Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 10, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 10, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

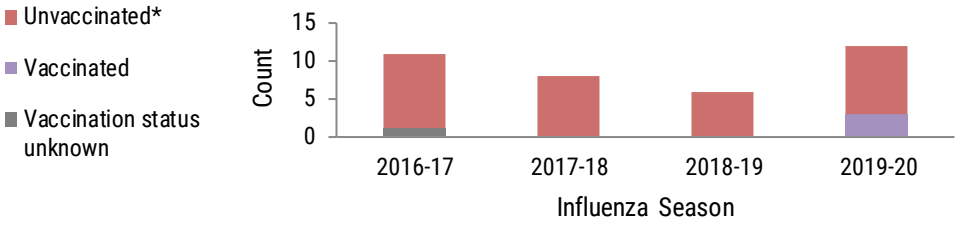
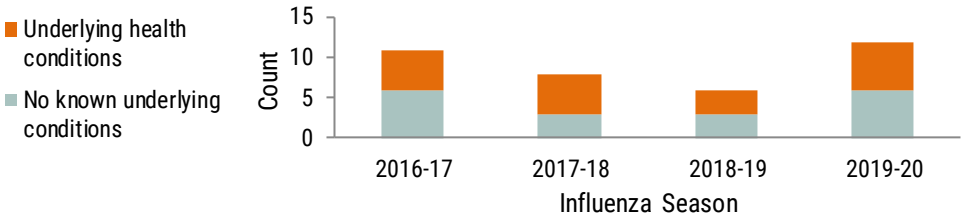
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 10, **the percent of emergency department and urgent care center visits for ILI in children <18 years increased** and was above levels observed at this time during the 2016-17 season.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 10, 2020.

Figures 25-26: In week 10, **two new influenza-associated pediatric deaths were reported**. A total of 12 influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 10, 2020.

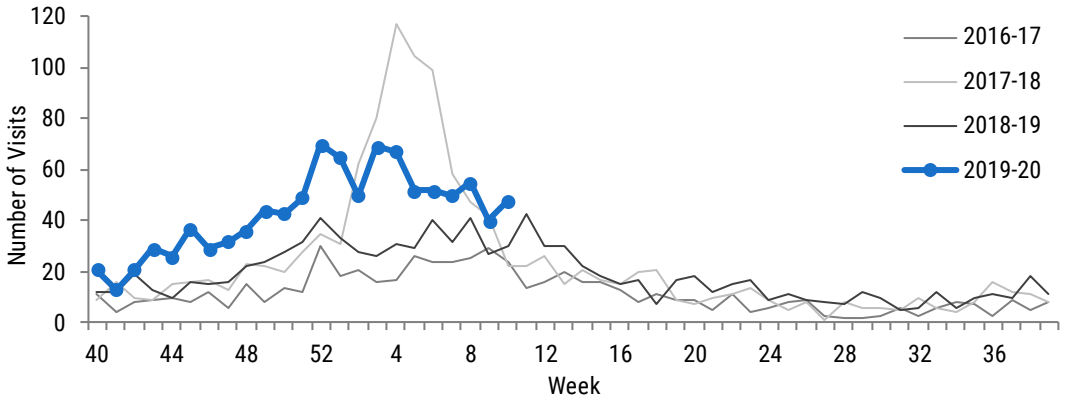
▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 10, 2020.

In week 10, **two new influenza-associated pediatric deaths were reported**. The first death was associated with influenza A 2009 (H1N1) in a child with known underlying medical conditions. The second was associated with influenza B in a child with known underlying medical conditions. Both were vaccinated for the 2019-20 season.

A total of 12 influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in March or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm



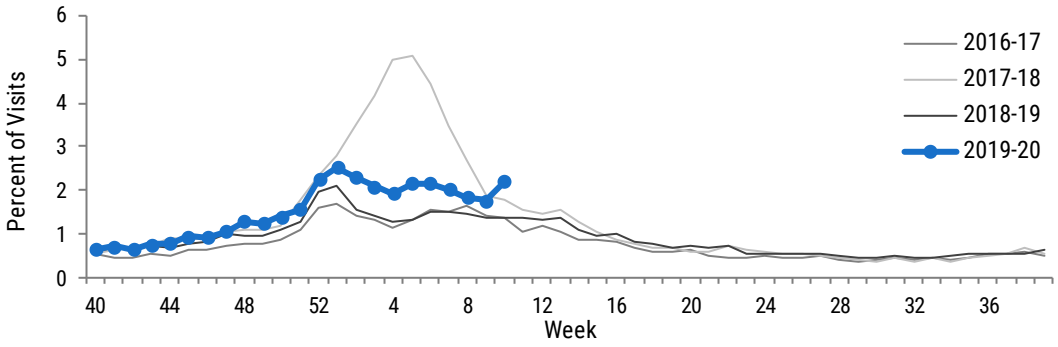
AMERICAN OVERSIGHT

At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 10, the **number of emergency department and urgent care center visits for influenza among pregnant women increased** and was above peak levels observed during the 2016-17 and 2018-19 seasons.



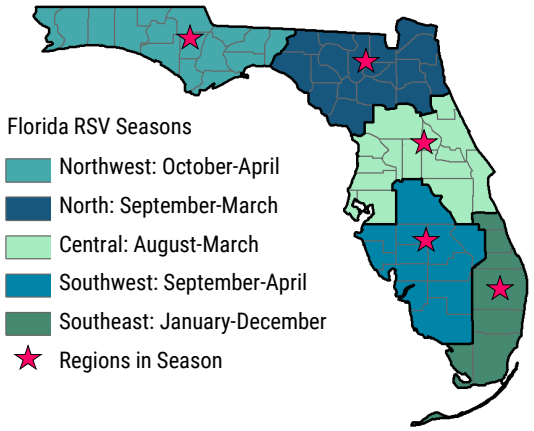
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 10, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 10, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years increased** and was above levels observed at this time during the 2016-17 and 2018-19 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 10, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

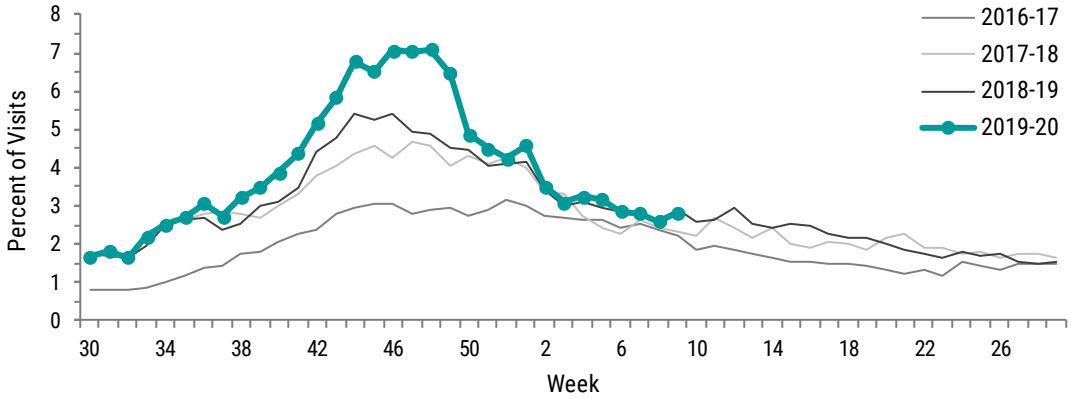
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

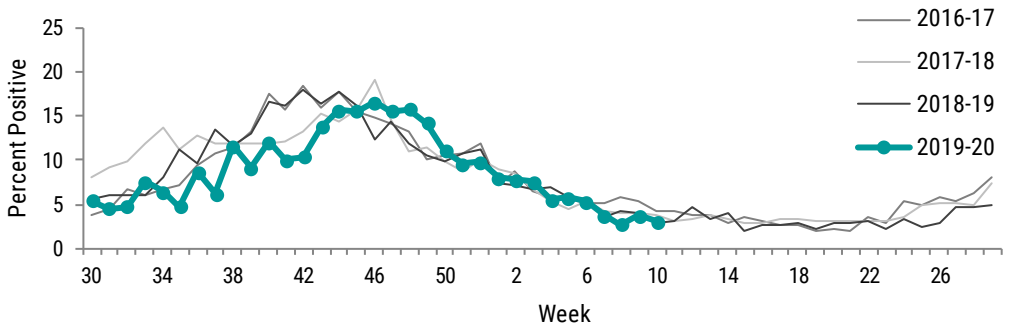
Week 10 (February 23-29, 2020) Activity Summary

In week 10, RSV activity in children <5 years increased and was similar to levels observed at this time in 2019.

No new RSV-associated outbreaks were reported in week 10. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 10, **the percent of emergency department and urgent care center visits for RSV among children <5 years increased** and was similar to levels observed at this time in 2019.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 10, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

AMERICAN OVERSIGHT

RSV Surveillance

Figure 31: In week 10, **the percent of specimens testing positive for RSV decreased.** Levels were similar to those observed at this time in previous seasons.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 10, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
No notable outbreaks were reported in week 10, 2020.							

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=370) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 11, 2020 Florida Flu Review
Date:	Wednesday, March 18, 2020 4:23:20 PM
Attachments:	Week 11, 2020 Florida Flu Review.pdf

Good afternoon!

Please find attached the week 11 Florida Flu Review.

Statewide, the percentage of respiratory specimens testing positive for influenza in sentinel laboratories decreased steadily over the last three weeks. Despite this decrease in laboratory-confirmed influenza activity, the percentage of visits for ILI increased notably during those same three weeks.

Recent trends in ILI activity may be a data artifact driven by an increase in the number of people seeking care for respiratory illness in response to concerns about coronavirus disease 2019 (COVID-19). It is also possible that these data represent a true increase in ILI activity statewide. The data displayed in this report are intended to track influenza activity in Florida. For information about COVID-19 in Florida, please visit: FloridaHealth.gov/diseases-and-conditions/COVID-19/.

For questions regarding COVID-19 in Florida please email COVID-19@FLHealth.gov or call 1-866-779-6121.

Eleven outbreaks were reported, up from ten outbreaks in the previous week. Of the eleven outbreaks reported, one was influenza-associated and ten were ILI.

No new influenza-associated pediatric deaths were reported. Twelve influenza-associated pediatric deaths have been reported so far this season; 75% of children were not vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

In addition to getting vaccinated, the Florida Department of Health recommends you take

AMERICAN OVERSIGHT

everyday precautions to prevent the spread of influenza:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Best,

Florida ILI Surveillance System Summary 16

Background

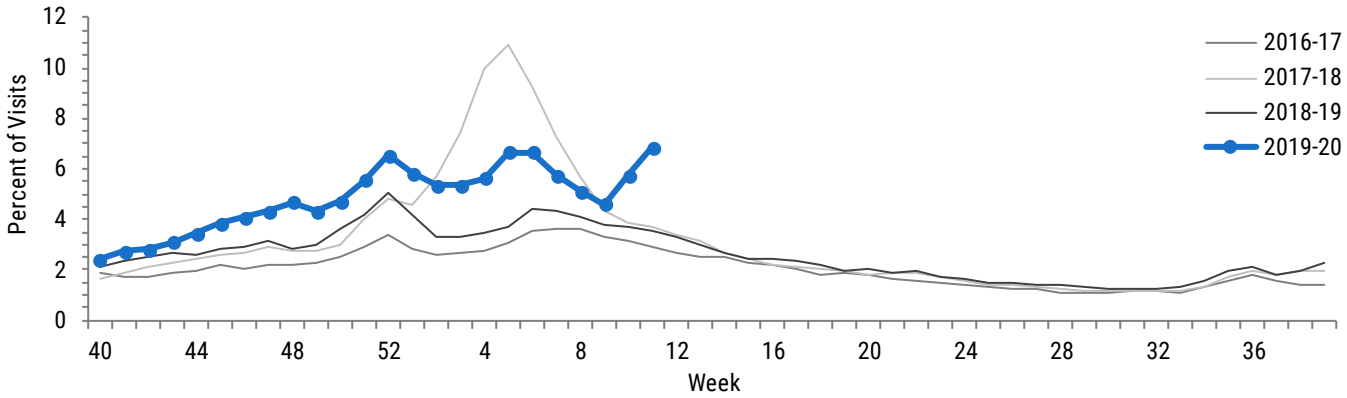
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



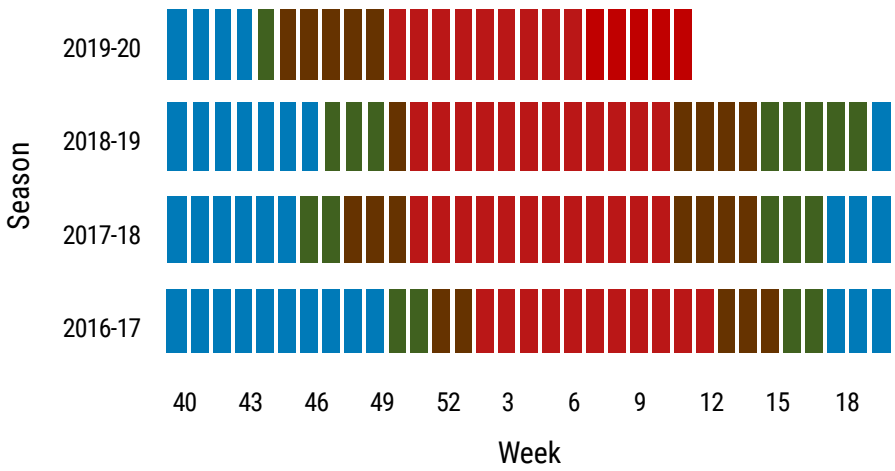
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 11, **the percent of emergency department and urgent care center visits for ILI statewide increased** and was above peak levels observed during the 2016-17 and 2018-19 seasons. While ILI activity has increased in recent weeks, laboratory-confirmed influenza activity has declined.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=370) statewide for the current season (week 40, 2019 to week 11, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 11, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 11, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

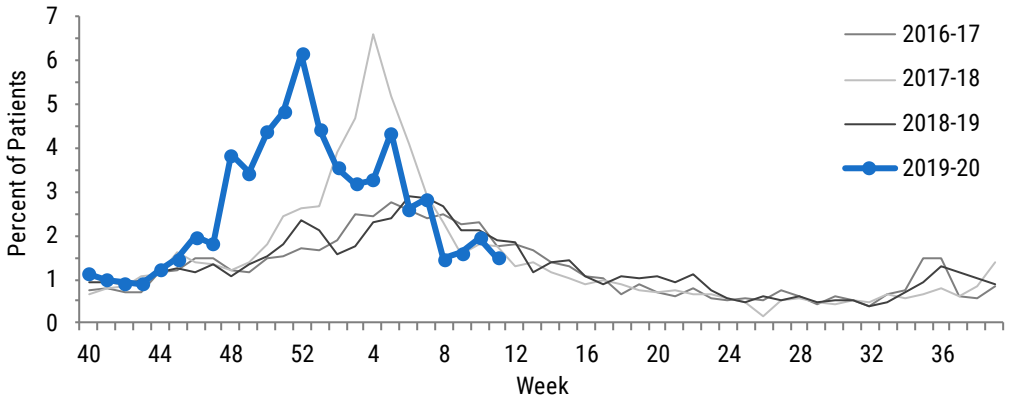
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 11, **the percent of patients with ILI reported by ILINet providers statewide decreased** and was below levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=4), week 40, 2016 to week 11, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



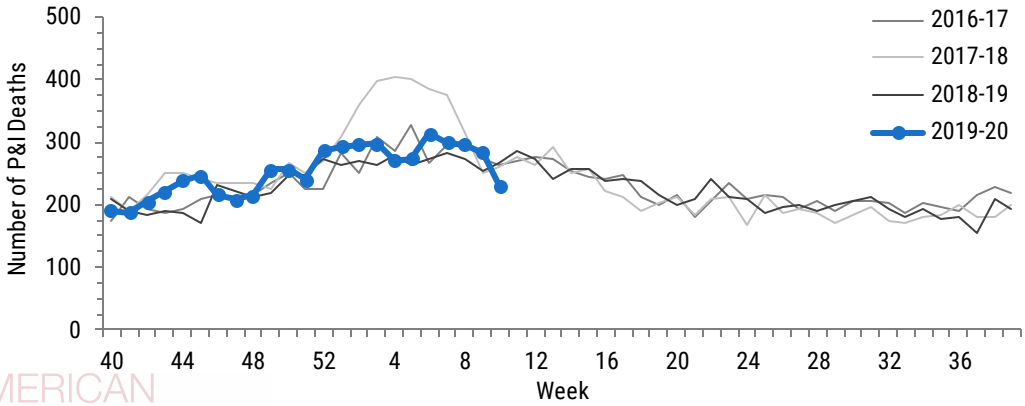


Figure 4: In week 10 (ending 3/7/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was below levels observed at this time in previous seasons.

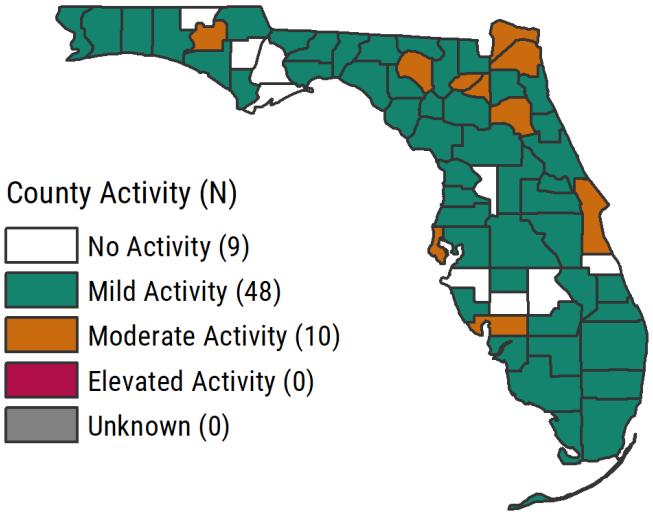
◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 10, 2020.

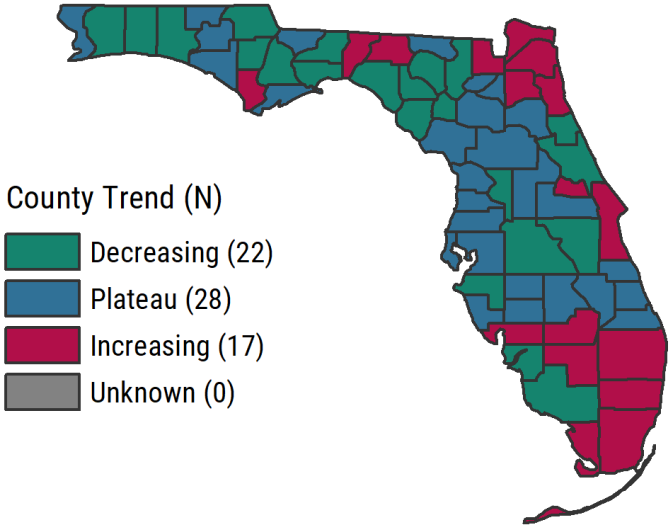
*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 11. Ten counties reported **moderate activity,** and no counties reported **elevated activity.**





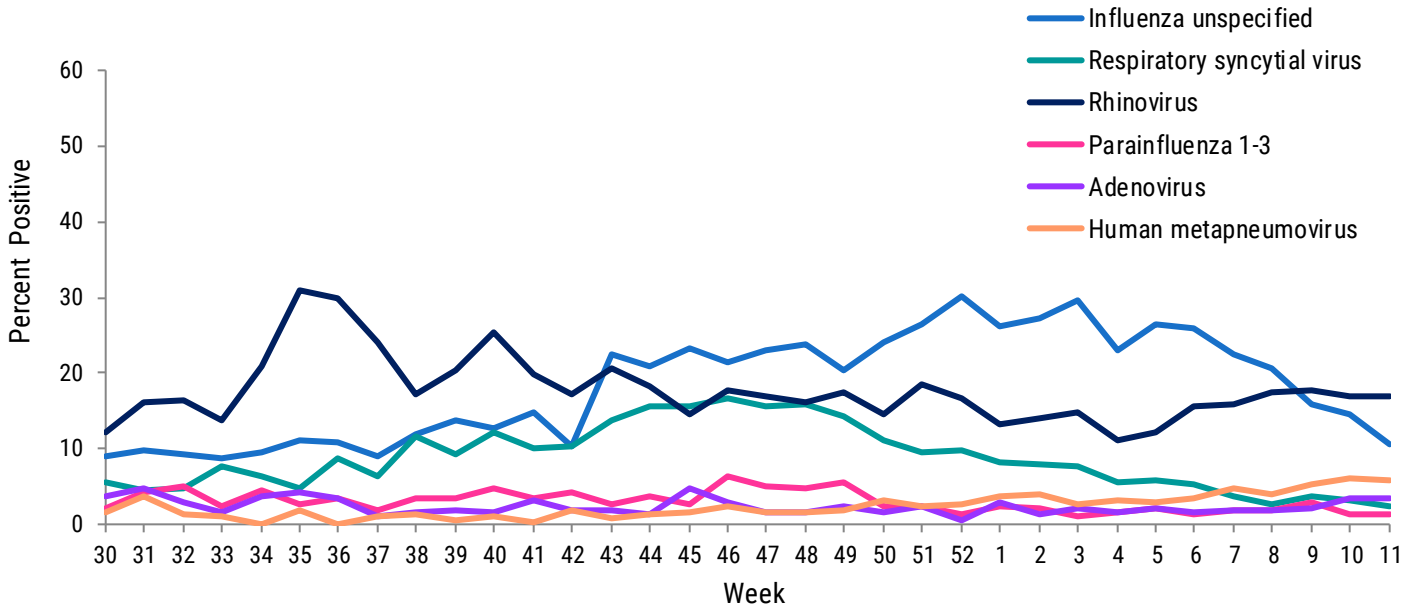


Figure 7: Most counties reported **activity at a plateau** for week 11. Seventeen counties reported **increasing activity,** and 22 counties reported **decreasing activity**.

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: The **percent of specimens testing positive for influenza decreased** in recent weeks. In week 11, the **percent of specimens testing positive for rhinovirus** was higher than other respiratory viruses under surveillance.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=8), week 40, 2019 to week 11, 2020.

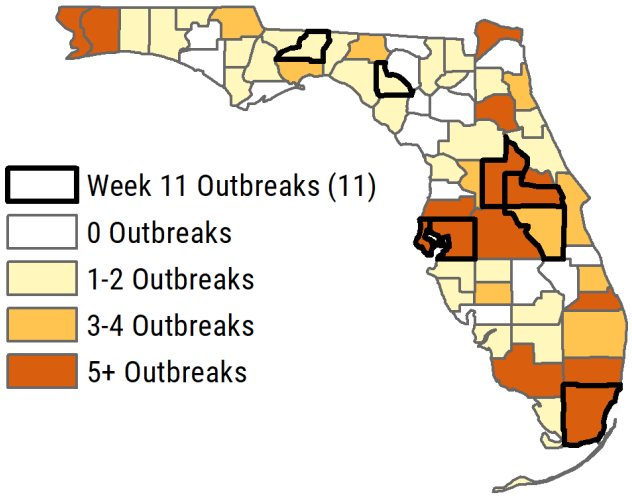
AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

Week 11 Outbreaks at a Glance:

Number Reported:
11 Outbreaks

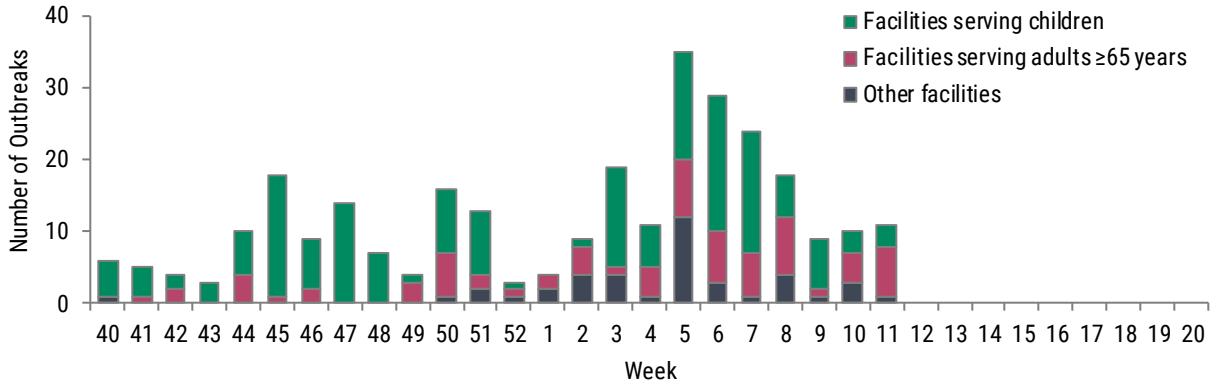
Influenza-Associated:
4 Outbreaks



Severe Outcomes*:
1 Outbreak

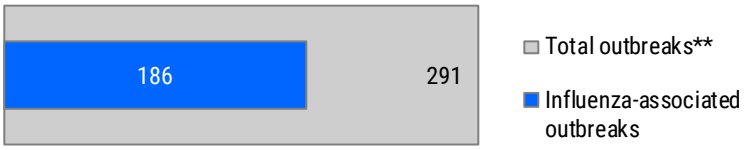
Outbreak Summary:

In week 11, four influenza-associated and seven ILI outbreaks were reported, a slight increase from the previous week.



Severe outcomes* were reported in one of eleven outbreaks. One hospitalization and no deaths were reported in this outbreak.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities).



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 11 are **outlined in bold.**

Figure 9: In week 11, **seven outbreaks** were reported among **facilities serving adults aged ≥65 years, three outbreaks** were reported in **facilities serving children,** and **one outbreak** was reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 11, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 11, **63.9% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 11, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

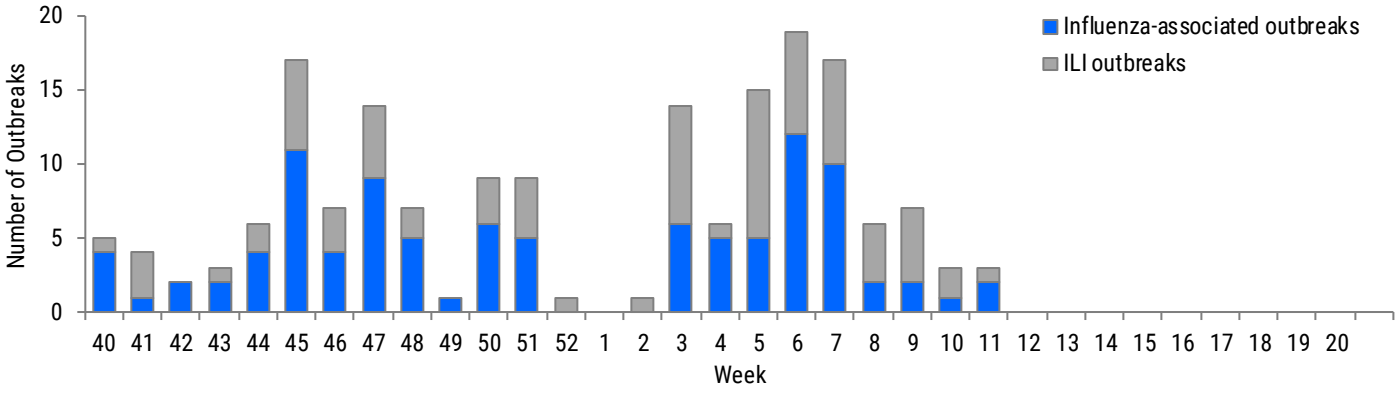
*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

Facilities Serving Children*:



3 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

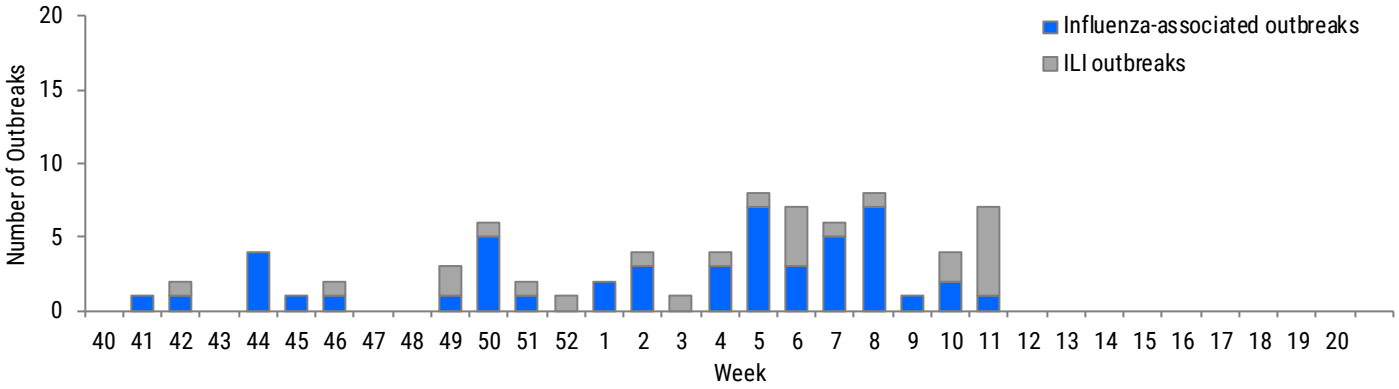
In week 11, three new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 11, **two influenza-associated outbreaks** and **one ILI outbreak** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 11, 2020.

Facilities Serving Adults ≥65 yrs.**:



7 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 11, seven new outbreaks of influenza or ILI were reported among facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

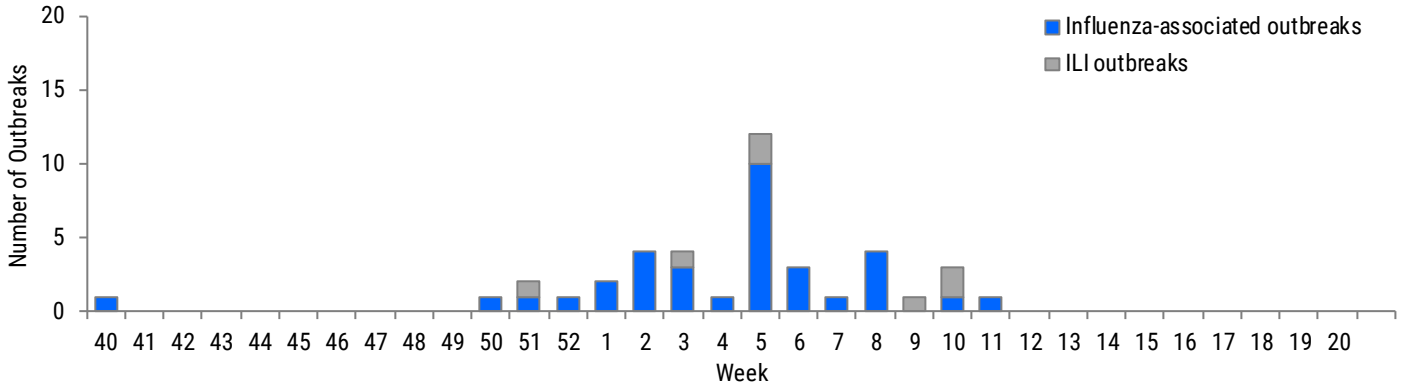
Figure 12: In week 11, **six ILI outbreaks** and **one influenza-associated outbreak** were reported among **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 11, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

Other Facilities*:



1 Outbreak

Summary of Outbreaks in Other Facilities:

In week 11, one new outbreak of influenza or ILI was reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 11, **one influenza-associated outbreak** was reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 11, 2020.

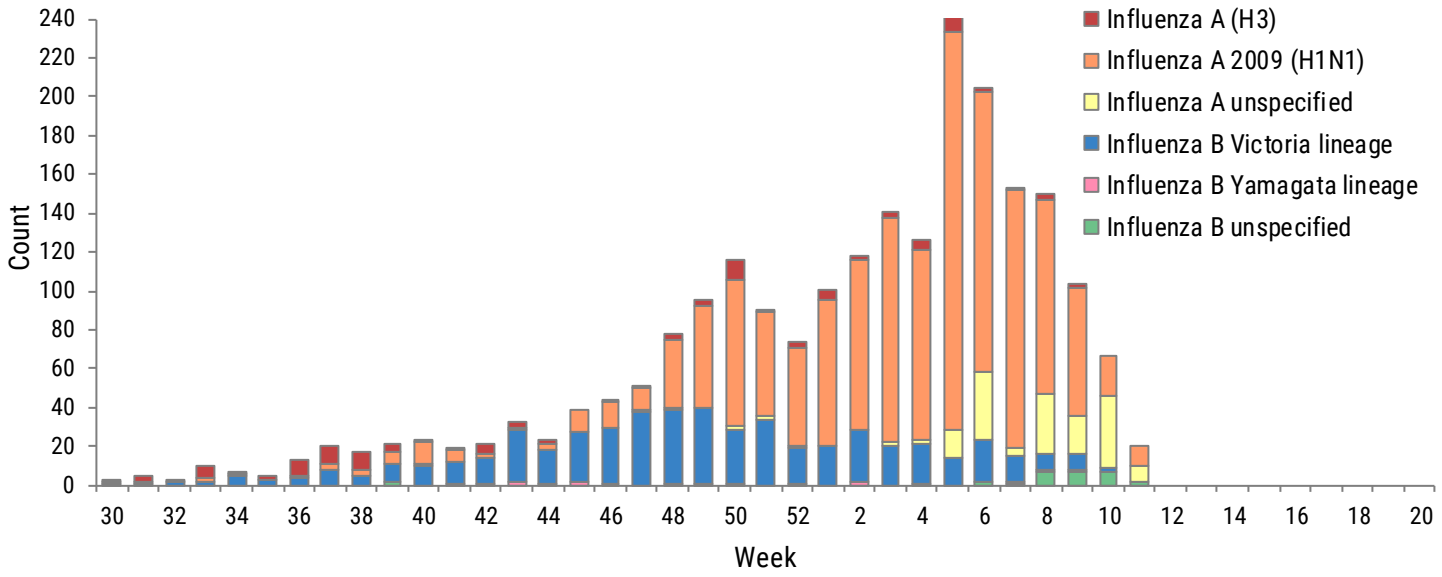


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

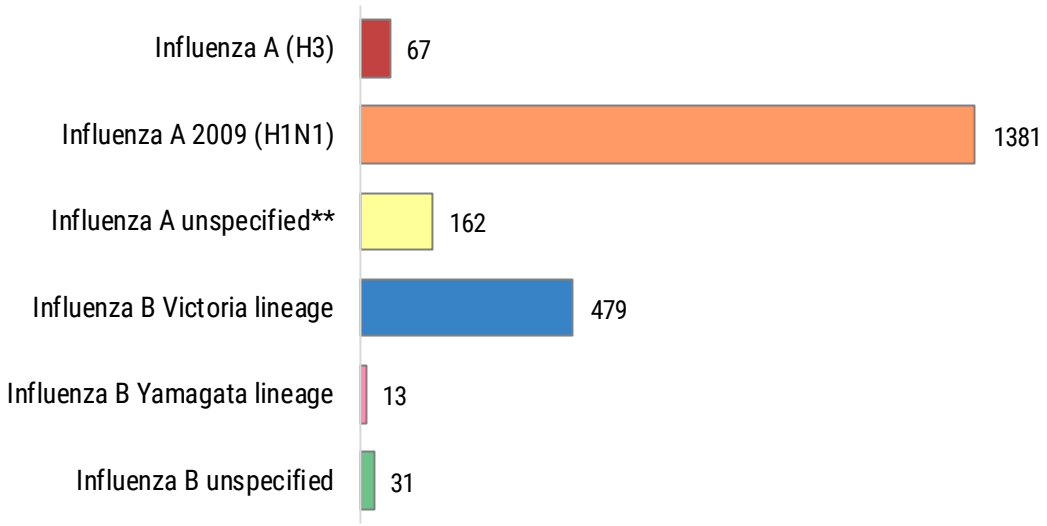
Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	136 (46.7%)	83 influenza-associated outbreaks 53 ILI outbreaks
Child daycares	40 (13.8%)	17 influenza-associated outbreaks 23 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	23 (7.9%)	10 influenza-associated outbreaks 13 ILI outbreaks
Nursing facilities	18 (6.2%)	14 influenza-associated outbreaks 4 ILI outbreaks
Other long-term care facilities	33 (11.3%)	26 influenza-associated outbreaks 7 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	33 (11.3%)	31 influenza-associated outbreaks 2 ILI outbreaks
Hospitals	3 (1.1%)	2 influenza-associated outbreaks 1 ILI outbreak
Additional facility types	5 (1.7%)	3 influenza-associated outbreaks 2 ILI outbreaks
Total	**291 (100.0%)**	**186 influenza-associated outbreaks** **105 ILI outbreaks**

AMERICAN OVERSIGHT



Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 11, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 11, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=370) from week 40, 2016 to week 11, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity increased** during week 11 and was above peak activity observed during the 2016-17 season.*

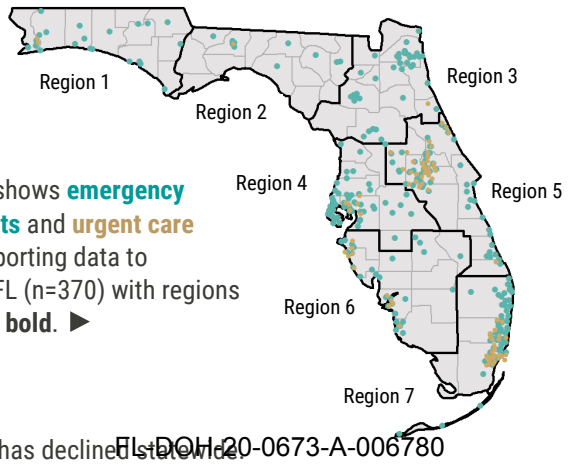

Figure 23 shows **emergency departments** and **urgent care centers** reporting data to ESSENCE-FL (n=370) with regions **outlined in bold**. ▶

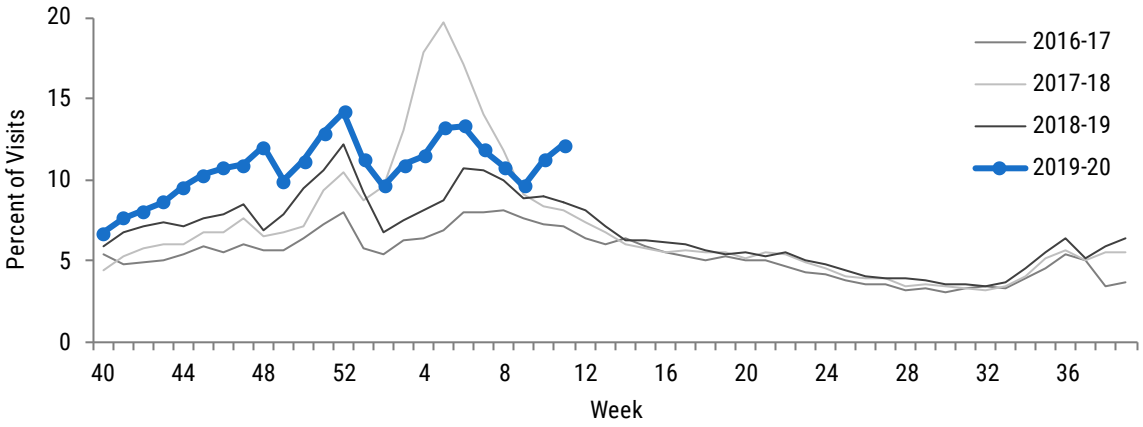
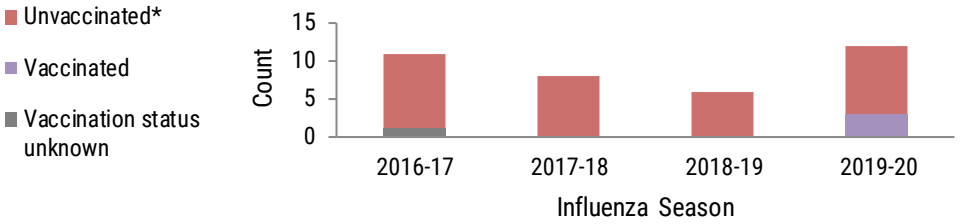
*While ILI activity has increased in recent weeks, laboratory-confirmed influenza activity has declined statewide.



AMERICAN OVERSIGHT

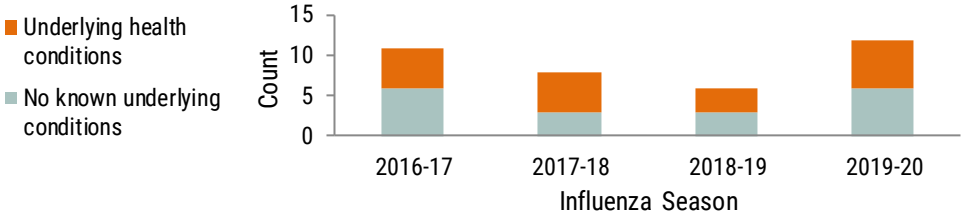
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 11, **the percent of emergency department and urgent care center visits for ILI in children <18 years increased** and was above peak levels observed during the 2016-17 season. While ILI activity has increased in recent weeks, laboratory-confirmed influenza activity has declined.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 11, 2020.

Figures 25-26: In week 11, **no new influenza-associated pediatric deaths were reported**. A total of 12 influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 11, 2020.

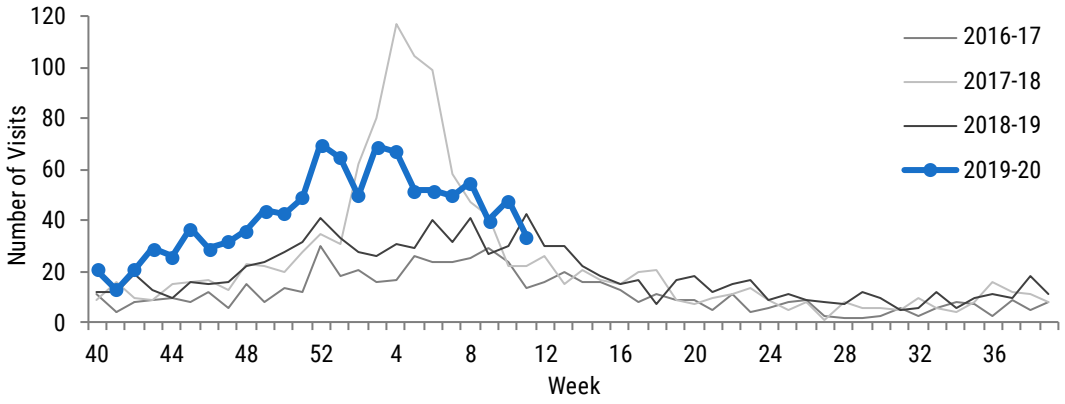
▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 11, 2020.

In week 11, **no new influenza-associated pediatric deaths were reported**.

A total of 12 influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in March or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm



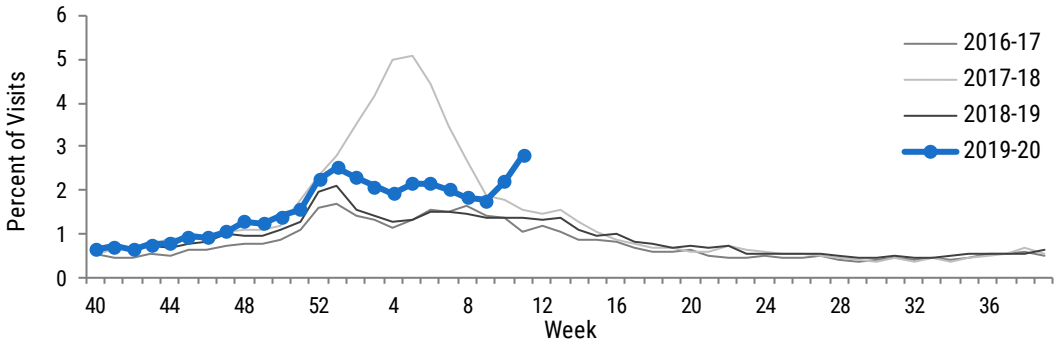
AMERICAN OVERSIGHT

At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 11, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was within levels observed at this time during previous seasons.



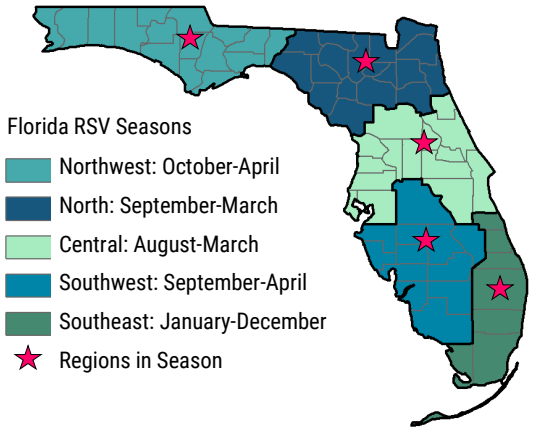
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 11, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 11, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years increased** and was above peak levels during the 2016-17 and 2018-19 seasons. While ILI activity has increased in recent weeks, laboratory-confirmed influenza activity has declined.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 11, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

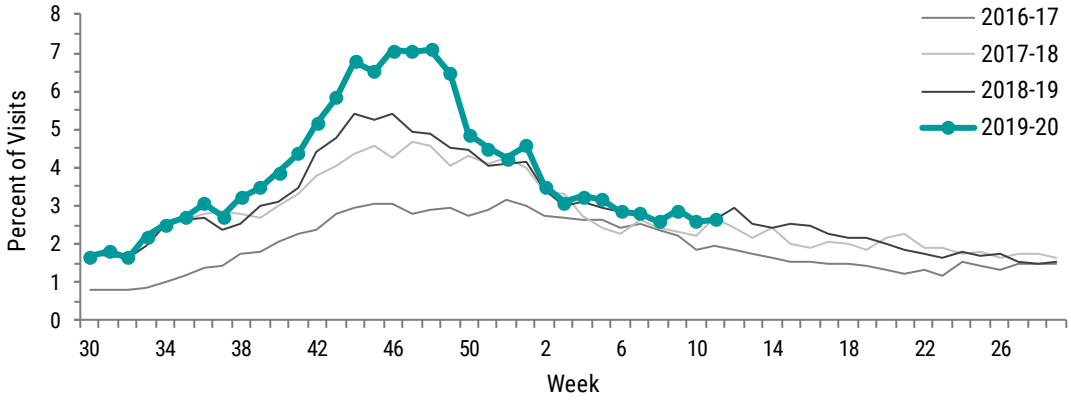
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

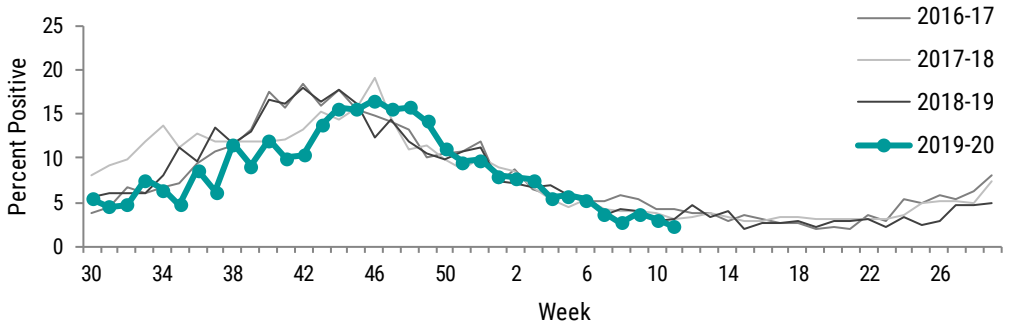
Week 11 (February 23-29, 2020) Activity Summary

In week 11, RSV activity in children <5 years increased and was similar to levels observed at this time in 2019.

One new RSV-associated outbreak was reported in week 11. A total of ten RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 11, **the percent of emergency department and urgent care center visits for RSV among children <5 years increased** and was similar to levels observed at this time in 2019.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 11, 2020.



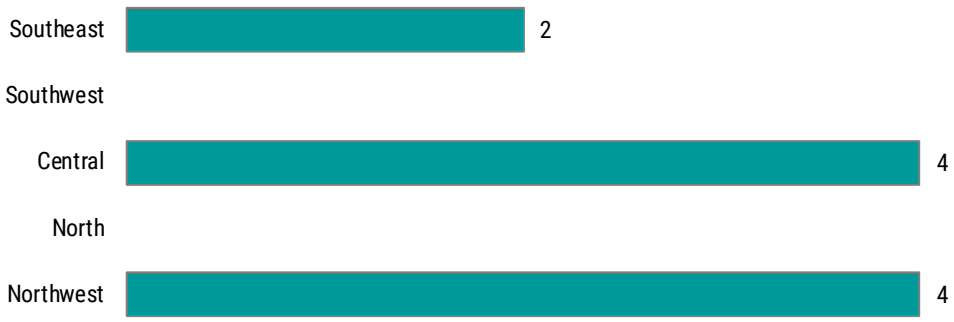
*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

AMERICAN OVERSIGHT

RSV Surveillance

Figure 31: In week 11, **the percent of specimens testing positive for RSV decreased.** Levels were slightly below those observed at this time in previous seasons.

Figure 31 shows **the percent of specimens testing positive for respiratory syncytial virus (RSV)**, as reported by hospital laboratories (n=8), week 30, 2016 to week 11, 2020. ▶



RSV-Associated Outbreaks in Week 11:

1 Outbreak

Summary of RSV-Associated Outbreaks:

In week 11, one new RSV-associated outbreak was reported. Since week 30, 2019, ten RSV-associated outbreaks have been reported.

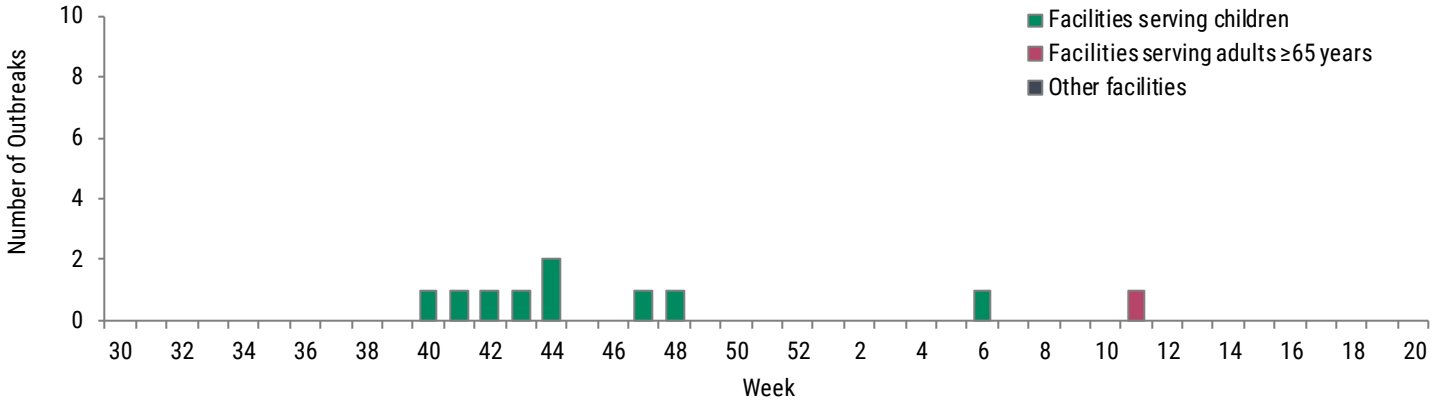


Figure 32: In week 11, one new RSV-associated outbreak was reported. Since week 30, outbreaks have been reported in Florida's southeast, central, and northwest regions.

◀ **Figure 32** shows **a summary of RSV-associated outbreaks by region*** as reported by county health departments in Merlin, week 30, 2019 to week 11, 2020.

*Regions defined in figure 29.

Figure 33: In week 11, one new RSV-associated outbreak was reported. This outbreak was reported in a **facility serving adults aged ≥65 years**. The majority of outbreaks reported since week 30 have been reported in **facilities serving children.**

▲ **Figure 33** shows **the number of RSV-associated outbreaks by setting and week** as reported by county health departments in Merlin, week 30, 2019 to week 11, 2020.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 11, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
No notable outbreaks were reported in week 11, 2020.							

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=370) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 11, 2020 Florida Flu Review
Date:	Wednesday, March 18, 2020 4:23:27 PM
Attachments:	Week 11, 2020 Florida Flu Review.pdf

Good afternoon!

Please find attached the week 11 Florida Flu Review.

Statewide, the percentage of respiratory specimens testing positive for influenza in sentinel laboratories decreased steadily over the last three weeks. Despite this decrease in laboratory-confirmed influenza activity, the percentage of visits for ILI increased notably during those same three weeks.

Recent trends in ILI activity may be a data artifact driven by an increase in the number of people seeking care for respiratory illness in response to concerns about coronavirus disease 2019 (COVID-19). It is also possible that these data represent a true increase in ILI activity statewide. The data displayed in this report are intended to track influenza activity in Florida. For information about COVID-19 in Florida, please visit: FloridaHealth.gov/diseases-and-conditions/COVID-19/.

For questions regarding COVID-19 in Florida please email COVID-19@FLHealth.gov or call 1-866-779-6121.

Eleven outbreaks were reported, up from ten outbreaks in the previous week. Of the eleven outbreaks reported, one was influenza-associated and ten were ILI.

No new influenza-associated pediatric deaths were reported. Twelve influenza-associated pediatric deaths have been reported so far this season; 75% of children were not vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

In addition to getting vaccinated, the Florida Department of Health recommends you take

AMERICAN OVERSIGHT

everyday precautions to prevent the spread of influenza:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Best,

Please note: Florida has a very broad public records law. Most written communications to or from state officials regarding state business are public records available to the public and media upon request. Your email communication may therefore be subject to public disclosure.

AMERICAN OVERSIGHT

Florida FLU REVIEW

Season: 2019-20

Week 11: 3/15/20-3/21/20

Geographic Spread: **Widespread**

Predominant Strain: **A 2009 (H1N1)**

ILI Activity Trend: **Increasing**

Week 11 influenza & influenza-like illness (ILI) activity summary:

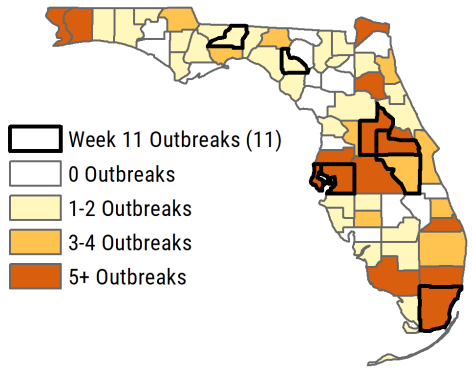
Statewide, the percentage of respiratory specimens testing positive for influenza in sentinel laboratories decreased steadily over the last three weeks. Despite this decrease in laboratory-confirmed influenza activity, the percentage of visits for ILI increased notably during those same three weeks.

Recent trends in ILI activity may be a data artifact driven by an increase in the number of people seeking care for respiratory illness in response to concerns about coronavirus disease 2019 (COVID-19). It is also possible that these data represent a true increase in ILI activity statewide. The data displayed in this report are intended to track influenza activity in Florida. For information about COVID-19 in Florida, please visit: FloridaHealth.gov/diseases-and-conditions/COVID-19/.

Eleven outbreaks were reported, up from ten outbreaks in the previous week. Of the eleven outbreaks reported, four were influenza-associated and seven were ILI.

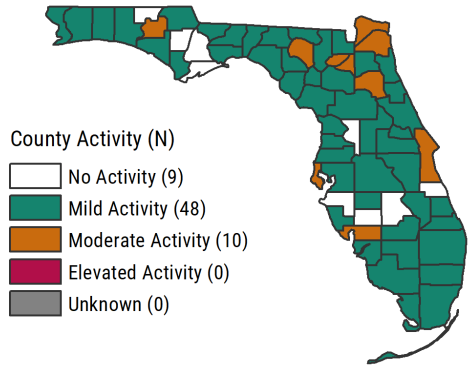
No new influenza-associated pediatric deaths were reported. Twelve influenza-associated pediatric deaths have been reported so far this season; 75% of children were not vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.



The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults ≥65 years, pregnant women, and people with underlying medical conditions).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza:



- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Florida ILI Surveillance System Summary 16

Background

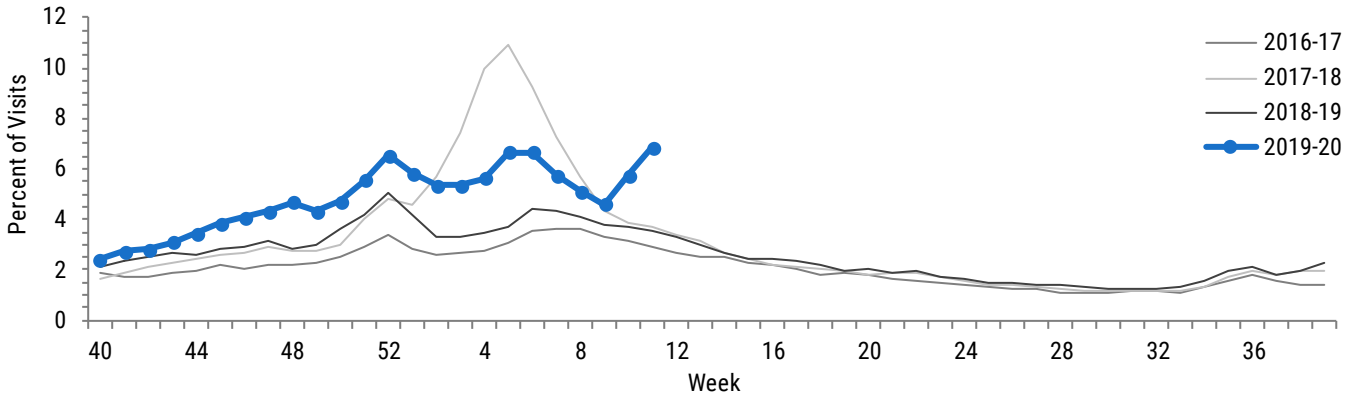
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



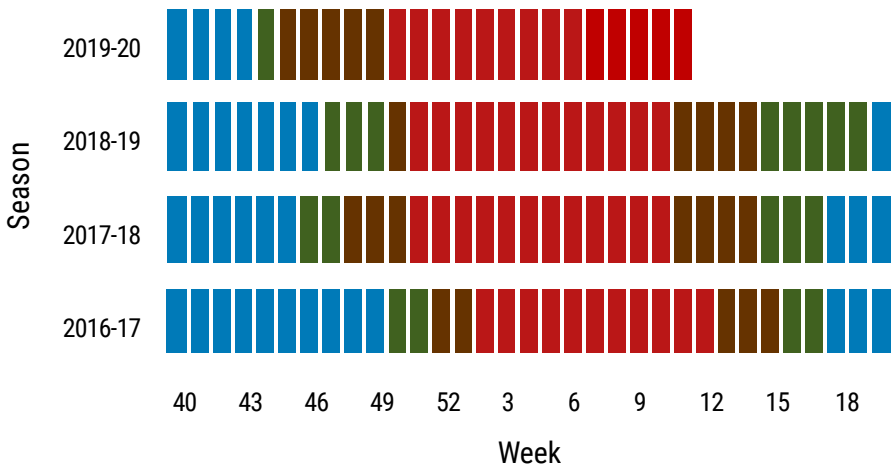
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 11, **the percent of emergency department and urgent care center visits for ILI statewide increased** and was above peak levels observed during the 2016-17 and 2018-19 seasons. While ILI activity has increased in recent weeks, laboratory-confirmed influenza activity has declined.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=370) statewide for the current season (week 40, 2019 to week 11, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 11, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 11, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

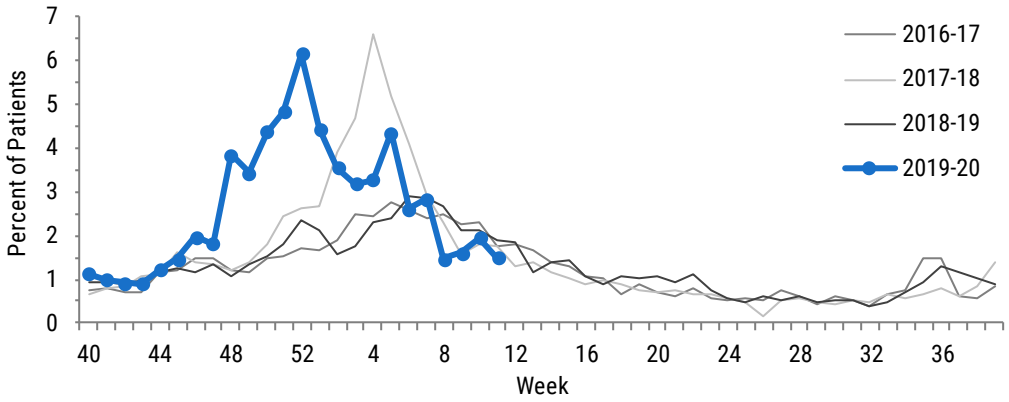
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 11, **the percent of patients with ILI reported by ILINet providers statewide decreased** and was below levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=4), week 40, 2016 to week 11, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



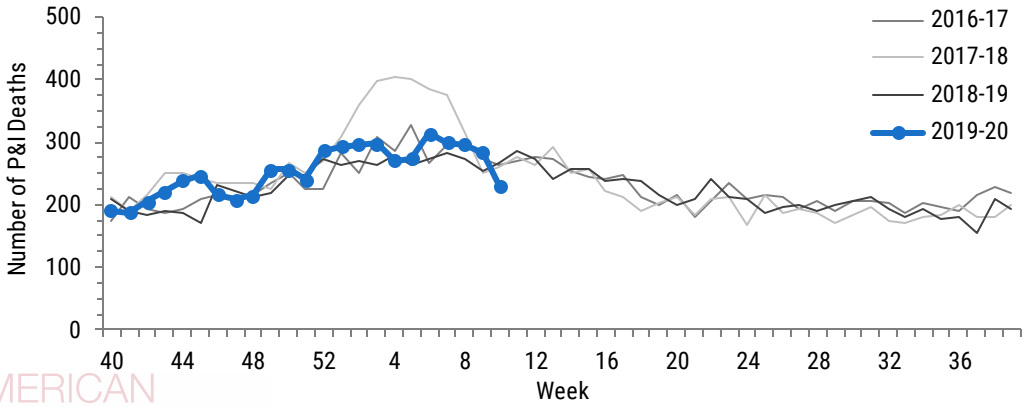


Figure 4: In week 10 (ending 3/7/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 10, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

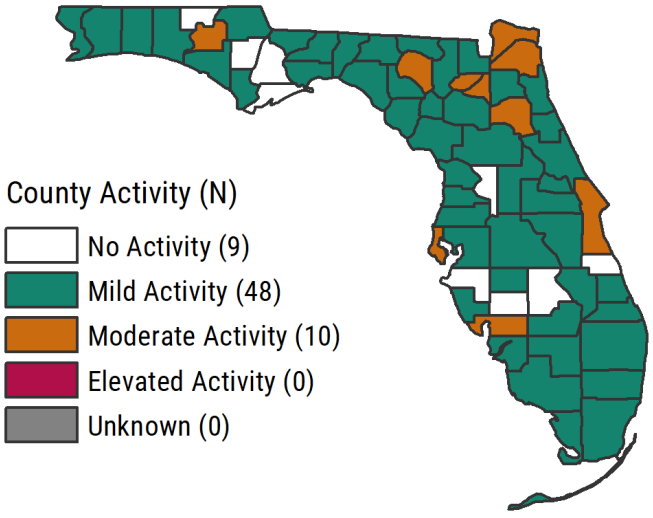
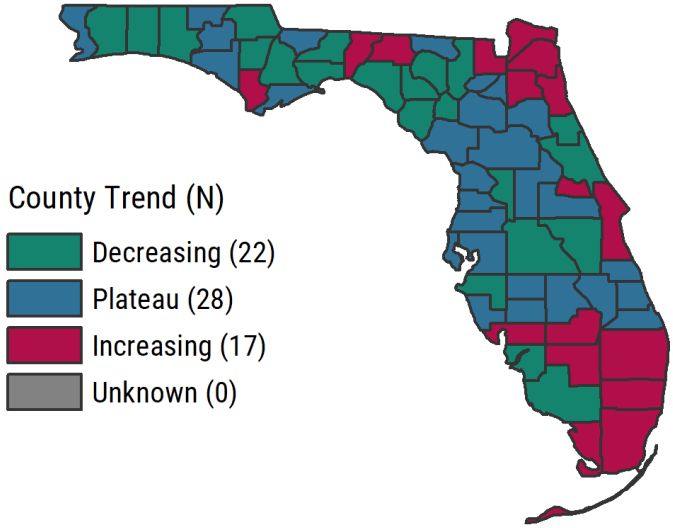
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 11. Ten counties reported **moderate activity,** and no counties reported **elevated activity.**





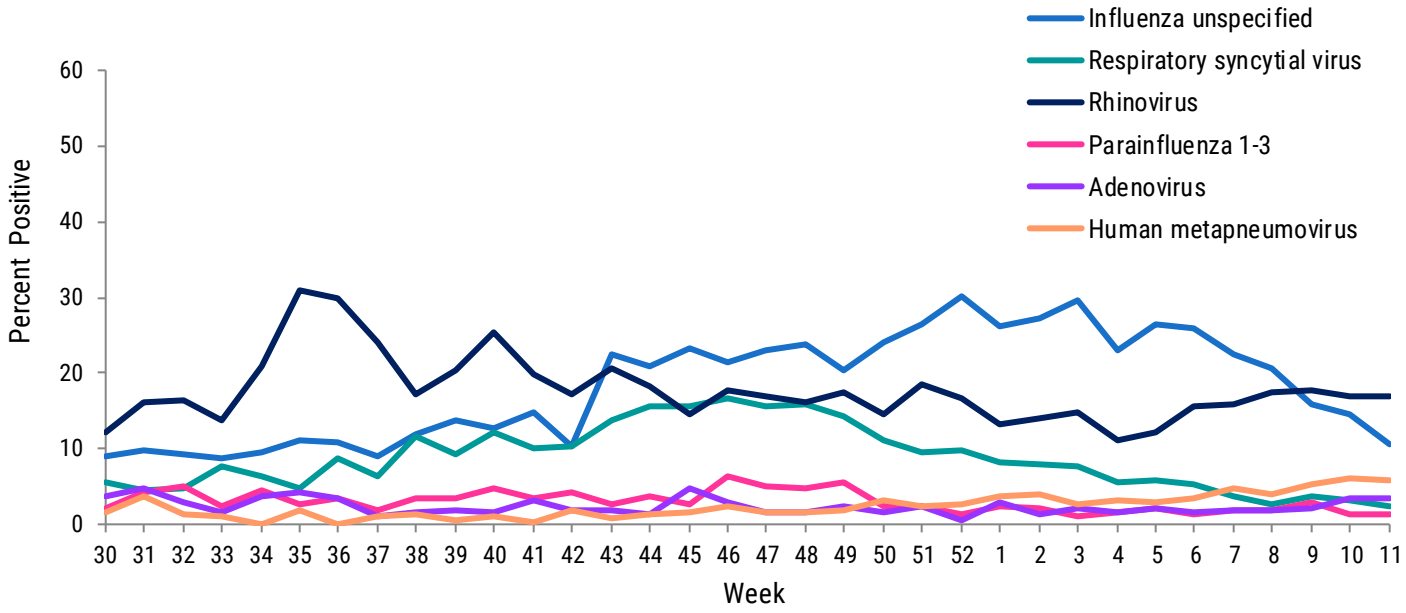


Figure 7: Most counties reported **activity at a plateau** for week 11. Seventeen counties reported **increasing activity,** and 22 counties reported **decreasing activity**.

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: The **percent of specimens testing positive for influenza decreased** in recent weeks. In week 11, the **percent of specimens testing positive for rhinovirus** was higher than other respiratory viruses under surveillance.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=8), week 40, 2019 to week 11, 2020.

AMERICAN OVERSIGHT

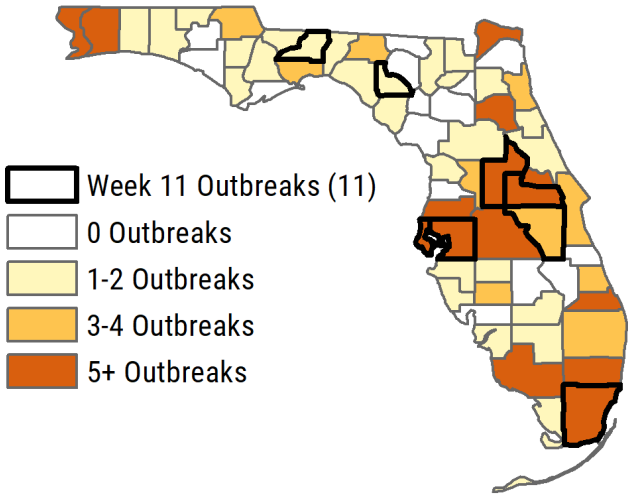
Influenza and ILI Outbreaks

Week 11 Outbreaks at a Glance:

Number Reported:
11 Outbreaks

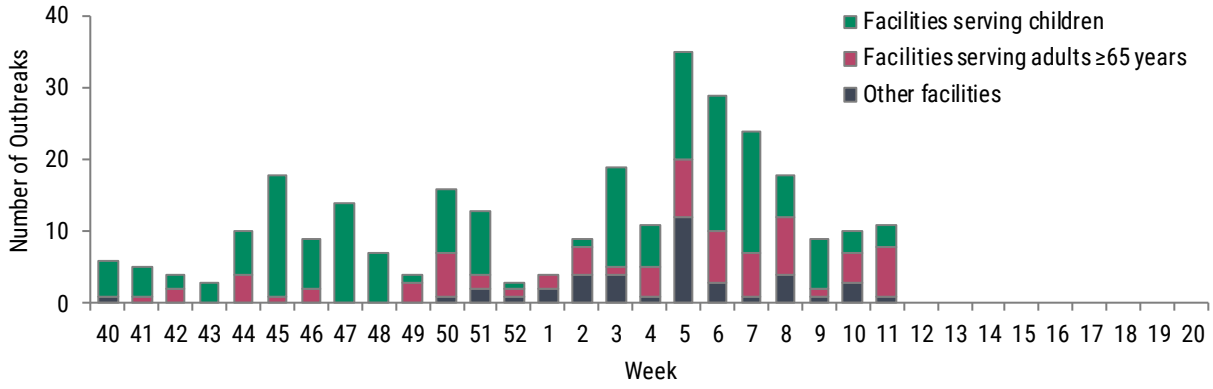
Influenza-Associated:
4 Outbreaks



Severe Outcomes*:
1 Outbreak

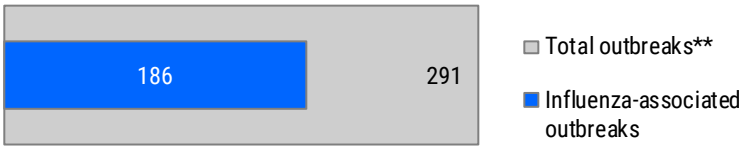
Outbreak Summary:

In week 11, four influenza-associated and seven ILI outbreaks were reported, a slight increase from the previous week.



Severe outcomes* were reported in one of eleven outbreaks. One hospitalization and no deaths were reported in this outbreak.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities).



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 11 are **outlined in bold.**

Figure 9: In week 11, **seven outbreaks** were reported among **facilities serving adults aged ≥65 years, three outbreaks** were reported in **facilities serving children,** and **one outbreak** was reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 11, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 11, **63.9% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 11, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

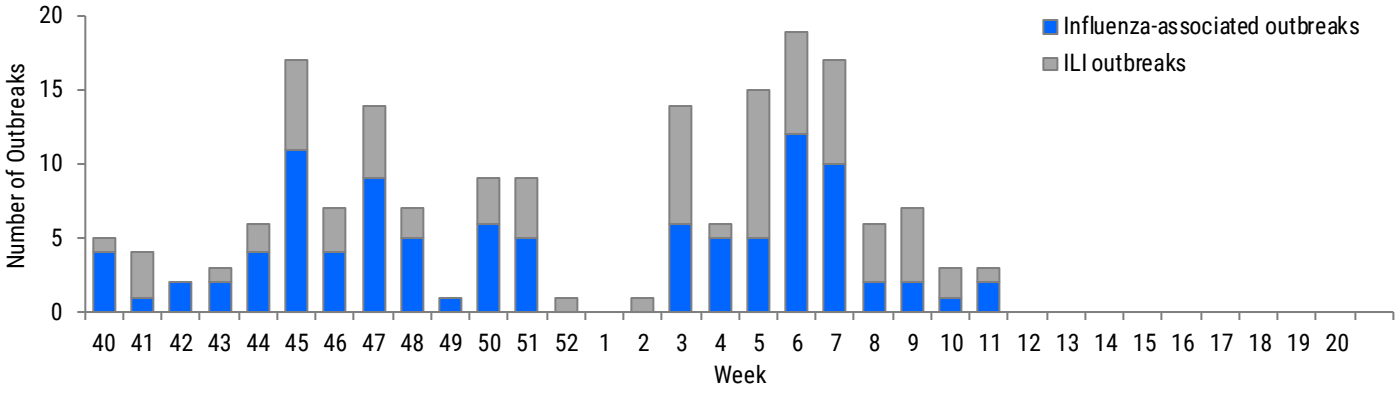
Influenza and ILI Outbreaks

Facilities Serving Children*:



3 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

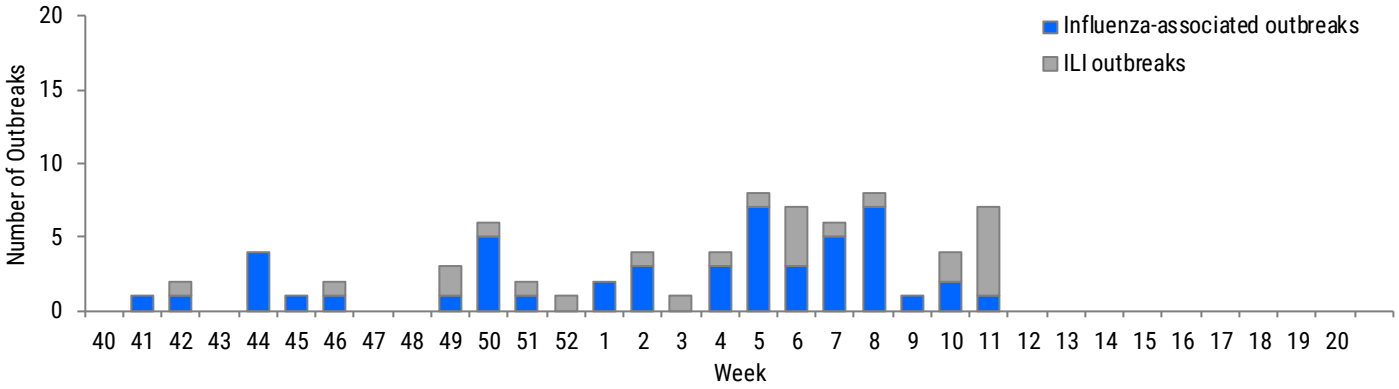
In week 11, three new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 11, **two influenza-associated outbreaks** and **one ILI outbreak** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 11, 2020.

Facilities Serving Adults ≥65 yrs.**:



7 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 11, seven new outbreaks of influenza or ILI were reported among facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 11, **six ILI outbreaks** and **one influenza-associated outbreak** were reported among **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 11, 2020.

AMERICAN OVERSIGHT

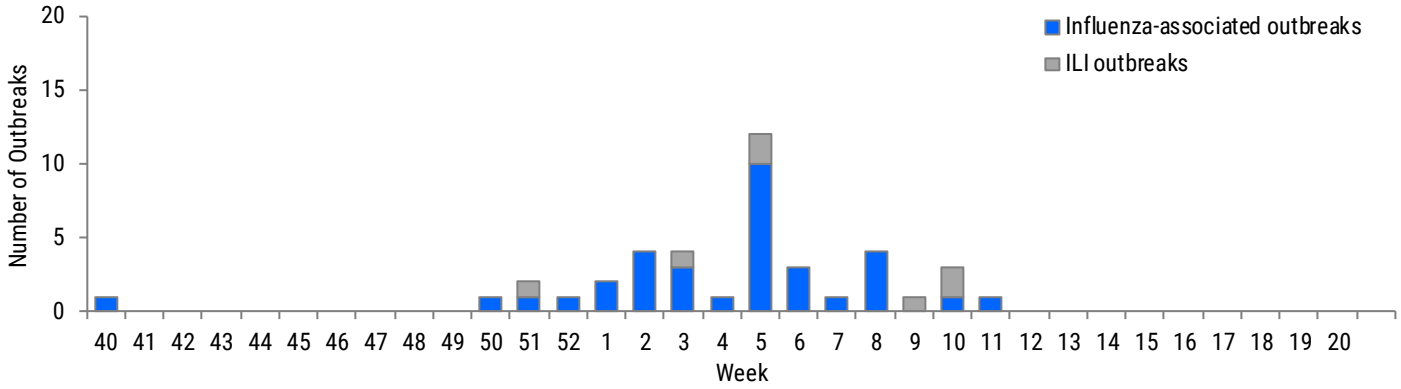
Influenza and ILI Outbreaks

Other Facilities*:



1 Outbreak

Summary of Outbreaks in Other Facilities:

In week 11, one new outbreak of influenza or ILI was reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 11, **one influenza-associated outbreak** was reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 11, 2020.

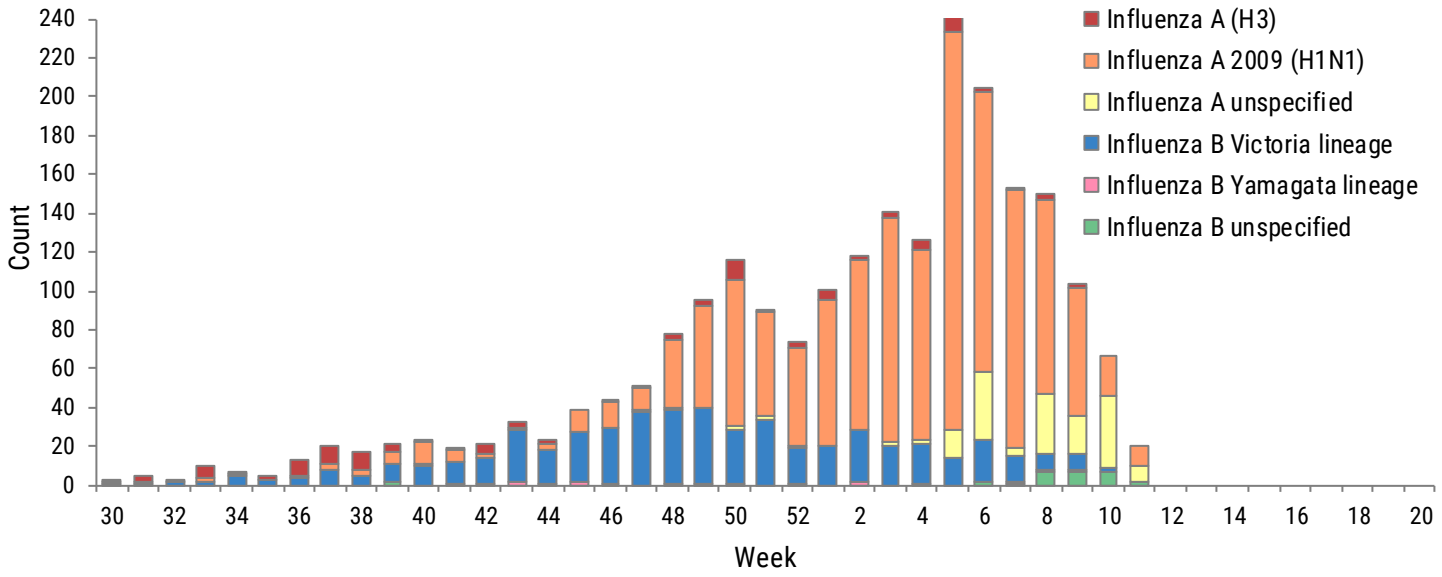


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	136 (46.7%)	83 influenza-associated outbreaks 53 ILI outbreaks
Child daycares	40 (13.8%)	17 influenza-associated outbreaks 23 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	23 (7.9%)	10 influenza-associated outbreaks 13 ILI outbreaks
Nursing facilities	18 (6.2%)	14 influenza-associated outbreaks 4 ILI outbreaks
Other long-term care facilities	33 (11.3%)	26 influenza-associated outbreaks 7 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	33 (11.3%)	31 influenza-associated outbreaks 2 ILI outbreaks
Hospitals	3 (1.1%)	2 influenza-associated outbreaks 1 ILI outbreak
Additional facility types	5 (1.7%)	3 influenza-associated outbreaks 2 ILI outbreaks
Total	**291 (100.0%)**	**186 influenza-associated outbreaks** **105 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 11, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 11, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=370) from week 40, 2016 to week 11, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity increased** during week 11 and was above peak activity observed during the 2016-17 season.*

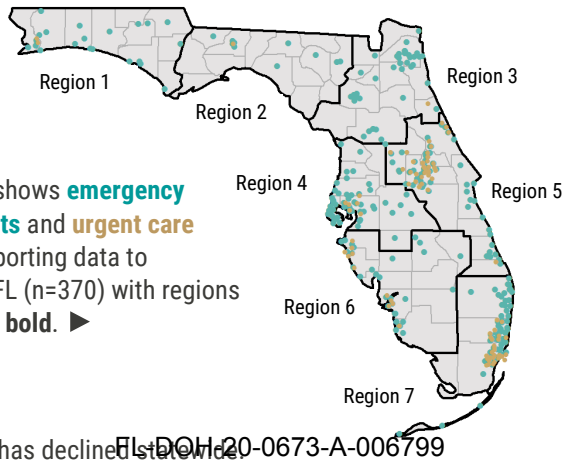

Figure 23 shows **emergency departments** and **urgent care centers** reporting data to ESSENCE-FL (n=370) with regions **outlined in bold**. ▶

*While ILI activity has increased in recent weeks, laboratory-confirmed influenza activity has declined statewide.

AMERICAN OVERSIGHT

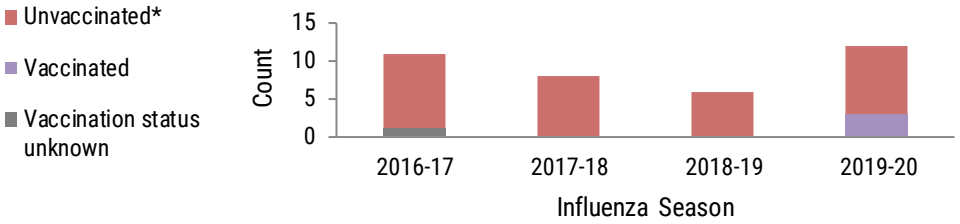
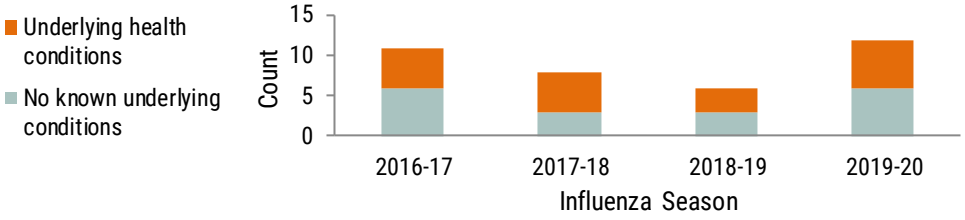
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 11, **the percent of emergency department and urgent care center visits for ILI in children <18 years increased** and was above peak levels observed during the 2016-17 season. While ILI activity has increased in recent weeks, laboratory-confirmed influenza activity has declined.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 11, 2020.

Figures 25-26: In week 11, **no new influenza-associated pediatric deaths were reported**. A total of 12 influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 11, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 11, 2020.

In week 11, **no new influenza-associated pediatric deaths were reported**.

A total of 12 influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in March or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm

AMERICAN OVERSIGHT

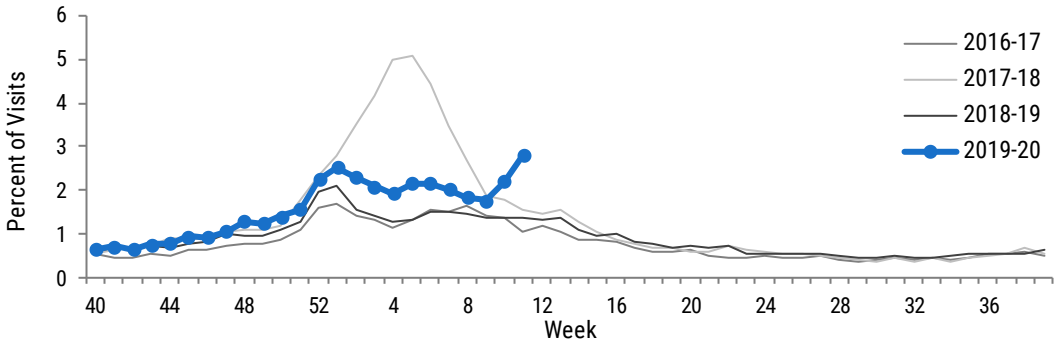
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 11, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was within levels observed at this time during previous seasons.



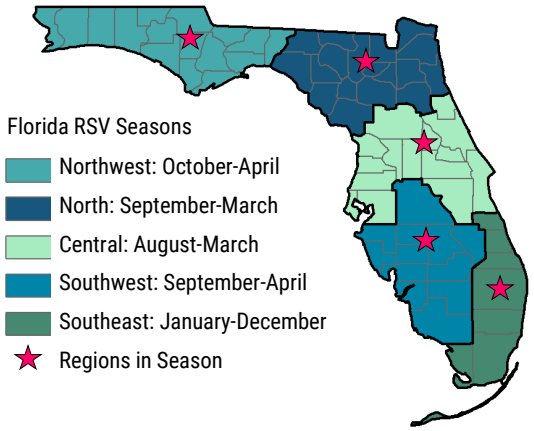
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 11, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 11, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years increased** and was above peak levels during the 2016-17 and 2018-19 seasons. While ILI activity has increased in recent weeks, laboratory-confirmed influenza activity has declined.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 11, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

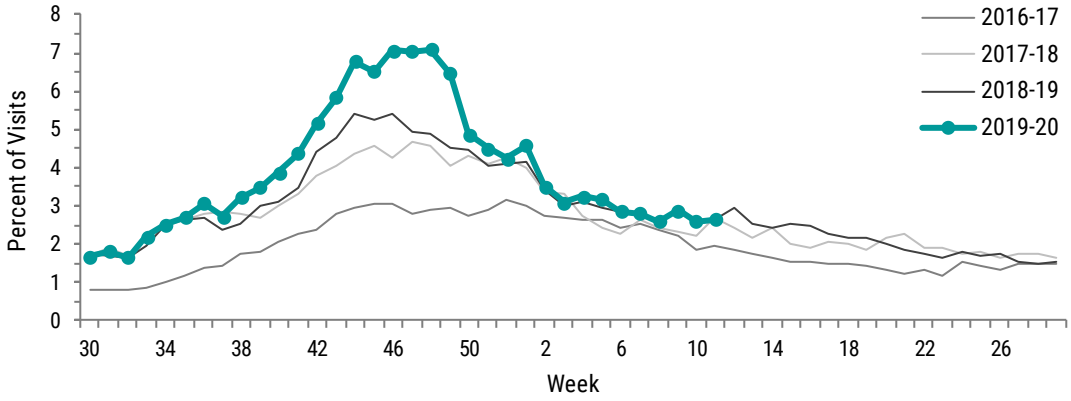
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

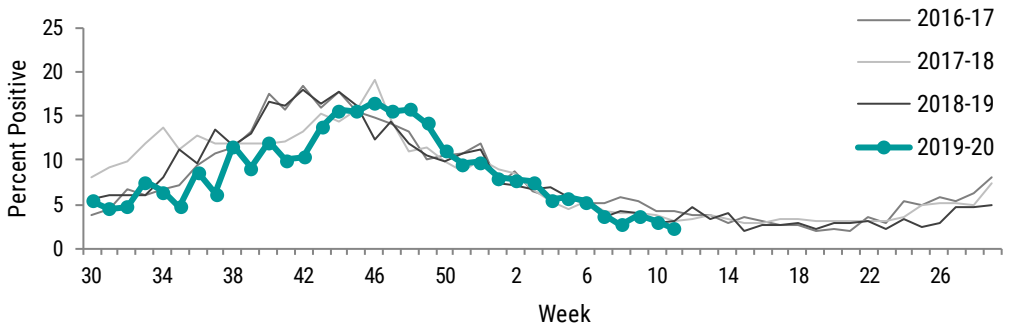
Week 11 (February 23-29, 2020) Activity Summary

In week 11, RSV activity in children <5 years increased and was similar to levels observed at this time in 2019.

One new RSV-associated outbreak was reported in week 11. A total of ten RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 11, **the percent of emergency department and urgent care center visits for RSV among children <5 years increased** and was similar to levels observed at this time in 2019.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 11, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 11, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
No notable outbreaks were reported in week 11, 2020.							

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=370) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 11, 2020 Florida Flu Review
Date:	Wednesday, March 18, 2020 4:23:27 PM
Attachments:	Week 11, 2020 Florida Flu Review.pdf

Good afternoon!

Please find attached the week 11 Florida Flu Review.

Statewide, the percentage of respiratory specimens testing positive for influenza in sentinel laboratories decreased steadily over the last three weeks. Despite this decrease in laboratory-confirmed influenza activity, the percentage of visits for ILI increased notably during those same three weeks.

Recent trends in ILI activity may be a data artifact driven by an increase in the number of people seeking care for respiratory illness in response to concerns about coronavirus disease 2019 (COVID-19). It is also possible that these data represent a true increase in ILI activity statewide. The data displayed in this report are intended to track influenza activity in Florida. For information about COVID-19 in Florida, please visit: FloridaHealth.gov/diseases-and-conditions/COVID-19/.

For questions regarding COVID-19 in Florida please email COVID-19@FLHealth.gov or call 1-866-779-6121.

Eleven outbreaks were reported, up from ten outbreaks in the previous week. Of the eleven outbreaks reported, one was influenza-associated and ten were ILI.

No new influenza-associated pediatric deaths were reported. Twelve influenza-associated pediatric deaths have been reported so far this season; 75% of children were not vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

In addition to getting vaccinated, the Florida Department of Health recommends you take

AMERICAN OVERSIGHT

everyday precautions to prevent the spread of influenza:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Best,

Florida ILI Surveillance System Summary 16

Background

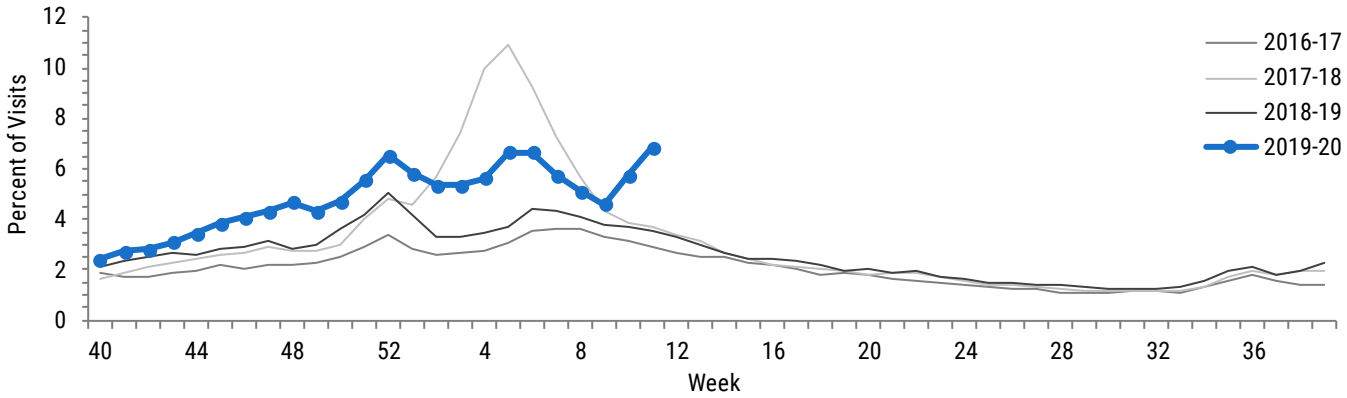
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



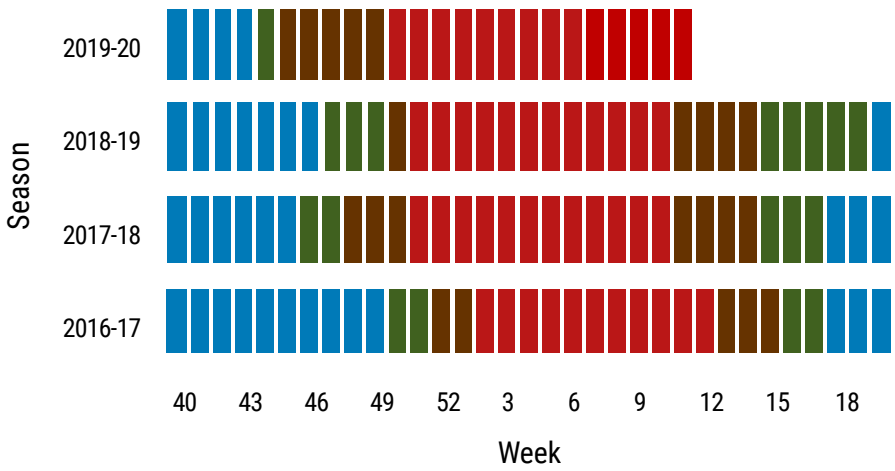
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 11, **the percent of emergency department and urgent care center visits for ILI statewide increased** and was above peak levels observed during the 2016-17 and 2018-19 seasons. While ILI activity has increased in recent weeks, laboratory-confirmed influenza activity has declined.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=370) statewide for the current season (week 40, 2019 to week 11, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 11, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 11, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

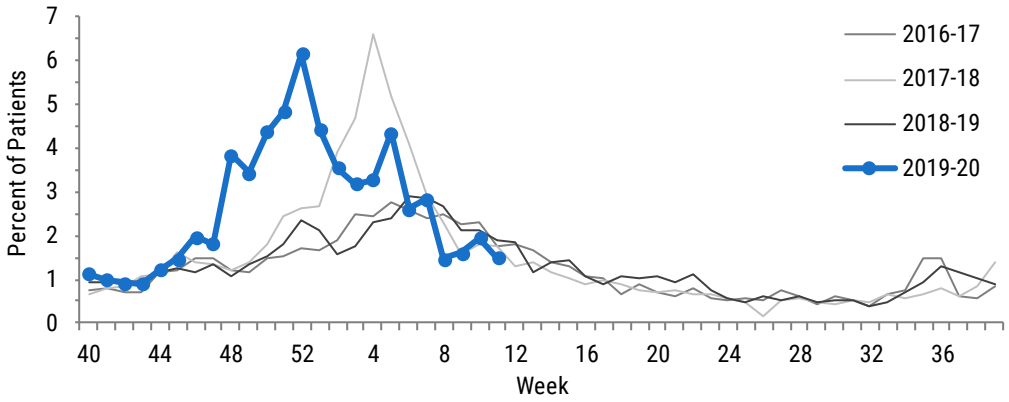
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 11, **the percent of patients with ILI reported by ILINet providers statewide decreased** and was below levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=4), week 40, 2016 to week 11, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



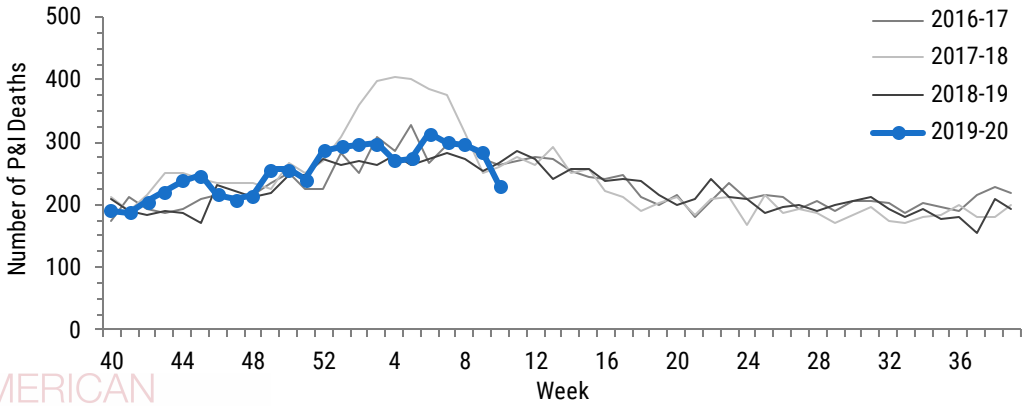


Figure 4: In week 10 (ending 3/7/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 10, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

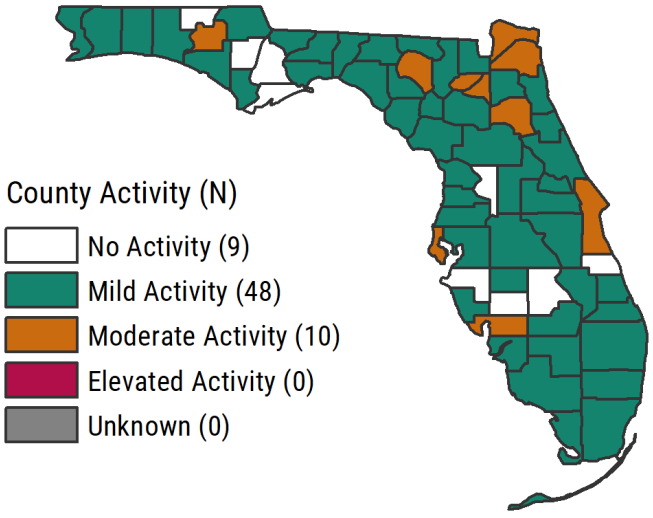
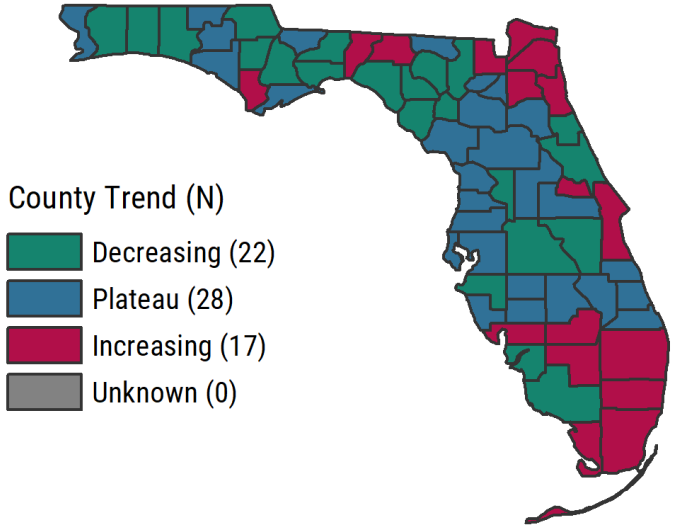
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 11. Ten counties reported **moderate activity,** and no counties reported **elevated activity.**





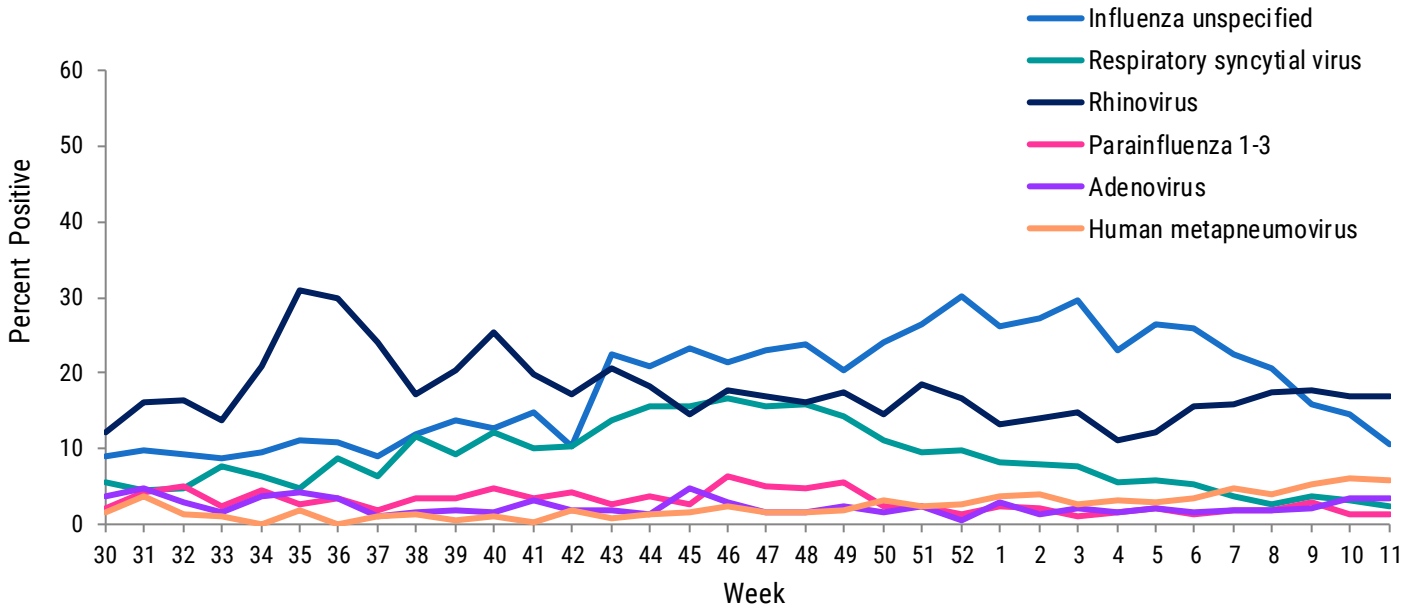


Figure 7: Most counties reported **activity at a plateau** for week 11. Seventeen counties reported **increasing activity,** and 22 counties reported **decreasing activity**.

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: The **percent of specimens testing positive for influenza decreased** in recent weeks. In week 11, the **percent of specimens testing positive for rhinovirus** was higher than other respiratory viruses under surveillance.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=8), week 40, 2019 to week 11, 2020.

AMERICAN OVERSIGHT

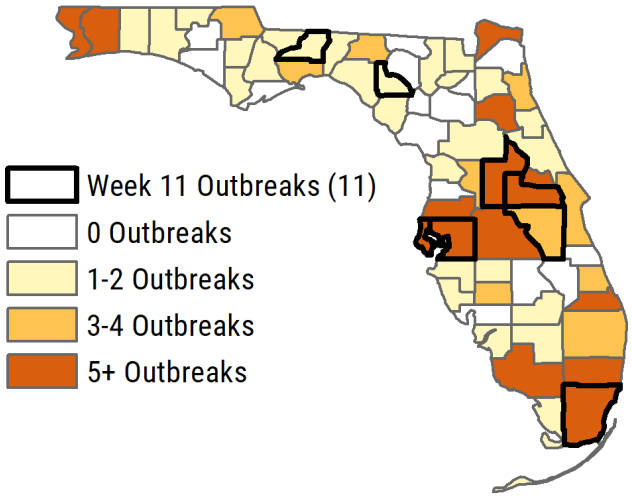
Influenza and ILI Outbreaks

Week 11 Outbreaks at a Glance:

Number Reported:
11 Outbreaks

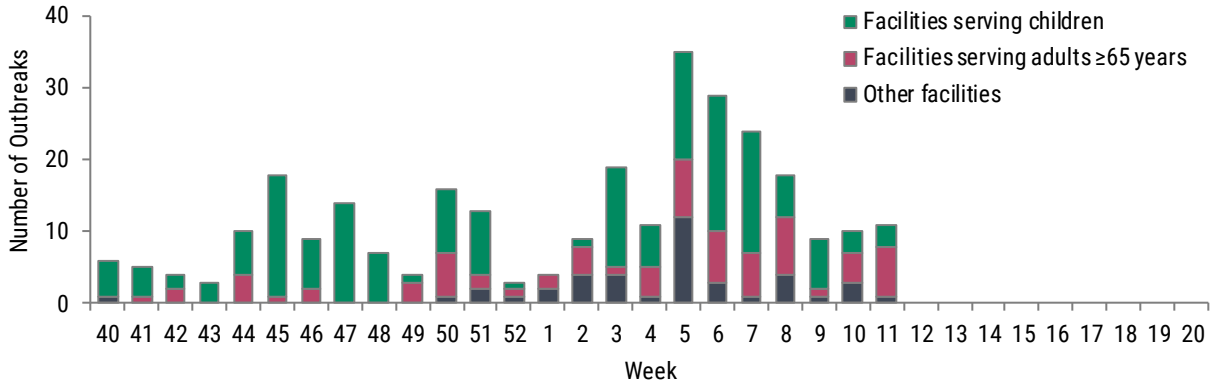
Influenza-Associated:
4 Outbreaks



Severe Outcomes*:
1 Outbreak

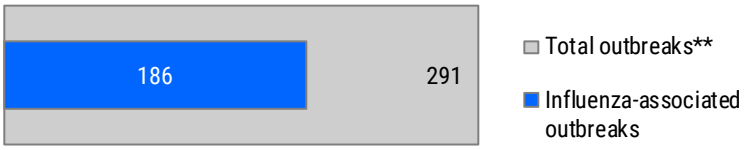
Outbreak Summary:

In week 11, four influenza-associated and seven ILI outbreaks were reported, a slight increase from the previous week.



Severe outcomes* were reported in one of eleven outbreaks. One hospitalization and no deaths were reported in this outbreak.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities).



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 11 are **outlined in bold.**

Figure 9: In week 11, **seven outbreaks** were reported among **facilities serving adults aged ≥65 years, three outbreaks** were reported in **facilities serving children,** and **one outbreak** was reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 11, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 11, **63.9% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 11, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

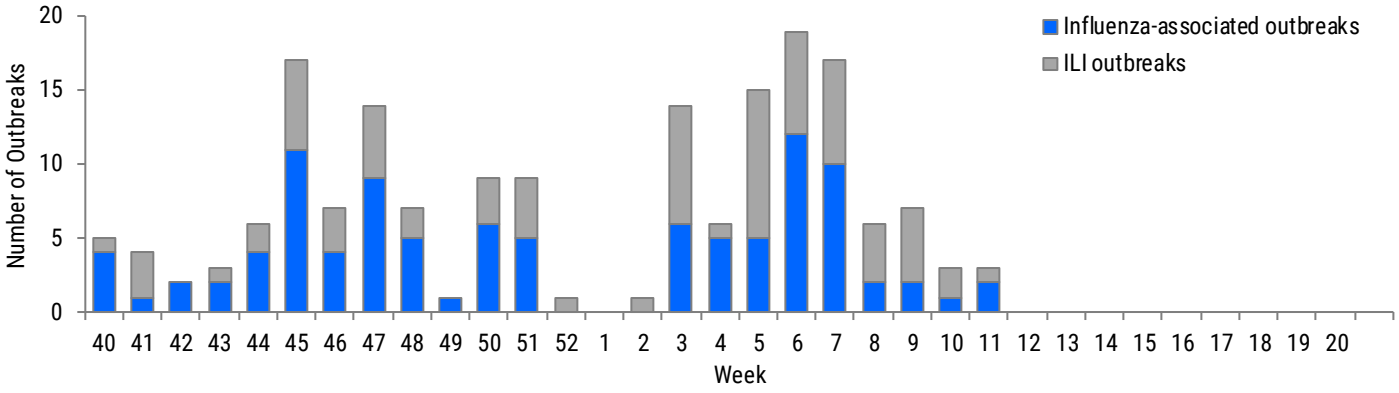
Influenza and ILI Outbreaks

Facilities Serving Children*:



3 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

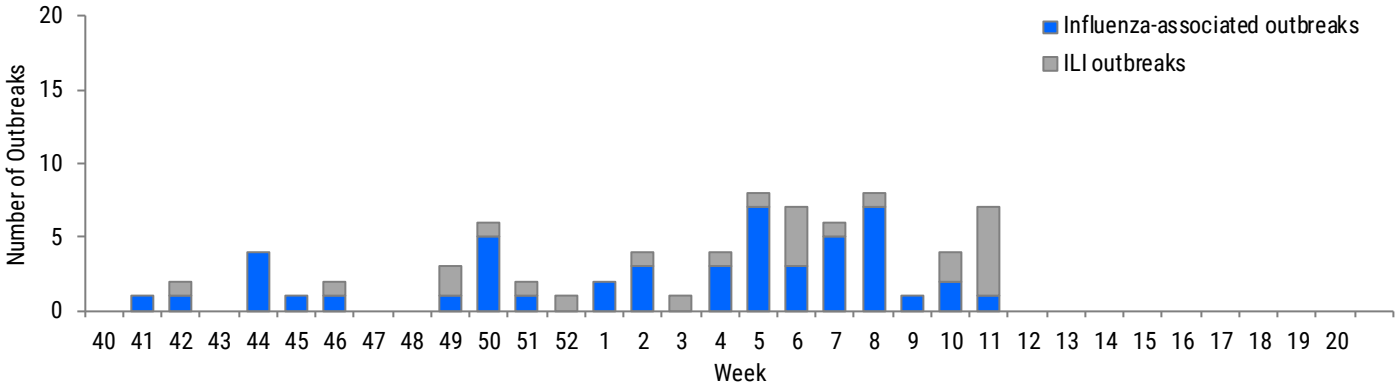
In week 11, three new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 11, **two influenza-associated outbreaks** and **one ILI outbreak** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 11, 2020.

Facilities Serving Adults ≥65 yrs.**:



7 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 11, seven new outbreaks of influenza or ILI were reported among facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 11, **six ILI outbreaks** and **one influenza-associated outbreak** were reported among **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 11, 2020.

AMERICAN OVERSIGHT

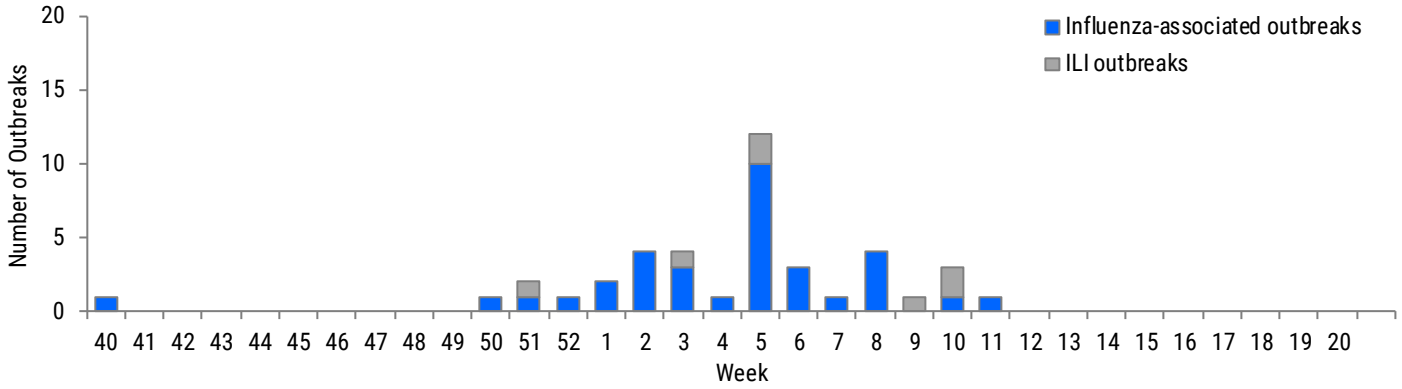
Influenza and ILI Outbreaks

Other Facilities*:



1 Outbreak

Summary of Outbreaks in Other Facilities:

In week 11, one new outbreak of influenza or ILI was reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 11, **one influenza-associated outbreak** was reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 11, 2020.

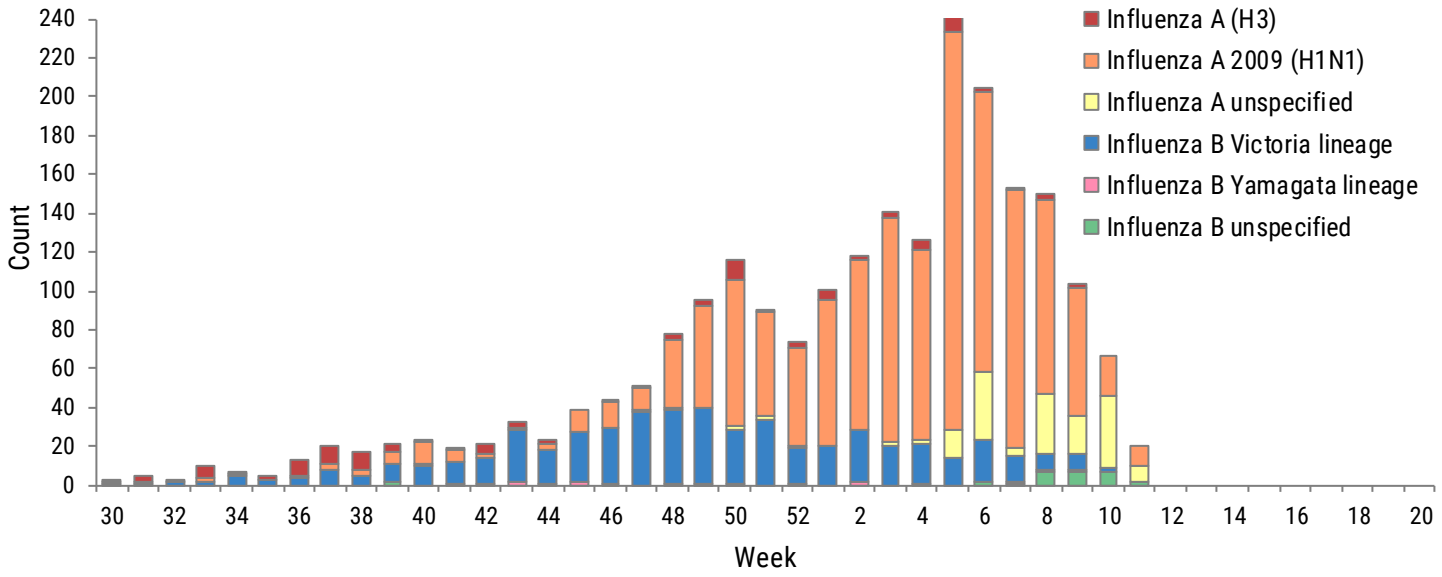


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	136 (46.7%)	83 influenza-associated outbreaks 53 ILI outbreaks
Child daycares	40 (13.8%)	17 influenza-associated outbreaks 23 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	23 (7.9%)	10 influenza-associated outbreaks 13 ILI outbreaks
Nursing facilities	18 (6.2%)	14 influenza-associated outbreaks 4 ILI outbreaks
Other long-term care facilities	33 (11.3%)	26 influenza-associated outbreaks 7 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	33 (11.3%)	31 influenza-associated outbreaks 2 ILI outbreaks
Hospitals	3 (1.1%)	2 influenza-associated outbreaks 1 ILI outbreak
Additional facility types	5 (1.7%)	3 influenza-associated outbreaks 2 ILI outbreaks
Total	**291 (100.0%)**	**186 influenza-associated outbreaks** **105 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 11, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 11, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=370) from week 40, 2016 to week 11, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity increased** during week 11 and was above peak activity observed during the 2016-17 season.*

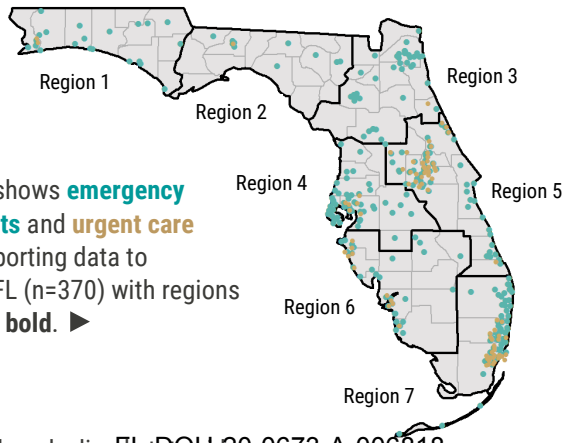

Figure 23 shows **emergency departments** and **urgent care centers** reporting data to ESSENCE-FL (n=370) with regions **outlined in bold**. ▶

*While ILI activity has increased in recent weeks, laboratory-confirmed influenza activity has declined statewide.

AMERICAN OVERSIGHT

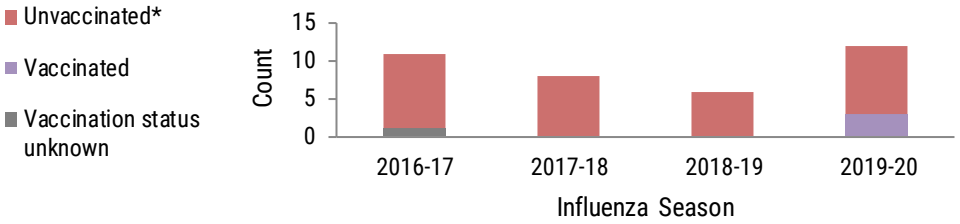
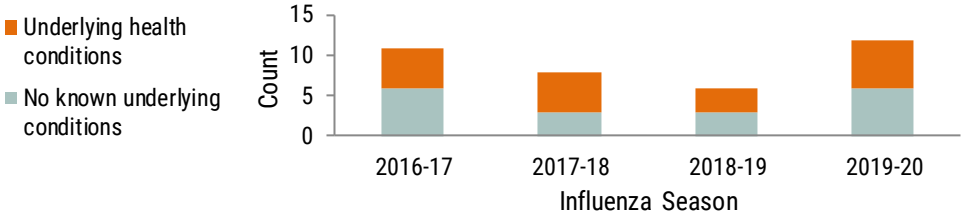
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 11, **the percent of emergency department and urgent care center visits for ILI in children <18 years increased** and was above peak levels observed during the 2016-17 season. While ILI activity has increased in recent weeks, laboratory-confirmed influenza activity has declined.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 11, 2020.

Figures 25-26: In week 11, **no new influenza-associated pediatric deaths were reported**. A total of 12 influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 11, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 11, 2020.

In week 11, **no new influenza-associated pediatric deaths were reported**.

A total of 12 influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in March or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm.

AMERICAN OVERSIGHT

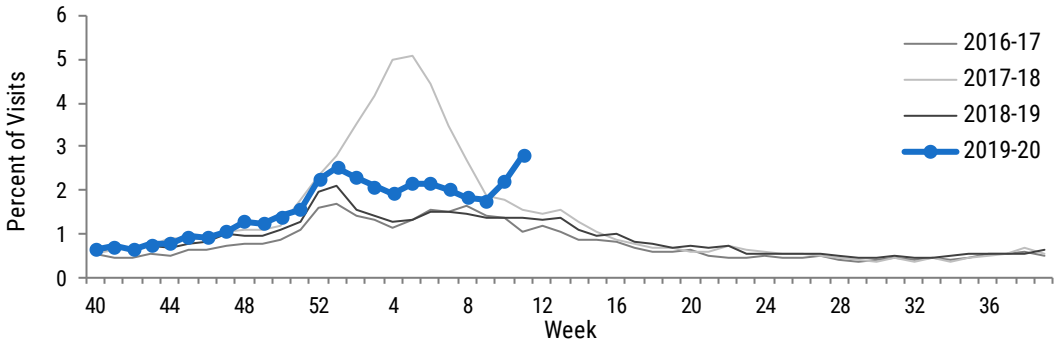
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 11, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was within levels observed at this time during previous seasons.



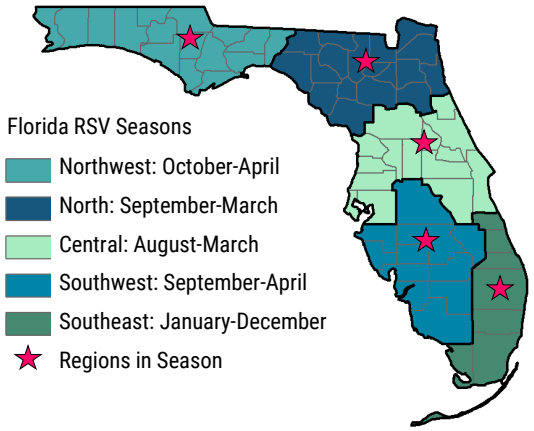
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 11, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 11, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years increased** and was above peak levels during the 2016-17 and 2018-19 seasons. While ILI activity has increased in recent weeks, laboratory-confirmed influenza activity has declined.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 11, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

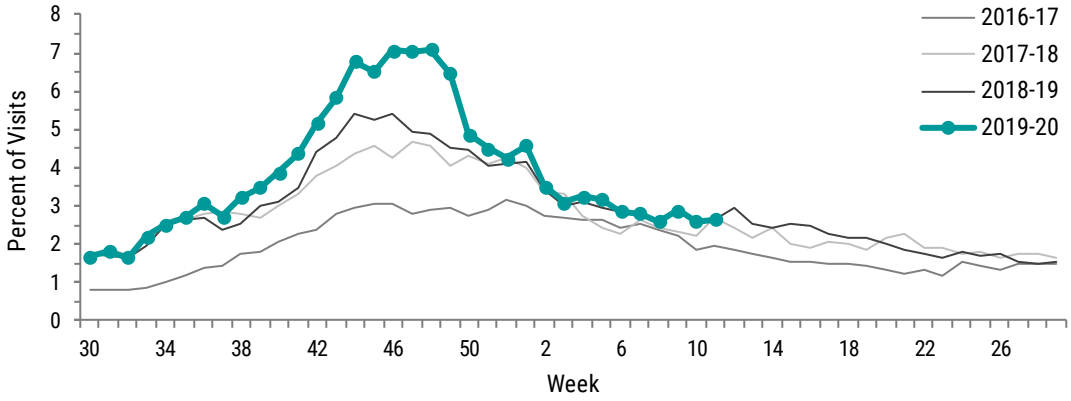
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

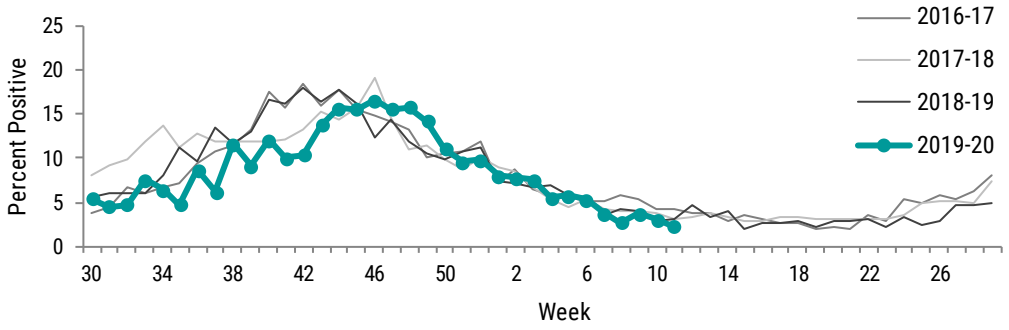
Week 11 (February 23-29, 2020) Activity Summary

In week 11, RSV activity in children <5 years increased and was similar to levels observed at this time in 2019.

One new RSV-associated outbreak was reported in week 11. A total of ten RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 11, **the percent of emergency department and urgent care center visits for RSV among children <5 years increased** and was similar to levels observed at this time in 2019.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 11, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 11, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
No notable outbreaks were reported in week 11, 2020.							

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=370) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 11, 2020 Florida Flu Review
Date:	Wednesday, March 18, 2020 4:23:20 PM
Attachments:	Week 11, 2020 Florida Flu Review.pdf

Good afternoon!

Please find attached the week 11 Florida Flu Review.

Statewide, the percentage of respiratory specimens testing positive for influenza in sentinel laboratories decreased steadily over the last three weeks. Despite this decrease in laboratory-confirmed influenza activity, the percentage of visits for ILI increased notably during those same three weeks.

Recent trends in ILI activity may be a data artifact driven by an increase in the number of people seeking care for respiratory illness in response to concerns about coronavirus disease 2019 (COVID-19). It is also possible that these data represent a true increase in ILI activity statewide. The data displayed in this report are intended to track influenza activity in Florida. For information about COVID-19 in Florida, please visit: FloridaHealth.gov/diseases-and-conditions/COVID-19/.

For questions regarding COVID-19 in Florida please email COVID-19@FLHealth.gov or call 1-866-779-6121.

Eleven outbreaks were reported, up from ten outbreaks in the previous week. Of the eleven outbreaks reported, one was influenza-associated and ten were ILI.

No new influenza-associated pediatric deaths were reported. Twelve influenza-associated pediatric deaths have been reported so far this season; 75% of children were not vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

In addition to getting vaccinated, the Florida Department of Health recommends you take

AMERICAN OVERSIGHT

everyday precautions to prevent the spread of influenza:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Best,

Florida ILI Surveillance System Summary 16

Background

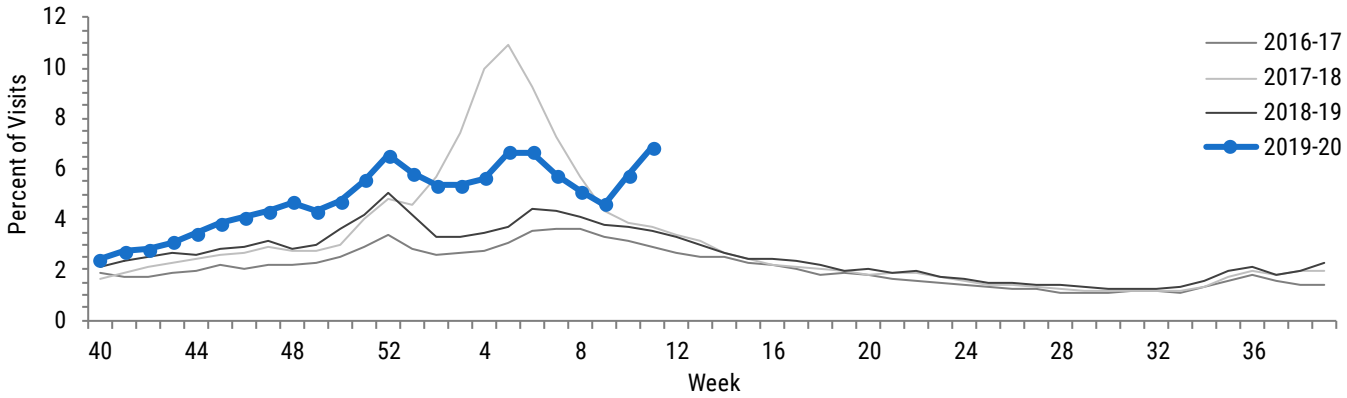
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



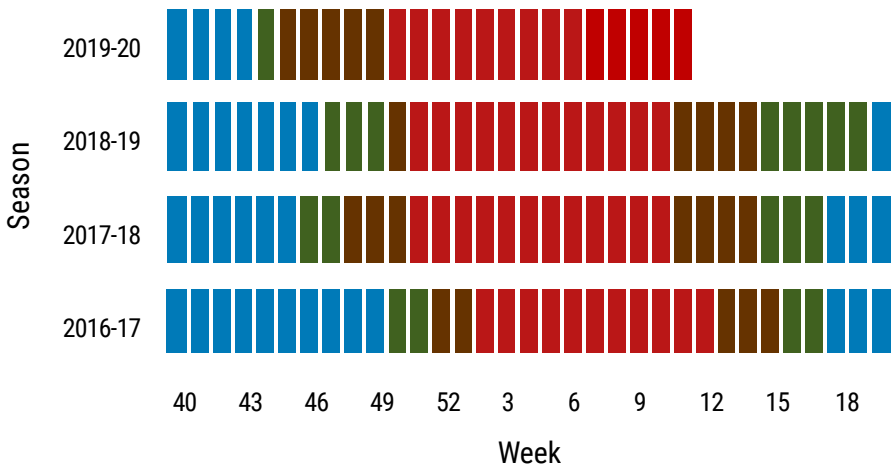
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 11, **the percent of emergency department and urgent care center visits for ILI statewide increased** and was above peak levels observed during the 2016-17 and 2018-19 seasons. While ILI activity has increased in recent weeks, laboratory-confirmed influenza activity has declined.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=370) statewide for the current season (week 40, 2019 to week 11, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 11, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 11, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

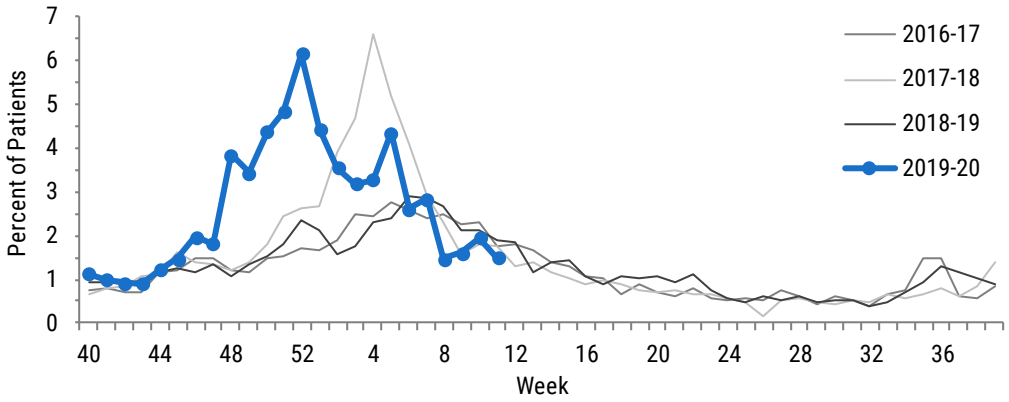
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 11, **the percent of patients with ILI reported by ILINet providers statewide decreased** and was below levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=4), week 40, 2016 to week 11, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



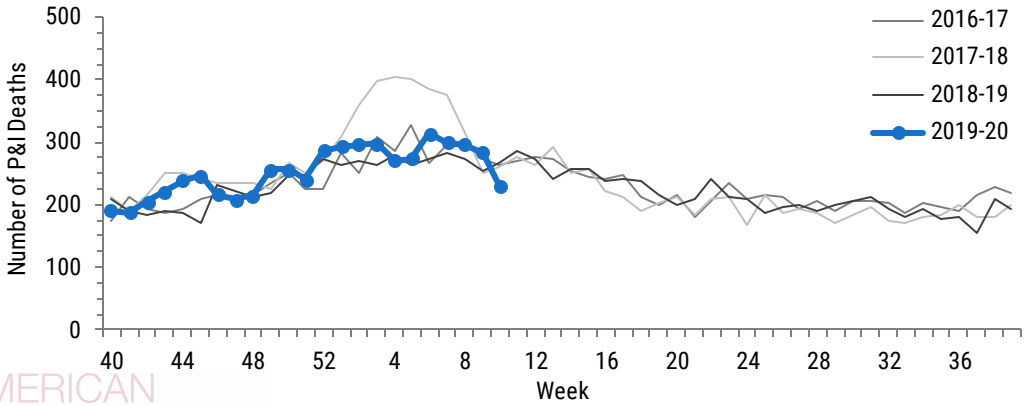


Figure 4: In week 10 (ending 3/7/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 10, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

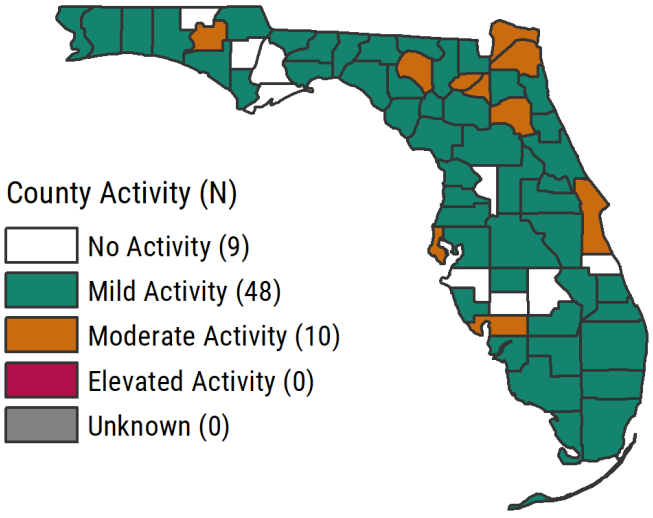
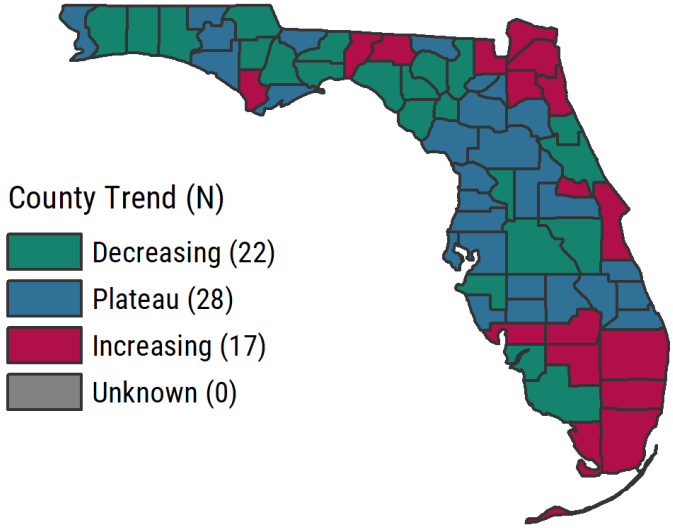
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 11. Ten counties reported **moderate activity,** and no counties reported **elevated activity.**





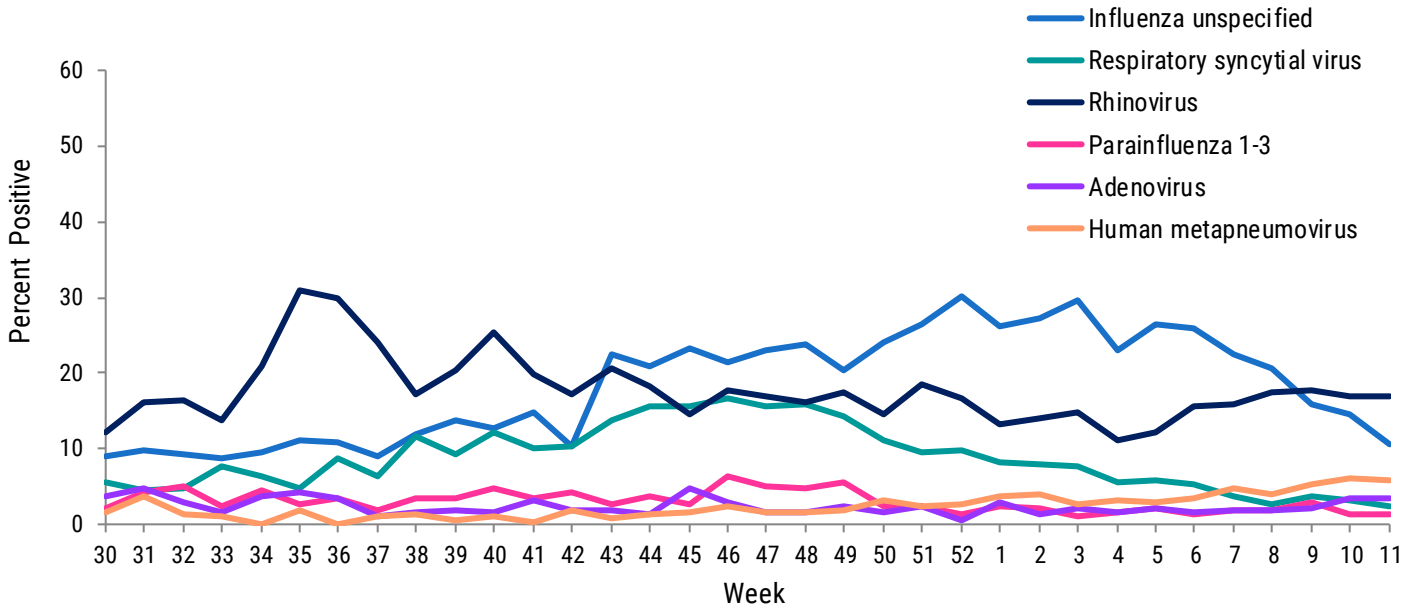


Figure 7: Most counties reported **activity at a plateau** for week 11. Seventeen counties reported **increasing activity,** and 22 counties reported **decreasing activity**.

