"CDC is committed to working with state, local, tribal and territorial public health departments to mitigate community spread of novel coronavirus in this nation," said CDC Director Robert R. Redfield, M.D. "Our partners are on the front lines of this response and we support their efforts to increase needed public health capacity to confront the challenges this virus presents."

Using funds provided to CDC through the HHS Secretary's Transfer, CDC will:

- Award an initial $25 million cooperative agreement to the states and local jurisdictions who have borne the largest burden of response and preparedness activities to date. This is an initial award for those jurisdictions who require immediate assistance for activities such as monitoring of travelers, data management, lab equipment, supplies, staffing, shipping, infection control, and surge staffing. Once supplemental funding is provided, support will be provided to all states and local jurisdictions for a variety of critical public health activities.
- Award an initial $10 million cooperative agreement to state and local jurisdictions to begin implementation of coronavirus surveillance across the U.S., building on existing influenza activities and other surveillance systems. This initial award is for a limited number of jurisdictions. Once supplemental funding is provided, additional support will be provided to all states and local jurisdictions to enhancing testing and surveillance.

CDC will use existing networks to reach out to state and local jurisdictions to access this initial funding.

Subject:	HHS Awards Health Centers Funds to Support COVID-19 Response in Florida
Date:	Wednesday, March 25, 2020 2:54:35 PM

Dear Dr. Rivkees,

Yesterday, the U.S. Department of Health and Human Services (HHS), through the Health Resources and Services Administration (HRSA), awarded **$4,518,410** to **47** health centers in Florida with funding provided by the Coronavirus Preparedness and Response Supplemental Appropriations Act, 2020. Health center recipients in Florida may use these awards to address screening and testing needs, acquire medical supplies and boost their telehealth capacity in response to the Coronavirus Disease 2019 (COVID-19) pandemic. Recognizing the urgency of the situation, and the important role health centers play in their communities, HHS is making funding for health center recipients in Florida available immediately.

Thank you for your critically important work in responding to the COVID-19 pandemic. The HRSA Office of Regional Operations and HHS Office of the Regional Director are committed to supporting your COVID-19 response efforts. Please do not hesitate to reach out to us with questions, concerns or requests for support and engagement.

Best,

Lisa Mariani
HRSA Regional Administrator, Region 4

John McGough
HHS Regional Director, Region 4

Subject: HHS COVID-19 Update, 3-25
Date: Wednesday, March 25, 2020 6:47:19 PM

Dear Governor and State Health Officials:

The federal government continues to take aggressive and proactive steps to address the coronavirus (COVID-19) pandemic. The health and safety of the American people is our top priority.

Many of you have been asking how your companies can assist in meeting the needs imposed by this pandemic. This includes everyone from individuals and families, to companies who want to manufacture, donate, or sell PPE and other materials to help the effort.

We have the answer!

How Can You Help? FEMA released information for how to help via donations, volunteering and for the private sector. Their specific guidance includes:

- **Businesses that have medical supplies or equipment to donate** are asked to go to www.fema.gov and provide of the offer through our online medical supplies and equipment form. The direct web link is www.fema.gov/coronavirus/covid-19-donations.
- **Businesses that want to sell medical supplies or equipment** to the federal government, please email specifics to covidsupplies@fema.dhs.gov.
- **Licensed medical volunteers can offer their services** by registering with the Emergency System for Advance Registration of Volunteer Health Professionals. You can access a direct link to do so through fema.gov
- **Donate Blood**: One thing people can do to help is to donate blood. Many blood drives have been cancelled, impacting the supply. Blood donation centers have the highest standards of safety and infection control. To find where you can donate blood, visit redcross.org.

Here are other items released today:

CMS Lessening Provider Financial Burdens: CMS announced modifications to its accelerated /advanced payment programs for health care providers and suppliers experiencing cash flow concerns due to COVID-19. This guidance allows CMS to streamline the payment calculations and eliminates regional office approval and review of supporting documents in an effort to further help providers and lessen their financial hardships.

How to Manage COVID-19 in Correctional and Detention Facilities: CDC published interim guidance to ensure continuation of essential public services and protection of the health and safety of incarcerated and detained persons, staff, and visitors.

1.

What to Do If You are A Traveler Returning from a High-Risk Country? CDC has released information on guidance for recommended actions to take upon returning from a high-risk country in terms of isolation procedures and what to do if you are sick.

How to Ensure Your Hospital is Prepared: CDC posted a comprehensive hospital preparedness checklist to help hospitals assess and improve their preparedness for responding to a community-wide outbreak of COVID-19.

Help for Facilities to Assess When to Discontinue Transmission-Based Precautions: To help prevent the spread of the virus that causes COVID-19 in healthcare facilities, CDC released a reference to guide healthcare regarding discontinuing transmission-based precautions and discharging hospitalized patients with COVID-19.

CMS Continues to Approve 1135 Waivers: CMS announced the approval of seven additional state Medicaid 1135 waivers bringing the total to 23 states with approved waivers. The list of states and waivers can be found here.

Updates on How to Collect, Handle, and Test Clinical Specimens: CDC updated their guidance for handling specimens to

AMERICAN OVERSIGHT

allow for only nasal swabs if a nasopharyngeal is not available when collecting specimens to test for COVID-19. FDA also released new FAQs on diagnostic testing for labs, manufacturers and general questions.

Subject: HHS Releases Funding and Other Resources for COVID-19
Date: Wednesday, March 11, 2020 3:56:42 PM

Dear Partner –

Thank you for your continued engagement and partnership with us to address and mitigate the spread of COVID-19. We highly value our strong ongoing partnership, and hope to continue to be a resource to you as you implement community mitigation techniques. As you might imagine, a number of HHS divisions are releasing COVID-19-related information on funding and guidance. We thought it would be helpful to batch up information on key issues to keep you up-to-date.

Funding for States to Address COVID-19
Perhaps of keenest interest to you and your health officials is an update on funding for states and communities to address mitigation of COVID-19. Today, the Department of Health and Human Services (HHS) is announcing upcoming action by the Centers for Disease Control and Prevention (CDC) to provide resources to state and local jurisdictions in support of our nation's response to the coronavirus disease 2019 (COVID-19).

The $8.3 billion dollar Supplemental passed by Congress included statutory language which prescribed the exact formula for disbursing the money: states will receive 90% of their 2019 CDC PHEP grants. This marks the first tranche of funding to states from the $8.3 billion supplemental. Today, CDC is contacting State Health Officers to move forward with awarding over $560 million to states, localities, territories, and tribes. CDC will use existing networks to reach out to state and local jurisdictions to access this initial funding. To view the list of CDC funding actions to jurisdictions, click here.

Helping Communities Know Mitigation Strategies
Yesterday, CDC released their "Implementation of Mitigation Strategies for Communities with Local COVID-19 Transmission." Essentially, this is a guide for communities describing possible mitigation strategies for communities dealing with transmission at three different levels: (1) None/Minimal, (2) Moderate, or (3) Substantial. Community mitigation strategies, which are non-pharmaceutical interventions, are often the most available interventions to help slow the transmission of COVID-19 in communities. The Mitigation Plans include a set of actions that persons and communities can take to slow the spread of respiratory virus infections. The Community Mitigation Plan can be found here.

Guidance on Infection Control For Healthcare Workers
Yesterday, CDC released updated guidance on infection prevention and control recommendations. Healthcare workers are fighting this outbreak on the front lines, and this guidance is intended to provide assistance to healthcare settings that are handling suspected or confirmed cases of COVID-19. This guidance is applicable to all U.S. healthcare settings, but not for non-healthcare settings. There is separate guidance for that. The new guidance on infection control can be found here.

Guidance on Laboratories
The CDC has been actively working to address the need for testing across the country. In addition to public health laboratories, private labs are doing testing. In addition to reviewing

AMERICAN OVERSIGHT

the Updated Guidance on Evaluating and Testing Persons for Coronavirus Disease 2019, the CDC recently updated the FAQ website for laboratories, and we encourage you to read through the site to answer preliminary questions, though we stand ready to answer other questions that you may have.

OMB Flexibilities

On March 9, 2020, OMB issued a memo that provides administrative relief for recipients and applicants of Federal financial assistance who are directly impacted by COVID-19. The grant flexibilities include 10 actions that HHS can take to provide short-term administrative and financial management relief, allowing funds to be awarded quicker and giving grantees the ability to focus on their critical response, research, or services. More information can be found here.

General Preparation Information

On March 9, 2020, the White House Coronavirus Task Force released practical steps that we recommend posting and sharing to keep workplaces, school, home and commercial establishments safe. This information can be found here.

As the President, the Vice President, and the entire White House team continue to stress, the COVID-19 response is a whole-of-government effort. Each department has a number of specific resources. We encourage you to explore those resources as necessary to respond to the situation in your communities.

If you have any questions on these items or other issues, please feel free to reach out.

Thanks,

Darcie L. Johnston
Director, Intergovernmental Affairs

Subject: HHS Statement on Coronavirus Supplemental Request
Date: Monday, February 24, 2020 10:04:25 PM

Dear Partner –

Please find below HHS's statement on the coronavirus supplemental request.

"The Administration has been effectively utilizing all available resources to protect the American people from COVID-19. Today, the White House sent a supplemental request to Congress to make $2.5 billion available for COVID-19 response efforts, including an emergency supplemental appropriation of $1.25 billion. HHS will also use the Secretary's transfer authority to provide needed resources to continue the Department's robust and multi-layered public health preparedness and response efforts – including public health surveillance, epidemiology, laboratory testing, support for state and local governments and other key partners, advanced research and development of new vaccines, therapeutics and diagnostics, advanced manufacturing enhancements, and support for the Strategic National Stockpile."

Date:	Friday, February 28, 2020 5:04:54 PM
Attachments:	Dr Schuchat_COVID-19_2020.jpg

Dear EISOs and LLS Fellows,

As the response to COVID-19 continues to evolve, it is increasingly likely that many of you (especially EISOs and LLS assigned to states) will be approached to participate in media interviews. During any emergency response that requires the activation of CDC's EOC, all communication functions are handed through the Joint Information Center (JIC) in the EOC. Decisions about who may serve as a CDC spokesperson with regard to media interviews are made by the public affairs specialists working in the JIC in collaboration with the Indecent Manager and CDC leadership. Those decisions are also guided by HHS's Office of the Assistant Secretary for Public Affairs (ASPA).

During EOC-led responses, a very limited number of spokespeople are approved to speak to media on behalf of CDC. In a rapidly evolving emergency response, it is critical that our messages remain as consistent as possible, are based on the most current information, and include important framing and nuances. The staff best positioned to deliver these nuanced messages are on all the calls, involved in all the conversations, and briefed on every aspect of the response = senior leaders at CDC (picture attached of EIS alum delivering key messages).

Please understand we want you to have as many opportunities as possible to talk with media about your work. This is a time when it's in the best interest of the agency and the public to limit the number of people talking to media for the reasons described above. This is also in your best interest, as it helps ensure that you will not be put in the position of being asked to speak and comment about things that are beyond the scope of your specific work. When media quote a CDC employee, that employee is invariably presented as speaking on behalf of the entire agency. Asking you to speak now offers far more risk than benefit given the fast-moving and politically complicated nature of the response.

Guidance is being developed and will be issued soon for all staff deployed to the field. **Any requests to speak about COVID-19 should be directed to the following address** eocjicmedia2@cdc.gov. Thanks for your cooperation and contributions to a complicated and ever evolving response.

For those of you that get a good weekend, have a good weekend. For those of you working – thanks for your service on behalf of EIS/LLS and CDC.

Regards,
Eric

Cc: Blackmore, Carina
Subject: ID Provider Request - PUI 0001106
Date: Wednesday, February 12, 2020 12:48:38 PM

See a note from the ID doc treating PUI 0001106, who tested negative for nCoV (NP/OP/sputum) yesterday. If a clinical expert on coronavirus could talk to Dr. Hsu we would appreciate it. Please call me on my cell to coordinate.

Thanks for informing us about the negative coronavirus result and appreciate you sending the written documentation to us when you receive. Even though the test result came after our conversation below, his condition is not improving. He remains febrile, and yesterday patient had some desats and transient hypotension with worsening R lung infiltrate, not responding to antimicrobials, increasing bands and LFTs as well, although he is a bit more stable now. We've elected to keep him on airborne / contact at this point as we don't know what pathogen he might have. Dr. Levent (the treating peds ID physician) & I discussed last night and we have a few questions:

1. While RT-PCR is clearly very sensitive, there could be some factors that could suggest false negative – the quality of the swabs collected and also the timing of swab collection within the natural course of this disease. For most viral diseases, I would expect positive PCR early during his febrile illness (which he was), but not sure. In other words, clinically he remains ill without a diagnosis. What is the likelihood of a false negative in this setting and would CDC be agreeable to recollecting a sample?
2. Would it still be possible to talk with the coronavirus CDC expert?

We're not doubting CDC's result, but as clinicians we are trained to put the puzzle pieces together and so far not successful. We recognize epidemiologically he neither fit the close contact with nCoV nor was he from Hubei, but despite all our commercial PCR tests / urine antigen, etc everything has come back negative so no alternative diagnoses. We will keep searching & managing him appropriately.

Vincent Hsu

Subject:	IMPORTANT: Telework Guidance and Template Agreement for Consideration for Employees of the State Personnel System (COVID-19)
Date:	Friday, March 13, 2020 3:33:25 PM
Attachments:	image001.png image003.png image005.png image007.png DMS Telework Agreement Template.doc
Importance:	High

Good afternoon,

Telework can be an effective and useful tool for supporting an agency's Continuity of Operations Plan (COOP) during a declared health emergency such as COVID-19.

The purpose of this document is to aid and guide state agencies as telework is being evaluated and considered as part of each agency's response to COVID-19 to ensure required staffing levels are maintained while addressing employee health concerns.

- Telework connected with a declared health emergency must be evaluated on a case by case basis. Not all positions will be eligible for telework nor will all employees be suited for telework due to a variety of reasons. However, telework is a viable option to assist agencies in maintaining continuity of operations during a health emergency.

- If not already determined, agencies should evaluate if the duties of a given position/job or a portion of the work can be effectively performed away from the regular work location.

- If the nature of an employee's work responsibilities can be accomplished away from the regular work location and if any necessary technological/equipment needs can be satisfied, the agency may permit and encourage employees to telework as a way to reduce the face-to-face contacts between employees (social distancing).

- Agencies should identify available equipment (laptops, telephones, etc.) to be assigned to employees for the purpose of teleworking. Consideration should be given to which positions are essential to operations when prioritizing the use of appropriate equipment for telework.

- Agencies should review their telework policies to ensure they are current and consider whether any component of their policies should be modified to allow broader use of telework as appropriate.

AMERICAN OVERSIGHT

If a position is deemed eligible for telework, the manager and employee will need to complete a written agreement that specifies the terms and conditions of the arrangement and provides for the termination of the telework arrangement upon the agency's determination that it is no longer necessary.
    - Agencies may want to prepare a telework agreement that includes the basic components for short-term telework arrangements associated with the current health emergency. (See attached template)

- In evaluating telework eligibility, considerations should include:
    - Is the position essential to the agency's required responsibilities?
    - Although an essential position, can the duties be performed away from the official worksite for a defined, short period of time? If so, how long?
    - Are there significant portions of the job that can be done away from the official worksite?
    - Does the position need continual supervision or input from others that is only available from the official worksite?
    - Is contact with other employees/customers required every day? Can contacts be accomplished through various forms of technology?
    - Are needed reference materials to perform the work available/accessible?
    - Is data security maintained?
    - Is specialized equipment or technology available at the employee's home?
    - Is the home workspace appropriate for telework?

- Although a position or job class may be identified by the agency as telework eligible, an evaluation of whether a given employee is an appropriate candidate for telework should be conducted. Agencies should consider individual employee factors such as the employee's:
    - Ability to work independently;
    - Comfort level with the required technology;
    - Past performance levels;
    - Dependability and trustworthiness; and
    - Level of self-motivation.

- Employees who are unable to work due to illness or who have sick family members under their care will not be good candidates for telework.

- Employees who are caring for well children due to school or day care closures may be able to perform portions of their work from home, depending on individual circumstances (e.g., the age and level of independence of the child).

- For additional guidance on telework, please refer to the DMS-HRM policy guideline titled *Identifying Positions Appropriate for Telework and Determining Employee Eligibility*.

Thank you!

AGREEMENT FOR TEMPORARY TELEWORK ARRANGEMENT TEMPLATE
Insert Agency Name
(For use when telework is associated with a health emergency
in support of an agency's Continuity of Operations Plan)

This is a telework agreement between _____ (agency) and _____ (employee).

Period covered: From _____ through _____.

The noted employee agrees to participate in the telework program and to follow all applicable statutes, rules, policies, procedures, and guidelines. The agency approves the employee's participation in telework as specifically outlined in this agreement.

Duration: This agreement will be valid for the period outlined above or as extended or otherwise modified by the agency.

Pay and Attendance: All pay and leave will be based on the employee's established work schedule. The employee's time and attendance will be recorded based on actual hours worked in accordance with the Fair Labor Standards Act.

Overtime: An employee working overtime will be compensated in accordance with applicable law and rules. Overtime must be approved in advance in accordance with agency policy, and although compensated, unauthorized overtime may be subject to disciplinary action.

Leave: Employees must obtain supervisory approval before taking leave in accordance with established agency procedures. The employee agrees to follow established procedures for requesting and obtaining approval of leave.

Equipment: The supervisor and the employee must agree upon the equipment, if applicable, to be used in telework. The State is not required to provide equipment for the home office; however, with the approval of the supervisor, the teleworker may be provided State-owned equipment necessary to perform work assignments.

Maintenance of Equipment: Equipment provided by the agency must be protected against damage and unauthorized use. Agency-owned equipment will be serviced and maintained by the agency. Equipment provided by the employee will be at no cost to the agency and will be maintained by the employee.

Costs: The agency will not be responsible for operating costs, home maintenance, or any other incidental costs (e.g., utilities, internet, etc.), associated with the use of the employee's residence for telework.

Workers' Compensation: The employee is covered by workers' compensation if injured in the course of performing official duties at the telework location.

Liability: The agency will not be liable for damages to the employee's property resulting from participation in the telework program. In signing this document, the employee agrees to hold the State harmless against any and all claims, excluding workers' compensation claims.

Verification of Home Safety: In signing this agreement, the employee verifies that the home office provides workspace that is free of safety and fire hazards. In addition, the employee will not conduct face-to-face business at his or her residence.

AMERICAN OVERSIGHT

Data Security: While teleworking, the employee will apply safeguards which are approved by the agency to protect records and electronic data from unauthorized disclosure or damage.

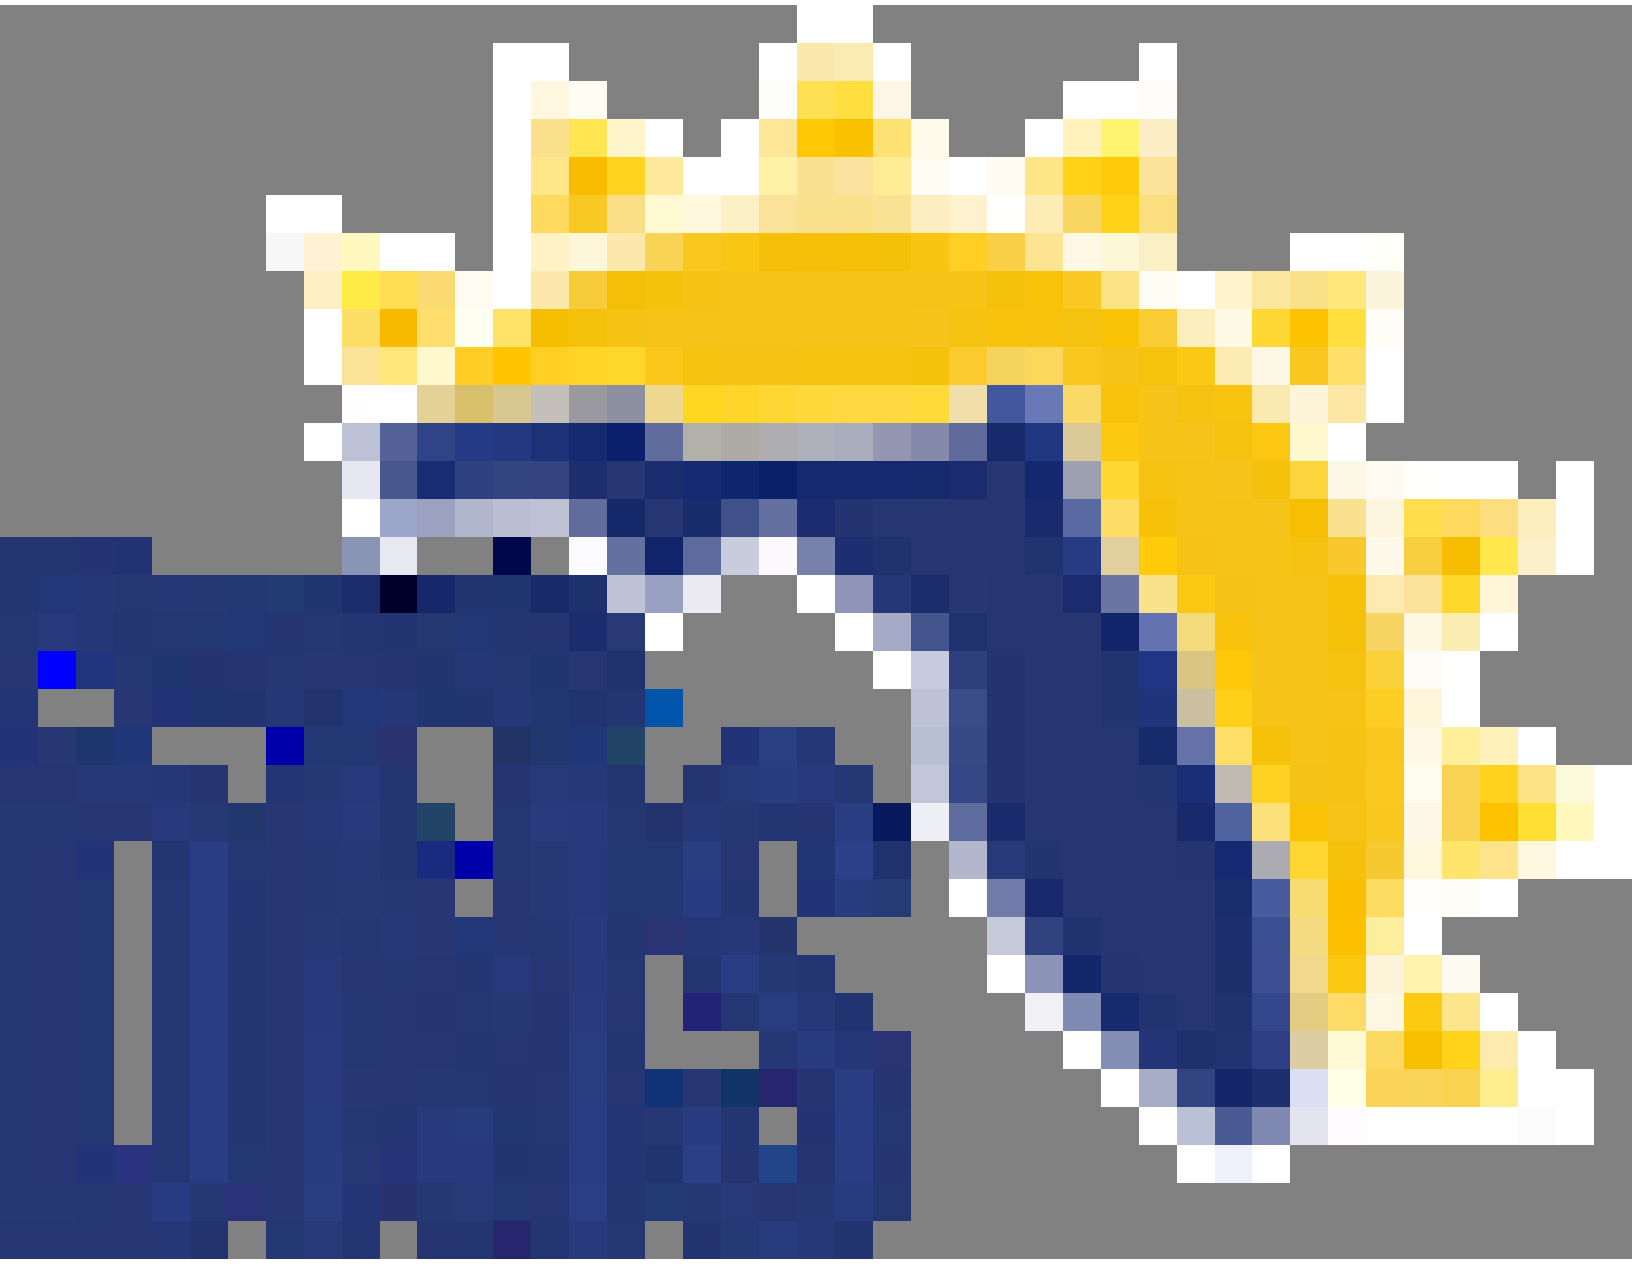
Termination of Agreement: It is understood by the employee that teleworking is a privilege. The Department reserves the right to terminate this agreement at any time and require the employee to report to work in-person.

Work Hours and Location: The working hours and work location agreed to as a part of the Telework Agreement, which may be modified as needed by agency management, are as follows:

Telework Location: _____

General Work Hours:

	(Hours)
Monday:	_____
Tuesday:	_____
Wednesday:	_____
Thursday:	_____
Friday:	_____
Saturday:	_____
Sunday:	_____



This agreement establishes the terms and conditions applicable for this period of telework.

Employee: _____ Date: _____

Supervisor: _____ Date: _____

Approving Authority: _____ Date: _____

Attachments:	image001.png image003.png image005.png image007.png 63 DMS Suspension of Rules 3-16-2020.pdf EmergencyLeaveDonationForm.docx COVID-19 Emergency Leave Transfer Program.docx

---

Good afternoon,

In response to our public health emergency and to help contain the spread of COVID-19, the Governor is allowing state employees the flexibility to donate and transfer available leave (sick, annual, special compensatory, and regular compensatory leave) to other state employees (intra- and inter-agency). This flexibility will also help mitigate the impacts of school closures and observe the Centers for Disease Control and Prevention and the Florida Department of Health's social distancing recommendations.

In order to assist employees who may not have enough leave to cover necessary absences, the Department of Management Services (DMS) is suspending the administrative rule provisions governing the existing sick leave transfer program to expand the opportunities for employees to transfer sick, annual, special compensatory, and regular compensatory leave to fellow employees.

Under this temporary COVID-19 Emergency Leave Transfer program, employees will have the ability to donate sick, annual, special compensatory leave, or regular compensatory leave to employees in need. The following requirements will govern this program:

- Employees who donate must retain at least 80 hours of sick leave.
- Employees who donate must transfer at least eight hours of leave to the recipient.
- Employees eligible for disability leave may not receive donations.
- Intra-agency and inter-agency donations are allowed.
- Unused leave donations will be returned to donating employees once Executive Order 20-52 expires.

Employees in need of leave donations and employees willing to donate leave should work directly with their agency HR offices. DMS has created the attached form that can be used to facilitate the leave donation process.

AMERICAN OVERSIGHT

In addition, DMS has suspended Rule 60L-34.0042(3), Florida Administrative Code for the particular purpose of allowing State Personnel System employees the flexibility to utilize sick leave for childcare or dependent care purposes.

If you have any questions regarding this temporary COVID-19 Emergency Leave Transfer program, please contact Matt Gregory at 850-921-4618, John Apthorp at 850-922-1274, or Mark Helms at 850-487-1508.

This message is being cascaded to Chiefs of Staff, Administration Directors, HR Directors, Communications Directors, and Legislative Directors.

Thank you!!

Sean W. Gellis | Interim General Counsel
Office of the General Counsel

AMERICAN OVERSIGHT

STATE OF FLORIDA
DEPARTMENT OF MANAGEMENT SERVICES

IN RE: SUSPENSION OF RULES, PURSUANT TO EXECUTIVE ORDER NUMBER 20-52, MADE NECESSARY BY THE COVID-19 PUBLIC HEALTH EMERGENCY.

DMS EO 20-01

_____/

EMERGENCY ORDER

WHEREAS, the Governor of the State of Florida issued Executive Order No. 20-52 in response to the COVID-19 Public Health Emergency which poses a severe threat to the entire State of Florida and requires that timely precautions are taken to protect the communities, critical infrastructure, and general welfare of this State;

WHEREAS, Section 4(B) of Executive Order No. 20-52 provides that each State agency may suspend the provisions of any regulatory statute prescribing the procedures for conduct of state business or the order or rules of that agency, if strict compliance with the provisions of any such statute, order, or rule would in any way prevent, hinder, or delay necessary action in coping with the emergency, including rules affecting the conditions of employment and the compensation of employees; and

WHEREAS, Rule 60L-34.0042(5), Florida Administrative Code, currently allows intra-agency and inter-agency transfers of sick leave only when an employee has completely exhausted all of their personal leave balances.

NOW THEREFORE, I hereby find that the Department of Management Services' timely performance of disaster response functions related to the COVID-19 Public Health Emergency is hindered by the application of procedures imposed by Rule 60L-34.0042(5), Florida Administrative Code.

AMERICAN OVERSIGHT

Therefore, pursuant to Section 4(B) of Executive Order No. 20-52, I hereby issue the following authorization(s):

1. Suspend Rule 60L-34.0041, Florida Administrative Code, and Rule 60L-34.0042(5), Florida Administrative Code, for the particular purpose of allowing state employees of the State Personnel System the flexibility to donate and transfer leave (sick, annual and personal) to other state employees of the State Personnel System (intra and inter-agency) to mitigate the impacts of school closures and adopt Centers for Disease Control and Department of Health social distancing recommendations, within the following parameters:
    a. A donating employee must retain at least 80 hours of sick leave in case of future illness;
    b. A donating employee must transfer at least eight hours of leave to a receiving employee;
    c. The provisions of Rule 60L-34.0042(5)(e)3., Florida Administrative Code remain in effect, meaning that any state employee who is eligible for disability leave is not eligible to receive donated or transferred leave.
2. Suspend Rule 60L-34.0042(3), Florida Administrative Code, for the particular purpose of allowing state employees of the State Personnel System the flexibility to utilize sick leave for childcare or dependent care purposes.

The effective dates of this Order shall correspond with the effective dates of Executive Order No. 20-52.

COVID-19: Emergency Leave Transfer Program Instructions for SPS HR Offices

March 16, 2020

In response to our public health emergency and to help contain the spread of COVID-19, the Governor is allowing state employees the flexibility to donate and transfer available leave (sick, annual, special compensatory, and regular compensatory leave) to other state employees (intra- and inter-agency). This flexibility will also help mitigate the impacts of school closures and observe the Centers for Disease Control and Prevention and the Florida Department of Health's social distancing recommendations.

In order to assist employees who may not have enough leave to cover necessary absences, the Department of Management Services (DMS) is suspending the administrative rule provisions governing the existing sick leave transfer program to expand the opportunities for employees to transfer sick, annual, special compensatory, and regular compensatory leave to fellow employees.

Under this temporary COVID-19 Emergency Leave Transfer program, employees will have the ability to donate sick, annual, special compensatory leave, or regular compensatory leave to employees in need. The following requirements will govern this program:

- Employees who donate must retain at least 80 hours of sick leave.
- Employees who donate must transfer at least eight hours of leave to the recipient.
- Employees eligible for disability leave may not receive donations.
- Intra-agency and inter-agency donations are allowed.
- Unused leave donations will be returned to donating employees once Executive Order 20-52 expires.

Employees in need of leave donations and employees willing to donate leave should work directly with their agency HR offices. DMS has created the attached form that can be used to facilitate the leave donation process.

In addition, DMS has suspended Rule 60L-34.0042(3), Florida Administrative Code for the particular purpose of allowing State Personnel System employees the flexibility to utilize sick leave for childcare or dependent care purposes.

If you have any questions regarding this temporary COVID-19 Emergency Leave Transfer program, please contact Matt Gregory at 850-921-4618, John Apthorp at 850-922-1274, or Mark Helms at 850-487-1508.

AMERICAN OVERSIGHT

Subject: information received from one of our SME"s
Date: Monday, March 16, 2020 9:53:58 AM

To all of the fine health care providers and emergency management professionals that we have had the opportunity to train, coach and interact with during the past several years. Please be assured that we appreciate the very critical work you are doing and know that you are in our thoughts and prayers as we go through the coronavirus pandemic. We realize that we had seen an increase in health care providers and emergency managers in our region of the state for incident management classes. We commend you for your interest and participation in these classes and hope that you will be able to utilize the information that we have given you.

As you go through the next several weeks, we wanted to remind you of some of the lessons that we stress on lengthy incidents:

1) Take care of your personal health and well being first and foremost. Get appropriate rest and if you are traveling to areas away from home to work be sure your kit is ready to go with any needed supplies.

2) If you are working with a group **watch out for each other**. Remember that your team is only as strong as the weakest member. There will be long hours, stressful situations and different team members may be struggling at different times. Get them help to overcome the issues that they are having at the time.

3) Watch vehicle travel when you are tired. Carpool when you can and pull over and rest if you are sleepy. We don't want to lose you on the highway.

4) Meet with your group periodically to discuss issues that can potentially help your team members function more efficiently. What are the alligators out there that may affect us today, tomorrow, and next week? Stay ahead of the situation.

5) Maintain your situational awareness. Be aware of what is happening in the vicinity you are working. Constantly reassess the information you are receiving and determine what is important and what isn't.

6) Communication is critical to being successful on a team of responders. Communicate often and openly and get the critical information to those who need it.

7) Fill out the necessary positions on you teams so that those in Command and General Staff positions are not overwhelmed doing tasks that should be accomplished by subordinates.

8) Have a plan and share it with all of the team members, get buy-in and look at all options. Remember to avoid groupthink.

Your work over the next weeks is going to be critical to the communities that we live and work in. Should you feel the need for mentoring or have open task books that need to be

AMERICAN OVERSIGHT

signed off we would be pleased to help you with these tasks. Again, please know that we appreciate each of you and look forward to our next opportunity visit again. Please reach out to us if we can help you with any Incident Management Resources.

AMERICAN OVERSIGHT

Subject: information received from one of our SME"s
Date: Monday, March 16, 2020 9:53:58 AM

To all of the fine health care providers and emergency management professionals that we have had the opportunity to train, coach and interact with during the past several years. Please be assured that we appreciate the very critical work you are doing and know that you are in our thoughts and prayers as we go through the coronavirus pandemic. We realize that we had seen an increase in health care providers and emergency managers in our region of the state for incident management classes. We commend you for your interest and participation in these classes and hope that you will be able to utilize the information that we have given you.

As you go through the next several weeks, we wanted to remind you of some of the lessons that we stress on lengthy incidents:

1) Take care of your personal health and well being first and foremost. Get appropriate rest and if you are traveling to areas away from home to work be sure your kit is ready to go with any needed supplies.

2) If you are working with a group **watch out for each other**. Remember that your team is only as strong as the weakest member. There will be long hours, stressful situations and different team members may be struggling at different times. Get them help to overcome the issues that they are having at the time.

3) Watch vehicle travel when you are tired. Carpool when you can and pull over and rest if you are sleepy. We don't want to lose you on the highway.

4) Meet with your group periodically to discuss issues that can potentially help your team members function more efficiently. What are the alligators out there that may affect us today, tomorrow, and next week? Stay ahead of the situation.

5) Maintain your situational awareness. Be aware of what is happening in the vicinity you are working. Constantly reassess the information you are receiving and determine what is important and what isn't.

6) Communication is critical to being successful on a team of responders. Communicate often and openly and get the critical information to those who need it.

7) Fill out the necessary positions on you teams so that those in Command and General Staff positions are not overwhelmed doing tasks that should be accomplished by subordinates.

8) Have a plan and share it with all of the team members, get buy-in and look at all options. Remember to avoid groupthink.

Your work over the next weeks is going to be critical to the communities that we live and work in. Should you feel the need for mentoring or have open task books that need to be

AMERICAN OVERSIGHT

signed off we would be pleased to help you with these tasks. Again, please know that we appreciate each of you and look forward to our next opportunity visit again. Please reach out to us if we can help you with any Incident Management Resources.

--

AMERICAN OVERSIGHT

I. Introduction

The vast, interconnected and complex system of transportation moves people and essential goods, and supports our critical infrastructure. As a decentralized network, the transportation sector is predominantly owned and operated by State and local governments and the private sector.

Each day, more than 371,000 international travelers arrive in the United States at international airports and preclearance stations. Our Nation's 328 international ports of entry represent the intersection of the transportation industry, public health, and homeland security.

Because of the sheer volume of traffic flowing through this and other international ports of entry, the potential exists for the rapid and widespread dissemination of a communicable disease within the U.S. Therefore, expeditious implementation of public health measures at our borders provides an opportunity to prevent the introduction of communicable diseases into the United States.

II. Purpose

Ensuring 24/7 public health capability to prevent or mitigate the introduction, transmission, and interstate spread of communicable diseases in the United States and territories.

The triggers for implementation of this plan include, but are not limited to: 1) Response to a quarantinable illness at a Port of Entry (POE), and 2) Response to any disease of public health significance at a POE.

III. Legal Authorities

Title 42 United States Code Section 264 (Section 361 of the Public Health Service Act) gives the Secretary of HHS responsibility for preventing the introduction, transmission, and spread of communicable diseases from foreign countries into the United States and from one state or U.S. possession into another. This statute is implemented through regulations found at 42 CFR Parts 70 and 71. Under its delegated authority, CDC, through the Division of Global Migration and Quarantine (DGMQ), is empowered to apprehend, detain, medically examine, or conditionally release persons suspected of carrying a quarantinable disease. By mutual agreement, U.S. Customs and Border Protection and the U.S. Coast Guard are required to aid in the enforcement of quarantine rules and regulations. Violation of federal quarantine rules and regulations constitutes a criminal misdemeanor, punishable by fine and/or imprisonment.

AMERICAN OVERSIGHT

It is incumbent on each CDC quarantine station to communicate with state and local public health officials to coordinate efforts related to the response to the introduction of diseases of public health significance.

State, local, territorial, and tribal governments are responsible for the health and safety of the people within their jurisdictional boundaries. Specific rules and regulations will vary by state. Upon request, the CDC is authorized to assist these agencies in their efforts to prevent disease transmission.

A. Florida Department of Health in Miami-Dade (DOH) Miami-Dade PUBLIC HEALTH: GENERAL PROVISIONS

- Per §381.0315, the State Health Officer is responsible for declaring public health emergencies and quarantines and issuing public health advisories. Ordering an individual to be examined, tested, vaccinated, treated, or quarantined for communicable diseases that have significant morbidity or mortality and present a severe danger to public health. Individuals who are unable or unwilling to be examined, tested, vaccinated, or treated for reasons of health, religion, or conscience may be subjected to quarantine. §381.0315(1)(b)(4)

B. Enforcement Authority:

- Authority and power are two different things: Power is the force by means of which you can oblige others to obey you. Authority is the right to direct and command, to be listened to or obeyed by others..."[1] The Florida Legislature has given broad authority to Health Departments to handle a bioterrorism event through use of quarantine. However, the force of local law enforcement and the National Guard is the means by which the Health Departments will be able to oblige the citizenry to obey its quarantine orders.

C. International vs. Domestic Flights:

- The origin of a flight dictates which agency is primarily responsible for responding to a disease event.

- Under CFR Title 42 sec 71.21, the Centers for Disease Control and Prevention Miami Quarantine Station (CDC MQS) or the nearest quarantine station is primarily responsible for responding to disease events on international flights.

---

[1] Maritain, Jacques (1882-1973), French philosopher. "The Democratic Charter," Man and the State, University of Chicago Press (1951).

AMERICAN OVERSIGHT

Under CFR Title 42 sec 70.4, the Florida Department of Health in Miami-Dade County (DOH Miami-Dade), or the local county health department is primarily responsible for responding to suspected communicable diseases on domestic flights.

The CDC MQS shall act as the primary contact point for all airlines (international and domestic origin) to report suspected communicable diseases or syndromes.

It is the responsibility of the airline to report to the CDC MQS all international flights, destined to arrive at MIA, in which the crew has reported to the captain the presence of "ill persons," as defined in CFR Title 42 sec 71.1 on board.

In addition CFR Title 42 sec 70.4 requires airlines engaged in domestic travel, to report to the "local health authority", suspected cases of communicable diseases on all flights. The CDC MQS will serve as a point of contact for DOH Miami-Dade and receive reports of suspected communicable diseases from domestic carriers, and in turn notify DOH Miami-Dade.

IV. Definitions

Communicable Disease – A disease that is transmitted through direct contact with an infected individual or indirectly through a vector.

Conditional Release – Release of a traveler from a public health restriction, such as quarantine and/or isolation under 42 C.F.R. part 71, provided that the traveler agrees to certain conditions. Conditional release can be accomplished through an order that is enforceable to the same extent as an order for quarantine or isolation.

Contact – A person who has been in such association with an infected person, animal, or contaminated environment as to have had an opportunity to acquire that infection.

Contact Tracing – Identification and diagnosis of persons who may have come into contact with an infected source.

Detention – The temporary holding of ill or exposed travelers and crew at a POE while the threat to public health is being determined by the Director of CDC, or while transportation to a medical or quarantine facility is being arranged, or the quarantine facility is being established.

Epidemic – The occurrence, in a defined community, of cases of an illness with a frequency clearly in excess of normal expectancy.

AMERICAN OVERSIGHT

Incubation Period – The time interval between initial contact with an infectious agent and the first appearance of symptoms associated with an infection.

Isolation – The separation of an individual or group infected with a communicable disease from those who are healthy in such a place and manner as determined by the Director of CDC to prevent the spread of communicable disease.

Pandemic – An epidemic occurring over a very wide area, crossing international boundaries and usually affecting a large number of people; a global epidemic.

Public Health Assessment – The initial interview of persons who were possible exposed to a given disease due to proximity to symptomatic person or other established criteria. This may be limited to providing well passengers contact forms and instructions for actions to take if symptoms occur.

Quarantinable Disease - Any of the communicable diseases listed in an Executive Order of the President, as provided under section 361(b) of the Public Health Service Act (42 USC 264). The current list of quarantinable diseases as set forth in Executive Order 13295 of April 4, 2003, as amended, is provided in section VI.

Quarantine – The separation of an individual or group that has been exposed to a communicable disease, but is not yet ill, from others who have not been so exposed, in such a manner and place as determined by the Director of CDC to prevent the possible spread of the communicable disease.

Screening – Active steps to identify the existence of disease in an individual or group of individuals through visual examinations, physical examinations, laboratory tests or other methods.

Surveillance – The ongoing systematic collection and analysis of data and the provision of information which leads to action being taken to prevent and control a disease.

Suspect – An ill person whose history and symptoms suggest that he or she may have or is developing a communicable disease.

Transmission – Mechanism by which an infectious agent is spread from a source to a person.

AMERICAN OVERSIGHT

VII. Background and Overview

Under Section 361(b) of the Public Health Service Act, DGMQ has the authority to isolate and quarantine individuals or groups of individuals who are known, or suspected of being ill with, or exposed to the following diseases:

- Cholera and suspected Cholera
- Diphtheria
- Infectious Tuberculosis
- Plague
- Smallpox
- Yellow Fever
- Viral Hemorrhagic Fevers
- Severe Acute Respiratory Syndrome (SARS)
- Influenza (novel strain with the potential for a pandemic)

Current federal regulations (42CFR71.21) require aircraft commanders to immediately report death and illness of passengers or crew onboard inbound international flights to the nearest CDC Quarantine Station.

A. Required Reporting

Ill persons displaying any of these conditions must be reported under federal regulations:

1.Fever (has a measured temperature of 100.4 °F [38 °C]† or greater, or feels warm to the touch, or gives a history of feeling feverish) accompanied by one or more of the following:
◦skin rash
◦difficulty breathing
◦persistent cough
◦decreased consciousness or confusion of recent onset
◦new unexplained bruising or bleeding (without previous injury)
◦persistent diarrhea
◦persistent vomiting (other than air sickness)
◦headache with stiff neck, or
◦appears obviously unwell;

OR
2.Fever that has persisted for more than 48 hours

OR
3.Symptoms or other indications of communicable disease, as the CDC may announce through posting of a notice in the Federal Register

B. Requested Reporting

In addition to the required reporting above, CDC Quarantine Stations also request reports from aircraft commanders of ill persons with the following conditions, which

AMERICAN OVERSIGHT

may also indicate a serious, communicable disease:

- Fever (a measured temperature of 100° F/37.8° C or greater) of any duration plus any one of the following:
  - difficulty breathing, or
  - headache with stiff neck, or reduced level of consciousness, or
  - unexplained bleeding
  - persistent cough
  - persistent vomiting

CDC recommends the following to help quarantine station personnel quickly act:

- Upon learning of a possible communicable illness or a death on board, the pilot, or designee, should immediately notify their land-based point of contact (for example, Operations Center, Flight Control, airline station manager) and provide the ill person's name, seat number (and seat changes, if any), symptoms, approximate age, point of origin, travel itinerary, and additional information about the ill person that may have been collected by volunteer, airline, or contract medical staff. See Appendix 2 for cockpit cards for reference on airplane.

- The CDC Quarantine Station staff can help evaluate an ill person and answer other questions regarding reporting requirements. **If contact cannot be made with the nearest station, please contact the Atlanta, Georgia CDC HQ Quarantine Duty Officer on call at 404-639-1220.**

- CDC Quarantine Stations, their contact information, and areas of jurisdiction are found at: http://www.cdc.gov/quarantine/QuarantineStationContactListFull.html.

- A flowchart on the response to arrival of an international flight with a suspected communicable disease is provided in the Agency Notification List (Appendix 3). Primary response agencies must be contacted **within 15 minutes** of notification by the pilot/captain of an arriving international conveyance of a suspect quarantinable disease or illness of public health significance.

- The Florida Department of Health in Miami-Dade County will be notified by the CDC MQS for domestic flights.

- The CDC Quarantine Station Manual of Operations provides case definitions and internal response protocols for illnesses of public health significance/threat onboard arriving flights. These internal protocols are updated periodically as more information regarding emerging/re-emerging infectious diseases is obtained.

AMERICAN OVERSIGHT

VIII. Emergency Operations

Emergency Response Steps:

A. Parking and Gate Procedures

Using the scenarios described in the previous section parking and gate procedures are:

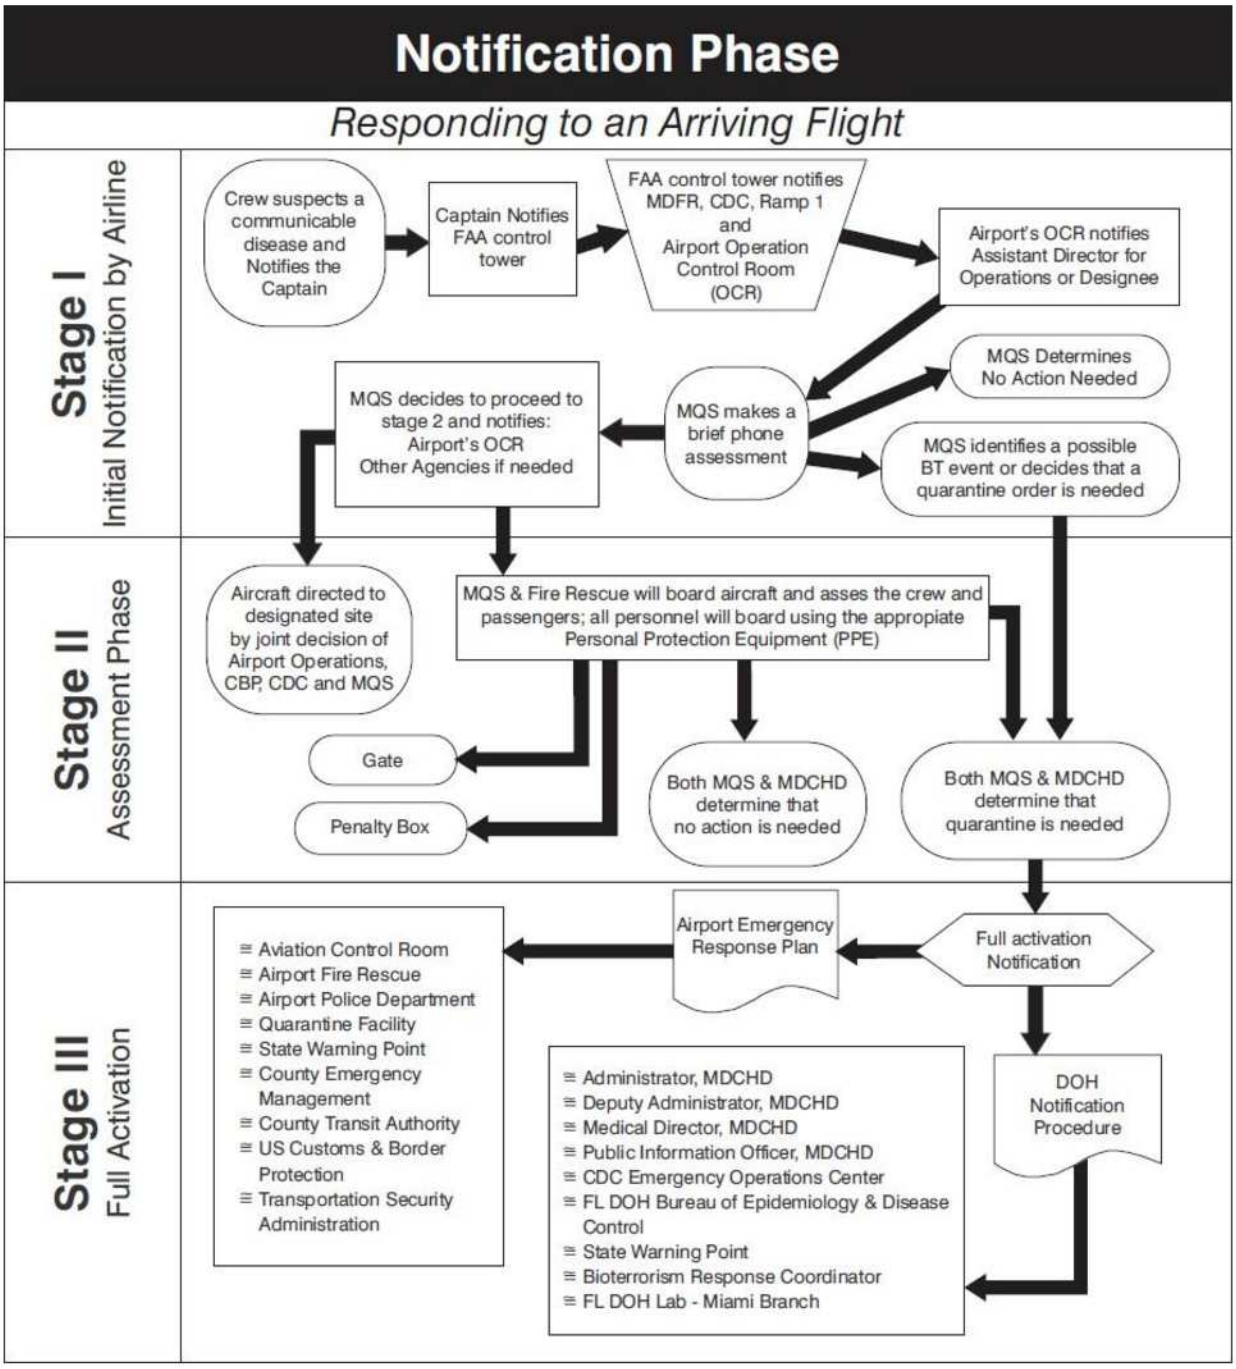
Timing of Notification	Report of Ill Traveler	Parking / Gate	Public Health/ EMS Access to Aircraft
Pre-Arrival	Illness and travel description meets criteria to suspect public health threat	Park at scheduled gate or Penalty Box	Air stairs truck
Pre-Arrival	Not enough information to determine potential public health threat	Park at scheduled gate	Jet bridge

B. Possible Scenarios of Ill Traveler Notification

Preparers of this document have identified four (4) possible scenarios of ill traveler notification. Parking and gate procedures will depend on the timing of notification and the information provided regarding an arriving ill passenger.

- Pre-arrival notification- The following triggers will call for CDC to be called to evaluate a potential public health situation.
    - Passenger/s exhibiting signs and symptoms listed for required or requested reporting.
    - Passenger/s is coming from an area with confirmed or suspect outbreak of disease of public health importance.

Pre-arrival notification- Report of ill traveler without enough information to determine cause of illness (may or may not include signs and symptoms of a communicable disease).



Post-arrival notification- Report of ill traveler prior to aircraft disembarkation- triggers for isolation activated upon evaluation on aircraft at gate.

Post-arrival notification- Report of ill traveler after disembarkation-triggers for isolation activated up after aircraft disembarkation. Notifications of a suspect communicable disease on an aircraft can come from the FAA control tower, the airport's operations center, or EMS.

- Once notification is made, the receiving office notifies the Miami Quarantine Station by calling the 24-hour phone number (305-526-2910).

- After regular office hours the phone is answered by a central answering system [the Director's Emergency Operations Center (DEOC)]; a voice message will play and the caller should select **option 0** for emergencies. The phone will be answered by staff at the DEOC who will obtain specifics about the emergency and connect the caller by phone to the on-call officer for the CDC Miami Quarantine Station.

AMERICAN OVERSIGHT

Pre-Designated Isolation Areas

- **Gate –** To be used in most circumstances. If a quarantinable disease emergency is suspected, the captain of the arriving aircraft will be directed by FAA or Airport AOC to secure the doors of the plane until emergency medical response/CDC MQS personnel arrive. See Appendix 4 for Memorandum outlining this NOTAM .

AMERICAN OVERSIGHT

- **Penalty Box** – Extreme circumstance. To be used for remote parking of aircraft, safe EMS / CDC response personnel access, isolation of aircraft, passenger, and crew from main terminals. Hard stand near this terminal can facilitate ill passenger/s evaluation and transport to medical facility.

- **Satellite (Upper E)** – In rare circumstance that an entire aircraft needs to be quarantined.

- Air conditioning to the aircraft cabins is to be maintained at all times.

- Everyone on board aircraft must remain onboard until public health assessment is complete.

- EMS/CDC personnel, with assistance from airline cabin crew will inform the crew and passengers as to the nature of the situation and the sequence of events.

C. Planeside Response

- The composition of an initial response group to a quarantinable disease emergency at the MIA should include the following:
  - CDC Quarantine Public Health Officer
  - MDFR
  - CBP Officer
  - MDPD Law Enforcement Officer
  - MDAD Operations
  - Airline Representative
  - Additional responders may include local public health authorities

- All agencies that interact with ill or exposed passengers will use appropriate personal protective equipment (PPE).

- Everyone on board aircraft must remain seated until the symptomatic person and identified close contacts are removed from the aircraft. Remaining passengers will be given contact form by CDC for completion prior to deplaning or directed to identified location within terminal for public health assessment.

- MDFR/ CDC personnel, with assistance from airline cabin crew, will inform the crew and passengers about the situation and the expected sequence of events. (See Appendix 5 for Public Health Announcement Scripts)

- The CDC MQS will board the aircraft with MDFR to perform an initial assessment, to rule out the presence of a bioterrorism event or a quarantinable disease that would constitute a public health threat.

AMERICAN OVERSIGHT

- If a quarantinable disease emergency is suspected, the CDC MQS personnel or their designated alternates will lead the illness response investigation, provide personal protection equipment (PPE) guidance, and direct the activities of all response staff present. If CDC MQS is not on site, MDFR will board the flight and consult with CDC MQS on-call officer by phone.

- CDC MQS and DOH Miami-Dade may undertake one or more of the following in response to a report of a quarantinable/communicable disease among passengers on an inbound aircraft:
  - The CDC MQS and DOH Miami-Dade will interview all passengers regarding symptoms, travel and exposure history.
  - The cases, i.e. passengers who are acutely ill with signs and symptoms, will be interviewed first utilizing the appropriate CDC form.
  - The CDC MQS/ DOH Miami-Dade will obtain passenger information from all contact passengers utilizing the "Passenger Locator Information Form".
  - Those passengers who will require epidemiologic follow-up will be given the "DOH Miami-Dade Possible Exposure Instructions" (Appendix 6) and the CDC Traveler's Health Alert Notice (if indicated).
  - Duty Officers, in consultation with the Quarantine Medical Officer and possibly the CDC-Division of Global Migration and Quarantine/Florida Department of Health- Bureau of Epidemiology, will make a decision about the disposition of all the passengers.
  - Transport will be done to the designated isolation or treating hospital if the passenger is suspected for a quarantinable disease. MDFR will be requested for transport.
  - If the communicable disease is not quarantinable under federal regulations a recommendation will be made to the passenger to seek immediate medical attention.
  - CDC MQS may notify DOH Miami-Dade of the case of suspect communicable disease so that the Health Department can determine action at the local/state level is needed.
  - It is anticipated that a single flight arriving at the MIA will be within the response capabilities of these agencies. However, a massive event, involving a single flight carrying large numbers of sick passengers, multiple flights carrying ill passengers arriving during a condensed time period, or a single case of smallpox or another suspected bioterrorism agent would require a large scale response, coordinated through the Miami-Dade Office of Emergency Management (OEM) and the State Warning Point (SWP).

AMERICAN OVERSIGHT

D. **POSSIBLE DISPOSITION OF PASSENGERS** (after all passengers have been assessed):

1. Persons will be released at the scene with no follow-up needed

- This scenario would occur, if no quarantinable disease, communicable disease of public health significance, or bioterrorism were suspected, and passengers are considered non-contacts.

- Passengers and/or crew members will be released and would be free to continue their trips. There will be no follow-up action.

- In collaboration with the DOH Miami-Dade, the CDC MQS will manage passengers wanting access to a physician after being told that they are safe to continue their trip.

2. Persons released but under epidemiological surveillance

- This would occur if there were a suspicion for a communicable disease of public health significance, which requires post exposure prophylaxis or observation for the development of symptoms. These passengers would be asymptomatic for the suspected disease, and conditionally released to continue on their journey to their final destination if they can arrive prior to the minimum incubation period.

- These passengers would be followed-up by the DOH Miami-Dade or local health authorities having jurisdiction over the individual during the incubation period.

3. Persons requiring quarantine

- This scenario would occur if there were a suspicion of the presence of a quarantinable disease and a communicable disease of public health significance. If a passenger is considered a close contact and depending on the phase, transmissibility and nature of the virus, close contacts may be quarantined in place, or alternatively released for home quarantine.

- In the event that quarantine is required to protect the public's health, onsite facilities will be used for a limited time until DOH Miami-Dade, Miami-Dade OEM or CDC MQS make arrangements for off-site facilities.

- The CDC Miami Quarantine Station will follow DGMQ protocols to activate the standing Memorandum of Understanding (MOU) with a designated hospital. NOTE: Activation of MOA with hospitals must be approved by headquarters.

- Examples of situations that may require quarantine of potentially exposed person(s) include smallpox, SARS, Ebola and other emerging infectious diseases considered to be a threat to public's health.

AMERICAN OVERSIGHT

- These passengers would be asymptomatic or not meet the case definition.

- Passengers would be transported to a temporary quarantine facility (priority will be given to the Concourse E in the Satellite Building for up to 72 hours, while DOH Miami-Dade and Miami-Dade ESF6 partners prepare the designated community quarantine facility.

- Passengers would be transported to the designated community quarantine facility once initial public health assessment was complete.

- After assessment, if the CDC MQS determines the presence of a quarantinable communicable disease or a bioterrorism event, CDC MQS will initiate full notification to the following CDC Emergency Operations Center (EOC). See Appendix 8 for Emergency Response Contact Database.

    - American Red Cross of Greater Miami and the Keys (ARC)
    - Federal Bureau of Investigation (FBI)
    - MIA's Airport Operations Center (AOC)
    - Miami-Dade County Fire Rescue (MDFR)
    - Miami-Dade Police Department (MDPD)
    - Florida Department of Health in Miami-Dade County (DOH)
    - State Warning Point (SWP)
    - Transportation Security Administration (TSA)
    - Customs & Border Protection (CBP)
    - US Department of State (DOS)
    - Miami-Dade Transit Authority (MDTA)

- Consideration will be given to contacting the designated isolation or treatment facility/hospital, as soon as there is any indication that passenger(s) will require airborne isolation or acute medical care. The facility must be notified once absolute determination is made that an ill passenger is to be transported to it.

NOTE: *The order of notifications will be determined by the event and flight origin. The Miami-Dade Aviation Department will activate the Airport's Emergency Response Plan in consultation with CDC, CBP and health authorities.*

AMERICAN OVERSIGHT

- In the event that quarantine is required for any passengers, a quarantine order will be obtained by the following steps:

  - **Step 1:** The CDC MQS will contact the DOH Miami-Dade Legal Counsel at the DOH main number: 305-324-2400 to notify the need of having a quarantine order issued.

  - **Step 2:** The DOH Miami-Dade Legal Counsel will contact the Director/ Administrator of the DOH Miami-Dade and have him/her complete the Quarantine Order and fax it to the CDC MQS.

  - **Step 3:** The MQS will copy the Quarantine Order and provide copies to the passenger(s), MDFR, MDPD and/or CBP and the hospital at which the passenger(s) will be quarantined.

- Depending on the type and extent of the situation, if needed, the local and/or state EOCs will be activated and one or more of the following agencies will be requested to provide additional response support:
  - Florida Department of Health in Miami-Dade County (DOH)
  - Miami-Dade Office of Emergency Management (OEM)
  - Florida Department of Emergency Management (FDEM)
  - Florida Department of Health (FDOH)
  - Federal Bureau of Investigation (FBI)
  - Transportation Security Administration (TSA)
  - Local Hospitals (alerted at World Health Organization Phase 4, 5, and 6 of Pandemic Alert)

E. Incident Command

- This plan follows protocols and guidelines established within the National Incident Management System (NIMS). An Incident Command System (ICS) will be implemented upon the activation of this plan and used to coordinate response activities. See Appendix 9 (**Incident Command Triggers for EOC Activation)**, for triggers for EOC activation, and transition of authority from federal to state and local agencies.

F. Screening/Detention

- **Operations/Logistics**
  - The Miami-Dade Aviation Department will secure screening and additional facilities for passengers when detention, restriction of movement, or quarantine is warranted.
  - Concourse H, fourth floor (formerly Club America) will be considered for use for up to 400 people for up to 72 hours.

AMERICAN OVERSIGHT

- For restriction of movement beyond 72 hours, a suitable off-site facility designated by the Florida Department of Health in Miami-Dade will be set up to house individuals.

- A suitable off-site facility designated by the DOH Miami-Dade collaboration with the Miami-Dade OEM will be set up to house individuals.

- Legal/Administration
  - Additional information about points of contact, procedures and timelines for seeking local/state, and/or federal orders to restrict movement is included in section above (C.3.) and Appendix 10 (Port of Entry Quarantine Response Timeline).

G. Conditional Release

- Under certain circumstances, the CDC MQS may conditionally release those passengers not deemed as close contacts of the index case(s), allowing them to continue their travel.

- For example, co-travelers who are not travel companions of the ill person(s) and who will complete travel within 24 hours of first exposure may be conditionally released to continue travel. These individuals will be asked to self-quarantine for up to five days.

- Passenger locator information will be collected, health information cards may be distributed, prophylaxis medications, if available, may be administered, and state and local health departments will be notified for tracking of the released persons.

H. Surge Capacity

- In the event of a large scale public health emergency, the CDC MQS will request the help of outside mutual response agencies to assist with medical screening and triage, public health screening of ill and exposed persons, distribution of health alert notices, administration of prophylaxis, and collection of personal locator information.

- The deployment of federal surge response staff to MQS may take 48 hours or longer. An effective response may require a two-tiered approach. CDC MQS will have a need for surge response by local public health officials and other members of the immediate health care community who can arrive at the airport immediately upon notification. Long-term (beyond 48 hours) sustainability of operations will require a federal response following the arrival of national assets.

AMERICAN OVERSIGHT

- Federal surge capacity resources that will be requested may include CDC deployed staff, United States Public Health Service (USPHS) commissioned corps officers, Health and Human Services (HHS), National Disaster Medical System (NDMS) staff, Regional Emergency Coordinators (REC) and other regional HHS personnel.

- CDC Miami Quarantine Station has the responsibility for providing training, equipment and overall management of surge personnel.

- Department of Homeland Security and MDAD Security Division has responsibility for badging of surge staff.

- Transportation of surge staff to and from deployment is the responsibility of each agency.

I. Decontamination

- Any aircraft and/or facility deemed to need decontamination will be prohibited for use until designated as safe. For additional information see Appendix 11 through 14.
- All costs for decontamination are the responsibility of the airline/facility manager.

J. Health Communication/Education

- All passengers, flight crew, travelers in the airport will be provided information specific to the incident at hand by CDC. This information will be in writing and in a language appropriate to the audience. Travel alerts, THANs, electronic notifications, posters and handouts may be sufficient for these purposes.

- Quarantine staff will be on hand to answer questions for those affected by the incident.

- Regular communication between federal officials and individuals in quarantine is important to ensuring that those in quarantine understand the situation and are informed of what they can expect during their time in quarantine. It may be useful to have social workers and health educators on site to serve as a resource to those in quarantine.

K. Media Communications

- When the Aviation Department is notified of a Level 1 Medical Emergency, MDAD Communications and social media staff will provide information to the news media and to the public only as it relates to the event's effect on airport operations (i.e. flights, terminal, landside). If the Aviation Department's AOC is activated, Communications and social media staff will report to the Operations Center and notify PIOs from Miami-Dade Fire Rescue and the

AMERICAN OVERSIGHT

- Miami-Dade Health Department to report as well. The PIOs will coordinate talking points for press releases and social media postings through the lead PIO as designated by the Incident Commander. Depending on the magnitude of the event, a joint information conference call line and conference call schedule will also be established for further coordination between agencies.

- Triggers for activation of the Communication Plan includes the disease being on the President's list of quarantinable diseases and one of the following:
  - Political implications
  - Involvement of three or more agencies
  - Of media interest

- Media inquiries will also be referred to the State of Florida Joint Information Center: ESF14@em.myflorida.com: (850) 921-0217. Media inquires for the Miami Quarantine Station will be referred to the CDC-INFO: 1-800-232-4636: CDCINFO@cdc.gov

L. International Communications

- Communication with international public health partners will be coordinated by the CDC quarantine stations.

- The U.S. Department of State will be notified whenever any international flight or person is legally detained or quarantined, to verify the status of the passenger(s), and to confirm those claiming diplomatic affiliations. If a diplomatic pouch is present on board the aircraft, its disposition will be determined by the U.S. Department of State in consultation with the Incident Commander.

M. The Quarantine Facilities

- Should quarantine of passengers be required, Florida Department of Health in Miami-Dade will work with the various response agencies planning for and activating a temporary care facility and quarantine facility.

- The public health aspect of the incident will be under the Miami Quarantine Station jurisdiction until longer term quarantine facilities are warranted. In a quarantine event beyond 72 hours, the authority will be handed to the Florida Department of Health in Miami-Dade.

- Consult "CDC Guidelines for Establishing Quarantine Facilities at U.S. Ports of Entry and in Community Settings."

- In some instances, home quarantine may be a more desirable option than quarantine in a designated facility.

- For more information on Community Mitigation Guidelines, please see: http://pandemicflu.gov/professional/community/. Written specifically for a pandemic influenza event, many of these guidelines may apply to other communicable diseases of public health significance.

AMERICAN OVERSIGHT

IX. Assignment of Responsibilities

Primary agency roles and responsibilities to staff a quarantine facility response

Miami-Dade Aviation Department: passenger logistics post deplaning
Aircraft Operator: aircraft hygiene and decontamination
MDFR: incident support
DOH Miami-Dade: support preliminary screening assessments
CDC MQS: subject matter experts
CBP: passive observation and security
MDPD: security
ICE or HSI: enforcement and security of detained individuals
FAA: aircraft communications
State and Local Emergency Management Authorities: planning and preparation support
MDTA: transportation to long term quarantine facilities
FBI: jurisdiction for terrorist threats and events
Local support and NGOs: support services for quarantined individuals
US DOS: diplomat liaison

A. Pilot-in-Command of Aircraft

- Immediately report to the nearest CDC Quarantine Station any death or illness among passengers or crew during the flight.

- Seek assistance from medical professionals on board the aircraft and on the ground (e.g. airline medical staff, contract medical consultants, CDC Quarantine Medical Officer, etc.) to make an initial assessment of the situation and communicate pertinent information to CDC Quarantine Station personnel who will coordinate the ground response upon arrival.

- Determine, in consultation with medical professionals, CDC, and other governmental entities, whether to proceed to the scheduled destination or divert to another airport. (Depending on the medical situation and current national transportation concerns, CDC, DOT, FAA, CBP, and TSA may directly influence the decision to divert.)

- Recommend what services may be needed at the POE upon arrival.

- Maintain contact with the FAA, airport operations center and air carrier operations center which will establish and maintain contact with the CDC Quarantine Station of jurisdiction.

AMERICAN OVERSIGHT

- Direct the cabin crew to isolate the ill person or relocate surrounding passengers, to the extent possible, covering any rash and providing masks if available and appropriate.

- Provide periodic updates to passengers and cabin crew on recommendations from authorities and agencies on the ground.

B. Air Carrier Operations Center/On-Airport Representative

- Coordinate operations and maintain communications between the captain of the conveyance and CDC to monitor the status of the ill person(s).

- Provide instructions to the crew, in consultation with airport authorities, CBP, and CDC Quarantine Station officials.

- Coordinate with CDC and state and local health departments on media relations and press management.

- Assist travelers in making alternative travel arrangements due to any delays caused by a public health incident.

- Instruct ground crews to delay off-loading baggage and cargo until authorized to do so by the unified command/incident commander.

- Recover and forward baggage of travelers delayed by a public health incident, subject to the necessary processing by CBP, TSA or other entities as appropriate.

- Ensure air circulation is maintained and functional hygiene facilities are available on the aircraft.

- Provide/coordinate for appropriate conveyance decontamination when necessary.

- Ensure food and beverages are available on the aircraft.

- Ensure that the pilot-in-command receives approved public health communication messaging.

- Offer language interpreters, when needed.

- Provide transportation to remote pads for CDC Quarantine Station officials, when needed.

- Coordinate sanitization of aircraft if needed.

AMERICAN OVERSIGHT

C. Miami-Dade Aviation Department (MDAD)

- Notify CDC, MDFR, CBP, MDPD and TSA personnel of any inbound conveyance with reported ill person(s) on board.
- Assist in deciding when and where the aircraft should park.
- Coordinate with the FAA to provide a parking area for the aircraft.
- Make appropriate notifications about the incident.
- Work with state/local public health to activate the quarantine facility, as needed.
- Arrange transportation for individuals who will be quarantined off site working with MDTA.
- In conjunction with CDC, maintain and periodically update the POE's Communicable Disease Response Plan to properly reflect responder organization, responsibilities and resources.
- In conjunction with CDC and other stakeholders, periodically exercise the POE's Communicable Disease Response Plan.
- Coordinate through the MIA PIO with federal, state, and local authorities on media relations, social media and press management.

D. Emergency Medical Services (MDFR) – Miami-Dade Fire Rescue

- When requested, assist public health personnel in conducting a preliminary public health assessment on-scene to determine if the individual requires medical treatment and if the person is ill with a quarantinable disease or disease of public health importance.
- Miami-Dade Fire Rescue will assume command of the incident, unless a bioterrorism event is suspected, in which case the FBI may assume command.
- The Incident Command Post (ICP) will be identified by a beacon light on top of the vehicle (if it is situated on the airport tarmac).
- The Incident Commander (IC) will request the dispatch of the Mobile Command Post (MCP), if needed.
- Once the MCP arrives on the scene, it will become the ICP.
- All arriving responders will report to the ICP and check in with the IC (*see* Incident Command Structure – Appendix 9).

AMERICAN OVERSIGHT

- If a determination to transport a passenger with a suspect quarantinable disease of public health importance/threat is made by CDC (or designee), MDFR and CDC (or designee) shall notify appropriate isolation and/or medical treatment facility.

- Remove ill person from the conveyance and transport by ambulance to the designated medical facility after CBP clearance or medical parole.

- The transportation vehicle(s) (ambulance and/or rescue vehicle) and its staff, must be adequately prepared and follow appropriate infection control precautions, in transporting a patient with a communicable disease such as smallpox:[2]
    - Remove unnecessary items from the ambulance(s) to avoid contamination and facilitate decontamination.
    - The ambulance should be equipped with a working 2-way communication device (e.g., two-way radio or cellular telephone).
    - Equip ambulance with all necessary equipment to permit adherence to appropriate isolation precautions.
    - The ambulance driver and attendant should wear appropriate PPE.
    - The ambulance driver and attendant(s) should remove their gloves and other personal protective equipment and dispose of them according to proper infection control practices as soon as the patient is placed in the ambulance and the doors are closed.
    - The patient should be covered in a linen sheet (to prevent contact with and potential contamination of objects in the area) and his nose and mouth should be covered with a disposable surgical mask (to decrease potential for droplet exposure of other individuals).
    - The patient should be transported directly to the appropriate isolation facility and stay in the vehicle until he or she can be taken into the isolation facility.

Infection Control and Ambulance Decontamination

- After the patient(s) have been transported and admitted into an appropriate receiving facility, the driver and attendant must, while in the ambulance, remove and place all protective clothing (gowns, gloves, masks, etc.) in biohazard bags, and replace them with clean protective clothing (gowns, gloves, masks, etc.).

- The bagged materials should be autoclaved or incinerated as medical waste.

---

[2] Adapted and reprinted from the CDC –Smallpox response Plan and Guidelines (version 3.0), Guide C, Part 1. Available at: http://www.bt.cdc.gov/agent/smallpox/response-plan/files/guide-c-part-1.doc

AMERICAN OVERSIGHT

- For certain suspected infectious agents such as smallpox, the ambulance(s) should not be used to transport non-smallpox cases after transportation of a suspected smallpox case until a full decontamination has been completed[3]:
    a. *Variola* virus (smallpox) is sensitive to chemical disinfection because of its envelope structure.
    b. The nature and extent of surface contamination will dictate the level of disinfection (i.e. low-level or intermediate-level) needed to make the surface safe to handle or use.
    c. However, use of high-level disinfectants or liquid chemical sterilants on large environmental surfaces (e.g., table tops, floors, walls) is not indicated under any circumstances.
    d. Environmental surfaces can be cleaned and subjected to low- to intermediate-level disinfection with an EPA-registered chemical germicide according to label instructions. There is no evidence for the transmission of *Variola* virus from nonporous surfaces. Therefore, there is no indication to use extraordinary procedures to clean and disinfect the interior surfaces of ambulances or other spaces occupied by smallpox patients. Routine approaches for cleaning and disinfection are adequate in these areas.
    e. There is no evidence to support air space decontamination of rooms, facilities, or vehicles (e.g. fumigation). Therefore, fumigation is not indicated for environmental control of the *Variola* virus.
    f. The surfaces of reusable medical equipment should be cleaned and then subjected to either low- or intermediate-level disinfection with an EPA-registered chemical germicide in accordance with label instructions.

E. State and Local Public Health Departments

- Specific Response Guidelines:

- For suspected communicable diseases on domestic flights, investigation will be led by the **Florida Department of Health in Miami-Dade (DOH).**

NOTE: *The CDC Miami Quarantine Station (CDC MQS) will be the initial point of contact for suspected communicable diseases on arriving flights (domestic and international), based on the pre-existing MOU between CDC MQS and the DOH Miami-Dade.*

---

[3] Adapted and reprinted from the CDC –Smallpox response Plan and Guidelines (version 3.0), Guide F, http://www.bt.cdc.gov/agent/smallpox/response-plan/files/guide-f.doc

AMERICAN OVERSIGHT

- Once the Office of Epidemiology and Disease Control (OEDC) at the DOH Miami-Dade is notified by the CDC MQS of a potential quarantinable communicable disease or a bioterrorism event, it will notify the following (Appendix K):
- Administrator, DOH Miami-Dade
- Public Health Preparedness, DOH Miami-Dade
- Medical Director, DOH Miami-Dade
- Public Information Officer, DOH Miami-Dade
- Florida DOH Bureau of Epidemiology and Disease Control
- State Warning Point (SWP)
- Office of Emergency Management (OEM)
- Bioterrorism Response Coordinator
- State Public Health Laboratory-Miami

– The DOH Miami-Dade will report to a pre-determined area and be escorted to the Incident Command Post (ICP) by the Miami-Dade County Aviation Department personnel.

– If the flight is blocked at a gate**,** the DOH Miami-Dade will respond to the appropriate Transportation Security Administration (TSA) checkpoint. TSA personnel will escort responders to the appropriate gate.

– The CDC MQS and the DOH Miami-Dade will respond to the ICP at the Penalty Box or other designated area and check in with the Incident Commander (IC).

– The IC is in charge of the entire incident.

– For an international flight, the CDC MQS Medical Officer is in charge of the epidemiological investigation of the crew and passengers.

– For a domestic flight, the designated DOH Miami-Dade staff will coordinate with CDC MQS to conduct epidemiological investigation of the crew and passengers.

AMERICAN OVERSIGHT

General Responsibilities:

- Provide support (upon CDC request) in the preliminary assessment of ill person(s).
- In the event of travelers' potential exposure to a person infected with a quarantinable disease or disease of public health importance, coordinate contact tracing and notification with CDC.
- Notify state and local medical examiner or coroner, as required.
- Coordinate with CDC and other federal entities, as necessary, in the issuance of quarantine and isolation orders, and the management of quarantine and isolation.
- Work with the Miami-Dade Aviation Department to activate the quarantine facility, as needed. Provide guidance to designated hospitals and/or the quarantine site medical clinic on the evaluation, diagnosis and clinical management of ill people, including assisting with arrangements for laboratory testing at local or state public health laboratories or at CDC.
- Provide clinical and public health information to local healthcare providers and the public.
- Provide public health information and recommendations to local and state authorities.
- Coordinate with CDC Quarantine Station on public health recommendations and implementation of protective measures, as needed.
- Collaborate with the Public Information Officer (PIO)/Joint Information Center (JIC) to develop and authorize information for the detained individuals, responders, the media and the public.

F. State and Local Law Enforcement Agencies

- Upon aircraft arrival, establish a security perimeter, secure the aircraft, and perform crowd control, as needed.
- Ensure that law enforcement responders have access to appropriate PPE.
- Enforce required actions (e.g., detention) for ill person or persons who have been exposed to an illness if any such persons are uncooperative.

AMERICAN OVERSIGHT

- Provide escort to ensure the security and enforcement of appropriate isolation and quarantine orders.[4]

Actions applicable to a report of illness on arriving aircraft

- Miami-Dade Police Department (MDPD) will be notified of an arriving flight by the CDC MQS and the airport's AOC. Once notified, they will do the following:
  - Dispatch a security team consisting of two Miami-Dade County Police Officers with the appropriate personal protective equipment (PPE).
  - Report to the Incident Command Post.

- **MDPD:**
  - Board the plane with CDC MQS and DOH Miami-Dade to provide security. Appropriate PPE will be provided to MDPD by CDC MQS if necessary.
  - Secure the perimeter of the aircraft in conjunction with CBP.
  - Provide security both in, and around any facilities used while assessment of passengers is being conducted. Appropriate PPE will be provided to MDPD officers if necessary.
  - MDPD will provide escort for the MDFR if transportation of patients to a designated hospital is required, in addition to CBP guarding and following the ambulance and providing security for international passengers.
  - Follow behind MDFR if a passenger from a domestic flight needs transportation to the hospital. MDPD officer(s) will remain in the hospital 24/7 until the ill passenger is cleared by the lead agencies, found not to have criminal intent, and is medically cleared for communicable disease. Security at the hospital may be provided in conjunction with the local sheriff's office. If a passenger from an international flight requires transportation to the hospital, a MDPD officer will follow behind MDFR. MDPD will provide additional escort. The MDPD officer would then remain in the hospital 24/7, until the ill passenger is cleared by the lead agencies to not have a quarantinable disease and found by the Federal Bureau of Investigation (FBI), not to have criminal intent.
  - Take over the surveillance of the passenger in the hospital, if required (due to noncompliance with isolation/quarantine), thereby enforcing the authority of the Health Department under Fla. Stat. 381.00315(1)(b)(4) This states that in the event of "communicable diseases that have significant morbidity or mortality and present a severe danger to public health" the State Health officer, after declaring a public health emergency, has the ability to order an individual who is unwilling to be examined, tested, vaccinated, or treated to be subjected to quarantine.

[4] State and local officials may not have authorities to enforce federal isolation and quarantine orders.

AMERICAN OVERSIGHT

Actions applicable when quarantine is considered

- After the initial public health assessment period is complete, and if a quarantinable disease is suspected, the aircraft will be towed to the temporary quarantine facility. MDPD will perform the following actions as the plane is transported to designated area and once the temporary quarantine facility is established:
    - Provide security on the airfield while the plane is towed from the Penalty Box to designated temporary facility.
    - In collaboration with CBP and TSA, provide security at all entrances and exits of the temporary quarantine facility.
    - Provide security on the airfield if quarantined passengers need access to their luggage for medical reasons.

G. Local Healthcare Facilities

- The isolation or treating hospital must be notified prior to transport so that they can make arrangements to accept the patient safely.
- The appropriate law enforcement agency having jurisdiction over the isolation facility will provide "quarantine" enforcement for all patients transported to isolation facilities with a "quarantine order" but refuse to be "quarantined."[5]
- Receive, isolate, evaluate and treat ill persons, as medically indicated.
- Maintain infection control measures to limit the spread of quarantinable diseases. This may include isolation of ill persons and use of PPE by staff and visitors, as medically indicated (See Appendixs 16 and 17 for Standard and Droplet Precautions).
- Obtain specified diagnostic specimens and ensure the specimens are promptly and safely transported to designated laboratories.
- Monitor exposed persons, and evaluate those who develop illness signs or symptoms while in quarantine.

---

[5] 381.0012 Enforcement authority – (5) It **shall be the duty** of every state and county attorney, **sheriff**, **police officer**, and other appropriate city and county officials **upon request to assist** the department or any of its agents in enforcing the state health laws and the rules adopted under this chapter. (**Emphasis supplied**)

AMERICAN OVERSIGHT

- Report cases, suspect cases, laboratory confirmation, and/or diagnoses immediately to appropriate public health authorities.

- Coordinate with public health authorities on media relations.

- Coordinate with local law enforcement for ill travelers placed under isolation orders or quarantine orders.

- Provide clinical and laboratory diagnostic information to federal, state, and local public health authorities.

- The hospital would proceed with the following steps for requesting a Quarantine Order from DOH Miami-Dade for a non-compliant patient(s):

  - **Step 1:** The hospital will contact the Florida Department of Health in Miami-Dade Legal Office at 305-324-2400 to request a Quarantine Order for non-compliant patients.

  - **Step 2:** The DOH Miami-Dade Legal Counsel will draft an order for the Director or Administrator of DOH Miami-Dade to sign.

  - **Step 3:** The DOH Miami-Dade Director/Administrator will execute the order and have it delivered to the hospital (via fax).

  - Work with public health authorities on media relations.

H. Centers for Disease Control and Prevention (CDC)

- Conduct public health assessments and arrange medical examinations of ill travelers and crew to determine the need for public health interventions.

- Authorize the temporary detention or quarantine, through federal order as necessary, of travelers and animals/cargo for appropriate public health evaluation and response to reports of illness, in consultation with other relevant federal entities.

- Notify and collaborate with other federal, state, and local agencies when ill travelers have been detained or paroled into the United States for evaluation or treatment for communicable diseases.

- Provide advice and guidance to the public health responders, including state and local public health authorities, in caring for ill and exposed persons.

- Provide training for CBP officers and other port and community partners regarding public health response at U.S. ports of entry.

AMERICAN OVERSIGHT

- Obtain information on ill and exposed travelers (e.g., demographics, contact information, travel itinerary, illness history, and medical status) and the conveyance (number of passengers, manifest availability), in accordance with the law and existing information sharing agreements.

- Rescind federal quarantine orders when the public health situation allows.

- Provide access to a medical review in instances where travelers challenge federal isolation or quarantine orders.

- Advise F/S/L/P officials potentially exposed to a quarantinable disease or disease of public health importance throughout the course of the epidemiological investigation and upon the final medical determination of the nature of the illness.

- Provide guidance to aircraft and airport operators on cleaning areas and conveyances potentially contaminated with communicable disease organisms.

- Coordinate with the Department of State and World Health Organization (WHO) to provide information about ill international travelers to ministries of health at their place of origin and at intermediate destinations.

- Coordinate with the Department of State, as necessary, to notify applicable foreign consulates or embassies that their foreign nationals have been detained for evaluation or treatment of a quarantinable disease.

- Participate in the management of media relations, in collaboration with state and local health departments and information officers from other response partners.

- In conjunction with the Miami-Dade Aviation Department and other stakeholders, maintain and periodically update the POE's Communicable Disease Response Plan to properly reflect responder organization, responsibilities and resources.

- In conjunction with the Miami-Dade Aviation Department and other stakeholders, periodically exercise the POE's Communicable Disease Response Plan.

- Collaborate with PIO/JIC to develop and authorize information for the detained, responders, the media, and the public.

I. U.S. Customs and Border Protection (CBP)

- For international arrivals with a potential ill person on board, meet the conveyance and prevent disembarkation until CDC or their designated alternate arrives.

AMERICAN OVERSIGHT

- Conduct passive observation of arriving international travelers and crew (using up-to-date information provided by CDC) during the routine performance of inspection duties through visual observations and questioning with a specific set of questions, for the purposes of identifying travelers and crew.

- To the extent necessary, provide on-site security escort of ill or potentially ill travelers and crew to ensure their separation from the general public.

- To the extent necessary, provide escort to ensure the security and enforcement on-site at the POE of individuals being detained pending their public health disposition, to include federal isolation and/or quarantine orders.

- Assist CDC in determining an on-site area appropriate for short-term detention and short-term quarantine.

- When CDC is not present, consult with the appropriate CDC Quarantine Station or Director's Emergency Operations Center to determine the public health disposition of ill or potentially ill travelers and crew.

- Assist CDC in identifying travelers at risk and those suspected of having been in contact with an ill person by reviewing passenger customs declarations (CBP Form 6059B), Advance Passenger Information System (APIS) data, and other sources of traveler information in response to a specific request by CDC, in a manner consistent with current information sharing arrangements, policies and laws.

- Parole or otherwise establish the correct immigration status for ill non-U.S. citizens and non-permanent residents (e.g. non-immigrant students, workers, etc.) if public health interventions are indicated.

- Assist CDC in distributing Traveler Health Alert Notices (THANs) and other public health information as well as posting traveler health information, as requested.

AMERICAN OVERSIGHT

J. Immigration and Customs Enforcement (ICE)

- To the extent necessary, provide off-POE escort and continued presence at the facility to ensure the security and enforcement for individuals being detained pending their public health disposition, to include federal isolation and/or quarantine orders.

- Assure that individuals who are cleared of public health orders are processed in accordance with the immigration or other laws (i.e., enforcement of warrants, detaining persons under Title 8 as needed, etc.).

K. Federal Aviation Administration (FAA)

- Provide air traffic control services and handling priority as required to permit safe and expeditious aircraft arrival and landing at the destination airport.

- Maintain communications between the aircraft pilot-in-command, the airport operating authority and CDC to advise on the progress of the flight and status of the ill person(s).

- Establish and assist with enforcement of temporary flight restrictions where requested by competent authority in the interest of public health and safety.

- Provide taxi instructions to a parking location designated by competent authority to effectively implement public health intervention in response to illnesses on board.

- At the request of TSA, divert a flight destined for the U.S. from landing in the U.S. or direct the flight to land at a specified airport in the U.S. that is equipped to examine and process a suspected infectious person on the aircraft.

L. State and Local Emergency Management Authorities

- Assist and support state and local public health authorities with supportive measures if temporary care and quarantine facilities are activated.

- Work with state and local health departments to support the planning and preparation activities to operate temporary care and quarantine facilities at each international and domestic airport, seaport, and land border crossing.

- Seek assistance from the Federal Emergency Management Agency (FEMA) when appropriate.

AMERICAN OVERSIGHT

M. Federal Bureau of Investigation (FBI)

- The FBI has jurisdiction over all terrorist threats and events. If a public health incident bears the potential to be an act of terrorism, the FBI will immediately be notified.

N. Local Support (and Non-Governmental) Organizations

- Miami-Dade OEM (ESF 6-Mass Care), ARC and the DOH Miami-Dade will provide support services to people exposed to the illness (quarantined individuals), as well as to service providers (See Appendix 18 American Red Cross Standard Operating Procedures). Such support services may be modified. Support services include, but are not limited to:

    - Meals (including special meals for those under dietary restrictions)
    - Beverages (including sterile water and formula for infants)
    - Eating utensils, plates and napkins
    - Tables and chairs
    - Cots and bedding
    - Space heaters and fans
    - Portable toilet facilities and toiletries
    - Hand-washing facilities
    - Portable showering facilities
    - Parent-child needs (e.g., diapers)
    - Telephones
    - Means of communicating with family
    - Television, movies, and radio
    - Internet access and email
    - Reading materials and games
    - Public address system
    - Interpreter services
    - Spiritual support
    - Mental health support

- The ARC will be responsible for providing support services during all phases of the event (initial assessment and temporary quarantine phases). Duties will include:

  Support Items/Infrastructure:

  – In collaboration with DOH Miami-Dade, supply and deliver support items for passengers during both the initial public health assessment and temporary quarantine phases of the event (*see* Appendix 19 for list of items).

AMERICAN OVERSIGHT

- Delivery of support materials to the Penalty Box or Satellite building during the initial public health assessment phase, should be within 1-2 hours of receiving notification of the arriving aircraft.

- Delivery of support materials to the temporary quarantine facility should be within 4-6 hours of receiving notification of the arriving aircraft.

Staff/Volunteer Duties: (See Appendix 20 for a Detailed List)

– ARC personnel will provide mental health and crisis management assistance if needed, to passengers in the temporary quarantine facility.

– ARC will coordinate and manage all organizations and personnel providing crisis counseling, food services, administrative assistance, and other support services to family members and support organizations.

– ARC will coordinate with other staff in the temporary quarantine facility to appropriately stage the facility, including arrangement of sleeping, eating, and recreation areas.

Family Assistance:

– In collaboration with the airline, ARC will establish a family waiting/receiving area in the airport to provide support to waiting family and friends of passengers requiring quarantine.

– ARC will coordinate on site child care services if necessary for waiting family members and friends with young children.

– ARC personnel will provide mental health and crisis management assistance if needed, to waiting family members and friends.

O. Miami-Dade Transit Authority (MDTA)

– Once the community quarantine facility is readied (up to 72 hours after initiation of quarantine), Miami-Dade Transit Authority (MDTA) buses will be used to transport passengers to temporary quarantine facilities throughout the County.

NOTE: *MDTA buses must have a police escort while they are transporting passengers from MIA to a community quarantine site.*

AMERICAN OVERSIGHT

P. U.S. Department of State (DOS)

- On international flights, if foreign diplomats, consular officials, or their dependents are on board, the U.S. Department of State (DOS), Bureau of Diplomatic Security should be notified so that they can contact consulates to verify the diplomatic status of passenger(s) claiming diplomatic affiliations.

- In the event that a quarantine order is issued, the DOS' Diplomatic Security Law Enforcement Center should be notified immediately at 571- 345-3146. This office will be responsible for notifying the home country of diplomats, consular officials, or their dependents and assisting in the handling of these individuals.

- If a diplomatic pouch is present on board the aircraft, its disposition will be determined by the DOS in consultation with the lead agency depending on the event (FBI or the CDC MQS or the DOH Miami-Dade).

- In the event that a quarantine order is issued, and foreign nationals (i.e. non-U.S. citizens or permanent residents) are on board, the DOS, Office of Foreign Missions should be contacted at 571-345-3146. This office will be responsible for notifying the home country of foreign nationals and assist in the handling of these individuals.

AMERICAN OVERSIGHT

X. APPENDIX

1. Memorandum of Agreement between FAA and CDC

MEMORANDUM OF AGREEMENT
BETWEEN
THE FEDERAL AVIATION ADMINISTRATION
AND
THE CENTERS FOR DISEASE CONTROL AND PREVENTION

1. PURPOSE.

The purposes of this Memorandum of Agreement (MOA) are to set forth the terms, conditions, and understandings by which the Federal Aviation Administration (FAA) of the U.S. Department of Transportation (DOT) and the Centers for Disease Control and Prevention (CDC) of the U.S. Department of Health and Human Services (HHS) (collectively the Parties and, individually, a Party) will relay notifications of reports that they receive of deaths, suspected cases of communicable disease, or other public health risks, on board aircraft and to establish other actions that the Parties agree to take to prepare for and respond to contingencies involving deaths, suspected cases of communicable disease, or other public health risks, on board aircraft. Note 1 to Paragraph 8.15 of Annex 9 to the Convention on International Civil Aviation (the Chicago Convention) provides some possible examples of when a communicable disease might be suspected and require further evaluation.

2. PARTIES.

The Parties to this MOA are the FAA and the CDC.

3. BACKGROUND.

HHS has the authority to make and enforce regulations necessary to prevent the introduction, transmission, or spread of communicable diseases from foreign countries into the United States or from one U.S. state or possession into another. This authority is implemented through HHS's Interstate and Foreign Quarantine Regulations, promulgated in Title 42, Code of Federal Regulations (CFR), Part 70 (Interstate) and Part 71 (Foreign), respectively. With respect to the activities contemplated under this MOA, the Division of Global Migration and Quarantine (DGMQ), is the office of primary responsibility within the CDC.

Title 42 CFR requires the commander of an aircraft to report deaths or suspected cases of communicable disease in circumstances defined by CDC. Paragraph 8.15 of Annex 9 to the Chicago Convention requires that "[t]he pilot-in-command of an aircraft shall ensure that a suspected communicable disease is reported promptly to air traffic control, in order to facilitate provision for the presence of any special medical personnel and equipment necessary for the management of public health risks on arrival." ICAO Document 4444

1

AMERICAN OVERSIGHT

provides guidance to ICAO Member States (including the United States) on the implementation of this requirement.

Specifically, ICAO Document 4444 sets forth, in paragraph 16.6.1, the items of information that the flight crew is expected to provide to the Air Traffic Services (ATS) unit with which the pilot is communicating regarding suspected cases of communicable disease, or other public health risks, on board an aircraft and further states that:

> 16.6.2 The ATS unit, upon receipt of information from a pilot regarding suspected case(s) of communicable disease, or other public health risk, on board the aircraft, shall forward a message as soon as possible to the ATS unit serving the destination/departure, unless procedures exist to notify the appropriate authority designated by the State and the aircraft operator or its designated representative.
>
> 16.6.3 When a report of a suspected case(s) of communicable disease, or other public health risk, on board an aircraft is received by an ATS unit serving the destination/departure, from another ATS unit, or from an aircraft or aircraft operator, the unit concerned shall forward a message as soon as possible to the public health authority (PHA) or the appropriate authority designated by the State as well as the aircraft operator or its designated representative, and the aerodrome authority.

In the United States, the FAA's Air Traffic Organization (ATO) provides air traffic services, and the CDC is the authority designated by the United States to arrange for any necessary public health response to reports of deaths, suspected cases of communicable disease, or other public health risks, on board aircraft.

This MOA establishes the terms, conditions, and understandings by which the FAA and the CDC will exchange notifications of reports that they receive of deaths, suspected cases of communicable disease, and other public health risks, on board aircraft and establishes other actions that the Parties will take to prepare for and respond to such contingencies. The primary mechanism by which FAA and CDC will exchange notifications of reports that they receive of deaths, suspected cases of communicable disease, and other public health risks, on board aircraft is the FAA's Domestic Events Network (DEN). The DEN is an FAA-sponsored, 24/7 telephonic conference call network that includes all the FAA Air Route Traffic Control Centers (ARTCCs) in the United States. It also includes various other governmental agencies that monitor the DEN, including the CDC Emergency Operations Center (EOC). The purpose of the DEN is to provide timely notification to the appropriate departments or agencies that there is an emerging aviation-related problem or incident. The DEN is managed and facilitated by FAA Air Traffic Security Coordinators (ATSCs) under the direction of ATO System Operations Security. All interagency communication regarding real-time aviation security concerns and other events with potential operational impacts on the National Airspace System should be initiated and coordinated on the DEN. The premise of the DEN is a "need to share" versus a "need to know." The DEN is an open mode of communication and is not to be used for classified information.

AMERICAN OVERSIGHT

A diagram illustrating the intended pathways for many of the potential government and industry communications regarding reports of deaths, suspected cases of communicable disease, or other public health risks, on board aircraft is included as Appendix 1 to this MOA. Appendix 1 does not form part of this MOA, and the Parties recognize that, in an actual event, reporting pathways may differ from what is depicted in Appendix 1 and that there are additional potential reporting pathways that are not depicted.

4. AUTHORITY.

A. The CDC is authorized to enter into this MOA pursuant to section 361 of the Public Health Service Act (42 United States Code (U.S.C.) § 264).

B. The FAA is authorized to enter into this MOA pursuant to 49 U.S.C. § 106(m).

5. RESPONSIBILITIES.

A. The FAA agrees to:

1. Develop procedures for ATSCs and ATS staff to use to notify the CDC EOC of any reports of deaths, suspected cases of communicable disease, or other public health risks, on board aircraft destined for or departing from the United States, transiting U.S. airspace, or operating in other airspace in which the FAA provides air traffic services, that are received by an FAA ATS unit.

2. Notify the CDC EOC of any reports of deaths, suspected cases of communicable disease, or other public health risks, on board aircraft destined for or departing from the United States, transiting U.S. airspace, or operating in other airspace in which the FAA provides air traffic services, that are received by any FAA ATS unit. The FAA will relay such reports to the CDC EOC using the DEN. To the extent that the report made to the FAA includes the information listed in Paragraph 16.6.1 of ICAO Document 4444, the FAA shall provide this information to the CDC EOC.

3. If an FAA ATS unit receives a report of a death, suspected case of communicable disease, or other public health risk, on board an aircraft that departed from or is destined for a location outside the United States, the FAA will, in addition to notifying the CDC EOC, forward a message as soon as possible to the ATS unit(s) serving the departure or destination outside the United States to notify said ATS unit(s) of the report of a death, suspected case of communicable disease, or other public health risk, unless procedures exist to notify the appropriate authority designated by the foreign country and the aircraft operator or its designated representative.

AMERICAN OVERSIGHT

B. The CDC agrees to:

1. Develop procedures to be used by watch officers in the CDC EOC to document receipt of notifications and actions taken when the FAA or another source notifies the CDC of a report of a death, suspected case of communicable disease, or other public health risk, on board an aircraft destined for or departing from the United States, transiting U.S. airspace, or operating in other airspace in which the FAA provides air traffic services. The CDC EOC will verbally acknowledge receipt from the DEN of reports of deaths, suspected cases of communicable disease, or other public health risks, on board aircraft.

