Subject:	Week 6, 2020 Florida Flu Review
Date:	Wednesday, February 12, 2020 4:05:55 PM
Attachments:	Week 6, 2020 Florida Flu Review.pdf

Good Afternoon!

Attached is the Week 6, 2020 Florida Flu Review.

Activity was stable in week 6 and remained at the highest level observed so far this season. Increases were observed in most regions of the state. Elevated activity is still expected for several more weeks.

Twenty-nine outbreaks were reported, down from 35 outbreaks in the previous week. Of the 29 outbreaks reported, 10 were influenza-associated and 19 were ILI.

No new influenza-associated pediatric deaths were reported. Seven influenza-associated pediatric deaths have been reported so far this season, all in unvaccinated children.

Influenza A 2009 (H1N1) remained the predominant strain. Earlier in the season, influenza B Victoria lineage viruses were predominant. Influenza B Victoria lineage viruses continue to circulate at lower levels.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. Vaccination should continue as long as influenza viruses are circulating. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions). On January 10, 2020, CDC issued a health advisory reminding clinicians that influenza B viruses can cause severe illness in people of all ages and reiterating vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

On February 21, 2020, CDC issued interim vaccine effectiveness (VE) estimates for the 2019-20 influenza season. For all ages, the VE was 45% (95% confidence interval [CI] = 36-53%) against any influenza virus illness and was 55% (95% CI = 42-65%) among children six months to 17 years (www.cdc.gov/mmwr/volumes/69/wr/pdfs/mm6907a1-H.pdf).

On January 10, 2020, CDC issued a health advisory reminding clinicians to reiterate vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

AMERICAN OVERSIGHT

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Thank you!

Good afternoon!

Attached is the Week 8, 2020 Florida Flu Review.

Week 8 influenza & influenza-like illness (ILI) activity summary:

Activity decreased in week 8 and remained above peak levels observed in the 2016-17 and 2018-19 seasons. Decreases were observed in all regions of the state. Elevated activity is still expected for several more weeks.

Eighteen outbreaks were reported, down from 24 outbreaks in the previous week. Of the 18 outbreaks reported, 12 were influenza-associated and six were ILI.

No new influenza-associated pediatric deaths were reported. Nine influenza-associated pediatric deaths have been reported so far this season; only one child was vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On February 21, 2020, CDC issued interim vaccine effectiveness (VE) estimates for the 2019-20 influenza season. For all ages, the VE was 45% (95% confidence interval [CI] = 36-53%) against any influenza virus illness and was 55% (95% CI = 42-65%) among children six months to 17 years (www.cdc.gov/mmwr/volumes/69/wr/pdfs/mm6907a1-H.pdf).

Subject:	What Governors Need to Know - HHS Issues New COVID-19 Resources
Date:	Wednesday, March 11, 2020 1:12:31 PM
Attachments:	PRELIMINARY - NOT FOR FURTHER DISCLOSURE Initial State and Local Funding.pdf

Dear Governor:

Thank you for your continued engagement and partnership with us to address and mitigate the spread of COVID-19.

As you might imagine, a number of HHS divisions are releasing COVID-19-related information on funding and guidance. We thought it would be helpful to batch up information on key issues to keep you up-to-date.

Funding for States to Address COVID-19

Perhaps of keenest interest to you and your health officials is an update on funding for states and communities to address mitigation of COVID-19.

Today, at 1 PM EST HHS will be announcing that more than $560 million will be made available to the 62 entities which have existing cooperative agreements with the CDC through its Public Health Emergency Program, known as "PHEP."

The $8.3 billion dollar Supplemental passed by Congress included statutory language which prescribed the exact formula for disbursing the money: states will receive 90% of their 2019 CDC PHEP grants. So that you know what your state will receive, we have attached a document identifying the amounts going to states, territories, or cities. This marks the first tranche of funding to states from the $8.3 billion supplemental. Your state health officers are receiving a letter today from CDC outlining what is needed to receive the funding, essentially they need to submit a spend plan and they will receive guidance on what that spend plan should contain.

Helping Communities Know Mitigation Strategies

Yesterday, CDC released their "Implementation." Essentially, this is a guide for communities describing possible mitigation strategies for communities dealing with transmission at three different levels: (1) None/Minimal, (2) Moderate, or (3) Substantial. Community mitigation strategies, which are non-pharmaceutical interventions, are often the most available interventions to help slow the transmission of COVID-19 in communities. The Mitigation Plans include a set of actions that persons and communities can take to slow the spread of respiratory virus infections. The Community Mitigation Plan can be found here.

Guidance on Infection Control For Healthcare Workers

Yesterday, CDC released updated guidance on infection prevention and control recommendations. Healthcare workers are fighting this outbreak on the front lines, and this guidance is intended to provide assistance to healthcare settings that are handling suspected or confirmed cases of COVID-19. This guidance is applicable to all U.S. healthcare settings, but not for non-healthcare settings. There is separate guidance for that. The new guidance on infection control can be found here.

AMERICAN OVERSIGHT

OMB Flexibilities
On March 9, 2020, OMB issued a memo that provides administrative relief for recipients and applicants of Federal financial assistance who are directly impacted by COVID-19. The grant flexibilities include 10 actions that HHS can take to provide short-term administrative and financial management relief, allowing funds to be awarded quicker and giving grantees the ability to focus on their critical response, research, or services. More information can be found here.

General Preparation Information: On March 9, 2020, the White House Coronavirus Task Force released practical steps that we recommend posting and sharing to keep workplaces, school, home and commercial establishments safe. This information can be found here.

CMS Specific Guidance:

- **CMS Guidance on Masks:** On March 10, 2020, CMS released guidance updating recommendations to expand the type of facemasks healthcare workers can use in situations involving COVID-19. This guidance aligns with the information by CDC regarding personal protective equipment as well. The memo sent to State Survey Agency Directors can be found here.

- **CMS FAQs on Suspension of Non-Emergency Survey Inspections**: On March 10, 2020, CMS released a frequently asked questions document to further explain the changes in guidance issued on March 4 that suspends all non-emergency survey inspections. This guidance and FAQ will help to enable State Inspectors to address the spread of COVID-19. The FAQ document can be found here.

- **CMS Nursing Home Guidance:** As you know, nursing homes and their residents are vulnerable populations for COVID-19. This week, CMS released updated guidance for infection control and prevention of COVID-19 in Nursing Homes which can be found here (3/9). The Press Release can be found here and all CMS guidance related to COVID-19 can be found here.

If you have any questions on these items or other issues, please feel free to reach out.

Thanks,

Darcie L. Johnston
Director, Intergovernmental Affairs
U.S. Department of Health and Human Services
Darcie.Johnston@hhs.gov

Subject:	[IMPORTANT UPDATE] FDA Issues New Policy to Help Expedite Availability of Diagnostics
Date:	Saturday, February 29, 2020 6:57:03 PM

Dear Partner –

Today, as part of the U.S. Food and Drug Administration's ongoing and aggressive commitment to address the coronavirus outbreak, the agency issued a new policy for certain laboratories seeking to develop diagnostic tests for coronavirus in order to achieve more rapid testing capacity in the U.S.

The new policy is for certain laboratories that develop and begin to use validated COVID-19 diagnostics before the FDA has completed review of their Emergency Use Authorization (EUA) requests. The immediately in effect guidance issued today describes the circumstances where the FDA does not intend to object to the use of these tests for clinical testing while the laboratories are pursuing an EUA with the FDA. Importantly, this policy only applies to laboratories that are certified to perform high-complexity testing consistent with requirements under Clinical Laboratory Improvement Amendments.

The FDA guidance provides recommendations for test developers, including information regarding test validation, FDA notification and interim confirmatory clinical testing. Following the completion of their test validation, laboratories should communicate with the FDA, via email, in order to notify the agency that the test has been validated. Laboratories should submit a completed EUA request within 15 business days of notification.

Subject:	[IMPORTANT UPDATE] FDA Issues New Policy to Help Expedite Availability of Diagnostics
Date:	Saturday, February 29, 2020 6:56:10 PM

Dear Partner –

Today, as part of the U.S. Food and Drug Administration's ongoing and aggressive commitment to address the coronavirus outbreak, the agency issued a new policy for certain laboratories seeking to develop diagnostic tests for coronavirus in order to achieve more rapid testing capacity in the U.S.

The new policy is for certain laboratories that develop and begin to use validated COVID-19 diagnostics before the FDA has completed review of their Emergency Use Authorization (EUA) requests. The immediately in effect guidance issued today describes the circumstances where the FDA does not intend to object to the use of these tests for clinical testing while the laboratories are pursuing an EUA with the FDA. Importantly, this policy only applies to laboratories that are certified to perform high-complexity testing consistent with requirements under Clinical Laboratory Improvement Amendments.

The FDA guidance provides recommendations for test developers, including information regarding test validation, FDA notification and interim confirmatory clinical testing. Following the completion of their test validation, laboratories should communicate with the FDA, via email, in order to notify the agency that the test has been validated. Laboratories should submit a completed EUA request within 15 business days of notification.

The link to the full press release is here.

From: Baker, Michael (OS/IEA)
To: Baker, Michael (OS/IEA)
Subject: [RELEASE] - HHS Awards $117 Million to End the HIV Epidemic in the United States
Date: Wednesday, February 26, 2020 10:59:31 AM

Dear Partner –

Today, the U.S. Department of Health and Human Services (HHS), through the Health Resources and Services Administration (HRSA), awarded approximately $117 million to expand access to HIV care, treatment, medication, and prevention services. This investment is a critical component of the Administration's *Ending the HIV Epidemic: A Plan for America (EHE)* initiative, which aims to reduce the number of new HIV infections in the United States by 90 percent by 2030.

The EHE initiative and today's awards focus on 48 counties, Washington, D.C., and San Juan, Puerto Rico, geographic areas where more than 50 percent of new HIV diagnoses occurred in 2016 and 2017, as well as the seven states with a substantial rural HIV burden.

"HRSA is a leader in working to end the HIV epidemic in the U.S.," said HHS Secretary Alex Azar. "These investments will support partnerships between organizations that are on the front lines of preventing and reducing HIV transmission, as well as improving the overall health outcomes for people with HIV."

HRSA's Health Center Program awards will be used to identify at-risk individuals and engage in preventive services, test for HIV, and prescribe pre-exposure prophylaxis (PrEP) when appropriate. Awards made to HRSA's Ryan White HIV/AIDS Program recipients will be used to link people who are either newly diagnosed with HIV, or diagnosed but currently not in care, to essential HIV care, treatment, and support services, helping them reach viral suppression and reduce HIV transmission.

For further discussion on this announcement, we invite you to a stakeholder call TODAY, February 26, 2020 with HRSA Administrator Tom Engels. Details can be found below:

Date: February 26, 2020
Time: 4:00 PM EST
Number: 888-790-3548
Passcode: 2511315

For a list of award recipients, visit:

Subject:	cancellation of EIS and LLS regional trainings - EIS and LLS needed for COVID-19 response
Date:	Thursday, March 5, 2020 12:15:58 PM

EIS and LLS,

The top priority for CDC right now is supporting the response to COVID-19. As EIS officers and LLS fellows, you are essential for the response. About 75% of EIS officers and LLS fellows have already or are currently deployed to support an EOC activation (COVID-19, Ebola, and polio). EIS officers and LLS alumni from both programs are fully engaged and making major contributions at all levels of these activations.

We are **canceling the EIS Regional trainings in Atlanta and Phoenix** given the prioritization of COVID-19 and the number of EIS officers and LLS fellows, supervisors, and EWB staff currently deployed and likely to be deployed in the coming weeks.

Our top priority is the COVID-19 response and other essential duties related to your assignments. At this time, we do not have the luxury of taking you away from your assignments for a week of training. Please note the following:

- In times of urgent need, the EIS and LLS Programs reserve the right to unilaterally assign an EISO or LLS fellow to a field team or other emergency response activity without first seeking supervisory approval. At this time, we expect all EIS officers and LLS fellows to support the COVID-19 response and some of you may be asked to deploy repeatedly. **We are asking all supervisors to support the need for EIS and LLS to deploy**.

- If you are deploying, you should NOT be concerned about CAL completion or EIS conference presentations – if COVID-19 interferes with CAL completion we will work with you on a case by case basis. EIS or LLS program requirements should not interfere with your availability to deploy.

- Field officers who are already working on the response in your assigned jurisdiction are not expected to deploy elsewhere.

- EIS conference is currently scheduled as originally planned. We will notify you as soon as possible if we expect any changes to the conference.

- We will identify alternatives to allow you to practice and get feedback on your EIS conference presentations. We will also determine alternatives for EIS and LLS rounds.

We understand that many of you will be disappointed Regional Trainings are cancelled. We also know that many of you are pushing yourselves (including EIS and LLS supervisors) to support the

AMERICAN OVERSIGHT

response and keep up with your regular duties. We hope we have alleviated any concerns about needing to focus on EIS conference presentations for the time being. We encourage you to reach out for support from your classmates, supervisors, and staff within EWB should you need it. We also encourage you to speak with EOC resiliency coordinators, be aware of deployment resources, and take advantage of the Employee Assistance Program (EAP).

You were all selected for EIS or LLS because of your ability to thrive in a response environment. Your contributions are recognized and valued by CDC leadership. Thank you for your selflessness and service to CDC and our local, state, and international partners.

Respectfully,
Eric

Hi everyone,

I hope you are doing well in what is undoubtedly a stressful and busy time for all of you. I know you are all working hard, and I'd like to thank you for all you're doing for the health of residents in your state and the country.

I wanted to ask you to check in when you can by phone or email and let me know how you're doing. Right now we are assuming you are in full response mode and don't have time to work on other activities, so I won't be contacting you to ask how your CALs are going. Of course, if you do need assistance with anything or are planning any coronavirus-related products such as MMWRs or manuscripts, please let me know.

I'm attaching a sample project determination for coronavirus. When time permits if you haven't already (I know public health response takes precedence and that you might not have time to do this right now), please submit a project determination for your activities.

Hang in there, everyone, and stay safe and healthy.

Subject: disinfection of PPE
Date: Sunday, March 22, 2020 2:22:15 PM

Howdy,
I am assuming you, like me, are knee deep in the COVID response.
Do you by any chance know who I could talk to about using UV light to disinfect PPE? I am guessing that hard surfaces (plastic) might work but what about cloth ? (masks/ gowns)
Any intel on this would be helpful

Thanks a lot. Thankful to have wise friends
Carina

Subject:	how to handle any COVID-19 speaking requests
Date:	Friday, February 28, 2020 5:04:54 PM
Attachments:	Dr Schuchat_COVID-19_2020.jpg

Dear EISOs and LLS Fellows,

As the response to COVID-19 continues to evolve, it is increasingly likely that many of you (especially EISOs and LLS assigned to states) will be approached to participate in media interviews. During any emergency response that requires the activation of CDC's EOC, all communication functions are handed through the Joint Information Center (JIC) in the EOC. Decisions about who may serve as a CDC spokesperson with regard to media interviews are made by the public affairs specialists working in the JIC in collaboration with the Indecent Manager and CDC leadership. Those decisions are also guided by HHS's Office of the Assistant Secretary for Public Affairs (ASPA).

During EOC-led responses, a very limited number of spokespeople are approved to speak to media on behalf of CDC. In a rapidly evolving emergency response, it is critical that our messages remain as consistent as possible, are based on the most current information, and include important framing and nuances. The staff best positioned to deliver these nuanced messages are on all the calls, involved in all the conversations, and briefed on every aspect of the response = senior leaders at CDC (picture attached of EIS alum delivering key messages).

Please understand we want you to have as many opportunities as possible to talk with media about your work. This is a time when it's in the best interest of the agency and the public to limit the number of people talking to media for the reasons described above. This is also in your best interest, as it helps ensure that you will not be put in the position of being asked to speak and comment about things that are beyond the scope of your specific work. When media quote a CDC employee, that employee is invariably presented as speaking on behalf of the entire agency. Asking you to speak now offers far more risk than benefit given the fast-moving and politically complicated nature of the response.

Guidance is being developed and will be issued soon for all staff deployed to the field. **Any requests to speak about COVID-19 should be directed to the following address** eocjicmedia2@cdc.gov. Thanks for your cooperation and contributions to a complicated and ever evolving response.

For those of you that get a good weekend, have a good weekend. For those of you working – thanks for your service on behalf of EIS/LLS and CDC.

Regards,
Eric

AMERICAN OVERSIGHT

Subject: information received from one of our SME"s
Date: Monday, March 16, 2020 9:53:58 AM

To all of the fine health care providers and emergency management professionals that we have had the opportunity to train, coach and interact with during the past several years. Please be assured that we appreciate the very critical work you are doing and know that you are in our thoughts and prayers as we go through the coronavirus pandemic. We realize that we had seen an increase in health care providers and emergency managers in our region of the state for incident management classes. We commend you for your interest and participation in these classes and hope that you will be able to utilize the information that we have given you.

As you go through the next several weeks, we wanted to remind you of some of the lessons that we stress on lengthy incidents:

1) Take care of your personal health and well being first and foremost. Get appropriate rest and if you are traveling to areas away from home to work be sure your kit is ready to go with any needed supplies.

2) If you are working with a group **watch out for each other**. Remember that your team is only as strong as the weakest member. There will be long hours, stressful situations and different team members may be struggling at different times. Get them help to overcome the issues that they are having at the time.

3) Watch vehicle travel when you are tired. Carpool when you can and pull over and rest if you are sleepy. We don't want to lose you on the highway.

4) Meet with your group periodically to discuss issues that can potentially help your team members function more efficiently. What are the alligators out there that may affect us today, tomorrow, and next week? Stay ahead of the situation.

5) Maintain your situational awareness. Be aware of what is happening in the vicinity you are working. Constantly reassess the information you are receiving and determine what is important and what isn't.

6) Communication is critical to being successful on a team of responders. Communicate often and openly and get the critical information to those who need it.

7) Fill out the necessary positions on you teams so that those in Command and General Staff positions are not overwhelmed doing tasks that should be accomplished by subordinates.

8) Have a plan and share it with all of the team members, get buy-in and look at all options. Remember to avoid groupthink.

Your work over the next weeks is going to be critical to the communities that we live and work in. Should you feel the need for mentoring or have open task books that need to be

AMERICAN OVERSIGHT

signed off we would be pleased to help you with these tasks. Again, please know that we appreciate each of you and look forward to our next opportunity visit again. Please reach out to us if we can help you with any Incident Management Resources.

Date:	Wednesday, March 25, 2020 7:56:25 PM

All

Many of our states are asking about the reagents and why are they not available to the public health lab **it is a supply and demand issue.**
Supply is low and demand is high - here is some info on an alternate reagent recipe for public health labs. Also including a FAQs sheet from FDA.

Here is the FDA FAQ site with alternative extraction reagents: https://www.fda.gov/medical-devices/emergency-situations-medical-devices/faqs-diagnostic-testing-sars-cov-2#whatif

If they want to use alternate reagents not already accepted by FDA, that would be considered a "Laboratory Developed Test", FDA guidance is at www.fda.gov/regulatory-information/search-fda-guidance-documents/policy-diagnostic-tests-coronavirus-disease-2019-during-public-health-emergency, and

FAQ's at https://www.fda.gov/medical-devices/emergency-situations-medical-devices/faqs-diagnostic-testing-sars-cov-2#clinicallaboratories

Attachments:	Site Visit External 2020 Florida_Torres.docx

Dear Dr. Blackmore and Dr. Stanek,

Thank you very much for hosting me for my site visit to FDOH last month to discuss Yari's EIS experience and how the Epidemiology Workforce Branch and FDOH can continue to work together to provide an excellent experience for future EISOs. I really appreciate you spending the day with me and enjoyed meeting you and FDOH staff in person.

Attached is an site visit report summarizing my meetings and the visit. The report is essentially the same as the internal report (I removed the logistics section pertaining to lodging and transportation and revised the wording in several spaces to improve clarity). One item we didn't discuss during the meeting but that has come up internally afterwards was the potential involvement of local health departments to improve field investigation opportunities. Would staff in Miami or Orlando, for example, have interest in setting up an arrangement to host an EISO to assist with field investigations?

Thank you again for meeting me, and please don't hesitate to contact me with questions or comments about the site visit report or any other concerns you have.

Regards,

Suzanne Beavers

Dear Colleagues:

Attached are the **CDC COVID-19 Key Points for March 3rd, 2020**. Feel free to share with partners and appropriate parties.

Kind Regards,

State Coordination Task Force

(Sent by BCC to PHEP directors, state epidemiologists, state health officials, public health laboratory directors, BCHC, and national and federal partners)

AMERICAN OVERSIGHT

CDC Daily Key Points

Coronavirus Disease 2019 ("COVID-19") Outbreak

March 03, 2020

Updated text is shown in colored text.

SNAPSHOT

CDC has reported:

- 60 confirmed and presumptive positive cases of COVID-19
- 6 COVID-19 related deaths
- 12 states reporting cases of COVID-19

MAIN KEY POINTS

- There is an expanding global outbreak of respiratory illness called COVID-19 caused by a novel (new) coronavirus.
- Community spread is being detected in a growing number of countries, including in parts of the United States.
- There are 60 reported U.S. cases of COVID-19 from 12 states.
- The potential public health threat posed by COVID-19 is high, both globally and to the United States. Individual risk is dependent on exposure.
- Under current circumstances, certain people will have an increased risk of infection. For example:
    - People in communities where ongoing community spread with the virus that causes COVID-19 has been reported are at elevated though still relatively low risk of exposure.
    - Healthcare workers caring for patients with COVID-19 are at elevated risk of exposure.
    - Close contacts of persons with COVID-19 also are at elevated risk of exposure.
    - Travelers returning from affected international locations where community spread is occurring also are at elevated risk of exposure.
- Public health efforts at this time are focused concurrently on containing spread of this virus and mitigating the impact of this virus.
- At this time, there is no vaccine to protect against COVID-19 and no medications approved to treat it.
- Nonpharmaceutical interventions are actions, apart from getting vaccinated and taking medicine, that people and communities can take to help slow the spread of respiratory illnesses like COVID-19.
- Currently they are the most important response strategy against COVID-19.
- All communities can take measures to reduce the spread of COVID-19. Everyone has a role to play in getting ready and staying healthy.

SITUATION UPDATE

- On March 3, a *Morbidity and Mortality Weekly Report* (*MMWR*) Update was published titled "Active Monitoring of Persons Exposed to Patients with Confirmed COVID-19 — United States, January–February 2020." (See Section "MMWR Update.")

AMERICAN OVERSIGHT

- As of March 3, 2020, 68 international locations (including the U.S.) have reported confirmed cases of COVID-19.
- 60 reported cases of COVID-19 have been detected in Arizona, California, Florida, Georgia, Illinois, Massachusetts, New York, New Hampshire, Oregon, Rhode Island, Washington and Wisconsin.
    - 11 of these cases occurred through person-to-person spread.
    - 22 cases all were in persons who had travel to China.
    - 27 cases where the source of exposure is still under investigation.
- As of March 3, CDC issued Travel Health Notices for the following locations:
    - Level 3 Travel Health Notice (avoid non-essential travel): China, Iran, South Korea, and Italy
    - Level 2 Travel Health Notices (Practice Enhanced Precautions): Japan
    - Level 1 (practice usual precautions): Hong Kong
- CDC also recommends that all travelers reconsider cruise ship voyages into or within Asia at this time.
    - This is consistent with guidance by the U.S. State Department.
- The situation is rapidly evolving. CDC is constantly reviewing and updating its guidance as needed.

REPORTING

- More public health laboratories are able to test for the virus that causes COVID-19, and they are reporting their results publicly.
- Because states are reporting publicly directly, sometimes in near real-time, CDC case counts may be different from what states, local authorities, or media are reporting.
- If there are discrepancies between case counts reported by state or local officials versus CDC reported numbers, the numbers provided by states will be the most up-to-date.
- State health laboratories are reporting their results to CDC.
- CDC is consolidating state reports and combining them with CDC confirmed test results and presenting a national aggregated case count daily from Monday through Friday.
- Case counts submitted to CDC by 4pm the prior day will be posted at noon.
- CDC is reporting cumulative confirmed and presumptive positive cases of COVID-19 in the United States since January 21, 2020.
- CDC is presenting data related to people who were repatriated via U.S. State Department flights from Wuhan, China and from the Diamond Princess cruise ship (Japan) in a separate chart available on the CDC website.
- CDC has discontinued reporting of the numbers of persons under investigation (PUIs) tested and those that tested negative.
- Now that states are testing and reporting their own results, CDC's numbers will not be representative of all the testing being done nationwide.

AMERICAN OVERSIGHT

MMWR UPDATE:

- On March 3, a *Morbidity and Mortality Weekly Report* (*MMWR*) Update was published titled "Active Monitoring of Persons Exposed to Patients with Confirmed COVID-19 — United States, January–February 2020."
- This MMWR report summarizes the thorough steps that were taken during the early days of the COVID-19 response to track the country's first the first 10 travel-related and the first 2 person-to-person (secondary from those travel-related cases) and their close contacts.
- CDC supported state/local public health officials as they tracked 445 close contacts of the first U.S. cases.

WHAT YOU CAN DO

- Everyone can do their part to help us respond to this emerging public health threat:
    - It's currently flu and respiratory disease season and CDC recommends getting a flu vaccine, taking everyday preventive actions to help stop the spread of germs, and taking flu antivirals if prescribed.
    - Individuals and communities should familiarize themselves with recommendations to protect themselves and their community from getting and spreading respiratory illnesses like coronavirus disease 2019.
    - If you are a healthcare provider, be on the look-out for people who have been in close contact with a person known to have COVID-19, and people who live in or have recently been in an area with ongoing spread, and have fever and respiratory symptoms.
    - If you are a healthcare provider caring for a COVID-19 patient or a public health responder, please take care of yourself and follow recommended infection control procedures.
    - If you have recently been to an area with ongoing spread of COVID-19 or have been exposed to someone sick with COVID-19 in the last 14 days, you may face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus. If you develop COVID-19 symptoms, contact your healthcare provider, and tell them about your symptoms and your travel or exposure to a COVID-19 patient.
    - For people who have had close contact with someone with COVID-19 who develop symptoms, contact your healthcare provider, and tell them about your symptoms and your exposure to a COVID-19 patient.
    - For people who are ill with COVID-19, please follow CDC guidance on how to reduce the risk of spreading your illness to others.

CDC ACTIONS

- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States to reduce the spread and the impact of this virus.

AMERICAN OVERSIGHT

- CDC is operationalizing all of its pandemic preparedness and response plans, working on multiple fronts to meet these goals, including specific measures to prepare communities to respond local transmission of the virus that causes COVID-19.
- Pandemic guidance developed in anticipation of an influenza pandemic is being repurposed and adapted for a COVID-19 pandemic.
- Public health partners are encouraged to review their pandemic preparedness plans at this time.
- CDC is aggressively responding to the global outbreak of COVID-19 and preparing for the potential of community spread in the United States.
- **CDC's Action for Preparing Communities for Potential Spread of COVID-19 include:**
  - Preparing first responders, healthcare providers, and health systems
  - Reinforcing state, territorial, and local public health readiness
  - Supporting communities, businesses, and schools

COMMUNITY BASED INTERVENTIONS (AKA COMMUNITY MITIGATION)

- Americans should be prepared for the possibility of a COVID-19 outbreak in their community. Everyone has a role to play.
- Currently a vaccine is not available for COVID-19. Until a vaccine is developed, community-based interventions, such as school dismissals, event cancellations, social distancing, plans to work remotely can help slow the spread of coronavirus.
- Your local public health department and community partners have been preparing for an event, like COVID-19 and have plans in place. Now is a good time for businesses, community and faith-based organizations, schools, and health-care systems to reexamine their preparedness plans to make sure they are ready.
- Strong community partnerships between local health departments, the health care sector, faith-based organizations, and other community partners are vital for this response, and will be necessary to prepare for and coordinate if an outbreak occurs.
  - Community-based interventions can be grouped in three categories:
    - Personal protective measures (e.g., voluntary home isolation of ill persons, voluntary home quarantine of exposed household members, covering nose/mouth when coughing or sneezing, hand hygiene, using face masks in community settings when ill)
    - Community measures aimed at increasing social distancing (e.g., school dismissals, social distancing in workplaces, postponing or cancelling mass gatherings)
    - Environmental measures (e.g., routine cleaning of frequently touched surfaces)
- CDC has recommendations to protect yourself and your community from getting and spreading respiratory illnesses like coronavirus disease 2019.

For more information please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

    - Level 1 (practice usual precautions): Hong Kong
- CDC also recommends that all travelers reconsider cruise ship voyages into or within Asia at this time.
    - This is consistent with guidance by the U.S. State Department.
- The situation is rapidly evolving. CDC is constantly reviewing and updating its guidance as needed.

REPORTING

- More public health laboratories are able to test for the virus that causes COVID-19, and they are reporting their results publicly.
- Because states are reporting publicly directly, sometimes in near real-time, CDC case counts may be different from what states, local authorities, or media are reporting.
- If there are discrepancies between case counts reported by state or local officials versus CDC reported numbers, the numbers provided by states will be the most up-to-date.
- State health laboratories are reporting their results to CDC.
- CDC is consolidating state reports and combining them with CDC confirmed test results and presenting a national aggregated case count daily from Monday through Friday.
- Case counts submitted to CDC by 4pm the prior day will be posted at noon.
- CDC is reporting cumulative confirmed and presumptive positive cases of COVID-19 in the United States since January 21, 2020.
- CDC is presenting data related to people who were repatriated via U.S. State Department flights from Wuhan, China and from the Diamond Princess cruise ship (Japan) in a separate chart available on the CDC website.
- CDC has discontinued reporting of the numbers of persons under investigation (PUIs) tested and those that tested negative.
- Now that states are testing and reporting their own results, CDC's numbers will not be representative of all the testing being done nationwide.

AMERICAN OVERSIGHT

MMWR UPDATE:

- On March 3, a *Morbidity and Mortality Weekly Report* (*MMWR*) Update was published titled "Active Monitoring of Persons Exposed to Patients with Confirmed COVID-19 — United States, January–February 2020."
- This MMWR report summarizes the thorough steps that were taken during the early days of the COVID-19 response to track the country's first the first 10 travel-related and the first 2 person-to-person (secondary from those travel-related cases) and their close contacts.
- CDC supported state/local public health officials as they tracked 445 close contacts of the first U.S. cases.

WHAT YOU CAN DO

- Everyone can do their part to help us respond to this emerging public health threat:
    - It's currently flu and respiratory disease season and CDC recommends getting a flu vaccine, taking everyday preventive actions to help stop the spread of germs, and taking flu antivirals if prescribed.
    - Individuals and communities should familiarize themselves with recommendations to protect themselves and their community from getting and spreading respiratory illnesses like coronavirus disease 2019.
    - If you are a healthcare provider, be on the look-out for people who have been in close contact with a person known to have COVID-19, and people who live in or have recently been in an area with ongoing spread, and have fever and respiratory symptoms.
    - If you are a healthcare provider caring for a COVID-19 patient or a public health responder, please take care of yourself and follow recommended infection control procedures.
    - If you have recently been to an area with ongoing spread of COVID-19 or have been exposed to someone sick with COVID-19 in the last 14 days, you may face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus. If you develop COVID-19 symptoms, contact your healthcare provider, and tell them about your symptoms and your travel or exposure to a COVID-19 patient.
    - For people who have had close contact with someone with COVID-19 who develop symptoms, contact your healthcare provider, and tell them about your symptoms and your exposure to a COVID-19 patient.
    - For people who are ill with COVID-19, please follow CDC guidance on how to reduce the risk of spreading your illness to others.

CDC ACTIONS

- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States to reduce the spread and the impact of this virus.

AMERICAN OVERSIGHT

- CDC is operationalizing all of its pandemic preparedness and response plans, working on multiple fronts to meet these goals, including specific measures to prepare communities to respond local transmission of the virus that causes COVID-19.
- Pandemic guidance developed in anticipation of an influenza pandemic is being repurposed and adapted for a COVID-19 pandemic.
- Public health partners are encouraged to review their pandemic preparedness plans at this time.
- CDC is aggressively responding to the global outbreak of COVID-19 and preparing for the potential of community spread in the United States.
- **CDC's Action for Preparing Communities for Potential Spread of COVID-19 include:**
  - Preparing first responders, healthcare providers, and health systems
  - Reinforcing state, territorial, and local public health readiness
  - Supporting communities, businesses, and schools

COMMUNITY BASED INTERVENTIONS (AKA COMMUNITY MITIGATION)

- Americans should be prepared for the possibility of a COVID-19 outbreak in their community. Everyone has a role to play.
- Currently a vaccine is not available for COVID-19. Until a vaccine is developed, community-based interventions, such as school dismissals, event cancellations, social distancing, plans to work remotely can help slow the spread of coronavirus.
- Your local public health department and community partners have been preparing for an event, like COVID-19 and have plans in place. Now is a good time for businesses, community and faith-based organizations, schools, and health-care systems to reexamine their preparedness plans to make sure they are ready.
- Strong community partnerships between local health departments, the health care sector, faith-based organizations, and other community partners are vital for this response, and will be necessary to prepare for and coordinate if an outbreak occurs.
  - Community-based interventions can be grouped in three categories:
    - Personal protective measures (e.g., voluntary home isolation of ill persons, voluntary home quarantine of exposed household members, covering nose/mouth when coughing or sneezing, hand hygiene, using face masks in community settings when ill)
    - Community measures aimed at increasing social distancing (e.g., school dismissals, social distancing in workplaces, postponing or cancelling mass gatherings)
    - Environmental measures (e.g., routine cleaning of frequently touched surfaces)
- CDC has recommendations to protect yourself and your community from getting and spreading respiratory illnesses like coronavirus disease 2019.

For more information please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

CDC Announces Additional COVID-19 Infections

At noon on Tuesday, March 3 the Centers for Disease Control and Prevention (CDC) reported 60 cases of COVID-19 from 12 states. Twenty-two of these cases are travel-related; 11 are believed to be person-to-person spread; and for the remaining 27 the source of exposure is still under investigation. Noteworthy developments in recent days include:

- Florida announced its first and second presumptive positive cases of COVID-19, one in a person with recent travel history (to Italy), the other with no currently known travel or contact history.
- Georgia announced its first and second confirmed cases of COVID-19, one is a person with recent travel history (to Italy), the other in a close contact of the first patient.
- New Hampshire also reported its first presumptive positive case of COVID-19 in a person with recent travel history (to Italy).
- New York state announced its first case of COVID-19 in a person with recent travel history (to Iran).
- Rhode Island announced its first presumptive positive case of COVID-19 in a person with recent travel history (to Italy).
- Washington state announced more cases of COVID-19 associated with an outbreak in a long-term care facility. Washington has announced it now has 14 cases of COVID-19, including 6 COVID-19 deaths.

The 12 states that have reported cases include: Arizona, California, Florida, Georgia, Illinois, Massachusetts, New Hampshire, New York, Oregon, Rhode Island, Washington, and Wisconsin.

As the outbreak of COVID-19 continues to expand and as testing capacity in the U.S. increases, CDC expects more cases to be detected across the country, including more instances of person-to-person spread in more states. While information so far suggests that most COVID-19 illness is mild, a report out of China suggests serious illness occurs in 16% of cases. Older people and people with certain underlying health conditions like heart disease, lung disease and diabetes, for example, seem to be at greater risk of serious illness.

The federal government has been working closely with state, local, tribal, and territorial partners, as well as public health partners, to prepare for and respond to this public health

AMERICAN OVERSIGHT

emergency. CDC expects additional instances of person-to-person spread in the coming days and weeks.

Cases reported to CDC include those confirmed by CDC as well as presumptive positive cases reported by states. A presumptive positive result is when a patient has tested positive by a public health laboratory, but results are pending confirmation at CDC. For public health purposes, a presumptive positive result using the CDC test is treated as a positive.

CDC will report total presumptive and confirmed cases weekdays at noon. This number is based on all state reports received by 4 p.m. the previous day. CDC is no longer reporting number of persons-under-investigation (PUIs) nor those PUIs that test negative because now that states are testing and reporting their own results, these numbers would not be representative of the testing being done nationally. States are reporting results quickly and in the event of a discrepancy between CDC and state case counts, the state case counts should always be considered more up-to-date.

For more information about COVID-19 visit www.cdc.gov/covid19.

Subject:	100% of EIS officers and LLS fellows are needed for the COVID-19 response
Date:	Wednesday, March 18, 2020 2:46:15 PM

EIS and LLS supervisors,

I am writing again, asking for your support in having EIS officers and LLS fellows deploy or take on other roles for CDC's response to COVID-19. I want to emphasize that **completing CALs (graduation requirements) should NOT factor into whether an EIS officer or LLS fellow deploys**. Supervisors should not be asking to review deployment roles or objectives before approving a deployment. In the past we wanted to ensure deployments aligned with our training objectives. We no longer have that luxury, the primary responsibility of the EIS and LLS programs needs to be supporting the response until we are informed otherwise.

We will deal with CAL completion and how COVID-19 might impact graduation on a case-by-case basis. I want to assure you we will be very understanding in finding ways to compensate if involvement with the COVID-19 response prevented anyone from fulfilling the requirements to graduate.

We understand that some EISOs or LLS fellows may not be able to deploy to the field because of obligations to care for family members or themselves. There are response roles that can be completed while teleworking and do not require travel. We are available to assist in finding deployment roles – contact us at EpiAid@cdc.gov and we can discuss their particular circumstance. In addition, any fellows who are not currently deployed can volunteer by:

1. Emailing us at EpiAid@cdc.gov
2. Volunteer for a Go Team by submitting name in ReADI
3. Responding directly to any calls for volunteers they receive through other communication channels

Thank you for your support of the EIS and LLS programs and of your officers or fellows. We know a lot is being asked of you as well and CDC leadership appreciates all you are doing with respect to your individual contributions and your support of the EIS officers and LLS fellows.

Regards,
Eric

Southeast Regional Newsletter

This newsletter will be distributed on a quarterly basis to all Southeast Antibiotic Resistance Lab Network sentinel sites, public health epidemiologists and labs. Articles will include regional updates, lab protocols, surveillance updates and staff introductions. Please email ARLN.Health@TN.gov if you are interested in submitting an article for the next newsletter. We are excited to use this newsletter as a means for the SE region to stay updated and connected!

CRE Colonization Lab Web Portal

The Tennessee laboratory informatics team is recruiting pilot sites for the lab web portal, LWP. Users with access to the LWP can request CRE colonization screenings with a point-and-click user interface. Final lab results will be available through the LWP and downloaded as PDFs.

The LWP will be available for everyone to request CRE colonization screenings after the initial pilot phase.

If you are interested in being a pilot site or have a site interested in your jurisdiction then please contact ARLN.Health@tn.gov

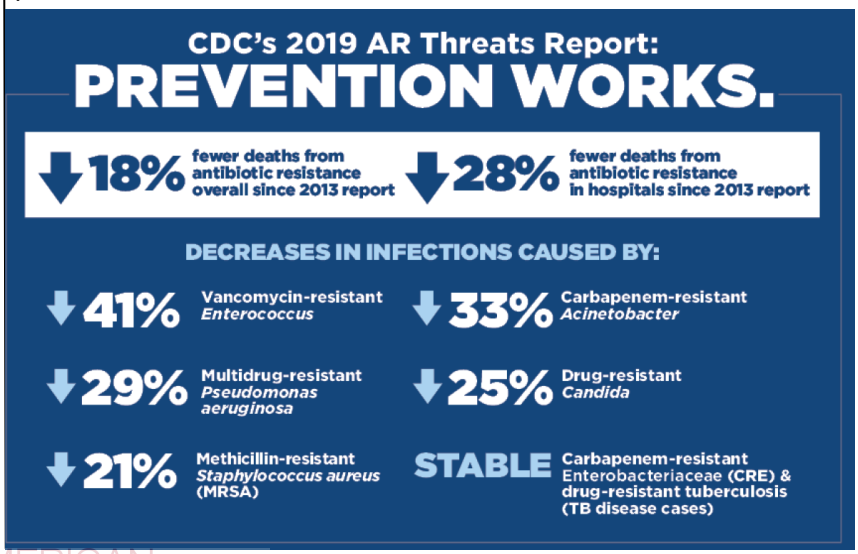
CDC's AR Threat Report 2019

In November 2019, CDC released an updated AR Threats Report. The updated report utilized electronic health data that was not available when the first report was released in 2013 and contains an updated threat list, a watch list and infection and death trends.

Sections of the updated report include the threat of antibiotic resistance, challenges and opportunities in detection and treatment for antibiotic-resistant infections, national action plan to combat antibiotic resistance and pathogen summaries.

The full report can be found here: www.cdc.gov/DrugResistance/Biggest-Threats.html

Highlights



Updated Numbers

Each year, antibiotic resistant bacteria and fungi cause more than **2.8 million infections** and **35,000 deaths**. In addition, *C. difficile* sent almost **223,900 people to the hospital** in 2017 and caused at least **12,800 deaths**.

The estimates from the 2013 report were that two million people were infected with resistant bacteria and fungi and that 23,000 people died each year. However, with the new data sources available, such as electronic health data, the CDC recalculated the 2013 estimates. The updated 2013 estimates were 2.6 million infections and 44,000 deaths. Based on these new numbers, the number of deaths attributable to antibiotic resistant infections has decreased 18 percent in the past six years.

The **Urgent Threat** list has been updated to included carbapenem-resistant *Acinetobacter* and *Candida auris*, which was unknown when the first report was released.

A **Watch List** was added which includes antibiotic resistant threats that are not yet common in the United States and have the potential to spread or become a challenge. Currently on the watch list are azole-resistant *Aspergillus fumigatus*, drug-resistant *Mycoplasma genitalium* and drug-resistant *Bordetella pertussis*.

The publication of the 2013 report led to the release of the National Action Plan for Combating Antibiotic Resistant Bacteria, CARB, which in turn led to the creation of the AR Solutions Initiative and in 2016, the **AR Lab Network**.

As of 2018, the AR Lab Network has detected a resistant pathogen that required a public health investigation **every four hours**. When this report was released in November 2019 the AR Lab Network had tested nearly 13,000 swabs, over **106,000** bacteria and sent more than **2,200** alerts on unusual resistance.

AMERICAN OVERSIGHT

Meet the Staff

Sarah Schmedes, PhD is a bioinformatician with the Florida Bureau of Public Health Laboratories, BPHL in Jacksonville, Fla. and serves as the bioinformatics regional resource, BRR lead for the Southeast Region. As the BRR, Schmedes provides bioinformatics support for next-generation sequencing data analysis, bioinformatics pipeline development and support to improve bioinformatics infrastructure and capabilities for public health labs in the region. Prior to joining FL BPHL, she was an APHL/CDC bioinformatics fellow in the Malaria Branch at the Centers for Disease Control and Prevention in Atlanta, Ga. Schmedes received her PhD in molecular genetics from the University of North Texas Health Science Center in Fort Worth, Texas and has previous molecular biology and bioinformatics research
experience in the areas of paleopathology, tick-borne diseases, human and microbial forensic genetics, microbiome genomics and malaria genomics. In her free time, she enjoys baking, knitting and traveling with her family. Schmedes can be reached by email at Sarah.Schmedes@flhealth.gov or by phone at (904) 791-1788 for all your bioinformatics needs.

Carol A. Rauch, MD, PhD is new to the Antimicrobial Resistance Laboratory Network as part of CDC's AR Lab Network Coordination and Strategy Unit, where she serves as technical laboratory liaison. She is based in Nashville with the Southeast Region, although she will work with the program as a whole. Most recently from Vanderbilt University Medical Center, Rauch has had a career in clinical microbiology where she has worked to optimize the interface with public health. She has extensive experience in laboratory quality, outbreak management, emergency and BT preparedness and healthcare-associated infections. Rauch enjoys gardening, cooking and spending time with her miniature schnauzer, Holly.

AMERICAN OVERSIGHT

Candida Updates

***Candida auris* PCR**

C. auris PCR for colonization screening is validated and running at the SE Regional Lab. Please be aware that swab capacity under PCR is greatly reduced, and only a small number of swabs can be tested in a day. As a result, we ask that all swab submissions are coordinated with the lab prior to submission to ensure timely testing and results.

No Retest on Known *C. auris* Positives

Based on CDC recommendations, the SE Regional lab will NOT retest swabs from patients who previously tested positive for *C. auris* if the prior positive was collected within the last three months. These swabs will be marked unsatisfactory and not tested. If the prior positive was collected more than three months ago, then the swab will be tested.

***Candida* AST Interpretations**

Lab reports for all *Candida* species do not include interpretations with the AST results as the susceptibility testing is for surveillance use only, and should not be used to inform treatment decisions.

Recipe: Melted Snowman Cookies

Recipe from allrecipes.com

Cookies

- 24 sugar cookies
- 24 large marshmallows
- 1 (.75 ounce) tube black decorating gel
- 1 (.75 ounce) tube orange decorating gel
- 75 silver nonpareils, or as desired (optional)
- 1 (.75 ounce) tube red decorating gel (optional)
- 1 (.75 ounce) tube green decorating gel (optional)

Icing

- 4 egg whites
- 8 cups confectioners' sugar, or as needed
- 1/4 cup lemon juice, or as needed

Directions

1. Beat egg whites lightly in a large bowl using an electric mixer until frothy. Slowly beat enough confectioners' sugar into egg whites to make icing that will hold shape; blend in lemon juice until desired consistency is reached.
2. Arrange cookies about one inch apart on a large sheet of waxed paper. Spread icing onto each cookie, allowing icing to drip over edges to look like melting snow.
3. Grease a microwave-safe plate. Place one marshmallow onto plate.
4. Microwave marshmallow until it starts to puff up, 20 to 30 seconds. Immediately place marshmallow on the edge of one cookie while the icing is still wet to look like a melted snowman. Repeat with remaining marshmallows and iced cookies.
5. Decorate 'melted snowmen' by piping 'twig-like arms' using black decorating gel on the icing. Make 'coal eyes' and a 'mouth' on the marshmallow using black decorating gel. Make a 'carrot nose' under the 'coal eyes' using orange decorating gel. Make 'coat buttons' by arranging silver nonpareils down the middle of the icing. Make 'scarves' or 'bow-ties' using red decorating gel or green decorating gel.
6. Allow cookies to fully dry before removing from waxed paper, at least one hour.

AMERICAN OVERSIGHT

From:	State and Local Readiness (CDC)
To:	CDC IMS State Coordination Task Force (SCTF) Lead
Subject:	2019-nCoV Key Points and Updated Guidance Documents
Date:	Monday, February 10, 2020 7:15:51 PM
Attachments:	CDC_2019-nCoV Daily Key Points__2_10_2020_final.pdf

Dear Colleagues,

Please find today's 2019-nCoV key points attached. Feel free to share amongst your staff and appropriate parties.

In addition, several guidance documents have been posted/updated on the CDC 2019-nCoV website.

Updated Guidance Documents

Information for Businesses and Employers: Interim guidance that may help prevent workplace exposures to acute respirator illness, including nCoV, in non-healthcare settings.

Information for Travelers: This page includes information about 2019 novel coronavirus (2019-nCoV) for travelers going to and returning from China, and information for aircrew and resources ship industry.

- Travelers from China arriving in the US
- Interim Recommendations for Airlines and Airline Crew: Novel Coronavirus in China
- Interim Guidance for Ships on Managing 2019 Novel Coronavirus

Interim Guidance of Emergency Medical Services (EMS) and 911 Public Safety Answering Points (PASPs) for 2019-nCoV in the US: Interim guidance for EMS including recommendations for 911 PSAPs, clinician practices, PUI/Patient transport, cleaning EMS vehicles, follow-up/reporting measures, and EMS employer responsibilities.

Interim U.S. Guidance for Risk Assessment and Public Health Management of Healthcare Personnel with Potential Exposure in a Healthcare Setting to Patients with 2019 Novel Coronavirus (2019-nCoV): This interim guidance is intended to assist with assessment of risk, monitoring, and work restriction decisions for HCP with potential exposure to 2019-nCoV.

Interim Considerations for Disposition of Hospitalized Patients with 2019-nCoV Infection: The following is intended to serve as a framework for patient disposition. All patients should be evaluated on a case-by-case basis and their disposition discussed with health care providers and public health departments.

Healthcare Supply of Personal Protective Equipment: CDC specific PPE recommendations based on the current 2019-nCoV situation and availability of PPE.

Frequently Asked Questions about Respirators and their Use: This document is intended to address frequently asked questions about respirators and their use.

AMERICAN OVERSIGHT

CDC Daily Key Points
2019 Novel Coronavirus (2019-nCoV)

February 10, 2020

MAIN KEY POINTS

- There is an expanding outbreak of respiratory illness centered in China caused by a novel (new) coronavirus abbreviated "2019-nCoV."
- This virus is able to spread from person-to-person and cause severe disease and death.
- The potential global public health threat posed by this virus is high, but right now, the immediate risk to most Americans is low.
- Most cases are still limited to mainland China.
- Right now, this virus is not spreading in the community in the United States and the vast majority of Americans have a low risk of exposure. The greater risk is for people who have recently traveled to China or their close contacts.
- This is a rapidly evolving situation and the risk assessment for Americans may change.
- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States so as to reduce the spread and the impact of this virus.
- Strategies are in place to reduce the number of travelers from China and screen the remaining travelers from that country for illness, with people potentially being subject to a 14-day quarantine.
- These measures are likely to cause some disruption.
- The U.S. public health system also is on high alert to detect cases of 2019-nCoV infection and prevent further spread in the community.
- The success of response efforts now will determine what the coming days, weeks, and months will bring here in the United States.
- While leaning forward aggressively with the hope that we will be able to prevent community spread, we also are preparing for the worst.
- The current outbreak meets two criteria for a pandemic. It is a new virus and it is capable of person-to-person spread.
- Extensive work has been done over the past 15 years to prepare for an influenza pandemic.
- Influenza pandemic preparedness platforms and plans would be appropriate in the event that the current 2019-nCoV outbreak triggers a pandemic.
- Public health partners are encouraged to review their pandemic preparedness plans. Selected materials are available from www.cdc.gov/ncov.

SITUATION UPDATE

- To date, 27 international locations (in addition to the U.S.) have reported confirmed cases of 2019-nCoV infection.
- As of February 10, 2020, at 7pm, 12 infections with 2019-nCoV have been reported in the U.S. in six states – Arizona, California, Illinois, Massachusetts, Washington, and Wisconsin.
    - To date, there have been 398 "persons under investigation" (PUIs) for possible 2019-nCoV infection reported to CDC, with 318 persons ruled

AMERICAN OVERSIGHT

Text in red new or updated.

out as negative. These data are updated regularly at https://www.cdc.gov/coronavirus/2019-ncov/cases-in-us.html.

- Two instances of person-to-person spread with this virus in the United States have been detected, in both cases after close, prolonged contact with a returned traveler from Wuhan.
- Over the weekend, the U.S. Embassy in China announced the death of the first American citizen from 2019-nCoV occurring in that country.
- CDC established a 2019-nCoV Incident Management System on January 7, 2020. On January 21, 2020, CDC activated its Emergency Operations Center to better provide ongoing support to the 2019-nCoV response.
    - As of February 7, 2020, more than 800 CDC staff members had been deployed to the 2019-nCoV Response.
- The CDC-established International Reagent Resource (IRR) is taking orders for real time Reverse Transcription-Polymerase Chain Reaction (rRT-PCR) tests that can diagnose 2019-nCoV in respiratory and serum samples from clinical specimens.
- Over the coming days and weeks, state and local public health departments will begin to test for 2019-nCoV in their laboratories. Test results will be validated at CDC for a period of time, after which states will perform their own testing and report results to CDC. CDC will continue to report case counts in aggregate.
- On February 1, 2020, CDC issued a Health Alert Network (HAN) update with some updates to previously posted guidance and, for the first time, guidance on clinical care of 2019-nCoV patients.
- On February 3, CDC issued "Interim U.S. Guidance for Risk Assessment and Public Health Management of Persons with Potential 2019 Novel Coronavirus (2019-nCoV) Exposure in Travel-associated or Community Settings" to provide U.S. public health authorities and other partners with a framework for assessing and managing risk of potential exposures to 2019-nCoV and implementing public health actions based on a person's risk level and clinical presentation.
- CDC is working with healthcare and industry partners to understand the supply chain for personal protective equipment (PPE) in order to adjust response actions appropriately. Based on the current 2019-nCoV situation and availability of PPE, on February 8, 2020, CDC posted:
    - "Healthcare Supply of Personal Protective Equipment" which outlines who needs PPE and who does not. (See section Use of Facemasks in U.S. below.)
    - "Strategies for Optimizing Supply of N-95 Respirators" which was posted in the face of potential ongoing 2019-nCoV transmission in the United States.
- CDC isolated the virus and sent it to the NIH's BEI Resources Repository for use by the broad scientific community.
- CDC is uploading the full genetic sequence of viruses from all U.S. patients into GenBank as they become available.
- CDC is working with state and local health departments on investigations to trace contacts of the U.S. 2019-nCoV patients to detect person-to-person spread.

AMERICAN OVERSIGHT

- CDC is preparing senior staff to support the WHO international senior technical mission being formed to work with Chinese public health counterparts to help improve understanding of this new disease, including learning more about transmissibility and severity.

WHAT YOU CAN DO

- While the immediate risk of this new virus to the American public is believed to be low at this time, everyone can do their part to help us respond to this emerging public health threat:
  - It's currently flu and respiratory disease season and CDC recommends getting a flu vaccine, taking everyday preventive actions to help stop the spread of germs, and taking flu antivirals if prescribed.
  - If you are a healthcare provider, be on the look-out for people who recently traveled from China and who have fever and respiratory symptoms.
  - If you are a healthcare provider caring for a 2019-nCoV patient or a public health responder, please take care of yourself and follow recommended infection control procedures.
  - For people who have had close contact with someone infected with 2019-nCoV who develop symptoms, contact your healthcare provider, and tell them about your symptoms and your exposure to a 2019-nCoV patient.
  - For people who are ill with 2019-nCoV, please follow CDC guidance on how to reduce the risk of spreading your illness to others. This guidance in on the CDC website.

USE OF FACEMASKS IN THE U.S.

- At this time, CDC does not recommend the use of facemasks or respirators among the general public. While limited person-to-person spread of 2019-nCoV among close contacts has been detected, this virus is not currently spreading in the community in the United States.
- In the United States, person-to-person spread has been seen only among people in close and prolonged contact with someone who has become infected with 2019-nCoV in China.
- If you are not sick:
  - Members of the general public in the United States DO NOT need to use facemasks. CDC does NOT recommend that people who are well wear a facemask to protect themselves from respiratory viruses, including 2019-nCoV.
  - Masks should be reserved for people who are sick, so they can protect others from getting infected.
- If you are sick (i.e., people with confirmed or possible 2019-nCoV infection, including patients under investigation who do not need to be hospitalized; and people with confirmed 2019-nCoV infection who were hospitalized and determined to be medically stable to go home):

AMERICAN OVERSIGHT

    - You should wear a facemask when you are around other people (e.g., sharing a room or vehicle) and before you enter a healthcare provider's office. This will help protect the people around from getting infected.
    - If you are not able to wear a facemask (for example, because it causes trouble breathing), then people who are in the same room with you should wear a facemask, but they should also limit the amount of time they spend in the same room with you.
- If worn properly, a facemask helps block the spread of respiratory viruses by the wearer from spreading to other people and surfaces.
- People with increased risk of exposure to 2019-nCoV, for example household contacts and caregivers of people with known or suspected 2019-nCoV, should wear a facemask if the patient is not able to wear a facemask (for example, due to difficulty breathing while wearing a facemask)
- Facemasks should be used once and then thrown away in the trash.
- Healthcare personnel should wear personal protective equipment (PPE), including respirators, when caring for confirmed or possible 2019-nCoV patients because they are in direct contact with patients, which increases their risk of exposure.
    - Respirators worn by healthcare personnel are not the same as facemasks sold in retail stores, online, etc. for public use.
    - For respirators to work effectively, they must fit snugly against the user's face to make sure particles don't pass through and infect the wearer; healthcare personnel are fit-tested for their respirators and trained to use them to be sure they work correctly.
    - Without proper training, respirators are likely to be worn incorrectly and used ineffectively.
    - Respirators and facemasks designed for general consumer use are not subject to the same regulations required for respirators in workplaces.
- There are everyday preventive actions that EVERYONE can take to prevent the spread of respiratory illnesses, including 2019-nCoV:
    - Avoid close contact with people who are sick.
    - Avoid touching your eyes, nose, and mouth with unwashed hands.
    - Stay home when you are sick.
    - Cover your cough or sneeze with a tissue, then throw the tissue in the trash.
    - Clean and disinfect frequently touched objects and surfaces using a regular household cleaning spray or wipe.
    - Clean your hands often by washing them with soap and water for at least 20 seconds or using an alcohol-based hand sanitizer with at least 60% alcohol. Always wash hands with soap and water if hands are visibly dirty.
    - Hands should be cleaned after going to the bathroom; before eating; and after blowing your nose, coughing, or sneezing.

AMERICAN OVERSIGHT

TRAVEL

- On January 31, Health and Human Services Secretary Alex M. Azar II declared a public health emergency for the United States to aid the nation's healthcare community in responding to 2019 novel coronavirus.
- Also on January 31, the President of the United States issued a "Proclamation on Suspension of Entry as Immigrants and Nonimmigrants of Persons who Pose a Risk of Transmitting 2019 Novel Coronavirus." The declaration became effective beginning 5 p.m. EST, Sunday, February 2, 2020.
    - Foreign nationals who have visited China in the past 14 days may not enter the United States.
    - Special precautions are required of U.S. citizens, immediate family members of U.S. citizens, and legal permanent residents entering the United States who have been in China during the past 14 days, including up to a 14-day quarantine.
    - All American citizens and exempted persons coming from China will be directed to ("**funneled to"**) one of 11 U.S. airports.
        - American citizens and exempted persons who have been in Hubei province in the previous 14 days will have an additional health assessment (screened for fever, cough, or difficulty breathing).
            - If symptomatic, American citizens and exempted persons will be transferred for further medical evaluation. (They will not be able to complete their itinerary.)
            - If asymptomatic, American citizens and exempted persons will be subject to a mandatory 14-day quarantine at or near that location. (They will not be able to complete their itinerary.)
        - American citizens and exempted persons who have been in other parts of mainland China (outside of Hubei Province) in the previous 14 days will have an additional health assessment (screened for fever, cough, or difficulty breathing).
            - If symptomatic, American citizens and exempted persons will be transferred for medical evaluation. (They will not be able to complete their itinerary at that time.)
            - If asymptomatic, American citizens and exempted persons will be allowed to reach their final destination and, after arrival, will be monitored under self-quarantine for 14 days.
    - CDC is working with public health partners to support the implementation of the travel policies detailed in the presidential proclamation (above).
    - As of February 10, about 30,000 people have been screened at U.S. airports.
    - On February 3, CDC issued "Interim U.S. Guidance for Risk Assessment and Public Health Management of Persons with Potential

AMERICAN OVERSIGHT

2019 Novel Coronavirus (2019-nCoV) Exposure in Travel-associated or Community Settings" to provide U.S. public health authorities and other partners with a framework for assessing and managing risk of potential exposures to 2019-nCoV and implementing public health actions based on a person's risk level and clinical presentation.

Repatriated Flights & Quarantine Orders

- CDC supported the Department of State in the safe and expedient ordered departure of U.S. citizens and residents from Wuhan, China on five chartered flights.
- The Department of Health and Human Services (DHHS) Secretary, under statutory authority, issued federal quarantine orders to all the passengers (891 people) entering the United States on these planes.
- The quarantine period is for 14 days, starting from the day the passengers left Wuhan, China.
- The quarantine is a precautionary and preventive step to maximize the containment of the virus in the interest of the health of the American public.
- This quarantine order also will protect the health of the repatriated persons, their families, and their communities.
- Medical staff will monitor the health of each traveler, including temperature checks and observation for respiratory symptoms.
- CDC will work with the state and local public health departments to transport any passenger exhibiting symptoms to a hospital for further evaluation.
- At the end of the 14-day period, people who have not developed symptoms will be free to leave.
- The first group of returning passengers will complete their 14-day quarantine period on February 11. No cases of 2019-nCoV infection were detected among this group of passengers. Another 600+ persons remain under quarantine.

AMERICAN OVERSIGHT

CDC Daily Key Points
2019 Novel Coronavirus (2019-nCoV)

February 7, 2020

MAIN KEY POINTS

- There is an expanding outbreak of respiratory illness centered in China caused by a novel (new) coronavirus abbreviated "2019-nCoV."
- This virus is able to spread from person-to-person and cause severe disease and death.
- The potential global public health threat posed by this virus is high, but right now, the immediate risk to most Americans is low.
- Most cases are still limited to mainland China.
- Right now, this virus is not spreading in the community in the United States and the vast majority of Americans have a low risk of exposure. The greater risk is for people who have recently traveled to China or their close contacts.
- This is a rapidly evolving situation and the risk assessment for Americans may change.
- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States so as to reduce the spread and the impact of this virus.
- Strategies are in place to reduce the number of travelers from China and screen the remaining travelers from that country for illness, with people potentially being subject to a 14-day quarantine.
- These measures are likely to cause some disruption.
- The U.S. public health system also is on high alert to detect cases of 2019-nCoV infection and prevent further spread in the community.
- The success of response efforts now will determine what the coming days, weeks, and months will bring here in the United States.
- While leaning forward aggressively with the hope that we will be able to prevent community spread, we also are preparing for the worst.
- The current outbreak meets two criteria for a pandemic. It is a new virus and it is capable of person-to-person spread.
- Extensive work has been done over the past 15 years to prepare for an influenza pandemic.
- Influenza pandemic preparedness platforms and plans would be appropriate in the event that the current 2019-nCoV outbreak triggers a pandemic.
- Public health partners are encouraged to review their pandemic preparedness plans. Selected materials are available from www.cdc.gov/ncov.

SITUATION UPDATE

- To date, 27 international locations (in addition to the U.S.) have reported confirmed cases of 2019-nCoV infection.
- As of February 6, 2020, at 7 pm, 12 infections with 2019-nCoV have been reported in the U.S. in six states — Arizona, California, Illinois, Massachusetts, Washington, and Wisconsin.
    - To date, there have been 337 "persons under investigation" (PUIs) for possible 2019-nCoV infection reported to CDC, with 225 persons ruled

AMERICAN OVERSIGHT

  - out as negative. These data are updated regularly at https://www.cdc.gov/coronavirus/2019-ncov/cases-in-us.html.
  - As part of efforts to detect cases of 2019-nCoV in the United States, CDC's laboratory had tested more than 2,000 samples as of February 6, 2020.
- Two instances of person-to-person spread with this virus in the United States have been detected, in both cases after close, prolonged contact with a returned traveler from Wuhan.
- CDC established a 2019-nCoV Incident Management System on January 7, 2020. On January 21, 2020, CDC activated its Emergency Operations Center to better provide ongoing support to the 2019-nCoV response.
  - As of February 7, 2020, more than 800 CDC staff members had been deployed to the 2019-nCoV Response.
- The CDC-established International Reagent Resource (IRR) is taking orders for real time Reverse Transcription-Polymerase Chain Reaction (rRT-PCR) tests that can diagnose 2019-nCoV in respiratory and serum samples from clinical specimens.
  - As of February 6, 2020, test kits had been sent to 33 states and 70 labs in 66 countries.
- On February 1, 2020, CDC issued a Health Alert Network (HAN) update with some updates to previously posted guidance and, for the first time, guidance on clinical care of 2019-nCoV patients.
- On February 3, CDC issued "Interim US Guidance for Risk Assessment and Public Health Management of Persons with Potential 2019 Novel Coronavirus (2019-nCoV) Exposure in Travel-associated or Community Settings" to provide U.S. public health authorities and other partners with a framework for assessing and managing risk of potential exposures to 2019-nCoV and implementing public health actions based on a person's risk level and clinical presentation.
- CDC isolated the virus and sent it to the NIH's BEI Resources Repository for use by the broad scientific community.
- CDC is uploading the full genetic sequence of viruses from all U.S. patients into GenBank as they become available.
- CDC is working with state and local health departments on investigations to trace contacts of the U.S. 2019-nCoV patients to detect person-to-person spread.
- Also, on February 6, 2020, CDC and Customs and Border (CBP) personnel had screened about 20,000 people with recent travel history to China at U.S. airports.
- CDC is preparing senior staff to support the WHO international senior technical mission being formed to work with Chinese public health counterparts to help improve understanding of this new disease, including learning more about transmissibility and severity.

AMERICAN OVERSIGHT

WHAT YOU CAN DO

- While the immediate risk of this new virus to the American public is believed to be low at this time, everyone can do their part to help us respond to this emerging public health threat:
    - It's currently flu and respiratory disease season and CDC recommends getting a flu vaccine, taking everyday preventive actions to help stop the spread of germs, and taking flu antivirals if prescribed.
    - If you are a healthcare provider, be on the look-out for people who recently traveled from China and who have fever and respiratory symptoms.
    - If you are a healthcare provider caring for a 2019-nCoV patient or a public health responder, please take care of yourself and follow recommended infection control procedures.
    - For people who have had close contact with someone infected with 2019-nCoV who develop symptoms, contact your healthcare provider, and tell them about your symptoms and your exposure to a 2019-nCoV patient.
    - For people who are ill with 2019-nCoV, please follow CDC guidance on how to reduce the risk of spreading your illness to others. This guidance in on the CDC website.

TRAVEL

- On January 31, Health and Human Services Secretary Alex M. Azar II declared a public health emergency for the United States to aid the nation's healthcare community in responding to 2019 novel coronavirus.
- Also on January 31, the President of the United States issued a "Proclamation on Suspension of Entry as Immigrants and Nonimmigrants of Persons who Pose a Risk of Transmitting 2019 Novel Coronavirus. The declaration became effective beginning 5 p.m. EST, Sunday, February 2, 2020.

U.S. Department of Health and Human Services

CDC works 24/7protecting America's health, safety and security. Whether diseases start at home or abroad, are curable or preventable, chronic or acute, or from human activity or deliberate attack, CDC responds to America's most pressing health threats. CDC is headquartered in Atlanta and has experts located throughout the United States and the world.

AMERICAN OVERSIGHT

CDC Daily Key Points

Coronavirus Disease 2019 ("COVID-19") Outbreak

February 20, 2020

All content updated since February 19 is shown in colored text.

MAIN KEY POINTS

- There is an expanding outbreak of respiratory illness centered in China caused by a novel (new) coronavirus.
- The International Committee on Taxonomy of Viruses (ICTV) has named this virus "SARS-CoV-2."
    - Due to potential for confusion with SARS-CoV, where possible, public communications will use "the virus that causes COVID-19."
- This virus that causes COVID-19 is able to spread from person-to-person and has caused disease ranging from mild to severe, including disease resulting in death.
- Most cases and most person-to-person spread with the new virus have occurred in mainland China, but outbreaks of COVID-19 have been detected outside of China too.
- Most COVID-19 cases outside of China have been associated with travel to or from China, but some person-to-person spread has been detected, including some community spread.
    - Other destinations with apparent community spread of COVID-19 have been identified—Singapore, Thailand, Vietnam, South Korea, and Taiwan. Information about COVID-19 was added to the CDC destination pages for these locations on February 19.
- CDC issued a Level 1 Travel Notice (Practice Usual Precautions) for Hong Kong and Japan on February 19.
- On February 20, the State Department updated their travel guidance for Hubei Province, China to recommend that U.S. citizens reconsider travel by cruise ship to or within East Asia and the Asia-Pacific Region.
- The potential global public health threat posed by this virus is high, but right now, the immediate risk to most Americans is low.
- The greater risk is for people who have recently traveled to China or been exposed to someone with COVID-19.
- Fifteen cases of COVID-19 have been reported in the United States. Most cases of COVID-19 in the United States have been associated with travel from China but some person-to-person spread among close contacts of travelers has been seen.
- It's important to note that this virus is not spreading in the community in the United States at this time.
- This is a rapidly evolving situation and the risk assessment for Americans may change.
- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States so as to reduce the spread and the impact of this virus.
- Strategies are in place to reduce the number of travelers from China and screen the remaining travelers from that country for illness, with people potentially being subject to a 14-day quarantine.

AMERICAN OVERSIGHT

- These measures are likely to cause some disruption.
- CDC has worked with Department of State to support the safe return of Americans overseas affected by the ongoing outbreaks of COVID-19, including most recently passengers from the *Diamond Princess* cruise ship. (See Section: "*Diamond Princess*")
- The U.S. public health system also is on high alert to detect cases of COVID-19 and prevent further spread in the community.
- The success of response efforts now will determine what the coming days, weeks, and months will bring here in the United States.
- While leaning forward aggressively with the hope that we will be able to prevent community spread, we also are preparing for the worst.
- The current outbreak meets two criteria for a pandemic. It is a new virus and it is capable of person-to-person spread. If sustained person-to-person spread in the community takes hold outside China, this will increase the likelihood that a global pandemic will result.
- Extensive work has been done over the past 15 years in the United States to prepare for an influenza pandemic.
    - Influenza pandemic preparedness platforms and plans would be appropriate in the event that the current COVID-19 outbreak triggers a pandemic.
    - Public health partners are encouraged to review their pandemic preparedness plans at this time.

SITUATION UPDATE

- To date, 30 international locations (in addition to the U.S.) have reported confirmed cases of COVID-19.
- As of February 19, 15 cases of COVID-19 have been reported in the U.S. in seven states — Arizona, California, Illinois, Massachusetts, Texas, Washington, and Wisconsin.
    - To date, there have been 479 "persons under investigation" (PUIs) for possible COVID-19 reported to CDC, with 412 persons ruled out as negative. These data are updated regularly at www.cdc.gov/coronavirus/2019-ncov/cases-in-us.html.
    - These numbers do not include passengers from the *Diamond Princess* cruise ship, including presumptive-positive cases, who were returned to the U.S. via State Department-chartered flights.
    - It is likely that additional cases of COVID-19 will be detected in the United States.
- On February 20, 263 people were released from federal quarantine after being returned to the U.S. from Wuhan, China via State Department-chartered flights.
    - People released from quarantine pose no health risk to their communities.
- CDC established a COVID-19 Incident Management System on January 7. On January 21, CDC activated its Emergency Operations Center to better provide ongoing support to the response.
- CDC developed a real time Reverse Transcription-Polymerase Chain Reaction (rRT-PCR) test that can diagnose COVID-19 in respiratory samples from clinical specimens.
- CDC isolated the virus and shared this material with NIH's BEI Resources Repository for use by the broad scientific community.
- CDC has been uploading the entire genome of the viruses from reported cases in the United States to GenBank as sequencing was completed.

AMERICAN OVERSIGHT

- On February 3, CDC issued "Interim U.S. Guidance for Risk Assessment and Public Health Management of Persons with Potential 2019 Novel Coronavirus Exposure in Travel-associated or Community Settings" to provide U.S. public health authorities and other partners with a framework for assessing and managing risk of potential exposures to COVID-19 and implementing public health actions based on a person's risk level and clinical presentation.
- CDC is working with state and local health departments on investigations to trace contacts of the U.S. COVID-19 patients to detect person-to-person spread.
- As of February 19, CDC and Customs and Border (CBP) personnel had screened about 43,000 people with recent travel history to China at U.S. airports.

WHAT YOU CAN DO

- While the immediate risk of this new virus to the American public is believed to be low at this time, everyone can do their part to help us respond to this emerging public health threat:
    - It's currently flu and respiratory disease season and CDC recommends getting a flu vaccine, taking everyday preventive actions to help stop the spread of germs, and taking flu antivirals if prescribed.
    - If you are a healthcare provider, be on the look-out for people with who recently traveled from China and fever and respiratory symptoms.
    - If you are a healthcare provider caring for a COVID-19 patient or a public health responder, please take care of yourself and follow recommended infection control procedures.
    - If you have been in China or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus. If you develop COVID-19 symptoms, contact your healthcare provider, and tell them about your symptoms and your travel or exposure to a COVID-19 patient.
    - For people who have had close contact with someone with COVID-19 who develop symptoms, contact your healthcare provider, and tell them about your symptoms and your exposure to a COVID-19 patient.
    - For people who are ill with COVID-19, please follow CDC guidance on how to reduce the risk of spreading your illness to others. This guidance in on the CDC website.

TESTING

- All testing for COVID-19 continues to be performed at CDC. At this time, all positive results from testing conducted in non-CDC, U.S. laboratories must be confirmed at CDC.
- CDC is remanufacturing test kits, which will be distributed following rigorous quality control processes.

REPATRIATED FLIGHTS & QUARANTINE ORDERS

- CDC has supported the Department of State in the safe and expedient ordered departure of U.S. citizens and residents affected by outbreaks of COVID-19.
    - Five chartered flights returned passengers from Wuhan City, China.

AMERICAN OVERSIGHT

    - Most recently, passengers from a cruise ship docked in Japan were repatriated. (See section: *Diamond Princess*)
- The Department of Health and Human Services (DHHS) Secretary, under statutory authority, issued federal quarantine orders to all such passengers entering the United States.
    - The quarantine period is for 14 days.
    - The quarantine is a precautionary and preventive step to maximize the containment of the virus in the interest of the health of the American public.
    - This quarantine order also serves to protect the health of the repatriated persons, their families, and their communities.
    - Medical staff monitor the health of each traveler, including temperature checks and observation for respiratory symptoms.
    - CDC works with the state and local public health departments to transport any passenger exhibiting symptoms to a hospital for further evaluation.
    - At the end of the 14-day period, people who have not developed symptoms will be free to leave.
- On February 12, 195 people from the first chartered flight were discharged from quarantine.
- On February 18, 347 people who were under federal quarantine were released.
- On February 20, 263 people who were under federal quarantine were released.

DIAMOND PRINCESS

- CDC is supporting the Department of State-led mission to repatriate U.S. citizens returning to the United States from Japan who were aboard the *Diamond Princess* cruise ship.
    - Due to the dynamic nature of the ongoing outbreak, the U.S. government recommended that U.S. citizens disembark and return to the United States.
- On February 16, 329 American citizens returned by flights chartered by the State Department.
    - The planes were met by a team of U.S. government personnel deployed at the bases to assess the health of the passengers.
    - The passengers were screened before leaving the ship and have been monitored and evaluated by medical and public health personnel during the trip and after arrival.
    - Those passengers who returned from Japan are being housed separately from the people already in quarantine who returned on previous U.S. Government repatriation flights from Wuhan.
- There are more than 100 American citizens still onboard the *Diamond Princess* cruise ship or in hospitals in Japan. These citizens have been placed under travel restrictions, as have the ship's other passengers and crew.
    - After disembarkation from the *Diamond Princess*, these passengers and crew will be required to wait at least 14 days without having symptoms or a positive coronavirus test result before they are permitted to board flights to the United States.
- The U.S. Government is taking measures to protect the health of the people under quarantine, their loved ones, and their communities, as well as the communities where they are being temporarily housed.
- Based on what is known about this virus and other coronaviruses, CDC believes the risk to the communities temporarily housing these people is low.

- There is an expanding outbreak of respiratory illness centered in China caused by a novel (new) coronavirus.
- The International Committee on Taxonomy of Viruses (ICTV) has named this virus "SARS-CoV-2."
    - Due to potential for confusion with SARS-CoV, where possible, public communications will use "the virus that causes COVID-19."
- This virus that causes COVID-19 is able to spread from person-to-person and has caused disease ranging from mild to severe, including disease resulting in death.
- Most cases and most person-to-person spread with the new virus have occurred in mainland China, but outbreaks of COVID-19 have been detected outside of China too.
- Most COVID-19 cases outside of China have been associated with travel to or from China, but some person-to-person spread has been detected, including some community spread.
    - Other destinations with apparent community spread of COVID-19 have been identified—Singapore, Thailand, Vietnam, South Korea, and Taiwan. Information about COVID-19 was added to the CDC destination pages for these locations on February 19.
- CDC issued a Level 1 Travel Notice (Practice Usual Precautions) for Hong Kong and Japan on February 19.
- On February 20, the State Department updated their travel guidance for Hubei Province, China to recommend that U.S. citizens reconsider travel by cruise ship to or within East Asia and the Asia-Pacific Region.
- The potential global public health threat posed by this virus is high, but right now, the immediate risk to most Americans is low.
- The greater risk is for people who have recently traveled to China or been exposed to someone with COVID-19.
- Fifteen cases of COVID-19 have been reported in the United States. Most cases of COVID-19 in the United States have been associated with travel from China but some person-to-person spread among close contacts of travelers has been seen.
- It's important to note that this virus is not spreading in the community in the United States at this time.
- This is a rapidly evolving situation and the risk assessment for Americans may change.
- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States so as to reduce the spread and the impact of this virus.
- Strategies are in place to reduce the number of travelers from China and screen the remaining travelers from that country for illness, with people potentially being subject to a 14-day quarantine.

AMERICAN OVERSIGHT

- These measures are likely to cause some disruption.
- CDC has worked with Department of State to support the safe return of Americans overseas affected by the ongoing outbreaks of COVID-19, including most recently passengers from the *Diamond Princess* cruise ship. (See Section: "*Diamond Princess*")
- The U.S. public health system also is on high alert to detect cases of COVID-19 and prevent further spread in the community.
- The success of response efforts now will determine what the coming days, weeks, and months will bring here in the United States.
- While leaning forward aggressively with the hope that we will be able to prevent community spread, we also are preparing for the worst.
- The current outbreak meets two criteria for a pandemic. It is a new virus and it is capable of person-to-person spread. If sustained person-to-person spread in the community takes hold outside China, this will increase the likelihood that a global pandemic will result.
- Extensive work has been done over the past 15 years in the United States to prepare for an influenza pandemic.
    - Influenza pandemic preparedness platforms and plans would be appropriate in the event that the current COVID-19 outbreak triggers a pandemic.
    - Public health partners are encouraged to review their pandemic preparedness plans at this time.

SITUATION UPDATE

- To date, 30 international locations (in addition to the U.S.) have reported confirmed cases of COVID-19.
- As of February 19, 15 cases of COVID-19 have been reported in the U.S. in seven states — Arizona, California, Illinois, Massachusetts, Texas, Washington, and Wisconsin.
    - To date, there have been 479 "persons under investigation" (PUIs) for possible COVID-19 reported to CDC, with 412 persons ruled out as negative. These data are updated regularly at www.cdc.gov/coronavirus/2019-ncov/cases-in-us.html.
    - These numbers do not include passengers from the *Diamond Princess* cruise ship, including presumptive-positive cases, who were returned to the U.S. via State Department-chartered flights.
    - It is likely that additional cases of COVID-19 will be detected in the United States.
- On February 20, 263 people were released from federal quarantine after being returned to the U.S. from Wuhan, China via State Department-chartered flights.
    - People released from quarantine pose no health risk to their communities.
- CDC established a COVID-19 Incident Management System on January 7. On January 21, CDC activated its Emergency Operations Center to better provide ongoing support to the response.
- CDC developed a real time Reverse Transcription-Polymerase Chain Reaction (rRT-PCR) test that can diagnose COVID-19 in respiratory samples from clinical specimens.
- CDC isolated the virus and shared this material with NIH's BEI Resources Repository for use by the broad scientific community.
- CDC has been uploading the entire genome of the viruses from reported cases in the United States to GenBank as sequencing was completed.

AMERICAN OVERSIGHT

- On February 3, CDC issued "Interim U.S. Guidance for Risk Assessment and Public Health Management of Persons with Potential 2019 Novel Coronavirus Exposure in Travel-associated or Community Settings" to provide U.S. public health authorities and other partners with a framework for assessing and managing risk of potential exposures to COVID-19 and implementing public health actions based on a person's risk level and clinical presentation.
- CDC is working with state and local health departments on investigations to trace contacts of the U.S. COVID-19 patients to detect person-to-person spread.
- As of February 19, CDC and Customs and Border (CBP) personnel had screened about 43,000 people with recent travel history to China at U.S. airports.

WHAT YOU CAN DO

- While the immediate risk of this new virus to the American public is believed to be low at this time, everyone can do their part to help us respond to this emerging public health threat:
    - It's currently flu and respiratory disease season and CDC recommends getting a flu vaccine, taking everyday preventive actions to help stop the spread of germs, and taking flu antivirals if prescribed.
    - If you are a healthcare provider, be on the look-out for people with who recently traveled from China and fever and respiratory symptoms.
    - If you are a healthcare provider caring for a COVID-19 patient or a public health responder, please take care of yourself and follow recommended infection control procedures.
    - If you have been in China or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus. If you develop COVID-19 symptoms, contact your healthcare provider, and tell them about your symptoms and your travel or exposure to a COVID-19 patient.
    - For people who have had close contact with someone with COVID-19 who develop symptoms, contact your healthcare provider, and tell them about your symptoms and your exposure to a COVID-19 patient.
    - For people who are ill with COVID-19, please follow CDC guidance on how to reduce the risk of spreading your illness to others. This guidance in on the CDC website.

TESTING

- All testing for COVID-19 continues to be performed at CDC. At this time, all positive results from testing conducted in non-CDC, U.S. laboratories must be confirmed at CDC.
- CDC is remanufacturing test kits, which will be distributed following rigorous quality control processes.

REPATRIATED FLIGHTS & QUARANTINE ORDERS

- CDC has supported the Department of State in the safe and expedient ordered departure of U.S. citizens and residents affected by outbreaks of COVID-19.
    - Five chartered flights returned passengers from Wuhan City, China.

AMERICAN OVERSIGHT

    - Most recently, passengers from a cruise ship docked in Japan were repatriated. (See section: *Diamond Princess*)
- The Department of Health and Human Services (DHHS) Secretary, under statutory authority, issued federal quarantine orders to all such passengers entering the United States.
    - The quarantine period is for 14 days.
    - The quarantine is a precautionary and preventive step to maximize the containment of the virus in the interest of the health of the American public.
    - This quarantine order also serves to protect the health of the repatriated persons, their families, and their communities.
    - Medical staff monitor the health of each traveler, including temperature checks and observation for respiratory symptoms.
    - CDC works with the state and local public health departments to transport any passenger exhibiting symptoms to a hospital for further evaluation.
    - At the end of the 14-day period, people who have not developed symptoms will be free to leave.
- On February 12, 195 people from the first chartered flight were discharged from quarantine.
- On February 18, 347 people who were under federal quarantine were released.
- On February 20, 263 people who were under federal quarantine were released.

DIAMOND PRINCESS

- CDC is supporting the Department of State-led mission to repatriate U.S. citizens returning to the United States from Japan who were aboard the *Diamond Princess* cruise ship.
    - Due to the dynamic nature of the ongoing outbreak, the U.S. government recommended that U.S. citizens disembark and return to the United States.
- On February 16, 329 American citizens returned by flights chartered by the State Department.
    - The planes were met by a team of U.S. government personnel deployed at the bases to assess the health of the passengers.
    - The passengers were screened before leaving the ship and have been monitored and evaluated by medical and public health personnel during the trip and after arrival.
    - Those passengers who returned from Japan are being housed separately from the people already in quarantine who returned on previous U.S. Government repatriation flights from Wuhan.
- There are more than 100 American citizens still onboard the *Diamond Princess* cruise ship or in hospitals in Japan. These citizens have been placed under travel restrictions, as have the ship's other passengers and crew.
    - After disembarkation from the *Diamond Princess*, these passengers and crew will be required to wait at least 14 days without having symptoms or a positive coronavirus test result before they are permitted to board flights to the United States.
- The U.S. Government is taking measures to protect the health of the people under quarantine, their loved ones, and their communities, as well as the communities where they are being temporarily housed.
- Based on what is known about this virus and other coronaviruses, CDC believes the risk to the communities temporarily housing these people is low.

AMERICAN OVERSIGHT

Last updated: February 21, 2020

CDC Coronavirus Disease 2019 (COVID-19) Guidance for State, Local, and Territorial Partners and Local Health Departments

Interim guidance documents relevant to State, Local, and Territorial partners regarding COVID-19

Aircraft

Interim Guidance for Airlines and Airline Crew: Coronavirus Disease 2019 (COVID-19)

- Interim guidance for the commercial airline industry about COVID-19

Safety Alert for Operators 20001: 2019 Novel Coronavirus: Interim Health Guidance for Air Carrier and Crews

- Interim guidance from the CDC and Federal Aviation Administration for Air Carriers and Crewmembers

Preventing Spread of Disease on Commercial Aircraft: Guidance for Cabin Crew

- This guidance provides cabin crew with practical methods to protect themselves, passengers, and other crew members when someone onboard is sick with a possible contagious disease.

Businesses, Employers, and Schools

Interim Guidance for Businesses and Employers to Plan and Respond to Coronavirus Disease 2019 (COVID-19), February 2020

- Interim guidance that may help prevent workplace exposures to acute respiratory illness, including COVID-19, in non-healthcare settings.

Healthcare Professionals

Evaluating and Reporting Persons Under Investigation (PUI)

- The Centers for Disease Control and Prevention (CDC) clinical criteria for a COVID-19 person under investigation (PUI). Subject to change as additional information becomes available.

Flowchart to Identify and Assess 2019 Novel Coronavirus

- Flowchart for the evaluation of patients who may be ill with or who may have been exposed to COVID-19.

Interim Infection Prevention and Control Recommendations for Patients with Confirmed Severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) or Persons Under Investigation for SARS-CoV-2 in Healthcare Settings

- Interim infection control procedures including administrative rules and engineering controls, environmental hygiene, correct work practices, and appropriate use of personal protective equipment (PPE) are all necessary to prevent infections from spreading during healthcare delivery. **This guidance is not intended for non-healthcare settings (e.g., schools) OR to persons outside of healthcare settings.**

AMERICAN OVERSIGHT

Last updated: February 21, 2020

Interim Guidance of Emergency Medical Services (EMS) Systems and 911 Public Safety Answering Points (PASPs) for COVID-19 in the United States

- Interim guidance for all first responders, including law enforcement, fire services, emergency medical services, and emergency management officials, who anticipate close contact with persons with confirmed or possible COVID-19 in the course of their work

Interim Guidance for Collection and Submission of Postmortem Specimens from Deceased Persons Under Investigation (PUI) for COVID-19, February 2020

- Interim guidance for the collection and submission of postmortem specimens from deceased persons under investigation (PUI) for COVID-19. This document also provides recommendations for biosafety and infection control practices during specimen collection and handling, including during autopsy procedures. The guidance can be utilized by medical examiners, coroners, pathologists, other workers involved in the postmortem care of deceased PUI, and local and state health departments.

Interim Guidance for Discontinuation of Transmission-Based Precautions and Disposition of Hospitalized Patients with COVID-19

- Interim guidance for healthcare providers and public health officials managing patients with coronavirus disease (COVID-19) to help prevent the spread of COVID-19 in healthcare facilities.

Interim Clinical Guidance for Management of Patients with Confirmed COVID-19

- Interim guidance for clinicians caring for patients with confirmed COVID-19

Interim Guidance for Implementing Home Care of People Not Requiring Hospitalization for 2019 Novel Coronavirus (2019-nCoV)

- Interim guidance for staff at local and state health departments, infection prevention and control professionals, and healthcare personnel who are coordinating the home care and isolation[1] of people with confirmed or suspected 2019-nCoV infection, including persons under investigation (see Criteria to Guide Evaluation of Persons Under Investigation (PUI) for 2019-nCoV).

Interim U.S. Guidance for Risk Assessment and Public Health Management of Healthcare Personnel with Potential Exposure in a Healthcare Setting to Patients with 2019 Novel Coronavirus (2019-nCoV)

- Interim guidance intended to assist with assessment of risk, monitoring, and work restriction decisions for HCP with potential exposure to 2019-nCoV. For guidance on assessment and management of exposure risk in non-healthcare settings, refer to the Interim US Guidance for Risk Assessment and Public Health Management of Persons with Potential 2019 Novel Coronavirus (2019-nCoV) Exposure in Travel-associated or Community Settings.

Infection Control

Interim Guidance for Preventing the Spread of Coronavirus Disease 2019 (COVID-19) in Homes and Residential Communities

AMERICAN OVERSIGHT

- Interim guidance to help prevent COVID-19 from spreading among people in their homes and in other residential communities.

Interim Guidance for Discontinuation of In-Home Isolation for Patients with COVID-19

- Interim guidance to help healthcare providers and public health officials managing patients with coronavirus disease (COVID-19) under in-home isolation to help prevent the spread of COVID-19 in the community.

Maritime

Interim Guidance for Ships on Managing Suspected Coronavirus Disease 2019

- Interim guidance for ships originating from, or stopping in, the United States to help prevent, detect, and medically manage suspected 2019-nCoV infections.

Personal Protective Equipment (PPE)

Healthcare Supply of Personal Protective Equipment

- CDC specific PPE recommendations based on the current COVID-19 situation and availability of PPE.

Public Health Officials

Information for Health Departments on Reporting a Person Under Investigation (PUI) for 2019-nCoV

- Information for health departments on reporting and specimen referral for Persons Under Investigation (PUIs).

Case Report Form for 2019 Novel Coronavirus

- The Case Report Form is intended for local and state health departments who have a laboratory confirmed case of 2019-nCoV to report to CDC.

Pandemic Preparedness Resources

- While the content at the links provided below was developed to prepare for, or respond to, an influenza ("flu") pandemic, the newly emerged coronavirus disease 2019 (COVID-19) is a respiratory disease that seems to be spreading much like flu. Guidance developed for influenza pandemic preparedness would be appropriate in the event the current COVID-19 outbreak triggers a pandemic.

Pregnant Women and Children

Interim Guidance on Breastfeeding for a Mother Confirmed or Under Investigation for COVID-19

- Interim guidance for women who are confirmed to have COVID-19 or are persons-under-investigation (PUI) for COVID-19 and are currently breastfeeding.

AMERICAN OVERSIGHT

Last updated: February 21, 2020

Interim Considerations for Infection Prevention and Control of Coronavirus Disease 2019 (COVID-19) in Inpatient Obstetric Healthcare Settings

- Interim for healthcare facilities providing obstetric care for pregnant patients with confirmed coronavirus disease (COVID-19) or pregnant persons under investigation (PUI) in inpatient obstetric healthcare settings including obstetrical triage, labor and delivery, recovery and inpatient postpartum settings.

Travelers

Information for Travelers

- This page includes information about 2019 novel coronavirus (COVID-19) for travelers going to and returning from China, and information for aircrew and resources ship industry.

Travelers to China

- Travel recommendations for travel to China

Travelers from China arriving in the U.S.

- Information for travelers from China arriving to the U.S.

Risk Assessment

Interim US Guidance for Risk Assessment and Public Health Management of Persons with Potential 2019 Novel Coronavirus (COVID-19) Exposure in Travel-associated or Community Settings

- Interim guidance to provide U.S. public health authorities and other partners with a framework for assessing and managing risk of potential exposures to COVID-19 and implementing public health actions based on a person's risk level and clinical presentation.

Interim U.S. Guidance for Risk Assessment and Public Health Management of Healthcare Personnel with Potential Exposure in a Healthcare Setting to Patients with 2019 Novel Coronavirus (2019-nCoV)

- Interim guidance is intended to assist with assessment of risk, monitoring, and work restriction decisions for healthcare providers with potential exposure to COVID-19.

Safety Alert for Operators 20001: 2019 Novel Coronavirus: Interim Health Guidance for Air Carrier and Crews

- Interim guidance from the CDC and Federal Aviation Administration for Air Carriers and Crewmembers

Preventing Spread of Disease on Commercial Aircraft: Guidance for Cabin Crew

- This guidance provides cabin crew with practical methods to protect themselves, passengers, and other crew members when someone onboard is sick with a possible contagious disease.

Businesses, Employers, and Schools

Interim Guidance for Businesses and Employers to Plan and Respond to Coronavirus Disease 2019 (COVID-19), February 2020

- Interim guidance that may help prevent workplace exposures to acute respiratory illness, including COVID-19, in non-healthcare settings.

Healthcare Professionals

Evaluating and Reporting Persons Under Investigation (PUI)

- The Centers for Disease Control and Prevention (CDC) clinical criteria for a COVID-19 person under investigation (PUI). Subject to change as additional information becomes available.

Flowchart to Identify and Assess 2019 Novel Coronavirus

- Flowchart for the evaluation of patients who may be ill with or who may have been exposed to COVID-19.

Interim Infection Prevention and Control Recommendations for Patients with Confirmed Severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) or Persons Under Investigation for SARS-CoV-2 in Healthcare Settings

- Interim infection control procedures including administrative rules and engineering controls, environmental hygiene, correct work practices, and appropriate use of personal protective equipment (PPE) are all necessary to prevent infections from spreading during healthcare delivery. **This guidance is not intended for non-healthcare settings (e.g., schools) OR to persons outside of healthcare settings.**

Interim Guidance of Emergency Medical Services (EMS) Systems and 911 Public Safety Answering Points (PASPs) for COVID-19 in the United States

- Interim guidance for all first responders, including law enforcement, fire services, emergency medical services, and emergency management officials, who anticipate close contact with persons with confirmed or possible COVID-19 in the course of their work

Interim Guidance for Collection and Submission of Postmortem Specimens from Deceased Persons Under Investigation (PUI) for COVID-19, February 2020

- Interim guidance for the collection and submission of postmortem specimens from deceased persons under investigation (PUI) for COVID-19. This document also provides recommendations for biosafety and infection control practices during specimen collection and handling, including during autopsy procedures. The guidance can be utilized by medical examiners, coroners, pathologists, other workers involved in the postmortem care of deceased PUI, and local and state health departments.

Interim Guidance for Discontinuation of Transmission-Based Precautions and Disposition of Hospitalized Patients with COVID-19

- Interim guidance for healthcare providers and public health officials managing patients with coronavirus disease (COVID-19) to help prevent the spread of COVID-19 in healthcare facilities.

Interim Clinical Guidance for Management of Patients with Confirmed COVID-19

- Interim guidance for clinicians caring for patients with confirmed COVID-19

Interim Guidance for Implementing Home Care of People Not Requiring Hospitalization for 2019 Novel Coronavirus (2019-nCoV)

- Interim guidance for staff at local and state health departments, infection prevention and control professionals, and healthcare personnel who are coordinating the home care and isolation[1] of people with confirmed or suspected 2019-nCoV infection, including persons under investigation (see Criteria to Guide Evaluation of Persons Under Investigation (PUI) for 2019-nCoV).

Interim U.S. Guidance for Risk Assessment and Public Health Management of Healthcare Personnel with Potential Exposure in a Healthcare Setting to Patients with 2019 Novel Coronavirus (2019-nCoV)

- Interim guidance intended to assist with assessment of risk, monitoring, and work restriction decisions for HCP with potential exposure to 2019-nCoV. For guidance on assessment and management of exposure risk in non-healthcare settings, refer to the Interim US Guidance for Risk Assessment and Public Health Management of Persons with Potential 2019 Novel Coronavirus (2019-nCoV) Exposure in Travel-associated or Community Settings.

Infection Control

Interim Guidance for Preventing the Spread of Coronavirus Disease 2019 (COVID-19) in Homes and Residential Communities

AMERICAN OVERSIGHT

- Interim guidance to help prevent COVID-19 from spreading among people in their homes and in other residential communities.

Interim Guidance for Discontinuation of In-Home Isolation for Patients with COVID-19

- Interim guidance to help healthcare providers and public health officials managing patients with coronavirus disease (COVID-19) under in-home isolation to help prevent the spread of COVID-19 in the community.

Maritime

Interim Guidance for Ships on Managing Suspected Coronavirus Disease 2019

- Interim guidance for ships originating from, or stopping in, the United States to help prevent, detect, and medically manage suspected 2019-nCoV infections.

Personal Protective Equipment (PPE)

Healthcare Supply of Personal Protective Equipment

- CDC specific PPE recommendations based on the current COVID-19 situation and availability of PPE.

Public Health Officials

Information for Health Departments on Reporting a Person Under Investigation (PUI) for 2019-nCoV

- Information for health departments on reporting and specimen referral for Persons Under Investigation (PUIs).

Case Report Form for 2019 Novel Coronavirus

- The Case Report Form is intended for local and state health departments who have a laboratory confirmed case of 2019-nCoV to report to CDC.

Pandemic Preparedness Resources

- While the content at the links provided below was developed to prepare for, or respond to, an influenza ("flu") pandemic, the newly emerged coronavirus disease 2019 (COVID-19) is a respiratory disease that seems to be spreading much like flu. Guidance developed for influenza pandemic preparedness would be appropriate in the event the current COVID-19 outbreak triggers a pandemic.

Pregnant Women and Children

Interim Guidance on Breastfeeding for a Mother Confirmed or Under Investigation for COVID-19

- Interim guidance for women who are confirmed to have COVID-19 or are persons-under-investigation (PUI) for COVID-19 and are currently breastfeeding.

AMERICAN OVERSIGHT

Last updated: February 21, 2020

Interim Considerations for Infection Prevention and Control of Coronavirus Disease 2019 (COVID-19) in Inpatient Obstetric Healthcare Settings

- Interim for healthcare facilities providing obstetric care for pregnant patients with confirmed coronavirus disease (COVID-19) or pregnant persons under investigation (PUI) in inpatient obstetric healthcare settings including obstetrical triage, labor and delivery, recovery and inpatient postpartum settings.

Travelers

Information for Travelers

- This page includes information about 2019 novel coronavirus (COVID-19) for travelers going to and returning from China, and information for aircrew and resources ship industry.

Travelers to China

- Travel recommendations for travel to China

Travelers from China arriving in the U.S.

Attachments:	CDC_COVID-19_Daily Key Points__2_25_2020_FINAL.pdf

Dear Colleagues:

Attached please find the CDC COVID-19 daily key points for Tuesday, February 25, 2020.

Below you will find a CDC media statement regarding the Westerdam cruise ship.

> Westerdam Media Statement:
>
> No testing of passengers from the Westerdam Cruise Ship for SARS-CoV-2, the virus that causes COVID-19, has been done at CDC. CDC is aware that an American passenger on the Westerdam tested positive for infection with SARS-CoV-2 in Malaysia and that two sequential tests on samples from that same person were negative. CDC is aware that follow-up testing among more than 1,500 passengers from the Westerdam has all been negative.
>
> At this time, CDC considers passengers from the Westerdam to be at "low risk" of SARS-CoV-2 infection during the 14 days after their last exposure per the agency's Risk Assessment guidance at https://www.cdc.gov/coronavirus/2019-ncov/php/risk-assessment.html. Given this level of risk, testing of Westerdam passengers for SARS-CoV-2 is not recommended unless additional exposures are identified to warrant testing.

Thank you,

State Coordination Task Force

Sent by BCC to PHEP Directors, SHOS, State Epis, Non-governmental Partners, STLTs, and BCHC

AMERICAN OVERSIGHT

CDC Daily Key Points

Coronavirus Disease 2019 ("COVID-19") Outbreak

February 25, 2020

All content updated since February 24 is shown in colored text.

MAIN KEY POINTS

- There is an expanding global outbreak of respiratory illness caused by a novel (new) coronavirus.
- This virus has been named "SARS-CoV-2;" the disease it causes has been named COVID-19.
    - Due to potential for confusion with SARS-CoV, where possible, public communications will use "the virus that causes COVID-19."
- While most COVID-19 cases outside of China have been associated with travel to or from China, community spread is being detected in a growing number of countries.
- Destinations with apparent community spread of COVID-19 include Hong Kong, Iran, Italy, Japan, Singapore, South Korea, Taiwan, and Thailand.
- The fact that COVID-19 has caused illness, including illness resulting in death, and sustained person-to-person spread is concerning. These factors meet two of the criteria of a pandemic.
- As community spread is detected in more and more countries, the world moves closer toward meeting the third criteria, worldwide spread of the new virus.
- The potential public health threat posed by COVID-19 is high, both globally and to the United States.
- But individual risk is dependent on exposure.
- For the general American public, who are unlikely to be exposed to this virus at this time, the immediate health risk from COVID-19 is low.
- Under current circumstances, certain people will have an increased risk of infection. For example, healthcare workers caring for patients with COVID-19 and other close contacts of persons with COVID-19. CDC has developed guidance to help in the risk assessment and management of people with potential exposures to COVID-19.
- However, it's important to note that current global circumstances suggest it is likely that this virus will cause a pandemic. In that case, risk assessment would be different.
- Global efforts at this time are focused concurrently on containing spread of this virus and mitigating the impact of this virus.
- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States so as to reduce the spread and the impact of this virus.
- CDC is operationalizing all of its pandemic preparedness and response plans, working on multiple fronts to meet these goals, including specific measures to prepare communities to respond local transmission of the virus that causes COVID-19.
- Pandemic guidance developed in anticipation of an influenza pandemic is being repurposed and adapted for a COVID-19 pandemic.
- Public health partners are encouraged to review their pandemic preparedness plans at this time.

AMERICAN OVERSIGHT

- At this time, there is no vaccine to protect against COVID-19 and no medications approved to treat it.
- Nonpharmaceutical interventions would be the most important response strategy.

SITUATION UPDATE

- On February 25, a *Morbidity and Mortality Weekly Report* (*MMWR*) Update was published titled "Public Health Response to the Coronavirus Disease 2019 Outbreak — United States, February 24, 2020." (See Section "MMWR Update.")
- To date, 37 international locations (including the U.S.) have reported confirmed cases of COVID-19.
- On February 24, CDC issued a Level 2 Travel Notices (Practice Enhanced Precautions) for Iran and Italy.
- On February 24, CDC issued Level 3 Travel Alert Notices (Practice Usual Precautions) for South Korea.
- CDC also recommends that all travelers reconsider cruise ship voyages into or within Asia at this time.
- This is consistent with guidance by the U.S. State Department.
- This is a rapidly evolving situation. CDC is constantly reviewing and updating its guidance as needed.
- CDC is reporting confirmed cases of COVID-19 in the United States in two categories:
    1. Cases detected through our domestic public health systems, and
    2. Cases among people who were repatriated via U.S. State Department flights from Wuhan, China and from the Diamond Princess cruise ship (Japan).
- Fourteen cases of COVID-19 have been detected in California, Illinois, Massachusetts, Washington, and Wisconsin through U.S. public health surveillance.
- Two of these cases occurred through person-to-person spread. The remaining cases all were in persons who had travel to China.
- 43 cases of COVID-19 have been detected among the 1,100+ people repatriated from Hubei Province, China and the Diamond Princess. (That includes 3 people repatriated from Wuhan and 40 people who were repatriated from the Diamond Princess, an increase of 4 since yesterday.)
- Almost all of the people from the Wuhan flights who were quarantined have finished their 14-day quarantine period.
- Because the passengers on the Diamond Princess were in a close setting where there was significant spread of COVID-19, they are considered at high-risk for infection. CDC expects to see additional confirmed cases of among those passengers.

***MMWR* UPDATE:**

- As of February 23, 2020, there were 76,936 reported cases in mainland China and 1,875 cases in locations outside mainland China.
- Fourteen cases have been diagnosed in the United States, and an additional 39 cases have occurred among repatriated persons from high-risk settings, for a current total of 53 cases within the United States.
    - No deaths have been reported in the United States.

AMERICAN OVERSIGHT

- CDC and partners are implementing aggressive measures to slow and contain the spread of COVID-19 in the United States.
    - Although these measures might not prevent widespread transmission of the virus in the United States, they are being implemented to
        1) slow the spread of illness;
        2) provide time to better prepare state and local health departments, health care systems, businesses, educational organizations, and the general public in the event that widespread transmission occurs; and
        3) better characterize COVID-19 to guide public health recommendations and the development and deployment of medical countermeasures, including diagnostics, therapeutics, and vaccines.
    - CDC's COVID-19 Response by the numbers:
        - As of February 24, 2020, a total of 1,336 CDC staff members have been involved in the COVID-19 response, including clinicians (i.e., physicians, nurses, and pharmacists), epidemiologists, veterinarians, laboratorians, communicators, data scientists and modelers, and coordination staff members.
        - CDC teams work with the Department of Homeland Security at 11 airports to screen all travelers from China who are returning to the United States.
        - As of February 23, 2020
            - A total of 46,016 air travelers have been screened at these 11 U.S. airports.
            - Eleven travelers were referred to a hospital and tested for infection; one tested positive and was isolated and managed medically.
            - Seventeen travelers were quarantined for 14 days because of travel from Hubei Province, China.
            - 479 persons for 43 states and territories had been or are being tested for COVID-19; 14 (3%) had a positive test, 412 (86%) had a negative test, and 53 (11%) test results are pending.
        - During January 18-Febrary 23, 2020, CDC laboratories used real-time reverse transcription–polymerase chain reaction (RT-PCR) to test 2,620 specimens from 1,007 persons for SARS-CoV-2.
        - During January 29-February 6, 2020, the U.S. government repatriated 808 U.S. citizens, residents, and their families from Hubei Province, China, on five chartered flights.
        - CDC posts travel notices to inform travelers and clinicians about current health issues that could affect travelers' health.
- CDC and partners are preparing for widespread transmission of COVID-19 in U.S. communities.
- The report is available online.

WHAT YOU CAN DO

- While the immediate risk of this new virus to the American public is believed to be low at this time, everyone can do their part to help us respond to this emerging public health threat:
    - It's currently flu and respiratory disease season and CDC recommends getting a flu vaccine, taking everyday preventive actions to help stop the spread of germs, and taking flu antivirals if prescribed.

AMERICAN OVERSIGHT

- If you are a healthcare provider, be on the look-out for people with who recently traveled from China and fever and respiratory symptoms.
- If you are a healthcare provider caring for a COVID-19 patient or a public health responder, please take care of yourself and follow recommended infection control procedures.
- If you have been in China or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus. If you develop COVID-19 symptoms, contact your healthcare provider, and tell them about your symptoms and your travel or exposure to a COVID-19 patient.
- For people who have had close contact with someone with COVID-19 who develop symptoms, contact your healthcare provider, and tell them about your symptoms and your exposure to a COVID-19 patient.
- For people who are ill with COVID-19, please follow CDC guidance on how to reduce the risk of spreading your illness to others. This guidance in on the CDC website.

TESTING

- CDC has two laboratories conducting testing for the virus that causes COVID-19. CDC can test approximately 400 specimens per day.
- CDC's testing capacity is more than adequate to meet current testing demands. (There is no backlog of tests at CDC.)
- A number of laboratories are able to test for the virus that causes COVID-19 using CDC's test.
- All confirmatory testing for COVID-19 continues to be performed at CDC. (All positive results from testing conducted in non-CDC, U.S. laboratories must be confirmed at CDC.)
- CDC continues to work on remanufacturing test kits to detect the virus that causes COVID-19, which will be distributed following rigorous quality control processes.
- Commercial labs are working to develop their own tests and hopefully will be available soon. This will allow a greater number of tests to happen close to where potential cases are.

CDC ACTIONS

- CDC is aggressively responding to the global outbreak of COVID-19 and preparing for the potential of community spread in the United States.
- **Preparing first responders, healthcare providers, and health systems:**
    - Establishing **visibility across healthcare systems** to understand healthcare use, particularly surges in demand for medical care and associated resources.
    - Conducting **extensive outreach to clinical and hospital professional organizations** to ensure health system **preparedness.**
    - Producing more than **23 guidance documents** on infection control, hospital preparedness assessments, personal protective equipment (PPE) supply planning, and clinical evaluation and management (as of February 22, 2020).
        - Working closely with healthcare facilities and providers to **reinforce infection control principles** that recognize PPE is one component of a larger set of practices that help to limit the spread of disease.

AMERICAN OVERSIGHT

        - **Developing a range of respirator conservation strategies**, including strategies to make supplies last longer (such as using alternative products like reusable respirators) and extending the use of disposable respirators.
    - Leveraging existing **telehealth tools** to direct people to the right level of healthcare for their medical needs.
    - **Working with supply chain partners** to understand supply usage, what products are available, and when more aggressive measures may need to be taken to ensure that healthcare workers at highest risk have access to PPE.
    - **Sharing information with stakeholders** to help them recognize when to shift the strategies they are using.
- **Reinforcing state, territorial, and local public health readiness:**
    - **Assessing state and local readiness** to implement community mitigation measures like home containment, including housing and transportation needs.
    - Coordinating with states to **identify and mitigate gaps in readiness** that will help reduce the spread of disease in the community while protecting workers, infrastructure, and institutions.
    - Linking public health agencies and healthcare systems to **identify and mitigate stressors to the health system**
    - **Tracking stockpiles of PPE** across jurisdictions.
    - Working with state and local public health to **use existing Public Health Emergency Preparedness (PHEP) funding** to support COVID-19 preparedness and response activities.
    - Leveraging funding mechanisms to help states **accelerate preparedness activities.**
    - Providing **technical assistance and guidance** to states to improve their ability to respond to the outbreak.
- **Supporting communities, businesses, and schools:**
    - **Creating business guidance** to help the public and private sectors ensure they are able to operate with adaptations like telework and flexible sick leave policies, as well as how to respond if an employee gets sick.
    - **Developing guidance for childcare programs, K-12 schools, and colleges/universities** to help them plan and prepare for COVID-19 and respond if there is a local outbreak in their community.
        - Providing **planning guides for COVID-19** that households, community- and faith-based organizations, event planners of mass gatherings, and public health communicators can use.
        - Educating communities about **nonpharmaceutical interventions (NPIs)** that help slow the spread of illness, like COVID-19.

NONPHARMACEUTICAL INTERVENTIONS

- Nonpharmaceutical Interventions (NPIs) are actions, apart from getting vaccinated and taking medicine, that people and communities can take to help slow the spread of illnesses like pandemic flu or COVID-19.
- NPIs are also known as community mitigation strategies.
- When a new virus spreads among people, causing illness worldwide, it is called a pandemic.

AMERICAN OVERSIGHT

- Because the virus is new, the human population has little or no immunity against it. This allows the virus to spread quickly from person to person worldwide.
- NPIs are among the best ways of controlling a pandemic caused by a respiratory virus when vaccines are not yet available.
- NPIs are grouped in three categories:
    1. personal NPIs (personal protective measures for everyday use and personal protective measures reserved for influenza pandemics);
    2. community NPIs (social distancing measures and school closures and dismissals); and
    3. environmental NPIs (surface cleaning measures)
- View information about NPIs and factors to consider before implementing nonpharmaceutical interventions.

For more information please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

        3) better characterize COVID-19 to guide public health recommendations and the development and deployment of medical countermeasures, including diagnostics, therapeutics, and vaccines.
    - CDC's COVID-19 Response by the numbers:
        - As of February 24, 2020, a total of 1,336 CDC staff members have been involved in the COVID-19 response, including clinicians (i.e., physicians, nurses, and pharmacists), epidemiologists, veterinarians, laboratorians, communicators, data scientists and modelers, and coordination staff members.
        - CDC teams work with the Department of Homeland Security at 11 airports to screen all travelers from China who are returning to the United States.
        - As of February 23, 2020
            - A total of 46,016 air travelers have been screened at these 11 U.S. airports.
            - Eleven travelers were referred to a hospital and tested for infection; one tested positive and was isolated and managed medically.
            - Seventeen travelers were quarantined for 14 days because of travel from Hubei Province, China.
            - 479 persons for 43 states and territories had been or are being tested for COVID-19; 14 (3%) had a positive test, 412 (86%) had a negative test, and 53 (11%) test results are pending.
        - During January 18-Febrary 23, 2020, CDC laboratories used real-time reverse transcription–polymerase chain reaction (RT-PCR) to test 2,620 specimens from 1,007 persons for SARS-CoV-2.
        - During January 29-February 6, 2020, the U.S. government repatriated 808 U.S. citizens, residents, and their families from Hubei Province, China, on five chartered flights.
        - CDC posts travel notices to inform travelers and clinicians about current health issues that could affect travelers' health.
- CDC and partners are preparing for widespread transmission of COVID-19 in U.S. communities.
- The report is available online.

WHAT YOU CAN DO

- While the immediate risk of this new virus to the American public is believed to be low at this time, everyone can do their part to help us respond to this emerging public health threat:
    - It's currently flu and respiratory disease season and CDC recommends getting a flu vaccine, taking everyday preventive actions to help stop the spread of germs, and taking flu antivirals if prescribed.

AMERICAN OVERSIGHT

- If you are a healthcare provider, be on the look-out for people with who recently traveled from China and fever and respiratory symptoms.
- If you are a healthcare provider caring for a COVID-19 patient or a public health responder, please take care of yourself and follow recommended infection control procedures.
- If you have been in China or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus. If you develop COVID-19 symptoms, contact your healthcare provider, and tell them about your symptoms and your travel or exposure to a COVID-19 patient.
- For people who have had close contact with someone with COVID-19 who develop symptoms, contact your healthcare provider, and tell them about your symptoms and your exposure to a COVID-19 patient.
- For people who are ill with COVID-19, please follow CDC guidance on how to reduce the risk of spreading your illness to others. This guidance in on the CDC website.

TESTING

- CDC has two laboratories conducting testing for the virus that causes COVID-19. CDC can test approximately 400 specimens per day.
- CDC's testing capacity is more than adequate to meet current testing demands. (There is no backlog of tests at CDC.)
- A number of laboratories are able to test for the virus that causes COVID-19 using CDC's test.
- All confirmatory testing for COVID-19 continues to be performed at CDC. (All positive results from testing conducted in non-CDC, U.S. laboratories must be confirmed at CDC.)
- CDC continues to work on remanufacturing test kits to detect the virus that causes COVID-19, which will be distributed following rigorous quality control processes.
- Commercial labs are working to develop their own tests and hopefully will be available soon. This will allow a greater number of tests to happen close to where potential cases are.

CDC ACTIONS

- CDC is aggressively responding to the global outbreak of COVID-19 and preparing for the potential of community spread in the United States.
- **Preparing first responders, healthcare providers, and health systems:**
    - Establishing **visibility across healthcare systems** to understand healthcare use, particularly surges in demand for medical care and associated resources.
    - Conducting **extensive outreach to clinical and hospital professional organizations** to ensure health system **preparedness.**
    - Producing more than **23 guidance documents** on infection control, hospital preparedness assessments, personal protective equipment (PPE) supply planning, and clinical evaluation and management (as of February 22, 2020).
        - Working closely with healthcare facilities and providers to **reinforce infection control principles** that recognize PPE is one component of a larger set of practices that help to limit the spread of disease.

AMERICAN OVERSIGHT

        - **Developing a range of respirator conservation strategies**, including strategies to make supplies last longer (such as using alternative products like reusable respirators) and extending the use of disposable respirators.
    - Leveraging existing **telehealth tools** to direct people to the right level of healthcare for their medical needs.
    - **Working with supply chain partners** to understand supply usage, what products are available, and when more aggressive measures may need to be taken to ensure that healthcare workers at highest risk have access to PPE.
    - **Sharing information with stakeholders** to help them recognize when to shift the strategies they are using.
- **Reinforcing state, territorial, and local public health readiness:**
    - **Assessing state and local readiness** to implement community mitigation measures like home containment, including housing and transportation needs.
    - Coordinating with states to **identify and mitigate gaps in readiness** that will help reduce the spread of disease in the community while protecting workers, infrastructure, and institutions.
    - Linking public health agencies and healthcare systems to **identify and mitigate stressors to the health system**
    - **Tracking stockpiles of PPE** across jurisdictions.
    - Working with state and local public health to **use existing Public Health Emergency Preparedness (PHEP) funding** to support COVID-19 preparedness and response activities.
    - Leveraging funding mechanisms to help states **accelerate preparedness activities.**
    - Providing **technical assistance and guidance** to states to improve their ability to respond to the outbreak.
- **Supporting communities, businesses, and schools:**
    - **Creating business guidance** to help the public and private sectors ensure they are able to operate with adaptations like telework and flexible sick leave policies, as well as how to respond if an employee gets sick.
    - **Developing guidance for childcare programs, K-12 schools, and colleges/universities** to help them plan and prepare for COVID-19 and respond if there is a local outbreak in their community.
        - Providing **planning guides for COVID-19** that households, community- and faith-based organizations, event planners of mass gatherings, and public health communicators can use.
        - Educating communities about **nonpharmaceutical interventions (NPIs)** that help slow the spread of illness, like COVID-19.

NONPHARMACEUTICAL INTERVENTIONS

- Nonpharmaceutical Interventions (NPIs) are actions, apart from getting vaccinated and taking medicine, that people and communities can take to help slow the spread of illnesses like pandemic flu or COVID-19.
- NPIs are also known as community mitigation strategies.
- When a new virus spreads among people, causing illness worldwide, it is called a pandemic.

AMERICAN OVERSIGHT

- Because the virus is new, the human population has little or no immunity against it. This allows the virus to spread quickly from person to person worldwide.
- NPIs are among the best ways of controlling a pandemic caused by a respiratory virus when vaccines are not yet available.
- NPIs are grouped in three categories:
    1. personal NPIs (personal protective measures for everyday use and personal protective measures reserved for influenza pandemics);
    2. community NPIs (social distancing measures and school closures and dismissals); and
    3. environmental NPIs (surface cleaning measures)
- View information about NPIs and factors to consider before implementing nonpharmaceutical interventions.

For more information please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

Subject:	2-25-2020 CDC COVID-19 Daily Key Points and STLT Westerdam Information
Date:	Wednesday, February 26, 2020 1:06:57 PM
Attachments:	CDC_COVID-19_Daily Key Points__2_25_2020_FINAL.pdf

Dear Colleagues:

Attached please find the CDC COVID-19 daily key points for Tuesday, February 25, 2020.

Below you will find a CDC media statement regarding the Westerdam cruise ship.

> Westerdam Media Statement:
>
> No testing of passengers from the Westerdam Cruise Ship for SARS-CoV-2, the virus that causes COVID-19, has been done at CDC. CDC is aware that an American passenger on the Westerdam tested positive for infection with SARS-CoV-2 in Malaysia and that two sequential tests on samples from that same person were negative. CDC is aware that follow-up testing among more than 1,500 passengers from the Westerdam has all been negative.
>
> At this time, CDC considers passengers from the Westerdam to be at "low risk" of SARS-CoV-2 infection during the 14 days after their last exposure per the agency's Risk Assessment guidance at https://www.cdc.gov/coronavirus/2019-ncov/php/risk-assessment.html. Given this level of risk, testing of Westerdam passengers for SARS-CoV-2 is not recommended unless additional exposures are identified to warrant testing.

Thank you,

State Coordination Task Force

Sent by BCC to PHEP Directors, SHOS, State Epis, Non-governmental Partners, STLTs, and BCHC

AMERICAN OVERSIGHT

CDC Daily Key Points

Coronavirus Disease 2019 ("COVID-19") Outbreak

February 25, 2020

All content updated since February 24 is shown in colored text.

MAIN KEY POINTS

- There is an expanding global outbreak of respiratory illness caused by a novel (new) coronavirus.
- This virus has been named "SARS-CoV-2;" the disease it causes has been named COVID-19.
    - Due to potential for confusion with SARS-CoV, where possible, public communications will use "the virus that causes COVID-19."
- While most COVID-19 cases outside of China have been associated with travel to or from China, community spread is being detected in a growing number of countries.
- Destinations with apparent community spread of COVID-19 include Hong Kong, Iran, Italy, Japan, Singapore, South Korea, Taiwan, and Thailand.
- The fact that COVID-19 has caused illness, including illness resulting in death, and sustained person-to-person spread is concerning. These factors meet two of the criteria of a pandemic.
- As community spread is detected in more and more countries, the world moves closer toward meeting the third criteria, worldwide spread of the new virus.
- The potential public health threat posed by COVID-19 is high, both globally and to the United States.
- But individual risk is dependent on exposure.
- For the general American public, who are unlikely to be exposed to this virus at this time, the immediate health risk from COVID-19 is low.
- Under current circumstances, certain people will have an increased risk of infection. For example, healthcare workers caring for patients with COVID-19 and other close contacts of persons with COVID-19. CDC has developed guidance to help in the risk assessment and management of people with potential exposures to COVID-19.
- However, it's important to note that current global circumstances suggest it is likely that this virus will cause a pandemic. In that case, risk assessment would be different.
- Global efforts at this time are focused concurrently on containing spread of this virus and mitigating the impact of this virus.
- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States so as to reduce the spread and the impact of this virus.
- CDC is operationalizing all of its pandemic preparedness and response plans, working on multiple fronts to meet these goals, including specific measures to prepare communities to respond local transmission of the virus that causes COVID-19.
- Pandemic guidance developed in anticipation of an influenza pandemic is being repurposed and adapted for a COVID-19 pandemic.
- Public health partners are encouraged to review their pandemic preparedness plans at this time.

AMERICAN OVERSIGHT

- At this time, there is no vaccine to protect against COVID-19 and no medications approved to treat it.
- Nonpharmaceutical interventions would be the most important response strategy.

SITUATION UPDATE

- On February 25, a *Morbidity and Mortality Weekly Report* (*MMWR*) Update was published titled "Public Health Response to the Coronavirus Disease 2019 Outbreak — United States, February 24, 2020." (See Section "MMWR Update.")
- To date, 37 international locations (including the U.S.) have reported confirmed cases of COVID-19.
- On February 24, CDC issued a Level 2 Travel Notices (Practice Enhanced Precautions) for Iran and Italy.
- On February 24, CDC issued Level 3 Travel Alert Notices (Practice Usual Precautions) for South Korea.
- CDC also recommends that all travelers reconsider cruise ship voyages into or within Asia at this time.
- This is consistent with guidance by the U.S. State Department.
- This is a rapidly evolving situation. CDC is constantly reviewing and updating its guidance as needed.
- CDC is reporting confirmed cases of COVID-19 in the United States in two categories:
    1. Cases detected through our domestic public health systems, and
    2. Cases among people who were repatriated via U.S. State Department flights from Wuhan, China and from the Diamond Princess cruise ship (Japan).
- Fourteen cases of COVID-19 have been detected in California, Illinois, Massachusetts, Washington, and Wisconsin through U.S. public health surveillance.
- Two of these cases occurred through person-to-person spread. The remaining cases all were in persons who had travel to China.
- 43 cases of COVID-19 have been detected among the 1,100+ people repatriated from Hubei Province, China and the Diamond Princess. (That includes 3 people repatriated from Wuhan and 40 people who were repatriated from the Diamond Princess, an increase of 4 since yesterday.)
- Almost all of the people from the Wuhan flights who were quarantined have finished their 14-day quarantine period.
- Because the passengers on the Diamond Princess were in a close setting where there was significant spread of COVID-19, they are considered at high-risk for infection. CDC expects to see additional confirmed cases of among those passengers.

***MMWR* UPDATE:**

- As of February 23, 2020, there were 76,936 reported cases in mainland China and 1,875 cases in locations outside mainland China.
- Fourteen cases have been diagnosed in the United States, and an additional 39 cases have occurred among repatriated persons from high-risk settings, for a current total of 53 cases within the United States.
    - No deaths have been reported in the United States.

AMERICAN OVERSIGHT

- CDC and partners are implementing aggressive measures to slow and contain the spread of COVID-19 in the United States.
    - Although these measures might not prevent widespread transmission of the virus in the United States, they are being implemented to
        1) slow the spread of illness;
        2) provide time to better prepare state and local health departments, health care systems, businesses, educational organizations, and the general public in the event that widespread transmission occurs; and
        3) better characterize COVID-19 to guide public health recommendations and the development and deployment of medical countermeasures, including diagnostics, therapeutics, and vaccines.
    - CDC's COVID-19 Response by the numbers:
        - As of February 24, 2020, a total of 1,336 CDC staff members have been involved in the COVID-19 response, including clinicians (i.e., physicians, nurses, and pharmacists), epidemiologists, veterinarians, laboratorians, communicators, data scientists and modelers, and coordination staff members.
        - CDC teams work with the Department of Homeland Security at 11 airports to screen all travelers from China who are returning to the United States.
        - As of February 23, 2020
            - A total of 46,016 air travelers have been screened at these 11 U.S. airports.
            - Eleven travelers were referred to a hospital and tested for infection; one tested positive and was isolated and managed medically.
            - Seventeen travelers were quarantined for 14 days because of travel from Hubei Province, China.
            - 479 persons for 43 states and territories had been or are being tested for COVID-19; 14 (3%) had a positive test, 412 (86%) had a negative test, and 53 (11%) test results are pending.
        - During January 18-Febrary 23, 2020, CDC laboratories used real-time reverse transcription–polymerase chain reaction (RT-PCR) to test 2,620 specimens from 1,007 persons for SARS-CoV-2.
        - During January 29-February 6, 2020, the U.S. government repatriated 808 U.S. citizens, residents, and their families from Hubei Province, China, on five chartered flights.
        - CDC posts travel notices to inform travelers and clinicians about current health issues that could affect travelers' health.
- CDC and partners are preparing for widespread transmission of COVID-19 in U.S. communities.
- The report is available online.

WHAT YOU CAN DO

- While the immediate risk of this new virus to the American public is believed to be low at this time, everyone can do their part to help us respond to this emerging public health threat:
    - It's currently flu and respiratory disease season and CDC recommends getting a flu vaccine, taking everyday preventive actions to help stop the spread of germs, and taking flu antivirals if prescribed.

AMERICAN OVERSIGHT

- If you are a healthcare provider, be on the look-out for people with who recently traveled from China and fever and respiratory symptoms.
- If you are a healthcare provider caring for a COVID-19 patient or a public health responder, please take care of yourself and follow recommended infection control procedures.
- If you have been in China or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus. If you develop COVID-19 symptoms, contact your healthcare provider, and tell them about your symptoms and your travel or exposure to a COVID-19 patient.
- For people who have had close contact with someone with COVID-19 who develop symptoms, contact your healthcare provider, and tell them about your symptoms and your exposure to a COVID-19 patient.
- For people who are ill with COVID-19, please follow CDC guidance on how to reduce the risk of spreading your illness to others. This guidance in on the CDC website.

TESTING

- CDC has two laboratories conducting testing for the virus that causes COVID-19. CDC can test approximately 400 specimens per day.
- CDC's testing capacity is more than adequate to meet current testing demands. (There is no backlog of tests at CDC.)
- A number of laboratories are able to test for the virus that causes COVID-19 using CDC's test.
- All confirmatory testing for COVID-19 continues to be performed at CDC. (All positive results from testing conducted in non-CDC, U.S. laboratories must be confirmed at CDC.)

AMERICAN OVERSIGHT

CDC Daily Key Points

Coronavirus Disease 2019 ("COVID-19") Outbreak

February 26, 2020

All content updated since February 25 is shown in colored text.

MAIN KEY POINTS

- There is an expanding global outbreak of respiratory illness caused by a novel (new) coronavirus.
- This virus has been named "SARS-CoV-2;" the disease it causes has been named COVID-19.
    - Due to potential for confusion with SARS-CoV, where possible, public communications will use "the virus that causes COVID-19."
- While most COVID-19 cases outside of China have been associated with travel to or from China, community spread is being detected in a growing number of countries.
- Destinations with widespread or sustained community spread of COVID-19 include China, Iran, Italy, Japan, and South Korea.
- Other destinations with instances of apparent community spread include Hong Kong, Singapore, Taiwan, Thailand, and Vietnam.
- The fact that COVID-19 has caused illness, including illness resulting in death, and sustained person-to-person spread is concerning. These factors meet two of the criteria of a pandemic.
- As community spread is detected in more and more countries, the world moves closer toward meeting the third criteria, worldwide spread of the new virus.
- The potential public health threat posed by COVID-19 is high, both globally and to the United States.
- But individual risk is dependent on exposure.
- For the general American public, who are unlikely to be exposed to this virus at this time, the immediate health risk from COVID-19 is low.
- Under current circumstances, certain people will have an increased risk of infection.
    - For example, healthcare workers caring for patients with COVID-19 and other close contacts of persons with COVID-19.
- CDC has developed guidance to help in the risk assessment and management of people with potential exposures to COVID-19.
- CDC expects that more cases will be reported in the United States, including person-to-person spread.
- Global efforts at this time are focused concurrently on containing spread of and mitigating the impact of this virus.
- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is aggressive and multi-layered, with the goal of detecting introductions of this virus in the United States and reducing the spread and the impact of this virus.
- CDC is operationalizing all of its pandemic preparedness and response plans, working on multiple fronts to meet these goals, including specific measures to prepare communities to respond local transmission of the virus that causes COVID-19.

AMERICAN OVERSIGHT

- Pandemic guidance developed in anticipation of an influenza pandemic is being repurposed and adapted for a COVID-19 pandemic.
- Public health partners are encouraged to review their pandemic preparedness plans at this time.
- At this time, there is no vaccine to protect against COVID-19 and no medications approved to treat it.
- Nonpharmaceutical interventions (NPIs) would be the most important response strategy. NPIs simultaneously help contain the spread of disease and reduce the impact of disease.

SITUATION UPDATE

- To date, 42 international locations (including the U.S.) have reported confirmed cases of COVID-19, most recently Algeria, Austria, Brazil, Croatia, Switzerland.
- CDC is reviewing and updating their travel guidance daily.
- To date, CDC has issued:
    - Level 3 Travel Health Notices (Avoid Nonessential Travel) for China and South Korea.
    - Level 2 Travel Health Notices (Practice Enhanced Precautions) for Iran, Italy, and Japan.
    - Level 1 Travel Health Notices (Practice Usual Precautions) for Hong Kong.
- CDC also recommends that all travelers reconsider cruise ship voyages into or within Asia at this time.
    - This is consistent with guidance by the U.S. State Department.
- This is a rapidly evolving situation. CDC is constantly reviewing and updating its guidance as needed.
- CDC is reporting confirmed cases of COVID-19 in the United States in two categories:
    1. Cases detected through our domestic public health systems, and
    2. Cases among people who were repatriated via U.S. State Department flights from Wuhan, China and from the *Diamond Princess* cruise ship (Japan).
- 15 cases of COVID-19 have been detected through U.S. public health surveillance.
    - Two of these cases occurred through person-to-person spread.
    - On February 26, CDC confirmed an infection with the virus that causes COVID-19 in a person who reportedly did not have relevant travel history or exposure to another COVID-19 patient.
    - It's possible this could be an instance of community spread of COVID-19, which would be the first time that has happened in the United States.
    - Community spread means spread of an illness for which the source of infection is unknown.
    - It's also possible, however, that the patient may have been exposed to a returned traveler who was infected.
    - All the remaining cases detected through the U.S. public health system were in persons who had travel to China.
- 45 cases of COVID-19 have been detected among the 1,100+ people repatriated from Hubei Province, China and the *Diamond Princess*.
    - 3 people were repatriated from Wuhan.
    - 42 people were repatriated from the Diamond Princess, an increase of 2 since yesterday.

AMERICAN OVERSIGHT

- Almost all of the people from the Wuhan flights who were quarantined have finished their 14-day quarantine period.
- Because the passengers on the Diamond Princess were in a close setting where there was significant spread of COVID-19, they are considered at high-risk for infection. CDC expects to see additional confirmed cases of among those passengers.

WHAT YOU CAN DO

- While the immediate risk of this new virus to the American public is believed to be low at this time, everyone can do their part to help us respond to this emerging public health threat:
    - It's currently flu and respiratory disease season and CDC recommends getting a flu vaccine, taking everyday preventive actions to help stop the spread of germs, and taking flu antivirals if prescribed.
    - If you are a healthcare provider, be on the look-out for people with who recently traveled from China and fever and respiratory symptoms.
    - If you are a healthcare provider caring for a COVID-19 patient or a public health responder, please take care of yourself and follow recommended infection control procedures.
    - If you have been in China or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus. If you develop COVID-19 symptoms, contact your healthcare provider, and tell them about your symptoms and your travel or exposure to a COVID-19 patient.
    - For people who have had close contact with someone with COVID-19 who develop symptoms, contact your healthcare provider, and tell them about your symptoms and your exposure to a COVID-19 patient.
    - For people who are ill with COVID-19, please follow CDC guidance on how to reduce the risk of spreading your illness to others. This guidance in on the CDC website.

TESTING

- CDC and FDA have developed a protocol that uses two of the three components of the original CDC test kit to detect the virus that causes COVID-19.
- By the end of this week, at least 40 public health laboratories should be able to begin testing using existing kits in their laboratories.
- Further, FDA and CDC have identified additional kits that will be evaluated and could be shipped to public health laboratories.
- In addition, CDC has two laboratories conducting testing for the virus that causes COVID-19. CDC can test approximately 400 specimens per day.
- Commercial labs are working to develop their own tests and hopefully will be available soon. This will allow a greater number of tests to happen close to where potential cases are.

CDC ACTIONS

- CDC is aggressively responding to the global outbreak of COVID-19 and preparing for the potential of community spread in the United States.

AMERICAN OVERSIGHT

- **Preparing first responders, healthcare providers, and health systems:**
    - Establishing **visibility across healthcare systems** to understand healthcare use, particularly surges in demand for medical care and associated resources.
    - Conducting **extensive outreach to clinical and hospital professional organizations** to ensure health system **preparedness**.
    - Producing more than **23 guidance documents** on infection control, hospital preparedness assessments, personal protective equipment (PPE) supply planning, and clinical evaluation and management (as of February 22, 2020).
        - Working closely with healthcare facilities and providers to **reinforce infection control principles** that recognize PPE is one component of a larger set of practices that help to limit the spread of disease.
        - **Developing a range of respirator conservation strategies**, including strategies to make supplies last longer (such as using alternative products like reusable respirators) and extending the use of disposable respirators.
    - Leveraging existing **telehealth tools** to direct people to the right level of healthcare for their medical needs.
    - **Working with supply chain partners** to understand supply usage, what products are available, and when more aggressive measures may need to be taken to ensure that healthcare workers at highest risk have access to PPE.
    - **Sharing information with stakeholders** to help them recognize when to shift the strategies they are using.
- **Reinforcing state, territorial, and local public health readiness:**
    - **Assessing state and local readiness** to implement community mitigation measures like home containment, including housing and transportation needs.
    - Coordinating with states to **identify and mitigate gaps in readiness** that will help reduce the spread of disease in the community while protecting workers, infrastructure, and institutions.
    - Linking public health agencies and healthcare systems to **identify and mitigate stressors to the health system**
    - **Tracking stockpiles of PPE** across jurisdictions.
    - Working with state and local public health to **use existing Public Health Emergency Preparedness (PHEP) funding** to support COVID-19 preparedness and response activities.
    - Leveraging funding mechanisms to help states **accelerate preparedness activities.**
    - Providing **technical assistance and guidance** to states to improve their ability to respond to the outbreak.
- **Supporting communities, businesses, and schools:**
    - **Creating business guidance** to help the public and private sectors ensure they are able to operate with adaptations like telework and flexible sick leave policies, as well as how to respond if an employee gets sick.
    - **Developing guidance for childcare programs, K-12 schools, and colleges/universities** to help them plan and prepare for COVID-19 and respond if there is a local outbreak in their community.

AMERICAN OVERSIGHT

- Providing **planning guides for COVID-19** that households, community- and faith-based organizations, event planners of mass gatherings, and public health communicators can use.
- Educating communities about **nonpharmaceutical interventions (NPIs)** that help slow the spread of illness, like COVID-19.

NONPHARMACEUTICAL INTERVENTIONS

- Nonpharmaceutical Interventions (NPIs) are actions, apart from getting vaccinated and taking medicine, that people and communities can take to help slow the spread of illnesses like pandemic flu or COVID-19.
- NPIs are also known as community mitigation strategies.
- When a new virus spreads among people, causing illness worldwide, it is called a pandemic.
- Because the virus is new, the human population has little or no immunity against it. This allows the virus to spread quickly from person to person worldwide.
- NPIs are among the best ways of controlling a pandemic caused by a respiratory virus when vaccines are not yet available.
- NPIs are grouped in three categories:
    1. personal NPIs (personal protective measures for everyday use and personal protective measures reserved for influenza pandemics);
    2. community NPIs (social distancing measures and school closures and dismissals); and
    3. environmental NPIs (surface cleaning measures)
- View information about NPIs and factors to consider before implementing nonpharmaceutical interventions.

For more information please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

AMERICAN OVERSIGHT

CDC Daily Key Points

Coronavirus Disease 2019 ("COVID-19") Outbreak

February 26, 2020

All content updated since February 25 is shown in colored text.

MAIN KEY POINTS

- There is an expanding global outbreak of respiratory illness caused by a novel (new) coronavirus.
- This virus has been named "SARS-CoV-2;" the disease it causes has been named COVID-19.
    - Due to potential for confusion with SARS-CoV, where possible, public communications will use "the virus that causes COVID-19."
- While most COVID-19 cases outside of China have been associated with travel to or from China, community spread is being detected in a growing number of countries.
- Destinations with widespread or sustained community spread of COVID-19 include China, Iran, Italy, Japan, and South Korea.
- Other destinations with instances of apparent community spread include Hong Kong, Singapore, Taiwan, Thailand, and Vietnam.
- The fact that COVID-19 has caused illness, including illness resulting in death, and sustained person-to-person spread is concerning. These factors meet two of the criteria of a pandemic.
- As community spread is detected in more and more countries, the world moves closer toward meeting the third criteria, worldwide spread of the new virus.
- The potential public health threat posed by COVID-19 is high, both globally and to the United States.
- But individual risk is dependent on exposure.
- For the general American public, who are unlikely to be exposed to this virus at this time, the immediate health risk from COVID-19 is low.
- Under current circumstances, certain people will have an increased risk of infection.
    - For example, healthcare workers caring for patients with COVID-19 and other close contacts of persons with COVID-19.
- CDC has developed guidance to help in the risk assessment and management of people with potential exposures to COVID-19.
- CDC expects that more cases will be reported in the United States, including person-to-person spread.
- Global efforts at this time are focused concurrently on containing spread of and mitigating the impact of this virus.
- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is aggressive and multi-layered, with the goal of detecting introductions of this virus in the United States and reducing the spread and the impact of this virus.
- CDC is operationalizing all of its pandemic preparedness and response plans, working on multiple fronts to meet these goals, including specific measures to prepare communities to respond local transmission of the virus that causes COVID-19.

AMERICAN OVERSIGHT

- Pandemic guidance developed in anticipation of an influenza pandemic is being repurposed and adapted for a COVID-19 pandemic.
- Public health partners are encouraged to review their pandemic preparedness plans at this time.
- At this time, there is no vaccine to protect against COVID-19 and no medications approved to treat it.
- Nonpharmaceutical interventions (NPIs) would be the most important response strategy. NPIs simultaneously help contain the spread of disease and reduce the impact of disease.

SITUATION UPDATE

- To date, 42 international locations (including the U.S.) have reported confirmed cases of COVID-19, most recently Algeria, Austria, Brazil, Croatia, Switzerland.
- CDC is reviewing and updating their travel guidance daily.
- To date, CDC has issued:
    - Level 3 Travel Health Notices (Avoid Nonessential Travel) for China and South Korea.
    - Level 2 Travel Health Notices (Practice Enhanced Precautions) for Iran, Italy, and Japan.
    - Level 1 Travel Health Notices (Practice Usual Precautions) for Hong Kong.
- CDC also recommends that all travelers reconsider cruise ship voyages into or within Asia at this time.
    - This is consistent with guidance by the U.S. State Department.
- This is a rapidly evolving situation. CDC is constantly reviewing and updating its guidance as needed.
- CDC is reporting confirmed cases of COVID-19 in the United States in two categories:
    1. Cases detected through our domestic public health systems, and
    2. Cases among people who were repatriated via U.S. State Department flights from Wuhan, China and from the *Diamond Princess* cruise ship (Japan).
- 15 cases of COVID-19 have been detected through U.S. public health surveillance.
    - Two of these cases occurred through person-to-person spread.
    - On February 26, CDC confirmed an infection with the virus that causes COVID-19 in a person who reportedly did not have relevant travel history or exposure to another COVID-19 patient.
    - It's possible this could be an instance of community spread of COVID-19, which would be the first time that has happened in the United States.
    - Community spread means spread of an illness for which the source of infection is unknown.
    - It's also possible, however, that the patient may have been exposed to a returned traveler who was infected.
    - All the remaining cases detected through the U.S. public health system were in persons who had travel to China.
- 45 cases of COVID-19 have been detected among the 1,100+ people repatriated from Hubei Province, China and the *Diamond Princess*.
    - 3 people were repatriated from Wuhan.
    - 42 people were repatriated from the Diamond Princess, an increase of 2 since yesterday.

AMERICAN OVERSIGHT

- Almost all of the people from the Wuhan flights who were quarantined have finished their 14-day quarantine period.
- Because the passengers on the Diamond Princess were in a close setting where there was significant spread of COVID-19, they are considered at high-risk for infection. CDC expects to see additional confirmed cases of among those passengers.

WHAT YOU CAN DO

- While the immediate risk of this new virus to the American public is believed to be low at this time, everyone can do their part to help us respond to this emerging public health threat:
    - It's currently flu and respiratory disease season and CDC recommends getting a flu vaccine, taking everyday preventive actions to help stop the spread of germs, and taking flu antivirals if prescribed.
    - If you are a healthcare provider, be on the look-out for people with who recently traveled from China and fever and respiratory symptoms.
    - If you are a healthcare provider caring for a COVID-19 patient or a public health responder, please take care of yourself and follow recommended infection control procedures.
    - If you have been in China or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus. If you develop COVID-19 symptoms, contact your healthcare provider, and tell them about your symptoms and your travel or exposure to a COVID-19 patient.
    - For people who have had close contact with someone with COVID-19 who develop symptoms, contact your healthcare provider, and tell them about your symptoms and your exposure to a COVID-19 patient.
    - For people who are ill with COVID-19, please follow CDC guidance on how to reduce the risk of spreading your illness to others. This guidance in on the CDC website.

TESTING

- CDC and FDA have developed a protocol that uses two of the three components of the original CDC test kit to detect the virus that causes COVID-19.
- By the end of this week, at least 40 public health laboratories should be able to begin testing using existing kits in their laboratories.
- Further, FDA and CDC have identified additional kits that will be evaluated and could be shipped to public health laboratories.
- In addition, CDC has two laboratories conducting testing for the virus that causes COVID-19. CDC can test approximately 400 specimens per day.
- Commercial labs are working to develop their own tests and hopefully will be available soon. This will allow a greater number of tests to happen close to where potential cases are.