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: The **percent of specimens testing positive for influenza decreased** in recent weeks. In week 11, the **percent of specimens testing positive for rhinovirus** was higher than other respiratory viruses under surveillance.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=8), week 40, 2019 to week 11, 2020.

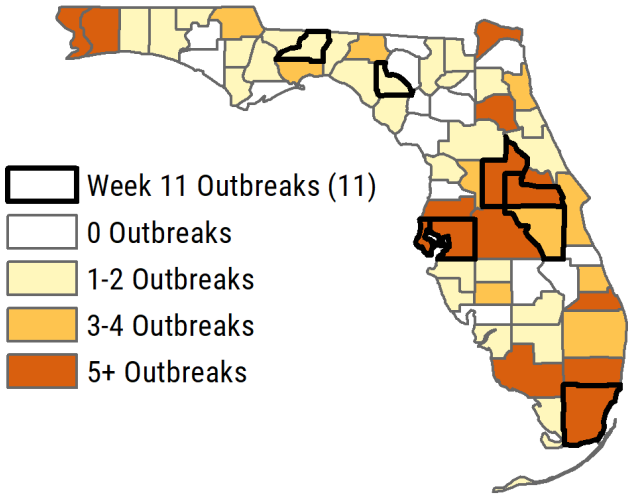
Influenza and ILI Outbreaks

Week 11 Outbreaks at a Glance:

Number Reported:
11 Outbreaks

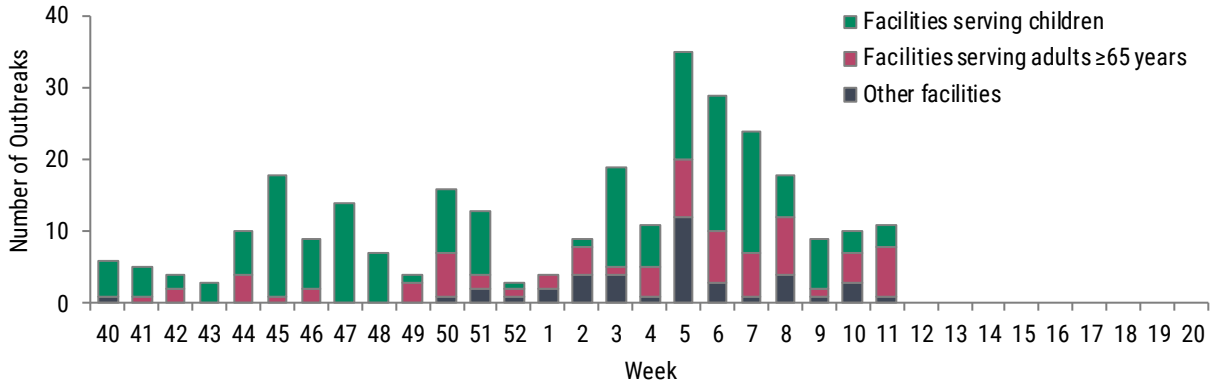
Influenza-Associated:
4 Outbreaks



Severe Outcomes*:
1 Outbreak

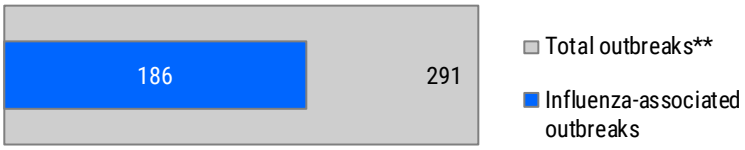
Outbreak Summary:

In week 11, four influenza-associated and seven ILI outbreaks were reported, a slight increase from the previous week.



Severe outcomes* were reported in one of eleven outbreaks. One hospitalization and no deaths were reported in this outbreak.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities).



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 11 are **outlined in bold.**

Figure 9: In week 11, **seven outbreaks** were reported among **facilities serving adults aged ≥65 years, three outbreaks** were reported in **facilities serving children,** and **one outbreak** was reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 11, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 11, **63.9% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 11, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

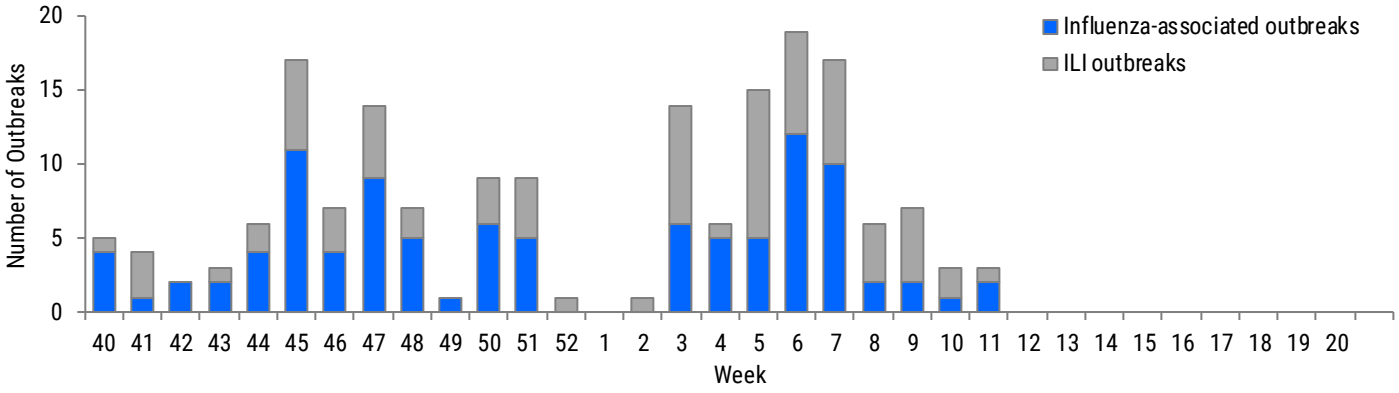
Influenza and ILI Outbreaks

Facilities Serving Children*:



3 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

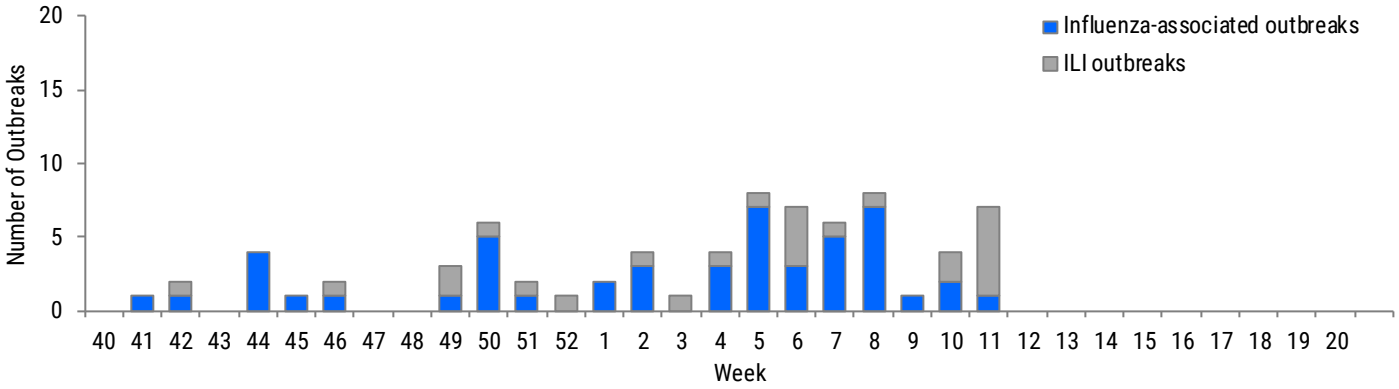
In week 11, three new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 11, **two influenza-associated outbreaks** and **one ILI outbreak** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 11, 2020.

Facilities Serving Adults ≥65 yrs.**:



7 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 11, seven new outbreaks of influenza or ILI were reported among facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 11, **six ILI outbreaks** and **one influenza-associated outbreak** were reported among **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 11, 2020.

AMERICAN OVERSIGHT

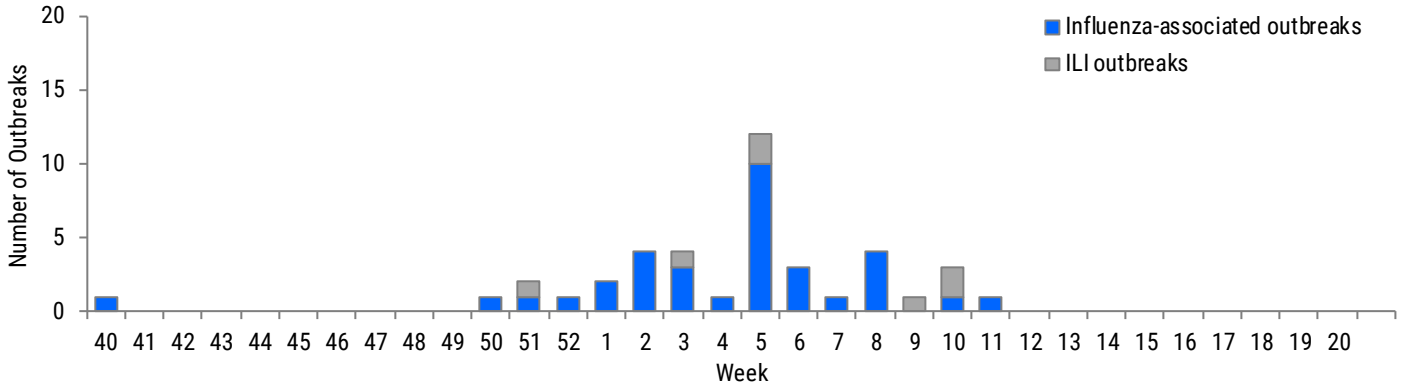
Influenza and ILI Outbreaks

Other Facilities*:



1 Outbreak

Summary of Outbreaks in Other Facilities:

In week 11, one new outbreak of influenza or ILI was reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 11, **one influenza-associated outbreak** was reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 11, 2020.

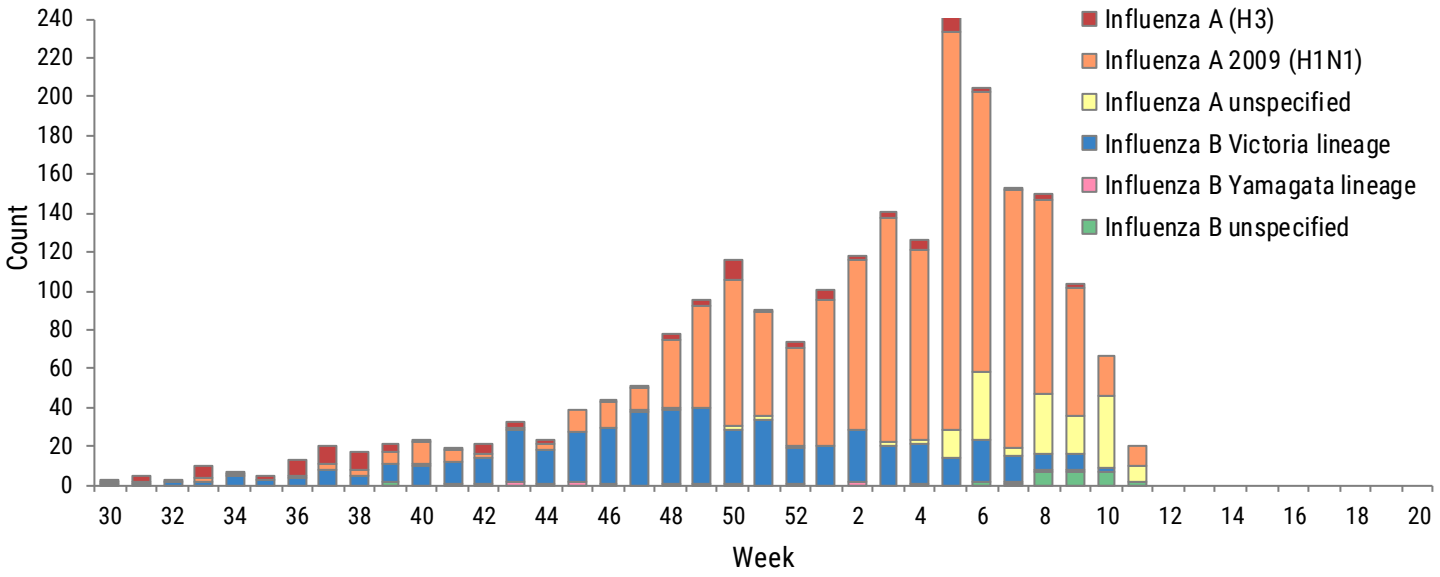


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	136 (46.7%)	83 influenza-associated outbreaks 53 ILI outbreaks
Child daycares	40 (13.8%)	17 influenza-associated outbreaks 23 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	23 (7.9%)	10 influenza-associated outbreaks 13 ILI outbreaks
Nursing facilities	18 (6.2%)	14 influenza-associated outbreaks 4 ILI outbreaks
Other long-term care facilities	33 (11.3%)	26 influenza-associated outbreaks 7 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	33 (11.3%)	31 influenza-associated outbreaks 2 ILI outbreaks
Hospitals	3 (1.1%)	2 influenza-associated outbreaks 1 ILI outbreak
Additional facility types	5 (1.7%)	3 influenza-associated outbreaks 2 ILI outbreaks
Total	**291 (100.0%)**	**186 influenza-associated outbreaks** **105 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 11, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 11, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=370) from week 40, 2016 to week 11, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity increased** during week 11 and was above peak activity observed during the 2016-17 season.*

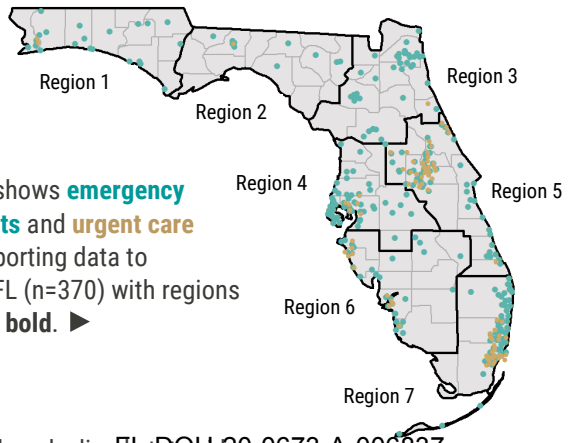

Figure 23 shows **emergency departments** and **urgent care centers** reporting data to ESSENCE-FL (n=370) with regions **outlined in bold**. ▶

*While ILI activity has increased in recent weeks, laboratory-confirmed influenza activity has declined statewide.

AMERICAN OVERSIGHT

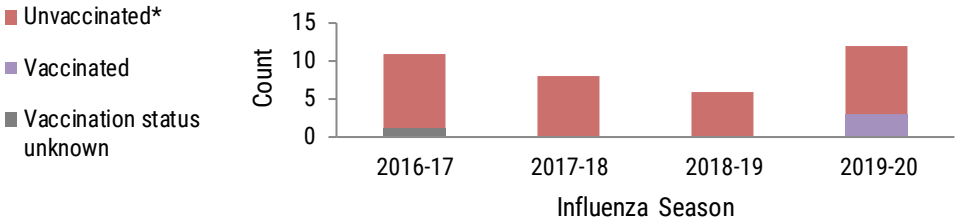
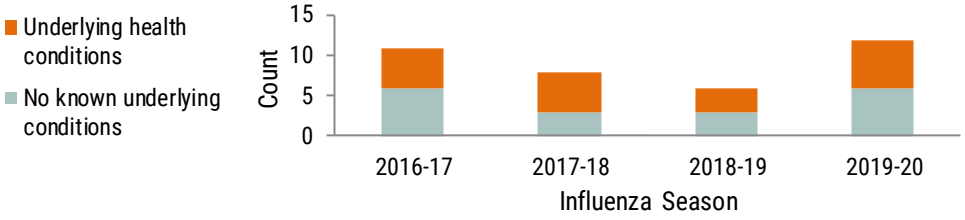
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 11, **the percent of emergency department and urgent care center visits for ILI in children <18 years increased** and was above peak levels observed during the 2016-17 season. While ILI activity has increased in recent weeks, laboratory-confirmed influenza activity has declined.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 11, 2020.

Figures 25-26: In week 11, **no new influenza-associated pediatric deaths were reported**. A total of 12 influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 11, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 11, 2020.

In week 11, **no new influenza-associated pediatric deaths were reported**.

A total of 12 influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in March or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm

AMERICAN OVERSIGHT

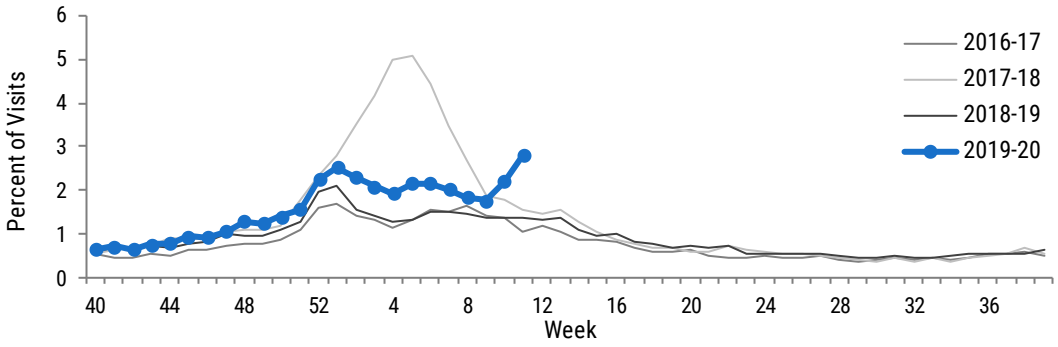
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 11, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was within levels observed at this time during previous seasons.



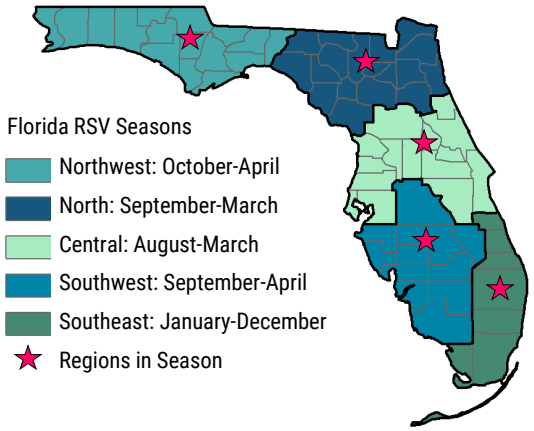
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 11, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 11, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years increased** and was above peak levels during the 2016-17 and 2018-19 seasons. While ILI activity has increased in recent weeks, laboratory-confirmed influenza activity has declined.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 11, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

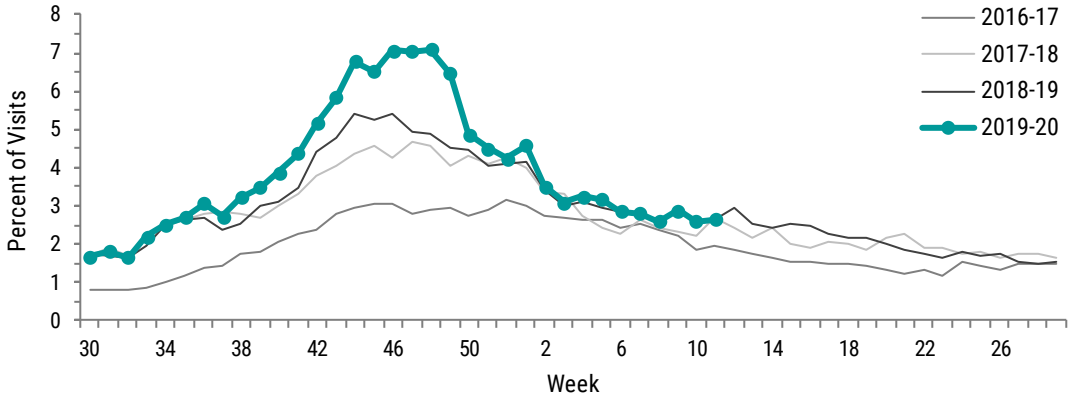
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

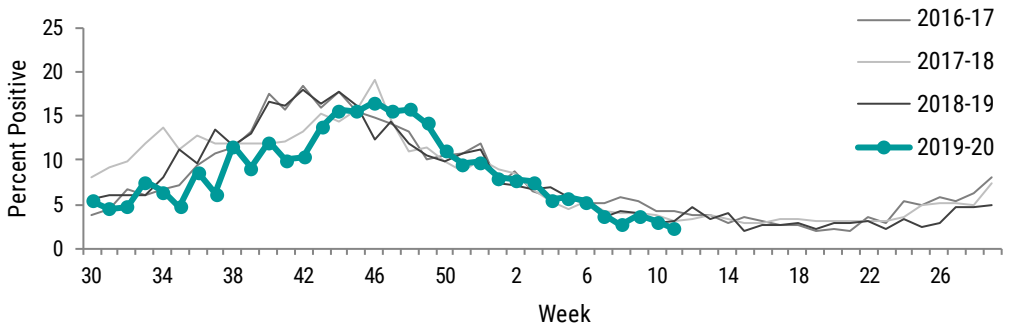
Week 11 (February 23-29, 2020) Activity Summary

In week 11, RSV activity in children <5 years increased and was similar to levels observed at this time in 2019.

One new RSV-associated outbreak was reported in week 11. A total of ten RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 11, **the percent of emergency department and urgent care center visits for RSV among children <5 years increased** and was similar to levels observed at this time in 2019.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 11, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

AMERICAN OVERSIGHT

RSV Surveillance

Figure 31: In week 11, **the percent of specimens testing positive for RSV decreased.** Levels were slightly below those observed at this time in previous seasons.

RSV-Associated Outbreaks in Week 11:

1 Outbreak

Summary of RSV-Associated Outbreaks:

In week 11, one new RSV-associated outbreak was reported. Since week 30, 2019, ten RSV-associated outbreaks have been reported.

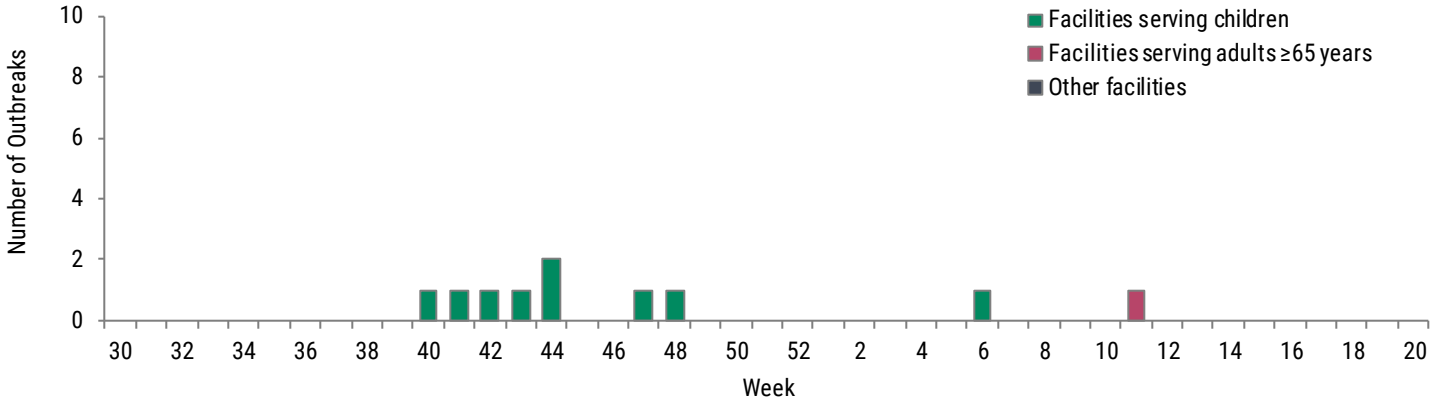

Figure 32: In week 11, one new RSV-associated outbreak was reported. Since week 30, outbreaks have been reported in Florida's southeast, central, and northwest regions.

◀ **Figure 32** shows **a summary of RSV-associated outbreaks by region*** as reported by county health departments in Merlin, week 30, 2019 to week 11, 2020.

*Regions defined in figure 29.

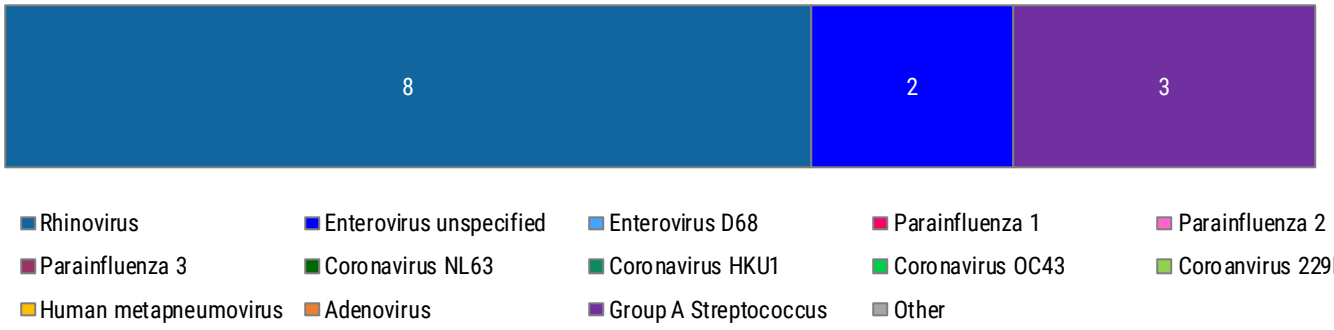

Figure 33: In week 11, one new RSV-associated outbreak was reported. This outbreak was reported in a **facility serving adults aged ≥65 years**. The majority of outbreaks reported since week 30 have been reported in **facilities serving children.**

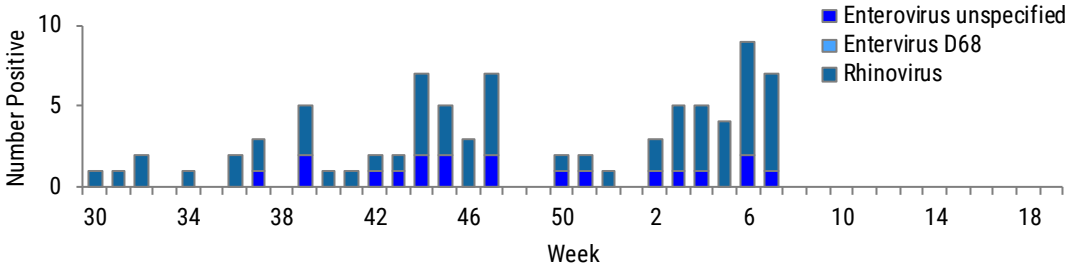

▲ **Figure 33** shows **the number of RSV-associated outbreaks by setting and week** as reported by county health departments in Merlin, week 30, 2019 to week 11, 2020.

AMERICAN OVERSIGHT

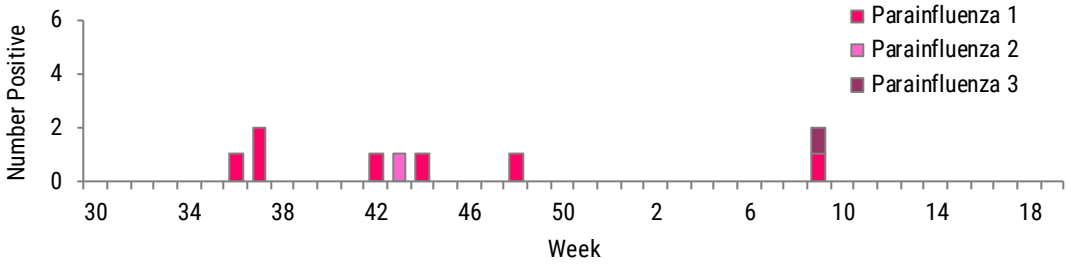
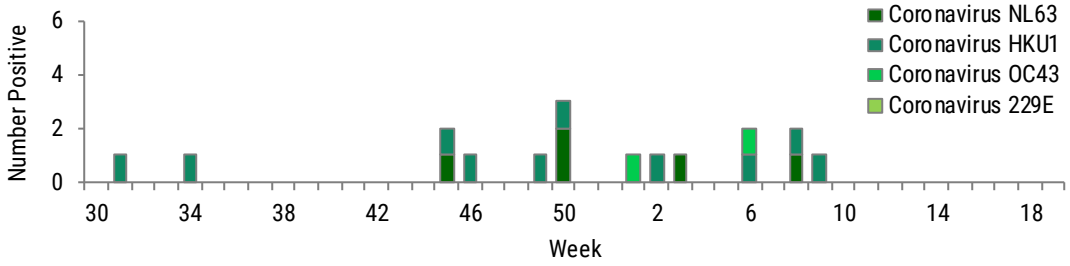
Other Respiratory Virus Surveillance





▲ **Figure 34** shows **the number of unique times a pathogen was associated with a respiratory outbreak** for outbreaks reported from week 30, 2019 to week 11, 2020.

◀ **Figure 35*** shows **the number of PCR-positive laboratory findings for enterovirus unspecified, enterovirus D68, and rhinovirus** by week** among specimens submitted to the Bureau of Public Health Laboratories (BPHL) for extended respiratory panel testing.

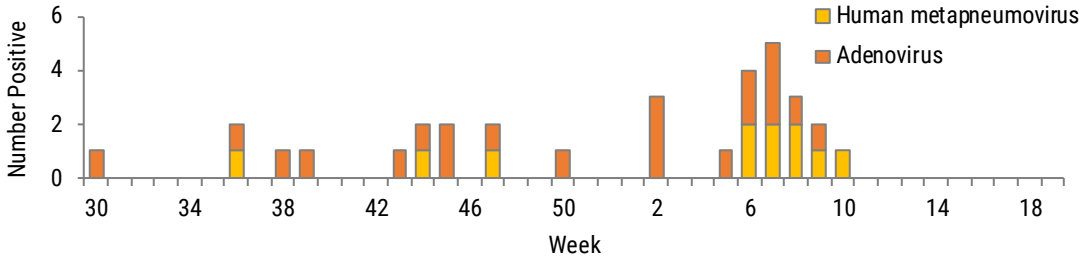


Figure 36* shows **the ▶ number of PCR-positive laboratory findings for parainfluenza 1-3** by week** among specimens submitted to BPHL for extended respiratory panel testing.

◀ **Figure 37*** shows **the number of PCR-positive laboratory findings for seasonal coronaviruses NL63, HKU1, OC43, and 229E** by week** among specimens submitted to BPHL for extended respiratory panel testing.

Figure 38* shows **the ▶ number of PCR-positive laboratory findings for human metapneumovirus and adenovirus** by week** among specimens submitted to BPHL for extended respiratory panel testing.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 11, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
No notable outbreaks were reported in week 11, 2020.							

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=370) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words “influenza” or “flu” in patient chief complaints. Chief complaints with the words “fever” and “cough,” or “fever” and “sore throat” are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida’s geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county’s influenza and ILI surveillance data weekly into The Florida Department of Health’s EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida’s reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 12, 2020 Florida Flu Review
Date:	Wednesday, March 25, 2020 3:52:43 PM
Attachments:	Week 12, 2020 Florida Flu Review.pdf

Good Afternoon!

Attached is the Week 12, 2020 Florida Flu Review.

Week 12 influenza & influenza-like illness (ILI) activity summary:

Statewide, the percentage of respiratory specimens testing positive for influenza continued to decrease.

Likewise, the percent of emergency department and urgent care center visits with discharge diagnoses that include influenza or flu decreased in recent weeks. Activity in week 12 was similar to an average of the past three influenza seasons for this time.

Of note, some of the figures in this report that previously displayed chief complaints of ILI were updated to display discharge diagnoses of influenza or flu to better reflect influenza activity trends in Florida.

Eight outbreaks were reported, down from eleven outbreaks in the previous week. Of the eight outbreaks reported, two were influenza-associated and six were ILI.

One new influenza-associated pediatric death was reported. Thirteen influenza-associated pediatric deaths have been reported so far this season; the majority these deaths were children who were not vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend vaccination as long as influenza viruses are circulating. Annual vaccination is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).

AMERICAN OVERSIGHT

- Avoid touching your eyes, nose, and mouth.
- If you do get sick with influenza, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Thank you!

Julia Munroe, MS
Respiratory Disease Epidemiologist
Bureau of Epidemiology
Division of Disease Control and Health Protection
Florida Department of Health
Office Phone: 850-901-6936

Mission: To protect, promote, and improve the health of all people in Florida through integrated state, county, and community efforts.

Please note: Florida has a very broad public records law. Most written communications to or from state officials regarding state business are public records available to the public and media upon request. Your email communications may therefore be subject to public disclosure.

Florida ILI Surveillance System Summary 16

Background

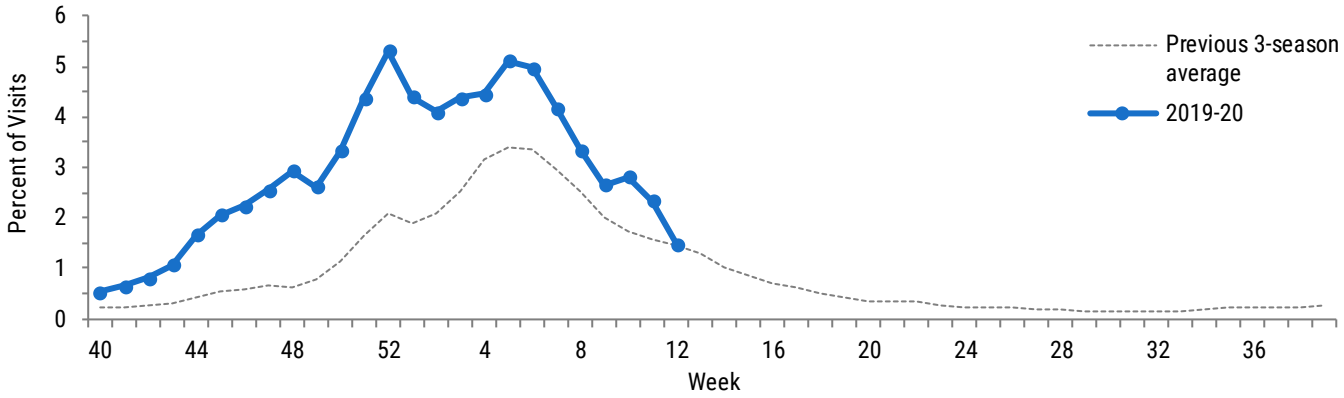
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



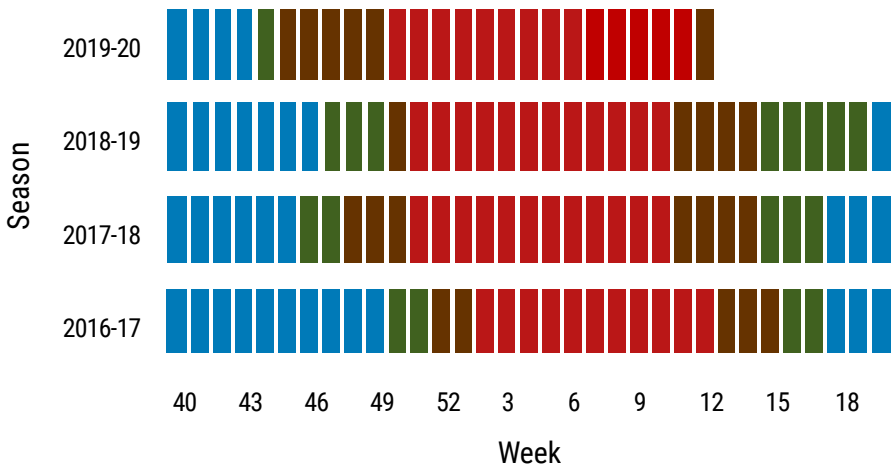
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 12, **the percent of emergency department and urgent care center visits with a discharge diagnosis of influenza or flu statewide decreased** and was similar to the previous three-season average for this time. Of note, the query used to capture these data now utilizes discharge diagnoses rather than chief complaints to better capture influenza activity trends in Florida.



▲ **Figure 1** shows **the percent of visits with discharge diagnoses that include influenza or flu** (with certain exceptions) for facilities participating in ESSENCE-FL (n=370) statewide for the current season (week 40, 2019 to week 12, 2020) and the previous three season average (2018-19, 2017-18, and 2016-17). Of note, influenza may not be laboratory-confirmed for all the visits included in this query. For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 12, Florida reported **regional geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 12, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

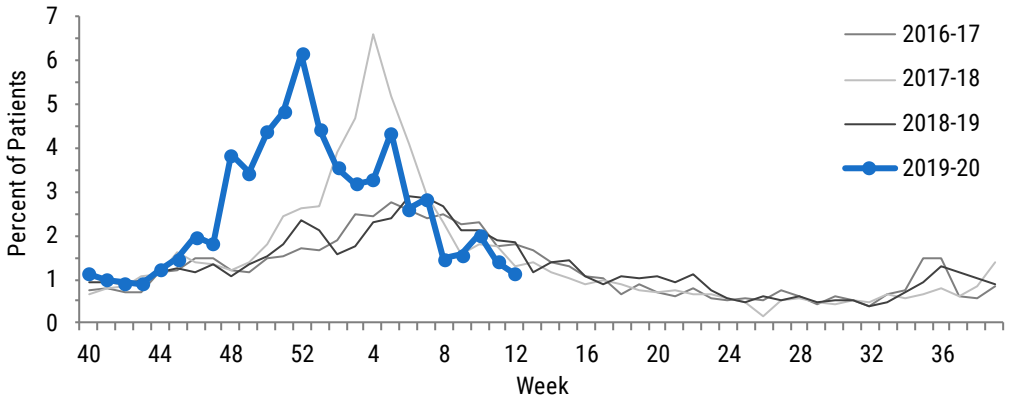
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 12, **the percent of patients with ILI reported by ILINet providers statewide decreased** and was below levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=7), week 40, 2016 to week 12, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



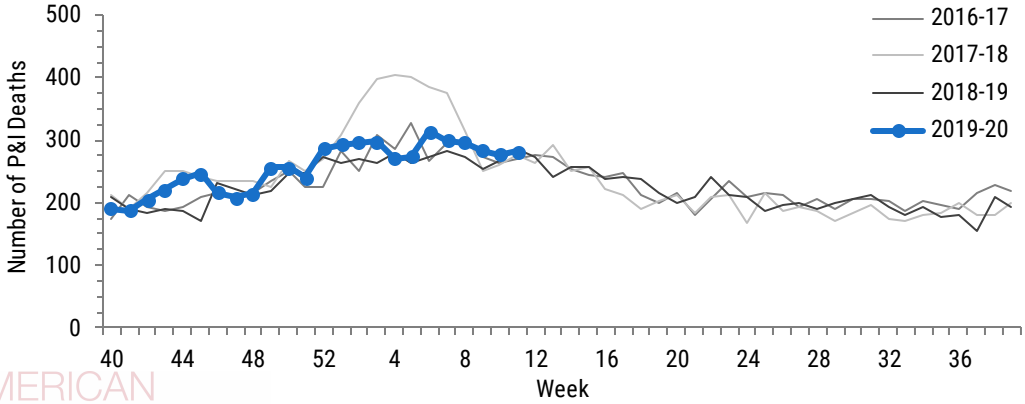


Figure 4: In week 11 (ending 3/14/20), **the number of pneumonia and influenza deaths identified statewide increased slightly** and was similar to levels observed at this time in previous seasons.

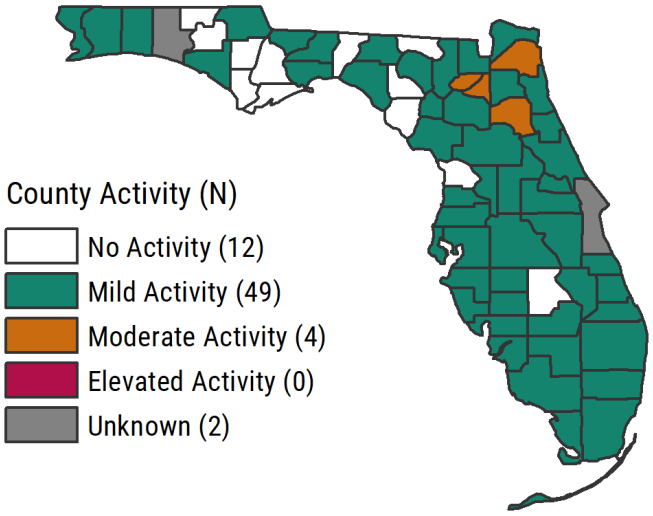
◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 11, 2020.

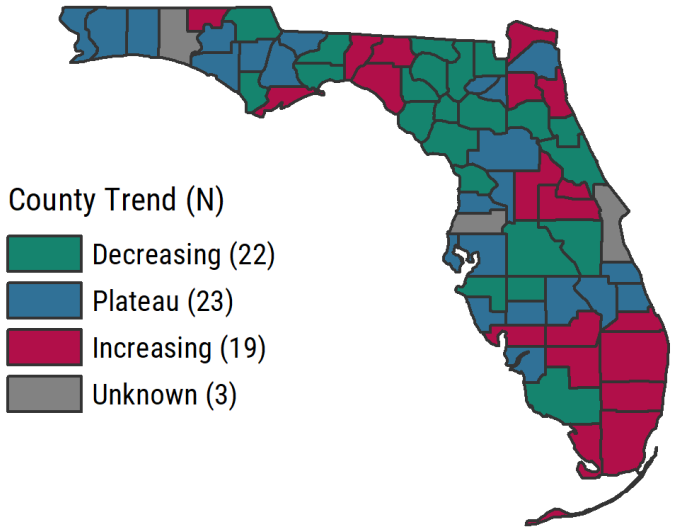
*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 12. Four counties reported **moderate activity,** and no counties reported **elevated activity.**





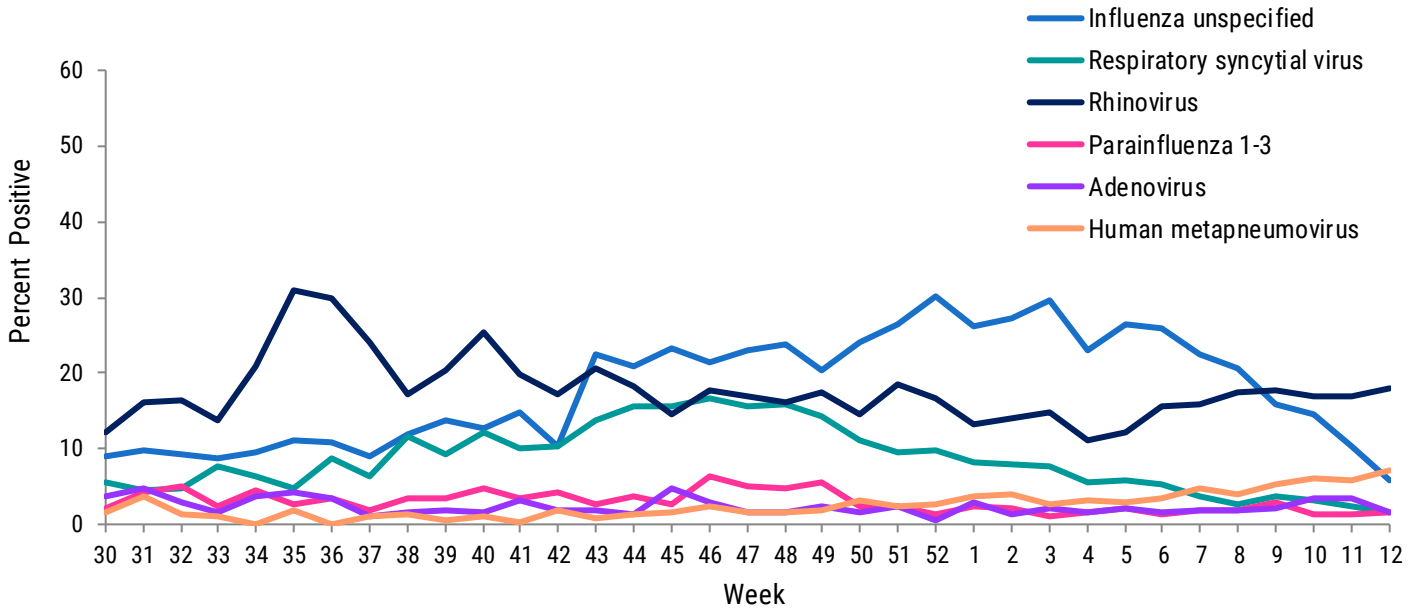


Figure 6: Most counties reported **activity at a plateau** for week 12. Nineteen counties reported **increasing activity,** and 22 counties reported **decreasing activity**.

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 12, the **percent of specimens testing positive for rhinovirus increased** and was higher than other respiratory viruses under surveillance (including influenza). The **percent of specimens testing positive for influenza decreased notably** in recent weeks.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=8), week 40, 2019 to week 12, 2020.

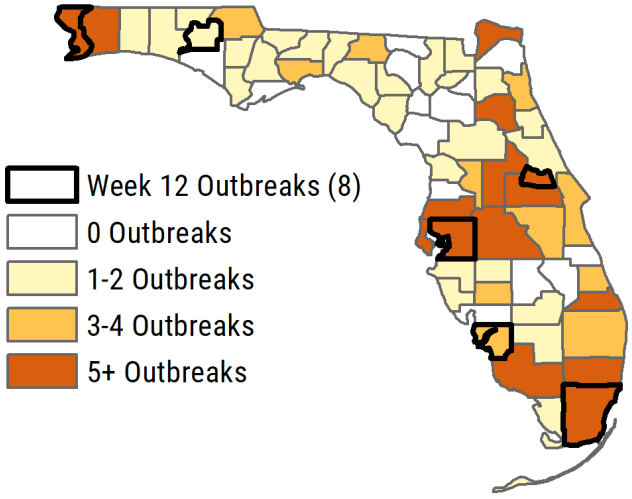
AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

Week 12 Outbreaks at a Glance:

Number Reported:
8 Outbreaks

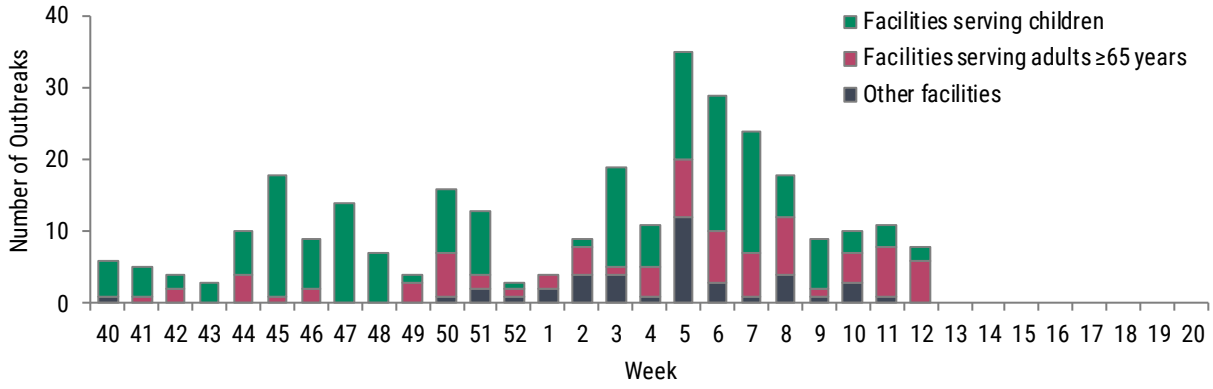
Influenza-Associated:
2 Outbreaks



Severe Outcomes*:
2 Outbreaks

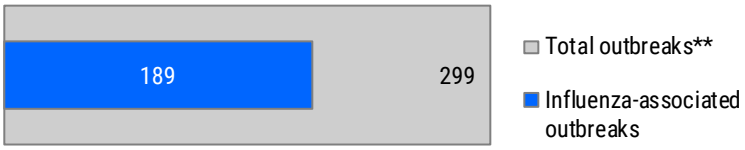
Outbreak Summary:

In week 12, two influenza-associated and six ILI outbreaks were reported, a slight increase from the previous week.



Severe outcomes* were reported in two of eight outbreaks. One or more hospitalizations and no deaths were reported in these outbreaks.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). Both of the outbreaks with severe outcomes in week 12 were in facilities serving adults aged ≥65 years.



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 12 are **outlined in bold.**

Figure 9: In week 12, **six outbreaks** were reported among **facilities serving adults aged ≥65 years, two outbreaks** were reported in **facilities serving children,** and **no outbreaks** were reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 12, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 12, **63.2% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 12, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

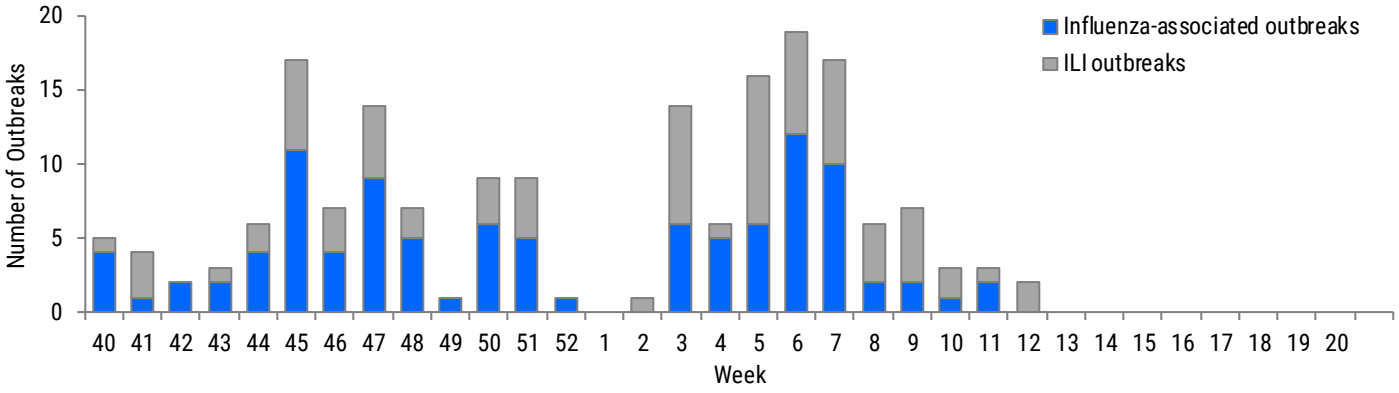
*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

Facilities Serving Children*:



2 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

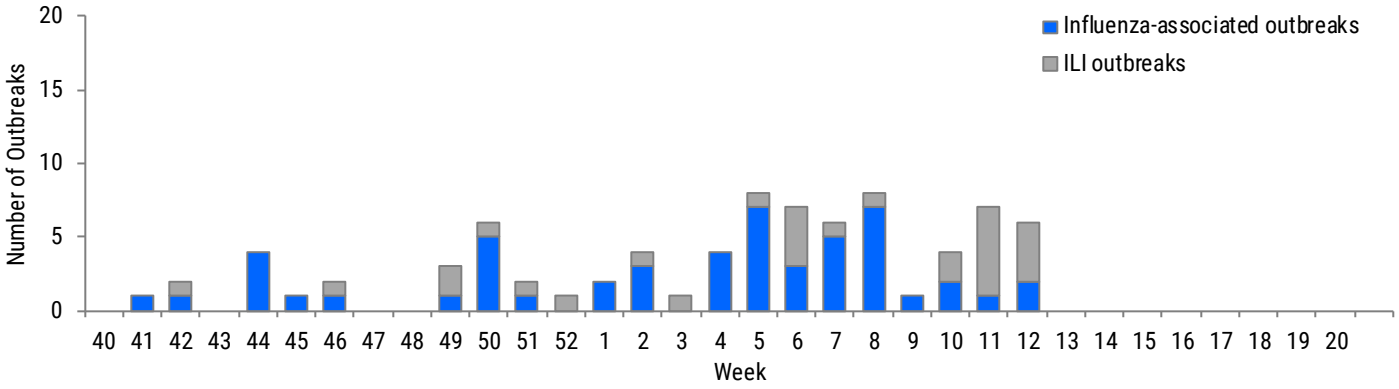
In week 12, two new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 12, **two ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 12, 2020.

Facilities Serving Adults ≥65 yrs.**:



6 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 12, six new outbreaks of influenza or ILI were reported among facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

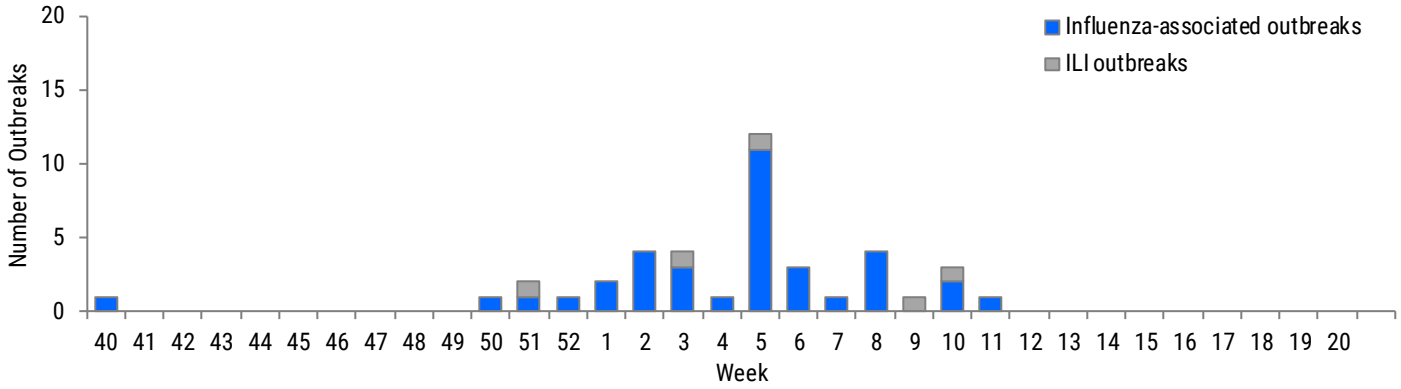
Figure 12: In week 12, **four ILI outbreaks** and **two influenza-associated outbreaks** were reported among **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 12, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

Other Facilities*:



0 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 12, no new outbreaks of influenza or ILI were reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 12, no new outbreaks were reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 12, 2020.

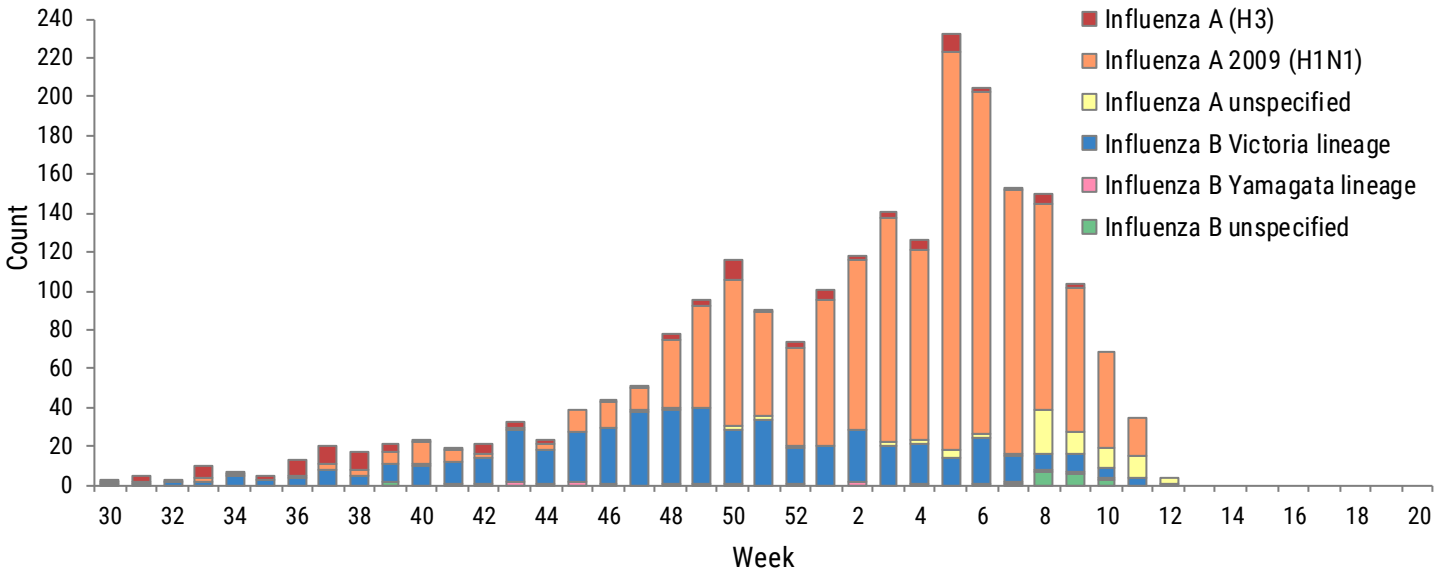


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

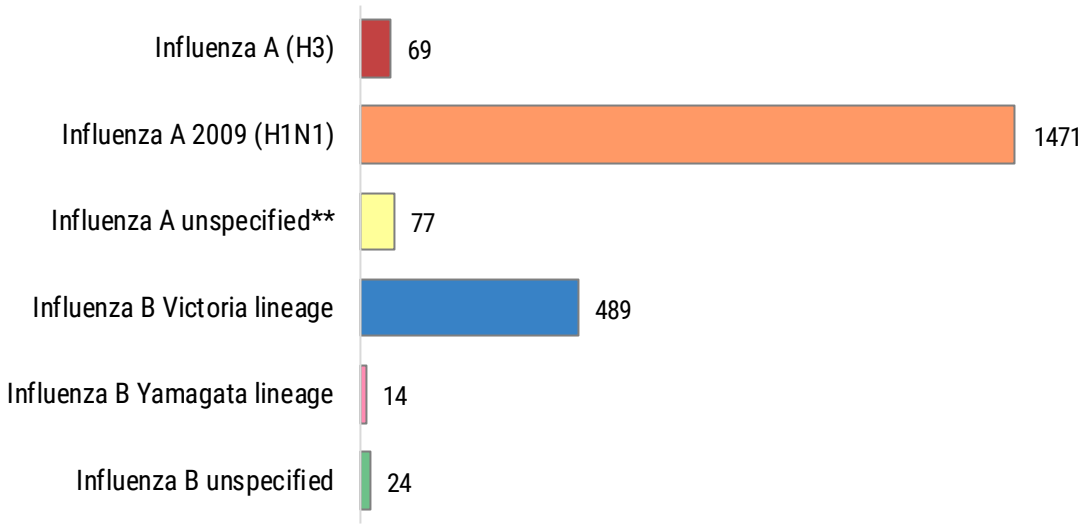
Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	137 (45.8%)	84 influenza-associated outbreaks 53 ILI outbreaks
Child daycares	41 (13.7%)	17 influenza-associated outbreaks 24 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	26 (8.7%)	12 influenza-associated outbreaks 14 ILI outbreaks
Nursing facilities	19 (6.4%)	14 influenza-associated outbreaks 5 ILI outbreaks
Other long-term care facilities	35 (11.7%)	26 influenza-associated outbreaks 9 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	33 (11.0%)	31 influenza-associated outbreaks 2 ILI outbreaks
Hospitals	3 (1.0%)	2 influenza-associated outbreaks 1 ILI outbreak
Additional facility types	5 (1.7%)	3 influenza-associated outbreaks 2 ILI outbreaks
Total	**299 (100.0%)**	**189 influenza-associated outbreaks** **110 ILI outbreaks**

AMERICAN OVERSIGHT



Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 12, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 12, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits with discharge diagnoses of influenza or flu** at ESSENCE-FL participating facilities (n=370) from week 40, 2016 to week 12, 2020. Data are organized by region (see Figure 23).

2019-20
Previous 3-season average

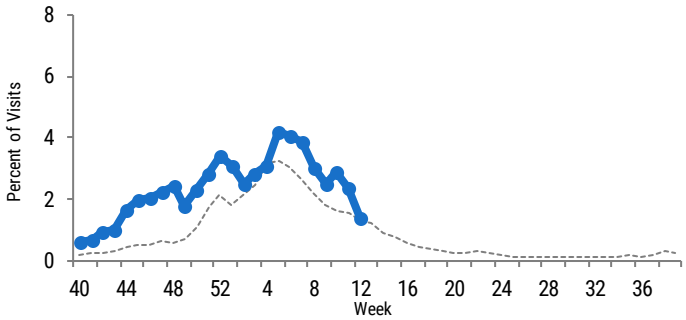

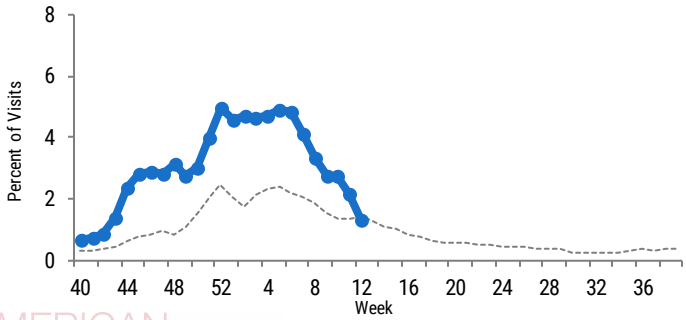

Figure 22: In **region 7, influenza and flu activity decreased** during week 12 and was similar to the previous three-season average for this time.*

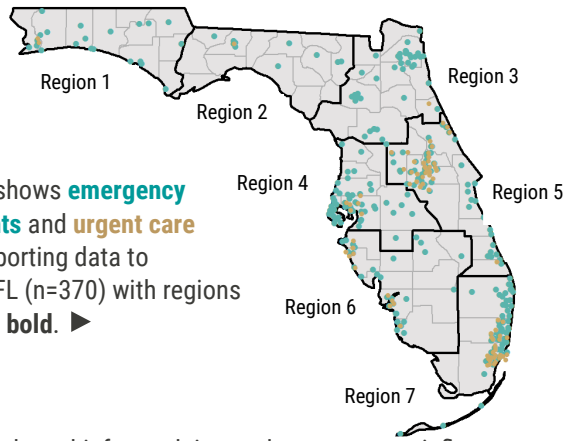

Figure 23 shows **emergency departments** and **urgent care centers** reporting data to ESSENCE-FL (n=370) with regions **outlined in bold**. ▶

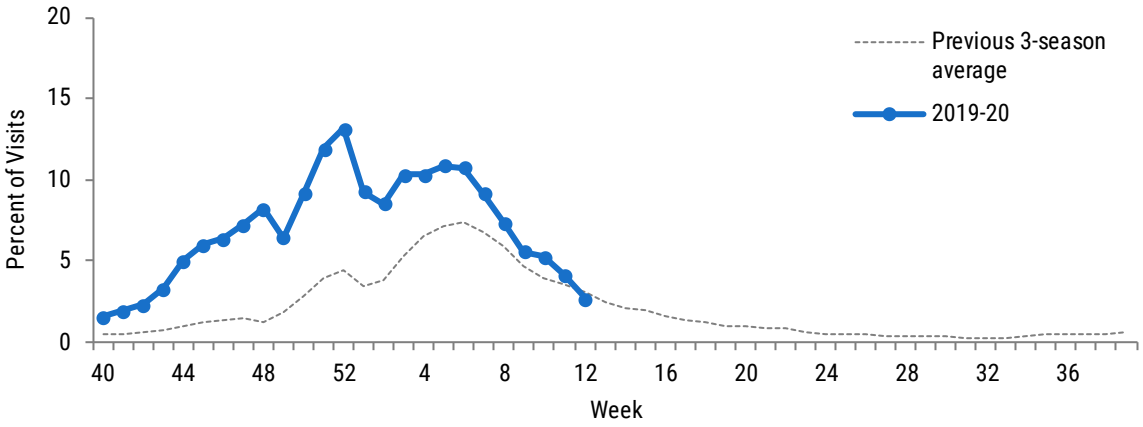
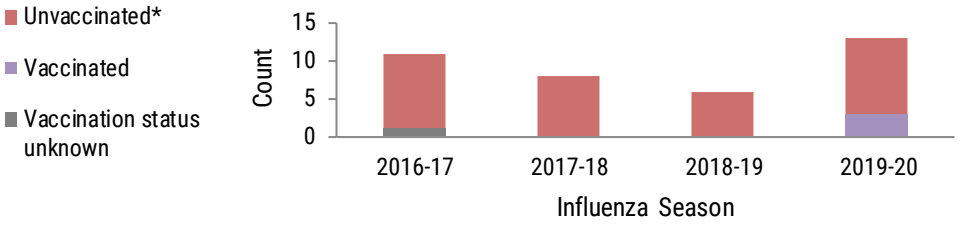
*Of note, the queries used to capture these data now utilizes discharge diagnoses rather than chief complaints to better capture influenza activity trends in Florida.



AMERICAN OVERSIGHT

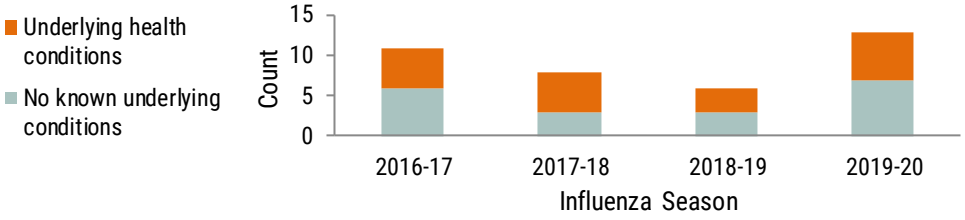
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 12, **the percent of emergency department and urgent care center visits with a discharge diagnosis of influenza or flu in children <18 years decreased** and was similar to the previous three-season average for this time. Of note, the query used to capture these data now utilizes discharge diagnoses rather than chief complaints to better capture influenza activity trends in Florida.



◀ **Figure 24** shows **the percent visits with discharge diagnoses that contain influenza or flu among children <18 years** at emergency departments and urgent care centers, as reported into ESSENCE-FL, for the current season (week 40, 2019 to week 12, 2020) and the previous three-season average.

Figures 25-26: In week 12, **one new influenza-associated pediatric death was reported**. A total of 13 influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 12, 2020.

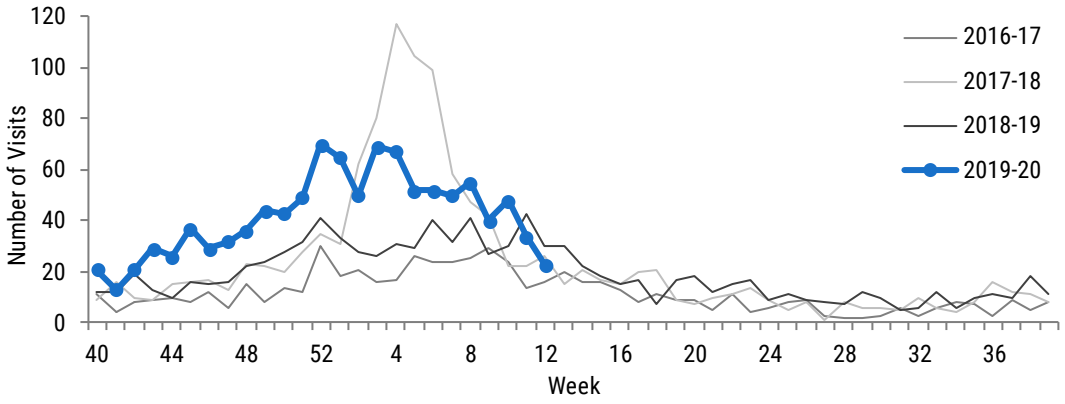
▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 12, 2020.

In week 12, **one new influenza-associated pediatric death was reported**. The death was associated with influenza A unspecified in a child with no known underlying health conditions who was not vaccinated for the 2019-20 season.

A total of 13 influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in March or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm.



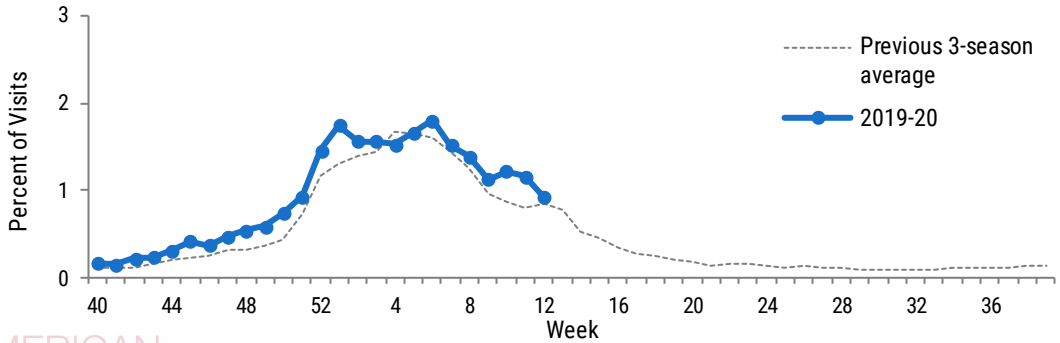
AMERICAN OVERSIGHT

At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 12, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was within levels observed at this time during previous seasons.



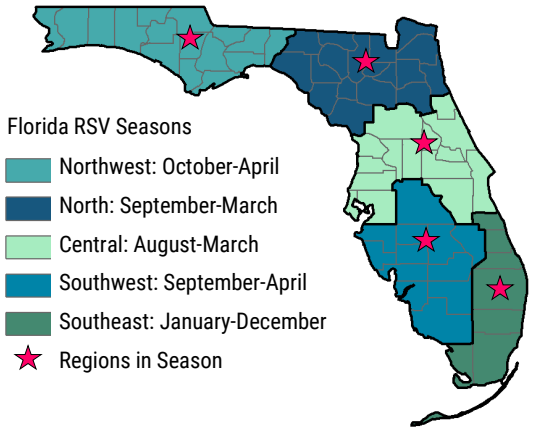
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 12, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 12, the **percent of emergency department and urgent care center visits with a discharge diagnosis of influenza or flu in adults ≥65 years decreased** and similar to the previous three-season average for this time. Of note, the query used to capture these data now utilizes discharge diagnoses rather than chief complaints to better capture influenza activity trends in Florida.



◀ **Figure 28** shows **the percent of visits with discharge diagnoses that contain influenza or flu among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, for the current season (week 40, 2019 to week 12, 2020) and the previous three-season average.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

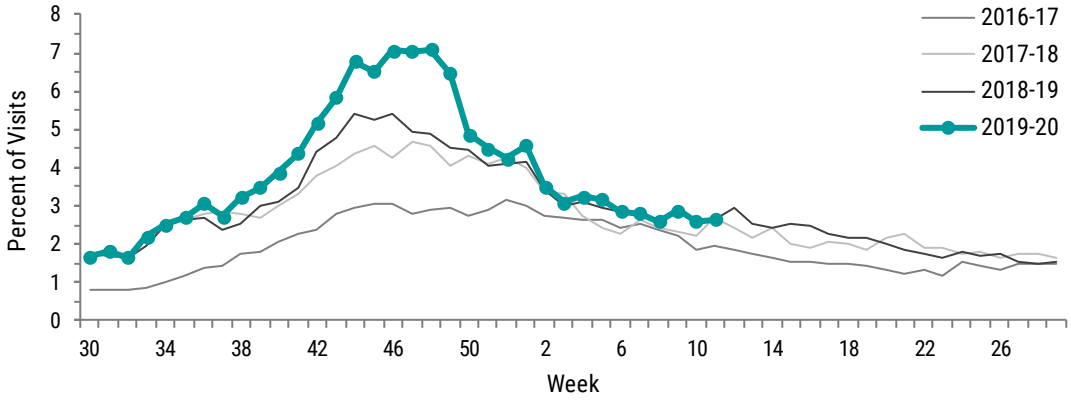
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

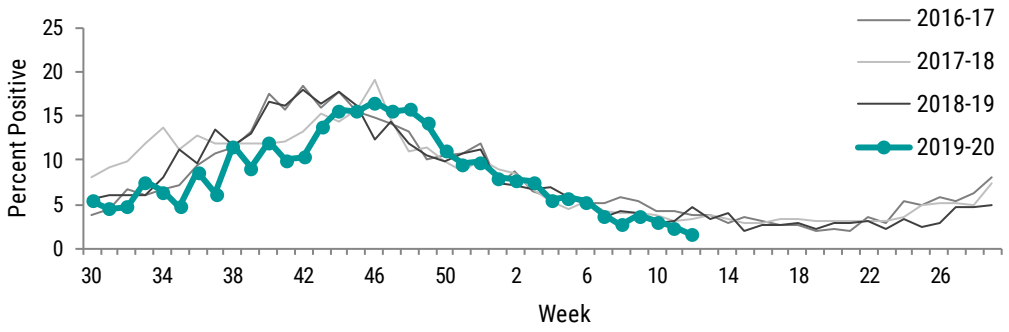
Week 12 (March 15-21, 2020) Activity Summary

In week 12, RSV activity in children <5 years increased and was similar to levels observed at this time in previous seasons.

No new RSV-associated outbreaks were reported in week 12. A total of ten RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 12, **the percent of emergency department and urgent care center visits for RSV among children <5 years increased** and was similar to levels observed at this time in previous seasons.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 12, 2020.



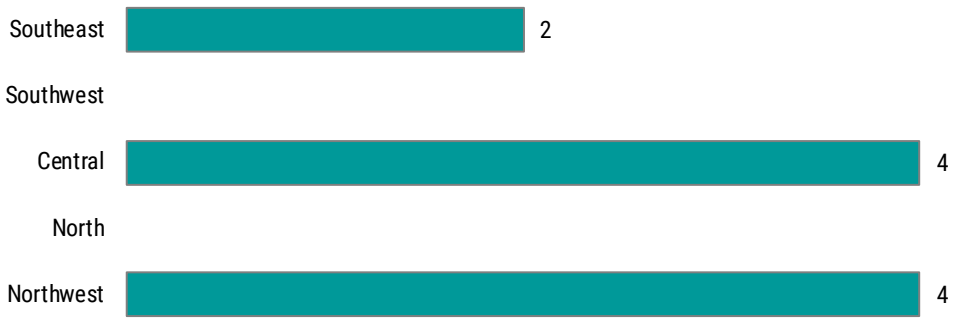
*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

AMERICAN OVERSIGHT

RSV Surveillance

Figure 31: In week 12, **the percent of specimens testing positive for RSV decreased.** Levels were below those observed at this time in previous seasons.

Figure 31 shows **the percent of specimens testing positive for respiratory syncytial virus (RSV)**, as reported by hospital laboratories (n=8), week 30, 2016 to week 12, 2020. ▶



RSV-Associated Outbreaks in Week 12:

0 Outbreaks

Summary of RSV-Associated Outbreaks:

In week 12, no new RSV-associated outbreaks were reported. Since week 30, 2019, ten RSV-associated outbreaks have been reported.

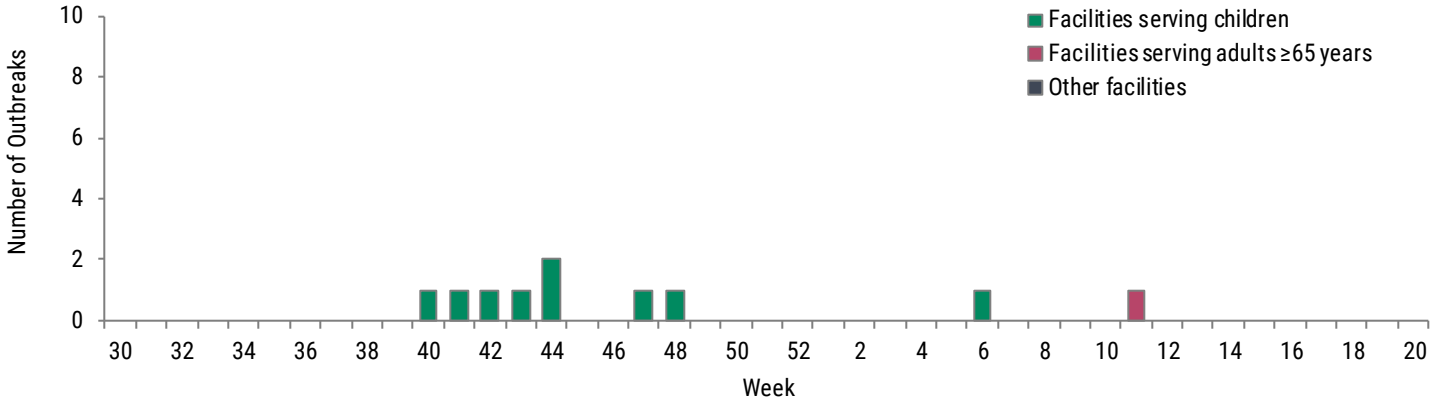


Figure 32: In week 12, no new RSV-associated outbreaks were reported. Since week 30, outbreaks have been reported in Florida's southeast, central, and northwest regions.*

◀ **Figure 32** shows **a summary of RSV-associated outbreaks by region*** as reported by county health departments in Merlin, week 30, 2019 to week 12, 2020.

*Regions defined in figure 29.

Figure 33: In week 12, no new RSV-associated outbreaks were reported. The majority of outbreaks reported since week 30 have been reported in **facilities serving children.**

◀ **Figure 35*** shows **the number of PCR-positive laboratory findings for enterovirus unspecified, enterovirus D68, and rhinovirus** by week** among specimens submitted to the Bureau of Public Health Laboratories (BPHL) for extended respiratory panel testing.

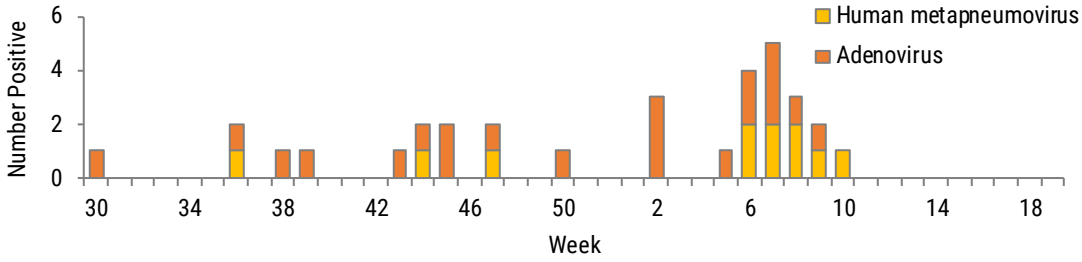

Figure 36* shows **the ▶ number of PCR-positive laboratory findings for parainfluenza 1-3** by week** among specimens submitted to BPHL for extended respiratory panel testing.

◀ **Figure 37*** shows **the number of PCR-positive laboratory findings for seasonal coronaviruses NL63, HKU1, OC43, and 229E** by week** among specimens submitted to BPHL for extended respiratory panel testing.

Figure 38* shows **the ▶ number of PCR-positive laboratory findings for human metapneumovirus and adenovirus** by week** among specimens submitted to BPHL for extended respiratory panel testing.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 12, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Long-term care facility	Washington	7	2	0	Unknown	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza and flu-related visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=370) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional figures, percentages are calculated as the proportion of ED and UCC visits to participating facilities that include the words “influenza” or “flu” in the discharge diagnoses (with certain exceptions).

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly influenza-like illness (ILI) and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For health care providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida’s geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county’s influenza and ILI surveillance data weekly into The Florida Department of Health’s EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida’s reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Date:	Wednesday, March 25, 2020 3:52:49 PM
Attachments:	Week 12, 2020 Florida Flu Review.pdf

Good Afternoon!

Attached is the Week 12, 2020 Florida Flu Review.

Week 12 influenza & influenza-like illness (ILI) activity summary:

Statewide, the percentage of respiratory specimens testing positive for influenza continued to decrease.

Likewise, the percent of emergency department and urgent care center visits with discharge diagnoses that include influenza or flu decreased in recent weeks. Activity in week 12 was similar to an average of the past three influenza seasons for this time.

Of note, some of the figures in this report that previously displayed chief complaints of ILI were updated to display discharge diagnoses of influenza or flu to better reflect influenza activity trends in Florida.

Eight outbreaks were reported, down from eleven outbreaks in the previous week. Of the eight outbreaks reported, two were influenza-associated and six were ILI.

One new influenza-associated pediatric death was reported. Thirteen influenza-associated pediatric deaths have been reported so far this season; the majority these deaths were children who were not vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend vaccination as long as influenza viruses are circulating. Annual vaccination is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).

AMERICAN OVERSIGHT

- Avoid touching your eyes, nose, and mouth.
- If you do get sick with influenza, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Thank you!

Florida ILI Surveillance System Summary 16

Background

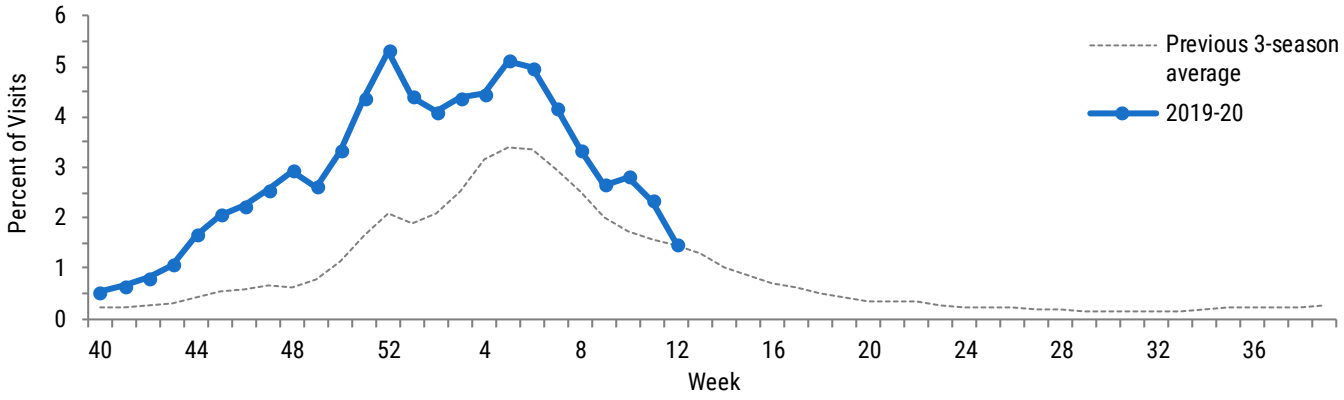
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



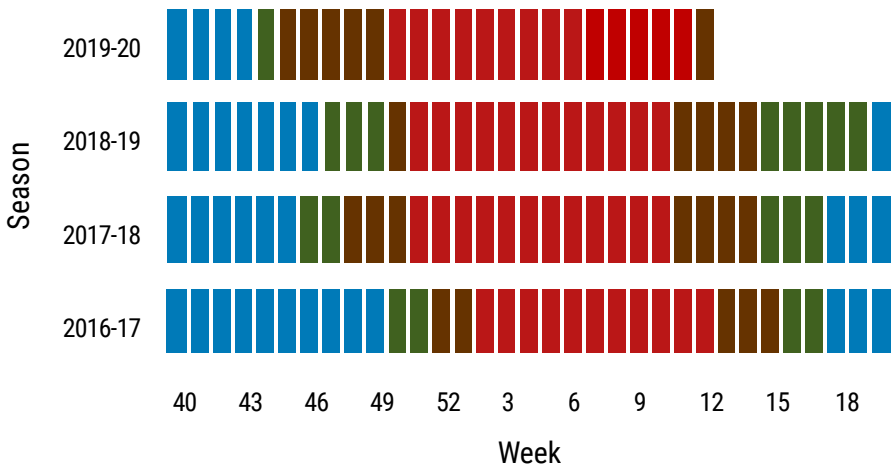
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 12, **the percent of emergency department and urgent care center visits with a discharge diagnosis of influenza or flu statewide decreased** and was similar to the previous three-season average for this time. Of note, the query used to capture these data now utilizes discharge diagnoses rather than chief complaints to better capture influenza activity trends in Florida.



▲ **Figure 1** shows **the percent of visits with discharge diagnoses that include influenza or flu** (with certain exceptions) for facilities participating in ESSENCE-FL (n=370) statewide for the current season (week 40, 2019 to week 12, 2020) and the previous three season average (2018-19, 2017-18, and 2016-17). Of note, influenza may not be laboratory-confirmed for all the visits included in this query. For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 12, Florida reported **regional geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 12, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

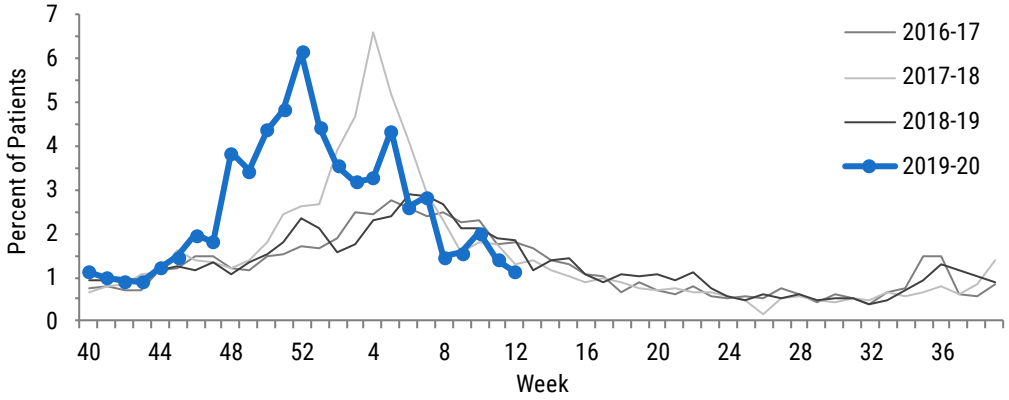
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 12, **the percent of patients with ILI reported by ILINet providers statewide decreased** and was below levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=7), week 40, 2016 to week 12, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



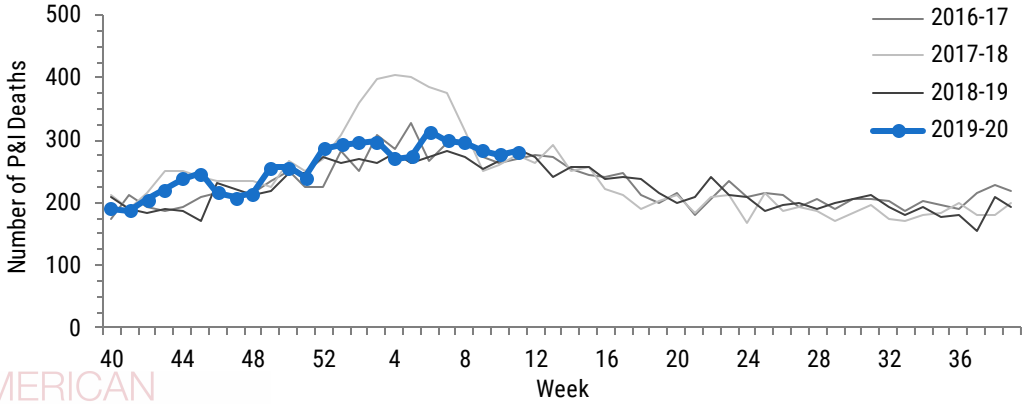


Figure 4: In week 11 (ending 3/14/20), **the number of pneumonia and influenza deaths identified statewide increased slightly** and was similar to levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 11, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

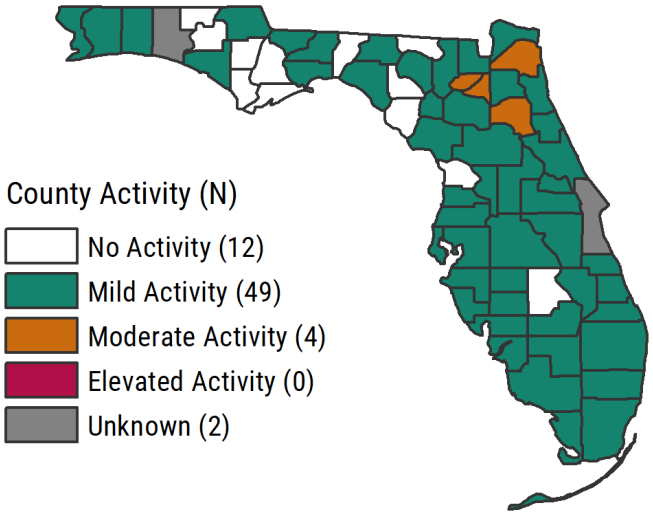
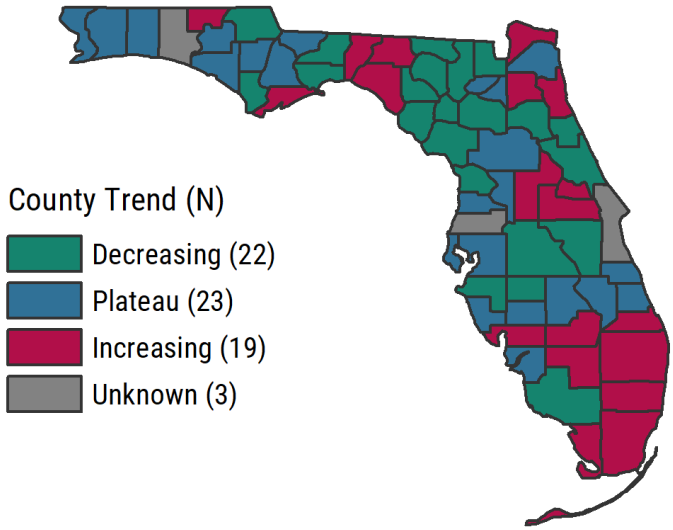
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 12. Four counties reported **moderate activity,** and no counties reported **elevated activity.**





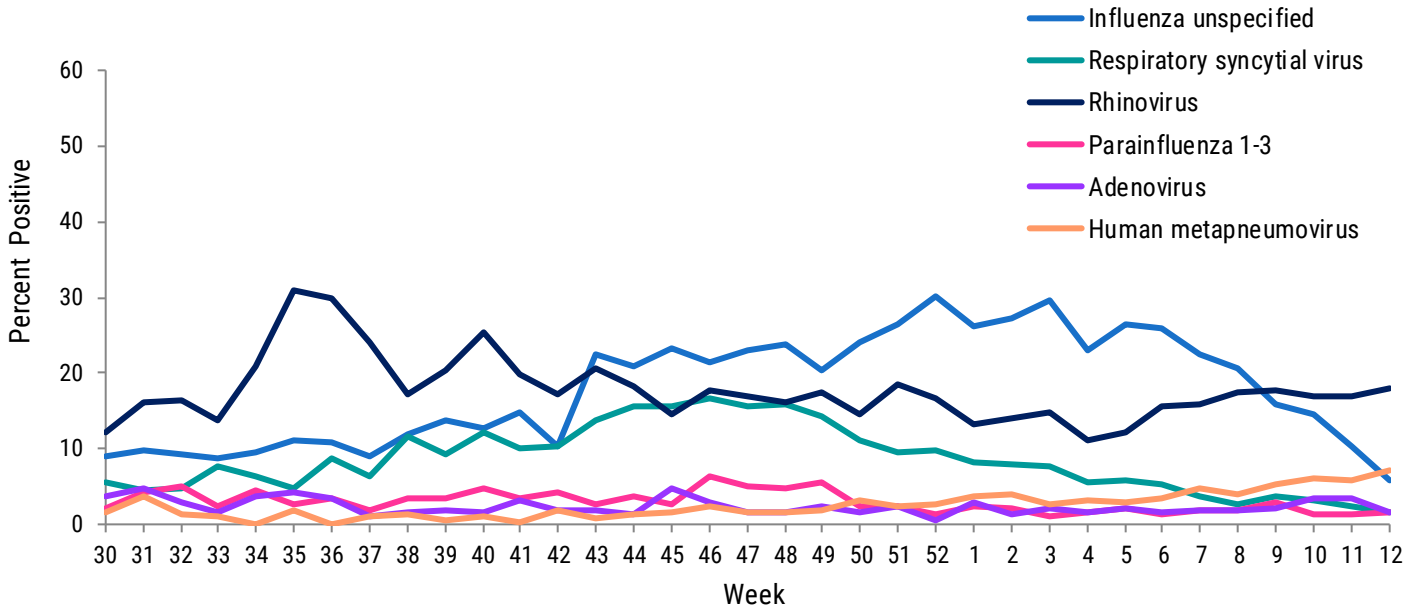


Figure 6: Most counties reported **activity at a plateau** for week 12. Nineteen counties reported **increasing activity,** and 22 counties reported **decreasing activity**.

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 12, the **percent of specimens testing positive for rhinovirus increased** and was higher than other respiratory viruses under surveillance (including influenza). The **percent of specimens testing positive for influenza decreased notably** in recent weeks.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=8), week 40, 2019 to week 12, 2020.

AMERICAN OVERSIGHT

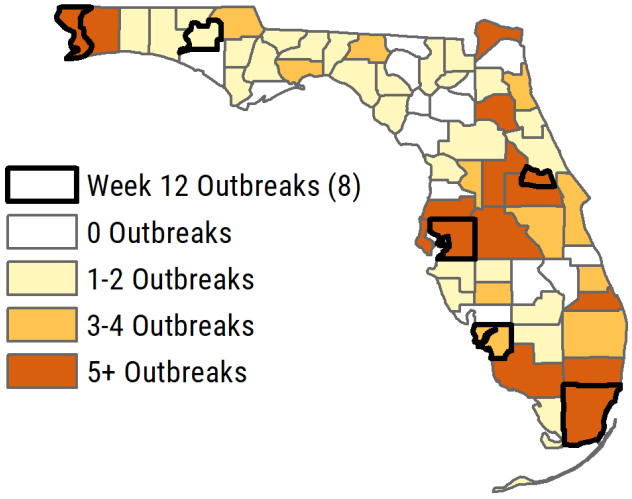
Influenza and ILI Outbreaks

Week 12 Outbreaks at a Glance:

Number Reported:
8 Outbreaks

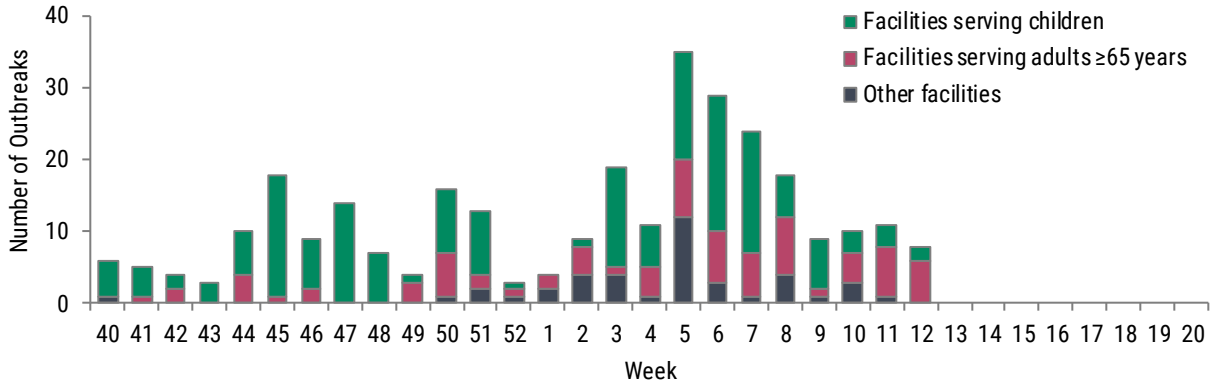
Influenza-Associated:
2 Outbreaks



Severe Outcomes*:
2 Outbreaks

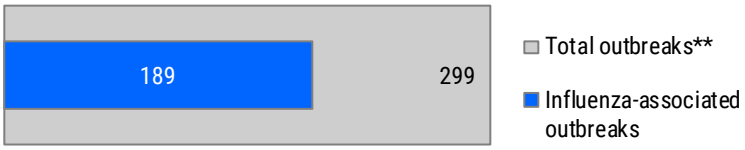
Outbreak Summary:

In week 12, two influenza-associated and six ILI outbreaks were reported, a slight increase from the previous week.



Severe outcomes* were reported in two of eight outbreaks. One or more hospitalizations and no deaths were reported in these outbreaks.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). Both of the outbreaks with severe outcomes in week 12 were in facilities serving adults aged ≥65 years.



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 12 are **outlined in bold.**

Figure 9: In week 12, **six outbreaks** were reported among **facilities serving adults aged ≥65 years, two outbreaks** were reported in **facilities serving children,** and **no outbreaks** were reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 12, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 12, **63.2% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 12, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

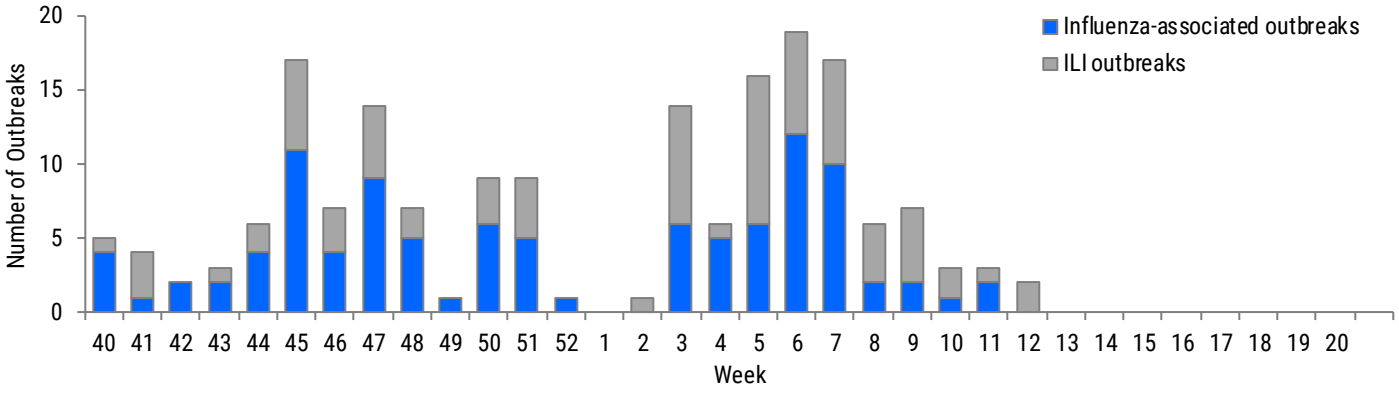
Influenza and ILI Outbreaks

Facilities Serving Children*:



2 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

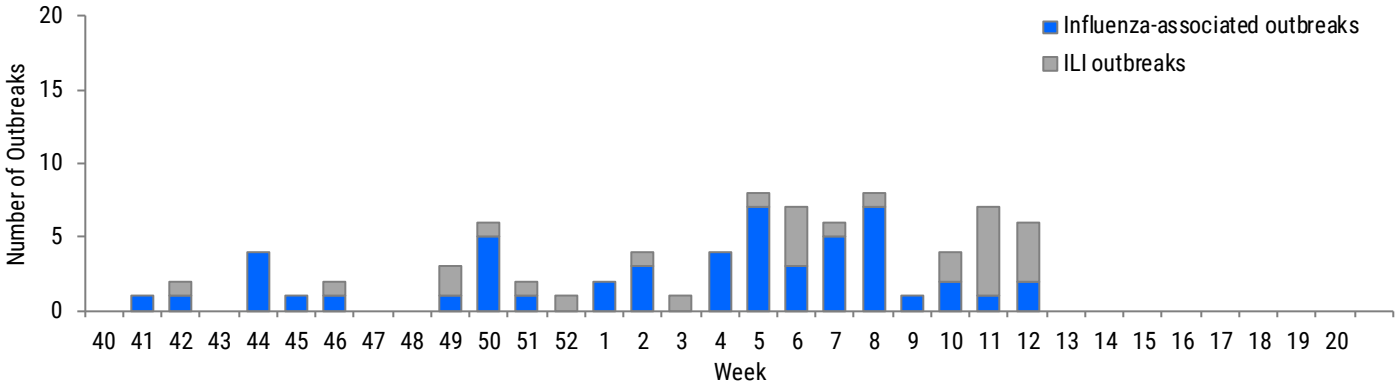
In week 12, two new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 12, **two ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 12, 2020.

Facilities Serving Adults ≥65 yrs.**:



6 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 12, six new outbreaks of influenza or ILI were reported among facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 12, **four ILI outbreaks** and **two influenza-associated outbreaks** were reported among **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 12, 2020.

AMERICAN OVERSIGHT

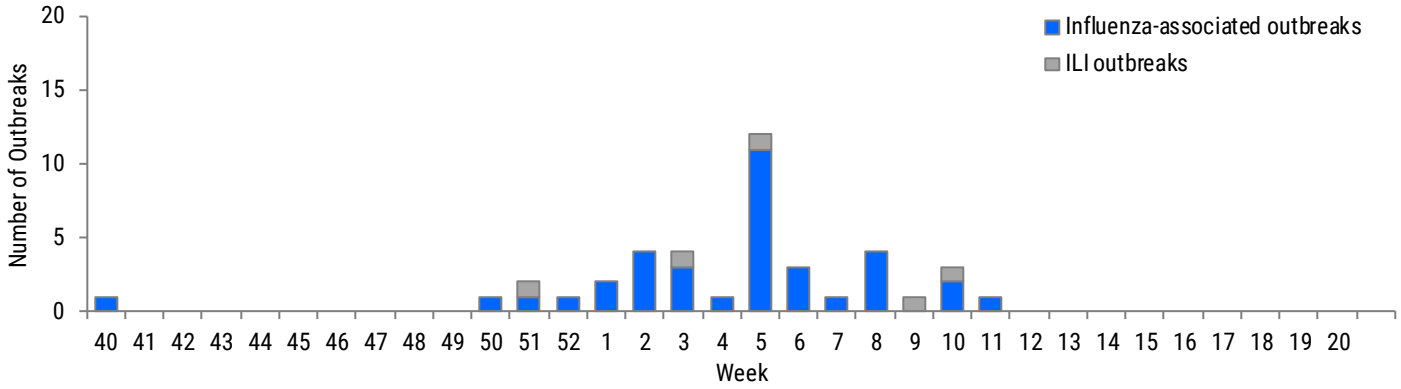
Influenza and ILI Outbreaks

Other Facilities*:



0 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 12, no new outbreaks of influenza or ILI were reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 12, no new outbreaks were reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 12, 2020.

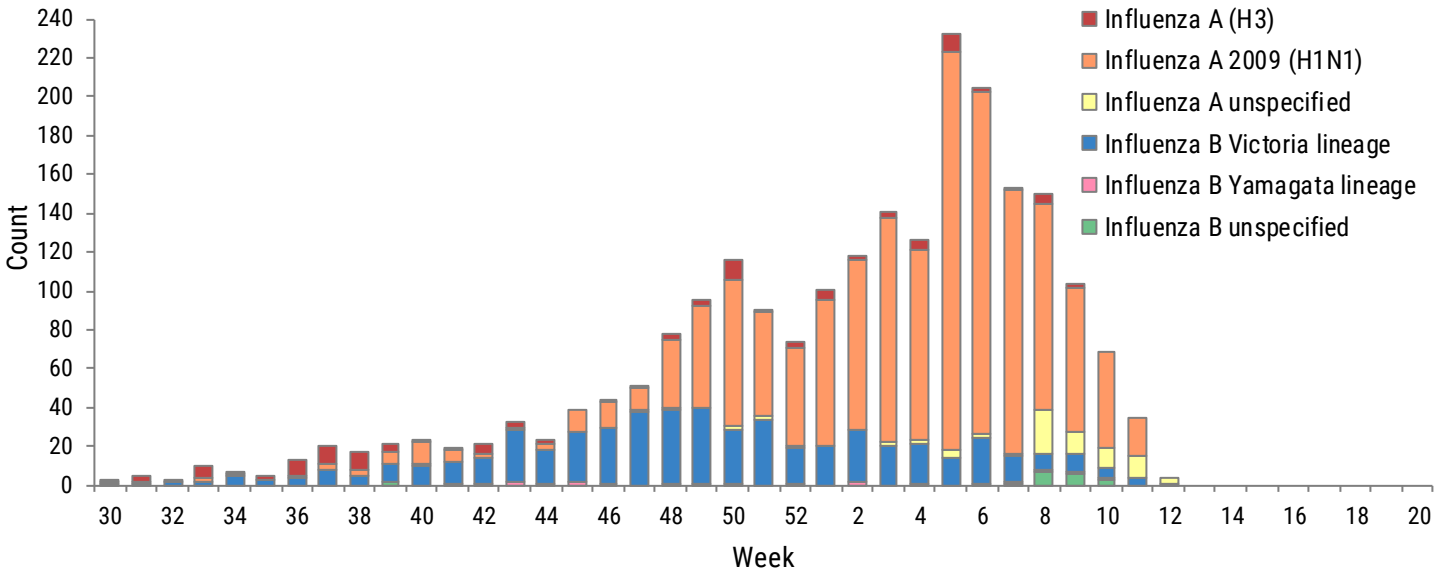


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	137 (45.8%)	84 influenza-associated outbreaks 53 ILI outbreaks
Child daycares	41 (13.7%)	17 influenza-associated outbreaks 24 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	26 (8.7%)	12 influenza-associated outbreaks 14 ILI outbreaks
Nursing facilities	19 (6.4%)	14 influenza-associated outbreaks 5 ILI outbreaks
Other long-term care facilities	35 (11.7%)	26 influenza-associated outbreaks 9 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	33 (11.0%)	31 influenza-associated outbreaks 2 ILI outbreaks
Hospitals	3 (1.0%)	2 influenza-associated outbreaks 1 ILI outbreak
Additional facility types	5 (1.7%)	3 influenza-associated outbreaks 2 ILI outbreaks
Total	**299 (100.0%)**	**189 influenza-associated outbreaks** **110 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 12, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 12, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits with discharge diagnoses of influenza or flu** at ESSENCE-FL participating facilities (n=370) from week 40, 2016 to week 12, 2020. Data are organized by region (see Figure 23).

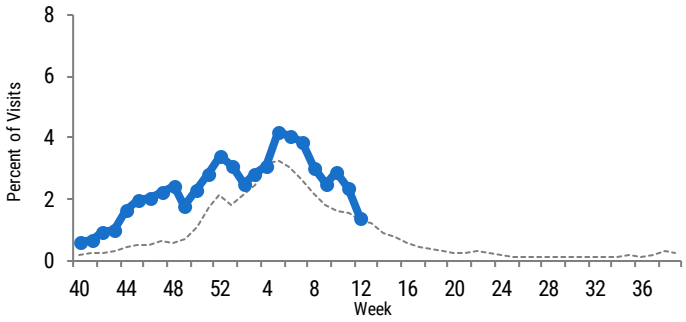

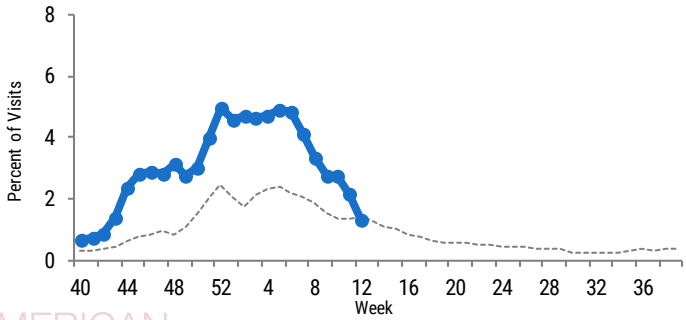

Figure 22: In **region 7, influenza and flu activity decreased** during week 12 and was similar to the previous three-season average for this time.*

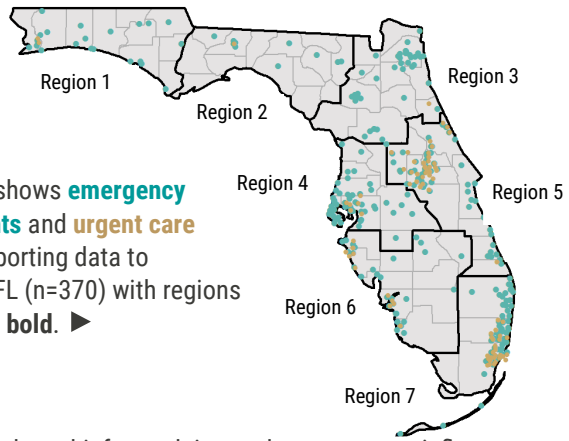

Figure 23 shows **emergency departments** and **urgent care centers** reporting data to ESSENCE-FL (n=370) with regions **outlined in bold**. ▶

*Of note, the queries used to capture these data now utilizes discharge diagnoses rather than chief complaints to better capture influenza activity trends in Florida.

AMERICAN OVERSIGHT

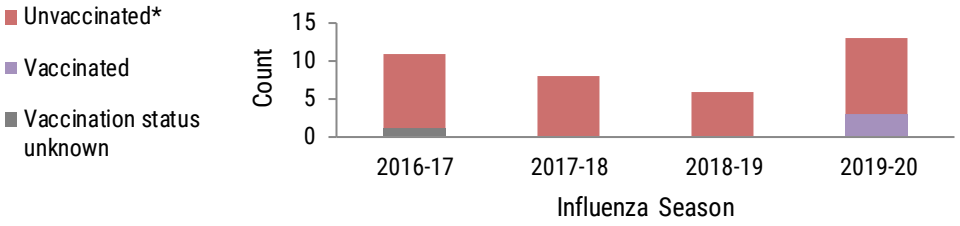
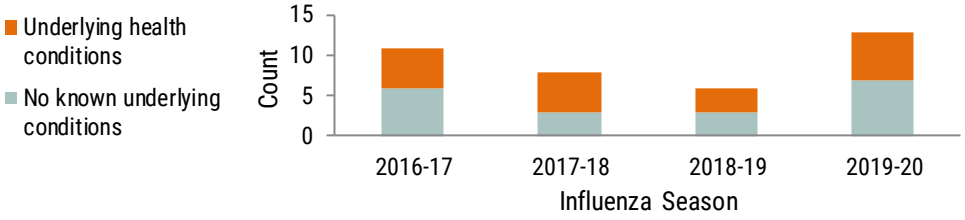
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 12, **the percent of emergency department and urgent care center visits with a discharge diagnosis of influenza or flu in children <18 years decreased** and was similar to the previous three-season average for this time. Of note, the query used to capture these data now utilizes discharge diagnoses rather than chief complaints to better capture influenza activity trends in Florida.



◀ **Figure 24** shows **the percent visits with discharge diagnoses that contain influenza or flu among children <18 years** at emergency departments and urgent care centers, as reported into ESSENCE-FL, for the current season (week 40, 2019 to week 12, 2020) and the previous three-season average.

Figures 25-26: In week 12, **one new influenza-associated pediatric death was reported**. A total of 13 influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 12, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 12, 2020.

In week 12, **one new influenza-associated pediatric death was reported**. The death was associated with influenza A unspecified in a child with no known underlying health conditions who was not vaccinated for the 2019-20 season.

A total of 13 influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in March or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm.

AMERICAN OVERSIGHT

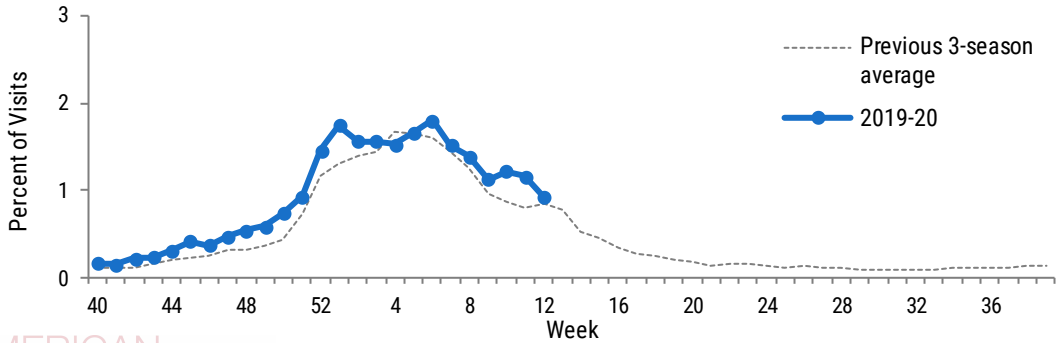
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 12, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was within levels observed at this time during previous seasons.



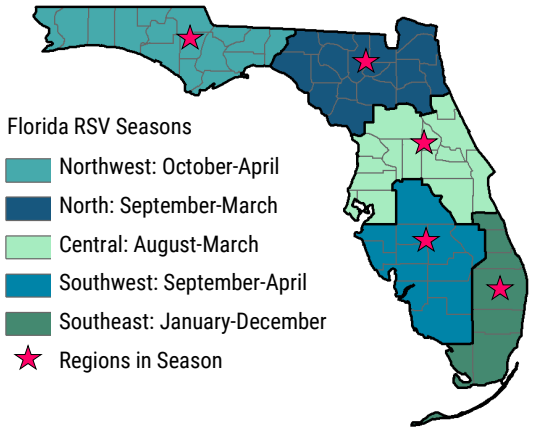
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 12, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 12, the **percent of emergency department and urgent care center visits with a discharge diagnosis of influenza or flu in adults ≥65 years decreased** and similar to the previous three-season average for this time. Of note, the query used to capture these data now utilizes discharge diagnoses rather than chief complaints to better capture influenza activity trends in Florida.



◀ **Figure 28** shows **the percent of visits with discharge diagnoses that contain influenza or flu among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, for the current season (week 40, 2019 to week 12, 2020) and the previous three-season average.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

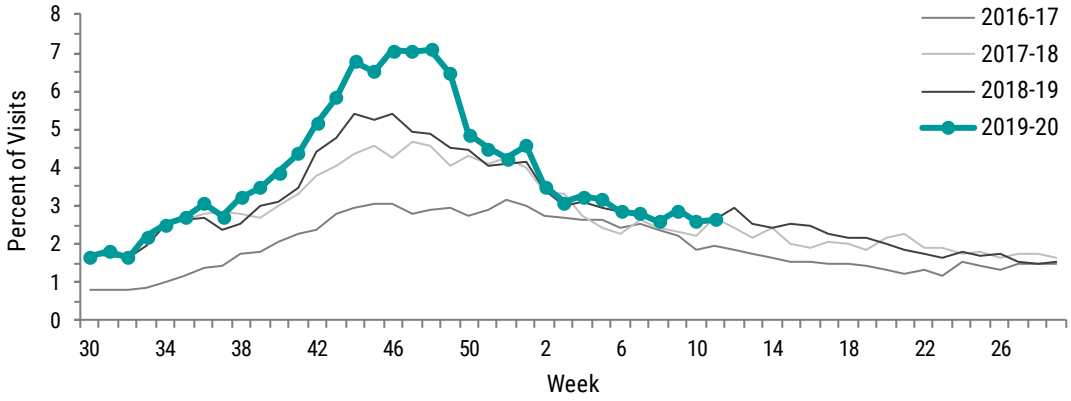
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

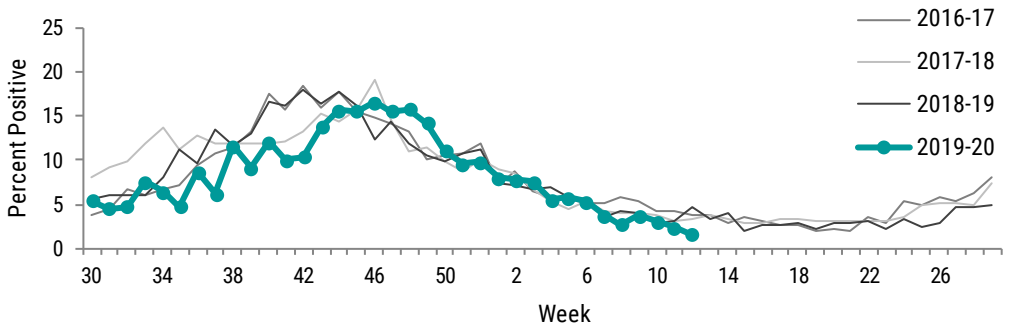
Week 12 (March 15-21, 2020) Activity Summary

In week 12, RSV activity in children <5 years increased and was similar to levels observed at this time in previous seasons.

No new RSV-associated outbreaks were reported in week 12. A total of ten RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 12, **the percent of emergency department and urgent care center visits for RSV among children <5 years increased** and was similar to levels observed at this time in previous seasons.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 12, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 12, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Long-term care facility	Washington	7	2	0	Unknown	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza and flu-related visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=370) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional figures, percentages are calculated as the proportion of ED and UCC visits to participating facilities that include the words “influenza” or “flu” in the discharge diagnoses (with certain exceptions).

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly influenza-like illness (ILI) and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For health care providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida’s geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county’s influenza and ILI surveillance data weekly into The Florida Department of Health’s EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida’s reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 12, 2020 Florida Flu Review
Date:	Wednesday, March 25, 2020 3:52:49 PM
Attachments:	Week 12, 2020 Florida Flu Review.pdf

Good Afternoon!

Attached is the Week 12, 2020 Florida Flu Review.

Week 12 influenza & influenza-like illness (ILI) activity summary:

Statewide, the percentage of respiratory specimens testing positive for influenza continued to decrease.

Likewise, the percent of emergency department and urgent care center visits with discharge diagnoses that include influenza or flu decreased in recent weeks. Activity in week 12 was similar to an average of the past three influenza seasons for this time.

Of note, some of the figures in this report that previously displayed chief complaints of ILI were updated to display discharge diagnoses of influenza or flu to better reflect influenza activity trends in Florida.

Eight outbreaks were reported, down from eleven outbreaks in the previous week. Of the eight outbreaks reported, two were influenza-associated and six were ILI.

One new influenza-associated pediatric death was reported. Thirteen influenza-associated pediatric deaths have been reported so far this season; the majority these deaths were children who were not vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend vaccination as long as influenza viruses are circulating. Annual vaccination is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).

AMERICAN OVERSIGHT

- Avoid touching your eyes, nose, and mouth.
- If you do get sick with influenza, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Thank you!

Julia Munroe, MS
Respiratory Disease Epidemiologist
Bureau of Epidemiology
Division of Disease Control and Health Protection
Florida Department of Health
Office Phone: 850-901-6936

Mission: To protect, promote, and improve the health of all people in Florida through integrated state, county, and community efforts.

Please note: Florida has a very broad public records law. Most written communications to or from state officials regarding state business are public records available to the public and media upon request. Your email communications may therefore be subject to public disclosure.

Florida ILI Surveillance System Summary 16

Background

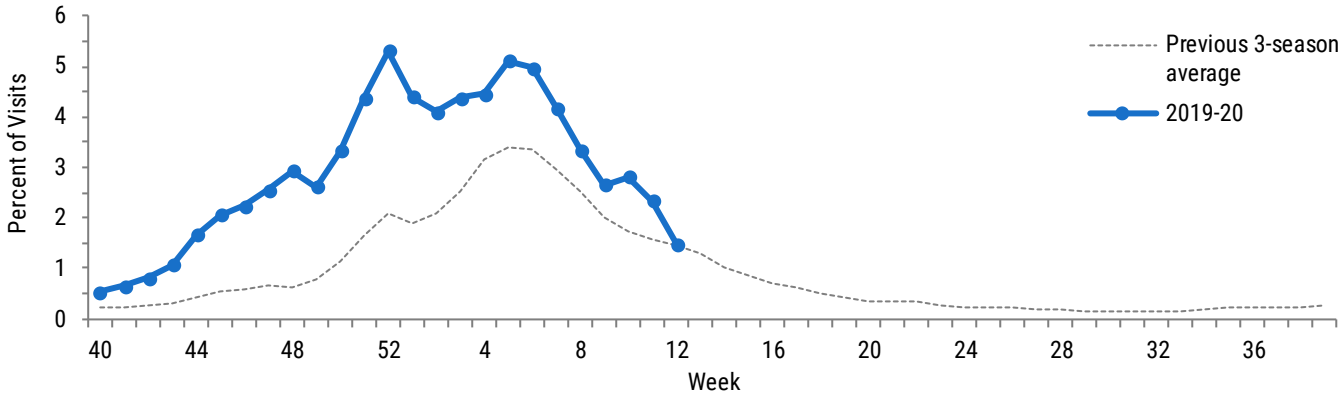
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



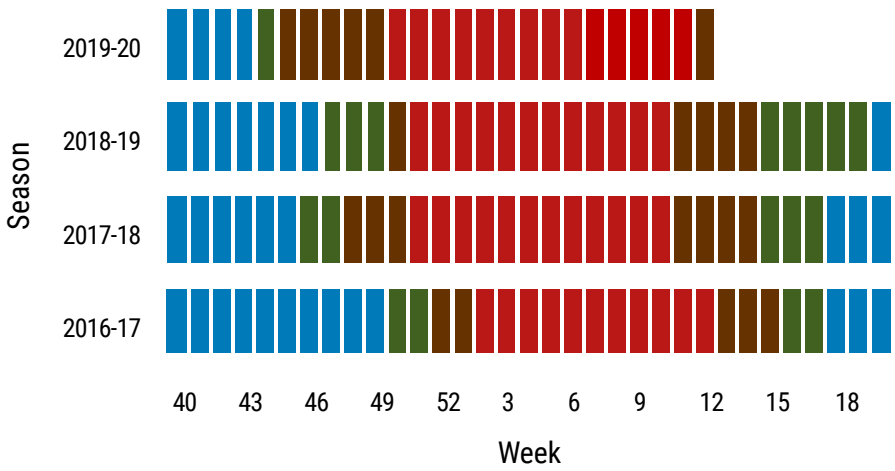
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 12, **the percent of emergency department and urgent care center visits with a discharge diagnosis of influenza or flu statewide decreased** and was similar to the previous three-season average for this time. Of note, the query used to capture these data now utilizes discharge diagnoses rather than chief complaints to better capture influenza activity trends in Florida.



▲ **Figure 1** shows **the percent of visits with discharge diagnoses that include influenza or flu** (with certain exceptions) for facilities participating in ESSENCE-FL (n=370) statewide for the current season (week 40, 2019 to week 12, 2020) and the previous three season average (2018-19, 2017-18, and 2016-17). Of note, influenza may not be laboratory-confirmed for all the visits included in this query. For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 12, Florida reported **regional geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 12, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

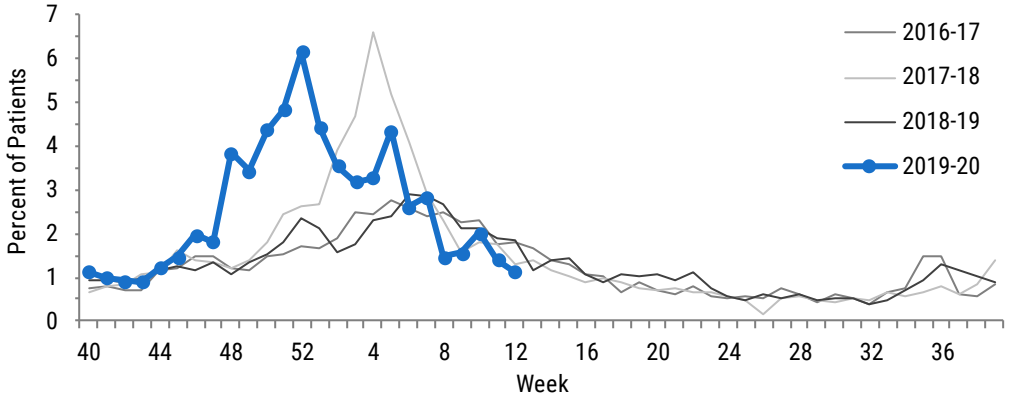
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 12, **the percent of patients with ILI reported by ILINet providers statewide decreased** and was below levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=7), week 40, 2016 to week 12, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



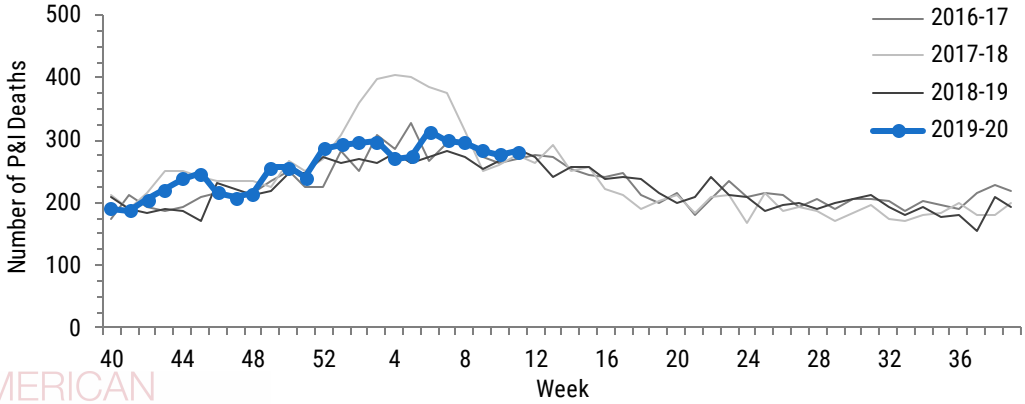


Figure 4: In week 11 (ending 3/14/20), **the number of pneumonia and influenza deaths identified statewide increased slightly** and was similar to levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 11, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

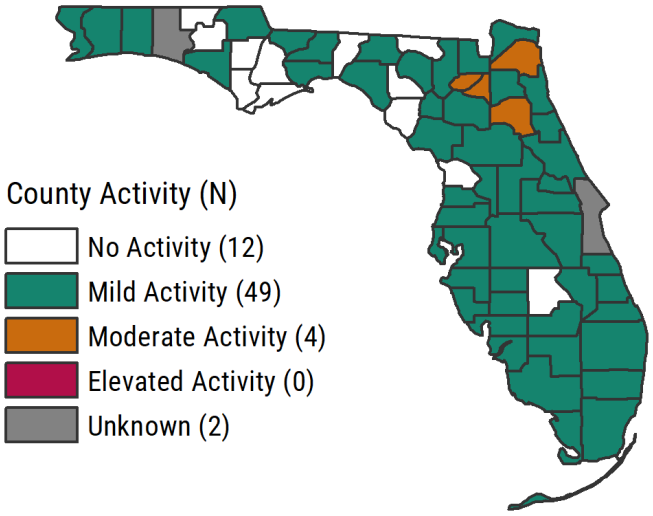
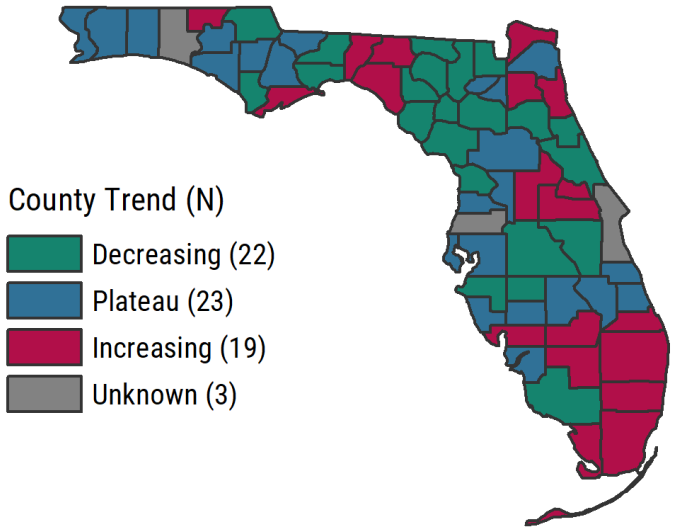
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 12. Four counties reported **moderate activity,** and no counties reported **elevated activity.**





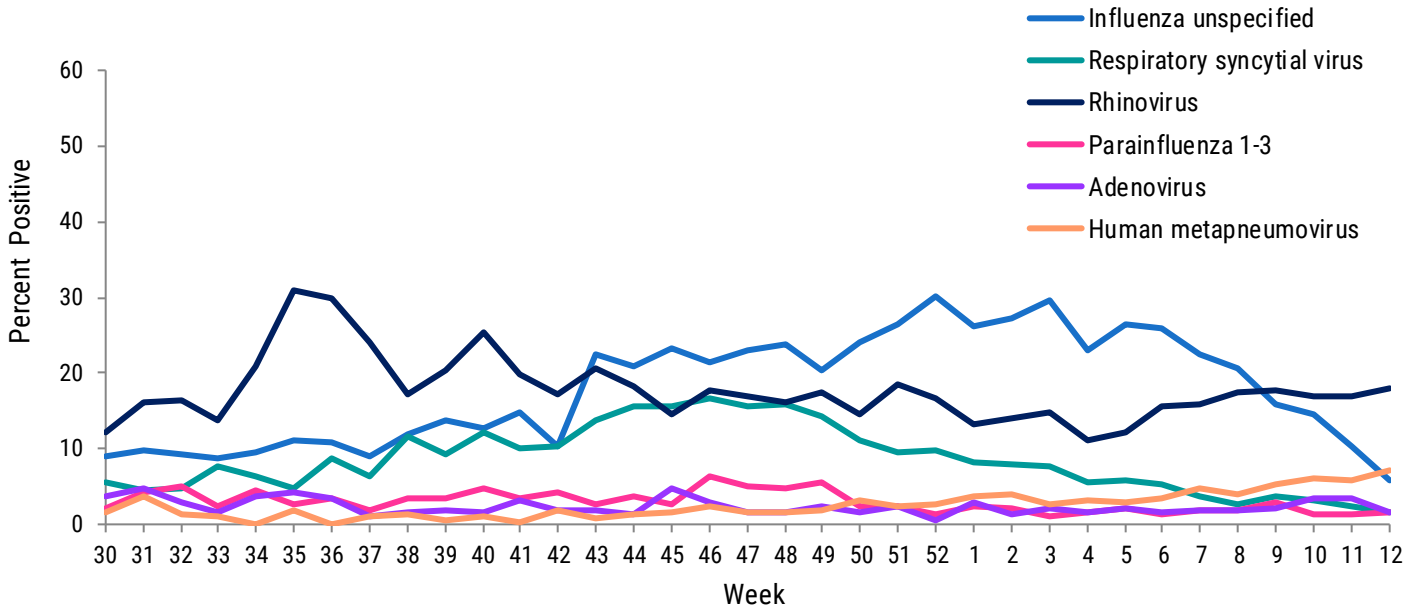


Figure 6: Most counties reported **activity at a plateau** for week 12. Nineteen counties reported **increasing activity,** and 22 counties reported **decreasing activity**.

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 12, the **percent of specimens testing positive for rhinovirus increased** and was higher than other respiratory viruses under surveillance (including influenza). The **percent of specimens testing positive for influenza decreased notably** in recent weeks.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=8), week 40, 2019 to week 12, 2020.

AMERICAN OVERSIGHT

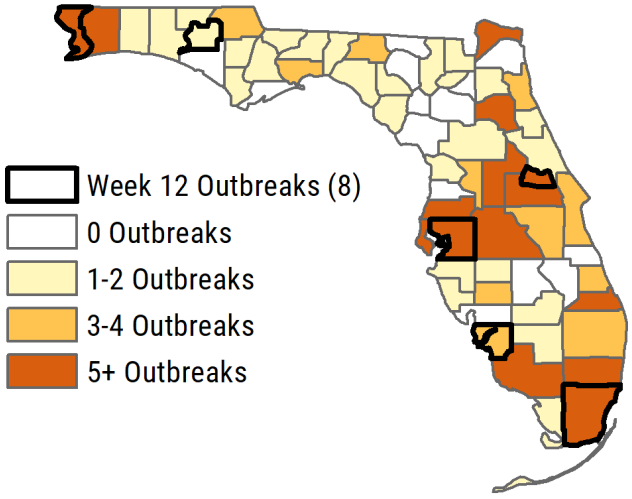
Influenza and ILI Outbreaks

Week 12 Outbreaks at a Glance:

Number Reported:
8 Outbreaks

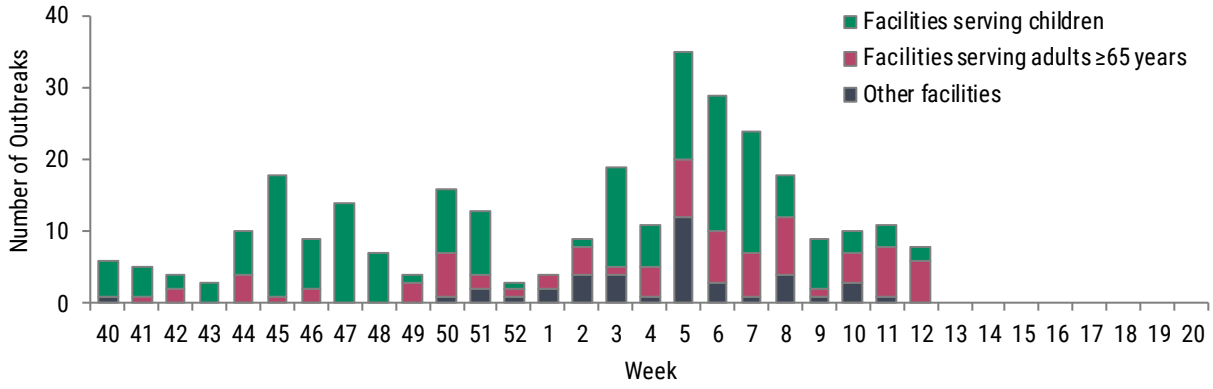
Influenza-Associated:
2 Outbreaks



Severe Outcomes*:
2 Outbreaks

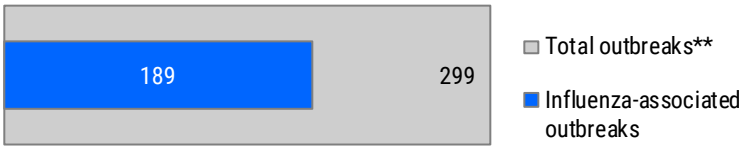
Outbreak Summary:

In week 12, two influenza-associated and six ILI outbreaks were reported, a slight increase from the previous week.