2. Develop procedures to communicate directly with aircraft operators or their designated representatives and airport operators regarding notifications received by the CDC of deaths, suspected cases of communicable disease, or other public health risks, on board aircraft, whether from the FAA or another source.

3. In response to a notification from the FAA or another source of a report of a death, suspected case of communicable disease, or other public health risk, on board an aircraft, the CDC agrees to notify the aircraft operator or its designated representative, and the departure and destination airport operators (where such airports are located within the United States), as well as to arrange for an appropriate public health response at departure or destination airports located within the United States. The CDC agrees to communicate directly with the aircraft operator or its designated representative and the airport operator(s), if applicable, for subsequent coordination with the aircraft concerning clinical details, airport preparation, and other aspects of the public health response. The CDC agrees that it will not request that ATC channels be used for any such subsequent coordination unless no other reasonable alternative exists.

4. The CDC EOC, via the DEN, will provide the FAA with follow-up information concerning CDC's actions in response to a notification from the FAA or another source of a report of a death, suspected case of communicable disease, or other public health risk, on board an aircraft.

5. The CDC EOC will notify FAA, via the DEN, of any reports that the CDC receives from sources other than the FAA of deaths, suspected cases of communicable disease, or other public health risks, on board aircraft destined for or departing from the United States, transiting U.S. airspace, or operating in other airspace in which the FAA provides air traffic services, that may require action by the CDC or by other federal, state, local, tribal, or foreign authorities that the CDC has received from sources other than the FAA.

AMERICAN OVERSIGHT

6. POINTS OF CONTACT.

A. FAA.

a. System Operations Security
Manager, Strategic Operations Security
800 Independence Ave, SW, BLDG 10A, Room 300
Washington, D.C. 20591
Office: 202-267-7382

b. Domestic Events Network
Manager, Tactical Operations Security
800 Independence Ave, SW, BLDG 10A, Room 300
Washington, D.C. 20591
Office: 202-493-4528

B. CDC.

a. Division of Global Migration and Quarantine (DGMQ)
1600 Clifton Road, NE, MS E-03
Atlanta, GA 30333
404-498-1600

b. CDC Emergency Operations Center
Office of the Director
1600 Clifton Road, NE
Atlanta, GA 20332
770-488-7100

7. RELATIONSHIP TO OTHER PROVISIONS.

Nothing in this MOA is intended to conflict with any applicable U.S. law or regulation. If any provision of this MOA is found to conflict with any applicable U.S. law or regulation or any obligation of the United States under an international agreement, then such law or regulation shall control, but the remaining provisions of this MOA shall remain in full force and effect.

8. FUNDS.

It is not anticipated that funds from either Party will be specifically required to implement this MOA. If such expenditures do occur, the expenditures by each Party are subject to its budgetary processes and to the availability of funds and resources pursuant to applicable

AMERICAN OVERSIGHT

laws, regulations, and policies. Each Party will be responsible for any expenditures it may make to implement this MOA.

Any transfer of funds between the Parties relating to this MOA shall be made in accordance with the Economy Act (31 U.S.C. §§ 1535, et seq.) or the authority provided to the FAA at 49 U.S.C § 106(m) and shall be subject to the availability of appropriations.

9. LIABILITY

Each party to this MOA will be solely responsible for its own acts and omissions and those of its officers, employees and agents.

10. AMENDMENTS

The Parties may amend this MOA at any time and shall document the details of any such amendment in a written agreement signed by both Parties.

11. NO PRIVATE RIGHTS CREATED & NO EFFECT ON LEGAL AUTHORITIES

This MOA is an interagency agreement between the CDC and the FAA and does not create or confer any right, benefit, or cause of action on any other person or party, private or public. Nothing in this MOA is intended to restrict the authority of either Party to act as provided by law or regulation, or to restrict any agency from enforcing any laws or regulations within its authority or jurisdiction.

12. EFFECTIVE DATE.

This MOA enters into force on the date of the last signature and shall remain in force until terminated in accordance with Article 13 of this MOA.

AMERICAN OVERSIGHT

13. TERMINATION.

Either Party may terminate this MOA upon thirty (20) business days' written notice to the other Party.

Appendix A – Selected Communication Paths for Aircraft Reporting A Death, Suspected Case of Communicable Disease, Or Other Public Health Risk

AMERICAN OVERSIGHT

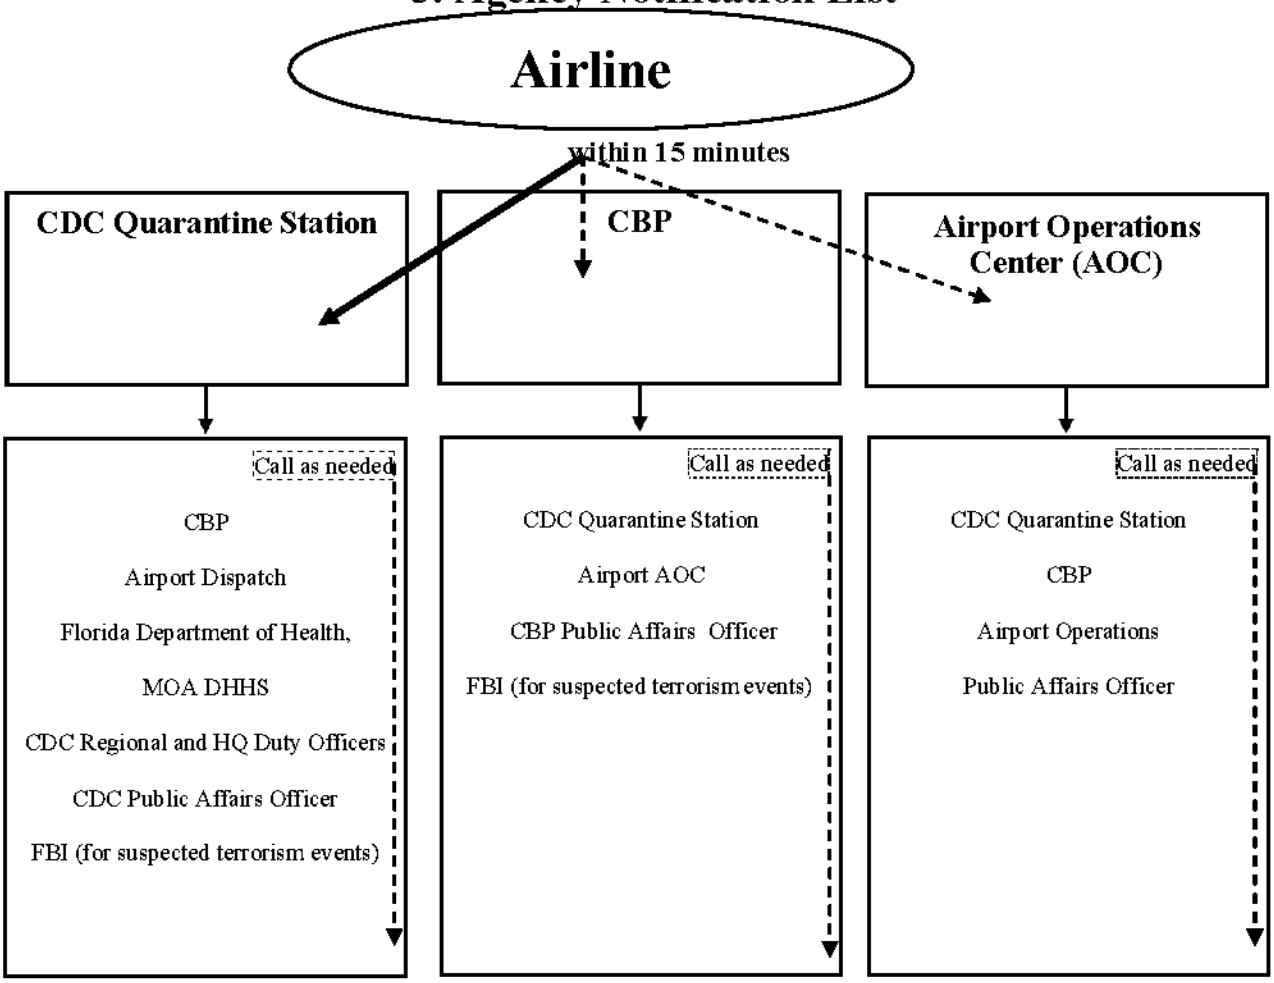
2. Cockpit Card Notifying Public Health about Ill Passengers or Crew on Flights Arriving in the United States

Federal regulations require that the captain of an aircraft destined for a U.S. airport report, before landing, any death on board or illnesses that may indicate a communicable disease.

Conditions <u>requiring</u> reporting to the Centers for Disease Control and Prevention (CDC):

- **Fever*** that has lasted more than 48 hours;
- **Fever*** of any duration **plus** any of the following:
  - o **rash,** or
  - o **swelling of the lymph glands**, or
  - o **jaundice (yellowing of skin or eyes);**
- **Persistent Diarrhea** (more than 3 stools within 24 hours)

Conditions that CDC <u>requests</u> be reported:



- **Fever*** of any duration **plus** any of the following:
  - **difficulty breathing**, or
  - **headache with stiff neck**, or
  - **reduced level of consciousness**, or
  - **unexplained bleeding**
  - **persistent vomiting**
  - **persistent cough**

- Contact your airline's point of contact (for example, Operations Center, Flight Control, airline station manager) as soon as you learn of an ill person or death. Provide the ill person's name, seat number, symptoms, approximate age, and point of origin.
- Tell the airline point of contact to immediately notify the CDC Quarantine Station at or closest to the airport where you are arriving to ensure a prompt ground response so the ill person can receive timely care and the risk for spreading disease will be minimized.

** Fever means a temperature of 100° F (37.8° C) or greater. Flight crew should consider someone to have a fever if the ill person feels warm to the touch, gives a history of feeling feverish, or has an actual measured temperature of 100° F (37.8° C) or greater.*

AMERICAN OVERSIGHT

3. Agency Notification List

Notifications among responding agencies to a communicable disease incident on an international aircraft should be timely and redundant. In particular, designated healthcare facilities/hospitals should be notified prior to transport and treatment of suspected ill persons.

Depending on the nature of the communicable disease event and the scope of the response (high public health significance vs. low public health significance), in addition to the responders listed in the notifications above, the entities listed below may also be notified.

- Miami Dade County Office of Emergency Management
- Florida Department of Health
- Florida Department of Emergency Management

5. Public Health Announcement Scripts

These messages should be read **after** a report of an ill person has been made to the Centers for Disease Control and Prevention (CDC) Quarantine Station, and/or if requested by the Quarantine Station. If possible, the public health announcement (PHA) should be made before landing or while taxiing to the gate to ensure that passengers remain in their seats once the plane has landed.

Situation 1: Ill person is still on the plane, and medical assistance is needed. Read PHA 1.

Situation 2: Ill person has been taken off the plane, and CDC has asked that Travel Health Alert Notices be handed out to everyone. Read PHA 2.

Situation 3: Ill person has been taken off the plane. CDC has asked that certain passengers sitting near the ill person receive Travel Health Alert Notices and provide their contact information by filling out a Passenger Locator Form. Read PHA 3.

Situation 4: There are no ill people on board. CDC has asked that a PHA be read because the flight is coming from an area of risk for a disease. Travel Health Alert Notices will be handed out to everyone on the plane. Read PHA 4.

Situation 5: There are no ill people on board. CDC has asked that a PHA be read and that passengers fill out the Passenger Locator Form. Travel Health Alert Notices will be handed out to everyone on the plane. Read PHA 5.

PHA 1
Please remain seated for an announcement. A person on board requires medical attention. This should take only a few minutes. Please remain seated while emergency medical team and public health staff are on board. We will provide more information as soon as possible. Thank you very much for your cooperation.

PHA 2
Please remain seated for an announcement. An ill person has been taken off the plane to receive medical treatment. As a precaution, public health officials have asked us to give you information about the illness and what to do if you become ill. Flight attendants will hand you a Travel Health Alert Notice as you leave the plane. Please read this card carefully and keep it for the time specified on the card. Thank you very much for your cooperation.

PHA 3
Please remain seated for an announcement. An ill person has been taken off the plane to receive medical treatment. As a precaution, we are collecting information on how to contact passengers who sat near the ill person. In case public health authorities need to contact you, we are asking you to provide information about how you can be reached in the next 3 weeks. Flight attendants are passing out the forms now. Please fill out the form completely and hand it back to a flight attendant before you leave the plane. We will also give you a Travel Health Alert Notice to

AMERICAN OVERSIGHT

inform you about the illness and what to do if you become ill. Please read the card carefully and keep it for the time specified on the card. Thank you very much for your cooperation.

PHA 4
Please remain seated for an announcement. This flight is returning from an area where cases of [*insert name of the infectious disease*] have been reported. There is a slight risk that travelers may have been around people ill with the disease while in the country. As a precaution, public health officials have asked us to give you information about the illness and what to do if you become ill. Flight attendants will hand you a Travel Health Alert Notice as you leave the plane. Please read this card carefully and keep it for the time specified on the card. Thank you very much for your cooperation.

PHA 5
Please remain seated for an announcement. This flight is returning from an area where cases of [*insert name of the infectious disease*] have been reported. There is a slight risk that travelers may have been around people ill with the disease while in the country. As a precaution, public health officials have asked us to give you information about the disease and what to do if you become ill. Flight attendants will hand you a Travel Health Alert Notice as you leave the plane. Please read this card carefully and keep it for the time specified on the card.

Public health officials may need to contact you, so we are asking you to provide information about how you can be reached in the next 3 weeks. Flight attendants are passing out the forms now. Please fill out the form completely and hand it back to a flight attendant before you leave the plane. Thank you very much for your cooperation.

AMERICAN OVERSIGHT

6. DOH Miami-Dade Possible Exposure Instructions

POSSIBLE EXPOSURE TO A CONTAGIOUS DISEASE

The DOH Miami-Dade has been notified of illness in a passenger who was on this flight. The cause of illness is being investigated but is not yet known. The following information is being requested in case the illness is a communicable disease, which could have been spread to other passengers. Any information you provide will be kept confidential and used only for health department follow-up if needed.

If you need any follow-up or preventive treatment, the DOH Miami-Dade will be contacting you. However, you should notify your health care provider and call the DOH Miami-Dade if, during the incubation period you develop symptoms such as:

- **Temperature of 100°F (38°C) or greater accompanied by rash;**
- **Temperature of 100°F (38°C) or greater accompanied by glandular swelling;**
- **Temperature of 100°F (38°C) or greater accompanied by jaundice;**
- **Temperature of 100°F (38°C) or greater which has persisted for more than 48 hours; or**
- **Diarrhea defined as the occurrence in a 24-hour period of three or more loose stools or a greater than normal amount of loose stools.**

In addition, it is recommended that a report be made for the following conditions which may indicate a reportable illness:

- **Hemorrhagic fever syndrome (persistent fever accompanied by abnormal bleeding from any site);**
- **Acute respiratory syndrome (severe cough or severe respiratory disease of less than 3 weeks duration); or**
- **Acute neurological syndrome (severe nervous system problem of less than 3 weeks duration)**

The DOH Miami-Dade 24 hour phone number is (305) 324-2400.

The attached form should be completed by / for each passenger. If you need assistance completing this form, please ask a health department or airline representative.

AMERICAN OVERSIGHT

7. Memorandum Of Agreement Between DOH Miami-Dade and Miami-Dade County

MEMORANDUM OF AGREEMENT
Between
MIAMI-DADE COUNTY HEALTH DEPARTMENT
And
MIAMI-DADE COUNTY

RECITALS

THIS MEMORANDUM OF AGREEMENT, entered into between Miami-Dade County, (hereinafter referred to as the "County") and the **Miami-Dade County Health Department**, (hereinafter referred to as "MDCHD").

WHEREAS, it is the intent of the Florida Legislature that the Department of Health provide public health services through the 67 county health departments in partnership with county governments, as specified in part I of §154.001 Florida Statutes (2006), and in so doing make every attempt possible to solicit the support and involvement of federal, state, and local government and the public and private sectors to achieve its mission; and

WHEREAS, the Florida Legislature has directed the Florida Department of Health to exercise quarantine authority, stating, "It is the duty of the Department of Health to declare, enforce, modify, and abolish quarantine of persons, animals, and premises as the circumstances indicate for controlling communicable diseases or providing protection from unsafe conditions that pose a threat to public health." (Florida Statute §381.0011(6)); and

WHEREAS, pursuant to Rule 64-D-3.005(1), Florida Administrative Code, authority to give notice of a quarantine is delegated to the County Health Department Directors and Administrators; and

WHEREAS, upon request, it is the duty of every city and county official of Miami-Dade County to assist the MDCHD in enforcing the state health laws and rules (Florida Statute §381.0012(5)); and

WHEREAS, it is the MDCHD's intent, in collaboration with the County, to house persons, when suspected of having contracted or having been exposed to an infectious disease, in order to keep them out of the community, or to confine them to a given place, and to prevent interaction between them and people generally of the community; and

WHEREAS, the County owns and manages the Miami-Dade County Auditorium located at 2901 W. Flagler Street, Miami, Florida that has been identified as an appropriate quarantine facility.

NOW, THEREFORE, in consideration of the mutual covenants contained herein and other good and valuable consideration, the recipient and sufficiency of which is hereby acknowledged, the parties hereby agree as follows:

I. **RECITALS**

The parties mutually agree that the foregoing recitals are true and correct and incorporated herein by reference.

AMERICAN OVERSIGHT

II. DEFINITIONS

1. Human quarantine: the act of segregating, handling, disinfecting, testing, transporting, treating, caring for, and managing fatalities of humans, to eliminate and control exposure of disease-causing agents (and to identify, contain and control chemical and/or radiological contamination) that pose hazards to the health of all Miami-Dade county visitors and residents.
2. Minor event: This is characterized by a biological, radiological, and/or terrorist attack that affects less than 100 individuals, who are then transported to a C facility. The most prominent features of the minor event are that the number of affected individuals remains under 100 and that these individuals are transported to the Q facility.
3. Major event: This is characterized by a biologic, radiological, and/or terrorist attack that affects 101 or more persons, who are quarantined in a specific area. The most prominent features of the major event are that the number of individuals affected remains over 101 and the entire area is quarantined.
4. Responders:

    - First Responders: This refers to the personnel with direct contact with victims and the event working within the quarantine area.

    - Second Responders: This refers to personnel with direct contact with suspected cases working outside of the quarantine area, i.e. personnel in an X Facility.

    - Third Responders: The public's response to the event. This refers to all personnel assisting the public and people in R Facilities, as well as people living within the county or the region.

5. Type C Facility: (C=Contagious) Isolation-Infectious individuals confirmed, probable and suspected smallpox cases, i.e. hospital.
6. Type R Facility: Residential-Asymptomatic contacts (not infectious), i.e. private home.
7. Type R-2 Facility: Asymptomatic contacts (not infectious) with mental health issues, homeless individuals who refuse to obey quarantine, i.e. arena or stadium.
8. Type R-3: Asymptomatic contacts (not infectious); these are tourists or visitors, i.e. hotel or motel.
9. Type X Facility: Isolation of persons with uncertain diagnosis-Vaccinated febrile contact without rash-(2 successive temperatures greater than 101F (38C) i.e. dormitory.

III. County Agrees to the Following:

1. During a critical health event and/or a declared state of emergency, the County shall provide access and usage of the Miami-Dade County Auditorium ("Facility") for purposes of enacting a Human Quarantine. The County understands that the Facility will be used as a Type X or Type R Facility and not as a Type C Facility.

2. The County shall provide the Facility for quarantine purposes to the MDCHD for no cost.

3. The Facility shall be able to accommodate large numbers of people (100 or more) at one time.

AMERICAN OVERSIGHT

4. The Facility shall have adequate utilities (i.e., water, electricity, and restrooms). MDCHD will be responsible for the cost of utilities while utilizing the Facility for quarantine purposes.

5. The County will allow the MDCHD to monitor and inspect the Facilities once a year upon reasonable notice.

IV. MDCHD Agrees to the Following:

1. If possible, MDCHD agrees to provide the County at least 24 hours notice of its intent to use the Facility.

2. Provide, or coordinate with other agencies to provide, all necessary medical equipment, such as IV fluids, antibiotics, skin care, oxygen monitoring (pulse ox) and oxygen (in-line or portable), medical vital signs monitoring, cardiac and respiratory resuscitation, ventilatory support, suctioning equipment, basic laboratory evaluations (blood chemistries, CBC), radiology (portable chest x-ray), etc.

3. Provide, or coordinate with other agencies to provide, all bedding, linens, and food service.

4. Determine the staffing configuration for this collaboration in the event of a decision to quarantine.

5. Oversee and maintain quality control/quality assurance at the quarantine site.

6. Coordinate physical security with the County and other agencies as deemed necessary.

7. Respond to operational issues and challenges as they occur in an event.

8. Monitor and inspect the facilities at least once a year.

9. Give the County reasonable notice and site location for any inspection of the Facility prior to initiating such inspection.

10. Coordinate the decontamination of the facilities once the Facility is no longer being used for quarantine. MDCHD will be responsible for payment of decontamination.

V. HIPPA

Where applicable, the County will comply with the Health Insurance Portability Accountability Act as well as all regulations promulgated thereunder (45CFR Parts 160, 162, and 164).

VI. Termination

This agreement may be terminated by either party upon no less than thirty (30) calendar days notice in writing to the other party, without cause, unless a lesser time is mutually agreed upon in writing by both parties. Said notice shall be delivered by certified mail, return receipt requested, or in person with proof of delivery.

AMERICAN OVERSIGHT

VII. Agreement to Follow Florida Governing Law

This Agreement is executed and entered into in the State of Florida, and shall be construed, performed and enforced in all respects in accordance with the laws, rules and regulations of the State of Florida. Each party shall perform its obligations in accordance with the terms and conditions of this Agreement.

VIII. All Terms and Conditions Included

This agreement contains all the terms and conditions agreed upon by both parties. There are no provisions, terms, conditions, or obligations other than those contained herein, and this agreement shall supersede all previous communications, representations, or agreements, either verbal or written between the parties. If any term or provision of the agreement is found to be illegal or unenforceable, the remainder of the agreement shall remain in full force and effect and such term or provision shall be stricken.

The term of this agreement shall be from November 1, 2007 or on the date on which the agreement has been signed by both parities, whichever is later. It shall remain in effect until either party terminates this Agreement.

This Agreement shall not be changed, modified or amended in any respect except by a written instrument signed by the parties hereto.

I have read the above Memorandum of Agreement and understand each section and paragraph.

IN WITNESS THEREOF, the parties hereto have caused this 4 page Agreement to be executed by their undersigned officials as duly authorized.

AMERICAN OVERSIGHT

12. Guidance for Commercial Aircraft Operators: Seasonal Influenza

Commercial air travel involves the movement of large numbers of people in closed and semi-closed settings. As with other close contact environments, these settings may facilitate the transmission of influenza viruses from person to person or through contact with contaminated environmental surfaces. The Centers for Disease Control and Prevention (CDC) recommends that efforts to reduce the spread of influenza virus on commercial aircraft focus on encouraging airline employees and passengers to:

•Get vaccinated (http://www.cdc.gov/flu/protect/vaccine/)
•Postpone travel when sick (http://www.flu.gov/individualfamily/travelers/index.html)
•Take everyday steps to protect themselves and others while traveling (http://www.cdc.gov/flu/protect/covercough.htm)

Management of Passengers and Crew Members with ILI Influenza-Like Illness (ILI)

Flight crew should consider someone to have a fever if the ill person feels warm to the touch, gives a history of feeling feverish, or has an actual measured temperature of 100° F (37.8° C) or higher. ILI has been defined as an illness with fever or feverishness, plus either cough or sore throat; however, not all ILI is influenza, and not all influenza illnesses fit the definition of ILI. Anyone with a respiratory illness should exercise good hand and respiratory hygiene, as noted above, to reduce the chance of spreading respiratory illnesses to others.

Steps to take on board

Crew members should take the following actions if a person has ILI during a flight:

- Keep interactions with the ill person as brief as possible.
- Ask the ill person to wear a face mask, if it can be tolerated and one is available.
- If a face mask cannot be tolerated, provide tissues and ask the ill person to cover his or her mouth and nose when coughing or sneezing.
- If the ill person is a passenger, move her or him to a seat that is separated from other passengers, if possible (≥6 feet of separation is ideal).
- Provide a plastic bag for proper disposal of used masks and tissues.
- Practice good hand hygiene and encourage others, including the ill person, to do the same:
    - Hands should be washed with soap and water or an alcohol-based hand rub especially after coughing or sneezing, after using the restroom, or after touching potentially contaminated surfaces or items (e.g., faucets, door handles, or someone's mobile phone).

AMERICAN OVERSIGHT

- Persons who are experiencing more severe illness (e.g., high fever, shortness of breath, difficulty breathing, rapid breathing, chest pain, altered mental status, dehydration, or worsening of chronic underlying medical conditions) should be reported to the airline in-flight medical consultant, according to airline protocols.

- If possible, continue operating the aircraft air-conditioning or ventilation system until all passengers and crew have disembarked to maximize air circulation in the cabin and thus the filtering of virus particles. Safety concerns may preclude this step on some aircrafts.

- If the ill person is a crew member, CDC recommends, in addition to the actions listed above, that the ill crew member.

- Follow individual company policy for onset of illness or incapacitation during flight operations.

- Discontinue work as soon as possible without affecting flight safety.

- See his or her health care provider, or a company-recommended health care provider if away from home base, and take antiviral medication for treatment of influenza if prescribed by the health care provider.

- Return to work only after fever has resolved for at least 24 hours without the use of fever-reducing medications.

Personal Protective Measures

- **Hand Hygiene**
  Routine hand hygiene is an important line of defense against infection with influenza viruses, as well as other viruses and bacteria. Wash hands with soap and water for 15-20 seconds or use an alcohol-based hand rub. Hands should always be washed before donning and after removing gloves and other personal protective items.

- **Gloves**
  Crew members should wear impermeable, disposable gloves if they are assisting an ill passenger or have contact with potentially contaminated surfaces or lavatories. Crew members should avoid touching their faces with gloved or unwashed hands. Hands should be washed with soap and water or with an alcohol-based hand rub after removing gloves. Improper use or disposal of gloves may actually increase transmission of infectious pathogens.

- **Face Masks and Respirators**
  Routine use of face masks and N95 respirators is NOT recommended for airline crew members. Crew members who wish to voluntarily wear face masks or N95 respirators while tending to an ill person should follow their airline's policy on the use of personal protective equipment during flight. To best ensure maximum protection from an N95 respirator, fit testing and training on proper technique is required

AMERICAN OVERSIGHT

Cleaning and Disinfection

Environmental management of influenza and other respiratory viral diseases should include routine cleaning and disinfection strategies, as well as more frequent cleaning of commonly touched hard surfaces, such as food trays, lavatory surfaces, and door handles. Commonly used environmental cleaners certified for use in the aircraft cabin are sufficient.
For more detailed information regarding these recommendations, please see http://www.cdc.gov/quarantine/travel-industry/air/guidance-seasonal-influenza-commerical-aircraft-operators.html

AMERICAN OVERSIGHT

13. Infection Control Guidelines for Cabin Crew Members on Commercial Aircraft

CDC Infection Control Guidelines or Cabin Crew Members on Commercial Aircraft can be found at http://wwnc.cdc.gov/travel/page/infection-control-guidelines -cabin-crew.htm

*All agencies will abide by their internal infection control guidelines.

PURPOSE

These guidelines provide cabin crew members (flight attendants) with practical measures to protect themselves, passengers, and other crew members when someone onboard is ill with a possible contagious infection. The practical measures for protecting yourselves and others include personal protection, management of an ill traveler, targeted clean-up measures, and post- flight measures. Since whether an illness is contagious is usually not known at the time, any body fluid (such as phlegm, diarrhea, vomit, or blood) must be treated as potentially infectious.

This guideline provides information on general infection control measures, as well as specific measures according to three infection categories: respiratory, gastrointestinal, and blood-borne.

As a general preventive measure, airline crew should be up to date on all recommended immunizations and other preventive health measures for their destination. Many infectious diseases can be prevented by vaccines!

ILLNESS CATEGORIES

Respiratory infections:

Symptoms: Germs (viruses or bacteria) in the respiratory system (such as measles, tuberculosis, influenza, whooping cough, or some pneumonias) can cause symptoms including coughing, sneezing, fever, rash, and difficulty breathing. Similar symptoms may also be caused by noninfectious conditions, such as asthma, allergic reactions, or reactions to irritating substances.

How infection spreads: Coughing, sneezing, or even singing or talking may spread respiratory germs. Depending on what is causing the infection, germs may be spread when another person inhales them from droplets or aerosols expelled into the air by a cough or sneeze. Another way of spreading these germs is by touching contaminated surfaces with your hands, then touching your mouth, eyes, or nose, before washing your hands. Some infections, such as tuberculosis (TB), do not spread easily without close and prolonged contact, while others, such as measles, can be transmitted after brief contact

AMERICAN OVERSIGHT

Gastrointestinal Infections:

Symptoms: Germs in the stomach or intestines, such as norovirus, can cause symptoms including nausea, abdominal pain, vomiting, diarrhea, or fever. Similar symptoms may also be triggered by a sensitivity or allergy to a food or food additive.

How infection spreads: Vomiting or diarrhea may spread germs to surfaces that other people may touch and then touch their mouth with contaminated hands. Infection may also be spread through contaminated food or liquids, for example, if an ill person prepares food or drink for other people.

Blood-borne Infections:

Symptoms: Certain infections, such as HIV/AIDS, hepatitis B and C, and viral hemorrhagic fevers, are carried in the bloodstreams of infected people. A person with one of these infections may have symptoms such as jaundice (a yellow appearance of the skin or white parts of the eyes) in the case of hepatitis B or C; or, in the case of hemorrhagic fevers, unexplained bleeding of the skin, eyes, or gums. However, a person with some of these diseases may not have any symptoms at all, yet still be contagious.

How infection spreads: Some of these infections can be spread when body surfaces that can easily absorb blood-borne pathogens, such as open cuts, scrapes, or mucous membranes (lining of mouth, eyes, or nose) come into direct contact with infectious bodily fluids.

INFECTION CONTROL MEASURES

- **Personal protection**
  - Treat any body fluid as though it is infectious
    - Hand hygiene is the single most important infection control measure. Wash hands with soap and water for at least 20 seconds after assisting ill travelers or coming in contact with body fluids or surfaces that may be contaminated.
    - An alcohol-based hand cleaner is an alternative to hand-washing but will not be effective if hands are visibly soiled.
    - Avoid touching your mouth, eyes, and nose with unwashed or gloved hands.
  - Disposable gloves (gloves do not replace proper hand hygiene) ◦Wear impermeable, disposable gloves when:
    - Physically tending to an ill traveler
    - Coming in contact with body fluids (such as used tissues, blood, vomit, or diarrhea), potentially contaminated surfaces or lavatories
    - Remove gloves carefully to avoid contaminating yourself or your clothing.
    - Properly dispose of soiled gloves after use into a plastic bag, and do not re-use.
    - Wash your hands with soap and water or with an alcohol-based hand cleaner after removing gloves.

AMERICAN OVERSIGHT

- Face masks: Surgical-type face masks worn by an ill person may help reduce the spread of respiratory germs from coughing, sneezing or talking; however, surgical facemasks are not recommended for use by a person who is not ill.

- Management of ill person:
  - Minimize the number of persons directly exposed to the ill traveler
  - Keep interactions with the ill traveler as brief as possible
  - Respiratory infections*:
    - Ask the ill traveler to cover his or her mouth with a tissue when coughing or sneezing. Provide tissues, if necessary.
    - Provide a plastic bag for disposing of used tissues.
    - Ask the ill traveler to wear a face mask particularly for persistent cough, if it can be tolerated and one is available.
    - Encourage the ill traveler to wash hands and/or use alcohol-based hand cleaner (if available).
    - Separate the ill traveler from others by 6 feet, if possible, and without compromising flight safety or exposing additional passengers.
    - Follow the instructions in "Targeted Clean-Up" below, as necessary.

***Note: measles and rubella (German measles) are caused by respiratory viruses with rash and fever being prominent signs. Therefore, follow these respiratory illness infection control measures if the ill traveler has a fever and rash.**

- Gastrointestinal infections:
  - Seat the ill traveler(s) close to a lavatory, if possible.
  - If possible, restrict the use of that lavatory to only the ill traveler(s).
  - If traveler is vomiting, provide air-sickness bags.
  - Provide a plastic bag for disposing of used air-sickness bags.
  - Encourage the ill traveler to wash hands and/or use alcohol-based hand cleaner (if available).
  - Follow the instructions in "Targeted Clean-Up" below as necessary.

- Blood-borne infections:
  - If the ill traveler is actively bleeding, such as from an injury or nosebleed, provide first aid according to your airline's guidelines.
  - Separate the ill traveler from others far enough to reduce the likelihood of blood splattering on other people, if possible.
  - Provide a plastic bag for disposing soiled tissues or towels.
  - Follow the instructions in "Targeted Clean-Up" below as necessary.

AMERICAN OVERSIGHT

- Targeted Clean-Up*
    - Hard (nonporous) surfaces, such as tray tables, TV monitors, seat arms, windows and walls that are visibly soiled: remove visible contaminations, then clean with a cleaning or disinfectant agent approved by your airline.
    - Soft (porous) surfaces, such as carpeted floor or seat cushions that are obviously soiled, such as with vomit or diarrhea: first remove as much of the contaminant as possible, then cover the area with an absorbent substance, followed by an impermeable material, such as plastic, to reduce the risk of spread beyond the immediate area or into the air.
    - If a contaminated item can be easily removed, is small enough to fit inside a plastic bag (such as a pillow, blanket or small cushion), and will not cause significant disruption to passengers by removing it (such as in a full flight), carefully place it inside a plastic bag** and tie or tape the bag shut securely to avoid leaking.
    - Dispose of used cleaning materials in a plastic bag** immediately after use**.

*Note: actions should be consistent with company policy.

**Biohazard bag if available; otherwise secure in plastic bag and label as biohazard.

- Post-Flight Measures
    - Properly dispose of contaminated items:
        - Place all receptacles that have been used by the ill traveler, as well as all bags containing materials used to clean up, in a plastic bag and tie it securely (see ** above).
        - Notify cleaning crew of areas that have been contaminated (specify respiratory, gastrointestinal, and/or blood-borne body fluids) which may need more than routine cleaning or possible removal such as:
            - visibly soiled soft materials (e.g., seat cushion)
            - hard surfaces like arm rests and tray tables
            - lavatory used by ill traveler(s)
        - Remind cleaning crew that this may require additional personal protective equipment and that they should follow company policy for such situations
            - Note: If ill traveler(s) changed seats, ensure that both areas are adequately cleaned.

AMERICAN OVERSIGHT

- When to see a health care provider after exposure to ill travelers:
  - Cabin crew members who have been exposed to travelers with known or suspected contagious infections should consult their health care providers shortly after the flight in question if they develop symptoms that concern them (such as fever, rash, persistent cough, vomiting, or diarrhea). Risk of infection depends on many factors, including the type of disease, flight duration, level of exposure, and level of immunity.
  - To avoid exposing others, crew members who are ill with a contagious infection should not report to work until they have recovered. Crew members who develop symptoms consistent with a contagious infection during flight should discontinue their work duties as soon as it is safe to do so and follow procedures as outlined for ill passengers. Crew members with gastrointestinal symptoms should not prepare or serve food or beverages.

AMERICAN OVERSIGHT

14. Standard Precautions

Excerpted from Guideline for Isolation Precautions in Hospitals (January 1996)

Background

Standard Precautions synthesize the major features of UP (Blood and Body Fluid Precautions) (**27,28**) (designed to reduce the risk of transmission of bloodborne pathogens) and BSI (body substance isolation)(**29,30**) (designed to reduce the risk of transmission of pathogens from moist body substances) and applies them to all patients receiving care in hospitals, regardless of their diagnosis or presumed infection status. Standard Precautions apply to 1) blood; 2) all body fluids, secretions, and excretions except sweat, regardless of whether or not they contain visible blood; 3) non-intact skin; and 4) mucous membranes. Standard Precautions are designed to reduce the risk of transmission of microorganisms from both recognized and unrecognized sources of infection in hospitals.

II. Standard Precautions

Use Standard Precautions, or the equivalent, for the care of all patients. *Category IB*

A. Hand washing

1. Wash hands after touching blood, body fluids, secretions, excretions, and contaminated items, whether or not gloves are worn. Wash hands immediately after gloves are removed, between patient contacts, and when otherwise indicated to avoid transfer of microorganisms to other patients or environments. It may be necessary to wash hands between tasks and procedures on the same patient to prevent cross-contamination of different body sites. Category IB
2. Use a plain (non-antimicrobial) soap for routine hand washing. *Category IB*
3. Use an antimicrobial agent or a waterless antiseptic agent for specific circumstances (e.g., control of outbreaks or hyper endemic infections), as defined by the infection control program. *Category IB* (See Contact Precautions for additional recommendations on using antimicrobial and antiseptic agents.)

B. Gloves

Wear gloves (clean, non-sterile gloves are adequate) when touching blood, body fluids, secretions, excretions, and contaminated items. Put on clean gloves just before touching mucous membranes and non-intact skin. Change gloves between tasks and procedures on the same patient after contact with material that may contain a high concentration of microorganisms. Remove gloves promptly after use, before touching non-contaminated items and environmental surfaces, and before going to another patient, and wash hands immediately to avoid transfer of microorganisms to other patients or environments.

AMERICAN OVERSIGHT

C. Mask, Eye Protection, Face Shield

Wear a mask and eye protection or a face shield to protect mucous membranes of the eyes, nose, and mouth during procedures and patient-care activities that are likely to generate splashes or sprays of blood, body fluids, secretions, and excretions.
Category IB

D. Gown

Wear a gown (a clean, non-sterile gown is adequate) to protect skin and to prevent soiling of clothing during procedures and patient-care activities that are likely to generate splashes or sprays of blood, body fluids, secretions, or excretions. Select a gown that is appropriate for the activity and amount of fluid likely to be encountered. Remove a soiled gown as promptly as possible and wash hands to avoid transfer of microorganisms to other patients or environments. *Category IB*

E. Patient-Care Equipment

Handle used patient-care equipment soiled with blood, body fluids, secretions, and excretions in a manner that prevents skin and mucous membrane exposures, contamination of clothing, and transfer of microorganisms to other patients and environments. Ensure that reusable equipment is not used for the care of another patient until it has been cleaned and reprocessed appropriately. Ensure that single-use items are discarded properly. Category IB

F. Environmental Control

Ensure that the hospital has adequate procedures for the routine care, cleaning, and disinfection of environmental surfaces, beds, bedrails, bedside equipment, and other frequently touched surfaces, and ensure that these procedures are being followed.
Category IB

G. Linen

Handle, transport, and process used linen soiled with blood, body fluids, secretions, and excretions in a manner that prevents skin and mucous membrane exposures and contamination of clothing and that avoids transfer of microorganisms to other patients and environments. *Category IB*

H. Occupational Health and Bloodborne Pathogens

1. Take care to prevent injuries when using needles, scalpels, and other sharp instruments or devices; when handling sharp instruments after procedures; when cleaning used instruments; and when disposing of used needles. Never recap used needles, or otherwise manipulate them using both hands, or use any other technique that involves directing the point of a needle toward any part of the body; rather, use either a one-handed "scoop" technique or a mechanical device designed for holding the needle sheath. Do not remove used needles from disposable syringes by hand, and do not bend, break, or otherwise manipulate used needles by hand. Place used disposable syringes and needles, scalpel blades, and other sharp items in appropriate

AMERICAN OVERSIGHT

puncture-resistant containers, which are located as close as practical to the area in which the items were used, and place reusable syringes and needles in a puncture-resistant container for transport to the reprocessing area. *Category IB*

2. Use mouthpieces, resuscitation bags, or other ventilation devices as an alternative to mouth-to-mouth resuscitation methods in areas where the need for resuscitation is predictable. *Category IB*

I. Patient Placement

Place a patient who contaminates the environment or who does not (or cannot be expected to) assist in maintaining appropriate hygiene or environmental control in a private room. If a private room is not available, consult with infection control professionals regarding patient placement or other alternatives. *Category IB*

AMERICAN OVERSIGHT

15. Droplet Precautions

Excerpted from Guideline for Isolation Precautions in Hospitals (January 1996)

Background

Droplet Precautions are designed to reduce the risk of droplet transmission of infectious agents. Droplet transmission involves contact of the conjunctivae or the mucous membranes of the nose or mouth of a susceptible person with large-particle droplets (larger than 5 µm in size) containing microorganisms generated from a person who has a clinical disease or who is a carrier of the microorganism. Droplets are generated from the source person primarily during coughing, sneezing, or talking and during the performance of certain procedures such as suctioning and bronchoscopy. Transmission via large-particle droplets requires close contact between source and recipient persons, because droplets do not remain suspended in the air and generally travel only short distances, usually 3 ft or less, through the air. Because droplets do not remain suspended in the air, special air handling and ventilation are not required to prevent droplet transmission. Droplet Precautions apply to any patient known or suspected to be infected with epidemiologically important pathogens that can be transmitted by infectious droplets.

IV. Droplet Precautions

In addition to Standard Precautions, use Droplet Precautions, or the equivalent, for a patient known or suspected to be infected with microorganisms transmitted by droplets (large-particle droplets [larger than 5 µm in size] that can be generated by the patient during coughing, sneezing, talking, or the performance of procedures). *Category IB*

In addition to Standard Precautions, use Droplet Precautions, or the equivalent, for a patient known or suspected to be infected with microorganisms transmitted by droplets (large-particle droplets [larger than 5 µm in size] that can be generated by the patient during coughing, sneezing, talking, or the performance of procedures). *Category IB*

A. Patient Placement

Place the patient in a private room. When a private room is not available, place the patient in a room with a patient(s) who has active infection with the same microorganism but with no other infection (cohorting). When a private room is not available and cohorting is not achievable, maintain spatial separation of at least 3 ft between the infected patient and other patients and visitors. Special air handling and ventilation are not necessary, and the door may remain open. *Category IB*

AMERICAN OVERSIGHT

B. Mask

In addition to wearing a mask as outlined under Standard Precautions, wear a mask when working within 3 ft of the patient. (Logistically, some hospitals may want to implement the wearing of a mask to enter the room.) *Category IB*

C. Patient Transport

Limit the movement and transport of the patient from the room to essential purposes only. If transport or movement is necessary, minimize patient dispersal of droplets by masking the patient, if possible. *Category IB*

AMERICAN OVERSIGHT

16. American Red Cross of Greater Miami and the Keys Standard Operating Procedure

American Red Cross Procedures

Issue Date:
Effective Date:
ORIGINATOR:
Amends:
Rescinds:

Subject: Staffing, Staging, and Coordination
Temporary Quarantine Facility
Reference: Miami International Airport
Communicable Disease Response Plan

16.01 PURPOSE

To establish guidance for the care and feeding of passengers, crew and staff, housed in a temporary quarantine facility for 72 hours.

16.02 GENERAL

I. The American Red Cross is a humanitarian organization led by volunteers. Their focus includes helping communities prepare and respond to disasters or emergencies.

II. The American Red Cross has a local branch located in Miami, Florida and has responded to emergencies affecting the Miami Dade County population.

III. Local contacts for the American Red Cross include :

a. Carlos Castillo, Director of Emergency Services: carlos.castillo@redcross.org 305-807-3588, 305-644-1200 #2541 (see Appendix 18 for additional contacts)

IV. Upon notification by the Miami Dade Airport Administration and the CDC Miami Quarantine Station (CDC MQS) that a temporary quarantine facility is necessary, American Red Cross (ARC) will begin its staging process.

V. ARC will coordinate their response actions and receive direction from DOH Miami-Dade.

AMERICAN OVERSIGHT

VI. The American Red Cross will be responsible for :
   a. The provision of personnel to provide meals for the temporary quarantine facility.
   b. The provision of meals, personal care and sleeping provisions for the temporary quarantine facility.

16.03 PROCEDURE

I. Within two hours American Red Cross will have a team onsite to coordinate with DOH Miami-Dade and the airport. Team members will park in long-term parking, and deploy to the quarantine area, where they will receive security badges and access to the pre-determined temporary quarantine facility.

II. Within four hours, American Red Cross will have an operational Family Assistance Center with a Mental Health counseling presence, and snacks and water for family members of the quarantined passengers in a facility provided.

III. In a period off approximately 8-12 hours, which may change as condition warrant, provide the following:
   a. Begin delivery of food items (three meals and snacks for each 24 hour day provided on a daily basis) for up to 300 passengers and crew
   b. Palettes of water for three - 24 hour day time period
   c. Cots – 350 total
   d. Blankets - 700 total
   e. Comfort kits – personal toiletries: one/person/day – 900 total
   f. Infant supplies including disposable bottles, infant formula, multi-sized diapers, diaper wipes - amount dependent on need
   g. Children's coloring books and crayons

IV. Within five hours, American Red Cross will deploy Tables (XX) and Chairs (XX) to the pre-determined temporary quarantine facility. These will be used for a variety of needs including feeding stations, mental health counseling area, health assessments.

AMERICAN OVERSIGHT

17. Infrastructure Items for Public Health Assessment Area and Temporary Quarantine Facility

Infrastructure Needs:

Initial public health assessment area (where passengers would be screened for signs/symptoms of illness of public health importance before transport to the temporary quarantine facility at the airport)

Please note: Estimation of the quantity of material needed is based on the full capacity of a 777 aircraft (i.e. 400 people). The Florida Department of Health in Miami-Dade stores PPE and supplies in very limited quantities. Requests for supplies will be submitted to the local Office of Emergency Management for support and/or via e-constellation requests to the Sate ESF6.

AMERICAN OVERSIGHT

From: State and Local Readiness (CDC)
To: State and Local Readiness (CDC)
Subject: INVITATION: Briefing Call on COVID-19 TODAY (March 12) at 2:00 p.m. ET
Date: Thursday, March 12, 2020 12:51:40 PM
Attachments: image001.png

State and Local Leaders,

On **Thursday, March 12, at 2:00 p.m. Eastern Time**, please join Senior Administration Officials for a briefing call on COVID-19 (coronavirus) regarding President Trump issuing a proclamation under section 212(f) of the Immigration and Nationality Act (INA) to restrict travel to the United States from foreign nationals who have recently been in certain European countries. Additional details can be found below. We will also provide an update on implementing mitigation strategies for communities with local COVID-transmission (A Framework for Mitigation: Implementation of Mitigation Strategies for Communities with Local COVID-19 Transmission).

Briefing Call Registration on 212(f) & Community Mitigation Strategies

- **Date: Today,** Thursday, March 11
- **Time:** 2:00 PM ET (please note time zone)
- **Call-In Registration**: **CLICK HERE**
- **Note:** You must RSVP to join the call. Upon successful registration, you will receive dial-in details to the email address you use to register. Note that multiple people cannot dial-in using the same registration information.

Below, please find additional information. The White House Office of Intergovernmental Affairs (WH IGA) will continue to share pertinent information as it becomes available. Please do not hesitate to reach out to our office directly if we can be of assistance.

Sincerely,
Zach

The White House Office of Intergovernmental Affairs

President Donald J. Trump Has Taken Unprecedented Steps to Respond to The Coronavirus and Protect the Health and Safety Of Americans

"Together we are putting into policy a plan to prevent, detect, treat and create a vaccine against coronavirus to save lives in America and the world. America will get it done!" – President Donald J. Trump

President Donald J. Trump signed a Presidential Proclamation, which suspends the entry of most foreign nationals who have been in certain European countries at any point during the 14 days prior to their scheduled arrival to the United States. These countries, known as the Schengen Area, include: Austria, Belgium, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Italy, Latvia, Liechtenstein, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Slovakia, Slovenia, Spain, Sweden, and Switzerland. This does not apply to legal permanent residents, (generally) immediate family members of U.S. citizens, and other individuals who are identified in the proclamation.

Statement from DHS Acting Secretary Chad F. Wolf: "Protecting the American people from threats to their safety is the most important job of the President of the United States. The actions President Trump is taking to deny entry to foreign nationals who have been in affected areas will keep Americans safe and save American lives. I applaud the president for making this tough but necessary decision. While these new travel restrictions will be disruptive to some travelers, this decisive action is needed to protect the American public from further exposure to the potentially deadly coronavirus. In January and February, the Administration issued similar travel restrictions on individuals who had been in China and Iran. That action proved to be effective in slowing the spread of the virus to the U.S., while public health officials prepared. In the next 48 hours, in the interest of public health, I intend to issue a supplemental Notice of Arrivals Restriction requiring U.S. passengers that have been in the Schengen Area to travel through select airports where the U.S. Government has implemented enhanced screening procedures."

RESTRICTING TRAVEL FROM IMPACTED AREAS: President Donald J. Trump is taking further action to curb the spread of the coronavirus to the United States from other countries.

- President Trump is issuing a proclamation under section 212(f) of the Immigration and Nationality Act (INA) to restrict travel to the United States from foreign nationals who have recently been in certain European countries.
    - Section 212(f) of the INA only applies to the movement of human beings, not goods or cargo.
- The restriction applies to foreign nationals who have been in the Schengen Area, 26 countries in Europe with open borders agreements, in the last 14 days.

AMERICAN OVERSIGHT

- Those who are exempt from these restrictions, such as American citizens, will be directed to a limited number of airports where screening can take place.
- There is extensive travel back and forth between Europe that heightens the risk here in the United States.

LOOKING OUT FOR AMERICAN BUSINESSES AND WORKERS: President Donald J. Trump is committed to protecting American businesses and workers from the impacts of coronavirus.

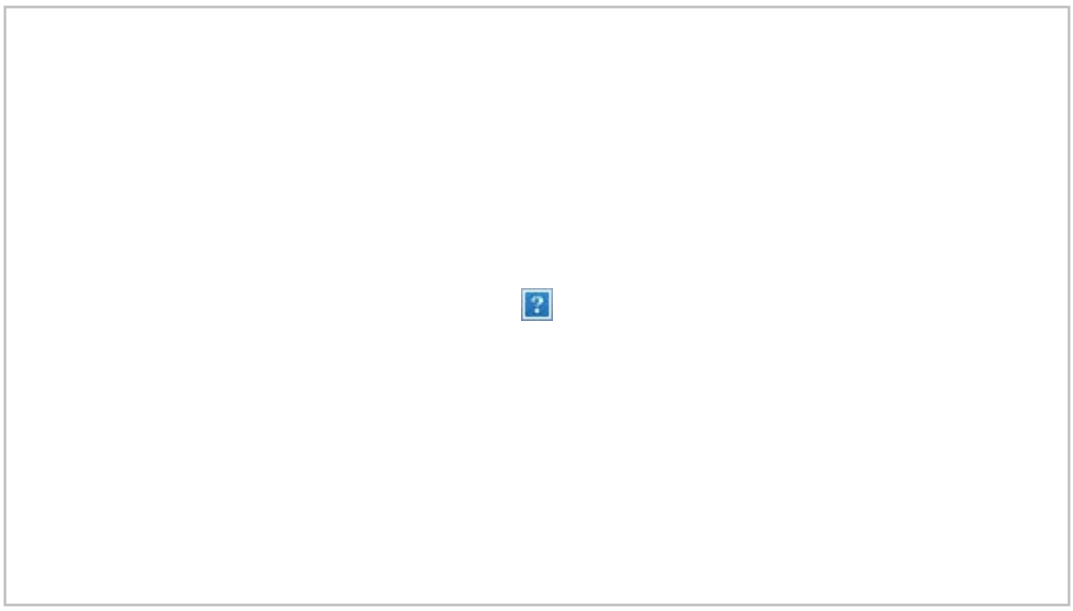
- The President is announcing an economic assistance package to help support businesses and workers who have been harmed by this outbreak.

- President Trump has instructed the Small Business Administration (SBA) to exercise available authority to provide loans to businesses affected by the coronavirus.
    - These loans will help overcome disruptions caused by the coronavirus.
    - The President is calling on Congress to increase funding for this program by an additional $50 billion.
- The President will be instructing the Department of the Treasury to defer tax payments for certain individuals and businesses negatively impacted by the coronavirus.
    - This action will provide more than $200 billion of additional liquidity to the economy.
- President Trump is calling on Congress to immediately pass payroll tax relief.
- The President announced that he will soon be taking emergency action to provide financial relief for workers who are ill, quarantined, or caring for others due to the coronavirus.
    - The President also called on Congress to take action to extend this relief for workers.

LEADING AN AGGRESSIVE, WHOLE-OF-GOVERNMENT APPROACH: President Trump has taken unprecedented steps to protect the health of Americans in response to the coronavirus.

- The President is leveraging all of our resources to respond to the coronavirus, bringing together government and private industry in a collaborative response.
- The Trump Administration declared a public health emergency in January to bolster response efforts.
- President Trump took early action to help curb the spread of the virus from other countries to the United States, providing important time for response and preparations.
    - In January, President Trump acted quickly to restrict travel from foreign nationals traveling from China.
    - In February, the President restricted travel for individuals recently

AMERICAN OVERSIGHT



traveling from Iran.
    - The Administration put into place mandatory screening for all travelers coming into the country from Italy and South Korea.
    - Travel advisories for severely impacted areas like Italy and South Korea have been raised to their highest level.
- Today, the President directed his Administration to make general-use face masks available to our healthcare workers.
    - The Administration's actions will help make millions of general-use respirators available to keep healthcare workers safe and mitigate transmission of the virus.
- President Trump signed into law more than $8 billion to fund response efforts.
- The Administration has taken bold steps to incentivize the development of therapeutics and vaccines to treat and prevent the spread of the coronavirus.
- Working across the public and private sectors, the Trump Administration continues to drastically expand testing capacity.
    - More than 1 million tests have been distributed nationwide, with another 4 million tests being shipped out by the end of the week.
    - Testing is now available in every State lab in the country and commercial labs are now deploying tests, which will help generate a dramatic increase in availability.
- The Trump Administration has released guidance on how to keep businesses, schools, community gathering places, and families safe.
    - From the start, President Trump has made keeping the public informed a top priority.
- The Administration has announced that health plans with health savings accounts will be able to cover coronavirus testing and treatment without co-payments.

ICYMI | Vice President Pence Discusses the Coronavirus Response on the Morning Shows

Earlier this morning, Vice President Pence joined Good Morning America, The Today Show, Fox & Friends, New Day, and CBS This Morning to discuss the steps that this administration is taking to combat the coronavirus.

ON ABC's GOOD MORNING AMERICA

AMERICAN OVERSIGHT

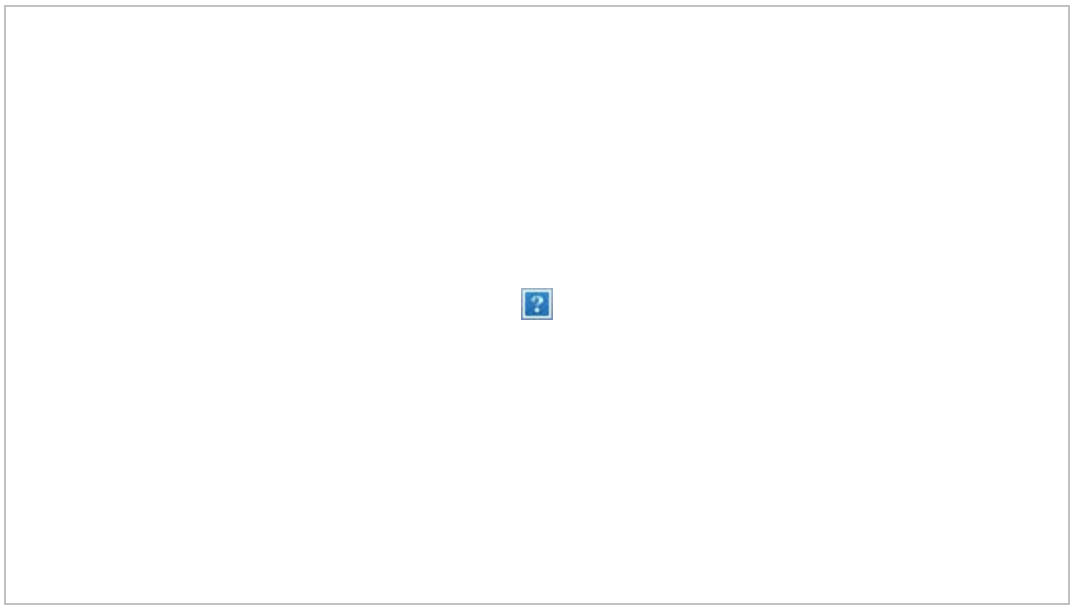
WATCH HERE.

From very early on, President Trump took decisive action to put the health of the American people first.

> "We all have known from the beginning that the coronavirus would continue to spread across this country, and it's one of the reasons why, from very early on, President Trump took decisive action to put the health of the American people first, not only declaring a public health emergency in January, but in that same month he suspended all travel from China -- an unprecedented move -- and quarantined Americans that were returning from the region. Since that time, George, we've -- we've issued travel advisories for areas of South Korea, Italy; screened all persons coming on direct flights. But, frankly, as we watched the epicenter of the coronavirus shift from China and South Korea to Europe, the President thought it was proper for us to impose a 30-day suspension on all travel from continental Europe."

The President, again, made another unprecedented decision in suspending all travel from Europe, because we want to stop the flow of people bringing the coronavirus here.

> "The reality is that, really, just two weeks ago, in Italy, there were less than 500 cases and now there's 12,000 cases in Italy, George. We have tens of thousands of people that travel to the United States from Europe every day. Seventy percent of new cases in the world were in Europe. And when we looked yesterday at the -- what was then the 35 states where we had cases, about 30 of them could be traced to contacts with Europe. And so the President, again, made another unprecedented decision in suspending all travel from Europe, because we essentially want -- we essentially want to stop the flow of people bringing the coronavirus here, but then continuing to surge resources, particularly into California, Washington State, New York, and other communities where we've seen community spread. It's a combination of efforts that's being driven by the top health experts in the world on our task force. But the President -- the President showed again yesterday a willingness to take decisive action on multiple levels to protect the American



AMERICAN OVERSIGHT

people."

We want to send a very clear message to Americans that if for any reason you believe you've been exposed to the coronavirus, you should not be worried about the cost of testing or treatment.

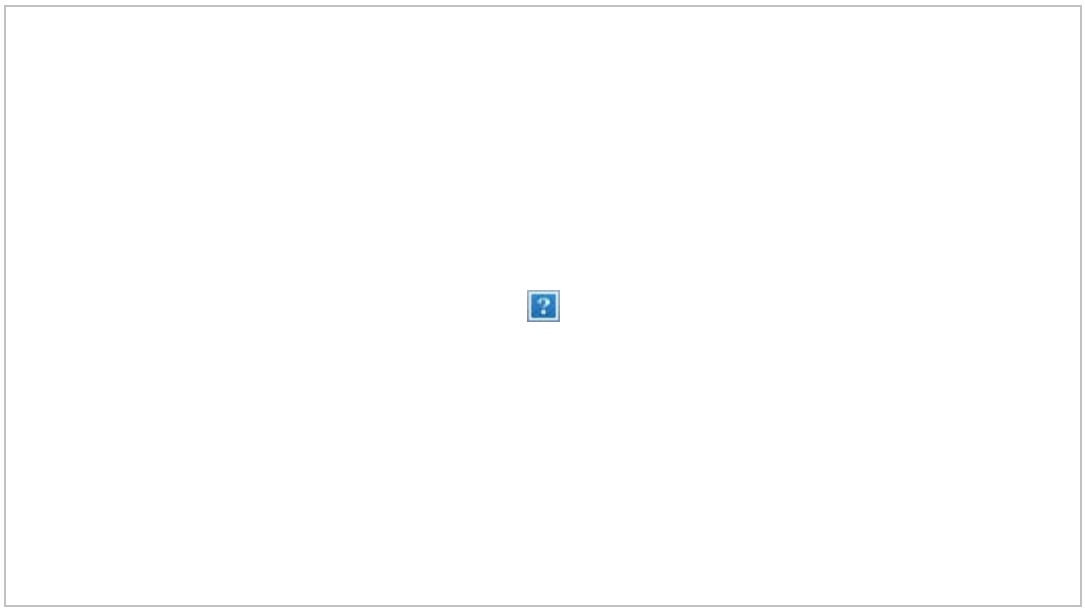
"We're making steady progress. We're going to continue to make a very clear message to Americans that if for any reason you believe you've been exposed to the coronavirus or you have symptoms, we don't want people to be worried about the cost of testing, to be worried about the cost of treatment… As the President made clear last night, we're working with Congress and exploring actions the President can take to make sure that hourly wage earners know that you can stay home without risking losing a paycheck or losing your job if you feel if you feel that you've been exposed to the coronavirus."

ON NBC's TODAY SHOW

WATCH HERE.

From early on in this effort, we have addressed the testing issue. We made changes through the FDA that allowed for state labs and hospitals to engage in testing.

"From early on in this effort we've been addressing the testing issue. We made changes through the FDA that allowed for state labs and university hospitals and hospitals to engage in testing. And I'm pleased to report every state lab in America can do testing now. Many university laboratories are doing it. Washington State – the University of Washington is doing extraordinary work. but we are literally working hour by hour to expand the testing and we think the key Savannah is going to be what we call commercial laboratories like LabCorp and Quest who are already spinning up production at the president's direction last week on tests that can be available on a broad basis in the days ahead for the American people. we're making real progress but rest assured we're going to continue to drive forward."



The American people should know that President Trump has no

AMERICAN OVERSIGHT

higher priority than the health, safety and well-being of the American people.

> "The American people should know that President Trump has no higher priority than the health and safety and wellbeing of the people in this country. You can go to coronavirus.gov right now to find out what every American can do to keep yourself, your family, your workplace and your school safe. But you can rest assured we're going to focus on communities where we've had community spread, and the President's action yesterday suspending travel from Europe is one more example of how he's putting the health of America first."

ON FOX NEWS' FOX & FRIENDS

WATCH HERE AND HERE.

The President has called this a whole-of-government approach, but he has also called this is a whole-of-America approach.

> "The President, you know, he said this was a whole-of-government approach but he also said this is a whole-of-America approach. So he's brought in business leaders from nursing homes; yesterday, banking; hospitals, and the rest. But one of the things we did that's most important on testing was the President brought in the leaders of the top commercial laboratories in the country who, as we speak, have already approved a test that is being spun up. It's being sent out to market. Quest, LabCorp, the largest commercial laboratories in the country, are working very closely with our administration. We're clearing the red tape out of the way. That's going to be the way that, in the days ahead, we're going to -- we're going to have broad-based testing available all across the country."

We are working together to contain the spread of the coronavirus. And we will get through this.

> "Our goal, as the coronavirus spreads in this country -- and the vast majority who would contract it will have flu-like symptoms and recover. Our goal nonetheless is to hold down that overall number as much as

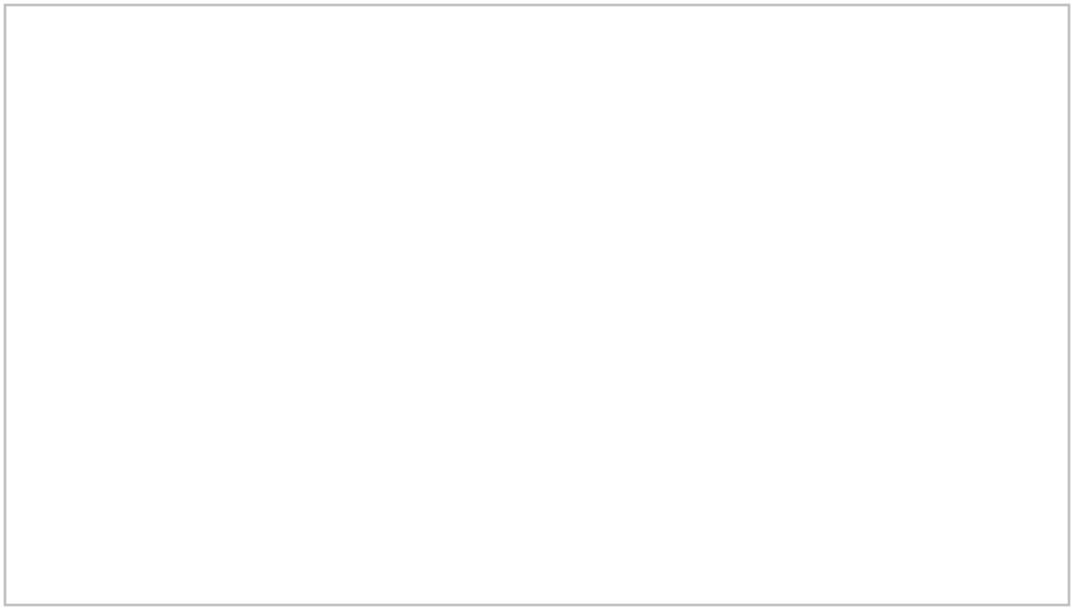
AMERICAN OVERSIGHT

possible. And we will do that with the continuing cooperation of American families, schools, businesses, and states. And that's the vision President Trump has. All of us working together will get through this."

We are focusing on supporting efforts at the state and local level in Washington State, and in California. CDC issued strong guidelines for those communities about public activities, large gatherings and at schools. We will continue simply to follow the data on this.

"Make no mistake about it: We are also focusing on supporting efforts at the state and local level in California, in Washington State, and in California. CDC issued very strong guidelines for those communities about public activities, large gatherings, schools. And we'll continue simply to follow the data on this and make strong recommendations where we have what's known as "community spread. But for every American, right now, as the President said last night, it's a good time to use common sense. Wash your hands often. Clean, you know, often-used surfaces. All that information is available at Coronavirus.gov. So we're going to try and mitigate the spread in this country but also prevent, through the President's decisive action last night, people from bringing the coronavirus into the United States any further from Europe."

We are encouraging best practices for every American. We are focusing on communities where we have community spread.



"I want to say to your viewers, just as the President said last night, the risk to the average American of contracting the coronavirus remains low, but we do know that seniors with serious underlying chronic health conditions are particularly vulnerable to very serious outcomes. And so we're encouraging best practices for every American. We're focusing on communities where we have community spread."

Those with a family member who is a senior citizen should support them in engaging in good hygiene and good health practices.

"For any American that's watching today that has a family member or a loved one who's a senior citizen with a serious underlying health condition, this is a very good time to help and to support them to be able to avoid public places, and everyone around them to engage in good hygiene and good practices to protect those that are most vulnerable."

ON CNN's NEW DAY

AMERICAN OVERSIGHT

WATCH HERE AND HERE.

We have been meeting with industry leaders in one relevant industry after another to ensure that the full resources of America are being brought to bear.

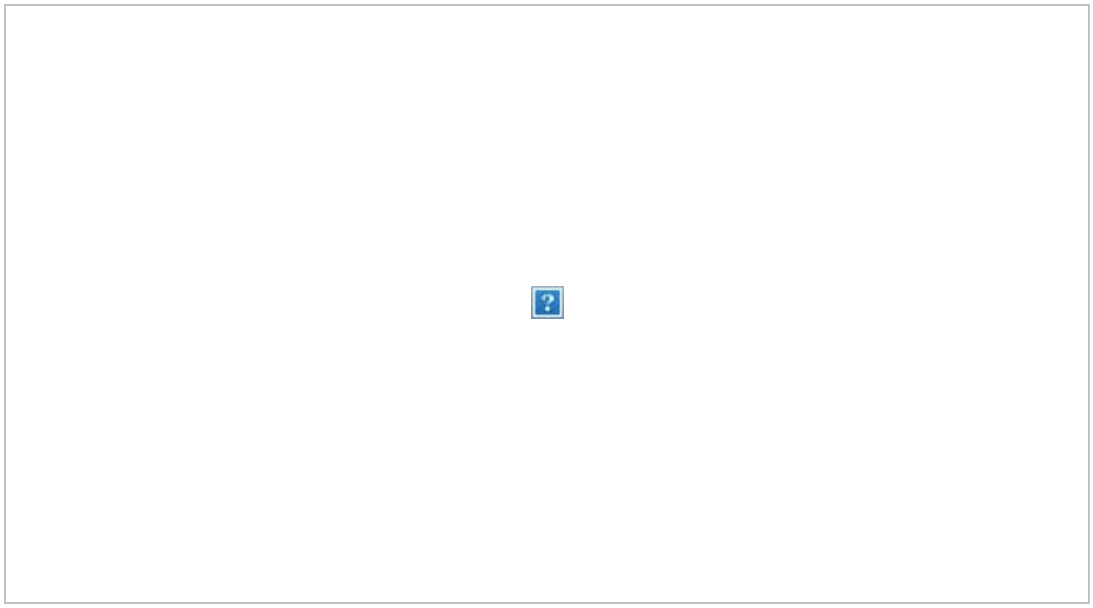
> "We're not doing a travel ban as our strategy. The suspending all travel for 30 days from Europe is a part of the strategy. The other part is an aggressive mitigation strategy. I spoke to the governors of New York, Washington State, and California tomorrow -- or yesterday. CDC issued strong guidance to those areas where we have community spread. We've flowed resources. We've flowed support to those areas. And so it's a combination of strategies that the President has employed here. As he says, it's "all hands on deck," "a whole-of-government approach," but it's also a whole-of-America approach. We've literally been meeting with industry leaders in one relevant industry after another to ensure that the full resources of America are being brought to bear."

Any American who is concerned about being exposed to the coronavirus, should call their doctor and get tested.

> "Anyone who's looking on today who might be concerned that they were exposed to coronavirus or have symptoms should call their doctor. Their doctor, with any question, can call their state laboratory and be able to find out how they can have a test processed."

We are making steady progress. We don't want anybody to avoid having a test because they are concerned financially.

> "But make no mistake about it: We're making steady progress. We've made changes at the FDA in January, at the President's direction. And the American people can be confident we're going to continue to roll out the test. And maybe most significant on that score is that the President brought health insurance companies in last week and they all agreed to waive the co-pays on testing. We expanded testing to Medicare and Medicaid patients. And we also expanded coverage for treatment, and health insurance companies expanded coverage for treatment. We don't



AMERICAN OVERSIGHT

want anybody to avoid having a test because they're concerned financially."

The risk to the average American remains low.

"I want people to know that the risk to contracting the coronavirus, according to all of our experts, for the average American remains low. Most people that contract it, will have flu-like symptoms and recover."

ON CBS This Morning

WATCH HERE.

We are going to continue to put in every effort in place to protect the health and safety of the American people.

"The President took the unprecedented step of suspending all travel from China which was the originating country of this virus. We also established travel advisories, and we've been screening passengers on all direct flights from South Korea and Italy. But with the epicenter of this epidemic now moving from China and South Korea to Europe, yesterday the President again took the unprecedented step of suspending all travel from Europe for the next 30 days, and that in combination with our strong mitigation efforts in communities that are experiencing what our experts call community spread, areas of California, Washington State, and New York, we're going to continue to put every effort at home and with regard to these travel restrictions in place to protect the health and safety of the American people."

In the days ahead, we are going to continue to see the availability of tests at your local doctor and your local pharmacy expand.

"Testing is happening in every state lab in the country. Many university hospitals have taken the FDA test, like the University of Washington, is doing a great job expanding testing capabilities. But the biggest piece on the testing is that our commercial labs that the President brought in last week, companies like Quest and LabCorp, have already had approved a new test that they several days ago had begun to take to market which

AMERICAN OVERSIGHT

they can do in a vast and expansive way across the country. And literally in the days ahead, we're going to continue to see the availability of tests at your local doctor, ultimately at your local pharmacy, continue to expand."

When President Trump learned that 70% of the new cases this week, around the world, were in Europe, he took decisive action to protect the American people.

"Make no mistake about it: All the new cases in the world, this week, 70% of the new cases were in Europe. And the increase has been dramatic. When the President imposed the travel advisory and we began screening all flights, all passengers coming into the United States from Italy two weeks ago, there were roughly 500 coronavirus cases. Now there's 12,000, about 1,000 in Germany, about 1,000 in France. That's the reason why the President essentially said full stop, we're going to suspend all travel, and that American citizens coming home and legal residents will be funneled through 13 different airports. They'll get an initial health screening coming in. But we're going to ask everyone returning to our country to self-quarantine for 14 days."

AMERICAN OVERSIGHT

President Donald J. Trump Has Taken Unprecedented Steps to Respond to The Coronavirus and Protect the Health and Safety Of Americans

"Together we are putting into policy a plan to prevent, detect, treat and create a vaccine against coronavirus to save lives in America and the world. America will get it done!" – President Donald J. Trump

President Donald J. Trump signed a Presidential Proclamation, which suspends the entry of most foreign nationals who have been in certain European countries at any point during the 14 days prior to their scheduled arrival to the United States. These countries, known as the Schengen Area, include: Austria, Belgium, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Italy, Latvia, Liechtenstein, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Slovakia, Slovenia, Spain, Sweden, and Switzerland. This does not apply to legal permanent residents, (generally) immediate family members of U.S. citizens, and other individuals who are identified in the proclamation.

Statement from DHS Acting Secretary Chad F. Wolf: "Protecting the American people from threats to their safety is the most important job of the President of the United States. The actions President Trump is taking to deny entry to foreign nationals who have been in affected areas will keep Americans safe and save American lives. I applaud the president for making this tough but necessary decision. While these new travel restrictions will be disruptive to some travelers, this decisive action is needed to protect the American public from further exposure to the potentially deadly coronavirus. In January and February, the Administration issued similar travel restrictions on individuals who had been in China and Iran. That action proved to be effective in slowing the spread of the virus to the U.S., while public health officials prepared. In the next 48 hours, in the interest of public health, I intend to issue a supplemental Notice of Arrivals Restriction requiring U.S. passengers that have been in the Schengen Area to travel through select airports where the U.S. Government has implemented enhanced screening procedures."

RESTRICTING TRAVEL FROM IMPACTED AREAS: President Donald J. Trump is taking further action to curb the spread of the coronavirus to the United States from other countries.

- President Trump is issuing a proclamation under section 212(f) of the Immigration and Nationality Act (INA) to restrict travel to the United States from foreign nationals who have recently been in certain European countries.
    - Section 212(f) of the INA only applies to the movement of human beings, not goods or cargo.
- The restriction applies to foreign nationals who have been in the Schengen Area, 26 countries in Europe with open borders agreements, in the last 14 days.
- Those who are exempt from these restrictions, such as American citizens, will be directed to a limited number of airports where screening can take

AMERICAN OVERSIGHT

place.
- There is extensive travel back and forth between Europe that heightens the risk here in the United States.

LOOKING OUT FOR AMERICAN BUSINESSES AND WORKERS: President Donald J. Trump is committed to protecting American businesses and workers from the impacts of coronavirus.

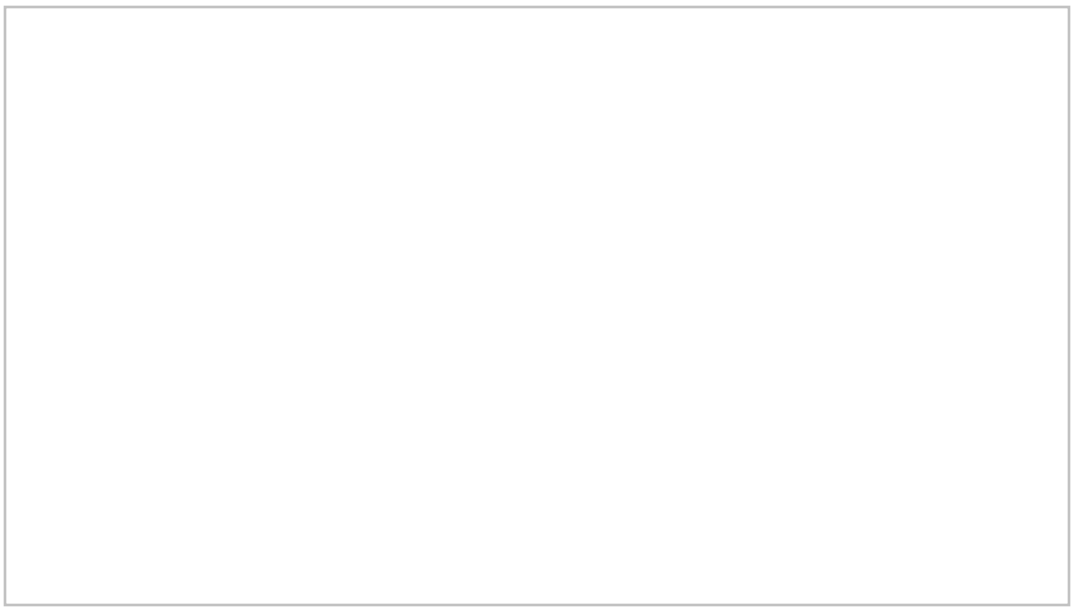
- The President is announcing an economic assistance package to help support businesses and workers who have been harmed by this outbreak.

- President Trump has instructed the Small Business Administration (SBA) to exercise available authority to provide loans to businesses affected by the coronavirus.
    - These loans will help overcome disruptions caused by the coronavirus.
    - The President is calling on Congress to increase funding for this program by an additional $50 billion.
- The President will be instructing the Department of the Treasury to defer tax payments for certain individuals and businesses negatively impacted by the coronavirus.
    - This action will provide more than $200 billion of additional liquidity to the economy.
- President Trump is calling on Congress to immediately pass payroll tax relief.
- The President announced that he will soon be taking emergency action to provide financial relief for workers who are ill, quarantined, or caring for others due to the coronavirus.
    - The President also called on Congress to take action to extend this relief for workers.

LEADING AN AGGRESSIVE, WHOLE-OF-GOVERNMENT APPROACH: President Trump has taken unprecedented steps to protect the health of Americans in response to the coronavirus.

- The President is leveraging all of our resources to respond to the coronavirus, bringing together government and private industry in a collaborative response.
- The Trump Administration declared a public health emergency in January to bolster response efforts.
- President Trump took early action to help curb the spread of the virus from other countries to the United States, providing important time for response and preparations.
    - In January, President Trump acted quickly to restrict travel from foreign nationals traveling from China.
    - In February, the President restricted travel for individuals recently traveling from Iran.
    - The Administration put into place mandatory screening for all

AMERICAN OVERSIGHT



travelers coming into the country from Italy and South Korea.
    - Travel advisories for severely impacted areas like Italy and South Korea have been raised to their highest level.
- Today, the President directed his Administration to make general-use face masks available to our healthcare workers.
    - The Administration's actions will help make millions of general-use respirators available to keep healthcare workers safe and mitigate transmission of the virus.
- President Trump signed into law more than $8 billion to fund response efforts.
- The Administration has taken bold steps to incentivize the development of therapeutics and vaccines to treat and prevent the spread of the coronavirus.
- Working across the public and private sectors, the Trump Administration continues to drastically expand testing capacity.
    - More than 1 million tests have been distributed nationwide, with another 4 million tests being shipped out by the end of the week.
    - Testing is now available in every State lab in the country and commercial labs are now deploying tests, which will help generate a dramatic increase in availability.
- The Trump Administration has released guidance on how to keep businesses, schools, community gathering places, and families safe.
    - From the start, President Trump has made keeping the public informed a top priority.
- The Administration has announced that health plans with health savings accounts will be able to cover coronavirus testing and treatment without co-payments.

ICYMI | Vice President Pence Discusses the Coronavirus Response on the Morning Shows

Earlier this morning, Vice President Pence joined Good Morning America, The Today Show, Fox & Friends, New Day, and CBS This Morning to discuss the steps that this administration is taking to combat the coronavirus.

ON ABC's GOOD MORNING AMERICA

AMERICAN OVERSIGHT

WATCH HERE.

From very early on, President Trump took decisive action to put the health of the American people first.

> "We all have known from the beginning that the coronavirus would continue to spread across this country, and it's one of the reasons why, from very early on, President Trump took decisive action to put the health of the American people first, not only declaring a public health emergency in January, but in that same month he suspended all travel from China -- an unprecedented move -- and quarantined Americans that were returning from the region. Since that time, George, we've -- we've issued travel advisories for areas of South Korea, Italy; screened all persons coming on direct flights. But, frankly, as we watched the epicenter of the coronavirus shift from China and South Korea to Europe, the President thought it was proper for us to impose a 30-day suspension on all travel from continental Europe."

The President, again, made another unprecedented decision in suspending all travel from Europe, because we want to stop the flow of people bringing the coronavirus here.

> "The reality is that, really, just two weeks ago, in Italy, there were less than 500 cases and now there's 12,000 cases in Italy, George. We have tens of thousands of people that travel to the United States from Europe every day. Seventy percent of new cases in the world were in Europe. And when we looked yesterday at the -- what was then the 35 states where we had cases, about 30 of them could be traced to contacts with Europe. And so the President, again, made another unprecedented decision in suspending all travel from Europe, because we essentially want -- we essentially want to stop the flow of people bringing the coronavirus here, but then continuing to surge resources, particularly into California, Washington State, New York, and other communities where we've seen community spread. It's a combination of efforts that's being driven by the top health experts in the world on our task force. But the President -- the President showed again yesterday a willingness to take decisive action on multiple levels to protect the American

AMERICAN OVERSIGHT

people."

We want to send a very clear message to Americans that if for any reason you believe you've been exposed to the coronavirus, you should not be worried about the cost of testing or treatment.

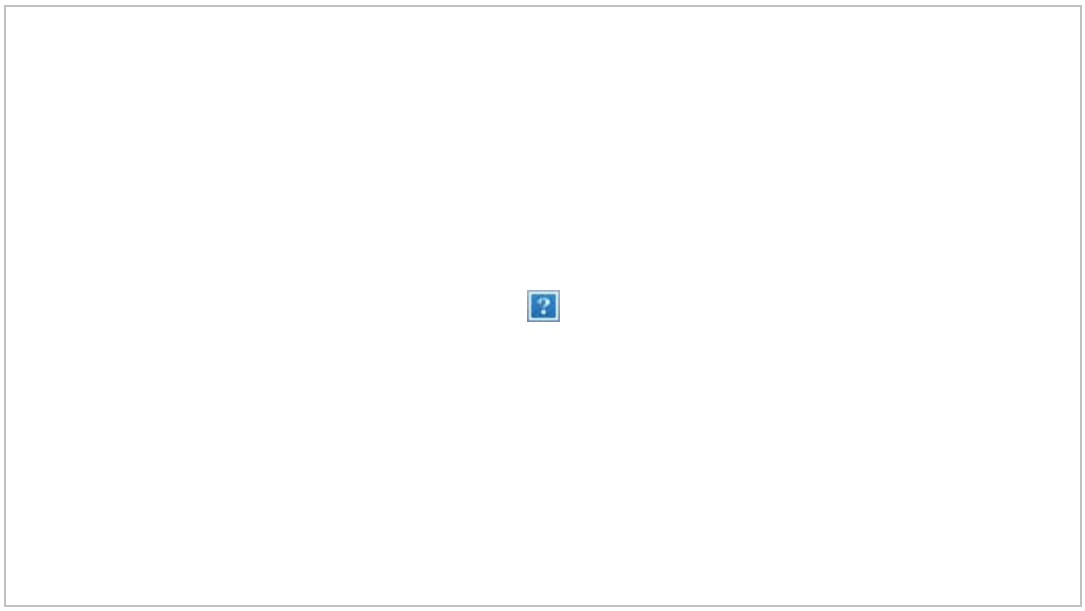
"We're making steady progress. We're going to continue to make a very clear message to Americans that if for any reason you believe you've been exposed to the coronavirus or you have symptoms, we don't want people to be worried about the cost of testing, to be worried about the cost of treatment… As the President made clear last night, we're working with Congress and exploring actions the President can take to make sure that hourly wage earners know that you can stay home without risking losing a paycheck or losing your job if you feel if you feel that you've been exposed to the coronavirus."

ON NBC's TODAY SHOW

WATCH HERE.

From early on in this effort, we have addressed the testing issue. We made changes through the FDA that allowed for state labs and hospitals to engage in testing.

"From early on in this effort we've been addressing the testing issue. We made changes through the FDA that allowed for state labs and university hospitals and hospitals to engage in testing. And I'm pleased to report every state lab in America can do testing now. Many university laboratories are doing it. Washington State – the University of Washington is doing extraordinary work. but we are literally working hour by hour to expand the testing and we think the key Savannah is going to be what we call commercial laboratories like LabCorp and Quest who are already spinning up production at the president's direction last week on tests that can be available on a broad basis in the days ahead for the American people. we're making real progress but rest assured we're going to continue to drive forward."



The American people should know that President Trump has no

AMERICAN OVERSIGHT

higher priority than the health, safety and well-being of the American people.

> "The American people should know that President Trump has no higher priority than the health and safety and wellbeing of the people in this country. You can go to coronavirus.gov right now to find out what every American can do to keep yourself, your family, your workplace and your school safe. But you can rest assured we're going to focus on communities where we've had community spread, and the President's action yesterday suspending travel from Europe is one more example of how he's putting the health of America first."

ON FOX NEWS' FOX & FRIENDS

WATCH HERE AND HERE.

The President has called this a whole-of-government approach, but he has also called this is a whole-of-America approach.

> "The President, you know, he said this was a whole-of-government approach but he also said this is a whole-of-America approach. So he's brought in business leaders from nursing homes; yesterday, banking; hospitals, and the rest. But one of the things we did that's most important on testing was the President brought in the leaders of the top commercial laboratories in the country who, as we speak, have already approved a test that is being spun up. It's being sent out to market. Quest, LabCorp, the largest commercial laboratories in the country, are working very closely with our administration. We're clearing the red tape out of the way. That's going to be the way that, in the days ahead, we're going to -- we're going to have broad-based testing available all across the country."

We are working together to contain the spread of the coronavirus. And we will get through this.

> "Our goal, as the coronavirus spreads in this country -- and the vast majority who would contract it will have flu-like symptoms and recover. Our goal nonetheless is to hold down that overall number as much as

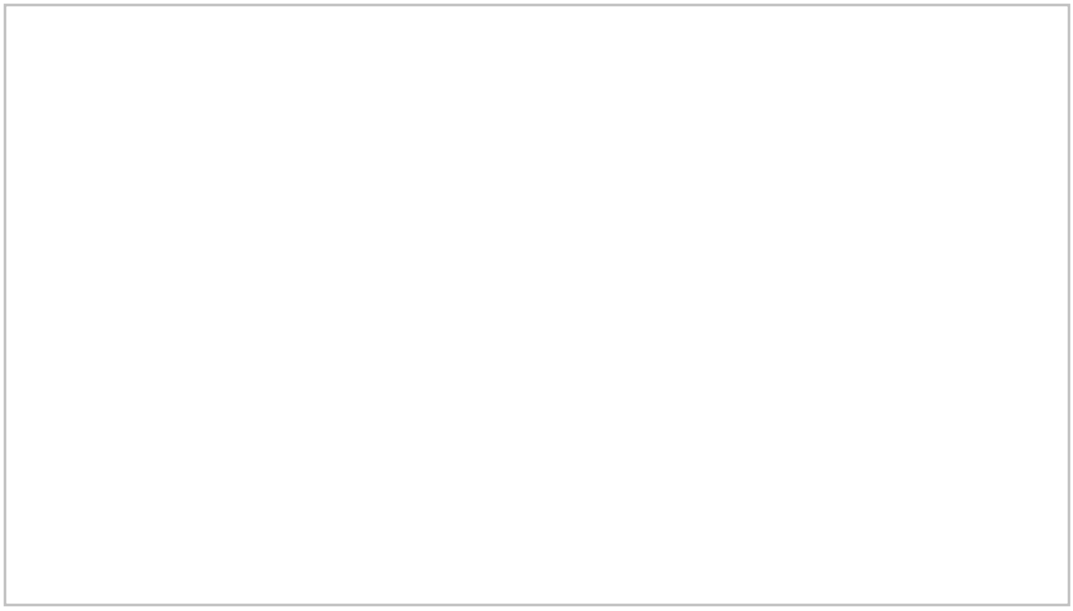
AMERICAN OVERSIGHT

possible. And we will do that with the continuing cooperation of American families, schools, businesses, and states. And that's the vision President Trump has. All of us working together will get through this."

We are focusing on supporting efforts at the state and local level in Washington State, and in California. CDC issued strong guidelines for those communities about public activities, large gatherings and at schools. We will continue simply to follow the data on this.

"Make no mistake about it: We are also focusing on supporting efforts at the state and local level in California, in Washington State, and in California. CDC issued very strong guidelines for those communities about public activities, large gatherings, schools. And we'll continue simply to follow the data on this and make strong recommendations where we have what's known as "community spread. But for every American, right now, as the President said last night, it's a good time to use common sense. Wash your hands often. Clean, you know, often-used surfaces. All that information is available at Coronavirus.gov. So we're going to try and mitigate the spread in this country but also prevent, through the President's decisive action last night, people from bringing the coronavirus into the United States any further from Europe."

We are encouraging best practices for every American. We are focusing on communities where we have community spread.



"I want to say to your viewers, just as the President said last night, the risk to the average American of contracting the coronavirus remains low, but we do know that seniors with serious underlying chronic health conditions are particularly vulnerable to very serious outcomes. And so we're encouraging best practices for every American. We're focusing on communities where we have community spread."

Those with a family member who is a senior citizen should support them in engaging in good hygiene and good health practices.

"For any American that's watching today that has a family member or a loved one who's a senior citizen with a serious underlying health condition, this is a very good time to help and to support them to be able to avoid public places, and everyone around them to engage in good hygiene and good practices to protect those that are most vulnerable."

ON CNN's NEW DAY

AMERICAN OVERSIGHT

WATCH HERE AND HERE.

We have been meeting with industry leaders in one relevant industry after another to ensure that the full resources of America are being brought to bear.

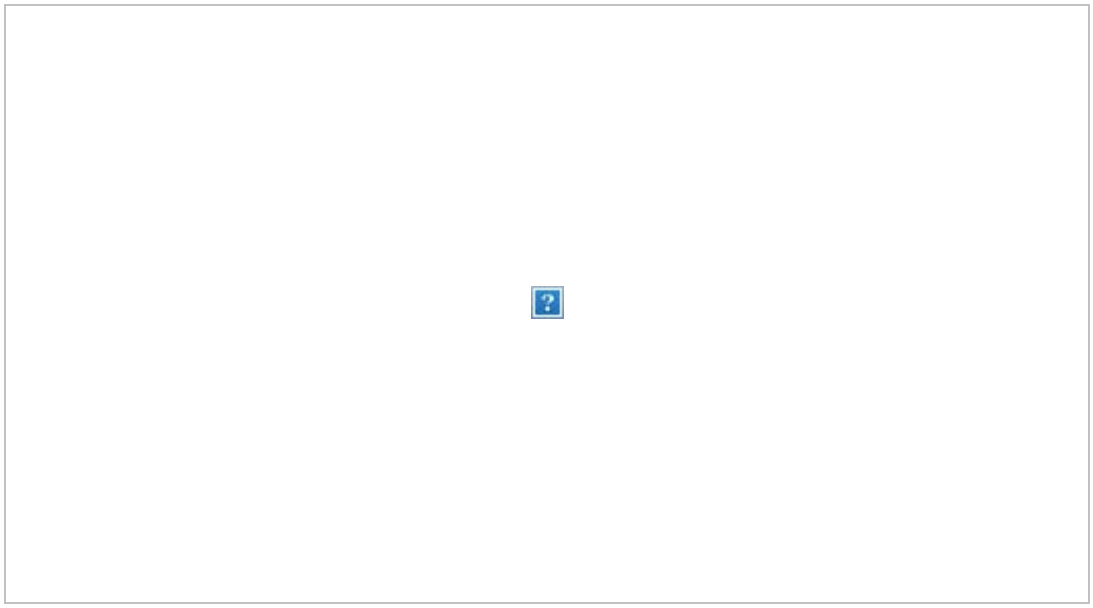
> "We're not doing a travel ban as our strategy. The suspending all travel for 30 days from Europe is a part of the strategy. The other part is an aggressive mitigation strategy. I spoke to the governors of New York, Washington State, and California tomorrow -- or yesterday. CDC issued strong guidance to those areas where we have community spread. We've flowed resources. We've flowed support to those areas. And so it's a combination of strategies that the President has employed here. As he says, it's "all hands on deck," "a whole-of-government approach," but it's also a whole-of-America approach. We've literally been meeting with industry leaders in one relevant industry after another to ensure that the full resources of America are being brought to bear."

Any American who is concerned about being exposed to the coronavirus, should call their doctor and get tested.

> "Anyone who's looking on today who might be concerned that they were exposed to coronavirus or have symptoms should call their doctor. Their doctor, with any question, can call their state laboratory and be able to find out how they can have a test processed."

We are making steady progress. We don't want anybody to avoid having a test because they are concerned financially.

> "But make no mistake about it: We're making steady progress. We've made changes at the FDA in January, at the President's direction. And the American people can be confident we're going to continue to roll out the test. And maybe most significant on that score is that the President brought health insurance companies in last week and they all agreed to waive the co-pays on testing. We expanded testing to Medicare and Medicaid patients. And we also expanded coverage for treatment, and health insurance companies expanded coverage for treatment. We don't



AMERICAN OVERSIGHT

want anybody to avoid having a test because they're concerned financially."

The risk to the average American remains low.

"I want people to know that the risk to contracting the coronavirus, according to all of our experts, for the average American remains low. Most people that contract it, will have flu-like symptoms and recover."

ON CBS This Morning

WATCH HERE.

We are going to continue to put in every effort in place to protect the health and safety of the American people.

"The President took the unprecedented step of suspending all travel from China which was the originating country of this virus. We also established travel advisories, and we've been screening passengers on all direct flights from South Korea and Italy. But with the epicenter of this epidemic now moving from China and South Korea to Europe, yesterday the President again took the unprecedented step of suspending all travel from Europe for the next 30 days, and that in combination with our strong mitigation efforts in communities that are experiencing what our experts call community spread, areas of California, Washington State, and New York, we're going to continue to put every effort at home and with regard to these travel restrictions in place to protect the health and safety of the American people."

In the days ahead, we are going to continue to see the availability of tests at your local doctor and your local pharmacy expand.

"Testing is happening in every state lab in the country. Many university hospitals have taken the FDA test, like the University of Washington, is doing a great job expanding testing capabilities. But the biggest piece on the testing is that our commercial labs that the President brought in last week, companies like Quest and LabCorp, have already had approved a new test that they several days ago had begun to take to market which

AMERICAN OVERSIGHT

they can do in a vast and expansive way across the country. And literally in the days ahead, we're going to continue to see the availability of tests at your local doctor, ultimately at your local pharmacy, continue to expand."

When President Trump learned that 70% of the new cases this week, around the world, were in Europe, he took decisive action to protect the American people.

"Make no mistake about it: All the new cases in the world, this week, 70% of the new cases were in Europe. And the increase has been dramatic. When the President imposed the travel advisory and we began screening all flights, all passengers coming into the United States from Italy two weeks ago, there were roughly 500 coronavirus cases. Now there's 12,000, about 1,000 in Germany, about 1,000 in France. That's the reason why the President essentially said full stop, we're going to suspend all travel, and that American citizens coming home and legal residents will be funneled through 13 different airports. They'll get an initial health screening coming in. But we're going to ask everyone returning to our country to self-quarantine for 14 days."

AMERICAN OVERSIGHT

Date: 2/4/2020

From: Yaritbel Torres Mendoza

Subject: Field EISO Monthly Report – [January, 2020]

To: FieldSupport@cdc.gov; Suzanne Beavers (fgx5@cdc.gov); Carina Blackmore (carina.blackmore@FLhealth.gov); Danielle Stanek (Danielle.Stanek@FLhealth.gov); AL EISO Guillermo Sanchez (xkv4); GA EISO Christine Szablewski (lqz9); KY EISO Erin Blau (okl2) and USVI EISO Springer Browne (okl4).

I. New Activities

- EWB supervisor field site visit 1/29–1/30.
- PHS VetPAC All Partners Access Network (APAN) website development, will be meeting biweekly.
- Attended webinar on Feline leukemia virus and feline immunodeficiency virus.
- Attended a Florida USDA accreditation training.
- 2019 novel corona virus
    - Attended FDOH and CDC meetings on 2019 nCoV.
    - Assisted with 2019 nCoV on-call calls from health care providers.
    - Attended COCA call on 2019 nCoV

II. Ongoing Activities

- **Syphilis reinfection**. (HSR: 2019-00170). A retrospective cohort study from patients who were diagnosed, reported, and met syphilis case definition with a novel and initial syphilis infection between 2012 and 2015 in Florida. The objectives of the study are to 1) determine how many patients had one or more follow-up serology tests performed over two years from their first syphilis diagnosis; 2) to identify how many reinfections occurred among patients that had a novel syphilis infection and had follow-up serology; and 3) to determine if age, gender, HIV status, pregnancy status, or self-reported sexual orientation influences the likelihood of follow-up serology tests or reinfection.
- **Community Assessment of Monroe County post-Hurricane Irma.** (HSR: 2019-00105, 70 days). On September 10, 2017, Monroe County experienced a direct hit from Hurricane Irma, a category 4 hurricane. As of January 25, 2019 the number of suicides for 2018 (35 suicides) have exceeded the 2013 record (31 suicides) for the annual number of suicides recorded in the last ten years. Because of the increase in suicides, the Florida Department of Health (FL DOH) in Monroe County contacted the FL DOH requesting support for a Community Assessment for Public Health Emergency Response (CASPER). The objectives of the CASPER are to: 1) To assess the economic, and physical and mental health impact of Monroe County residents post-Hurricane Irma; and 2) to assess the knowledge of and perceived barriers to accessing health resources among Monroe County residents post-Hurricane Irma. CASPER took place from May 20th to May 25th, 2019, approximately over 200 surveys were completed. Analysis is stil pending.
- Tuesday Monthly Seminar
- Biweekly EWB supervisory meeting

AMERICAN OVERSIGHT

- US PHS Veterinary Pac meeting
- On call
- Followed up with the high risk *B. suis* exposures for follow up serology and retesting of their pet dog.
- Submitted Monroe County CASPER report for FDOH clearance.
- Dengue thrombocytopenia syndromic surveillance.

III. Miscellaneous

A. Annual leave taken (with dates): MLK

B. Upcoming annual leave and official travel planned (with dates):

Polio deployment to Ghana: 2/8–3/21

C. Upcoming conferences (with dates and locations): None

IV. Pictures (optional)

Good Day Paul and Kara,

Thank you kindly for reaching out today.

As per telephonic guidance received the evening of 12 March 2020 from Alberto Moscoso and team at Florida Department of Health, as well as Cindy Friedman and Paul Weidle from US CDC, it was recommended that an email notification to be sent to individuals with travel history aboard Sky Princess voyage A [22-29 February 2020] and voyage B [29 February – 7 March]. Attached are the email notifications sent on 13 March 2020.

Thanks,

_____

PRINCESS CRUISES

IMPORTANT NOTICE REGARDING YOUR CRUISE

Sky Princess - Voyages Y008A & Y009

March 13, 2020

Dear Princess Guest,

We have been notified by the Florida Department of Health of three positive COVID-19 cases associated with Port Everglades in Broward County, Florida. All three cases are connected to, or employed by, Metro Cruise Services – an external company that operates at Port Everglades. We have been informed that these external contractors worked in the disembarkation area of terminal 2 in Port Everglades on February 29, 2020. Only one individual reported illness symptom onset before February 29.