CDC ACTIONS

- CDC is aggressively responding to the global outbreak of COVID-19 and preparing for the potential of community spread in the United States.

AMERICAN OVERSIGHT

- **Preparing first responders, healthcare providers, and health systems:**
    - Establishing **visibility across healthcare systems** to understand healthcare use, particularly surges in demand for medical care and associated resources.
    - Conducting **extensive outreach to clinical and hospital professional organizations** to ensure health system **preparedness**.
    - Producing more than **23 guidance documents** on infection control, hospital preparedness assessments, personal protective equipment (PPE) supply planning, and clinical evaluation and management (as of February 22, 2020).
        - Working closely with healthcare facilities and providers to **reinforce infection control principles** that recognize PPE is one component of a larger set of practices that help to limit the spread of disease.
        - **Developing a range of respirator conservation strategies**, including strategies to make supplies last longer (such as using alternative products like reusable respirators) and extending the use of disposable respirators.
    - Leveraging existing **telehealth tools** to direct people to the right level of healthcare for their medical needs.
    - **Working with supply chain partners** to understand supply usage, what products are available, and when more aggressive measures may need to be taken to ensure that healthcare workers at highest risk have access to PPE.
    - **Sharing information with stakeholders** to help them recognize when to shift the strategies they are using.

U.S. Department of Health and Human Services

AMERICAN OVERSIGHT

CDC works 24/7 protecting America's health, safety and security. Whether diseases start at home or abroad, are curable or preventable, chronic or acute, or from human activity or deliberate attack, CDC responds to America's most pressing health threats. CDC is headquartered in Atlanta and has experts located throughout the United States and the world.

CDC Media Telebriefing: Update on COVID-19

What The Centers for Disease Control and Prevention (CDC) will provide an update to media on the COVID-19 response.

Who Nancy Messonnier, M.D., Director,
National Center for Immunization and Respiratory Diseases

When 12:15 p.m. ET Friday, Feb. 28, 2020

Dial-In

Non-Media: 888-795-0855
International: 1-630-395-0498
PASSCODE: 6656039

Important Instructions
Due to anticipated high volume, please plan to dial in to the telebriefing 15 minutes before the start time.

Media: If you would like to ask a question during the call, press *1 on your touchtone phone. Press *2 to withdraw your question. You may queue up at any time. You will hear a tone to indicate your question is pending.

TRANSCRIPT
A transcript will be available following the briefing at CDC's web site:www.cdc.gov/media.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Outbreak
March 11, 2020 as of 9:55pm

Updated text is shown in colored text.

SNAPSHOT

- CDC has reported:
  - 938 confirmed and presumptive positive cases of COVID-19
  - 29 COVID-19 related deaths
  - 38 states and the District of Columbia.

MAIN KEY POINTS

- There is an expanding global outbreak of respiratory illness called COVID-19 caused by a novel (new) coronavirus.
- Community spread is being detected in a growing number of places, including in the states of California, Washington, and New York in the United States.
- There are 938 reported U.S. cases of COVID-19 from 38 states, New York City, and the District of Columbia. New states reporting cases since yesterday include South Dakota and Michigan.
- The potential public health threat posed by COVID-19 is high, both globally and to the United States.
- More cases of COVID-19 are expected in the United States in the coming days, including more instances of community spread.
- As the outbreak continues, at some point, widespread transmission of COVID-19 in the United States is expected occur.
- Many people will get sick, but based on what is known about this virus, most people will not develop serious illness.
- Based on data out of China, where this virus first emerged, older adults and persons of all ages who have serious long-term health problems seem to be at higher risk for more serious COVID-19 illness.
  - It's important that people who are at higher risk of serious COVID-19 illness take special precautions to reduce their risk of getting sick.
  - CDC has guidance for what people at higher risk should do at this time.
- Public health efforts at this time are focused concurrently on containing spread of this virus and mitigating the impact of this virus.
- There is no vaccine to protect against COVID-19 and no medications approved to treat it.
- Nonpharmaceutical interventions are actions, apart from getting vaccinated and taking medicine, that people and communities can take to help slow the spread of respiratory illnesses like COVID-19.
- Currently, nonpharmaceutical interventions are the most important response strategy against COVID-19.
- All communities can take measures to reduce the spread of COVID-19. Everyone has a role to play in getting ready and staying healthy.

AMERICAN OVERSIGHT

SITUATION UPDATE

- 938 reported cases of COVID-19 have been detected in Arizona, California, Colorado, Connecticut, Florida, Georgia, Hawaii, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, Nevada, New Hampshire, New Jersey, New York (and New York City), North Carolina, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, and Wisconsin.
    - 75 of these cases occurred through close contact with another case.
    - 92 cases occurred in persons who had traveled to international areas with sustained (ongoing) transmission and among their close contacts.
    - 771 cases are still being investigated to determine the source of exposure.
- CDC has developed a map of the U.S. that shows affected states and how many COVID-19 cases they have reported.
- Because states are reporting their results directly and publicly, sometimes in near real-time, CDC case counts may be different from what states, local authorities, or media are reporting.
    - In the event of a discrepancy between case counts reported by state or local public health officials versus CDC-reported numbers, the numbers reported by states should be considered the most up to date.
- As of the evening of March 10, 79 state and local public health labs in 50 states and the District of Columbia have verified they are successfully using COVID-19 diagnostic tests.
- CDC has developed a map showing which states and territories have one or more laboratories that have successfully verified and are currently using COVID-19 diagnostic tests.
    - This list is provided by the Association of Public Health Laboratories (APHL).
    - The same page includes information on the number of COVID-19 specimens tested.
- As of the evening of March 10, 2020, CDC and local and state public health laboratories had tested a total of 11,079 specimens.
- CDC is reviewing and updating travel notices almost on a daily basis.
- On March 8, CDC recommended travelers, particularly those with underlying health issues, defer all cruise ship travel worldwide.
- CDC also recommends that older adults and travelers with underlying health issues avoid situations that put them at increased risk for more severe disease, including avoiding non-essential travel on long plane trips.
- On March 11, WHO made the assessment that COVID-19 can be characterized as a pandemic.

NEW GUIDANCE

- On March 10, CDC posted "Implementation of Mitigation Strategies for Communities with Local COVID-19 Transmission."
- This document is a framework for actions which local and state health departments can recommend in their community to both prepare for and mitigate community transmission of COVID-19 in the United States.
- Selection and implementation of these actions should be guided by the local characteristics of disease transmission, local population demographics, and public health and healthcare system capacity.

AMERICAN OVERSIGHT

PANDEMIC DEFINITION:

- Pandemics happen when a disease emerges to infect people easily and spreads from person to person in an efficient and sustained way globally.
- In 2009, WHO declared the outbreak of the H1N1 influenza a global pandemic.
- The federal government has been working closely with state, local, tribal, and territorial partners, as well as public health partners, to prepare for and respond to this public health threat for months.
- CDC has been implementing its pandemic preparedness and response plans, working on multiple fronts, including providing specific guidance on measures to prepare communities to respond to local spread of the virus that causes COVID-19.
- On March 10, CDC posted "Implementation of Mitigation Strategies for Communities with Local COVID-19 Transmission"

WHO KEY POINTS ON COVID-19 AS PANDEMIC:

- On March 11, WHO made the assessment that COVID-19 can be characterized as a pandemic.
    - WHO has been assessing this outbreak around the clock, since the news of this virus first emerged on December 31, 2019.
    - In the past two weeks, the number of cases of COVID-19 outside China has increased 13-fold, and the number of countries with cases has tripled.
    - There are now more than 118,000 cases in 114 countries, and 4,291 people have lost their lives.
    - The number of cases, the number of deaths, and the number of affected countries are all expected to increase.
    - WHO believes that what the world is seeing can be characterized as a pandemic.
    - All countries can still change the course of this pandemic with decisive action.
    - At this time, WHO does not have a formal process or criteria for defining an outbreak as a pandemic and this characterization does not change the scale or strategy of the WHO response.

INFECTION CONTROL/MASK GUIDANCE

- On March 10, CDC published updated Interim Infection Prevention and Control Recommendations for Patients with Suspected or Confirmed COVID-19 in Healthcare Settings.
- Respiratory protection of healthcare workers is a priority and is especially important during aerosol-generating procedures for patients.
- Healthcare facilities are increasingly unable to procure reliable and sufficient infection control supplies, including N95 respirators.
- Because of supply demands associated with the COVID-19 response, CDC is updating its interim COVID-19 infection control guidance for the healthcare setting.
    - The aim of the revised interim guidance is to prioritize the use of N95 respirators and other respiratory protection devices during high-risk procedures, while still protecting healthcare personnel with facemasks and eye protection during other routine patient care activities in the setting of temporary respirator shortages.

AMERICAN OVERSIGHT

    - This interim guidance aims to support healthcare facilities in practical decision-making at the local level.
    - This guidance also outlines multiple interventions that can be used to enhance protection of healthcare personnel.
- The spread of COVID-19 can be stopped in many ways, such as prompt screening and triage, limiting personnel in the room, hand hygiene, source control, and effective environmental cleaning.
- Employers and healthcare workers should remember the hierarchy of controls.
    - PPE is only one aspect of patient and worker safety and involves a high level of worker involvement and is highly dependent on proper fit and correct use.
    - All healthcare facilities should be reviewing their infection control supply inventories and taking steps to optimize supplies. This is particularly true for facilities that perform aerosol-generating procedures, so that appropriate PPE will be available for high-risk procedures now and as potential COVID-19 cases increase.
- Healthcare administrators should continue to do everything possible to acquire the needed supplies to protect their staff and patients.
    - When the supply chain is restored, facilities with a respiratory protection program should return to use of respirators for patients with known or suspected COVID-19.
    - The anticipated timeline for return to routine levels of PPE is not known.
- CDC has posted information about strategies to optimize the current supply of N95 respirators, including the use of devices that provide higher levels of respiratory protection (e.g., powered air purifying respirators [PAPRs]) when N95s are not available. CDC has also provided a companion checklist to help healthcare facilities prioritize the implementation of the strategies.
- The majority of nursing homes and outpatient clinics, including hemodialysis facilities, do not currently have respiratory protection programs or fit-tested HCP.
    - These facilities would not be able to implement all of the recommended infection control interventions in the previous version of this guidance.
    - Without respiratory protection programs and fit testing, unnecessary transfer of patients with known or suspected COVID-19 to another facility (e.g., acute care hospital) for evaluation and care may occur.
    - In areas with community transmission, acute-care facilities will be quickly overwhelmed by transfers of patients who have only mild illness and do not require hospitalization.

PEOPLE AT HIGHER RISK OF EXPOSURE/INFECTION

- Right now, some people are at higher risk of exposure/infection, including:
    - People in communities where ongoing community spread with the virus that causes COVID-19 has been reported are at elevated though still relatively low risk of exposure.
    - Healthcare workers caring for patients with COVID-19 are at elevated risk of exposure.
    - Close contacts of persons with COVID-19 also are at elevated risk of exposure.
    - Travelers returning from affected international locations where community spread is occurring also are at elevated risk of having been exposed.

AMERICAN OVERSIGHT

PEOPLE AT HIGHER RISK OF SERIOUS COVID-19 ILLNESS

- Early information out of China, where COVID-19 first started, shows that some people are at higher risk of getting very sick from this illness.
- The people who are at greatest risk are those who are older and those who have serious long-term health conditions like diabetes, heart disease, or lung disease.
- This seems to be a disease that affects adults, and older adults, most seriously.
    - Starting at age 60, there is an increasing risk of severe disease and the risk increases with age.
    - The highest risk of serious illness and death is in people older than 80 years.
- People with serious underlying health conditions also are more likely to develop serious outcomes including death.
- Reports out of China that looked at more than 70,000 COVID-19 patients found that about 80% of illness was mild and people recovered. 15% to 20% developed serious illness.
- Of the more than 70,000 cases, only about 2% were in people younger than 19.
- These are early data and more information from countries outside of China, including experience here in the United States, will inform the public health response as time goes on. For now, data suggest that measures should be taken to protect America's oldest population, who are most vulnerable to severe COVID-19 illness.

WHAT YOU CAN DO

- Everyone can do their part to help respond to this emerging public health threat:
    - Individuals and communities should familiarize themselves with recommendations to protect themselves and their community from getting and spreading respiratory illnesses like COVID-19.
    - Older people and people with severe chronic conditions should take special precautions because they are at higher risk of developing serious COVID-19 illness.
    - If you are a healthcare provider, be on the look-out for:
        - People who recently traveled from China or another affected area and who have symptoms associated with COVID-19, and
        - People who have been in close contact with someone with COVID-19 or patients with pneumonia of unknown cause. (Consult the most recent definition for patients under investigation [PUIs].)
    - If you are a healthcare provider or a public health responder caring for a COVID-19 patient, please take care of yourself and follow recommended infection control procedures.
    - If you are a close contact of someone with COVID-19 and develop symptoms of COVID-19, call your healthcare provider and tell them about your symptoms and your exposure. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.
    - If you are a resident in a community where there is ongoing spread of COVID-19 and you develop COVID-19 symptoms, call your healthcare provider and tell them about your symptoms. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.

AMERICAN OVERSIGHT

- For people who are ill with COVID-19, but are not sick enough to be hospitalized, please follow CDC guidance on how to reduce the risk of spreading your illness to others. People who are mildly ill with COVID-19 are able to isolate at home during their illness.
- If you have been in China or another affected area or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus.

CDC ACTIONS

- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States to reduce the spread and the impact of this virus.
- CDC is operationalizing all of its pandemic preparedness and response plans, working on multiple fronts to meet these goals, including specific measures to prepare communities to respond to local transmission of the virus that causes COVID-19.
- Pandemic guidance developed in anticipation of an influenza pandemic is being repurposed and adapted for a COVID-19 pandemic.
- Public health partners are encouraged to review their pandemic preparedness plans at this time.
- CDC is aggressively responding to the global outbreak of COVID-19 and preparing for the potential of community spread in more parts of the United States.
- CDC's Action for Preparing Communities for Potential Spread of COVID-19 include:
    - Preparing first responders, healthcare providers, and health systems
    - Reinforcing state, territorial, and local public health readiness
    - Supporting communities, businesses, and schools

COMMUNITY BASED INTERVENTIONS (AKA COMMUNITY MITIGATION)

- Americans should be prepared for the possibility of a COVID-19 outbreak in their community. Everyone has a role to play.
- Currently, a vaccine is not available for COVID-19. Until a vaccine is developed, community-based interventions, such as school dismissals, event cancellations, social distancing, and plans to work remotely, can help slow the spread of coronavirus.
- Your local public health department and community partners have been preparing for an event like COVID-19 and have plans in place. Now is a good time for businesses, community and faith-based organizations, schools, and health-care systems to reexamine their preparedness plans to make sure they are ready.
- Strong community partnerships between local health departments, the health care sector, faith-based organizations, and other community partners are vital for this response, and will be necessary to prepare for and coordinate if an outbreak occurs.
    - Community-based interventions can be grouped in three categories:
        - Personal protective measures (e.g., voluntary home isolation of ill persons, voluntary home quarantine of exposed household members, covering nose/mouth when coughing or sneezing, hand hygiene, using face masks in community settings when ill)

AMERICAN OVERSIGHT

        - Community measures aimed at increasing social distancing (e.g., school dismissals, social distancing in workplaces, postponing or cancelling mass gatherings)
        - Environmental measures (e.g., routine cleaning of frequently touched surfaces)
    - CDC has recommendations to protect yourself and your community from getting and spreading respiratory illnesses like COVID-19.

For more information please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

AMERICAN OVERSIGHT

The objectives of this plan are to ensure that all passengers disembark as quickly as possible; receive screening for health concerns and testing for COVID-19 if desired; and quickly travel to their home state if possible. HHS developed this plan to remove all ticketed passengers from the Grand Princess cruise ship moored in Oakland Harbor, CA, and transport them to their home states where they can continue to be monitored by State/Commonwealth and local public health authorities. HHS will organize and fund all physical movements, public health monitoring, and associated logistics between Oakland Harbor and every person's final destination in the United States.

Physical Movement

Coming off the ship, HHS medical teams will use CDC guidelines to screen all passengers and determine if any passengers require additional evaluation for COVID-19; and identify those who require immediate medical attention. Passengers will be transferred by bus to an air terminal and then flown by contract aircraft to one of several U.S. military installations outside of California. If preferred by the state, HHS can attempt to send passengers directly to their home states, though this must be balanced with the need to remove all passengers from the ship as quickly as possible. At the military installations, HHS medical teams will use CDC guidelines to screen passengers for symptoms again, assign risk strata, and initiate health monitoring as appropriate. Those who develop confirmed COVID-19 will be transported to an HHS care site or local health facility.

Other U.S. residents who are asymptomatic may travel to their home states regardless of their testing status (i.e., refused testing, test result pending, negative result, or positive result). If allowed to return to their home states, passengers will be flown as soon as possible by charter flight to an agreed upon airport, after which ground transportation will also be coordinated with state and local authorities. Upon arrival at their final destinations, travelers will fall under the authorities of state and local public health officials for additional monitoring (if needed) and other public health actions as determined by the state and local health authorities. State and local health officials may utilize any public health authority as directed by state policy, but are highly encouraged to follow CDC guidance.

All passengers will remain under federal health authority until responsibility for individual monitoring and supervision is transferred to a state or local health official. **State Executives and/or senior health officials may indicate that they are prepared to receive passengers through written communication (confirmatory email) with the Regional Emergency Coordinators.** State officials may also indicate a requirement for final SARS-CoV-2 test results prior to individual transfer, recognizing that passengers have the option to refuse testing. Those who are positive for SARS-COV-2 will travel separately from those who are negative or unknown.

Public Health Monitoring

Prior to leaving California, any person who has or develops significant symptoms of any kind will be taken to an HHS care site (if symptoms are mild to moderate) in Oakland Harbor or a local hospital if they require care beyond the local HHS capability. HHS health care teams will also assist passengers throughout their movements and monitoring periods with any acute medical conditions, management of chronic conditions, and coordinate with the patients' personal physicians as needed. Passengers who develop respiratory symptoms at any time will be taken to an HHS care site or local health facility until COVID-19 can be ruled out.

Following their arrival at one of the military installations (in California or elsewhere), HHS will coordinate with state and local health authorities to offer COVID-19 testing. HHS teams will conduct appropriate oropharyngeal/nasal swabs and send those samples to a local laboratory. Depending on

AMERICAN OVERSIGHT

individual location at the time that test results are available, the laboratory will send test results to CDC as required by protocol, to the HHS health monitoring team at the military installation, and/or the passenger's home state public health authority.

Passengers (patients) who remain under HHS care for COVID-19 will remain isolated until resolution of symptoms and negative SARS-CoV-2 PCR results from at least 2 consecutive sets of NP/OP swabs collected at least 24 hours apart. Other patients under HHS care who have non-COVID-19 health conditions will be released after 14 days of health monitoring and stabilization of other health conditions. As needed, patients will be transported to a community health center or hospital if their care needs are beyond the capabilities of the HHS medical team or if they require continued inpatient care, convalescence, or rehabilitation after 14 days.

- Selection and implementation of these actions should be guided by the local characteristics of disease transmission, local population demographics, and public health and healthcare system capacity.

AMERICAN OVERSIGHT

PANDEMIC DEFINITION:

- Pandemics happen when a disease emerges to infect people easily and spreads from person to person in an efficient and sustained way globally.
- In 2009, WHO declared the outbreak of the H1N1 influenza a global pandemic.
- The federal government has been working closely with state, local, tribal, and territorial partners, as well as public health partners, to prepare for and respond to this public health threat for months.
- CDC has been implementing its pandemic preparedness and response plans, working on multiple fronts, including providing specific guidance on measures to prepare communities to respond to local spread of the virus that causes COVID-19.
- On March 10, CDC posted "Implementation of Mitigation Strategies for Communities with Local COVID-19 Transmission"

WHO KEY POINTS ON COVID-19 AS PANDEMIC:

- On March 11, WHO made the assessment that COVID-19 can be characterized as a pandemic.
    - WHO has been assessing this outbreak around the clock, since the news of this virus first emerged on December 31, 2019.
    - In the past two weeks, the number of cases of COVID-19 outside China has increased 13-fold, and the number of countries with cases has tripled.
    - There are now more than 118,000 cases in 114 countries, and 4,291 people have lost their lives.
    - The number of cases, the number of deaths, and the number of affected countries are all expected to increase.
    - WHO believes that what the world is seeing can be characterized as a pandemic.
    - All countries can still change the course of this pandemic with decisive action.
    - At this time, WHO does not have a formal process or criteria for defining an outbreak as a pandemic and this characterization does not change the scale or strategy of the WHO response.

INFECTION CONTROL/MASK GUIDANCE

- On March 10, CDC published updated Interim Infection Prevention and Control Recommendations for Patients with Suspected or Confirmed COVID-19 in Healthcare Settings.
- Respiratory protection of healthcare workers is a priority and is especially important during aerosol-generating procedures for patients.
- Healthcare facilities are increasingly unable to procure reliable and sufficient infection control supplies, including N95 respirators.
- Because of supply demands associated with the COVID-19 response, CDC is updating its interim COVID-19 infection control guidance for the healthcare setting.
    - The aim of the revised interim guidance is to prioritize the use of N95 respirators and other respiratory protection devices during high-risk procedures, while still protecting healthcare personnel with facemasks and eye protection during other routine patient care activities in the setting of temporary respirator shortages.

AMERICAN OVERSIGHT

    - This interim guidance aims to support healthcare facilities in practical decision-making at the local level.
    - This guidance also outlines multiple interventions that can be used to enhance protection of healthcare personnel.
- The spread of COVID-19 can be stopped in many ways, such as prompt screening and triage, limiting personnel in the room, hand hygiene, source control, and effective environmental cleaning.
- Employers and healthcare workers should remember the hierarchy of controls.
    - PPE is only one aspect of patient and worker safety and involves a high level of worker involvement and is highly dependent on proper fit and correct use.
    - All healthcare facilities should be reviewing their infection control supply inventories and taking steps to optimize supplies. This is particularly true for facilities that perform aerosol-generating procedures, so that appropriate PPE will be available for high-risk procedures now and as potential COVID-19 cases increase.
- Healthcare administrators should continue to do everything possible to acquire the needed supplies to protect their staff and patients.
    - When the supply chain is restored, facilities with a respiratory protection program should return to use of respirators for patients with known or suspected COVID-19.
    - The anticipated timeline for return to routine levels of PPE is not known.
- CDC has posted information about strategies to optimize the current supply of N95 respirators, including the use of devices that provide higher levels of respiratory protection (e.g., powered air purifying respirators [PAPRs]) when N95s are not available. CDC has also provided a companion checklist to help healthcare facilities prioritize the implementation of the strategies.
- The majority of nursing homes and outpatient clinics, including hemodialysis facilities, do not currently have respiratory protection programs or fit-tested HCP.
    - These facilities would not be able to implement all of the recommended infection control interventions in the previous version of this guidance.
    - Without respiratory protection programs and fit testing, unnecessary transfer of patients with known or suspected COVID-19 to another facility (e.g., acute care hospital) for evaluation and care may occur.
    - In areas with community transmission, acute-care facilities will be quickly overwhelmed by transfers of patients who have only mild illness and do not require hospitalization.

PEOPLE AT HIGHER RISK OF EXPOSURE/INFECTION

- Right now, some people are at higher risk of exposure/infection, including:
    - People in communities where ongoing community spread with the virus that causes COVID-19 has been reported are at elevated though still relatively low risk of exposure.
    - Healthcare workers caring for patients with COVID-19 are at elevated risk of exposure.
    - Close contacts of persons with COVID-19 also are at elevated risk of exposure.
    - Travelers returning from affected international locations where community spread is occurring also are at elevated risk of having been exposed.

AMERICAN OVERSIGHT

PEOPLE AT HIGHER RISK OF SERIOUS COVID-19 ILLNESS

- Early information out of China, where COVID-19 first started, shows that some people are at higher risk of getting very sick from this illness.
- The people who are at greatest risk are those who are older and those who have serious long-term health conditions like diabetes, heart disease, or lung disease.
- This seems to be a disease that affects adults, and older adults, most seriously.
    - Starting at age 60, there is an increasing risk of severe disease and the risk increases with age.
    - The highest risk of serious illness and death is in people older than 80 years.
- People with serious underlying health conditions also are more likely to develop serious outcomes including death.
- Reports out of China that looked at more than 70,000 COVID-19 patients found that about 80% of illness was mild and people recovered. 15% to 20% developed serious illness.
- Of the more than 70,000 cases, only about 2% were in people younger than 19.
- These are early data and more information from countries outside of China, including experience here in the United States, will inform the public health response as time goes on. For now, data suggest that measures should be taken to protect America's oldest population, who are most vulnerable to severe COVID-19 illness.

WHAT YOU CAN DO

- Everyone can do their part to help respond to this emerging public health threat:
    - Individuals and communities should familiarize themselves with recommendations to protect themselves and their community from getting and spreading respiratory illnesses like COVID-19.
    - Older people and people with severe chronic conditions should take special precautions because they are at higher risk of developing serious COVID-19 illness.
    - If you are a healthcare provider, be on the look-out for:
        - People who recently traveled from China or another affected area and who have symptoms associated with COVID-19, and
        - People who have been in close contact with someone with COVID-19 or patients with pneumonia of unknown cause. (Consult the most recent definition for patients under investigation [PUIs].)
    - If you are a healthcare provider or a public health responder caring for a COVID-19 patient, please take care of yourself and follow recommended infection control procedures.
    - If you are a close contact of someone with COVID-19 and develop symptoms of COVID-19, call your healthcare provider and tell them about your symptoms and your exposure. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.
    - If you are a resident in a community where there is ongoing spread of COVID-19 and you develop COVID-19 symptoms, call your healthcare provider and tell them about your symptoms. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.

AMERICAN OVERSIGHT

- For people who are ill with COVID-19, but are not sick enough to be hospitalized, please follow CDC guidance on how to reduce the risk of spreading your illness to others. People who are mildly ill with COVID-19 are able to isolate at home during their illness.
- If you have been in China or another affected area or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus.

CDC ACTIONS

- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States to reduce the spread and the impact of this virus.
- CDC is operationalizing all of its pandemic preparedness and response plans, working on multiple fronts to meet these goals, including specific measures to prepare communities to respond to local transmission of the virus that causes COVID-19.
- Pandemic guidance developed in anticipation of an influenza pandemic is being repurposed and adapted for a COVID-19 pandemic.
- Public health partners are encouraged to review their pandemic preparedness plans at this time.
- CDC is aggressively responding to the global outbreak of COVID-19 and preparing for the potential of community spread in more parts of the United States.
- CDC's Action for Preparing Communities for Potential Spread of COVID-19 include:
    - Preparing first responders, healthcare providers, and health systems
    - Reinforcing state, territorial, and local public health readiness
    - Supporting communities, businesses, and schools

COMMUNITY BASED INTERVENTIONS (AKA COMMUNITY MITIGATION)

- Americans should be prepared for the possibility of a COVID-19 outbreak in their community. Everyone has a role to play.
- Currently, a vaccine is not available for COVID-19. Until a vaccine is developed, community-based interventions, such as school dismissals, event cancellations, social distancing, and plans to work remotely, can help slow the spread of coronavirus.
- Your local public health department and community partners have been preparing for an event like COVID-19 and have plans in place. Now is a good time for businesses, community and faith-based organizations, schools, and health-care systems to reexamine their preparedness plans to make sure they are ready.
- Strong community partnerships between local health departments, the health care sector, faith-based organizations, and other community partners are vital for this response, and will be necessary to prepare for and coordinate if an outbreak occurs.
    - Community-based interventions can be grouped in three categories:
        - Personal protective measures (e.g., voluntary home isolation of ill persons, voluntary home quarantine of exposed household members, covering nose/mouth when coughing or sneezing, hand hygiene, using face masks in community settings when ill)

AMERICAN OVERSIGHT

        - Community measures aimed at increasing social distancing (e.g., school dismissals, social distancing in workplaces, postponing or cancelling mass gatherings)
        - Environmental measures (e.g., routine cleaning of frequently touched surfaces)
    - CDC has recommendations to protect yourself and your community from getting and spreading respiratory illnesses like COVID-19.

For more information please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

AMERICAN OVERSIGHT

The objectives of this plan are to ensure that all passengers disembark as quickly as possible; receive screening for health concerns and testing for COVID-19 if desired; and quickly travel to their home state if possible. HHS developed this plan to remove all ticketed passengers from the Grand Princess cruise ship moored in Oakland Harbor, CA, and transport them to their home states where they can continue to be monitored by State/Commonwealth and local public health authorities. HHS will organize and fund all physical movements, public health monitoring, and associated logistics between Oakland Harbor and every person's final destination in the United States.

Physical Movement

Coming off the ship, HHS medical teams will use CDC guidelines to screen all passengers and determine if any passengers require additional evaluation for COVID-19; and identify those who require immediate medical attention. Passengers will be transferred by bus to an air terminal and then flown by contract aircraft to one of several U.S. military installations outside of California. If preferred by the state, HHS can attempt to send passengers directly to their home states, though this must be balanced with the need to remove all passengers from the ship as quickly as possible. At the military installations, HHS medical teams will use CDC guidelines to screen passengers for symptoms again, assign risk strata, and initiate health monitoring as appropriate. Those who develop confirmed COVID-19 will be transported to an HHS care site or local health facility.

Other U.S. residents who are asymptomatic may travel to their home states regardless of their testing status (i.e., refused testing, test result pending, negative result, or positive result). If allowed to return to their home states, passengers will be flown as soon as possible by charter flight to an agreed upon airport, after which ground transportation will also be coordinated with state and local authorities. Upon arrival at their final destinations, travelers will fall under the authorities of state and local public health officials for additional monitoring (if needed) and other public health actions as determined by the state and local health authorities. State and local health officials may utilize any public health authority as directed by state policy, but are highly encouraged to follow CDC guidance.

All passengers will remain under federal health authority until responsibility for individual monitoring and supervision is transferred to a state or local health official. **State Executives and/or senior health officials may indicate that they are prepared to receive passengers through written communication (confirmatory email) with the Regional Emergency Coordinators.** State officials may also indicate a requirement for final SARS-CoV-2 test results prior to individual transfer, recognizing that passengers have the option to refuse testing. Those who are positive for SARS-COV-2 will travel separately from those who are negative or unknown.

Public Health Monitoring

Prior to leaving California, any person who has or develops significant symptoms of any kind will be taken to an HHS care site (if symptoms are mild to moderate) in Oakland Harbor or a local hospital if they require care beyond the local HHS capability. HHS health care teams will also assist passengers throughout their movements and monitoring periods with any acute medical conditions, management of chronic conditions, and coordinate with the patients' personal physicians as needed. Passengers who develop respiratory symptoms at any time will be taken to an HHS care site or local health facility until COVID-19 can be ruled out.

Following their arrival at one of the military installations (in California or elsewhere), HHS will coordinate with state and local health authorities to offer COVID-19 testing. HHS teams will conduct appropriate oropharyngeal/nasal swabs and send those samples to a local laboratory. Depending on

AMERICAN OVERSIGHT

individual location at the time that test results are available, the laboratory will send test results to CDC as required by protocol, to the HHS health monitoring team at the military installation, and/or the passenger's home state public health authority.

Passengers (patients) who remain under HHS care for COVID-19 will remain isolated until resolution of symptoms and negative SARS-CoV-2 PCR results from at least 2 consecutive sets of NP/OP swabs collected at least 24 hours apart. Other patients under HHS care who have non-COVID-19 health conditions will be released after 14 days of health monitoring and stabilization of other health conditions. As needed, patients will be transported to a community health center or hospital if their care needs are beyond the capabilities of the HHS medical team or if they require continued inpatient care, convalescence, or rehabilitation after 14 days.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Outbreak
March 11, 2020 as of 9:55pm

Updated text is shown in colored text.

SNAPSHOT

- CDC has reported:
  - 938 confirmed and presumptive positive cases of COVID-19
  - 29 COVID-19 related deaths
  - 38 states and the District of Columbia.

MAIN KEY POINTS

- There is an expanding global outbreak of respiratory illness called COVID-19 caused by a novel (new) coronavirus.
- Community spread is being detected in a growing number of places, including in the states of California, Washington, and New York in the United States.
- There are 938 reported U.S. cases of COVID-19 from 38 states, New York City, and the District of Columbia. New states reporting cases since yesterday include South Dakota and Michigan.
- The potential public health threat posed by COVID-19 is high, both globally and to the United States.
- More cases of COVID-19 are expected in the United States in the coming days, including more instances of community spread.
- As the outbreak continues, at some point, widespread transmission of COVID-19 in the United States is expected occur.
- Many people will get sick, but based on what is known about this virus, most people will not develop serious illness.
- Based on data out of China, where this virus first emerged, older adults and persons of all ages who have serious long-term health problems seem to be at higher risk for more serious COVID-19 illness.
  - It's important that people who are at higher risk of serious COVID-19 illness take special precautions to reduce their risk of getting sick.
  - CDC has guidance for what people at higher risk should do at this time.
- Public health efforts at this time are focused concurrently on containing spread of this virus and mitigating the impact of this virus.
- There is no vaccine to protect against COVID-19 and no medications approved to treat it.
- Nonpharmaceutical interventions are actions, apart from getting vaccinated and taking medicine, that people and communities can take to help slow the spread of respiratory illnesses like COVID-19.
- Currently, nonpharmaceutical interventions are the most important response strategy against COVID-19.
- All communities can take measures to reduce the spread of COVID-19. Everyone has a role to play in getting ready and staying healthy.

AMERICAN OVERSIGHT

SITUATION UPDATE

- 938 reported cases of COVID-19 have been detected in Arizona, California, Colorado, Connecticut, Florida, Georgia, Hawaii, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, Nevada, New Hampshire, New Jersey, New York (and New York City), North Carolina, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, and Wisconsin.
    - 75 of these cases occurred through close contact with another case.
    - 92 cases occurred in persons who had traveled to international areas with sustained (ongoing) transmission and among their close contacts.
    - 771 cases are still being investigated to determine the source of exposure.
- CDC has developed a map of the U.S. that shows affected states and how many COVID-19 cases they have reported.
- Because states are reporting their results directly and publicly, sometimes in near real-time, CDC case counts may be different from what states, local authorities, or media are reporting.
    - In the event of a discrepancy between case counts reported by state or local public health officials versus CDC-reported numbers, the numbers reported by states should be considered the most up to date.
- As of the evening of March 10, 79 state and local public health labs in 50 states and the District of Columbia have verified they are successfully using COVID-19 diagnostic tests.
- CDC has developed a map showing which states and territories have one or more laboratories that have successfully verified and are currently using COVID-19 diagnostic tests.
    - This list is provided by the Association of Public Health Laboratories (APHL).
    - The same page includes information on the number of COVID-19 specimens tested.
- As of the evening of March 10, 2020, CDC and local and state public health laboratories had tested a total of 11,079 specimens.
- CDC is reviewing and updating travel notices almost on a daily basis.
- On March 8, CDC recommended travelers, particularly those with underlying health issues, defer all cruise ship travel worldwide.
- CDC also recommends that older adults and travelers with underlying health issues avoid situations that put them at increased risk for more severe disease, including avoiding non-essential travel on long plane trips.
- On March 11, WHO made the assessment that COVID-19 can be characterized as a pandemic.

NEW GUIDANCE

- On March 10, CDC posted "Implementation of Mitigation Strategies for Communities with Local COVID-19 Transmission."
- This document is a framework for actions which local and state health departments can recommend in their community to both prepare for and mitigate community transmission of COVID-19 in the United States.
- Selection and implementation of these actions should be guided by the local characteristics of disease transmission, local population demographics, and public health and healthcare system capacity.

AMERICAN OVERSIGHT

PANDEMIC DEFINITION:

- Pandemics happen when a disease emerges to infect people easily and spreads from person to person in an efficient and sustained way globally.
- In 2009, WHO declared the outbreak of the H1N1 influenza a global pandemic.
- The federal government has been working closely with state, local, tribal, and territorial partners, as well as public health partners, to prepare for and respond to this public health threat for months.
- CDC has been implementing its pandemic preparedness and response plans, working on multiple fronts, including providing specific guidance on measures to prepare communities to respond to local spread of the virus that causes COVID-19.
- On March 10, CDC posted "Implementation of Mitigation Strategies for Communities with Local COVID-19 Transmission"

WHO KEY POINTS ON COVID-19 AS PANDEMIC:

- On March 11, WHO made the assessment that COVID-19 can be characterized as a pandemic.
    - WHO has been assessing this outbreak around the clock, since the news of this virus first emerged on December 31, 2019.
    - In the past two weeks, the number of cases of COVID-19 outside China has increased 13-fold, and the number of countries with cases has tripled.
    - There are now more than 118,000 cases in 114 countries, and 4,291 people have lost their lives.
    - The number of cases, the number of deaths, and the number of affected countries are all expected to increase.
    - WHO believes that what the world is seeing can be characterized as a pandemic.
    - All countries can still change the course of this pandemic with decisive action.
    - At this time, WHO does not have a formal process or criteria for defining an outbreak as a pandemic and this characterization does not change the scale or strategy of the WHO response.

INFECTION CONTROL/MASK GUIDANCE

- On March 10, CDC published updated Interim Infection Prevention and Control Recommendations for Patients with Suspected or Confirmed COVID-19 in Healthcare Settings.
- Respiratory protection of healthcare workers is a priority and is especially important during aerosol-generating procedures for patients.
- Healthcare facilities are increasingly unable to procure reliable and sufficient infection control supplies, including N95 respirators.
- Because of supply demands associated with the COVID-19 response, CDC is updating its interim COVID-19 infection control guidance for the healthcare setting.
    - The aim of the revised interim guidance is to prioritize the use of N95 respirators and other respiratory protection devices during high-risk procedures, while still protecting healthcare personnel with facemasks and eye protection during other routine patient care activities in the setting of temporary respirator shortages.

AMERICAN OVERSIGHT

    - This interim guidance aims to support healthcare facilities in practical decision-making at the local level.
    - This guidance also outlines multiple interventions that can be used to enhance protection of healthcare personnel.
- The spread of COVID-19 can be stopped in many ways, such as prompt screening and triage, limiting personnel in the room, hand hygiene, source control, and effective environmental cleaning.
- Employers and healthcare workers should remember the hierarchy of controls.
    - PPE is only one aspect of patient and worker safety and involves a high level of worker involvement and is highly dependent on proper fit and correct use.
    - All healthcare facilities should be reviewing their infection control supply inventories and taking steps to optimize supplies. This is particularly true for facilities that perform aerosol-generating procedures, so that appropriate PPE will be available for high-risk procedures now and as potential COVID-19 cases increase.
- Healthcare administrators should continue to do everything possible to acquire the needed supplies to protect their staff and patients.
    - When the supply chain is restored, facilities with a respiratory protection program should return to use of respirators for patients with known or suspected COVID-19.
    - The anticipated timeline for return to routine levels of PPE is not known.
- CDC has posted information about strategies to optimize the current supply of N95 respirators, including the use of devices that provide higher levels of respiratory protection (e.g., powered air purifying respirators [PAPRs]) when N95s are not available. CDC has also provided a companion checklist to help healthcare facilities prioritize the implementation of the strategies.
- The majority of nursing homes and outpatient clinics, including hemodialysis facilities, do not currently have respiratory protection programs or fit-tested HCP.
    - These facilities would not be able to implement all of the recommended infection control interventions in the previous version of this guidance.
    - Without respiratory protection programs and fit testing, unnecessary transfer of patients with known or suspected COVID-19 to another facility (e.g., acute care hospital) for evaluation and care may occur.
    - In areas with community transmission, acute-care facilities will be quickly overwhelmed by transfers of patients who have only mild illness and do not require hospitalization.

PEOPLE AT HIGHER RISK OF EXPOSURE/INFECTION

- Right now, some people are at higher risk of exposure/infection, including:
    - People in communities where ongoing community spread with the virus that causes COVID-19 has been reported are at elevated though still relatively low risk of exposure.
    - Healthcare workers caring for patients with COVID-19 are at elevated risk of exposure.
    - Close contacts of persons with COVID-19 also are at elevated risk of exposure.
    - Travelers returning from affected international locations where community spread is occurring also are at elevated risk of having been exposed.

AMERICAN OVERSIGHT

PEOPLE AT HIGHER RISK OF SERIOUS COVID-19 ILLNESS

- Early information out of China, where COVID-19 first started, shows that some people are at higher risk of getting very sick from this illness.
- The people who are at greatest risk are those who are older and those who have serious long-term health conditions like diabetes, heart disease, or lung disease.
- This seems to be a disease that affects adults, and older adults, most seriously.
    - Starting at age 60, there is an increasing risk of severe disease and the risk increases with age.
    - The highest risk of serious illness and death is in people older than 80 years.
- People with serious underlying health conditions also are more likely to develop serious outcomes including death.
- Reports out of China that looked at more than 70,000 COVID-19 patients found that about 80% of illness was mild and people recovered. 15% to 20% developed serious illness.
- Of the more than 70,000 cases, only about 2% were in people younger than 19.
- These are early data and more information from countries outside of China, including experience here in the United States, will inform the public health response as time goes on. For now, data suggest that measures should be taken to protect America's oldest population, who are most vulnerable to severe COVID-19 illness.

WHAT YOU CAN DO

- Everyone can do their part to help respond to this emerging public health threat:
    - Individuals and communities should familiarize themselves with recommendations to protect themselves and their community from getting and spreading respiratory illnesses like COVID-19.
    - Older people and people with severe chronic conditions should take special precautions because they are at higher risk of developing serious COVID-19 illness.
    - If you are a healthcare provider, be on the look-out for:
        - People who recently traveled from China or another affected area and who have symptoms associated with COVID-19, and
        - People who have been in close contact with someone with COVID-19 or patients with pneumonia of unknown cause. (Consult the most recent definition for patients under investigation [PUIs].)
    - If you are a healthcare provider or a public health responder caring for a COVID-19 patient, please take care of yourself and follow recommended infection control procedures.
    - If you are a close contact of someone with COVID-19 and develop symptoms of COVID-19, call your healthcare provider and tell them about your symptoms and your exposure. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.
    - If you are a resident in a community where there is ongoing spread of COVID-19 and you develop COVID-19 symptoms, call your healthcare provider and tell them about your symptoms. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.

AMERICAN OVERSIGHT

- For people who are ill with COVID-19, but are not sick enough to be hospitalized, please follow CDC guidance on how to reduce the risk of spreading your illness to others. People who are mildly ill with COVID-19 are able to isolate at home during their illness.
- If you have been in China or another affected area or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus.

CDC ACTIONS

- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States to reduce the spread and the impact of this virus.
- CDC is operationalizing all of its pandemic preparedness and response plans, working on multiple fronts to meet these goals, including specific measures to prepare communities to respond to local transmission of the virus that causes COVID-19.
- Pandemic guidance developed in anticipation of an influenza pandemic is being repurposed and adapted for a COVID-19 pandemic.
- Public health partners are encouraged to review their pandemic preparedness plans at this time.
- CDC is aggressively responding to the global outbreak of COVID-19 and preparing for the potential of community spread in more parts of the United States.
- CDC's Action for Preparing Communities for Potential Spread of COVID-19 include:
    - Preparing first responders, healthcare providers, and health systems
    - Reinforcing state, territorial, and local public health readiness
    - Supporting communities, businesses, and schools

COMMUNITY BASED INTERVENTIONS (AKA COMMUNITY MITIGATION)

- Americans should be prepared for the possibility of a COVID-19 outbreak in their community. Everyone has a role to play.
- Currently, a vaccine is not available for COVID-19. Until a vaccine is developed, community-based interventions, such as school dismissals, event cancellations, social distancing, and plans to work remotely, can help slow the spread of coronavirus.
- Your local public health department and community partners have been preparing for an event like COVID-19 and have plans in place. Now is a good time for businesses, community and faith-based organizations, schools, and health-care systems to reexamine their preparedness plans to make sure they are ready.
- Strong community partnerships between local health departments, the health care sector, faith-based organizations, and other community partners are vital for this response, and will be necessary to prepare for and coordinate if an outbreak occurs.
    - Community-based interventions can be grouped in three categories:
        - Personal protective measures (e.g., voluntary home isolation of ill persons, voluntary home quarantine of exposed household members, covering nose/mouth when coughing or sneezing, hand hygiene, using face masks in community settings when ill)

AMERICAN OVERSIGHT

        - Community measures aimed at increasing social distancing (e.g., school dismissals, social distancing in workplaces, postponing or cancelling mass gatherings)
        - Environmental measures (e.g., routine cleaning of frequently touched surfaces)
    - CDC has recommendations to protect yourself and your community from getting and spreading respiratory illnesses like COVID-19.

For more information please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

AMERICAN OVERSIGHT

The objectives of this plan are to ensure that all passengers disembark as quickly as possible; receive screening for health concerns and testing for COVID-19 if desired; and quickly travel to their home state if possible. HHS developed this plan to remove all ticketed passengers from the Grand Princess cruise ship moored in Oakland Harbor, CA, and transport them to their home states where they can continue to be monitored by State/Commonwealth and local public health authorities. HHS will organize and fund all physical movements, public health monitoring, and associated logistics between Oakland Harbor and every person's final destination in the United States.

Physical Movement

Coming off the ship, HHS medical teams will use CDC guidelines to screen all passengers and determine if any passengers require additional evaluation for COVID-19; and identify those who require immediate medical attention. Passengers will be transferred by bus to an air terminal and then flown by contract aircraft to one of several U.S. military installations outside of California. If preferred by the state, HHS can attempt to send passengers directly to their home states, though this must be balanced with the need to remove all passengers from the ship as quickly as possible. At the military installations, HHS medical teams will use CDC guidelines to screen passengers for symptoms again, assign risk strata, and initiate health monitoring as appropriate. Those who develop confirmed COVID-19 will be transported to an HHS care site or local health facility.

Other U.S. residents who are asymptomatic may travel to their home states regardless of their testing status (i.e., refused testing, test result pending, negative result, or positive result). If allowed to return to their home states, passengers will be flown as soon as possible by charter flight to an agreed upon airport, after which ground transportation will also be coordinated with state and local authorities. Upon arrival at their final destinations, travelers will fall under the authorities of state and local public health officials for additional monitoring (if needed) and other public health actions as determined by the state and local health authorities. State and local health officials may utilize any public health authority as directed by state policy, but are highly encouraged to follow CDC guidance.

All passengers will remain under federal health authority until responsibility for individual monitoring and supervision is transferred to a state or local health official. **State Executives and/or senior health officials may indicate that they are prepared to receive passengers through written communication (confirmatory email) with the Regional Emergency Coordinators.** State officials may also indicate a requirement for final SARS-CoV-2 test results prior to individual transfer, recognizing that passengers have the option to refuse testing. Those who are positive for SARS-COV-2 will travel separately from those who are negative or unknown.

Public Health Monitoring

Prior to leaving California, any person who has or develops significant symptoms of any kind will be taken to an HHS care site (if symptoms are mild to moderate) in Oakland Harbor or a local hospital if they require care beyond the local HHS capability. HHS health care teams will also assist passengers throughout their movements and monitoring periods with any acute medical conditions, management of chronic conditions, and coordinate with the patients' personal physicians as needed. Passengers who develop respiratory symptoms at any time will be taken to an HHS care site or local health facility until COVID-19 can be ruled out.

Following their arrival at one of the military installations (in California or elsewhere), HHS will coordinate with state and local health authorities to offer COVID-19 testing. HHS teams will conduct appropriate oropharyngeal/nasal swabs and send those samples to a local laboratory. Depending on

AMERICAN OVERSIGHT

individual location at the time that test results are available, the laboratory will send test results to CDC as required by protocol, to the HHS health monitoring team at the military installation, and/or the passenger's home state public health authority.

Passengers (patients) who remain under HHS care for COVID-19 will remain isolated until resolution of symptoms and negative SARS-CoV-2 PCR results from at least 2 consecutive sets of NP/OP swabs collected at least 24 hours apart. Other patients under HHS care who have non-COVID-19 health conditions will be released after 14 days of health monitoring and stabilization of other health conditions. As needed, patients will be transported to a community health center or hospital if their care needs are beyond the capabilities of the HHS medical team or if they require continued inpatient care, convalescence, or rehabilitation after 14 days.

Attachments:	CDC_COVID-19_Daily Key Points__3_12_2020_FINAL.pdf Considerations for school closure Draft 031220 Updated.pdf Force Health Protection Guidance (Supplement 4) (002).pdf

Dear Colleagues:

Attached, please find

1. **CDC COVID-19 Key Points for Thursday, March 12, 2020. Please feel free to share with staff and appropriate parties.**
2. **CDC draft of Considerations for School closure guidance**. Recommendations on school closure based on available science, reports from other countries and consultation with school health experts.
3. **Force Health Protection Guidance**

An additional note on U.S. Military guidance during the COVID-19 pandemic: Many of you have military bases and personnel in your states and communities. Attached for your information is the Department of Defense Force Protection Guidance, including a risk based table for global implementation of guidance for military members returning home from either CDC travel health notice (THN) Level 3 (Avoid non-essential travel) or Level 2(Special precautions for high-risk travelers) areas to stay home for 14 days, social distance and self-monitor.

Kind Regards,

State Coordination Task Force

(Sent by BCC to PHEP directors, state epidemiologists, state health officials, public health laboratory directors, BCHC, and national and federal partners)

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Outbreak
March 12, 2020 as of 9:30pm

Updated text is shown in colored text.

SNAPSHOT

- CDC has reported:
  - 1,215 confirmed and presumptive positive cases of COVID-19
  - 36 COVID-19 related deaths
  - 42 states and the District of Columbia

MAIN KEY POINTS

- The global outbreak of respiratory illness caused by a new coronavirus that emerged from China has reached pandemic proportions, according to the World Health Organization.
- The United States is in the early phase of the outbreak.
- Public health efforts at this time are focused concurrently on containing spread of this virus and mitigating the impact of this virus.
- There is no vaccine to protect against COVID-19 and no medications approved to treat it.
- Nonpharmaceutical interventions are actions, apart from getting vaccinated and taking medicine, that people and communities can take to help slow the spread of respiratory illnesses like COVID-19 and reduce the impact of that outbreak.
- School closures are one of a number of nonpharmaceutical interventions.
- On March 12, CDC posted "Considerations for school closures" which provides information about the appropriate timing of school closures.
- More cases of COVID-19 are expected in the United States in the coming days, including more instances of community spread.
- As the outbreak continues, at some point, widespread transmission of the virus that causes COVID-19 in the United States is expected occur.
- Many people will get sick, but based on what is known about this virus, most people will not develop serious illness.
- Based on data out of China, where this virus first emerged, older adults and persons of all ages who have serious long-term health problems seem to be at higher risk for more serious COVID-19 illness.
  - It's important that people who are at higher risk of serious COVID-19 illness take special precautions to reduce their risk of getting sick and that the people around them take action to help protect those who are most vulnerable.
  - CDC has guidance for what people at higher risk should do at this time.
- All communities can take measures to reduce the spread of COVID-19. Everyone has a role to play in getting ready and staying healthy.

SITUATION UPDATE

- 1,215 reported cases of COVID-19 have been detected in Arizona, Arkansas, California, Colorado, Connecticut, Delaware, Florida, Georgia, Hawaii, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York (and New York City), North

AMERICAN OVERSIGHT

Carolina, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, and Wisconsin.
    - 102 of these cases occurred through close contact with another case.
    - 125 cases occurred in persons who had traveled to international areas with sustained (ongoing) transmission and among their close contacts.
    - 988 cases are still being investigated to determine the source of exposure.
- CDC has developed a map of the U.S. that shows affected states and how many COVID-19 cases they have reported.
- Because states are reporting their results directly and publicly, sometimes in near real-time, CDC case counts may be different from what states, local authorities, or media are reporting.
    - In the event of a discrepancy between case counts reported by state or local public health officials versus CDC-reported numbers, the numbers reported by states should be considered the most up to date.
- As of the evening of March 11, 81 state and local public health labs in 50 states and the District of Columbia have verified they are successfully using COVID-19 diagnostic tests.
- CDC has developed a map showing which states and territories have one or more laboratories that have successfully verified and are currently using COVID-19 diagnostic tests.
    - This list is provided by the Association of Public Health Laboratories (APHL).
    - The same page includes information on the number of COVID-19 specimens tested.
- As of the evening of March 11, 2020, CDC and local and state public health laboratories had tested a total of 13,624 specimens.
- CDC is reviewing and updating travel notices almost on a daily basis.
- U.S. citizens, residents, and their immediate family members who have been in China or Iran within in the past 14 days can enter the United States, but they are subject to health monitoring and possible quarantine for up to 14 days.
- On March 11, President Trump issued a proclamation that foreign nationals who have been in one or more of 26 European countries within the past 14 days cannot enter the United States for a period of 30 days.
- On March 11, CDC issued a:
    - Level 3 Travel Health Notice recommending travelers avoid all nonessential travel to most of Europe.
    - Global Level 2 Travel Health Notice recommending older adults and those who have chronic medical conditions consider postponing nonessential travel.
- On March 8, CDC recommended travelers, particularly those with underlying health issues, defer all cruise ship travel worldwide.

CONSIDERATIONS FOR SCHOOL CLOSURES

- There is a role for school closures in response to school-based cases of COVID-19:
    - For decontamination and contact tracing (few days of closure)
    - In response to significant absenteeism of staff and students (short to medium length, i.e., 2–4 weeks of closure)
    - As part of a larger community mitigation strategy for jurisdictions with substantial community spread (medium to long length, i.e., 4–8 weeks or more of closure)
- Available modeling data indicate that short- to medium-length closures early in the outbreak will not impact the spread of COVID-19 or health care measures (e.g., hospitalizations). There

AMERICAN OVERSIGHT

may be some impact of much longer closures (8 or more weeks) further into the outbreak when there is more community spread.
- The same model shows other mitigation efforts (e.g., handwashing, home isolation) have more impact on both spread of disease and health care measures.
- In other countries, places that closed schools (e.g., Hong Kong) have not had more success in reducing spread than those that did not (e.g., Singapore).
- In places where school closures are necessary, the anticipated academic and economic impacts and unintended impacts on disease outcomes must be planned for and mitigated. All of the following must be addressed:
    - Provision of academic support (e.g., tele-ed)
    - Alternatives for school-based meals and other services (e.g., behavioral and mental health services) for economically and physically vulnerable children
    - Support for families for whom telework and paid sick leave is not available
    - Continued protection for high risk individuals
- Special consideration must be given for healthcare workers so that school closures do not impact their ability to work.

PANDEMIC INFORMATION

- Pandemics happen when a disease emerges to infect people easily and spreads from person to person in an efficient and sustained way globally.
- This is the first pandemic known to be caused by the emergence of a new coronavirus.
- In the past century, there have been four pandemics caused by the emergence of novel influenza viruses.
    - Pandemic guidance developed in anticipation of an influenza pandemic is being repurposed and adapted for a COVID-19 pandemic.
- The federal government has been working closely with state, local, tribal, and territorial partners, as well as public health partners, to prepare for and respond to this public health threat for months.
- CDC has been implementing its pandemic preparedness and response plans, working on multiple fronts, including providing specific guidance on measures to prepare communities to respond to local spread of the virus that causes COVID-19.
- Pandemics of respiratory disease follow a certain progression outlined in a "Pandemic Intervals Framework."
    - Pandemics begin with an investigation phase, followed by recognition, initiation, and acceleration phases.
    - The peak of illnesses occurs at the end of the acceleration phase, which is followed by a deceleration phase, during which there is a decrease in illnesses.
- Different countries can be in different phases of the pandemic at any point in time and different parts of the same country can also be in different phases of a pandemic.
- Nationally, the United States is currently in the initiation phase, but states where community spread is occurring are in the acceleration phase.
- The duration and severity of each phase can vary depending on the characteristics of the virus and the public health response.
- Public health partners are encouraged to review their pandemic preparedness plans at this time.

AMERICAN OVERSIGHT

PEOPLE AT HIGHER RISK OF EXPOSURE/INFECTION

- The immediate risk of being exposed to this virus is still low for most Americans, but as the outbreak expands, that risk will increase. Cases of COVID-19 and instances of community spread are being reported in a growing number of states.
- Right now, people are at higher risk of exposure/infection include:
    - People in communities where ongoing community spread of the virus that causes COVID-19 has been reported are at elevated risk of exposure, with level of risk dependent on the location.
    - Healthcare workers caring for patients with COVID-19 are at elevated risk of exposure.
    - Close contacts of persons with COVID-19 also are at elevated risk of exposure.
    - Travelers returning from affected international locations where community spread is occurring also are at elevated risk of exposure, with level of risk dependent on where they traveled.

PEOPLE AT HIGHER RISK OF SERIOUS COVID-19 ILLNESS

- Early information out of China, where COVID-19 first started, shows that some people are at higher risk of getting very sick from this illness. This includes:
    - Older adults, with risk increasing by age
    - People who have serious chronic medical conditions like
        - Heart disease
        - Diabetes
        - Lung disease

WHAT YOU CAN DO

- Everyone can do their part to help respond to this emerging public health threat:
    - Individuals and communities should familiarize themselves with recommendations to protect themselves and their community from getting and spreading respiratory illnesses like COVID-19.
    - Older people and people with severe chronic conditions should take special precautions because they are at higher risk of developing serious COVID-19 illness.
    - If you are a healthcare provider, use your judgement to determine if a patient has signs and symptoms compatible with COVID-19 and whether the patient should be tested. Factors to consider, in addition to clinical symptoms, may include:
        - Does the patient have recent travel from an affected area?
        - Has the patient been in close contact with someone with COVID-19 or patients with pneumonia of unknown cause?
        - Does the patient reside in an area where there has been community spread of COVID-19?
    - If you are a healthcare provider or a public health responder caring for a COVID-19 patient, please take care of yourself and follow recommended infection control procedures.
    - If you are a close contact of someone with COVID-19 and develop symptoms of COVID-19, call your healthcare provider and tell them about your symptoms and your exposure. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.

AMERICAN OVERSIGHT

- If you are a resident in a community where there is ongoing spread of COVID-19 and you develop COVID-19 symptoms, call your healthcare provider and tell them about your symptoms. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.
- For people who are ill with COVID-19, but are not sick enough to be hospitalized, please follow CDC guidance on how to reduce the risk of spreading your illness to others. People who are mildly ill with COVID-19 are able to isolate at home during their illness.
- If you have been in China or another affected area or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus.

CDC ACTIONS

- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States to reduce the spread and the impact of this virus.
- CDC is operationalizing all of its pandemic preparedness and response plans, working on multiple fronts to meet these goals, including specific measures to prepare communities to respond to local transmission of the virus that causes COVID-19.
- CDC is aggressively responding to the global outbreak of COVID-19 and preparing for the potential of community spread in more parts of the United States.
- CDC's Action for Preparing Communities for Potential Spread of COVID-19 include:
    - Preparing first responders, healthcare providers, and health systems
    - Reinforcing state, territorial, and local public health readiness
    - Supporting communities, businesses, and schools

COMMUNITY BASED INTERVENTIONS (AKA COMMUNITY MITIGATION)

- Americans should be prepared for the possibility of a COVID-19 outbreak in their community. Everyone has a role to play.
- Currently, a vaccine is not available for COVID-19. Until a vaccine is developed, community-based interventions, such as school dismissals, event cancellations, social distancing, and plans to work remotely, can help slow the spread of coronavirus.
- Your local public health department and community partners have been preparing for an event like COVID-19 and have plans in place. Now is a good time for businesses, community and faith-based organizations, schools, and health-care systems to reexamine their preparedness plans to make sure they are ready.
- Strong community partnerships between local health departments, the health care sector, faith-based organizations, and other community partners are vital for this response, and will be necessary to prepare for and coordinate if an outbreak occurs.
    - Community-based interventions can be grouped in three categories:
        - Personal protective measures (e.g., voluntary home isolation of ill persons, voluntary home quarantine of exposed household members, covering

AMERICAN OVERSIGHT

nose/mouth when coughing or sneezing, hand hygiene, using face masks in community settings when ill)
        - Community measures aimed at increasing social distancing (e.g., school dismissals, social distancing in workplaces, postponing or cancelling mass gatherings)
        - Environmental measures (e.g., routine cleaning of frequently touched surfaces)
- CDC has recommendations to protect yourself and your community from getting and spreading respiratory illnesses like COVID-19.

For more information please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

AMERICAN OVERSIGHT

Considerations for School Closure

Recommendations on school closure based on available science, reports from other countries and consultation with school health experts.

1. There is a role for school closure in response to school-based cases of COVID-19 for decontamination and contact tracing (few days of closure), in response to significant absenteeism of staff and students (short to medium length, i.e. 2-4 weeks of closure), or as part of a larger community mitigation strategy for jurisdictions with substantial community spread* (medium to long length, i.e. 4-8 weeks or more of closure).

2. Available modeling data indicate that early, short to medium closures do not impact the epi curve of COVID-19 or available health care measures (e.g., hospitalizations). There may be some impact of much longer closures (8 weeks, 20 weeks) further into community spread, but that modelling also shows that other mitigation efforts (e.g., handwashing, home isolation) have more impact on both spread of disease and health care measures. In other countries, those places who closed school (e.g., Hong Kong) have not had more success in reducing spread than those that did not (e.g., Singapore).

3. In places where school closures are necessary, the anticipated academic and economic impacts and unintended impacts on disease outcomes must be planned for and mitigated. Provision of academic support (e.g., tele-ed), alternatives for school-based meals as well as other services (e.g., behavioral and mental health services) for economically and physically vulnerable children, support for families for whom telework and paid sick leave is not available, ensuring that high risk individuals continue to be protected must all be addressed. Special consideration must be given for health care workers so that school closures do not impact their ability to work.

*Substantial community spread is defined as large scale community transmission, health care staffing significantly impacted, multiple cases within communal settings.

AMERICAN OVERSIGHT

School Decision Tree

All Schools Regardless of Community Spread

Confirmed person with COVID-19 in building? → Assess Risk → *Short (potential 2-5 Day) Building Dismissal to Clean/Disinfect/Contact Trace in consultation with local health officials*

No Community Spread

- Prepare
- Teach and reinforce healthy hygiene
- Develop information sharing systems
- Intensify cleaning and disinfection
- Monitor for absenteeism
- Assess group gatherings and events – consider postponing non-critical gatherings and events
- Require sick students and staff stay home
- Establish procedures for someone becoming sick at school

→ *Monitor changes in community spread*

Minimal to Moderate OR Substantial Community Spread

Is community spread Minimal to Moderate or Substantial?

M/M

- Coordinate with local health officials.
- Implement multiple social distancing strategies for gatherings, classrooms, and movement through the building.
- Consider ways to accommodate needs of children and families at high risk.

S

- Coordinate with local health officials.
- Implement multiple social distancing strategies for gatherings, classrooms, and movement through the building WITH EXTENDED SCHOOL DISMISSALS.
- Consider ways to accommodate needs of children and families at high risk.

AMERICAN OVERSIGHT

Factors for Consideration for School Closure

Closing schools early in the spread of disease for a short time (e.g., 2 weeks) will be unlikely to stem the spread of disease or prevent impact on the health care system, while causing significant disruption for families, schools, and those who may be responding to COVID-19 outbreaks in health care settings. It may also increase impact on older adults who care for grandchildren. Waiting to enact school closures until at the correct time in the epidemic (e.g., later in the spread of disease) combined with other social distancing interventions allows for optimal impact despite disruption.

	Factors in favor of school closure	Factors against school closure	Further considerations
In response to school-based case (Less than 1 week closure)	• **Impact on disease** ○ Allows for decontamination ○ Allows time for epidemical evaluation and conact tracing; further action can be scaled based on epi investigation.	• **Impact on disease** ○ Social mixing may still occur outside of school with less ability to monitor, especially among older students.	• May occur frequently during a wide-spread outbreak
Short-term (2 weeks closure)	• **Impact on disease** ○ Allows time for further understanding of the local COVID-19 situation (e.g., community spread) ○ Increases social distancing amongst immediate school community. ○ Gives time for potentially exposed individuals to develop symptoms while not in school • **Impact on families** ○ Children may be less impacted by social isolation from their peers for shorter time frames • **Impact on school** ○ Schools are better prepared for short-term closures because they've been more likely to have experienced those (e.g., for weather)	• **Impact on disease** ○ Modeling data for other respiratory infections where children have higher disease impacts, suggests that early short term closures are not impactful in terms of overall transmission. ○ Social mixing may still occur outside of school with less ability to monitor, especially among older students. ○ Will increase risk to older adults or those with co-morbidities, as almost 40% of US grandparents provide childcare for grandchildren. School closures will likely increase this percentage. • **Impact on families** ○ Key services are interrupted for students (e.g., meals, other social,	• Disproportionate impact of children being out of school whose parents/family members are hourly and low-wage workers • Research from school staff tells us that schools find closures more acceptable when other events, gatherings, and facilities in the community are also closed or cancelled. • Concerns about household mixing of sick and well family members needs to be addressed • Consider non-closure social distancing first (e.g., staggering recess, cancelling assemblies and inter-school events.) • Economic impact if school staff are not paid during school closure must be considered.

AMERICAN OVERSIGHT

	○ Given current timing, some schools may be able to take advantage of spring break closures ○ Provides protection for older staff and students and staff with underlying medical conditions	physical health, and mental health services, after school programs) ○ Economic impact for families because of the costs of childcare and lost wages. There may be a loss of productivity even for parents who are able to telework. ○ Some families may not have capacity for students to participate in distance learning (e.g., no computers, internet access issues) even if provided by school. • **Impact on schools** ○ Potential academic impact because of the disruption to the continuity of learning • **Impact on health care** ○ Available health care workforce is decreased as HCW stay home with children.	
Medium-term (4 weeks closure)	• **Impact on disease** ○ Provides more protection for older staff and students and staff with underlying medical conditions • **Impact on schools** ○ Planned closures of longer periods may be easier for families to plan for than rolling closures with unexpected timing and duration, including possibly last-minute notice	• **Impact on disease** ○ Longer closures may result in more students congregating outside of school (e.g., other students' homes, shopping malls) ○ Will increase risk to older adults or those with co-morbidities, as almost 40% of US grandparents provide childcare for grandchildren. School closures will likely increase this percentage. • **Impact on families** ○ Students who rely on key services (e.g., meals, other social, physical health, and mental health services,	• Disproportionate impact of children being out of school whose parents/family members are hourly and low-wage workers • If a school closes for this length of time, schools must consider ways to continue key services • Research from school staff tells us that schools find closures more acceptable when other events, gatherings, and facilities in the community are also closed or cancelled. • Consider coupling with other social actions to mitigate risk of increased social mixing in other community areas

AMERICAN OVERSIGHT

		after school programs) are put at greater risk ○ Economic impact grows with length of closure; furthermore, this may exacerbate disparities among families at different SES levels (e.g., parents with lower wage jobs may lose jobs) ○ High school seniors likely to lose ability to participate in their prom, graduation etc. ○ Some families may not have capacity for students to participate in distance learning (e.g., no computers, internet access issues) even if provided by school. • **Impact on schools** ○ Significant impact on academic outcomes may occur. Losing one month of learning may prevent students from meeting grade level knowledge and skill expectations and may jeopardize schools' ability to meet standardized testing requirements ○ School staff may be differentially impacted (e.g., hourly workers may be less able to sustain longer closures) • **Impact on health care** ○ Available health care workforce is decreased as HCW stay home with children.	• Because closures are likely to increase anxiety among students, families, and community members, excellent messaging is needed along with the school closure. • Economic impact if school staff are not paid during school closure must be considered.
Long-term (8 weeks, 20 weeks closure)	• **Impact on disease** ○ Modeling data for other respiratory infections where children have	• **Impact on disease** ○ Longer closures may result in more students congregating outside of	• Disproportionate impact of children being out of school for hourly and low-wage workers (compared to salaried

AMERICAN OVERSIGHT

	higher disease impacts, suggests that longer closures are may have greater impact in terms of overall transmission. Provides substantial protection for older staff and students and staff with underlying medical conditions
	• **Impact on schools**
	  ○ Schools without distance learning may see closures of this length as reason to implement distance learning approaches they may not have previously had or used
		school (e.g., other students' homes, shopping malls)
		  ○ Will increase risk to older adults or those with co-morbidities, as almost 40% of US grandparents provide childcare for grandchildren. School closures will likely increase this percentage.
		• **Impact on families**
		  ○ Students who rely on key services (e.g., meals, other social, physical health, and mental health services, after school programs) are put at substantial risk
		  ○ Economic impact grows with length of closure; furthermore, this may exacerbate disparities among families at different SES levels (e.g., parents with lower wage jobs may lose jobs)
		  ○ Student engagement with schools and peers diminishes, which could increase anxiety and other mental health and emotional problems.
		  ○ High school seniors likely to lose ability to participate in their prom, graduation etc.
		• **Impact on schools**
		  ○ Significant impact on academic outcomes will likely occur; losing 2 months of learning is likely to prevent many students from meeting grade level knowledge and skill expectations and will jeopardize schools' ability to meet standardized testing requirements
			workers who may have more flexible leave and telework opportunities)
			• If a school closes for this length of time, schools must consider ways to continue key services
			• Research from school staff tells us that schools find closures more acceptable when other events, gatherings, and facilities in the community are also closed or cancelled.
			• Because closures are likely to increase anxiety among students, families, and community members, excellent messaging is needed along with the school closure.
			• Given current timing, 20 week closures may not impact schools much more substantially than 8 week closures. Many schools end for the year in late May; some continue until mid June.
			• A 20 week scenario could still have substantial impact on parents who need to find summer care for students. If schools are dismissed, one would expect summer camps might be cancelled as well
			• Economic impact if school staff are not paid during school closure must be considered.

AMERICAN OVERSIGHT

		○ Loss of educational progress, even having to add an extra semester or year to graduate or move up a grade ○ Staff within the schools may be differentially impacted (e.g., hourly workers may be less able to sustain longer closures) ○ Maintaining communication with school staff, families, and students becomes substantially more difficult as the school closure lengthens. • **Impact on health care** ○ Available health care workforce is decreased as HCW stay home with children.	

Points for further consideration, regardless of degree of spread or length of potential closure

- Clear rationale, decision-making and communication with all stakeholders is extremely important. Families need to know who is making decisions, what those decisions are and when school-based mitigation efforts are planned to start and end.
- While we have data that can contribute to decisions about when to dismiss schools, there is almost no available data on the right time to re-start schools. We would advise to plan for a length of time and then evaluate based on continued community spread.
- The relationship between state and local education agencies and state and local public health must be strong and communication must be clear and thorough.
- Critical academic infrastructure and service provision must be considered during school closure.

AMERICAN OVERSIGHT

OFFICE OF THE UNDER SECRETARY OF DEFENSE
4000 DEFENSE PENTAGON
WASHINGTON, D.C. 20301-4000

PERSONNEL AND
READINESS

MAR 1 1 2020

MEMORANDUM FOR CHIEF MANAGEMENT OFFICER OF THE DEPARTMENT OF DEFENSE
SECRETARIES OF THE MILITARY DEPARTMENTS
CHAIRMAN OF THE JOINT CHIEFS OF STAFF
UNDER SECRETARIES OF DEFENSE
CHIEF OF THE NATIONAL GUARD BUREAU
GENERAL COUNSEL OF THE DEPARTMENT OF DEFENSE
ASSISTANT SECRETARY OF DEFENSE FOR LEGISLATIVE AFFAIRS
ASSISTANT TO THE SECRETARY OF DEFENSE FOR PUBLIC AFFAIRS
DIRECTORS OF DEFENSE AGENCIES
DIRECTORS OF DOD FIELD ACTIVITIES

SUBJECT: Force Health Protection Guidance (Supplement 4) – Department of Defense Guidance for Personnel Traveling During the Novel Coronavirus Outbreak

This memorandum supplements requirements in DoD Instruction 6200.03 "Public Health Emergency Management (PHEM) Within the DoD," March 28, 2019, with respect to coronavirus disease 2019 (COVID-19). The COVID-19 outbreak continues to spread globally and as a result, the Centers for Disease Control and Prevention (CDC) is rapidly issuing Travel Health Notices (THNs) and guidance for persons with travel in countries or areas with COVID-19 transmission. CDC THNs tier these locations as Level 3 (Widespread sustained (ongoing) transmission), Level 2 (Sustained (ongoing) community transmission) and Level 1 (Risk of limited community transmission), with associated monitoring guidance for returning travelers. The CDC THNs are at: https://www.cdc.gov/coronavirus/2019-ncov/travelers/index.html. This guidance applies to all DoD Components, except that it does not apply to air crew of military aircraft.

All existing Novel Coronavirus Outbreak FHP guidance remains in effect and applies to all DoD Components, including the Reserves and National Guard, and, as appropriate, foreign military personnel who are under DoD authority. The FHP guidance for China travelers ("Force Health Protection Guidance (Supplement 1) – Department of Defense Guidance for Monitoring of Personnel Returning from China During the Novel Coronavirus Outbreak," dated February 7, 2020), remains in effect. FHP documents are at: https://www.defense.gov/Explore/Spotlight/Coronavirus. Individuals should continue to check the CDC COVID-19 website for additional updates at: https://www.cdc.gov/coronavirus/2019-ncov/index.html.

This document provides pre- and post-travel health guidance for all DoD travelers to enable mission assurance and Force Health Protection (FHP), utilizing the CDC THNs for DoD Component considerations. DoD Components may be more restrictive based on local risk assessment in consultation with public health authorities. Command location, local community transmission, risk to mission, and risk to force are all key considerations in DoD Component decision making.

AMERICAN OVERSIGHT

Actions for all DoD travelers

Actions prior to official travel:

- DoD Components shall incorporate CDC guidance into the full scope of planning for official travel, to include the following:
    - Consider the risk profile of the traveler (e.g., older individuals or those with underlying diseases). Limit travel to those individuals who are healthy, to the greatest extent possible. For DoD civilian personnel, these considerations must be consistent with the requirements of the Rehabilitation Act of 1973, as amended.
    - Coordinate with the receiving installation to ensure the post-travel requirements in this document can be implemented at that location.

Actions upon departure/exit screening:

- DoD Components should emphasize each individual's responsibility to avoid travel when sick.
- For travel on military aircraft, DoD Components should ensure exit screening is conducted at the point of embarkation. At a minimum, this should consist of a questionnaire[1] to assess risk of exposure, temperature check (fever is >100.4°F or 38°C per CDC), and visual check for signs and symptoms (i.e., feeling feverish, coughing or shortness of breath per CDC) of COVID-19. If the screening yields concerns, a secondary medical evaluation by a health professional should be conducted. DoD Components should also be prepared to appropriately manage a patient under investigation if such a determination is made, to include referral to the appropriate medical authority per CDC guidance found at: https://www.cdc.gov/coronavirus/2019-ncov/hcp/index.html.
- Travel on commercial air carriers may not include exit screening of travelers. Therefore, taking the appropriate action upon arrival is critical.

Actions for all Service members

Actions upon arrival from a CDC THN Level 3 or Level 2 location:

DoD Components should identify all Service members who travel or have traveled in the prior 14 days to, through, or from a CDC THN Level 3 or Level 2 country. This includes travel by military or commercial means, as well as private conveyance, and includes all forms of travel to include Permanent Change of Station, Temporary Duty, and leave. DoD Components should place these Service members under a 14-day restriction of movement (ROM). During the ROM (starting from the day of departure from the Level 3 or Level 2 country):

[1] Guidance to support questionnaire development is at https://www.cdc.gov/coronavirus/2019-ncov/php/risk-assessment.html

AMERICAN OVERSIGHT

- Service members should be restricted to their residence or other appropriate domicile for 14 days and limit close contact (within 6 feet or 2 meters) with others during this 14-day period. Immediate supervisors will not require Service members to report to their duty location or otherwise disregard the ROM.

- Service members should self-monitor by taking their temperatures twice a day to check for fever, and remain alert for cough or difficulty breathing. If they feel feverish or develop a fever (>100.4°F or 38°C per CDC), cough, or difficulty breathing during the self-monitoring period, they should self-isolate, limit contact with others, notify their supervisor or chain of command, and seek advice by telephone from the appropriate healthcare provider to determine whether medical evaluation is needed.

- For any in-person assessments of Service members (including asymptomatic individuals), medical personnel should apply CDC guidance to include wearing appropriate personal protective equipment (https://www.cdc.gov/coronavirus/2019-ncov/infection-control/control-recommendations.html).

- Service members living in open-bay settings, or rooms with shared bathrooms and/or kitchen facilities, should be placed in separate lodging to span the 14-day ROM period. The DoD Component to which the Service member is assigned will arrange and fund the separate lodging if needed.

- Service members should separate themselves from other people in the home or dwelling if residing with roommates or family members and avoid sharing personal items.

- Service members should not travel, visit public or crowded areas, or use public transportation and should avoid interaction with pets or other animals.

- Medical evaluation and care should be immediately arranged if the Service member displays fever or symptoms consistent with COVID-19, as per CDC guidance (https://www.cdc.gov/coronavirus/2019-ncov/hcp/index.html).

    - The Service member should call ahead before going to a medical treatment facility, informing medical staff of his/her symptoms and travel history.

    - Medical staff should follow CDC guidance when assessing individuals displaying fever and symptoms consistent with COVID-19.

    - DoD Components should appropriately report an individual if identified as a patient under investigation, per previously published Under Secretary of Defense for Personnel and Readiness guidance, "Force Health Protection Guidance for the Novel Coronavirus Outbreak," dated January 30, 2020.

AMERICAN OVERSIGHT

Actions upon arrival from a non-CDC THN Level 2 or Level 3 CONUS or OCONUS location:

DoD Components should identify and track all Service members who travel or have a history of travel in the prior 14 days to, through, or from a non-CDC THN Level 2 or Level 3 CONUS or OCONUS location. This includes travel by military or commercial means as well as private conveyance and includes all forms of travel to include Permanent Change of Station, Temporary Duty, and leave. DoD Components should ensure that these Service members take the following actions for the next 14 days:

- Implement self-observation, i.e., remain alert for fever, cough, or difficulty breathing.
- To the extent possible, implement social distancing, e.g., remain out of congregate settings, avoid mass gatherings, and maintain 6 feet or 2 meter distance from others when possible.
- Immediately self-isolate, limit contact with others, and seek advice by telephone from the appropriate healthcare provider to determine whether medical evaluation is required, if individuals feel feverish or develop measured fever, cough, or difficulty breathing.

Actions for DoD civilian employees, contractor personnel, and family members

DoD strongly recommends that DoD civilian employees, contractor personnel, and family members who travel to, through, and from countries with a CDC THN for COVID-19 follow this DoD guidance, which is more stringent than CDC guidance. DoD Components should restrict DoD workplace access for 14 days for DoD civilian employees and contractor personnel whose travel has included THN Level 2 and Level 3 locations. If these civilian employees and contractor personnel feel feverish or develop a fever, cough, or difficulty breathing, they should notify their supervisor or chain of command. For all other travel, DoD Components will encourage self-observation and accommodation of social distancing. To restrict access from the DoD workplace and maximize telework options, DoD Components shall implement the Under Secretary of Defense for Personnel and Readiness memorandum, "Civilian Personnel Guidance for DoD Components in Responding to Coronavirus Disease 2019," dated March 8, 2020. For contractor personnel, DoD Components should implement measures in consultation with the appropriate contracting office.

This guidance is effective March 13, 2020. My point of contact is COL Jennifer M. Kishimori, who may be reached at (703) 681-8179 or jennifer.m.kishimori.mil@mail.mil.

Alexis Lasselle Ross

Subject:	3-12-20 CDC COVID-19 Key Points, Considerations for School Closures Guidance, and Force Health Protection Guidance
Date:	Friday, March 13, 2020 8:21:43 AM
Attachments:	CDC_COVID-19_Daily Key Points__3_12_2020_FINAL.pdf Considerations for school closure Draft 031220 Updated.pdf Force Health Protection Guidance (Supplement 4) (002).pdf

Dear Colleagues:

Attached, please find

1. **CDC COVID-19 Key Points for Thursday, March 12, 2020. Please feel free to share with staff and appropriate parties.**
2. **CDC draft of Considerations for School closure guidance**. Recommendations on school closure based on available science, reports from other countries and consultation with school health experts.
3. **Force Health Protection Guidance**

An additional note on U.S. Military guidance during the COVID-19 pandemic: Many of you have military bases and personnel in your states and communities. Attached for your information is the Department of Defense Force Protection Guidance, including a risk based table for global implementation of guidance for military members returning home from either CDC travel health notice (THN) Level 3 (Avoid non-essential travel) or Level 2(Special precautions for high-risk travelers) areas to stay home for 14 days, social distance and self-monitor.

Kind Regards,

State Coordination Task Force

(Sent by BCC to PHEP directors, state epidemiologists, state health officials, public health laboratory directors, BCHC, and national and federal partners)

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Outbreak
March 12, 2020 as of 9:30pm

Updated text is shown in colored text.

SNAPSHOT

- CDC has reported:
  - 1,215 confirmed and presumptive positive cases of COVID-19
  - 36 COVID-19 related deaths
  - 42 states and the District of Columbia

MAIN KEY POINTS

- The global outbreak of respiratory illness caused by a new coronavirus that emerged from China has reached pandemic proportions, according to the World Health Organization.
- The United States is in the early phase of the outbreak.
- Public health efforts at this time are focused concurrently on containing spread of this virus and mitigating the impact of this virus.
- There is no vaccine to protect against COVID-19 and no medications approved to treat it.
- Nonpharmaceutical interventions are actions, apart from getting vaccinated and taking medicine, that people and communities can take to help slow the spread of respiratory illnesses like COVID-19 and reduce the impact of that outbreak.
- School closures are one of a number of nonpharmaceutical interventions.
- On March 12, CDC posted "Considerations for school closures" which provides information about the appropriate timing of school closures.
- More cases of COVID-19 are expected in the United States in the coming days, including more instances of community spread.
- As the outbreak continues, at some point, widespread transmission of the virus that causes COVID-19 in the United States is expected occur.
- Many people will get sick, but based on what is known about this virus, most people will not develop serious illness.
- Based on data out of China, where this virus first emerged, older adults and persons of all ages who have serious long-term health problems seem to be at higher risk for more serious COVID-19 illness.
  - It's important that people who are at higher risk of serious COVID-19 illness take special precautions to reduce their risk of getting sick and that the people around them take action to help protect those who are most vulnerable.
  - CDC has guidance for what people at higher risk should do at this time.
- All communities can take measures to reduce the spread of COVID-19. Everyone has a role to play in getting ready and staying healthy.

SITUATION UPDATE

- 1,215 reported cases of COVID-19 have been detected in Arizona, Arkansas, California, Colorado, Connecticut, Delaware, Florida, Georgia, Hawaii, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York (and New York City), North

AMERICAN OVERSIGHT

Carolina, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, and Wisconsin.
    - 102 of these cases occurred through close contact with another case.
    - 125 cases occurred in persons who had traveled to international areas with sustained (ongoing) transmission and among their close contacts.
    - 988 cases are still being investigated to determine the source of exposure.
- CDC has developed a map of the U.S. that shows affected states and how many COVID-19 cases they have reported.
- Because states are reporting their results directly and publicly, sometimes in near real-time, CDC case counts may be different from what states, local authorities, or media are reporting.
    - In the event of a discrepancy between case counts reported by state or local public health officials versus CDC-reported numbers, the numbers reported by states should be considered the most up to date.
- As of the evening of March 11, 81 state and local public health labs in 50 states and the District of Columbia have verified they are successfully using COVID-19 diagnostic tests.
- CDC has developed a map showing which states and territories have one or more laboratories that have successfully verified and are currently using COVID-19 diagnostic tests.
    - This list is provided by the Association of Public Health Laboratories (APHL).
    - The same page includes information on the number of COVID-19 specimens tested.
- As of the evening of March 11, 2020, CDC and local and state public health laboratories had tested a total of 13,624 specimens.
- CDC is reviewing and updating travel notices almost on a daily basis.
- U.S. citizens, residents, and their immediate family members who have been in China or Iran within in the past 14 days can enter the United States, but they are subject to health monitoring and possible quarantine for up to 14 days.
- On March 11, President Trump issued a proclamation that foreign nationals who have been in one or more of 26 European countries within the past 14 days cannot enter the United States for a period of 30 days.
- On March 11, CDC issued a:
    - Level 3 Travel Health Notice recommending travelers avoid all nonessential travel to most of Europe.
    - Global Level 2 Travel Health Notice recommending older adults and those who have chronic medical conditions consider postponing nonessential travel.
- On March 8, CDC recommended travelers, particularly those with underlying health issues, defer all cruise ship travel worldwide.

CONSIDERATIONS FOR SCHOOL CLOSURES

- There is a role for school closures in response to school-based cases of COVID-19:
    - For decontamination and contact tracing (few days of closure)
    - In response to significant absenteeism of staff and students (short to medium length, i.e., 2–4 weeks of closure)
    - As part of a larger community mitigation strategy for jurisdictions with substantial community spread (medium to long length, i.e., 4–8 weeks or more of closure)
- Available modeling data indicate that short- to medium-length closures early in the outbreak will not impact the spread of COVID-19 or health care measures (e.g., hospitalizations). There

AMERICAN OVERSIGHT

may be some impact of much longer closures (8 or more weeks) further into the outbreak when there is more community spread.
- The same model shows other mitigation efforts (e.g., handwashing, home isolation) have more impact on both spread of disease and health care measures.
- In other countries, places that closed schools (e.g., Hong Kong) have not had more success in reducing spread than those that did not (e.g., Singapore).
- In places where school closures are necessary, the anticipated academic and economic impacts and unintended impacts on disease outcomes must be planned for and mitigated. All of the following must be addressed:
    - Provision of academic support (e.g., tele-ed)
    - Alternatives for school-based meals and other services (e.g., behavioral and mental health services) for economically and physically vulnerable children
    - Support for families for whom telework and paid sick leave is not available
    - Continued protection for high risk individuals
- Special consideration must be given for healthcare workers so that school closures do not impact their ability to work.

PANDEMIC INFORMATION

- Pandemics happen when a disease emerges to infect people easily and spreads from person to person in an efficient and sustained way globally.
- This is the first pandemic known to be caused by the emergence of a new coronavirus.
- In the past century, there have been four pandemics caused by the emergence of novel influenza viruses.
    - Pandemic guidance developed in anticipation of an influenza pandemic is being repurposed and adapted for a COVID-19 pandemic.
- The federal government has been working closely with state, local, tribal, and territorial partners, as well as public health partners, to prepare for and respond to this public health threat for months.
- CDC has been implementing its pandemic preparedness and response plans, working on multiple fronts, including providing specific guidance on measures to prepare communities to respond to local spread of the virus that causes COVID-19.
- Pandemics of respiratory disease follow a certain progression outlined in a "Pandemic Intervals Framework."
    - Pandemics begin with an investigation phase, followed by recognition, initiation, and acceleration phases.
    - The peak of illnesses occurs at the end of the acceleration phase, which is followed by a deceleration phase, during which there is a decrease in illnesses.
- Different countries can be in different phases of the pandemic at any point in time and different parts of the same country can also be in different phases of a pandemic.
- Nationally, the United States is currently in the initiation phase, but states where community spread is occurring are in the acceleration phase.
- The duration and severity of each phase can vary depending on the characteristics of the virus and the public health response.
- Public health partners are encouraged to review their pandemic preparedness plans at this time.

AMERICAN OVERSIGHT

PEOPLE AT HIGHER RISK OF EXPOSURE/INFECTION

- The immediate risk of being exposed to this virus is still low for most Americans, but as the outbreak expands, that risk will increase. Cases of COVID-19 and instances of community spread are being reported in a growing number of states.
- Right now, people are at higher risk of exposure/infection include:
    - People in communities where ongoing community spread of the virus that causes COVID-19 has been reported are at elevated risk of exposure, with level of risk dependent on the location.
    - Healthcare workers caring for patients with COVID-19 are at elevated risk of exposure.
    - Close contacts of persons with COVID-19 also are at elevated risk of exposure.
    - Travelers returning from affected international locations where community spread is occurring also are at elevated risk of exposure, with level of risk dependent on where they traveled.

PEOPLE AT HIGHER RISK OF SERIOUS COVID-19 ILLNESS

- Early information out of China, where COVID-19 first started, shows that some people are at higher risk of getting very sick from this illness. This includes:
    - Older adults, with risk increasing by age
    - People who have serious chronic medical conditions like
        - Heart disease
        - Diabetes
        - Lung disease

WHAT YOU CAN DO

- Everyone can do their part to help respond to this emerging public health threat:
    - Individuals and communities should familiarize themselves with recommendations to protect themselves and their community from getting and spreading respiratory illnesses like COVID-19.
    - Older people and people with severe chronic conditions should take special precautions because they are at higher risk of developing serious COVID-19 illness.
    - If you are a healthcare provider, use your judgement to determine if a patient has signs and symptoms compatible with COVID-19 and whether the patient should be tested. Factors to consider, in addition to clinical symptoms, may include:
        - Does the patient have recent travel from an affected area?
        - Has the patient been in close contact with someone with COVID-19 or patients with pneumonia of unknown cause?
        - Does the patient reside in an area where there has been community spread of COVID-19?
    - If you are a healthcare provider or a public health responder caring for a COVID-19 patient, please take care of yourself and follow recommended infection control procedures.
    - If you are a close contact of someone with COVID-19 and develop symptoms of COVID-19, call your healthcare provider and tell them about your symptoms and your exposure. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.

AMERICAN OVERSIGHT

- If you are a resident in a community where there is ongoing spread of COVID-19 and you develop COVID-19 symptoms, call your healthcare provider and tell them about your symptoms. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.
- For people who are ill with COVID-19, but are not sick enough to be hospitalized, please follow CDC guidance on how to reduce the risk of spreading your illness to others. People who are mildly ill with COVID-19 are able to isolate at home during their illness.
- If you have been in China or another affected area or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus.

CDC ACTIONS

- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States to reduce the spread and the impact of this virus.
- CDC is operationalizing all of its pandemic preparedness and response plans, working on multiple fronts to meet these goals, including specific measures to prepare communities to respond to local transmission of the virus that causes COVID-19.
- CDC is aggressively responding to the global outbreak of COVID-19 and preparing for the potential of community spread in more parts of the United States.
- CDC's Action for Preparing Communities for Potential Spread of COVID-19 include:
    - Preparing first responders, healthcare providers, and health systems
    - Reinforcing state, territorial, and local public health readiness
    - Supporting communities, businesses, and schools

COMMUNITY BASED INTERVENTIONS (AKA COMMUNITY MITIGATION)

- Americans should be prepared for the possibility of a COVID-19 outbreak in their community. Everyone has a role to play.
- Currently, a vaccine is not available for COVID-19. Until a vaccine is developed, community-based interventions, such as school dismissals, event cancellations, social distancing, and plans to work remotely, can help slow the spread of coronavirus.
- Your local public health department and community partners have been preparing for an event like COVID-19 and have plans in place. Now is a good time for businesses, community and faith-based organizations, schools, and health-care systems to reexamine their preparedness plans to make sure they are ready.
- Strong community partnerships between local health departments, the health care sector, faith-based organizations, and other community partners are vital for this response, and will be necessary to prepare for and coordinate if an outbreak occurs.
    - Community-based interventions can be grouped in three categories:
        - Personal protective measures (e.g., voluntary home isolation of ill persons, voluntary home quarantine of exposed household members, covering

AMERICAN OVERSIGHT

nose/mouth when coughing or sneezing, hand hygiene, using face masks in community settings when ill)
        - Community measures aimed at increasing social distancing (e.g., school dismissals, social distancing in workplaces, postponing or cancelling mass gatherings)
        - Environmental measures (e.g., routine cleaning of frequently touched surfaces)
- CDC has recommendations to protect yourself and your community from getting and spreading respiratory illnesses like COVID-19.

For more information please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

AMERICAN OVERSIGHT

Considerations for School Closure

Recommendations on school closure based on available science, reports from other countries and consultation with school health experts.

1. There is a role for school closure in response to school-based cases of COVID-19 for decontamination and contact tracing (few days of closure), in response to significant absenteeism of staff and students (short to medium length, i.e. 2-4 weeks of closure), or as part of a larger community mitigation strategy for jurisdictions with substantial community spread* (medium to long length, i.e. 4-8 weeks or more of closure).

2. Available modeling data indicate that early, short to medium closures do not impact the epi curve of COVID-19 or available health care measures (e.g., hospitalizations). There may be some impact of much longer closures (8 weeks, 20 weeks) further into community spread, but that modelling also shows that other mitigation efforts (e.g., handwashing, home isolation) have more impact on both spread of disease and health care measures. In other countries, those places who closed school (e.g., Hong Kong) have not had more success in reducing spread than those that did not (e.g., Singapore).

3. In places where school closures are necessary, the anticipated academic and economic impacts and unintended impacts on disease outcomes must be planned for and mitigated. Provision of academic support (e.g., tele-ed), alternatives for school-based meals as well as other services (e.g., behavioral and mental health services) for economically and physically vulnerable children, support for families for whom telework and paid sick leave is not available, ensuring that high risk individuals continue to be protected must all be addressed. Special consideration must be given for health care workers so that school closures do not impact their ability to work.

*Substantial community spread is defined as large scale community transmission, health care staffing significantly impacted, multiple cases within communal settings.

AMERICAN OVERSIGHT

School Decision Tree

All Schools Regardless of Community Spread

Confirmed person with COVID-19 in building? → Assess Risk → *Short (potential 2-5 Day) Building Dismissal to Clean/Disinfect/Contact Trace in consultation with local health officials*

No Community Spread

- Prepare
- Teach and reinforce healthy hygiene
- Develop information sharing systems
- Intensify cleaning and disinfection
- Monitor for absenteeism
- Assess group gatherings and events – consider postponing non-critical gatherings and events
- Require sick students and staff stay home
- Establish procedures for someone becoming sick at school

→ *Monitor changes in community spread*

Minimal to Moderate OR Substantial Community Spread

Is community spread Minimal to Moderate or Substantial?

M/M

- Coordinate with local health officials.
- Implement multiple social distancing strategies for gatherings, classrooms, and movement through the building.
- Consider ways to accommodate needs of children and families at high risk.

S

- Coordinate with local health officials.
- Implement multiple social distancing strategies for gatherings, classrooms, and movement through the building WITH EXTENDED SCHOOL DISMISSALS.
- Consider ways to accommodate needs of children and families at high risk.

AMERICAN OVERSIGHT

Factors for Consideration for School Closure

Closing schools early in the spread of disease for a short time (e.g., 2 weeks) will be unlikely to stem the spread of disease or prevent impact on the health care system, while causing significant disruption for families, schools, and those who may be responding to COVID-19 outbreaks in health care settings. It may also increase impact on older adults who care for grandchildren. Waiting to enact school closures until at the correct time in the epidemic (e.g., later in the spread of disease) combined with other social distancing interventions allows for optimal impact despite disruption.

	Factors in favor of school closure	Factors against school closure	Further considerations
In response to school-based case (Less than 1 week closure)	• **Impact on disease** ○ Allows for decontamination ○ Allows time for epidemical evaluation and conact tracing; further action can be scaled based on epi investigation.	• **Impact on disease** ○ Social mixing may still occur outside of school with less ability to monitor, especially among older students.	• May occur frequently during a wide-spread outbreak
Short-term (2 weeks closure)	• **Impact on disease** ○ Allows time for further understanding of the local COVID-19 situation (e.g., community spread) ○ Increases social distancing amongst immediate school community. ○ Gives time for potentially exposed individuals to develop symptoms while not in school • **Impact on families** ○ Children may be less impacted by social isolation from their peers for shorter time frames • **Impact on school** ○ Schools are better prepared for short-term closures because they've been more likely to have experienced those (e.g., for weather)	• **Impact on disease** ○ Modeling data for other respiratory infections where children have higher disease impacts, suggests that early short term closures are not impactful in terms of overall transmission. ○ Social mixing may still occur outside of school with less ability to monitor, especially among older students. ○ Will increase risk to older adults or those with co-morbidities, as almost 40% of US grandparents provide childcare for grandchildren. School closures will likely increase this percentage. • **Impact on families** ○ Key services are interrupted for students (e.g., meals, other social,	• Disproportionate impact of children being out of school whose parents/family members are hourly and low-wage workers • Research from school staff tells us that schools find closures more acceptable when other events, gatherings, and facilities in the community are also closed or cancelled. • Concerns about household mixing of sick and well family members needs to be addressed • Consider non-closure social distancing first (e.g., staggering recess, cancelling assemblies and inter-school events.) • Economic impact if school staff are not paid during school closure must be considered.

AMERICAN OVERSIGHT

	○ Given current timing, some schools may be able to take advantage of spring break closures ○ Provides protection for older staff and students and staff with underlying medical conditions	physical health, and mental health services, after school programs) ○ Economic impact for families because of the costs of childcare and lost wages. There may be a loss of productivity even for parents who are able to telework. ○ Some families may not have capacity for students to participate in distance learning (e.g., no computers, internet access issues) even if provided by school. • **Impact on schools** ○ Potential academic impact because of the disruption to the continuity of learning • **Impact on health care** ○ Available health care workforce is decreased as HCW stay home with children.	
Medium-term (4 weeks closure)	• **Impact on disease** ○ Provides more protection for older staff and students and staff with underlying medical conditions • **Impact on schools** ○ Planned closures of longer periods may be easier for families to plan for than rolling closures with unexpected timing and duration, including possibly last-minute notice	• **Impact on disease** ○ Longer closures may result in more students congregating outside of school (e.g., other students' homes, shopping malls) ○ Will increase risk to older adults or those with co-morbidities, as almost 40% of US grandparents provide childcare for grandchildren. School closures will likely increase this percentage. • **Impact on families** ○ Students who rely on key services (e.g., meals, other social, physical health, and mental health services,	• Disproportionate impact of children being out of school whose parents/family members are hourly and low-wage workers • If a school closes for this length of time, schools must consider ways to continue key services • Research from school staff tells us that schools find closures more acceptable when other events, gatherings, and facilities in the community are also closed or cancelled. • Consider coupling with other social actions to mitigate risk of increased social mixing in other community areas

AMERICAN OVERSIGHT

		after school programs) are put at greater risk ○ Economic impact grows with length of closure; furthermore, this may exacerbate disparities among families at different SES levels (e.g., parents with lower wage jobs may lose jobs) ○ High school seniors likely to lose ability to participate in their prom, graduation etc. ○ Some families may not have capacity for students to participate in distance learning (e.g., no computers, internet access issues) even if provided by school. • **Impact on schools** ○ Significant impact on academic outcomes may occur. Losing one month of learning may prevent students from meeting grade level knowledge and skill expectations and may jeopardize schools' ability to meet standardized testing requirements ○ School staff may be differentially impacted (e.g., hourly workers may be less able to sustain longer closures) • **Impact on health care** ○ Available health care workforce is decreased as HCW stay home with children.	• Because closures are likely to increase anxiety among students, families, and community members, excellent messaging is needed along with the school closure. • Economic impact if school staff are not paid during school closure must be considered.
Long-term (8 weeks, 20 weeks closure)	• **Impact on disease** ○ Modeling data for other respiratory infections where children have	• **Impact on disease** ○ Longer closures may result in more students congregating outside of	• Disproportionate impact of children being out of school for hourly and low-wage workers (compared to salaried

AMERICAN OVERSIGHT

	higher disease impacts, suggests that longer closures are may have greater impact in terms of overall transmission. Provides substantial protection for older staff and students and staff with underlying medical conditions
	• **Impact on schools**
	  ○ Schools without distance learning may see closures of this length as reason to implement distance learning approaches they may not have previously had or used
		school (e.g., other students' homes, shopping malls)
		  ○ Will increase risk to older adults or those with co-morbidities, as almost 40% of US grandparents provide childcare for grandchildren. School closures will likely increase this percentage.
		• **Impact on families**
		  ○ Students who rely on key services (e.g., meals, other social, physical health, and mental health services, after school programs) are put at substantial risk
		  ○ Economic impact grows with length of closure; furthermore, this may exacerbate disparities among families at different SES levels (e.g., parents with lower wage jobs may lose jobs)
		  ○ Student engagement with schools and peers diminishes, which could increase anxiety and other mental health and emotional problems.
		  ○ High school seniors likely to lose ability to participate in their prom, graduation etc.
		• **Impact on schools**
		  ○ Significant impact on academic outcomes will likely occur; losing 2 months of learning is likely to prevent many students from meeting grade level knowledge and skill expectations and will jeopardize schools' ability to meet standardized testing requirements
			workers who may have more flexible leave and telework opportunities)
			• If a school closes for this length of time, schools must consider ways to continue key services
			• Research from school staff tells us that schools find closures more acceptable when other events, gatherings, and facilities in the community are also closed or cancelled.
			• Because closures are likely to increase anxiety among students, families, and community members, excellent messaging is needed along with the school closure.
			• Given current timing, 20 week closures may not impact schools much more substantially than 8 week closures. Many schools end for the year in late May; some continue until mid June.
			• A 20 week scenario could still have substantial impact on parents who need to find summer care for students. If schools are dismissed, one would expect summer camps might be cancelled as well
			• Economic impact if school staff are not paid during school closure must be considered.

AMERICAN OVERSIGHT

		○ Loss of educational progress, even having to add an extra semester or year to graduate or move up a grade ○ Staff within the schools may be differentially impacted (e.g., hourly workers may be less able to sustain longer closures) ○ Maintaining communication with school staff, families, and students becomes substantially more difficult as the school closure lengthens. • **Impact on health care** ○ Available health care workforce is decreased as HCW stay home with children.	

Points for further consideration, regardless of degree of spread or length of potential closure

- Clear rationale, decision-making and communication with all stakeholders is extremely important. Families need to know who is making decisions, what those decisions are and when school-based mitigation efforts are planned to start and end.
- While we have data that can contribute to decisions about when to dismiss schools, there is almost no available data on the right time to re-start schools. We would advise to plan for a length of time and then evaluate based on continued community spread.
- The relationship between state and local education agencies and state and local public health must be strong and communication must be clear and thorough.
- Critical academic infrastructure and service provision must be considered during school closure.

AMERICAN OVERSIGHT

OFFICE OF THE UNDER SECRETARY OF DEFENSE
4000 DEFENSE PENTAGON
WASHINGTON, D.C. 20301-4000

PERSONNEL AND
READINESS

MAR 1 1 2020

MEMORANDUM FOR CHIEF MANAGEMENT OFFICER OF THE DEPARTMENT OF DEFENSE
SECRETARIES OF THE MILITARY DEPARTMENTS
CHAIRMAN OF THE JOINT CHIEFS OF STAFF
UNDER SECRETARIES OF DEFENSE
CHIEF OF THE NATIONAL GUARD BUREAU
GENERAL COUNSEL OF THE DEPARTMENT OF DEFENSE
ASSISTANT SECRETARY OF DEFENSE FOR LEGISLATIVE AFFAIRS
ASSISTANT TO THE SECRETARY OF DEFENSE FOR PUBLIC AFFAIRS
DIRECTORS OF DEFENSE AGENCIES
DIRECTORS OF DOD FIELD ACTIVITIES

SUBJECT: Force Health Protection Guidance (Supplement 4) – Department of Defense Guidance for Personnel Traveling During the Novel Coronavirus Outbreak

This memorandum supplements requirements in DoD Instruction 6200.03 "Public Health Emergency Management (PHEM) Within the DoD," March 28, 2019, with respect to coronavirus disease 2019 (COVID-19). The COVID-19 outbreak continues to spread globally and as a result, the Centers for Disease Control and Prevention (CDC) is rapidly issuing Travel Health Notices (THNs) and guidance for persons with travel in countries or areas with COVID-19 transmission. CDC THNs tier these locations as Level 3 (Widespread sustained (ongoing) transmission), Level 2 (Sustained (ongoing) community transmission) and Level 1 (Risk of limited community transmission), with associated monitoring guidance for returning travelers. The CDC THNs are at: https://www.cdc.gov/coronavirus/2019-ncov/travelers/index.html. This guidance applies to all DoD Components, except that it does not apply to air crew of military aircraft.

All existing Novel Coronavirus Outbreak FHP guidance remains in effect and applies to all DoD Components, including the Reserves and National Guard, and, as appropriate, foreign military personnel who are under DoD authority. The FHP guidance for China travelers ("Force Health Protection Guidance (Supplement 1) – Department of Defense Guidance for Monitoring of Personnel Returning from China During the Novel Coronavirus Outbreak," dated February 7, 2020), remains in effect. FHP documents are at: https://www.defense.gov/Explore/Spotlight/Coronavirus. Individuals should continue to check the CDC COVID-19 website for additional updates at: https://www.cdc.gov/coronavirus/2019-ncov/index.html.

This document provides pre- and post-travel health guidance for all DoD travelers to enable mission assurance and Force Health Protection (FHP), utilizing the CDC THNs for DoD Component considerations. DoD Components may be more restrictive based on local risk assessment in consultation with public health authorities. Command location, local community transmission, risk to mission, and risk to force are all key considerations in DoD Component decision making.

AMERICAN OVERSIGHT

Actions for all DoD travelers

Actions prior to official travel:

- DoD Components shall incorporate CDC guidance into the full scope of planning for official travel, to include the following:
    - Consider the risk profile of the traveler (e.g., older individuals or those with underlying diseases). Limit travel to those individuals who are healthy, to the greatest extent possible. For DoD civilian personnel, these considerations must be consistent with the requirements of the Rehabilitation Act of 1973, as amended.
    - Coordinate with the receiving installation to ensure the post-travel requirements in this document can be implemented at that location.

Actions upon departure/exit screening:

- DoD Components should emphasize each individual's responsibility to avoid travel when sick.
- For travel on military aircraft, DoD Components should ensure exit screening is conducted at the point of embarkation. At a minimum, this should consist of a questionnaire[1] to assess risk of exposure, temperature check (fever is >100.4°F or 38°C per CDC), and visual check for signs and symptoms (i.e., feeling feverish, coughing or shortness of breath per CDC) of COVID-19. If the screening yields concerns, a secondary medical evaluation by a health professional should be conducted. DoD Components should also be prepared to appropriately manage a patient under investigation if such a determination is made, to include referral to the appropriate medical authority per CDC guidance found at: https://www.cdc.gov/coronavirus/2019-ncov/hcp/index.html.
- Travel on commercial air carriers may not include exit screening of travelers. Therefore, taking the appropriate action upon arrival is critical.

Actions for all Service members

Actions upon arrival from a CDC THN Level 3 or Level 2 location:

DoD Components should identify all Service members who travel or have traveled in the prior 14 days to, through, or from a CDC THN Level 3 or Level 2 country. This includes travel by military or commercial means, as well as private conveyance, and includes all forms of travel to include Permanent Change of Station, Temporary Duty, and leave. DoD Components should place these Service members under a 14-day restriction of movement (ROM). During the ROM (starting from the day of departure from the Level 3 or Level 2 country):

[1] Guidance to support questionnaire development is at https://www.cdc.gov/coronavirus/2019-ncov/php/risk-assessment.html

AMERICAN OVERSIGHT

- Service members should be restricted to their residence or other appropriate domicile for 14 days and limit close contact (within 6 feet or 2 meters) with others during this 14-day period. Immediate supervisors will not require Service members to report to their duty location or otherwise disregard the ROM.

- Service members should self-monitor by taking their temperatures twice a day to check for fever, and remain alert for cough or difficulty breathing. If they feel feverish or develop a fever (>100.4°F or 38°C per CDC), cough, or difficulty breathing during the self-monitoring period, they should self-isolate, limit contact with others, notify their supervisor or chain of command, and seek advice by telephone from the appropriate healthcare provider to determine whether medical evaluation is needed.

- For any in-person assessments of Service members (including asymptomatic individuals), medical personnel should apply CDC guidance to include wearing appropriate personal protective equipment (https://www.cdc.gov/coronavirus/2019-ncov/infection-control/control-recommendations.html).

- Service members living in open-bay settings, or rooms with shared bathrooms and/or kitchen facilities, should be placed in separate lodging to span the 14-day ROM period. The DoD Component to which the Service member is assigned will arrange and fund the separate lodging if needed.

- Service members should separate themselves from other people in the home or dwelling if residing with roommates or family members and avoid sharing personal items.

- Service members should not travel, visit public or crowded areas, or use public transportation and should avoid interaction with pets or other animals.

- Medical evaluation and care should be immediately arranged if the Service member displays fever or symptoms consistent with COVID-19, as per CDC guidance (https://www.cdc.gov/coronavirus/2019-ncov/hcp/index.html).

    - The Service member should call ahead before going to a medical treatment facility, informing medical staff of his/her symptoms and travel history.

    - Medical staff should follow CDC guidance when assessing individuals displaying fever and symptoms consistent with COVID-19.

    - DoD Components should appropriately report an individual if identified as a patient under investigation, per previously published Under Secretary of Defense for Personnel and Readiness guidance, "Force Health Protection Guidance for the Novel Coronavirus Outbreak," dated January 30, 2020.

AMERICAN OVERSIGHT

Actions upon arrival from a non-CDC THN Level 2 or Level 3 CONUS or OCONUS location:

DoD Components should identify and track all Service members who travel or have a history of travel in the prior 14 days to, through, or from a non-CDC THN Level 2 or Level 3 CONUS or OCONUS location. This includes travel by military or commercial means as well as private conveyance and includes all forms of travel to include Permanent Change of Station, Temporary Duty, and leave. DoD Components should ensure that these Service members take the following actions for the next 14 days:

- Implement self-observation, i.e., remain alert for fever, cough, or difficulty breathing.
- To the extent possible, implement social distancing, e.g., remain out of congregate settings, avoid mass gatherings, and maintain 6 feet or 2 meter distance from others when possible.
- Immediately self-isolate, limit contact with others, and seek advice by telephone from the appropriate healthcare provider to determine whether medical evaluation is required, if individuals feel feverish or develop measured fever, cough, or difficulty breathing.

Actions for DoD civilian employees, contractor personnel, and family members

DoD strongly recommends that DoD civilian employees, contractor personnel, and family members who travel to, through, and from countries with a CDC THN for COVID-19 follow this DoD guidance, which is more stringent than CDC guidance. DoD Components should restrict DoD workplace access for 14 days for DoD civilian employees and contractor personnel whose travel has included THN Level 2 and Level 3 locations. If these civilian employees and contractor personnel feel feverish or develop a fever, cough, or difficulty breathing, they should notify their supervisor or chain of command. For all other travel, DoD Components will encourage self-observation and accommodation of social distancing. To restrict access from the DoD workplace and maximize telework options, DoD Components shall implement the Under Secretary of Defense for Personnel and Readiness memorandum, "Civilian Personnel Guidance for DoD Components in Responding to Coronavirus Disease 2019," dated March 8, 2020. For contractor personnel, DoD Components should implement measures in consultation with the appropriate contracting office.

This guidance is effective March 13, 2020. My point of contact is COL Jennifer M. Kishimori, who may be reached at (703) 681-8179 or jennifer.m.kishimori.mil@mail.mil.

Subject:	3-12-20 CDC COVID-19 Key Points, Considerations for School Closures Guidance, and Force Health Protection Guidance
Date:	Friday, March 13, 2020 8:16:11 AM
Attachments:	CDC_COVID-19_Daily Key Points__3_12_2020_FINAL.pdf Considerations for school closure Draft 031220 Updated.pdf Force Health Protection Guidance (Supplement 4) (002).pdf

Dear Colleagues:

Attached, please find

1. **CDC COVID-19 Key Points for Thursday, March 12, 2020. Please feel free to share with staff and appropriate parties.**
2. **CDC draft of Considerations for School closure guidance**. Recommendations on school closure based on available science, reports from other countries and consultation with school health experts.
3. **Force Health Protection Guidance**

An additional note on U.S. Military guidance during the COVID-19 pandemic: Many of you have military bases and personnel in your states and communities. Attached for your information is the Department of Defense Force Protection Guidance, including a risk based table for global implementation of guidance for military members returning home from either CDC travel health notice (THN) Level 3 (Avoid non-essential travel) or Level 2(Special precautions for high-risk travelers) areas to stay home for 14 days, social distance and self-monitor.

Kind Regards,

State Coordination Task Force

(Sent by BCC to PHEP directors, state epidemiologists, state health officials, public health laboratory directors, BCHC, and national and federal partners)

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Outbreak
March 12, 2020 as of 9:30pm

Updated text is shown in colored text.

SNAPSHOT

- CDC has reported:
  - 1,215 confirmed and presumptive positive cases of COVID-19
  - 36 COVID-19 related deaths
  - 42 states and the District of Columbia

MAIN KEY POINTS

- The global outbreak of respiratory illness caused by a new coronavirus that emerged from China has reached pandemic proportions, according to the World Health Organization.
- The United States is in the early phase of the outbreak.
- Public health efforts at this time are focused concurrently on containing spread of this virus and mitigating the impact of this virus.
- There is no vaccine to protect against COVID-19 and no medications approved to treat it.
- Nonpharmaceutical interventions are actions, apart from getting vaccinated and taking medicine, that people and communities can take to help slow the spread of respiratory illnesses like COVID-19 and reduce the impact of that outbreak.
- School closures are one of a number of nonpharmaceutical interventions.
- On March 12, CDC posted "Considerations for school closures" which provides information about the appropriate timing of school closures.
- More cases of COVID-19 are expected in the United States in the coming days, including more instances of community spread.
- As the outbreak continues, at some point, widespread transmission of the virus that causes COVID-19 in the United States is expected occur.
- Many people will get sick, but based on what is known about this virus, most people will not develop serious illness.
- Based on data out of China, where this virus first emerged, older adults and persons of all ages who have serious long-term health problems seem to be at higher risk for more serious COVID-19 illness.
  - It's important that people who are at higher risk of serious COVID-19 illness take special precautions to reduce their risk of getting sick and that the people around them take action to help protect those who are most vulnerable.
  - CDC has guidance for what people at higher risk should do at this time.
- All communities can take measures to reduce the spread of COVID-19. Everyone has a role to play in getting ready and staying healthy.

SITUATION UPDATE

- 1,215 reported cases of COVID-19 have been detected in Arizona, Arkansas, California, Colorado, Connecticut, Delaware, Florida, Georgia, Hawaii, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York (and New York City), North

AMERICAN OVERSIGHT

Carolina, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, and Wisconsin.
    - 102 of these cases occurred through close contact with another case.
    - 125 cases occurred in persons who had traveled to international areas with sustained (ongoing) transmission and among their close contacts.
    - 988 cases are still being investigated to determine the source of exposure.
- CDC has developed a map of the U.S. that shows affected states and how many COVID-19 cases they have reported.
- Because states are reporting their results directly and publicly, sometimes in near real-time, CDC case counts may be different from what states, local authorities, or media are reporting.
    - In the event of a discrepancy between case counts reported by state or local public health officials versus CDC-reported numbers, the numbers reported by states should be considered the most up to date.
- As of the evening of March 11, 81 state and local public health labs in 50 states and the District of Columbia have verified they are successfully using COVID-19 diagnostic tests.
- CDC has developed a map showing which states and territories have one or more laboratories that have successfully verified and are currently using COVID-19 diagnostic tests.
    - This list is provided by the Association of Public Health Laboratories (APHL).
    - The same page includes information on the number of COVID-19 specimens tested.
- As of the evening of March 11, 2020, CDC and local and state public health laboratories had tested a total of 13,624 specimens.
- CDC is reviewing and updating travel notices almost on a daily basis.
- U.S. citizens, residents, and their immediate family members who have been in China or Iran within in the past 14 days can enter the United States, but they are subject to health monitoring and possible quarantine for up to 14 days.
- On March 11, President Trump issued a proclamation that foreign nationals who have been in one or more of 26 European countries within the past 14 days cannot enter the United States for a period of 30 days.
- On March 11, CDC issued a:
    - Level 3 Travel Health Notice recommending travelers avoid all nonessential travel to most of Europe.
    - Global Level 2 Travel Health Notice recommending older adults and those who have chronic medical conditions consider postponing nonessential travel.
- On March 8, CDC recommended travelers, particularly those with underlying health issues, defer all cruise ship travel worldwide.

CONSIDERATIONS FOR SCHOOL CLOSURES

- There is a role for school closures in response to school-based cases of COVID-19:
    - For decontamination and contact tracing (few days of closure)
    - In response to significant absenteeism of staff and students (short to medium length, i.e., 2–4 weeks of closure)
    - As part of a larger community mitigation strategy for jurisdictions with substantial community spread (medium to long length, i.e., 4–8 weeks or more of closure)
- Available modeling data indicate that short- to medium-length closures early in the outbreak will not impact the spread of COVID-19 or health care measures (e.g., hospitalizations). There

AMERICAN OVERSIGHT

may be some impact of much longer closures (8 or more weeks) further into the outbreak when there is more community spread.
- The same model shows other mitigation efforts (e.g., handwashing, home isolation) have more impact on both spread of disease and health care measures.
- In other countries, places that closed schools (e.g., Hong Kong) have not had more success in reducing spread than those that did not (e.g., Singapore).
- In places where school closures are necessary, the anticipated academic and economic impacts and unintended impacts on disease outcomes must be planned for and mitigated. All of the following must be addressed:
    - Provision of academic support (e.g., tele-ed)
    - Alternatives for school-based meals and other services (e.g., behavioral and mental health services) for economically and physically vulnerable children
    - Support for families for whom telework and paid sick leave is not available
    - Continued protection for high risk individuals
- Special consideration must be given for healthcare workers so that school closures do not impact their ability to work.

PANDEMIC INFORMATION

- Pandemics happen when a disease emerges to infect people easily and spreads from person to person in an efficient and sustained way globally.
- This is the first pandemic known to be caused by the emergence of a new coronavirus.
- In the past century, there have been four pandemics caused by the emergence of novel influenza viruses.
    - Pandemic guidance developed in anticipation of an influenza pandemic is being repurposed and adapted for a COVID-19 pandemic.
- The federal government has been working closely with state, local, tribal, and territorial partners, as well as public health partners, to prepare for and respond to this public health threat for months.
- CDC has been implementing its pandemic preparedness and response plans, working on multiple fronts, including providing specific guidance on measures to prepare communities to respond to local spread of the virus that causes COVID-19.
- Pandemics of respiratory disease follow a certain progression outlined in a "Pandemic Intervals Framework."
    - Pandemics begin with an investigation phase, followed by recognition, initiation, and acceleration phases.
    - The peak of illnesses occurs at the end of the acceleration phase, which is followed by a deceleration phase, during which there is a decrease in illnesses.
- Different countries can be in different phases of the pandemic at any point in time and different parts of the same country can also be in different phases of a pandemic.
- Nationally, the United States is currently in the initiation phase, but states where community spread is occurring are in the acceleration phase.
- The duration and severity of each phase can vary depending on the characteristics of the virus and the public health response.
- Public health partners are encouraged to review their pandemic preparedness plans at this time.

AMERICAN OVERSIGHT

PEOPLE AT HIGHER RISK OF EXPOSURE/INFECTION

- The immediate risk of being exposed to this virus is still low for most Americans, but as the outbreak expands, that risk will increase. Cases of COVID-19 and instances of community spread are being reported in a growing number of states.
- Right now, people are at higher risk of exposure/infection include:
    - People in communities where ongoing community spread of the virus that causes COVID-19 has been reported are at elevated risk of exposure, with level of risk dependent on the location.
    - Healthcare workers caring for patients with COVID-19 are at elevated risk of exposure.
    - Close contacts of persons with COVID-19 also are at elevated risk of exposure.
    - Travelers returning from affected international locations where community spread is occurring also are at elevated risk of exposure, with level of risk dependent on where they traveled.

PEOPLE AT HIGHER RISK OF SERIOUS COVID-19 ILLNESS

- Early information out of China, where COVID-19 first started, shows that some people are at higher risk of getting very sick from this illness. This includes:
    - Older adults, with risk increasing by age
    - People who have serious chronic medical conditions like
        - Heart disease
        - Diabetes
        - Lung disease

WHAT YOU CAN DO

- Everyone can do their part to help respond to this emerging public health threat:
    - Individuals and communities should familiarize themselves with recommendations to protect themselves and their community from getting and spreading respiratory illnesses like COVID-19.
    - Older people and people with severe chronic conditions should take special precautions because they are at higher risk of developing serious COVID-19 illness.
    - If you are a healthcare provider, use your judgement to determine if a patient has signs and symptoms compatible with COVID-19 and whether the patient should be tested. Factors to consider, in addition to clinical symptoms, may include:
        - Does the patient have recent travel from an affected area?
        - Has the patient been in close contact with someone with COVID-19 or patients with pneumonia of unknown cause?
        - Does the patient reside in an area where there has been community spread of COVID-19?
    - If you are a healthcare provider or a public health responder caring for a COVID-19 patient, please take care of yourself and follow recommended infection control procedures.
    - If you are a close contact of someone with COVID-19 and develop symptoms of COVID-19, call your healthcare provider and tell them about your symptoms and your exposure. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.

AMERICAN OVERSIGHT

- If you are a resident in a community where there is ongoing spread of COVID-19 and you develop COVID-19 symptoms, call your healthcare provider and tell them about your symptoms. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.
- For people who are ill with COVID-19, but are not sick enough to be hospitalized, please follow CDC guidance on how to reduce the risk of spreading your illness to others. People who are mildly ill with COVID-19 are able to isolate at home during their illness.
- If you have been in China or another affected area or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus.

CDC ACTIONS

- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States to reduce the spread and the impact of this virus.
- CDC is operationalizing all of its pandemic preparedness and response plans, working on multiple fronts to meet these goals, including specific measures to prepare communities to respond to local transmission of the virus that causes COVID-19.
- CDC is aggressively responding to the global outbreak of COVID-19 and preparing for the potential of community spread in more parts of the United States.
- CDC's Action for Preparing Communities for Potential Spread of COVID-19 include:
    - Preparing first responders, healthcare providers, and health systems
    - Reinforcing state, territorial, and local public health readiness
    - Supporting communities, businesses, and schools

COMMUNITY BASED INTERVENTIONS (AKA COMMUNITY MITIGATION)

- Americans should be prepared for the possibility of a COVID-19 outbreak in their community. Everyone has a role to play.
- Currently, a vaccine is not available for COVID-19. Until a vaccine is developed, community-based interventions, such as school dismissals, event cancellations, social distancing, and plans to work remotely, can help slow the spread of coronavirus.
- Your local public health department and community partners have been preparing for an event like COVID-19 and have plans in place. Now is a good time for businesses, community and faith-based organizations, schools, and health-care systems to reexamine their preparedness plans to make sure they are ready.
- Strong community partnerships between local health departments, the health care sector, faith-based organizations, and other community partners are vital for this response, and will be necessary to prepare for and coordinate if an outbreak occurs.
    - Community-based interventions can be grouped in three categories:
        - Personal protective measures (e.g., voluntary home isolation of ill persons, voluntary home quarantine of exposed household members, covering

AMERICAN OVERSIGHT

nose/mouth when coughing or sneezing, hand hygiene, using face masks in community settings when ill)
        - Community measures aimed at increasing social distancing (e.g., school dismissals, social distancing in workplaces, postponing or cancelling mass gatherings)
        - Environmental measures (e.g., routine cleaning of frequently touched surfaces)
- CDC has recommendations to protect yourself and your community from getting and spreading respiratory illnesses like COVID-19.

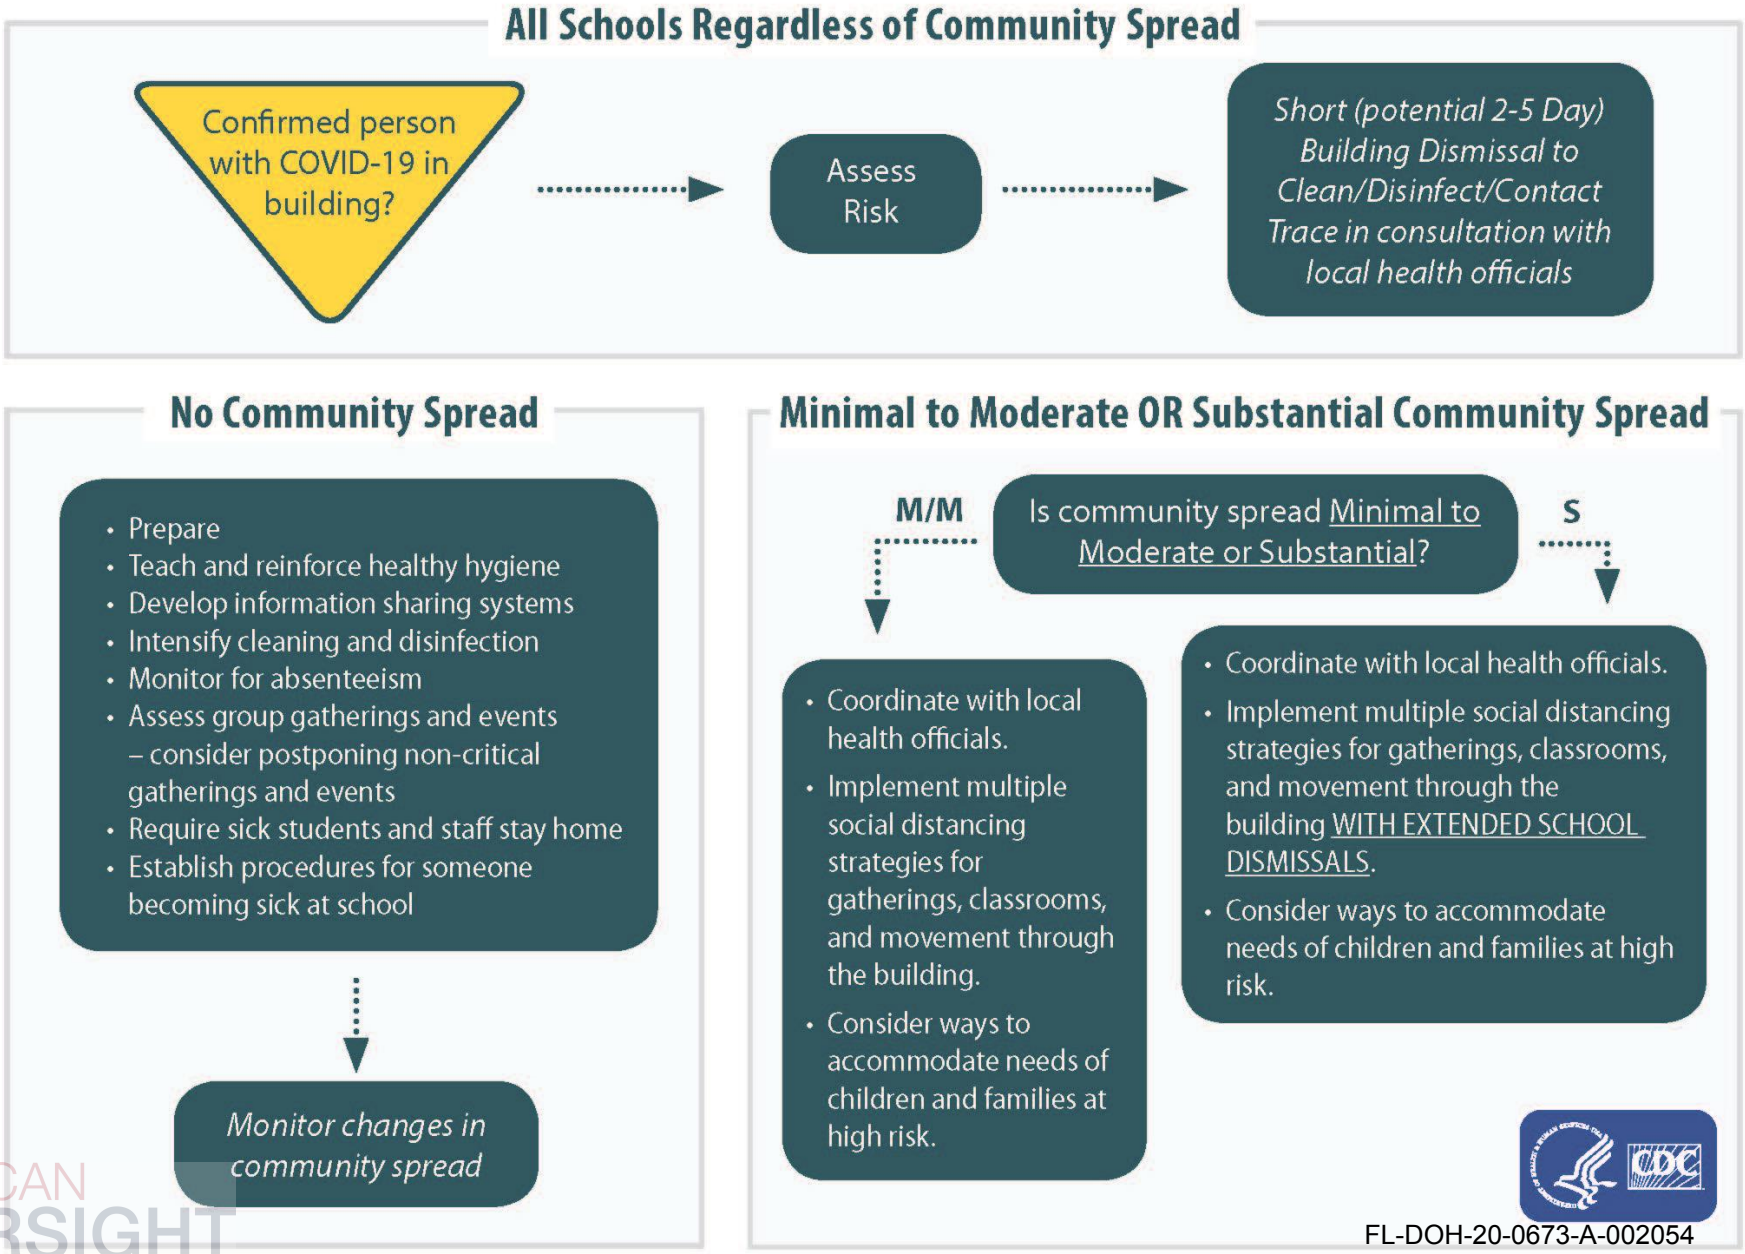
For more information please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

AMERICAN OVERSIGHT

Considerations for School Closure

Recommendations on school closure based on available science, reports from other countries and consultation with school health experts.

1. There is a role for school closure in response to school-based cases of COVID-19 for decontamination and contact tracing (few days of closure), in response to significant absenteeism of staff and students (short to medium length, i.e. 2-4 weeks of closure), or as part of a larger community mitigation strategy for jurisdictions with substantial community spread* (medium to long length, i.e. 4-8 weeks or more of closure).



2. Available modeling data indicate that early, short to medium closures do not impact the epi curve of COVID-19 or available health care measures (e.g., hospitalizations). There may be some impact of much longer closures (8 weeks, 20 weeks) further into community spread, but that modelling also shows that other mitigation efforts (e.g., handwashing, home isolation) have more impact on both spread of disease and health care measures. In other countries, those places who closed school (e.g., Hong Kong) have not had more success in reducing spread than those that did not (e.g., Singapore).

3. In places where school closures are necessary, the anticipated academic and economic impacts and unintended impacts on disease outcomes must be planned for and mitigated. Provision of academic support (e.g., tele-ed), alternatives for school-based meals as well as other services (e.g., behavioral and mental health services) for economically and physically vulnerable children, support for families for whom telework and paid sick leave is not available, ensuring that high risk individuals continue to be protected must all be addressed. Special consideration must be given for health care workers so that school closures do not impact their ability to work.

*Substantial community spread is defined as large scale community transmission, health care staffing significantly impacted, multiple cases within communal settings.

School Decision Tree

AMERICAN OVERSIGHT

Factors for Consideration for School Closure

Closing schools early in the spread of disease for a short time (e.g., 2 weeks) will be unlikely to stem the spread of disease or prevent impact on the health care system, while causing significant disruption for families, schools, and those who may be responding to COVID-19 outbreaks in health care settings. It may also increase impact on older adults who care for grandchildren. Waiting to enact school closures until at the correct time in the epidemic (e.g., later in the spread of disease) combined with other social distancing interventions allows for optimal impact despite disruption.

	Factors in favor of school closure	Factors against school closure	Further considerations
In response to school-based case (Less than 1 week closure)	• **Impact on disease** ○ Allows for decontamination ○ Allows time for epidemical evaluation and conact tracing; further action can be scaled based on epi investigation.	• **Impact on disease** ○ Social mixing may still occur outside of school with less ability to monitor, especially among older students.	• May occur frequently during a wide-spread outbreak
Short-term (2 weeks closure)	• **Impact on disease** ○ Allows time for further understanding of the local COVID-19 situation (e.g., community spread) ○ Increases social distancing amongst immediate school community. ○ Gives time for potentially exposed individuals to develop symptoms while not in school • **Impact on families** ○ Children may be less impacted by social isolation from their peers for shorter time frames • **Impact on school** ○ Schools are better prepared for short-term closures because they've been more likely to have experienced those (e.g., for weather)	• **Impact on disease** ○ Modeling data for other respiratory infections where children have higher disease impacts, suggests that early short term closures are not impactful in terms of overall transmission. ○ Social mixing may still occur outside of school with less ability to monitor, especially among older students. ○ Will increase risk to older adults or those with co-morbidities, as almost 40% of US grandparents provide childcare for grandchildren. School closures will likely increase this percentage. • **Impact on families** ○ Key services are interrupted for students (e.g., meals, other social,	• Disproportionate impact of children being out of school whose parents/family members are hourly and low-wage workers • Research from school staff tells us that schools find closures more acceptable when other events, gatherings, and facilities in the community are also closed or cancelled. • Concerns about household mixing of sick and well family members needs to be addressed • Consider non-closure social distancing first (e.g., staggering recess, cancelling assemblies and inter-school events.) • Economic impact if school staff are not paid during school closure must be considered.

AMERICAN OVERSIGHT

	○ Given current timing, some schools may be able to take advantage of spring break closures ○ Provides protection for older staff and students and staff with underlying medical conditions	physical health, and mental health services, after school programs) ○ Economic impact for families because of the costs of childcare and lost wages. There may be a loss of productivity even for parents who are able to telework. ○ Some families may not have capacity for students to participate in distance learning (e.g., no computers, internet access issues) even if provided by school. • **Impact on schools** ○ Potential academic impact because of the disruption to the continuity of learning • **Impact on health care** ○ Available health care workforce is decreased as HCW stay home with children.	
Medium-term (4 weeks closure)	• **Impact on disease** ○ Provides more protection for older staff and students and staff with underlying medical conditions • **Impact on schools** ○ Planned closures of longer periods may be easier for families to plan for than rolling closures with unexpected timing and duration, including possibly last-minute notice	• **Impact on disease** ○ Longer closures may result in more students congregating outside of school (e.g., other students' homes, shopping malls) ○ Will increase risk to older adults or those with co-morbidities, as almost 40% of US grandparents provide childcare for grandchildren. School closures will likely increase this percentage. • **Impact on families** ○ Students who rely on key services (e.g., meals, other social, physical health, and mental health services,	• Disproportionate impact of children being out of school whose parents/family members are hourly and low-wage workers • If a school closes for this length of time, schools must consider ways to continue key services • Research from school staff tells us that schools find closures more acceptable when other events, gatherings, and facilities in the community are also closed or cancelled. • Consider coupling with other social actions to mitigate risk of increased social mixing in other community areas

AMERICAN OVERSIGHT

		after school programs) are put at greater risk ○ Economic impact grows with length of closure; furthermore, this may exacerbate disparities among families at different SES levels (e.g., parents with lower wage jobs may lose jobs) ○ High school seniors likely to lose ability to participate in their prom, graduation etc. ○ Some families may not have capacity for students to participate in distance learning (e.g., no computers, internet access issues) even if provided by school. • **Impact on schools** ○ Significant impact on academic outcomes may occur. Losing one month of learning may prevent students from meeting grade level knowledge and skill expectations and may jeopardize schools' ability to meet standardized testing requirements ○ School staff may be differentially impacted (e.g., hourly workers may be less able to sustain longer closures) • **Impact on health care** ○ Available health care workforce is decreased as HCW stay home with children.	• Because closures are likely to increase anxiety among students, families, and community members, excellent messaging is needed along with the school closure. • Economic impact if school staff are not paid during school closure must be considered.
Long-term (8 weeks, 20 weeks closure)	• **Impact on disease** ○ Modeling data for other respiratory infections where children have	• **Impact on disease** ○ Longer closures may result in more students congregating outside of	• Disproportionate impact of children being out of school for hourly and low-wage workers (compared to salaried

AMERICAN OVERSIGHT

	higher disease impacts, suggests that longer closures are may have greater impact in terms of overall transmission. Provides substantial protection for older staff and students and staff with underlying medical conditions
	• **Impact on schools**
	  ○ Schools without distance learning may see closures of this length as reason to implement distance learning approaches they may not have previously had or used
		school (e.g., other students' homes, shopping malls)
		  ○ Will increase risk to older adults or those with co-morbidities, as almost 40% of US grandparents provide childcare for grandchildren. School closures will likely increase this percentage.
		• **Impact on families**
		  ○ Students who rely on key services (e.g., meals, other social, physical health, and mental health services, after school programs) are put at substantial risk
		  ○ Economic impact grows with length of closure; furthermore, this may exacerbate disparities among families at different SES levels (e.g., parents with lower wage jobs may lose jobs)
		  ○ Student engagement with schools and peers diminishes, which could increase anxiety and other mental health and emotional problems.
		  ○ High school seniors likely to lose ability to participate in their prom, graduation etc.
		• **Impact on schools**
		  ○ Significant impact on academic outcomes will likely occur; losing 2 months of learning is likely to prevent many students from meeting grade level knowledge and skill expectations and will jeopardize schools' ability to meet standardized testing requirements
			workers who may have more flexible leave and telework opportunities)
			• If a school closes for this length of time, schools must consider ways to continue key services
			• Research from school staff tells us that schools find closures more acceptable when other events, gatherings, and facilities in the community are also closed or cancelled.
			• Because closures are likely to increase anxiety among students, families, and community members, excellent messaging is needed along with the school closure.
			• Given current timing, 20 week closures may not impact schools much more substantially than 8 week closures. Many schools end for the year in late May; some continue until mid June.
			• A 20 week scenario could still have substantial impact on parents who need to find summer care for students. If schools are dismissed, one would expect summer camps might be cancelled as well
			• Economic impact if school staff are not paid during school closure must be considered.

AMERICAN OVERSIGHT

		○ Loss of educational progress, even having to add an extra semester or year to graduate or move up a grade ○ Staff within the schools may be differentially impacted (e.g., hourly workers may be less able to sustain longer closures) ○ Maintaining communication with school staff, families, and students becomes substantially more difficult as the school closure lengthens. • **Impact on health care** ○ Available health care workforce is decreased as HCW stay home with children.	

Points for further consideration, regardless of degree of spread or length of potential closure

- Clear rationale, decision-making and communication with all stakeholders is extremely important. Families need to know who is making decisions, what those decisions are and when school-based mitigation efforts are planned to start and end.
- While we have data that can contribute to decisions about when to dismiss schools, there is almost no available data on the right time to re-start schools. We would advise to plan for a length of time and then evaluate based on continued community spread.
- The relationship between state and local education agencies and state and local public health must be strong and communication must be clear and thorough.
- Critical academic infrastructure and service provision must be considered during school closure.

AMERICAN OVERSIGHT

OFFICE OF THE UNDER SECRETARY OF DEFENSE
4000 DEFENSE PENTAGON
WASHINGTON, D.C. 20301-4000

PERSONNEL AND
READINESS

MAR 1 1 2020

MEMORANDUM FOR CHIEF MANAGEMENT OFFICER OF THE DEPARTMENT OF DEFENSE
SECRETARIES OF THE MILITARY DEPARTMENTS
CHAIRMAN OF THE JOINT CHIEFS OF STAFF
UNDER SECRETARIES OF DEFENSE
CHIEF OF THE NATIONAL GUARD BUREAU
GENERAL COUNSEL OF THE DEPARTMENT OF DEFENSE
ASSISTANT SECRETARY OF DEFENSE FOR LEGISLATIVE AFFAIRS
ASSISTANT TO THE SECRETARY OF DEFENSE FOR PUBLIC AFFAIRS
DIRECTORS OF DEFENSE AGENCIES
DIRECTORS OF DOD FIELD ACTIVITIES

SUBJECT: Force Health Protection Guidance (Supplement 4) – Department of Defense Guidance for Personnel Traveling During the Novel Coronavirus Outbreak

This memorandum supplements requirements in DoD Instruction 6200.03 "Public Health Emergency Management (PHEM) Within the DoD," March 28, 2019, with respect to coronavirus disease 2019 (COVID-19). The COVID-19 outbreak continues to spread globally and as a result, the Centers for Disease Control and Prevention (CDC) is rapidly issuing Travel Health Notices (THNs) and guidance for persons with travel in countries or areas with COVID-19 transmission. CDC THNs tier these locations as Level 3 (Widespread sustained (ongoing) transmission), Level 2 (Sustained (ongoing) community transmission) and Level 1 (Risk of limited community transmission), with associated monitoring guidance for returning travelers. The CDC THNs are at: https://www.cdc.gov/coronavirus/2019-ncov/travelers/index.html. This guidance applies to all DoD Components, except that it does not apply to air crew of military aircraft.