Severe outcomes* were reported in two of eight outbreaks. One or more hospitalizations and no deaths were reported in these outbreaks.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). Both of the outbreaks with severe outcomes in week 12 were in facilities serving adults aged ≥65 years.



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 12 are **outlined in bold.**

Figure 9: In week 12, **six outbreaks** were reported among **facilities serving adults aged ≥65 years, two outbreaks** were reported in **facilities serving children,** and **no outbreaks** were reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 12, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 12, **63.2% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 12, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

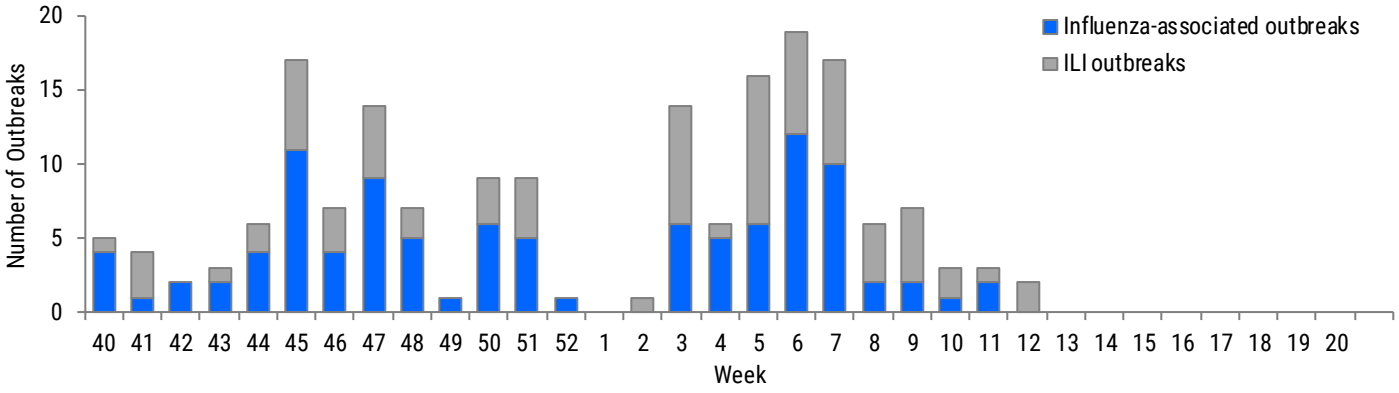
Influenza and ILI Outbreaks

Facilities Serving Children*:



2 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

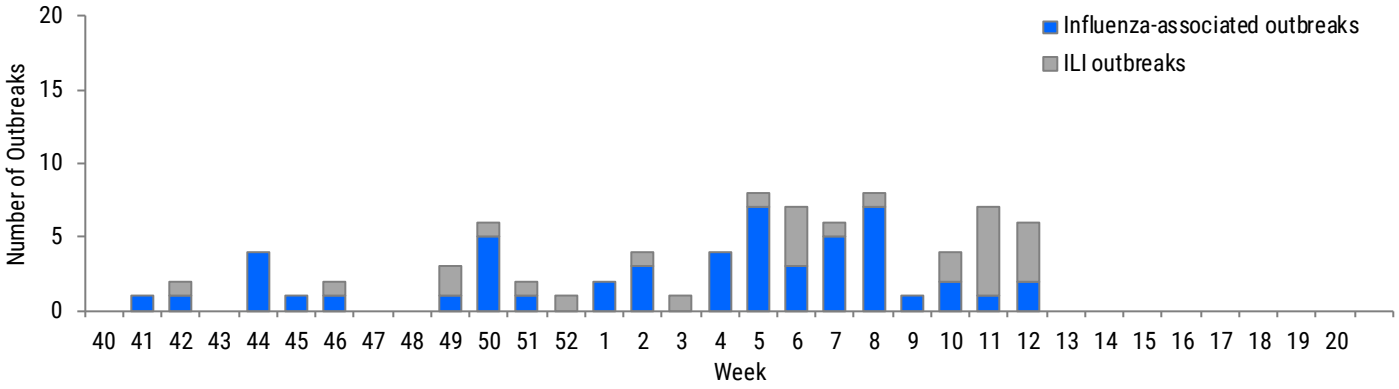
In week 12, two new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 12, **two ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 12, 2020.

Facilities Serving Adults ≥65 yrs.**:



6 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 12, six new outbreaks of influenza or ILI were reported among facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 12, **four ILI outbreaks** and **two influenza-associated outbreaks** were reported among **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 12, 2020.

AMERICAN OVERSIGHT

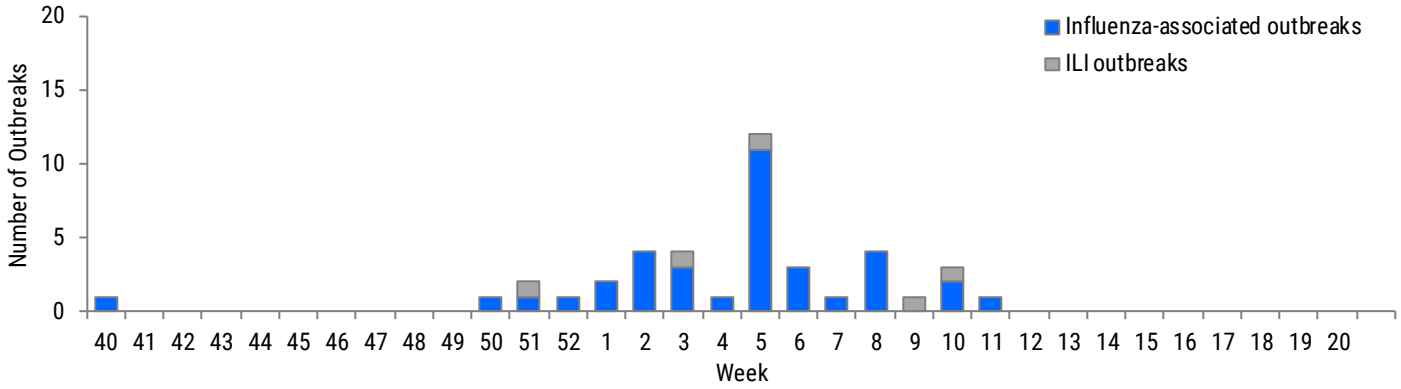
Influenza and ILI Outbreaks

Other Facilities*:



0 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 12, no new outbreaks of influenza or ILI were reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 12, no new outbreaks were reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 12, 2020.

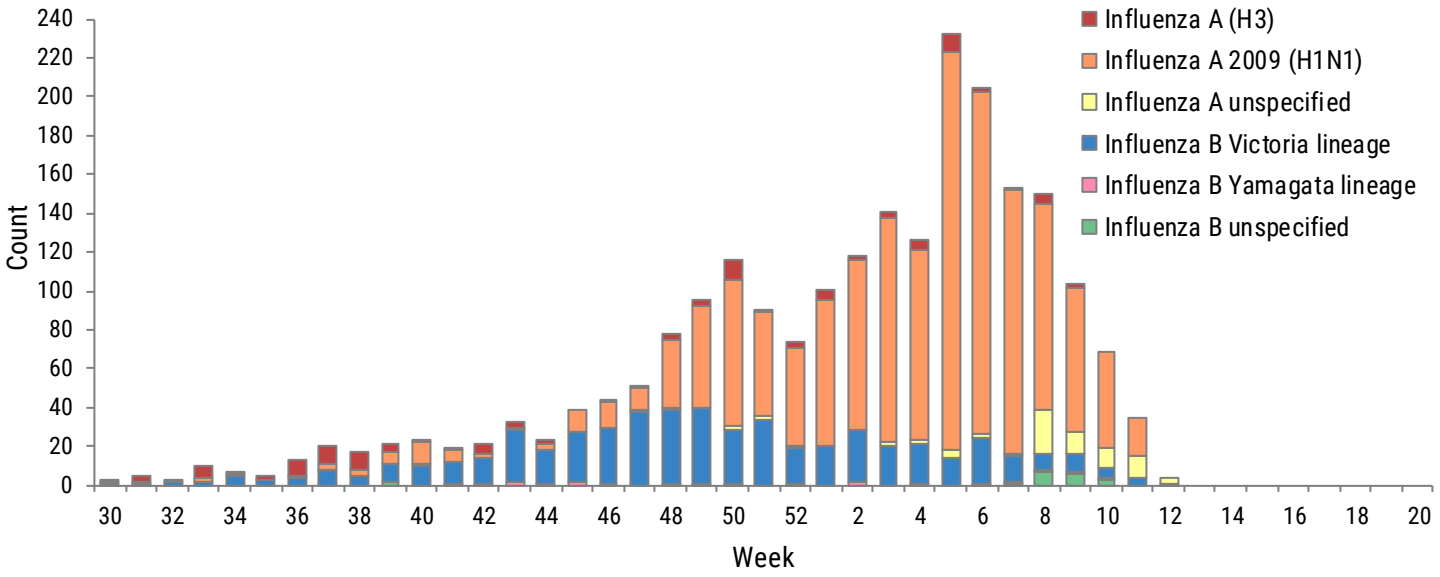


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	137 (45.8%)	84 influenza-associated outbreaks 53 ILI outbreaks
Child daycares	41 (13.7%)	17 influenza-associated outbreaks 24 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	26 (8.7%)	12 influenza-associated outbreaks 14 ILI outbreaks
Nursing facilities	19 (6.4%)	14 influenza-associated outbreaks 5 ILI outbreaks
Other long-term care facilities	35 (11.7%)	26 influenza-associated outbreaks 9 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	33 (11.0%)	31 influenza-associated outbreaks 2 ILI outbreaks
Hospitals	3 (1.0%)	2 influenza-associated outbreaks 1 ILI outbreak
Additional facility types	5 (1.7%)	3 influenza-associated outbreaks 2 ILI outbreaks
Total	**299 (100.0%)**	**189 influenza-associated outbreaks** **110 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 12, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 12, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits with discharge diagnoses of influenza or flu** at ESSENCE-FL participating facilities (n=370) from week 40, 2016 to week 12, 2020. Data are organized by region (see Figure 23).

2019-20
Previous 3-season average

Figure 16: In **region 1, influenza and flu activity decreased** during week 12 but remained slightly above the previous three-season average for this time.*

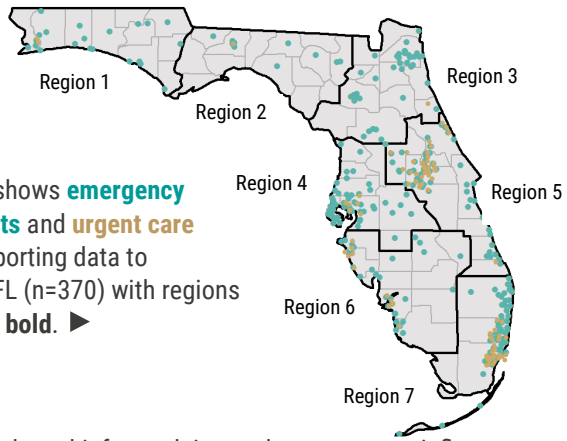

Figure 23 shows **emergency departments** and **urgent care centers** reporting data to ESSENCE-FL (n=370) with regions **outlined in bold**. ▶

*Of note, the queries used to capture these data now utilizes discharge diagnoses rather than chief complaints to better capture influenza activity trends in Florida.

AMERICAN OVERSIGHT

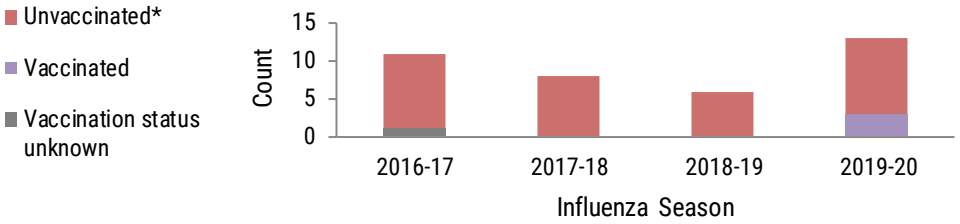
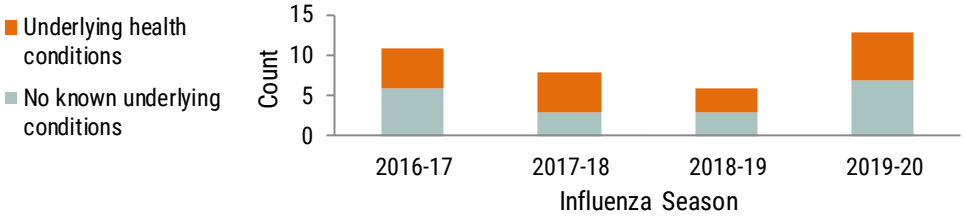
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 12, **the percent of emergency department and urgent care center visits with a discharge diagnosis of influenza or flu in children <18 years decreased** and was similar to the previous three-season average for this time. Of note, the query used to capture these data now utilizes discharge diagnoses rather than chief complaints to better capture influenza activity trends in Florida.



◀ **Figure 24** shows **the percent visits with discharge diagnoses that contain influenza or flu among children <18 years** at emergency departments and urgent care centers, as reported into ESSENCE-FL, for the current season (week 40, 2019 to week 12, 2020) and the previous three-season average.

Figures 25-26: In week 12, **one new influenza-associated pediatric death was reported**. A total of 13 influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 12, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 12, 2020.

In week 12, **one new influenza-associated pediatric death was reported**. The death was associated with influenza A unspecified in a child with no known underlying health conditions who was not vaccinated for the 2019-20 season.

A total of 13 influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in March or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm.

AMERICAN OVERSIGHT

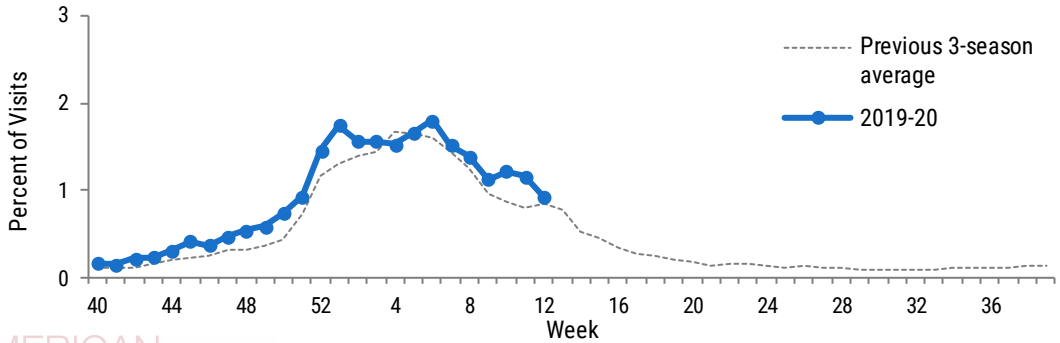
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 12, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was within levels observed at this time during previous seasons.



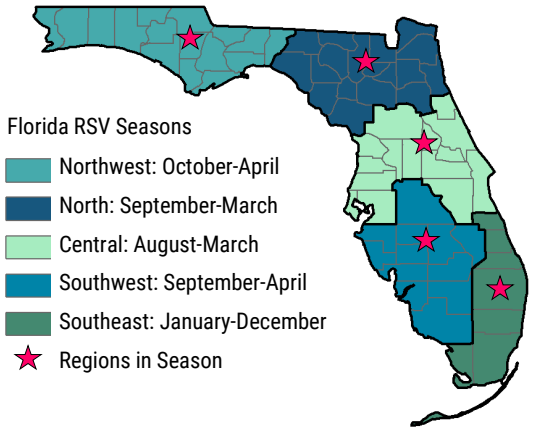
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 12, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 12, the **percent of emergency department and urgent care center visits with a discharge diagnosis of influenza or flu in adults ≥65 years decreased** and similar to the previous three-season average for this time. Of note, the query used to capture these data now utilizes discharge diagnoses rather than chief complaints to better capture influenza activity trends in Florida.



◀ **Figure 28** shows **the percent of visits with discharge diagnoses that contain influenza or flu among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, for the current season (week 40, 2019 to week 12, 2020) and the previous three-season average.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

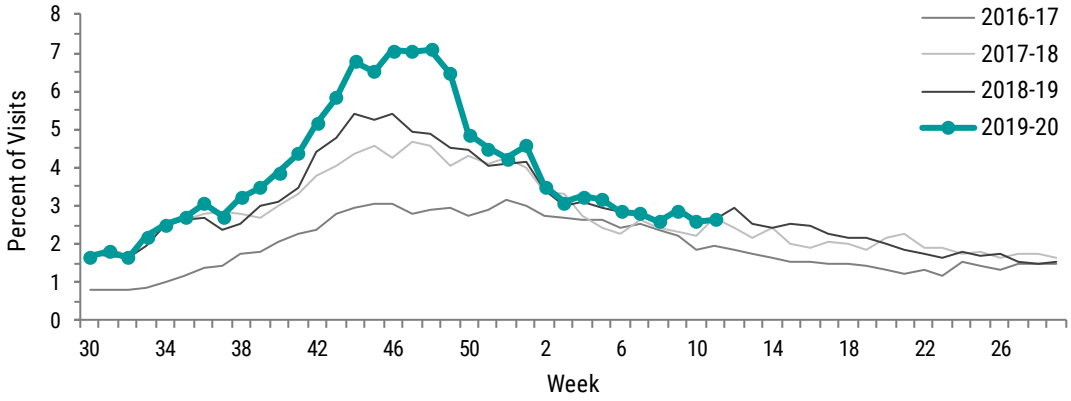
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

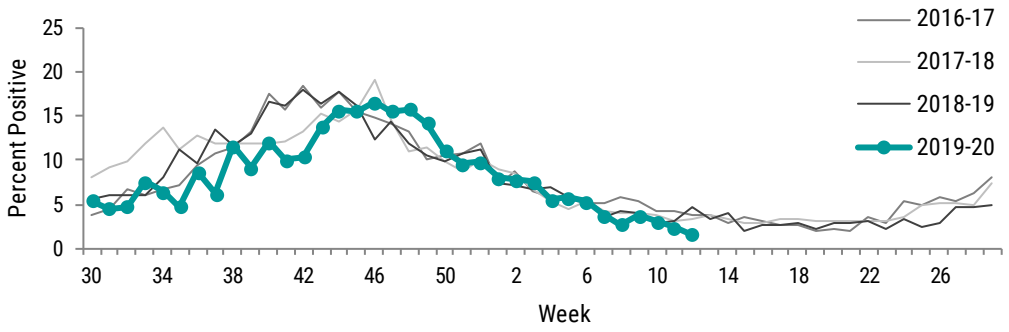
Week 12 (March 15-21, 2020) Activity Summary

In week 12, RSV activity in children <5 years increased and was similar to levels observed at this time in previous seasons.

No new RSV-associated outbreaks were reported in week 12. A total of ten RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 12, **the percent of emergency department and urgent care center visits for RSV among children <5 years increased** and was similar to levels observed at this time in previous seasons.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 12, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

◀ **Figure 37*** shows **the number of PCR-positive laboratory findings for seasonal coronaviruses NL63, HKU1, OC43, and 229E** by week** among specimens submitted to BPHL for extended respiratory panel testing.

Figure 38* shows **the ▶ number of PCR-positive laboratory findings for human metapneumovirus and adenovirus** by week** among specimens submitted to BPHL for extended respiratory panel testing.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 12, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Long-term care facility	Washington	7	2	0	Unknown	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza and flu-related visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=370) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional figures, percentages are calculated as the proportion of ED and UCC visits to participating facilities that include the words “influenza” or “flu” in the discharge diagnoses (with certain exceptions).

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly influenza-like illness (ILI) and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For health care providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida’s geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county’s influenza and ILI surveillance data weekly into The Florida Department of Health’s EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida’s reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 12, 2020 Florida Flu Review
Date:	Wednesday, March 25, 2020 3:52:43 PM
Attachments:	Week 12, 2020 Florida Flu Review.pdf

Good Afternoon!

Attached is the Week 12, 2020 Florida Flu Review.

Week 12 influenza & influenza-like illness (ILI) activity summary:

Statewide, the percentage of respiratory specimens testing positive for influenza continued to decrease.

Likewise, the percent of emergency department and urgent care center visits with discharge diagnoses that include influenza or flu decreased in recent weeks. Activity in week 12 was similar to an average of the past three influenza seasons for this time.

Of note, some of the figures in this report that previously displayed chief complaints of ILI were updated to display discharge diagnoses of influenza or flu to better reflect influenza activity trends in Florida.

Eight outbreaks were reported, down from eleven outbreaks in the previous week. Of the eight outbreaks reported, two were influenza-associated and six were ILI.

One new influenza-associated pediatric death was reported. Thirteen influenza-associated pediatric deaths have been reported so far this season; the majority these deaths were children who were not vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend vaccination as long as influenza viruses are circulating. Annual vaccination is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).

AMERICAN OVERSIGHT

- Avoid touching your eyes, nose, and mouth.
- If you do get sick with influenza, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Thank you!

Julia Munroe, MS
Respiratory Disease Epidemiologist
Bureau of Epidemiology
Division of Disease Control and Health Protection
Florida Department of Health
Office Phone: 850-901-6936

Mission: To protect, promote, and improve the health of all people in Florida through integrated state, county, and community efforts.

Please note: Florida has a very broad public records law. Most written communications to or from state officials regarding state business are public records available to the public and media upon request. Your email communications may therefore be subject to public disclosure.

Florida ILI Surveillance System Summary 16

Background

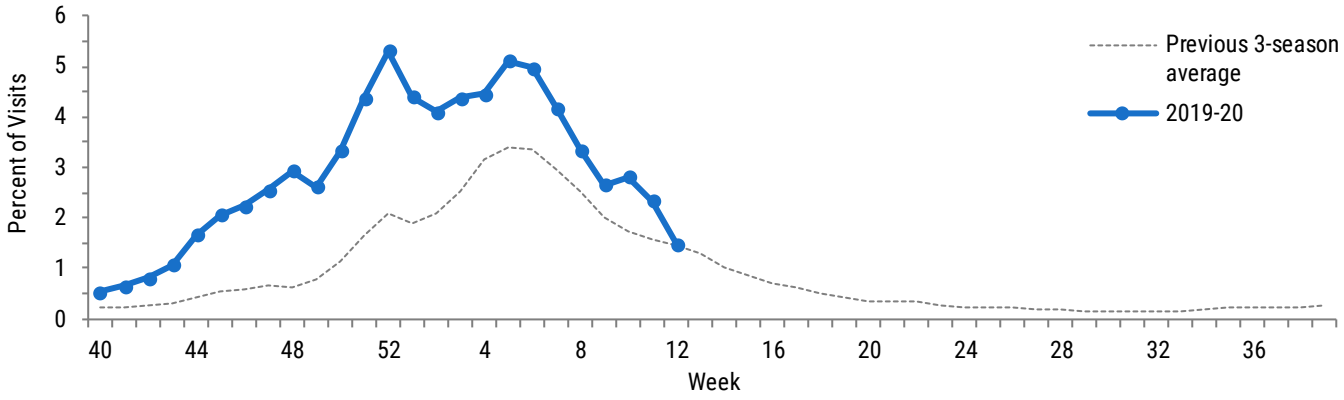
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



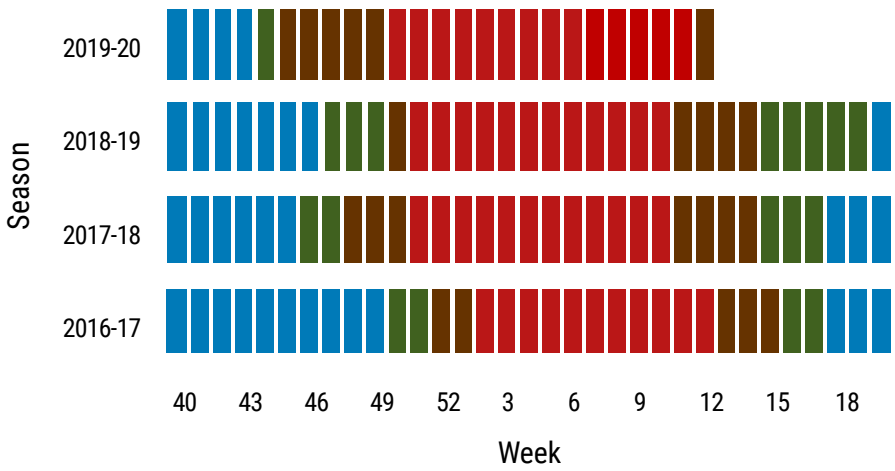
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 12, **the percent of emergency department and urgent care center visits with a discharge diagnosis of influenza or flu statewide decreased** and was similar to the previous three-season average for this time. Of note, the query used to capture these data now utilizes discharge diagnoses rather than chief complaints to better capture influenza activity trends in Florida.



▲ **Figure 1** shows **the percent of visits with discharge diagnoses that include influenza or flu** (with certain exceptions) for facilities participating in ESSENCE-FL (n=370) statewide for the current season (week 40, 2019 to week 12, 2020) and the previous three season average (2018-19, 2017-18, and 2016-17). Of note, influenza may not be laboratory-confirmed for all the visits included in this query. For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 12, Florida reported **regional geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 12, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

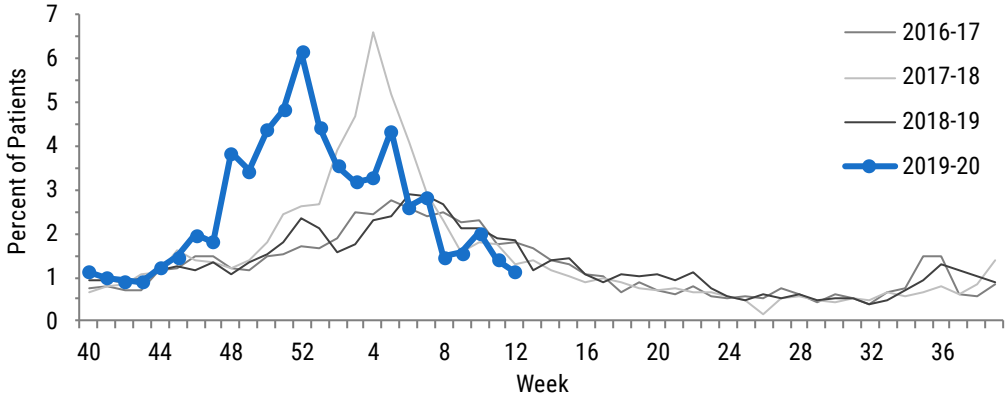
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 12, **the percent of patients with ILI reported by ILINet providers statewide decreased** and was below levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=7), week 40, 2016 to week 12, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



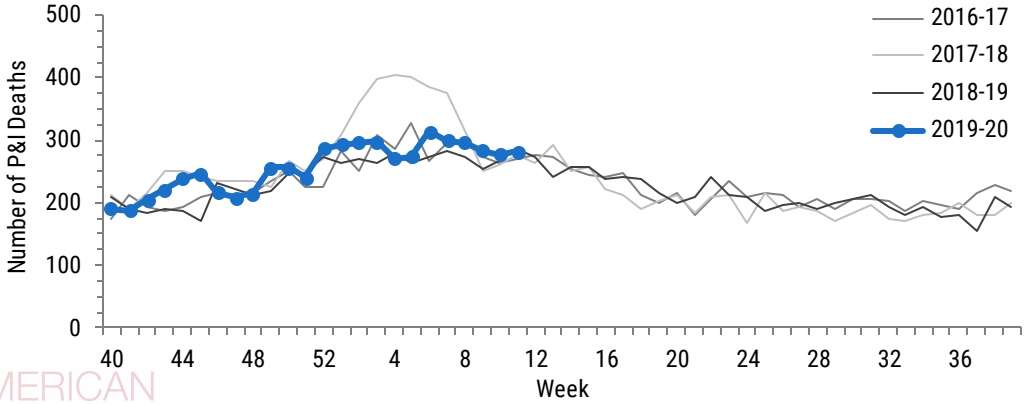


Figure 4: In week 11 (ending 3/14/20), **the number of pneumonia and influenza deaths identified statewide increased slightly** and was similar to levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 11, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

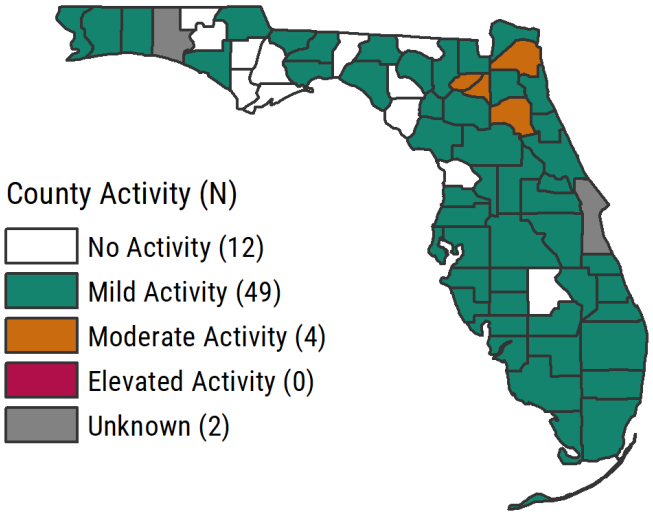
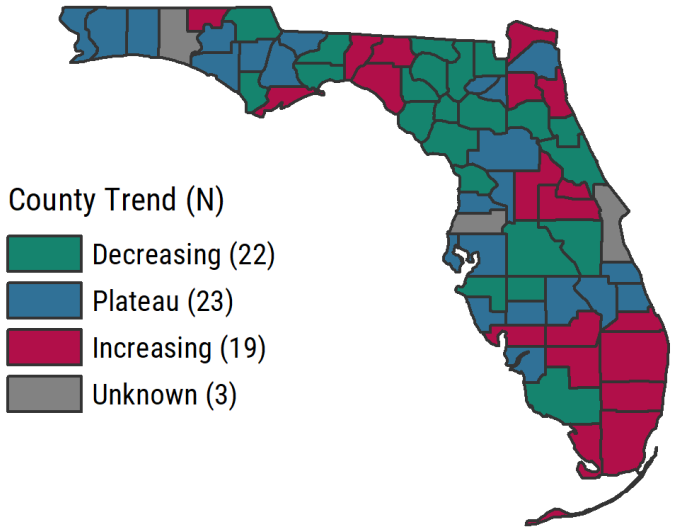
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 12. Four counties reported **moderate activity,** and no counties reported **elevated activity.**





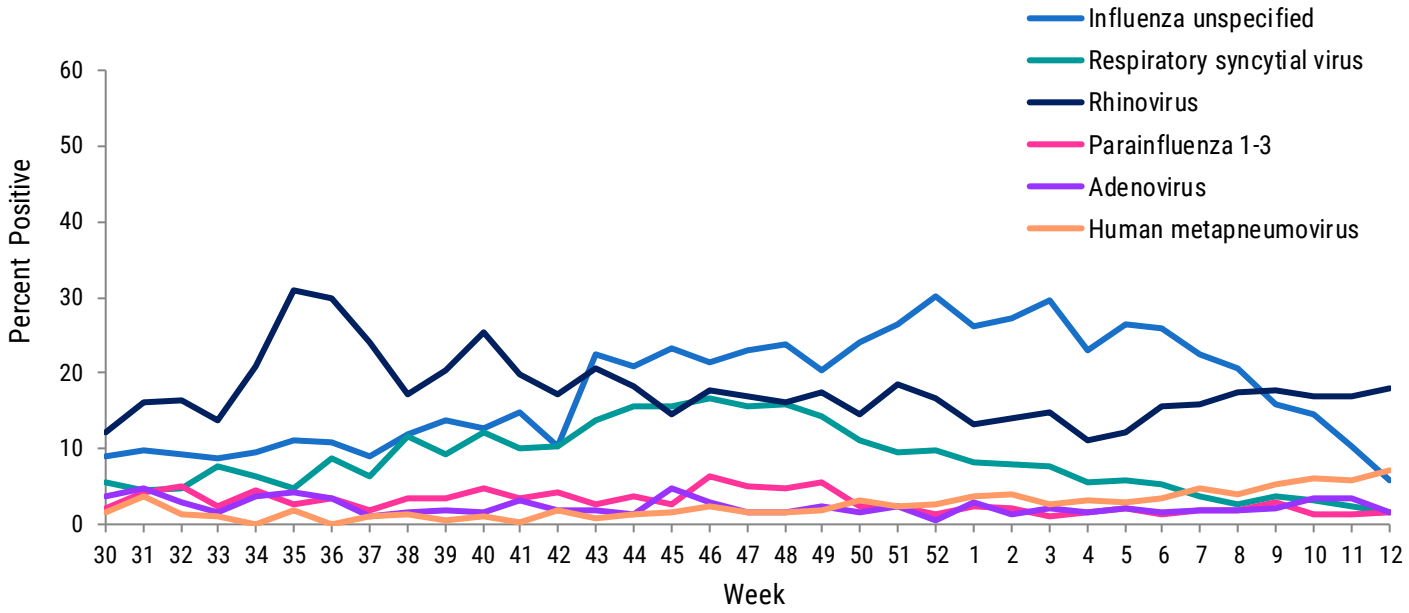


Figure 6: Most counties reported **activity at a plateau** for week 12. Nineteen counties reported **increasing activity,** and 22 counties reported **decreasing activity**.

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 12, the **percent of specimens testing positive for rhinovirus increased** and was higher than other respiratory viruses under surveillance (including influenza). The **percent of specimens testing positive for influenza decreased notably** in recent weeks.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=8), week 40, 2019 to week 12, 2020.

AMERICAN OVERSIGHT

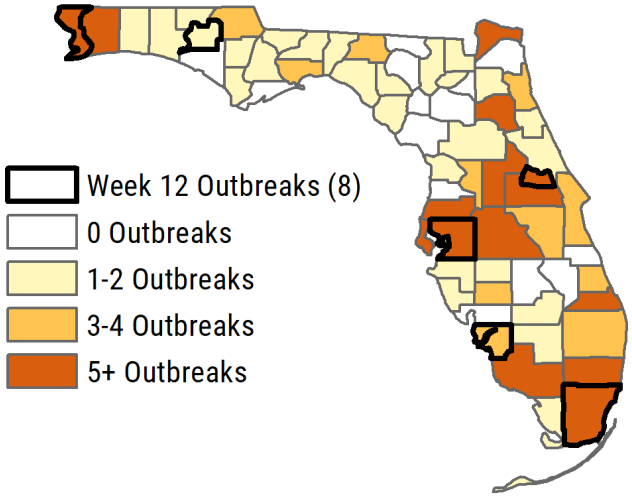
Influenza and ILI Outbreaks

Week 12 Outbreaks at a Glance:

Number Reported:
8 Outbreaks

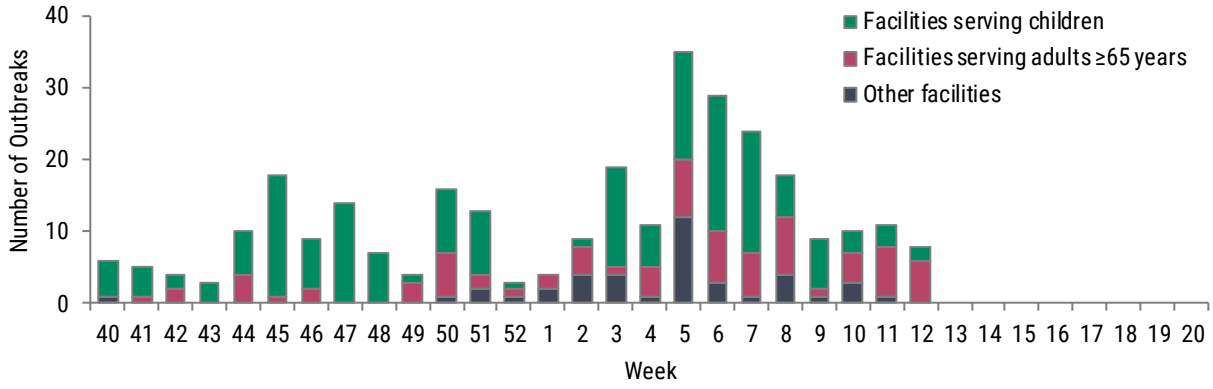
Influenza-Associated:
2 Outbreaks



Severe Outcomes*:
2 Outbreaks

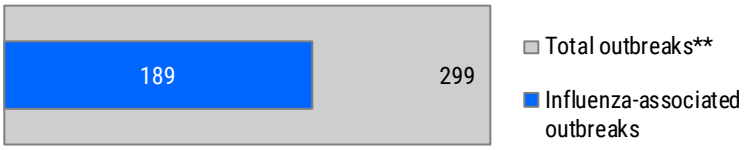
Outbreak Summary:

In week 12, two influenza-associated and six ILI outbreaks were reported, a slight increase from the previous week.



Severe outcomes* were reported in two of eight outbreaks. One or more hospitalizations and no deaths were reported in these outbreaks.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). Both of the outbreaks with severe outcomes in week 12 were in facilities serving adults aged ≥65 years.



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 12 are **outlined in bold.**

Figure 9: In week 12, **six outbreaks** were reported among **facilities serving adults aged ≥65 years, two outbreaks** were reported in **facilities serving children,** and **no outbreaks** were reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 12, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 12, **63.2% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 12, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

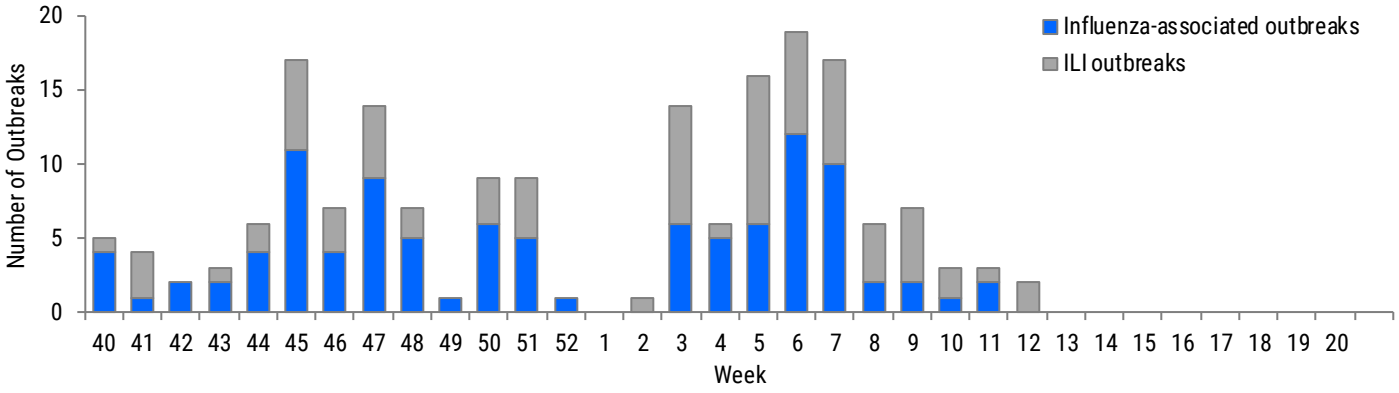
Influenza and ILI Outbreaks

Facilities Serving Children*:



2 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

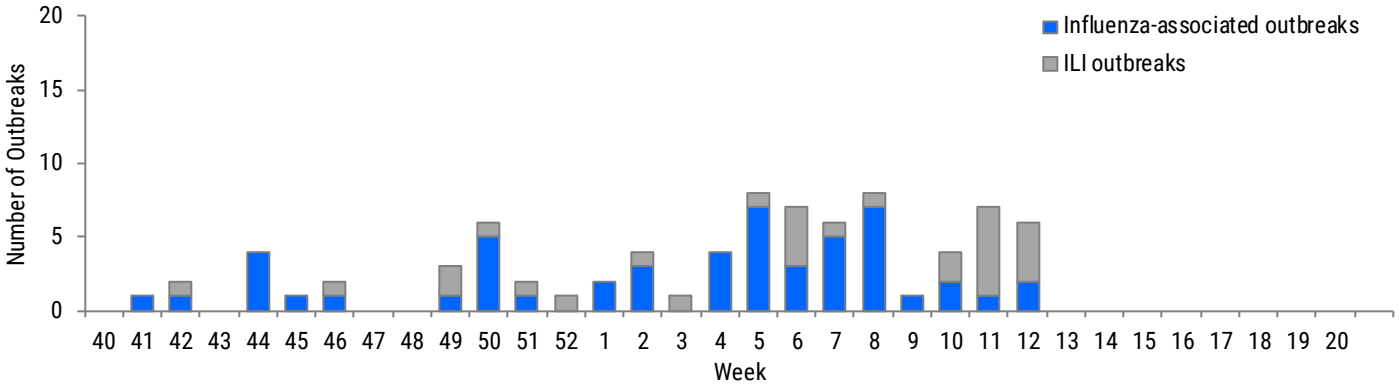
In week 12, two new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 12, **two ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 12, 2020.

Facilities Serving Adults ≥65 yrs.**:



6 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 12, six new outbreaks of influenza or ILI were reported among facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 12, **four ILI outbreaks** and **two influenza-associated outbreaks** were reported among **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 12, 2020.

AMERICAN OVERSIGHT

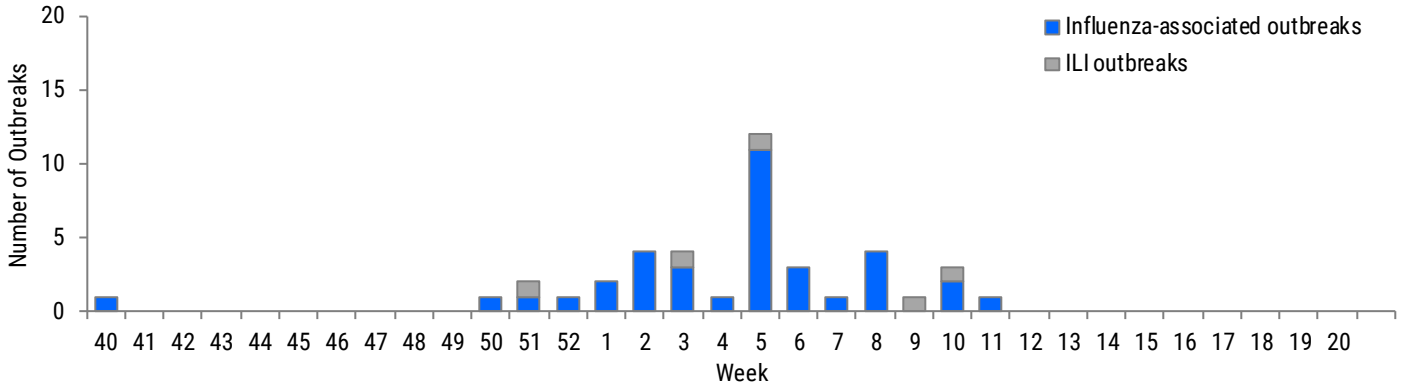
Influenza and ILI Outbreaks

Other Facilities*:



0 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 12, no new outbreaks of influenza or ILI were reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 12, no new outbreaks were reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 12, 2020.

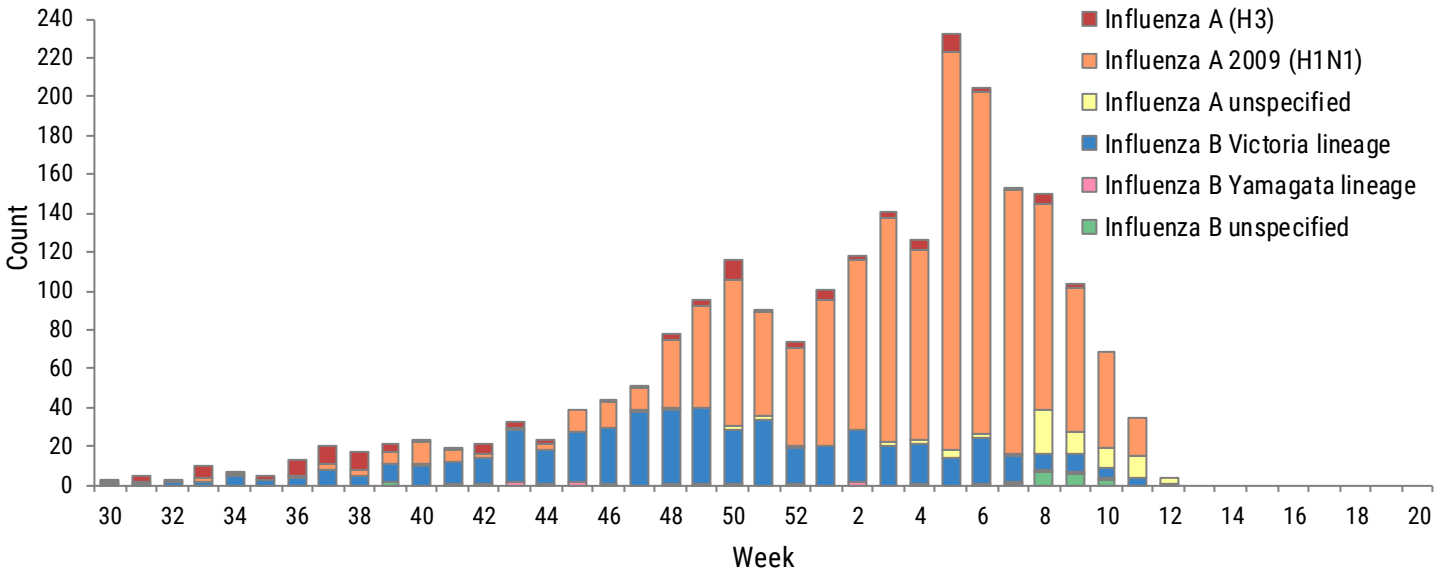


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	137 (45.8%)	84 influenza-associated outbreaks 53 ILI outbreaks
Child daycares	41 (13.7%)	17 influenza-associated outbreaks 24 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	26 (8.7%)	12 influenza-associated outbreaks 14 ILI outbreaks
Nursing facilities	19 (6.4%)	14 influenza-associated outbreaks 5 ILI outbreaks
Other long-term care facilities	35 (11.7%)	26 influenza-associated outbreaks 9 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	33 (11.0%)	31 influenza-associated outbreaks 2 ILI outbreaks
Hospitals	3 (1.0%)	2 influenza-associated outbreaks 1 ILI outbreak
Additional facility types	5 (1.7%)	3 influenza-associated outbreaks 2 ILI outbreaks
Total	**299 (100.0%)**	**189 influenza-associated outbreaks** **110 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 12, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 12, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits with discharge diagnoses of influenza or flu** at ESSENCE-FL participating facilities (n=370) from week 40, 2016 to week 12, 2020. Data are organized by region (see Figure 23).

2019-20

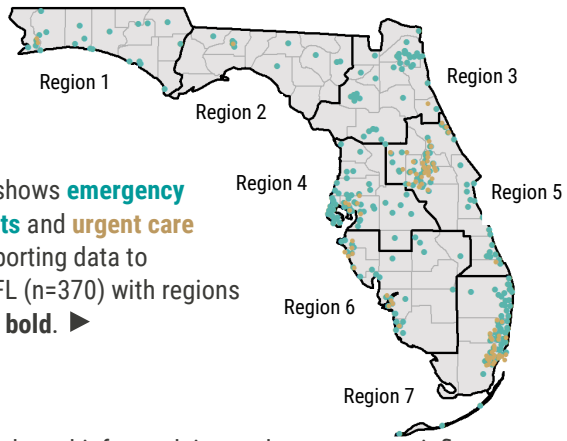

Figure 23 shows **emergency departments** and **urgent care centers** reporting data to ESSENCE-FL (n=370) with regions **outlined in bold**. ▶

*Of note, the queries used to capture these data now utilizes discharge diagnoses rather than chief complaints to better capture influenza activity trends in Florida.

AMERICAN OVERSIGHT

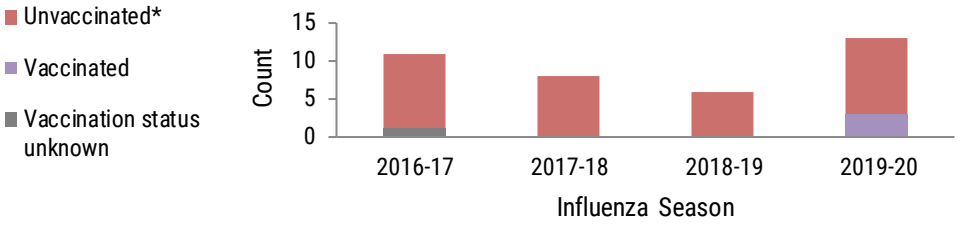
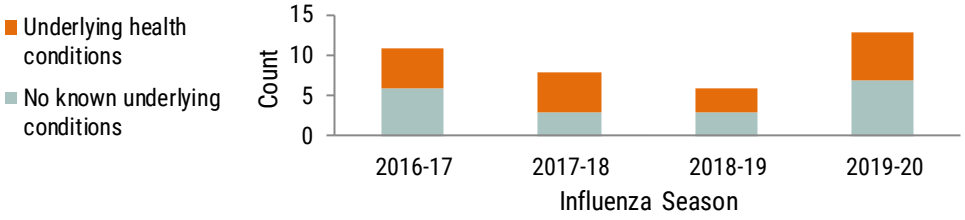
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 12, **the percent of emergency department and urgent care center visits with a discharge diagnosis of influenza or flu in children <18 years decreased** and was similar to the previous three-season average for this time. Of note, the query used to capture these data now utilizes discharge diagnoses rather than chief complaints to better capture influenza activity trends in Florida.



◀ **Figure 24** shows **the percent visits with discharge diagnoses that contain influenza or flu among children <18 years** at emergency departments and urgent care centers, as reported into ESSENCE-FL, for the current season (week 40, 2019 to week 12, 2020) and the previous three-season average.

Figures 25-26: In week 12, **one new influenza-associated pediatric death was reported**. A total of 13 influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 12, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 12, 2020.

In week 12, **one new influenza-associated pediatric death was reported**. The death was associated with influenza A unspecified in a child with no known underlying health conditions who was not vaccinated for the 2019-20 season.

A total of 13 influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in March or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm.

AMERICAN OVERSIGHT

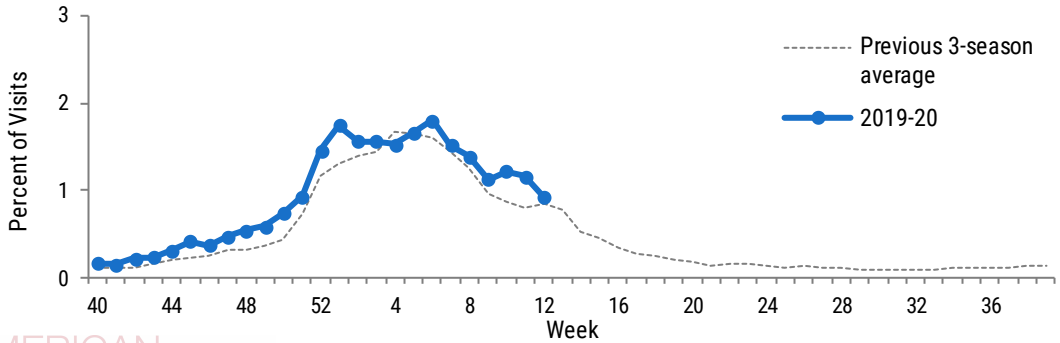
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 12, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was within levels observed at this time during previous seasons.



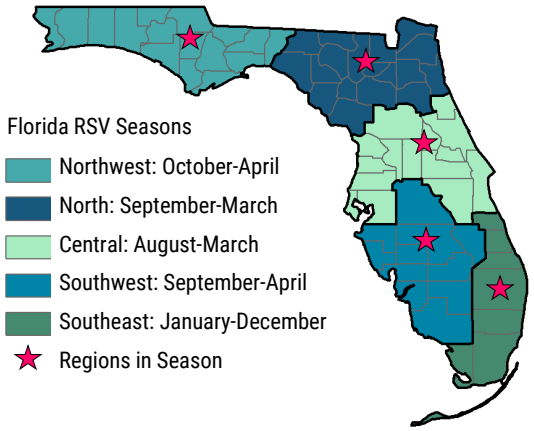
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 12, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 12, the **percent of emergency department and urgent care center visits with a discharge diagnosis of influenza or flu in adults ≥65 years decreased** and similar to the previous three-season average for this time. Of note, the query used to capture these data now utilizes discharge diagnoses rather than chief complaints to better capture influenza activity trends in Florida.



◀ **Figure 28** shows **the percent of visits with discharge diagnoses that contain influenza or flu among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, for the current season (week 40, 2019 to week 12, 2020) and the previous three-season average.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

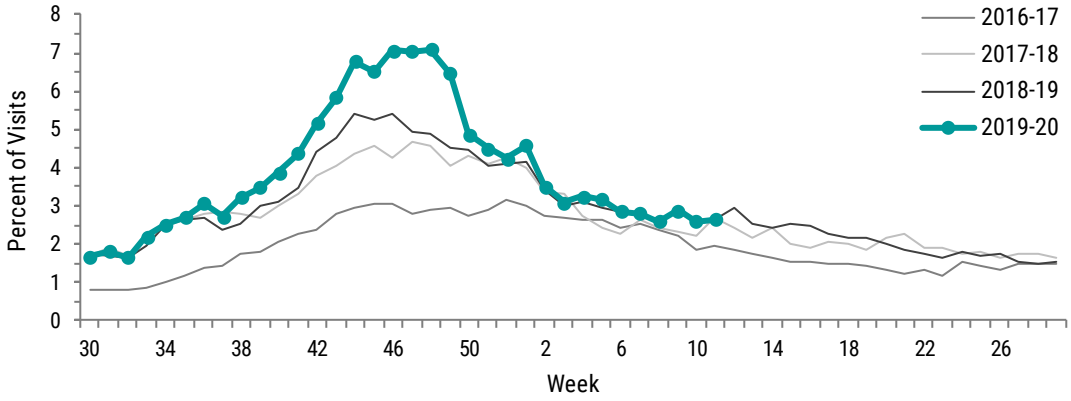
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

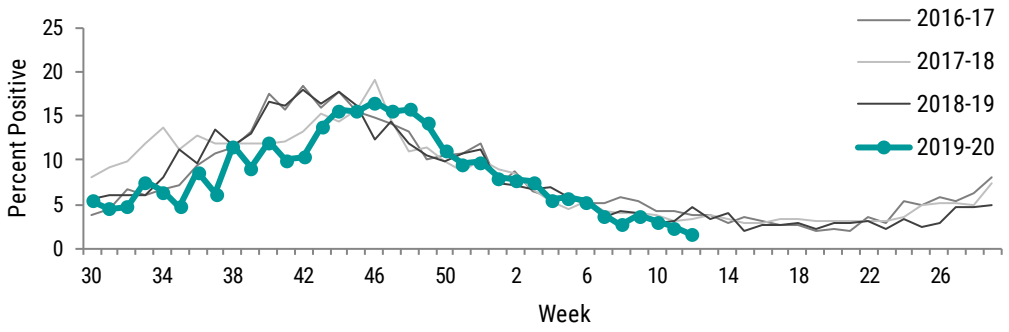
Week 12 (March 15-21, 2020) Activity Summary

In week 12, RSV activity in children <5 years increased and was similar to levels observed at this time in previous seasons.

No new RSV-associated outbreaks were reported in week 12. A total of ten RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 12, **the percent of emergency department and urgent care center visits for RSV among children <5 years increased** and was similar to levels observed at this time in previous seasons.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 12, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

AMERICAN OVERSIGHT

RSV Surveillance

Figure 31: In week 12, **the percent of specimens testing positive for RSV decreased.** Levels were below those observed at this time in previous seasons.

◀ **Figure 37*** shows **the number of PCR-positive laboratory findings for seasonal coronaviruses NL63, HKU1, OC43, and 229E** by week** among specimens submitted to BPHL for extended respiratory panel testing.

Figure 38* shows **the ▶ number of PCR-positive laboratory findings for human metapneumovirus and adenovirus** by week** among specimens submitted to BPHL for extended respiratory panel testing.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 12, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Long-term care facility	Washington	7	2	0	Unknown	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza and flu-related visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=370) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional figures, percentages are calculated as the proportion of ED and UCC visits to participating facilities that include the words “influenza” or “flu” in the discharge diagnoses (with certain exceptions).

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly influenza-like illness (ILI) and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For health care providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida’s geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county’s influenza and ILI surveillance data weekly into The Florida Department of Health’s EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida’s reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 5, 2020 Florida Flu Review
Date:	Wednesday, February 5, 2020 3:40:25 PM
Attachments:	Week 5, 2020 Florida Flu Review.pdf

Good Afternoon!

Attached is the Week 5, 2020 Florida Flu Review.

Week 5 influenza & influenza-like illness (ILI) activity summary:

Activity increased in week 5 and reached the highest level observed so far this season. Notable increases were observed in all regions of the state. Elevated activity is still expected for several more weeks.

Thirty-five outbreaks were reported, up from 11 outbreaks in the previous week. Of the 35 outbreaks reported, 19 were influenza-associated and 16 were ILI.

Two new influenza-associated pediatric deaths were reported. One child was not vaccinated for the 2019-20 season, and the other was too young to be vaccinated. Seven influenza-associated pediatric deaths have been reported so far this season, all in unvaccinated children.

Influenza A 2009 (H1N1) remained the predominant strain. Earlier in the season, influenza B Victoria lineage viruses were predominant. Influenza B Victoria lineage viruses continue to circulate at lower levels.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. Vaccination should continue as long as influenza viruses are circulating. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On January 10, 2020, CDC issued a health advisory reminding clinicians that influenza B viruses can cause severe illness in people of all ages and reiterating vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

AMERICAN OVERSIGHT

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Thank you!

Julia Munroe, MS
Respiratory Disease Epidemiologist
Bureau of Epidemiology
Division of Disease Control and Health Protection
Florida Department of Health
Office Phone: 850-901-6936

Mission: To protect, promote, and improve the health of all people in Florida through integrated state, county, and community efforts.

Please note: Florida has a very broad public records law. Most written communications to or from state officials regarding state business are public records available to the public and media upon request. Your email communications may therefore be subject to public disclosure.

Florida ILI Surveillance System Summary 16

Background

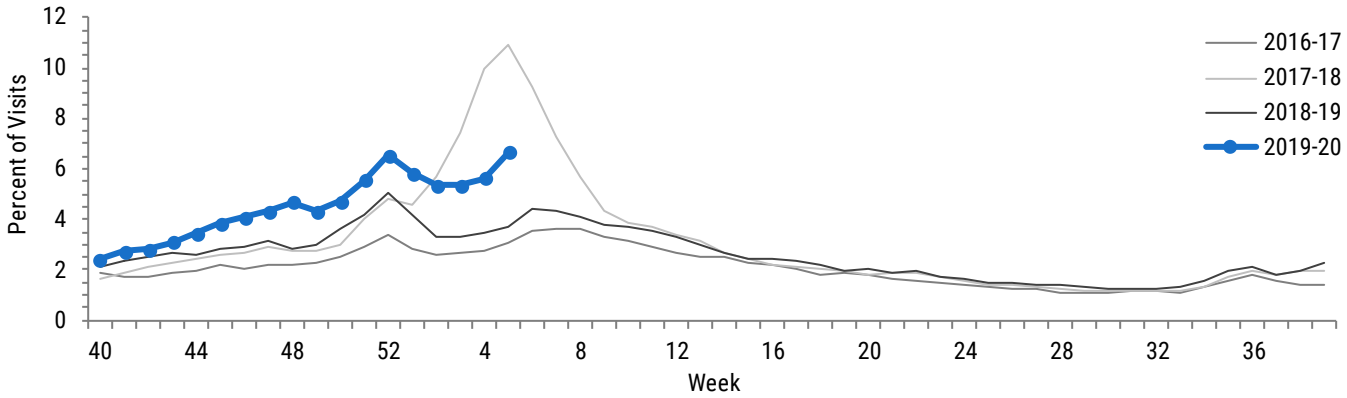
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



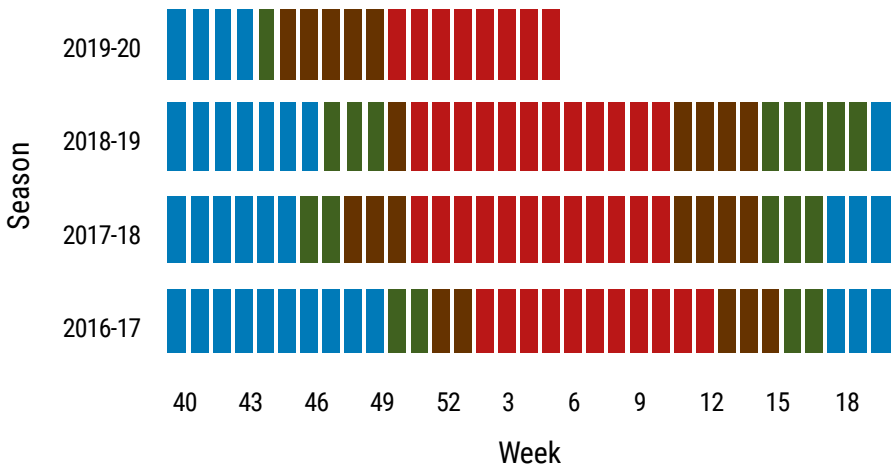
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 5, **the percent of emergency department and urgent care center visits for ILI statewide increased** and reached the highest level observed so far this season. Activity in week 5 was above peak levels observed during the 2018-19 and 2016-17 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=368) statewide for the current season (week 40, 2019 to week 5, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 5, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 5, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

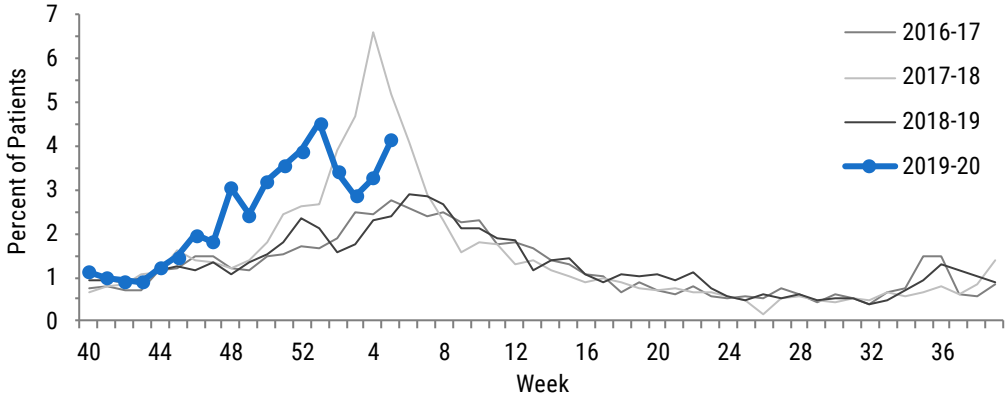
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 5, **the percent of patients with ILI reported by ILINet providers statewide increased** and was above peak levels observed during the 2018-19 and 2016-17 seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=9), week 40, 2016 to week 5, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



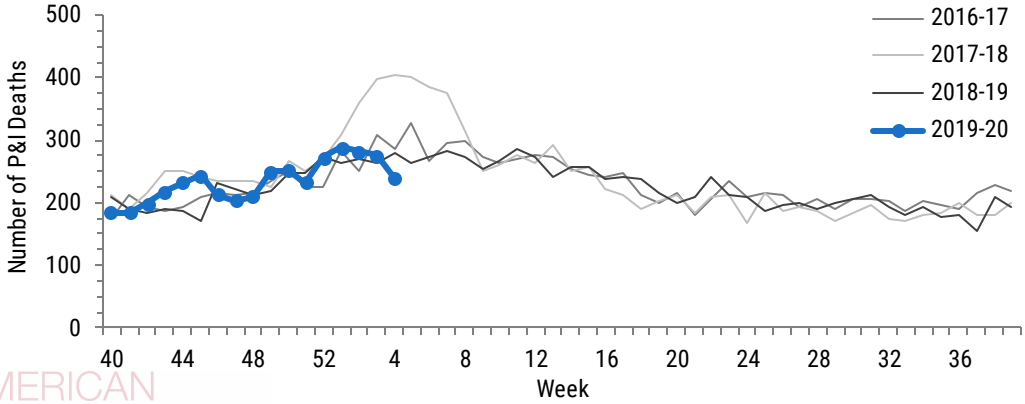


Figure 4: In week 4 (ending 1/25/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 4, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

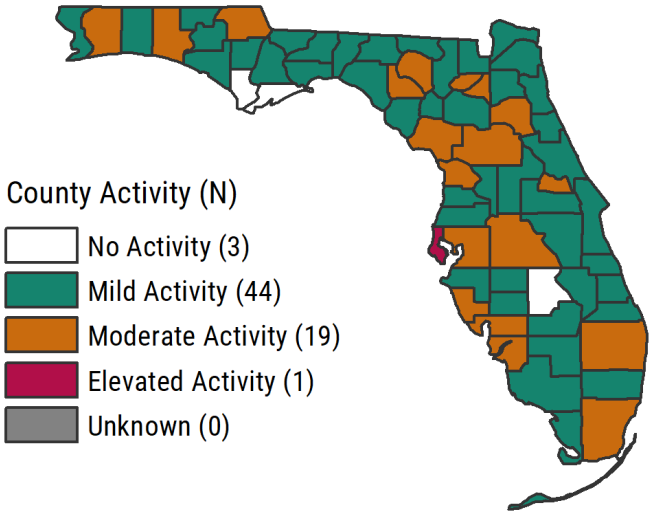
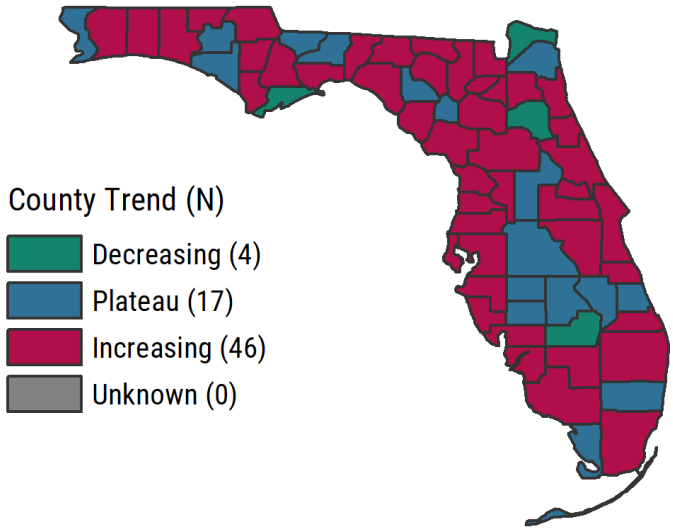
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 5. Nineteen counties reported **moderate activity,** and one county reported **elevated activity.**





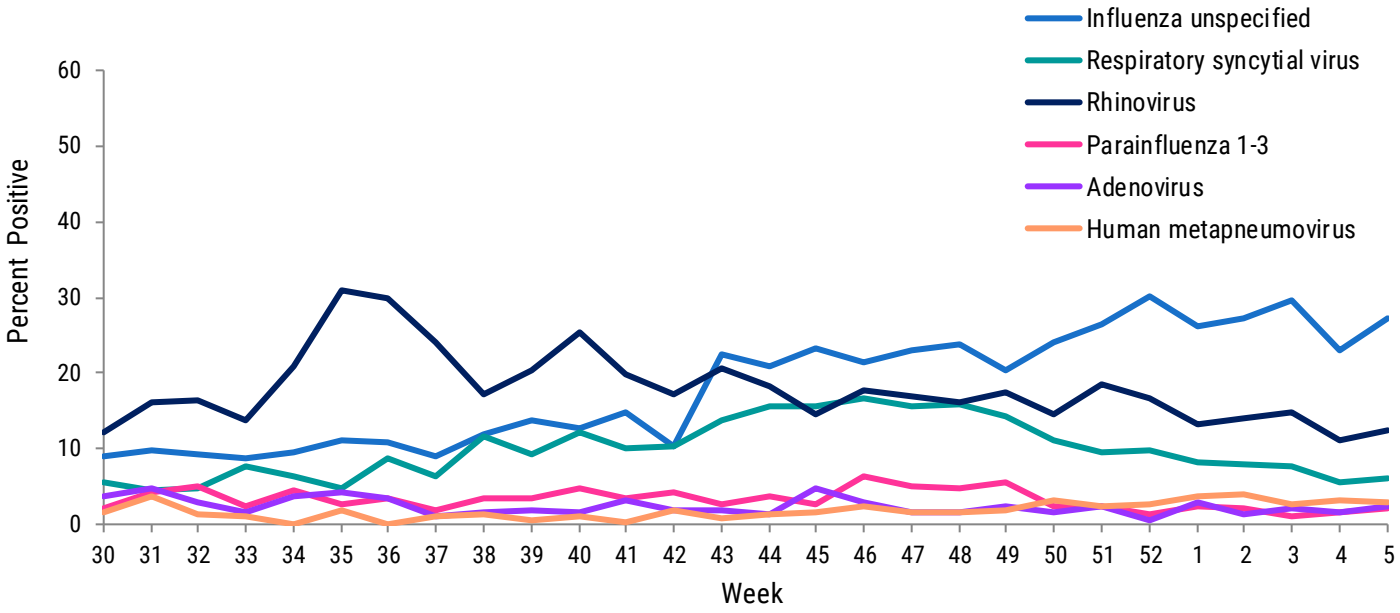


Figure 6: Most counties reported **increasing activity** in week 5. Seventeen counties reported **activity at a plateau,** and four counties reported **decreasing activity.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 5, the **percent of specimens testing positive for influenza** **increased** and remained higher than other respiratory viruses under surveillance.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=7), week 40, 2019 to week 5, 2020.

AMERICAN OVERSIGHT

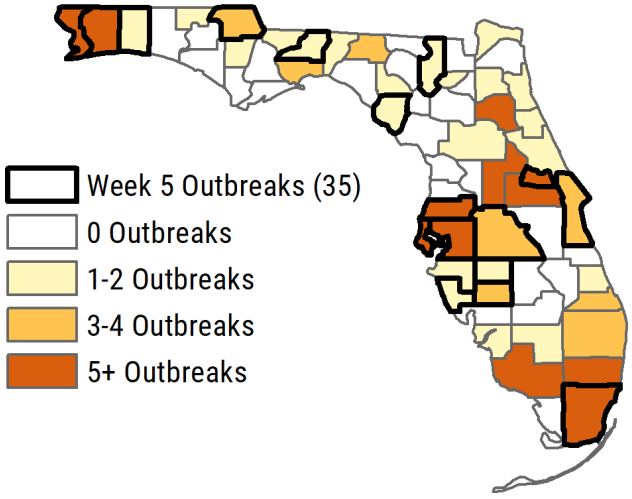
Influenza and ILI Outbreaks

Week 5 Outbreaks at a Glance:

Number Reported:
35 Outbreaks

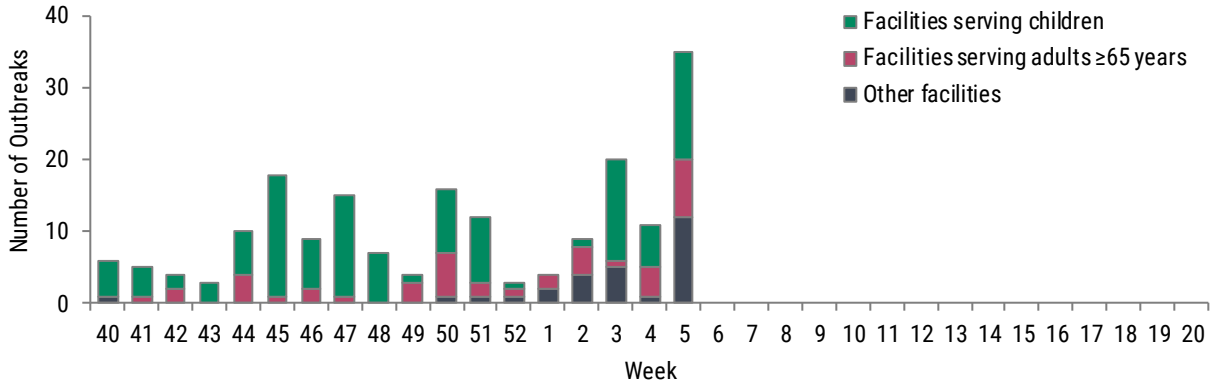
Influenza-Associated:
19 Outbreaks



Severe Outcomes*:
5 Outbreaks

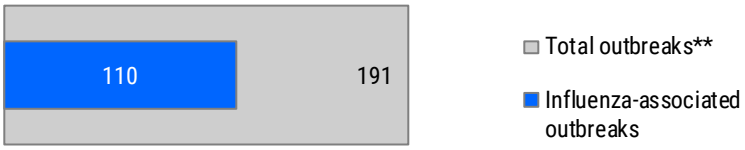
Outbreak Summary:

In week 5, 19 influenza-associated and 16 ILI outbreaks were reported, a notable increase from the previous week.



Severe outcomes* were reported in five of 35 outbreaks. One or more hospitalizations were reported in each of these five outbreaks. No deaths were reported.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 5, four of the five outbreaks with severe outcomes were in facilities serving adults aged ≥65 years.



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 5 are **outlined in bold.**

Figure 9: In week 5, **eight outbreaks** were reported in **facilities serving adults aged ≥65 years, 15 outbreaks** were reported in **facilities serving children,** and **12 outbreaks** were reported in **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 5, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 5, **57.6% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 5, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

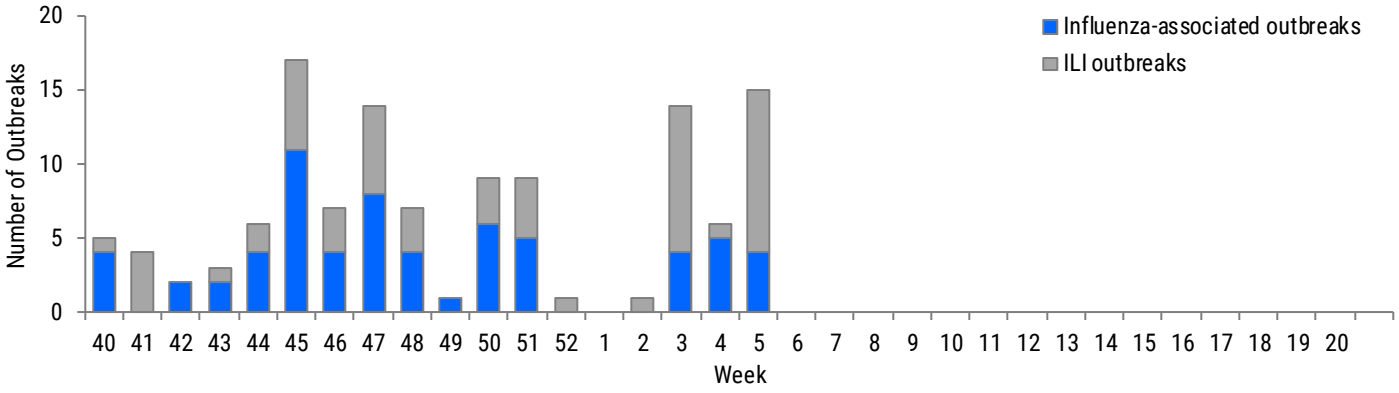
Influenza and ILI Outbreaks

Facilities Serving Children*:



15 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

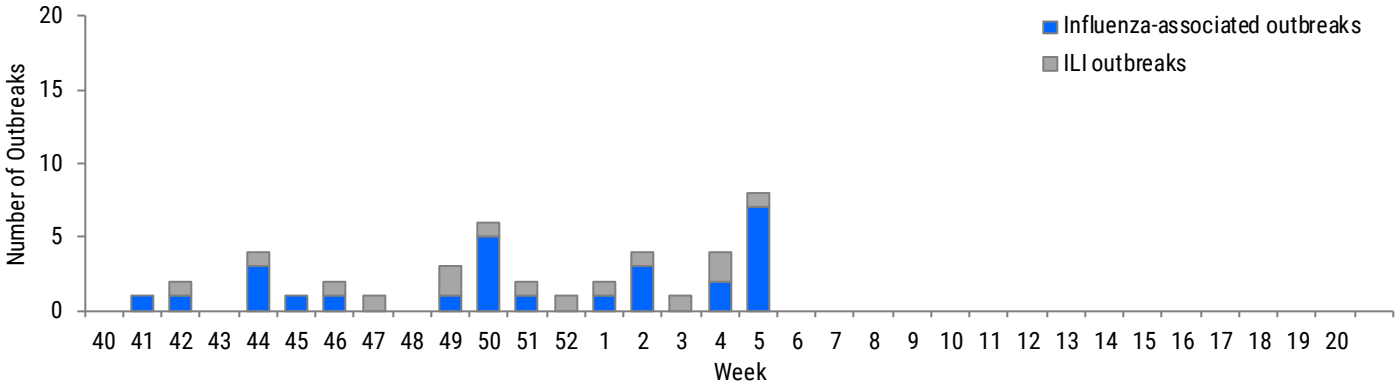
In week 5, 15 new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 5, **four influenza-associated outbreaks** and **11 ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 5, 2020.

Facilities Serving Adults ≥65 yrs.**:



8 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 5, eight new outbreaks of influenza or ILI were reported in facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 5, **seven influenza-associated outbreaks** and **one ILI outbreak** were reported in **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 5, 2020.

AMERICAN OVERSIGHT

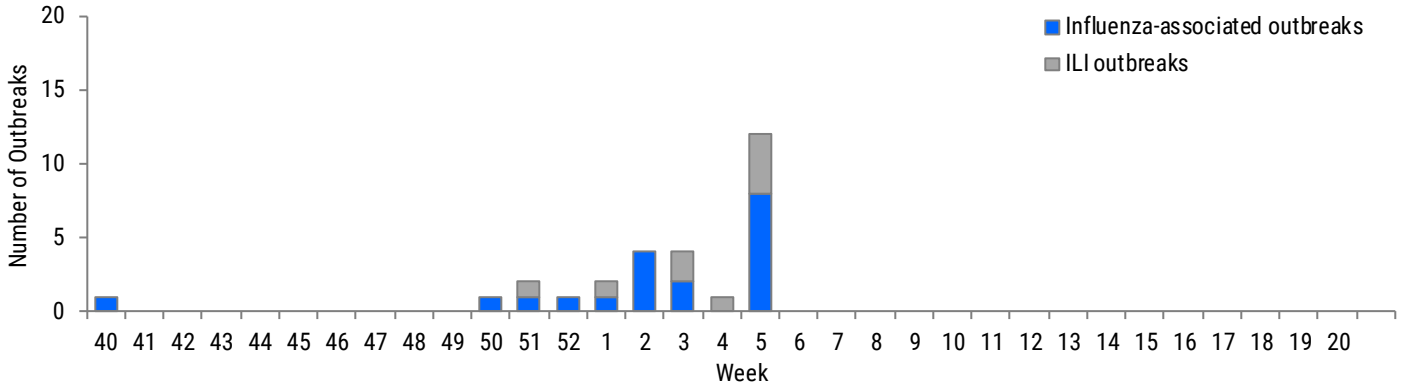
Influenza and ILI Outbreaks

Other Facilities*:



12 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 5, 12 new outbreaks of influenza or ILI were reported in other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 5, **eight influenza-associated outbreaks** and **four ILI outbreaks** were reported in **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 5, 2020.

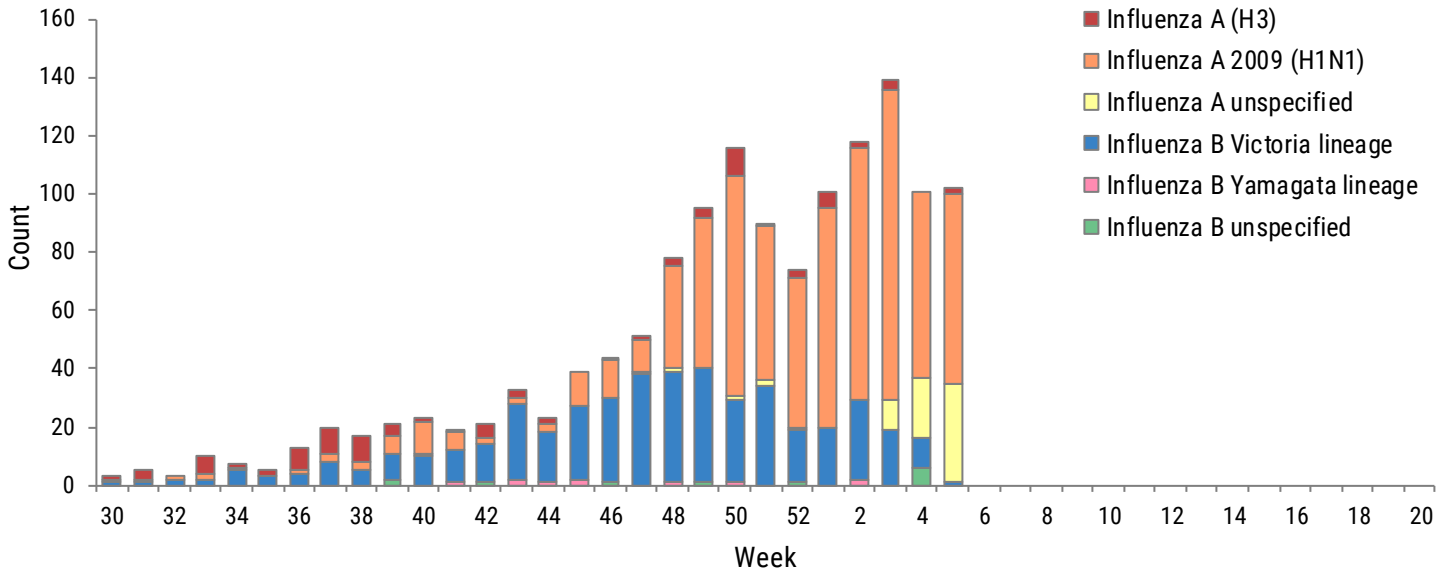


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	99 (51.8%)	55 influenza-associated outbreaks 44 ILI outbreaks
Child daycares	22 (11.5%)	9 influenza-associated outbreaks 13 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	13 (6.8%)	4 influenza-associated outbreaks 9 ILI outbreaks
Nursing facilities	10 (5.2%)	8 influenza-associated outbreaks 2 ILI outbreaks
Other long-term care facilities	19 (9.9%)	15 influenza-associated outbreaks 4 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	24 (12.6%)	16 influenza-associated outbreaks 8 ILI outbreak
Hospitals	2 (1.0%)	2 influenza-associated outbreaks 0 ILI outbreaks
Additional facility types	2 (1.0%)	1 influenza-associated outbreak 1 ILI outbreak
Total	**191 (100.0%)**	**110 influenza-associated outbreaks** **81 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 5, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 5, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=368) from week 40, 2016 to week 5, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

AMERICAN OVERSIGHT

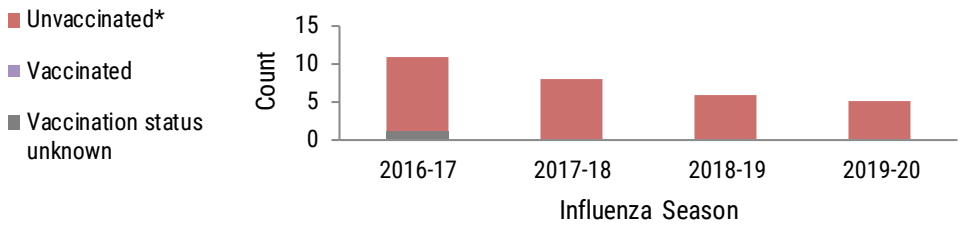
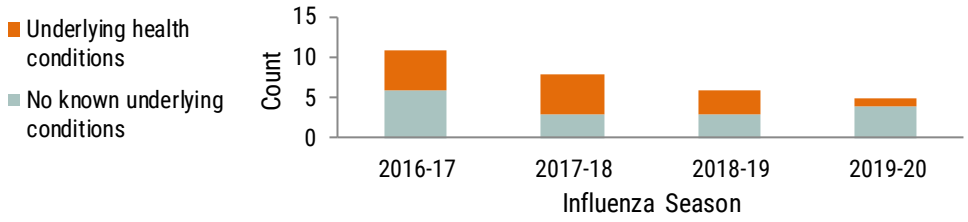
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 5, **the percent of emergency department and urgent care center visits for ILI in children <18 years increased** and was above peak activity observed during the 2018-19 and 2016-17 seasons.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 5, 2020.

Figures 25-26: In week 5, **two new influenza-associated pediatric deaths were reported,** one in an unvaccinated child and one in a child who was too young to be vaccinated. A total of seven influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 5, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 5, 2020.

In week 4, **two new influenza-associated pediatric deaths were reported**. One death was associated with influenza A unspecified in a child with no known underlying medical conditions. The other death was associated with influenza B unspecified in a child with an underlying medical condition. Neither child was vaccinated for the 2019-20 season.

A total of seven influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm

AMERICAN OVERSIGHT

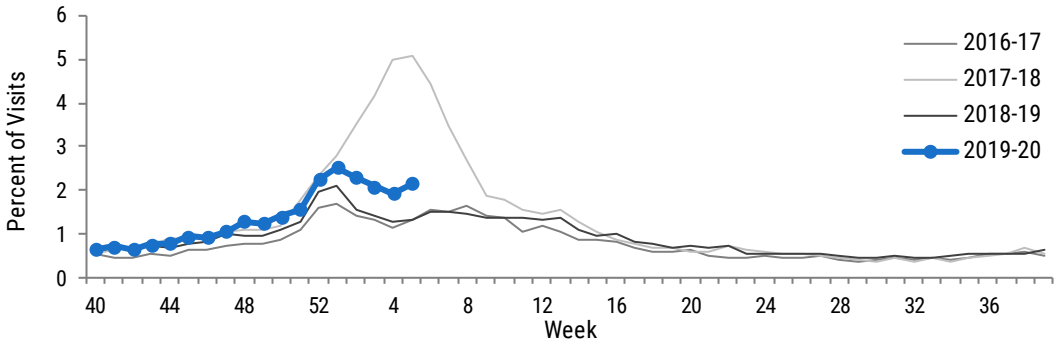
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 5, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was within levels observed at this time in past seasons.



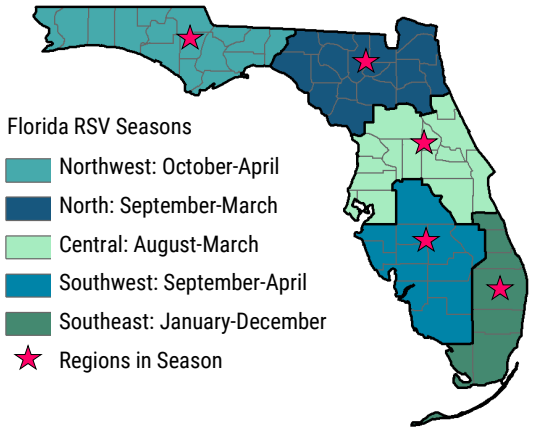
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 5, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 5, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years increased** and was above peak activity levels observed during the 2018-19 and 2016-17 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 5, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

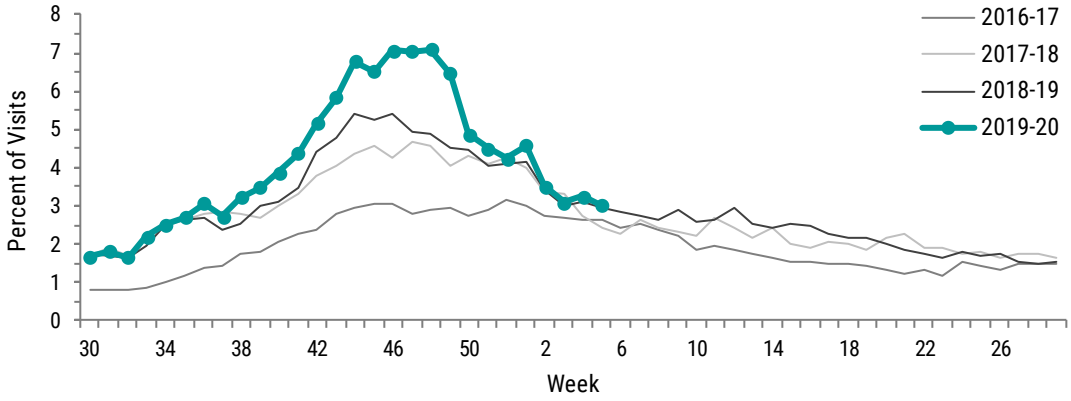
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

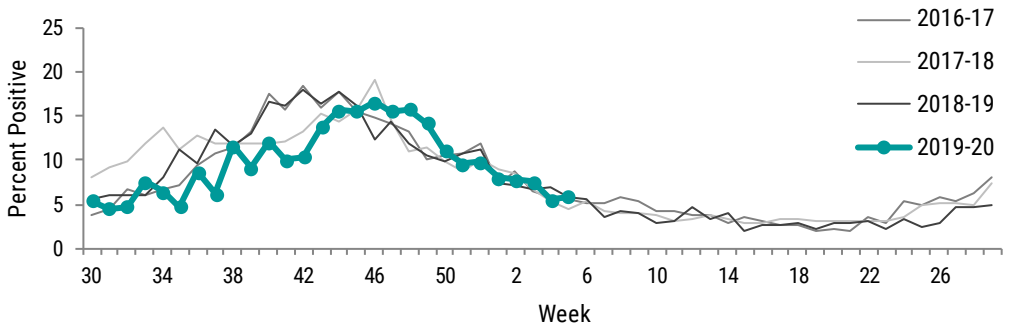
Week 5 (January 26-February 1, 2020) Activity Summary

In week 5, RSV activity in children <5 years decreased and was similar to levels observed at this time in 2019.

No new RSV-associated outbreaks were reported. A total of eight RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 5, **the percent of emergency department and urgent care center visits for RSV among children <5 years decreased** and was similar to levels observed at this time in 2019.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 5, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

Primary or secondary school	Santa Rosa	100	Unknown	Unknown	Unknown	Unknown	Open
Primary or secondary school	Okaloosa	88	Unknown	Unknown	Unknown	Unknown	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=368) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Good Afternoon!

Attached is the Week 5, 2020 Florida Flu Review.

Week 5 influenza & influenza-like illness (ILI) activity summary:

Activity increased in week 5 and reached the highest level observed so far this season. Notable increases were observed in all regions of the state. Elevated activity is still expected for several more weeks.

Thirty-five outbreaks were reported, up from 11 outbreaks in the previous week. Of the 35 outbreaks reported, 19 were influenza-associated and 16 were ILI.

Two new influenza-associated pediatric deaths were reported. One child was not vaccinated for the 2019-20 season, and the other was too young to be vaccinated. Seven influenza-associated pediatric deaths have been reported so far this season, all in unvaccinated children.

Influenza A 2009 (H1N1) remained the predominant strain. Earlier in the season, influenza B Victoria lineage viruses were predominant. Influenza B Victoria lineage viruses continue to circulate at lower levels.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. Vaccination should continue as long as influenza viruses are circulating. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On January 10, 2020, CDC issued a health advisory reminding clinicians that influenza B viruses can cause severe illness in people of all ages and reiterating vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

AMERICAN OVERSIGHT

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Thank you!

Julia Munroe, MS
Respiratory Disease Epidemiologist
Bureau of Epidemiology
Division of Disease Control and Health Protection
Florida Department of Health
Office Phone: 850-901-6936

Mission: To protect, promote, and improve the health of all people in Florida through integrated state, county, and community efforts.

Please note: Florida has a very broad public records law. Most written communications to or from state officials regarding state business are public records available to the public and media upon request. Your email communications may therefore be subject to public disclosure.

Florida ILI Surveillance System Summary 16

Background

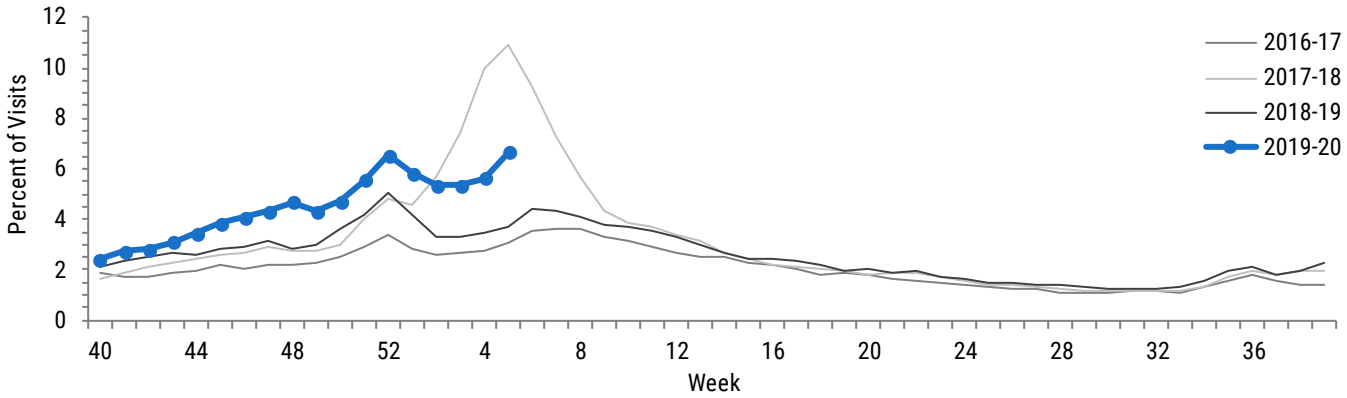
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



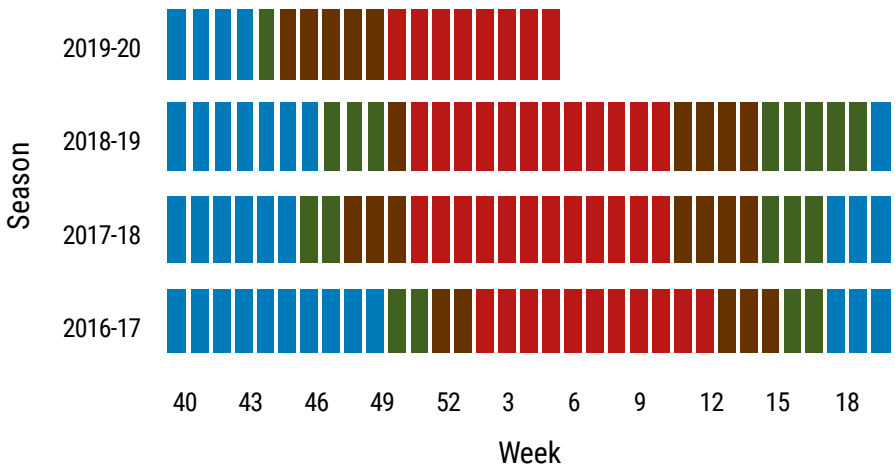
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 5, **the percent of emergency department and urgent care center visits for ILI statewide increased** and reached the highest level observed so far this season. Activity in week 5 was above peak levels observed during the 2018-19 and 2016-17 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=368) statewide for the current season (week 40, 2019 to week 5, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 5, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 5, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

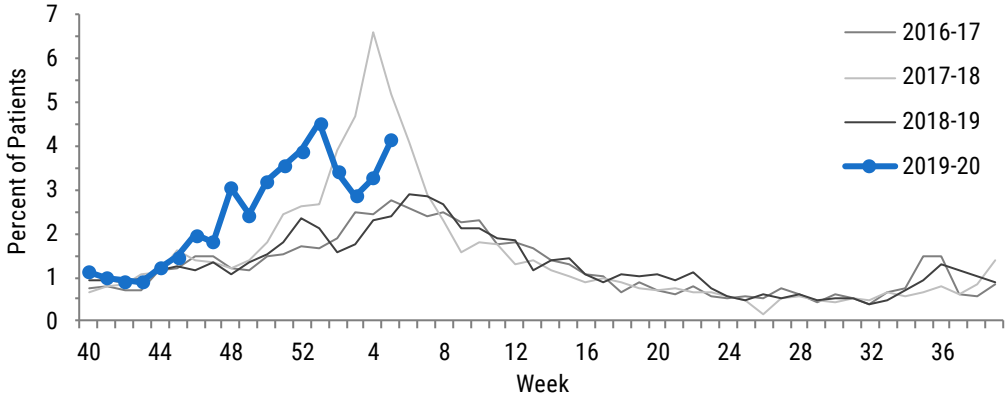
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 5, **the percent of patients with ILI reported by ILINet providers statewide increased** and was above peak levels observed during the 2018-19 and 2016-17 seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=9), week 40, 2016 to week 5, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



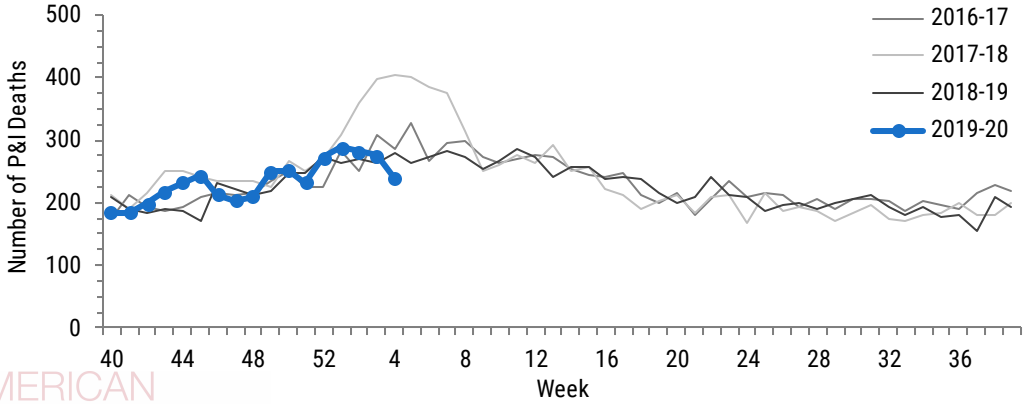


Figure 4: In week 4 (ending 1/25/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 4, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

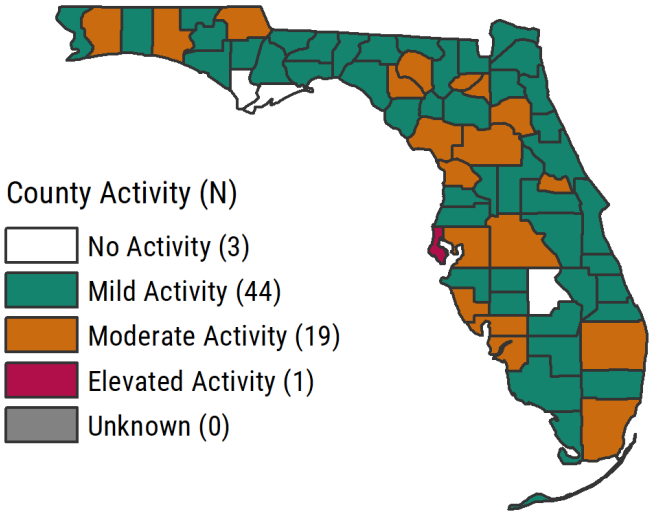
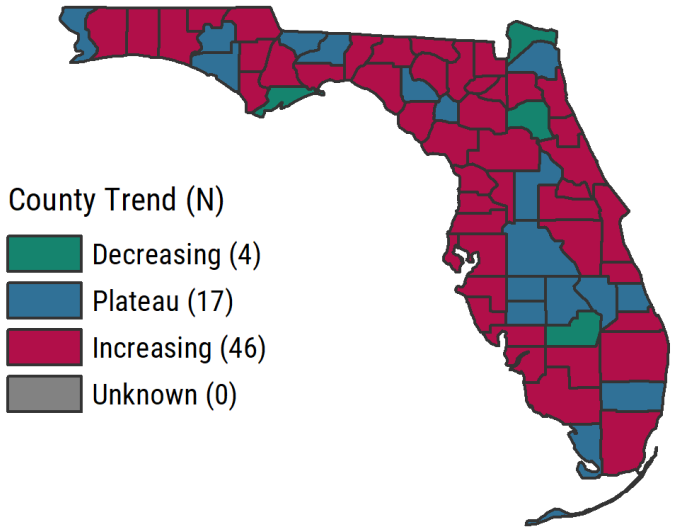
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 5. Nineteen counties reported **moderate activity,** and one county reported **elevated activity.**





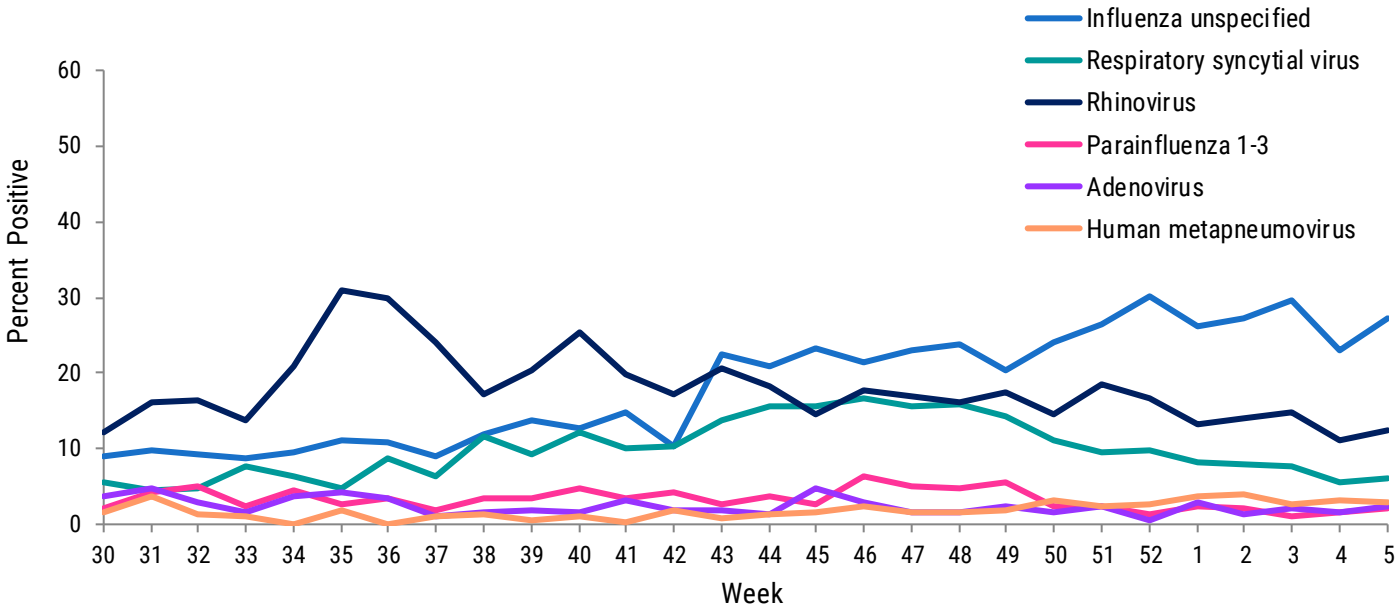


Figure 6: Most counties reported **increasing activity** in week 5. Seventeen counties reported **activity at a plateau,** and four counties reported **decreasing activity.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 5, the **percent of specimens testing positive for influenza** **increased** and remained higher than other respiratory viruses under surveillance.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=7), week 40, 2019 to week 5, 2020.

AMERICAN OVERSIGHT

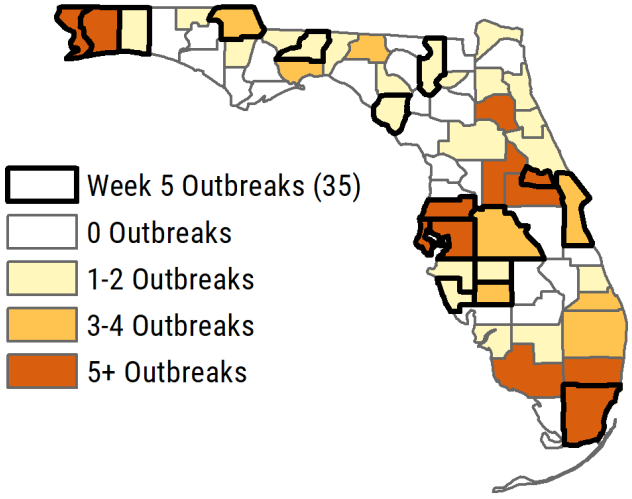
Influenza and ILI Outbreaks

Week 5 Outbreaks at a Glance:

Number Reported:
35 Outbreaks

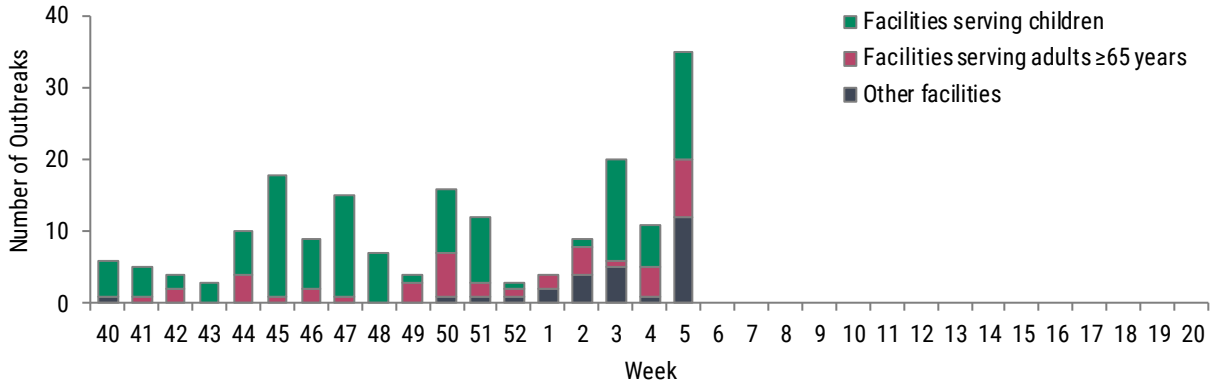
Influenza-Associated:
19 Outbreaks



Severe Outcomes*:
5 Outbreaks

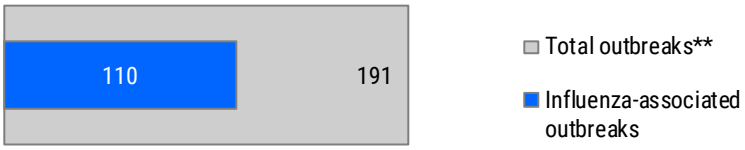
Outbreak Summary:

In week 5, 19 influenza-associated and 16 ILI outbreaks were reported, a notable increase from the previous week.



Severe outcomes* were reported in five of 35 outbreaks. One or more hospitalizations were reported in each of these five outbreaks. No deaths were reported.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 5, four of the five outbreaks with severe outcomes were in facilities serving adults aged ≥65 years.



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 5 are **outlined in bold.**

Figure 9: In week 5, **eight outbreaks** were reported in **facilities serving adults aged ≥65 years, 15 outbreaks** were reported in **facilities serving children,** and **12 outbreaks** were reported in **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 5, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 5, **57.6% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 5, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

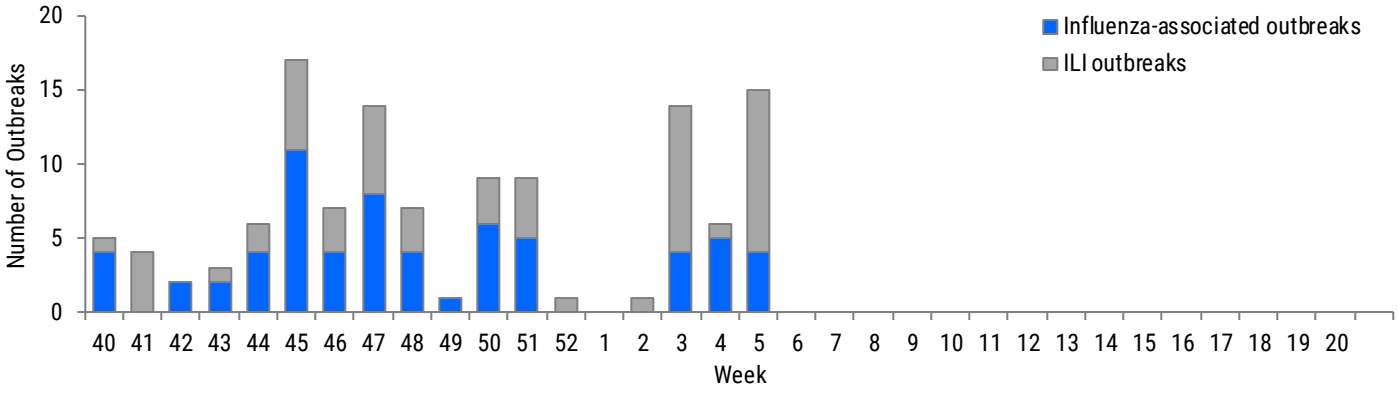
Influenza and ILI Outbreaks

Facilities Serving Children*:



15 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

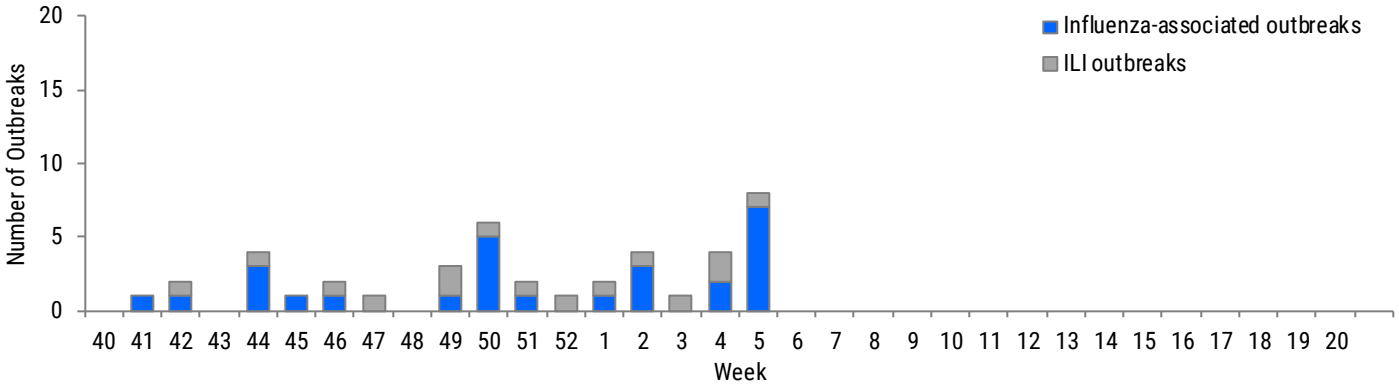
In week 5, 15 new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 5, **four influenza-associated outbreaks** and **11 ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 5, 2020.

Facilities Serving Adults ≥65 yrs.**:



8 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 5, eight new outbreaks of influenza or ILI were reported in facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 5, **seven influenza-associated outbreaks** and **one ILI outbreak** were reported in **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 5, 2020.

AMERICAN OVERSIGHT

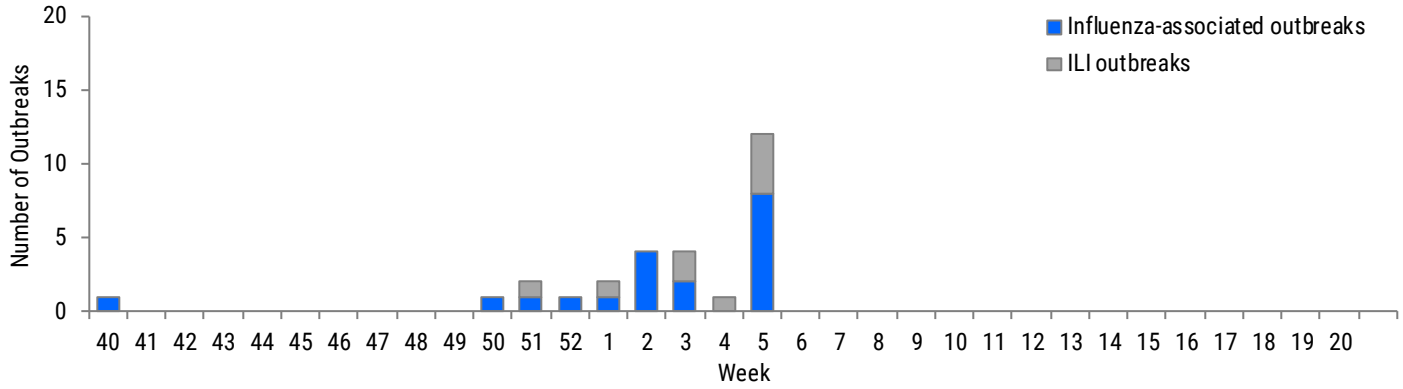
Influenza and ILI Outbreaks

Other Facilities*:



12 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 5, 12 new outbreaks of influenza or ILI were reported in other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 5, **eight influenza-associated outbreaks** and **four ILI outbreaks** were reported in **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 5, 2020.

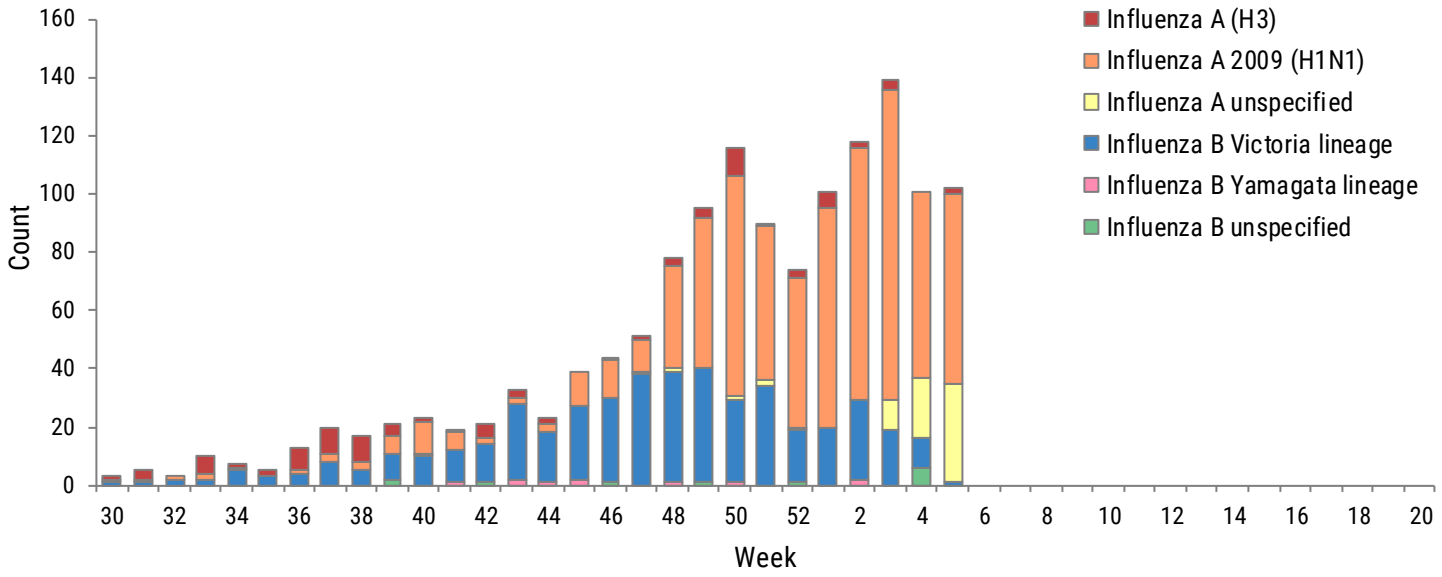


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	99 (51.8%)	55 influenza-associated outbreaks 44 ILI outbreaks
Child daycares	22 (11.5%)	9 influenza-associated outbreaks 13 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	13 (6.8%)	4 influenza-associated outbreaks 9 ILI outbreaks
Nursing facilities	10 (5.2%)	8 influenza-associated outbreaks 2 ILI outbreaks
Other long-term care facilities	19 (9.9%)	15 influenza-associated outbreaks 4 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	24 (12.6%)	16 influenza-associated outbreaks 8 ILI outbreak
Hospitals	2 (1.0%)	2 influenza-associated outbreaks 0 ILI outbreaks
Additional facility types	2 (1.0%)	1 influenza-associated outbreak 1 ILI outbreak
Total	**191 (100.0%)**	**110 influenza-associated outbreaks** **81 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 5, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 5, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=368) from week 40, 2016 to week 5, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

AMERICAN OVERSIGHT

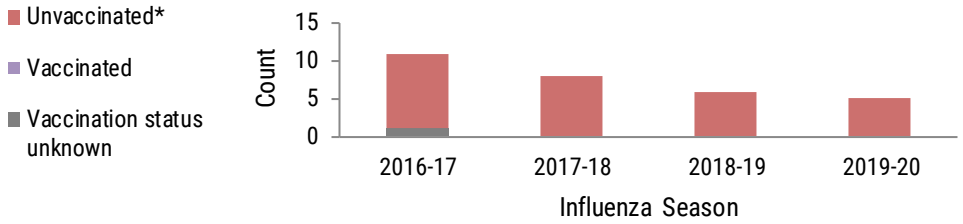
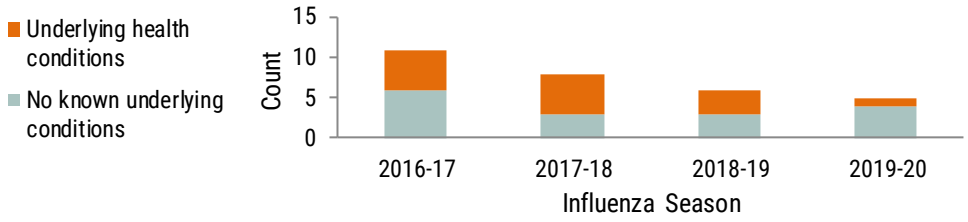
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 5, **the percent of emergency department and urgent care center visits for ILI in children <18 years increased** and was above peak activity observed during the 2018-19 and 2016-17 seasons.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 5, 2020.

Figures 25-26: In week 5, **two new influenza-associated pediatric deaths were reported,** one in an unvaccinated child and one in a child who was too young to be vaccinated. A total of seven influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 5, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 5, 2020.

In week 4, **two new influenza-associated pediatric deaths were reported**. One death was associated with influenza A unspecified in a child with no known underlying medical conditions. The other death was associated with influenza B unspecified in a child with an underlying medical condition. Neither child was vaccinated for the 2019-20 season.

A total of seven influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm

AMERICAN OVERSIGHT

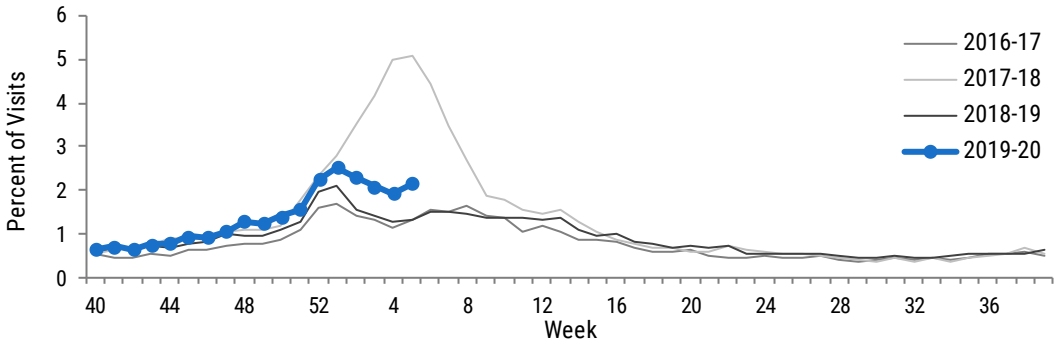
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 5, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was within levels observed at this time in past seasons.



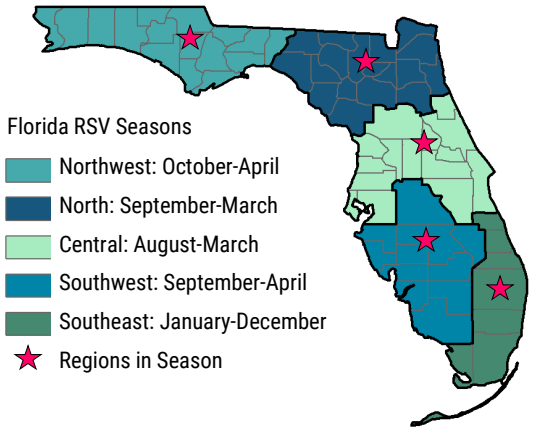
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 5, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 5, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years increased** and was above peak activity levels observed during the 2018-19 and 2016-17 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 5, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

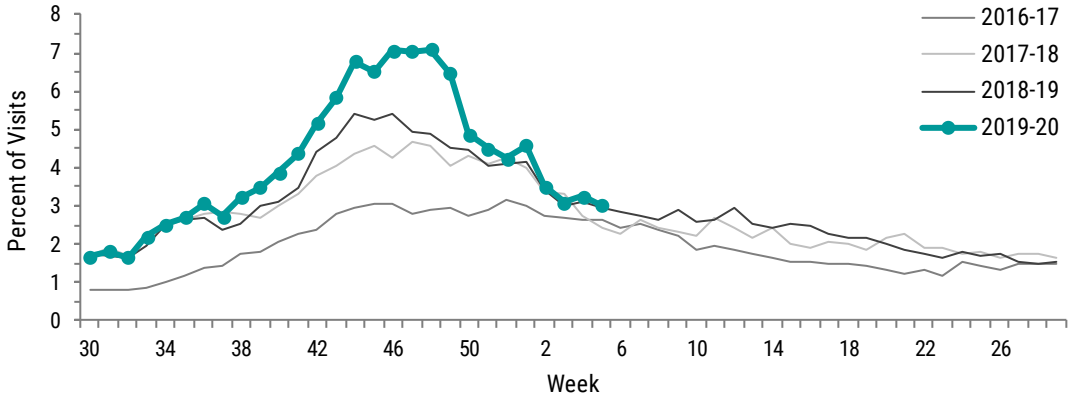
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

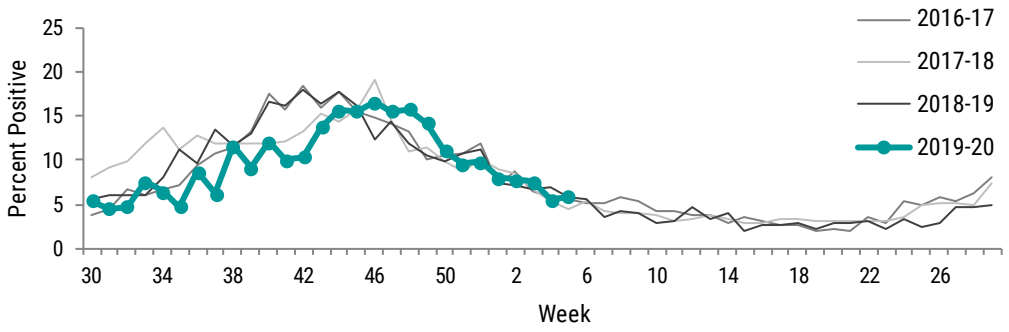
Week 5 (January 26-February 1, 2020) Activity Summary

In week 5, RSV activity in children <5 years decreased and was similar to levels observed at this time in 2019.

No new RSV-associated outbreaks were reported. A total of eight RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 5, **the percent of emergency department and urgent care center visits for RSV among children <5 years decreased** and was similar to levels observed at this time in 2019.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 5, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=368) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 5, 2020 Florida Flu Review
Date:	Wednesday, February 5, 2020 3:40:32 PM
Attachments:	Week 5, 2020 Florida Flu Review.pdf

Good Afternoon!

Attached is the Week 5, 2020 Florida Flu Review.

Week 5 influenza & influenza-like illness (ILI) activity summary:

Activity increased in week 5 and reached the highest level observed so far this season. Notable increases were observed in all regions of the state. Elevated activity is still expected for several more weeks.

Thirty-five outbreaks were reported, up from 11 outbreaks in the previous week. Of the 35 outbreaks reported, 19 were influenza-associated and 16 were ILI.

Two new influenza-associated pediatric deaths were reported. One child was not vaccinated for the 2019-20 season, and the other was too young to be vaccinated. Seven influenza-associated pediatric deaths have been reported so far this season, all in unvaccinated children.

Influenza A 2009 (H1N1) remained the predominant strain. Earlier in the season, influenza B Victoria lineage viruses were predominant. Influenza B Victoria lineage viruses continue to circulate at lower levels.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. Vaccination should continue as long as influenza viruses are circulating. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On January 10, 2020, CDC issued a health advisory reminding clinicians that influenza B viruses can cause severe illness in people of all ages and reiterating vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

AMERICAN OVERSIGHT

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Thank you!

Julia Munroe, MS
Respiratory Disease Epidemiologist
Bureau of Epidemiology
Division of Disease Control and Health Protection
Florida Department of Health
Office Phone: 850-901-6936

Mission: To protect, promote, and improve the health of all people in Florida through integrated state, county, and community efforts.

Please note: Florida has a very broad public records law. Most written communications to or from state officials regarding state business are public records available to the public and media upon request. Your email communications may therefore be subject to public disclosure.

Florida ILI Surveillance System Summary 16

Background

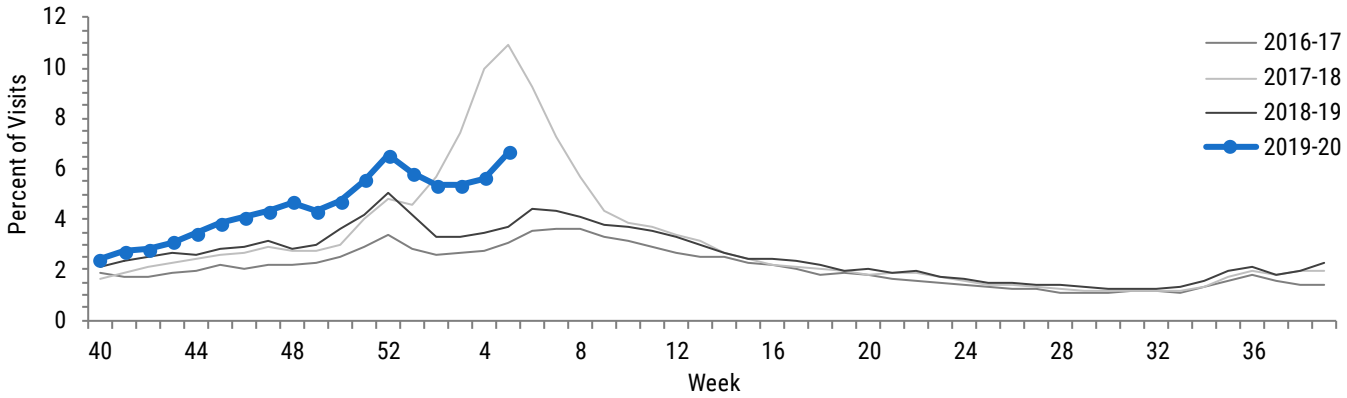
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



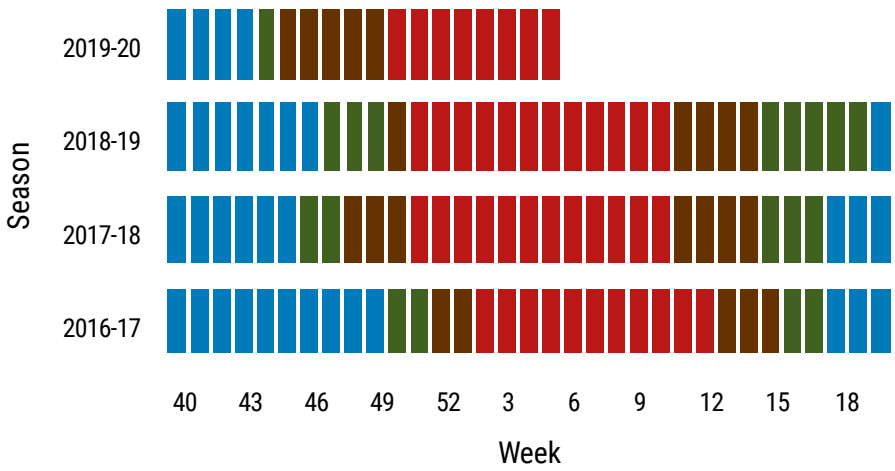
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 5, **the percent of emergency department and urgent care center visits for ILI statewide increased** and reached the highest level observed so far this season. Activity in week 5 was above peak levels observed during the 2018-19 and 2016-17 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=368) statewide for the current season (week 40, 2019 to week 5, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 5, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 5, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

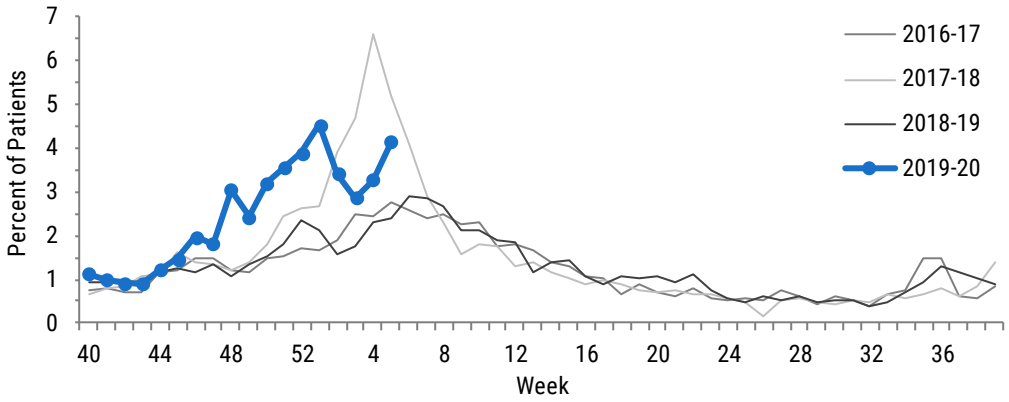
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 5, **the percent of patients with ILI reported by ILINet providers statewide increased** and was above peak levels observed during the 2018-19 and 2016-17 seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=9), week 40, 2016 to week 5, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



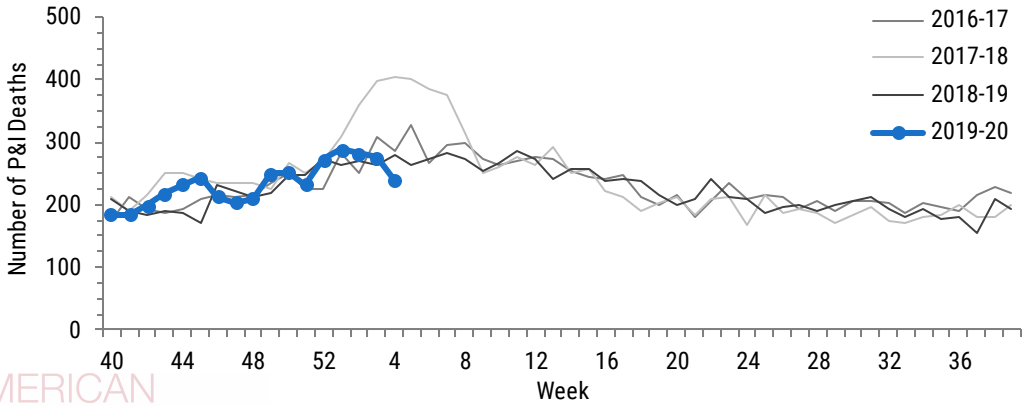


Figure 4: In week 4 (ending 1/25/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 4, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

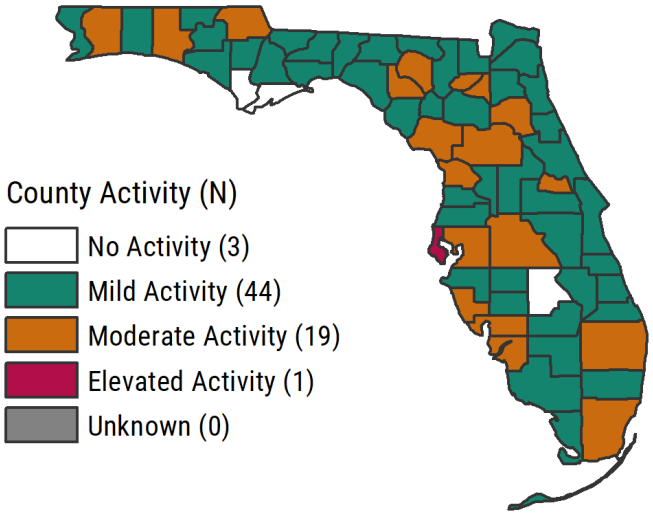
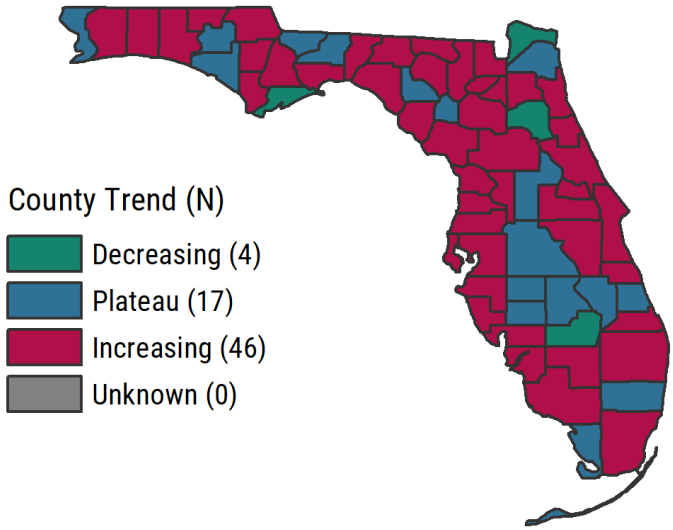
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 5. Nineteen counties reported **moderate activity,** and one county reported **elevated activity.**





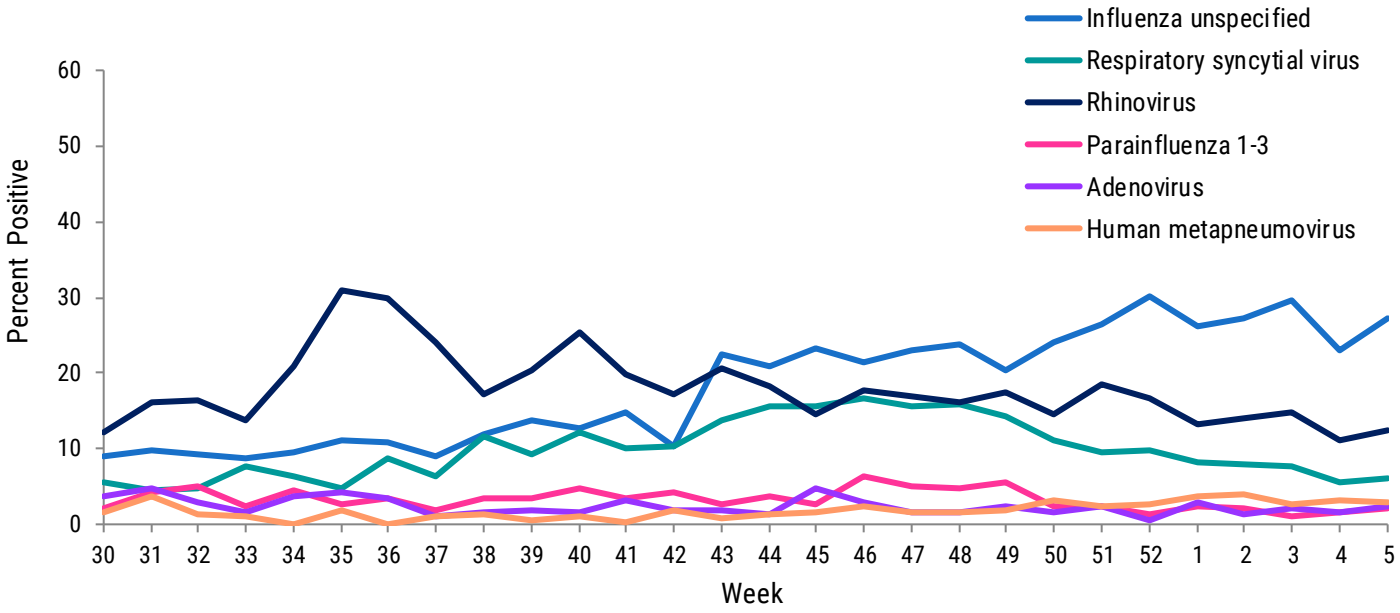


Figure 6: Most counties reported **increasing activity** in week 5. Seventeen counties reported **activity at a plateau,** and four counties reported **decreasing activity.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 5, the **percent of specimens testing positive for influenza** **increased** and remained higher than other respiratory viruses under surveillance.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=7), week 40, 2019 to week 5, 2020.