The Florida Department of Health is working closely with Metro Cruise Services to provide appropriate guidance and monitoring to their employees with potential close contact.

The Florida Department of Health is in close consultation with the CDC on this investigation and is working to connect other employees at Metro Cruise Services who may have come into contact with the three individuals. The Florida Department of Health believes the risk of exposure to cruise ship guests from these individuals is generally low.

CDC recommends that all individuals with recent travel history on a cruise ship, monitor their health for 14 days after they return to the United States. If you develop symptoms, immediately self-isolate and contact your county Health Department or health care provider. CDC advice for cruise ship guests can be found here: https://wwwnc.cdc.gov/travel/page/covid-19-cruise-ship.

Updated information on COVID-19 can be found at the CDC website: https://www.cdc.gov/coronavirus/2019-ncov/index.html.

Thank you for taking the time to read this important information.

Subject:	Long Term Care Resources for Pandemic Planning
Date:	Thursday, February 20, 2020 3:35:13 PM

Long Term Care Partners,

Hope things are well with you all. As I am sure you are aware, the Department has activated an incident management team for responding to the novel coronavirus COVID-19. While we have no cases in Florida, we are taking this opportunity to review pandemic preparedness plans should this outbreak escalate to a global pandemic.

Older populations and people with underlying health issues appear to be at increased risk for this virus. We believe it is important that long-term care facilities begin planning now and ensuring they have protocols in place for a pandemic scenario. Specific actions include:

- Criteria and protocols for closing units or the entire facility to new admissions when the pandemic virus is in the facility
- Criteria and protocols for enforcing visitor limitations
- A plan for cohorting symptomatic residents or groups
- An occupational health plan for addressing staff absences
- Plans for increased cleaning of common surfaces

The linked checklist is an excellent resource for long-term care and other residential facilities to assist them with pandemic planning. While the document references influenza, coronavirus is a respiratory disease and most of the same activities apply. Link: https://www.cdc.gov/flu/pandemic-resources/pdf/longtermcare.pdf

Can you all share with long term care facilities and/or post this resource on your websites? Thank you.

Florida HEALTH

10 ways to manage respiratory symptoms at home

Continue to monitor and record symptoms. The Florida Department of Health in Miami-Dade County will be contacting you with results within 7 days of testing.

1. **Stay home** from work, school, and away from other public places. If you must go out, avoid using any kind of public transportation, ridesharing, or taxis.

2. **Monitor your symptoms** carefully. If your symptoms get worse, call your healthcare provider immediately.

3. **Get rest and stay hydrated.**

4. If you have a medical appointment, **call the healthcare provider** ahead of time and tell them that you have or may have COVID-19.

5. For medical emergencies, call 911 and **notify the dispatch personnel** that you have or may have COVID-19.

6. **Cover your cough and sneezes.**

7. **Wash your hands often** with soap and water for at least 20 seconds or clean your hands with an alcohol-based hand sanitizer that contains at least 60% alcohol.

8. As much as possible, **stay** in a specific room and **away from other people** in your home. Also, you should use a separate bathroom, if available. If you need to be around other people in or outside of the home, wear a facemask.

9. **Avoid sharing personal items** with other people in your household, like dishes, towels, and bedding.

10. **Clean all surfaces** that are touched often, like counters, tabletops, and doorknobs. Use household cleaning sprays or wipes according to the label instructions.

AMERICAN OVERSIGHT

INTERNAL REFERENCE ONLY

Pre-Arrival to Testing Site Instructions

1. Vehicle Capacity: 2 – (1 Driver and 1 Passenger)
    a. The passenger must be sitting at an operating window
2. If there are two (2) people in one (1) vehicle, each person is individually registered and tested if they meet the testing criteria.
    a. A vehicle with more than two (2) people will be turned away from the testing site.
    b. If a vehicle arrives with more than two (2) people, the onsite lead Charge Nurse will make a clinical decision to proceed.
    c. If a person arrives with no appointment, the onsite lead Charge Nurse will make a clinical decision to proceed.
3. Each person(s) must remain in the vehicle from time of arrival to departure of the testing area
4. Testing is done via an open vehicle window. Ensure windows are operational.

THINGS TO CONSIDER ·There are no bathrooms; · Each person needing a test must be seated next to a working window; · All passengers must remain in the vehicle from arrival to departure; ·Try to limit the people in your vehicle to those needing a test; · Eat prior to appointment or bring snacks and water. There may be significant wait times (expect several hours)

At Arrival to Testing Site Instructions

1. Pull forward slowly, as instructed until arriving to first station.
2. Place car into park.
3. Slightly roll down window and speak loudly.

Testing Flow

Station 1 – Appointment Validation

- Assessors will ask for person(s) ID and confirm individual's name and the assigned code matches the appointment list
- Assessors provide an information packet to vehicle informing person(s) of public health information, including contact information

AMERICAN OVERSIGHT

Station 2 – Lab Registration (est. time: ~5 min per person)

- Scribers complete paper form with demographic information for each person to be tested (information relayed to Scribers via the Runner for each car):
    - First Name
    - Last Name
    - Phone
    - Email
    - Address
    - Date of Birth
    - Sex
    - Race & Ethnicity
- Scriber places lab requisition bag under the wiper of the front vehicle window.

Station 3 – Swabbing and Decontamination (est. time: 5 min)

- **Primary Swabber**
    - Confirm verbal authorization from person being swabbed for swab collection (ask runner)
    - Receive collection tube and swab from runner
    - Label collection tube with person's ID
    - Take swab of person(s) in car
    - Immediately place specimen swab into specimen collection tube
    - Insert specimen collection tube into secondary containment (specimen bag)
    - Place specimen bag on to temporary specimen bag staging table
    - Place form and sample bag in envelope, signs form as chain of custody, and places envelope in shipping container
    - Quality Control officer verifies all labels match and places specimen into sample cooler
        - Specimens must be maintained at a temperature between 2˚ -8˚ C (35.6˚F to 46.4˚F)
        - Specimens must be shipped in less than 48 hours of collection

VEHICLE EXITS

AMERICAN OVERSIGHT

Laboratory Processing

- All labs are processed using LabCorp

- **Results**
  - Participants are called by a Florida Department of Health in Miami-Dade employee to receive results.
  - Results may take up to 7 days depending on lab processing.

- **Negative Results**

Encourage individual to practice proper hygiene techniques, maintain social distancing measures as well as monitoring for signs and symptoms of COVID-19. Proper hygiene measures include washing the hands before meals and after using the bathroom, avoiding touching their face, proper covering of cough and sneeze.

- **Positive Results**

Monitor for signs and symptoms of complications such as:

- Difficulty breathing or shortness of breath,
- Persistent pain or pressure in the chest,
- new confusion or inability to arouse
- Blush lips or face

If this occurs, person is to immediately go to the nearest hospital or call 911. Currently, there is no treatment or vaccine for COVID-19. The best treatment available is based on the individuals' symptoms. Get plenty of rest, fluids, and use fever reducing and pain medication if needed. A Florida Department of Health in Miami-Dade employee will be reaching out all positive COVID-19 individuals daily either by telephone or via text messaging.

AMERICAN OVERSIGHT

Testing Request from Community

Agent: Thank you for contacting the _____. My name is _____. How can I assist you today?

Caller: I would like a COVID-19 test.

Agent: Are you or a family member experiencing any **severe** acute lower respiratory illness? The emergency warning signs include, but not limited to:

- Difficulty breathing or shortness of breath,
- Persistent pain or pressure in the chest,
- New confusion or inability to arouse
- Bluish lips or face

Caller Answers "Yes," then direct the person to seek emergency care immediately or call 911 for assistance. Caller answers "no" continue with the script.

Agent: Before directing you to a testing site, I will need to determine if you meet the criteria for COVID-19 testing.

Agent: Do you have a cough or shortness of breath

Caller Answers "Yes" to either cough or shortness of breath continue with the script.

Caller Answers "No". Then caller does not meet criteria.

AND the individual meets one or more of the following criteria

Agent: Are you age 65 or greater?

Caller Answers "Yes" continue script caller meets criteria.

Caller Answers "No" caller does not meet criteria.

Agent: Are you immunocompromised?

Caller Answers "Yes" continue script caller meets criteria.

Caller Answers "No" caller does not meet criteria.

CALLER MEETS CRITERIA:

Agent: You have met the criteria for COVID-19 testing. Miami-Dade County has a COVID-19 drive thru specimen collection site. Are you interested in scheduling an appointment?

Caller: Yes

Agent: *Proceed to make an appointment. Collect caller's demographic information, provide caller with address, special code and time of appointment. They should plan on arriving early as wait times will be long.*

AMERICAN OVERSIGHT

AGENT INFORMS CALLER

THINGS TO CONSIDER ·There are no bathrooms; · Each person needing a test must be seated next to a working window; · All passengers must remain in the vehicle from arrival to departure; ·Try to limit the people in your vehicle to those needing a test; · Eat prior to arriving to the specimen collection site; · Bring snacks and beverages as there may be significant wait times (expect several hours).

Agent: Only people with an appointment, special code and a valid Florida ID, license, passport, etc. will be tested.

Agent: Will you be driving yourself to the COVID-19 test collection site?

Caller Answers "Yes"

Agent: Upon arrival to the specimen collection site, you are to remain in your vehicle from the time of arrival to departure of the testing area. Testing will be done via an open vehicle window. Please ensure your window is operable.

Caller Answers "No"

Agent: Only you and your driver should be in the car upon arrival at the test site. Your driver will be registered and tested. Both windows of the vehicle should be operable. If you bring anyone other than yourself and a designated driver, you will be turned away and your appointment will be canceled.

Agent: Please confirm verbally that you understand this.

Caller: How soon can I get my test results?

Agent: Your results should be available within 7 days of testing. A Florida Department of Health in Miami-Dade employee will call you. Please do not call the state lab, the state health department or the local health department to get your results.

CALLER DOES NOT MEET CRITERIA:

Agent: I am sorry but based on the criteria for the specimen collection site you do not meet criteria for testing at this time. You may reach out to your medical provider for additional medical guidance. Please continue to take steps to protect yourself • Wash your hands often with soap and water for at least 20 seconds. If soap and water are not available, clean your hands with an alcohol-based hand sanitizer that contains at least 60% alcohol, covering all surfaces of your hands and rubbing them together until they feel dry. • Avoid close contact with people who are sick. • Avoid touching your eyes, nose, and mouth with unwashed hands. • Clean all "high-touch" surfaces every day. High touch surfaces include counters, tabletops, doorknobs, bathroom fixtures, toilets, phones, keyboards, tablets, and bedside tables. Continue to take steps to protect others • Stay home if you're sick. • Cover coughs and sneezes. • If available, wear a facemask if you are sick.

Always reach out and **c**ontact your medical provider for guidance.

AMERICAN OVERSIGHT

Monitor for any symptoms:

- Note the day your symptoms begin.
- Check your own temperature two times a day.
- Keep a daily record of fever, cough, and additional respiratory symptoms.
- Seek further evaluation from a healthcare provider via telemedicine or in-person if your symptoms get worse. Always call before visiting your doctor's office.
- Seek medical attention immediately if you develop any of the following emergency warning signs for COVID-19 or other medical emergencies **Call 911 in case of an emergency**: - Extreme difficulty breathing - Bluish lips or face - Constant pain or pressure in the chest - Severe constant dizziness or lightheadedness - Acting confused - Difficult to wake up - Slurred speech (new or worsening).

For medical emergencies, call 911 and notify the dispatch personnel that you may have COVID-19.

If you have no insurance or a medical provider, I can direct you to the Florida Department of Health in Miami-Dade website for a list of Federally Qualified Health Centers. Please visit Miamidade.floridahealth.gov

If you have additional questions, you can call the Department of Health 24/7 COVID-19 Call Center The number to call is **1 (866) 779-6121** or visit http://miamidade.floridahealth.gov/

The “7 Key Questions”

Priority Information Requirement	Measure
1. Significant reporting of increasing demand for patient care service? a) Urgent Care/ER b) ICU	**Facility Impact and Ability to Meet Demand**
2. Ability to meet demand for increasing patient care services? a) Urgent Care/ER b) ICU	
3. Significant reporting of strategies to augment facility/hospital operations?	
4. Significant reporting of staffing shortages impacting patient care services? a) Urgent Care/ER b) ICU	
5. Impact on need for ventilators/ventilator ancillary supplies? a) Increased demand of ventilators/ventilator ancillary supplies? b) Decreased availability of ventilators/ventilator ancillary supplies?	**Supply Chain (Facility Demand and Supply)**
6. Impact on key pharmaceuticals? a) Increased demand of key pharmaceuticals b) Decreased availability of key pharmaceuticals	
7. Impact on PPE? a) Increased demand of PPE b) Decreased availability of PPE	

AMERICAN OVERSIGHT

Washington State Department of Health Incident Management Team

COVID-19 Leader's Intent

Phase 2

February 14, 2020

The novel coronavirus outbreak has required the Department of Health Incident Management Team to enhance several significant foundational public health capabilities, in order to effectively detect cases of disease, conduct laboratory analysis for the virus, share information between local, state and federal public health agencies, provide the public with information about what they can do to stay healthy, monitor people at risk of developing the disease, and if necessary quarantine individuals when other locations are not available.

At this time, the operationalization of the containment strategies are fairly well established and there is much concern that as the virus has spread to many countries, that this event is evolving and containment in the US may not be feasible in the medium to long term. Therefore, the Department of Health must focus its planning and preparation work to strategies for broader personal, community, and environmental mitigation and readying systems to reduce impact.

Task

Relying on existing emergency response plans where developed, the DOH IMT will focus on engaging partners in standing up and implementing community mitigation efforts to slow the spread of COVID-19 in communities, and simultaneously facilitate the preparation of multiple sectors for impact and minimizing that impact. Community mitigation efforts, are by definition a set of layered approaches to create social barriers to the transmission of the disease.

<u>Health Care Sector Work</u>

The work here must be to decrease demand on the health care system and increase supply of health care COVID-19 healthcare services.

- Stand up systems to track and maintain awareness of the health care system stressors (staffing, space, and "stuff"—materials) and to the extent possible, rely on existing data and systems capabilities. Health care supply chain information must be incorporated with epidemiologic and health care stress indicators to inform a real-time common operating picture. With these systems we will engage partners to identify thresholds and operational strategies for implementing community mitigation measures.

AMERICAN OVERSIGHT

- Coordinate with health care partners and health plans to support them, in their efforts, to develop and implement strategies for a) reducing demand (e.g., increase use of nurse advice lines, telemedicine, home self-assessments and home care guidelines), b) conserving scarce health care resources (staffing, personal protective equipment, ventilators, and medical supplies, and c) expanding surge capacity/output.
- Assist them with tools such as planning checklists.
- Keep local public health informed of this work and assist them in connecting with and supporting their local health care delivery partners.
- Assist EMS in their readiness.

Schools/Universities

- In collaboration with OSPI, Washington State Board for Community and Technical Colleges, and Washington Student Achievement Council, assist schools and universities (public, private, and religious) with implementation of school guidelines. Keep local public health informed of this work and assist them in connecting with and supporting their local public and private schools.
- Engage school leadership and health officers in environmental and community mitigation efforts to slow the spread of COVID-19. Assist them in understanding social distancing measures and the potential use of school closures and dismissals (staff work but students not in attendance). Assist them in understanding decision making processes and legal authorities for school closures and dismissals, including health officer role/authority.
- Encourage their pre-planning for how schools may continue educational learning via home-based instruction.
- Identify "secondary" impacts and consider options for mitigating those impacts of other services provided at school (e.g., meal programs, counseling services, etc).

Businesses

(To be developed next week after a 5pm planning meeting today). Include surveillance of supply systems and engagement of emergency management.

Chinese American and Other Asian Communities

- In collaboration with Commission on Pacific American Affairs, other Asian/Pacific led Islander organizations, Public Health: Seattle & King County, engage in comprehensive efforts to educate them on COVID-19, mitigation efforts, monitoring of COVID-19 related discrimination, and stigma/discrimination reduction efforts.

Elected Officials (Must be done in tight coordination with Secretary Wiesman)

- Identify organizations representing elected officials and engage them in education on community mitigation tools, when those tools may be recommended for use, their role and legal authorities in implementing those. Include local public health in this effort.

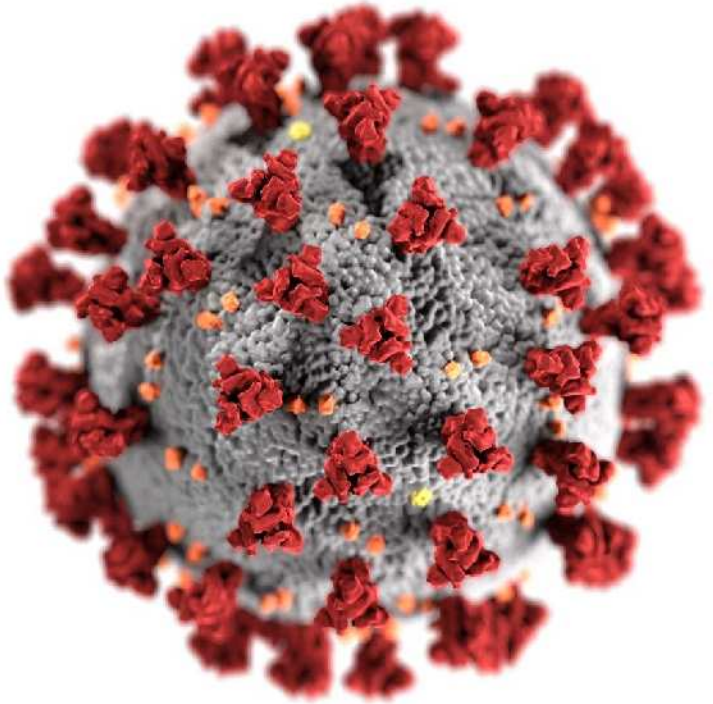
AMERICAN OVERSIGHT

- These key partners must be enrolled in systems for sharing information about the outbreak and notification of changes in the situation.

Purpose

The Washington State's Department of Health must fulfill our responsibility to prevent disease spread, promote health, and protect the public's health. Additionally, our state's healthcare system operates at full capacity on a daily basis. Since our state is still experiencing health care surge with respect to the current influenza season this system is under considerable stress. The COVID-19 presents an additional burden as well as an additional demand on the supply chain. Overall, the burden on the health care system impedes their ability to care for critically injured and ill patients on a daily basis. This response must support their ability to care for people in our communities when they need that care, which involves both mitigating spread of COVID-19 and building health care capacity.

End State



Our public health actions will prevent the spread of disease long enough for our state (country) to emerge from influenza season. With that, our health care partners will have built systems to decrease demand and conserve their resources, space, and personnel, in order to effectively care for those who require medical care. Our other sectors, especially schools and businesses will have leaned into preparations to minimize impacts.

CORONAVIRUS DISEASE

Considerations for Crisis Standards of Care

Senior Health Official and State Epidemiologist Touchbase Call

February 18, 2020

CDC

For more information: www.cdc.gov/COVID19

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-004754

COVID-19 Health System Concerns

- Medical system
  - Current concerns: increasing stress on PPE supply
  - Depending on intensity of outbreak: insufficient staff and staff safety, appropriate patient triage and care, medical countermeasure use, prioritization of laboratory testing
- Emergency Medical Services
  - Responding to suspect COVID cases
- Communicating to the public and community resilience

AMERICAN OVERSIGHT

Continuum of Care

Incident demand/resource imbalance increases →

Patient-level of care → Population-level of care

← Recovery

	Conventional	Contingency	Crisis
Space	Usual patient care space fully utilized	Patient care areas re-purposed (PACU, monitored units for ICU-level care)	Facility damaged/unsafe or non-patient care areas (classrooms, etc.) used for patient care
Staff	Usual staff called in and utilized	Staff extension (brief deferrals of non-emergent service, supervision of broader group of patients, change in responsibilities, documentation, etc.)	Trained staff unavailable or unable to adequately care for volume of patients even with extension techniques
Supplies	Cached and usual supplies used	Conservation, adaptation, and substitution of supplies with occasional re-use of select supplies	Critical supplies lacking, possible reallocation of life-sustaining resources
Standard of care	Usual care	Functionally equivalent care	Crisis standards of care[a]

Normal operating conditions

Extreme operating conditions

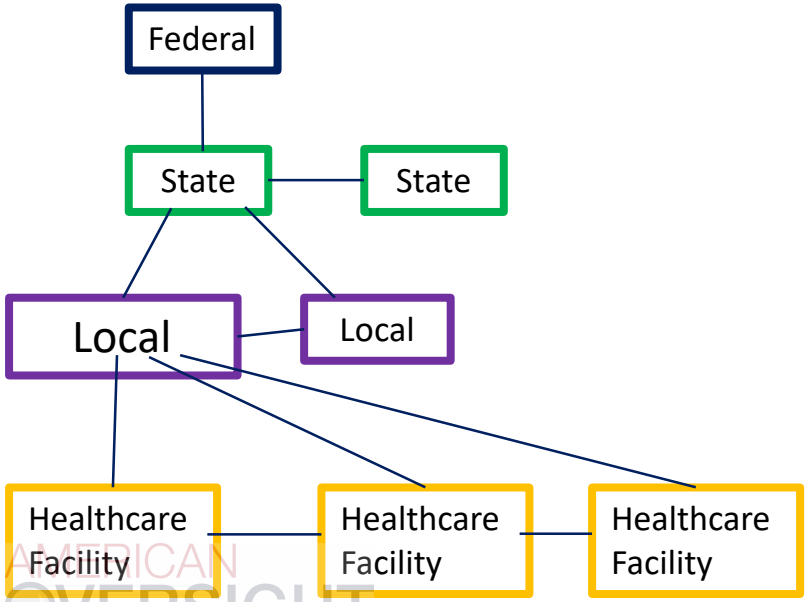
Indicator(s): Potential for contingency care[b]

Indicator(s): Potential for crisis standards of care[d]

Trigger(s): Decision point for contingency care[c]

Crisis care trigger(s): Decision point for crisis standards of care[e]

AMERICAN OVERSIGHT



What is Crisis Standards of Care (CSC)?

- Crisis Standards of Care (CSC) guidelines help public health and healthcare personnel determine how to utilize resources during a public health emergency
- Why is it necessary?
  - During catastrophic events, there may not be enough resources to give all patients the level of care they would normally receive.
  - A substantial change in usual healthcare operations and level of care it is possible to deliver due to a catastrophic disaster (e.g., pandemic influenza, earthquake, hurricane) (IOM 2012).

AMERICAN OVERSIGHT

How does CSC fit into response structure?

Emergency Response Activities

CSC Guidance, Policies, and Authorities

HHS/others

State Disaster Medical Advisory Committee (SDMAC)

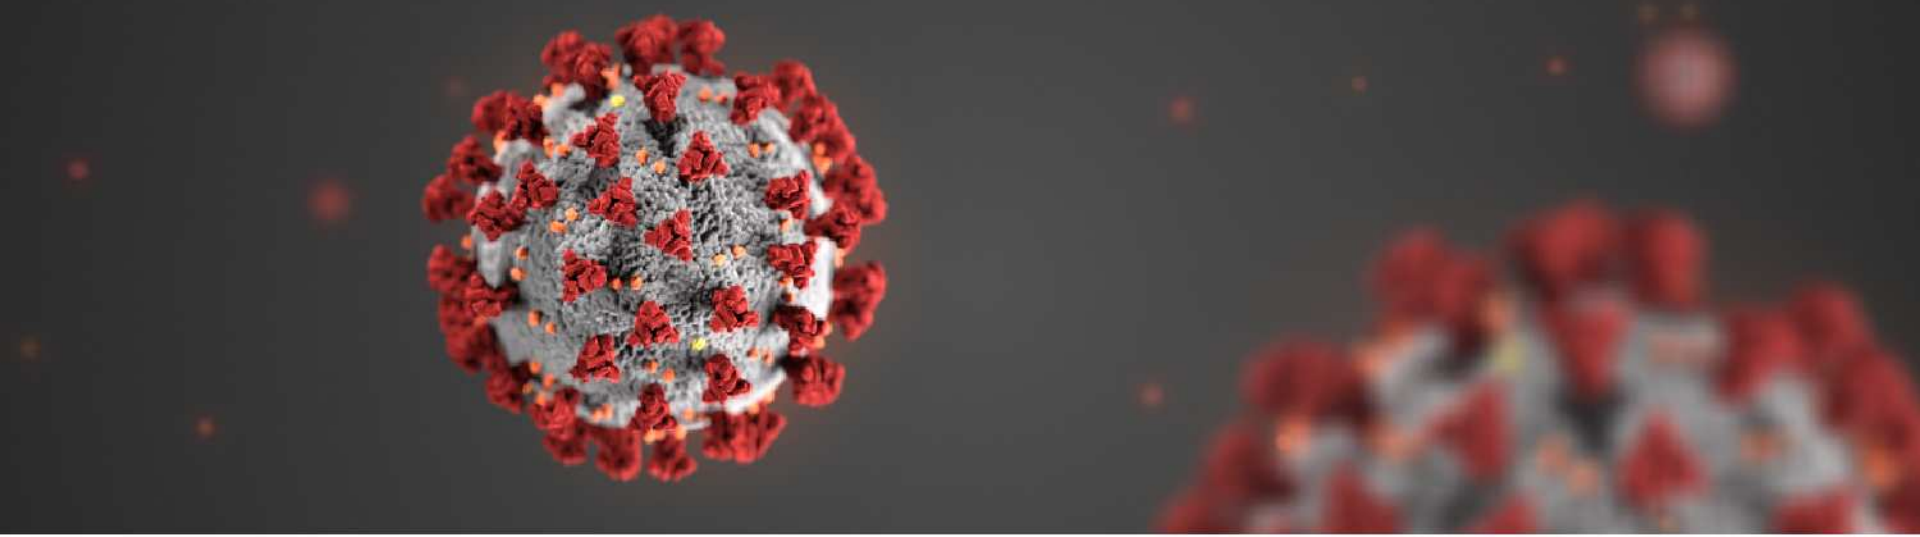
Regional Disaster Medical Advisory Committee (RDMAC)

Clinical Care Committee

Triage Team

AMERICAN OVERSIGHT

Federal Role in CSC (examples)



1. **Provision of staff/stuff/space**
   - Is there a role for personnel (deployments)
   - Possible utilizing alternative care strategies (e.g., scripts for telemedicine, nurse triage lines)
2. **Technical assistance**
   - Clinical and operational guidance for ventilator allocation, respirator use, or other scarce resource
   - Facilitate standardization of CSC approach across country (sharing best practices)
3. **Use of federal authorities to support jurisdictional efforts**

  - During catastrophic events, there may not be enough resources to give all patients the level of care they would normally receive.
  - A substantial change in usual healthcare operations and level of care it is possible to deliver due to a catastrophic disaster (e.g., pandemic influenza, earthquake, hurricane) (IOM 2012).

AMERICAN OVERSIGHT

How does CSC fit into response structure?

Emergency response breaks down into specific roles for feds, states and locals. CSC implementation requires guidance, policies and authorities at the federal, state/local and facility level.

CSC guidance can be developed at the federal, state and local level. As are medical decisions. Question is, can we do more at the Federal guidance and Medical decision making levels to help state and locals?

AMERICAN OVERSIGHT

Federal Role in CSC (examples)

1. **Provision of staff/stuff/space**
   - Is there a role for personnel (deployments)
   - Possible utilizing alternative care strategies (e.g., scripts for telemedicine, nurse triage lines)
2. **Technical assistance**
   - Clinical and operational guidance for ventilator allocation, respirator use, or other scarce resource
   - Facilitate standardization of CSC approach across country (sharing best practices)

The "7 Key Questions"

PRIORITY INFORMATION REQUIREMENT	MEASURE
1. Significant reporting of increasing demand for patient care services? a) Urgent Care/ER b) ICU	Facility Impact and Ability to Meet Demand
2. Ability to meet demand for increasing patient care services? a) Urgent Care/ER b) ICU	
3. Significant reporting of strategies to augment facility/hospital operations?	
4. Significant reporting of staffing shortages impacting patient care services? a) Urgent Care/ER b) ICU	
5. Impact on need for ventilators/ventilator ancillary supplies? a) Increased demand of ventilator/ ventilator ancillary supplies b) Decreased availability of ventilator/ ventilator ancillary supplies	Supply Chain (Facility Demand and Supply)
6. Impact on key pharmaceuticals? a) Increased demand of key pharmaceuticals b) Decreased availability of key pharmaceuticals	
7. Impact on PPE? a) Increased demand of PPE b) Decreased availability of PPE	

CDC

AMERICAN OVERSIGHT

Maximizing Capacity

- Decrease demand of services (PRIMARY FOCUS)
  - Online self-assessment
  - Protocols for nurse triage lines
  - Telemedicine

  We need to get our payers thinking about paying for these services.

- Increase supply of services for COVID-19 (HARD TO DO)
  - Health Care System Service/Operational Modficiations
  - Alternate care systems

Conservation Strategies/Crisis Standards of Care

- Need to prepare for:
  - Limited PPE
    - PPE conservation strategies (https://www.cdc.gov/coronavirus/2019-ncov/hcp/healthcare-supply-ppe.html)
  - Limited bed space
  - Limited ICU space
  - Limited ventilators

Resources for the Healthcare System

PARTICULATE RESPIRATORS and General PPE (N95, Elastomeric, PAPR, CAPR)[1]

STRATEGIES FOR SCARCE RESOURCE SITUATIONS

2020 UPDATE DRAFT for REVIEW

Conventional Capacity – The spaces, staff, and supplies used are consistent with daily practices within the institution. These spaces and practices are used during a major mass casualty incident that triggers activation of the facility emergency operations plan.	**Contingency Capacity** – The spaces, staff, and supplies used are not consistent with daily practices, but provide care to a standard that is functionally equivalent to usual patient care practices. These spaces or practices may be used temporarily during a major mass casualty incident or on a more sustained basis during a disaster (when the demands of the incident exceed community resources)	**Crisis Capacity** – Adaptive spaces, staff, and supplies are not consistent with usual standards of care, but provide sufficiency of care in the setting of a catastrophic disaster (i.e., provide the best possible care to patients given the circumstances and resources available). Crisis capacity activation constitutes a significant and adjustment to standards of care (Hick et al, 2009).

RECOMMENDATIONS	***Strategy***	***Conventional***	***Contingency***	***Crisis***
General Infection Control Procedures • 1. Establish procedures for managing visitors and ill healthcare personnel. • 2. Establish triage procedures and separate areas for ill and well patients. • 3. Assign dedicated staff to minimize exposure. • 4. Require, when possible, or strongly encourage vaccination of primary personnel and first responders, according to vaccine schedule as recommended for existing circumstances by the CDC and the Advisory Committee for Immunization Practices (ACIP). • 5. Seriously consider creation of a registry to reflect the vaccination status of primary personnel and first responders to aid in decisions regarding service assignments. • 6. Educate and routinely train all staff regarding use and proper handling of particulate respirators. • 7. Maintain good hand hygiene procedures including gloves, hand washing with soap and water and/or alcohol based hand sanitizers depending on the current recommendations. • 7a) Maintain proficiency in N95 Fit Testing **Cache/ Increase Supply Levels** • 8. Clarify current CDC and OSHA guidelines for respirator use; monitor for updates and recommendations.[2] • 9. Cache additional supplies of respirators and their functional components (e.g. fit testing supplies, batteries, cartridges, filters, hoods etc.). • 10. Review vendor agreements, contingencies for delivery and production, including alternate vendors. • 11. Maintain a reserve sufficient to meet estimated needs for respiratory protection for all respiratory infectious diseases.	*Prepare*			
• 12. Obtain masks and cartridges from alternate sources such as industrial suppliers and companies – welding, manufacturing, etc. – as indicated. • 13. Request Strategic National Stockpile of respirators with the knowledge that they may be from different manufacturers. They may not be functional in all situations (i.e. surgical use) and they may require additional fit testing before deployment.	*Substitute*			
Decrease Use of Respirators • 14. Clarify current CDC and OSHA guidelines for respirator use; monitor for updates and recommendations.[2] • 15. Medical/surgical masks can be reused by infected patients until the masks are no longer useable due to moisture or damage.	*Substitute & Conserve*			
• 16. When Respirators are in short supply, aerosol-generating procedures should only be performed on patients when medically necessary and cannot be postponed. • 17. Limit the number of healthcare personnel with patient contact to only those essential for patient care and support, especially during aerosol generating procedures. • 17a) Consider limiting all visitors • 17(b): Consider changes in staffing (i.e. unimmunized staff given assignments that would not require significant PPE use)	*Conserve*			
Extended Use[3] • 18. Clarify current CDC and OSHA guidelines for respirator use; monitor for updates and recommendations.[2] • 19. Policies and recommendations around "extended use" or "re-use" of respirators should include input from occupational health,	*Re-use*			

AMERICAN OVERSIGHT

infection control, infectious disease specialists, state and local public health and any national recommendations around the situation at hand. • 20. For N95, consider wearing a loose-fitting barrier that does not interfere with fit or seal (e.g., surgical mask, face shield) over the respirator to extend its use.[3] • 21. In general, wearing an N95 respirator over multiple serial patient encounters (while minimizing touching) is favored over removing and re-donning between encounters (i.e. extended use is favored over re-use of N95).[3] • 22. Cleaning and filter replacement procedures and extended use of filters and/or hoods/shields on all other mechanical respirators (i.e. elastomeric respirators, PAPRs , CAPRs etc.) should be done according to manufacturer's protocols and guidelines.				
Re-use Respirator After Removal[3] • 23. Clarify current CDC and OSHA guidelines for respirator use; monitor for updates and recommendations.[2] • 24. Policies and recommendations around "extended use" or "re-use" of respirators should include input from occupational health, infection control, infectious disease specialists, state and local public health and any national recommendations around the situation at hand.	*Re-use* *Re-allocate*			
• 25. Use and store used respirators (hood, mask, shield) individually in such a way that the physical integrity and efficacy of the respirator will not be compromised.[3] • 26. Label respirator with a user's name before use to prevent inadvertent use by another individual.[3] • 27. Practice appropriate hand hygiene before and after removal of the respirator and, if necessary and possible, appropriately disinfect the object used to store it.[3] • 28. Respirators should be discarded if visibly damaged or contaminated.[3] • 29. Five (5) is the recommended number of donning of a re-used N95-type respirator.[3] • 30. Consider N95 decontamination with ultraviolet germicidal irradiation (UVGI), or other tested method of decontamination to extend the use of respirators.[4] **Re-allocate/ prioritize** • 31. Respirators use should be prioritized only to those healthcare providers identified as highest risk. • 32. Identify medical personnel and caregivers with documented vaccination, immunity after an illness or lower risk of complicated infection to provide direct patient contact without a respirator.	*Re-use* *Re-allocate*			

[1]Refers to any device such as N95, elastomeric respirators, Powered Air Purifying respirators (PAPRs), Controlled Air Purifying Respirator (CAPRs) or equivalent. NIOSH approved particulate respirators can be found at: https://www.cdc.gov/niosh/npptl/topics/respirators/disp_part/RespSource.html; https://www.cdc.gov/niosh/npptl/topics/respirators/disp_part/default.html

[2]CDC and NIOSH overview of respirators: https://www.cdc.gov/niosh/topics/respirators/default.html

[3]"Extended use" is defined as wearing the same respirator for repeated close contact encounters with multiple patients without removing the respirator between patients (e.g. triage area, dedicated waiting rooms or wards, etc). "Reuse" is defined as using the same respirator for multiple encounters but removing it after each encounter. https://www.cdc.gov/niosh/topics/hcwcontrols/recommendedguidanceextuse.html https://www.cdc.gov/niosh/npptl/topics/respirators/disp_part/respsource3respreuse.html

CDC Confirms 15th Case of Coronavirus Disease (COVID-19)

CDC today confirmed another infection with Coronavirus Disease (COVID-19) in the United States. The patient is among a group of people under a federal quarantine order at JBSA-Lackland in Texas because of their recent return to the U.S. on a State Department-chartered flight that arrived on February 7, 2020.

All people who lived or travelled in Hubei Province, China, are considered at high risk of having been exposed to this virus and are subject to a temporary 14-day quarantine upon entry into the United States. This is the first person under quarantine at JBSA-Lackland who had symptoms and tested positive for COVID-19. The individual is currently isolated and receiving medical care at a designated hospital nearby.

This brings the total number of COVID-19 cases in the United States to 15. There will likely be additional cases in the coming days and weeks, including among other people recently returned from Wuhan. While 195 people were discharged from quarantine on Tuesday, more than 600 people who returned on chartered flights from Wuhan remain under federal quarantine and are being closely monitored to contain the spread of the virus.

For the latest information on the outbreak, visit CDC's Novel Coronavirus 2019 website.

NOVEL CORONAVIRUS 2019 (COVID-19)

AMERICAN OVERSIGHT

Presentation Overview

- COVID-19 outbreak
- Transmission and symptoms
- Prevention
- Treatment and testing
- Travel advisories
- Public health monitoring
- Influenza

AMERICAN OVERSIGHT

COVID-19 OUTBREAK

AMERICAN OVERSIGHT

Number of Confirmed Cases

More public health laboratories can test for the virus that causes COVID-19, and they are reporting their results publicly. Because states are reporting publicly directly, sometimes in near real-time, CDC case counts may be different from what states, local authorities, or media are reporting

- **Worldwide**
  - 127,820 confirmed cases
  - 4,717 deaths

  Last updated at 9:38 AM on 3/12/2020; John Hopkins CSSE GIS map
- **U.S**
  - 1,000 positive cases and 70 positive repatriated cases (46 cases from Diamond Princess; 21 cases from Grand Princess; and 3 cases from Wuhan, China)
  - 31 deaths

  Last updated at ~1:55PM on 3/11/2020; CNN
- **Florida**
  - 33 positive cases (26 Florida residents; 5 repatriated; 3 non-Florida resident)
  - 2 deaths

  Last updated 9:40 AM on 3/12/2020; FL DOH

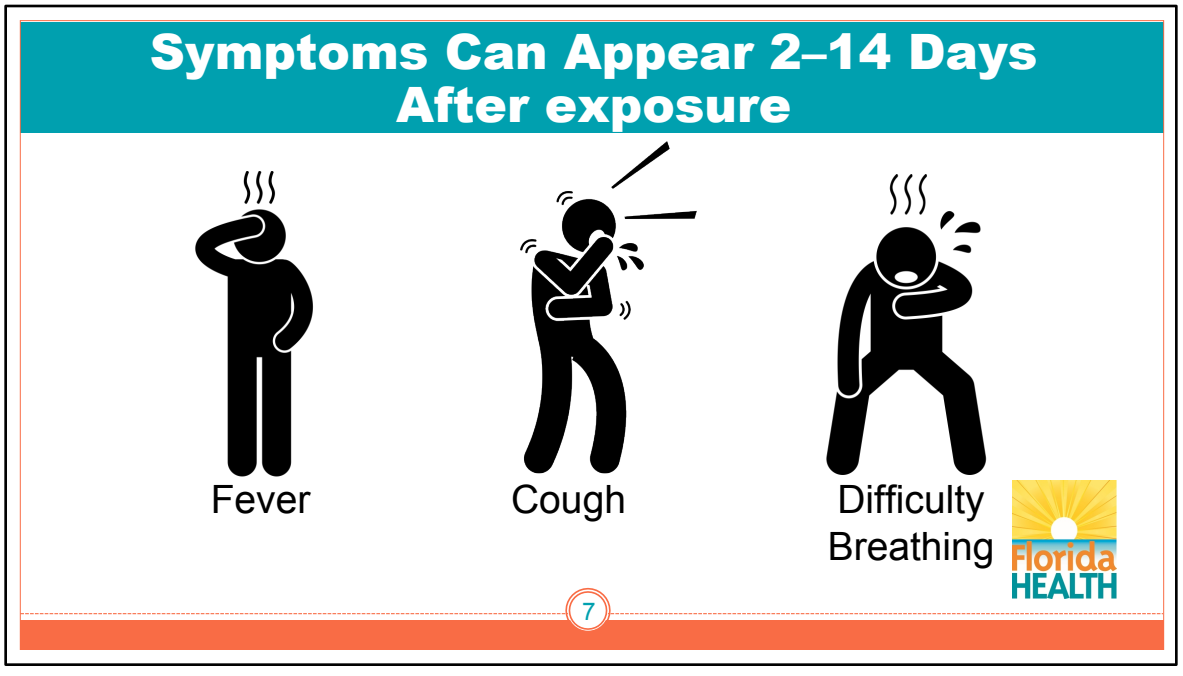
AMERICAN OVERSIGHT

TRANSMISSION AND SYMPTOMS

AMERICAN OVERSIGHT

COVID-19 Most Often Spreads from Person to Person

- Spread through respiratory droplets from an infected person who coughs or sneezes
- Spread among close contacts

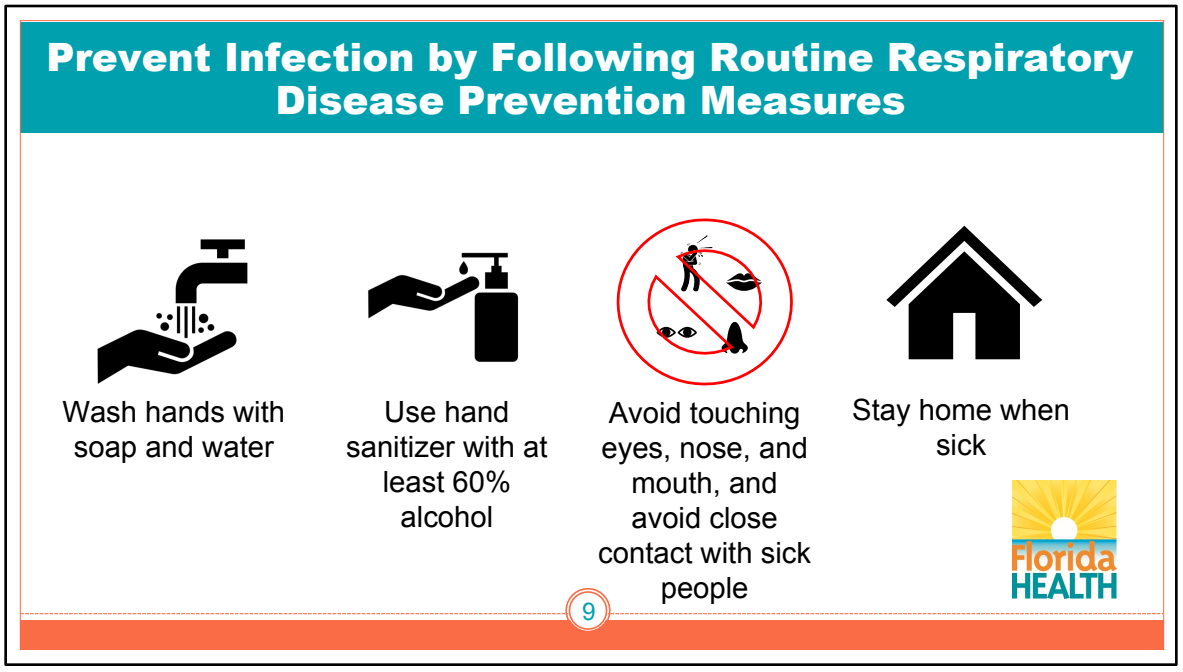


6

Most often, spread from person-to-person happens among close contacts (about 6 feet). Person-to-person spread is thought to occur mainly by respiratory droplets produced when an infected person coughs or sneezes, similar to how influenza and other respiratory pathogens spread. These droplets can land in the mouths or noses of people who are nearby or possibly be inhaled into the lungs. It's currently unclear if a person can get 2019-nCoV by touching a surface or object that has the virus on it and then touching their own mouth, nose, or possibly their eyes.

With most respiratory viruses, people are expected to be most contagious while they have symptoms.

AMERICAN OVERSIGHT



Symptoms may be mild to severe and may appear 2-14 days after exposure.

AMERICAN OVERSIGHT

PREVENTION

AMERICAN OVERSIGHT

There is currently no vaccine to prevent 2019-nCoV infection. The best way to prevent infection is to avoid being exposed to this virus. CDC & DOH always recommend these actions to help prevent the spread of respiratory viruses, including:

- Wash your hands often with soap and water for at least 20 seconds, especially after going to the bathroom; before eating; and after blowing your nose, coughing, or sneezing.
- If soap and water are not readily available, use an alcohol-based hand sanitizer with at least 60% alcohol. Always wash hands with soap and water if hands are visibly dirty.
- Avoid touching your eyes, nose, and mouth with unwashed hands.
- Avoid close contact with people who are sick.
- Stay home when you are sick.
- Cover your cough or sneeze with a tissue, then throw the tissue in the trash.
- Clean and disinfect frequently touched objects and surfaces using a regular household cleaning spray or wipe

AMERICAN OVERSIGHT

People at risk and have symptoms of fever, cough or difficulty breathing, please take these steps:

- Call ahead to your health care provider and tell them about your travel or exposure and your symptoms.
- Avoid contact with others.
- Do not travel while sick.
- Cover your mouth and nose when coughing or sneezing.
- Wash hands often with soap and water for at least 20 seconds, especially after coughing, sneezing or blowing your nose.
- If masks are to be worn, it is critical to follow best practices on how to wear, remove and dispose of them and on hand hygiene after removal.

Florida HEALTH

10

AMERICAN OVERSIGHT

Suspected or Confirmed COVID-19 Cases are Asked to Take Precautions

- Immediately isolate at home or health care facility.
- Do not participate public activities such as work or school.
- Only travel by ambulance or private car and avoid public transportation.
- Always wear a mask when around other people or pets at home.
- Always cover your coughs and sneezes and clean your hands often.

www.cdc.gov/coronavirus/index.html

Florida HEALTH

11

AMERICAN OVERSIGHT

TREATMENT AND TESTING

AMERICAN OVERSIGHT

There is No Specific Treatment for COVID-19 at This Time

The CDC recommends people who think they may have been exposed to COVID-19 should call their county health department immediately and self-isolate.

Florida HEALTH

13

There is no specific antiviral treatment recommended for 2019-nCoV infection. People infected with 2019-nCoV should receive supportive care to help relieve symptoms. For severe cases, treatment should include care to support vital organ functions.

AMERICAN OVERSIGHT

Testing

- The CDC developed a test for COVID-19.
- The DOH Bureau of Public Health Laboratories are testing with CDC's test kits.
- Some commercial labs can test for COVID-19

AMERICAN OVERSIGHT

TRAVEL ADVISORIES

AMERICAN OVERSIGHT

CDC Travel Advisories

Countries with sustained community or widespread transmission

- China (level 3)
- Iran (level 3)
- South Korea (level 3)
- Italy (level 3)
- Japan (level 2)

https://www.cdc.gov/coronavirus/2019-ncov/travelers/index.html

AMERICAN OVERSIGHT

COVID-19 Travel Updates

- It is recommended that travelers from affected areas who are sick delay or avoid travel.
- General recommendations for personal hygiene, cough etiquette and keeping a distance of at least six feet from persons showing symptoms remain particularly important for all travelers.

- **Level 3 travelers**: CDC recommends 14-day self-isolation and social distancing upon return to the United States. Social distancing includes avoiding going out in public and close personal interactions. If you become symptomatic, immediately self-isolate and contact your County Health Department (CHD) or health care provider.
- **Level 2 travelers and cruises**: FL DOH and CDC recommends that travelers should monitor their health and limit interactions with others for 14 days after returning to the United States.

Florida HEALTH

17

important for travelers who are sick to delay or avoid travel

AMERICAN OVERSIGHT

COVID-19 Travel Updates

- **Nile Cruise Advisory**: FL DOH is advising all individuals who traveled on a river cruise on the Nile River in Egypt in February 2020 to self-isolate for 14 days following their date of return to the United States.
- **Port Everglades Advisory:**

  FL DOH recommends:
  - All individuals experiencing symptoms who have recently traveled through Port Everglades to immediately contact their CHD or health care provider and self-isolate for 14 Days
  - Employees of Metro Cruise Services at Port Everglades with any association to the three positive cases self-isolate at home

AMERICAN OVERSIGHT

PUBLIC HEALTH MONITORING

AMERICAN OVERSIGHT

DOH is Monitoring those Possibly Exposed

- Personnel at the agency's 67 county health departments (CHDs) and central office in Tallahassee are working together to protect Floridians from emerging diseases.
- DOH receives information from CDC on U.S. citizens/residents/family returning from impacted areas.
- CHDs work with travelers to restrict their movement, monitor for illness, isolate persons with symptoms, and ensure health care providers use proper infection control techniques.

AMERICAN OVERSIGHT

DOH Monitoring Process

For people who may have been exposed, but do not have symptoms:

- Monitor for symptoms for 14 days.
- Self isolate for 14 days.
  - Stay home as much as possible.
  - Avoid travel on publicly used vehicles, gathering with groups of people, and going out in public.
  - Excluded from work, school, and other public places.
- Follow provided education on prevention of spread.

Florida HEALTH

21

AMERICAN OVERSIGHT

Immediate Risk to Americans Remains Low

- More cases in the U.S. are likely to be identified in the coming days.
- There is currently limited person-to-person spread in the community, but this may change.
- Everyone can do their part to prevent the spread of COVID-19 and other respiratory viruses.

AMERICAN OVERSIGHT

If you have any questions, please contact the Florida Department of Health in Miami-Dade County at

305-470-5660

You can also visit the CDC's website for updates regarding COVID-19

BioWatch National Conference Call (BWNCC) Framework

PURPOSE

The purpose of the BioWatch National Conference Call (BWNCC) is for information sharing and situational assessment following a BioWatch Actionable Result (BAR) in order to develop a common operating picture. This framework guides that discussion.

FORMAT AND USE

- The items in each section provide an outline for discussion. They should not be regarded as discussion requirements or limitations.
- The BWNCC Framework can be used with one or multiple jurisdictions.
- Throughout the BWNCC Framework, information presented as *(blue, italicized, and in parentheses)* denotes areas where a speaker will provide situation-specific information. If you may be a speaker during the BWNCC, you are encouraged to review the BWNCC Framework section(s) during which you might speak and be prepared to provide situation-specific information.
- The BWNCC Framework includes several questions the BWNCC Facilitator may ask participants. The BWNCC Facilitator may ask additional questions or omit questions based on the scope of the incident.
- For additional information on the content discussed in each BWNCC Framework section, reference the *BioWatch National Conference Call (BWNCC) Framework Overview*, which is available on the BioWatch Toolbox.

SECTION 1. INTRODUCTION

Hello everyone and welcome to this BioWatch National Conference Call. The current time is *(Time Eastern)*. To limit background noise and feedback, please mute your phone now and remember to unmute before you speak.

My name is *(Name)*, I am the *(Title)*, of the BioWatch Program, Countering Weapons of Mass Destruction Office, Department of Homeland Security. I am the facilitator of this call. Information

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-004811

discussed on this call is sensitive to United States national security. Parties who are not affiliated with this subject matter must leave now.

The BWNCC Facilitator will pause to allow people to leave

The purpose of this call is for information sharing and situational assessment following a BioWatch Actionable Result (BAR) in order to develop a common operating picture. Participants in the BWNCC are federal, state, and local government subject matter experts from a multitude of disciplines and emergency support functions.

This call does not constitute a formal declaration of emergency by the local, state, or federal government nor is it a forum to request federal emergency response resources. However, BioWatch specific resources are available and will be addressed later in this call. The jurisdiction has chosen to *(use/not use)* the decision support tool (DST).

If the jurisdiction is using the DST, the BWNCC Facilitator will ask the jurisdictional coordinator to provide the HSIN link here and ask who will be running the DST.

Please mute your phone now and remember to unmute before you speak.

SECTION 2. ROLL CALL

If more than one BioWatch jurisdiction is participating on the BWNCC, the BWNCC Facilitator will specify the order in which each will present their information.

We will begin the roll call with state and local representatives, including locally deployed federal representatives in the field offices. The Jurisdictional Coordinator will conduct the local roll call and I will follow with the roll call for federal representatives at national headquarters.

Please identify yourself by name and agency. In the interest of time, please identify a single representative to speak on behalf of each agency.

I will now turn it over to the JC.

JURISDICTIONAL ROLL CALL – FACILITATED BY THE JURISDICTIONAL COORDINATOR:

Jurisdictional Coordinator: Roll call for state and local officials, including Federal Partners at Local Field Offices:

- ❒ Public Health (ESF #6 and ESF #8)
- ❒ Emergency Management (ESF #5)
- ❒ Law Enforcement / Intelligence (ESF #13)
- ❒ BioWatch Laboratory

AMERICAN OVERSIGHT

- ❒ Field Operations
- ❒ Veterinarian (ESF #8 and ESF #11)
- ❒ Hazardous Materials / Environmental Sampling (ESF #10)
- ❒ Public Affairs / External Affairs (ESF #15)
- ❒ FBI Weapons of Mass Destruction (WMD) Coordinators
- ❒ EPA On-Scene Coordinators (OSCs)
- ❒ Military Installation(s)
- ❒ For any other agencies not previously identified representing the jurisdiction - please identify your speaking representatives now.

FEDERAL HEADQUARTERS ROLL CALL – FACILITATED BY THE BWNCC FACILITATOR:

BWNCC Facilitator: We have completed the state and local roll call; I will now conduct the Federal Headquarters roll call.

- ❒ National Operations Center (NOC)
- ❒ BioWatch Program
- ❒ DHS National Biosurveillance Integration Center (NBIC)
- ❒ DHS Intelligence and Analysis (I&A)
- ❒ DHS Public Affairs
- ❒ CWMD Public Affairs
- ❒ HHS / Assistant Secretary for Preparedness and Response (ASPR)
- ❒ HHS / Centers for Disease Control and Prevention (CDC)
- ❒ EPA Office of Emergency Management (OEM)
- ❒ FBI WMD Directorate (Operations Response Unit and Biological Countermeasures Unit)
- ❒ Department of Defense (DoD) Office of the Secretary of Defense / USNORTHCOM
- ❒ For any other agencies not previously identify - please identify your speaking representatives now

AMERICAN OVERSIGHT

SECTION 3. JURISDICTIONAL BRIEF

If applicable, the BWNCC Facilitator should share information on any recent BARs for the same agent and any other critical information that will help BWNCC participants develop a common operating picture.

Thank you everyone. We are here today to discuss a BAR declared by the *(Jurisdiction)* jurisdiction. There *(was/were) (Number of collectors)* collector(s) that tested positive for *(Agent)*. *(Number)* positive collector(s) are located at outdoor site(s) and *(Number)* positive collectors are located at indoor sites. *(Jurisdiction)* has had *(Number)* previous BARs for *(Agent[s])* in *(Year[s])*. The most recent BAR was for *(Agent)* in *(Year)*.

3.1: LABORATORY SUMMARY

We will now discuss key findings regarding laboratory and field data. *If the DST is being used, the BWNCC Facilitator will ask the JC/jurisdiction if there are any Laboratory Operations resources (BAR Data Form, Laboratory Results Summary Sheet etc.) available on HSIN.*

It is our understanding that a Technical Laboratory Consultation Call *(did/did not)* occur. Is that correct?

- ❒ What is the range for the Ct values detected?
- ❒ Has the laboratory processed any other samples (i.e., QA samples) in the past week in which this agent was tested for or results were generated for?
- ❒ Did any work with *(Agent)* recently occur in the laboratory space where BioWatch samples are processed?
- ❒ Did any other collector filters under analysis generate reactive results not meeting the algorithm in the screening or verification panels for *(Agent)*?

3.2 FIELD SUMMARY

The *(Jurisdiction)*'s array consists of *(Number)* of collectors with *(Number)* outdoor collectors and *(Number)* indoor collectors. Is that correct? *If DST is being used, the BWNCC Facilitator will ask the JC/jurisdiction if there are any Field Operations resources available (maps, etc.) on HSIN.*

- ❒ What was the sampling period for the collector(s) that reported the BAR?
- ❒ Can you briefly describe approximately where each collector that tested positive is located and provide us with a general understanding of the area?
- ❒ Did your team report any unusual activity around these collector(s)?

AMERICAN OVERSIGHT

- ❒ Did the collector(s) have any mechanical problems that may have compromised sampling capacity?
- ❒ What were the weather conditions during the sampling period?
- ❒ What are the weather conditions today?
- ❒ Do you have any other relevant environmental information to share?
- ❒ Are there any questions or comments from the jurisdictional or federal partners regarding this information?

3.3: LAW ENFORCEMENT AND INTELLIGENCE SUMMARY

LOCAL LAW ENFORCEMENT AND INTELLIGENCE

We will now discuss key local law enforcement findings and intelligence findings. *If DST is being used, the BWNCC Facilitator will ask the JC/jurisdiction if there are any Law Enforcement resources available on HSIN.*

- ❒ Are you aware of any credible threats to the jurisdiction or intelligence about potential threats?
- ❒ Have there been any recent applicable criminal or suspicious activities near or relevant to the area in question that you are free to discuss?
- ❒ Have there been any special events, large gatherings, VIP visits, etc.?
- ❒ Does the local Fusion Center have anything to add?
- ❒ Does the Local FBI WMD Coordinator have anything to add?
- ❒ Any other items for discussion?

FEDERAL LAW ENFORCEMENT AND INTELLIGENCE

We will now discuss key law enforcement and intelligence findings from federal representatives.

- ❒ Does FBI HQ have anything to add about their threat credibility evaluation at this stage?
- ❒ Does DHS Intelligence and Analysis have any information to share?
- ❒ Does the DHS National Operations Center have any information to share?
- ❒ Are there any questions or additional comments from the jurisdictional or federal partners regarding the law enforcement and intelligence information provided?

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-004815

LAW ENFORCEMENT ASSESSMENT

Based on the available information:

- ❒ Do current conditions warrant a law enforcement investigation for the possibility of an intentional release?

  If Yes:

  - ❒ Has the jurisdiction already begun a law enforcement investigation? What current steps are being taken?
  - ❒ Do any other state, local, and federal participants have additional perspectives to add?

3.4: PUBLIC HEALTH SUMMARY

LOCAL HUMAN AND ANIMAL HEALTH – FACILITATED BY THE JC

We will now discuss key human and animal health surveillance data from local representatives. I will turn this portion over to the JC. *If DST is being used, the BWNCC Facilitator will ask the JC/jurisdiction to describe any public health resources available on HSIN.*

- ❒ Has there been any recent *human* health surveillance data that could be related to the disease caused by (*Agent*)?
- ❒ Has there been any recent *animal* health surveillance data that could be related to the disease caused by (*Agent*)?
- ❒ Is there any other relevant public health information for discussion?

FEDERAL HUMAN AND ANIMAL HEALTH

We will now discuss key findings from the federal representatives regarding human and animal health surveillance data.

- ❒ Does HHS/CDC have anything to add?
- ❒ Does HHS/ASPR have anything to add?
- ❒ Does the DHS NBIC have anything to add?

QUESTIONS AND OTHER INFORMATION

- ❒ Is there any other agency on the call with public health information to share?

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-004816

- ❒ Are there any questions or additional comments from the jurisdictional or federal partners regarding the public health and veterinary surveillance data provided?

PUBLIC HEALTH ASSESSMENT

Based on the public health information available:

- ❒ Does a public health risk exist based on this BWNCC discussion?

  If Yes:

  - ❒ Has the jurisdiction already taken public health response actions?

    If Yes: What current actions are being taken?

- ❒ Do the circumstances of the incident warrant a public health investigation?

  If Yes:

  - ❒ Has the jurisdiction already begun a public health investigation?

    If Yes:

    - ❒ What current actions are being taken?
    - ❒ Do the circumstances of the incident warrant additional public health response beyond an investigation?

SECTION 4. JURISDICTIONAL NEXT STEPS

The questions in this section are open for group discussion. If BWNCC participants are not sharing feedback to the questions, the BWNCC Facilitator may have to call on agencies/individuals.

IF THERE IS **NO** PUBLIC HEALTH OR LAW ENFORCEMENT THREAT/INVESTIGATION

We will now discuss the jurisdiction's next steps based on the assessment of the situation. Please note that it may be deemed appropriate to take no further action in response to this BAR.

- ❒ Given the current situational assessment, will the jurisdiction take any additional actions that we have not yet discussed?

  If Yes:

  - ❒ What actions will be taken?

IF THERE **IS** A PUBLIC HEATH OR LAW ENFORCEMENT THREAT/INVESTIGATION

We will now discuss the jurisdiction's next steps. These may include emergency management operations, risk communication activities, public health operations, and briefings to elected officials. Conversely, it may be deemed appropriate to take no further action in response to this

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-004817

BAR. Given the current situational assessment, (*JC/Jurisdiction Facilitator*) please highlight your jurisdiction's next steps.

The BWNCC Facilitator may prompt discussion if no actions are identified. Some actions the jurisdiction may decide to take include the following:

- *No action*
- *BioWatch-specific actions*
  - *Change filter retrieval frequencies*
  - *Modify the collector array (e.g., additional collectors)*
  - *Activate Phase I/II sampling*
- *Emergency Management Operations*
  - *Transition to response framework to include emergency declaration*
  - *Requests for Federal assistance (e.g., expecting to request Federal assistance, in the process of requesting federal assistance, etc.)*
  - *Activate and staff local Emergency Operations Center*
- *Risk Communication Activities*
  - *Risk Communication Conference Call*
  - *Media and/or public inquiries*
  - *Press releases*
- *Public Health Operations*
  - *Enhanced passive surveillance*
  - *Active surveillance*
  - *Continued syndromic surveillance*
  - *Joint public health/law enforcement investigation of agent-related disease*
  - *Strategic National Stockpile (SNS) action (e.g., considering/requested SNS)*
  - *Points of Distribution (PODs) actions (e.g., considering/activated PODs)*
- *Communications with elected officials*
  - *Briefings made or planned to be made to elected political leadership*

SECTION 5. REQUEST FOR RESOURCES

Given the situational assessment, does the jurisdiction wish to receive or continue to receive the following BioWatch Program-managed resources?

- ❒ Rapidly Deployable Laboratory (RDL) (or elements of) consumables, reagents, or surge laboratory staff
- ❒ Environmental sampling supplies
- ❒ DHS/CWMD Public Affairs risk communication / messaging support

AMERICAN OVERSIGHT

If resources are requested:

The BioWatch Program will coordinate the delivery of the BioWatch resources as well as any on-site control or access issues through the Jurisdictional Coordinator following this conference call.

SECTION 6. FEDERAL AGENCY ACTIONS

We will now highlight next steps from our federal agencies. I will call you by agency for your response.

Federal Agencies (*BWNCC Facilitator will call on participating components, directorates and offices based on the roll call*)**:**

- ❒ DHS NBIC
- ❒ DHS I&A
- ❒ DHS Public Affairs
- ❒ CWMD Public Affairs
- ❒ HHS / ASPR
- ❒ HHS / CDC
- ❒ EPA
- ❒ FBI WMD Directorate
- ❒ Department of Defense (DoD) / USNORTHCOM
- ❒ Others – Do any other federal representatives on the call have next steps to report?

SECTION 7. CLOSING THE CALL

Are there any additional comments at this time before we close this conference call?

Is there need for another BWNCC? *If DST was used, the BWNCC Facilitator will ask if it will be used again on any subsequent BWNCCs.*

If Needed: The date and time for the next BioWatch National Conference Call will be at: *(Date/Time)* and the phone number is 1-855-852-7677; the access code is 498-9534.

Thank you everyone for your contributions to this BioWatch National Conference Call. The time is now (*Time Eastern*) and this call is adjourned.

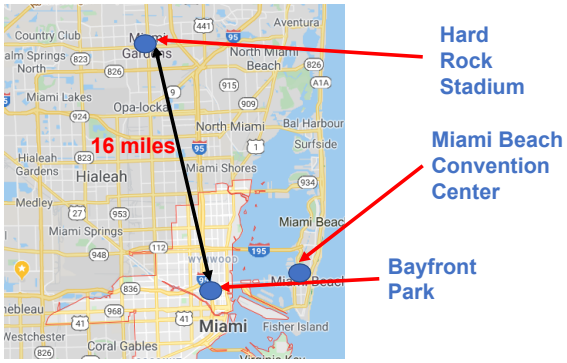
The BioWatch Target Organisms

Biological Agent	Disease
Bacillus anthracis	**Anthrax**
Francisella tularensis	**Tularemia**
Yersinia pestis	**Plague**
Burkholderia mallei/ B. pseudomallei	**Glanders/Melioidosis**
Variola virus	**Smallpox**

FOUO

[THIS SLIDE IS FOUO]



Talking Points

- The BioWatch program currently monitors the air for the 5 biological agents: *Bacillus anthracis, Francisella tularensis, Yersinia pestis, Burkholderia* species and Variola virus.
- As shown, this list includes some agents that are rarely seen or have been eradicated in the United States as well as some agents that exist naturally in our environment.
- Four of the BioWatch agents are Category A agents. These are: *B. anthracis*, *Y. pestis*, *F. tularensis*, and Variola virus.
- According to the CDC, Category A bioterrorism agents pose a risk to national security because they: Can be easily disseminated or transmitted from person to person, result in high death rates and have the potential for major public health impact, might cause public panic and social disruption and require special action for public health preparedness.
- The BioWatch agents categorized as Category B agents, the second highest priority agents, are the *Burkholderia* species *Burkholderia mallei* and *B. pseudomallei*. These agents are moderately easy to disseminate, result in moderate death rates and low illness and injury rates.

- COVID-19 outbreak
- Transmission and symptoms
- Prevention
- Treatment and testing
- Travel advisories
- Public health monitoring
- Influenza

2

AMERICAN OVERSIGHT

COVID-19 OUTBREAK

AMERICAN OVERSIGHT

Number of Confirmed Cases as of 4:30PM on March 10, 2020

More public health laboratories can test for the virus that causes COVID-19, and they are reporting their results publicly. Because states are reporting publicly directly, sometimes in near real-time, CDC case counts may be different from what states, local authorities, or media are reporting

- **Worldwide**
  - 121,564 confirmed cases
  - 4,373 deaths

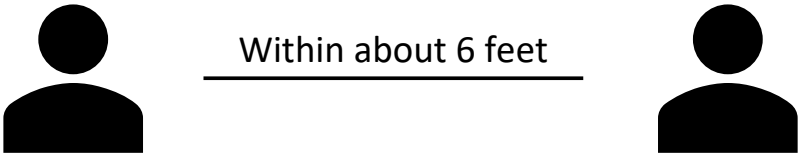
  Last updated at 1:55 PM on 3/11/2020; John Hopkins CSSE GIS map
- **U.S**
  - 1,000 positive cases and 70 positive repatriated cases (46 cases from Diamond Princess; 21 cases from Grand Princess; and 3 cases from Wuhan, China)
  - 31 deaths

  Last updated at ~1:55PM on 3/11/2020; CNN
- **Florida**
  - 28 positive cases (21 Florida residents; 5 repatriated; 2 non-Florida resident)
  - 2 deaths

  Last updated 2:00 PM on 3/11/2020; FL DOH

Florida HEALTH

4



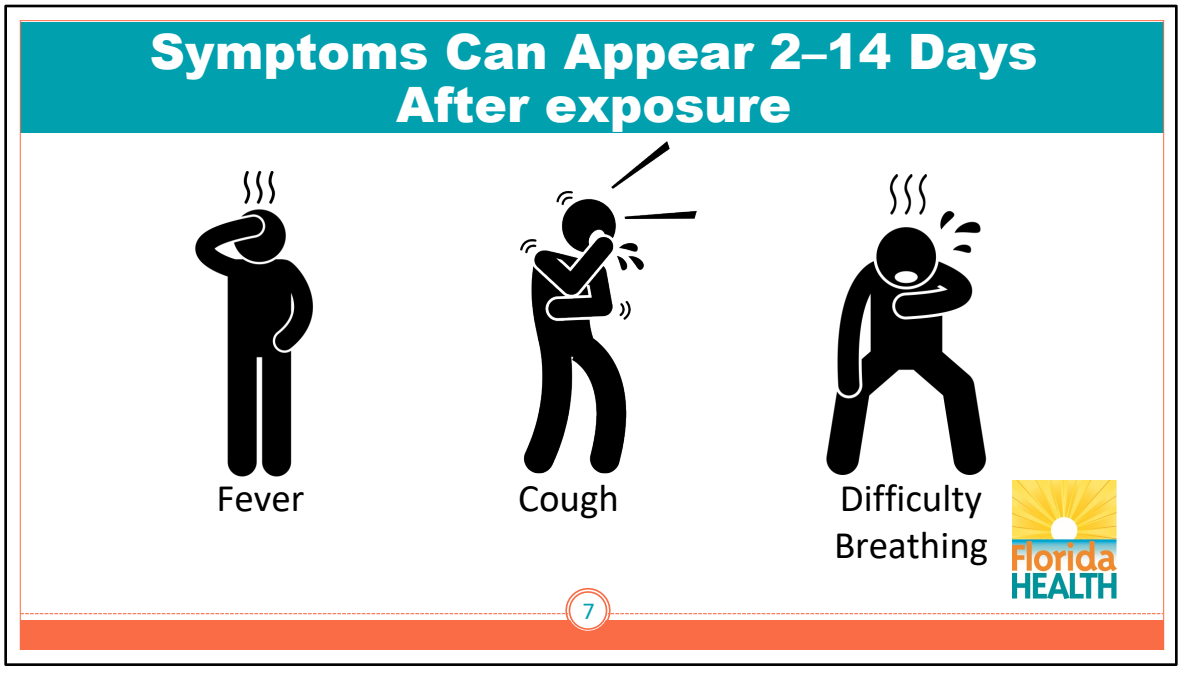
AMERICAN OVERSIGHT

TRANSMISSION AND SYMPTOMS

AMERICAN OVERSIGHT

COVID-19 Most Often Spreads from Person to Person

- Spread through respiratory droplets from an infected person who coughs or sneezes
- Spread among close contacts

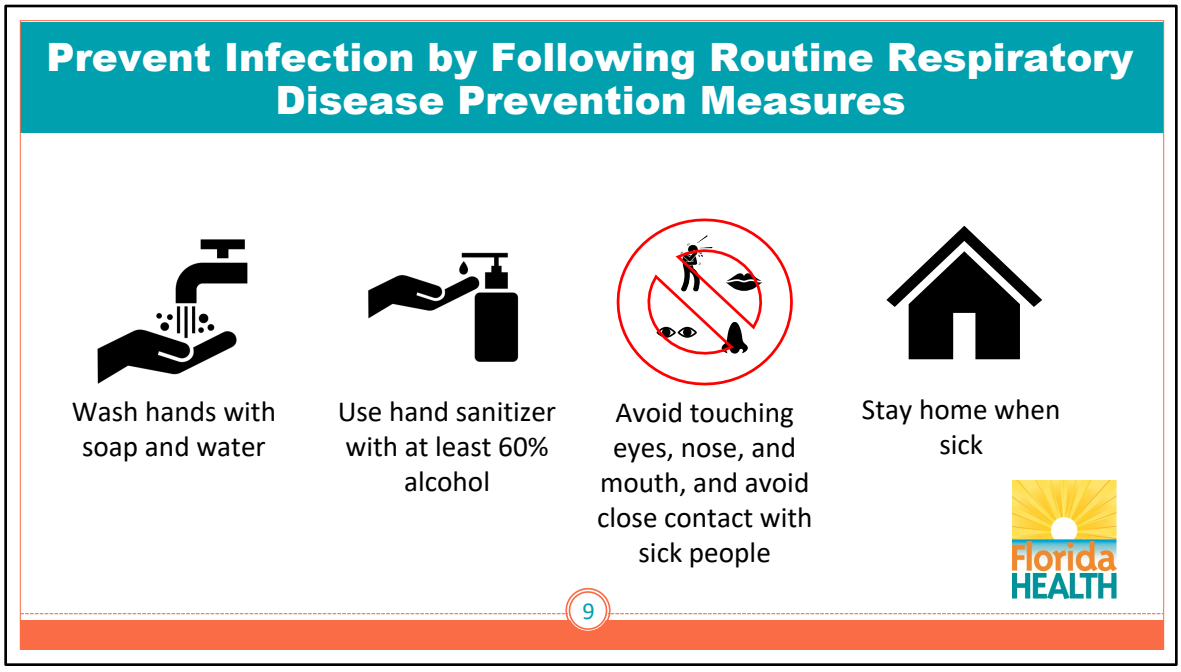


6

Most often, spread from person-to-person happens among close contacts (about 6 feet). Person-to-person spread is thought to occur mainly by respiratory droplets produced when an infected person coughs or sneezes, similar to how influenza and other respiratory pathogens spread. These droplets can land in the mouths or noses of people who are nearby or possibly be inhaled into the lungs. It's currently unclear if a person can get 2019-nCoV by touching a surface or object that has the virus on it and then touching their own mouth, nose, or possibly their eyes.

With most respiratory viruses, people are expected to be most contagious while they have symptoms.

AMERICAN OVERSIGHT



Symptoms may be mild to severe and may appear 2-14 days after exposure.

AMERICAN OVERSIGHT

PREVENTION

AMERICAN OVERSIGHT

There is currently no vaccine to prevent 2019-nCoV infection. The best way to prevent infection is to avoid being exposed to this virus. CDC & DOH always recommend these actions to help prevent the spread of respiratory viruses, including:

- Wash your hands often with soap and water for at least 20 seconds, especially after going to the bathroom; before eating; and after blowing your nose, coughing, or sneezing.
- If soap and water are not readily available, use an alcohol-based hand sanitizer with at least 60% alcohol. Always wash hands with soap and water if hands are visibly dirty.
- Avoid touching your eyes, nose, and mouth with unwashed hands.
- Avoid close contact with people who are sick.
- Stay home when you are sick.
- Cover your cough or sneeze with a tissue, then throw the tissue in the trash.
- Clean and disinfect frequently touched objects and surfaces using a regular household cleaning spray or wipe

AMERICAN OVERSIGHT

People at risk and have symptoms of fever, cough or difficulty breathing, please take these steps:

- Call ahead to your health care provider and tell them about your travel or exposure and your symptoms.
- Avoid contact with others.
- Do not travel while sick.
- Cover your mouth and nose when coughing or sneezing.
- Wash hands often with soap and water for at least 20 seconds, especially after coughing, sneezing or blowing your nose.
- A medical mask is not required if exhibiting no symptoms
  - If masks are to be worn, it is critical to follow best practices on how to wear, remove and dispose of them and on hand hygiene after removal.

Florida HEALTH

10

AMERICAN OVERSIGHT

Suspected or Confirmed COVID-19 Cases are Asked to Take Precautions

- Immediately isolate at home or health care facility.
- Do not participate public activities such as work or school.
- Only travel by ambulance or private car and avoid public transportation.
- Always wear a mask when around other people or pets at home.
- Always cover your coughs and sneezes and clean your hands often.

www.cdc.gov/coronavirus/index.html

AMERICAN OVERSIGHT

TREATMENT AND TESTING

AMERICAN OVERSIGHT

There is No Specific Treatment for COVID-19 at This Time

The CDC recommends people who think they may have been exposed to COVID-19 should call their county health department immediately and self-isolate.

13

There is no specific antiviral treatment recommended for 2019-nCoV infection. People infected with 2019-nCoV should receive supportive care to help relieve symptoms. For severe cases, treatment should include care to support vital organ functions.

AMERICAN OVERSIGHT

Testing is Only Available through Public Health Currently

- The CDC developed a test for COVID-19.
- The DOH Bureau of Public Health Laboratories are testing with CDC's test kits.
- Some commercial labs can test for COVID-19

AMERICAN OVERSIGHT

TRAVEL ADVISORIES

AMERICAN OVERSIGHT

COVID-19 Travel Updates

- It is recommended that older adults and those who have chronic medical conditions consider postponing travel to places with sustained community transmission.
- General recommendations for personal hygiene, cough etiquette and keeping a distance of at least six feet from persons showing symptoms remain particularly important for all travelers.
- Level 3 travelers: FL DOH recommends travelers to self-isolation for 14 days and practice social distancing upon return to the United States.
- Level 2 travelers and cruises: FL DOH recommends that travelers should monitor their health and limit interactions with others for 14 days after returning to the United States.
- Nile Cruise Advisory: FL DOH is advising all individuals who traveled on a river cruise on the Nile River in Egypt in February 2020 to self-isolate for 14 days following their date of return to the United States.

Florida HEALTH

16

important for travelers who are sick to delay or avoid travel or if travelers are immunocompromised avoid travel to affected areas

AMERICAN OVERSIGHT

CDC Travel Advisories

To countries with sustained community or wide spread transmission.

As of March 2, 2020:

- China
- Iran
- South Korea
- Italy
- Japan

https://www.cdc.gov/coronavirus/2019-ncov/travelers/index.html

Please monitor the CDC's website for updated travel advisories

AMERICAN OVERSIGHT

PUBLIC HEALTH MONITORING

AMERICAN OVERSIGHT

DOH is Monitoring those Possibly Exposed

- Personnel at the agency's 67 county health departments (CHDs) and central office in Tallahassee are working together to protect Floridians from emerging diseases.
- DOH receives information from CDC on U.S. citizens/residents/family returning from impacted areas.
- CHDs work with travelers to restrict their movement, monitor for illness, isolate persons with symptoms, and ensure health care providers use proper infection control techniques.

AMERICAN OVERSIGHT

DOH Monitoring Process

For people who may have been exposed, but do not have symptoms:

- Monitor for symptoms for 14 days.
- Self isolate for 14 days.
  - Stay home as much as possible.
  - Avoid travel on publicly used vehicles, gathering with groups of people, and going out in public.
  - Excluded from work, school, and other public places.
- Follow provided education on prevention of spread.

Florida HEALTH

AMERICAN OVERSIGHT

Immediate Risk to Americans Remains Low

- More cases in the U.S. are likely to be identified in the coming days.
- There is currently limited person-to-person spread in the community, but this may change.
- Everyone can do their part to prevent the spread of COVID-19 and other respiratory viruses.

AMERICAN OVERSIGHT

BioWatch National Conference Call (BWNCC) Framework

PURPOSE

The purpose of the BioWatch National Conference Call (BWNCC) is for information sharing and situational assessment following a BioWatch Actionable Result (BAR) in order to develop a common operating picture. This framework guides that discussion.

FORMAT AND USE

- The items in each section provide an outline for discussion. They should not be regarded as discussion requirements or limitations.
- The BWNCC Framework can be used with one or multiple jurisdictions.
- Throughout the BWNCC Framework, information presented as *(blue, italicized, and in parentheses)* denotes areas where a speaker will provide situation-specific information. If you may be a speaker during the BWNCC, you are encouraged to review the BWNCC Framework section(s) during which you might speak and be prepared to provide situation-specific information.
- The BWNCC Framework includes several questions the BWNCC Facilitator may ask participants. The BWNCC Facilitator may ask additional questions or omit questions based on the scope of the incident.
- For additional information on the content discussed in each BWNCC Framework section, reference the *BioWatch National Conference Call (BWNCC) Framework Overview*, which is available on the BioWatch Toolbox.

SECTION 1. INTRODUCTION

Hello everyone and welcome to this BioWatch National Conference Call. The current time is *(Time Eastern)*. To limit background noise and feedback, please mute your phone now and remember to unmute before you speak.

My name is *(Name)*, I am the *(Title)*, of the BioWatch Program, Countering Weapons of Mass Destruction Office, Department of Homeland Security. I am the facilitator of this call. Information

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-004862

discussed on this call is sensitive to United States national security. Parties who are not affiliated with this subject matter must leave now.

The BWNCC Facilitator will pause to allow people to leave

The purpose of this call is for information sharing and situational assessment following a BioWatch Actionable Result (BAR) in order to develop a common operating picture. Participants in the BWNCC are federal, state, and local government subject matter experts from a multitude of disciplines and emergency support functions.

This call does not constitute a formal declaration of emergency by the local, state, or federal government nor is it a forum to request federal emergency response resources. However, BioWatch specific resources are available and will be addressed later in this call. The jurisdiction has chosen to *(use/not use)* the decision support tool (DST).

If the jurisdiction is using the DST, the BWNCC Facilitator will ask the jurisdictional coordinator to provide the HSIN link here and ask who will be running the DST.

Please mute your phone now and remember to unmute before you speak.

SECTION 2. ROLL CALL

If more than one BioWatch jurisdiction is participating on the BWNCC, the BWNCC Facilitator will specify the order in which each will present their information.

We will begin the roll call with state and local representatives, including locally deployed federal representatives in the field offices. The Jurisdictional Coordinator will conduct the local roll call and I will follow with the roll call for federal representatives at national headquarters.

Please identify yourself by name and agency. In the interest of time, please identify a single representative to speak on behalf of each agency.

I will now turn it over to the JC.

JURISDICTIONAL ROLL CALL – FACILITATED BY THE JURISDICTIONAL COORDINATOR:

Jurisdictional Coordinator: Roll call for state and local officials, including Federal Partners at Local Field Offices:

- ❒ Public Health (ESF #6 and ESF #8)
- ❒ Emergency Management (ESF #5)
- ❒ Law Enforcement / Intelligence (ESF #13)
- ❒ BioWatch Laboratory

AMERICAN OVERSIGHT

- ❒ Field Operations
- ❒ Veterinarian (ESF #8 and ESF #11)
- ❒ Hazardous Materials / Environmental Sampling (ESF #10)
- ❒ Public Affairs / External Affairs (ESF #15)
- ❒ FBI Weapons of Mass Destruction (WMD) Coordinators
- ❒ EPA On-Scene Coordinators (OSCs)
- ❒ Military Installation(s)
- ❒ For any other agencies not previously identified representing the jurisdiction - please identify your speaking representatives now.

FEDERAL HEADQUARTERS ROLL CALL – FACILITATED BY THE BWNCC FACILITATOR:

BWNCC Facilitator: We have completed the state and local roll call; I will now conduct the Federal Headquarters roll call.

- ❒ National Operations Center (NOC)
- ❒ BioWatch Program
- ❒ DHS National Biosurveillance Integration Center (NBIC)
- ❒ DHS Intelligence and Analysis (I&A)
- ❒ DHS Public Affairs
- ❒ CWMD Public Affairs
- ❒ HHS / Assistant Secretary for Preparedness and Response (ASPR)
- ❒ HHS / Centers for Disease Control and Prevention (CDC)
- ❒ EPA Office of Emergency Management (OEM)
- ❒ FBI WMD Directorate (Operations Response Unit and Biological Countermeasures Unit)
- ❒ Department of Defense (DoD) Office of the Secretary of Defense / USNORTHCOM
- ❒ For any other agencies not previously identify - please identify your speaking representatives now

AMERICAN OVERSIGHT

SECTION 3. JURISDICTIONAL BRIEF

If applicable, the BWNCC Facilitator should share information on any recent BARs for the same agent and any other critical information that will help BWNCC participants develop a common operating picture.

Thank you everyone. We are here today to discuss a BAR declared by the *(Jurisdiction)* jurisdiction. There *(was/were) (Number of collectors)* collector(s) that tested positive for *(Agent)*. *(Number)* positive collector(s) are located at outdoor site(s) and *(Number)* positive collectors are located at indoor sites. *(Jurisdiction)* has had *(Number)* previous BARs for *(Agent[s])* in *(Year[s])*. The most recent BAR was for *(Agent)* in *(Year)*.

3.1: LABORATORY SUMMARY

We will now discuss key findings regarding laboratory and field data. *If the DST is being used, the BWNCC Facilitator will ask the JC/jurisdiction if there are any Laboratory Operations resources (BAR Data Form, Laboratory Results Summary Sheet etc.) available on HSIN.*

It is our understanding that a Technical Laboratory Consultation Call *(did/did not)* occur. Is that correct?

- ❒ What is the range for the Ct values detected?
- ❒ Has the laboratory processed any other samples (i.e., QA samples) in the past week in which this agent was tested for or results were generated for?
- ❒ Did any work with *(Agent)* recently occur in the laboratory space where BioWatch samples are processed?
- ❒ Did any other collector filters under analysis generate reactive results not meeting the algorithm in the screening or verification panels for *(Agent)*?

3.2 FIELD SUMMARY

The *(Jurisdiction)*'s array consists of *(Number)* of collectors with *(Number)* outdoor collectors and *(Number)* indoor collectors. Is that correct? *If DST is being used, the BWNCC Facilitator will ask the JC/jurisdiction if there are any Field Operations resources available (maps, etc.) on HSIN.*

- ❒ What was the sampling period for the collector(s) that reported the BAR?
- ❒ Can you briefly describe approximately where each collector that tested positive is located and provide us with a general understanding of the area?
- ❒ Did your team report any unusual activity around these collector(s)?

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-004865

- ❒ Did the collector(s) have any mechanical problems that may have compromised sampling capacity?
- ❒ What were the weather conditions during the sampling period?
- ❒ What are the weather conditions today?
- ❒ Do you have any other relevant environmental information to share?
- ❒ Are there any questions or comments from the jurisdictional or federal partners regarding this information?

3.3: LAW ENFORCEMENT AND INTELLIGENCE SUMMARY

LOCAL LAW ENFORCEMENT AND INTELLIGENCE

We will now discuss key local law enforcement findings and intelligence findings. *If DST is being used, the BWNCC Facilitator will ask the JC/jurisdiction if there are any Law Enforcement resources available on HSIN.*

- ❒ Are you aware of any credible threats to the jurisdiction or intelligence about potential threats?
- ❒ Have there been any recent applicable criminal or suspicious activities near or relevant to the area in question that you are free to discuss?
- ❒ Have there been any special events, large gatherings, VIP visits, etc.?
- ❒ Does the local Fusion Center have anything to add?
- ❒ Does the Local FBI WMD Coordinator have anything to add?
- ❒ Any other items for discussion?

FEDERAL LAW ENFORCEMENT AND INTELLIGENCE

We will now discuss key law enforcement and intelligence findings from federal representatives.

- ❒ Does FBI HQ have anything to add about their threat credibility evaluation at this stage?
- ❒ Does DHS Intelligence and Analysis have any information to share?
- ❒ Does the DHS National Operations Center have any information to share?
- ❒ Are there any questions or additional comments from the jurisdictional or federal partners regarding the law enforcement and intelligence information provided?

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-004866

LAW ENFORCEMENT ASSESSMENT

Based on the available information:

- ❒ Do current conditions warrant a law enforcement investigation for the possibility of an intentional release?

  If Yes:

  - ❒ Has the jurisdiction already begun a law enforcement investigation? What current steps are being taken?
  - ❒ Do any other state, local, and federal participants have additional perspectives to add?

3.4: PUBLIC HEALTH SUMMARY

LOCAL HUMAN AND ANIMAL HEALTH – FACILITATED BY THE JC

We will now discuss key human and animal health surveillance data from local representatives. I will turn this portion over to the JC. *If DST is being used, the BWNCC Facilitator will ask the JC/jurisdiction to describe any public health resources available on HSIN.*

- ❒ Has there been any recent *human* health surveillance data that could be related to the disease caused by (*Agent*)?
- ❒ Has there been any recent *animal* health surveillance data that could be related to the disease caused by (*Agent*)?
- ❒ Is there any other relevant public health information for discussion?

FEDERAL HUMAN AND ANIMAL HEALTH

We will now discuss key findings from the federal representatives regarding human and animal health surveillance data.

- ❒ Does HHS/CDC have anything to add?
- ❒ Does HHS/ASPR have anything to add?
- ❒ Does the DHS NBIC have anything to add?

QUESTIONS AND OTHER INFORMATION

- ❒ Is there any other agency on the call with public health information to share?

AMERICAN OVERSIGHT

- ❒ Are there any questions or additional comments from the jurisdictional or federal partners regarding the public health and veterinary surveillance data provided?

PUBLIC HEALTH ASSESSMENT

Based on the public health information available:

- ❒ Does a public health risk exist based on this BWNCC discussion?

  If Yes:

  - ❒ Has the jurisdiction already taken public health response actions?

    If Yes: What current actions are being taken?

- ❒ Do the circumstances of the incident warrant a public health investigation?

  If Yes:

  - ❒ Has the jurisdiction already begun a public health investigation?

    If Yes:

    - ❒ What current actions are being taken?
    - ❒ Do the circumstances of the incident warrant additional public health response beyond an investigation?

SECTION 4. JURISDICTIONAL NEXT STEPS

The questions in this section are open for group discussion. If BWNCC participants are not sharing feedback to the questions, the BWNCC Facilitator may have to call on agencies/individuals.

IF THERE IS **NO** PUBLIC HEALTH OR LAW ENFORCEMENT THREAT/INVESTIGATION

We will now discuss the jurisdiction's next steps based on the assessment of the situation. Please note that it may be deemed appropriate to take no further action in response to this BAR.

- ❒ Given the current situational assessment, will the jurisdiction take any additional actions that we have not yet discussed?

  If Yes:

  - ❒ What actions will be taken?

IF THERE **IS** A PUBLIC HEATH OR LAW ENFORCEMENT THREAT/INVESTIGATION

We will now discuss the jurisdiction's next steps. These may include emergency management operations, risk communication activities, public health operations, and briefings to elected officials. Conversely, it may be deemed appropriate to take no further action in response to this

AMERICAN OVERSIGHT

BAR. Given the current situational assessment, (*JC/Jurisdiction Facilitator*) please highlight your jurisdiction's next steps.

The BWNCC Facilitator may prompt discussion if no actions are identified. Some actions the jurisdiction may decide to take include the following:

- *No action*
- *BioWatch-specific actions*
  - *Change filter retrieval frequencies*
  - *Modify the collector array (e.g., additional collectors)*
  - *Activate Phase I/II sampling*
- *Emergency Management Operations*
  - *Transition to response framework to include emergency declaration*
  - *Requests for Federal assistance (e.g., expecting to request Federal assistance, in the process of requesting federal assistance, etc.)*
  - *Activate and staff local Emergency Operations Center*
- *Risk Communication Activities*
  - *Risk Communication Conference Call*
  - *Media and/or public inquiries*
  - *Press releases*
- *Public Health Operations*
  - *Enhanced passive surveillance*
  - *Active surveillance*
  - *Continued syndromic surveillance*
  - *Joint public health/law enforcement investigation of agent-related disease*
  - *Strategic National Stockpile (SNS) action (e.g., considering/requested SNS)*
  - *Points of Distribution (PODs) actions (e.g., considering/activated PODs)*
- *Communications with elected officials*
  - *Briefings made or planned to be made to elected political leadership*

SECTION 5. REQUEST FOR RESOURCES

Given the situational assessment, does the jurisdiction wish to receive or continue to receive the following BioWatch Program-managed resources?

- ❒ Rapidly Deployable Laboratory (RDL) (or elements of) consumables, reagents, or surge laboratory staff
- ❒ Environmental sampling supplies
- ❒ DHS/CWMD Public Affairs risk communication / messaging support

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-004869

If resources are requested:

The BioWatch Program will coordinate the delivery of the BioWatch resources as well as any on-site control or access issues through the Jurisdictional Coordinator following this conference call.

SECTION 6. FEDERAL AGENCY ACTIONS

We will now highlight next steps from our federal agencies. I will call you by agency for your response.

Federal Agencies (*BWNCC Facilitator will call on participating components, directorates and offices based on the roll call*)**:**

- ❒ DHS NBIC
- ❒ DHS I&A
- ❒ DHS Public Affairs
- ❒ CWMD Public Affairs
- ❒ HHS / ASPR
- ❒ HHS / CDC
- ❒ EPA
- ❒ FBI WMD Directorate
- ❒ Department of Defense (DoD) / USNORTHCOM
- ❒ Others – Do any other federal representatives on the call have next steps to report?

SECTION 7. CLOSING THE CALL

Are there any additional comments at this time before we close this conference call?

Is there need for another BWNCC? *If DST was used, the BWNCC Facilitator will ask if it will be used again on any subsequent BWNCCs.*

If Needed: The date and time for the next BioWatch National Conference Call will be at: *(Date/Time)* and the phone number is 1-855-852-7677; the access code is 498-9534.

Thank you everyone for your contributions to this BioWatch National Conference Call. The time is now (*Time Eastern*) and this call is adjourned.

AMERICAN OVERSIGHT

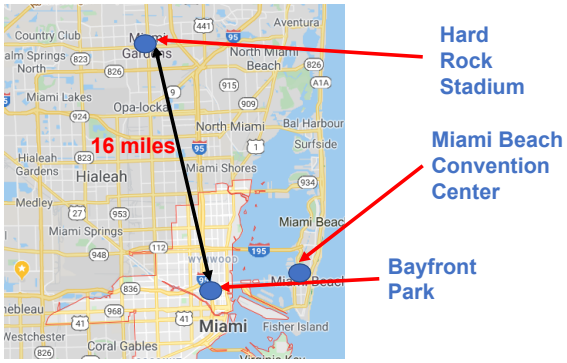
The BioWatch Target Organisms

Biological Agent	Disease
Bacillus anthracis	**Anthrax**
Francisella tularensis	**Tularemia**
Yersinia pestis	**Plague**
Burkholderia mallei/ B. pseudomallei	**Glanders/Melioidosis**
Variola virus	**Smallpox**

FOUO

[THIS SLIDE IS FOUO]



Talking Points

- The BioWatch program currently monitors the air for the 5 biological agents: *Bacillus anthracis, Francisella tularensis, Yersinia pestis, Burkholderia* species and Variola virus.
- As shown, this list includes some agents that are rarely seen or have been eradicated in the United States as well as some agents that exist naturally in our environment.
- Four of the BioWatch agents are Category A agents. These are: *B. anthracis*, *Y. pestis*, *F. tularensis*, and Variola virus.
- According to the CDC, Category A bioterrorism agents pose a risk to national security because they: Can be easily disseminated or transmitted from person to person, result in high death rates and have the potential for major public health impact, might cause public panic and social disruption and require special action for public health preparedness.
- The BioWatch agents categorized as Category B agents, the second highest priority agents, are the *Burkholderia* species *Burkholderia mallei* and *B. pseudomallei*. These agents are moderately easy to disseminate, result in moderate death rates and low illness and injury rates.

Hi Tim, The good news is you are coming right at the best time. Expect to be plugged into the Coronavirus response from day one. The bad news is that tomorrow morning will likely be a tad chaotic. We may have our two first cases confirmed tomorrow and we have just declared an emergency. I have a meeting between 830-9 am. It may drag out a little. I will try to meet you at 8 and we will get your badge and computer etc set up started. Then we will all get together as soon as we have a chance. Hopefully shortly after 9. Just wanted to give you a heads up and wish you a warm welcome :). Carina

Subject:	MS MARINA - CDC/FDOH concurrence that this is not a COVID-19 concern
Date:	Saturday, March 21, 2020 2:00:08 PM

Kevin and Ashley:

Please see below the cut line for CDC review and recommendation.

Additionally, Nicole Kimbrel in ESF-8, advised verbally that FDOH concurs with CDC's interpretation/recommendation.

Unless requested, I will advise USCG that there is no need to coordinate a teleconference concerning the MS MARINA. Should the port wish to discuss, I will let you know.

Please let me know if you need further.

v/r,

CDR Fitzgerald
D7 LNO to the FL EOC

Hi Eli,
I have reached out to the ship physician to confirm all the information you sent me, discussed this case with our medical officer, and provided a situational update to Florida Department of Health (FDOH).

It looks like this ship has 3 passengers onboard who have tested positive for Influenza A and do not have known exposure to COVID-19 cases. There is no ILI outbreak onboard. I will follow up with the ship to instruct that these three passengers wear surgical masks while disembarking.

Given the information we have now, we do not have any additional concerns or public health recommendations regarding this vessel. Please let us know if you have any other questions or concerns.

Thank you and all the best,
Emily

Subject: MS Marina (Oceania)

Hi Joe – are you tracking the MS Marina (Oceania)? I'm tracking 653 Amcits on board, COVID(+) cases on ship, headed to Miami but no ports there open. This is going to be a problem soon. We're getting inquiries from the Australians and Andorrans. This is the latest I have:

18MAR: Indications that an Oceania cruise ship will be arriving at Port of Miami sometime next week with various COVID-19 positives on it. Consular Affairs from the Australian Embassy contacted to say they had been notified overnight that the MS Marina (Oceania) is returning to Miami from South America via the Panama Canal after it was denied docking by several countries. The latest advice the Embassy has is that it is passing through the Canal could take 5 or 6 days. Australian Embassy in Mexico and Honorary Consul in Panama are trying to assist at least 49 Australians on board - some of whom are starting to run short of medications etc. - but are having difficulty contacting the crew and Oceania's agents in Panama. CONS provided them with the contact for Norwegian cruise lines which is a parent company of Oceania. OFM indicates Port of Miami is not aware of the ship coming to Miami and questioned where it would even dock as all available ports are occupied. OFM in touch with Norwegian.

Subject:	NACDD Chronic Disease Directors Forum First Thursday Webinar

Dear Colleagues,

Update to our 3/5 webinar speaker line up: In addition to the speakers listed below, Dr. Karen Hacker and Dr. Peter Briss will be providing an update on coronavirus on the webinar this Thursday.

For our March 2020 webinar we are looking at leading to address upstream factors. We are excited to have the following speakers join us:

* Carol Hall Walker and Deborah Garneau (Rhode Island Department of Health) to discuss the Rhode Island Health Equity Measures.

* Shamarial Roberson (Florida) as our Chronic Disease Director respondent.

* Karla Sneegas from CDC's Office on Smoking and Health to share information on Tips 2020.

Please join us and bring your questions, comments, and experiences to share.

Register in advance for upcoming webinars with this link: https://chronicdisease.zoom.us/meeting/register/uJYvc-urpjwrOcPx6hOXeJ3eSfuM4yRpSA <https://chronicdisease.zoom.us/meeting/register/uJYvc-urpjwrOcPx6hOXeJ3eSfuM4yRpSA> . After registering, you will receive a confirmation email containing information about joining the meeting. Note that you will need to register each month.

Slides and webinar recordings are available here: https://www.chronicdisease.org/page/CDDF_First_Thursday.

For more information please contact Abby Lowe-Wilson at alwilson@chronicdisease.org <mailto:alwilson@chronicdisease.org> .

Division of Vital Statistics Newsletter — February 2020

-

Click here to view the full NVSS newsletter online

This month, we're focused on improvements. To begin, we will be proposing improvements to the next VSCP contract, and will be seeking your input. Please take a moment to read and find out how you can contribute your ideas. This issue also highlights our newest VSCP Special Project, Address Data for Geocoding, which is collecting data from every jurisdiction to improve our ability to calculate life expectancy and mortality at more local levels. You'll also find out how Iowa is improving data quality and timeliness through a new birth registration facility report card. Additionally, we connect you to upcoming NAPHSIS trainings that may be of interest, and to information on how jurisdictions can work with NCHS to test newly implemented data systems.

Whether it's by joining our projects, attending a training, or sharing your own ideas for the future, we encourage you to stay connected with us and be a part of making the National Vital Statistics System better.

Enjoy!
Steve

WORKOUT FROM HOME

Options for People with Disability and Chronic Health Conditions

It is especially important for people to stay active during this time. Exercise can help boost immunity and keep us in good physical and mental health. The National Center on Health, Physical Activity and Disability (NCHPAD) has curated a playlist of the top exercise from home videos on their YouTube channel for kids and adults. The playlist includes 32 options for all abilities to choose an exercise mode that works and is enjoyable to them. Example exercise videos include: inclusive yoga class, standing and seated cardio workouts, strength activities using household items, high intensity workouts and much more!