All existing Novel Coronavirus Outbreak FHP guidance remains in effect and applies to all DoD Components, including the Reserves and National Guard, and, as appropriate, foreign military personnel who are under DoD authority. The FHP guidance for China travelers ("Force Health Protection Guidance (Supplement 1) – Department of Defense Guidance for Monitoring of Personnel Returning from China During the Novel Coronavirus Outbreak," dated February 7, 2020), remains in effect. FHP documents are at: https://www.defense.gov/Explore/Spotlight/Coronavirus. Individuals should continue to check the CDC COVID-19 website for additional updates at: https://www.cdc.gov/coronavirus/2019-ncov/index.html.

This document provides pre- and post-travel health guidance for all DoD travelers to enable mission assurance and Force Health Protection (FHP), utilizing the CDC THNs for DoD Component considerations. DoD Components may be more restrictive based on local risk assessment in consultation with public health authorities. Command location, local community transmission, risk to mission, and risk to force are all key considerations in DoD Component decision making.

AMERICAN OVERSIGHT

Actions for all DoD travelers

Actions prior to official travel:

- DoD Components shall incorporate CDC guidance into the full scope of planning for official travel, to include the following:
    - Consider the risk profile of the traveler (e.g., older individuals or those with underlying diseases). Limit travel to those individuals who are healthy, to the greatest extent possible. For DoD civilian personnel, these considerations must be consistent with the requirements of the Rehabilitation Act of 1973, as amended.
    - Coordinate with the receiving installation to ensure the post-travel requirements in this document can be implemented at that location.

Actions upon departure/exit screening:

- DoD Components should emphasize each individual's responsibility to avoid travel when sick.
- For travel on military aircraft, DoD Components should ensure exit screening is conducted at the point of embarkation. At a minimum, this should consist of a questionnaire[1] to assess risk of exposure, temperature check (fever is >100.4°F or 38°C per CDC), and visual check for signs and symptoms (i.e., feeling feverish, coughing or shortness of breath per CDC) of COVID-19. If the screening yields concerns, a secondary medical evaluation by a health professional should be conducted. DoD Components should also be prepared to appropriately manage a patient under investigation if such a determination is made, to include referral to the appropriate medical authority per CDC guidance found at: https://www.cdc.gov/coronavirus/2019-ncov/hcp/index.html.
- Travel on commercial air carriers may not include exit screening of travelers. Therefore, taking the appropriate action upon arrival is critical.

Actions for all Service members

Actions upon arrival from a CDC THN Level 3 or Level 2 location:

DoD Components should identify all Service members who travel or have traveled in the prior 14 days to, through, or from a CDC THN Level 3 or Level 2 country. This includes travel by military or commercial means, as well as private conveyance, and includes all forms of travel to include Permanent Change of Station, Temporary Duty, and leave. DoD Components should place these Service members under a 14-day restriction of movement (ROM). During the ROM (starting from the day of departure from the Level 3 or Level 2 country):

[1] Guidance to support questionnaire development is at https://www.cdc.gov/coronavirus/2019-ncov/php/risk-assessment.html

AMERICAN OVERSIGHT

- Service members should be restricted to their residence or other appropriate domicile for 14 days and limit close contact (within 6 feet or 2 meters) with others during this 14-day period. Immediate supervisors will not require Service members to report to their duty location or otherwise disregard the ROM.

- Service members should self-monitor by taking their temperatures twice a day to check for fever, and remain alert for cough or difficulty breathing. If they feel feverish or develop a fever (>100.4°F or 38°C per CDC), cough, or difficulty breathing during the self-monitoring period, they should self-isolate, limit contact with others, notify their supervisor or chain of command, and seek advice by telephone from the appropriate healthcare provider to determine whether medical evaluation is needed.

- For any in-person assessments of Service members (including asymptomatic individuals), medical personnel should apply CDC guidance to include wearing appropriate personal protective equipment (https://www.cdc.gov/coronavirus/2019-ncov/infection-control/control-recommendations.html).

- Service members living in open-bay settings, or rooms with shared bathrooms and/or kitchen facilities, should be placed in separate lodging to span the 14-day ROM period. The DoD Component to which the Service member is assigned will arrange and fund the separate lodging if needed.

- Service members should separate themselves from other people in the home or dwelling if residing with roommates or family members and avoid sharing personal items.

- Service members should not travel, visit public or crowded areas, or use public transportation and should avoid interaction with pets or other animals.

- Medical evaluation and care should be immediately arranged if the Service member displays fever or symptoms consistent with COVID-19, as per CDC guidance (https://www.cdc.gov/coronavirus/2019-ncov/hcp/index.html).

    - The Service member should call ahead before going to a medical treatment facility, informing medical staff of his/her symptoms and travel history.

    - Medical staff should follow CDC guidance when assessing individuals displaying fever and symptoms consistent with COVID-19.

    - DoD Components should appropriately report an individual if identified as a patient under investigation, per previously published Under Secretary of Defense for Personnel and Readiness guidance, "Force Health Protection Guidance for the Novel Coronavirus Outbreak," dated January 30, 2020.

AMERICAN OVERSIGHT

Actions upon arrival from a non-CDC THN Level 2 or Level 3 CONUS or OCONUS location:

DoD Components should identify and track all Service members who travel or have a history of travel in the prior 14 days to, through, or from a non-CDC THN Level 2 or Level 3 CONUS or OCONUS location. This includes travel by military or commercial means as well as private conveyance and includes all forms of travel to include Permanent Change of Station, Temporary Duty, and leave. DoD Components should ensure that these Service members take the following actions for the next 14 days:

- Implement self-observation, i.e., remain alert for fever, cough, or difficulty breathing.
- To the extent possible, implement social distancing, e.g., remain out of congregate settings, avoid mass gatherings, and maintain 6 feet or 2 meter distance from others when possible.
- Immediately self-isolate, limit contact with others, and seek advice by telephone from the appropriate healthcare provider to determine whether medical evaluation is required, if individuals feel feverish or develop measured fever, cough, or difficulty breathing.

Actions for DoD civilian employees, contractor personnel, and family members

DoD strongly recommends that DoD civilian employees, contractor personnel, and family members who travel to, through, and from countries with a CDC THN for COVID-19 follow this DoD guidance, which is more stringent than CDC guidance. DoD Components should restrict DoD workplace access for 14 days for DoD civilian employees and contractor personnel whose travel has included THN Level 2 and Level 3 locations. If these civilian employees and contractor personnel feel feverish or develop a fever, cough, or difficulty breathing, they should notify their supervisor or chain of command. For all other travel, DoD Components will encourage self-observation and accommodation of social distancing. To restrict access from the DoD workplace and maximize telework options, DoD Components shall implement the Under Secretary of Defense for Personnel and Readiness memorandum, "Civilian Personnel Guidance for DoD Components in Responding to Coronavirus Disease 2019," dated March 8, 2020. For contractor personnel, DoD Components should implement measures in consultation with the appropriate contracting office.

This guidance is effective March 13, 2020. My point of contact is COL Jennifer M. Kishimori, who may be reached at (703) 681-8179 or jennifer.m.kishimori.mil@mail.mil.

U.S. Department of Health and Human Services

CDC works 24/7protecting America's health, safety and security. Whether diseases start at home or abroad, are curable or preventable, chronic or acute, or from human activity or deliberate attack, CDC responds to America's most pressing health threats. CDC is headquartered in Atlanta and has experts located throughout the United States and the world.

Kind Regards,

State Coordination Task Force

(Sent by BCC to PHEP directors, state epidemiologists, state health officials, public health laboratory directors, BCHC, and national and federal partners)

Factors for Consideration for School Closure

Closing schools early in the spread of disease for a short time (e.g., 2 weeks) will be unlikely to stem the spread of disease or prevent impact on the health care system, while causing significant disruption for families, schools, and those who may be responding to COVID-19 outbreaks in health care settings. It may also increase impact on older adults who care for grandchildren. Waiting to enact school closures until at the correct time in the epidemic (e.g., later in the spread of disease) combined with other social distancing interventions allows for optimal impact despite disruption.

	Factors in favor of school closure	Factors against school closure	Further considerations
In response to school-based case (Less than 1 week closure)	• **Impact on disease** ○ Allows for decontamination ○ Allows time for epidemical evaluation and contact tracing; further action can be scaled based on epi investigation.	• **Impact on disease** ○ Social mixing may still occur outside of school with less ability to monitor, especially among older students.	• May occur frequently during a wide-spread outbreak
Short-term (2 weeks closure)	• **Impact on disease** ○ Allows time for further understanding of the local COVID-19 situation (e.g., community spread) ○ Increases social distancing amongst immediate school community. ○ Gives time for potentially exposed individuals to develop symptoms while not in school • **Impact on families** ○ Children may be less impacted by social isolation from their peers for shorter time frames • **Impact on school** ○ Schools are better prepared for short-term closures because they've been more likely to have experienced those (e.g., for weather) ○ Given current timing, some schools may be able to take advantage of spring break closures	• **Impact on disease** ○ Modeling data for other respiratory infections where children have higher disease impacts, suggests that early short-term closures are not impactful in terms of overall transmission. ○ Social mixing may still occur outside of school with less ability to monitor, especially among older students. ○ Will increase risk to older adults or those with co-morbidities, as almost 40% of US grandparents provide childcare for grandchildren. School closures will likely increase this percentage. • **Impact on families** ○ Key services are interrupted for students (e.g., meals, other social,	• Disproportionate impact of children being out of school whose parents/family members are hourly and low-wage workers • Research from school staff tells us that schools find closures more acceptable when other events, gatherings, and facilities in the community are also closed or cancelled. • Concerns about household mixing of sick and well family members needs to be addressed • Consider non-closure social distancing first (e.g., staggering recess, cancelling assemblies and inter-school events.) • Economic impact if school staff are not paid during school closure must be considered.

AMERICAN OVERSIGHT

	○ Provides protection for older staff and students and staff with underlying medical conditions	physical health, and mental health services, after school programs) ○ Economic impact for families because of the costs of childcare and lost wages. There may be a loss of productivity even for parents who are able to telework. ○ Some families may not have capacity for students to participate in distance learning (e.g., no computers, internet access issues) even if provided by school. • **Impact on schools** ○ Potential academic impact because of the disruption to the continuity of learning • **Impact on health care** ○ Available health care workforce is decreased as HCW stay home with children.	
Medium-term (4 weeks closure)	• **Impact on disease** ○ Provides more protection for older staff and students and staff with underlying medical conditions • **Impact on schools** ○ Planned closures of longer periods may be easier for families to plan for than rolling closures with unexpected timing and duration, including possibly last-minute notice	• **Impact on disease** ○ Longer closures may result in more students congregating outside of school (e.g., other students' homes, shopping malls) ○ Will increase risk to older adults or those with co-morbidities, as almost 40% of US grandparents provide childcare for grandchildren. School closures will likely increase this percentage. • **Impact on families** ○ Students who rely on key services (e.g., meals, other social, physical health, and mental health services, after school programs) are put at greater risk	• Disproportionate impact of children being out of school whose parents/family members are hourly and low-wage workers • If a school closes for this length of time, schools must consider ways to continue key services • Research from school staff tells us that schools find closures more acceptable when other events, gatherings, and facilities in the community are also closed or cancelled. • Consider coupling with other social actions to mitigate risk of increased social mixing in other community areas

AMERICAN OVERSIGHT

		○ Economic impact grows with length of closure; furthermore, this may exacerbate disparities among families at different SES levels (e.g., parents with lower wage jobs may lose jobs) ○ High school seniors likely to lose ability to participate in their prom, graduation etc. ○ Some families may not have capacity for students to participate in distance learning (e.g., no computers, internet access issues) even if provided by school. • **Impact on schools** ○ Significant impact on academic outcomes may occur. Losing one month of learning may prevent students from meeting grade level knowledge and skill expectations and may jeopardize schools' ability to meet standardized testing requirements ○ School staff may be differentially impacted (e.g., hourly workers may be less able to sustain longer closures) • **Impact on health care** ○ Available health care workforce is decreased as HCW stay home with children.	• Because closures are likely to increase anxiety among students, families, and community members, excellent messaging is needed along with the school closure. • Economic impact if school staff are not paid during school closure must be considered.
Long-term (8 weeks, 20 weeks closure)	• **Impact on disease** ○ Modeling data for other respiratory infections where children have higher disease impacts, suggests that longer closures are may have greater impact in terms of overall	• **Impact on disease** ○ Longer closures may result in more students congregating outside of school (e.g., other students' homes, shopping malls)	• Disproportionate impact of children being out of school for hourly and low-wage workers (compared to salaried workers who may have more flexible leave and telework opportunities)

AMERICAN OVERSIGHT

	transmission. Provides substantial protection for older staff and students and staff with underlying medical conditions
	• **Impact on schools**
	  ○ Schools without distance learning may see closures of this length as reason to implement distance learning approaches they may not have previously had or used
		○ Will increase risk to older adults or those with co-morbidities, as almost 40% of US grandparents provide childcare for grandchildren. School closures will likely increase this percentage.
		• **Impact on families**
		  ○ Students who rely on key services (e.g., meals, other social, physical health, and mental health services, after school programs) are put at substantial risk
		  ○ Economic impact grows with length of closure; furthermore, this may exacerbate disparities among families at different SES levels (e.g., parents with lower wage jobs may lose jobs)
		  ○ Student engagement with schools and peers diminishes, which could increase anxiety and other mental health and emotional problems.
		  ○ High school seniors likely to lose ability to participate in their prom, graduation etc.
		• **Impact on schools**
		  ○ Significant impact on academic outcomes will likely occur; losing 2 months of learning is likely to prevent many students from meeting grade level knowledge and skill expectations and will jeopardize schools' ability to meet standardized testing requirements
		  ○ Loss of educational progress, even having to add an extra semester or
			• If a school closes for this length of time, schools must consider ways to continue key services
			• Research from school staff tells us that schools find closures more acceptable when other events, gatherings, and facilities in the community are also closed or cancelled.
			• Because closures are likely to increase anxiety among students, families, and community members, excellent messaging is needed along with the school closure.
			• Given current timing, 20-week closures may not impact schools much more substantially than 8 week closures. Many schools end for the year in late May; some continue until mid-June.
			• A 20-week scenario could still have substantial impact on parents who need to find summer care for students. If schools are dismissed, one would expect summer camps might be cancelled as well
			• Economic impact if school staff are not paid during school closure must be considered.

AMERICAN OVERSIGHT

		year to graduate or move up a grade ○ Staff within the schools may be differentially impacted (e.g., hourly workers may be less able to sustain longer closures) ○ Maintaining communication with school staff, families, and students becomes substantially more difficult as the school closure lengthens. • **Impact on health care** ○ Available health care workforce is decreased as HCW stay home with children.	

Points for further consideration, regardless of degree of spread or length of potential closure

- Clear rationale, decision-making and communication with all stakeholders is extremely important. Families need to know who is making decisions, what those decisions are and when school-based mitigation efforts are planned to start and end.
- While we have data that can contribute to decisions about when to dismiss schools, there is almost no available data on the right time to re-start schools. We would advise to plan for a length of time and then evaluate based on continued community spread.
- The relationship between state and local education agencies and state and local public health must be strong and communication must be clear and thorough.
- Critical academic infrastructure and service provision must be considered during school closure.

U.S. Department of Health and Human Services

CDC works 24/7protecting America's health, safety and security. Whether diseases start at home or abroad, are curable or preventable, chronic or acute, or from human activity or deliberate attack, CDC responds to America's most pressing health threats. CDC is headquartered in Atlanta and has experts located throughout the United States and the world.

Kind Regards,

State Coordination Task Force

(Sent by BCC to PHEP directors, state epidemiologists, state health officials, public health laboratory directors, BCHC, and national and federal partners)

AMERICAN OVERSIGHT

Considerations for School Closure

Recommendations on school closure based on available science, reports from other countries and consultation with school health experts.

1. There is a role for school closure in response to school-based cases of COVID-19 for decontamination and contact tracing (few days of closure), in response to significant absenteeism of staff and students (short to medium length, i.e. 2-4 weeks of closure), or as part of a larger community mitigation strategy for jurisdictions with substantial community spread* (medium to long length, i.e. 4-8 weeks or more of closure).

2. Available modeling data indicate that early, short to medium closures do not impact the epi curve of COVID-19 or available health care measures (e.g., hospitalizations). There may be some impact of much longer closures (8 weeks, 20 weeks) further into community spread, but that modelling also shows that other mitigation efforts (e.g., handwashing, home isolation) have more impact on both spread of disease and health care measures. In other countries, those places who closed school (e.g., Hong Kong) have not had more success in reducing spread than those that did not (e.g., Singapore).

3. In places where school closures are necessary, the anticipated academic and economic impacts and unintended impacts on disease outcomes must be planned for and mitigated. Provision of academic support (e.g., tele-ed), alternatives for school-based meals as well as other services (e.g., behavioral and mental health services) for economically and physically vulnerable children, support for families for whom telework and paid sick leave is not available, ensuring that high risk individuals continue to be protected must all be addressed. Special consideration must be given for health care workers so that school closures do not impact their ability to work.

*Substantial community spread is defined as large scale community transmission, health care staffing significantly impacted, multiple cases within communal settings.

AMERICAN OVERSIGHT

School Decision Tree

All Schools Regardless of Community Spread

Confirmed person with COVID-19 in building?

- Implement multiple social distancing strategies for gatherings, classrooms, and movement through the building WITH EXTENDED SCHOOL DISMISSALS.
- Consider ways to accommodate needs of children and families at high risk.

AMERICAN OVERSIGHT

Factors for Consideration for School Closure

Closing schools early in the spread of disease for a short time (e.g., 2 weeks) will be unlikely to stem the spread of disease or prevent impact on the health care system, while causing significant disruption for families, schools, and those who may be responding to COVID-19 outbreaks in health care settings. It may also increase impact on older adults who care for grandchildren. Waiting to enact school closures until at the correct time in the epidemic (e.g., later in the spread of disease) combined with other social distancing interventions allows for optimal impact despite disruption.

	Factors in favor of school closure	Factors against school closure	Further considerations
In response to school-based case (Less than 1 week closure)	• **Impact on disease** ○ Allows for decontamination ○ Allows time for epidemical evaluation and contact tracing; further action can be scaled based on epi investigation.	• **Impact on disease** ○ Social mixing may still occur outside of school with less ability to monitor, especially among older students.	• May occur frequently during a wide-spread outbreak
Short-term (2 weeks closure)	• **Impact on disease** ○ Allows time for further understanding of the local COVID-19 situation (e.g., community spread) ○ Increases social distancing amongst immediate school community. ○ Gives time for potentially exposed individuals to develop symptoms while not in school • **Impact on families** ○ Children may be less impacted by social isolation from their peers for shorter time frames • **Impact on school** ○ Schools are better prepared for short-term closures because they've been more likely to have experienced those (e.g., for weather) ○ Given current timing, some schools may be able to take advantage of spring break closures	• **Impact on disease** ○ Modeling data for other respiratory infections where children have higher disease impacts, suggests that early short-term closures are not impactful in terms of overall transmission. ○ Social mixing may still occur outside of school with less ability to monitor, especially among older students. ○ Will increase risk to older adults or those with co-morbidities, as almost 40% of US grandparents provide childcare for grandchildren. School closures will likely increase this percentage. • **Impact on families** ○ Key services are interrupted for students (e.g., meals, other social,	• Disproportionate impact of children being out of school whose parents/family members are hourly and low-wage workers • Research from school staff tells us that schools find closures more acceptable when other events, gatherings, and facilities in the community are also closed or cancelled. • Concerns about household mixing of sick and well family members needs to be addressed • Consider non-closure social distancing first (e.g., staggering recess, cancelling assemblies and inter-school events.) • Economic impact if school staff are not paid during school closure must be considered.

AMERICAN OVERSIGHT

	○ Provides protection for older staff and students and staff with underlying medical conditions	physical health, and mental health services, after school programs) ○ Economic impact for families because of the costs of childcare and lost wages. There may be a loss of productivity even for parents who are able to telework. ○ Some families may not have capacity for students to participate in distance learning (e.g., no computers, internet access issues) even if provided by school. • **Impact on schools** ○ Potential academic impact because of the disruption to the continuity of learning • **Impact on health care** ○ Available health care workforce is decreased as HCW stay home with children.	
Medium-term (4 weeks closure)	• **Impact on disease** ○ Provides more protection for older staff and students and staff with underlying medical conditions • **Impact on schools** ○ Planned closures of longer periods may be easier for families to plan for than rolling closures with unexpected timing and duration, including possibly last-minute notice	• **Impact on disease** ○ Longer closures may result in more students congregating outside of school (e.g., other students' homes, shopping malls) ○ Will increase risk to older adults or those with co-morbidities, as almost 40% of US grandparents provide childcare for grandchildren. School closures will likely increase this percentage. • **Impact on families** ○ Students who rely on key services (e.g., meals, other social, physical health, and mental health services, after school programs) are put at greater risk	• Disproportionate impact of children being out of school whose parents/family members are hourly and low-wage workers • If a school closes for this length of time, schools must consider ways to continue key services • Research from school staff tells us that schools find closures more acceptable when other events, gatherings, and facilities in the community are also closed or cancelled. • Consider coupling with other social actions to mitigate risk of increased social mixing in other community areas

AMERICAN OVERSIGHT

		○ Economic impact grows with length of closure; furthermore, this may exacerbate disparities among families at different SES levels (e.g., parents with lower wage jobs may lose jobs) ○ High school seniors likely to lose ability to participate in their prom, graduation etc. ○ Some families may not have capacity for students to participate in distance learning (e.g., no computers, internet access issues) even if provided by school. • **Impact on schools** ○ Significant impact on academic outcomes may occur. Losing one month of learning may prevent students from meeting grade level knowledge and skill expectations and may jeopardize schools' ability to meet standardized testing requirements ○ School staff may be differentially impacted (e.g., hourly workers may be less able to sustain longer closures) • **Impact on health care** ○ Available health care workforce is decreased as HCW stay home with children.	• Because closures are likely to increase anxiety among students, families, and community members, excellent messaging is needed along with the school closure. • Economic impact if school staff are not paid during school closure must be considered.
Long-term (8 weeks, 20 weeks closure)	• **Impact on disease** ○ Modeling data for other respiratory infections where children have higher disease impacts, suggests that longer closures are may have greater impact in terms of overall	• **Impact on disease** ○ Longer closures may result in more students congregating outside of school (e.g., other students' homes, shopping malls)	• Disproportionate impact of children being out of school for hourly and low-wage workers (compared to salaried workers who may have more flexible leave and telework opportunities)

AMERICAN OVERSIGHT

To:	State and Local Readiness (CDC)
Subject:	3-14-20 OSHA Enforcement Memo on Respirator Annual Fit Testing
Date:	Sunday, March 15, 2020 7:50:08 AM

Dear Colleagues:

Yesterday the Occupational Safety and Health Administration (OSHA) released **Temporary Enforcement Guidance - Healthcare Respiratory Protection Annual Fit-Testing for N95 Filtering Facepieces During the COVID-19 Outbreak**. The guidance can be found here: https://www.osha.gov/memos/2020-03-14/temporary-enforcement-guidance-healthcare-respiratory-protection-annual-fit

A fit test is required for anyone wearing a respirator to protect against COVID-19. Annual fit test can be temporarily suspended if employee has already been fit tested to that respirator.

See relevant bullets from memo below:

- Perform initial fit tests for each HCP with the same model, style, and size respirator that the worker will be required to wear for protection against COVID-19 (initial fit testing is essential to determine if the respirator properly fits the worker and is capable of providing the expected level of protection);

- Inform workers that the employer is temporarily suspending the annual fit testing of N95 filtering facepiece respirators to preserve and prioritize the supply of respirators for use in situations where they are required to be worn.

Kind Regards,

State Coordination Task Force

(Sent by BCC to PHEP directors, state epidemiologists, state health officials, public health laboratory directors, BCHC, and national and federal partners)

State Coordination Task Force

(Sent by BCC to PHEP directors, state epidemiologists, state health officials, public health laboratory directors, BCHC, and national and federal partners)

AMERICAN OVERSIGHT

From:	State and Local Readiness (CDC)
To:	State and Local Readiness (CDC)
Subject:	3-14-20 OSHA Enforcement Memo on Respirator Annual Fit Testing
Date:	Sunday, March 15, 2020 7:47:10 AM
Importance:	High

Dear Colleagues:

Yesterday the Occupational Safety and Health Administration (OSHA) released **Temporary Enforcement Guidance - Healthcare Respiratory Protection Annual Fit-Testing for N95 Filtering Facepieces During the COVID-19 Outbreak**. The guidance can be found here: https://www.osha.gov/memos/2020-03-14/temporary-enforcement-guidance-healthcare-respiratory-protection-annual-fit

A fit test is required for anyone wearing a respirator to protect against COVID-19. Annual fit test can be temporarily suspended if employee has already been fit tested to that respirator.

See relevant bullets from memo below:

- Perform initial fit tests for each HCP with the same model, style, and size respirator that the worker will be required to wear for protection against COVID-19 (initial fit testing is essential to determine if the respirator properly fits the worker and is capable of providing the expected level of protection);

- Inform workers that the employer is temporarily suspending the annual fit testing of N95 filtering facepiece respirators to preserve and prioritize the supply of respirators for use in situations where they are required to be worn.

Kind Regards,

State Coordination Task Force

(Sent by BCC to PHEP directors, state epidemiologists, state health officials, public health laboratory directors, BCHC, and national and federal partners)

Subject:	3-17-20 CDC Weekly Key Messages, Daily Key Points, and Links to Updated COVID-19 Guidance
Date:	Wednesday, March 18, 2020 8:28:36 AM
Attachments:	CDC_COVID-19_Daily Key Points__3.17.2020_FINAL.pdf CDC_COVID-19 Weekly Key Messages__3.17.20_FINAL.pdf
Importance:	High

Dear Colleagues:

Attached please find the CDC COVID-19 weekly key messages (Week of 3/8) and CDC COVID-19 Key Points for Tuesday, March 17, 2020. Please feel free to share with your staff and other partners.

In addition, The CDC COVID-19 Website has been updated with several new/updated interim guidance documents. Click the links below to find the guidance.

- Updated **home isolation guidance**
- Updated information on when to end isolation on **What to do it you are sick**
- New Guidance – **Criteria for Return to Work for Healthcare Personnel with Confirmed or Suspected (COVID-19)**
- New Guidance – **Ending home isolation for people who are immunocompromised**

Kind Regards,

State Coordination Task Force

(Sent by BCC to PHEP directors, state epidemiologists, state health officials, public health laboratory directors, BCHC, and national and federal partners)

CORONAVIRUS DISEASE 2019 (COVID-19) NAMING

- The International Committee on Taxonomy of Viruses named the novel coronavirus causing an outbreak of respiratory illness that was first detected in Wuhan, Hubei Province, China, Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-CoV-2).
    - Due to potential for confusion with SARS-CoV, where possible, public communications will use “the virus that causes COVID-19.”
- On February 11, 2020, the World Health Organization (WHO) named the disease caused by this virus Coronavirus Disease 2019 (COVID-19).
    - **Disease name:** COVID-19

OUTBREAK SUMMARY

- There is an expanding outbreak of COVID-19 caused by a novel (new) coronavirus.

AMERICAN OVERSIGHT

    - The outbreak began in China but is spreading worldwide and is now considered a pandemic.
- Initially, many of the patients reportedly had some link to a large seafood and animal market, suggesting animal-to-person spread. Since then, sustained (ongoing) person-to-person spread in the community is occurring in some international locations.
- The newly emerged COVID-19 is a respiratory disease that seems to be spreading much like flu. It can spread from person-to-person.
- The new virus can cause illness varying from mild to severe, including potentially resulting in death.
- Outbreaks like this — when a new virus has emerged to infect people and spread between people — are especially concerning.

International

- Global case numbers are reported by WHO in their COVID-19 situation reports.
    - As of **March 16, more than 167,511** cases have been identified worldwide. More than **86,434** of these cases have occurred outside of China.
- On January 30, WHO declared this outbreak a Public Health Emergency of International Concern (PHEIC). A PHEIC is declared if an event poses a public health threat to other nations through the spread of disease and potentially requires a coordinated international response.
- On March 11, 2020, WHO announced that the outbreak of COVID-19 can be characterized as a pandemic.

Domestic

- On January 31, Health and Human Services Secretary Alex M. Azar II declared a public health emergency for the United States to aid the nation's healthcare community in responding to COVID-19.
- This is a very serious public health threat and the federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The goal of the ongoing US public health response is to minimize introductions of this virus, detect new cases quickly, and reduce community spread of this new coronavirus in the US.
- As the virus continues to spread internationally and in the United States, it becomes harder and harder contain its spread.
- What is currently known about the potential cases of community spread has raised the level of concern about the immediate threat for COVID-19 for certain communities.
- The coming days and weeks are likely to bring more confirmed cases of COVID-19 in the United States and globally, but strong public health measures now may blunt the impact of the virus in the United States.
- Pandemics of respiratory disease follow a certain progression outlined in the Pandemic Intervals Framework, part of the National Pandemic Strategy.
    - Pandemics begin with an investigation phase, followed by recognition, initiation, and acceleration phases.

AMERICAN OVERSIGHT

    - The peak of illnesses occurs at the end of the acceleration phase, which is followed by a deceleration phase, during which there is a decrease in illnesses.
    - Different countries can be in different phases of the pandemic at any point in time and different parts of the same country can also be in different phases of a pandemic.
    - Nationally, the United States is currently in the initiation phase, but states where community spread is occurring are in the acceleration phase.
    - The duration and severity of each phase can vary depending on the characteristics of the virus and the public health response.
- Public health partners are encouraged to review their pandemic preparedness plans at this time. Selected pandemic preparedness materials are available online.
- On March 13, the President of the United States declared the COVID-19 outbreak a national emergency.
- On March 16, the White House announced a program called "15 Days to Slow the Spread." This is a nationwide effort to slow the spread of COVID-19 through the implementation of social distancing at all levels of society.

U.S. OUTBREAK STATISTICS

Cases in the United States as of **March 16, 2020**:

- **Travel-related: 205**
- **Close contact: 214**
- **Under investigation: 3,068**
- **Total cases: 3,487**
- **Deaths: 68**
- **Jurisdictions reporting cases: 53 (49 states and the District of Columbia)**

For global cases, please see the WHO daily situation reports.

SITUATION IN THE U.S.

- Different parts of the country are seeing different levels of COVID-19 activity. The United States nationally is currently in the initiation phase, but states where community spread is occurring are in the acceleration phase. The duration and severity of each phase can vary depending on the characteristics of the virus and the public health response.
- CDC and state and local public health laboratories are testing for the virus that causes COVID-19.
- More and more states are reporting cases of COVID-19 to CDC.
- U.S. COVID-19 cases include:
    - Imported cases in travelers
    - Cases among close contacts of a known case
    - Community-acquired cases where the source of the infection is unknown.
- Three U.S. states are experiencing sustained community spread: Washington, California, and New York.

CLUSTER IN WASHINGTON STATE

- On February 29, CDC and public health officials in the state of Washington reported three hospitalized patients who have tested presumptive-positive for the virus that causes COVID-19.

AMERICAN OVERSIGHT

- One of the patients died and was the first reported death in the United States from COVID-19.
- Two of the patients are from a long-term care facility where one is a healthcare worker.
    - This was the first reported case in a healthcare worker.
- Additional residents and staff of the long-term care facility who have not yet been tested for COVID-19 are reportedly either ill with respiratory symptoms or hospitalized with pneumonia of unknown cause.
- The patient who died was being treated in the same hospital as one of the other presumptive positive cases, but was not a resident of the long-term care facility.
- While there is an ongoing investigation, the source of these infections is currently unknown.
- Circumstances suggest person-to-person spread, including in the long-term care facility.
- CDC has deployed a team to Washington to support the ongoing investigation to find and identify how the patients were exposed and do extensive contact tracing of people who were exposed or might have been exposed to the patients.
- CDC infection control experts are assessing the risk of additional healthcare worker exposures and carefully reviewing infection control practices within the facility to protect residents and healthcare workers from further spread of COVID-19.
    - The general strategies CDC recommends to prevent the spread of COVID-19 in long-term care facilities (LTCF) are the same strategies these facilities use every day to detect and prevent the spread of other respiratory viruses like influenza. View Strategies to Prevent the Spread of COVID-19 in LTCF for more information.
    - All healthcare facilities can take steps now to prepare for COVID-19 and protect both their patients and staff.

CORONAVIRUS BACKGROUND

- Coronaviruses are a group of viruses that have a halo or crown-like (corona) appearance when viewed under a microscope. They are common in many different species of animals, including camels, cattle, cats, and bats.
- It is rare for animal coronaviruses to become capable of infecting humans and then spreading between people.
    - Severe acute respiratory syndrome (SARS-CoV) and Middle East respiratory syndrome (MERS-CoV) are examples of coronaviruses that originated in animals and spread to people.
    - That is what is suspected happened with the virus that causes the current outbreak of COVID-19.
- Human coronaviruses are a common cause of mild to moderate upper-respiratory illness. But three coronaviruses have emerged to cause more severe illness: Severe Acute Respiratory Syndrome (SARS-CoV), Middle East Respiratory Syndrome (MERS-CoV), and now the virus that causes COVID-19.
    - At this time, there is no evidence that companion animals, including pets, can spread COVID-19. CDC has not received any reports of pets or other animals becoming sick with COVID-19.
    - There is no reason to think that any animals, including pets, in the United States might be a source of infection with this new coronavirus.

AMERICAN OVERSIGHT

- On February 28, the Hong Kong Agriculture, Fisheries and Conservation Department (AFCD) reported a pet dog had tested "weak positive" to COVID-19 through nose and mouth samples. The dog had contact with a person infected with COVID-19.
- CDC is working with human and animal health partners to monitor this situation and will continue to provide updates as information becomes available.
- It's important to remember that dogs have their own coronaviruses, which cannot spread to people.
    - *AFCD official report available*

TRANSMISSION

- Much is unknown about how the new coronavirus that causes COVID-19 spreads. Current knowledge is largely based on what is known about similar coronaviruses.
- Most often, person-to-person spread is thought to happen among people in close contact (about 6 feet) with each other.
- Person-to-person spread is thought to occur mainly through respiratory droplets produced when an infected person coughs or sneezes, similar to how influenza and other respiratory pathogens spread. These droplets can land in the mouths or noses of people who are nearby or possibly be inhaled into the lungs.
- How easily a virus spreads person-to-person can vary. Some viruses are highly contagious (like measles), while other viruses are less so.
- It may be possible that a person can get COVID-19 by touching a surface or object that has the virus on it and then touching their own mouth, nose, or possibly their eyes, but this is not thought to be the main way the virus spreads.
- Typically, with most respiratory viruses, people are thought to be most contagious when they are most symptomatic (sickest).
- Mother-to-child transmission during pregnancy is unlikely, but after birth a newborn is susceptible to person-to-person spread.
- To date, CDC does not have any evidence to suggest that animals imported from China pose a risk for spreading the new coronavirus in the United States.
- At this time, CDC has no data to suggest that this new coronavirus or other similar coronaviruses are spread by mosquitoes or ticks.
    - Mosquitoes and ticks cannot spread all types of viruses. For a virus to pass to a person through a mosquito or tick bite, the virus must be able to replicate inside the mosquito or tick.
- There is much more to learn about the spread of this new coronavirus, severity of the disease, and other features associated with this outbreak and investigations are ongoing. This information will further inform the risk assessment.

DIAGNOSIS AND TREATMENT

AMERICAN OVERSIGHT

- CDC developed a real time Reverse Transcription-Polymerase Chain Reaction (rRT-PCR) test to detect SARS-CoV-2 (the virus that causes COVID-19) in respiratory samples from clinical specimens.
- On January 24, CDC publicly posted the assay protocol for this test.
- CDC submitted an Emergency Use Authorization (EUA) package to the U.S. Food and Drug Administration on February 3 for its test.
- FDA approved the Emergency Use Authorization on February 4.
- The first manufactured batch of CDC test kits were made available for ordering by domestic and international partners through the agency's International Reagent Resource (IRR) on February 5.
- Upon arrival at public health laboratories, when laboratories began trying to verify the assay, several laboratories reported issues.
    - Specifically, some laboratories found sporadic reactivity in the negative control of one of the three assay components.
    - This sporadic activity resulted in an inconclusive test result.
- Routine quality control (QC) measures aim to identify these types of issues. It is unclear why QC did not detect this issue before the kits were sent out to states.
- On February 18, CDC stood up a new surge laboratory to support testing for COVID-19. This expanded capacity to 350 samples per day
- On February 20, CDC completed contracts with 2 large commercial manufacturers to ensure reagent availability for the public health laboratories
- On February 26, CDC, in conjunction with FDA, determined how to move forward and shared this information immediately with public health labs through the Association of Public Health Laboratories (APHL):
    - CDC is remanufacturing the test kits to ensure that laboratories have effective and reliable kits. The new kits include the two components (e.g., reagents) that are specific to novel coronavirus.
    - Before new test kits were available:
        - States that were able to validate all three assays should continue to test in this manner.
        - States that were able to validate the other two assays (N1 and N2) can test using these two assays.
    - FDA granted CDC "enforcement discretion," which means that testing in this manner was able to move forward while an updated EUA is officially completed.
    - CDC distributed updated instructions for use through APHL.
- On February 27, CDC distributed new test kits to 7 laboratories to serve as evaluation sites to ensure these health departments are able to verify the assay. An additional 40 test kits were hand-carried to IRR for repackaging and distribution to additional public health labs.
- On February 29, IRR began to distribute new test kits to the additional 40 laboratories.
- As of the evening of March 16, at least one lab in all 50 states (and Washington, D.C.) is able to run the CDC assay. 89 public health labs are running the CDC test.
- Commercial manufacturers are now producing their own tests.
- As of March 16th, CDC has tested over 4255 samples.

AMERICAN OVERSIGHT

- There is no specific antiviral treatment for COVID-19. People with COVID-19 should receive supportive care to help relieve symptoms.
- For severe cases, treatment should include care to support vital organ functions.

PREVENTION

- There is currently no vaccine to prevent COVID-19. The best way to prevent infection is to avoid being exposed to the virus.
- CDC always recommends everyday preventive actions to help prevent the spread of respiratory viruses, including:
    - Avoid touching your eyes, nose, and mouth with unwashed hands.
    - Avoid close contact with people who are sick.
    - Stay home when you are sick.
    - Cover your cough or sneeze with a tissue, then throw the tissue in the trash.
    - Clean and disinfect frequently touched objects and surfaces using a regular household cleaning spray or wipe.
    - Wash your hands often with soap and water for at least 20 seconds, especially after blowing your nose, coughing or sneezing; going to the bathroom; and before eating or preparing food.
    - If soap and water are not readily available, use an alcohol-based hand sanitizer with at least 60% alcohol. Always wash hands with soap and water if hands are visibly dirty.

PEOPLE AT RISK FOR SERIOUS ILLNESS

- Older adults and people who have severe underlying medical conditions seem to be at higher risk for more serious COVID-19 illness.
- Based upon available information to date, those most at risk include—
    - People 65 years and older
    - People who live in a nursing home or long-term care facility
    - People of any age with the following underlying medical conditions, particularly those that are not well controlled
        - Heart disease
        - Diabetes
        - Lung disease
- Early data suggest older people are twice as likely to have serious COVID-19 illness.
- If you are at increased risk for COVID-19 complications due to age or because you have a serious underlying medical condition, it is especially important for you to take actions to reduce your risk of exposure.
- If you are a person with a serious underlying medical condition that can put you at higher risk, stay home and away from other people.
    - Stock up on supplies
    - Make a plan with family members, friends, caregivers, and/or healthcare providers and consider including the following in your plan:

AMERICAN OVERSIGHT

- Alternate caregiver in case your caregiver is sick or paid service is limited or unavailable—it's a good idea to have at least three alternate caregivers
- A 30-day supply of medications and a checklist to monitor usage
- Nonperishable food items for at least 30 days
- Phone bank plan in case of quarantine (this reduces feelings of loneliness and isolation)

- If you feel sick, use these guidelines to reduce the risk of spread:
  - Stay home.
  - Call your healthcare provider and let them know about your symptoms. Tell them that you have or may have COVID-19. This will help them take care of you and keep other people from getting infected or exposed.
  - If you need emergency help, call 911.
  - If you are not sick enough to be hospitalized, you can recover at home. Follow CDC instructions for how to take care of yourself at home.

What people at higher risk can do to prepare

- Have supplies on hand
  - Contact your healthcare professional to ask about obtaining extra necessary medications to have on hand in case there is an outbreak of COVID-19 in your community and you need to stay home.
  - If you cannot get extra medications, consider using mail-order for medications.
  - Be sure you have over-the-counter medicines and medical supplies (tissues, etc.) to treat fever and other symptoms. Most people will be able to recover from COVID-19 at home.
  - Have enough household items and groceries on hand so that you will be prepared to stay at home for at least 14 days.
- Take everyday precautions
  - Avoid close contact with people who are sick.
  - Take everyday preventive actions.
    - Wash your hands often with soap and water for at least 20 seconds, especially after blowing your nose, coughing, or sneezing, or having been in a public place.
    - If soap and water are not available, use a hand sanitizer that contains at least 60% alcohol.
    - To the extent possible, avoid touching high-touch surfaces in public places – elevator buttons, door handles, handrails, handshaking with people, etc. Use a tissue or your sleeve to cover your hand or finger if you must touch something.
    - Wash your hands after touching surfaces in public places.
    - Avoid touching your face, nose, eyes, etc.
    - Clean and disinfect your home to remove germs. Practice routine cleaning of frequently touched surfaces (for example: tables, doorknobs, light switches, handles, desks, toilets, faucets, sinks and cell phones).

AMERICAN OVERSIGHT

        - Avoid crowds, especially in poorly ventilated spaces. Your risk of exposure to respiratory viruses like COVID-19 may increase in crowded, closed-in settings with little air circulation if there are people in the crowd who are sick.
- If COVID-19 is spreading in your community, take extra measures to put distance between yourself and other people.
    - Stay home as much as possible.
        - Consider ways of getting food brought to your house through family, social, or commercial networks.
- Have a plan for if you get sick.
    - **Consult with your healthcare provider for more information about** monitoring your health for symptoms suggestive of COVID-19**.**
    - Stay in touch with others by phone or email. You may need to ask for help from friends, family, neighbors, community health workers, etc. if you become sick.
    - Determine who can provide you with care if your caregiver gets sick.
    - Plan for how you will get more supplies if you need them before you recover.
- Watch for symptoms and emergency warning signs.
    - Pay attention for potential COVID-19 symptoms including, fever, cough, and shortness of breath. If you feel like you are developing symptoms, call your doctor.
    - If you develop emergency warning signs for COVID-19 get medical attention immediately. In adults, emergency warning signs*:
        - Difficulty breathing or shortness of breath
        - Persistent pain or pressure in the chest
        - New confusion or inability to arouse
        - Bluish lips or face

          *This list is not all inclusive. Please consult your medical provider for any other symptom that is severe or concerning.

What to do if you are at higher risk and get sick:

- Stay home and call your doctor.
- Call your healthcare provider and let them know about your symptoms. Tell them that you have or may have COVID-19. This will help them take care of you and keep other people from getting infected or exposed.
- If you are not sick enough to be hospitalized, you can recover at home. Follow CDC instructions for how to take care of yourself at home.
- Know when to get emergency help.
- Get medical attention immediately if you have any of the emergency warning signs listed above.

Community Support for Older Adults

- Community preparedness planning for COVID-19 should include older adults and people with disabilities, and the organizations that support them in their communities, to ensure their needs are taken into consideration.

AMERICAN OVERSIGHT

- Many of these people live in the community, and many depend on services and supports provided in their homes or in the community to maintain their health and independence.
- Long-term care facilities should be vigilant to prevent the introduction and spread of COVID-19. Information for long-term care facilities can be found here.

Family and Caregiver Support

- Know what medications your loved one is taking and see if you can help them have extra on hand.
- Monitor food and other medical supplies (hearing aid batteries, oxygen, incontinence, dialysis, wound care) needed and create a back-up plan.
- Stock up on non-perishable food items to have on hand in your home to minimize trips to stores.
- If you care for a loved one living in a care facility, monitor the situation, ask about the health of the other residents frequently and know the protocol if there is an outbreak.

Coping for People at Risk for Serious Illness and Caregivers

- People at higher risk for COVID-19 (including older people and people with severe underlying medical conditions), as well as the people who care for and about them, may feel especially stressed, worried, or anxious.
    - Things you can do to take care of yourself and help the people you care for:
        - Take breaks from watching, reading, or listening to news stories, including social media. Remind others that you care for to do the same.
        - Stay connected to others through calls (audio or video), instant messaging, email, letters, or other forms of communication, even if you cannot be together in person.
        - Talk with people you trust about your concerns and how you are feeling.
- If you, or someone you care about, is feeling overwhelmed with emotions like sadness, depression, or anxiety, or if you are concerned about harming yourself or others, call 911 or the SAMHSA Disaster Distress Helpline: 1-800-985-5990 or text TalkWithUs to 66746 (TTY 1-800-846-8517).

Tribal Elders and Multi-generational Tribal Families

- Tribal communities and Urban American Indians and Alaska Natives are particularly vulnerable to COVID-19 because of unique characteristics of health that impact tribal members.
- Any exposure to COVID-19 can pose a threat to tribal and urban American Indian and Alaska Native communities.
- Many tribal communities are made up of interdependent multi-generational families that house many Elders. These families may be both geographically and socially close. For tribal families, avoiding sick children or Elders may not seem practical or desirable.
- Families can take steps to protect the health and safety of Elders.
    - Consider limiting visitation except for caregivers or healers.
    - Avoid communing at social tribal events or gatherings, supermarkets, or casinos.

AMERICAN OVERSIGHT

- Consider seeking out other partners in the community to help with housing accommodations or optional caregiving, in case of illness.

Rural Communities

- Rural communities face some COVID-19 challenges that are different from urban and suburban communities. These differences warrant additional guidance.
- Many rural communities have experienced multiple closings of hospitals and healthcare facilities. This can leave an already vulnerable population without immediate access to healthcare, should an outbreak occur in the community.
- People living in rural communities can take steps to prepare.
    - Identify the two closest healthcare facilities to contact in case of an outbreak
    - Create an information card with the numbers and addresses of healthcare facilities and the family and friends who are physically nearest to you.
    - Locate state, local, or tribal health centers in advance to identify available resources
    - Create a phone tree system (activating a group of people by telephone to get a message out quickly) with family, friends, and neighbors

People with Asthma

- People with asthma may be at higher risk of getting infected with COVID-19. COVID-19 can affect your respiratory tract (nose, throat, lungs), cause an asthma attack, and possibly lead to pneumonia and acute respiratory disease.
- If you have asthma, you should prepare for COVID-19 and follow your Asthma Action Plan.
    - Take your asthma medication exactly as prescribed.
        - Talk to your healthcare provider, insurer, and pharmacist about creating an emergency supply of prescription medications, such as asthma inhalers.
        - Make sure that you have 30 days of non-prescription medications and supplies on hand too, in case you need to stay home for a long time.
    - Know how to use your inhaler.
    - Avoid your asthma triggers.
    - Clean and disinfect frequently touched surfaces like tables, doorknobs, light switches, countertops, handles, desks, phones, keyboards, toilets, faucets, and sinks daily to protect yourself against COVID-19.
        - Avoid disinfectants that can cause an asthma attack.
    - As more cases of COVID-19 are discovered and our communities take action to combat the spread of disease, it is natural for some people to feel concerned or stressed. Strong emotions can trigger an asthma attack. Take steps to help yourself cope with stress and anxiety.
- If you have symptoms
    - Contact your health care provider to ask about your symptoms.

For Pregnant People:

- Pregnant people may be at higher risk for having severe illness from COVID-19.
- CDC has limited information on adverse pregnancy outcomes in pregnant people with COVID-19.

AMERICAN OVERSIGHT

- Pregnancy loss, including miscarriage and stillbirth, has been observed in cases of infection with other related coronaviruses [SARS-CoV and MERS-CoV] during pregnancy.
- There is limited information on infant outcomes of COVID-19 illness during pregnancy.
- Other respiratory viral infections during pregnancy, such as influenza, have been associated with adverse neonatal outcomes, including low birth weight and preterm birth.
- High fevers during the first trimester of pregnancy can increase the risk of certain birth defects.

- It is especially important for pregnant people to take actions to reduce their risk of exposure.

MINIMIZING STIGMA AND MISINFORMATION

- Minimizing stigma and misinformation is important, especially during contagious disease outbreaks.
- **Everyone:** Know the facts about COVID-19 and help prevent the spread of rumors:
  - Fight stigma by supporting people who are coming back to school or work after completing their quarantine or isolation period for COVID-19 exposure or illness.
  - Someone who has completed their quarantine or met the requirements to discontinue infection control measures does not pose a risk of spreading COVID-19.
  - People of Asian descent, including Chinese Americans, are not more likely to get coronavirus than anyone else. Let people know that being of Asian descent does not increase the chance of getting or spreading COVID-19.
  - Viruses cannot target people from specific populations, ethnicities, or racial backgrounds.
    - People who have not been in contact with a person who is a confirmed or suspected case are not at greater risk of acquiring and spreading this new virus than others.
- People who returned more than 14 days ago from an area with widespread or ongoing community spread and do not have symptoms of coronavirus do not put others at risk.
- To help counter stigma, public health professionals can:
  - Maintain privacy and confidentiality of those seeking health care and those who may be part of any contact investigation.
  - Communicate the risk or lack of risk from associations with products, people, and places in a timely manner.
  - Raise awareness of COVID-19 while showing empathy for people's concerns and fears.
  - Share accurate information about how the virus spreads.
  - Speak out against negative behaviors, including negative statements on social media about groups of people, or exclusion of people who pose no risk from regular activities.
    - Be cautious about the images that are shared. Make sure they do not reinforce stereotypes.
    - Engage with stigmatized groups in person and through media channels including news media and social media.

AMERICAN OVERSIGHT

- Share with others the need for social support for people who have returned from an area with ongoing spread or are worried about friends or relatives in the affected areas.

TRAVEL

Presidential Proclamations announcing travel restrictions for travelers from China, Iran, United Kingdom, Republic of Ireland, and most of Europe

- On January 31, President Trump issued the first Presidential Proclamation implementing temporary measures to increase our abilities to detect and contain the novel coronavirus proactively and aggressively.
    - The proclamation suspends entry to the United States of foreign nationals who have been in China (excluding Hong Kong and Macau) in the past 14 days.
- On March 2, a Presidential Proclamation suspended entry to the United States of foreign nationals who have been in Iran in the past 14 days.
    - For more information, consult the notice published in the Federal Register.
- On March 11, a Presidential Proclamation suspended entry to the United States of foreign nationals who have been in 26 countries in Europe (known as the Schengen Area) in the past 14 days.
    - The order suspends the entry of foreign nationals for 30 days from these European states: Austria, Belgium, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Italy, Latvia, Liechtenstein, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Slovakia, Slovenia, Spain, Sweden, and Switzerland.
- On March 14, a Presidential proclamation suspended entry to the United States of foreign nationals who have been in the United Kingdom (excluding overseas territories outside of Europe) or the Republic of Ireland in the past 14 days.
- Exemptions to these travel restrictions include American citizens, legal permanent residents, and immediate family members of US citizens and legal permanent residents. (Hereafter referred to as "American citizens and exempted persons.")

American Citizens and Exempted Persons:

- All American citizens and exempted persons coming from
    - **China, and Iran** will be directed to ("**funneled to"**) one of 11 US airports (the first 11 airports in the list below).
    - **Europe, the United Kingdom, and the Republic of Ireland** will be directed to ("funneled to") one of 13 US airports (including the last 2 airports in the list below).
- American citizens and exempted persons who have been in **Hubei province** in the previous 14 days will have an additional health assessment (screened for fever, cough, or difficulty breathing).
    - If symptomatic, American citizens and exempted persons will be transferred for further medical evaluation. (They will not be able to complete their itinerary.)

AMERICAN OVERSIGHT

        - If asymptomatic, American citizens and exempted persons will be subject to a mandatory quarantine at or near that location until 14 days after they left Hubei Province. (They will not be able to complete their itinerary.)
    - American citizens and exempted persons who have been in **other parts of mainland China (outside of Hubei Province) or Iran** in the previous 14 days will have an additional health assessment (screened for fever, cough, or difficulty breathing).
        - If symptomatic, American citizens and exempted persons will be transferred for medical evaluation. (They will not be able to complete their itinerary at that time.)
        - If asymptomatic, American citizens and exempted persons will be allowed to reach their final destination and, after arrival, will be asked to stay home and self-monitor for 14 days.
    - American citizens and exempted persons who have been to the **Schengen area of Europe, UK and Ireland** in the previous 14 days will screened by Department of Homeland Security and receive a Travelers' Health Alert Notice.
        - If symptomatic, American citizens and exempted persons will be transferred for medical evaluation. (They will not be able to complete their itinerary at that time.)
        - If asymptomatic, American citizens and exempted persons will be allowed to reach their final destination and, after arrival, will be asked to stay home and self-monitor for 14 days.
    - The 13 airports where travelers are being funneled include:
        - John F. Kennedy International Airport (JFK), New York
        - Chicago O'Hare International Airport (ORD), Illinois
        - San Francisco International Airport (SFO), California
        - Seattle-Tacoma International Airport (SEA), Washington
        - Daniel K. Inouye International Airport (HNL), Hawaii
        - Los Angeles International Airport (LAX), California
        - Hartsfield-Jackson Atlanta International Airport (ATL), Georgia
        - Washington-Dulles International Airport (IAD), Virginia
        - Newark Liberty International Airport (EWR), New Jersey
        - Dallas/Fort Worth International Airport (DFW), Texas
        - Detroit Metropolitan Airport (DTW), Michigan
        - Boston Logan International Airport (BOS), Massachusetts
        - Miami International Airport (MIA), Florida
    - As of March 12, about 57,000 people have been screened at U.S. airports.

Travel Notices and Advisories:

- **CDC's most current travel notices:**
    - Level 3 Travel Health Notices (Avoid Nonessential Travel) for China, Iran, most of Europe (Schengen Area), the United Kingdom and the Republic of Ireland, South Korea, and cruise travel worldwide.
    - Level 2 Travel Health Notices (Practice Enhanced Precautions) for the global outbreak

AMERICAN OVERSIGHT

- CDC has posted a webpage about COVID-19 and considerations for travel in the United States.

Repatriation flights and quarantine orders:

- CDC has supported the Department of State in the safe and expedient ordered departure of US citizens and residents affected by outbreaks of COVID-19.
- Chartered flights returned passengers from Wuhan City, China and passengers from a cruise ship docked in Japan. (See section: Diamond Princess).
- The Department of Health and Human Services (DHHS) Secretary, under statutory authority, issued federal quarantine orders to all such passengers entering the United States.
    - The quarantine period is for 14 days.
    - The quarantine is a precautionary and preventive step to maximize the containment of the virus in the interest of the health of the American public.
    - This quarantine order also serves to protect the health of the repatriated persons, their families, and their communities.
- Based on what is known about this virus and other coronaviruses, CDC believes the risk to the communities temporarily housing these people is low.
- At the end of the 14-day period, people who have not developed symptoms have their quarantine order lifted and are free to return home.
- As of March 6th, almost everyone from the repatriation flights who were quarantined has been released and returned home.

***Diamond Princess*:**

- CDC supported the Department of State-led mission to repatriate US citizens returning to the United States from Japan who were aboard the *Diamond Princess* cruise ship.
    - Due to the dynamic nature of the ongoing outbreak, the US government recommended that US citizens disembark and return to the United States.
- On February 16, 329 American citizens returned by flights chartered by the State Department.
    - The planes were met by a team of U.S. government personnel deployed at the bases to assess the health of the passengers.
    - The passengers were screened before leaving the ship and were monitored and evaluated by medical and public health personnel during the trip and after arrival. They will continue to be monitored by medical and public health personnel throughout the 14-day quarantine period.
- Americans returned by flights chartered by the State Department are subject to a 14-day federal quarantine and were housed at two existing federal quarantine sites for repatriated travelers:
    - Travis Air Force Base in California
    - Joint Base San Antonio-Lackland in Texas
    - All of these individuals completed their quarantine.
- No US citizens remain on the Diamond Princess.
- More than 25 Americans who were on board the *Diamond Princess* remain in Japan, hospitalized with COVID-19, including some who are reportedly severely ill.

Grand Princess*:

AMERICAN OVERSIGHT

- CDC has been working with the California Department of Public Health, other federal, state, and local partners and the Princess Cruise Line to investigate a possible cluster of COVID-19 cases connected with a Grand Princess voyage from February 11-21. Additionally, CDC worked with the same partners to assess the risk for passengers currently aboard the Grand Princess.
    - CDC notified states about the risk and management of passengers aboard the Grand Princess between February 11 and 21 who might have COVID-19 symptoms.
- At this time, the U.S. Department of Health and Human Services (HHS) is working with state and local partners in California to support the return of passengers currently aboard the Grand Princess.
- On March 8, HHS announced that the Grand Princess would dock in the Port of Oakland.
    - Passengers are being transferred to federal military installations for medical screening, COVID-19 testing, and a 14-day quarantine.
    - Nearly 1,000 passengers who are California residents are completing the mandatory quarantine at Travis Air Force Base.
    - Additional residents of California and residents of other states are completing the mandatory quarantine at Marine Corps Air Station Miramar in San Diego, Lackland Air Force Base in San Antonio, or Dobbins Air Reserve Base in Georgia.
    - Throughout the quarantine, passengers will be monitored for symptoms of COVID-19.
    - The Department of State is working closely with the home countries of several hundred passengers to arrange for repatriation to their countries.
    - If you were on the initial—February 11-21—Grand Princess cruise and have COVID-19 symptoms, please call your healthcare provider and explain your symptoms and potential exposure.
        - Your healthcare provider will advise you of how to move forward.
        - In the meantime, CDC always recommends everyday preventive actions to help prevent the spread of respiratory diseases.
    - CDC is monitoring a number of other cruises for potential and confirmed COVID-19 cases, including a cluster of cases among people who traveled on Nile River Cruises in Egypt in late February and early March.
        - CDC is notifying states of known returned travelers who may have been exposed.

**Please continue to look for updates in CDC's Daily Key Points and in next week's Key Messages document. The situation is rapidly evolving and CDC will provide updates as they become available.*

WHAT CDC IS DOING

CDC Response in the US:

- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The goal of the ongoing US public health response is to detect new cases quickly and prevent further spread of COVID-19 in this country.

AMERICAN OVERSIGHT

- CDC established a COVID-19 Incident Management Structure on January 7. On January 21, CDC activated its Emergency Operations Center to better provide ongoing support to the COVID-19 response.
    - The US government has taken unprecedented steps with respect to travel in response to the growing public health threat posed by this new coronavirus.
    - Effective February 2, at 5pm, the US government suspended entry of foreign nationals who have been in China within the past 14 days.
        - US citizens, residents, and their immediate family members who have been in Hubei province and other parts of mainland China are allowed to enter the United States, but they are subject to health monitoring and possible quarantine for up to 14 days.
    - On February 29, the U.S. government announced it was suspending entry of foreign nationals who have been in Iran within the past 14 days.
    - As of March 13, all American citizens and exempted persons coming from most of Europe (knows as the Schengen Area) will be funneled through 13 airports (listed in the above Travel section). As of March 16, all American citizens and exempted persons coming from the United Kingdom (excluding overseas territories outside of Europe) or the Republic of Ireland will also be funneled through those 13 airports.
        - CDC and partners will conduct enhanced illness response at these points of entry.
    - CDC has issued the following travel guidance related to COVID-19:
        - China — Level 3, Avoid Nonessential Travel — updated February 22;
        - Iran — Level 3, Avoid Nonessential Travel — updated February 28;
        - South Korea — Level 3, Avoid Nonessential Travel — updated February 24;
        - Most of Europe (Schengen Area) — Level 3, Avoid Nonessential Travel – updated March 12;
        - Global Outbreak — Level 2, Practice Enhanced Precautions — posted March 11.
        - United Kingdom and U.K. — Level 3, Avoid Nonessential Travel — posted March 15.
        - COVID-19 and Cruise Ship Travel – Level 3, Avoid Nonessential Travel — posted March 17.
    - CDC is issuing clinical guidance, including clinical care guidance and healthcare infection control guidance.
    - On March 2, FDA announced that commercial companies may sell test kits under CDC's EUA.
    - CDC has deployed multidisciplinary teams to support state health departments with clinical management, contact tracing, and communications.
    - CDC has helped mobilize state health departments to receive returned repatriated travelers.
    - Through the Public Health Emergency Preparedness (PHEP) cooperative agreement, 62 state PHEP programs across the country are part of the multi-agency infrastructure

AMERICAN OVERSIGHT

working on quarantine, isolation, case finding, protecting health care workers and assuring medical supply chains.

- State PHEP programs stand ready to address future developments in the outbreak.
- CDC has developed a fast-track approval method that enables jurisdictions to request the redirection of Public Health Emergency Preparedness (PHEP) cooperative agreement funds for the rapid procurement of services, supplies, and equipment needed during the COVID-19 response.
- CDC has reduced the normal 30-day request process to one to three business days for urgent requests.
- CDC has coordinated a funding strategy and developed guidance for awarding an initial $35 million to jurisdictions responding to COVID-19.
- The funding is being awarded through two mechanisms:
    - Component A of the Crisis Response Cooperative Agreement, and
    - The Epidemiology and Laboratory Capacity (ELC) Cooperative Agreement to select state and local jurisdictions.
- These initial awards support activities such as monitoring of travelers, data management, laboratory equipment, supplies, staffing, shipping, infection control, surge staffing, and sentinel surveillance.
- Awards were issued March 6.
- CDC has worked with the Department of State, supporting the safe return of Americans who have been stranded as a result of the ongoing outbreaks of COVID-19 and related travel restrictions. CDC has worked to assess the health of passengers as they return to the United States and provided continued daily monitoring of people who are quarantined.
- An important part of CDC's role during a public health emergency is to develop a test for the pathogen and equip state and local public health labs with testing capacity. CDC developed a molecular test to detect COVID-19 from human clinical specimens and distributed this test to state and local health laboratories.
- After distribution of a CDC rRT-PCR test to diagnose COVID-19 to state and local public health labs started, performance issues were identified related to a problem in the manufacturing of one of the reagents. Laboratories were not able to verify the test performance.
- CDC worked on two potential resolutions to this problem.
    - CDC developed a new protocol that uses two of the three components of the original CDC test kit to detect the virus that causes COVID-19 after establishing that the third component, which was the problem with the original test, can be excluded from testing without affecting accuracy.
        - CDC is working with FDA to amend the existing Emergency Use Authorization (EUA) for the test.
    - Further, newly manufactured kits were provided to the International Reagent Resource for distribution.

AMERICAN OVERSIGHT

        - On February 27, CDC distributed new test kits to 7 laboratories to serve as evaluation sites to ensure health departments are able to verify the assay. On February 29, 6 of 7 pilot laboratories reported successful completion of the verification panel.
        - An additional 40 test kits were hand carried to IRR for repackaging and distribution to additional public health labs.
        - On February 28, IRR began to distribute new test kits to the additional 40 laboratories.
        - As of March 16, 89 public-health labs are now testing samples with the CDC assay (50 states plus Washington DC and Guam).
    - Combined with other reagents that CDC has procured, there are enough testing kits to test more than 75,000 people.
    - In addition, CDC is conducting laboratory testing in two of its laboratories at its headquarters in Atlanta. CDC can test approximately 350 specimens per day.
    - CDC has been uploading the entire genome of the viruses from reported cases in the United States to GenBank as sequencing was completed.
    - CDC has grown the virus in cell culture, which is necessary for further studies, including for additional genetic characterization. The cell-grown virus was sent to NIH's BEI Resources Repository for use by the broad scientific community.
    - CDC has deployed staff to assist in local areas experiencing clusters of COVID-19.

Internationally:

Note: Due to the rapidly changing situation, any statements on CDC involvement in China need case-by-case clearance.

- CDC is working diligently and closely with partners to support the response to this novel coronavirus outbreak.
- CDC has staff stationed in more than 60 countries across the globe. CDC has offices in China, in a number of the countries reporting cases of COVID-19, and in countries that have not yet reported cases of COVID-19 but are busy with planning and preparedness efforts.
    - CDC and the government of China have collaborated for the past 30 years addressing public health priorities affecting the US, China, and the world.
- In addition to working with host country officials, CDC staff are working in coordination with Department of State and other agencies within US embassies.
- CDC is mobilizing Atlanta-based staff to support the response. Many of these staffers have extensive experience responding to global outbreaks.
- CDC has identified experts who are prepared to join a planned WHO mission to support efforts to better understand the severity and transmissibility of the virus.
- CDC is providing technical assistance to the Government of Italy for exit screening flights departing from Italy to the United States.
- In China, CDC is an important technical partner for the Chinese Field Epidemiology Training Program (FETP). and has been involved in the program since 2004.

AMERICAN OVERSIGHT

        - More than 800 FETP-trained residents or graduates of FETP are supporting ongoing COVID-19 response efforts.
        - In 2019 specialized FETP training tracks were established in non-communicable diseases and tuberculosis.
- CDC has supported China CDC's national influenza laboratory for more than 20 years.
- CDC works in close partnership with the China CDC's National Influenza Epidemiology, Virology, and Pandemic Preparedness Centers, China's provincial and local CDCs, hospitals, and academic institutions.
- CDC supports Chinese partners in monitoring seasonal and novel influenza viruses, as well as enhancing efforts to detect and respond to seasonal, avian, and other novel influenza viruses with pandemic potential. CDC's key supporting activities include:
    - Strengthening influenza surveillance for seasonal and novel influenza viruses
    - Conducting research to estimate disease burden and vaccine effectiveness among populations at greatest risk (including young children, older adults, and pregnant women)
    - Promoting influenza vaccination policy development and coverage
    - Supporting novel virus risk assessments
    - Establishing pandemic influenza preparedness in China
    - Maintaining close ties between US and China influenza experts
- In other countries, CDC is collaborating with WHO to support Ministries of Health to prepare and respond to the epidemic.
    - CDC is helping to support countries to implement WHO recommendations related to the diagnosis and care of patients, tracking the epidemic, and identifying people who might have COVID-19.
    - CDC staff are also starting to work together with country colleagues to conduct investigations that will help inform response efforts going forward.
    - CDC works closely with countries to establish FETPs that train a workforce of field epidemiologists —or disease detectives— to identify and contain outbreaks close to the source.
    - For country-specific information, please contact CDCglobal@cdc.gov.

RECOMMENDATIONS

- CDC routinely advises that people help protect themselves from respiratory illnesses by washing their hands often, avoiding touching their face with unwashed hands, avoiding close contact with people who appear sick, and cleaning frequently touched surfaces.
    - CDC defines close contact as—
        - Being within about 6 feet (2 meters) of someone with COVID-19 for a prolonged period of time, such as living with, visiting, caring for or sharing a room in a healthcare facility

          - or –

AMERICAN OVERSIGHT

        - By having direct contact with infectious secretions from a patient, such as being coughed on.
    - If you are a resident in a community where person-to-person spread of COVID-19 has been detected and you develop COVID-19 symptoms, call your healthcare provider and tell them about your symptoms.
    - For people who are ill with COVID-19, but are not sick enough to be hospitalized, please follow CDC guidance on how to reduce the risk of spreading your illness to others. People who are mildly ill with COVID-19 are able to isolate at home during their illness.

Recent International Travelers:

- If you have traveled internationally, watch your health, and limit interactions with others for 14 days after returning to the United States.
- If you feel sick with fever, cough, or difficulty breathing during this time, you should:
    - Seek medical advice. Before you go to a doctor's office or emergency room, call ahead and tell them about your recent travel and your symptoms.
    - Avoid contact with others.
    - Not travel while sick.
    - Cover your mouth and nose with a tissue or your sleeve (not your hands) when coughing or sneezing.
    - Clean your hands often by washing them with soap and water for at least 20 seconds or using an alcohol-based hand sanitizer that contains at least 60% alcohol immediately after coughing, sneezing or blowing your nose. Soap and water should be used if hands are visibly dirty.
    - If you were in a country with widespread sustained (ongoing) transmission—China, Iran, South Korea, most of Europe (known as the Schengen Area), the United Kingdom, or the Republic of Ireland—stay home, monitor yourself, and practice social distancing for 14 days after you left that country.

People Confirmed to Have, or Being Evaluated for, COVID-19:

- Your doctors and public health staff will evaluate whether you can be cared for at home. If it is determined that you can be isolated at home, you will be monitored by staff from your local or state health department. You should follow the prevention steps below until a healthcare professional or local or state health department says you can return to your normal activities. Detailed information is available at Interim Guidance for Preventing COVID-19 from Spreading to Others in Homes and Communities.
    - Stay home except to get medical care.
    - Separate yourself from other people in your home.
    - Call ahead before visiting your doctor.
    - Wear a facemask.
    - Cover your coughs and sneezes with a tissue or cough or sneeze into your sleeve.
    - Wash your hands often with soap and water for at least 20 seconds.
    - Avoid sharing household items like eating utensils, cups, or linens.
    - Monitor your symptoms and seek prompt medical attention if your symptoms worsen.

AMERICAN OVERSIGHT

On February 27, CDC updated interim guidance for state and local public health officials on how to assess and manage the risks posed by patients who may have been exposed to this new coronavirus.

- This guidance establishes four risk categories: High, Medium, Low and No Identifiable Risk.
- The categories are based on a person's travel history and possible contact with patients who have laboratory-confirmed infections.
- The guidance **offers recommendations** for movement restrictions and public health evaluations for people in different risk categories.
- **In most cases, state and local authorities will make these decisions. Federal public health authority primarily extends to international arrivals at ports of entry and preventing interstate communicable disease threats.**
- These guidelines are subject to change as the situation requires. They do not apply retroactively to people who have been in an affected area with sustained transmission during the previous 14 days and are already in the United States, or those being managed as part of a contact investigation.
- CDC will provide separate guidance for healthcare settings.

Close Contacts of Patients Under Investigation:

People who have had close contact with someone who is confirmed to have, or being evaluated for, COVID-19, should:

- Monitor your health starting from the day you first had close contact with the person and continue for 14 days after you last had close contact with the person. Watch for these signs and symptoms:
    - Fever—take your temperature twice a day.
    - Coughing.
    - Shortness of breath or difficulty breathing.
    - Other early symptoms to watch for are chills, body aches, sore throat, headache, diarrhea, nausea, vomiting, and runny nose.
- **If you develop fever or any of these symptoms, call your healthcare professional right away.**
    - **Before** going to your medical appointment, be sure to tell your healthcare professional about your close contact with someone who is confirmed to have, or being evaluated for, COVID-19. This notification will help the healthcare professional's office take steps to keep other people from getting infected. Ask your healthcare professional to call the local or state health department.
- On March 16, the White House recommended that if someone in your household has tested positive for COVID-19, the entire household should stay home and you should contact your medical provider.
- Detailed information for caregivers and household members can be found on the Interim Guidance for Preventing COVID-19 from Spreading to Others in Homes and Communities web page.

Healthcare Professionals

AMERICAN OVERSIGHT

- As availability of diagnostic testing for COVID-19 increases, clinicians will be able to access laboratory tests for diagnosing COVID-19 through clinical laboratories performing tests authorized by FDA under an Emergency Use Authorization (EUA).
    - Clinicians will also be able to access laboratory testing through public health laboratories in their jurisdictions.
- This expands testing to a wider group of symptomatic patients. Clinicians should use their judgment to determine if a patient has signs and symptoms compatible with COVID-19 and whether the patient should be tested.
    - Decisions on which patients receive testing should be based on the local epidemiology of COVID-19, as well as the clinical course of illness.
    - Most patients with confirmed COVID-19 have developed fever and/or symptoms of acute respiratory illness (e.g., cough, difficulty breathing).
    - Clinicians are strongly encouraged to test for other causes of respiratory illness, including infections such as influenza.
- Epidemiologic factors that may help guide decisions on whether to test include: any persons, including healthcare workers, who have had close contact with a laboratory-confirmed COVID-19 patient within 14 days of symptom onset, or a history of travel from affected geographic areas within 14 days of symptom onset.

Recommendations for Reporting, Testing, and Specimen Collection:

- Clinicians should immediately implement recommended infection prevention and control practices if a patient is suspected of having COVID-19. They should also notify infection control personnel at their healthcare facility and their state or local health department if a patient is classified as a PUI for COVID-19.
- State health departments that have identified a PUI or a laboratory-confirmed case should complete a PUI and Case Report form through the processes identified on CDC's Coronavirus Disease 2019 website.
- State and local health departments can contact CDC's Emergency Operations Center (EOC) at 770-488-7100 for assistance with obtaining, storing, and shipping appropriate specimens to CDC for testing, including after hours or on weekends or holidays.
- Currently, diagnostic testing for COVID-19 is being performed at state public health laboratories and CDC. Testing for other respiratory pathogens should not delay specimen testing for COVID-19.
- On March 13, CDC updated its guidance for specimen collection for testing for COVID-19to to collect a single upper respiratory nasopharyngeal swab (NP) instead of an NP and oropharyngeal swab (OP).
- For patients who develop a productive cough, sputum should be collected and tested for SARS-CoV-2. The induction of sputum is not recommended.
- For patients for whom it is clinically indicated (e.g., those receiving invasive mechanical ventilation), a lower respiratory tract aspirate or bronchoalveolar lavage sample should be collected and tested as a lower respiratory tract specimen.

AMERICAN OVERSIGHT

- Specimens should be collected as soon as possible once a PUI is identified, regardless of the time of symptom onset. See Interim Guidelines for Collecting, Handling, and Testing Clinical Specimens from Patients Under Investigation (PUIs) for COVID-19 and Biosafety FAQs for handling and processing specimens from suspected cases and PUIs.
- Clinical specimens should be collected from PUIs for routine testing of respiratory pathogens at either clinical or public health labs. Note that clinical laboratories should NOT attempt viral isolation from specimens collected.
- Maintain proper infection control when collecting specimens.
- Additional guidance for collection, handling, and testing of clinical specimens is available on CDC's website.
- Detailed information on specimen types and shipping can be found on the Information for Laboratories web page

COMMUNITY BASED INTERVENTIONS (AKA COMMUNITY MITIGATION)

- Protect yourself and your community from getting and spreading respiratory illnesses like coronavirus disease 2019. Everyone has a role to play in getting ready and staying healthy.
    - For most people in the U.S., the immediate risk of being exposed to the virus that causes COVID-19 is thought to be low. The virus is not currently widespread in the U.S.
    - In places where ongoing community spread of the virus that causes COVID-19 has been reported, people are at elevated risk of exposure.
- Currently a vaccine is not available for COVID-19. Until a vaccine is developed, community-based interventions, such as temporary school dismissals, postponing or cancelling large events, social distancing (i.e. limiting face-to-face contact) can help slow the spread of coronavirus.
- Your local public health department and community partners have been preparing for disease outbreaks, like COVID-19 and have plans in place. Now is a good time for businesses, community and faith-based organizations, and health-care systems to reexamine their preparedness plans to make sure they are ready.
- Strong community partnerships between local public health departments, the healthcare sector, faith-based organizations, and other community partners are vital for this response, and will be necessary to prepare for and coordinate if an outbreak occurs in their local communities.
- Community-based interventions can be grouped in three categories:
    - Personal protective measures (e.g., voluntary home isolation of ill persons, voluntary home quarantine of exposed household members, respiratory and cough etiquette, using facemasks in community settings when ill, practicing hand hygiene)
    - Community measures aimed at increasing social distancing (e.g., temporary school dismissals, social distancing in workplaces (like working remotely), postponing or cancelling mass gatherings)
    - Environmental measures (e.g., routine cleaning of frequently touched objects or surfaces)

Household/Personal Protective Measures

AMERICAN OVERSIGHT

- Everyone can do their part to help plan for, prepare, and respond to this emerging public health threat.
- CDC recommends that individuals/households create an emergency plan of action, practice good personal health habits and plan for home-based care (if needed), be prepared for your child's school or childcare facility to be temporarily dismissed, and plan for changes at your workplace.
- During an outbreak in your community, **stay home when you are sick** with COVID-19 symptoms, keep away from others who are sick, and limit face-to-face contact with others.

Community Measures

- **Mass gatherings:**
    - Mass gatherings and events, such as concerts, festivals, conferences, worship services, and sporting events, increase the chance of a virus, like COVID-19, to spread and infect people crowded together within a close proximity.
    - On March 16, the White House recommended avoiding social gatherings in groups of more than 10 people.
- **Community and faith-based organizations:**
    - Local leaders and community organizers play a vital role to bring the community together to help plan for and reduce the impact of a potential COVID-19 outbreak. Since you know your community members the best, you can ensure groups most vulnerable to COVID-19 are considered and included in the planning process.
    - CDC recommends finding out if your local government has a private-public emergency planning group that meets regularly that you can join. If not, suggest one that should be set up. Building strong alliances before an outbreak can help provide your organization with the support and resources needed.
    - CDC has created interim guidance to help you create an emergency plan for your community and faith-based organization.
- **Administrators of U.S. childcare programs and K-12 schools:**
    - Schools should plan for and prepare for a potential community-level outbreak of COVID-19. Fortunately, many of the steps to plan and prepare for COVID-19 are the same steps schools take to keep students healthy and safe from the flu.
    - The decision to dismiss a school should be made locally. CDC recommends working with local health officials to determine if, when, and for how long schools may need to be dismissed in the event of an outbreak. (NOTE: The U.S. Department of Education does not recommend using "school closure" terminology.)
    - School administrators should plan to provide critical support services, such as continuity of education and continuity of school meal programs, if schools are dismissed.
    - CDC has posted guidance for school settings on its website.
    - CDC has posted recommendations of considerations for school dismissals.

Information for Law Enforcement

- For law enforcement personnel performing daily routine activities, the immediate health risk is low.

AMERICAN OVERSIGHT

- CDC has developed recommendations for law enforcement to protect themselves from exposure.
    - Law enforcement who must make contact with individuals confirmed or suspected to have COVID-19 should follow CDC's Interim Guidance for EMS.
    - Have a trained Emergency Medical Service/ Emergency Medical Technician (EMS/EMT) assess and transport anyone you think might have COVID-19 to a healthcare facility.
    - Ensure only trained personnel wearing appropriate personal protective equipment (PPE) have contact with individuals who have or may have COVID-19.
- Different styles of PPE may be necessary to perform operational duties.
    - These alternative styles (i.e. coveralls) must provide protection that is at least as great as that provided by the minimum amount of PPE recommended.
- Learn your employer's plan for exposure control and participate in all-hands training on the use of PPE for respiratory protection, if available.
- If close contact occurs during apprehension:
    - Clean and disinfect duty belt and gear prior to reuse. Use a household cleaning spray or wipe, according to the product label.
    - Follow standard operating procedures for the containment and disposal of used PPE.
    - Follow standard operating procedures for containing and laundering clothes. Avoid shaking the clothes.

HAND HYGIENE IN COMMUNITY SETTINGS (ENVIRONMENTAL MEASURES)

- Handwashing is one of the best ways to protect yourself and your family from getting sick.
- Clean hands can stop germs from spreading from one person to another and throughout an entire community—from your home and workplace to childcare facilities.
- Wash your hands often with soap and water for at least 20 seconds, especially after blowing your nose, coughing, or sneezing; going to the bathroom; and before eating or preparing food.
- If soap and water are not readily available, use an alcohol-based hand sanitizer with at least 60% alcohol.
- Always wash hands with soap and water if hands are visibly dirty.
- Follow these steps to make sure you wash your hands properly:
    1. Wet your hands with clean, running water (warm or cold), turn off the tap, and apply soap.
    2. Lather your hands by rubbing them together with the soap. Lather the backs of your hands, between your fingers, and under your nails.
    3. Scrub your hands for at least 20 seconds. Need a timer? Hum the "Happy Birthday" song from beginning to end twice.
    4. Rinse your hands well under clean, running water.
    5. Dry your hands using a clean towel or air dry them.

INFECTION PREVENTION AND CONTROL FOR HEALTHCARE SETTINGS

AMERICAN OVERSIGHT

- Healthcare facilities are increasingly unable to procure reliable and sufficient supplies for infection control, including N95 respirators.
- Because of demands associated with the COVID-19 response, CDC has updated the current national COVID-19 infection control guidance for healthcare in the midst of supply realities and growing insight about the spread of COVID-19.
- Protection of healthcare personnel is a priority. CDC's updated guidance on infection control aims to prioritize the use of N95 respirators and other respiratory protection devices for use during high-risk procedures while still protecting health care personnel with facemasks and eye protection during other routine patient care activities, in the setting of respirator shortages.
- CDC's updated, interim IPC guidance also aims to support health care facilities in practical decision-making at the local level to maintain a functional health care system while protecting healthcare workers.
- The guidance also outlines multiple interventions that can be implemented to enhance protection of health care personnel
- CDC has updated guidance on the PPE healthcare personnel should use when caring for patients with known or suspected COVID-19:
    - Eye protection, gown, and gloves continue to be recommended.
    - While respirators remain preferred, facemasks are an acceptable alternative until the supply chain is restored.
        - Facemasks protect the wearer from splashes and sprays.
        - Respirators, which filter inspired air, offer respiratory protection.
    - Respirators should be prioritized for procedures that are likely to generate respiratory aerosols, which would pose the highest exposure risk to healthcare professionals.
- The risk of transmission can be reduced by several types of actions, like prompt screening and triage, limiting personnel in the room, hand hygiene, source control, and effective environmental cleaning.
- CDC reminds all employers and healthcare personnel about the hierarchy of controls.
    - PPE is only one aspect of patient and worker safety and involves a high level of worker involvement and is highly dependent on proper fit and correct use.
- All healthcare facilities should continuously review their infection control supply inventories and taking steps to optimize supplies.
    - This is particularly true for areas in facilities where aerosol-generating procedures are performed, so that appropriate PPE will be available for high-risk procedures now and as potential COVID-19 cases increase.
- Healthcare administrators should continue to do everything possible to acquire the needed supplies to protect their staff and patients.
- When the supply chain is restored, facilities with a respiratory protection program should return to use of respirators for patients with known or suspected COVID-19.
- The anticipated timeline for return to routine levels of PPE is not known.

AMERICAN OVERSIGHT

    - CDC has posted information about strategies to optimize the current supply of N95 respirators, including the use of devices that provide higher levels of respiratory protection (e.g., powered air purifying respirators [PAPRs]) when N95s are not available.
    - CDC has also posted a companion checklist to help healthcare facilities prioritize the implementation of the strategies is available.
- The majority of nursing homes and outpatient clinics, including hemodialysis facilities, do not typically procure N-95 respirators, currently have respiratory protection programs, nor fit-tested HCP. Therefore, they would not be able to implement all the recommended infection control interventions for care of COVID-19 patients.
    - Without respiratory protection programs and fit testing, unnecessary transfer of stable patients with known or suspected COVID-19 to another facility (e.g., acute care hospital) for evaluation and care may occur.
    - In areas with community transmission, acute-care facilities will be quickly overwhelmed by transfers of patients who have only mild illness and do not require hospitalization.
- Healthcare personnel (HCP) are on the front lines of caring for patients with confirmed or possible COVID-19. HCP caring for these patients have an increased risk of exposure to this virus.
- HCP can minimize their risk of exposure when caring for confirmed or possible COVID-19 patients by following CDC infection prevention and control (IPC) guidelines, including use of recommended personal protective equipment (PPE).
- Infection control procedures and appropriate use of PPE are necessary to prevent infections from spreading while caring for patients. CDC reminds all employers and HCP that PPE is only one aspect of safe care of patients with COVID-19.
    - Focusing only on PPE gives a false sense of security of safe care and worker safety.
    - It is critical to focus on other strategies to prevent spread of COVID-19 in healthcare settings. Examples include prompt screening and triage of patients and limiting the numbers of healthcare personnel entering the patient room.
- CDC's current guidelines are designed to prevent the spread of COVID-19 within healthcare facilities to healthcare personnel, visitors, and other patients who may be exposed to a patient with COVID-19.
- Healthcare personnel caring for patients with confirmed or suspected COVID-19 should adhere to CDC recommendations for infection prevention and control (IPC):
    - Assess and triage patients with acute respiratory symptoms and risk factors for COVID-19 to minimize chances of exposure. Care for patients with known or suspected COVID-19 in a single-person room with the door closed. Reserve Airborne Infection Isolation Rooms (AIIRs) for patients undergoing aerosol-generating procedures.
    - Use Standard, Contact, and Airborne Precautions, including eye protection, when caring for patients with confirmed or possible COVID-19.
    - Perform hand hygiene with alcohol-based hand sanitizer before and after all patient contact, before and after contact with potentially infectious materials, and before putting on and upon removal of PPE, including gloves. Use soap and water if hands are visibly soiled.

AMERICAN OVERSIGHT

    - Practice how to properly don, use, and doff PPE in a manner to prevent self-contamination.
    - Perform aerosol-generating procedures (e.g., sputum induction, open suctioning of airways) in an AIIR, while following appropriate IPC practices, including use of appropriate PPE.
    - The collection of respiratory specimens (e.g., nasopharyngeal swabs) are not considered aerosol generating procedures. These procedures should take place in an examination room with the door closed.
    - Healthcare facilities can minimize the chance for exposures by ensuring facility policies and practices are in place and implemented before patient arrival, upon patient arrival, and throughout the duration of the affected patient's time in the healthcare setting.
    - CDC has created Interim Considerations for Infection Prevention and Control of Coronavirus Disease 2019 (COVID-19) in Inpatient Obstetric Healthcare Settings
- Healthcare facilities should promptly notify state or local public health authorities of patients with known or possible COVID-19 (i.e., persons under investigation or PUIs), and should designate specific persons within the healthcare facility who are responsible for communication with public health officials and dissemination of information to HCP.
- All healthcare facilities should ensure that their healthcare personnel are correctly trained and capable of implementing infection control procedures. Individual healthcare personnel should ensure they understand and can adhere to infection control requirements.
- Routine cleaning and disinfection procedures are appropriate for SARS-CoV-2 in healthcare settings, including those patient-care areas in which aerosol-generating procedures are performed.
    - Products with EPA-approved emerging viral pathogens claims are recommended for use against SARS-CoV-2, the virus that causes COVID-19.
- Management of laundry, food service utensils, and medical waste should also be performed in accordance with routine procedures. Federal, state, and local guidelines and regulations specify the categories of medical waste that are subject to regulation and outline the requirements associated with treatment and disposal.
- CDC recommends that employees who are confirmed to have COVID-19, those who appear to have acute respiratory illness symptoms upon arrival to work, and persons who become sick during the work day promptly put on a facemask, be separated from other people, and be sent home immediately.
- If facemasks are not available, sick healthcare personnel should cover their noses and mouths with a tissue when coughing or sneezing (or an elbow or shoulder if no tissue is available), prior to leaving the facility.

WHAT CDC IS DOING TO PROTECT HEALTHCARE PERSONNEL

- CDC is providing regular communication to the US healthcare community through targeted outreach activities.

AMERICAN OVERSIGHT

- CDC is rapidly developing guidance and resources to protect US healthcare personnel. Current guidance and recommendations are designed to protect healthcare personnel and prevent the spread of the virus that causes COVID-19 within US healthcare facilities.
- CDC has deployed field teams to provide onsite infection control assessment and consultation to the US healthcare facilities currently treating confirmed COVID-19 patients and the passengers returning from China.
- CDC is preparing first responders, healthcare providers, and health systems, by:
    - Establishing visibility across healthcare systems to understand healthcare use, particularly surges in demand for medical care and associated resources.
    - Conducting extensive outreach to clinical and hospital professional organizations to ensure health system preparedness.
    - Producing guidance documents on infection control, hospital clinical evaluation and patient management.
    - Working closely with healthcare facilities and providers to reinforce infection control principles that recognize PPE is one component of a larger set of practices that help to limit the spread of disease.
    - Developing a range of respirator conservation strategies, including strategies to make supplies last longer (such as using alternative products like reusable respirators) and extending the use of disposable respirators.
    - Leveraging existing telehealth tools to direct people to the right level of care.
    - Working with supply chain partners to understand supply usage, what products are available, and when more aggressive measures may need to be taken to ensure that HCPs at highest risk have access to PPE.
    - Sharing information with stakeholders to help them recognize when to shift the strategies they are using.
- The first report of an infected healthcare provider occurred on February 29 in a long-term care facility in Washington.
- Healthcare personnel (HCP) often have prolonged close contact with patients in healthcare settings and may come in contact with a person infected with COVID-19. HCPs can protect themselves by properly following recommended infection control practices, including the appropriate use of PPE when caring for patients with COVID-19.
- CDC recommends evaluating asymptomatic HCPs with close contact or a potential exposure to COVID-19 by assessing risk, monitoring symptoms, and determining the need for appropriate work restrictions.

OPTIMIZING THE SUPPLY OF N95 RESPIRATORS

- Protection of healthcare workers is a priority. CDC's Strategies for Optimizing the Supply of N95 Respirators offers a series of strategies or options to optimize supplies of disposable N95 filtering facepiece respirators (commonly called "N95 respirators") in healthcare settings where there is limited supply.

AMERICAN OVERSIGHT

- It also includes considerations for use by federal, state, and local public health officials, respiratory protection program managers, occupational health service leaders, infection prevention and control program leaders, and other leaders in healthcare settings who are responsible for developing and implementing policies and procedures for preventing pathogen transmission in healthcare settings.
- CDC has provided additional resources related to these strategies:
    - Checklist for Healthcare Facilities: Strategies for Optimizing the Supply of N95 Respirators during the COVID-19 Response is intended to help healthcare facilities prioritize the implementation of the strategies presented in the Strategies for Optimizing the Supply for N95 Respirators guidance.
    - Release of Stockpiled N95 Filtering Facepiece Respirators Beyond the Manufacturer-Designated Shelf Life: Considerations for the COVID-19 Response
        - In times of increased demand and decreased supply, consideration can be made to use the N95s listed in the guidance past their manufacturer-designated shelf life when responding to COVID-19.
        - This preliminary information from the NIOSH study suggests certain N95 models beyond their manufacturer-designated shelf life will be protective. CDC recommends that N95s that have exceeded their manufacturer-designated shelf life should be used only as outlined in the Strategies for Optimizing the Supply of N95 Respirators.

MANAGEMENT OF PATIENTS GUIDANCE FOR HEALTHCARE PROVIDERS

Clinical Presentation

- Most frequently reported symptoms of COVID-19 include fever, cough, sore throat, myalgia, or fatigue. Less commonly reported symptoms include sputum production, headache, hemoptysis, and diarrhea. Older patients and people with chronic medical conditions may be at higher risk of severe illness.
    - Possible risk factors for progressing to severe illness may include, but are not limited to, older age and people of any age with underlying chronic medical conditions such as heart disease, lung disease and diabetes.

Clinical Course

- Symptoms among reported cases of COVID-19 vary in severity from mild illness to severe or fatal illness.
- Some reports suggest the potential for clinical deterioration during the second week of illness.
- Among hospitalized patients with confirmed COVID-19, some will develop complications:
    - Acute respiratory distress syndrome (ARDS)
    - Intensive care for respiratory support
    - Pneumonia resulting in death
    - Secondary infection

Laboratory and Radiographic Findings

AMERICAN OVERSIGHT

- SARS-CoV-2 RNA has been detected from upper and lower respiratory tract specimens, and the virus has been isolated from bronchoalveolar lavage fluid.
- The duration of shedding of SARS-CoV-2 RNA in the upper and lower respiratory tracts is not yet known but may be several weeks or longer.

Clinical Management and Treatment

- No specific treatment for COVID-19 is currently available. Prompt infection prevention and control measures and supportive management of complications is recommended.
- Remdesivir is an investigational antiviral drug that is being studied in patients with COVID-19.
    - There are two clinical trials available for patients with COVID-19 in the United States, one for patients with severe coronavirus disease and one for patients with moderate coronavirus disease.
- Patients with mild clinical presentation may not initially require hospitalization.
- The decision to monitor a patient in the inpatient or outpatient setting should be made on a case-by-case basis.

INTERIM GUIDANCE FOR BUSINESSES AND EMPLOYERS (NON-HEALTHCARE SETTINGS)

- Interim guidance for businesses and employers to plan for and respond to COVID-19 is now available on CDC's website. This interim guidance may help prevent workplace exposures to acute respiratory illnesses, including COVID-19, in non-healthcare settings. The guidance also provides planning considerations if there are more widespread, community outbreaks.
- Employers can use strategies now to prevent workplace exposures to acute respiratory illness:
    - Actively encouraging sick employees to stay home
    - Separating sick employees
    - Emphasizing staying home when sick, respiratory etiquette, and hand hygiene by all employees
    - Performing routine environmental cleaning
    - Advising employees before traveling to take certain steps
    - Checking the CDC's Traveler's Health Notices website for the latest guidance and recommendations for each country to which you will travel
- For the general public, who are unlikely to be exposed to this virus, the immediate health risk from COVID-19 is considered low at this time. Some people, like healthcare workers caring for COVID-19 patients and other close contacts of COVID-19 patients, will have an increased risk of infection.
    - Employees who are well but who have a sick family member at home with COVID-19 should notify their supervisor and refer to CDC guidance for how to conduct a risk assessment of their potential exposure. Recommendations released March 16 state that if someone in a household has tested positive, keep the entire household at home.
    - If an employee is confirmed to have COVID-19, employers should inform fellow employees of their possible exposure to COVID-19 in the workplace but maintain confidentiality as required by the Americans with Disabilities Act. Employees exposed to

AMERICAN OVERSIGHT

a co-worker with confirmed COVID-19 should refer to CDC guidance for how to conduct a risk assessment of their potential exposure.

- Employers should be ready to implement strategies to protect the workforce from COVID-19 while ensuring the continuity of operations.
    - An infectious disease outbreak response plan should include possible work-related exposures and health risks to employees. The plan should also explore flexible worksites (e.g., telecommuting) and work hours in accordance with human resource policies.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 (COVID-19) Outbreak
March 17, 2020 as of 10:00pm

Updated text is shown in colored text.

SNAPSHOT

- CDC has reported:
  - 4,226 confirmed and presumptive positive cases of COVID-19
  - 75 COVID-19 related deaths
  - 49 states, the District of Columbia, Puerto Rico, Guam, and the US Virgin Islands have reported cases

MAIN KEY POINTS

- On March 16, 2020 President Trump and the White House Coronavirus Task Force issued new guidelines to help protect Americans during the Coronavirus pandemic.
  - The initiative, called "15 Days to Slow the Spread," lays out guidelines for a nationwide effort to slow the spread of COVID-19. It calls for the implementation of measures to increase social distancing between people at all levels of society.
  - This is a massive proactive, preventive response to COVID-19. It aims to slow the spread and blunt the impact of this disease on the United States.
- All segments of U.S. society have a role to play at this time:
  - People across the country are asked to stay home as much as much as possible and otherwise practice social distancing.
  - This includes canceling or postponing gatherings of more than 10 people and closing schools in some areas as determined by local and state governments.
  - It also includes special measures to protect those people who are most vulnerable to this disease.
- The Centers for Medicare & Medicaid Services (CMS) has taken new measures to keep America's nursing home residents safe from COVID-19. These measures are based on the newest CDC recommendations.
  - Those who are sick are asked to stay home and follow the new guidance for when it's OK for them to interact with other people again.
- There is no vaccine to protect against COVID-19 and no medications approved to treat it.
- There is a body of evidence—based on about 200 journal articles—that supports the effectiveness of social distancing measures, both when used alone and in combination with other measures.
  - Much of this data is outlined in CDC's Community Mitigation Guidelines to Prevent Pandemic Influenza — United States, 2017.
  - These recommendations work better when implemented in concert.
- While the new guidelines are recommended for the next 15 days, government leaders will continually reassess the status of the outbreak in the United States. It may be possible to extend these recommended measures for additional periods of time.
- This is a historic, unprecedented outbreak, the likes of which have not been seen since the influenza pandemic of 1918.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 (COVID-19) Outbreak
March 17, 2020 as of 10:00pm

SITUATION UPDATE

- 4,226 reported cases of COVID-19 have been detected in all states except West Virginia.
- 245 of these cases occurred through close contact with another case.
- 229 cases occurred in persons who had traveled to international areas with sustained (ongoing) transmission and among their close contacts.
- 3,752 cases are still being investigated to determine the source of exposure.
- As of the evening of March 15, 89 state and local public health labs in 50 states and the District of Columbia have verified they are successfully using COVID-19 diagnostic tests. This includes one or more PHL in 50 states plus D.C. and Guam. (See map showing which states and territories have one or more laboratories that have successfully verified and are currently using COVID-19 diagnostic tests.)
- As of the evening of March 16, 2020, CDC and local and state public health laboratories had tested a total of 31,878 specimens.
- CDC is adapting some of the agency's existing surveillance systems to better track COVID-19.
- The agency will roll out a COVID-19 surveillance report in the coming days.
- On Monday, March 16 CDC reported the first confirmed case in a CDC employee.

CDC GUIDANCE UPDATES

- CDC is reviewing and updating travel notices almost on a daily basis.
    - U.S. citizens, residents, and their immediate family members who have been in China, Iran, the United Kingdom, Ireland or any one of 26 European countries within in the past 14 days can enter the United States, but they are subject to health monitoring and possible quarantine for up to 14 days.
    - CDC also has a Global Level 2 Travel Health Notice recommending older adults and those who have chronic medical conditions consider postponing nonessential travel.
    - On March 17, CDC posted a Level 3 Travel Health Notice for Cruise Ship Travel, recommending travelers defer all cruise ship travel worldwide.
- CDC updated its guidance for specimen collection for testing for COVID-19 to collect a single upper respiratory nasopharyngeal swab (NP) instead of an NP and oropharyngeal swab (OP).
- CDC also posted new guidance on when people who have had COVID-19 and have been isolating at home can discontinue isolating in "Discontinuation of Home Isolation for Persons with COVID-19."
    - Persons with COVID-19 who have symptoms and were directed to care for themselves at home may discontinue home isolation if:
        - At least 3 days (72 hours) have passed since recovery—defined as resolution of fever without the use of fever-reducing medications and improvement in respiratory symptoms (e.g., cough, shortness of breath); and,
        - At least 7 days have passed since symptoms first appeared.
- CDC posted Guidance for child care settings, including a decision tree on when schools should close.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 (COVID-19) Outbreak
March 17, 2020 as of 10:00pm

PANDEMIC INFORMATION

- Pandemics happen when a disease emerges to infect people easily and spreads from person to person in an efficient and sustained way globally.
- This is the first pandemic known to be caused by the emergence of a new coronavirus.
- In the past century, there have been four pandemics caused by the emergence of novel influenza viruses.
    - Pandemic guidance developed in anticipation of an influenza pandemic is being repurposed and adapted for a COVID-19 pandemic.
- The federal government has been working closely with state, local, tribal, and territorial partners, as well as public health partners, to prepare for and respond to this public health threat for months.
- CDC has been implementing its pandemic preparedness and response plans, working on multiple fronts, including providing specific guidance on measures to prepare communities to respond to local spread of the virus that causes COVID-19.
- Pandemics of respiratory disease follow a certain progression outlined in a "Pandemic Intervals Framework."
    - Pandemics begin with an investigation phase, followed by recognition, initiation, and acceleration phases.
    - The peak of illnesses occurs at the end of the acceleration phase, which is followed by a deceleration phase, during which there is a decrease in illnesses.
- Different countries can be in different phases of the pandemic at any point in time and different parts of the same country can also be in different phases of a pandemic.
- Nationally, the United States is currently in the initiation phase, but states where community spread is occurring are in the acceleration phase.
- The duration and severity of each phase can vary depending on the characteristics of the virus and the public health response.
- Public health partners are encouraged to review their pandemic preparedness plans at this time.

WHAT YOU CAN DO

- Everyone can do their part to help respond to this emerging public health threat:
    - On March 16, the White House announced a program called "15 Days to Slow the Spread," which is a nationwide effort to slow the spread of COVID-19 through the implementation of social distancing at all levels of society.
    - Older people and people with severe chronic conditions should take special precautions because they are at higher risk of developing serious COVID-19 illness.
    - If you are a healthcare provider, use your judgement to determine if a patient has signs and symptoms compatible with COVID-19 and whether the patient should be tested. Factors to consider, in addition to clinical symptoms, may include:
        - Does the patient have recent travel from an affected area?
        - Has the patient been in close contact with someone with COVID-19 or patients with pneumonia of unknown cause?
        - Does the patient reside in an area where there has been community spread of COVID-19?

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 (COVID-19) Outbreak
March 17, 2020 as of 10:00pm

- If you are a healthcare provider or a public health responder caring for a COVID-19 patient, please take care of yourself and follow recommended infection control procedures.
- If you are a close contact of someone with COVID-19 and develop symptoms of COVID-19, call your healthcare provider and tell them about your symptoms and your exposure. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.
- For people who are ill with COVID-19, but are not sick enough to be hospitalized, please follow CDC guidance on how to reduce the risk of spreading your illness to others. People who are mildly ill with COVID-19 are able to isolate at home during their illness.
- If you have been in China or another affected area or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus.

For more information please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Pandemic
March 18, 2020 as of 11:20pm

Updated text is shown in colored text.

SNAPSHOT

- CDC has reported:
  - 7,038 confirmed and presumptive positive cases of COVID-19
  - 97 COVID-19 related deaths
  - All 50 states, the District of Columbia, Puerto Rico, Guam, and the US Virgin Islands have reported cases of COVID-19 (West Virginia confirmed their first case of COVID-19.)

MAIN KEY POINTS

- On March 16, 2020 President Trump and the White House Coronavirus Task Force issued new guidelines to help protect Americans during the Coronavirus pandemic.
  - The initiative, called "15 Days to Slow the Spread," lays out guidelines for a nationwide effort to slow the spread of COVID-19. It calls for the implementation of measures to increase social distancing between people at all levels of society.
  - This is a massive proactive, preventive response to COVID-19. It aims to slow the spread and blunt the impact of this disease on the United States.
- All segments of U.S. society have a role to play at this time:
  - People across the country are asked to stay home as much as much as possible and otherwise practice social distancing.
  - This includes canceling or postponing gatherings of more than 10 people and closing schools in some areas as determined by local and state governments.
  - It also includes special measures to protect those people who are most vulnerable to this disease.
    - Two CDC Morbidity & Mortality Weekly Reports (MMWRs) published today underscore how vulnerable older people are to developing serious illness from COVID-19. (See section MMWR publications.)
  - People who are sick are asked to follow CDC guidance on recovering at home and follow the new guidance for when it's OK to interact with other people again.
- There is no vaccine to protect against COVID-19 and no medications approved to treat it.
- There is a body of evidence—based on about 200 journal articles—that supports the effectiveness of social distancing measures, both when used alone and in combination with other measures.
  - Much of this data is outlined in CDC's Community Mitigation Guidelines to Prevent Pandemic Influenza — United States, 2017.
  - These recommendations work better when implemented in concert.
- While the new guidelines are recommended for the next 15 days, government leaders will continually reassess the status of the outbreak in the United States. It may be possible to extend these recommended measures for additional periods of time.
- This is a historic, unprecedented outbreak, the likes of which have not been seen since the influenza pandemic of 1918.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Pandemic
March 18, 2020 as of 11:20pm

SITUATION UPDATE

- 7,038 reported cases of COVID-19 have been detected in all 50 states.
- 276 of these cases occurred through close contact with another case.
- 269 cases occurred in persons who had traveled to international areas with sustained (ongoing) transmission and among their close contacts.
- 6,493 cases are still being investigated to determine the source of exposure.
    - The number of cases of COVID-19 being reported in the United States is rising quickly.
    - With increasing laboratory testing and reporting across the country, CDC expected to see a rise in cases, but the growing number of cases also reflects a rapid spread of disease across communities
    - While these numbers are concerning, it's not unexpected and the more robust information will allow us to better understand and track the size and scope of the outbreak and strengthen prevention and response efforts.
- As of the evening of March 16, 89 state and local public health labs in 50 states, the District of Columbia, Guam, and Puerto Rico have verified they are successfully using COVID-19 diagnostic tests. See map showing which states and territories have one or more laboratories that have successfully verified and are currently using COVID-19 diagnostic tests.
- As of the evening of March 17, 2020, CDC and local and state public health laboratories had tested a total of 37,824 specimens.
- CDC is adapting some of the agency's existing surveillance systems to better track COVID-19.
- The agency will roll out a COVID-19 surveillance report in the coming days.
- On Monday, March 16 CDC reported the first confirmed case in a CDC employee.

MMWR PUBLICATIONS

- On March 18, CDC published COVID-19 in a Long-Term Care Facility — King County, Washington, February 27–March 9, 2020 in the Morbidity & Mortality Weekly Report.
    - This report looked at an outbreak of COVID-19 in a long-term residential care facility in Washington state. During the outbreak, 81 residents of one facility were infected along with 34 staff members and 14 visitors. Twenty-three people died.
    - An investigation into the outbreak identified factors that likely contributed to the vulnerability of these facilities, including:
        1. Staff members who worked while symptomatic;
        2. Staff members who worked in more than one facility;
        3. Inadequate familiarity and adherence to standard, droplet, and contact precautions and eye protection recommendations;
        4. Challenges to implementing infection control practices including inadequate supplies of PPE and other items (e.g., alcohol-based hand sanitizer)
        5. Delayed recognition of cases because of low index of suspicion, limited testing availability, and difficulty identifying persons with COVID-19 based on signs and symptoms alone.
    - These findings underscore improvements that can be made across long-term care facilities in the United States to help protect residents from COVID-19 outbreaks as the pandemic continues to expand in the United States.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Pandemic
March 18, 2020 as of 11:20pm

- On March 18, CDC published Severe Outcomes Among Patients with Coronavirus Disease 2019 (COVID-19) — United States, February 12–March 16, 2020 in the Morbidity & Mortality Weekly Report.
    - This report looked at severity of disease—by age group—among 4,226 COVID-19 cases in the United States that occurred during February 12–March 16, 2020.
    - Overall, 31% of cases, 45% of hospitalizations, 53% of ICU admissions, and 80% of deaths associated with COVID-19 occurred among adults aged 65 years or older. The highest percentage of severe outcomes were among persons adults aged 85 years or older.
    - In contrast, no ICU admissions or deaths were reported among persons aged 19 years or younger.
    - Similar to reports from other countries, this finding suggests that the risk for serious disease and death from COVID-19 is higher in older age groups.
    - Approximately 49 million people in the United States are aged 65 years or older.
    - Data on other risk factors, including serious underlying health conditions that could increase risk for complications and severe illness, were unavailable at the time of this analysis.

CDC GUIDANCE UPDATES

- CDC is reviewing and updating travel notices almost on a daily basis.
    - On March 18, CDC posted a Level 3 Travel Health Notice (Avoid Nonessential Travel) for Malaysia. Malaysia is experiencing widespread ongoing transmission of respiratory illness caused by COVID-19.
    - U.S. citizens, residents, and their immediate family members who have been in China, Iran, the United Kingdom, Ireland or any one of 26 European countries within in the past 14 days can enter the United States, but they are subject to health monitoring and possible quarantine for up to 14 days.
    - CDC also has a Global Level 2 Travel Health Notice recommending older adults and those who have chronic medical conditions consider postponing nonessential travel.
    - On March 17, CDC posted a Level 3 Travel Health Notice for Cruise Ship Travel, recommending travelers defer all cruise ship travel worldwide.
- CDC updated its guidance for specimen collection for testing for COVID-19 to collect a single upper respiratory nasopharyngeal swab (NP) instead of an NP and oropharyngeal swab (OP).
- CDC also posted new guidance on when people who have had COVID-19 and have been isolating at home can discontinue isolating in Discontinuation of Home Isolation for Persons with COVID-19.
    - Persons with COVID-19 who have symptoms and were directed to care for themselves at home may discontinue home isolation if:
        - At least 3 days (72 hours) have passed since recovery—defined as resolution of fever without the use of fever-reducing medications and improvement in respiratory symptoms (e.g., cough, shortness of breath); and,
        - At least 7 days have passed since symptoms first appeared.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Pandemic
March 18, 2020 as of 11:20pm

- CDC posted Guidance for child care settings, including a decision tree on when schools should close.

WHAT YOU CAN DO

- Everyone can do their part to help respond to this emerging public health threat:
    - On March 16, the White House announced a program called 15 Days to Slow the Spread which is a nationwide effort to slow the spread of COVID-19 through the implementation of social distancing at all levels of society.
    - Older people and people with severe chronic conditions should take special precautions because they are at higher risk of developing serious COVID-19 illness.
    - If you are a healthcare provider, use your judgement to determine if a patient has signs and symptoms compatible with COVID-19 and whether the patient should be tested. Factors to consider, in addition to clinical symptoms, may include:
        - Does the patient have recent travel from an affected area?
        - Has the patient been in close contact with someone with COVID-19 or patients with pneumonia of unknown cause?
        - Does the patient reside in an area where there has been community spread of COVID-19?
    - If you are a healthcare provider or a public health responder caring for a COVID-19 patient, please take care of yourself and follow recommended infection control procedures.
    - If you are a close contact of someone with COVID-19 and develop symptoms of COVID-19, call your healthcare provider and tell them about your symptoms and your exposure. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.
    - For people who are ill with COVID-19, but are not sick enough to be hospitalized, please follow CDC guidance on how to reduce the risk of spreading your illness to others. People who are mildly ill with COVID-19 are able to isolate at home during their illness.
    - If you have been in China or another affected area or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus.

For more information please visit CDC's Coronavirus Disease 2019 Outbreak page at www.cdc.gov/COVID19.

Dear Colleagues,

Attached are the **CDC COVID-19 key points for Wednesday, March 18, 2020**. Please feel free to share with your staff and other partners.

Also, CDC has released/updated several COVID-19 interim guidance websites. Links below.

New/ Updated CDC COVID-19 Guidance:

- Prepare to Care for COVID-19: Get Your Practice Ready
- FAQs about Hand Hygiene for Healthcare Personnel Responding to COVID-2019
- New At-Risk landing page with new content:
  - Older Adults
  - People with Asthma and COVID-19
  - COVID-19: What people with HIV should know
  - Caring for someone at home

You can also keep up with CDC updates on Coronavirus Disease 2019 by signing up for email updates, syndicating available content, and subscribing to Coronavirus Disease 2019 RSS Feed.

Kind Regards,

State Coordination Task Force

(Sent by BCC to PHEP directors, state epidemiologists, state health officials, public health laboratory directors, BCHC, and national and federal partners)

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Pandemic
March 18, 2020 as of 11:20pm

Updated text is shown in colored text.

SNAPSHOT

- CDC has reported:
  - 7,038 confirmed and presumptive positive cases of COVID-19
  - 97 COVID-19 related deaths
  - All 50 states, the District of Columbia, Puerto Rico, Guam, and the US Virgin Islands have reported cases of COVID-19 (West Virginia confirmed their first case of COVID-19.)

MAIN KEY POINTS

- On March 16, 2020 President Trump and the White House Coronavirus Task Force issued new guidelines to help protect Americans during the Coronavirus pandemic.
  - The initiative, called "15 Days to Slow the Spread," lays out guidelines for a nationwide effort to slow the spread of COVID-19. It calls for the implementation of measures to increase social distancing between people at all levels of society.
  - This is a massive proactive, preventive response to COVID-19. It aims to slow the spread and blunt the impact of this disease on the United States.
- All segments of U.S. society have a role to play at this time:
  - People across the country are asked to stay home as much as much as possible and otherwise practice social distancing.
  - This includes canceling or postponing gatherings of more than 10 people and closing schools in some areas as determined by local and state governments.
  - It also includes special measures to protect those people who are most vulnerable to this disease.
    - Two CDC Morbidity & Mortality Weekly Reports (MMWRs) published today underscore how vulnerable older people are to developing serious illness from COVID-19. (See section MMWR publications.)
  - People who are sick are asked to follow CDC guidance on recovering at home and follow the new guidance for when it's OK to interact with other people again.
- There is no vaccine to protect against COVID-19 and no medications approved to treat it.
- There is a body of evidence—based on about 200 journal articles—that supports the effectiveness of social distancing measures, both when used alone and in combination with other measures.
  - Much of this data is outlined in CDC's Community Mitigation Guidelines to Prevent Pandemic Influenza — United States, 2017.
  - These recommendations work better when implemented in concert.
- While the new guidelines are recommended for the next 15 days, government leaders will continually reassess the status of the outbreak in the United States. It may be possible to extend these recommended measures for additional periods of time.
- This is a historic, unprecedented outbreak, the likes of which have not been seen since the influenza pandemic of 1918.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Pandemic
March 18, 2020 as of 11:20pm

SITUATION UPDATE

- 7,038 reported cases of COVID-19 have been detected in all 50 states.
- 276 of these cases occurred through close contact with another case.
- 269 cases occurred in persons who had traveled to international areas with sustained (ongoing) transmission and among their close contacts.
- 6,493 cases are still being investigated to determine the source of exposure.
    - The number of cases of COVID-19 being reported in the United States is rising quickly.
    - With increasing laboratory testing and reporting across the country, CDC expected to see a rise in cases, but the growing number of cases also reflects a rapid spread of disease across communities
    - While these numbers are concerning, it's not unexpected and the more robust information will allow us to better understand and track the size and scope of the outbreak and strengthen prevention and response efforts.
- As of the evening of March 16, 89 state and local public health labs in 50 states, the District of Columbia, Guam, and Puerto Rico have verified they are successfully using COVID-19 diagnostic tests. See map showing which states and territories have one or more laboratories that have successfully verified and are currently using COVID-19 diagnostic tests.
- As of the evening of March 17, 2020, CDC and local and state public health laboratories had tested a total of 37,824 specimens.
- CDC is adapting some of the agency's existing surveillance systems to better track COVID-19.
- The agency will roll out a COVID-19 surveillance report in the coming days.
- On Monday, March 16 CDC reported the first confirmed case in a CDC employee.

MMWR PUBLICATIONS

- On March 18, CDC published COVID-19 in a Long-Term Care Facility — King County, Washington, February 27–March 9, 2020 in the Morbidity & Mortality Weekly Report.
    - This report looked at an outbreak of COVID-19 in a long-term residential care facility in Washington state. During the outbreak, 81 residents of one facility were infected along with 34 staff members and 14 visitors. Twenty-three people died.
    - An investigation into the outbreak identified factors that likely contributed to the vulnerability of these facilities, including:
        1. Staff members who worked while symptomatic;
        2. Staff members who worked in more than one facility;
        3. Inadequate familiarity and adherence to standard, droplet, and contact precautions and eye protection recommendations;
        4. Challenges to implementing infection control practices including inadequate supplies of PPE and other items (e.g., alcohol-based hand sanitizer)
        5. Delayed recognition of cases because of low index of suspicion, limited testing availability, and difficulty identifying persons with COVID-19 based on signs and symptoms alone.
    - These findings underscore improvements that can be made across long-term care facilities in the United States to help protect residents from COVID-19 outbreaks as the pandemic continues to expand in the United States.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Pandemic
March 18, 2020 as of 11:20pm

- On March 18, CDC published Severe Outcomes Among Patients with Coronavirus Disease 2019 (COVID-19) — United States, February 12–March 16, 2020 in the Morbidity & Mortality Weekly Report.
    - This report looked at severity of disease—by age group—among 4,226 COVID-19 cases in the United States that occurred during February 12–March 16, 2020.
    - Overall, 31% of cases, 45% of hospitalizations, 53% of ICU admissions, and 80% of deaths associated with COVID-19 occurred among adults aged 65 years or older. The highest percentage of severe outcomes were among persons adults aged 85 years or older.

- This is a historic, unprecedented outbreak, the likes of which have not been seen since the influenza pandemic of 1918.
- The White House Task Force on Coronavirus has established www.coronavirus.gov as the centralized website for the Federal government.
  - CDC continues to maintain www.cdc.gov/covid19.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Pandemic
March 19, 2020 as of 10:30pm

SITUATION UPDATE

- 10,442 reported cases of COVID-19 have been detected in all 50 states.
- 310 of these cases occurred through close contact with another case.
- 290 cases occurred in persons who had traveled to international areas with sustained (ongoing) transmission and among their close contacts.
- 9,842 cases are still being investigated to determine the source of exposure.
    - The number of cases of COVID-19 being reported in the US is rising quickly.
    - This increase was expected given an increase in testing and ongoing rapid spread of disease across communities in the United States.
    - While these numbers are concerning, the increase is not unexpected.
    - More robust data will allow us to better understand and track the size and scope of the outbreak and strengthen prevention and response efforts.
- A CDC study published March 17 shows that younger people can develop serious COVID-19 illness requiring hospitalization. This finding is different from the first reports from China. Younger people are still much less likely to die from COVID-19 than older people. (See MMWR Publications)
- As of the evening of March 18, 89 state and local public health labs in 50 states, the District of Columbia, Guam and Puerto Rico have verified they are successfully using COVID-19 diagnostic tests. See map showing which states and territories have one or more laboratories that have successfully verified and are currently using COVID-19 diagnostic tests.
- As of the evening of March 19, 2020, CDC and local and state public health laboratories had tested a total of 44,872 specimens.
- Private laboratories are increasing their testing capacity. In addition to the approximately 2,500 tests per day currently done nationally, it is projected that:
    - Roche will increase their capacity up to 10,000 tests per day by end of this week
    - BioReference will increase their capacity by an additional 3,000 tests per day.
- CDC is adapting some of the agency's existing surveillance systems to better track COVID-19.
    - CDC plans to roll out a COVID-19 surveillance report next week.
- On Monday, March 16, CDC reported the first confirmed case in a CDC employee.

MMWR PUBLICATIONS

- On March 18, CDC published COVID-19 in a Long-Term Care Facility — King County, Washington, February 27–March 9, 2020 in the Morbidity & Mortality Weekly Report.
    - This report looked at an outbreak of COVID-19 in a long-term residential care facility in Washington state. During the outbreak, 81 residents of one facility were infected along with 34 staff members and 14 visitors. Twenty-three people died.
    - An investigation into the outbreak identified factors that likely contributed to the vulnerability of these facilities, including:
        1. Staff members who worked while symptomatic;
        2. Staff members who worked in more than one facility;
        3. Inadequate familiarity and adherence to standard, droplet, and contact precautions and eye protection recommendations;

AMERICAN OVERSIGHT

4. Challenges to implementing infection control practices including inadequate supplies of PPE and other items (e.g., alcohol-based hand sanitizer)
5. Delayed recognition of cases because of low index of suspicion, limited testing availability, and difficulty identifying persons with COVID-19 based on signs and symptoms alone.

- These findings underscore improvements that can be made across long-term care facilities in the United States to help protect residents from COVID-19 outbreaks as the pandemic continues to expand in the United States.

- On March 18, CDC published Severe Outcomes Among Patients with Coronavirus Disease 2019 (COVID-19) — United States, February 12–March 16, 2020 in the Morbidity & Mortality Weekly Report.
  - This report looked at severity of disease—by age group—among 4,226 COVID-19 cases in the United States that occurred during February 12–March 16, 2020.
  - Overall, 31% of cases, 45% of hospitalizations, 53% of ICU admissions, and 80% of deaths associated with COVID-19 occurred among adults aged 65 years or older. The highest percentage of severe outcomes were among persons adults aged 85 years or older.
  - Among 2,449 patients with known age, 6% were aged 85 years or older, 25% were aged 65–84 years, 18% each were aged 55–64 years and 45–54 years, and 29% were aged 20–44 years. Only 5% of cases occurred in persons aged 0–19 years.
  - Similar to reports from other countries, this finding suggests that the risk for serious disease and death from COVID-19 is higher in older age groups.
  - These preliminary data also demonstrate that severe illness leading to hospitalization, including ICU admission and death, can occur in adults of any age with COVID-19.
  - Approximately 49 million people in the United States are aged 65 years or older.
  - Data on other risk factors, including serious underlying health conditions that could increase risk for complications and severe illness, were unavailable at the time of this analysis.

CDC GUIDANCE UPDATES

- On March 17, 2020, CDC updated guidance, Strategies for Optimizing the Supply of N95 Respirators: Crisis/Alternate Strategies.
- CDC is reviewing and updating travel notices almost on a daily basis.
  - On March 18, CDC posted a Level 3 Travel Health Notice (Avoid Nonessential Travel) for Malaysia. Malaysia is experiencing widespread ongoing transmission of respiratory illness caused by COVID-19.
  - U.S. citizens, residents, and their immediate family members who have been in China, Iran, the United Kingdom, Ireland or any one of 26 European countries within in the past 14 days can enter the United States, but they are subject to health monitoring and possible quarantine for up to 14 days.
  - CDC also has a Global Level 2 Travel Health Notice recommending older adults and those who have chronic medical conditions consider postponing nonessential travel.
  - On March 17, CDC posted a Level 3 Travel Health Notice for Cruise Ship Travel, recommending travelers defer all cruise ship travel worldwide.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Pandemic
March 19, 2020 as of 10:30pm

- CDC updated its guidance for specimen collection for testing for COVID-19 to collect a single upper respiratory nasopharyngeal swab (NP) instead of an NP and oropharyngeal swab (OP).
- CDC also posted new guidance on when people who have had COVID-19 and have been isolating at home can discontinue isolating in Discontinuation of Home Isolation for Persons with COVID-19.
    - Persons with COVID-19 who have symptoms and were directed to care for themselves at home may discontinue home isolation if:
        - At least 3 days (72 hours) have passed since recovery—defined as resolution of fever without the use of fever-reducing medications and improvement in respiratory symptoms (e.g., cough, shortness of breath); and,
        - At least 7 days have passed since symptoms first appeared.
- CDC posted Guidance for child care settings, including a decision tree on when schools should close.

WHAT YOU CAN DO

- Everyone can do their part to help respond to this emerging public health threat:
    - On March 16, the White House announced a program called 15 Days to Slow the Spread which is a nationwide effort to slow the spread of COVID-19 through the implementation of social distancing at all levels of society.
    - Older people and people with severe chronic conditions should take special precautions because they are at higher risk of developing serious COVID-19 illness.
    - If you are a healthcare provider, use your judgement to determine if a patient has signs and symptoms compatible with COVID-19 and whether the patient should be tested. Factors to consider, in addition to clinical symptoms, may include:
        - Does the patient have recent travel from an affected area?
        - Has the patient been in close contact with someone with COVID-19 or patients with pneumonia of unknown cause?
        - Does the patient reside in an area where there has been community spread of COVID-19?
    - If you are a healthcare provider or a public health responder caring for a COVID-19 patient, please take care of yourself and follow recommended infection control procedures.
    - If you are a close contact of someone with COVID-19 and develop symptoms of COVID-19, call your healthcare provider and tell them about your symptoms and your exposure. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.
    - For people who are ill with COVID-19, but are not sick enough to be hospitalized, please follow CDC guidance on how to reduce the risk of spreading your illness to others. People who are mildly ill with COVID-19 are able to isolate at home during their illness.
    - If you have been in China or another affected area or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Pandemic
March 20, 2020 as of 10:45pm

Updated text is shown in colored text.

SNAPSHOT

- CDC has reported:
  - 15,219 confirmed and presumptive positive cases of COVID-19
  - 201 COVID-19-related deaths
  - All 50 states, the District of Columbia, Puerto Rico, Guam, and the US Virgin Islands have reported cases of COVID-19.

MAIN KEY POINTS

- On March 16, 2020 President Trump and the White House Coronavirus Task Force issued new guidelines to help protect Americans during the Coronavirus pandemic.
  - The initiative, called 15 Days to Slow the Spread, lays out guidelines for a nationwide effort to slow the spread of COVID-19. It calls for the implementation of measures to increase social distancing between people at all levels of society.
  - This is a massive proactive, preventive response to COVID-19. It aims to slow the spread and blunt the impact of this disease on the United States.
- All segments of U.S. society have a role to play at this time:
  - People across the country are asked to stay home as much as much as possible and otherwise practice social distancing.
  - This includes canceling or postponing gatherings of more than 10 people and closing schools in some areas as determined by local and state governments.
  - It also includes special measures to protect those people who are most vulnerable to this disease.
    - Two CDC Morbidity & Mortality Weekly Reports (MMWRs) published March 17 underscore how vulnerable older people are to developing serious illness from COVID-19. (See section MMWR publications.)
  - People who are sick are asked to follow CDC guidance on recovering at home and follow the new guidance for when it's OK to interact with other people again.
- There is no vaccine to protect against COVID-19 and no medications approved to treat it.
- There is a body of evidence—based on about 200 journal articles—that supports the effectiveness of social distancing measures, both when used alone and in combination with other measures.
  - Much of this data is outlined in CDC's Community Mitigation Guidelines to Prevent Pandemic Influenza — United States, 2017.
  - These recommendations work better when implemented in concert.
- While the new guidelines are recommended for the next 15 days, government leaders will continually reassess the status of the outbreak in the United States. It may be that these measures will need to be modified or extended for additional periods of time.
- This is a historic, unprecedented outbreak, the likes of which have not been seen since the influenza pandemic of 1918.
- The White House Task Force on Coronavirus has established www.coronavirus.gov as the centralized website for the Federal government.
  - CDC continues to maintain www.cdc.gov/covid19.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Pandemic
March 20, 2020 as of 10:45pm

- CDC continues to maintain www.cdc.gov/covid19.

SITUATION UPDATE

- 15,219 reported cases of COVID-19 have been detected in all 50 states.
- 321 of these cases occurred through close contact with another case.
- 337 cases occurred in persons who had traveled to international areas with sustained (ongoing) transmission and among their close contacts.
- 14,561 cases are still being investigated to determine the source of exposure.
    - The number of cases of COVID-19 being reported in the US is rising quickly.
    - This increase was expected given an increase in testing and ongoing rapid spread of disease across communities in the United States.
- While these numbers are concerning, the increase is not unexpected.
- More robust data will allow us to better understand and track the size and scope of the outbreak and strengthen prevention and response efforts.
- On March 20, 2020, new web content on the 15-Day Pause was posted. The 15-day pause recommended by the White House presents the entire country with an opportunity to implement actions designed to slow and limit the spread of COVID-19.
- On March 19, 2020, a new online interactive COVID-19 symptom self-checker was launched.
    - The self-checker helps users make decisions about seeking appropriate medical care. This system is not intended for diagnosis or treatment of COVID-19 or other diseases.
    - As of the morning of March 20, 2020, approximately 25,000 users per hour had used the self-checker. The self-checker is being used by people from the United States and other countries.
- On March 18, 2020, CDC posted a new webpage with guidance for colleges and universities including:
    - Interim Guidance for Administrators of US Institutions of Higher Education
        - FAQs for Administrators of Institutes of Higher Education
- On March 19, 2020, CDC posted additional guidance on COVID-19 for clinicians and health care facilities, including:
    - Protect Your Patients and Staff from COVID-19: CDC's Recommended Infection Control Procedures
    - Disinfecting Your Facility if Someone is Sick
    - Clinician Toolkit, which includes outdoor and indoor signs and patient handouts with tips for home care
- On March 18, 2020, CDC Principal Deputy Director Dr. Anne Schuchat did a Q&A on What to Expect When You're Expecting for an audience of 16 million new and expectant mothers. Dr. Schuchat answered questions related to COVID-19 and pregnancy, infant care, and breastfeeding.
- A CDC study published March 17 shows that younger people can develop serious COVID-19 illness requiring hospitalization. This finding is different from the first reports from China. Younger people are still much less likely to die from COVID-19 than older people. (See MMWR Publications)

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Pandemic
March 20, 2020 as of 10:45pm

- As of March 17, 2020, there are confirmed COVID-19 cases in corrections facilities in NY, WA and GA. Discussion of implementing releases of non-violent offenders to reduce populations incarcerated, decrease chance of spread.
- As March 19, 91 state and local public health labs in 50 states, the District of Columbia, Guam and Puerto Rico have verified they are successfully using COVID-19 diagnostic tests. See map showing which states and territories have one or more laboratories that have successfully verified and are currently using COVID-19 diagnostic tests.
- As of March 19, 2020, CDC and local and state public health laboratories had tested a total of 54,205 specimens.
- Private laboratories are increasing their testing capacity. In addition to the approximately 2,500 tests per day currently done nationally, it is projected that:
    - Roche will increase their capacity up to 10,000 tests per day by end of this week
    - BioReference will increase their capacity by an additional 3,000 tests per day.
- CDC is adapting some of the agency's existing surveillance systems to better track COVID-19.
    - CDC plans to roll out a COVID-19 surveillance report next week.
- On Monday, March 16, CDC reported the first confirmed case in a CDC employee.

CDC GUIDANCE UPDATES

- On March 19, CDC updated technical guidance and consumer information about cleaning and disinfecting your home when someone is sick.
- On March 17, updates were made to CDC guidance on alternate non-95 PPE guidance: Strategies for Optimizing the Supply of N95 Respirators: Crisis/Alternate Strategies.
- CDC is reviewing and updating travel notices almost on a daily basis.
    - On March 19, the U.S. State Department posted a Level 4 Global Health Advisory, warning travelers Do Not Travel.
    - On March 19, CDC posted after-travel precautions for Travelers from Countries with Widespread Sustained (Ongoing) Transmission Arriving in the United States.
    - On March 18, CDC posted a Level 3 Travel Health Notice (Avoid Nonessential Travel) for Malaysia. Malaysia is experiencing widespread ongoing transmission of respiratory illness caused by COVID-19.
    - U.S. citizens, residents, and their immediate family members who have been in China, Iran, the United Kingdom, Ireland or any one of 26 European countries within in the past 14 days can enter the United States, but they are subject to health monitoring and possible quarantine for up to 14 days.
    - CDC also has a Global Level 2 Travel Health Notice recommending older adults and those who have chronic medical conditions consider postponing nonessential travel.
    - On March 17, CDC posted a Level 3 Travel Health Notice for Cruise Ship Travel, recommending travelers defer all cruise ship travel worldwide.
- CDC updated its guidance for specimen collection for testing for COVID-19 to collect a single upper respiratory nasopharyngeal swab (NP) instead of an NP and oropharyngeal swab (OP).
- CDC also posted new guidance on when people who have had COVID-19 and have been isolating at home can discontinue isolating in Discontinuation of Home Isolation for Persons with COVID-19.

AMERICAN OVERSIGHT

    - Persons with COVID-19 who have symptoms and were directed to care for themselves at home may discontinue home isolation if:
        - At least 3 days (72 hours) have passed since recovery—defined as resolution of fever without the use of fever-reducing medications and improvement in respiratory symptoms (e.g., cough, shortness of breath); and,
        - At least 7 days have passed since symptoms first appeared.
- CDC posted Guidance for child care settings, including a decision tree on when schools should close.

WHAT YOU CAN DO

- Everyone can do their part to help respond to this emerging public health threat:
    - On March 16, the White House announced a program called 15 Days to Slow the Spread which is a nationwide effort to slow the spread of COVID-19 through the implementation of social distancing at all levels of society.
    - Older people and people with severe chronic conditions should take special precautions because they are at higher risk of developing serious COVID-19 illness.
    - If you are a healthcare provider, use your judgement to determine if a patient has signs and symptoms compatible with COVID-19 and whether the patient should be tested. Factors to consider, in addition to clinical symptoms, may include:
        - Does the patient have recent travel from an affected area?
        - Has the patient been in close contact with someone with COVID-19 or patients with pneumonia of unknown cause?
        - Does the patient reside in an area where there has been community spread of COVID-19?
    - If you are a healthcare provider or a public health responder caring for a COVID-19 patient, please take care of yourself and follow recommended infection control procedures.
    - If you are a close contact of someone with COVID-19 and develop symptoms of COVID-19, call your healthcare provider and tell them about your symptoms and your exposure. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.
    - For people who are ill with COVID-19, but are not sick enough to be hospitalized, please follow CDC guidance on how to reduce the risk of spreading your illness to others. People who are mildly ill with COVID-19 are able to isolate at home during their illness.
    - If you have been in China or another affected area or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus.

Whether diseases start at home or abroad, are curable or preventable, chronic or acute, or from human activity or deliberate attack, CDC responds to America's most pressing health threats. CDC is headquartered in Atlanta and has experts located throughout the United States and the world.

Subject:	3-23-20 CDC COVID-19 Key Points and Summary of Updated Guidance Documents
Date:	Monday, March 23, 2020 11:20:42 PM
Attachments:	CDC_COVID-19_Daily Key Points__3_23_2020_FINAL.pdf

Dear Colleagues:

Attached please find the CDC COVID-19 key points for Monday, March 23, 2020. Please feel free to share with your staff and other partners.

Below is a summary of CDC COVID-19 new/updated guidance documents as of Monday, March 23, 2020.

New Guidance= Highlighted
All others, updated since March 21, 2020.

At-Risk

- Children and Coronavirus Disease 2019 (COVID-19)
- Interim Guidance for responding to coronavirus disease 2019 (COVID-19) among people experiencing unsheltered homelessness
- List of underlying medical Conditions (updated)

Communication Resources:

- Print Resources: Stay at home if you are sick!

Community Mitigation:

- Interim Guidance on Management of Coronavirus Disease 2019 (COVID-19) in Correctional and Detention Facilities
- Interim Guidance for Businesses and Employers to Plan and Respond to Coronavirus Disease 2019 (COVID-19)

Cruise Ships

- Cruise Passengers returning via charter flights

Healthcare

- Discontinuation of Transmission-Based Precautions and Disposition of Patients with COVID-19 in Healthcare Settings (Interim Guidance)
- Interim Infection Control Guidance on COVID-19 for Personnel at Blood and Plasma Collection Facilities

AMERICAN OVERSIGHT

- Interim Guidance for Collection and Submission of Postmortem Specimens from Deceased Persons Under Investigation (PUI) for COVID-19, February 2020
- Interim Guidance for Discontinuation of Transmission-Based Precautions and Disposition of Hospitalized Patients with COVID-19

Infection Control

- Environmental Cleaning Guidance for community facilities and households

Risk Assessment

- Risk Assessment and Management Guidance (updated)

Travel Notices:

- Level 3 Travel Health Notices: Chile, Pakistan, Thailand, Turkey

You can also keep up with CDC updates on Coronavirus Disease 2019 by signing up for email updates, syndicating available content, and subscribing to Coronavirus Disease 2019 RSS Feed.

Kind Regards,

CDC State Coordination Task Force

(Sent by BCC to PHEP directors, state epidemiologists, state health officials, public health laboratory directors, BCHC, and national and federal partners)

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Pandemic
March 23, 2020 as of 10:45pm

Updated text is shown in colored text.

SNAPSHOT

- CDC has reported:
  - 33,404 confirmed and presumptive positive cases of COVID-19
  - 400 COVID-19-related deaths
  - All 50 states, the District of Columbia, Puerto Rico, Guam, and the US Virgin Islands have reported cases of COVID-19.

MAIN KEY POINTS

- On March 16, 2020 President Trump and the White House Coronavirus Task Force issued new guidelines to help protect Americans during the Coronavirus pandemic.
  - The initiative, called 15 Days to Slow the Spread, lays out guidelines for a nationwide effort to slow the spread of COVID-19. It calls for the implementation of measures to increase social distancing between people at all levels of society.
  - This is a massive proactive, preventive response to COVID-19. It aims to slow the spread and blunt the impact of this disease on the United States.
- All segments of U.S. society have a role to play at this time:
  - People across the country are asked to stay home as much as much as possible and otherwise practice social distancing.
  - This includes canceling or postponing gatherings of more than 10 people and closing schools in some areas as determined by local and state governments.
  - It also includes special measures to protect those people who are most vulnerable to this disease.
    - Two CDC Morbidity & Mortality Weekly Reports (MMWRs) published March 17 underscore how vulnerable older people are to developing serious illness from COVID-19.
  - People who are sick are asked to follow CDC guidance on recovering at home and follow the new guidance for when it's OK to interact with other people again.
- There is no vaccine to protect against COVID-19 and no medications approved to treat it.
- There is a body of evidence—based on about 200 journal articles—that supports the effectiveness of social distancing measures, both when used alone and in combination with other measures.
  - Much of this data is outlined in CDC's Community Mitigation Guidelines to Prevent Pandemic Influenza — United States, 2017.
  - These recommendations work better when implemented in concert.
- While the new guidelines are recommended for the next 15 days, government leaders will continually reassess the status of the outbreak in the United States. It may be that these measures will need to be modified or extended for additional periods of time.
- This is a historic, unprecedented outbreak, the likes of which have not been seen since the influenza pandemic of 1918.
- The White House Task Force on Coronavirus has established www.coronavirus.gov as the centralized website for the Federal government.
  - CDC continues to maintain www.cdc.gov/covid19.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Pandemic
March 23, 2020 as of 10:45pm

SITUATION UPDATE

- 33,404 reported cases of COVID-19 have been detected in all 50 states.
- 539 of these cases occurred through close contact with another case.
- 449 cases occurred in persons who had traveled to international areas with sustained (ongoing) transmission and among their close contacts.
- 32,416 cases are still being investigated to determine the source of exposure.
    - The number of cases of COVID-19 being reported in the US is rising quickly.
    - This increase was expected given an increase in testing and ongoing rapid spread of disease across communities in the United States.
- While these numbers are concerning, the increase is not unexpected.
- More robust data will allow us to better understand and track the size and scope of the outbreak and strengthen prevention and response efforts.
- On March 20, new web content on the 15-Day Pause was posted. The 15-day pause recommended by the White House presents the entire country with an opportunity to implement actions designed to slow and limit the spread of COVID-19.
- On March 19, a new online interactive COVID-19 symptom self-checker was launched.
    - The self-checker helps users make decisions about seeking appropriate medical care. This system is not intended for diagnosis or treatment of COVID-19 or other diseases.
- On March 18, CDC posted a new webpage with guidance for colleges and universities including:
    - Interim Guidance for Administrators of US Institutions of Higher Education
    - FAQs for Administrators of Institutes of Higher Education
- On March 19, CDC posted additional guidance on COVID-19 for clinicians and health care facilities, including:
    - Guidance on infection control procedures to Protect Your Patients and Staff from COVID-19;
    - Disinfecting Your Facility if Someone is Sick; and
    - A Clinician Toolkit, which includes outdoor and indoor signs and patient handouts with tips for home care.
    - On March 18, CDC Principal Deputy Director Dr. Anne Schuchat did a Q&A on What to Expect When You're Expecting for an audience of 16 million new and expectant mothers. Dr. Schuchat answered questions related to COVID-19 and pregnancy, infant care, and breastfeeding.
- A CDC study published March 17 shows that younger people can develop serious COVID-19 illness requiring hospitalization. This finding is different from the first reports from China. Younger people are still much less likely to die from COVID-19 than older people.
- As of March 17, 2020, there are confirmed COVID-19 cases in corrections facilities in NY, WA and GA. Discussion of implementing releases of non-violent offenders to reduce populations incarcerated, decrease chance of spread.
- As of March 22, 91 state and local public health labs in 50 states, the District of Columbia, Guam, and Puerto Rico have verified they are successfully using COVID-19 diagnostic tests. See map showing which states and territories have one or more laboratories that have successfully verified and are currently using COVID-19 diagnostic tests.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Pandemic
March 23, 2020 as of 10:45pm

- As of March 22, CDC and local and state public health laboratories had tested a total of 61,847 specimens.
- Private laboratories are increasing their testing capacity. In addition to the approximately 2,500 tests per day currently done nationally, it is projected that:
    - Roche will increase their capacity up to 10,000 tests per day by end of this week
    - BioReference will increase their capacity by an additional 3,000 tests per day.
- CDC is adapting some of the agency's existing surveillance systems to better track COVID-19.
    - CDC plans to roll out a COVID-19 surveillance report next week.
- On Monday, March 16, CDC reported the first confirmed case in a CDC employee.

CDC GUIDANCE UPDATES

- On March 22, CDC posted COVID-19 information specific to children including:
    - Tips for parents during school dismissal,
    - Guidance for Schools and Childcare Programs, and
    - Updated FAQs related to children and COVID-19
- On March 22, CDC posted Guidance for Retirement Communities and Independent Living to help them plan, prepare, and respond to COVID-19.
- On March 19, CDC updated technical guidance and consumer information about cleaning and disinfecting your home when someone is sick.
- On March 17, updates were made to CDC guidance on alternate non-95 PPE guidance: Strategies for Optimizing the Supply of N95 Respirators: Crisis/Alternate Strategies.
- CDC is reviewing and updating travel notices almost on a daily basis.
    - As of March 23, CDC has issued 9 additional Level 3 Travel notices for Australia, Brazil, Canada, Chile, Israel, Japan, Pakistan, Thailand, and Turkey.
    - On March 19, the U.S. State Department posted a Level 4 Global Health Advisory, warning travelers Do Not Travel.
    - On March 19, CDC posted after-travel precautions for Travelers from Countries with Widespread Sustained (Ongoing) Transmission Arriving in the United States.
    - On March 18, CDC posted a Level 3 Travel Health Notice (Avoid Nonessential Travel) for Malaysia. Malaysia is experiencing widespread ongoing transmission of respiratory illness caused by COVID-19.
    - U.S. citizens, residents, and their immediate family members who have been in China, Iran, the United Kingdom, Ireland or any one of 26 European countries within in the past 14 days can enter the United States, but they are subject to health monitoring and possible quarantine for up to 14 days.
    - CDC also has a Global Level 2 Travel Health Notice recommending older adults and those who have chronic medical conditions consider postponing nonessential travel.
    - On March 17, CDC posted a Level 3 Travel Health Notice for Cruise Ship Travel, recommending travelers defer all cruise ship travel worldwide.
    - On March 21, CDC posted additional guidance for travelers returning from cruise ships.
- CDC updated its guidance for specimen collection for testing for COVID-19 to collect a single upper respiratory nasopharyngeal swab (NP) instead of an NP and oropharyngeal swab (OP).