AMERICAN OVERSIGHT

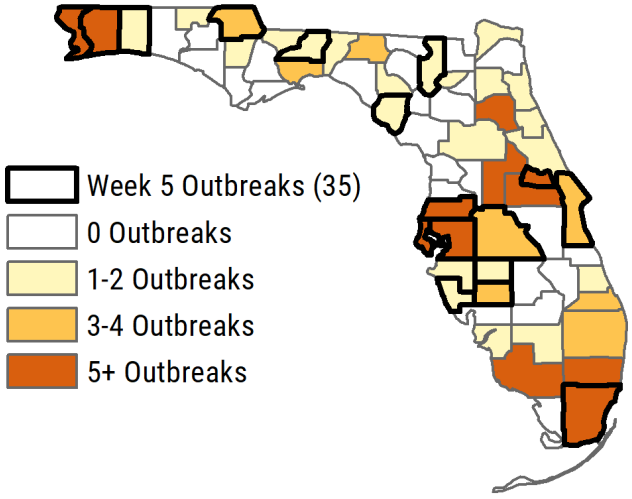
Influenza and ILI Outbreaks

Week 5 Outbreaks at a Glance:

Number Reported:
35 Outbreaks

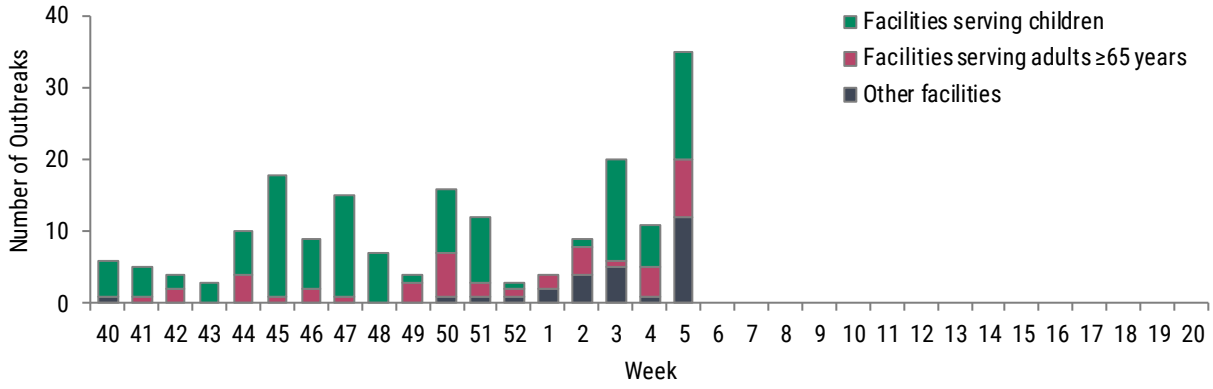
Influenza-Associated:
19 Outbreaks



Severe Outcomes*:
5 Outbreaks

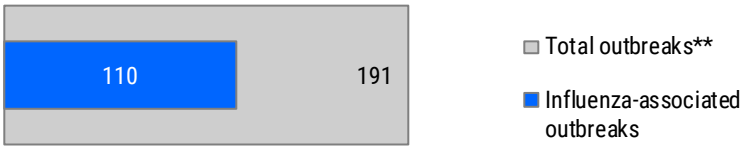
Outbreak Summary:

In week 5, 19 influenza-associated and 16 ILI outbreaks were reported, a notable increase from the previous week.



Severe outcomes* were reported in five of 35 outbreaks. One or more hospitalizations were reported in each of these five outbreaks. No deaths were reported.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 5, four of the five outbreaks with severe outcomes were in facilities serving adults aged ≥65 years.



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 5 are **outlined in bold.**

Figure 9: In week 5, **eight outbreaks** were reported in **facilities serving adults aged ≥65 years, 15 outbreaks** were reported in **facilities serving children,** and **12 outbreaks** were reported in **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 5, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 5, **57.6% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 5, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

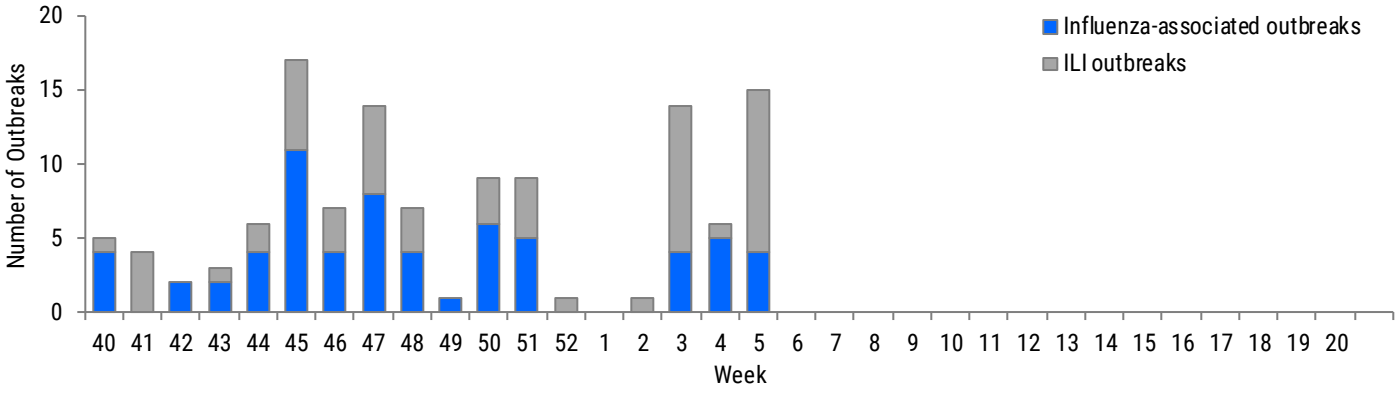
Influenza and ILI Outbreaks

Facilities Serving Children*:



15 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

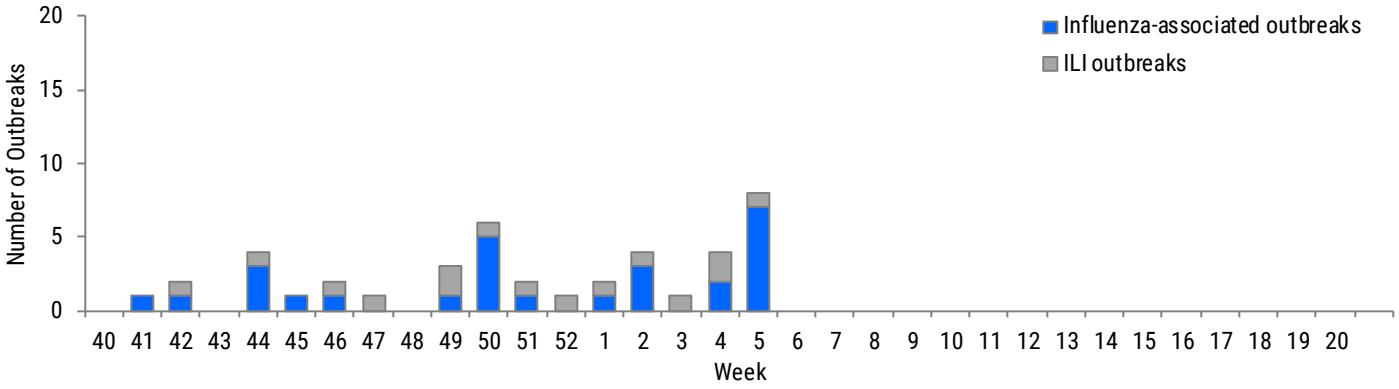
In week 5, 15 new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 5, **four influenza-associated outbreaks** and **11 ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 5, 2020.

Facilities Serving Adults ≥65 yrs.**:



8 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 5, eight new outbreaks of influenza or ILI were reported in facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 5, **seven influenza-associated outbreaks** and **one ILI outbreak** were reported in **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 5, 2020.

AMERICAN OVERSIGHT

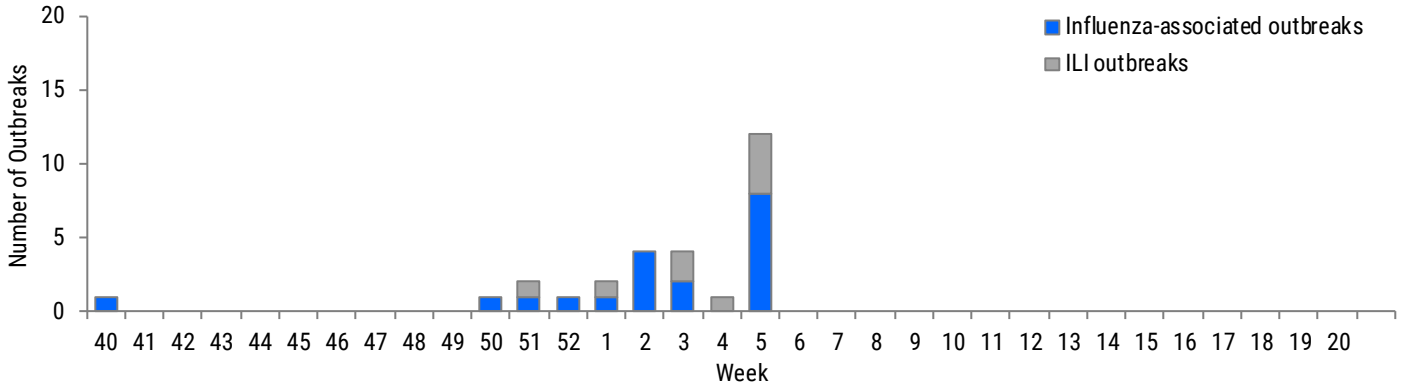
Influenza and ILI Outbreaks

Other Facilities*:



12 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 5, 12 new outbreaks of influenza or ILI were reported in other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 5, **eight influenza-associated outbreaks** and **four ILI outbreaks** were reported in **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 5, 2020.

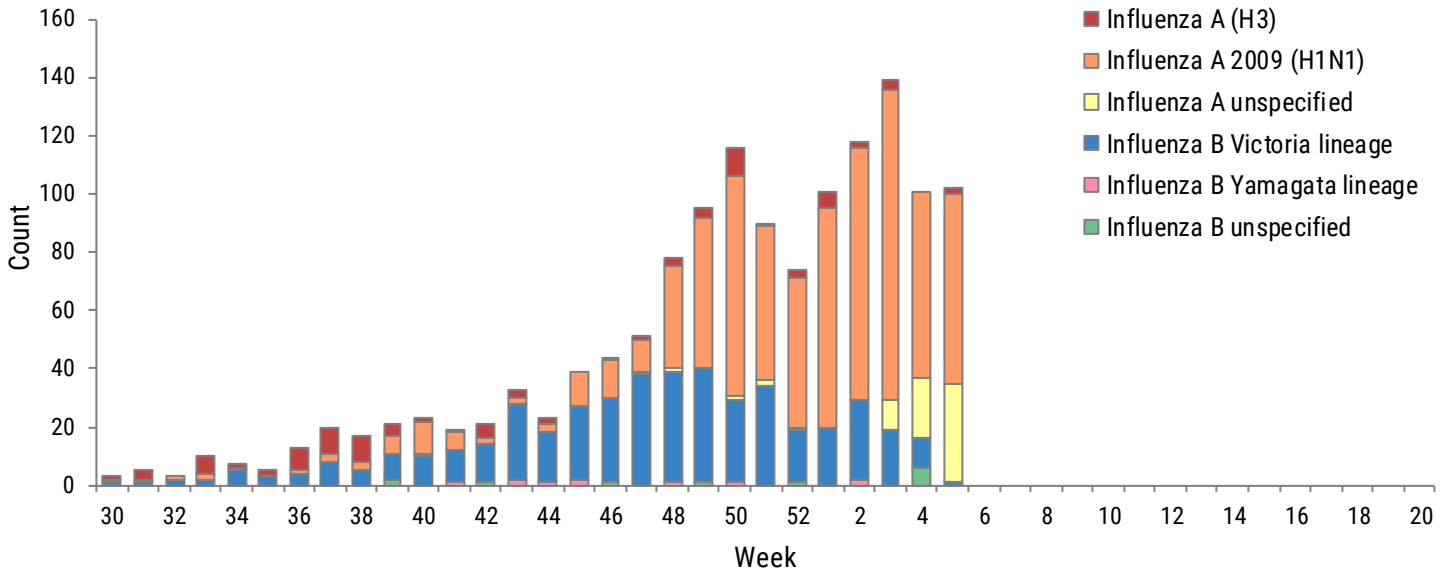


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	99 (51.8%)	55 influenza-associated outbreaks 44 ILI outbreaks
Child daycares	22 (11.5%)	9 influenza-associated outbreaks 13 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	13 (6.8%)	4 influenza-associated outbreaks 9 ILI outbreaks
Nursing facilities	10 (5.2%)	8 influenza-associated outbreaks 2 ILI outbreaks
Other long-term care facilities	19 (9.9%)	15 influenza-associated outbreaks 4 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	24 (12.6%)	16 influenza-associated outbreaks 8 ILI outbreak
Hospitals	2 (1.0%)	2 influenza-associated outbreaks 0 ILI outbreaks
Additional facility types	2 (1.0%)	1 influenza-associated outbreak 1 ILI outbreak
Total	**191 (100.0%)**	**110 influenza-associated outbreaks** **81 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 5, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 5, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=368) from week 40, 2016 to week 5, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity increased** during week 5 and was similar to peak levels observed during the 2018-19 season.

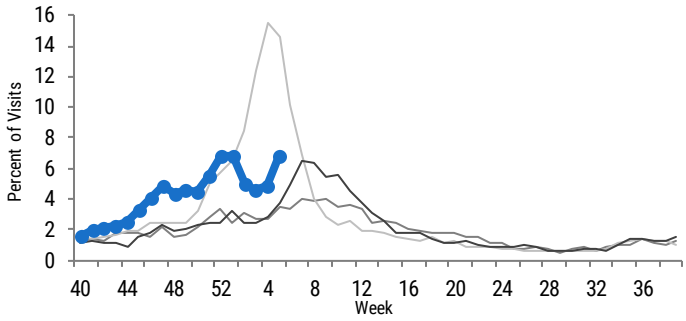

Figure 17: In **region 2, ILI activity increased** during week 5 and was above peak activity observed during the 2018-19 and 2016-17 seasons.

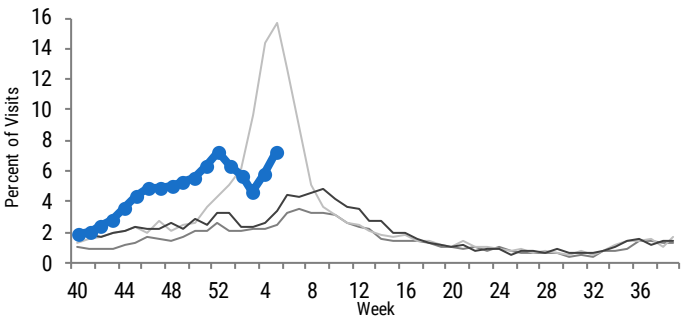

Figure 18: In **region 3, ILI activity increased** during week 5 and was above peak activity observed during the 2018-19 and 2016-17 seasons.

AMERICAN OVERSIGHT

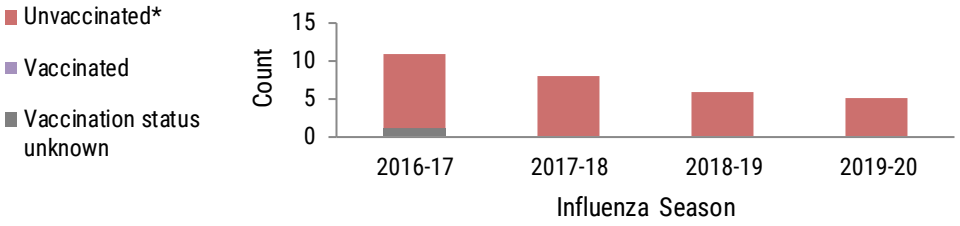
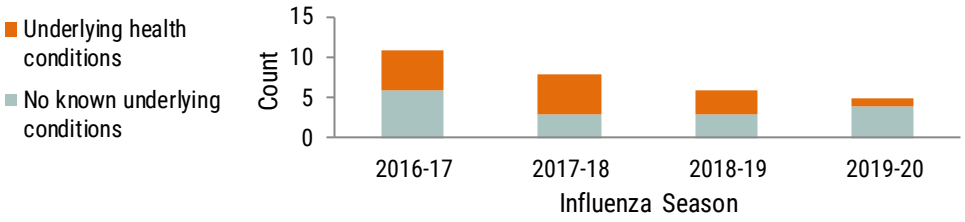
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 5, **the percent of emergency department and urgent care center visits for ILI in children <18 years increased** and was above peak activity observed during the 2018-19 and 2016-17 seasons.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 5, 2020.

Figures 25-26: In week 5, **two new influenza-associated pediatric deaths were reported,** one in an unvaccinated child and one in a child who was too young to be vaccinated. A total of seven influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 5, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 5, 2020.

In week 4, **two new influenza-associated pediatric deaths were reported**. One death was associated with influenza A unspecified in a child with no known underlying medical conditions. The other death was associated with influenza B unspecified in a child with an underlying medical condition. Neither child was vaccinated for the 2019-20 season.

A total of seven influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm

AMERICAN OVERSIGHT

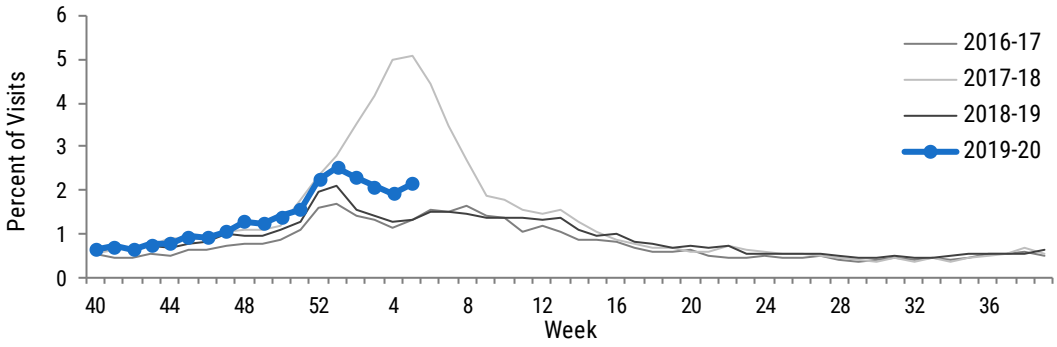
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 5, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was within levels observed at this time in past seasons.



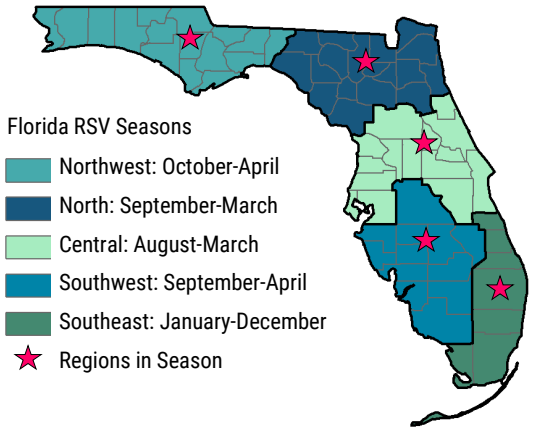
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 5, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 5, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years increased** and was above peak activity levels observed during the 2018-19 and 2016-17 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 5, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

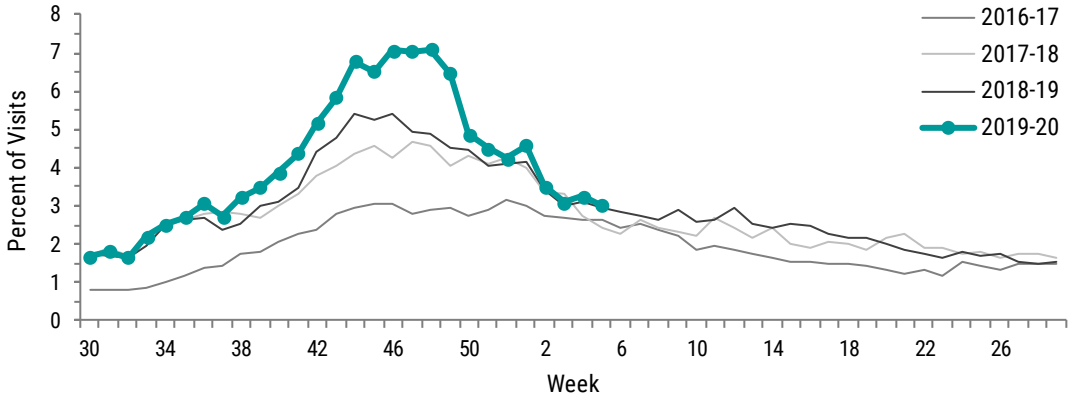
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

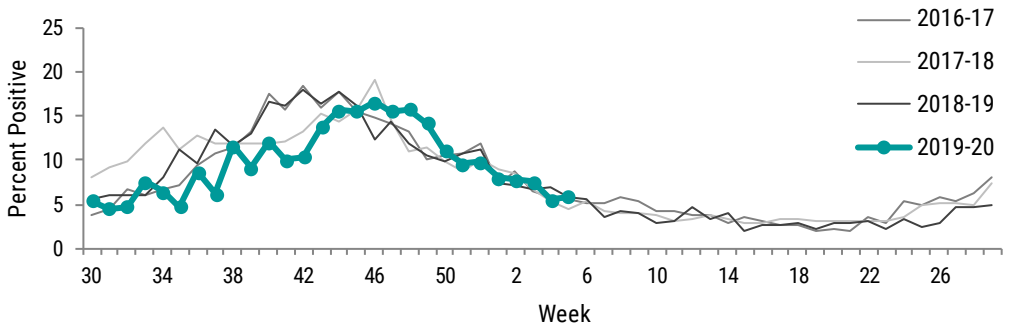
Week 5 (January 26-February 1, 2020) Activity Summary

In week 5, RSV activity in children <5 years decreased and was similar to levels observed at this time in 2019.

No new RSV-associated outbreaks were reported. A total of eight RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 5, **the percent of emergency department and urgent care center visits for RSV among children <5 years decreased** and was similar to levels observed at this time in 2019.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 5, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

Primary or secondary school	Okaloosa	88	Unknown	Unknown	Unknown	Unknown	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=368) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 5, 2020 Florida Flu Review
Date:	Wednesday, February 5, 2020 3:40:25 PM
Attachments:	Week 5, 2020 Florida Flu Review.pdf

Good Afternoon!

Attached is the Week 5, 2020 Florida Flu Review.

Week 5 influenza & influenza-like illness (ILI) activity summary:

Activity increased in week 5 and reached the highest level observed so far this season. Notable increases were observed in all regions of the state. Elevated activity is still expected for several more weeks.

Thirty-five outbreaks were reported, up from 11 outbreaks in the previous week. Of the 35 outbreaks reported, 19 were influenza-associated and 16 were ILI.

Two new influenza-associated pediatric deaths were reported. One child was not vaccinated for the 2019-20 season, and the other was too young to be vaccinated. Seven influenza-associated pediatric deaths have been reported so far this season, all in unvaccinated children.

Influenza A 2009 (H1N1) remained the predominant strain. Earlier in the season, influenza B Victoria lineage viruses were predominant. Influenza B Victoria lineage viruses continue to circulate at lower levels.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. Vaccination should continue as long as influenza viruses are circulating. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On January 10, 2020, CDC issued a health advisory reminding clinicians that influenza B viruses can cause severe illness in people of all ages and reiterating vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

AMERICAN OVERSIGHT

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Thank you!

Julia Munroe, MS
Respiratory Disease Epidemiologist
Bureau of Epidemiology
Division of Disease Control and Health Protection
Florida Department of Health
Office Phone: 850-901-6936

Mission: To protect, promote, and improve the health of all people in Florida through integrated state, county, and community efforts.

Please note: Florida has a very broad public records law. Most written communications to or from state officials regarding state business are public records available to the public and media upon request. Your email communications may therefore be subject to public disclosure.

Florida ILI Surveillance System Summary 16

Background

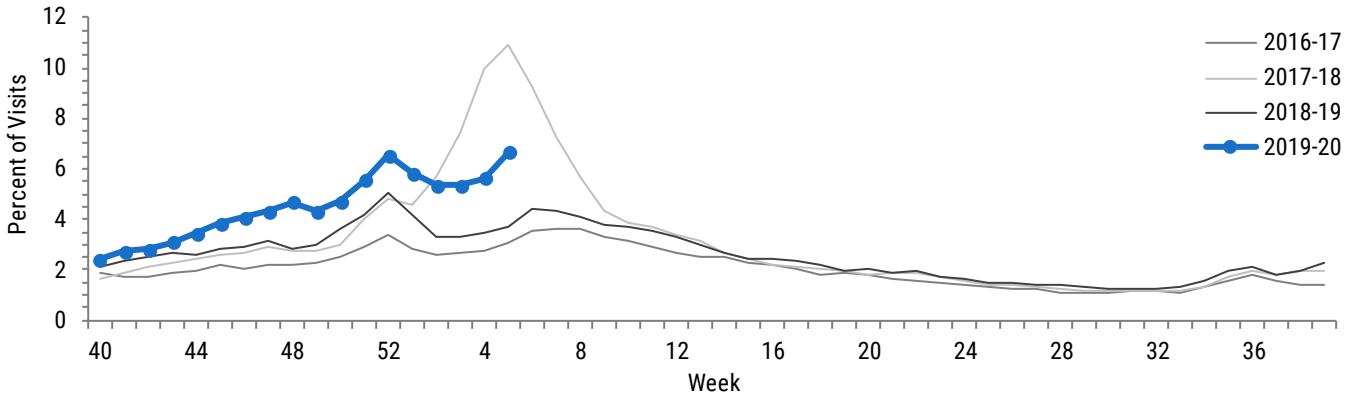
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



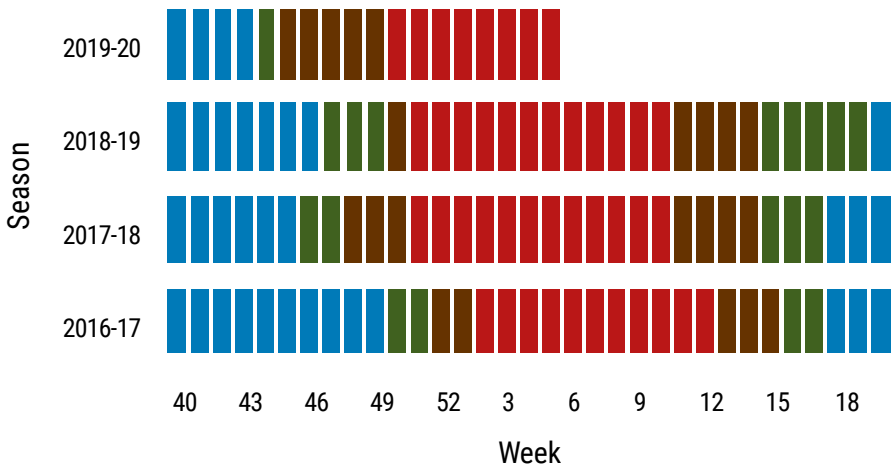
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 5, **the percent of emergency department and urgent care center visits for ILI statewide increased** and reached the highest level observed so far this season. Activity in week 5 was above peak levels observed during the 2018-19 and 2016-17 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=368) statewide for the current season (week 40, 2019 to week 5, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 5, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 5, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

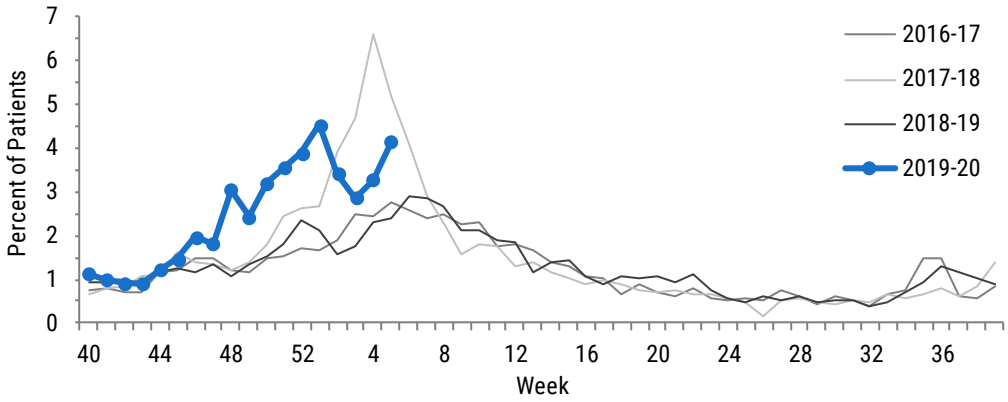
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 5, **the percent of patients with ILI reported by ILINet providers statewide increased** and was above peak levels observed during the 2018-19 and 2016-17 seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=9), week 40, 2016 to week 5, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



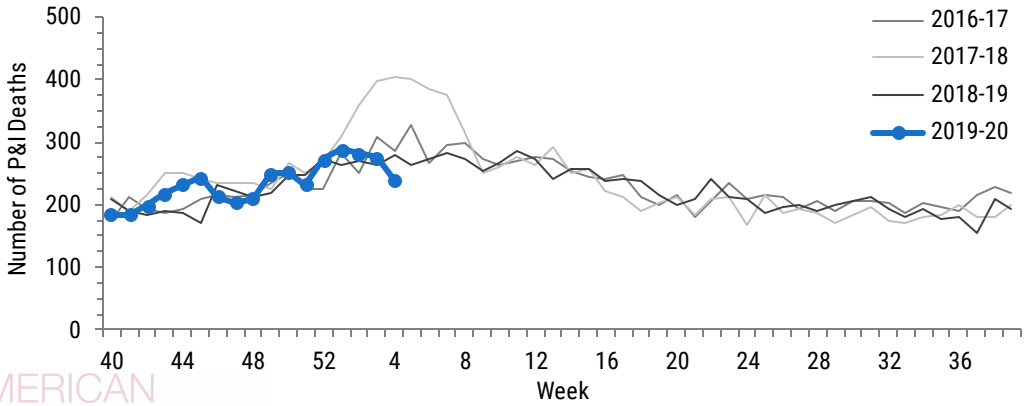


Figure 4: In week 4 (ending 1/25/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 4, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

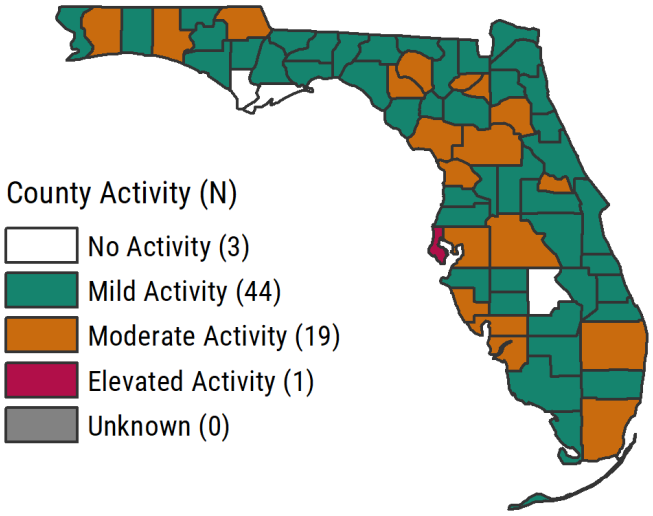
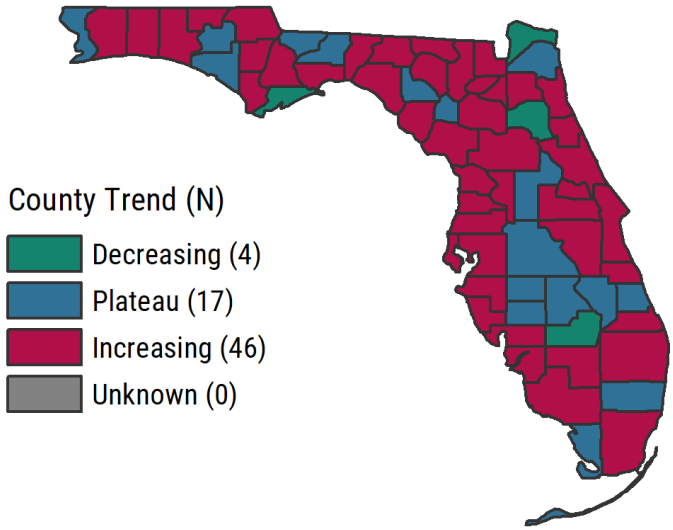
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 5. Nineteen counties reported **moderate activity,** and one county reported **elevated activity.**





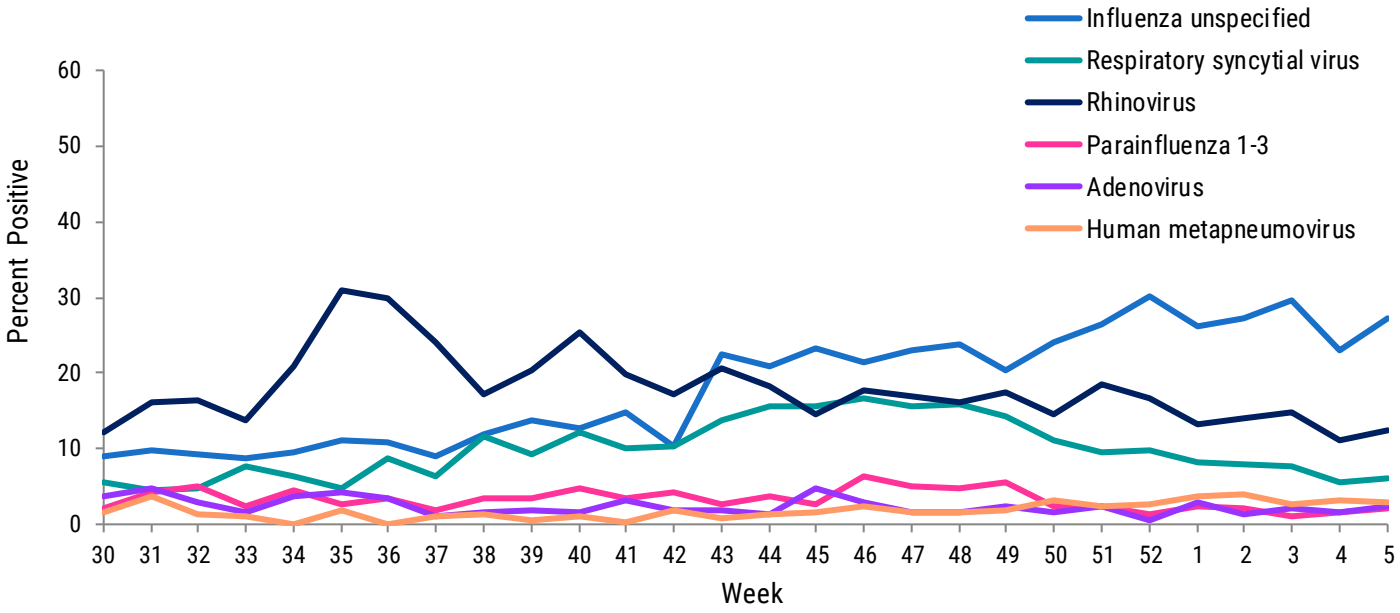


Figure 6: Most counties reported **increasing activity** in week 5. Seventeen counties reported **activity at a plateau,** and four counties reported **decreasing activity.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 5, the **percent of specimens testing positive for influenza** **increased** and remained higher than other respiratory viruses under surveillance.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=7), week 40, 2019 to week 5, 2020.

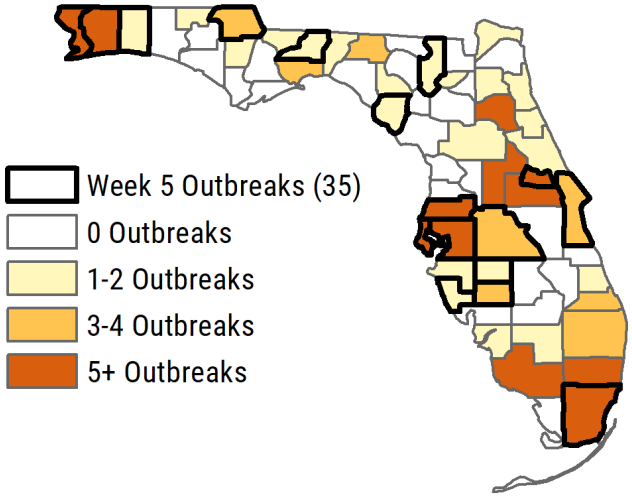
Influenza and ILI Outbreaks

Week 5 Outbreaks at a Glance:

Number Reported:
35 Outbreaks

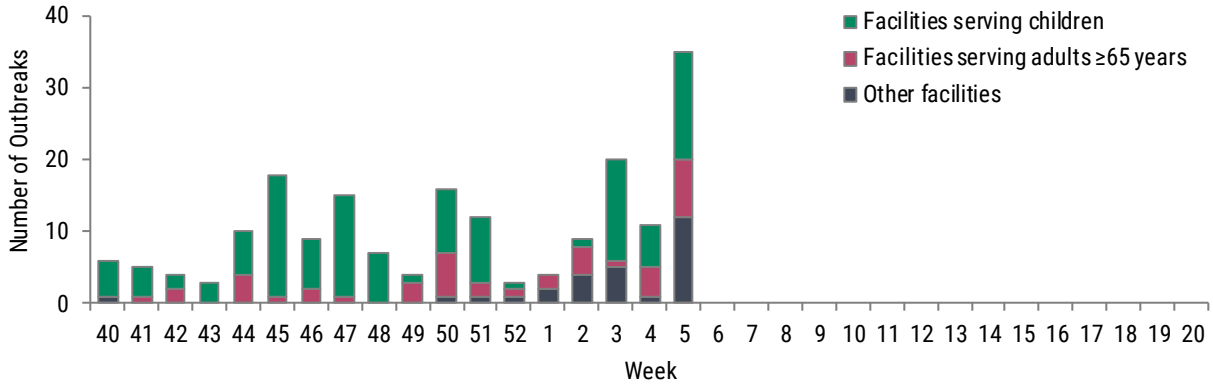
Influenza-Associated:
19 Outbreaks



Severe Outcomes*:
5 Outbreaks

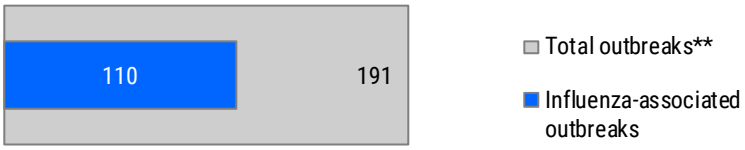
Outbreak Summary:

In week 5, 19 influenza-associated and 16 ILI outbreaks were reported, a notable increase from the previous week.



Severe outcomes* were reported in five of 35 outbreaks. One or more hospitalizations were reported in each of these five outbreaks. No deaths were reported.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 5, four of the five outbreaks with severe outcomes were in facilities serving adults aged ≥65 years.



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 5 are **outlined in bold.**

Figure 9: In week 5, **eight outbreaks** were reported in **facilities serving adults aged ≥65 years, 15 outbreaks** were reported in **facilities serving children,** and **12 outbreaks** were reported in **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 5, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 5, **57.6% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 5, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

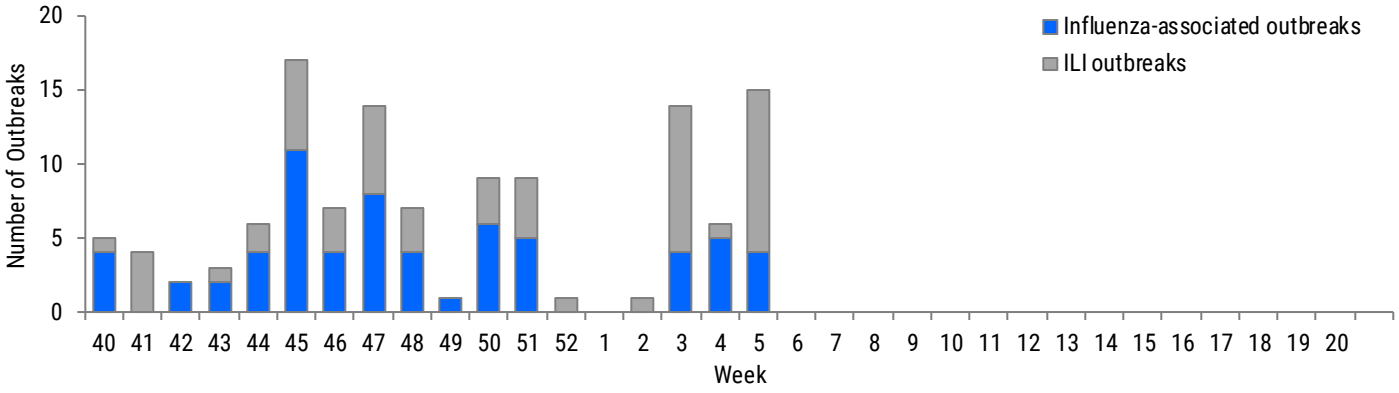
Influenza and ILI Outbreaks

Facilities Serving Children*:



15 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

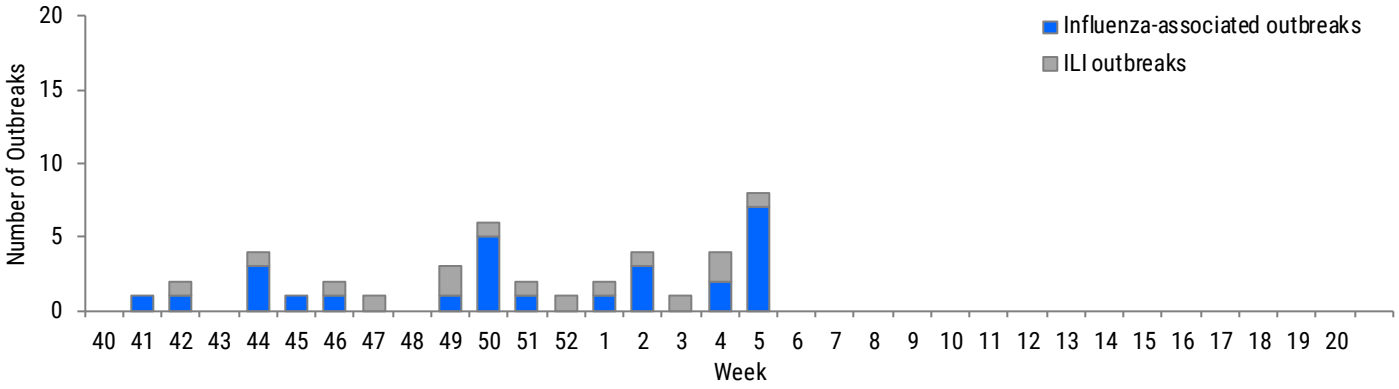
In week 5, 15 new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 5, **four influenza-associated outbreaks** and **11 ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 5, 2020.

Facilities Serving Adults ≥65 yrs.**:



8 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 5, eight new outbreaks of influenza or ILI were reported in facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 5, **seven influenza-associated outbreaks** and **one ILI outbreak** were reported in **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 5, 2020.

AMERICAN OVERSIGHT

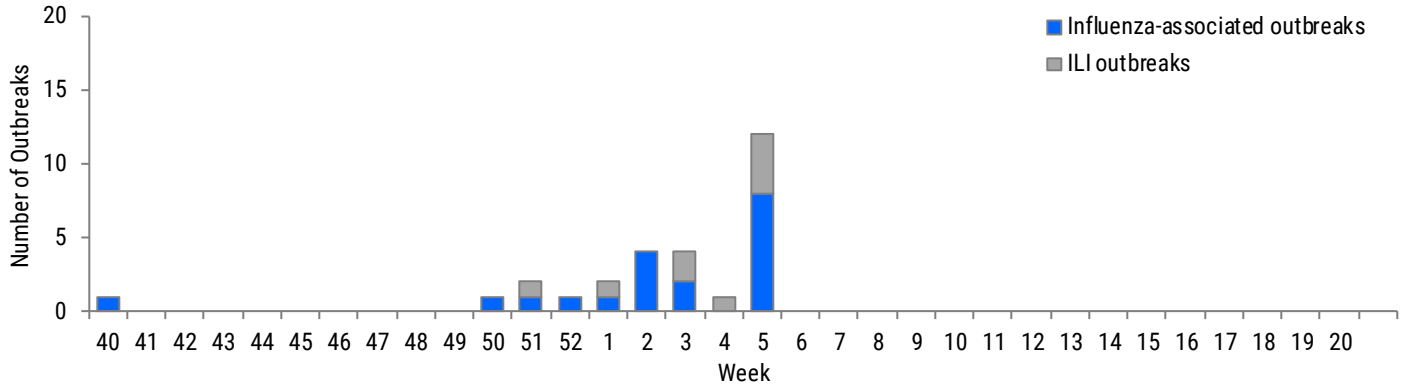
Influenza and ILI Outbreaks

Other Facilities*:



12 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 5, 12 new outbreaks of influenza or ILI were reported in other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 5, **eight influenza-associated outbreaks** and **four ILI outbreaks** were reported in **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 5, 2020.

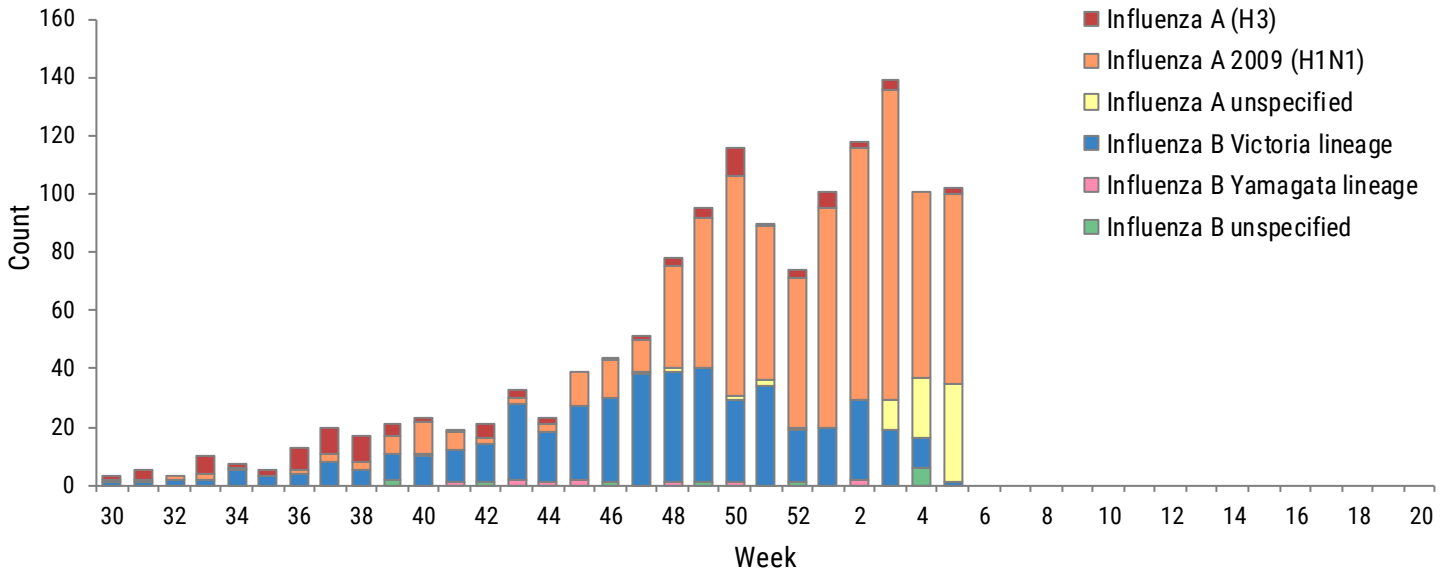


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	99 (51.8%)	55 influenza-associated outbreaks 44 ILI outbreaks
Child daycares	22 (11.5%)	9 influenza-associated outbreaks 13 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	13 (6.8%)	4 influenza-associated outbreaks 9 ILI outbreaks
Nursing facilities	10 (5.2%)	8 influenza-associated outbreaks 2 ILI outbreaks
Other long-term care facilities	19 (9.9%)	15 influenza-associated outbreaks 4 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	24 (12.6%)	16 influenza-associated outbreaks 8 ILI outbreak
Hospitals	2 (1.0%)	2 influenza-associated outbreaks 0 ILI outbreaks
Additional facility types	2 (1.0%)	1 influenza-associated outbreak 1 ILI outbreak
Total	**191 (100.0%)**	**110 influenza-associated outbreaks** **81 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 5, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 5, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=368) from week 40, 2016 to week 5, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity increased** during week 5 and was similar to peak levels observed during the 2018-19 season.

AMERICAN OVERSIGHT

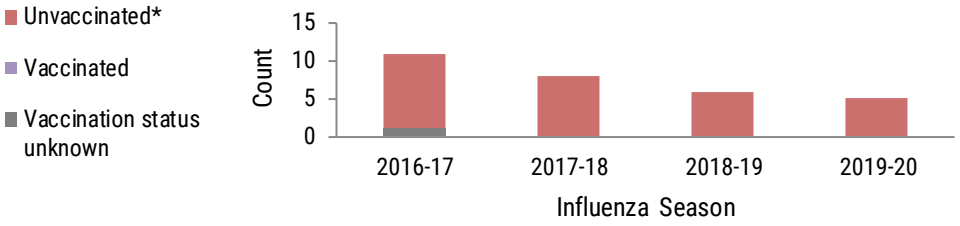
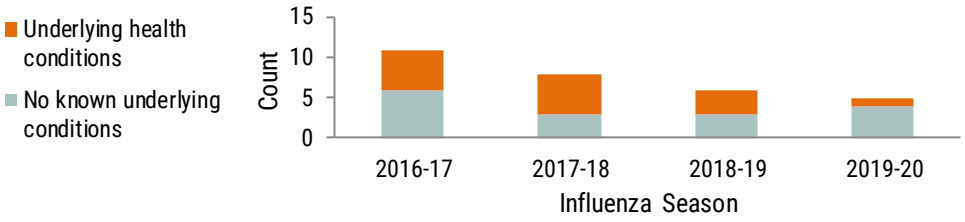
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 5, **the percent of emergency department and urgent care center visits for ILI in children <18 years increased** and was above peak activity observed during the 2018-19 and 2016-17 seasons.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 5, 2020.

Figures 25-26: In week 5, **two new influenza-associated pediatric deaths were reported,** one in an unvaccinated child and one in a child who was too young to be vaccinated. A total of seven influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 5, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 5, 2020.

In week 4, **two new influenza-associated pediatric deaths were reported**. One death was associated with influenza A unspecified in a child with no known underlying medical conditions. The other death was associated with influenza B unspecified in a child with an underlying medical condition. Neither child was vaccinated for the 2019-20 season.

A total of seven influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm

AMERICAN OVERSIGHT

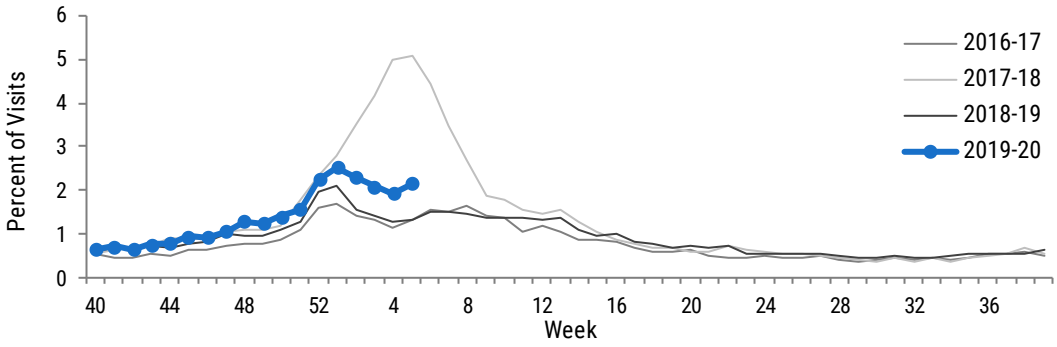
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 5, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was within levels observed at this time in past seasons.



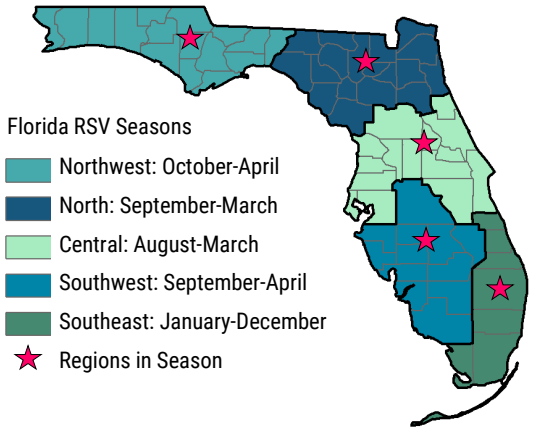
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 5, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 5, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years increased** and was above peak activity levels observed during the 2018-19 and 2016-17 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 5, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

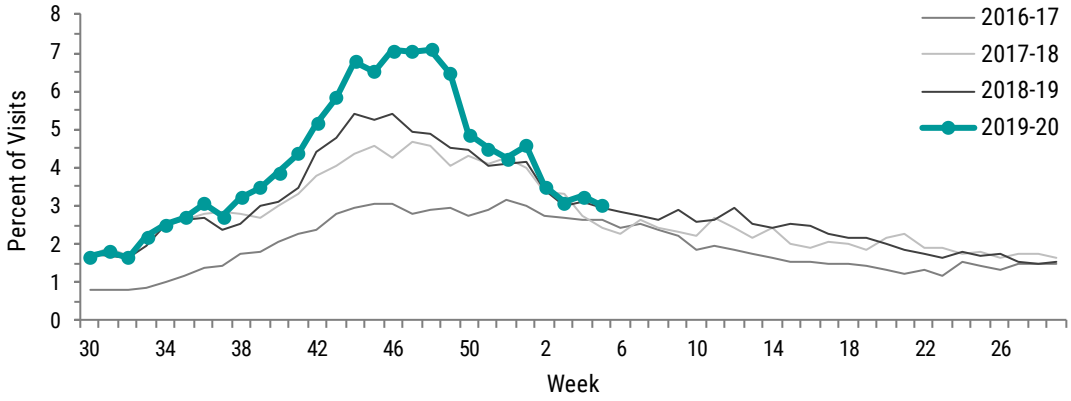
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

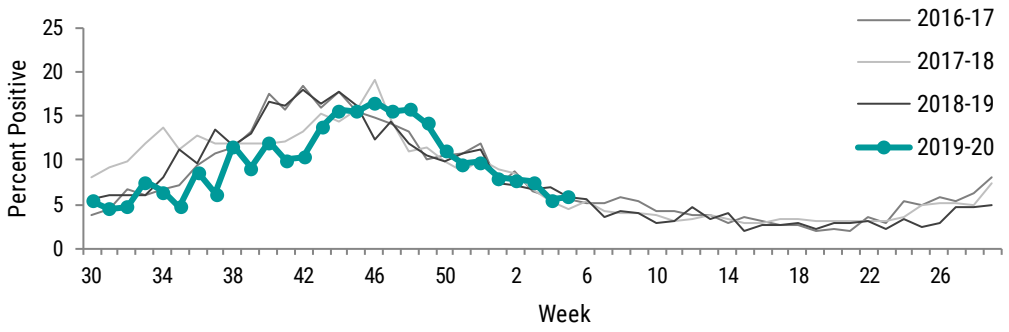
Week 5 (January 26-February 1, 2020) Activity Summary

In week 5, RSV activity in children <5 years decreased and was similar to levels observed at this time in 2019.

No new RSV-associated outbreaks were reported. A total of eight RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 5, **the percent of emergency department and urgent care center visits for RSV among children <5 years decreased** and was similar to levels observed at this time in 2019.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 5, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

AMERICAN OVERSIGHT

RSV Surveillance

Figure 31: In week 5, **the percent of specimens testing positive for RSV increased.** Levels were similar to those observed at this time in previous seasons.

◀ **Figure 35*** shows **the number of PCR-positive laboratory findings for enterovirus unspecified, enterovirus D68, and rhinovirus** by week** among specimens submitted to the Bureau of Public Health Laboratories (BPHL) for extended respiratory panel testing.

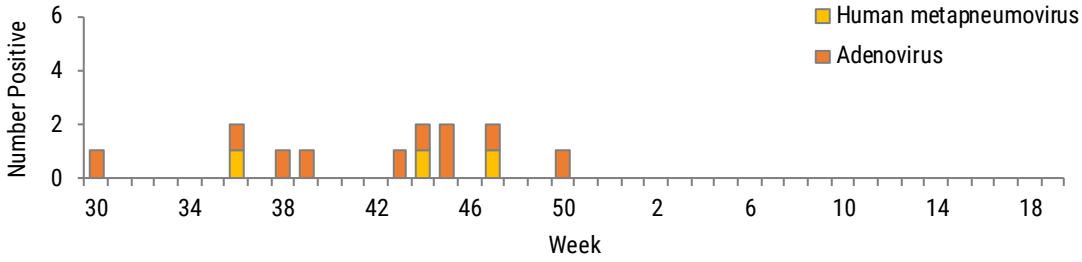

Figure 36* shows **the ▶ number of PCR-positive laboratory findings for parainfluenza 1-3** by week** among specimens submitted to BPHL for extended respiratory panel testing.

◀ **Figure 37*** shows **the number of PCR-positive laboratory findings for seasonal coronaviruses NL63, HKU1, OC43, and 229E** by week** among specimens submitted to BPHL for extended respiratory panel testing.

Figure 38* shows **the ▶ number of PCR-positive laboratory findings for human metapneumovirus and adenovirus** by week** among specimens submitted to BPHL for extended respiratory panel testing.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 5, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Long-term care facility	Pinellas	3	3	0	Influenza A unspecified	Yes	Open
Primary or secondary school	Hillsborough	46	Unknown	Unknown	Unknown	Unknown	Open
Primary or secondary school	Hillsborough	52	Unknown	Unknown	Unknown	Unknown	Open
Correctional facility	Columbia	33	Unknown	Unknown	Influenza A 2009 (H1N1)	Unknown	Open
Correctional facility	Columbia	146	Unknown	Unknown	Influenza A 2009 (H1N1)	Unknown	Open
Correctional facility	Leon	35	0	0	Influenza A 2009 (H1N1)	Yes	Open
Primary or secondary school	Santa Rosa	54	Unknown	Unknown	Unknown	Unknown	Open
Primary or secondary school	Santa Rosa	100	Unknown	Unknown	Unknown	Unknown	Open
Primary or secondary school	Okaloosa	88	Unknown	Unknown	Unknown	Unknown	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=368) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 6, 2020 Florida Flu Review
Date:	Wednesday, February 12, 2020 4:05:49 PM
Attachments:	Week 6, 2020 Florida Flu Review.pdf

Good Afternoon!

Attached is the Week 6, 2020 Florida Flu Review.

Activity was stable in week 6 and remained at the highest level observed so far this season. Increases were observed in most regions of the state. Elevated activity is still expected for several more weeks.

Twenty-nine outbreaks were reported, down from 35 outbreaks in the previous week. Of the 29 outbreaks reported, 10 were influenza-associated and 19 were ILI.

No new influenza-associated pediatric deaths were reported. Seven influenza-associated pediatric deaths have been reported so far this season, all in unvaccinated children.

Influenza A 2009 (H1N1) remained the predominant strain. Earlier in the season, influenza B Victoria lineage viruses were predominant. Influenza B Victoria lineage viruses continue to circulate at lower levels.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. Vaccination should continue as long as influenza viruses are circulating. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions). On January 10, 2020, CDC issued a health advisory reminding clinicians that influenza B viruses can cause severe illness in people of all ages and reiterating vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Florida ILI Surveillance System Summary 16

Background

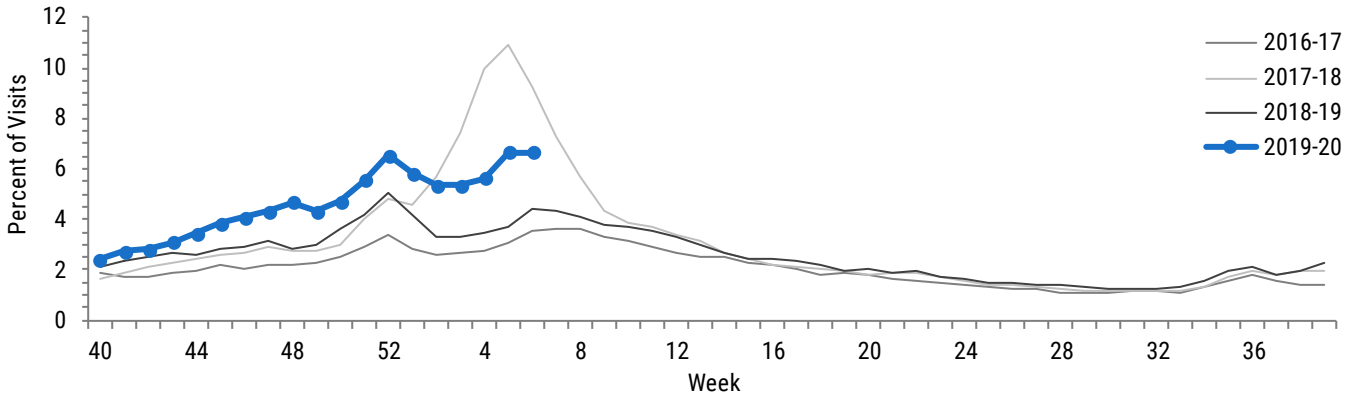
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



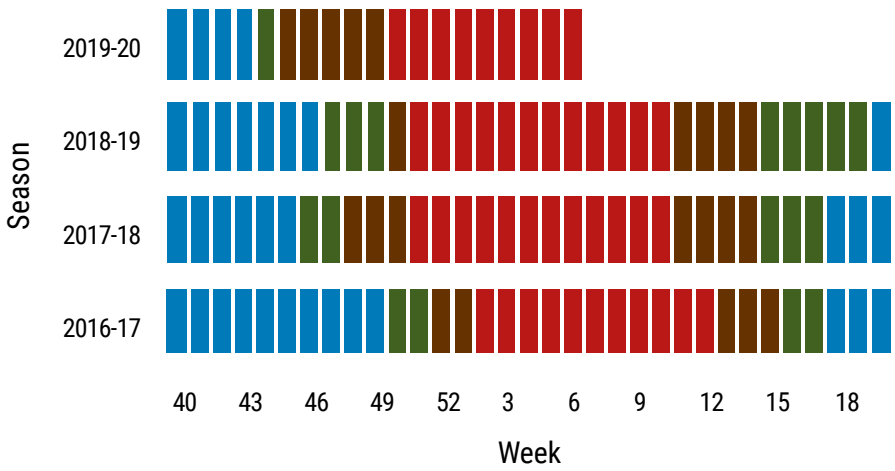
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 6, **the percent of emergency department and urgent care center visits for ILI statewide was stable** compared to the previous week and remained the highest level observed so far this season. Activity in week 6 was above peak levels observed during the 2018-19 and 2016-17 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=368) statewide for the current season (week 40, 2019 to week 6, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 6, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 6, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

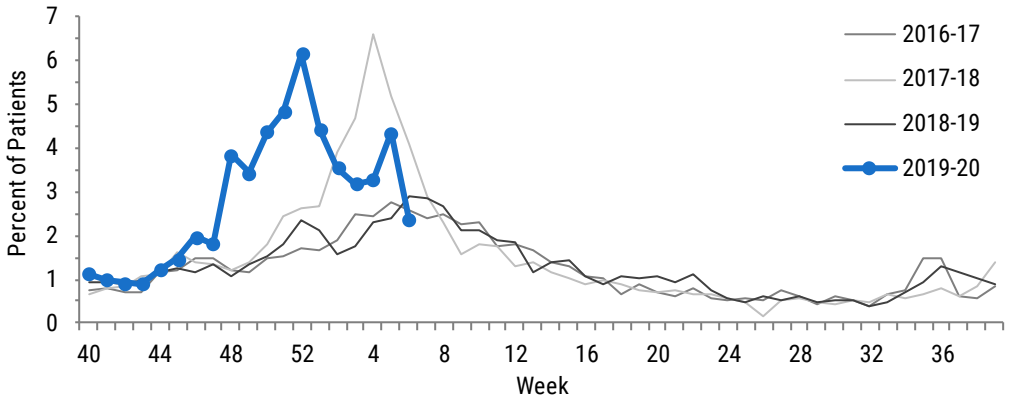
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 6, **the percent of patients with ILI reported by ILINet providers statewide decreased** and was below levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=7), week 40, 2016 to week 6, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



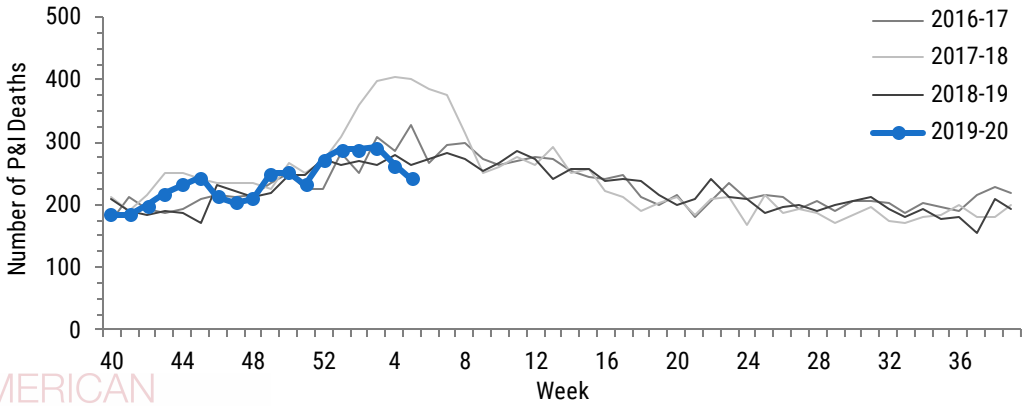


Figure 4: In week 5 (ending 2/1/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 5, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

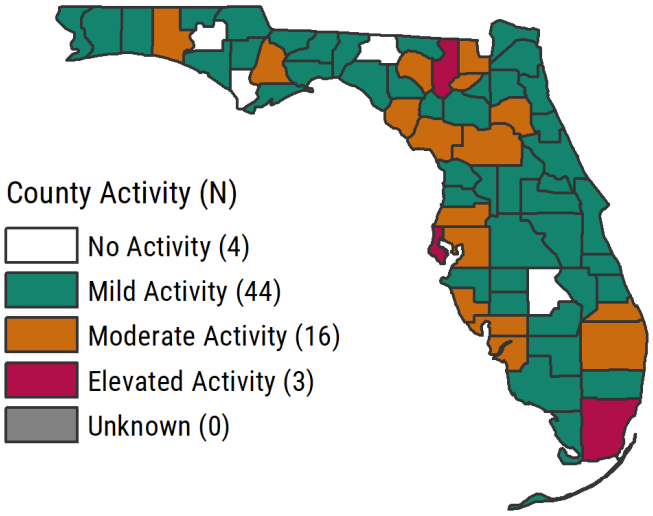
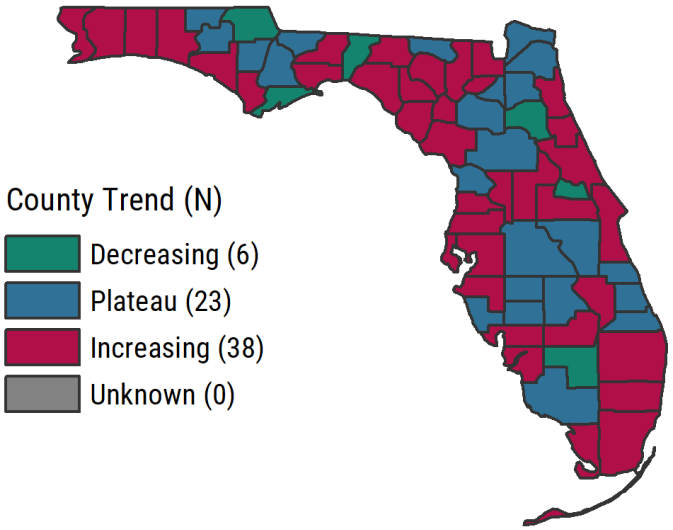
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 6. Sixteen counties reported **moderate activity,** and three counties reported **elevated activity.**





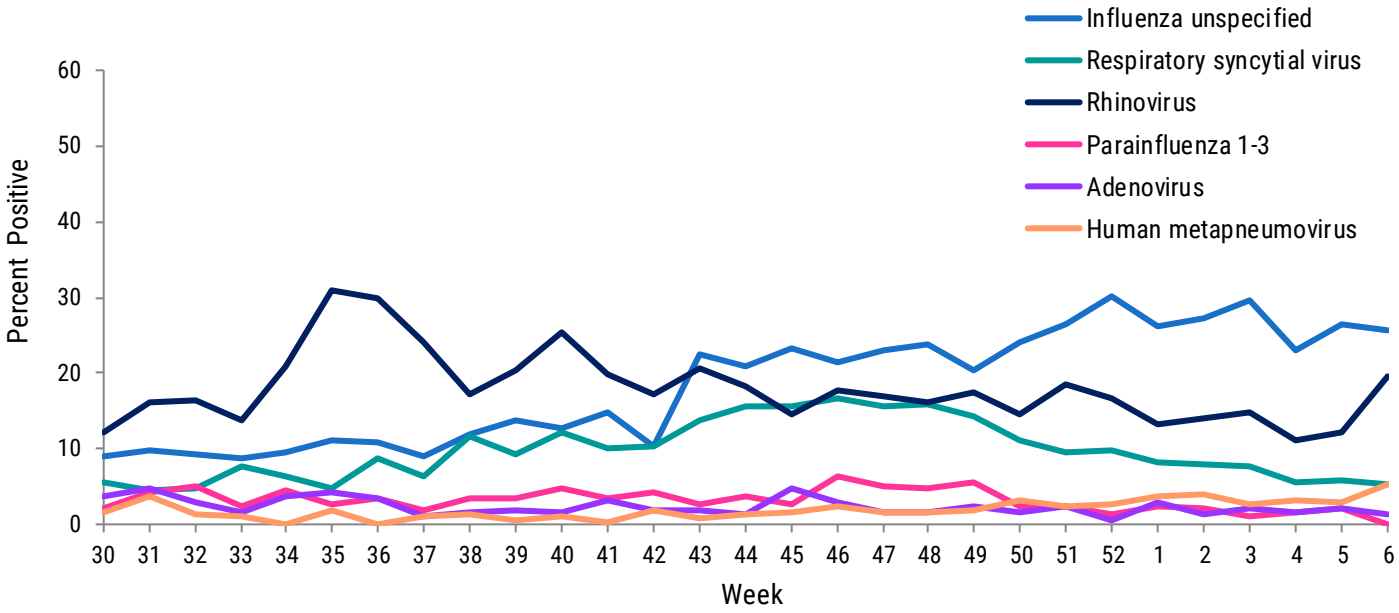


Figure 6: Most counties reported **increasing activity** in week 6. Twenty-three counties reported **activity at a plateau,** and six counties reported **decreasing activity.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 6, the **percent of specimens testing positive for influenza decreased slightly** and remained higher than other respiratory viruses under surveillance.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=7), week 40, 2019 to week 6, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

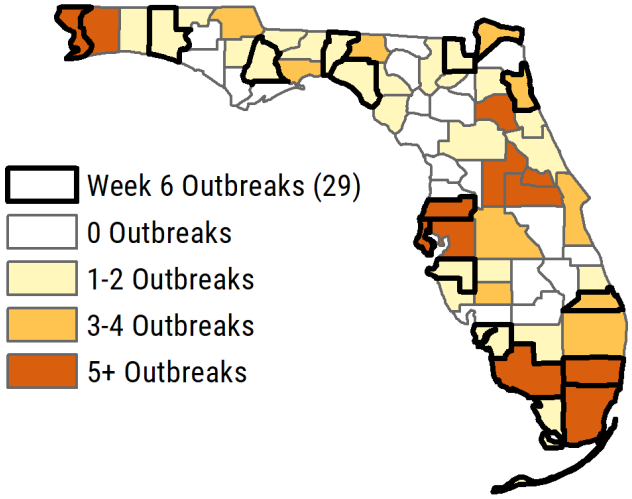
Week 6 Outbreaks at a Glance:

Number Reported:
29 Outbreaks

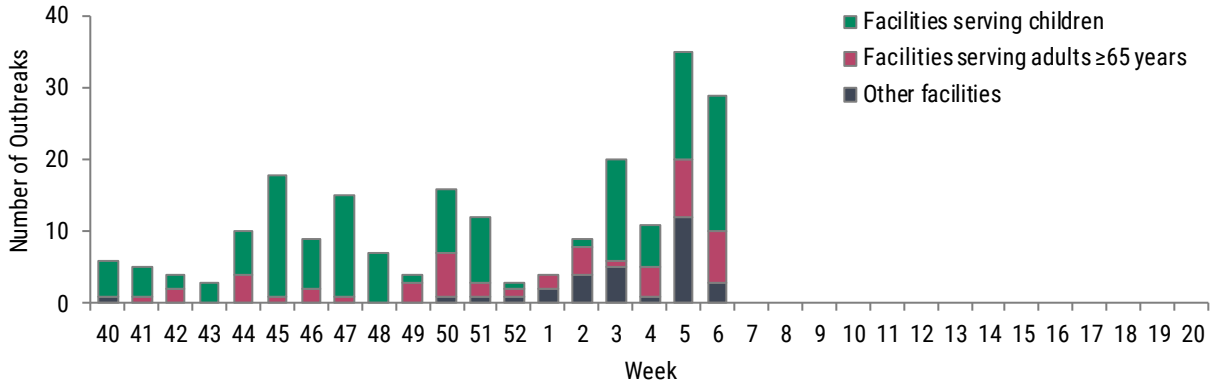
Influenza-Associated:
10 Outbreaks



Severe Outcomes*:
3 Outbreaks

Outbreak Summary:

In week 6, 10 influenza-associated and 19 ILI outbreaks were reported, a decrease from the previous week.



Severe outcomes* were reported in three of 29 outbreaks. One or more hospitalizations were reported in each of these three outbreaks. No deaths were reported.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 6, all three outbreaks with severe outcomes were in facilities serving adults aged ≥65 years.

▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 6 are **outlined in bold.**

Figure 9: In week 6, **seven outbreaks** were reported in **facilities serving adults aged ≥65 years, 19 outbreaks** were reported in **facilities serving children,** and **three outbreaks** were reported in **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 6, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 6, **54.5% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 6, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

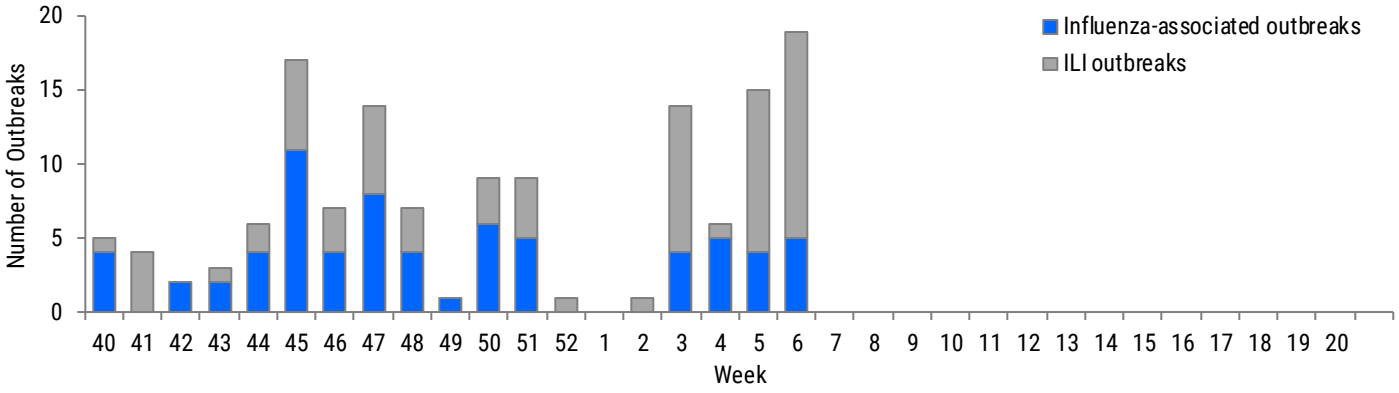
Facilities Serving Children*:



19 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

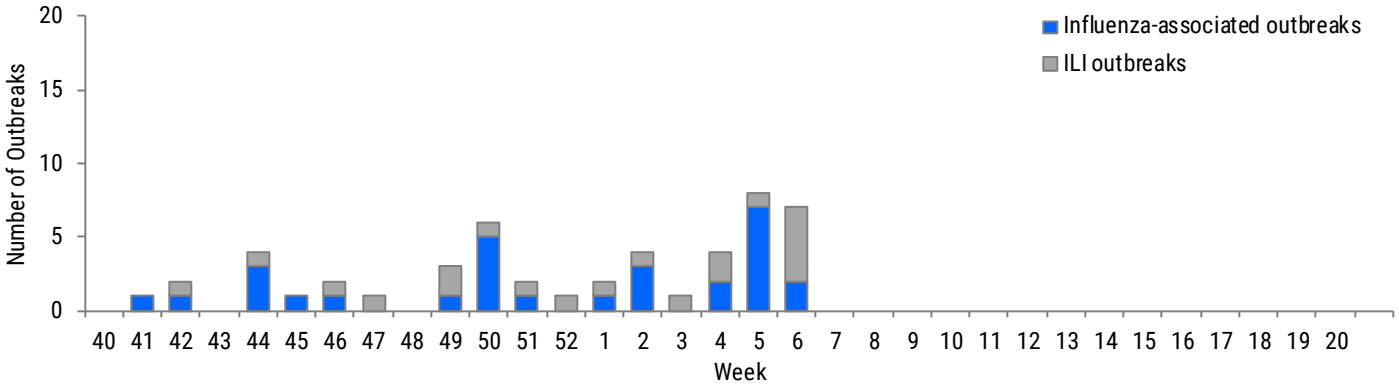
In week 6, 19 new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 6, **five influenza-associated outbreaks** and **14 ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 6, 2020.

Facilities Serving Adults ≥65 yrs.**:



7 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 6, seven new outbreaks of influenza or ILI were reported in facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 6, **two influenza-associated outbreaks** and **five ILI outbreaks** were reported in **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 6, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

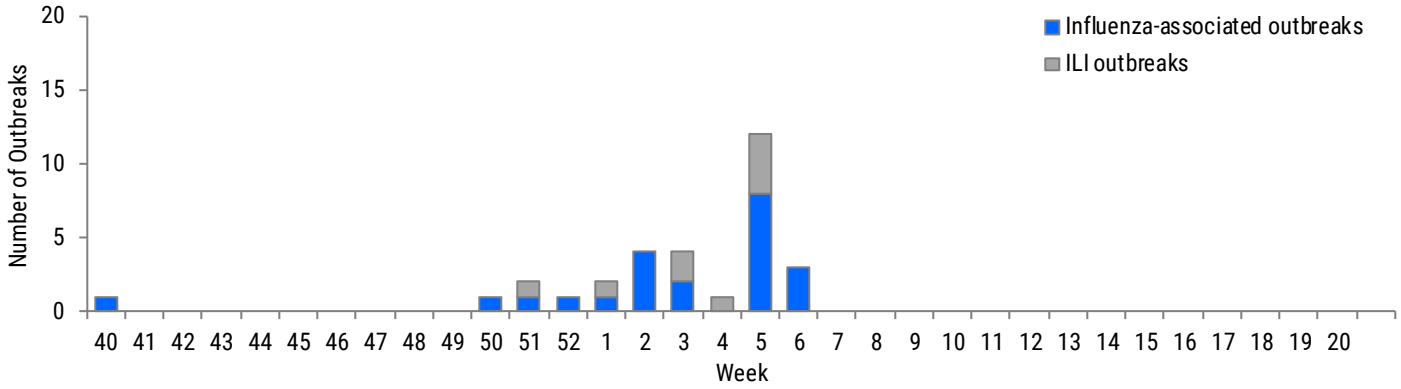
Other Facilities*:



3 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 6, three new outbreaks of influenza or ILI were reported in other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 6, **three influenza-associated outbreaks** were reported in **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 6, 2020.

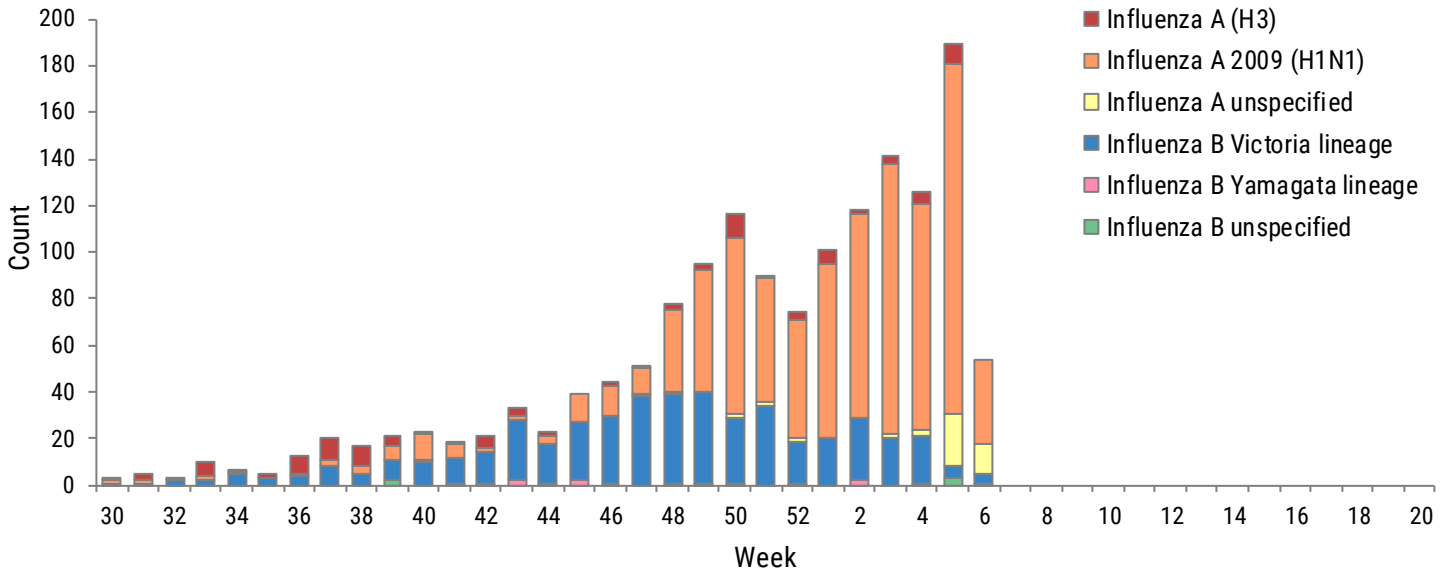


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	112 (50.9%)	59 influenza-associated outbreaks 53 ILI outbreaks
Child daycares	28 (12.7%)	10 influenza-associated outbreaks 18 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	14 (6.4%)	4 influenza-associated outbreaks 10 ILI outbreaks
Nursing facilities	12 (5.5%)	9 influenza-associated outbreaks 3 ILI outbreaks
Other long-term care facilities	23 (10.5%)	16 influenza-associated outbreaks 7 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	27 (12.3%)	19 influenza-associated outbreaks 8 ILI outbreak
Hospitals	2 (0.9%)	2 influenza-associated outbreaks 0 ILI outbreaks
Additional facility types	2 (0.9%)	1 influenza-associated outbreak 1 ILI outbreak
Total	**220 (100.0%)**	**120 influenza-associated outbreaks** **100 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 6, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 6, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=368) from week 40, 2016 to week 6, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity increased** during week 6 and was above peak levels observed during the 2018-19 and 2016-17 seasons.

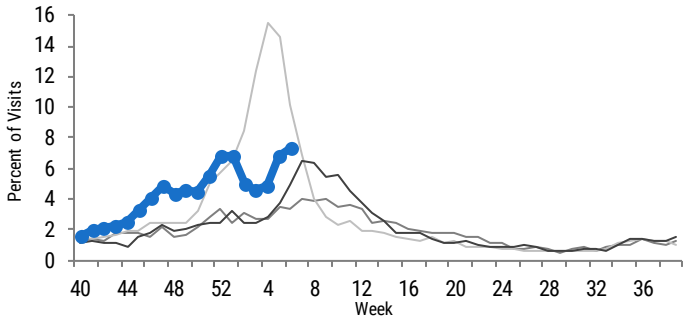

Figure 17: In **region 2, ILI activity decreased** during week 6 and was above peak activity observed during the 2018-19 and 2016-17 seasons.

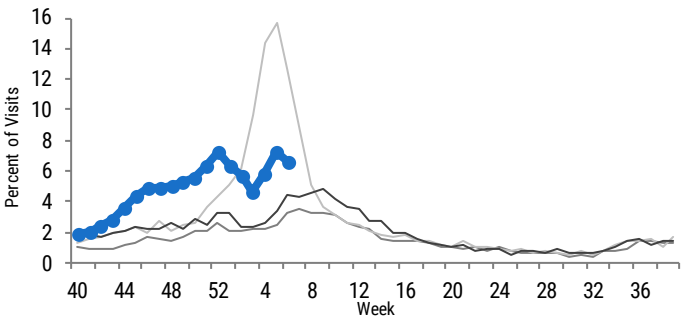

Figure 18: In **region 3, ILI activity decreased** during week 6 and was above peak activity observed during the 2018-19 and 2016-17 seasons.

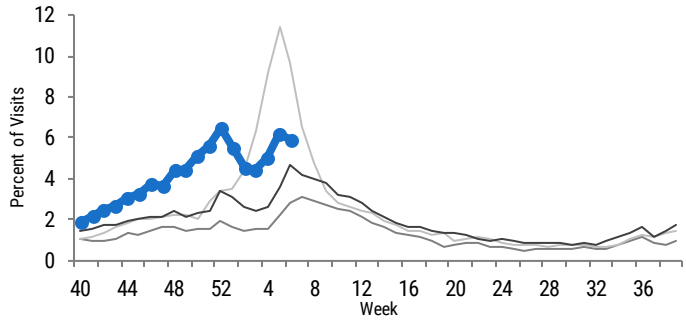

Figure 19: In **region 4, ILI activity increased** during week 6 and was above peak activity levels observed during the 2018-19 and 2016-17 seasons.

AMERICAN OVERSIGHT

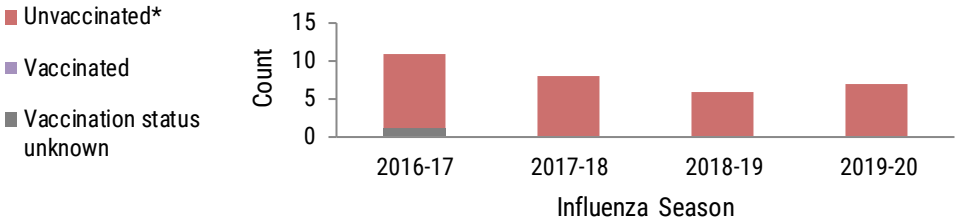
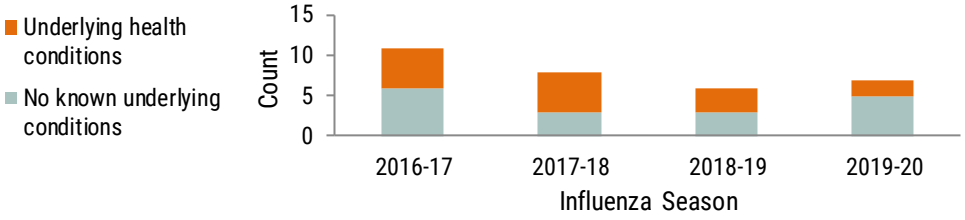
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 6, **the percent of emergency department and urgent care center visits for ILI in children <18 years increased** and was above peak activity observed during the 2018-19 and 2016-17 seasons.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 6, 2020.

Figures 25-26: In week 6, **no new influenza-associated pediatric deaths were reported**. A total of seven influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 6, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 6, 2020.

In week 6, **no new influenza-associated pediatric deaths were reported**.

A total of seven influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm

AMERICAN OVERSIGHT

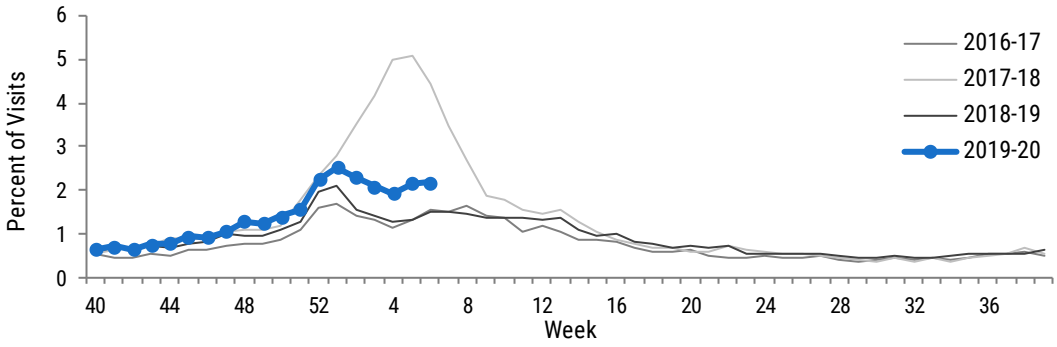
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 6, the **number of emergency department and urgent care center visits for influenza among pregnant women was stable** and was within levels observed at this time in past seasons.



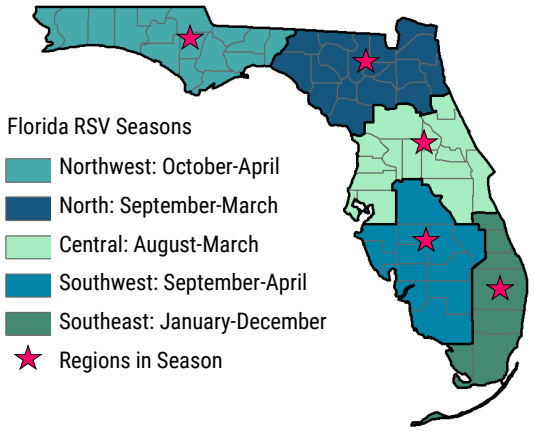
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 6, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 6, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years was stable** and was above peak activity levels observed during the 2018-19 and 2016-17 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 6, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

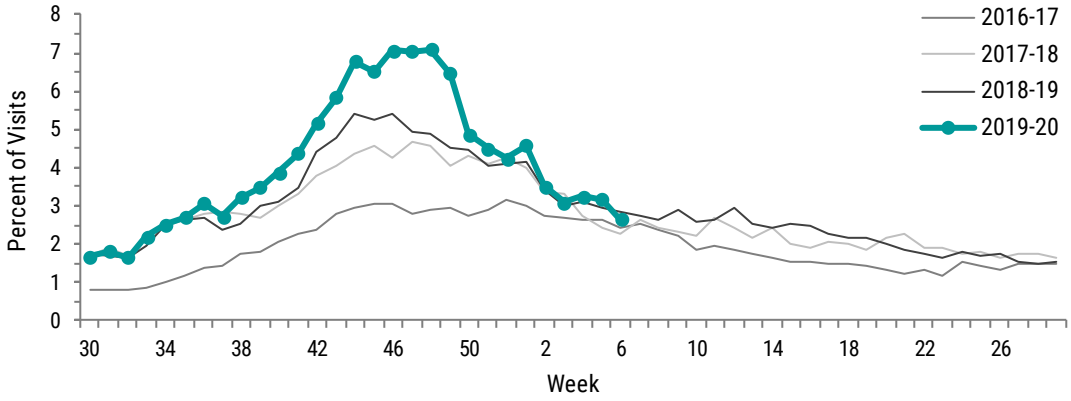
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

Week 6 (January 26-February 1, 2020) Activity Summary

In week 6, RSV activity in children <5 years decreased and was similar to levels observed at this time in 2019.

One new RSV-associated outbreak was reported in a Pinellas County child daycare. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 6, **the percent of emergency department and urgent care center visits for RSV among children <5 years decreased** and was similar to levels observed at this time in past seasons.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 6, 2020.

*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

RSV-Associated Outbreaks in Week 6:

1 Outbreak

Summary of RSV-Associated Outbreaks:

In week 6, one new RSV-associated outbreaks was reported. Since week 30, 2019, nine RSV-associated outbreaks have been reported.

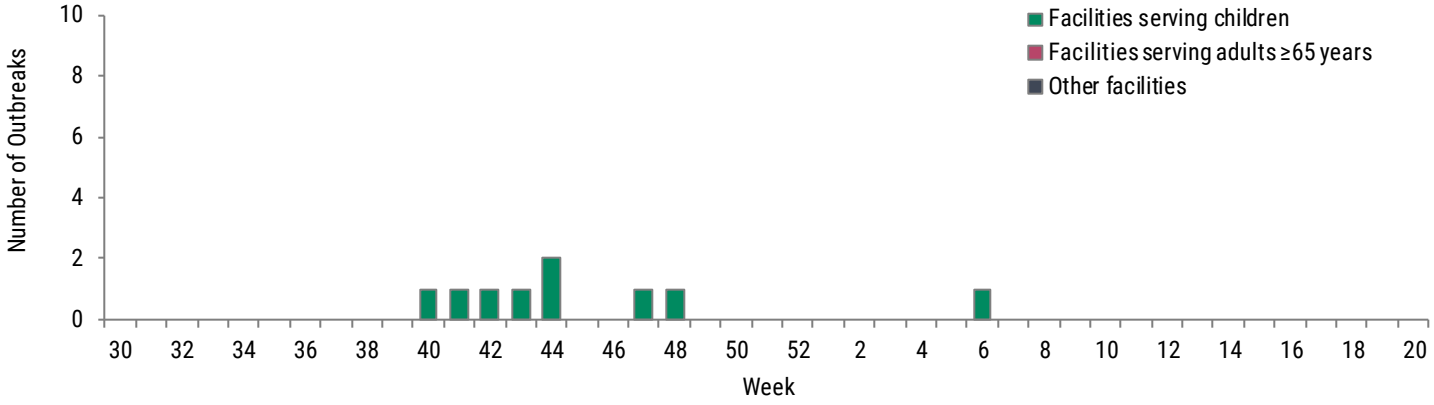

Figure 32: In week 6, **one new RSV-associated outbreak** was reported in Florida's central region. Since week 30, outbreaks have been reported in Florida's southeast, central, and northwest regions.

◀ **Figure 32** shows **a summary of RSV-associated outbreaks by region*** as reported by county health departments in Merlin, week 30, 2019 to week 6, 2020.

*Regions defined in figure 29.

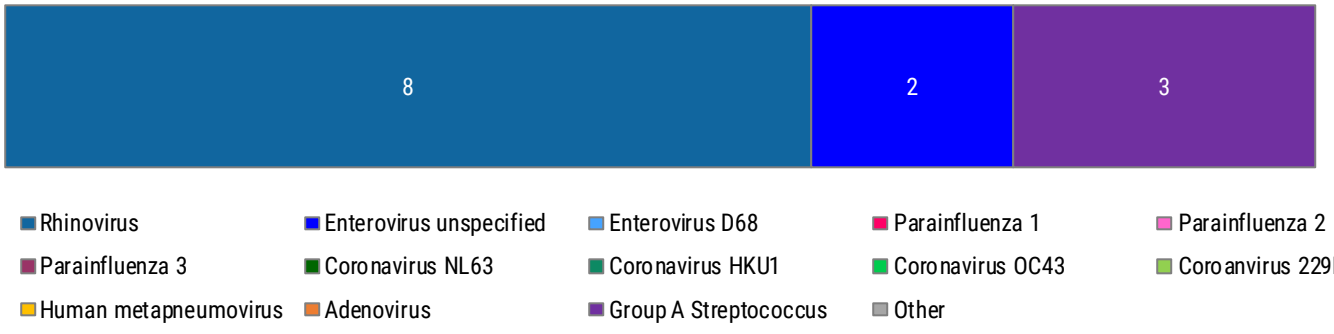

Figure 33: In week 6, one new RSV-associated outbreaks was reported in a **facility serving children.** All of the outbreaks reported since week 30 have been reported in **facilities serving children.**

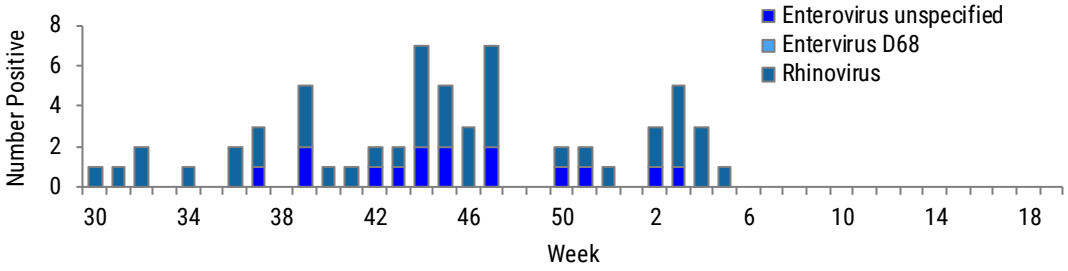

▲ **Figure 33** shows **the number of RSV-associated outbreaks by setting and week** as reported by county health departments in Merlin, week 30, 2019 to week 6, 2020.

AMERICAN OVERSIGHT

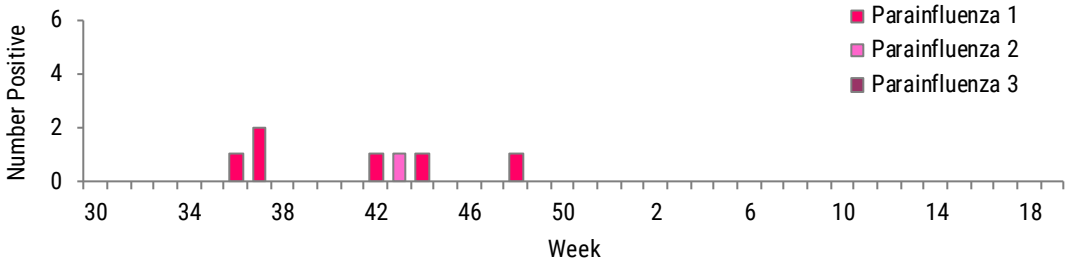
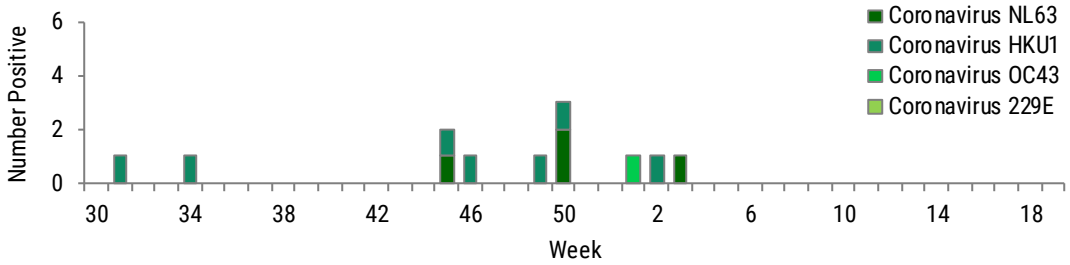
Other Respiratory Virus Surveillance





▲ **Figure 34** shows **the number of unique times a pathogen was associated with a respiratory outbreak** for outbreaks reported from week 30, 2019 to week 6, 2020.

◀ **Figure 35*** shows **the number of PCR-positive laboratory findings for enterovirus unspecified, enterovirus D68, and rhinovirus** by week** among specimens submitted to the Bureau of Public Health Laboratories (BPHL) for extended respiratory panel testing.

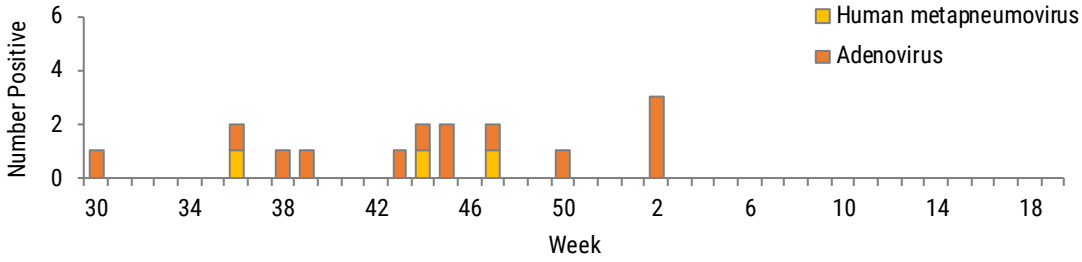


Figure 36* shows **the ▶ number of PCR-positive laboratory findings for parainfluenza 1-3** by week** among specimens submitted to BPHL for extended respiratory panel testing.

◀ **Figure 37*** shows **the number of PCR-positive laboratory findings for seasonal coronaviruses NL63, HKU1, OC43, and 229E** by week** among specimens submitted to BPHL for extended respiratory panel testing.

Figure 38* shows **the ▶ number of PCR-positive laboratory findings for human metapneumovirus and adenovirus** by week** among specimens submitted to BPHL for extended respiratory panel testing.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 6, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Primary or secondary school	Pinellas	107	Unknown	Unknown	Unknown	Unknown	Open
Correctional facility	Walton	60	0	0	Influenza A unspecified	Yes	Open
Correctional facility	Martin	55	0	0	Influenza A 2009 (H1N1)	Yes	Open
Primary or secondary school	Lee	36	0	0	Unknown	Unknown	Open
Correctional facility	Liberty	31	Unknown	0	Influenza A 2009 (H1N1)	Yes	Open
Nursing facility	Monroe	5	2	Unknown	Influenza A unspecified and influenza B unspecified	Unknown	Open
Assisted living facility	Nassau	5	2	Unknown	Unknown	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=368) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 6, 2020 Florida Flu Review
Date:	Wednesday, February 12, 2020 4:05:55 PM
Attachments:	Week 6, 2020 Florida Flu Review.pdf

Good Afternoon!

Attached is the Week 6, 2020 Florida Flu Review.

Activity was stable in week 6 and remained at the highest level observed so far this season. Increases were observed in most regions of the state. Elevated activity is still expected for several more weeks.

Twenty-nine outbreaks were reported, down from 35 outbreaks in the previous week. Of the 29 outbreaks reported, 10 were influenza-associated and 19 were ILI.

No new influenza-associated pediatric deaths were reported. Seven influenza-associated pediatric deaths have been reported so far this season, all in unvaccinated children.

Influenza A 2009 (H1N1) remained the predominant strain. Earlier in the season, influenza B Victoria lineage viruses were predominant. Influenza B Victoria lineage viruses continue to circulate at lower levels.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. Vaccination should continue as long as influenza viruses are circulating. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions). On January 10, 2020, CDC issued a health advisory reminding clinicians that influenza B viruses can cause severe illness in people of all ages and reiterating vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Florida ILI Surveillance System Summary 16

Background

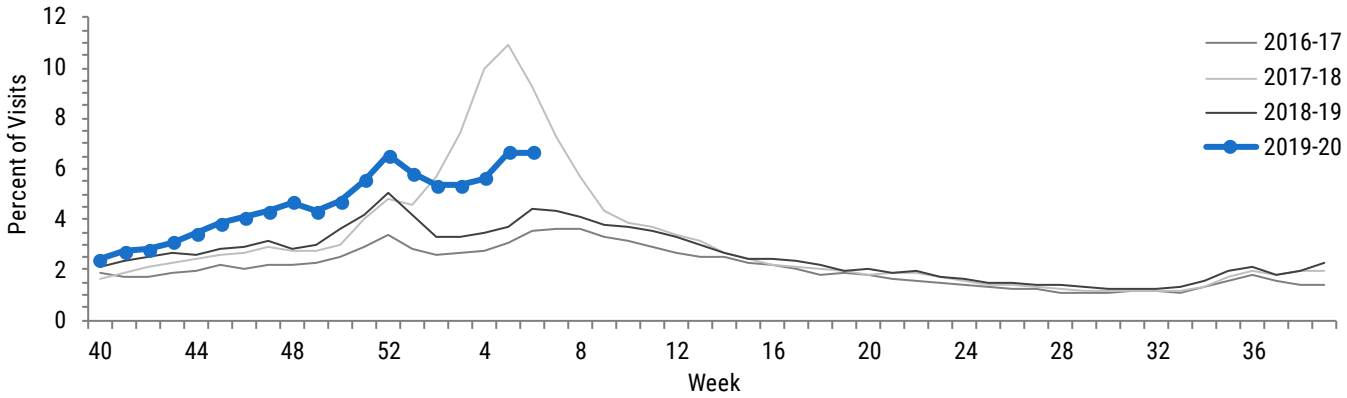
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



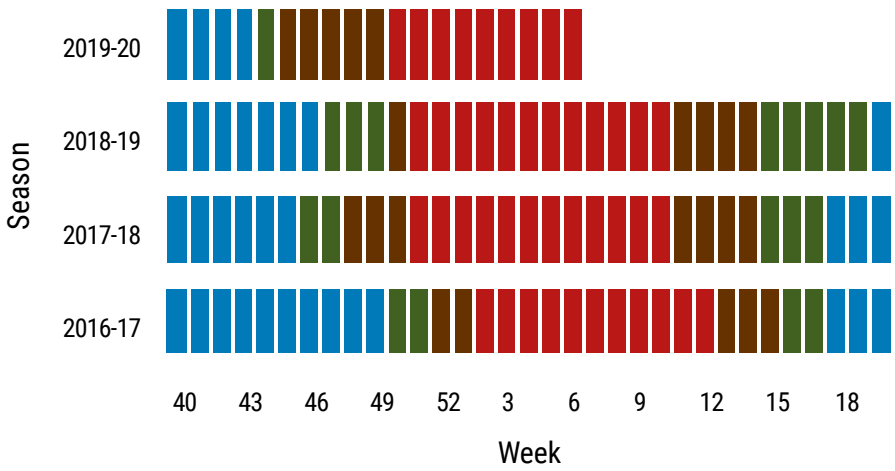
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 6, **the percent of emergency department and urgent care center visits for ILI statewide was stable** compared to the previous week and remained the highest level observed so far this season. Activity in week 6 was above peak levels observed during the 2018-19 and 2016-17 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=368) statewide for the current season (week 40, 2019 to week 6, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 6, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 6, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

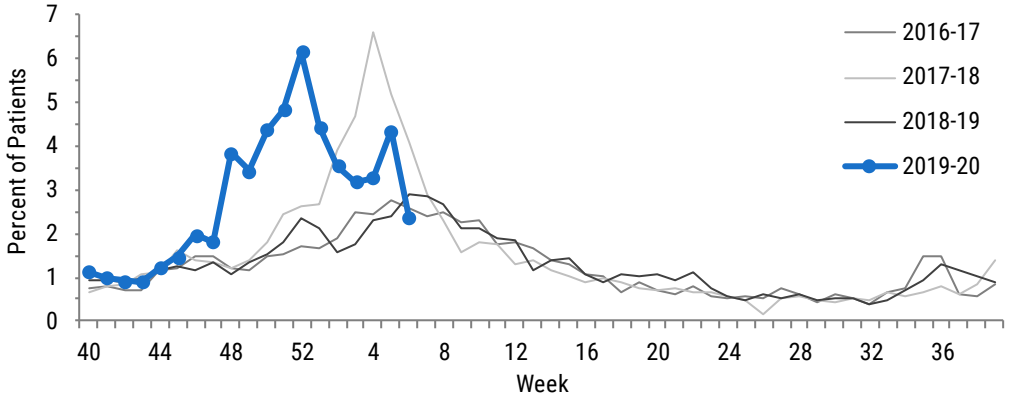
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 6, **the percent of patients with ILI reported by ILINet providers statewide decreased** and was below levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=7), week 40, 2016 to week 6, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



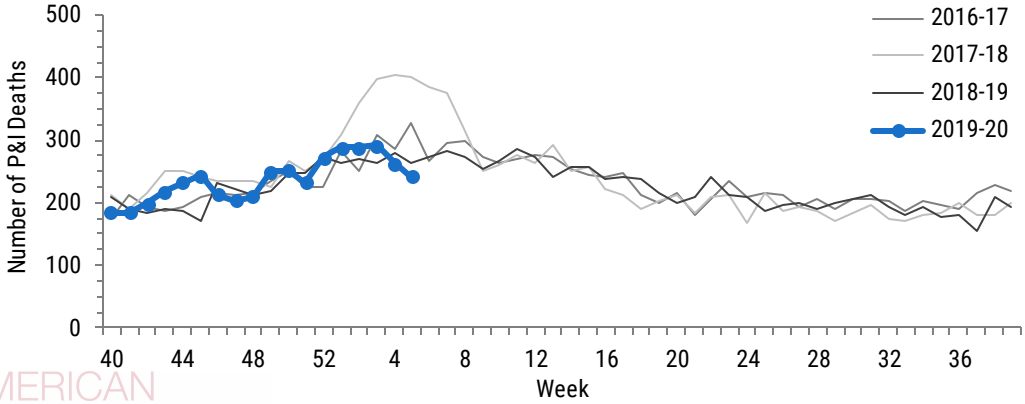


Figure 4: In week 5 (ending 2/1/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 5, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

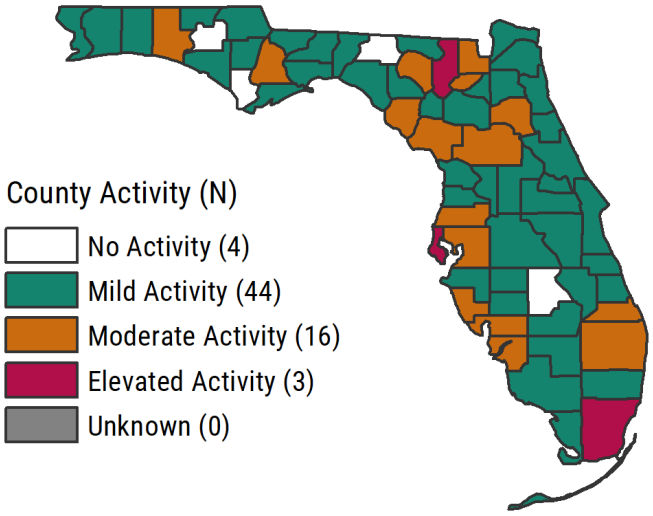
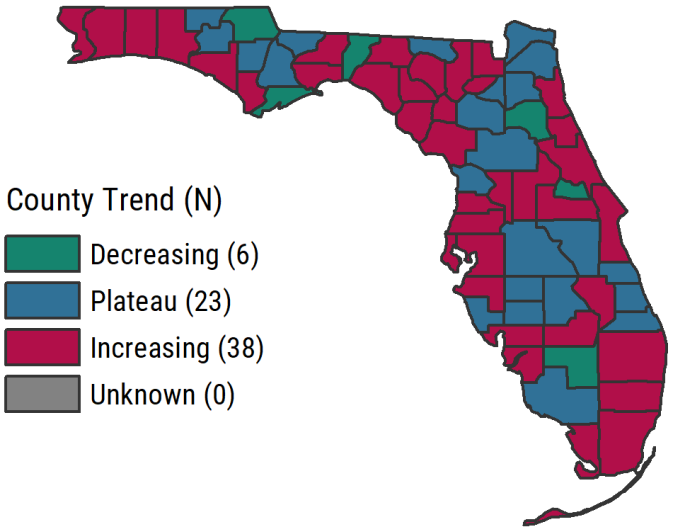
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 6. Sixteen counties reported **moderate activity,** and three counties reported **elevated activity.**





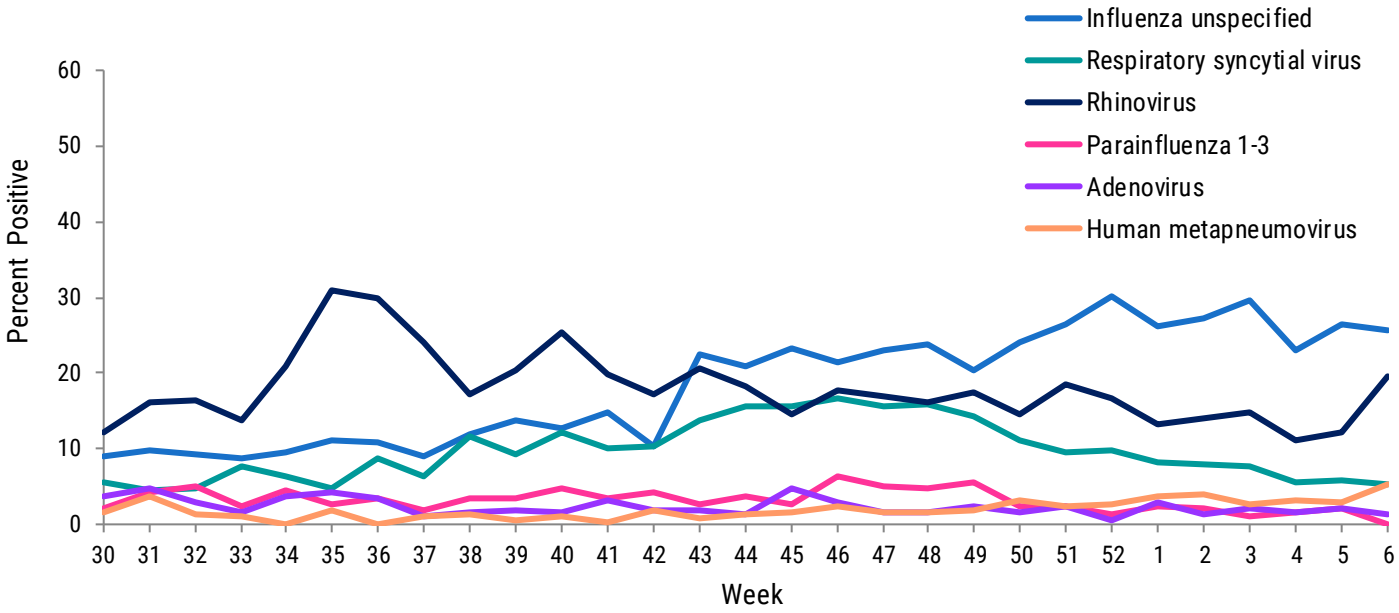


Figure 6: Most counties reported **increasing activity** in week 6. Twenty-three counties reported **activity at a plateau,** and six counties reported **decreasing activity.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 6, the **percent of specimens testing positive for influenza decreased slightly** and remained higher than other respiratory viruses under surveillance.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=7), week 40, 2019 to week 6, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

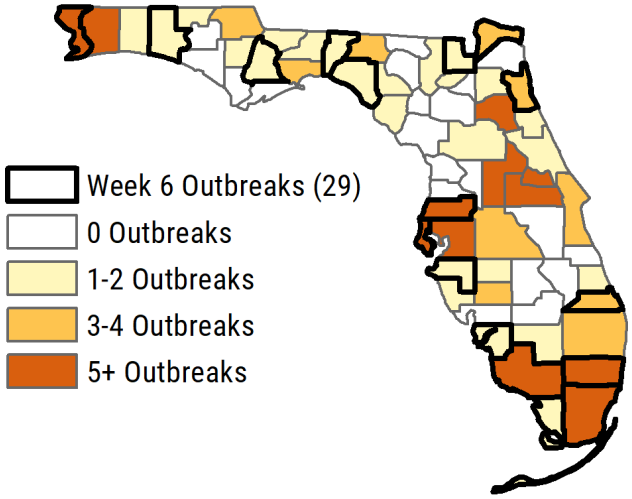
Week 6 Outbreaks at a Glance:

Number Reported:
29 Outbreaks

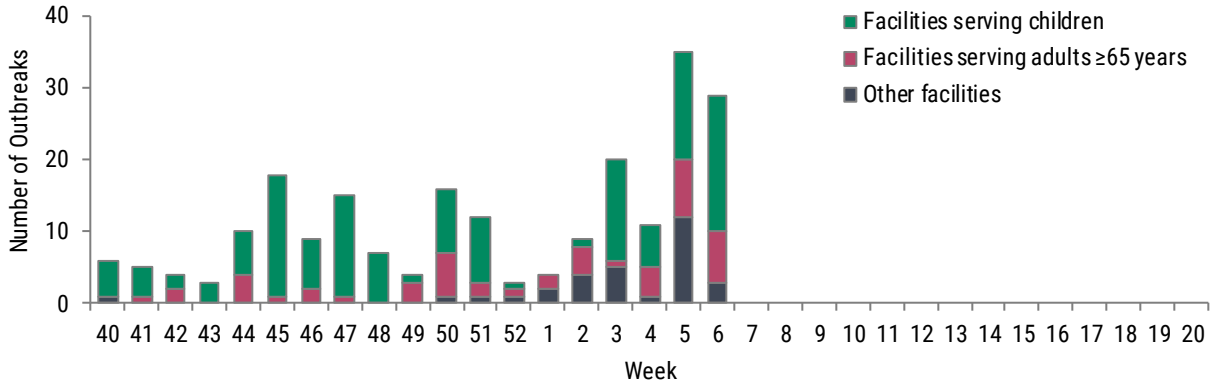
Influenza-Associated:
10 Outbreaks



Severe Outcomes*:
3 Outbreaks

Outbreak Summary:

In week 6, 10 influenza-associated and 19 ILI outbreaks were reported, a decrease from the previous week.



Severe outcomes* were reported in three of 29 outbreaks. One or more hospitalizations were reported in each of these three outbreaks. No deaths were reported.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 6, all three outbreaks with severe outcomes were in facilities serving adults aged ≥65 years.

▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 6 are **outlined in bold.**

Figure 9: In week 6, **seven outbreaks** were reported in **facilities serving adults aged ≥65 years, 19 outbreaks** were reported in **facilities serving children,** and **three outbreaks** were reported in **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 6, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 6, **54.5% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 6, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

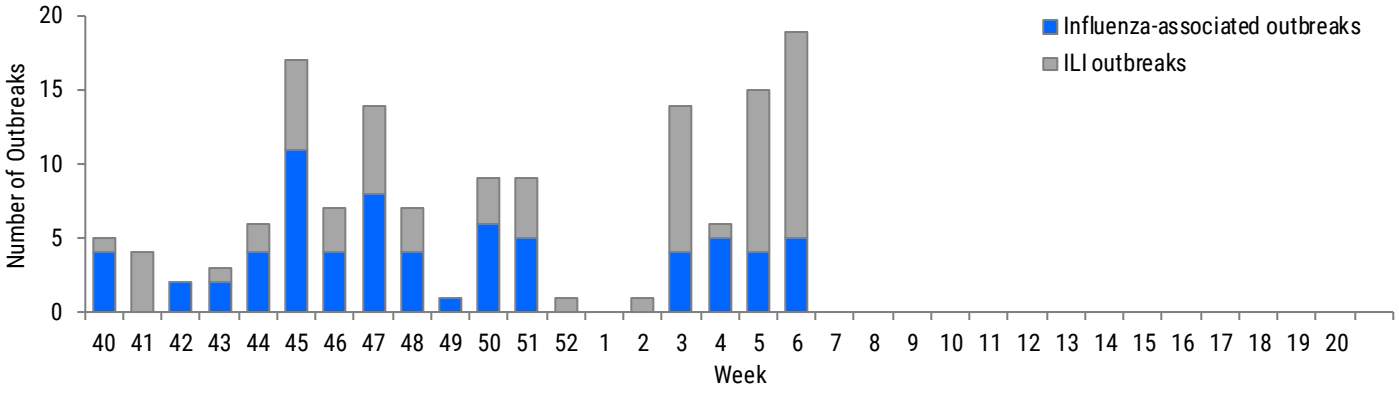
Facilities Serving Children*:



19 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

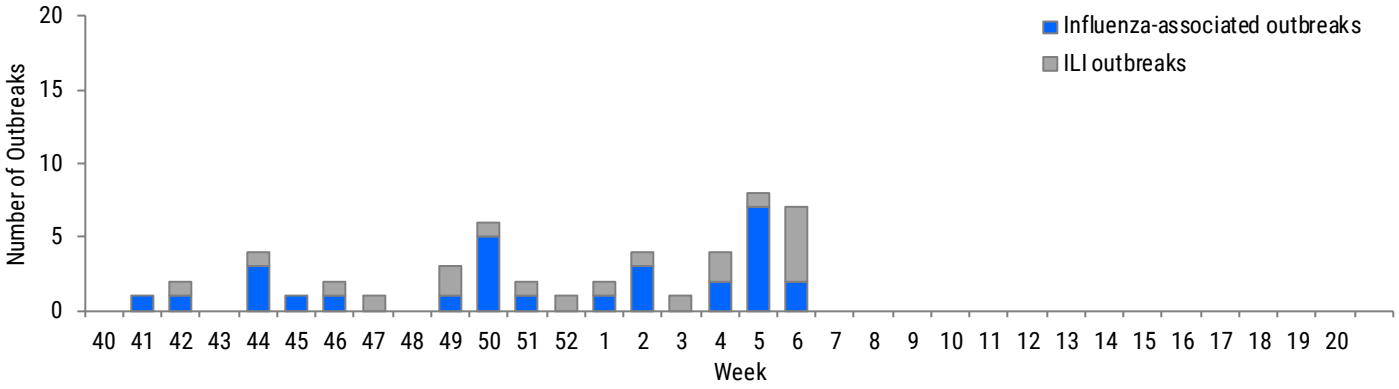
In week 6, 19 new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 6, **five influenza-associated outbreaks** and **14 ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 6, 2020.

Facilities Serving Adults ≥65 yrs.**:



7 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 6, seven new outbreaks of influenza or ILI were reported in facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 6, **two influenza-associated outbreaks** and **five ILI outbreaks** were reported in **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 6, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

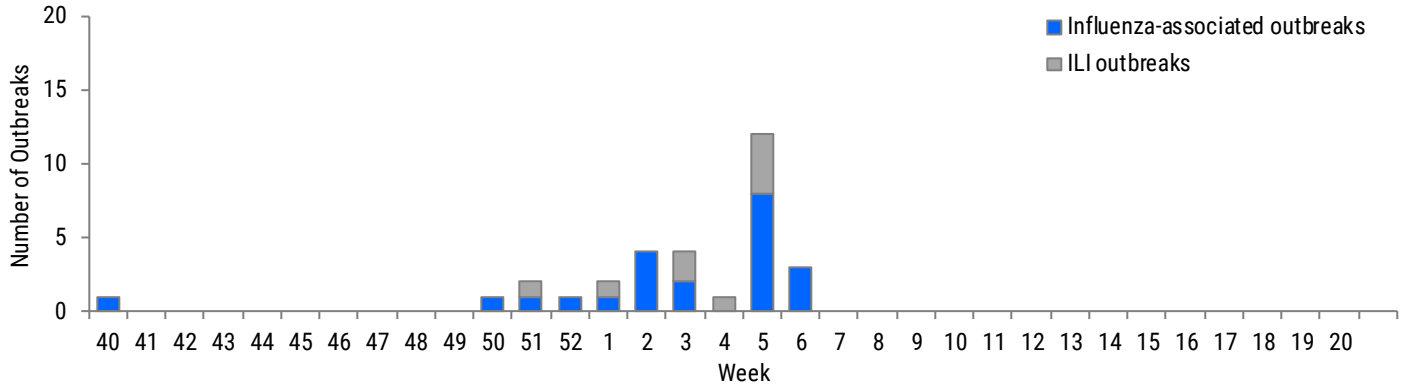
Other Facilities*:



3 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 6, three new outbreaks of influenza or ILI were reported in other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 6, **three influenza-associated outbreaks** were reported in **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 6, 2020.

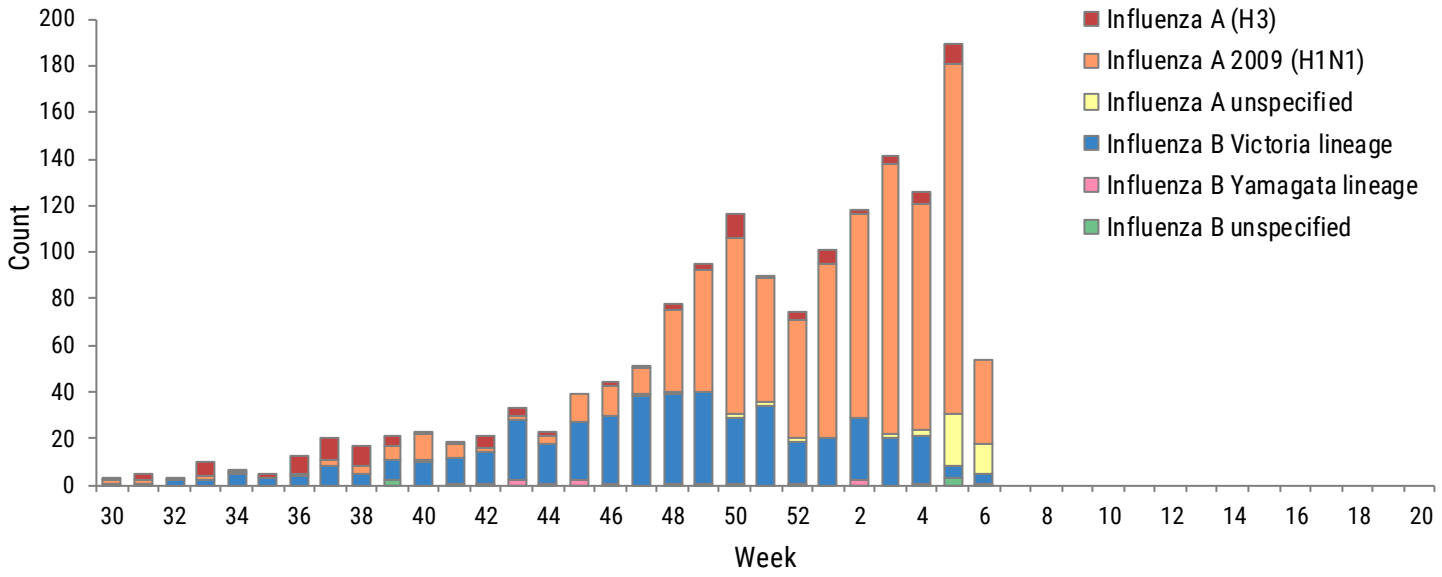


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	112 (50.9%)	59 influenza-associated outbreaks 53 ILI outbreaks
Child daycares	28 (12.7%)	10 influenza-associated outbreaks 18 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	14 (6.4%)	4 influenza-associated outbreaks 10 ILI outbreaks
Nursing facilities	12 (5.5%)	9 influenza-associated outbreaks 3 ILI outbreaks
Other long-term care facilities	23 (10.5%)	16 influenza-associated outbreaks 7 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	27 (12.3%)	19 influenza-associated outbreaks 8 ILI outbreak
Hospitals	2 (0.9%)	2 influenza-associated outbreaks 0 ILI outbreaks
Additional facility types	2 (0.9%)	1 influenza-associated outbreak 1 ILI outbreak
Total	**220 (100.0%)**	**120 influenza-associated outbreaks** **100 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 6, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 6, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=368) from week 40, 2016 to week 6, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity increased** during week 6 and was above peak levels observed during the 2018-19 and 2016-17 seasons.

AMERICAN OVERSIGHT

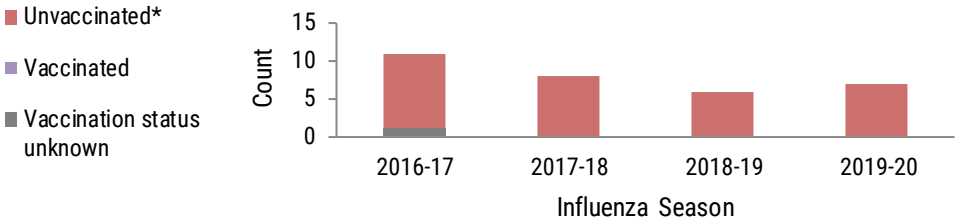
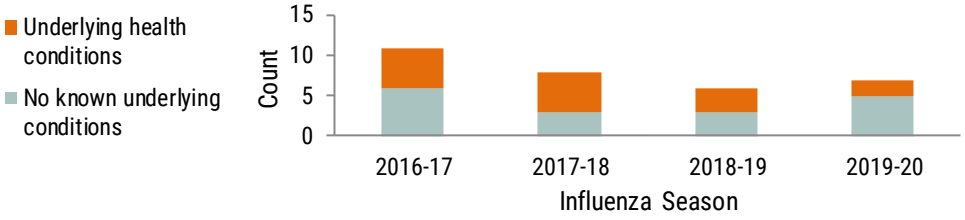
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 6, **the percent of emergency department and urgent care center visits for ILI in children <18 years increased** and was above peak activity observed during the 2018-19 and 2016-17 seasons.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 6, 2020.

Figures 25-26: In week 6, **no new influenza-associated pediatric deaths were reported**. A total of seven influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 6, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 6, 2020.

In week 6, **no new influenza-associated pediatric deaths were reported**.

A total of seven influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm.

AMERICAN OVERSIGHT

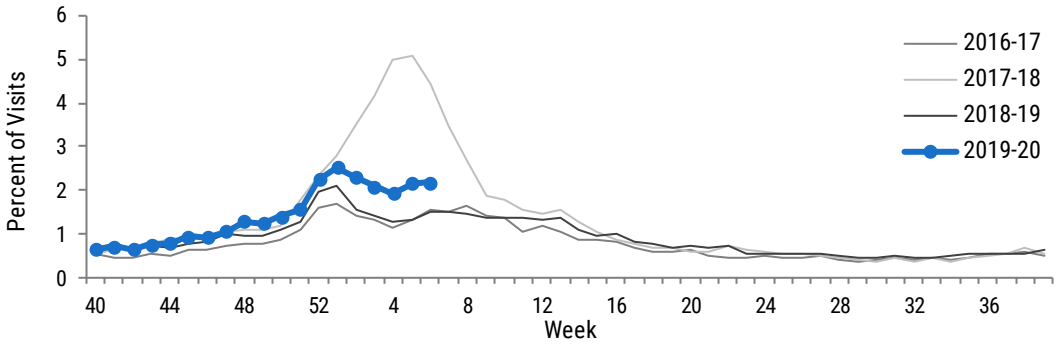
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 6, the **number of emergency department and urgent care center visits for influenza among pregnant women was stable** and was within levels observed at this time in past seasons.



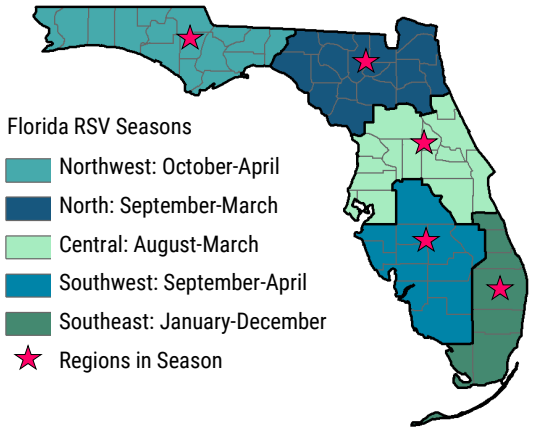
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 6, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 6, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years was stable** and was above peak activity levels observed during the 2018-19 and 2016-17 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 6, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

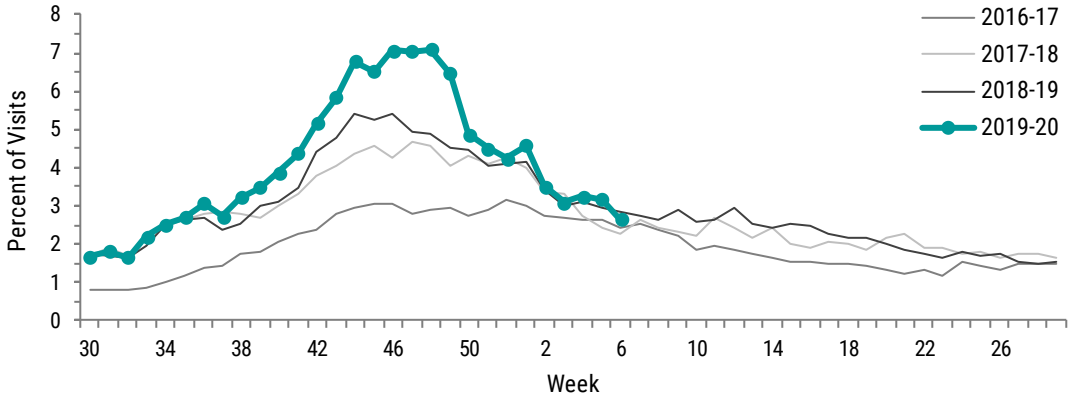
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

Week 6 (January 26-February 1, 2020) Activity Summary

In week 6, RSV activity in children <5 years decreased and was similar to levels observed at this time in 2019.

One new RSV-associated outbreak was reported in a Pinellas County child daycare. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 6, **the percent of emergency department and urgent care center visits for RSV among children <5 years decreased** and was similar to levels observed at this time in past seasons.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 6, 2020.