AMERICAN OVERSIGHT

From:	State and Local Readiness (CDC)
To:	State and Local Readiness (CDC)
Subject:	New CDC COVID-19 Check and Record Everyday (CARE) Booklet
Date:	Wednesday, February 26, 2020 8:09:25 AM
Attachments:	2019nCoV_CARE_EngChinese_Feb25.pdf
Importance:	High

Dear Colleagues:

Attached is CDC's new COVID-19 Check and Record Everyday (CARE) booklet. Here is what to know:

- **Who gets a CARE booklet? And when?** Every traveler referred by CBP from mainland China, whenever they get released during the screening process or the completion of secondary screening. This is the same process as the current T-HAN and Temperature and Symptom log. If the traveler is an unaccompanied minor, a booklet will be provided to the person in charge of picking them up at their final destination

- **What language is the booklet in?** English on one side and Simplified Chinese on the other for the print version. A Spanish version will be available online in the coming weeks.

- **When will CDC staff at quarantine stations start handing out the new booklet?** Distribution of the booklets will start by **Friday, February 28th.**

- **What is the role of CDC/QS staff?** The role of CDC/QS staff is to ensure every traveler referred from mainland China by CBP receives a CARE booklet in an envelope. Booklets are shipped pre-assembled in a labeled envelope.

- **What is the role of State and Local Health Departments?**Travelers are advised to connect with the State and Local Health Departments at their destination; these numbers are listed in the booklet.

- **How many CARE booklets will quarantine stations receive?**Each station will receive a different number of booklets every week based on the number of travelers entered in QARS the previous week. Because this is an estimate, we've added an additional 10% of booklets to each shipment.

- **What if the information in the booklet changes?**Information is quickly and frequently changing. If the CARE booklet changes, we will print and ship a new version of the booklet. The new version will have a different color on the outside label of the envelope containing the booklet. If this happens, quarantine stations will receive an email with the new information and outdated materials will be discarded. The first and current shipment contains ayellow outline on the label.

AMERICAN OVERSIGHT

- **Does the shipment contain thermometers and phones?**No, we will not be supplying thermometers or phones at this time.

- **Will the booklet be available online?** Yes, we plan on having an online version of the booklet available in the coming weeks.

Thank you,

State Coordination Task Force

Sent by BCC to State Health Officials, State Epidemiologists, PHEP Directors, and COVID-19 Primary/Secondary Contacts

COVID 19 CORONAVIRUS DISEASE

AMERICAN OVERSIGHT

FL-DOH-20-0673-A-004910

You have received this booklet of important health information because you traveled from the People's Republic of China. There is an ongoing outbreak of coronavirus disease 2019 (COVID-19) in China. COVID-19 is a respiratory illness caused by a virus that can spread from person to person.

If you have returned from Hubei Province within the last 14 days, you will be monitored by the public health department in your destination state. Monitoring will include agreements or legal orders such as a quarantine order.

Under these agreements or quarantine orders:

- You must stay at your home, or at a location chosen by your state or local health department or the U.S. government for a 14-day period from the time you left Hubei Province.
- Follow the directions in the quarantine order and the directions provided by your health department and the U.S. government.

If you have returned from China (other than Hubei Province), CDC strongly recommends you protect yourself and others by self-monitoring at home for 14 days from the time you left China. Take these steps to monitor your health:

1. Take your temperature with a thermometer two times a day and watch for cough or difficulty breathing (see instructions in this booklet).
2. Stay home from school.
3. Employees: Discuss your work situation with your employer before returning to work.
4. Do not take public transportation, taxis, or ride-shares.
5. Avoid crowded places (such as shopping centers and movie theaters) and limit your activities in public.
6. Keep your distance from others (about 6 feet or 2 meters).
7. If you get sick with fever, cough, or trouble breathing, follow instructions on page 3.
8. If you need to seek medical care for other reasons, such as dialysis, call ahead to your doctor and tell them about your recent travel to China.

Your health department may have specific instructions for you to follow that may be more restrictive than described above.

AMERICAN OVERSIGHT

FL-DOH-20-0673-A-004911

Connect with your health department upon return from travel (phone list included in this booklet). They will let you know:

- How you should report your health checks to the health department
- How often you should report your health checks
- Who to contact if you get sick with symptoms of fever, cough, or trouble breathing
- What else you should do if you develop symptoms
- Who to contact if you have questions

When you connect with the health department, ask them for the following contact information. Keep track of this important information by writing it below.

The contact information for staff at the health department is:

Name(s):

Phone Number:

After-hours phone number:

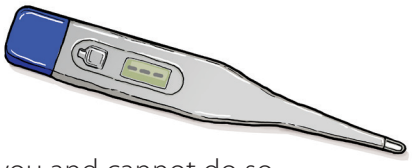
Email or website:

Other method:

Use the space below to write important information given to you.

How do I report my health checks?

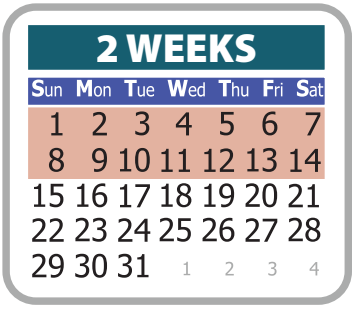
How often should I report my health checks?



If I get sick, what does the health department want me to do?

Who do I contact if I have additional questions?

AMERICAN OVERSIGHT



If you have been exposed to a person with COVID-19, it may take up to 14 days to know if you will get sick. It is important to check your health two times each day for 14 days after you leave China. Follow the steps below to check and record your health.

Step 1 Do health checks every morning and every night:

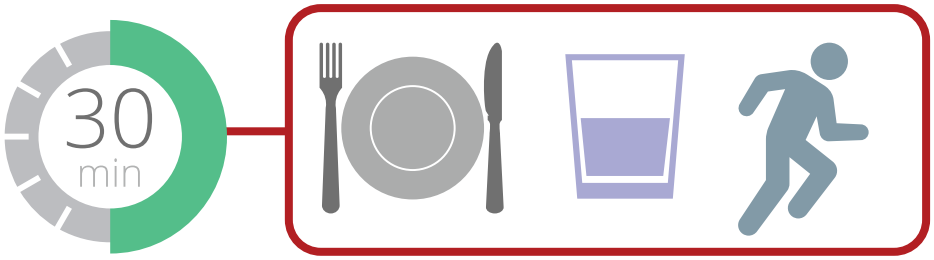
- Take your temperature and/or that of family members who traveled with you and cannot do so themselves.
- In addition to fever, be alert for any other symptoms of COVID-19, including cough or difficulty breathing.
- Write your temperature and any symptoms in the log included in this booklet.
- Write family members' temperatures and symptoms in their own booklets.

Family members who did not travel with you do not need to be monitored.

Step 2 If your health department asks you to report your temperature and any symptoms, follow their instructions.

Step 3 If you have fever (fever is 100.4°F/38°C or higher), cough, or trouble breathing:

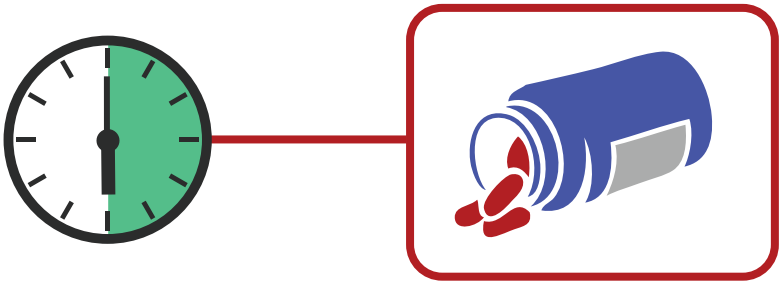
1. Do not go out in public.
2. Call the phone number listed for your health department in this booklet. Remind them that you are self-monitoring.
3. If you can't reach your health department, seek medical advice – call ahead before you go to a doctor's office or emergency room. Tell them about your recent travel, your symptoms, and guidance received from the health department.
4. Avoid contact with others.
5. Do not travel while sick.
6. Cover your mouth and nose with a tissue or your sleeve (not your hands) when coughing or sneezing.
7. Wash hands often with soap and water for at least 20 seconds to avoid spreading the virus to others.
8. Wash your hands with soap and water immediately after coughing, sneezing, or blowing your nose. If soap and water are not readily available, you can use an alcohol-based hand sanitizer that contains 60%-95% alcohol. Always wash hands with soap and water if hands are visibly dirty.



AMERICAN OVERSIGHT

FL-DOH-20-0673-A-004913

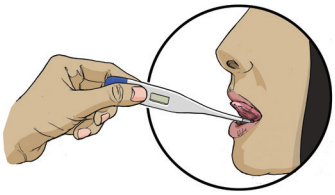
If you have a medical emergency, call 911. Tell them your symptoms and that you traveled from China.



Before you take your temperature:

Wait 30 minutes after eating, drinking, or exercising.

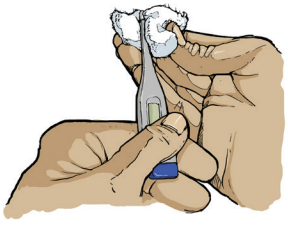
Wait at least 6 hours after taking medicines that can lower your temperature, like:



- Acetaminophen, also called paracetamol
- Ibuprofen
- Aspirin

AMERICAN OVERSIGHT

1. Turn the thermometer on by pressing the button near the screen.



2. Hold the tip of the thermometer under your tongue until it beeps. Do not bite the thermometer.

3. Read your temperature on the screen. If your temperature is 100.4°F/38°C or higher, you have a fever.

4. Write your temperature in the 14-Day Symptom and Temperature Log in this booklet.

5. Clean the top of your thermometer with soap and water and dry it well.

PLEASE NOTE: For infants and children younger than 4 years old, use an age-appropriate thermometer such as an ear thermometer. If you do not have one, use a regular thermometer by placing it under the child's arm in the center of the armpit.

For the armpit method, if the child's temperature is 99.4°F/37.4°C or higher, they have a fever. Tell the public health worker that you are taking the child's temperature this way.

AMERICAN OVERSIGHT

FL-DOH-20-0673-A-004915

Two times a day (morning and night), write down your temperature and any COVID-19 symptoms you may have: feeling feverish, coughing, or difficulty breathing. Do this every day for 14 days after you left China.

1. Fill in the dates on the log, starting with Day 0 and ending with Day 14. Day 0 is the day you left China.
2. Start recording your temperature and symptoms, beginning with today's date. **Fever is 100.4°F/38°C or higher.**
3. If you get sick, contact your health department. Be sure to tell them you were in China, your symptoms, and that you are self-monitoring.
4. Your daily health checks are complete 14 days after you left China, or as indicated by public health authorities.

DAY	DATE	SYMPTOMS	TEMP
DAY 0	Feb 1, 2020	Day 0 is the day you left the China.	
DAY 1	Feb 2, 2020	No Symptoms	97.4 F
		No Symptoms	98.6 F
DAY 2	Feb 3, 2020	No Symptoms	96.9 F
		No Symptoms	98.6 F
DAY 3	Feb 4, 2020	No Symptoms	98.0 F
		No Symptoms	98.6 F
DAY 4	Feb 5, 2020	No Symptoms	97.3 F
		No Symptoms	98.6 F
DAY 5	Feb 6, 2020	No Symptoms	96.5 F
		No Symptoms	98.6 F

Phone Numbers for State and Local Health Departments

CARE

This is a list of telephone numbers for health departments across the United States that travelers can use to connect with the health department in their destination state or the state they are in. These phone lines are monitored at all times, and travelers may call 24 hours a day and 7 days a week unless noted. Members of the public with general questions about COVID-19 should call their state health department's main daytime telephone number or they can contact CDC at www.cdc.gov/cdc-info or 1-800-CDC-INFO (800-232-4636) or TTY 888-232-6348.

COVID 19 CORONAVIRUS DISEASE

AMERICAN OVERSIGHT

FL-DOH-20-0673-A-004920

日常检查并记录

COVID 19 CORONAVIRUS DISEASE

您收到这份重要的健康信息手册是因为您的航班来自中华人民共和国。在中国, 2019 冠状病毒疾病（COVID-19）疫情持续蔓延。COVID-19 是一种由病毒引起的呼吸系统疾病，并且可以在人与人之间传播。

如果您在过去的14天内从湖北省返回， 您目的地州的公共卫生部门将对您进行监测。监测将包括协议或法律条令，例如检疫条令。

根据这些协议或检疫条令:

- 从您离开湖北省开始的14天内，您必须呆在家中，或待在您所在州或地方卫生部门，或美国政府所指定的地点。
- 请遵循检疫条令，您卫生部门还有美国政府提供的指示。

如果您从中国返回 (湖北省除外), CDC 强烈建议您在离开中国的14天内，通过在家自我监测来保护自己与他人。请采取以下步骤来监测您的健康:

1. 每日两次用体温计测量您的体温，并且密切关注咳嗽，或呼吸困难 (请参见手册中的指示)。
2. 呆在家中，请不要去学校。
3. 雇员：请在返回工作之前和您的雇主讨论您的工作情况。
4. 请不要乘坐公共交通，出租车，或与他人共同乘车。
5. 避免去拥挤的地点 (例如，购物中心和电影院) 并且限制您在公共场所的活动。
6. 与他人保持距离 (大约 6 英尺 或 2 米).
7. **如果您生病并伴有发烧，咳嗽，或呼吸困难，请遵循第三页的指示。**
8. 如果因为其他的原因需要就医，如透析，请提前打电话联系您的医生并且告知他们您最近去中国的旅行。

您当地的卫生部门可能会有更严格的具体指示供您遵循。

AMERICAN OVERSIGHT

FL-DOH-20-0673-A-004921

*** 如果您需要急诊，请拨打911。告知他们您的症状，并且您曾去过中国。**

在您旅行返回后，请与您的卫生部门联系 (手册中包含电话列表). 他们会告知您:

- 如何向卫生部门报告您的健康检查?
- 应该多久报告一次您的健康检查?
- 如果生病并伴有发烧，咳嗽，或呼吸困难的症状，您该联系谁?
- 如果出现症状，您还应该做什么?
- 如果有疑问，您应该询问谁?

当您与卫生部门联系时，请寻求以下联系方式。
请在下方填写并记录重要信息。

卫生部门的工作人员联系方式:

姓名:

电话号码:

非办公时间电话号码:

邮箱或网址:

其他方式:

请使用以下空白处填写提供给您的重要信息。

如何报告我的健康检查?

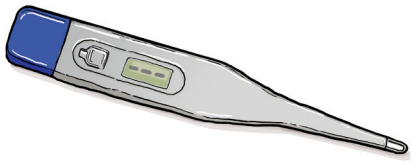
我应该多久报告一次我的健康检查?

如果我生病了，卫生部门希望我怎么做?

如果有其他的疑问，我应该联系谁?

AMERICAN OVERSIGHT

每日检测并记录您的健康



COVID 19 CORONAVIRUS DISEASE

如果您曾接触过感染2019 冠状病毒疾病(COVID-19)的人，可能需要14天的时间得知您是否会生病。在您离开中国后的14天内，每天2次检测您的健康是十分重要的。请按照以下步骤来监测和记录您的健康。

第一步 请每日早，晚检测您的健康.

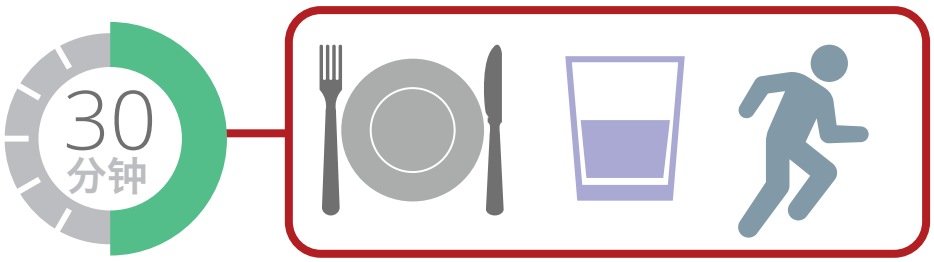
- 请测量您的体温，并/或帮助其他与您同行但无法自行测量的家庭成员。
- 除了发烧，请警惕其他2019冠状病毒疾病的症状，包括咳嗽，或呼吸困难。
- 请在此手册的日志中填写您的体温和其他任何症状。
- 请将家庭成员的体温和症状填写在他们的手册中。

未与您同行的家庭成员无需被检测。

第二步 如果您的卫生部门要求您报告您的体温和任何症状，请遵循他们的指示。

第三步 如果您发烧 (发烧为100.4˚ F/38˚ C 或更高)，咳嗽，或呼吸困难:

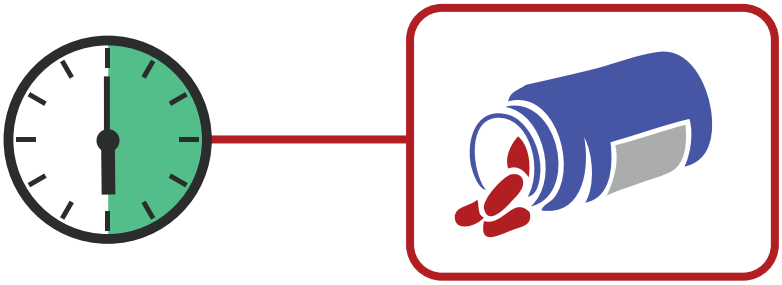
1. 请不要去公共场所。
2. 请拨打本手册中列出的您当地卫生部门的电话号码，提醒他们您在自我监测。
3. 如果无法联系到您的卫生部门，请寻求医生建议 — 请在去医生办公室或急诊室之前先打电话咨询。告知他们您最近的旅行，您的症状，和卫生部门给您的指示。
4. 避免与他人接触。
5. 请不要生病时旅行。
6. 在咳嗽或打喷嚏时请用纸巾或您的衣袖 (不要用手)掩盖口鼻。
7. 避免传播病毒给他人，请用肥皂和水洗手，至少20秒。
8. 请在咳嗽，打喷嚏，或擦鼻涕后，立即用肥皂和水洗手。如果没有肥皂和水，您可以使用酒精含量60%-95% 的酒精类洗手液进行手部消毒。如果手看起来脏，请经常用肥皂和水洗手。



AMERICAN OVERSIGHT

FL-DOH-20-0673-A-004923

*** 如果您需要急诊，请拨打911。告知他们您的症状，并且您曾去过中国。**

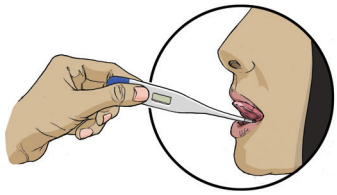


在您测量体温之前:

饭后，饮水后，或运动后，请等待30 分钟

在服用退烧药后，请等待至少6小时，比如:

- 对乙酰氨基酚，又称为扑热息痛，
- 布洛芬
- 阿司匹林

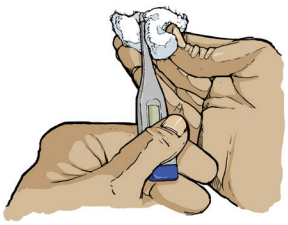


AMERICAN OVERSIGHT

如何测量您的体温

COVID 19 CORONAVIRUS DISEASE

1. 通过按压屏幕旁边的按钮来打开体温计。



2. 把体温计的尖端放在舌头下面，直到它发出哔哔声。不要咬体温计。

3. 在屏幕上读取您的体温。如果您的体温为 100.4˚ F/38˚ C 或更高，您已发烧。

4. 请在手册内，在14天症状和体温日志中写下您测量的体温。

5. 用肥皂和水清洗体温计的尖端，并晾干。

请注意: 对于4岁以下婴幼儿，请使用适龄的体温计测量，比如耳温枪。如果您没有此类体温计，请将常规体温计放置在儿童的腋窝中央。

使用腋窝测量的方式，如果孩子的体温为 **99.4˚ F/37.4˚ C 或更高**，孩子已发烧。请告知公共卫生工作人员，您用此方法为您的孩子测量体温。

AMERICAN OVERSIGHT

FL-DOH-20-0673-A-004925

*** 如果您需要急诊，请拨打911。告知他们您的症状，并且您曾去过中国。**

如何使用您的症状和体温日志

CARE

每天两次（早上和晚上），写下您的体温和任何2019冠状病毒疾病的症状：感觉发热，咳嗽，或呼吸困难。请在离开中国后的14天内，每天都要这样记录。

1. 在日志中填写日期，从第0天开始到第14天结束。第0天是您离开中国的时间。
2. 从今日起开始记录您的体温和症状。发烧为100.4° F/38° C 或更高.
3. 如果您生病了，联系您的卫生部门。请一定告知他们您曾去过中国，您的症状，并且您正在自我监测。
4. 您的日常健康检查会在您离开中国后的14天完成，或根据公共卫生官员的指示。

日	日期	症状	体温(°C摄氏度)
第0天	2020年2月1日	第0天是您离开中国的日期。	
第1天	2020年2月2日	无症状	36.3
		无症状	37
第2天	2020年2月3日	无症状	36
		无症状	37
第3天	2020年2月4日	无症状	36.7
		无症状	37
第4天	2020年2月5日	无症状	36.4
		无症状	37
第5天	2020年2月6日	无症状	35.8
		无症状	37

范例

AMERICAN OVERSIGHT

症状和体温日志

COVID 19 CORONAVIRUS DISEASE

请您在之后的14天内，每天都在下列表格中记录下您的症状和体温。

日	日期	症状	体温（°C摄氏度）
第0天		**第0天是您离开中国的日期。**	
第1天			
第2天			
第3天			
第4天			
第5天			
第6天			
第7天			
第8天			
第9天			
第10天			
第11天			
第12天			
第13天			
第14天			

如果您生病了，请依照指示联系您的卫生部门，告知他们您曾去过中国，您的症状，并且您在自我监测中。您的日常健康检查在您离开中国后的14天完成，或根据公共官员的指示 。

Subject: NEW Ventilator Guidance - COVID-19
Date: Monday, March 23, 2020 2:22:26 PM

Dear Governor and State Health Officials-

Below please find new FDA guidance to expand the availability of ventilators as well as other respiratory devices:

What Types of Ventilators Can be Used to Expand Supply? The FDA issued guidance to expand the availability of ventilators as well as other respiratory devices and their accessories during this pandemic. Wherever possible, health care facilities should use FDA-cleared conventional/standard full featured ventilators when necessary to support patients with respiratory failure. However, to expand availability, FDA will not object to limited modifications to the *indications, claims, functionality, or to the hardware, software, or materials of FDA-cleared devices used* to support patients with respiratory failure or respiratory insufficiency. This policy applies only during the public health emergency.

Examples of changes to the indications could include a significant change or modification in *design, material, chemical composition, energy source, or manufacturing process*. Specific examples of products FDA will allow include:

- The use of powered emergency ventilators and anesthesia gas machines for patients needing mechanical ventilation;
- The use of ventilators outside of their cleared environment for use (use of a ventilators in a health care facility when it is only cleared for use at home or during transport);
- the use of devices indicated for sleep apnea (including CPAP and BiPAP), provided that appropriate design mitigations are in place to minimize aerosolization; or
- The use of oxygen concentrators for primary supply when medically necessary and clinically appropriate.

FDA will also allow for modifications to the FDA-cleared *indications, claims, or functionality* of these devices, without a prior submission of a premarket notification. Examples of circumstances where FDA currently believes a modification would be allowable include:

- Modifications to motors, batteries, or other electrical components;
- Material changes to components in the gas pathway or with other patient tissue contact;
- Introduction of filtration to minimize aerosolization;
- Software modifications intended to modify the ventilation parameters including inspiratory pressure, tidal volumes, flow rates, positive end-expiratory pressure (PEEP) in accordance with any applicable device standard;
- Software modifications implementing physiological closed loop (automated)

AMERICAN OVERSIGHT

algorithms for oxygen titration where the algorithms/devices are the subject of an FDA-approved Investigational Device Exemption (IDE); and
- Hardware and/or software modifications implementing the capability for remote monitoring and remote adjustment of ventilator parameters (i.e., adjustment of parameters by trained health care providers from outside an isolation unit to avoid unnecessary exposures).

FDA is interested in interacting with manufacturers of ventilatory support devices that are not currently legally marketed in the U.S. as well as manufacturers who have not previously been engaged in medical device manufacturing with capabilities to increase supply of these devices. FDA will work interactively with these manufacturers through its Emergency Use Authorization (EUA) process. The guidance includes specific information to send to FDA and all information and questions can be sent to: CDRH-COVID19-Ventilators@fda.hhs.gov.

Subject:	Office for Civil Rights (OCR) Announces Notification: Enforcement Discretion for Telehealth Remote Communications During the COVID-19
Date:	Thursday, March 19, 2020 11:33:59 AM

OCR Announces Notification of Enforcement Discretion for Telehealth Remote Communications During the COVID-19 Nationwide Public Health Emergency

https://www.hhs.gov/about/news/2020/03/17/ocr-announces-notification-of-enforcement-discretion-for-telehealth-remote-communications-during-the-covid-19.html

Today, the Office for Civil Rights (OCR) at the U.S Department of Health and Human Services (HHS) announced, effective immediately, that it will exercise its enforcement discretion and will waive potential penalties for HIPAA violations against health care providers that serve patients through everyday communications technologies during the COVID-19 nationwide public health emergency.

This exercise of discretion applies to widely available communications apps, such as FaceTime or Skype, when used in good faith for any telehealth treatment or diagnostic purpose, regardless of whether the telehealth service is directly related to COVID-19.

In support of this action, OCR will be providing further guidance explaining how covered health care providers can use remote video communication products and offer telehealth to patients responsibly.

"We are empowering medical providers to serve patients wherever they are during this national public health emergency," said Roger Severino, OCR Director. "We are especially concerned about reaching those most at risk, including older persons and persons with disabilities," Severino added.

The Notification of Enforcement Discretion on telehealth remote communications may be found at: https://www.hhs.gov/hipaa/for-professionals/special-topics/emergency-preparedness/notification-enforcement-discretion-telehealth/index.html.

For more information on HIPAA and COVID-19, see OCR's February 2020 Bulletin: https://www.hhs.gov/sites/default/files/february-2020-hipaa-and-novel-coronavirus.pdf - PDF

Date:	Tuesday, March 24, 2020 2:15:17 PM
Attachments:	BIO - John McGough HHS Regional Director - Region 1 Boston & Region 4 Atlanta.pdf

Hello Jade.

I work for HHS Region IV Director John McGough, who has oversight of the eight southeastern states. He held a call with SG Rivkees that was coordinated by Courtney back in November to discuss the HHS priorities as they relate to the Florida county health directors. John has asked me to acquire contact information for all of the county health directors, in the event an emergency or fast-developing COVID-19 situation, either involving testing, PPEs, staffing, cruise ship arrivals, etc., requires him to reach someone on the weekends, or in the evening. Believe me, because he also leads the six Region I states, which include Boston, his plate is full and he would not be making a call unless there were no other options.

Courtney returned my call Friday evening and told me she would provide me with the list. Since I see that she is now deployed and out of pocket, I will refer the request to you, per her instructions.

Thanks in advance.

Sincerely,

Deric

John G. McGough
U.S. Department of Health and Human Services
Regional Director for New England & the Southeast

John G. McGough was appointed by the White House in January of 2018 to serve as Regional Director of the U.S. Department of Health & Human Services for Region 1 in New England. As a Presidential Appointee, Mr. McGough provides executive leadership as the primary representative for the Secretary of Health and Human Services. The office of the Regional Director is tasked with intergovernmental and external affairs bringing together federal, state, local and tribal government organizations, along with other external partners. In his role, Mr. McGough is responsible for the six New England states of Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont, as well as the Region's 10 federally recognized Tribes.

In July of 2019, McGough was additionally tasked with serving as Regional Director for Region 4 in the Southeast including the states of Alabama, Florida, Georgia, Kentucky, Mississippi, North Carolina, South Carolina, and Tennessee, as well as the Region's 6 federally recognized Tribes.

Prior to his appointment with HHS, McGough served as Chief of Staff for Maine's Republican Governor Paul R. LePage for seven years. During the 2010 gubernatorial campaign, he served as Deputy Chief of Staff and Policy Director. Prior to joining the campaign, McGough was the Director of Human Resources for the City of South Portland, Maine. McGough previously served as Assistant City Administrator/Human Resources Officer for the City of Waterville, Maine. He is also the former Chief of Staff for the House Republican Leader in the Maine House of Representatives.

McGough earned a Bachelor's and Master's Degree in Public Administration from the University of Maine system. He resides in Brunswick, Maine and attends the Pathway Vineyard Church. He has one daughter, Molly, who attends college.

OMNI Learning Community ASTHO*Connects*:
Engaging Primary Care Associations and Federally Qualified Health Centers
February 4, 2020
Time: 1:00 – 2:00 PM EDT
Phone: 646-876-9923; 290 202 789
URL: https://astho.zoom.us/j/290202789

Cohort 1: Alaska✧Florida✧Illinois✧Kentucky✧Nevada✧Ohio✧Pennsylvania✧
Rhode Island✧Tennessee✧Vermont✧Washington✧West Virginia
Cohort 2: Indiana✧New York✧Wyoming

Desired Outcomes:

- Provide the federal perspective on engaging primary care associations and leveraging federally qualified health centers for OMNI related work.
- Highlight two FQHCs on their role providing services to pregnant and postpartum women affected by opioid use disorder and infants prenatally exposed to substances.

Agenda:

1:00 PM EST	**Welcome –** ASTHO • Welcome from ASTHO • Overview of agenda and objectives
1:05 PM EST	**Overview of Efforts to Engage PCAs** • *Sue Lin, PhD, MS, Director, Quality Division, Office of Quality Improvement, HRSA Bureau of Primary Health Care*
1:15 PM EST	**State Highlight on Engaging PCAs –** *Pennsylvania* • *Scott Constantini, Director of Behavioral Health, The Wright Center for Community Health*
1:30 PM EST	**State Highlight on Engaging PCAs –** *Colorado* • *Jessica Cram, Licensed Addiction Counselor, Denver Health*
1:45 PM EST	**Q&A and Discussion**
1:55 PM EST	**Wrap-up and Next Steps** • Next state share call
2:00 PM EST	**Adjourn**

Vision: Healthy Communities, Healthy People

AMERICAN OVERSIGHT

Health Center Program Highlights

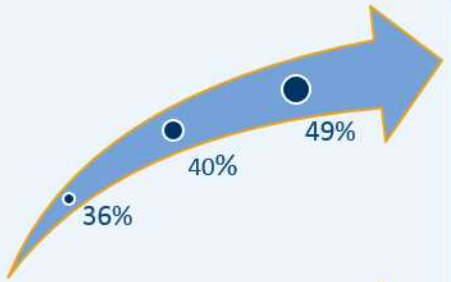
Source: Uniform Data System, 2018

AMERICAN OVERSIGHT

HRSA Health Center Program

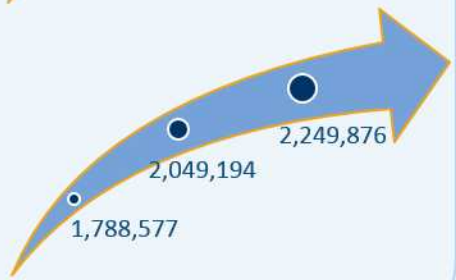
Behavioral Health Integration

In 2018, health centers provided over **10.8 million** mental health clinic visits



Over 11,700 mental health FTEs **10.5%** ↑

70.6% of patients screened for depression with a documented follow-up plan



2016-2018 Progress

SBIRT implementation increased to **49%**

Mental health patients served increased by **26%**

Strategies to Enhance Integrated Behavioral Health Services (2019-2020)

- Increase access to high quality, integrated behavioral health services including the prevention or treatment of mental health conditions and substance use disorders, including opioid use disorder
- Improve provider awareness of clinical strategies to address behavioral health needs of special populations (e.g., women, adolescents, LGBT)
- Enhance behavioral health capacity in health centers through sharing promising practices in workforce recruitment, training, and integration

Training and Technical Assistance (T/TA)

- SBIRT, Depression Screening, and Trauma-Informed Care Communities of Practice
- Promising Practices and Resource Sharing on:
  - ✓ Maternal Depression and Substance Use
  - ✓ Suicide Prevention and Treatment

T/TA Resources: https://bphc.hrsa.gov/qualityimprovement/clinicalquality/behavioralhealth/index.html

Source: Uniform Data System, 2016-2018

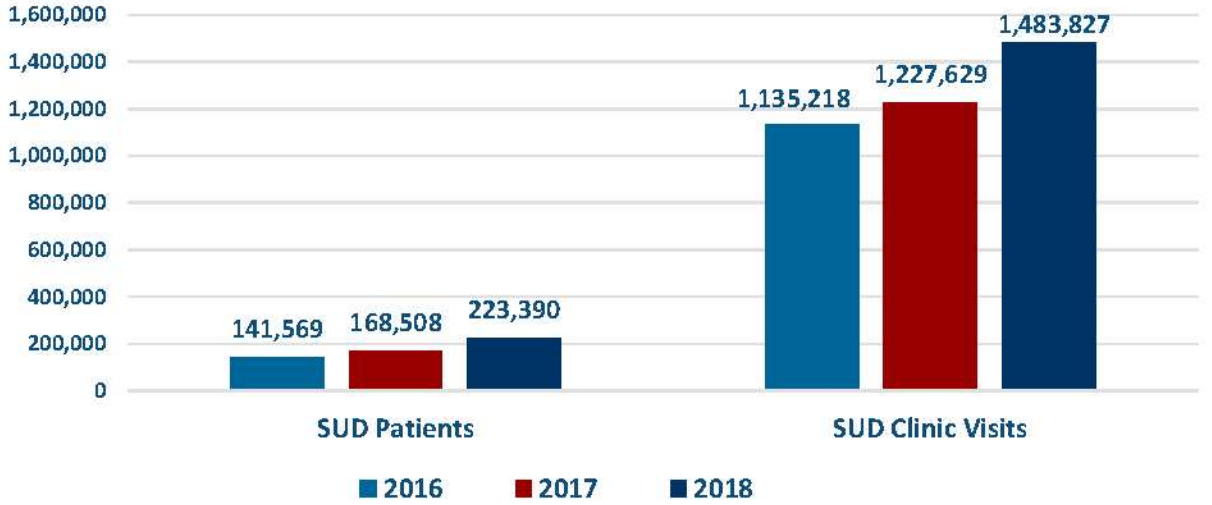
AMERICAN OVERSIGHT

HRSA Health Center Program

Substance Use Disorder Services

1,748 health center providers (FTEs) delivering SUD services: **23.4%** ↑

Nearly **1.5 million** SUD clinic visits: **20.9%** ↑



223,390 patients receiving SUD services: **32.6%** ↑

Medication-Assisted Treatment (MAT) Expansion

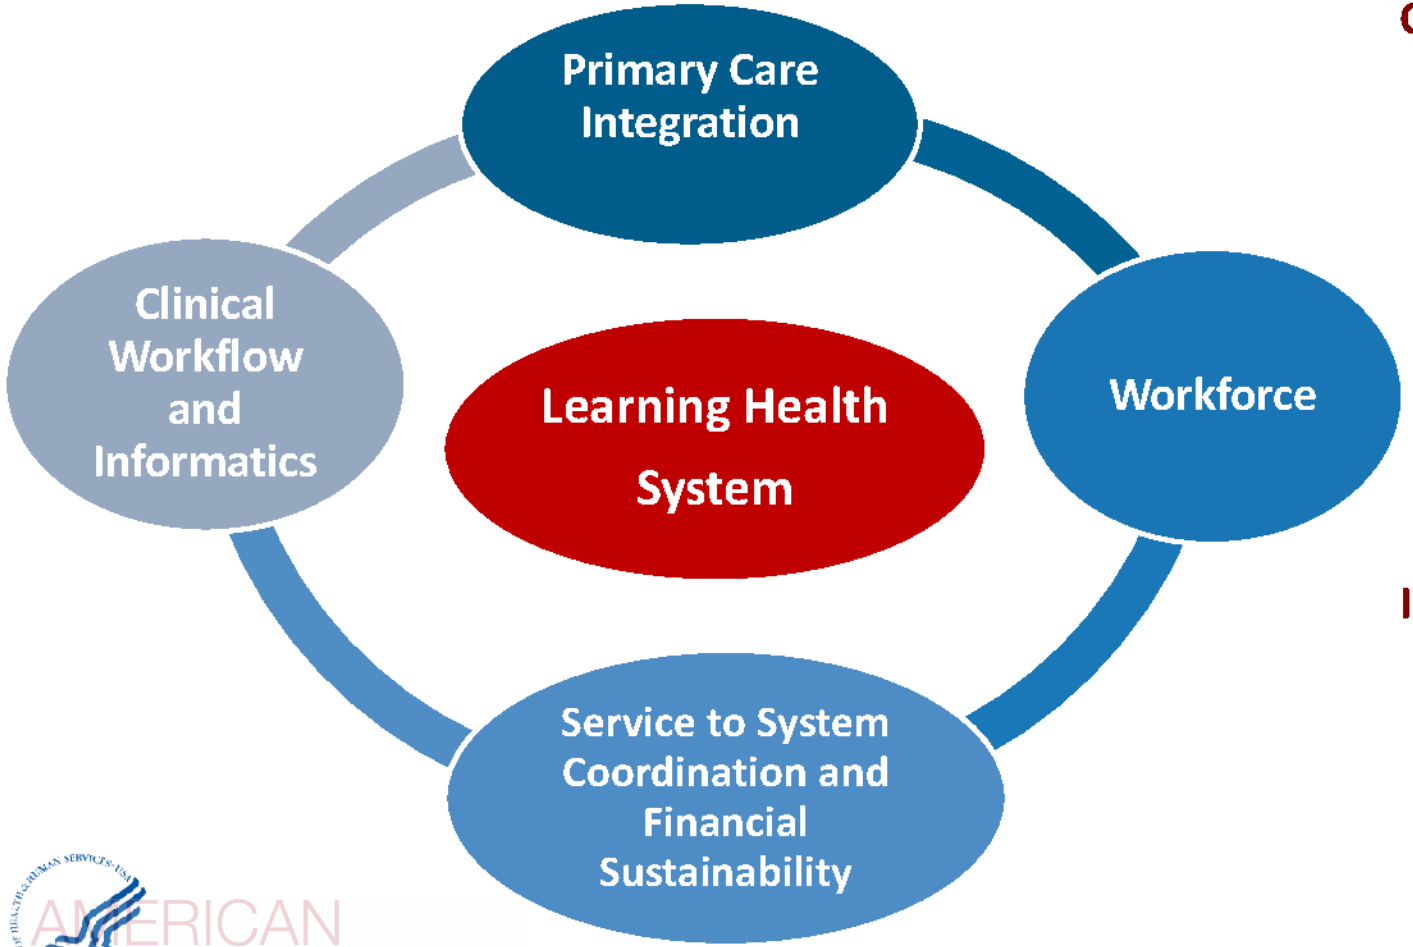
64.7% increase in the number of health center providers with a DATA 2000 Waiver in 2018

46.3% increase in the number of patients receiving MAT services

Health Center Program SUD Services, 2016-2018

Training and Technical Assistance (T/TA) Resources

- **HRSA SUD and Primary Care Integration Webpage**: https://bphc.hrsa.gov/qualityimprovement/clinicalquality/substance-use-disorder-primary-care-integration
- **Webinars** (http://www.astho.org/Webinars/): ASTHO's **O**pioid Use Disorder, **M**aternal Outcomes, and **N**eonatal Abstinence Syndrome **I**nitiative (OMNI) Learning Community discusses state-level approaches to addressing NAS (https://www.astho.org/generickey/GenericKeyDetails.aspx?contentid=21095&folderid=5162&catid=7254)
- **UCSF National Clinician Consultation Center's Substance Use Warmline** (http://nccc.ucsf.edu/clinical-resources/substance-use-resources/) provides clinician-to-clinician expert consultation addressing integrated behavioral health treatment & chronic pain management; M-F, 9 am to 8 pm ET by phone at 855-300-3595, or by submitting patient cases online (https://nccc.ucsf.edu/clinician-consultation/substance-use-management/)



Source: Uniform Data System, 2016-2018

AMERICAN OVERSIGHT

HRSA Health Center Program

HRSA Center of Excellence (COE) for Behavioral Health Technical Assistance

The COE provides Training and Technical Assistance (T/TA) on evidence-based interventions and best practices to support the integration of behavioral health in HRSA funded programs.

COE Key Functions

- To share promising practices and support behavioral health integration (BHI) in primary care
- To support the initiation of SUD/MAT programs
- To build grantee capacities on the financial sustainability of integrated behavioral health programs
- To leverage innovative, real-time T/TA modalities

IBHS T/TA Requested Topics

- Enhance BHI service delivery
- Prevention & treatment of opioid use disorder
- Medication-assisted treatment
- Tele-behavioral health
- Pain management

AMERICAN OVERSIGHT

HRSA Health Center Program

Health Center and Home Visiting Program Collaboration

In 2018, health centers provided care for over **563,000** prenatal care patients

74% of prenatal care patients entered prenatal care during their first trimester

8% of newborns had Low Birth Weight (< 2,500 grams)

Strategies to Enhance Collaboration and Integration (2019-2020)

- Improve awareness and knowledge on evidence-based home visiting programs
- Build sustainable partnerships to enhance pregnancy, child health and development, and other family outcomes
- Share promising practices for home visiting service coordination and primary care integration
- Disseminate resources that promote community-level engagement
- Encourage connections and resource sharing around Substance Use Disorder and Mental Health to address gaps in care
- Primary Care and Home Visiting Partnerships to Promote Maternal and Child Health T/TA Webinar

Through Complimentary Services, Health Centers and Home Visiting Programs can:

Resource: HRSA's Maternal and Child Health Bureau's Home Visiting webpage (https://mchb.hrsa.gov/maternal-child-health-initiatives/home-visiting-overview)

AMERICAN OVERSIGHT

HRSA Health Center Program

PCAs: Supporting State/Regional Value Transformation

1. Accelerate **Value-Based Care** Delivery
2. Increase **Access** to Comprehensive Primary Health Care
3. Strengthen the Health Center **Workforce**
4. Enhance Health Center **Emergency Preparedness**
5. Advance Health Center **Clinical Quality and Performance**

AMERICAN OVERSIGHT

ASTHOConnects

A virtual learning series for public health leaders.

Scott Constantini, BS

Director of Behavioral Health, The Wright Center for Community Health

AMERICAN OVERSIGHT

THE WRIGHT CENTER for COMMUNITY HEALTH | THE WRIGHT CENTER for GRADUATE MEDICAL EDUCATION

At a Glance:

- **Our Level 3 Patient-Centered Medical Homes** (PCMH), which hold the **FQLA designation**, integrate Primary Medical, Dental, Behavioral Health, Addiction Medicine, Ryan White Infectious Disease, and School-Based Health Center services, providing inclusive access to a seven-county radius in Northeast Pennsylvania.

- **The Wright Center's Graduate Medical Education Safety-Net Consortium** (GME-SNC) has a dual mission to improve the health and welfare of the communities we serve through inclusive and responsive health services and the sustainable renewal of an inspired and competent workforce that is privileged to serve.

AMERICAN OVERSIGHT

Pennsylvania Opioid Use Disorder Center of Excellence

- **Our designations as a Pennsylvania Opioid Use Disorder Center of Excellence** in 2016 and **PacMAT** in 2018 have transformed all of our care delivery service lines and our organizational culture toward recovery.
- We currently have 22 **waivered providers** and 3 who are board-certified in Addiction Medicine.
- 739 total patients served in our OUD-COE since 2016.

AMERICAN OVERSIGHT

Healthy MOMS (Maternal Opiate Medical Support)

82 total moms served since program began in 2018

54 moms currently in the program

To date, **38 babies** have delivered in Healthy MOMS Program.

AMERICAN OVERSIGHT

Warm Hand-off Initiative

- Built Collaborative Relationships with Local Partners
- TWCCH Residents Rounding at Local Hospitals
- Educated Hospital Teams / Didactics

AMERICAN OVERSIGHT

Our Partnership with the State

- We're grateful for the funding and legislative support of **Gov. Wolf, Sec. Dr. Levine, Sec. Miller and Sec. Smith.**
- **State Grants:** PacMAT ($1.75M); PADHS OUD Support Services and Housing ($2.6M); AllOne Opioid Pregnancy Recovery ($500,000); DDAP Pregnancy Support Services ($382,441)
- **Federal Grants:** USDA Distance Learning and Telemedicine ($463,223); HRSA Rural Communities Opioid Response ($1M); SAMHSA MAT-PDOA ($1.5M)

Jessica Cram, MA, LAC, LPCC
Licensed Addiction Counselor, Denver Health

Sean Buck, MD
Family Physician, Denver Health

AMERICAN OVERSIGHT

FL-DOH-20-0673-A-004969

OUD, Maternal Outcomes, & Neonatal Abstinence Syndrome

Jessica Cram, MA, LAC, LPCC
&
Sean Buck, MD

AMERICAN OVERSIGHT

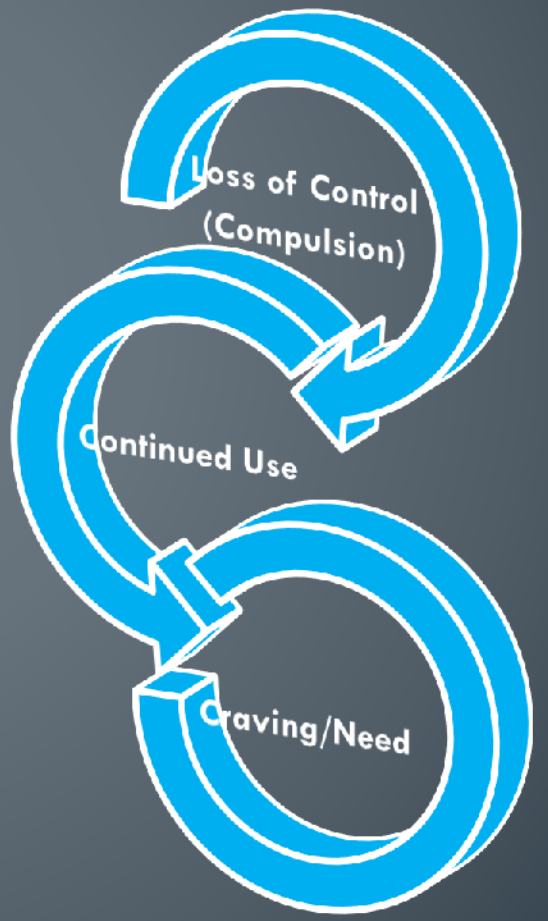
Objectives

- Integrated addiction counselor 2014
- MAT 2016
  - First OB MAT patient in 2019
- Integrated addiction services?
- Case Study
  - Medical perspective
  - Counselor perspective
  - Treatment outcomes

AMERICAN OVERSIGHT

Medication Assisted Treatment

- Medication
  - Stops cravings
  - Blocks withdrawal
  - Obstructs the effectiveness of opioids/heroin
- Behavioral Support
  - Addiction Counselor
  - Peer support

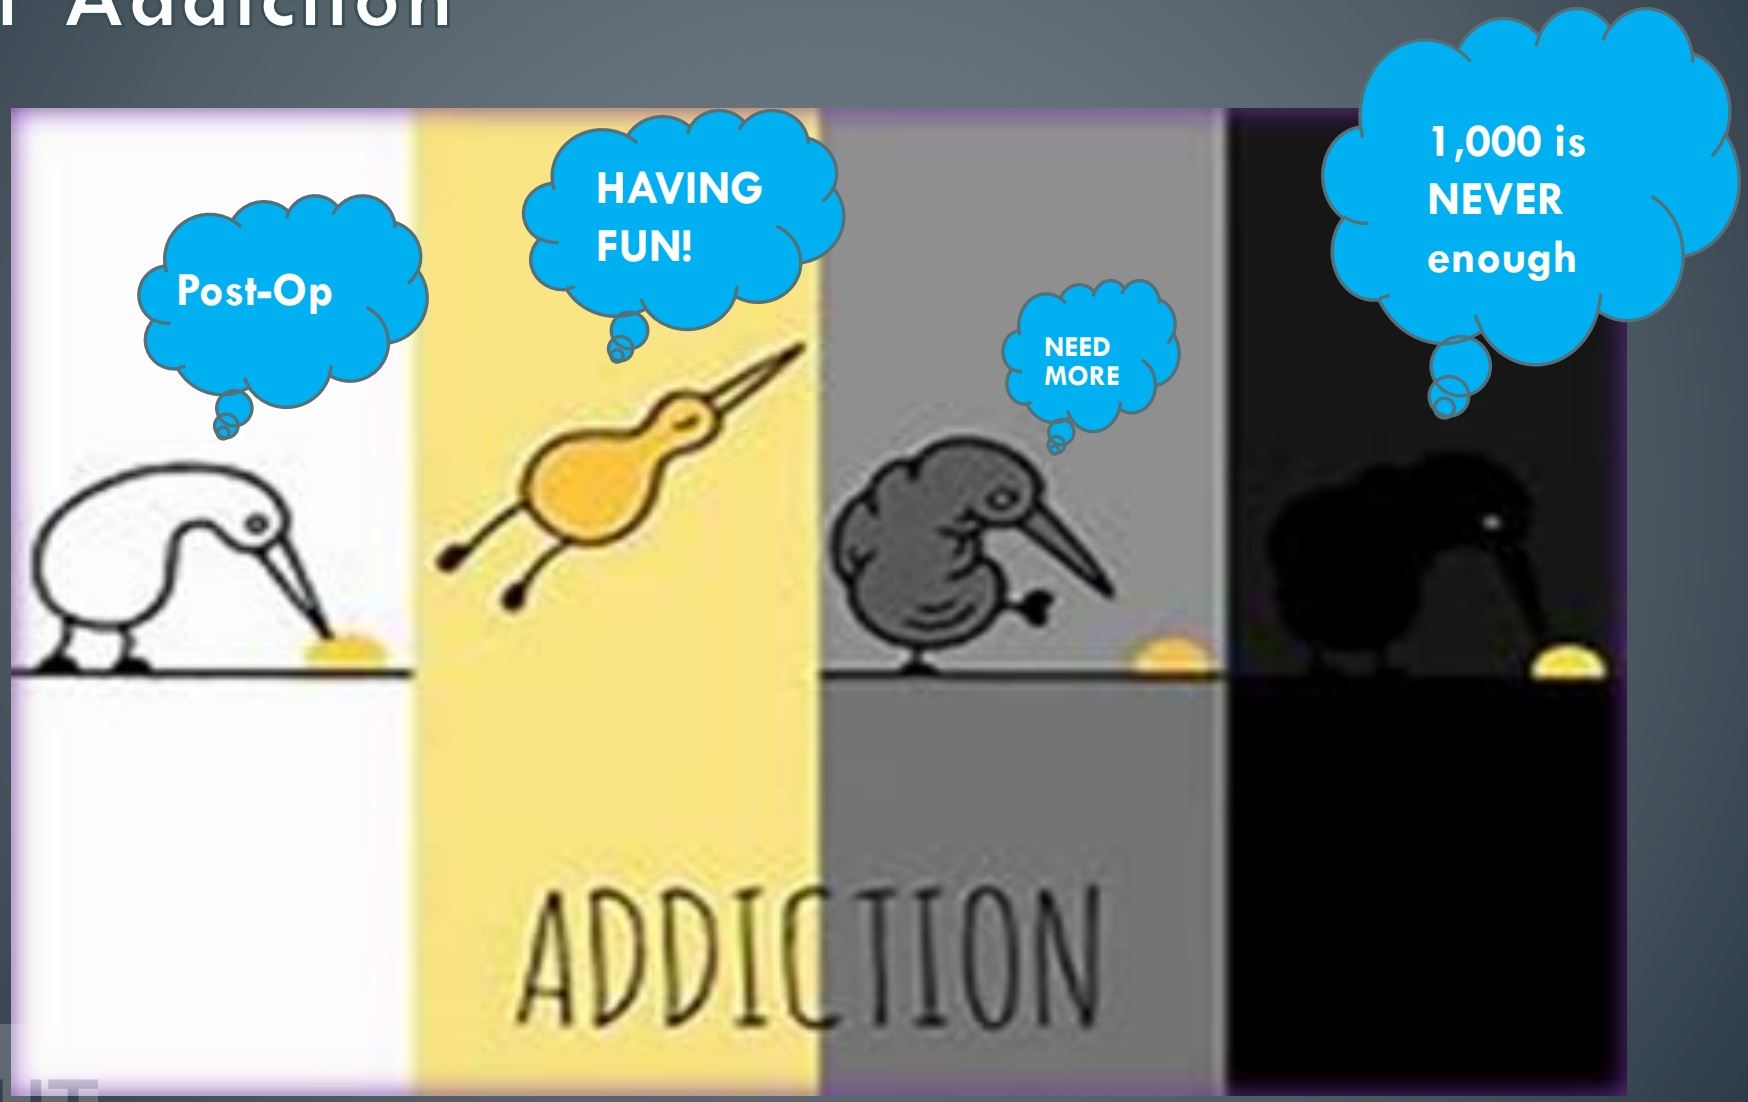


Success

AMERICAN OVERSIGHT

Addiction Considerations?

- Interest in Treatment
- Understand risks/benefits
- No contra-indications (allergy)
- Can follow safety precautions
- Reasonably adherent
- Pregnant or Child-bearing age
- Liver Disease
- Drug-drug interactions
- Detox
- Prior treatment experience
- Psychiatric Stability
- Psychosocial Circumstances
- Co-morbid substance use disorder: alcohol and benzodiazepines
- Readiness?



AMERICAN OVERSIGHT

Pregnancy Considerations

- NAS counseling (likely 5d stay)
- Likely CPS report
- Drug testing expectations
- Extra US around 32w (nonstandard)
- Many visits, the patient was able to see BH, psych, and LAC or BH, LAC, and MD.
- Many FQHCs are able to provide this integrated care! MDs can counsel specifically on risks of medications and risks to baby of continued use. A few of her MAT visits were converted to OB visits with FHT and size measurements completed.

AMERICAN OVERSIGHT

Cycle of Addiction

AMERICAN OVERSIGHT

Patient-Centered Care

DON'Ts

- Require/Force Treatment
- Offensive language
  - Dirty/clean
  - Junky
  - Addict

DO's

- Chief Complaint??
- Motivational Interviewing
- Educate
- Offer Resources
- Follow DH opioid prescribing guidelines

AMERICAN OVERSIGHT

Case Presentation

- 31yo G1P0 presents at 8w1d due to missed period. Reports nearly daily opioid (Percocet and IV heroin), methamphetamine (smoking), and cocaine (smoking) use as well as occasional EtOH and daily tobacco use. Reports some IPV (though out relationship) + legal troubles.
- Medical history:
  - ADHD
  - PCOS (on metformin)
  - Generalized anxiety
  - No PSH. SHx: In college for behavioral health BA, reports some IPV (though out of relationship), + legal troubles.

AMERICAN OVERSIGHT

Continued

- Presents for OBI at 12w3d and due to proximity to Lowry clinic, transitioned care to Lowery for MAT. Also referred to psychiatry at this time. Started on Subutex at this visit and then with fu in six days. No opioid use, no recent meth use, + cocaine use. Engaged in MAT clinic. Fu at 16w3d with MD without concerns. Then some e-cig and MJ use. No return to opioid treatment since starting MAT. Still with consistent cocaine use and + meth at around 14-16w.
- At about 18w, saw psychiatry, who started bupropion (due to h/o ADHD and stimulant use), increase sertraline. Trialed PRN hydroxyzine. At this time, started talking a lot about her guilt surrounding using in pregnancy. Still with + cocaine. First negative utox at around 24w! Continued to be negative and then positive for cocaine around 26w, then negative until + around 36w twice. Socially, she was having lots of conflict with her brother (who she lived with), then moved out to live in a hostel with boyfriend (positive influence).

AMERICAN OVERSIGHT

Outcome

- Delivered sober at 40w0d due to IOL due to gHTN. Uncomplicated delivery, baby with uncomplicated newborn nursery course with minimal to no NAS (kept for 5d for observation). DH has NAS babies in well-baby nursery, though many placed send to NICU.

OMNI Learning Community ASTHOConnects: Engaging Primary Care Associations and Federally Qualified Health Centers

February 4, 2020
Presenter Bios

Sue Lin, PhD, MS

Sue Lin is the Director of the Quality Division in the U.S. Department of Health and Human Services' Health Resources and Services Administration (HRSA), Bureau of Primary Health Care, Office of Quality Improvement. She directs HRSA's Advance in Precision Medicine Initiative and oversees the Health Center Program clinical quality initiatives in patient centered medical home transformation and comprehensive primary care integration with behavioral health, substance use disorder, oral health, HIV care, and public health. Sue received her PhD in Epidemiology from the University of Maryland, College Park and MS in Biomedical Engineering from the University of Michigan, Ann Arbor.

Scott Constantini, BS

Scott Constantini is the Director of Behavioral Health at The Wright Center for Community Health and aims to ensure that patients receive comprehensive treatment for behavioral health and addiction issues within the Patient-Centered Medical Home setting. He has over 20 years' experience working directly with individuals with substance abuse challenges and behavioral health disorders and has implemented unique programs and specialized treatment services to effectively treat our community's high-risk population. He oversees The Wright Center's behavioral health service line integration into daily primary care workflow, including the daily operations of planning, organization, direction and controls of services provided. Scott oversaw The Wright Center for Community Health's Opioid Use Disorder Center of Excellence (OUD-COE) startup and implementation in 2017 and actively coordinates with community resources, including inpatient and outpatient providers. He is responsible for distribution and dissemination of the Medically Assisted Treatment (MAT) and community-based case management workflow within the OUD-COE and ensures all required COE data is collected and reported monthly to the state. Scott looks at recovery as a full circle, helping patients change their lifestyle, their thinking and their habits to engage them on the journey to taking better care of themselves.

AMERICAN OVERSIGHT

Jessica Cram, MA, LAC, LPCC

Jessica Cram is a PhD candidate, licensed addiction counselor, and licensed professional counselor candidate. She grew up in the Upper Peninsula of Michigan, moved to Denver in 2010 and doesn't plan on moving. She enjoys the outdoors, mountain hikes, and time with her daughter. Jessica has compassionately cared for individuals with a use disorder since 2010 and does not see an end in sight.

Sean Buck, MD

Dr. Buck is a family physician working in Denver, Colorado. He grew up in Denver, attended the University of Wisconsin School of Medicine and Public Health. He studied addiction medicine, anthropology, and health care administrator. Dr. Buck has a passion for treating patients with a use disorder. He enjoys trail running, skiing, and backpacking.

AMERICAN OVERSIGHT

To: Baker, Michael (OS/IEA)
Subject: Opportunity for "drive-through" testing site synergy
Date: Tuesday, March 17, 2020 4:41:17 PM

State Health Official –

First, let me thank you for all the work that you are currently doing to respond to COVID-19. We value your dedication to this.

As we continue to monitor and respond to the ongoing COVID-19 outbreak, we are working to drastically increase the number of sites that are testing for coronavirus around the country. As you are aware from the communications from Admiral Brett Giroir, FEMA, and ASPR throughout the past few days, we – in partnership with state and local health authorities – are standing up a number of "drive-through" testing sites across the nation for populations that are most in need of testing. While we are working to operationalize these, we know that there are a number of independent or private sites that are simultaneously opening their own "drive-through" testing operations.

If you are aware of sites in your state that are doing this testing, and are comfortable with sharing those with HHS for publication on the website that we are developing for this response, please share those with the U.S. Health and Human Services team. We want to amplify the availability of these testing operations to connect individuals to testing. You can reply to this email, or call me at the number below.

Please let me know the locations of these operations as soon possible. We are hoping for the location, address, and contact information for those sites. We thank you for your continued partnership and support during this outbreak. The leadership that you provide in your state is invaluable, and we look forward to continuing to work together to protect the health and well-being of the nation.

Thank you,

Michael Baker
Office of Intergovernmental and External Affairs

Subject: Please Register - COVID 19- National Call, Feb. 14th
Date: Thursday, February 13, 2020 5:39:01 PM

State and Local Leaders,

Please join us for a national briefing call **TOMORROW, Friday, February 14 at 1:45 p.m. Eastern Time** on the President's Coronavirus Task Force **(Please register, see link below).** The national briefing call will include updates from the U.S. Department of Health & Human Services and Centers for Disease Control & Prevention (CDC) along with our Federal partners at U.S. Department of Homeland Security, U.S. Department of Transportation, and the State Department. This national briefing call will provide an update from the Federal government and our ongoing partnership with State and local jurisdictions.

Additional Information

- You can find more information and resources at the CDC website here: https://www.cdc.gov/coronavirus/.
- ICYMI – USA Today: Our Coronavirus Response Is Protecting Americans (see full Op-Ed below)

Briefing Call Details
Date: Friday, February 14
Time: 1:45 p.m. Eastern Time
Call-In Information: LINK *(Participants will receive instructions on accessing the conference after RSVPing to the link)*

Thanks,

Darcie Johnston, Director
Office of Intergovernmental Affairs

ICYMI - Our Coronavirus Response Is Protecting Americans
USA Today
By Secretary of State Mike Pompeo and HHS Secretary Alex Azar
February 11, 2020
Link to op-ed here.

The first duty of the federal government is to keep our citizens safe. Since the United States first became aware on Dec. 30 of what has become known as the novel coronavirus, America's public health officials have closely monitored the situation, worked to understand the virus and taken steps to limit Americans' exposure to it.

Our task force is ensuring that our whole of government, layered, public health plan has the resources necessary to protect Americans. We've treated the sick, and traced back their travel

AMERICAN OVERSIGHT

history and contacts to minimize the spread of the virus. We've worked swiftly to screen and safely receive American travelers returning from China, and bar foreign travelers who have recently visited the epicenter of the outbreak.

Consistent with the World Health Organization International Health Regulations, our travel restrictions were intentionally devised to complement the Chinese government's policy of isolating approximately 50 million of its own citizens in Hubei province. Other nations, such as Italy and South Korea, have taken similar measures.

Our efforts in China

Thus far, the United States has only had 12 confirmed cases of the virus. We were saddened to hear last week that one American, a 60-year-old woman in Wuhan, China, has died. But we're undeterred in our vigilance to protect our people. And we're mobilizing resources around the world to help other nations fight the disease, too. This is American altruism at its finest.

Let's start with our efforts focused on the country where the virus first appeared — China. In the words of President Donald Trump, "We're offering them tremendous help." During the first week of January, the Centers for Disease Control and Prevention made an offer of assistance in order to understand the disease and help bolster response efforts.

The Department of Health and Human Services subsequently provided to the WHO a list of world-class medical professionals ready to deploy their skills in China and learn from China's efforts to combat this new coronavirus. In the last week of January, Secretary Azar personally extended an offer of help to Health Minister Ma Xiaowei; Secretary Pompeo did the same with Chinese State Councilor Yang Jiechi. We hope the mission will commence immediately, whether bilaterally or under the auspices of the WHO.

We've also facilitated the delivery of vast amounts of medical supplies to the Chinese people. Just last week, the State Department helped transport 17.8 tons of relief supplies to Hubei. And more assistance will continue to be offered — the United States is prepared to spend up to $100 million in existing State and U.S. Agency for International Development funds to assist China and other impacted countries to contain and combat the virus.

While State managed the logistics, the donations themselves were provided by Samaritan's Purse, Boeing, Intermountain Healthcare and The Church of Jesus Christ of Latter-day Saints, and coordinated by a nongovernmental organization called Project HOPE. Time and again, when diseases and disasters strike, the American people have stepped up to help citizens of other countries without being asked. Our robust charitable giving and enthusiastic civil society groups are channeling the American people's concern for their fellow man.

Cooperation with other nations

Then there are America's actions to help the citizens of other countries, beyond China. CDC staff based in more than 60 countries are working closely with ministries of health and other health partners, often in conjunction with their colleagues at the State Department and other federal agencies.

AMERICAN OVERSIGHT

For instance, the United States has made coronavirus test kits available to 191 qualified laboratories around the world; so far, labs from 36 countries have put in orders. We've deployed staff to train health professionals in 15 hospitals in Vietnam. In Kenya, health experts at the U.S. Embassy in Nairobi, as part of our Infectious Diseases Task Force, engaged the government early on to recommend best practices in airport screening and public health.

Our quick and effective reaction abroad is facilitated by partnerships that America has carefully nurtured over decades — long before the latest outbreak.

We believe our actions will slow the transmission of the virus to and within the United States and other countries, solidify our ties of friendship with our allies and partners, and help save lives by giving us more time to refine preparedness measures and better understand the virus.

We all hope that our concerted efforts will control the virus and cause it to subside. But the world doesn't need to wait for that day to see how America remains a force for good throughout the globe.

AMERICAN OVERSIGHT

DEFINING THE COMPONENTS AND MINIMAL CAPABILITIES OF COMPREHENSIVE STATE AND LOCAL VECTOR-BORNE DISEASE PREVENTION AND CONTROL PROGRAMMING

PROJECT SUMMARY

2019 – 2020

AMERICAN OVERSIGHT

EXECUTIVE SUMMARY

In 2019 – 2020, SGNL Solutions (SGNL), in consultation with the Council of State and Territorial Epidemiologists (CSTE) and with the financial support from the Centers for Disease Control and Prevention (CDC), National Center for Emerging and Zoonotic Infectious Diseases (NCEZID), Division of Vector-Borne Diseases (DVBD), facilitated a consensus process with local, state, and national level stakeholders to identify the components and capabilities of a comprehensive approach framework (the framework) to reduce illness and death from vector-borne diseases (VBD). SGNL also analyzed available data to attempt to determine the cost of resources needed to support a comprehensive approach in VBD programs at both the minimal and optimal performance levels. SGNL employed an iterative, consensus-based, mixed-methods approach involving five conference calls with an expert working group, two in-person workshops, an online self-assessment, key informant interviews, and an extensive information gathering and analysis process. Through this process, six components with numerous sub-components and associated minimal capabilities were developed. The process also revealed several challenges, namely an absence of necessary measures and data needed to conduct a cost analysis. SGNL also sought to coordinate the framework with CDC's effort to develop a national strategy for VBD prevention, but given the timing of CDC's strategy development, this coordination was not accomplished. Future alignment between efforts could help strengthen the national VBD strategy and further improve the framework.

AMERICAN OVERSIGHT

BACKGROUND

Vector-borne diseases (VBDs) are caused by infective pathogens that are transmitted by living organisms (e.g., ticks, mosquitos, fleas) between humans or from animals to humans. VBDs are a major public health concern in the United States. Between 2004 and 2016, more than 640,000 cases of VBDs were reported in the United States, and 9 new germs spread by bites from infected mosquitoes and ticks were discovered or introduced domestically.[1] Disease cases from mosquito, tick, and flea bites tripled in the United States during this period. Since 2014, major outbreaks of dengue, malaria, chikungunya, yellow fever, and Zika have afflicted populations, claimed lives, and overwhelmed health systems across the globe. While the United States has not yet experienced this level of VBD outbreak, recent reports by the Centers for Disease Control and Prevention (CDC) indicate that the number of cases of domestic VBDs has increased, emerging VBDs pose a rising threat, and jurisdictions have limited capacity to respond.[2] In an assessment conducted by the National Association of County and City Health Officials (NACCHO), 84% of state and local health departments and vector control organizations (the nation's main defense against VBDs) need improvement in at least one core competency area based on the standards for vector control competency developed and promoted by the CDC and American Mosquito Control Association (AMCA).[3] In most jurisdictions across the United States, a comprehensive approach to VBD prevention requires a system in which multiple partners (private, public, and academic) contribute resources and perform mutually reinforcing activities to meet common goals. However, consensus over what constitutes such a comprehensive, jurisdiction-wide approach has not yet been reached.

PROJECT APPROACH

In 2019, SGNL Solutions (SGNL), in consultation with the Council of State and Territorial Epidemiologists (CSTE) and with the financial support from the CDC's National Center for Emerging and Zoonotic Infectious Diseases (NCEZID), Division of Vector-Borne Diseases (DVBD), facilitated a consensus process with local, state, and national level stakeholders to identify the components and capabilities of a comprehensive approach framework (the framework) to reduce illness and death from vector-borne diseases. SGNL also analyzed available data to determine the cost of resources needed to support a comprehensive vector-borne disease program at both the minimal and optimal performance levels. The original Scope of Work can be found in Box 1.

Timeline

The initial project timeframe was February 15, 2019 to July 31, 2019. However, the contract was extended to December 31, 2019 to provide additional time to coordinate with and be informed by CDC's effort to develop a national strategy for VBD. The project was extended a second time to July 31, 2020 to allow for time to present the findings to the workgroup.

Key Terms

Burden of Disease	Disease burden is the impact of a health problem as measured by financial cost, mortality, morbidity, or other indicators.
Components	Elements and structures that make up a vector-borne disease (VBD) system within a jurisdiction (e.g., city, county, territory, state)
Capabilities	Specific activities/functions within each component that entities of a VBD system within a jurisdiction should be able to collectively perform
Competencies	The specific knowledge, skills, and abilities needed or possessed by individuals within entities of a VBD system within a jurisdiction

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005004

Disability-Adjusted Life Year (DALY)	the sum of the Years of Life Lost (YLL) due to premature mortality in the population and the Years Lost due to Disability (YLD) for people living with the health condition or its consequences
Quality-adjusted life years (QALYs)	a measure of disease burden, including both the quality and the quantity of life lived

BOX 1 – SCOPE OF WORK

SGNL Solutions will develop a consensus definition of the key elements for a comprehensive state and local vector-borne disease program. This definition will define the core components and competencies needed for each key element to include a range from minimal to optimal performance. SGNL Solutions will lead a workgroup with relevant stakeholders, including federal, state, and local epidemiologists and members of partner organizations to assess existing vector-borne disease programs of varying sizes and vector-borne disease burden. SGNL Solutions will also analyze available data and complete a cost analysis of the resources needed to support a comprehensive vector-borne disease program at both the minimal and optimal performance levels. SGNL Solutions will develop a report, a manuscript suitable for publication in a peer-reviewed journal, and a webinar presentation with key findings.

AMERICAN OVERSIGHT

ACTIVITIES, METHODS, AND PROCESS

SGNL designed and undertook an iterative, consensus-based, mixed-methods process to achieve the project goals. SGNL enlisted the support of the CSTE Vector-Borne Diseases (VBD) Subcommittee and additional national partners (together constituting "the workgroup") and CDC to inform the project activities. Activities included an environmental scan, workgroup conference calls, in-person stakeholder workshops, and an assessment. Descriptions of each activity are provided below. After the process, most workgroup members agreed that components in the framework represented a comprehensive VBD prevention approach and that the minimal capabilities could be considered appropriate as minimal performance.

Workgroup Calls

SGNL conducted five conference calls (see Appendix A for workgroup member list). During each call, the workgroup provided feedback on the current draft of the framework. Audio recordings of the workgroup calls are included with the submission of this report. The first and second workgroup calls oriented the workgroup members to the project goals and offered an opportunity to ask clarifying questions to CDC. The following questions were explored:

- What is CDC's vision for VBD control and prevention?
- What is the vision for VBD control and prevention from the perspective of workgroup members? Does this match CDC's vision?
- What is the purpose of the comprehensive VBD program core components and capabilities?
- What is the mission of a comprehensive VBD program?
    - What are the desired outcomes?
- How do we define comprehensive?

AMERICAN OVERSIGHT

    - Do we include public, private, and academic?
- What factors influence variability in VBD programs?
- What costs are involved with various program components and are data available to be shared?

The third and fourth workgroup calls focused reviewing revisions to the framework and gaining a better understanding of VBD program costs in local and state jurisdictions. The following questions were explored:

- Is the component done by the health department (HD), another governmental entity, or by an external party?
- If done by HD or governmental entity, how many FTEs support the component?
- What is/are the funding source(s) for the component?

The objective of the fifth workgroup call was to validate the revised framework and core capabilities.

Environmental Scan

SGNL conducted an extensive discovery and analysis process based on available reports, data, and evaluations of domestic VBD prevention programming, VBD burden, and associated resource costs. SGNL also provided the workgroup access to an online document repository to submit relevant documents. The environment scan aimed to answer the following questions.

- How do we define vector and VBD?
- What do we know about VBD programs? Have descriptive studies of state or local programs been conducted?

AMERICAN OVERSIGHT

- Have assessments of state or local program capabilities occurred (surveillance, epi, prevention, mitigation)?
- Do related comprehensive components or core capabilities exist?
- What else might we need to align with (federal guidelines, existing standards from Association for Public Health Laboratories, CSTE, Public Health Accreditation Board)?
- What are examples of standards/core components/capabilities that are adaptable?

In-Person Workshops

SGNL held two in-person stakeholder workshops (see Appendix C) for agendas and facilitation guides). The first in-person exploratory workshop was with stakeholders at NACCHO's 2019 Vector Summit. The workshop objectives were to:

- Identify components of a comprehensive VBD program
- Identify capabilities, or specific activities and functions, for various components
- Determine the extent to which components and capabilities are essential or adaptable (can be changed to meet local needs without compromising effectiveness)?

Approximately 15 attendees from local, state, and private/semi-private organizations participated in the workshop. Attendees were provided context and led through a concept mapping process. Although SGNL staff used the then current draft of the Framework to design the discussion, attendees were not asked to review and respond to the draft in order to gather unbiased reactions. Following this workshop, SGNL organized and facilitated a second

AMERICAN OVERSIGHT

in-person workshop with personnel from CDC DVBD. Objectives for this workshop were to:

- Identify the vectors of concern, categorized by core, enhanced, and comprehensive
- Identify the vector borne diseases of concern, categorized by core, enhanced, and comprehensive
- Explore the possible program components employed to address the vectors and VBDs of concern, categorized by core, enhanced, and comprehensive

This workshop resulted in a more refined definition of the minimal capabilities within the comprehensive framework that should be exercised in state and local jurisdictions.

Online Self-Assessment

SGNL designed and administered an online self-assessment based on the framework to determine to what extent the components and capabilities were present in range of jurisdictions and to understand the resources and funding associated with those components and capabilities. Nineteen workgroup members responded to the online assessment. The full instrument and findings can be found in Appendix B. The assessment was designed to explore the following questions.

- Did the respondent's organization perform any surveillance, prevention, or control activities related to six vectors of concern (mosquitoes, ticks, and fleas, and triatominae/kissing bugs, lice, and deer flies)?
- Did the respondent's organization perform any surveillance, prevention, or control activities related to 30 VBDs?

AMERICAN OVERSIGHT

- To what extent were the framework components present in their jurisdiction through the work of the health departments or other organizations?
- Who in their jurisdiction (whether their organization or another organization) was primarily responsible for the core capabilities?
- How did their organization fund the VBD-related efforts performed in the current budget year?
- What were the sources of funding, number of FTEs, types of activities, and infrastructure supported by the funding?

It should also be noted that throughout this project, SGNL made an effort to coordinate our findings and products with CDC's effort to develop a national strategy for VBD prevention. However, the national strategy development process is still underway, so we were not able to align the framework with that effort in the given timeline.

AMERICAN OVERSIGHT

FRAMEWORK OF COMPONENTS AND MINIMAL CAPABILITIES OF COMPREHENSIVE STATE AND LOCAL VBD PREVENTION AND CONTROL PROGRAMMING

Through the activities, methods, and processes undertaken by SGNL, the following framework of the components and minimal capabilities within a comprehensive approach to state and local VBD prevention and control was developed. Our findings indicate that in most jurisdictions across the United States, a comprehensive approach to VBD prevention requires a system in which multiple partners (private, public, and academic) contribute resources and perform mutually reinforcing activities to meet common (though possibly uncoordinated) VBD prevention and control goals. Therefore, rather than focusing entirely on the activities of state and local health departments, this framework reflects the components and minimal capabilities of a system of stakeholders jointly contributing towards VBD prevention and control.

Key Terms

- Components are elements and structures that make up a VBD system within a jurisdiction (e.g., city, county, territory, state).
- Minimal capabilities are specific activities and functions within each component that entities of a VBD system within a jurisdiction should be able to collectively perform.

These components and minimal capabilities are not listed in order of priority.

COMPONENT 1: A designated, functioning mechanism for convening system partners to coordinate VBD efforts.

1.1: Leadership that is knowledgeable and supportive of efforts to address VBD
1.2: A convening entity or mechanism (e.g., program, multi-partner collaborative)
1.3: A plan to address VBD in jurisdiction

AMERICAN OVERSIGHT

Minimal Capabilities

- Identify, access, and educate leaders within the jurisdiction.
- Identify priorities based on surveillance data and public perceptions.
- Include VBD in an all hazards planning process within the jurisdiction.
- Identify and interact with other VBD stakeholders within the jurisdiction.
- Develop a comprehensive and coordinated strategy for VBD efforts within the jurisdiction.

COMPONENT 2: Resources (e.g., facilities, staffing, partnerships, and funding) that can be used and leveraged to support and sustain VBD prevention efforts.

2.1: Facilities, infrastructure, and materials necessary to address VBD
2.2: Staff that possess the core competencies and qualifications necessary to effectively address VBD
2.3: Sustainable, right-sized funding to support VBD prevention
2.4: Partnerships, collaborations, and/or agreements with key local, regional, and state, national, and private sector organizations

Minimal Capabilities

- Maintain a database for VBD related data (e.g., case reporting, surveillance, and analysis).
- Utilize a data transmission mechanism (e.g., HL7).
- Assign epidemiology staffing to support VBD programming.
- Assign laboratory staffing to support VBD programming.
- Assign communications staffing to support VBD programming.

COMPONENT 3: Surveillance system aimed at the accurate and timely measurement of vector ecology and patterns of disease.

3.1: Data collection mechanisms (e.g., pathogen, serological, clinical, syndromic, ecology, vector, risk factors)
3.2: Analysis mechanisms (e.g., laboratory, informatics, GIS)
3.3: Staff that possess the core competencies and qualifications to interpret analysis outputs
3.4: Established mechanisms for disseminating surveillance information to leadership, collaborators, and the public

Minimal Capabilities

- Maintain general awareness of vector distribution
- Collect VBD case reports from providers.

AMERICAN OVERSIGHT

- Confirm VBD cases.
- Transmit case information as required by local, state, and national regulations.
- Conduct routine surveillance activities at local, state, and national levels.

COMPONENT 4: System that makes use of mutually reinforcing, data-driven, evidence-based actions to reduce VBD morbidity and mortality.

4.1: Routine review of local data regarding ecology, disease transmission, and other factors (e.g., resistance, public perceptions, resources) to select appropriate prevention and control strategies
4.2: Evidence-based practices related to communication, education, and outreach to the public regarding risk and preventive strategies
4.3 Evidence-based practices related to vector control including environmental alterations (improved design or operation of infrastructure), chemical, physical and cultural control
4.4 Consideration of the public health and ecological impacts on VBD of established and proposed laws, regulations, and infrastructure development, and the enforce laws and regulations that affect VBD

Minimal Capabilities

- Provide timely information about specific risks and comprehensive mitigation strategies to the public, partners, and decision makers.
- Ensure use of a comprehensive menu of evidence-based interventions and adaptation considerations options across social ecological model.

COMPONENT 5: Prepared to react to novel VBD situations (e.g., outbreak).

5.1: Defined risk scenarios based on local data (e.g., jurisdictional characteristics, stakeholder perceptions)
5.2: An early warning system in which reception of predefined signals (e.g. novel vector, novel VBD above norm for place or time, unexpected increase of known vector or VBD, situation exceeding capacity to respond) triggers interventions
5.3: Authorities and collaborators prepared for outbreaks of diseases prior to their arrival

Minimal Capabilities

- Identify risks (vectors, diseases, ecology, public perceptions).

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005013

- Determine thresholds for response.
- Activate communication mechanism when response is triggered.

COMPONENT 6: Evaluation and continuous improvement of VBD processes, programs, and interventions.

6.1: Evaluation of interventions and technologies in practice
6.2: Development and testing of possible new interventions and technologies
6.3: Dissemination of findings from evaluation for local improvements
6.4: Contribution of findings to the evidence base of the field

Minimal Capabilities

- Formally evaluate VBD processes, outputs, and outcomes.
- Use evaluation findings to improve VBD efforts.

CHALLENGES TO DEFINING A COMPREHENSIVE APPROACH

Reaching agreement over several key project concepts and definitions presented significant challenges to the workgroup and slowed the framework development process. Most difficult was reaching consensus on the breadth of a comprehensive VBD prevention approach. Specifically, is a comprehensive approach exclusive to state and local health departments or is it inclusive of the entire system (i.e., state and local health departments and other stakeholders)? Similarly, the workgroup heavily debated the meaning of the term core components. For example, the inclusion of academic research and product development and testing (e.g., field testing and evaluating new mitigation products by private entities) was a point of contention. Some workgroup members agreed that this element was essential, or core, to a comprehensive approach while others were reluctant to include an activity that their health departments did not currently include in their VBD prevention efforts. However, it is our belief, and one that was confirmed through discussions with CDC, that in most jurisdictions across the United States, a comprehensive approach to VBD prevention requires a system in which multiple partners (private, public, and academic) contribute resources and perform mutually reinforcing (though not necessarily coordinated or through formal partnerships) activities to meet common

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005014

goals. We understood this to mean that our charge was to define all the components that could be done in a jurisdiction, or affected by, public, private, and academic partners as core. The proposed framework reflects this.

These difficulties may be related to the composition of the workgroup itself, which included mostly state (75%) and local (6%) VBD health department stakeholders and national association representatives (19%). Also, because VBD concerns are variable by geographic area, needs can differ widely state to state. Therefore, consensus about what should be considered a comprehensive VBD prevention approach could be better framed regionally, rather than nationally. Furthermore, if academic or private sector partners were also involved, we may have found more agreement with a system wide approach.

Interestingly, when polled individually via an online self-assessment, most workgroup members indicated that all the framework components were either primarily performed by their organization or by another organization within their jurisdiction, confirming a system of stakeholders providing reinforcing activities. There are limitations in the findings from the online self-assessment. Because the respondents were all members of the workgroup, the state health department perspectives were most dominant. Greater representation of local public health, academic, and private sector respondents in the self-assessment may have yielded more diverse results.

Another challenge involved determining which capabilities constituted minimal to optimal performance. Workgroup agreement over what should be considered minimal or optimal performance was not reached, nor were we able to achieve clarity from CDC on what constitutes “optimal”. This reluctance within the workgroup could be related to perceived negative undertones related to the terms “minimal” and “optimal”, and possible future judgments or consequences (i.e. financial). With the help of CDC, we did define minimum desired capabilities within the components. Again, when

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005015

polled individually via the online self-assessment, most workgroup members indicated that nearly all the minimum capabilities in the framework were done in their jurisdictions. However, without a clearly defined definition of “optimal”, we were unable to derive the upper end of this performance range.

AMERICAN OVERSIGHT

CHALLENGES PREVENTING A COST ANALYSIS

SGNL was charged with analyzing available data and completing a retrospective cost analysis of the resources needed to support a comprehensive vector-borne disease program at both the minimal and optimal performance levels. However, a cost analysis was not possible given the information available at the time of this project.

A cost analysis involves the systematic collection, categorization, and analysis of costs (resources and inputs) associated with a public health program or intervention. Resources and inputs include the labor, buildings, supplies, and equipment used in the delivery of a program. A cost analysis must also consider both the financial and economic costs. Financial costs are those most easily ascertained, such as those in included in a program budget or department expenditure data. Economic costs are costs that exist but may not involve a direct exchange of funding from the program or is provided by another partner in the system. These costs have monetary value but are often hidden. Considering both types costs in a cost analysis is important, doing otherwise will result in an incomplete picture of the resources involved in a program. Such an analysis is not meant to include the change in health outcomes (e.g., morbidity and mortality) and whether the program was effective (e.g., cost benefit analysis). A cost analysis answers the following questions:

1. How much does it cost to implement a program or intervention?
2. Where do the resources to cover the cost come from (the state and local public health system, CDC's, or all parties involved in a comprehensive approach to VBD prevention)?
3. What are the program and cost categories involved?

We undertook several data gathering methods to gather the information needed for the cost analysis. We dedicated large portions of five workgroup calls to discussing program costing and asked cost and funding specific questions in the online self-assessment. SGNL also gathered publicly available VBD program budget documents for some states (California and

AMERICAN OVERSIGHT

Florida) and local jurisdictions. We made multiple requests to workgroup members for cost-related data but received none. We also reviewed the Epidemiology and Laboratory Capacity (ELC) funding amounts provided by CDC, but that data only showed what was awarded by CDC to the jurisdictions, not the total cost of jurisdiction VBD programming. We gathered data on vector prevalence and disease cases across jurisdictions of various sizes and sought VBD programming budgets for those jurisdictions. While this information and data gathered afforded some insight into costing of individual VBD programs, these efforts did not provide enough data to reveal a pattern to programming cost consistent across jurisdictions and states. No discernable pattern or indicators, such vector prevalence, disease prevalence, cost of the diseases, mortality, morbidity, jurisdiction spending per capita, or FTEs per $100,000 in funding, emerged to help us understand costs or budgeted amounts that could be compared across jurisdictions as part of a cost analysis. Funding for VBD programming seemed to be determined less by measurable, outcome-driven factors and more by perception of risk and political motives and pressures. Our task was further complicated in that it involved not only an accounting of the actual costs associated with a single jurisdiction’s VBD prevention programming, but also an analysis of the costs of a proposed comprehensive VBD approach that had not been fully vetted by all system stakeholders at minimal and optimal performance levels, which had not yet been defined.

A cost analysis is an important undertaking and could help ensure adequate and strategic funding of VBD prevention programs. While a cost analysis was not possible at this time given the information available to SGNL, an effort could be made in the future once program performance levels are defined and the comprehensive approach components (an output of this project) are better socialized and used within program budgets and CDC funding opportunities. In addition, a cost benefit analysis that involves correlated costs to benefits or outcomes (e.g., population size, vector and

AMERICAN OVERSIGHT

disease prevalence, mortality, morbidity, disability adjusted life years, quality of life years) would further support the CDC's mission.

AMERICAN OVERSIGHT

RECOMMENDATIONS

Overall, workgroup members, in-person workshop participants, and other consulted stakeholders seemed supportive of the effort to define the components of comprehensive VBD prevention approaches. Furthermore, we found that most agreed with the current framework as drafted. However, additional steps could be taken to improve upon the framework and to conduct a cost analysis. The following recommendations are not listed in order of priority and can be completed independent of other recommendations.

Components of a Comprehensive VBD Prevention Approach

- Define "optimal" capabilities for each component.
- Define metrics necessary to assess performance across a minimal to optimal capability range.
- Conduct additional pilot tests, especially with local, academic, and private sector representatives, to collect feedback on and further refine the framework.
- Use the framework to inform CDC's effort to develop a national strategy for VBD to ensure alignment of concepts and consistency of terminology.
- Make use of the framework components as programming categories within CDC's ELC funding opportunity.

Costs of a Comprehensive VBD Approach

- Define indicators beyond case incidence, such as DALYs and QALYs associated with VBD in the United States, that could be compared across jurisdictions.
- Develop and require/encourage the use of a standard approach (which includes the costs of all involved parties in the VBD prevention

AMERICAN OVERSIGHT

systems) to conduct a cost analysis for use by local and state VBD programs receiving ELC funding.

- Make use of such a standard cost analysis as part of the ELC funding process.

APPENDIX B: VBD PROGRAM SELF-ASSESSMENT AND FINDINGS

ONLINE SELF-ASSESSMENT INSTRUMENT

Thank you for agreeing to take part in this assessment exploring the components, capabilities, and resourcing of state and local approaches to reduce illness and death from vector-borne diseases (VBD).

We recognize that in most jurisdictions, VBD prevention requires a system in which multiple partners contribute resources and perform mutually reinforcing activities to meet common goals. As such, you will be asked questions related to your own organization and your partners. Your responses will be compiled and used only in the aggregate with no individual attribution. The assessment is expected to take approximately 30 minutes to complete.

If you have questions about this assessment, please contact the project director, Justin Snair, at jsnair@sgnl.solutions. Please click the red button below to begin the assessment.

AMERICAN OVERSIGHT

Q22 Indicate which funding sources support VBD-related efforts performed by your organization.

- ☐ Local government budget (e.g., taxes, assessments, fees)
- ☐ State government budget (e.g., taxes, assessments, fees)
- ☐ Federal sources (routine/core funding direct or passed through state)
- ☐ Federal sources (supplemental/emergency funding direct or passed through state)
- ☐ Private foundations (e.g., grants)
- ☐ Other _____

AMERICAN OVERSIGHT

Q23 To the best of your ability, provide information about each type of funding that you receive or leverage for VBD-related efforts.

	Source Description	$ Amount	# FTE Supported	Activities Supported	Infrastructure/ Materials Supported
Q22 = Local government budget (e.g., taxes, assessments, fees) Local government budget (e.g., taxes, assessments, fees)					
Q22 = State government budget (e.g., taxes, assessments, fees) State government budget (e.g., taxes, assessments, fees)					
Q22 = Federal sources (routine/core funding direct of passed through state) Federal sources (routine/core funding direct or passed through state)					

AMERICAN OVERSIGHT

Q22 = Federal sources (supplemental/emergency funding direct or passed through state) Federal sources (supplemental/emergency funding direct or passed through state)					
Q22 = Private foundations (e.g., grants) Private foundations (e.g., grants)					
Q22 = Other Other

AMERICAN OVERSIGHT

Q10 - We recognize that in most jurisdictions a comprehensive approach requires a system in which multiple partners contribute resources and perform mutually reinforcing activities to meet common goals. Components are the elements and structures that make up a vector-borne disease (VBD) system within a jurisdiction (e.g., city, county, territory, state). Capabilities are the specific activities/functions within each component that entities of a VBD system within a jurisdiction should be able to collectively perform. Consider all of the organizations and programs in your jurisdiction that work to reduce VBD morbidity and mortality. Indicate the extent to which you agree with each component statement.

#	Field	Minimum	Maximum	Mean	Std Deviation	Variance	Count
1	Component 1: My jurisdiction has a designated, functioning mechanism for convening partners to plan and coordinate VBD efforts.	1.00	5.00	1.72	1.04	1.09	18
2	Component 2: My jurisdiction has resources (e.g., facilities, staffing, partnerships, and funding) that can be used and leveraged to support and sustain VBD prevention efforts	1.00	4.00	1.83	0.76	0.58	18

AMERICAN OVERSIGHT

3	Component 3: My jurisdiction has a surveillance system aimed at the accurate and timely measurement of the introduction of vectors and pathogens and the incidence of disease.	1.00	4.00	1.83	0.96	0.92	18
4	Component 4: My jurisdiction makes use of mutually reinforcing, data-driven, evidence-based actions to reduce VBD morbidity and mortality.	1.00	4.00	1.61	0.83	0.68	18
5	Component 5: My jurisdiction is prepared to react to novel VBD situations (e.g., outbreak).	1.00	4.00	1.78	0.85	0.73	18
6	Component 6: My jurisdiction evaluates and	1.00	4.00	1.83	0.83	0.69	18

AMERICAN OVERSIGHT

	continuously improve its VBD processes, programs, and interventions.

APPENDIX C: WORKSHOP AGENDAS AND FACILITATION GUIDES

Exploring the Core Components of a Comprehensive Vector-Borne Disease Program

Vector Summit | Facilitated Session | 1:00 – 4:00 pm | April15, 2019 |

Session Objectives

- Identify key components of a comprehensive vector-borne disease program
- Identify capabilities, or specific activities and functions, for various components
- Determine the extent to which components and capabilities are essential or adaptable (can be changed to meet local needs without compromising effectiveness)?

Agenda-in-Brief

Day 1	
1:00 PM	Welcome & Introductions
1:15 PM	Context
1:30 PM	Components
2:15 PM	Break
2:30 PM	Capabilities
3:45 PM	Next Steps
4:00 PM	Adjourn

AMERICAN OVERSIGHT

Facilitation Guide

Block	Activity/Talking Points	Notes/Supplies
12:00 PM (60 minutes)	<u>Final Prep</u> ● Sign in sheet ● Materials (packets) ● Check AV ● Queue slides ● Position facilitation supplies ● Table/chair set up	
1:00 PM (15 minutes) Aims ● Orient participants to the space and agenda ● Prepare participants for interactions ● Set expectations for day	<u>Welcome and Introductions</u> ● Welcome – **Justin Snair** with support from **Jordan Peart** ● **Laura Runnels** introduces herself and leads a round of introductions with participants ● **Laura** orients participants to the day of work ○ Amenities: parking, breaks, bathrooms, private space, water, food, wifi, outlets, suitcases ○ Emergency Procedures: shelter in place, evaluation ○ Meeting Objectives (flip chart) ○ Format: Combination of presentations and discussions ○ Agenda Review (flip chart) ○ Materials Provided: ○ Outputs: Meeting proceedings ○ Ground Rules (flip chart) ▪ WAIT (Why Am I Talking) ▪ Be present (limit device use & side conversations; participate) ▪ Be transparent (share information openly) ▪ Be curious (limit gut	Flip chart Markers

From Eric Hargarten- HHS

Hi all -

We wanted to notify you that the provided supplies will arrive at the shipping locations you provided as early as 8 AM EST and as late as 8 PM EST today (Wednesday March 18th). Upon arrival the driver will contact the shipping point of contact you provided.

A few other important notes about the shipments and what to expect:

- **Shipment details**: Testing kits are coming from Henry Schein and other supplies will come from the following companies: McKesson, Medline (FedEx), Uline (UPS), Grainger (UPS), DuPont (UPS), Taylor Communications (UPS)
    - Some deliveries will be on pallets or skids, smaller shipments will not (for example, bar code labels will not be on skids)
- **Delivery timelines:** all **ESTIMATES** based on latest information:
    - By COB Wednesday: Henry Schein, McKesson, Uline, Grainger, DuPont, Medline
    - By 10:30 am Thurs: Taylor Communications (bar code labels)

Please note that due to the extraordinary circumstances we are trying to provide the most accurate and comprehensive information, but things are subject to change. We will provide updates in the morning and evening on Wednesday.

Thank you

Eric Hargarten

The above chart depicts the types and amounts of PPE required per 7 day, 14 day, and 31 da

Walkthrough:

- **Current hospitalization rates are holding at ~ 20% of positive cases. (Currently, CO is below 100)**
- **CDC default estimate is 2 Drs, 2 Nurses, and 4 other associated personnel (Techs, etc…). Beckers Hospital statistics indicate between 7-8 Full Time Employees per bed and reinforces the number of staff used.**
- **CDC PPE Calculator (for Ebola) is a usable approximation of PPE for COVID cases.**

The above numbers can serve as a "recurring" supply requirement based on "burn rate" calculations largely established by CDC standards. Recommend re-running the calculator with updated data as needed.

Recommend: Establish PPE recurring resupply at a 14 or 31 day frequency which would allow the State to both adjust to increasing requirements as well as redistribute quantities to meet dynamic need.

Contains Nonbinding Recommendations

Temporary Policy for Preparation of Certain Alcohol-Based Hand Sanitizer Products During the Public Health Emergency (COVID-19) Guidance for Industry[2]

This guidance represents the current thinking of the Food and Drug Administration (FDA or Agency) on this topic. It does not establish any rights for any person and is not binding on FDA or the public. You can use an alternative approach if it satisfies the requirements of the applicable statutes and regulations. To discuss an alternative approach, contact the FDA office responsible for this guidance as listed on the title page.

I. INTRODUCTION

The Food and Drug Administration (FDA or Agency) plays a critical role in protecting the United States from emerging infectious diseases, such as the Coronavirus Disease 2019 (COVID-19) pandemic. FDA is committed to providing timely guidance to support continuity and response efforts to this pandemic.

FDA is issuing this guidance in response to a number of queries from entities that are not currently licensed or registered drug manufacturers that would like to prepare alcohol-based hand sanitizers, either for public distribution or for their own internal use. The Agency is issuing this guidance to communicate its policy for the temporary preparation of certain alcohol-based hand sanitizer products by firms that register as over-the-counter (OTC) drug manufacturers to prepare alcohol-based hand sanitizers under the circumstances described in this guidance ("firms") for the duration of the public health emergency declared by the Secretary of Health and Human Services (HHS) on January 31, 2020.[3] At such time when the public health emergency is over, as declared by the Secretary, FDA intends to discontinue this enforcement discretion policy and withdraw this guidance.

[2] This guidance has been prepared by the Center for Drug Evaluation and Research at the Food and Drug Administration. FDA has issued a separate guidance for industry entitled Policy for Temporary Compounding of Certain Alcohol-Based Hand Sanitizer Products During the Public Health Emergency (March 2020), that describes the Agency's policy for the temporary compounding of certain alcohol-based hand sanitizer products by pharmacists in State licensed pharmacies or Federal facilities and registered outsourcing facilities. The compounding guidance is available at https://www.fda.gov/regulatory-information/search-fda-guidance-documents/policy-temporary-compounding-certain-alcohol-based-hand-sanitizer-products-during-public-health. We update guidances periodically. For the most recent version of a guidance, check the FDA guidance web page at https://www.fda.gov/regulatory-information/search-fda-guidance-documents.

[3] The HHS Public Health Emergency Declaration is available at https://www.phe.gov/emergency/news/healthactions/phe/Pages/2019-nCoV.aspx.

AMERICAN OVERSIGHT

FL-DOH-20-0673-A-005110

Given this public health emergency, this guidance is being implemented without prior public comment because the FDA has determined that prior public participation for this guidance is not feasible or appropriate (see section 701(h)(1)(C)(i) of the Federal Food, Drug, and Cosmetic Act (FD&C Act) (21 U.S.C. § 371(h)(1)(C)(i)) and 21 CFR § 10.115(g)(2)). This guidance document is being implemented immediately, but it remains subject to comment in accordance with the Agency's good guidance practices.

In general, FDA's guidance documents do not establish legally enforceable responsibilities. Instead, guidances describe the Agency's current thinking on a topic and should be viewed only as recommendations, unless specific regulatory or statutory requirements are cited. The use of the word *should* in Agency guidances means that something is suggested or recommended, but not required.

II. BACKGROUND

There is currently an outbreak of respiratory disease caused by a novel coronavirus that was first detected in Wuhan City, Hubei Province, China, and that has now spread globally, to include the United States. The virus has been named "SARS-CoV-2" and the disease it causes has been named "Coronavirus Disease 2019" (COVID-19). On January 31, 2020, the Department of Health and Human Services (HHS) issued a declaration of a public health emergency related to COVID-19 and mobilized the Operating Divisions of HHS.[4] In addition, on March 13, 2020, the President declared a national emergency in response to COVID-19.[5]

Hand hygiene is an important part of the U.S. response to COVID-19. Washing hands often with soap and water for at least 20 seconds is essential, especially after going to the bathroom; before eating; and after coughing, sneezing, or blowing one's nose. If soap and water are not readily available, the Centers for Disease Control and Prevention (CDC) recommends consumers use an alcohol-based hand sanitizer that contains at least 60 percent alcohol (also referred to as ethanol or ethyl alcohol).[6]

---

[4] Secretary of Health and Human Services Alex M Azar, Determination that a Public Health Emergency Exists. (Jan. 31, 2020), *available at* https://www.phe.gov/emergency/news/healthactions/phe/Pages/2019-nCoV.aspx).