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Pandemic
March 23, 2020 as of 10:45pm

- CDC also posted new guidance on when people who have had COVID-19 and have been isolating at home can discontinue isolating in Discontinuation of Home Isolation for Persons with COVID-19.
    - Persons with COVID-19 who have symptoms and were directed to care for themselves at home may discontinue home isolation if:
        - At least 3 days (72 hours) have passed since recovery—defined as resolution of fever without the use of fever-reducing medications and improvement in respiratory symptoms (e.g., cough, shortness of breath); and,
        - At least 7 days have passed since symptoms first appeared.
- CDC posted Guidance for child care settings, including a decision tree on when schools should close.

WHAT YOU CAN DO

- Everyone can do their part to help respond to this emerging public health threat:
    - On March 16, the White House announced a program called 15 Days to Slow the Spread which is a nationwide effort to slow the spread of COVID-19 through the implementation of social distancing at all levels of society.
    - Older people and people with severe chronic conditions should take special precautions because they are at higher risk of developing serious COVID-19 illness.
    - If you are a healthcare provider, use your judgement to determine if a patient has signs and symptoms compatible with COVID-19 and whether the patient should be tested. Factors to consider, in addition to clinical symptoms, may include:
        - Does the patient have recent travel from an affected area?
        - Has the patient been in close contact with someone with COVID-19 or patients with pneumonia of unknown cause?
        - Does the patient reside in an area where there has been community spread of COVID-19?
    - If you are a healthcare provider or a public health responder caring for a COVID-19 patient, please take care of yourself and follow recommended infection control procedures.
    - People who get a fever or cough should consider whether they might have COVID-19, depending on where they live, their travel history or other exposures.
        - More than half of the United States is seeing some level of community spread of COVID-19.
        - Testing for COVID-19 may be accessed through medical providers or public health departments, but there is no treatment for this virus.
        - Most people have mild illness and are able to recover at home without medical care.
    - For people who are ill with COVID-19, but are not sick enough to be hospitalized, please follow CDC guidance on how to reduce the risk of spreading your illness to others. People who are mildly ill with COVID-19 are able to isolate at home during their illness.
    - If you have been in China or another affected area or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement

AMERICAN OVERSIGHT

and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus.

For more information please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

Dear Colleagues,

Attached please find the CDC COVID-19 weekly key messages for Sunday, March 22, 2020. Feel free to share with your staff and other partners.

In addition, CDC released/updated several guidance documents on the CDC COVID-19 webpage.

- New People who are at higher risk for severe illness (consumer page)
- New COVID-19 and Underlying Medical Conditions (healthcare professional page)
- New Interim Guidance for Responding to Coronavirus Disease 2019 (COVID-19) among People Experiencing Unsheltered Homelessness
- Updates to Information for Health Departments on Reporting Cases of COVID-19
    - COVID-19 Case Report Form Instructions
    - Completing a CRF and Specimen guidance
- New FAQs for consumers on Higher Risk & Underlying Conditions

CORONAVIRUS DISEASE 2019 (COVID-19) NAMING

- The International Committee on Taxonomy of Viruses named the novel coronavirus causing an outbreak of respiratory illness that was first detected in Wuhan, Hubei Province, China, Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-CoV-2).
    - Due to potential for confusion with SARS-CoV, where possible, public communications will use “the virus that causes COVID-19.”
- On February 11, 2020, the World Health Organization (WHO) named the disease caused by this virus Coronavirus Disease 2019 (COVID-19).
    - **Disease name:** COVID-19

OUTBREAK SUMMARY

- There is an expanding outbreak of COVID-19 caused by a novel (new) coronavirus.
    - The outbreak began in China but is spreading worldwide and is now considered a pandemic.

AMERICAN OVERSIGHT

- Initially, many of the patients reportedly had some link to a large seafood and animal market, suggesting animal-to-person spread. Since then, sustained (ongoing) person-to-person spread in the community is occurring in some international locations.
- The newly-emerged COVID-19 is a respiratory disease that seems to be spreading much like flu. It can spread from person to person.
- The new virus can cause illness varying from mild to severe, including potentially resulting in death.
- Outbreaks like this — when a new virus has emerged to infect people and spread between people — are especially concerning.

International

- Global case numbers are reported by WHO in their COVID-19 situation reports.
    - As of **March 21, 292,142** cases have been confirmed worldwide. More than **210,644** of these cases have occurred outside of China.
- On January 30, WHO declared this outbreak a Public Health Emergency of International Concern (PHEIC). A PHEIC is declared if an event poses a public health threat to other nations through the spread of disease and potentially requires a coordinated international response.
- On March 11, 2020, WHO announced that the outbreak of COVID-19 can be characterized as a pandemic.

Domestic

- On January 31, Health and Human Services Secretary Alex M. Azar II declared a public health emergency for the United States to aid the nation's healthcare community in responding to COVID-19.
- This is a very serious public health threat and the federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The goal of the ongoing US public health response is to minimize introductions of this virus, detect new cases quickly, and reduce community spread of this new coronavirus in the US.
- As the virus continues to spread internationally and in the United States, it becomes harder and harder contain its spread.
- What is currently known about the potential cases of community spread has raised the level of concern about the immediate threat for COVID-19 for certain communities.
- The coming days and weeks are likely to bring more confirmed cases of COVID-19 in the United States and globally, but strong public health measures now may blunt the impact of the virus in the United States.
- Pandemics of respiratory disease follow a certain progression outlined in the Pandemic Intervals Framework, part of the National Pandemic Strategy.
    - Pandemics begin with an investigation phase, followed by recognition, initiation, and acceleration phases.

AMERICAN OVERSIGHT

    - The peak of illnesses occurs at the end of the acceleration phase, which is followed by a deceleration phase, during which there is a decrease in illnesses.
    - Different countries can be in different phases of the pandemic at any point in time and different parts of the same country can also be in different phases of a pandemic.
    - Nationally, the United States is currently in the initiation phase, but states where community spread is occurring are in the acceleration phase.
    - The duration and severity of each phase can vary depending on the characteristics of the virus and the public health response.
- Public health partners are encouraged to review their pandemic preparedness plans at this time. Selected pandemic preparedness materials are available online.
- On March 13, the President of the United States declared the COVID-19 outbreak a national emergency.
- On March 16, the White House announced a program called "15 Days to Slow the Spread." This is a nationwide effort to slow the spread of COVID-19 through the implementation of social distancing at all levels of society.

U.S. OUTBREAK STATISTICS

Cases in the United States as of **March 20, 2020:**

- **Travel-related: 337**
- **Close contact: 321**
- **Under investigation: 14,561**
- **Total cases: 15,219**
- **Deaths: 201**
- **Jurisdictions reporting cases: All 50 states, the District of Columbia, Puerto Rico, Guam, and the US Virgin Islands have reported cases of COVID-19**

For global cases, please see the WHO daily situation reports.

SITUATION IN THE U.S.

- The number of cases of COVID-19 being reported in the United States is rising quickly.
    - This increase is expected given an increase in testing and ongoing rapid spread of disease across communities in the United States.
    - While these numbers are concerning, the increase is not unexpected.
    - More robust data will allow us to better understand and track the size and scope of the outbreak and strengthen prevention and response efforts.
- Different parts of the country are seeing different levels of COVID-19 activity. The United States nationally is currently in the initiation phase, but states where community spread is occurring are in the acceleration phase. The duration and severity of each phase can vary depending on the characteristics of the virus and the public health response.
- CDC and state and local public health laboratories are testing for the virus that causes COVID-19.
- More and more states are reporting cases of COVID-19 to CDC.
- U.S. COVID-19 cases include:
    - Imported cases in travelers
    - Cases among close contacts of a known case

AMERICAN OVERSIGHT

    - Community-acquired cases where the source of the infection is unknown.
- Twenty-seven U.S. states are reporting some community spread of COVID-19.

CORONAVIRUS BACKGROUND

- Coronaviruses are a group of viruses that have a halo or crown-like (corona) appearance when viewed under a microscope. They are common in many different species of animals, including camels, cattle, cats, and bats.
- It is rare for animal coronaviruses to become capable of infecting humans and then spreading between people.
    - Severe acute respiratory syndrome (SARS-CoV) and Middle East respiratory syndrome (MERS-CoV) are examples of coronaviruses that originated in animals and spread to people.
    - That is what is suspected happened with the virus that causes the current outbreak of COVID-19.
- Human coronaviruses are a common cause of mild to moderate upper-respiratory illness. But three coronaviruses have emerged to cause more severe illness: Severe Acute Respiratory Syndrome (SARS-CoV), Middle East Respiratory Syndrome (MERS-CoV), and now the virus that causes COVID-19.

TRANSMISSION

- Much is unknown about how the new coronavirus that causes COVID-19 spreads. Current knowledge is largely based on what is known about similar coronaviruses.
- Most often, person-to-person spread is thought to happen among people in close contact (about 6 feet) with each other.
- Person-to-person spread is thought to occur mainly through respiratory droplets produced when an infected person coughs or sneezes, similar to how influenza and other respiratory pathogens spread. These droplets can land in the mouths or noses of people who are nearby or possibly be inhaled into the lungs.
- How easily a virus spreads person-to-person can vary. Some viruses are highly contagious (like measles), while other viruses are less so.
- It may be possible that a person can get COVID-19 by touching a surface or object that has the virus on it and then touching their own mouth, nose, or possibly their eyes, but this is not thought to be the main way the virus spreads.
- Typically, with most respiratory viruses, people are thought to be most contagious when they are most symptomatic (sickest).
- Mother-to-child transmission during pregnancy is unlikely, but after birth a newborn is susceptible to person-to-person spread.
- There is no reason at this time to think that any animals, including pets, in the United States might be a source of infection with the new coronavirus that causes COVID-19.

AMERICAN OVERSIGHT

    - On February 28, the Hong Kong Agriculture, Fisheries and Conservation Department (AFCD) reported a pet dog had tested "weak positive" to COVID-19 through nose and mouth samples. The dog had contact with a person infected with COVID-19.
        - CDC is working with human and animal health partners to monitor this situation and will continue to provide updates as information becomes available.
        - It's important to remember that dogs have their own coronaviruses, which cannot spread to people.
            - *AFCD official report available*
- At this time, CDC has no data to suggest that this new coronavirus or other similar coronaviruses are spread by mosquitoes or ticks.
    - Mosquitoes and ticks cannot spread all types of viruses. For a virus to pass to a person through a mosquito or tick bite, the virus must be able to replicate inside the mosquito or tick.
- There is much more to learn about the spread of this new coronavirus, severity of the disease, and other features associated with this outbreak and investigations are ongoing. This information will further inform the risk assessment.

DIAGNOSIS AND TREATMENT

Diagnostics

- CDC developed a real time Reverse Transcription-Polymerase Chain Reaction (rRT-PCR) test to detect SARS-CoV-2 (the virus that causes COVID-19) in respiratory samples from clinical specimens.
- On January 24, CDC publicly posted the assay protocol for this test.
- CDC submitted an Emergency Use Authorization (EUA) package to the U.S. Food and Drug Administration on February 3 for its test.
- FDA approved the Emergency Use Authorization on February 4.
- The first manufactured batch of CDC test kits were made available for ordering by domestic and international partners through the agency's International Reagent Resource (IRR) on February 5.
- Upon arrival at public health laboratories, when laboratories began trying to verify the assay, several laboratories reported issues.
    - Specifically, some laboratories found sporadic reactivity in the negative control of one of the three assay components.
    - This sporadic activity resulted in an inconclusive test result.
- Routine quality control (QC) measures aim to identify these types of issues. It is unclear why QC did not detect this issue before the kits were sent out to states.
- On February 18, CDC stood up a new surge laboratory to support testing for COVID-19. This expanded capacity to 350 samples per day
- On February 20, CDC completed contracts with 2 large commercial manufacturers to ensure reagent availability for the public health laboratories

AMERICAN OVERSIGHT

- On February 26, CDC, in conjunction with FDA, determined how to move forward and shared this information immediately with public health labs through the Association of Public Health Laboratories (APHL):
    - CDC is remanufacturing the test kits to ensure that laboratories have effective and reliable kits. The new kits include the two components (e.g., reagents) that are specific to novel coronavirus.
    - Before new test kits were available:
        - States that were able to validate all three assays should continue to test in this manner.
        - States that were able to validate the other two assays (N1 and N2) can test using these two assays.
    - FDA granted CDC "enforcement discretion," which means that testing in this manner was able to move forward while an updated EUA is officially completed.
    - CDC distributed updated instructions for use through APHL.
- On February 27, CDC distributed new test kits to 7 laboratories to serve as evaluation sites to ensure these health departments are able to verify the assay. An additional 40 test kits were hand-carried to IRR for repackaging and distribution to additional public health labs.
- On February 29, IRR began to distribute new test kits to the additional 40 laboratories.
- On March 16, FDA reauthorized the EUA for the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel.
- As of March 21, 91 public health labs are running the CDC test, representing all 50 states, as well as the District of Columbia, Guam, and Puerto Rico.
- Commercial manufacturers are now producing their own tests.
- As of March 22, CDC has tested over 4,607 samples.
- Overall, CDC and public health labs have tested 71,870 samples as of March 22.

Treatment

- There is no specific antiviral treatment for COVID-19. People with COVID-19 should receive supportive care to help relieve symptoms.
- Most people have mild illness and are able to recover at home.
- For severe cases, treatment should include care to support vital organ functions.
- *See more in Management of Patients Guidance for Healthcare Providers section*

PREVENTION

- There is currently no vaccine to prevent COVID-19. The best way to prevent infection is to avoid being exposed to the virus.
- CDC always recommends everyday preventive actions to help prevent the spread of respiratory viruses, including:
    - Avoid touching your eyes, nose, and mouth with unwashed hands.
    - Avoid close contact with people who are sick.

AMERICAN OVERSIGHT

- Stay home when you are sick.
- Cover your cough or sneeze with a tissue, then throw the tissue in the trash.
- Clean and disinfect frequently touched objects and surfaces using a regular household cleaning spray or wipe.
- Wash your hands often with soap and water for at least 20 seconds, especially after blowing your nose, coughing or sneezing; going to the bathroom; and before eating or preparing food.
- If soap and water are not readily available, use an alcohol-based hand sanitizer with at least 60% alcohol. Always wash hands with soap and water if hands are visibly dirty.

PEOPLE AT RISK FOR SERIOUS ILLNESS

- Older adults and people who have severe underlying medical conditions are at higher risk for more serious COVID-19 illness.
- Eight out of 10 deaths reported in the United States have been in adults aged 65 years or older.
- Based upon available information to date, those most at risk include—
    - People 65 years and older
    - People who live in a nursing home or long-term care facility
    - People of any age with the following underlying medical conditions, particularly those that are not well controlled
        - Heart disease
        - Diabetes
        - Lung disease
- Severe illness leading to hospitalization, including ICU admission and death, can occur in adults of any age with COVID-19.
- The risk for serious disease and death from COVID-19 in the United States increases with age.
- Preliminary data in the United States indicate fatality is highest among persons aged 85 years or older, ranging from 10% to 27%.
- Early data suggest older people are twice as likely to have serious COVID-19 illness.
- If you are at increased risk for COVID-19 complications due to age or because you have a serious underlying medical condition, it is especially important for you to take actions to reduce your risk of exposure.
- If you are a person with a serious underlying medical condition that can put you at higher risk, stay home and away from other people.
    - Stock up on supplies.
    - Make a plan with family members, friends, caregivers, and/or healthcare providers and consider including the following in your plan:
        - Alternate caregiver in case your caregiver is sick or paid service is limited or unavailable—it's a good idea to have at least three alternate caregivers
        - A 30-day supply of medications and a checklist to monitor usage
        - Nonperishable food items for at least 14 days

AMERICAN OVERSIGHT

        - Phone bank plan in case of quarantine (this reduces feelings of loneliness and isolation)
    - If you feel sick, use these guidelines to reduce the risk of spread:
        - Stay home.
        - Call your healthcare provider and let them know about your symptoms. Tell them that you have or may have COVID-19. This will help them take care of you and keep other people from getting infected or exposed.
        - If you need emergency help, call 911.
        - If you are not sick enough to be hospitalized, you can recover at home. Follow CDC instructions for how to take care of yourself at home.

What people at higher risk can do to prepare

- Have supplies on hand
    - Contact your healthcare professional to ask about obtaining extra necessary medications to have on hand in case there is an outbreak of COVID-19 in your community and you need to stay home.
    - If you cannot get extra medications, consider using mail-order for medications.
    - Be sure you have over-the-counter medicines and medical supplies (tissues, etc.) to treat fever and other symptoms. Most people will be able to recover from COVID-19 at home.
    - Have enough household items and groceries on hand so that you will be prepared to stay at home for at least 14 days.
- Take everyday precautions
    - Avoid close contact with people who are sick.
    - Take everyday preventive actions.
        - Wash your hands often with soap and water for at least 20 seconds, especially after blowing your nose, coughing, or sneezing, or having been in a public place.
        - If soap and water are not available, use a hand sanitizer that contains at least 60% alcohol.
        - To the extent possible, avoid touching high-touch surfaces in public places – elevator buttons, door handles, handrails, handshaking with people, etc. Use a tissue or your sleeve to cover your hand or finger if you must touch something.
        - Wash your hands after touching surfaces in public places.
        - Avoid touching your face, nose, eyes, etc.
        - Clean and disinfect your home to remove germs. Practice routine cleaning of frequently touched surfaces (for example: tables, doorknobs, light switches, handles, desks, toilets, faucets, sinks and cell phones).
        - Avoid crowds, especially in poorly ventilated spaces. Your risk of exposure to respiratory viruses like COVID-19 may increase in crowded, closed-in settings with little air circulation if there are people in the crowd who are sick.

AMERICAN OVERSIGHT

- If COVID-19 is spreading in your community, take extra measures to put distance between yourself and other people.
    - Stay home as much as possible.
        - Consider ways of getting food brought to your house through family, social, or commercial networks.
- Have a plan for if you get sick.
    - **Consult with your healthcare provider for more information about** monitoring your health for symptoms suggestive of COVID-19**.**
    - Stay in touch with others by phone or email. You may need to ask for help from friends, family, neighbors, community health workers, etc. if you become sick.
    - Determine who can provide you with care if your caregiver gets sick.
    - Plan for how you will get more supplies if you need them before you recover.
- Watch for symptoms and emergency warning signs.
    - Pay attention for potential COVID-19 symptoms including, fever, cough, and shortness of breath. If you feel like you are developing symptoms, call your doctor.
    - If you develop emergency warning signs for COVID-19 get medical attention immediately. In adults, emergency warning signs*:
        - Difficulty breathing or shortness of breath
        - Persistent pain or pressure in the chest
        - New confusion or inability to arouse
        - Bluish lips or face

          *This list is not all inclusive. Please consult your medical provider for any other symptom that is severe or concerning.

What to do if you are at higher risk and get sick

- Stay home and call your doctor.
- Call your healthcare provider and let them know about your symptoms. Tell them that you have or may have COVID-19. This will help them take care of you and keep other people from getting infected or exposed.
- If you are not sick enough to be hospitalized, you can recover at home. Follow CDC instructions for how to take care of yourself at home.
- Know when to get emergency help.
- Get medical attention immediately if you have any of the emergency warning signs listed above.

Community Support for Older Adults

- Community preparedness planning for COVID-19 should include older adults and people with disabilities, and the organizations that support them in their communities, to ensure their needs are taken into consideration.
    - Many of these people live in the community, and many depend on services and supports provided in their homes or in the community to maintain their health and independence.

AMERICAN OVERSIGHT

- Long-term care facilities should be vigilant to prevent the introduction and spread of COVID-19. Information for long-term care facilities can be found here.

Family and Caregiver Support

- Know what medications your loved one is taking and see if you can help them have extra on hand.
- Monitor food and other medical supplies (hearing aid batteries, oxygen, incontinence, dialysis, wound care) needed and create a back-up plan.
- Stock up on non-perishable food items to have on hand in your home to minimize trips to stores.
- If you care for a loved one living in a care facility, monitor the situation, ask about the health of the other residents frequently and know the protocol if there is an outbreak.

Coping for People at Risk for Serious Illness and Caregivers

- People at higher risk for COVID-19 (including older people and people with severe underlying medical conditions), as well as the people who care for and about them, may feel especially stressed, worried, or anxious.
    - Things you can do to take care of yourself and help the people you care for:
        - Take breaks from watching, reading, or listening to news stories, including social media. Remind others that you care for to do the same.
        - Stay connected to others through calls (audio or video), instant messaging, email, letters, or other forms of communication, even if you cannot be together in person.
        - Talk with people you trust about your concerns and how you are feeling.
- If you, or someone you care about, is feeling overwhelmed with emotions like sadness, depression, or anxiety, or if you are concerned about harming yourself or others, call 911 or the SAMHSA Disaster Distress Helpline: 1-800-985-5990 or text TalkWithUs to 66746 (TTY 1-800-846-8517).

Tribal Elders and Multi-generational Tribal Families

- Tribal communities and Urban American Indians and Alaska Natives are particularly vulnerable to COVID-19 because of unique characteristics of health that impact tribal members.
- Any exposure to COVID-19 can pose a threat to tribal and urban American Indian and Alaska Native communities.
- Many tribal communities are made up of interdependent multi-generational families that house many Elders. These families may be both geographically and socially close. For tribal families, avoiding sick children or Elders may not seem practical or desirable.
- Families can take steps to protect the health and safety of Elders.
    - Consider limiting visitation except for caregivers or healers.
    - Avoid communing at social tribal events or gatherings, supermarkets, or casinos.

AMERICAN OVERSIGHT

- Consider seeking out other partners in the community to help with housing accommodations or optional caregiving, in case of illness.

Rural Communities

- Rural communities face some COVID-19 challenges that are different from urban and suburban communities. These differences warrant additional guidance.
- Many rural communities have experienced multiple closings of hospitals and healthcare facilities. This can leave an already vulnerable population without immediate access to healthcare, should an outbreak occur in the community.
- People living in rural communities can take steps to prepare.
    - Identify the two closest healthcare facilities to contact in case of an outbreak
    - Create an information card with the numbers and addresses of healthcare facilities and the family and friends who are physically nearest to you.
    - Locate state, local, or tribal health centers in advance to identify available resources
    - Create a phone tree system (activating a group of people by telephone to get a message out quickly) with family, friends, and neighbors

People with Asthma

- People with asthma may be at higher risk of getting infected with COVID-19. COVID-19 can affect your respiratory tract (nose, throat, lungs), cause an asthma attack, and possibly lead to pneumonia and acute respiratory disease.
- If you have asthma, you should prepare for COVID-19 and follow your Asthma Action Plan.
    - Take your asthma medication exactly as prescribed.
        - Talk to your healthcare provider, insurer, and pharmacist about creating an emergency supply of prescription medications, such as asthma inhalers.
        - Make sure that you have 30 days of non-prescription medications and supplies on hand too, in case you need to stay home for a long time.
    - Know how to use your inhaler.
    - Avoid your asthma triggers.
    - Clean and disinfect frequently touched surfaces like tables, doorknobs, light switches, countertops, handles, desks, phones, keyboards, toilets, faucets, and sinks daily to protect yourself against COVID-19.
        - Avoid disinfectants that can cause an asthma attack.
    - As more cases of COVID-19 are discovered and our communities take action to combat the spread of disease, it is natural for some people to feel concerned or stressed. Strong emotions can trigger an asthma attack. Take steps to help yourself cope with stress and anxiety.
- If you have symptoms
    - Contact your health care provider to ask about your symptoms.

Pregnant People

- Pregnant people may be at higher risk for having severe illness from COVID-19.

AMERICAN OVERSIGHT

- CDC has limited information on adverse pregnancy outcomes in pregnant people with COVID-19.
    - Pregnancy loss, including miscarriage and stillbirth, has been observed in cases of infection with other related coronaviruses [SARS-CoV and MERS-CoV] during pregnancy.
    - There is limited information on infant outcomes of COVID-19 illness during pregnancy.
    - Other respiratory viral infections during pregnancy, such as influenza, have been associated with adverse neonatal outcomes, including low birth weight and preterm birth.
    - High fevers during the first trimester of pregnancy can increase the risk of certain birth defects.
- It is especially important for pregnant people to take actions to reduce their risk of exposure.

MINIMIZING STIGMA AND MISINFORMATION

- Minimizing stigma and misinformation is important, especially during contagious disease outbreaks.
- **Everyone:** Know the facts about COVID-19 and help prevent the spread of rumors:
    - Fight stigma by supporting people who are coming back to school or work after completing their quarantine or isolation period for COVID-19 exposure or illness.
    - Someone who has completed their quarantine or met the requirements to discontinue infection control measures does not pose a risk of spreading COVID-19.
    - People of Asian descent, including Chinese Americans, are not more likely to get coronavirus than anyone else. Let people know that being of Asian descent does not increase the chance of getting or spreading COVID-19.
    - Viruses cannot target people from specific populations, ethnicities, or racial backgrounds.
        - People who have not been in contact with a person who is a confirmed or suspected case are not at greater risk of acquiring and spreading this new virus than others.
- People who returned more than 14 days ago from an area with widespread or ongoing community spread and do not have symptoms of coronavirus do not put others at risk.
- To help counter stigma, public health professionals can:
    - Maintain privacy and confidentiality of those seeking health care and those who may be part of any contact investigation.
    - Communicate the risk or lack of risk from associations with products, people, and places in a timely manner.
    - Raise awareness of COVID-19 while showing empathy for people's concerns and fears.
    - Share accurate information about how the virus spreads.
    - Speak out against negative behaviors, including negative statements on social media about groups of people, or exclusion of people who pose no risk from regular activities.
        - Be cautious about the images that are shared. Make sure they do not reinforce stereotypes.
        - Engage with stigmatized groups in person and through media channels including news media and social media.

AMERICAN OVERSIGHT

- Share with others the need for social support for people who have returned from an area with ongoing spread or are worried about friends or relatives in the affected areas.

TRAVEL

Presidential Proclamations announcing travel restrictions for travelers from China, Iran, United Kingdom, Republic of Ireland, and most of Europe

- On January 31, President Trump issued the first Presidential Proclamation implementing temporary measures to increase our abilities to detect and contain the novel coronavirus proactively and aggressively.
    - The proclamation suspends entry to the United States of foreign nationals who have been in China (excluding Hong Kong and Macau) in the past 14 days.
- On March 2, a Presidential Proclamation suspended entry to the United States of foreign nationals who have been in Iran in the past 14 days.
    - For more information, consult the notice published in the Federal Register.
- On March 11, a Presidential Proclamation suspended entry to the United States of foreign nationals who have been in 26 countries in Europe (known as the Schengen Area) in the past 14 days.
    - The order suspends the entry of foreign nationals for 30 days from these European states: Austria, Belgium, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Italy, Latvia, Liechtenstein, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Slovakia, Slovenia, Spain, Sweden, and Switzerland.
- On March 14, a Presidential proclamation suspended entry to the United States of foreign nationals who have been in the United Kingdom (excluding overseas territories outside of Europe) or the Republic of Ireland in the past 14 days.
- Exemptions to these travel restrictions include American citizens, legal permanent residents, and immediate family members of US citizens and legal permanent residents. (Hereafter referred to as "American citizens and exempted persons.")
- **Under the Presidential Proclamations:** All American citizens and exempted persons coming from
    - **China, and Iran** will be directed to ("**funneled to"**) one of 11 US airports (the first 11 airports in the list below).
    - **Europe, the United Kingdom, and the Republic of Ireland** will be directed to ("funneled to") one of 13 US airports (including the last 2 airports in the list below).
- American citizens and exempted persons who have been in **China or Iran** in the previous 14 days will have an additional health assessment (screened for fever, cough, or difficulty breathing).
    - If symptomatic, American citizens and exempted persons will be transferred for medical evaluation. (They will not be able to complete their itinerary at that time.)
    - If asymptomatic, American citizens and exempted persons will be allowed to reach their final destination and, after arrival, will be asked to stay home and self-monitor for 14 days.

AMERICAN OVERSIGHT

- American citizens and exempted persons who have been to the **Schengen area of Europe, UK and Ireland** in the previous 14 days will screened by Department of Homeland Security and receive a Travelers' Health Alert Notice.
    - If symptomatic, American citizens and exempted persons will be transferred for medical evaluation. (They will not be able to complete their itinerary at that time.)
    - If asymptomatic, American citizens and exempted persons will be allowed to reach their final destination and, after arrival, will be asked to stay home and self-monitor for 14 days.
- The 13 airports where travelers are being funneled include:
    - John F. Kennedy International Airport (JFK), New York
    - Chicago O'Hare International Airport (ORD), Illinois
    - San Francisco International Airport (SFO), California
    - Seattle-Tacoma International Airport (SEA), Washington
    - Daniel K. Inouye International Airport (HNL), Hawaii
    - Los Angeles International Airport (LAX), California
    - Hartsfield-Jackson Atlanta International Airport (ATL), Georgia
    - Washington-Dulles International Airport (IAD), Virginia
    - Newark Liberty International Airport (EWR), New Jersey
    - Dallas/Fort Worth International Airport (DFW), Texas
    - Detroit Metropolitan Airport (DTW), Michigan
    - Boston Logan International Airport (BOS), Massachusetts
    - Miami International Airport (MIA), Florida
- As of March 18, about 60,000 people have been screened at U.S. airports.

CDC Travel Health Notices and Other Travel Guidance

- CDC has issued Level 3 Travel Health Notices (Avoid Nonessential Travel) for Australia, Brazil, Canada, China, Iran, Israel, Japan, most of Europe (Schengen Area), the United Kingdom and the Republic of Ireland, Malaysia, South Korea, and cruise travel worldwide.
- CDC has issued Level 2 Travel Health Notices (Practice Enhanced Precautions) for the global outbreak.
- CDC has posted after-travel precautions for Travelers from Countries with Widespread Sustained (Ongoing) Transmission Arriving in the United States.
- CDC has posted a webpage about COVID-19 and considerations for travel in the United States.
- On March 19, the U.S. State Department posted a Level 4 Global Health Advisory, warning travelers Do Not Travel.

Repatriation flights and quarantine orders

- CDC has supported the Department of State in the safe and expedient ordered departure of US citizens and residents affected by outbreaks of COVID-19.
- Chartered flights returned passengers from Wuhan City, China and passengers from a cruise ship docked in Japan. (See section: Diamond Princess).

AMERICAN OVERSIGHT

- The Department of Health and Human Services (DHHS) Secretary, under statutory authority, issued federal quarantine orders to all such passengers entering the United States.
    - The quarantine period is for 14 days.
    - The quarantine is a precautionary and preventive step to maximize the containment of the virus in the interest of the health of the American public.
    - This quarantine order also serves to protect the health of the repatriated persons, their families, and their communities.
- Based on what is known about this virus and other coronaviruses, CDC believes the risk to the communities temporarily housing these people is low.
- At the end of the 14-day period, people who have not developed symptoms have their quarantine order lifted and are free to return home.
- As of March 18th, everyone from the Wuhan and Diamond Princess repatriation flights who were quarantined or isolated under federal orders has been released and returned home.
    - A small number of people are still isolated or quarantined under state orders

Cruise Ships and River Cruises*

- The U.S. Government's priority is to protect the health of passengers and crew, their loved ones, the traveling public, and communities within the US.
- CDC recommends all persons defer any travel on cruise ships, including river cruises, worldwide because of the increased risk of COVID-19 on board ships.
- CDC is continuously tracking cruise ships that are coming into domestic ports that may have confirmed, suspected, or no cases of COVID-19.
    - Cruise ships, both domestic and international, carrying American citizens are being assessed and documented.
    - The situation in the United States is evolving, both with increasing community transmission and an increasing number of cruise ships coming into port. CDC is continuing to reevaluate its approach to returning cruise ships.
    - As CDC reevaluates the approach to returning cruise ships, CDC's priority is to protect passengers' and crews' health while helping them get home as quickly and safely as possible.
- On March 13, the Cruise Lines International Association voluntarily suspended cruise travel out of U.S. ports.
    - Many cruise ships will soon be ending their voyages and coming into port in the U.S. and other countries. New cruise voyages will be postponed.
- On March 15, CDC released a Health Alert Network (HAN) Update providing information and guidance about global travel on cruise ships, including river cruises, due to COVID-19.
    - The HAN provides broad information and recommendations for clinicians seeing patients who have recently traveled by cruise ship or river cruise.
    - State and local health departments should check the Epidemic Information Exchange (Epi-X) notification system for information on COVID-19 cases on cruise ships and river cruises. If a ship has one or more confirmed COVID-19 cases on board, CDC will send an Epi-X alert to state health departments alerting them to these cases.

AMERICAN OVERSIGHT

- On March 17, CDC posted a Global Level 3 Travel Health Notice for Cruise Ship Travel recommending travelers defer all cruise ship travel worldwide.
    - Cruise travelers should stay home for 14 days after returning from travel, monitor their health, and practice social distancing.
- In an effort to make sure returning passengers and crew members without symptoms can get home as quickly and safely as possible, CDC will not hold ships in port and will not prevent disembarking passengers and crew from onward travel. They will be treated like other travelers returning from areas with widespread ongoing transmission, such as Europe.
    - Passengers without symptoms will be allowed to travel home immediately via commercial carrier.
    - Cruise line passengers and crew members are advised to stay home for 14 days, monitor their health, and practice social distancing.
        - Social distancing means staying out of crowded places and keeping a distance of about 6 feet (2 meters) from others as much as possible.
        - Cruise lines will give disembarking passengers details about how to monitor themselves at home and practice social distancing.
        - These recommendations are consistent with CDC recommendations for travelers returning from countries with widespread ongoing transmission.
    - Any passengers who get sick with fever, new or worsening cough, or shortness of breath during their cruise should isolate themselves in their cabin and notify the onboard medical center immediately.
        - Crew members who get sick should follow any instructions from the cruise line.
    - If an ill passenger or crew member is identified on board the ship, the cruise line will report to the CDC Quarantine Station responsible for the port. CDC staff will determine if further action is needed.
- If a ship has one or more confirmed COVID-19 cases on board, CDC will send an Epi-X alert to state health departments alerting them to these cases.
- CDC will also alert WHO per the International Health Regulations to ensure non-US citizen travelers are aware of their risk.

Diamond Princess

- CDC supported the Department of State-led mission to repatriate US citizens returning to the United States from Japan who were aboard the *Diamond Princess* cruise ship.
- On February 16, 329 American citizens returned by flights chartered by the State Department.
- Americans returned by flights chartered by the State Department are subject to a 14-day federal quarantine and were housed at two existing federal quarantine sites for repatriated travelers:
    - Travis Air Force Base in California
    - Joint Base San Antonio-Lackland in Texas
- The passengers were screened before leaving the ship and were monitored and evaluated by medical and public health personnel during the trip and after arrival. They were monitored by medical and public health personnel throughout the 14-day quarantine period. All of these individuals completed their quarantine.

AMERICAN OVERSIGHT

- 11 Americans who were on board the *Diamond Princess* remain in Japan, including some who are still hospitalized.

Grand Princess*

- CDC has been working with the California Department of Public Health, other federal, state, and local partners and the Princess Cruise Line to investigate a cluster of COVID-19 cases connected with a Grand Princess voyage from February 11-21. Additionally, CDC worked with the same partners to assess the risk for passengers currently aboard the Grand Princess.
    - CDC notified states about the risk and management of passengers aboard the Grand Princess between February 11 and 21 who might have COVID-19 symptoms.
- The U.S. Department of Health and Human Services (HHS) is continuing to work with state and local partners in California to support the return of passengers from the Grand Princess.
- On March 9, the Grand Princess docked in the Port of Oakland.
    - Passengers were transferred to federal military installations across the United States for medical screening, COVID-19 testing, and a 14-day quarantine.
    - Nearly 1,000 passengers who are California residents are completing the mandatory quarantine at Travis Air Force Base.
    - Additional residents of California and residents of other states are completing the mandatory quarantine at Marine Corps Air Station Miramar in San Diego, Lackland Air Force Base in San Antonio, or Dobbins Air Reserve Base in Georgia.
    - Throughout the quarantine, passengers will be monitored for symptoms of COVID-19.
    - The Department of State is working closely with the home countries of several hundred foreign national passengers to arrange for repatriation to their countries.

**Please continue to look for updates in CDC's Daily Key Points and in next week's Key Messages document. The situation is rapidly evolving and CDC will provide updates as they become available.*

Nile River Cruises

- As of March 14, 2020, 16 state health departments have notified CDC of **62** COVID-19 cases and **42** patients under investigation (PUIs) associated with cruise boats on the Nile River in Egypt. Those 16 states are California, Colorado, Delaware, Florida, Iowa, Illinois, Maryland, North Carolina, New Mexico, Ohio, Pennsylvania, Rhode Island, Tennessee, Texas, Virginia, and Wisconsin.
    - Most of these American citizens have returned to the United States.
    - Three American citizens remain in Egypt, 1 of whom is in the hospital.
- The affected cruise boats on the Nile River include at least the following ships:
    - M/S A'sara
    - M.S. Esplanade
    - M.S. Queen of Hansa
    - M.S. Sun Goddess
    - Crown Empress
    - M.S. Mayfair
- As of March 12, the Pilgrim tour agency suspended all Egyptian river cruise tours.

AMERICAN OVERSIGHT

- On March 19, Cairo, Egypt temporarily halted all flights to its airports as a further measure against the spread of COVID-19. The suspension of air traffic will continue until March 31.
- The M/S A'sara took at least four voyages.
    - Cruise 1 had 9 confirmed cases among American passengers and was associated with a cluster of cases in Texas.
    - Cruise 2 had 2 confirmed cases among American passengers.
    - Cruise 3 had 6 confirmed cases among American passengers.
    - Cruise 4 had 29 confirmed cases among American passengers.
- The M.S/ Queen Hansa sailed February 28–March 2. It had at least 1 confirmed case among American passengers.
- The M.S. Esplanade sailed February 24–February 27. As of March 11, it had 7 cases among American passengers and was associated with a cluster in Iowa.

WHAT CDC IS DOING

CDC Response in the US:

- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The goal of the ongoing US public health response is to detect new cases quickly and prevent further spread of COVID-19 in this country.
- CDC established a COVID-19 Incident Management Structure on January 7. On January 21, CDC activated its Emergency Operations Center to better provide ongoing support to the COVID-19 response.
    - The US government has taken unprecedented steps with respect to travel in response to the growing public health threat posed by this new coronavirus.
    - Effective February 2, at 5pm, the US government suspended entry of foreign nationals who have been in China within the past 14 days.
        - US citizens, residents, and their immediate family members who have been in mainland China are allowed to enter the United States, but they are subject to health monitoring for up to 14 days.
    - On February 29, the U.S. government announced it was suspending entry of foreign nationals who have been in Iran within the past 14 days.
    - As of March 13, all American citizens and exempted persons coming from most of Europe (knows as the Schengen Area) will be funneled through 13 airports (listed in the above Travel section). As of March 16, all American citizens and exempted persons coming from the United Kingdom (excluding overseas territories outside of Europe) or the Republic of Ireland will also be funneled through those 13 airports.
        - CDC and partners will conduct enhanced illness response at these points of entry.
    - CDC has issued the following travel guidance related to COVID-19:
        - China — Level 3, Avoid Nonessential Travel — updated February 22;
        - Iran — Level 3, Avoid Nonessential Travel — updated February 28;

AMERICAN OVERSIGHT

    - South Korea — Level 3, Avoid Nonessential Travel — updated February 24;
    - Most of Europe (Schengen Area) — Level 3, Avoid Nonessential Travel – updated March 12;
    - Global Outbreak — Level 2, Practice Enhanced Precautions — posted March 11.
    - United Kingdom and Ireland — Level 3, Avoid Nonessential Travel — posted March 15.
    - COVID-19 and Cruise Ship Travel — Level 3, Avoid Nonessential Travel — posted March 17.
    - Malaysia — Level 3, Avoid Nonessential Travel — posted March 18.
    - Australia— Level 3, Avoid Nonessential Travel — posted March 21.
    - Brazil— Level 3, Avoid Nonessential Travel — posted March 21.
    - Canada — Level 3, Avoid Nonessential Travel — posted March 21.
    - Israel — Level 3, Avoid Nonessential Travel — posted March 21.
    - Japan — Level 3, Avoid Nonessential Travel — posted March 21.
- CDC is issuing clinical guidance, including clinical care guidance and healthcare infection control guidance.
- On March 2, FDA announced that commercial companies may sell test kits under CDC's EUA.
- CDC has deployed multidisciplinary teams to support state health departments with clinical management, contact tracing, and communications.
- CDC has helped mobilize state health departments to receive returned repatriated travelers.
- Through the Public Health Emergency Preparedness (PHEP) cooperative agreement, 62 state PHEP programs across the country are part of the multi-agency infrastructure working on quarantine, isolation, case finding, protecting health care workers and assuring medical supply chains.
- On March 16, CDC awarded nearly $570 million in funding to 65 state, local, territorial, and tribal jurisdictions to provide resources to prevent, prepare for, and respond to the COVID-19 outbreak.
    1. CDC made these awards 10 days after the President signed into law the Coronavirus Preparedness and Response Supplemental Appropriations Act, 2020 (P.L. 116-123)
    2. CDC has authorized recipients to begin spending their funds immediately.
- CDC activated the Cooperative Agreement for Emergency Response: Public Health Crisis Response (CDC-RFA-TP18-1802) to award a total of $569,822,380 to the 65 eligible jurisdictions on the approved but unfunded (ABU) list for the cooperative agreement.
    1. The 65 jurisdictions include the 50 states; eight U.S. territories and freely associated states; six directly funded localities (Chicago, Houston, Los Angeles County, New York City, Philadelphia, and the District of Columbia); and one tribal nation (Cherokee Nation).

AMERICAN OVERSIGHT

- This funding gives state and local health departments the flexibility to implement response actions based on the disease characteristics and priorities in their communities.
- The funding supports two required activities:
    1. Accelerated laboratory testing, data collection, and real-time reporting to CDC for identification and tracking of COVID-19 cases in the community; and
    2. Implementation of COVID-19 community intervention plans.
- The supplemental funding is in addition to funding in the amount of $35 million to 21 jurisdictions for immediate COVID-19 response activities.
    - CDC awarded that initial funding on March 6.
    - For the 21 jurisdictions that received the initial funding, CDC has combined their initial funding with the new supplemental funding to reduce the administrative burden of managing two awards.
- CDC has worked with the Department of State, supporting the safe return of Americans who have been stranded as a result of the ongoing outbreaks of COVID-19 and related travel restrictions. CDC has worked to assess the health of passengers as they return to the United States and provided continued daily monitoring of people who are quarantined.
- An important part of CDC's role during a public health emergency is to develop a test for the pathogen and equip state and local public health labs with testing capacity. CDC developed a molecular test to detect COVID-19 from human clinical specimens and distributed this test to state and local health laboratories.
- After distribution of a CDC rRT-PCR test to diagnose COVID-19 to state and local public health labs started, performance issues were identified related to a problem in the manufacturing of one of the reagents. Laboratories were not able to verify the test performance.
- CDC worked on two potential resolutions to this problem.
    - CDC developed a new protocol that uses two of the three components of the original CDC test kit to detect the virus that causes COVID-19 after establishing that the third component, which was the problem with the original test, can be excluded from testing without affecting accuracy.
        - CDC worked with FDA to amend the existing Emergency Use Authorization (EUA) for the test.
    - Further, newly manufactured kits were provided to the International Reagent Resource for distribution.
        - On February 27, CDC distributed new test kits to 7 laboratories to serve as evaluation sites to ensure health departments are able to verify the assay. On February 29, 6 of 7 pilot laboratories reported successful completion of the verification panel.
        - An additional 40 test kits were hand carried to IRR for repackaging and distribution to additional public health labs.

AMERICAN OVERSIGHT

        - On February 28, IRR began to distribute new test kits to the additional 40 laboratories.
        - As of March 19th, 91 public health labs are running the CDC test, representing all 50 states, as well as the District of Columbia, Guam, and Puerto Rico.
        - Commercial manufacturers are now producing their own tests.
    - Combined with other reagents that CDC has procured, there are enough testing kits to test more than 75,000 people.
    - In addition, CDC is conducting laboratory testing in two of its laboratories at its headquarters in Atlanta. CDC can test approximately 350 specimens per day.
    - CDC has been uploading the entire genome of the viruses from reported cases in the United States to GenBank as sequencing was completed.
    - CDC has grown the virus in cell culture, which is necessary for further studies, including for additional genetic characterization. The cell-grown virus was sent to NIH's BEI Resources Repository for use by the broad scientific community.
    - CDC has deployed staff to assist in local areas experiencing clusters of COVID-19.

CDC International Response

Note: Due to the rapidly changing situation, any statements on CDC involvement in China need case-by-case clearance.

- CDC is working diligently and closely with partners to support the response to this novel coronavirus outbreak.
- CDC has staff stationed in more than 60 countries across the globe. CDC has offices in China, in a number of the countries reporting cases of COVID-19, and in countries that have not yet reported cases of COVID-19 but are busy with planning and preparedness efforts.
    - CDC and the government of China have collaborated for the past 30 years addressing public health priorities affecting the US, China, and the world.
- In addition to working with host country officials, CDC staff are working in coordination with Department of State and other agencies within US embassies.
- CDC is mobilizing Atlanta-based staff to support the response. Many of these staffers have extensive experience responding to global outbreaks.
- CDC has identified experts who are prepared to join a planned WHO mission to support efforts to better understand the severity and transmissibility of the virus.
- CDC is providing technical assistance to the Government of Italy for exit screening flights departing from Italy to the United States.
- In China, CDC is an important technical partner for the Chinese Field Epidemiology Training Program (FETP). and has been involved in the program since 2004.
    - More than 800 FETP-trained residents or graduates of FETP are supporting ongoing COVID-19 response efforts.
    - In 2019 specialized FETP training tracks were established in non-communicable diseases and tuberculosis.

AMERICAN OVERSIGHT

- CDC has supported China CDC's national influenza laboratory for more than 20 years.
- CDC works in close partnership with the China CDC's National Influenza Epidemiology, Virology, and Pandemic Preparedness Centers, China's provincial and local CDCs, hospitals, and academic institutions.
- CDC supports Chinese partners in monitoring seasonal and novel influenza viruses, as well as enhancing efforts to detect and respond to seasonal, avian, and other novel influenza viruses with pandemic potential. CDC's key supporting activities include:
    - Strengthening influenza surveillance for seasonal and novel influenza viruses
    - Conducting research to estimate disease burden and vaccine effectiveness among populations at greatest risk (including young children, older adults, and pregnant women)
    - Promoting influenza vaccination policy development and coverage
    - Supporting novel virus risk assessments
    - Establishing pandemic influenza preparedness in China
    - Maintaining close ties between US and China influenza experts
- In other countries, CDC is collaborating with WHO to support Ministries of Health to prepare and respond to the epidemic.
    - CDC is helping to support countries to implement WHO recommendations related to the diagnosis and care of patients, tracking the epidemic, and identifying people who might have COVID-19.
    - CDC staff are also starting to work together with country colleagues to conduct investigations that will help inform response efforts going forward.
    - CDC works closely with countries to establish FETPs that train a workforce of field epidemiologists —or disease detectives— to identify and contain outbreaks close to the source.
    - For country-specific information, please contact CDCglobal@cdc.gov.

RECOMMENDATIONS

- CDC routinely advises that people help protect themselves from respiratory illnesses by washing their hands often, avoiding touching their face with unwashed hands, avoiding close contact with people who appear sick, and cleaning frequently touched surfaces.
    - CDC defines close contact as—
        - Being within about 6 feet (2 meters) of someone with COVID-19 for a prolonged period of time, such as living with, visiting, caring for or sharing a room in a healthcare facility

          - or –
        - By having direct contact with infectious secretions from a patient, such as being coughed on.

AMERICAN OVERSIGHT

- If you are a resident in a community where person-to-person spread of COVID-19 has been detected and you develop COVID-19 symptoms, call your healthcare provider and tell them about your symptoms.
- If you have symptoms of COVID-19 and want to get tested, try calling your state or local health department or a medical provider. While supplies of these tests are increasing, it may still be difficult to find a place to get tested.
- Most people have mild illness and are able to recover at home.
- For people who are ill with COVID-19, but are not sick enough to be hospitalized, please follow CDC guidance on how to reduce the risk of spreading your illness to others. People who are mildly ill with COVID-19 are able to isolate at home during their illness.

Recent International Travelers

- If you have traveled internationally, watch your health, and limit interactions with others for 14 days after returning to the United States.
- If you feel sick with fever, cough, or difficulty breathing during this time, you should:
    - Seek medical advice. Before you go to a doctor's office or emergency room, call ahead and tell them about your recent travel and your symptoms.
    - Avoid contact with others.
    - Not travel while sick.
    - Cover your mouth and nose with a tissue or your sleeve (not your hands) when coughing or sneezing.
    - Clean your hands often by washing them with soap and water for at least 20 seconds or using an alcohol-based hand sanitizer that contains at least 60% alcohol immediately after coughing, sneezing or blowing your nose. Soap and water should be used if hands are visibly dirty.
    - If you were in a country with widespread sustained (ongoing) transmission—China, Iran, South Korea, most of Europe (known as the Schengen Area), the United Kingdom, or the Republic of Ireland—stay home, monitor yourself, and practice social distancing for 14 days after you left that country.

People Confirmed to Have, or Being Evaluated for, COVID-19

- Your doctors and public health staff will evaluate whether you can be cared for at home. If it is determined that you can be isolated at home, you will be monitored by staff from your local or state health department. You should follow the prevention steps below until a healthcare professional or local or state health department says you can return to your normal activities. Detailed information is available at Interim Guidance for Preventing COVID-19 from Spreading to Others in Homes and Communities.
    - Stay home except to get medical care.
    - Separate yourself from other people in your home.
    - Call ahead before visiting your doctor.
    - Wear a facemask.

AMERICAN OVERSIGHT

- Cover your coughs and sneezes with a tissue or cough or sneeze into your sleeve.
- Wash your hands often with soap and water for at least 20 seconds.
- Avoid sharing household items like eating utensils, cups, or linens.
- Monitor your symptoms and seek prompt medical attention if your symptoms worsen.

On February 27, CDC updated interim guidance for state and local public health officials on how to assess and manage the risks posed by patients who may have been exposed to this new coronavirus.

- This guidance establishes four risk categories: High, Medium, Low and No Identifiable Risk.
- The categories are based on a person's travel history and possible contact with patients who have laboratory-confirmed infections.
- The guidance **offers recommendations** for movement restrictions and public health evaluations for people in different risk categories.
- **In most cases, state and local authorities will make these decisions. Federal public health authority primarily extends to international arrivals at ports of entry and preventing interstate communicable disease threats.**
- These guidelines are subject to change as the situation requires. They do not apply retroactively to people who have been in an affected area with sustained transmission during the previous 14 days and are already in the United States, or those being managed as part of a contact investigation.
- CDC will provide separate guidance for healthcare settings.

Close Contacts of Patients Under Investigation

People who have had close contact with someone who is confirmed to have, or being evaluated for, COVID-19, should:

- Monitor your health starting from the day you first had close contact with the person and continue for 14 days after you last had close contact with the person. Watch for these signs and symptoms:
    - Fever—take your temperature twice a day.
    - Coughing.
    - Shortness of breath or difficulty breathing.
    - Other early symptoms to watch for are chills, body aches, sore throat, headache, diarrhea, nausea, vomiting, and runny nose.
- **If you develop fever or any of these symptoms, call your healthcare professional right away.**
    - **Before** going to your medical appointment, be sure to tell your healthcare professional about your close contact with someone who is confirmed to have, or being evaluated for, COVID-19. This notification will help the healthcare professional's office take steps to keep other people from getting infected. Ask your healthcare professional to call the local or state health department.
- On March 16, the White House recommended that if someone in your household has tested positive for COVID-19, the entire household should stay home and you should contact your medical provider.

AMERICAN OVERSIGHT

- Detailed information for caregivers and household members can be found on the Interim Guidance for Preventing COVID-19 from Spreading to Others in Homes and Communities web page.

Healthcare Professionals

- As availability of diagnostic testing for COVID-19 increases, clinicians will be able to access laboratory tests for diagnosing COVID-19 through clinical laboratories performing tests authorized by FDA under an Emergency Use Authorization (EUA).
    - Clinicians will also be able to access laboratory testing through public health laboratories in their jurisdictions.
- This expands testing to a wider group of symptomatic patients. Clinicians should use their judgment to determine if a patient has signs and symptoms compatible with COVID-19 and whether the patient should be tested.
    - Decisions on which patients receive testing should be based on the local epidemiology of COVID-19, as well as the clinical course of illness.
    - Most patients with confirmed COVID-19 have developed fever and/or symptoms of acute respiratory illness (e.g., cough, difficulty breathing).
    - Clinicians are strongly encouraged to test for other causes of respiratory illness, including infections such as influenza.
- Epidemiologic factors that may help guide decisions on whether to test include: any persons, including healthcare workers, who have had close contact with a laboratory-confirmed COVID-19 patient within 14 days of symptom onset, or a history of travel from affected geographic areas within 14 days of symptom onset.

Recommendations for Reporting, Testing, and Specimen Collection

- Clinicians should immediately implement recommended infection prevention and control practices if a patient is suspected of having COVID-19. They should also notify infection control personnel at their healthcare facility and their state or local health department if a patient is classified as a PUI for COVID-19.
- State health departments that have identified a PUI or a laboratory-confirmed case should complete a PUI and Case Report form through the processes identified on CDC's Coronavirus Disease 2019 website.
- State and local health departments can contact CDC's Emergency Operations Center (EOC) at 770-488-7100 for assistance with obtaining, storing, and shipping appropriate specimens to CDC for testing, including after hours or on weekends or holidays.
- Currently, diagnostic testing for COVID-19 is being performed at state public health laboratories and CDC. Testing for other respiratory pathogens should not delay specimen testing for COVID-19.
- On March 13, CDC updated its guidance for specimen collection for testing for COVID-19to to collect a single upper respiratory nasopharyngeal swab (NP) instead of an NP and oropharyngeal swab (OP).

AMERICAN OVERSIGHT

- For patients who develop a productive cough, sputum should be collected and tested for SARS-CoV-2. The induction of sputum is not recommended.
- For patients for whom it is clinically indicated (e.g., those receiving invasive mechanical ventilation), a lower respiratory tract aspirate or bronchoalveolar lavage sample should be collected and tested as a lower respiratory tract specimen.
- Specimens should be collected as soon as possible once a PUI is identified, regardless of the time of symptom onset. See Interim Guidelines for Collecting, Handling, and Testing Clinical Specimens from Patients Under Investigation (PUIs) for COVID-19 and Biosafety FAQs for handling and processing specimens from suspected cases and PUIs.
- Clinical specimens should be collected from PUIs for routine testing of respiratory pathogens at either clinical or public health labs. Note that clinical laboratories should NOT attempt viral isolation from specimens collected.
- Maintain proper infection control when collecting specimens.
- Additional guidance for collection, handling, and testing of clinical specimens is available on CDC's website.
- Detailed information on specimen types and shipping can be found on the Information for Laboratories web page

COMMUNITY BASED INTERVENTIONS (AKA COMMUNITY MITIGATION)

- Protect yourself and your community from getting and spreading respiratory illnesses like coronavirus disease 2019. Everyone has a role to play in getting ready and staying healthy.
    - For most people in the U.S., the immediate risk of being exposed to the virus that causes COVID-19 is thought to be low. The virus is not currently widespread in the U.S.
    - In places where ongoing community spread of the virus that causes COVID-19 has been reported, people are at elevated risk of exposure.
- Currently a vaccine is not available for COVID-19. Until a vaccine is developed, community-based interventions, such as temporary school dismissals, postponing or cancelling large events, social distancing (i.e. limiting face-to-face contact) can help slow the spread of coronavirus.
- Your local public health department and community partners have been preparing for disease outbreaks, like COVID-19 and have plans in place. Now is a good time for businesses, community and faith-based organizations, and health-care systems to reexamine their preparedness plans to make sure they are ready.
- Strong community partnerships between local public health departments, the healthcare sector, faith-based organizations, and other community partners are vital for this response, and will be necessary to prepare for and coordinate if an outbreak occurs in their local communities.
- Community-based interventions can be grouped in three categories:
    - Personal protective measures (e.g., voluntary home isolation of ill persons, voluntary home quarantine of exposed household members, respiratory and cough etiquette, using facemasks in community settings when ill, practicing hand hygiene)

AMERICAN OVERSIGHT

- Community measures aimed at increasing social distancing (e.g., temporary school dismissals, social distancing in workplaces (like working remotely), postponing or cancelling mass gatherings)
- Environmental measures (e.g., routine cleaning of frequently touched objects or surfaces)

Household/Personal Protective Measures

- Everyone can do their part to help plan for, prepare, and respond to this emerging public health threat.
- CDC recommends that individuals/households create an emergency plan of action, practice good personal health habits and plan for home-based care (if needed), be prepared for your child's school or childcare facility to be temporarily dismissed, and plan for changes at your workplace.
- During an outbreak in your community, **stay home when you are sick** with COVID-19 symptoms, keep away from others who are sick, and limit face-to-face contact with others.

Community Measures

- **Mass gatherings:**
  - Mass gatherings and events, such as concerts, festivals, conferences, worship services, and sporting events, increase the chance of a virus, like COVID-19, to spread and infect people crowded together within a close proximity.
  - On March 16, the White House recommended avoiding social gatherings in groups of more than 10 people.
- **Community and faith-based organizations:**
  - Local leaders and community organizers play a vital role to bring the community together to help plan for and reduce the impact of a potential COVID-19 outbreak. Since you know your community members the best, you can ensure groups most vulnerable to COVID-19 are considered and included in the planning process.
  - CDC recommends finding out if your local government has a private-public emergency planning group that meets regularly that you can join. If not, suggest one that should be set up. Building strong alliances before an outbreak can help provide your organization with the support and resources needed.
  - CDC has created interim guidance to help you create an emergency plan for your community and faith-based organization.
- **Administrators of U.S. childcare programs and K-12 schools and administrators of institutions of higher education:**
  - Schools should plan for and prepare for a potential community-level outbreak of COVID-19. Fortunately, many of the steps to plan and prepare for COVID-19 are the same steps schools take to keep students healthy and safe from the flu.
  - The decision to dismiss a school should be made locally. CDC recommends working with local health officials to determine if, when, and for how long schools may need to be

AMERICAN OVERSIGHT

dismissed in the event of an outbreak. (NOTE: The U.S. Department of Education does not recommend using "school closure" terminology.)

- School administrators should plan to provide critical support services, such as continuity of education and continuity of school meal programs, if schools are dismissed.
- CDC has posted guidance for childcare and K-12 school settings on its website.
- CDC has posted recommendations of considerations for school dismissals.
- CDC has posted guidance for institutions of higher education (IHE) on its website.
    - This guidance includes considerations about addressing campus housing. Guidance for IHE with students participating in international travel or study abroad programs is also available.

- **Homeless shelters:**
    - People experiencing homelessness may be at risk for infection during an outbreak of COVID-19.
        - CDC has created interim guidance for homeless shelters that address planning for and responding to COVID-19 in these settings.
        - CDC has also posted Interim Guidance for Responding to COVID-19 among People Experiencing Unsheltered Homelessnessv.

Information for Law Enforcement

- For law enforcement personnel performing daily routine activities, the immediate health risk is low.
- CDC has developed recommendations for law enforcement to protect themselves from exposure.
    - Law enforcement who must make contact with individuals confirmed or suspected to have COVID-19 should follow CDC's Interim Guidance for EMS.
    - Have a trained Emergency Medical Service/ Emergency Medical Technician (EMS/EMT) assess and transport anyone you think might have COVID-19 to a healthcare facility.
    - Ensure only trained personnel wearing appropriate personal protective equipment (PPE) have contact with individuals who have or may have COVID-19.
- Different styles of PPE may be necessary to perform operational duties.
    - These alternative styles (i.e. coveralls) must provide protection that is at least as great as that provided by the minimum amount of PPE recommended.
- Learn your employer's plan for exposure control and participate in all-hands training on the use of PPE for respiratory protection, if available.
- If close contact occurs during apprehension:
    - Clean and disinfect duty belt and gear prior to reuse. Use a household cleaning spray or wipe, according to the product label.
    - Follow standard operating procedures for the containment and disposal of used PPE.
    - Follow standard operating procedures for containing and laundering clothes. Avoid shaking the clothes.

AMERICAN OVERSIGHT

HAND HYGIENE IN COMMUNITY SETTINGS (ENVIRONMENTAL MEASURES)

- Handwashing is one of the best ways to protect yourself and your family from getting sick.
- Clean hands can stop germs from spreading from one person to another and throughout an entire community—from your home and workplace to childcare facilities.
- Wash your hands often with soap and water for at least 20 seconds, especially after blowing your nose, coughing, or sneezing; going to the bathroom; and before eating or preparing food.
- If soap and water are not readily available, use an alcohol-based hand sanitizer with at least 60% alcohol.
- Always wash hands with soap and water if hands are visibly dirty.
- Follow these steps to make sure you wash your hands properly:
    1. Wet your hands with clean, running water (warm or cold), turn off the tap, and apply soap.
    2. Lather your hands by rubbing them together with the soap. Lather the backs of your hands, between your fingers, and under your nails.
    3. Scrub your hands for at least 20 seconds. Need a timer? Hum the "Happy Birthday" song from beginning to end twice.
    4. Rinse your hands well under clean, running water.
    5. Dry your hands using a clean towel or air dry them.

INFECTION PREVENTION AND CONTROL FOR HEALTHCARE SETTINGS

- Healthcare facilities are increasingly unable to procure reliable and sufficient supplies for infection control, including N95 respirators.
- Because of demands associated with the COVID-19 response, CDC has updated the current national COVID-19 infection control guidance for healthcare in the midst of supply realities and growing insight about the spread of COVID-19.
- Protection of healthcare personnel is a priority. CDC's updated guidance on infection control aims to prioritize the use of N95 respirators and other respiratory protection devices for use during high-risk procedures while still protecting health care personnel with facemasks and eye protection during other routine patient care activities, in the setting of respirator shortages.
- CDC's updated, interim IPC guidance also aims to support health care facilities in practical decision-making at the local level to maintain a functional health care system while protecting healthcare workers.
- The guidance also outlines multiple interventions that can be implemented to enhance protection of health care personnel
- CDC has updated guidance on the PPE healthcare personnel should use when caring for patients with known or suspected COVID-19:
    - Eye protection, gown, and gloves continue to be recommended.
    - While respirators remain preferred, facemasks are an acceptable alternative until the supply chain is restored.
        - Facemasks protect the wearer from splashes and sprays.

AMERICAN OVERSIGHT

        - Respirators, which filter inspired air, offer respiratory protection.
    - Respirators should be prioritized for procedures that are likely to generate respiratory aerosols, which would pose the highest exposure risk to healthcare professionals.
- The risk of transmission can be reduced by several types of actions, like prompt screening and triage, limiting personnel in the room, hand hygiene, source control, and effective environmental cleaning.
- CDC reminds all employers and healthcare personnel about the hierarchy of controls.
    - PPE is only one aspect of patient and worker safety and involves a high level of worker involvement and is highly dependent on proper fit and correct use.
- All healthcare facilities should continuously review their infection control supply inventories and taking steps to optimize supplies.
    - This is particularly true for areas in facilities where aerosol-generating procedures are performed, so that appropriate PPE will be available for high-risk procedures now and as potential COVID-19 cases increase.
- Healthcare administrators should continue to do everything possible to acquire the needed supplies to protect their staff and patients.
- When the supply chain is restored, facilities with a respiratory protection program should return to use of respirators for patients with known or suspected COVID-19.
- The anticipated timeline for return to routine levels of PPE is not known.
    - CDC has posted information about strategies to optimize the current supply of N95 respirators, including the use of devices that provide higher levels of respiratory protection (e.g., powered air purifying respirators [PAPRs]) when N95s are not available.
    - CDC has also posted a companion checklist to help healthcare facilities prioritize the implementation of the strategies is available.
- The majority of nursing homes and outpatient clinics, including hemodialysis facilities, do not typically procure N-95 respirators, currently have respiratory protection programs, nor fit-tested HCP. Therefore, they would not be able to implement all the recommended infection control interventions for care of COVID-19 patients.
    - Without respiratory protection programs and fit testing, unnecessary transfer of stable patients with known or suspected COVID-19 to another facility (e.g., acute care hospital) for evaluation and care may occur.
    - In areas with community transmission, acute-care facilities will be quickly overwhelmed by transfers of patients who have only mild illness and do not require hospitalization.
- Healthcare personnel (HCP) are on the front lines of caring for patients with confirmed or possible COVID-19. HCP caring for these patients have an increased risk of exposure to this virus.
- HCP can minimize their risk of exposure when caring for confirmed or possible COVID-19 patients by following CDC infection prevention and control (IPC) guidelines, including use of recommended personal protective equipment (PPE).
- Infection control procedures and appropriate use of PPE are necessary to prevent infections from spreading while caring for patients. CDC reminds all employers and HCP that PPE is only one aspect of safe care of patients with COVID-19.

AMERICAN OVERSIGHT

    - Focusing only on PPE gives a false sense of security of safe care and worker safety.
    - It is critical to focus on other strategies to prevent spread of COVID-19 in healthcare settings. Examples include prompt screening and triage of patients and limiting the numbers of healthcare personnel entering the patient room.
- CDC's current guidelines are designed to prevent the spread of COVID-19 within healthcare facilities to healthcare personnel, visitors, and other patients who may be exposed to a patient with COVID-19.
- Healthcare personnel caring for patients with confirmed or suspected COVID-19 should adhere to CDC recommendations for infection prevention and control (IPC):
    - Assess and triage patients with acute respiratory symptoms and risk factors for COVID-19 to minimize chances of exposure. Care for patients with known or suspected COVID-19 in a single-person room with the door closed. Reserve Airborne Infection Isolation Rooms (AIIRs) for patients undergoing aerosol-generating procedures.
    - Use Standard, Contact, and Airborne Precautions, including eye protection, when caring for patients with confirmed or possible COVID-19.
    - Perform hand hygiene with alcohol-based hand sanitizer before and after all patient contact, before and after contact with potentially infectious materials, and before putting on and upon removal of PPE, including gloves. Use soap and water if hands are visibly soiled.
    - Practice how to properly don, use, and doff PPE in a manner to prevent self-contamination.
    - Perform aerosol-generating procedures (e.g., sputum induction, open suctioning of airways) in an AIIR, while following appropriate IPC practices, including use of appropriate PPE.
    - The collection of respiratory specimens (e.g., nasopharyngeal swabs) are not considered aerosol generating procedures. These procedures should take place in an examination room with the door closed.
    - Healthcare facilities can minimize the chance for exposures by ensuring facility policies and practices are in place and implemented before patient arrival, upon patient arrival, and throughout the duration of the affected patient's time in the healthcare setting.
    - CDC has created Interim Considerations for Infection Prevention and Control of Coronavirus Disease 2019 (COVID-19) in Inpatient Obstetric Healthcare Settings
- Healthcare facilities should promptly notify state or local public health authorities of patients with known or possible COVID-19 (i.e., persons under investigation or PUIs), and should designate specific persons within the healthcare facility who are responsible for communication with public health officials and dissemination of information to HCP.
- All healthcare facilities should ensure that their healthcare personnel are correctly trained and capable of implementing infection control procedures. Individual healthcare personnel should ensure they understand and can adhere to infection control requirements.

AMERICAN OVERSIGHT

- Routine cleaning and disinfection procedures are appropriate for SARS-CoV-2 in healthcare settings, including those patient-care areas in which aerosol-generating procedures are performed.
    - Products with EPA-approved emerging viral pathogens claims are recommended for use against SARS-CoV-2, the virus that causes COVID-19.
- Management of laundry, food service utensils, and medical waste should also be performed in accordance with routine procedures. Federal, state, and local guidelines and regulations specify the categories of medical waste that are subject to regulation and outline the requirements associated with treatment and disposal.
- CDC recommends that employees who are confirmed to have COVID-19, those who appear to have acute respiratory illness symptoms upon arrival to work, and persons who become sick during the work day promptly put on a facemask, be separated from other people, and be sent home immediately.
- If facemasks are not available, sick healthcare personnel should cover their noses and mouths with a tissue when coughing or sneezing (or an elbow or shoulder if no tissue is available), prior to leaving the facility.

Long-term care facilities

- The general strategies CDC recommends to prevent the spread of COVID-19 in long-term care facilities (LTCF) are the same strategies these facilities use every day to detect and prevent the spread of other respiratory viruses like influenza. View Strategies to Prevent the Spread of COVID-19 in LTCF for more information.
- All healthcare facilities can take steps now to prepare for COVID-19 and protect both their patients and staff.
- In late February, there was an outbreak of COVID-19 in a long-term care facility in Washington state infecting patients and a healthcare professionals.
- CDC deployed a team to Washington to support the ongoing investigation to find and identify how the patients were exposed and do extensive contact tracing of people who were exposed or might have been exposed to the patients.

WHAT CDC IS DOING TO PROTECT HEALTHCARE PERSONNEL

- CDC is providing regular communication to the US healthcare community through targeted outreach activities.
- CDC is rapidly developing guidance and resources to protect US healthcare personnel. Current guidance and recommendations are designed to protect healthcare personnel and prevent the spread of the virus that causes COVID-19 within US healthcare facilities.
- CDC has deployed field teams to provide onsite infection control assessment and consultation to the US healthcare facilities currently treating confirmed COVID-19 patients and the passengers returning from China.
- CDC is preparing first responders, healthcare providers, and health systems, by:

AMERICAN OVERSIGHT

    - Establishing visibility across healthcare systems to understand healthcare use, particularly surges in demand for medical care and associated resources.
    - Conducting extensive outreach to clinical and hospital professional organizations to ensure health system preparedness.
    - Producing guidance documents on infection control, hospital clinical evaluation and patient management.
    - Working closely with healthcare facilities and providers to reinforce infection control principles that recognize PPE is one component of a larger set of practices that help to limit the spread of disease.
    - Developing a range of respirator conservation strategies, including strategies to make supplies last longer (such as using alternative products like reusable respirators) and extending the use of disposable respirators.
    - Leveraging existing telehealth tools to direct people to the right level of care.
    - Working with supply chain partners to understand supply usage, what products are available, and when more aggressive measures may need to be taken to ensure that HCPs at highest risk have access to PPE.
    - Sharing information with stakeholders to help them recognize when to shift the strategies they are using.
- The first report of an infected healthcare provider occurred on February 29 in a long-term care facility in Washington.
- Healthcare personnel (HCP) often have prolonged close contact with patients in healthcare settings and may come in contact with a person infected with COVID-19. HCPs can protect themselves by properly following recommended infection control practices, including the appropriate use of PPE when caring for patients with COVID-19.
- CDC recommends evaluating asymptomatic HCPs with close contact or a potential exposure to COVID-19 by assessing risk, monitoring symptoms, and determining the need for appropriate work restrictions.

OPTIMIZING THE SUPPLY OF N95 RESPIRATORS

- Protection of healthcare workers is a priority. CDC's Strategies for Optimizing the Supply of N95 Respirators offers a series of strategies or options to optimize supplies of disposable N95 filtering facepiece respirators (commonly called "N95 respirators") in healthcare settings where there is limited supply.
- It also includes considerations for use by federal, state, and local public health officials, respiratory protection program managers, occupational health service leaders, infection prevention and control program leaders, and other leaders in healthcare settings who are responsible for developing and implementing policies and procedures for preventing pathogen transmission in healthcare settings.
- CDC has provided additional resources related to these strategies:
    - Checklist for Healthcare Facilities: Strategies for Optimizing the Supply of N95 Respirators during the COVID-19 Response is intended to help healthcare facilities

AMERICAN OVERSIGHT

prioritize the implementation of the strategies presented in the Strategies for Optimizing the Supply for N95 Respirators guidance.

- Release of Stockpiled N95 Filtering Facepiece Respirators Beyond the Manufacturer-Designated Shelf Life: Considerations for the COVID-19 Response
    - In times of increased demand and decreased supply, consideration can be made to use the N95s listed in the guidance past their manufacturer-designated shelf life when responding to COVID-19.
    - This preliminary information from the NIOSH study suggests certain N95 models beyond their manufacturer-designated shelf life will be protective. CDC recommends that N95s that have exceeded their manufacturer-designated shelf life should be used only as outlined in the Strategies for Optimizing the Supply of N95 Respirators.

MANAGEMENT OF PATIENTS GUIDANCE FOR HEALTHCARE PROVIDERS

Clinical Presentation

- Most frequently reported symptoms of COVID-19 include fever, cough, sore throat, myalgia, or fatigue. Less commonly reported symptoms include sputum production, headache, hemoptysis, and diarrhea. Older patients and people with chronic medical conditions may be at higher risk of severe illness.
    - Possible risk factors for progressing to severe illness may include, but are not limited to, older age and people of any age with underlying chronic medical conditions such as heart disease, lung disease and diabetes.

Clinical Course

- Symptoms among reported cases of COVID-19 vary in severity from mild illness to severe or fatal illness.
- Some reports suggest the potential for clinical deterioration during the second week of illness.
- Among hospitalized patients with confirmed COVID-19, some will develop complications:
    - Acute respiratory distress syndrome (ARDS)
    - Intensive care for respiratory support
    - Pneumonia resulting in death
    - Secondary infection

Laboratory and Radiographic Findings

- SARS-CoV-2 RNA has been detected from upper and lower respiratory tract specimens, and the virus has been isolated from bronchoalveolar lavage fluid.
- The duration of shedding of SARS-CoV-2 RNA in the upper and lower respiratory tracts is not yet known but may be several weeks or longer.

Clinical Management and Treatment

AMERICAN OVERSIGHT

- There are no U.S. Food and Drug Administration (FDA)-approved drugs specifically for the treatment of patients with COVID-19.
- At present, clinical management includes infection prevention and control measures and supportive care, including supplementary oxygen and mechanical ventilatory support when indicated.
- Patients with mild clinical presentation may not initially require hospitalization.
- The decision to monitor a patient in the inpatient or outpatient setting should be made on a case-by-case basis.

Therapeutic Options for COVID-19 Patients

- There are two approved drugs (chloroquine and hydroxychloroquine) and one investigational agent (remdesivir) currently in use in the United States.
    - The two approved drugs have not been approved specifically for the treatment of patients with COVID-19.
    - For full information on therapeutic options and obtaining these drugs, visit Information for Clinicians on Therapeutic Options for COVID-19 Patients.
- Remdesivir is an investigational intravenous drug with broad antiviral activity that inhibits viral replication through premature termination of RNA transcription. It has in-vitro activity against SARS-CoV-2 and in-vitro and in-vivo activity against related betacoronaviruses.
    - It is available through three clinical trials or on an uncontrolled compassionate use basis.
- Hydroxychloroquine and chloroquine are oral prescription drugs that have been used for treatment of malaria and certain inflammatory conditions.
    - Based upon limited in-vitro and anecdotal data, chloroquine or hydroxychloroquine are currently recommended for treatment of hospitalized COVID-19 patients in several countries.

INTERIM GUIDANCE FOR BUSINESSES AND EMPLOYERS (NON-HEALTHCARE SETTINGS)

- Interim guidance for businesses and employers to plan for and respond to COVID-19 is now available on CDC's website. This interim guidance may help prevent workplace exposures to acute respiratory illnesses, including COVID-19, in non-healthcare settings.
- Employers can use strategies now to prevent workplace exposures to acute respiratory illness:
    - Actively encouraging sick employees to stay home
    - Separating sick employees
    - Emphasizing staying home when sick, respiratory etiquette, and hand hygiene by all employees
    - Performing routine environmental cleaning
    - Advising employees before traveling to take certain steps
    - Checking the CDC's Traveler's Health Notices website for the latest guidance and recommendations for each country to which you will travel
- Some people, like healthcare workers caring for COVID-19 patients and other close contacts of COVID-19 patients, will have an increased risk of infection.

AMERICAN OVERSIGHT

    - Employees who are well but who have a sick family member at home with COVID-19 should notify their supervisor and refer to CDC guidance for how to conduct a risk assessment of their potential exposure. Recommendations released March 16 state that if someone in a household has tested positive, keep the entire household at home.
    - If an employee is confirmed to have COVID-19, employers should inform fellow employees of their possible exposure to COVID-19 in the workplace but maintain confidentiality as required by the Americans with Disabilities Act. Employees exposed to a co-worker with confirmed COVID-19 should refer to CDC guidance for how to conduct a risk assessment of their potential exposure.
- Employers should be ready to implement strategies to protect the workforce from COVID-19 while ensuring the continuity of operations.
    - An infectious disease outbreak response plan should include possible work-related exposures and health risks to employees. The plan should also explore flexible worksites (e.g., telecommuting) and work hours in accordance with human resource policies.
    - Determine how you will operate if absenteeism spikes from increases in sick employees, those who stay home to care for sick family members, and those who must stay home to watch their children dismissed from childcare programs and K-12 schools.

AMERICAN OVERSIGHT

Subject:	3-24-2020 CDC COVID-19 Key Points, Telehealth Expansion Notice, and Updated CDC Guidance
Date:	Wednesday, March 25, 2020 8:17:11 AM
Attachments:	CDC_COVID-19_Daily Key Points__3_24_2020_FINAL.pdf

Dear Colleagues:

Attached please find the CDC COVID-19 key points for Tuesday, March 24, 2020. Please feel free to share with your staff and other partners.

Please see below for updated CDC COVID-19 guidance posted on the CDC COVID-19 webpage.

- **New Tool**: Coronavirus Disease 2019 (COVID-19) Outpatient Dialysis Facility Preparedness Assessment Tool
- **Level 3 Travel Health Notices** for: Ecuador, Singapore, Indonesia, Romania, Saudi Arabia, Qatar, Philippines, India, South Africa

Secretary Azar Announces Historic Expansion of Telehealth Access to Combat COVID-19

On Tuesday, the President and the Department of Health and Human Services (HHS) announced unprecedented steps to expand Americans' access to telehealth services during the COVID-19 outbreak. The Centers for Medicare & and Medicaid Services (CMS) expanded Medicare coverage for telehealth visits, the HHS Office for Civil Rights (OCR) announced it will waive potential HIPAA penalties for good faith use of telehealth during the emergency, and the HHS Office of Inspector General (OIG) provided flexibility for healthcare providers to reduce or waive beneficiary cost-sharing for telehealth visits paid by federal healthcare programs.

This includes major shifts in various laws that makes telehealth more accessible:

- See CMS's press release: https://www.cms.gov/newsroom/press-releases/president-trump-expands-telehealth-benefits-medicare-beneficiaries-during-covid-19-outbreak
- See OCR's guidance: https://www.hhs.gov/hipaa/for-professionals/special-topics/emergency-preparedness/notification-enforcement-discretion-telehealth/index.html
- See OIG's policy statement: https://oig.hhs.gov/compliance/alerts/index.asp

Kind Regards,

CDC State Coordination Task Force

(Sent by BCC to PHEP directors, state epidemiologists, state health officials, public health laboratory directors, BCHC, and national and federal partners)

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Pandemic
March 24, 2020 as of 9:30pm

Updated text is shown in colored text.

SNAPSHOT

- CDC has reported:
  - 44,183 confirmed and presumptive positive cases of COVID-19
  - 544 COVID-19-related deaths
  - All 50 states, the District of Columbia, Puerto Rico, Guam, and the US Virgin Islands have reported cases of COVID-19.

MAIN KEY POINTS

- On March 16, 2020 President Trump and the White House Coronavirus Task Force issued new guidelines to help protect Americans during the Coronavirus pandemic.
  - The initiative, called 15 Days to Slow the Spread, lays out guidelines for a nationwide effort to slow the spread of COVID-19. It calls for the implementation of measures to increase social distancing between people at all levels of society.
  - This is a massive proactive, preventive response to COVID-19. It aims to slow the spread and blunt the impact of this disease on the United States.
- All segments of U.S. society have a role to play at this time:
  - People across the country are asked to stay home as much as much as possible and otherwise practice social distancing.
  - This includes canceling or postponing gatherings of more than 10 people and closing schools in some areas as determined by local and state governments.
  - It also includes special measures to protect those people who are most vulnerable to this disease.
  - People who are sick are asked to follow CDC guidance on recovering at home and follow the new guidance for when it's OK to interact with other people again.
- There is no vaccine to protect against COVID-19 and no medications approved to treat it.
- There is a body of evidence—based on about 200 journal articles—that supports the effectiveness of social distancing measures, both when used alone and in combination with other measures.
  - Much of this data is outlined in CDC's Community Mitigation Guidelines to Prevent Pandemic Influenza — United States, 2017.
  - These recommendations work better when implemented in concert.
- While the new guidelines are recommended for the 15-day period ending March 30, government leaders will continually reassess the status of the outbreak in the United States. It may be that these measures will need to be modified or extended for additional periods of time.
- This is a historic, unprecedented outbreak, the likes of which have not been seen since the influenza pandemic of 1918.
- The White House Task Force on Coronavirus has established www.coronavirus.gov as the centralized website for the Federal government.
  - CDC continues to maintain www.cdc.gov/covid19.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Pandemic
March 24, 2020 as of 9:30pm

SITUATION UPDATE

- 44,183 reported cases of COVID-19 have been detected in all 50 states.
- 569 of these cases occurred through close contact with another case.
- 479 cases occurred in people who had traveled to international areas with sustained (ongoing) transmission and among their close contacts.
- 43,135 cases are either still being investigated to determine the source of exposure, or have an unknown source of exposure and are therefore assumed to be a result of community spread.
- The number of cases of COVID-19 being reported in the United States is rising quickly.
    - Early on, most cases in the United States were among travelers returning from affected countries or close contacts of people who had COVID-19.
    - Now, more and more cases are resulting from community spread where the source of the exposure is unknown.
- As COVID-19 activity continues to increase, it will be possible to track activity using some existing surveillance systems that track respiratory illnesses, including flu.
- CDC's most recent FluView showed that the percent of specimens testing positive for influenza at clinical laboratories is decreasing. At the same time, levels of influenza-like-illness (ILI)—as measured by people seeking care for fever, cough, and sore throat—increased for the second week in a row after declining for three weeks.
    - This means that more people are seeking care for respiratory illness than usual at this time of year and that the increase is not due to increasing influenza activity.
    - There are likely multiple factors that contribute to this increase. These may include concern over COVID-19 causing people to seek treatment for respiratory illness when they otherwise would not have, delayed or cancelled visits for routine healthcare, and the ILI surveillance system picking up COVID-19 illness activity.
- CDC and partners that collaborate on surveillance are adapting many of the surveillance systems that routinely collect information on viruses, illnesses, hospitalizations and deaths to better track COVID-19.
    - They are additionally creating new systems to track COVID-19.
    - All sources of information will be made available in one place on the web to facilitate tracking of COVID-19
    - The agency plans to roll out COVID-19 surveillance data on the website this week.
- As of March 23, 91 state and local public health labs in 50 states, the District of Columbia, Guam, and Puerto Rico verified they are successfully using COVID-19 diagnostic tests. See map showing which states and territories have one or more laboratories that have successfully verified and are currently using COVID-19 diagnostic tests.
- As of March 23, 2020, CDC and local and state public health laboratories had tested a total of 88,042 specimens.
- Private laboratories are increasing their testing capacity. In addition to the approximately 2,500 tests per day currently done nationally, it is projected that:
    - Roche will increase their capacity up to 10,000 tests per day by end of this week
    - BioReference will increase their capacity by an additional 3,000 tests per day.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Pandemic
March 24, 2020 as of 9:30pm

- In addition, the Food and Drug Administration has issued a number of Emergency Use Authorizations for commercial manufacturers to develop other COVID-19 tests, including a point-of-care test that could deliver results in as short as 30 minutes.,

CDC GUIDANCE UPDATES

- On March 23, 2020 CDC posted additional guidance for specific community settings including:
  - Management of COVID-19 in Correctional and Detention Facilities,
  - Discontinuation of Transmission-Based Precautions and Disposition of Patients with COVID-19 in Healthcare Settings, and
  - Infection Control Guidance for Personnel at Blood and Plasma Collection Facilities.
- On March 22, CDC posted COVID-19 information specific to children including:
  - Tips for parents during school dismissal,
  - Guidance for Schools and Childcare Programs, and
  - Updated FAQs related to children and COVID-19
- On March 22, CDC posted Guidance for Retirement Communities and Independent Living to help them plan, prepare, and respond to COVID-19.
- On March 19, CDC updated technical guidance and consumer information about cleaning and disinfecting your home when someone is sick.
- On March 17, updates were made to CDC guidance on alternate non-95 PPE guidance: Strategies for Optimizing the Supply of N95 Respirators: Crisis/Alternate Strategies.
- CDC is reviewing and updating travel notices almost on a daily basis.
  - On March 23, CDC issued 9 additional Level 3 Travel notices for Ecuador, India, Indonesia, Philippines, Qatar, Romania, Saudi Arabia, Singapore, and South Africa.
- CDC updated its guidance for specimen collection for testing for COVID-19 to collect a single upper respiratory nasopharyngeal swab (NP) instead of an NP and oropharyngeal swab (OP).
- CDC also posted new guidance on when people who have had COVID-19 and have been isolating at home can discontinue isolating in Discontinuation of Home Isolation for Persons with COVID-19.
  - People with COVID-19 who have symptoms and were directed to care for themselves at home may discontinue home isolation if:
    - At least 3 days (72 hours) have passed since recovery—defined as resolution of fever without the use of fever-reducing medications and improvement in respiratory symptoms (e.g., cough, shortness of breath); and,
    - At least 7 days have passed since symptoms first appeared.
- CDC posted Guidance for child care settings, including a decision tree on when schools should close.

WHAT YOU CAN DO

- Everyone can do their part to help respond to this emerging public health threat:
  - On March 16, the White House announced a program called 15 Days to Slow the Spread, which is a nationwide effort to slow the spread of COVID-19 through the implementation of social distancing at all levels of society.

AMERICAN OVERSIGHT

    - CDC developed print resources to promote this message, including a Stay at home if you are sick! poster.
- Older people and people with severe chronic conditions should take special precautions because they are at higher risk of developing serious COVID-19 illness.
- If you are a healthcare provider, use your judgement to determine if a patient has signs and symptoms compatible with COVID-19 and whether the patient should be tested. Factors to consider, in addition to clinical symptoms, may include:
    - Does the patient have recent travel from an affected area?
    - Has the patient been in close contact with someone with COVID-19 or patients with pneumonia of unknown cause?
    - Does the patient reside in an area where there has been community spread of COVID-19?
- If you are a healthcare provider or a public health responder caring for a COVID-19 patient, please take care of yourself and follow recommended infection control procedures.
- CDC and federal partners recommend that people postpone routine medical or dental care at this time. This will help to reduce the burden on the healthcare system.
    - If you cannot postpone medical treatment, call your provider before visiting to see if they offer consultations by phone or telemedicine.
- People who get a fever or cough should consider whether they might have COVID-19, depending on where they live, their travel history, or other exposures.
    - More than half of the United States is seeing some level of community spread of COVID-19.
    - Testing for COVID-19 may be accessed through medical providers or public health departments, but there is no treatment for this virus.
    - Most people have mild illness and are able to recover at home without medical care.
- For people who are ill with COVID-19, but are not sick enough to be hospitalized, please follow CDC guidance on how to reduce the risk of spreading your illness to others. People who are mildly ill with COVID-19 are able to isolate at home during their illness.
- If you have been in China or another affected area or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus.

For more information please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

AMERICAN OVERSIGHT

From:	State and Local Readiness (CDC)
To:	State and Local Readiness (CDC)
Subject:	3-4-2020 CDC COVID-19 Key Points and Travel Health Alert Notice (THAN) Cards
Date:	Thursday, March 5, 2020 11:52:37 AM
Attachments:	CDC_COVID-19_Daily Key Points__3_4_2020_FINAL.pdf 03-03-2020_COVID-19_THAN_Level 3s.pdf

---

Dear Colleagues:

Attached, please find **CDC COVID-19 Key Points from 03-04-2020**. Feel free to share with partners and appropriate parties.

In addition, CDC has updated **COVID-19 Travel Health Alert Notice (THAN) Cards** for travelers, a PDF version is attached.

CDC has launched a new webpage for Travelers from Countries with Widespread Sustained (Ongoing) Transmission Arriving in the United States.

The full link is: https://www.cdc.gov/coronavirus/2019-ncov/travelers/after-travel-precautions.html
The shortened link is: www.cdc.gov/COVIDTravel

The shortened link is printed on the back of the updated Travel Health Alert Notice (THAN) card, which is attached. The THAN cards will be distributed to all travelers from countries with a Level 3 travel notice. Travelers from China will continue to receive the **Check and Record Everyday (CARE) booklet, available here:** https://www.cdc.gov/coronavirus/2019-ncov/travelers/care-booklet.html.

The launch of the above webpage corresponds with changes to travel notice language. Level 3 travel notices can be accessed from the above page and advise travelers to "stay home and monitor their health during travel and for 14 days after returning to the United States."

Kind Regards,

State Coordination Task Force

(Sent by BCC to PHEP directors, state epidemiologists, state health officials, public health laboratory directors, BCHC, and national and federal partners)

AMERICAN OVERSIGHT

COVID 19 CORONAVIRUS DISEASE

Health Alert: Coronavirus Disease 2019 (COVID-19)

You have traveled to a country with an outbreak of COVID-19 and are at higher risk.

COVID-19 is a respiratory illness that can spread from person to person.

Stay Home

Stay home for the next 14 days and monitor your health. Take your temperature with a thermometer two times a day and watch for symptoms.

If you feel sick and have symptoms:

- Call ahead before you go to a doctor's office or emergency room.
- Tell the doctor about your recent travel and your symptoms.
- Avoid contact with others.
- Do not travel while sick.

Symptoms

Illnesses have ranged from mild symptoms to severe illness and death. Symptoms may appear 2–14 days after exposure.

Symptoms can include:

Fever (100.4°F/38°C or higher)

Cough

Shortness of breath

CDC Daily Key Points

Coronavirus Disease 2019 ("COVID-19") Outbreak

March 04, 2020

Updated text is shown in colored text.

SNAPSHOT

CDC has reported:

- 80 confirmed and presumptive positive cases of COVID-19
- 9 COVID-19 related deaths
- 13 states reporting cases of COVID-19

MAIN KEY POINTS

- There is an expanding global outbreak of respiratory illness called COVID-19 caused by a novel (new) coronavirus.
- Community spread is being detected in a growing number of countries, including in parts of the United States.
- There are 80 reported U.S. cases of COVID-19 from 13 states.
- The potential public health threat posed by COVID-19 is high, both globally and to the United States. Individual risk is dependent on exposure.
- Under current circumstances, certain people will have an increased risk of infection. For example:
    - People in communities where ongoing community spread with the virus that causes COVID-19 has been reported are at elevated though still relatively low risk of exposure.
    - Healthcare workers caring for patients with COVID-19 are at elevated risk of exposure.
    - Close contacts of persons with COVID-19 also are at elevated risk of exposure.
    - Travelers returning from affected international locations where community spread is occurring also are at elevated risk of exposure.
- Public health efforts at this time are focused concurrently on containing spread of this virus and mitigating the impact of this virus.
- At this time, there is no vaccine to protect against COVID-19 and no medications approved to treat it.
- Nonpharmaceutical interventions are actions, apart from getting vaccinated and taking medicine, that people and communities can take to help slow the spread of respiratory illnesses like COVID-19.
- Currently, nonpharmaceutical interventions are the most important response strategy against COVID-19.
- All communities can take measures to reduce the spread of COVID-19. Everyone has a role to play in getting ready and staying healthy.

SITUATION UPDATE

- As of March 2, 2020, 85 international locations (including the U.S.) have reported confirmed cases of COVID-19, including most recently Argentina, Chile, Poland and Ukraine.

AMERICAN OVERSIGHT

- 80 reported cases of COVID-19 have been detected in Arizona, California, Florida, Georgia, Illinois, Massachusetts, New York, New Hampshire, North Carolina, Oregon, Rhode Island, Washington and Wisconsin.
    - 16 of these cases occurred through person-to-person spread.
    - 24 cases occurred in persons who had traveled to international areas with sustained (ongoing) transmission.
    - 40 cases are still being investigated to determine the source of exposure.
- On March 4, CDC updated its guidance for "Evaluating and Reporting Persons Under Investigation (PUI)."
    - Criteria for evaluation of Persons Under Investigation (PUI) were expanded to a wider group of symptomatic patients.
    - On Thursday, March 5, CDC will host a clinician education call on the topic of COVID-19. Visit CDC's website for information on how to join this call.
- CDC has developed a map of the U.S. that shows affected states and how many COVID-19 cases they have reported.
- As of March 4, 2020, CDC had issued the following Travel Health Notices:
    - Level 3 Travel Health Notice (avoid non-essential travel): China, Iran, South Korea, and Italy
    - Level 2 Travel Health Notices (Practice Enhanced Precautions): Japan
    - Level 1 (practice usual precautions): Hong Kong
- CDC also recommends that all travelers reconsider cruise ship voyages into or within Asia at this time.
    - This is consistent with guidance by the U.S. State Department.
- The situation is rapidly evolving. CDC is constantly reviewing and updating its guidance as needed.

REPORTING

- More public health laboratories are able to test for the virus that causes COVID-19, and they are reporting their results publicly.
- As of March 4, 42 state and local public health laboratories are able to test for COVID-19.
    - CDC has developed a map showing the states that have successfully verified and are currently using COVID-19 diagnostic tests.
    - This list of states currently testing for COVID-19 is provided by the Association of Public Health Laboratories (APHL).
- Because states are reporting their results directly and publicly, sometimes in near real-time, CDC case counts may differ from what states, local authorities, or media are reporting.
    - If there are discrepancies between case counts reported by state or local officials and CDC-reported numbers, the numbers provided by states will be the most up to date.
- State health laboratories are reporting their results to CDC.
    - CDC is consolidating state reports and combining them with CDC-confirmed test results to present a national aggregated case count daily from Monday through Friday.
    - CDC is reporting cumulative confirmed and presumptive positive cases of COVID-19 in the United States since January 21, 2020.

AMERICAN OVERSIGHT

    - CDC will post case counts submitted to CDC by 4pm the prior day on the COVID-19 response website at noon.
- As of March 2, 2020, 1,235 patients had been tested at CDC. This does not include testing being done at state and local public health laboratories, which began this week.
- CDC is presenting data related to people who were repatriated via U.S. State Department flights from Wuhan, China and from the Diamond Princess cruise ship (Japan) in a separate chart available on the CDC website.

WHAT YOU CAN DO

- Everyone can do their part to help respond to this emerging public health threat:
    - It's currently flu and respiratory disease season and CDC recommends getting a flu vaccine, taking everyday preventive actions to help stop the spread of germs, and taking flu antivirals if prescribed.
    - Individuals and communities should familiarize themselves with recommendations to protect themselves and their community from getting and spreading respiratory illnesses like coronavirus disease 2019.
    - If you are a healthcare provider, be on the look-out for people who have been in close contact with a person known to have COVID-19, and people who live in or have recently been in an area with ongoing spread, and have fever and respiratory symptoms.
    - If you are a healthcare provider caring for a COVID-19 patient or a public health responder, please take care of yourself and follow recommended infection control procedures.
    - If you have recently been to an area with ongoing spread of COVID-19 or have been exposed to someone sick with COVID-19 in the last 14 days, you may face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus. If you develop COVID-19 symptoms, contact your healthcare provider, and tell them about your symptoms and your travel or exposure to a COVID-19 patient.
    - For people who have had close contact with someone with COVID-19 who develop symptoms, contact your healthcare provider, and tell them about your symptoms and your exposure to a COVID-19 patient.
    - For people who are ill with COVID-19, please follow CDC guidance on how to reduce the risk of spreading your illness to others.

CDC ACTIONS

- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States to reduce the spread and the impact of this virus.
- CDC is operationalizing all of its pandemic preparedness and response plans, working on multiple fronts to meet these goals, including specific measures to prepare communities to respond to local transmission of the virus that causes COVID-19.
- Pandemic guidance developed in anticipation of an influenza pandemic is being repurposed and adapted for a COVID-19 pandemic.

AMERICAN OVERSIGHT

- Public health partners are encouraged to review their pandemic preparedness plans at this time.
- CDC is aggressively responding to the global outbreak of COVID-19 and preparing for the potential of community spread in the United States.
- CDC's Action for Preparing Communities for Potential Spread of COVID-19 include:
  - Preparing first responders, healthcare providers, and health systems
  - Reinforcing state, territorial, and local public health readiness
  - Supporting communities, businesses, and schools

COMMUNITY BASED INTERVENTIONS (AKA COMMUNITY MITIGATION)

- Americans should be prepared for the possibility of a COVID-19 outbreak in their community. Everyone has a role to play.
- Currently, a vaccine is not available for COVID-19. Until a vaccine is developed, community-based interventions, such as school dismissals, event cancellations, social distancing, and plans to work remotely can help slow the spread of coronavirus.
- Your local public health department and community partners have been preparing for an event like COVID-19 and have plans in place. Now is a good time for businesses, community and faith-based organizations, schools, and health-care systems to reexamine their preparedness plans to make sure they are ready.
- Strong community partnerships between local health departments, the healthcare sector, faith-based organizations, and other community partners are vital for this response, and will need to prepare for and coordinate response to an outbreak, if it occurs.
  - Community-based interventions can be grouped in three categories:
    - Personal protective measures (e.g., voluntary home isolation of ill persons, voluntary home quarantine of exposed household members, covering nose/mouth when coughing or sneezing, hand hygiene, using face masks in community settings when ill)
    - Community measures aimed at increasing social distancing (e.g., school dismissals, social distancing in workplaces, postponing or cancelling mass gatherings)
    - Environmental measures (e.g., routine cleaning of frequently touched surfaces)
- CDC has recommendations to protect yourself and your community from getting and spreading respiratory illnesses like coronavirus disease 2019.

For more information please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

---

Dear Colleagues:

Attached, please find **CDC COVID-19 Key Points from 03-04-2020**. Feel free to share with partners and appropriate parties.

In addition, CDC has updated **COVID-19 Travel Health Alert Notice (THAN) Cards** for travelers, a PDF version is attached.

CDC has launched a new webpage for Travelers from Countries with Widespread Sustained (Ongoing) Transmission Arriving in the United States.

The full link is: https://www.cdc.gov/coronavirus/2019-ncov/travelers/after-travel-precautions.html
The shortened link is: www.cdc.gov/COVIDTravel

The shortened link is printed on the back of the updated Travel Health Alert Notice (THAN) card, which is attached. The THAN cards will be distributed to all travelers from countries with a Level 3 travel notice. Travelers from China will continue to receive the **Check and Record Everyday (CARE) booklet, available here:** https://www.cdc.gov/coronavirus/2019-ncov/travelers/care-booklet.html.

The launch of the above webpage corresponds with changes to travel notice language. Level 3 travel notices can be accessed from the above page and advise travelers to "stay home and monitor their health during travel and for 14 days after returning to the United States."

Kind Regards,

State Coordination Task Force

(Sent by BCC to PHEP directors, state epidemiologists, state health officials, public health laboratory directors, BCHC, and national and federal partners)

AMERICAN OVERSIGHT

COVID 19 CORONAVIRUS DISEASE

Health Alert: Coronavirus Disease 2019 (COVID-19)

You have traveled to a country with an outbreak of COVID-19 and are at higher risk.

COVID-19 is a respiratory illness that can spread from person to person.

Stay Home

Stay home for the next 14 days and monitor your health. Take your temperature with a thermometer two times a day and watch for symptoms.

If you feel sick and have symptoms:

- Call ahead before you go to a doctor's office or emergency room.
- Tell the doctor about your recent travel and your symptoms.
- Avoid contact with others.
- Do not travel while sick.

Symptoms

Illnesses have ranged from mild symptoms to severe illness and death. Symptoms may appear 2–14 days after exposure.

Symptoms can include:

Fever (100.4°F/38°C or higher)

Cough

Shortness of breath

CDC Daily Key Points

Coronavirus Disease 2019 ("COVID-19") Outbreak

March 04, 2020

Updated text is shown in colored text.

SNAPSHOT

CDC has reported:

- 80 confirmed and presumptive positive cases of COVID-19
- 9 COVID-19 related deaths
- 13 states reporting cases of COVID-19

MAIN KEY POINTS

- There is an expanding global outbreak of respiratory illness called COVID-19 caused by a novel (new) coronavirus.
- Community spread is being detected in a growing number of countries, including in parts of the United States.
- There are 80 reported U.S. cases of COVID-19 from 13 states.
- The potential public health threat posed by COVID-19 is high, both globally and to the United States. Individual risk is dependent on exposure.
- Under current circumstances, certain people will have an increased risk of infection. For example:
    - People in communities where ongoing community spread with the virus that causes COVID-19 has been reported are at elevated though still relatively low risk of exposure.
    - Healthcare workers caring for patients with COVID-19 are at elevated risk of exposure.
    - Close contacts of persons with COVID-19 also are at elevated risk of exposure.
    - Travelers returning from affected international locations where community spread is occurring also are at elevated risk of exposure.
- Public health efforts at this time are focused concurrently on containing spread of this virus and mitigating the impact of this virus.
- At this time, there is no vaccine to protect against COVID-19 and no medications approved to treat it.
- Nonpharmaceutical interventions are actions, apart from getting vaccinated and taking medicine, that people and communities can take to help slow the spread of respiratory illnesses like COVID-19.
- Currently, nonpharmaceutical interventions are the most important response strategy against COVID-19.
- All communities can take measures to reduce the spread of COVID-19. Everyone has a role to play in getting ready and staying healthy.

SITUATION UPDATE

- As of March 2, 2020, 85 international locations (including the U.S.) have reported confirmed cases of COVID-19, including most recently Argentina, Chile, Poland and Ukraine.

AMERICAN OVERSIGHT

- 80 reported cases of COVID-19 have been detected in Arizona, California, Florida, Georgia, Illinois, Massachusetts, New York, New Hampshire, North Carolina, Oregon, Rhode Island, Washington and Wisconsin.
    - 16 of these cases occurred through person-to-person spread.
    - 24 cases occurred in persons who had traveled to international areas with sustained (ongoing) transmission.
    - 40 cases are still being investigated to determine the source of exposure.
- On March 4, CDC updated its guidance for "Evaluating and Reporting Persons Under Investigation (PUI)."
    - Criteria for evaluation of Persons Under Investigation (PUI) were expanded to a wider group of symptomatic patients.
    - On Thursday, March 5, CDC will host a clinician education call on the topic of COVID-19. Visit CDC's website for information on how to join this call.
- CDC has developed a map of the U.S. that shows affected states and how many COVID-19 cases they have reported.
- As of March 4, 2020, CDC had issued the following Travel Health Notices:
    - Level 3 Travel Health Notice (avoid non-essential travel): China, Iran, South Korea, and Italy
    - Level 2 Travel Health Notices (Practice Enhanced Precautions): Japan
    - Level 1 (practice usual precautions): Hong Kong
- CDC also recommends that all travelers reconsider cruise ship voyages into or within Asia at this time.
    - This is consistent with guidance by the U.S. State Department.
- The situation is rapidly evolving. CDC is constantly reviewing and updating its guidance as needed.

REPORTING

- More public health laboratories are able to test for the virus that causes COVID-19, and they are reporting their results publicly.
- As of March 4, 42 state and local public health laboratories are able to test for COVID-19.
    - CDC has developed a map showing the states that have successfully verified and are currently using COVID-19 diagnostic tests.
    - This list of states currently testing for COVID-19 is provided by the Association of Public Health Laboratories (APHL).
- Because states are reporting their results directly and publicly, sometimes in near real-time, CDC case counts may differ from what states, local authorities, or media are reporting.
    - If there are discrepancies between case counts reported by state or local officials and CDC-reported numbers, the numbers provided by states will be the most up to date.
- State health laboratories are reporting their results to CDC.
    - CDC is consolidating state reports and combining them with CDC-confirmed test results to present a national aggregated case count daily from Monday through Friday.
    - CDC is reporting cumulative confirmed and presumptive positive cases of COVID-19 in the United States since January 21, 2020.

AMERICAN OVERSIGHT

    - CDC will post case counts submitted to CDC by 4pm the prior day on the COVID-19 response website at noon.
- As of March 2, 2020, 1,235 patients had been tested at CDC. This does not include testing being done at state and local public health laboratories, which began this week.
- CDC is presenting data related to people who were repatriated via U.S. State Department flights from Wuhan, China and from the Diamond Princess cruise ship (Japan) in a separate chart available on the CDC website.

WHAT YOU CAN DO

- Everyone can do their part to help respond to this emerging public health threat:
    - It's currently flu and respiratory disease season and CDC recommends getting a flu vaccine, taking everyday preventive actions to help stop the spread of germs, and taking flu antivirals if prescribed.
    - Individuals and communities should familiarize themselves with recommendations to protect themselves and their community from getting and spreading respiratory illnesses like coronavirus disease 2019.
    - If you are a healthcare provider, be on the look-out for people who have been in close contact with a person known to have COVID-19, and people who live in or have recently been in an area with ongoing spread, and have fever and respiratory symptoms.
    - If you are a healthcare provider caring for a COVID-19 patient or a public health responder, please take care of yourself and follow recommended infection control procedures.
    - If you have recently been to an area with ongoing spread of COVID-19 or have been exposed to someone sick with COVID-19 in the last 14 days, you may face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus. If you develop COVID-19 symptoms, contact your healthcare provider, and tell them about your symptoms and your travel or exposure to a COVID-19 patient.
    - For people who have had close contact with someone with COVID-19 who develop symptoms, contact your healthcare provider, and tell them about your symptoms and your exposure to a COVID-19 patient.
    - For people who are ill with COVID-19, please follow CDC guidance on how to reduce the risk of spreading your illness to others.

CDC ACTIONS

- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States to reduce the spread and the impact of this virus.
- CDC is operationalizing all of its pandemic preparedness and response plans, working on multiple fronts to meet these goals, including specific measures to prepare communities to respond to local transmission of the virus that causes COVID-19.
- Pandemic guidance developed in anticipation of an influenza pandemic is being repurposed and adapted for a COVID-19 pandemic.

AMERICAN OVERSIGHT

- Public health partners are encouraged to review their pandemic preparedness plans at this time.
- CDC is aggressively responding to the global outbreak of COVID-19 and preparing for the potential of community spread in the United States.
- CDC's Action for Preparing Communities for Potential Spread of COVID-19 include:
  - Preparing first responders, healthcare providers, and health systems
  - Reinforcing state, territorial, and local public health readiness
  - Supporting communities, businesses, and schools

COMMUNITY BASED INTERVENTIONS (AKA COMMUNITY MITIGATION)

- Americans should be prepared for the possibility of a COVID-19 outbreak in their community. Everyone has a role to play.
- Currently, a vaccine is not available for COVID-19. Until a vaccine is developed, community-based interventions, such as school dismissals, event cancellations, social distancing, and plans to work remotely can help slow the spread of coronavirus.
- Your local public health department and community partners have been preparing for an event like COVID-19 and have plans in place. Now is a good time for businesses, community and faith-based organizations, schools, and health-care systems to reexamine their preparedness plans to make sure they are ready.
- Strong community partnerships between local health departments, the healthcare sector, faith-based organizations, and other community partners are vital for this response, and will need to prepare for and coordinate response to an outbreak, if it occurs.
  - Community-based interventions can be grouped in three categories:
    - Personal protective measures (e.g., voluntary home isolation of ill persons, voluntary home quarantine of exposed household members, covering nose/mouth when coughing or sneezing, hand hygiene, using face masks in community settings when ill)
    - Community measures aimed at increasing social distancing (e.g., school dismissals, social distancing in workplaces, postponing or cancelling mass gatherings)
    - Environmental measures (e.g., routine cleaning of frequently touched surfaces)
- CDC has recommendations to protect yourself and your community from getting and spreading respiratory illnesses like coronavirus disease 2019.

Subject:	[IMPORTANT UPDATE] FDA Issues New Policy to Help Expedite Availability of Diagnostics
Date:	Saturday, February 29, 2020 6:57:03 PM

Dear Partner –

Today, as part of the U.S. Food and Drug Administration's ongoing and aggressive commitment to address the coronavirus outbreak, the agency issued a new policy for certain laboratories seeking to develop diagnostic tests for coronavirus in order to achieve more rapid testing capacity in the U.S.

The new policy is for certain laboratories that develop and begin to use validated COVID-19 diagnostics before the FDA has completed review of their Emergency Use Authorization (EUA) requests. The immediately in effect guidance issued today describes the circumstances where the FDA does not intend to object to the use of these tests for clinical testing while the laboratories are pursuing an EUA with the FDA. Importantly, this policy only applies to laboratories that are certified to perform high-complexity testing consistent with requirements under Clinical Laboratory Improvement Amendments.

The FDA guidance provides recommendations for test developers, including information regarding test validation, FDA notification and interim confirmatory clinical testing. Following the completion of their test validation, laboratories should communicate with the FDA, via email, in order to notify the agency that the test has been validated. Laboratories should submit a completed EUA request within 15 business days of notification.

The link to the full press release is here.

AMERICAN OVERSIGHT

From: Baker, Michael (OS/IEA)
To: Baker, Michael (OS/IEA)
Subject: [RELEASE] - HHS Awards $117 Million to End the HIV Epidemic in the United States
Date: Wednesday, February 26, 2020 10:59:31 AM

Dear Partner –

Today, the U.S. Department of Health and Human Services (HHS), through the Health Resources and Services Administration (HRSA), awarded approximately $117 million to expand access to HIV care, treatment, medication, and prevention services. This investment is a critical component of the Administration's *Ending the HIV Epidemic: A Plan for America (EHE)* initiative, which aims to reduce the number of new HIV infections in the United States by 90 percent by 2030.

The EHE initiative and today's awards focus on 48 counties, Washington, D.C., and San Juan, Puerto Rico, geographic areas where more than 50 percent of new HIV diagnoses occurred in 2016 and 2017, as well as the seven states with a substantial rural HIV burden.

"HRSA is a leader in working to end the HIV epidemic in the U.S.," said HHS Secretary Alex Azar. "These investments will support partnerships between organizations that are on the front lines of preventing and reducing HIV transmission, as well as improving the overall health outcomes for people with HIV."

HRSA's Health Center Program awards will be used to identify at-risk individuals and engage in preventive services, test for HIV, and prescribe pre-exposure prophylaxis (PrEP) when appropriate. Awards made to HRSA's Ryan White HIV/AIDS Program recipients will be used to link people who are either newly diagnosed with HIV, or diagnosed but currently not in care, to essential HIV care, treatment, and support services, helping them reach viral suppression and reduce HIV transmission.

For further discussion on this announcement, we invite you to a stakeholder call TODAY, February 26, 2020 with HRSA Administrator Tom Engels. Details can be found below:

Date: February 26, 2020
Time: 4:00 PM EST
Number: 888-790-3548
Passcode: 2511315

For a list of award recipients, visit:

- Health Center Program: https://bphc.hrsa.gov/program-opportunities/primary-care-hiv-prevention/fy2020-awards
- Ryan White HIV/AIDS Program: https://hab.hrsa.gov/about-ryan-white-hivaids-program/fy2020-ending-hiv-epidemic-awards

For more information about HRSA's role in the Ending the HIV Epidemic initiative, visit: www.hrsa.gov/ending-hiv-epidemic.

Sincerely,

AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

From:	State and Local Readiness (CDC)
To:	State and Local Readiness (CDC)
Subject:	Attached: Update on COVID-19 response to Governors (2-20-2020 COVID-19 SHO & State Epi Call)
Date:	Thursday, February 20, 2020 5:28:23 PM
Attachments:	02 20 2020 MEMO AMA call with governors on COVID-19.docx

Dear Colleagues,

Attached is the "Update on COVID-19 response to Governors" document mentioned on today's CDC COVID-19 SHO & State Epi Call.

Thank you,

State Coordination Task Force

Sent by BCC to State Health Officials and State Epidemiologists

AMERICAN OVERSIGHT

DATE: February 19, 2020

TO: The Secretary

THROUGH: Judy Stecker, Deputy Chief of Staff
Ann C. Agnew, Executive Secretary

FROM: Laura Trueman, Director, IEA

SUBJECT: Meeting with U.S. Governors – BRIEFING MEMO

Details:
Date: Thursday, February 20, 2020
Time: 2:30 PM – 3:30 PM
Location: 615-F
HHS Staff: Brian Harrison (IOS), Judy Stecker (IOS), Laura Trueman (IEA), Darcie Johnston (IEA), Dr. Robert Redfield (CDC), Dr. Robert Kadlec (ASPR), Dr. Anthony Fauci (NIAID), Michael Baker (IEA)
External Attendees: Acting Deputy Secretary Ken Cuccinelli (DHS)
Press: No

Who requested this meeting?: White House Intergovernmental Affairs

Topic: Update on COVID-19 response to Governors

Secretary's Role: Provide high-level overview on the Administration's action plan and next steps and answer questions the Governors may have.

Background:
The purpose of this call is to update Governors on the Administration's recent actions in the ongoing COVID-19 response, encourage Governors to begin planning for a more intensive response, and answer questions that the Governors may have on HHS and Administration actions. The Governors may be staffed by state health and emergency response individuals from their states on this call.

Additionally, National Governor Association Executive Director Bill McBride and Association of State and Territorial Health Officials CEO Mike Fraser have been invited to listen on the call.

In addition to HHS subject matter experts, Acting Deputy Secretary Ken Cuccinelli of the Department of Homeland Security will provide a brief DHS update.

After these updates, Governors will be able to ask questions.

AMERICAN OVERSIGHT

Proposed Run of Show:

2:30 PM	Welcome and introductions by Laura Trueman
2:31 PM – 2:35 PM	High-Level Overview by Secretary Azar
2:35 PM – 2:38 PM	CDC updates with Dr. Bob Redfield
2:38 PM – 2:41 PM	DHS Updates with Acting Deputy Secretary Cuccinelli
2:41 PM – Call end	Discussion and Q&A
	Close Call by Laura Trueman

Discussion Points

Discussion on Prudent Planning for State, Local, and Tribal Governments

i. What would your roles and responsibilities be if a pandemic impacted your state/communities?
ii. What are your authorities at the state level? What are the authorities of your local officials?
iii. How will you communicate with key stakeholders in the health care system and critical industries?
iv. Discussion of available planning resources.

AMERICAN OVERSIGHT

Coronavirus TPs:

Thank you all for joining today's call.

- We appreciate you talking with us so we can provide you a status update on the Administration's COVID-19 response.
- While the immediate risk to the American public is still currently low, we wanted to update you all on recent Departmental and Administration actions, and answer questions that you may have.

First, let me provide you with a brief status update on the current case count. This data is current as of last night, though as you all know this is a rapidly changing situation and we are constantly monitoring developments to update our response.

- As of February 19, there are 74,185 cases in China and 2,004 deaths. Outside of China, we are tracking 991 cases, 542 with Diamond Princess. Other countries of concern include Singapore, Hong Kong, Japan (29 non-Diamond Princess cases out of 66), and South Korea.
- In the U.S., we currently stand at 15 cases, plus 28 presumptive cases in process of being confirmed at CDC from Diamond Princess; total would give the US 43 cases.
- Those 15 confirmed cases have been reported in the U.S. in seven states — Arizona, California, Illinois, Massachusetts, Texas, Washington, and Wisconsin.
- Of the 15 original cases, 3 have been released, 4 remain in the hospital, and 4 are in home isolation; there are 58 POI pending, 6 from Diamond Princess.
- Our scientists and public health experts are trying to learn more about the virus using the data we have from China and the cases we have here. And we are working with Chinese counterparts and other international experts on the ground in China.

We want to continue to assure you that protecting the public health and preparing for events like this is what we do, and we are proud to work with state and local health departments to do it. As we continue our federal response planning, we look towards a realistic phase 2 that may require a transition from containment to mitigation.

- We sincerely appreciate the partnership that you, our nation's Governors, and the mayors in your states have worked with us on.
- Though there has been limited transmission in the U.S. so far, we are preparing for the possibility that there may be increased person to person transmission.

AMERICAN OVERSIGHT

- In a situation where we move from containment to mitigation of disease spread in an affected community, we know that there will need to be some adjustments to our current posture.
- In preparation for this transition, we strongly recommend that you, your public health teams, and your emergency management teams to review your emergency response plans. We suggest you explore and confirm the authorities that you possess to aid in the response to wide-spread transmission in U.S. jurisdictions.
- Confer and collaborate with your Attorneys General and legislature leaders to confirm and identify what authorities that you have and any that you may need to be granted.
- State and local officials will be responsible for three major pieces of a response:
    - Transportation;
    - Housing; and
    - Coordinating with locals and private sector
- Most importantly, we encourage you to lean in and be ready to execute on any necessary actions. We all know that in emergency response, time is of the utmost importance.
- When we talk about having the world's finest public health system, that is talking about the high quality coordination that occurs from HHS on down to your health departments and local hospitals.

Finally, a few additional actions we've taken that I'd like to highlight:

- As of February 17, CDC and Customs and Border (CBP) personnel had screened about 41,000 people with recent travel history to China at U.S. airports.
- Both the NIH and the Biomedical Advanced Research Development Authority (BARDA) in ASPR have entered into partnerships with industry partners to accelerate the development of a COVID-19 vaccine candidate.
- CDC has links and planning resources widely available, including some that focus on public health law, some that focus on preparedness standards, and some that discuss funding. Our staff will be highlighting those for you, and we encourage you to review them to help answer any questions that you may have.

Across the government, we continue to value our partnership with you as we respond to this outbreak. I'll now turn this over to Dr. Bob Redfield for a further update on recent CDC actions.

AMERICAN OVERSIGHT

Recent Update on the Situation Involving the Diamond Princess

- CDC is supporting the Department of State-led mission to repatriate U.S. citizens returning to the United States from Japan who were aboard the Diamond Princess cruise ship.
    - Due to the dynamic nature of the ongoing outbreak, the U.S. government recommended that U.S. citizens disembark and return to the United States.
- On February 16, 329 American citizens returned by flights chartered by the State Department.
    - The planes were met by a team of U.S. government personnel deployed at the bases to assess the health of the passengers.
    - The passengers were screened before leaving the ship and have been monitored and evaluated by medical and public health personnel during the trip and after arrival.
    - Those passengers who returned from Japan are being housed separately from the people already in quarantine who returned on previous U.S. Government repatriation flights from Wuhan.
- There are more than 100 American citizens still onboard the Diamond Princess cruise ship or in hospitals in Japan. These citizens have been placed under travel restrictions, as have the ship's other passengers and crew.
    - After disembarkation from the Diamond Princess, these passengers and crew will be required to wait at least 14 days without having symptoms or a positive coronavirus test result before they are permitted to board flights to the United States.
- The U.S. Government is taking measures to protect the health of the people under quarantine, their loved ones, and their communities, as well as the communities where they are being temporarily housed.
- Based on what is known about this virus and other coronaviruses, CDC believes the risk to the communities temporarily housing these people is low.

Good morning,

In an effort to follow the recommendations of experts for social distancing due to the coronavirus outbreak, the Dean decided to cancel this meeting for now.

We will inform you as soon as a new date has been selected for this meeting.

Thank you!

Kind regards,

Miladys (Milly) Martínez

Senior Executive Assistant to Dean Tomás R. Guilarte

Robert Stempel College of Public Health & Social Work

AMERICAN OVERSIGHT

PLEASE JOIN US!

The Robert Stempel College
of Public Health and Social Work
is celebrating

the Reaffirmation of its Accreditation

April 3, 2020
3 P.M. - 5:00 P.M.
AHC-5 ATRIUM
RSVP to Milly Martinez (milmarti@fiu.edu)

AMERICAN OVERSIGHT

Directions to the FIU Modesto Maidique Campus

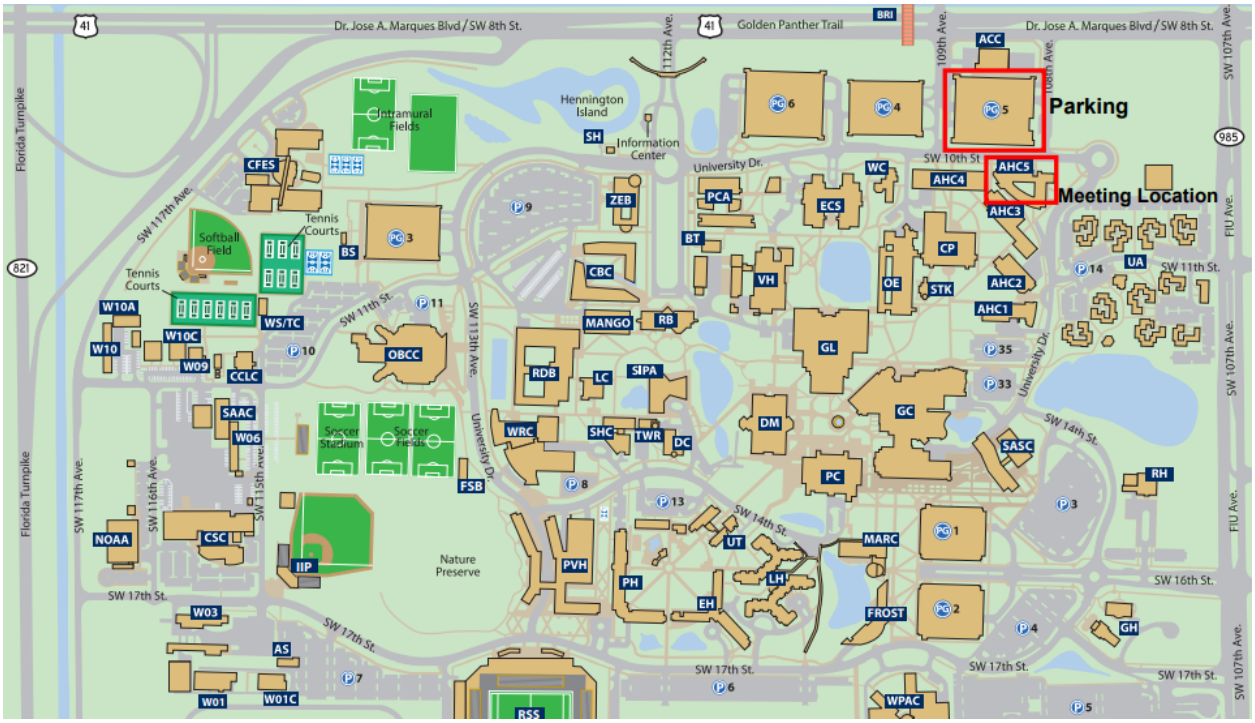
Address:
Florida International University
11200 SW 8th St
Miami, FL 33199

Parking Garage 5 - PG5
SW 8th St and 109th Ave

From Miami International Airport:
Take the SR 836 (Dolphin Expressway) WEST exit from the Airport
Follow SR 836 (Dolphin Expressway) to the Florida Turnpike
Take the Florida Turnpike SOUTH exit
Follow the Florida Turnpike to the Tamiami Trail exit (SW 8th Street)

From I-95, Downtown Miami, Ft. Lauderdale, and West Palm Beach:
Take I-95 to SR 836 (Dolphin Expressway) WEST
Follow SR 836 (Dolphin Expressway) to the Florida Turnpike
Take the Florida Turnpike SOUTH exit
Follow the Florida Turnpike to the Tamiami Trail exit (SW 8th Street)

From western Palm Beach / Broward County or the Florida Turnpike north:
Take the Florida Turnpike SOUTH
Follow the Florida Turnpike to the Tamiami Trail exit (SW 8th Street)



From above:

1. Enter FIU on 8th St and SW 109th Ave
2. You will see, on your right, the Red Parking Garage (PGR), and on your left **Parking Garage 5 (PG5). Please use PG5 as this garage is adjacent to the AHC5 building**
3. If your vehicle has already been registered online, you are able to park at any "student" parking space, located on floors 3 – rooftop.

Academic Health Center 5 **(AHC5)** is located directly in front of **PG5**. Please take the elevator to the 5th floor and exit to the left, where you will see the entrance to the Office of the Dean.

AMERICAN OVERSIGHT

Subject: Canceled: COVID-19 Weekly Clinician Call

Attachments: Healthcare Provider Agenda W 1130.docx

Importance: High

The weekly conference call for healthcare practitioners is moving from Wednesdays, 11:30-12:00 to Wednesdays, 2:00-2:30. A meeting invitation for the new call was distributed yesterday afternoon from EOC-Plans@em.myflorida.com <mailto:EOC-Plans@em.myflorida.com> . Please accept that new invite and remove this one from your calendars. Please share the new invite with your partners as appropriate.

AMERICAN OVERSIGHT

Healthcare Provider Call

Hosted by the Florida Department of Health

Every Wednesday
11:30 AM to 12:00 PM

Call-In Information

Call-In Number: 888-585-9008
Participant Code: 872-128-152

Description

This is a weekly conference call hosted by the Florida Department of Health to disseminate the most up-to-date information regarding COVID-19 to healthcare provider partners. All medical professionals are invited to participate on the call. There will be an opportunity for questions as time permits.

Standing Agenda

- Situation Updates from the Florida Department of Health
- Briefing from the Florida Agency for Healthcare Administration
- Updates from other State Agencies
- Questions from Partners

Intended Audience

This call is intended solely for healthcare provider partners in Florida. Other partners should relay any questions or concerns to their local county health department.

Contact the Joint Information Center at JIC-Reports@em.myflorida.com for help with any technical issues with the Conference Call.

Importance: High

The weekly conference call for healthcare practitioners is moving from Wednesdays, 11:30-12:00 to Wednesdays, 2:00-2:30. A meeting invitation for the new call was distributed yesterday afternoon from EOC-Plans@em.myflorida.com <mailto:EOC-Plans@em.myflorida.com> . Please accept that new invite and remove this one from your calendars. Please share the new invite with your partners as appropriate.

AMERICAN OVERSIGHT

Healthcare Provider Call

Hosted by the Florida Department of Health

Every Wednesday
11:30 AM to 12:00 PM

Call-In Information

Call-In Number: 888-585-9008
Participant Code: 872-128-152

Description

This is a weekly conference call hosted by the Florida Department of Health to disseminate the most up-to-date information regarding COVID-19 to healthcare provider partners. All medical professionals are invited to participate on the call. There will be an opportunity for questions as time permits.

Standing Agenda

- Situation Updates from the Florida Department of Health
- Briefing from the Florida Agency for Healthcare Administration
- Updates from other State Agencies
- Questions from Partners

Intended Audience

This call is intended solely for healthcare provider partners in Florida. Other partners should relay any questions or concerns to their local county health department.

Contact the Joint Information Center at JIC-Reports@em.myflorida.com for help with any technical issues with the Conference Call.

Subject: Canceled: COVID-19 Weekly Clinician Call

Attachments: Healthcare Provider Agenda W 1130.docx

Importance: High

The weekly conference call for healthcare practitioners is moving from Wednesdays, 11:30-12:00 to Wednesdays, 2:00-2:30. A meeting invitation for the new call was distributed yesterday afternoon from EOC-Plans@em.myflorida.com <mailto:EOC-Plans@em.myflorida.com> . Please accept that new invite and remove this one from your calendars. Please share the new invite with your partners as appropriate.

AMERICAN OVERSIGHT

Healthcare Provider Call

Hosted by the Florida Department of Health

Every Wednesday
11:30 AM to 12:00 PM

Call-In Information

Call-In Number: 888-585-9008
Participant Code: 872-128-152

Description

This is a weekly conference call hosted by the Florida Department of Health to disseminate the most up-to-date information regarding COVID-19 to healthcare provider partners. All medical professionals are invited to participate on the call. There will be an opportunity for questions as time permits.

Standing Agenda

- Situation Updates from the Florida Department of Health
- Briefing from the Florida Agency for Healthcare Administration
- Updates from other State Agencies
- Questions from Partners

Intended Audience

This call is intended solely for healthcare provider partners in Florida. Other partners should relay any questions or concerns to their local county health department.

Contact the Joint Information Center at JIC-Reports@em.myflorida.com for help with any technical issues with the Conference Call.

Subject: Canceled: Florida Healthcare Provider Stakeholder Call for 2019 Novel Coronavirus

Importance: High

The Florida Department of Health invites you to join us for a weekly public health stakeholder conference call regarding the 2019 novel corona virus outbreak. The target audience for this call is the healthcare community in Florida. During the call we will provide the most current situation both globally, as well as in Florida and share the Department's response actions.

Please share this invitation with your membership as appropriate.

AMERICAN OVERSIGHT

When: Each Wednesday at 2:00 p.m. EST

Call in Information: 888-585-9008 Pin 208-305-233

Subject: Canceled: Florida Healthcare Provider Stakeholder Call for 2019 Novel Coronavirus

Importance: High

The Florida Department of Health invites you to join us for a weekly public health stakeholder conference call regarding the 2019 novel corona virus outbreak. The target audience for this call is the healthcare community in Florida. During the call we will provide the most current situation both globally, as well as in Florida and share the Department's response actions.

Please share this invitation with your membership as appropriate.

AMERICAN OVERSIGHT

When: Each Wednesday at 2:00 p.m. EST

Call in Information: 888-585-9008 Pin 208-305-233

Subject: Canceled: Florida Healthcare Provider Stakeholder Call for 2019 Novel Coronavirus

Importance: High

The Florida Department of Health invites you to join us for a weekly public health stakeholder conference call regarding the 2019 novel corona virus outbreak. The target audience for this call is the healthcare community in Florida. During the call we will provide the most current situation both globally, as well as in Florida and share the Department's response actions.

Please share this invitation with your membership as appropriate.

AMERICAN OVERSIGHT

When: Each Wednesday at 2:00 p.m. EST

Call in Information: 888-585-9008 Pin 208-305-233

Subject: Canceled: Florida Healthcare Provider Stakeholder Call for 2019 Novel Coronavirus

Importance: High

The Florida Department of Health invites you to join us for a weekly public health stakeholder conference call regarding the 2019 novel corona virus outbreak. The target audience for this call is the healthcare community in Florida. During the call we will provide the most current situation both globally, as well as in Florida and share the Department's response actions.

Please share this invitation with your membership as appropriate.

AMERICAN OVERSIGHT

When: Each Wednesday at 2:00 p.m. EST

Call in Information: 888-585-9008 Pin 208-305-233

Subject: Canceled: Florida Healthcare Provider Stakeholder Call for 2019 Novel Coronavirus

Importance: High

The Florida Department of Health invites you to join us for a weekly public health stakeholder conference call regarding the 2019 novel corona virus outbreak. The target audience for this call is the healthcare community in Florida. During the call we will provide the most current situation both globally, as well as in Florida and share the Department's response actions.

Please share this invitation with your membership as appropriate.

AMERICAN OVERSIGHT

When: Each Wednesday at 2:00 p.m. EST

Call in Information: 888-585-9008 Pin 208-305-233

Subject:	Canceled: Hepatitis A Regional Call - HHS Regions 4 & 6
Importance:	High

Hi All,

We know you're busy either responding to COVID-19 or covering for colleagues who are responding, so out of respect for the competing demands on your time we're going to cancel this round of hepatitis A regional calls. Please don't hesitate to reach out or email viralhepatitisoutbreak@cdc.gov <mailto:viralhepatitisoutbreak@cdc.gov> with any questions or concerns. We're still available to help in any way we can.

Thanks,

Megan

Dear Subcommittee on Insular Affairs Members & Meeting Participants –

Well, change is a constant!! Given that we have a last minute request from the White House for our members to brief officials on COVID-19 while they are in town, the meeting of the Subcommittee on Insular Affairs held during Washington Week will be cancelled this year. However, in the absence of the full committee meeting, Cendra and I would still appreciate having a working session with our partners and staff not traveling to the White House tomorrow to further our priorities and action steps for the coming year. It is critical that we keep this work moving. I have emailed these individuals separately.

Apologies for multiple emails.

Thanks,

Karl

Subject: Materials & Time Change for Subcommittee on IA During ASTHO WA Week

Dear Subcommittee on Insular Affairs Members & Meeting Participants,

AMERICAN OVERSIGHT

On behalf of Subcommittee Chair Esther Muna, CNMI and ASTHO CEO Mike Fraser, we welcome you to Washington Week and thank you for your active engagement and participation! Please note our meeting has been changed to the following date and time:

Tuesday, February 25th, 2020

4:00 – 5:30 pm ET

Madison Hotel – Adams B

1177 15th Street, NW

Washington, DC 20005

A calendar invite will follow.

Attached and below please find materials for our meeting. During our time together, we will re-visit the priorities established during last year's meeting, hear about progress made on these, and define action steps and priorities for the coming year. Also, please note that during or after the Tuesday dinner, those of us visiting on the Hill Wednesday and engaging in meetings with the Administration on Thursday will huddle to hone talking points.

https://naturalresources.house.gov/imo/media/doc/Insular%20Fact%20Sheet_ks.pdf

https://scholarlycommons.pacific.edu/pjh/vol2/iss1/1/

The Insular Affairs Subcommittee to the ASTHO Government Affairs Policy Committee was formed in 2018 to identify the unique policy needs and priorities of the Pacific and Atlantic jurisdictions. The subcommittee provides a forum for ASTHO's members to exchange information on policy challenges and solutions within the insular areas. Additionally, the subcommittee provides recommendations to the full committee on policy priorities.

See you soon!

Karl

Association of State and Territorial Health Officials **Subcommittee on Insular Affairs Subcommittee Meeting**

Tuesday, February 25, 2020

4:00 – 5:30 PM

The Madison Hotel | 1177 15th St. NW Washington, DC 20005 | Room Name: Adams B

Welcome and Introductions – Esther Muna (Chair, CNMI), Michael Fraser (CEO, ASTHO), Karl Ensign (Territorial Support ASTHO)
Overview of the Compact of Free Association – Bill Gallo, CDC
Overview of the Insular Affairs Subcommittee Priorities – Karl Ensign, ASTHO
Legislative Overview of the Past Year – Carolyn McCoy, ASTHO
Addressing Subcommittee Priorities – Priority Setting & Action Steps • *Improve Funding for Public Health & Related Services* • *Improve Data on Health Status & Outcomes* • *Strategize on Ways to Advocate for Improving Support to Veterans*
Next Steps and Adjourn – Karl Ensign (ASTHO), and Esther Muna (Chair CNMI)

AMERICAN OVERSIGHT

ASTHO Insular Areas – Priorities & Needs

ASTHO Insular Area members represent territories and freely associated states in the Pacific and Atlantic oceans:

- **Territories:** American Samoa, Commonwealth of the Northern Marianna Islands, and Guam in the Pacific, and Puerto Rico and the US Virgin Islands in the Atlantic.

- **Freely Associated States:** Federated States of Micronesia, Palau, and the Republic of the Marshall Islands in the Pacific.

Providing public health services in remote islands in the Pacific and the Atlantic is often costlier than in the states. Moreover, the policy needs of these jurisdictions are complex and often substantially different than those of the states. Largely, this stems from differences in the following areas:

- **Service configuration.** Pacific health officials oversee a broad array of services including emergency and hospital services in addition to the more traditional array of public health services within states. Officials also oversee behavioral health, environmental services, outpatient clinics and primary care. Health officials are also concerned with food and pharma safety, given the general dependency on imports. This dependency is heightened when food and pharmaceuticals are not readily available following a disaster.

- **Eligibility for federal funding and program participation.** Typically, territories are eligible for the same programs as states but have a lower reimbursement rate for entitlement programs such as Medicaid and a cap on the amount they can receive. This leads to frequent gaps in coverage. Until recently they have been able to close some of this gap through special appropriations but those are set to expire at the end of calendar year 2019 resulting in the "Medicaid Cliff" (https://www.npr.org/sections/health-shots/2019/11/20/780452645/americas-shame-medicaid-funding-slashed-in-u-s-territories). The freely associated states operate under a Compact of Free Association (COFA) with the United States, making them generally ineligible for entitlement funding. Instead, they must rely on other sources of funding including those administered to these jurisdictions under COFA through the Department of the Interior. COFA is set for renewal in 2023.

- **Population health needs.** Insular areas have challenges often associated with the developing world (such as dysentery, Dengue, Zika, and Hansen's Disease) along with those related to westernization (such as souring obesity rates and Diabetes). Mental health needs are also acute and treatment options are extremely limited. Given their need, all islands have facilities that meet the Health Professional Shortage Area (HPSA) designation, meaning there is limited access to primary care.

AMERICAN OVERSIGHT

- **Increased susceptibility to extreme weather events.** Within the past few years alone, extreme weather events on a scale not seen before wrecked havoc in both the Pacific (typoons Soudelor and Yutu) and the Atlantic (hurricanes Maria and Irma). This and other events associated with changing climates and rising sea levels place all Insular Areas at ongoing risk.

Insular Areas Strategic Priorities. Profile data and strategic plans facilitated in four jurisdictions (CNMI, Guam, FSM, Puerto Rico) revealed the following strategic priorities.

- Preventing and treating NCDs by addressing cancer, respiratory diseases, heart disease, stroke, and diabetes; lessening major risk factors for NCDs; and improving nutrition and physical activity.
- Lessening the prevalence and spread of communicable diseases: preventing and controlling Zika; addressing tuberculosis (TB), including multi-drug resistant TB; decreasing vaccine preventable diseases; treating and preventing sexually transmitted diseases including HIV; and eradicating leprosy.
- Meeting the needs of specialized populations, including efforts focused on maternal, infant, and child health; veterans; mental health and substance abuse prevention; and older adults.

Capacity-Building Assistance (CBA) Needs. To address these priorities, THA leaders and ASTHO identified the following as CBA needs within their agencies:

- Improving information technology and the collection and use of data: implementing electronic health records; strengthening data collection and linking; using data to inform decisionmaking; and strengthening surveillance capabilities.
- Better equipping and training the workforce: undertaking recruitment and retention planning; improving training; placing qualified students in health and medical fields; and addressing the aging health workforce.
- Improving key business processes: improving grants and contracts management; streamlining procurement and recruitment and onboarding processes.
- Entering into strategic partnerships: forging and strengthening collaborations with peer agencies, as well as local and community agencies and groups.
- Developing sustainable funding: planning for COFA funding replacement; achieving parity with state Medicare and Medicaid funding; meeting the needs of the un- and underinsured; applying for funding for nurses and prevention programs.
- Developing effective policies: implementing sugar-sweetened beverage taxes; establishing import taxes on unhealthy food.
- Improving education and outreach activities: engaging remote communities, indigent, and high-risk groups; improving education programs for family planning and other programs.

Policy Priorities. The newly-formed Insular Affairs Subcommittee to the ASTHO Government Affairs Committee has formulated the following policy priorities:

AMERICAN OVERSIGHT

- **Provide Long-term, Stable Medicaid Financing for the Territories.** Territorial health care is largely dependent on federal Medicaid funding. Yet despite immense need and relatively high eligibility rates, funding for territories' Medicaid expenses is capped and appropriations frequently expire. Severe and devastating hurricanes in the Atlantic and typhoons in the Pacific have further challenged the economies of the territories, impacting their ability to provide the necessary matching payments. For these reasons, long term, stable funding for Medicaid should be provided by raising or eliminating the cap, or through increased appropriation levels as a back-up. Additionally, the Federal Medical Assistance Percentage (FMAP) should be based on the same formula used to determine states' FMAP.

- **Working Capital.** Currently, jurisdictions with limited funding need to advance large amounts of capital to fund programs and services. Goal is to continue to hold jurisdictions accountable through their fiduciary responsibility while easing cash flow issues. Discussions with OGS, PIHOA etc. are underway. More background can be found here.

- **Strategize on ways to Advocate for improving support to Veterans.** The Insular Areas have some of the highest induction rates on a per capita basis and the military actively recruits on the islands. Yet access to health and supportive services are often not provided in the Insular Areas, particularly in the Freely-Associated States. Strategic meetings need to be held with the VA.

- **Improve the Inclusion of both Territories and Freely associated States (T/FAS) in Grant Announcements and Funding Eligibility Similar to American Indian and Alaskan Native (AI/AN).** Insular Area are often not explicitly included in eligibility criteria or are excluded from participating.

- **Improve Data on Health Status and Outcomes.** The Insular Areas are known to suffer from both first and third world public health challenges and existing data show relatively high rates of morbidity and mortality for a wide range of infectious and chronic disease. Access to health care and preventive services is often a challenge and there are workforce shortages of key health care specialists. Yet especially in the Pacific, reliable and consistent data on these challenges is not consistently available, challenging strategic planning, program development and implementation, and advocacy efforts.

  a. **Advocate for undertaking a new National Academy of Sciences (NAS) Health Assessment**
     - The last comprehensive assessment of health status in the Pacific -- the Pacific Partnerships for Health ("the Blue Book") -- was completed in 1998 and is out-of-date.
     - Monitor legislation into which funding for this could be inserted to fund a second assessment.
     - Include language to this effect in testimony as it was for Nate Smith's testimony before the House Labor, Health and Human Services and Education Appropriations Subcommittee.
     - Included request in outside testimony to the Senate Labor, HHS, Education and Related agencies requesting this assessment.

AMERICAN OVERSIGHT

- Included in comments to the Senate HELP Committee on The Lowering Healthcare Act of 2019 bill a request to include this assessment in the authorizing legislation.

b. Advocate that the insular areas fully participate in the National Electronic Disease Surveillance System (NEDS)

- Funding eligibility for NEDS and public health programs mandate states report into NEDS but these same requirements do not apply to the Insular Areas.
- Insular Areas are provided capitated rather than entitlement funding and those that do submit data are reported “below the line” in data reported out.
- As a result, Insular Area data is not included in public health data sets and reports (e.g., NCHS Data Store, HP2020).
- Catalogue key data that are – and are not – available on the Insular Areas in comparison to states.
- Team with PIHOA, TFAH, CSTE and other partners on strategy.
- Meet with key federal departmental (HHS, DOI) staff to better-understand the issue (e.g., funding, capacity) and strategize on needed improvements (could be done in conjunction with Hill Week).

AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

Insular Areas Subcommittee Priorities Identified to Date
December 2019

Improve Funding for Public Health & Related Services

1. **Provide Long-term, Stable Medicaid Financing for the Territories**
    - Territorial health care is largely dependent on federal Medicaid funding.
    - Yet despite immense need and relatively high eligibility rates, funding for territories' Medicaid expenses is capped and appropriations frequently expire.
    - Severe and devastating hurricanes in the Atlantic and typhoons in the Pacific have further challenged the economies of the territories, impacting their ability to provide the necessary matching payments.
    - For these reasons, long term, stable funding for Medicaid should be provided by raising or eliminating the cap, or through increased appropriation levels as a back-up.
    - Additionally, the Federal Medical Assistance Percentage (FMAP) should be based on the same formula used to determine states' FMAP.

2. **Support Re-Negotiation of the Compacts of Free Association**
    - The freely associated states in the Pacific (Federated States of Micronesia, Republic of the Marshall Islands, and Palau) operate under Compacts of Free Association (COFA) with the United States.
    - COFA enables citizens of these jurisdiction to travel to the United States without visa restrictions.
    - Additionally, COFA provides funding important to a number of activities and functions, including public health, administered through the Department of the Interior.
    - COFA is set for renewal in 2023.

3. **Working Capital**
    - Address the issue of the need for jurisdictions with limited funding needing to advance large amounts of capital to fund programs and services.
    - Discussions with OGS, PIHOA etc. are underway.
    - Goal is to hold jurisdictions accountable (fiduciary responsibility) while easing cash flow issues.
    - More on the subject can be found here.

4. **Improve the Inclusion of both Territories and Freely associated States (T/FAS) in Grant Announcements and Funding Eligibility Similar to American Indian and Alaskan Native (AI/AN)**
    - Insular Area are often not explicitly included in eligibility criteria or are excluded from participating.

AMERICAN OVERSIGHT

Improve Data on Health Status and Outcomes

- Access to health care and preventive services is often a challenge and there are workforce shortages of key health care specialists. Yet especially in the Pacific, reliable and consistent data on these challenges is not consistently available, challenging strategic planning, program development and implementation, and advocacy efforts.

5. **Advocate for undertaking a new National Academy of Sciences (NAS) Health Assessment**
    - The last comprehensive assessment of health status in the Pacific -- the Pacific Partnerships for Health ("the Blue Book") -- was completed in 1998 and is out-of-date.
    - Monitor legislation into which funding for this could be inserted to fund a second assessment.
    - Include language to this effect in testimony as it was for Nate Smith's testimony before the House Labor, Health and Human Services and Education Appropriations Subcommittee.
    - Included request in outside testimony to the Senate Labor, HHS, Education and Related agencies requesting this assessment.
    - Included in comments to the Senate HELP Committee on The Lowering Healthcare Act of 2019 bill a request to include this assessment in the authorizing legislation.

6. **Advocate that the insular areas fully participate in the National Electronic Disease Surveillance System (NEDS)**
    - Funding eligibility for NEDS and public health programs mandate states report into NEDS but these same requirements do not apply to the Insular Areas.
    - Insular Areas are provided capitated rather than entitlement funding and those that do submit data are reported "below the line" in data reported out.
    - As a result, Insular Area data is not included in public health data sets and reports (e.g., NCHS Data Store, HP2020).

Strategize on ways to Advocate for Improving Support to Veterans

- The Insular Areas have very high induction rates on a per capita basis and the military actively recruits on the islands.
- Yet access to health and supportive services are often not provided in the Insular Areas, particularly in the Freely-Associated States.

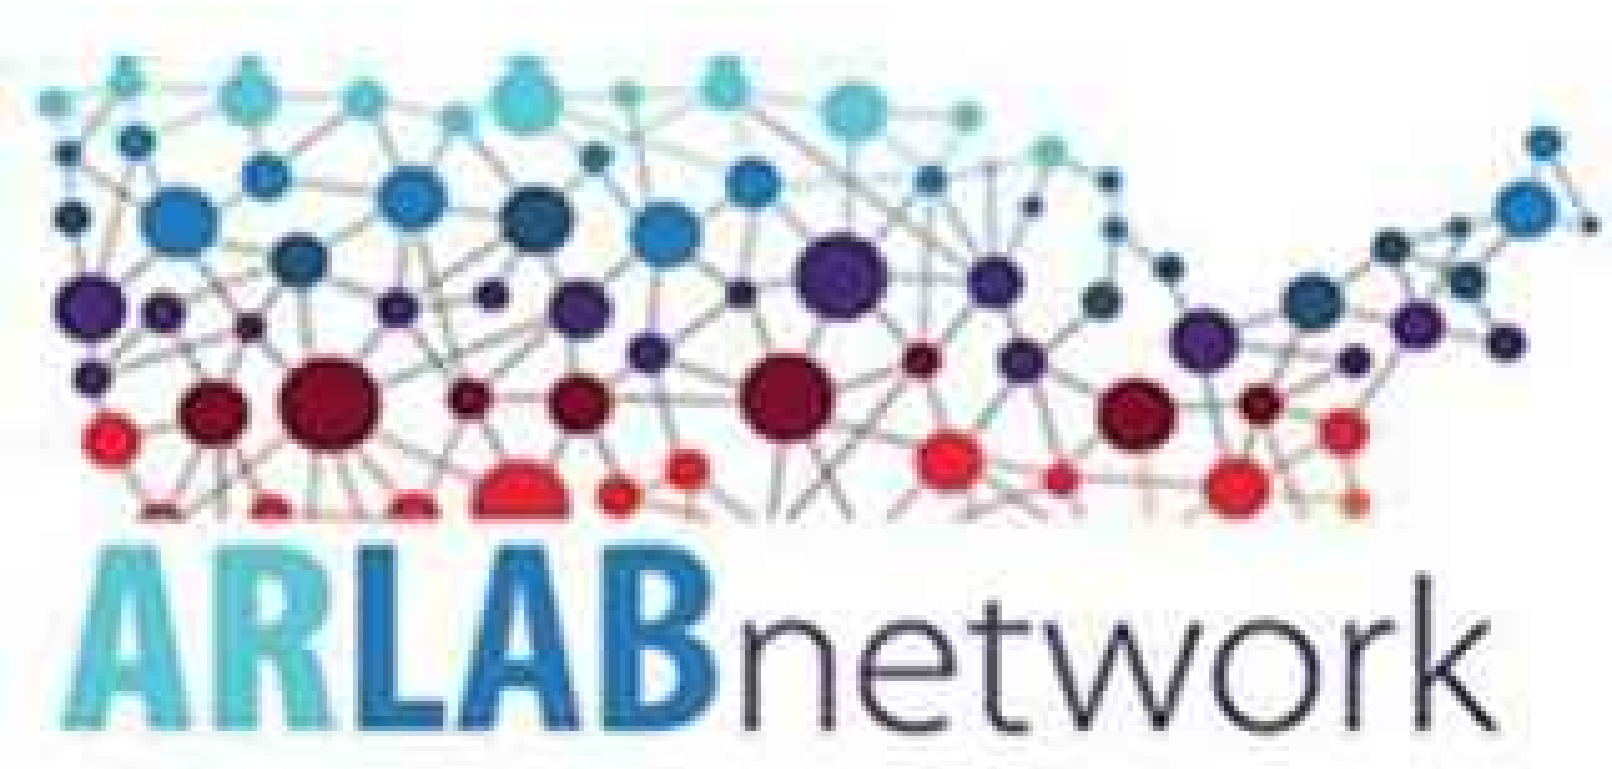
Subject: Canceled: Q1 SE Regional AR Lab Network Call

Attachments: ATT23545 1.jpg



Importance: High

COVID-19 is an emerging, rapidly evolving situation and we recognize that AR Lab Network lab staff and epidemiologists are being asked to shift their focus away from regular duties to the COVID-19 response. We have decided to postpone our next SE Regional call after receiving feedback from the jurisdictions in the SE Region.

We plan to choose an alternative date for our next regional call and will keep you all updated.

Thanks!

Subject:	cancellation of EIS and LLS regional trainings - EIS and LLS needed for COVID-19 response
Date:	Thursday, March 5, 2020 12:15:58 PM

EIS and LLS,

The top priority for CDC right now is supporting the response to COVID-19. As EIS officers and LLS fellows, you are essential for the response. About 75% of EIS officers and LLS fellows have already or are currently deployed to support an EOC activation (COVID-19, Ebola, and polio). EIS officers and LLS alumni from both programs are fully engaged and making major contributions at all levels of these activations.

We are **canceling the EIS Regional trainings in Atlanta and Phoenix** given the prioritization of COVID-19 and the number of EIS officers and LLS fellows, supervisors, and EWB staff currently deployed and likely to be deployed in the coming weeks.

Our top priority is the COVID-19 response and other essential duties related to your assignments. At this time, we do not have the luxury of taking you away from your assignments for a week of training. Please note the following:

- In times of urgent need, the EIS and LLS Programs reserve the right to unilaterally assign an EISO or LLS fellow to a field team or other emergency response activity without first seeking supervisory approval. At this time, we expect all EIS officers and LLS fellows to support the COVID-19 response and some of you may be asked to deploy repeatedly. **We are asking all supervisors to support the need for EIS and LLS to deploy**.

- If you are deploying, you should NOT be concerned about CAL completion or EIS conference presentations – if COVID-19 interferes with CAL completion we will work with you on a case by case basis. EIS or LLS program requirements should not interfere with your availability to deploy.

- Field officers who are already working on the response in your assigned jurisdiction are not expected to deploy elsewhere.

- EIS conference is currently scheduled as originally planned. We will notify you as soon as possible if we expect any changes to the conference.

- We will identify alternatives to allow you to practice and get feedback on your EIS conference presentations. We will also determine alternatives for EIS and LLS rounds.

We understand that many of you will be disappointed Regional Trainings are cancelled. We also know that many of you are pushing yourselves (including EIS and LLS supervisors) to support the

AMERICAN OVERSIGHT

response and keep up with your regular duties. We hope we have alleviated any concerns about needing to focus on EIS conference presentations for the time being. We encourage you to reach out for support from your classmates, supervisors, and staff within EWB should you need it. We also encourage you to speak with EOC resiliency coordinators, be aware of deployment resources, and take advantage of the Employee Assistance Program (EAP).

You were all selected for EIS or LLS because of your ability to thrive in a response environment. Your contributions are recognized and valued by CDC leadership. Thank you for your selflessness and service to CDC and our local, state, and international partners.

Respectfully,
Eric

Eric Pevzner, PhD, MPH

AMERICAN OVERSIGHT

From:	EIS (CDC)
To:	CDC EISO Class 2018; CDC EISO Class 2019; CDC EISO Supervisors 2018; CDC EISO Supervisors 2019
Cc:	CDC CSELS DSEPD EWB; Duncan, Heather (CDC/DDPHSS/CSELS/DSEPD); Glynn, Kate (CDC/DDPHSS/CSELS/DSEPD); Smith, Teresa M. (CDC/DDPHSS/CSELS/DSEPD); Iademarco, Michael (CDC/DDPHSS/CSELS/OD); Simone, Patricia (Pattie) (CDC/DDPHSS/CSELS/DSEPD); Black, Erin (CDC/DDPHSS/CSELS/DSEPD)
Subject:	Cancellation of EIS conference – next steps
Date:	Monday, March 16, 2020 12:40:45 PM

EISOs,

I am writing to inform you of the cancellation of the EIS conference scheduled for May 4–7th. As of March 15, 2020, CDC is recommending the cancellation or postponement of in-person events consisting of 50 people or more throughout the U.S. We have been working on contingency planning for weeks and we determined that even a virtual conference is not feasible given the presenters and audience are needed for the COVID-19 response. During this time, response priorities take precedence over developing presentations for EIS Conference.

We understand that cancelling conference has broad implications for all of you, especially the 2nd year EISOs. We are cognizant of the potential impacts on CAL completion, job searching, graduation, and other elements that are important to all of you and the program. We want you to know the following:

- The match for the incoming class will be conducted virtually with an extended recruitment period starting on March 23, 2020 and an extended period for virtual interviewing from April 20 – May 8.
- We will work with 2nd year officers on a case-by-case basis if your COVID-19 response involvement might compromise your ability to complete your CALs. We do not want CAL completion to be a deterrent to your involvement. If you have concerns, please reach out to your EWB supervisor or CIO liaison to discuss your situation.
- We are working to plan a 2-day EIS presentation and graduation event for June. The event would include presentations from 2nd year EISOs who needed conference to fulfill the CAL requirement, a graduation ceremony, and the EIS satirical review.
- We know that EIS conference is a time when many of you were planning to network and interview for jobs. We are working to identify alternative ways to support your search for CDC jobs.

For all of you currently or preparing to deploy, we hope that the cancellation of the conference alleviates any tension you might have been experiencing regarding how to prepare your presentation in the midst of COVID-19, Ebola, and polio responses.

EISO's are playing a vital role in supporting this nation's public health response, at the local, state, and federal level. Thank you for your service. Your dedication and contributions are valued and appreciated. At this time, we expect every EISO to contribute to the response in some way. We expect most field EISOs are supporting the response within their assigned jurisdiction and do not expect you to deploy elsewhere. If you are not already involved in response activities, please volunteer now. If you need guidance on how to find a deployment role, please contact us at EpiAid@cdc.gov. If you have had difficulty obtaining supervisory approval to support the response,

AMERICAN OVERSIGHT

please contact your CIO liaison or EWB supervisor so that we can assist.

Please reserve time on your schedules for a **call on March 18, 2020 at 12 pm EST** to answer your questions and discuss planning for an EIS presentation and graduation event for all EISOs tentatively scheduled for June. We will be sending the link for the Skype Meeting ASAP.

Respectfully,
Eric

AMERICAN OVERSIGHT

Thank you Charles and Hello Eleni and Yesenia,

The CBP Coronavirus Task Force will serve as your CBP Lead as they are working with CBP's Office of Field Operations and coordinating with CDC on screening and quarantine issues at Ports of Entry (land, sea, air), as well as adherence to current travel restrictions.

Please let me know if I can provide any additional help – or if you do not receive a response from my Task Force colleagues.

Thanks,

Chris

Hi Dr. Rosenfarb –

In light of the guidance below and my earlier discussions with ConGen in Brazil, I understand that the US Government does not anticipate conducting any screening of our guests upon their arrival in the US and that we would need to comply with State of Florida screening requirements.

I am adding to this email Dr. Yesenia Villalta, Administrator of the Department of Health in Florida, who advises us that CBP is responsible for conducting the necessary screenings of our guests upon arrival at MIA. Rather than try to negotiate these details, I thought it would be helpful to link the Federal group up with Dr. Yesenia to resolve this matter.

Thanks,

Eleni

Subject: [EXTERNAL] CDC guidance for Silver Shadow

Leah,
Thanks for speaking just now. To reiterate CDC's recommendation:

- The cruise line charter flight should transport the AMCITs to one of the designated funneling airports in the US (Miami), where they would disembark away from the main passenger terminal and be transferred to onward charter flights (also arranged by the cruise line) to their home of record. (Our info is that the passengers reside in 22 different states)
- Health screening of passengers would be done by the cruise line company prior to boarding in Recife, with no additional screening performed at the funneling airport (unless the individual has become obviously ill on the initial flight).
- 14 day home monitoring at the passenger's final destination is the recommended guidance.
- Individual state public health authorities at the final destinations should be contacted by the cruise line in advance of arrival at each of the final destinations in the event monitored quarantine is necessary.

From our side, our ConGen in Recife has already explained to the company what they need to do to arrange the charter (including their responsibility to clear with FL authorities—company has already told us that they are working on it with FL). The CBP attache at post is already tracking the plan for charter (and has alerted Miami airport as heads up).

Please let me know if the final CDC guidance differs from anything stated above.

Regards,
Dr. Rosenfarb

Leah,
Thanks for speaking just now. To reiterate CDC's recommendation:

- The cruise line charter flight should transport the AMCITs to one of the designated funneling airports in the US (Miami), where they would disembark away from the main passenger terminal and be transferred to onward charter flights (also arranged by the cruise line) to their home of record. (Our info is that the passengers reside in 22 different states)
- Health screening of passengers would be done by the cruise line company prior to boarding in Recife, with no additional screening performed at the funneling airport (unless the individual has become obviously ill on the initial flight).
- 14 day home monitoring at the passenger's final destination is the recommended guidance.
- Individual state public health authorities at the final destinations should be contacted by the cruise line in advance of arrival at each of the final destinations in the event monitored quarantine is necessary.

From our side, our ConGen in Recife has already explained to the company what they need to do to arrange the charter (including their responsibility to clear with FL authorities—company has already

AMERICAN OVERSIGHT

told us that they are working on it with FL). The CBP attache at post is already tracking the plan for charter (and has alerted Miami airport as heads up).

Please let me know if the final CDC guidance differs from anything stated above.

Regards,
Dr. Rosenfarb

Interim Recommendations regarding Shelter Characteristics for the 2019 Novel Coronavirus Outbreak United States Government Repatriation Operation
1 February 2020

Background:

In the setting of the expanding outbreak associated with a novel coronavirus from Wuhan, the United States Government has arranged for evacuation of US personnel in affected areas. Because these individuals will be evacuating from an outbreak zone, health screening and exposure risk assessments will be required to determine presence of illness or history of high-risk exposures upon entry to the US. Upon entry into the United States, these individuals will be placed under a quarantine order for 14 days after their last potential exposure to allow for illness detection and health monitoring. Individuals within the group will have different antecedent exposure risks. They should not be housed together in congregate settings, where an individual who becomes symptomatic could expose the rest of the evacuees.

Shelter requirements:

1) Separate quarters with separate bathroom facilities for each individual or family group are preferred.
   a. Cleaning supplies, e.g. household cleaning wipes, must be provided in any shared bathroom.
   b. If an individual sharing a bathroom becomes symptomatic, all others sharing the bathroom should be considered PUI contacts until the symptomatic person is appropriately evaluated and cleared.
2) No close congregation for social or dining activities. Food should be delivered to the individual quarters.
3) Overhead announcements and group SMS should be used instead of physical gatherings to share information.
4) Quarters should have a supply of face masks for individuals to put on if they become symptomatic.
5) Other support services (e.g. laundry, prescription medication refills, telephone/wifi/communication capability) will need to be provided.
6) Garbage should be bagged and left outside by the door of each of the quarters for routine pick up. Special handling is not required.
7) Appropriate infection control capabilities to manage initial clinical assessment of individuals who become ill should include a designated room(s) with a door that can be closed. The room(s) should be separate from residential facilities. Symptomatic individuals should be promptly evaluated and, if appropriate, await transfer to a medical facility in the room keeping the door closed. The room should be supplied with disposable facemasks for the ill individual to wear throughout the evaluation and

AMERICAN OVERSIGHT

transport process. Cleaning supplies e.g., hospital disinfectant spray or wipes, should be stocked in each evaluation room to clean and disinfect the room's surfaces after it's vacated by the ill individual. Current CDC healthcare guidance is here: https://www.cdc.gov/coronavirus/2019-nCoV/hcp/index.html

8) Each residential space, all common areas for staff members, and each clinical evaluation room must have supplies of alcohol-based hand rubs, as well as sinks with soap and water, and paper towels.
9) PPE supplies (disposable face shields, N95 disposable respirators, disposable gowns and gloves) should be maintained in each clinical assessment area to allow for response and assessment of individuals who become ill.
10) A system for temperature and symptom monitoring should provide assessment in-place for the individuals/family groups in their separate quarters.
11) Nearby medical facilities should have the capability to manage the assessment and treatment of ill persons (to include normal airborne infection isolation rooms)
12) The location should be secure against unauthorized access and be appropriate for enforcing quarantine, if enacted.

Michael Bell, MD
Deputy Director, Division of Healthcare Quality Promotion
Centers for Disease Control and Prevention

AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

CDC Daily Key Points
2019 Novel Coronavirus (2019-nCoV)

February 5, 2020

MAIN KEY POINTS

- There is an expanding outbreak of respiratory illness centered in China caused by a novel (new) coronavirus abbreviated "2019-nCoV."
- This virus is able to spread from person-to-person and cause severe disease and death.
- The potential global public health threat posed by this virus is high, but right now, the immediate risk to most Americans is low.
- Most cases are still limited to mainland China.
- Right now, this virus is not spreading in the community in the United States and the vast majority of Americans have a low risk of exposure. The greater risk is for people who have recently traveled to China or their close contacts.
- This is a rapidly evolving situation and the risk assessment for Americans may change.
- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States so as to reduce the spread and the impact of this virus.
- Strategies are in place to reduce the number of travelers from China and screen the remaining travelers from that country for illness, with people potentially being subject to a 14-day quarantine.
- The U.S. public health system also is on high alert to detect cases of 2019-nCoV infection and prevent further spread in the community.
- These measures are likely to cause some disruption.
- The success of response efforts now will determine what the coming days, weeks and months will bring here in the United States.
- While leaning forward aggressively, with the hope that we will be able to prevent community spread, we also are preparing for the worst.
- The current outbreak meets two criteria for a pandemic. It is a new virus and it is capable of person-to-person spread.
- Extensive work has been done over the past 15 years to prepare for an influenza pandemic.
- Influenza pandemic preparedness platforms and plans would be appropriate in the event that the current 2019-nCoV outbreak triggers a pandemic.
- Public health partners are encouraged to review their pandemic preparedness plans. Selected materials are available from www.cdc.gov/ncov.

SITUATION UPDATE

- To date, 27 international locations (in addition to the U.S.) have reported confirmed cases of 2019-nCoV infection.
- As of February 5, 2020, 11 infections with 2019-nCoV have been reported in the U.S. in five states – Arizona, California, Illinois, Massachusetts, and Washington.

AMERICAN OVERSIGHT

FL-DOH-20-0673-A-002346

- Two instances of person-to-person spread with this virus in the United States have been detected, in both cases after close, prolonged contact with a returned traveler from Wuhan.
- On Monday, February 3, 2020, CDC submitted an Emergency Use Authorization (EUA) package to the Food and Drug Administration (FDA) for its real time Reverse Transcription-Polymerase Chain Reaction (rRT-PCR) test that can diagnose 2019-nCoV in respiratory and serum samples from clinical specimens. FDA approved the EUA on February 4, 2020.
- The International Reagent Resource (IRR) is taking orders for diagnostic test kits and will begin shipping them to qualified laboratories. Only registered users will be able to order and obtain the diagnostic panel. (See section on "Testing" below.)
- On February 1, 2020, CDC issued a Health Alert Network (HAN) update to previously posted guidance and, for the first time, guidance on clinical care of 2019—nCoV patients.
- On February 3, 2020, CDC issued "Interim US Guidance for Risk Assessment and Public Health Management of Persons with Potential 2019 Novel Coronavirus (2019-nCoV) Exposure in Travel-associated or Community Settings" to provide U.S. public health authorities and other partners with a framework for assessing and managing risk of potential exposures to 2019-nCoV and implementing public health actions based on a person's risk level and clinical presentation.
- CDC has isolated the virus and sent it to the NIH's BEI Resources Repository for use by the broad scientific community.
- CDC is uploading the full genetic sequence of viruses from all U.S. patients into GenBank as they become available.
- CDC is working with state and local health departments on investigations to trace contacts of the U.S. 2019-nCoV patients to detect person-to-person spread.
- CDC is preparing senior staff to support the WHO international senior technical mission being formed to work with Chinese public health counterparts to help improve understanding of this new disease, including learning more about transmissibility and severity.

WHAT YOU CAN DO

- While the immediate risk of this new virus to the American public is believed to be low at this time, everyone can do their part to help us respond to this emerging public health threat:
    - It's currently flu and respiratory disease season and CDC recommends getting a flu vaccine, taking everyday preventive actions to help stop the spread of germs, and taking flu antivirals if prescribed.
    - If you are a healthcare provider, be on the look-out for people who recently traveled from China and who have fever and respiratory symptoms.
    - If you are a healthcare provider caring for a 2019-nCoV patient or a public health responder, please take care of yourself and follow recommended infection control procedures.

AMERICAN OVERSIGHT

- For people who have had close contact with someone infected with 2019-nCoV and who develop symptoms, contact your healthcare provider, and tell them about your symptoms and your exposure to a 2019-nCoV patient.
- For people who are ill with 2019-nCoV, please follow CDC guidance on how to reduce the risk of spreading your illness to others. This guidance in on the CDC website.

TESTING

- CDC developed a new laboratory test kit for use in testing patient specimens for 2019-nCoV.
- The test kit is called the "Centers for Disease Control and Prevention (CDC) 2019-Novel Coronavirus (2019-nCoV) Real-Time Reverse Transcriptase (RT)-PCR Diagnostic Panel." It is intended for use with the Applied Biosystems 7500 Fast DX Real-Time PCR Instrument with SDS 1.4 software.
  - Each test kit can test approximately 700–800 patient specimens.
  - The test utilizes a technology that can provide results in 4 hours from initial sample processing to result. (Note: Other steps involved in management of patient specimens, laboratory testing, and reporting may require additional time to perform.)
- CDC's test kit is intended for use by laboratories designated by CDC as qualified, and in the United States, certified under the Clinical Laboratory Improvement Amendments (CLIA) to perform high complexity tests. This include:
  - 115 qualified U.S. laboratories, including U.S. state and local public health laboratories and Department of Defense (DoD) laboratories
  - 191 qualified international laboratories, such as World Health Organization (WHO) Global Influenza Surveillance Response System (GISRS) laboratories
    - Laboratories will place orders via the IRR Website. All the laboratories that will be placing orders are already registered and have active accounts with the IRR.
    - Each laboratory that places an order will receive one test kit initially.
- The test will not be available in U.S. hospitals or other primary care settings.
- This test is intended for use with upper and lower respiratory specimens collected from individuals who meet CDC criteria for 2019-nCoV testing.
- At this time, CDC only recommends diagnostic testing of patients who meet the clinical criteria for a 2019-nCoV patient under investigation (PUI), per Interim Guidelines for Collecting, Handling and Testing Clinical Specimens from Patients Under Investigation (PUIs) for 2019 Novel Coronavirus (2019-nCoV).
- On Monday, February 3, 2020, CDC submitted an Emergency Use Authorization (EUA) package to the U.S. Food and Drug Administration (FDA) in order to expedite FDA permitted use of the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel in the United States. For more information, see FDA EUA

AMERICAN OVERSIGHT

website: https://www.fda.gov/emergency-preparedness-and-response/mcm-legal-regulatory-and-policy-framework/emergency-use-authorization.

- The EUA process enables FDA to consider and authorize the use of unapproved, but potentially life-saving medical or diagnostic products during a public health emergency. The U.S. Secretary of Health and Human Services declared the 2019-nCoV virus a U.S. public health emergency on Friday, January 31, 2020.
- FDA approved the EUA on February 4, 2020.

Interpretation of test results from CDC 2019-Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel:

Positive Result:

- A positive test result means that 2019-nCoV was found in your sample. If you have a positive test result, it is very likely that you are infected with 2019-nCoV. Your healthcare provider will work with you to determine how best to care for you based on the test results along with other factors of your medical history and symptoms.

Negative Result:

- A negative test result means that 2019-nCoV was not found in your sample. However, negative results do not necessarily preclude 2019-nCoV infection and should not be used as the sole basis for treatment or other patient management decisions. Other risk factors such as travel history or contact with 2019-nCoV infected individuals should be considered.

Negative result if you are symptomatic:

- For 2019-nCoV, a negative test result for a sample collected while a person has symptoms likely means that 2019-nCoV is not causing your current illness.

Negative result if you are asymptomatic:

- While a negative test most likely means you do not have 2019-nCoV infection, patients who have no symptoms may:
  1) in fact, not be infected with nCoV, or
  2) have an infection that has not developed enough to be detected by the test.
  Optimum specimen types and timing for peak viral levels during infections caused by 2019-nCoV have not been determined so collection of multiple specimens (types and time points) may be necessary to definitively rule out 2019-nCoV viral presence in asymptomatic PUI's.

TRAVEL

- On January 31, Health and Human Services Secretary Alex M. Azar II declared a public health emergency for the United States to aid the nation's healthcare community in responding to 2019 novel coronavirus.
- Also on January 31, the President of the United States issued a "Proclamation on Suspension of Entry as Immigrants and Nonimmigrants of Persons who Pose a Risk of Transmitting 2019 Novel Coronavirus."

AMERICAN OVERSIGHT

- Foreign nationals who have visited China in the past 14 days may not enter the United States.
- Special precautions are required of U.S. citizens, immediate family members of U.S. citizens, and legal permanent residents entering the United States who have been in China during the past 14 days, including up to a 14-day quarantine.
- All American citizens and exempted persons coming from China will be directed to ("**funneled to"**) one of 11 U.S. airports.
    - American citizens and exempted persons who have been in Hubei province in the previous 14 days will have an additional health assessment (screened for fever, cough, or difficulty breathing).
        - If symptomatic, American citizens and exempted persons will be transferred for further medical evaluation. (They will not be able to complete their itinerary.)
        - If asymptomatic, American citizens and exempted persons will be subject to a mandatory 14-day quarantine at or near that location. (They will not be able to complete their itinerary.)
    - American citizens and exempted persons who have been in other parts of mainland China (outside of Hubei Province) in the previous 14 days will have an additional health assessment (screened for fever, cough, or difficulty breathing).
        - If symptomatic, American citizens and exempted persons will be transferred for medical evaluation. (They will not be able to complete their itinerary at that time.)
        - If asymptomatic, American citizens and exempted persons will be allowed to reach their final destination and, after arrival, will be monitored under self-quarantine for 14 days.
- CDC is working with public health partners to support the implementation of the travel policies detailed in the presidential proclamation (above).
- On February 3, 2020, CDC issued "Interim US Guidance for Risk Assessment and Public Health Management of Persons with Potential 2019 Novel Coronavirus (2019-nCoV) Exposure in Travel-associated or Community Settings" to provide U.S. public health authorities and other partners with a framework for assessing and managing risk of potential exposures to 2019-nCoV and implementing public health actions based on a person's risk level and clinical presentation.

The declaration became effective beginning 5 p.m. EST, Sunday, February 2, 2020.

The 11 airports where flights are being funneled to include:

- John F. Kennedy International Airport (JFK), New York
- Chicago O'Hare International Airport (ORD), Illinois

AMERICAN OVERSIGHT

- San Francisco International Airport (SFO), California
- Seattle-Tacoma International Airport (SEA), Washington
- Daniel K. Inouye International Airport (HNL), Hawaii
- Los Angeles International Airport (LAX), California
- Hartsfield-Jackson Atlanta International Airport (ATL), Georgia
- Washington-Dulles International Airport (IAD), Virginia
- Newark Liberty International Airport (EWR), New Jersey
- Dallas/Fort Worth International Airport (DFW), Texas
- Detroit Metropolitan Airport (DTW), Michigan

Travel to China:

On January 30, 2020, the U.S. State Department issued a level 4 travel advisory, their highest threat level, requesting Americans not to travel to China because of the public health threat posed by the novel coronavirus.

CDC has issued a level 3 Travel Health Notice for China (its highest level) recommending that all travelers avoid non-essential travel.

First Repatriated Flight Plus Quarantine Order:

- The Department of Health and Human Services (DHHS) Secretary, under statutory authority, issued federal quarantine orders to 195 United States citizens who repatriated to the U.S. from Wuhan, China on January 29, 2020.
- The quarantine will last 14 days from when the plane left Wuhan, China.
- This action is a precautionary and preventive step to maximize the containment of the virus in the interest of the health of the American public.
- This quarantine order also will protect the health of the repatriated citizens, their families, and their communities.
- These individuals will continue to be housed at the March Air Reserve Base in Riverside, California.
- Medical staff will monitor the health of each traveler, including temperature checks and observation for respiratory symptoms.

Additional Repatriation Flights:

- CDC will continue to support the Department of State in the safe and expedient ordered departure of all U.S. citizens and residents from Wuhan, China.
- This week, four planes carrying U.S. citizens from Wuhan, China will arrive at Air Force bases in several states. Two of these flights arrived on February 5, 2020.
- These planes will be met by a team of CDC personnel deployed there to assess the health of the passengers. The passengers have been screened, monitored, and evaluated by medical and public health personnel every step

AMERICAN OVERSIGHT

of the way, including before takeoff, during the flight, during a refueling in and now post-arrival which will be at several other locations.
- CDC staff will conduct risk assessments to ensure the health of each traveler, including temperature checks and observing for respiratory symptoms.
- These repatriated passengers will be issued quarantine orders upon arrival at their designated quarantine location.
- CDC will work with the state and local public health departments to transport any passenger exhibiting symptoms to a hospital for further evaluation.

For more information please visit the 2019 Novel Coronavirus Outbreak Page at: https://www.cdc.gov/coronavirus/2019-ncov/index.html.

AMERICAN OVERSIGHT

CDC WEEKLY KEY MESSAGES

2019 Novel Coronavirus (2019-nCoV) Outbreak, Wuhan, China

February 4, 2020

This document summarizes key messages about the 2019-nCoV outbreak and the response. It will be updated and distributed regularly. For the most current information, visit www.cdc.gov/ncov.

CONTENTS

CONTENTS 1
OUTBREAK SUMMARY 1
OUTBREAK STATISTICS 2
OUTBREAK BACKGROUND 3
TRANSMISSION 3
DIAGNOSIS AND TREATMENT 3
PREVENTION 4
TRAVEL 4
CDC LABORATORY TEST FOR 2019 NOVEL CORONAVIRUS 6
WHAT CDC IS DOING 10
RECOMMENDATIONS 12

OUTBREAK SUMMARY

- There is an expanding outbreak, centered in China, of respiratory illness caused by a novel (new) coronavirus abbreviated "2019-nCoV."
- The 2019 novel coronavirus (2019-nCoV) is a new respiratory virus that can cause illness varying from mild to severe, including potentially resulting in death. It can spread from person-to-person.
- This virus is spreading from person-to-person in China. A growing number of countries are reporting cases in travelers from China and some limited person-to-person spread has been reported in countries outside of China, including in the United States.
- As of **February 3, 2020, 17,385** cases have been identified worldwide, including **11** in the United States.
- On January 30, 2020, the World Health Organization (WHO) declared this outbreak a Public Health Emergency of International Concern (PHEIC). A PHEIC is declared if an event poses a public health threat to other nations through the spread of disease and potentially requires a coordinated international response.

AMERICAN OVERSIGHT

- On January 31, 2020, Health and Human Services Secretary Alex M. Azar II declared a public health emergency for the United States to aid the nation's healthcare community in responding to 2019 novel coronavirus.
- Also on January 31, the President of the United States issued a "Proclamation on Suspension of Entry as Immigrants and Nonimmigrants of Persons who Pose a Risk of Transmitting 2019 Novel Coronavirus."
- The situation is rapidly changing, and we are monitoring it closely. Guidance will be updated as needed.
- Outbreaks like this — when a new virus has emerged to infect people and spread between people — are especially concerning.
- This is a very serious public health threat and the federal government is working closely with state, local, tribal, and territorial partners as well as public health partners to respond to this public health threat.
- The goal of the ongoing U.S. public health response is to detect new cases quickly and prevent community spread of 2019-nCoV in this country.
- The coming days and weeks are likely to bring more confirmed cases of 2019-nCoV in the United States and globally, but strong public health measures now may blunt the impact of the virus in the United States.
- While it is unclear how this situation will evolve in the United States, CDC is preparing as if it were the next pandemic.

OUTBREAK STATISTICS

As of **February 3, 2020**:

U.S. cases: 11
U.S. deaths: 0
Total patients under investigation (PUI): 260
- Positive: 11
- Negative: 167
- Pending: 82

States with patients under investigation: 36

Global cases: 17,385
- Mainland China: 17,205
- Outside mainland China: 180 in 26 locations, including the United States

Global deaths: 362
- China: 361
- Outside China: 1

AMERICAN OVERSIGHT

OUTBREAK BACKGROUND

- In early January 2020, Chinese health officials identified a novel (new) coronavirus linked to an outbreak of respiratory illness in Wuhan, Hubei Province, China.
- Most cases have been detected in China, but some cases have been detected in more than two dozen other locations. Most infections outside of China have occurred in travelers coming from Wuhan City.
- Initially, many of the patients in the Wuhan outbreak reportedly had some link to a large seafood and animal market, suggesting animal-to-person spread.
- Since then, Chinese officials report that sustained person-to-person spread in the community is occurring in China.
- Most cases in the U.S. have been associated with travel to Wuhan, China; however, person-to-person spread has also been seen in close (household) contacts of confirmed 2019-nCoV cases.
- Coronaviruses are a group of viruses that have a halo or crown-like (corona) appearance when viewed under a microscope. They are common in many different species of animals, including camels, cattle, cats, and bats.
- Human coronaviruses are a common cause of mild to moderate upper-respiratory illness in humans. But two coronaviruses have emerged to cause more severe illness: Severe Acute Respiratory Syndrome (SARS) and Middle East Respiratory Syndrome (MERS).

TRANSMISSION

Much is unknown about how 2019-nCoV can be spread. Current knowledge is largely based on what is known about other coronaviruses.

- Most often, person-to-person spread is thought to happen among people in close contact (about 6 feet) with each other.
- Person-to-person spread is thought to occur mainly via respiratory droplets produced when an infected person coughs or sneezes, similar to how influenza and other respiratory pathogens spread. These droplets can land in the mouths or noses of people who are nearby or possibly be inhaled into the lungs.
- It's also possible that a person may be able to get 2019-nCoV by touching a surface or object that has the virus on it and then touching their own mouth, nose, or possibly their eyes.
- Typically, with most respiratory viruses, people are thought to be most contagious when they are most symptomatic (sickest).
- How easily a virus spreads person-to-person can vary. Some viruses are highly contagious (like measles), while other viruses are less so.
- There is much more to learn about the transmissibility, severity, and other features associated with 2019-nCoV and investigations are ongoing. This information will further inform the risk assessment.

DIAGNOSIS AND TREATMENT

- CDC has developed a real time Reverse Transcription-Polymerase Chain Reaction (rRT-PCR) test that can diagnose 2019-nCoV in respiratory and serum samples from clinical specimens. On

AMERICAN OVERSIGHT

January 24, 2020, CDC publicly posted the assay protocol for this test. Currently, testing for this virus must take place at CDC.
- CDC submitted an Emergency Use Authorization (EUA) package to the U.S. Food and Drugs Administration on February 3, 2020.
- Once FDA approves the EUA, the CDC test kits will distributed to domestic and international partners through the agency's International Reagent Resource.
- There is no specific antiviral treatment for 2019-nCoV infection. People infected with 2019-nCoV should receive supportive care to help relieve symptoms.
- For severe cases, treatment should include care to support vital organ functions.

PREVENTION

There is currently no vaccine to prevent 2019-nCoV infection. The best way to prevent infection is to avoid being exposed to this virus.

CDC always recommends everyday preventive actions to help prevent the spread of respiratory viruses, including:

- Avoid touching your eyes, nose, and mouth with unwashed hands.
- Avoid close contact with people who are sick.
- Stay home when you are sick.
- Cover your cough or sneeze with a tissue, then throw the tissue in the trash.
- Clean and disinfect frequently touched objects and surfaces using a regular household cleaning spray or wipe.
- Wash your hands often with soap and water for at least 20 seconds, especially after going to the bathroom; before eating; and after blowing your nose, coughing, or sneezing.
- If soap and water are not readily available, use an alcohol-based hand sanitizer with at least 60% alcohol. Always wash hands with soap and water if hands are visibly dirty.

TRAVEL

Travel from China:

President Trump issued a Presidential Proclamation January 31, 2020, to implement temporary measures to increase our abilities to detect and contain the novel coronavirus proactively and aggressively.

The proclamation:

- Suspends entry to the United States to foreign nationals who have visited China (excluding Hong Kong and Macau) in the past 14 days. There are some exemptions, including for immediate family members of U.S. citizens and legal permanent residents. (Hereafter referred to as "American citizens and exempted persons.")

AMERICAN OVERSIGHT

In addition:

- All American citizens and exempted persons coming from China will be directed to ("**funneled to"**) one of 11 U.S. airports.
    - American citizens and exempted persons who have been in Hubei province in the previous 14 days will have an additional health assessment (screened for fever, cough, or difficulty breathing).
        - If symptomatic, American citizens and exempted persons will be transferred for further medical evaluation. (They will not be able to complete their itinerary.)
        - If asymptomatic, American citizens and exempted persons will be subject to a mandatory 14-day quarantine at or near that location. (They will not be able to complete their itinerary.)
    - American citizens and exempted persons who have been in other parts of mainland China (outside of Hubei Province) in the previous 14 days will have an additional health assessment (screened for fever, cough, or difficulty breathing).
        - If symptomatic, American citizens and exempted persons will be transferred for medical evaluation. (They will not be able to complete their itinerary at that time.)
        - If asymptomatic, American citizens and exempted persons will be allowed to reach their final destination and, after arrival, will be monitored under self-quarantine for 14 days.

The declaration took effect at 5 p.m. EST, Sunday, February 2, 2020.

The 11 airports where flights are being funneled to include:

- John F. Kennedy International Airport (JFK), New York
- Chicago O'Hare International Airport (ORD), Illinois
- San Francisco International Airport (SFO), California
- Seattle-Tacoma International Airport (SEA), Washington
- Daniel K. Inouye International Airport (HNL), Hawaii
- Los Angeles International Airport, (LAX), California
- Hartsfield-Jackson Atlanta International Airport (ATL), Georgia
- Washington-Dulles International Airport (IAD), Virginia
- Newark Liberty International Airport (EWR), New Jersey
- Dallas/Fort Worth International Airport (DFW), Texas
- Detroit Metropolitan Airport (DTW), Michigan

AMERICAN OVERSIGHT

Travel to China:

- On January 30, 2020, the U.S. State Department issued a level 4 travel advisory, their highest threat level, requesting Americans not to travel to China because of the public health threat posed by the new coronavirus.
- CDC has issued a level 3 Travel Health Notice for Wuhan, China recommending that all travelers avoid non-essential travel.

First Repatriated Flight Plus Quarantine Order:

- The Department of Health and Human Services (DHHS) Secretary, under statutory authority, issued federal quarantine orders to 195 evacuees who came to the U.S. from Wuhan, China on January 29, 2020.
- The quarantine will last 14 days from when the plane left Wuhan, China.
- This action is a precautionary and preventive step to maximize the containment of the virus in the interest of the health of the American public.
- This quarantine order also will protect the health of the evacuees, their families, and their communities.
- These individuals will continue to be housed at the March Air Reserve Base in Riverside, California.
- Medical staff will monitor the health of each traveler, including temperature checks and observation for respiratory symptoms.

Additional Repatriation Flights:

- On January 23, 2020, the Department of State ordered the departure of all U.S. Consulate General Wuhan personnel and their family members.
- The Department of State is working with the U.S. Government interagency and People's Republic of China counterparts on staging additional evacuation flights to the U.S. from Wuhan.
- CDC will continue to support the Department of State in the safe and expedient ordered departure of all evacuees from Wuhan, China.

CDC LABORATORY TEST FOR 2019 NOVEL CORONAVIRUS

- CDC has developed a new laboratory test kit for use in testing patient specimens for 2019 novel coronavirus (2019-nCoV).
- The test kit is called the "Centers for Disease Control and Prevention (CDC) 2019-Novel Coronavirus (2019-nCoV) Real-Time Reverse Transcriptase (RT)-PCR Diagnostic Panel." It is intended for use with the Applied Biosystems 7500 Fast DX Real-Time PCR Instrument with SDS 1.4 software.
    - Each test kit is enough for conducting 1,000 tests.

AMERICAN OVERSIGHT

    - The test utilizes a technology that can provide results in 4 hours from initial sample processing to result. (Note: Other steps involved in management of patient specimens, laboratory testing, and reporting may require additional time to perform.)

- CDC's test kit is intended for use by laboratories designated by CDC as qualified, and in the United States, certified under the Clinical Laboratory Improvement Amendments (CLIA) to perform high complexity tests.
    - This includes U.S. state and local public health laboratories and Department of Defense (DoD) laboratories.
    - The test kits also will be shipped to qualified international laboratories, such as WHO Global Influenza Surveillance Response System (GISRS) laboratories. For more information, see the section labeled CDC Laboratory Test Kit Distribution (general audiences).
- The test will not be available in U.S. hospitals or other primary care settings.
- This test is intended for use with upper and lower respiratory specimens collected from individuals who meet CDC criteria for 2019-nCoV testing.
- At this time, CDC only recommends diagnostic testing of patients who meet the clinical criteria for a 2019-nCoV patient under investigation (PUI), per Interim Guidelines for Collecting, Handling and Testing Clinical Specimens from Patients Under Investigation (PUIs) for 2019 Novel Coronavirus (2019-nCoV).
    - For more information about interpreting test results, see section labeled "Interpretation of test results from CDC 2019-Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel."

Emergency Use Authorization Package Submittal:

- On Monday, February 3, 2020, CDC submitted an Emergency Use Authorization (EUA) package to the U.S. Food and Drug Administration (FDA) in order to expedite FDA permitted use of the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel in the United States. For more information, see FDA EUA Website: https://www.fda.gov/emergency-preparedness-and-response/mcm-legal-regulatory-and-policy-framework/emergency-use-authorization.
- The EUA process enables FDA to consider and authorize the use of unapproved, but potentially life-saving medical or diagnostic products during a public health emergency. The U.S. Secretary of Health and Human Services declared the 2019-nCoV virus a U.S. public health emergency on Friday, January 31, 2020. (For more information, see the Emergency Use Authorization Background section below).
- Criteria upon which CDC's 2019-nCoV test is being submitted for EUA authorization, include the following:
    - The 2019-nCoV can cause a serious or life-threatening disease or condition, including severe respiratory illness, to humans infected by this virus;
    - There is no adequate, approved, and available alternative to the emergency use of the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel for diagnosing 2019-nCoV infection.

AMERICAN OVERSIGHT

- Based on the totality of scientific evidence available to FDA, it is reasonable to believe that the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel may be effective in diagnosing 2019-nCoV infection, and that the known and potential benefits of the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel, when used for diagnosing 2019-nCoV infection, outweigh the known and potential risks.

- CDC has provided guidance on specimen collection, storage and shipping at "Interim Guidelines for Collecting, Handling and Testing Clinical Specimens from Patients Under Investigation (PUIs) for 2019 Novel Coronavirus (2019-nCoV)."
- Public health officials anticipate that distribution of the tests will improve 2019-nCoV laboratory testing capacity in the United States.

CDC Laboratory Test Kit Distribution:

- Once CDC's diagnostic test is authorized by FDA under the EUA , the International Reagent Resource (IRR) will begin distributing the test to the following laboratories:
  - 115 qualified U.S. laboratories; this includes U.S. state and local public health laboratories and Department of Defense (DoD) laboratories.
  - 191 qualified international laboratories, such as WHO Global Influenza Surveillance Response System (GISRS) laboratories.
  - Laboratories will place orders via the IRR Website. All the laboratories that will be placing orders are already registered and have active accounts with the IRR.
  - Each laboratory that places an order will receive one test kit initially, and each test kit is enough for approximately 1,000 patient specimens.

Background: Emergency Use Authorization:

- The FDA is responsible for reviewing and approving medical products for use in the United States. This usually is a lengthy process.
- However, when the U.S. Secretary of Health and Human Services (HHS) determines that there is a significant potential for a public health emergency that has a significant potential to affect national security or the health and security of United States citizens living abroad and that circumstances exist justifying the authorization of an emergency use of a product pursuant to section 564 of the Federal Food, Drug and Cosmetic Act, the commissioner of the FDA can use an EUA to permit use of certain unapproved medical products or unapproved uses of approved medical products. There are several criteria necessary for the FDA Commissioner to issue an EUA, including:
  - The agent or agents specified in the declaration can cause a serious or life-threatening disease or condition;
  - Based on the scientific information available, it is reasonable to believe that the medical countermeasure may be effective in diagnosing, treating, or preventing the disease or caused by a CBRN (chemical, biological, radiological, nuclear) agent. The exact type and amount of data needed to support an EUA may vary depending on the nature of the circumstances giving rise to the declaration and the type of the candidate product;

AMERICAN OVERSIGHT

- The known and potential benefits outweigh the known and potential risks of the product when used to diagnose, prevent, or treat the serious or life-threatening disease or condition; AND
- There is no adequate, approved, and available alternative to the product for diagnosing, preventing, or treating the serious or life-threatening disease or condition. A potential alternative product may be considered "unavailable" if there are insufficient supplies to fully meet the emergency need. A potential alternative product may be considered "inadequate" if there are contradicting data for special circumstances or populations (e.g., immunocompromised individuals, individuals with drug allergies).

Information for Laboratory Professionals:

- The CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel contains the following:
  - 2019-nCoV_N1, 2019-nCoV_N2 and 2019-nCoV_N3 primers and probes that target the nucleocapsid (N) gene and are designed for both universal detection of SARS-like coronavirus as well as specific detection of the 2019-nCoV. CDC has published the primers and probes sequences for 2019-nCoV online: https://www.cdc.gov/coronavirus/2019-ncov/lab/rt-pcr-panel-primer-probes.html
  - RP primers and probes that target the Human RNase P gene
  - nCoVPC, the 2019-nCoV positive control used in the assay
- The CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel also requires the use of additional authorized materials and authorized ancillary reagents that are not included with the test but are commonly used in clinical laboratories and are described in the authorized CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel Instructions for Use Package Insert.
- The CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel requires the following control materials, or other authorized control materials; all controls listed below must generate expected results in order for a test to be considered valid, as outlined in the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel Instructions for Use:
  - Human Specimen Control (HSC): A human cell culture preparation used as an extraction control and positive control for the RNase P primer and probe set that is extracted and tested concurrently with each specimen extraction run.
  - Positive Control for 2019-nCoV (nCoVPC): Run with each batch of specimens. Monitors for failures of rRT-PCR reagents and reaction conditions.
  - No Template Control (NTC): Nuclease-free water included in each run. Monitors for reagent and system contamination.
- Contact your state and/or local public health laboratory for a consultation for testing of a patient under investigation (PUI).
- Use appropriate personal protective equipment when collecting and handling specimens from individuals suspected of being infected with 2019-nCoV as outlined in the CDC Interim Guidelines for Collecting, Handling and Testing Clinical Specimens from Patients Under

AMERICAN OVERSIGHT

Investigation (PUIs) for 2019 Novel Coronavirus (2019-nCoV). Other specimens not listed in this guidance will not be accepted for testing.

Interpretation of test results from CDC 2019-Novel Coronavirus (2019-nCoV) Real-Time RT-PCR Diagnostic Panel:

Note: *these are consistent with but not identical to the package insert and were synthesized from input from lab and epi teams.

Positive Result:

A positive test result means that 2019-nCoV was found in your sample. If you have a positive test result, it is very likely that you are infected with 2019-nCoV. Your healthcare professional will work with you to determine how best to care for you based on the test results along with other factors of your medical history and symptoms.

Negative Result:

A negative test result means that 2019-nCoV was not found in your sample. However, negative results do not necessarily preclude 2019-nCoV infection and should not be used as the sole basis for treatment or other patient management decisions. Other risk factors such as travel history or contact with 2019-nCoV infected individuals should be considered.

Negative result if you are symptomatic:

For 2019-nCoV, a negative test result for a sample collected while a person has symptoms likely means that 2019-nCoV is not causing your current illness.

Negative result if you are asymptomatic:

While a negative test most likely means you do not have 2019-nCoV infection, patients who have no symptoms may:

1) in fact, not be infected with nCoV, or
2) have an infection that has not developed enough to be detected by the test. Optimum specimen types and timing for peak viral levels during infections caused by 2019-nCoV have not been determined so collection of multiple specimens (types and time points) may be necessary to definitively rule out 2019-nCoV viral presence in asymptomatic PUI's.

WHAT CDC IS DOING

CDC Response in the United States:

- The federal government is working closely with state, local, tribal, and territorial partners as well as public health partners to respond to this public health threat.
- The goal of the ongoing U.S. public health response is to detect new cases quickly and prevent further spread of 2019-nCoV in this country.
- CDC established a 2019-nCoV Incident Management Structure on January 7, 2020. On January 21, 2020, CDC activated its Emergency Operations Center to better provide ongoing support to the 2019-nCoV response.

AMERICAN OVERSIGHT

- On January 27, 2020, CDC issued updated travel guidance for China, recommending that travelers avoid all nonessential travel to all of the country (Level 3 Travel Health Notice).
- The U.S. government has taken unprecedented steps with respect to travel in response to the growing public health threat posed by this new coronavirus.
    - Effective February 2, 2020, at 5pm, the U.S. government suspended entry of foreign nationals who have been in China within the past 14 days.
    - U.S. citizens, residents, and their immediate family members who have been in Hubei province and other parts of mainland China are allowed to enter the United States, but they are subject to health monitoring and possible quarantine for up to 14 days.
    - See more at: "Proclamation on Suspension of Entry as Immigrants and Nonimmigrants of Persons who Pose a Risk of Transmitting 2019 Novel Coronavirus"
- CDC issued an updated interim Health Alert Notice (HAN) Update to inform state and local health departments and healthcare professionals about this outbreak on February 1, 2020.
- On January 30, 2020, CDC published guidance for healthcare professionals on the clinical care of 2019-nCoV patients.
- CDC has deployed multidisciplinary teams to Washington, Illinois, California, and Arizona to assist health departments with clinical management, contact tracing, and communications.
- CDC has developed a real time Reverse Transcription-Polymerase Chain Reaction (rRT-PCR) test that can diagnose 2019-nCoV in respiratory and serum samples from clinical specimens. On January 24, 2020, CDC publicly posted the assay protocol for this test. Currently, testing for this virus must take place at CDC.
- CDC submitted an Emergency Use Authorization package to the FDA on February 3, 2020.
- Once FDA approves the EUA, the CDC test kits will distributed to domestic and international partners through the agency's International Reagent Resource.
- CDC uploaded to GenBank the entire genome of the virus from reported cases in the United States as sequencing was completed.
- CDC also is growing the virus in cell culture, which is necessary for further studies, including for additional genetic characterization.

Internationally:

- CDC is working diligently and closely with partners to support the response to this novel coronavirus outbreak.
- CDC will work through WHO's China country office to support Chinese public health counterparts and help improve understanding of this new disease, including learning more about transmissibility and severity.
- One Beijing-based CDC expert is currently working with WHO in China and additional CDC headquarters experts are being identified and prepared for deployment.
- CDC staff based in 60+ countries around the world are working closely with ministries of health and other health partners to prepare and respond to the novel coronavirus.
- In addition to working with host country officials, CDC staff are working in coordination with Department of State and other agencies within U.S. embassies.
- CDC is mobilizing Atlanta-based staff to support the response. Many of these staffers have extensive experience responding to global outbreaks.

AMERICAN OVERSIGHT

- CDC and the government of China have collaborated for the past 30 years addressing public health priorities affecting the U.S., China, and the world.
- CDC works closely with countries to establish Field Epidemiology Training Programs (FETPs) that train a workforce of field epidemiologists —or disease detectives— to identify and contain outbreaks close to the source.
- In China, CDC is the primary technical partner for the Chinese FETP. Using classroom and hands-on experience, this program has graduated 279 epidemiologists who conducted more than 2,000 outbreak investigations as part of their training.
- Specialized training tracks are now being established in non-communicable diseases and tuberculosis.
- With technical guidance from CDC, 71 graduates completed training for the new Western FETP that supports 13 under-served provinces of China — remote areas more vulnerable to novel infections and with increasing transport corridors.
- CDC has supported China CDC's national influenza laboratory for more than 20 years.
- CDC works in close partnership with the China CDC's National Influenza Epidemiology, Virology, and Pandemic Preparedness Centers, China's provincial and local CDCs, hospitals, and academic institutions.
- CDC supports Chinese partners in monitoring seasonal and novel influenza viruses, as well as enhancing efforts to detect and respond to seasonal, avian, and other novel influenza viruses with pandemic potential. CDC's key supporting activities include:
    - Strengthening influenza surveillance for seasonal and novel influenza viruses
    - Conducting research to estimate disease burden and vaccine effectiveness among populations at greatest risk (including young children, older adults, and pregnant women)
    - Promoting influenza vaccination policy development and coverage
    - Supporting novel virus risk assessments
    - Establishing pandemic influenza preparedness in China
    - Maintaining close ties between U.S. and China influenza experts

RECOMMENDATIONS

CDC routinely advises that people help protect themselves from respiratory illnesses by washing their hands often, avoiding touching their face with unwashed hands, avoiding close contact with people who appear sick, and cleaning frequently touched surfaces.

Recent Travelers to China:

If you were in China and feel sick with fever, cough, or difficulty breathing, within 14 days after leaving the country, you should:

- Seek medical advice. Before you go to a doctor's office or emergency room, call ahead and tell them about your recent travel and your symptoms.
- Avoid contact with others.
- Not travel while sick.
- Cover your mouth and nose with a tissue or your sleeve (not your hands) when coughing or sneezing.

AMERICAN OVERSIGHT

- Wash your hands often with soap and water for at least 20 seconds to avoid spreading the virus to others. Use an alcohol-based hand sanitizer if soap and water are not available.

People Confirmed to Have, or Being Evaluated for, 2019-nCoV:
Your doctors and public health staff will evaluate whether you can be cared for at home. If it is determined that you can be isolated at home, you will be monitored by staff from your local or state health department. You should follow the prevention steps below until a healthcare professional or local or state health department says you can return to your normal activities. Detailed information is available at Interim Guidance for Preventing 2019 Novel Coronavirus (2019-nCoV) from Spreading to Others in Homes and Communities.

- Stay home except to get medical care.
- Separate yourself from other people in your home.
- Call ahead before visiting your doctor.
- Wear a facemask.
- Cover your coughs and sneezes with a tissue or cough or sneeze into your sleeve.
- Wash your hands often with soap and water for at least 20 seconds.
- Avoid sharing household items like eating utensils, cups, or linens.
- Monitor your symptoms and seek prompt medical attention if your symptoms worsen.

On February 3, 2020, CDC published interim guidance for state and local public health officials on how to assess and manage the risks posed by patients who may have been exposed to the 2019-nCoV virus.

- This guidance establishes four risk categories: High, Medium, Low and No Identifiable Risk.
- The categories are based on a person's travel history and possible contact with patients who have laboratory-confirmed infections.
- The guidance **offers recommendations** for movement restrictions and public health evaluations for people in different risk categories.
- **In most cases, state and local authorities will make these decisions. Federal public health authority primarily extends to international arrivals at ports of entry and preventing interstate communicable disease threats.**
- These guidelines are subject to change as the situation requires. They do not apply retroactively to people who have been in China during the previous 14 days and are already in the United States, or those being managed as part of a contact investigation.
- CDC will provide separate guidance for healthcare settings.

Close Contacts of Patients Under Investigation:
People who have had close contact with someone who is confirmed to have, or being evaluated for, 2019-nCoV infection, should:

- Monitor your health starting from the day you first had close contact with the person and continue for 14 days after you last had close contact with the person. Watch for these signs and symptoms:
    - Fever—take your temperature twice a day.
    - Coughing.
    - Shortness of breath or difficulty breathing.

AMERICAN OVERSIGHT

    - Other early symptoms to watch for are chills, body aches, sore throat, headache, diarrhea, nausea, vomiting, and runny nose.
- **If you develop fever or any of these symptoms, call your healthcare professional right away.**
    - **Before** going to your medical appointment, be sure to tell your healthcare professional about your close contact with someone who is confirmed to have, or being evaluated for, 2019-nCoV infection. This notification will help the healthcare professional's office take steps to keep other people from getting infected. Ask your healthcare professional to call the local or state health department.
- If you do not have any symptoms, you can continue with your daily activities, such as going to work, school, or other public areas.

Detailed information for caregivers and household members can be found on the Interim Guidance for Preventing 2019 Novel Coronavirus (2019-nCoV) from Spreading to Others in Homes and Communities web page.

For Healthcare Professionals:

Patients in the United States who meet the following criteria should be evaluated as a patient under investigation (PUI) in association with the outbreak of 2019-nCoV in Wuhan City, China.

Clinical Features	&	Epidemiologic Risk
Fever **or** signs/symptoms of lower respiratory illness (e.g. cough or shortness of breath)	**AND**	Any person, including healthcare workers, who has had close contact with a laboratory-confirmed 2019-nCoV patient within 14 days of symptom onset
Fever **and** signs/symptoms of a lower respiratory illness (e.g., cough or shortness of breath)	**AND**	A history of travel from **Hubei Province**, China within 14 days of symptom onset
Fever **and** signs/symptoms of a lower respiratory illness (e.g., cough or shortness of breath) requiring hospitalization	**AND**	A history of travel from mainland **China** within 14 days of symptom onset

Note: Fever may be subjective or confirmed. The criteria are intended to serve as guidance for evaluation. Patients should be evaluated and discussed with public health departments on a case-by-case basis if their clinical presentation or exposure history is equivocal (e.g., uncertain travel or exposure).The above criteria are available on the Interim Guidance for Healthcare Professionals web page.

AMERICAN OVERSIGHT

Recommendations for Reporting, Testing, and Specimen Collection:

- Healthcare professionals should **immediately** notify both infection control personnel at their healthcare facility AND their local or state health department in the event of a PUI for 2019-nCoV.
- State health departments that have identified a PUI should immediately contact CDC's Emergency Operations Center (EOC) at 770-488-7100 and complete a 2019-nCoV PUI case investigation form available on CDC's Interim Guidance for Healthcare Professionals.
- At this time, diagnostic testing for 2019-nCoV can be conducted only at CDC.
- Clinical specimens should be collected from PUIs for routine testing of respiratory pathogens at either clinical or public health labs. Note that clinical laboratories should NOT attempt viral isolation from specimens collected from 2019-nCoV PUIs.
- Testing for other respiratory pathogens should not delay specimen shipping to CDC.
- **For biosafety reasons, it is not recommended to perform virus isolation in cell culture or initial characterization of viral agents recovered in cultures of specimens from a PUI for 2019-nCoV.**
- To increase the likelihood of detecting 2019-nCoV infection, CDC recommends collecting and testing multiple clinical specimens from different sites, including all three specimen types—lower respiratory, upper respiratory, and serum specimens. Additional specimen types (e.g., stool, urine) may be collected and stored initially until decision is made by CDC whether additional specimen sources should be tested. Specimens should be collected as soon as possible once a PUI is identified regardless of time of symptom onset. Maintain proper infection control when collecting specimens.

Additional guidance for collection, handling, and testing of clinical specimens is available on CDC's website. Detailed information on specimen types and shipping can be found on the Information for Laboratories web page.

AMERICAN OVERSIGHT

Text Illness Monitoring (T.I.M.)

A mobile text platform designed to help public health with monitoring

Using T.I.M. for 2019 Novel Coronavirus Monitoring

Monitoring conducted by public health officials has traditionally been conducted via telephone calls, which can be a time-consuming process requiring staff resources. CDC has developed the Text Illness Monitoring (T.I.M.) system, a nationally-centralized option utilizing two-way Short Message Service (SMS)/text messaging to aid in the process. Text messaging is an efficient method to elicit, manage, and act on any 2019-nCoV symptoms among those who are exposed or potentially exposed to the virus. The T.I.M. system was utilized to monitor for influenza symptoms in Michigan[1] with success.

How it works

Participation in the text monitoring program is voluntary for both the state/local health departments. Consenting persons in participating state and local municipalities will receive 2-5 text messages a day for up to14 days asking if they have symptoms consistent with 2019-nCoV. State/local health officials will immediately be alerted to any person that responds that they are experiencing symptoms and to any persons who fail to respond to two consecutive messages. State/local health officials would then follow up with individuals who are reporting symptoms or those that have been unresponsive.

Key benefits

- Reduces the resource burden on public health for illness monitoring, for contract tracing and monitoring of asymptomatic individuals
- Facilitates reporting through an online dashboard
- Compliant to regulations set by industry standards, telecom authorities and government policy
- Information is protected

Frequently Asked Questions

How do I get access to T.I.M.?

State or local public health departments may request access by sending an email to **eocevent340@cdc.gov.** The public health department will need to provide a primary and secondary point of contact to act as an administrator in T.I.M. After registration, the public health administrators will receive an email with information on how to log in and access the system.

Is there a dashboard and what information can be seen?

The system access includes a dashboard with summary information on number of persons being monitored, and information related to the alerts/notifications that public health needs to take action on (i.e., those that reply YES to a text indicating symptoms, those that have not responded to two consecutive texts).

Who will be able to access the information in T.I.M.?

Public health administrators and their designees will have access to data within their jurisdiction. CDC will only have access to the deidentified aggregate data for monitoring campaigns.

Can I request access for other people in my jurisdiction?

The administrators may add users for their state.

How will I know if someone responds that they have symptoms?

If someone in your jurisdiction replies YES to a text message indicating symptoms you will receive an email notification. An email notification will also be sent if a person does not respond to two consecutive texts sent. These alerts/notifications are also captured on the dashboard.

Subject:	CDC COVID-19 airport screener volunteers wanted
Date:	Friday, February 28, 2020 9:44:40 AM

Hello EIS/LLS,

The Global Migration Task Force (GMTF) in the CDC Emergency Operations Center is currently seeking available FTEs to deploy to the 11 US airports to serve as tertiary screeners and medical officers.

> **Tertiary screeners** are responsible for conducting and documenting passenger screening interviews/triage case reviews; distributing communication materials and health information updates; conducting data entry and transport coordination activities; and providing basic quarantine station support, including purchasing, property management, document processing, timekeeping, and answering inquiries, etc.
>
> **Medical officers** are responsible for reviewing the clinical information collected at the quarantine stations, evaluating the history and presenting symptoms, assessing available laboratory data, consulting with specialists, and making a clinical recommendation for disposition of ill travelers. We are accepting licensed medical physicians, physician assistants, and nurse practitioners for this role.

We are also looking for deployers who are fluent in Mandarin to fill both the tertiary screener and medical officer roles.

All positions above require that you pass a medical clearance exam and are respiratory fit tested. You will be required to interact with travelers and wear personal protective equipment that includes respiratory protection. Upon return to your duty stations you will be advised to self-monitor for 14 days while you go about your normal activities of daily living. Additional information is available on DeployCDC.

Deployments are 29 days in length and we have vacancies at all 11 station locations for March and April. The station locations include:

- Los Angeles
- New York
- San Francisco
- Atlanta
- Chicago
- Newark
- Seattle
- Honolulu
- Detroit
- Washington DC
- Dallas

AMERICAN OVERSIGHT

If you are interested in a deployment opportunity with GMTF, please respond to eocdgmqsrldaid@cdc.gov with your supervisory approval and answer the following.

AMERICAN OVERSIGHT

From: CDC IMS 2019 NCOV Response Epi Surveillance State Coordination Unit
To: CDC IMS 2019 NCOV Response Epi Surveillance State Coordination Unit
Subject: CDC COVID-19 Case Count Confirmation 03/03/2020
Date: Tuesday, March 3, 2020 8:10:10 PM
Attachments: CSTE COVID-19 Response New CDC Standard Process for Displaying Reported Cases.msg
ATTACHMENT1_ReportingUpdates_2020March1.docx

Dear Partners,

As described in an email sent today from the CSTE COVID-19 Leadership Team (attached), CDC is instituting a standard process for confirming publicly reported cases by jurisdiction. We are doing this in order to coordinate consistent public messaging and improve data visualization on CDC's public-facing website for the COVID-19 response. **Currently, this will be a daily process (Monday–Friday)**. As the response evolves, the frequency of these requests will likely decrease.

At the bottom of this email, you will find a table with the current preliminary case counts for each jurisdiction **as of 4 pm ET on Tuesday, March 3, 2020**. These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. They do not include people who returned to the U.S. via State Department-chartered flights.

This email is being sent to the State Epidemiologist for each jurisdiction. Please, **by 9 am ET Wednesday, March 4**, reply to this email and provide written confirmation to CDC (eocevent118@cdc.gov) of receiving the report and either:

- confirm the case count information provided (cases as of 4 pm ET), or,
- if incorrect, provide updated values by using the table shell below

	Value as of 4pm ET
Jurisdiction Name	
Presumptive Cases	
Lab-confirmed Cases*	
Total Cases (Presumptive + Lab-confirmed Cases)	
Total Deaths among Cases (Presumptive + Lab-confirmed Cases)	

**Currently, all confirmatory testing occurs at CDC*
Note: These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. It does not include people who returned to the U.S. via State Department-chartered flights.

Per discussion with the CSTE COVID-19 Leadership Team, CDC will post **only the total case count [presumptive + lab-confirmed] on the CDC website, which will be updated daily at 12 pm ET. Jurisdictions with one to five cases will be depicted as having "1–5 cases"; others will be listed as having "0 cases" or their actual number of cases (e.g. "6").** The other information collected (e.g. number of deaths) will be used for internal awareness and will not be shared publicly at this time. **We ask that the preliminary information shared in this email not be distributed**.

DCIPHER users can update and analyze their own jurisdiction's data at: https://dcipher.cdc.gov/. If your jurisdiction does not currently have DCIPHER users, but you would like to move to Phase 2 reporting as described in the attached guidance, please email eocevent118@cdc.gov to confirm your readiness.

Thank you for your partnership,

CDC COVID-19 Epidemiology Task Force

website

***Reported deaths are reported from state or local health department and include confirmed and presumptive cases.

AMERICAN OVERSIGHT

Dear state and territorial partners:

Thank you for your continued partnership in the ongoing emergency response to COVID-19. The information included below aligns with what was shared by CDC during the 5 pm ET CSTE call on Saturday, February 29th regarding: 1) confirming a jurisdiction's 'Phase 2' status for reporting PUI and cases; 2) updates to the PUI and Case Report Form; 3) an update on the status of historical PUI data imports into DCIPHER; 4) clarifications to the CDC reporting process for PUI/Case Report Forms and lab findings; 5) management of the PHLIP laboratory reporting process; and 6) major avoidable issues we hope to overcome with your assistance. We plan for the noted changes to go into effect at **5 pm ET, Sunday, March 1.**

Jurisdictional 'Phase 2' Status

As we have previously outlined, jurisdictions need to be able to do several tasks before they can move into 'Phase 2'. These include assessing ill persons and determining PUI status; assigning unique identifiers to PUI and cases at the reporting jurisdiction level; and reporting PUI and cases of COVID-19 using a brief, combined form.

Given the need to maintain timely, actionable data at the national level, and process laboratory results at CDC for initial or confirmatory testing, **we anticipate that all jurisdictions will be onboarded to 'Phase 2' during the week of March 2.** As soon as your jurisdiction is able to confirm its 'Phase 2' status, please email eocevent118@cdc.gov.

As part of the 'Phase 2' rollout, CDC needs to better understand each jurisdiction's plan for providing data to CDC for the PUI and Case Report Form via DCIPHER, an electronic PUI and case reporting system. We request that each jurisdiction provides a list of ≤5 DCIPHER users before **Monday, March 2 at 5pm ET,** if they have not already done so. In addition, we ask that jurisdictions confirm their intent to input data on PUI and case-patients directly into the DCIPHER platform (preferred option) or if alternative arrangements need to be made to send data to CDC. Please email eocevent118@cdc.gov with the requested information by **March 2 at 5pm ET**.

Updates to PUI and Case Report Form on CDC's Website

On the PUI and Case Report Form included in the CSTE email on Wednesday, February 26th, there were 2 'current status of person' options: "person under investigation" or "laboratory-confirmed case." Given increased laboratory capacity at the state and local level to test for the virus that causes COVID-19 and the need to send presumptive positive specimens to CDC for confirmatory testing, there will now be 5 status classifications.

1. PUI, testing pending*
2. PUI, tested negative*
3. Presumptive case (positive local test), confirmatory testing pending†
4. Presumptive case (positive local test), confirmatory testing negative†
5. Laboratory-confirmed case†

**Testing conducted by local lab or CDC lab*
† At this time, all confirmatory testing occurs at CDC

We have also added critical laboratory testing result fields at the end of the PUI and Case Report Form to reflect COVID-19 laboratory test results from state or local laboratories and CDC. CDC will work towards populating our laboratory results into the CDC result field for each specimen sent to us so that results can be viewed in DCIPHER as they are resulted and communicated to individual jurisdictions.

These updates to the PUI and Case Report Form, as well as data dictionary and instructions, can be found in Attachments 2-4, and were made available on CDC's website as of March 1, 2020.

Historical PUI Data Imported into DCIPHER

As of February 28, data reported to CDC on PUI, presumptive cases, and laboratory-confirmed cases have been made available in DCIPHER.

AMERICAN OVERSIGHT

- Jurisdictions in 'Phase 2' are now able to go into the DCIPHER platform to view and edit existing records of PUI, presumptive positive, and laboratory-confirmed cases, as their status changes or more data become available.
- Jurisdictions in 'Phase 1' should continue to call the EOC Watch Desk at 770-488-7100 to update information on existing PUI, presumptive positive, or laboratory-confirmed cases of COVID-19.

CDC Reporting Process for PUI/Case Reports and Lab Findings

For reporting jurisdictions that have the capacity to do their own testing:

For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs or Presumptive Cases (persons with a positive test performed locally without CDC lab confirmation*) into DCIPHER with the jurisdiction-issued nCoV ID, unless other arrangements to transmit data have been made and approved by CDC.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. Please update the person's disposition to 'PUI, tested negative' in DCIPHER.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify CDC of the positive result. The specimen will be identified as a 'presumptive positive'* until the result is confirmed at CDC per the Emergency Use Agreement.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected and submitted on the PUI and Case Report Form.
    c. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.
    d. Please also update the person's disposition in DCIPHER to "Presumptive Case, confirmatory testing pending"

For jurisdictions that are in 'Phase 1':

1. The jurisdictions should call the EOC Watch Desk/PUI desk at 770-488-7100 to receive a CDC-issued nCoV ID, and to complete a PUI and Case Report Form.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. Please email eocevent118@cdc.gov and provide the nCoV ID and test result.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify them of the positive result. The specimen will be identified as a 'presumptive positive'* until the result is confirmed at CDC per the Emergency Use Agreement.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected on the PUI and Case Report form.
    c. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.

For reporting jurisdictions that do not have testing capacity and are sending specimens to CDC for testing:

For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs into DCIPHER with the jurisdiction-issued nCoV IDs, unless other arrangements to transmit data have been made and approved by CDC.
2. Please ensure the jurisdiction-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

For jurisdictions that are in 'Phase 1':

1. The jurisdiction should call the EOC Watch Desk/PUI desk at **770-488-7100** to obtain a CDC-issued nCoV ID number, and complete a PUI and Case Report Form.

AMERICAN OVERSIGHT

2. Please make sure the CDC-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

Specimens from Presumptive Cases must be tested at CDC to change their disposition to 'Confirmed Case'. However, **local public health action is recommended for Presumptive Cases identified through local or state laboratory testing.*

Management of the PHLIP reporting process

CDC and APHL have been working with public health laboratories to add automated reporting of the novel coronavirus test results through their existing influenza reporting mechanism, which is most frequently PHLIP.

We ask that participating PHLIP labs begin including nCoV IDs within the lab test message reported through PHLIP. This will allow CDC to: (1) Match these records with persons reported into DCIPHER and (2) work with states to properly characterize the status of persons without existing records in DCIPHER. Information on how to include the nCoV ID in the message is available via APHL starting at the bottom of Page 4 (Attachment 5).

Major avoidable challenges we hope to overcome with your assistance

We recognize the challenges that public health emergencies bring. With your assistance, we hope to avoid the following challenges by following the processes outlined above:

1. Unclear data flow processes for jurisdictional data on PUI and case-patients to CDC
2. Laboratory samples that are not able to be linked with PUI or case-patients
3. Incorrect reports of national and state-level PUI and case burden

We appreciate your ongoing partnership. Please email eocevent118@cdc.gov with any questions regarding the PUI or case reporting process.

Best,
CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Sent: Tuesday, March 03, 2020 5:36 PM EST
To: CSTE Emergency Response <Preparedness@cste.org>
CC: CSTE Novel Coronavirus 2019 <CSTEncov2019@cste.org>
Subject: CSTE COVID-19 Response | New CDC Standard Process for Displaying Reported Cases

Sent to State Epidemiologists and the CSTE Executive Board

Good evening,

Please see below for a message from CDC's COVID-19 Epidemiology Task Force:

> Colleagues,
>
> To coordinate consistent public messaging and improve data visualization on the CDC public-facing website for the COVID-19 response homepage, CDC is instituting a daily, standard process for displaying reported *cases by state*. Today, this process was discussed with the CSTE COVID-19 Core Group to work collaboratively and incorporate jurisdictional implementation feedback.
>
> **CDC plans to initiate this process tonight, 3/3/2020. Around 6 pm ET, CDC will send each state an email**(emails will go to the staff identified as DCIPHER contacts and the State Epidemiologist) that includes two items:
> 1. Current case count as of 4 pm ET
>   a. Graphical map will represent case count ranges by state (count of presumptive, lab confirmed, total [presumptive + lab confirmed], and deaths among cases)
>   b. Map table will represent **only total case counts by state**. If state reports 1 to 5 cases, counts will be represented as a range (*i.e.,* 1-5 cases). The other information collected will not be shared publicly, but are for internal awareness.
> 2. Link to DCIPHER where the jurisdiction can review, update, and visualize their data
>
> By 9 am ET the following day, please provide written confirmation to CDC (eocevent118@cdc.gov) of receiving the report and either:
> - confirm the case count information provided (cases as of 4 pm ET), or,
> - if incorrect, provide updated values.
>
> These case counts by state will then be reflected in the CDC web update scheduled for release at 12 pm ET.
>
> ****NEW** Daily rhythm for case-confirmation process and external communication**
>
> 
>
>
> 1. (12:00pm, ET): Deadline for CSV States to submit cases to DCIPHER.**This reflects an update in guidance (previous deadline was 9am, ET).**
> 2. (4:00pm, ET): Deadline for Direct Data Entry States to submit cases to DCIPHER
> 3. (6:00pm, ET): CDC sends 4pm ET numbers back to states for final confirmation by 9:00am, ET, next day
> 4. (9:00am, ET next day): Deadline for states to confirm cases for public reporting on CDC COVID-19 homepage
>   a. If no confirmation email received, CDC will use last confirmed numbers reported by state
>   b. If no confirmation email received and state has never confirmed cases to CDC, CDC will take enhanced proactive steps to seek confirmation from the state reporting their initial case(s). If no response from state, cases will not be reported on CDC web update
> 5. (12:00pm, ET): CDC COVID-19 homepage updates go live online
>
> Sincerely,
> CDC COVID-19 Epidemiology Task Force

ATTACHMENT1_ReportingUpdates_2020March1.docx

Dear Partners,

As described in an email sent from the CSTE COVID-19 Leadership Team (see attached), CDC is instituting a standard process for confirming publicly reported cases by jurisdiction.

What you need to do/know now:

- We will conduct case confirmation **daily** (Monday – Friday). As the response evolves, the frequency of these requests will likely decrease.
- At the bottom of this email, you will find a table with the current preliminary case counts we have for each jurisdiction **as of 4 pm ET on Wednesday, March 4**.
- By **9 am ET Thursday, March 5**, please confirm case counts for your jurisdiction (your numbers **as of 4 pm ET today)** using the CDC Case Confirmation Portal (data are collected via Epi Info and stored on a secure CDC server):

https://go.usa.gov/xdftq

What you need to know about how your information will be presented:

- These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. They do not include people who returned to the United States via State Department-chartered flights. **We ask that the preliminary information shared in this email not be distributed.**
- What will be shared on the CDC website (updated daily at 12 pm, ET):
  - **The total case count** [presumptive + lab-confirmed], i.e., the actual number of *total* cases (e.g., 0, 6, 35) will be posted. **EXCEPTION**: **Jurisdictions with one to five cases will be depicted as a range: "1–5 cases"**
  - Other information shared will be used for internal awareness and will not be shared publicly at this time.

What you need to do/know later:

- DCIPHER users can update and analyze their own jurisdiction's data at: https://dcipher.cdc.gov/. If your jurisdiction does not currently have DCIPHER users, but you would like to move to Phase 2 reporting as described in the attached guidance, please email eocevent118@cdc.gov to confirm your readiness.

Sincerely,

CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Dear state and territorial partners:

Thank you for your continued partnership in the ongoing emergency response to COVID-19. The information included below aligns with what was shared by CDC during the 5 pm ET CSTE call on Saturday, February 29th regarding: 1) confirming a jurisdiction's 'Phase 2' status for reporting PUI and cases; 2) updates to the PUI and Case Report Form; 3) an update on the status of historical PUI data imports into DCIPHER; 4) clarifications to the CDC reporting process for PUI/Case Report Forms and lab findings; 5) management of the PHLIP laboratory reporting process; and 6) major avoidable issues we hope to overcome with your assistance. We plan for the noted changes to go into effect at **5 pm ET, Sunday, March 1.**

Jurisdictional 'Phase 2' Status

As we have previously outlined, jurisdictions need to be able to do several tasks before they can move into 'Phase 2'. These include assessing ill persons and determining PUI status; assigning unique identifiers to PUI and cases at the reporting jurisdiction level; and reporting PUI and cases of COVID-19 using a brief, combined form.

Given the need to maintain timely, actionable data at the national level, and process laboratory results at CDC for initial or confirmatory testing, **we anticipate that all jurisdictions will be onboarded to 'Phase 2' during the week of March 2.** As soon as your jurisdiction is able to confirm its 'Phase 2' status, please email eocevent118@cdc.gov.

As part of the 'Phase 2' rollout, CDC needs to better understand each jurisdiction's plan for providing data to CDC for the PUI and Case Report Form via DCIPHER, an electronic PUI and case reporting system. We request that each jurisdiction provides a list of ≤5 DCIPHER users before **Monday, March 2 at 5pm ET,** if they have not already done so. In addition, we ask that jurisdictions confirm their intent to input data on PUI and case-patients directly into the DCIPHER platform (preferred option) or if alternative arrangements need to be made to send data to CDC. Please email eocevent118@cdc.gov with the requested information by **March 2 at 5pm ET**.

Updates to PUI and Case Report Form on CDC's Website

On the PUI and Case Report Form included in the CSTE email on Wednesday, February 26th, there were 2 'current status of person' options: "person under investigation" or "laboratory-confirmed case." Given increased laboratory capacity at the state and local level to test for the virus that causes COVID-19 and the need to send presumptive positive specimens to CDC for confirmatory testing, there will now be 5 status classifications.

1. PUI, testing pending*
2. PUI, tested negative*
3. Presumptive case (positive local test), confirmatory testing pending†
4. Presumptive case (positive local test), confirmatory testing negative†
5. Laboratory-confirmed case†

**Testing conducted by local lab or CDC lab*
† At this time, all confirmatory testing occurs at CDC

We have also added critical laboratory testing result fields at the end of the PUI and Case Report Form to reflect COVID-19 laboratory test results from state or local laboratories and CDC. CDC will work towards populating our laboratory results into the CDC result field for each specimen sent to us so that results can be viewed in DCIPHER as they are resulted and communicated to individual jurisdictions.

These updates to the PUI and Case Report Form, as well as data dictionary and instructions, can be found in Attachments 2-4, and were made available on CDC's website as of March 1, 2020.

Historical PUI Data Imported into DCIPHER

As of February 28, data reported to CDC on PUI, presumptive cases, and laboratory-confirmed cases have been made available in DCIPHER.

AMERICAN OVERSIGHT

- Jurisdictions in 'Phase 2' are now able to go into the DCIPHER platform to view and edit existing records of PUI, presumptive positive, and laboratory-confirmed cases, as their status changes or more data become available.
- Jurisdictions in 'Phase 1' should continue to call the EOC Watch Desk at 770-488-7100 to update information on existing PUI, presumptive positive, or laboratory-confirmed cases of COVID-19.

CDC Reporting Process for PUI/Case Reports and Lab Findings

For reporting jurisdictions that have the capacity to do their own testing:

For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs or Presumptive Cases (persons with a positive test performed locally without CDC lab confirmation*) into DCIPHER with the jurisdiction-issued nCoV ID, unless other arrangements to transmit data have been made and approved by CDC.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. Please update the person's disposition to 'PUI, tested negative' in DCIPHER.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify CDC of the positive result. The specimen will be identified as a 'presumptive positive'* until the result is confirmed at CDC per the Emergency Use Agreement.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected and submitted on the PUI and Case Report Form.
    c. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.
    d. Please also update the person's disposition in DCIPHER to "Presumptive Case, confirmatory testing pending"

For jurisdictions that are in 'Phase 1':

1. The jurisdictions should call the EOC Watch Desk/PUI desk at 770-488-7100 to receive a CDC-issued nCoV ID, and to complete a PUI and Case Report Form.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. Please email eocevent118@cdc.gov and provide the nCoV ID and test result.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify them of the positive result. The specimen will be identified as a 'presumptive positive'* until the result is confirmed at CDC per the Emergency Use Agreement.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected on the PUI and Case Report form.
    c. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.

For reporting jurisdictions that do not have testing capacity and are sending specimens to CDC for testing:

For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs into DCIPHER with the jurisdiction-issued nCoV IDs, unless other arrangements to transmit data have been made and approved by CDC.
2. Please ensure the jurisdiction-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

For jurisdictions that are in 'Phase 1':

1. The jurisdiction should call the EOC Watch Desk/PUI desk at **770-488-7100** to obtain a CDC-issued nCoV ID number, and complete a PUI and Case Report Form.

AMERICAN OVERSIGHT

2. Please make sure the CDC-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

Specimens from Presumptive Cases must be tested at CDC to change their disposition to 'Confirmed Case'. However, **local public health action is recommended for Presumptive Cases identified through local or state laboratory testing.*

Management of the PHLIP reporting process

CDC and APHL have been working with public health laboratories to add automated reporting of the novel coronavirus test results through their existing influenza reporting mechanism, which is most frequently PHLIP.

We ask that participating PHLIP labs begin including nCoV IDs within the lab test message reported through PHLIP. This will allow CDC to: (1) Match these records with persons reported into DCIPHER and (2) work with states to properly characterize the status of persons without existing records in DCIPHER. Information on how to include the nCoV ID in the message is available via APHL starting at the bottom of Page 4 (Attachment 5).

Major avoidable challenges we hope to overcome with your assistance

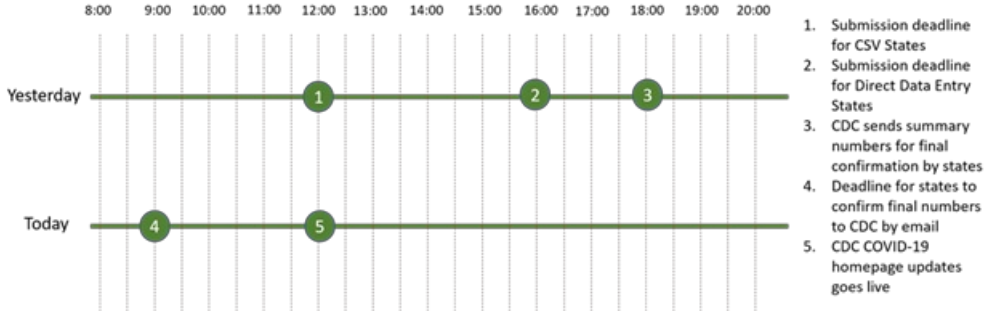
We recognize the challenges that public health emergencies bring. With your assistance, we hope to avoid the following challenges by following the processes outlined above:

1. Unclear data flow processes for jurisdictional data on PUI and case-patients to CDC
2. Laboratory samples that are not able to be linked with PUI or case-patients
3. Incorrect reports of national and state-level PUI and case burden

We appreciate your ongoing partnership. Please email eocevent118@cdc.gov with any questions regarding the PUI or case reporting process.

Best,
CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT



From: CSTE Emergency Response <Preparedness@cste.org>
Sent: Tuesday, March 03, 2020 5:36 PM EST
To: CSTE Emergency Response <Preparedness@cste.org>
CC: CSTE Novel Coronavirus 2019 <CSTEncov2019@cste.org>
Subject: CSTE COVID-19 Response | New CDC Standard Process for Displaying Reported Cases

Sent to State Epidemiologists and the CSTE Executive Board

Good evening,

Please see below for a message from CDC's COVID-19 Epidemiology Task Force:

> Colleagues,
>
> To coordinate consistent public messaging and improve data visualization on the CDC public-facing website for the COVID-19 response homepage, CDC is instituting a daily, standard process for displaying reported *cases by state*. Today, this process was discussed with the CSTE COVID-19 Core Group to work collaboratively and incorporate jurisdictional implementation feedback.
>
> **CDC plans to initiate this process tonight, 3/3/2020. Around 6 pm ET, CDC will send each state an email**(emails will go to the staff identified as DCIPHER contacts and the State Epidemiologist) that includes two items:
> 1. Current case count as of 4 pm ET
>   a. Graphical map will represent case count ranges by state (count of presumptive, lab confirmed, total [presumptive + lab confirmed], and deaths among cases)
>   b. Map table will represent **only total case counts by state**. If state reports 1 to 5 cases, counts will be represented as a range (*i.e.,* 1-5 cases). The other information collected will not be shared publicly, but are for internal awareness.
> 2. Link to DCIPHER where the jurisdiction can review, update, and visualize their data
>
> By 9 am ET the following day, please provide written confirmation to CDC (eocevent118@cdc.gov) of receiving the report and either:
> - confirm the case count information provided (cases as of 4 pm ET), or,
> - if incorrect, provide updated values.
>
> These case counts by state will then be reflected in the CDC web update scheduled for release at 12 pm ET.
>
> ****NEW** Daily rhythm for case-confirmation process and external communication**
>
> 
>
>
> 1. (12:00pm, ET): Deadline for CSV States to submit cases to DCIPHER.**This reflects an update in guidance (previous deadline was 9am, ET).**
> 2. (4:00pm, ET): Deadline for Direct Data Entry States to submit cases to DCIPHER
> 3. (6:00pm, ET): CDC sends 4pm ET numbers back to states for final confirmation by 9:00am, ET, next day
> 4. (9:00am, ET next day): Deadline for states to confirm cases for public reporting on CDC COVID-19 homepage
>   a. If no confirmation email received, CDC will use last confirmed numbers reported by state
>   b. If no confirmation email received and state has never confirmed cases to CDC, CDC will take enhanced proactive steps to seek confirmation from the state reporting their initial case(s). If no response from state, cases will not be reported on CDC web update
> 5. (12:00pm, ET): CDC COVID-19 homepage updates go live online
>
> Sincerely,
> CDC COVID-19 Epidemiology Task Force

Attachments: CSTE COVID-19 Response New CDC Standard Process for Displaying Reported... (141 KB).msg
ATTACHMENT1_ReportingUpdates_2020March1.docx

Dear Partners,

As described in an email sent from the CSTE COVID-19 Leadership Team (see attached), CDC is instituting a standard process for confirming publicly reported cases by jurisdiction.

What you need to do/know now:

- We will conduct case confirmation **daily** (Monday – Friday). As the response evolves, the frequency of these requests will likely decrease.
- At the bottom of this email, you will find a table with the current preliminary case counts we have for each jurisdiction **as of 4 pm ET on Thursday, March 5**.
- By **9 am ET Friday, March 6**, please confirm case counts for your jurisdiction (your numbers **as of 4 pm ET Thursday, March 5)** using the CDC Case Confirmation Portal (data are collected via Epi Info and stored on a secure CDC server):

https://go.usa.gov/xdftq

What you need to know about how your information will be presented:

- These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. They do not include people who returned to the United States via State Department-chartered flights. **We ask that the preliminary information shared in this email not be distributed.**
- What will be shared on the CDC website (updated daily at 12 pm, ET):
  - **The total case count** [presumptive + lab-confirmed], i.e., the actual number of *total* cases (e.g., 0, 6, 35) will be posted. **EXCEPTION**: **Jurisdictions with one to five cases will be depicted as a range: "1–5 cases"**
  - Other information shared will be used for internal awareness and will not be shared publicly at this time.

What you need to do/know later:

- DCIPHER users can update and analyze their own jurisdiction's data at: https://dcipher.cdc.gov/. If your jurisdiction does not currently have DCIPHER users, but you would like to move to Phase 2 reporting as described in the attached guidance, please email eocevent118@cdc.gov to confirm your readiness.

Sincerely,

CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

***Reported deaths are reported from state or local health department and include confirmed and presumptive cases.

AMERICAN OVERSIGHT

Dear state and territorial partners:

Thank you for your continued partnership in the ongoing emergency response to COVID-19. The information included below aligns with what was shared by CDC during the 5 pm ET CSTE call on Saturday, February 29th regarding: 1) confirming a jurisdiction's 'Phase 2' status for reporting PUI and cases; 2) updates to the PUI and Case Report Form; 3) an update on the status of historical PUI data imports into DCIPHER; 4) clarifications to the CDC reporting process for PUI/Case Report Forms and lab findings; 5) management of the PHLIP laboratory reporting process; and 6) major avoidable issues we hope to overcome with your assistance. We plan for the noted changes to go into effect at **5 pm ET, Sunday, March 1.**

Jurisdictional 'Phase 2' Status

As we have previously outlined, jurisdictions need to be able to do several tasks before they can move into 'Phase 2'. These include assessing ill persons and determining PUI status; assigning unique identifiers to PUI and cases at the reporting jurisdiction level; and reporting PUI and cases of COVID-19 using a brief, combined form.

Given the need to maintain timely, actionable data at the national level, and process laboratory results at CDC for initial or confirmatory testing, **we anticipate that all jurisdictions will be onboarded to 'Phase 2' during the week of March 2.** As soon as your jurisdiction is able to confirm its 'Phase 2' status, please email eocevent118@cdc.gov.

As part of the 'Phase 2' rollout, CDC needs to better understand each jurisdiction's plan for providing data to CDC for the PUI and Case Report Form via DCIPHER, an electronic PUI and case reporting system. We request that each jurisdiction provides a list of ≤5 DCIPHER users before **Monday, March 2 at 5pm ET,** if they have not already done so. In addition, we ask that jurisdictions confirm their intent to input data on PUI and case-patients directly into the DCIPHER platform (preferred option) or if alternative arrangements need to be made to send data to CDC. Please email eocevent118@cdc.gov with the requested information by **March 2 at 5pm ET**.

Updates to PUI and Case Report Form on CDC's Website

On the PUI and Case Report Form included in the CSTE email on Wednesday, February 26th, there were 2 'current status of person' options: "person under investigation" or "laboratory-confirmed case." Given increased laboratory capacity at the state and local level to test for the virus that causes COVID-19 and the need to send presumptive positive specimens to CDC for confirmatory testing, there will now be 5 status classifications.

1. PUI, testing pending*
2. PUI, tested negative*
3. Presumptive case (positive local test), confirmatory testing pending†
4. Presumptive case (positive local test), confirmatory testing negative†
5. Laboratory-confirmed case†

**Testing conducted by local lab or CDC lab*
† At this time, all confirmatory testing occurs at CDC

We have also added critical laboratory testing result fields at the end of the PUI and Case Report Form to reflect COVID-19 laboratory test results from state or local laboratories and CDC. CDC will work towards populating our laboratory results into the CDC result field for each specimen sent to us so that results can be viewed in DCIPHER as they are resulted and communicated to individual jurisdictions.

These updates to the PUI and Case Report Form, as well as data dictionary and instructions, can be found in Attachments 2-4, and were made available on CDC's website as of March 1, 2020.

Historical PUI Data Imported into DCIPHER

As of February 28, data reported to CDC on PUI, presumptive cases, and laboratory-confirmed cases have been made available in DCIPHER.

AMERICAN OVERSIGHT

- Jurisdictions in 'Phase 2' are now able to go into the DCIPHER platform to view and edit existing records of PUI, presumptive positive, and laboratory-confirmed cases, as their status changes or more data become available.
- Jurisdictions in 'Phase 1' should continue to call the EOC Watch Desk at 770-488-7100 to update information on existing PUI, presumptive positive, or laboratory-confirmed cases of COVID-19.

CDC Reporting Process for PUI/Case Reports and Lab Findings

For reporting jurisdictions that have the capacity to do their own testing:

For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs or Presumptive Cases (persons with a positive test performed locally without CDC lab confirmation*) into DCIPHER with the jurisdiction-issued nCoV ID, unless other arrangements to transmit data have been made and approved by CDC.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. Please update the person's disposition to 'PUI, tested negative' in DCIPHER.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify CDC of the positive result. The specimen will be identified as a 'presumptive positive'* until the result is confirmed at CDC per the Emergency Use Agreement.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected and submitted on the PUI and Case Report Form.
    c. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.
    d. Please also update the person's disposition in DCIPHER to "Presumptive Case, confirmatory testing pending"

For jurisdictions that are in 'Phase 1':

1. The jurisdictions should call the EOC Watch Desk/PUI desk at 770-488-7100 to receive a CDC-issued nCoV ID, and to complete a PUI and Case Report Form.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. Please email eocevent118@cdc.gov and provide the nCoV ID and test result.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify them of the positive result. The specimen will be identified as a 'presumptive positive'* until the result is confirmed at CDC per the Emergency Use Agreement.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected on the PUI and Case Report form.
    c. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.

For reporting jurisdictions that do not have testing capacity and are sending specimens to CDC for testing:

For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs into DCIPHER with the jurisdiction-issued nCoV IDs, unless other arrangements to transmit data have been made and approved by CDC.
2. Please ensure the jurisdiction-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

For jurisdictions that are in 'Phase 1':

1. The jurisdiction should call the EOC Watch Desk/PUI desk at **770-488-7100** to obtain a CDC-issued nCoV ID number, and complete a PUI and Case Report Form.

AMERICAN OVERSIGHT

2. Please make sure the CDC-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

Specimens from Presumptive Cases must be tested at CDC to change their disposition to 'Confirmed Case'. However, **local public health action is recommended for Presumptive Cases identified through local or state laboratory testing.*

Management of the PHLIP reporting process

CDC and APHL have been working with public health laboratories to add automated reporting of the novel coronavirus test results through their existing influenza reporting mechanism, which is most frequently PHLIP.

We ask that participating PHLIP labs begin including nCoV IDs within the lab test message reported through PHLIP. This will allow CDC to: (1) Match these records with persons reported into DCIPHER and (2) work with states to properly characterize the status of persons without existing records in DCIPHER. Information on how to include the nCoV ID in the message is available via APHL starting at the bottom of Page 4 (Attachment 5).

Major avoidable challenges we hope to overcome with your assistance

We recognize the challenges that public health emergencies bring. With your assistance, we hope to avoid the following challenges by following the processes outlined above:

1. Unclear data flow processes for jurisdictional data on PUI and case-patients to CDC
2. Laboratory samples that are not able to be linked with PUI or case-patients
3. Incorrect reports of national and state-level PUI and case burden

We appreciate your ongoing partnership. Please email eocevent118@cdc.gov with any questions regarding the PUI or case reporting process.

Best,
CDC COVID-19 Epidemiology Task Force

CSTE COVID-19 Response New CDC Standard Process for Displaying Reported Cases.msg

---

Dear Partners,

As described in an email sent from the CSTE COVID-19 Leadership Team (see attached), CDC is instituting a standard process for confirming publicly reported cases by jurisdiction.

What you need to do/know now:

- We will conduct case confirmation **daily** (for web posting Monday–Friday). As the response evolves, the frequency of these requests will likely decrease.
- At the bottom of this email, you will find a table with the current preliminary case counts we have for each jurisdiction **as of 4 pm ET on Sunday, March 8**.
- By **9 am ET Monday, March 9**, please confirm case counts for your jurisdiction (your numbers **as of 4 pm ET Sunday, March 8)** using the CDC Case Confirmation Portal (data are collected via Epi Info and stored on a secure CDC server):

https://go.usa.gov/xdftq

What you need to know about how your information will be presented:

- These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. They do not include people who returned to the United States via State Department-chartered flights. **We ask that the preliminary information shared in this email not be distributed.**
- What will be shared on the CDC website (updated daily at 12 pm, ET):
  - **The total case count** [presumptive + lab-confirmed], i.e., the actual number of *total* cases (e.g., 0, 6, 35) will be posted. **EXCEPTION**: **Jurisdictions with one to five cases will be depicted as a range: "1–5 cases"**
  - Other information shared will be used for internal awareness and will not be shared publicly at this time.

What you need to do/know later:

- DCIPHER users can update and analyze their own jurisdiction's data at: https://dcipher.cdc.gov/. If your jurisdiction does not currently have DCIPHER users, but you would like to move to Phase 2 reporting as described in the attached guidance, please email eocevent118@cdc.gov to confirm your readiness.

Sincerely,

CDC COVID-19 Epidemiology Task Force

* Presumptive cases have tested positive at a state/local laboratory but are not yet confirmed by CDC lab

AMERICAN OVERSIGHT

**Values to be shared on the CDC website

***Reported deaths are reported from state or local health department and include confirmed and presumptive cases.

AMERICAN OVERSIGHT

Updated Sunday, March 8 (major updates are highlighted in yellow)

Dear state and territorial partners:

Thank you for your continued partnership in the ongoing emergency response to COVID-19. The information included below aligns with what was shared by CDC during the 5 pm ET CSTE call on Saturday, February 29th and a CSTE email sent Friday, March 6th regarding: 1) confirming a jurisdiction's 'Phase 2' status for reporting PUI and cases; 2) updates to the PUI and Case Report Form; 3) an update on the status of historical PUI data imports into DCIPHER; 4) clarifications to the CDC reporting process for PUI/Case Report Forms and lab findings; 5) management of the PHLIP laboratory reporting process; 6) grouping of the PUI/Case Report variables into 3 tiers; and 7) major avoidable issues we hope to overcome with your assistance.

Jurisdictional 'Phase 2' Status

As we have previously outlined, jurisdictions need to be able to do several tasks before they can move into 'Phase 2'. These include assessing ill persons and determining PUI status; assigning unique identifiers to PUI and cases at the reporting jurisdiction level; and reporting PUI and cases of COVID-19 using a brief, combined form.

As of March 6th, CDC made the reporting of PUI to CDC through DCIPHER optional for jurisdictions in Phase 2. Jurisdictions **should continue to report presumptive positive and confirmed positive cases to CDC**.

Given the need to maintain timely, actionable data at the national level, and process laboratory results at CDC for initial or confirmatory testing, **all jurisdictions should now be, or actively working towards being, onboarded to 'Phase 2'.** If your jurisdiction has not yet confirmed its 'Phase 2' status, including how you will be inputting data into DCIPHER (preferred method: direct entry), please email eocevent118@cdc.gov.

Updates to PUI and Case Report Form on CDC's Website

On the PUI and Case Report Form included in the CSTE email on Wednesday, February 26th, there were 2 'current status of person' options: "person under investigation" or "laboratory-confirmed case." Given increased laboratory capacity at the state and local level to test for the virus that causes COVID-19 and the need to send presumptive positive specimens to CDC for confirmatory testing, there will now be 5 status classifications.

1. PUI, testing pending*
2. PUI, tested negative*
3. Presumptive case (positive local test), confirmatory testing pending†
4. Presumptive case (positive local test), confirmatory testing negative†
5. Laboratory-confirmed case†

**Testing conducted by local lab (public health, commercial or hospital lab) or CDC lab*
† At this time, all confirmatory testing occurs at CDC

We have also added critical laboratory testing result fields at the end of the PUI and Case Report Form to reflect COVID-19 laboratory test results from state or local laboratories and CDC. CDC will work towards populating our laboratory results into the CDC result field for each specimen sent to us so that results can be viewed in DCIPHER as they are resulted and communicated to individual jurisdictions.

These updates to the PUI and Case Report Form, as well as data dictionary and instructions, can be found in Attachments 2-4, and were made available on CDC's website as of March 1, 2020.

Historical PUI Data Imported into DCIPHER

As of February 28, data reported to CDC on PUI, presumptive cases, and laboratory-confirmed cases have been made available in DCIPHER.

- Jurisdictions in 'Phase 2' are now able to go into the DCIPHER platform to view and edit existing records of PUI, presumptive positive, and laboratory-confirmed cases, as their status changes or more data become available.

AMERICAN OVERSIGHT

- Jurisdictions in 'Phase 1' should continue to call the EOC Watch Desk at 770-488-7100 to update information on existing PUI, presumptive positive, or laboratory-confirmed cases of COVID-19.

CDC Reporting Process for PUI/Case Reports and Lab Findings – Revised March 6th

As of March 6, information for PUIs no longer needs to be entered into DCIPHER. However, jurisdictions may use NNDSS or DCIPHER to manage their PUIs.

For reporting jurisdictions that have the capacity to do their own testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter Presumptive Cases (persons with a positive test performed locally without CDC lab confirmation*) into DCIPHER with the jurisdiction-issued nCoV ID, unless other arrangements to transmit data have been made and approved by CDC.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. If the person is already in DCIPHER, please update the person's disposition to 'PUI, tested negative' in DCIPHER.
3. If a specimen is tested locally, is **POSITIVE,** and is **the jurisdiction's first case (presumptive or confirmed) or is part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify CDC of the positive result. The specimen will be identified as a 'presumptive positive'* until the result is confirmed at CDC per the Emergency Use Agreement.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected and submitted on the PUI and Case Report Form.
    c. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.
    d. Please also update the person's disposition in DCIPHER to "Presumptive Case, confirmatory testing pending"
4. If a specimen is tested locally, is **POSITIVE,** and is **from a jurisdiction with existing presumptive or confirmed cases and is not part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.
    b. Update the person's disposition in DCIPHER to "Presumptive Case, confirmatory testing pending"

For jurisdictions that are in 'Phase 1':

1. The jurisdictions should call the EOC Watch Desk/PUI desk at 770-488-7100 to receive a CDC-issued nCoV ID, and to complete a PUI and Case Report Form.
2. If a specimen is tested locally and is **NEGATIVE**, no further action is needed unless the person has already been reported to CDC as a PUI; if so:
    a. Please email eocevent118@cdc.gov and provide the nCoV ID and test result.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify them of the positive result. The specimen will be identified as a 'presumptive positive'* until the result is confirmed at CDC per the Emergency Use Agreement.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected on the PUI and Case Report form.
    c. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.

For reporting jurisdictions that do not have testing capacity and are sending specimens to CDC for testing:

AMERICAN OVERSIGHT

For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs into DCIPHER with the jurisdiction-issued nCoV IDs, unless other arrangements to transmit data have been made and approved by CDC.
2. Please ensure the jurisdiction-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

For jurisdictions that are in 'Phase 1':

1. The jurisdiction should call the EOC Watch Desk/PUI desk at **770-488-7100** to obtain a CDC-issued nCoV ID number, and complete a PUI and Case Report Form.
2. Please make sure the CDC-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

Specimens from Presumptive Cases must be tested at CDC to change their disposition to 'Confirmed Case'. However, **local public health action is recommended for Presumptive Cases identified through local or state laboratory testing.*

Management of the PHLIP reporting process

CDC and APHL have been working with public health laboratories to add automated reporting of the novel coronavirus test results through their existing influenza reporting mechanism, which is most frequently PHLIP.

We ask that participating PHLIP labs begin including nCoV IDs within the lab test message reported through PHLIP. This will allow CDC to: (1) Match these records with persons reported into DCIPHER and (2) work with states to properly characterize the status of persons without existing records in DCIPHER. Information on how to include the nCoV ID in the message is available via APHL starting at the bottom of Page 4 (Attachment 5).

Grouping of the PUI/Case Report variables into 3 tiers

To support jurisdictions in providing timely case information, the variables included in the Persons Under Investigation (PUI) and Case Report Form have been grouped into 3 tiers. While all the information being collected is important to inform the response, Tier 1 variables are key in understanding the current burden within communities and are typically more readily available. CDC asks that Tier 1 variables be entered/submitted within 24 hours of being collected. The remaining variables should be submitted as soon as possible.

- Tier 1 Variables (to be reported directly into DCIPHER or via *csv* file upload)
  - CDC 2019-nCoV ID (cdc_ncov2019_id) (required field)
  - Reporting jurisdiction (state) (required field)
  - Current status of the person (current_status) (required field)
  - State of residence (res_state)
  - County of residence (res_county)
  - Sex (sex)
  - Age (age)
  - Age Units (ageunit)
  - Symptoms present during course of illness (sympstatus)
  - If symptomatic, onset date (onset_dt)
  - Hospitalization status (hosp_yn)
  - Death (death_yn)

- Tier 2 Variables
  - Report date of case to CDC (case_cdcreport_dt)
  - ICU Admission status (icu_yn)
  - If female, currently pregnant (pregnant_yn)
  - Travel to mainland China (exp_China)
  - Travel to other non-US country (exp_othcountry)

AMERICAN OVERSIGHT

- Travel to other non-US country, specify (exp_othcountry_spec)
- Household contact with a COVID-19 case patient (exp_house)
- Community contact with a COVID-19 case patient (exp_community)
- Any healthcare contact with a COVID-19 case patient (exp_health)
- Healthcare contact with a COVID-19 case patient, healthcare worker (exp_health_hcw)
- Exposure to a cluster of patients with ARDS with unknown etiology (exp_cluster)
- Specimen type (see series on specimen type)
- Specimen ID (see series on specimen ID)
- Specimen sent to CDC (see series on specimen sent to CDC)

- Tier 3 Variables
  - The remaining variables collected on the PUI and Case Report Form

Major avoidable challenges we hope to overcome with your assistance

We recognize the challenges that public health emergencies bring. With your assistance, we hope to avoid the following challenges by following the processes outlined above:

1. Unclear data flow processes for jurisdictional data on PUI and case-patients to CDC
2. Laboratory samples that are not able to be linked with PUI or case-patients
3. Incorrect reports of national and state-level PUI and case burden

We appreciate your ongoing partnership. Please email eocevent118@cdc.gov with any questions regarding the PUI or case reporting process.

Best,
CDC COVID-19 Epidemiology Task Force

To: CSTE Emergency Response <Preparedness@cste.org>
CC: CSTE Novel Coronavirus 2019 <CSTEncov2019@cste.org>
Subject: CSTE COVID-19 Response | New CDC Standard Process for Displaying Reported Cases

Sent to State Epidemiologists and the CSTE Executive Board

Good evening,

Please see below for a message from CDC's COVID-19 Epidemiology Task Force:

> Colleagues,
>
> To coordinate consistent public messaging and improve data visualization on the CDC public-facing website for the COVID-19 response homepage, CDC is instituting a daily, standard process for displaying reported *cases by state*. Today, this process was discussed with the CSTE COVID-19 Core Group to work collaboratively and incorporate jurisdictional implementation feedback.
>
> **CDC plans to initiate this process tonight, 3/3/2020. Around 6 pm ET, CDC will send each state an email**(emails will go to the staff identified as DCIPHER contacts and the State Epidemiologist) that includes two items:
> 1. Current case count as of 4 pm ET
>   a. Graphical map will represent case count ranges by state (count of presumptive, lab confirmed, total [presumptive + lab confirmed], and deaths among cases)
>   b. Map table will represent **only total case counts by state**. If state reports 1 to 5 cases, counts will be represented as a range (*i.e.,* 1-5 cases). The other information collected will not be shared publicly, but are for internal awareness.
> 2. Link to DCIPHER where the jurisdiction can review, update, and visualize their data
>
> By 9 am ET the following day, please provide written confirmation to CDC (eocevent118@cdc.gov) of receiving the report and either:
> - confirm the case count information provided (cases as of 4 pm ET), or,
> - if incorrect, provide updated values.
>
> These case counts by state will then be reflected in the CDC web update scheduled for release at 12 pm ET.
>
> ****NEW** Daily rhythm for case-confirmation process and external communication**
>
> 
>
>
> 1. (12:00pm, ET): Deadline for CSV States to submit cases to DCIPHER.**This reflects an update in guidance (previous deadline was 9am, ET).**
> 2. (4:00pm, ET): Deadline for Direct Data Entry States to submit cases to DCIPHER
> 3. (6:00pm, ET): CDC sends 4pm ET numbers back to states for final confirmation by 9:00am, ET, next day
> 4. (9:00am, ET next day): Deadline for states to confirm cases for public reporting on CDC COVID-19 homepage
>   a. If no confirmation email received, CDC will use last confirmed numbers reported by state
>   b. If no confirmation email received and state has never confirmed cases to CDC, CDC will take enhanced proactive steps to seek confirmation from the state reporting their initial case(s). If no response from state, cases will not be reported on CDC web update
> 5. (12:00pm, ET): CDC COVID-19 homepage updates go live online
>
> Sincerely,
> CDC COVID-19 Epidemiology Task Force

From: CDC IMS 2019 NCOV Response Epi Surveillance State Coordination Unit
To: CDC IMS 2019 NCOV Response Epi Surveillance State Coordination Unit
Subject: CDC COVID-19 Case Count Confirmation 03/10/2020
Date: Tuesday, March 10, 2020 9:20:36 PM
Attachments: CSTE COVID-19 Response New CDC Standard Process for Displaying Reported... (141 KB).msg
Attachment1_ReportingUpdates_2020March8.docx

Dear Partners,

As described in an email sent from the CSTE COVID-19 Leadership Team (see attached), CDC is instituting a standard process for confirming publicly reported cases by jurisdiction.

What you need to do/know now:

- We will conduct case confirmation **daily** (for web posting Monday–Friday). As the response evolves, the frequency of these requests will likely decrease.
- At the bottom of this email, you will find a table with the current preliminary case counts we have for each jurisdiction **as of 4 pm ET on Tuesday, March 10**.
- By **9 am ET Wednesday, March 11**, please confirm case counts for your jurisdiction (your numbers **as of 4 pm ET Tuesday, March 10**) using the CDC Case Confirmation Portal (data are collected via Epi Info and stored on a secure CDC server):

https://go.usa.gov/xdftq

What you need to know about how your information will be presented:

- These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. They do not include people who returned to the United States via State Department-chartered flights. **We ask that the preliminary information shared in this email not be distributed.**
- What will be shared on the CDC website (updated daily at 12 pm, ET):
  - **The total case count** [presumptive + lab-confirmed], i.e., the actual number of *total* cases (e.g., 0, 6, 35) will be posted. **EXCEPTION**: **Jurisdictions with one to five cases will be depicted as a range: "1–5 cases"**
  - Other information shared will be used for internal awareness and will not be shared publicly at this time.

What you need to do/know later:

- DCIPHER users can update and analyze their own jurisdiction's data at: https://dcipher.cdc.gov/. If your jurisdiction does not currently have DCIPHER users, but you would like to move to Phase 2 reporting as described in the attached guidance, please email eocevent118@cdc.gov to confirm your readiness.

Sincerely,

CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Updated Sunday, March 8 (major updates are highlighted in yellow)

Dear state and territorial partners:

Thank you for your continued partnership in the ongoing emergency response to COVID-19. The information included below aligns with what was shared by CDC during the 5 pm ET CSTE call on Saturday, February 29th and a CSTE email sent Friday, March 6th regarding: 1) confirming a jurisdiction's 'Phase 2' status for reporting PUI and cases; 2) updates to the PUI and Case Report Form; 3) an update on the status of historical PUI data imports into DCIPHER; 4) clarifications to the CDC reporting process for PUI/Case Report Forms and lab findings; 5) management of the PHLIP laboratory reporting process; 6) grouping of the PUI/Case Report variables into 3 tiers; and 7) major avoidable issues we hope to overcome with your assistance.

Jurisdictional 'Phase 2' Status

As we have previously outlined, jurisdictions need to be able to do several tasks before they can move into 'Phase 2'. These include assessing ill persons and determining PUI status; assigning unique identifiers to PUI and cases at the reporting jurisdiction level; and reporting PUI and cases of COVID-19 using a brief, combined form.

As of March 6th, CDC made the reporting of PUI to CDC through DCIPHER optional for jurisdictions in Phase 2. Jurisdictions **should continue to report presumptive positive and confirmed positive cases to CDC**.

Given the need to maintain timely, actionable data at the national level, and process laboratory results at CDC for initial or confirmatory testing, **all jurisdictions should now be, or actively working towards being, onboarded to 'Phase 2'.** If your jurisdiction has not yet confirmed its 'Phase 2' status, including how you will be inputting data into DCIPHER (preferred method: direct entry), please email eocevent118@cdc.gov.

Updates to PUI and Case Report Form on CDC's Website

On the PUI and Case Report Form included in the CSTE email on Wednesday, February 26th, there were 2 'current status of person' options: "person under investigation" or "laboratory-confirmed case." Given increased laboratory capacity at the state and local level to test for the virus that causes COVID-19 and the need to send presumptive positive specimens to CDC for confirmatory testing, there will now be 5 status classifications.

1. PUI, testing pending*
2. PUI, tested negative*
3. Presumptive case (positive local test), confirmatory testing pending†
4. Presumptive case (positive local test), confirmatory testing negative†
5. Laboratory-confirmed case†

**Testing conducted by local lab (public health, commercial or hospital lab) or CDC lab*
† At this time, all confirmatory testing occurs at CDC

We have also added critical laboratory testing result fields at the end of the PUI and Case Report Form to reflect COVID-19 laboratory test results from state or local laboratories and CDC. CDC will work towards populating our laboratory results into the CDC result field for each specimen sent to us so that results can be viewed in DCIPHER as they are resulted and communicated to individual jurisdictions.

These updates to the PUI and Case Report Form, as well as data dictionary and instructions, can be found in Attachments 2-4, and were made available on CDC's website as of March 1, 2020.

Historical PUI Data Imported into DCIPHER

As of February 28, data reported to CDC on PUI, presumptive cases, and laboratory-confirmed cases have been made available in DCIPHER.

- Jurisdictions in 'Phase 2' are now able to go into the DCIPHER platform to view and edit existing records of PUI, presumptive positive, and laboratory-confirmed cases, as their status changes or more data become available.

AMERICAN OVERSIGHT

- Jurisdictions in 'Phase 1' should continue to call the EOC Watch Desk at 770-488-7100 to update information on existing PUI, presumptive positive, or laboratory-confirmed cases of COVID-19.

CDC Reporting Process for PUI/Case Reports and Lab Findings – Revised March 6th

As of March 6, information for PUIs no longer needs to be entered into DCIPHER. However, jurisdictions may use NNDSS or DCIPHER to manage their PUIs.

For reporting jurisdictions that have the capacity to do their own testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter Presumptive Cases (persons with a positive test performed locally without CDC lab confirmation*) into DCIPHER with the jurisdiction-issued nCoV ID, unless other arrangements to transmit data have been made and approved by CDC.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. If the person is already in DCIPHER, please update the person's disposition to 'PUI, tested negative' in DCIPHER.
3. If a specimen is tested locally, is **POSITIVE,** and is **the jurisdiction's first case (presumptive or confirmed) or is part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify CDC of the positive result. The specimen will be identified as a 'presumptive positive'* until the result is confirmed at CDC per the Emergency Use Agreement.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected and submitted on the PUI and Case Report Form.
    c. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.
    d. Please also update the person's disposition in DCIPHER to "Presumptive Case, confirmatory testing pending"
4. If a specimen is tested locally, is **POSITIVE,** and is **from a jurisdiction with existing presumptive or confirmed cases and is not part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.
    b. Update the person's disposition in DCIPHER to "Presumptive Case, confirmatory testing pending"

For jurisdictions that are in 'Phase 1':

1. The jurisdictions should call the EOC Watch Desk/PUI desk at 770-488-7100 to receive a CDC-issued nCoV ID, and to complete a PUI and Case Report Form.
2. If a specimen is tested locally and is **NEGATIVE**, no further action is needed unless the person has already been reported to CDC as a PUI; if so:
    a. Please email eocevent118@cdc.gov and provide the nCoV ID and test result.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify them of the positive result. The specimen will be identified as a 'presumptive positive'* until the result is confirmed at CDC per the Emergency Use Agreement.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected on the PUI and Case Report form.
    c. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.

For reporting jurisdictions that do not have testing capacity and are sending specimens to CDC for testing:

AMERICAN OVERSIGHT

For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs into DCIPHER with the jurisdiction-issued nCoV IDs, unless other arrangements to transmit data have been made and approved by CDC.
2. Please ensure the jurisdiction-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

For jurisdictions that are in 'Phase 1':

1. The jurisdiction should call the EOC Watch Desk/PUI desk at **770-488-7100** to obtain a CDC-issued nCoV ID number, and complete a PUI and Case Report Form.
2. Please make sure the CDC-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

Specimens from Presumptive Cases must be tested at CDC to change their disposition to 'Confirmed Case'. However, **local public health action is recommended for Presumptive Cases identified through local or state laboratory testing.*

Management of the PHLIP reporting process

CDC and APHL have been working with public health laboratories to add automated reporting of the novel coronavirus test results through their existing influenza reporting mechanism, which is most frequently PHLIP.

We ask that participating PHLIP labs begin including nCoV IDs within the lab test message reported through PHLIP. This will allow CDC to: (1) Match these records with persons reported into DCIPHER and (2) work with states to properly characterize the status of persons without existing records in DCIPHER. Information on how to include the nCoV ID in the message is available via APHL starting at the bottom of Page 4 (Attachment 5).

Grouping of the PUI/Case Report variables into 3 tiers

To support jurisdictions in providing timely case information, the variables included in the Persons Under Investigation (PUI) and Case Report Form have been grouped into 3 tiers. While all the information being collected is important to inform the response, Tier 1 variables are key in understanding the current burden within communities and are typically more readily available. CDC asks that Tier 1 variables be entered/submitted within 24 hours of being collected. The remaining variables should be submitted as soon as possible.

- Tier 1 Variables (to be reported directly into DCIPHER or via *csv* file upload)
  - CDC 2019-nCoV ID (cdc_ncov2019_id) (required field)
  - Reporting jurisdiction (state) (required field)
  - Current status of the person (current_status) (required field)
  - State of residence (res_state)
  - County of residence (res_county)
  - Sex (sex)
  - Age (age)
  - Age Units (ageunit)
  - Symptoms present during course of illness (sympstatus)
  - If symptomatic, onset date (onset_dt)
  - Hospitalization status (hosp_yn)
  - Death (death_yn)

- Tier 2 Variables
  - Report date of case to CDC (case_cdcreport_dt)
  - ICU Admission status (icu_yn)
  - If female, currently pregnant (pregnant_yn)
  - Travel to mainland China (exp_China)
  - Travel to other non-US country (exp_othcountry)

AMERICAN OVERSIGHT

- Travel to other non-US country, specify (exp_othcountry_spec)
- Household contact with a COVID-19 case patient (exp_house)
- Community contact with a COVID-19 case patient (exp_community)
- Any healthcare contact with a COVID-19 case patient (exp_health)
- Healthcare contact with a COVID-19 case patient, healthcare worker (exp_health_hcw)
- Exposure to a cluster of patients with ARDS with unknown etiology (exp_cluster)
- Specimen type (see series on specimen type)
- Specimen ID (see series on specimen ID)
- Specimen sent to CDC (see series on specimen sent to CDC)

- Tier 3 Variables
  - The remaining variables collected on the PUI and Case Report Form

Major avoidable challenges we hope to overcome with your assistance

We recognize the challenges that public health emergencies bring. With your assistance, we hope to avoid the following challenges by following the processes outlined above:

1. Unclear data flow processes for jurisdictional data on PUI and case-patients to CDC
2. Laboratory samples that are not able to be linked with PUI or case-patients
3. Incorrect reports of national and state-level PUI and case burden

We appreciate your ongoing partnership. Please email eocevent118@cdc.gov with any questions regarding the PUI or case reporting process.

Best,
CDC COVID-19 Epidemiology Task Force

CSTE Emergency Preparedness & Response
Coronavirus Disease (COVID-19)

Sent to State Epidemiologists and the CSTE Executive Board

Good evening,

Please see below for a message from CDC's COVID-19 Epidemiology Task Force:

> Colleagues,
>
> To coordinate consistent public messaging and improve data visualization on the CDC public-facing website for the COVID-19 response homepage, CDC is instituting a daily, standard process for displaying reported *cases by state*. Today, this process was discussed with the CSTE COVID-19 Core Group to work collaboratively and incorporate jurisdictional implementation feedback.
>
> **CDC plans to initiate this process tonight, 3/3/2020. Around 6 pm ET, CDC will send each state an email**(emails will go to the staff identified as DCIPHER contacts and the State Epidemiologist) that includes two items:
> 1. Current case count as of 4 pm ET
>   a. Graphical map will represent case count ranges by state (count of presumptive, lab confirmed, total [presumptive + lab confirmed], and deaths among cases)
>   b. Map table will represent **only total case counts by state**. If state reports 1 to 5 cases, counts will be represented as a range (*i.e.,* 1-5 cases). The other information collected will not be shared publicly, but are for internal awareness.
> 2. Link to DCIPHER where the jurisdiction can review, update, and visualize their data
>
> By 9 am ET the following day, please provide written confirmation to CDC (eocevent118@cdc.gov) of receiving the report and either:
> - confirm the case count information provided (cases as of 4 pm ET), or,
> - if incorrect, provide updated values.
>
> These case counts by state will then be reflected in the CDC web update scheduled for release at 12 pm ET.
>
> ****NEW** Daily rhythm for case-confirmation process and external communication**
>
> 
>
>
> 1. (12:00pm, ET): Deadline for CSV States to submit cases to DCIPHER.**This reflects an update in guidance (previous deadline was 9am, ET).**
> 2. (4:00pm, ET): Deadline for Direct Data Entry States to submit cases to DCIPHER
> 3. (6:00pm, ET): CDC sends 4pm ET numbers back to states for final confirmation by 9:00am, ET, next day
> 4. (9:00am, ET next day): Deadline for states to confirm cases for public reporting on CDC COVID-19 homepage
>   a. If no confirmation email received, CDC will use last confirmed numbers reported by state
>   b. If no confirmation email received and state has never confirmed cases to CDC, CDC will take enhanced proactive steps to seek confirmation from the state reporting their initial case(s). If no response from state, cases will not be reported on CDC web update
> 5. (12:00pm, ET): CDC COVID-19 homepage updates go live online
>
> Sincerely,
> CDC COVID-19 Epidemiology Task Force

From: CDC IMS 2019 NCOV Response Epi Surveillance State Coordination Unit
To: CDC IMS 2019 NCOV Response Epi Surveillance State Coordination Unit
Subject: CDC COVID-19 Case Count Confirmation 03/11/2020
Date: Wednesday, March 11, 2020 6:54:03 PM
Attachments: CSTE COVID-19 Response New CDC Standard Process for Displaying Reported... (141 KB).msg
Attachment1_ReportingUpdates_2020March8.docx

Dear Partners,

As described in an email sent from the CSTE COVID-19 Leadership Team (see attached), CDC is instituting a standard process for confirming publicly reported cases by jurisdiction.

What you need to do/know now:

- We will conduct case confirmation **daily** (for web posting Monday–Friday). As the response evolves, the frequency of these requests will likely decrease.
- At the bottom of this email, you will find a table with the current preliminary case counts we have for each jurisdiction **as of 4 pm ET on Wednesday, March 11**.
- By **9 am ET Thursday, March 12**, please confirm case counts for your jurisdiction (your numbers **as of 4 pm ET Wednesday, March 11)** using the CDC Case Confirmation Portal (data are collected via Epi Info and stored on a secure CDC server):

https://go.usa.gov/xdftq

What you need to know about how your information will be presented:

- These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. They do not include people who returned to the United States via State Department-chartered flights. **We ask that the preliminary information shared in this email not be distributed.**
- What will be shared on the CDC website (updated daily at 12 pm, ET):
  - **The total case count** [presumptive + lab-confirmed], i.e., the actual number of *total* cases (e.g., 0, 6, 35) will be posted. **EXCEPTION**: **Jurisdictions with one to five cases will be depicted as a range: "1–5 cases"**
  - Other information shared will be used for internal awareness and will not be shared publicly at this time.

What you need to do/know later:

- DCIPHER users can update and analyze their own jurisdiction's data at: https://dcipher.cdc.gov/. If your jurisdiction does not currently have DCIPHER users, but you would like to move to Phase 2 reporting as described in the attached guidance, please email eocevent118@cdc.gov to confirm your readiness.

Sincerely,

CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Updated Sunday, March 8 (major updates are highlighted in yellow)

Dear state and territorial partners:

Thank you for your continued partnership in the ongoing emergency response to COVID-19. The information included below aligns with what was shared by CDC during the 5 pm ET CSTE call on Saturday, February 29th and a CSTE email sent Friday, March 6th regarding: 1) confirming a jurisdiction's 'Phase 2' status for reporting PUI and cases; 2) updates to the PUI and Case Report Form; 3) an update on the status of historical PUI data imports into DCIPHER; 4) clarifications to the CDC reporting process for PUI/Case Report Forms and lab findings; 5) management of the PHLIP laboratory reporting process; 6) grouping of the PUI/Case Report variables into 3 tiers; and 7) major avoidable issues we hope to overcome with your assistance.

Jurisdictional 'Phase 2' Status

As we have previously outlined, jurisdictions need to be able to do several tasks before they can move into 'Phase 2'. These include assessing ill persons and determining PUI status; assigning unique identifiers to PUI and cases at the reporting jurisdiction level; and reporting PUI and cases of COVID-19 using a brief, combined form.

As of March 6th, CDC made the reporting of PUI to CDC through DCIPHER optional for jurisdictions in Phase 2. Jurisdictions **should continue to report presumptive positive and confirmed positive cases to CDC**.

Given the need to maintain timely, actionable data at the national level, and process laboratory results at CDC for initial or confirmatory testing, **all jurisdictions should now be, or actively working towards being, onboarded to 'Phase 2'.** If your jurisdiction has not yet confirmed its 'Phase 2' status, including how you will be inputting data into DCIPHER (preferred method: direct entry), please email eocevent118@cdc.gov.

Updates to PUI and Case Report Form on CDC's Website

On the PUI and Case Report Form included in the CSTE email on Wednesday, February 26th, there were 2 'current status of person' options: "person under investigation" or "laboratory-confirmed case." Given increased laboratory capacity at the state and local level to test for the virus that causes COVID-19 and the need to send presumptive positive specimens to CDC for confirmatory testing, there will now be 5 status classifications.

1. PUI, testing pending*
2. PUI, tested negative*
3. Presumptive case (positive local test), confirmatory testing pending†
4. Presumptive case (positive local test), confirmatory testing negative†
5. Laboratory-confirmed case†

**Testing conducted by local lab (public health, commercial or hospital lab) or CDC lab*
† At this time, all confirmatory testing occurs at CDC

We have also added critical laboratory testing result fields at the end of the PUI and Case Report Form to reflect COVID-19 laboratory test results from state or local laboratories and CDC. CDC will work towards populating our laboratory results into the CDC result field for each specimen sent to us so that results can be viewed in DCIPHER as they are resulted and communicated to individual jurisdictions.

These updates to the PUI and Case Report Form, as well as data dictionary and instructions, can be found in Attachments 2-4, and were made available on CDC's website as of March 1, 2020.

Historical PUI Data Imported into DCIPHER

As of February 28, data reported to CDC on PUI, presumptive cases, and laboratory-confirmed cases have been made available in DCIPHER.

- Jurisdictions in 'Phase 2' are now able to go into the DCIPHER platform to view and edit existing records of PUI, presumptive positive, and laboratory-confirmed cases, as their status changes or more data become available.

AMERICAN OVERSIGHT

- Jurisdictions in 'Phase 1' should continue to call the EOC Watch Desk at 770-488-7100 to update information on existing PUI, presumptive positive, or laboratory-confirmed cases of COVID-19.

CDC Reporting Process for PUI/Case Reports and Lab Findings – Revised March 6th

As of March 6, information for PUIs no longer needs to be entered into DCIPHER. However, jurisdictions may use NNDSS or DCIPHER to manage their PUIs.

For reporting jurisdictions that have the capacity to do their own testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter Presumptive Cases (persons with a positive test performed locally without CDC lab confirmation*) into DCIPHER with the jurisdiction-issued nCoV ID, unless other arrangements to transmit data have been made and approved by CDC.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. If the person is already in DCIPHER, please update the person's disposition to 'PUI, tested negative' in DCIPHER.
3. If a specimen is tested locally, is **POSITIVE,** and is **the jurisdiction's first case (presumptive or confirmed) or is part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify CDC of the positive result. The specimen will be identified as a 'presumptive positive'* until the result is confirmed at CDC per the Emergency Use Agreement.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected and submitted on the PUI and Case Report Form.
    c. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.
    d. Please also update the person's disposition in DCIPHER to "Presumptive Case, confirmatory testing pending"
4. If a specimen is tested locally, is **POSITIVE,** and is **from a jurisdiction with existing presumptive or confirmed cases and is not part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.
    b. Update the person's disposition in DCIPHER to "Presumptive Case, confirmatory testing pending"

For jurisdictions that are in 'Phase 1':

1. The jurisdictions should call the EOC Watch Desk/PUI desk at 770-488-7100 to receive a CDC-issued nCoV ID, and to complete a PUI and Case Report Form.
2. If a specimen is tested locally and is **NEGATIVE**, no further action is needed unless the person has already been reported to CDC as a PUI; if so:
    a. Please email eocevent118@cdc.gov and provide the nCoV ID and test result.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify them of the positive result. The specimen will be identified as a 'presumptive positive'* until the result is confirmed at CDC per the Emergency Use Agreement.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected on the PUI and Case Report form.
    c. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.

For reporting jurisdictions that do not have testing capacity and are sending specimens to CDC for testing:

AMERICAN OVERSIGHT

For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs into DCIPHER with the jurisdiction-issued nCoV IDs, unless other arrangements to transmit data have been made and approved by CDC.
2. Please ensure the jurisdiction-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

For jurisdictions that are in 'Phase 1':

1. The jurisdiction should call the EOC Watch Desk/PUI desk at **770-488-7100** to obtain a CDC-issued nCoV ID number, and complete a PUI and Case Report Form.
2. Please make sure the CDC-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

Specimens from Presumptive Cases must be tested at CDC to change their disposition to 'Confirmed Case'. However, **local public health action is recommended for Presumptive Cases identified through local or state laboratory testing.*

Management of the PHLIP reporting process

CDC and APHL have been working with public health laboratories to add automated reporting of the novel coronavirus test results through their existing influenza reporting mechanism, which is most frequently PHLIP.

We ask that participating PHLIP labs begin including nCoV IDs within the lab test message reported through PHLIP. This will allow CDC to: (1) Match these records with persons reported into DCIPHER and (2) work with states to properly characterize the status of persons without existing records in DCIPHER. Information on how to include the nCoV ID in the message is available via APHL starting at the bottom of Page 4 (Attachment 5).

Grouping of the PUI/Case Report variables into 3 tiers

To support jurisdictions in providing timely case information, the variables included in the Persons Under Investigation (PUI) and Case Report Form have been grouped into 3 tiers. While all the information being collected is important to inform the response, Tier 1 variables are key in understanding the current burden within communities and are typically more readily available. CDC asks that Tier 1 variables be entered/submitted within 24 hours of being collected. The remaining variables should be submitted as soon as possible.

- Tier 1 Variables (to be reported directly into DCIPHER or via *csv* file upload)
  - CDC 2019-nCoV ID (cdc_ncov2019_id) (required field)
  - Reporting jurisdiction (state) (required field)
  - Current status of the person (current_status) (required field)
  - State of residence (res_state)
  - County of residence (res_county)
  - Sex (sex)
  - Age (age)
  - Age Units (ageunit)
  - Symptoms present during course of illness (sympstatus)
  - If symptomatic, onset date (onset_dt)
  - Hospitalization status (hosp_yn)
  - Death (death_yn)

- Tier 2 Variables
  - Report date of case to CDC (case_cdcreport_dt)
  - ICU Admission status (icu_yn)
  - If female, currently pregnant (pregnant_yn)
  - Travel to mainland China (exp_China)
  - Travel to other non-US country (exp_othcountry)

AMERICAN OVERSIGHT

- Travel to other non-US country, specify (exp_othcountry_spec)
- Household contact with a COVID-19 case patient (exp_house)
- Community contact with a COVID-19 case patient (exp_community)
- Any healthcare contact with a COVID-19 case patient (exp_health)
- Healthcare contact with a COVID-19 case patient, healthcare worker (exp_health_hcw)
- Exposure to a cluster of patients with ARDS with unknown etiology (exp_cluster)
- Specimen type (see series on specimen type)
- Specimen ID (see series on specimen ID)
- Specimen sent to CDC (see series on specimen sent to CDC)

- Tier 3 Variables
  - The remaining variables collected on the PUI and Case Report Form

Major avoidable challenges we hope to overcome with your assistance

We recognize the challenges that public health emergencies bring. With your assistance, we hope to avoid the following challenges by following the processes outlined above:

1. Unclear data flow processes for jurisdictional data on PUI and case-patients to CDC
2. Laboratory samples that are not able to be linked with PUI or case-patients
3. Incorrect reports of national and state-level PUI and case burden

We appreciate your ongoing partnership. Please email eocevent118@cdc.gov with any questions regarding the PUI or case reporting process.

Best,
CDC COVID-19 Epidemiology Task Force

From: CDC IMS 2019 NCOV Response Epi Surveillance State Coordination Unit
To: CDC IMS 2019 NCOV Response Epi Surveillance State Coordination Unit
Subject: CDC COVID-19 Case Count Confirmation 03/12/2020
Date: Thursday, March 12, 2020 6:18:16 PM
Attachments: CSTE COVID-19 Response New CDC Standard Process for Displaying Reported... (141 KB).msg
Attachment1_ReportingUpdates_2020March8.docx

Dear Partners,

As described in an email sent from the CSTE COVID-19 Leadership Team (see attached), CDC is instituting a standard process for confirming publicly reported cases by jurisdiction.

What you need to do/know now:

- We will conduct case confirmation **daily** (for web posting Monday–Friday). As the response evolves, the frequency of these requests will likely decrease.
- At the bottom of this email, you will find a table with the current preliminary case counts we have for each jurisdiction **as of 4 pm ET on Thursday, March 12**.
- By **9 am ET Friday, March 13**, please confirm case counts for your jurisdiction (your numbers **as of 4 pm ET Thursday, March 12)** using the CDC Case Confirmation Portal (data are collected via Epi Info and stored on a secure CDC server):

https://go.usa.gov/xdftq

What you need to know about how your information will be presented:

- These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. They do not include people who returned to the United States via State Department-chartered flights. **We ask that the preliminary information shared in this email not be distributed.**
- What will be shared on the CDC website (updated daily at 12 pm, ET):
  - **The total case count** [presumptive + lab-confirmed], i.e., the actual number of *total* cases (e.g., 0, 6, 35) will be posted. **EXCEPTION**: **Jurisdictions with one to five cases will be depicted as a range: "1–5 cases"**
  - Other information shared will be used for internal awareness and will not be shared publicly at this time.

What you need to do/know later:

- DCIPHER users can update and analyze their own jurisdiction's data at: https://dcipher.cdc.gov/. If your jurisdiction does not currently have DCIPHER users, but you would like to move to Phase 2 reporting as described in the attached guidance, please email eocevent118@cdc.gov to confirm your readiness.

Sincerely,

CDC COVID-19 Epidemiology Task Force

**Values to be shared on the CDC website

***Reported deaths are reported from state or local health department and include confirmed and presumptive cases.

AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

Updated Sunday, March 8 (major updates are highlighted in yellow)

Dear state and territorial partners:

Thank you for your continued partnership in the ongoing emergency response to COVID-19. The information included below aligns with what was shared by CDC during the 5 pm ET CSTE call on Saturday, February 29th and a CSTE email sent Friday, March 6th regarding: 1) confirming a jurisdiction's 'Phase 2' status for reporting PUI and cases; 2) updates to the PUI and Case Report Form; 3) an update on the status of historical PUI data imports into DCIPHER; 4) clarifications to the CDC reporting process for PUI/Case Report Forms and lab findings; 5) management of the PHLIP laboratory reporting process; 6) grouping of the PUI/Case Report variables into 3 tiers; and 7) major avoidable issues we hope to overcome with your assistance.

Jurisdictional 'Phase 2' Status

As we have previously outlined, jurisdictions need to be able to do several tasks before they can move into 'Phase 2'. These include assessing ill persons and determining PUI status; assigning unique identifiers to PUI and cases at the reporting jurisdiction level; and reporting PUI and cases of COVID-19 using a brief, combined form.

As of March 6th, CDC made the reporting of PUI to CDC through DCIPHER optional for jurisdictions in Phase 2. Jurisdictions **should continue to report presumptive positive and confirmed positive cases to CDC**.

Given the need to maintain timely, actionable data at the national level, and process laboratory results at CDC for initial or confirmatory testing, **all jurisdictions should now be, or actively working towards being, onboarded to 'Phase 2'.** If your jurisdiction has not yet confirmed its 'Phase 2' status, including how you will be inputting data into DCIPHER (preferred method: direct entry), please email eocevent118@cdc.gov.

Updates to PUI and Case Report Form on CDC's Website

On the PUI and Case Report Form included in the CSTE email on Wednesday, February 26th, there were 2 'current status of person' options: "person under investigation" or "laboratory-confirmed case." Given increased laboratory capacity at the state and local level to test for the virus that causes COVID-19 and the need to send presumptive positive specimens to CDC for confirmatory testing, there will now be 5 status classifications.

1. PUI, testing pending*
2. PUI, tested negative*
3. Presumptive case (positive local test), confirmatory testing pending†
4. Presumptive case (positive local test), confirmatory testing negative†
5. Laboratory-confirmed case†

**Testing conducted by local lab (public health, commercial or hospital lab) or CDC lab*
† At this time, all confirmatory testing occurs at CDC

We have also added critical laboratory testing result fields at the end of the PUI and Case Report Form to reflect COVID-19 laboratory test results from state or local laboratories and CDC. CDC will work towards populating our laboratory results into the CDC result field for each specimen sent to us so that results can be viewed in DCIPHER as they are resulted and communicated to individual jurisdictions.