*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

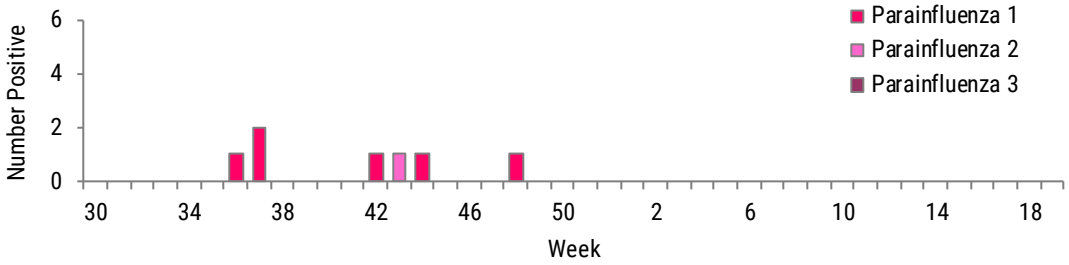
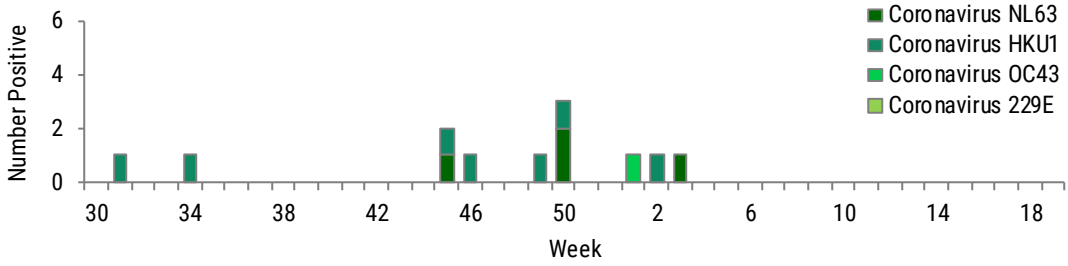
Other Respiratory Virus Surveillance





▲ **Figure 34** shows **the number of unique times a pathogen was associated with a respiratory outbreak** for outbreaks reported from week 30, 2019 to week 6, 2020.

◀ **Figure 35*** shows **the number of PCR-positive laboratory findings for enterovirus unspecified, enterovirus D68, and rhinovirus** by week** among specimens submitted to the Bureau of Public Health Laboratories (BPHL) for extended respiratory panel testing.

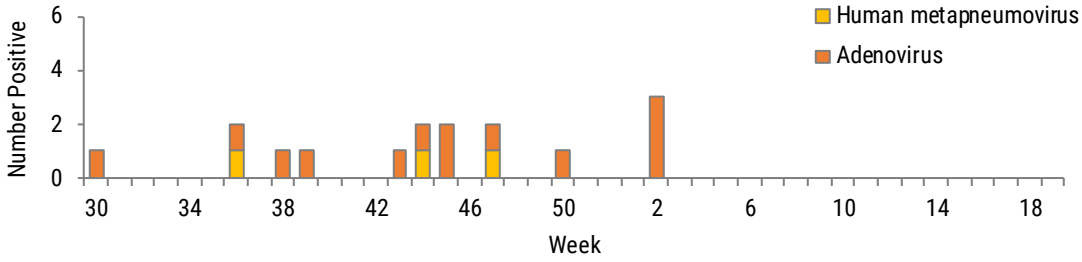


Figure 36* shows **the ▶ number of PCR-positive laboratory findings for parainfluenza 1-3** by week** among specimens submitted to BPHL for extended respiratory panel testing.

◀ **Figure 37*** shows **the number of PCR-positive laboratory findings for seasonal coronaviruses NL63, HKU1, OC43, and 229E** by week** among specimens submitted to BPHL for extended respiratory panel testing.

Figure 38* shows **the ▶ number of PCR-positive laboratory findings for human metapneumovirus and adenovirus** by week** among specimens submitted to BPHL for extended respiratory panel testing.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 6, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Primary or secondary school	Pinellas	107	Unknown	Unknown	Unknown	Unknown	Open
Correctional facility	Walton	60	0	0	Influenza A unspecified	Yes	Open
Correctional facility	Martin	55	0	0	Influenza A 2009 (H1N1)	Yes	Open
Primary or secondary school	Lee	36	0	0	Unknown	Unknown	Open
Correctional facility	Liberty	31	Unknown	0	Influenza A 2009 (H1N1)	Yes	Open
Nursing facility	Monroe	5	2	Unknown	Influenza A unspecified and influenza B unspecified	Unknown	Open
Assisted living facility	Nassau	5	2	Unknown	Unknown	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=368) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 6, 2020 Florida Flu Review
Date:	Wednesday, February 12, 2020 4:05:55 PM
Attachments:	Week 6, 2020 Florida Flu Review.pdf

Good Afternoon!

Attached is the Week 6, 2020 Florida Flu Review.

Activity was stable in week 6 and remained at the highest level observed so far this season. Increases were observed in most regions of the state. Elevated activity is still expected for several more weeks.

Twenty-nine outbreaks were reported, down from 35 outbreaks in the previous week. Of the 29 outbreaks reported, 10 were influenza-associated and 19 were ILI.

No new influenza-associated pediatric deaths were reported. Seven influenza-associated pediatric deaths have been reported so far this season, all in unvaccinated children.

Influenza A 2009 (H1N1) remained the predominant strain. Earlier in the season, influenza B Victoria lineage viruses were predominant. Influenza B Victoria lineage viruses continue to circulate at lower levels.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. Vaccination should continue as long as influenza viruses are circulating. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions). On January 10, 2020, CDC issued a health advisory reminding clinicians that influenza B viruses can cause severe illness in people of all ages and reiterating vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Florida ILI Surveillance System Summary 16

Background

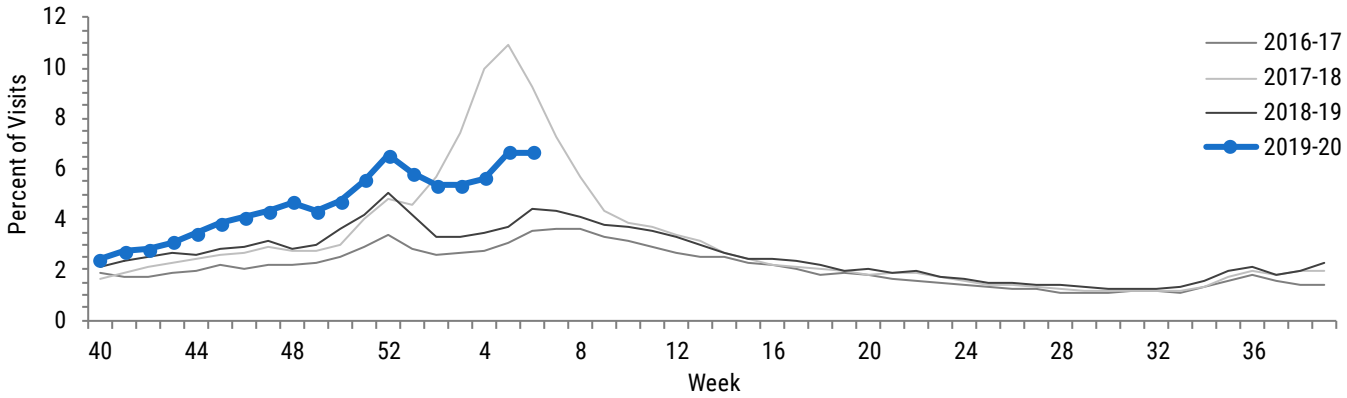
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



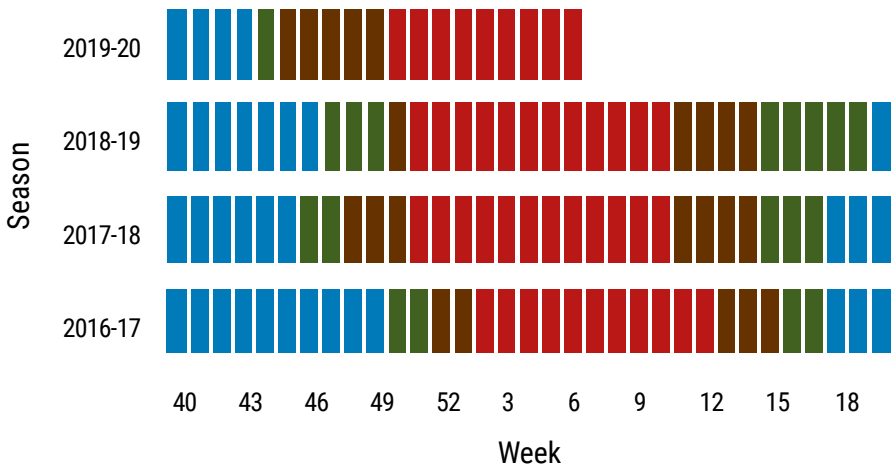
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 6, **the percent of emergency department and urgent care center visits for ILI statewide was stable** compared to the previous week and remained the highest level observed so far this season. Activity in week 6 was above peak levels observed during the 2018-19 and 2016-17 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=368) statewide for the current season (week 40, 2019 to week 6, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 6, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 6, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

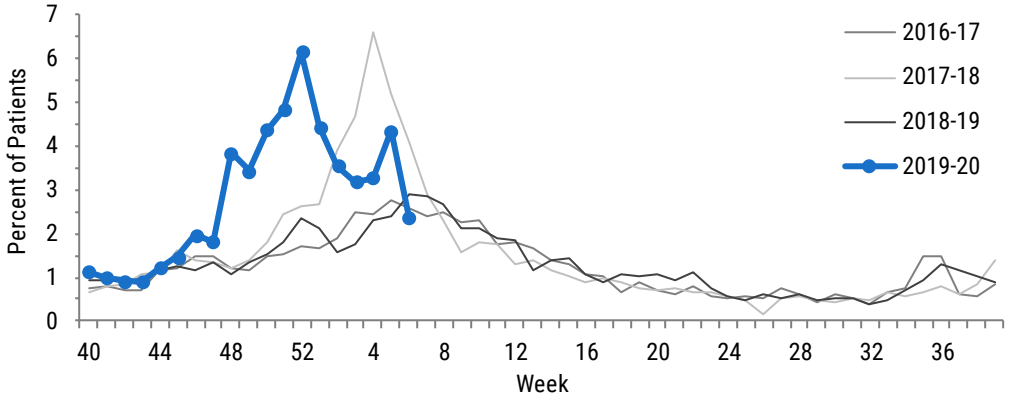
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 6, **the percent of patients with ILI reported by ILINet providers statewide decreased** and was below levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=7), week 40, 2016 to week 6, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



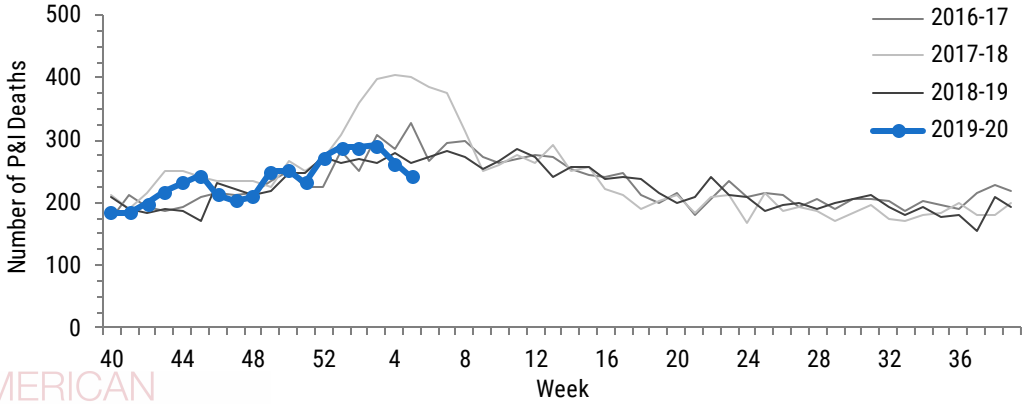


Figure 4: In week 5 (ending 2/1/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 5, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

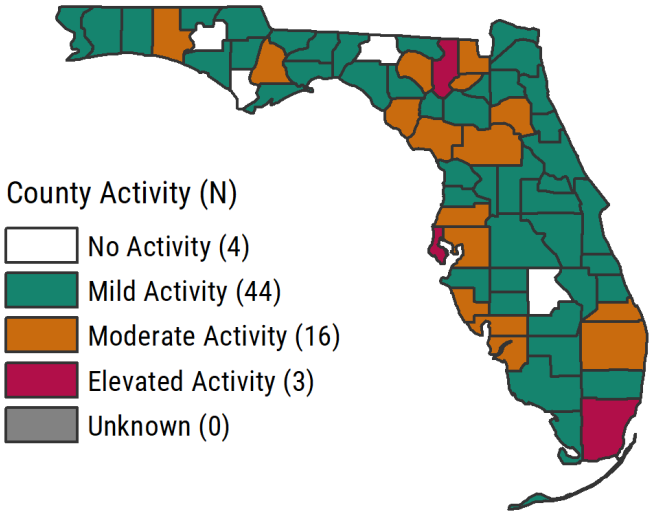
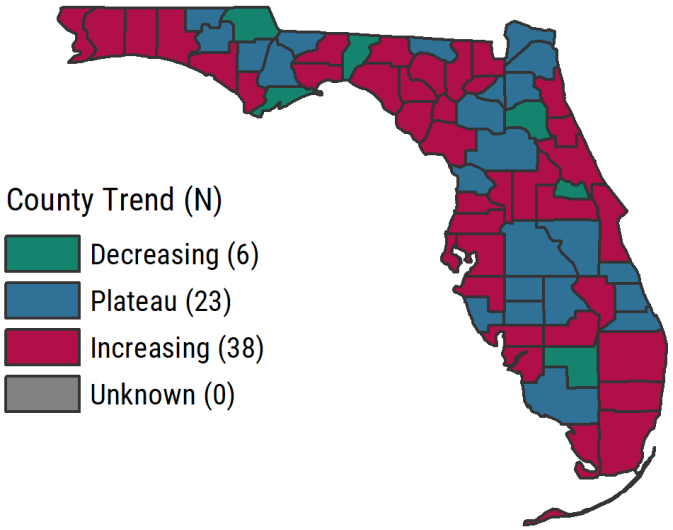
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 6. Sixteen counties reported **moderate activity,** and three counties reported **elevated activity.**





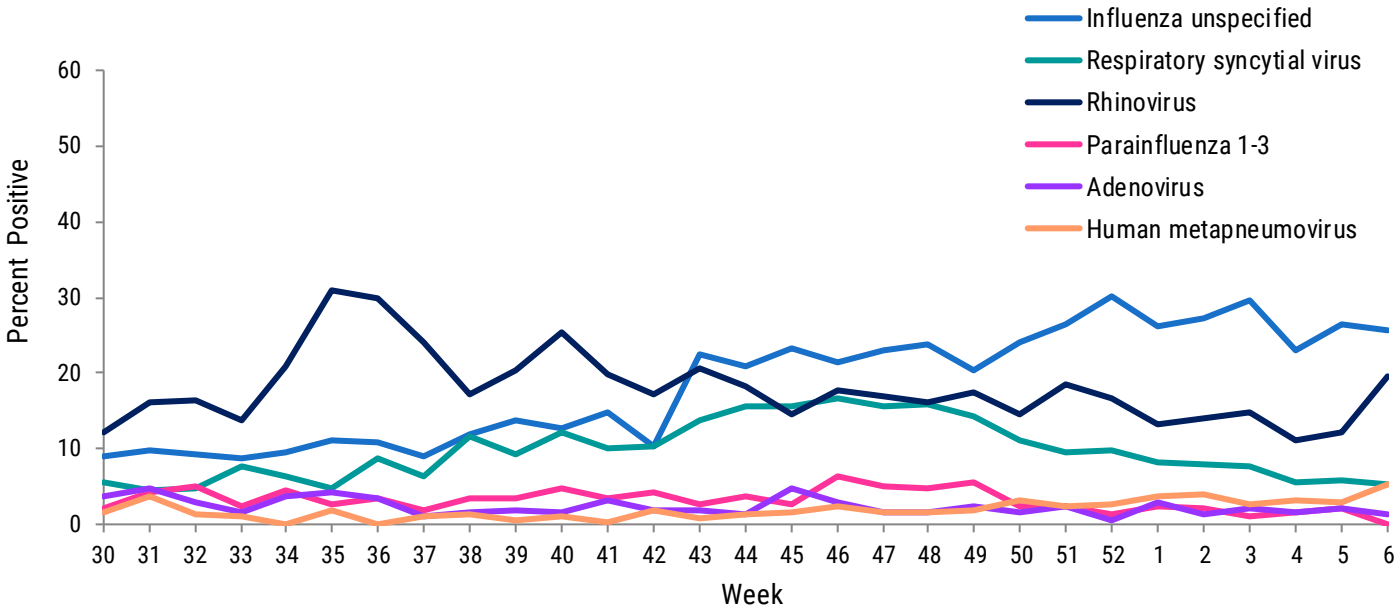


Figure 6: Most counties reported **increasing activity** in week 6. Twenty-three counties reported **activity at a plateau,** and six counties reported **decreasing activity.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 6, the **percent of specimens testing positive for influenza** **decreased slightly** and remained higher than other respiratory viruses under surveillance.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=7), week 40, 2019 to week 6, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

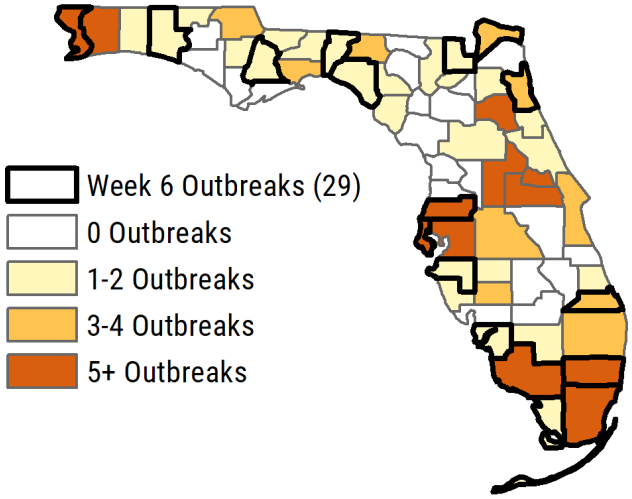
Week 6 Outbreaks at a Glance:

Number Reported:
29 Outbreaks

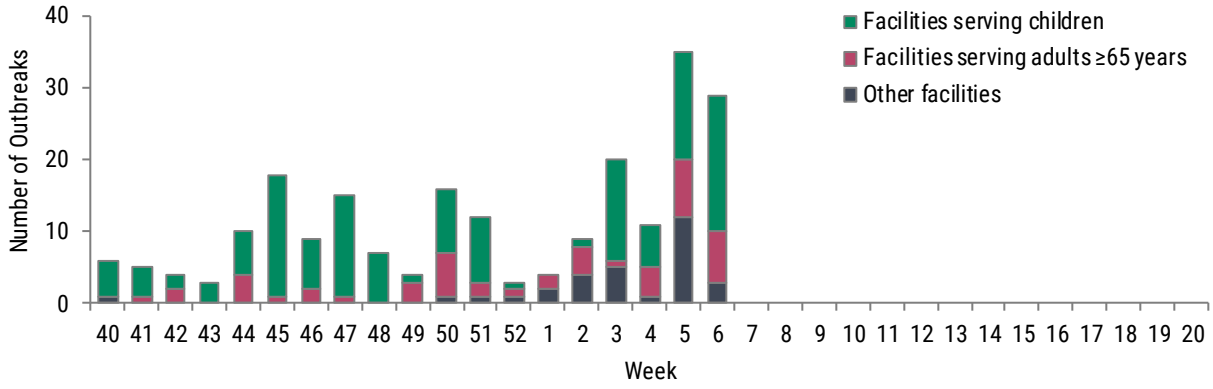
Influenza-Associated:
10 Outbreaks



Severe Outcomes*:
3 Outbreaks

Outbreak Summary:

In week 6, 10 influenza-associated and 19 ILI outbreaks were reported, a decrease from the previous week.



Severe outcomes* were reported in three of 29 outbreaks. One or more hospitalizations were reported in each of these three outbreaks. No deaths were reported.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 6, all three outbreaks with severe outcomes were in facilities serving adults aged ≥65 years.

▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 6 are **outlined in bold.**

Figure 9: In week 6, **seven outbreaks** were reported in **facilities serving adults aged ≥65 years, 19 outbreaks** were reported in **facilities serving children,** and **three outbreaks** were reported in **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 6, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 6, **54.5% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 6, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

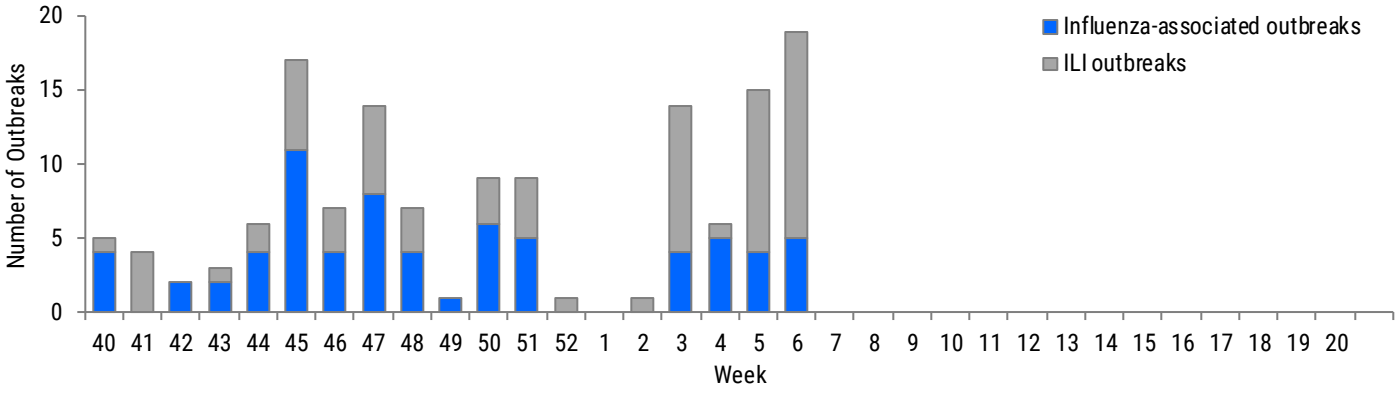
Facilities Serving Children*:



19 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

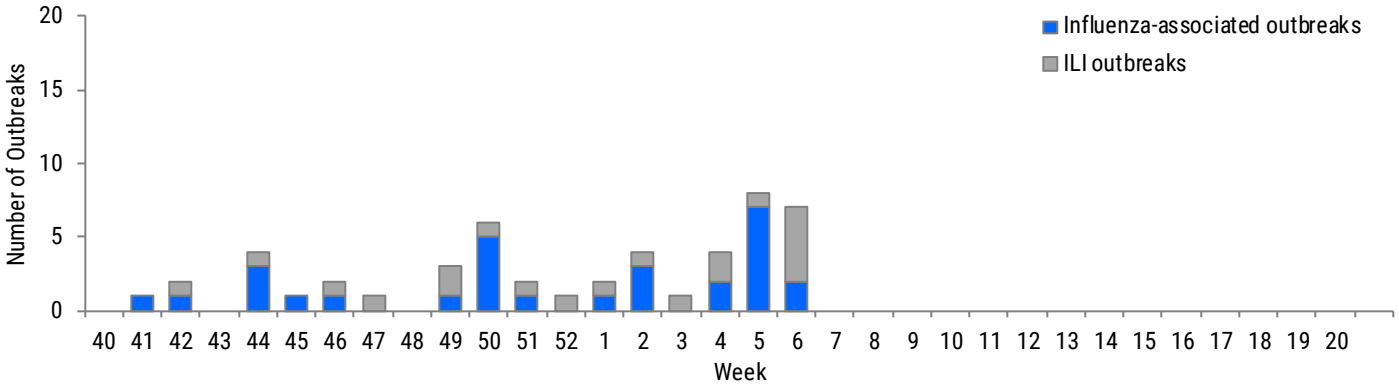
In week 6, 19 new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 6, **five influenza-associated outbreaks** and **14 ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 6, 2020.

Facilities Serving Adults ≥65 yrs.**:



7 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 6, seven new outbreaks of influenza or ILI were reported in facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 6, **two influenza-associated outbreaks** and **five ILI outbreaks** were reported in **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 6, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

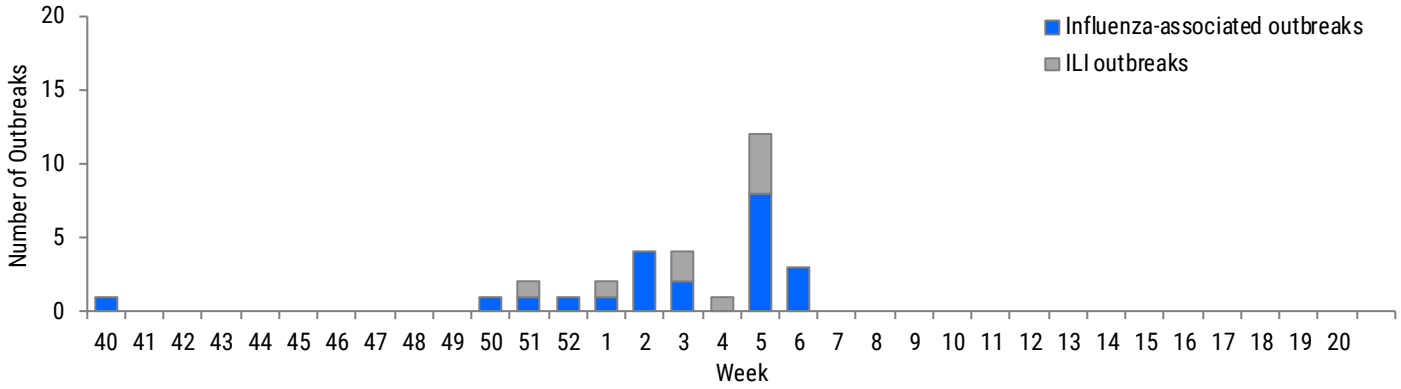
Other Facilities*:



3 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 6, three new outbreaks of influenza or ILI were reported in other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 6, **three influenza-associated outbreaks** were reported in **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 6, 2020.

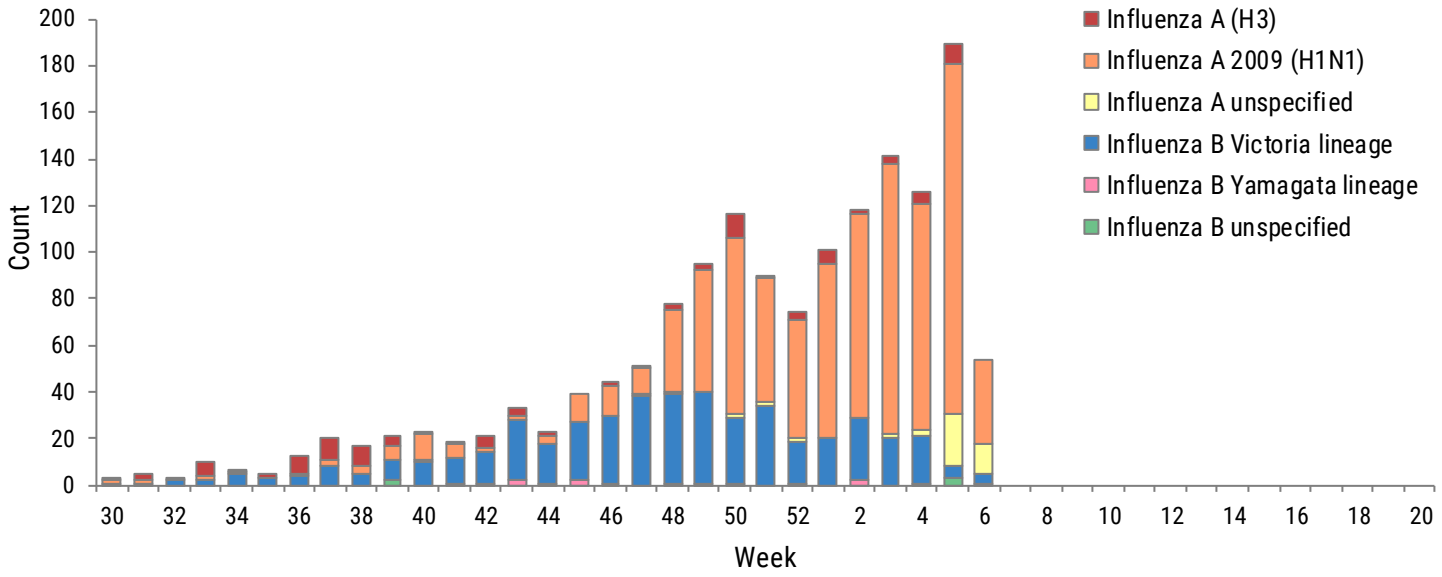


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	112 (50.9%)	59 influenza-associated outbreaks 53 ILI outbreaks
Child daycares	28 (12.7%)	10 influenza-associated outbreaks 18 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	14 (6.4%)	4 influenza-associated outbreaks 10 ILI outbreaks
Nursing facilities	12 (5.5%)	9 influenza-associated outbreaks 3 ILI outbreaks
Other long-term care facilities	23 (10.5%)	16 influenza-associated outbreaks 7 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	27 (12.3%)	19 influenza-associated outbreaks 8 ILI outbreak
Hospitals	2 (0.9%)	2 influenza-associated outbreaks 0 ILI outbreaks
Additional facility types	2 (0.9%)	1 influenza-associated outbreak 1 ILI outbreak
Total	**220 (100.0%)**	**120 influenza-associated outbreaks** **100 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 6, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 6, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=368) from week 40, 2016 to week 6, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity increased** during week 6 and was above peak levels observed during the 2018-19 and 2016-17 seasons.

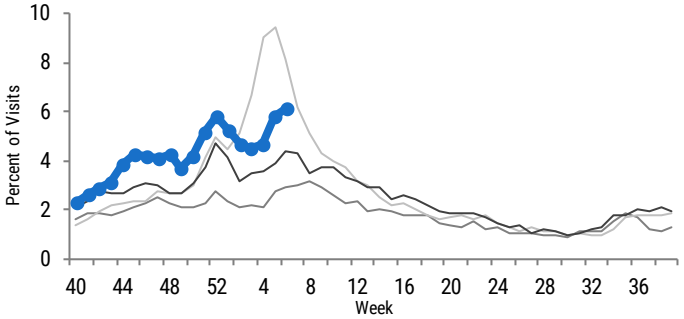

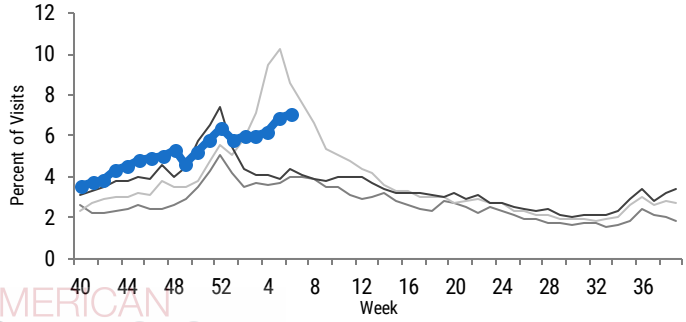

Figure 22: In **region 7, ILI activity increased** during week 6 and was similar to peak activity observed during the 2018-19 season.

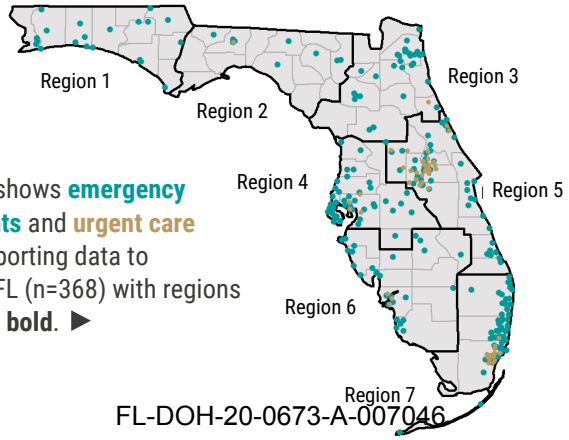

Figure 23 shows **emergency departments** and **urgent care centers** reporting data to ESSENCE-FL (n=368) with regions **outlined in bold**. ▶

AMERICAN OVERSIGHT

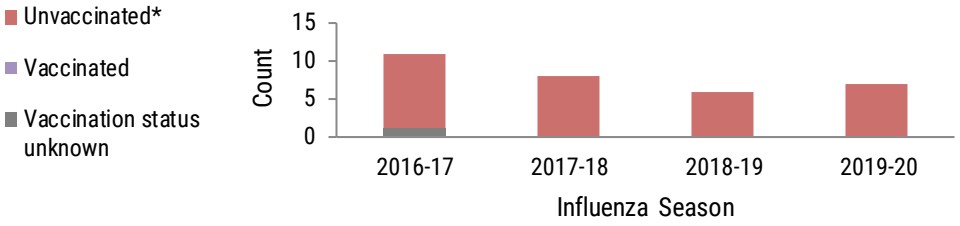
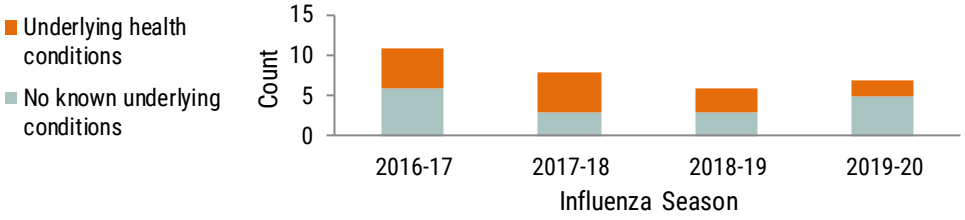
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 6, **the percent of emergency department and urgent care center visits for ILI in children <18 years increased** and was above peak activity observed during the 2018-19 and 2016-17 seasons.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 6, 2020.

Figures 25-26: In week 6, **no new influenza-associated pediatric deaths were reported**. A total of seven influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 6, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 6, 2020.

In week 6, **no new influenza-associated pediatric deaths were reported**.

A total of seven influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm.

AMERICAN OVERSIGHT

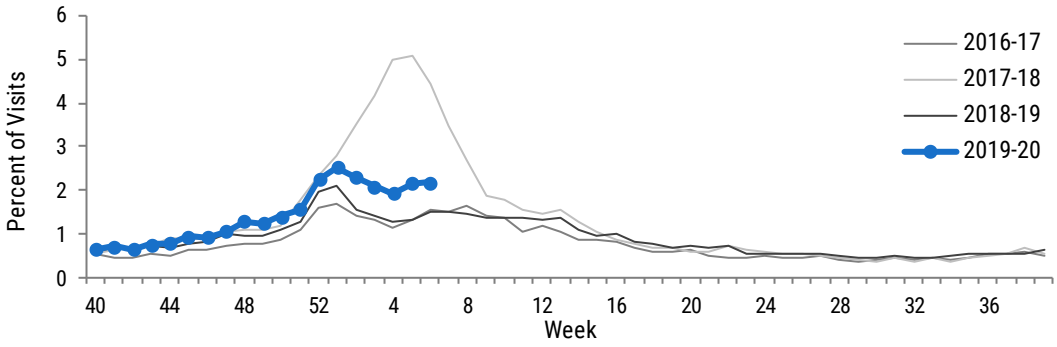
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 6, the **number of emergency department and urgent care center visits for influenza among pregnant women was stable** and was within levels observed at this time in past seasons.



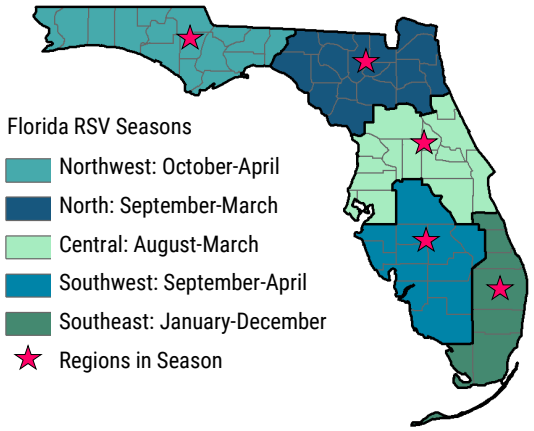
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 6, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 6, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years was stable** and was above peak activity levels observed during the 2018-19 and 2016-17 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 6, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

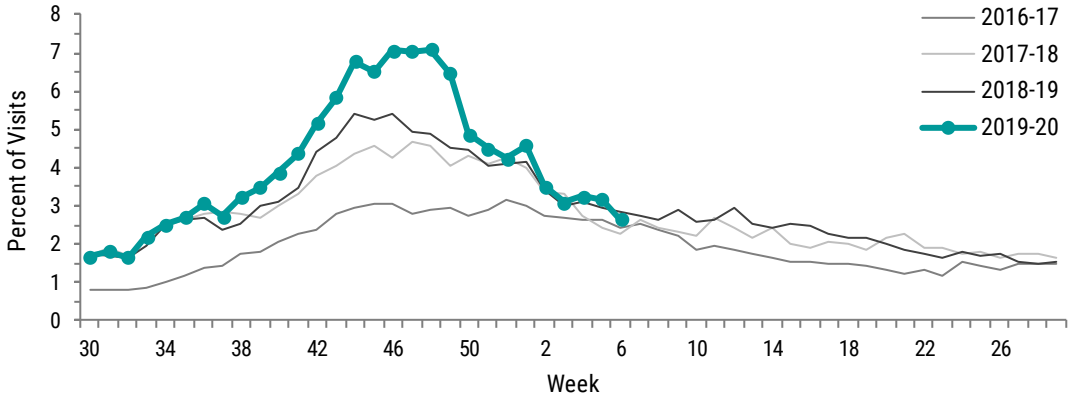
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

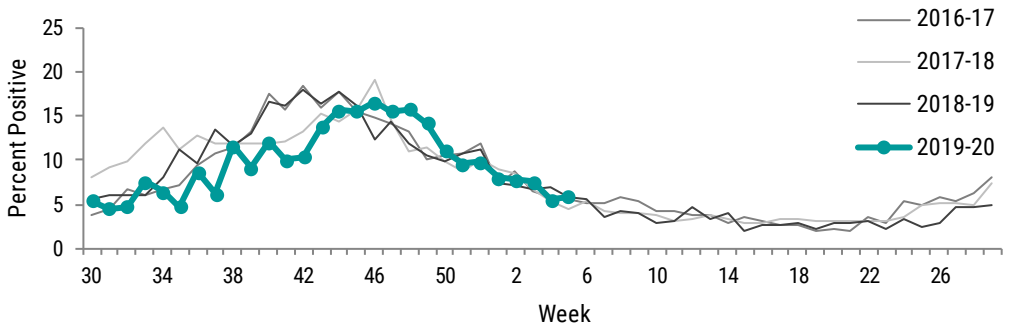
Week 6 (January 26-February 1, 2020) Activity Summary

In week 6, RSV activity in children <5 years decreased and was similar to levels observed at this time in 2019.

One new RSV-associated outbreak was reported in a Pinellas County child daycare. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 6, **the percent of emergency department and urgent care center visits for RSV among children <5 years decreased** and was similar to levels observed at this time in past seasons.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 6, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

◀ **Figure 37*** shows **the number of PCR-positive laboratory findings for seasonal coronaviruses NL63, HKU1, OC43, and 229E** by week** among specimens submitted to BPHL for extended respiratory panel testing.

Figure 38* shows **the ▶ number of PCR-positive laboratory findings for human metapneumovirus and adenovirus** by week** among specimens submitted to BPHL for extended respiratory panel testing.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 6, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Primary or secondary school	Pinellas	107	Unknown	Unknown	Unknown	Unknown	Open
Correctional facility	Walton	60	0	0	Influenza A unspecified	Yes	Open
Correctional facility	Martin	55	0	0	Influenza A 2009 (H1N1)	Yes	Open
Primary or secondary school	Lee	36	0	0	Unknown	Unknown	Open
Correctional facility	Liberty	31	Unknown	0	Influenza A 2009 (H1N1)	Yes	Open
Nursing facility	Monroe	5	2	Unknown	Influenza A unspecified and influenza B unspecified	Unknown	Open
Assisted living facility	Nassau	5	2	Unknown	Unknown	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=368) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 6, 2020 Florida Flu Review
Date:	Wednesday, February 12, 2020 4:05:49 PM
Attachments:	Week 6, 2020 Florida Flu Review.pdf

Good Afternoon!

Attached is the Week 6, 2020 Florida Flu Review.

Activity was stable in week 6 and remained at the highest level observed so far this season. Increases were observed in most regions of the state. Elevated activity is still expected for several more weeks.

Twenty-nine outbreaks were reported, down from 35 outbreaks in the previous week. Of the 29 outbreaks reported, 10 were influenza-associated and 19 were ILI.

No new influenza-associated pediatric deaths were reported. Seven influenza-associated pediatric deaths have been reported so far this season, all in unvaccinated children.

Influenza A 2009 (H1N1) remained the predominant strain. Earlier in the season, influenza B Victoria lineage viruses were predominant. Influenza B Victoria lineage viruses continue to circulate at lower levels.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. Vaccination should continue as long as influenza viruses are circulating. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions). On January 10, 2020, CDC issued a health advisory reminding clinicians that influenza B viruses can cause severe illness in people of all ages and reiterating vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Florida ILI Surveillance System Summary 16

Background

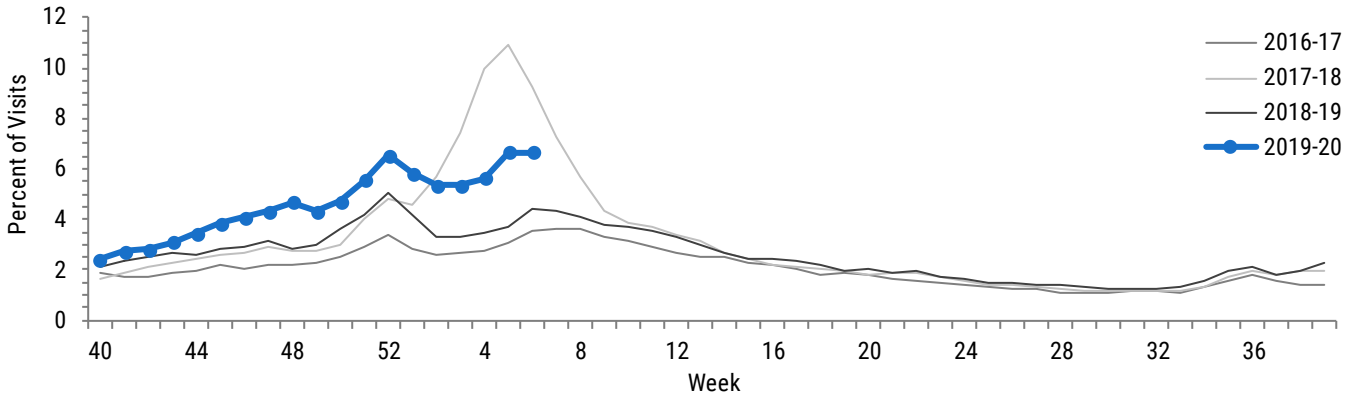
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



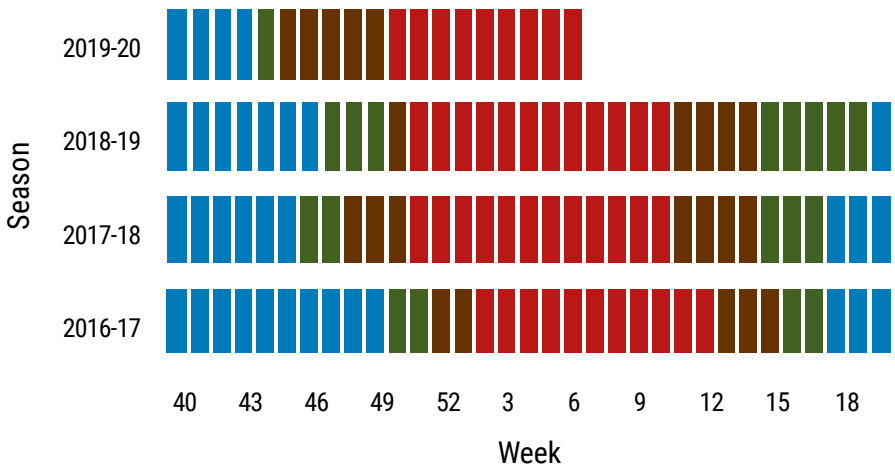
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 6, **the percent of emergency department and urgent care center visits for ILI statewide was stable** compared to the previous week and remained the highest level observed so far this season. Activity in week 6 was above peak levels observed during the 2018-19 and 2016-17 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=368) statewide for the current season (week 40, 2019 to week 6, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 6, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 6, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

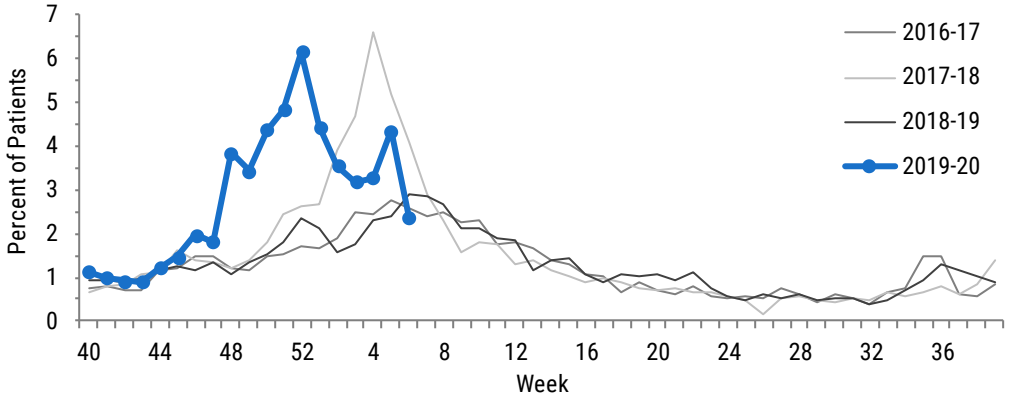
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 6, **the percent of patients with ILI reported by ILINet providers statewide decreased** and was below levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=7), week 40, 2016 to week 6, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



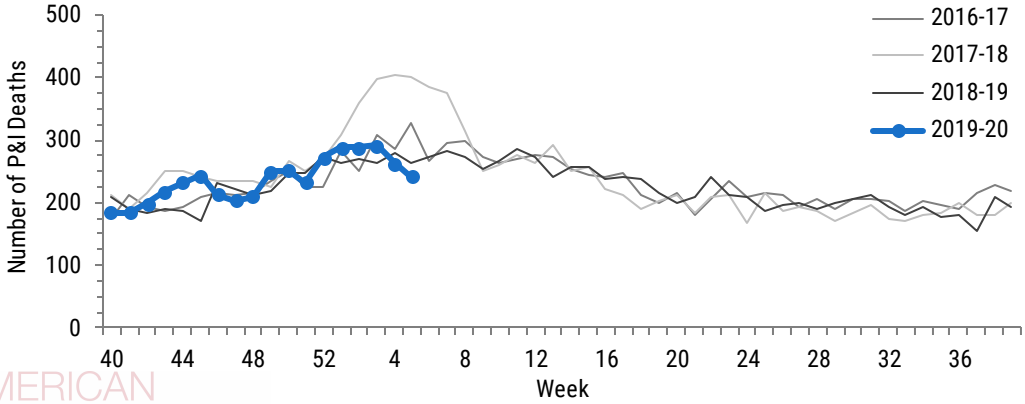


Figure 4: In week 5 (ending 2/1/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 5, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

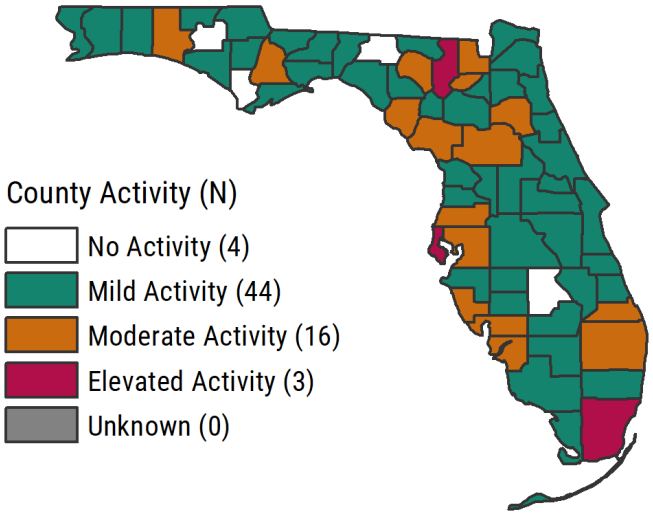
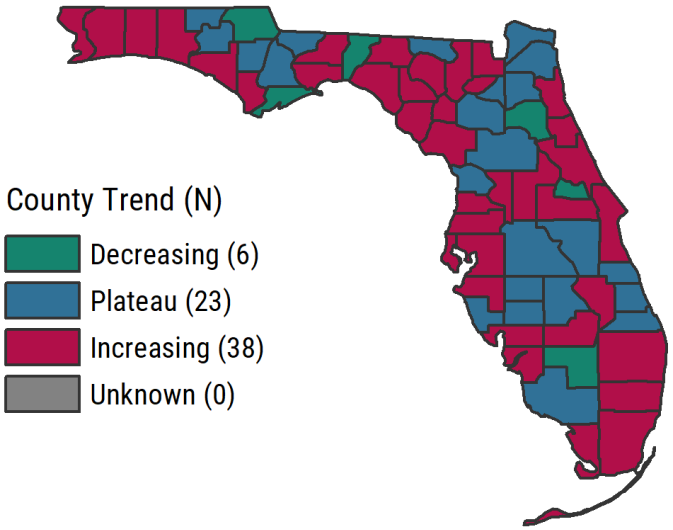
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 6. Sixteen counties reported **moderate activity,** and three counties reported **elevated activity.**





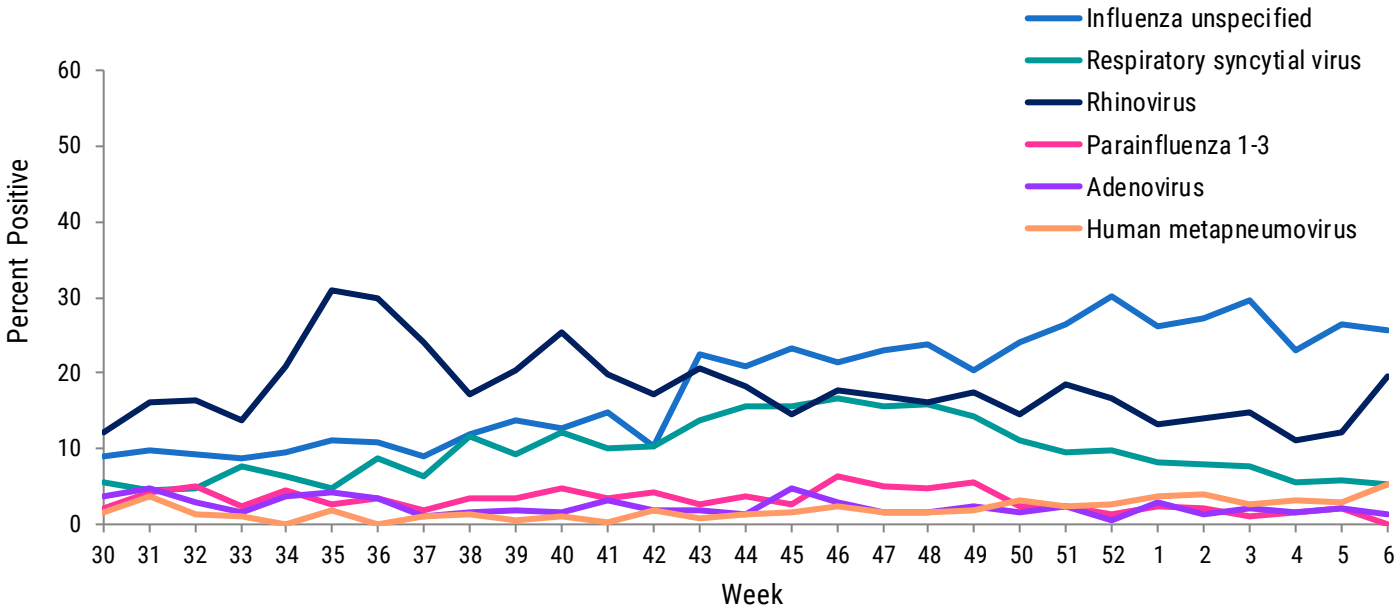


Figure 6: Most counties reported **increasing activity** in week 6. Twenty-three counties reported **activity at a plateau,** and six counties reported **decreasing activity.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 6, the **percent of specimens testing positive for influenza** **decreased slightly** and remained higher than other respiratory viruses under surveillance.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=7), week 40, 2019 to week 6, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

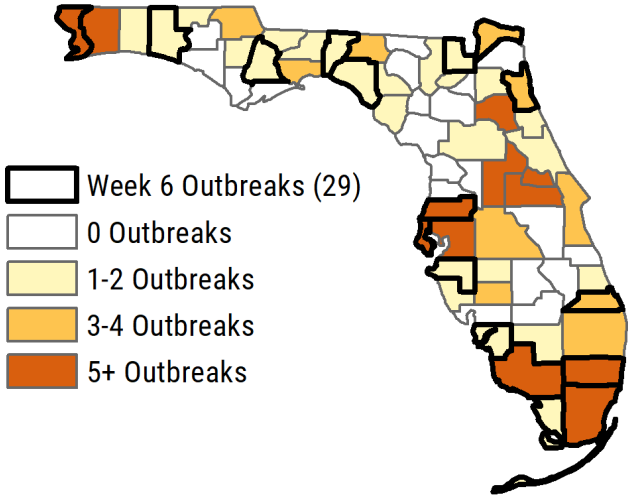
Week 6 Outbreaks at a Glance:

Number Reported:
29 Outbreaks

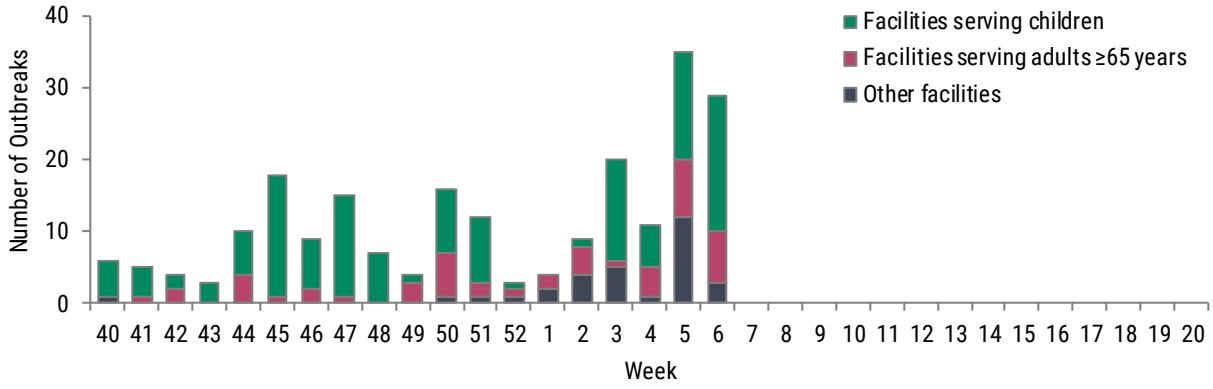
Influenza-Associated:
10 Outbreaks



Severe Outcomes*:
3 Outbreaks

Outbreak Summary:

In week 6, 10 influenza-associated and 19 ILI outbreaks were reported, a decrease from the previous week.



Severe outcomes* were reported in three of 29 outbreaks. One or more hospitalizations were reported in each of these three outbreaks. No deaths were reported.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 6, all three outbreaks with severe outcomes were in facilities serving adults aged ≥65 years.

▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 6 are **outlined in bold.**

Figure 9: In week 6, **seven outbreaks** were reported in **facilities serving adults aged ≥65 years, 19 outbreaks** were reported in **facilities serving children,** and **three outbreaks** were reported in **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 6, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 6, **54.5% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 6, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

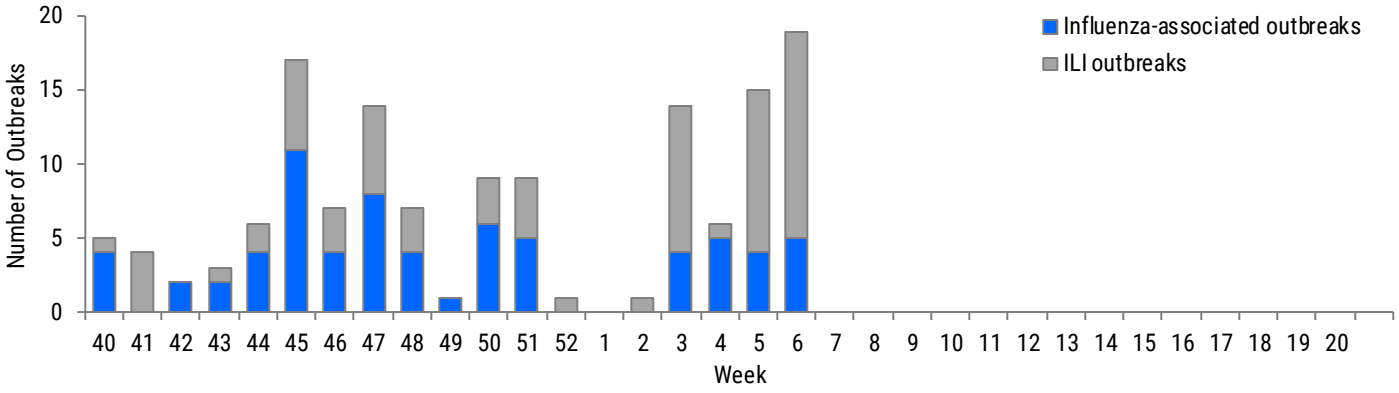
Facilities Serving Children*:



19 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

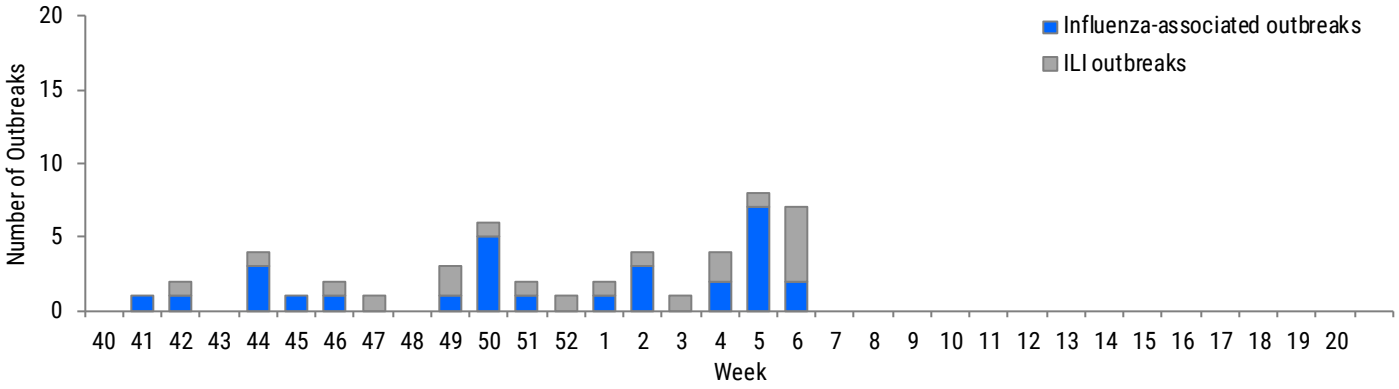
In week 6, 19 new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 6, **five influenza-associated outbreaks** and **14 ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 6, 2020.

Facilities Serving Adults ≥65 yrs.**:



7 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 6, seven new outbreaks of influenza or ILI were reported in facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 6, **two influenza-associated outbreaks** and **five ILI outbreaks** were reported in **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 6, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

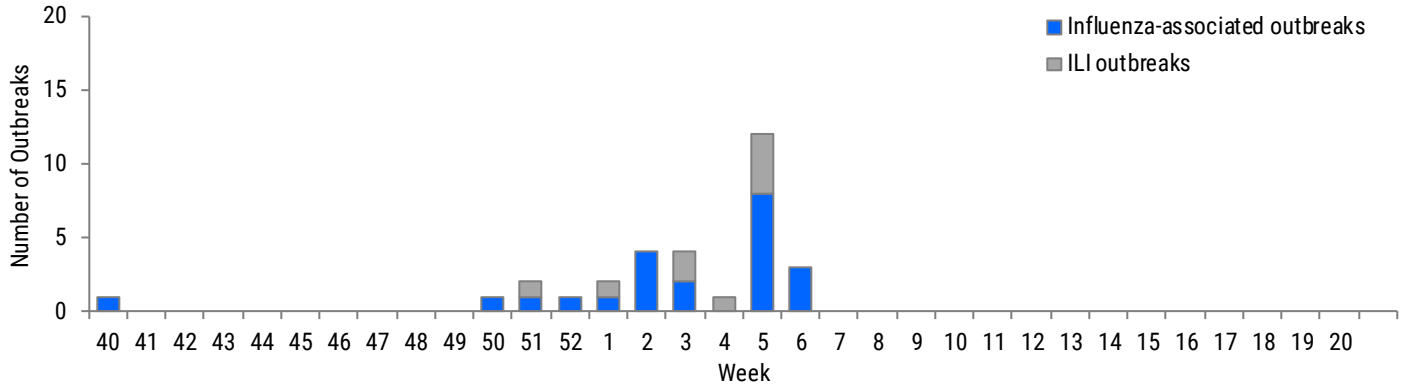
Other Facilities*:



3 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 6, three new outbreaks of influenza or ILI were reported in other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 6, **three influenza-associated outbreaks** were reported in **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 6, 2020.

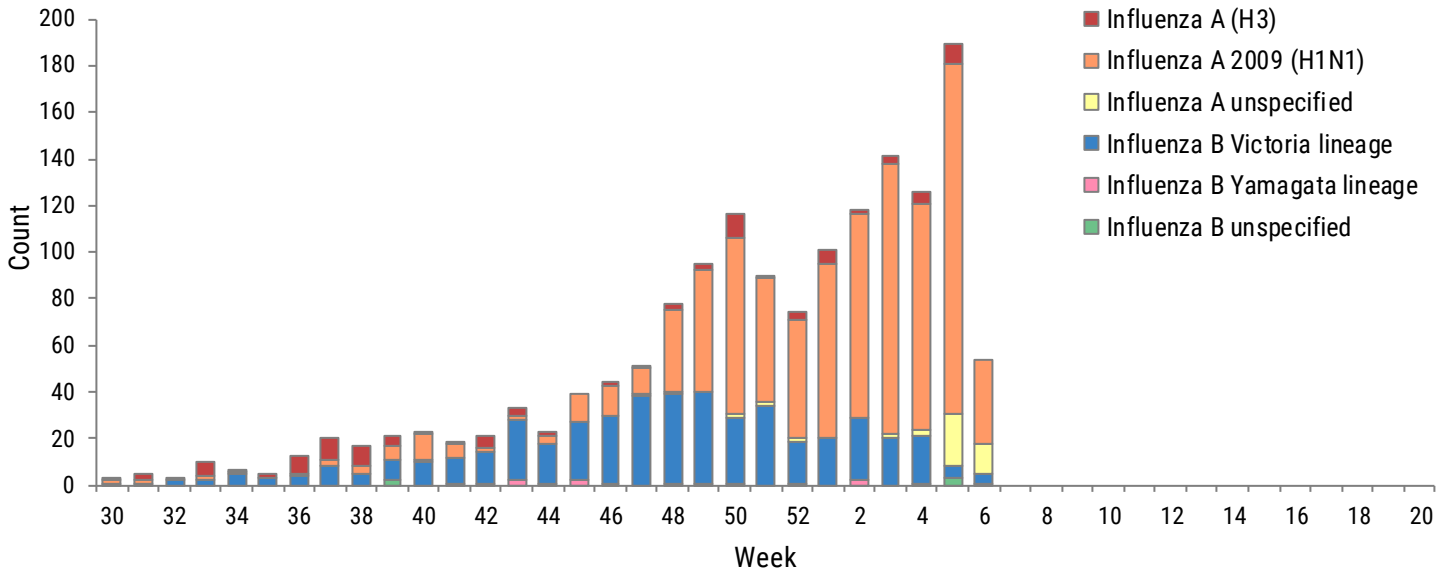


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	112 (50.9%)	59 influenza-associated outbreaks 53 ILI outbreaks
Child daycares	28 (12.7%)	10 influenza-associated outbreaks 18 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	14 (6.4%)	4 influenza-associated outbreaks 10 ILI outbreaks
Nursing facilities	12 (5.5%)	9 influenza-associated outbreaks 3 ILI outbreaks
Other long-term care facilities	23 (10.5%)	16 influenza-associated outbreaks 7 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	27 (12.3%)	19 influenza-associated outbreaks 8 ILI outbreak
Hospitals	2 (0.9%)	2 influenza-associated outbreaks 0 ILI outbreaks
Additional facility types	2 (0.9%)	1 influenza-associated outbreak 1 ILI outbreak
Total	**220 (100.0%)**	**120 influenza-associated outbreaks** **100 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 6, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 6, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=368) from week 40, 2016 to week 6, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity increased** during week 6 and was above peak levels observed during the 2018-19 and 2016-17 seasons.

AMERICAN OVERSIGHT

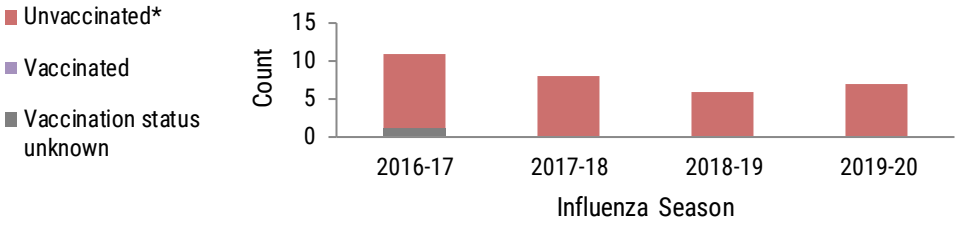
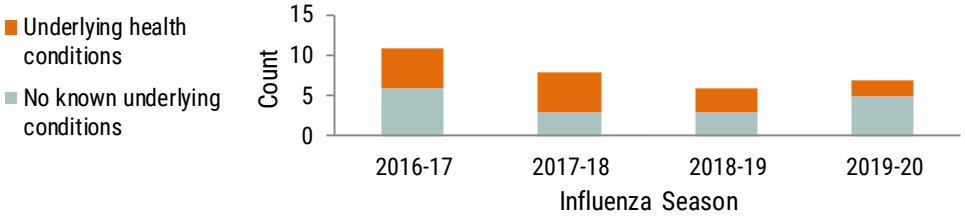
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 6, **the percent of emergency department and urgent care center visits for ILI in children <18 years increased** and was above peak activity observed during the 2018-19 and 2016-17 seasons.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 6, 2020.

Figures 25-26: In week 6, **no new influenza-associated pediatric deaths were reported**. A total of seven influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 6, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 6, 2020.

In week 6, **no new influenza-associated pediatric deaths were reported**.

A total of seven influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm

AMERICAN OVERSIGHT

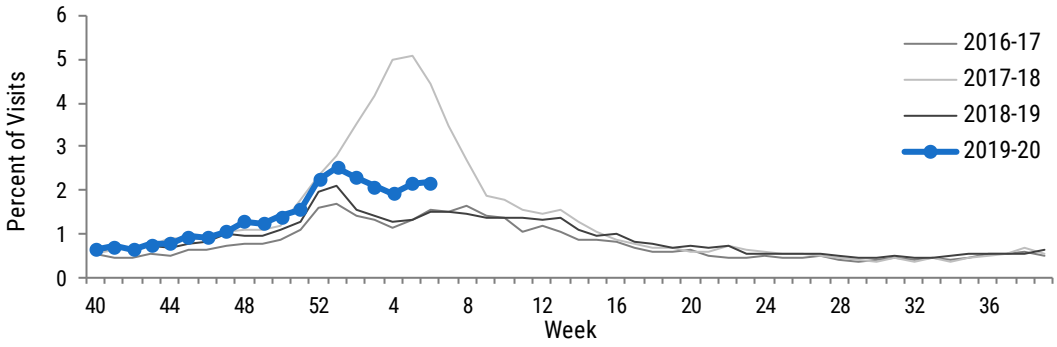
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 6, the **number of emergency department and urgent care center visits for influenza among pregnant women was stable** and was within levels observed at this time in past seasons.



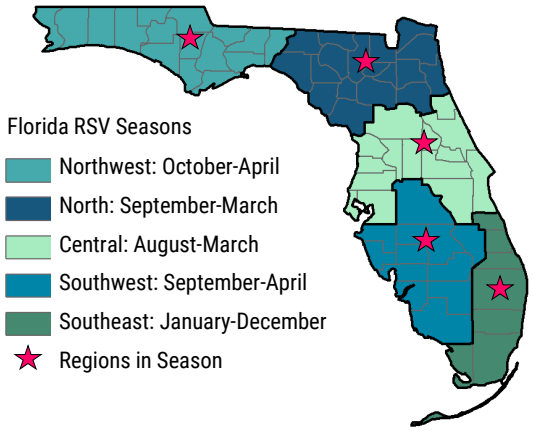
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 6, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 6, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years was stable** and was above peak activity levels observed during the 2018-19 and 2016-17 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 6, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

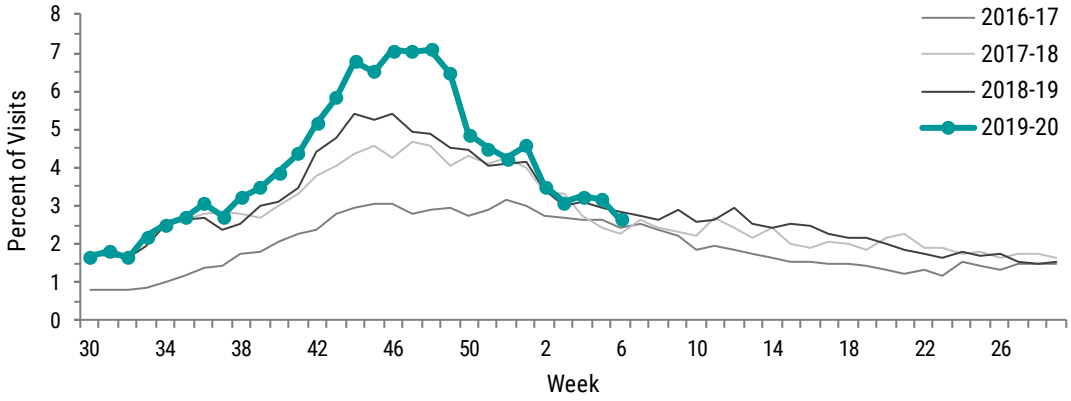
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

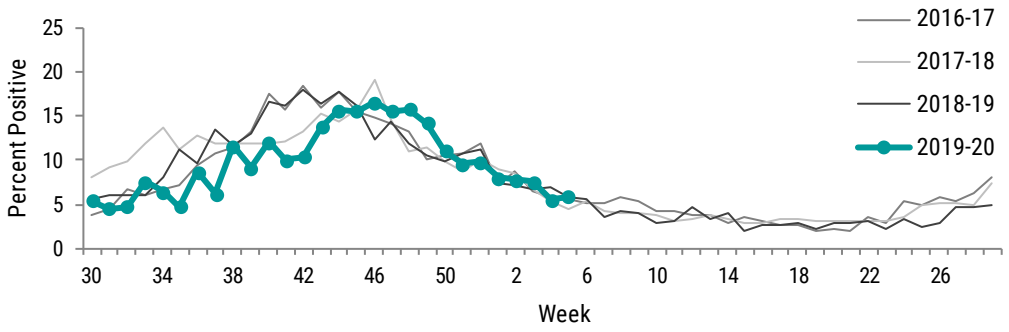
Week 6 (January 26-February 1, 2020) Activity Summary

In week 6, RSV activity in children <5 years decreased and was similar to levels observed at this time in 2019.

One new RSV-associated outbreak was reported in a Pinellas County child daycare. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 6, **the percent of emergency department and urgent care center visits for RSV among children <5 years decreased** and was similar to levels observed at this time in past seasons.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 6, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

AMERICAN OVERSIGHT

RSV Surveillance

Figure 31: In week 6, **the percent of specimens testing positive for RSV increased.** Levels were similar to those observed at this time in previous seasons.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 6, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Primary or secondary school	Pinellas	107	Unknown	Unknown	Unknown	Unknown	Open
Correctional facility	Walton	60	0	0	Influenza A unspecified	Yes	Open
Correctional facility	Martin	55	0	0	Influenza A 2009 (H1N1)	Yes	Open
Primary or secondary school	Lee	36	0	0	Unknown	Unknown	Open
Correctional facility	Liberty	31	Unknown	0	Influenza A 2009 (H1N1)	Yes	Open
Nursing facility	Monroe	5	2	Unknown	Influenza A unspecified and influenza B unspecified	Unknown	Open
Assisted living facility	Nassau	5	2	Unknown	Unknown	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=368) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 7, 2020 Florida Flu Review
Date:	Wednesday, February 19, 2020 2:53:17 PM
Attachments:	Week 7, 2020 Florida Flu Review.pdf

Good Afternoon!

Attached is the Week 7, 2020 Florida Flu Review.

Week 7 influenza & influenza-like illness (ILI) activity summary:

Activity decreased in week 7 and remained above peak levels observed in the 2016-17 and 2018-19 seasons. Decreases were observed in most regions of the state. Elevated activity is still expected for several more weeks.

Twenty-four outbreaks were reported, down from 29 outbreaks in the previous week. Of the 24 outbreaks reported, 12 were influenza-associated and 12 were ILI.

Two new influenza-associated pediatric deaths were reported. Nine influenza-associated pediatric deaths have been reported so far this season; only one child was vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On January 10, 2020, CDC issued a health advisory reminding clinicians to reiterate vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of

AMERICAN OVERSIGHT

fever-reducing medication).

Thank you!

Julia Munroe, MS
Respiratory Disease Epidemiologist
Bureau of Epidemiology
Division of Disease Control and Health Protection

Summary of Notable Outbreaks 15
Florida ILI Surveillance System Summary 16

Background

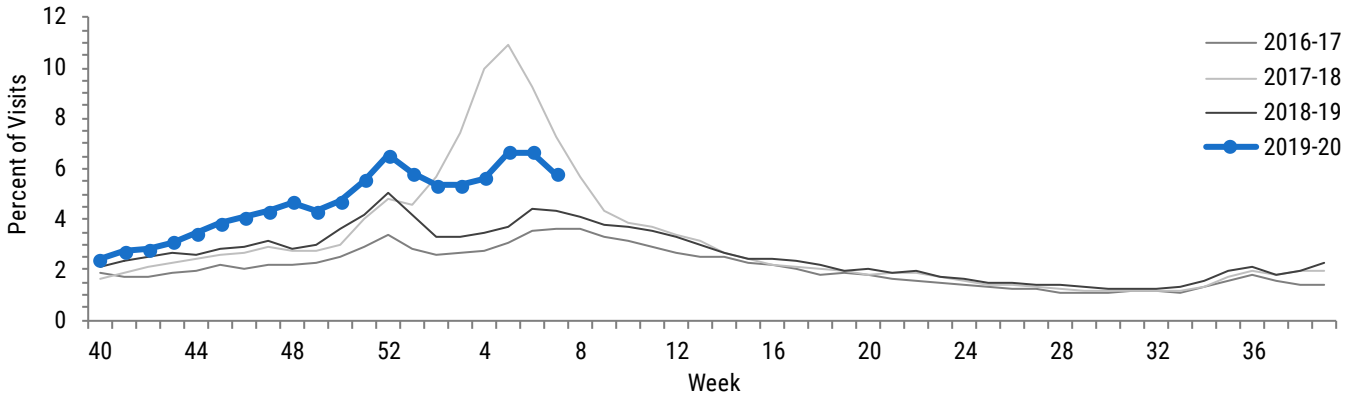
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

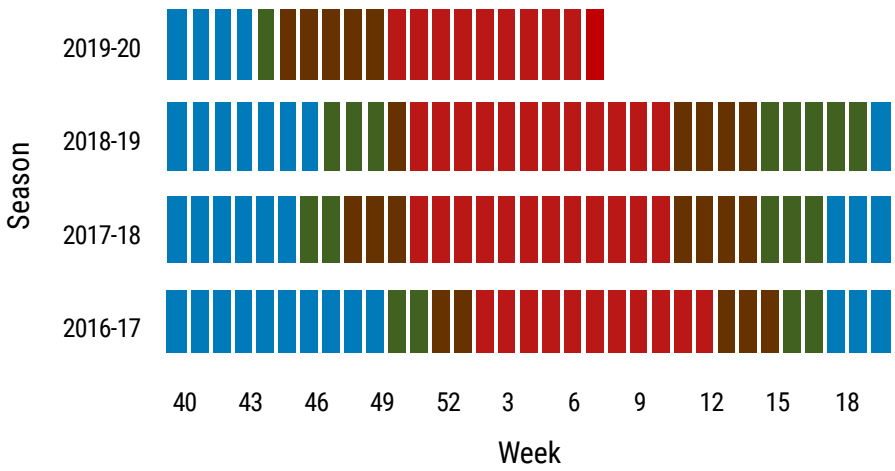
Figure 1: In week 7, **the percent of emergency department and urgent care center visits for ILI statewide decreased** but remained above peak levels observed during the 2018-19 and 2016-17 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=369) statewide for the current season (week 40, 2019 to week 7, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 7, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 7, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

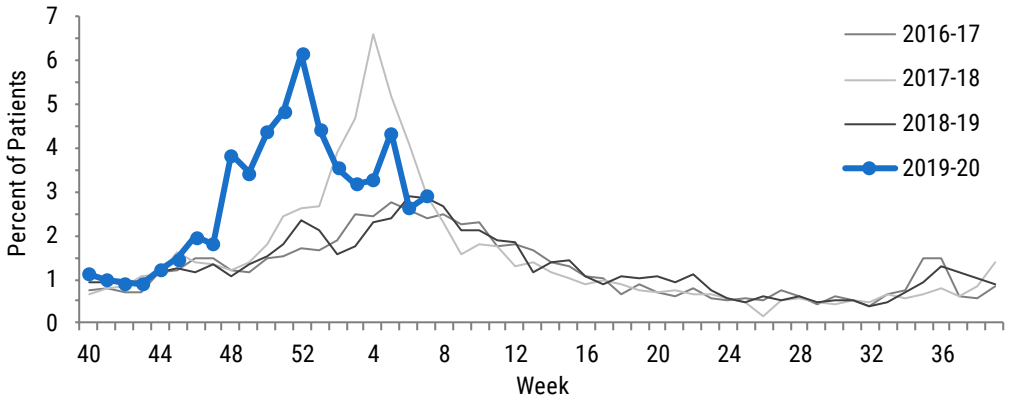
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 7, **the percent of patients with ILI reported by ILINet providers statewide increased** and was similar to levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=9), week 40, 2016 to week 7, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



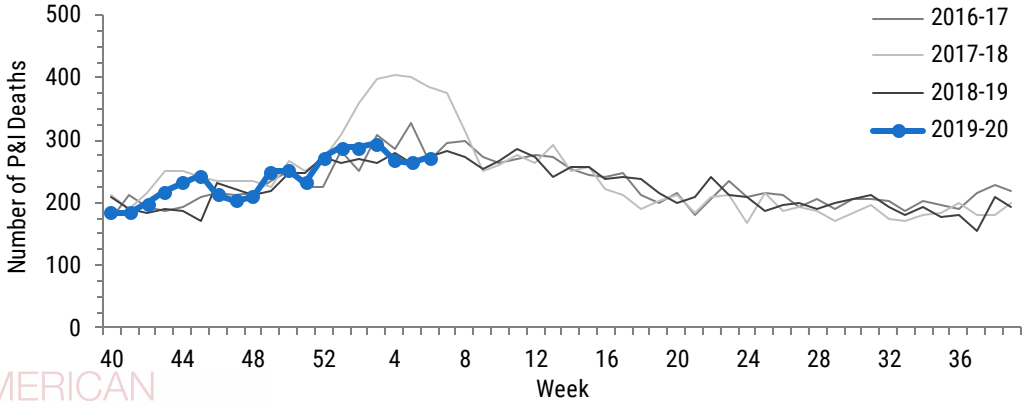


Figure 4: In week 6 (ending 2/8/20), **the number of pneumonia and influenza deaths identified statewide increased** and was similar to levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 6, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

County Influenza Activity

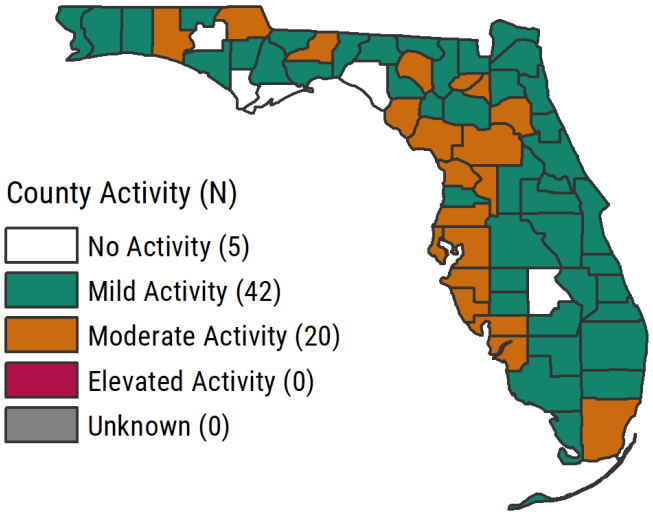
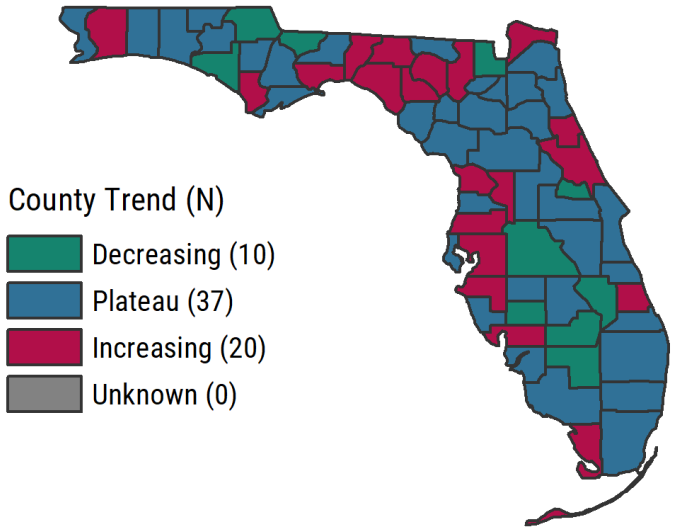
Figure 5: Most counties reported **mild activity** for week 7. Twenty counties reported **moderate activity.**





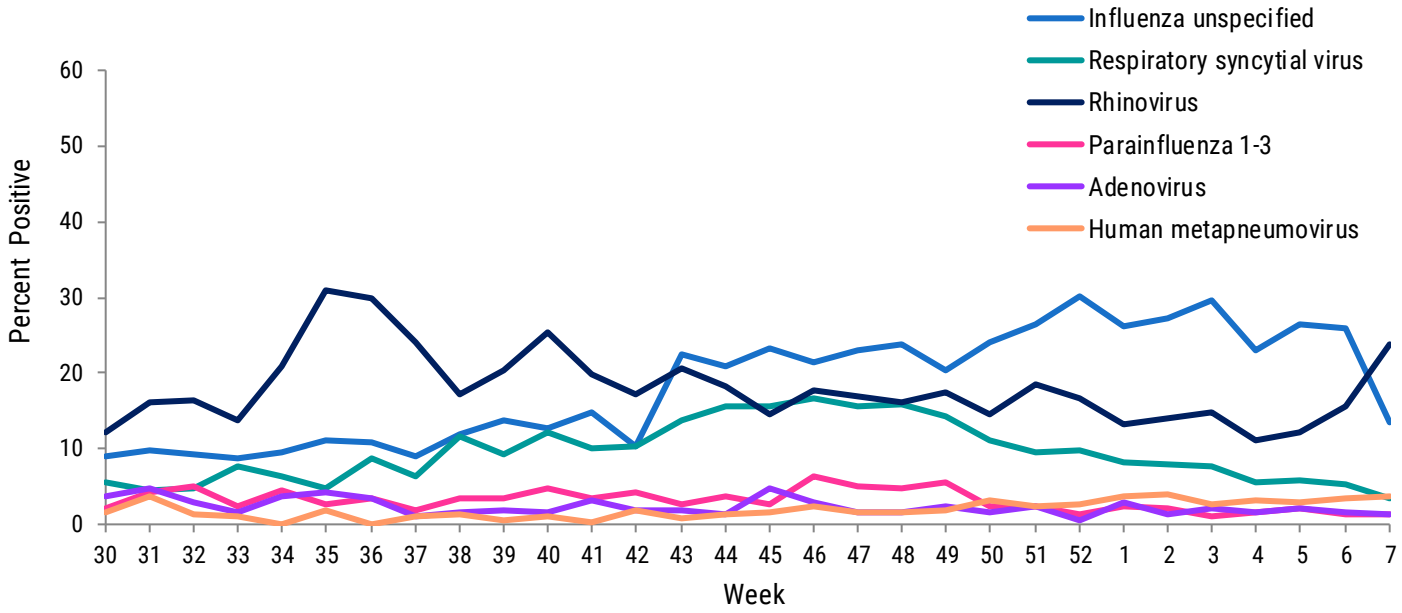


Figure 7: Most counties reported **activity at a plateau** for week 7. Twenty counties reported **increasing activity,** and ten counties reported **decreasing activity.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 7, the **percent of specimens testing positive for rhinovirus increased** and was higher than other respiratory viruses under surveillance. Of note, the volume of laboratory tests reported in week 7 was lower than expected.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=7), week 40, 2019 to week 7, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

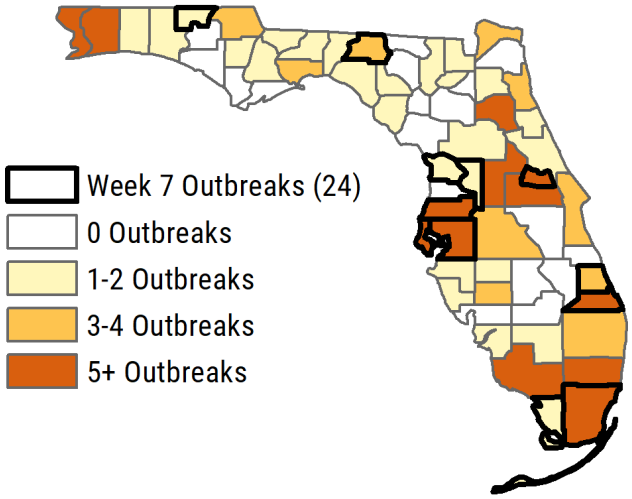
Week 7 Outbreaks at a Glance:

Number Reported:
24 Outbreaks

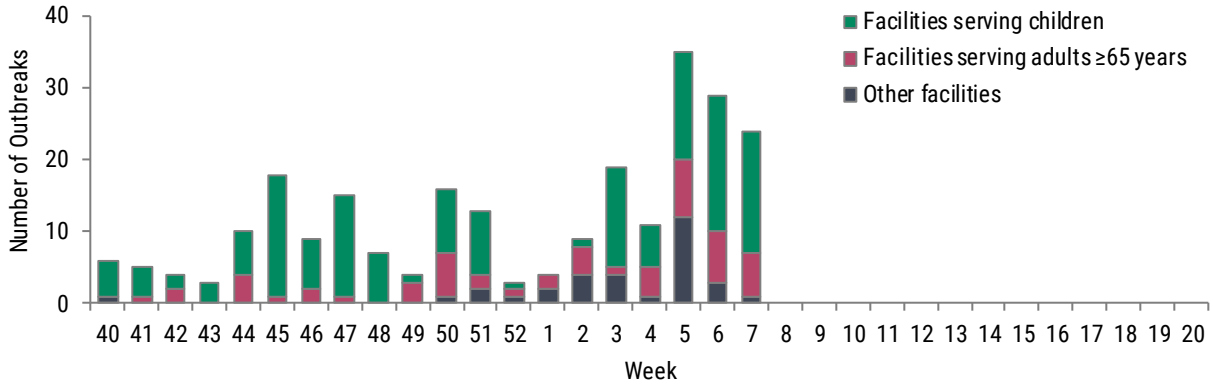
Influenza-Associated:
12 Outbreaks



Severe Outcomes*:
2 Outbreaks

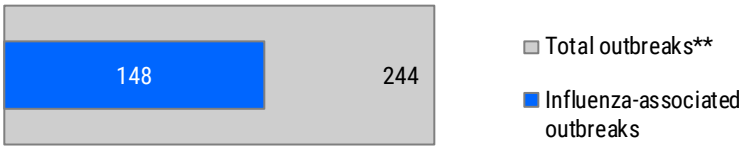
Outbreak Summary:

In week 7, 12 influenza-associated and 12 ILI outbreaks were reported, a decrease from the previous week.



Severe outcomes* were reported in two of 24 outbreaks. One or more hospitalizations were reported in each of these two outbreaks. No deaths were reported.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 7, both outbreaks with severe outcomes were in facilities serving adults aged ≥65 years.



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 7 are **outlined in bold.**

Figure 9: In week 7, **six outbreaks** were reported in **facilities serving adults aged ≥65 years, 17 outbreaks** were reported in **facilities serving children,** and **one outbreak** was reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 7, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 7, **60.7% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 7, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

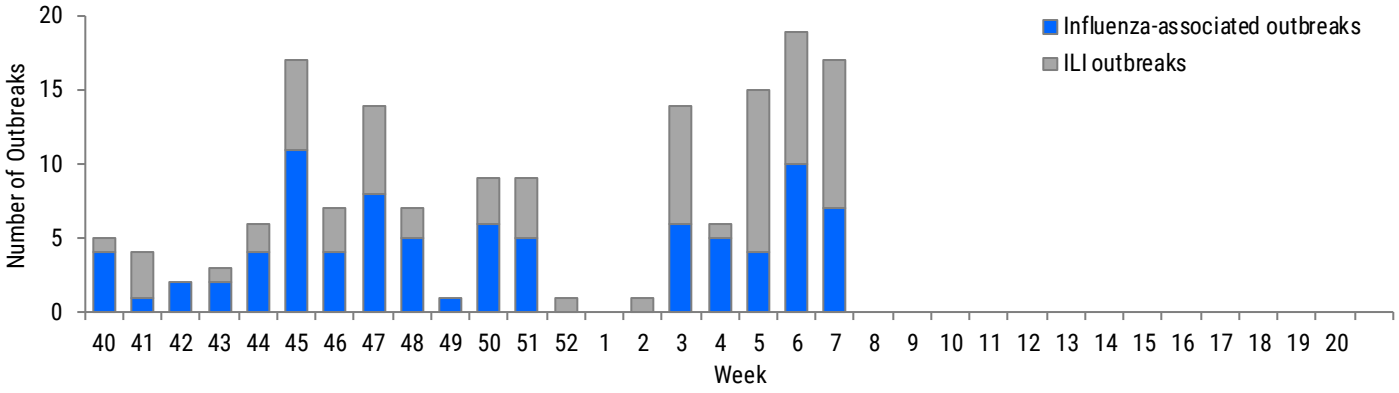
Facilities Serving Children*:



17 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

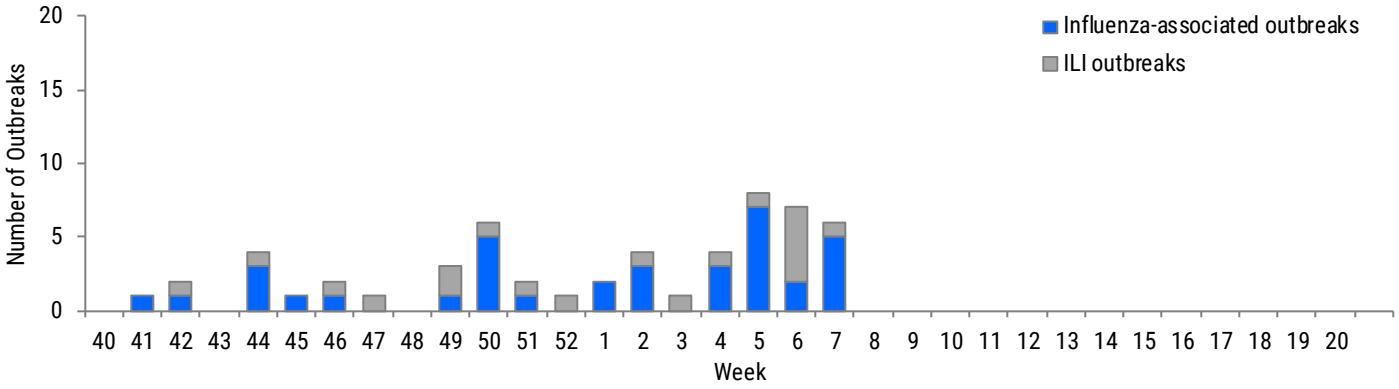
In week 7, 17 new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 7, **seven influenza-associated outbreaks** and **10 ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 7, 2020.

Facilities Serving Adults ≥65 yrs.**:



6 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 7, six new outbreaks of influenza or ILI were reported in facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 7, **five influenza-associated outbreaks** and **one ILI outbreak** were reported in **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 7, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

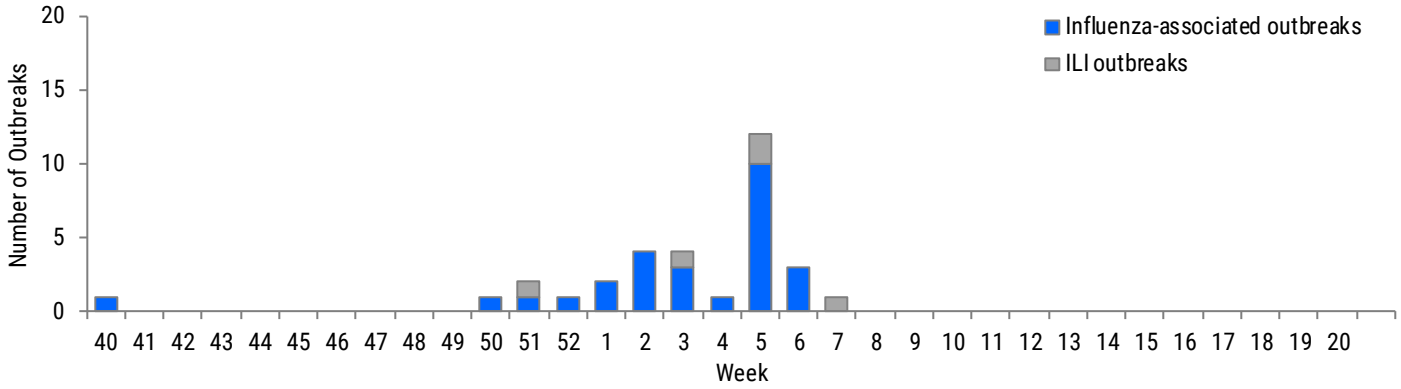
Other Facilities*:



1 Outbreak

Summary of Outbreaks in Other Facilities:

In week 7, one new outbreak of influenza or ILI was reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 7, **one ILI outbreak** was reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 7, 2020.

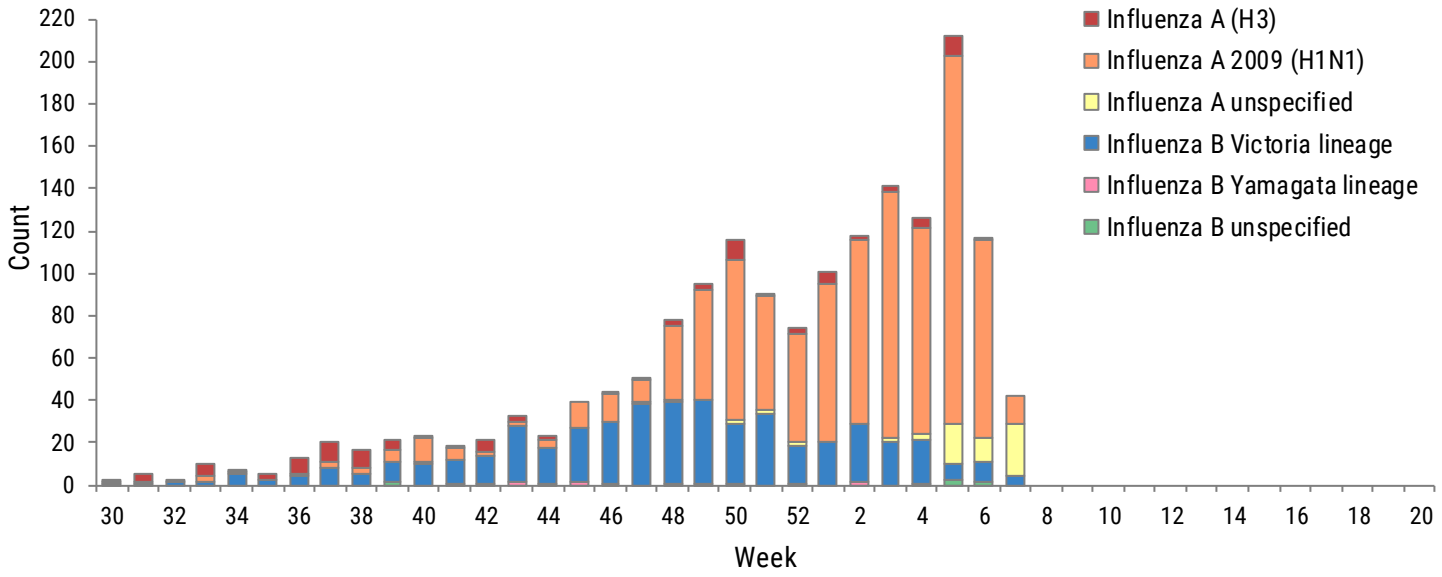


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	122 (50.0%)	71 influenza-associated outbreaks 51 ILI outbreaks
Child daycares	35 (14.3%)	14 influenza-associated outbreaks 21 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	16 (6.6%)	5 influenza-associated outbreaks 11 ILI outbreaks
Nursing facilities	13 (5.3%)	11 influenza-associated outbreaks 2 ILI outbreaks
Other long-term care facilities	26 (10.7%)	20 influenza-associated outbreaks 6 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	27 (11.1%)	24 influenza-associated outbreaks 3 ILI outbreak
Hospitals	2 (0.8%)	2 influenza-associated outbreaks 0 ILI outbreaks
Additional facility types	3 (1.23%)	1 influenza-associated outbreak 2 ILI outbreaks
Total	**244 (100.0%)**	**148 influenza-associated outbreaks** **96 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 7, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 7, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=369) from week 40, 2016 to week 7, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity decreased** during week 7 and was within levels observed at this time in previous seasons.

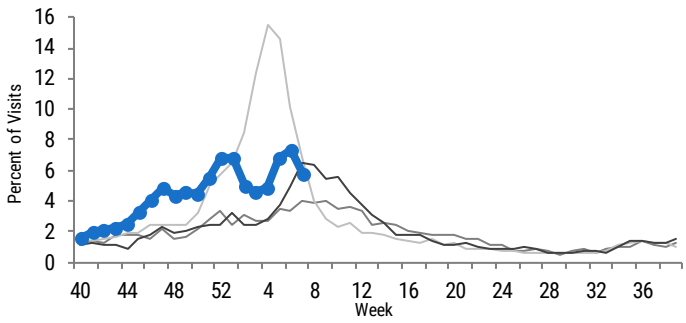

Figure 17: In **region 2, ILI activity decreased** during week 7 and was above peak activity observed during the 2018-19 and 2016-17 seasons.

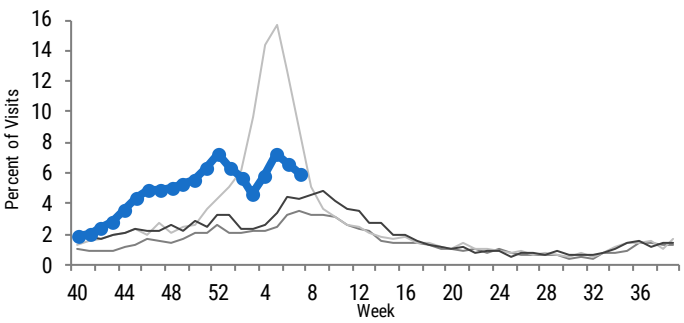

Figure 18: In **region 3, ILI activity decreased** during week 7 and was above peak activity observed during the 2018-19 and 2016-17 seasons.

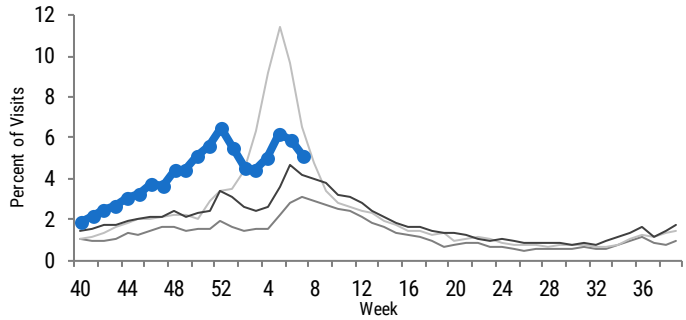

Figure 19: In **region 4, ILI activity decreased** during week 7 and was above peak activity levels observed during the 2018-19 and 2016-17 seasons.

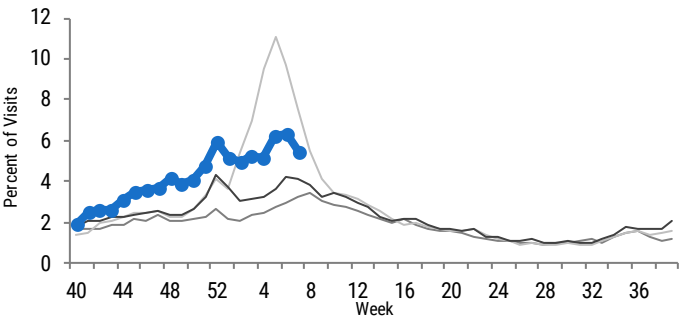

Figure 20: In **region 5, ILI activity decreased** during week 7 and was above peak activity observed during the 2018-19 and 2016-17 seasons.

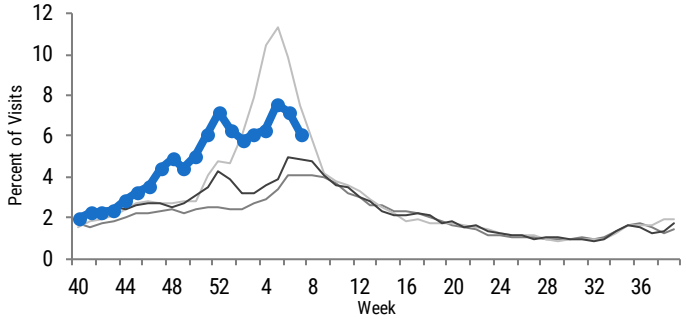

Figure 21: In **region 6, ILI activity decreased** during week 7 and was above peak activity observed during the 2018-19 and 2016-17 seasons.

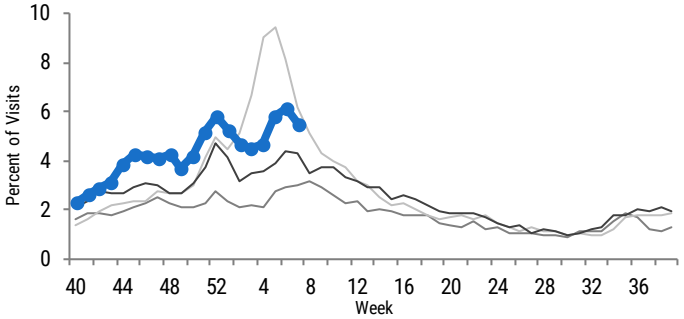

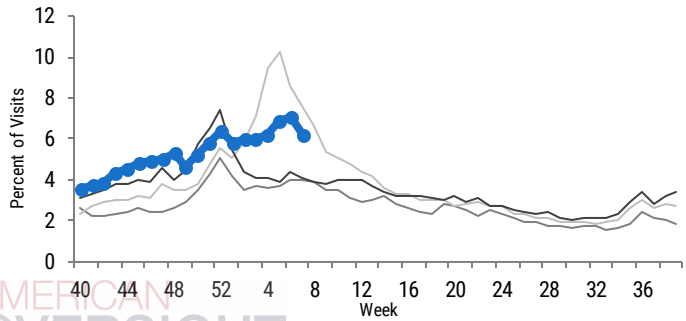

Figure 22: In **region 7, ILI activity decreased** during week 7 and was above levels observed at this time during the 2016-17 and 2018-19 seasons.

AMERICAN OVERSIGHT

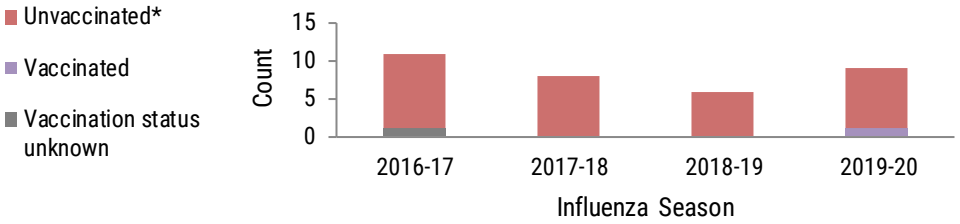
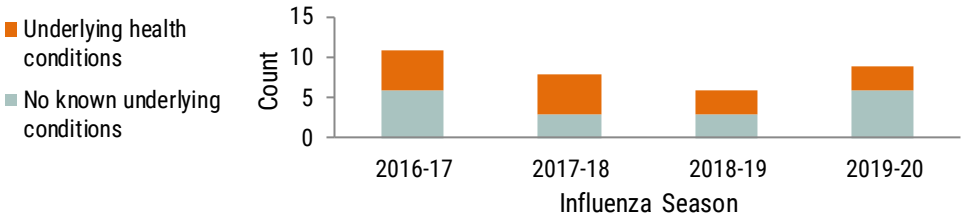
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 7, **the percent of emergency department and urgent care center visits for ILI in children <18 years decreased** and was above levels observed at this time during the 2018-19 and 2016-17 seasons.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 7, 2020.

Figures 25-26: In week 7, **two new influenza-associated pediatric deaths were reported,** one in an unvaccinated child and one in a child who was vaccinated for the 2019-20 season. A total of nine influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 7, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 7, 2020.

In week 7, **two new influenza-associated pediatric deaths were reported**. One death was associated with influenza A unspecified in a child with no known underlying medical conditions. The other death was associated with influenza B unspecified in a child with known underlying medical conditions. One child was vaccinated for the 2019-20 season.

A total of nine influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm

AMERICAN OVERSIGHT

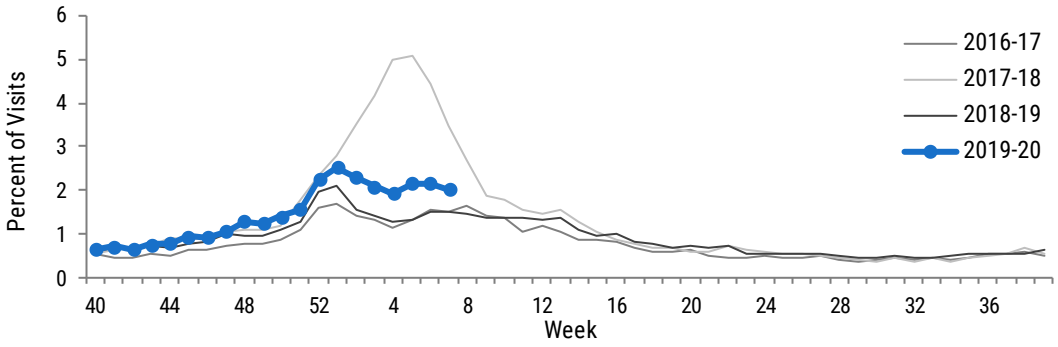
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 7, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was within levels observed at this time in past seasons.



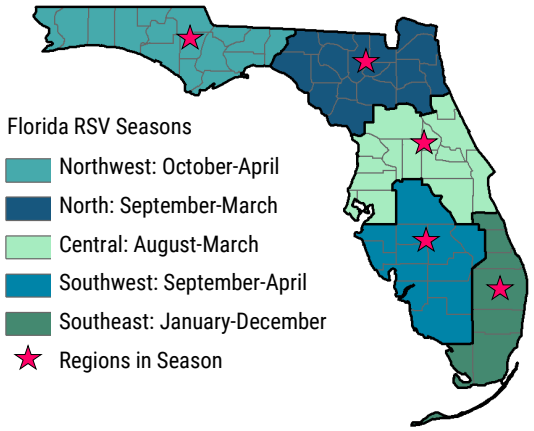
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 7, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 7, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years decreased** and was above levels observed at this time during the 2018-19 and 2016-17 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 7, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

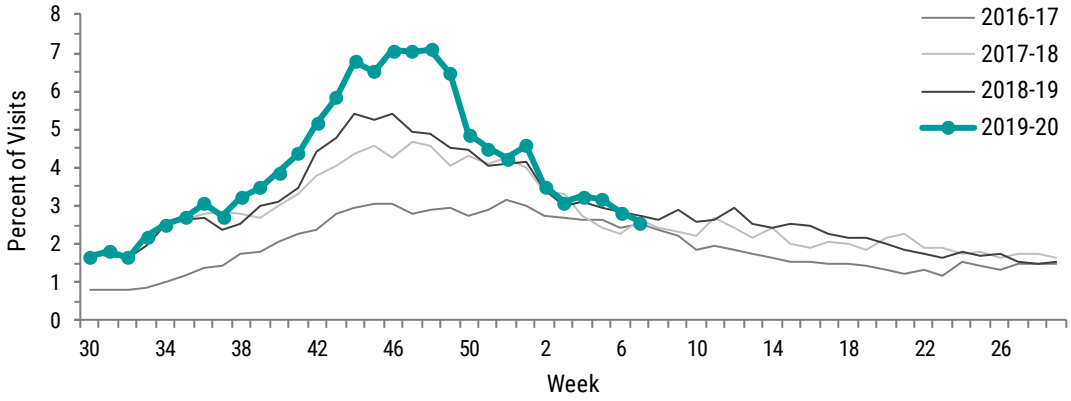
A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

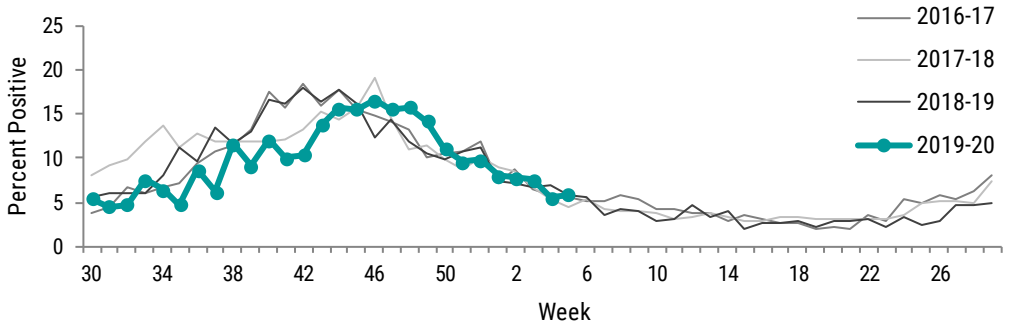
Week 7 (February 9-15, 2020) Activity Summary

In week 7, RSV activity in children <5 years decreased and was similar to levels observed at this time in past seasons.

No new RSV-associated outbreaks were reported in week 7. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 7, **the percent of emergency department and urgent care center visits for RSV among children <5 years decreased** and was similar to levels observed at this time in past seasons.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 7, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

AMERICAN OVERSIGHT

RSV Surveillance

Figure 31: In week 7, **the percent of specimens testing positive for RSV increased.** Levels were similar to those observed at this time in previous seasons.

RSV-Associated Outbreaks in Week 7:

0 Outbreaks

Summary of RSV-Associated Outbreaks:

In week 7, no new RSV-associated outbreaks were reported. Since week 30, 2019, nine RSV-associated outbreaks have been reported.

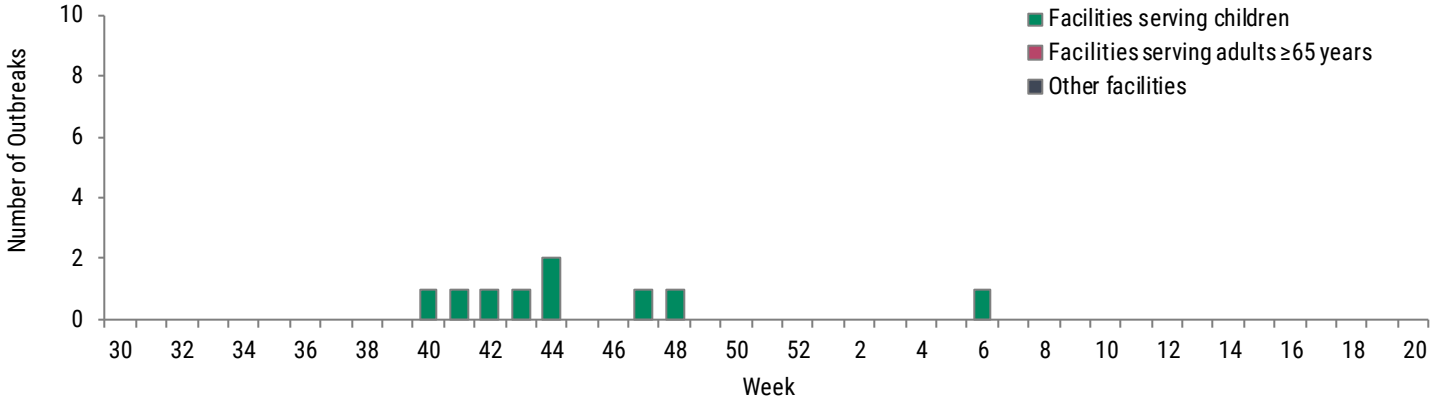

Figure 32: In week 7, no new RSV-associated outbreaks were reported. Since week 30, outbreaks have been reported in Florida's southeast, central, and northwest regions.

◀ **Figure 32** shows **a summary of RSV-associated outbreaks by region*** as reported by county health departments in Merlin, week 30, 2019 to week 7, 2020.

*Regions defined in figure 29.

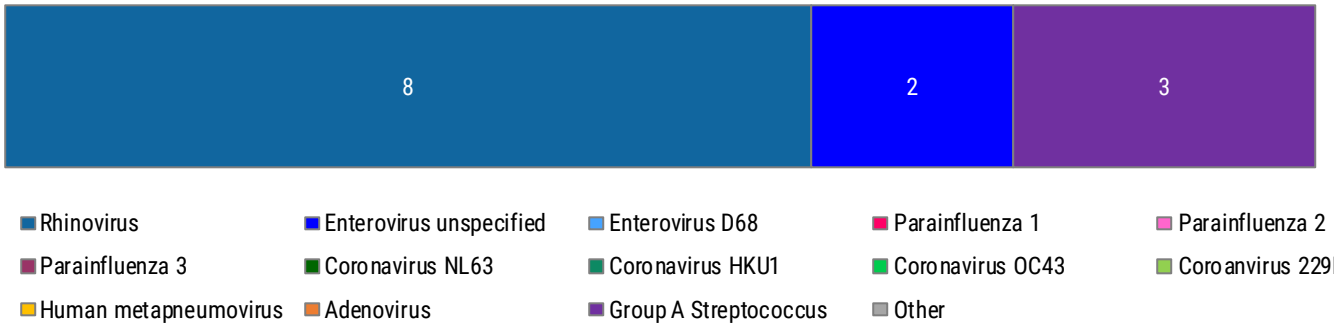

Figure 33: In week 7, no new RSV-associated outbreaks were reported. All of the outbreaks reported since week 30 have been reported in **facilities serving children.**

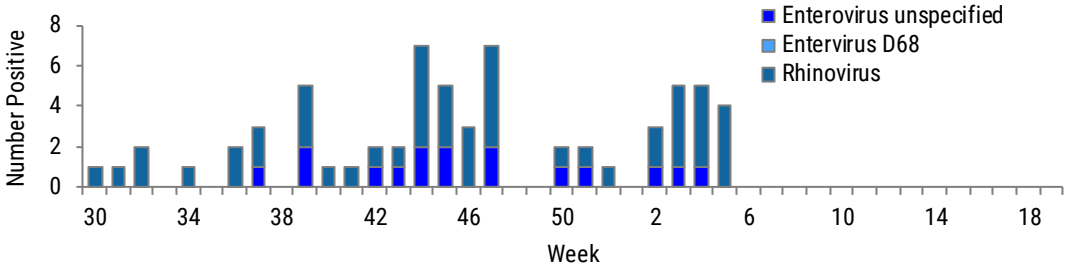

▲ **Figure 33** shows **the number of RSV-associated outbreaks by setting and week** as reported by county health departments in Merlin, week 30, 2019 to week 7, 2020.

AMERICAN OVERSIGHT

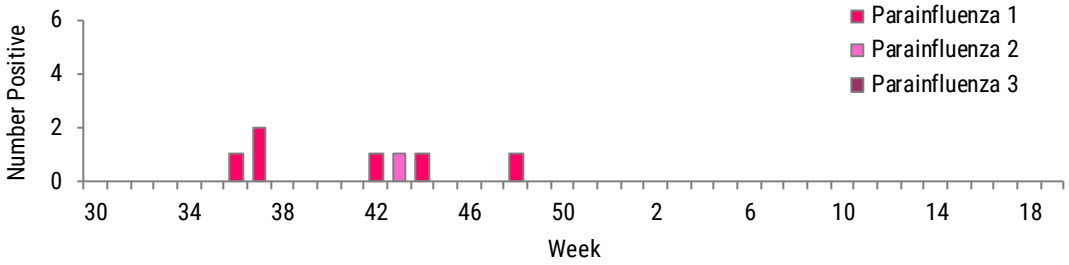
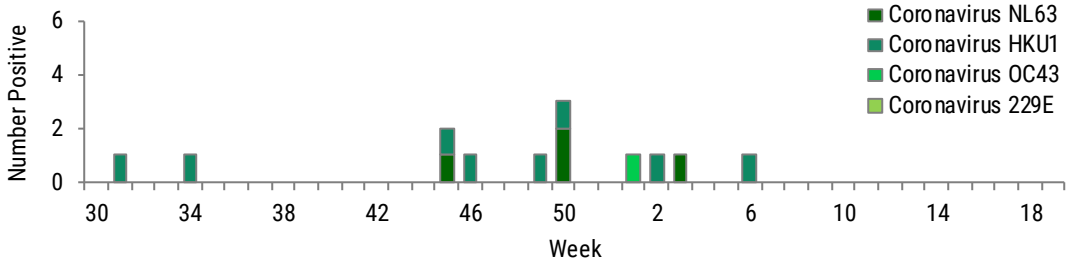
Other Respiratory Virus Surveillance





▲ **Figure 34** shows **the number of unique times a pathogen was associated with a respiratory outbreak** for outbreaks reported from week 30, 2019 to week 7, 2020.

◀ **Figure 35*** shows **the number of PCR-positive laboratory findings for enterovirus unspecified, enterovirus D68, and rhinovirus** by week** among specimens submitted to the Bureau of Public Health Laboratories (BPHL) for extended respiratory panel testing.

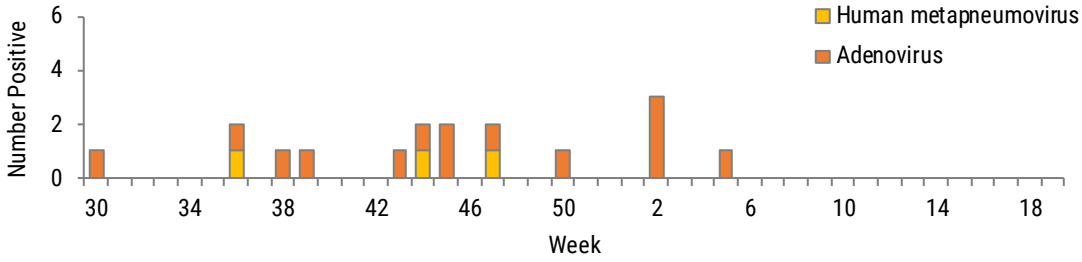


Figure 36* shows **the ▶ number of PCR-positive laboratory findings for parainfluenza 1-3** by week** among specimens submitted to BPHL for extended respiratory panel testing.

◀ **Figure 37*** shows **the number of PCR-positive laboratory findings for seasonal coronaviruses NL63, HKU1, OC43, and 229E** by week** among specimens submitted to BPHL for extended respiratory panel testing.

Figure 38* shows **the ▶ number of PCR-positive laboratory findings for human metapneumovirus and adenovirus** by week** among specimens submitted to BPHL for extended respiratory panel testing.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 7, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Assisted living facility	Citrus	31	0	0	Influenza A unspecified	Yes	Closed
Long-term care facility	Madison	5	3	0	Influenza A 2009 (H1N1)	Yes	Open
Long-term care facility	Monroe	4	2	Unknown	Influenza A unspecified	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=369) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 7, 2020 Florida Flu Review
Date:	Wednesday, February 19, 2020 2:53:23 PM
Attachments:	Week 7, 2020 Florida Flu Review.pdf

Good Afternoon!

Attached is the Week 7, 2020 Florida Flu Review.

Week 7 influenza & influenza-like illness (ILI) activity summary:

Activity decreased in week 7 and remained above peak levels observed in the 2016-17 and 2018-19 seasons. Decreases were observed in most regions of the state. Elevated activity is still expected for several more weeks.

Twenty-four outbreaks were reported, down from 29 outbreaks in the previous week. Of the 24 outbreaks reported, 12 were influenza-associated and 12 were ILI.

Two new influenza-associated pediatric deaths were reported. Nine influenza-associated pediatric deaths have been reported so far this season; only one child was vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On January 10, 2020, CDC issued a health advisory reminding clinicians to reiterate vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of

AMERICAN OVERSIGHT

fever-reducing medication).

Thank you!

Florida ILI Surveillance System Summary 16

Background

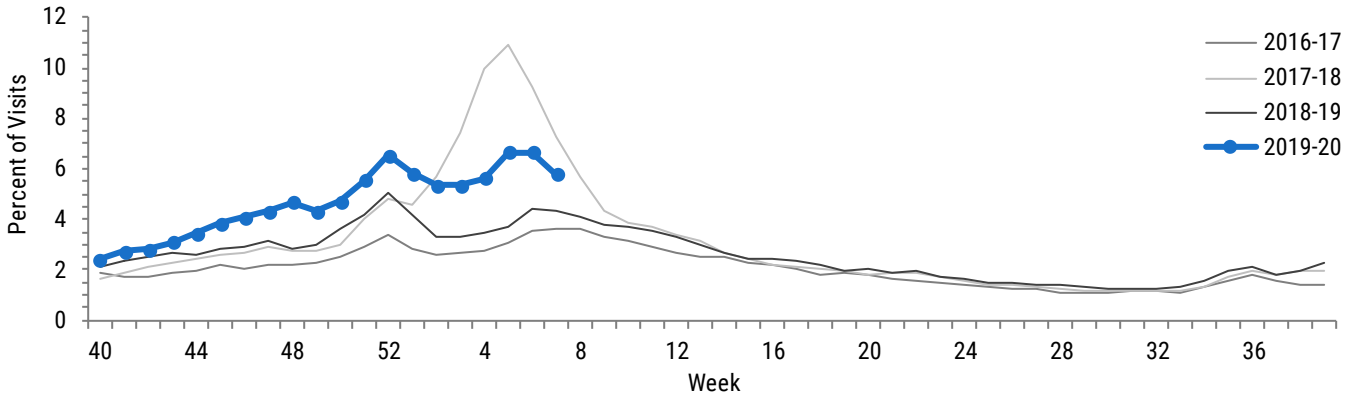
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

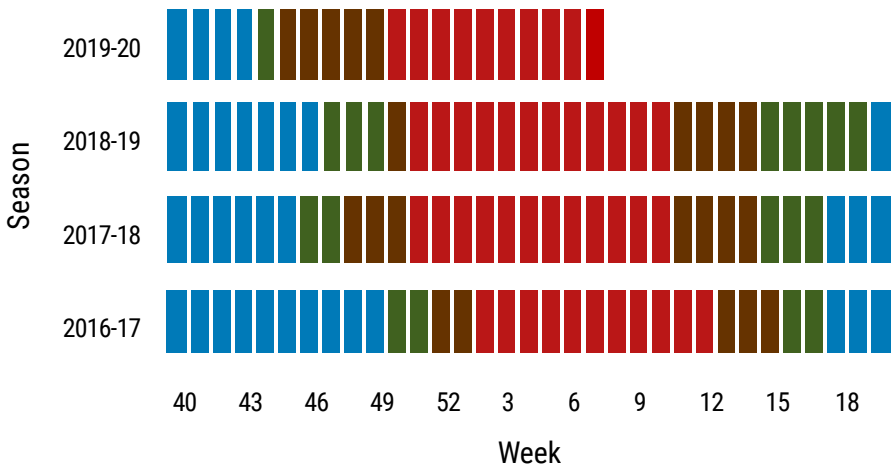
Figure 1: In week 7, **the percent of emergency department and urgent care center visits for ILI statewide decreased** but remained above peak levels observed during the 2018-19 and 2016-17 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=369) statewide for the current season (week 40, 2019 to week 7, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 7, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 7, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

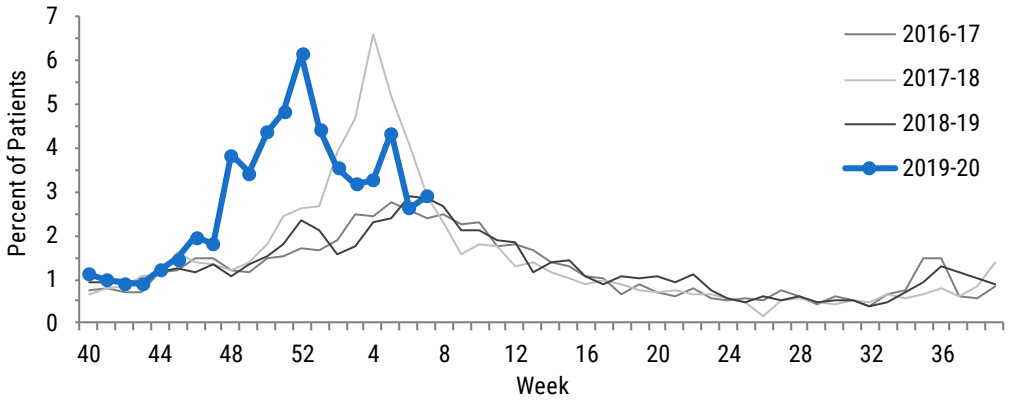
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 7, **the percent of patients with ILI reported by ILINet providers statewide increased** and was similar to levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=9), week 40, 2016 to week 7, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



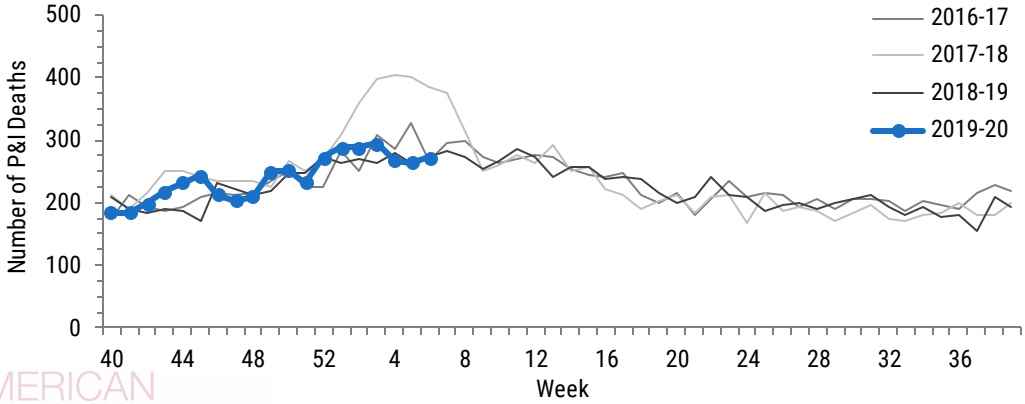


Figure 4: In week 6 (ending 2/8/20), **the number of pneumonia and influenza deaths identified statewide increased** and was similar to levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 6, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

County Influenza Activity

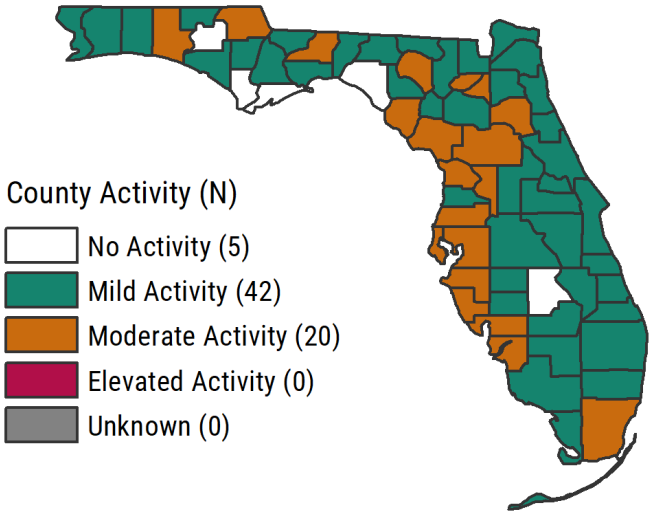
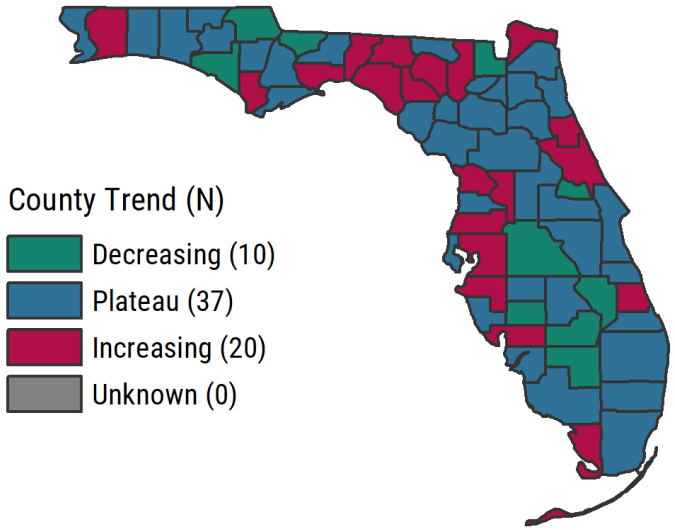
Figure 5: Most counties reported **mild activity** for week 7. Twenty counties reported **moderate activity.**





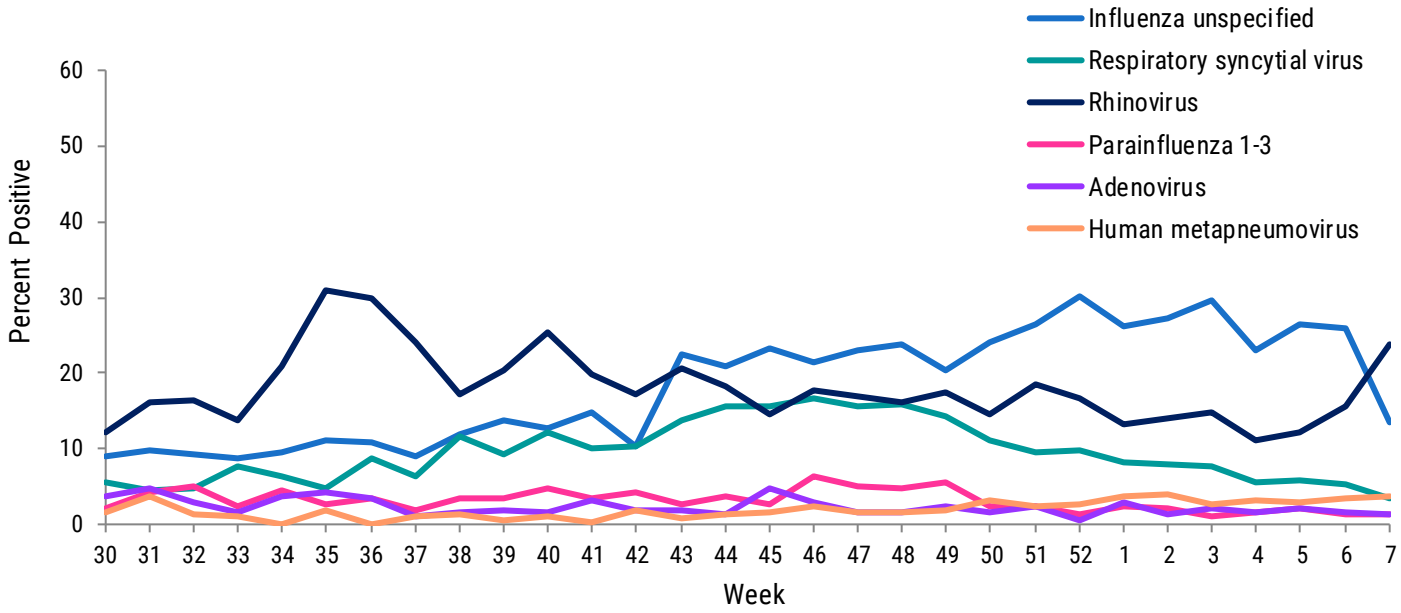


Figure 7: Most counties reported **activity at a plateau** for week 7. Twenty counties reported **increasing activity,** and ten counties reported **decreasing activity.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 7, the **percent of specimens testing positive for rhinovirus increased** and was higher than other respiratory viruses under surveillance. Of note, the volume of laboratory tests reported in week 7 was lower than expected.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=7), week 40, 2019 to week 7, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

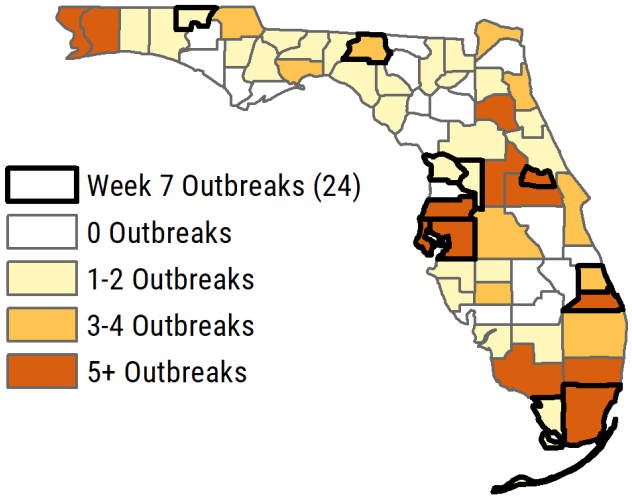
Week 7 Outbreaks at a Glance:

Number Reported:
24 Outbreaks

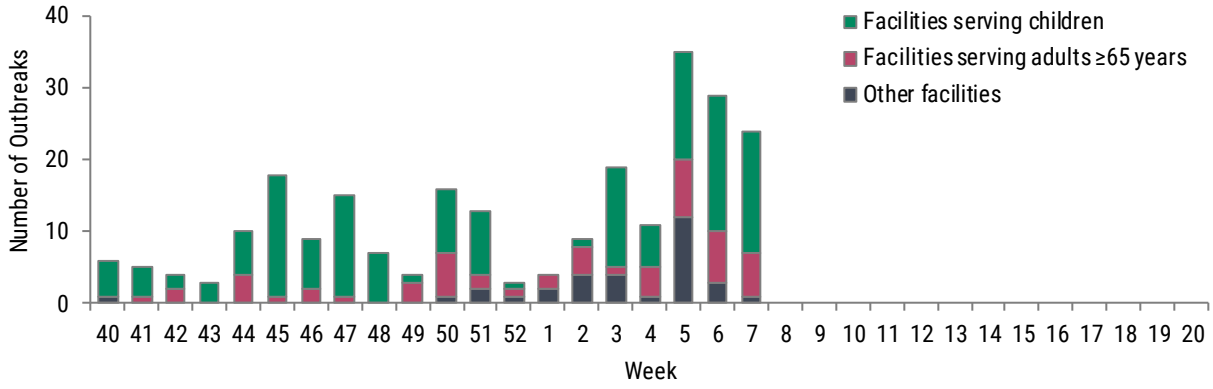
Influenza-Associated:
12 Outbreaks



Severe Outcomes*:
2 Outbreaks

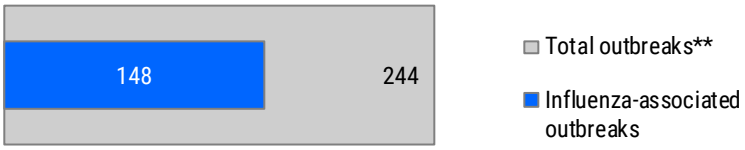
Outbreak Summary:

In week 7, 12 influenza-associated and 12 ILI outbreaks were reported, a decrease from the previous week.