[5] Proclamation on Declaring a National Emergency Concerning the Novel Coronavirus Disease (COVID-19) Outbreak (Mar. 13, 2020), *available at* https://www.whitehouse.gov/presidential-actions/proclamation-declaring-national-emergency-concerning-novel-coronavirus-disease-covid-19-outbreak/.

[6] Isopropyl alcohol and ethyl alcohol are two of the active ingredients currently being evaluated by FDA as part of its review of over-the-counter (OTC) monographs for hand sanitizers for use in reducing bacteria on the skin that potentially can cause disease or decreasing bacteria on the skin. See "Safety and Effectiveness of Consumer Antiseptic Rubs; Topical Antimicrobial Drug Products for Over-the-Counter Human Use," Final Rule, 84 FR 14847 (April 12, 2019); "Safety and Effectiveness of Health Care Antiseptics; Topical Antimicrobial Drug Products for Over-the-Counter Human Use," Final Rule, 82 FR 60474 (December 20, 2017); "Topical Antimicrobial Drug Products for Over-the-Counter Human Use; Tentative Final Monograph for Health-Care Antiseptic Drug Products," Proposed Rule, 59 FR 31402 (June 17, 1994) (1994 TFM).

AMERICAN OVERSIGHT

III. DISCUSSION

We understand that some consumers and health care professionals are currently experiencing difficulties accessing alcohol-based hand sanitizers. We are also aware of reports that some consumers are producing hand sanitizers for personal use in their homes; the Agency lacks verifiable information on the methods being used to prepare such products and whether they are safe for use on human skin.

In response to the demand for alcohol-based sanitizers, certain entities that are not currently regulated by FDA as drug manufacturers have requested guidance on the preparation and distribution of hand sanitizer products for the public's use.

Because of the public health emergency posed by COVID-19, FDA does not intend to take action against firms[7] that prepare alcohol-based hand sanitizers for consumer use and for use as health care personnel hand rubs for the duration of the public health emergency declared by the Secretary of HHS on January 31, 2020, provided the following circumstances are present:

1. The hand sanitizer is manufactured using only the following United States Pharmacopoeia (USP) grade ingredients in the preparation of the product (percentage in final product formulation) consistent with World Health Organization (WHO) recommendations:[8]
    a. Alcohol (ethanol) (USP or Food Chemical Codex (FCC) grade) (80%, volume/volume (v/v)) in an aqueous solution denatured according to Alcohol and Tobacco Tax and Trade Bureau regulations in 27 CFR part 20; **or** Isopropyl Alcohol (75%, v/v) in an aqueous solution.[9]
    b. Glycerol (1.45% v/v).[10]
    c. Hydrogen peroxide (0.125% v/v).
    d. Sterile distilled water or boiled cold water.

    The firm does not add other active or inactive ingredients. Different or additional ingredients may impact the quality and potency of the product.

---

[7] Specifically, FDA does not intend to take action against firms, for the duration of the public health emergency declared by the Secretary of HHS on January 31, 2020, for violations of sections 501(a)(2)(B), 502(f)(1), 505, or 582 of the FD&C Act (21 U.S.C. §§ 351(a)(2)(B), 352(f)(1), 355, and 360eee-1).

[8] The 1994 TFM is available at https://www.gpo.gov/fdsys/pkg/FR-1994-06-17/html/94-14503.htm. WHO's recommendations, titled "Guide to Local Production: WHO-recommended Handrub Formulations," are available at https://www.who.int/gpsc/5may/Guide_to_Local_Production.pdf.

[9] Consistent with the 1994 TFM, alcohol should be used in a final product concentration between 60-95% (v/v) in an aqueous solution denatured according to Alcohol and Tobacco Tax and Trade Bureau regulations in 27 CFR part 20; isopropyl alcohol should be used in a concentration between 70-91.3% (v/v). This guidance is consistent with WHO's recommended formulation specifications of 80% alcohol and 75% isopropyl alcohol.

[10] Although WHO's recommended formulation includes glycerol 1.45% (v/v), reports indicate that glycerol negatively impacts effectiveness of isopropyl alcohol (https://www.ncbi.nlm.nih.gov/pubmed/28670452), and reports studying the effectiveness of WHO's formulation have suggested a reduction from 1.45% to 0.725% (https://www.ncbi.nlm.nih.gov/pubmed/23388358/).

AMERICAN OVERSIGHT

2. The firm pays particular attention to ensure the ethanol or isopropyl alcohol active ingredient is correct and the correct amount of the active ingredient is used. A simple record should be used to document key steps and controls to assure each batch matches the formula developed for the drug product.

3. The hand sanitizer is prepared under sanitary conditions and equipment utilized is well maintained and fit for this purpose.[11]

4. The firm uses the most accurate method of analysis available at the site for verification of alcohol content in samples of the finished drug product before each batch is released for distribution. Methods can include gas chromatography (GC), alcoholmeter, hydrometer, or other chemical analysis of at least equivalent accuracy. The sample tested can be performed on in-process material before filling into the final containers to be distributed.

5. The hand sanitizer is labeled consistent with the attached labeling in Appendix A (Labeling for Ethyl Alcohol Formulation Consumer Use), Appendix B (Labeling for Isopropyl Alcohol Formulation Consumer Use), Appendix C (Labeling for Ethyl Alcohol Formulation Health Care Personnel Handrub Use), or Appendix D (Labeling for Isopropyl Alcohol Formulation Health Care Personnel Handrub Use).

6. Firms register their facility and list these products in the FDA Drug Registration and Listing System (DRLS, https://www.fda.gov/drugs/guidance-compliance-regulatory-information/drug-registration-and-listing-system-drls-and-edrls). Upon completion of registration and listing, firms receive automatic confirmation from the FDA and do not need to wait for a further communication from FDA before they begin to manufacture and distribute these products. FDA relies on registration and listing information to help manage drug shortages, monitor safety issues that may arise with product distributed to the public, and manage product recalls, among other important FDA public safety activities. Our help desk is standing by to assist with facilitating this process and can be contacted by sending an email to: edrls@fda.hhs.gov.

This policy does not extend to other types of products, such as: products (1) that use different active ingredients; (2) whose potency falls above or below the formulation described above; (3) that are marketed with claims that do not conform to the "Topical Antimicrobial Drug Products for Over-the-Counter Human Use; Tentative Final Monograph for Health-Care Antiseptic Drug Products," Proposed Rule, 59 FR 31402 (June 17, 1994) (e.g., pathogen-specific disease claims): (4) that are surgical hand rubs; or (5) whose labeling is false or misleading in any particular.

Firms will need to have a way to accept adverse event reports for any products they manufacture, and submit adverse event reports to FDA (for more information, please see FDA's guidance on adverse event reporting requirements, https://www.fda.gov/media/77193/download).[12]

[11] Facilities must prevent insanitary conditions under section 501(a)(2)(A) of the FD&C Act (21 U.S.C. § 351(a)(2)(A)).
[12] See Section 760 of the FD&C Act (21 U.S.C. § 379aa).

AMERICAN OVERSIGHT

FDA encourages consumers and health care professionals to report adverse events experienced with the use of hand sanitizers to FDA's MedWatch Adverse Event Reporting program:

- Complete and submit the report online; or
- Download and complete the form, then submit it via fax at 1-800-FDA-0178.

Simple Respiratory Protection—Evaluation of the Filtration Performance of Cloth Masks and Common Fabric Materials Against 20–1000 nm Size Particles

SAMY RENGASAMY[1]*, BENJAMIN EIMER[2] and RONALD E. SHAFFER[1]

[1]National Institute for Occupational Safety and Health/National Personal Protective Technology Laboratory—Technology Research Branch, 626 Cochrans Mill Road, Pittsburgh, PA 15236, USA; [2]Technology Research Branch, URS Corp., Pittsburgh, PA, USA

Received 4 February 2010; in final form 10 May 2010; published online 28 June 2010

A shortage of disposable filtering facepiece respirators can be expected during a pandemic respiratory infection such as influenza A. Some individuals may want to use common fabric materials for respiratory protection because of shortage or affordability reasons. To address the filtration performance of common fabric materials against nano-size particles including viruses, five major categories of fabric materials including sweatshirts, T-shirts, towels, scarves, and cloth masks were tested for polydisperse and monodisperse aerosols (20–1000 nm) at two different face velocities (5.5 and 16.5 cm s^{-1}) and compared with the penetration levels for N95 respirator filter media. The results showed that cloth masks and other fabric materials tested in the study had 40–90% instantaneous penetration levels against polydisperse NaCl aerosols employed in the National Institute for Occupational Safety and Health particulate respirator test protocol at 5.5 cm s^{-1}. Similarly, varying levels of penetrations (9–98%) were obtained for different size monodisperse NaCl aerosol particles in the 20–1000 nm range. The penetration levels of these fabric materials against both polydisperse and monodisperse aerosols were much higher than the penetrations for the control N95 respirator filter media. At 16.5 cm s^{-1} face velocity, monodisperse aerosol penetrations slightly increased, while polydisperse aerosol penetrations showed no significant effect except one fabric mask with an increase. Results obtained in the study show that common fabric materials may provide marginal protection against nanoparticles including those in the size ranges of virus-containing particles in exhaled breath.

Keywords: fabric material; H1N1; H5N1; infectious aerosol; influenza; pandemic; particle penetration; respiratory protection

INTRODUCTION

The outbreaks of avian influenza A (H5N1) and the recent novel influenza virus A (H1N1) pandemic are major health problems (WHO, 2006, 2009). To reduce exposure to infectious influenza aerosols, several government agencies and nongovernment organizations have recommended a number of nonpharmaceutical interventions, including respiratory protection. The Centers for Disease Control and Prevention (CDC) recommends the use of National Institute for Occupational Safety and Health (NIOSH)-approved respirators for reducing exposure to infectious aerosols such as those that cause severe acute respiratory syndrome (SARS) and novel influenza (H1N1) (CDC, 2001, 2003, 2004, 2009). The use of large number of respirators created a demand during the spread of SARS in the USA (Srinivasan *et al.*, 2004). Recently, CDC predicted that the need for disposable N95 respirators could exceed 90 million for the protection of healthcare

workers for an outbreak of 42 days of influenza A (H5N1), indicating a possible shortage of respirators (Bailar *et al.*, 2006; CDC, 2006).

The issue of a respirator shortage during a widespread influenza pandemic was addressed by the Institute of Medicine (IOM), which released a report entitled 'Reusability of Facemasks during an Influenza Pandemic. Facing the flu' (Bailar *et al.*, 2006). One of the recommendations was to conduct research on the effectiveness of woven cloth masks for the transmission of influenza virus because cloth masks may be the only option available for some individuals during a pandemic. Research on alternative respiratory protective materials, including common fabric materials such as T-shirts, handkerchiefs, and scarves, was also recommended (Bailar *et al.*, 2006). In the absence of respirators, some individuals may use improvised common fabric materials for respiratory protection while entering a contaminated environment, such as when caring for an infected family member at home. These household materials are not designed for respiratory protection and their use may provide a false sense of protection because their effectiveness against larger and $<$1000 nm size particles including viruses is not well understood. This indicates that further studies are needed to better understand the filtration performance of cloth masks and common fabric materials against a wide range of particle sizes, including the size of many viruses.

The knowledge on the filtration performance of improvised materials for particulates is limited, however. Previous studies challenged the improvised materials with large-size biological and inert particles and reported varying levels of protection for different size particles (Guyton *et al.*, 1959; Cooper *et al.*, 1983a,b). In one study, the filtration efficiency of a number of fabric materials was tested using human subjects. The authors reported that the filtration efficiency of single layer of bath towel, cotton shirt, handkerchief, and other materials was in the 28–73% range against *Bacillus globigii* aerosols of 2000 nm mass median diameter (Guyton *et al.*, 1959). Another study measured the effectiveness factor obtained from filtration efficiency and pressure drop for different common fabric materials using a manikin (Cooper *et al.*, 1983a). Fabric materials were challenged with mineral oil aerosol particles of 410–4800 nm diameter size and the effectiveness factor calculated. For many fabric materials including shirt, sheet, towel, and handkerchief, the effectiveness factor decreased with decreasing particle size from 4800 to 410 nm, indicating further decrease in the respiratory protection for virus-containing particles $<$410 nm (Cooper *et al.*, 1983a).

Recent studies showed that patients, as well as control subjects, generate significant levels of submicron as well as larger size particles including the size of many viruses during breathing, coughing, and talking (Fairchild and Stampfer, 1987; Papineni and Rosenthal, 1997; Edwards *et al.*, 2004; Yang *et al.*, 2007; Fabian *et al.*, 2008; Blachere *et al.*, 2009; Lindsley *et al.*, 2010). Although some viruses can be quite small ($\sim$20 nm), they are often generated by humans as larger size particles (e.g. attached to mucus secretions). For example, one study (Fabian *et al.*, 2008) showed 87% of particles in exhaled breath of influenza-infected patients were under 1000 nm in diameter and the rest of the particles larger than that size. Similarly, the transmission of infectious diseases through exposure to smaller and $>$1000 nm size aerosols has been reviewed (Fiegel *et al.*, 2006; Hall, 2007). Although much debate still exists on the relative contributions of the various routes of disease transmission (e.g. inhalation, contact, and droplet) (IOM, 2009), infected individuals produce smaller size particles ($<$1000 nm) that can travel long distances and larger size particles ($\sim$10000 nm) capable of reaching shorter distances. Some individuals may improvise fabric materials for emergency respiratory protection to reduce inhalation of infectious aerosols, indicating the need for further studies to assess their filtration performance against a wide range of particle sizes. In this study, household fabric materials and cloth masks were challenged with polydisperse as well as monodisperse particles in the 20–1000 nm size range, which include the size of many viruses and initial penetration levels measured and compared with those values obtained for N95 respirator filter media. In this study, we hypothesized that cloth masks and fabric materials would capture some aerosol but would exhibit high variability because they were not designed for that purpose.

MATERIALS AND METHODS

Fabric materials

Common fabric materials of five major categories including sweatshirts, T-shirts, towels, scarves, and cloth masks were selected for aerosol penetration tests (Table 1). Table 1 also shows the fiber composition of fabric materials and the resistance levels measured at 5.5 cm s^{-1} face velocity. The fiber composition for cloth masks is not available. Fabric materials for each category were randomly selected

from three different manufacturers based on availability. The commercial cloth masks were advertised as pollution and allergen masks and did not make any claim as to their effectiveness for submicron-size particles. It should be noted that none of the other fabric materials was designed to be used as a filtering media. N95 respirator filter media was tested in parallel with the fabric materials for comparison of the filtration performance against submicron-size aerosol particles.

Polydisperse aerosol penetration test method

Three samples from each fabric materials were tested for polydisperse NaCl aerosol (75 ± 20 nm count median diameter and a geometric standard deviation not exceeding 1.86) penetrations with a TSI 8130 Automated Filter Tester (TSI 8130) used for NIOSH particulate respirator certification (NIOSH, 2007). Penetration levels for 100 cm^2 samples were measured at two different face velocities 5.5 and 16.5 cm s^{-1} corresponding to 33 and 99 l min^{-1} flow rates. A standard face velocity of 5.3 cm s^{-1} is employed for testing various filter media. In this study, a face velocity closer to this value, i.e. 5.5 cm s^{-1}, and a relatively higher face velocity, 16.5 cm s^{-1}, were employed for testing the filtration performance of fabric materials. The flow rates are based on the area of the fabric material tested to achieve the face velocities employed in the study. Initial penetration levels of NaCl particles were measured for 1 min with no loading as conducted in the NIOSH 42 CFR 84 test protocol. Percentage penetration was determined as the ratio of particle concentration downstream to upstream multiplied by 100. Polydisperse aerosol is commonly used for filtration performance testing and allows comparison to standard filters made (N95, P2, P3, high efficiency particulate air, etc.).

Monodisperse aerosol penetration test method

Another set of three samples from each group of the same fabric models was tested against monodisperse NaCl particles using a TSI 3160 Fractional Efficiency Tester (TSI 3160) as described previously (Rengasamy *et al.*, 2007). Similar to polydisperse aerosols, penetration levels for 100 cm^2 samples were measured at face velocities 5.5 and 16.5 cm s^{-1}. Initial percentage penetration levels

for 10 different monodisperse aerosols (20, 30, 40, 50, 60, 80, 100, 200, 300, and 400 nm) were measured for each sample. These monodisperse aerosol tests were conducted to better understand the filtration performance against <400 nm size particles. This size range is necessary to determine the aerosol size range of minimum efficiency.

Penetration of NaCl particles as a function of particle size from 500 to 1000 nm

Penetration levels for larger size particles (500–1000 nm) were measured as a function of particle size. Polydisperse NaCl aerosols were generated using a constant output atomizer (Model 3076; TSI, Inc.) and passed through a dryer, a ^{85}Kr neutralizer, and then into the Plexiglas box containing the test fabric material. The upstream and downstream aerosol number concentrations and size distributions (500–1000 nm range) were measured for 2 min alternately using a scanning mobility particle sizer (SMPS 3080; TSI, Inc.) in scanning mode and an ultrafine condensation particle counter as described previously (Rengasamy *et al.*, 2009a). Percentage penetration was calculated from the ratio of the particle number concentration downstream to the concentration upstream. These monodisperse aerosol tests were conducted to better understand the filtration performance against 500–1000 nm size particles.

Data analysis

The data were analyzed using the SigmaPlot® (Jandel Corporation) computer program. Average penetration values and 95% confidence intervals were calculated for each model.

RESULTS

Polydisperse aerosol penetrations

Average penetration levels for the three different cloth masks were between 74 and 90%, while N95 filter media controls showed 0.12% at 5.5 cm s^{-1} face velocity (Fig. 1). The penetration levels increased significantly for the N95 control filter media but remained <5%, while none of the fabric materials showed any significant increase at 16.5 cm s^{-1} face velocity. Figure 2 shows polydisperse aerosol penetration levels for sweatshirts and T-shirts. Of the three sweatshirts, one model (Hanes) showed 40% penetration level at 5.5 cm s^{-1}, which increased to 57% at 16.5 cm s^{-1} face velocity. The other two models (Norma Kamali and Faded Glory) showed penetration levels in the 70–82% range at both

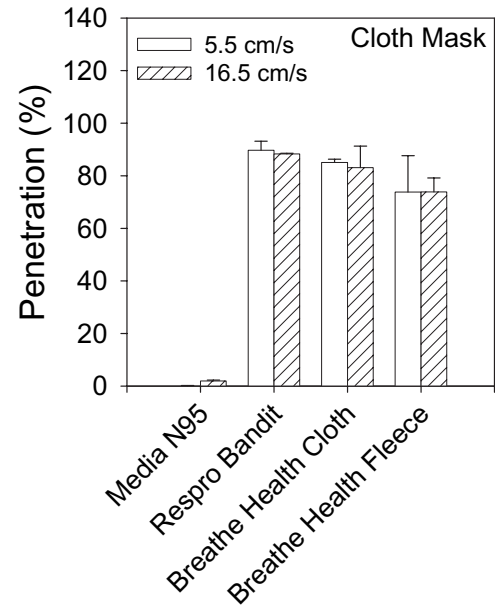

Fig. 1. Polydisperse NaCl aerosol penetration levels for cloth masks at two different face velocities. Error bars indicate 95% confidence level.

5.5 and 16.5 cm s^{-1} face velocities (Fig. 2a). At the same time, T-shirts showed penetration levels >86% at 5.5 cm s^{-1} with no significant increase at 16.5 cm s^{-1} (Fig. 2b). Average penetration levels for the three different model towels and scarves were in the 60–66% and 73–89% ranges, respectively, with no significant increase at 16.5 cm s^{-1} (Fig. 3a,b). Table 1 shows airflow resistance (in millimeter water) at 5.5 cm s^{-1} face velocity. In general, the resistance levels were less than or comparable to N95 filter material employed in the study (9.8 ± 0.2 cm water gauge; 1 cm water gauge = 1.33 kPa). A cotton towel model (Pinzon) and a scarf material (Today's Gentleman) showed slightly higher resistance levels than the other fabric materials. Slightly higher airflow resistance levels were obtained at 16.5 cm s^{-1}.

Monodisperse aerosol penetrations

Penetration levels for monodisperse aerosol particle (20–400 nm range) were combined with those for 500–1000 nm range particles measured as a function of particle size. For the cloth masks, monodisperse aerosol penetration levels (35–68%) for 20 nm size particles increased steadily, reached maximum (73–82%) at 100 nm range, plateaued up to 400 nm, and increased slightly up to 1000 nm at 5.5 cm s^{-1} face velocity (Fig. 4a). Slightly higher penetration levels were obtained at 16.5 cm s^{-1} face

velocity for the different size particles (20–1000 nm range) (Fig. 4b). Penetration levels for the three sweatshirt and T-shirt models were, respectively, in the 30–61% and 56–79% ranges for 20-nm size particles and increased to 80–93% and 89–97% for 1000 nm particles (Fig. 5a,c). A slight increase in penetration levels was obtained for 20–1000 nm size particles, which remained the same or decreased slightly with increasing particle sizes at 16.5 cm s^{-1} face velocity (Fig. 5b,d). In the case of towels and scarves, penetration levels varied from 9 to 74% for 20 nm size particles and increased monotonically at 5.5 cm s^{-1} face velocity (Fig. 6a,c). Penetration levels of different size particles increased at 16.5 cm s^{-1} face velocity at varying levels (Fig. 6b,d).

DISCUSSION

The results obtained in the study showed that cloth masks and other fabric materials tested in the study had 40–90% instantaneous penetration levels when challenged with polydisperse NaCl aerosols employed in the NIOSH particulate respirator test protocol at a face velocity of 5.5 cm s^{-1}. Similarly, varying levels of penetrations (9–98%) were

obtained for different size monodisperse NaCl aerosol particles in the 20–1000 nm range. Monodisperse aerosol penetration curves for many fabric materials were similar to the curve for a mechanical filter indicating that electret charge was not incorporated in the fabric materials tested in the study. The penetration levels for these fabric materials against polydisperse, as well as monodisperse aerosols, were much higher than the values for the control N95 respirator filter media. A poor filtration performance is

expected for improvised fabric materials because these materials are not designed for respiratory protection.

The wide variation in penetration levels obtained for many fabric materials tested in our study agree with the penetration results reported previously (Guyton *et al.*, 1959; Cooper *et al.*, 1983a). For example, the filtration efficiency (i.e. inverse of the penetration) of fabric materials was in the range of 3–33% (penetration range 67–97%) for 1000 nm particles at 5.5 cm s^{-1} face velocity that is comparable to the filtration efficiency (27–73%) of single-layer fabric materials against *B. globigii* particles (2000 nm) at a breathing flow rate of 10 l min^{-1} (Guyton *et al.*, 1959). The increase in efficiency can be attributed to the efficient capturing of larger size *B. globigii* particles. Similarly, the penetration values measured in our study 56–94% and 67–97% for 400 and 1000 nm size particles, respectively, at 5.5 cm s^{-1} face velocity are similar compared to 54 and 59% penetrations for 400 and 1000 nm size particles, respectively, at 1.5 cm s^{-1} face velocity reported previously (Cooper *et al.*, 1983a).

The filtration efficiency of improvised fabric materials is comparable to some commonly used Federal Drug Agency-cleared surgical masks and unapproved dust masks (Oberg and Brosseau, 2008; Rengasamy *et al.*, 2008; Rengasamy *et al.*, 2009b). For example, previous studies showed that some surgical masks had high penetration levels against similar size polydisperse as well as monodisperse aerosols at a similar face velocity (Rengasamy *et al.*, 2009b). Two of the five surgical masks showed 51–89% penetration levels against polydisperse aerosols. Similarly, three dust mask models had high penetration levels (81–89%) for polydisperse aerosol particles (Rengasamy *et al.*, 2008). Thus, the penetration results obtained in the study indicate that the filtration performance of fabric materials is similar in some aspects to some surgical masks to reduce the transmission of infectious diseases. However, this study did not evaluate the fabric materials for protection against droplets and liquid splashes.

The use of fabric materials may provide only minimal levels of respiratory protection to a wearer against virus-size submicron aerosol particles (e.g. droplet nuclei). This is partly because fabric materials show only marginal filtration performance against virus-size particles when sealed around the edges. Face seal leakage will further decrease the

Downloaded from https://academic.oup.com/annweh/article-abstract/54/7/789/202744 by guest on 21 March 2020

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005125

respiratory protection offered by fabric materials. As expected, a previous study using a manikin showed greater particle penetration for loosely held fabric materials than fully sealed materials around edges (Guyton *et al.*, 1959). Interestingly, however, some studies have reported that improvised fabric materials can provide a good fit and measurable protection level against test aerosols (Dato *et al.*, 2006; Sandee *et al.*, 2009). In one study, fit factors between 13 and 67 were obtained for three subjects using hand-fashioned masks out of a Hanes T-shirt, a modest level of protection to the wearer (Dato *et al.*, 2006). Similarly, home-made face masks made of tea cloths tested on human subjects provided marginal protection as measured by a PortaCount® Plus (TSI, Inc.) that also uses 20–1000 nm size ambient air particles compared to surgical and CE-marked FFP2 masks (Sandee *et al.*, 2009). The authors reported protection factor levels of 2–3, 4–6, and 66–141 for tea cloths, surgical masks, and FFP2 masks, respectively, under various test conditions. The fabric materials tested in our study might also be expected to provide marginal levels of respiratory protection for 20–1000 nm aerosols (droplet nuclei). Fabric materials may provide respiratory protection levels (i.e. total inward leakage) similar to the levels obtained using some surgical masks, which have been measured to be <10 (Oberg and Brosseau, 2008). Thus, the use of improvised fabric materials may be of some value compared to no protection at all when respirators are not available. Moreover, fabric materials would not suffer from limited supplies unlike respirators and surgical masks for emergency protection.

Some of the fabric materials tested in this study had relatively better filtration performance than others. For example, the Hanes sweatshirt showed less penetration levels against polydisperse aerosols at 5.5 cm s^{-1} face velocity compared to other fabric materials. Similarly, monodisperse aerosol penetration values for particles <60 nm size were less for Hanes sweatshirt. However, the penetration values for >60 nm size particles were higher similar to the penetrations for other sweatshirts and the reason for the discrepancy is not clear. The filtration performance of the towels (Aquis, Pinzon, and Pem America) and one scarf (Walmart) against <100 nm size monodisperse aerosol particles was relatively better than the other fabric materials. Moreover, filtration performance of the fabric materials showed no correlation with the airflow resistance levels. Filtration of polydisperse aerosol particles was effective by 100% cotton fabrics in one case, while 100% polyester, 100% cotton, or cotton/polyester combination was better for nanoparticle (<100 nm) range. Filtration performance of the fabric material cannot be estimated *a priori* from material composition because it is mostly dependent on fiber characteristics, including diameter, charge, and packing density. Moreover, the finished fabric products do not carry information on fiber properties involved in particle filtration. Thus, the selection process for a better performing improvised fabric material may be difficult for a common user. In spite of the poor performance, fabric materials may provide some level of protection against the transmission of infectious aerosols when used in combination with other protective measures. Recently, a review paper analyzed the data obtained from seven case–control studies on the intervention measures of SARS transmission (Jefferson *et al.*, 2009). The authors concluded that a combination of several measures including the use of respiratory protection devices, gloves, and other hygienic practices may reduce the spread of infectious diseases considerably than by a single method. Moreover, cloth masks and fabric materials covering the mouth and nose may serve as a reminder to not touch those areas with the hands serving to minimize contact transmission and reduce exposure to liquid splashes and droplets, although these premises would need to be confirmed experimentally.

The limitations of our study include that only a few types of fabric materials were tested in the study. Some fabric materials not tested in the study may perform better. None of the materials had been worn or laundered, which could also affect filtration performance. Moreover, face seal leakage of aerosol particles was not measured, which is a critical component of respiratory protection. Further studies on respiratory protection of common fabric materials on human subjects for an even wider size range (20–5000 nm) of aerosol particles (e.g. to include more data on filtration performance against droplets) would be helpful to better assess the value of common fabric materials to reduce exposure to infectious aerosols.

CONCLUSION

Common fabric materials and cloth masks showed a wide variation in penetration values for polydisperse (40–90%) as well as monodisperse aerosol particles in the 20–1000 nm range (40–97%) at 5.5 cm s^{-1} face velocity. The penetration levels obtained for fabric materials against both polydisperse and monodisperse aerosols were much higher than the value for the control N95 respirator filter media but were in the range found for some surgical masks

Downloaded from https://academic.oup.com/annweh/article-abstract/54/7/789/202744 by guest on 21 March 2020

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005126

in previous studies. Penetrations of monodisperse aerosol particles slightly increased at 16.5 cm s^{-1} face velocity, while polydisperse aerosols showed no significant effect except one fabric mask with an increase. The penetration values obtained for common fabric materials indicate that only marginal respiratory protection can be expected for submicron particles taking into consideration face seal leakage.

Simple Respiratory Mask

To the Editor: The US Department of Labor recommends air-purifying respirators (e.g., N95, N99, or N100) as part of a comprehensive respiratory protection program for workers directly involved with avian influenza–infected birds or patients (*1*). N95 respirators have 2 advantages over simple cloth or surgical masks; they are ≥95% efficient at filtering 0.3-μm particles (smaller than the 5-μm size of large droplets—created during talking, coughing, and sneezing—which usually transmit influenza) and are fit tested to ensure that infectious droplets and particles do not leak around the mask (*2–4*). Even if N95 filtration is unnecessary for avian influenza, N95 fit offers advantages over a loose-fitting surgical mask by eliminating leakage around the mask.

The World Health Organization recommends protective equipment including masks (if they not available, a cloth to cover the mouth is recommended) for persons who must handle dead or ill chickens in regions affected by H5N1 (*5*). Quality commercial masks are not always accessible, but anecdotal evidence has showed that handmade masks of cotton gauze were protective in military barracks and in healthcare workers during the Manchurian epidemic (*6,7*). A simple, locally made, washable mask may be a solution if commercial masks are not available. We describe the test results of 1 handmade, reusable, cotton mask.

For material, we choose heavyweight T-shirts similar to the 2-ply battle dress uniform T-shirts used for protective masks against ricin and saxitoxin in mouse experiments (*8*). Designs and T-shirts were initially screened with a short version of a qualitative Bitrex fit test (*9*) (Allegro Industries, Garden Grove, CA, USA). The best were tested by using a standard quantitative fit test, the Portacount Plus Respirator Fit Tester with N95-Companion (TSI, Shoreview, MN, USA) (*10*). Poor results from the initial quantitative fit testing on early prototypes resulted in the addition of 4 layers of material to the simplest mask design. This mask is referred to as the prototype mask (Figure).

A Hanes Heavyweight 100% preshrunk cotton T-shirt (made in Honduras) was boiled for 10 minutes and air-dried to maximize shrinkage and sterilize the material in a manner available in developing countries. A scissor, marker, and ruler were used to cut out 1 outer layer (≈37 × 72 cm) and 8 inner layers (≤18 cm^2). The mask was assembled and fitted as shown in the Figure.

A fit factor is the number generated during quantitative fit testing by simulating workplace activities (a series of exercises, each 1 minute in duration). The Portacount Plus Respirator Fit Tester with N95-Companion used for the test is an ambient aerosol instrument that measures aerosol concentration outside and inside the prototype mask. The challenge agent used is the ambient microscopic dust and other aerosols that are present in the air.

A commercially available N95 respirator requires a fit factor of 100 to be considered adequate in the workplace. The prototype mask achieved a fit factor of 67 for 1 author with a Los Alamos National Laboratory (LANL) panel face size of 4, a common size. Although insufficient for the workplace, this mask offered substantial protection from the challenge aerosol and showed good fit with minimal leakage. The other 2 authors with LANL panel face size 10, the largest size, achieved fit factors of 13 and 17 by making the prototype mask inner layers slightly larger (22 cm^2).

We do not advocate use of this respirator in place of a properly fitted commercial respirator. Although subjectively we did not find the work of breathing required with the prototype mask to be different from that required with a standard N95 filtering facepiece, persons with respiratory compromise of any type should not use this mask. While testers wore the mask for an hour without difficulty, we cannot comment on its utility during strenuous work or adverse environmental conditions.

We showed that a hand-fashioned mask can provide a good fit and a measurable level of protection from a challenge aerosol. Problems remain. When made by naive users, this mask may be less effective because of variations in material, assembly, facial structure, cultural practices, and

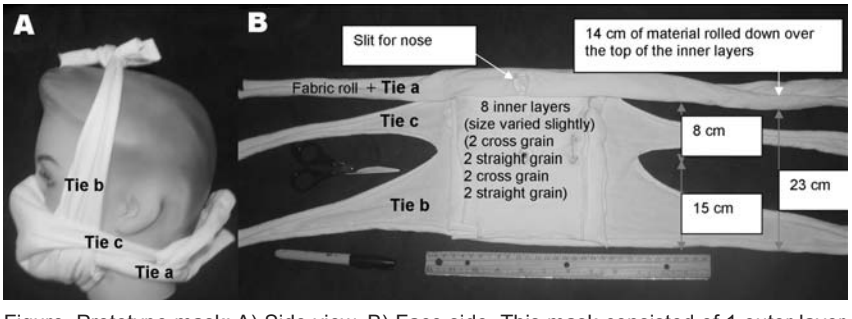

Figure. Prototype mask: A) Side view, B) Face side. This mask consisted of 1 outer layer (≈37cm × 72 cm) rolled and cut as in panel B with 8 inner layers (≤18 cm^2) placed inside (against the face). The nose slit was first placed over the bridge of the nose, and the roll was tied below the back of the neck. The area around the nose was adjusted to eliminate any leakage. If the seal was not tight, it was adjusted by adding extra material under the roll between the cheek and nose and/or pushing the rolled fabric above or below the cheekbone. Tie b was tied over the head. A cloth extension was added if tie b was too short. Finally tie c was tied behind the head. The mask was then fit tested.

AMERICAN OVERSIGHT

FL-DOH-20-0673-A-005129

handling. No easy, definitive, and affordable test can demonstrate effectiveness before each use. Wearers may find the mask uncomfortable.

We encourage innovation to improve respiratory protection options. Future studies must be conducted to determine levels of protection achieved when naive users, following instructions, produce a similar mask from identical or similar raw materials. Research is needed to determine the minimal level of protection needed when resources are not available for N95 air-purifying respirators since the pandemic threat from H5N1 and other possible influenza strains will exist for the foreseeable future.

Linguatuliasis in Germany

To the Editor: Pentastomids or tongue worms are a unique group of vermiform parasites, phylogenetically related to arthropods (*1*). Of the many pentastomid species, only a few, including *Linguatula serrata*, infect humans. The adult parasites are long, flat, or annulated and have 4 hooks surrounding a central mouth. Adult *L. serrata* inhabit the nasal passages and paranasal sinuses of wild and domestic canids, which serve as definitive hosts. Infective eggs containing larvae are discharged into the environment by nasopharyngeal secretions and are ingested by herbivores, the natural intermediate hosts. Humans can become dead-end intermediate hosts; visceral linguatuliasis then develops (*2*) if infective eggs are ingested. The liver is the organ most often involved (*3–5*), but the lung (*4,6,7*) or other organs (*4,8*) may be affected. Parasites may also be found in lymph nodes. In the viscera, the primary 4-legged larva molts several times and eventually forms the legless nymph. Lesions due to *Linguatula* may be confused with malignancy, particularly in the lung (*6*).

We describe a recent infection with *L. serrata* in Germany in a patient who had pulmonary symptoms and in whom malignancy was suspected. The patient was a 39-year-old man of Russian origin who had been living in Germany since 1999. He was admitted to the hospital with weight loss, night sweats, chest pain, and coughing. He had been a smoker for 20 years, and his past medical history included pneumonia and sinusitis in 1989 during his military service at Lake Baikal, Russia. The patient had been living in a farmhouse in Karaganda, Kazakhstan, until he immigrated to Germany.

A chest radiograph and computed tomographic scan showed multiple, small lesions in both lungs. Malignancy was suspected, and a bronchoscopy was performed. Numerous granulomatous nodules were discovered. Thoracotomy was performed, and stringlike nodules on the pleural surface were resected. Except for a mild eosinophilia (7%, 500 cells/μL), the leukocyte count was normal. All other parameters, including C-reactive protein levels, angiotensin-converting enzyme, and tumor markers were normal. Histologic examination of the nodules showed a targetoid appearance with a sharp demarcation from the surrounding lung tissue by a thick fibrocollagenous capsule. In the center of the nodules, a transverse section (Figure, right inset) and a longitudinal section (Figure, main panel) of a parasite were visible. The parasite had a chitinous cuticle 2.5 μm thick and cuticular

Coronavirus Disease 2019 (COVID-19)

Strategies for Optimizing the Supply of N95 Respirators: Crisis/Alternate Strategies

Crisis/Alternate Strategies

These crisis capacity or alternate strategies accompany and build on the conventional and contingency capacity strategies. The following measures are *not* commensurate with current U.S. standards of care. However, individual measures or a combination of these measures may need to be considered during periods of expected or known N95 respirator shortages. It is important to consult with entities that include some combination of: local healthcare coalitions, federal, state, or local public health officials, appropriate state agencies that are managing the overall emergency response related to COVID-19, and state crisis standards of care committees. Even when state/local healthcare coalitions or public health authorities can shift resources between health care facilities, these strategies may still be necessary.

When N95 Supplies are Running Low

Personal Protective Equipment and Respiratory Protection

Use of respirators beyond the manufacturer-designated shelf life for healthcare delivery

Consideration can be made to use N95 respirators beyond the manufacturer-designated shelf life for care of patients with COVID-19, tuberculosis, measles, and varicella. However, respirators beyond the manufacturer-designated shelf life may not perform to the requirements for which they were certified. Over time, components such as the straps and nose bridge material may degrade, which can affect the quality of the fit and seal. Many models found in U.S. stockpiles and stockpiles of healthcare facilities have been found to continue to perform in accordance with NIOSH performance standards. However, fluid resistance and flammability were not assessed. Use of the N95 respirators recommended in Release of Stockpiled N95 Filtering Facepiece Respirators Beyond the Manufacturer-Designated Shelf Life: Considerations for the COVID-19 Response can be considered. It is optimal to use these respirators in the context of a respiratory protection program that includes medical evaluation, training, and fit testing. If used in healthcare delivery, it is particularly important that HCP perform the expected seal check, prior to entering a patient care area. CDC does not recommend using N95s beyond the manufacturer-designated shelf life in surgical settings.

Use of respirators approved under standards used in other countries that are similar to NIOSH-approved N95 respirators

Other countries approve respirators for occupational use and approve respirators to these standards. These products are evaluated using some methods similar to those used by NIOSH, and some methods that are different, but are expected to protect HCPs. These respirators are expected to provide protection to workers. Those with equivalent or similar protection to NIOSH-approved respirators may be available to provide respiratory protection to workers exposed to harmful airborne particulate matter. These devices are expected to be suitable alternatives to provide protection during the COVID-19 response when supplies are short. The country, conformity assessment standards, acceptable product classifications, standards and guidance documents, and protection factor determination are provided in alphabetical order. All of these respirators have protection factors of at least 10 in the countries listed below, as outlined in the standards and guidance documents specified.

Country	Performance Standard	Acceptable product classifications	Standards/Guidance Documents	Protection Factor ≥ 10
Australia	AS/NZS 1716:2012	P3 P2	AS/NZS 1715:2009	YES

Limited re-use of N95 respirators for COVID-19 patients

Limited re-use of N95 respirators when caring for patients with COVID-19 might become necessary. However, it is unknown what the potential contribution of contact transmission is for SARS-CoV-2, and caution should be used. Re-use should be implemented according to CDC guidance. Re-use has been recommended as an option for conserving respirators during previous respiratory pathogen outbreaks and pandemics. It may also be necessary to re-use N95 respirators when caring for patients with varicella or measles, although contact transmission poses a risk to HCP who implement this practice.

Use of additional respirators beyond the manufacturer-designated shelf life for healthcare delivery

Use of additional N95 respirators beyond the manufacturer-designated shelf life for care of patients with COVID-19, tuberculosis, measles, and varicella can be considered. However, respirators beyond the manufacturer-designated shelf life may not perform to the requirements for which they were certified. Over time, components such as the straps and nose bridge material may degrade, which can affect the quality of the fit and seal. Some models have been found NOT to perform in accordance with NIOSH performances standards, and consideration may be given to use these respirators as identified in Release of Stockpiled N95 Filtering Facepiece Respirators Beyond the Manufacturer-Designated Shelf Life: Considerations for the COVID-19 Response. In addition, consideration can be given to use N95 respirators beyond the manufacturer-designated shelf life that have not been evaluated by NIOSH. It is optimal to use these respirators in the context of a respiratory protection program that includes medical evaluation, training, and fit testing. It is particularly important that HCP perform the expected seal check, prior to entering a patient care area.

Prioritize the use of N95 respirators and facemasks by activity type

The number of infectious particles required to cause an infection (infectious dose) is often uncertain or unknown for respiratory pathogens. Further, there is often uncertainty about the influence of factors such as exposure duration and nature of clinical symptoms on the likelihood of infection transmission from person-to-person. When facemasks must be used by HCP entering a patient care area, source control (i.e. masking of symptomatic patients) and maintaining distance from the patient are particularly important to reduce the risk of transmission.

AMERICAN OVERSIGHT

This prioritization approach to conservation is intended to be used when N95 respirators are so limited that routinely practiced standards of care for all HCP wearing N95 respirators when caring for a COVID-19 patient are no longer possible. N95 respirators beyond their manufacture-designated shelf life, when available, are preferable to use of facemasks. The use of N95s or elastomeric respirators or PAPRs should be prioritized for HCP with the highest potential exposures including being present in the room during aerosol generating procedures performed on symptomatic persons.

Suggested facemask or respirator use, based upon distance from a patient with suspected or known COVID-19 and use of source control*

HCP planned proximity to the case patient during encounter	**Facemask or respirator determination**	
	Patient masked for entire encounter (i.e., with source control)	**Unmasked patient or mask needs to be removed for any period of time during the patient encounter**
HCP will remain at greater than 6 feet from symptomatic patient	HCP remaining at this distance from the patient should not need to enter the patient care area; if entry required: no facemask or respirator	HCP remaining at this distance from the patient should not need to enter the patient care area; if entry required: no facemask or respirator
HCP will be within 3 to 6 feet of symptomatic patient	HCP remaining at this distance from the patient should not need to enter the patient care area; if entry required: facemask	HCP remaining at this distance from the patient should not need to enter the patient care area; if entry required: facemask
HCP will be within 3 feet of symptomatic patient, including providing direct patient care	Facemask	N95 respirator/ elastomeric /PAPR, based on availability
HCP will be present in the room during aerosol generating procedures performed on symptomatic persons	N95 respirator/ elastomeric /PAPR, based on availability	N95 respirator/ elastomeric /PAPR, based on availability

*Based on availability, organizations may require and/or individuals may voluntarily choose to utilize higher levels of protection

When No Respirators are Left

Administrative Controls

Exclude HCP at higher risk for severe illness from COVID-19 from contact with known or suspected COVID-19 patients

During severe resource limitations, consider excluding HCP who may be at higher risk for severe illness from COVID-19, such as those of older age, those with chronic medical conditions, or those who may be pregnant, from caring for patients with confirmed or suspected COVID-19 infection.

Designate convalescent HCP for provision of care to known or suspected COVID-19 patients

It may be possible to designate HCP who have clinically recovered from COVID-19 to preferentially provide care for additional patients with COVID-19. Individuals who have recovered from COVID-19 infection may have developed some protective immunity, but this has not yet been confirmed.

Engineering Controls

Expedient patient isolation rooms for risk-reduction

AMERICAN OVERSIGHT

Portable fan devices with high-efficiency particulate air (HEPA) filtration that are carefully placed can increase the effective air changes per hour of clean air to the patient room, reducing risk to individuals entering the room without respiratory protection. NIOSH has developed guidance for using portable HEPA filtration systems to create expedient patient isolation rooms. The expedient patient isolation room approach involves establishing a high-ventilation-rate, negative pressure, inner isolation zone that sits within a “clean” larger ventilated zone. In the absence of any remaining supply of N95 respirators, it may be possible to use this technology in conjunction with HCP wearing facemasks.

Ventilated Headboards

NIOSH has developed the ventilated headboard that draws exhaled air from a patient in bed into a HEPA filter, decreasing risk of HCP exposure to patient-generated aerosol. This technology consists of lightweight, sturdy, and adjustable aluminum framing with a retractable plastic canopy. The ventilated headboard can be deployed in combination with HEPA fan/filter units to provide surge isolation capacity within a variety of environments, from traditional patient rooms to triage stations, and emergency medical shelters. In the absence of any remaining supply of N95 respirators, it may be possible to use this technology in conjunction with HCP and/or patients wearing facemasks.

Personal Protective Equipment and Respiratory Protection

HCP use of non-NIOSH approved masks or homemade masks

In settings where N95 respirators are so limited that routinely practiced standards of care for wearing N95 respirators and equivalent or higher level of protection respirators are no longer possible, and surgical masks are not available, as a last resort, it may be necessary for HCP to use masks that have never been evaluated or approved by NIOSH or homemade masks. It may be considered to use these masks for care of patients with COVID-19, tuberculosis, measles, and varicella. However, caution should be exercised when considering this option.[1,2]

Strategies for Optimizing the Supply of N95 Respirators: Crisis/Alternate Strategies

Crisis/Alternate Strategies

These crisis capacity or alternate strategies accompany and build on the conventional and contingency capacity strategies. The following measures are *not* commensurate with current U.S. standards of care. However, individual measures or a combination of these measures may need to be considered during periods of expected or known N95 respirator shortages. It is important to consult with entities that include some combination of: local healthcare coalitions, federal, state, or local public health officials, appropriate state agencies that are managing the overall emergency response related to COVID-19, and state crisis standards of care committees. Even when state/local healthcare coalitions or public health authorities can shift resources between health care facilities, these strategies may still be necessary.

When N95 Supplies are Running Low

Personal Protective Equipment and Respiratory Protection

Use of respirators beyond the manufacturer-designated shelf life for healthcare delivery

Consideration can be made to use N95 respirators beyond the manufacturer-designated shelf life for care of patients with COVID-19, tuberculosis, measles, and varicella. However, respirators beyond the manufacturer-designated shelf life may not perform to the requirements for which they were certified. Over time, components such as the straps and nose bridge material may degrade, which can affect the quality of the fit and seal. Many models found in U.S. stockpiles and stockpiles of healthcare facilities have been found to continue to perform in accordance with NIOSH performance standards. However, fluid resistance and flammability were not assessed. Use of the N95 respirators recommended in Release of Stockpiled N95 Filtering Facepiece Respirators Beyond the Manufacturer-Designated Shelf Life: Considerations for the COVID-19 Response can be considered. It is optimal to use these respirators in the context of a respiratory protection program that includes medical evaluation, training, and fit testing. If used in healthcare delivery, it is particularly important that HCP perform the expected seal check, prior to entering a patient care area. CDC does not recommend using N95s beyond the manufacturer-designated shelf life in surgical settings.

Use of respirators approved under standards used in other countries that are similar to NIOSH-approved N95 respirators

Other countries approve respirators for occupational use and approve respirators to these standards. These products are evaluated using some methods similar to those used by NIOSH, and some methods that are different, but are expected to protect HCPs. These respirators are expected to provide protection to workers. Those with equivalent or similar protection to NIOSH-approved respirators may be available to provide respiratory protection to workers exposed to harmful airborne particulate matter. These devices are expected to be suitable alternatives to provide protection during the COVID-19 response when supplies are short. The country, conformity assessment standards, acceptable product classifications, standards and guidance documents, and protection factor determination are provided in alphabetical order. All of these respirators have protection factors of at least 10 in the countries listed below, as outlined in the standards and guidance documents specified.

Country	Performance Standard	Acceptable product classifications	Standards/Guidance Documents	Protection Factor ≥ 10
Australia	AS/NZS 1716:2012	P3 P2	AS/NZS 1715:2009	YES

Limited re-use of N95 respirators for COVID-19 patients

Limited re-use of N95 respirators when caring for patients with COVID-19 might become necessary. However, it is unknown what the potential contribution of contact transmission is for SARS-CoV-2, and caution should be used. Re-use should be implemented according to CDC guidance. Re-use has been recommended as an option for conserving respirators during previous respiratory pathogen outbreaks and pandemics. It may also be necessary to re-use N95 respirators when caring for patients with varicella or measles, although contact transmission poses a risk to HCP who implement this practice.

Use of additional respirators beyond the manufacturer-designated shelf life for healthcare delivery

Use of additional N95 respirators beyond the manufacturer-designated shelf life for care of patients with COVID-19, tuberculosis, measles, and varicella can be considered. However, respirators beyond the manufacturer-designated shelf life may not perform to the requirements for which they were certified. Over time, components such as the straps and nose bridge material may degrade, which can affect the quality of the fit and seal. Some models have been found NOT to perform in accordance with NIOSH performances standards, and consideration may be given to use these respirators as identified in Release of Stockpiled N95 Filtering Facepiece Respirators Beyond the Manufacturer-Designated Shelf Life: Considerations for the COVID-19 Response. In addition, consideration can be given to use N95 respirators beyond the manufacturer-designated shelf life that have not been evaluated by NIOSH. It is optimal to use these respirators in the context of a respiratory protection program that includes medical evaluation, training, and fit testing. It is particularly important that HCP perform the expected seal check, prior to entering a patient care area.

Prioritize the use of N95 respirators and facemasks by activity type

The number of infectious particles required to cause an infection (infectious dose) is often uncertain or unknown for respiratory pathogens. Further, there is often uncertainty about the influence of factors such as exposure duration and nature of clinical symptoms on the likelihood of infection transmission from person-to-person. When facemasks must be used by HCP entering a patient care area, source control (i.e. masking of symptomatic patients) and maintaining distance from the patient are particularly important to reduce the risk of transmission.

AMERICAN OVERSIGHT

This prioritization approach to conservation is intended to be used when N95 respirators are so limited that routinely practiced standards of care for all HCP wearing N95 respirators when caring for a COVID-19 patient are no longer possible. N95 respirators beyond their manufacture-designated shelf life, when available, are preferable to use of facemasks. The use of N95s or elastomeric respirators or PAPRs should be prioritized for HCP with the highest potential exposures including being present in the room during aerosol generating procedures performed on symptomatic persons.

Suggested facemask or respirator use, based upon distance from a patient with suspected or known COVID-19 and use of source control*

HCP planned proximity to the case patient during encounter	**Facemask or respirator determination**	
	Patient masked for entire encounter (i.e., with source control)	**Unmasked patient or mask needs to be removed for any period of time during the patient encounter**
HCP will remain at greater than 6 feet from symptomatic patient	HCP remaining at this distance from the patient should not need to enter the patient care area; if entry required: no facemask or respirator	HCP remaining at this distance from the patient should not need to enter the patient care area; if entry required: no facemask or respirator
HCP will be within 3 to 6 feet of symptomatic patient	HCP remaining at this distance from the patient should not need to enter the patient care area; if entry required: facemask	HCP remaining at this distance from the patient should not need to enter the patient care area; if entry required: facemask
HCP will be within 3 feet of symptomatic patient, including providing direct patient care	Facemask	N95 respirator/ elastomeric /PAPR, based on availability
HCP will be present in the room during aerosol generating procedures performed on symptomatic persons	N95 respirator/ elastomeric /PAPR, based on availability	N95 respirator/ elastomeric /PAPR, based on availability

*Based on availability, organizations may require and/or individuals may voluntarily choose to utilize higher levels of protection

When No Respirators are Left

Administrative Controls

Exclude HCP at higher risk for severe illness from COVID-19 from contact with known or suspected COVID-19 patients

During severe resource limitations, consider excluding HCP who may be at higher risk for severe illness from COVID-19, such as those of older age, those with chronic medical conditions, or those who may be pregnant, from caring for patients with confirmed or suspected COVID-19 infection.

Designate convalescent HCP for provision of care to known or suspected COVID-19 patients

It may be possible to designate HCP who have clinically recovered from COVID-19 to preferentially provide care for additional patients with COVID-19. Individuals who have recovered from COVID-19 infection may have developed some protective immunity, but this has not yet been confirmed.

Engineering Controls

Expedient patient isolation rooms for risk-reduction

AMERICAN OVERSIGHT

Portable fan devices with high-efficiency particulate air (HEPA) filtration that are carefully placed can increase the effective air changes per hour of clean air to the patient room, reducing risk to individuals entering the room without respiratory protection. NIOSH has developed guidance for using portable HEPA filtration systems to create expedient patient isolation rooms. The expedient patient isolation room approach involves establishing a high-ventilation-rate, negative pressure, inner isolation zone that sits within a “clean” larger ventilated zone. In the absence of any remaining supply of N95 respirators, it may be possible to use this technology in conjunction with HCP wearing facemasks.

Ventilated Headboards

NIOSH has developed the ventilated headboard that draws exhaled air from a patient in bed into a HEPA filter, decreasing risk of HCP exposure to patient-generated aerosol. This technology consists of lightweight, sturdy, and adjustable aluminum framing with a retractable plastic canopy. The ventilated headboard can be deployed in combination with HEPA fan/filter units to provide surge isolation capacity within a variety of environments, from traditional patient rooms to triage stations, and emergency medical shelters. In the absence of any remaining supply of N95 respirators, it may be possible to use this technology in conjunction with HCP and/or patients wearing facemasks.

Personal Protective Equipment and Respiratory Protection

HCP use of non-NIOSH approved masks or homemade masks

In settings where N95 respirators are so limited that routinely practiced standards of care for wearing N95 respirators and equivalent or higher level of protection respirators are no longer possible, and surgical masks are not available, as a last resort, it may be necessary for HCP to use masks that have never been evaluated or approved by NIOSH or homemade masks. It may be considered to use these masks for care of patients with COVID-19, tuberculosis, measles, and varicella. However, caution should be exercised when considering this option.[1,2]

Coronavirus Disease 2019 (COVID-19)

Strategies for Optimizing the Supply of N95 Respirators: Crisis/Alternate Strategies

Crisis/Alternate Strategies

These crisis capacity or alternate strategies accompany and build on the conventional and contingency capacity strategies. The following measures are *not* commensurate with current U.S. standards of care. However, individual measures or a combination of these measures may need to be considered during periods of expected or known N95 respirator shortages. It is important to consult with entities that include some combination of: local healthcare coalitions, federal, state, or local public health officials, appropriate state agencies that are managing the overall emergency response related to COVID-19, and state crisis standards of care committees. Even when state/local healthcare coalitions or public health authorities can shift resources between health care facilities, these strategies may still be necessary.

When N95 Supplies are Running Low

Personal Protective Equipment and Respiratory Protection

Use of respirators beyond the manufacturer-designated shelf life for healthcare delivery

Consideration can be made to use N95 respirators beyond the manufacturer-designated shelf life for care of patients with COVID-19, tuberculosis, measles, and varicella. However, respirators beyond the manufacturer-designated shelf life may not perform to the requirements for which they were certified. Over time, components such as the straps and nose bridge material may degrade, which can affect the quality of the fit and seal. Many models found in U.S. stockpiles and stockpiles of healthcare facilities have been found to continue to perform in accordance with NIOSH performance standards. However, fluid resistance and flammability were not assessed. Use of the N95 respirators recommended in Release of Stockpiled N95 Filtering Facepiece Respirators Beyond the Manufacturer-Designated Shelf Life: Considerations for the COVID-19 Response can be considered. It is optimal to use these respirators in the context of a respiratory protection program that includes medical evaluation, training, and fit testing. If used in healthcare delivery, it is particularly important that HCP perform the expected seal check, prior to entering a patient care area. CDC does not recommend using N95s beyond the manufacturer-designated shelf life in surgical settings.

Use of respirators approved under standards used in other countries that are similar to NIOSH-approved N95 respirators

Other countries approve respirators for occupational use and approve respirators to these standards. These products are evaluated using some methods similar to those used by NIOSH, and some methods that are different, but are expected to protect HCPs. These respirators are expected to provide protection to workers. Those with equivalent or similar protection to NIOSH-approved respirators may be available to provide respiratory protection to workers exposed to harmful airborne particulate matter. These devices are expected to be suitable alternatives to provide protection during the COVID-19 response when supplies are short. The country, conformity assessment standards, acceptable product classifications, standards and guidance documents, and protection factor determination are provided in alphabetical order. All of these respirators have protection factors of at least 10 in the countries listed below, as outlined in the standards and guidance documents specified.

Country	Performance Standard	Acceptable product classifications	Standards/Guidance Documents	Protection Factor ≥ 10
Australia	AS/NZS 1716:2012	P3 P2	AS/NZS 1715:2009	YES

Limited re-use of N95 respirators for COVID-19 patients

Limited re-use of N95 respirators when caring for patients with COVID-19 might become necessary. However, it is unknown what the potential contribution of contact transmission is for SARS-CoV-2, and caution should be used. Re-use should be implemented according to CDC guidance. Re-use has been recommended as an option for conserving respirators during previous respiratory pathogen outbreaks and pandemics. It may also be necessary to re-use N95 respirators when caring for patients with varicella or measles, although contact transmission poses a risk to HCP who implement this practice.

Use of additional respirators beyond the manufacturer-designated shelf life for healthcare delivery

Use of additional N95 respirators beyond the manufacturer-designated shelf life for care of patients with COVID-19, tuberculosis, measles, and varicella can be considered. However, respirators beyond the manufacturer-designated shelf life may not perform to the requirements for which they were certified. Over time, components such as the straps and nose bridge material may degrade, which can affect the quality of the fit and seal. Some models have been found NOT to perform in accordance with NIOSH performances standards, and consideration may be given to use these respirators as identified in Release of Stockpiled N95 Filtering Facepiece Respirators Beyond the Manufacturer-Designated Shelf Life: Considerations for the COVID-19 Response. In addition, consideration can be given to use N95 respirators beyond the manufacturer-designated shelf life that have not been evaluated by NIOSH. It is optimal to use these respirators in the context of a respiratory protection program that includes medical evaluation, training, and fit testing. It is particularly important that HCP perform the expected seal check, prior to entering a patient care area.

Prioritize the use of N95 respirators and facemasks by activity type

The number of infectious particles required to cause an infection (infectious dose) is often uncertain or unknown for respiratory pathogens. Further, there is often uncertainty about the influence of factors such as exposure duration and nature of clinical symptoms on the likelihood of infection transmission from person-to-person. When facemasks must be used by HCP entering a patient care area, source control (i.e. masking of symptomatic patients) and maintaining distance from the patient are particularly important to reduce the risk of transmission.

AMERICAN OVERSIGHT

This prioritization approach to conservation is intended to be used when N95 respirators are so limited that routinely practiced standards of care for all HCP wearing N95 respirators when caring for a COVID-19 patient are no longer possible. N95 respirators beyond their manufacture-designated shelf life, when available, are preferable to use of facemasks. The use of N95s or elastomeric respirators or PAPRs should be prioritized for HCP with the highest potential exposures including being present in the room during aerosol generating procedures performed on symptomatic persons.

Strategies for Optimizing the Supply of N95 Respirators: Crisis/Alternate Strategies

Crisis/Alternate Strategies

These crisis capacity or alternate strategies accompany and build on the conventional and contingency capacity strategies. The following measures are *not* commensurate with current U.S. standards of care. However, individual measures or a combination of these measures may need to be considered during periods of expected or known N95 respirator shortages. It is important to consult with entities that include some combination of: local healthcare coalitions, federal, state, or local public health officials, appropriate state agencies that are managing the overall emergency response related to COVID-19, and state crisis standards of care committees. Even when state/local healthcare coalitions or public health authorities can shift resources between health care facilities, these strategies may still be necessary.

When N95 Supplies are Running Low

Personal Protective Equipment and Respiratory Protection

Use of respirators beyond the manufacturer-designated shelf life for healthcare delivery

Consideration can be made to use N95 respirators beyond the manufacturer-designated shelf life for care of patients with COVID-19, tuberculosis, measles, and varicella. However, respirators beyond the manufacturer-designated shelf life may not perform to the requirements for which they were certified. Over time, components such as the straps and nose bridge material may degrade, which can affect the quality of the fit and seal. Many models found in U.S. stockpiles and stockpiles of healthcare facilities have been found to continue to perform in accordance with NIOSH performance standards. However, fluid resistance and flammability were not assessed. Use of the N95 respirators recommended in Release of Stockpiled N95 Filtering Facepiece Respirators Beyond the Manufacturer-Designated Shelf Life: Considerations for the COVID-19 Response can be considered. It is optimal to use these respirators in the context of a respiratory protection program that includes medical evaluation, training, and fit testing. If used in healthcare delivery, it is particularly important that HCP perform the expected seal check, prior to entering a patient care area. CDC does not recommend using N95s beyond the manufacturer-designated shelf life in surgical settings.

Use of respirators approved under standards used in other countries that are similar to NIOSH-approved N95 respirators

Other countries approve respirators for occupational use and approve respirators to these standards. These products are evaluated using some methods similar to those used by NIOSH, and some methods that are different, but are expected to protect HCPs. These respirators are expected to provide protection to workers. Those with equivalent or similar protection to NIOSH-approved respirators may be available to provide respiratory protection to workers exposed to harmful airborne particulate matter. These devices are expected to be suitable alternatives to provide protection during the COVID-19 response when supplies are short. The country, conformity assessment standards, acceptable product classifications, standards and guidance documents, and protection factor determination are provided in alphabetical order. All of these respirators have protection factors of at least 10 in the countries listed below, as outlined in the standards and guidance documents specified.

Country	Performance Standard	Acceptable product classifications	Standards/Guidance Documents	Protection Factor ≥ 10
Australia	AS/NZS 1716:2012	P3 P2	AS/NZS 1715:2009	YES

Limited re-use of N95 respirators for COVID-19 patients

Limited re-use of N95 respirators when caring for patients with COVID-19 might become necessary. However, it is unknown what the potential contribution of contact transmission is for SARS-CoV-2, and caution should be used. Re-use should be implemented according to CDC guidance. Re-use has been recommended as an option for conserving respirators during previous respiratory pathogen outbreaks and pandemics. It may also be necessary to re-use N95 respirators when caring for patients with varicella or measles, although contact transmission poses a risk to HCP who implement this practice.

Use of additional respirators beyond the manufacturer-designated shelf life for healthcare delivery

Use of additional N95 respirators beyond the manufacturer-designated shelf life for care of patients with COVID-19, tuberculosis, measles, and varicella can be considered. However, respirators beyond the manufacturer-designated shelf life may not perform to the requirements for which they were certified. Over time, components such as the straps and nose bridge material may degrade, which can affect the quality of the fit and seal. Some models have been found NOT to perform in accordance with NIOSH performances standards, and consideration may be given to use these respirators as identified in Release of Stockpiled N95 Filtering Facepiece Respirators Beyond the Manufacturer-Designated Shelf Life: Considerations for the COVID-19 Response. In addition, consideration can be given to use N95 respirators beyond the manufacturer-designated shelf life that have not been evaluated by NIOSH. It is optimal to use these respirators in the context of a respiratory protection program that includes medical evaluation, training, and fit testing. It is particularly important that HCP perform the expected seal check, prior to entering a patient care area.

Prioritize the use of N95 respirators and facemasks by activity type

The number of infectious particles required to cause an infection (infectious dose) is often uncertain or unknown for respiratory pathogens. Further, there is often uncertainty about the influence of factors such as exposure duration and nature of clinical symptoms on the likelihood of infection transmission from person-to-person. When facemasks must be used by HCP entering a patient care area, source control (i.e. masking of symptomatic patients) and maintaining distance from the patient are particularly important to reduce the risk of transmission.

AMERICAN OVERSIGHT

This prioritization approach to conservation is intended to be used when N95 respirators are so limited that routinely practiced standards of care for all HCP wearing N95 respirators when caring for a COVID-19 patient are no longer possible. N95 respirators beyond their manufacture-designated shelf life, when available, are preferable to use of facemasks. The use of N95s or elastomeric respirators or PAPRs should be prioritized for HCP with the highest potential exposures including being present in the room during aerosol generating procedures performed on symptomatic persons.

Suggested facemask or respirator use, based upon distance from a patient with suspected or known COVID-19 and use of source control*

HCP planned proximity to the case patient during encounter	**Facemask or respirator determination**	
	Patient masked for entire encounter (i.e., with source control)	**Unmasked patient or mask needs to be removed for any period of time during the patient encounter**
HCP will remain at greater than 6 feet from symptomatic patient	HCP remaining at this distance from the patient should not need to enter the patient care area; if entry required: no facemask or respirator	HCP remaining at this distance from the patient should not need to enter the patient care area; if entry required: no facemask or respirator
HCP will be within 3 to 6 feet of symptomatic patient	HCP remaining at this distance from the patient should not need to enter the patient care area; if entry required: facemask	HCP remaining at this distance from the patient should not need to enter the patient care area; if entry required: facemask
HCP will be within 3 feet of symptomatic patient, including providing direct patient care	Facemask	N95 respirator/ elastomeric /PAPR, based on availability
HCP will be present in the room during aerosol generating procedures performed on symptomatic persons	N95 respirator/ elastomeric /PAPR, based on availability	N95 respirator/ elastomeric /PAPR, based on availability

*Based on availability, organizations may require and/or individuals may voluntarily choose to utilize higher levels of protection

When No Respirators are Left

Administrative Controls

Exclude HCP at higher risk for severe illness from COVID-19 from contact with known or suspected COVID-19 patients

During severe resource limitations, consider excluding HCP who may be at higher risk for severe illness from COVID-19, such as those of older age, those with chronic medical conditions, or those who may be pregnant, from caring for patients with confirmed or suspected COVID-19 infection.

Designate convalescent HCP for provision of care to known or suspected COVID-19 patients

It may be possible to designate HCP who have clinically recovered from COVID-19 to preferentially provide care for additional patients with COVID-19. Individuals who have recovered from COVID-19 infection may have developed some protective immunity, but this has not yet been confirmed.

Engineering Controls

Expedient patient isolation rooms for risk-reduction

AMERICAN OVERSIGHT

Portable fan devices with high-efficiency particulate air (HEPA) filtration that are carefully placed can increase the effective air changes per hour of clean air to the patient room, reducing risk to individuals entering the room without respiratory protection. NIOSH has developed guidance for using portable HEPA filtration systems to create expedient patient isolation rooms. The expedient patient isolation room approach involves establishing a high-ventilation-rate, negative pressure, inner isolation zone that sits within a “clean” larger ventilated zone. In the absence of any remaining supply of N95 respirators, it may be possible to use this technology in conjunction with HCP wearing facemasks.

Ventilated Headboards

NIOSH has developed the ventilated headboard that draws exhaled air from a patient in bed into a HEPA filter, decreasing risk of HCP exposure to patient-generated aerosol. This technology consists of lightweight, sturdy, and adjustable aluminum framing with a retractable plastic canopy. The ventilated headboard can be deployed in combination with HEPA fan/filter units to provide surge isolation capacity within a variety of environments, from traditional patient rooms to triage stations, and emergency medical shelters. In the absence of any remaining supply of N95 respirators, it may be possible to use this technology in conjunction with HCP and/or patients wearing facemasks.

Personal Protective Equipment and Respiratory Protection

HCP use of non-NIOSH approved masks or homemade masks

In settings where N95 respirators are so limited that routinely practiced standards of care for wearing N95 respirators and equivalent or higher level of protection respirators are no longer possible, and surgical masks are not available, as a last resort, it may be necessary for HCP to use masks that have never been evaluated or approved by NIOSH or homemade masks. It may be considered to use these masks for care of patients with COVID-19, tuberculosis, measles, and varicella. However, caution should be exercised when considering this option.[1,2]

AMERICAN OVERSIGHT

From: State and Local Readiness (CDC)
To: CDC IMS State Coordination Task Force (SCTF) Lead
Subject: President"s Coronavirus Guidelines For America: 15 Days to Slow the Spread
Date: Tuesday, March 17, 2020 12:18:54 PM
Attachments: image001.png

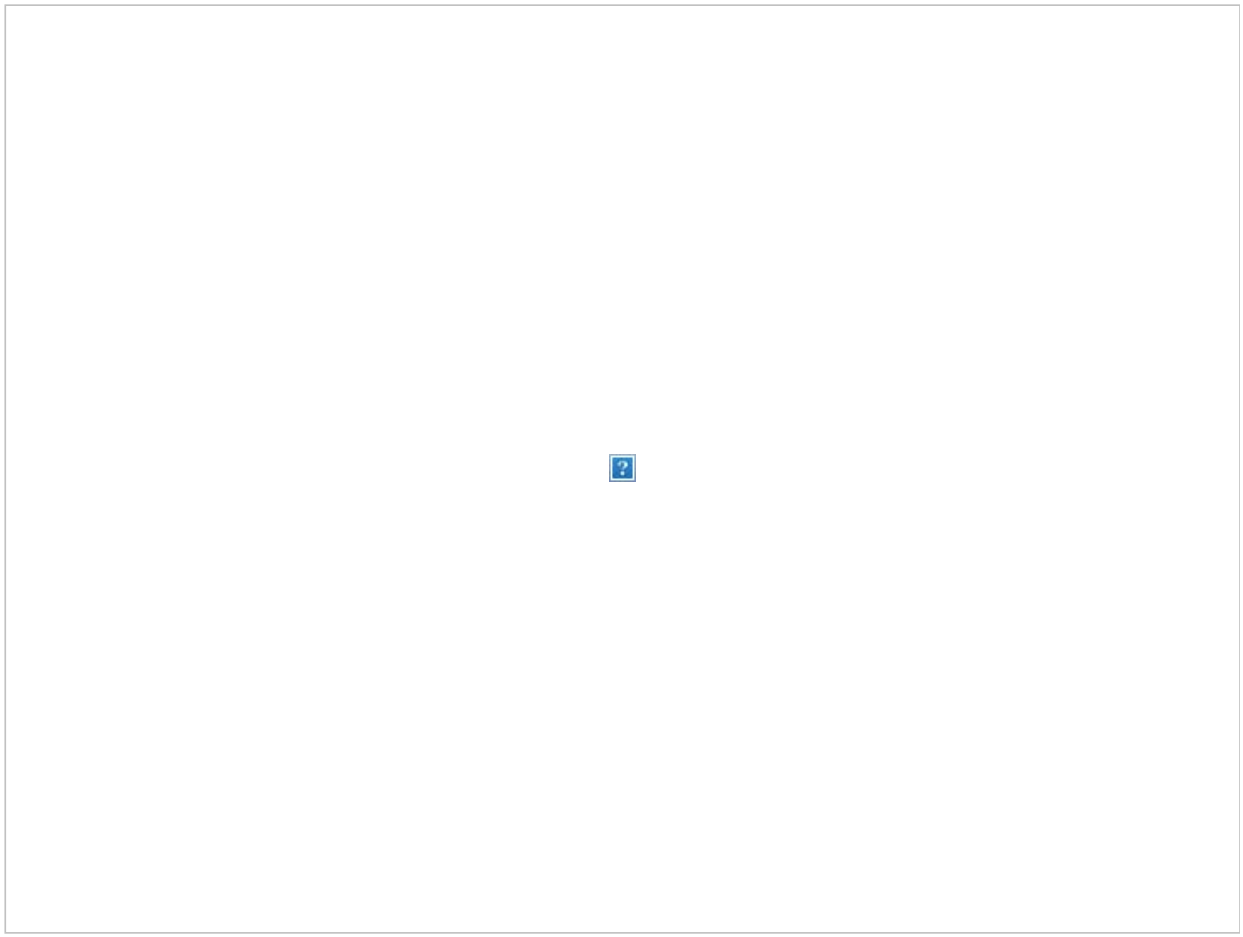
Dear Colleagues:

Yesterday, President Donald. J. Trump announced new guidelines to address COVID-19. Below, please find additional information on ***The President's Coronavirus Guidelines for America: 15 Days to Slow the Spread***. Please feel free to share broadly.

As a reminder, the CDC's official Coronavirus website – **www.coronavirus.gov** – is the best source for up-to-date information and guidance.

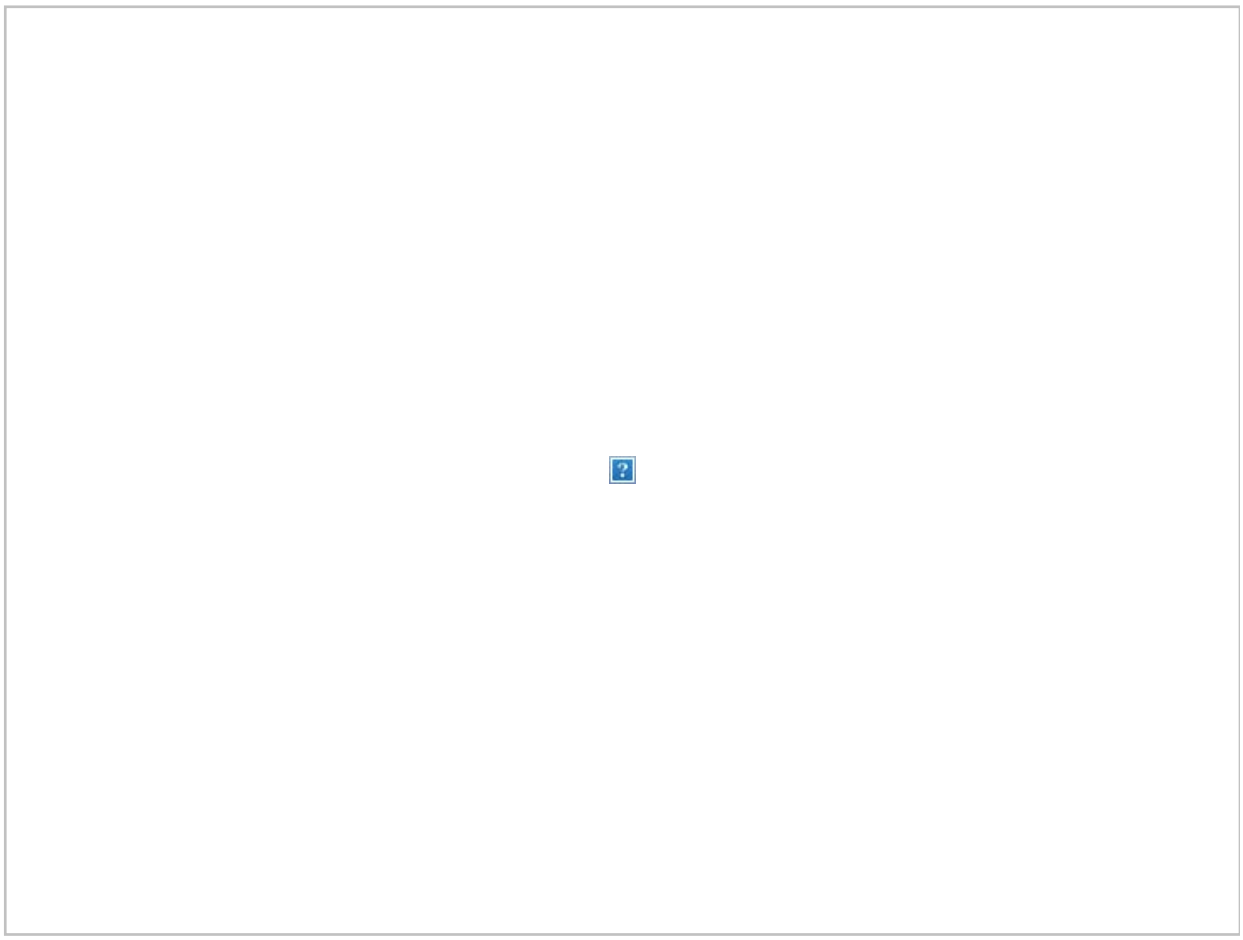
The President's Coronavirus Guidelines for America: 15 Days to Slow the Spread

1. Listen to and follow the directions of your state and local authorities.
2. If you feel sick, stay home. Do not go to work. Contact your medical provider.
3. If your children are sick, keep them at home. Do not send them to school. Contact your medical provider.
4. If someone in your household has tested positive for the coronavirus, keep the entire household at home. Do not go to work. Do not go to school. Contact your medical provider.
5. If you are an older person, stay home and away from other people.
6. If you are a person with a serious underlying health condition that can put you at increased risk (for example, a condition that impairs your lung or heart function or weakens your immune system), stay home and away from other people.
7. Even if you are young, or otherwise healthy, you are at risk and your activities can increase the risk for others. It is critical that you do your part to stop the spread of the coronavirus:
    a. Work or engage in schooling from home whenever possible.
    b. If you work in a critical infrastructure industry, as defined by the Department of Homeland Security, such as healthcare services and pharmaceutical and food supply, you have a special responsibility to maintain your normal work schedule. You and your employers should follow CDC guidance to protect your health at work.
    c. Avoid social gatherings in groups of more than 10 people.
    d. Avoid eating or drinking in bars, restaurants, and food courts – use drive-thru, pickup, or delivery options.
    e. Avoid discretionary travel, shopping trips, and social visits.
    f. Do not visit nursing homes or retirement or long-term care facilities unless to provide critical assistance.



AMERICAN OVERSIGHT

8. Practice good hygiene:
    a. Wash your hands, especially after touching any frequently used item or surface.
    b. Avoid touching your face.
    c. Sneeze or cough into a tissue, or the inside of your elbow.
    d. Disinfect frequently used items and surfaces as much as possible.



* School operations can accelerate the spread of the coronavirus. Governors of states with evidence of community transmission should close schools in affected and surrounding areas. Governors should close schools in communities that are near areas of community transmission, even if those areas are in neighboring states. In addition, state and local officials should close schools where coronavirus has been identified in the population associated with the school. States and localities that close schools need to address childcare needs of critical responders, as well as the nutritional needs of children.

** Older people are particularly at risk from the coronavirus. All states should follow Federal guidance and halt social visits to nursing homes and retirement and long-term care facilities.

*** In states with evidence of community transmission, bars, restaurants, food courts, gyms, and other indoor and outdoor venues where groups of people congregate should be closed.

AMERICAN OVERSIGHT

Kind Regards,

State Coordination Task Force

(Sent by BCC to PHEP directors, state epidemiologists, state health officials, public health laboratory directors, BCHC, and national and federal partners)

Subject:	public health lab reagent
Date:	Wednesday, March 25, 2020 7:56:25 PM

All

Many of our states are asking about the reagents and why are they not available to the public health lab **it is a supply and demand issue.**
Supply is low and demand is high - here is some info on an alternate reagent recipe for public health labs. Also including a FAQs sheet from FDA.

Here is the FDA FAQ site with alternative extraction reagents: https://www.fda.gov/medical-devices/emergency-situations-medical-devices/faqs-diagnostic-testing-sars-cov-2#whatif

If they want to use alternate reagents not already accepted by FDA, that would be considered a "Laboratory Developed Test", FDA guidance is at www.fda.gov/regulatory-information/search-fda-guidance-documents/policy-diagnostic-tests-coronavirus-disease-2019-during-public-health-emergency, and

FAQ's at https://www.fda.gov/medical-devices/emergency-situations-medical-devices/faqs-diagnostic-testing-sars-cov-2#clinicallaboratories

Subject:	Quarterly Multi-State Collaborative All-State Discussion Call on Cannabis and Public Health

Please see the updated call in number and the proposed agenda (below).
Call in: 1-877-680-2010, Participant Code: 23065250. Call is at 11AM PST/2PM EST.

Thanks to all of you who are working on a covid19 response in your state, and to those of you who are keeping other important public health work going while your colleagues respond. We know not everyone will be able to attend this call, but are still planning to hold it, with a focus on the covid19/marijuana overlap. Marijuana operations (retail stores, processors, grows) have been deemed essential services in states so far, so we want to facilitate time for you all to talk about how you are approaching that, and to put forward any science-based questions that you need responses to for future work in this space.

Proposed agenda:

* Brief roll call
* Call purpose
* Covid19 response tracking
* Facilitated discussion about covid19 response and marijuana licensees
* Vaping updates and/or any other cannabis and public health topics (as time allows)

Let me know if you have any questions.

Respectfully,
Gillian

ORIGINAL MEETING REQUEST MESSAGE

Dear State Colleagues,

Thank you for completing the When2Meet poll. This looked like the best time for all states who responded. As a reminder, these quarterly calls will bring adult use and medical states together to provide updates related to cannabis vaping policy, prevention, and education, and to discuss other relevant cannabis and public health topics. CDC will provide updates about our cannabis related work as part of these calls, as well.

I will send a more detailed agenda closer to the call. In the meantime, please reach out to me if there are specific topics you would like to add to the agenda.

Respectfully,
Gillian

ORIGINAL MESSAGE

Dear State Colleagues,

It's hard to believe February is already upon us. I wanted to send out the notes from our cannabis vaping call earlier in January (see attached). Per our discussions on that call, we'll be moving to hold these multi-state, all state calls on a quarterly basis, and will continue to facilitate discussion on cannabis vaping issues, but will incorporate other cannabis and public health topics that are of interest to both medical and adult use states. If you are interested in continuing to participate in all-state cannabis and public health calls, please complete this When2Meet poll <https://www.when2meet.com/?8693306-VyueN> so we can try to schedule a March call. We'll talk on that call about getting a standing quarterly call on the calendar (e.g., X day of the last week of the second month of the quarter, or something like that). As a reminder, When2Meet automatically saves your entries. Please remember to select your timezone before completing the poll.

We will also pick back up with quarterly topic-based calls for adult use states only (the multi-state collaborative group), since some additional public

AMERICAN OVERSIGHT

health and policy issues exist in the adult use landscape. Adult use states - I will be sending a separate poll to try to schedule one of those calls in February, as I know some of you already have issues you'd like to discuss with each other, with legislative sessions underway.

For both the all-state and adult use state calls, I will continue to develop the agenda in the same manner - reaching out to a variety of states to solicit topics. Please feel free to reach out to me any time with policy questions, TA requests, or topics for these multi-state calls.

Thanks again for all you do in the field!

Respectfully,
Gillian

I hope that is ok.

Subject: 100% of EIS officers and LLS fellows are needed for the COVID-19 response

EIS and LLS supervisors,

I am writing again, asking for your support in having EIS officers and LLS fellows deploy or take on other roles for CDC's response to COVID-19. I want to emphasize that **completing CALs (graduation requirements) should NOT factor into whether an EIS officer or LLS fellow deploys**. Supervisors should not be asking to review deployment roles or objectives before approving a deployment. In the past we wanted to ensure deployments aligned with our training objectives. We no longer have that luxury, the primary responsibility of the EIS and LLS programs needs to be supporting the response until we are informed otherwise.

We will deal with CAL completion and how COVID-19 might impact graduation on a case-by-case basis. I want to assure you we will be very understanding in finding ways to compensate if involvement with the COVID-19 response prevented anyone from fulfilling the requirements to graduate.

We understand that some EISOs or LLS fellows may not be able to deploy to the field because of obligations to care for family members or themselves. There are response roles that can be completed while teleworking and do not require travel. We are available to assist in finding deployment roles – contact us at EpiAid@cdc.gov and we can discuss their particular circumstance. In addition, any fellows who are not currently deployed can volunteer by:

1. Emailing us at EpiAid@cdc.gov
2. Volunteer for a Go Team by submitting name in ReADI
3. Responding directly to any calls for volunteers they receive through other communication

AMERICAN OVERSIGHT

channels

Thank you for your support of the EIS and LLS programs and of your officers or fellows. We know a lot is being asked of you as well and CDC leadership appreciates all you are doing with respect to your individual contributions and your support of the EIS officers and LLS fellows.

Regards,
Eric

Good afternoon all,

Please review the attached draft skeleton agenda and notes below from our last call (action items bolded) in advance of our planning call on Wednesday.

- Panel on fleaborne diseases
    - Possible speakers
        - Paige Armstrong (DVBD) – **Paige, can you confirm?**
        - Laura Robinson and/or Bonny Mayes (TX) – **Bonny, can you confirm?**
        - Sarah Park (HI)
        - Plague – Carina recommended Danielle, Vicki Kramer (CA) – **Carina, any follow**

AMERICAN OVERSIGHT

up?

- Chagas and kissing bugs presentation/panel
    - Need speakers – **any ideas from AZ or TX?**
- TBRF – Bonny reached out to Job Lopez from TX
    - Hanna from WA – **Liz, can you follow up?**
- Vector control and risk reduction, focus on communication
    - Pros and cons of spraying, etc.
    - Risk communication during emergency response
    - Possible speakers:
        - Whitney Qualls (TX) – **Bonny can you confirm?**
        - Someone from WA – **Liz are our 3 WA speakers confirmed?**
        - Kiersten recommended CA
        - Roxanne (CDC)? – **Carina were you able to follow up?**
- EEE ecology (not in current draft agenda)
    - Possible speakers
        - Andrea Morrison (FL)
        - Katie Brown (MA)
        - Michigan
- Tick management (not in current draft agenda) – Abelardo can recommend speakers

Thanks and talk to you all on Wednesday!
Ashley

EXTERNAL EMAIL CAUTION: Use caution opening attachments or clicking links.

Dear Eleni,
2 questions and 2 points:

Among the 8 persons who will come on air ambulance,

1. Are any moderately or severe ill, or are they all with mild influenza-like illness?
2. What is their final destination/state of residence?

We are working on specific guidance for you – coming after we clear some items with Florida Health authorities, including Yesenia.

A couple of things for your awareness:

1. We strongly advise that the charter flights have clinicians (doctor/nurse) on board for safe travel and to assist with the arrival process in Miami in case anyone is ill.
2. We request that you distribute this infographic to the American passengers who will be traveling by charter (attached).

Best,
Michelle

Subject: RE: [EXTERNAL] Brazil: Status of Royal Caribbean Silver Shadow

Good Morning, Doug –

I will provide an update on Silver Shadow later this morning but, as of late last night, she was prepared to debark guests for charter flights home later today. I will provide an updated timeline after our internal calls this morning.

Thanks,

AMERICAN OVERSIGHT

Eleni

Subject: [EXTERNAL] Brazil: Status of Royal Caribbean Silver Shadow

All - good morning. I have broken the Brazil and Chile ships into separate threads, for ease of tracking.

When able, if someone could provide a short status update on the Silver Shadow and any pending asks (for USG or Brazil) that would be very helpful, thanks. Doug

Hello Abdias –

I had reached out earlier today to your colleague, Chris Ashe. As mentioned in my earlier email, Azamara Pursuit has decided to abandon its efforts to dock and debark in South America and is instead en route to Miami.

Similarly, Celebrity Eclipse continues to have issues docking in Chile and is now considering a 10+ day trip to San Diego. If that is the course chosen, can you please provide guidance as to visa issues that will arise with the South American and Mexican guests onboard? I will send you a manifest by nationality shortly.

Thanks,

Eleni

Subject: [EXTERNAL] Re: Royal Caribbean Ships off Brazil/Chile

Sorry - now with Eleni from RC. Again, due-outs are:

- State - send CDC global ship tracking list; create small-group email distro;
- CDC - send Royal Caribbean and Amy Dubois/HHS protocols for screening; Make

AMERICAN OVERSIGHT

determination on screening protocols for passengers from a "healthy" ship
- Royal Caribbean - send #s of Canadians to CDC; update on infection status; send manifests for four ships

Hi Dr. Rosenfarb –

In light of the guidance below and my earlier discussions with ConGen in Brazil, I understand that the US Government does not anticipate conducting any screening of our guests upon their arrival in the US and that we would need to comply with State of Florida screening requirements.

AMERICAN OVERSIGHT

I am adding to this email Dr. Yesenia Villalta, Administrator of the Department of Health in Florida, who advises us that CBP is responsible for conducting the necessary screenings of our guests upon arrival at MIA. Rather than try to negotiate these details, I thought it would be helpful to link the Federal group up with Dr. Yesenia to resolve this matter.

Thanks,

Eleni

Subject: [EXTERNAL] CDC guidance for Silver Shadow

Leah,
Thanks for speaking just now. To reiterate CDC's recommendation:

- The cruise line charter flight should transport the AMCITs to one of the designated funneling airports in the US (Miami), where they would disembark away from the main passenger terminal and be transferred to onward charter flights (also arranged by the cruise line) to their home of record. (Our info is that the passengers reside in 22 different states)
- Health screening of passengers would be done by the cruise line company prior to boarding in Recife, with no additional screening performed at the funneling airport (unless the individual

AMERICAN OVERSIGHT

has become obviously ill on the initial flight).

- 14 day home monitoring at the passenger's final destination is the recommended guidance.
- Individual state public health authorities at the final destinations should be contacted by the cruise line in advance of arrival at each of the final destinations in the event monitored quarantine is necessary.

From our side, our ConGen in Recife has already explained to the company what they need to do to arrange the charter (including their responsibility to clear with FL authorities—company has already told us that they are working on it with FL). The CBP attache at post is already tracking the plan for charter (and has alerted Miami airport as heads up).

Please let me know if the final CDC guidance differs from anything stated above.

Regards,
Dr. Rosenfarb

AMERICAN OVERSIGHT

Daucher, Kevin G <DaucherKG@state.gov>; Chung, Julie J <ChungJJ@state.gov>; CGRCU-Internal <CGRCU-Internal@state.gov>
Subject: [EXTERNAL] CDC guidance for Silver Shadow

Leah,
Thanks for speaking just now. To reiterate CDC's recommendation:

- The cruise line charter flight should transport the AMCITs to one of the designated funneling airports in the US (Miami), where they would disembark away from the main passenger terminal and be transferred to onward charter flights (also arranged by the cruise line) to their home of record. (Our info is that the passengers reside in 22 different states)
- Health screening of passengers would be done by the cruise line company prior to boarding in Recife, with no additional screening performed at the funneling airport (unless the individual has become obviously ill on the initial flight).
- 14 day home monitoring at the passenger's final destination is the recommended guidance.
- Individual state public health authorities at the final destinations should be contacted by the cruise line in advance of arrival at each of the final destinations in the event monitored quarantine is necessary.

From our side, our ConGen in Recife has already explained to the company what they need to do to arrange the charter (including their responsibility to clear with FL authorities—company has already told us that they are working on it with FL). The CBP attache at post is already tracking the plan for charter (and has alerted Miami airport as heads up).

Please let me know if the final CDC guidance differs from anything stated above.

Regards,
Dr. Rosenfarb

Hi Dr. Rosenfarb –

In light of the guidance below and my earlier discussions with ConGen in Brazil, I understand that the US Government does not anticipate conducting any screening of our guests upon their arrival in the US and that we would need to comply with State of Florida screening requirements.

I am adding to this email Dr. Yesenia Villalta, Administrator of the Department of Health in Florida, who advises us that CBP is responsible for conducting the necessary screenings of our guests upon arrival at MIA. Rather than try to negotiate these details, I thought it would be helpful to link the Federal group up with Dr. Yesenia to resolve this matter.

Subject:	RE: [EXTERNAL] CDC guidance for Silver Shadow
Date:	Monday, March 16, 2020 12:16:52 PM

Hi Dr. Rosenfarb –

In light of the guidance below and my earlier discussions with ConGen in Brazil, I understand that the US Government does not anticipate conducting any screening of our guests upon their arrival in the US and that we would need to comply with State of Florida screening requirements.

I am adding to this email Dr. Yesenia Villalta, Administrator of the Department of Health in Florida, who advises us that CBP is responsible for conducting the necessary screenings of our guests upon arrival at MIA. Rather than try to negotiate these details, I thought it would be helpful to link the Federal group up with Dr. Yesenia to resolve this matter.

Thanks,

Eleni

Subject: [EXTERNAL] CDC guidance for Silver Shadow

Leah,
Thanks for speaking just now. To reiterate CDC's recommendation:

- The cruise line charter flight should transport the AMCITs to one of the designated funneling airports in the US (Miami), where they would disembark away from the main passenger terminal and be transferred to onward charter flights (also arranged by the cruise line) to their home of record. (Our info is that the passengers reside in 22 different states)
- Health screening of passengers would be done by the cruise line company prior to boarding in Recife, with no additional screening performed at the funneling airport (unless the individual has become obviously ill on the initial flight).
- 14 day home monitoring at the passenger's final destination is the recommended guidance.
- Individual state public health authorities at the final destinations should be contacted by the cruise line in advance of arrival at each of the final destinations in the event monitored quarantine is necessary.

From our side, our ConGen in Recife has already explained to the company what they need to do to arrange the charter (including their responsibility to clear with FL authorities—company has already told us that they are working on it with FL). The CBP attache at post is already tracking the plan for charter (and has alerted Miami airport as heads up).

Please let me know if the final CDC guidance differs from anything stated above.

Regards,
Dr. Rosenfarb

Subject:	RE: [EXTERNAL] FW: MOA for CST testing lab (UNCLASSIFIED)
Date:	Wednesday, March 25, 2020 5:42:26 PM

I'll have someone look at it.

AHCA certified CLIA, so to the extent there are certification requirements, then we would need to be at least part of that process. Not sure if that warrants being part of the agreement though.

Subject: [External] FW: [EXTERNAL] FW: MOA for CST testing lab (UNCLASSIFIED)

Louise & Stefan,
Attached is the FLNG MOA for the testing machine between DOH and FLNG. Col. Bradford's team drafted it. Are these the right state parties to the MOA? The Colonel said the lab comes with some NG personnel, but they are not currently CLIA certified. Also, supplies and wrap-around services will need to be procured. Do you have any edits? If you have any questions, please let me know.

All,
Some logistics items to be addressed/questions to be answered about the lab, but don't necessarily need to be addressed in the MOA. These are logs/finc/management questions but worth noting and sharing internally.

1. Staffing the lab
    a. How many lab techs are needed to operate the lab at full capacity.
    b. The Colonel says the lab can test 500 samples per day, but is that in an 8, 12, or 24 hour period?
    c. Currently the NG personnel are not CLIA certified; so lab techs will need to be procured – who pays for the lab techs (DOH, AHCA, DEM)
2. Testing materials
    a. What materials are included with the lab (what not included)
    b. What materials are needed to operate the lab at full capacity
    c. Procuring those material that help the lab operate – who procures/pays for these material
3. Wrap-around services
    a. What services are needed (ie, 24-hr security, food for staff, maintenance of lab, etc.)
    b. Who pays for the wrap-around services (DOH, AHCA, DEM)?
4. Timing – It will take at least a week to get the lab.
5. Location – where to stage the lab – that's a logs/mgt decision

Erik

Attached is the draft MOA we discussed. Please let me know if you have any suggestions. I contacted LTC Eastman and asked what we would need and what we may receive to run this machine. The National Guard Bureau is still working those details as far as what PPE, pipets, kits, etc. may come with the machine. He will get back with me. NGB is sending 2 to NY, so we will have a good idea of what to expect based on what they receive. He did say this would not get to us for about a week even if we do get one.

AMERICAN OVERSIGHT

Hi Eli,
I have reached out to the ship physician to confirm all the information you sent me, discussed this case with our medical officer, and provided a situational update to Florida Department of Health (FDOH).

It looks like this ship has 3 passengers onboard who have tested positive for Influenza A and do not have known exposure to COVID-19 cases. There is no ILI outbreak onboard. I will follow up with the ship to instruct that these three passengers wear surgical masks while disembarking.

Given the information we have now, we do not have any additional concerns or public health recommendations regarding this vessel. Please let us know if you have any other questions or concerns.

Thank you and all the best,
Emily

Good news here for the MS Marina

Here are the next two ship that I just got info in (good timing here)

Costa Magica and Costa Favolosa:

- The Costa Magica is currently close to the Martinique with 930 crew members, 50 of which may have symptoms of Covid-19 (one crew member have been brought inland by helicopter to get urgent care).

- The Costa Favolosa is currently close to Guadeloupe with 1030 crew members, among which 50 may also present symptoms of Covid-19

Perhaps USCG can track these vessels? I have no idea where home port is but in the thread of email sent me they are talking Miami as a landing place.
Sorry for the good news. ☺

Regards,
Jeanne

Subject: MS Marina (Oceania)

Hi Joe – are you tracking the MS Marina (Oceania)? I'm tracking 653 Amcits on board, COVID(+) cases on ship, headed to Miami but no ports there open. This is going to be a problem soon. We're getting inquiries from the Australians and Andorrans. This is the latest I have:

18MAR: Indications that an Oceania cruise ship will be arriving at Port of Miami sometime next week with various COVID-19 positives on it. Consular Affairs from the Australian Embassy contacted to say they had been notified overnight that the MS Marina (Oceania) is returning to Miami from South America via the Panama Canal after it was denied docking by several countries. The latest advice the Embassy has is that it is passing through the Canal could take 5 or 6 days. Australian Embassy in Mexico and Honorary Consul in Panama are trying to assist at least 49 Australians on board - some of whom are starting to run short of medications etc. - but are having difficulty contacting the crew and Oceania's agents in Panama. CONS provided them with the contact for Norwegian cruise lines which is a parent company of Oceania. OFM indicates Port of Miami is not aware of the ship coming to Miami and questioned where it would even dock as all available ports are occupied. OFM in touch with Norwegian.

Under Florida law, correspondence with the Florida Division of Emergency Management, which is neither confidential nor exempt pursuant to Florida Statutes Chapter 119, is a public record made available upon request.

Sam/Ashley

This is the string I got below and why I asked if you had this ship on the radar. Let me know if you find something out. HHS has no ask….we just want to make sure you are aware this may be headed to Miami.

Respectfully,
Jeanne

Subject: MS Marina (Oceania)

Hi Joe – are you tracking the MS Marina (Oceania)? I'm tracking 653 Amcits on board, COVID(+) cases on ship, headed to Miami but no ports there open. This is going to be a problem soon. We're getting inquiries from the Australians and Andorrans. This is the latest I have:

18MAR: Indications that an Oceania cruise ship will be arriving at Port of Miami sometime next week with various COVID-19 positives on it. Consular Affairs from the Australian Embassy contacted to say they had been notified overnight that the MS Marina (Oceania) is returning to Miami from South America via the Panama Canal after it was denied docking by several countries. The latest advice the Embassy has is that it is passing through the Canal could take 5 or 6 days. Australian Embassy in Mexico and Honorary Consul in Panama are trying to assist at least 49 Australians on board - some of whom are starting to run short of medications etc. - but are having difficulty contacting the crew and Oceania's agents in Panama. CONS provided them with the contact for Norwegian cruise lines which is a parent company of Oceania. OFM indicates Port of Miami is not aware of the ship coming to Miami and questioned where it would even dock as all available ports are occupied. OFM in touch with Norwegian.

Under Florida law, correspondence with the Florida Division of Emergency Management, which is neither confidential nor exempt pursuant to Florida Statutes Chapter 119, is a public record made available upon request.

Hi All – I was made aware of this article by Tom Scott and others. It contains a nice history of vector control and a call for renewed political will and investment in VBDs and VBD control as a public health priority. Just wanted to throw this out there in case you think this topic may be of interest to the workshop participants.

Talk to you soon,
Abelardo

Good morning all,

Some materials that may be helpful for our workshop planning call this afternoon:

Workshop description:

Title: Improving Public Health Practice for Vector-Borne Diseases

This workshop will highlight a range of vectors and vector-borne diseases. There will be a series of presentations on vector ecology, surveillance, and emerging VBD issues. The final list of

AMERICAN OVERSIGHT

speakers/topics will be made when we have the draft agenda for the CSTE conference to ensure the workshop complements presentations and roundtables happening later in the week. The workshop will provide ample time for discussion and sharing of best practices.