These updates to the PUI and Case Report Form, as well as data dictionary and instructions, can be found in Attachments 2-4, and were made available on CDC's website as of March 1, 2020.

Historical PUI Data Imported into DCIPHER

As of February 28, data reported to CDC on PUI, presumptive cases, and laboratory-confirmed cases have been made available in DCIPHER.

- Jurisdictions in 'Phase 2' are now able to go into the DCIPHER platform to view and edit existing records of PUI, presumptive positive, and laboratory-confirmed cases, as their status changes or more data become available.

AMERICAN OVERSIGHT

- Jurisdictions in 'Phase 1' should continue to call the EOC Watch Desk at 770-488-7100 to update information on existing PUI, presumptive positive, or laboratory-confirmed cases of COVID-19.

CDC Reporting Process for PUI/Case Reports and Lab Findings – Revised March 6th

As of March 6, information for PUIs no longer needs to be entered into DCIPHER. However, jurisdictions may use NNDSS or DCIPHER to manage their PUIs.

For reporting jurisdictions that have the capacity to do their own testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter Presumptive Cases (persons with a positive test performed locally without CDC lab confirmation*) into DCIPHER with the jurisdiction-issued nCoV ID, unless other arrangements to transmit data have been made and approved by CDC.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. If the person is already in DCIPHER, please update the person's disposition to 'PUI, tested negative' in DCIPHER.
3. If a specimen is tested locally, is **POSITIVE,** and is **the jurisdiction's first case (presumptive or confirmed) or is part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify CDC of the positive result. The specimen will be identified as a 'presumptive positive'* until the result is confirmed at CDC per the Emergency Use Agreement.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected and submitted on the PUI and Case Report Form.
    c. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.
    d. Please also update the person's disposition in DCIPHER to "Presumptive Case, confirmatory testing pending"
4. If a specimen is tested locally, is **POSITIVE,** and is **from a jurisdiction with existing presumptive or confirmed cases and is not part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.
    b. Update the person's disposition in DCIPHER to "Presumptive Case, confirmatory testing pending"

For jurisdictions that are in 'Phase 1':

1. The jurisdictions should call the EOC Watch Desk/PUI desk at 770-488-7100 to receive a CDC-issued nCoV ID, and to complete a PUI and Case Report Form.
2. If a specimen is tested locally and is **NEGATIVE**, no further action is needed unless the person has already been reported to CDC as a PUI; if so:
    a. Please email eocevent118@cdc.gov and provide the nCoV ID and test result.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify them of the positive result. The specimen will be identified as a 'presumptive positive'* until the result is confirmed at CDC per the Emergency Use Agreement.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected on the PUI and Case Report form.
    c. Send the specimen to CDC for confirmatory testing, labeled with the nCoV ID.

For reporting jurisdictions that do not have testing capacity and are sending specimens to CDC for testing:

AMERICAN OVERSIGHT

For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs into DCIPHER with the jurisdiction-issued nCoV IDs, unless other arrangements to transmit data have been made and approved by CDC.
2. Please ensure the jurisdiction-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

For jurisdictions that are in 'Phase 1':

1. The jurisdiction should call the EOC Watch Desk/PUI desk at **770-488-7100** to obtain a CDC-issued nCoV ID number, and complete a PUI and Case Report Form.
2. Please make sure the CDC-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

Specimens from Presumptive Cases must be tested at CDC to change their disposition to 'Confirmed Case'. However, **local public health action is recommended for Presumptive Cases identified through local or state laboratory testing.*

Management of the PHLIP reporting process

CDC and APHL have been working with public health laboratories to add automated reporting of the novel coronavirus test results through their existing influenza reporting mechanism, which is most frequently PHLIP.

We ask that participating PHLIP labs begin including nCoV IDs within the lab test message reported through PHLIP. This will allow CDC to: (1) Match these records with persons reported into DCIPHER and (2) work with states to properly characterize the status of persons without existing records in DCIPHER. Information on how to include the nCoV ID in the message is available via APHL starting at the bottom of Page 4 (Attachment 5).

Grouping of the PUI/Case Report variables into 3 tiers

To support jurisdictions in providing timely case information, the variables included in the Persons Under Investigation (PUI) and Case Report Form have been grouped into 3 tiers. While all the information being collected is important to inform the response, Tier 1 variables are key in understanding the current burden within communities and are typically more readily available. CDC asks that Tier 1 variables be entered/submitted within 24 hours of being collected. The remaining variables should be submitted as soon as possible.

- Tier 1 Variables (to be reported directly into DCIPHER or via *csv* file upload)
  - CDC 2019-nCoV ID (cdc_ncov2019_id) (required field)
  - Reporting jurisdiction (state) (required field)
  - Current status of the person (current_status) (required field)
  - State of residence (res_state)
  - County of residence (res_county)
  - Sex (sex)
  - Age (age)
  - Age Units (ageunit)
  - Symptoms present during course of illness (sympstatus)
  - If symptomatic, onset date (onset_dt)
  - Hospitalization status (hosp_yn)
  - Death (death_yn)

- Tier 2 Variables
  - Report date of case to CDC (case_cdcreport_dt)
  - ICU Admission status (icu_yn)
  - If female, currently pregnant (pregnant_yn)
  - Travel to mainland China (exp_China)
  - Travel to other non-US country (exp_othcountry)

AMERICAN OVERSIGHT

    - Travel to other non-US country, specify (exp_othcountry_spec)
    - Household contact with a COVID-19 case patient (exp_house)
    - Community contact with a COVID-19 case patient (exp_community)
    - Any healthcare contact with a COVID-19 case patient (exp_health)
    - Healthcare contact with a COVID-19 case patient, healthcare worker (exp_health_hcw)
    - Exposure to a cluster of patients with ARDS with unknown etiology (exp_cluster)
    - Specimen type (see series on specimen type)
    - Specimen ID (see series on specimen ID)
    - Specimen sent to CDC (see series on specimen sent to CDC)

- Tier 3 Variables
    - The remaining variables collected on the PUI and Case Report Form

Major avoidable challenges we hope to overcome with your assistance

We recognize the challenges that public health emergencies bring. With your assistance, we hope to avoid the following challenges by following the processes outlined above:

1. Unclear data flow processes for jurisdictional data on PUI and case-patients to CDC
2. Laboratory samples that are not able to be linked with PUI or case-patients
3. Incorrect reports of national and state-level PUI and case burden

We appreciate your ongoing partnership. Please email eocevent118@cdc.gov with any questions regarding the PUI or case reporting process.

Best,
CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

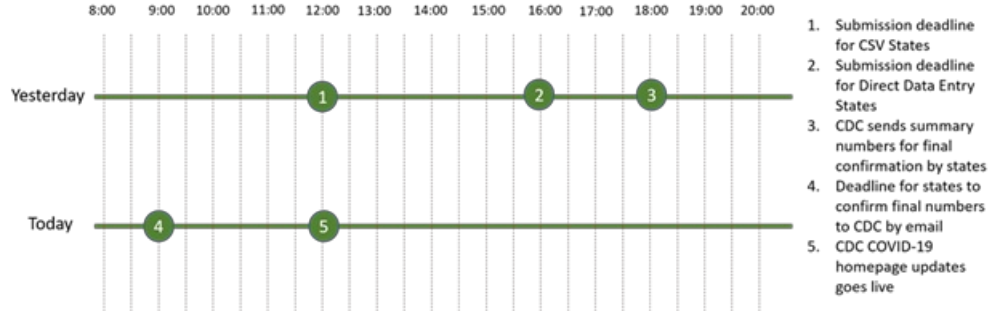
CC: CSTE Novel Coronavirus 2019 <CSTEncov2019@cste.org>
Subject: CSTE COVID-19 Response | New CDC Standard Process for Displaying Reported Cases



CSTE Emergency Preparedness & Response
Coronavirus Disease (COVID-19)

Sent to State Epidemiologists and the CSTE Executive Board

Good evening,

Please see below for a message from CDC's COVID-19 Epidemiology Task Force:

> Colleagues,
>
> To coordinate consistent public messaging and improve data visualization on the CDC public-facing website for the COVID-19 response homepage, CDC is instituting a daily, standard process for displaying reported *cases by state*. Today, this process was discussed with the CSTE COVID-19 Core Group to work collaboratively and incorporate jurisdictional implementation feedback.
>
> **CDC plans to initiate this process tonight, 3/3/2020. Around 6 pm ET, CDC will send each state an email**(emails will go to the staff identified as DCIPHER contacts and the State Epidemiologist) that includes two items:
> 1. Current case count as of 4 pm ET
>   a. Graphical map will represent case count ranges by state (count of presumptive, lab confirmed, total [presumptive + lab confirmed], and deaths among cases)
>   b. Map table will represent **only total case counts by state**. If state reports 1 to 5 cases, counts will be represented as a range (*i.e.,* 1-5 cases). The other information collected will not be shared publicly, but are for internal awareness.
> 2. Link to DCIPHER where the jurisdiction can review, update, and visualize their data
>
> By 9 am ET the following day, please provide written confirmation to CDC (eocevent118@cdc.gov) of receiving the report and either:
> - confirm the case count information provided (cases as of 4 pm ET), or,
> - if incorrect, provide updated values.
>
> These case counts by state will then be reflected in the CDC web update scheduled for release at 12 pm ET.
>
> ****NEW** Daily rhythm for case-confirmation process and external communication**

> 1. (12:00pm, ET): Deadline for CSV States to submit cases to DCIPHER.**This reflects an update in guidance (previous deadline was 9am, ET).**
> 2. (4:00pm, ET): Deadline for Direct Data Entry States to submit cases to DCIPHER
> 3. (6:00pm, ET): CDC sends 4pm ET numbers back to states for final confirmation by 9:00am, ET, next day
> 4. (9:00am, ET next day): Deadline for states to confirm cases for public reporting on CDC COVID-19 homepage
>   a. If no confirmation email received, CDC will use last confirmed numbers reported by state
>   b. If no confirmation email received and state has never confirmed cases to CDC, CDC will take enhanced proactive steps to seek confirmation from the state reporting their initial case(s). If no response from state, cases will not be reported on CDC web update
> 5. (12:00pm, ET): CDC COVID-19 homepage updates go live online
>
> Sincerely,
> CDC COVID-19 Epidemiology Task Force

Dear Partners,

CDC continues to institute a standard process for confirming publicly reported cases by jurisdiction.

What you need to do/know now:

- We will conduct case confirmation **daily** (for web posting Monday–Friday). As the response evolves, the frequency of these requests will likely decrease.
- At the bottom of this email, you will find a table with the current preliminary case counts we have for each jurisdiction **as of 4 pm ET on Sunday, March 15**.
- By **9 am ET Monday, March 16**, please confirm case counts for your jurisdiction (your numbers **as of 4 pm ET Sunday, March 15)** using the CDC Case Confirmation Portal (data are collected via Epi Info and stored on a secure CDC server):

https://go.usa.gov/xdftq

What you need to know about how your information will be presented:

- These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. They do not include people who returned to the United States via State Department-chartered flights. **We ask that the preliminary information shared in this email not be distributed.**
- What will be shared on the CDC website (updated daily at 12 pm, ET):
  - **The total case count** [presumptive + lab-confirmed], i.e., the actual number of *total* cases (e.g., 0, 6, 35) will be posted. **EXCEPTION**: **Jurisdictions with one to five cases will be depicted as a range: "1–5 cases"**
  - Other information shared will be used for internal awareness and will not be shared publicly at this time.

What you need to do/know later:

- DCIPHER users can update and analyze their own jurisdiction's data at: https://dcipher.cdc.gov/. If your jurisdiction does not currently have DCIPHER users, but you would like to move to Phase 2 reporting as described in the attached guidance, please email eocevent118@cdc.gov to confirm your readiness.

Updated guidance: See Attachment 1 that addresses commonly asked questions and the effects of new laboratory testing guidance on use of the National Case Report Form. Key changes are highlighted in yellow. These updates are reflected in the National Case Report Form Instruction Guide (attachment: 2019nCoV_PUICRF instructions_2020Mar15_final), which will be posted to the CDC website later this week.

Sincerely,

CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Version 13 Mar 2020

Instructions for Completing the Human Infection with 2019 Novel Coronavirus (COVID-19) Person Under Investigation (PUI) and Case Report Form

Purpose: This document describes the procedures for completing the 2019 Novel Coronavirus (COVID-19) Person Under Investigation (PUI) and Case Report Form (CRF) for persons under investigation who are being tested or have been tested for the virus that causes COVID-19.

- PUI: Any person who is currently under investigation for having the virus that causes COVID-19, or who was under investigation but tested negative for the virus.
- Laboratory-confirmed case of COVID-19: Individual who has tested positive for the virus that causes COVID-19 in at least one respiratory specimen (Note: effective 3/14/2020 there is no longer the designation of “presumptive positive”).

If a sample from a PUI tests positive for the virus that causes COVID-19, the form should be updated to indicate an individual’s change in status from a PUI to being a laboratory-confirmed case.

The form should be completed if a person has a positive laboratory result for the virus that causes COVID-19, even when not previously identified as a PUI.

General:

1. All dates should be formatted MM/DD/YYYY.
2. If completing the .pdf version of the form, use an “X” to mark boxes. Make sure to carefully mark boxes so that the “X” does not cross multiple boxes.

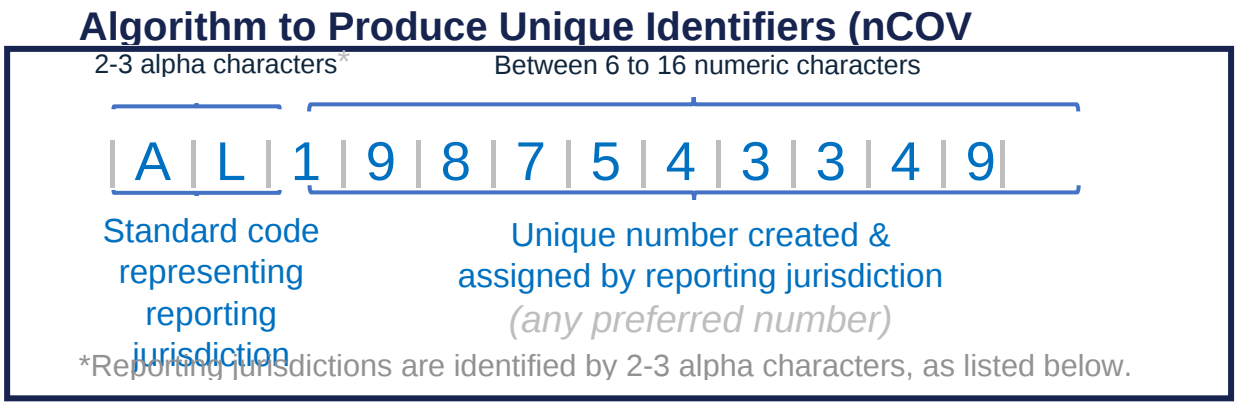
Header:

PATIENT IDENTIFIER INFORMATION IS NOT TRANSMITTED TO CDC AND IS FOR LOCAL-USE ONLY:
Patient first name: Enter case’s first (given) name.
Patient last name: Enter case’s last (family) name.
Date of birth (MM/DD/YYYY): Enter date of birth in MM/DD/YYYY format.

ID information:

Reporting jurisdiction: Enter the reporting jurisdiction where the PUI or case was identified. The reporting jurisdiction must be a state/city/territory authorized to submit data through NNDSS.

Reporting health department: Enter the name of the health department completing the PUI or case report.



Case state/local ID: Enter a local-use ID assigned by the state or local health department if desired for patient tracking or matching.

CDC 2019-nCoV ID: Enter the CDC 2019-nCoV ID assigned to the PUI or case. If the case was already identified as a PUI in collaboration with CDC, or was part of a contact investigation in which CDC was collaborating with the state or local health department, this CDC 2019-nCoV ID should have

AMERICAN OVERSIGHT

already been assigned and the CDC 2019-nCoV ID that was already provided by CDC should be entered. The CDC 2019 nCoV ID should be a part of the state or local health departments records; please check with the reporting jurisdiction. This may have previously been called a PUI ID. **Do not assign a new 2019-nCoV ID for these individuals**.

If this is a new PUI or case that was not previously under investigation or reported, the CDC 2019-nCoV ID should be assigned by the jurisdiction. CDC 2019-nCoV IDs should be assigned for all PUIs and laboratory-confirmed cases so that this person can be tracked at the jurisdictional and national level. The reporting jurisdiction should assign the CDC 2019-nCoV ID, and use this ID for all specimens and data transmitted to CDC for that person. The structure of the ID should be as follows:

!!! Important !!!

Do not add special characters, dashes, or white spaces to the nCoV ID. The alpha- and numeric-portions of the ID are seamless. The numeric portion of the ID cannot begin with zero ('0').

This ID will be used to track information about the PUI or case-patient in CDC data systems and **must** be provided on all forms or specimens related to this individual.

Contact ID: Only fill out this field if a PUI or case-patient is a known contact to another confirmed case of COVID-19. Contact IDs are assigned using the original (source) case-patient's nCoV ID followed by a hyphen and a sequential number indicating the order in which the contact was identified (e.g., Confirmed case CA102034567 may have contacts CA102034567 -01 and CA102034567 -02). If the person was previously under investigation in collaboration with CDC, or was part of a contact investigation in which CDC was collaborating with state/local health departments, this Contact ID may have been

AMERICAN OVERSIGHT

assigned previously. This should be a part of the state or local health departments records; please check with the reporting jurisdiction.

NNDSS loc. rec. ID/Case ID: For NNDSS reporters, enter the GenV2 or NETSS patient identifier.

Interviewer information

Name of interviewer: Enter the last name and first name of the person performing the interview.

Affiliation/Organization: Enter the interviewer's affiliation/organization.

Telephone: Enter the interviewer's telephone number.

Email: Enter the interviewer's email address.

Basic case information

What is the current status of this person?

- Select "PUI, testing pending" if a PUI has been identified but the initial laboratory testing has not yet been completed.
- Select "PUI, tested negative" if a PUI was previously identified, but the laboratory testing for the virus that causes COVID-19 was negative.
- Select "laboratory-confirmed case" if a person has at least one respiratory specimen that tested positive for the virus that causes COVID-19 by a CDC laboratory, state or local public health laboratory, or commercial laboratory using FDA-validated COVID 19 NAA. (Note: effective 3/14/2020 there is no longer the designation of "presumptive positive").

Please update this field each time the individual's status changes.

Report date of PUI to CDC: Enter the date the person was initially reported to CDC **as a PUI** in MM/DD/YYYY format.

Report date of case to CDC: Enter the date the case-patient was initially reported to CDC **as a case** in MM/DD/YYYY format. That is, please report the date at which the person changed from not being a case to being either a laboratory-confirmed case.

County of Residence: Please enter the individual's county of residence. Residence is typically defined by CSTE as the place of 'usual residence' at the time an infection is acquired.

State of Residence: Please enter the individual's county of residence. Residence is typically defined by CSTE as the place of 'usual residence' at the time an infection is acquired. The state of residence and reporting jurisdiction may be two distinct places.

Ethnicity: Select appropriate response. If unknown, select not specified.

Sex: Select appropriate response.

Race: Check all race categories that apply. If other, please specify in free text.

AMERICAN OVERSIGHT

Date of birth: Enter the PUI or case-patient's date of birth in MM/DD/YYYY format. Only enter data in this field if data can be transmitted to CDC per state/local policy.

Age: Enter the PUI or case-patient's age. Age may be entered in units of years, months, or days. Units will be specified later.

Age units (year/month/day): Select age units.

Date of first positive specimen collection: Enter the date of this person's first positive respiratory specimen collection, regardless of specimen type, in MM/DD/YYYY format. If the person tested positive, but the date is unknown, select "Unknown." If the person is a PUI and tested negative or is awaiting initial test results, select "N/A."

Did the patient develop pneumonia?: Select the appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select 'unknown' if missing chart.

Did the patient have acute respiratory distress syndrome?: Select appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select "unknown" if missing chart.

Did the patient have another diagnosis/etiology for their illness?: Select appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select "unknown" if missing chart.

Did the patient have an abnormal chest X-ray?: Select appropriate response. Select "unknown" if missing chart. Select 'yes' if—at any time—the person had an abnormal chest X-ray as part of this illness.

Symptoms present during course of illness?: This question refers to the PUI or case-patient's symptom status related to the entire duration of illness. If the PUI or case-patient was ever symptomatic as part of this illness with COVID-19, select "symptomatic." If the PUI or case-patient was asymptomatic (never experienced symptoms as part of this illness), please select "asymptomatic." If symptom status is unknown, select "unknown."

- If symptomatic, record symptom onset date in MM/DD/YYYY format or mark "unknown."
- If the PUI or case-patient was previously symptomatic and symptoms are currently resolved at the time of completing or updating this form, list date of symptom resolution in MM/DD/YYYY format. If exact dates of symptom resolution are not known, but there is a known approximate date, enter this in the date field. If still symptomatic at time of interview, mark "Still symptomatic." If the PUI or case-patient had symptoms, and the symptoms are resolved, but there is no information about the time frame of symptom resolution, mark "Symptoms resolved, unknown date." If the interviewer and patient do not know the symptom status, mark "Unknown symptom status."

Was the patient hospitalized? Select the appropriate response. If yes, provide dates of first hospital admission and first hospital discharge in MM/DD/YYYY format. If the patient is currently hospitalized, please leave the discharge date blank. This field can be revised at a later time.

Was the patient admitted to an intensive care unit (ICU)? Select the appropriate response. Select "unknown" if the medical chart is not available or ICU admission is not known.

AMERICAN OVERSIGHT

Did the patient receive mechanical ventilation (MV)/intubation? Select “Yes” if the patient was mechanically ventilated during hospitalization via intubation *or* tracheostomy. If yes, count the total number of days with mechanical ventilation. Round up to whole number. Select “unknown” if the medical chart is not available.

Did the patient receive extracorporeal membrane oxygenation (ECMO)?: Select the appropriate response. Select “unknown” if the medical chart is not available.

Did the patient die as a result of this illness? Select appropriate response. If "Yes," then enter date of death in MM/DD/YYYY format. If unknown date of death, please select “Unknown date of death.” (In DCIPHER, this is phrased as “Check if date of death unknown.”)

Is the patient a health care worker in the United States?: Select the appropriate response. HCP are defined as all paid and unpaid persons working in health-care settings who have the potential for exposure to patients and/or to infectious materials, including body substances, contaminated medical supplies and equipment, contaminated environmental surfaces, or contaminated air. HCP might include (but are not limited to) physicians, nurses, nursing assistants, therapists, technicians, emergency medical service personnel, dental personnel, pharmacists, laboratory personnel, autopsy personnel, students and trainees, contractual staff not employed by the health-care facility, and persons (e.g., clerical, dietary, housekeeping, laundry, security, maintenance, administrative, billing, and volunteers) not directly involved in patient care but potentially exposed to infectious agents that can be transmitted to and from HCP and patients.

Does the patient have a history of being in a healthcare facility (as a patient, worker, or visitor) in China?: Select the appropriate response.

In the 14 days prior to illness onset, did the patient have any of the following exposures: Check all that apply. For healthcare contact with another lab-confirmed COVID-19 case-patient, check if the PUI or case-patient identified in the current form was a patient, a visitor (e.g., accompanying family member who was seeking care), or a healthcare worker, when they contacted a lab-confirmed COVID-19 case-patient.

If the PUI or case-patient traveled to a non-US country that was not China, select all of the countries that the person traveled to within the past 14 days by selecting all relevant response options from the drop-down menu. If the country that the PUI or case-patient traveled to in the past 14 days is not listed, you may write the appropriate country in the text field. If the PUI or case-patient had traveled on a cruise, had exposure to large social gatherings (e.g. conference, concert), or had work-related exposures to large groups (e.g. airport screeners, port workers), please include details in the free text field.

If the patient had contact with another COVID-19 case, was this person a U.S. case?: Select the appropriate response. If yes, please provide the nCoV ID of the source case. If the patient did not have contact with another case, please select “N/A.”

Under what process was the PUI or case first identified? Please check all that apply. If identified by the EpiX notification of travelers, please provide the DGMQID. If other, please specify.

AMERICAN OVERSIGHT

Symptoms, clinical course, past medical history and social history:

Collected from (check all that apply): Please select “patient interview” or “medical record review.” If both sources were used to collect information on symptoms, clinical course, past medical history, and social history, please select both response options.

During this illness, did you experience any of the following symptoms? Please select “Yes,” “No,” or “Unknown” for each specific symptom. Please indicate the symptoms that the PUI or case-patient has experienced to date, even if he/she is no longer experiencing these symptoms. All symptoms should have an answer. If other symptoms were experienced, then describe the symptom in the space after “Other”.

Pre-existing medical conditions?: Mark the appropriate response based on whether the PUI or case-patient has *any* pre-existing medical conditions prior to investigation or confirmation of COVID-19. If PUI or case-patient has no pre-existing medical conditions, mark “No.” If not collected during interview and medical chart is missing, mark “Unknown.” After answering the initial (summary) question, please provide a response for *each* pre-existing condition. All questions—other than pregnancy—pertain to a *current* or *past* history of the condition. If “Yes” to neurologic/neurodevelopment/intellectual disability or Other Chronic Diseases, please specify. The pregnancy question should be marked “Yes” if the PUI or case-patient is female and currently or recently pregnant (i.e., gave birth while ill with COVID-19).

Current smoker: Select the appropriate response.

Former smoker: Select the appropriate response.

Respiratory diagnostic testing: For each pathogen, indicate whether the test was positive, negative, pending, or not done. If the PUI or case-patient had a test performed for another pathogen, please check the appropriate test result and specify the name of the pathogen next to “Other, Specify.” (In DCIPHER, please specify additional tests/pathogens only if they are positive.) If multiple tests for the same pathogen were completed, mark “Positive” if any of the tests for that pathogen were positive during the course of the illness suspected to be COVID-19.

Specimens for COVID-19 testing: For each specimen tested for the virus that causes COVID-19, record if the specimen was from a nasopharyngeal swab (NP), oropharyngeal swab (OP), sputum, or other specimen (specify type). If combined NP/OP swabs are collected, record results in the field for NP swabs. Jurisdictions can provide up to three results for each type of specimen; if additional specimens are collected, please provide information about these specimens in the “additional state/local specimen ID” fields below this question. If there are still additional specimens, please use the notes field following the specimen collection information to provide specimen IDs. Provide the local, state, or jurisdictional specimen ID associated with each specimen, as well as the date the specimen was collected in MM/DD/YYYY format. For specimens tested at a local or state public health laboratory or at a commercial laboratory, select ”State Lab Tested.” For specimens tested at CDC, select “Sent to CDC.” For each test performed, indicate the result: positive, negative, pending, not done, or indeterminate.

Please update these test results as they become available.

Additional state/local Specimen IDs: Provide additional specimen IDs from state/local laboratories for specimens tested for the virus that causes COVID-19. If needed, prioritize listing those specimens testing positive for the virus that causes COVID-19, regardless of specimen type.

AMERICAN OVERSIGHT

Updated Sunday, March 15 (major updates are highlighted in yellow)

Dear state and territorial partners:

Thank you for your continued partnership in the ongoing emergency response to COVID-19. The information included below aligns with what was shared by CDC during the 5 pm ET CSTE call on Saturday, February 29th, a CSTE email sent Friday, March 6th, and in a CSTE email sent during the weekend of March 14 regarding: 1) confirming a jurisdiction's 'Phase 2' status for reporting PUI and cases; 2) additional guidance on using the current PUI and Case Report Form, including classification of all positive laboratory tests as confirmed cases; 3) update on the status of historical PUI data imports into DCIPHER; 4) clarifications to the CDC reporting process for PUI/Case Report Forms and lab findings; 5) management of the PHLIP laboratory reporting process; 6) prioritization of the PUI/Case Report variables; and 7) major avoidable issues we hope to overcome with your assistance.

1. Jurisdictional 'Phase 2' Status

Given the need to maintain timely, actionable data at the national level, and process laboratory results at CDC for testing, **all jurisdictions should now be, or actively working towards being, onboarded to 'Phase 2',** which includes being able to assign unique identifiers to PUI/cases at the reporting jurisdiction level. If your jurisdiction has not yet confirmed its 'Phase 2' status, including how you will be inputting data into DCIPHER (preferred method: direct entry), please email eocevent118@cdc.gov.

Reminder: as of March 6th, CDC made the reporting of PUI to CDC through DCIPHER optional for jurisdictions in Phase 2. Jurisdictions **should continue to report positive cases to CDC** using the combined PUI/Case Report Form.

2. Updates to PUI and Case Report Form (CRF) on CDC's Website

Please continue to use the 5 status classifications below when completing a CRF. However, note the changes in how to apply the classifications.

1. PUI, testing pending
2. PUI, tested negative
3. Presumptive case (positive test by state or local health department lab*), confirmatory testing pending
4. Presumptive case (positive test by state or local health department lab*), confirmatory testing negative
5. Laboratory-confirmed case†

**These designations are no longer applicable on or after 3/14/2020*

†Now includes positive tests conducted by the CDC laboratory, commercial lab using FDA-validated COVID 19 NAA, or state or local health department lab.

These changes reflect FDA's acceptance of CDC's request for "enforcement discretion" to allow state and local public-health laboratories to consider positive samples to be interpreted as "positive" with no need for confirmatory testing. This action was supported by data submitted by CDC showing agreement between results in state and local public health labs with corresponding results from CDC. **These changes are retrospective such that samples already submitted to CDC for confirmation and had been awaiting confirmation may now be considered to be positive.** CDC is still interested in receiving any specimens for which testing was "inconclusive" and which could not be resolved by repeat testing. For reporting purposes, these persons can be classified as "PUI, testing pending" until resulted by the CDC Laboratory. For epidemiologists, this will have little impact operationally, since the policy from the beginning was to act on "presumptive positives" as though they have already been confirmed. This means that the cases that previously were considered "presumptive" will all now be considered "confirmed". **For CDC analyses, presumptive and confirmed positive cases will be treated the same. Jurisdictions do not need to make changes to the historical data previously reported to CDC.**

Critical laboratory testing result fields are included at the end of the CRF to reflect COVID-19 laboratory test results. To minimize the need for making changes to the CRF at this time, **please use the same fields to report**

AMERICAN OVERSIGHT

specimens tested at the local level whether the testing laboratory was the state or jurisdiction public health laboratory or commercial laboratory. Further, **if the specimen was from a combined nasopharyngeal (NP) and oropharyngeal (OP) swab, record the results in the NP swab field**. CDC will work towards populating our laboratory results into the CDC result field for each specimen sent to us so that results can be viewed in DCIPHER as they are resulted and communicated to individual jurisdictions. To support this matching process and to ensure the specimen is tested, please make sure to include an nCoV ID when submitting the specimen(s) to CDC.

If the PUI or case-patient had traveled on a cruise, had exposure to large social gatherings (e.g. conference, concert), or work-related exposures to large groups (e.g. airport screeners, port workers), please indicate in the free text field available with the "Other, specify:" option for the question: "In the 14 days prior to illness onset, did the patient have any of the following exposures (check all that apply)."

Updates to the CRF instructions were made available in an email to all jurisdictions sent on March 16, 2020; these changes will also be reflected in the material made available on CDC's website.

3. Historical PUI Data Imported into DCIPHER

As of February 28, data reported to CDC on PUI, presumptive cases, and laboratory-confirmed cases have been made available in DCIPHER.

- Jurisdictions in 'Phase 2' are now able to go into the DCIPHER platform to view and edit existing records of PUI, presumptive positive, and laboratory-confirmed cases, as their status changes or more data become available.
- Jurisdictions in 'Phase 1' should continue to call the EOC Watch Desk at 770-488-7100 to update information on existing PUI, cases of COVID-19.

4. CDC Reporting Process for PUI/Case Reports and Lab Findings – Revised March 6th

CDC laboratory has received several specimens that were not assigned an nCoV ID. **Please note that all specimens need an nCoV ID for submission to CDC laboratory.** In the event that a sample is missing an nCoV ID, the specimen will be frozen, our staff will reach out to the point-of-contact listed on the submission form, and we will test the specimen once the nCoV ID has been submitted. Please provide an nCoV ID with all specimens to avoid delays in testing.

As of March 6, information for PUIs no longer needs to be entered into DCIPHER. However, jurisdictions may use NNDSS or DCIPHER to manage their PUIs.

For reporting jurisdictions that have the capacity to do their own testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter cases into DCIPHER with the jurisdiction-issued nCoV ID, unless other arrangements to transmit data have been made and approved by CDC.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. If the person is already in DCIPHER, please update the person's disposition to 'PUI, tested negative' in DCIPHER.
3. If a specimen is tested locally, is **POSITIVE,** and is **the jurisdiction's first case or is part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify CDC of the positive result.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected and submitted on the PUI and Case Report Form.

AMERICAN OVERSIGHT

4. If a specimen is tested locally, is **POSITIVE,** and is **from a jurisdiction with existing presumptive or confirmed cases and is not part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Update the person's disposition in DCIPHER to "Confirmed Case"

For jurisdictions that are in 'Phase 1':

1. The jurisdictions should call the EOC Watch Desk/PUI desk at 770-488-7100 to receive a CDC-issued nCoV ID, and to complete a PUI and Case Report Form.
2. If a specimen is tested locally and is **NEGATIVE**, no further action is needed unless the person has already been reported to CDC as a PUI; if so:
    a. Please email eocevent118@cdc.gov and provide the nCoV ID and test result.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify them of the positive result.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected on the PUI and Case Report form.

For reporting jurisdictions that do not have testing capacity and are sending specimens to CDC for testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs into DCIPHER with the jurisdiction-issued nCoV IDs, unless other arrangements to transmit data have been made and approved by CDC.
2. Please ensure the jurisdiction-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

For jurisdictions that are in 'Phase 1':

1. The jurisdiction should call the EOC Watch Desk/PUI desk at **770-488-7100** to obtain a CDC-issued nCoV ID number, and complete a PUI and Case Report Form.
2. Please make sure the CDC-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

5. Management of the PHLIP reporting process

CDC and APHL have been working with public health laboratories to add automated reporting of the novel coronavirus test results through their existing influenza reporting mechanism, which is most frequently PHLIP.

We ask that participating PHLIP labs begin including nCoV IDs within the lab test message reported through PHLIP. This will allow CDC to: (1) Match these records with persons reported into DCIPHER and (2) work with states to properly characterize the status of persons without existing records in DCIPHER. Information on how to include the nCoV ID in the message has been made available via APHL starting at the bottom of Page 4 (https://www.aphl.org/Materials/02.12.2020_Informatics_FAQs_and_Guidance.pdf).

6. Prioritization of PUI/Case Report variables

To support improved data reporting, CDC has employed the Data Collation & Integration for Public Health Event Response (DCIPHER) platform that jurisdictions can use to directly enter or import and view their data. As of Friday, March 13, all 50 states and 3 jurisdictions (New York City, Washington DC, and U.S. Virgin Islands) are using DCIPHER for the COVID-19 response. Previously, to support jurisdictions in providing timely case information, CDC group the variables included in the National Case Report into 3 tiers to help jurisdictions prioritize what data are collected and reported. While all the information being collected is important, the

AMERICAN OVERSIGHT

variables that were included on CDC's list of Tier 1 and Tier 2 variables [**High Priority Variables**] are key to understanding the current burden of disease and its transmission within communities. Further, it is important that this information be entered/submitted within 24 hours of the case being identified to provide adequate situational awareness. The remaining variables (previously referred to as Tier 3 variables) should be submitted as soon as possible, some, of which, may require following up with cases over time.

High Priority Variables
Timeline: entered/submitted within 24 hours of being collected.

- CDC 2019-nCoV ID (cdc_ncov2019_id) (required field)
- Reporting jurisdiction (state) (required field)
- Current status of the person (current_status) (required field)
- State of residence (res_state)
- County of residence (res_county)
- Sex (sex)
- Age (age)
- Age Units (ageunit)
- Symptoms present during course of illness (sympstatus)
- If symptomatic, onset date (onset_dt)
- Hospitalization status (hosp_yn)
- ICU admission status (icu_yn): may not be readily available during initial interview; update as soon as possible
- Death (death_yn): may not be readily available during initial interview; update as soon as possible
- If female, currently pregnant (pregnant_yn)
- Health care worker in the United States (hc_work_yn)
- Exposure data
  - Travel to mainland China (exp_China)
  - Travel to other non-US country (exp_othcountry)
  - Travel to other non-US country, specify (exp_othcountry_spec)
  - Household contact with a COVID-19 case patient (exp_house)
  - Community contact with a COVID-19 case patient (exp_community)
  - Any healthcare contact with a COVID-19 case patient (exp_health)
  - Healthcare contact with a COVID-19 case patient, healthcare worker (exp_health_hcw)
  - Exposure to a cluster of patients with ARDS with unknown etiology (exp_cluster)
- Specimen information
  - Specimen type (see series on specimen type)
  - Specimen ID (see series on specimen ID)
  - Specimen sent to CDC (see series on specimen sent to CDC)
- Report date of case to CDC (case_cdcreport_dt)

Other Variables of Importance
Timeline: submitted as soon as possible or available.

- Specific information on the hospitalization, including admission and discharge dates and ventilation status
- Information on signs and symptoms
- Information on pre-existing conditions
- The remaining variables collected on the PUI and Case Report Form

7. <u>Major avoidable challenges we hope to overcome with your assistance</u>

AMERICAN OVERSIGHT

We recognize the challenges that public health emergencies bring. With your assistance, we hope to avoid the following challenges by following the processes outlined above:

1. Unclear data flow processes for jurisdictional data on PUI and case-patients to CDC
2. Laboratory samples that are not able to be linked with PUI or case-patients
3. Incorrect reports of national and state-level PUI and case burden, as well as descriptive statistics about the population impacted

We appreciate your ongoing partnership. Please email eocevent118@cdc.gov with any questions regarding the PUI or case reporting process.

Best,
CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Subject: FW: CSTE COVID-19 Response | Confirmatory testing of COVID-19 samples is no longer required

---

From: CSTE Emergency Response <Preparedness@cste.org>
Sent: Saturday, March 14, 2020 8:27 PM
To: CSTE Emergency Response
Cc: CSTE Novel Coronavirus 2019
Subject: CSTE COVID-19 Response | Confirmatory testing of COVID-19 samples is no longer required

Sent to State Epidemiologists, Deputy State Epidemiologists, CLUE, Infectious Disease Points of Contact, and the CSTE Executive Board

Good evening,

The message below regarding confirmatory testing of COVID-19 samples has been shared by Greg Armstrong, Deputy Incident Manager, CDC COVID-19 response.

--

CSTE
Council of State and Territorial Epidemiologists
Emergency Preparedness & Response Mailbox
Business Hours Line: 770.458.3811
After-Hours Line: 678.256.3945
preparedness.cste.org

Dear CSTE Colleagues,

Summary: State and local public health laboratories are no longer required to send “presumptive positive” samples to CDC for confirmation. From now on, respiratory samples positive for SARS-CoV2 in a state and public-health laboratory will be considered “positive” with no need for further testing.

More details: Last night, FDA accepted CDC’s request for “enforcement discretion” to allow state and local public-health laboratories to consider positive samples to be interpreted as “positive” with no need for confirmatory testing. This action was supported by data submitted by CDC showing agreement between results in state and local public health labs with corresponding results from CDC. CDC was asked to submit an amendment to its emergency-use authorization (EUA) for formal review.

For epidemiologists, this means that the cases that previously were considered “presumptive” will all now be considered “confirmed.”

Your laboratories should have received notification of this change already through APHL. These changes are retrospective such that samples already submitted to CDC for confirmation and had been awaiting confirmation may now be considered to be positive. CDC is still interested in receiving any specimens for which testing was “inconclusive” and which could not be resolved by repeat testing.

Sincerely,

Gregory Armstrong, MD
Currently assigned to CDC Coronavirus Response as Deputy Incident Manager
garmstrong@cdc.gov

2019nCoV_PUICRF instructions_2020Mar15_final_clean.docx

Dear Partners,

CDC continues to institute a standard process for confirming publicly reported cases by jurisdiction.

What you need to do/know now:

- We will conduct case confirmation **daily** (for web posting Monday–Friday). As the response evolves, the frequency of these requests will likely decrease.
- At the bottom of this email, you will find a table with the following:
  - current preliminary case counts we have for each jurisdiction **as of 4 pm ET on Monday, March 16**.
  - general community level transmission characterization (current options: Yes [community transmission is occurring], Undetermined, N/A)
- By **9 am ET Tuesday, March 17**, please use the CDC Case Confirmation Portal (data are collected via Epi Info and stored on a secure CDC server) to:
  - confirm case counts for your jurisdiction (your numbers **as of 4 pm ET Monday, March 16)**
  - if needed, modify your "community level transmission characterization" by using the "additional information" field in the link below

https://go.usa.gov/xdftq

What you need to know about how your information will be presented:

- These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. They do not include people who returned to the United States via State Department-chartered flights. **We ask that the preliminary information shared in this email not be distributed.**
- What will be shared on the CDC website (updated daily at 12 pm, ET):
  - **The total case count**, i.e., the actual number of *total* cases (e.g., 0, 6, 35) will be posted. **EXCEPTION**: **Jurisdictions with one to five cases will be depicted as a range: "1–5 cases"**
  - General community level transmission characterization
  - Other information shared will be used for internal awareness and will not be shared publicly at this time.

What you need to do/know later:

- DCIPHER users can update and analyze their own jurisdiction's data at: https://dcipher.cdc.gov/. If your jurisdiction does not currently have DCIPHER users, but you would like to move to Phase 2 reporting as described in the attached guidance, please email eocevent118@cdc.gov to confirm your readiness.

Resending updated guidance [initially sent on 3/15]: See Attachment 1 that addresses commonly asked questions and the effects of new laboratory testing guidance on use of the National Case Report Form. Key changes are highlighted in yellow. These updates are reflected in the National Case Report Form Instruction Guide (attachment: 2019nCoV_PUICRF instructions_2020Mar15_final), which will be posted to the CDC website later this week.

Sincerely,

CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Version 13 Mar 2020

Instructions for Completing the Human Infection with 2019 Novel Coronavirus (COVID-19) Person Under Investigation (PUI) and Case Report Form

Purpose: This document describes the procedures for completing the 2019 Novel Coronavirus (COVID-19) Person Under Investigation (PUI) and Case Report Form (CRF) for persons under investigation who are being tested or have been tested for the virus that causes COVID-19.

- PUI: Any person who is currently under investigation for having the virus that causes COVID-19, or who was under investigation but tested negative for the virus.
- Laboratory-confirmed case of COVID-19: Individual who has tested positive for the virus that causes COVID-19 in at least one respiratory specimen (Note: effective 3/14/2020 there is no longer the designation of "presumptive positive").

If a sample from a PUI tests positive for the virus that causes COVID-19, the form should be updated to indicate an individual's change in status from a PUI to being a laboratory-confirmed case.

The form should be completed if a person has a positive laboratory result for the virus that causes COVID-19, even when not previously identified as a PUI.

General:

1. All dates should be formatted MM/DD/YYYY.
2. If completing the .pdf version of the form, use an "X" to mark boxes. Make sure to carefully mark boxes so that the "X" does not cross multiple boxes.

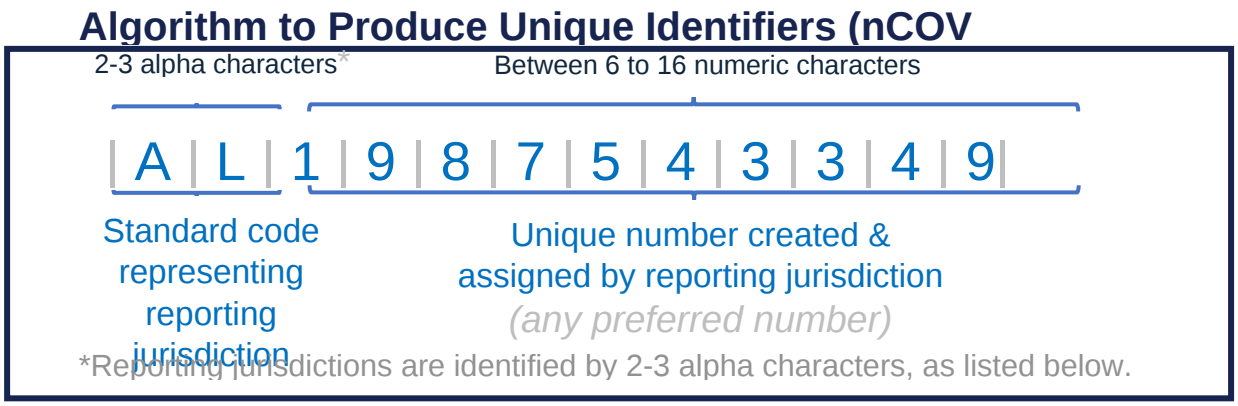
Header:

PATIENT IDENTIFIER INFORMATION IS NOT TRANSMITTED TO CDC AND IS FOR LOCAL-USE ONLY:
Patient first name: Enter case's first (given) name.
Patient last name: Enter case's last (family) name.
Date of birth (MM/DD/YYYY): Enter date of birth in MM/DD/YYYY format.

ID information:

Reporting jurisdiction: Enter the reporting jurisdiction where the PUI or case was identified. The reporting jurisdiction must be a state/city/territory authorized to submit data through NNDSS.

Reporting health department: Enter the name of the health department completing the PUI or case report.



Case state/local ID: Enter a local-use ID assigned by the state or local health department if desired for patient tracking or matching.

CDC 2019-nCoV ID: Enter the CDC 2019-nCoV ID assigned to the PUI or case. If the case was already identified as a PUI in collaboration with CDC, or was part of a contact investigation in which CDC was collaborating with the state or local health department, this CDC 2019-nCoV ID should have

AMERICAN OVERSIGHT

already been assigned and the CDC 2019-nCoV ID that was already provided by CDC should be entered. The CDC 2019 nCoV ID should be a part of the state or local health departments records; please check with the reporting jurisdiction. This may have previously been called a PUI ID. **Do not assign a new 2019-nCoV ID for these individuals**.

If this is a new PUI or case that was not previously under investigation or reported, the CDC 2019-nCoV ID should be assigned by the jurisdiction. CDC 2019-nCoV IDs should be assigned for all PUIs and laboratory-confirmed cases so that this person can be tracked at the jurisdictional and national level. The reporting jurisdiction should assign the CDC 2019-nCoV ID, and use this ID for all specimens and data transmitted to CDC for that person. The structure of the ID should be as follows:

!!! Important !!!

Do not add special characters, dashes, or white spaces to the nCoV ID. The alpha- and numeric-portions of the ID are seamless. The numeric portion of the ID cannot begin with zero ('0').

State	Code	State	Code	State	Code	Territory/Jurisdiction	Code
Alabama	AL	Louisiana	LA	Ohio	OH	American Samoa	AS
Alaska	AK	Maine	ME	Oklahoma	OK	District of Columbia	DC
Arizona	AZ	Maryland	MD	Oregon	OR	Guam	GU
Arkansas	AR	Massachusetts	MA	Pennsylvania	PA	New York City	NYC
California	CA	Michigan	MI	Rhode Island	RI	Northern Mariana Islands	MP
Colorado	CO	Minnesota	MN	South Carolina	SC	Puerto Rico	PR
Connecticut	CT	Mississippi	MS	South Dakota	SD	U.S. Virgin Islands	VI
Delaware	DE	Missouri	MO	Tennessee	TN	Federated States of Micronesia	FSM
Florida	FL	Montana	MT	Texas	TX	Republic of Marshall Islands	RMI
Georgia	GA	Nebraska	NE	Utah	UT	Republic of Palau	ROP
Hawaii	HI	Nevada	NV	Vermont	VT		
Idaho	ID	New Hampshire	NH	Virginia	VA		
Illinois	IL	New Jersey	NJ	Washington	WA		
Indiana	IN	New Mexico	NM	West Virginia	WV		
Iowa	IA	New York	NY	Wisconsin	WI		
Kansas	KS	North Carolina	NC	Wyoming	WY		
Kentucky	KY	North Dakota	ND				

This ID will be used to track information about the PUI or case-patient in CDC data systems and **must** be provided on all forms or specimens related to this individual.

Contact ID: Only fill out this field if a PUI or case-patient is a known contact to another confirmed case of COVID-19. Contact IDs are assigned using the original (source) case-patient's nCoV ID followed by a hyphen and a sequential number indicating the order in which the contact was identified (e.g., Confirmed case CA102034567 may have contacts CA102034567 -01 and CA102034567 -02). If the person was previously under investigation in collaboration with CDC, or was part of a contact investigation in which CDC was collaborating with state/local health departments, this Contact ID may have been

AMERICAN OVERSIGHT

assigned previously. This should be a part of the state or local health departments records; please check with the reporting jurisdiction.

NNDSS loc. rec. ID/Case ID: For NNDSS reporters, enter the GenV2 or NETSS patient identifier.

Interviewer information

Name of interviewer: Enter the last name and first name of the person performing the interview.

Affiliation/Organization: Enter the interviewer's affiliation/organization.

Telephone: Enter the interviewer's telephone number.

Email: Enter the interviewer's email address.

Basic case information

What is the current status of this person?

- Select "PUI, testing pending" if a PUI has been identified but the initial laboratory testing has not yet been completed.
- Select "PUI, tested negative" if a PUI was previously identified, but the laboratory testing for the virus that causes COVID-19 was negative.
- Select "laboratory-confirmed case" if a person has at least one respiratory specimen that tested positive for the virus that causes COVID-19 by a CDC laboratory, state or local public health laboratory, or commercial laboratory using FDA-validated COVID 19 NAA. (Note: effective 3/14/2020 there is no longer the designation of "presumptive positive").

Please update this field each time the individual's status changes.

Report date of PUI to CDC: Enter the date the person was initially reported to CDC **as a PUI** in MM/DD/YYYY format.

Report date of case to CDC: Enter the date the case-patient was initially reported to CDC **as a case** in MM/DD/YYYY format. That is, please report the date at which the person changed from not being a case to being either a laboratory-confirmed case.

County of Residence: Please enter the individual's county of residence. Residence is typically defined by CSTE as the place of 'usual residence' at the time an infection is acquired.

State of Residence: Please enter the individual's county of residence. Residence is typically defined by CSTE as the place of 'usual residence' at the time an infection is acquired. The state of residence and reporting jurisdiction may be two distinct places.

Ethnicity: Select appropriate response. If unknown, select not specified.

Sex: Select appropriate response.

Race: Check all race categories that apply. If other, please specify in free text.

AMERICAN OVERSIGHT

Date of birth: Enter the PUI or case-patient's date of birth in MM/DD/YYYY format. Only enter data in this field if data can be transmitted to CDC per state/local policy.

Age: Enter the PUI or case-patient's age. Age may be entered in units of years, months, or days. Units will be specified later.

Age units (year/month/day): Select age units.

Date of first positive specimen collection: Enter the date of this person's first positive respiratory specimen collection, regardless of specimen type, in MM/DD/YYYY format. If the person tested positive, but the date is unknown, select "Unknown." If the person is a PUI and tested negative or is awaiting initial test results, select "N/A."

Did the patient develop pneumonia?: Select the appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select 'unknown' if missing chart.

Did the patient have acute respiratory distress syndrome?: Select appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select "unknown" if missing chart.

Did the patient have another diagnosis/etiology for their illness?: Select appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select "unknown" if missing chart.

Did the patient have an abnormal chest X-ray?: Select appropriate response. Select "unknown" if missing chart. Select 'yes' if—at any time—the person had an abnormal chest X-ray as part of this illness.

Symptoms present during course of illness?: This question refers to the PUI or case-patient's symptom status related to the entire duration of illness. If the PUI or case-patient was ever symptomatic as part of this illness with COVID-19, select "symptomatic." If the PUI or case-patient was asymptomatic (never experienced symptoms as part of this illness), please select "asymptomatic." If symptom status is unknown, select "unknown."

- If symptomatic, record symptom onset date in MM/DD/YYYY format or mark "unknown."
- If the PUI or case-patient was previously symptomatic and symptoms are currently resolved at the time of completing or updating this form, list date of symptom resolution in MM/DD/YYYY format. If exact dates of symptom resolution are not known, but there is a known approximate date, enter this in the date field. If still symptomatic at time of interview, mark "Still symptomatic." If the PUI or case-patient had symptoms, and the symptoms are resolved, but there is no information about the time frame of symptom resolution, mark "Symptoms resolved, unknown date." If the interviewer and patient do not know the symptom status, mark "Unknown symptom status."

Was the patient hospitalized? Select the appropriate response. If yes, provide dates of first hospital admission and first hospital discharge in MM/DD/YYYY format. If the patient is currently hospitalized, please leave the discharge date blank. This field can be revised at a later time.

Was the patient admitted to an intensive care unit (ICU)? Select the appropriate response. Select "unknown" if the medical chart is not available or ICU admission is not known.

AMERICAN OVERSIGHT

Did the patient receive mechanical ventilation (MV)/intubation? Select “Yes” if the patient was mechanically ventilated during hospitalization via intubation *or* tracheostomy. If yes, count the total number of days with mechanical ventilation. Round up to whole number. Select “unknown” if the medical chart is not available.

Did the patient receive extracorporeal membrane oxygenation (ECMO)?: Select the appropriate response. Select “unknown” if the medical chart is not available.

Did the patient die as a result of this illness? Select appropriate response. If "Yes," then enter date of death in MM/DD/YYYY format. If unknown date of death, please select “Unknown date of death.” (In DCIPHER, this is phrased as “Check if date of death unknown.”)

Is the patient a health care worker in the United States?: Select the appropriate response. HCP are defined as all paid and unpaid persons working in health-care settings who have the potential for exposure to patients and/or to infectious materials, including body substances, contaminated medical supplies and equipment, contaminated environmental surfaces, or contaminated air. HCP might include (but are not limited to) physicians, nurses, nursing assistants, therapists, technicians, emergency medical service personnel, dental personnel, pharmacists, laboratory personnel, autopsy personnel, students and trainees, contractual staff not employed by the health-care facility, and persons (e.g., clerical, dietary, housekeeping, laundry, security, maintenance, administrative, billing, and volunteers) not directly involved in patient care but potentially exposed to infectious agents that can be transmitted to and from HCP and patients.

Does the patient have a history of being in a healthcare facility (as a patient, worker, or visitor) in China?: Select the appropriate response.

In the 14 days prior to illness onset, did the patient have any of the following exposures: Check all that apply. For healthcare contact with another lab-confirmed COVID-19 case-patient, check if the PUI or case-patient identified in the current form was a patient, a visitor (e.g., accompanying family member who was seeking care), or a healthcare worker, when they contacted a lab-confirmed COVID-19 case-patient.

If the PUI or case-patient traveled to a non-US country that was not China, select all of the countries that the person traveled to within the past 14 days by selecting all relevant response options from the drop-down menu. If the country that the PUI or case-patient traveled to in the past 14 days is not listed, you may write the appropriate country in the text field. If the PUI or case-patient had traveled on a cruise, had exposure to large social gatherings (e.g. conference, concert), or had work-related exposures to large groups (e.g. airport screeners, port workers), please include details in the free text field.

If the patient had contact with another COVID-19 case, was this person a U.S. case?: Select the appropriate response. If yes, please provide the nCoV ID of the source case. If the patient did not have contact with another case, please select “N/A.”

Under what process was the PUI or case first identified? Please check all that apply. If identified by the EpiX notification of travelers, please provide the DGMQID. If other, please specify.

AMERICAN OVERSIGHT

Symptoms, clinical course, past medical history and social history:

Collected from (check all that apply): Please select “patient interview” or “medical record review.” If both sources were used to collect information on symptoms, clinical course, past medical history, and social history, please select both response options.

During this illness, did you experience any of the following symptoms? Please select “Yes,” “No,” or “Unknown” for each specific symptom. Please indicate the symptoms that the PUI or case-patient has experienced to date, even if he/she is no longer experiencing these symptoms. All symptoms should have an answer. If other symptoms were experienced, then describe the symptom in the space after “Other”.

Pre-existing medical conditions?: Mark the appropriate response based on whether the PUI or case-patient has *any* pre-existing medical conditions prior to investigation or confirmation of COVID-19. If PUI or case-patient has no pre-existing medical conditions, mark “No.” If not collected during interview and medical chart is missing, mark “Unknown.” After answering the initial (summary) question, please provide a response for *each* pre-existing condition. All questions—other than pregnancy—pertain to a *current* or *past* history of the condition. If “Yes” to neurologic/neurodevelopment/intellectual disability or Other Chronic Diseases, please specify. The pregnancy question should be marked “Yes” if the PUI or case-patient is female and currently or recently pregnant (i.e., gave birth while ill with COVID-19).

Current smoker: Select the appropriate response.

Former smoker: Select the appropriate response.

Respiratory diagnostic testing: For each pathogen, indicate whether the test was positive, negative, pending, or not done. If the PUI or case-patient had a test performed for another pathogen, please check the appropriate test result and specify the name of the pathogen next to “Other, Specify.” (In DCIPHER, please specify additional tests/pathogens only if they are positive.) If multiple tests for the same pathogen were completed, mark “Positive” if any of the tests for that pathogen were positive during the course of the illness suspected to be COVID-19.

Specimens for COVID-19 testing: For each specimen tested for the virus that causes COVID-19, record if the specimen was from a nasopharyngeal swab (NP), oropharyngeal swab (OP), sputum, or other specimen (specify type). If combined NP/OP swabs are collected, record results in the field for NP swabs. Jurisdictions can provide up to three results for each type of specimen; if additional specimens are collected, please provide information about these specimens in the “additional state/local specimen ID” fields below this question. If there are still additional specimens, please use the notes field following the specimen collection information to provide specimen IDs. Provide the local, state, or jurisdictional specimen ID associated with each specimen, as well as the date the specimen was collected in MM/DD/YYYY format. For specimens tested at a local or state public health laboratory or at a commercial laboratory, select ”State Lab Tested.” For specimens tested at CDC, select “Sent to CDC.” For each test performed, indicate the result: positive, negative, pending, not done, or indeterminate.

Please update these test results as they become available.

Additional state/local Specimen IDs: Provide additional specimen IDs from state/local laboratories for specimens tested for the virus that causes COVID-19. If needed, prioritize listing those specimens testing positive for the virus that causes COVID-19, regardless of specimen type.

AMERICAN OVERSIGHT

Updated Sunday, March 15 (major updates are highlighted in yellow)

Dear state and territorial partners:

Thank you for your continued partnership in the ongoing emergency response to COVID-19. The information included below aligns with what was shared by CDC during the 5 pm ET CSTE call on Saturday, February 29th, a CSTE email sent Friday, March 6th, and in a CSTE email sent during the weekend of March 14 regarding: 1) confirming a jurisdiction's 'Phase 2' status for reporting PUI and cases; 2) additional guidance on using the current PUI and Case Report Form, including classification of all positive laboratory tests as confirmed cases; 3) update on the status of historical PUI data imports into DCIPHER; 4) clarifications to the CDC reporting process for PUI/Case Report Forms and lab findings; 5) management of the PHLIP laboratory reporting process; 6) prioritization of the PUI/Case Report variables; and 7) major avoidable issues we hope to overcome with your assistance.

1. Jurisdictional 'Phase 2' Status

Given the need to maintain timely, actionable data at the national level, and process laboratory results at CDC for testing, **all jurisdictions should now be, or actively working towards being, onboarded to 'Phase 2',** which includes being able to assign unique identifiers to PUI/cases at the reporting jurisdiction level. If your jurisdiction has not yet confirmed its 'Phase 2' status, including how you will be inputting data into DCIPHER (preferred method: direct entry), please email eocevent118@cdc.gov.

Reminder: as of March 6th, CDC made the reporting of PUI to CDC through DCIPHER optional for jurisdictions in Phase 2. Jurisdictions **should continue to report positive cases to CDC** using the combined PUI/Case Report Form.

2. Updates to PUI and Case Report Form (CRF) on CDC's Website

Please continue to use the 5 status classifications below when completing a CRF. However, note the changes in how to apply the classifications.

1. PUI, testing pending
2. PUI, tested negative
3. Presumptive case (positive test by state or local health department lab*), confirmatory testing pending
4. Presumptive case (positive test by state or local health department lab*), confirmatory testing negative
5. Laboratory-confirmed case†

**These designations are no longer applicable on or after 3/14/2020*

†Now includes positive tests conducted by the CDC laboratory, commercial lab using FDA-validated COVID 19 NAA, or state or local health department lab.

These changes reflect FDA's acceptance of CDC's request for "enforcement discretion" to allow state and local public-health laboratories to consider positive samples to be interpreted as "positive" with no need for confirmatory testing. This action was supported by data submitted by CDC showing agreement between results in state and local public health labs with corresponding results from CDC. **These changes are retrospective such that samples already submitted to CDC for confirmation and had been awaiting confirmation may now be considered to be positive.** CDC is still interested in receiving any specimens for which testing was "inconclusive" and which could not be resolved by repeat testing. For reporting purposes, these persons can be classified as "PUI, testing pending" until resulted by the CDC Laboratory. For epidemiologists, this will have little impact operationally, since the policy from the beginning was to act on "presumptive positives" as though they have already been confirmed. This means that the cases that previously were considered "presumptive" will all now be considered "confirmed". **For CDC analyses, presumptive and confirmed positive cases will be treated the same. Jurisdictions do not need to make changes to the historical data previously reported to CDC.**

Critical laboratory testing result fields are included at the end of the CRF to reflect COVID-19 laboratory test results. To minimize the need for making changes to the CRF at this time, **please use the same fields to report**

AMERICAN OVERSIGHT

specimens tested at the local level whether the testing laboratory was the state or jurisdiction public health laboratory or commercial laboratory. Further, **if the specimen was from a combined nasopharyngeal (NP) and oropharyngeal (OP) swab, record the results in the NP swab field**. CDC will work towards populating our laboratory results into the CDC result field for each specimen sent to us so that results can be viewed in DCIPHER as they are resulted and communicated to individual jurisdictions. To support this matching process and to ensure the specimen is tested, please make sure to include an nCoV ID when submitting the specimen(s) to CDC.

If the PUI or case-patient had traveled on a cruise, had exposure to large social gatherings (e.g. conference, concert), or work-related exposures to large groups (e.g. airport screeners, port workers), please indicate in the free text field available with the "Other, specify:" option for the question: "In the 14 days prior to illness onset, did the patient have any of the following exposures (check all that apply)."

Changes will also be reflected in the material made available on CDC's website.

3. Historical PUI Data Imported into DCIPHER

As of February 28, data reported to CDC on PUI, presumptive cases, and laboratory-confirmed cases have been made available in DCIPHER.

- Jurisdictions in 'Phase 2' are now able to go into the DCIPHER platform to view and edit existing records of PUI, presumptive positive, and laboratory-confirmed cases, as their status changes or more data become available.
- Jurisdictions in 'Phase 1' should continue to call the EOC Watch Desk at 770-488-7100 to update information on existing PUI, cases of COVID-19.

4. CDC Reporting Process for PUI/Case Reports and Lab Findings – Revised March 6th

CDC laboratory has received several specimens that were not assigned an nCoV ID. **Please note that all specimens need an nCoV ID for submission to CDC laboratory.** In the event that a sample is missing an nCoV ID, the specimen will be frozen, our staff will reach out to the point-of-contact listed on the submission form, and we will test the specimen once the nCoV ID has been submitted. Please provide an nCoV ID with all specimens to avoid delays in testing.

As of March 6, information for PUIs no longer needs to be entered into DCIPHER. However, jurisdictions may use NNDSS or DCIPHER to manage their PUIs.

For reporting jurisdictions that have the capacity to do their own testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter cases into DCIPHER with the jurisdiction-issued nCoV ID, unless other arrangements to transmit data have been made and approved by CDC.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. If the person is already in DCIPHER, please update the person's disposition to 'PUI, tested negative' in DCIPHER.
3. If a specimen is tested locally, is **POSITIVE,** and is **the jurisdiction's first case or is part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify CDC of the positive result.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected and submitted on the PUI and Case Report Form.
4. If a specimen is tested locally, is **POSITIVE,** and is **from a jurisdiction with existing presumptive or confirmed cases and is not part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Update the person's disposition in DCIPHER to "Confirmed Case"

AMERICAN OVERSIGHT

For jurisdictions that are in 'Phase 1':

1. The jurisdictions should call the EOC Watch Desk/PUI desk at 770-488-7100 to receive a CDC-issued nCoV ID, and to complete a PUI and Case Report Form.
2. If a specimen is tested locally and is **NEGATIVE**, no further action is needed unless the person has already been reported to CDC as a PUI; if so:
    a. Please email eocevent118@cdc.gov and provide the nCoV ID and test result.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify them of the positive result.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected on the PUI and Case Report form.

For reporting jurisdictions that do not have testing capacity and are sending specimens to CDC for testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs into DCIPHER with the jurisdiction-issued nCoV IDs, unless other arrangements to transmit data have been made and approved by CDC.
2. Please ensure the jurisdiction-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

For jurisdictions that are in 'Phase 1':

1. The jurisdiction should call the EOC Watch Desk/PUI desk at **770-488-7100** to obtain a CDC-issued nCoV ID number, and complete a PUI and Case Report Form.
2. Please make sure the CDC-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

5. Management of the PHLIP reporting process

CDC and APHL have been working with public health laboratories to add automated reporting of the novel coronavirus test results through their existing influenza reporting mechanism, which is most frequently PHLIP.

We ask that participating PHLIP labs begin including nCoV IDs within the lab test message reported through PHLIP. This will allow CDC to: (1) Match these records with persons reported into DCIPHER and (2) work with states to properly characterize the status of persons without existing records in DCIPHER. Information on how to include the nCoV ID in the message has been made available via APHL starting at the bottom of Page 4 (https://www.aphl.org/Materials/02.12.2020_Informatics_FAQs_and_Guidance.pdf).

6. Prioritization of PUI/Case Report variables

To support improved data reporting, CDC has employed the Data Collation & Integration for Public Health Event Response (DCIPHER) platform that jurisdictions can use to directly enter or import and view their data. As of Friday, March 13, all 50 states and 3 jurisdictions (New York City, Washington DC, and U.S. Virgin Islands) are using DCIPHER for the COVID-19 response. Previously, to support jurisdictions in providing timely case information, CDC group the variables included in the National Case Report into 3 tiers to help jurisdictions prioritize what data are collected and reported. While all the information being collected is important, the variables that were included on CDC's list of Tier 1 and Tier 2 variables [**High Priority Variables**] are key to understanding the current burden of disease and its transmission within communities. Further, it is important that this information be entered/submitted within 24 hours of the case being identified to provide adequate situational awareness. The remaining variables (previously referred to as Tier 3 variables) should be submitted as soon as possible, some, of which, may require following up with cases over time.

AMERICAN OVERSIGHT

High Priority Variables
Timeline: entered/submitted within 24 hours of being collected.

- CDC 2019-nCoV ID (cdc_ncov2019_id) (required field)
- Reporting jurisdiction (state) (required field)
- Current status of the person (current_status) (required field)
- State of residence (res_state)
- County of residence (res_county)
- Sex (sex)
- Age (age)
- Age Units (ageunit)
- Symptoms present during course of illness (sympstatus)
- If symptomatic, onset date (onset_dt)
- Hospitalization status (hosp_yn)
- ICU admission status (icu_yn): may not be readily available during initial interview; update as soon as possible
- Death (death_yn): may not be readily available during initial interview; update as soon as possible
- If female, currently pregnant (pregnant_yn)
- Health care worker in the United States (hc_work_yn)
- Exposure data
  - Travel to mainland China (exp_China)
  - Travel to other non-US country (exp_othcountry)
  - Travel to other non-US country, specify (exp_othcountry_spec)
  - Household contact with a COVID-19 case patient (exp_house)
  - Community contact with a COVID-19 case patient (exp_community)
  - Any healthcare contact with a COVID-19 case patient (exp_health)
  - Healthcare contact with a COVID-19 case patient, healthcare worker (exp_health_hcw)
  - Exposure to a cluster of patients with ARDS with unknown etiology (exp_cluster)
- Specimen information
  - Specimen type (see series on specimen type)
  - Specimen ID (see series on specimen ID)
  - Specimen sent to CDC (see series on specimen sent to CDC)
- Report date of case to CDC (case_cdcreport_dt)

Other Variables of Importance
Timeline: submitted as soon as possible or available.

- Specific information on the hospitalization, including admission and discharge dates and ventilation status
- Information on signs and symptoms
- Information on pre-existing conditions
- The remaining variables collected on the PUI and Case Report Form

7. Major avoidable challenges we hope to overcome with your assistance

We recognize the challenges that public health emergencies bring. With your assistance, we hope to avoid the following challenges by following the processes outlined above:

1. Unclear data flow processes for jurisdictional data on PUI and case-patients to CDC
2. Laboratory samples that are not able to be linked with PUI or case-patients
3. Incorrect reports of national and state-level PUI and case burden, as well as descriptive statistics about the population impacted

AMERICAN OVERSIGHT

We appreciate your ongoing partnership. Please email eocevent118@cdc.gov with any questions regarding the PUI or case reporting process.

Best,
CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Subject: FW: CSTE COVID-19 Response | Confirmatory testing of COVID-19 samples is no longer required

---

From: CSTE Emergency Response <Preparedness@cste.org>
Sent: Saturday, March 14, 2020 8:27 PM
To: CSTE Emergency Response
Cc: CSTE Novel Coronavirus 2019
Subject: CSTE COVID-19 Response | Confirmatory testing of COVID-19 samples is no longer required

Sent to State Epidemiologists, Deputy State Epidemiologists, CLUE, Infectious Disease Points of Contact, and the CSTE Executive Board

Good evening,

The message below regarding confirmatory testing of COVID-19 samples has been shared by Greg Armstrong, Deputy Incident Manager, CDC COVID-19 response.

CSTE
Council of State and Territorial Epidemiologists
Emergency Preparedness & Response Mailbox
Business Hours Line: 770.458.3811
After-Hours Line: 678.256.3945
preparedness.cste.org

Dear CSTE Colleagues,

Summary: State and local public health laboratories are no longer required to send “presumptive positive” samples to CDC for confirmation. From now on, respiratory samples positive for SARS-CoV2 in a state and public-health laboratory will be considered “positive” with no need for further testing.

More details: Last night, FDA accepted CDC’s request for “enforcement discretion” to allow state and local public-health laboratories to consider positive samples to be interpreted as “positive” with no need for confirmatory testing. This action was supported by data submitted by CDC showing agreement between results in state and local public health labs with corresponding results from CDC. CDC was asked to submit an amendment to its emergency-use authorization (EUA) for formal review.

For epidemiologists, this means that the cases that previously were considered “presumptive” will all now be considered “confirmed.”

Your laboratories should have received notification of this change already through APHL. These changes are retrospective such that samples already submitted to CDC for confirmation and had been awaiting confirmation may now be considered to be positive. CDC is still interested in receiving any specimens for which testing was “inconclusive” and which could not be resolved by repeat testing.

Sincerely,

Gregory Armstrong, MD
Currently assigned to CDC Coronavirus Response as Deputy Incident Manager
garmstrong@cdc.gov

Dear Partners,

CDC continues to institute a standard process for confirming publicly reported cases by jurisdiction.

What you need to do/know now:

- We will conduct case confirmation **daily** (for web posting Monday–Friday). As the response evolves, the frequency of these requests will likely decrease.
- At the bottom of this email, you will find a table with the following:
  - current preliminary case counts we have for each jurisdiction **as of 4 pm ET on Tuesday, March 17**.
  - general community level transmission characterization
- By **9 am ET Wednesday, March 18**, **please use the CDC Case Confirmation Portal** (data are collected via Epi Info and stored on a secure CDC server) to:
  - confirm case counts for your jurisdiction (your numbers **as of 4 pm ET Tuesday, March 17)**
  - if needed, modify your "community level transmission characterization"

https://go.usa.gov/xdtyJ

What you need to know about how your information will be presented:

- These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. They do not include people who returned to the United States via State Department-chartered flights. **We ask that the preliminary information shared in this email not be distributed.**
- What will be shared on the CDC website (updated daily at 12 pm, ET):
  - **The total case count**, i.e., the actual number of *total* cases (e.g., 0, 6, 35) will be posted. **EXCEPTION**: **Jurisdictions with one to five cases will be depicted as a range: "1–5 cases"**
  - Community level transmission characterization
  - Other information shared will be used for internal awareness and will not be shared publicly at this time.

What you need to do/know later:

- DCIPHER users can update and analyze their own jurisdiction's data at: https://dcipher.cdc.gov/. If your jurisdiction does not currently have DCIPHER users, but you would like to move to Phase 2 reporting as described in the attached guidance, please email eocevent118@cdc.gov to confirm your readiness.

Sincerely,

CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Version 13 Mar 2020

Instructions for Completing the Human Infection with 2019 Novel Coronavirus (COVID-19) Person Under Investigation (PUI) and Case Report Form

Purpose: This document describes the procedures for completing the 2019 Novel Coronavirus (COVID-19) Person Under Investigation (PUI) and Case Report Form (CRF) for persons under investigation who are being tested or have been tested for the virus that causes COVID-19.

- PUI: Any person who is currently under investigation for having the virus that causes COVID-19, or who was under investigation but tested negative for the virus.
- Laboratory-confirmed case of COVID-19: Individual who has tested positive for the virus that causes COVID-19 in at least one respiratory specimen (Note: effective 3/14/2020 there is no longer the designation of "presumptive positive").

If a sample from a PUI tests positive for the virus that causes COVID-19, the form should be updated to indicate an individual's change in status from a PUI to being a laboratory-confirmed case.

The form should be completed if a person has a positive laboratory result for the virus that causes COVID-19, even when not previously identified as a PUI.

General:

1. All dates should be formatted MM/DD/YYYY.
2. If completing the .pdf version of the form, use an "X" to mark boxes. Make sure to carefully mark boxes so that the "X" does not cross multiple boxes.

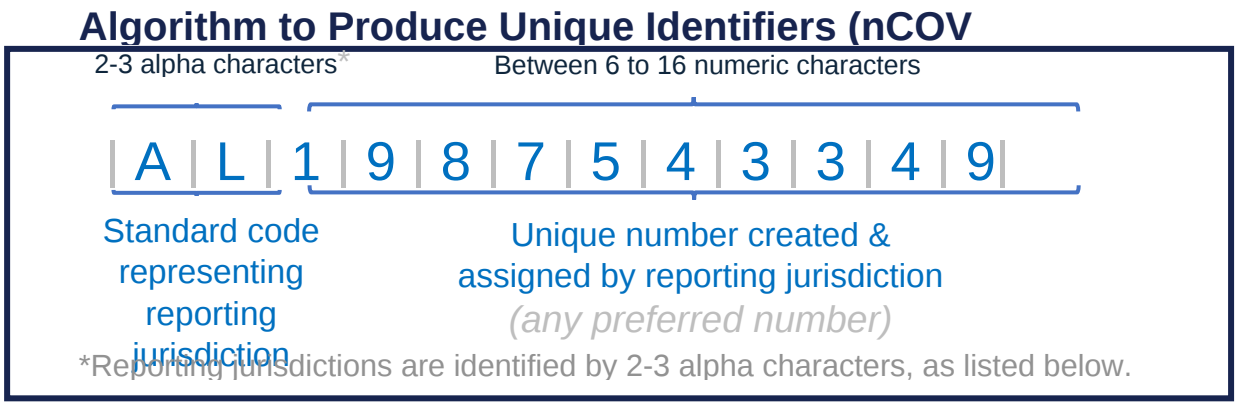
Header:

PATIENT IDENTIFIER INFORMATION IS NOT TRANSMITTED TO CDC AND IS FOR LOCAL-USE ONLY:
Patient first name: Enter case's first (given) name.
Patient last name: Enter case's last (family) name.
Date of birth (MM/DD/YYYY): Enter date of birth in MM/DD/YYYY format.

ID information:

Reporting jurisdiction: Enter the reporting jurisdiction where the PUI or case was identified. The reporting jurisdiction must be a state/city/territory authorized to submit data through NNDSS.

Reporting health department: Enter the name of the health department completing the PUI or case report.



Case state/local ID: Enter a local-use ID assigned by the state or local health department if desired for patient tracking or matching.

CDC 2019-nCoV ID: Enter the CDC 2019-nCoV ID assigned to the PUI or case. If the case was already identified as a PUI in collaboration with CDC, or was part of a contact investigation in which CDC was collaborating with the state or local health department, this CDC 2019-nCoV ID should have

AMERICAN OVERSIGHT

already been assigned and the CDC 2019-nCoV ID that was already provided by CDC should be entered. The CDC 2019 nCoV ID should be a part of the state or local health departments records; please check with the reporting jurisdiction. This may have previously been called a PUI ID. **Do not assign a new 2019-nCoV ID for these individuals**.

If this is a new PUI or case that was not previously under investigation or reported, the CDC 2019-nCoV ID should be assigned by the jurisdiction. CDC 2019-nCoV IDs should be assigned for all PUIs and laboratory-confirmed cases so that this person can be tracked at the jurisdictional and national level. The reporting jurisdiction should assign the CDC 2019-nCoV ID, and use this ID for all specimens and data transmitted to CDC for that person. The structure of the ID should be as follows:

!!! Important !!!

Do not add special characters, dashes, or white spaces to the nCoV ID. The alpha- and numeric-portions of the ID are seamless. The numeric portion of the ID cannot begin with zero ('0').

State	Code
Alabama	AL
Alaska	AK

This ID will be used to track information about the PUI or case-patient in CDC data systems and **must** be provided on all forms or specimens related to this individual.

Contact ID: Only fill out this field if a PUI or case-patient is a known contact to another confirmed case of COVID-19. Contact IDs are assigned using the original (source) case-patient's nCoV ID followed by a hyphen and a sequential number indicating the order in which the contact was identified (e.g., Confirmed case CA102034567 may have contacts CA102034567 -01 and CA102034567 -02). If the person was previously under investigation in collaboration with CDC, or was part of a contact investigation in which CDC was collaborating with state/local health departments, this Contact ID may have been

AMERICAN OVERSIGHT

assigned previously. This should be a part of the state or local health departments records; please check with the reporting jurisdiction.

NNDSS loc. rec. ID/Case ID: For NNDSS reporters, enter the GenV2 or NETSS patient identifier.

Interviewer information

Name of interviewer: Enter the last name and first name of the person performing the interview.

Affiliation/Organization: Enter the interviewer's affiliation/organization.

Telephone: Enter the interviewer's telephone number.

Email: Enter the interviewer's email address.

Basic case information

What is the current status of this person?

- Select "PUI, testing pending" if a PUI has been identified but the initial laboratory testing has not yet been completed.
- Select "PUI, tested negative" if a PUI was previously identified, but the laboratory testing for the virus that causes COVID-19 was negative.
- Select "laboratory-confirmed case" if a person has at least one respiratory specimen that tested positive for the virus that causes COVID-19 by a CDC laboratory, state or local public health laboratory, or commercial laboratory using FDA-validated COVID 19 NAA. (Note: effective 3/14/2020 there is no longer the designation of "presumptive positive").

Please update this field each time the individual's status changes.

Report date of PUI to CDC: Enter the date the person was initially reported to CDC **as a PUI** in MM/DD/YYYY format.

Report date of case to CDC: Enter the date the case-patient was initially reported to CDC **as a case** in MM/DD/YYYY format. That is, please report the date at which the person changed from not being a case to being either a laboratory-confirmed case.

County of Residence: Please enter the individual's county of residence. Residence is typically defined by CSTE as the place of 'usual residence' at the time an infection is acquired.

State of Residence: Please enter the individual's county of residence. Residence is typically defined by CSTE as the place of 'usual residence' at the time an infection is acquired. The state of residence and reporting jurisdiction may be two distinct places.

Ethnicity: Select appropriate response. If unknown, select not specified.

Sex: Select appropriate response.

Race: Check all race categories that apply. If other, please specify in free text.

AMERICAN OVERSIGHT

Date of birth: Enter the PUI or case-patient's date of birth in MM/DD/YYYY format. Only enter data in this field if data can be transmitted to CDC per state/local policy.

Age: Enter the PUI or case-patient's age. Age may be entered in units of years, months, or days. Units will be specified later.

Age units (year/month/day): Select age units.

Date of first positive specimen collection: Enter the date of this person's first positive respiratory specimen collection, regardless of specimen type, in MM/DD/YYYY format. If the person tested positive, but the date is unknown, select "Unknown." If the person is a PUI and tested negative or is awaiting initial test results, select "N/A."

Did the patient develop pneumonia?: Select the appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select 'unknown' if missing chart.

Did the patient have acute respiratory distress syndrome?: Select appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select "unknown" if missing chart.

Did the patient have another diagnosis/etiology for their illness?: Select appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select "unknown" if missing chart.

Did the patient have an abnormal chest X-ray?: Select appropriate response. Select "unknown" if missing chart. Select 'yes' if—at any time—the person had an abnormal chest X-ray as part of this illness.

Symptoms present during course of illness?: This question refers to the PUI or case-patient's symptom status related to the entire duration of illness. If the PUI or case-patient was ever symptomatic as part of this illness with COVID-19, select "symptomatic." If the PUI or case-patient was asymptomatic (never experienced symptoms as part of this illness), please select "asymptomatic." If symptom status is unknown, select "unknown."

- If symptomatic, record symptom onset date in MM/DD/YYYY format or mark "unknown."
- If the PUI or case-patient was previously symptomatic and symptoms are currently resolved at the time of completing or updating this form, list date of symptom resolution in MM/DD/YYYY format. If exact dates of symptom resolution are not known, but there is a known approximate date, enter this in the date field. If still symptomatic at time of interview, mark "Still symptomatic." If the PUI or case-patient had symptoms, and the symptoms are resolved, but there is no information about the time frame of symptom resolution, mark "Symptoms resolved, unknown date." If the interviewer and patient do not know the symptom status, mark "Unknown symptom status."

Was the patient hospitalized? Select the appropriate response. If yes, provide dates of first hospital admission and first hospital discharge in MM/DD/YYYY format. If the patient is currently hospitalized, please leave the discharge date blank. This field can be revised at a later time.

Was the patient admitted to an intensive care unit (ICU)? Select the appropriate response. Select "unknown" if the medical chart is not available or ICU admission is not known.

AMERICAN OVERSIGHT

Did the patient receive mechanical ventilation (MV)/intubation? Select “Yes” if the patient was mechanically ventilated during hospitalization via intubation *or* tracheostomy. If yes, count the total number of days with mechanical ventilation. Round up to whole number. Select “unknown” if the medical chart is not available.

Did the patient receive extracorporeal membrane oxygenation (ECMO)?: Select the appropriate response. Select “unknown” if the medical chart is not available.

Did the patient die as a result of this illness? Select appropriate response. If "Yes," then enter date of death in MM/DD/YYYY format. If unknown date of death, please select “Unknown date of death.” (In DCIPHER, this is phrased as “Check if date of death unknown.”)

Is the patient a health care worker in the United States?: Select the appropriate response. HCP are defined as all paid and unpaid persons working in health-care settings who have the potential for exposure to patients and/or to infectious materials, including body substances, contaminated medical supplies and equipment, contaminated environmental surfaces, or contaminated air. HCP might include (but are not limited to) physicians, nurses, nursing assistants, therapists, technicians, emergency medical service personnel, dental personnel, pharmacists, laboratory personnel, autopsy personnel, students and trainees, contractual staff not employed by the health-care facility, and persons (e.g., clerical, dietary, housekeeping, laundry, security, maintenance, administrative, billing, and volunteers) not directly involved in patient care but potentially exposed to infectious agents that can be transmitted to and from HCP and patients.

Does the patient have a history of being in a healthcare facility (as a patient, worker, or visitor) in China?: Select the appropriate response.

In the 14 days prior to illness onset, did the patient have any of the following exposures: Check all that apply. For healthcare contact with another lab-confirmed COVID-19 case-patient, check if the PUI or case-patient identified in the current form was a patient, a visitor (e.g., accompanying family member who was seeking care), or a healthcare worker, when they contacted a lab-confirmed COVID-19 case-patient.

If the PUI or case-patient traveled to a non-US country that was not China, select all of the countries that the person traveled to within the past 14 days by selecting all relevant response options from the drop-down menu. If the country that the PUI or case-patient traveled to in the past 14 days is not listed, you may write the appropriate country in the text field. If the PUI or case-patient had traveled on a cruise, had exposure to large social gatherings (e.g. conference, concert), or had work-related exposures to large groups (e.g. airport screeners, port workers), please include details in the free text field.

If the patient had contact with another COVID-19 case, was this person a U.S. case?: Select the appropriate response. If yes, please provide the nCoV ID of the source case. If the patient did not have contact with another case, please select “N/A.”

Under what process was the PUI or case first identified? Please check all that apply. If identified by the EpiX notification of travelers, please provide the DGMQID. If other, please specify.

AMERICAN OVERSIGHT

Symptoms, clinical course, past medical history and social history:

Collected from (check all that apply): Please select “patient interview” or “medical record review.” If both sources were used to collect information on symptoms, clinical course, past medical history, and social history, please select both response options.

During this illness, did you experience any of the following symptoms? Please select “Yes,” “No,” or “Unknown” for each specific symptom. Please indicate the symptoms that the PUI or case-patient has experienced to date, even if he/she is no longer experiencing these symptoms. All symptoms should have an answer. If other symptoms were experienced, then describe the symptom in the space after “Other”.

Pre-existing medical conditions?: Mark the appropriate response based on whether the PUI or case-patient has *any* pre-existing medical conditions prior to investigation or confirmation of COVID-19. If PUI or case-patient has no pre-existing medical conditions, mark “No.” If not collected during interview and medical chart is missing, mark “Unknown.” After answering the initial (summary) question, please provide a response for *each* pre-existing condition. All questions—other than pregnancy—pertain to a *current* or *past* history of the condition. If “Yes” to neurologic/neurodevelopment/intellectual disability or Other Chronic Diseases, please specify. The pregnancy question should be marked “Yes” if the PUI or case-patient is female and currently or recently pregnant (i.e., gave birth while ill with COVID-19).

Current smoker: Select the appropriate response.

Former smoker: Select the appropriate response.

Respiratory diagnostic testing: For each pathogen, indicate whether the test was positive, negative, pending, or not done. If the PUI or case-patient had a test performed for another pathogen, please check the appropriate test result and specify the name of the pathogen next to “Other, Specify.” (In DCIPHER, please specify additional tests/pathogens only if they are positive.) If multiple tests for the same pathogen were completed, mark “Positive” if any of the tests for that pathogen were positive during the course of the illness suspected to be COVID-19.

Specimens for COVID-19 testing: For each specimen tested for the virus that causes COVID-19, record if the specimen was from a nasopharyngeal swab (NP), oropharyngeal swab (OP), sputum, or other specimen (specify type). If combined NP/OP swabs are collected, record results in the field for NP swabs. Jurisdictions can provide up to three results for each type of specimen; if additional specimens are collected, please provide information about these specimens in the “additional state/local specimen ID” fields below this question. If there are still additional specimens, please use the notes field following the specimen collection information to provide specimen IDs. Provide the local, state, or jurisdictional specimen ID associated with each specimen, as well as the date the specimen was collected in MM/DD/YYYY format. For specimens tested at a local or state public health laboratory or at a commercial laboratory, select ”State Lab Tested.” For specimens tested at CDC, select “Sent to CDC.” For each test performed, indicate the result: positive, negative, pending, not done, or indeterminate.

Please update these test results as they become available.

Additional state/local Specimen IDs: Provide additional specimen IDs from state/local laboratories for specimens tested for the virus that causes COVID-19. If needed, prioritize listing those specimens testing positive for the virus that causes COVID-19, regardless of specimen type.

AMERICAN OVERSIGHT

Updated Sunday, March 15 (major updates are highlighted in yellow)

Dear state and territorial partners:

Thank you for your continued partnership in the ongoing emergency response to COVID-19. The information included below aligns with what was shared by CDC during the 5 pm ET CSTE call on Saturday, February 29th, a CSTE email sent Friday, March 6th, and in a CSTE email sent during the weekend of March 14 regarding: 1) confirming a jurisdiction's 'Phase 2' status for reporting PUI and cases; 2) additional guidance on using the current PUI and Case Report Form, including classification of all positive laboratory tests as confirmed cases; 3) update on the status of historical PUI data imports into DCIPHER; 4) clarifications to the CDC reporting process for PUI/Case Report Forms and lab findings; 5) management of the PHLIP laboratory reporting process; 6) prioritization of the PUI/Case Report variables; and 7) major avoidable issues we hope to overcome with your assistance.

1. Jurisdictional 'Phase 2' Status

Given the need to maintain timely, actionable data at the national level, and process laboratory results at CDC for testing, **all jurisdictions should now be, or actively working towards being, onboarded to 'Phase 2',** which includes being able to assign unique identifiers to PUI/cases at the reporting jurisdiction level. If your jurisdiction has not yet confirmed its 'Phase 2' status, including how you will be inputting data into DCIPHER (preferred method: direct entry), please email eocevent118@cdc.gov.

Reminder: as of March 6th, CDC made the reporting of PUI to CDC through DCIPHER optional for jurisdictions in Phase 2. Jurisdictions **should continue to report positive cases to CDC** using the combined PUI/Case Report Form.

2. Updates to PUI and Case Report Form (CRF) on CDC's Website

Please continue to use the 5 status classifications below when completing a CRF. However, note the changes in how to apply the classifications.

1. PUI, testing pending
2. PUI, tested negative
3. Presumptive case (positive test by state or local health department lab*), confirmatory testing pending
4. Presumptive case (positive test by state or local health department lab*), confirmatory testing negative
5. Laboratory-confirmed case†

**These designations are no longer applicable on or after 3/14/2020*

†Now includes positive tests conducted by the CDC laboratory, commercial lab using FDA-validated COVID 19 NAA, or state or local health department lab.

These changes reflect FDA's acceptance of CDC's request for "enforcement discretion" to allow state and local public-health laboratories to consider positive samples to be interpreted as "positive" with no need for confirmatory testing. This action was supported by data submitted by CDC showing agreement between results in state and local public health labs with corresponding results from CDC. **These changes are retrospective such that samples already submitted to CDC for confirmation and had been awaiting confirmation may now be considered to be positive.** CDC is still interested in receiving any specimens for which testing was "inconclusive" and which could not be resolved by repeat testing. For reporting purposes, these persons can be classified as "PUI, testing pending" until resulted by the CDC Laboratory. For epidemiologists, this will have little impact operationally, since the policy from the beginning was to act on "presumptive positives" as though they have already been confirmed. This means that the cases that previously were considered "presumptive" will all now be considered "confirmed". **For CDC analyses, presumptive and confirmed positive cases will be treated the same. Jurisdictions do not need to make changes to the historical data previously reported to CDC.**

Critical laboratory testing result fields are included at the end of the CRF to reflect COVID-19 laboratory test results. To minimize the need for making changes to the CRF at this time, **please use the same fields to report**

AMERICAN OVERSIGHT

specimens tested at the local level whether the testing laboratory was the state or jurisdiction public health laboratory or commercial laboratory. Further, **if the specimen was from a combined nasopharyngeal (NP) and oropharyngeal (OP) swab, record the results in the NP swab field**. CDC will work towards populating our laboratory results into the CDC result field for each specimen sent to us so that results can be viewed in DCIPHER as they are resulted and communicated to individual jurisdictions. To support this matching process and to ensure the specimen is tested, please make sure to include an nCoV ID when submitting the specimen(s) to CDC.

If the PUI or case-patient had traveled on a cruise, had exposure to large social gatherings (e.g. conference, concert), or work-related exposures to large groups (e.g. airport screeners, port workers), please indicate in the free text field available with the "Other, specify:" option for the question: "In the 14 days prior to illness onset, did the patient have any of the following exposures (check all that apply)."

Changes will also be reflected in the material made available on CDC's website.

3. Historical PUI Data Imported into DCIPHER

As of February 28, data reported to CDC on PUI, presumptive cases, and laboratory-confirmed cases have been made available in DCIPHER.

- Jurisdictions in 'Phase 2' are now able to go into the DCIPHER platform to view and edit existing records of PUI, presumptive positive, and laboratory-confirmed cases, as their status changes or more data become available.
- Jurisdictions in 'Phase 1' should continue to call the EOC Watch Desk at 770-488-7100 to update information on existing PUI, cases of COVID-19.

4. CDC Reporting Process for PUI/Case Reports and Lab Findings – Revised March 6th

CDC laboratory has received several specimens that were not assigned an nCoV ID. **Please note that all specimens need an nCoV ID for submission to CDC laboratory.** In the event that a sample is missing an nCoV ID, the specimen will be frozen, our staff will reach out to the point-of-contact listed on the submission form, and we will test the specimen once the nCoV ID has been submitted. Please provide an nCoV ID with all specimens to avoid delays in testing.

As of March 6, information for PUIs no longer needs to be entered into DCIPHER. However, jurisdictions may use NNDSS or DCIPHER to manage their PUIs.

For reporting jurisdictions that have the capacity to do their own testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter cases into DCIPHER with the jurisdiction-issued nCoV ID, unless other arrangements to transmit data have been made and approved by CDC.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. If the person is already in DCIPHER, please update the person's disposition to 'PUI, tested negative' in DCIPHER.
3. If a specimen is tested locally, is **POSITIVE,** and is **the jurisdiction's first case or is part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify CDC of the positive result.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected and submitted on the PUI and Case Report Form.
4. If a specimen is tested locally, is **POSITIVE,** and is **from a jurisdiction with existing presumptive or confirmed cases and is not part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Update the person's disposition in DCIPHER to "Confirmed Case"

AMERICAN OVERSIGHT

For jurisdictions that are in 'Phase 1':

1. The jurisdictions should call the EOC Watch Desk/PUI desk at 770-488-7100 to receive a CDC-issued nCoV ID, and to complete a PUI and Case Report Form.
2. If a specimen is tested locally and is **NEGATIVE**, no further action is needed unless the person has already been reported to CDC as a PUI; if so:
    a. Please email eocevent118@cdc.gov and provide the nCoV ID and test result.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify them of the positive result.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected on the PUI and Case Report form.

For reporting jurisdictions that do not have testing capacity and are sending specimens to CDC for testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs into DCIPHER with the jurisdiction-issued nCoV IDs, unless other arrangements to transmit data have been made and approved by CDC.
2. Please ensure the jurisdiction-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

For jurisdictions that are in 'Phase 1':

1. The jurisdiction should call the EOC Watch Desk/PUI desk at **770-488-7100** to obtain a CDC-issued nCoV ID number, and complete a PUI and Case Report Form.
2. Please make sure the CDC-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

5. Management of the PHLIP reporting process

CDC and APHL have been working with public health laboratories to add automated reporting of the novel coronavirus test results through their existing influenza reporting mechanism, which is most frequently PHLIP.

We ask that participating PHLIP labs begin including nCoV IDs within the lab test message reported through PHLIP. This will allow CDC to: (1) Match these records with persons reported into DCIPHER and (2) work with states to properly characterize the status of persons without existing records in DCIPHER. Information on how to include the nCoV ID in the message has been made available via APHL starting at the bottom of Page 4 (https://www.aphl.org/Materials/02.12.2020_Informatics_FAQs_and_Guidance.pdf).

6. Prioritization of PUI/Case Report variables

To support improved data reporting, CDC has employed the Data Collation & Integration for Public Health Event Response (DCIPHER) platform that jurisdictions can use to directly enter or import and view their data. As of Friday, March 13, all 50 states and 3 jurisdictions (New York City, Washington DC, and U.S. Virgin Islands) are using DCIPHER for the COVID-19 response. Previously, to support jurisdictions in providing timely case information, CDC group the variables included in the National Case Report into 3 tiers to help jurisdictions prioritize what data are collected and reported. While all the information being collected is important, the variables that were included on CDC's list of Tier 1 and Tier 2 variables [**High Priority Variables**] are key to understanding the current burden of disease and its transmission within communities. Further, it is important that this information be entered/submitted within 24 hours of the case being identified to provide adequate situational awareness. The remaining variables (previously referred to as Tier 3 variables) should be submitted as soon as possible, some, of which, may require following up with cases over time.

AMERICAN OVERSIGHT

High Priority Variables
Timeline: entered/submitted within 24 hours of being collected.

- CDC 2019-nCoV ID (cdc_ncov2019_id) (required field)
- Reporting jurisdiction (state) (required field)
- Current status of the person (current_status) (required field)
- State of residence (res_state)
- County of residence (res_county)
- Sex (sex)
- Age (age)
- Age Units (ageunit)
- Symptoms present during course of illness (sympstatus)
- If symptomatic, onset date (onset_dt)
- Hospitalization status (hosp_yn)
- ICU admission status (icu_yn): may not be readily available during initial interview; update as soon as possible
- Death (death_yn): may not be readily available during initial interview; update as soon as possible
- If female, currently pregnant (pregnant_yn)
- Health care worker in the United States (hc_work_yn)
- Exposure data
  - Travel to mainland China (exp_China)
  - Travel to other non-US country (exp_othcountry)
  - Travel to other non-US country, specify (exp_othcountry_spec)
  - Household contact with a COVID-19 case patient (exp_house)
  - Community contact with a COVID-19 case patient (exp_community)
  - Any healthcare contact with a COVID-19 case patient (exp_health)
  - Healthcare contact with a COVID-19 case patient, healthcare worker (exp_health_hcw)
  - Exposure to a cluster of patients with ARDS with unknown etiology (exp_cluster)
- Specimen information
  - Specimen type (see series on specimen type)
  - Specimen ID (see series on specimen ID)
  - Specimen sent to CDC (see series on specimen sent to CDC)
- Report date of case to CDC (case_cdcreport_dt)

Other Variables of Importance
Timeline: submitted as soon as possible or available.

- Specific information on the hospitalization, including admission and discharge dates and ventilation status
- Information on signs and symptoms
- Information on pre-existing conditions
- The remaining variables collected on the PUI and Case Report Form

7. <u>Major avoidable challenges we hope to overcome with your assistance</u>
We recognize the challenges that public health emergencies bring. With your assistance, we hope to avoid the following challenges by following the processes outlined above:

1. Unclear data flow processes for jurisdictional data on PUI and case-patients to CDC
2. Laboratory samples that are not able to be linked with PUI or case-patients
3. Incorrect reports of national and state-level PUI and case burden, as well as descriptive statistics about the population impacted

AMERICAN OVERSIGHT

We appreciate your ongoing partnership. Please email eocevent118@cdc.gov with any questions regarding the PUI or case reporting process.

Best,
CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Subject: FW: CSTE COVID-19 Response | Confirmatory testing of COVID-19 samples is no longer required

---

From: CSTE Emergency Response <Preparedness@cste.org>
Sent: Saturday, March 14, 2020 8:27 PM
To: CSTE Emergency Response
Cc: CSTE Novel Coronavirus 2019
Subject: CSTE COVID-19 Response | Confirmatory testing of COVID-19 samples is no longer required

Sent to State Epidemiologists, Deputy State Epidemiologists, CLUE, Infectious Disease Points of Contact, and the CSTE Executive Board

Good evening,

The message below regarding confirmatory testing of COVID-19 samples has been shared by Greg Armstrong, Deputy Incident Manager, CDC COVID-19 response.

--

CSTE
Council of State and Territorial Epidemiologists
Emergency Preparedness & Response Mailbox
Business Hours Line: 770.458.3811
After-Hours Line: 678.256.3945
preparedness.cste.org

Dear CSTE Colleagues,

Summary: State and local public health laboratories are no longer required to send “presumptive positive” samples to CDC for confirmation. From now on, respiratory samples positive for SARS-CoV2 in a state and public-health laboratory will be considered “positive” with no need for further testing.

More details: Last night, FDA accepted CDC’s request for “enforcement discretion” to allow state and local public-health laboratories to consider positive samples to be interpreted as “positive” with no need for confirmatory testing. This action was supported by data submitted by CDC showing agreement between results in state and local public health labs with corresponding results from CDC. CDC was asked to submit an amendment to its emergency-use authorization (EUA) for formal review.

For epidemiologists, this means that the cases that previously were considered “presumptive” will all now be considered “confirmed.”

Your laboratories should have received notification of this change already through APHL. These changes are retrospective such that samples already submitted to CDC for confirmation and had been awaiting confirmation may now be considered to be positive. CDC is still interested in receiving any specimens for which testing was “inconclusive” and which could not be resolved by repeat testing.

Sincerely,

Gregory Armstrong, MD
Currently assigned to CDC Coronavirus Response as Deputy Incident Manager
garmstrong@cdc.gov

2019nCoV_PUICRF instructions_2020Mar15_final_clean.docx

Dear Partners,

CDC continues to institute a standard process for confirming publicly reported cases by jurisdiction.

What you need to do/know now:

- We will conduct case confirmation **daily** (for web posting Monday–Friday). As the response evolves, the frequency of these requests will likely decrease.
- At the bottom of this email, you will find a table with the following:
  - current preliminary case counts we have for each jurisdiction **as of 4 pm ET on Wednesday, March 18**.
  - general community level transmission characterization
- By **9 am ET Thursday, March 19**, **please use the CDC Case Confirmation Portal** (data are collected via Epi Info and stored on a secure CDC server) to:
  - confirm case counts for your jurisdiction (your numbers **as of 4 pm ET Wednesday, March 18)**
  - if needed, modify your "community level transmission characterization"

https://go.usa.gov/xdtyJ

What you need to know about how your information will be presented:

- These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. They do not include people who returned to the United States via State Department-chartered flights. **We ask that the preliminary information shared in this email not be distributed.**
- What will be shared on the CDC website (updated daily at 12 pm, ET):
  - **The total case count**, i.e., the actual number of *total* cases (e.g., 0, 6, 35) will be posted. **EXCEPTION**: **Jurisdictions with one to five cases will be depicted as a range: "1–5 cases"**
  - Community level transmission characterization
  - Other information shared will be used for internal awareness and will not be shared publicly at this time.

What you need to do/know later:

- DCIPHER users can update and analyze their own jurisdiction's data at: https://dcipher.cdc.gov/. If your jurisdiction does not currently have DCIPHER users, but you would like to move to Phase 2 reporting as described in the attached guidance, please email eocevent118@cdc.gov to confirm your readiness.

Sincerely,

CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Version 13 Mar 2020

Instructions for Completing the Human Infection with 2019 Novel Coronavirus (COVID-19) Person Under Investigation (PUI) and Case Report Form

Purpose: This document describes the procedures for completing the 2019 Novel Coronavirus (COVID-19) Person Under Investigation (PUI) and Case Report Form (CRF) for persons under investigation who are being tested or have been tested for the virus that causes COVID-19.

- PUI: Any person who is currently under investigation for having the virus that causes COVID-19, or who was under investigation but tested negative for the virus.
- Laboratory-confirmed case of COVID-19: Individual who has tested positive for the virus that causes COVID-19 in at least one respiratory specimen (Note: effective 3/14/2020 there is no longer the designation of "presumptive positive").

If a sample from a PUI tests positive for the virus that causes COVID-19, the form should be updated to indicate an individual's change in status from a PUI to being a laboratory-confirmed case.

The form should be completed if a person has a positive laboratory result for the virus that causes COVID-19, even when not previously identified as a PUI.

General:

1. All dates should be formatted MM/DD/YYYY.
2. If completing the .pdf version of the form, use an "X" to mark boxes. Make sure to carefully mark boxes so that the "X" does not cross multiple boxes.

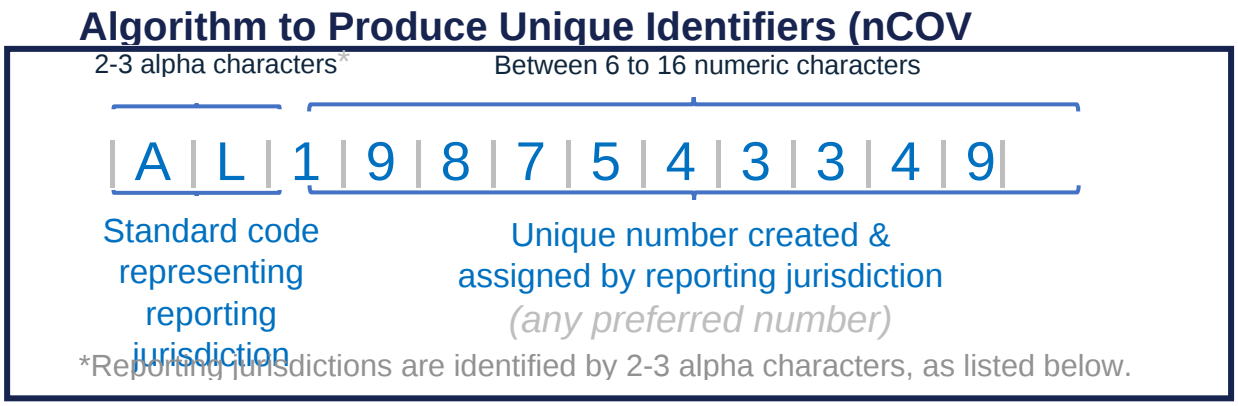
Header:

PATIENT IDENTIFIER INFORMATION IS NOT TRANSMITTED TO CDC AND IS FOR LOCAL-USE ONLY:
Patient first name: Enter case's first (given) name.
Patient last name: Enter case's last (family) name.
Date of birth (MM/DD/YYYY): Enter date of birth in MM/DD/YYYY format.

ID information:

Reporting jurisdiction: Enter the reporting jurisdiction where the PUI or case was identified. The reporting jurisdiction must be a state/city/territory authorized to submit data through NNDSS.

Reporting health department: Enter the name of the health department completing the PUI or case report.



Case state/local ID: Enter a local-use ID assigned by the state or local health department if desired for patient tracking or matching.

CDC 2019-nCoV ID: Enter the CDC 2019-nCoV ID assigned to the PUI or case. If the case was already identified as a PUI in collaboration with CDC, or was part of a contact investigation in which CDC was collaborating with the state or local health department, this CDC 2019-nCoV ID should have

AMERICAN OVERSIGHT

already been assigned and the CDC 2019-nCoV ID that was already provided by CDC should be entered. The CDC 2019 nCoV ID should be a part of the state or local health departments records; please check with the reporting jurisdiction. This may have previously been called a PUI ID. **Do not assign a new 2019-nCoV ID for these individuals**.

If this is a new PUI or case that was not previously under investigation or reported, the CDC 2019-nCoV ID should be assigned by the jurisdiction. CDC 2019-nCoV IDs should be assigned for all PUIs and laboratory-confirmed cases so that this person can be tracked at the jurisdictional and national level. The reporting jurisdiction should assign the CDC 2019-nCoV ID, and use this ID for all specimens and data transmitted to CDC for that person. The structure of the ID should be as follows:

!!! Important !!!

Do not add special characters, dashes, or white spaces to the nCoV ID. The alpha- and numeric-portions of the ID are seamless. The numeric portion of the ID cannot begin with zero ('0').

State	Code
Alabama	AL
Alaska	AK
Arizona	AZ

This ID will be used to track information about the PUI or case-patient in CDC data systems and **must** be provided on all forms or specimens related to this individual.

Contact ID: Only fill out this field if a PUI or case-patient is a known contact to another confirmed case of COVID-19. Contact IDs are assigned using the original (source) case-patient's nCoV ID followed by a hyphen and a sequential number indicating the order in which the contact was identified (e.g., Confirmed case CA102034567 may have contacts CA102034567 -01 and CA102034567 -02). If the person was previously under investigation in collaboration with CDC, or was part of a contact investigation in which CDC was collaborating with state/local health departments, this Contact ID may have been

AMERICAN OVERSIGHT

assigned previously. This should be a part of the state or local health departments records; please check with the reporting jurisdiction.

NNDSS loc. rec. ID/Case ID: For NNDSS reporters, enter the GenV2 or NETSS patient identifier.

Interviewer information

Name of interviewer: Enter the last name and first name of the person performing the interview.

Affiliation/Organization: Enter the interviewer's affiliation/organization.

Telephone: Enter the interviewer's telephone number.

Email: Enter the interviewer's email address.

Basic case information

What is the current status of this person?

- Select "PUI, testing pending" if a PUI has been identified but the initial laboratory testing has not yet been completed.
- Select "PUI, tested negative" if a PUI was previously identified, but the laboratory testing for the virus that causes COVID-19 was negative.
- Select "laboratory-confirmed case" if a person has at least one respiratory specimen that tested positive for the virus that causes COVID-19 by a CDC laboratory, state or local public health laboratory, or commercial laboratory using FDA-validated COVID 19 NAA. (Note: effective 3/14/2020 there is no longer the designation of "presumptive positive").

Please update this field each time the individual's status changes.

Report date of PUI to CDC: Enter the date the person was initially reported to CDC **as a PUI** in MM/DD/YYYY format.

Report date of case to CDC: Enter the date the case-patient was initially reported to CDC **as a case** in MM/DD/YYYY format. That is, please report the date at which the person changed from not being a case to being either a laboratory-confirmed case.

County of Residence: Please enter the individual's county of residence. Residence is typically defined by CSTE as the place of 'usual residence' at the time an infection is acquired.

State of Residence: Please enter the individual's county of residence. Residence is typically defined by CSTE as the place of 'usual residence' at the time an infection is acquired. The state of residence and reporting jurisdiction may be two distinct places.

Ethnicity: Select appropriate response. If unknown, select not specified.

Sex: Select appropriate response.

Race: Check all race categories that apply. If other, please specify in free text.

AMERICAN OVERSIGHT

Date of birth: Enter the PUI or case-patient's date of birth in MM/DD/YYYY format. Only enter data in this field if data can be transmitted to CDC per state/local policy.

Age: Enter the PUI or case-patient's age. Age may be entered in units of years, months, or days. Units will be specified later.

Age units (year/month/day): Select age units.

Date of first positive specimen collection: Enter the date of this person's first positive respiratory specimen collection, regardless of specimen type, in MM/DD/YYYY format. If the person tested positive, but the date is unknown, select "Unknown." If the person is a PUI and tested negative or is awaiting initial test results, select "N/A."

Did the patient develop pneumonia?: Select the appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select 'unknown' if missing chart.

Did the patient have acute respiratory distress syndrome?: Select appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select "unknown" if missing chart.

Did the patient have another diagnosis/etiology for their illness?: Select appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select "unknown" if missing chart.

Did the patient have an abnormal chest X-ray?: Select appropriate response. Select "unknown" if missing chart. Select 'yes' if—at any time—the person had an abnormal chest X-ray as part of this illness.

Symptoms present during course of illness?: This question refers to the PUI or case-patient's symptom status related to the entire duration of illness. If the PUI or case-patient was ever symptomatic as part of this illness with COVID-19, select "symptomatic." If the PUI or case-patient was asymptomatic (never experienced symptoms as part of this illness), please select "asymptomatic." If symptom status is unknown, select "unknown."

- If symptomatic, record symptom onset date in MM/DD/YYYY format or mark "unknown."
- If the PUI or case-patient was previously symptomatic and symptoms are currently resolved at the time of completing or updating this form, list date of symptom resolution in MM/DD/YYYY format. If exact dates of symptom resolution are not known, but there is a known approximate date, enter this in the date field. If still symptomatic at time of interview, mark "Still symptomatic." If the PUI or case-patient had symptoms, and the symptoms are resolved, but there is no information about the time frame of symptom resolution, mark "Symptoms resolved, unknown date." If the interviewer and patient do not know the symptom status, mark "Unknown symptom status."

Was the patient hospitalized? Select the appropriate response. If yes, provide dates of first hospital admission and first hospital discharge in MM/DD/YYYY format. If the patient is currently hospitalized, please leave the discharge date blank. This field can be revised at a later time.

Was the patient admitted to an intensive care unit (ICU)? Select the appropriate response. Select "unknown" if the medical chart is not available or ICU admission is not known.

AMERICAN OVERSIGHT

Did the patient receive mechanical ventilation (MV)/intubation? Select “Yes” if the patient was mechanically ventilated during hospitalization via intubation *or* tracheostomy. If yes, count the total number of days with mechanical ventilation. Round up to whole number. Select “unknown” if the medical chart is not available.

Did the patient receive extracorporeal membrane oxygenation (ECMO)?: Select the appropriate response. Select “unknown” if the medical chart is not available.

Did the patient die as a result of this illness? Select appropriate response. If "Yes," then enter date of death in MM/DD/YYYY format. If unknown date of death, please select “Unknown date of death.” (In DCIPHER, this is phrased as “Check if date of death unknown.”)

Is the patient a health care worker in the United States?: Select the appropriate response. HCP are defined as all paid and unpaid persons working in health-care settings who have the potential for exposure to patients and/or to infectious materials, including body substances, contaminated medical supplies and equipment, contaminated environmental surfaces, or contaminated air. HCP might include (but are not limited to) physicians, nurses, nursing assistants, therapists, technicians, emergency medical service personnel, dental personnel, pharmacists, laboratory personnel, autopsy personnel, students and trainees, contractual staff not employed by the health-care facility, and persons (e.g., clerical, dietary, housekeeping, laundry, security, maintenance, administrative, billing, and volunteers) not directly involved in patient care but potentially exposed to infectious agents that can be transmitted to and from HCP and patients.

Does the patient have a history of being in a healthcare facility (as a patient, worker, or visitor) in China?: Select the appropriate response.

In the 14 days prior to illness onset, did the patient have any of the following exposures: Check all that apply. For healthcare contact with another lab-confirmed COVID-19 case-patient, check if the PUI or case-patient identified in the current form was a patient, a visitor (e.g., accompanying family member who was seeking care), or a healthcare worker, when they contacted a lab-confirmed COVID-19 case-patient.

If the PUI or case-patient traveled to a non-US country that was not China, select all of the countries that the person traveled to within the past 14 days by selecting all relevant response options from the drop-down menu. If the country that the PUI or case-patient traveled to in the past 14 days is not listed, you may write the appropriate country in the text field. If the PUI or case-patient had traveled on a cruise, had exposure to large social gatherings (e.g. conference, concert), or had work-related exposures to large groups (e.g. airport screeners, port workers), please include details in the free text field.

If the patient had contact with another COVID-19 case, was this person a U.S. case?: Select the appropriate response. If yes, please provide the nCoV ID of the source case. If the patient did not have contact with another case, please select “N/A.”

Under what process was the PUI or case first identified? Please check all that apply. If identified by the EpiX notification of travelers, please provide the DGMQID. If other, please specify.

AMERICAN OVERSIGHT

Symptoms, clinical course, past medical history and social history:

Collected from (check all that apply): Please select “patient interview” or “medical record review.” If both sources were used to collect information on symptoms, clinical course, past medical history, and social history, please select both response options.

During this illness, did you experience any of the following symptoms? Please select “Yes,” “No,” or “Unknown” for each specific symptom. Please indicate the symptoms that the PUI or case-patient has experienced to date, even if he/she is no longer experiencing these symptoms. All symptoms should have an answer. If other symptoms were experienced, then describe the symptom in the space after “Other”.

Pre-existing medical conditions?: Mark the appropriate response based on whether the PUI or case-patient has *any* pre-existing medical conditions prior to investigation or confirmation of COVID-19. If PUI or case-patient has no pre-existing medical conditions, mark “No.” If not collected during interview and medical chart is missing, mark “Unknown.” After answering the initial (summary) question, please provide a response for *each* pre-existing condition. All questions—other than pregnancy—pertain to a *current* or *past* history of the condition. If “Yes” to neurologic/neurodevelopment/intellectual disability or Other Chronic Diseases, please specify. The pregnancy question should be marked “Yes” if the PUI or case-patient is female and currently or recently pregnant (i.e., gave birth while ill with COVID-19).

Current smoker: Select the appropriate response.

Former smoker: Select the appropriate response.

Respiratory diagnostic testing: For each pathogen, indicate whether the test was positive, negative, pending, or not done. If the PUI or case-patient had a test performed for another pathogen, please check the appropriate test result and specify the name of the pathogen next to “Other, Specify.” (In DCIPHER, please specify additional tests/pathogens only if they are positive.) If multiple tests for the same pathogen were completed, mark “Positive” if any of the tests for that pathogen were positive during the course of the illness suspected to be COVID-19.

Specimens for COVID-19 testing: For each specimen tested for the virus that causes COVID-19, record if the specimen was from a nasopharyngeal swab (NP), oropharyngeal swab (OP), sputum, or other specimen (specify type). If combined NP/OP swabs are collected, record results in the field for NP swabs. Jurisdictions can provide up to three results for each type of specimen; if additional specimens are collected, please provide information about these specimens in the “additional state/local specimen ID” fields below this question. If there are still additional specimens, please use the notes field following the specimen collection information to provide specimen IDs. Provide the local, state, or jurisdictional specimen ID associated with each specimen, as well as the date the specimen was collected in MM/DD/YYYY format. For specimens tested at a local or state public health laboratory or at a commercial laboratory, select ”State Lab Tested.” For specimens tested at CDC, select “Sent to CDC.” For each test performed, indicate the result: positive, negative, pending, not done, or indeterminate.

Please update these test results as they become available.

Additional state/local Specimen IDs: Provide additional specimen IDs from state/local laboratories for specimens tested for the virus that causes COVID-19. If needed, prioritize listing those specimens testing positive for the virus that causes COVID-19, regardless of specimen type.

AMERICAN OVERSIGHT

Updated Sunday, March 15 (major updates are highlighted in yellow)

Dear state and territorial partners:

Thank you for your continued partnership in the ongoing emergency response to COVID-19. The information included below aligns with what was shared by CDC during the 5 pm ET CSTE call on Saturday, February 29th, a CSTE email sent Friday, March 6th, and in a CSTE email sent during the weekend of March 14 regarding: 1) confirming a jurisdiction's 'Phase 2' status for reporting PUI and cases; 2) additional guidance on using the current PUI and Case Report Form, including classification of all positive laboratory tests as confirmed cases; 3) update on the status of historical PUI data imports into DCIPHER; 4) clarifications to the CDC reporting process for PUI/Case Report Forms and lab findings; 5) management of the PHLIP laboratory reporting process; 6) prioritization of the PUI/Case Report variables; and 7) major avoidable issues we hope to overcome with your assistance.

1. Jurisdictional 'Phase 2' Status

Given the need to maintain timely, actionable data at the national level, and process laboratory results at CDC for testing, **all jurisdictions should now be, or actively working towards being, onboarded to 'Phase 2',** which includes being able to assign unique identifiers to PUI/cases at the reporting jurisdiction level. If your jurisdiction has not yet confirmed its 'Phase 2' status, including how you will be inputting data into DCIPHER (preferred method: direct entry), please email eocevent118@cdc.gov.

Reminder: as of March 6th, CDC made the reporting of PUI to CDC through DCIPHER optional for jurisdictions in Phase 2. Jurisdictions **should continue to report positive cases to CDC** using the combined PUI/Case Report Form.

2. Updates to PUI and Case Report Form (CRF) on CDC's Website

Please continue to use the 5 status classifications below when completing a CRF. However, note the changes in how to apply the classifications.

1. PUI, testing pending
2. PUI, tested negative
3. Presumptive case (positive test by state or local health department lab*), confirmatory testing pending
4. Presumptive case (positive test by state or local health department lab*), confirmatory testing negative
5. Laboratory-confirmed case†

**These designations are no longer applicable on or after 3/14/2020*

†Now includes positive tests conducted by the CDC laboratory, commercial lab using FDA-validated COVID 19 NAA, or state or local health department lab.

These changes reflect FDA's acceptance of CDC's request for "enforcement discretion" to allow state and local public-health laboratories to consider positive samples to be interpreted as "positive" with no need for confirmatory testing. This action was supported by data submitted by CDC showing agreement between results in state and local public health labs with corresponding results from CDC. **These changes are retrospective such that samples already submitted to CDC for confirmation and had been awaiting confirmation may now be considered to be positive.** CDC is still interested in receiving any specimens for which testing was "inconclusive" and which could not be resolved by repeat testing. For reporting purposes, these persons can be classified as "PUI, testing pending" until resulted by the CDC Laboratory. For epidemiologists, this will have little impact operationally, since the policy from the beginning was to act on "presumptive positives" as though they have already been confirmed. This means that the cases that previously were considered "presumptive" will all now be considered "confirmed". **For CDC analyses, presumptive and confirmed positive cases will be treated the same. Jurisdictions do not need to make changes to the historical data previously reported to CDC.**

Critical laboratory testing result fields are included at the end of the CRF to reflect COVID-19 laboratory test results. To minimize the need for making changes to the CRF at this time, **please use the same fields to report**

AMERICAN OVERSIGHT

specimens tested at the local level whether the testing laboratory was the state or jurisdiction public health laboratory or commercial laboratory. Further, **if the specimen was from a combined nasopharyngeal (NP) and oropharyngeal (OP) swab, record the results in the NP swab field**. CDC will work towards populating our laboratory results into the CDC result field for each specimen sent to us so that results can be viewed in DCIPHER as they are resulted and communicated to individual jurisdictions. To support this matching process and to ensure the specimen is tested, please make sure to include an nCoV ID when submitting the specimen(s) to CDC.

If the PUI or case-patient had traveled on a cruise, had exposure to large social gatherings (e.g. conference, concert), or work-related exposures to large groups (e.g. airport screeners, port workers), please indicate in the free text field available with the "Other, specify:" option for the question: "In the 14 days prior to illness onset, did the patient have any of the following exposures (check all that apply)."

Changes will also be reflected in the material made available on CDC's website.

3. Historical PUI Data Imported into DCIPHER

As of February 28, data reported to CDC on PUI, presumptive cases, and laboratory-confirmed cases have been made available in DCIPHER.

- Jurisdictions in 'Phase 2' are now able to go into the DCIPHER platform to view and edit existing records of PUI, presumptive positive, and laboratory-confirmed cases, as their status changes or more data become available.
- Jurisdictions in 'Phase 1' should continue to call the EOC Watch Desk at 770-488-7100 to update information on existing PUI, cases of COVID-19.

4. CDC Reporting Process for PUI/Case Reports and Lab Findings – Revised March 6th

CDC laboratory has received several specimens that were not assigned an nCoV ID. **Please note that all specimens need an nCoV ID for submission to CDC laboratory.** In the event that a sample is missing an nCoV ID, the specimen will be frozen, our staff will reach out to the point-of-contact listed on the submission form, and we will test the specimen once the nCoV ID has been submitted. Please provide an nCoV ID with all specimens to avoid delays in testing.

As of March 6, information for PUIs no longer needs to be entered into DCIPHER. However, jurisdictions may use NNDSS or DCIPHER to manage their PUIs.

For reporting jurisdictions that have the capacity to do their own testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter cases into DCIPHER with the jurisdiction-issued nCoV ID, unless other arrangements to transmit data have been made and approved by CDC.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. If the person is already in DCIPHER, please update the person's disposition to 'PUI, tested negative' in DCIPHER.
3. If a specimen is tested locally, is **POSITIVE,** and is **the jurisdiction's first case or is part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify CDC of the positive result.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected and submitted on the PUI and Case Report Form.
4. If a specimen is tested locally, is **POSITIVE,** and is **from a jurisdiction with existing presumptive or confirmed cases and is not part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Update the person's disposition in DCIPHER to "Confirmed Case"

AMERICAN OVERSIGHT

For jurisdictions that are in 'Phase 1':

1. The jurisdictions should call the EOC Watch Desk/PUI desk at 770-488-7100 to receive a CDC-issued nCoV ID, and to complete a PUI and Case Report Form.
2. If a specimen is tested locally and is **NEGATIVE**, no further action is needed unless the person has already been reported to CDC as a PUI; if so:
    a. Please email eocevent118@cdc.gov and provide the nCoV ID and test result.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify them of the positive result.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected on the PUI and Case Report form.

For reporting jurisdictions that do not have testing capacity and are sending specimens to CDC for testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs into DCIPHER with the jurisdiction-issued nCoV IDs, unless other arrangements to transmit data have been made and approved by CDC.
2. Please ensure the jurisdiction-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

For jurisdictions that are in 'Phase 1':

1. The jurisdiction should call the EOC Watch Desk/PUI desk at **770-488-7100** to obtain a CDC-issued nCoV ID number, and complete a PUI and Case Report Form.
2. Please make sure the CDC-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

5. Management of the PHLIP reporting process

CDC and APHL have been working with public health laboratories to add automated reporting of the novel coronavirus test results through their existing influenza reporting mechanism, which is most frequently PHLIP.

We ask that participating PHLIP labs begin including nCoV IDs within the lab test message reported through PHLIP. This will allow CDC to: (1) Match these records with persons reported into DCIPHER and (2) work with states to properly characterize the status of persons without existing records in DCIPHER. Information on how to include the nCoV ID in the message has been made available via APHL starting at the bottom of Page 4 (https://www.aphl.org/Materials/02.12.2020_Informatics_FAQs_and_Guidance.pdf).

6. Prioritization of PUI/Case Report variables

To support improved data reporting, CDC has employed the Data Collation & Integration for Public Health Event Response (DCIPHER) platform that jurisdictions can use to directly enter or import and view their data. As of Friday, March 13, all 50 states and 3 jurisdictions (New York City, Washington DC, and U.S. Virgin Islands) are using DCIPHER for the COVID-19 response. Previously, to support jurisdictions in providing timely case information, CDC group the variables included in the National Case Report into 3 tiers to help jurisdictions prioritize what data are collected and reported. While all the information being collected is important, the variables that were included on CDC's list of Tier 1 and Tier 2 variables [**High Priority Variables**] are key to understanding the current burden of disease and its transmission within communities. Further, it is important that this information be entered/submitted within 24 hours of the case being identified to provide adequate situational awareness. The remaining variables (previously referred to as Tier 3 variables) should be submitted as soon as possible, some, of which, may require following up with cases over time.

AMERICAN OVERSIGHT

High Priority Variables
Timeline: entered/submitted within 24 hours of being collected.

- CDC 2019-nCoV ID (cdc_ncov2019_id) (required field)
- Reporting jurisdiction (state) (required field)
- Current status of the person (current_status) (required field)
- State of residence (res_state)
- County of residence (res_county)
- Sex (sex)
- Age (age)
- Age Units (ageunit)
- Symptoms present during course of illness (sympstatus)
- If symptomatic, onset date (onset_dt)
- Hospitalization status (hosp_yn)
- ICU admission status (icu_yn): may not be readily available during initial interview; update as soon as possible
- Death (death_yn): may not be readily available during initial interview; update as soon as possible
- If female, currently pregnant (pregnant_yn)
- Health care worker in the United States (hc_work_yn)
- Exposure data
  - Travel to mainland China (exp_China)
  - Travel to other non-US country (exp_othcountry)
  - Travel to other non-US country, specify (exp_othcountry_spec)
  - Household contact with a COVID-19 case patient (exp_house)
  - Community contact with a COVID-19 case patient (exp_community)
  - Any healthcare contact with a COVID-19 case patient (exp_health)
  - Healthcare contact with a COVID-19 case patient, healthcare worker (exp_health_hcw)
  - Exposure to a cluster of patients with ARDS with unknown etiology (exp_cluster)
- Specimen information
  - Specimen type (see series on specimen type)
  - Specimen ID (see series on specimen ID)
  - Specimen sent to CDC (see series on specimen sent to CDC)
- Report date of case to CDC (case_cdcreport_dt)

Other Variables of Importance
Timeline: submitted as soon as possible or available.

- Specific information on the hospitalization, including admission and discharge dates and ventilation status
- Information on signs and symptoms
- Information on pre-existing conditions
- The remaining variables collected on the PUI and Case Report Form

7. <u>Major avoidable challenges we hope to overcome with your assistance</u>
We recognize the challenges that public health emergencies bring. With your assistance, we hope to avoid the following challenges by following the processes outlined above:

1. Unclear data flow processes for jurisdictional data on PUI and case-patients to CDC
2. Laboratory samples that are not able to be linked with PUI or case-patients
3. Incorrect reports of national and state-level PUI and case burden, as well as descriptive statistics about the population impacted

AMERICAN OVERSIGHT

We appreciate your ongoing partnership. Please email eocevent118@cdc.gov with any questions regarding the PUI or case reporting process.

Best,
CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Subject: FW: CSTE COVID-19 Response | Confirmatory testing of COVID-19 samples is no longer required

---

From: CSTE Emergency Response <Preparedness@cste.org>
Sent: Saturday, March 14, 2020 8:27 PM
To: CSTE Emergency Response
Cc: CSTE Novel Coronavirus 2019
Subject: CSTE COVID-19 Response | Confirmatory testing of COVID-19 samples is no longer required

Sent to State Epidemiologists, Deputy State Epidemiologists, CLUE, Infectious Disease Points of Contact, and the CSTE Executive Board

Good evening,

The message below regarding confirmatory testing of COVID-19 samples has been shared by Greg Armstrong, Deputy Incident Manager, CDC COVID-19 response.

--

CSTE
Council of State and Territorial Epidemiologists
Emergency Preparedness & Response Mailbox
Business Hours Line: 770.458.3811
After-Hours Line: 678.256.3945
preparedness.cste.org

Dear CSTE Colleagues,

Summary: State and local public health laboratories are no longer required to send “presumptive positive” samples to CDC for confirmation. From now on, respiratory samples positive for SARS-CoV2 in a state and public-health laboratory will be considered “positive” with no need for further testing.

More details: Last night, FDA accepted CDC’s request for “enforcement discretion” to allow state and local public-health laboratories to consider positive samples to be interpreted as “positive” with no need for confirmatory testing. This action was supported by data submitted by CDC showing agreement between results in state and local public health labs with corresponding results from CDC. CDC was asked to submit an amendment to its emergency-use authorization (EUA) for formal review.

For epidemiologists, this means that the cases that previously were considered “presumptive” will all now be considered “confirmed.”

Your laboratories should have received notification of this change already through APHL. These changes are retrospective such that samples already submitted to CDC for confirmation and had been awaiting confirmation may now be considered to be positive. CDC is still interested in receiving any specimens for which testing was “inconclusive” and which could not be resolved by repeat testing.

Sincerely,

Gregory Armstrong, MD
Currently assigned to CDC Coronavirus Response as Deputy Incident Manager
garmstrong@cdc.gov

Dear Partners,

CDC continues to institute a standard process for confirming publicly reported cases by jurisdiction.

What you need to do/know now:

- We will conduct case confirmation **daily** (for web posting Monday–Friday). As the response evolves, the frequency of these requests will likely decrease.
- At the bottom of this email, you will find a table with the following:
  - current preliminary case counts we have for each jurisdiction **as of 4 pm ET on Thursday, March 19**.
  - general community level transmission characterization
- By **9 am ET Friday, March 20**, **please use the CDC Case Confirmation Portal via the link below** (data are collected via Epi Info and stored on a secure CDC server) to:
  - confirm case counts for your jurisdiction (your numbers **as of 4 pm ET Thursday, March 19)**
  - if needed, modify your **"community level transmission characterization"**

Please use the link provided below and not a previously saved link in your web browser

https://go.usa.gov/xdtyJ

What you need to know about how your information will be presented:

- These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. They do not include people who returned to the United States via State Department-chartered flights. **We ask that the preliminary information shared in this email not be distributed.**
- What will be shared on the CDC website (updated daily at 12 pm, ET):
  - **The total case count**, i.e., the actual number of *total* cases (e.g., 0, 6, 35) will be posted. **EXCEPTION**: **Jurisdictions with one to five cases will be depicted as a range: "1–5 cases"**
  - Community level transmission characterization
  - Other information shared will be used for internal awareness and will not be shared publicly at this time.

What you need to do/know later:

- DCIPHER users can update and analyze their own jurisdiction's data at: https://dcipher.cdc.gov/. If your jurisdiction does not currently have DCIPHER users, but you would like to move to Phase 2 reporting as described in the attached guidance, please email eocevent118@cdc.gov to confirm your readiness.

Sincerely,

CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Version 13 Mar 2020

Instructions for Completing the Human Infection with 2019 Novel Coronavirus (COVID-19) Person Under Investigation (PUI) and Case Report Form

Purpose: This document describes the procedures for completing the 2019 Novel Coronavirus (COVID-19) Person Under Investigation (PUI) and Case Report Form (CRF) for persons under investigation who are being tested or have been tested for the virus that causes COVID-19.

- PUI: Any person who is currently under investigation for having the virus that causes COVID-19, or who was under investigation but tested negative for the virus.
- Laboratory-confirmed case of COVID-19: Individual who has tested positive for the virus that causes COVID-19 in at least one respiratory specimen (Note: effective 3/14/2020 there is no longer the designation of "presumptive positive").

If a sample from a PUI tests positive for the virus that causes COVID-19, the form should be updated to indicate an individual's change in status from a PUI to being a laboratory-confirmed case.

The form should be completed if a person has a positive laboratory result for the virus that causes COVID-19, even when not previously identified as a PUI.

General:

1. All dates should be formatted MM/DD/YYYY.
2. If completing the .pdf version of the form, use an "X" to mark boxes. Make sure to carefully mark boxes so that the "X" does not cross multiple boxes.

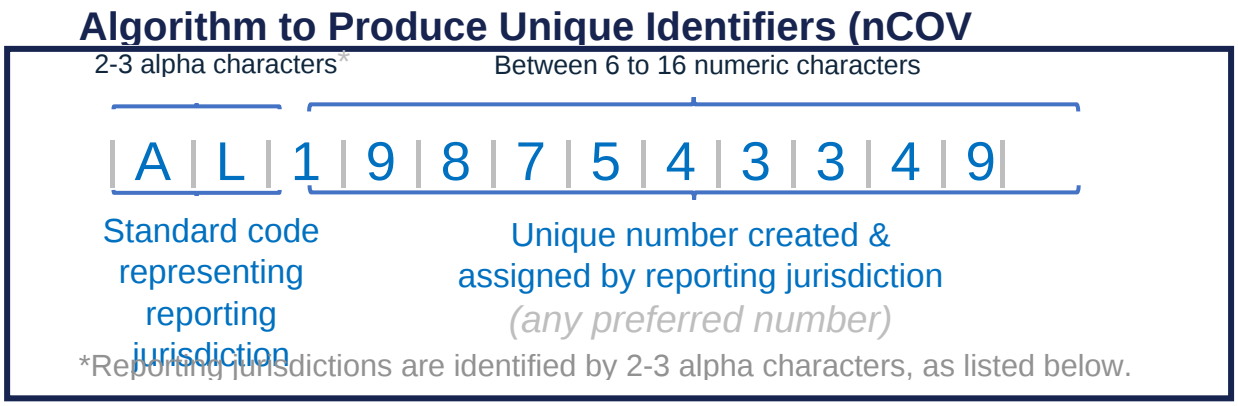
Header:

PATIENT IDENTIFIER INFORMATION IS NOT TRANSMITTED TO CDC AND IS FOR LOCAL-USE ONLY:
Patient first name: Enter case's first (given) name.
Patient last name: Enter case's last (family) name.
Date of birth (MM/DD/YYYY): Enter date of birth in MM/DD/YYYY format.

ID information:

Reporting jurisdiction: Enter the reporting jurisdiction where the PUI or case was identified. The reporting jurisdiction must be a state/city/territory authorized to submit data through NNDSS.

Reporting health department: Enter the name of the health department completing the PUI or case report.



Case state/local ID: Enter a local-use ID assigned by the state or local health department if desired for patient tracking or matching.

CDC 2019-nCoV ID: Enter the CDC 2019-nCoV ID assigned to the PUI or case. If the case was already identified as a PUI in collaboration with CDC, or was part of a contact investigation in which CDC was collaborating with the state or local health department, this CDC 2019-nCoV ID should have

AMERICAN OVERSIGHT

already been assigned and the CDC 2019-nCoV ID that was already provided by CDC should be entered. The CDC 2019 nCoV ID should be a part of the state or local health departments records; please check with the reporting jurisdiction. This may have previously been called a PUI ID. **Do not assign a new 2019-nCoV ID for these individuals**.

If this is a new PUI or case that was not previously under investigation or reported, the CDC 2019-nCoV ID should be assigned by the jurisdiction. CDC 2019-nCoV IDs should be assigned for all PUIs and laboratory-confirmed cases so that this person can be tracked at the jurisdictional and national level. The reporting jurisdiction should assign the CDC 2019-nCoV ID, and use this ID for all specimens and data transmitted to CDC for that person. The structure of the ID should be as follows:

!!! Important !!!

Do not add special characters, dashes, or white spaces to the nCoV ID. The alpha- and numeric-portions of the ID are seamless. The numeric portion of the ID cannot begin with zero ('0').

State	Code
Alabama	AL
Alaska	AK
Arizona	AZ
Arkansas	AR

This ID will be used to track information about the PUI or case-patient in CDC data systems and **must** be provided on all forms or specimens related to this individual.

Contact ID: Only fill out this field if a PUI or case-patient is a known contact to another confirmed case of COVID-19. Contact IDs are assigned using the original (source) case-patient's nCoV ID followed by a hyphen and a sequential number indicating the order in which the contact was identified (e.g., Confirmed case CA102034567 may have contacts CA102034567 -01 and CA102034567 -02). If the person was previously under investigation in collaboration with CDC, or was part of a contact investigation in which CDC was collaborating with state/local health departments, this Contact ID may have been

AMERICAN OVERSIGHT

assigned previously. This should be a part of the state or local health departments records; please check with the reporting jurisdiction.

NNDSS loc. rec. ID/Case ID: For NNDSS reporters, enter the GenV2 or NETSS patient identifier.

Interviewer information

Name of interviewer: Enter the last name and first name of the person performing the interview.

Affiliation/Organization: Enter the interviewer's affiliation/organization.

Telephone: Enter the interviewer's telephone number.

Email: Enter the interviewer's email address.

Basic case information

What is the current status of this person?

- Select "PUI, testing pending" if a PUI has been identified but the initial laboratory testing has not yet been completed.
- Select "PUI, tested negative" if a PUI was previously identified, but the laboratory testing for the virus that causes COVID-19 was negative.
- Select "laboratory-confirmed case" if a person has at least one respiratory specimen that tested positive for the virus that causes COVID-19 by a CDC laboratory, state or local public health laboratory, or commercial laboratory using FDA-validated COVID 19 NAA. (Note: effective 3/14/2020 there is no longer the designation of "presumptive positive").

Please update this field each time the individual's status changes.

Report date of PUI to CDC: Enter the date the person was initially reported to CDC **as a PUI** in MM/DD/YYYY format.

Report date of case to CDC: Enter the date the case-patient was initially reported to CDC **as a case** in MM/DD/YYYY format. That is, please report the date at which the person changed from not being a case to being either a laboratory-confirmed case.

County of Residence: Please enter the individual's county of residence. Residence is typically defined by CSTE as the place of 'usual residence' at the time an infection is acquired.

State of Residence: Please enter the individual's county of residence. Residence is typically defined by CSTE as the place of 'usual residence' at the time an infection is acquired. The state of residence and reporting jurisdiction may be two distinct places.

Ethnicity: Select appropriate response. If unknown, select not specified.

Sex: Select appropriate response.

Race: Check all race categories that apply. If other, please specify in free text.

AMERICAN OVERSIGHT

Date of birth: Enter the PUI or case-patient's date of birth in MM/DD/YYYY format. Only enter data in this field if data can be transmitted to CDC per state/local policy.

Age: Enter the PUI or case-patient's age. Age may be entered in units of years, months, or days. Units will be specified later.

Age units (year/month/day): Select age units.

Date of first positive specimen collection: Enter the date of this person's first positive respiratory specimen collection, regardless of specimen type, in MM/DD/YYYY format. If the person tested positive, but the date is unknown, select "Unknown." If the person is a PUI and tested negative or is awaiting initial test results, select "N/A."

Did the patient develop pneumonia?: Select the appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select 'unknown' if missing chart.

Did the patient have acute respiratory distress syndrome?: Select appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select "unknown" if missing chart.

Did the patient have another diagnosis/etiology for their illness?: Select appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select "unknown" if missing chart.

Did the patient have an abnormal chest X-ray?: Select appropriate response. Select "unknown" if missing chart. Select 'yes' if—at any time—the person had an abnormal chest X-ray as part of this illness.

Symptoms present during course of illness?: This question refers to the PUI or case-patient's symptom status related to the entire duration of illness. If the PUI or case-patient was ever symptomatic as part of this illness with COVID-19, select "symptomatic." If the PUI or case-patient was asymptomatic (never experienced symptoms as part of this illness), please select "asymptomatic." If symptom status is unknown, select "unknown."

- If symptomatic, record symptom onset date in MM/DD/YYYY format or mark "unknown."
- If the PUI or case-patient was previously symptomatic and symptoms are currently resolved at the time of completing or updating this form, list date of symptom resolution in MM/DD/YYYY format. If exact dates of symptom resolution are not known, but there is a known approximate date, enter this in the date field. If still symptomatic at time of interview, mark "Still symptomatic." If the PUI or case-patient had symptoms, and the symptoms are resolved, but there is no information about the time frame of symptom resolution, mark "Symptoms resolved, unknown date." If the interviewer and patient do not know the symptom status, mark "Unknown symptom status."

Was the patient hospitalized? Select the appropriate response. If yes, provide dates of first hospital admission and first hospital discharge in MM/DD/YYYY format. If the patient is currently hospitalized, please leave the discharge date blank. This field can be revised at a later time.

Was the patient admitted to an intensive care unit (ICU)? Select the appropriate response. Select "unknown" if the medical chart is not available or ICU admission is not known.

AMERICAN OVERSIGHT

Did the patient receive mechanical ventilation (MV)/intubation? Select “Yes” if the patient was mechanically ventilated during hospitalization via intubation *or* tracheostomy. If yes, count the total number of days with mechanical ventilation. Round up to whole number. Select “unknown” if the medical chart is not available.

Did the patient receive extracorporeal membrane oxygenation (ECMO)?: Select the appropriate response. Select “unknown” if the medical chart is not available.