Severe outcomes* were reported in two of 24 outbreaks. One or more hospitalizations were reported in each of these two outbreaks. No deaths were reported.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 7, both outbreaks with severe outcomes were in facilities serving adults aged ≥65 years.



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 7 are **outlined in bold.**

Figure 9: In week 7, **six outbreaks** were reported in **facilities serving adults aged ≥65 years, 17 outbreaks** were reported in **facilities serving children,** and **one outbreak** was reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 7, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 7, **60.7% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 7, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

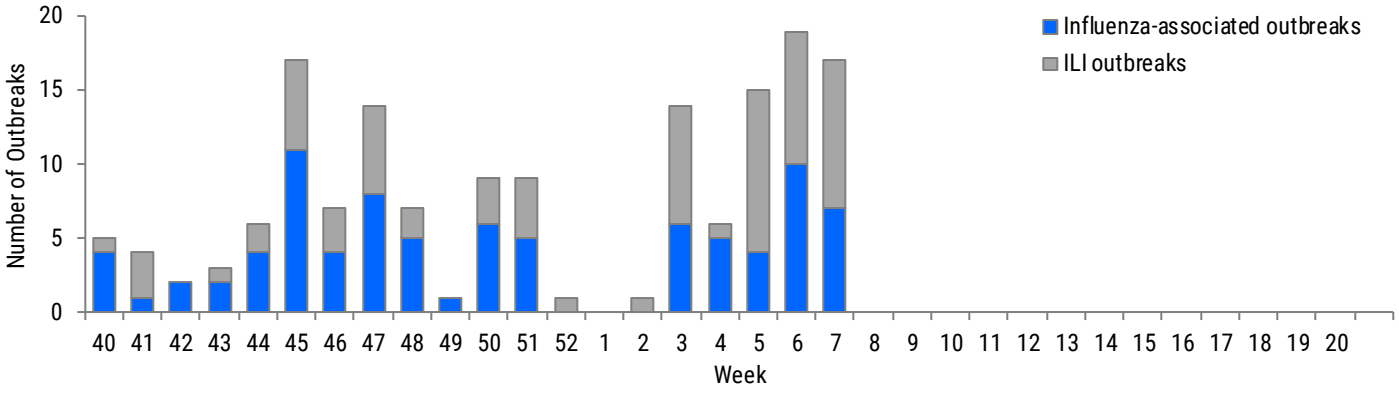
Facilities Serving Children*:



17 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

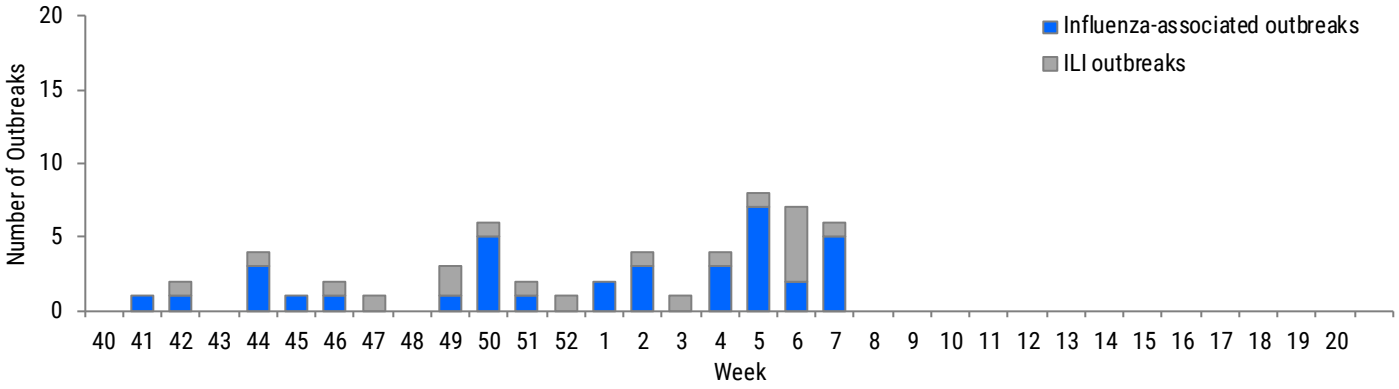
In week 7, 17 new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 7, **seven influenza-associated outbreaks** and **10 ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 7, 2020.

Facilities Serving Adults ≥65 yrs.**:



6 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 7, six new outbreaks of influenza or ILI were reported in facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 7, **five influenza-associated outbreaks** and **one ILI outbreak** were reported in **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 7, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

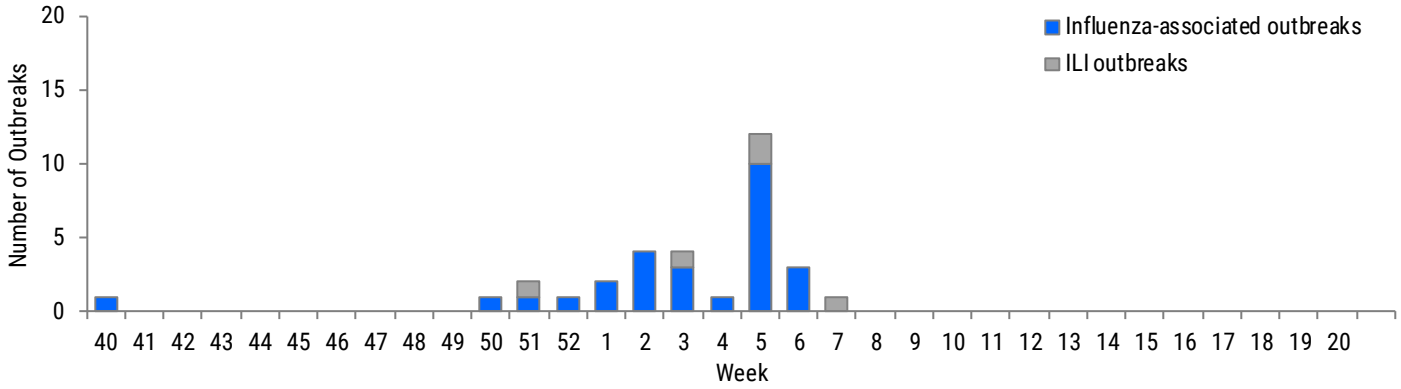
Other Facilities*:



1 Outbreak

Summary of Outbreaks in Other Facilities:

In week 7, one new outbreak of influenza or ILI was reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 7, **one ILI outbreak** was reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 7, 2020.

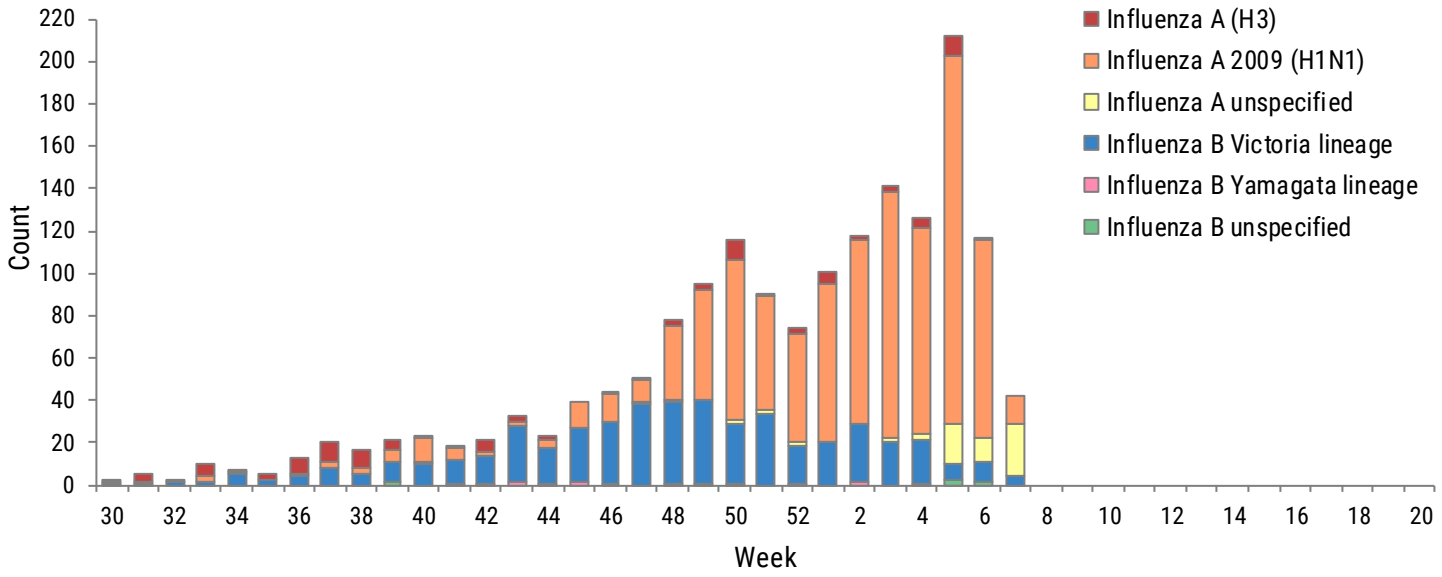


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	122 (50.0%)	71 influenza-associated outbreaks 51 ILI outbreaks
Child daycares	35 (14.3%)	14 influenza-associated outbreaks 21 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	16 (6.6%)	5 influenza-associated outbreaks 11 ILI outbreaks
Nursing facilities	13 (5.3%)	11 influenza-associated outbreaks 2 ILI outbreaks
Other long-term care facilities	26 (10.7%)	20 influenza-associated outbreaks 6 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	27 (11.1%)	24 influenza-associated outbreaks 3 ILI outbreak
Hospitals	2 (0.8%)	2 influenza-associated outbreaks 0 ILI outbreaks
Additional facility types	3 (1.23%)	1 influenza-associated outbreak 2 ILI outbreaks
Total	**244 (100.0%)**	**148 influenza-associated outbreaks** **96 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 7, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 7, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=369) from week 40, 2016 to week 7, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity decreased** during week 7 and was within levels observed at this time in previous seasons.

AMERICAN OVERSIGHT

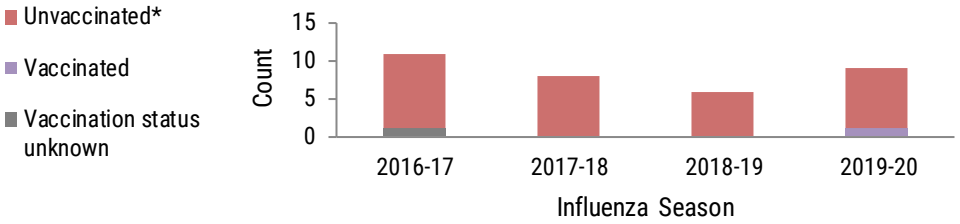
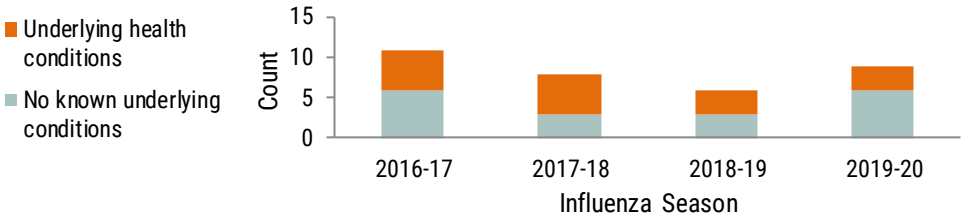
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 7, **the percent of emergency department and urgent care center visits for ILI in children <18 years decreased** and was above levels observed at this time during the 2018-19 and 2016-17 seasons.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 7, 2020.

Figures 25-26: In week 7, **two new influenza-associated pediatric deaths were reported,** one in an unvaccinated child and one in a child who was vaccinated for the 2019-20 season. A total of nine influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 7, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 7, 2020.

In week 7, **two new influenza-associated pediatric deaths were reported**. One death was associated with influenza A unspecified in a child with no known underlying medical conditions. The other death was associated with influenza B unspecified in a child with known underlying medical conditions. One child was vaccinated for the 2019-20 season.

A total of nine influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm

AMERICAN OVERSIGHT

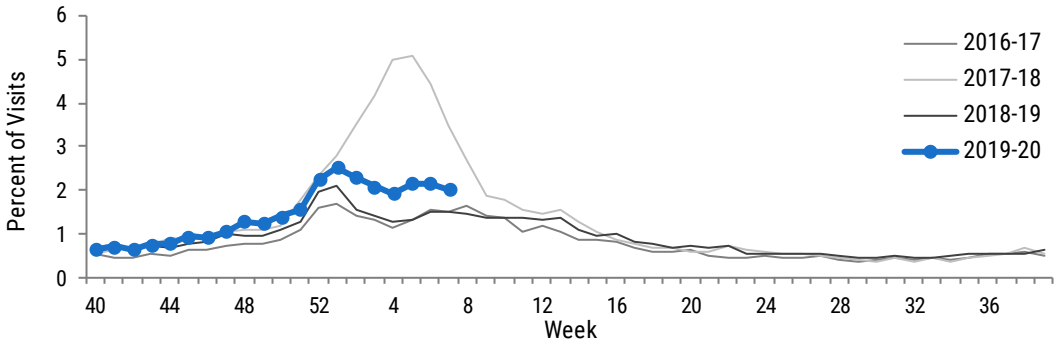
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 7, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was within levels observed at this time in past seasons.



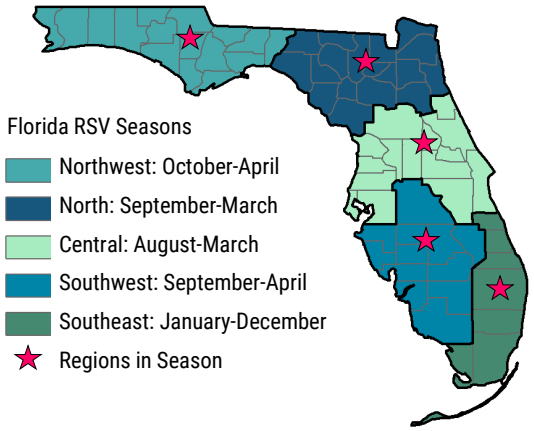
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 7, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 7, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years decreased** and was above levels observed at this time during the 2018-19 and 2016-17 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 7, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

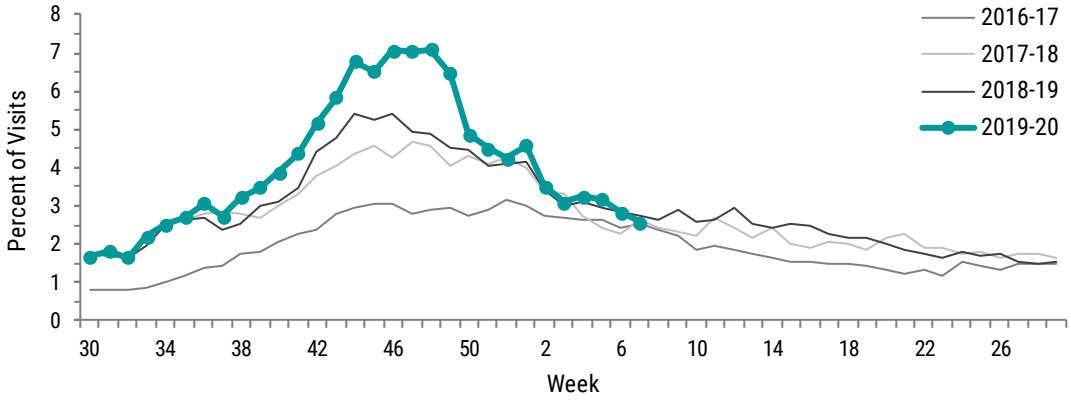
A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

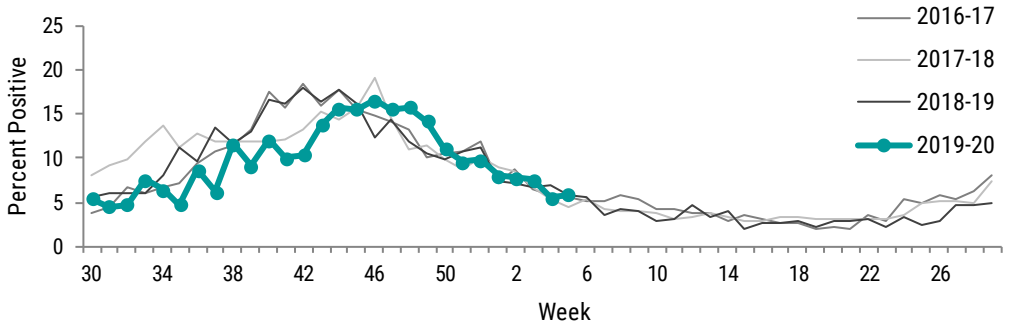
Week 7 (February 9-15, 2020) Activity Summary

In week 7, RSV activity in children <5 years decreased and was similar to levels observed at this time in past seasons.

No new RSV-associated outbreaks were reported in week 7. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 7, **the percent of emergency department and urgent care center visits for RSV among children <5 years decreased** and was similar to levels observed at this time in past seasons.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 7, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

◀ **Figure 35*** shows **the number of PCR-positive laboratory findings for enterovirus unspecified, enterovirus D68, and rhinovirus** by week** among specimens submitted to the Bureau of Public Health Laboratories (BPHL) for extended respiratory panel testing.

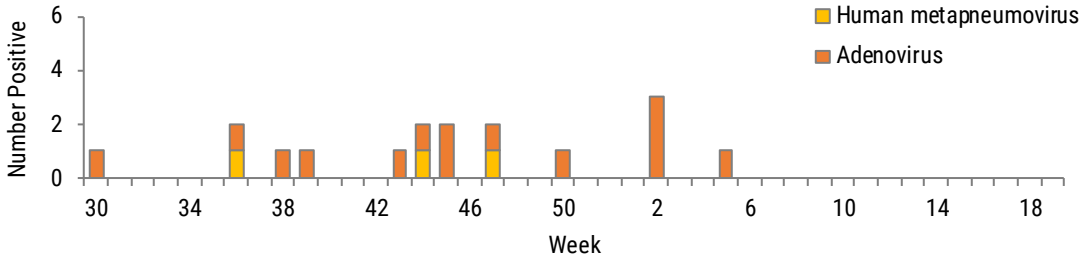

Figure 36* shows **the ▶ number of PCR-positive laboratory findings for parainfluenza 1-3** by week** among specimens submitted to BPHL for extended respiratory panel testing.

◀ **Figure 37*** shows **the number of PCR-positive laboratory findings for seasonal coronaviruses NL63, HKU1, OC43, and 229E** by week** among specimens submitted to BPHL for extended respiratory panel testing.

Figure 38* shows **the ▶ number of PCR-positive laboratory findings for human metapneumovirus and adenovirus** by week** among specimens submitted to BPHL for extended respiratory panel testing.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 7, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Assisted living facility	Citrus	31	0	0	Influenza A unspecified	Yes	Closed
Long-term care facility	Madison	5	3	0	Influenza A 2009 (H1N1)	Yes	Open
Long-term care facility	Monroe	4	2	Unknown	Influenza A unspecified	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=369) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 7, 2020 Florida Flu Review
Date:	Wednesday, February 19, 2020 2:53:23 PM
Attachments:	Week 7, 2020 Florida Flu Review.pdf

Good Afternoon!

Attached is the Week 7, 2020 Florida Flu Review.

Week 7 influenza & influenza-like illness (ILI) activity summary:

Activity decreased in week 7 and remained above peak levels observed in the 2016-17 and 2018-19 seasons. Decreases were observed in most regions of the state. Elevated activity is still expected for several more weeks.

Twenty-four outbreaks were reported, down from 29 outbreaks in the previous week. Of the 24 outbreaks reported, 12 were influenza-associated and 12 were ILI.

Two new influenza-associated pediatric deaths were reported. Nine influenza-associated pediatric deaths have been reported so far this season; only one child was vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On January 10, 2020, CDC issued a health advisory reminding clinicians to reiterate vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of

AMERICAN OVERSIGHT

fever-reducing medication).

Thank you!

Florida ILI Surveillance System Summary 16

Background

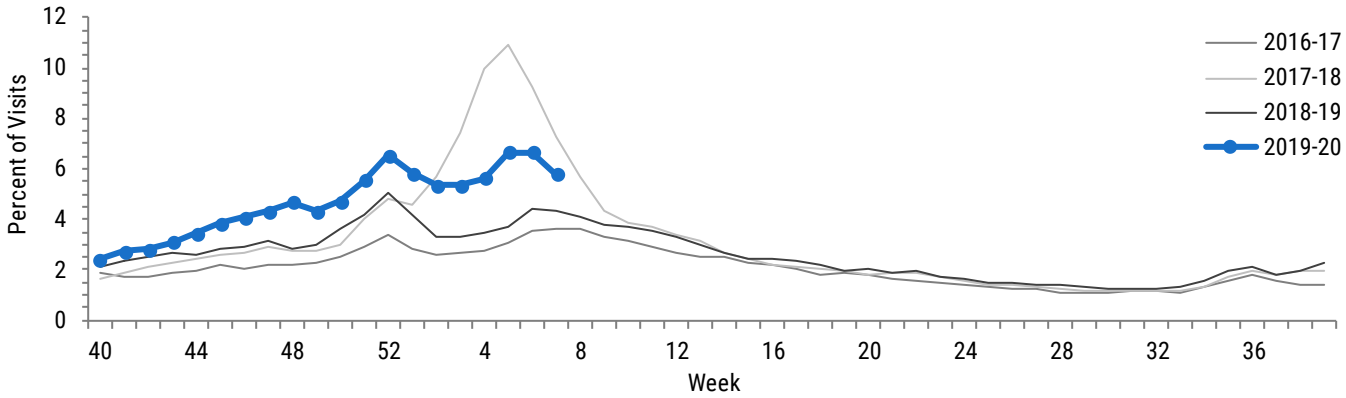
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

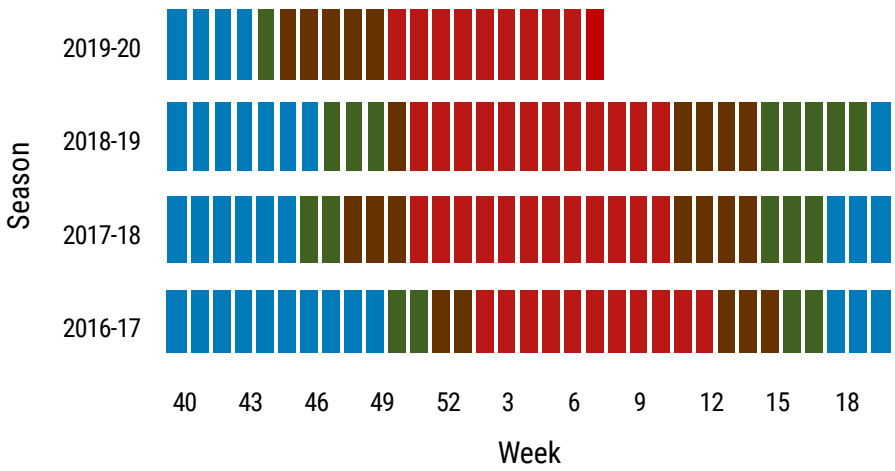
Figure 1: In week 7, **the percent of emergency department and urgent care center visits for ILI statewide decreased** but remained above peak levels observed during the 2018-19 and 2016-17 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=369) statewide for the current season (week 40, 2019 to week 7, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 7, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 7, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

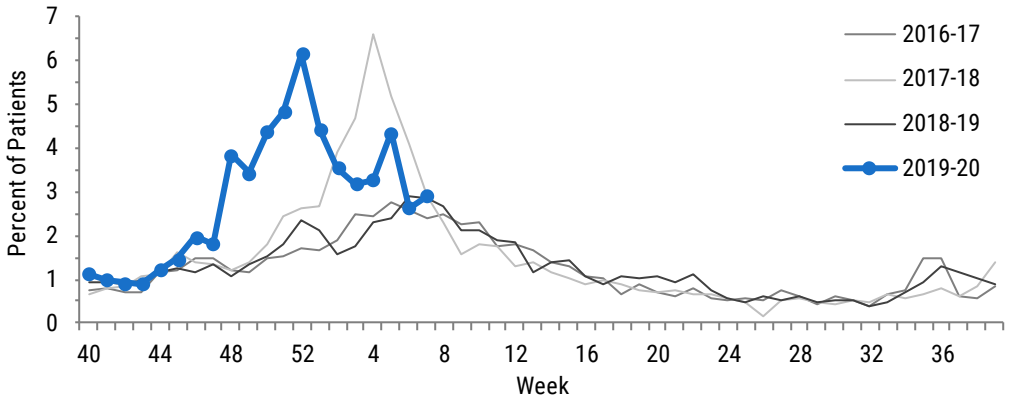
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 7, **the percent of patients with ILI reported by ILINet providers statewide increased** and was similar to levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=9), week 40, 2016 to week 7, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



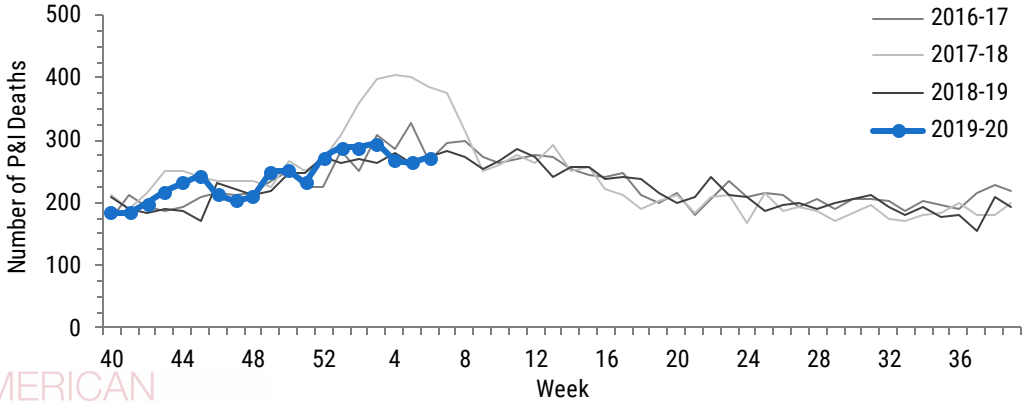


Figure 4: In week 6 (ending 2/8/20), **the number of pneumonia and influenza deaths identified statewide increased** and was similar to levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 6, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

County Influenza Activity

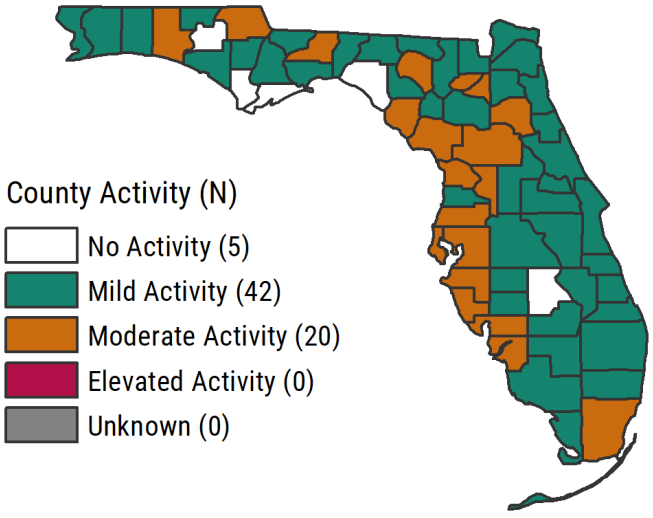
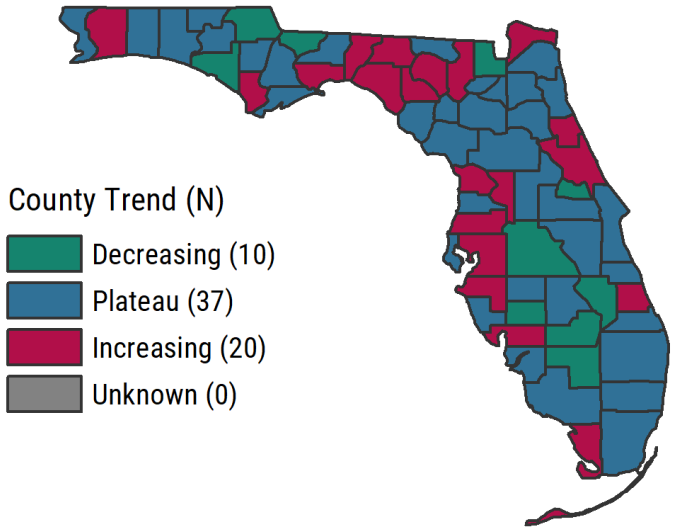
Figure 5: Most counties reported **mild activity** for week 7. Twenty counties reported **moderate activity.**





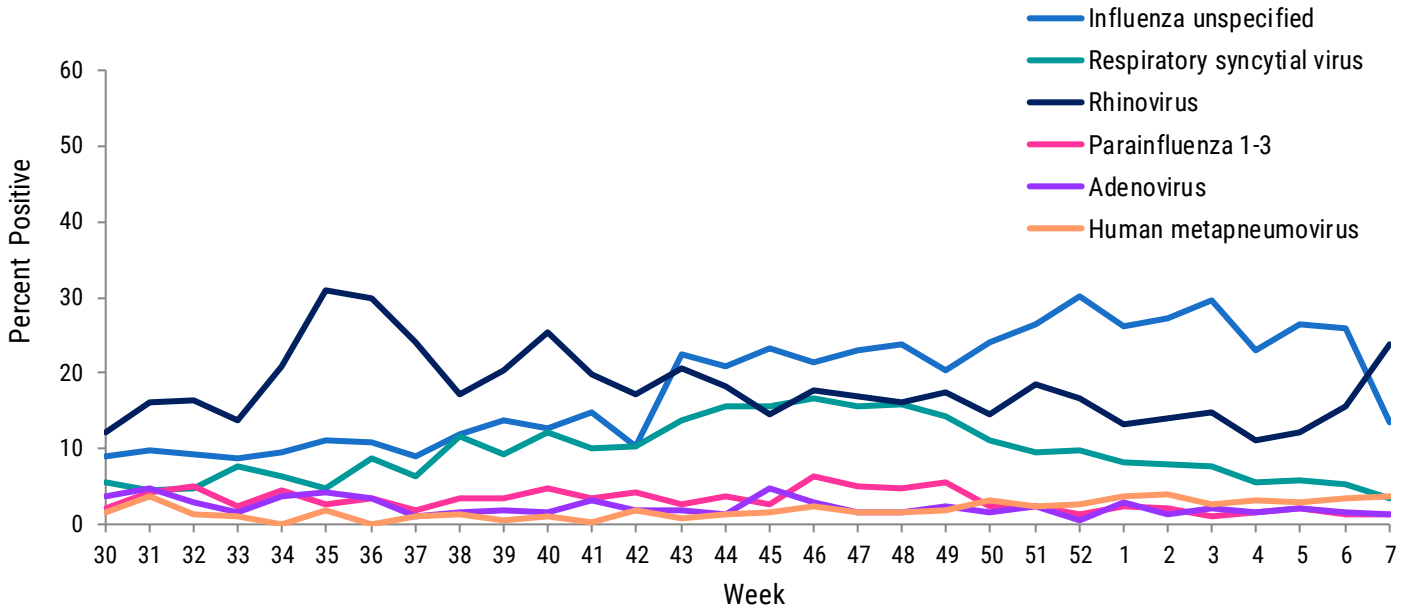


Figure 7: Most counties reported **activity at a plateau** for week 7. Twenty counties reported **increasing activity,** and ten counties reported **decreasing activity.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 7, the **percent of specimens testing positive for rhinovirus increased** and was higher than other respiratory viruses under surveillance. Of note, the volume of laboratory tests reported in week 7 was lower than expected.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=7), week 40, 2019 to week 7, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

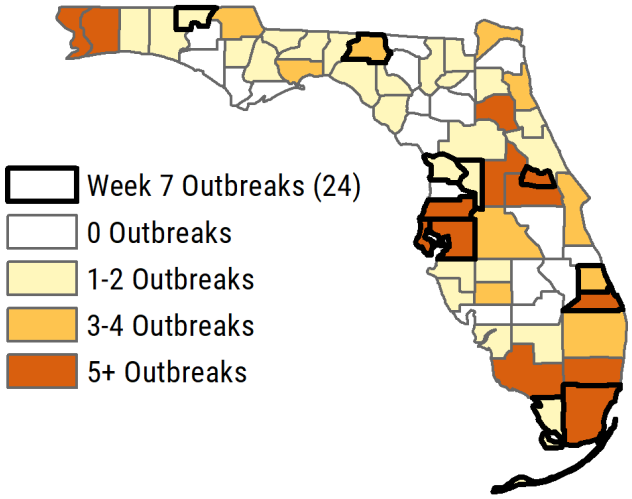
Week 7 Outbreaks at a Glance:

Number Reported:
24 Outbreaks

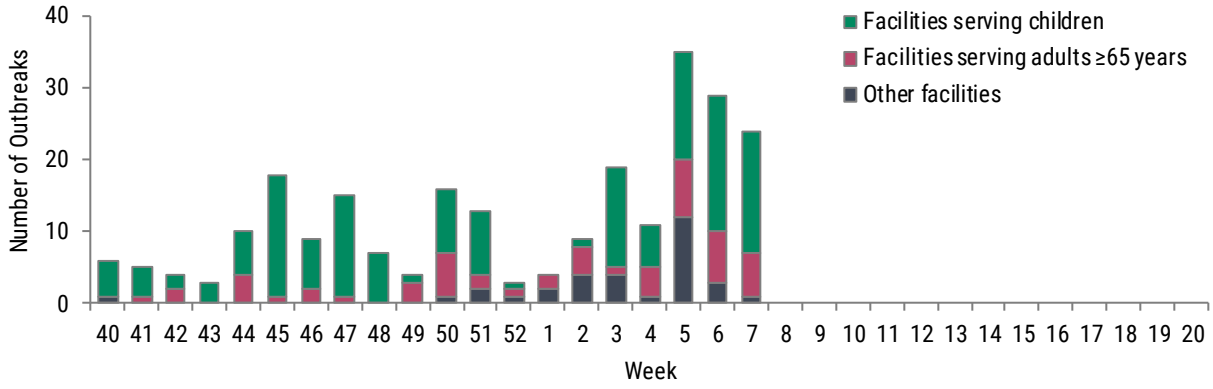
Influenza-Associated:
12 Outbreaks



Severe Outcomes*:
2 Outbreaks

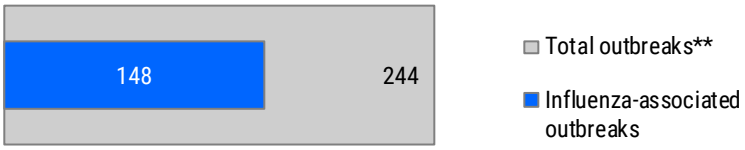
Outbreak Summary:

In week 7, 12 influenza-associated and 12 ILI outbreaks were reported, a decrease from the previous week.



Severe outcomes* were reported in two of 24 outbreaks. One or more hospitalizations were reported in each of these two outbreaks. No deaths were reported.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 7, both outbreaks with severe outcomes were in facilities serving adults aged ≥65 years.



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 7 are **outlined in bold.**

Figure 9: In week 7, **six outbreaks** were reported in **facilities serving adults aged ≥65 years, 17 outbreaks** were reported in **facilities serving children,** and **one outbreak** was reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 7, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 7, **60.7% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 7, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

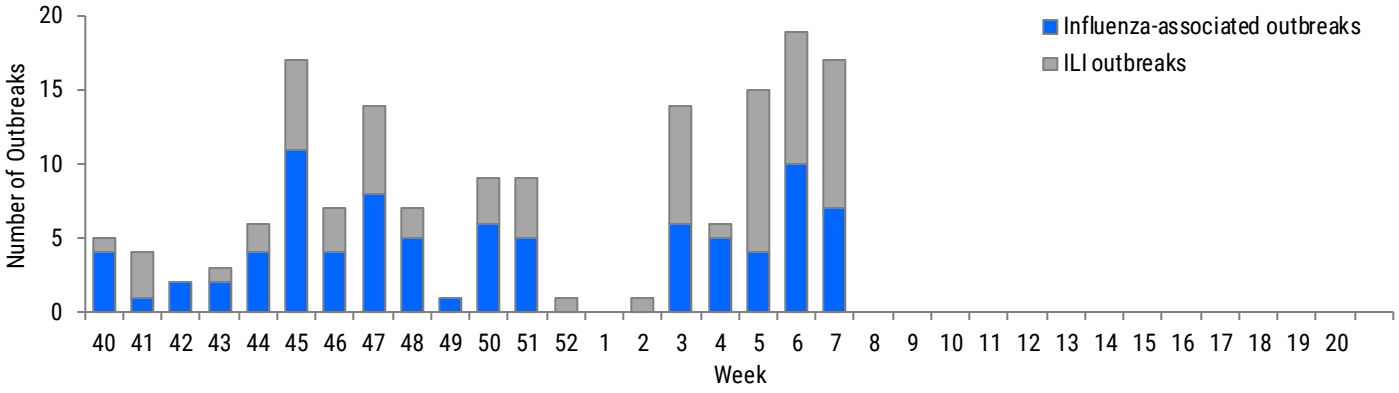
Facilities Serving Children*:



17 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

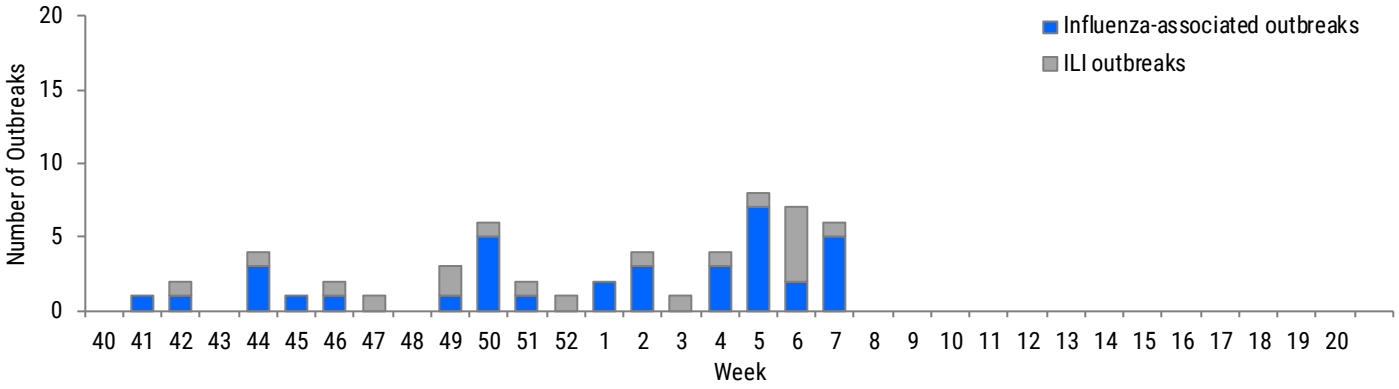
In week 7, 17 new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 7, **seven influenza-associated outbreaks** and **10 ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 7, 2020.

Facilities Serving Adults ≥65 yrs.**:



6 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 7, six new outbreaks of influenza or ILI were reported in facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 7, **five influenza-associated outbreaks** and **one ILI outbreak** were reported in **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 7, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

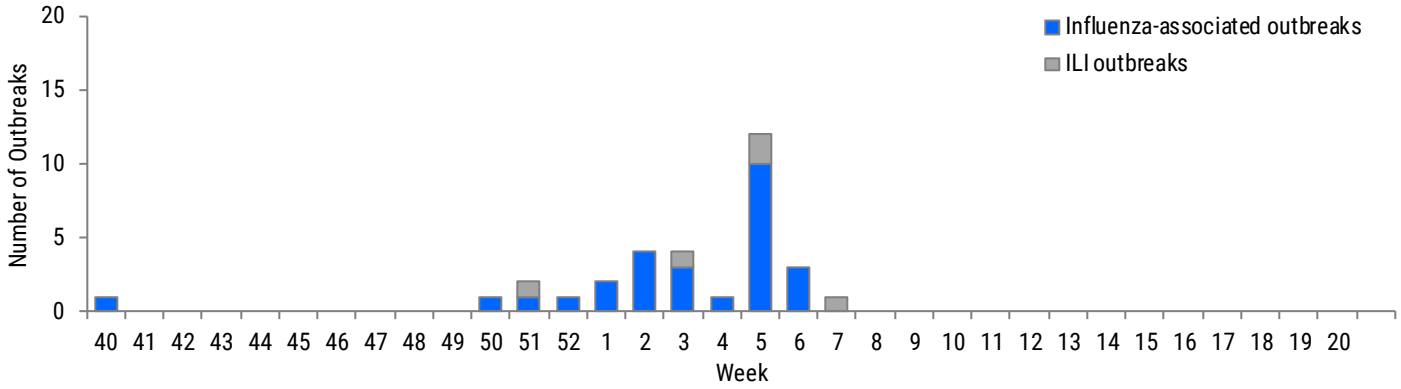
Other Facilities*:



1 Outbreak

Summary of Outbreaks in Other Facilities:

In week 7, one new outbreak of influenza or ILI was reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 7, **one ILI outbreak** was reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 7, 2020.

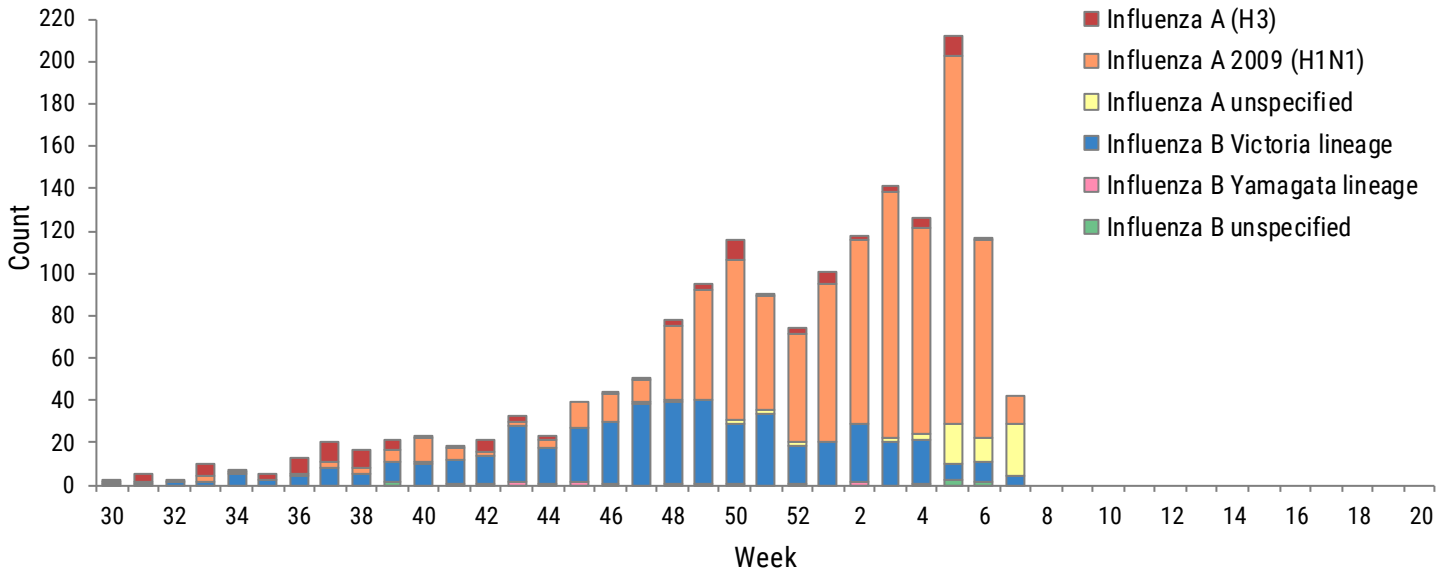


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	122 (50.0%)	71 influenza-associated outbreaks 51 ILI outbreaks
Child daycares	35 (14.3%)	14 influenza-associated outbreaks 21 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	16 (6.6%)	5 influenza-associated outbreaks 11 ILI outbreaks
Nursing facilities	13 (5.3%)	11 influenza-associated outbreaks 2 ILI outbreaks
Other long-term care facilities	26 (10.7%)	20 influenza-associated outbreaks 6 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	27 (11.1%)	24 influenza-associated outbreaks 3 ILI outbreak
Hospitals	2 (0.8%)	2 influenza-associated outbreaks 0 ILI outbreaks
Additional facility types	3 (1.23%)	1 influenza-associated outbreak 2 ILI outbreaks
Total	**244 (100.0%)**	**148 influenza-associated outbreaks** **96 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 7, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 7, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=369) from week 40, 2016 to week 7, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity decreased** during week 7 and was within levels observed at this time in previous seasons.

AMERICAN OVERSIGHT

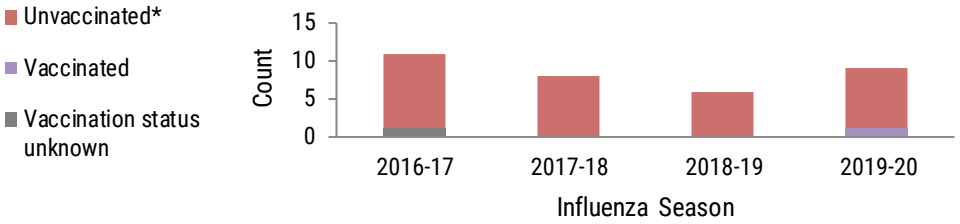
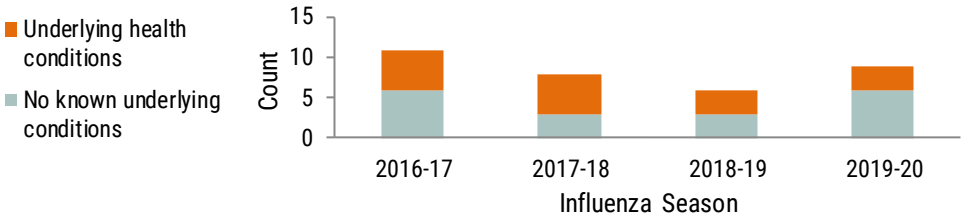
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 7, **the percent of emergency department and urgent care center visits for ILI in children <18 years decreased** and was above levels observed at this time during the 2018-19 and 2016-17 seasons.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 7, 2020.

Figures 25-26: In week 7, **two new influenza-associated pediatric deaths were reported,** one in an unvaccinated child and one in a child who was vaccinated for the 2019-20 season. A total of nine influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 7, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 7, 2020.

In week 7, **two new influenza-associated pediatric deaths were reported**. One death was associated with influenza A unspecified in a child with no known underlying medical conditions. The other death was associated with influenza B unspecified in a child with known underlying medical conditions. One child was vaccinated for the 2019-20 season.

A total of nine influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm

AMERICAN OVERSIGHT

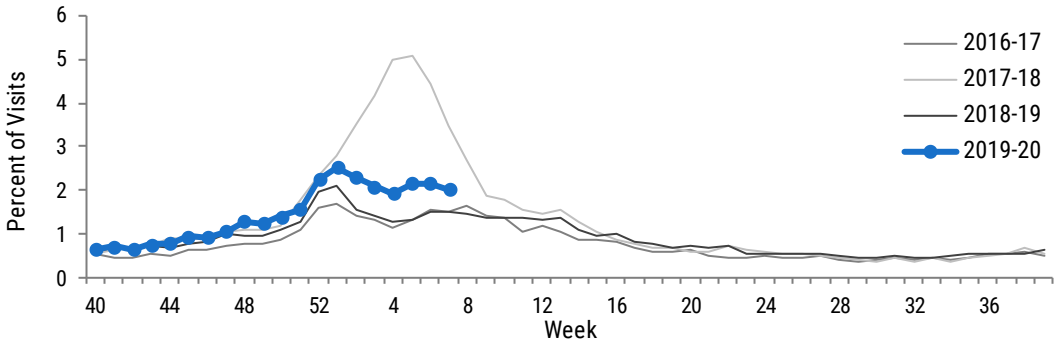
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 7, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was within levels observed at this time in past seasons.



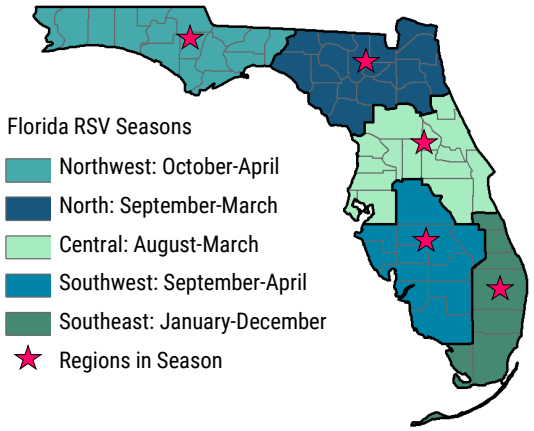
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 7, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 7, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years decreased** and was above levels observed at this time during the 2018-19 and 2016-17 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 7, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

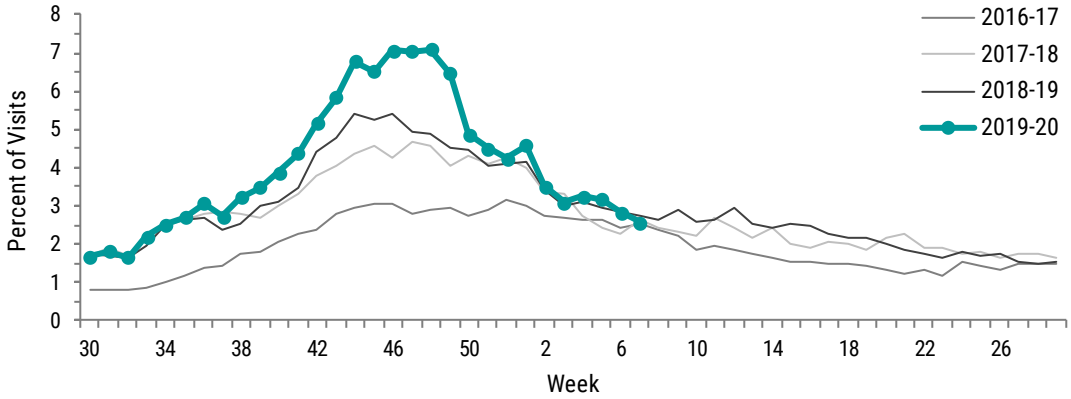
A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

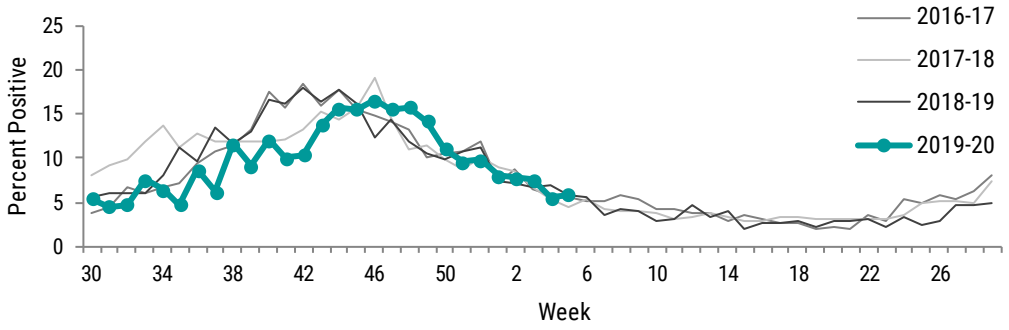
Week 7 (February 9-15, 2020) Activity Summary

In week 7, RSV activity in children <5 years decreased and was similar to levels observed at this time in past seasons.

No new RSV-associated outbreaks were reported in week 7. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 7, **the percent of emergency department and urgent care center visits for RSV among children <5 years decreased** and was similar to levels observed at this time in past seasons.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 7, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

◀ **Figure 35*** shows **the number of PCR-positive laboratory findings for enterovirus unspecified, enterovirus D68, and rhinovirus** by week** among specimens submitted to the Bureau of Public Health Laboratories (BPHL) for extended respiratory panel testing.

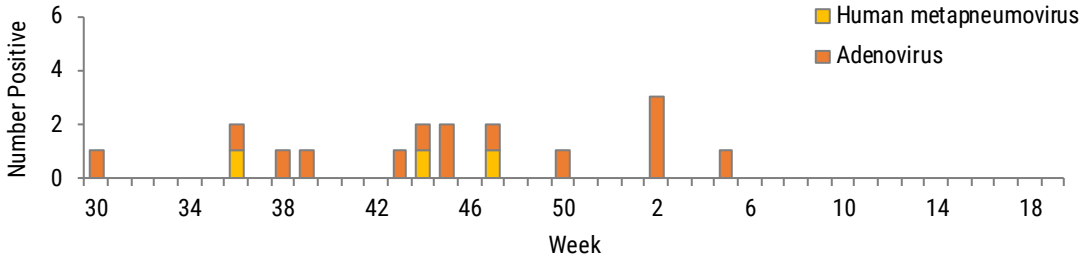

Figure 36* shows **the ▶ number of PCR-positive laboratory findings for parainfluenza 1-3** by week** among specimens submitted to BPHL for extended respiratory panel testing.

◀ **Figure 37*** shows **the number of PCR-positive laboratory findings for seasonal coronaviruses NL63, HKU1, OC43, and 229E** by week** among specimens submitted to BPHL for extended respiratory panel testing.

Figure 38* shows **the ▶ number of PCR-positive laboratory findings for human metapneumovirus and adenovirus** by week** among specimens submitted to BPHL for extended respiratory panel testing.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 7, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Assisted living facility	Citrus	31	0	0	Influenza A unspecified	Yes	Closed
Long-term care facility	Madison	5	3	0	Influenza A 2009 (H1N1)	Yes	Open
Long-term care facility	Monroe	4	2	Unknown	Influenza A unspecified	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=369) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 7, 2020 Florida Flu Review
Date:	Wednesday, February 19, 2020 2:53:17 PM
Attachments:	Week 7, 2020 Florida Flu Review.pdf

Good Afternoon!

Attached is the Week 7, 2020 Florida Flu Review.

Week 7 influenza & influenza-like illness (ILI) activity summary:

Activity decreased in week 7 and remained above peak levels observed in the 2016-17 and 2018-19 seasons. Decreases were observed in most regions of the state. Elevated activity is still expected for several more weeks.

Twenty-four outbreaks were reported, down from 29 outbreaks in the previous week. Of the 24 outbreaks reported, 12 were influenza-associated and 12 were ILI.

Two new influenza-associated pediatric deaths were reported. Nine influenza-associated pediatric deaths have been reported so far this season; only one child was vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On January 10, 2020, CDC issued a health advisory reminding clinicians to reiterate vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of

AMERICAN OVERSIGHT

fever-reducing medication).

Thank you!

Julia Munroe, MS
Respiratory Disease Epidemiologist
Bureau of Epidemiology
Division of Disease Control and Health Protection
Florida Department of Health
Office Phone: 850-901-6936

Mission: To protect, promote, and improve the health of all people in Florida through integrated state, county, and community efforts.

Please note: Florida has a very broad public records law. Most written communications to or from state officials regarding state business are public records available to the public and media upon request. Your email communications may therefore be subject to public disclosure.

Florida ILI Surveillance System Summary 16

Background

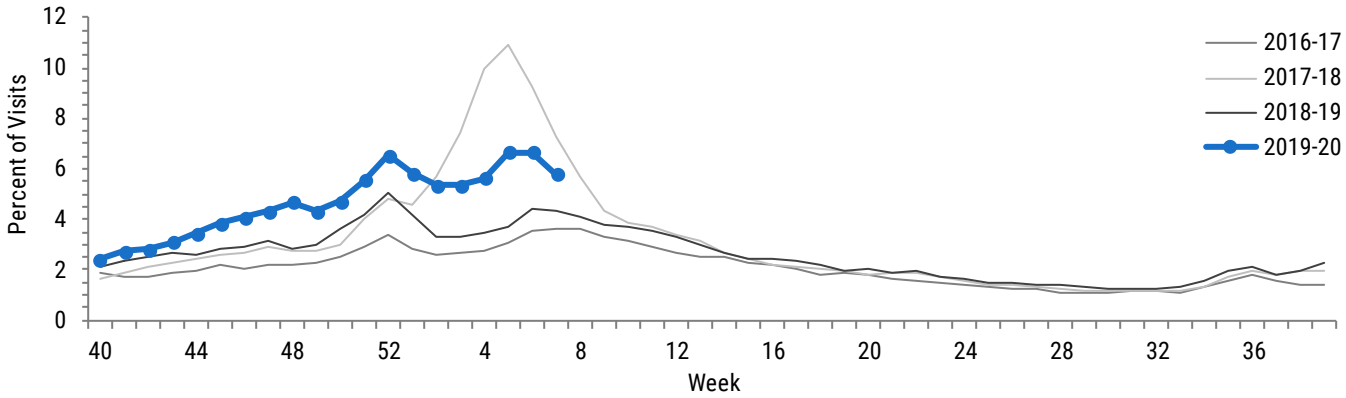
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

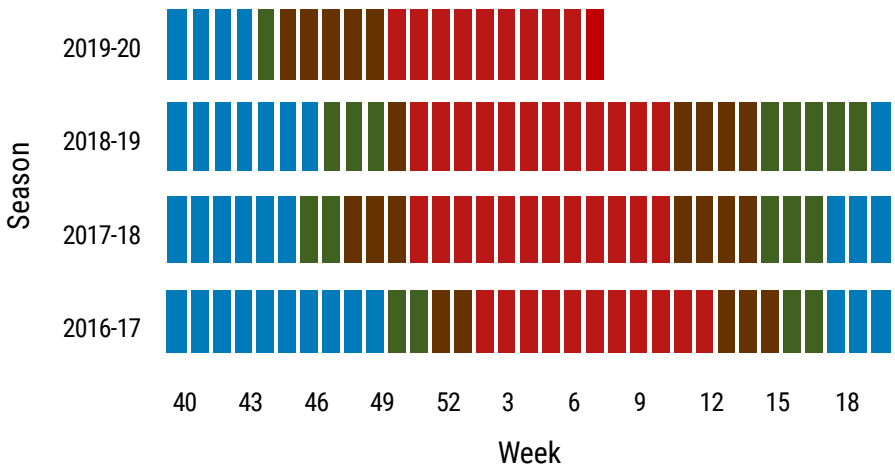
Figure 1: In week 7, **the percent of emergency department and urgent care center visits for ILI statewide decreased** but remained above peak levels observed during the 2018-19 and 2016-17 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=369) statewide for the current season (week 40, 2019 to week 7, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 7, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 7, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

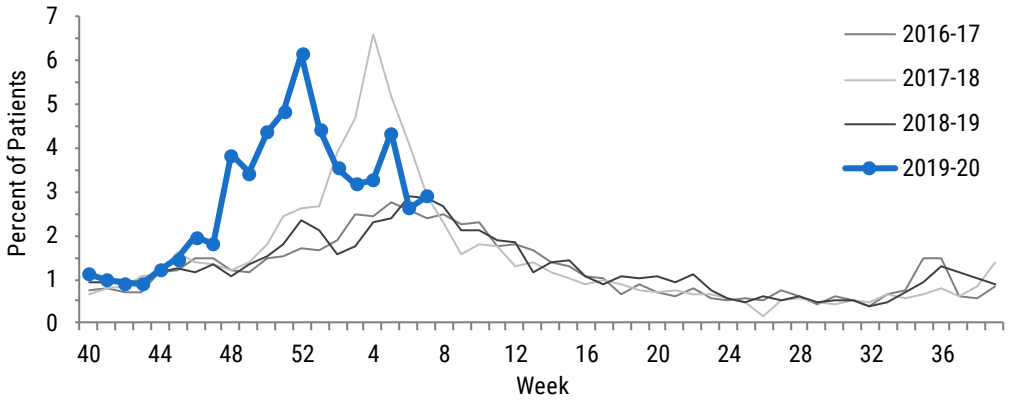
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 7, **the percent of patients with ILI reported by ILINet providers statewide increased** and was similar to levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=9), week 40, 2016 to week 7, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



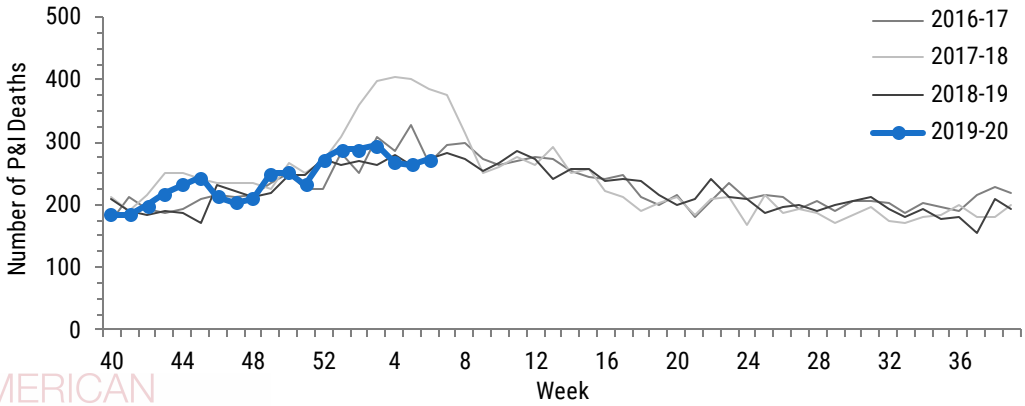


Figure 4: In week 6 (ending 2/8/20), **the number of pneumonia and influenza deaths identified statewide increased** and was similar to levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 6, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

County Influenza Activity

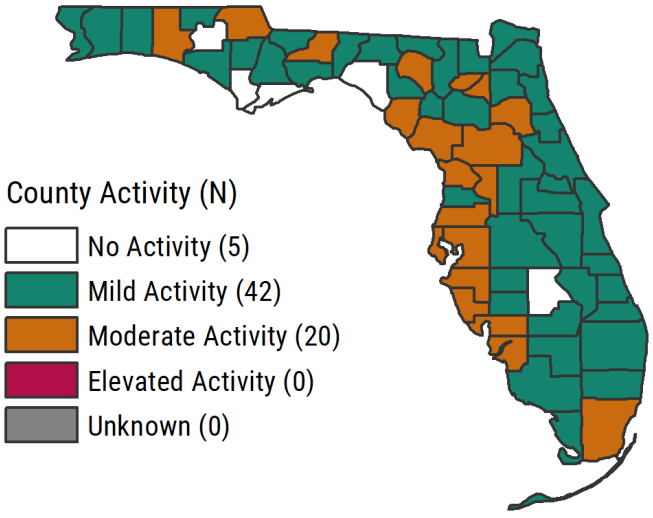
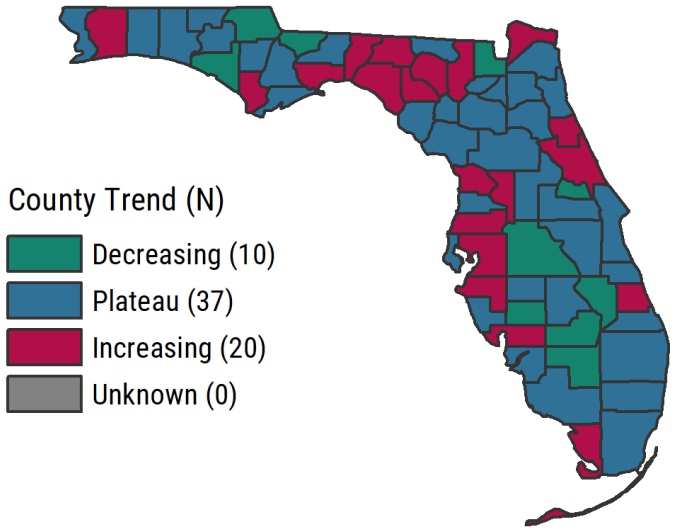
Figure 5: Most counties reported **mild activity** for week 7. Twenty counties reported **moderate activity.**





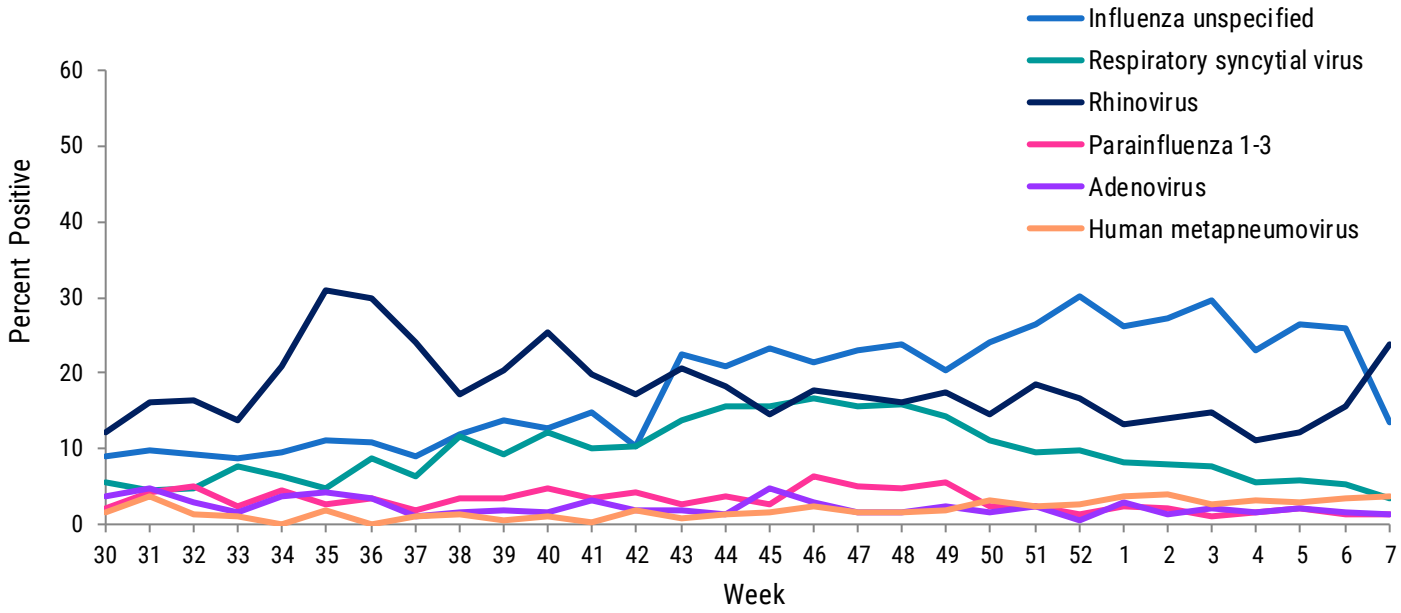


Figure 7: Most counties reported **activity at a plateau** for week 7. Twenty counties reported **increasing activity,** and ten counties reported **decreasing activity.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 7, the **percent of specimens testing positive for rhinovirus increased** and was higher than other respiratory viruses under surveillance. Of note, the volume of laboratory tests reported in week 7 was lower than expected.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=7), week 40, 2019 to week 7, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

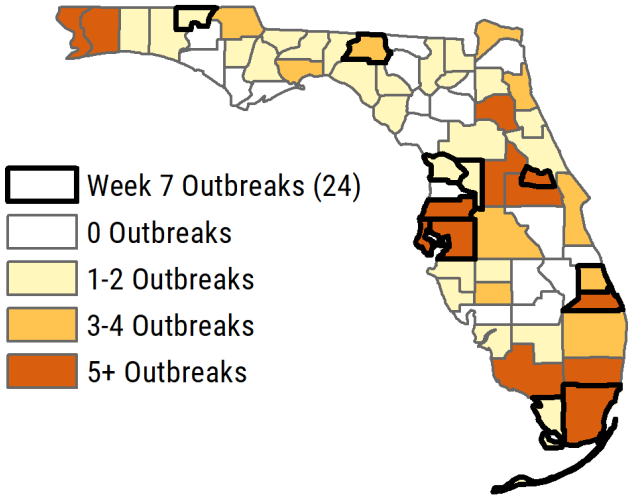
Week 7 Outbreaks at a Glance:

Number Reported:
24 Outbreaks

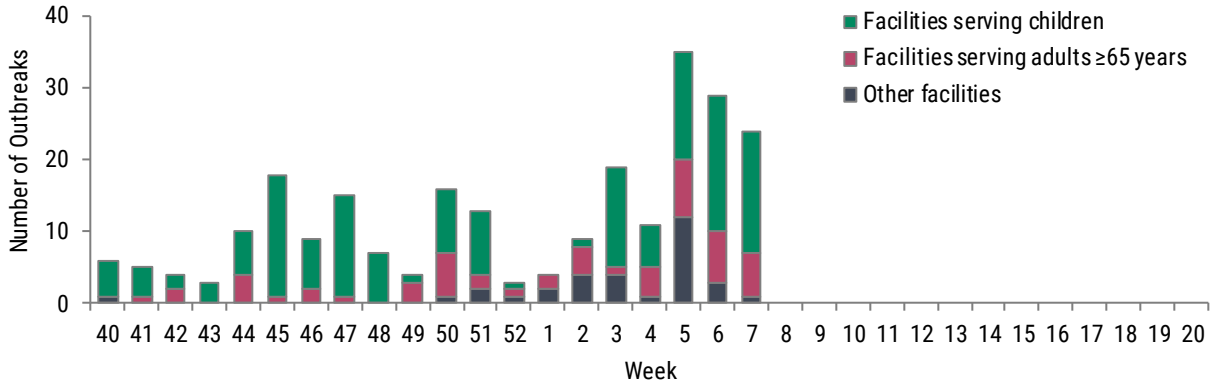
Influenza-Associated:
12 Outbreaks



Severe Outcomes*:
2 Outbreaks

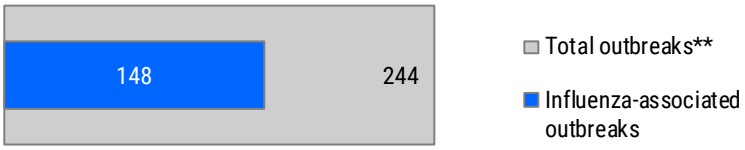
Outbreak Summary:

In week 7, 12 influenza-associated and 12 ILI outbreaks were reported, a decrease from the previous week.



Severe outcomes* were reported in two of 24 outbreaks. One or more hospitalizations were reported in each of these two outbreaks. No deaths were reported.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 7, both outbreaks with severe outcomes were in facilities serving adults aged ≥65 years.



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 7 are **outlined in bold.**

Figure 9: In week 7, **six outbreaks** were reported in **facilities serving adults aged ≥65 years, 17 outbreaks** were reported in **facilities serving children,** and **one outbreak** was reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 7, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 7, **60.7% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 7, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

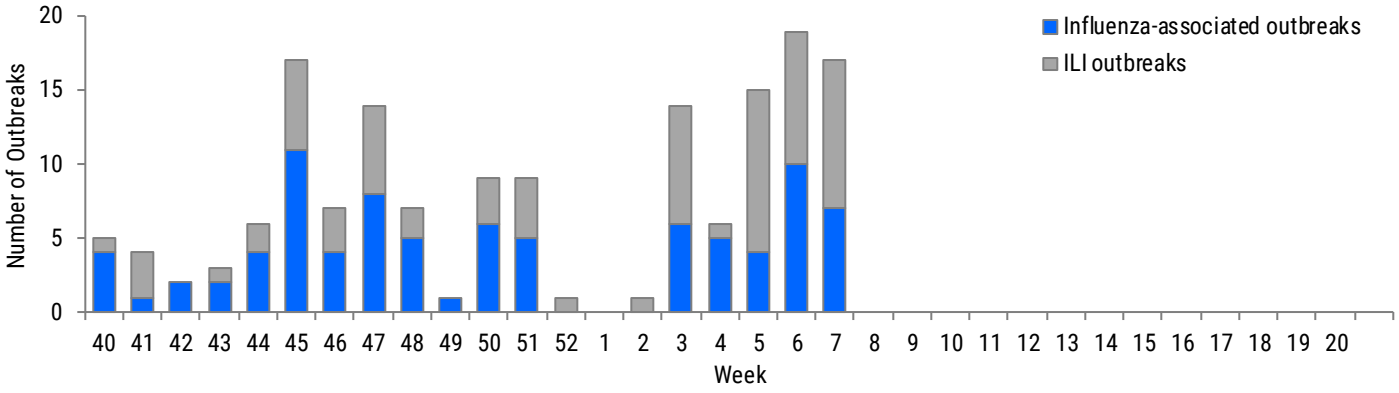
Facilities Serving Children*:



17 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

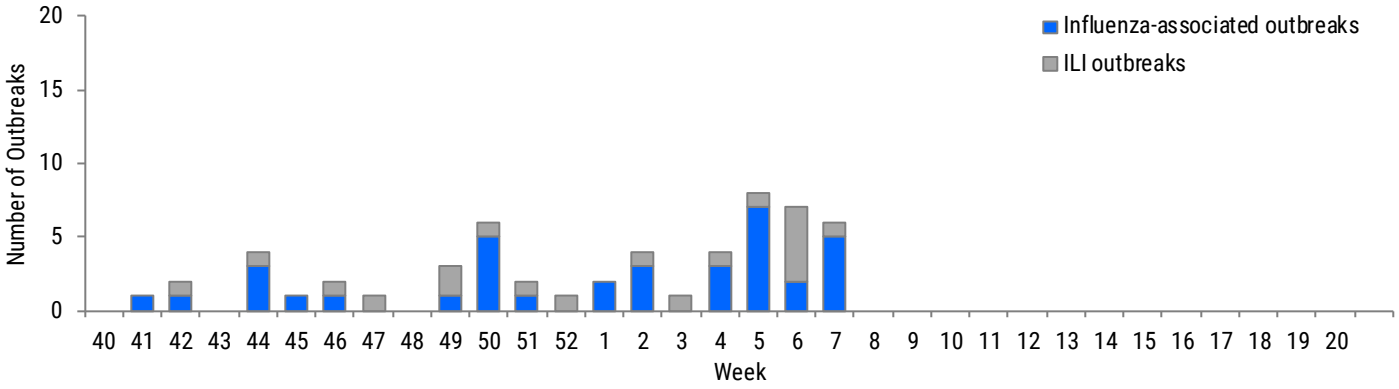
In week 7, 17 new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 7, **seven influenza-associated outbreaks** and **10 ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 7, 2020.

Facilities Serving Adults ≥65 yrs.**:



6 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 7, six new outbreaks of influenza or ILI were reported in facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 7, **five influenza-associated outbreaks** and **one ILI outbreak** were reported in **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 7, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

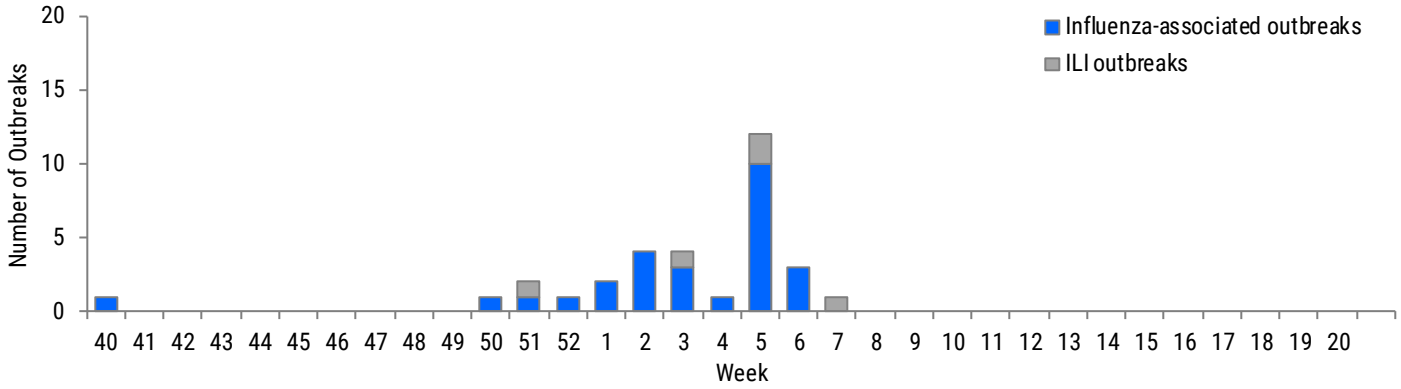
Other Facilities*:



1 Outbreak

Summary of Outbreaks in Other Facilities:

In week 7, one new outbreak of influenza or ILI was reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 7, **one ILI outbreak** was reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 7, 2020.

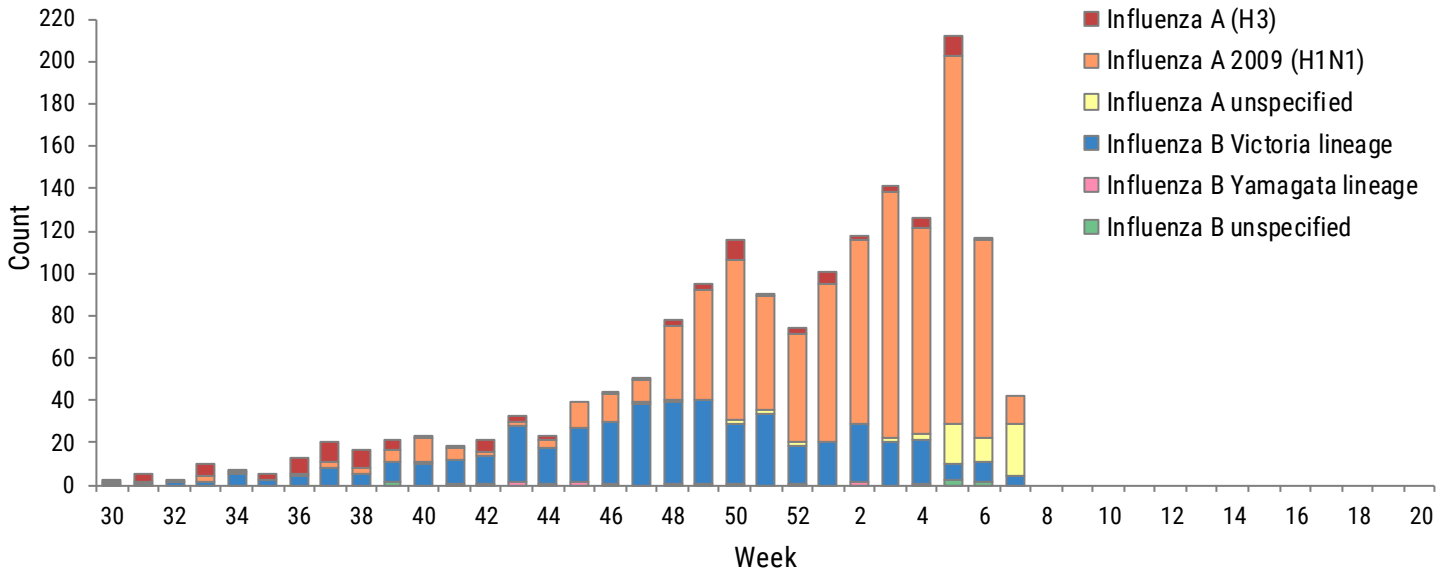


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	122 (50.0%)	71 influenza-associated outbreaks 51 ILI outbreaks
Child daycares	35 (14.3%)	14 influenza-associated outbreaks 21 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	16 (6.6%)	5 influenza-associated outbreaks 11 ILI outbreaks
Nursing facilities	13 (5.3%)	11 influenza-associated outbreaks 2 ILI outbreaks
Other long-term care facilities	26 (10.7%)	20 influenza-associated outbreaks 6 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	27 (11.1%)	24 influenza-associated outbreaks 3 ILI outbreak
Hospitals	2 (0.8%)	2 influenza-associated outbreaks 0 ILI outbreaks
Additional facility types	3 (1.23%)	1 influenza-associated outbreak 2 ILI outbreaks
Total	**244 (100.0%)**	**148 influenza-associated outbreaks** **96 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 7, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 7, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=369) from week 40, 2016 to week 7, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

AMERICAN OVERSIGHT

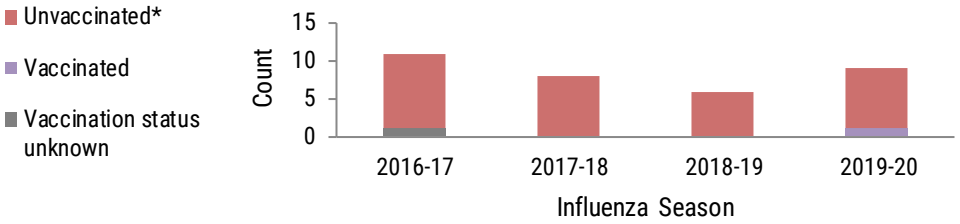
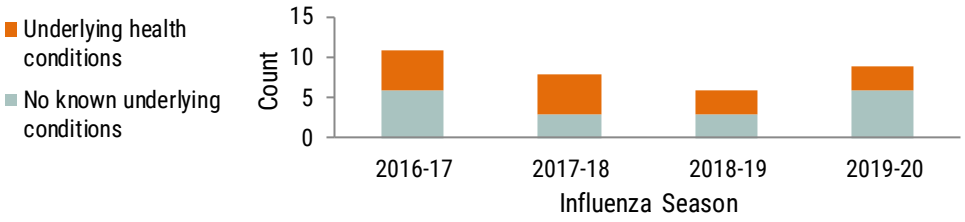
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 7, **the percent of emergency department and urgent care center visits for ILI in children <18 years decreased** and was above levels observed at this time during the 2018-19 and 2016-17 seasons.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 7, 2020.

Figures 25-26: In week 7, **two new influenza-associated pediatric deaths were reported,** one in an unvaccinated child and one in a child who was vaccinated for the 2019-20 season. A total of nine influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 7, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 7, 2020.

In week 7, **two new influenza-associated pediatric deaths were reported**. One death was associated with influenza A unspecified in a child with no known underlying medical conditions. The other death was associated with influenza B unspecified in a child with known underlying medical conditions. One child was vaccinated for the 2019-20 season.

A total of nine influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm

AMERICAN OVERSIGHT

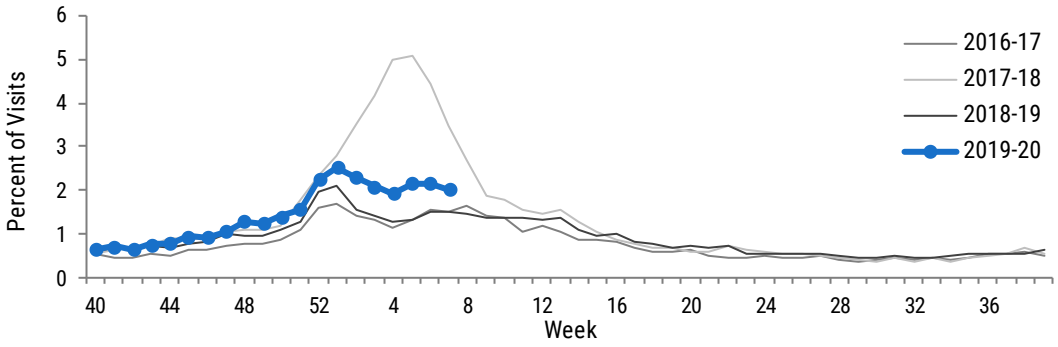
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 7, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was within levels observed at this time in past seasons.



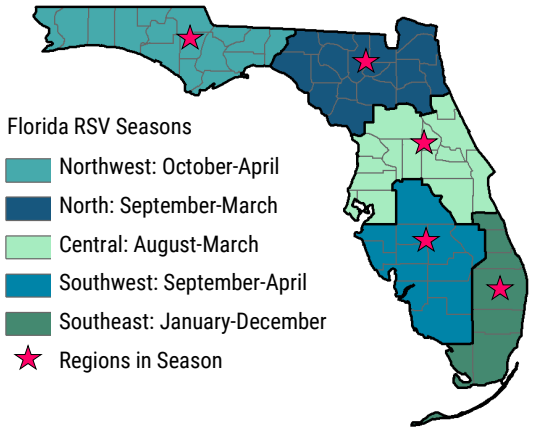
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 7, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 7, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years decreased** and was above levels observed at this time during the 2018-19 and 2016-17 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 7, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

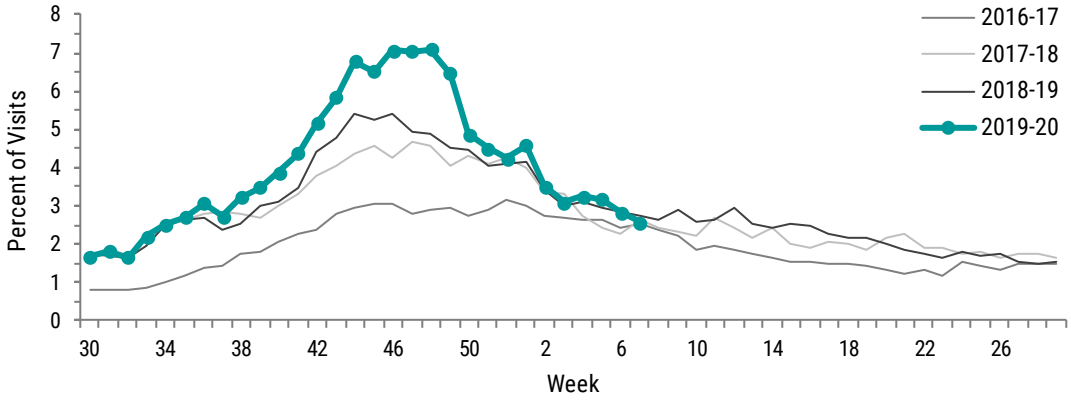
A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

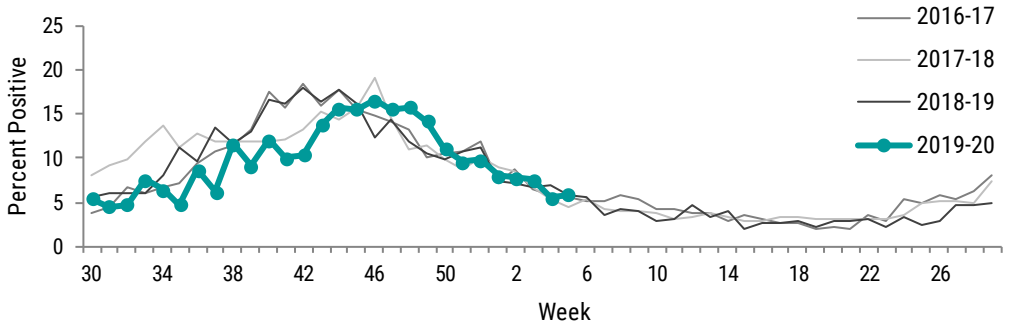
Week 7 (February 9-15, 2020) Activity Summary

In week 7, RSV activity in children <5 years decreased and was similar to levels observed at this time in past seasons.

No new RSV-associated outbreaks were reported in week 7. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 7, **the percent of emergency department and urgent care center visits for RSV among children <5 years decreased** and was similar to levels observed at this time in past seasons.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 7, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

AMERICAN OVERSIGHT

RSV Surveillance

Figure 31: In week 7, **the percent of specimens testing positive for RSV increased.** Levels were similar to those observed at this time in previous seasons.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 7, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Assisted living facility	Citrus	31	0	0	Influenza A unspecified	Yes	Closed
Long-term care facility	Madison	5	3	0	Influenza A 2009 (H1N1)	Yes	Open
Long-term care facility	Monroe	4	2	Unknown	Influenza A unspecified	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=369) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 8, 2020 Florida Flu Review
Date:	Wednesday, February 26, 2020 2:13:11 PM
Attachments:	Week 8, 2020 Florida Flu Review.pdf

Good afternoon!

Attached is the Week 8, 2020 Florida Flu Review.

Week 8 influenza & influenza-like illness (ILI) activity summary:

Activity decreased in week 8 and remained above peak levels observed in the 2016-17 and 2018-19 seasons. Decreases were observed in all regions of the state. Elevated activity is still expected for several more weeks.

Eighteen outbreaks were reported, down from 24 outbreaks in the previous week. Of the 18 outbreaks reported, 12 were influenza-associated and six were ILI.

No new influenza-associated pediatric deaths were reported. Nine influenza-associated pediatric deaths have been reported so far this season; only one child was vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On February 21, 2020, CDC issued interim vaccine effectiveness (VE) estimates for the 2019-20 influenza season. For all ages, the VE was 45% (95% confidence interval [CI] = 36-53%) against any influenza virus illness and was 55% (95% CI = 42-65%) among children six months to 17 years (www.cdc.gov/mmwr/volumes/69/wr/pdfs/mm6907a1-H.pdf).

On January 10, 2020, CDC issued a health advisory reminding clinicians to reiterate vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

AMERICAN OVERSIGHT

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Thank you!

Florida ILI Surveillance System Summary 16

Background

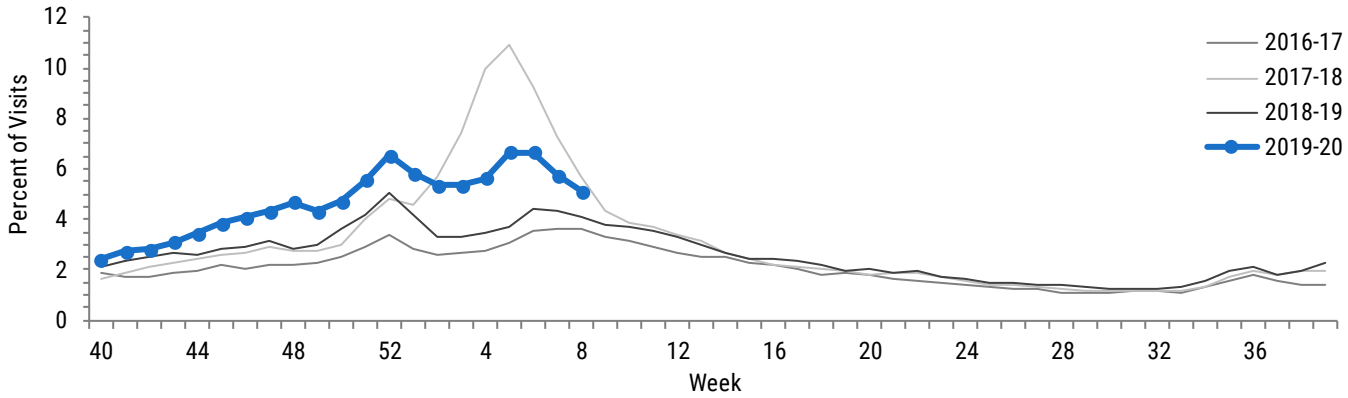
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

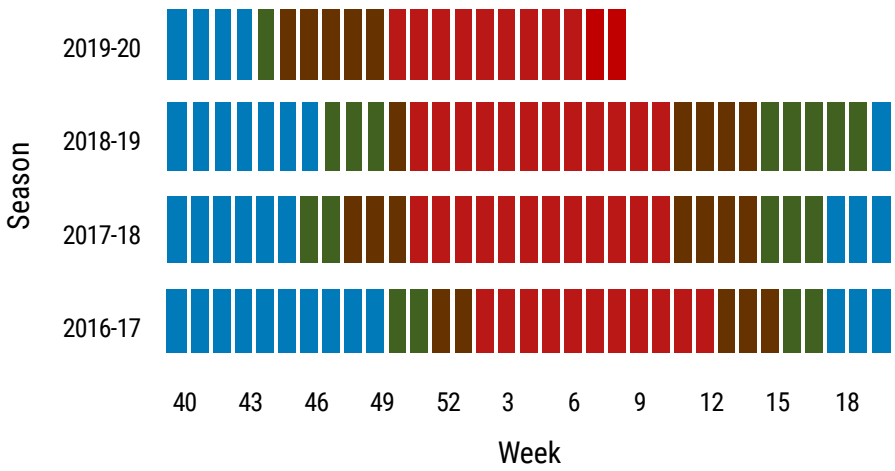
Figure 1: In week 8, **the percent of emergency department and urgent care center visits for ILI statewide decreased** but remained above peak levels observed during the 2018-19 and 2016-17 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=369) statewide for the current season (week 40, 2019 to week 8, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 8, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 8, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

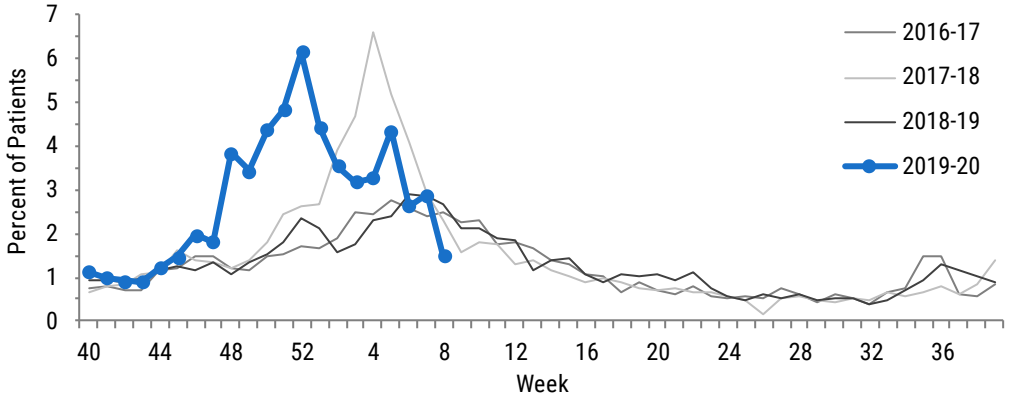
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 8, **the percent of patients with ILI reported by ILINet providers statewide decreased** and was below levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=9), week 40, 2016 to week 8, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



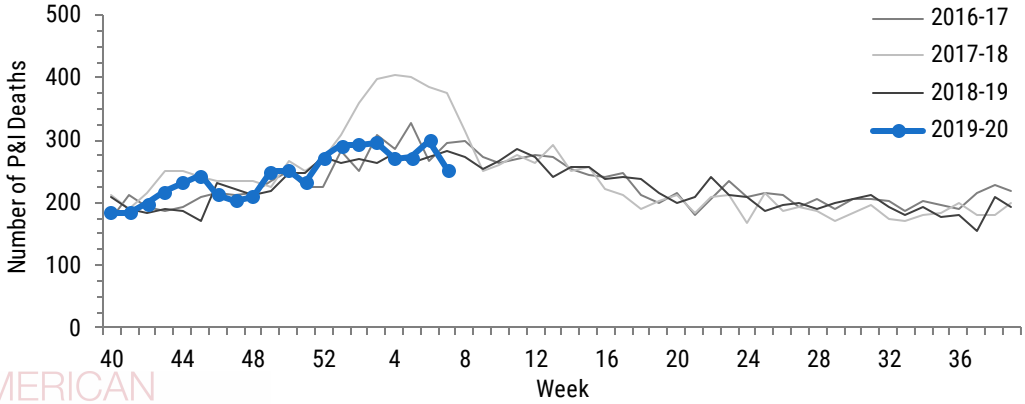


Figure 4: In week 7 (ending 2/15/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 7, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

County Influenza Activity

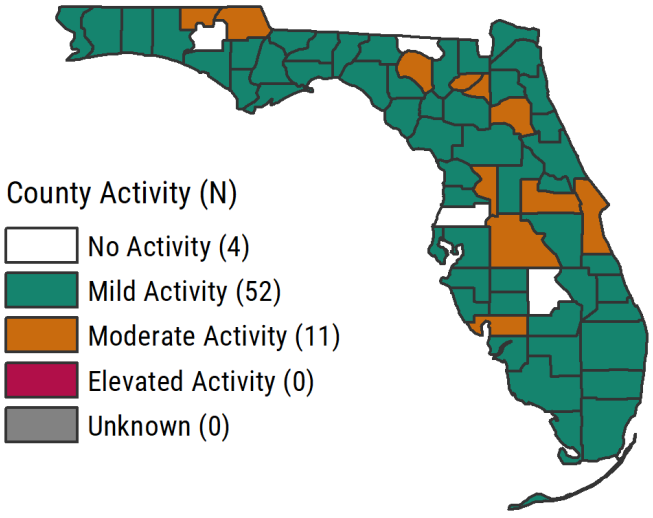
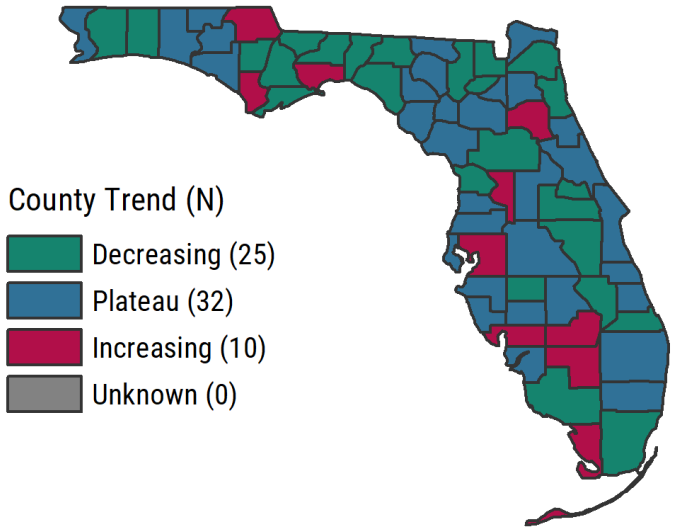
Figure 5: Most counties reported **mild activity** for week 8. Eleven counties reported **moderate activity.**





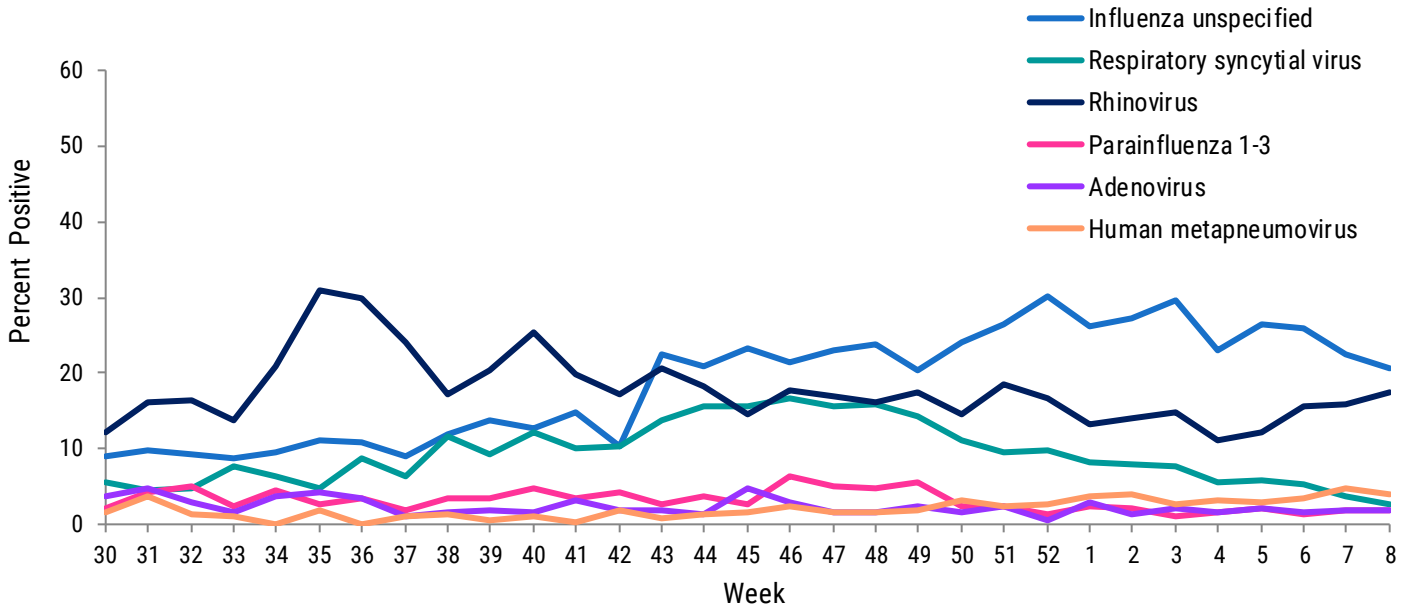


Figure 7: Most counties reported **activity at a plateau** for week 8. Ten counties reported **increasing activity,** and twenty-five counties reported **decreasing activity.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 8, the **percent of specimens testing positive for influenza decreased** but remained higher than other respiratory viruses under surveillance. The **percent of specimens testing positive for rhinovirus** increased notably in recent weeks.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=9), week 40, 2019 to week 8, 2020.

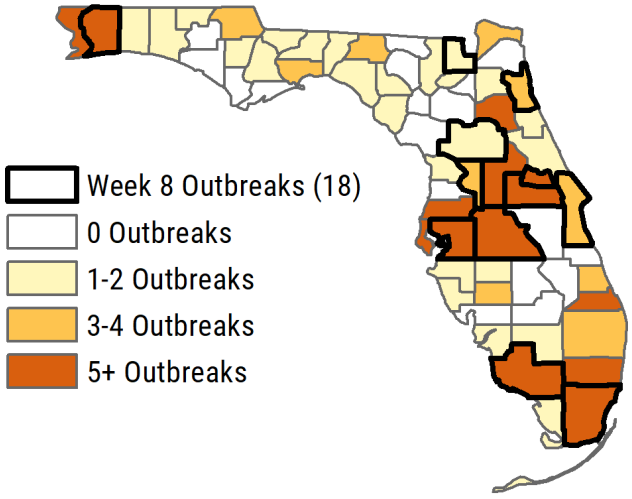
AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

Week 8 Outbreaks at a Glance:

Number Reported:
18 Outbreaks

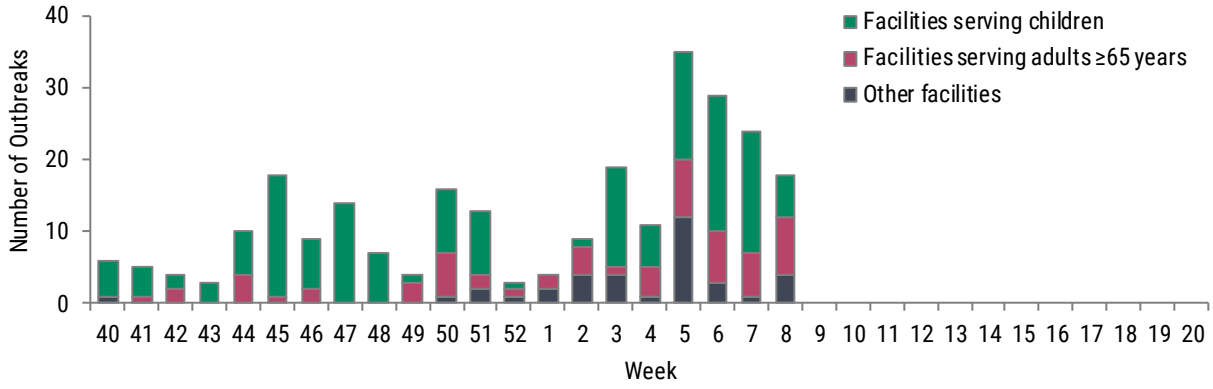
Influenza-Associated:
12 Outbreaks



Severe Outcomes*:
4 Outbreaks

Outbreak Summary:

In week 8, 12 influenza-associated and six ILI outbreaks were reported, a decrease from the previous week.



Severe outcomes* were reported in four of 18 outbreaks. One or more hospitalizations were reported in each of these four outbreaks. One death was reported.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 8, all four outbreaks with severe outcomes were in facilities serving adults aged ≥65 years.

▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 8 are **outlined in bold.**

Figure 9: In week 8, **eight outbreaks** were reported in **facilities serving adults aged ≥65 years, six outbreaks** were reported in **facilities serving children,** and **four outbreaks** were reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 8, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 8, **62.8% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 8, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

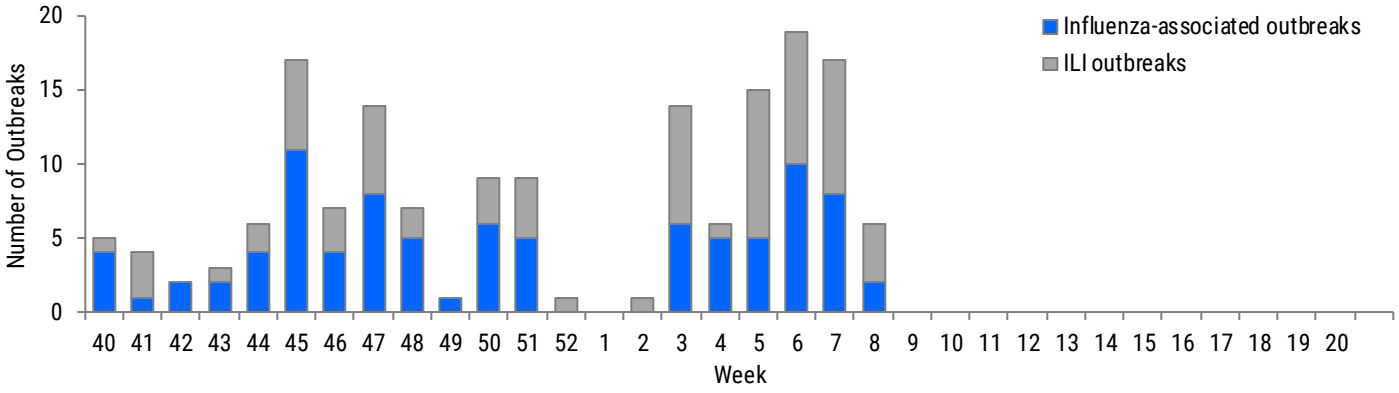
*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

Facilities Serving Children*:



6 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

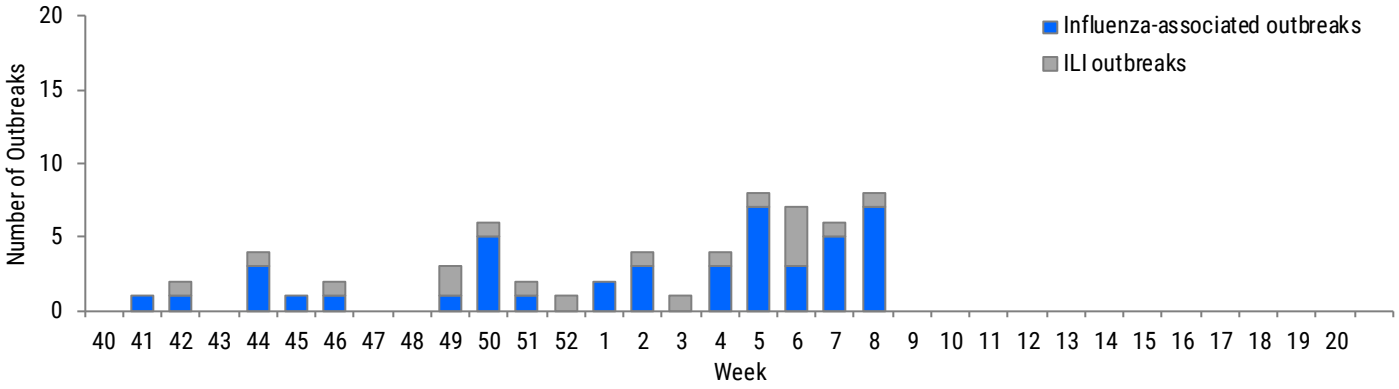
In week 8, six new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 8, **two influenza-associated outbreaks** and **four ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 8, 2020.

Facilities Serving Adults ≥65 yrs.**:



8 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 8, eight new outbreaks of influenza or ILI were reported in facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

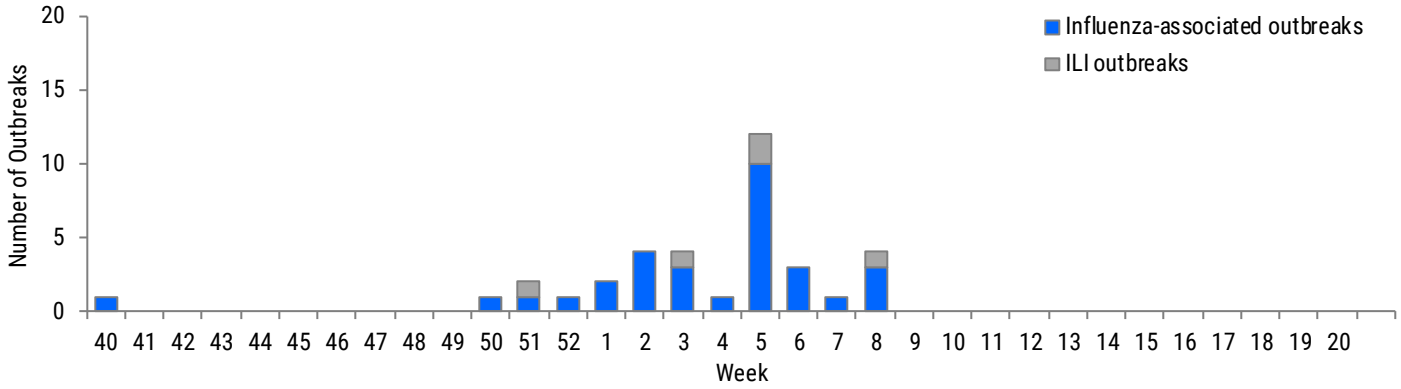
Figure 12: In week 8, **seven influenza-associated outbreaks** and **one ILI outbreak** were reported in **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 8, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

Other Facilities*:



4 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 8, four new outbreaks of influenza or ILI were reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 8, **three influenza-associated outbreaks** and **one ILI outbreak** were reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 8, 2020.

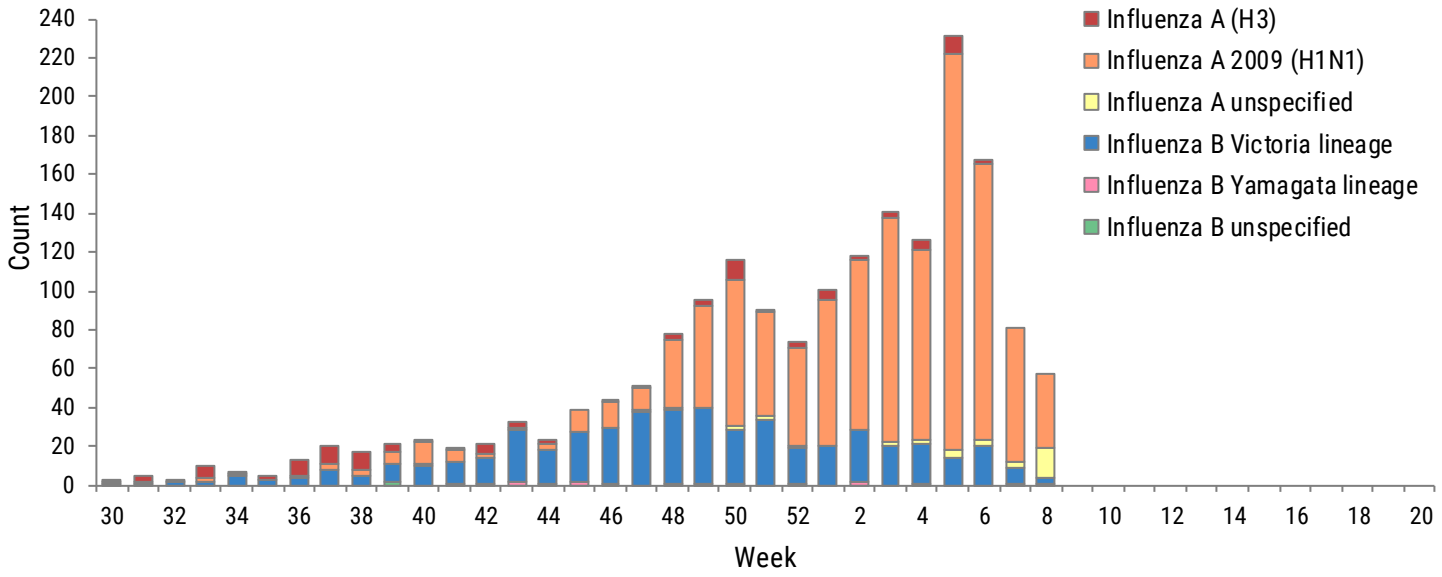


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

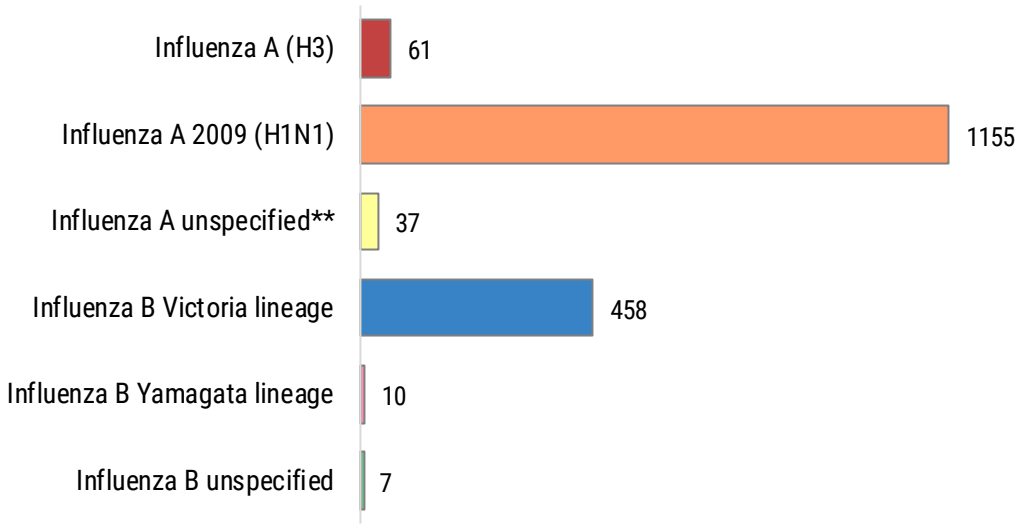
Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	126 (48.3%)	74 influenza-associated outbreaks 52 ILI outbreaks
Child daycares	37 (14.2%)	15 influenza-associated outbreaks 22 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	18 (6.9%)	8 influenza-associated outbreaks 10 ILI outbreaks
Nursing facilities	15 (5.8%)	12 influenza-associated outbreaks 3 ILI outbreaks
Other long-term care facilities	29 (11.1%)	24 influenza-associated outbreaks 5 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	30 (11.5%)	27 influenza-associated outbreaks 3 ILI outbreak
Hospitals	2 (0.8%)	2 influenza-associated outbreaks 0 ILI outbreaks
Additional facility types	4 (1.5%)	1 influenza-associated outbreak 2 ILI outbreaks
Total	**261 (100.0%)**	**164 influenza-associated outbreaks** **97 ILI outbreaks**

AMERICAN OVERSIGHT



Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 8, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 8, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=369) from week 40, 2016 to week 8, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity decreased** during week 8 and was above peak activity observed during the 2016-17 season.

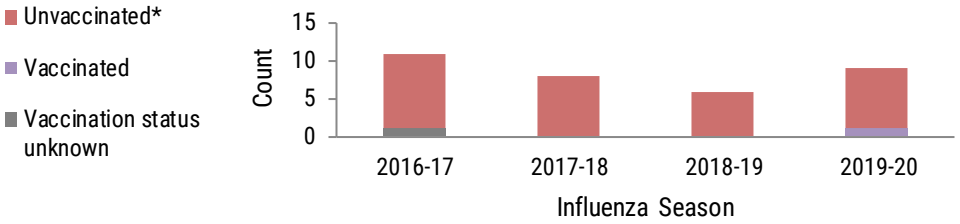
AMERICAN OVERSIGHT

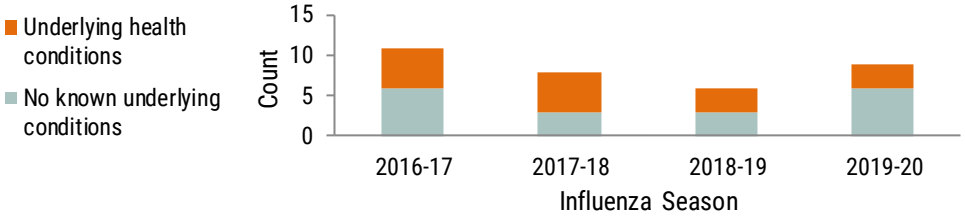
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 8, **the percent of emergency department and urgent care center visits for ILI in children <18 years decreased** and was above levels observed at this time during the 2018-19 and 2016-17 seasons.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 8, 2020.

Figures 25-26: In week 8, **no new influenza-associated pediatric deaths were reported**. A total of nine influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 8, 2020.

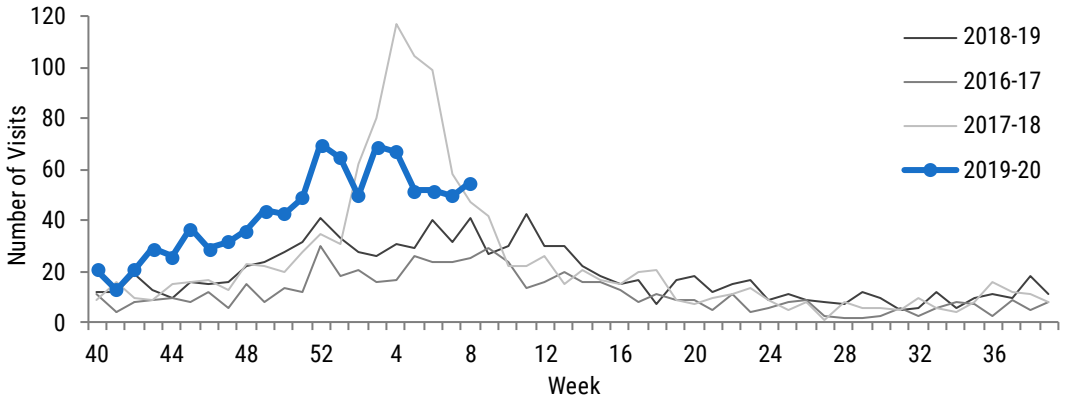
▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 8, 2020.

In week 8, **no new influenza-associated pediatric deaths were reported**.

A total of nine influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm.



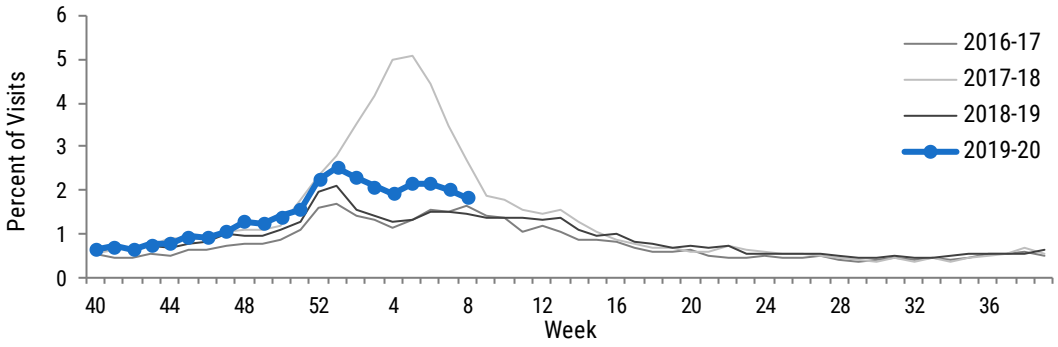
AMERICAN OVERSIGHT

At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 8, the **number of emergency department and urgent care center visits for influenza among pregnant women increased** and was above levels observed at this time in past seasons.



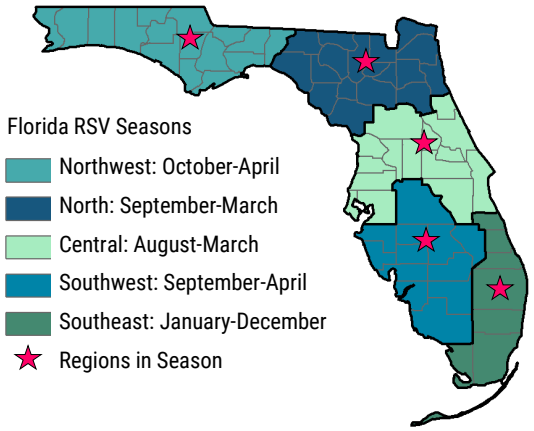
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 8, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 8, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years decreased** and was above levels observed at this time during the 2018-19 and 2016-17 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 8, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

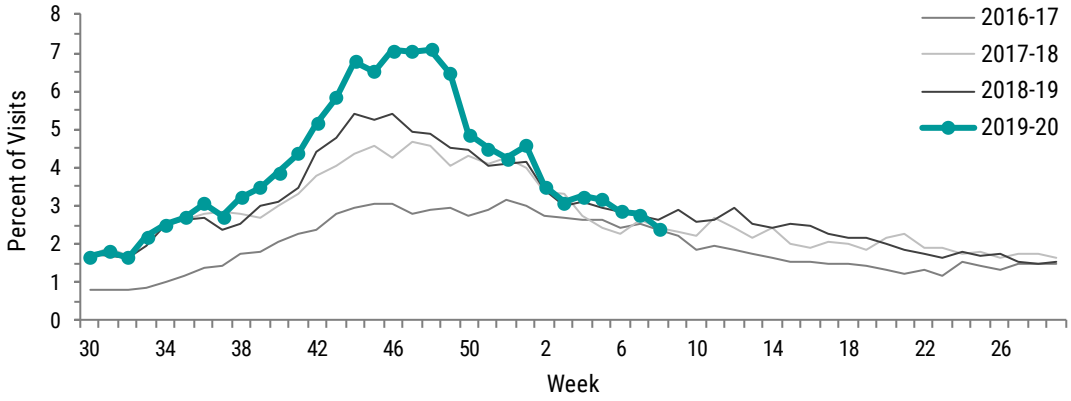
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

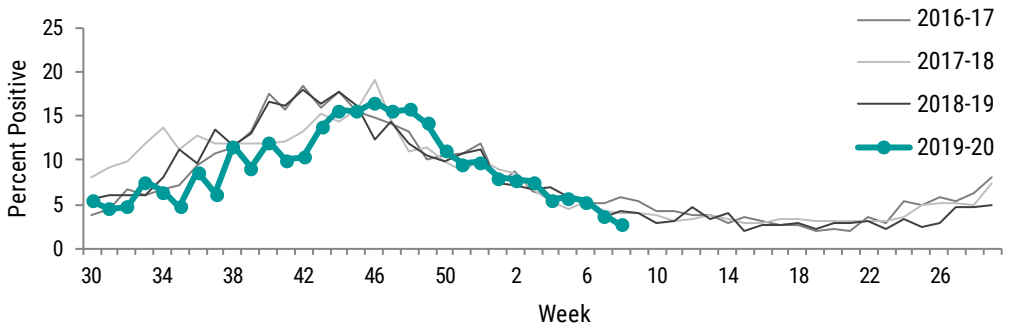
Week 8 (February 16-22, 2020) Activity Summary

In week 8, RSV activity in children <5 years decreased and was similar to levels observed at this time in past seasons.

No new RSV-associated outbreaks were reported in week 8. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 8, **the percent of emergency department and urgent care center visits for RSV among children <5 years decreased** and was similar to levels observed at this time in past seasons.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 8, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

AMERICAN OVERSIGHT

RSV Surveillance

Figure 31: In week 8, **the percent of specimens testing positive for RSV decreased.** Levels were slightly below those observed at this time in previous seasons.

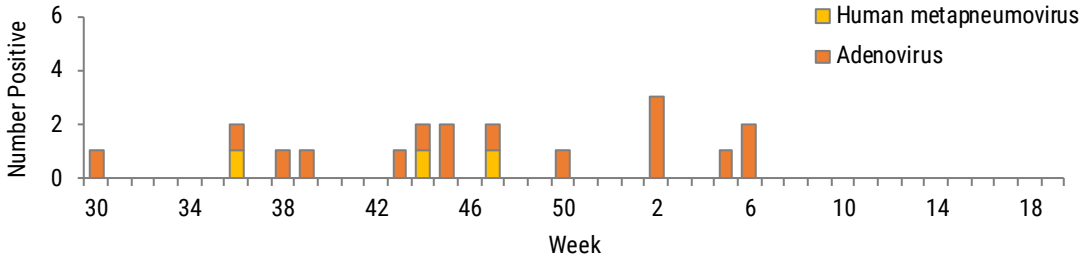

Figure 36* shows **the ▶ number of PCR-positive laboratory findings for parainfluenza 1-3** by week** among specimens submitted to BPHL for extended respiratory panel testing.

◀ **Figure 37*** shows **the number of PCR-positive laboratory findings for seasonal coronaviruses NL63, HKU1, OC43, and 229E** by week** among specimens submitted to BPHL for extended respiratory panel testing.

Figure 38* shows **the ▶ number of PCR-positive laboratory findings for human metapneumovirus and adenovirus** by week** among specimens submitted to BPHL for extended respiratory panel testing.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 8, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Nursing home	Santa Rosa	54	Unknown	Unknown	Influenza A unspecified	Yes	Open
Assisted living facility	Polk	2	2	0	Influenza A unspecified	Yes	Closed
Assisted living facility	Sumter	8	4	0	Influenza A 2009 (H1N1)	Yes	Open
Assisted living facility	Seminole	12	3	1	Influenza A 2009 (H1N1)	Yes	Closed
Correctional facility	Sumter	40	Unknown	Unknown	Influenza A unspecified	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=369) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Attachments:	Week 8, 2020 Florida Flu Review.pdf

Good afternoon!

Attached is the Week 8, 2020 Florida Flu Review.

Week 8 influenza & influenza-like illness (ILI) activity summary:

Activity decreased in week 8 and remained above peak levels observed in the 2016-17 and 2018-19 seasons. Decreases were observed in all regions of the state. Elevated activity is still expected for several more weeks.

Eighteen outbreaks were reported, down from 24 outbreaks in the previous week. Of the 18 outbreaks reported, 12 were influenza-associated and six were ILI.

No new influenza-associated pediatric deaths were reported. Nine influenza-associated pediatric deaths have been reported so far this season; only one child was vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On February 21, 2020, CDC issued interim vaccine effectiveness (VE) estimates for the 2019-20 influenza season. For all ages, the VE was 45% (95% confidence interval [CI] = 36-53%) against any influenza virus illness and was 55% (95% CI = 42-65%) among children six months to 17 years (www.cdc.gov/mmwr/volumes/69/wr/pdfs/mm6907a1-H.pdf).

On January 10, 2020, CDC issued a health advisory reminding clinicians to reiterate vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

AMERICAN OVERSIGHT

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Thank you!

Florida ILI Surveillance System Summary 16

Background

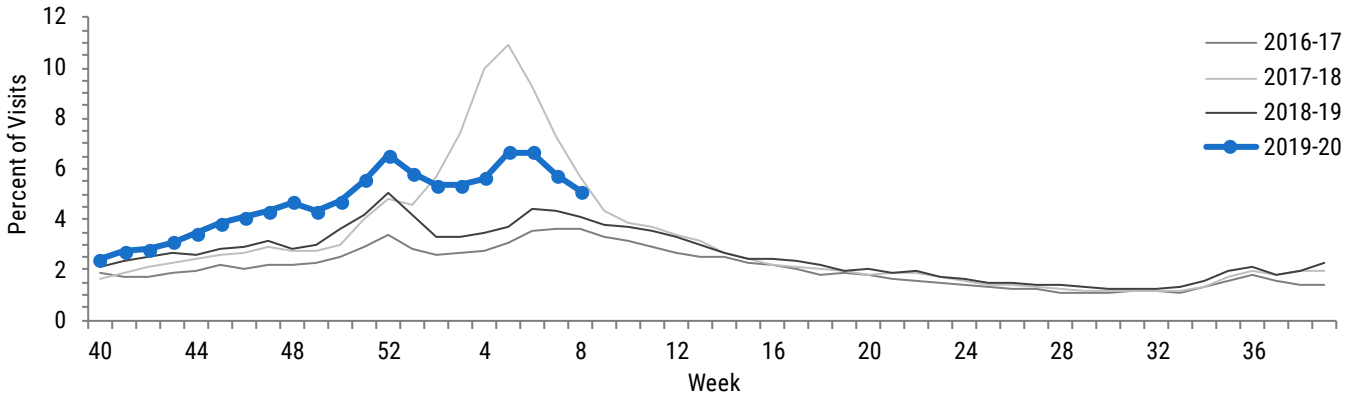
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



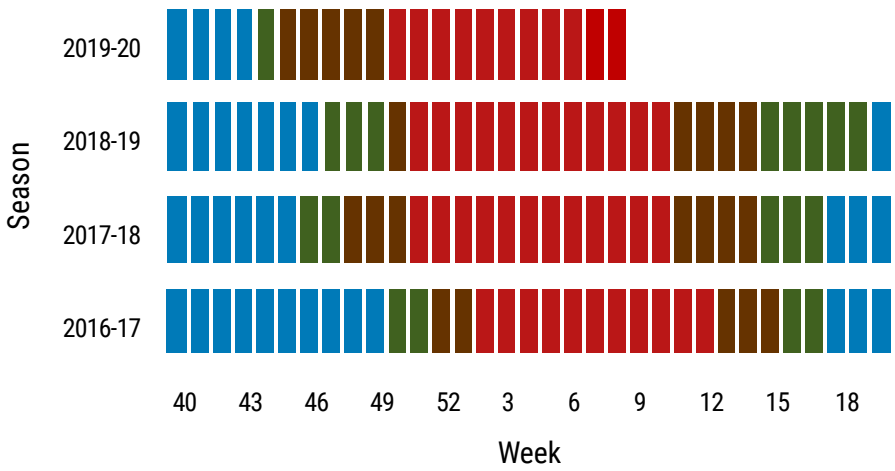
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 8, **the percent of emergency department and urgent care center visits for ILI statewide decreased** but remained above peak levels observed during the 2018-19 and 2016-17 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=369) statewide for the current season (week 40, 2019 to week 8, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 8, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 8, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

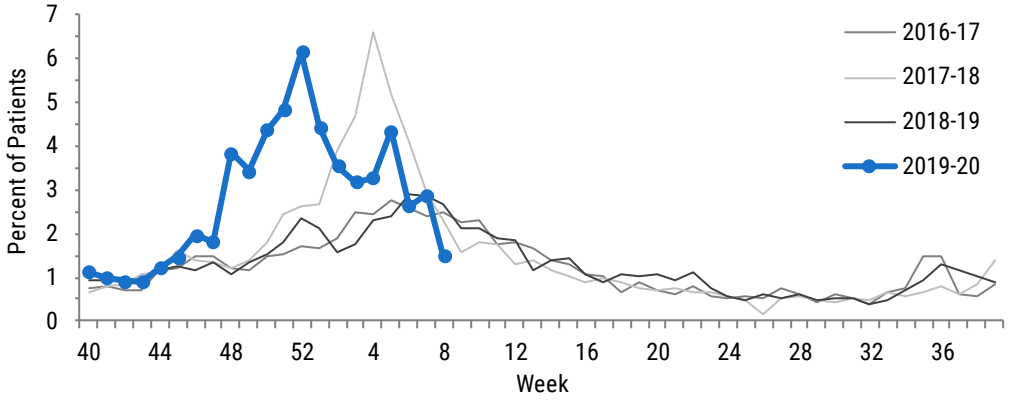
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 8, **the percent of patients with ILI reported by ILINet providers statewide decreased** and was below levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=9), week 40, 2016 to week 8, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



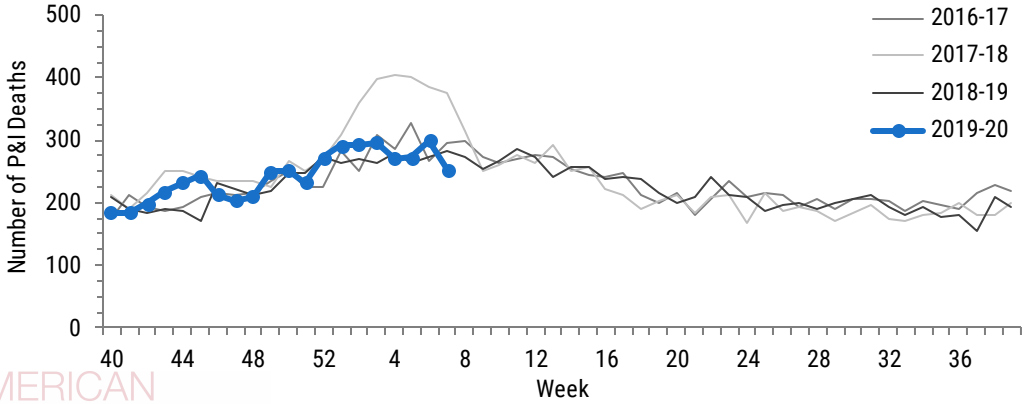


Figure 4: In week 7 (ending 2/15/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was below levels observed at this time in previous seasons.