Notes from last call:

- Discuss a breadth of VBD topics
- Texas suggested flea-borne and Chagas
- TBRF—Job Lopez from TX as potential speaker
- Vector ecology—similar to tick ecology last year
- Sociopolitical drivers of VBDs/Climate change etc. (article linked below)
- Mosquitoes!
- Note: include more interactive time based on comments from last year's evaluation
- Kiersten suggested a couple titles: "Improving Public Health Practice for Vector-Borne Diseases" and "Improving Knowledge of the Bugs We're Fighting"

This is the article Liz referenced about dengue and the various things impacting its resurgence in Honduras.
https://www.nytimes.com/2019/12/29/world/americas/honduras-dengue-epidemic.html

Thanks and looking forward to chatting soon!
Ashley

Abstract

Vector-borne diseases (VBDs) such as malaria, dengue, and leishmaniasis exert a huge burden of morbidity and mortality worldwide, particularly affecting the poorest of the poor. The principal method by which these diseases are controlled is through vector control, which has a long and distinguished history. Vector control, to a greater extent than drugs or vaccines, has been responsible for shrinking the map of many VBDs. Here, we describe the history of vector control programmes worldwide from the late 1800s to date. Pre 1940, vector control relied on a thorough understanding of vector ecology and epidemiology, and implementation of environmental management tailored to the ecology and behaviour of local vector species. This complex understanding was replaced by a simplified dependency on a handful of insecticide-based tools, particularly for malaria control, without an adequate understanding of entomology and epidemiology and without proper monitoring and evaluation. With the rising threat from insecticide-resistant vectors, global environmental change, and the need to incorporate more vector control interventions to eliminate these diseases, we advocate for continued investment in evidence-based vector control. There is a need to return to vector control approaches based on a thorough knowledge of the determinants of pathogen transmission, which utilise a range of insecticide and non–insecticide-based approaches in a locally tailored manner for more effective and sustainable vector control.

Author summary

Vector-borne diseases (VBDs) such as dengue, Chagas disease, human African trypanosomiasis (HAT), leishmaniasis, and malaria exert a huge burden of morbidity and mortality worldwide. The principal method by which these diseases are controlled is through vector control. The authors chart the history of vector control through time from elucidation of the transmission route of VBDs to the present day. Pre-1940 vector control relied heavily

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005222

on environmental management and larval control based on a thorough understanding of pathogen transmission but was replaced by insecticide-based vector control, often deployed as a monotherapy. The authors call for increased political will and investment in vector control and a return to locally tailored vector control that draws on the entire toolbox of interventions available.

Introduction

Vector-borne diseases (VBDs) are infections caused by pathogens that are transmitted by arthropods such as mosquitoes, triatomine bugs, blackflies, tsetse flies, sand flies, lice, and ticks. Dengue, Chagas disease, Japanese encephalitis, leishmaniasis, lymphatic filariasis (LF), malaria, and yellow fever threaten over 80% of the world's population and disproportionately affect the poorest populations living in the tropics and subtropics [1]. Many of these VBDs are co-endemic, and it is estimated that more than half the world's population live in areas where 2 or more VBDs are present [1]. VBDs contribute significantly to the global burden of disease, accounting for 17% of the global estimated burden of all infectious diseases [2]. Perhaps the best known VBD, malaria, is a major cause of morbidity and mortality, particularly in sub-Saharan Africa (SSA), with approximately half the world's population predicted to be at risk of malaria (Table 1) [3]. Many VBDs are classified as neglected tropical diseases (NTDs), e.g., arboviral diseases like dengue and chikungunya, Chagas disease, human African trypanosomiasis (HAT), leishmaniasis, LF, and onchocerciasis [4]. The burden of NTDs is poorly understood, and until the last 5 to 10 years, these diseases have suffered from a lack of prioritisation and investment. Important aspects of NTD biology, epidemiology, and prevention remain inadequately understood. While the global numbers of deaths from vector-borne NTDs is lower than for malaria, vector-borne NTDs continue to cause high levels of morbidity and represent a significant public health burden; e.g., from 1990 to 2013, dengue cases increased

Table 1. Global burden of VBDs.

	Data source	Estimated cases worldwide in 2017 (thousands [95% CI])	Estimated global all-age DALYs in 2017 (thousands [95% CI])	Estimated all-age deaths worldwide in 2017 (thousands [95% CI])

nearly 450% globally [5]. Some zoonotic NTDs have an additional veterinary health burden [6, 7].

Vector control is the principal method available for controlling many VBDs—both historically and today. Moreover, for some diseases, such as dengue (a vaccine is licensed but is not widely used due to safety concerns [10]), chikungunya, Zika, and West Nile disease, vector control is currently the only method available to protect populations. Vector control aims to limit the transmission of pathogens by reducing or eliminating human contact with the vector. A wide range of vector control tools exist, which can be broadly classified into chemical- and non–chemical-based tools (Table 2). Tools targeting immature vectors can act by killing the immature stages (e.g., chemical or biological larvicides and predator species) or by removing suitable aquatic habitats (e.g., habitat modification or manipulation). Tools targeting the adult vectors function by killing the vector (e.g., indoor residual spraying [IRS], space spraying) and/or reducing vector contact (blood-feeding success) with human and/or animal reservoir hosts (e.g., topical repellents, house screening, insecticide-treated bed nets [ITNs], insecticide-treated dog collars). There are also several novel vector control tools under development, e.g., genetic manipulation of mosquitoes, bacterial infection of vectors (e.g., *Wolbachia*), and insecticide-treated eave tubes (Box 1).

Table 2. Categories and examples of vector control methods [11].

Chemical	Immature	Chemical larvicides	Contact pesticides affecting insect nervous system (e.g., temephos) or endocrine system (insect growth regulators, e.g., pyriproxyfen)
	Adult	ITNs	Pyrethroid-treated ITNs or combination ITNs (e.g., pyrethroid plus synergist piperonyl butoxide) for malaria, LF, and leishmaniasis control
		Insecticide-treated materials for personal protection	Insecticide-treated clothing for workers and mobile populations
		IRS	Spraying of residual insecticides (typically either pyrethroids, carbamates, or organophosphates) indoors for malaria and *Aedes*-borne disease control
		Space spraying	Aircraft, vehicle or hand-held space spraying for dengue epidemic and other *Aedes*-borne disease control
		Insecticidal treatment of habitat	Focal, perifocal, ground, or aerial insecticide spraying
		Insecticide-treated cattle	Pour-on or spot-on pyrethroids for control of tsetse
		Insecticide-treated traps and targets	Targets for control of HAT and insecticide-treated adulticidal oviposition traps for *Aedes*-borne diseases
		Topical repellent	Chemicals (e.g., N,N-diethyl-meta-toluamide [DEET], picaridin) applied to the skin to reduce vector biting
		Spatial repellent	Transfluthrin/metafluthrin passive emanators or coils
Nonchemical	Immature	Microbial larvicides	*Bacillus thuringiensis* var. *israelensis*, *B. sphaericus*
		Predator species	Predatory fish or invertebrates
		Habitat modification, i.e., a permanent change of land and/or water	Drainage of surface water, land reclamation and filling, and coverage of large water storage containers (or complete coverage of water surfaces) with a material that is impenetrable to mosquitoes, such as expanded polystyrene beads
		Habitat manipulation, i.e., a recurrent activity	Water-level manipulation, exposing habitats to the sun (depending on the ecology of the vector), flushing of streams, drain clearance, and source reduction, including rubbish disposal and regular emptying and cleaning of domestic containers (e.g., flowerpots, animal drinking water troughs)
		Regulatory measures	Removal of man-made aquatic habitats and appropriate waste disposal
	Adult	House improvement and screening	Closing eaves, door and window screening
		Removal trapping	Solar-powered mosquito trapping system for malaria control and sticky adulticidal oviposition traps for *Aedes*-borne diseases

Abbreviations: HAT, human African trypanosomiasis; IRS, indoor residual spraying; ITN, insecticide-treated bed net; LF, lymphatic filariasis

Box 1. Examples of novel vector control interventions being developed

Gene drive

Gene drive is a method of genetic modification that can be used to spread favourable traits through interbreeding populations of malaria mosquitoes [12]. The gene drive allows genes to spread through populations in a self-sustaining manner, even if they confer a fitness cost. The technique can be used for population replacement (reducing the ability of mosquitoes to transmit a pathogen) or population suppression (reducing the size of the vector population by, e.g., reducing fertility of females or biasing the sex ratio towards males). The 'Target Malaria' group started initial work in Burkina Faso, in preparation for releases of gene drive mosquitoes.

Wolbachia

Wolbachia is a genus of bacteria that naturally infect some insect species but are not normally found in *Aedes* mosquitoes. Introduction of *Wolbachia* into *Aedes* mosquitoes reduces transmission of dengue and other arboviruses to people [13]. Mosquitoes carrying *Wolbachia* are released by field teams and mate with the wild mosquito population, and over time the percentage of mosquitoes carrying *Wolbachia* increases. The 'World Mosquito Program' is conducting a randomised controlled trial and programmatic evaluations in several countries worldwide (e.g., [14, 15]).

Spatial repellents

Spatial repellents are chemicals that prevent a vector from entering a space occupied by a potential human host to reduce encounters between the vector and the host [16]. They are typically used against malaria or *Aedes* mosquitoes and can be used indoors or outdoors, where they may serve as a useful tool in combating outdoor transmission of malaria. Spatial repellents exist in a number of formats, including coils, passive emanators, and impregnated fabric. Although several small trials of spatial repellent coils have been performed [17, 18], spatial repellents are not yet recommended for disease prevention. Results from randomised controlled trials for malaria and dengue are currently being analysed. A research programme was recently funded by UNITAID to carry out a second efficacy evaluation of spatial repellent passive emanators against malaria, and a second trial is being considered for dengue.

Eave tubes

Eave tubes are small plastic tubes with insecticide-laden electrostatic netting that are inserted into the house wall, below the roof [19]. Mosquitoes are lured to the house by host odours emanating through the eave tubes and are killed after contacting the insecticide-treated netting. Eave tubes are being tested in a large randomised-controlled trial in Côte d'Ivoire, which includes other house improvements, including eave closure and window screening [20].

Our goal was to review the history of vector control from the 1800s to the present day, highlighting what tools and approaches were adopted and the impacts they had on vectors and infection and disease. This Review focuses on the main VBDs: *Aedes*-borne viruses, Chagas

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005225

disease, HAT, leishmaniasis, LF, malaria, and onchocerciasis. Malaria is the dominant focus of the Review given the high burden of morbidity and mortality and well-documented history of thinking on malaria vector control [21, 22]. The manuscript uses some terminology that is often misused in the public health literature and may require definition: 'control' refers to deliberate efforts to reduce disease incidence, prevalence, morbidity, or mortality to a locally acceptable level; 'elimination' refers to interruption of local transmission requiring continued efforts to prevent reestablishment of transmission; and 'eradication' refers to permanent reduction to zero of the worldwide incidence of infection as a result of deliberate efforts, so that intervention measures are no longer needed [23]. A summary of the programmes and campaigns discussed is given in Fig 1 and Table 3. The World Health Organization (WHO) calls for effective, locally adapted, and sustainable vector control in its recent Global Vector Control Response (GVCR) 2017–2030 strategy [2]. Increasing our understanding of the different types of vector control tools that were used in the past, what settings they were used in, and their impacts on vectors and disease can hopefully help us to select and promote new and existing vector control methods to sustainably reduce the burden and threat of VBDs. We conclude by drawing out key lessons from the history of vector control and identifying how these can be applied now and in the future.

A brief history of vector control

Elucidation of the transmission route of VBDs and early vector control

In the 1890s and early 1900s, the transmission route of Chagas disease, HAT, LF, malaria, and yellow fever were elucidated, primarily in response to the germ theory of Pasteur and Koch and advancements in microscopy [64–69]. The first VBD of humans to be identified was malaria when in 1897, ground-breaking work by Sir Ronald Ross showed that *Anopheles* mosquitoes transmitted malaria parasites [66]. However, vector control had been taking place prior to this, mainly due to an awareness of the connection between fevers and proximity of swamps and marshes. For example, historical reports from Greek (circa 550 B.C.) and Roman times describe large drainage schemes and reductions in 'plague' and fever [70, 71]. There are reports of the use of mechanical vector control methods, such as sleeping in high buildings, where mosquitoes were unable to fly due to wind; the use of bed nets in Egypt (as noted by Herodotus 484–425 B.C.) and by the Romans; and the use of bed curtains, as noted by Marco Polo during his travels to India in the 13th century [70]. Sanitary measures helped to control yellow fever in the US in the late 1700s, including cleaning sewers and pumping bilge water out of ships, which was practiced in Philadelphia during a large outbreak in 1793 when refugee ships from Saint Dominigue (now Haiti) inadvertently brought in the *Ae. aegypti* vector [72, 73].

Environmental management as the primary tool for control of VBDs

Prior to the use of insecticides, VBD control generally relied on understanding local vector behavioural ecology and tailored environmental control, although these were often labour intensive. Following Ross's discovery and pioneering work on quantitative epidemiology of VBDs, the focus of malaria control was on elimination of anopheline vectors, primarily by changing the aquatic habitats where the vectors developed. There was also a focus on housing improvements such as screening of doors and windows. The first trial of a malaria intervention was carried out by Angelo Celli among railway workers in Italy in 1899–1900 [74–76]. The combined intervention of housing screening, whitewashing internal walls, burning special powders (probably pyrethrum), and protective clothing was highly successful. Celli found that 92% of the families left unprotected contracted malaria compared to only 4% in the intervention group.

Environmental management flourished in both Malaya (now Malaysia) and Netherlands East Indies (now Indonesia) in the early 1900s. British doctor Sir Malcolm Watson joined the Malayan Medical Service in 1900, where he led vector control efforts against malaria based on an understanding of the ecology of local vectors [28]. Drainage of aquatic habitats controlled malaria in 2 coastal towns in the state of Selangor and allowed resumption of port development. Later, Watson's work expanded to lowland areas—where he controlled *An. umbrosus* by clearing the forest within 0.8 km of plantation labourer houses so that water bodies were exposed to the sun—and in 1909 to hilly regions, where subsoil drainage was successful against *An. maculatus*. Watson also oversaw successful drainage schemes in Singapore in 1911, where local malaria transmission was practically eliminated [28]. The Dutch zoologist Nicolaas Swellengrebel was inspired by Watson and set out to replicate the work throughout the Indonesian archipelago between 1920 and 1935, terming his methods 'species sanitation' [31]. Swellengrebel aimed to control malaria primarily through environmental management, such as filling in or draining ponds and lagoons, maintaining and flushing drains, or planting shade trees depending on the vector species present and its ecology.

The Pontine marshes, near Rome, Italy, suffered from high malaria transmission for over 1,000 years. Large-scale drainage from 1930 onwards was highly successful in malaria control against the Italian malaria vector *An. labranchiae* [34]. This was done as part of the three-pronged 'bonifica integrale' campaign, or 'bonification', instigated by Mussolini. The campaign included agricultural improvements—e.g., draining swamps to increase agricultural land; hygienic measures, such as building sturdy, well-screened brick housing; and quinine distribution.

Another excellent example of environmental management for malaria control was in the Zambian Copperbelt during the 1920s and 1930s [37, 38, 77]. Control measures launched at the Roan Antelope Copper Mine in 1929—including vegetation clearance, modification of river boundaries, draining swamps, oil application to open water bodies, and house screening—were highly effective in targeting *An. gambiae* and *An. funestus* [37]. In 3 to 5 years, malaria-related mortality and morbidity declined by 70%–95%, and over a 20-year period, the programme averted an estimated 4,173 deaths and 161,205 malaria attacks.

Environmental management was also being implemented on a large scale in the southern US. The Tennessee Valley Authority (TVA) was set up in 1933 to exploit the Tennessee River's potential for hydroelectric power and improve the land and waterways for agricultural development of the region [39, 40]. At the time, the region was highly endemic for malaria, and the creation of artificial lakes would have exacerbated the problem. Vector control tools implemented included regulation of water levels in lakes, shoreline improvements such as deepening or diking and draining, larviciding, house screening, and later dichlorodiphenyltrichloroethane (DDT) spraying. Massive reductions in malaria were seen, and the disease was essentially eliminated from the area by the late 1940s.

Control of yellow fever in the Americas at the start of the 20th century was heavily reliant on environmental management. At this time, the US had taken control of Cuba following the end of the Spanish American war, but outbreaks of yellow fever and malaria were taking the lives of many US soldiers [78]. Following confirmation that *Ae. aegypti* was the yellow fever virus vector, in 1901 Major William Gorgas, Chief Sanitary Officer, was asked to initiate a programme for the elimination of *Ae. aegypti*, work he carried out with Joseph Le Prince [29]. The programme was highly successful and comprised house inspections, oiling or destruction of mosquito-producing containers, and isolation of yellow fever patients in screened quarters with fumigation of their premises with sulphur or pyrethrum. Havana residents not covering their cisterns were made to pay a US$10 fine. After introduction of the mosquito brigades, yellow fever deaths dropped from an average of 467 per year between 1890 and 1900 to 18 in

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005231

1901 [29]. Later the *Aedes* programme was expanded to include *Anopheles* control by drainage, filling or oiling of standing water, ditching in a herringbone pattern, cutting vegetation at edges of ponds or streams, the addition of larvivorous fish or oil to wells, restricting animal grazing during the wet season to avoid creating habitats in flooded footprints, and intermittent short-duration flooding of watercress beds in Havana (versus constant flooding). This resulted in a fall in malaria deaths from 5,643 between 1890 and 1900 to 444 deaths between 1900 and 1910, despite a greatly increased human population [29].

In 1904, Gorgas became Chief Sanitary Officer during the building of the Panama Canal and with the aid of Le Prince eliminated yellow fever and kept malaria at low levels [29]. Control was achieved by screening living quarters, draining or filling standing water, installing drains, and larviciding using oil or Paris Green [30]. Paris Green is not used currently due to high human toxicity and ecological concerns, and we now have much less toxic chemicals that can be applied in a more targeted manner. After these successes, similar campaigns were launched by Joseph White in Havana, Oswaldo Cruz in Rio de Janeiro, and Emilio Ribas in Santos [79]. Successful control was followed by a period of apathy. Complacency was brought to a halt by an epidemic of yellow fever in Rio de Janeiro in 1928 in which population densities of *Ae. aegypti* were again at high levels. The Cooperative Yellow Fever Service, a collaboration between the Brazilian Government and the Rockefeller Foundation, was established under the direction of Fred Soper with the aim of eradicating *Ae. aegypti* from Brazil. From 1930 to 1934, Soper led a well-organised campaign, with control measures including oiling of water containers and house searches for larvae and adults. Campaigns initiated by the Cooperative Yellow Fever Service also succeeded in eliminating *An. gambiae* from the northeast of Brazil in 1942 largely using larviciding with Paris Green, complemented in some areas by house spraying with short-acting pyrethroids [36].

In the late 1800s, colonial expansion in SSA and massive outbreaks of HAT led to a number of scientific missions to study the disease. In 1903, David Bruce and colleagues found that the trypanosome that causes HAT was transmitted by *Glossina palpalis* (now *G. fuscipes*) [69]. In colonial times, game destruction and bush clearing were widely practised for tsetse control in many countries. The impetus for game destruction was a natural experiment—a rinderpest epizootic in the 1890s eliminated wild hosts and domestic stock across large parts of east and southern Africa [80]. This led to the disappearance of tsetse from large areas, but as the game populations recovered, so did the tsetse. Game destruction was first introduced in Southern Rhodesia (now Zimbabwe) in 1919, and by 1921, cases of trypanosomiasis were greatly reduced [81]. From 1922 until the early 1980s, game destruction was generally adopted as a tsetse control method [26]. In the 1950s, game destruction in Shinyanga, Tanzania, succeeded in eradicating an isolated tsetse population [25]. Full or partial habitat destruction was also practiced. For example, riverine tsetse species were eradicated from rivers and streams in Ghana and Nigeria by removing short bush and trees with low branches [24]. Despite these successes, the huge environmental impact of bush clearing and game destruction would be unacceptable today.

Traps and targets for tsetse control also started to be developed around this time, as scientists gained an understanding of tsetse behaviour in response to visual (e.g., colour, movement, size/shape) and olfactory cues [27, 82]. For example, in 1909 on the island of Príncipe, estate staff were made to wear squares of black cloth coated with bird lime on their backs, which succeeded in reducing local densities of *G. palpalis*. This approach was later incorporated into an island-wide programme (including, also, habitat and host destruction), which eliminated tsetse and lasted until at least 1932 [83, 84]. Early traps developed included the Harris Trap used in Zululand from 1931 onwards against *G. pallipides* [83] and the 'animal' trap used in West Africa to control *G. fuscipes* and *G. tachnoides* [85].

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005232

From 1942 to 1945, *An. gambiae* was eradicated from Upper Egypt (Aswan, Qena, Girga, and Asyût Provinces) through a meticulous campaign of weekly larviciding using Paris Green and, to a lesser extent, house spraying using pyrethrum [43]. Residual treatment of trains, automobiles, and planes was also performed to prevent spread of *An. gambiae* to uninfested areas to the north. The number of malaria cases in the region fell from 10,193 cases in 1942 to 59 in 1946.

Prior to the use of residual insecticides, environmental management was also the standard control method against phlebotomine sand fly transmission of *Leishmania* species causing human cutaneous leishmaniasis (CL) and visceral leishmaniasis (VL). Early attempts towards the end of World War I to control sand flies was in response to epidemics of sand fly fever (rather than to leishmaniasis) that disrupted British troops in the Middle East and Mediterranean regions. Based on investigations of local sand fly ecologies and larval development locations, environmental management included the following: pitching camps away from refuse, debris, and loose friable rocks; pitching camps on levelled drained ground; sealing soil cracks with cresol, sand, or sawdust; and treatment with lime—all to render the ground impermeable to ovipositing and emerging sand flies. Additional chemical control included spraying cresol, crude oil, or paraffin or treating with tar around tents and the lower 3 feet (0.9 m) of buildings [86]. Similarly, in India, naphthalene in kerosene with petrol and carbon disulphide was applied 120 yards (110 m) around army barracks, resulting in a 50% reduction in sand flies [86]. Few chemical advances were made against adult sand flies during this period. Bed nets needed to be fine mesh sizes due to the small size of sand flies and were considered too uncomfortable in hot climates. Thus, sand fly control was in existence prior to its definitive incrimination as a vector of *Leishmania*, the result of cumulative experiments between 1904 and 1942 [86–88]. Plastering walls of houses, cattle sheds, and latrines with lime and mud to eliminate cracks used as diurnal resting sites by *Ph. argentipes*, a vector in the Indian subcontinent, continues to be part of an integrated approach to sand fly control [89].

Post–World War II era and the advent of DDT

The first residual insecticide DDT was added to the vector control toolbox in the early 1940s, consequently increasing the popularity of insecticide-based control. World War II had stemmed the supply of pyrethrum (derived from chrysanthemum flowers) from Japan, and alternatives were urgently needed [90]. The first major demonstration of DDT use was at the end of World War II when the allies used the insecticide to control an epidemic of typhus, transmitted by body lice, amongst the populations of war-torn Europe [91].

With the advent of DDT, malaria eradication became a more realistic proposition. In 1947, spurred on by malaria control successes—including the TVA and Malaria Control in War Areas programme to control malaria around military training bases in the southern US [92]—the US National Malaria Eradication Programme was established [44]. This was a joint undertaking by state and local health agencies in 13 southeastern states and the Communicable Disease Center of the US Public Health Service. Indoor DDT spraying, drainage, removal of mosquito larval development sites, and insecticide spraying eliminated malaria transmission, and in 1949 the US was declared free of malaria as a significant public health problem [44]. Support for an eradication approach and IRS using DDT was bolstered by insights from the Ross-Macdonald model, which illustrated that malaria transmission was highly sensitive to reductions in mosquito longevity [93, 94]. In 1955, WHO launched the Global Malaria Eradication Programme (GMEP)—excluding SSA, which they deemed too problematic—with the goal of interrupting transmission through IRS with DDT and other residual insecticides [45, 46]. Environmental management—such as drainage of marshes and housing improvements to

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005233

prevent mosquito bites—was abandoned, and only later were antimalaria drugs included in the strategy. The GMEP succeeded in eliminating malaria from Europe, North America, the Caribbean, and parts of Asia and South-Central America, primarily where there were more temperate climates, seasonal transmission, and well-functioning control programmes. The northern part of Venezuela was the first to be WHO certified as malaria free in June 1961 through the use of IRS with DDT, sanitary engineering (water management and house improvement), and larviciding [95]. Parasite resistance to drugs, mosquito resistance to insecticides, lack of community participation, and reduced funding led to abandoning the GMEP in 1969 after it was realised that elimination was not possible everywhere with the approach adopted [45].

Also around this time, the Pare-Taveta Malaria Scheme, a pilot project to test the feasibility of malaria eradication in Africa, was initiated [96]. Between 1954 and 1966, the project evaluated the effect of IRS with dieldrin on malaria and mortality in the Taveta subdistrict of Kenya and the Pare district of Tanganyika (now Tanzania). The project succeeded in reducing malaria to low levels, but intensive IRS could not be sustained, and malaria bounced back after the intervention was stopped.

In 1947, Brazil called for elimination of *Ae*. *aegypti* across the whole South American continent, a task that was coordinated by the Pan-American Sanitary Bureau with the continued involvement of Fred Soper [47]. Brazil was encouraged by the success of the Cooperative Yellow Fever Service in northeast Brazil but also understood that *Ae*. *aegypti* could not be eradicated from Brazil unless frontiers and ports were protected from invasion from other countries in the region. Container inspections, oiling of larval development sites, and later perifocal spraying of DDT in water containers and nearby walls succeeded in eradicating *Ae*. *aegypti* from large parts of South America during the 1950s and 1960s. By October 1961, 16 countries in the Western Hemisphere were free of *Ae*. *aegypti* (Bolivia, Chile, Ecuador, Guatemala, Nicaragua, Paraguay, Uruguay, French Guiana, Brazil, Costa Rica, El Salvador, Honduras, Panama, Peru, Canal Zone, and British Honduras) [48]. During the 1940s and 1950s, yellow fever was virtually eliminated in the Americas, but unfortunately, this success became the downfall of the programme. As yellow fever subsided, political support for the eradication campaigns waned despite warnings from Soper about the risk that could result from pulling back the hemisphere-wide *Ae*. *aegypti* control programme [97]. Weak vector control and surveillance meant, as predicted, that *Ae*. *aegypti* gradually returned to many countries, most likely due to re-infestation from countries that had not achieved eradication, including Argentina, French Guyana, the US, Venezuela, and several Caribbean countries.

The advent of DDT and dieldrin also saw the use of residual insecticides for tsetse control. Ground spraying of insecticides onto tsetse resting sites was carried out from the 1950s until the mid-1970s by tsetse control programmes in large parts of East Africa, combined with screening, treatment, and follow-up of patients [98–100]. Aerial spraying was first used in Zululand, South Africa, in the 1950s but was expanded greatly in the 1970s and 1980s. The most successful example of aerial spraying was in the Okavango Delta of Botswana, where it was used from 1973 to 1991 and again in the early 2000s against *G*. *m*. *centralis* succeeding in eliminating tsetse and HAT [25, 51]. Reduced infrastructures for spraying, high costs, and concerns about the environmental impact of DDT and dieldrin, however, resulted in ground and aerial spraying being largely discontinued [69]. The idea of insecticide-treated cattle for tsetse fly control was also developed in the 1940s [101, 102]. Experiments in Tanganyika (now Tanzania) showed that DDT-treated cattle reduced the abundance of *G*. *morsitans* by 99% and *G*. *swynnerloni* by 93% [101]. Insecticides also started to be used in traps and targets. For example, reinvasion of Príncipe by tsetse in the 1950s led to the use of insecticidal 'animal' traps between 1956 and 1958, which were successful in eradicating tsetse in Príncipe [103].

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005234

Much of the historical control of leishmaniasis has been attributed to IRS using DDT, both targeted specifically against *Leishmania* vectors, or as a beneficial consequence of the GMEP in the 1950s. In China, approximately 530,000 cases of co-circulating zoonotic and anthroponotic *Leishmania* species were reported north of the Yangtze River prior to the creation of the People's Republic in 1949. The national VL control programme, which started in 1951, included human VL case detection and treatment, IRS of houses and animal shelters using DDT, and elimination or topical deltamethrin treatment of dogs. This campaign reduced the case incidence from 94 per 100,000 population in 1950 to approximately 0.03 per 100,000 population by 1980, with clear effects associated with IRS interventions alone in some regions [49]. In Brazil, where zoonotic VL occurs, the government commission to investigate leishmaniasis and other diseases—created in 1936 and headed by Evandro Chagas—led to the first use of DDT in the 1950s in northeast Brazil. VL case incidence was reduced by 58% in 14 sprayed areas compared to a rise of 12% in 14 untreated areas [104]. Implementation of an integrated approach similar to that adopted in China (without the option of topical insecticide for dogs) led to considerable reductions in the number of cases, though with some reservations about the residuality of DDT on adobe houses [105, 106].

Reductions in *Leishmania* vectors—as well as human incidence, though this is less well reported—have been attributed to the GMEP operating in various countries [107]. In Rio de Janeiro, Brazil, DDT IRS circumstantially led to a reduction from 12.7% prevalence in 1947 to 0.3% in 1953 [108]. IRS spraying during the Indian National Malaria Eradication Programme of 1958 to 1970 apparently resulted in zero cases of VL being reported from the State of Bihar during that time period [109]. Perhaps the more compelling evidence is the rise in VL cases once the GMEP largely ceased in the late 1960s [107, 110]. For example, in the subsequent VL epidemic in Bihar, India, case numbers rose from a few to 40,000 cases by 1978 [109]. Similar rebounds were reported in several countries [107, 110, 111]. Retrospective analysis of household survey data from the Peruvian Andes showed that IRS with DDT from the 1950s until the 1970s resulted in a decrease in CL cases. Cases increased after IRS was discontinued [50].

GMEP abandoned—What next for malaria?

After the GMEP was abandoned, many countries switched from eradication to malaria control, even though WHO reaffirmed that eradication was still the ultimate goal [112]. During the 1970s and 1980s, malaria was poorly controlled. There were epidemics in the Indian subcontinent (1973–1976) and Turkey (1977) and focalisation of the malaria problem where there was sociopolitical instability or limited socioeconomic development, including countries in SSA, Brazil, and Sri Lanka [46, 113]. The economic crisis in the early 1970s and reorientation of collaborating agencies like the United Nations Children's Fund (UNICEF) towards general health (rather than malaria) meant less funding for malaria control, oil shortages led to increases in insecticide prices, drug and insecticide resistance were increasing, and operational capacity in programmes was reduced [45]. Also of note was a large WHO-funded research study conducted from 1969 to 1976 in Garki, northern Nigeria, known as the Garki Project [114]. Despite the GMEP not being implemented in Africa, WHO wanted to test whether IRS with propoxur and mass drug administration (MDA) with chloroquine and sulfadoxine-pyrimethamine would interrupt malaria transmission. The measures were successful in reducing parasite prevalence from 80% to 30%, but 1 year after stopping control, malaria rebounded back to pre-intervention levels.

After these setbacks, WHO called for a more tactical approach to malaria control based on the biological, social, ecological, and economic determinants of malaria rather than blanket distribution of insecticide-based vector control and MDA. This approach was endorsed by the

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005235

World Health Assembly (WHA) in 1978 [115] and further developed at the Seventeenth WHO Expert Committee on Malaria in 1979 [116]. In the early 1990s, WHO devised with member states a new global malaria control strategy, which was endorsed by the WHA in 1993 [117]. The new strategy called for a selective approach in determining whether and where to attempt vector control (and if so, what method to use) and deemphasised IRS, stating that 'the proper use of insecticides is a complex matter, involving considerable expense and trained personnel and demanding sustained application, usually for many years.' A renewed focus on research led to new vector control tools becoming available.

In the early 1970s, ITNs emerged as a vector control idea because many communities were already sleeping under untreated bed nets. At this time, synthetic pyrethroids were developed (permethrin, cypermethrin, and deltamethrin), which were safe to use for impregnation of ITNs [118]. Following pioneering trials on ITNs, including those in The Gambia in the 1980s that showed huge impacts on malaria infection and mortality [119–121], WHO recommended the use of ITNs for children and pregnant women [122]. In the early 2000s, the late Chris Curtis and others were strong advocates for ITNs as a public good and for their provision via the public sector with financial assistance from donors [123]. Following several studies that showed a community-level effect of ITNs [124–126] through mass killing of mosquitoes, there was an increasing push for ITNs to be provided to entire communities, rather than just high-risk groups [127]. As a result, the WHO position statement was strengthened in 2007 to recommend the use of long-lasting ITNs (with long-lasting pyrethroid formulations that last for 3 years) distributed either free or highly subsidised and used by all community members [128]. A major stimulus for malaria control at this time was the recognition that malaria restrained economic development and that eliminating malaria in SSA would lead to rapid development [129]. Political will and resources for malaria increased, and in 2007, malaria eradication hit the agenda again following calls by the Bill and Melinda Gates Foundation to eradicate malaria with massive scale-up of existing and experimental interventions [130]. ITN coverage increased rapidly from 2000, predominantly financed through the Global Fund to fight AIDS, Tuberculosis and Malaria [131, 132], and an estimated 50% of the population at risk of malaria of SSA were sleeping under an ITN in 2017 [8]. IRS was used only in specific areas, and therefore only 7% of the population at risk in SSA was covered by IRS in 2017 [8]. Much of the IRS conducted in SSA was funded by the US Presidents Malaria Initiative [133].

Both ITNs and IRS have had considerable public health impact. Between 2000 and 2015, there was a decline in malaria infection by over 50% and an estimated 663 million clinical cases averted in SSA. ITNs were estimated to have been responsible for an estimated 68% of averted cases and IRS for 13% of cases averted [63]. This reliance on insecticide-based malaria vector control has, however, fuelled the development of insecticide resistance [134]. WHO noted that 68 of the 80 malaria-endemic countries that provided data for 2010–2017 reported resistance to at least 1 of the 4 insecticide classes in one malaria vector species, while 57 countries reported resistance to 2 or more insecticide classes [8]. Existing evidence is equivocal as to whether insecticide resistance is adversely impacting malaria control, but it remains a major concern [135–137]. In response to the growing threat of insecticide resistance, a public–private partnership—the Innovative Vector Control Consortium—was established in 2005 to bring new insecticide chemistries to the market, which led to several ongoing market-shaping initiatives on next-generation ITNs and IRS (www.ivcc.com). Despite these efforts, since 2017 WHO World Malaria Reports have highlighted stalling progress against malaria [8, 138, 139]. The reasons for this stagnation include inadequate coverage of ITNs, the need to replace old nets, high rainfall in some parts of SSA, and insecticide resistance. WHO called for increased investment, including filling gaps in coverage of core malaria tools like ITNs [8] and the need to develop additional tools for vector control.

NTDs—Lagging behind in vector control

Vector control for vector-borne NTDs, including Chagas disease, Gambian HAT, leishmaniasis, LF, and onchocerciasis, took longer to gain traction compared to efforts against anopheline and *Aedes* vectors.

Despite the early discovery by Sir Patrick Manson of transmission of the main LF parasite—*Wuchereria bancrofti*—by mosquitoes in 1878 [67, 140], vector control against LF played a lesser role than for other VBDs. Uniquely among VBDs, LF can be transmitted by 5 genera of mosquito (*Anopheles*, *Aedes*, *Culex*, *Mansonia*, and *Ochlerotatus*), although it typically requires a large number of infective mosquito bites over many years to result in an infectious human host [141]. Although vector control for LF is advocated by WHO [142], much of the focus today is on use of MDA to eliminate microfilariae from the blood of infected humans in order to interrupt mosquito transmission. Despite this, there are several examples from the Pacific region of elimination of LF using vector control alone—including IRS using DDT against *Anopheles* vectors in the Solomon Islands and Papua New Guinea [52–54], as well as sanitation campaigns against culicine vectors in Australia [143]. It is likely that the recent massive rollout of ITNs in SSA has contributed to a decline in LF, although the evidence is equivocal [144–147]. In Papua New Guinea, however, an MDA campaign from 1994 to 1998 reduced transmission, but large declines in mosquito and human infection were not seen until ITNs were introduced in 2009 [148], which was consistent with the notion that combining drugs with vector control would be more effective than either approach alone. Polystyrene beads used in pit latrines against culicine vectors were also shown to augment MDA in India and Zanzibar in the 1980s and 1990s [149–151]. In 1997, WHO called for eradication of LF and 5 other infectious diseases. In 2000 the Global Programme to Eliminate Lymphatic Filariasis (GPELF) was launched, with vector control currently playing a minor role to MDA as a supplementary intervention [152, 153].

Vector control has been integral to the control of onchocerciasis [154], particularly in the Onchocerciasis Control Programme (OCP) in Africa from 1974 to 2002 [55]. Weekly aerial larviciding was conducted from 1976 to 1989 along the rivers of a wide area of west African savanna (700,000 km^2) where onchocerciasis was endemic [155]. The programme initially covered Benin, Burkina Faso, the northern parts of Côte d'Ivoire, Ghana, southeastern Mali, southwestern Niger, and Togo but was expanded to include additional river basins in Benin, Côte d'Ivoire, Ghana, Guinea, Sierra Leone, and Togo from where *Simulium* were invading [156]. The programme was hugely successful, and the level of onchocerciasis endemicity declined rapidly. Longitudinal entomological surveys at 4 catching points in Burkina Faso showed a decline in annual transmission potential of infective *Onchocerca volvulus* larvae from between 300 and 900 in 1975 to less than 100 by 1982 [155]. The same study reported a reduction in prevalence of human microfilariae infections from around 70% in 1976 to almost negligible levels through to 2000. The absence of—or at least very low levels of—transmission have been maintained since, despite the absence of vector control or ivermectin MDA. Several important lessons were learned from the OCP that can be applied to vector control more widely, including the need to rotate insecticides (implemented following development of resistance to temephos and chlorphoxim) and the value of using a targeted approach to eliminating residual foci based on entomological and epidemiological monitoring [156]. In 1991, the Onchocerciasis Elimination Program of the Americas (OEPA) was launched [157], and in 1995, the African Programme for Onchocerciasis Control (APOC) was established in 19 African countries not included in the OCP [56, 158]. Several of the APOC countries successfully used ground larviciding, although both APOC and the OEPA relied predominantly on community-directed treatment with ivermectin, the use of which was bolstered by the Merck Mectizan donation scheme that began in 1987 [159].

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005237

Vector control has also been highly effective against Chagas disease as illustrated by successes of the Southern Cone Initiative (SCI) initiated during 1991 in Argentina, Bolivia, Brazil, Chile, Paraguay, and Uruguay [57–59] and similar initiatives launched in 1997 in Central America and Andean Pact countries. Interventions against the vector *T. infestans* focused mainly on IRS, house improvements (replacement of mud walls and floors with cement, and thatched roofs with corrugated metal), and community education. In the 1980s, there were thought to be between 16 and 18 million people infected with *Trypanosoma cruzi*, and the SCI achieved a decline in infestation rate and a sharp decline in the infection rates of children [160]. Uruguay became the first Latin American country to eliminate Chagas disease in 1997 [161], and domestic transmission was effectively eliminated in Chile (1999); Brazil (2006); substantial areas of Argentina, Bolivia, and Paraguay; and parts of Central America [162]. Despite these successes, there are estimated to be still over 6 million people infected with the parasite [6], and continued vigilance is necessary to combat peridomestic and sylvatic vector populations, which can re-invade houses or mediate transmission outside the home [162]. In some regions, successful vector control to maintain low house infestation rates is a prerequisite for human treatment [163].

Vector control continues to play an important role in the fight against leishmaniasis, particularly where sand flies are endophilic [50, 109, 111, 164, 165]. Control is complex, however, due to the numerous aetiologies and transmission cycles, many of which in the Americas are sylvatic, and most *Leishmania* species involve a zoonotic reservoir. To tackle anthroponotic VL, an elimination initiative was launched by India, Bangladesh, and Nepal in 2005 incorporating an IRS component alongside screening and treatment, which was associated with a reduction in VL cases from over 77,000 in 1992 to fewer than 6,000 cases in 2016 [60]. A large cluster randomised trial of ITNs in India and Nepal against anthroponotic VL, however, failed to show effectiveness against infection or disease [166], perhaps due to the vector being more exophagic than expected [167]. In contrast, successful deployment of bed nets reduced anthroponotic CL incidence in a variety of Old World foci [110]. Against zoonotic VL, an alternative insecticide application is deltamethrin-impregnated dog collars, which provide high levels of individual protection against canine infection [168]. Community-level dog collar implementation in Iran reduced human infection incidence by 43% [169] and infantile clinical VL by 50% [168].

Traps and targets for tsetse control also continued to be developed, now incorporating synthetic pyrethroids [82]. In West Africa, the Challier Laveissiére biconical trap was developed and found to catch many more tsetse than the 'animal' trap [170]. Deltamethrin-impregnated biconical traps deployed along River Léraba in Burkina Faso in the 1970s rapidly reduced *G. palpalis gambiensis* and *G. tachinoides* [171]. Different variants of the biconical trap were developed and deployed in different settings, including the pyramidal trap, monoconical and Vavoua trap, bipyramidal trap, and others [27]. Insecticidal targets, panels of insecticide-impregnated cloth, were developed including the R type, which was the first to be widely deployed, and the simplified S type target, which consisted of a rectangle of black cloth flanked by two pieces of black mosquito netting attached to a frame and inserted via a pole into the ground [172]. Pyrethroid treatment of cattle to combat ticks and tsetse was used widely in successful control programmes in Burkina Faso, Tanzania, Zanzibar, and Zimbabwe [173]. The sterile insect technique was used experimentally in Nigeria and Tanzania but only programmatically in Zanzibar, where between 1994 and 1997 tsetse was eliminated [174]. Unfortunately, scaling down of tsetse control campaigns and neglect of surveillance activities led to an increase in HAT cases by the turn of the century. Renewed efforts are underway to eliminate *T. b. gambiense* and *T. b. rhodesiense* HAT through reduction of the parasite reservoir using screening and treatment of humans, as well as vector control, including traps and targets for

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005238

riverine tsetse and insecticide-treated cattle for savannah flies [175, 176]. WHO aims to eliminate HAT as a public health problem by 2020 (with elimination of transmission by 2030) and has developed a roadmap to achieve this goal [177]. Active screening and treatment of human cases provides the mainstay of efforts to achieve the elimination goal. Increased control efforts have coincided with plummeting case numbers from 25,841 cases of *T. b. gambiense* HAT in 2000 to 2,110 in 2016 and from 709 *T. b. rhodesiense* HAT cases in 2000 to 54 in 2016 [62]. While active screening and treatment have been responsible for the majority of this decline, in the last decade, new cost-effective methods of controlling riverine species of tsetse—the important vectors of *T. b. gambiense*—have begun to make an important contribution to the global effort. In particular, 'Tiny Targets' are—despite their small size—proving highly effective in reducing the density of riverine species where active screening and treatment alone is not predicted to achieve the elimination goals [178, 179]. Tiny Targets are currently deployed by control programmes in Chad, Côte d'Ivoire, the Democratic Republic of Congo, Guinea, and Uganda.

In Europe, the US, and Australia—where VBDs such as malaria were once endemic—effective disease control programs were replaced by the control of nuisance biting mosquitoes and the intermittent control of epidemics caused by viruses, such as West Nile virus, dengue, and Zika [180]. In Europe, large-scale mosquito control is confined largely to the Rhine Valley, where authorities are conducting larviciding and environmental management [181, 182]. In the US, mosquito abatement districts are present in many states, including large-scale programmes in California and Florida. The abatement district programme has been successful—e.g., in 2018, there were no locally transmitted Zika cases in US states despite importation of cases due to travellers returning from affected areas [61]. The distribution of *Ae. aegypti* in Australia is restricted to Queensland, where routine control measures include IRS (targeting the premises of contacts of dengue cases), lethal ovitraps, barrier/harbourage spraying, treatment of containers with residual chemicals, and source reduction [183].

The growing global threat of *Aedes*-borne diseases

While protozoa and nematodes were the dominant vector-borne pathogens of the 19th to 20th centuries, arboviruses are likely to be most important in the 21st century. *Aedes*-borne viral diseases, including chikungunya, dengue fever, yellow fever, and Zika disease, are a growing threat worldwide [184, 185] due to geographic expansion of vectors and viruses through globalisation and urbanisation [186]. Urbanisation, often unplanned, is typically associated with inadequate housing and lack of basic services, including water and waste management, which creates ideal habitats for expanding *Ae. aegypti* populations [187]. *Aedes albopictus*—once confined to tropical forests of Southeast Asia—has increased its geographic range since the mid-1960s and adapted to live in human-made habitats in urban and peri-urban areas [188]. This is exacerbated by a lack of investment in *Aedes* vector control, which in its current form is failing to prevent *Aedes*-borne epidemics. Indeed, as noted by Margaret Chan, Director General of WHO, during her opening address at the 69th WHA in 2016, '. . . Above all, the spread of Zika, the resurgence of dengue, and the emerging threat of Chikungunya are the price being paid for a massive policy failure that dropped the ball on mosquito control in the 1970s.' Successful *Aedes*-control campaigns of the past were replaced by reactive control during epidemics, which has been largely ineffective. In general, there is a lack of clarity on what vector control methods are effective for *Aedes*-borne diseases because the tools available have not been rigorously assessed against epidemiological outcomes [189]. This is of great concern because in the absence of effective vaccines, programmes that limit contact between humans and vectors and are expedient, comprehensive, and sustained are the most effective method of controlling arboviral diseases [189].

Discussion

Vector control has been the principal method of preventing VBDs for over 100 years and remains highly effective, when comprehensively applied and sustained. It remains, for several diseases, the only control tool we currently have at our disposal. Key lessons that we can learn from the history of vector control are discussed further as follows and summarised in the 'Key learning points'.

History shows that complacency and lack of investment in vector control leads to VBD resurgence. A striking example comes from South America, where,—despite achieving eradication of *Ae*. *aegypti* in 16 countries—after control programmes were scaled back the vector reinvaded, flourished, and caused hemisphere-wide epidemics from multiple different viruses [48]. It is estimated that 91% (68/75) of malaria resurgence events from the 1930s to the 2000s were attributed, at least in part, to weakened vector control programmes [190]. Complacency in tsetse control and surveillance led to flareups of HAT in the early 2000s.

Political will and central coordination clearly have important roles to play. For example, the current successes in reducing VL incidence between 2012 and 2017 in the Indian subcontinent [191] are attributed to the advocacy and political support generated with substantial donations from pharmaceutical industry, governments, and nongovernmental agencies [192]. The VL initiative and other programmes—including the Pan American Sanitary Bureau efforts to eliminate *Ae*. *aegypti* from the South American continent, the OCP, and the SCI—all involved strong cross-border collaboration [48, 55, 59]. These large-scale collaborations enabled effective coordination and dialogue, sharing of best practices, and cross-border containment. Effectiveness of this approach is exemplified today by the Elimination8—a collaboration between 8 countries in southern Africa to eliminate malaria (https://malariaelimination8.org/).

It is imperative that political will and investment in vector control is maintained, particularly as we approach elimination targets when the cost per VBD case averted will inevitably increase. Despite this, vector control is chronically underfunded, for research and development (R&D) and at programme level. Investment in vector control R&D is dwarfed by that for drugs, diagnostics, and vaccines [193]. For example, for malaria, only 18 million US$ (3% of total R&D investment) supported vector control in 2014. Although we have seen an increase in investment in dengue vector control R&D from 5 million US$ in 2010 to 21 million US$ in 2014 (an increase from 8% to 25% of total R&D investment), there is negligible or no investment in vector control R&D for other VBDs such as LF. At the programme level, additional funding is needed to increase vector control capacity and build health systems. Programmes lack skilled personnel, in particular public health entomologists and vector control technicians [194]. Surveillance systems and monitoring and evaluation need significant strengthening to allow programmes to target interventions, track progress against programmatic indicators, and make adjustments as needed. Huge funding shortfalls are a roadblock to more effective intervention—even for malaria, which is better funded than other VBDs. Global financing for malaria control and elimination was 2.9 billion US$ in 2015, which represents only 46% of the Global Technical Strategy 2020 annual investment milestone of 6.4 billion US$ [195, 196]. NTDs received only 0.6% of Official Development Assistance in 2012, compared to 6.8% for malaria and 47.2% for HIV/AIDS [197]. At the international level, vector control is losing expertise fast with a massive reduction in the number of entomologists working at WHO's headquarters in Geneva. To sustain and further the gains already made, political will must be enhanced and investment in vector control dramatically increased.

Throughout the history of vector control, a range of different tools were successfully applied. It is striking, however, that environmental management such as drainage and filling and larviciding come up repeatedly—particularly pre 1940—but were less common thereafter

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005240

(as noted by Keiser and colleagues for malaria control [22]). Work by Watson and Schwellengrebel, which took an ecological perspective [28, 31], shows that success can be achieved when we have a thorough understanding of the vector and context for transmission as a knowledge base on which to build vector control efforts. Similarly, the development of highly effective baits for tsetse would not have been possible without a rational and detailed understanding of vector behaviour. Unfortunately, the success of this approach is often forgotten in the search for seemingly more easily scalable solutions. Insecticides such as DDT gained favour because they gave a rapid result and were often less labour intensive to implement than environmental management. The availability of residual insecticides initiated a fundamental shift in vector control approaches from locally tailored approaches based on an understanding of the epidemiology and ecological, environmental, economic, and social determinants of VBDs to a focus on deployment of uniform insecticide-based commodities, particularly for malaria. In essence, entomologists stopped being thinkers and became monolithic deployment automatons.

Many of the historical vector control examples involved collaboration with the non-health sector. For example, public–private partnerships such as those in the Zambian Copper Belt and the pioneering work of Celli on improved housing against malaria [37, 38, 74, 77]. This has been largely taken over by health-sector–led vector control. There is huge potential for engagement of the non-health sector for greater resilience against VBDs and increased sustainability of vector control. For instance, farmers can be mandated to dry their fields regularly to reduce *Anopheles* habitats [198], the private sector (e.g., extractive industries) can implement vector control to maintain the health of their workforce and surrounding communities [199], and the housing sector can be engaged to implement housing improvements (e.g., screening) that can dramatically reduce house entry of anopheline and *Aedes* mosquitoes [200].

Development and testing of novel vector control tools is essential. While we are waiting for new tools to come to the market, however, the vector control community should draw upon the full toolbox of interventions that are currently available, including noninsecticidal tools like environmental management. This is particularly important given the changing landscape of VBDs, which mandates a transformation in how we do vector control. For example, insecticide resistance in *Anopheles* and *Aedes* vectors is on the rise and threatens to undermine control of these diseases [134, 201]. Social and environmental change such as urbanisation, climate change, agricultural expansion and intensification, water resource development, deforestation, natural resource exploitation, trade, and population movement are creating enabling conditions for VBD transmission, and current tools do not fully address these VBD determinants [202]. It is increasingly acknowledged that in order to control VBD more effectively and/or drive VBD transmission to zero, multiple interventions need to be applied based on local conditions and needs, and that this may not be achievable with the current tools being used [189, 203–205]. For example, in many settings—even in the presence of universal coverage with core malaria interventions—malaria vectors are able to maintain robust transmission through outdoor biting, feeding on nonhuman animal hosts, and resting outdoors [206]. Environmental management—e.g., house screening against malaria—can also play a role after VBD elimination has been achieved by reducing the risk of reestablishment of transmission.

A criticism of this rationale may be that some of the historic examples, particularly those against yellow fever in South America, involved a 'military-like' vector control response in less complex ecosystems that some say would not be feasible today. This is a reasonable point to consider. We argue, however, that a weakness of many of the historic examples was a lack of community engagement in vector control. This could be strengthened, particularly for control of *Aedes* mosquitoes. There are contemporary examples of successful community-based vector control against dengue, HAT, and malaria [207–209].

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005241

There is an increasing recognition of the role that vector control can play in disease prevention. For example, the WHO GVCR strategy came about following calls from countries to strengthen vector control in the wake of the Zika epidemic [2]. The GVCR has 4 pillars of action, to (i) strengthen inter- and intra-sectoral action and collaboration; (ii) engage and mobilize communities; (iii) enhance vector surveillance and monitoring and evaluation of interventions; and (iv) scale up and integrate tools and approaches, within the health sector and—where relevant—outside the health sector. Rather than a one-size-fits-all approach, the GVCR advocates for locally appropriate solutions (insecticidal and noninsecticidal) based on solid epidemiological and entomological evidence, which harks back to the approach used by many successful historic vector control programmes. The GVCR will help to galvanise this transformative approach to vector control and should be supported by the entire vector control community.

Conclusion

Vector control has been shown to be highly effective, historically and presently. Lack of funding and weak programmatic capacity undermine programmes and mean that we are not well equipped to face the pressing new challenges to VBD control, such as environmental change, insecticide resistance, and population growth. There is an urgent need for increased investment in strengthening programmatic capacity for surveillance and control, as well as the development of new vector control tools. We cannot afford to wait until new tools and strategies, such as *Wolbachia* and genetically modified mosquitoes, are available. Instead, we should revisit successful programs from the past and adopt a problem-solving approach that implements tailored vector control solutions drawing upon our entire toolbox of available interventions, including insecticide and non–insecticide-based control methods.

Key learning points

- Political will and investment in capacity and capability must be maintained in order to keep VBDs and vector control as public health priorities. If this is not done, disease resurgence is inevitable.
- Train and retain entomologists at all programme levels—a better understanding of the vectors will enable more effective control.
- Encourage cross-border collaboration and regional efforts where possible.
- Expand the toolbox of vector control to include environmental management and larval control and develop the role of sectors outside health to deliver environmental interventions.
- Single vector control tools are unlikely to be sustainable; combined control (including additional vector control tools, vaccines, MDA, and diagnosis and treatment) are more effective and sustainable.

Subject: communications test

Emerald Coast Healthcare Coalition is conducting our quarterly communications test which seems very timely with everything going on due to coronavirus - this test ensures that we maintain communication with our partners
Please respond to me only - do not copy all
Please send email answering YES that you received my communication for this test
Thank you

--

Subject: communications test

Emerald Coast Healthcare Coalition is conducting our quarterly communications test which seems very timely with everything going on due to coronavirus - this test ensures that we maintain communication with our partners
Please respond to me only - do not copy all
Please send email answering YES that you received my communication for this test
Thank you

--

Ann Hill, Executive Director
Emerald Coast Healthcare Coalition
850-585-1679

Subject: communications test

Emerald Coast Healthcare Coalition is conducting our quarterly communications test which seems very timely with everything going on due to coronavirus - this test ensures that we maintain communication with our partners
Please respond to me only - do not copy all
Please send email answering YES that you received my communication for this test
Thank you

--

Ann Hill, Executive Director
Emerald Coast Healthcare Coalition
850-585-1679

Subject: communications test

Emerald Coast Healthcare Coalition is conducting our quarterly communications test which seems very timely with everything going on due to coronavirus - this test ensures that we maintain communication with our partners
Please respond to me only - do not copy all
Please send email answering YES that you received my communication for this test
Thank you

--

Subject: MS Marina (Oceania)

Hi Joe – are you tracking the MS Marina (Oceania)? I'm tracking 653 Amcits on board, COVID(+) cases on ship, headed to Miami but no ports there open. This is going to be a problem soon. We're getting inquiries from the Australians and Andorrans. This is the latest I have:

18MAR: Indications that an Oceania cruise ship will be arriving at Port of Miami sometime next week with various COVID-19 positives on it. Consular Affairs from the Australian Embassy contacted to say they had been notified overnight that the MS Marina (Oceania) is returning to Miami from South America via the Panama Canal after it was denied docking by several countries. The latest advice the Embassy has is that it is passing through the Canal could take 5 or 6 days. Australian Embassy in Mexico and Honorary Consul in Panama are trying to assist at least 49 Australians on board - some of whom are starting to run short of medications etc. - but are having difficulty contacting the crew and Oceania's agents in Panama. CONS provided them with the contact for Norwegian cruise lines which is a parent company of Oceania. OFM indicates Port of Miami is not aware of the ship coming to Miami and questioned where it would even dock as all available ports are occupied. OFM in touch with Norwegian.

Erik,

Correct, AHCA certifies CLIA, so we would need to be part of the MOU. I sent the CMS 116 attachment to our field supervisor to begin approval and to make sure there are no hiccups with getting this expedited. They are working on it now.

Thanks,

From: Sayler, Erik <Erik.Sayler@em.myflorida.com>

Louise and Stefan,

AMERICAN OVERSIGHT

Our national guard liaison officer Maj. DeLeon is working to help secure a mobile testing lab resource from the National Guard Bureau (NGB) from the Civil Support Team (CST). The Major says there are 10 such mobile labs in the NGB. To secure it, we need an MOU for the equipment (the Guard is drafting that) and the DOH will need to authorize the CST members to work under their Clinical Laboratory Improvement Amendments (CLIA) certification.

Kevin Guthrie asked me to help facilitate this. I believe this touches on both DOH and AHCA jurisdiction. The attached emails include background information and the CLIA application. I'll let you know when I receive the NGB MOU for the equipment.

Sincerely,

Erik L. Sayler
Deputy General Counsel
Florida Division of Emergency Management

Subject:	RE: [EXTERNAL] Re: Royal Caribbean Ships off Brazil/Chile
Date:	Tuesday, March 17, 2020 2:16:49 PM
Attachments:	SOP for disembarking international cruise ships with passengers arriving in charter flights (ver 3_17_2020).docx

Here is interim guidance from CDC for these two ships/flights (also attached)

1. Pre-departure
    a. Send ship and flight manifests to CDC.
    b. Send information about possible COVID illness among any passengers (not just American Citizens and including reports of # of persons with confirmed or suspected COVID) to CDC
    c. Distribute general CDC COVID info-graphic and instructions for cruise ship passengers.
    d. In advance, cruise line should make arrangements for land-based management, including for persons with symptoms/illness (as described below) and communicate and clear those plans to appropriate local/state health authorities.
2. At disembarkation from boat and before boarding charter flight, screening questionnaire completed
    a. General screening questionnaire provided by CDC, or other questionnaire as per local/national authorities at port administered to passengers/crew disembarking
    b. Persons who are ill must be evaluated at local health facility – not allowed to board charter unless cleared by local clinician and deemed fit-to-fly.
3. Passengers without any symptoms can board charter flights.
4. During flight, have clinicians (physician and nurse) on board charter to assist/evaluate any passengers who become ill during travel and to assist at arrival in US
5. Upon arrival at airport in US
    a. CBP/CWMD will perform screening as if passengers were arriving from level 3 countries, as per their protocols.
    b. CDC Quarantine Station staff are available for illness response, as per protocol.
    c. Any ill persons are evaluated and referred for evaluation locally as per Quarantine Station protocol.
    d. Passengers who are not ill will be allowed to continue their travel on commercial flights.
6. After arrival
    a. CDC will provide EpiX notification to receiving states, if meet criteria from our protocol.
    b. Passengers should understand that all must self-quarantine and practice social distancing for 14 days.
7. For an air ambulance/medical evacuation flight, passengers should go to pre-determined clinical facility as arranged by cruise line/air ambulance company. This plan must be in place and cleared with local and state health authorities before departure of the charter flight.

AMERICAN OVERSIGHT

a. Persons who do not require hospitalization but are not fit-to-travel to home destination, should remain in hotel (as cleared with local/state health authorities) until fit-to travel.

    i. Alternative transportation arranges such as private vehicle or charter flights to home destination made be possible based on individual assessment.

    ii. Additional guidance is available at https://www.cdc.gov/coronavirus/2019-ncov/downloads/sick-with-2019-nCoV-fact-sheet.pdf

b. These persons must follow all CDC guidance for persons who have been on cruise ships in the last 14 days. They must stay home for 14 days from the time they disembark, practice social distancing, and monitor their health. Social distancing means staying out of crowded places, avoiding group gatherings, and maintaining distance (approximately 6 feet or 2 meters) from others when possible.

AMERICAN OVERSIGHT

Thank you for joining the call today. Leah - I don't believe I have everyone from CDC who was on the call, including Rachel - please add if that's the case.

I've listed the do-outs that I'm tracking below, and this chain can serve as the new, smaller group of folks working on the Brazil/Chile RC ships.

- State - send CDC global ship tracking list; create small-group email distro;
- CDC - send Royal Caribbean and Amy Dubois/HHS protocols for screening; Make determination on screening protocols for passengers from a "healthy" ship
- Royal Caribbean - send #s of Canadians to CDC; update on infection status; send manifests for four ships

Proposed SOP for Disembarking International Cruise Ships With Passengers Arriving In US On Charter Flights (Working Draft As Of 3/16/20)

1) Pre-departure
    a. Send ship and flight manifests to CDC.
    b. Send information about possible COVID illness among any passengers (not just American Citizens and including reports of # of persons with confirmed or suspected COVID) to CDC
    c. Distribute general CDC COVID info-graphic and instructions for cruise ship passengers.
    d. In advance, cruise line should make arrangements for land-based management, including for persons with symptoms/illness (as described below) and communicate and clear those plans to appropriate local/state health authorities.
2) At disembarkation from boat and before boarding charter flight, screening questionnaire completed
    a. General screening questionnaire provided by CDC, or other questionnaire as per local/national authorities at port administered to passengers/crew disembarking
    b. Persons who are ill must be evaluated at local health facility – not allowed to board charter unless cleared by local clinician and deemed fit-to-fly.
3) Passengers without any symptoms can board charter flights.
4) During flight, have clinicians (physician and nurse) on board charter to assist/evaluate any passengers who become ill during travel and to assist at arrival in US
5) Upon arrival at airport in US
    a. CBP/CWMD will perform screening as if passengers were arriving from level 3 countries, as per their protocols.
    b. CDC Quarantine Station staff are available for illness response, as per protocol.
    c. Any ill persons are evaluated and referred for evaluation locally as per Quarantine Station protocol.
    d. Passengers who are not ill will be allowed to continue their travel on commercial flights.
6) After arrival
    a. CDC will provide EpiX notification to receiving states, if meet criteria from our protocol.
    b. Passengers should understand that all must self-quarantine and practice social distancing for 14 days.
7) If there is an air ambulance flight, passengers should go to pre-determined clinical facility as arranged by cruise line/air ambulance company. This plan must be in place and cleared with local and state health authorities before departure of the charter flight.
    a. Persons who do not require hospitalization but are not fit-to-travel to home destination, should remain in hotel (as cleared with local/state health authorities) until fit-to travel.
        i. Alternative transportation arranges such as private vehicle or charter flights to home destination made be possible based on individual assessment.
        ii. Additional guidance is available at https://www.cdc.gov/coronavirus/2019-ncov/downloads/sick-with-2019-nCoV-fact-sheet.pdf
    b. These persons must follow all CDC guidance for persons who have been on cruise ships in the last 14 days. They must stay home for 14 days from the time they disembark, practice social distancing, and monitor their health. Social distancing means staying out of crowded places, avoiding group gatherings, and maintaining distance (approximately 6 feet or 2 meters) from others when possible.

Dear Eleni,
Please clarify your request and the plan – which passengers are you referring to? The air ambulance passengers or the ones who are not ill and are coming in the larger charter?

As I wrote earlier, CDC will not be conducting any health screening. For the passengers who are not arriving by air ambulance, CBP/CWMD would screen the passengers based on their own protocol. CDC Quarantine Station staff will be available to respond to any illness events, as requested by CBP.

For the air ambulance, they need assessment – I understood that you have made arrangements with Dr. Barth Green/University of Miami, who is not affiliated with CDC. He/his team would make an assessment of those 6 individuals.

AMERICAN OVERSIGHT

I've listed the do-outs that I'm tracking below, and this chain can serve as the new, smaller group of folks working on the Brazil/Chile RC ships.

- State - send CDC global ship tracking list; create small-group email distro;
- CDC - send Royal Caribbean and Amy Dubois/HHS protocols for screening; Make determination on screening protocols for passengers from a "healthy" ship
- Royal Caribbean - send #s of Canadians to CDC; update on infection status; send manifests for four ships

Also – forgot to add that the Florida Surgeon General, Dr Scott Rivkees, who is now included on the emails, has asked CDC to pass on his request that passengers wear surgical masks, if available, on the charter flight, arriving in Miami.

Subject: RE: [EXTERNAL] Re: Royal Caribbean Ships off Brazil/Chile

Here is interim guidance from CDC for these two ships/flights (also attached)

1. Pre-departure
    a. Send ship and flight manifests to CDC.
    b. Send information about possible COVID illness among any passengers (not just American Citizens and including reports of # of persons with confirmed or suspected COVID) to CDC
    c. Distribute general CDC COVID info-graphic and instructions for cruise ship passengers.
    d. In advance, cruise line should make arrangements for land-based management, including for persons with symptoms/illness (as described below) and communicate and clear those plans to appropriate local/state health authorities.
2. At disembarkation from boat and before boarding charter flight, screening questionnaire completed
    a. General screening questionnaire provided by CDC, or other questionnaire as per local/national authorities at port administered to passengers/crew disembarking
    b. Persons who are ill must be evaluated at local health facility – not allowed to board charter unless cleared by local clinician and deemed fit-to-fly.
3. Passengers without any symptoms can board charter flights.

AMERICAN OVERSIGHT

4. During flight, have clinicians (physician and nurse) on board charter to assist/evaluate any passengers who become ill during travel and to assist at arrival in US
5. Upon arrival at airport in US
    a. CBP/CWMD will perform screening as if passengers were arriving from level 3 countries, as per their protocols.
    b. CDC Quarantine Station staff are available for illness response, as per protocol.
    c. Any ill persons are evaluated and referred for evaluation locally as per Quarantine Station protocol.
    d. Passengers who are not ill will be allowed to continue their travel on commercial flights.
6. After arrival
    a. CDC will provide EpiX notification to receiving states, if meet criteria from our protocol.
    b. Passengers should understand that all must self-quarantine and practice social distancing for 14 days.
7. For an air ambulance/medical evacuation flight, passengers should go to pre-determined clinical facility as arranged by cruise line/air ambulance company. This plan must be in place and cleared with local and state health authorities before departure of the charter flight.
    a. Persons who do not require hospitalization but are not fit-to-travel to home destination, should remain in hotel (as cleared with local/state health authorities) until fit-to travel.
        i. Alternative transportation arranges such as private vehicle or charter flights to home destination made be possible based on individual assessment.
        ii. Additional guidance is available at https://www.cdc.gov/coronavirus/2019-ncov/downloads/sick-with-2019-nCoV-fact-sheet.pdf
    b. These persons must follow all CDC guidance for persons who have been on cruise ships in the last 14 days. They must stay home for 14 days from the time they disembark, practice social distancing, and monitor their health. Social distancing means staying out of crowded places, avoiding group gatherings, and maintaining distance (approximately 6 feet or 2 meters) from others when possible.

Hi Michelle –

Thank you for the guidance … very helpful! I think we are prepared to be in full compliance with perhaps a few items remaining to be addressed. I will forward to our operations team to make sure we are good to go.

Thanks for your help!

Thanks Michelle.

Can I share this with ANVISA, for their awareness?

Is there anything else you need from ANVISA at this point? Is RC in contact with them for the ground logistics?

Just making sure all the loops are closed.

Subject: RE: [EXTERNAL] Re: Royal Caribbean Ships off Brazil/Chile

EXTERNAL EMAIL CAUTION: Use caution opening attachments or clicking links.

Here is interim guidance from CDC for these two ships/flights (also attached)

1. Pre-departure
    a. Send ship and flight manifests to CDC.
    b. Send information about possible COVID illness among any passengers (not just American Citizens and including reports of # of persons with confirmed or suspected COVID) to CDC
    c. Distribute general CDC COVID info-graphic and instructions for cruise ship passengers.
    d. In advance, cruise line should make arrangements for land-based management, including for persons with symptoms/illness (as described below) and communicate and clear those plans to appropriate local/state health authorities.
2. At disembarkation from boat and before boarding charter flight, screening questionnaire completed
    a. General screening questionnaire provided by CDC, or other questionnaire as per

AMERICAN OVERSIGHT

local/national authorities at port administered to passengers/crew disembarking

b. Persons who are ill must be evaluated at local health facility – not allowed to board charter unless cleared by local clinician and deemed fit-to-fly.

3. Passengers without any symptoms can board charter flights.
4. During flight, have clinicians (physician and nurse) on board charter to assist/evaluate any passengers who become ill during travel and to assist at arrival in US
5. Upon arrival at airport in US
   a. CBP/CWMD will perform screening as if passengers were arriving from level 3 countries, as per their protocols.
   b. CDC Quarantine Station staff are available for illness response, as per protocol.
   c. Any ill persons are evaluated and referred for evaluation locally as per Quarantine Station protocol.
   d. Passengers who are not ill will be allowed to continue their travel on commercial flights.
6. After arrival
   a. CDC will provide EpiX notification to receiving states, if meet criteria from our protocol.
   b. Passengers should understand that all must self-quarantine and practice social distancing for 14 days.
7. For an air ambulance/medical evacuation flight, passengers should go to pre-determined clinical facility as arranged by cruise line/air ambulance company. This plan must be in place and cleared with local and state health authorities before departure of the charter flight.
   a. Persons who do not require hospitalization but are not fit-to-travel to home destination, should remain in hotel (as cleared with local/state health authorities) until fit-to travel.
      i. Alternative transportation arranges such as private vehicle or charter flights to home destination made be possible based on individual assessment.
      ii. Additional guidance is available at https://www.cdc.gov/coronavirus/2019-ncov/downloads/sick-with-2019-nCoV-fact-sheet.pdf
   b. These persons must follow all CDC guidance for persons who have been on cruise ships in the last 14 days. They must stay home for 14 days from the time they disembark, practice social distancing, and monitor their health. Social distancing means staying out of crowded places, avoiding group gatherings, and maintaining distance (approximately 6 feet or 2 meters) from others when possible.

Sorry - now with Eleni from RC. Again, due-outs are:

- State - send CDC global ship tracking list; create small-group email distro;
- CDC - send Royal Caribbean and Amy Dubois/HHS protocols for screening; Make determination on screening protocols for passengers from a "healthy" ship
- Royal Caribbean - send #s of Canadians to CDC; update on infection status; send

AMERICAN OVERSIGHT

manifests for four ships

All -

Thank you for joining the call today. Leah - I don't believe I have everyone from CDC who was on the call, including Rachel - please add if that's the case.

I've listed the do-outs that I'm tracking below, and this chain can serve as the new, smaller group of folks working on the Brazil/Chile RC ships.

- State - send CDC global ship tracking list; create small-group email distro;
- CDC - send Royal Caribbean and Amy Dubois/HHS protocols for screening; Make determination on screening protocols for passengers from a "healthy" ship
- Royal Caribbean - send #s of Canadians to CDC; update on infection status; send manifests for four ships

Hi Michelle –

Below please see an update on care for guests upon arrival at MIA.

Dr. Barth Green, the Global Coordinator for CDC, will accept all 45 US nationals from the Silver Explorer, providing that Bec Ware, R.N. can provide him details about these people. Minutes ago, I spoke with Bec, and she will provide Dr. Green with the information that he needs, including their marital status, their physical condition, where they are landing and what time they are to arrive at Miami International Airport. He will have a Medical team waiting to greet these folks, to screen them, and to triage them accordingly.

Until then, I will arrange for Dr. Green to receive 60 Quest Novel Coronavirus (2019-nCoV)/COVID-19 test kits from my office, so that he can make final determinations on those who are ill. Ms. Stephanie Buchler will follow Quest collection instructions and will ensure courier specimen pickup, if necessary.

Dr. Green will direct his Medical staff to triage the arrival of these patients to either Jackson Memorial Hospital or Hotel St. Michel in Coral Gables, depending on their physical condition.

Subject: RE: [EXTERNAL] Re: Royal Caribbean Ships off Brazil/Chile

EXTERNAL EMAIL CAUTION: Use caution opening attachments or clicking links.

AMERICAN OVERSIGHT

Here is interim guidance from CDC for these two ships/flights (also attached)

1. Pre-departure
    a. Send ship and flight manifests to CDC.
    b. Send information about possible COVID illness among any passengers (not just American Citizens and including reports of # of persons with confirmed or suspected COVID) to CDC
    c. Distribute general CDC COVID info-graphic and instructions for cruise ship passengers.
    d. In advance, cruise line should make arrangements for land-based management, including for persons with symptoms/illness (as described below) and communicate and clear those plans to appropriate local/state health authorities.
2. At disembarkation from boat and before boarding charter flight, screening questionnaire completed
    a. General screening questionnaire provided by CDC, or other questionnaire as per local/national authorities at port administered to passengers/crew disembarking
    b. Persons who are ill must be evaluated at local health facility – not allowed to board charter unless cleared by local clinician and deemed fit-to-fly.
3. Passengers without any symptoms can board charter flights.
4. During flight, have clinicians (physician and nurse) on board charter to assist/evaluate any passengers who become ill during travel and to assist at arrival in US
5. Upon arrival at airport in US
    a. CBP/CWMD will perform screening as if passengers were arriving from level 3 countries, as per their protocols.
    b. CDC Quarantine Station staff are available for illness response, as per protocol.
    c. Any ill persons are evaluated and referred for evaluation locally as per Quarantine Station protocol.
    d. Passengers who are not ill will be allowed to continue their travel on commercial flights.
6. After arrival
    a. CDC will provide EpiX notification to receiving states, if meet criteria from our protocol.
    b. Passengers should understand that all must self-quarantine and practice social distancing for 14 days.
7. For an air ambulance/medical evacuation flight, passengers should go to pre-determined clinical facility as arranged by cruise line/air ambulance company. This plan must be in place and cleared with local and state health authorities before departure of the charter flight.
    a. Persons who do not require hospitalization but are not fit-to-travel to home destination, should remain in hotel (as cleared with local/state health authorities) until fit-to travel.
        i. Alternative transportation arranges such as private vehicle or charter flights to home destination made be possible based on individual assessment.
        ii. Additional guidance is available at

AMERICAN OVERSIGHT

https://www.cdc.gov/coronavirus/2019-ncov/downloads/sick-with-2019-nCoV-fact-sheet.pdf

b. These persons must follow all CDC guidance for persons who have been on cruise ships in the last 14 days. They must stay home for 14 days from the time they disembark, practice social distancing, and monitor their health. Social distancing means staying out of crowded places, avoiding group gatherings, and maintaining distance (approximately 6 feet or 2 meters) from others when possible.

At long last, we have confirmation of the first charter flight to Miami:

The American guests from Silver Explorer will be departing Puerto Montt to Miami confirmed to depart at 12AM local time arriving in MIA at 910AM. Tail is CCBGD.

More details to follow!

Dear Eleni,
Could you kindly clarify Dr. Green at CDC? Is that CDC as in Centers for Disease Control and Prevention or is that a typo? If yes, we do not know him – could you kindly share his contact information?

Most importantly, you need to work with and have the approval of the Florida State and Local Health Departments – Dr. Rivkees, the Florida Surgeon General and Dr. Roberson, the Deputy Surgeon General are on this email.

Best,
Michelle

Subject: RE: [EXTERNAL] Re: Royal Caribbean Ships off Brazil/Chile

Hi Michelle –

Below please see an update on care for guests upon arrival at MIA.

Dr. Barth Green, the Global Coordinator for CDC, will accept all 45 US nationals from the Silver Explorer, providing that Bec Ware, R.N. can provide him details about these people. Minutes ago, I spoke with Bec, and she will provide Dr. Green with the information that he needs, including their marital status, their physical condition, where they are landing and what time they are to arrive at Miami International Airport. He will have a Medical team waiting to greet these folks, to screen them, and to triage them accordingly.

Until then, I will arrange for Dr. Green to receive 60 Quest Novel Coronavirus (2019-nCoV)/COVID-19 test kits from my office, so that he can make final determinations on those who are ill. Ms. Stephanie Buchler will follow Quest collection instructions and will ensure courier specimen pickup, if necessary.

AMERICAN OVERSIGHT

Dr. Green will direct his Medical staff to triage the arrival of these patients to either Jackson Memorial Hospital or Hotel St. Michel in Coral Gables, depending on their physical condition.

Subject: RE: [EXTERNAL] Re: Royal Caribbean Ships off Brazil/Chile

EXTERNAL EMAIL CAUTION: Use caution opening attachments or clicking links.

Here is interim guidance from CDC for these two ships/flights (also attached)

1. Pre-departure
    a. Send ship and flight manifests to CDC.
    b. Send information about possible COVID illness among any passengers (not just American Citizens and including reports of # of persons with confirmed or suspected COVID) to CDC
    c. Distribute general CDC COVID info-graphic and instructions for cruise ship passengers.
    d. In advance, cruise line should make arrangements for land-based management, including for persons with symptoms/illness (as described below) and communicate and clear those plans to appropriate local/state health authorities.
2. At disembarkation from boat and before boarding charter flight, screening questionnaire completed
    a. General screening questionnaire provided by CDC, or other questionnaire as per local/national authorities at port administered to passengers/crew disembarking
    b. Persons who are ill must be evaluated at local health facility – not allowed to board charter unless cleared by local clinician and deemed fit-to-fly.
3. Passengers without any symptoms can board charter flights.
4. During flight, have clinicians (physician and nurse) on board charter to assist/evaluate

AMERICAN OVERSIGHT

any passengers who become ill during travel and to assist at arrival in US

5. Upon arrival at airport in US
    a. CBP/CWMD will perform screening as if passengers were arriving from level 3 countries, as per their protocols.
    b. CDC Quarantine Station staff are available for illness response, as per protocol.
    c. Any ill persons are evaluated and referred for evaluation locally as per Quarantine Station protocol.
    d. Passengers who are not ill will be allowed to continue their travel on commercial flights.
6. After arrival
    a. CDC will provide EpiX notification to receiving states, if meet criteria from our protocol.
    b. Passengers should understand that all must self-quarantine and practice social distancing for 14 days.
7. For an air ambulance/medical evacuation flight, passengers should go to pre-determined clinical facility as arranged by cruise line/air ambulance company. This plan must be in place and cleared with local and state health authorities before departure of the charter flight.
    a. Persons who do not require hospitalization but are not fit-to-travel to home destination, should remain in hotel (as cleared with local/state health authorities) until fit-to travel.
        i. Alternative transportation arranges such as private vehicle or charter flights to home destination made be possible based on individual assessment.
        ii. Additional guidance is available at https://www.cdc.gov/coronavirus/2019-ncov/downloads/sick-with-2019-nCoV-fact-sheet.pdf
    b. These persons must follow all CDC guidance for persons who have been on cruise ships in the last 14 days. They must stay home for 14 days from the time they disembark, practice social distancing, and monitor their health. Social distancing means staying out of crowded places, avoiding group gatherings, and maintaining distance (approximately 6 feet or 2 meters) from others when possible.

All -

Thank you for joining the call today. Leah - I don't believe I have everyone from CDC who was on the call, including Rachel - please add if that's the case.

I've listed the do-outs that I'm tracking below, and this chain can serve as the new, smaller group of folks working on the Brazil/Chile RC ships.

- State - send CDC global ship tracking list; create small-group email distro;
- CDC - send Royal Caribbean and Amy Dubois/HHS protocols for screening; Make determination on screening protocols for passengers from a "healthy" ship
- Royal Caribbean - send #s of Canadians to CDC; update on infection status; send manifests for four ships

Dear Eleni,
Could you kindly clarify Dr. Green at CDC? Is that CDC as in Centers for Disease Control and Prevention or is that a typo? If yes, we do not know him – could you kindly share his contact information?

Most importantly, you need to work with and have the approval of the Florida State and Local Health Departments – Dr. Rivkees, the Florida Surgeon General and Dr. Roberson, the Deputy Surgeon General are on this email.

Best,
Michelle

AMERICAN OVERSIGHT

EXTERNAL EMAIL CAUTION: Use caution opening attachments or clicking links.

Here is interim guidance from CDC for these two ships/flights (also attached)

1. Pre-departure
    a. Send ship and flight manifests to CDC.
    b. Send information about possible COVID illness among any passengers (not just American Citizens and including reports of # of persons with confirmed or suspected COVID) to CDC
    c. Distribute general CDC COVID info-graphic and instructions for cruise ship passengers.
    d. In advance, cruise line should make arrangements for land-based management, including for persons with symptoms/illness (as described below) and communicate and clear those plans to appropriate local/state health authorities.
2. At disembarkation from boat and before boarding charter flight, screening questionnaire completed
    a. General screening questionnaire provided by CDC, or other questionnaire as per local/national authorities at port administered to passengers/crew disembarking
    b. Persons who are ill must be evaluated at local health facility – not allowed to board charter unless cleared by local clinician and deemed fit-to-fly.
3. Passengers without any symptoms can board charter flights.
4. During flight, have clinicians (physician and nurse) on board charter to assist/evaluate any passengers who become ill during travel and to assist at arrival in US
5. Upon arrival at airport in US
    a. CBP/CWMD will perform screening as if passengers were arriving from level 3 countries, as per their protocols.
    b. CDC Quarantine Station staff are available for illness response, as per protocol.
    c. Any ill persons are evaluated and referred for evaluation locally as per Quarantine Station protocol.
    d. Passengers who are not ill will be allowed to continue their travel on commercial flights.
6. After arrival
    a. CDC will provide EpiX notification to receiving states, if meet criteria from our protocol.
    b. Passengers should understand that all must self-quarantine and practice social distancing for 14 days.
7. For an air ambulance/medical evacuation flight, passengers should go to pre-determined clinical facility as arranged by cruise line/air ambulance company. This plan must be in place and cleared with local and state health authorities before departure of the charter flight.
    a. Persons who do not require hospitalization but are not fit-to-travel to home destination, should remain in hotel (as cleared with local/state health authorities) until fit-to travel.
        i. Alternative transportation arranges such as private vehicle or charter flights to home destination made be possible based on individual assessment.

AMERICAN OVERSIGHT

ii. Additional guidance is available at https://www.cdc.gov/coronavirus/2019-ncov/downloads/sick-with-2019-nCoV-fact-sheet.pdf

b. These persons must follow all CDC guidance for persons who have been on cruise ships in the last 14 days. They must stay home for 14 days from the time they disembark, practice social distancing, and monitor their health. Social distancing means staying out of crowded places, avoiding group gatherings, and maintaining distance (approximately 6 feet or 2 meters) from others when possible.

Thanks Michelle.

Can I share this with ANVISA, for their awareness?

Is there anything else you need from ANVISA at this point? Is RC in contact with them for the ground logistics?

Just making sure all the loops are closed.

Amy

Subject: RE: [EXTERNAL] Re: Royal Caribbean Ships off Brazil/Chile

EXTERNAL EMAIL CAUTION: Use caution opening attachments or clicking links.

Here is interim guidance from CDC for these two ships/flights (also attached)

1. Pre-departure
    a. Send ship and flight manifests to CDC.
    b. Send information about possible COVID illness among any passengers (not just American Citizens and including reports of # of persons with confirmed or suspected COVID) to CDC
    c. Distribute general CDC COVID info-graphic and instructions for cruise ship passengers.
    d. In advance, cruise line should make arrangements for land-based management, including for persons with symptoms/illness (as described below) and communicate and clear those plans to appropriate local/state health authorities.
2. At disembarkation from boat and before boarding charter flight, screening questionnaire completed
    a. General screening questionnaire provided by CDC, or other questionnaire as per local/national authorities at port administered to passengers/crew disembarking
    b. Persons who are ill must be evaluated at local health facility – not allowed to board charter unless cleared by local clinician and deemed fit-to-fly.
3. Passengers without any symptoms can board charter flights.
4. During flight, have clinicians (physician and nurse) on board charter to assist/evaluate any passengers who become ill during travel and to assist at arrival in US
5. Upon arrival at airport in US
    a. CBP/CWMD will perform screening as if passengers were arriving from level 3 countries, as per their protocols.
    b. CDC Quarantine Station staff are available for illness response, as per protocol.
    c. Any ill persons are evaluated and referred for evaluation locally as per Quarantine Station protocol.
    d. Passengers who are not ill will be allowed to continue their travel on commercial flights.
6. After arrival
    a. CDC will provide EpiX notification to receiving states, if meet criteria from our protocol.
    b. Passengers should understand that all must self-quarantine and practice social distancing for 14 days.
7. For an air ambulance/medical evacuation flight, passengers should go to pre-determined clinical facility as arranged by cruise line/air ambulance company. This plan must be in place and cleared with local and state health authorities before departure of the charter flight.

AMERICAN OVERSIGHT

a. Persons who do not require hospitalization but are not fit-to-travel to home destination, should remain in hotel (as cleared with local/state health authorities) until fit-to travel.

    i. Alternative transportation arranges such as private vehicle or charter flights to home destination made be possible based on individual assessment.

    ii. Additional guidance is available at https://www.cdc.gov/coronavirus/2019-ncov/downloads/sick-with-2019-nCoV-fact-sheet.pdf

b. These persons must follow all CDC guidance for persons who have been on cruise ships in the last 14 days. They must stay home for 14 days from the time they disembark, practice social distancing, and monitor their health. Social distancing means staying out of crowded places, avoiding group gatherings, and maintaining distance (approximately 6 feet or 2 meters) from others when possible.

AMERICAN OVERSIGHT

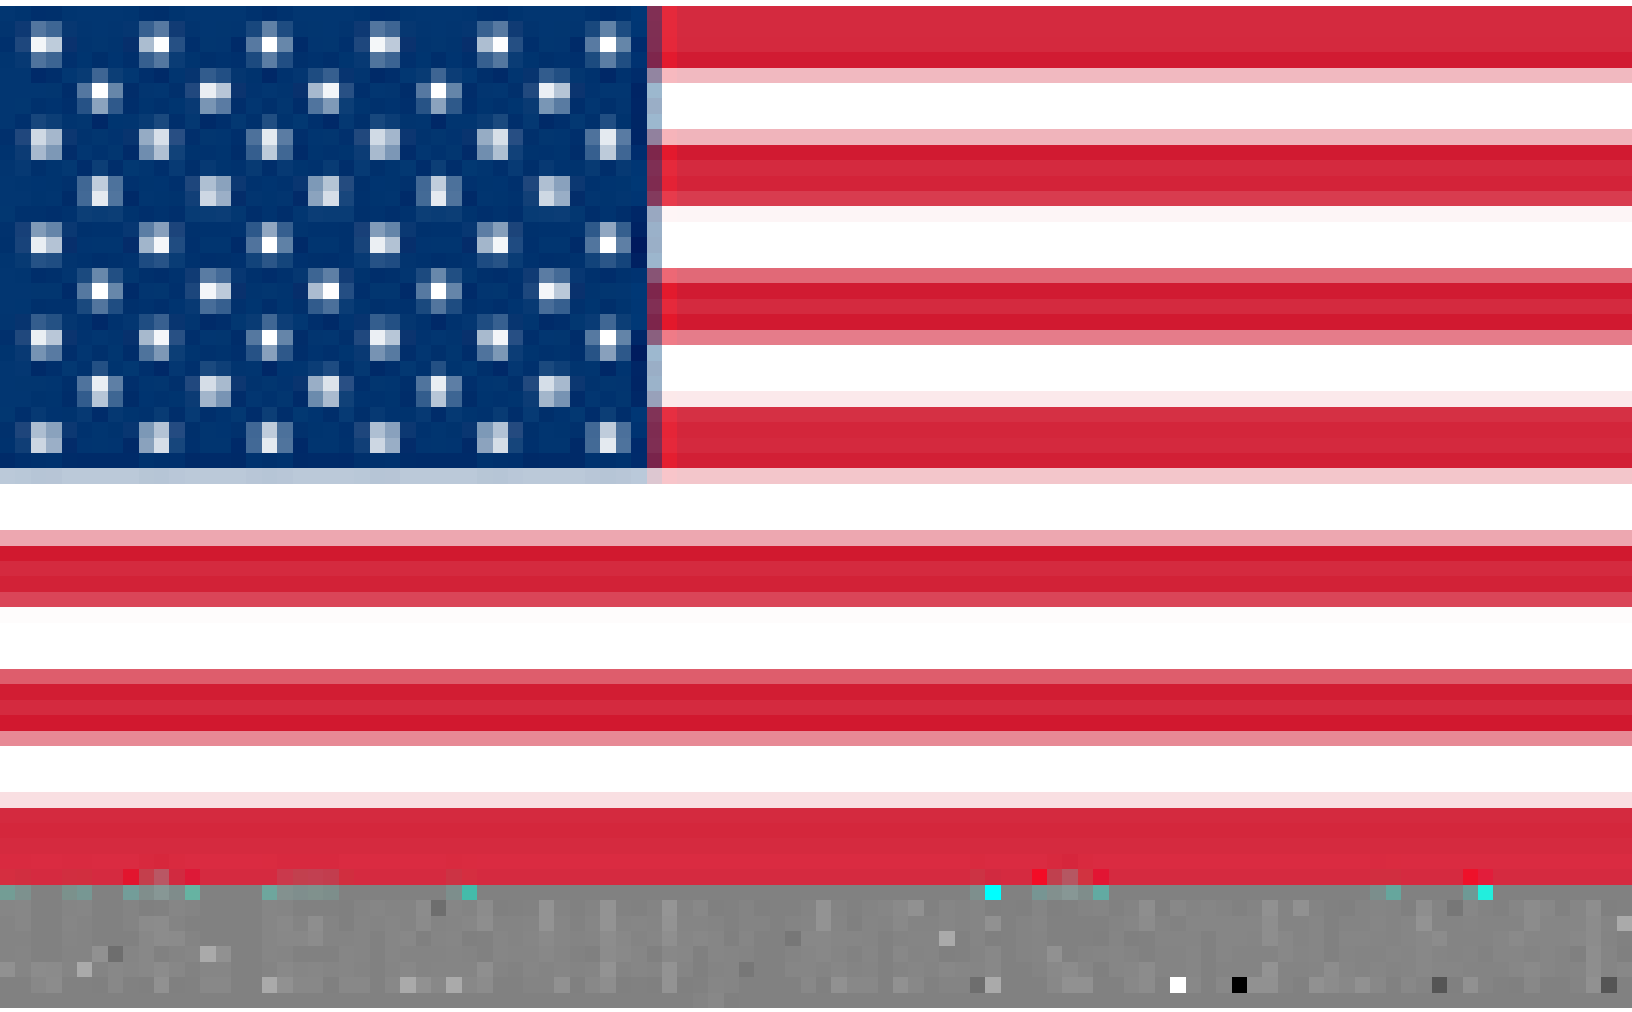
Thank you for joining the call today. Leah - I don't believe I have everyone from CDC who was on the call, including Rachel - please add if that's the case.

I've listed the do-outs that I'm tracking below, and this chain can serve as the new, smaller group of folks working on the Brazil/Chile RC ships.



- State - send CDC global ship tracking list; create small-group email distro;
- CDC - send Royal Caribbean and Amy Dubois/HHS protocols for screening; Make determination on screening protocols for passengers from a "healthy" ship
- Royal Caribbean - send #s of Canadians to CDC; update on infection status; send manifests for four ships

Subject:	RE: [Non-DoD Source] Port Everglades Vessel Arrivals for March 20
Date:	Tuesday, March 24, 2020 12:06:37 PM

This is a developing situation. Here is what Holland America posted on their website yesteday.

ZAANDAM: This morning aboard Zaandam, 13 guests and 29 crew reported to the ship's medical center with influenza-like symptoms. Out of an abundance of caution, we have now asked all guests to remain in their staterooms until we have more information. There are 1,243 guests and 586 crew on board.

Zaandam is following the response protocols that have been developed in coordination with the U.S. Centers for Disease Control and Prevention (CDC). Since it is flu season, and COVID-19 testing is not available on board, it is difficult to determine the cause of these elevated cases at this time.

The safety and well-being of our guests and crew is one of our highest priorities. The ship has activated these precautionary measures out of an abundance of caution:

As is our standard practice, all ill persons have been isolated and their close contacts placed in quarantine.
Guests have been asked to remain in their staterooms and monitor their health. If they become symptomatic, they are asked to call the medical center for an evaluation and care from the ship's medical professionals (at no charge).
Effective today, meal service will be provided by room service until further notice. All public areas are closed.
The entire ship is operating at maximum sanitation levels, including rigorous cleaning and disinfecting of public and crew areas.
Crew who are not required for the safe operation of the ship are being quarantined. Those that are needed to maintain the ship's operation are being asked to self-isolate when not performing essential functions, practice social distancing, self-monitor and report any illness to the Medical Center.
Both internet and guest stateroom telephone services remain complimentary so that guests may stay in touch with their families.
Zaandam was sailing a South America voyage that departed Buenos Aires, Argentina, on March 7 and was originally scheduled to end in San Antonio, Chile, on March 21. However, due to global health concerns, Holland America Line made the decision to suspend its global cruise operations for 30 days and end its current cruises in progress as quickly as possible and return guests home. Despite previous confirmations that guests could disembark in Punta Arenas, Chile, for flights, we were not permitted to do so. No one has been off the ship since March 14 in Punta Arenas.

AMERICAN OVERSIGHT

Zaandam then sailed to Valparaiso, Chile, where it remained at anchor March 20-21 while taking on provisions and fuel, including regular medications for those that needed them. Zaandam departed Valparaiso on March 21 and is currently sailing north. Our intention is to proceed to Fort Lauderdale, Florida, for arrival on March 30, however we are still working on securing a reservation to transit the Panama Canal. Alternative options are also being developed.

Subject: [Non-DoD Source] Port Everglades Vessel Arrivals for March 20

As discussed briefly during Wednesday morning's Unified Command meeting, attached is the Port Everglades Harbormaster report of vessels currently in Port Everglades and those that have

AMERICAN OVERSIGHT

submitted berth applications to enter the port on March 20th. Would appreciate a review against any USCG, CDC, CBP, and FDOH data to verify that all of the ships currently in port or scheduled to arrive tomorrow have no open health issues.