Did the patient die as a result of this illness? Select appropriate response. If "Yes," then enter date of death in MM/DD/YYYY format. If unknown date of death, please select “Unknown date of death.” (In DCIPHER, this is phrased as “Check if date of death unknown.”)

Is the patient a health care worker in the United States?: Select the appropriate response. HCP are defined as all paid and unpaid persons working in health-care settings who have the potential for exposure to patients and/or to infectious materials, including body substances, contaminated medical supplies and equipment, contaminated environmental surfaces, or contaminated air. HCP might include (but are not limited to) physicians, nurses, nursing assistants, therapists, technicians, emergency medical service personnel, dental personnel, pharmacists, laboratory personnel, autopsy personnel, students and trainees, contractual staff not employed by the health-care facility, and persons (e.g., clerical, dietary, housekeeping, laundry, security, maintenance, administrative, billing, and volunteers) not directly involved in patient care but potentially exposed to infectious agents that can be transmitted to and from HCP and patients.

Does the patient have a history of being in a healthcare facility (as a patient, worker, or visitor) in China?: Select the appropriate response.

In the 14 days prior to illness onset, did the patient have any of the following exposures: Check all that apply. For healthcare contact with another lab-confirmed COVID-19 case-patient, check if the PUI or case-patient identified in the current form was a patient, a visitor (e.g., accompanying family member who was seeking care), or a healthcare worker, when they contacted a lab-confirmed COVID-19 case-patient.

If the PUI or case-patient traveled to a non-US country that was not China, select all of the countries that the person traveled to within the past 14 days by selecting all relevant response options from the drop-down menu. If the country that the PUI or case-patient traveled to in the past 14 days is not listed, you may write the appropriate country in the text field. If the PUI or case-patient had traveled on a cruise, had exposure to large social gatherings (e.g. conference, concert), or had work-related exposures to large groups (e.g. airport screeners, port workers), please include details in the free text field.

If the patient had contact with another COVID-19 case, was this person a U.S. case?: Select the appropriate response. If yes, please provide the nCoV ID of the source case. If the patient did not have contact with another case, please select “N/A.”

Under what process was the PUI or case first identified? Please check all that apply. If identified by the EpiX notification of travelers, please provide the DGMQID. If other, please specify.

AMERICAN OVERSIGHT

Symptoms, clinical course, past medical history and social history:

Collected from (check all that apply): Please select “patient interview” or “medical record review.” If both sources were used to collect information on symptoms, clinical course, past medical history, and social history, please select both response options.

During this illness, did you experience any of the following symptoms? Please select “Yes,” “No,” or “Unknown” for each specific symptom. Please indicate the symptoms that the PUI or case-patient has experienced to date, even if he/she is no longer experiencing these symptoms. All symptoms should have an answer. If other symptoms were experienced, then describe the symptom in the space after “Other”.

Pre-existing medical conditions?: Mark the appropriate response based on whether the PUI or case-patient has *any* pre-existing medical conditions prior to investigation or confirmation of COVID-19. If PUI or case-patient has no pre-existing medical conditions, mark “No.” If not collected during interview and medical chart is missing, mark “Unknown.” After answering the initial (summary) question, please provide a response for *each* pre-existing condition. All questions—other than pregnancy—pertain to a *current* or *past* history of the condition. If “Yes” to neurologic/neurodevelopment/intellectual disability or Other Chronic Diseases, please specify. The pregnancy question should be marked “Yes” if the PUI or case-patient is female and currently or recently pregnant (i.e., gave birth while ill with COVID-19).

Current smoker: Select the appropriate response.

Former smoker: Select the appropriate response.

Respiratory diagnostic testing: For each pathogen, indicate whether the test was positive, negative, pending, or not done. If the PUI or case-patient had a test performed for another pathogen, please check the appropriate test result and specify the name of the pathogen next to “Other, Specify.” (In DCIPHER, please specify additional tests/pathogens only if they are positive.) If multiple tests for the same pathogen were completed, mark “Positive” if any of the tests for that pathogen were positive during the course of the illness suspected to be COVID-19.

Specimens for COVID-19 testing: For each specimen tested for the virus that causes COVID-19, record if the specimen was from a nasopharyngeal swab (NP), oropharyngeal swab (OP), sputum, or other specimen (specify type). If combined NP/OP swabs are collected, record results in the field for NP swabs. Jurisdictions can provide up to three results for each type of specimen; if additional specimens are collected, please provide information about these specimens in the “additional state/local specimen ID” fields below this question. If there are still additional specimens, please use the notes field following the specimen collection information to provide specimen IDs. Provide the local, state, or jurisdictional specimen ID associated with each specimen, as well as the date the specimen was collected in MM/DD/YYYY format. For specimens tested at a local or state public health laboratory or at a commercial laboratory, select ”State Lab Tested.” For specimens tested at CDC, select “Sent to CDC.” For each test performed, indicate the result: positive, negative, pending, not done, or indeterminate.

Please update these test results as they become available.

Additional state/local Specimen IDs: Provide additional specimen IDs from state/local laboratories for specimens tested for the virus that causes COVID-19. If needed, prioritize listing those specimens testing positive for the virus that causes COVID-19, regardless of specimen type.

AMERICAN OVERSIGHT

Updated Sunday, March 15 (major updates are highlighted in yellow)

Dear state and territorial partners:

Thank you for your continued partnership in the ongoing emergency response to COVID-19. The information included below aligns with what was shared by CDC during the 5 pm ET CSTE call on Saturday, February 29th, a CSTE email sent Friday, March 6th, and in a CSTE email sent during the weekend of March 14 regarding: 1) confirming a jurisdiction's 'Phase 2' status for reporting PUI and cases; 2) additional guidance on using the current PUI and Case Report Form, including classification of all positive laboratory tests as confirmed cases; 3) update on the status of historical PUI data imports into DCIPHER; 4) clarifications to the CDC reporting process for PUI/Case Report Forms and lab findings; 5) management of the PHLIP laboratory reporting process; 6) prioritization of the PUI/Case Report variables; and 7) major avoidable issues we hope to overcome with your assistance.

1. Jurisdictional 'Phase 2' Status

Given the need to maintain timely, actionable data at the national level, and process laboratory results at CDC for testing, **all jurisdictions should now be, or actively working towards being, onboarded to 'Phase 2',** which includes being able to assign unique identifiers to PUI/cases at the reporting jurisdiction level. If your jurisdiction has not yet confirmed its 'Phase 2' status, including how you will be inputting data into DCIPHER (preferred method: direct entry), please email eocevent118@cdc.gov.

Reminder: as of March 6th, CDC made the reporting of PUI to CDC through DCIPHER optional for jurisdictions in Phase 2. Jurisdictions **should continue to report positive cases to CDC** using the combined PUI/Case Report Form.

2. Updates to PUI and Case Report Form (CRF) on CDC's Website

Please continue to use the 5 status classifications below when completing a CRF. However, note the changes in how to apply the classifications.

1. PUI, testing pending
2. PUI, tested negative
3. Presumptive case (positive test by state or local health department lab*), confirmatory testing pending
4. Presumptive case (positive test by state or local health department lab*), confirmatory testing negative
5. Laboratory-confirmed case†

**These designations are no longer applicable on or after 3/14/2020*

†Now includes positive tests conducted by the CDC laboratory, commercial lab using FDA-validated COVID 19 NAA, or state or local health department lab.

These changes reflect FDA's acceptance of CDC's request for "enforcement discretion" to allow state and local public-health laboratories to consider positive samples to be interpreted as "positive" with no need for confirmatory testing. This action was supported by data submitted by CDC showing agreement between results in state and local public health labs with corresponding results from CDC. **These changes are retrospective such that samples already submitted to CDC for confirmation and had been awaiting confirmation may now be considered to be positive.** CDC is still interested in receiving any specimens for which testing was "inconclusive" and which could not be resolved by repeat testing. For reporting purposes, these persons can be classified as "PUI, testing pending" until resulted by the CDC Laboratory. For epidemiologists, this will have little impact operationally, since the policy from the beginning was to act on "presumptive positives" as though they have already been confirmed. This means that the cases that previously were considered "presumptive" will all now be considered "confirmed". **For CDC analyses, presumptive and confirmed positive cases will be treated the same. Jurisdictions do not need to make changes to the historical data previously reported to CDC.**

Critical laboratory testing result fields are included at the end of the CRF to reflect COVID-19 laboratory test results. To minimize the need for making changes to the CRF at this time, **please use the same fields to report**

AMERICAN OVERSIGHT

specimens tested at the local level whether the testing laboratory was the state or jurisdiction public health laboratory or commercial laboratory. Further, **if the specimen was from a combined nasopharyngeal (NP) and oropharyngeal (OP) swab, record the results in the NP swab field**. CDC will work towards populating our laboratory results into the CDC result field for each specimen sent to us so that results can be viewed in DCIPHER as they are resulted and communicated to individual jurisdictions. To support this matching process and to ensure the specimen is tested, please make sure to include an nCoV ID when submitting the specimen(s) to CDC.

If the PUI or case-patient had traveled on a cruise, had exposure to large social gatherings (e.g. conference, concert), or work-related exposures to large groups (e.g. airport screeners, port workers), please indicate in the free text field available with the "Other, specify:" option for the question: "In the 14 days prior to illness onset, did the patient have any of the following exposures (check all that apply)."

Changes will also be reflected in the material made available on CDC's website.

3. Historical PUI Data Imported into DCIPHER

As of February 28, data reported to CDC on PUI, presumptive cases, and laboratory-confirmed cases have been made available in DCIPHER.

- Jurisdictions in 'Phase 2' are now able to go into the DCIPHER platform to view and edit existing records of PUI, presumptive positive, and laboratory-confirmed cases, as their status changes or more data become available.
- Jurisdictions in 'Phase 1' should continue to call the EOC Watch Desk at 770-488-7100 to update information on existing PUI, cases of COVID-19.

4. CDC Reporting Process for PUI/Case Reports and Lab Findings – Revised March 6th

CDC laboratory has received several specimens that were not assigned an nCoV ID. **Please note that all specimens need an nCoV ID for submission to CDC laboratory.** In the event that a sample is missing an nCoV ID, the specimen will be frozen, our staff will reach out to the point-of-contact listed on the submission form, and we will test the specimen once the nCoV ID has been submitted. Please provide an nCoV ID with all specimens to avoid delays in testing.

As of March 6, information for PUIs no longer needs to be entered into DCIPHER. However, jurisdictions may use NNDSS or DCIPHER to manage their PUIs.

For reporting jurisdictions that have the capacity to do their own testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter cases into DCIPHER with the jurisdiction-issued nCoV ID, unless other arrangements to transmit data have been made and approved by CDC.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. If the person is already in DCIPHER, please update the person's disposition to 'PUI, tested negative' in DCIPHER.
3. If a specimen is tested locally, is **POSITIVE,** and is **the jurisdiction's first case or is part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify CDC of the positive result.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected and submitted on the PUI and Case Report Form.
4. If a specimen is tested locally, is **POSITIVE,** and is **from a jurisdiction with existing presumptive or confirmed cases and is not part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Update the person's disposition in DCIPHER to "Confirmed Case"

AMERICAN OVERSIGHT

For jurisdictions that are in 'Phase 1':

1. The jurisdictions should call the EOC Watch Desk/PUI desk at 770-488-7100 to receive a CDC-issued nCoV ID, and to complete a PUI and Case Report Form.
2. If a specimen is tested locally and is **NEGATIVE**, no further action is needed unless the person has already been reported to CDC as a PUI; if so:
    a. Please email eocevent118@cdc.gov and provide the nCoV ID and test result.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify them of the positive result.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected on the PUI and Case Report form.

For reporting jurisdictions that do not have testing capacity and are sending specimens to CDC for testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs into DCIPHER with the jurisdiction-issued nCoV IDs, unless other arrangements to transmit data have been made and approved by CDC.
2. Please ensure the jurisdiction-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

For jurisdictions that are in 'Phase 1':

1. The jurisdiction should call the EOC Watch Desk/PUI desk at **770-488-7100** to obtain a CDC-issued nCoV ID number, and complete a PUI and Case Report Form.
2. Please make sure the CDC-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

5. Management of the PHLIP reporting process

CDC and APHL have been working with public health laboratories to add automated reporting of the novel coronavirus test results through their existing influenza reporting mechanism, which is most frequently PHLIP.

We ask that participating PHLIP labs begin including nCoV IDs within the lab test message reported through PHLIP. This will allow CDC to: (1) Match these records with persons reported into DCIPHER and (2) work with states to properly characterize the status of persons without existing records in DCIPHER. Information on how to include the nCoV ID in the message has been made available via APHL starting at the bottom of Page 4 (https://www.aphl.org/Materials/02.12.2020_Informatics_FAQs_and_Guidance.pdf).

6. Prioritization of PUI/Case Report variables

To support improved data reporting, CDC has employed the Data Collation & Integration for Public Health Event Response (DCIPHER) platform that jurisdictions can use to directly enter or import and view their data. As of Friday, March 13, all 50 states and 3 jurisdictions (New York City, Washington DC, and U.S. Virgin Islands) are using DCIPHER for the COVID-19 response. Previously, to support jurisdictions in providing timely case information, CDC group the variables included in the National Case Report into 3 tiers to help jurisdictions prioritize what data are collected and reported. While all the information being collected is important, the variables that were included on CDC's list of Tier 1 and Tier 2 variables [**High Priority Variables**] are key to understanding the current burden of disease and its transmission within communities. Further, it is important that this information be entered/submitted within 24 hours of the case being identified to provide adequate situational awareness. The remaining variables (previously referred to as Tier 3 variables) should be submitted as soon as possible, some, of which, may require following up with cases over time.

AMERICAN OVERSIGHT

High Priority Variables
Timeline: entered/submitted within 24 hours of being collected.

- CDC 2019-nCoV ID (cdc_ncov2019_id) (required field)
- Reporting jurisdiction (state) (required field)
- Current status of the person (current_status) (required field)
- State of residence (res_state)
- County of residence (res_county)
- Sex (sex)
- Age (age)
- Age Units (ageunit)
- Symptoms present during course of illness (sympstatus)
- If symptomatic, onset date (onset_dt)
- Hospitalization status (hosp_yn)
- ICU admission status (icu_yn): may not be readily available during initial interview; update as soon as possible
- Death (death_yn): may not be readily available during initial interview; update as soon as possible
- If female, currently pregnant (pregnant_yn)
- Health care worker in the United States (hc_work_yn)
- Exposure data
  - Travel to mainland China (exp_China)
  - Travel to other non-US country (exp_othcountry)
  - Travel to other non-US country, specify (exp_othcountry_spec)
  - Household contact with a COVID-19 case patient (exp_house)
  - Community contact with a COVID-19 case patient (exp_community)
  - Any healthcare contact with a COVID-19 case patient (exp_health)
  - Healthcare contact with a COVID-19 case patient, healthcare worker (exp_health_hcw)
  - Exposure to a cluster of patients with ARDS with unknown etiology (exp_cluster)
- Specimen information
  - Specimen type (see series on specimen type)
  - Specimen ID (see series on specimen ID)
  - Specimen sent to CDC (see series on specimen sent to CDC)
- Report date of case to CDC (case_cdcreport_dt)

Other Variables of Importance
Timeline: submitted as soon as possible or available.

- Specific information on the hospitalization, including admission and discharge dates and ventilation status
- Information on signs and symptoms
- Information on pre-existing conditions
- The remaining variables collected on the PUI and Case Report Form

7. Major avoidable challenges we hope to overcome with your assistance

We recognize the challenges that public health emergencies bring. With your assistance, we hope to avoid the following challenges by following the processes outlined above:

1. Unclear data flow processes for jurisdictional data on PUI and case-patients to CDC
2. Laboratory samples that are not able to be linked with PUI or case-patients
3. Incorrect reports of national and state-level PUI and case burden, as well as descriptive statistics about the population impacted

AMERICAN OVERSIGHT

We appreciate your ongoing partnership. Please email eocevent118@cdc.gov with any questions regarding the PUI or case reporting process.

Best,
CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Subject: FW: CSTE COVID-19 Response | Confirmatory testing of COVID-19 samples is no longer required

---

From: CSTE Emergency Response <Preparedness@cste.org>
Sent: Saturday, March 14, 2020 8:27 PM
To: CSTE Emergency Response
Cc: CSTE Novel Coronavirus 2019
Subject: CSTE COVID-19 Response | Confirmatory testing of COVID-19 samples is no longer required

Sent to State Epidemiologists, Deputy State Epidemiologists, CLUE, Infectious Disease Points of Contact, and the CSTE Executive Board

Good evening,

The message below regarding confirmatory testing of COVID-19 samples has been shared by Greg Armstrong, Deputy Incident Manager, CDC COVID-19 response.

--

CSTE
Council of State and Territorial Epidemiologists
Emergency Preparedness & Response Mailbox
Business Hours Line: 770.458.3811
After-Hours Line: 678.256.3945
preparedness.cste.org

Dear CSTE Colleagues,

Summary: State and local public health laboratories are no longer required to send “presumptive positive” samples to CDC for confirmation. From now on, respiratory samples positive for SARS-CoV2 in a state and public-health laboratory will be considered “positive” with no need for further testing.

More details: Last night, FDA accepted CDC’s request for “enforcement discretion” to allow state and local public-health laboratories to consider positive samples to be interpreted as “positive” with no need for confirmatory testing. This action was supported by data submitted by CDC showing agreement between results in state and local public health labs with corresponding results from CDC. CDC was asked to submit an amendment to its emergency-use authorization (EUA) for formal review.

For epidemiologists, this means that the cases that previously were considered “presumptive” will all now be considered “confirmed.”

Your laboratories should have received notification of this change already through APHL. These changes are retrospective such that samples already submitted to CDC for confirmation and had been awaiting confirmation may now be considered to be positive. CDC is still interested in receiving any specimens for which testing was “inconclusive” and which could not be resolved by repeat testing.

Sincerely,

Gregory Armstrong, MD
Currently assigned to CDC Coronavirus Response as Deputy Incident Manager
garmstrong@cdc.gov

To:	CDC IMS 2019 NCOV Response Epi Surveillance State Coordination Unit
Subject:	CDC COVID-19 Case Count Confirmation 03/23/2020
Date:	Monday, March 23, 2020 7:01:58 PM
Attachments:	CSTE COVID-19 Response Confirmatory testing of COVID-19 samples is no... (77.6 KB).msg 2019nCoV_PUICRF instructions_2020Mar15_final_clean.docx Attachment1_ReportingUpdates_2020March15_final.docx

Dear Partners,

CDC continues to institute a standard process for confirming publicly reported cases by jurisdiction.

What you need to do/know now:

- We will conduct case confirmation **daily** (for web posting Monday–Friday). As the response evolves, the frequency of these requests will likely decrease.
- At the bottom of this email, you will find a table with the following:
  - current preliminary case counts we have for each jurisdiction **as of 4 pm ET on Monday, March 23**.
  - general community level transmission characterization
- By **9 am ET Tuesday, March 24**, **please use the CDC Case Confirmation Portal via the link below** (data are collected via Epi Info and stored on a secure CDC server) to:
  - confirm case counts for your jurisdiction (your numbers **as of 4 pm ET Monday, March 23)**
  - if needed, modify your **"community level transmission characterization"**

Please use the link provided below and not a previously saved link in your web browser

https://go.usa.gov/xdtyJ

What you need to know about how your information will be presented:

- These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. They do not include people who returned to the United States via State Department-chartered flights. **We ask that the preliminary information shared in this email not be distributed.**
- What will be shared on the CDC website (updated daily at 12 pm, ET):
  - **The total case count**, i.e., the actual number of *total* cases (e.g., 0, 6, 35) will be posted. **EXCEPTION**: **Jurisdictions with one to five cases will be depicted as a range: "1–5 cases"**
  - Community level transmission characterization
  - Other information shared will be used for internal awareness and will not be shared publicly at this time.

What you need to do/know later:

- DCIPHER users can update and analyze their own jurisdiction's data at: https://dcipher.cdc.gov/. If your jurisdiction does not currently have DCIPHER users, but you would like to move to Phase 2 reporting as described in the attached guidance, please email eocevent118@cdc.gov to confirm your readiness.

Sincerely,

CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Version 13 Mar 2020

Instructions for Completing the Human Infection with 2019 Novel Coronavirus (COVID-19) Person Under Investigation (PUI) and Case Report Form

Purpose: This document describes the procedures for completing the 2019 Novel Coronavirus (COVID-19) Person Under Investigation (PUI) and Case Report Form (CRF) for persons under investigation who are being tested or have been tested for the virus that causes COVID-19.

- PUI: Any person who is currently under investigation for having the virus that causes COVID-19, or who was under investigation but tested negative for the virus.
- Laboratory-confirmed case of COVID-19: Individual who has tested positive for the virus that causes COVID-19 in at least one respiratory specimen (Note: effective 3/14/2020 there is no longer the designation of "presumptive positive").

If a sample from a PUI tests positive for the virus that causes COVID-19, the form should be updated to indicate an individual's change in status from a PUI to being a laboratory-confirmed case.

The form should be completed if a person has a positive laboratory result for the virus that causes COVID-19, even when not previously identified as a PUI.

General:

1. All dates should be formatted MM/DD/YYYY.
2. If completing the .pdf version of the form, use an "X" to mark boxes. Make sure to carefully mark boxes so that the "X" does not cross multiple boxes.

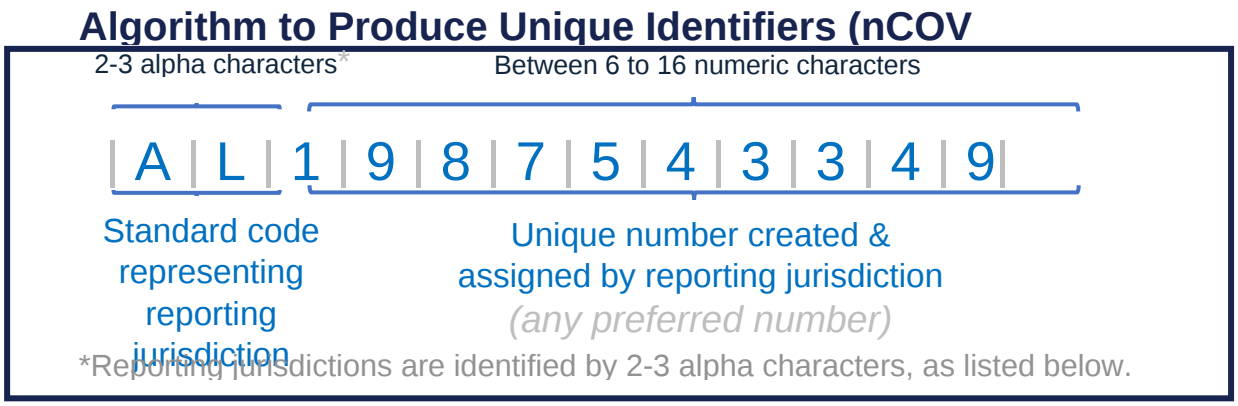
Header:

PATIENT IDENTIFIER INFORMATION IS NOT TRANSMITTED TO CDC AND IS FOR LOCAL-USE ONLY:
Patient first name: Enter case's first (given) name.
Patient last name: Enter case's last (family) name.
Date of birth (MM/DD/YYYY): Enter date of birth in MM/DD/YYYY format.

ID information:

Reporting jurisdiction: Enter the reporting jurisdiction where the PUI or case was identified. The reporting jurisdiction must be a state/city/territory authorized to submit data through NNDSS.

Reporting health department: Enter the name of the health department completing the PUI or case report.



Case state/local ID: Enter a local-use ID assigned by the state or local health department if desired for patient tracking or matching.

CDC 2019-nCoV ID: Enter the CDC 2019-nCoV ID assigned to the PUI or case. If the case was already identified as a PUI in collaboration with CDC, or was part of a contact investigation in which CDC was collaborating with the state or local health department, this CDC 2019-nCoV ID should have

AMERICAN OVERSIGHT

already been assigned and the CDC 2019-nCoV ID that was already provided by CDC should be entered. The CDC 2019 nCoV ID should be a part of the state or local health departments records; please check with the reporting jurisdiction. This may have previously been called a PUI ID. **Do not assign a new 2019-nCoV ID for these individuals**.

If this is a new PUI or case that was not previously under investigation or reported, the CDC 2019-nCoV ID should be assigned by the jurisdiction. CDC 2019-nCoV IDs should be assigned for all PUIs and laboratory-confirmed cases so that this person can be tracked at the jurisdictional and national level. The reporting jurisdiction should assign the CDC 2019-nCoV ID, and use this ID for all specimens and data transmitted to CDC for that person. The structure of the ID should be as follows:

!!! Important !!!

Do not add special characters, dashes, or white spaces to the nCoV ID. The alpha- and numeric-portions of the ID are seamless. The numeric portion of the ID cannot begin with zero ('0').

State	Code
Alabama	AL
Alaska	AK
Arizona	AZ

This ID will be used to track information about the PUI or case-patient in CDC data systems and **must** be provided on all forms or specimens related to this individual.

Contact ID: Only fill out this field if a PUI or case-patient is a known contact to another confirmed case of COVID-19. Contact IDs are assigned using the original (source) case-patient's nCoV ID followed by a hyphen and a sequential number indicating the order in which the contact was identified (e.g., Confirmed case CA102034567 may have contacts CA102034567 -01 and CA102034567 -02). If the person was previously under investigation in collaboration with CDC, or was part of a contact investigation in which CDC was collaborating with state/local health departments, this Contact ID may have been

AMERICAN OVERSIGHT

assigned previously. This should be a part of the state or local health departments records; please check with the reporting jurisdiction.

NNDSS loc. rec. ID/Case ID: For NNDSS reporters, enter the GenV2 or NETSS patient identifier.

Interviewer information

Name of interviewer: Enter the last name and first name of the person performing the interview.

Affiliation/Organization: Enter the interviewer's affiliation/organization.

Telephone: Enter the interviewer's telephone number.

Email: Enter the interviewer's email address.

Basic case information

What is the current status of this person?

- Select "PUI, testing pending" if a PUI has been identified but the initial laboratory testing has not yet been completed.
- Select "PUI, tested negative" if a PUI was previously identified, but the laboratory testing for the virus that causes COVID-19 was negative.
- Select "laboratory-confirmed case" if a person has at least one respiratory specimen that tested positive for the virus that causes COVID-19 by a CDC laboratory, state or local public health laboratory, or commercial laboratory using FDA-validated COVID 19 NAA. (Note: effective 3/14/2020 there is no longer the designation of "presumptive positive").

Please update this field each time the individual's status changes.

Report date of PUI to CDC: Enter the date the person was initially reported to CDC **as a PUI** in MM/DD/YYYY format.

Report date of case to CDC: Enter the date the case-patient was initially reported to CDC **as a case** in MM/DD/YYYY format. That is, please report the date at which the person changed from not being a case to being either a laboratory-confirmed case.

County of Residence: Please enter the individual's county of residence. Residence is typically defined by CSTE as the place of 'usual residence' at the time an infection is acquired.

State of Residence: Please enter the individual's county of residence. Residence is typically defined by CSTE as the place of 'usual residence' at the time an infection is acquired. The state of residence and reporting jurisdiction may be two distinct places.

Ethnicity: Select appropriate response. If unknown, select not specified.

Sex: Select appropriate response.

Race: Check all race categories that apply. If other, please specify in free text.

AMERICAN OVERSIGHT

Date of birth: Enter the PUI or case-patient's date of birth in MM/DD/YYYY format. Only enter data in this field if data can be transmitted to CDC per state/local policy.

Age: Enter the PUI or case-patient's age. Age may be entered in units of years, months, or days. Units will be specified later.

Age units (year/month/day): Select age units.

Date of first positive specimen collection: Enter the date of this person's first positive respiratory specimen collection, regardless of specimen type, in MM/DD/YYYY format. If the person tested positive, but the date is unknown, select "Unknown." If the person is a PUI and tested negative or is awaiting initial test results, select "N/A."

Did the patient develop pneumonia?: Select the appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select 'unknown' if missing chart.

Did the patient have acute respiratory distress syndrome?: Select appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select "unknown" if missing chart.

Did the patient have another diagnosis/etiology for their illness?: Select appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select "unknown" if missing chart.

Did the patient have an abnormal chest X-ray?: Select appropriate response. Select "unknown" if missing chart. Select 'yes' if—at any time—the person had an abnormal chest X-ray as part of this illness.

Symptoms present during course of illness?: This question refers to the PUI or case-patient's symptom status related to the entire duration of illness. If the PUI or case-patient was ever symptomatic as part of this illness with COVID-19, select "symptomatic." If the PUI or case-patient was asymptomatic (never experienced symptoms as part of this illness), please select "asymptomatic." If symptom status is unknown, select "unknown."

- If symptomatic, record symptom onset date in MM/DD/YYYY format or mark "unknown."
- If the PUI or case-patient was previously symptomatic and symptoms are currently resolved at the time of completing or updating this form, list date of symptom resolution in MM/DD/YYYY format. If exact dates of symptom resolution are not known, but there is a known approximate date, enter this in the date field. If still symptomatic at time of interview, mark "Still symptomatic." If the PUI or case-patient had symptoms, and the symptoms are resolved, but there is no information about the time frame of symptom resolution, mark "Symptoms resolved, unknown date." If the interviewer and patient do not know the symptom status, mark "Unknown symptom status."

Was the patient hospitalized? Select the appropriate response. If yes, provide dates of first hospital admission and first hospital discharge in MM/DD/YYYY format. If the patient is currently hospitalized, please leave the discharge date blank. This field can be revised at a later time.

Was the patient admitted to an intensive care unit (ICU)? Select the appropriate response. Select "unknown" if the medical chart is not available or ICU admission is not known.

AMERICAN OVERSIGHT

Did the patient receive mechanical ventilation (MV)/intubation? Select “Yes” if the patient was mechanically ventilated during hospitalization via intubation *or* tracheostomy. If yes, count the total number of days with mechanical ventilation. Round up to whole number. Select “unknown” if the medical chart is not available.

Did the patient receive extracorporeal membrane oxygenation (ECMO)?: Select the appropriate response. Select “unknown” if the medical chart is not available.

Did the patient die as a result of this illness? Select appropriate response. If "Yes," then enter date of death in MM/DD/YYYY format. If unknown date of death, please select “Unknown date of death.” (In DCIPHER, this is phrased as “Check if date of death unknown.”)

Is the patient a health care worker in the United States?: Select the appropriate response. HCP are defined as all paid and unpaid persons working in health-care settings who have the potential for exposure to patients and/or to infectious materials, including body substances, contaminated medical supplies and equipment, contaminated environmental surfaces, or contaminated air. HCP might include (but are not limited to) physicians, nurses, nursing assistants, therapists, technicians, emergency medical service personnel, dental personnel, pharmacists, laboratory personnel, autopsy personnel, students and trainees, contractual staff not employed by the health-care facility, and persons (e.g., clerical, dietary, housekeeping, laundry, security, maintenance, administrative, billing, and volunteers) not directly involved in patient care but potentially exposed to infectious agents that can be transmitted to and from HCP and patients.

Does the patient have a history of being in a healthcare facility (as a patient, worker, or visitor) in China?: Select the appropriate response.

In the 14 days prior to illness onset, did the patient have any of the following exposures: Check all that apply. For healthcare contact with another lab-confirmed COVID-19 case-patient, check if the PUI or case-patient identified in the current form was a patient, a visitor (e.g., accompanying family member who was seeking care), or a healthcare worker, when they contacted a lab-confirmed COVID-19 case-patient.

If the PUI or case-patient traveled to a non-US country that was not China, select all of the countries that the person traveled to within the past 14 days by selecting all relevant response options from the drop-down menu. If the country that the PUI or case-patient traveled to in the past 14 days is not listed, you may write the appropriate country in the text field. If the PUI or case-patient had traveled on a cruise, had exposure to large social gatherings (e.g. conference, concert), or had work-related exposures to large groups (e.g. airport screeners, port workers), please include details in the free text field.

If the patient had contact with another COVID-19 case, was this person a U.S. case?: Select the appropriate response. If yes, please provide the nCoV ID of the source case. If the patient did not have contact with another case, please select “N/A.”

Under what process was the PUI or case first identified? Please check all that apply. If identified by the EpiX notification of travelers, please provide the DGMQID. If other, please specify.

AMERICAN OVERSIGHT

Symptoms, clinical course, past medical history and social history:

Collected from (check all that apply): Please select “patient interview” or “medical record review.” If both sources were used to collect information on symptoms, clinical course, past medical history, and social history, please select both response options.

During this illness, did you experience any of the following symptoms? Please select “Yes,” “No,” or “Unknown” for each specific symptom. Please indicate the symptoms that the PUI or case-patient has experienced to date, even if he/she is no longer experiencing these symptoms. All symptoms should have an answer. If other symptoms were experienced, then describe the symptom in the space after “Other”.

Pre-existing medical conditions?: Mark the appropriate response based on whether the PUI or case-patient has *any* pre-existing medical conditions prior to investigation or confirmation of COVID-19. If PUI or case-patient has no pre-existing medical conditions, mark “No.” If not collected during interview and medical chart is missing, mark “Unknown.” After answering the initial (summary) question, please provide a response for *each* pre-existing condition. All questions—other than pregnancy—pertain to a *current* or *past* history of the condition. If “Yes” to neurologic/neurodevelopment/intellectual disability or Other Chronic Diseases, please specify. The pregnancy question should be marked “Yes” if the PUI or case-patient is female and currently or recently pregnant (i.e., gave birth while ill with COVID-19).

Current smoker: Select the appropriate response.

Former smoker: Select the appropriate response.

Respiratory diagnostic testing: For each pathogen, indicate whether the test was positive, negative, pending, or not done. If the PUI or case-patient had a test performed for another pathogen, please check the appropriate test result and specify the name of the pathogen next to “Other, Specify.” (In DCIPHER, please specify additional tests/pathogens only if they are positive.) If multiple tests for the same pathogen were completed, mark “Positive” if any of the tests for that pathogen were positive during the course of the illness suspected to be COVID-19.

Specimens for COVID-19 testing: For each specimen tested for the virus that causes COVID-19, record if the specimen was from a nasopharyngeal swab (NP), oropharyngeal swab (OP), sputum, or other specimen (specify type). If combined NP/OP swabs are collected, record results in the field for NP swabs. Jurisdictions can provide up to three results for each type of specimen; if additional specimens are collected, please provide information about these specimens in the “additional state/local specimen ID” fields below this question. If there are still additional specimens, please use the notes field following the specimen collection information to provide specimen IDs. Provide the local, state, or jurisdictional specimen ID associated with each specimen, as well as the date the specimen was collected in MM/DD/YYYY format. For specimens tested at a local or state public health laboratory or at a commercial laboratory, select ”State Lab Tested.” For specimens tested at CDC, select “Sent to CDC.” For each test performed, indicate the result: positive, negative, pending, not done, or indeterminate.

Please update these test results as they become available.

Additional state/local Specimen IDs: Provide additional specimen IDs from state/local laboratories for specimens tested for the virus that causes COVID-19. If needed, prioritize listing those specimens testing positive for the virus that causes COVID-19, regardless of specimen type.

AMERICAN OVERSIGHT

Updated Sunday, March 15 (major updates are highlighted in yellow)

Dear state and territorial partners:

Thank you for your continued partnership in the ongoing emergency response to COVID-19. The information included below aligns with what was shared by CDC during the 5 pm ET CSTE call on Saturday, February 29th, a CSTE email sent Friday, March 6th, and in a CSTE email sent during the weekend of March 14 regarding: 1) confirming a jurisdiction's 'Phase 2' status for reporting PUI and cases; 2) additional guidance on using the current PUI and Case Report Form, including classification of all positive laboratory tests as confirmed cases; 3) update on the status of historical PUI data imports into DCIPHER; 4) clarifications to the CDC reporting process for PUI/Case Report Forms and lab findings; 5) management of the PHLIP laboratory reporting process; 6) prioritization of the PUI/Case Report variables; and 7) major avoidable issues we hope to overcome with your assistance.

1. Jurisdictional 'Phase 2' Status

Given the need to maintain timely, actionable data at the national level, and process laboratory results at CDC for testing, **all jurisdictions should now be, or actively working towards being, onboarded to 'Phase 2',** which includes being able to assign unique identifiers to PUI/cases at the reporting jurisdiction level. If your jurisdiction has not yet confirmed its 'Phase 2' status, including how you will be inputting data into DCIPHER (preferred method: direct entry), please email eocevent118@cdc.gov.

Reminder: as of March 6th, CDC made the reporting of PUI to CDC through DCIPHER optional for jurisdictions in Phase 2. Jurisdictions **should continue to report positive cases to CDC** using the combined PUI/Case Report Form.

2. Updates to PUI and Case Report Form (CRF) on CDC's Website

Please continue to use the 5 status classifications below when completing a CRF. However, note the changes in how to apply the classifications.

1. PUI, testing pending
2. PUI, tested negative
3. Presumptive case (positive test by state or local health department lab*), confirmatory testing pending
4. Presumptive case (positive test by state or local health department lab*), confirmatory testing negative
5. Laboratory-confirmed case†

**These designations are no longer applicable on or after 3/14/2020*

†Now includes positive tests conducted by the CDC laboratory, commercial lab using FDA-validated COVID 19 NAA, or state or local health department lab.

These changes reflect FDA's acceptance of CDC's request for "enforcement discretion" to allow state and local public-health laboratories to consider positive samples to be interpreted as "positive" with no need for confirmatory testing. This action was supported by data submitted by CDC showing agreement between results in state and local public health labs with corresponding results from CDC. **These changes are retrospective such that samples already submitted to CDC for confirmation and had been awaiting confirmation may now be considered to be positive.** CDC is still interested in receiving any specimens for which testing was "inconclusive" and which could not be resolved by repeat testing. For reporting purposes, these persons can be classified as "PUI, testing pending" until resulted by the CDC Laboratory. For epidemiologists, this will have little impact operationally, since the policy from the beginning was to act on "presumptive positives" as though they have already been confirmed. This means that the cases that previously were considered "presumptive" will all now be considered "confirmed". **For CDC analyses, presumptive and confirmed positive cases will be treated the same. Jurisdictions do not need to make changes to the historical data previously reported to CDC.**

Critical laboratory testing result fields are included at the end of the CRF to reflect COVID-19 laboratory test results. To minimize the need for making changes to the CRF at this time, **please use the same fields to report**

AMERICAN OVERSIGHT

specimens tested at the local level whether the testing laboratory was the state or jurisdiction public health laboratory or commercial laboratory. Further, **if the specimen was from a combined nasopharyngeal (NP) and oropharyngeal (OP) swab, record the results in the NP swab field**. CDC will work towards populating our laboratory results into the CDC result field for each specimen sent to us so that results can be viewed in DCIPHER as they are resulted and communicated to individual jurisdictions. To support this matching process and to ensure the specimen is tested, please make sure to include an nCoV ID when submitting the specimen(s) to CDC.

If the PUI or case-patient had traveled on a cruise, had exposure to large social gatherings (e.g. conference, concert), or work-related exposures to large groups (e.g. airport screeners, port workers), please indicate in the free text field available with the "Other, specify:" option for the question: "In the 14 days prior to illness onset, did the patient have any of the following exposures (check all that apply)."

Changes will also be reflected in the material made available on CDC's website.

3. Historical PUI Data Imported into DCIPHER

As of February 28, data reported to CDC on PUI, presumptive cases, and laboratory-confirmed cases have been made available in DCIPHER.

- Jurisdictions in 'Phase 2' are now able to go into the DCIPHER platform to view and edit existing records of PUI, presumptive positive, and laboratory-confirmed cases, as their status changes or more data become available.
- Jurisdictions in 'Phase 1' should continue to call the EOC Watch Desk at 770-488-7100 to update information on existing PUI, cases of COVID-19.

4. CDC Reporting Process for PUI/Case Reports and Lab Findings – Revised March 6th

CDC laboratory has received several specimens that were not assigned an nCoV ID. **Please note that all specimens need an nCoV ID for submission to CDC laboratory.** In the event that a sample is missing an nCoV ID, the specimen will be frozen, our staff will reach out to the point-of-contact listed on the submission form, and we will test the specimen once the nCoV ID has been submitted. Please provide an nCoV ID with all specimens to avoid delays in testing.

As of March 6, information for PUIs no longer needs to be entered into DCIPHER. However, jurisdictions may use NNDSS or DCIPHER to manage their PUIs.

For reporting jurisdictions that have the capacity to do their own testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter cases into DCIPHER with the jurisdiction-issued nCoV ID, unless other arrangements to transmit data have been made and approved by CDC.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. If the person is already in DCIPHER, please update the person's disposition to 'PUI, tested negative' in DCIPHER.
3. If a specimen is tested locally, is **POSITIVE,** and is **the jurisdiction's first case or is part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify CDC of the positive result.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected and submitted on the PUI and Case Report Form.
4. If a specimen is tested locally, is **POSITIVE,** and is **from a jurisdiction with existing presumptive or confirmed cases and is not part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Update the person's disposition in DCIPHER to "Confirmed Case"

AMERICAN OVERSIGHT

For jurisdictions that are in 'Phase 1':

1. The jurisdictions should call the EOC Watch Desk/PUI desk at 770-488-7100 to receive a CDC-issued nCoV ID, and to complete a PUI and Case Report Form.
2. If a specimen is tested locally and is **NEGATIVE**, no further action is needed unless the person has already been reported to CDC as a PUI; if so:
    a. Please email eocevent118@cdc.gov and provide the nCoV ID and test result.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify them of the positive result.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected on the PUI and Case Report form.

For reporting jurisdictions that do not have testing capacity and are sending specimens to CDC for testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs into DCIPHER with the jurisdiction-issued nCoV IDs, unless other arrangements to transmit data have been made and approved by CDC.
2. Please ensure the jurisdiction-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

For jurisdictions that are in 'Phase 1':

1. The jurisdiction should call the EOC Watch Desk/PUI desk at **770-488-7100** to obtain a CDC-issued nCoV ID number, and complete a PUI and Case Report Form.
2. Please make sure the CDC-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

5. Management of the PHLIP reporting process

CDC and APHL have been working with public health laboratories to add automated reporting of the novel coronavirus test results through their existing influenza reporting mechanism, which is most frequently PHLIP.

We ask that participating PHLIP labs begin including nCoV IDs within the lab test message reported through PHLIP. This will allow CDC to: (1) Match these records with persons reported into DCIPHER and (2) work with states to properly characterize the status of persons without existing records in DCIPHER. Information on how to include the nCoV ID in the message has been made available via APHL starting at the bottom of Page 4 (https://www.aphl.org/Materials/02.12.2020_Informatics_FAQs_and_Guidance.pdf).

6. Prioritization of PUI/Case Report variables

To support improved data reporting, CDC has employed the Data Collation & Integration for Public Health Event Response (DCIPHER) platform that jurisdictions can use to directly enter or import and view their data. As of Friday, March 13, all 50 states and 3 jurisdictions (New York City, Washington DC, and U.S. Virgin Islands) are using DCIPHER for the COVID-19 response. Previously, to support jurisdictions in providing timely case information, CDC group the variables included in the National Case Report into 3 tiers to help jurisdictions prioritize what data are collected and reported. While all the information being collected is important, the variables that were included on CDC's list of Tier 1 and Tier 2 variables [**High Priority Variables**] are key to understanding the current burden of disease and its transmission within communities. Further, it is important that this information be entered/submitted within 24 hours of the case being identified to provide adequate situational awareness. The remaining variables (previously referred to as Tier 3 variables) should be submitted as soon as possible, some, of which, may require following up with cases over time.

AMERICAN OVERSIGHT

High Priority Variables
Timeline: entered/submitted within 24 hours of being collected.

- CDC 2019-nCoV ID (cdc_ncov2019_id) (required field)
- Reporting jurisdiction (state) (required field)
- Current status of the person (current_status) (required field)
- State of residence (res_state)
- County of residence (res_county)
- Sex (sex)
- Age (age)
- Age Units (ageunit)
- Symptoms present during course of illness (sympstatus)
- If symptomatic, onset date (onset_dt)
- Hospitalization status (hosp_yn)
- ICU admission status (icu_yn): may not be readily available during initial interview; update as soon as possible
- Death (death_yn): may not be readily available during initial interview; update as soon as possible
- If female, currently pregnant (pregnant_yn)
- Health care worker in the United States (hc_work_yn)
- Exposure data
  - Travel to mainland China (exp_China)
  - Travel to other non-US country (exp_othcountry)
  - Travel to other non-US country, specify (exp_othcountry_spec)
  - Household contact with a COVID-19 case patient (exp_house)
  - Community contact with a COVID-19 case patient (exp_community)
  - Any healthcare contact with a COVID-19 case patient (exp_health)
  - Healthcare contact with a COVID-19 case patient, healthcare worker (exp_health_hcw)
  - Exposure to a cluster of patients with ARDS with unknown etiology (exp_cluster)
- Specimen information
  - Specimen type (see series on specimen type)
  - Specimen ID (see series on specimen ID)
  - Specimen sent to CDC (see series on specimen sent to CDC)
- Report date of case to CDC (case_cdcreport_dt)

Other Variables of Importance
Timeline: submitted as soon as possible or available.

- Specific information on the hospitalization, including admission and discharge dates and ventilation status
- Information on signs and symptoms
- Information on pre-existing conditions
- The remaining variables collected on the PUI and Case Report Form

7. Major avoidable challenges we hope to overcome with your assistance

We recognize the challenges that public health emergencies bring. With your assistance, we hope to avoid the following challenges by following the processes outlined above:

1. Unclear data flow processes for jurisdictional data on PUI and case-patients to CDC
2. Laboratory samples that are not able to be linked with PUI or case-patients
3. Incorrect reports of national and state-level PUI and case burden, as well as descriptive statistics about the population impacted

AMERICAN OVERSIGHT

We appreciate your ongoing partnership. Please email eocevent118@cdc.gov with any questions regarding the PUI or case reporting process.

Best,
CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Subject: FW: CSTE COVID-19 Response | Confirmatory testing of COVID-19 samples is no longer required

---

From: CSTE Emergency Response <Preparedness@cste.org>
Sent: Saturday, March 14, 2020 8:27 PM
To: CSTE Emergency Response
Cc: CSTE Novel Coronavirus 2019
Subject: CSTE COVID-19 Response | Confirmatory testing of COVID-19 samples is no longer required

Sent to State Epidemiologists, Deputy State Epidemiologists, CLUE, Infectious Disease Points of Contact, and the CSTE Executive Board

Good evening,

The message below regarding confirmatory testing of COVID-19 samples has been shared by Greg Armstrong, Deputy Incident Manager, CDC COVID-19 response.

--

CSTE
Council of State and Territorial Epidemiologists
Emergency Preparedness & Response Mailbox
Business Hours Line: 770.458.3811
After-Hours Line: 678.256.3945
preparedness.cste.org

Dear CSTE Colleagues,

Summary: State and local public health laboratories are no longer required to send “presumptive positive” samples to CDC for confirmation. From now on, respiratory samples positive for SARS-CoV2 in a state and public-health laboratory will be considered “positive” with no need for further testing.

More details: Last night, FDA accepted CDC’s request for “enforcement discretion” to allow state and local public-health laboratories to consider positive samples to be interpreted as “positive” with no need for confirmatory testing. This action was supported by data submitted by CDC showing agreement between results in state and local public health labs with corresponding results from CDC. CDC was asked to submit an amendment to its emergency-use authorization (EUA) for formal review.

For epidemiologists, this means that the cases that previously were considered “presumptive” will all now be considered “confirmed.”

Your laboratories should have received notification of this change already through APHL. These changes are retrospective such that samples already submitted to CDC for confirmation and had been awaiting confirmation may now be considered to be positive. CDC is still interested in receiving any specimens for which testing was “inconclusive” and which could not be resolved by repeat testing.

Sincerely,

Gregory Armstrong, MD
Currently assigned to CDC Coronavirus Response as Deputy Incident Manager
garmstrong@cdc.gov

Dear Partners,

CDC continues to institute a standard process for confirming publicly reported cases by jurisdiction.

What you need to do/know now:

- We will conduct case confirmation **daily** (for web posting Monday–Friday). As the response evolves, the frequency of these requests will likely decrease.
- At the bottom of this email, you will find a table with the following:
  - current preliminary case counts we have for each jurisdiction **as of 4 pm ET on Tuesday, March 24**.
  - general community level transmission characterization
- By **9 am ET Wednesday, March 25**, **please use the CDC Case Confirmation Portal via the link below** (data are collected via Epi Info and stored on a secure CDC server) to:
  - confirm case counts for your jurisdiction (your numbers **as of 4 pm ET Tuesday, March 24)**
  - if needed, modify your **"community level transmission characterization"**

Please use the link provided below and not a previously saved link in your web browser

https://go.usa.gov/xdtyJ

What you need to know about how your information will be presented:

- These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. They do not include people who returned to the United States via State Department-chartered flights. **We ask that the preliminary information shared in this email not be distributed.**
- What will be shared on the CDC website (updated daily at 12 pm, ET):
  - **The total case count**, i.e., the actual number of *total* cases (e.g., 0, 6, 35) will be posted. **EXCEPTION**: **Jurisdictions with one to five cases will be depicted as a range: "1–5 cases"**
  - Community level transmission characterization
  - Other information shared will be used for internal awareness and will not be shared publicly at this time.

What you need to do/know later:

- DCIPHER users can update and analyze their own jurisdiction's data at: https://dcipher.cdc.gov/. If your jurisdiction does not currently have DCIPHER users, but you would like to move to Phase 2 reporting as described in the attached guidance, please email eocevent118@cdc.gov to confirm your readiness.

Sincerely,

CDC COVID-19 Epidemiology Task Force

Jurisdiction	Code	Total cases reported*	Deaths reported**	Community Transmission Characterization

AMERICAN OVERSIGHT

Version 13 Mar 2020

Instructions for Completing the Human Infection with 2019 Novel Coronavirus (COVID-19) Person Under Investigation (PUI) and Case Report Form

Purpose: This document describes the procedures for completing the 2019 Novel Coronavirus (COVID-19) Person Under Investigation (PUI) and Case Report Form (CRF) for persons under investigation who are being tested or have been tested for the virus that causes COVID-19.

- PUI: Any person who is currently under investigation for having the virus that causes COVID-19, or who was under investigation but tested negative for the virus.
- Laboratory-confirmed case of COVID-19: Individual who has tested positive for the virus that causes COVID-19 in at least one respiratory specimen (Note: effective 3/14/2020 there is no longer the designation of "presumptive positive").

If a sample from a PUI tests positive for the virus that causes COVID-19, the form should be updated to indicate an individual's change in status from a PUI to being a laboratory-confirmed case.

The form should be completed if a person has a positive laboratory result for the virus that causes COVID-19, even when not previously identified as a PUI.

General:

1. All dates should be formatted MM/DD/YYYY.
2. If completing the .pdf version of the form, use an "X" to mark boxes. Make sure to carefully mark boxes so that the "X" does not cross multiple boxes.

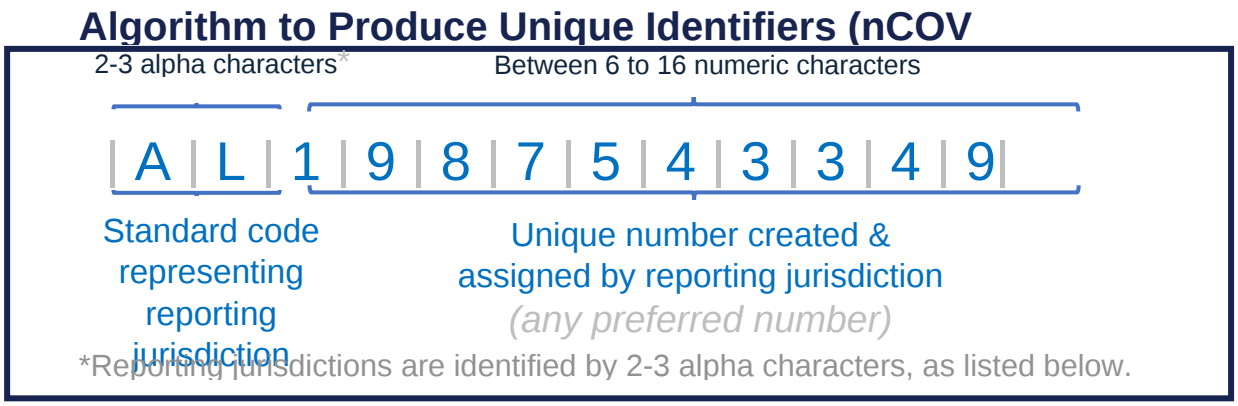
Header:

PATIENT IDENTIFIER INFORMATION IS NOT TRANSMITTED TO CDC AND IS FOR LOCAL-USE ONLY:
Patient first name: Enter case's first (given) name.
Patient last name: Enter case's last (family) name.
Date of birth (MM/DD/YYYY): Enter date of birth in MM/DD/YYYY format.

ID information:

Reporting jurisdiction: Enter the reporting jurisdiction where the PUI or case was identified. The reporting jurisdiction must be a state/city/territory authorized to submit data through NNDSS.

Reporting health department: Enter the name of the health department completing the PUI or case report.



Case state/local ID: Enter a local-use ID assigned by the state or local health department if desired for patient tracking or matching.

CDC 2019-nCoV ID: Enter the CDC 2019-nCoV ID assigned to the PUI or case. If the case was already identified as a PUI in collaboration with CDC, or was part of a contact investigation in which CDC was collaborating with the state or local health department, this CDC 2019-nCoV ID should have

AMERICAN OVERSIGHT

already been assigned and the CDC 2019-nCoV ID that was already provided by CDC should be entered. The CDC 2019 nCoV ID should be a part of the state or local health departments records; please check with the reporting jurisdiction. This may have previously been called a PUI ID. **Do not assign a new 2019-nCoV ID for these individuals**.

If this is a new PUI or case that was not previously under investigation or reported, the CDC 2019-nCoV ID should be assigned by the jurisdiction. CDC 2019-nCoV IDs should be assigned for all PUIs and laboratory-confirmed cases so that this person can be tracked at the jurisdictional and national level. The reporting jurisdiction should assign the CDC 2019-nCoV ID, and use this ID for all specimens and data transmitted to CDC for that person. The structure of the ID should be as follows:

!!! Important !!!

Do not add special characters, dashes, or white spaces to the nCoV ID. The alpha- and numeric-portions of the ID are seamless. The numeric portion of the ID cannot begin with zero ('0').

State	Code
Alabama	AL
Alaska	AK
Arizona	AZ
Arkansas	AR

Republic of Palau	ROP

This ID will be used to track information about the PUI or case-patient in CDC data systems and **must** be provided on all forms or specimens related to this individual.

Contact ID: Only fill out this field if a PUI or case-patient is a known contact to another confirmed case of COVID-19. Contact IDs are assigned using the original (source) case-patient's nCoV ID followed by a hyphen and a sequential number indicating the order in which the contact was identified (e.g., Confirmed case CA102034567 may have contacts CA102034567 -01 and CA102034567 -02). If the person was previously under investigation in collaboration with CDC, or was part of a contact investigation in which CDC was collaborating with state/local health departments, this Contact ID may have been

AMERICAN OVERSIGHT

assigned previously. This should be a part of the state or local health departments records; please check with the reporting jurisdiction.

NNDSS loc. rec. ID/Case ID: For NNDSS reporters, enter the GenV2 or NETSS patient identifier.

Interviewer information

Name of interviewer: Enter the last name and first name of the person performing the interview.

Affiliation/Organization: Enter the interviewer's affiliation/organization.

Telephone: Enter the interviewer's telephone number.

Email: Enter the interviewer's email address.

Basic case information

What is the current status of this person?

- Select "PUI, testing pending" if a PUI has been identified but the initial laboratory testing has not yet been completed.
- Select "PUI, tested negative" if a PUI was previously identified, but the laboratory testing for the virus that causes COVID-19 was negative.
- Select "laboratory-confirmed case" if a person has at least one respiratory specimen that tested positive for the virus that causes COVID-19 by a CDC laboratory, state or local public health laboratory, or commercial laboratory using FDA-validated COVID 19 NAA. (Note: effective 3/14/2020 there is no longer the designation of "presumptive positive").

Please update this field each time the individual's status changes.

Report date of PUI to CDC: Enter the date the person was initially reported to CDC **as a PUI** in MM/DD/YYYY format.

Report date of case to CDC: Enter the date the case-patient was initially reported to CDC **as a case** in MM/DD/YYYY format. That is, please report the date at which the person changed from not being a case to being either a laboratory-confirmed case.

County of Residence: Please enter the individual's county of residence. Residence is typically defined by CSTE as the place of 'usual residence' at the time an infection is acquired.

State of Residence: Please enter the individual's county of residence. Residence is typically defined by CSTE as the place of 'usual residence' at the time an infection is acquired. The state of residence and reporting jurisdiction may be two distinct places.

Ethnicity: Select appropriate response. If unknown, select not specified.

Sex: Select appropriate response.

Race: Check all race categories that apply. If other, please specify in free text.

AMERICAN OVERSIGHT

Date of birth: Enter the PUI or case-patient's date of birth in MM/DD/YYYY format. Only enter data in this field if data can be transmitted to CDC per state/local policy.

Age: Enter the PUI or case-patient's age. Age may be entered in units of years, months, or days. Units will be specified later.

Age units (year/month/day): Select age units.

Date of first positive specimen collection: Enter the date of this person's first positive respiratory specimen collection, regardless of specimen type, in MM/DD/YYYY format. If the person tested positive, but the date is unknown, select "Unknown." If the person is a PUI and tested negative or is awaiting initial test results, select "N/A."

Did the patient develop pneumonia?: Select the appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select 'unknown' if missing chart.

Did the patient have acute respiratory distress syndrome?: Select appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select "unknown" if missing chart.

Did the patient have another diagnosis/etiology for their illness?: Select appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select "unknown" if missing chart.

Did the patient have an abnormal chest X-ray?: Select appropriate response. Select "unknown" if missing chart. Select 'yes' if—at any time—the person had an abnormal chest X-ray as part of this illness.

Symptoms present during course of illness?: This question refers to the PUI or case-patient's symptom status related to the entire duration of illness. If the PUI or case-patient was ever symptomatic as part of this illness with COVID-19, select "symptomatic." If the PUI or case-patient was asymptomatic (never experienced symptoms as part of this illness), please select "asymptomatic." If symptom status is unknown, select "unknown."

- If symptomatic, record symptom onset date in MM/DD/YYYY format or mark "unknown."
- If the PUI or case-patient was previously symptomatic and symptoms are currently resolved at the time of completing or updating this form, list date of symptom resolution in MM/DD/YYYY format. If exact dates of symptom resolution are not known, but there is a known approximate date, enter this in the date field. If still symptomatic at time of interview, mark "Still symptomatic." If the PUI or case-patient had symptoms, and the symptoms are resolved, but there is no information about the time frame of symptom resolution, mark "Symptoms resolved, unknown date." If the interviewer and patient do not know the symptom status, mark "Unknown symptom status."

Was the patient hospitalized? Select the appropriate response. If yes, provide dates of first hospital admission and first hospital discharge in MM/DD/YYYY format. If the patient is currently hospitalized, please leave the discharge date blank. This field can be revised at a later time.

Was the patient admitted to an intensive care unit (ICU)? Select the appropriate response. Select "unknown" if the medical chart is not available or ICU admission is not known.

AMERICAN OVERSIGHT

Did the patient receive mechanical ventilation (MV)/intubation? Select “Yes” if the patient was mechanically ventilated during hospitalization via intubation *or* tracheostomy. If yes, count the total number of days with mechanical ventilation. Round up to whole number. Select “unknown” if the medical chart is not available.

Did the patient receive extracorporeal membrane oxygenation (ECMO)?: Select the appropriate response. Select “unknown” if the medical chart is not available.

Did the patient die as a result of this illness? Select appropriate response. If "Yes," then enter date of death in MM/DD/YYYY format. If unknown date of death, please select “Unknown date of death.” (In DCIPHER, this is phrased as “Check if date of death unknown.”)

Is the patient a health care worker in the United States?: Select the appropriate response. HCP are defined as all paid and unpaid persons working in health-care settings who have the potential for exposure to patients and/or to infectious materials, including body substances, contaminated medical supplies and equipment, contaminated environmental surfaces, or contaminated air. HCP might include (but are not limited to) physicians, nurses, nursing assistants, therapists, technicians, emergency medical service personnel, dental personnel, pharmacists, laboratory personnel, autopsy personnel, students and trainees, contractual staff not employed by the health-care facility, and persons (e.g., clerical, dietary, housekeeping, laundry, security, maintenance, administrative, billing, and volunteers) not directly involved in patient care but potentially exposed to infectious agents that can be transmitted to and from HCP and patients.

Does the patient have a history of being in a healthcare facility (as a patient, worker, or visitor) in China?: Select the appropriate response.

In the 14 days prior to illness onset, did the patient have any of the following exposures: Check all that apply. For healthcare contact with another lab-confirmed COVID-19 case-patient, check if the PUI or case-patient identified in the current form was a patient, a visitor (e.g., accompanying family member who was seeking care), or a healthcare worker, when they contacted a lab-confirmed COVID-19 case-patient.

If the PUI or case-patient traveled to a non-US country that was not China, select all of the countries that the person traveled to within the past 14 days by selecting all relevant response options from the drop-down menu. If the country that the PUI or case-patient traveled to in the past 14 days is not listed, you may write the appropriate country in the text field. If the PUI or case-patient had traveled on a cruise, had exposure to large social gatherings (e.g. conference, concert), or had work-related exposures to large groups (e.g. airport screeners, port workers), please include details in the free text field.

If the patient had contact with another COVID-19 case, was this person a U.S. case?: Select the appropriate response. If yes, please provide the nCoV ID of the source case. If the patient did not have contact with another case, please select “N/A.”

Under what process was the PUI or case first identified? Please check all that apply. If identified by the EpiX notification of travelers, please provide the DGMQID. If other, please specify.

AMERICAN OVERSIGHT

Symptoms, clinical course, past medical history and social history:

Collected from (check all that apply): Please select “patient interview” or “medical record review.” If both sources were used to collect information on symptoms, clinical course, past medical history, and social history, please select both response options.

During this illness, did you experience any of the following symptoms? Please select “Yes,” “No,” or “Unknown” for each specific symptom. Please indicate the symptoms that the PUI or case-patient has experienced to date, even if he/she is no longer experiencing these symptoms. All symptoms should have an answer. If other symptoms were experienced, then describe the symptom in the space after “Other”.

Pre-existing medical conditions?: Mark the appropriate response based on whether the PUI or case-patient has *any* pre-existing medical conditions prior to investigation or confirmation of COVID-19. If PUI or case-patient has no pre-existing medical conditions, mark “No.” If not collected during interview and medical chart is missing, mark “Unknown.” After answering the initial (summary) question, please provide a response for *each* pre-existing condition. All questions—other than pregnancy—pertain to a *current* or *past* history of the condition. If “Yes” to neurologic/neurodevelopment/intellectual disability or Other Chronic Diseases, please specify. The pregnancy question should be marked “Yes” if the PUI or case-patient is female and currently or recently pregnant (i.e., gave birth while ill with COVID-19).

Current smoker: Select the appropriate response.

Former smoker: Select the appropriate response.

Respiratory diagnostic testing: For each pathogen, indicate whether the test was positive, negative, pending, or not done. If the PUI or case-patient had a test performed for another pathogen, please check the appropriate test result and specify the name of the pathogen next to “Other, Specify.” (In DCIPHER, please specify additional tests/pathogens only if they are positive.) If multiple tests for the same pathogen were completed, mark “Positive” if any of the tests for that pathogen were positive during the course of the illness suspected to be COVID-19.

Specimens for COVID-19 testing: For each specimen tested for the virus that causes COVID-19, record if the specimen was from a nasopharyngeal swab (NP), oropharyngeal swab (OP), sputum, or other specimen (specify type). If combined NP/OP swabs are collected, record results in the field for NP swabs. Jurisdictions can provide up to three results for each type of specimen; if additional specimens are collected, please provide information about these specimens in the “additional state/local specimen ID” fields below this question. If there are still additional specimens, please use the notes field following the specimen collection information to provide specimen IDs. Provide the local, state, or jurisdictional specimen ID associated with each specimen, as well as the date the specimen was collected in MM/DD/YYYY format. For specimens tested at a local or state public health laboratory or at a commercial laboratory, select ”State Lab Tested.” For specimens tested at CDC, select “Sent to CDC.” For each test performed, indicate the result: positive, negative, pending, not done, or indeterminate.

Please update these test results as they become available.

Additional state/local Specimen IDs: Provide additional specimen IDs from state/local laboratories for specimens tested for the virus that causes COVID-19. If needed, prioritize listing those specimens testing positive for the virus that causes COVID-19, regardless of specimen type.

AMERICAN OVERSIGHT

Updated Sunday, March 15 (major updates are highlighted in yellow)

Dear state and territorial partners:

Thank you for your continued partnership in the ongoing emergency response to COVID-19. The information included below aligns with what was shared by CDC during the 5 pm ET CSTE call on Saturday, February 29th, a CSTE email sent Friday, March 6th, and in a CSTE email sent during the weekend of March 14 regarding: 1) confirming a jurisdiction's 'Phase 2' status for reporting PUI and cases; 2) additional guidance on using the current PUI and Case Report Form, including classification of all positive laboratory tests as confirmed cases; 3) update on the status of historical PUI data imports into DCIPHER; 4) clarifications to the CDC reporting process for PUI/Case Report Forms and lab findings; 5) management of the PHLIP laboratory reporting process; 6) prioritization of the PUI/Case Report variables; and 7) major avoidable issues we hope to overcome with your assistance.

1. Jurisdictional 'Phase 2' Status

Given the need to maintain timely, actionable data at the national level, and process laboratory results at CDC for testing, **all jurisdictions should now be, or actively working towards being, onboarded to 'Phase 2',** which includes being able to assign unique identifiers to PUI/cases at the reporting jurisdiction level. If your jurisdiction has not yet confirmed its 'Phase 2' status, including how you will be inputting data into DCIPHER (preferred method: direct entry), please email eocevent118@cdc.gov.

Reminder: as of March 6th, CDC made the reporting of PUI to CDC through DCIPHER optional for jurisdictions in Phase 2. Jurisdictions **should continue to report positive cases to CDC** using the combined PUI/Case Report Form.

2. Updates to PUI and Case Report Form (CRF) on CDC's Website

Please continue to use the 5 status classifications below when completing a CRF. However, note the changes in how to apply the classifications.

1. PUI, testing pending
2. PUI, tested negative
3. Presumptive case (positive test by state or local health department lab*), confirmatory testing pending
4. Presumptive case (positive test by state or local health department lab*), confirmatory testing negative
5. Laboratory-confirmed case†

**These designations are no longer applicable on or after 3/14/2020*

†Now includes positive tests conducted by the CDC laboratory, commercial lab using FDA-validated COVID 19 NAA, or state or local health department lab.

These changes reflect FDA's acceptance of CDC's request for "enforcement discretion" to allow state and local public-health laboratories to consider positive samples to be interpreted as "positive" with no need for confirmatory testing. This action was supported by data submitted by CDC showing agreement between results in state and local public health labs with corresponding results from CDC. **These changes are retrospective such that samples already submitted to CDC for confirmation and had been awaiting confirmation may now be considered to be positive.** CDC is still interested in receiving any specimens for which testing was "inconclusive" and which could not be resolved by repeat testing. For reporting purposes, these persons can be classified as "PUI, testing pending" until resulted by the CDC Laboratory. For epidemiologists, this will have little impact operationally, since the policy from the beginning was to act on "presumptive positives" as though they have already been confirmed. This means that the cases that previously were considered "presumptive" will all now be considered "confirmed". **For CDC analyses, presumptive and confirmed positive cases will be treated the same. Jurisdictions do not need to make changes to the historical data previously reported to CDC.**

Critical laboratory testing result fields are included at the end of the CRF to reflect COVID-19 laboratory test results. To minimize the need for making changes to the CRF at this time, **please use the same fields to report**

AMERICAN OVERSIGHT

specimens tested at the local level whether the testing laboratory was the state or jurisdiction public health laboratory or commercial laboratory. Further, **if the specimen was from a combined nasopharyngeal (NP) and oropharyngeal (OP) swab, record the results in the NP swab field**. CDC will work towards populating our laboratory results into the CDC result field for each specimen sent to us so that results can be viewed in DCIPHER as they are resulted and communicated to individual jurisdictions. To support this matching process and to ensure the specimen is tested, please make sure to include an nCoV ID when submitting the specimen(s) to CDC.

If the PUI or case-patient had traveled on a cruise, had exposure to large social gatherings (e.g. conference, concert), or work-related exposures to large groups (e.g. airport screeners, port workers), please indicate in the free text field available with the "Other, specify:" option for the question: "In the 14 days prior to illness onset, did the patient have any of the following exposures (check all that apply)."

Changes will also be reflected in the material made available on CDC's website.

3. Historical PUI Data Imported into DCIPHER

As of February 28, data reported to CDC on PUI, presumptive cases, and laboratory-confirmed cases have been made available in DCIPHER.

- Jurisdictions in 'Phase 2' are now able to go into the DCIPHER platform to view and edit existing records of PUI, presumptive positive, and laboratory-confirmed cases, as their status changes or more data become available.
- Jurisdictions in 'Phase 1' should continue to call the EOC Watch Desk at 770-488-7100 to update information on existing PUI, cases of COVID-19.

4. CDC Reporting Process for PUI/Case Reports and Lab Findings – Revised March 6th

CDC laboratory has received several specimens that were not assigned an nCoV ID. **Please note that all specimens need an nCoV ID for submission to CDC laboratory.** In the event that a sample is missing an nCoV ID, the specimen will be frozen, our staff will reach out to the point-of-contact listed on the submission form, and we will test the specimen once the nCoV ID has been submitted. Please provide an nCoV ID with all specimens to avoid delays in testing.

As of March 6, information for PUIs no longer needs to be entered into DCIPHER. However, jurisdictions may use NNDSS or DCIPHER to manage their PUIs.

For reporting jurisdictions that have the capacity to do their own testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter cases into DCIPHER with the jurisdiction-issued nCoV ID, unless other arrangements to transmit data have been made and approved by CDC.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. If the person is already in DCIPHER, please update the person's disposition to 'PUI, tested negative' in DCIPHER.
3. If a specimen is tested locally, is **POSITIVE,** and is **the jurisdiction's first case or is part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify CDC of the positive result.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected and submitted on the PUI and Case Report Form.
4. If a specimen is tested locally, is **POSITIVE,** and is **from a jurisdiction with existing presumptive or confirmed cases and is not part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Update the person's disposition in DCIPHER to "Confirmed Case"

AMERICAN OVERSIGHT

For jurisdictions that are in 'Phase 1':

1. The jurisdictions should call the EOC Watch Desk/PUI desk at 770-488-7100 to receive a CDC-issued nCoV ID, and to complete a PUI and Case Report Form.
2. If a specimen is tested locally and is **NEGATIVE**, no further action is needed unless the person has already been reported to CDC as a PUI; if so:
    a. Please email eocevent118@cdc.gov and provide the nCoV ID and test result.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify them of the positive result.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected on the PUI and Case Report form.

For reporting jurisdictions that do not have testing capacity and are sending specimens to CDC for testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs into DCIPHER with the jurisdiction-issued nCoV IDs, unless other arrangements to transmit data have been made and approved by CDC.
2. Please ensure the jurisdiction-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

For jurisdictions that are in 'Phase 1':

1. The jurisdiction should call the EOC Watch Desk/PUI desk at **770-488-7100** to obtain a CDC-issued nCoV ID number, and complete a PUI and Case Report Form.
2. Please make sure the CDC-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

5. Management of the PHLIP reporting process

CDC and APHL have been working with public health laboratories to add automated reporting of the novel coronavirus test results through their existing influenza reporting mechanism, which is most frequently PHLIP.

We ask that participating PHLIP labs begin including nCoV IDs within the lab test message reported through PHLIP. This will allow CDC to: (1) Match these records with persons reported into DCIPHER and (2) work with states to properly characterize the status of persons without existing records in DCIPHER. Information on how to include the nCoV ID in the message has been made available via APHL starting at the bottom of Page 4 (https://www.aphl.org/Materials/02.12.2020_Informatics_FAQs_and_Guidance.pdf).

6. Prioritization of PUI/Case Report variables

To support improved data reporting, CDC has employed the Data Collation & Integration for Public Health Event Response (DCIPHER) platform that jurisdictions can use to directly enter or import and view their data. As of Friday, March 13, all 50 states and 3 jurisdictions (New York City, Washington DC, and U.S. Virgin Islands) are using DCIPHER for the COVID-19 response. Previously, to support jurisdictions in providing timely case information, CDC group the variables included in the National Case Report into 3 tiers to help jurisdictions prioritize what data are collected and reported. While all the information being collected is important, the variables that were included on CDC's list of Tier 1 and Tier 2 variables [**High Priority Variables**] are key to understanding the current burden of disease and its transmission within communities. Further, it is important that this information be entered/submitted within 24 hours of the case being identified to provide adequate situational awareness. The remaining variables (previously referred to as Tier 3 variables) should be submitted as soon as possible, some, of which, may require following up with cases over time.

AMERICAN OVERSIGHT

High Priority Variables
Timeline: entered/submitted within 24 hours of being collected.

- CDC 2019-nCoV ID (cdc_ncov2019_id) (required field)
- Reporting jurisdiction (state) (required field)
- Current status of the person (current_status) (required field)
- State of residence (res_state)
- County of residence (res_county)
- Sex (sex)
- Age (age)
- Age Units (ageunit)
- Symptoms present during course of illness (sympstatus)
- If symptomatic, onset date (onset_dt)
- Hospitalization status (hosp_yn)
- ICU admission status (icu_yn): may not be readily available during initial interview; update as soon as possible
- Death (death_yn): may not be readily available during initial interview; update as soon as possible
- If female, currently pregnant (pregnant_yn)
- Health care worker in the United States (hc_work_yn)
- Exposure data
  - Travel to mainland China (exp_China)
  - Travel to other non-US country (exp_othcountry)
  - Travel to other non-US country, specify (exp_othcountry_spec)
  - Household contact with a COVID-19 case patient (exp_house)
  - Community contact with a COVID-19 case patient (exp_community)
  - Any healthcare contact with a COVID-19 case patient (exp_health)
  - Healthcare contact with a COVID-19 case patient, healthcare worker (exp_health_hcw)
  - Exposure to a cluster of patients with ARDS with unknown etiology (exp_cluster)
- Specimen information
  - Specimen type (see series on specimen type)
  - Specimen ID (see series on specimen ID)
  - Specimen sent to CDC (see series on specimen sent to CDC)
- Report date of case to CDC (case_cdcreport_dt)

Other Variables of Importance
Timeline: submitted as soon as possible or available.

- Specific information on the hospitalization, including admission and discharge dates and ventilation status
- Information on signs and symptoms
- Information on pre-existing conditions
- The remaining variables collected on the PUI and Case Report Form

7. Major avoidable challenges we hope to overcome with your assistance

We recognize the challenges that public health emergencies bring. With your assistance, we hope to avoid the following challenges by following the processes outlined above:

1. Unclear data flow processes for jurisdictional data on PUI and case-patients to CDC
2. Laboratory samples that are not able to be linked with PUI or case-patients
3. Incorrect reports of national and state-level PUI and case burden, as well as descriptive statistics about the population impacted

AMERICAN OVERSIGHT

We appreciate your ongoing partnership. Please email eocevent118@cdc.gov with any questions regarding the PUI or case reporting process.

Best,
CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Subject: FW: CSTE COVID-19 Response | Confirmatory testing of COVID-19 samples is no longer required

---

From: CSTE Emergency Response <Preparedness@cste.org>
Sent: Saturday, March 14, 2020 8:27 PM
To: CSTE Emergency Response
Cc: CSTE Novel Coronavirus 2019
Subject: CSTE COVID-19 Response | Confirmatory testing of COVID-19 samples is no longer required

Sent to State Epidemiologists, Deputy State Epidemiologists, CLUE, Infectious Disease Points of Contact, and the CSTE Executive Board

Good evening,

The message below regarding confirmatory testing of COVID-19 samples has been shared by Greg Armstrong, Deputy Incident Manager, CDC COVID-19 response.

--

CSTE
Council of State and Territorial Epidemiologists
Emergency Preparedness & Response Mailbox
Business Hours Line: 770.458.3811
After-Hours Line: 678.256.3945
preparedness.cste.org

Dear CSTE Colleagues,

Summary: State and local public health laboratories are no longer required to send “presumptive positive” samples to CDC for confirmation. From now on, respiratory samples positive for SARS-CoV2 in a state and public-health laboratory will be considered “positive” with no need for further testing.

More details: Last night, FDA accepted CDC’s request for “enforcement discretion” to allow state and local public-health laboratories to consider positive samples to be interpreted as “positive” with no need for confirmatory testing. This action was supported by data submitted by CDC showing agreement between results in state and local public health labs with corresponding results from CDC. CDC was asked to submit an amendment to its emergency-use authorization (EUA) for formal review.

For epidemiologists, this means that the cases that previously were considered “presumptive” will all now be considered “confirmed.”

Your laboratories should have received notification of this change already through APHL. These changes are retrospective such that samples already submitted to CDC for confirmation and had been awaiting confirmation may now be considered to be positive. CDC is still interested in receiving any specimens for which testing was “inconclusive” and which could not be resolved by repeat testing.

Sincerely,

Gregory Armstrong, MD
Currently assigned to CDC Coronavirus Response as Deputy Incident Manager
garmstrong@cdc.gov

Dear Partners,

CDC continues to institute a standard process for confirming publicly reported cases by jurisdiction.

What you need to do/know now:

- We will conduct case confirmation **daily** (for web posting Monday–Friday). As the response evolves, the frequency of these requests will likely decrease.
- At the bottom of this email, you will find a table with the following:
  - current preliminary case counts we have for each jurisdiction **as of 4 pm ET on Wednesday, March 25**.
  - general community level transmission characterization
- By **9 am ET Thursday, March 26**, **please use the CDC Case Confirmation Portal via the link below** (data are collected via Epi Info and stored on a secure CDC server) to:
  - confirm case counts for your jurisdiction (your numbers **as of 4 pm ET Wednesday, March 25)**
  - if needed, modify your **"community level transmission characterization"**

Please use the link provided below and not a previously saved link in your web browser

https://go.usa.gov/xdtyJ

What you need to know about how your information will be presented:

- These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. They do not include people who returned to the United States via State Department-chartered flights. **We ask that the preliminary information shared in this email not be distributed.**
- What will be shared on the CDC website (updated daily at 12 pm, ET):
  - **The total case count**, i.e., the actual number of *total* cases (e.g., 0, 6, 35) will be posted. **EXCEPTION**: **Jurisdictions with one to five cases will be depicted as a range: "1–5 cases"**
  - Community level transmission characterization
  - Other information shared will be used for internal awareness and will not be shared publicly at this time.

What you need to do/know later:

- DCIPHER users can update and analyze their own jurisdiction's data at: https://dcipher.cdc.gov/. If your jurisdiction does not currently have DCIPHER users, but you would like to move to Phase 2 reporting as described in the attached guidance, please email eocevent118@cdc.gov to confirm your readiness.

Sincerely,

CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Version 13 Mar 2020

Instructions for Completing the Human Infection with 2019 Novel Coronavirus (COVID-19) Person Under Investigation (PUI) and Case Report Form

Purpose: This document describes the procedures for completing the 2019 Novel Coronavirus (COVID-19) Person Under Investigation (PUI) and Case Report Form (CRF) for persons under investigation who are being tested or have been tested for the virus that causes COVID-19.

- PUI: Any person who is currently under investigation for having the virus that causes COVID-19, or who was under investigation but tested negative for the virus.
- Laboratory-confirmed case of COVID-19: Individual who has tested positive for the virus that causes COVID-19 in at least one respiratory specimen (Note: effective 3/14/2020 there is no longer the designation of "presumptive positive").

If a sample from a PUI tests positive for the virus that causes COVID-19, the form should be updated to indicate an individual's change in status from a PUI to being a laboratory-confirmed case.

The form should be completed if a person has a positive laboratory result for the virus that causes COVID-19, even when not previously identified as a PUI.

General:

1. All dates should be formatted MM/DD/YYYY.
2. If completing the .pdf version of the form, use an "X" to mark boxes. Make sure to carefully mark boxes so that the "X" does not cross multiple boxes.

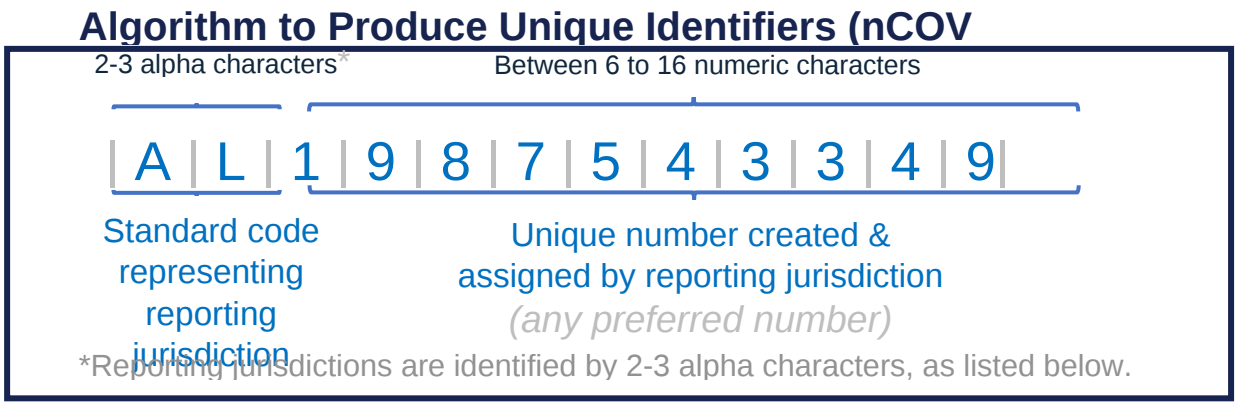
Header:

PATIENT IDENTIFIER INFORMATION IS NOT TRANSMITTED TO CDC AND IS FOR LOCAL-USE ONLY:
Patient first name: Enter case's first (given) name.
Patient last name: Enter case's last (family) name.
Date of birth (MM/DD/YYYY): Enter date of birth in MM/DD/YYYY format.

ID information:

Reporting jurisdiction: Enter the reporting jurisdiction where the PUI or case was identified. The reporting jurisdiction must be a state/city/territory authorized to submit data through NNDSS.

Reporting health department: Enter the name of the health department completing the PUI or case report.



Case state/local ID: Enter a local-use ID assigned by the state or local health department if desired for patient tracking or matching.

CDC 2019-nCoV ID: Enter the CDC 2019-nCoV ID assigned to the PUI or case. If the case was already identified as a PUI in collaboration with CDC, or was part of a contact investigation in which CDC was collaborating with the state or local health department, this CDC 2019-nCoV ID should have

AMERICAN OVERSIGHT

already been assigned and the CDC 2019-nCoV ID that was already provided by CDC should be entered. The CDC 2019 nCoV ID should be a part of the state or local health departments records; please check with the reporting jurisdiction. This may have previously been called a PUI ID. **Do not assign a new 2019-nCoV ID for these individuals**.

If this is a new PUI or case that was not previously under investigation or reported, the CDC 2019-nCoV ID should be assigned by the jurisdiction. CDC 2019-nCoV IDs should be assigned for all PUIs and laboratory-confirmed cases so that this person can be tracked at the jurisdictional and national level. The reporting jurisdiction should assign the CDC 2019-nCoV ID, and use this ID for all specimens and data transmitted to CDC for that person. The structure of the ID should be as follows:

!!! Important !!!

Do not add special characters, dashes, or white spaces to the nCoV ID. The alpha- and numeric-portions of the ID are seamless. The numeric portion of the ID cannot begin with zero ('0').

State	Code
Alabama	AL
Alaska	AK

This ID will be used to track information about the PUI or case-patient in CDC data systems and **must** be provided on all forms or specimens related to this individual.

Contact ID: Only fill out this field if a PUI or case-patient is a known contact to another confirmed case of COVID-19. Contact IDs are assigned using the original (source) case-patient's nCoV ID followed by a hyphen and a sequential number indicating the order in which the contact was identified (e.g., Confirmed case CA102034567 may have contacts CA102034567 -01 and CA102034567 -02). If the person was previously under investigation in collaboration with CDC, or was part of a contact investigation in which CDC was collaborating with state/local health departments, this Contact ID may have been

AMERICAN OVERSIGHT

assigned previously. This should be a part of the state or local health departments records; please check with the reporting jurisdiction.

NNDSS loc. rec. ID/Case ID: For NNDSS reporters, enter the GenV2 or NETSS patient identifier.

Interviewer information

Name of interviewer: Enter the last name and first name of the person performing the interview.

Affiliation/Organization: Enter the interviewer's affiliation/organization.

Telephone: Enter the interviewer's telephone number.

Email: Enter the interviewer's email address.

Basic case information

What is the current status of this person?

- Select "PUI, testing pending" if a PUI has been identified but the initial laboratory testing has not yet been completed.
- Select "PUI, tested negative" if a PUI was previously identified, but the laboratory testing for the virus that causes COVID-19 was negative.
- Select "laboratory-confirmed case" if a person has at least one respiratory specimen that tested positive for the virus that causes COVID-19 by a CDC laboratory, state or local public health laboratory, or commercial laboratory using FDA-validated COVID 19 NAA. (Note: effective 3/14/2020 there is no longer the designation of "presumptive positive").

Please update this field each time the individual's status changes.

Report date of PUI to CDC: Enter the date the person was initially reported to CDC **as a PUI** in MM/DD/YYYY format.

Report date of case to CDC: Enter the date the case-patient was initially reported to CDC **as a case** in MM/DD/YYYY format. That is, please report the date at which the person changed from not being a case to being either a laboratory-confirmed case.

County of Residence: Please enter the individual's county of residence. Residence is typically defined by CSTE as the place of 'usual residence' at the time an infection is acquired.

State of Residence: Please enter the individual's county of residence. Residence is typically defined by CSTE as the place of 'usual residence' at the time an infection is acquired. The state of residence and reporting jurisdiction may be two distinct places.

Ethnicity: Select appropriate response. If unknown, select not specified.

Sex: Select appropriate response.

Race: Check all race categories that apply. If other, please specify in free text.

AMERICAN OVERSIGHT

Date of birth: Enter the PUI or case-patient's date of birth in MM/DD/YYYY format. Only enter data in this field if data can be transmitted to CDC per state/local policy.

Age: Enter the PUI or case-patient's age. Age may be entered in units of years, months, or days. Units will be specified later.

Age units (year/month/day): Select age units.

Date of first positive specimen collection: Enter the date of this person's first positive respiratory specimen collection, regardless of specimen type, in MM/DD/YYYY format. If the person tested positive, but the date is unknown, select "Unknown." If the person is a PUI and tested negative or is awaiting initial test results, select "N/A."

Did the patient develop pneumonia?: Select the appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select 'unknown' if missing chart.

Did the patient have acute respiratory distress syndrome?: Select appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select "unknown" if missing chart.

Did the patient have another diagnosis/etiology for their illness?: Select appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select "unknown" if missing chart.

Did the patient have an abnormal chest X-ray?: Select appropriate response. Select "unknown" if missing chart. Select 'yes' if—at any time—the person had an abnormal chest X-ray as part of this illness.

Symptoms present during course of illness?: This question refers to the PUI or case-patient's symptom status related to the entire duration of illness. If the PUI or case-patient was ever symptomatic as part of this illness with COVID-19, select "symptomatic." If the PUI or case-patient was asymptomatic (never experienced symptoms as part of this illness), please select "asymptomatic." If symptom status is unknown, select "unknown."

- If symptomatic, record symptom onset date in MM/DD/YYYY format or mark "unknown."
- If the PUI or case-patient was previously symptomatic and symptoms are currently resolved at the time of completing or updating this form, list date of symptom resolution in MM/DD/YYYY format. If exact dates of symptom resolution are not known, but there is a known approximate date, enter this in the date field. If still symptomatic at time of interview, mark "Still symptomatic." If the PUI or case-patient had symptoms, and the symptoms are resolved, but there is no information about the time frame of symptom resolution, mark "Symptoms resolved, unknown date." If the interviewer and patient do not know the symptom status, mark "Unknown symptom status."

Was the patient hospitalized? Select the appropriate response. If yes, provide dates of first hospital admission and first hospital discharge in MM/DD/YYYY format. If the patient is currently hospitalized, please leave the discharge date blank. This field can be revised at a later time.

Was the patient admitted to an intensive care unit (ICU)? Select the appropriate response. Select "unknown" if the medical chart is not available or ICU admission is not known.

AMERICAN OVERSIGHT

Did the patient receive mechanical ventilation (MV)/intubation? Select “Yes” if the patient was mechanically ventilated during hospitalization via intubation *or* tracheostomy. If yes, count the total number of days with mechanical ventilation. Round up to whole number. Select “unknown” if the medical chart is not available.

Did the patient receive extracorporeal membrane oxygenation (ECMO)?: Select the appropriate response. Select “unknown” if the medical chart is not available.

Did the patient die as a result of this illness? Select appropriate response. If "Yes," then enter date of death in MM/DD/YYYY format. If unknown date of death, please select “Unknown date of death.” (In DCIPHER, this is phrased as “Check if date of death unknown.”)

Is the patient a health care worker in the United States?: Select the appropriate response. HCP are defined as all paid and unpaid persons working in health-care settings who have the potential for exposure to patients and/or to infectious materials, including body substances, contaminated medical supplies and equipment, contaminated environmental surfaces, or contaminated air. HCP might include (but are not limited to) physicians, nurses, nursing assistants, therapists, technicians, emergency medical service personnel, dental personnel, pharmacists, laboratory personnel, autopsy personnel, students and trainees, contractual staff not employed by the health-care facility, and persons (e.g., clerical, dietary, housekeeping, laundry, security, maintenance, administrative, billing, and volunteers) not directly involved in patient care but potentially exposed to infectious agents that can be transmitted to and from HCP and patients.

Does the patient have a history of being in a healthcare facility (as a patient, worker, or visitor) in China?: Select the appropriate response.

In the 14 days prior to illness onset, did the patient have any of the following exposures: Check all that apply. For healthcare contact with another lab-confirmed COVID-19 case-patient, check if the PUI or case-patient identified in the current form was a patient, a visitor (e.g., accompanying family member who was seeking care), or a healthcare worker, when they contacted a lab-confirmed COVID-19 case-patient.

If the PUI or case-patient traveled to a non-US country that was not China, select all of the countries that the person traveled to within the past 14 days by selecting all relevant response options from the drop-down menu. If the country that the PUI or case-patient traveled to in the past 14 days is not listed, you may write the appropriate country in the text field. If the PUI or case-patient had traveled on a cruise, had exposure to large social gatherings (e.g. conference, concert), or had work-related exposures to large groups (e.g. airport screeners, port workers), please include details in the free text field.

If the patient had contact with another COVID-19 case, was this person a U.S. case?: Select the appropriate response. If yes, please provide the nCoV ID of the source case. If the patient did not have contact with another case, please select “N/A.”

Under what process was the PUI or case first identified? Please check all that apply. If identified by the EpiX notification of travelers, please provide the DGMQID. If other, please specify.

AMERICAN OVERSIGHT

Symptoms, clinical course, past medical history and social history:

Collected from (check all that apply): Please select “patient interview” or “medical record review.” If both sources were used to collect information on symptoms, clinical course, past medical history, and social history, please select both response options.

During this illness, did you experience any of the following symptoms? Please select “Yes,” “No,” or “Unknown” for each specific symptom. Please indicate the symptoms that the PUI or case-patient has experienced to date, even if he/she is no longer experiencing these symptoms. All symptoms should have an answer. If other symptoms were experienced, then describe the symptom in the space after “Other”.

Pre-existing medical conditions?: Mark the appropriate response based on whether the PUI or case-patient has *any* pre-existing medical conditions prior to investigation or confirmation of COVID-19. If PUI or case-patient has no pre-existing medical conditions, mark “No.” If not collected during interview and medical chart is missing, mark “Unknown.” After answering the initial (summary) question, please provide a response for *each* pre-existing condition. All questions—other than pregnancy—pertain to a *current* or *past* history of the condition. If “Yes” to neurologic/neurodevelopment/intellectual disability or Other Chronic Diseases, please specify. The pregnancy question should be marked “Yes” if the PUI or case-patient is female and currently or recently pregnant (i.e., gave birth while ill with COVID-19).

Current smoker: Select the appropriate response.

Former smoker: Select the appropriate response.

Respiratory diagnostic testing: For each pathogen, indicate whether the test was positive, negative, pending, or not done. If the PUI or case-patient had a test performed for another pathogen, please check the appropriate test result and specify the name of the pathogen next to “Other, Specify.” (In DCIPHER, please specify additional tests/pathogens only if they are positive.) If multiple tests for the same pathogen were completed, mark “Positive” if any of the tests for that pathogen were positive during the course of the illness suspected to be COVID-19.

Specimens for COVID-19 testing: For each specimen tested for the virus that causes COVID-19, record if the specimen was from a nasopharyngeal swab (NP), oropharyngeal swab (OP), sputum, or other specimen (specify type). If combined NP/OP swabs are collected, record results in the field for NP swabs. Jurisdictions can provide up to three results for each type of specimen; if additional specimens are collected, please provide information about these specimens in the “additional state/local specimen ID” fields below this question. If there are still additional specimens, please use the notes field following the specimen collection information to provide specimen IDs. Provide the local, state, or jurisdictional specimen ID associated with each specimen, as well as the date the specimen was collected in MM/DD/YYYY format. For specimens tested at a local or state public health laboratory or at a commercial laboratory, select ”State Lab Tested.” For specimens tested at CDC, select “Sent to CDC.” For each test performed, indicate the result: positive, negative, pending, not done, or indeterminate.

Please update these test results as they become available.

Additional state/local Specimen IDs: Provide additional specimen IDs from state/local laboratories for specimens tested for the virus that causes COVID-19. If needed, prioritize listing those specimens testing positive for the virus that causes COVID-19, regardless of specimen type.

AMERICAN OVERSIGHT

Updated Sunday, March 15 (major updates are highlighted in yellow)

Dear state and territorial partners:

Thank you for your continued partnership in the ongoing emergency response to COVID-19. The information included below aligns with what was shared by CDC during the 5 pm ET CSTE call on Saturday, February 29th, a CSTE email sent Friday, March 6th, and in a CSTE email sent during the weekend of March 14 regarding: 1) confirming a jurisdiction's 'Phase 2' status for reporting PUI and cases; 2) additional guidance on using the current PUI and Case Report Form, including classification of all positive laboratory tests as confirmed cases; 3) update on the status of historical PUI data imports into DCIPHER; 4) clarifications to the CDC reporting process for PUI/Case Report Forms and lab findings; 5) management of the PHLIP laboratory reporting process; 6) prioritization of the PUI/Case Report variables; and 7) major avoidable issues we hope to overcome with your assistance.

1. Jurisdictional 'Phase 2' Status

Given the need to maintain timely, actionable data at the national level, and process laboratory results at CDC for testing, **all jurisdictions should now be, or actively working towards being, onboarded to 'Phase 2',** which includes being able to assign unique identifiers to PUI/cases at the reporting jurisdiction level. If your jurisdiction has not yet confirmed its 'Phase 2' status, including how you will be inputting data into DCIPHER (preferred method: direct entry), please email eocevent118@cdc.gov.

Reminder: as of March 6th, CDC made the reporting of PUI to CDC through DCIPHER optional for jurisdictions in Phase 2. Jurisdictions **should continue to report positive cases to CDC** using the combined PUI/Case Report Form.

2. Updates to PUI and Case Report Form (CRF) on CDC's Website

Please continue to use the 5 status classifications below when completing a CRF. However, note the changes in how to apply the classifications.

1. PUI, testing pending
2. PUI, tested negative
3. Presumptive case (positive test by state or local health department lab*), confirmatory testing pending
4. Presumptive case (positive test by state or local health department lab*), confirmatory testing negative
5. Laboratory-confirmed case†

**These designations are no longer applicable on or after 3/14/2020*

†Now includes positive tests conducted by the CDC laboratory, commercial lab using FDA-validated COVID 19 NAA, or state or local health department lab.

These changes reflect FDA's acceptance of CDC's request for "enforcement discretion" to allow state and local public-health laboratories to consider positive samples to be interpreted as "positive" with no need for confirmatory testing. This action was supported by data submitted by CDC showing agreement between results in state and local public health labs with corresponding results from CDC. **These changes are retrospective such that samples already submitted to CDC for confirmation and had been awaiting confirmation may now be considered to be positive.** CDC is still interested in receiving any specimens for which testing was "inconclusive" and which could not be resolved by repeat testing. For reporting purposes, these persons can be classified as "PUI, testing pending" until resulted by the CDC Laboratory. For epidemiologists, this will have little impact operationally, since the policy from the beginning was to act on "presumptive positives" as though they have already been confirmed. This means that the cases that previously were considered "presumptive" will all now be considered "confirmed". **For CDC analyses, presumptive and confirmed positive cases will be treated the same. Jurisdictions do not need to make changes to the historical data previously reported to CDC.**

Critical laboratory testing result fields are included at the end of the CRF to reflect COVID-19 laboratory test results. To minimize the need for making changes to the CRF at this time, **please use the same fields to report**

AMERICAN OVERSIGHT

specimens tested at the local level whether the testing laboratory was the state or jurisdiction public health laboratory or commercial laboratory. Further, **if the specimen was from a combined nasopharyngeal (NP) and oropharyngeal (OP) swab, record the results in the NP swab field**. CDC will work towards populating our laboratory results into the CDC result field for each specimen sent to us so that results can be viewed in DCIPHER as they are resulted and communicated to individual jurisdictions. To support this matching process and to ensure the specimen is tested, please make sure to include an nCoV ID when submitting the specimen(s) to CDC.

If the PUI or case-patient had traveled on a cruise, had exposure to large social gatherings (e.g. conference, concert), or work-related exposures to large groups (e.g. airport screeners, port workers), please indicate in the free text field available with the "Other, specify:" option for the question: "In the 14 days prior to illness onset, did the patient have any of the following exposures (check all that apply)."

Changes will also be reflected in the material made available on CDC's website.

3. Historical PUI Data Imported into DCIPHER

As of February 28, data reported to CDC on PUI, presumptive cases, and laboratory-confirmed cases have been made available in DCIPHER.

- Jurisdictions in 'Phase 2' are now able to go into the DCIPHER platform to view and edit existing records of PUI, presumptive positive, and laboratory-confirmed cases, as their status changes or more data become available.
- Jurisdictions in 'Phase 1' should continue to call the EOC Watch Desk at 770-488-7100 to update information on existing PUI, cases of COVID-19.

4. CDC Reporting Process for PUI/Case Reports and Lab Findings – Revised March 6th

CDC laboratory has received several specimens that were not assigned an nCoV ID. **Please note that all specimens need an nCoV ID for submission to CDC laboratory.** In the event that a sample is missing an nCoV ID, the specimen will be frozen, our staff will reach out to the point-of-contact listed on the submission form, and we will test the specimen once the nCoV ID has been submitted. Please provide an nCoV ID with all specimens to avoid delays in testing.

As of March 6, information for PUIs no longer needs to be entered into DCIPHER. However, jurisdictions may use NNDSS or DCIPHER to manage their PUIs.

For reporting jurisdictions that have the capacity to do their own testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter cases into DCIPHER with the jurisdiction-issued nCoV ID, unless other arrangements to transmit data have been made and approved by CDC.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. If the person is already in DCIPHER, please update the person's disposition to 'PUI, tested negative' in DCIPHER.
3. If a specimen is tested locally, is **POSITIVE,** and is **the jurisdiction's first case or is part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify CDC of the positive result.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected and submitted on the PUI and Case Report Form.
4. If a specimen is tested locally, is **POSITIVE,** and is **from a jurisdiction with existing presumptive or confirmed cases and is not part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Update the person's disposition in DCIPHER to "Confirmed Case"

AMERICAN OVERSIGHT

For jurisdictions that are in 'Phase 1':

1. The jurisdictions should call the EOC Watch Desk/PUI desk at 770-488-7100 to receive a CDC-issued nCoV ID, and to complete a PUI and Case Report Form.
2. If a specimen is tested locally and is **NEGATIVE**, no further action is needed unless the person has already been reported to CDC as a PUI; if so:
    a. Please email eocevent118@cdc.gov and provide the nCoV ID and test result.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify them of the positive result.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected on the PUI and Case Report form.

For reporting jurisdictions that do not have testing capacity and are sending specimens to CDC for testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs into DCIPHER with the jurisdiction-issued nCoV IDs, unless other arrangements to transmit data have been made and approved by CDC.
2. Please ensure the jurisdiction-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

For jurisdictions that are in 'Phase 1':

1. The jurisdiction should call the EOC Watch Desk/PUI desk at **770-488-7100** to obtain a CDC-issued nCoV ID number, and complete a PUI and Case Report Form.
2. Please make sure the CDC-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

5. Management of the PHLIP reporting process

CDC and APHL have been working with public health laboratories to add automated reporting of the novel coronavirus test results through their existing influenza reporting mechanism, which is most frequently PHLIP.

We ask that participating PHLIP labs begin including nCoV IDs within the lab test message reported through PHLIP. This will allow CDC to: (1) Match these records with persons reported into DCIPHER and (2) work with states to properly characterize the status of persons without existing records in DCIPHER. Information on how to include the nCoV ID in the message has been made available via APHL starting at the bottom of Page 4 (https://www.aphl.org/Materials/02.12.2020_Informatics_FAQs_and_Guidance.pdf).

6. Prioritization of PUI/Case Report variables

To support improved data reporting, CDC has employed the Data Collation & Integration for Public Health Event Response (DCIPHER) platform that jurisdictions can use to directly enter or import and view their data. As of Friday, March 13, all 50 states and 3 jurisdictions (New York City, Washington DC, and U.S. Virgin Islands) are using DCIPHER for the COVID-19 response. Previously, to support jurisdictions in providing timely case information, CDC group the variables included in the National Case Report into 3 tiers to help jurisdictions prioritize what data are collected and reported. While all the information being collected is important, the variables that were included on CDC's list of Tier 1 and Tier 2 variables [**High Priority Variables**] are key to understanding the current burden of disease and its transmission within communities. Further, it is important that this information be entered/submitted within 24 hours of the case being identified to provide adequate situational awareness. The remaining variables (previously referred to as Tier 3 variables) should be submitted as soon as possible, some, of which, may require following up with cases over time.

AMERICAN OVERSIGHT

High Priority Variables
Timeline: entered/submitted within 24 hours of being collected.

- CDC 2019-nCoV ID (cdc_ncov2019_id) (required field)
- Reporting jurisdiction (state) (required field)
- Current status of the person (current_status) (required field)
- State of residence (res_state)
- County of residence (res_county)
- Sex (sex)
- Age (age)
- Age Units (ageunit)
- Symptoms present during course of illness (sympstatus)
- If symptomatic, onset date (onset_dt)
- Hospitalization status (hosp_yn)
- ICU admission status (icu_yn): may not be readily available during initial interview; update as soon as possible
- Death (death_yn): may not be readily available during initial interview; update as soon as possible
- If female, currently pregnant (pregnant_yn)
- Health care worker in the United States (hc_work_yn)
- Exposure data
  - Travel to mainland China (exp_China)
  - Travel to other non-US country (exp_othcountry)
  - Travel to other non-US country, specify (exp_othcountry_spec)
  - Household contact with a COVID-19 case patient (exp_house)
  - Community contact with a COVID-19 case patient (exp_community)
  - Any healthcare contact with a COVID-19 case patient (exp_health)
  - Healthcare contact with a COVID-19 case patient, healthcare worker (exp_health_hcw)
  - Exposure to a cluster of patients with ARDS with unknown etiology (exp_cluster)
- Specimen information
  - Specimen type (see series on specimen type)
  - Specimen ID (see series on specimen ID)
  - Specimen sent to CDC (see series on specimen sent to CDC)
- Report date of case to CDC (case_cdcreport_dt)

Other Variables of Importance
Timeline: submitted as soon as possible or available.

- Specific information on the hospitalization, including admission and discharge dates and ventilation status
- Information on signs and symptoms
- Information on pre-existing conditions
- The remaining variables collected on the PUI and Case Report Form

7. Major avoidable challenges we hope to overcome with your assistance

We recognize the challenges that public health emergencies bring. With your assistance, we hope to avoid the following challenges by following the processes outlined above:

1. Unclear data flow processes for jurisdictional data on PUI and case-patients to CDC
2. Laboratory samples that are not able to be linked with PUI or case-patients
3. Incorrect reports of national and state-level PUI and case burden, as well as descriptive statistics about the population impacted

AMERICAN OVERSIGHT

We appreciate your ongoing partnership. Please email eocevent118@cdc.gov with any questions regarding the PUI or case reporting process.

Best,
CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Subject: FW: CSTE COVID-19 Response | Confirmatory testing of COVID-19 samples is no longer required

---

From: CSTE Emergency Response <Preparedness@cste.org>
Sent: Saturday, March 14, 2020 8:27 PM
To: CSTE Emergency Response
Cc: CSTE Novel Coronavirus 2019
Subject: CSTE COVID-19 Response | Confirmatory testing of COVID-19 samples is no longer required

Sent to State Epidemiologists, Deputy State Epidemiologists, CLUE, Infectious Disease Points of Contact, and the CSTE Executive Board

Good evening,

The message below regarding confirmatory testing of COVID-19 samples has been shared by Greg Armstrong, Deputy Incident Manager, CDC COVID-19 response.

--

CSTE
Council of State and Territorial Epidemiologists
Emergency Preparedness & Response Mailbox
Business Hours Line: 770.458.3811
After-Hours Line: 678.256.3945
preparedness.cste.org

Dear CSTE Colleagues,

Summary: State and local public health laboratories are no longer required to send “presumptive positive” samples to CDC for confirmation. From now on, respiratory samples positive for SARS-CoV2 in a state and public-health laboratory will be considered “positive” with no need for further testing.

More details: Last night, FDA accepted CDC’s request for “enforcement discretion” to allow state and local public-health laboratories to consider positive samples to be interpreted as “positive” with no need for confirmatory testing. This action was supported by data submitted by CDC showing agreement between results in state and local public health labs with corresponding results from CDC. CDC was asked to submit an amendment to its emergency-use authorization (EUA) for formal review.

For epidemiologists, this means that the cases that previously were considered “presumptive” will all now be considered “confirmed.”

Your laboratories should have received notification of this change already through APHL. These changes are retrospective such that samples already submitted to CDC for confirmation and had been awaiting confirmation may now be considered to be positive. CDC is still interested in receiving any specimens for which testing was “inconclusive” and which could not be resolved by repeat testing.

Sincerely,

Gregory Armstrong, MD
Currently assigned to CDC Coronavirus Response as Deputy Incident Manager
garmstrong@cdc.gov

Dear Partners,

CDC continues to institute a standard process for confirming publicly reported cases by jurisdiction.

What you need to do/know now:

- We will conduct case confirmation **daily** (for web posting Monday–Friday). As the response evolves, the frequency of these requests will likely decrease.
- At the bottom of this email, you will find a table with the following:
  - current preliminary case counts we have for each jurisdiction **as of 4 pm ET on Sunday, March 22**.
  - general community level transmission characterization
- By **9 am ET Monday, March 23**, **please use the CDC Case Confirmation Portal via the link below** (data are collected via Epi Info and stored on a secure CDC server) to:
  - confirm case counts for your jurisdiction (your numbers **as of 4 pm ET Sunday, March 22)**
  - if needed, modify your **"community level transmission characterization"**

Please use the link provided below and not a previously saved link in your web browser

https://go.usa.gov/xdtyJ

What you need to know about how your information will be presented:

- These data represent cases detected and tested in the United States through U.S. public health surveillance systems since January 21, 2020. They do not include people who returned to the United States via State Department-chartered flights. **We ask that the preliminary information shared in this email not be distributed.**
- What will be shared on the CDC website (updated daily at 12 pm, ET):
  - **The total case count**, i.e., the actual number of *total* cases (e.g., 0, 6, 35) will be posted. **EXCEPTION**: **Jurisdictions with one to five cases will be depicted as a range: "1–5 cases"**
  - Community level transmission characterization
  - Other information shared will be used for internal awareness and will not be shared publicly at this time.

What you need to do/know later:

- DCIPHER users can update and analyze their own jurisdiction's data at: https://dcipher.cdc.gov/. If your jurisdiction does not currently have DCIPHER users, but you would like to move to Phase 2 reporting as described in the attached guidance, please email eocevent118@cdc.gov to confirm your readiness.

Sincerely,

CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Version 13 Mar 2020

Instructions for Completing the Human Infection with 2019 Novel Coronavirus (COVID-19) Person Under Investigation (PUI) and Case Report Form

Purpose: This document describes the procedures for completing the 2019 Novel Coronavirus (COVID-19) Person Under Investigation (PUI) and Case Report Form (CRF) for persons under investigation who are being tested or have been tested for the virus that causes COVID-19.

- PUI: Any person who is currently under investigation for having the virus that causes COVID-19, or who was under investigation but tested negative for the virus.
- Laboratory-confirmed case of COVID-19: Individual who has tested positive for the virus that causes COVID-19 in at least one respiratory specimen (Note: effective 3/14/2020 there is no longer the designation of "presumptive positive").

If a sample from a PUI tests positive for the virus that causes COVID-19, the form should be updated to indicate an individual's change in status from a PUI to being a laboratory-confirmed case.

The form should be completed if a person has a positive laboratory result for the virus that causes COVID-19, even when not previously identified as a PUI.

General:

1. All dates should be formatted MM/DD/YYYY.
2. If completing the .pdf version of the form, use an "X" to mark boxes. Make sure to carefully mark boxes so that the "X" does not cross multiple boxes.

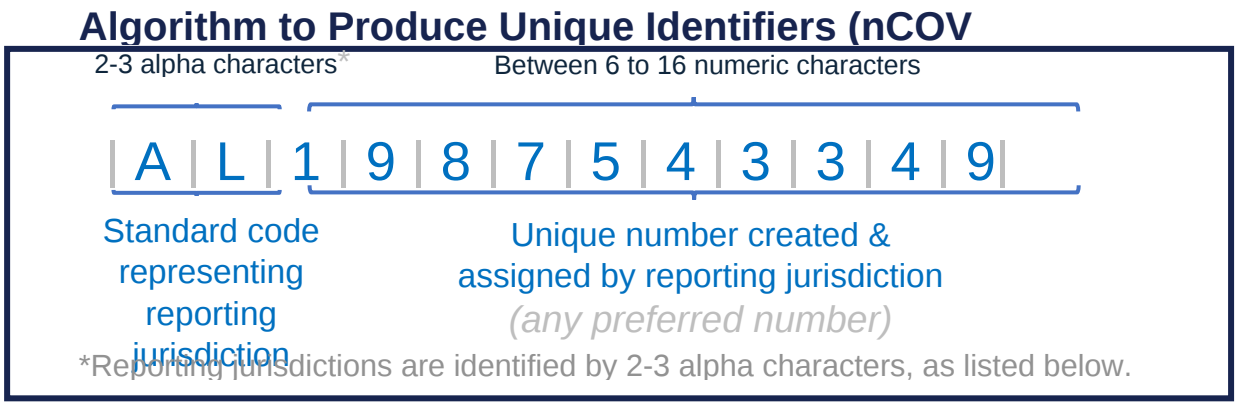
Header:

PATIENT IDENTIFIER INFORMATION IS NOT TRANSMITTED TO CDC AND IS FOR LOCAL-USE ONLY:
Patient first name: Enter case's first (given) name.
Patient last name: Enter case's last (family) name.
Date of birth (MM/DD/YYYY): Enter date of birth in MM/DD/YYYY format.

ID information:

Reporting jurisdiction: Enter the reporting jurisdiction where the PUI or case was identified. The reporting jurisdiction must be a state/city/territory authorized to submit data through NNDSS.

Reporting health department: Enter the name of the health department completing the PUI or case report.



Case state/local ID: Enter a local-use ID assigned by the state or local health department if desired for patient tracking or matching.

CDC 2019-nCoV ID: Enter the CDC 2019-nCoV ID assigned to the PUI or case. If the case was already identified as a PUI in collaboration with CDC, or was part of a contact investigation in which CDC was collaborating with the state or local health department, this CDC 2019-nCoV ID should have

AMERICAN OVERSIGHT

already been assigned and the CDC 2019-nCoV ID that was already provided by CDC should be entered. The CDC 2019 nCoV ID should be a part of the state or local health departments records; please check with the reporting jurisdiction. This may have previously been called a PUI ID. **Do not assign a new 2019-nCoV ID for these individuals**.

If this is a new PUI or case that was not previously under investigation or reported, the CDC 2019-nCoV ID should be assigned by the jurisdiction. CDC 2019-nCoV IDs should be assigned for all PUIs and laboratory-confirmed cases so that this person can be tracked at the jurisdictional and national level. The reporting jurisdiction should assign the CDC 2019-nCoV ID, and use this ID for all specimens and data transmitted to CDC for that person. The structure of the ID should be as follows:

!!! Important !!!

Do not add special characters, dashes, or white spaces to the nCoV ID. The alpha- and numeric-portions of the ID are seamless. The numeric portion of the ID cannot begin with zero ('0').

This ID will be used to track information about the PUI or case-patient in CDC data systems and **must** be provided on all forms or specimens related to this individual.

Contact ID: Only fill out this field if a PUI or case-patient is a known contact to another confirmed case of COVID-19. Contact IDs are assigned using the original (source) case-patient's nCoV ID followed by a hyphen and a sequential number indicating the order in which the contact was identified (e.g., Confirmed case CA102034567 may have contacts CA102034567 -01 and CA102034567 -02). If the person was previously under investigation in collaboration with CDC, or was part of a contact investigation in which CDC was collaborating with state/local health departments, this Contact ID may have been

AMERICAN OVERSIGHT

assigned previously. This should be a part of the state or local health departments records; please check with the reporting jurisdiction.

NNDSS loc. rec. ID/Case ID: For NNDSS reporters, enter the GenV2 or NETSS patient identifier.

Interviewer information

Name of interviewer: Enter the last name and first name of the person performing the interview.

Affiliation/Organization: Enter the interviewer's affiliation/organization.

Telephone: Enter the interviewer's telephone number.

Email: Enter the interviewer's email address.

Basic case information

What is the current status of this person?

- Select "PUI, testing pending" if a PUI has been identified but the initial laboratory testing has not yet been completed.
- Select "PUI, tested negative" if a PUI was previously identified, but the laboratory testing for the virus that causes COVID-19 was negative.
- Select "laboratory-confirmed case" if a person has at least one respiratory specimen that tested positive for the virus that causes COVID-19 by a CDC laboratory, state or local public health laboratory, or commercial laboratory using FDA-validated COVID 19 NAA. (Note: effective 3/14/2020 there is no longer the designation of "presumptive positive").

Please update this field each time the individual's status changes.

Report date of PUI to CDC: Enter the date the person was initially reported to CDC **as a PUI** in MM/DD/YYYY format.

Report date of case to CDC: Enter the date the case-patient was initially reported to CDC **as a case** in MM/DD/YYYY format. That is, please report the date at which the person changed from not being a case to being either a laboratory-confirmed case.

County of Residence: Please enter the individual's county of residence. Residence is typically defined by CSTE as the place of 'usual residence' at the time an infection is acquired.

State of Residence: Please enter the individual's county of residence. Residence is typically defined by CSTE as the place of 'usual residence' at the time an infection is acquired. The state of residence and reporting jurisdiction may be two distinct places.

Ethnicity: Select appropriate response. If unknown, select not specified.

Sex: Select appropriate response.

Race: Check all race categories that apply. If other, please specify in free text.

AMERICAN OVERSIGHT

Date of birth: Enter the PUI or case-patient's date of birth in MM/DD/YYYY format. Only enter data in this field if data can be transmitted to CDC per state/local policy.

Age: Enter the PUI or case-patient's age. Age may be entered in units of years, months, or days. Units will be specified later.

Age units (year/month/day): Select age units.

Date of first positive specimen collection: Enter the date of this person's first positive respiratory specimen collection, regardless of specimen type, in MM/DD/YYYY format. If the person tested positive, but the date is unknown, select "Unknown." If the person is a PUI and tested negative or is awaiting initial test results, select "N/A."

Did the patient develop pneumonia?: Select the appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select 'unknown' if missing chart.

Did the patient have acute respiratory distress syndrome?: Select appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select "unknown" if missing chart.

Did the patient have another diagnosis/etiology for their illness?: Select appropriate response. Refer to the clinical discharge summary in the patient's medical chart. This should not be from ICD codes. Select "unknown" if missing chart.

Did the patient have an abnormal chest X-ray?: Select appropriate response. Select "unknown" if missing chart. Select 'yes' if—at any time—the person had an abnormal chest X-ray as part of this illness.

Symptoms present during course of illness?: This question refers to the PUI or case-patient's symptom status related to the entire duration of illness. If the PUI or case-patient was ever symptomatic as part of this illness with COVID-19, select "symptomatic." If the PUI or case-patient was asymptomatic (never experienced symptoms as part of this illness), please select "asymptomatic." If symptom status is unknown, select "unknown."

- If symptomatic, record symptom onset date in MM/DD/YYYY format or mark "unknown."
- If the PUI or case-patient was previously symptomatic and symptoms are currently resolved at the time of completing or updating this form, list date of symptom resolution in MM/DD/YYYY format. If exact dates of symptom resolution are not known, but there is a known approximate date, enter this in the date field. If still symptomatic at time of interview, mark "Still symptomatic." If the PUI or case-patient had symptoms, and the symptoms are resolved, but there is no information about the time frame of symptom resolution, mark "Symptoms resolved, unknown date." If the interviewer and patient do not know the symptom status, mark "Unknown symptom status."

Was the patient hospitalized? Select the appropriate response. If yes, provide dates of first hospital admission and first hospital discharge in MM/DD/YYYY format. If the patient is currently hospitalized, please leave the discharge date blank. This field can be revised at a later time.

Was the patient admitted to an intensive care unit (ICU)? Select the appropriate response. Select "unknown" if the medical chart is not available or ICU admission is not known.

AMERICAN OVERSIGHT

Did the patient receive mechanical ventilation (MV)/intubation? Select “Yes” if the patient was mechanically ventilated during hospitalization via intubation *or* tracheostomy. If yes, count the total number of days with mechanical ventilation. Round up to whole number. Select “unknown” if the medical chart is not available.

Did the patient receive extracorporeal membrane oxygenation (ECMO)?: Select the appropriate response. Select “unknown” if the medical chart is not available.

Did the patient die as a result of this illness? Select appropriate response. If "Yes," then enter date of death in MM/DD/YYYY format. If unknown date of death, please select “Unknown date of death.” (In DCIPHER, this is phrased as “Check if date of death unknown.”)

Is the patient a health care worker in the United States?: Select the appropriate response. HCP are defined as all paid and unpaid persons working in health-care settings who have the potential for exposure to patients and/or to infectious materials, including body substances, contaminated medical supplies and equipment, contaminated environmental surfaces, or contaminated air. HCP might include (but are not limited to) physicians, nurses, nursing assistants, therapists, technicians, emergency medical service personnel, dental personnel, pharmacists, laboratory personnel, autopsy personnel, students and trainees, contractual staff not employed by the health-care facility, and persons (e.g., clerical, dietary, housekeeping, laundry, security, maintenance, administrative, billing, and volunteers) not directly involved in patient care but potentially exposed to infectious agents that can be transmitted to and from HCP and patients.

Does the patient have a history of being in a healthcare facility (as a patient, worker, or visitor) in China?: Select the appropriate response.

In the 14 days prior to illness onset, did the patient have any of the following exposures: Check all that apply. For healthcare contact with another lab-confirmed COVID-19 case-patient, check if the PUI or case-patient identified in the current form was a patient, a visitor (e.g., accompanying family member who was seeking care), or a healthcare worker, when they contacted a lab-confirmed COVID-19 case-patient.

If the PUI or case-patient traveled to a non-US country that was not China, select all of the countries that the person traveled to within the past 14 days by selecting all relevant response options from the drop-down menu. If the country that the PUI or case-patient traveled to in the past 14 days is not listed, you may write the appropriate country in the text field. If the PUI or case-patient had traveled on a cruise, had exposure to large social gatherings (e.g. conference, concert), or had work-related exposures to large groups (e.g. airport screeners, port workers), please include details in the free text field.

If the patient had contact with another COVID-19 case, was this person a U.S. case?: Select the appropriate response. If yes, please provide the nCoV ID of the source case. If the patient did not have contact with another case, please select “N/A.”

Under what process was the PUI or case first identified? Please check all that apply. If identified by the EpiX notification of travelers, please provide the DGMQID. If other, please specify.

AMERICAN OVERSIGHT

Symptoms, clinical course, past medical history and social history:

Collected from (check all that apply): Please select “patient interview” or “medical record review.” If both sources were used to collect information on symptoms, clinical course, past medical history, and social history, please select both response options.

During this illness, did you experience any of the following symptoms? Please select “Yes,” “No,” or “Unknown” for each specific symptom. Please indicate the symptoms that the PUI or case-patient has experienced to date, even if he/she is no longer experiencing these symptoms. All symptoms should have an answer. If other symptoms were experienced, then describe the symptom in the space after “Other”.

Pre-existing medical conditions?: Mark the appropriate response based on whether the PUI or case-patient has *any* pre-existing medical conditions prior to investigation or confirmation of COVID-19. If PUI or case-patient has no pre-existing medical conditions, mark “No.” If not collected during interview and medical chart is missing, mark “Unknown.” After answering the initial (summary) question, please provide a response for *each* pre-existing condition. All questions—other than pregnancy—pertain to a *current* or *past* history of the condition. If “Yes” to neurologic/neurodevelopment/intellectual disability or Other Chronic Diseases, please specify. The pregnancy question should be marked “Yes” if the PUI or case-patient is female and currently or recently pregnant (i.e., gave birth while ill with COVID-19).

Current smoker: Select the appropriate response.

Former smoker: Select the appropriate response.

Respiratory diagnostic testing: For each pathogen, indicate whether the test was positive, negative, pending, or not done. If the PUI or case-patient had a test performed for another pathogen, please check the appropriate test result and specify the name of the pathogen next to “Other, Specify.” (In DCIPHER, please specify additional tests/pathogens only if they are positive.) If multiple tests for the same pathogen were completed, mark “Positive” if any of the tests for that pathogen were positive during the course of the illness suspected to be COVID-19.

Specimens for COVID-19 testing: For each specimen tested for the virus that causes COVID-19, record if the specimen was from a nasopharyngeal swab (NP), oropharyngeal swab (OP), sputum, or other specimen (specify type). If combined NP/OP swabs are collected, record results in the field for NP swabs. Jurisdictions can provide up to three results for each type of specimen; if additional specimens are collected, please provide information about these specimens in the “additional state/local specimen ID” fields below this question. If there are still additional specimens, please use the notes field following the specimen collection information to provide specimen IDs. Provide the local, state, or jurisdictional specimen ID associated with each specimen, as well as the date the specimen was collected in MM/DD/YYYY format. For specimens tested at a local or state public health laboratory or at a commercial laboratory, select ”State Lab Tested.” For specimens tested at CDC, select “Sent to CDC.” For each test performed, indicate the result: positive, negative, pending, not done, or indeterminate.

Please update these test results as they become available.

Additional state/local Specimen IDs: Provide additional specimen IDs from state/local laboratories for specimens tested for the virus that causes COVID-19. If needed, prioritize listing those specimens testing positive for the virus that causes COVID-19, regardless of specimen type.

AMERICAN OVERSIGHT

Updated Sunday, March 15 (major updates are highlighted in yellow)

Dear state and territorial partners:

Thank you for your continued partnership in the ongoing emergency response to COVID-19. The information included below aligns with what was shared by CDC during the 5 pm ET CSTE call on Saturday, February 29th, a CSTE email sent Friday, March 6th, and in a CSTE email sent during the weekend of March 14 regarding: 1) confirming a jurisdiction's 'Phase 2' status for reporting PUI and cases; 2) additional guidance on using the current PUI and Case Report Form, including classification of all positive laboratory tests as confirmed cases; 3) update on the status of historical PUI data imports into DCIPHER; 4) clarifications to the CDC reporting process for PUI/Case Report Forms and lab findings; 5) management of the PHLIP laboratory reporting process; 6) prioritization of the PUI/Case Report variables; and 7) major avoidable issues we hope to overcome with your assistance.

1. Jurisdictional 'Phase 2' Status

Given the need to maintain timely, actionable data at the national level, and process laboratory results at CDC for testing, **all jurisdictions should now be, or actively working towards being, onboarded to 'Phase 2',** which includes being able to assign unique identifiers to PUI/cases at the reporting jurisdiction level. If your jurisdiction has not yet confirmed its 'Phase 2' status, including how you will be inputting data into DCIPHER (preferred method: direct entry), please email eocevent118@cdc.gov.

Reminder: as of March 6th, CDC made the reporting of PUI to CDC through DCIPHER optional for jurisdictions in Phase 2. Jurisdictions **should continue to report positive cases to CDC** using the combined PUI/Case Report Form.

2. Updates to PUI and Case Report Form (CRF) on CDC's Website

Please continue to use the 5 status classifications below when completing a CRF. However, note the changes in how to apply the classifications.

1. PUI, testing pending
2. PUI, tested negative
3. Presumptive case (positive test by state or local health department lab*), confirmatory testing pending
4. Presumptive case (positive test by state or local health department lab*), confirmatory testing negative
5. Laboratory-confirmed case†

**These designations are no longer applicable on or after 3/14/2020*

†Now includes positive tests conducted by the CDC laboratory, commercial lab using FDA-validated COVID 19 NAA, or state or local health department lab.

These changes reflect FDA's acceptance of CDC's request for "enforcement discretion" to allow state and local public-health laboratories to consider positive samples to be interpreted as "positive" with no need for confirmatory testing. This action was supported by data submitted by CDC showing agreement between results in state and local public health labs with corresponding results from CDC. **These changes are retrospective such that samples already submitted to CDC for confirmation and had been awaiting confirmation may now be considered to be positive.** CDC is still interested in receiving any specimens for which testing was "inconclusive" and which could not be resolved by repeat testing. For reporting purposes, these persons can be classified as "PUI, testing pending" until resulted by the CDC Laboratory. For epidemiologists, this will have little impact operationally, since the policy from the beginning was to act on "presumptive positives" as though they have already been confirmed. This means that the cases that previously were considered "presumptive" will all now be considered "confirmed". **For CDC analyses, presumptive and confirmed positive cases will be treated the same. Jurisdictions do not need to make changes to the historical data previously reported to CDC.**

Critical laboratory testing result fields are included at the end of the CRF to reflect COVID-19 laboratory test results. To minimize the need for making changes to the CRF at this time, **please use the same fields to report**

AMERICAN OVERSIGHT

specimens tested at the local level whether the testing laboratory was the state or jurisdiction public health laboratory or commercial laboratory. Further, **if the specimen was from a combined nasopharyngeal (NP) and oropharyngeal (OP) swab, record the results in the NP swab field**. CDC will work towards populating our laboratory results into the CDC result field for each specimen sent to us so that results can be viewed in DCIPHER as they are resulted and communicated to individual jurisdictions. To support this matching process and to ensure the specimen is tested, please make sure to include an nCoV ID when submitting the specimen(s) to CDC.

If the PUI or case-patient had traveled on a cruise, had exposure to large social gatherings (e.g. conference, concert), or work-related exposures to large groups (e.g. airport screeners, port workers), please indicate in the free text field available with the "Other, specify:" option for the question: "In the 14 days prior to illness onset, did the patient have any of the following exposures (check all that apply)."

Changes will also be reflected in the material made available on CDC's website.

3. Historical PUI Data Imported into DCIPHER

As of February 28, data reported to CDC on PUI, presumptive cases, and laboratory-confirmed cases have been made available in DCIPHER.

- Jurisdictions in 'Phase 2' are now able to go into the DCIPHER platform to view and edit existing records of PUI, presumptive positive, and laboratory-confirmed cases, as their status changes or more data become available.
- Jurisdictions in 'Phase 1' should continue to call the EOC Watch Desk at 770-488-7100 to update information on existing PUI, cases of COVID-19.

4. CDC Reporting Process for PUI/Case Reports and Lab Findings – Revised March 6th

CDC laboratory has received several specimens that were not assigned an nCoV ID. **Please note that all specimens need an nCoV ID for submission to CDC laboratory.** In the event that a sample is missing an nCoV ID, the specimen will be frozen, our staff will reach out to the point-of-contact listed on the submission form, and we will test the specimen once the nCoV ID has been submitted. Please provide an nCoV ID with all specimens to avoid delays in testing.

As of March 6, information for PUIs no longer needs to be entered into DCIPHER. However, jurisdictions may use NNDSS or DCIPHER to manage their PUIs.

For reporting jurisdictions that have the capacity to do their own testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter cases into DCIPHER with the jurisdiction-issued nCoV ID, unless other arrangements to transmit data have been made and approved by CDC.
2. If a specimen is tested locally and is **NEGATIVE**:
    a. If the person is already in DCIPHER, please update the person's disposition to 'PUI, tested negative' in DCIPHER.
3. If a specimen is tested locally, is **POSITIVE,** and is **the jurisdiction's first case or is part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify CDC of the positive result.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected and submitted on the PUI and Case Report Form.
4. If a specimen is tested locally, is **POSITIVE,** and is **from a jurisdiction with existing presumptive or confirmed cases and is not part of a unique event (e.g., part of a large cluster of potential cases within a group at high risk**):
    a. Update the person's disposition in DCIPHER to "Confirmed Case"

AMERICAN OVERSIGHT

For jurisdictions that are in 'Phase 1':

1. The jurisdictions should call the EOC Watch Desk/PUI desk at 770-488-7100 to receive a CDC-issued nCoV ID, and to complete a PUI and Case Report Form.
2. If a specimen is tested locally and is **NEGATIVE**, no further action is needed unless the person has already been reported to CDC as a PUI; if so:
    a. Please email eocevent118@cdc.gov and provide the nCoV ID and test result.
3. If a specimen is tested locally and is **POSITIVE**:
    a. Call the EOC Watch Desk/PUI desk at **770-488-7100** and notify them of the positive result.
    b. On the call with CDC, please provide: (1) jurisdiction-issued nCoV ID and (2) a brief summary of the person's information that aligns with information collected on the PUI and Case Report form.

For reporting jurisdictions that do not have testing capacity and are sending specimens to CDC for testing:
For jurisdictions that are in 'Phase 2':

1. The jurisdiction should enter all PUIs into DCIPHER with the jurisdiction-issued nCoV IDs, unless other arrangements to transmit data have been made and approved by CDC.
2. Please ensure the jurisdiction-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

For jurisdictions that are in 'Phase 1':

1. The jurisdiction should call the EOC Watch Desk/PUI desk at **770-488-7100** to obtain a CDC-issued nCoV ID number, and complete a PUI and Case Report Form.
2. Please make sure the CDC-issued nCoV ID is entered in the **alternative specimen ID** field on the 50.34/DASH form sent in with the specimen to CDC for testing.
3. Testing results will be returned to the state lab per current protocol.

5. Management of the PHLIP reporting process

CDC and APHL have been working with public health laboratories to add automated reporting of the novel coronavirus test results through their existing influenza reporting mechanism, which is most frequently PHLIP.

We ask that participating PHLIP labs begin including nCoV IDs within the lab test message reported through PHLIP. This will allow CDC to: (1) Match these records with persons reported into DCIPHER and (2) work with states to properly characterize the status of persons without existing records in DCIPHER. Information on how to include the nCoV ID in the message has been made available via APHL starting at the bottom of Page 4 (https://www.aphl.org/Materials/02.12.2020_Informatics_FAQs_and_Guidance.pdf).

6. Prioritization of PUI/Case Report variables

To support improved data reporting, CDC has employed the Data Collation & Integration for Public Health Event Response (DCIPHER) platform that jurisdictions can use to directly enter or import and view their data. As of Friday, March 13, all 50 states and 3 jurisdictions (New York City, Washington DC, and U.S. Virgin Islands) are using DCIPHER for the COVID-19 response. Previously, to support jurisdictions in providing timely case information, CDC group the variables included in the National Case Report into 3 tiers to help jurisdictions prioritize what data are collected and reported. While all the information being collected is important, the variables that were included on CDC's list of Tier 1 and Tier 2 variables [**High Priority Variables**] are key to understanding the current burden of disease and its transmission within communities. Further, it is important that this information be entered/submitted within 24 hours of the case being identified to provide adequate situational awareness. The remaining variables (previously referred to as Tier 3 variables) should be submitted as soon as possible, some, of which, may require following up with cases over time.

AMERICAN OVERSIGHT

High Priority Variables
Timeline: entered/submitted within 24 hours of being collected.

- CDC 2019-nCoV ID (cdc_ncov2019_id) (required field)
- Reporting jurisdiction (state) (required field)
- Current status of the person (current_status) (required field)
- State of residence (res_state)
- County of residence (res_county)
- Sex (sex)
- Age (age)
- Age Units (ageunit)
- Symptoms present during course of illness (sympstatus)
- If symptomatic, onset date (onset_dt)
- Hospitalization status (hosp_yn)
- ICU admission status (icu_yn): may not be readily available during initial interview; update as soon as possible
- Death (death_yn): may not be readily available during initial interview; update as soon as possible
- If female, currently pregnant (pregnant_yn)
- Health care worker in the United States (hc_work_yn)
- Exposure data
  - Travel to mainland China (exp_China)
  - Travel to other non-US country (exp_othcountry)
  - Travel to other non-US country, specify (exp_othcountry_spec)
  - Household contact with a COVID-19 case patient (exp_house)
  - Community contact with a COVID-19 case patient (exp_community)
  - Any healthcare contact with a COVID-19 case patient (exp_health)
  - Healthcare contact with a COVID-19 case patient, healthcare worker (exp_health_hcw)
  - Exposure to a cluster of patients with ARDS with unknown etiology (exp_cluster)
- Specimen information
  - Specimen type (see series on specimen type)
  - Specimen ID (see series on specimen ID)
  - Specimen sent to CDC (see series on specimen sent to CDC)
- Report date of case to CDC (case_cdcreport_dt)

Other Variables of Importance
Timeline: submitted as soon as possible or available.

- Specific information on the hospitalization, including admission and discharge dates and ventilation status
- Information on signs and symptoms
- Information on pre-existing conditions
- The remaining variables collected on the PUI and Case Report Form

7. <u>Major avoidable challenges we hope to overcome with your assistance</u>
We recognize the challenges that public health emergencies bring. With your assistance, we hope to avoid the following challenges by following the processes outlined above:

1. Unclear data flow processes for jurisdictional data on PUI and case-patients to CDC
2. Laboratory samples that are not able to be linked with PUI or case-patients
3. Incorrect reports of national and state-level PUI and case burden, as well as descriptive statistics about the population impacted

AMERICAN OVERSIGHT

We appreciate your ongoing partnership. Please email eocevent118@cdc.gov with any questions regarding the PUI or case reporting process.

Best,
CDC COVID-19 Epidemiology Task Force

AMERICAN OVERSIGHT

Subject: FW: CSTE COVID-19 Response | Confirmatory testing of COVID-19 samples is no longer required

---

From: CSTE Emergency Response <Preparedness@cste.org>

Council of State and Territorial Epidemiologists
Emergency Preparedness & Response Mailbox
Business Hours Line: 770.458.3811
After-Hours Line: 678.256.3945
preparedness.cste.org

Dear CSTE Colleagues,

Summary: State and local public health laboratories are no longer required to send “presumptive positive” samples to CDC for confirmation. From now on, respiratory samples positive for SARS-CoV2 in a state and public-health laboratory will be considered “positive” with no need for further testing.

More details: Last night, FDA accepted CDC’s request for “enforcement discretion” to allow state and local public-health laboratories to consider positive samples to be interpreted as “positive” with no need for confirmatory testing. This action was supported by data submitted by CDC showing agreement between results in state and local public health labs with corresponding results from CDC. CDC was asked to submit an amendment to its emergency-use authorization (EUA) for formal review.

For epidemiologists, this means that the cases that previously were considered “presumptive” will all now be considered “confirmed.”

Your laboratories should have received notification of this change already through APHL. These changes are retrospective such that samples already submitted to CDC for confirmation and had been awaiting confirmation may now be considered to be positive. CDC is still interested in receiving any specimens for which testing was “inconclusive” and which could not be resolved by repeat testing.

Sincerely,

Gregory Armstrong, MD
Currently assigned to CDC Coronavirus Response as Deputy Incident Manager
garmstrong@cdc.gov

CORONAVIRUS DISEASE 2019 (COVID-19) NAMING UPDATES

- The International Committee on Taxonomy of Viruses named the novel coronavirus causing an outbreak of respiratory illness that was first detected in Wuhan, Hubei Province, China, Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-CoV-2).
    - Due to potential for confusion with SARS-CoV, where possible, public communications will use "the virus that causes COVID-19."
- On February 11, 2020, the World Health Organization (WHO) named the disease caused by this virus Coronavirus Disease 2019 (COVID-19).
    - **Disease name:** COVID-19

AMERICAN OVERSIGHT

OUTBREAK SUMMARY

- There is an expanding outbreak of COVID-19, centered in China, caused by a novel (new) coronavirus.
- The new virus can cause illness varying from mild to severe, including potentially resulting in death. It can spread from person-to-person.
- This virus is spreading from person-to-person in China. A growing number of countries are reporting cases in travelers from China and some limited person-to-person spread has been reported in countries outside of China, including in the United States.
- Global case numbers are reported by the World Health Organization in their Coronavirus Disease 2019 (COVID-19) situation reports.
    - As of **February 16, more than 50,000** cases have been identified worldwide, including **15** in the United States. Fewer than 700 cases have occurred outside China.
- On January 30, WHO declared this outbreak a Public Health Emergency of International Concern (PHEIC). A PHEIC is declared if an event poses a public health threat to other nations through the spread of disease and potentially requires a coordinated international response.
- On January 31, Health and Human Services Secretary Alex M. Azar II declared a public health emergency for the United States to aid the nation's healthcare community in responding to COVID-19.
- Also on January 31, the President of the United States issued a "Proclamation on Suspension of Entry as Immigrants and Nonimmigrants of Persons who Pose a Risk of Transmitting 2019 Novel Coronavirus."
- The situation is rapidly changing, and CDC is monitoring it closely. Guidance will be updated as needed.
- Outbreaks like this — when a new virus has emerged to infect people and spread between people — are especially concerning.
- This is a very serious public health threat and the federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The goal of the ongoing US public health response is to minimize introductions of this virus, detect new cases quickly, and reduce community spread of this new coronavirus in the US.
- The coming days and weeks are likely to bring more confirmed cases of COVID-19 in the United States and globally, but strong public health measures now may blunt the impact of the virus in the United States.
- While it is unclear how this situation will evolve in the United States, CDC is preparing as if it were the next pandemic, while hoping it is not.
- The current outbreak meets two criteria for a pandemic. It is a new virus and it is capable of person-to-person spread. If sustained person-to-person spread in the community begins outside in China, this will increase the likelihood that a global pandemic will result.
- Extensive work has been done over the past 15 years in the United States to prepare for an influenza pandemic.

AMERICAN OVERSIGHT

- The newly emerged coronavirus disease 2019 (COVID-19) is a respiratory disease that seems to be spreading much like flu.
- Guidance developed for influenza pandemic preparedness would be appropriate in the event the current COVID-19 outbreak triggers a pandemic.
- Selected pandemic preparedness materials are available online.

OUTBREAK STATISTICS

As of **February 14, 2020**:

- US cases: **15**
- US deaths: 0
- Total patients under investigation (PUI): **443**
  - Positive: **15**
  - Negative: **347**
  - Pending: **81**
- States with patients under investigation: **42**
- The US Embassy in China announced the death of the first American citizen from COVID-19 occurring in that country on February 7.

For global cases, please see the daily situation reports from the World Health Organization.

OUTBREAK BACKGROUND

- In early January 2020, Chinese health officials identified a novel (new) coronavirus (now named SARS-CoV-2) linked to an outbreak of respiratory illness in Wuhan, Hubei Province, China.
- Most cases have been detected in China, but some cases have been detected in more than two dozen other locations. Most infections outside of China have occurred in travelers coming from Wuhan City.
- Initially, many of the patients in the Wuhan outbreak reportedly had some link to a large seafood and animal market, suggesting animal-to-person spread.
- Since then, Chinese officials report that sustained person-to-person spread in the community is occurring in China.
- Most cases in the US have been associated with travel to Wuhan, China; however, person-to-person spread also has been seen in close (household) contacts of confirmed COVID-19 cases.
- Coronaviruses are a group of viruses that have a halo or crown-like (corona) appearance when viewed under a microscope. They are common in many different species of animals, including camels, cattle, cats, and bats.
- Human coronaviruses are a common cause of mild to moderate upper-respiratory illness. But three coronaviruses have emerged to cause more severe illness: Severe Acute Respiratory Syndrome (SARS-CoV), Middle East Respiratory Syndrome (MERS-CoV), and now the virus that causes COVID-19.

