by CDC to conduct testing according to protocol xxx and, in the United States, certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA), 42 U.S.C. § 263a, to perform high complexity tests.

**Subject**: RE: ACTION NEEDED: DRAFT CDC EUA Request for Sentinel Surveillance Activities

Tim,

Getting the authorization letter done, need to touch base where we are on this.

Drafting the review memo, Kim will do that this afternoon.

Uwe

**Subject:** FW: ACTION NEEDED: DRAFT CDC EUA Request for Sentinel Surveillance Activities

Dear Laura,

Attached please find the following documents you submitted on February 21, 2020 to support the use of the FDA-authorized CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel in surveillance activities. These documents have been reviewed and edited by FDA's OCET and OCC.

1. Draft COVID-19 sentinel surveillance
2. Draft SARS-CoV-2 surveillance risk benefit
3. Draft CDC Surveillance EUA Request Cover letter

Please do not hesitate to reach out to me with questions.

## Problems with CDC coronavirus test delay expanded US screening

By David Lim

02/20/2020 05:03 PM EST

Problems with a coronavirus test developed by the CDC have delayed the Trump administration's efforts to expand screening to state and local public health labs, more than two weeks after the FDA granted permission to distribute the CDC test nationwide.

Only three of the more than 100 public health labs across the country have verified the CDC test for use, according to the Association of Public Health Laboratories.

The delay has also hampered CDC's plan to screen samples collected by its national flu-surveillance network for the coronavirus, according to Peter Kyriacopoulos, APHL's senior director of public policy. CDC hopes to use public health labs in Chicago, New York City, Los Angeles, San Francisco and Seattle to screen samples that test negative for the flu and other common respiratory viruses for the coronavirus.

CDC confirmed the problems with the coronavirus test, and with using its flu-surveillance network to screen for the virus. But the agency declined to answer further questions on the matter.

The delay in establishing additional screening capacity could impede the U.S. government's ability to detect scattered cases before they snowball into larger outbreaks, former FDA Commissioner Scott Gottlieb told POLITICO.

"By that point, it may be harder to contain spread, and we'll be forced to rely on mitigation tactics to just limit the impact of the virus," he said.

More than 75,000 cases of coronavirus infection have been confirmed globally as of Thursday, and more than 2,100 people have died, according to the World Health Organization. The vast majority of cases are in China, where the virus first emerged, although countries such as Japan, South Korea and Iran are also battling local outbreaks.

In the United States, efforts to expand use of the CDC test have struggled after one of the three reagents upon which the test depends delivered inconclusive results during quality checks, said Kelly Wroblewski, APHL's director of infectious diseases. Samples that test positive at any of the three labs are still being sent to CDC for retesting.

CDC has not told public health labs when it will distribute a second version of the diagnostic test, Wroblewski said. That has left many labs struggling to decide if it is worth continuing to pursue verification of the current version, because they will have to go through the process again once the CDC revises its testing procedure, she added.

AMERICAN OVERSIGHT

Nancy Messonnier, director of the CDC's National Center for Immunization and Respiratory Diseases, told reporters on Feb. 14 that the public health agency is reformulating the original test and is moving quickly to get the revised version to labs. FDA would have to authorize any changes to the coronavirus test before the CDC could distribute a new one.

But concerns about money also threaten the rollout of state and local coronavirus testing. Over the weekend, more than 20 Senate Democrats called for additional cash after Trump administration officials told senators during a Feb. 12 briefing that HHS would soon exhaust existing funding for its response to the virus.

"We strongly urge the administration to transmit an emergency supplemental request that ensures it can and will fully reimburse states for the costs they are incurring as part of this response," the senators wrote in a letter to HHS Secretary Alex Azar and OMB Director Mick Mulvaney.

The diagnostic test can cost up to $250 to run, depending on procedures and volume of tests a lab performs, according to Wroblewski. But it is unclear who is paying for personnel costs and other items such as personal protective gear, machines to extract RNA and sample transportation, according to APHL.

"This is a national-level response, so we would hope the federal government would have an interest in supporting a national-level response," Kyriacopoulos said. "Labs are much more interested in beginning to get the work done. But figuring out how to pay for it is not far behind."

**Cc:** Shuren, Jeff <Jeff.Shuren@fda.hhs.gov>; McGivern, David <David.McGivern@fda.hhs.gov>; Wilson, Carolyn <Carolyn.Wilson@fda.hhs.gov>
**Subject:** RE: Coronavirus and MERS culturing

Dear Tim,

As I mentioned to Uwe yesterday, the idea was to handle the COVID-19 materials for the CDRH devices as we did for Zika. CBER has the laboratories and knowledge to propagate the virus. DMD will be able to design the panel that will best challenge the sensitivity and specificity of the devices we are getting in house. Therefore, after Tony grows and inactivates the BSL-3 stocks, I would be preparing the dilutions of the viral stocks with David's help to formulate the final panel. In addition, I was also the one receiving at CDRH the orders, distributing the panels when available to the companies, as well as receiving the results of the testing. This strategy allowed DMD to have knowledge of the progress companies where doing with the panel testing and compile all the results for the EUA devices.

The preparation of the panel will take some time as the virus strains need still to be grown (and as Tony said the BSL-3 just got validated to work with COVID-19), inactivated, titrated, and the panel will have to be prepared with different dilutions that could satisfy the sensitivity observed in our devices.