Regards,

Glenn

AMERICAN OVERSIGHT

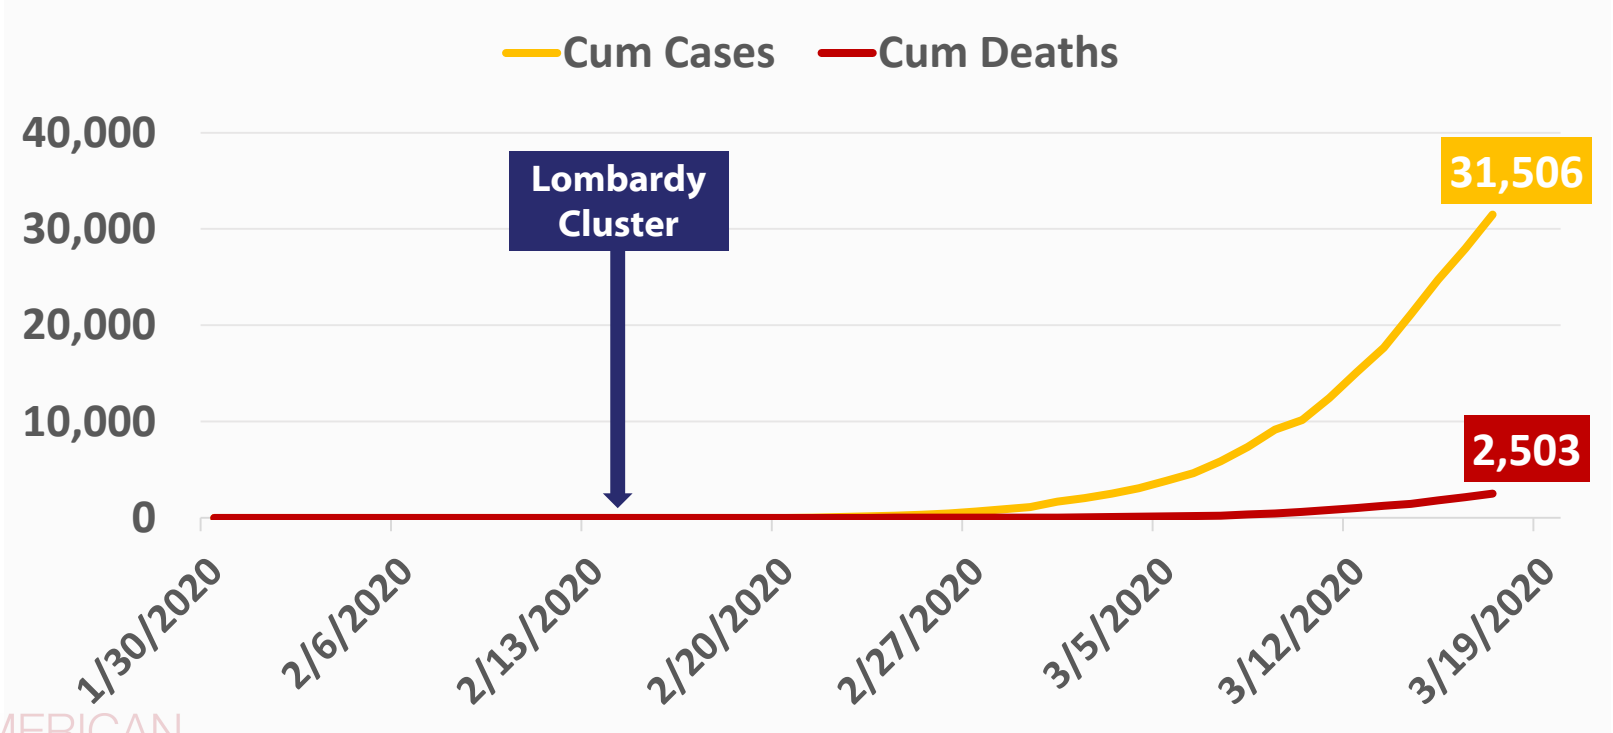
Altered Standards of Care in Response to COVID-19: Background, Tools and Experiences

March 19, 2020

For more information: www.cdc.gov/COVID19

AMERICAN OVERSIGHT



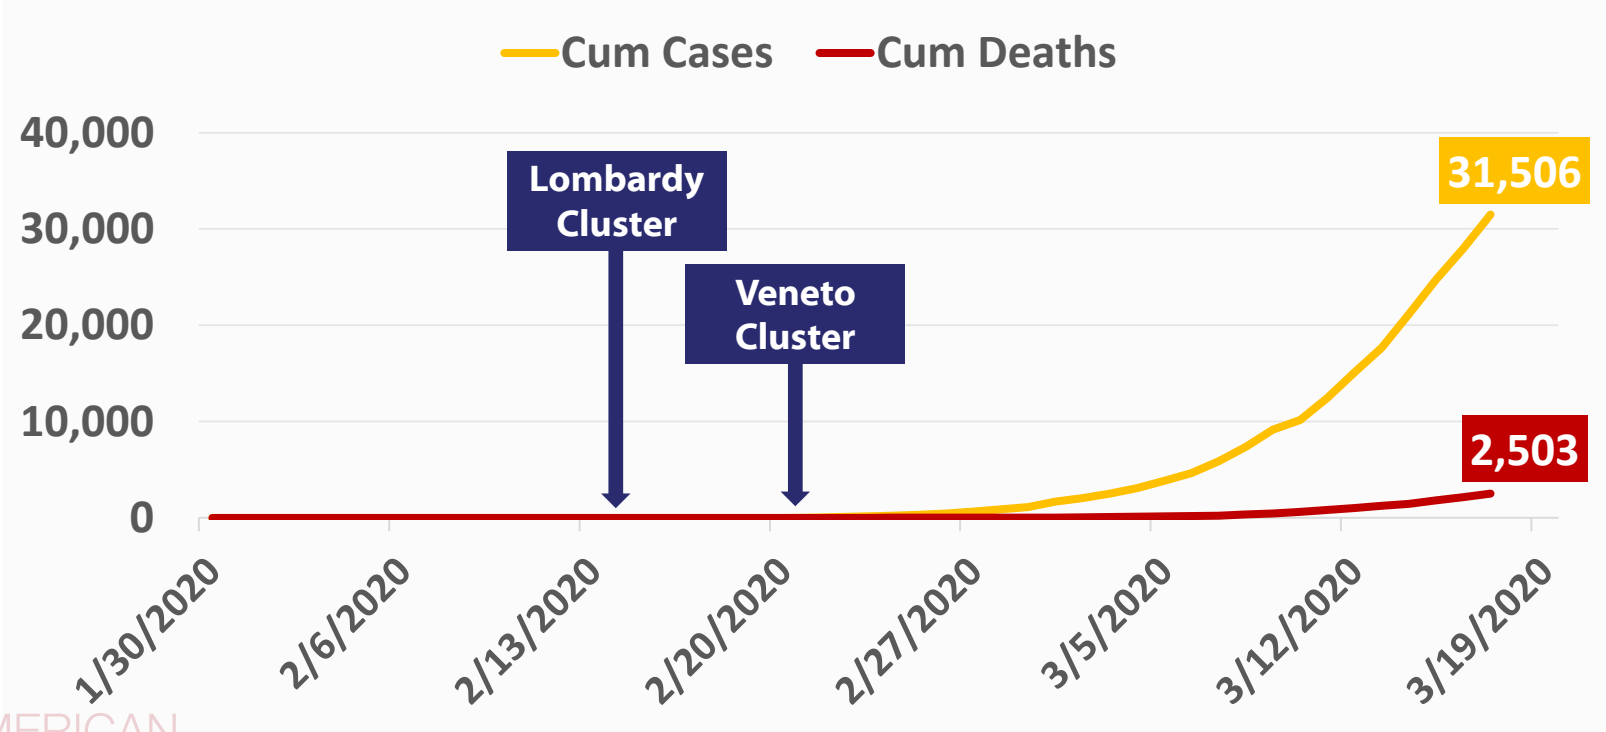
FL-DOH-20-0673-A-005426

Outline

- Example from Italy
- Fundamentals of a Response: Space, Staff, Stuff
- Crisis Standards of Care (CSCs)
- Examples of Elements of CSCs
- Applying CSCs to COVID-19
- Legal considerations

AMERICAN OVERSIGHT

The outbreak in Italy started with a cluster of cases in the Lombardy region of Italy in mid-February

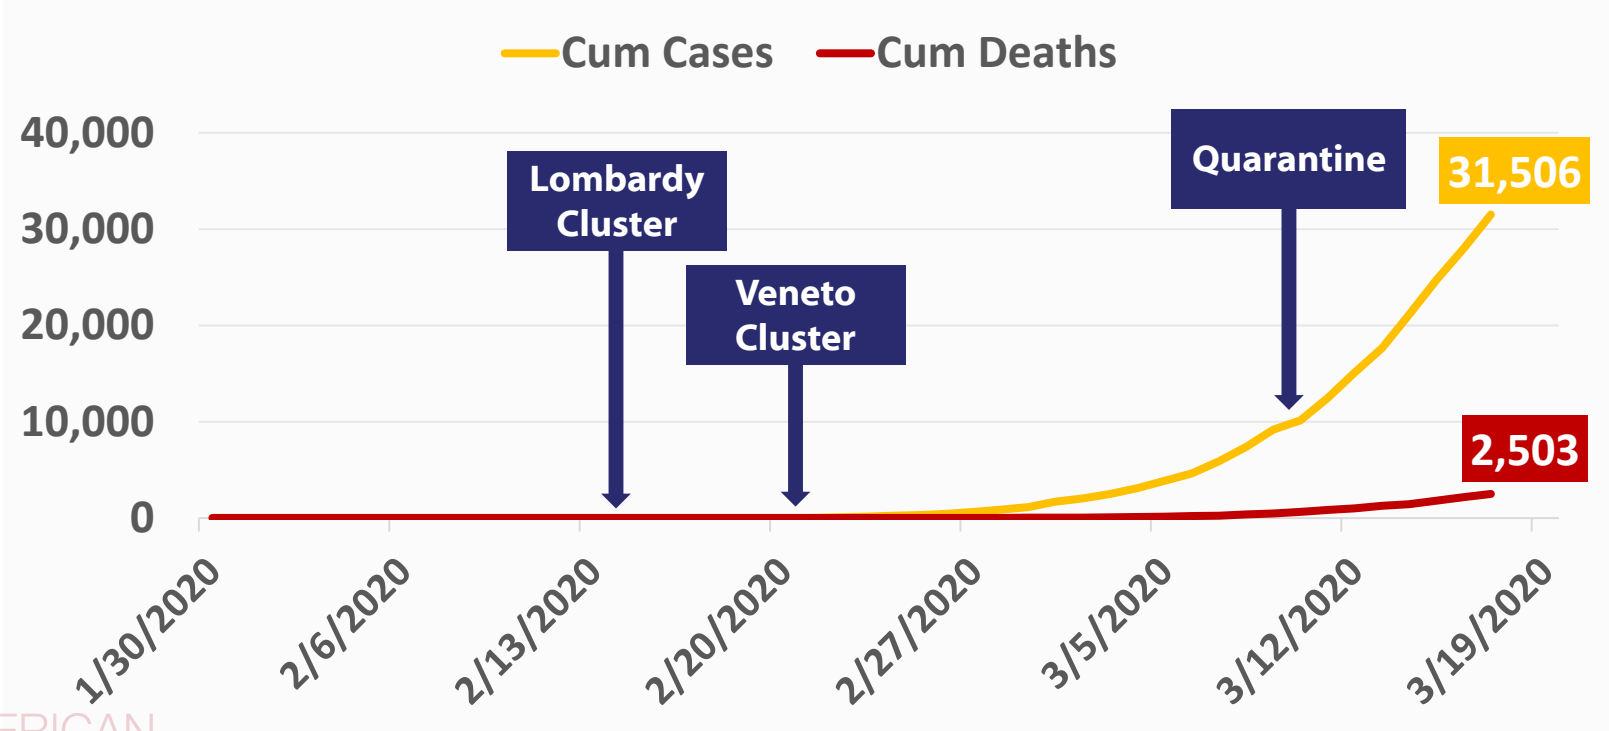


AMERICAN OVERSIGHT

FL-DOH-20-0673-A-005428

Data: Italy Protezione Civile

One week after the Lombardy Cluster, a smaller cluster of cases appeared in the Veneto region



AMERICAN OVERSIGHT

Data: Italy Protezione Civile

FL-DOH-20-0673-A-005429

Cases in Italy continued to rise exponentially and exceed healthcare system capacity

AMERICAN OVERSIGHT

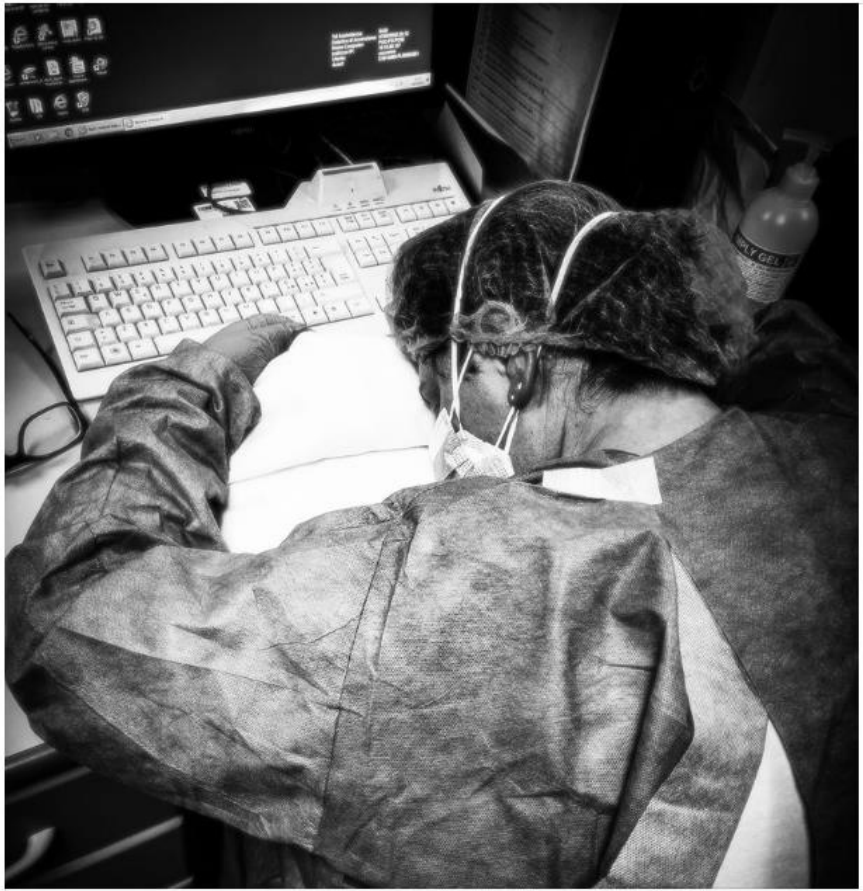
EL-DOH-20-0673-A-005430

Data: Italy Protezione Civile

Lombardi region: Large influx of critically ill patients

- **Pre-Crisis ICU capacity**
  - 720 beds (representing 2.9% of total hospital beds at 74 hospitals)
  - Routinely operated at 85-90% capacity in the winter

- **Between 20 February and 7 March:**
  - 3,420 COVID-19 admissions of which 556 (16%) required ICU level care
  - Related to the older population with more medical co-morbidities



- **Adjusted to form cohorted COVID-19 ICU beds**
  - Increased capacity to 482 dedicated COVID-19 ICU beds for in 14 days

AMERICAN OVERSIGHT

COVID-19 Concerns for the health system

- Current concerns as transmission accelerates:
  - **Space**: Maintaining capacity for inpatient, emergency, and critical care
  - **Staff**: Sufficient staff for patient triage and appropriate level of care
  - **Supply**: Increasing stress on PPE supply

- Clear communications to the public

AMERICAN OVERSIGHT

What are Crisis Standards of Care (CSC)?

- Crisis Standards of Care (CSC) guidelines help public health and healthcare personnel determine how to utilize resources during a public health emergency.
- Guides action by the state, county, and healthcare facilities
- Why is it necessary?
  - During catastrophic events, there may not be enough resources to give all patients the level of care they would normally receive.
  - A substantial change in usual healthcare operations and level of care it is possible to deliver due to a catastrophic disaster (e.g., pandemic influenza, earthquake, hurricane) (IOM 2012).

AMERICAN OVERSIGHT

COVID-19 health system elements to be accounted for as demand exceeds capacity

- **Process**
  - How are crisis care decisions integrated into hospital incident command?
  - What is the process for resource triage or allocation?
- **Criteria**
  - What is the basis for the allocation decisions (i.e. best practices/best evidence)?
- **Coordination**
  - How is this standard of care equalized across the region to assure consistency?
- **Policy**
  - How do regulatory and state actions support these non-traditional approaches to care?

AMERICAN OVERSIGHT

Continuum of Care

Continuum of Care

Conventional

Contingency

Crisis

	Conventional	Contingency	Crisis
Space	Usual patient care space fully utilized	Patient care areas re-purposed (PACU, monitored units for ICU-level care)	Facility damaged/unsafe or non-patient care areas (classrooms, etc.) used for patient care
Staff	Usual staff called in and utilized	Staff extension (brief deferrals of non-emergent service, supervision of broader group of patients, change in responsibilities, documentation, etc.)	Trained staff unavailable or unable to adequately care for volume of patients even with extension techniques
Supplies	Cached and usual supplies used	Conservation, adaptation, and substitution of supplies with occasional re-use of select supplies	Critical supplies lacking, possible reallocation of life-sustaining resources
Standard of care	Usual care	Functionally equivalent care	Crisis standards of care[a]

AMERICAN OVERSIGHT

Examples of triggers for shifting along this continuum of care standards

- Sustained community wide transmission
- Supply/medication shortage
- Unable to maintain normal staffing levels
- No available ICU beds
- Significant delays in access to care due to demand

- Duty to Plan: Health Care, Crisis Standards of Care, and Novel Coronavirus SARS-CoV-2 (https://nam.edu/duty-to-plan-health-care-crisis-standards-of-care-and-novel-coronavirus-sars-cov-2/)

AMERICAN OVERSIGHT

Crisis Standards of Care Considerations: Stuff

PPE	Current recommended actions	Planning for next 2 weeks
N95s	Reference CDC optimizing guidance OSHA fit testing waiver FDA EUA	Optimizing guidance incorporated for all products as part of larger IPC program • Extended use • Re-use • Alternative strategies • Disinfection
Face masks	CDC optimizing guidance posted 3/18/2020	
Face shields		
Gowns		
Gloves	Single use	Single use
Vents	• Understand stockpiled resources and how to request • Review CDC technical recommendations • Account for available ventilators and ancillary equipment	Identify alternative ventilator options Develop, socialize and coordinate triage and care protocols for life saving supplies across healthcare coalition

AMERICAN OVERSIGHT

Crisis Standards of Care Considerations: Space

Current Recommended Actions	Planning for next 2 weeks
Monitor daily bed use	Identify options for non-ED triage/evaluation and other locations for hospital-level care • Tents or off-site locations, understanding the minimum requirements for clinical care • Remote telehealth • Bots • Outpatient outreach and tools
Timely discharge of patients not requiring acute, inpatient management	Identify non-medical floor beds to accommodate overflow patients (e.g. surgical floors) Identify referral facilities within coalition if capacity exceeded
Timely transition of ICU patients to regular medical floor when appropriate	Identify non-ICU locations to provide advanced level care (e.g. post-anesthesia care units, telemetry floors) Identify referral facilities within coalition if capacity exceeded Review triage algorithms for ICU admission

AMERICAN OVERSIGHT

Crisis Standards of Care Considerations: Staff

Current recommended actions	Planning for next two weeks
Review hospital incident command system plans at the hospital and healthcare coalition level	Curtail non-essential staff
Plan for continuity of operations due to absenteeism	Reassignment of staff from other duties (shift elective surgery staff to other emergent/inpatient/critical care locations)
Review facility telemedicine services	Change staff hours, staffing patterns
Understand authorities around expanding scope of practice policies and establish t trigger decisions	Modify staff – to – patient ratios
Create crisis standards of care teams to assist with hospital specific triage and coordination	Obtain equivalent staff through hiring, expanded practice scope
Evaluate potential federal staffing option	Coordinate and allocate staffing resources between hospitals and facilities within and outside jurisdiction
	Track triggers to expand scope of practice for provider

AMERICAN OVERSIGHT

Actions for Hospital Incident Command

Prepare for patient surge while facing staff and supply shortages

- Be in regular communication with healthcare coalition or health department to understand regional resources
- Understand current hospital resources (vents, bed counts, etc.)
- Determine allocation strategies and triggers for when/how they need to be implemented
  - Decision process needs to be clear and made only when no other resources are available
  - Determine a triage process and team to include two clinicians that are not the caregivers for the patient(s) for clinical decision making
  - Ensure strategies/decision making processes are reviewed by health facility leadership

AMERICAN OVERSIGHT

Reference: Duty to Plan: Health Care, Crisis Standards of Care, and Novel Coronavirus SARS-CoV-2 (https://nam.edu/duty-to-plan-health-care-crisis-standards-of-care-and-novel-coronavirus-sars-cov-2/)

FL-DOH-20-0673-A-005446

Actions for Outpatient Services

- Review future appointments for the next three months
  - Strive to move visits to virtual appointments (telehealth, telemedicine, phone based appointments)
  - Cancel or postpone elective or non-urgent appointments and procedures
  - Provide good communication to patients about COVID-19
    - Encourage home care and over the counter medication unless they have severe symptoms
    - Offer to write “prescriptions” for home quarantine and self isolation as needed

AMERICAN OVERSIGHT

Reference: Duty to Plan: Health Care, Crisis Standards of Care, and Novel Coronavirus SARS-CoV-2 (https://nam.edu/duty-to-plan-health-care-crisis-standards-of-care-and-novel-coronavirus-sars-cov-2/)

Actions for Emergency Departments

Prevent transmission from suspect COVID patients, reduce burden in ED, and divert non-critical suspect COVID-19 patients

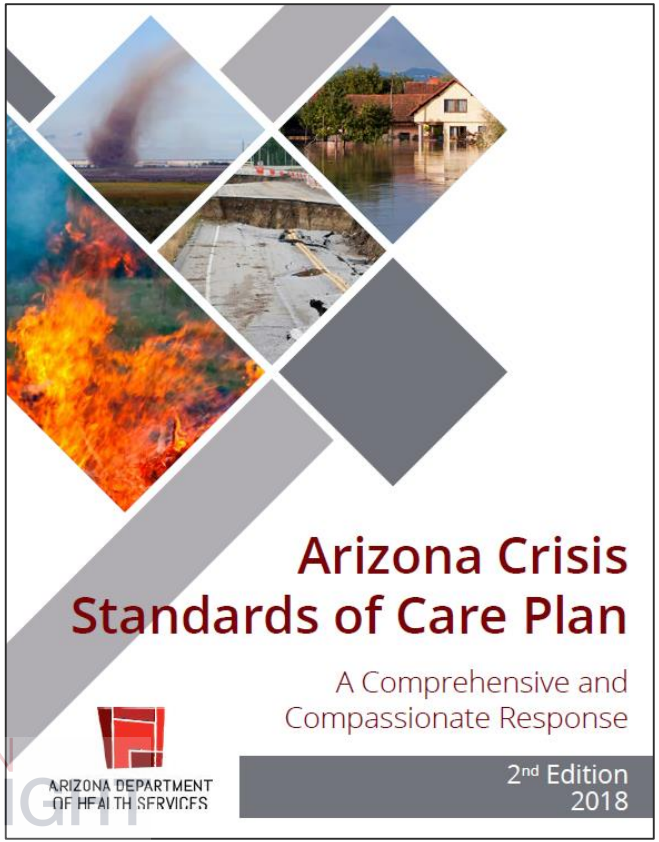
- Identify and establish outside triage point for non-critical COVID-19 patients (triage tents, parking lot triage)
- Coordinate with EMS (e.g. telephone triage) to avoid ED visits that can be treated as outpatient
- Identify potential changes in patient flow that can expedite non-emergency visits, when necessary
  - Specific times of day that individuals with respiratory illness to present
  - Specific entrance and triage route for those with respiratory illnesses

AMERICAN OVERSIGHT

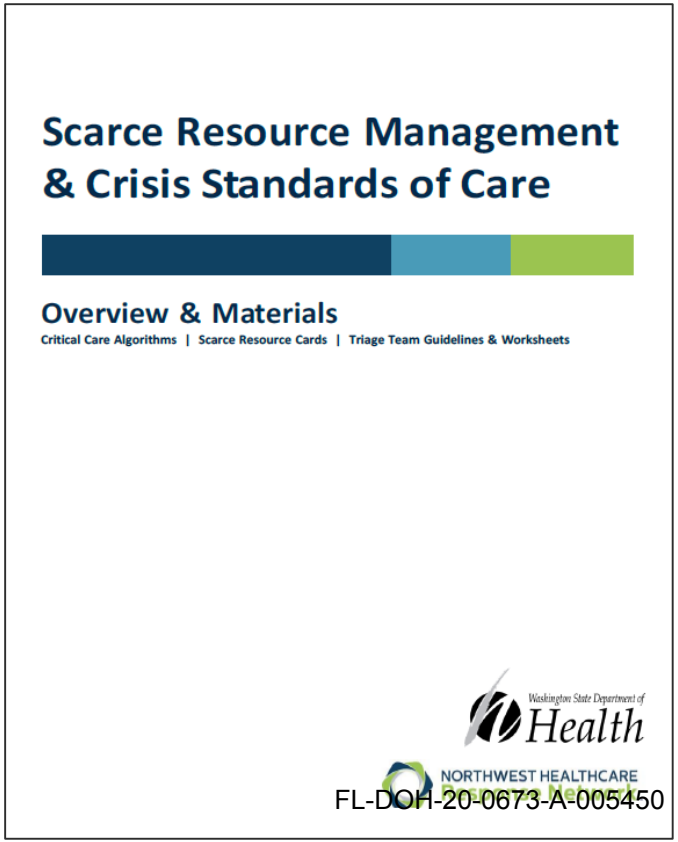
Reference: Duty to Plan: Health Care, Crisis Standards of Care, and Novel Coronavirus SARS-CoV-2 (https://nam.edu/duty-to-plan-health-care-crisis-standards-of-care-and-novel-coronavirus-sars-cov-2/)

Actions for Inpatient Care

Optimize personal protective equipment, protect staff, and prevent hospital transmission of COVID-19



- Cohort patients and staff by unit or floor as numbers of cases increase
- Designate a specific room/floor for non-infectious hospitalized patients
- Cancel elective procedures
- Assess spaces such as pre-, post- anesthesia care, same day surgery, gastroenterology labs, intermediate care, and step-down units for critical care expansion
- Restrict visitors and promote electronic visiting instead of in-person visits



AMERICAN OVERSIGHT

ADULT Critical Care Triage Worksheet
Critical Care Guidelines During Crisis Capacity[1]

Washington State Department of Health

NORTHWEST HEALTHCARE Response Network.

This Worksheet, along with the corresponding Adult Critical Care Algorithm, are to be used by "Triage Teams" during a declared emergency event whereby an appropriate healthcare official has implemented crisis standards of care. It is recommended that a "Triage Team" be comprised of senior medical personnel, preferably not those primarily taking care of the individual patient under consideration. Please see "Scarce Resource Triage Team Guidelines" for further information.

STEP 1: Screen adult patients for ICU care during scarce resources

Proceed to following after reviewing patient's end of life directives/POLST or similar living will documents. For the following conditions consider available staffing and resources. If resources are inadequate, ***consider*** transferring the following patients to out-patient or palliative care with appropriate resources and support as can be provided.

1. Pre-existing or Persistent coma or vegetative state
2. Severe acute trauma (e.g. non-survivable head injury)
3. Severe burns with Low Survival burn scores based on the Triage Decision for Burn Victims table (See Table A below). See Burn Scarce Resource Card for management of critical burn patient outside of a Burn Center.
4. Significant underlying disease process that predict poor short term survival*

   **Examples of underlying diseases that predict poor short-term survival, despite standard treatment, include but are not limited to:*
   - *Severe congestive heart failure*
   - *Severe chronic lung disease*
   - *Central nervous system, solid organ or hematopoietic malignancy with poor prognosis for recovery*
   - *Severe cirrhotic liver disease with multi-organ dysfunction*
5. Baseline functional status (consider loss of reserves in energy, physical ability, cognition and general health)

AMERICAN OVERSIGHT

Ref: WA CSC

Legal considerations

- Space
  - Waiving facility licensure rules to allow alternate triage, testing, and care sites
- Staff
  - Waiving or suspending healthcare provider licensing statutes and regulations to expanding scopes of practice, ease continuing education requirements, or allow retired practitioners to respond
  - Providing licensure reciprocity, liability protections, and workers compensation
- Equipment
  - Waiving procurement rules
  - Seizing private property for public use

AMERICAN OVERSIGHT

Legal considerations (cont.)

Guiding Ethical Principles of Crisis Standards of Care

Save the largest number of lives among those who have the longest to live

- Duty to Plan
- Distributive Justice
- Duty to Steward Resources
- Duty to Care
- Proportionality
- Consistency and Fairness
- Transparency and Public Accountability

AMERICAN OVERSIGHT

CMS Waivers to support CSC: WA State experience (cont.)

- **Discharge Planning** 42 C.F.R. §482.43(a)(8), 485.642(a)(8): Allowing for discharges in an efficient manner will free beds for acutely ill patients.

- **Facilities and Make-shift clinic and Physical Environment** 42 C.F.R. §482.41; A-0700 et seq: Non-hospital buildings/space can be used for patient care, provided sufficient safety and comfort is provided for patients and staff.

- **Medical Staff** 42 C.F.R. §482.22(a); A-0341: Physicians whose privileges will expire and new physicians can practice before full medical staff/governing body review and approval, keeping clinicians on the front lines during the emergency.

AMERICAN OVERSIGHT

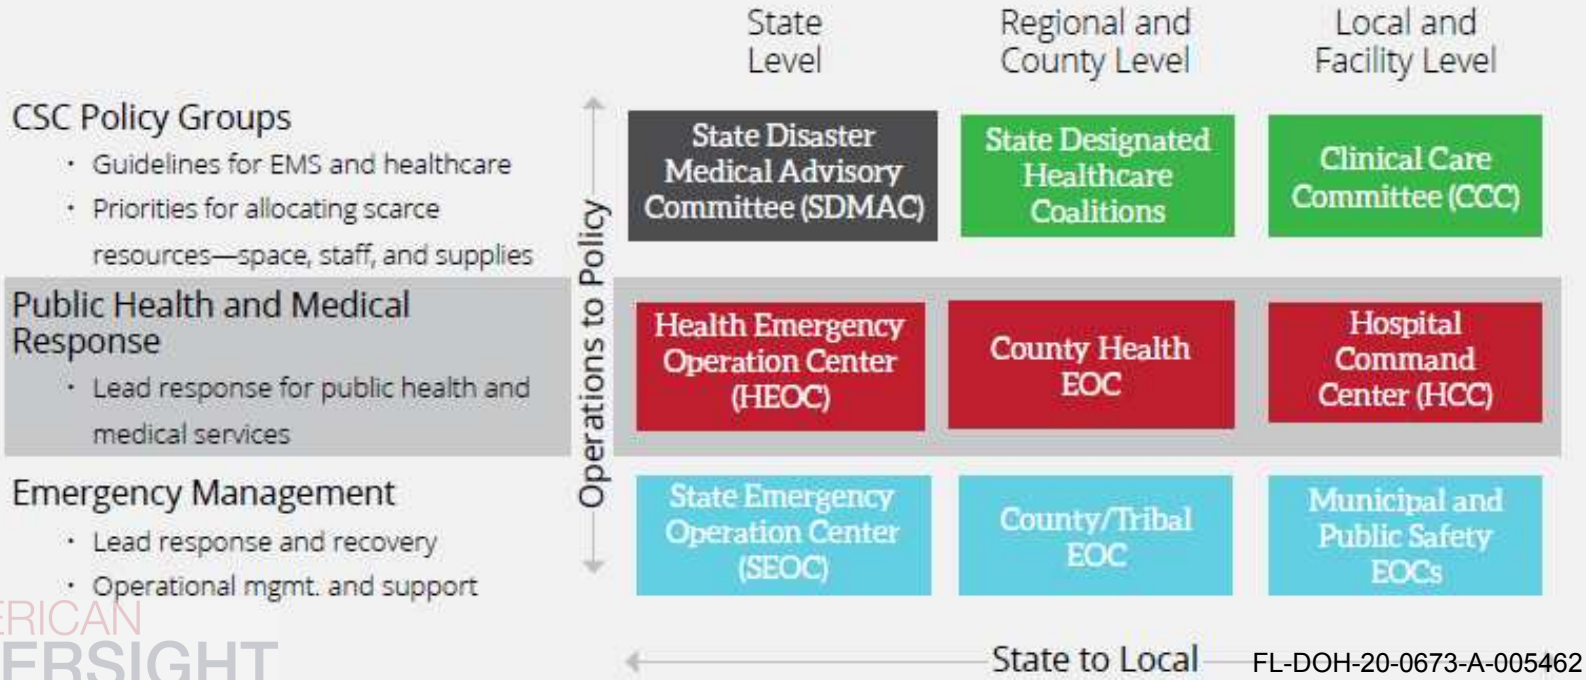
CMS Waivers to support CSC: WA State experience (cont.)

- **Delivery of Services in Alternate Clinic Locations:** Waiver/flexibility to allow Federally Qualified Health Centers (FQHC) and Rural Health Clinics (RHC) providers to bill for their Prospective Payment System (PPS) rate, or other permissible reimbursement, when providing services from alternative physical settings, such as a mobile clinic or temporary location.

- **Flexibility for Teaching Hospitals.** Allow flexibility in how the teaching physician is present with the patient and resident.

AMERICAN OVERSIGHT

CMS Waivers to support CSC: WA State experience (cont.)



- **Skilled Nursing Facility/Nursing Facility (SNF/NF) Conditions of Participation (CoP):**
  - Waiver to allow receiving facilities or alternate settings to receive SNF/NF or ICF/IID payment if a client is moved to a specialty facility to receive care and recover from COVID-19 during the COVID-19 crisis.
  - Non-SNF/NF buildings/space can be certified for use as a temporary SNF/NF… allows state to open a temporary COVID 19 nursing facility to assist COVID 19 positive SNF/NF residents
  - Waiver of certain conditions of participation and certification requirements for opening a nursing facility if the state determines there is a need to quickly stand up a temporary COVID-19 facility

AMERICAN OVERSIGHT

CSCs establish direction, control, and coordination across different levels of the response.

AMERICAN OVERSIGHT

SCARCE RESOURCE MANAGEMENT and CRISIS STANDARDS OF CARE

I. INTRODUCTION

In the event of a large-scale disaster, either a no-notice event such as a natural disaster or a prolonged situation such as a pandemic, there is the potential for an overwhelming number of critically ill or injured patients. In these situations, certain medical resources may become scarce and prioritization of care may need to be considered.

Medical surge is a complex multifactorial event, the response to which is equally complex. In an effort to better understand, measure, discuss best practices and manage medical surge, it is essential to have an overall guiding framework.

In 2009, the Institute of Medicine (currently the National Academy of Medicine) published a landmark report, *Guidance for Establishing Crisis Standards of Care for Use in Disaster Situation: A Letter Report*. In this report the authors defined Crisis Standards of Care as follows:

> "A substantial change in usual healthcare operations and the level of care it is possible to deliver, which is made necessary by a pervasive (e.g. pandemic influenza) or catastrophic (e.g. earthquake, hurricane) disaster. This change in the level of care delivered is justified by specific circumstances and is formally declared by a state government in recognition that crisis operations will be in effect for a sustained period. The formal declaration that crisis standards of care are in operation enables specific legal/regulatory power and protections for healthcare providers in the necessary task of allocating and using scarce medical resources and implementing alternate care facility operations."[1]

They outlined a framework for the discussion of surge capacity defining it as a continuum from conventional to contingency, and finally crisis. They defined this "Continuum of Care" as follows:

> **Conventional Capacity:** The spaces, staff, and supplies used are consistent with daily practices within the institution. These spaces and practices are used during a major mass casualty incident that triggers activation of the facility emergency operations plan.
>
> **Contingency Capacity:** The spaces, staff, and supplies used are not consistent with daily practices but provide care that is functionally equivalent to usual patient care. These spaces or practices may be used temporarily during a major mass casualty incident or on a more sustained basis during a disaster (when the demands of the incident exceed community resources).
>
> **Crisis Capacity:** Adaptive spaces, staff, and supplies are not consistent with usual standards of care but provide sufficiency of care in the context of a catastrophic disaster (i.e., provide the best possible care to patients given the circumstances and resources available). Crisis capacity activation constitutes a significant adjustment to standards of care. [1]

---

[1] IOM (Institute of Medicine). 2012 *Crisis Standards of Care: A Systems Framework for Catastrophic Disaster Response.* Washington, DC: The National Academies Press.

AMERICAN OVERSIGHT

The National Academy of Medicine also stresses the importance of an ethically grounded system to guide decision making in crisis to ensure the most appropriate use of resources. They define these ethical principles as:

- **Fairness** – standards that are, to the highest degree possible, recognized as fair by all those affected by them – including the members of affected communities, practitioners, and provider organizations, evidence-based and responsive to specific needs of individuals and the population.
- **Duty to care** – standards are focused on the duty of healthcare professionals to care for patients in need of medical care
- **Duty to steward resources** – healthcare institutions and public health officials have a duty to steward scarce resources, reflecting the utilitarian goal of saving the greatest possible number of lives.
- **Transparency** – in design and decision making
- **Consistency** – in application across populations and among individuals regardless of their human condition (e.g. race, age disability, ethnicity, ability to pay, socioeconomic status, preexisting health conditions, social worth, perceived obstacles to treatment, pass use of resources)
- **Proportionality** – public and individual requirements must be commensurate with the scale of the emergency and degree of scarce resources
- **Accountability** – if individual decisions and implementation standards, and of governments for ensuring appropriate protections and just allocation of available resources[1]

This framework has been nationally accepted and adopted and has been used by King and PIerce Counties and adopted by the Washington State Department of Health Disaster Medical Advisory Committee.

I. Background:

In 2012, consistent with recommendations from the Institute of Medicine (IOM), the Northwest Healthcare Response Network developed a Disaster Clinical Advisory Committee (DCAC), a group of more than 45 clinicians from healthcare organizations across King and Pierce counties, representing more than 15 clinical subspecialties, working in coordination with Public Health – Seattle & King County and Tacoma-Pierce County Health Department. Since that time, a WA State Disaster Medical Advisory Committee (DMAC) has been developed and along with DCAC have focused on the development of clinically focused tools and planning for medical surge, including strategies for the implementation of Crisis Standards of Care.

The content of this document is based on a thorough review of the literature, guidelines published by leading national healthcare specialty colleges and societies, recommendations of the National Academy of Medicine and detailed discussion and deliberation by the WA State Disaster Medical Advisory Committee (DMAC), the Disaster Clinical Advisory Committee (DCAC) Central District and included input from both local and state Community Engagement Reports.[2,3]

II. Contents:

All individual Scarce Resource Cards and Triage Algorithms are continually under review and open for comments as outlined below in Section D.

[2] 5.Li-Vollmer, M. Health Care Decisions in Disasters: Engaging the Public On Medical Service Prioritization During a Severe Influenza Pandemic. Journal of Participatory Medicine. Vol 2. December 14, 2010.

[3] Washington State Crisis Standards of Care Community Engagement Report, June 2019, DOH

AMERICAN OVERSIGHT

A. Scarce Resource Cards

The Scarce Resource Cards (SRC) are based on work done by Minnesota Public Health[2]. They provide specific strategies which can be used in the conservation, adaptation, substitution, re-use, and re-allocation of a critical resource during an emergency. Additionally, the cards provide recommendations to be implemented in preparation as well as response thus covering the whole continuum of care (conventional, contingency, and crisis) as described above.

The content and composition between cards varies. Some cards are designed to provide specific clinical treatment strategies (e.g. Mass Casualty Burn Treatment Card). Others outline specific patient populations for which the recommendations are made (e.g. in-patient vs out-patient dialysis patients).

Scarce resource cards have been created for the following potentially limited resources:

- Behavioral Health
- Blood products
- Burn
- Hemodynamic support and IV fluids
- Mechanical ventilation
- Medication administration
- Nutritional support
- Oxygen
- Renal replacement therapy
- Respirator and General PPE
- Staffing

AMERICAN OVERSIGHT

B. Scarce Resource Triage Algorithms and Worksheets

Adult and Pediatric Critical Care Triage Algorithms which should be used when Critical Care resources are overwhelmed. The Algorithms are designed to be used side-by-side with the respective Worksheet which provides more in-depth clinical considerations and information needed to move through each step in the Algorithm. Decisions made using these algorithms need to be managed by a Triage Team.

Guidelines for the composition, roles and responsibilities of Triage Teams and their oversight are included in the Triage Team Guidelines mentioned below.

C. Crisis Standards of Care Clinical Triage Team Guidelines

Allocation of a scarce resource is a complex task and, in order to maintain the ethical framework outlined above, it is crucial that the decision-making process be consistent and that oversight and review mechanisms be established. The Triage Team Guidelines provide institutional and regional recommendations for this process.

D. Update and Input Procedures

1. All documents contained in this packet are maintained by NWHRN.
2. Each document is reviewed every 3 years during scheduled plan review. During a specific response, it is recognized that the clinical situation may change based on numerous incident-dependent factors. Therefore, in response, documents are reviewed as outlined in the Triage Team Guidelines.
3. At any time, input is welcomed and can be discussed at the institutional level with specific institutional DCAC members (if applicable). Input can also be made directly to the Chair or Vice-Chair of the WA State DMAC or to the Senior Medical Advisor of NWHRN. A full list of local DCAC and state DMAC members and the Senior Medical Advisor is available from NWHRN.

[2] http://www.health.state.mn.us/oep/healthcare/crisis/standards.pdf

AMERICAN OVERSIGHT

III. Institutional Distribution

The institutional distribution of the contents of this packet will be determined by each institution's Emergency Manager, DCAC member(s), if applicable, and appropriate administration.

IV. WA State Crisis Standards of Care Guidance Framework

In any medical surge, the primary goal is to prevent or limit the time in "Crisis" (as defined above by the NAM). It is understood that movement within the continuum of care is a fluid process and can vary depending on the resource in question or the situation at hand.

It is also paramount, when faced with potential scarce resources that the response is coordinated and communications among all of healthcare is maintained to provide accurate and up-to-date situational awareness. WA State in conjunction with State DMAC, DOH, and state healthcare coalitions have developed the WA State Crisis Standards of Care Guidance Framework and is available through DOH. This document outlines regional roles and responsibilities, provide an ethical framework and other tools which will assist in coordinated planning and response.

AMERICAN OVERSIGHT

BEHAVIORAL HEALTH – PATIENT PLANNING and RESPONSE 05-09-2019 FINAL

STRATEGIES FOR SCARCE RESOURCE SITUATIONS

Conventional Capacity – The spaces, staff, and supplies used are consistent with daily practices within the institution. These spaces and practices are used during a major mass casualty incident that triggers activation of the facility emergency operations plan.	**Contingency Capacity –** The spaces, staff, and supplies used are not consistent with daily practices, but provide care to a standard that is functionally equivalent to usual patient care practices. These spaces or practices may be used temporarily during a major mass casualty incident or on a more sustained basis during a disaster (when the demands of the incident exceed community resources)	**Crisis Capacity –** Adaptive spaces, staff, and supplies are not consistent with usual standards of care, but provide sufficiency of care in the setting of a catastrophic disaster (i.e., provide the best possible care to patients given the circumstances and resources available). Crisis capacity activation constitutes a significant and adjustment to standards of care (Hick et al, 2009).

RECOMMENDATIONS	***Strategy***	***Conventional***	***Contingency***	***Crisis***
PLANNING **General** • 1. Encourage patients to assemble and maintain a disaster kit, to include an extra month worth of their medications, in addition to food, water, sanitation, and first aid supplies, should they need to shelter in place. • 2. Encourage patients to discuss planning for disruption in their care with their current healthcare providers, including primary care providers as well as behavioral health providers. • 3. Encourage Behavioral Health Providers to develop a disaster plan with the patient as part of treatment planning.	*Prepare*			

Gathering Resources
• 4. Encourage patients to identify tools and strategies they have found helpful in symptom relief and write down what works. Include a copy of the document in their disaster kit.
• 5. Encourage patients to explore other avenues for self-help, such as apps to assist with medication and symptom management, and to practice these prior to a disaster. Examples:
  ○ 5a) Headspace (meditation and mindfulness) https://www.headspace.com
  ○ 5b) Virtual Hopebox (distraction, coping exercises, relaxation) https://psyberguide.org/apps/virtual-hope-box/
• 6. Encourage patients to identify family members or friends who are helpful to them and include them as part of their resources. Family resources can be found at https://www.mentalhealth.gov/talk/friends-family-members
	Prepare			

Preparing a Team • 7. Encourage patients to reach out and identify a specific individual in their lives who can be a monitor and coach during disruptive/stressful events. • 8. Family and friends should be encouraged to take advantage of training through Red Cross, National Alliance on Mental Illness (NAMI), or local community mental health clinics, to assist the patient during times of disaster. https://www.namiwa.org/index.php/programs/education-training	*Prepare*			
Response • 9. Patients should be encouraged to locate their physical resources, such as food, water, and medications. • 10. Patients should reach out to their pre-identified support system (family, friends), and to their identified disaster monitor and coach. • 11. Patients should retrieve any written materials and plans to assist them in monitoring and managing symptoms. • 12. Patients may wish to reach out to community organizations (e.g. Red Cross, National Alliance on Mental Health and local community mental health clinics) for additional resources if available at the time of the disaster.

BEHAVIORAL HEALTH STAFF PLANNING and RESPONSE 05/09/2019 FINAL

STRATEGIES FOR SCARCE RESOURCE SITUATIONS

Conventional Capacity – The spaces, staff, and supplies used are consistent with daily practices within the institution. These spaces and practices are used during a major mass casualty incident that triggers activation of the facility emergency operations plan.	**Contingency Capacity** – The spaces, staff, and supplies used are not consistent with daily practices, but provide care to a standard that is functionally equivalent to usual patient care practices. These spaces or practices may be used temporarily during a major mass casualty incident or on a more sustained basis during a disaster (when the demands of the incident exceed community resources)	**Crisis Capacity** – Adaptive spaces, staff, and supplies are not consistent with usual standards of care but provide sufficiency of care in the setting of a catastrophic disaster (i.e., provide the best possible care to patients given the circumstances and resources available). Crisis capacity activation constitutes a significant and adjustment to standards of care (Hick et al, 2009).

RECOMMENDATIONS	***Strategy***	***Conventional***	***Contingency***	***Crisis***
GENERAL (For all clinical settings: inpatient, outpatient, group homes, specialty care facilities, ACF)				
• 1. Include Staff mental/behavioral health guidance/resources in all response plans and continue to maintain, test and update mental health surge plans.				
• 2. Include Mental Health surge issues in trainings and exercises including De-escalation Training, Management of the aggressive patient and Staff Safety.[1,2]	*Prepare*			
PLANNING for PATIENT Mental Health Surge				
• 3. Identify all staff with mental health/behavioral health training and appoint key individuals to lead and organize disaster mental health preparedness and response ○ 3a) Recommend specific disaster mental health training for Behavioral Health providers currently embedded in general medical settings. These individuals will be key in providing Just-in-Time (JIT) training to others in times of mental health patient surge. ○ 3b) Store resources and JIT disaster mental health training materials. (e.g. Health Support Team Curriculum, or Skills for Psychological Recovery National Child Traumatic Stress Network). See references below for specific material recommendations.[3,4,5]	*Prepare*			
PLANNING for STAFF Mental Health needs:				
• 4. Encourage psychological first aid training to all medical staff especially for key clinical leaders and administrators.[5,6]				
• 5. Identify and train willing behavioral health and non-behavioral health providers with more comprehensive curricula than PFA, to act as monitors and evaluators for their colleagues. Utilize evidence-based questionnaires as needed to determine current staff functioning. For example, ProQOL is one quick evaluation tool (https://proqol.org)				
• 6. Provide psycho-education for staff on caregiver fatigue, including symptoms, and coping/support tools[4,5,7,8]	*Prepare*			
• 7. Teach appropriate debrief strategies recognizing[9,10,11] ○ Group debriefing may not be appropriate for all. Prepare and plan to do 1 on 1 debriefing ○ The pace of the debrief session should be responder driven not agenda driven ○ Individuals process traumatic situations at their own pace. Forcing graphic or stressful debriefing can cause increased trauma.				
PLANNING FOR IN-PATIENT PSYCHIATRIC FACILITIES:				
• 8. Encourage inpatient psychiatric facilities to develop connections with other inpatient psychiatric facilities to develop planning for potential patient transfers, evacuations and staffing.	*Prepare*			
• 9. All inpatient psychiatric facilities should develop general disaster planning to include basic care for patients e.g. adequate food/water/shelter, staffing shortfalls, medications, transport of patients, methods of transport, and management of patients who may represent a danger to themselves or others.				

AMERICAN OVERSIGHT

©2020 Northwest Healthcare Response Network.

RESPONSE **Patient Surge** • 10. Notify pre-trained providers to prepare for surge. Implement JIT training of other staff to help with patient surge. • 11. Ensure Alternate Care Facilities have written educational materials to assist with patients, and access to mental health consultation as needed. • 12. In preparation for possible loss of electronic medical records, have printed patient information to include diagnosis, allergies and current medications/dosages. • 13. Modify individual treatment to shorter, symptom focused appointments. • 14. Utilize psycho-educational, and brief evidence-based interventions. • 15. Use Telehealth mental health providers as off-site resource.	*Substitute/ Adapt*			
• 16. Shift treatment to emphasize coping strategies, interventions to manage symptoms, and identifying and accessing personal resources. • 17. Deploy multi-disciplinary response teams as needed to provide Just in Time training for healthcare providers/organizations, and to provide consultation on Behavioral Health interventions including medications and crisis management. • 18. Shift from individual therapy to group intervention.	*Substitute/ Adapt*			
Staff Self Care • 19. Consider "deliberate Coping and Calming" strategies or "Personal Reflective Debrief" techniques over mandated and prescribed CISD for staff during and after traumatic events.[9,10] • 20. Encourage and support staff self-care. When possible maintain schedules, routines and shifts. • 21. During an event encourage personal "pauses" for reflection and self-evaluation. • 22. Encourage utilization of organizational support systems, (e.g. employee assistance program, wellness programs, etc.). • 23. Maintain consistent scheduled communication between administrators and providers during and after acute event. (e.g. huddles, check-ins, sign-outs, etc)	*Substitute/ Adapt*			
MEDICATIONS RECOMMENDATIONS: • 24. Psychiatric medications may not be available due to supply chain disruptions during a major event. Encourage all facilities who care for mental health patients (outpatient, in-patient medical, long term care, group homes, or specialty care facilities) to develop psychiatric medication supply strategies. Consider increasing par levels, developing stockpiles, and/or planning with local retail pharmacies as potential psychiatric medication supply strategies.	*Prepare*

Blood Products – Last Updated 2/17/2020

STRATEGIES FOR SCARCE RESOURCE SITUATIONS Highest relevance: 1) P=pandemic 2) W=weather 3) MCI

Conventional Capacity – The spaces, staff, and supplies used are consistent with daily practices within the institution. These spaces and practices are used during a major mass casualty incident that triggers activation of the facility emergency operations plan.

Contingency Capacity – The spaces, staff, and supplies used are not consistent with daily practices, but provide care to a standard that is functionally equivalent to usual patient care practices. These spaces or practices may be used temporarily during a major mass casualty incident or on a more sustained basis during a disaster (when the demands of the incident exceed community resources

Crisis Capacity – Adaptive spaces, staff, and supplies are not consistent with usual standards of care, but provide sufficiency of care in the setting of a catastrophic disaster (i.e., provide the best possible care to patients given the circumstances and resources available). Crisis capacity activation constitutes a significant and adjustment to standards of care (Hick et al, 2009).

Category	*RECOMMENDATIONS*	*Healthcare Facility*	*Blood Center*	*Strategy*	*Conventional*	*Contingency*	*Crisis*
All Blood Products	1. • Increase donations and consider local increase in frozen reserves P • Increase O positive levels P, W, MCI • Consider maintaining a frozen blood reserve if severe shortage P • Increase recruitment for specific product needs		√	*Prepare*			
	2. • Consider adjustment to donor HGB/HCT eligibility/ explore FDA variance*		√	*Adapt*			
	3. • Relax travel deferrals for possible malaria and BSE (bovine spongiform encephalitis)*P, MCI		√	*Prepare*			
Whole Blood	○ 3a. Consider using ABO-type specific whole blood if components cannot be produced MCI, P, W						
Packed Red Blood Cells	4. • Use cell-saver and auto transfusion to degree possible** P, W, +/- MCI	√		*Re-use*			
	5. • Limit O negative use to women of child-bearing age P,W, MCI	√		*Conserve*			
	6.• Use O positive in emergent transfusion in males or females who are no longer childbearing, to conserve O negative** (Seattle Children's and Mary Bridge Children's currently uses O neg in males < 18 yrs)	√		*Conserve*			
	7. • Change donations from whole blood to 2x RBC apheresis collection if specific shortage of PRBC's (Cascade has current capability)	√	√	*Adapt*			
	8. • Use aliquots from parent product for several children when possible P, W, MCI	√		*Conserve*			
	9. • Encourage use of blood sparing protocols for all patients P,W,MCI	√		*Adapt*			
	10. • Consider use of erythropoietin (EPO) for chronic anemia in appropriate patients	√		*Adapt*			
	11. • Prioritize freshest blood for infants and small children	√		*Conserve*			
	12. • More aggressive crystalloid resuscitation prior to transfusion in shortage situations (blood substitutes may play future role) Use RBC:Plasma in 1:1 ratio in Trauma cases. P, W, MCI	√		*Conserve*			
	13. • Long-term shortage, collect autologous blood pre-operatively and consider crossover transfusion P	√		*Conserve*			
	14. • Implement lower hemoglobin triggers for transfusion P, W, MCI	√	√**	*Conserve*			

©2020 Northwest Healthcare Response Network.

AMERICAN OVERSIGHT

	15. • Consider limiting high-consumption elective surgeries (select cardiac, orthopedic, spinal, etc.)** (procedures likely to require blood transfusions) P, W, +/- MCI	√	√**	Conserve			
	16. • Consider use of EPO in patients with anticipated acute blood loss P, W, MCI						
	17. • Further limit PRBC use, if needed, to active bleeding states, consider subsequent restrictions including transfusion for treatable shock states only** (modification of transfusion thresholds) W, P, MCI	√	√**	Re-allocate			
	18. • Consider Minimum Qualifications for Survival (MQS) limits on use of PRBCs (for example, only initiate for patients that will require <6 units PRBCs and/or consider stopping transfusion when >6 units utilized), specific MQS limits should reflect available resources at facility. ** P, W, MCI	√	√**	Re-allocate			
	19. • Reduce or waive usual 56 days inter-donation period * based upon pre-donation hemoglobin/ explore FDA variance* P, MCI		√	Adapt			
	20. • Reduce weight restrictions for 2x RBC apheresis donations according to instruments used and medical director guidance * W, P, MCI		√	Adapt			
Plasma	21. • Consider increase in red cell: Plasma ratio (3:1) in massive transfusion protocols in consultation with blood bank medical staff** W, P	√		Conserve			
	22. • Encourage early use of plasma in trauma with anticipated massive hemorrhaging and/or brain injury. Thaw early and use blood warmer.	√		Conserve			
	23. • Switch community inventory to liquid plasma P, W, MCI		√**	Adapt			
	24. • Consider using Group A Plasma P, W, MCI		√**	Adapt			
	25. • Accept female donors without white cell antibody testing. P, W, MCI		√**	Adapt			
	26. • Though not true substitute, consider use of fibrinolysis inhibitors or other modalities to reverse coagulopathic states (tranexamic acid, aminocaproic acid, activated coagulation factor use, fibrinogen concentrate, prothrombin complex concentrate, or other appropriate therapies) MCI, P, W	√		Substitute			
	27. • Obtain FDA variance to exceed 24 collections per year for critical types* P =/-W (e.g. Group AB) P, W, MCI		√	Adapt			
Cryoprecipitate	28. • Encourage early use of cryo in trauma with anticipated massive hemorrhaging and/or brain injury. Thaw early and use blood warmer.	√		Conserve			
	29. • Though not true substitute, consider use of fibrinolysis inhibitors or other modalities to reverse coagulopathic states (tranexamic acid, aminocaproic acid, activated coagulation factor use, fibrinogen concentrate, prothrombin complex concentrate, or other appropriate therapies). MCI, P, W	√		Substitute			
	30. • Obtain FDA variance to exceed 24 collections per year for critical types* P =/-W (e.g. Group AB). P		√	Adapt			
Platelets	31. • Though not true substitute, consider use of desmopressin (DDAVP) to stimulate improved platelet performance in renal and hepatic failure patients MCI, P, W	√		Substitute			
	32. • Consider aliquoting from apheresis platelets. For children, consider splitting whole blood platelets for more than one recipient. P, W, MCI		√	Adapt Leukoreduced		Nonleukoreduced	

©2020 Northwest Healthcare Response Network.

AMERICAN OVERSIGHT

	33. • Convert whole blood donors to apheresis donors. Standard Practice. W, P, MCI		√	*Adapt*			
	34. • Transfuse platelets only for active bleeding, further restrict to life-threatening bleeding if required by situation P, W, MCI	√		*Conserve*			
	35. • No prophylactic use of platelets. P, W, MCI	√		*Adapt*			
	36. • Accept female platelet donors regardless of HLA antibody, W, P, MCI		√	*Adapt*			
	37. • Consider changing bacterial detection strategy. MCI, P. Potentially W		√	*Adapt*			
	38. • Obtain FDA variance to allow new Pool and Store sites to ship across state lines* P, W, MCI		√	*Adapt*			
	39. • Apply for variance of 5 day outdate requirement *. W, P, MCI		√	*Adapt*			

Adapted from the Minnesota Department of Health, Office of Emergency Preparedness

**FDA approval/variance required via American Association of Blood Banks (AABB)*

***Education and/or experience is necessary in the setting of a community-wide critical shortage*

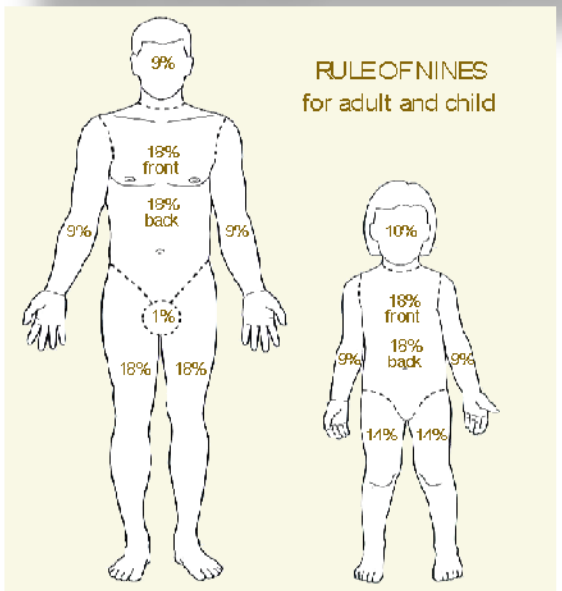
MASS CASUALTY BURN TREATMENT – 2/24/2020 FINAL
REGIONAL RESOURCE CARD

Harborview Medical Center (HMC)
Transfer Center 1-888-731-4791

INITIAL ASSESSMENT

Call UW Transfer Center to talk with a Burn Fellow/Attending, who can assist with triage, care of burn injured patients and transfer

Mass Casualty Burn Consultation Guide:



1. ≥ 20 % TBSA adults, ≥ 15% peds (2nd/3rd degree)
2. Circumferential 3rd degree burn
3. Respiratory injury/inhalation
4. Burn plus trauma or other comorbidities
5. High-voltage electrical (1000V) or chemical injury

YES

NO

OUTPATIENT MANAGEMENT
< 20% TBSA adults, < 15% TBSA pediatrics

- Oral fluid (sports drinks, electrolyte solution)
- PO pain management
- Refer to burn dressing guide and supply list
- Elevate extremity burns

DO NOT COUNT 1st DEGREE BURNS when calculating the Rule of Nines TBSA (Total Body Surface Area)

- 1st degree: red intact skin , no blisters
- 2nd degree: red/pink, moist, sensate, blisters, blanches
- 3rd degree: dry, leathery, insensate, non-blanching (see photos below for reference)

PRIMARY ASSESSMENT & INTERVENTIONS

6. Protect yourself using body substance isolation. Stop the burning process, cover with loose linen, keep warm
7. **Perform standard primary and secondary survey for any trauma patient.** Do not be distracted by burn tissue
8. **Airway/Breathing** - Assess for altered LOC, obstruction, respiratory compromise, burns to face or oropharynx
   - 8a. Administer 100% oxygen via non rebreather/ETT, if suspected inhalation injury (enclosed space, carbonaceous sputum, COHgb ≥ 10%)
   - 8b. Carbon monoxide (CO) exposure signs and symptoms:
     - HA and nausea (20%-30%)
     - Confusion (30%-40%)
     - Coma (40%-60%)
     - Death (>60%)
   - 8c. Consider intubation for GCS ≤ 8, ≥40% TBSA, direct upper airway injury, deep facial burns
9. **Circulation** - Assess vital signs. Hypovolemic shock signs including tachycardia are common >20% TBSA
   - 9a.2 large bore IV/IO's
   - 9b. **Initial fluids** LR/NS if estimated TBSA ≥ 20% adults and ≥15% pediatrics : (See secondary assessment for next steps in fluid resuscitation #12c)
     - ≤ 5 years: 125 mL/hr
     - 6-13 years: 250 mL/hr
     - ≥ 14 years : 500 mL/hr
   - 9c. Treat adult SBP <90 and pediatric SBP < [70 + (2x age in years)] with IV/IO fluid bolus. Avoid extra fluid when possible
10. **Disability** – Assess neurologic status: GCS/AVPU, check pupils, cervical spine protection, if trauma, high-voltage (>1000 V) injury
11. **Expose/Estimate** - Brush away loose material if concern for chemical exposure, remove clothing, jewelry, and contact lens. Protect from heat loss; hypothermia occurs quickly
    - 11a. Circumferential trunk or extremity burn: elevate extremities, check pulses. Full-thickness eschar may need surgical release

Additional Burn Center Consults

- **Cyanide Poisoning** – Consider if severe metabolic acidosis despite adequate fluid resuscitation as outlined in 12c.
- **Electrical**–If myoglobin in urine (red pigment) there is a risk of rhabdomyolysis
- **Chemical and radiologic** – consider need for antidote or specific therapies. Consult Poison Control

YES

SECONDARY ASSESSMENT & INTERVENTIONS

12. **Adjuncts-**
    - 12a. **Nasogastric or orogastric** – Intubated patients
    - 12b. **Estimate TBSA** using Rule of Nines chart
    - 12c. **Consensus formula LR/NS**: 3 mL x kg x % TBSA= fluids in 24 hrs. Give ½ in first 8 hrs and ½ in next 16 hrs. Increase/decrease fluids by 20% hourly to target UO
    - 12d. **Pediatrics**:<30kg, add maintenance fluid (below) using D5LR in addition to Consensus formula in #12c
      - 4 m x 1st 10 kg
      - 2 m x 2nd 10 kg
      - 1 mL x remaining kg = total mL/hr
    - 12e. **Foley** – Target urine output (uo) 30 mL/hr adults or 1mL/kg/hr in pediatrics < 30 kg.
    - 12f. **Pain control** – Use small doses of opioids
13. **History** – AMPLET or SAMPLE mnemonic
14. **Head to Toe Assessment**

YES

CRITICAL BURN FEATURES

15. TBSA >25% partial thickness or >10% full-thickness burns
16. Circumferential full thickness burns
17. Burn plus trauma or other comorbidities
18. Hemodynamic instability despite ongoing fluid resuscitation as outlined in 9b and 12c

CRITICAL: High priority for transfer to Burn Center.

YES

NO

SERIOUS BURN FEATURES

19. Secondary priority for transfer-may have to manage in place awaiting transfer (up to 72 hours)
    - 20. Refer to burn dressing guide and supply list
    - 21. Infection control – provider gown, glove, and mask when wounds exposed. No prophylactic antibiotics
    - 22. Intubated: Consider tube feeds
      - 22a. Non-intubated: encourage high calorie PO

AMERICAN OVERSIGHT

©2020 Northwest Healthcare Response Network. Burn Triage SRC.

	Resource and Recommendations	Strategy	Conventional	Contingency	Crisis
Command and Control, Communication, Coordination	**General Preparedness Information** • 23. HMC Burn Center is an ABA/ACS verified burn center in the WAMI region with 18 ICU and 23 acute care beds. • 24. Mass burn incidents are unusual but do occur. The ability of non-burn hospitals to triage and initially treat victims is critical to successful response and should be a planning goal of all hospitals with numbers of victims depending on the facility size and role in the community. • 25. In a major incident, victims may require care at the initial receiving hospital for up to 72 hours until transfer to definitive burn care. • 26. The role of the Disaster Medical Control Center (DMCC) in any major event is to distribute patients from the scene to area hospitals. There are different DMCC's in the region. HMC is the DMCC for King County. Patient distribution is often done by the DMCC with limited information from the field. In an event involving many burn patients it is highly probable that multiple ED's will receive patients and be responsible for their initial triage/stabilization. • 27. Notification: In a major burn incident, HMC, DMCC, NWHRN, Public health and area EOC's will be notified. • 28. If HMC is unable to accommodate casualties or require assistance with transportation/resource issues, multiple levels of coordination and communication will need to occur between area hospitals, DMCC, Healthcare coalitions, Public Health, area EOC's and potentially other regional burn centers depending on the magnitude of the event and extent of injuries. *(See Burn Surge Annex, pending 2021)*	*Prepare*			
Space	**Capacity** • 29. Each facility is encouraged to activate its own internal contingency/disaster plan if needed to manage multiple burn patients. • 30. In a major event, some burn ICU patients may need to be cared for in non-burn center acute care units. • 31. In coordination with HMC Burn Center, forward movement to other burn centers in adjoining states may be needed.	*Adapt*			
	• 32. National Disaster Medical System (NDMS) patient movement may need to be utilized.	*Adapt*			

AMERICAN OVERSIGHT
©2020 Northwest Healthcare Response Network.

	Resource and Recommendations	*Strategy*	*Conventional*	*Contingency*	*Crisis*
Supplies (for 72 hours)	**Outpatient/ Supplies Planning** • 33. Institutions should prepare based on role in community. Outpatient clinics and urgent care centers may also cache appropriate supplies for their location and patient population. Suggested burn dressing supplies (per patient) (see below) **Inpatient Supplies Planning** • 34. Institutions should prepare based on role in community. In contingency or crisis situations non-burn centers may be asked to stabilize or potential provide extended care to burn patients. Suggested burn dressing supplies (per patient) (see below)	*Prepare* *Increase Supply*			
Staffing	**Staff** • 35. Strong consideration should be given to training physician and nursing staff on care of major burns pre-incident and having quick-reference cards/materials available for burn stabilization. • 36. Level II & III Trauma Centers should consider having a cohort of providers trained in the ABA Advanced Burn Life Support (ABLS) and ACS Disaster Management Emergency Preparedness (DMEP). • 37. Identify staff with prior burn treatment experience (i.e. military). • 38. See Staffing Scarce Resource Card for further staffing considerations. • 39. Staff should have access to just-in-time training provided to non-burn nursing and physician staff reinforcing key points of burn patient care (including importance of adequate fluid resuscitation, urine output parameters, principles of analgesia, dressing changes, wound care and monitoring) • 40. In a Mass casualty event, call the HMC Transfer Center 1-888-731-4791 for consultation in caring for burn patients. • 41. NDMS personnel and other supplemental staff may be required.	*Adapt* *Adapt* *Conserve* *Adapt* *Subst* *Prepare*			
Special	**Special Considerations** Consider availability of resources for: • 42. Pediatrics: age-and size appropriate equipment: intravenous, intraosseous access devices, medication dosing guides. Consider using color-coding pediatric guides.				

AMERICAN OVERSIGHT
©2020 Northwest Healthcare Response Network.

	Resource and Recommendations	*Strategy*	*Conventional*	*Contingency*	*Crisis*
Triage	**Critical Burn Features : Survivability Grid** • 43. The following grid provides an example of triage decisions that may become necessary in the setting of overwhelmed resources or in austere conditions where crisis standards of care may be instituted. The survivability grid utilizes the same 4 color scheme used for EMS personal. Survivability will differ if the patient has sustained an inhalation injury. • 44. Use of the survivability table should be done in close collaboration with the Burn Center but should **NOT** substitute for a more global assessment of the patient. (See ABLS 2018 update) http://ameriburn.org/wp-content/uploads/2019/08/2018-abls-providermanual.pdf • 45. If Burn Center resources are limited, critical burn patients may need to be cared for in non-burn centers. Just in Time training and on-line resources are available to non-burn centers in these situations. Please refer to: https://crisisstandardsofcare.utah.edu/Pages/home.aspx; This website requires registration and login password. please consider planning ahead and gaining access before an event occurs.	*Re-Allocate*			

AMERICAN OVERSIGHT

UW Medicine
HARBORVIEW MEDICAL CENTER
REGIONAL BURN CENTER

Burn Dressing Guide and Supply Estimates:

- Goal for partial thickness burn healing is to keep the wound moist and free from infection
- **1st degree burn:**
  - **1st degree burns do not count when calculating the TBSA using the Rule of Nines burn chart.** Apply lotion or ointment and leave open to air. No dressings needed
- **2nd degree burn:**
  - Apply a greasy gauze dressing with thin layer of antibiotic ointment. Change every 1-2 days
  - Or apply silver impregnated dressing to moist burns on flat surfaces. Dressing must lay flat against the burn. Secure in place with elastic, netting etc. Change every 7 days
- **3rd degree burn:**
  - Apply SSD and cover with thin layer of gauze Change every 1-2 days

- SSD 400 gm jar: 1 jar per 9% tbsa
- Antibiotic ointment: 1 tube per 9% tbsa
- Greasy gauze 4 in x 9 yard roll: 1 roll per 9% tbsa
- Gauze 6 inch x 3 yd roll: 1 roll per 9% tbsa
- 4x4 gauze: (1 box or boat) per 4% tbsa

Adult	SSD (Jar)	Greasy gauze (roll)	Antibiotic ointment (tubes)	Kerlix roll (6 in)	4x4 Gauze (Boat or package)	4x8 Gauze	18x18 Gauze	Elastic netting (inch)	Silver Impregnated drg
Head	1	1/4 face	8	-	1	3	-	10 inch	-
Arm	1	1	8	1	-	-	1-2	6 inch	Three 8x 8s OR One 8x 20

HEMODYNAMIC SUPPORT AND IV FLUIDS – March 19, 2019 FINAL

STRATEGIES FOR SCARCE RESOURCE SITUATIONS

Conventional Capacity – The spaces, staff, and supplies used are consistent with daily practices within the institution. These spaces and practices are used during a major mass casualty incident that triggers activation of the facility emergency operations plan.	**Contingency Capacity** – The spaces, staff, and supplies used are not consistent with daily practices, but provide care to a standard that is functionally equivalent to usual patient care practices. These spaces or practices may be used temporarily during a major mass casualty incident or on a more sustained basis during a disaster (when the demands of the incident exceed community resources)	**Crisis Capacity** – Adaptive spaces, staff, and supplies are not consistent with usual standards of care, but provide sufficiency of care in the setting of a catastrophic disaster (i.e., provide the best possible care to patients given the circumstances and resources available). Crisis capacity activation constitutes a significant and adjustment to standards of care (Hick et al, 2009).

RECOMMENDATIONS	***Strategy***	***Conventional***	***Contingency***	***Crisis***
Equipment and Supplies and Training • 1. Cache intravenous (IV) cannulas, tubing, fluids, medications, and administration supplies, oral rehydration packets (ORS) and intraosseous (IO) equipment, including drill and manual placement needles. • 2. Conduct training and education re: oral and enteral hydration, IO and hypodermoclysis fluid administration options. • 3. Develop system wide scarce resource communication plans with clear lines of responsibility and accountability to keep staff aware of shortages and conservation strategies. • 4. Consider centralized inventory control of critical medications and fluids (e.g. procedural areas, ORs, day surgery areas may have separate inventory control of critical resources).	*Prepare*			
IV Fluid Conservation Strategies[1] • 5. Monitor CDC, FDA and ASHP updates on supply and conservation strategies. • 6. Switch to oral therapy whenever possible (e.g. antibiotics, anticoagulants, electrolyte replacements).				
• 7. Discontinue KVO (Keep vein open) orders. • 8. Adopt NPO strategies as recommended by the ASA[2] (2 hours for liquids, 4 hours for breast milk, 6 hours for infant formula, light meal or nonhuman milk) to limit "maintenance IVF". • 9. Review electronic medical record order sets to ensure conservation strategies are being enforced. • 10. If oral therapy is not feasible or indicated consider IM or SQ injection.				
• 11. If IV medications must be used, consider alternative compounding strategies to minimize IVF use such as syringe infusion pumps; IV push administration, following the "ISMP Safe Practice Guidelines for Adult IV Push Medications".[3] • 12. Consider using alternative fluids (e.g. dextrose or LR), or other volume expanders (e.g. colloids) depending on clinical situation. • 13. Repackage small bags from larger source following the "Repackaging of certain Human Drug Products by Pharmacies and Outsourcing Facilities" 2017, authored by FDA.[4]				
Emphasize Enteral Hydration Instead of IV Hydration **Provide oral hydration (ORT), when possible** • 14. Provide guidelines for oral rehydration therapy, including indications for hospital referral, to outpatient providers. **Utilize Appropriate Oral Rehydration Solution** • 15. Oral rehydration solution: 1-liter water (5 cups) + 1 tsp salt + 8 tsp sugar, add flavor (e.g., ½ cup juice) as needed. • 16. Rehydration for moderate dehydration 50-100mL / kg over 2-4 hours. **Pediatric Hydration** Pediatric maintenance fluids: • 17. Four mL/kg/h for first 10kg of body weight (40 mL/h for 1st 10 kg). • 18. Two mL/kg/h for second 10kg of body weight (20 mL/h for 2nd 10kg = 60 mL/h for 20kg child). • 19. One mL/kg/h for each kg over 20kg (example - 40 kg child = 60 mL/h plus 20 mL/h = 80 mL/h). Supplement for each diarrhea or emesis.	*Substitute*			
Provide nasogastric or gastrostomy (NG, G-tube) hydration for both adults and pediatric patients when applicable. • 20. For fluid support, 8-12F (pediatric: infant 3.5F, < 2yrs 5F) tubes are better tolerated than standard size tubes. • 21. For additional equipment size guidelines, refer to a pediatric length-based resuscitation tape, e.g., the Broselow™ Tape. NOTE: Clinical (urine output, etc.) and laboratory (BUN, urine specific gravity) assessments and electrolyte correction are key components of fluid therapy and are not specifically addressed by these recommendations.	*Substitute*			

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005482
©2020 Northwest Healthcare Response Network.

IV and Syringe Pumps • 22. Ensure IV pumps are charged and battery life monitored. • 23. Consider stocking alternate emergency equipment for IV administration such as buretrols and drip counters, other devices such as the Drip Assist [T] designed for use in austere environments.	*Conserve*			
• 24. Reserve IV pumps, if limited, for use for critical medications such as sedatives, analgesics, certain antibiotics and hemodynamic support.	*Conserve*			
Substitute Epinephrine for Other Vasopressor Agents in Shortage • 25. For hemodynamically unstable patients > 18 yo who are adequately volume-resuscitated, consider adding 6mg epinephrine (6mL of 1mg/ml) to1000mL NS on mini-drip tubing and titrate to target blood pressure. • 26. For children < 18 yrs. add 0.6 X weight(kg) to equal total mg of Epinephrine to add to a 100 mL bag of NS. Run on mini-drip tubing start at 1 mL/hr (= 60 drips/hr or 1 drip/minute). This starting epinephrine rate = 0.1 mcg/kg/min, a standard starting epinephrine dose, assuming that 1 mL=60 drips for mini-drip tubing; increase drip rate to target blood pressure.	*Substitute*			
Re-use CVP, NG, and Other Supplies After Appropriate Sterilizations/Disinfection • 27. In crisis situations, when considering re-use of otherwise single use disposable equipment, alternate sterilization techniques should be discussed using available expert opinions such as CDC, WHO, local public health and infection control specialists. When possible, consensus recommendation should be made. Possible sterilization options during crisis include: ○ 27a) High-level disinfection for at least twenty minutes for devices in contact with body surfaces (including mucous membranes); glutaraldehyde, hydrogen peroxide 6%, or bleach (5.25%) diluted 1:20 (2500 ppm) may be acceptable solutions. NOTE: chlorine levels reduced if stored in polyethylene containers - double the bleach concentration to compensate).	*Re-use*			
Intraosseous and Subcutaneous (Hypodermoclysis) Replacement Fluids • 28. Consider "clysis" as an option when alternative routes of fluid administration are impossible/unavailable. • 29. Intraosseous administration should be considered before hypodermoclysis. Intraosseous • 30. Intraosseous infusion is not generally recommended for hydration purposes, but may be used until alternative routes are available. Intraosseous infusion requires pump or pressure bag. Rate of fluid delivery is often limited by pain of pressure within the marrow cavity. This may be reduced by pre-medication with lidocaine (preservative-free) 0.5mg/kg slow IV push. Hypodermoclysis [5,6] • 31. Cannot correct more than moderate dehydration via this technique. • 32. Many medications cannot be administered subcutaneously. • 33. Common infusion sites: pectoral chest, abdomen, thighs, upper arms. • 34. Common fluids: normal saline (NS), D5NS, D5 1/2 NS (Can add up to 20-40 mEq potassium if needed.). • 35. Insert 21/24 gauge needle into subcutaneous tissue at a 45 degree angle, adjust drip rate to 1-2 mL per minute (May use 2 sites simultaneously if needed.). • 36. Maximal volume about 3 liters / day; requires site rotation. • 37. Local swelling can be reduced with massage to area. • 38. Hyaluronidase 150 units / liter facilitates fluid absorption but is not required; may not decrease occurrence of local edema.	*Substitute*			
Consider Use of Veterinary and Other Alternative Sources for Intravenous Fluids and Administration Sets	*Adapt*

MECHANICAL VENTILATION/EXTERNAL OXYGENATION

STRATEGIES FOR SCARCE RESOURCE SITUATIONS

Conventional Capacity – The spaces, staff, and supplies used are consistent with daily practices within the institution. These spaces and practices are used during a major mass casualty incident that triggers activation of the facility emergency operations plan.	**Contingency Capacity –** The spaces, staff, and supplies used are not consistent with daily practices, but provide care to a standard that is functionally equivalent to usual patient care practices. These spaces or practices may be used temporarily during a major mass casualty incident or on a more sustained basis during a disaster (when the demands of the incident exceed community resources)	**Crisis Capacity –** Adaptive spaces, staff, and supplies are not consistent with usual standards of care, but provide sufficiency of care in the setting of a catastrophic disaster (i.e., provide the best possible care to patients given the circumstances and resources available). Crisis capacity activation constitutes a significant and adjustment to standards of care (Hick et al, 2009).

RECOMMENDATIONS	***Strategy***	***Conventional***	***Contingency***	***Crisis***
Increase Hospital Stocks of Ventilators and Ventilator Circuits, ECMO or bypass circuits	*Prepare*			
Access Alternative Sources for ventilators / specialized equipment • Obtain specialized equipment from vendors, healthcare partners, regional, state, or Federal stockpiles via usual emergency management processes and provide just-in-time training and quick reference materials for obtained equipment.	*Substitute*			
Decrease Demand for Ventilators • Increase threshold for intubation / ventilation. • Decrease elective procedures that require post-operative intubation. • Decrease elective procedures that utilize anesthesia machines. • Use non-invasive ventilatory support when possible.	*Conserve*			
Re-use Ventilator Circuits • Appropriate cleaning must precede sterilization. • If using gas (ethylene oxide) sterilization, allow full 12-hour aeration cycle to avoid accumulation of toxic byproducts on surface. • Use irradiation or other techniques as appropriate.	*Re-use*			
Use Alternative Respiratory Support Technologies • Use transport ventilators with appropriate alarms – especially for stable patients without complex ventilation requirements. • Use anesthesia machines for mechanical ventilation as appropriate / capable. • Use bi-level (BiPAP) equipment to provide mechanical ventilation. (Contingency and Crisis) • Consider bag-valve ventilation as temporary measure while awaiting definitive solution / equipment (as appropriate to situation extremely labor intensive and may consume large amounts of oxygen).	*Adapt*			
Assign Limited Ventilators to Patients Most Likely to Benefit if No Other Options are Available: **See Pediatric and/or Adult Critical Care Algorithm**	*Re-allocate*

OXYGEN - 03/29/2019 DRAFT REVISION

STRATEGIES FOR SCARCE RESOURCE SITUATIONS

Conventional Capacity – The spaces, staff, and supplies used are consistent with daily practices within the institution. These spaces and practices are used during a major mass casualty incident that triggers activation of the facility emergency operations plan.	**Contingency Capacity** – The spaces, staff, and supplies used are not consistent with daily practices, but provide care to a standard that is functionally equivalent to usual patient care practices. These spaces or practices may be used temporarily during a major mass casualty incident or on a more sustained basis during a disaster (when the demands of the incident exceed community resources)	**Crisis Capacity** – Adaptive spaces, staff, and supplies are not consistent with usual standards of care, but provide sufficiency of care in the setting of a catastrophic disaster (i.e., provide the best possible care to patients given the circumstances and resources available). Crisis capacity activation constitutes a significant and adjustment to standards of care (Hick et al, 2009).

RECOMMENDATIONS	***Strategy***	***Conventional***	***Contingency***	***Crisis***
Inhaled Medications • 1. Use compressed or room air for administration of nebulized medications when clinically appropriate. • 2. Restrict the use of Small Volume Nebulizers when inhaler substitutes are available. • 3. Restrict continuous nebulization therapy. • 4. Minimize frequency through medication substitution that results in fewer treatments (6h-12h instead of 4h-6h applications). • 5. Change children from albuterol continuous nebulizers to Albuterol 8 puffs MDI Q2 hrs when they are ready to stop continuous treatments. Only use albuterol nebulizers in continuous form for truly acute status asthmaticus.	*Substitute & Conserve*			
High-Flow Applications • 6. Assure all resuscitation oxygen bags have shut off valves and are shut off when not in use.	*Conserve*			
• 7. Restrict the use of high-flow adult cannula systems as these can demand 12 to 40 LPM flows. • 8. Restrict the use of simple and partial rebreathing masks to 10 LPM maximum. • 9. Consider intubation or non-invasive ventilation with a well-sealed mask over the use of high flow oxygen delivery systems for both adult and pediatric patients during critical shortages.	*Conserve*			
Air-Oxygen Blenders • 10. Eliminate the low-flow reference bleed occurring with any low-flow metered oxygen blender use. This can amount to an additional 12 LPM. Reserve air-oxygen blender use for mechanical ventilators using high-flow non-metered outlets. (These do not utilize reference bleeds). • 11. Disconnect blenders when not in use.	*Conserve*			
Oxygen Conservation Devices • 12. Use reservoir cannulas if available at 1/2 the flow setting of standard cannulas. • 13. Replace simple and partial rebreather mask use with reservoir cannulas or venti-masks at flow rates of 6-10 LPM • 14. Use High Efficiency nebulizers and use air flow instead of oxygen when clinically possible.	*Substitute & Adapt*			
Augment Oxygen Supply • 15. Use hospital-based or independent home medical equipment supplier oxygen concentrators if available to provide low-flow cannula oxygen for patients and preserve the primary oxygen supply for more critical applications. • 16. Consider other source of oxygen such as dental or veterinary offices. • 17. Obtain oxygen supply from industrial sources, such as supplied by welding companies and underwater diving operations.	*Substitute & Conserve*			
• 18. Reduce hospital wide PSI from 50-40.	*Conserve*			
Monitor Use and Revise Clinical Targets • 19. Employ oxygen titration protocols to optimize flow or % to match targets for SPO2 or PaO2. • 20. Discontinue oxygen at earliest possible time.	*Conserve*			

AMERICAN OVERSIGHT

FL-DOH-20-0673-A-005485

©2020 Northwest Healthcare Response Network.

- 21. Consider variable parameters for initiating and continuing oxygen therapy:

Starting Example	Initiate O2	O2 Target	Note: These target ranges need to be continually re-evaluated depending on resources available, the patient's clinical presentation, or measured PaO2 determination. If no pulse oximetry is available initiate oxygen therapy based on clinical assessment (e.g. cyanosis, increased work of breathing, valid respiratory scores etc.)
Normal Lung Adults	SPO2 <88-90%	SPO2 90%	
Pediatrics	SPO2 <88-90%	SPO2 90%	
Severe COPD History	SPO2 <85%	SPO2 88-90%	

Expendable Oxygen Appliances

- 22. All non-standard disinfection and sterilization procedures should be tested and assessed prior to widespread use. Possible options during crisis include: Use terminal sterilization or high-level disinfection procedures for oxygen appliances, small & large-bore tubing, and ventilator circuits. Bleach concentrations of 1:10, high-level chemical disinfection, or irradiation may be suitable. Ethylene oxide gas sterilization (if available) is optimal, but requires a 12-hour aeration cycle to prevent ethylene chlorohydrin formation with polyvinyl chloride plastics.

Re-use

Oxygen Re-Allocation Implementation

- 23. For patient prioritization for oxygen administration or re-allocation during severe resource limitations please see Adult and Pediatric Critical Care Algorithms.

Re-Allocate

Renal Replacement Therapy Card

STRATEGIES FOR SCARCE RESOURCE SITUATIONS

Conventional Capacity – The spaces, staff, and supplies used are consistent with daily practices within the institution. These spaces and practices are used during a major mass casualty incident that triggers activation of the facility emergency operations plan.	**Contingency Capacity** – The spaces, staff, and supplies used are not consistent with daily practices, but provide care to a standard that is functionally equivalent to usual patient care practices. These spaces or practices may be used temporarily during a major mass casualty incident or on a more sustained basis during a disaster (when the demands of the incident exceed community resources)	**Crisis Capacity** – Adaptive spaces, staff, and supplies are not consistent with usual standards of care, but provide sufficiency of care in the setting of a catastrophic disaster (i.e., provide the best possible care to patients given the circumstances and resources available). Crisis capacity activation constitutes a significant and adjustment to standards of care (Hick et al, 2009).

Category	*RECOMMENDATIONS*	*Inpatient*	*Outpatient*	*Strategy*	*Conventional*	*Contingency*	*Crisis*
A. General	1. All organizations that provide dialysis need to maintain internal emergency plans to provide care for the special needs of dialysis patients during any external or internal emergency that may disrupt standard operations. These plans should address appropriate water and power supply, equipment and supply needs and staff/provider considerations. (See links to resources in #2 below)	√	√	*Prepare*			
	2. All dialysis providers must advise their patients in developing their own preparedness plans including emergency and contingency plans for food, medications, transportation and emergency contact resources. • Dialysis patients need to be self-sufficient for up to 96hrs. Note that shelters are unlikely to have foods appropriate for renal dietary needs (low sodium, etc.). Personal planning guidance is available at: https://www.kidney.org/sites/default/files/11-10-0807_IBD_disasterbrochure.pdf https://www.davita.com/kidney-disease/overview/living-with-ckd/emergency-preparedness-for-people-with-kidney-disease/e/4930		√				
	3. Medical needs of re-located renal failure patients from outside our region are substantial; the medical leadership of Northwest Kidney Center, DaVita and NW Renal Network need to be made aware of such incoming patients in order to be able to plan for their medical needs.[1]	√	√				
	Transportation Interruptions 4. Chronic dialysis patients should coordinate with their service providers/dialysis clinics first for transportation and other assistance during service/transportation interruptions.		√	*Prepare*			
	5. If individual providers/dialysis clinics are unable to meet emergent supplemental transportation needs, refer to the King County Winter Weather Medical Transport Plan and Pierce County Department of Emergency Management for their possible assistance [2].		√	*Adapt*			
B. Water	**Water Supply** 6. Identify and quantify water-purifying capabilities for dialysis 7. Identify alternative water source if city water is unavailable	√	√	*Prepare*			
	8. Identify limitations and special arrangements needed to use water tanker a) Availability of reverse osmosis (RO) machines with carbon tanks b) Available means to generate adequate water pressure to units providing dialysis	√	√				
	Water Contamination 9. Consider alternate sources of highly purified water (e.g. Northwest Kidney Center water reserve tank, individual facility wells, etc.) keeping in mind that potable water alone is NOT sufficiently purified for dialysis.	√	√	*Prepare*			
	10. Consider transferring stable inpatients to outpatient dialysis centers for dialysis treatments and vice versa depending on location of purified water source	√	√	*Substitute Adapt*			

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005487
©2020 Northwest Healthcare Response Network.

	11. Consider use of other regional assets for water reserves a) JBLM assets: well, tanker b) Navy assets: desalination and reverse osmosis capabilities (ship dependent) c) Commercial vessels	√	√	*Adapt*			
C. Power	12. Consider transferring stable inpatients to outpatient dialysis centers for dialysis treatments and vice versa	√	√	*Substitute* *Adapt*			
	13. Consider transferring inpatients or outpatients to other hospitals or facilities out of the affected region until issues have been resolved.	√	√				
D. Supplies	**Dialysis Catheters, Machines, Reverse Osmosis Machines, and/or Other Supply Shortages** 14. Maintain adequate stock of dialysis tubing sets and venous/peritoneal access catheters (Quinton, etc.) and medications (e.g. Kayexalate)	√	√	*Prepare*			
	15. Identify other sources of supplies and machines	√	√				
	16. Transfer machines/supplies between outpatient centers and hospitals, or between hospitals	√	√	*Substitute*			
E. Staff	17. Consider alternative staffing assignments with the following recommendations: **Alternative Staff Recommendations** *(listed in order of consideration)* **Dialysis Techs**: 1. Former Dialysis Techs who are now techs in other specialties; 2. General Nurse with prior dialysis experience. **Dialysis Nurses**: 1. General RN or Transplant RN with previous HD[1] or PD[2] experience; 2. Critical Care nurse with a dialysis training; 3. Critical Care Nurse with no dialysis experience and JIT[3]; 4. General nurse with JIT **MDs (Nephrologist)**: 1. Telemedicine nephrologist; 2. Retired nephrologist who has maintained medical license; 3. ARNPs/PAs trained in dialysis; 4. Critical Care MD with experienced dialysis nurse and JIT training.; 5. Dialysis nurse with extensive inpatient dialysis experience [1]Hemodialysis [2]Peritoneal Dialysis [3]Just-in-time Training (i.e. video, written instructions, handbook, etc.)			*Substitute*			
F. Treatment	**Crush Syndrome** 18. Initiate normal saline IV hydration and acidosis prevention protocols immediately either pre-hospital or as soon as possible upon arrival to a healthcare facility to prevent/treat rhabdomyolysis. Additional treatment recommendations: a) avoid nephrotoxic agents such as NSAIDS, aminoglycosides, ACE/ARB's along with other drugs which may cause hyperkalemia b) aggressive monitoring and treatment of potential hyperkalemia c) close monitoring of fluid status.	√		*Conserve*			

AMERICAN OVERSIGHT

©2020 Northwest Healthcare Response Network.

	Mode of Dialysis 19. Optimize the mode of dialysis to provide care for the most patients possible given resources available a) if water is scarce, consider PD and CRRT as modes of dialysis b) if water is readily available restrict to HD or PD and discontinue CRRT for staff considerations.	√	√	*Substitute*			
	Increased Demand on Resources 20. Shorten duration of dialysis for patients that are more likely to tolerate it safely	√	√	*Conserve*			
	21. Patients to utilize their home "kits" of medication (Kayexalate) and follow dietary plans to help increase time between treatments.		√				
G. Triage	**Insufficient Resources Available For All Patients Requiring Dialysis** 22. Change dialysis from 'scheduled' to 'as needed' based on clinical and laboratory findings (particularly hyperkalemia and impaired pulmonary function) – parameters may change based on demand for resources	√	√	*Conserve*			
	23. Conceivable (but extraordinary) situations may occur where resources are insufficient to the point that some patients may not be able to receive dialysis (for example, pandemic when demand nationwide exceeds available resources). Prioritization should follow the Crisis RRT Triage Algorithm and Worksheet. In multi-organ system failure (MOSF) refer to the Adult/Pediatric Critical Care Triage Algorithm and Worksheet.	√	√	*Re-allocate*

PARTICULATE RESPIRATORS[1] AND GENERAL PPE
(N95, Elastomeric, PAPR, CAPR)
STRATEGIES FOR SCARCE RESOURCE SITUATIONS

Conventional Capacity – The spaces, staff, and supplies used are consistent with daily practices within the institution. These spaces and practices are used during a major mass casualty incident that triggers activation of the facility emergency operations plan.	**Contingency Capacity** – The spaces, staff, and supplies used are not consistent with daily practices, but provide care to a standard that is functionally equivalent to usual patient care practices. These spaces or practices may be used temporarily during a major mass casualty incident or on a more sustained basis during a disaster (when the demands of the incident exceed community resources)	**Crisis Capacity** – Adaptive spaces, staff, and supplies are not consistent with usual standards of care, but provide sufficiency of care in the setting of a catastrophic disaster (i.e., provide the best possible care to patients given the circumstances and resources available). Crisis capacity activation constitutes a significant and adjustment to standards of care (Hick et al, 2009).

RECOMMENDATIONS	***Strategy***	***Conventional***	***Contingency***	***Crisis***
General Infection Control Procedures • 1. Screen all patients for symptoms specific to current situation and keep updated to any changing screening recommendations • 2. At healthcare facilities where patients have scheduled appointments, consider screening prior to arrival to limit exposure and resources • 3. Establish procedures for managing visitors and ill healthcare personnel. • 4. Establish triage procedures and separate areas for ill and well patients. • 5. Assign dedicated staff to minimize exposure. • 6. Require, when possible, or strongly encourage vaccination of primary personnel and first responders, according to vaccine schedule as recommended for existing circumstances by the CDC and the Advisory Committee for Immunization Practices (ACIP). • 7. Seriously consider creation of a registry to reflect the vaccination status of primary personnel and first responders to aid in decisions regarding service assignments. • 8. Educate and routinely train all staff regarding appropriate use and proper donning and doffing procedures of PPE and particulate respirators. • 9. Maintain good hand hygiene procedures including gloves, hand washing with soap and water and/or alcohol based hand sanitizers depending on the current recommendations. • 10. Maintain plan for N95 Fit Testing **Engineering Controls** • 11. When applicable to specific institution consider designing and installing engineering controls to reduce or eliminate exposure by shielding healthcare providers and other patients from infection individuals. Examples of engineering controls include physical barriers or partitions to guide patients through triage areas, curtains between patients in shared areas, closed suctioning systems for airway suctioning for intubated patients, as well as appropriate air-handling systems (with appropriate directionality, filtration, exchange rate, etc.) that are installed and properly maintained. **Cache/ Increase Supply Levels** • 12. Clarify current CDC and OSHA guidelines for respirator and other PPE use; monitor for updates and recommendations.[2] • 13. Cache additional supplies of PPE and respirators and their functional components (e.g. fit testing supplies, batteries, cartridges, filters, hoods etc.). • 14. Review vendor agreements, contingencies for delivery and production, including alternate vendors. • 15. Consider other NIOSH approved respirators in times of short supply (e.g. These include N99, N100, P95, P99, P100, R95, R99, and R100.)[5] • 16. Review current supply of PPE and determine baseline and surge burn rates to better plan supply needs. • 17. Maintain a reserve sufficient to meet estimated needs of PPE for all infectious diseases. • 18. Review cached PPE on a regular basis for expirations dates and consider replacing/updating caches by rotating PPE into daily use	*Prepare*			
• 19. Obtain masks, cartridges and other PPE from alternate sources such as industrial suppliers and companies – welding, manufacturing, etc. – as indicated.	*Substitute*			

AMERICAN OVERSIGHT

©2020 Northwest Healthcare Response Network.

• 20. Request Strategic National Stockpile of respirators with the knowledge that they may be from different manufacturers. They may not be functional in all situations (i.e. surgical use) and they may require additional fit testing before deployment. • 21. Do not discard unused expired PPE; submit for extension through *** (?NIOSH? CDC?)				
Decrease Use of PPE • 22. Clarify current CDC, OSHA and NIOSH guidelines for PPE use; monitor for updates and recommendations.[2,3] • 23. Medical/surgical masks can be reused by infected patients until the masks are no longer useable due to moisture or damage.	*Substitute & Conserve*			
• 24. When PPE, especially Respirators are in short supply, aerosol-generating procedures should only be performed on patients when medically necessary and cannot be postponed. • 25. Limit the number of healthcare personnel with patient contact to only those essential for patient care and support, especially during aerosol generating procedures. • 26. Consider primary use of PAPRs, CAPRs Elastomeric or other Respirators to conserve on N95 masks • 27. Ensure staff are educated and understand specific PPE requirements during current situations so as not to *overuse* PPE • 28. Develop specific protocols for PPE distribution so as to ensure PPE is being used responsibly • 29. Cohort patients with known disease to limit donning and doffing of PPE • 30. Consider limiting visitors • 31. Consider changes in staffing (i.e. unimmunized staff given assignments that would not require significant PPE use)	*Conserve*			
Respirator Extended Use[6] • 32. Clarify current CDC and OSHA guidelines for respirator use; monitor for updates and recommendations.[6] • 33. Policies and recommendations around "extended use" or "re-use" of respirators should include input from occupational health, infection control, infectious disease specialists, state and local public health and any national recommendations around the situation at hand. • 34. For N95, consider wearing a loose-fitting barrier that does not interfere with fit or seal (e.g., surgical mask, face shield) over the respirator to extend its use. • 35. In general, wearing an N95 respirator over multiple serial patient encounters (while minimizing touching) is favored over removing and re-donning between encounters (i.e. extended use is favored over re-use of N95).[3] • 36. Cleaning and filter replacement procedures and extended use of filters and/or hoods/shields on all other mechanical respirators (i.e. elastomeric respirators, PAPRs , CAPRs etc.) should be done according to manufacturer's protocols and guidelines.	*Re-use*			
Re-use Respirator After Removal[6] • 37. Clarify current CDC and OSHA guidelines for respirator use; monitor for updates and recommendations.[6] • 38. Review manufacturer recommendations for cleaning and re-using PAPRs and CAPR face shields when appropriate. • 39. Policies and recommendations around "extended use" or "re-use" of respirators should include input from occupational health, infection control, infectious disease specialists, state and local public health and any national recommendations around the situation at hand.	*Re-use* *Re-allocate*			
• 40. Use and store used respirators (hood, mask, shield) individually in such a way that the physical integrity and efficacy of the respirator will not be compromised.[6] • 41. Label respirator with a user's name before use to prevent inadvertent use by another individual.[6] • 42. Practice appropriate hand hygiene before and after removal of the respirator and, if necessary and possible, appropriately disinfect the object used to store it.[6] • 43. Respirators should be discarded if visibly damaged or contaminated.[6] • 44. The specific number of safe reuses for N95's is very difficult to estimate. In general check the specific N95 manufacturer recommendations. In general Five (5) is the recommended number of donning of a re-used N95-type respirator.[6] • 45. Consider N95 decontamination with ultraviolet germicidal irradiation (UVGI), or other tested method of decontamination to extend the use of respirators.[4] **Re-allocate/ prioritize** • 46. Respirators use should be prioritized only to those healthcare providers identified as highest risk based on epidemiology of current situation. • 47. Identify medical personnel and caregivers with documented vaccination, immunity after an illness or lower risk of complicated infection to provide direct patient contact without a respirator.	*Re-use* *Re-allocate*

STAFFING

STRATEGIES FOR SCARCE RESOURCE SITUATIONS

Conventional Capacity – The spaces, staff, and supplies used are consistent with daily practices within the institution. These spaces and practices are used during a major mass casualty incident that triggers activation of the facility emergency operations plan.	**Contingency Capacity** – The spaces, staff, and supplies used are not consistent with daily practices, but provide care to a standard that is functionally equivalent to usual patient care practices. These spaces or practices may be used temporarily during a major mass casualty incident or on a more sustained basis during a disaster (when the demands of the incident exceed community resources)	**Crisis Capacity** – Adaptive spaces, staff, and supplies are not consistent with usual standards of care, but provide sufficiency of care in the setting of a catastrophic disaster (i.e., provide the best possible care to patients given the circumstances and resources available). Crisis capacity activation constitutes a significant and adjustment to standards of care (Hick et al, 2009).

RECOMMENDATIONS	***Strategy***	***Conventional***	***Contingency***	***Crisis***
Staff and Supply Planning • Assure facility has process and supporting policies for disaster credentialing and privileging - including degree of supervision required, clinical scope of practice, mentoring and orientation, and verification of credentials. • Encourage employee personal preparedness planning (ready.gov, redcross.org). • Cache adequate personal protective equipment (PPE) and support supplies. • Educate staff on facility disaster response and recommend regularly scheduled HICS training. • Educate staff on community, regional and state disaster plans and resources. • Develop facility plans addressing staff's family / pets or staff shelter needs (such as daycare and unaccompanied minor needs) as well as transportation plans for staff to get to and from the facility. • Include a process of staff identification and verification. Recommend photos and hard-copy files. • Create Job Cards for essential services and functions. • Pre-identify critical positions and ensure redundant staffing for these. • Recommend redundant staff communications and notification plans/procedures.	*Prepare*			
Focus Staff Time on Core Clinical Duties • Minimize meetings and relieve administrative responsibilities not related to event. • Cohort inpatients per OSHA/Public Health or CDC guidelines.	*Conserve*			
• Reduce documentation requirements.	*Adapt*			
Using Supplemental Staff • Utilize administrative positions (e.g. nurse managers) as patient care extenders. • Adjust personnel work schedules (longer but less frequent shifts, etc.) if this will not result in skill / PPE compliance deterioration. • Voluntary call-back of staff • Increase use of agency, per diem, travelers, float pools, locums staff • Retain staff for extended hours (in accordance with labor contract and existing contracts/agreements when applicable) • Use family members/lay volunteers to provide basic patient hygiene and feeding – releasing staff for other duties. • Postpone and reschedule out-patient non-acute and preventative care appointments to open more acute care out-patient appointments during surge.	*Substitute* *Adapt*			
Focus Staff Expertise on Core Clinical Needs • Personnel with specific critical skills (ventilator, burn management) should concentrate on those skills; specify job duties that can be safely performed by other medical professionals. • Reduce availability of non-time sensitive laboratory, radiographic, and other studies. • Postpone and reschedule elective procedures if it will improve staffing and space needs and does not result in undue patient inconvenience	*Conserve*			
• Have specialty staff oversee larger numbers of differently specialized staff and patients (for example, medical/surgery nurses working in critical care are overseen by a critical care nurse).	*Substitute* *Conserve*			
Use Alternative Personnel to Minimize Changes to Standards of Care • Bring in equally trained staff (burn or critical care nurses, Disaster Medical Assistance Team [DMAT], other health system or Federal sources). • Cancel all non-acute/preventative care appointments, surgeries and procedures (e.g. endoscopies, etc.) and divert staff to emergency duties including in-hospital or assisting public health at external clinics/screening/dispensing sites.	*Adapt*			

AMERICAN OVERSIGHT

©2020 Northwest Healthcare Response Network.

• Use less trained personnel from outside institution with appropriate mentoring and just-in-time education (e.g., healthcare trainees or other health care workers, Medical Reserve Corps, retirees). • Implement alternate consultation and care techniques such as telemedicine. • Provide just-in-time training for specific skills.

ADULT Critical Care Triage Algorithm

Crisis Standards of Care

Updated Version: Mar 2020

This Algorithm is intended to be used alongside the attached Worksheet.
Answering each question requires the supplemental information in the Worksheet.
Please use them together

Assumptions for use:

1. Health Officer has declared a crisis situation requiring scarce resource management and crisis standards of care, where crisis standards of care is defined as *"a substantial change in usual healthcare operations and the level of care it is possible to deliver which is made necessary by a pervasive or catastrophic disaster"*.[1]
2. Healthcare systems are overwhelmed despite maximizing all possible surge and mitigation strategies impacting the space and/or staff and/or supplies needed to deliver usual levels of care.