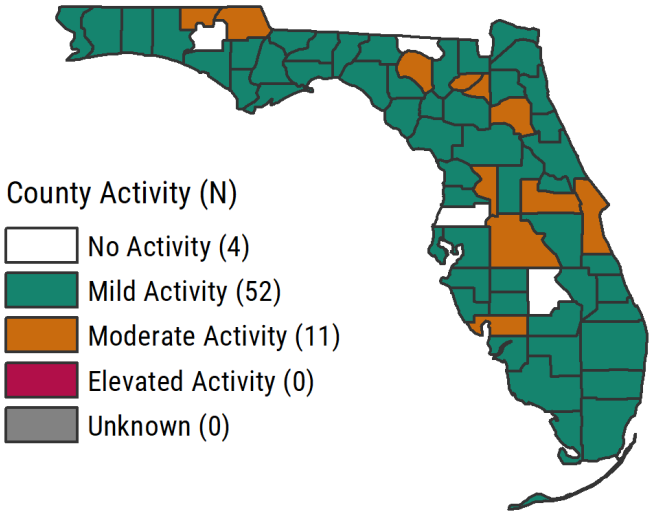
◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 7, 2020.

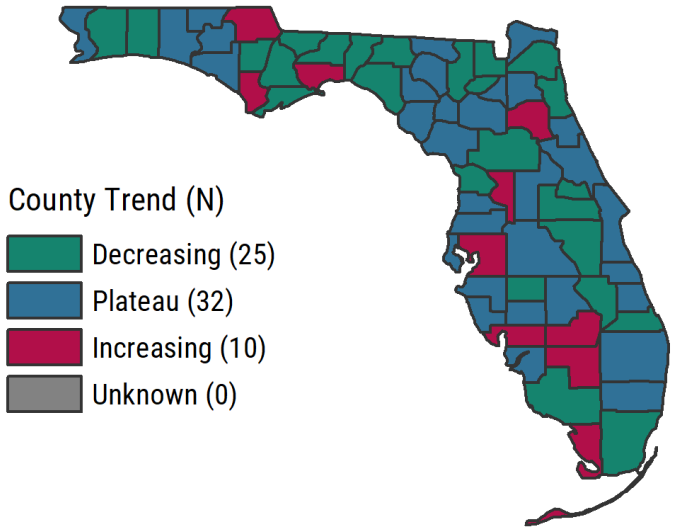
*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 8. Eleven counties reported **moderate activity.**





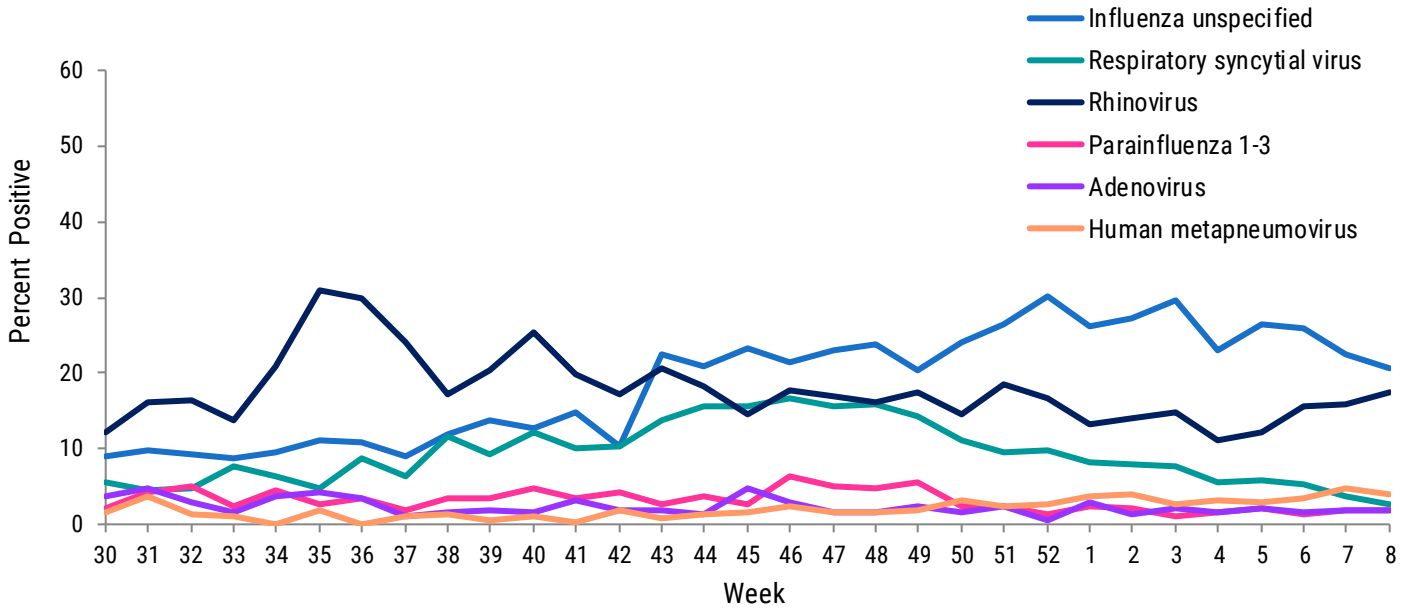


Figure 7: Most counties reported **activity at a plateau** for week 8. Ten counties reported **increasing activity,** and twenty-five counties reported **decreasing activity.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 8, the **percent of specimens testing positive for influenza** **decreased** but remained higher than other respiratory viruses under surveillance. The **percent of specimens testing positive for rhinovirus** increased notably in recent weeks.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=9), week 40, 2019 to week 8, 2020.

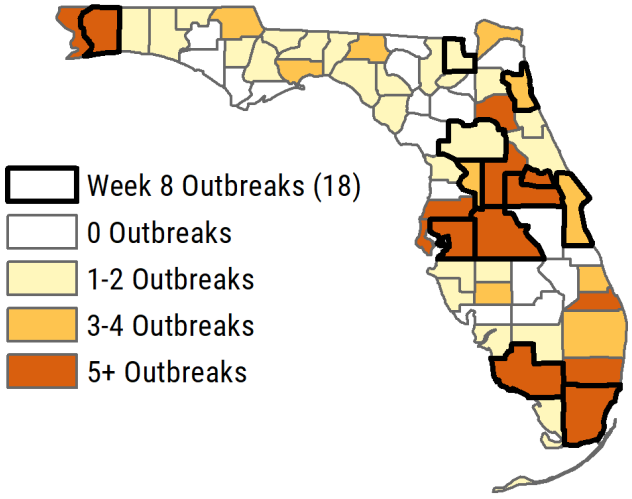
AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

Week 8 Outbreaks at a Glance:

Number Reported:
18 Outbreaks

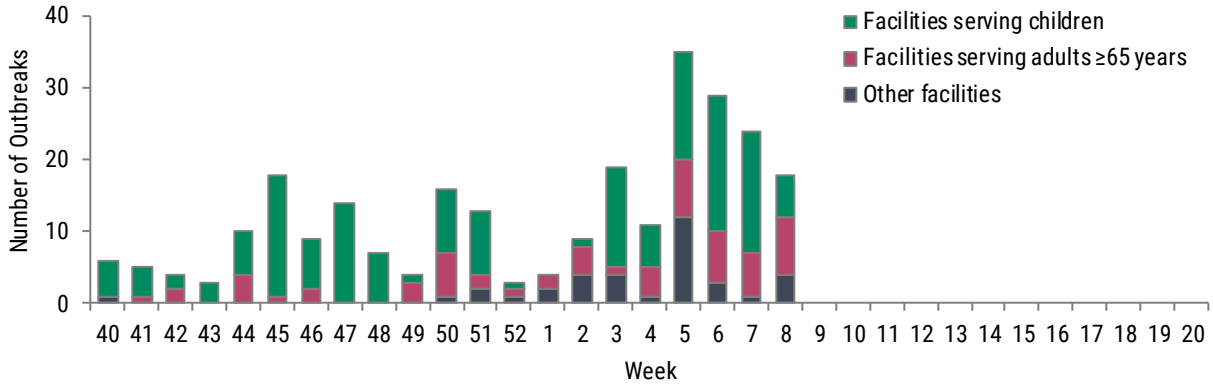
Influenza-Associated:
12 Outbreaks



Severe Outcomes*:
4 Outbreaks

Outbreak Summary:

In week 8, 12 influenza-associated and six ILI outbreaks were reported, a decrease from the previous week.



Severe outcomes* were reported in four of 18 outbreaks. One or more hospitalizations were reported in each of these four outbreaks. One death was reported.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 8, all four outbreaks with severe outcomes were in facilities serving adults aged ≥65 years.

▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 8 are **outlined in bold.**

Figure 9: In week 8, **eight outbreaks** were reported in **facilities serving adults aged ≥65 years, six outbreaks** were reported in **facilities serving children,** and **four outbreaks** were reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 8, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 8, **62.8% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 8, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

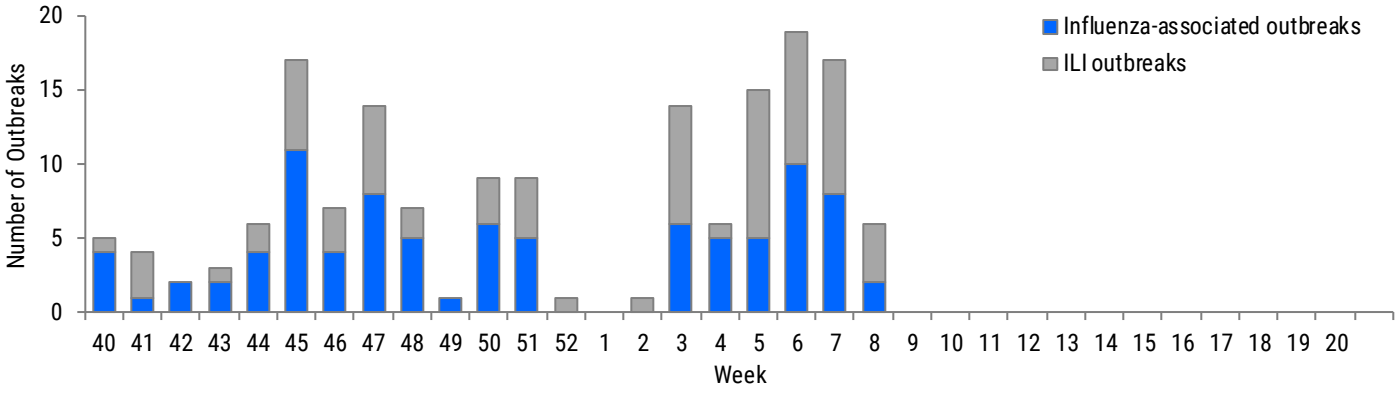
*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

Facilities Serving Children*:



6 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

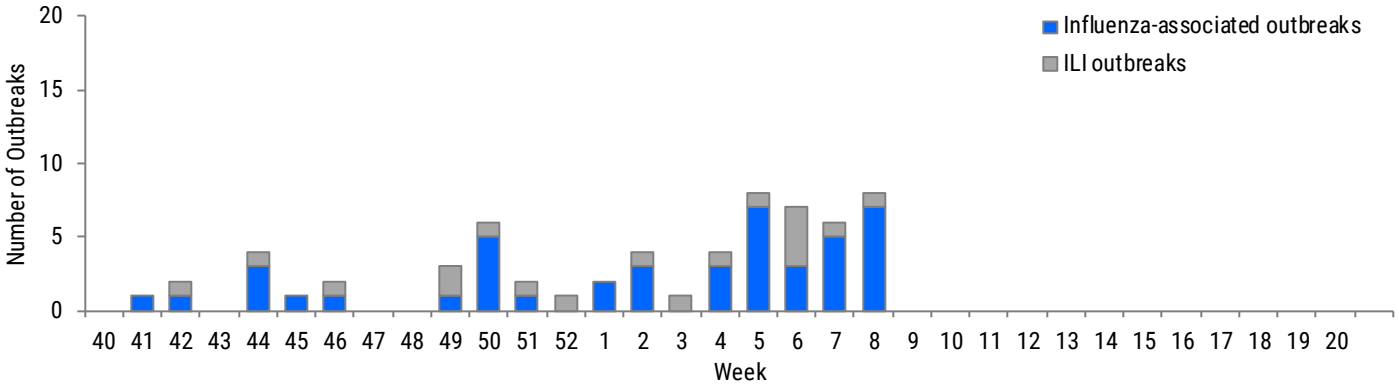
In week 8, six new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 8, **two influenza-associated outbreaks** and **four ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 8, 2020.

Facilities Serving Adults ≥65 yrs.**:



8 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 8, eight new outbreaks of influenza or ILI were reported in facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

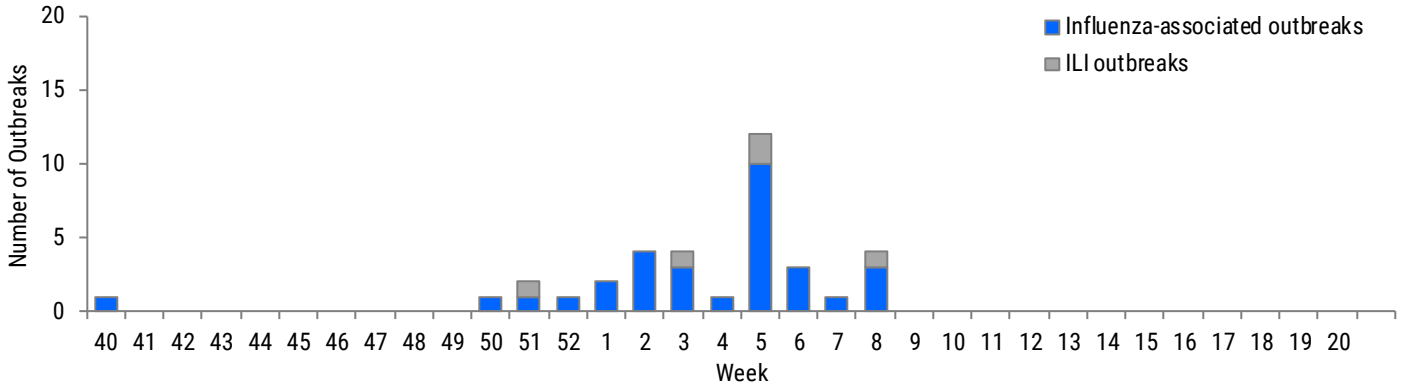
Figure 12: In week 8, **seven influenza-associated outbreaks** and **one ILI outbreak** were reported in **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 8, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

Other Facilities*:



4 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 8, four new outbreaks of influenza or ILI were reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 8, **three influenza-associated outbreaks** and **one ILI outbreak** were reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 8, 2020.

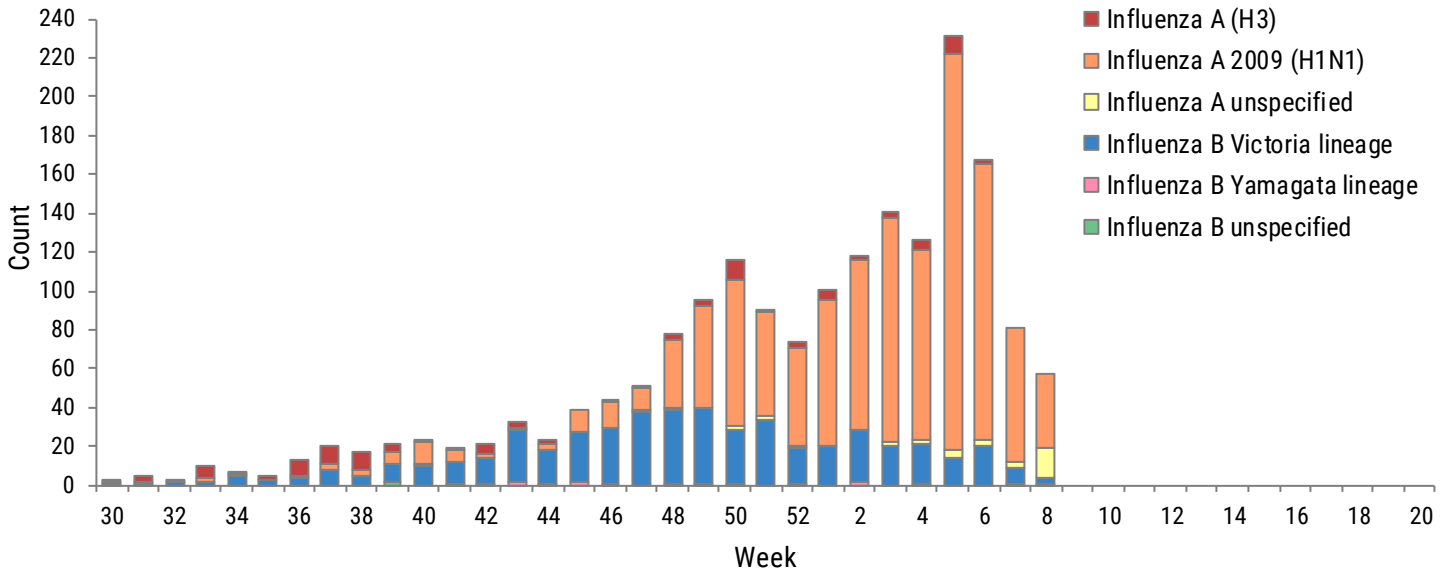


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

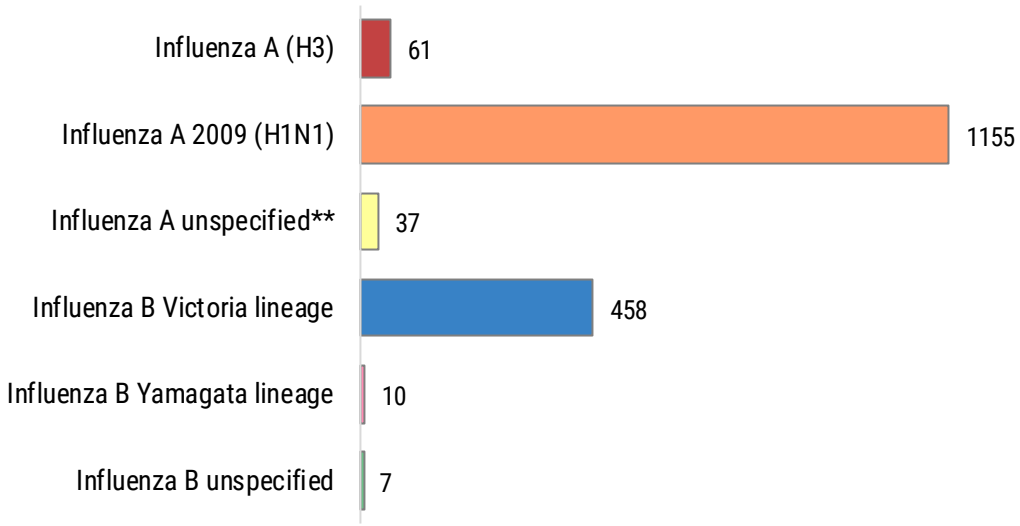
Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	126 (48.3%)	74 influenza-associated outbreaks 52 ILI outbreaks
Child daycares	37 (14.2%)	15 influenza-associated outbreaks 22 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	18 (6.9%)	8 influenza-associated outbreaks 10 ILI outbreaks
Nursing facilities	15 (5.8%)	12 influenza-associated outbreaks 3 ILI outbreaks
Other long-term care facilities	29 (11.1%)	24 influenza-associated outbreaks 5 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	30 (11.5%)	27 influenza-associated outbreaks 3 ILI outbreak
Hospitals	2 (0.8%)	2 influenza-associated outbreaks 0 ILI outbreaks
Additional facility types	4 (1.5%)	1 influenza-associated outbreak 2 ILI outbreaks
Total	**261 (100.0%)**	**164 influenza-associated outbreaks** **97 ILI outbreaks**

AMERICAN OVERSIGHT



Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 8, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 8, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=369) from week 40, 2016 to week 8, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity decreased** during week 8 and was above peak activity observed during the 2016-17 season.

AMERICAN OVERSIGHT

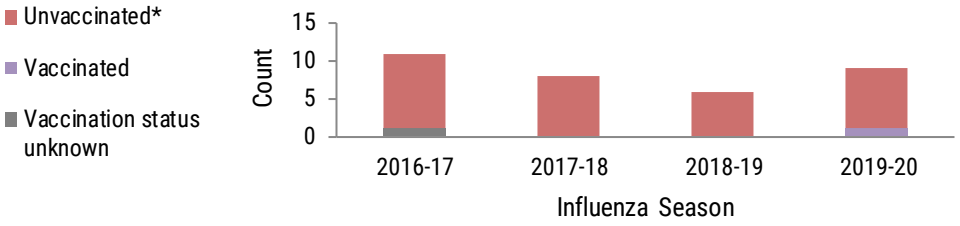
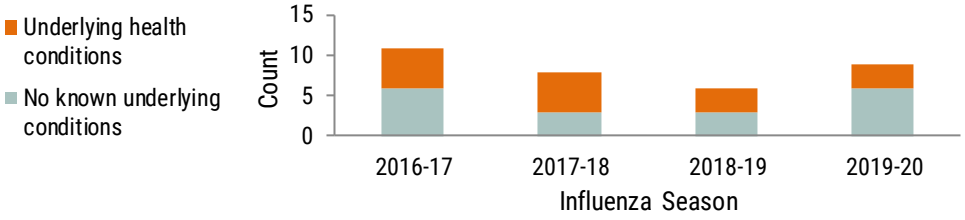
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 8, **the percent of emergency department and urgent care center visits for ILI in children <18 years decreased** and was above levels observed at this time during the 2018-19 and 2016-17 seasons.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 8, 2020.

Figures 25-26: In week 8, **no new influenza-associated pediatric deaths were reported**. A total of nine influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 8, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 8, 2020.

In week 8, **no new influenza-associated pediatric deaths were reported**.

A total of nine influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm.

AMERICAN OVERSIGHT

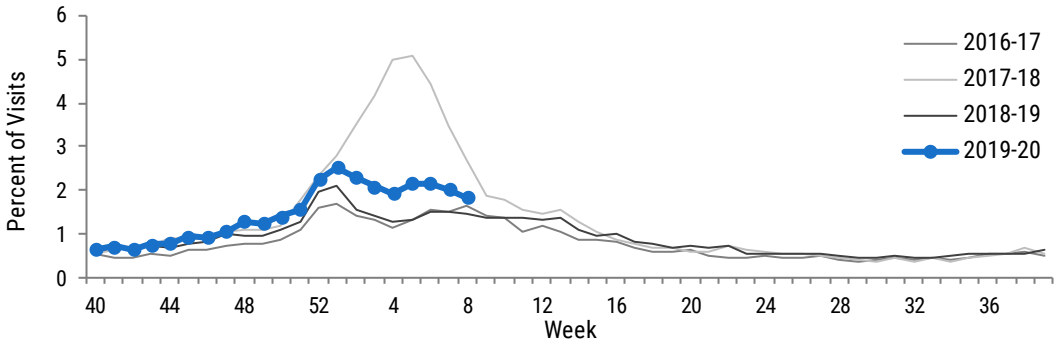
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 8, the **number of emergency department and urgent care center visits for influenza among pregnant women increased** and was above levels observed at this time in past seasons.



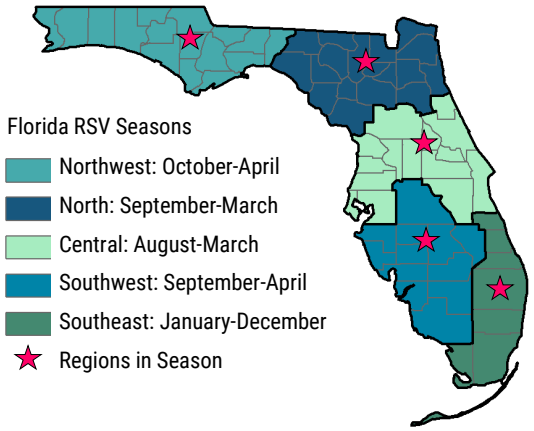
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 8, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 8, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years decreased** and was above levels observed at this time during the 2018-19 and 2016-17 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 8, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

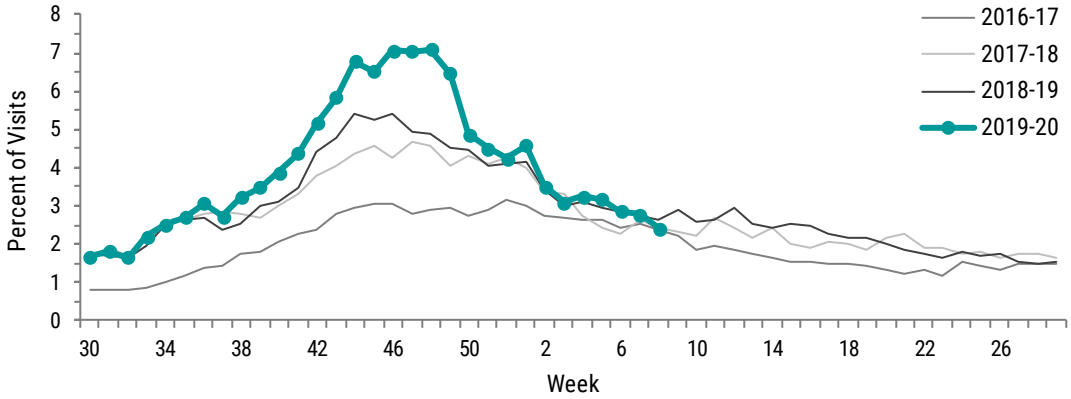
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

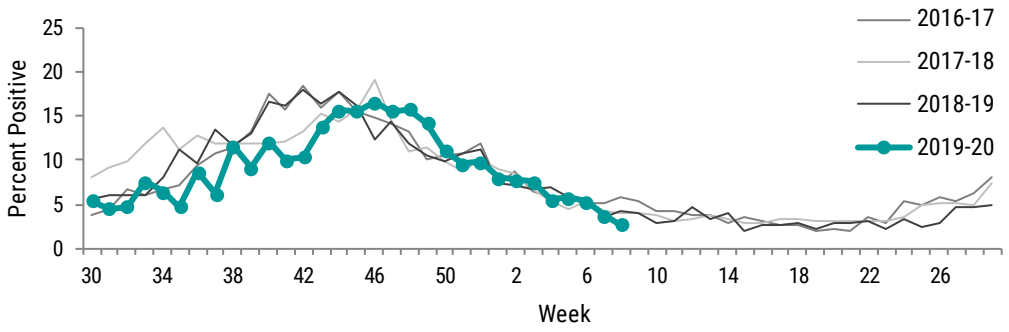
Week 8 (February 16-22, 2020) Activity Summary

In week 8, RSV activity in children <5 years decreased and was similar to levels observed at this time in past seasons.

No new RSV-associated outbreaks were reported in week 8. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 8, **the percent of emergency department and urgent care center visits for RSV among children <5 years decreased** and was similar to levels observed at this time in past seasons.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 8, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

RSV-Associated Outbreaks in Week 8:

0 Outbreaks

Summary of RSV-Associated Outbreaks:

In week 8, no new RSV-associated outbreaks were reported. Since week 30, 2019, nine RSV-associated outbreaks have been reported.

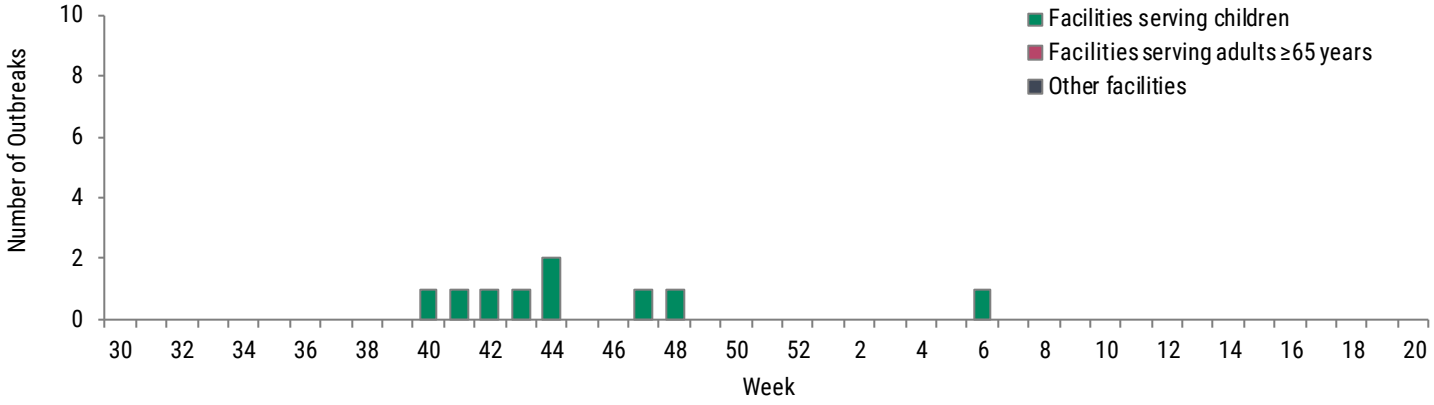

Figure 32: In week 8, no new RSV-associated outbreaks were reported. Since week 30, outbreaks have been reported in Florida's southeast, central, and northwest regions.

◀ **Figure 32** shows **a summary of RSV-associated outbreaks by region*** as reported by county health departments in Merlin, week 30, 2019 to week 8, 2020.

*Regions defined in figure 29.

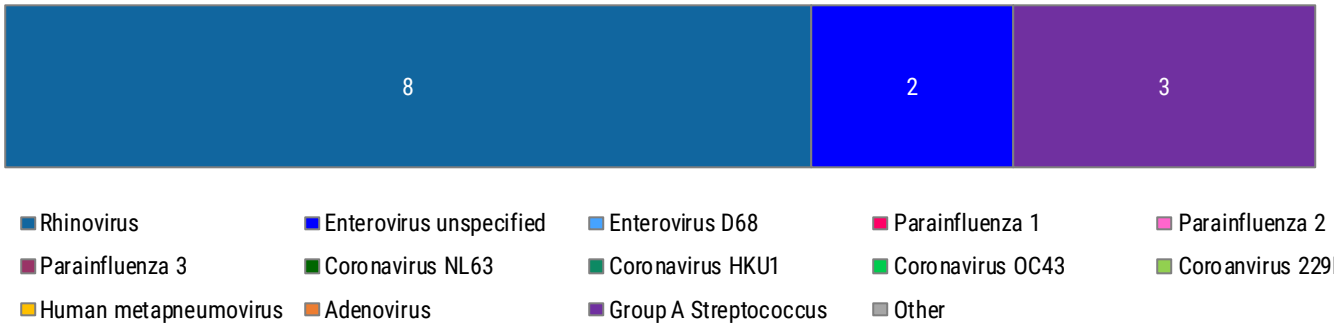

Figure 33: In week 8, no new RSV-associated outbreaks were reported. All of the outbreaks reported since week 30 have been reported in **facilities serving children.**

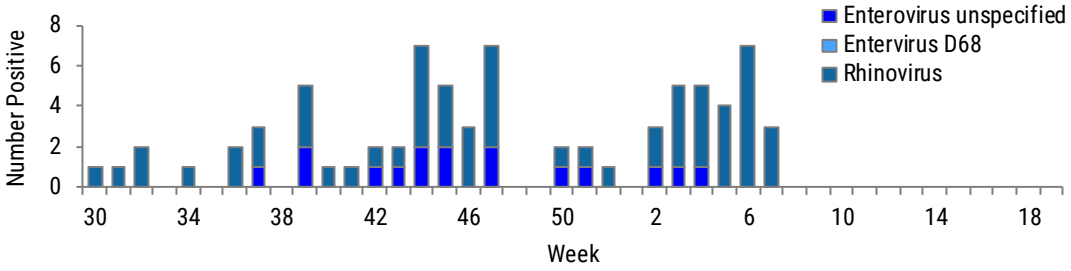

▲ **Figure 33** shows **the number of RSV-associated outbreaks by setting and week** as reported by county health departments in Merlin, week 30, 2019 to week 8, 2020.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 8, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Nursing home	Santa Rosa	54	Unknown	Unknown	Influenza A unspecified	Yes	Open
Assisted living facility	Polk	2	2	0	Influenza A unspecified	Yes	Closed
Assisted living facility	Sumter	8	4	0	Influenza A 2009 (H1N1)	Yes	Open
Assisted living facility	Seminole	12	3	1	Influenza A 2009 (H1N1)	Yes	Closed
Correctional facility	Sumter	40	Unknown	Unknown	Influenza A unspecified	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=369) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Attachments:	Week 8, 2020 Florida Flu Review.pdf

Good afternoon!

Attached is the Week 8, 2020 Florida Flu Review.

Week 8 influenza & influenza-like illness (ILI) activity summary:

Activity decreased in week 8 and remained above peak levels observed in the 2016-17 and 2018-19 seasons. Decreases were observed in all regions of the state. Elevated activity is still expected for several more weeks.

Eighteen outbreaks were reported, down from 24 outbreaks in the previous week. Of the 18 outbreaks reported, 12 were influenza-associated and six were ILI.

No new influenza-associated pediatric deaths were reported. Nine influenza-associated pediatric deaths have been reported so far this season; only one child was vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On February 21, 2020, CDC issued interim vaccine effectiveness (VE) estimates for the 2019-20 influenza season. For all ages, the VE was 45% (95% confidence interval [CI] = 36-53%) against any influenza virus illness and was 55% (95% CI = 42-65%) among children six months to 17 years (www.cdc.gov/mmwr/volumes/69/wr/pdfs/mm6907a1-H.pdf).

On January 10, 2020, CDC issued a health advisory reminding clinicians to reiterate vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

AMERICAN OVERSIGHT

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Thank you!

Florida ILI Surveillance System Summary 16

Background

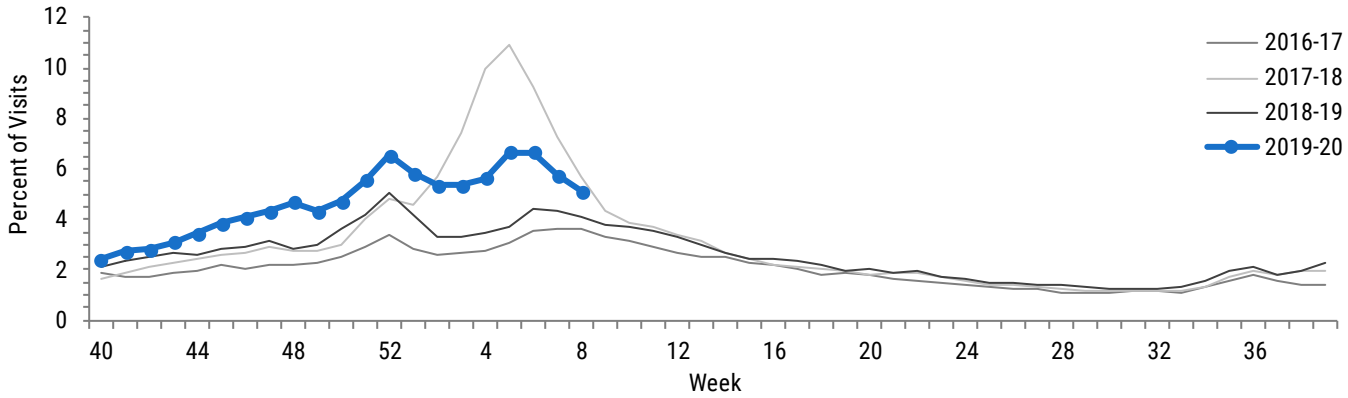
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



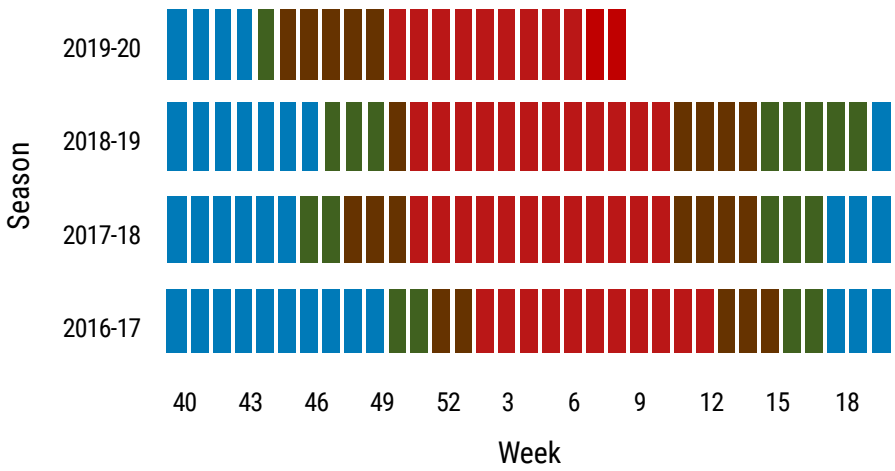
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 8, **the percent of emergency department and urgent care center visits for ILI statewide decreased** but remained above peak levels observed during the 2018-19 and 2016-17 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=369) statewide for the current season (week 40, 2019 to week 8, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 8, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 8, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

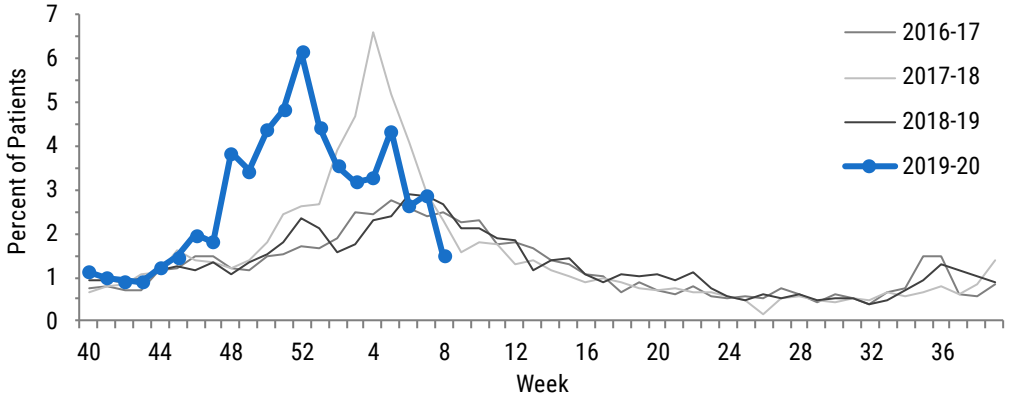
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 8, **the percent of patients with ILI reported by ILINet providers statewide decreased** and was below levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=9), week 40, 2016 to week 8, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



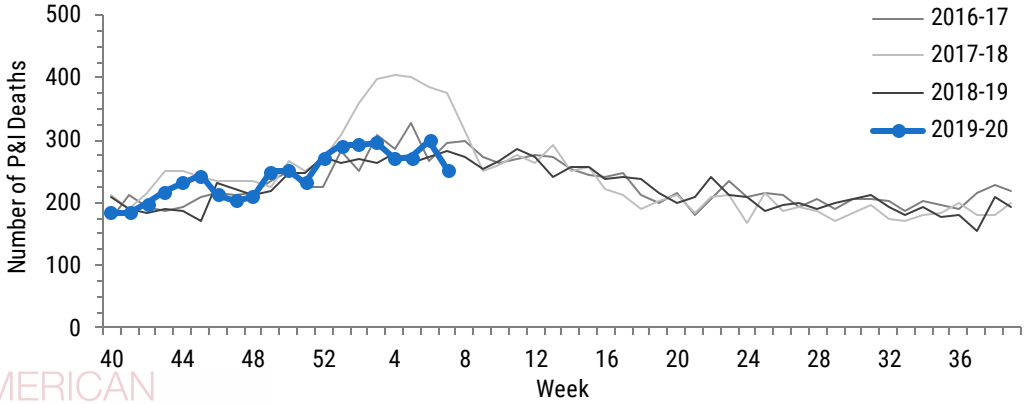


Figure 4: In week 7 (ending 2/15/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 7, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

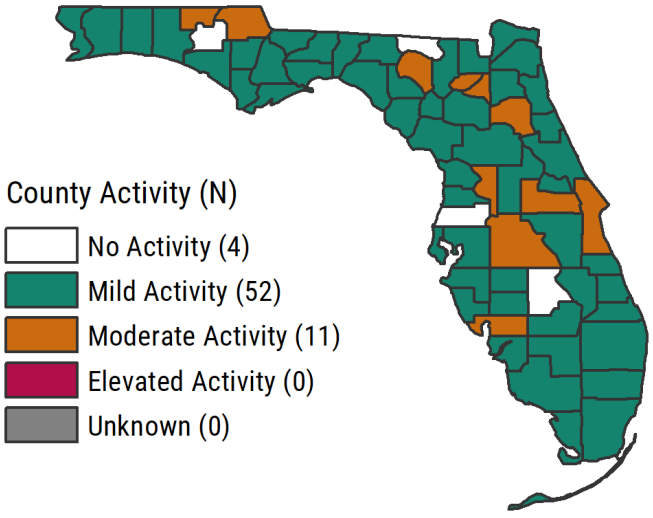
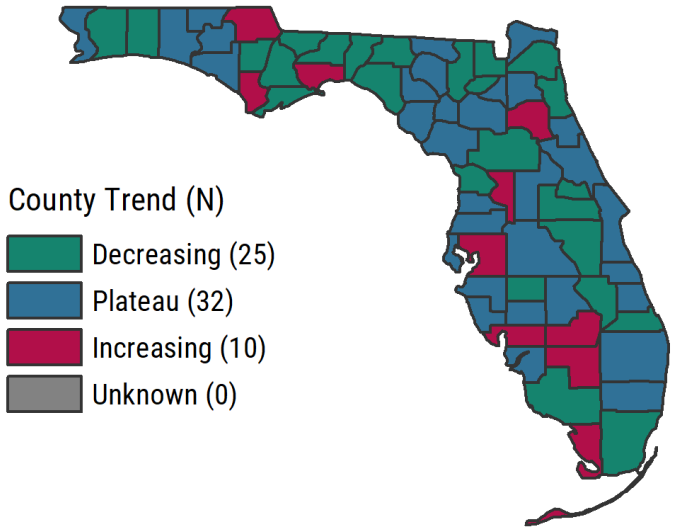
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 8. Eleven counties reported **moderate activity.**





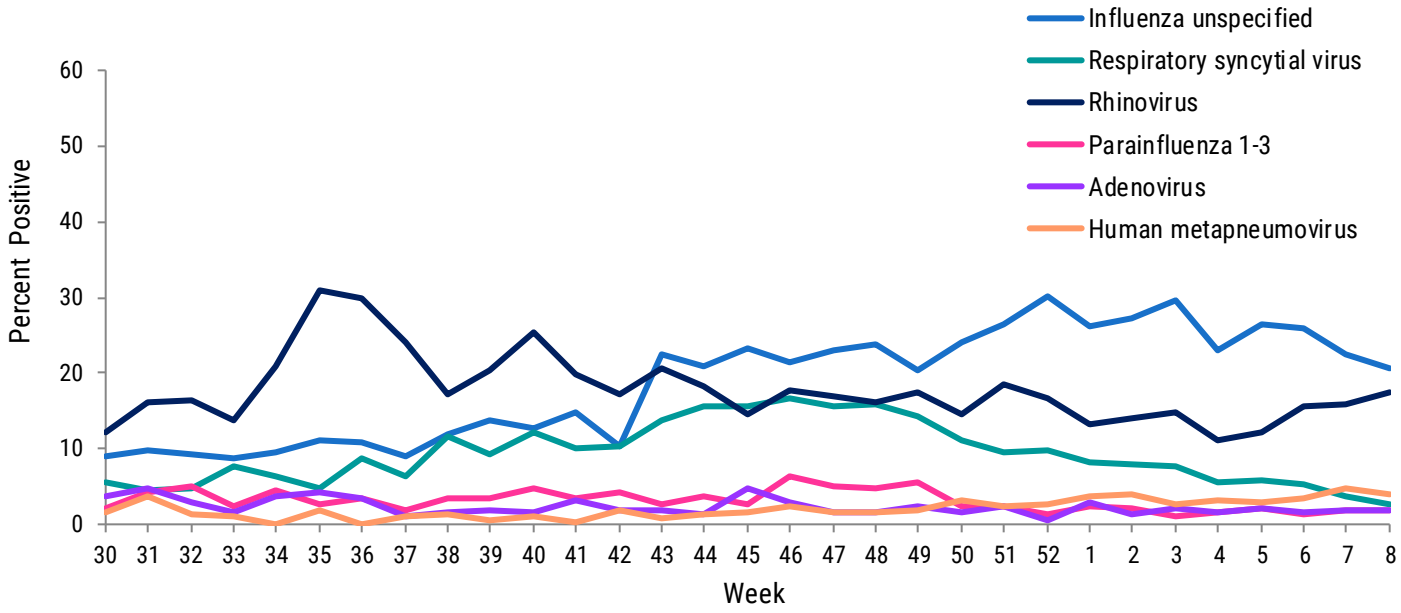


Figure 7: Most counties reported **activity at a plateau** for week 8. Ten counties reported **increasing activity,** and twenty-five counties reported **decreasing activity.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 8, the **percent of specimens testing positive for influenza** **decreased** but remained higher than other respiratory viruses under surveillance. The **percent of specimens testing positive for rhinovirus** increased notably in recent weeks.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=9), week 40, 2019 to week 8, 2020.

AMERICAN OVERSIGHT

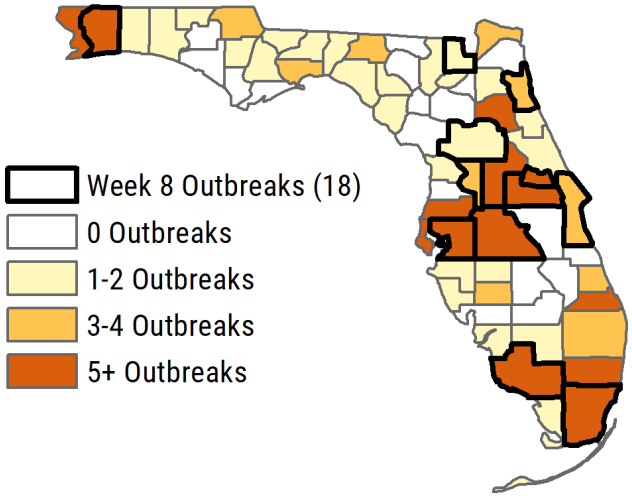
Influenza and ILI Outbreaks

Week 8 Outbreaks at a Glance:

Number Reported:
18 Outbreaks

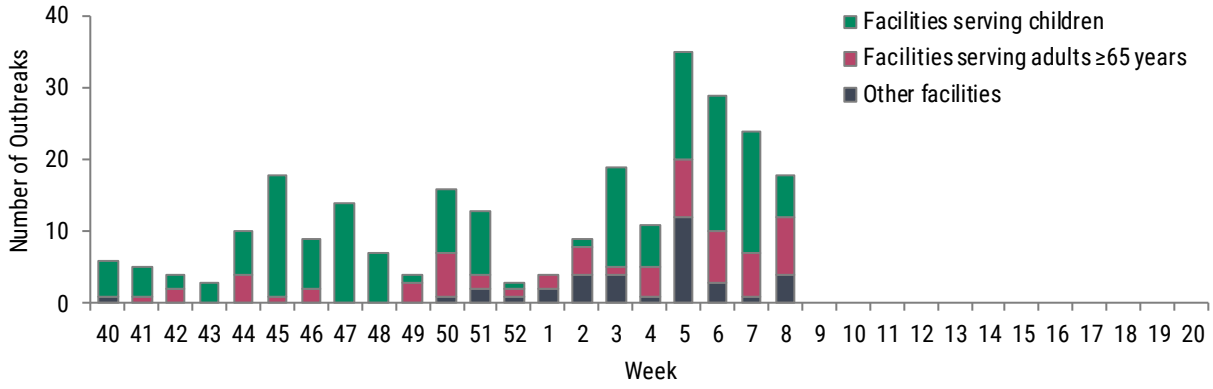
Influenza-Associated:
12 Outbreaks



Severe Outcomes*:
4 Outbreaks

Outbreak Summary:

In week 8, 12 influenza-associated and six ILI outbreaks were reported, a decrease from the previous week.



Severe outcomes* were reported in four of 18 outbreaks. One or more hospitalizations were reported in each of these four outbreaks. One death was reported.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 8, all four outbreaks with severe outcomes were in facilities serving adults aged ≥65 years.

▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 8 are **outlined in bold.**

Figure 9: In week 8, **eight outbreaks** were reported in **facilities serving adults aged ≥65 years, six outbreaks** were reported in **facilities serving children,** and **four outbreaks** were reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 8, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 8, **62.8% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 8, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

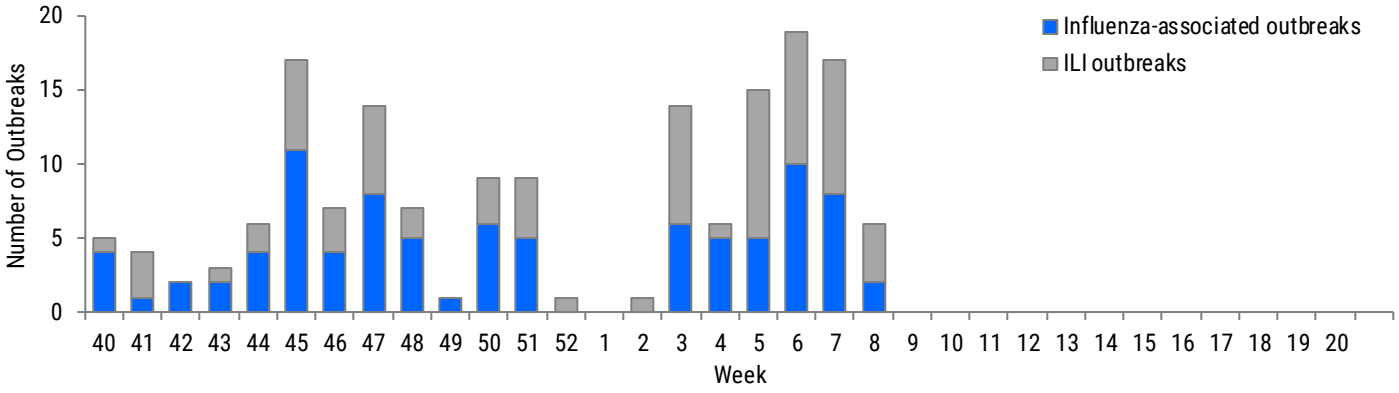
Influenza and ILI Outbreaks

Facilities Serving Children*:



6 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

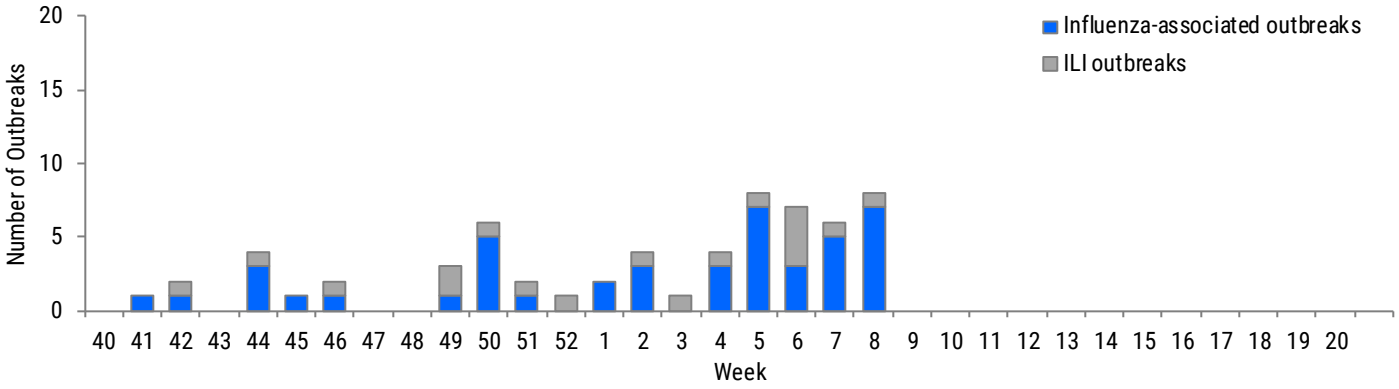
In week 8, six new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 8, **two influenza-associated outbreaks** and **four ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 8, 2020.

Facilities Serving Adults ≥65 yrs.**:



8 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 8, eight new outbreaks of influenza or ILI were reported in facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 8, **seven influenza-associated outbreaks** and **one ILI outbreak** were reported in **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 8, 2020.

AMERICAN OVERSIGHT

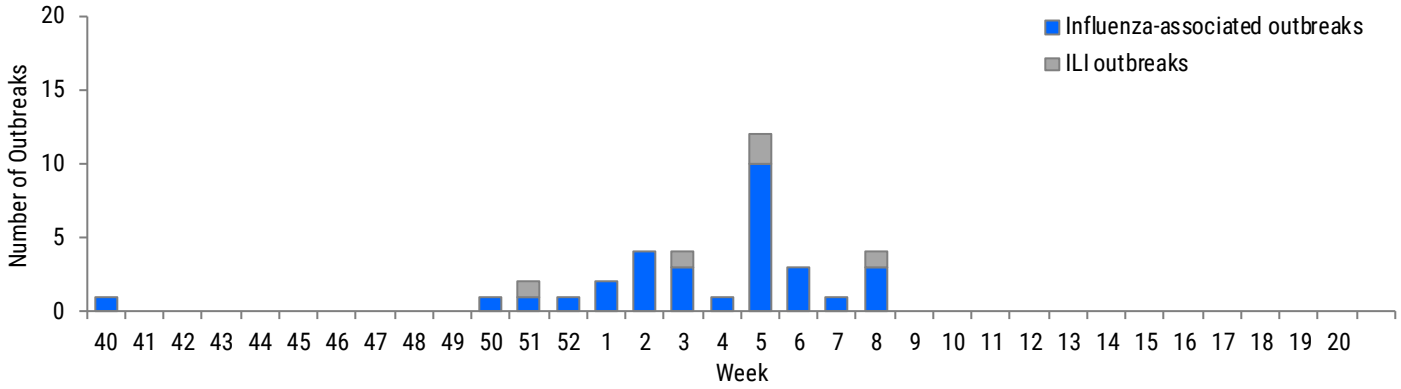
Influenza and ILI Outbreaks

Other Facilities*:



4 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 8, four new outbreaks of influenza or ILI were reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 8, **three influenza-associated outbreaks** and **one ILI outbreak** were reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 8, 2020.

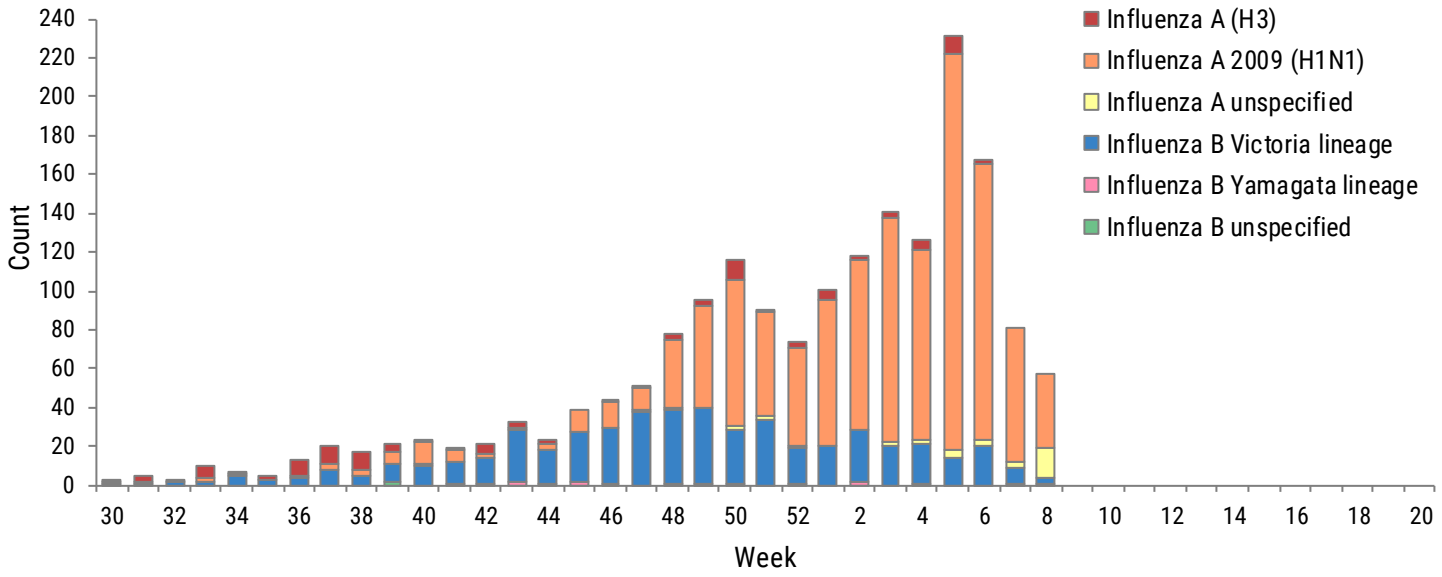


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	126 (48.3%)	74 influenza-associated outbreaks 52 ILI outbreaks
Child daycares	37 (14.2%)	15 influenza-associated outbreaks 22 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	18 (6.9%)	8 influenza-associated outbreaks 10 ILI outbreaks
Nursing facilities	15 (5.8%)	12 influenza-associated outbreaks 3 ILI outbreaks
Other long-term care facilities	29 (11.1%)	24 influenza-associated outbreaks 5 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	30 (11.5%)	27 influenza-associated outbreaks 3 ILI outbreak
Hospitals	2 (0.8%)	2 influenza-associated outbreaks 0 ILI outbreaks
Additional facility types	4 (1.5%)	1 influenza-associated outbreak 2 ILI outbreaks
Total	**261 (100.0%)**	**164 influenza-associated outbreaks** **97 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 8, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 8, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=369) from week 40, 2016 to week 8, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity decreased** during week 8 and was above peak activity observed during the 2016-17 season.

AMERICAN OVERSIGHT

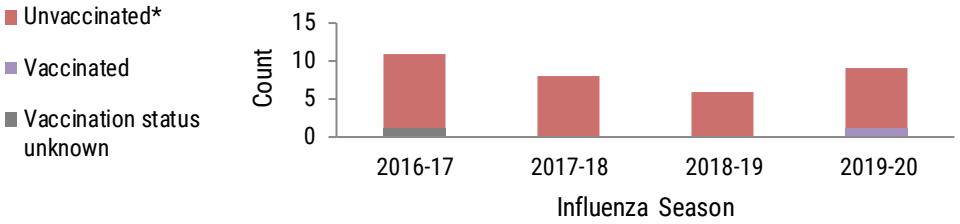
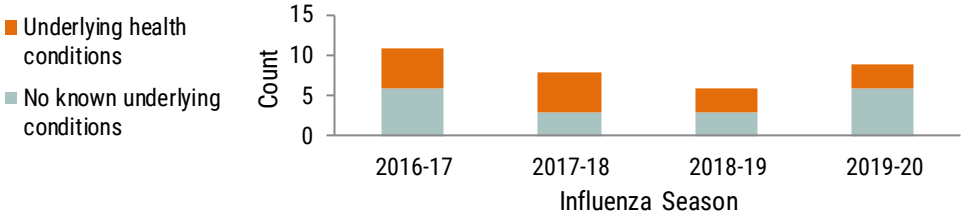
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 8, **the percent of emergency department and urgent care center visits for ILI in children <18 years decreased** and was above levels observed at this time during the 2018-19 and 2016-17 seasons.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 8, 2020.

Figures 25-26: In week 8, **no new influenza-associated pediatric deaths were reported**. A total of nine influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 8, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 8, 2020.

In week 8, **no new influenza-associated pediatric deaths were reported**.

A total of nine influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm.

AMERICAN OVERSIGHT

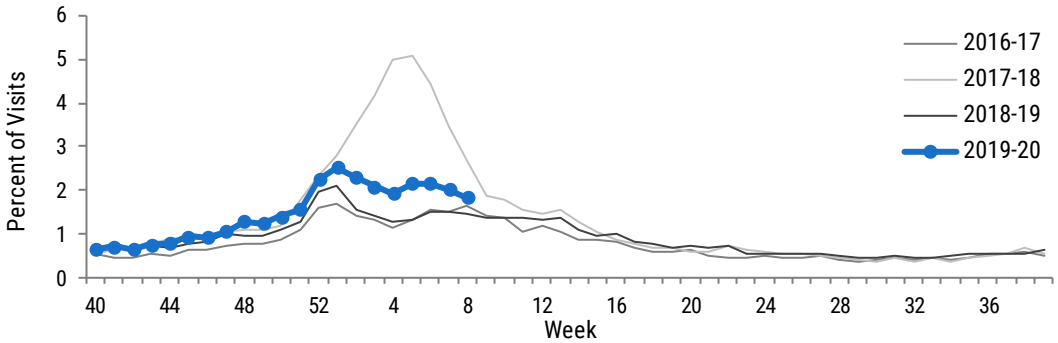
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 8, the **number of emergency department and urgent care center visits for influenza among pregnant women increased** and was above levels observed at this time in past seasons.



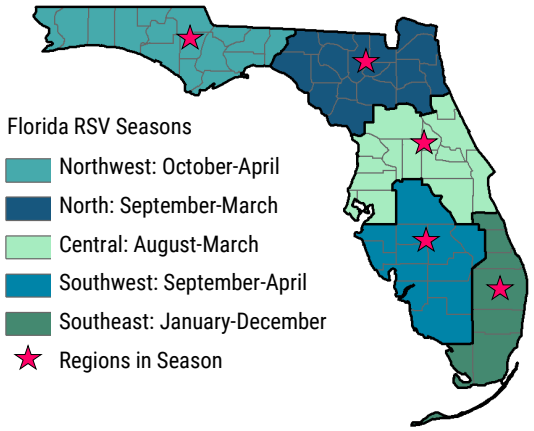
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 8, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 8, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years decreased** and was above levels observed at this time during the 2018-19 and 2016-17 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 8, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

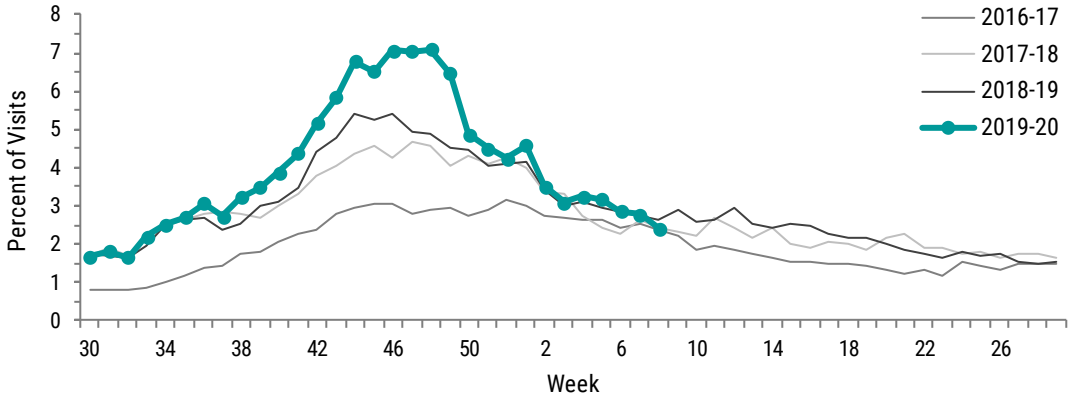
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

Week 8 (February 16-22, 2020) Activity Summary

In week 8, RSV activity in children <5 years decreased and was similar to levels observed at this time in past seasons.

No new RSV-associated outbreaks were reported in week 8. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 8, **the percent of emergency department and urgent care center visits for RSV among children <5 years decreased** and was similar to levels observed at this time in past seasons.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 8, 2020.

*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 8, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Nursing home	Santa Rosa	54	Unknown	Unknown	Influenza A unspecified	Yes	Open
Assisted living facility	Polk	2	2	0	Influenza A unspecified	Yes	Closed
Assisted living facility	Sumter	8	4	0	Influenza A 2009 (H1N1)	Yes	Open
Assisted living facility	Seminole	12	3	1	Influenza A 2009 (H1N1)	Yes	Closed
Correctional facility	Sumter	40	Unknown	Unknown	Influenza A unspecified	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=369) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 8, 2020 Florida Flu Review
Date:	Wednesday, February 26, 2020 2:13:11 PM
Attachments:	Week 8, 2020 Florida Flu Review.pdf

Good afternoon!

Attached is the Week 8, 2020 Florida Flu Review.

Week 8 influenza & influenza-like illness (ILI) activity summary:

Activity decreased in week 8 and remained above peak levels observed in the 2016-17 and 2018-19 seasons. Decreases were observed in all regions of the state. Elevated activity is still expected for several more weeks.

Eighteen outbreaks were reported, down from 24 outbreaks in the previous week. Of the 18 outbreaks reported, 12 were influenza-associated and six were ILI.

No new influenza-associated pediatric deaths were reported. Nine influenza-associated pediatric deaths have been reported so far this season; only one child was vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On February 21, 2020, CDC issued interim vaccine effectiveness (VE) estimates for the 2019-20 influenza season. For all ages, the VE was 45% (95% confidence interval [CI] = 36-53%) against any influenza virus illness and was 55% (95% CI = 42-65%) among children six months to 17 years (www.cdc.gov/mmwr/volumes/69/wr/pdfs/mm6907a1-H.pdf).

On January 10, 2020, CDC issued a health advisory reminding clinicians to reiterate vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

AMERICAN OVERSIGHT

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Thank you!

Florida ILI Surveillance System Summary 16

Background

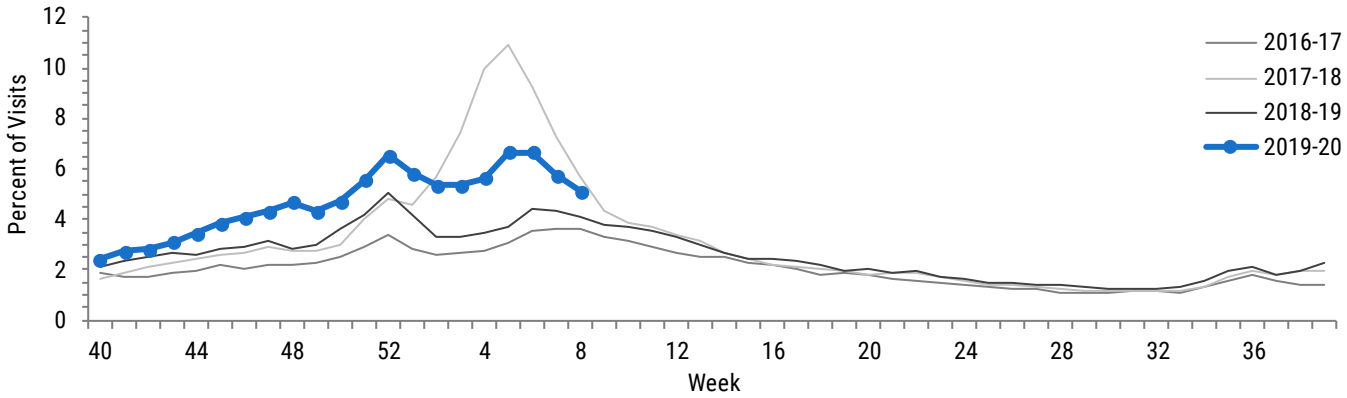
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



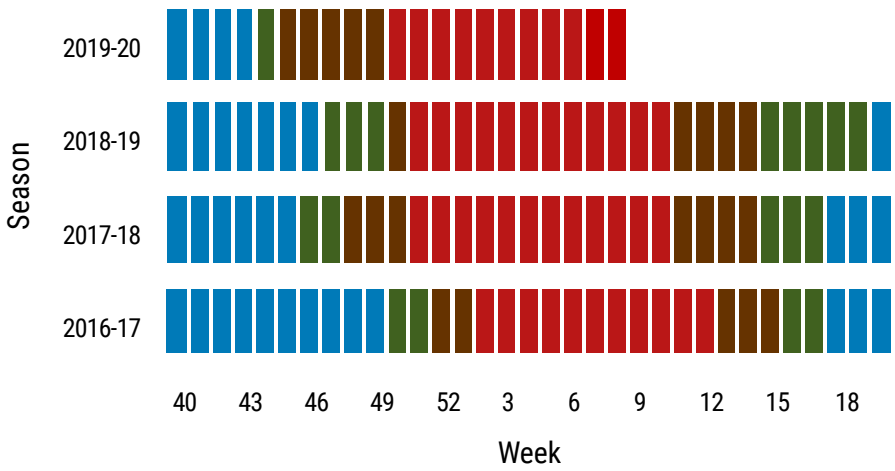
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 8, **the percent of emergency department and urgent care center visits for ILI statewide decreased** but remained above peak levels observed during the 2018-19 and 2016-17 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=369) statewide for the current season (week 40, 2019 to week 8, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 8, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 8, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

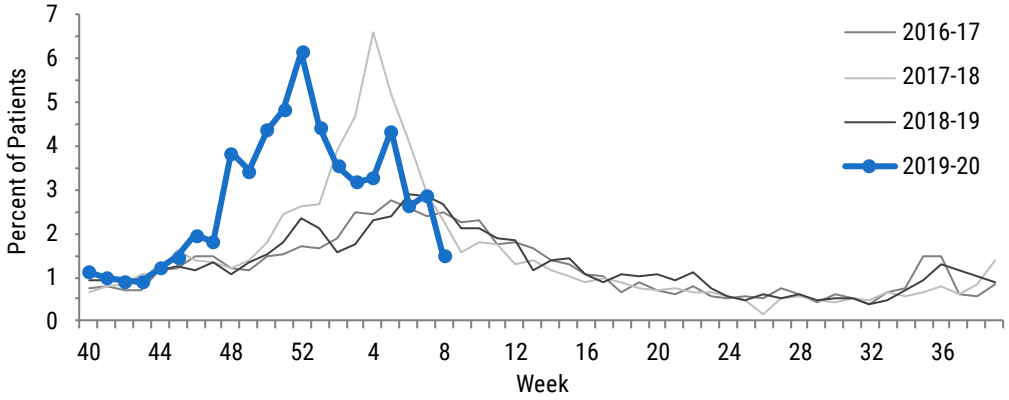
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 8, **the percent of patients with ILI reported by ILINet providers statewide decreased** and was below levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=9), week 40, 2016 to week 8, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



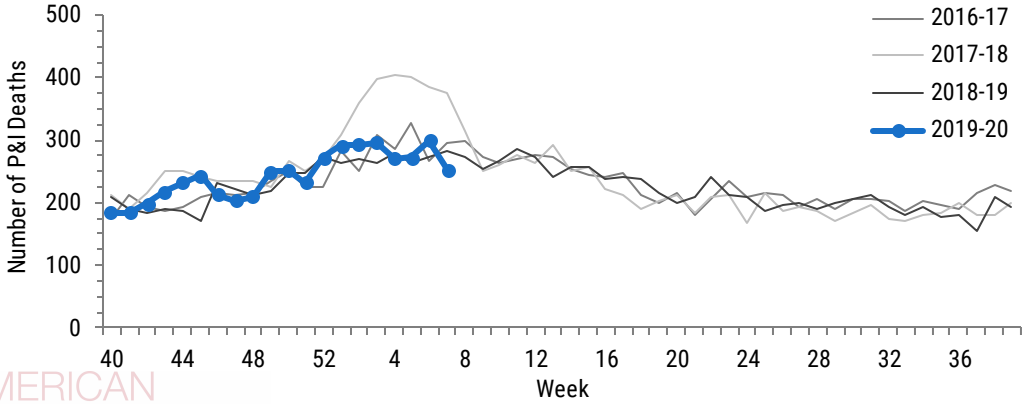


Figure 4: In week 7 (ending 2/15/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 7, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

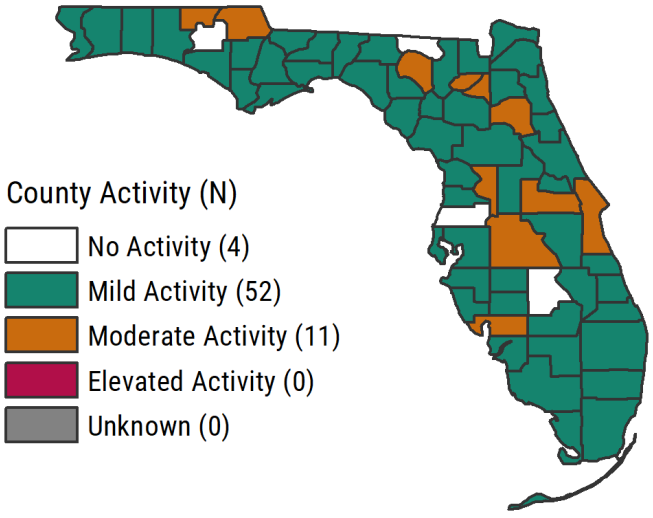
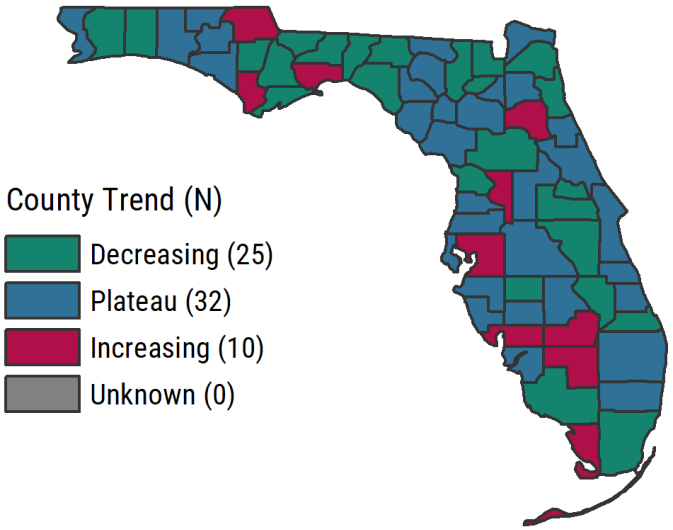
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 8. Eleven counties reported **moderate activity.**





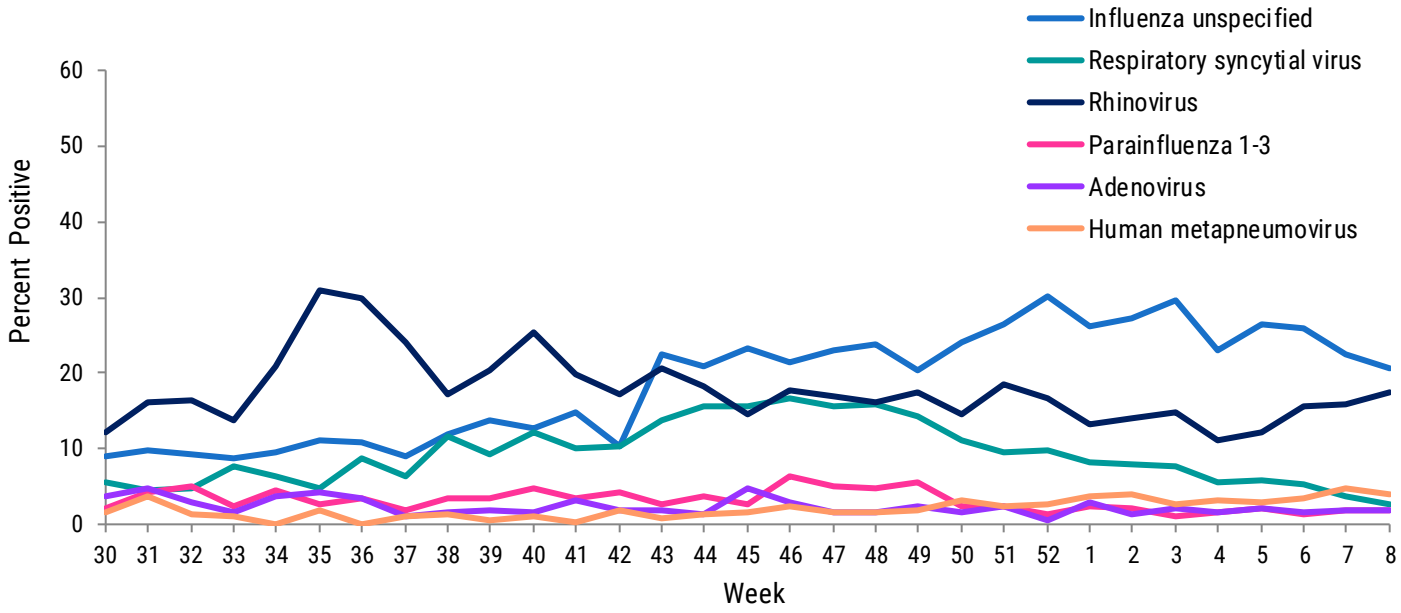


Figure 7: Most counties reported **activity at a plateau** for week 8. Ten counties reported **increasing activity,** and twenty-five counties reported **decreasing activity.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 8, the **percent of specimens testing positive for influenza** **decreased** but remained higher than other respiratory viruses under surveillance. The **percent of specimens testing positive for rhinovirus** increased notably in recent weeks.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=9), week 40, 2019 to week 8, 2020.

AMERICAN OVERSIGHT

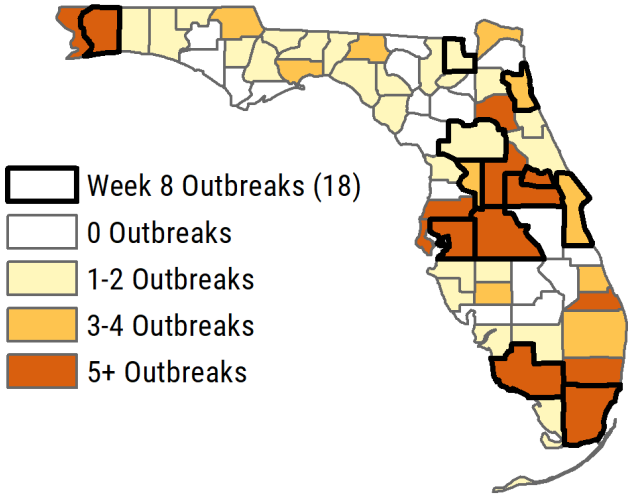
Influenza and ILI Outbreaks

Week 8 Outbreaks at a Glance:

Number Reported:
18 Outbreaks

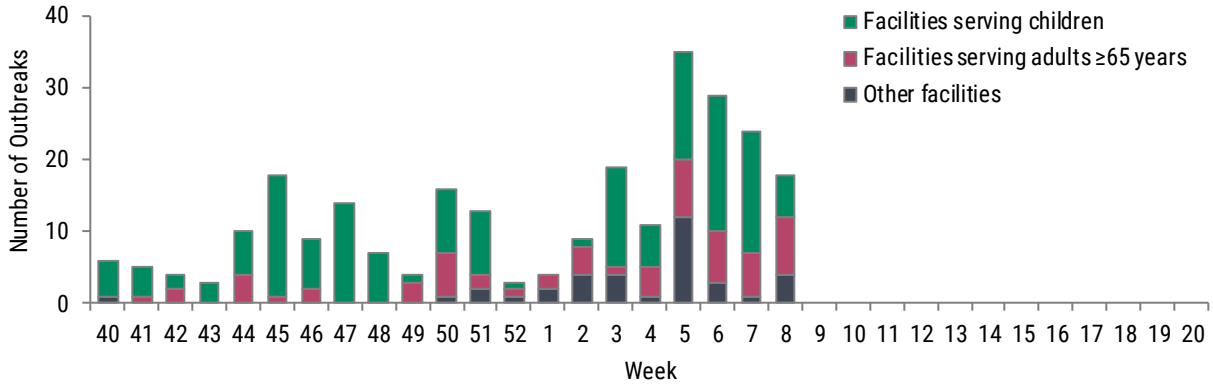
Influenza-Associated:
12 Outbreaks



Severe Outcomes*:
4 Outbreaks

Outbreak Summary:

In week 8, 12 influenza-associated and six ILI outbreaks were reported, a decrease from the previous week.



Severe outcomes* were reported in four of 18 outbreaks. One or more hospitalizations were reported in each of these four outbreaks. One death was reported.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 8, all four outbreaks with severe outcomes were in facilities serving adults aged ≥65 years.

▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 8 are **outlined in bold.**

Figure 9: In week 8, **eight outbreaks** were reported in **facilities serving adults aged ≥65 years, six outbreaks** were reported in **facilities serving children,** and **four outbreaks** were reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 8, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 8, **62.8% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 8, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

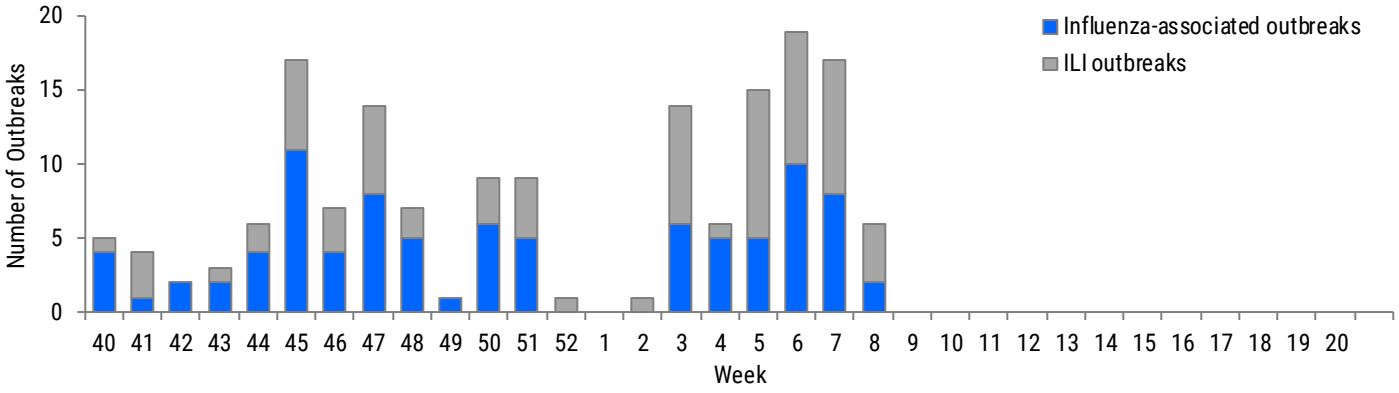
Influenza and ILI Outbreaks

Facilities Serving Children*:



6 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

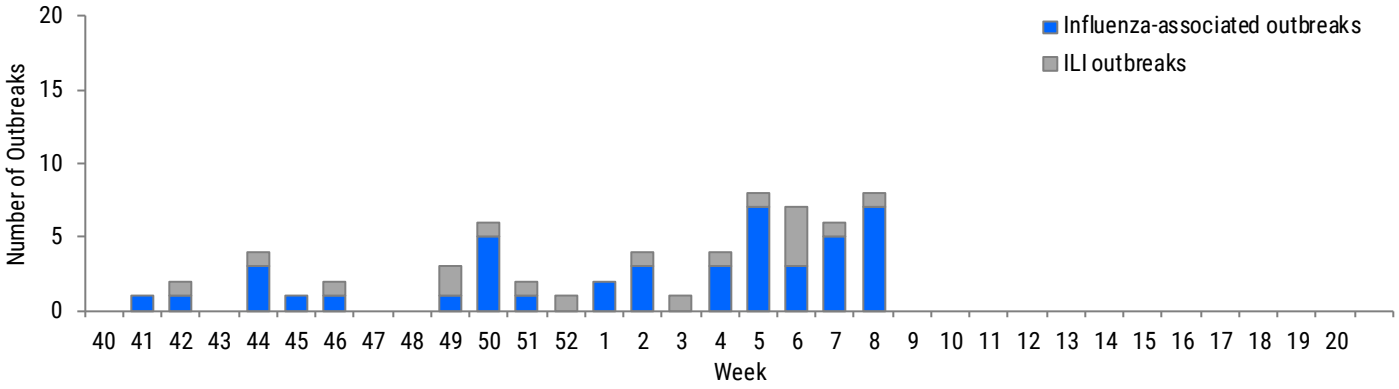
In week 8, six new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 8, **two influenza-associated outbreaks** and **four ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 8, 2020.

Facilities Serving Adults ≥65 yrs.**:



8 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 8, eight new outbreaks of influenza or ILI were reported in facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 8, **seven influenza-associated outbreaks** and **one ILI outbreak** were reported in **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 8, 2020.

AMERICAN OVERSIGHT

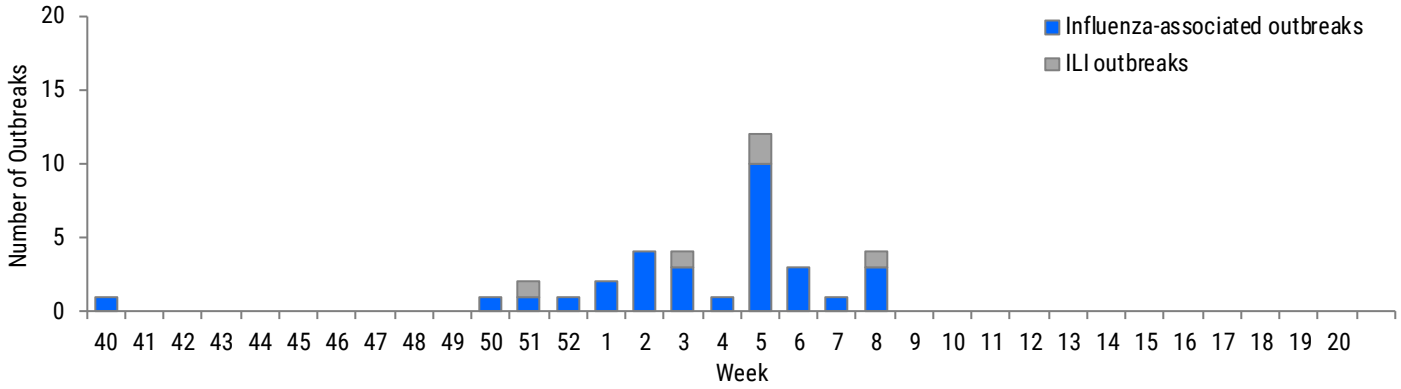
Influenza and ILI Outbreaks

Other Facilities*:



4 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 8, four new outbreaks of influenza or ILI were reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 8, **three influenza-associated outbreaks** and **one ILI outbreak** were reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 8, 2020.

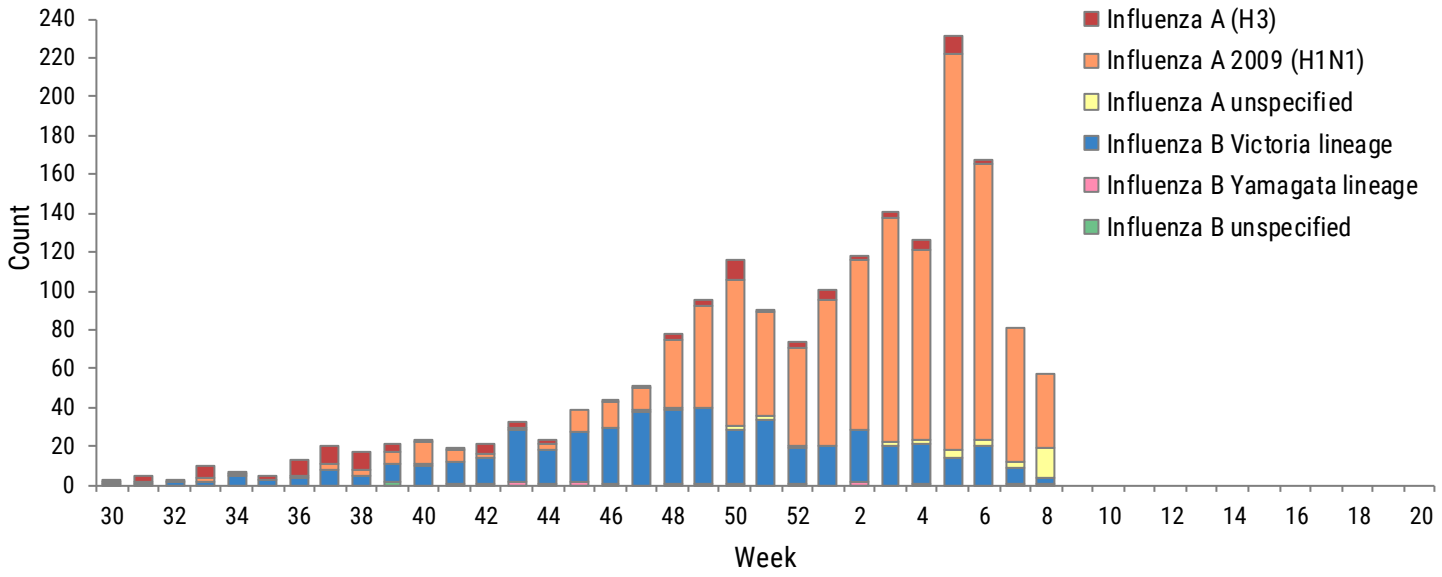


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	126 (48.3%)	74 influenza-associated outbreaks 52 ILI outbreaks
Child daycares	37 (14.2%)	15 influenza-associated outbreaks 22 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	18 (6.9%)	8 influenza-associated outbreaks 10 ILI outbreaks
Nursing facilities	15 (5.8%)	12 influenza-associated outbreaks 3 ILI outbreaks
Other long-term care facilities	29 (11.1%)	24 influenza-associated outbreaks 5 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	30 (11.5%)	27 influenza-associated outbreaks 3 ILI outbreak
Hospitals	2 (0.8%)	2 influenza-associated outbreaks 0 ILI outbreaks
Additional facility types	4 (1.5%)	1 influenza-associated outbreak 2 ILI outbreaks
Total	**261 (100.0%)**	**164 influenza-associated outbreaks** **97 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 8, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 8, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=369) from week 40, 2016 to week 8, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity decreased** during week 8 and was above peak activity observed during the 2016-17 season.

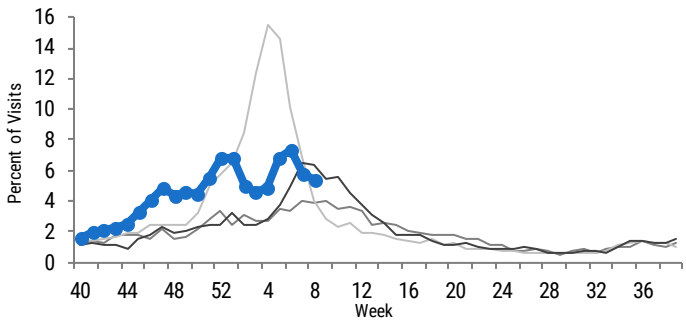

Figure 17: In **region 2, ILI activity decreased** during week 8 and was above peak activity observed during the 2018-19 and 2016-17 seasons.

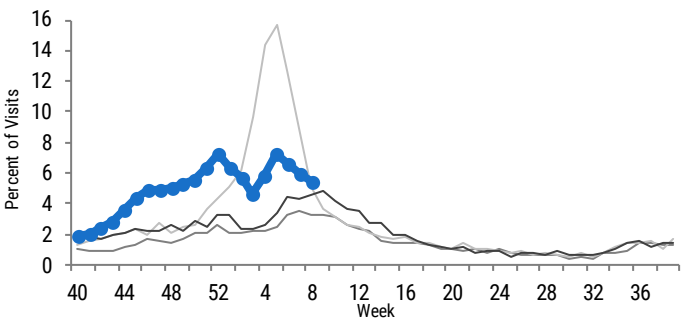

Figure 18: In **region 3, ILI activity decreased** during week 8 and was above peak activity observed during the 2016-17 season.

AMERICAN OVERSIGHT

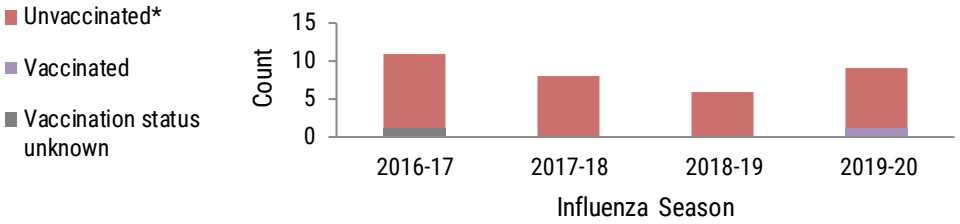
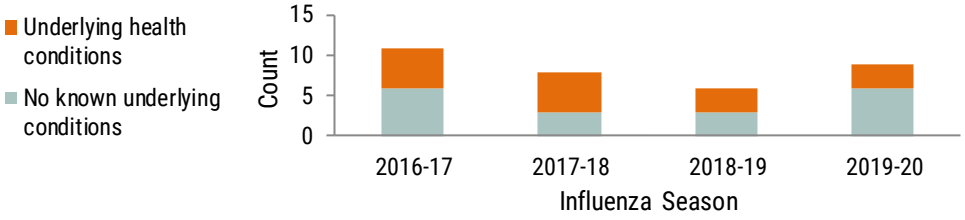
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 8, **the percent of emergency department and urgent care center visits for ILI in children <18 years decreased** and was above levels observed at this time during the 2018-19 and 2016-17 seasons.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 8, 2020.

Figures 25-26: In week 8, **no new influenza-associated pediatric deaths were reported**. A total of nine influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 8, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 8, 2020.

In week 8, **no new influenza-associated pediatric deaths were reported**.

A total of nine influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm

AMERICAN OVERSIGHT

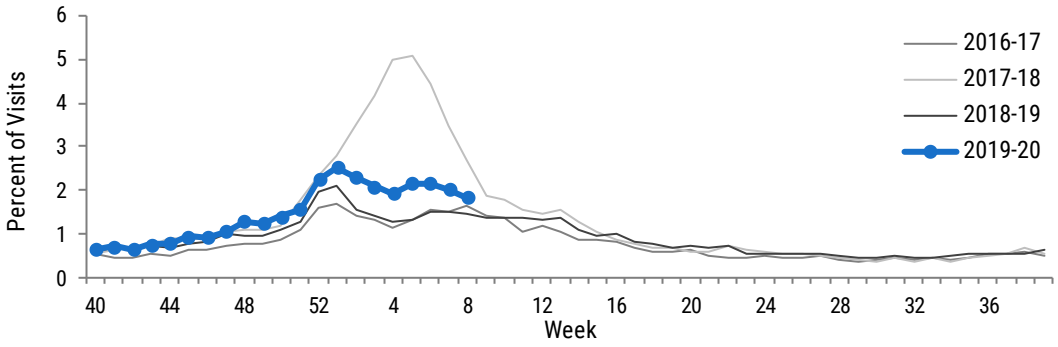
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 8, the **number of emergency department and urgent care center visits for influenza among pregnant women increased** and was above levels observed at this time in past seasons.



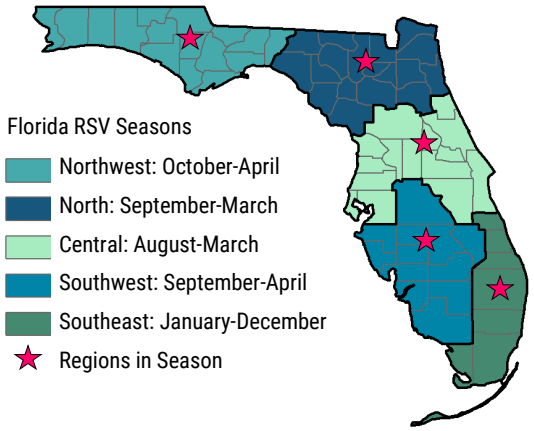
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 8, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 8, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years decreased** and was above levels observed at this time during the 2018-19 and 2016-17 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 8, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

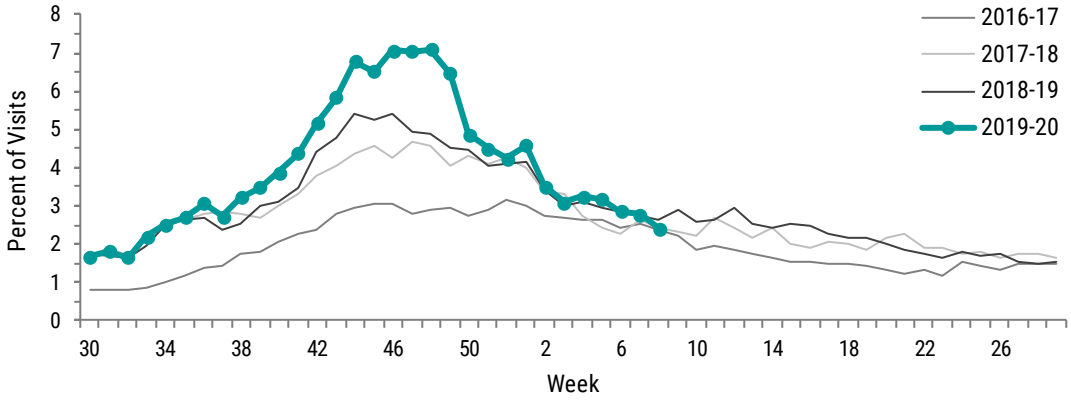
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

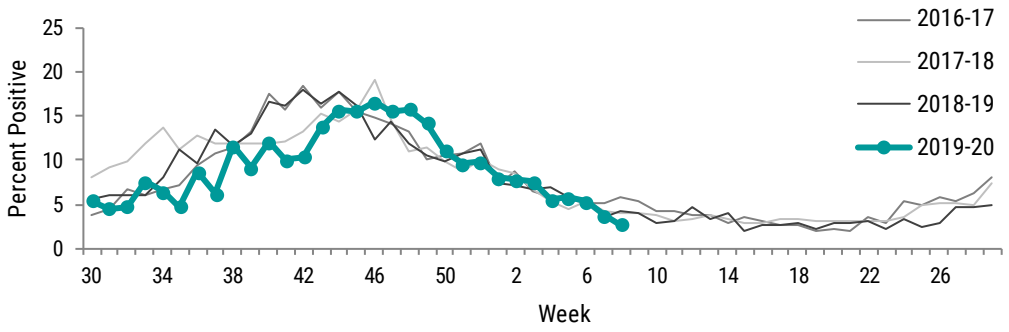
Week 8 (February 16-22, 2020) Activity Summary

In week 8, RSV activity in children <5 years decreased and was similar to levels observed at this time in past seasons.

No new RSV-associated outbreaks were reported in week 8. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 8, **the percent of emergency department and urgent care center visits for RSV among children <5 years decreased** and was similar to levels observed at this time in past seasons.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 8, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

AMERICAN OVERSIGHT

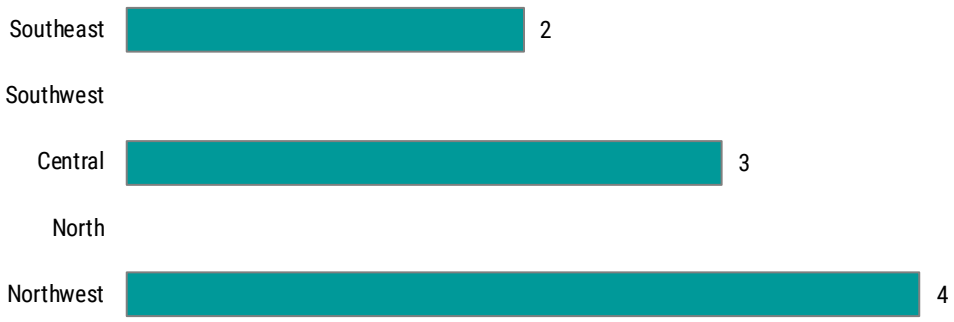
RSV Surveillance

Figure 31: In week 8, **the percent of specimens testing positive for RSV decreased.** Levels were slightly below those observed at this time in previous seasons.

Figure 31 shows **the percent of specimens testing positive for respiratory syncytial virus (RSV)**, as reported by hospital laboratories (n=9), week 30, 2016 to week 8, 2020. ▶



RSV-Associated Outbreaks in Week 8:

0 Outbreaks

Summary of RSV-Associated Outbreaks:

In week 8, no new RSV-associated outbreaks were reported. Since week 30, 2019, nine RSV-associated outbreaks have been reported.

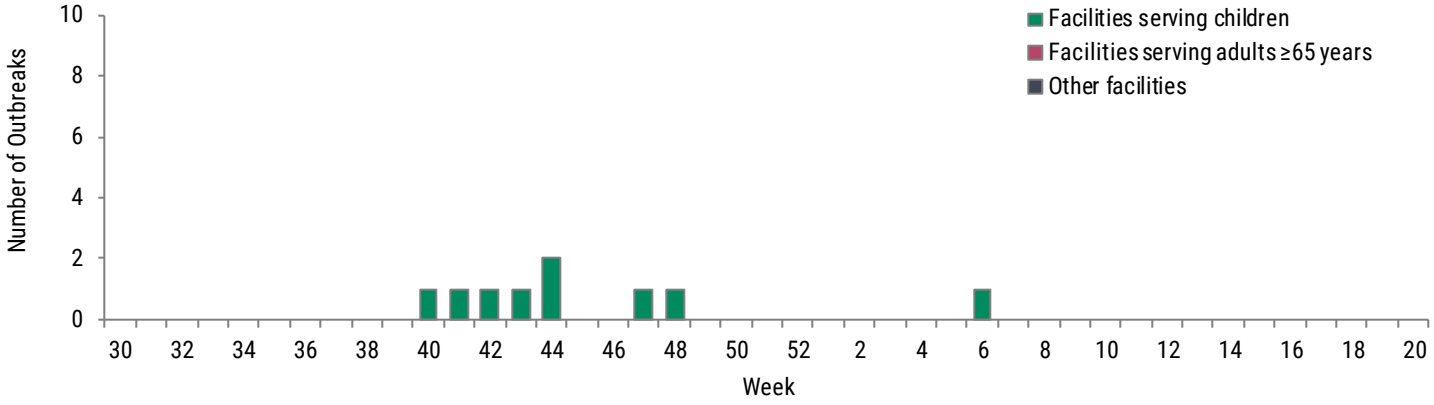


Figure 32: In week 8, no new RSV-associated outbreaks were reported. Since week 30, outbreaks have been reported in Florida's southeast, central, and northwest regions.

◀ **Figure 32** shows **a summary of RSV-associated outbreaks by region*** as reported by county health departments in Merlin, week 30, 2019 to week 8, 2020.

*Regions defined in figure 29.

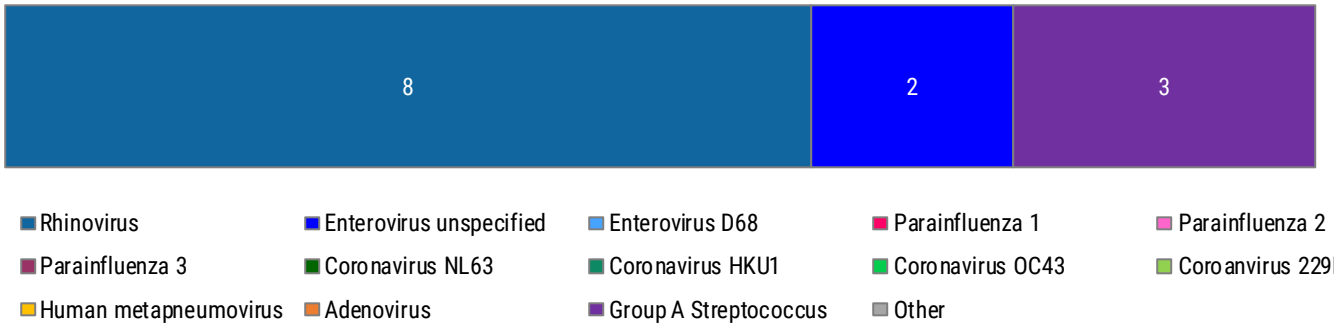

Figure 33: In week 8, no new RSV-associated outbreaks were reported. All of the outbreaks reported since week 30 have been reported in **facilities serving children.**

AMERICAN OVERSIGHT

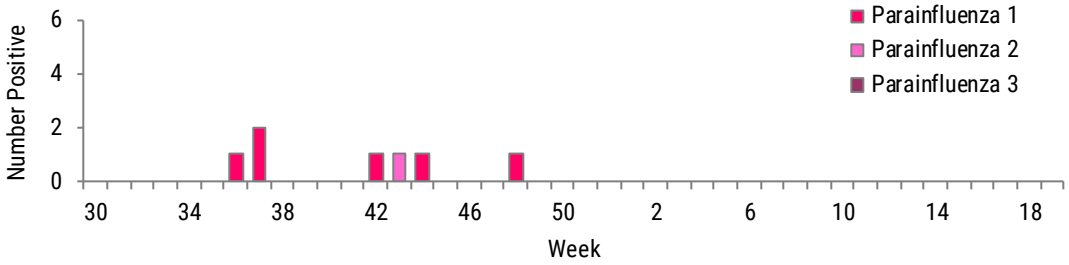
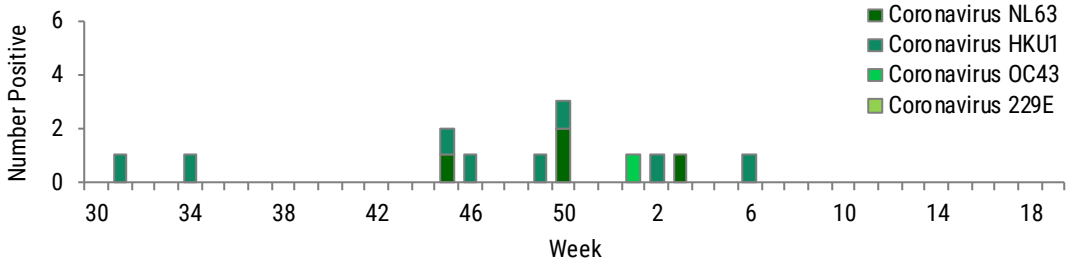
Other Respiratory Virus Surveillance





▲ **Figure 34** shows **the number of unique times a pathogen was associated with a respiratory outbreak** for outbreaks reported from week 30, 2019 to week 8, 2020.

◀ **Figure 35*** shows **the number of PCR-positive laboratory findings for enterovirus unspecified, enterovirus D68, and rhinovirus** by week** among specimens submitted to the Bureau of Public Health Laboratories (BPHL) for extended respiratory panel testing.

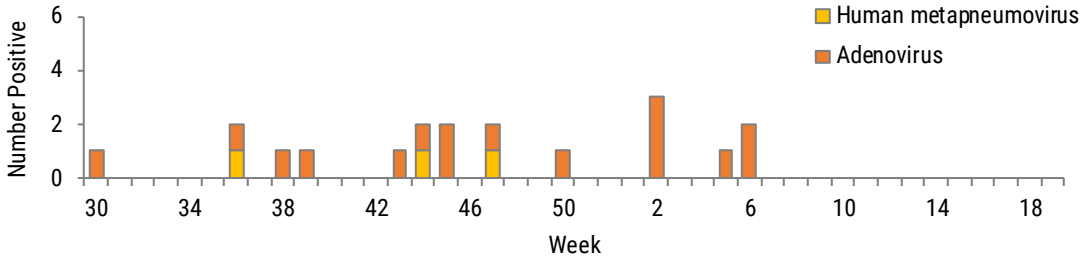


Figure 36* shows **the ▶ number of PCR-positive laboratory findings for parainfluenza 1-3** by week** among specimens submitted to BPHL for extended respiratory panel testing.

◀ **Figure 37*** shows **the number of PCR-positive laboratory findings for seasonal coronaviruses NL63, HKU1, OC43, and 229E** by week** among specimens submitted to BPHL for extended respiratory panel testing.

Figure 38* shows **the ▶ number of PCR-positive laboratory findings for human metapneumovirus and adenovirus** by week** among specimens submitted to BPHL for extended respiratory panel testing.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 8, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Nursing home	Santa Rosa	54	Unknown	Unknown	Influenza A unspecified	Yes	Open
Assisted living facility	Polk	2	2	0	Influenza A unspecified	Yes	Closed
Assisted living facility	Sumter	8	4	0	Influenza A 2009 (H1N1)	Yes	Open
Assisted living facility	Seminole	12	3	1	Influenza A 2009 (H1N1)	Yes	Closed
Correctional facility	Sumter	40	Unknown	Unknown	Influenza A unspecified	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=369) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 9, 2020 Florida Flu Review
Date:	Wednesday, March 4, 2020 2:45:57 PM
Attachments:	Week 9, 2020 Florida Flu Review.pdf

Good afternoon!

Attached is the Week 9, 2020 Florida Flu Review.

Week 9 influenza & influenza-like illness (ILI) activity summary:

Activity decreased in week 9 but remained above peak levels observed in the 2016-17 season. Decreases were observed in all regions of the state. Elevated activity is still expected for several more weeks.

Nine outbreaks were reported, down from 18 outbreaks in the previous week. Of the nine outbreaks reported, two were influenza-associated and seven were ILI.
One new influenza-associated pediatric death was reported in an unvaccinated child with underlying medical conditions. Ten influenza-associated pediatric deaths have been reported so far this season; only one child was vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On January 10, 2020, CDC issued a health advisory reminding clinicians to reiterate vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Week 9: 2/23/20-2/29/20

Geographic Spread: **Widespread**

Predominant Strain: **A 2009 (H1N1)**

ILI Activity Trend: **Decreasing**

Week 9 influenza & influenza-like illness (ILI) activity summary:

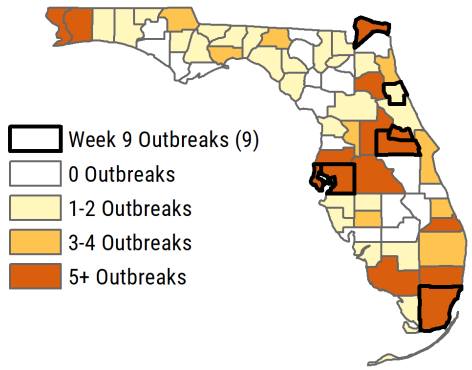
Activity decreased in week 9 but remained above peak levels observed in the 2016-17 season. Decreases were observed in all regions of the state. Elevated activity is still expected for several more weeks.

Nine outbreaks were reported, down from 18 outbreaks in the previous week. Of the nine outbreaks reported, two were influenza-associated and seven were ILI.

One new influenza-associated pediatric death was reported in an unvaccinated child with underlying medical conditions. Ten influenza-associated pediatric deaths have been reported so far this season; only one child was vaccinated for the 2019-20 season.

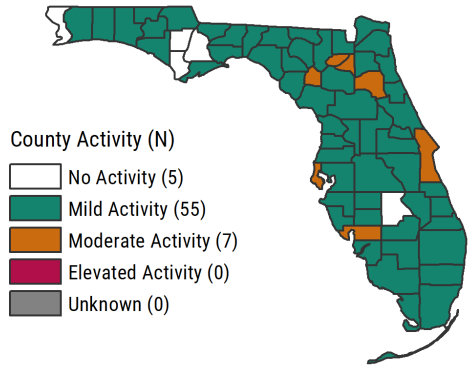
Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults ≥65 years, pregnant women, and people with underlying medical conditions).



On January 10, 2020, CDC issued a health advisory reminding clinicians to reiterate vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:



- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Florida ILI Surveillance System Summary 16

Background

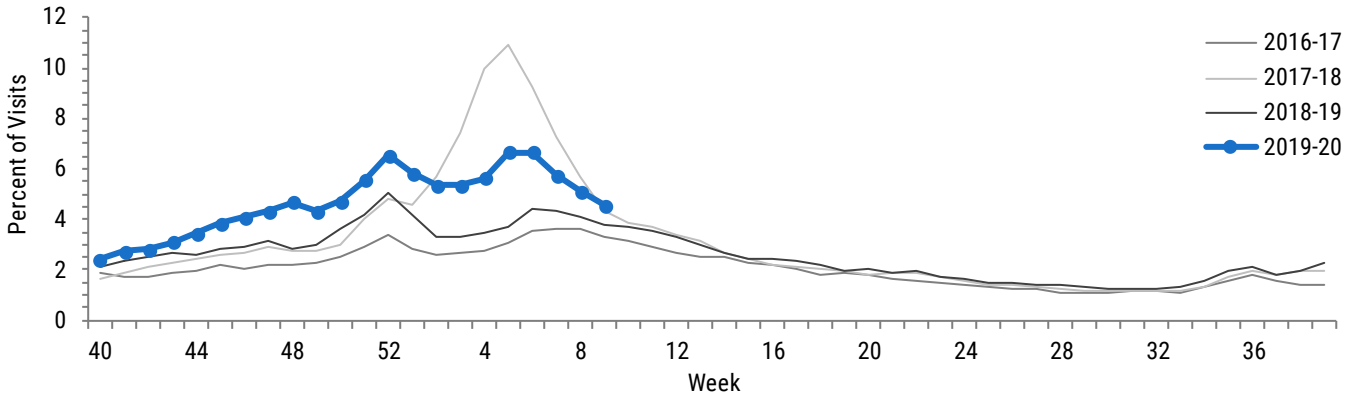
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



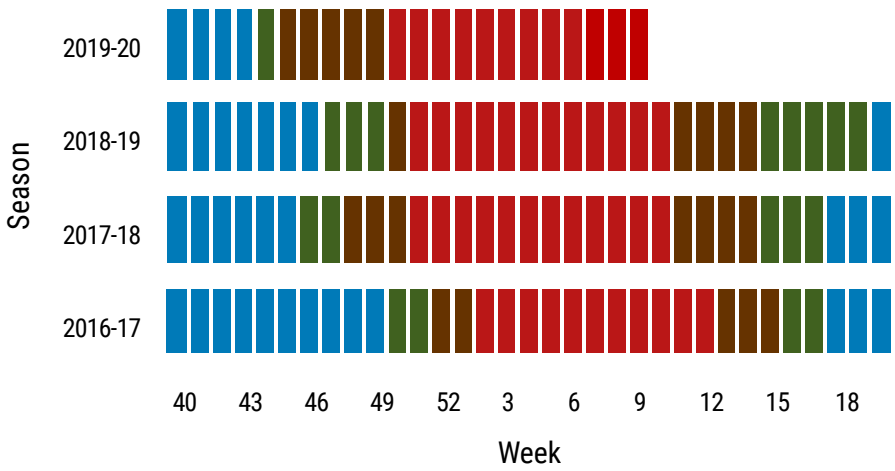
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 9, **the percent of emergency department and urgent care center visits for ILI statewide decreased** but remained above peak levels observed during the 2016-17 season.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=369) statewide for the current season (week 40, 2019 to week 9, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 9, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 9, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

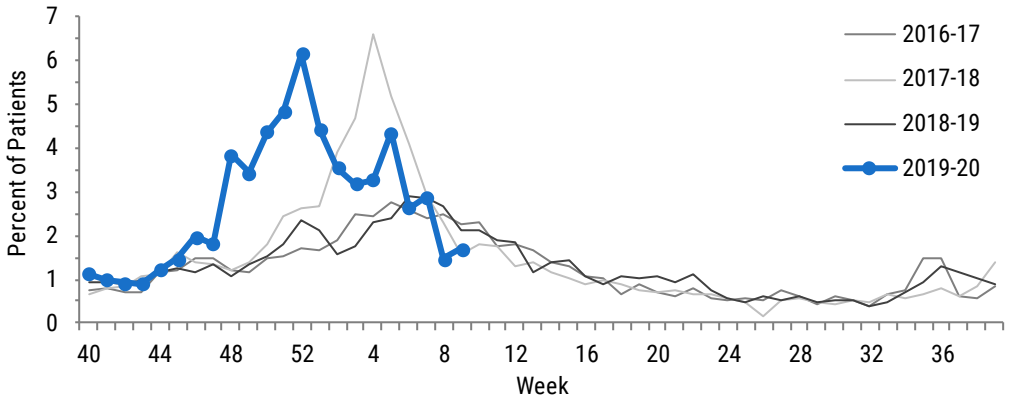
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 9, **the percent of patients with ILI reported by ILINet providers statewide increased** and was below levels observed during the 2016-17 and 2018-19 seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=7), week 40, 2016 to week 9, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



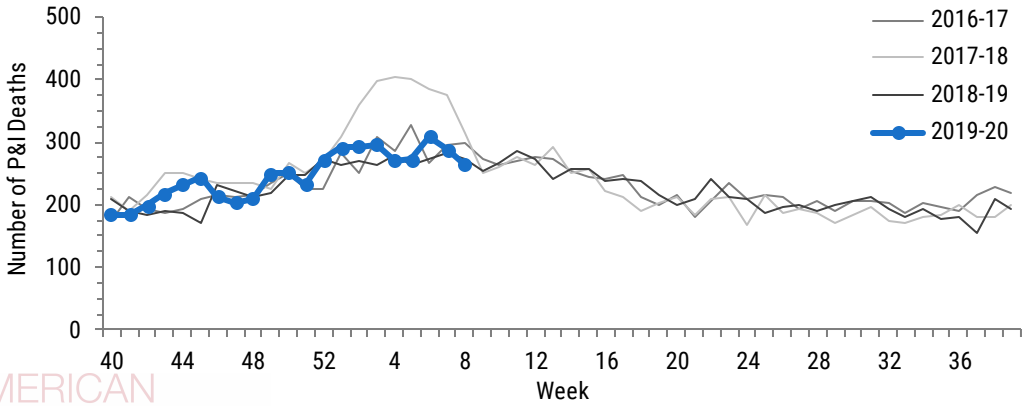


Figure 4: In week 8 (ending 2/22/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was slightly below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 8, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

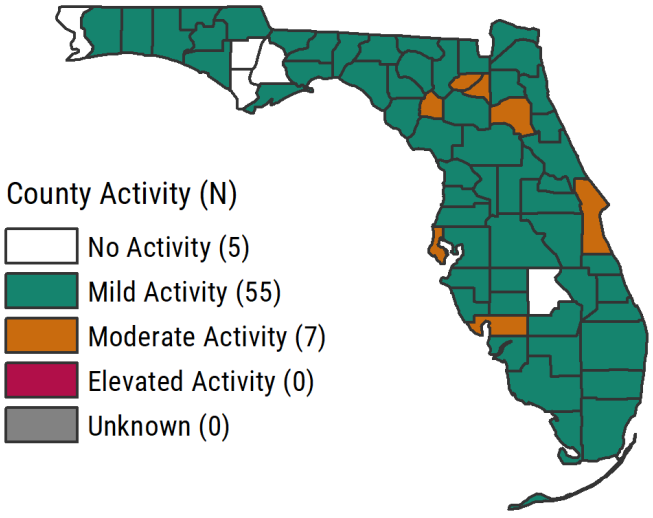
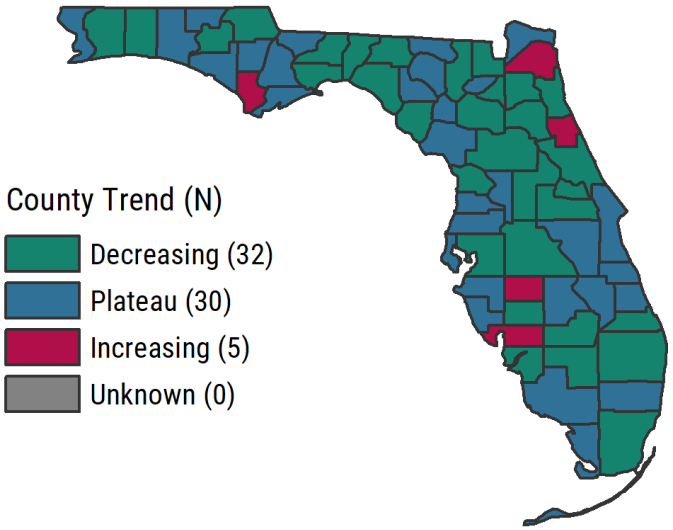
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 9. Seven counties reported **moderate activity.**





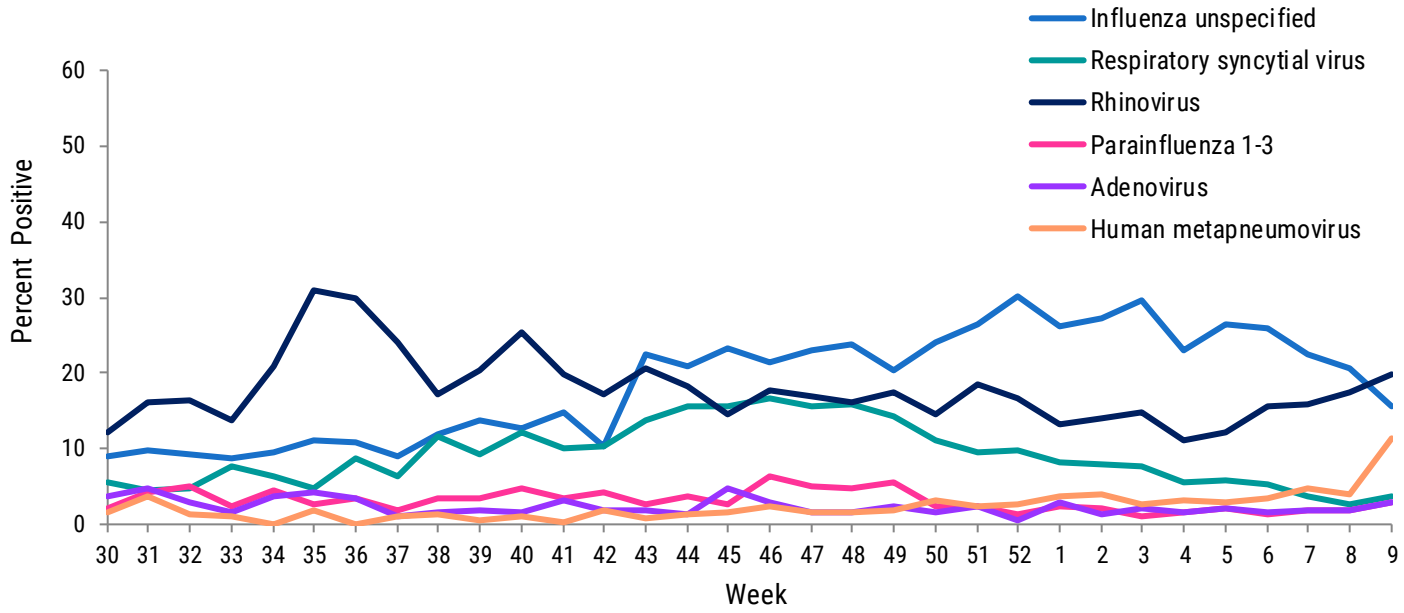


Figure 7: Most counties reported **decreasing activity** for week 9. Five counties reported **increasing activity,** and thirty counties reported **activity at a plateau.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: The **percent of specimens testing positive for influenza decreased** in recent weeks. Of note, the volume of laboratory tests reported in week 9 was lower than expected.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=7), week 40, 2019 to week 9, 2020.

AMERICAN OVERSIGHT

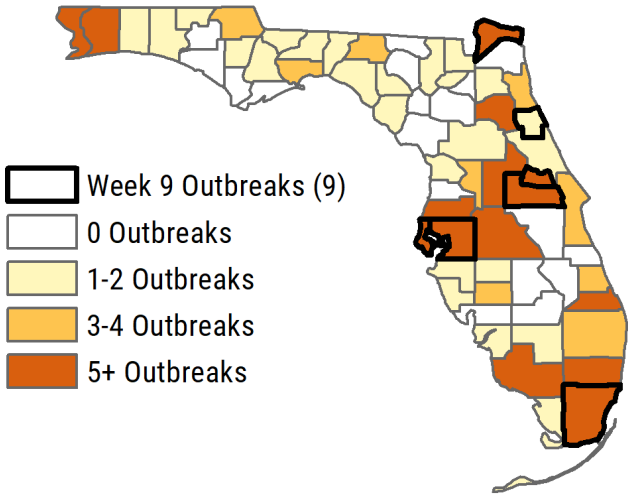
Influenza and ILI Outbreaks

Week 9 Outbreaks at a Glance:

Number Reported:
9 Outbreaks

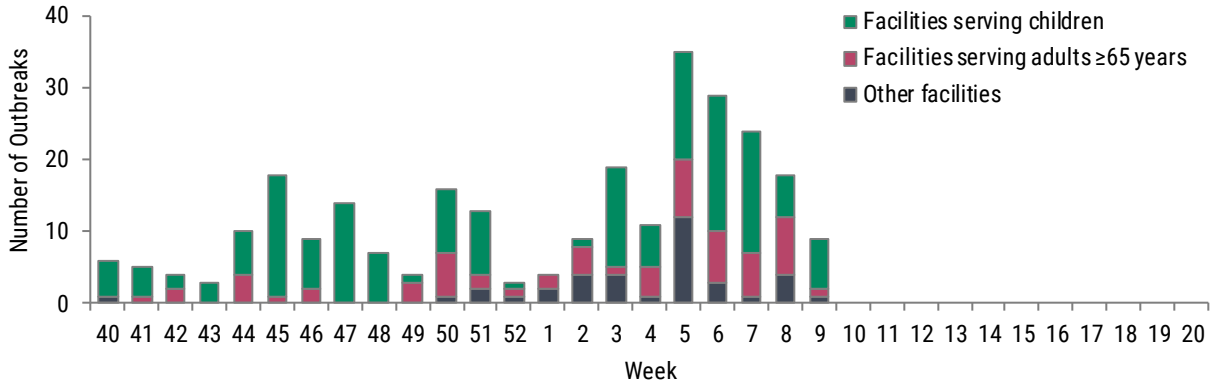
Influenza-Associated:
2 Outbreaks



Severe Outcomes*:
1 Outbreak

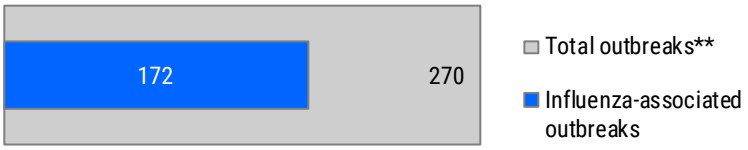
Outbreak Summary:

In week 9, two influenza-associated and seven ILI outbreaks were reported, a decrease from the previous week.



Severe outcomes* were reported in one of nine outbreaks. Two hospitalizations and no deaths were reported in this outbreak.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 9, the outbreak with severe outcomes was in a facility serving adults aged ≥65 years.



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 9 are **outlined in bold.**

Figure 9: In week 9, **one outbreak** was reported among **facilities serving adults aged ≥65 years, seven outbreaks** were reported in **facilities serving children,** and **one outbreak** was reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 9, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 9, **63.7% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 9, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

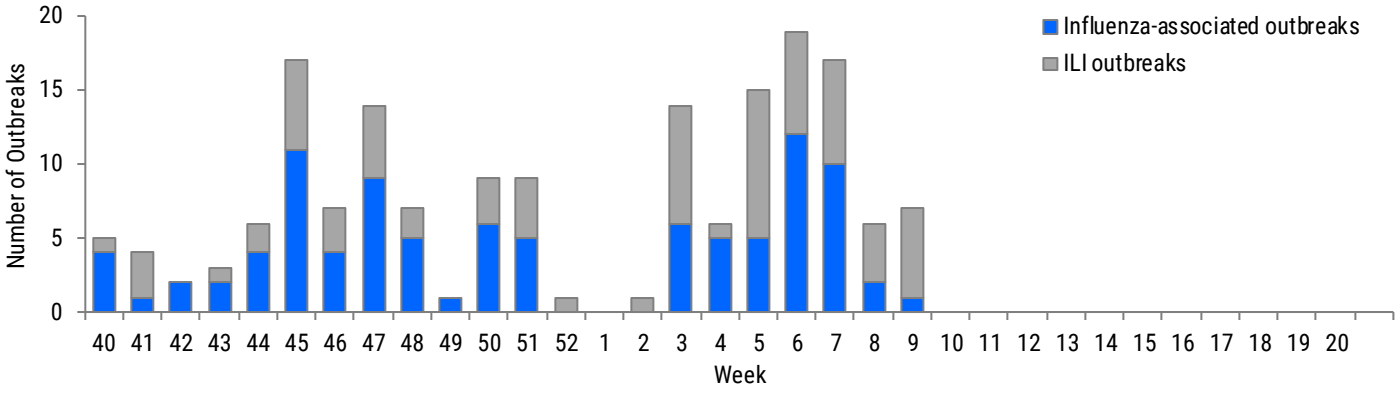
Influenza and ILI Outbreaks

Facilities Serving Children*:



7 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

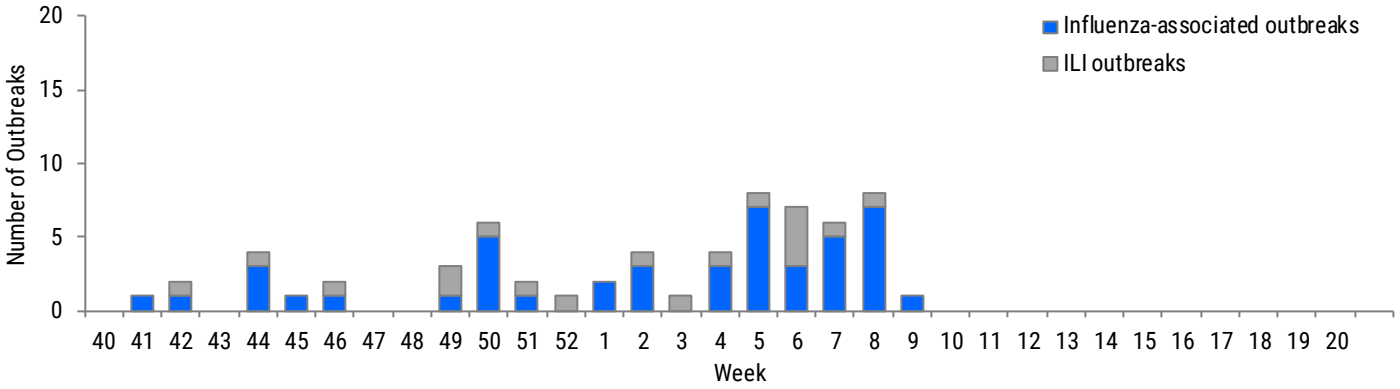
In week 9, seven new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 9, **one influenza-associated outbreak** and **six ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 9, 2020.

Facilities Serving Adults ≥65 yrs.**:



1 Outbreak

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 9, one new outbreak of influenza or ILI was reported among facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 9, **one influenza-associated outbreak** was reported among **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 9, 2020.

AMERICAN OVERSIGHT

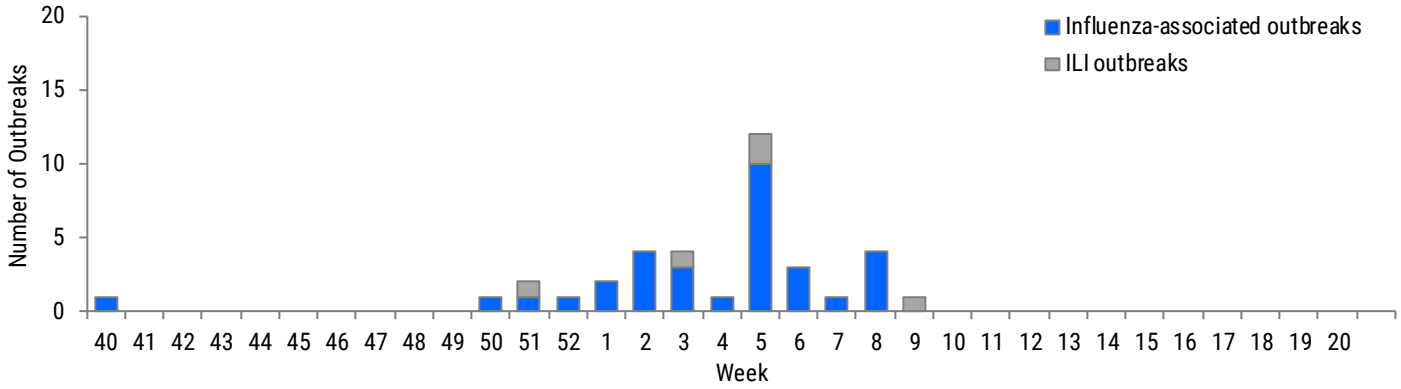
Influenza and ILI Outbreaks

Other Facilities*:



1 Outbreak

Summary of Outbreaks in Other Facilities:

In week 9, one new outbreak of influenza or ILI was reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 9, **one ILI outbreak** was reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 9, 2020.

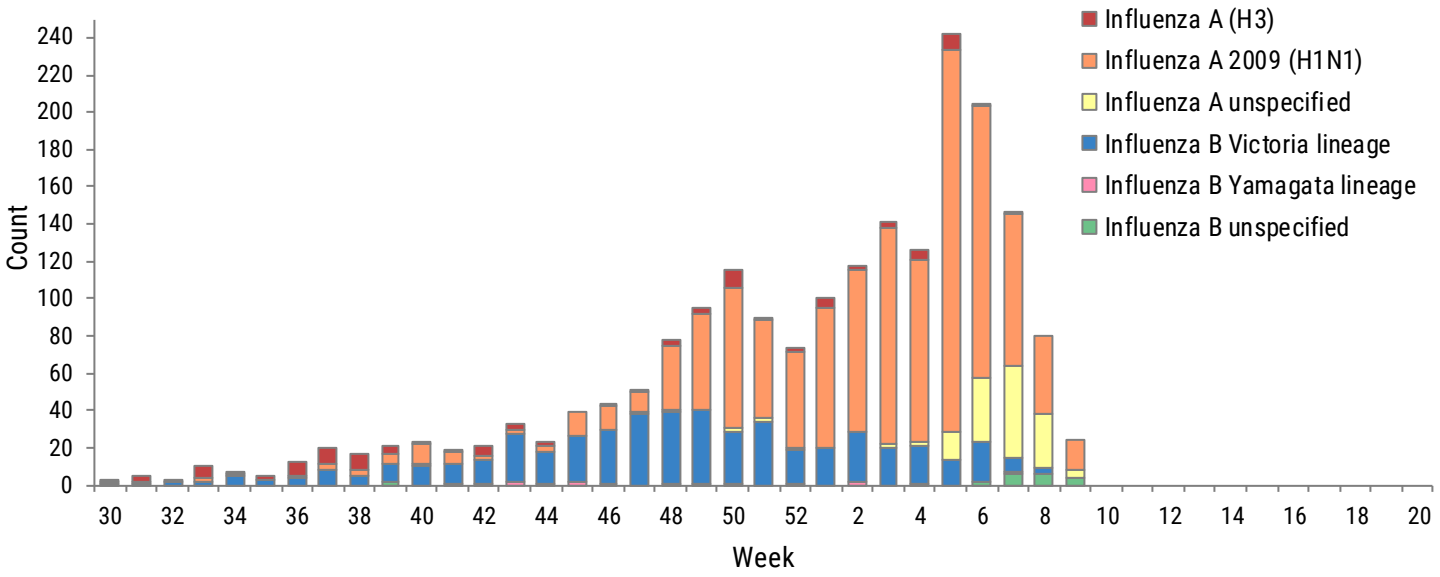


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	130 (48.2%)	78 influenza-associated outbreaks 52 ILI outbreaks
Child daycares	40 (14.8%)	17 influenza-associated outbreaks 23 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	19 (7.0%)	9 influenza-associated outbreaks 10 ILI outbreaks
Nursing facilities	15 (5.6%)	12 influenza-associated outbreaks 3 ILI outbreaks
Other long-term care facilities	29 (10.7%)	24 influenza-associated outbreaks 5 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	30 (11.1%)	28 influenza-associated outbreaks 2 ILI outbreaks
Hospitals	3 (1.1%)	2 influenza-associated outbreaks 1 ILI outbreak
Additional facility types	4 (1.5%)	2 influenza-associated outbreaks 2 ILI outbreaks
Total	**270 (100.0%)**	**172 influenza-associated outbreaks** **98 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 9, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 9, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=369) from week 40, 2016 to week 9, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity decreased** during week 9 and was above peak activity observed during the 2016-17 season.