AMERICAN OVERSIGHT

I proposed a meeting with CBER for next week, now that that the BSL-3 and the funds are available since 2/21/2020, to set up a timeline for the next steps.

Regards,

Mayra

**Subject:** RE: Coronavirus and MERS culturing

Dear Tim,

I am adding Drs. Carolyn Wilson, Mayra Garcia from CDRH and David McGivern to this email chain for communication purpose. Dr. Wilson is the director of office of research at CBER who oversees all 2019-nCoV activities. Dr. McGivern at the Office of Blood Research and Review at CBER will work with Mayra at CDRH to generate reference standards for industry to use.

My group is to propagate virus and then work with David's group to establish conditions for heat-inactivation of the virus. We have just received the approval to conduct the work, but there are a few house-keeping items that we need to take care of before we can start the work.

I would leave to Dr. Wilson, Mayra and Dr. McGivern to speak on the part regarding dialogues with industries.

Best,

Tony

Hi Tony, Shufeng and Christopher,

We are getting inquiries from IVD test developers who are ready to finish the validation of their molecular Coronavirus assays so they can submit them to CDRH for EUA authorization. I have heard that you are developing a source of Coronavirus and mers and was wondering if you are in dialogue with companies already and if we can introduce them to you so they can get in line to receive samples when they are ready.

Thanks so much in advance!

Best,
*Tim*

Hello Tim,
Likewise, I am delighted to meet you today. Please see attached for the IBC application we received from CBER for review and approval. We will have to contact the PI's at CBER to find out when they will have the materials ready. Based on the application, it seems like they are only preparing nConV19 (SARS CoV 2) and MERS CoV materials. (b) (5) [redacted] Hope this is helpful and let me know if I can be of further assistance. Take care.

Pillai

Hi Pillai,

Great to meet you today! I wanted to reach out and have copied Jeff to find out more details about the coronavirus and mers cultures. We have a number of test developers who cannot complete validation of their EUA assays until they have at least mock samples made with virus to test.

How soon will virus be available?
Can we connect developers with someone here at the agency so they can coordinate access?

Thanks!

Hi Uwe and Steve,

Would a COVID-19 diagnostic be reviewed in DMD?

I expect the Breakthrough Program will reply to the email below with standard information about how to submit a Breakthrough Designation (Breakthrough guidance, eCopy guidance, address, etc.). If you find the below of interest and want to reach out, that would be fine, too. Just let the program know if you do.

Regards,
Allen

Dear All,

Please find attached the final documents with edits/comments back to CDC for your final review. I would like to send them back to CDC tomorrow morning. I will be unavailable 9-10:30am and 11:30 am – 1:00pm. If I could get any comments before 10:30 am hopefully I can send final docs back to CDC in the 10:30-11:30 window.

Thanks
Best regards
Kim

**To:** Ross, Jennifer; Busch, Marcy; Dennis, Claire; Sadove, Elizabeth; Scherf, Uwe; Sapsford, Kim E
**Cc:** Stenzel, Timothy; Flannery, Ellen
**Subject:** Update on EUA for CDC "surveillance"
**When:** Thursday, February 20, 2020 8:30 AM-9:00 AM (UTC-05:00) Eastern Time (US & Canada).
**Where:** webex

CDC says they will submit a new EUA referencing the data in their first EUA in a day or two.
Protocol attached.
It would be good to touch base to ensure we are all on the same page for next steps.

AMERICA'S OVERSIGHT

Maybe we would also be able to discuss a little about the draft letter of authorization:

This letter is in response to your request that the Food and Drug Administration (FDA) issue an Emergency Use Authorization (EUA) for emergency use of the Centers for Disease Control and Prevention (CDC) 2019-Novel Coronavirus (2019-nCoV) Real-Time Reverse Transcriptase (RT)-PCR Diagnostic Panel for the presumptive qualitative detection of nucleic acid from the SARS-CoV-2 (formerly 2019-nCoV) in nasopharyngeal (NP) or oropharyngeal (OP) respiratory specimens collected from individuals consented or notified prior to sample collection that SARS-CoV-2 testing would be performed if specimens are negative for influenza and other respiratory pathogens in order to determine if unrecognized community transmission of SARS-CoV-2 is occurring, pursuant to Section 564 of the Federal Food, Drug, and Cosmetic Act (the Act) (21 U.S.C. §360bbb-3). Testing is limited to qualified laboratories designated by CDC to conduct testing according to protocol xxx and, in the United States, certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA), 42 U.S.C. § 263a, to perform high complexity tests.

**Please disregard the previous email send today at 11:09 AM. It was send in error. This is the correct version with our edits to your draft documents.**

Dear Laura,

Attached please find the following documents you submitted on February 21, 2020 to support the use of the FDA-authorized CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel in surveillance activities. These documents have been reviewed and edited by FDA's OCET and OCC.

1. Draft COVID-19 sentinel surveillance
2. Draft SARS-CoV-2 surveillance risk benefit
3. Draft CDC Surveillance EUA Request Cover letter

Please do not hesitate to reach out to me with questions.

Thanks,
Uwe

Hi Uwe,

Thanks, if the MERS CDC EUA authorization letter is handy, I would like to review. The CDC is asking for the same sort of authorization now.

Thanks! ☺

Best,
*Tim*