Washington State has adopted and will use the ethical framework developed by the National Academy of Medicine, which stresses the importance of an ethically grounded system to guide decision-making in a crisis standards of care situation. All decisions and communications will be based on the ethical principles below. The National Academy of Medicine defines these ethical principles as:

- **Fairness** – Standards that are, to the highest degree possible, recognized as fair by those affected by them – including the members of affected communities, practitioners, and provider organizations, evidence based and responsive to specific needs of individuals and the population.
- **Duty to care** – Standards are focused on the duty of healthcare professionals to care for patients in need of medical care.
- **Duty to steward resources** – healthcare institutions and public health officials have a duty to steward scarce resources, reflecting the utilitarian goal of saving the greatest possible number of lives.
- **Transparency** – in design decision making, and information sharing.
- **Consistency** – in application across populations and among individuals regardless of their human condition (e.g. race, age disability, ethnicity, ability to pay, socioeconomic status, preexisting health conditions, social worth, perceived obstacles to treatment, past use of resources).
- **Proportionality** – public and individual requirements must be commensurate with the scale of the emergency and degree of scarce resources.
- **Accountability** – of individual decisions and implementation standards, and of governments for ensuring appropriate protections and just allocation of available resources.[2]

ADULT Critical Care Triage Worksheet

Critical Care Guidelines During Crisis Capacity[1]

This Worksheet, along with the corresponding Adult Critical Care Algorithm, are to be used by "Triage Teams" during a declared emergency event whereby an appropriate healthcare official has implemented crisis standards of care. It is recommended that a "Triage Team" be comprised of senior medical personnel, preferably not those primarily taking care of the individual patient under consideration. Please see "Scarce Resource Triage Team Guidelines" for further information.

STEP 1: Screen adult patients for ICU care during scarce resources

Proceed to following after reviewing patient's end of life directives/POLST or similar living will documents. For the following conditions consider available staffing and resources. If resources are inadequate, ***consider*** transferring the following patients to out-patient or palliative care with appropriate resources and support as can be provided.

1. Pre-existing or Persistent coma or vegetative state
2. Severe acute trauma (e.g. non-survivable head injury)
3. Severe burns with Low Survival burn scores based on the Triage Decision for Burn Victims table (See Table A below). See Burn Scarce Resource Card for management of critical burn patient outside of a Burn Center.
4. Significant underlying disease process that predict poor short term survival*

   **Examples of underlying diseases that predict poor short-term survival, despite standard treatment, include but are not limited to:*
   - *Severe congestive heart failure*
   - *Severe chronic lung disease*
   - *Central nervous system, solid organ or hematopoietic malignancy with poor prognosis for recovery*
   - *Severe cirrhotic liver disease with multi-organ dysfunction*
5. Baseline functional status (consider loss of reserves in energy, physical ability, cognition and general health)

©2020 Northwest Healthcare Response Network.

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005497

STEP 2: Determine if patient meets ICU Inclusion Criteria

2A: Patients must have at least one of the following INCLUSION CRITERIA:

- ☐ **1.** Requires ventilatory support, either invasive or non-invasive
  - ☐ Clinical evidence of impending respiratory failure
    - *Refractory hypoxemia (SpO2<90% on FIO2>0.85)*
    - *Respiratory acidosis (pH<7.2)*
  - ☐ Inability to protect or maintain airway
- ☐ **2.** Hypotension (SBP <90) secondary to either an acute medical or trauma condition, with clinical evidence of shock (altered level off consciousness decreased urine output, or other evidence of end stage organ failure) refractory to volume resuscitation that cannot be managed in a non-ICU setting.

2B: To determine critical care resource allocation the following should be considered:

- Expected duration of need of critical care resource
- Prognosis with consideration to both current epidemiology and underlying illness*
- Response to current treatment
- Degree of Organ Dysfunction as measured by the MSOFA (Modified Sequential Organ Failure Assessment Score) - *Please see Step 6 regarding use of scoring system*
- Baseline functional status (consider loss of reserves in energy, physical ability, cognition and general health)

**Examples of underlying diseases that predict poor short-term survival, despite standard treatment, include but are not limited to:*

- *Severe congestive heart failure*
- *Severe chronic lung disease*
- *Central nervous system, solid organ or hematopoietic malignancy with poor prognosis for recovery*
- *Severe cirrhotic liver disease with multi-organ dysfunction*

STEP 4: Assess for re-allocation of Critical Care Resource

To determine critical care resource allocation the following should be considered:

- Expected duration of need of critical care resource
- Prognosis with consideration to both current epidemiology and underlying illness*
- Response to current treatment
- Degree of Organ Dysfunction as measured by the MSOFA (Modified Sequential Organ Failure Assessment Score) – *Please see Step 6 regarding use of scoring systems*
- Baseline functional status (consider loss of reserves in energy, physical ability, cognition and general health)

**Examples of underlying diseases that predict poor short-term survival, despite standard treatment, include but are not limited to:*

- *Severe congestive heart failure*
- *Severe chronic lung disease*
- *Central nervous system, solid organ or hematopoietic malignancy with poor prognosis for recovery*
- *Severe cirrhotic liver disease with multi-organ dysfunction*

AMERICAN OVERSIGHT
©2020 Northwest Healthcare Response Network.

FL-DOH-20-0673-A-005498

STEP 5: Critical care waiting list

If a patient meets ICU inclusion criteria and resources are not available, patient will be placed on an ICU waiting list. As resources become available their clinical situation will be re-assessed and they will be re-triaged based on criteria outlined in Step 6. If a clear distinction cannot be made between patients of similar triage priority, the resource will be allocated to the patient who has been waiting the longest.

STEP 6: Admit to ICU

Patient data collection outlined on Step 6 of the Algorithm will be continuous and ongoing. It is recommended that every 24 hours of a patient's ICU stay, their clinical condition will be reviewed and they will be determined to be "Improving", "Unchanged" or "Worsening". This determination must not only take into account data points as outlined in Step 6 but must also include updated epidemiology, critical care resource availability and census demands.

Previously, recommendations had been made to use MSOFA score alone to determine triage categories. However, based on more recent data[2,3] it is current consensus that a specific SOFA or MSOFA score cannot accurately define clinical categories alone, and therefore all criteria outlined in Step 6 including current epidemiology must be taken into account when deciding if patients are "Improving," "Unchanged," or "Worsening".

Other Adult Considerations

All patients receiving critical care ***before the onset*** of crisis standards will be re-assessed based on the same criteria as all incoming critical care patients. The same Data as outlined in Step 6 should be obtained and resources re-allocated if needed dependent on the Triage Team assessment and decisions.

The use of ECMO should be decided on an individual basis by the ICU attending, nursing supervisor and ECMO representative based on prognosis, suspected duration of ECMO, availability of staff and other resources.

1. Crisis Capacity: Adaptive spaces, staff and supplies are not consistent with usual standards of care, but provide sufficiency of care in the setting of a catastrophic disaster (i.e. provide the best possible care to patients given the circumstances and resources available). Crisis capacity activation constitutes a significant adjustment to standards of care. (Hick et al, 2009, IOM)

Pediatric Critical Care Triage Algorithm

Crisis Standards of Care

Updated Version: Mar 2020

This Algorithm is intended to be used alongside the attached Worksheet.
Answering each question requires the supplemental information in the Worksheet.
*****Please use them together.*****

Assumptions for use:

1. Health Officer has declared a crisis situation requiring scarce resource management and crisis standards of care, where crisis standards of care is defined as *"a substantial change in usual healthcare operations and the level of care it is possible to deliver which is made necessary by a pervasive or catastrophic disaster"*.[1]
2. Healthcare systems are overwhelmed despite maximizing all possible surge and mitigation strategies impacting the space and/or staff and/or supplies needed to deliver usual levels of care.

Washington State has adopted and will use the ethical framework developed by the National Academy of Medicine, which stresses the importance of an ethically grounded system to guide decision-making in a crisis standards of care situation. All decisions and communications will be based on the ethical principles below. The National Academy of Medicine defines these ethical principles as:

- **Fairness** – Standards that are, to the highest degree possible, recognized as fair by those affected by them – including the members of affected communities, practitioners, and provider organizations, evidence based and responsive to specific needs of individuals and the population.
- **Duty to care** – Standards are focused on the duty of healthcare professionals to care for patients in need of medical care.
- **Duty to steward resources** – healthcare institutions and public health officials have a duty to steward scarce resources, reflecting the utilitarian goal of saving the greatest possible number of lives.
- **Transparency** – in design decision making, and information sharing.
- **Consistency** – in application across populations and among individuals regardless of their human condition (e.g. race, age disability, ethnicity, ability to pay, socioeconomic status, preexisting health conditions, social worth, perceived obstacles to treatment, past use of resources).
- **Proportionality** – public and individual requirements must be commensurate with the scale of the emergency and degree of scarce resources.
- **Accountability** – of individual decisions and implementation standards, and of governments for ensuring appropriate protections and just allocation of available resources.[2]

Pediatric Critical Care Triage Worksheet

Critical Care Guidelines During Crisis Capacity[1]

Updated Version: Mar 2020

This Worksheet, along with the corresponding Pediatric Critical Care Algorithm, are to be used by "Triage Teams" during a declared emergency event whereby an appropriate healthcare official has implemented crisis standards of care. It is recommended that a "Triage Team" be comprised of senior medical personnel, preferably not those primarily taking care of the individual patient under consideration. Please see "Scarce Resource Triage Team Guidelines" for further information.

STEP 1: Screen Pediatric Patients for ICU care During Scarce Resources

Proceed to the following after reviewing goals of care with patient and family (e.g. limited code status). The goals of care should reflect the best interest of the patient.

For the following conditions consider available staffing and resources. If resources are inadequate, consider transferring the following patients to out-patient or palliative care with appropriate resources and support as can be provided.

- ☐ **1.** Pre-existing or Persistent encephalopathy, coma or vegetative state
- ☐ **2.** Severe acute trauma (e.g. non-survivable head injury)
- ☐ **3.** Severe burns with Low Survival burn scores based on the Triage Decision for Burn Victims table (See Table A). See Burn Scarce Resource Card for management of critical burn patient outside of a Burn Center.
- ☐ **4.** Significant underlying disease process that predict poor short term survival*

**Examples of underlying diseases that predict poor short-term survival, despite standard treatment, include but are not limited to:*

- *Known severe chromosomal abnormalities with poor prognosis*
- *Known severe metabolic, neuromuscular, cardiac, oncologic or pulmonary disease with poor prognosis*
- *Extreme prematurity at the limits of viability*

©2020 Northwest Healthcare Response Network.

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005503

STEP 2: Determine if patient meets ICU Inclusion Criteria

2A: Patients must have at least one of the following INCLUSION CRITERIA:

☐ **1.** Requires ventilatory support, either invasive or non-invasive

- ☐ Clinical evidence of impending respiratory failure
  - *Refractory hypoxemia (SpO2<90% on FIO2>0.85)*
  - *Respiratory acidosis (pH<7.2)*
- ☐ Inability to protect or maintain airway

☐ **2.** Hypotension (see table A) or clinical evidence of shock (defined as an altered level of consciousness, decreased urine output, or other evidence of end stage organ failure) refractory to volume resuscitation secondary to either an acute medical or trauma condition that cannot be managed in a non-ICU setting.

Age	SBP (mmHG)
0-28 days	<60
1 month – 1 year	<70
1 year – 10 years	(age in years x 2) + 70
>10 years	<90

Table A[2]

2B: To determine critical care resource allocation the following should be considered:

- Expected duration of need of critical care resource
- Prognosis with consideration to both current epidemiology and underlying illness*
- Response to current treatment
- Degree of Organ Dysfunction as measured by the Pediatric Logistic Organ Dysfunction (PELOD 2) score. **(Table C) – *Please see Step 6 regarding use of scoring systems.***

**Examples of underlying diseases that predict poor short-term survival, despite standard treatment, include but are not limited to:*

- *Known severe chromosomal abnormalities with poor prognosis*
- *Known severe metabolic, neuromuscular, cardiac, oncologic or pulmonary disease with poor prognosis*
- *Extreme prematurity at the limits of viability*

STEP 4: Assess for re-allocation of Critical Care Resource

To determine critical care resource allocation the following should be considered:

- Expected duration of need of critical care resource
- Prognosis with consideration to both current epidemiology and underlying illness*
- Response to current treatment
- Degree of Organ Dysfunction as measured by the Pediatric Logistic Organ Dysfunction (PELOD 2) score. **(Table C) – *Please see Step 6 regarding use of scoring systems.***

**Examples of underlying diseases that predict poor short-term survival, despite standard treatment, include but are not limited to:*

- *Known severe chromosomal abnormalities with poor prognosis*
- *Known severe metabolic, neuromuscular, cardiac, oncologic or pulmonary disease with poor prognosis*
- *Extreme prematurity at the limits of viability*

AMERICAN OVERSIGHT
©2020 Northwest Healthcare Response Network.

FL-DOH-20-0673-A-005504

STEP 5: Critical care waiting list

If a patient meets ICU inclusion criteria and resources are not available, patient will be placed on an ICU waiting list. As resources become available their clinical situation will be re-assessed and they will be re-triaged based on criteria outlined in Step 6. If a clear distinction cannot be made between patients of similar triage priority, the resource will be allocated to the patient who has been waiting the longest.

STEP 6: Admit to ICU

Patient data collection outlined on Step 6 of the Algorithm will be continuous and ongoing. It is recommended that every 24 hours of a patient's ICU stay, their clinical condition will be reviewed and they will be determined to be "Improving", "Unchanged" or "Worsening". This determination must not only take into account data points as outlined in Step 6 but must also include updated epidemiology, critical care resource availability and census demands.

Pediatric prognostic scoring systems currently available (e.g. PELOD2) are unable to accurately predict patient outcomes and thus should not be used as a sole indicator of prognosis especially in a disaster situation. When considering critical care resource allocation in a crisis, it is recommended that decisions be made by a Triage Team. Decisions should be made based on best clinical judgment with full knowledge of regional resource availability. (Ped Crit Care 2011)

Other Pediatric Considerations

All patients receiving critical care ***before the onset*** of crisis standards will be re-assessed based on the same criteria as all incoming critical care patients. The same Data as outlined in Step 2 should be obtained and resources re-allocated if needed dependent on the Triage Team assessment and decisions.

The use of ECMO should be decided on an individual basis by the PICU and/or NICU attending, nursing supervisor and ECMO representative based on prognosis, suspected duration of ECMO, availability of staff and other resources.

Table C. PELOD2 Scoring System[3]

Organ Dysfunctions and Variables[a]	Points by Severity Levels						
	0	1	2	3	4	5	6
Neurologic[b]							
Glasgow Coma Score	≥ 11	5–10			3–4		
Pupillary reaction	Both reactive					Both fixed	
Cardiovascular[c]							
Lactatemia (mmol/L)	< 5.0	5.0–10.9			≥ 11.0		
Mean arterial pressure (mm Hg)							
0 to < 1 mo	≥ 46		31–45	17–30			≤ 16
1–11 mo	≥ 55		39–54	25–38			≤ 24
12–23 mo	≥ 60		44–59	31–43			≤ 30
24–59 mo	≥ 62		46–61	32–44			≤ 31
60–143 mo	≥ 65		49–64	36–48			≤ 35
≥ 144 mo	≥ 67		52–66	38–51			≤ 37
Renal							
Creatinine (µmoL/L)							
0 to < 1 mo	≤ 69		≥ 70				
1–11 mo	≤ 22		≥ 23				
12–23 mo	≤ 34		≥ 35				
24–59 mo	≤ 50		≥ 51				
60–143 mo	≤ 58		≥ 59				
≥ 144 mo	≤ 92		≥ 93				
Respiratory[d]							
Pao_2 (mm Hg)/Fio_2	≥ 61		≤ 60				
$Paco_2$ (mm Hg)	≤ 58	59–94		≥ 95			
Invasive ventilation	No			Yes			
Hematologic							
WBC count (× 10^9/L)	> 2		≤ 2				
Platelets (× 10^9/L)	≥ 142	77–141	≤ 76				

[a]All variables must be collected, but measurements can be done only if justified by the patient's clinical status. If a variable is not measured, it should be considered normal. If a variable is measured more than once in 24 hr, the worst value is used in calculating the score. Fio_2: fraction of inspired oxygen.

[b]Neurologic dysfunction: Glasgow Coma Score: use the lowest value. If the patient is sedated, record the estimated Glasgow Coma Score before sedation. Assess only patients with known or suspected acute central nervous system disease. Pupillary reactions: nonreactive pupils must be > 3 mm. Do not assess after iatrogenic pupillary dilatation.

[c]Cardiovascular dysfunction: Heart rate and mean arterial pressure: do not assess during crying or iatrogenic agitation.

[d]Respiratory dysfunction: Pao_2: use arterial measurement only. Pao_2/Fio_2 ratio is considered normal in children with cyanotic heart disease. $Paco_2$ can be measured from arterial, capillary, or venous samples. Invasive ventilation: the use of mask ventilation is not considered invasive ventilation.

Logit (mortality) = −6.61 + 0.47 × PELOD-2 score.

Probability of death = 1/(1 + exp [−logit(mortality)]).

CRITICAL CARE MEDICINE

1. Crisis Capacity: Adaptive spaces, staff and supplies are not consistent with usual standards of care, but provide sufficiency of care in the setting of a catastrophic disaster (i.e. provide the best possible care to patients given the circumstances and resources available). Crisis capacity activation constitutes a significant adjustment to standards of care. (Hick et al, 2009)

Scarce Resource Triage Team Guidelines

To be used in conjunction with Scarce Resource Algorithms during Crisis Standards of Care

Updated: Mar 2020

Introduction

In the event of a large scale disaster—either a no notice event such as a natural disaster or a prolonged situation such as a pandemic—there is the potential for an overwhelming number of critically ill or injured patients. In these situations, certain medical resources may become scarce and prioritization of care may need to be considered.

In 2009 the Institute of Medicine (currently the National Academy of Medicine) published a landmark report, Guidance for Establishing Crisis Standards of Care for use in Disaster Situation: A Letter Report. In this report the authors defined surge capacity as a continuum from conventional to contingency and finally crisis. This framework has been nationally accepted and adopted. The definition of "Crisis Capacity" as set by the NAM, is a situation where space, staff and supplies "are not consistent with usual standards of care, but provide sufficiency of care in the context of a catastrophic disaster (i.e., provide the best possible care to patients given the circumstances and resources available)."[1]

The content of this document is based on a thorough review of the literature, guidelines published by leading national healthcare specialty colleges and societies, recommendations of the National Academy of Medicine and detailed discussion and deliberation by the WA State Disaster Medical Advisory Committee (DMAC), the Disaster Clinical Advisory Committee (DCAC) Central District and included input from both local and state Community Engagement Reports.[2,3]

This document is to be used in conjunction with the DOH Scarce Resource Triage Algorithms which were developed by regional workgroups of Subject Matter Experts (SME), and approved by the Disaster Clinical Advisory Committee (DCAC) Central District. Implementation of these algorithms depends upon the development of individual Crisis Standards of Care Hospital, Hospital System, and Regional Triage Teams as outlined below.

Purpose

To provide a transparent, fair, equitable, and consistent approach to allocation of scarce resources during a declared emergency in which Crisis Standards of Care (CSC) has been implemented.

Scope

All healthcare organizations and providers within the affected region of the CSC declaration.

Assumptions

- A Health Officer has declared a crisis situation and crisis standards of care has been activated.
- Healthcare systems are overwhelmed despite maximizing all possible surge and mitigation strategies impacting the space and/or staff and/or supplies needed to deliver usual levels of care
- Federal assets have been requested but may be delayed.

Implementation Recommendations

A. General

All healthcare organizations within the affected region agree to implement a uniform triage process as outlined in this document to be used along with the DOH Scarce Resource Triage Algorithms to include: Adult Critical Care, Pediatric Critical Care and Renal Replacement Therapy (pending) Algorithms.

B. CSC Triage Teams: Identification and Composition

1. **CSC Hospital Clinical Triage Team**

   It is recommended that every in-patient healthcare institution have a CSC Hospital Clinical Triage Team which will report to the Medical Care Branch Director (or equivalent position within organization's command structure) during activation of HICS.

   a. It is recommended the CSC Hospital Clinical Triage Team

      - At least 2-3 senior clinicians with experience in tertiary triage (e.g. Critical Care, Emergency Medicine, Trauma Surgery, etc.), with one designated as Lead Triage Officer who oversees all Triage processes.
      - 1 medical ethicist
      - When possible clinicians on the Triage Team will not be primary providers of the patients under consideration
      - When patients requiring a scarce resource fall under a specific specialty such as burn, trauma, pediatrics, etc. then all attempts will be made to consult that specialty either in person or remotely during consideration

   b. All patients presented to the CSC Hospital Clinical Triage Team will be recorded in a CSC Hospital Clinical Triage Team Log, which will include:

      - Date and time of referral
      - Name of referring clinician and contact information
      - Patient identifiers: These should include only date of birth and sex. Patient's name and other demographic data should not be considered by the Triage Team. Hospital specific MRN should be notated to confirm patient identification but should not be made available to the Triage Team
      - All clinical information presented to the Triage Team at the time of decision
      - Triage Team decision, date and time of the decision, and all supporting documentation reviewed and produced for the decision
      - If patient is referred, date and time of referral and contact information of receiving Clinical Triage Team
      - Patient outcome (if known)

   c. If the patient requires referral outside an individual hospital and the hospital is part of a wider hospital system please see Section 2. If the hospital is not part of a larger hospital system then please refer to Section 3.

   d. It is recommended the CSC Hospital Clinical Triage Team follow the communication guidelines outlined in this document in order to maintain accurate and up to date situational awareness.

2. **Hospital systems during CSC**

   It is recommended every Hospital System maintain good communications between individual hospitals in their system to assist in situational awareness for the scarce resource in question. It is recommended that every hospital system have a mechanism by which a critical resource can be maximized and distributed throughout their system and that all appropriate channels have been exhausted to obtain additional resources. When a specific healthcare facility within a hospital system lacks a specific resource, identifying that resource within their system should be the first step in patient placement. This would be managed by the CSC Hospital System Triage Team.

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005508

a. All patients presented to the CSC Hospital System Triage Team will be recorded in a CSC Hospital System Triage Team Log, which will include:
   - Date and time of referral
   - Name of referring clinician and contact information
   - Patient identifiers: These should include only date of birth and sex. Patient's name and other demographic data should not be considered by the Triage Team. Hospital specific MRN should be notated to confirm patient identification but should not be made available to Triage Team.
   - All clinical information presented to the Triage Team at the time of decision
   - Triage Team decision, date and time of the decision, and all supporting documentation reviewed and produced for the decision
   - If patient is referred to the Regional Triage Team, date and time of referral and contact information of receiving Regional Triage Team
   - Patient outcome (if known)

b. Those patients who cannot be managed within their system will need to be presented to the CSC Regional Clinical Triage Team for consideration and prioritization within a different hospital system.

3. CSC Regional Clinical Triage Team

It is recommended a CSC Regional Clinical Triage Team manage prioritization and placement of patients in need of a scarce resource in the affected geographic region who cannot be managed within a specific hospital system.

It is recommended the CSC Regional Clinical Triage Team fairly represent the healthcare facilities and systems within the region. If a region has developed a healthcare coalition DCAC then it is recommended that members of the CSC Regional Triage team be determined in coordination with local DCAC, State DMAC, LHO, other Public Health experts, outside SME's, etc. and can consist of members from the local DCAC, healthcare executives or the clinical community at large.

If a region does not have a local DCAC then CSC Regional Clinical Triage Team members will be determined by the State DMAC in coordination with the SHO, LHO, other Public Health experts, outside SME's, etc. and can consist of members from the DMAC, healthcare executives or the clinical community at large. Recommended members of the CSC Regional Clinical Triage Team are as follows:

- Senior clinicians with experience in tertiary triage (e.g. Critical Care, Emergency Medicine, Trauma Surgery, etc.), with one designated as Lead Triage Officer who oversees all Triage processes.
- 1 medical ethicist
- When possible, clinicians on the CSC Regional Clinical Triage Team will not be primary providers of the patients under consideration, nor members of the referring CSC Hospital or Hospital System Clinical Triage Team(s).
- When patients requiring a scarce resource fall under a specific specialty such as burn, trauma, pediatrics, etc. then all attempts will be made to consult that specialty either in person or remotely during consideration.

a. All patients presented to the CSC Regional Clinical Triage Team will be recorded in a CSC Regional Clinical Triage Team Log which will include:
   - Date and time of referral
   - Name of referring clinician and contact information
   - Patient identifiers: These should include only date of birth and sex. Patient's name and other demographic data should not be considered by the Triage Team. Hospital specific MRN should be notated to confirm patient identification, but should not be made available to Triage Team.
   - All clinical information presented to the Triage Team at the time of decision Triage Team decision date and time and all supporting documentation
   - Patient outcome (if known)

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005509

b. It is recommended the CSC Regional Clinical Triage Team follow the communication guidelines below in order to maintain accurate and up to date situational awareness.

c. The CSC Regional Clinical Triage Team is under the same Oversight and Re-evaluation processes as the CSC Hospital and Hospital System Triage Teams outlined below.

C. Oversight

In order to maintain transparency and ensure a fair, equitable and consistent approach to allocation of a scarce resources it is important that all triage teams have an oversight process for decisions made during an event.

1. **CSC Hospital and Hospital Systems Oversight Committee**

   When an event occurs which requires activation of the CSC Hospital or Hospital System Clinical Triage Team the following documentation will be required and should be maintained and reviewed by the CSC Oversight Committee designated by the Medical Operations Branch Director under HICS.

   a. It is recommended the CSC Triage Team Oversight Committee consist of the
      - Senior clinicians with experience in tertiary triage (e.g. Critical Care, Emergency Medicine, Trauma Surgery, etc.), with one designated as Chair who oversees all Oversight processes
      - When possible clinicians on the CSC Triage Team Oversight Committee will not be primary providers of the patients under consideration
      - When patients requiring a scarce resource fall under a specific specialty such as burn, trauma, pediatrics, etc. then all attempts will be made to consult that specialty either in person or remotely during consideration
      - At least one medical ethicist

   b. All patients presented to the CSC Hospital or Hospital System Triage Team will be reviewed by an CSC Oversight Committee and will be recorded in an CSC Oversight Triage Team Log, which will
      - All patient demographics
      - Date and time of the case consideration
      - All patient information presented to the Clinical Triage Team at the time of consideration
      - Triage Team decision, date and time of the decision, and all supporting documentation reviewed and produced for the decision
      - If patient was referred, date and time of referral and contact information of receiving Clinical Triage Team
      - Patient outcome

   c. It is recommended that at agreed upon intervals the CSC Oversight Committee will review all cases presented to the CSC Hospital or Hospital System Triage Team to ensure the following:
      - All appropriate clinical information was considered
      - Accurate documentation was recorded
      - Significant variances be reviewed and addressed

   d. Depending on the nature of the incident oversight review may be in real time (e.g. in a prolonged event such as a pandemic). However in no notice, sudden or brief events, this review may be retrospective.

©2020 Northwest Healthcare Response Network.

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005510

2. **CSC Regional Oversight Committee**

When an event occurs which requires activation of the CSC Regional Clinical Triage Team the following documentation will be required and will be maintained and reviewed by the CSC Regional Oversight Committee. If a region has developed a healthcare coalition DCAC then it is recommended that members of the CSC Regional Oversight team be determined in coordination with local DCAC, State DMAC,LHO, other Public Health experts, outside SME's, etc. and can consist of members from the local DCAC, healthcare executives or the clinical community at large.

If a region does not have a local DCAC then the CSC Regional Oversight Team members will be determined by the State DMAC in coordination with the SHO, LHO, other Public Health experts, outside SME's, etc. and can consist of members from the DMAC (or their designees), healthcare executives or the clinical community at large. Recommended members of the CSC Regional Clinical Triage Team are as follows:

- Senior clinicians with experience in tertiary triage (e.g. Critical Care, Emergency Medicine, Trauma Surgery, etc.), with one designated as Chair who oversees all Oversight processes.
- When possible clinicians on the Regional Triage Team Oversight Committee will not be primary providers of the patients under consideration nor members of the Regional Triage Team.
- When patients requiring a scarce resource fall under a specific specialty such as burn, trauma, pediatrics, etc. then all attempts will be made to consult that specialty either in person or remotely during consideration.
- At least one medical ethicist

a. All patients presented to the CSC Regional Oversight Committee will be recorded in a CSC Regional Oversight Committee Log, which will include:
   - All patient demographics
   - Date and time of the case consideration
   - All patient information presented to the CSC Regional Clinical Triage Team at the time of consideration.
   - The CSC Regional Clinical Triage Team decision date, time and supporting documentation reviewed and produced for the decision
   - Patient outcome

b. It is recommended that at agreed upon intervals the CSC Regional Oversight Committee will review all cases presented to the Regional Triage Team to ensure the following:
   - All appropriate clinical information was considered
   - Accurate documentation was recorded
   - Extreme variances be reviewed and addressed

c. Depending on the nature of the incident oversight review may be in real time (i.e. in a prolonged event such as a pandemic). However in no notice, sudden or brief events, this review may be retrospective.

©2020 Northwest Healthcare Response Network.

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005511

D. Re-evaluation Process During Response

1. Request to change process

a. During an event individual clinicians may request a specific change to the Scarce Resource Cards, Triage Algorithms or protocols based on new clinical information such as changes in prognostic indicators or outcome measure. These requests should be made in writing to the Chair and Vice Chair of the WA State DMAC (or their designee).

b. WA State DMAC will keep a log and record of every CSC Reevaluation Process Request, date and time of request, and all the supporting documentation presented during the request and evaluation.

- Each request will be reviewed by the DMAC Chair and Vice Chair or their designee along with all relevant partners including additional input from SME's
- All request decisions will be made in a timely fashion and will be based on consensus of all relevant partners
- Final decisions for all CSC Reevaluation Process Requests will be in writing, dated and timed, and include all supporting documentation

2. Request to reevaluate specific case

a. Any clinician may bring a CSC Request for Patient Reevaluation of a specific case to the respective Medical Care Branch Director and designated ethicist. The Medical Care Branch Director has authority over the respective CSC Clinical Triage Team who made the initial decision under consideration (i.e. individual CSC hospital, hospital system, or regional Clinical Triage Team).

- At the individual hospital and hospital system, the Medical Branch Director will be determined by standards HICS designations within the organization
- At the Regional level, the Medical Branch Director will be the Chair or Vice Chair of the State DMAC (or their designee)
- At all levels, a CSC Request for Patient Reevaluation will be reviewed by the Medical Branch Director, a designated ethicist and any other relevant partners.

b. A log will be maintained of every Request for Reevaluation, date and time of request, and all supporting documentation presented during the request and reevaluation.

c. Every case brought to the Medical Care Branch Director and designated ethicist will be reviewed in a timely fashion to ensure the Triage Team documentation was complete and the decision process was consistent with Scarce Resource Cards, Triage algorithms, protocols or any other clinical documentation related to the case *that was available at the time the original decision was made.*

d. Depending on the event (i.e. no notice vs prolonged) it is understood that this process may be retrospective. However, if the event is more prolonged and the potential outcomes of the patient may be affected, then processes should be in place to allow a sufficiently rapid decision.

e. Final decisions for CSC Request for Patient Reevaluation of a specific case will be in writing, dated and timed, and include all supporting documentation.

f. Decision made by the respective Medical Care Branch Director and designated ethicist will be final.

©2020 Northwest Healthcare Response Network.

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-005512

E. Resource Update Protocols

1 **During response**

It is understood that during an event, the clinical situation may change depending on resource availability, new epidemiologic information, new treatment protocols and guidelines, etc. *It will be the responsibility of the entire healthcare community* to maintain close communication with the Local and State Health Officer and all relevant partners to maintain accurate situational awareness and consensus regarding local triage recommendations.

2. **During preparedness**

All Scarce Resource Cards and algorithms and any supporting documentation will be reviewed and updated every 3 years.

3. **Communications**

a. During response, NWHRN in conjunction with DMAC will be responsible for identifying all pertinent partners during an activation of the Scarce Resource Triage Team Guidelines to include but not limited to: LHO, SME's, DOH and Federal partners.

b. Depending on the situation, clinical updates may be required at various frequencies, and will be determined by DMAC Chair and Vice Chair, SHO, LHO and all other pertinent partners. State Health officer (SHO) in conjunction with NWHRN will be responsible for disseminating this information in a timely fashion to all appropriate clinical entities.

c. Communications will be electronically, but if circumstances are such that electronic communication is not possible, secondary communication processes will include FAX, phone and courier.

Hi everyone,

Let me first say that we appreciate everyone's effort on the polio surge and your flexibility in these uncertain and rapidly changing times with the COVID-19 response. We in the polio EOC, as well as CDC as whole, have your safety and health as our top priority.

You are receiving this email because you are currently set to return home from your polio TDY between 7-14 days from now. **We ask that you work with the EOC to immediately curtail your travel and return to the US.**

If you believe that anything may impact your date for return to work at your home office, please let us know and we can reach out to your supervisory chain. New agency guidance regarding post-

AMERICAN OVERSIGHT

deployment telework and monitoring policies should be coming out by the end of the week and will be sent to you.

Please continue to monitor all information you receive from the post where you are located which may impact your travel, as well as any guidance you receive from the EOC. Thank you for your contributions to polio eradication, the contributions you may be being asked to make regarding COVID-19 in your TDY location, and your commitments to CDC's mission.

Hi Caroline. We would be interested in a consult to discuss the port situation and your recommendations to minimize exposure to employees and passengers. Are u still willing to set this up? Thanks Carina

Dr. Blackmore:

I communicated to our morning team that there was follow up needed with you all.

AMERICAN OVERSIGHT

Separately, FL health leadership (FL Surgeon General I think?) reached out to Jay Butler here at CDC separately to discuss issues, involving our cruise ship task force. Chris Jones, the lead for our call unit, followed up and was told that local leadership was connected with staff at the Miami Quarantine station and that there were no additional questions.

Are there remaining issues you would like to discuss? We can have a call tonight or set up additional calls in the AM. Apologize for the miscommunication: we were told all was taken care of. Happy to help in any way we can!

Sara

Yes I believe we do need to circle back. What you describe didn't address the issues at the port itself. Let me check with the health officer first thing

Hi Nicki,
You can reach out to me 850-251-5558 (cell) or Dr. Blackmore (state epi) at 850-528-1595 (cell) to discuss the situation.
We understand the home care guidelines, but we have a lot of questions about this particular situation.

Additionally, we would like to request info on any other FL residents known to be infected with COVID-19.

Perhaps its best to schedule a conference call at your convenience. Let us know your preference.

Sincerely,

Scott Pritchard, MPH

Marisa
I am including Sherri Berger on this email for SA.

Could you please provide more specifics on your contact with Florida and GA? Who specifically has been contacted by regarding the requested transfers?

There are a number of items that the accepting states have to have and place and agree to for individuals requiring isolation. CDC can provide guidance if home isolation is being considered and happy to address questions.

Thanks Nicki

Hi Marisa - I don't think I'm the right person but want to make sure I loop in our repatriation and global migration teams. Also our state coordination colleagues. I don't think it is a cdc decision but they may have a suggestion on who at cdc might be able to speak with FL DoH.

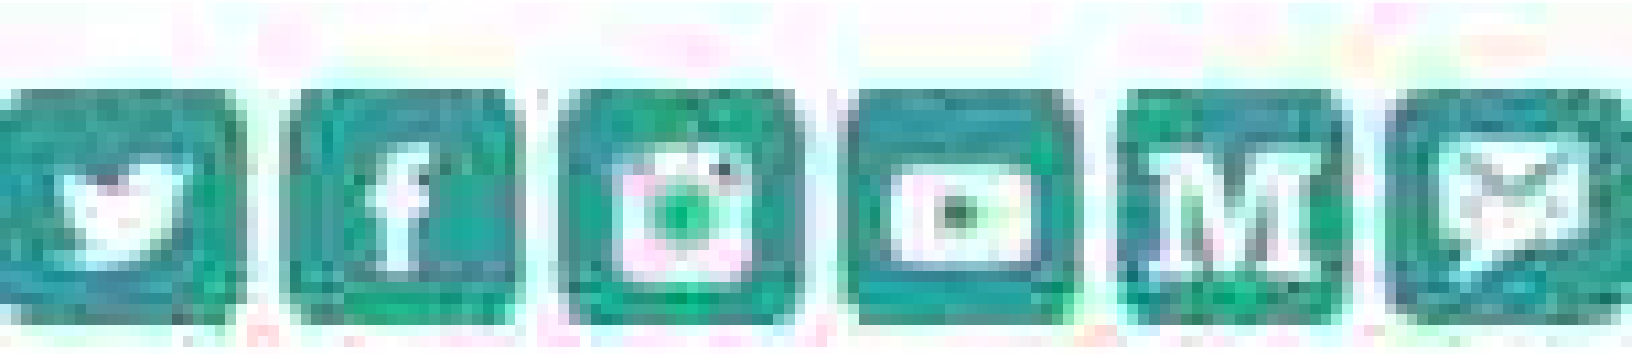
Subject: CDC contact for transfer of FL and GA residents COVID-19 + patients in Washington

Hi Satish,
How are you? I'm contacting FL and GA Depts of Health to arrange for transfer home to FL and GA of two COVID-19 + from the Diamond Princess cruise ship who are clinically stable and hospitalized in Spokane, WA.



There are many logistics, first getting the state to accept the patient and then to arrange transportation. Scott Pritchard, Interim Director, Infectious Disease Prevention and Investigations Section of FL DOH was very concerned and wanted to know who the CDC contact is for this decision. He also thought that their state epi and commissioner of health would want to be on a call with CDC before accepting the patient.

Is there a CDC contact? May I pass on a message from you representing CDC saying that you approve of this effort? Thanks and sorry to bug you!
Best,
Marisa

Hi Nicki,
You can reach out to me 850-251-5558 (cell) or Dr. Blackmore (state epi) at 850-528-1595 (cell) to discuss the situation.
We understand the home care guidelines, but we have a lot of questions about this particular situation.

Additionally, we would like to request info on any other FL residents known to be infected with COVID-19.

Perhaps its best to schedule a conference call at your convenience. Let us know your preference.

Sincerely,

Scott Pritchard, MPH
Interim Director
Infectious Disease Prevention and Investigations Section
Bureau of Epidemiology

Marisa

AMERICAN OVERSIGHT

I am including Sherri Berger on this email for SA.

Could you please provide more specifics on your contact with Florida and GA? Who specifically has been contacted by regarding the requested transfers?

There are a number of items that the accepting states have to have and place and agree to for individuals requiring isolation. CDC can provide guidance if home isolation is being considered and happy to address questions.

Thanks Nicki

Hi Marisa - I don't think I'm the right person but want to make sure I loop in our repatriation and global migration teams. Also our state coordination colleagues. I don't think it is a cdc decision but they may have a suggestion on who at cdc might be able to speak with FL DoH.

Subject: CDC COVID-19 Case Count Confirmation 03/05/2020

Dear Partners,

As described in an email sent from the CSTE COVID-19 Leadership Team (see attached), CDC is instituting a standard process for confirming publicly reported cases by jurisdiction.

What you need to do/know now:

- We will conduct case confirmation **daily** (Monday – Friday). As the response evolves, the frequency of these requests will likely decrease.
- At the bottom of this email, you will find a table with the current preliminary case counts we have for each jurisdiction **as of 4 pm ET on Thursday, March 5**.
- By **9 am ET Friday, March 6**, please confirm case counts for your jurisdiction (your numbers **as of 4 pm ET Thursday, March 5)** using the CDC Case Confirmation Portal (data are collected via Epi Info and stored on a secure CDC server):

https://go.usa.gov/xdftq

What you need to know about how your information will be presented:

- These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. They do not include people who returned to the United States via State Department-chartered flights. **We ask that the preliminary information shared in this email not be distributed.**
- What will be shared on the CDC website (updated daily at 12 pm, ET):
    - **The total case count** [presumptive + lab-confirmed], i.e., the actual number of *total* cases (e.g., 0, 6, 35) will be posted. **EXCEPTION**: **Jurisdictions with one to five cases will be depicted as a range: "1–5 cases"**
    - Other information shared will be used for internal awareness and will not be shared publicly at this time.

What you need to do/know later:

- DCIPHER users can update and analyze their own jurisdiction's data at: https://dcipher.cdc.gov/. If your jurisdiction does not currently have DCIPHER users, but you would like to move to Phase 2 reporting as described in the attached guidance, please email eocevent118@cdc.gov to confirm your readiness.

Sincerely,

CDC COVID-19 Epidemiology Task Force

Dear Dr. Blackmore,

A generic email went out tonight (see below) asking states to confirm their COVID-19 case-counts for tomorrow's web update. We wanted to reach out to you personally, though, because we did not receive confirmation of Florida's case counts for Monday's web update, and we realize numbers may have changed over the weekend.

At your earliest, could you please confirm the COVID-19 case counts for Florida as of March 9, and make any corrections as needed to the table below? Please also let us know if you would like us to add any alternate contacts for future case confirmation emails. We greatly appreciate your response.

Subject: RE: CDC COVID-19 Case Count Confirmation 3/22/2020
Date: Monday, March 23, 2020 1:41:56 PM

I submitted the survey for Florida this morning, and I see that the count is updated to what I submitted on the website (https://www.cdc.gov/coronavirus/2019-ncov/cases-updates/cases-in-us.html), but the community transmission is not (I selected "Yes, distinct clusters of cases in a, or a few, defined geographical area(s)"). Did I do something wrong on the survey? I want to be sure our data are appropriately reflected…

Thanks!
Leah

Dear Partners,

CDC continues to institute a standard process for confirming publicly reported cases by jurisdiction.

What you need to do/know now:

- We will conduct case confirmation **daily** (for web posting Monday–Friday). As the response evolves, the

AMERICAN OVERSIGHT

frequency of these requests will likely decrease.
- At the bottom of this email, you will find a table with the following:
    - current preliminary case counts we have for each jurisdiction **as of 4 pm ET on Sunday, March 22**.
    - general community level transmission characterization
- By **9 am ET Monday, March 23**, **please use the CDC Case Confirmation Portal via the link below** (data are collected via Epi Info and stored on a secure CDC server) to:
    - confirm case counts for your jurisdiction (your numbers **as of 4 pm ET Sunday, March 22)**
    - if needed, modify your **"community level transmission characterization"**

Please use the link provided below and not a previously saved link in your web browser

https://go.usa.gov/xdtyJ

What you need to know about how your information will be presented:

- These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. They do not include people who returned to the United States via State Department-chartered flights. **We ask that the preliminary information shared in this email not be distributed.**
- What will be shared on the CDC website (updated daily at 12 pm, ET):
    - **The total case count**, i.e., the actual number of *total* cases (e.g., 0, 6, 35) will be posted. **EXCEPTION**: **Jurisdictions with one to five cases will be depicted as a range: "1–5 cases"**
    - Community level transmission characterization
    - Other information shared will be used for internal awareness and will not be shared publicly at this time.

What you need to do/know later:

- DCIPHER users can update and analyze their own jurisdiction's data at: https://dcipher.cdc.gov/. If your jurisdiction does not currently have DCIPHER users, but you would like to move to Phase 2 reporting as described in the attached guidance, please email eocevent118@cdc.gov to confirm your readiness.

Sincerely,

CDC COVID-19 Epidemiology Task Force

Hi Leah,

Thanks for bringing this to our attention. I don't see FL's response from yesterday in the Epi Info results but I do see your response from today at 6:45am confirming 1141 cases, 17 deaths, and (Yes, distinct clusters of cases in a, or a few, defined geographical area(s)). We will make sure the map is updated today and thank you for confirming case counts and contacting us if it doesn't look correct. We appreciate it.

Thanks,

Colin Schwensohn

Subject: CDC COVID-19 Weekly Key Messages, Consular Notification Guidance, and CDC Media Telebriefing TODAY at 12:15 PM EDT

Dear Colleagues:

Please see the attached CDC COVID-19 weekly key messages, Consular Notification Guidance, and the bridgeline for today's **CDC Media Telebriefing at 12:15 PM EDT provided below**.

Please reference the "Consular Notification Guidance for State and Local Authorities." This document was developed by the U.S. State Department. It outlines existing requirements and treaty obligations for notifying foreign embassies and consulates in the United States when a foreign national is being medically detained (i.e., a case when a quarantine order is issued because of possible exposure to COVID-19 disease).

Dr. Rivkees

As always it is a pleasure to speak with you. I spoke with our HHS Liaison to the Department of State and he is willing to work to set up a call with the Department of State. Based on your desire we can include CDC. I included the CDC guidance on cruise ships.

I should have a name of a Customs and Border Protection (CBP) representative for you shortly.

Regards,
Jeanne

Great. We plan to be on site. Let me get back to you on who the POC will be.
What we were also hoping for is a training session with some of our staff who is augmenting the response (e.g. EMS, nurses) to build capacity. Our local epidemiologists have basic infection control expertise but they are very stretched right now. When is Sri able to deploy?

Hello Dr. Blackmore,

I wanted to introduce you to Srinivas Nanduri who will help with the infection prevention and control aspects of this investigation. As we discussed on the phone today, his deployment will be about 5 days and will largely be focused on the following objectives:

1. To provide targeted infection control assessment and observation of the affected healthcare facility to included hand hygiene, transmission based precaution use, and environmental cleaning.
2. To provide training on essential infection control activities such as hand hygiene and PPE donning and doffing
3. Provide technical support on healthcare worker and patient/resident monitoring during this time
4. To build internal capacity within the health departments for these types of assessments moving forward through mechanisms such as tele-infection control assessments (ICAR) or focused onsite ICARs
5. If times allows, to conduct preparedness assessment at other healthcare facilities

We do ask that local or state PH support be present onsite with him as much as possible. And you will continue to have our support from CDC headquarters 24/7.

AMERICAN OVERSIGHT

Please reach out to Sri directly to arrange further logistics.

Best,
Elizabeth Soda

Great. We plan to be on site. Let me get back to you on who the POC will be.
What we were also hoping for is a training session with some of our staff who is augmenting the response (e.g. EMS, nurses) to build capacity. Our local epidemiologists have basic infection control expertise but they are very stretched right now. When is Sri able to deploy?

Subject: CDC Infection Prevention and Control Assistance

Hello Dr. Blackmore,

I wanted to introduce you to Srinivas Nanduri who will help with the infection prevention and control aspects of this investigation. As we discussed on the phone today, his deployment will be about 5 days and will largely be focused on the following objectives:

1. To provide targeted infection control assessment and observation of the affected healthcare facility to included hand hygiene, transmission based precaution use, and environmental cleaning.
2. To provide training on essential infection control activities such as hand hygiene and PPE donning and doffing
3. Provide technical support on healthcare worker and patient/resident monitoring during this time
4. To build internal capacity within the health departments for these types of assessments moving forward through mechanisms such as tele-infection control assessments (ICAR) or

AMERICAN OVERSIGHT

focused onsite ICARs

5. If times allows, to conduct preparedness assessment at other healthcare facilities

We do ask that local or state PH support be present onsite with him as much as possible. And you will continue to have our support from CDC headquarters 24/7.

Please reach out to Sri directly to arrange further logistics.

Best,
Elizabeth Soda

Great. We plan to be on site. Let me get back to you on who the POC will be.
What we were also hoping for is a training session with some of our staff who is augmenting the response (e.g. EMS, nurses) to build capacity. Our local epidemiologists have basic infection control expertise but they are very stretched right now. When is Sri able to deploy?

Hello Dr. Blackmore,

I wanted to introduce you to Srinivas Nanduri who will help with the infection prevention and control aspects of this investigation. As we discussed on the phone today, his deployment will be about 5 days and will largely be focused on the following objectives:

1. To provide targeted infection control assessment and observation of the affected healthcare facility to included hand hygiene, transmission based precaution use, and environmental cleaning.
2. To provide training on essential infection control activities such as hand hygiene and PPE donning and doffing
3. Provide technical support on healthcare worker and patient/resident monitoring during this time
4. To build internal capacity within the health departments for these types of assessments moving forward through mechanisms such as tele-infection control assessments (ICAR) or focused onsite ICARs
5. If times allows, to conduct preparedness assessment at other healthcare facilities

AMERICAN OVERSIGHT

We do ask that local or state PH support be present onsite with him as much as possible. And you will continue to have our support from CDC headquarters 24/7.

Please reach out to Sri directly to arrange further logistics.

Best,
Elizabeth Soda

Hi Dr. Blackmore,
Just wanted to check in with you about my deployment to Broward County so far. Dr. Thaqi likely looped you in already but I supported condensing of existing guidelines for SNFs and ALFs and training on them to public health staff and the IMT staff. Also helped with some site visits to these facilities supplementing existing Broward county infection control assessment protocols. Reaching out to you to let you know that my initial objectives for this mission could be considered complete. Let me know if you think there is anything else that I should be assisting the county or you with.
Thanks,
Srinivas

1. To provide targeted infection control assessment and observation of the affected healthcare facility to included hand hygiene, transmission based precaution use, and environmental cleaning.
2. To provide training on essential infection control activities such as hand hygiene and PPE donning and doffing
3. Provide technical support on healthcare worker and patient/resident monitoring during this time
4. To build internal capacity within the health departments for these types of assessments moving forward through mechanisms such as tele-infection control assessments (ICAR) or focused onsite ICARs
5. If times allows, to conduct preparedness assessment at other healthcare facilities

We do ask that local or state PH support be present onsite with him as much as possible. And you will continue to have our support from CDC headquarters 24/7.

Please reach out to Sri directly to arrange further logistics.

Best,
Elizabeth Soda

Great. We plan to be on site. Let me get back to you on who the POC will be.
What we were also hoping for is a training session with some of our staff who is augmenting the response (e.g. EMS, nurses) to build capacity. Our local epidemiologists have basic infection control expertise but they are very stretched right now. When is Sri able to deploy?

Subject: CDC Infection Prevention and Control Assistance

Hello Dr. Blackmore,

I wanted to introduce you to Srinivas Nanduri who will help with the infection prevention and control aspects of this investigation. As we discussed on the phone today, his deployment will be about 5 days and will largely be focused on the following objectives:

1. To provide targeted infection control assessment and observation of the affected healthcare facility to included hand hygiene, transmission based precaution use, and environmental cleaning.
2. To provide training on essential infection control activities such as hand hygiene and PPE donning and doffing
3. Provide technical support on healthcare worker and patient/resident monitoring during this time
4. To build internal capacity within the health departments for these types of assessments moving forward through mechanisms such as tele-infection control assessments (ICAR) or focused onsite ICARs
5. If times allows, to conduct preparedness assessment at other healthcare facilities

We do ask that local or state PH support be present onsite with him as much as possible. And you will continue to have our support from CDC headquarters 24/7.

Dear Dr. Abdul

Thank you for contacting the CDC with a novel coronavirus person under investigation (PUI) inquiry. If you suspect you have a patient with possible novel coronavirus infection, please contact your local health department immediately for further guidance. General information on novel coronavirus, including infection control measures can be found online here. CDC is working closely with local and state health authorities. CDC will only be facilitating novel coronavirus referral testing in coordination with public health departments.

2019 nCoV CORONAVIRUS

HEALTH ALERT: *Travelers from China*

There is an outbreak of respiratory illness in China.

Travelers are required to be monitored for up to 14 days after leaving China.

Travelers should stay home and monitor their health within this 14-day period.

A health official will contact you to give additional instructions.

Take your temperature with a thermometer 2 times a day and watch your health.

If you develop a fever (100.4°F/38°C or higher), cough, or have difficulty breathing:

- Call your health department for advice before seeking care.
- If you can't reach your health department, call ahead before going to a doctor's office or emergency room.
- Tell them your symptoms and that you were in China.

2019 nCoV CORONAVIRUS

健康预警：来自中国的旅客请注意

近期，在中国爆发了由新型冠状病毒所引起的呼吸系统疾病。

我们要求各位旅客在离开中国后的14天内接受健康监察。

在这14天内，您需要在家隔离，并且监测您的健康情况。

卫生官员将与您联系，为您提供进一步的指导。

请每天用体温计测量您的体温两次，并且密切关注您的身体健康。

如果您出现发烧(100.4F/38C)，咳嗽，或呼吸困难的症状：

- 请在看医生之前，先打电话向您当地的卫生部门寻求建议。
- 如果您无法联系到当地的卫生部门，请在去医生办公室或急诊室之前先打电话咨询。
- 告知医生您的症状，并让医生知道您曾去过中国。

Just Released: Third Edition of the CIFOR Guidelines for Foodborne Disease Outbreak Response
The Council to Improve Foodborne Outbreak Response (CIFOR) released the streamlined and easy-to-read third edition of the CIFOR Guidelines for Foodborne Disease Outbreak Response. The CIFOR Guidelines are a comprehensive source of information on foodborne disease investigation and control for local, state and federal health agencies. Download the new Guidelines: https://cifor.us/products/guidelines.

Newsletter Blurb (Long)

Just Released: Third Edition of the CIFOR Guidelines for Foodborne Disease Outbreak Response

The Council to Improve Foodborne Outbreak Response (CIFOR) released the streamlined and easy-to-read third edition of the CIFOR Guidelines for Foodborne Disease Outbreak Response. The CIFOR Guidelines are a comprehensive source of information on foodborne disease investigation and control for local, state and federal health agencies.

The Guidelines describe (a) the overall approach to addressing foodborne disease outbreaks, including preparation, detection, investigation, control and follow-up; and (b) the roles of key organizations in foodborne disease outbreaks.

These are a few of the updates in the new third edition:

- Provides information on the value and use of complaint systems
- Highlights Whole Genome Sequencing and Culture-Independent Diagnostic Testing
- Better illustrates how epidemiology, lab, and environmental health data come together
- Highlights importance of environmental assessments
- Recommends routine interviewing to collect detailed exposure information
- Expands effective models of sub-cluster investigations and product tracebacks

Download the new Guidelines: https://cifor.us/products/guidelines.

Subject: communications test

Emerald Coast Healthcare Coalition is conducting our quarterly communications test which seems very timely with everything going on due to coronavirus - this test ensures that we maintain communication with our partners
Please respond to me only - do not copy all
Please send email answering YES that you received my communication for this test
Thank you

--

Subject: communications test

Emerald Coast Healthcare Coalition is conducting our quarterly communications test which seems very timely with everything going on due to coronavirus - this test ensures that we maintain communication with our partners
Please respond to me only - do not copy all
Please send email answering YES that you received my communication for this test
Thank you

--

Ann Hill, Executive Director
Emerald Coast Healthcare Coalition
850-585-1679

Subject: communications test

Emerald Coast Healthcare Coalition is conducting our quarterly communications test which seems very timely with everything going on due to coronavirus - this test ensures that we maintain communication with our partners
Please respond to me only - do not copy all
Please send email answering YES that you received my communication for this test
Thank you

--

Ann Hill, Executive Director
Emerald Coast Healthcare Coalition
850-585-1679

Change Orlando report - they have one opening.
Add critical need statement: need test kits otherwise testing becomes nonexistent

2019 Novel Coronavirus (2019-nCov)

Coronavirus Disease 2019 (COVID-19) in the U.S.

As of February 24, 2020

In the United States, there have been 14 confirmed cases of COVID-19 detected through U.S. public health surveillance systems. There have also been 39 cases of COVID-19 reported among people repatriated to the United States.

CDC provides updated U.S. case information online on Mondays, Wednesdays, and Fridays.

Hi and I'm sure you are inundated with calls. First, thanks for all of your help in the past and appreciate your help on the coronavirus. I have been in contact with the Maricopa and Pima County health departments regarding our teams that are training in Arizona. Florida is much more complicated as our teams are spread out throughout the state. I was wondering if you have a contact at the Florida Public Health for me to reach out to regarding our teams training in Florida? Thanks so much,
Gary Green, MD

Subject: Coronavirus Guidance

Hello Francisco and CDC colleagues – I hope all is well with you. As you can imagine, we have received a number of inquiries from MLB Clubs and Players with respect to the coronavirus and we are planning to disseminate guidance that is based on CDC recommendations. Prior to dissemination of this guidance, is there someone at CDC that you could recommend that we could briefly coordinate with to ensure that our guidance is 100% accurate and consistent with current CDC guidelines? CDC was incredibly helpful to us on the Zika situation a few years ago and it would be very much appreciated if CDC could provide similar guidance and support to our industry on this current public health topic as well.

Thank you in advance and I look forward to hearing back from you.

Sincerely,
Jon Coyles

Attachments:	Memo re Coronavirus.pdf

Scott and Carina,
Francisco kindly forwarded me your contact information. I'm the medical director for Major League Baseball and just wanted to establish contact with the Florida public health in case the need arises for increased measure with our 15 teams currently doing spring training in Florida. I have distributed the enclosed memo to all of our teams and in close contact with them regarding any potential exposures. I have made similar contacts in Arizona with our teams training there and is much easier because they are all in one county. Florida is a bit more challenging with our team all spread out. Our teams are being very cautious with respect to screening people with potential travel risks. If you have any recommendations for MLB over the next month, please reach out to me and we will implement them. Also, I wanted to ensure that there are testing facilities throughout Florida that have the capability to test for coronavirus if needed and how to refer patients for testing.
Thank you in advance and let me know if there is anything we can do to assist Florida public health.

Subject: Coronavirus Guidance

Hello Francisco and CDC colleagues – I hope all is well with you. As you can imagine, we have received a number of inquiries from MLB Clubs and Players with respect to the coronavirus and we are planning to disseminate guidance that is based on CDC recommendations. Prior to dissemination of this guidance, is there someone at CDC that you could recommend that we could briefly coordinate with to ensure that our guidance is 100% accurate and consistent with current CDC guidelines? CDC was incredibly helpful to us on the Zika situation a few years ago and it would be very much appreciated if CDC could provide similar guidance and support to our industry on this current public health topic as well.

Thank you in advance and I look forward to hearing back from you.

Sincerely,
Jon Coyles

Jonathan D. Coyles | MLB | Vice President • Drug, Health & Safety Programs

AMERICAN OVERSIGHT

MAJOR LEAGUE BASEBALL
1271 AVENUE OF THE AMERICAS, NEW YORK, NY 10020

M E M O R A N D U M

TO: All Major League Clubs and Players

FROM: Office of the Commissioner

DATE: February 27, 2020

RE: Coronavirus

Most of you are likely aware of the public health concerns regarding the outbreak of respiratory disease caused by a novel (new) coronavirus. The outbreak first stated in Wuhan, China but cases have been identified in a growing number of countries worldwide, including the United States.[1] The World Health Organization has declared the outbreak a "public health emergency" and has implemented travel restrictions to China and South Korea as a result. Although the greatest risk of infection is for individuals located in China and South Korea, or those who have recently traveled to or from these countries, it is important to inform all travelling employees (including players) about this serious and potentially fatal virus.

Major League Baseball is actively monitoring the spread of coronavirus, particularly in the United States, and is working closely with the Centers for Disease Control ("CDC"). As of this writing, there are 14 confirmed cases in the United States confined to 6 states, including, Arizona, California, Illinois, Massachusetts, Washington, and Wisconsin. Nearly all of these cases (12 of 14) are related to travel to China. This number is expected to rise, but CDC and other global public health entities are implementing aggressive measures to slow the spread of the virus and mitigate its impact.

While CDC has advised that the immediate risk of this new virus in the United States is believed to be low at this time, we can all do our part to help respond to this emerging public health threat. Since coronavirus is spread from person-to-person contact, the best way to prevent infection is to avoid being exposed to an infected person. Although there is currently no vaccine or specific treatment for coronavirus, CDC recommends a number of everyday preventive measures to prevent the spread of coronavirus, including:

- Avoid close contact with anyone who is sick
- Avoid touching your eyes, nose and mouth
- Stay home when you are sick
- Cover your cough or sneeze with a tissue, then throw the tissue in the trash
- Wash hands frequently with soap and water for at least 20 seconds, especially after using the rest room, before eating, and after blowing your nose, coughing or sneezing
- Regularly use hand sanitizer that contains at least 60% alcohol
- Regularly clean and disinfect frequently touched objects and surfaces
- Avoid travelling to, or practice enhanced precautions when travelling to, high risk areas identified by the CDC (see www.cdc.gov/travel for current travel health notices)

[1] A complete listing of locations with confirmed coronavirus cases can be found on the CDC website at: www.cdc.gov/coronavirus/2019-ncov/locations-confirmed-cases.html

AMERICAN OVERSIGHT

If you feel sick, particularly if you have any early symptoms of a respiratory illness (*e.g.,* fever, cough or shortness of breath), you should:

- Stay home except to seek medical care
- Seek prompt medical attention if your symptoms worsen
- Continue to practice good hygiene:
    - Cover your cough or sneeze with a tissue, then throw the tissue in the trash
    - Wash hands frequently with soap and water for at least 20 seconds, especially after blowing your nose, coughing or sneezing
    - Regularly use hand sanitizer that contains at least 60% alcohol
- Clean and disinfect frequently touched objects and surfaces regularly
- Do not travel while sick

CDC has placed Level 3 travel warnings on China and South Korea, meaning that travelers should avoid all nonessential travel to these countries. CDC has also placed Level 2 travel warnings on Italy, Japan and Iran, meaning that enhanced precautions should be practiced. Prior to travel to any country with a Level 2 or Level 3 travel warning, Clubs are required to have their employees notify a team physician, and the team physician must notify MLB's Medical Director, Dr. Gary Green, prior to commencement of travel to ensure that CDC-recommended precautions are followed.

All travelers arriving from China, South Korea and other areas with a high exposure risk will be screened upon entry to the United States pursuant to CDC guidelines. Even if a traveler from China or South Korea is asymptomatic, the CDC considers them to be at medium risk and should stay home and monitored per CDC guidelines for 14 days to ensure that they do not develop symptoms. CDC also recommends that these individuals not travel again during this 14-day period.

If you recently traveled from China, South Korea or an area with a high exposure risk within the past 14 days and feel sick with fever, cough, or difficulty breathing, avoid contact with others and immediately seek medical care. You should call ahead before visiting your health care provider and tell him or her about your travel and symptoms. Your healthcare provider will provide specific recommendations (*e.g.,* wearing a facemask) to keep others from being infected or exposed. While sick, avoid contact with others (including those in your home), do not go out except to seek medical care, and delay any travel to reduce the possibility of spreading the illness to others.

Patients with confirmed coronavirus disease should remain under home isolation until the risk of secondary transmission to others is thought to be low. The decision to discontinue home isolation should be made in consultation with healthcare providers and state and local health departments.

The Office of the Commissioner will continue to closely monitor this rapidly evolving situation and provide additional guidance in the future. Additional information on coronavirus is available on the CDC website at www.cdc.gov/COVID19. Please contact Dr. Gary Green at 310-740-7322 or Jon Coyles at 212-931-7859 if you have any immediate questions or concerns.

Hi and I'm sure you are inundated with calls. First, thanks for all of your help in the past and appreciate your help on the coronavirus. I have been in contact with the Maricopa and Pima County health departments regarding our teams that are training in Arizona. Florida is much more complicated as our teams are spread out throughout the state. I was wondering if you have a contact at the Florida Public Health for me to reach out to regarding our teams training in Florida? Thanks so much,
Gary Green, MD

Subject: COVID Priority Services--Animal and Ag Industries

NASPHV,

This morning during the active member call we discussed creating a list of priority services that should be excluded from mandatory shutdowns. The concern is a complete shutdown of these services (or quarantines on large numbers of employees) will lead to disruption of the food supply, increased risk to public health, significant welfare issues to animals, unnecessary euthanasia, and overall ethical dilemmas.

I generated this list based on today's call. Please add to this as needed.

Animal Food Supply Chain Services (specifically employees working in processing plants)
Veterinary Critical and Emergency Care
Initial Rabies Vaccines to animals in high risk areas
Rabies Booster Vaccines to rabies exposed pets and livestock
Other vaccinations in response to specific situations (example: parvo or distemper outbreaks)
Responding to reportable veterinary conditions (specifically foreign animal diseases and others requiring movement restrictions)
Animal Movement Regulations including required veterinary inspections

--

Subject: COVID Priority Services--Animal and Ag Industries

NASPHV,

This morning during the active member call we discussed creating a list of priority services that should be excluded from mandatory shutdowns. The concern is a complete shutdown of these services (or quarantines on large numbers of employees) will lead to disruption of the food supply, increased risk to public health, significant welfare issues to animals, unnecessary euthanasia, and overall ethical dilemmas.

I generated this list based on today's call. Please add to this as needed.

Animal Food Supply Chain Services (specifically employees working in processing plants)
Veterinary Critical and Emergency Care
Initial Rabies Vaccines to animals in high risk areas
Rabies Booster Vaccines to rabies exposed pets and livestock
Other vaccinations in response to specific situations (example: parvo or distemper outbreaks)
Responding to reportable veterinary conditions (specifically foreign animal diseases and others requiring movement restrictions)
Animal Movement Regulations including required veterinary inspections

Hi Julia,
My sincere apologies for the delay in responding to you on this! I've added you to my internal list. These calls are not being coordinated through the ELC so I don't know if the call information will update with each call. It is my understanding that the invites are going to, at minimum, PHEP Directors and State Epidemiologists; we have been sending them to ELC Governance Team members.

Hi Angelica,

I have been asked to host these calls for the Florida Department of Health, but I am not receiving these emails directly. Could you add me to your email distribution list so I receive these emails moving forward? Also, could you clarify if the call-in number and passcode listed here is the one we should use moving forward?

Thank you so much for your help!

Best,
Julia

Julia Munroe, MS
Respiratory Disease Epidemiologist
Bureau of Epidemiology
Division of Disease Control and Health Protection
Florida Department of Health
Office Phone: 850-901-6936

Mission: To protect, promote, and improve the health of all people in Florida through integrated state, county, and community efforts.

Please note: Florida has a very broad public records law. Most written communications to or from state officials regarding state business are public records available to the public and media upon request. Your email communications may therefore be subject to public disclosure.

Subject: COVID-19 All State Call: Tuesday, 2/18/20; 2:00-2:45pm EST

The CDC will be hosting an all-state COVID-19 call on Tuesday, February 18 from 2:00pm-2:45pm EST. The ELC is not coordinating this call; however, we wanted to share this information in the event you had not received it through other channels.

CDC's Coronavirus Disease-2019 (COVID-19) response team will host a national call from 2 p.m. to 2:45 p.m. EST on Tuesday, February 18, to provide state and local partners with the latest information on the novel coronavirus outbreak and U.S. preparedness efforts.

Invited participants include state, local, and territorial preparedness directors, state epidemiologists, state health officials, public health laboratory directors, and nongovernmental partners. Participant information can be found below.

Participant Information

Bridgeline: 1(888)790-1880
Participant Passcode: 8138992

Please note, this update call is being held on a Tuesday, in lieu of President's Day observance. Future calls will be held on Mondays.

Subject:	RE: COVID-19 Public Health Response Operations
Date:	Saturday, February 29, 2020 7:02:26 PM

Good Evening Colleagues,

As a follow-up to yesterday call, please find the "Interim Guidance for Administrators of US Childcare Programs and K-12 Schools to Plan, Prepare, and Respond to Coronavirus Disease 2019 (COVID-19)" here.

Schools should continue to collaborate, share information, and review plans with local health officials to help protect the whole school community, including those with special health needs. School plans should be designed to minimize disruption to teaching and learning and protect students and staff from social stigma and discrimination. Plans can build on everyday practices (e.g., encouraging hand hygiene, monitoring absenteeism, communicating routinely) that include strategies for before, during, and after a possible outbreak.

Thank you!

State Coordination Task Force (SCTF)
Center for Preparedness and Response (CPR)

Centers for Disease Control and Prevention (CDC)

All

FYI.... I know nothing of what is happening on these ships, just they are due to arrive in the next 48 hours.

From the State Department...

- Tracking **33 cruise ships** that have/are set to debark in the next 48hrs.
- 3 out of 33 are sked to arrive in US ports in next 48 hrs – GRANDEUR OF THE SEAS (Miami, FL), MSC LIRCA (Miami, FL), SEVEN SEAS EXPLORER (Miami, FL) –

Just wanting to know if the Port of Miami remains open. I understand that the cruise lines are to follow normal practices for debarkation of ships as they do every day.

Let me know if you have any questions.
Thanks

Respectfully,
Jeanne

Hi Carina,

I know everyone is swamped these days! I don't know the answer but will send to NIOSH EOC desk. I am sure they get this question a lot.

Hope you are doing as well as you can.

Take care,

Renée

Subject: disinfection of PPE

Howdy,
I am assuming you, like me, are knee deep in the COVID response.
Do you by any chance know who I could talk to about using UV light to disinfect PPE? I am guessing that hard surfaces (plastic) might work but what about cloth ? (masks/ gowns)
Any intel on this would be helpful

Thanks a lot. Thankful to have wise friends
Carina

Received the following from our LNO with DoS for your awareness
I am thinking they may be medivac'd to FL?

Costa Magica and Costa Favolosa are north of Cuba heading north toward the U.S. Costa Magica has a crew member in critical condition (male, 32, Philippines, bilateral pneumonia)and in is need of urgent medical evacuation. The Company is coordinating with USCG to perform a medivac (details being worked). Magica has an additional 3 crew members who need medical support ashore and Favolosa has 5 crew members who need medical support ashore. The Company is also working a plan to repatriate ~300 EU, ~600 Philippine and ~250 Indonesia asymptomatic crew members later this week.

EIS Supervisor Seminar: 2020 EIS Virtual Match

Epidemiology Workforce Branch
Division of Scientific Education and Professional Development

AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

Priorities for EIS conference contingency planning

- **Match incoming EISOs to positions (essential for deployment preparedness)**
- **EISO training on scientific communication**
- **Facilitating job search for graduating EISOs**
- **Bringing EISOs together**

AMERICAN OVERSIGHT

Recruitment and matching

- **Open recruitment and virtual meetings between incoming EIS officers and positions ASAP**
- **Prepare for 3-week period of video-based interviewing – including the scheduled week of conference**

AMERICAN OVERSIGHT

Next steps following EIS cancellation

- **Plan for 2-day training in June at Clifton or Sheraton**
  - **Prioritize 2nd year EISOs needing EIS conference for CAL completion**
  - **Considering award sessions, graduation, satirical review**
- **Plan for 5-day scientific program in 2021**

AMERICAN OVERSIGHT

Post EIS Employment

- **EWB working with CDC leadership to compensate for the loss of interviewing and networking that would normally be at conference**
- **Asking that COVID-19 funds be used for positions for graduating EISOs**

AMERICAN OVERSIGHT

2020 EIS Virtual Recruitment and Match Timeline

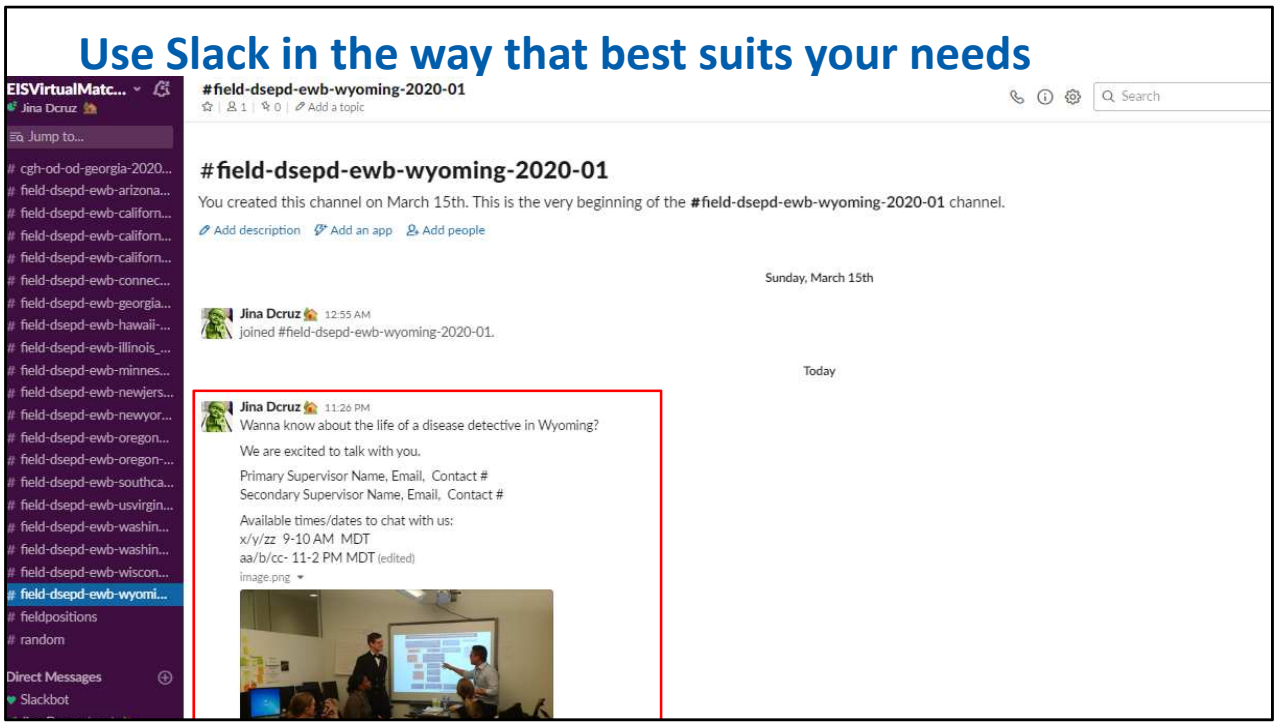
3/20	PDs/CVs Distributed
3/23–4/17	Recruitment Period
4/13–4/17	Interview Scheduling
4/20–5/7	Interviews
5/8, 2pm ET	Submit Ranks/Ratings
5/11	Run Match
5/11–5/14	Scramble
5/15	Release Match Results

AMERICAN OVERSIGHT

Virtual Recruiting: March 23rd to April 17th

- Develop a system that is as flexible as possible to accommodate the schedules of those of you who are involved in response
- Provide tools for you to facilitate and encourage interaction but not be proscriptive about how you use those tools.
- Slack is a team collaboration tool (not unlike Microsoft Teams) that allows asynchronous or live communication via messaging, voice, or video calls.
- Is available to internal CDC and external users and can be accessed via web browser, desktop, or mobile phone. Note, it doesn't seem to like Internet Explorer, so you may want to go ahead and request Chrome via the SRT.

AMERICAN OVERSIGHT



Slack is organized into channels.

- Slack is organized into channels (similar to a folder). There will be (1) a general channel that houses information from the EIS Program, (2) An events channel where we will post group events, (3) and a Slack resources channel where we will will post user guides, tips & tricks, and other documentation.
- We will pre-populate Slack with channels for the CIOs, a general field channel, and channels for each individual position.
- Within each channel you can post messages, upcoming recruiting events, videos, etc. Incoming officers will also be able to join your channel and post questions that you can respond to when you have the available time.

AMERICAN OVERSIGHT

Use Slack in the way that best suits your needs

- Post messages and monitor the slack messages for questions from incoming officers

Use Slack in the way that best suits your needs

slack

powerpoint

- Post videos, PowerPoint slides, and other documentation

Use Slack to post on the main calendar

- We are investigating the best way to set up a shared calendar on slack in the events channel. You will be able to post your recruiting events such as webinars or AMA (Ask Me Anything) sessions.

We prefer you use Slack…

- We prefer you use Slack as we are concerned that incoming officers may be involved in the COVID-19 response or otherwise occupied during this period and Slack will provide them a way to check in on recruiting on their own schedules in one central location. We also understand, however, that you may not have the resources to monitor a slack channel or prefer to use your own method of interaction.

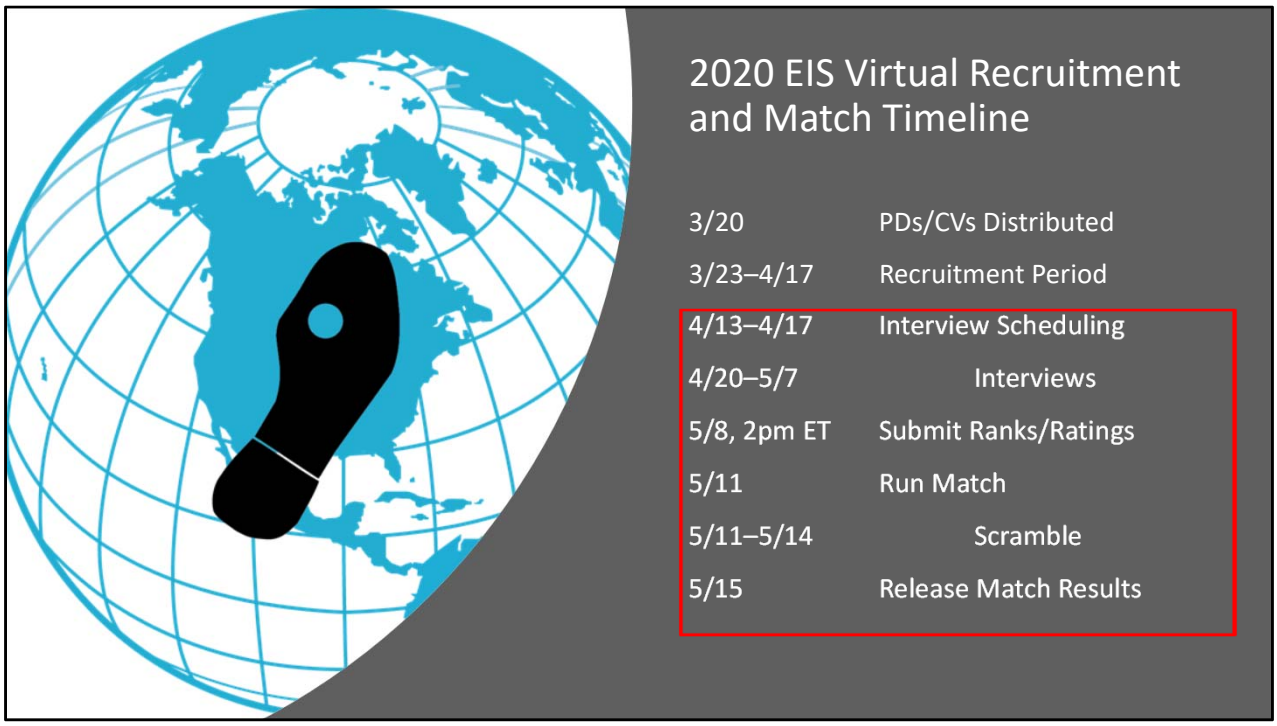
AMERICAN OVERSIGHT

At a minimum please post a "Preferred Method of Communication" message in Slack.

- **Who can be contacted directly (supervisor, 2ndary supervisor, EISO, etc.)**
  - **How to contact them (via Slack message, email, phone, etc.)**
  - **Best times/ways to contact**
- **Will you monitor your position's Slack channel?**
  - **If so, how often will you expect you will be checking in and responding to messages?**

- At a minimum, please post a pinned message on your preferred method of communication.
- We are going to ask incoming officers **not to initiate one-on-one contact until they have read the "preferred method of communication" post for a given position**

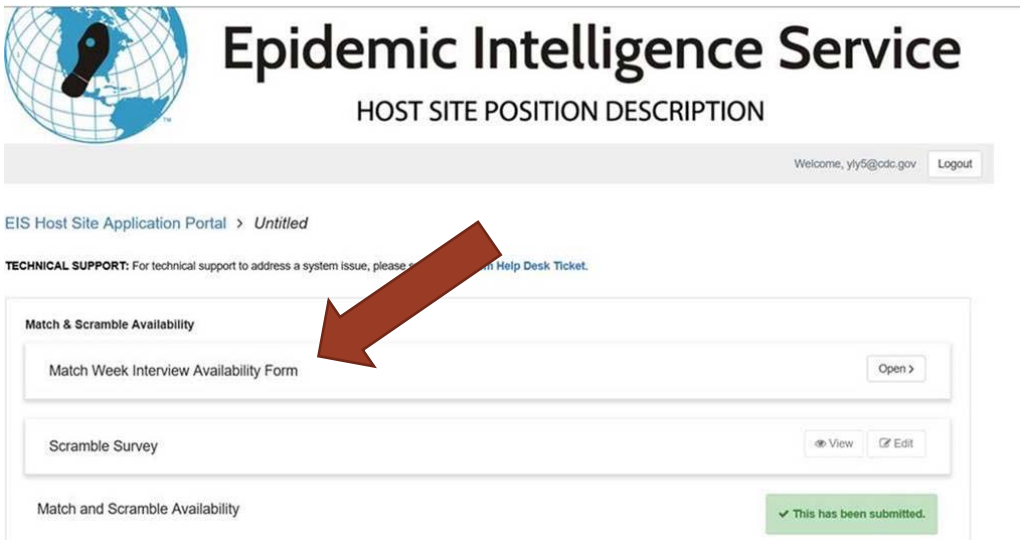
AMERICAN OVERSIGHT



- We are trying to develop this platform as rapidly as possible, so please bear with us. We will be sending out more detailed guidance.
- Each position will also be assigned an EWB staff POC who can assist you with slack and other issues with virtual recruitment and we will have Slack technical support backing them up.
- We invite your feedback on technical issues and we also ask that you share what seems to be working well for you.

AMERICAN OVERSIGHT

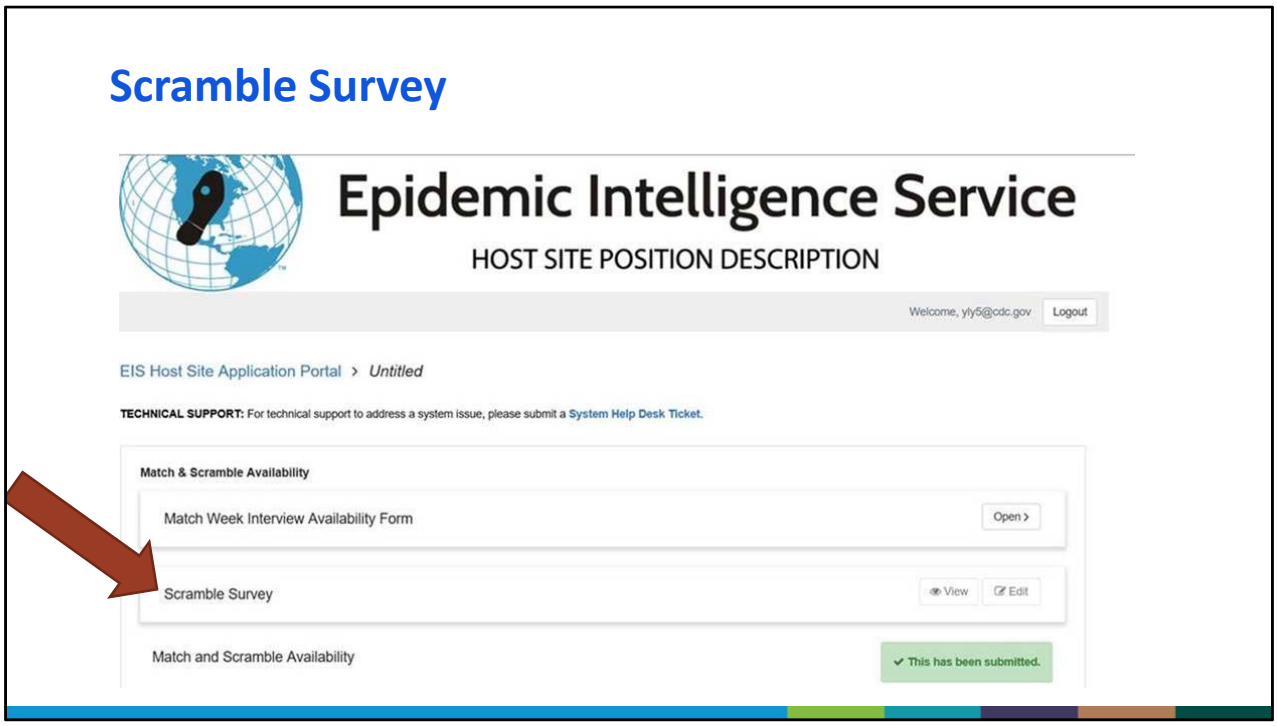
Questions on Slack or the Virtual Recruitment Period?



AMERICAN OVERSIGHT

- Now I would like to go into a little more detail with respect to scheduling and conducting virtual interviews, running match, and the scramble process.
- Note that we will schedule another webinar in early to mid-April that will go into more technical detail on the eFMS platform that is used for the interview scheduling, rating submission, and match process.

AMERICAN OVERSIGHT



Set your interview availability by COB April 14th

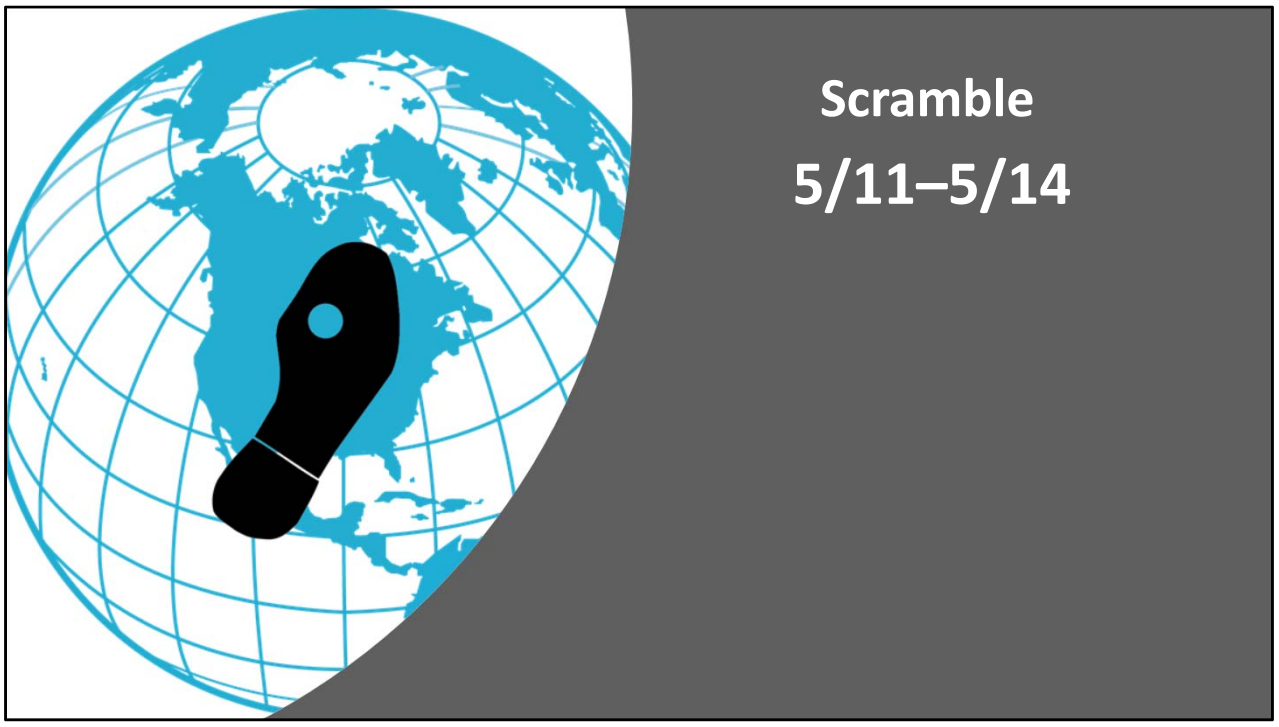
- The first task related to virtual interviews will be for you to set up your availability for the 3 weeks during the interview time period. You can enter your availability in eFMS as was done last year.
- Please submit your schedule by COB on April 14th.
- Incoming officers will select interview slots over the next two days. On Friday April 17th, you will be able to see your schedule in eFMS. You should then send individual invites, including Skype or Zoom information, to the officers.

AMERICAN OVERSIGHT

Scramble Survey

- When entering your interview availability, the system will also ask if you want your position to be entered into the scramble. In the event that an officer falls through the match, we will conduct a scramble in which the unmatched officers are given a list of unmatched positions that want to participate in the scramble rather than go unmatched. The officers and positions will then have a last opportunity to interview and match during this process.

AMERICAN OVERSIGHT



- From April 20th to May 7th you may conduct your interviews as scheduled using Skype or your preferred platform (e.g., Zoom).
- We want to ensure that interviews are as uniform as possible across positions and officers, so we ask that you conduct only the one 30 minute interview; please do not schedule additional interviews outside of the system with officers or conduct in-person interviews even if the officer is in Atlanta and available. You may, however, have as many people as you wish participate in the one interview.
- We also hope that you will be able to conduct video interviews rather than voice-only calls, but we understand that some who may be in the field may not be able to do this given speed of internet connections and other technical difficulties, so this will not be a requirement.

AMERICAN OVERSIGHT

- At any time after you complete all of your interviews, you may enter the ratings of the officers you interviewed in eFMS. Please have your ratings submitted by 2pm EST on May 7th. There will be a validation process where you will be asked to confirm your ratings and justify any zero scores. More information on this process will be forthcoming.

AMERICAN OVERSIGHT

If you elected to have your position participate in the scramble and you do not match, scramble interviews will be conducted between May 11th and the 14th, with final match to be completed by COB on the 14th.

AMERICAN OVERSIGHT

Match Notification

5/15

- We will notify the EAC, supervisors, and officers of the match results no later than May 15th.

AMERICAN OVERSIGHT

To Do Checklist

- ❑ Accept the Slack Invitation when it is sent out next week
- ❑ Post a message in your position's channel indicating contact preferences
- ❑ Review incoming officer CVs
- ❑ Plan your recruitment events
- ❑ Contact your EWB POC if you need assistance

AMERICAN OVERSIGHT

Questions?

For more information, contact CDC

Subject: RE: EIS Supervisor Seminar: EIS Conference and Match Orientation
Date: Tuesday, February 25, 2020 2:44:13 PM

Thanks, I didn't receive this!

-----Original Appointment-----
From: Foster, Monique Aaron (CDC/DDID/NCHHSTP/DVH) <ydg9@cdc.gov> **On Behalf Of** EIS (CDC)
Sent: Tuesday, February 25, 2020 2:20 PM
To: Gupta, Neil (CDC/DDID/NCHHSTP/DVH); Harris, Aaron M. (CDC/DDID/NCHHSTP/DVH)
Subject: FW: EIS Supervisor Seminar: EIS Conference and Match Orientation
When: Wednesday, March 18, 2020 1:00 PM-2:00 PM (UTC-05:00) Eastern Time (US & Canada).
Where: Adobe Connect Webinar
Importance: High

Not sure if you already received this but wanted to pass this along as I'll be deployed for COVID-19 on this day. If it's slow at the quarantine station I'll try to join remotely.

Regards,
Monique

Subject: EIS Supervisor Seminar: EIS Conference and Match Orientation
When: Wednesday, March 18, 2020 1:00 PM-2:00 PM (UTC-05:00) Eastern Time (US & Canada).
Where: Adobe Connect Webinar
Importance: High

*****This seminar is primarily for supervisors who have been approved to match at the 2020 EIS Conference; however, all supervisors are welcome to participate. As a reminder, final dispositions on approvals to participate in the 2020 EIS match will be sent on March 9.*****

EIS Supervisors –

Do you have questions about the 2020 EIS Conference and match?
Would you like to become familiar with the recruitment venue?
Would you like to see an overview on how to schedule interviews, and assign and enter your match scores?

Then please join us for the next EIS Supervisor Seminar, where we will be discussing the EIS Conference and match!

During the seminar, we will review 2020 EIS match process, including the recruitment venue, how to enter your interview slots, and how to enter your scores.

If you already have questions about EIS Conference or match that you would like addressed during the seminar, please send them ahead of time to Larry Cohen at cbu1@cdc.gov. We will compile the submitted questions and answer them during the seminar.

AMERICAN OVERSIGHT

We look forward to your participation at the next EIS Supervisor Seminar!

Thank you,
EIS Program

Subject:	RE: Examples of good state support for IR testing
Date:	Tuesday, March 3, 2020 10:22:18 AM

Good morning Bob,

The three states that I recommend are Florida, Mississippi, and Louisiana.

Florida contact is Dr. Carina Blackmore. Blackmore, Carina (CDC flhealth.gov) carina.blackmore@flhealth.gov
In this model, the State DOH received Zika and then Hurricane Funding that supported a contract with the University of Florida, Florida Medical Entomology Laboratory to conduct state-wide testing on Aedes aegypti, Aedes albopictus, and Culex spp.

Mississippi contact is Dr. Wendy Varnado. Varnado, Wendy Wendy.Varnado@msdh.ms.gov

Louisiana contact is Chrissie Waldron-Scott. Christine Scott-Waldron Christine.Scott-Waldron@la.gov
The State DOH has contracted with Louisiana State University to start testing this year.

Let me know if you need additional information.

Roxanne

Hi Roxanne,

AMERICAN OVERSIGHT

ASTHO is working on a document to promote state health departments to support Insecticide Resistance testing. I think it would be valuable to include a few brief examples or mini-case studies of different state approaches to IR. Can you suggest 3 states that other states may want to model? Do you have information on who to contact?
Thanks,
Bob Vanderslice

Subject: FL Call Follow-up

Hello Everyone,

Thank you for chatting with us today.

As I mentioned the CDC Healthcare Infection Control can be reached for further TA via eocevent141@cdc.gov or via phone at 404-414-8385

I think your biggest challenge is going to be figuring out the contracted staff and how they have interacted with other facilities. It would be reasonable to apply many of the below listed concepts to other at risk facilities based upon how these staff moved to detect cases earlier among residents and staff. If helpful someone from our team developed a rapid facility phone assessment which could be deployed (attached).

Here are some good links:
LTC guidance which can apply to AL: https://www.cdc.gov/coronavirus/2019-ncov/healthcare-facilities/prevent-spread-in-long-term-care-facilities.html
General IPC guidance: https://www.cdc.gov/coronavirus/2019-ncov/infection-control/control-recommendations.html
Criteria for return to work for HCP (healthcare personnel): https://www.cdc.gov/coronavirus/2019-ncov/healthcare-facilities/hcp-return-work.html

Please remember many of the docs I have attached are not CDC cleared. Some were created as tools by our field team or by other jurisdictions so feel free to modify to your own needs.

A couple important points and lessons learned from other states:

1. Ensure a good active monitoring system for residents (at least once a day although more often if possible). They should be mindful (as you know) the elderly may present in other and

AMERICAN OVERSIGHT

potentially less dramatic fashion especially if they have baseline lung disease. I have attached a symptom/temp checking that we created for HCP but could be modified for use with residents.

2. Likewise a good monitoring system for all HCP is key. They should be self-monitoring with delegation (i.e., they know who to call with symptoms) when at home and then have a symptom/temp check before starting their shift. This pre-shift check could happen upon facility arrival or via something like facetime before leaving for work. Just make sure they take their temp and show while on facetime.
3. Implement universal masking for HCP while in the facility. Attached is a PPE strategy for LTC which accounts for shortages in gowns and extend use of masks and eye protection. In addition, I have attached some docs about general PPE for all HCF which we do expect to be posted to the web soon.
4. Ideally gowns, gloves, mask/respirator, eye should be used for all cases, PUIs, and anyone with unknown respiratory illness. Again may need to refer to the PPE strategy doc if not doable. NTEC has a good video that helps with donning and doffing: https://repository.netecweb.org/items/show/688
5. Restrict visitors. Any visitor that must enter should have symptom/temp check, masked, and controlled movement in and out of resident rooms. I have attached an example letter to families that can be modified.
6. Restrict resident movements, no congregate settings.
7. I have attached some cleaning consideration as well to include the use of nursing/CNAs to wipe high touch surfaces for cases or PUIs instead of EVS.
8. I have also attached a line list if you want it.
9. Contact tracing and risk assessment is not practical in this setting and ideally time should be spent in the above activities plus IPC. We understand that work restricting staff may shutter the entire facility and thus the emphasis of the good monitoring of HCP. We discuss this in the new risk assessment at the very bottom of the page: https://www.cdc.gov/coronavirus/2019-ncov/hcp/guidance-risk-assesment-hcp.html
10. You and other PH staff should be wearing a facemask when you enter the facility and institute self-monitoring as well.

Please feel free to reach out with questions.

Best,
Elizabeth and Nicola

Subject: RE: FL request for CDC assistance

Carina,
In response to your question about assessing risk level of contacts, below is the approach that we have been using. Please let me know if you have additional questions. When you have time, I'd be interested in following up on the questions about port workers.
Stephanie

How contacts are assessed: There is not a precise time-defined criteria for determining what is "prolonged" contact. Low risk is generally considered to be very brief interactions such as a brief greeting conversation, handshake, generally of less than 10 minutes. Medium risk exposures typically include those that include an interaction of 30 minutes or longer within 6 feet such as eating a meal together. Types of exposures that fall between are assessed on a case by case basis and take into consideration careful assessment of all aspects of the interaction including whether the case was symptomatic and how close the contact was to the case.

https://www.cdc.gov/coronavirus/2019-ncov/php/risk-assessment.html

Close contact in the guidance above is defined as 1) being within approximately 6 feet of a COVID-19 case for a prolonged period of time; close contact can occur while caring for, living with, visiting, or sharing a healthcare waiting area or room with a COVID-19 case or 2) having direct contact with infectious secretions of a COVId-19 case (e.g. being coughed on).
Medium risk exposures include "Being on an aircraft, being seated within 6 feet of a traveler with symptomatic lab-confirmed COVID-19 infection…".
Low risk exposures include "Being in the same indoor environment as a person with symptomatic lab-confirmed COVID-19 for a prolonged period of time but not meeting the definition of close contact

Ok. I am not familiar with that request. What we are interested in is a consult. We had a call the other night and had discussed a follow up call. I was working with someone else on that. Who made the request. Do you know.

Subject: FL request for CDC assistance

Dr. Blackmore,
I wanted to follow up on a call we had received through our EOC that Florida may have questions or possibly want assistance in investigating recent reports of cases of COVID-19 in Florida related to cruise port workers in Broward County. Please call me when it's convenient for you.
Thank you,
Stephanie

Scott –

Runa referred your email to me as we are trying to consolidate our state communication to the extent possible to help expedite responses.

When you say you haven't heard any summaries of private provider calls directly to CDC, I am not sure if you referring to getting testing results from PUIs or knowing that a provider has called to inquire about a patient potentially meeting criteria to be a PUI.

For the former, we have identified that there is an issue with the eLIMS automatic reporting feature. In the interim, until the issue is resolved, we are emailing negative nCoV PCR results to the public health lab submitter email that is included with the specimen. Official reports will follow when the eLIMS issue is resolved. The lab is testing throughout the weekend and we email the negative results out as soon as we get them.

If your question is about providers that might have called about a potential PUI, when that occurs, the provider is being instructed to contact the health department.

If I have not answered your question or if you have additional questions, don't hesitate to reach out.

Thanks,
Alicia Budd

Thanks. We still haven't heard any summaries of private provider calls directly to CDC. We really need to have the is information.

Hi Scott,

We are staffed 24/7. I apologize for the delay, we are looking into why it occurred. I believe our on-call staff spoke with your department this morning. Please let me know if any questions or concerns remain.

Sincerely,
Runa

Subject: EOC PUI team Questions

Hi Runa,
What are the working hours of the EOC PUI team? FL has been waiting in a call on a PUI since around 8pm last night.

Also, when does CDC anticipate ending the request to call for every PUI?

Sincerely

Scott Pritchard, MPH
Interim Director