AMERICAN OVERSIGHT

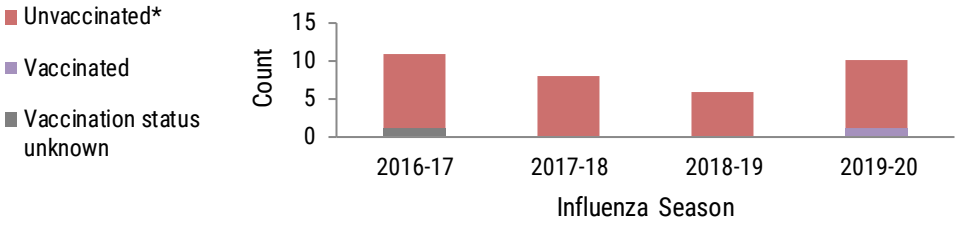
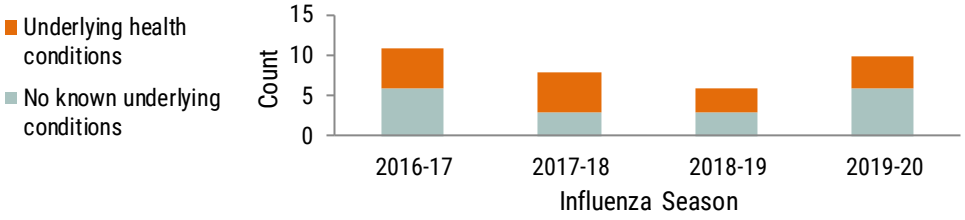
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 9, **the percent of emergency department and urgent care center visits for ILI in children <18 years decreased** and was above levels observed at this time during the 2016-17 season.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 9, 2020.

Figures 25-26: In week 9, **one new influenza-associated pediatric death was reported**. A total of ten influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 9, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 9, 2020.

In week 9, **one new influenza-associated pediatric death was reported**. The death was associated with influenza A 2009 (H1N1) in a child with known underlying medical conditions who was not vaccinated for the 2019-20 season.

A total of ten influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm

AMERICAN OVERSIGHT

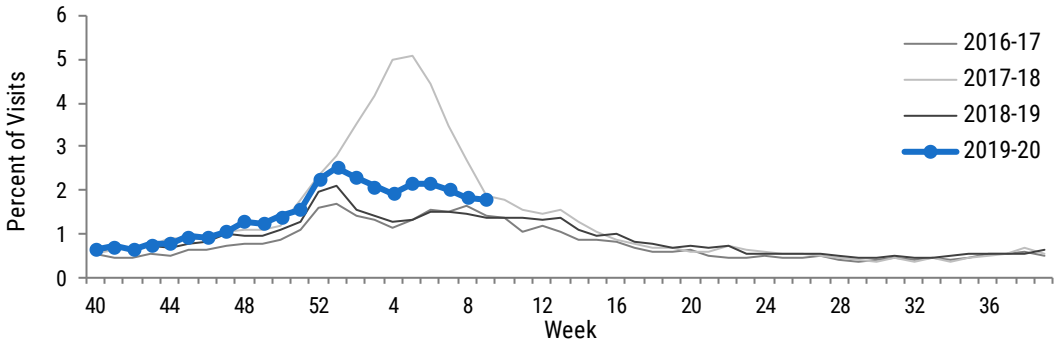
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 9, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was above peak levels observed during the 2016-17 season.



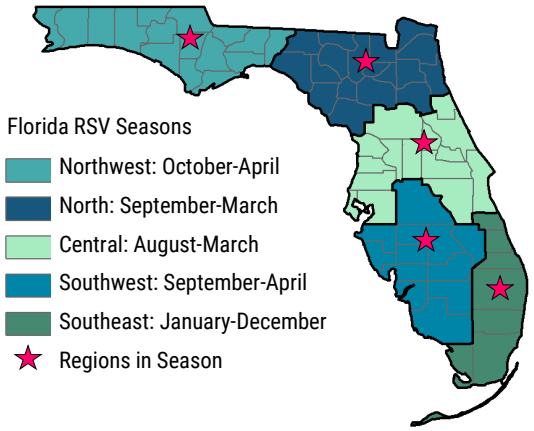
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 9, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 9, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years decreased** and was above levels observed at this time during the 2016-17 season.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 9, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

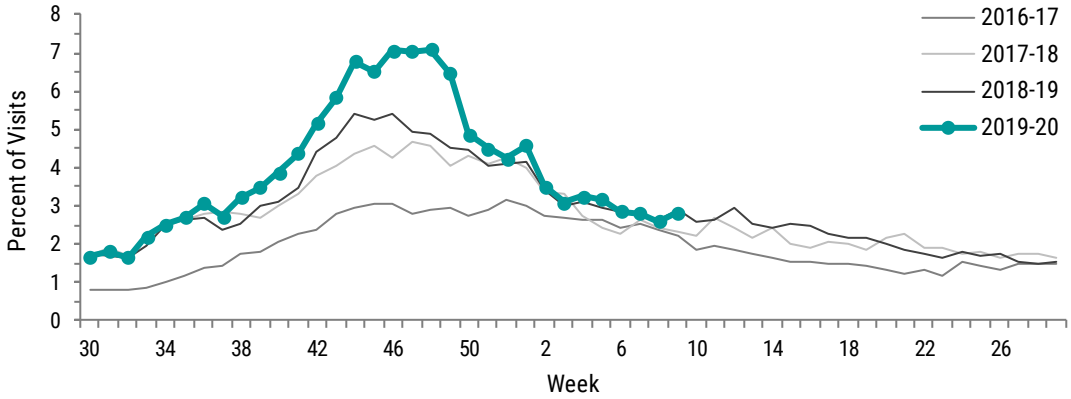
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

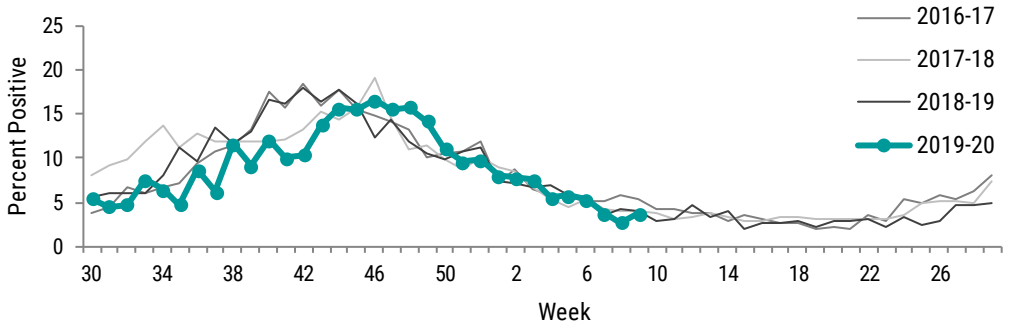
Week 9 (February 23-29, 2020) Activity Summary

In week 9, RSV activity in children <5 years increased and was similar to levels observed at this time in 2019.

No new RSV-associated outbreaks were reported in week 9. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 9, **the percent of emergency department and urgent care center visits for RSV among children <5 years increased** and was similar to levels observed at this time in 2019.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 9, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

AMERICAN OVERSIGHT

RSV Surveillance

Figure 31: In week 9, **the percent of specimens testing positive for RSV increased.** Levels were similar to those observed at this time in previous seasons.

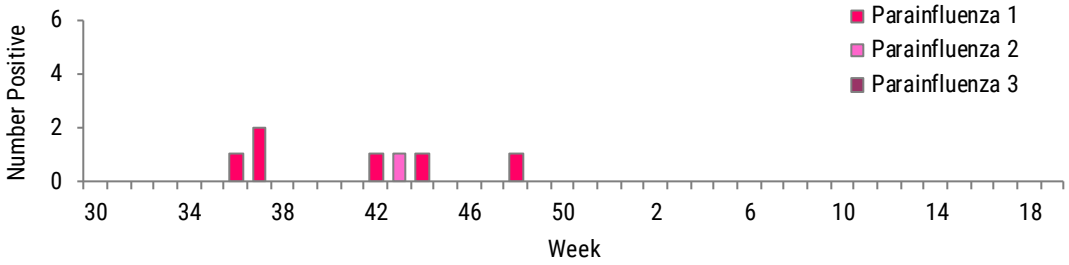
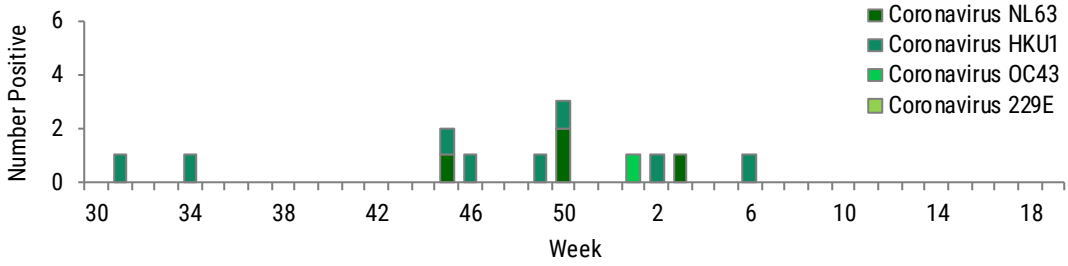
Other Respiratory Virus Surveillance





▲ **Figure 34** shows **the number of unique times a pathogen was associated with a respiratory outbreak** for outbreaks reported from week 30, 2019 to week 9, 2020.

◀ **Figure 35*** shows **the number of PCR-positive laboratory findings for enterovirus unspecified, enterovirus D68, and rhinovirus** by week** among specimens submitted to the Bureau of Public Health Laboratories (BPHL) for extended respiratory panel testing.

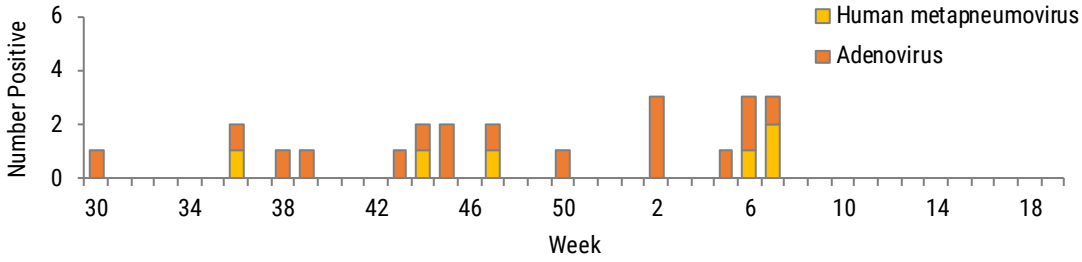


Figure 36* shows **the ▶ number of PCR-positive laboratory findings for parainfluenza 1-3** by week** among specimens submitted to BPHL for extended respiratory panel testing.

◀ **Figure 37*** shows **the number of PCR-positive laboratory findings for seasonal coronaviruses NL63, HKU1, OC43, and 229E** by week** among specimens submitted to BPHL for extended respiratory panel testing.

Figure 38* shows **the ▶ number of PCR-positive laboratory findings for human metapneumovirus and adenovirus** by week** among specimens submitted to BPHL for extended respiratory panel testing.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 9, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Assisted living facility	Pinellas	3	2	Unknown	Influenza unspecified	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=369) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 9, 2020 Florida Flu Review
Date:	Wednesday, March 4, 2020 2:46:03 PM
Attachments:	Week 9, 2020 Florida Flu Review.pdf

Good afternoon!

Attached is the Week 9, 2020 Florida Flu Review.

Week 9 influenza & influenza-like illness (ILI) activity summary:

Activity decreased in week 9 but remained above peak levels observed in the 2016-17 season. Decreases were observed in all regions of the state. Elevated activity is still expected for several more weeks.

Nine outbreaks were reported, down from 18 outbreaks in the previous week. Of the nine outbreaks reported, two were influenza-associated and seven were ILI.
One new influenza-associated pediatric death was reported in an unvaccinated child with underlying medical conditions. Ten influenza-associated pediatric deaths have been reported so far this season; only one child was vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On January 10, 2020, CDC issued a health advisory reminding clinicians to reiterate vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Florida ILI Surveillance System Summary 16

Background

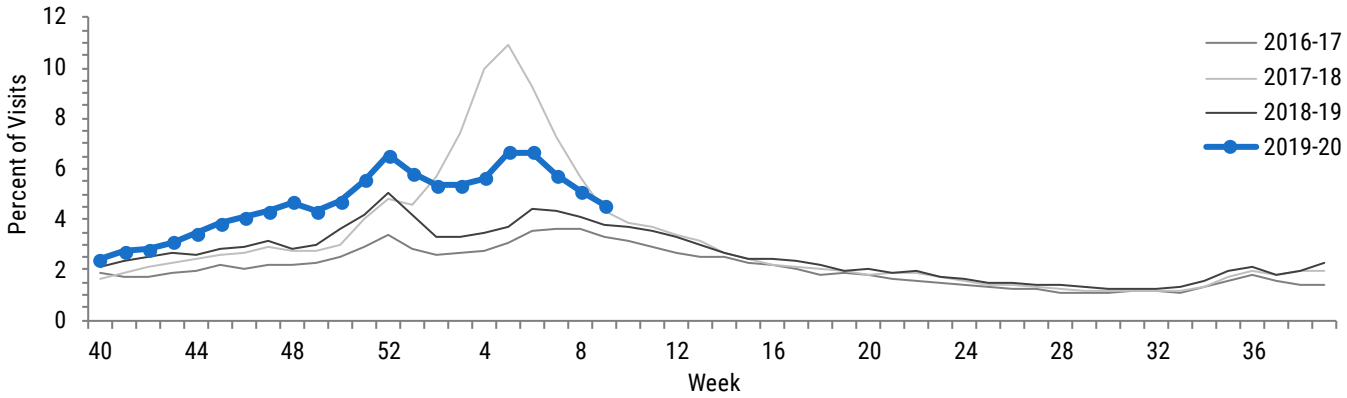
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



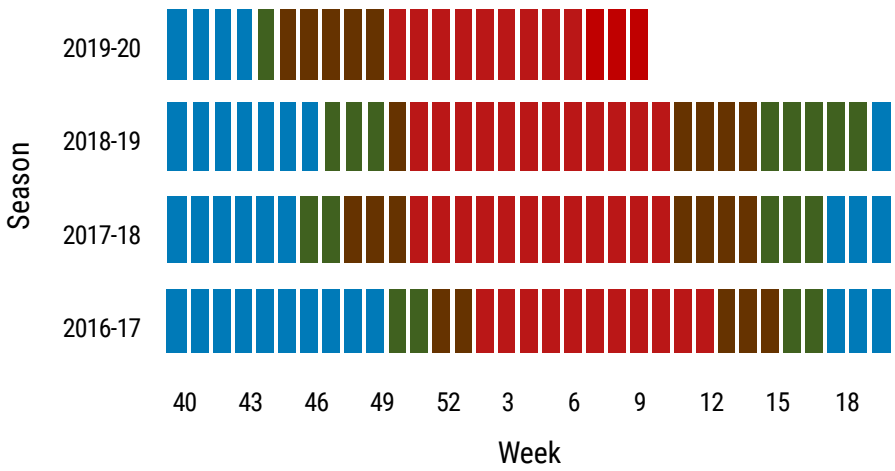
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 9, **the percent of emergency department and urgent care center visits for ILI statewide decreased** but remained above peak levels observed during the 2016-17 season.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=369) statewide for the current season (week 40, 2019 to week 9, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 9, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 9, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

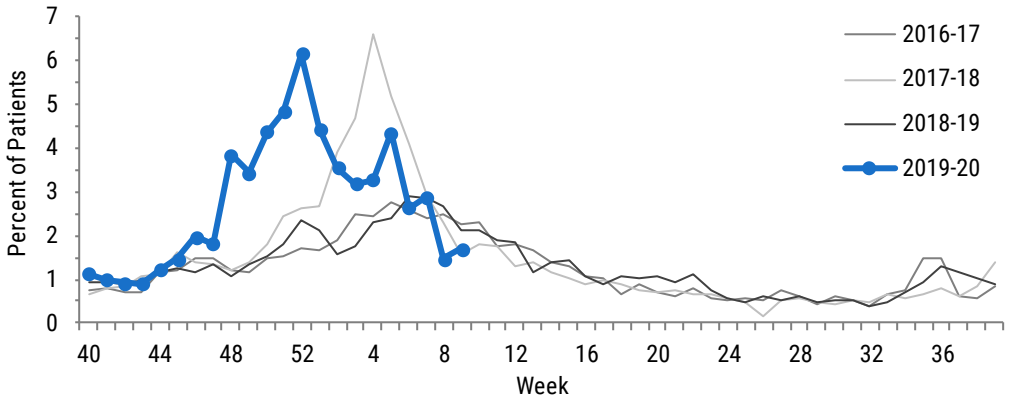
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 9, **the percent of patients with ILI reported by ILINet providers statewide increased** and was below levels observed during the 2016-17 and 2018-19 seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=7), week 40, 2016 to week 9, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



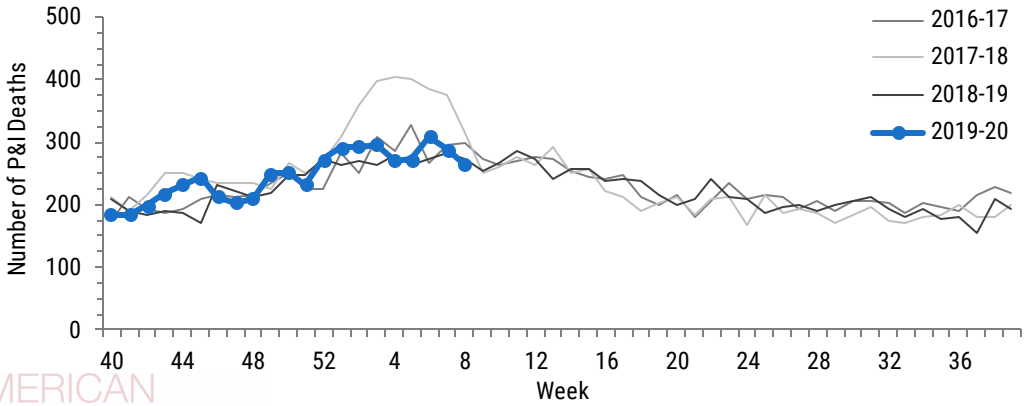


Figure 4: In week 8 (ending 2/22/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was slightly below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 8, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

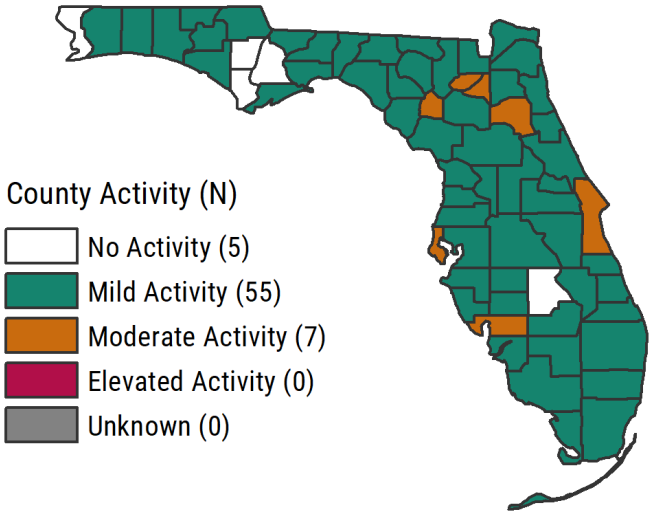
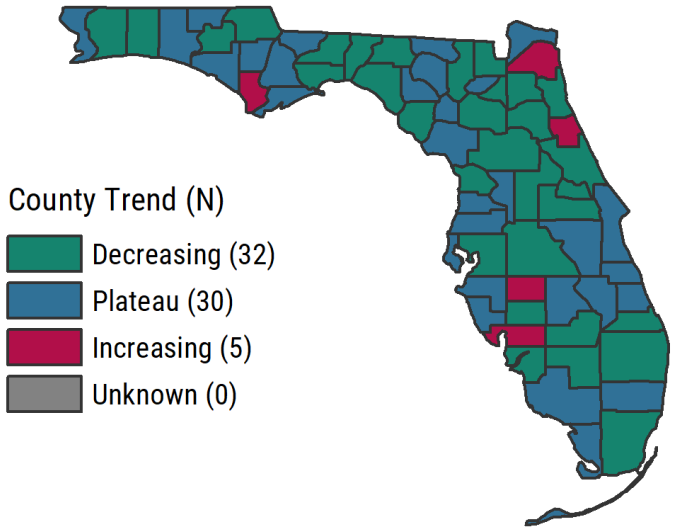
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 9. Seven counties reported **moderate activity.**





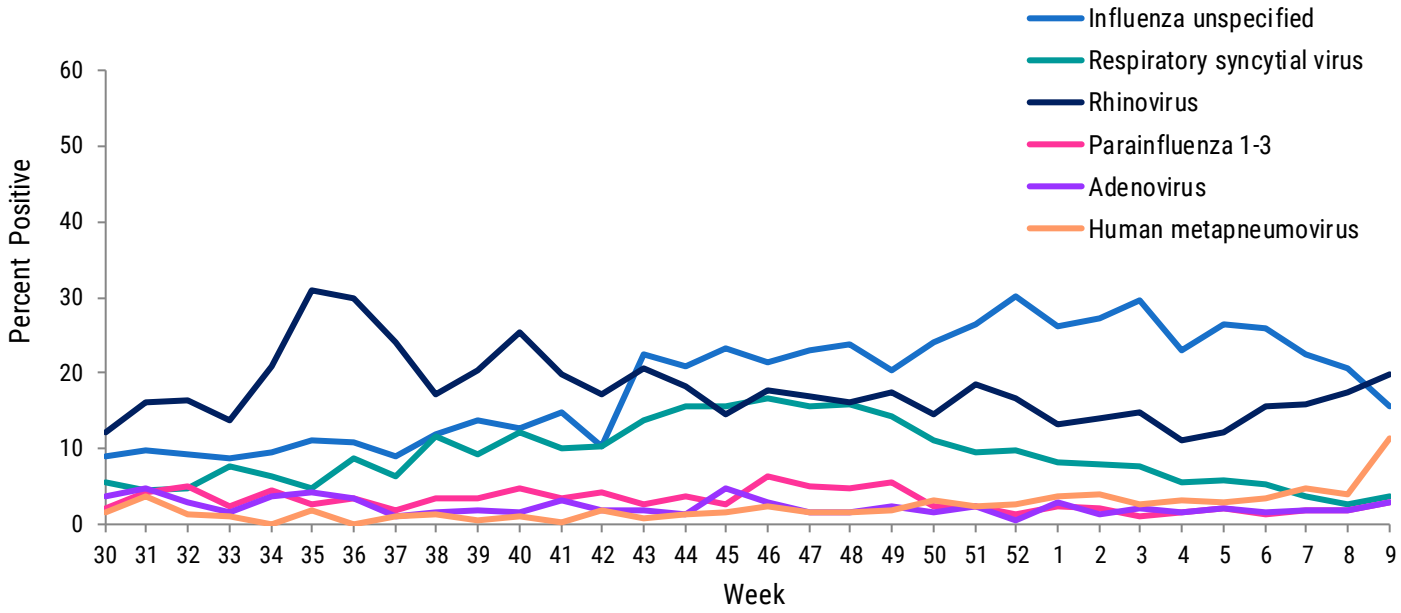


Figure 7: Most counties reported **decreasing activity** for week 9. Five counties reported **increasing activity,** and thirty counties reported **activity at a plateau.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: The **percent of specimens testing positive for influenza decreased** in recent weeks. Of note, the volume of laboratory tests reported in week 9 was lower than expected.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=7), week 40, 2019 to week 9, 2020.

AMERICAN OVERSIGHT

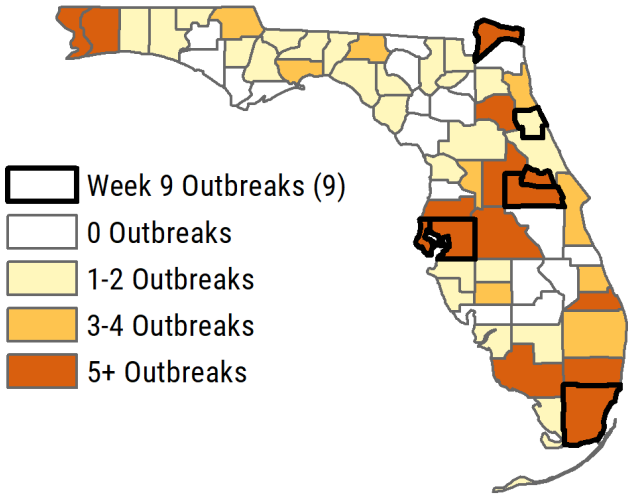
Influenza and ILI Outbreaks

Week 9 Outbreaks at a Glance:

Number Reported:
9 Outbreaks

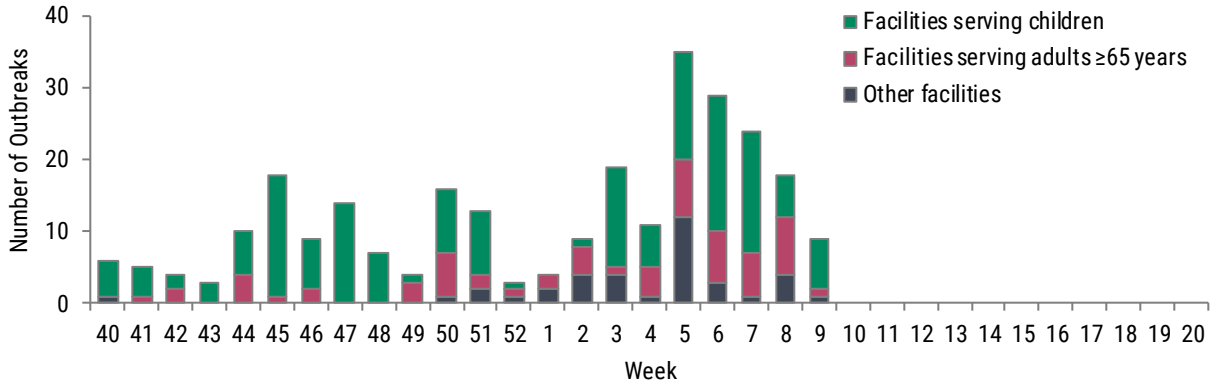
Influenza-Associated:
2 Outbreaks



Severe Outcomes*:
1 Outbreak

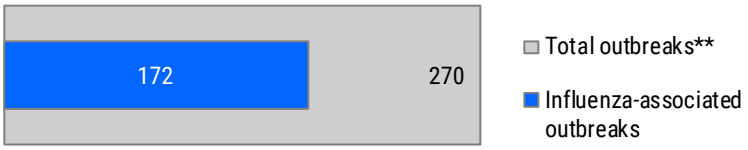
Outbreak Summary:

In week 9, two influenza-associated and seven ILI outbreaks were reported, a decrease from the previous week.



Severe outcomes* were reported in one of nine outbreaks. Two hospitalizations and no deaths were reported in this outbreak.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 9, the outbreak with severe outcomes was in a facility serving adults aged ≥65 years.



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 9 are **outlined in bold.**

Figure 9: In week 9, **one outbreak** was reported among **facilities serving adults aged ≥65 years, seven outbreaks** were reported in **facilities serving children,** and **one outbreak** was reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 9, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 9, **63.7% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 9, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

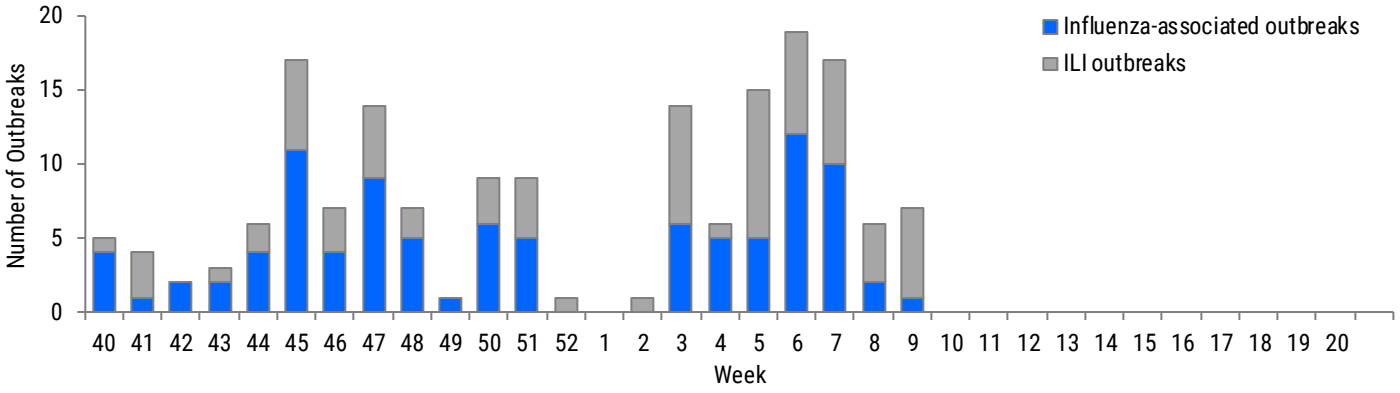
Influenza and ILI Outbreaks

Facilities Serving Children*:



7 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

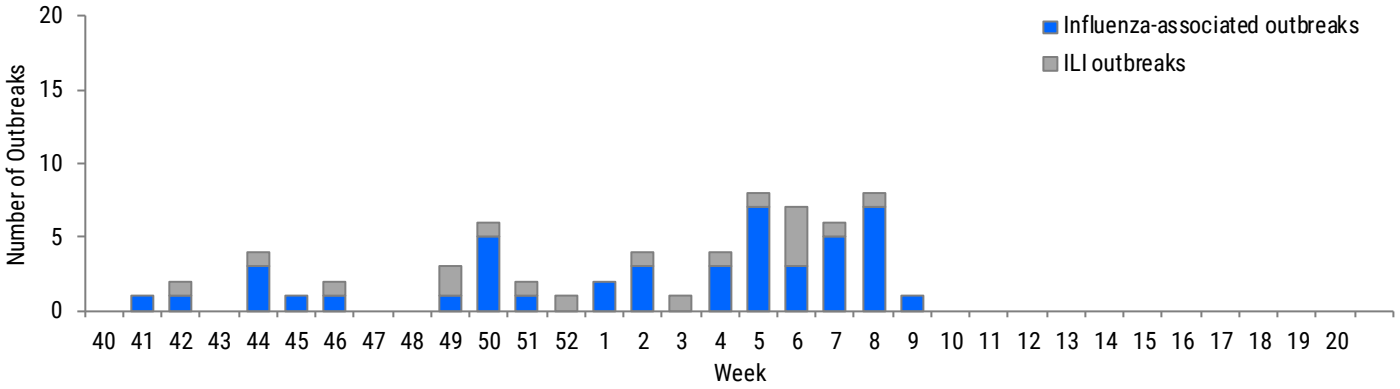
In week 9, seven new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 9, **one influenza-associated outbreak** and **six ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 9, 2020.

Facilities Serving Adults ≥65 yrs.**:



1 Outbreak

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 9, one new outbreak of influenza or ILI was reported among facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 9, **one influenza-associated outbreak** was reported among **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 9, 2020.

AMERICAN OVERSIGHT

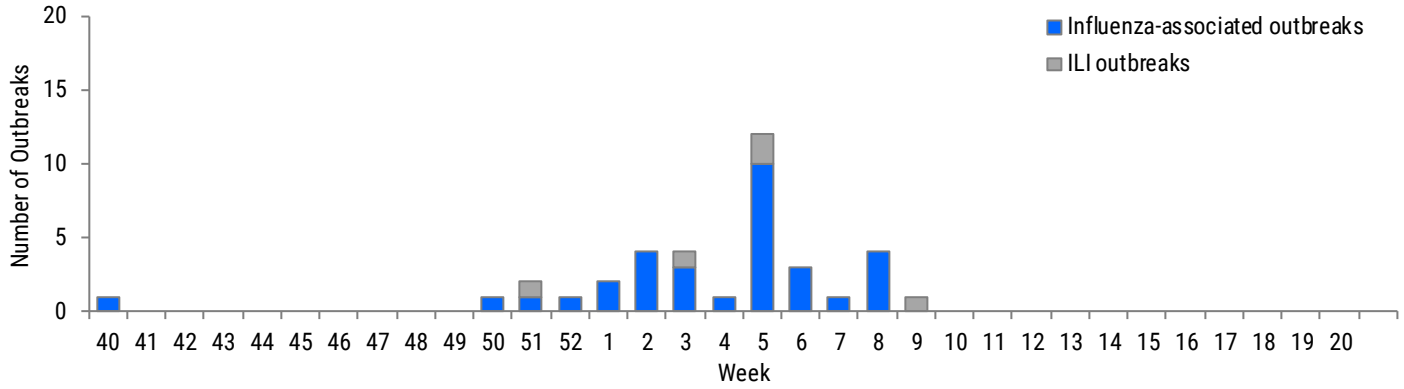
Influenza and ILI Outbreaks

Other Facilities*:



1 Outbreak

Summary of Outbreaks in Other Facilities:

In week 9, one new outbreak of influenza or ILI was reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 9, **one ILI outbreak** was reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 9, 2020.

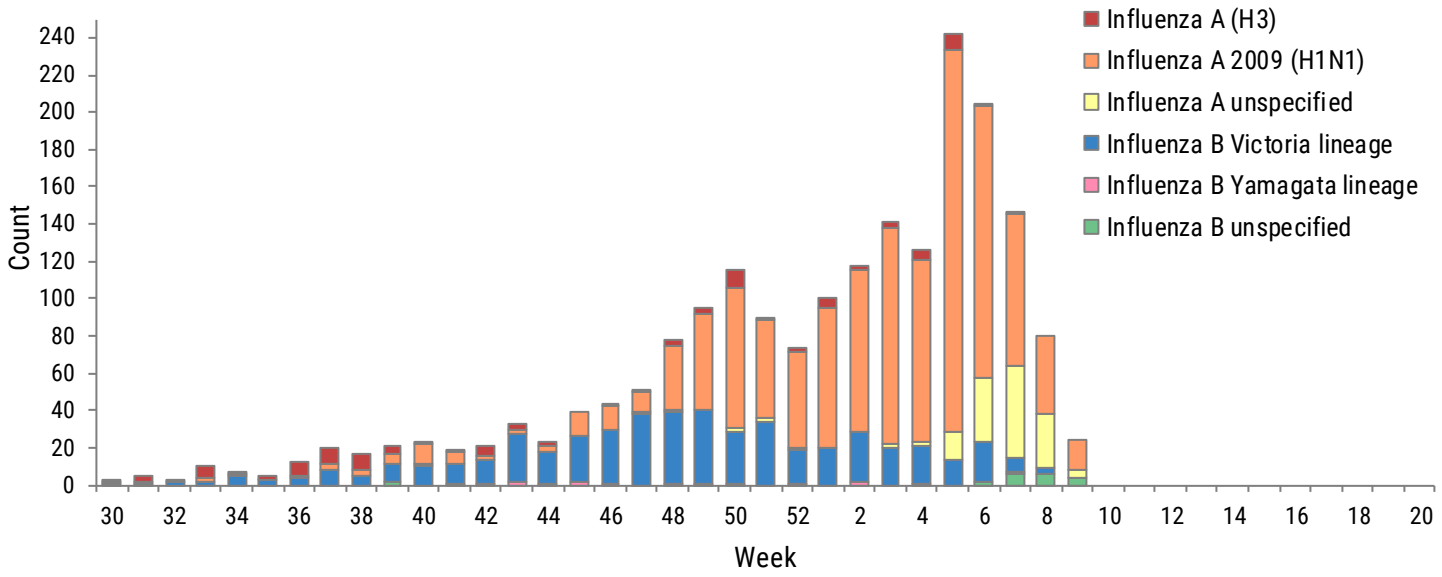


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	130 (48.2%)	78 influenza-associated outbreaks 52 ILI outbreaks
Child daycares	40 (14.8%)	17 influenza-associated outbreaks 23 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	19 (7.0%)	9 influenza-associated outbreaks 10 ILI outbreaks
Nursing facilities	15 (5.6%)	12 influenza-associated outbreaks 3 ILI outbreaks
Other long-term care facilities	29 (10.7%)	24 influenza-associated outbreaks 5 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	30 (11.1%)	28 influenza-associated outbreaks 2 ILI outbreaks
Hospitals	3 (1.1%)	2 influenza-associated outbreaks 1 ILI outbreak
Additional facility types	4 (1.5%)	2 influenza-associated outbreaks 2 ILI outbreaks
Total	**270 (100.0%)**	**172 influenza-associated outbreaks** **98 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 9, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 9, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=369) from week 40, 2016 to week 9, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity decreased** during week 9 and was above peak activity observed during the 2016-17 season.

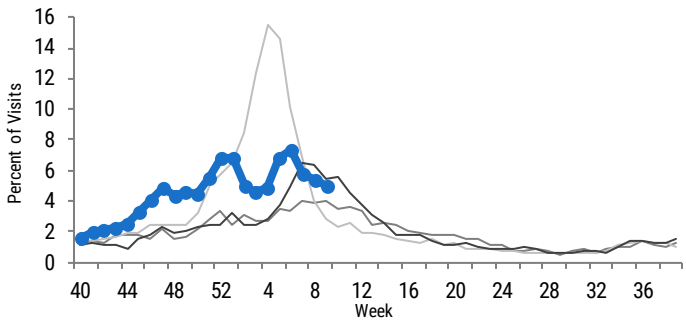

Figure 17: In **region 2, ILI activity decreased** during week 9 and was above peak activity observed during the 2016-17 season.

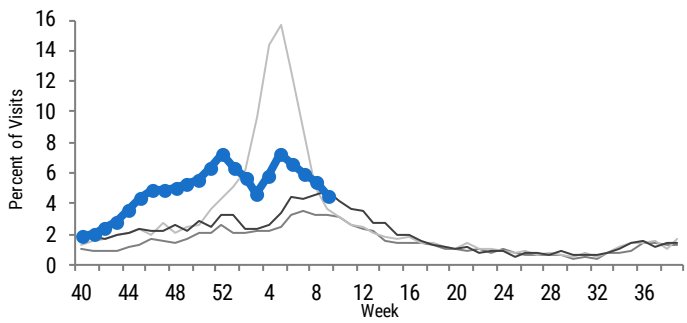

Figure 18: In **region 3, ILI activity decreased** during week 9 and was above peak activity observed during the 2016-17 season.

AMERICAN OVERSIGHT

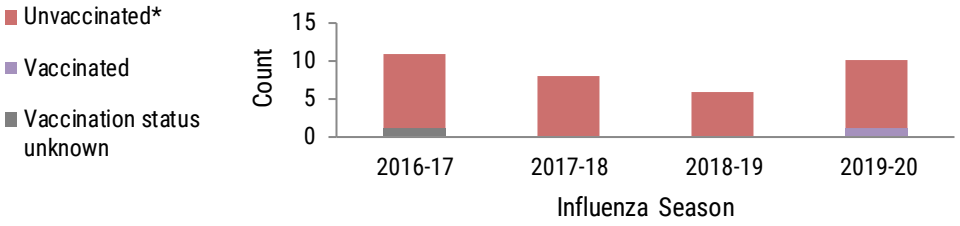
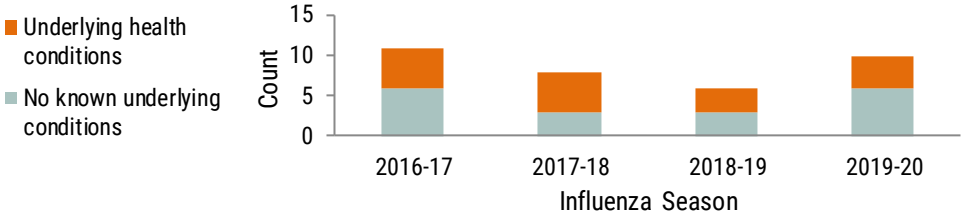
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 9, **the percent of emergency department and urgent care center visits for ILI in children <18 years decreased** and was above levels observed at this time during the 2016-17 season.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 9, 2020.

Figures 25-26: In week 9, **one new influenza-associated pediatric death was reported**. A total of ten influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 9, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 9, 2020.

In week 9, **one new influenza-associated pediatric death was reported**. The death was associated with influenza A 2009 (H1N1) in a child with known underlying medical conditions who was not vaccinated for the 2019-20 season.

A total of ten influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm

AMERICAN OVERSIGHT

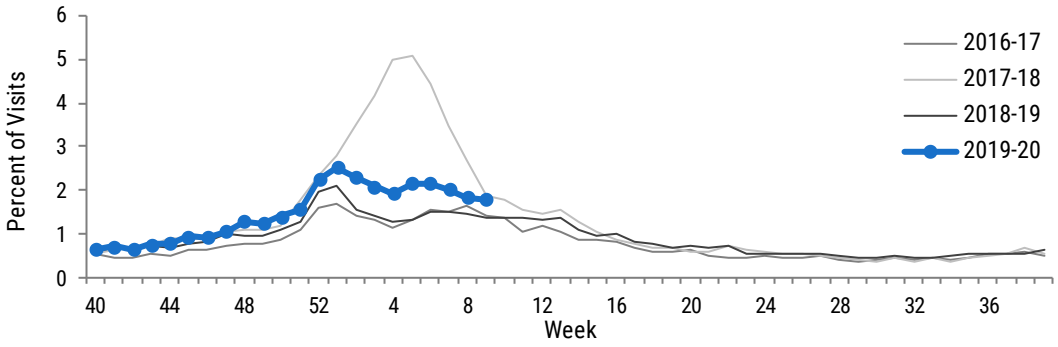
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 9, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was above peak levels observed during the 2016-17 season.



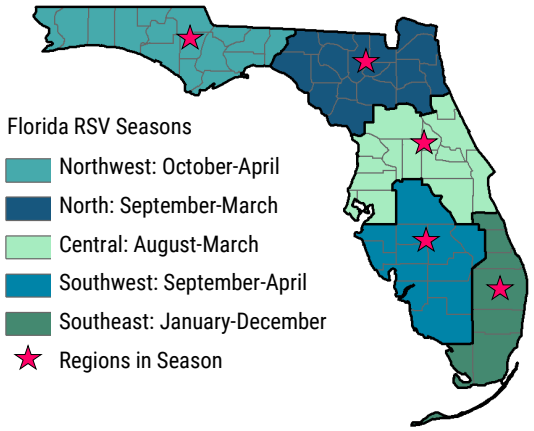
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 9, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 9, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years decreased** and was above levels observed at this time during the 2016-17 season.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 9, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

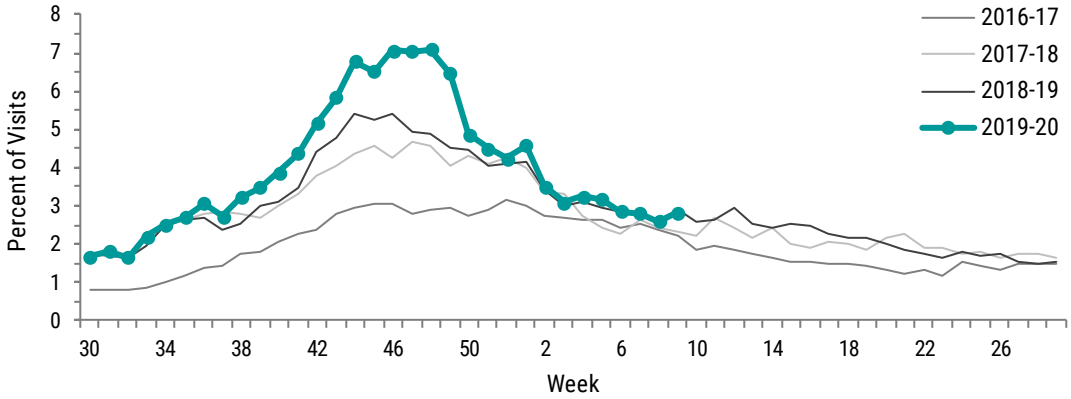
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

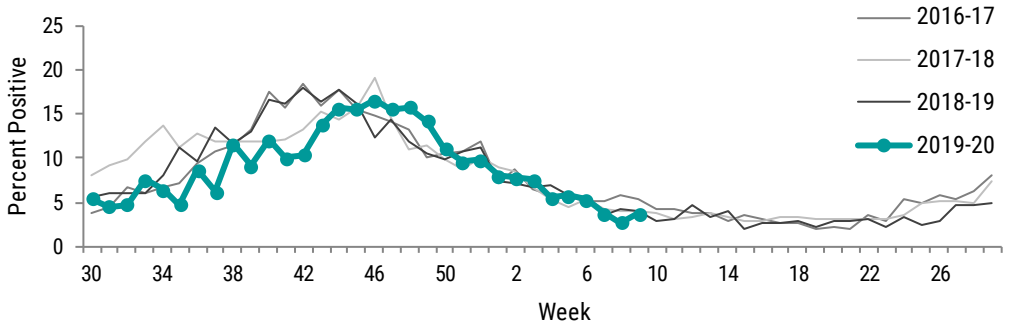
Week 9 (February 23-29, 2020) Activity Summary

In week 9, RSV activity in children <5 years increased and was similar to levels observed at this time in 2019.

No new RSV-associated outbreaks were reported in week 9. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 9, **the percent of emergency department and urgent care center visits for RSV among children <5 years increased** and was similar to levels observed at this time in 2019.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 9, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

◀ **Figure 35*** shows **the number of PCR-positive laboratory findings for enterovirus unspecified, enterovirus D68, and rhinovirus** by week** among specimens submitted to the Bureau of Public Health Laboratories (BPHL) for extended respiratory panel testing.

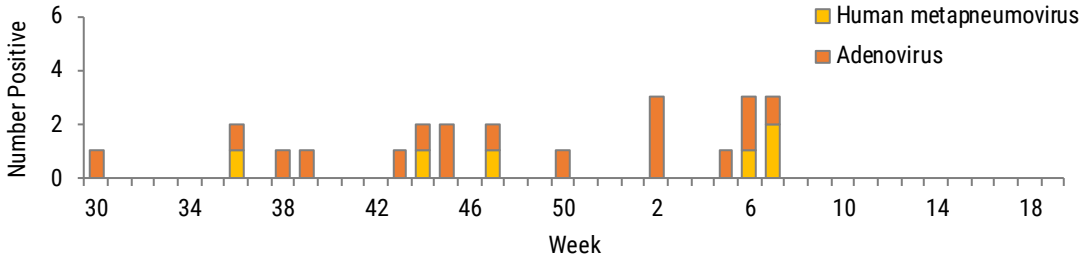

Figure 36* shows **the ▶ number of PCR-positive laboratory findings for parainfluenza 1-3** by week** among specimens submitted to BPHL for extended respiratory panel testing.

◀ **Figure 37*** shows **the number of PCR-positive laboratory findings for seasonal coronaviruses NL63, HKU1, OC43, and 229E** by week** among specimens submitted to BPHL for extended respiratory panel testing.

Figure 38* shows **the ▶ number of PCR-positive laboratory findings for human metapneumovirus and adenovirus** by week** among specimens submitted to BPHL for extended respiratory panel testing.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 9, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Assisted living facility	Pinellas	3	2	Unknown	Influenza unspecified	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=369) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 9, 2020 Florida Flu Review
Date:	Wednesday, March 4, 2020 2:46:03 PM
Attachments:	Week 9, 2020 Florida Flu Review.pdf

Good afternoon!

Attached is the Week 9, 2020 Florida Flu Review.

Week 9 influenza & influenza-like illness (ILI) activity summary:

Activity decreased in week 9 but remained above peak levels observed in the 2016-17 season. Decreases were observed in all regions of the state. Elevated activity is still expected for several more weeks.

Nine outbreaks were reported, down from 18 outbreaks in the previous week. Of the nine outbreaks reported, two were influenza-associated and seven were ILI.
One new influenza-associated pediatric death was reported in an unvaccinated child with underlying medical conditions. Ten influenza-associated pediatric deaths have been reported so far this season; only one child was vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On January 10, 2020, CDC issued a health advisory reminding clinicians to reiterate vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Florida ILI Surveillance System Summary 16

Background

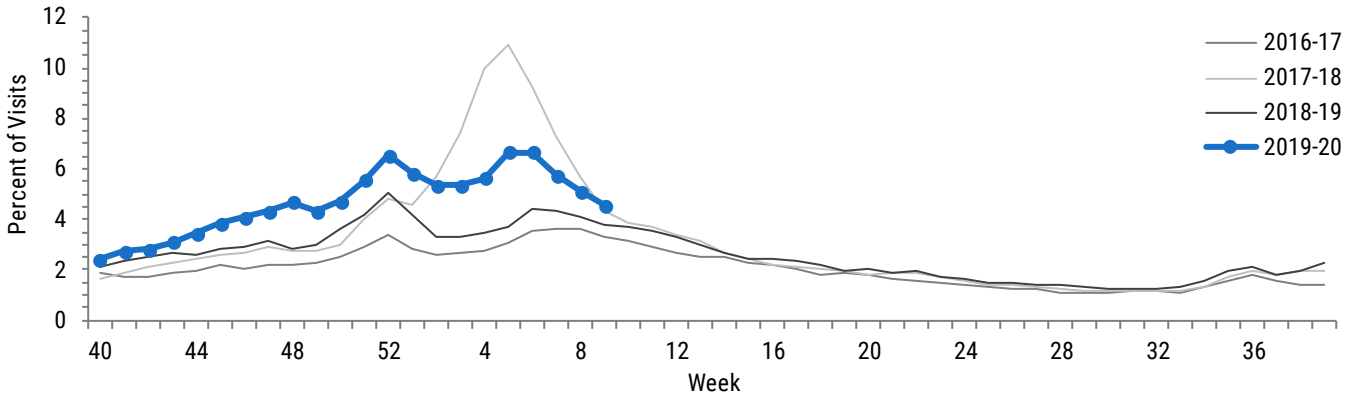
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



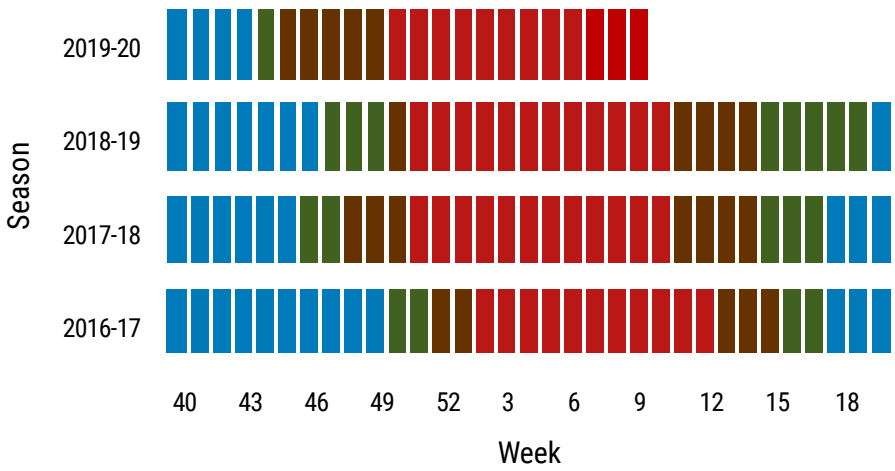
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 9, **the percent of emergency department and urgent care center visits for ILI statewide decreased** but remained above peak levels observed during the 2016-17 season.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=369) statewide for the current season (week 40, 2019 to week 9, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 9, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 9, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

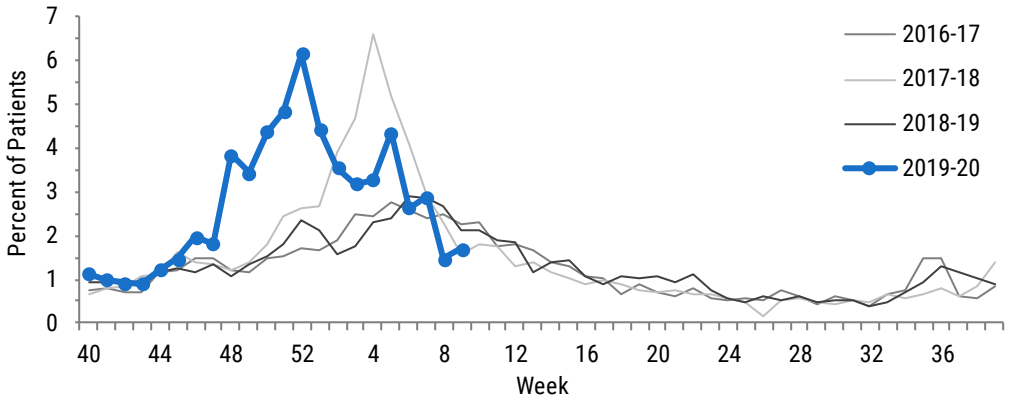
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 9, **the percent of patients with ILI reported by ILINet providers statewide increased** and was below levels observed during the 2016-17 and 2018-19 seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=7), week 40, 2016 to week 9, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



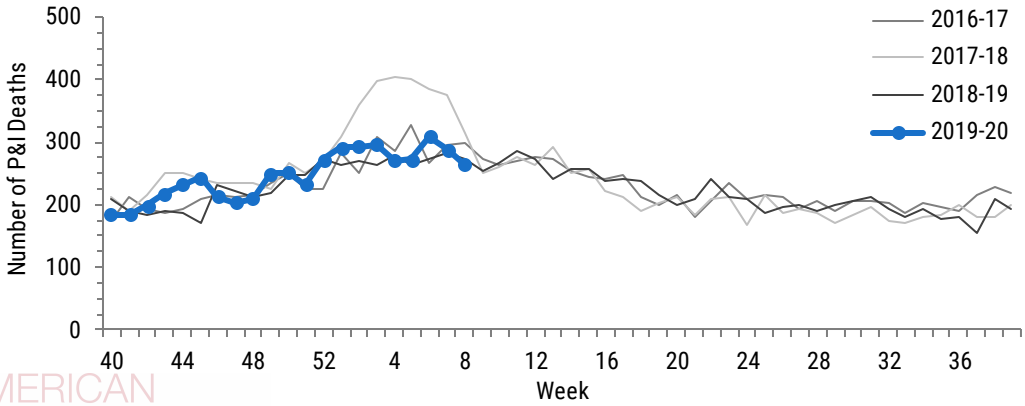


Figure 4: In week 8 (ending 2/22/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was slightly below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 8, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

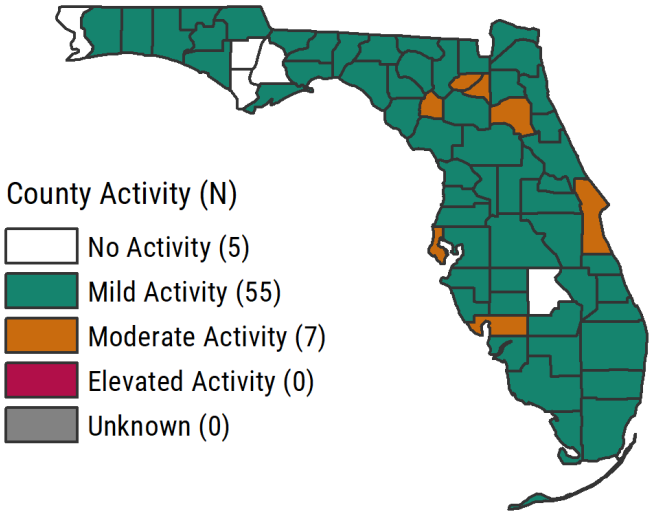
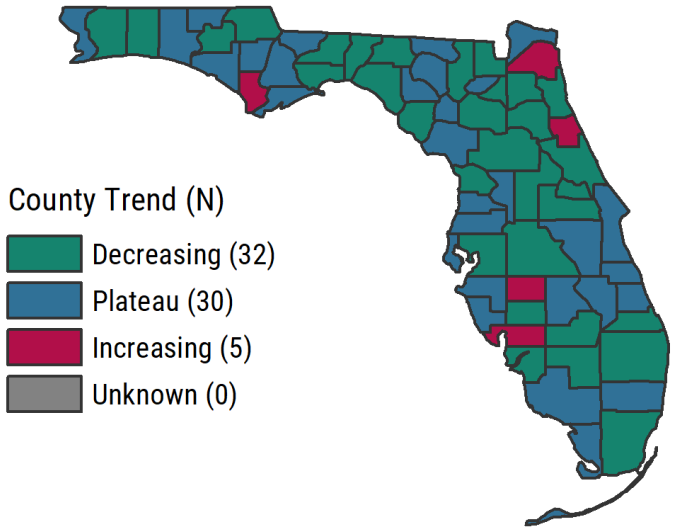
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 9. Seven counties reported **moderate activity.**





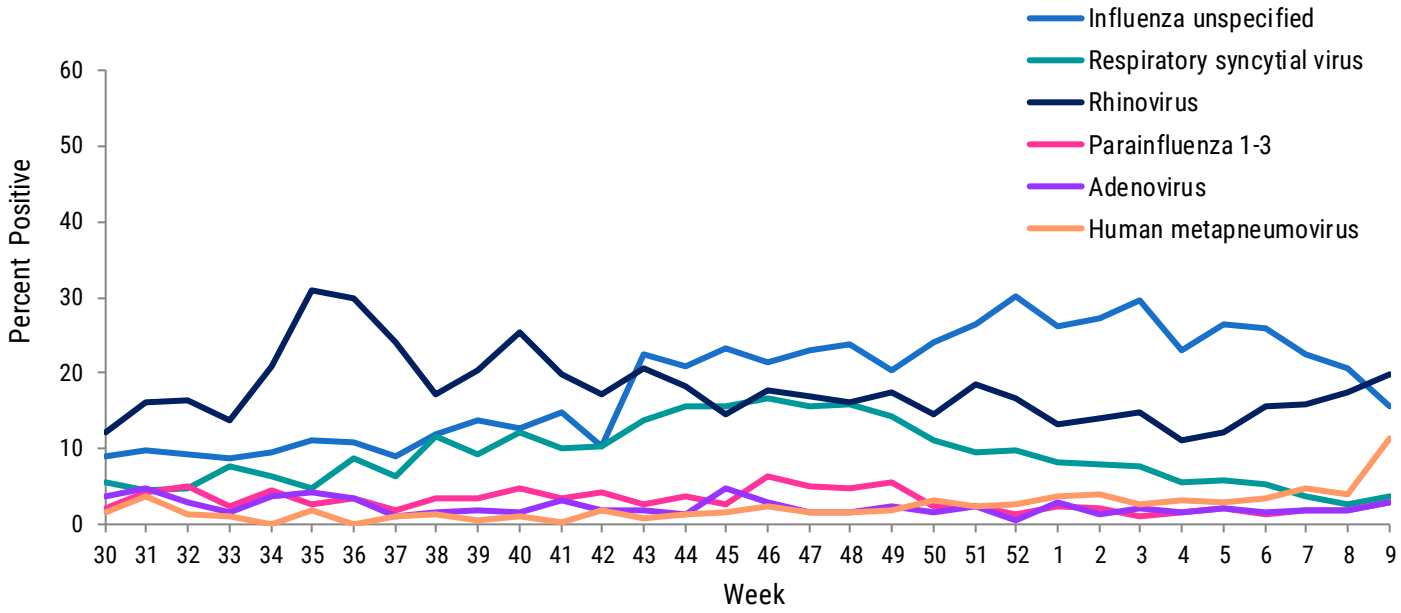


Figure 7: Most counties reported **decreasing activity** for week 9. Five counties reported **increasing activity,** and thirty counties reported **activity at a plateau.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: The **percent of specimens testing positive for influenza decreased** in recent weeks. Of note, the volume of laboratory tests reported in week 9 was lower than expected.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=7), week 40, 2019 to week 9, 2020.

AMERICAN OVERSIGHT

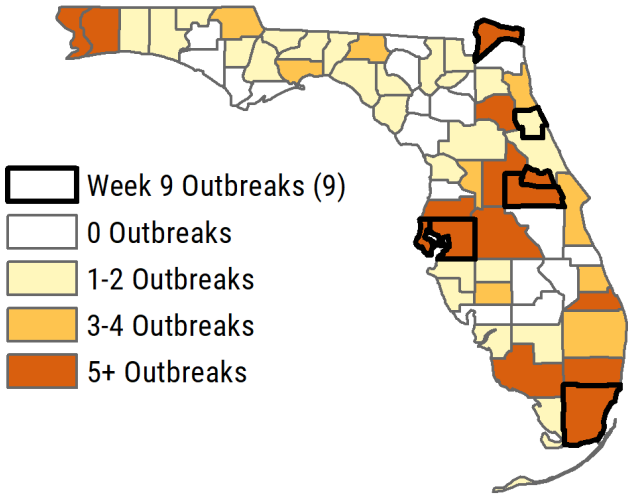
Influenza and ILI Outbreaks

Week 9 Outbreaks at a Glance:

Number Reported:
9 Outbreaks

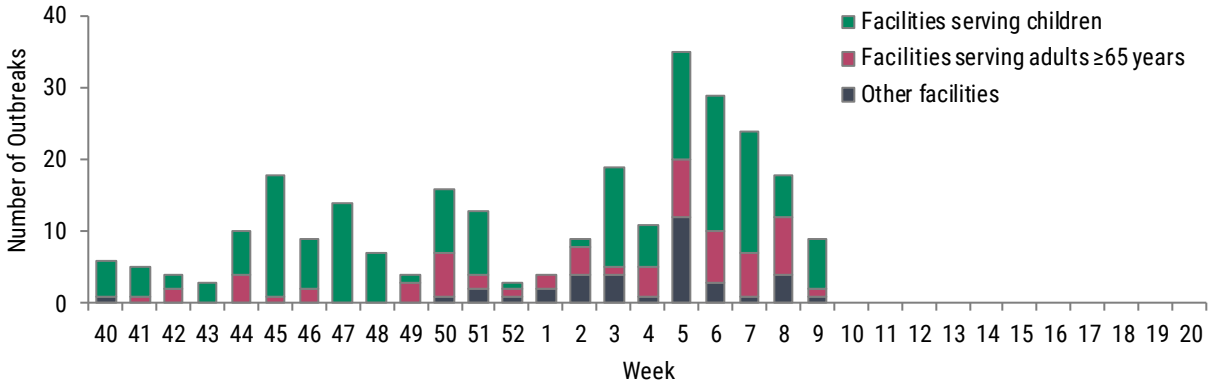
Influenza-Associated:
2 Outbreaks



Severe Outcomes*:
1 Outbreak

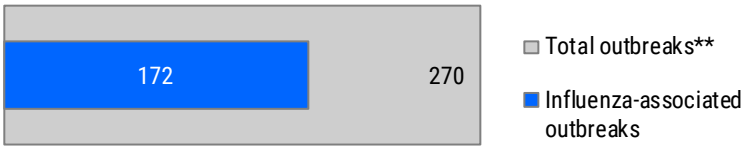
Outbreak Summary:

In week 9, two influenza-associated and seven ILI outbreaks were reported, a decrease from the previous week.



Severe outcomes* were reported in one of nine outbreaks. Two hospitalizations and no deaths were reported in this outbreak.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 9, the outbreak with severe outcomes was in a facility serving adults aged ≥65 years.



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 9 are **outlined in bold.**

Figure 9: In week 9, **one outbreak** was reported among **facilities serving adults aged ≥65 years, seven outbreaks** were reported in **facilities serving children,** and **one outbreak** was reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 9, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 9, **63.7% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 9, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

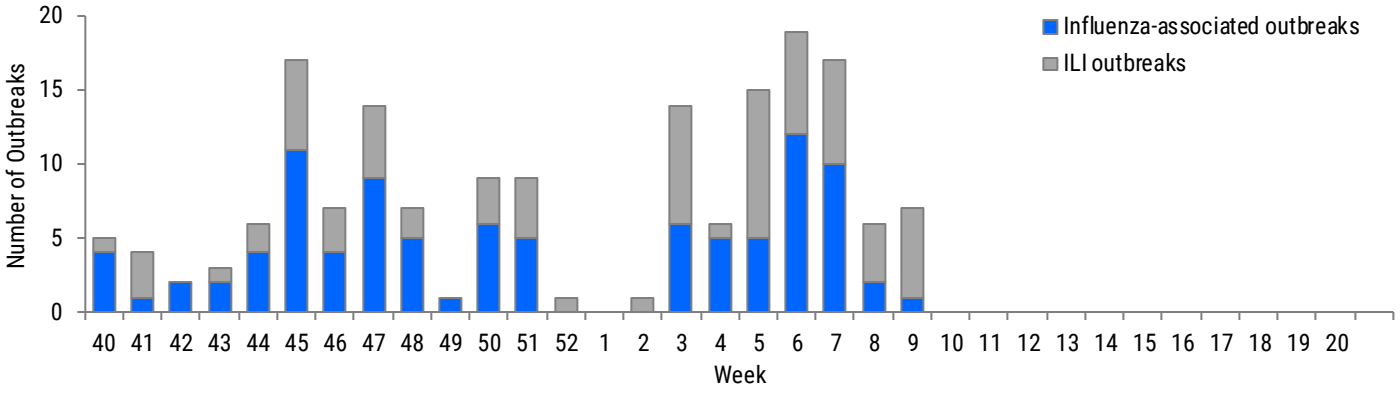
Influenza and ILI Outbreaks

Facilities Serving Children*:



7 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

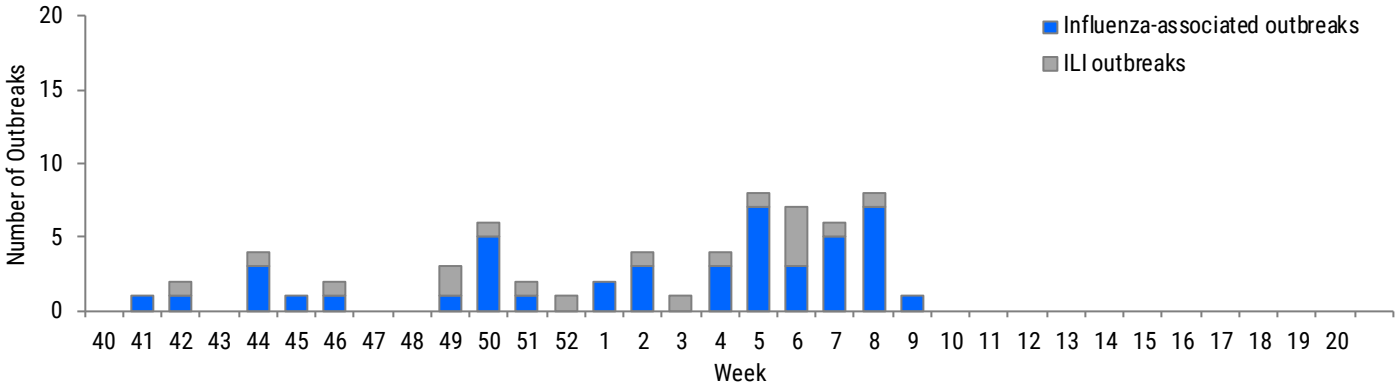
In week 9, seven new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 9, **one influenza-associated outbreak** and **six ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 9, 2020.

Facilities Serving Adults ≥65 yrs.**:



1 Outbreak

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 9, one new outbreak of influenza or ILI was reported among facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 9, **one influenza-associated outbreak** was reported among **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 9, 2020.

AMERICAN OVERSIGHT

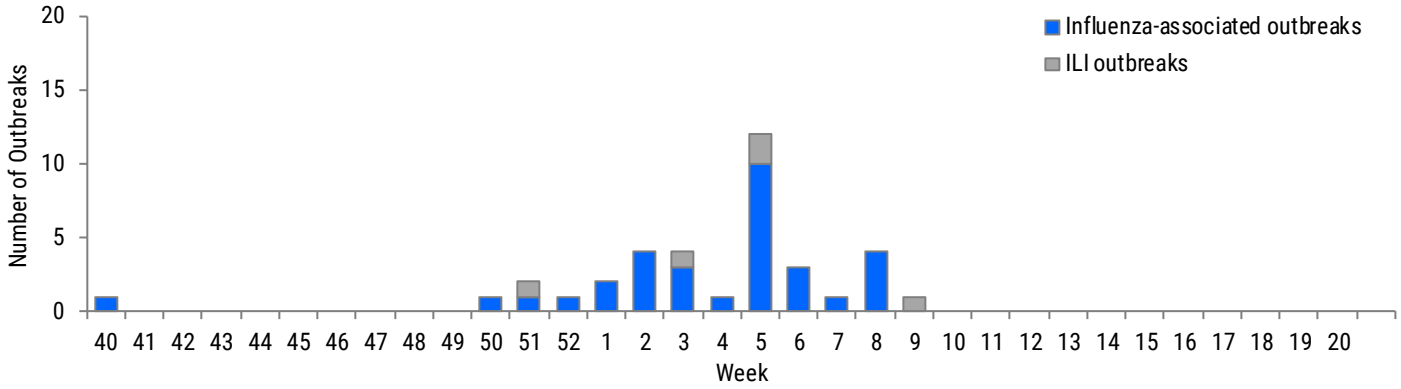
Influenza and ILI Outbreaks

Other Facilities*:



1 Outbreak

Summary of Outbreaks in Other Facilities:

In week 9, one new outbreak of influenza or ILI was reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 9, **one ILI outbreak** was reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 9, 2020.

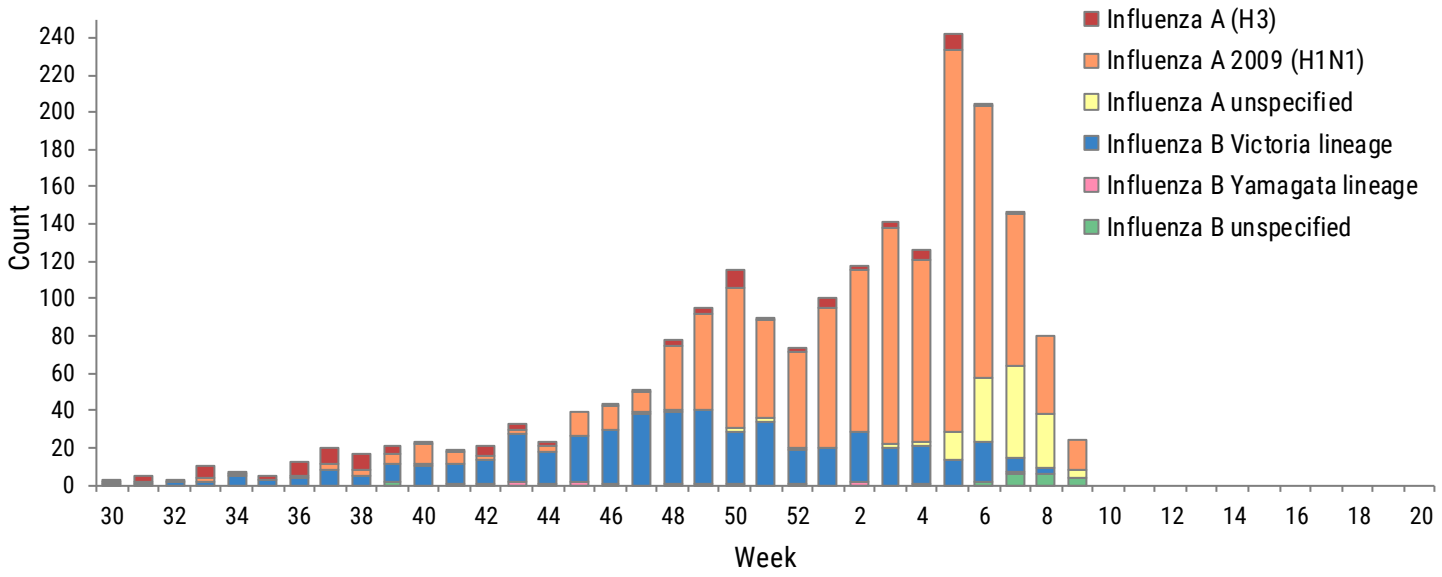


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	130 (48.2%)	78 influenza-associated outbreaks 52 ILI outbreaks
Child daycares	40 (14.8%)	17 influenza-associated outbreaks 23 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	19 (7.0%)	9 influenza-associated outbreaks 10 ILI outbreaks
Nursing facilities	15 (5.6%)	12 influenza-associated outbreaks 3 ILI outbreaks
Other long-term care facilities	29 (10.7%)	24 influenza-associated outbreaks 5 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	30 (11.1%)	28 influenza-associated outbreaks 2 ILI outbreaks
Hospitals	3 (1.1%)	2 influenza-associated outbreaks 1 ILI outbreak
Additional facility types	4 (1.5%)	2 influenza-associated outbreaks 2 ILI outbreaks
Total	**270 (100.0%)**	**172 influenza-associated outbreaks** **98 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 9, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 9, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=369) from week 40, 2016 to week 9, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

AMERICAN OVERSIGHT

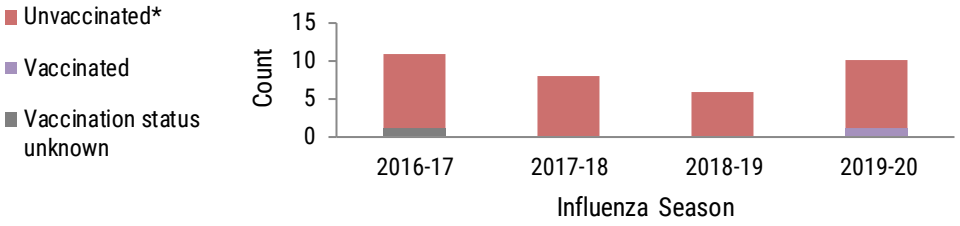
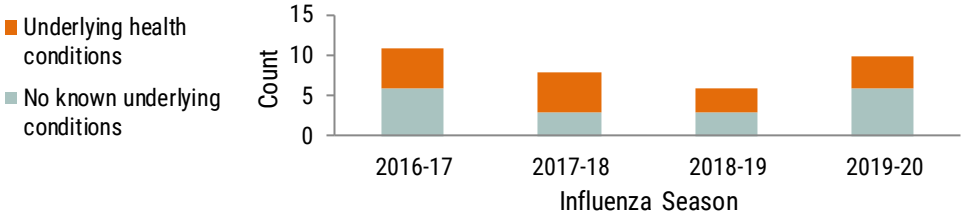
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 9, **the percent of emergency department and urgent care center visits for ILI in children <18 years decreased** and was above levels observed at this time during the 2016-17 season.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 9, 2020.

Figures 25-26: In week 9, **one new influenza-associated pediatric death was reported**. A total of ten influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 9, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 9, 2020.

In week 9, **one new influenza-associated pediatric death was reported**. The death was associated with influenza A 2009 (H1N1) in a child with known underlying medical conditions who was not vaccinated for the 2019-20 season.

A total of ten influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm

AMERICAN OVERSIGHT

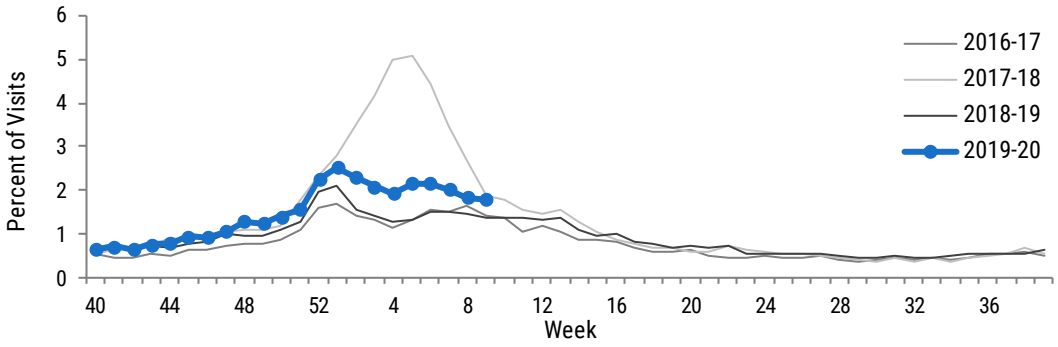
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 9, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was above peak levels observed during the 2016-17 season.



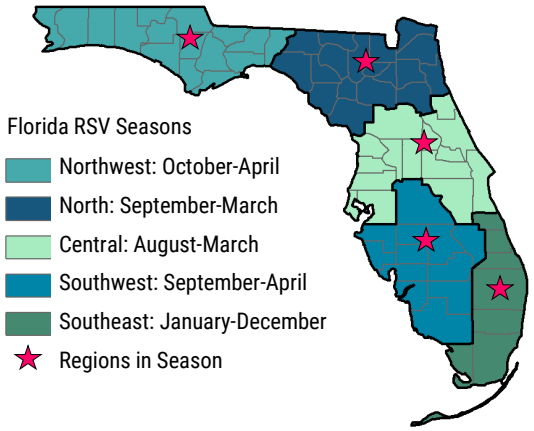
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 9, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 9, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years decreased** and was above levels observed at this time during the 2016-17 season.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 9, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

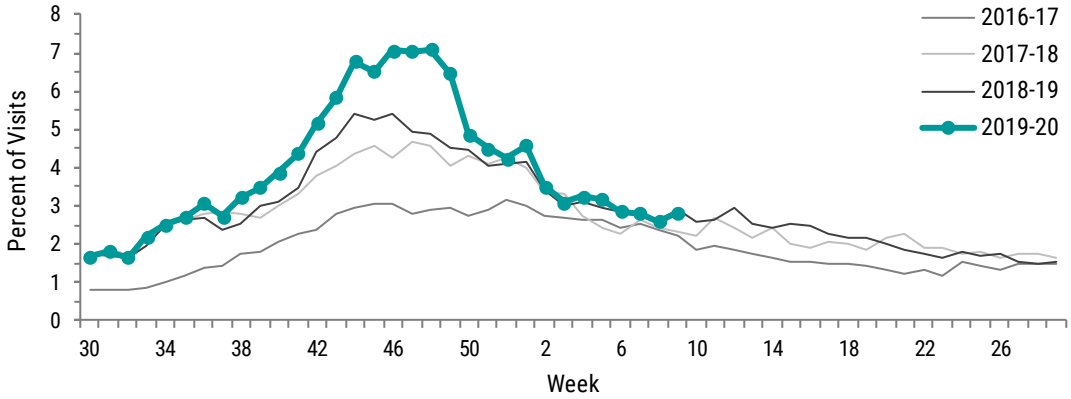
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

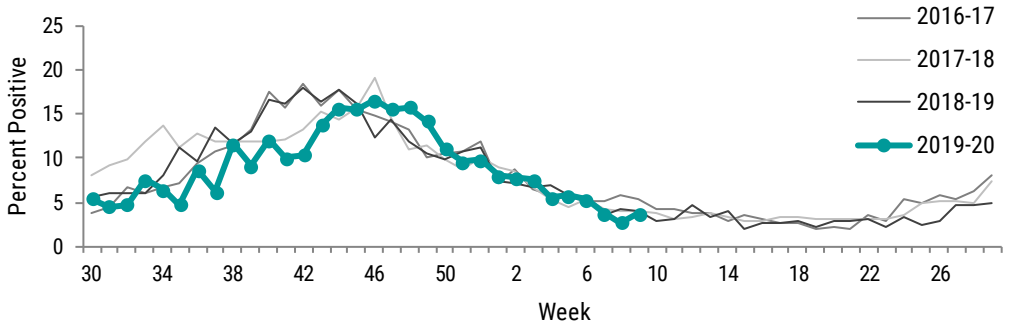
Week 9 (February 23-29, 2020) Activity Summary

In week 9, RSV activity in children <5 years increased and was similar to levels observed at this time in 2019.

No new RSV-associated outbreaks were reported in week 9. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 9, **the percent of emergency department and urgent care center visits for RSV among children <5 years increased** and was similar to levels observed at this time in 2019.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 9, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 9, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Assisted living facility	Pinellas	3	2	Unknown	Influenza unspecified	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=369) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 9, 2020 Florida Flu Review
Date:	Wednesday, March 4, 2020 2:45:57 PM
Attachments:	Week 9, 2020 Florida Flu Review.pdf

Good afternoon!

Attached is the Week 9, 2020 Florida Flu Review.

Week 9 influenza & influenza-like illness (ILI) activity summary:

Activity decreased in week 9 but remained above peak levels observed in the 2016-17 season. Decreases were observed in all regions of the state. Elevated activity is still expected for several more weeks.

Nine outbreaks were reported, down from 18 outbreaks in the previous week. Of the nine outbreaks reported, two were influenza-associated and seven were ILI.
One new influenza-associated pediatric death was reported in an unvaccinated child with underlying medical conditions. Ten influenza-associated pediatric deaths have been reported so far this season; only one child was vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On January 10, 2020, CDC issued a health advisory reminding clinicians to reiterate vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Florida ILI Surveillance System Summary 16

Background

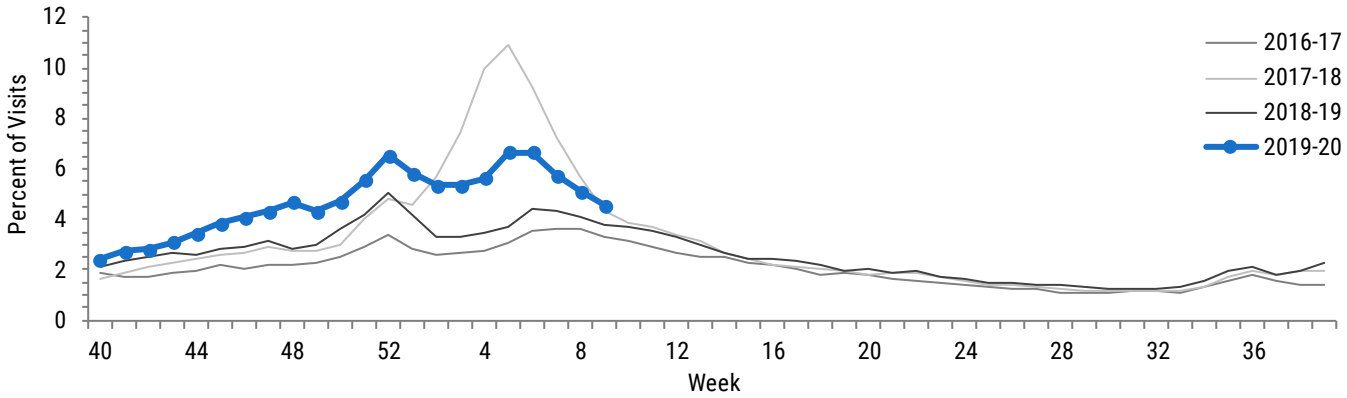
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



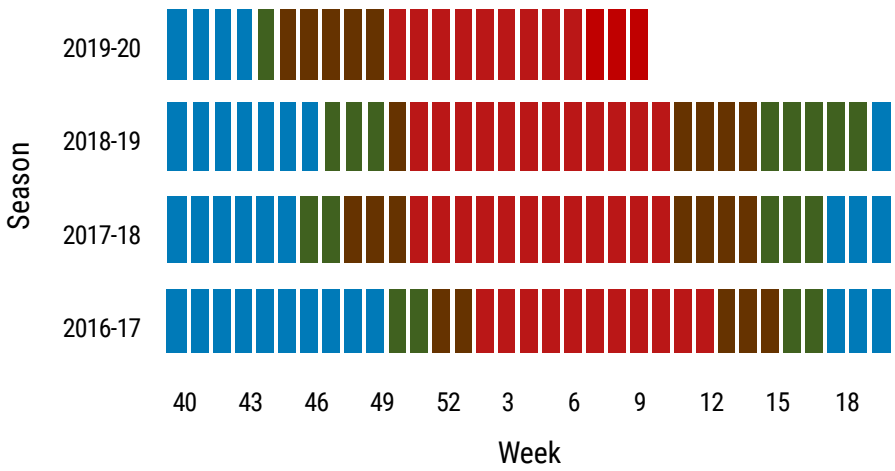
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 9, **the percent of emergency department and urgent care center visits for ILI statewide decreased** but remained above peak levels observed during the 2016-17 season.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=369) statewide for the current season (week 40, 2019 to week 9, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 9, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 9, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

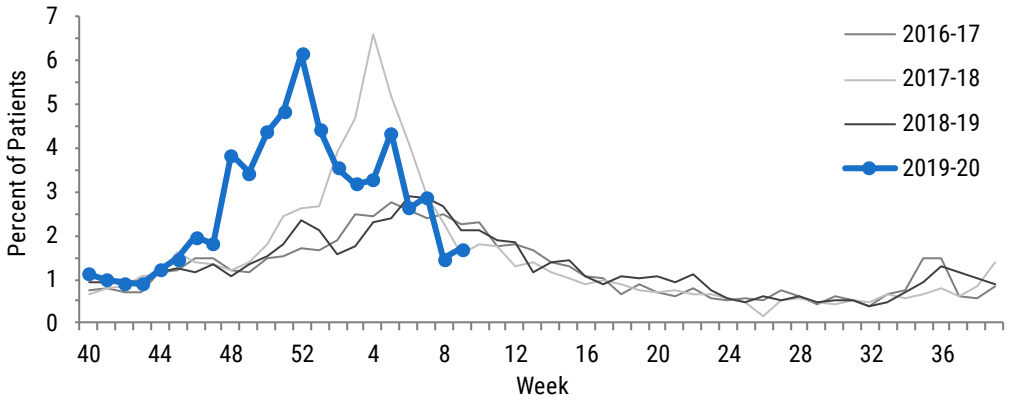
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 9, **the percent of patients with ILI reported by ILINet providers statewide increased** and was below levels observed during the 2016-17 and 2018-19 seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=7), week 40, 2016 to week 9, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



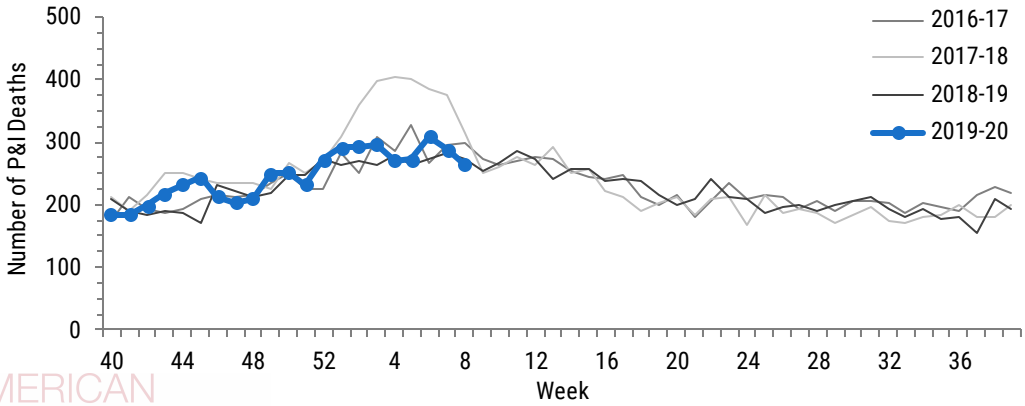


Figure 4: In week 8 (ending 2/22/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was slightly below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 8, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

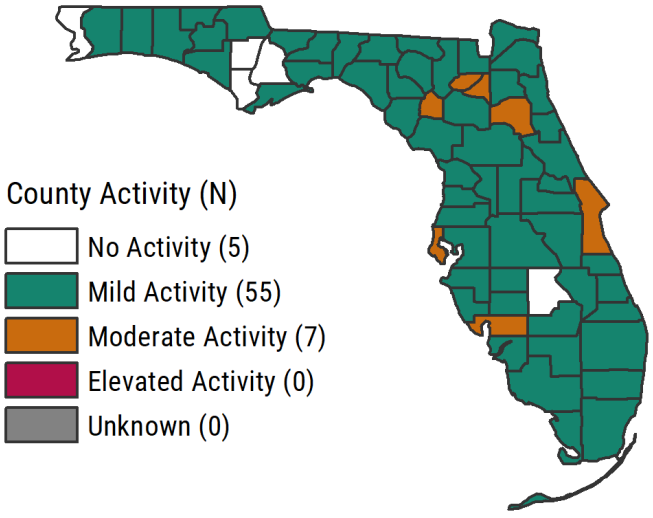
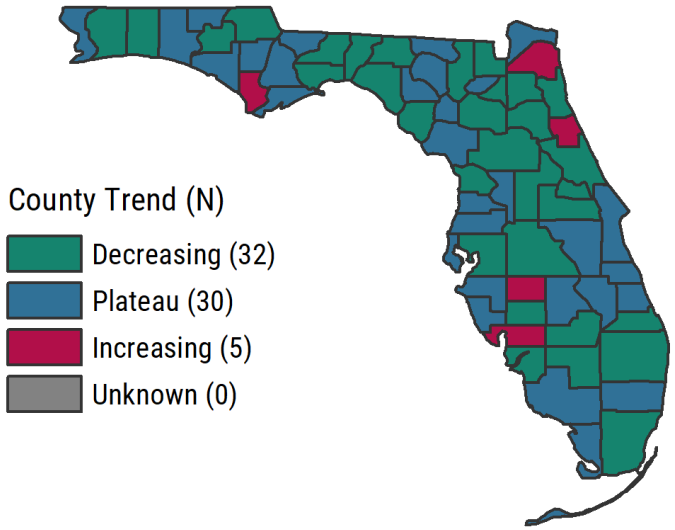
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 9. Seven counties reported **moderate activity.**





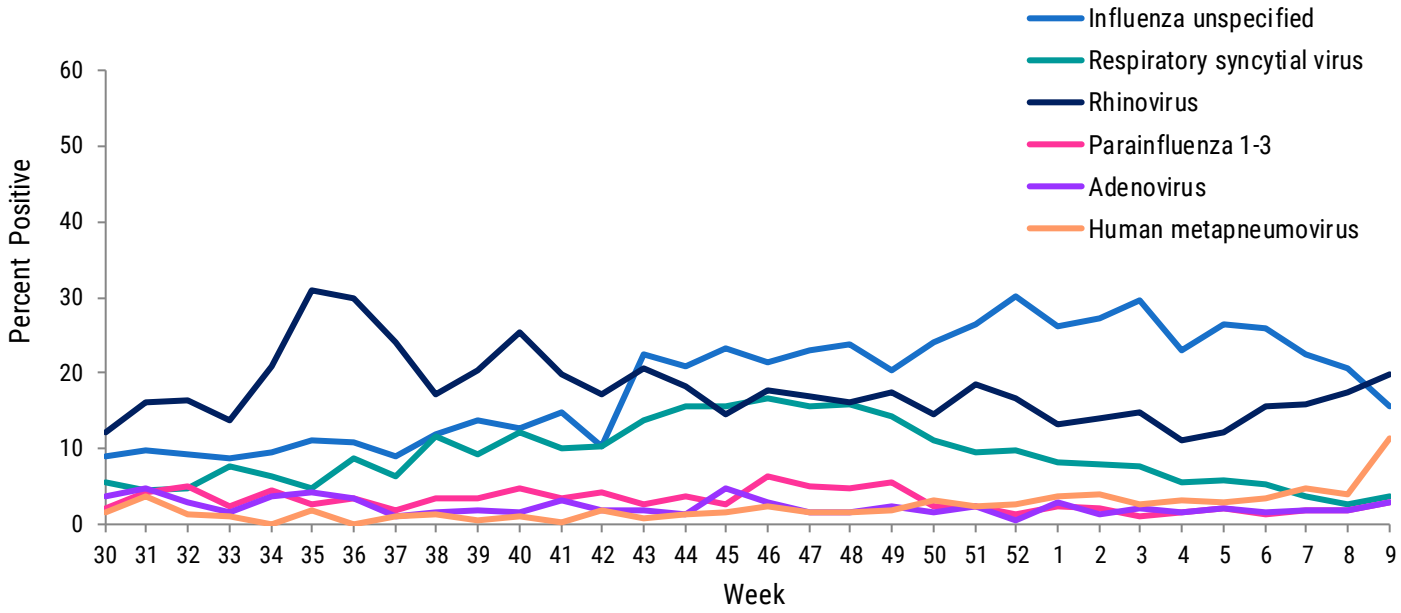


Figure 7: Most counties reported **decreasing activity** for week 9. Five counties reported **increasing activity,** and thirty counties reported **activity at a plateau.**

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: The **percent of specimens testing positive for influenza decreased** in recent weeks. Of note, the volume of laboratory tests reported in week 9 was lower than expected.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=7), week 40, 2019 to week 9, 2020.

AMERICAN OVERSIGHT

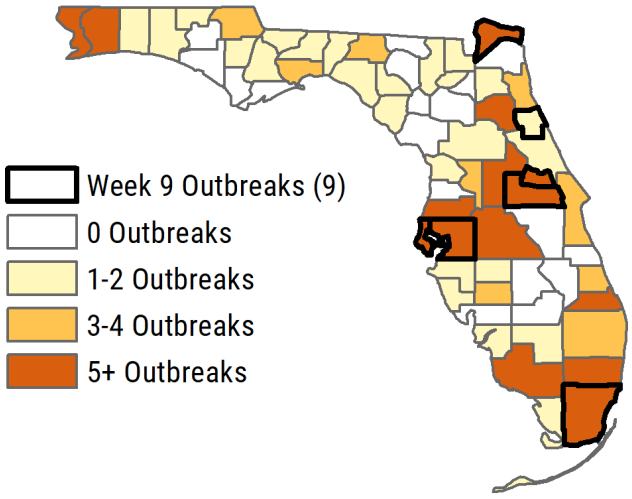
Influenza and ILI Outbreaks

Week 9 Outbreaks at a Glance:

Number Reported:
9 Outbreaks

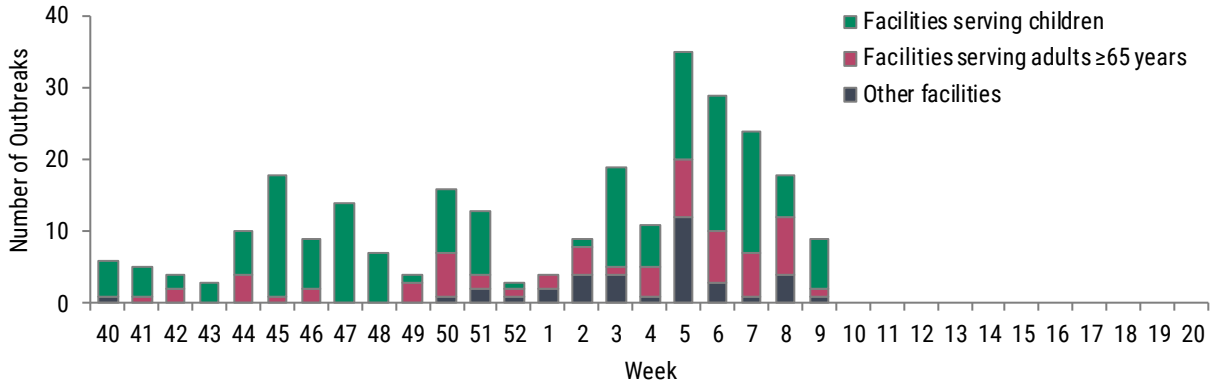
Influenza-Associated:
2 Outbreaks



Severe Outcomes*:
1 Outbreak

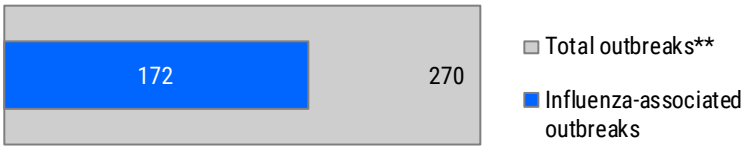
Outbreak Summary:

In week 9, two influenza-associated and seven ILI outbreaks were reported, a decrease from the previous week.



Severe outcomes* were reported in one of nine outbreaks. Two hospitalizations and no deaths were reported in this outbreak.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 9, the outbreak with severe outcomes was in a facility serving adults aged ≥65 years.



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 9 are **outlined in bold.**

Figure 9: In week 9, **one outbreak** was reported among **facilities serving adults aged ≥65 years, seven outbreaks** were reported in **facilities serving children,** and **one outbreak** was reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 9, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 9, **63.7% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 9, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

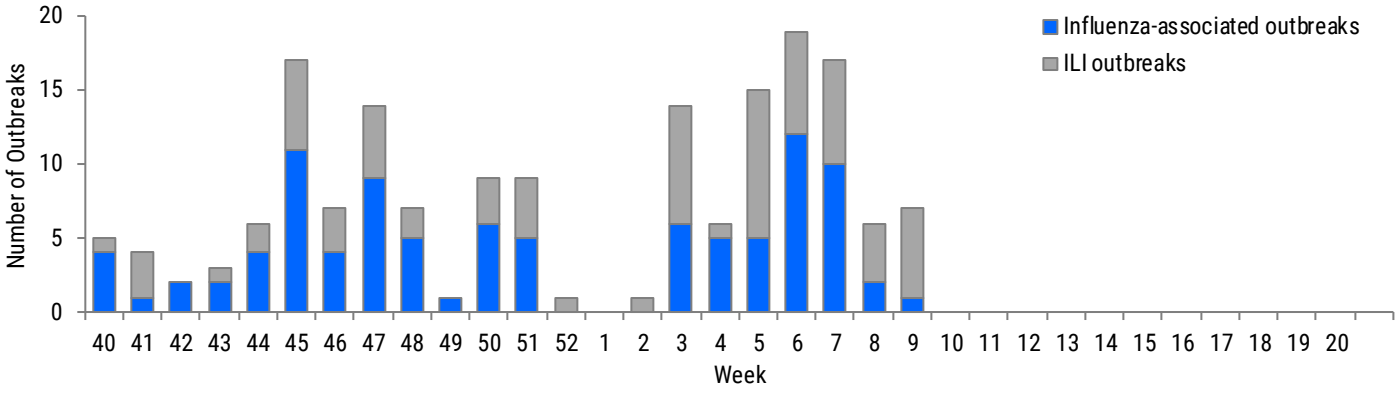
Influenza and ILI Outbreaks

Facilities Serving Children*:



7 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

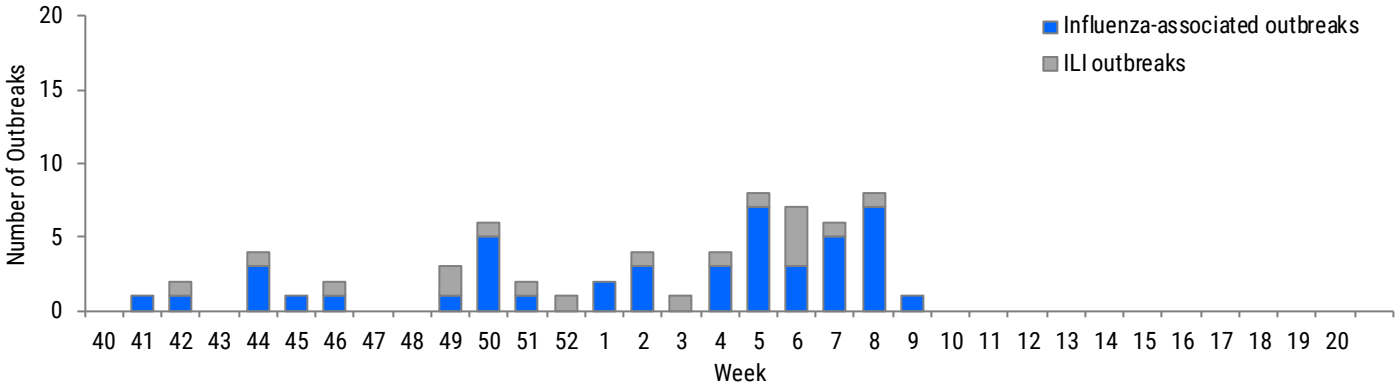
In week 9, seven new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 9, **one influenza-associated outbreak** and **six ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 9, 2020.

Facilities Serving Adults ≥65 yrs.**:



1 Outbreak

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 9, one new outbreak of influenza or ILI was reported among facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 9, **one influenza-associated outbreak** was reported among **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 9, 2020.

AMERICAN OVERSIGHT

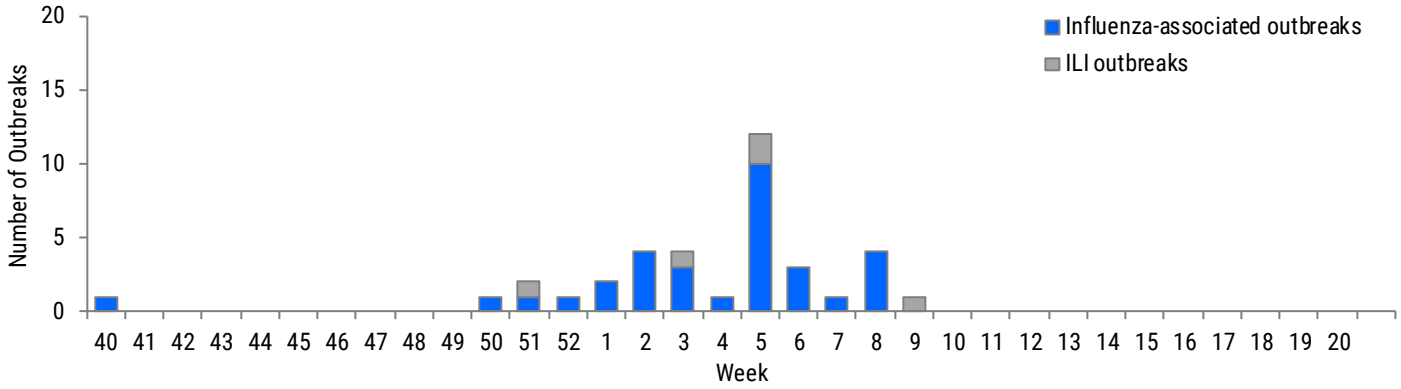
Influenza and ILI Outbreaks

Other Facilities*:



1 Outbreak

Summary of Outbreaks in Other Facilities:

In week 9, one new outbreak of influenza or ILI was reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 9, **one ILI outbreak** was reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 9, 2020.

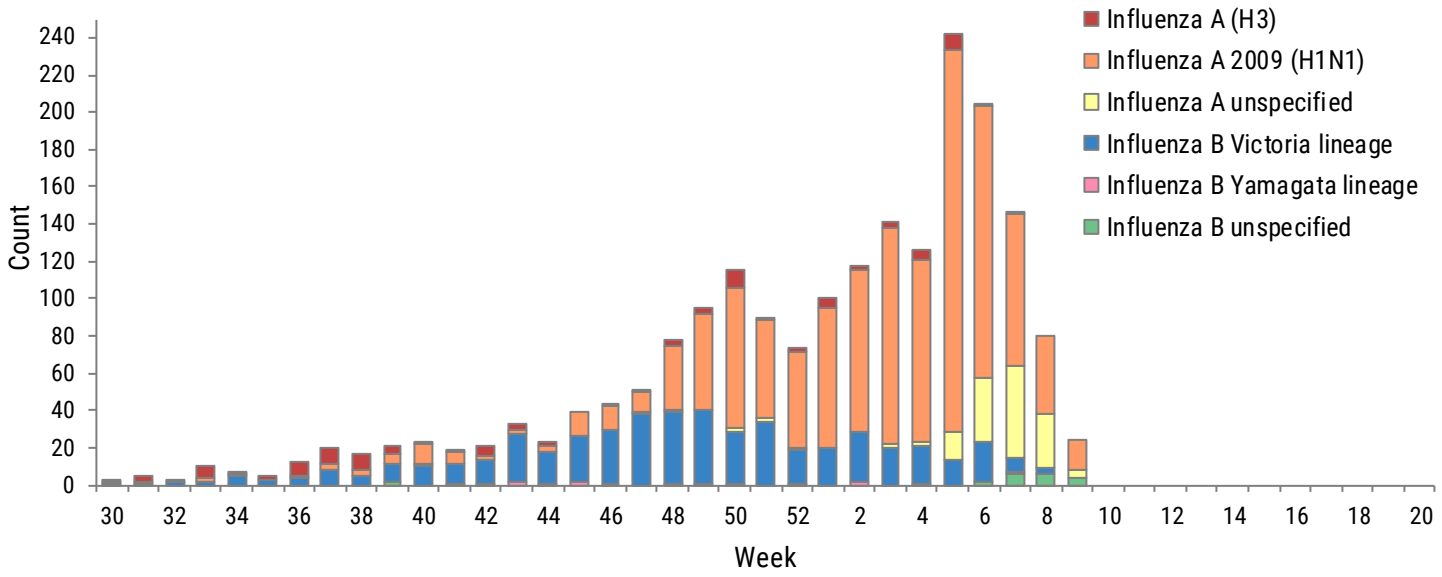


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	130 (48.2%)	78 influenza-associated outbreaks 52 ILI outbreaks
Child daycares	40 (14.8%)	17 influenza-associated outbreaks 23 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	19 (7.0%)	9 influenza-associated outbreaks 10 ILI outbreaks
Nursing facilities	15 (5.6%)	12 influenza-associated outbreaks 3 ILI outbreaks
Other long-term care facilities	29 (10.7%)	24 influenza-associated outbreaks 5 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	30 (11.1%)	28 influenza-associated outbreaks 2 ILI outbreaks
Hospitals	3 (1.1%)	2 influenza-associated outbreaks 1 ILI outbreak
Additional facility types	4 (1.5%)	2 influenza-associated outbreaks 2 ILI outbreaks
Total	**270 (100.0%)**	**172 influenza-associated outbreaks** **98 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 9, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 9, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

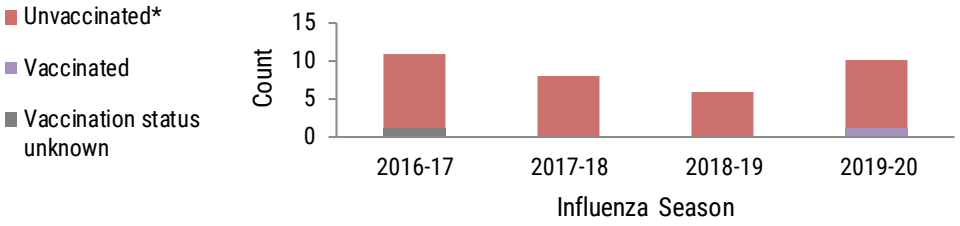
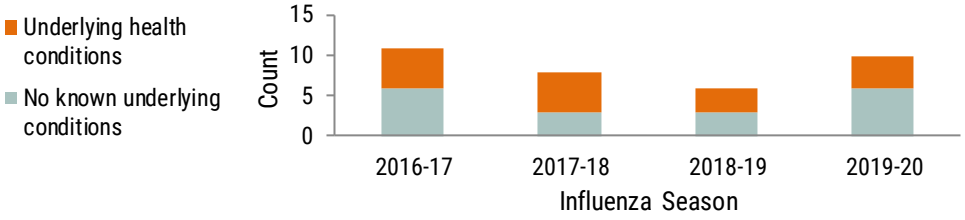
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 9, **the percent of emergency department and urgent care center visits for ILI in children <18 years decreased** and was above levels observed at this time during the 2016-17 season.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 9, 2020.

Figures 25-26: In week 9, **one new influenza-associated pediatric death was reported**. A total of ten influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 9, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 9, 2020.

In week 9, **one new influenza-associated pediatric death was reported**. The death was associated with influenza A 2009 (H1N1) in a child with known underlying medical conditions who was not vaccinated for the 2019-20 season.

A total of ten influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm

AMERICAN OVERSIGHT

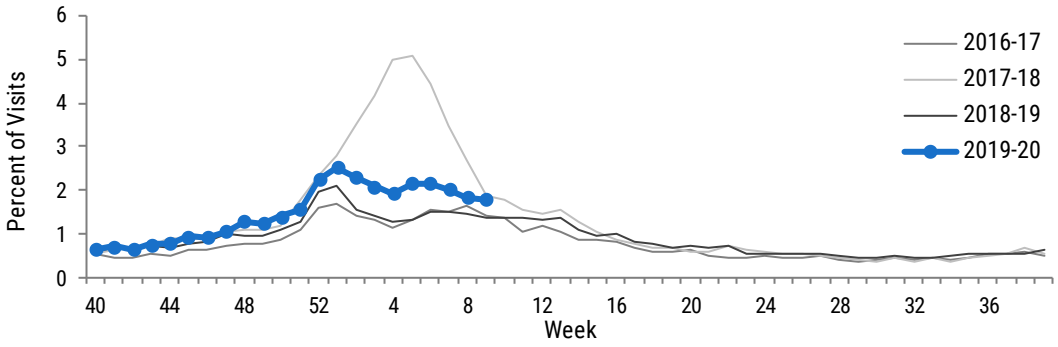
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 9, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was above peak levels observed during the 2016-17 season.



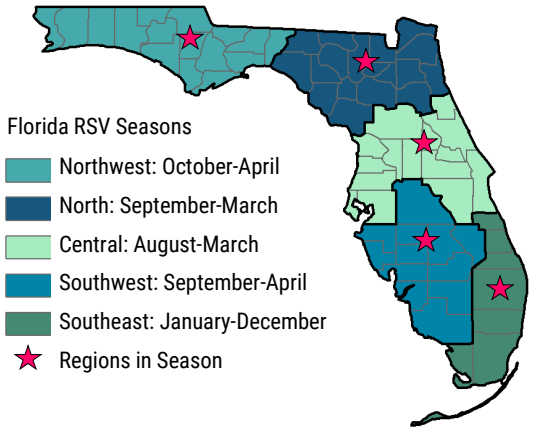
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 9, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 9, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years decreased** and was above levels observed at this time during the 2016-17 season.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 9, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

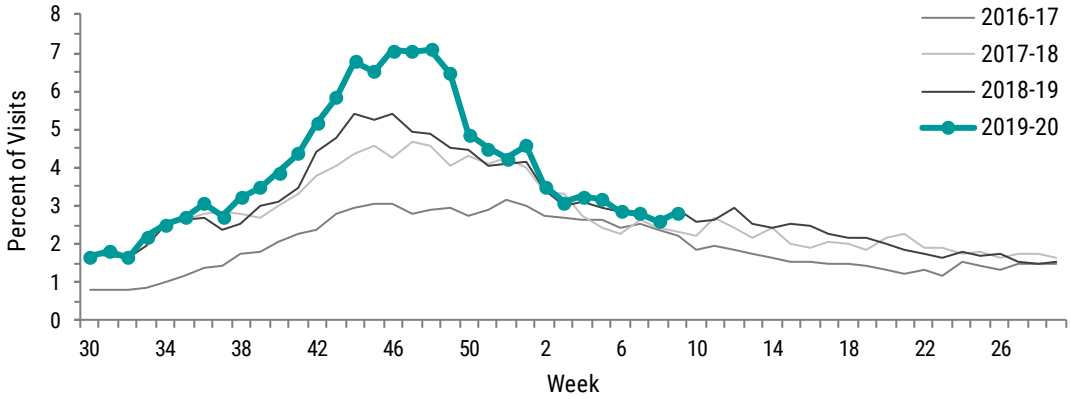
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

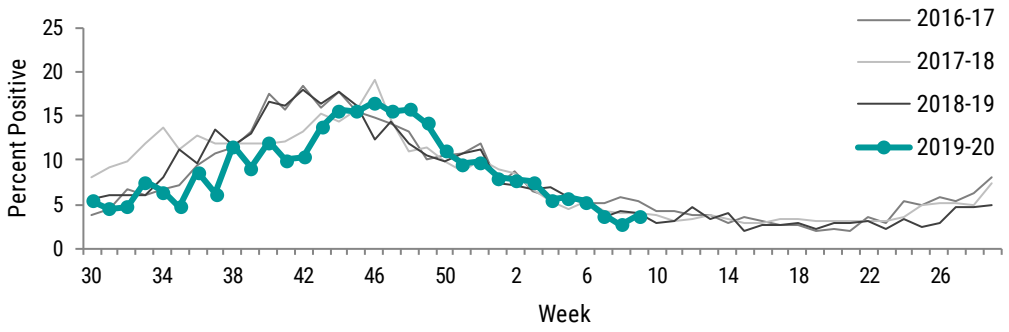
Week 9 (February 23-29, 2020) Activity Summary

In week 9, RSV activity in children <5 years increased and was similar to levels observed at this time in 2019.

No new RSV-associated outbreaks were reported in week 9. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 9, **the percent of emergency department and urgent care center visits for RSV among children <5 years increased** and was similar to levels observed at this time in 2019.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 9, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

AMERICAN OVERSIGHT

RSV Surveillance

Figure 31: In week 9, **the percent of specimens testing positive for RSV increased.** Levels were similar to those observed at this time in previous seasons.

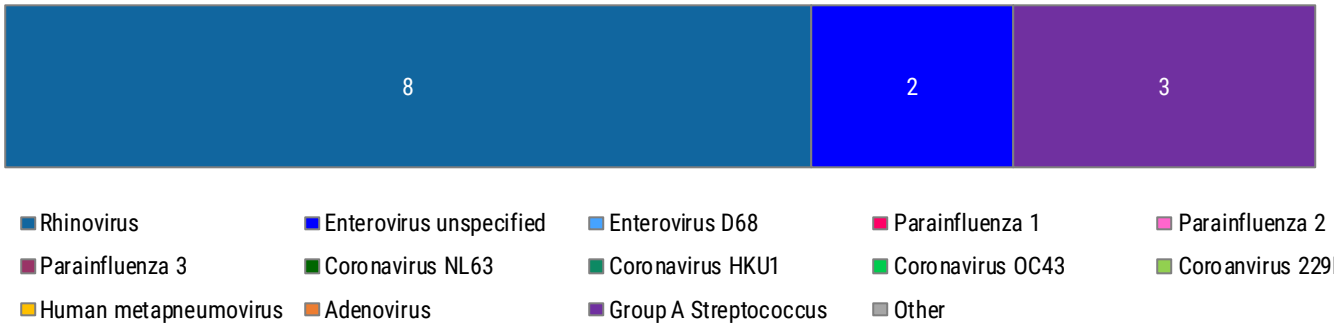

Figure 33: In week 9, no new RSV-associated outbreaks were reported. All of the outbreaks reported since week 30 have been reported in **facilities serving children.**

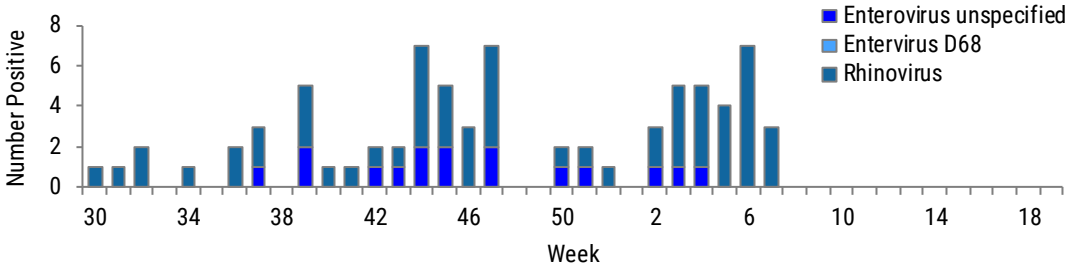

▲ **Figure 33** shows **the number of RSV-associated outbreaks by setting and week** as reported by county health departments in Merlin, week 30, 2019 to week 9, 2020.

AMERICAN OVERSIGHT

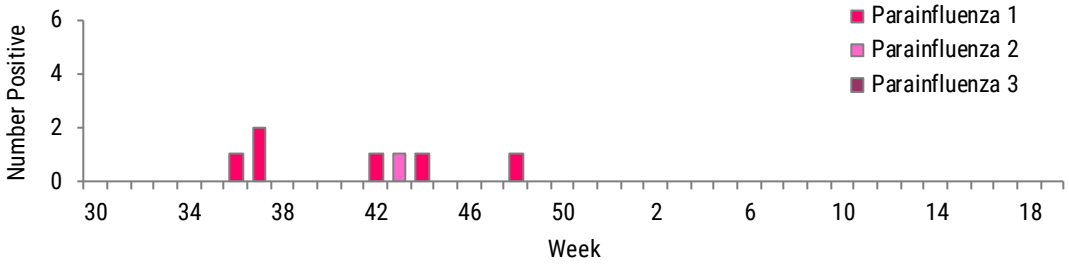
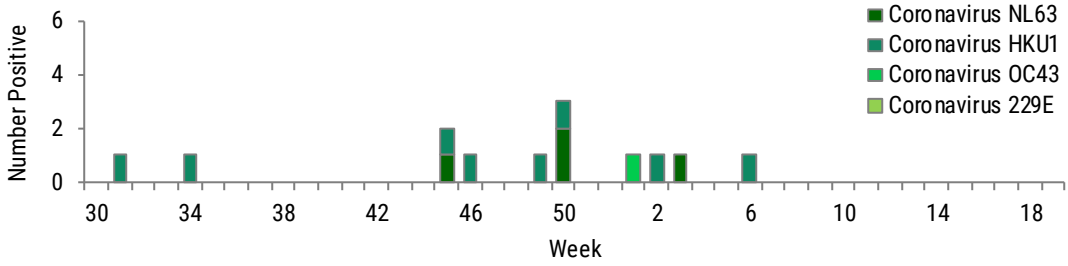
Other Respiratory Virus Surveillance





▲ **Figure 34** shows **the number of unique times a pathogen was associated with a respiratory outbreak** for outbreaks reported from week 30, 2019 to week 9, 2020.

◀ **Figure 35*** shows **the number of PCR-positive laboratory findings for enterovirus unspecified, enterovirus D68, and rhinovirus** by week** among specimens submitted to the Bureau of Public Health Laboratories (BPHL) for extended respiratory panel testing.

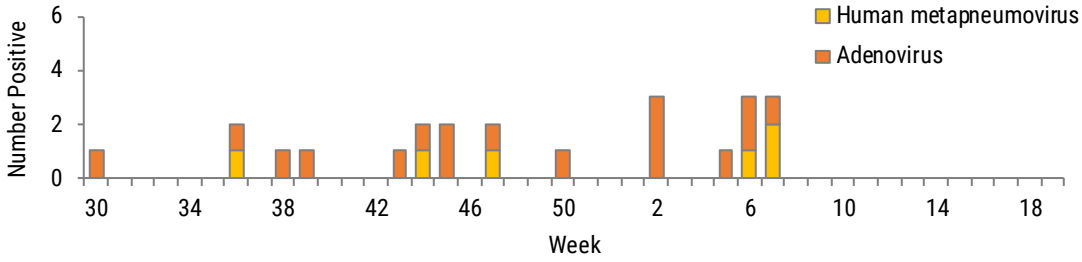


Figure 36* shows **the ▶ number of PCR-positive laboratory findings for parainfluenza 1-3** by week** among specimens submitted to BPHL for extended respiratory panel testing.

◀ **Figure 37*** shows **the number of PCR-positive laboratory findings for seasonal coronaviruses NL63, HKU1, OC43, and 229E** by week** among specimens submitted to BPHL for extended respiratory panel testing.

Figure 38* shows **the ▶ number of PCR-positive laboratory findings for human metapneumovirus and adenovirus** by week** among specimens submitted to BPHL for extended respiratory panel testing.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 9, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
Assisted living facility	Pinellas	3	2	Unknown	Influenza unspecified	Yes	Open

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=369) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

AMERICAN OVERSIGHT

From:	Baker, Michael (OS/IEA)
To:	Baker, Michael (OS/IEA)
Subject:	What Governors Need to Know - HHS Issues New COVID-19 Resources
Date:	Wednesday, March 11, 2020 1:12:31 PM
Attachments:	PRELIMINARY - NOT FOR FURTHER DISCLOSURE Initial State and Local Funding.pdf

Dear Governor:

Thank you for your continued engagement and partnership with us to address and mitigate the spread of COVID-19.

As you might imagine, a number of HHS divisions are releasing COVID-19-related information on funding and guidance. We thought it would be helpful to batch up information on key issues to keep you up-to-date.

Funding for States to Address COVID-19

Perhaps of keenest interest to you and your health officials is an update on funding for states and communities to address mitigation of COVID-19.

Today, at 1 PM EST HHS will be announcing that more than $560 million will be made available to the 62 entities which have existing cooperative agreements with the CDC through its Public Health Emergency Program, known as "PHEP."

The $8.3 billion dollar Supplemental passed by Congress included statutory language which prescribed the exact formula for disbursing the money: states will receive 90% of their 2019 CDC PHEP grants. So that you know what your state will receive, we have attached a document identifying the amounts going to states, territories, or cities. This marks the first tranche of funding to states from the $8.3 billion supplemental. Your state health officers are receiving a letter today from CDC outlining what is needed to receive the funding, essentially they need to submit a spend plan and they will receive guidance on what that spend plan should contain.

Helping Communities Know Mitigation Strategies

Yesterday, CDC released their "Implementation." Essentially, this is a guide for communities describing possible mitigation strategies for communities dealing with transmission at three different levels: (1) None/Minimal, (2) Moderate, or (3) Substantial. Community mitigation strategies, which are non-pharmaceutical interventions, are often the most available interventions to help slow the transmission of COVID-19 in communities. The Mitigation Plans include a set of actions that persons and communities can take to slow the spread of respiratory virus infections. The Community Mitigation Plan can be found here.

Guidance on Infection Control For Healthcare Workers

Yesterday, CDC released updated guidance on infection prevention and control recommendations. Healthcare workers are fighting this outbreak on the front lines, and this guidance is intended to provide assistance to healthcare settings that are handling suspected or confirmed cases of COVID-19. This guidance is applicable to all U.S. healthcare settings, but not for non-healthcare settings. There is separate guidance for that. The new guidance on infection control can be found here.

AMERICAN OVERSIGHT

OMB Flexibilities
On March 9, 2020, OMB issued a memo that provides administrative relief for recipients and applicants of Federal financial assistance who are directly impacted by COVID-19. The grant flexibilities include 10 actions that HHS can take to provide short-term administrative and financial management relief, allowing funds to be awarded quicker and giving grantees the ability to focus on their critical response, research, or services. More information can be found here.

General Preparation Information: On March 9, 2020, the White House Coronavirus Task Force released practical steps that we recommend posting and sharing to keep workplaces, school, home and commercial establishments safe. This information can be found here.

CMS Specific Guidance:

- **CMS Guidance on Masks:** On March 10, 2020, CMS released guidance updating recommendations to expand the type of facemasks healthcare workers can use in situations involving COVID-19. This guidance aligns with the information by CDC regarding personal protective equipment as well. The memo sent to State Survey Agency Directors can be found here.

- **CMS FAQs on Suspension of Non-Emergency Survey Inspections**: On March 10, 2020, CMS released a frequently asked questions document to further explain the changes in guidance issued on March 4 that suspends all non-emergency survey inspections. This guidance and FAQ will help to enable State Inspectors to address the spread of COVID-19. The FAQ document can be found here.

- **CMS Nursing Home Guidance:** As you know, nursing homes and their residents are vulnerable populations for COVID-19. This week, CMS released updated guidance for infection control and prevention of COVID-19 in Nursing Homes which can be found here (3/9). The Press Release can be found here and all CMS guidance related to COVID-19 can be found here.

If you have any questions on these items or other issues, please feel free to reach out.

Thanks,

Darcie L. Johnston
Director, Intergovernmental Affairs
U.S. Department of Health and Human Services
Darcie.Johnston@hhs.gov

Good morning Dr. Blackmore

We are following up on the email below. At your earliest, could you please confirm the case counts for FL below? We are hoping for confirmation by 11am ET, and we apologize for the quick turnaround.

Subject: CDC COVID-19 Case Count Confirmation 03/04/2020

Dear Partners,

As described in an email sent from the CSTE COVID-19 Leadership Team (see attached), CDC is instituting a standard process for confirming publicly reported cases by jurisdiction.

What you need to do/know now:

- We will conduct case confirmation **daily** (Monday – Friday). As the response evolves, the frequency of these requests will likely decrease.
- At the bottom of this email, you will find a table with the current preliminary case counts we have for each jurisdiction **as of 4 pm ET on Wednesday, March 4**.
- By **9 am ET Thursday, March 5**, please confirm case counts for your jurisdiction (your numbers **as of 4 pm ET today)** using the CDC Case Confirmation Portal (data are collected via Epi Info and stored on a secure CDC server):

https://go.usa.gov/xdftq

What you need to know about how your information will be presented:

- These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. They do not include people who returned to the United States via State Department-chartered flights. **We ask that the preliminary information shared in this email not be distributed.**
- What will be shared on the CDC website (updated daily at 12 pm, ET):
  - **The total case count** [presumptive + lab-confirmed], i.e., the actual number of *total* cases (e.g., 0, 6, 35) will be posted. **EXCEPTION**: **Jurisdictions with one to five cases will be**

AMERICAN OVERSIGHT

depicted as a range: "1–5 cases"
- Other information shared will be used for internal awareness and will not be shared publicly at this time.

What you need to do/know later:

- DCIPHER users can update and analyze their own jurisdiction's data at: https://dcipher.cdc.gov/. If your jurisdiction does not currently have DCIPHER users, but you would like to move to Phase 2 reporting as described in the attached guidance, please email eocevent118@cdc.gov to confirm your readiness.

Sincerely,

CDC COVID-19 Epidemiology Task Force

**Values to be shared on the CDC website

***Reported deaths are reported from state or local health department and include confirmed and presumptive cases.

AMERICAN OVERSIGHT

Dear state and territorial partners:

Thank you for your continued partnership in the ongoing emergency response to COVID-19. The information included below aligns with what was shared by CDC during the 5 pm ET CSTE call on Saturday, February 29th regarding: 1) confirming a jurisdiction's 'Phase 2' status for reporting PUI and cases; 2) updates to the PUI and Case Report Form; 3) an update on the status of historical PUI data imports into DCIPHER; 4) clarifications to the CDC reporting process for PUI/Case Report Forms and lab findings; 5) management of the PHLIP laboratory reporting process; and 6) major avoidable issues we hope to overcome with your assistance. We plan for the noted changes to go into effect at **5 pm ET, Sunday, March 1.**

Jurisdictional 'Phase 2' Status

As we have previously outlined, jurisdictions need to be able to do several tasks before they can move into 'Phase 2'. These include assessing ill persons and determining PUI status; assigning unique identifiers to PUI and cases at the reporting jurisdiction level; and reporting PUI and cases of COVID-19 using a brief, combined form.

Given the need to maintain timely, actionable data at the national level, and process laboratory results at CDC for initial or confirmatory testing, **we anticipate that all jurisdictions will be onboarded to 'Phase 2' during the week of March 2.** As soon as your jurisdiction is able to confirm its 'Phase 2' status, please email eocevent118@cdc.gov.

As part of the 'Phase 2' rollout, CDC needs to better understand each jurisdiction's plan for providing data to CDC for the PUI and Case Report Form via DCIPHER, an electronic PUI and case reporting system. We request that each jurisdiction provides a list of ≤5 DCIPHER users before **Monday, March 2 at 5pm ET,** if they have not already done so. In addition, we ask that jurisdictions confirm their intent to input data on PUI and case-patients directly into the DCIPHER platform (preferred option) or if alternative arrangements need to be made to send data to CDC. Please email eocevent118@cdc.gov with the requested information by **March 2 at 5pm ET**.

Updates to PUI and Case Report Form on CDC's Website

On the PUI and Case Report Form included in the CSTE email on Wednesday, February 26th, there were 2 'current status of person' options: "person under investigation" or "laboratory-confirmed case." Given increased laboratory capacity at the state and local level to test for the virus that causes COVID-19 and the need to send presumptive positive specimens to CDC for confirmatory testing, there will now be 5 status classifications.

1. PUI, testing pending*
2. PUI, tested negative*
3. Presumptive case (positive local test), confirmatory testing pending†
4. Presumptive case (positive local test), confirmatory testing negative†
5. Laboratory-confirmed case†

**Testing conducted by local lab or CDC lab*
† At this time, all confirmatory testing occurs at CDC

We have also added critical laboratory testing result fields at the end of the PUI and Case Report Form to reflect COVID-19 laboratory test results from state or local laboratories and CDC. CDC will work towards populating our laboratory results into the CDC result field for each specimen sent to us so that results can be viewed in DCIPHER as they are resulted and communicated to individual jurisdictions.

These updates to the PUI and Case Report Form, as well as data dictionary and instructions, can be found in Attachments 2-4, and were made available on CDC's website as of March 1, 2020.

Historical PUI Data Imported into DCIPHER

As of February 28, data reported to CDC on PUI, presumptive cases, and laboratory-confirmed cases have been made available in DCIPHER.

AMERICAN OVERSIGHT

- Jurisdictions in 'Phase 2' are now able to go into the DCIPHER platform to view and edit existing records of PUI, presumptive positive, and laboratory-confirmed cases, as their status changes or more data become available.
- Jurisdictions in 'Phase 1' should continue to call the EOC Watch Desk at 770-488-7100 to update information on existing PUI, presumptive positive, or laboratory-confirmed cases of COVID-19.

CDC Reporting Process for PUI/Case Reports and Lab Findings

For reporting jurisdictions that have the capacity to do their own testing:

For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs or Presumptive Cases (persons with a positive test performed locally without CDC lab confirmation*) into DCIPHER with the jurisdiction-issued nCoV ID, unless other arrangements to transmit data have been made and approved by CDC.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. Please update the person's disposition to 'PUI, tested negative' in DCIPHER.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify CDC of the positive result. The specimen will be identified as a 'presumptive positive'* until the result is confirmed at CDC per the Emergency Use Agreement.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected and submitted on the PUI and Case Report Form.
    c. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.
    d. Please also update the person's disposition in DCIPHER to "Presumptive Case, confirmatory testing pending"

For jurisdictions that are in 'Phase 1':

1. The jurisdictions should call the EOC Watch Desk/PUI desk at 770-488-7100 to receive a CDC-issued nCoV ID, and to complete a PUI and Case Report Form.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. Please email eocevent118@cdc.gov and provide the nCoV ID and test result.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify them of the positive result. The specimen will be identified as a 'presumptive positive'* until the result is confirmed at CDC per the Emergency Use Agreement.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected on the PUI and Case Report form.
    c. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.

For reporting jurisdictions that do not have testing capacity and are sending specimens to CDC for testing:

For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs into DCIPHER with the jurisdiction-issued nCoV IDs, unless other arrangements to transmit data have been made and approved by CDC.
2. Please ensure the jurisdiction-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

For jurisdictions that are in 'Phase 1':

1. The jurisdiction should call the EOC Watch Desk/PUI desk at **770-488-7100** to obtain a CDC-issued nCoV ID number, and complete a PUI and Case Report Form.

AMERICAN OVERSIGHT

2. Please make sure the CDC-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

Specimens from Presumptive Cases must be tested at CDC to change their disposition to 'Confirmed Case'. However, **local public health action is recommended for Presumptive Cases identified through local or state laboratory testing.*

Management of the PHLIP reporting process

CDC and APHL have been working with public health laboratories to add automated reporting of the novel coronavirus test results through their existing influenza reporting mechanism, which is most frequently PHLIP.

We ask that participating PHLIP labs begin including nCoV IDs within the lab test message reported through PHLIP. This will allow CDC to: (1) Match these records with persons reported into DCIPHER and (2) work with states to properly characterize the status of persons without existing records in DCIPHER. Information on how to include the nCoV ID in the message is available via APHL starting at the bottom of Page 4 (Attachment 5).

Major avoidable challenges we hope to overcome with your assistance

We recognize the challenges that public health emergencies bring. With your assistance, we hope to avoid the following challenges by following the processes outlined above:

1. Unclear data flow processes for jurisdictional data on PUI and case-patients to CDC
2. Laboratory samples that are not able to be linked with PUI or case-patients
3. Incorrect reports of national and state-level PUI and case burden

We appreciate your ongoing partnership. Please email eocevent118@cdc.gov with any questions regarding the PUI or case reporting process.

Best,
CDC COVID-19 Epidemiology Task Force

CC: CSTE Novel Coronavirus 2019 <CSTEncov2019@cste.org>
Subject: CSTE COVID-19 Response | New CDC Standard Process for Displaying Reported Cases

Sent to State Epidemiologists and the CSTE Executive Board

Good evening,

Please see below for a message from CDC's COVID-19 Epidemiology Task Force:

> Colleagues,
>
> To coordinate consistent public messaging and improve data visualization on the CDC public-facing website for the COVID-19 response homepage, CDC is instituting a daily, standard process for displaying reported *cases by state*. Today, this process was discussed with the CSTE COVID-19 Core Group to work collaboratively and incorporate jurisdictional implementation feedback.
>
> **CDC plans to initiate this process tonight, 3/3/2020. Around 6 pm ET, CDC will send each state an email**(emails will go to the staff identified as DCIPHER contacts and the State Epidemiologist) that includes two items:
> 1. Current case count as of 4 pm ET
>   a. Graphical map will represent case count ranges by state (count of presumptive, lab confirmed, total [presumptive + lab confirmed], and deaths among cases)
>   b. Map table will represent **only total case counts by state**. If state reports 1 to 5 cases, counts will be represented as a range (*i.e.,* 1-5 cases). The other information collected will not be shared publicly, but are for internal awareness.
> 2. Link to DCIPHER where the jurisdiction can review, update, and visualize their data
>
> By 9 am ET the following day, please provide written confirmation to CDC (eocevent118@cdc.gov) of receiving the report and either:
> - confirm the case count information provided (cases as of 4 pm ET), or,
> - if incorrect, provide updated values.
>
> These case counts by state will then be reflected in the CDC web update scheduled for release at 12 pm ET.
>
> ****NEW** Daily rhythm for case-confirmation process and external communication**
>
> 
>
>
> 1. (12:00pm, ET): Deadline for CSV States to submit cases to DCIPHER.**This reflects an update in guidance (previous deadline was 9am, ET).**
> 2. (4:00pm, ET): Deadline for Direct Data Entry States to submit cases to DCIPHER
> 3. (6:00pm, ET): CDC sends 4pm ET numbers back to states for final confirmation by 9:00am, ET, next day
> 4. (9:00am, ET next day): Deadline for states to confirm cases for public reporting on CDC COVID-19 homepage
>   a. If no confirmation email received, CDC will use last confirmed numbers reported by state
>   b. If no confirmation email received and state has never confirmed cases to CDC, CDC will take enhanced proactive steps to seek confirmation from the state reporting their initial case(s). If no response from state, cases will not be reported on CDC web update
> 5. (12:00pm, ET): CDC COVID-19 homepage updates go live online
>
> Sincerely,
> CDC COVID-19 Epidemiology Task Force