AMERICAN OVERSIGHT

TRANSMISSION

- Much is unknown about how the new coronavirus that causes COVID-19 spreads. Current knowledge is largely based on what is known about similar coronaviruses.
- Most often, person-to-person spread is thought to happen among people in close contact (about 6 feet) with each other.
- Person-to-person spread is thought to occur mainly via respiratory droplets produced when an infected person coughs or sneezes, similar to how influenza and other respiratory pathogens spread. These droplets can land in the mouths or noses of people who are nearby or possibly be inhaled into the lungs.
- How easily a virus spreads person-to-person can vary. Some viruses are highly contagious (like measles), while other viruses are less so.
- Based on our current knowledge, it is unclear whether a person may become infected with the new coronavirus by touching a surface or object contaminated with the virus and then touching their own mouth, nose, or possibly their eyes.
- Typically, with most respiratory viruses, people are thought to be most contagious when they are most symptomatic (sickest).
- Mother-to-child transmission during pregnancy is unlikely, but after birth a newborn is susceptible to person-to-person spread.
- To date, CDC does not have any evidence to suggest that animals imported from China pose a risk for spreading the new coronavirus in the United States.
- At this time, CDC has no data to suggest that this new coronavirus or other similar coronaviruses are spread by mosquitoes.
    - Mosquitoes cannot spread all types of viruses. For a virus to pass to a person through a mosquito bite, the virus must be able to replicate inside the mosquito.
- There is much more to learn about the spread of this new coronavirus, severity of the disease, and other features associated with this outbreak and investigations are ongoing. This information will further inform the risk assessment.

DIAGNOSIS AND TREATMENT

- CDC developed a real time Reverse Transcription-Polymerase Chain Reaction (rRT-PCR) test to diagnose COVID-19 in respiratory samples from clinical specimens.
- On January 24, CDC publicly posted the assay protocol for this test.
- CDC submitted an Emergency Use Authorization (EUA) package to the U.S. Food and Drug Administration on February 3 for its test.
- FDA approved the Emergency Use Authorization on February 4.
- The kits are distributed through the International Reagent Resource (IRR).
- IRR began distribution of the test kits to states, but shortly thereafter performance issues were identified related to a problem in the manufacturing of one of the reagents which led to laboratories not being able to verify the test performance.

AMERICAN OVERSIGHT

- CDC is remanufacturing the kits using more robust quality control measures. New tests will be distributed once this issue has been addressed.
- CDC continues to perform initial and confirmatory testing.
- There is no specific antiviral treatment for COVID-19. People with COVID-19 should receive supportive care to help relieve symptoms.
- For severe cases, treatment should include care to support vital organ functions.

PREVENTION

- There is currently no vaccine to prevent COVID-19. The best way to prevent infection is to avoid being exposed to the virus.
- CDC always recommends everyday preventive actions to help prevent the spread of respiratory viruses, including:
    - Avoid touching your eyes, nose, and mouth with unwashed hands.
    - Avoid close contact with people who are sick.
    - Stay home when you are sick.
    - Cover your cough or sneeze with a tissue, then throw the tissue in the trash.
    - Clean and disinfect frequently touched objects and surfaces using a regular household cleaning spray or wipe.
    - Wash your hands often with soap and water for at least 20 seconds, especially after going to the bathroom; before eating; and after blowing your nose, coughing, or sneezing.
    - If soap and water are not readily available, use an alcohol-based hand sanitizer with at least 60% alcohol. Always wash hands with soap and water if hands are visibly dirty.

MINIMIZING STIGMA AND MISINFORMATION

- Minimizing stigma and misinformation is important, especially during contagious disease outbreaks.
- **Everyone:** Know the facts about COVID-19 and help prevent the spread of rumors:
    - Fight stigma and fear by supporting people who are coming back to school or work after completing their quarantine or isolation period for COVID-19 exposure or illness.
    - Someone who has completed their quarantine or met the requirements to discontinue infection control measures does not pose a risk of spreading COVID-19.
    - People of Asian descent, including Chinese Americans, are not more likely to get coronavirus than anyone else. Help fight fear by letting people know that being of Asian descent does not increase the chance of getting or spreading COVID-19.
    - Viruses cannot target people from specific populations, ethnicities, or racial backgrounds.
        - People who have not been in contact with a person who is a confirmed or suspected case are not at greater risk of acquiring and spreading this new virus than others.

AMERICAN OVERSIGHT

- People who returned more than 14 days ago from areas where COVID-19 is active and do not have symptoms of coronavirus do not put others at risk.
- To help counter stigma, public health professionals can:
    - Maintain privacy and confidentiality of those seeking health care and those who may be part of any contact investigation.
    - Communicate the risk or lack of risk from associations with products, people, and places in a timely manner.
    - Raise awareness of COVID-19 without increasing fear.
    - Share accurate information about how the virus spreads.
    - Speak out against negative behaviors, including negative statements on social media about groups of people, or exclusion of people who pose no risk from regular activities.
        - Be cautious about the images that are shared. Make sure they do not reinforce stereotypes.
        - Engage with stigmatized groups in person and through media channels including news media and social media.
- Share the need for social support for people who have returned from China or are worried about friends or relatives in the affected region.

TRAVEL

Travel from China:

- President Trump issued a Presidential Proclamation on January 31, to implement temporary measures to increase our abilities to detect and contain the novel coronavirus proactively and aggressively.
- The proclamation took effect at 5 p.m. EST, Sunday, February 2.
- The proclamation suspends entry to the United States of foreign nationals who have been in China (excluding Hong Kong and Macau) in the past 14 days. There are some exemptions, including for immediate family members of US citizens and legal permanent residents. (Hereafter referred to as "American citizens and exempted persons.")
- In addition:
    - All American citizens and exempted persons coming from China will be directed to ("**funneled to"**) one of 11 US airports.
    - American citizens and exempted persons who have been in Hubei province in the previous 14 days will have an additional health assessment (screened for fever, cough, or difficulty breathing).
        - If symptomatic, American citizens and exempted persons will be transferred for further medical evaluation. (They will not be able to complete their itinerary.)
        - If asymptomatic, American citizens and exempted persons will be subject to a mandatory quarantine at or near that location until 14 days after they left Hubei Province. (They will not be able to complete their itinerary.)

AMERICAN OVERSIGHT

        - American citizens and exempted persons who have been in other parts of mainland China (outside of Hubei Province) in the previous 14 days will have an additional health assessment (screened for fever, cough, or difficulty breathing).
            - If symptomatic, American citizens and exempted persons will be transferred for medical evaluation. (They will not be able to complete their itinerary at that time.)
            - If asymptomatic, American citizens and exempted persons will be allowed to reach their final destination and, after arrival, will self-monitor under public health supervision for 14 days.
- The 11 airports where travelers are being funneled include:
    - John F. Kennedy International Airport (JFK), New York
    - Chicago O'Hare International Airport (ORD), Illinois
    - San Francisco International Airport (SFO), California
    - Seattle-Tacoma International Airport (SEA), Washington
    - Daniel K. Inouye International Airport (HNL), Hawaii
    - Los Angeles International Airport (LAX), California
    - Hartsfield-Jackson Atlanta International Airport (ATL), Georgia
    - Washington-Dulles International Airport (IAD), Virginia
    - Newark Liberty International Airport (EWR), New Jersey
    - Dallas/Fort Worth International Airport (DFW), Texas
    - Detroit Metropolitan Airport (DTW), Michigan
- As of February 14, about 38,000 people have been screened at US airports.

Travel to China:

- On January 27, CDC issued a level 3 Travel Health Notice for China recommending that all travelers avoid non-essential travel (this does not include the Special Administrative Regions of Hong Kong and Macau, or the island of Taiwan).
- On January 30, the US State Department issued a level 4 travel advisory, their highest threat level, requesting Americans not to travel to China because of the public health threat posed by COVID-19.

Repatriation flights and quarantine orders:

- CDC has supported the Department of State in the safe and expedient ordered departure of US citizens and residents affected by outbreaks of COVID-19.
- Five chartered flights returned passengers from Wuhan City, China.
- Most recently, passengers from a cruise ship docked in Japan were in the process of being repatriated. (See section: Diamond Princess)
- The Department of Health and Human Services (DHHS) Secretary, under statutory authority, issued federal quarantine orders to all such passengers entering the United States.
- The quarantine period is for 14 days.

AMERICAN OVERSIGHT

- The quarantine is a precautionary and preventive step to maximize the containment of the virus in the interest of the health of the American public.
- This quarantine order also serves to protect the health of the repatriated persons, their families, and their communities.
- Medical staff monitor the health of each traveler, including temperature checks and observation for respiratory symptoms.
- CDC works with the state and local public health departments to transport any passenger exhibiting symptoms to a hospital for further evaluation.
- At the end of the 14-day period, people who have not developed symptoms will be free to leave.
- On February 12, 195 people from the first chartered flight were discharged from quarantine.

Diamond Princess:

- CDC is supporting the Department of State-led mission to repatriate US citizens returning to the United States from Japan who were aboard the Diamond Princess cruise ship.
- There are approximately 400 US citizens onboard the Diamond Princess cruise ship.
- Due to the dynamic nature of the ongoing outbreak, the US government recommended that US citizens disembark and return to the United States.
- Americans returned by flights chartered by the State Department will be subject to a 14-day federal quarantine and be housed at two existing federal quarantine sites for repatriated travelers:
    - Travis Air Force Base in California
    - Joint Base San Antonio-Lackland in Texas
- Those passengers returning from Japan will be housed separately from people already in quarantine from previous Wuhan repatriation flights.
- These planes will be met by a team of US Government personnel deployed at these bases to assess the health of the passengers.
- The passengers were screened before leaving the ship and will be monitored and evaluated by medical and public health personnel during the trip and after arrival.
- Anyone who becomes ill on the flight will be sent directly to a local hospital for medical evaluation.
- The US Government is taking measures to protect the health of the people under quarantine, their loved ones, and their communities, as well as the communities where they are being temporarily housed.
- Based on what is known about this virus and other coronaviruses, CDC believes the risk to the communities temporarily housing these people is low.

WHAT CDC IS DOING

CDC Response in the US:

- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.

AMERICAN OVERSIGHT

- The goal of the ongoing US public health response is to detect new cases quickly and prevent further spread of COVID-19 in this country.
- CDC established a COVID-19 Incident Management Structure on January 7. On January 21, CDC activated its Emergency Operations Center to better provide ongoing support to the COVID-19 response.
- On January 27, CDC issued updated travel guidance for China, recommending that travelers avoid all nonessential travel to all of the country (Level 3 Travel Health Notice).
- The US government has taken unprecedented steps with respect to travel in response to the growing public health threat posed by this new coronavirus.
    - Effective February 2, at 5pm, the US government suspended entry of foreign nationals who have been in China within the past 14 days.
    - US citizens, residents, and their immediate family members who have been in Hubei province and other parts of mainland China are allowed to enter the United States, but they are subject to health monitoring and possible quarantine for up to 14 days.
    - See more at: "Proclamation on Suspension of Entry as Immigrants and Nonimmigrants of Persons who Pose a Risk of Transmitting 2019 Novel Coronavirus".
- CDC issued an interim Health Alert Network (HAN) Update to inform state and local health departments and healthcare professionals about this outbreak on February 1.
- On January 30, CDC published guidance for healthcare professionals on the clinical care of COVID-19 patients.
- On February 3, CDC posted guidance for assessing the potential risk for various exposures to COVID-19 and managing those people appropriately.
- CDC has deployed multidisciplinary teams to support state health departments with clinical management, contact tracing, and communications.
- CDC has worked with the Department of State, supporting the safe return of Americans who have been stranded as a result of the ongoing outbreaks of COVID-19 and related travel restrictions. CDC has worked to assess the health of passengers as they return to the United States and provided continued daily monitoring of people who are quarantined.
- CDC has developed a real time Reverse Transcription-Polymerase Chain Reaction (rRT-PCR) test that can diagnose COVID-19 in respiratory and serum samples from clinical specimens. On January 24, CDC publicly posted the assay protocol for this test.
- CDC's International Reagent Resource began distributing test kits domestically on February 6. However, CDC identified a problem in the manufacturing of one of the three controls used in the verification process of the test.
    - To address this issue, CDC is remanufacturing the test kits, out of an abundance of caution, to ensure that laboratories have effective and reliable kits. This process is being expedited. The new kits will be made available to both domestic and international laboratories as soon as possible.
- CDC has been uploading the entire genome of the viruses from reported cases in the United States to GenBank as sequencing was completed.

AMERICAN OVERSIGHT

- CDC has grown the virus in cell culture, which is necessary for further studies, including for additional genetic characterization. The cell-grown virus was sent to NIH's BEI Resources Repository for use by the broad scientific community.

Internationally:

Note: Due to the rapidly changing situation, any statements on CDC involvement in China need case-by-case clearance.

- CDC is working diligently and closely with partners to support the response to this novel coronavirus outbreak.
- CDC has staff stationed in more than 60 countries across the globe. CDC has offices in China, in a number of the countries reporting cases of COVID-19, and in countries that have not yet reported cases of COVID-19 but are busy with planning and preparedness efforts.
    - CDC and the government of China have collaborated for the past 30 years addressing public health priorities affecting the US, China, and the world.
- In addition to working with host country officials, CDC staff are working in coordination with Department of State and other agencies within US embassies.
- CDC is mobilizing Atlanta-based staff to support the response. Many of these staffers have extensive experience responding to global outbreaks.
- CDC has identified experts who are prepared to join a planned WHO mission to support efforts to better understand the severity and transmissibility of the virus.
- In China, CDC is an important technical partner for the Chinese Field Epidemiology Training Program (FETP).
    - Using classroom and hands-on experience, the China FETP program has graduated 279 epidemiologists who conducted more than 2,000 outbreak investigations as part of their training.
    - Specialized training tracks are now being established in non-communicable diseases and tuberculosis.
    - With technical guidance from CDC, 71 graduates completed training for the new Western FETP that supports 13 under-served provinces of China — remote areas more vulnerable to novel infections and with increasing transport corridors.
- CDC has supported China CDC's national influenza laboratory for more than 20 years.
- CDC works in close partnership with the China CDC's National Influenza Epidemiology, Virology, and Pandemic Preparedness Centers, China's provincial and local CDCs, hospitals, and academic institutions.
- CDC supports Chinese partners in monitoring seasonal and novel influenza viruses, as well as enhancing efforts to detect and respond to seasonal, avian, and other novel influenza viruses with pandemic potential. CDC's key supporting activities include:
    - Strengthening influenza surveillance for seasonal and novel influenza viruses
    - Conducting research to estimate disease burden and vaccine effectiveness among populations at greatest risk (including young children, older adults, and pregnant women)

AMERICAN OVERSIGHT

    - Promoting influenza vaccination policy development and coverage
    - Supporting novel virus risk assessments
    - Establishing pandemic influenza preparedness in China
    - Maintaining close ties between US and China influenza experts
- In other countries, CDC is collaborating with WHO to support Ministries of Health to prepare and respond to the epidemic.
    - CDC is helping to support countries to implement WHO recommendations related to the diagnosis and care of patients, tracking the epidemic, and identifying people who might have COVID-19.
    - CDC staff are also starting to work together with country colleagues to conduct investigations that will help inform response efforts going forward.
    - CDC works closely with countries to establish FETPs that train a workforce of field epidemiologists —or disease detectives— to identify and contain outbreaks close to the source.

RECOMMENDATIONS

- CDC routinely advises that people help protect themselves from respiratory illnesses by washing their hands often, avoiding touching their face with unwashed hands, avoiding close contact with people who appear sick, and cleaning frequently touched surfaces.
    - CDC defines close contact as—
        - Being within about 6 feet (2 meters) of someone with COVID-19 for a prolonged period of time, such as living with, visiting, caring for or sharing a room in a healthcare facility
          - or –
        - By having direct contact with infectious secretions from a patient, such as being coughed on.

Recent Travelers to China:

- If you were in China and feel sick with fever, cough, or difficulty breathing, within 14 days after leaving the country, you should:
    - Seek medical advice. Before you go to a doctor's office or emergency room, call ahead and tell them about your recent travel and your symptoms.
    - Avoid contact with others.
    - Not travel while sick.
    - Cover your mouth and nose with a tissue or your sleeve (not your hands) when coughing or sneezing.
    - Wash your hands often with soap and water for at least 20 seconds to avoid spreading the virus to others. Use an alcohol-based hand sanitizer if soap and water are not available.

AMERICAN OVERSIGHT

People Confirmed to Have, or Being Evaluated for, COVID-19:

- Your doctors and public health staff will evaluate whether you can be cared for at home. If it is determined that you can be isolated at home, you will be monitored by staff from your local or state health department. You should follow the prevention steps below until a healthcare professional or local or state health department says you can return to your normal activities. Detailed information is available at Interim Guidance for Preventing COVID-19 from Spreading to Others in Homes and Communities.
    - Stay home except to get medical care.
    - Separate yourself from other people in your home.
    - Call ahead before visiting your doctor.
    - Wear a facemask.
    - Cover your coughs and sneezes with a tissue or cough or sneeze into your sleeve.
    - Wash your hands often with soap and water for at least 20 seconds.
    - Avoid sharing household items like eating utensils, cups, or linens.
    - Monitor your symptoms and seek prompt medical attention if your symptoms worsen.

On February 3, CDC published interim guidance for state and local public health officials on how to assess and manage the risks posed by patients who may have been exposed to this new coronavirus.

- This guidance establishes four risk categories: High, Medium, Low and No Identifiable Risk.
- The categories are based on a person's travel history and possible contact with patients who have laboratory-confirmed infections.
- The guidance **offers recommendations** for movement restrictions and public health evaluations for people in different risk categories.
- **In most cases, state and local authorities will make these decisions. Federal public health authority primarily extends to international arrivals at ports of entry and preventing interstate communicable disease threats.**
- These guidelines are subject to change as the situation requires. They do not apply retroactively to people who have been in China during the previous 14 days and are already in the United States, or those being managed as part of a contact investigation.
- CDC will provide separate guidance for healthcare settings.

Close Contacts of Patients Under Investigation:

People who have had close contact with someone who is confirmed to have, or being evaluated for, COVID-19, should:

- Monitor your health starting from the day you first had close contact with the person and continue for 14 days after you last had close contact with the person. Watch for these signs and symptoms:
    - Fever—take your temperature twice a day.
    - Coughing.
    - Shortness of breath or difficulty breathing.
    - Other early symptoms to watch for are chills, body aches, sore throat, headache, diarrhea, nausea, vomiting, and runny nose.

AMERICAN OVERSIGHT

- **If you develop fever or any of these symptoms, call your healthcare professional right away.**
    - **Before** going to your medical appointment, be sure to tell your healthcare professional about your close contact with someone who is confirmed to have, or being evaluated for, COVID-19. This notification will help the healthcare professional's office take steps to keep other people from getting infected. Ask your healthcare professional to call the local or state health department.
- If you do not have any symptoms, you can continue with your daily activities, such as going to work, school, or other public areas.
- Detailed information for caregivers and household members can be found on the Interim Guidance for Preventing COVID-19 from Spreading to Others in Homes and Communities web page.

For Healthcare Professionals:

Patients in the United States who meet the following criteria should be evaluated as a patient under investigation (PUI) in association with the outbreak of COVID-19 in Wuhan City, China.

Clinical Features	&	Epidemiologic Risk
Fever **or** signs/symptoms of lower respiratory illness (e.g., cough or shortness of breath)	**AND**	Any person, including healthcare workers, who has had close contact with a laboratory-confirmed COVID-19 patient within 14 days of symptom onset
Fever **and** signs/symptoms of a lower respiratory illness (e.g., cough or shortness of breath)	**AND**	A history of travel from **Hubei Province**, China within 14 days of symptom onset
Fever **and** signs/symptoms of a lower respiratory illness (e.g., cough or shortness of breath) requiring hospitalization	**AND**	A history of travel from mainland **China** within 14 days of symptom onset

Note: Fever may be subjective or confirmed. The criteria are intended to serve as guidance for evaluation. Patients should be evaluated and discussed with public health departments on a case-by-case basis if their clinical presentation or exposure history is equivocal (e.g., uncertain travel or exposure).The above criteria are available on the Interim Guidance for Healthcare Professionals web page.

Recommendations for Reporting, Testing, and Specimen Collection:

- Healthcare professionals should **immediately** notify both infection control personnel at their healthcare facility AND their local or state health department in the event of a PUI for COVID-19.
- State health departments that have identified a PUI should immediately contact CDC's Emergency Operations Center (EOC) at 770-488-7100 and complete a COVID-19 PUI case investigation form available on CDC's Interim Guidance for Healthcare Professionals.

AMERICAN OVERSIGHT

- Clinical specimens should be collected from PUIs for routine testing of respiratory pathogens at either clinical or public health labs. Note that clinical laboratories should NOT attempt viral isolation from specimens collected from COVID-19 PUIs.
- **For biosafety reasons, it is not recommended to perform virus isolation in cell culture or initial characterization of viral agents recovered in cultures of specimens from a PUI for COVID-19.**
- To increase the likelihood of detecting the virus, CDC recommends collecting and testing multiple clinical specimens from different sites, including both lower and upper respiratory. Additional specimen types (e.g., stool, urine) may be collected and stored initially until decision is made by CDC whether additional specimen sources should be tested. Specimens should be collected as soon as possible once a PUI is identified regardless of time of symptom onset. Maintain proper infection control when collecting specimens. Additional guidance for collection, handling, and testing of clinical specimens is available on CDC's website. Detailed information on specimen types and shipping can be found on the Information for Laboratories web page.

INFECTION PREVENTION AND CONTROL FOR HEALTHCARE SETTINGS

- Healthcare personnel (HCP) are on the front lines of caring for patients with confirmed or possible COVID-19. HCP caring for these patients have an increased risk of exposure to this virus.
- HCP can minimize their risk of exposure when caring for confirmed or possible COVID-19 patients by following CDC infection prevention and control (IPC) guidelines, including use of recommended personal protective equipment (PPE).
- Based on what CDC knows now related to severity, transmission efficiency, and shedding duration, CDC is currently recommending Standard, Contact, and Airborne Precautions, including eye protection, when caring for patients with confirmed or possible COVID-19.
- As CDC learns more about COVID-19, and as the needs of the response within US healthcare facilities change, CDC will refine and update this early and aggressive IPC approach.
- Infection control procedures and appropriate use of PPE are necessary to prevent infections from spreading while caring for patients. CDC reminds all employers and HCP that PPE is only one aspect of safe care of patients with COVID-19.
    - Focusing only on PPE gives a false sense of security of safe care and worker safety.
    - It is critical to focus on other pathways to prevent spread of SARS-CoV-2 in healthcare settings. Examples include prompt screening and triage, limiting personnel in the room, and using Airborne Infection Isolation Rooms (AIIR).
- CDC's current guidelines are designed to prevent the spread of SARS-CoV-2 within healthcare facilities to healthcare personnel and other patients who may be exposed to a patient with confirmed or possible COVID-19.
- Healthcare personnel caring for patients with confirmed or suspected COVID-19 should adhere to CDC recommendations for infection prevention and control (IPC):
    - Assess and triage patients with acute respiratory symptoms and risk factors for COVID-19 to minimize chances of exposure. Place a facemask on the patient and isolating them in an AIIR, if available.

AMERICAN OVERSIGHT

    - Use Standard, Contact, and Airborne Precautions, including eye protection, when caring for patients with confirmed or possible COVID-19.
    - Perform hand hygiene with alcohol-based hand sanitizer before and after all patient contact, before and after contact with potentially infectious material, and before putting on and upon removal of PPE, including gloves. Use soap and water if hands are visibly soiled.
    - Practice how to properly don, use, and doff PPE in a manner to prevent self-contamination.
    - Perform aerosol-generating procedures (e.g., sputum induction, open suctioning of airways) in an AIIR, while following appropriate IPC practices, including use of appropriate PPE.
    - The collection of respiratory specimens (e.g., nasopharyngeal swabs) are likely to induce coughing or sneezing. HCP collecting specimens for testing for COVID-19 from patients with known or suspected COVID-19 (i.e., PUI) should adhere to Standard, Contact, and Airborne Precautions, including the use of eye protection. These procedures should take place in an AIIR or in an examination room with the door closed. Ideally, the patient should not be placed in any room where room exhaust is recirculated within the building without HEPA filtration.
    - Healthcare facilities can minimize the chance for exposures by ensuring facility policies and practices are in place and implemented before patient arrival, upon patient arrival, and throughout the duration of the affected patient's time in the healthcare setting.
- Healthcare facilities should promptly notify state or local public health authorities of patients with known or possible COVID-19 (i.e., persons under investigation or PUIs), and should designate specific persons within the healthcare facility who are responsible for communication with public health officials and dissemination of information to HCP.
- All healthcare facilities should ensure that their personnel are correctly trained and capable of implementing infection control procedures. Individual healthcare personnel should ensure they understand and can adhere to infection control requirements.
- Routine cleaning and disinfection procedures are appropriate for SARS-CoV-2 in healthcare settings, including those patient-care areas in which aerosol-generating procedures are performed.
    - Products with EPA-approved emerging viral pathogens claims are recommended for use against SARS-CoV-2.
- Management of laundry, food service utensils, and medical waste should also be performed in accordance with routine procedures. Federal, state, and local guidelines and regulations specify the categories of medical waste that are subject to regulation and outline the requirements associated with treatment and disposal.
- As a reminder, the role of face masks is for source control, and not to prevent exposure.
- CDC recommends that employees who are confirmed to have COVID-19, those who appear to have acute respiratory illness symptoms upon arrival to work, and persons who become sick

AMERICAN OVERSIGHT

during the work day promptly put on a facemask, be separated from other people, and be sent home immediately.

- If facemasks are not available, sick HCPs should cover their noses and mouths with a tissue when coughing or sneezing (or an elbow or shoulder if no tissue is available).

WHAT CDC IS DOING TO PROTECT HEALTHCARE PERSONNEL

- CDC is providing regular communication to the US healthcare community through targeted outreach activities.
- CDC is rapidly developing guidance and resources to protect US healthcare personnel. Current guidance and recommendations are designed to protect healthcare personnel and prevent the spread of the virus that causes COVID-19 within US healthcare facilities.
- CDC has deployed field teams to provide onsite infection control assessment and consultation to the US healthcare facilities currently treating confirmed COVID-19 patients and the passengers returning from China.

MANAGEMENT OF PATIENTS GUIDANCE FOR HEALTHCARE PROVIDERS

Clinical Presentation

- Most frequently reported symptoms of COVID-19 include fever, cough, sore throat, myalgia, or fatigue. Less commonly reported symptoms include sputum production, headache, hemoptysis, and diarrhea. Older patients and people with chronic medical conditions may be at higher risk of severe illness.
    - Possible risk factors for progressing to severe illness may include, but are not limited to, older age and underlying chronic medical conditions such as lung disease, cancer, heart failure, cerebrovascular disease, renal disease, liver disease, diabetes, immunocompromising conditions, and pregnancy.

Clinical Course

- Symptoms among reported cases of COVID-19 vary in severity from mild illness to severe or fatal illness.
- Some reports suggest the potential for clinical deterioration during the second week of illness.
- Among hospitalized patients with confirmed COVID-19, some will develop complications:
    - Acute respiratory distress syndrome (ARDS)
    - Intensive care for respiratory support
    - Pneumonia resulting in death
    - Secondary infection

Laboratory and Radiographic Findings

- SARS-CoV-2 RNA has been detected from upper and lower respiratory tract specimens, and the virus has been isolated from bronchoalveolar lavage fluid.

AMERICAN OVERSIGHT

- The duration of shedding of SARS-CoV-2 RNA in the upper and lower respiratory tracts is not yet known but may be several weeks or longer.

Clinical Management and Treatment

- No specific treatment for COVID-19 is currently available. Prompt infection prevention and control measures and supportive management of complications is recommended.
- Patients with mild clinical presentation may not initially require hospitalization.
- The decision to monitor a patient in the inpatient or outpatient setting should be made on a case-by-case basis.

INTERIM GUIDANCE FOR BUSINESSES AND EMPLOYERS (NON-HEALTHCARE SETTINGS)

- Interim guidance for businesses and employers to plan for and respond to COVID-19 is now available on the CDC website. This interim guidance may help prevent workplace exposures to acute respiratory illnesses, including COVID-19, in non-healthcare settings. The guidance also provides planning considerations if there are more widespread, community outbreaks of COVID-19.
- Employers can use strategies now to prevent workplace exposures to acute respiratory illness, such as:
    - Actively encouraging sick employees to stay home
    - Separating sick employees
    - Emphasizing staying home when sick, respiratory etiquette, and hand hygiene by all employees
    - Performing routine environmental cleaning
    - Advising employees before traveling to take certain steps
    - Checking the CDC's Traveler's Health Notices website for the latest guidance and recommendations for each country to which you will travel
- For the general public, who are unlikely to be exposed to this virus, the immediate health risk from COVID-19 is considered low at this time. Some people, like healthcare workers caring for COVID-19 patients and other close contacts of COVID-19 patients, will have an increased risk of infection.
    - Employees who are well but who have a sick family member at home with COVID-19 should notify their supervisor and refer to CDC guidance for how to conduct a risk assessment of their potential exposure.
    - If an employee is confirmed to have COVID-19, employers should inform fellow employees of their possible exposure to COVID-19 in the workplace but maintain confidentiality as required by the Americans with Disabilities Act. Employees exposed to a co-worker with confirmed COVID-19 should refer to CDC guidance for how to conduct a risk assessment of their potential exposure.
- Employers should be ready to implement strategies to protect the workforce from COVID-19 while ensuring the continuity of operations.

AMERICAN OVERSIGHT

- An infectious disease outbreak response plan should include possible work-related exposures and health risks to employees. The plan should also explore flexible worksites (e.g., telecommuting) and work hours in accordance with human resource policies.

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Outbreak

February 16, 2020

All content updated since February 13 is shown in colored text.

MAIN KEY POINTS

- There is an expanding outbreak of respiratory illness centered in China caused by a novel (new) coronavirus.
- The International Committee on Taxonomy of Viruses (ICTV) has named this virus "SARS-CoV-2." The World Health Organization has named the disease associated with this virus coronavirus disease 2019 or "COVID-19."
    - Due to potential for confusion with SARS-CoV, where possible, public communications will use "the virus that causes COVID-19."
- This virus that causes COVID-19 is able to spread from person-to-person and has caused disease ranging from mild to severe, including disease resulting in death.
- Most cases and most person-to-person spread with the new virus have occurred in mainland China, but outbreaks of COVID-19 have been detected outside of China too.
- Most COVID-19 cases outside of China have been associated with travel to or from China, but some person-to-person spread has been detected, including some community spread.
- The potential global public health threat posed by this virus is high, but right now, the immediate risk to most Americans is low.
- Fifteen cases of COVID-19 have been reported in the United States. Most cases of COVID-19 in the United States have been associated with travel from China but some person-to-person spread among close contacts of travelers has been seen.
- It's important to note that this virus is not spreading in the community in the United States at this time.
- The vast majority of Americans have a low risk of exposure at this time.
- The greater risk is for people who have recently traveled to China or been exposed to someone with COVID-19.
- This is a rapidly evolving situation and the risk assessment for Americans may change.
- The federal government is working closely with state, local, tribal, and territorial partners as well as public health partners to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States so as to reduce the spread and the impact of this virus.
- Strategies are in place to reduce the number of travelers from China and screen the remaining travelers from that country for illness, with people potentially being subject to a 14-day quarantine.
- These measures are likely to cause some disruption.
- CDC has been working with the Department of State, supporting the safe return of Americans overseas impacted by the ongoing outbreaks of COVID-19, including most recently passengers from the Diamond Princess cruise ship. (See Section: "Diamond Princess")

AMERICAN OVERSIGHT

- The US public health system also is on high alert to detect cases of COVID-19 and prevent further spread in the community.
- The success of response efforts now will determine what the coming days, weeks, and months will bring here in the United States.
- While leaning forward aggressively with the hope that we will be able to prevent community spread, we also are preparing for the worst.
- The current outbreak meets two criteria for a pandemic. It is a new virus and it is capable of person-to-person spread. If sustained person-to-person spread in the community takes hold outside in China, this will increase the likelihood that a global pandemic will result.
- Extensive work has been done over the past 15 years in the United States to prepare for an influenza pandemic.
- Influenza pandemic preparedness platforms and plans would be appropriate in the event that the current COVID-19 outbreak triggers a pandemic.
- Public health partners are encouraged to review their pandemic preparedness plans at this time.

SITUATION UPDATE

- To date, 28 international locations (in addition to the US) have reported confirmed cases of COVID-19.
- As of February 14, 2020, 15 cases of COVID-19 have been reported in the US in seven states — Arizona, California, Illinois, Massachusetts, Texas, Washington, and Wisconsin.
    - To date, there have been 443 "persons under investigation" (PUIs) for possible COVID-19 reported to CDC, with 347 persons ruled out as negative. These data are updated regularly at www.cdc.gov/coronavirus/2019-ncov/cases-in-us.html.
    - As part of efforts to detect cases of COVID-19 in the United States, CDC's laboratory had tested more than 2,000 samples as of February 12.
- The three most recent cases of COVID-19 in the United States were identified in people who had recently returned from Wuhan, China on US State Department chartered flights.
- They had been under federal quarantine for 14 days because of their recent exposure to widespread COVID-19 activity in Wuhan.
- No additional cases of COVID-19 have been detected among quarantined persons at this time.
- On February 12, 195 people who were on the first (of five) chartered flight from Wuhan were released from quarantine.
- More than 600 people remain under quarantine.
- It is likely that additional cases of COVID-19 will be detected in the United States.
- Two instances of person-to-person spread with this virus in the United States have been detected, in both cases after close, prolonged contact with a returned traveler from Wuhan.
- CDC established a COVID-19 Incident Management System on January 7, 2020. On January 21, CDC activated its Emergency Operations Center to better provide ongoing support to the response.

AMERICAN OVERSIGHT

  - As of February 7, more than 800 CDC staff members had been deployed to the response.
- CDC developed a real time Reverse Transcription-Polymerase Chain Reaction (rRT-PCR) tests that can diagnose COVID-19 in respiratory samples from clinical specimens.
- On February 1, CDC issued a Health Alert Network (HAN) update with some updates to previously posted guidance and, for the first time, guidance on clinical care of COVID-19 patients.
- On February 3, CDC issued "Interim US Guidance for Risk Assessment and Public Health Management of Persons with Potential 2019 Novel Coronavirus Exposure in Travel-associated or Community Settings" to provide US public health authorities and other partners with a framework for assessing and managing risk of potential exposures to COVID-19 and implementing public health actions based on a person's risk level and clinical presentation.
- CDC isolated the virus and sent to the NIH's BEI Resources Repository for use by the broad scientific community.
- CDC has been uploading the entire genome of the viruses from reported cases in the United States to GenBank as sequencing was completed.
- CDC is working with state and local health departments on investigations to trace contacts of the US COVID-19 patients to detect person-to-person spread.
- As of February 14, CDC and Customs and Border (CBP) personnel had screened about 38,000 people with recent travel history to China at US airports.

WHAT YOU CAN DO

- While the immediate risk of this new virus to the American public is believed to be low at this time, everyone can do their part to help us respond to this emerging public health threat:
  - It's currently flu and respiratory disease season and CDC recommends getting a flu vaccine, taking everyday preventive actions to help stop the spread of germs, and taking flu antivirals if prescribed.
  - If you are a healthcare provider, be on the look-out for people with who recently traveled from China and fever and respiratory symptoms.
  - If you are a healthcare provider caring for a COVID-19 patient or a public health responder, please take care of yourself and follow recommended infection control procedures.
  - If you have been in China or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus. If you develop COVID-19 symptoms, contact your healthcare provider, and tell them about your symptoms and your travel or exposure to a COVID-19 patient.
  - For people who have had close contact with someone with COVID-19 who develop symptoms, contact your healthcare provider, and tell them about your symptoms and your exposure to a COVID-19 patient.

AMERICAN OVERSIGHT

- For people who are ill with COVID-19, please follow CDC guidance on how to reduce the risk of spreading your illness to others. This guidance in on the CDC website.

TESTING

- All testing for infection with SARS-CoV-2 continues to be performed at CDC.
- CDC is remanufacturing test kits, which will be distributed following rigorous quality control processes.

REPATRIATED FLIGHTS & QUARANTINE ORDERS

- CDC has supported the Department of State in the safe and expedient ordered departure of US citizens and residents affected by outbreaks of COVID-19.
- Five chartered flights returned passengers from Wuhan City, China.
- Most recently, passengers from a cruise ship docked in Japan were in the process of being repatriated. (See section: Diamond Princess)
- The Department of Health and Human Services (DHHS) Secretary, under statutory authority, issued federal quarantine orders to all such passengers entering the United States.
- The quarantine period is for 14 days.
- The quarantine is a precautionary and preventive step to maximize the containment of the virus in the interest of the health of the American public.
- This quarantine order also serves to protect the health of the repatriated persons, their families, and their communities.
- Medical staff monitor the health of each traveler, including temperature checks and observation for respiratory symptoms.
- CDC works with the state and local public health departments to transport any passenger exhibiting symptoms to a hospital for further evaluation.
- At the end of the 14-day period, people who have not developed symptoms will be free to leave.
- On February 12, 195 people from the first chartered flight were discharged from quarantine.

DIAMOND PRINCESS

- CDC is supporting the Department of State-led mission to repatriate US citizens returning to the United States from Japan who were aboard the Diamond Princess cruise ship.
- There are approximately 400 US citizens onboard the Diamond Princess cruise ship.
- Due to the dynamic nature of the ongoing outbreak, the US government recommended that US citizens disembark and return to the United States.
- Americans returned by flights chartered by the State Department will be subject to a 14-day federal quarantine and be housed at two existing federal quarantine sites for repatriated travelers:
  - Travis Air Force Base in California
  - Joint Base San Antonio-Lackland in Texas

AMERICAN OVERSIGHT

- Those passengers returning from Japan will be housed separately from people already in quarantined from previous US Government repatriation flights from Wuhan.
- These planes will be met by a team of US Government personnel deployed at these bases to assess the health of the passengers.
- The passengers were screened before leaving the ship and will be monitored and evaluated by medical and public health personnel during the trip and after arrival.
- Anyone who becomes ill on the flight will be sent directly to a local hospital for medical evaluation.
- The US Government is taking measures to protect the health of the people under quarantine, their loved ones, and their communities, as well as the communities where they are being temporarily housed.
- Based on what is known about this virus and other coronaviruses, CDC believes the risk to the communities temporarily housing these people is low.

For more information please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

CORONAVIRUS DISEASE 2019 (COVID-19) NAMING

- The International Committee on Taxonomy of Viruses named the novel coronavirus causing an outbreak of respiratory illness that was first detected in Wuhan, Hubei Province, China, Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-CoV-2).
    - Due to potential for confusion with SARS-CoV, where possible, public communications will use "the virus that causes COVID-19."
- On February 11, 2020, the World Health Organization (WHO) named the disease caused by this virus Coronavirus Disease 2019 (COVID-19).
    - **Disease name:** COVID-19

AMERICAN OVERSIGHT

OUTBREAK SUMMARY

- There is an expanding outbreak of COVID-19, centered in China, caused by a novel (new) coronavirus.
- The new virus can cause illness varying from mild to severe, including potentially resulting in death. It can spread from person-to-person.
- This virus is spreading from person-to-person in China. A growing number of countries are reporting cases in travelers from China and person-to-person spread has been reported in countries outside of China, including in the United States.
- Chinese officials report that sustained person-to-person spread in the community is occurring in China. In addition, other destinations have apparent community spread, meaning some people have been infected who are not sure how or where they became infected.
- Global case numbers are reported by the World Health Organization in their Coronavirus Disease 2019 (COVID-19) situation reports.
    - As of **February 23, more than 78,800** cases have been identified worldwide. Fewer than 1,800 cases have occurred outside China.
- On January 30, WHO declared this outbreak a Public Health Emergency of International Concern (PHEIC). A PHEIC is declared if an event poses a public health threat to other nations through the spread of disease and potentially requires a coordinated international response.
- On January 31, Health and Human Services Secretary Alex M. Azar II declared a public health emergency for the United States to aid the nation's healthcare community in responding to COVID-19.
- Also on January 31, the President of the United States issued a "Proclamation on Suspension of Entry as Immigrants and Nonimmigrants of Persons who Pose a Risk of Transmitting 2019 Novel Coronavirus."
- The situation is rapidly changing, and CDC is monitoring it closely. Guidance will be updated as needed.
- Outbreaks like this — when a new virus has emerged to infect people and spread between people — are especially concerning.
- This is a very serious public health threat and the federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The goal of the ongoing US public health response is to minimize introductions of this virus, detect new cases quickly, and reduce community spread of this new coronavirus in the US.
- The coming days and weeks are likely to bring more confirmed cases of COVID-19 in the United States and globally, but strong public health measures now may blunt the impact of the virus in the United States.
- While it is unclear how this situation will evolve in the United States, CDC is preparing as if it were the next pandemic, while hoping it is not.

AMERICAN OVERSIGHT

- The current outbreak meets two criteria for a pandemic. It is a new virus and it is capable of person-to-person spread. If sustained person-to-person spread in the community begins outside in China, this will increase the likelihood that a global pandemic will result.
- Extensive work has been done over the past 15 years in the United States to prepare for an influenza pandemic.
    - Guidance developed for influenza pandemic preparedness would be appropriate in the event the current COVID-19 outbreak triggers a pandemic.
    - Selected pandemic preparedness materials are available online.
- The newly emerged coronavirus disease 2019 (COVID-19) is a respiratory disease that seems to be spreading much like flu.

U.S. OUTBREAK STATISTICS

Confirmed cases in the United States as of **February 21, 2020**:

- Travel-related: **12**
- Person-to-person spread: **2**
- Total confirmed cases: **14**
- Total tested: **426**
- Deaths: 0

Persons repatriated to the United States and tested positive by CDC, as of **February 21, 2020**:

- Wuhan, China: **3**
- *Diamond Princess* Cruise Ship: **36**

For global cases, please see the daily situation reports from the World Health Organization.

OUTBREAK BACKGROUND

- In early January 2020, Chinese health officials identified a novel (new) coronavirus (now named SARS-CoV-2) linked to an outbreak of respiratory illness in Wuhan, Hubei Province, China.
- Most cases have been detected in China, but some cases have been detected in more than thirty other locations. Most infections outside of China have occurred in travelers coming from Wuhan City.
- Initially, many of the patients in the Wuhan outbreak reportedly had some link to a large seafood and animal market, suggesting animal-to-person spread.
- Since then, Chinese officials report that sustained person-to-person spread in the community is occurring in China.
- Most cases in the US have been associated with travel to Wuhan, China; however, person-to-person spread also has been seen in close (household) contacts of confirmed COVID-19 cases.
- Coronaviruses are a group of viruses that have a halo or crown-like (corona) appearance when viewed under a microscope. They are common in many different species of animals, including camels, cattle, cats, and bats.

AMERICAN OVERSIGHT

- Human coronaviruses are a common cause of mild to moderate upper-respiratory illness. But three coronaviruses have emerged to cause more severe illness: Severe Acute Respiratory Syndrome (SARS-CoV), Middle East Respiratory Syndrome (MERS-CoV), and now the virus that causes COVID-19.

TRANSMISSION

- Much is unknown about how the new coronavirus that causes COVID-19 spreads. Current knowledge is largely based on what is known about similar coronaviruses.
- Most often, person-to-person spread is thought to happen among people in close contact (about 6 feet) with each other.
- Person-to-person spread is thought to occur mainly via respiratory droplets produced when an infected person coughs or sneezes, similar to how influenza and other respiratory pathogens spread. These droplets can land in the mouths or noses of people who are nearby or possibly be inhaled into the lungs.
- How easily a virus spreads person-to-person can vary. Some viruses are highly contagious (like measles), while other viruses are less so.
- Based on our current knowledge, it is unclear whether a person may become infected with the new coronavirus by touching a surface or object contaminated with the virus and then touching their own mouth, nose, or possibly their eyes.
- Typically, with most respiratory viruses, people are thought to be most contagious when they are most symptomatic (sickest).
- Mother-to-child transmission during pregnancy is unlikely, but after birth a newborn is susceptible to person-to-person spread.
- To date, CDC does not have any evidence to suggest that animals imported from China pose a risk for spreading the new coronavirus in the United States.
- At this time, CDC has no data to suggest that this new coronavirus or other similar coronaviruses are spread by mosquitoes.
    - Mosquitoes cannot spread all types of viruses. For a virus to pass to a person through a mosquito bite, the virus must be able to replicate inside the mosquito.
- There is much more to learn about the spread of this new coronavirus, severity of the disease, and other features associated with this outbreak and investigations are ongoing. This information will further inform the risk assessment.

DIAGNOSIS AND TREATMENT

- CDC developed a real time Reverse Transcription-Polymerase Chain Reaction (rRT-PCR) test to detect SARS-CoV-2 (the virus that causes COVID-19) in respiratory samples from clinical specimens.
- On January 24, CDC publicly posted the assay protocol for this test.

AMERICAN OVERSIGHT

- CDC submitted an Emergency Use Authorization (EUA) package to the U.S. Food and Drug Administration on February 3 for its test.
- FDA approved the Emergency Use Authorization on February 4.
- The first manufactured batch of CDC test kits were made available for ordering by domestic and international partners through the agency's International Reagent Resource (IRR) on February 5.
- Upon arrival at public health laboratories, when laboratories began trying to verify the assay, several laboratories reported issues.
    - Specifically, some laboratories found sporadic reactivity in the negative control of one of the three assay components.
    - This sporadic activity resulted in an inconclusive test result.
- Routine quality control (QC) measures aim to identify these types of issues. It is unclear why QC did not detect this issue before the kits were sent out to states. CDC is looking into this situation further.
- To address this issue, CDC is remanufacturing the complete test kits to ensure that laboratories have effective and reliable kits.
- The new kits are being manufactured as quickly as possible and will be made available to domestic and international laboratories immediately thereafter.
- At this time:
    - CDC continues to perform initial and confirmatory testing.
    - Laboratories that have verified the assay are able to test.
        - All positive results from testing conducted in non-CDC laboratories must be confirmed at CDC.
    - Laboratories that have encountered problems verifying the assay should not continue testing.
    - CDC understands that 2-3 states are currently using the CDC diagnostic test for patient care. Many are not testing due to the current reagent issues.
- There is no specific antiviral treatment for COVID-19. People with COVID-19 should receive supportive care to help relieve symptoms.
- For severe cases, treatment should include care to support vital organ functions.

PREVENTION

- There is currently no vaccine to prevent COVID-19. The best way to prevent infection is to avoid being exposed to the virus.
- CDC always recommends everyday preventive actions to help prevent the spread of respiratory viruses, including:
    - Avoid touching your eyes, nose, and mouth with unwashed hands.
    - Avoid close contact with people who are sick.
    - Stay home when you are sick.
    - Cover your cough or sneeze with a tissue, then throw the tissue in the trash.
    - Clean and disinfect frequently touched objects and surfaces using a regular household cleaning spray or wipe.

AMERICAN OVERSIGHT

- Wash your hands often with soap and water for at least 20 seconds, especially after going to the bathroom; before eating; and after blowing your nose, coughing, or sneezing.
- If soap and water are not readily available, use an alcohol-based hand sanitizer with at least 60% alcohol. Always wash hands with soap and water if hands are visibly dirty.

MINIMIZING STIGMA AND MISINFORMATION

- Minimizing stigma and misinformation is important, especially during contagious disease outbreaks.
- **Everyone:** Know the facts about COVID-19 and help prevent the spread of rumors:
    - Fight stigma and fear by supporting people who are coming back to school or work after completing their quarantine or isolation period for COVID-19 exposure or illness.
    - Someone who has completed their quarantine or met the requirements to discontinue infection control measures does not pose a risk of spreading COVID-19.
    - People of Asian descent, including Chinese Americans, are not more likely to get coronavirus than anyone else. Help fight fear by letting people know that being of Asian descent does not increase the chance of getting or spreading COVID-19.
    - Viruses cannot target people from specific populations, ethnicities, or racial backgrounds.
        - People who have not been in contact with a person who is a confirmed or suspected case are not at greater risk of acquiring and spreading this new virus than others.
- People who returned more than 14 days ago from areas where COVID-19 is active and do not have symptoms of coronavirus do not put others at risk.
- To help counter stigma, public health professionals can:
    - Maintain privacy and confidentiality of those seeking health care and those who may be part of any contact investigation.
    - Communicate the risk or lack of risk from associations with products, people, and places in a timely manner.
    - Raise awareness of COVID-19 without increasing fear.
    - Share accurate information about how the virus spreads.
    - Speak out against negative behaviors, including negative statements on social media about groups of people, or exclusion of people who pose no risk from regular activities.
        - Be cautious about the images that are shared. Make sure they do not reinforce stereotypes.
        - Engage with stigmatized groups in person and through media channels including news media and social media.
- Share the need for social support for people who have returned from China or are worried about friends or relatives in the affected region.

AMERICAN OVERSIGHT

TRAVEL

Travel from China:

- President Trump issued a Presidential Proclamation on January 31, to implement temporary measures to increase our abilities to detect and contain the novel coronavirus proactively and aggressively.
- The proclamation took effect at 5 p.m. EST, Sunday, February 2.
- The proclamation suspends entry to the United States of foreign nationals who have been in China (excluding Hong Kong and Macau) in the past 14 days. There are some exemptions, including for immediate family members of US citizens and legal permanent residents. (Hereafter referred to as "American citizens and exempted persons.")
- In addition:
    - All American citizens and exempted persons coming from China will be directed to ("**funneled to"**) one of 11 US airports.
    - American citizens and exempted persons who have been in Hubei province in the previous 14 days will have an additional health assessment (screened for fever, cough, or difficulty breathing).
        - If symptomatic, American citizens and exempted persons will be transferred for further medical evaluation. (They will not be able to complete their itinerary.)
        - If asymptomatic, American citizens and exempted persons will be subject to a mandatory quarantine at or near that location until 14 days after they left Hubei Province. (They will not be able to complete their itinerary.)
    - American citizens and exempted persons who have been in other parts of mainland China (outside of Hubei Province) in the previous 14 days will have an additional health assessment (screened for fever, cough, or difficulty breathing).
        - If symptomatic, American citizens and exempted persons will be transferred for medical evaluation. (They will not be able to complete their itinerary at that time.)
        - If asymptomatic, American citizens and exempted persons will be allowed to reach their final destination and, after arrival, will self-monitor under public health supervision for 14 days.
- The 11 airports where travelers are being funneled include:
    - John F. Kennedy International Airport (JFK), New York
    - Chicago O'Hare International Airport (ORD), Illinois
    - San Francisco International Airport (SFO), California
    - Seattle-Tacoma International Airport (SEA), Washington
    - Daniel K. Inouye International Airport (HNL), Hawaii
    - Los Angeles International Airport (LAX), California
    - Hartsfield-Jackson Atlanta International Airport (ATL), Georgia
    - Washington-Dulles International Airport (IAD), Virginia
    - Newark Liberty International Airport (EWR), New Jersey

AMERICAN OVERSIGHT

    - Dallas/Fort Worth International Airport (DFW), Texas
    - Detroit Metropolitan Airport (DTW), Michigan
- As of February 23, about 45,000 people have been screened at US airports.

Travel Notices and Advisories:

- On January 27, CDC issued a level 3 Travel Health Notice for China recommending that all travelers avoid non-essential travel (this does not include the Special Administrative Regions of Hong Kong and Macau, or the island of Taiwan).
- On January 30, the US State Department issued a level 4 travel advisory, their highest threat level, requesting Americans not to travel to China because of the public health threat posed by COVID-19.
- On February 19, CDC issued a travel notice for Hong Kong, recommending that travelers practice usual precautions (Level 1).
- On February 22, CDC issued travel notices for Japan and South Korea, recommending that travelers practice enhanced precautions (Level 2). Older adults and those with chronic medical conditions should consider postponing nonessential travel to these countries.
- On February 23, CDC issued travel notices for Iran and Italy, recommending that travelers practice usual precautions (Level 1).
- CDC recommends that all travelers reconsider cruise ship voyages into or within Asia at this time.
    - CDC's recommendation is consistent with guidance from the U.S. Department of State.

Repatriation flights and quarantine orders:

- CDC has supported the Department of State in the safe and expedient ordered departure of US citizens and residents affected by outbreaks of COVID-19.
- Five chartered flights returned passengers from Wuhan City, China.
- Most recently, passengers from a cruise ship docked in Japan are in the process of being repatriated. (See section: *Diamond Princess*)
- The Department of Health and Human Services (DHHS) Secretary, under statutory authority, issued federal quarantine orders to all such passengers entering the United States.
    - The quarantine period is for 14 days.
    - The quarantine is a precautionary and preventive step to maximize the containment of the virus in the interest of the health of the American public.
    - This quarantine order also serves to protect the health of the repatriated persons, their families, and their communities.
- Medical staff monitor the health of each traveler, including temperature checks and observation for respiratory symptoms.
- CDC works with state and local public health departments and/or HHS's Incident Management Team (IMT) to transport any passenger exhibiting symptoms to a hospital for further evaluation.
- At the end of the 14-day period, people who have not developed symptoms have their quarantine order lifted and are free to return home.

AMERICAN OVERSIGHT

- Almost all people from the Wuhan flights who were quarantined have fulfilled their 14-day quarantine period and have been released.

***Diamond Princess*:**

- CDC supported the Department of State-led mission to repatriate US citizens returning to the United States from Japan who were aboard the *Diamond Princess* cruise ship.
    - Due to the dynamic nature of the ongoing outbreak, the US government recommended that US citizens disembark and return to the United States.
- On February 16, 329 American citizens returned by flights chartered by the State Department.
    - The planes were met by a team of U.S. government personnel deployed at the bases to assess the health of the passengers.
    - The passengers were screened before leaving the ship and were monitored and evaluated by medical and public health personnel during the trip and after arrival. They will continue to be monitored throughout the 14-day quarantine period.
- Americans returned by flights chartered by the State Department are subject to a 14-day federal quarantine and are housed at two existing federal quarantine sites for repatriated travelers:
    - Travis Air Force Base in California
    - Joint Base San Antonio-Lackland in Texas
- Passengers who elected not to return on the repatriation flights remain in Japan under a 14-day travel restriction.
    - CDC, in partnership with the US Embassy in Tokyo, is monitoring their health during the 14-day travel restriction in order to ensure they are healthy prior to their return to the United States.
- More than 60 Americans who were on board the *Diamond Princess* remain in Japan, hospitalized with COVID-2, including some who are reportedly severely ill.
- The US Government is taking measures to protect the health of the people under quarantine, their loved ones, and their communities, as well as the communities where they are being temporarily housed.
- Based on what is known about this virus and other coronaviruses, CDC believes the risk to the communities temporarily housing these people is low.

WHAT CDC IS DOING

CDC Response in the US:

- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The goal of the ongoing US public health response is to detect new cases quickly and prevent further spread of COVID-19 in this country.
- CDC established a COVID-19 Incident Management Structure on January 7. On January 21, CDC activated its Emergency Operations Center to better provide ongoing support to the COVID-19 response.

AMERICAN OVERSIGHT

- On January 27, CDC issued updated travel guidance for China, recommending that travelers avoid all nonessential travel to all of the country (Level 3 Travel Health Notice).
- The US government has taken unprecedented steps with respect to travel in response to the growing public health threat posed by this new coronavirus.
    - Effective February 2, at 5pm, the US government suspended entry of foreign nationals who have been in China within the past 14 days.
    - US citizens, residents, and their immediate family members who have been in Hubei province and other parts of mainland China are allowed to enter the United States, but they are subject to health monitoring and possible quarantine for up to 14 days.
    - See more at: "Proclamation on Suspension of Entry as Immigrants and Nonimmigrants of Persons who Pose a Risk of Transmitting 2019 Novel Coronavirus".
- CDC issued an interim Health Alert Network (HAN) Update to inform state and local health departments and healthcare professionals about this outbreak on February 1.
- On January 30, CDC published guidance for healthcare professionals on the clinical care of COVID-19 patients.
- On February 3, CDC posted guidance for assessing the potential risk for various exposures to COVID-19 and managing those people appropriately.
- CDC has deployed multidisciplinary teams to support state health departments with clinical management, contact tracing, and communications.
    - CDC has helped mobilize state health departments to receive returned repatriated travelers.
    - Through the Public Health Emergency Preparedness (PHEP) cooperative agreement, 62 state PHEP programs across the country are part of the multi-agency infrastructure working on quarantine, isolation, case finding, protecting health care workers and assuring medical supply chains.
    - State PHEP programs stand ready to address future developments in the outbreak.
- CDC has worked with the Department of State, supporting the safe return of Americans who have been stranded as a result of the ongoing outbreaks of COVID-19 and related travel restrictions. CDC has worked to assess the health of passengers as they return to the United States and provided continued daily monitoring of people who are quarantined.
- CDC has developed a real time Reverse Transcription-Polymerase Chain Reaction (rRT-PCR) test that can diagnose COVID-19 in respiratory and serum samples from clinical specimens. On January 24, CDC publicly posted the assay protocol for this test.
- CDC's International Reagent Resource began distributing test kits domestically on February 6. However, CDC identified a problem in the manufacturing of one of the three controls used in the verification process of the test.
    - To address this issue, CDC is remanufacturing the complete test kits, to ensure that laboratories have effective and reliable kits. This process is being expedited. The new kits will be made available to both domestic and international laboratories as soon as possible.
- CDC has been uploading the entire genome of the viruses from reported cases in the United States to GenBank as sequencing was completed.

AMERICAN OVERSIGHT

- CDC has grown the virus in cell culture, which is necessary for further studies, including for additional genetic characterization. The cell-grown virus was sent to NIH's BEI Resources Repository for use by the broad scientific community.

Internationally:

Note: Due to the rapidly changing situation, any statements on CDC involvement in China need case-by-case clearance.

- CDC is working diligently and closely with partners to support the response to this novel coronavirus outbreak.
- CDC has staff stationed in more than 60 countries across the globe. CDC has offices in China, in a number of the countries reporting cases of COVID-19, and in countries that have not yet reported cases of COVID-19 but are busy with planning and preparedness efforts.
    - CDC and the government of China have collaborated for the past 30 years addressing public health priorities affecting the US, China, and the world.
- In addition to working with host country officials, CDC staff are working in coordination with Department of State and other agencies within US embassies.
- CDC is mobilizing Atlanta-based staff to support the response. Many of these staffers have extensive experience responding to global outbreaks.
- CDC has identified experts who are prepared to join a planned WHO mission to support efforts to better understand the severity and transmissibility of the virus.
- In China, CDC is an important technical partner for the Chinese Field Epidemiology Training Program (FETP).
    - Using classroom and hands-on experience, the China FETP program has graduated 279 epidemiologists who conducted more than 2,000 outbreak investigations as part of their training.
    - Specialized training tracks are now being established in non-communicable diseases and tuberculosis.
    - With technical guidance from CDC, 71 graduates completed training for the new Western FETP that supports 13 under-served provinces of China — remote areas more vulnerable to novel infections and with increasing transport corridors.
- CDC has supported China CDC's national influenza laboratory for more than 20 years.
- CDC works in close partnership with the China CDC's National Influenza Epidemiology, Virology, and Pandemic Preparedness Centers, China's provincial and local CDCs, hospitals, and academic institutions.
- CDC supports Chinese partners in monitoring seasonal and novel influenza viruses, as well as enhancing efforts to detect and respond to seasonal, avian, and other novel influenza viruses with pandemic potential. CDC's key supporting activities include:
    - Strengthening influenza surveillance for seasonal and novel influenza viruses
    - Conducting research to estimate disease burden and vaccine effectiveness among populations at greatest risk (including young children, older adults, and pregnant women)

AMERICAN OVERSIGHT

    - Promoting influenza vaccination policy development and coverage
    - Supporting novel virus risk assessments
    - Establishing pandemic influenza preparedness in China
    - Maintaining close ties between US and China influenza experts
- In other countries, CDC is collaborating with WHO to support Ministries of Health to prepare and respond to the epidemic.
    - CDC is helping to support countries to implement WHO recommendations related to the diagnosis and care of patients, tracking the epidemic, and identifying people who might have COVID-19.
    - CDC staff are also starting to work together with country colleagues to conduct investigations that will help inform response efforts going forward.
    - CDC works closely with countries to establish FETPs that train a workforce of field epidemiologists —or disease detectives— to identify and contain outbreaks close to the source.
    - For country-specific information, please contact CDCglobal@cdc.gov.

RECOMMENDATIONS

- CDC routinely advises that people help protect themselves from respiratory illnesses by washing their hands often, avoiding touching their face with unwashed hands, avoiding close contact with people who appear sick, and cleaning frequently touched surfaces.
    - CDC defines close contact as—
        - Being within about 6 feet (2 meters) of someone with COVID-19 for a prolonged period of time, such as living with, visiting, caring for or sharing a room in a healthcare facility
          - *or* –
        - By having direct contact with infectious secretions from a patient, such as being coughed on.

Recent Travelers to China:

- If you were in China and feel sick with fever, cough, or difficulty breathing, within 14 days after leaving the country, you should:
    - Seek medical advice. Before you go to a doctor's office or emergency room, call ahead and tell them about your recent travel and your symptoms.
    - Avoid contact with others.
    - Not travel while sick.
    - Cover your mouth and nose with a tissue or your sleeve (not your hands) when coughing or sneezing.
    - Wash your hands often with soap and water for at least 20 seconds to avoid spreading the virus to others. Use an alcohol-based hand sanitizer if soap and water are not available.

AMERICAN OVERSIGHT

People Confirmed to Have, or Being Evaluated for, COVID-19:

- Your doctors and public health staff will evaluate whether you can be cared for at home. If it is determined that you can be isolated at home, you will be monitored by staff from your local or state health department. You should follow the prevention steps below until a healthcare professional or local or state health department says you can return to your normal activities. Detailed information is available at Interim Guidance for Preventing COVID-19 from Spreading to Others in Homes and Communities.
    - Stay home except to get medical care.
    - Separate yourself from other people in your home.
    - Call ahead before visiting your doctor.
    - Wear a facemask.
    - Cover your coughs and sneezes with a tissue or cough or sneeze into your sleeve.
    - Wash your hands often with soap and water for at least 20 seconds.
    - Avoid sharing household items like eating utensils, cups, or linens.
    - Monitor your symptoms and seek prompt medical attention if your symptoms worsen.

On February 3, CDC published interim guidance for state and local public health officials on how to assess and manage the risks posed by patients who may have been exposed to this new coronavirus.

- This guidance establishes four risk categories: High, Medium, Low and No Identifiable Risk.
- The categories are based on a person's travel history and possible contact with patients who have laboratory-confirmed infections.
- The guidance **offers recommendations** for movement restrictions and public health evaluations for people in different risk categories.
- **In most cases, state and local authorities will make these decisions. Federal public health authority primarily extends to international arrivals at ports of entry and preventing interstate communicable disease threats.**
- These guidelines are subject to change as the situation requires. They do not apply retroactively to people who have been in China during the previous 14 days and are already in the United States, or those being managed as part of a contact investigation.
- CDC will provide separate guidance for healthcare settings.

Close Contacts of Patients Under Investigation:

People who have had close contact with someone who is confirmed to have, or being evaluated for, COVID-19, should:

- Monitor your health starting from the day you first had close contact with the person and continue for 14 days after you last had close contact with the person. Watch for these signs and symptoms:
    - Fever—take your temperature twice a day.
    - Coughing.
    - Shortness of breath or difficulty breathing.
    - Other early symptoms to watch for are chills, body aches, sore throat, headache, diarrhea, nausea, vomiting, and runny nose.

AMERICAN OVERSIGHT

- **If you develop fever or any of these symptoms, call your healthcare professional right away.**
    - **Before** going to your medical appointment, be sure to tell your healthcare professional about your close contact with someone who is confirmed to have, or being evaluated for, COVID-19. This notification will help the healthcare professional's office take steps to keep other people from getting infected. Ask your healthcare professional to call the local or state health department.
- If you do not have any symptoms, you can continue with your daily activities, such as going to work, school, or other public areas.
- Detailed information for caregivers and household members can be found on the Interim Guidance for Preventing COVID-19 from Spreading to Others in Homes and Communities web page.

For Healthcare Professionals:

Patients in the United States who meet the following criteria should be evaluated as a patient under investigation (PUI) in association with the outbreak of COVID-19 in Wuhan City, China.

Clinical Features	&	Epidemiologic Risk
Fever **or** signs/symptoms of lower respiratory illness (e.g., cough or shortness of breath)	**AND**	Any person, including healthcare workers, who has had close contact with a laboratory-confirmed COVID-19 patient within 14 days of symptom onset
Fever **and** signs/symptoms of a lower respiratory illness (e.g., cough or shortness of breath)	**AND**	A history of travel from **Hubei Province**, China within 14 days of symptom onset
Fever **and** signs/symptoms of a lower respiratory illness (e.g., cough or shortness of breath) requiring hospitalization	**AND**	A history of travel from mainland **China** within 14 days of symptom onset

Note: Fever may be subjective or confirmed. The criteria are intended to serve as guidance for evaluation. Patients should be evaluated and discussed with public health departments on a case-by-case basis if their clinical presentation or exposure history is equivocal (e.g., uncertain travel or exposure).The above criteria are available on the Interim Guidance for Healthcare Professionals web page.

Recommendations for Reporting, Testing, and Specimen Collection:

- Healthcare professionals should **immediately** notify both infection control personnel at their healthcare facility AND their local or state health department in the event of a PUI for COVID-19.
- State health departments that have identified a PUI should immediately contact CDC's Emergency Operations Center (EOC) at 770-488-7100 and complete a COVID-19 PUI case investigation form available on CDC's Interim Guidance for Healthcare Professionals.
- Clinical specimens should be collected from PUIs for routine testing of respiratory pathogens at either clinical or public health labs. Note that clinical laboratories should NOT attempt viral isolation from specimens collected from COVID-19 PUIs.

AMERICAN OVERSIGHT

- **For biosafety reasons, it is not recommended to perform virus isolation in cell culture or initial characterization of viral agents recovered in cultures of specimens from a PUI for COVID-19.**
- For initial diagnostic testing for COVID-19, CDC recommends collecting and testing upper respiratory (nasopharyngeal AND oropharyngeal swabs), and lower respiratory (sputum, if possible) for those patients with productive coughs.
    - Induction of sputum is not recommended.
- Specimens should be collected as soon as possible once a PUI is identified regardless of time of symptom onset.
- Maintain proper infection control when collecting specimens.
- Additional guidance for collection, handling, and testing of clinical specimens is available on CDC's website.
- Detailed information on specimen types and shipping can be found on the Information for Laboratories web page.

INFECTION PREVENTION AND CONTROL FOR HEALTHCARE SETTINGS

- Healthcare personnel (HCP) are on the front lines of caring for patients with confirmed or possible COVID-19. HCP caring for these patients have an increased risk of exposure to this virus.
- HCP can minimize their risk of exposure when caring for confirmed or possible COVID-19 patients by following CDC infection prevention and control (IPC) guidelines, including use of recommended personal protective equipment (PPE).
- Based on what CDC knows now related to severity, transmission efficiency, and shedding duration, CDC is currently recommending Standard, Contact, and Airborne Precautions, including eye protection, when caring for patients with confirmed or possible COVID-19.
- As CDC learns more about COVID-19, and as the needs of the response within US healthcare facilities change, CDC will refine and update this early and aggressive IPC approach.
- Infection control procedures and appropriate use of PPE are necessary to prevent infections from spreading while caring for patients. CDC reminds all employers and HCP that PPE is only one aspect of safe care of patients with COVID-19.
    - Focusing only on PPE gives a false sense of security of safe care and worker safety.
    - It is critical to focus on other pathways to prevent spread of SARS-CoV-2 in healthcare settings. Examples include prompt screening and triage, limiting personnel in the room, and using Airborne Infection Isolation Rooms (AIIR).
- CDC's current guidelines are designed to prevent the spread of SARS-CoV-2 within healthcare facilities to healthcare personnel and other patients who may be exposed to a patient with confirmed or possible COVID-19.
- Healthcare personnel caring for patients with confirmed or suspected COVID-19 should adhere to CDC recommendations for infection prevention and control (IPC):
    - Assess and triage patients with acute respiratory symptoms and risk factors for COVID-19 to minimize chances of exposure. Place a facemask on the patient and isolating them in an AIIR, if available.

AMERICAN OVERSIGHT

    - Use Standard, Contact, and Airborne Precautions, including eye protection, when caring for patients with confirmed or possible COVID-19.
    - Perform hand hygiene with alcohol-based hand sanitizer before and after all patient contact, before and after contact with potentially infectious material, and before putting on and upon removal of PPE, including gloves. Use soap and water if hands are visibly soiled.
    - Practice how to properly don, use, and doff PPE in a manner to prevent self-contamination.
    - Perform aerosol-generating procedures (e.g., sputum induction, open suctioning of airways) in an AIIR, while following appropriate IPC practices, including use of appropriate PPE.
    - The collection of respiratory specimens (e.g., nasopharyngeal swabs) are likely to induce coughing or sneezing. HCP collecting specimens for testing for COVID-19 from patients with known or suspected COVID-19 (i.e., PUI) should adhere to Standard, Contact, and Airborne Precautions, including the use of eye protection. These procedures should take place in an AIIR or in an examination room with the door closed. Ideally, the patient should not be placed in any room where room exhaust is recirculated within the building without HEPA filtration.
    - Healthcare facilities can minimize the chance for exposures by ensuring facility policies and practices are in place and implemented before patient arrival, upon patient arrival, and throughout the duration of the affected patient's time in the healthcare setting.
- Healthcare facilities should promptly notify state or local public health authorities of patients with known or possible COVID-19 (i.e., persons under investigation or PUIs), and should designate specific persons within the healthcare facility who are responsible for communication with public health officials and dissemination of information to HCP.
- All healthcare facilities should ensure that their personnel are correctly trained and capable of implementing infection control procedures. Individual healthcare personnel should ensure they understand and can adhere to infection control requirements.
- Routine cleaning and disinfection procedures are appropriate for SARS-CoV-2 in healthcare settings, including those patient-care areas in which aerosol-generating procedures are performed.
    - Products with EPA-approved emerging viral pathogens claims are recommended for use against SARS-CoV-2.
- Management of laundry, food service utensils, and medical waste should also be performed in accordance with routine procedures. Federal, state, and local guidelines and regulations specify the categories of medical waste that are subject to regulation and outline the requirements associated with treatment and disposal.
- As a reminder, the role of face masks is for source control, and not to prevent exposure.
- CDC recommends that employees who are confirmed to have COVID-19, those who appear to have acute respiratory illness symptoms upon arrival to work, and persons who become sick

AMERICAN OVERSIGHT

during the work day promptly put on a facemask, be separated from other people, and be sent home immediately.

- If facemasks are not available, sick HCPs should cover their noses and mouths with a tissue when coughing or sneezing (or an elbow or shoulder if no tissue is available).

WHAT CDC IS DOING TO PROTECT HEALTHCARE PERSONNEL

- CDC is providing regular communication to the US healthcare community through targeted outreach activities.
- CDC is rapidly developing guidance and resources to protect US healthcare personnel. Current guidance and recommendations are designed to protect healthcare personnel and prevent the spread of the virus that causes COVID-19 within US healthcare facilities.
- CDC has deployed field teams to provide onsite infection control assessment and consultation to the US healthcare facilities currently treating confirmed COVID-19 patients and the passengers returning from China.

MANAGEMENT OF PATIENTS GUIDANCE FOR HEALTHCARE PROVIDERS

Clinical Presentation

- Most frequently reported symptoms of COVID-19 include fever, cough, sore throat, myalgia, or fatigue. Less commonly reported symptoms include sputum production, headache, hemoptysis, and diarrhea. Older patients and people with chronic medical conditions may be at higher risk of severe illness.
    - Possible risk factors for progressing to severe illness may include, but are not limited to, older age and underlying chronic medical conditions such as lung disease, cancer, heart failure, cerebrovascular disease, renal disease, liver disease, diabetes, immunocompromising conditions, and pregnancy.

Clinical Course

- Symptoms among reported cases of COVID-19 vary in severity from mild illness to severe or fatal illness.
- Some reports suggest the potential for clinical deterioration during the second week of illness.
- Among hospitalized patients with confirmed COVID-19, some will develop complications:
    - Acute respiratory distress syndrome (ARDS)
    - Intensive care for respiratory support
    - Pneumonia resulting in death
    - Secondary infection

Laboratory and Radiographic Findings

- SARS-CoV-2 RNA has been detected from upper and lower respiratory tract specimens, and the virus has been isolated from bronchoalveolar lavage fluid.

AMERICAN OVERSIGHT

- The duration of shedding of SARS-CoV-2 RNA in the upper and lower respiratory tracts is not yet known but may be several weeks or longer.

Clinical Management and Treatment

- No specific treatment for COVID-19 is currently available. Prompt infection prevention and control measures and supportive management of complications is recommended.
- Patients with mild clinical presentation may not initially require hospitalization.
- The decision to monitor a patient in the inpatient or outpatient setting should be made on a case-by-case basis.

INTERIM GUIDANCE FOR BUSINESSES AND EMPLOYERS (NON-HEALTHCARE SETTINGS)

- Interim guidance for businesses and employers to plan for and respond to COVID-19 is now available on the CDC website. This interim guidance may help prevent workplace exposures to acute respiratory illnesses, including COVID-19, in non-healthcare settings. The guidance also provides planning considerations if there are more widespread, community outbreaks of COVID-19.
- Employers can use strategies now to prevent workplace exposures to acute respiratory illness, such as:
    - Actively encouraging sick employees to stay home
    - Separating sick employees
    - Emphasizing staying home when sick, respiratory etiquette, and hand hygiene by all employees
    - Performing routine environmental cleaning
    - Advising employees before traveling to take certain steps
    - Checking the CDC's Traveler's Health Notices website for the latest guidance and recommendations for each country to which you will travel
- For the general public, who are unlikely to be exposed to this virus, the immediate health risk from COVID-19 is considered low at this time. Some people, like healthcare workers caring for COVID-19 patients and other close contacts of COVID-19 patients, will have an increased risk of infection.
    - Employees who are well but who have a sick family member at home with COVID-19 should notify their supervisor and refer to CDC guidance for how to conduct a risk assessment of their potential exposure.
    - If an employee is confirmed to have COVID-19, employers should inform fellow employees of their possible exposure to COVID-19 in the workplace but maintain confidentiality as required by the Americans with Disabilities Act. Employees exposed to a co-worker with confirmed COVID-19 should refer to CDC guidance for how to conduct a risk assessment of their potential exposure.
- Employers should be ready to implement strategies to protect the workforce from COVID-19 while ensuring the continuity of operations.

AMERICAN OVERSIGHT

- An infectious disease outbreak response plan should include possible work-related exposures and health risks to employees. The plan should also explore flexible worksites (e.g., telecommuting) and work hours in accordance with human resource policies.

AMERICAN OVERSIGHT

CDC Daily Key Points

Coronavirus Disease 2019 ("COVID-19") Outbreak

February 24, 2020

All content updated since February 21 is shown in colored text.

MAIN KEY POINTS

- There is an expanding global outbreak of respiratory illness caused by a novel (new) coronavirus.
- This virus has been named "SARS-CoV-2;" the disease it causes has been named COVID-19.
    - Due to potential for confusion with SARS-CoV, where possible, public communications will use "the virus that causes COVID-19."
- While most COVID-19 cases outside of China have been associated with travel to or from China, community spread is being detected in a growing number of countries.
- Destinations with apparent community spread of COVID-19 include Hong Kong, Iran, Italy, Japan, Singapore, South Korea, Taiwan, and Thailand.
- The fact that COVID-19 has caused illness, including illness resulting in death, and sustained person-to-person spread is concerning. These factors meet two of the criteria of a pandemic.
- As community spread is detected in more and more countries, the world moves closer toward meeting the third criteria, worldwide spread of the new virus.
- The potential public health threat posed by COVID-19 is high, both globally and to the United States.
- But individual risk is dependent on exposure.
- For the general American public, who are unlikely to be exposed to this virus at this time, the immediate health risk from COVID-19 is low.
- Under current circumstances, certain people will have an increased risk of infection. For example, healthcare workers caring for patients with COVID-19 and other close contacts of persons with COVID-19. CDC has developed guidance to help in the risk assessment and management of people with potential exposures to COVID-19.
- However, it's important to note that current global circumstances suggest it is likely that this virus will cause a pandemic. In that case, risk assessment would be different.
- Global efforts at this time are focused concurrently on containing spread of this virus and mitigating the impact of this virus.
- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States so as to reduce the spread and the impact of this virus.
- CDC is operationalizing all of its pandemic preparedness and response plans, working on multiple fronts to meet these goals, including specific measures to prepare communities to respond local transmission of the virus that causes COVID-19.
- Pandemic guidance developed in anticipation of an influenza pandemic is being repurposed and adapted for a COVID-19 pandemic.
- Public health partners are encouraged to review their pandemic preparedness plans at this time.

AMERICAN OVERSIGHT

- At this time, there is no vaccine to protect against COVID-19 and no medications approved to treat it.
- Nonpharmaceutical interventions would be the most important response strategy.
- CDC launched a new weekly email newsletter with updates on the agency's COVID-19 outbreak response. Sign up for the newsletter.

SITUATION UPDATE

- To date, 35 international locations (including the U.S.) have reported confirmed cases of COVID-19.
- More than 77,000 cases have been confirmed on mainland China, with more than 2,500 deaths.
- On February 22, 2020, CDC issued a Level 2 Travel Notice (Practice Enhanced Precautions) for Japan and South Korea.
- On February 23, 2020 CDC issued Level 1 Travel Alert Notices (Practice Usual Precautions) for Iran and Italy.
- CDC also recommends that all travelers reconsider cruise ship voyages into or within Asia at this time.
- This is consistent with guidance by the U.S. State Department.
- For the latest travel guidance, visit COVID-19 Information for Travel.
- This is a rapidly evolving situation. CDC is constantly reviewing and updating its guidance as needed.
- CDC is reporting confirmed cases of COVID-19 in the United States in two categories:
    1. Cases detected through our domestic public health systems, and
    2. Cases among people who were repatriated via U.S. State Department flights from Wuhan, China and from the Diamond Princess cruise ship (Japan).
- Fourteen cases of COVID-19 have been detected in California, Illinois, Massachusetts, Washington, and Wisconsin through U.S. public health surveillance.
- Two of these cases occurred through person-to-person spread. The remaining cases all were in persons who had travel to China.
- 39 cases of COVID-19 have been detected among the 1,100+ people repatriated from Hubei Province, China and the Diamond Princess. (That includes 3 people repatriated from Wuhan and 36 people who were repatriated from the Diamond Princes.)
- Almost all of the people from the Wuhan flights who were quarantined have finished their 14-day quarantine period.
- Because the passengers on the Diamond Princess were in a close setting where there was significant spread of COVID-19, they are considered at high-risk for infection. CDC expects to see additional confirmed cases of among those passengers.

WHAT YOU CAN DO

- While the immediate risk of this new virus to the American public is believed to be low at this time, everyone can do their part to help us respond to this emerging public health threat:
    - It's currently flu and respiratory disease season and CDC recommends getting a flu vaccine, taking everyday preventive actions to help stop the spread of germs, and taking flu antivirals if prescribed.

AMERICAN OVERSIGHT

- If you are a healthcare provider, be on the look-out for people with who recently traveled from China and fever and respiratory symptoms.
- If you are a healthcare provider caring for a COVID-19 patient or a public health responder, please take care of yourself and follow recommended infection control procedures.
- If you have been in China or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus. If you develop COVID-19 symptoms, contact your healthcare provider, and tell them about your symptoms and your travel or exposure to a COVID-19 patient.
- For people who have had close contact with someone with COVID-19 who develop symptoms, contact your healthcare provider, and tell them about your symptoms and your exposure to a COVID-19 patient.
- For people who are ill with COVID-19, please follow CDC guidance on how to reduce the risk of spreading your illness to others. This guidance in on the CDC website.

TESTING

- All testing for COVID-19 continues to be performed at CDC. At this time, all positive results from testing conducted in non-CDC, U.S. laboratories must be confirmed at CDC.
- CDC is remanufacturing test kits, which will be distributed following rigorous quality control processes.

REPATRIATED FLIGHTS & QUARANTINE ORDERS

- CDC has supported the Department of State in the safe and expedient ordered departure of U.S. citizens and residents affected by outbreaks of COVID-19.
  - Five chartered flights returned passengers from Wuhan City, China.
  - Most recently, passengers from a cruise ship docked in Japan were repatriated. (See section: *Diamond Princess*)
- The Department of Health and Human Services (DHHS) Secretary, under statutory authority, issued federal quarantine orders to all such passengers entering the United States.
- Almost all of the people from the Wuhan flights who were quarantined fulfilled their 14-day quarantine period and been released.
  - On February 12, 195 people from the first chartered flight were discharged from quarantine.
  - On February 18, 347 people who were under federal quarantine were released.
  - On February 20, 263 people who were under federal quarantine were released.
- People released from quarantine pose no health risk to their communities.

DIAMOND PRINCESS

- On February 16, 329 American citizens returned by flights chartered by the State Department.
- Persons who are not sick are being kept in quarantine.
- Persons who are sick with COVID-19 are in isolation and receiving medical care as needed.

AMERICAN OVERSIGHT

- All American passengers have disembarked from the *Diamond Princess* cruise ship. These people have been placed under travel restrictions, as have the ship's other passengers and crew.
- Some American crew members of the Diamond Princess remain aboard the ship.
- More than 60 Americans who were on board the Diamond Princess remain in Japan, hospitalized with COVID-2, including some who are reportedly severely ill.
- The U.S. Government is taking measures to protect the health of the people under quarantine, their loved ones, and their communities, as well as the communities where they are being temporarily housed.
- Based on what is known about this virus and other coronaviruses, CDC believes the risk to the communities temporarily housing these people is low.

WESTERDAM

- No testing of passengers from the Westerdam Cruise Ship for SARS-CoV-2, the virus that causes COVID-19, has been done at CDC.
- CDC is aware that an American passenger on the Westerdam tested positive for infection with SARS-CoV-2 in Malaysia and that two subsequent and sequential tests on samples from that same person were negative.
- CDC is aware that follow-up testing among more than 1,500 passengers from the Westerdam has all been negative.
- CDC considers passengers from the Westerdam to be at "low risk" of SARS-CoV-2 infection during the 14 days after their last exposure per the agency's Risk Assessment guidance.
- Given this level of risk, testing of Westerdam passengers for SARS-CoV-2 is not recommended unless additional exposures are identified to warrant testing.

CDC ACTIONS

- CDC is aggressively responding to the global outbreak of COVID-19 and preparing for the potential of community spread in the United States.
- **Preparing first responders, healthcare providers, and health systems:**
    - Establishing **visibility across healthcare systems** to understand healthcare use, particularly surges in demand for medical care and associated resources.
    - Conducting **extensive outreach to clinical and hospital professional organizations** to ensure health system **preparedness.**
    - Producing more than **23 guidance documents** on infection control, hospital preparedness assessments, personal protective equipment (PPE) supply planning, and clinical evaluation and management (as of February 22, 2020).
        - Working closely with healthcare facilities and providers to **reinforce infection control principles** that recognize PPE is one component of a larger set of practices that help to limit the spread of disease.
        - **Developing a range of respirator conservation strategies**, including strategies to make supplies last longer (such as using alternative products like reusable respirators) and extending the use of disposable respirators.
    - Leveraging existing **telehealth tools** to direct people to the right level of healthcare for their medical needs.

AMERICAN OVERSIGHT

    - **Working with supply chain partners** to understand supply usage, what products are available, and when more aggressive measures may need to be taken to ensure that healthcare workers at highest risk have access to PPE.
    - **Sharing information with stakeholders** to help them recognize when to shift the strategies they are using.
- **Reinforcing state, territorial, and local public health readiness:**
    - **Assessing state and local readiness** to implement community mitigation measures like home containment, including housing and transportation needs.
    - Coordinating with states to **identify and mitigate gaps in readiness** that will help reduce the spread of disease in the community while protecting workers, infrastructure, and institutions.
    - Linking public health agencies and healthcare systems to **identify and mitigate stressors to the health system**
    - **Tracking stockpiles of PPE** across jurisdictions.
    - Working with state and local public health to **use existing Public Health Emergency Preparedness (PHEP) funding** to support COVID-19 preparedness and response activities.
    - Leveraging funding mechanisms to help states **accelerate preparedness activities.**
    - Providing **technical assistance and guidance** to states to improve their ability to respond to the outbreak.
- **Supporting communities, businesses, and schools:**
    - **Creating business guidance** to help the public and private sectors ensure they are able to operate with adaptations like telework and flexible sick leave policies, as well as how to respond if an employee gets sick.
    - **Developing guidance for childcare programs, K-12 schools, and colleges/universities** to help them plan and prepare for COVID-19 and respond if there is a local outbreak in their community.
    - Providing **planning guides for COVID-19** that households, community- and faith-based organizations, event planners of mass gatherings, and public health communicators can use.
    - Educating communities about **nonpharmaceutical interventions (NPIs)** that help slow the spread of illness, like COVID-19.

For more information, please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

CORONAVIRUS DISEASE 2019 (COVID-19) NAMING

- The International Committee on Taxonomy of Viruses named the novel coronavirus causing an outbreak of respiratory illness that was first detected in Wuhan, Hubei Province, China, Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-CoV-2).
    - Due to potential for confusion with SARS-CoV, where possible, public communications will use "the virus that causes COVID-19."
- On February 11, 2020, the World Health Organization (WHO) named the disease caused by this virus Coronavirus Disease 2019 (COVID-19).
    - **Disease name:** COVID-19

AMERICAN OVERSIGHT

OUTBREAK SUMMARY

- There is an expanding outbreak of COVID-19, centered in China, caused by a novel (new) coronavirus.
- The new virus can cause illness varying from mild to severe, including potentially resulting in death. It can spread from person-to-person.
- This virus is spreading from person-to-person in China. A growing number of countries are reporting cases in travelers from China and person-to-person spread has been reported in countries outside of China, including in the United States.
- Chinese officials report that sustained person-to-person spread in the community is occurring in China. In addition, other destinations have apparent community spread, meaning some people have been infected who are not sure how or where they became infected.
- Global case numbers are reported by the World Health Organization in their Coronavirus Disease 2019 (COVID-19) situation reports.
    - As of **February 23, more than 78,800** cases have been identified worldwide. Fewer than 1,800 cases have occurred outside China.
- On January 30, WHO declared this outbreak a Public Health Emergency of International Concern (PHEIC). A PHEIC is declared if an event poses a public health threat to other nations through the spread of disease and potentially requires a coordinated international response.
- On January 31, Health and Human Services Secretary Alex M. Azar II declared a public health emergency for the United States to aid the nation's healthcare community in responding to COVID-19.
- Also on January 31, the President of the United States issued a "Proclamation on Suspension of Entry as Immigrants and Nonimmigrants of Persons who Pose a Risk of Transmitting 2019 Novel Coronavirus."
- The situation is rapidly changing, and CDC is monitoring it closely. Guidance will be updated as needed.
- Outbreaks like this — when a new virus has emerged to infect people and spread between people — are especially concerning.
- This is a very serious public health threat and the federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The goal of the ongoing US public health response is to minimize introductions of this virus, detect new cases quickly, and reduce community spread of this new coronavirus in the US.
- The coming days and weeks are likely to bring more confirmed cases of COVID-19 in the United States and globally, but strong public health measures now may blunt the impact of the virus in the United States.
- While it is unclear how this situation will evolve in the United States, CDC is preparing as if it were the next pandemic, while hoping it is not.

AMERICAN OVERSIGHT

- The current outbreak meets two criteria for a pandemic. It is a new virus and it is capable of person-to-person spread. If sustained person-to-person spread in the community begins outside in China, this will increase the likelihood that a global pandemic will result.
- Extensive work has been done over the past 15 years in the United States to prepare for an influenza pandemic.
    - Guidance developed for influenza pandemic preparedness would be appropriate in the event the current COVID-19 outbreak triggers a pandemic.
    - Selected pandemic preparedness materials are available online.
- The newly emerged coronavirus disease 2019 (COVID-19) is a respiratory disease that seems to be spreading much like flu.

U.S. OUTBREAK STATISTICS

Confirmed cases in the United States as of **February 21, 2020**:

- Travel-related: **12**
- Person-to-person spread: **2**
- Total confirmed cases: **14**
- Total tested: **426**
- Deaths: 0

Persons repatriated to the United States and tested positive by CDC, as of **February 21, 2020**:

- Wuhan, China: **3**
- *Diamond Princess* Cruise Ship: **36**

For global cases, please see the daily situation reports from the World Health Organization.

OUTBREAK BACKGROUND

- In early January 2020, Chinese health officials identified a novel (new) coronavirus (now named SARS-CoV-2) linked to an outbreak of respiratory illness in Wuhan, Hubei Province, China.
- Most cases have been detected in China, but some cases have been detected in more than thirty other locations. Most infections outside of China have occurred in travelers coming from Wuhan City.
- Initially, many of the patients in the Wuhan outbreak reportedly had some link to a large seafood and animal market, suggesting animal-to-person spread.
- Since then, Chinese officials report that sustained person-to-person spread in the community is occurring in China.
- Most cases in the US have been associated with travel to Wuhan, China; however, person-to-person spread also has been seen in close (household) contacts of confirmed COVID-19 cases.
- Coronaviruses are a group of viruses that have a halo or crown-like (corona) appearance when viewed under a microscope. They are common in many different species of animals, including camels, cattle, cats, and bats.

AMERICAN OVERSIGHT

- Human coronaviruses are a common cause of mild to moderate upper-respiratory illness. But three coronaviruses have emerged to cause more severe illness: Severe Acute Respiratory Syndrome (SARS-CoV), Middle East Respiratory Syndrome (MERS-CoV), and now the virus that causes COVID-19.

TRANSMISSION

- Much is unknown about how the new coronavirus that causes COVID-19 spreads. Current knowledge is largely based on what is known about similar coronaviruses.
- Most often, person-to-person spread is thought to happen among people in close contact (about 6 feet) with each other.
- Person-to-person spread is thought to occur mainly via respiratory droplets produced when an infected person coughs or sneezes, similar to how influenza and other respiratory pathogens spread. These droplets can land in the mouths or noses of people who are nearby or possibly be inhaled into the lungs.
- How easily a virus spreads person-to-person can vary. Some viruses are highly contagious (like measles), while other viruses are less so.
- Based on our current knowledge, it is unclear whether a person may become infected with the new coronavirus by touching a surface or object contaminated with the virus and then touching their own mouth, nose, or possibly their eyes.
- Typically, with most respiratory viruses, people are thought to be most contagious when they are most symptomatic (sickest).
- Mother-to-child transmission during pregnancy is unlikely, but after birth a newborn is susceptible to person-to-person spread.
- To date, CDC does not have any evidence to suggest that animals imported from China pose a risk for spreading the new coronavirus in the United States.
- At this time, CDC has no data to suggest that this new coronavirus or other similar coronaviruses are spread by mosquitoes.
    - Mosquitoes cannot spread all types of viruses. For a virus to pass to a person through a mosquito bite, the virus must be able to replicate inside the mosquito.
- There is much more to learn about the spread of this new coronavirus, severity of the disease, and other features associated with this outbreak and investigations are ongoing. This information will further inform the risk assessment.

DIAGNOSIS AND TREATMENT

- CDC developed a real time Reverse Transcription-Polymerase Chain Reaction (rRT-PCR) test to detect SARS-CoV-2 (the virus that causes COVID-19) in respiratory samples from clinical specimens.
- On January 24, CDC publicly posted the assay protocol for this test.

AMERICAN OVERSIGHT

- CDC submitted an Emergency Use Authorization (EUA) package to the U.S. Food and Drug Administration on February 3 for its test.
- FDA approved the Emergency Use Authorization on February 4.
- The first manufactured batch of CDC test kits were made available for ordering by domestic and international partners through the agency's International Reagent Resource (IRR) on February 5.
- Upon arrival at public health laboratories, when laboratories began trying to verify the assay, several laboratories reported issues.
    - Specifically, some laboratories found sporadic reactivity in the negative control of one of the three assay components.
    - This sporadic activity resulted in an inconclusive test result.
- Routine quality control (QC) measures aim to identify these types of issues. It is unclear why QC did not detect this issue before the kits were sent out to states. CDC is looking into this situation further.
- To address this issue, CDC is remanufacturing the complete test kits to ensure that laboratories have effective and reliable kits.
- The new kits are being manufactured as quickly as possible and will be made available to domestic and international laboratories immediately thereafter.
- At this time:
    - CDC continues to perform initial and confirmatory testing.
    - Laboratories that have verified the assay are able to test.
        - All positive results from testing conducted in non-CDC laboratories must be confirmed at CDC.
    - Laboratories that have encountered problems verifying the assay should not continue testing.
    - CDC understands that 2-3 states are currently using the CDC diagnostic test for patient care. Many are not testing due to the current reagent issues.
- There is no specific antiviral treatment for COVID-19. People with COVID-19 should receive supportive care to help relieve symptoms.
- For severe cases, treatment should include care to support vital organ functions.

PREVENTION

- There is currently no vaccine to prevent COVID-19. The best way to prevent infection is to avoid being exposed to the virus.
- CDC always recommends everyday preventive actions to help prevent the spread of respiratory viruses, including:
    - Avoid touching your eyes, nose, and mouth with unwashed hands.
    - Avoid close contact with people who are sick.
    - Stay home when you are sick.
    - Cover your cough or sneeze with a tissue, then throw the tissue in the trash.
    - Clean and disinfect frequently touched objects and surfaces using a regular household cleaning spray or wipe.

AMERICAN OVERSIGHT

- Wash your hands often with soap and water for at least 20 seconds, especially after going to the bathroom; before eating; and after blowing your nose, coughing, or sneezing.
- If soap and water are not readily available, use an alcohol-based hand sanitizer with at least 60% alcohol. Always wash hands with soap and water if hands are visibly dirty.

MINIMIZING STIGMA AND MISINFORMATION

- Minimizing stigma and misinformation is important, especially during contagious disease outbreaks.
- **Everyone:** Know the facts about COVID-19 and help prevent the spread of rumors:
    - Fight stigma and fear by supporting people who are coming back to school or work after completing their quarantine or isolation period for COVID-19 exposure or illness.
    - Someone who has completed their quarantine or met the requirements to discontinue infection control measures does not pose a risk of spreading COVID-19.
    - People of Asian descent, including Chinese Americans, are not more likely to get coronavirus than anyone else. Help fight fear by letting people know that being of Asian descent does not increase the chance of getting or spreading COVID-19.
    - Viruses cannot target people from specific populations, ethnicities, or racial backgrounds.
        - People who have not been in contact with a person who is a confirmed or suspected case are not at greater risk of acquiring and spreading this new virus than others.
- People who returned more than 14 days ago from areas where COVID-19 is active and do not have symptoms of coronavirus do not put others at risk.
- To help counter stigma, public health professionals can:
    - Maintain privacy and confidentiality of those seeking health care and those who may be part of any contact investigation.
    - Communicate the risk or lack of risk from associations with products, people, and places in a timely manner.
    - Raise awareness of COVID-19 without increasing fear.
    - Share accurate information about how the virus spreads.
    - Speak out against negative behaviors, including negative statements on social media about groups of people, or exclusion of people who pose no risk from regular activities.
        - Be cautious about the images that are shared. Make sure they do not reinforce stereotypes.
        - Engage with stigmatized groups in person and through media channels including news media and social media.
- Share the need for social support for people who have returned from China or are worried about friends or relatives in the affected region.

AMERICAN OVERSIGHT

TRAVEL

Travel from China:

- President Trump issued a Presidential Proclamation on January 31, to implement temporary measures to increase our abilities to detect and contain the novel coronavirus proactively and aggressively.
- The proclamation took effect at 5 p.m. EST, Sunday, February 2.
- The proclamation suspends entry to the United States of foreign nationals who have been in China (excluding Hong Kong and Macau) in the past 14 days. There are some exemptions, including for immediate family members of US citizens and legal permanent residents. (Hereafter referred to as "American citizens and exempted persons.")
- In addition:
    - All American citizens and exempted persons coming from China will be directed to ("**funneled to"**) one of 11 US airports.
    - American citizens and exempted persons who have been in Hubei province in the previous 14 days will have an additional health assessment (screened for fever, cough, or difficulty breathing).
        - If symptomatic, American citizens and exempted persons will be transferred for further medical evaluation. (They will not be able to complete their itinerary.)
        - If asymptomatic, American citizens and exempted persons will be subject to a mandatory quarantine at or near that location until 14 days after they left Hubei Province. (They will not be able to complete their itinerary.)
    - American citizens and exempted persons who have been in other parts of mainland China (outside of Hubei Province) in the previous 14 days will have an additional health assessment (screened for fever, cough, or difficulty breathing).
        - If symptomatic, American citizens and exempted persons will be transferred for medical evaluation. (They will not be able to complete their itinerary at that time.)
        - If asymptomatic, American citizens and exempted persons will be allowed to reach their final destination and, after arrival, will self-monitor under public health supervision for 14 days.
- The 11 airports where travelers are being funneled include:
    - John F. Kennedy International Airport (JFK), New York
    - Chicago O'Hare International Airport (ORD), Illinois
    - San Francisco International Airport (SFO), California
    - Seattle-Tacoma International Airport (SEA), Washington
    - Daniel K. Inouye International Airport (HNL), Hawaii
    - Los Angeles International Airport (LAX), California
    - Hartsfield-Jackson Atlanta International Airport (ATL), Georgia
    - Washington-Dulles International Airport (IAD), Virginia
    - Newark Liberty International Airport (EWR), New Jersey

AMERICAN OVERSIGHT

    - Dallas/Fort Worth International Airport (DFW), Texas
    - Detroit Metropolitan Airport (DTW), Michigan
- As of February 23, about 45,000 people have been screened at US airports.

Travel Notices and Advisories:

- On January 27, CDC issued a level 3 Travel Health Notice for China recommending that all travelers avoid non-essential travel (this does not include the Special Administrative Regions of Hong Kong and Macau, or the island of Taiwan).
- On January 30, the US State Department issued a level 4 travel advisory, their highest threat level, requesting Americans not to travel to China because of the public health threat posed by COVID-19.
- On February 19, CDC issued a travel notice for Hong Kong, recommending that travelers practice usual precautions (Level 1).
- On February 22, CDC issued travel notices for Japan and South Korea, recommending that travelers practice enhanced precautions (Level 2). Older adults and those with chronic medical conditions should consider postponing nonessential travel to these countries.
- On February 23, CDC issued travel notices for Iran and Italy, recommending that travelers practice usual precautions (Level 1).
- CDC recommends that all travelers reconsider cruise ship voyages into or within Asia at this time.
    - CDC's recommendation is consistent with guidance from the U.S. Department of State.

Repatriation flights and quarantine orders:

- CDC has supported the Department of State in the safe and expedient ordered departure of US citizens and residents affected by outbreaks of COVID-19.
- Five chartered flights returned passengers from Wuhan City, China.
- Most recently, passengers from a cruise ship docked in Japan are in the process of being repatriated. (See section: *Diamond Princess*)
- The Department of Health and Human Services (DHHS) Secretary, under statutory authority, issued federal quarantine orders to all such passengers entering the United States.
    - The quarantine period is for 14 days.
    - The quarantine is a precautionary and preventive step to maximize the containment of the virus in the interest of the health of the American public.
    - This quarantine order also serves to protect the health of the repatriated persons, their families, and their communities.
- Medical staff monitor the health of each traveler, including temperature checks and observation for respiratory symptoms.
- CDC works with state and local public health departments and/or HHS's Incident Management Team (IMT) to transport any passenger exhibiting symptoms to a hospital for further evaluation.
- At the end of the 14-day period, people who have not developed symptoms have their quarantine order lifted and are free to return home.

AMERICAN OVERSIGHT

- Almost all people from the Wuhan flights who were quarantined have fulfilled their 14-day quarantine period and have been released.

***Diamond Princess*:**

- CDC supported the Department of State-led mission to repatriate US citizens returning to the United States from Japan who were aboard the *Diamond Princess* cruise ship.
    - Due to the dynamic nature of the ongoing outbreak, the US government recommended that US citizens disembark and return to the United States.
- On February 16, 329 American citizens returned by flights chartered by the State Department.
    - The planes were met by a team of U.S. government personnel deployed at the bases to assess the health of the passengers.
    - The passengers were screened before leaving the ship and were monitored and evaluated by medical and public health personnel during the trip and after arrival. They will continue to be monitored throughout the 14-day quarantine period.
- Americans returned by flights chartered by the State Department are subject to a 14-day federal quarantine and are housed at two existing federal quarantine sites for repatriated travelers:
    - Travis Air Force Base in California
    - Joint Base San Antonio-Lackland in Texas
- Passengers who elected not to return on the repatriation flights remain in Japan under a 14-day travel restriction.
    - CDC, in partnership with the US Embassy in Tokyo, is monitoring their health during the 14-day travel restriction in order to ensure they are healthy prior to their return to the United States.
- More than 60 Americans who were on board the *Diamond Princess* remain in Japan, hospitalized with COVID-2, including some who are reportedly severely ill.
- The US Government is taking measures to protect the health of the people under quarantine, their loved ones, and their communities, as well as the communities where they are being temporarily housed.
- Based on what is known about this virus and other coronaviruses, CDC believes the risk to the communities temporarily housing these people is low.

WHAT CDC IS DOING

CDC Response in the US:

- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The goal of the ongoing US public health response is to detect new cases quickly and prevent further spread of COVID-19 in this country.
- CDC established a COVID-19 Incident Management Structure on January 7. On January 21, CDC activated its Emergency Operations Center to better provide ongoing support to the COVID-19 response.

AMERICAN OVERSIGHT

- On January 27, CDC issued updated travel guidance for China, recommending that travelers avoid all nonessential travel to all of the country (Level 3 Travel Health Notice).
- The US government has taken unprecedented steps with respect to travel in response to the growing public health threat posed by this new coronavirus.
    - Effective February 2, at 5pm, the US government suspended entry of foreign nationals who have been in China within the past 14 days.
    - US citizens, residents, and their immediate family members who have been in Hubei province and other parts of mainland China are allowed to enter the United States, but they are subject to health monitoring and possible quarantine for up to 14 days.
    - See more at: "Proclamation on Suspension of Entry as Immigrants and Nonimmigrants of Persons who Pose a Risk of Transmitting 2019 Novel Coronavirus".
- CDC issued an interim Health Alert Network (HAN) Update to inform state and local health departments and healthcare professionals about this outbreak on February 1.
- On January 30, CDC published guidance for healthcare professionals on the clinical care of COVID-19 patients.
- On February 3, CDC posted guidance for assessing the potential risk for various exposures to COVID-19 and managing those people appropriately.
- CDC has deployed multidisciplinary teams to support state health departments with clinical management, contact tracing, and communications.
    - CDC has helped mobilize state health departments to receive returned repatriated travelers.
    - Through the Public Health Emergency Preparedness (PHEP) cooperative agreement, 62 state PHEP programs across the country are part of the multi-agency infrastructure working on quarantine, isolation, case finding, protecting health care workers and assuring medical supply chains.
    - State PHEP programs stand ready to address future developments in the outbreak.
- CDC has worked with the Department of State, supporting the safe return of Americans who have been stranded as a result of the ongoing outbreaks of COVID-19 and related travel restrictions. CDC has worked to assess the health of passengers as they return to the United States and provided continued daily monitoring of people who are quarantined.
- CDC has developed a real time Reverse Transcription-Polymerase Chain Reaction (rRT-PCR) test that can diagnose COVID-19 in respiratory and serum samples from clinical specimens. On January 24, CDC publicly posted the assay protocol for this test.
- CDC's International Reagent Resource began distributing test kits domestically on February 6. However, CDC identified a problem in the manufacturing of one of the three controls used in the verification process of the test.
    - To address this issue, CDC is remanufacturing the complete test kits, to ensure that laboratories have effective and reliable kits. This process is being expedited. The new kits will be made available to both domestic and international laboratories as soon as possible.
- CDC has been uploading the entire genome of the viruses from reported cases in the United States to GenBank as sequencing was completed.

AMERICAN OVERSIGHT

- CDC has grown the virus in cell culture, which is necessary for further studies, including for additional genetic characterization. The cell-grown virus was sent to NIH's BEI Resources Repository for use by the broad scientific community.

Internationally:

Note: Due to the rapidly changing situation, any statements on CDC involvement in China need case-by-case clearance.

- CDC is working diligently and closely with partners to support the response to this novel coronavirus outbreak.
- CDC has staff stationed in more than 60 countries across the globe. CDC has offices in China, in a number of the countries reporting cases of COVID-19, and in countries that have not yet reported cases of COVID-19 but are busy with planning and preparedness efforts.
    - CDC and the government of China have collaborated for the past 30 years addressing public health priorities affecting the US, China, and the world.
- In addition to working with host country officials, CDC staff are working in coordination with Department of State and other agencies within US embassies.
- CDC is mobilizing Atlanta-based staff to support the response. Many of these staffers have extensive experience responding to global outbreaks.
- CDC has identified experts who are prepared to join a planned WHO mission to support efforts to better understand the severity and transmissibility of the virus.
- In China, CDC is an important technical partner for the Chinese Field Epidemiology Training Program (FETP).
    - Using classroom and hands-on experience, the China FETP program has graduated 279 epidemiologists who conducted more than 2,000 outbreak investigations as part of their training.
    - Specialized training tracks are now being established in non-communicable diseases and tuberculosis.
    - With technical guidance from CDC, 71 graduates completed training for the new Western FETP that supports 13 under-served provinces of China — remote areas more vulnerable to novel infections and with increasing transport corridors.
- CDC has supported China CDC's national influenza laboratory for more than 20 years.
- CDC works in close partnership with the China CDC's National Influenza Epidemiology, Virology, and Pandemic Preparedness Centers, China's provincial and local CDCs, hospitals, and academic institutions.
- CDC supports Chinese partners in monitoring seasonal and novel influenza viruses, as well as enhancing efforts to detect and respond to seasonal, avian, and other novel influenza viruses with pandemic potential. CDC's key supporting activities include:
    - Strengthening influenza surveillance for seasonal and novel influenza viruses
    - Conducting research to estimate disease burden and vaccine effectiveness among populations at greatest risk (including young children, older adults, and pregnant women)

AMERICAN OVERSIGHT

    - Promoting influenza vaccination policy development and coverage
    - Supporting novel virus risk assessments
    - Establishing pandemic influenza preparedness in China
    - Maintaining close ties between US and China influenza experts
- In other countries, CDC is collaborating with WHO to support Ministries of Health to prepare and respond to the epidemic.
    - CDC is helping to support countries to implement WHO recommendations related to the diagnosis and care of patients, tracking the epidemic, and identifying people who might have COVID-19.
    - CDC staff are also starting to work together with country colleagues to conduct investigations that will help inform response efforts going forward.
    - CDC works closely with countries to establish FETPs that train a workforce of field epidemiologists —or disease detectives— to identify and contain outbreaks close to the source.
    - For country-specific information, please contact CDCglobal@cdc.gov.

RECOMMENDATIONS

- CDC routinely advises that people help protect themselves from respiratory illnesses by washing their hands often, avoiding touching their face with unwashed hands, avoiding close contact with people who appear sick, and cleaning frequently touched surfaces.
    - CDC defines close contact as—
        - Being within about 6 feet (2 meters) of someone with COVID-19 for a prolonged period of time, such as living with, visiting, caring for or sharing a room in a healthcare facility
          - *or* –
        - By having direct contact with infectious secretions from a patient, such as being coughed on.

Recent Travelers to China:

- If you were in China and feel sick with fever, cough, or difficulty breathing, within 14 days after leaving the country, you should:
    - Seek medical advice. Before you go to a doctor's office or emergency room, call ahead and tell them about your recent travel and your symptoms.
    - Avoid contact with others.
    - Not travel while sick.
    - Cover your mouth and nose with a tissue or your sleeve (not your hands) when coughing or sneezing.
    - Wash your hands often with soap and water for at least 20 seconds to avoid spreading the virus to others. Use an alcohol-based hand sanitizer if soap and water are not available.

AMERICAN OVERSIGHT

People Confirmed to Have, or Being Evaluated for, COVID-19:

- Your doctors and public health staff will evaluate whether you can be cared for at home. If it is determined that you can be isolated at home, you will be monitored by staff from your local or state health department. You should follow the prevention steps below until a healthcare professional or local or state health department says you can return to your normal activities. Detailed information is available at Interim Guidance for Preventing COVID-19 from Spreading to Others in Homes and Communities.
    - Stay home except to get medical care.
    - Separate yourself from other people in your home.
    - Call ahead before visiting your doctor.
    - Wear a facemask.
    - Cover your coughs and sneezes with a tissue or cough or sneeze into your sleeve.
    - Wash your hands often with soap and water for at least 20 seconds.
    - Avoid sharing household items like eating utensils, cups, or linens.
    - Monitor your symptoms and seek prompt medical attention if your symptoms worsen.

On February 3, CDC published interim guidance for state and local public health officials on how to assess and manage the risks posed by patients who may have been exposed to this new coronavirus.

- This guidance establishes four risk categories: High, Medium, Low and No Identifiable Risk.
- The categories are based on a person's travel history and possible contact with patients who have laboratory-confirmed infections.
- The guidance **offers recommendations** for movement restrictions and public health evaluations for people in different risk categories.
- **In most cases, state and local authorities will make these decisions. Federal public health authority primarily extends to international arrivals at ports of entry and preventing interstate communicable disease threats.**
- These guidelines are subject to change as the situation requires. They do not apply retroactively to people who have been in China during the previous 14 days and are already in the United States, or those being managed as part of a contact investigation.
- CDC will provide separate guidance for healthcare settings.

Close Contacts of Patients Under Investigation:

People who have had close contact with someone who is confirmed to have, or being evaluated for, COVID-19, should:

- Monitor your health starting from the day you first had close contact with the person and continue for 14 days after you last had close contact with the person. Watch for these signs and symptoms:
    - Fever—take your temperature twice a day.
    - Coughing.
    - Shortness of breath or difficulty breathing.
    - Other early symptoms to watch for are chills, body aches, sore throat, headache, diarrhea, nausea, vomiting, and runny nose.

AMERICAN OVERSIGHT

- **If you develop fever or any of these symptoms, call your healthcare professional right away.**
    - **Before** going to your medical appointment, be sure to tell your healthcare professional about your close contact with someone who is confirmed to have, or being evaluated for, COVID-19. This notification will help the healthcare professional's office take steps to keep other people from getting infected. Ask your healthcare professional to call the local or state health department.
- If you do not have any symptoms, you can continue with your daily activities, such as going to work, school, or other public areas.
- Detailed information for caregivers and household members can be found on the Interim Guidance for Preventing COVID-19 from Spreading to Others in Homes and Communities web page.

For Healthcare Professionals:

Patients in the United States who meet the following criteria should be evaluated as a patient under investigation (PUI) in association with the outbreak of COVID-19 in Wuhan City, China.

Clinical Features	&	Epidemiologic Risk
Fever **or** signs/symptoms of lower respiratory illness (e.g., cough or shortness of breath)	**AND**	Any person, including healthcare workers, who has had close contact with a laboratory-confirmed COVID-19 patient within 14 days of symptom onset
Fever **and** signs/symptoms of a lower respiratory illness (e.g., cough or shortness of breath)	**AND**	A history of travel from **Hubei Province**, China within 14 days of symptom onset
Fever **and** signs/symptoms of a lower respiratory illness (e.g., cough or shortness of breath) requiring hospitalization	**AND**	A history of travel from mainland **China** within 14 days of symptom onset

Note: Fever may be subjective or confirmed. The criteria are intended to serve as guidance for evaluation. Patients should be evaluated and discussed with public health departments on a case-by-case basis if their clinical presentation or exposure history is equivocal (e.g., uncertain travel or exposure).The above criteria are available on the Interim Guidance for Healthcare Professionals web page.

Recommendations for Reporting, Testing, and Specimen Collection:

- Healthcare professionals should **immediately** notify both infection control personnel at their healthcare facility AND their local or state health department in the event of a PUI for COVID-19.
- State health departments that have identified a PUI should immediately contact CDC's Emergency Operations Center (EOC) at 770-488-7100 and complete a COVID-19 PUI case investigation form available on CDC's Interim Guidance for Healthcare Professionals.
- Clinical specimens should be collected from PUIs for routine testing of respiratory pathogens at either clinical or public health labs. Note that clinical laboratories should NOT attempt viral isolation from specimens collected from COVID-19 PUIs.

AMERICAN OVERSIGHT

- **For biosafety reasons, it is not recommended to perform virus isolation in cell culture or initial characterization of viral agents recovered in cultures of specimens from a PUI for COVID-19.**
- For initial diagnostic testing for COVID-19, CDC recommends collecting and testing upper respiratory (nasopharyngeal AND oropharyngeal swabs), and lower respiratory (sputum, if possible) for those patients with productive coughs.
    - Induction of sputum is not recommended.
- Specimens should be collected as soon as possible once a PUI is identified regardless of time of symptom onset.
- Maintain proper infection control when collecting specimens.
- Additional guidance for collection, handling, and testing of clinical specimens is available on CDC's website.
- Detailed information on specimen types and shipping can be found on the Information for Laboratories web page.

INFECTION PREVENTION AND CONTROL FOR HEALTHCARE SETTINGS

- Healthcare personnel (HCP) are on the front lines of caring for patients with confirmed or possible COVID-19. HCP caring for these patients have an increased risk of exposure to this virus.
- HCP can minimize their risk of exposure when caring for confirmed or possible COVID-19 patients by following CDC infection prevention and control (IPC) guidelines, including use of recommended personal protective equipment (PPE).
- Based on what CDC knows now related to severity, transmission efficiency, and shedding duration, CDC is currently recommending Standard, Contact, and Airborne Precautions, including eye protection, when caring for patients with confirmed or possible COVID-19.
- As CDC learns more about COVID-19, and as the needs of the response within US healthcare facilities change, CDC will refine and update this early and aggressive IPC approach.
- Infection control procedures and appropriate use of PPE are necessary to prevent infections from spreading while caring for patients. CDC reminds all employers and HCP that PPE is only one aspect of safe care of patients with COVID-19.
    - Focusing only on PPE gives a false sense of security of safe care and worker safety.
    - It is critical to focus on other pathways to prevent spread of SARS-CoV-2 in healthcare settings. Examples include prompt screening and triage, limiting personnel in the room, and using Airborne Infection Isolation Rooms (AIIR).
- CDC's current guidelines are designed to prevent the spread of SARS-CoV-2 within healthcare facilities to healthcare personnel and other patients who may be exposed to a patient with confirmed or possible COVID-19.
- Healthcare personnel caring for patients with confirmed or suspected COVID-19 should adhere to CDC recommendations for infection prevention and control (IPC):
    - Assess and triage patients with acute respiratory symptoms and risk factors for COVID-19 to minimize chances of exposure. Place a facemask on the patient and isolating them in an AIIR, if available.

AMERICAN OVERSIGHT

    - Use Standard, Contact, and Airborne Precautions, including eye protection, when caring for patients with confirmed or possible COVID-19.
    - Perform hand hygiene with alcohol-based hand sanitizer before and after all patient contact, before and after contact with potentially infectious material, and before putting on and upon removal of PPE, including gloves. Use soap and water if hands are visibly soiled.
    - Practice how to properly don, use, and doff PPE in a manner to prevent self-contamination.
    - Perform aerosol-generating procedures (e.g., sputum induction, open suctioning of airways) in an AIIR, while following appropriate IPC practices, including use of appropriate PPE.
    - The collection of respiratory specimens (e.g., nasopharyngeal swabs) are likely to induce coughing or sneezing. HCP collecting specimens for testing for COVID-19 from patients with known or suspected COVID-19 (i.e., PUI) should adhere to Standard, Contact, and Airborne Precautions, including the use of eye protection. These procedures should take place in an AIIR or in an examination room with the door closed. Ideally, the patient should not be placed in any room where room exhaust is recirculated within the building without HEPA filtration.
    - Healthcare facilities can minimize the chance for exposures by ensuring facility policies and practices are in place and implemented before patient arrival, upon patient arrival, and throughout the duration of the affected patient's time in the healthcare setting.
- Healthcare facilities should promptly notify state or local public health authorities of patients with known or possible COVID-19 (i.e., persons under investigation or PUIs), and should designate specific persons within the healthcare facility who are responsible for communication with public health officials and dissemination of information to HCP.
- All healthcare facilities should ensure that their personnel are correctly trained and capable of implementing infection control procedures. Individual healthcare personnel should ensure they understand and can adhere to infection control requirements.
- Routine cleaning and disinfection procedures are appropriate for SARS-CoV-2 in healthcare settings, including those patient-care areas in which aerosol-generating procedures are performed.
    - Products with EPA-approved emerging viral pathogens claims are recommended for use against SARS-CoV-2.
- Management of laundry, food service utensils, and medical waste should also be performed in accordance with routine procedures. Federal, state, and local guidelines and regulations specify the categories of medical waste that are subject to regulation and outline the requirements associated with treatment and disposal.
- As a reminder, the role of face masks is for source control, and not to prevent exposure.
- CDC recommends that employees who are confirmed to have COVID-19, those who appear to have acute respiratory illness symptoms upon arrival to work, and persons who become sick

AMERICAN OVERSIGHT

during the work day promptly put on a facemask, be separated from other people, and be sent home immediately.

- If facemasks are not available, sick HCPs should cover their noses and mouths with a tissue when coughing or sneezing (or an elbow or shoulder if no tissue is available).

WHAT CDC IS DOING TO PROTECT HEALTHCARE PERSONNEL

- CDC is providing regular communication to the US healthcare community through targeted outreach activities.
- CDC is rapidly developing guidance and resources to protect US healthcare personnel. Current guidance and recommendations are designed to protect healthcare personnel and prevent the spread of the virus that causes COVID-19 within US healthcare facilities.
- CDC has deployed field teams to provide onsite infection control assessment and consultation to the US healthcare facilities currently treating confirmed COVID-19 patients and the passengers returning from China.

MANAGEMENT OF PATIENTS GUIDANCE FOR HEALTHCARE PROVIDERS

Clinical Presentation

- Most frequently reported symptoms of COVID-19 include fever, cough, sore throat, myalgia, or fatigue. Less commonly reported symptoms include sputum production, headache, hemoptysis, and diarrhea. Older patients and people with chronic medical conditions may be at higher risk of severe illness.
    - Possible risk factors for progressing to severe illness may include, but are not limited to, older age and underlying chronic medical conditions such as lung disease, cancer, heart failure, cerebrovascular disease, renal disease, liver disease, diabetes, immunocompromising conditions, and pregnancy.

Clinical Course

- Symptoms among reported cases of COVID-19 vary in severity from mild illness to severe or fatal illness.
- Some reports suggest the potential for clinical deterioration during the second week of illness.
- Among hospitalized patients with confirmed COVID-19, some will develop complications:
    - Acute respiratory distress syndrome (ARDS)
    - Intensive care for respiratory support
    - Pneumonia resulting in death
    - Secondary infection

Laboratory and Radiographic Findings

- SARS-CoV-2 RNA has been detected from upper and lower respiratory tract specimens, and the virus has been isolated from bronchoalveolar lavage fluid.

AMERICAN OVERSIGHT

- The duration of shedding of SARS-CoV-2 RNA in the upper and lower respiratory tracts is not yet known but may be several weeks or longer.

Clinical Management and Treatment

- No specific treatment for COVID-19 is currently available. Prompt infection prevention and control measures and supportive management of complications is recommended.
- Patients with mild clinical presentation may not initially require hospitalization.
- The decision to monitor a patient in the inpatient or outpatient setting should be made on a case-by-case basis.

INTERIM GUIDANCE FOR BUSINESSES AND EMPLOYERS (NON-HEALTHCARE SETTINGS)

- Interim guidance for businesses and employers to plan for and respond to COVID-19 is now available on the CDC website. This interim guidance may help prevent workplace exposures to acute respiratory illnesses, including COVID-19, in non-healthcare settings. The guidance also provides planning considerations if there are more widespread, community outbreaks of COVID-19.
- Employers can use strategies now to prevent workplace exposures to acute respiratory illness, such as:
    - Actively encouraging sick employees to stay home
    - Separating sick employees
    - Emphasizing staying home when sick, respiratory etiquette, and hand hygiene by all employees
    - Performing routine environmental cleaning
    - Advising employees before traveling to take certain steps
    - Checking the CDC's Traveler's Health Notices website for the latest guidance and recommendations for each country to which you will travel
- For the general public, who are unlikely to be exposed to this virus, the immediate health risk from COVID-19 is considered low at this time. Some people, like healthcare workers caring for COVID-19 patients and other close contacts of COVID-19 patients, will have an increased risk of infection.
    - Employees who are well but who have a sick family member at home with COVID-19 should notify their supervisor and refer to CDC guidance for how to conduct a risk assessment of their potential exposure.
    - If an employee is confirmed to have COVID-19, employers should inform fellow employees of their possible exposure to COVID-19 in the workplace but maintain confidentiality as required by the Americans with Disabilities Act. Employees exposed to a co-worker with confirmed COVID-19 should refer to CDC guidance for how to conduct a risk assessment of their potential exposure.
- Employers should be ready to implement strategies to protect the workforce from COVID-19 while ensuring the continuity of operations.

AMERICAN OVERSIGHT

- An infectious disease outbreak response plan should include possible work-related exposures and health risks to employees. The plan should also explore flexible worksites (e.g., telecommuting) and work hours in accordance with human resource policies.

AMERICAN OVERSIGHT

CDC Daily Key Points

Coronavirus Disease 2019 ("COVID-19") Outbreak

February 24, 2020

All content updated since February 21 is shown in colored text.

MAIN KEY POINTS

- There is an expanding global outbreak of respiratory illness caused by a novel (new) coronavirus.
- This virus has been named "SARS-CoV-2;" the disease it causes has been named COVID-19.
    - Due to potential for confusion with SARS-CoV, where possible, public communications will use "the virus that causes COVID-19."
- While most COVID-19 cases outside of China have been associated with travel to or from China, community spread is being detected in a growing number of countries.
- Destinations with apparent community spread of COVID-19 include Hong Kong, Iran, Italy, Japan, Singapore, South Korea, Taiwan, and Thailand.
- The fact that COVID-19 has caused illness, including illness resulting in death, and sustained person-to-person spread is concerning. These factors meet two of the criteria of a pandemic.
- As community spread is detected in more and more countries, the world moves closer toward meeting the third criteria, worldwide spread of the new virus.
- The potential public health threat posed by COVID-19 is high, both globally and to the United States.
- But individual risk is dependent on exposure.
- For the general American public, who are unlikely to be exposed to this virus at this time, the immediate health risk from COVID-19 is low.
- Under current circumstances, certain people will have an increased risk of infection. For example, healthcare workers caring for patients with COVID-19 and other close contacts of persons with COVID-19. CDC has developed guidance to help in the risk assessment and management of people with potential exposures to COVID-19.
- However, it's important to note that current global circumstances suggest it is likely that this virus will cause a pandemic. In that case, risk assessment would be different.
- Global efforts at this time are focused concurrently on containing spread of this virus and mitigating the impact of this virus.
- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States so as to reduce the spread and the impact of this virus.
- CDC is operationalizing all of its pandemic preparedness and response plans, working on multiple fronts to meet these goals, including specific measures to prepare communities to respond local transmission of the virus that causes COVID-19.
- Pandemic guidance developed in anticipation of an influenza pandemic is being repurposed and adapted for a COVID-19 pandemic.
- Public health partners are encouraged to review their pandemic preparedness plans at this time.

AMERICAN OVERSIGHT

- At this time, there is no vaccine to protect against COVID-19 and no medications approved to treat it.
- Nonpharmaceutical interventions would be the most important response strategy.
- CDC launched a new weekly email newsletter with updates on the agency's COVID-19 outbreak response. Sign up for the newsletter.

SITUATION UPDATE

- To date, 35 international locations (including the U.S.) have reported confirmed cases of COVID-19.
- More than 77,000 cases have been confirmed on mainland China, with more than 2,500 deaths.
- On February 22, 2020, CDC issued a Level 2 Travel Notice (Practice Enhanced Precautions) for Japan and South Korea.
- On February 23, 2020 CDC issued Level 1 Travel Alert Notices (Practice Usual Precautions) for Iran and Italy.
- CDC also recommends that all travelers reconsider cruise ship voyages into or within Asia at this time.
- This is consistent with guidance by the U.S. State Department.
- For the latest travel guidance, visit COVID-19 Information for Travel.
- This is a rapidly evolving situation. CDC is constantly reviewing and updating its guidance as needed.
- CDC is reporting confirmed cases of COVID-19 in the United States in two categories:
    1. Cases detected through our domestic public health systems, and
    2. Cases among people who were repatriated via U.S. State Department flights from Wuhan, China and from the Diamond Princess cruise ship (Japan).
- Fourteen cases of COVID-19 have been detected in California, Illinois, Massachusetts, Washington, and Wisconsin through U.S. public health surveillance.
- Two of these cases occurred through person-to-person spread. The remaining cases all were in persons who had travel to China.
- 39 cases of COVID-19 have been detected among the 1,100+ people repatriated from Hubei Province, China and the Diamond Princess. (That includes 3 people repatriated from Wuhan and 36 people who were repatriated from the Diamond Princes.)
- Almost all of the people from the Wuhan flights who were quarantined have finished their 14-day quarantine period.
- Because the passengers on the Diamond Princess were in a close setting where there was significant spread of COVID-19, they are considered at high-risk for infection. CDC expects to see additional confirmed cases of among those passengers.

WHAT YOU CAN DO

- While the immediate risk of this new virus to the American public is believed to be low at this time, everyone can do their part to help us respond to this emerging public health threat:
    - It's currently flu and respiratory disease season and CDC recommends getting a flu vaccine, taking everyday preventive actions to help stop the spread of germs, and taking flu antivirals if prescribed.

AMERICAN OVERSIGHT

- If you are a healthcare provider, be on the look-out for people with who recently traveled from China and fever and respiratory symptoms.
- If you are a healthcare provider caring for a COVID-19 patient or a public health responder, please take care of yourself and follow recommended infection control procedures.
- If you have been in China or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus. If you develop COVID-19 symptoms, contact your healthcare provider, and tell them about your symptoms and your travel or exposure to a COVID-19 patient.
- For people who have had close contact with someone with COVID-19 who develop symptoms, contact your healthcare provider, and tell them about your symptoms and your exposure to a COVID-19 patient.
- For people who are ill with COVID-19, please follow CDC guidance on how to reduce the risk of spreading your illness to others. This guidance in on the CDC website.

TESTING

- All testing for COVID-19 continues to be performed at CDC. At this time, all positive results from testing conducted in non-CDC, U.S. laboratories must be confirmed at CDC.
- CDC is remanufacturing test kits, which will be distributed following rigorous quality control processes.

REPATRIATED FLIGHTS & QUARANTINE ORDERS

- CDC has supported the Department of State in the safe and expedient ordered departure of U.S. citizens and residents affected by outbreaks of COVID-19.
  - Five chartered flights returned passengers from Wuhan City, China.
  - Most recently, passengers from a cruise ship docked in Japan were repatriated. (See section: *Diamond Princess*)
- The Department of Health and Human Services (DHHS) Secretary, under statutory authority, issued federal quarantine orders to all such passengers entering the United States.
- Almost all of the people from the Wuhan flights who were quarantined fulfilled their 14-day quarantine period and been released.
  - On February 12, 195 people from the first chartered flight were discharged from quarantine.
  - On February 18, 347 people who were under federal quarantine were released.
  - On February 20, 263 people who were under federal quarantine were released.
- People released from quarantine pose no health risk to their communities.

DIAMOND PRINCESS

- On February 16, 329 American citizens returned by flights chartered by the State Department.
- Persons who are not sick are being kept in quarantine.
- Persons who are sick with COVID-19 are in isolation and receiving medical care as needed.

AMERICAN OVERSIGHT

- All American passengers have disembarked from the *Diamond Princess* cruise ship. These people have been placed under travel restrictions, as have the ship's other passengers and crew.
- Some American crew members of the Diamond Princess remain aboard the ship.
- More than 60 Americans who were on board the Diamond Princess remain in Japan, hospitalized with COVID-2, including some who are reportedly severely ill.
- The U.S. Government is taking measures to protect the health of the people under quarantine, their loved ones, and their communities, as well as the communities where they are being temporarily housed.
- Based on what is known about this virus and other coronaviruses, CDC believes the risk to the communities temporarily housing these people is low.

WESTERDAM

- No testing of passengers from the Westerdam Cruise Ship for SARS-CoV-2, the virus that causes COVID-19, has been done at CDC.
- CDC is aware that an American passenger on the Westerdam tested positive for infection with SARS-CoV-2 in Malaysia and that two subsequent and sequential tests on samples from that same person were negative.
- CDC is aware that follow-up testing among more than 1,500 passengers from the Westerdam has all been negative.
- CDC considers passengers from the Westerdam to be at "low risk" of SARS-CoV-2 infection during the 14 days after their last exposure per the agency's Risk Assessment guidance.
- Given this level of risk, testing of Westerdam passengers for SARS-CoV-2 is not recommended unless additional exposures are identified to warrant testing.

CDC ACTIONS

- CDC is aggressively responding to the global outbreak of COVID-19 and preparing for the potential of community spread in the United States.
- **Preparing first responders, healthcare providers, and health systems:**
    - Establishing **visibility across healthcare systems** to understand healthcare use, particularly surges in demand for medical care and associated resources.
    - Conducting **extensive outreach to clinical and hospital professional organizations** to ensure health system **preparedness.**
    - Producing more than **23 guidance documents** on infection control, hospital preparedness assessments, personal protective equipment (PPE) supply planning, and clinical evaluation and management (as of February 22, 2020).
        - Working closely with healthcare facilities and providers to **reinforce infection control principles** that recognize PPE is one component of a larger set of practices that help to limit the spread of disease.
        - **Developing a range of respirator conservation strategies**, including strategies to make supplies last longer (such as using alternative products like reusable respirators) and extending the use of disposable respirators.
    - Leveraging existing **telehealth tools** to direct people to the right level of healthcare for their medical needs.

AMERICAN OVERSIGHT

    - **Working with supply chain partners** to understand supply usage, what products are available, and when more aggressive measures may need to be taken to ensure that healthcare workers at highest risk have access to PPE.
    - **Sharing information with stakeholders** to help them recognize when to shift the strategies they are using.
- **Reinforcing state, territorial, and local public health readiness:**
    - **Assessing state and local readiness** to implement community mitigation measures like home containment, including housing and transportation needs.
    - Coordinating with states to **identify and mitigate gaps in readiness** that will help reduce the spread of disease in the community while protecting workers, infrastructure, and institutions.
    - Linking public health agencies and healthcare systems to **identify and mitigate stressors to the health system**
    - **Tracking stockpiles of PPE** across jurisdictions.
    - Working with state and local public health to **use existing Public Health Emergency Preparedness (PHEP) funding** to support COVID-19 preparedness and response activities.
    - Leveraging funding mechanisms to help states **accelerate preparedness activities.**
    - Providing **technical assistance and guidance** to states to improve their ability to respond to the outbreak.
- **Supporting communities, businesses, and schools:**
    - **Creating business guidance** to help the public and private sectors ensure they are able to operate with adaptations like telework and flexible sick leave policies, as well as how to respond if an employee gets sick.
    - **Developing guidance for childcare programs, K-12 schools, and colleges/universities** to help them plan and prepare for COVID-19 and respond if there is a local outbreak in their community.
    - Providing **planning guides for COVID-19** that households, community- and faith-based organizations, event planners of mass gatherings, and public health communicators can use.
    - Educating communities about **nonpharmaceutical interventions (NPIs)** that help slow the spread of illness, like COVID-19.

For more information, please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

CORONAVIRUS DISEASE 2019 (COVID-19) NAMING

- The International Committee on Taxonomy of Viruses named the novel coronavirus causing an outbreak of respiratory illness that was first detected in Wuhan, Hubei Province, China, Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-CoV-2).
    - Due to potential for confusion with SARS-CoV, where possible, public communications will use "the virus that causes COVID-19."
- On February 11, 2020, the World Health Organization (WHO) named the disease caused by this virus Coronavirus Disease 2019 (COVID-19).
    - **Disease name:** COVID-19

AMERICAN OVERSIGHT

OUTBREAK SUMMARY

- There is an expanding outbreak of COVID-19, centered in China, caused by a novel (new) coronavirus.
- The new virus can cause illness varying from mild to severe, including potentially resulting in death. It can spread from person-to-person.
- This virus is spreading from person-to-person in China. A growing number of countries are reporting cases in travelers from China and person-to-person spread has been reported in countries outside of China, including in the United States.
- Chinese officials report that sustained person-to-person spread in the community is occurring in China. In addition, other destinations have apparent community spread, meaning some people have been infected who are not sure how or where they became infected.
- Global case numbers are reported by the World Health Organization in their Coronavirus Disease 2019 (COVID-19) situation reports.
    - As of **February 23, more than 78,800** cases have been identified worldwide. Fewer than 1,800 cases have occurred outside China.
- On January 30, WHO declared this outbreak a Public Health Emergency of International Concern (PHEIC). A PHEIC is declared if an event poses a public health threat to other nations through the spread of disease and potentially requires a coordinated international response.
- On January 31, Health and Human Services Secretary Alex M. Azar II declared a public health emergency for the United States to aid the nation's healthcare community in responding to COVID-19.
- Also on January 31, the President of the United States issued a "Proclamation on Suspension of Entry as Immigrants and Nonimmigrants of Persons who Pose a Risk of Transmitting 2019 Novel Coronavirus."
- The situation is rapidly changing, and CDC is monitoring it closely. Guidance will be updated as needed.
- Outbreaks like this — when a new virus has emerged to infect people and spread between people — are especially concerning.
- This is a very serious public health threat and the federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The goal of the ongoing US public health response is to minimize introductions of this virus, detect new cases quickly, and reduce community spread of this new coronavirus in the US.
- The coming days and weeks are likely to bring more confirmed cases of COVID-19 in the United States and globally, but strong public health measures now may blunt the impact of the virus in the United States.
- While it is unclear how this situation will evolve in the United States, CDC is preparing as if it were the next pandemic, while hoping it is not.

AMERICAN OVERSIGHT

- The current outbreak meets two criteria for a pandemic. It is a new virus and it is capable of person-to-person spread. If sustained person-to-person spread in the community begins outside in China, this will increase the likelihood that a global pandemic will result.
- Extensive work has been done over the past 15 years in the United States to prepare for an influenza pandemic.
    - Guidance developed for influenza pandemic preparedness would be appropriate in the event the current COVID-19 outbreak triggers a pandemic.
    - Selected pandemic preparedness materials are available online.
- The newly emerged coronavirus disease 2019 (COVID-19) is a respiratory disease that seems to be spreading much like flu.

U.S. OUTBREAK STATISTICS

Confirmed cases in the United States as of **February 21, 2020**:

- Travel-related: **12**
- Person-to-person spread: **2**
- Total confirmed cases: **14**
- Total tested: **426**
- Deaths: 0

Persons repatriated to the United States and tested positive by CDC, as of **February 21, 2020**:

- Wuhan, China: **3**
- *Diamond Princess* Cruise Ship: **36**

For global cases, please see the daily situation reports from the World Health Organization.

OUTBREAK BACKGROUND

- In early January 2020, Chinese health officials identified a novel (new) coronavirus (now named SARS-CoV-2) linked to an outbreak of respiratory illness in Wuhan, Hubei Province, China.
- Most cases have been detected in China, but some cases have been detected in more than thirty other locations. Most infections outside of China have occurred in travelers coming from Wuhan City.
- Initially, many of the patients in the Wuhan outbreak reportedly had some link to a large seafood and animal market, suggesting animal-to-person spread.
- Since then, Chinese officials report that sustained person-to-person spread in the community is occurring in China.
- Most cases in the US have been associated with travel to Wuhan, China; however, person-to-person spread also has been seen in close (household) contacts of confirmed COVID-19 cases.
- Coronaviruses are a group of viruses that have a halo or crown-like (corona) appearance when viewed under a microscope. They are common in many different species of animals, including camels, cattle, cats, and bats.

AMERICAN OVERSIGHT

- Human coronaviruses are a common cause of mild to moderate upper-respiratory illness. But three coronaviruses have emerged to cause more severe illness: Severe Acute Respiratory Syndrome (SARS-CoV), Middle East Respiratory Syndrome (MERS-CoV), and now the virus that causes COVID-19.

TRANSMISSION

- Much is unknown about how the new coronavirus that causes COVID-19 spreads. Current knowledge is largely based on what is known about similar coronaviruses.
- Most often, person-to-person spread is thought to happen among people in close contact (about 6 feet) with each other.
- Person-to-person spread is thought to occur mainly via respiratory droplets produced when an infected person coughs or sneezes, similar to how influenza and other respiratory pathogens spread. These droplets can land in the mouths or noses of people who are nearby or possibly be inhaled into the lungs.
- How easily a virus spreads person-to-person can vary. Some viruses are highly contagious (like measles), while other viruses are less so.
- Based on our current knowledge, it is unclear whether a person may become infected with the new coronavirus by touching a surface or object contaminated with the virus and then touching their own mouth, nose, or possibly their eyes.
- Typically, with most respiratory viruses, people are thought to be most contagious when they are most symptomatic (sickest).
- Mother-to-child transmission during pregnancy is unlikely, but after birth a newborn is susceptible to person-to-person spread.
- To date, CDC does not have any evidence to suggest that animals imported from China pose a risk for spreading the new coronavirus in the United States.
- At this time, CDC has no data to suggest that this new coronavirus or other similar coronaviruses are spread by mosquitoes.
    - Mosquitoes cannot spread all types of viruses. For a virus to pass to a person through a mosquito bite, the virus must be able to replicate inside the mosquito.
- There is much more to learn about the spread of this new coronavirus, severity of the disease, and other features associated with this outbreak and investigations are ongoing. This information will further inform the risk assessment.

DIAGNOSIS AND TREATMENT

- CDC developed a real time Reverse Transcription-Polymerase Chain Reaction (rRT-PCR) test to detect SARS-CoV-2 (the virus that causes COVID-19) in respiratory samples from clinical specimens.
- On January 24, CDC publicly posted the assay protocol for this test.

AMERICAN OVERSIGHT

- CDC submitted an Emergency Use Authorization (EUA) package to the U.S. Food and Drug Administration on February 3 for its test.
- FDA approved the Emergency Use Authorization on February 4.
- The first manufactured batch of CDC test kits were made available for ordering by domestic and international partners through the agency's International Reagent Resource (IRR) on February 5.
- Upon arrival at public health laboratories, when laboratories began trying to verify the assay, several laboratories reported issues.
    - Specifically, some laboratories found sporadic reactivity in the negative control of one of the three assay components.
    - This sporadic activity resulted in an inconclusive test result.
- Routine quality control (QC) measures aim to identify these types of issues. It is unclear why QC did not detect this issue before the kits were sent out to states. CDC is looking into this situation further.
- To address this issue, CDC is remanufacturing the complete test kits to ensure that laboratories have effective and reliable kits.
- The new kits are being manufactured as quickly as possible and will be made available to domestic and international laboratories immediately thereafter.
- At this time:
    - CDC continues to perform initial and confirmatory testing.
    - Laboratories that have verified the assay are able to test.
        - All positive results from testing conducted in non-CDC laboratories must be confirmed at CDC.
    - Laboratories that have encountered problems verifying the assay should not continue testing.
    - CDC understands that 2-3 states are currently using the CDC diagnostic test for patient care. Many are not testing due to the current reagent issues.
- There is no specific antiviral treatment for COVID-19. People with COVID-19 should receive supportive care to help relieve symptoms.
- For severe cases, treatment should include care to support vital organ functions.

PREVENTION

- There is currently no vaccine to prevent COVID-19. The best way to prevent infection is to avoid being exposed to the virus.
- CDC always recommends everyday preventive actions to help prevent the spread of respiratory viruses, including:
    - Avoid touching your eyes, nose, and mouth with unwashed hands.
    - Avoid close contact with people who are sick.
    - Stay home when you are sick.
    - Cover your cough or sneeze with a tissue, then throw the tissue in the trash.
    - Clean and disinfect frequently touched objects and surfaces using a regular household cleaning spray or wipe.

AMERICAN OVERSIGHT

- Wash your hands often with soap and water for at least 20 seconds, especially after going to the bathroom; before eating; and after blowing your nose, coughing, or sneezing.
- If soap and water are not readily available, use an alcohol-based hand sanitizer with at least 60% alcohol. Always wash hands with soap and water if hands are visibly dirty.

MINIMIZING STIGMA AND MISINFORMATION

- Minimizing stigma and misinformation is important, especially during contagious disease outbreaks.
- **Everyone:** Know the facts about COVID-19 and help prevent the spread of rumors:
    - Fight stigma and fear by supporting people who are coming back to school or work after completing their quarantine or isolation period for COVID-19 exposure or illness.
    - Someone who has completed their quarantine or met the requirements to discontinue infection control measures does not pose a risk of spreading COVID-19.
    - People of Asian descent, including Chinese Americans, are not more likely to get coronavirus than anyone else. Help fight fear by letting people know that being of Asian descent does not increase the chance of getting or spreading COVID-19.
    - Viruses cannot target people from specific populations, ethnicities, or racial backgrounds.
        - People who have not been in contact with a person who is a confirmed or suspected case are not at greater risk of acquiring and spreading this new virus than others.
- People who returned more than 14 days ago from areas where COVID-19 is active and do not have symptoms of coronavirus do not put others at risk.
- To help counter stigma, public health professionals can:
    - Maintain privacy and confidentiality of those seeking health care and those who may be part of any contact investigation.
    - Communicate the risk or lack of risk from associations with products, people, and places in a timely manner.
    - Raise awareness of COVID-19 without increasing fear.
    - Share accurate information about how the virus spreads.
    - Speak out against negative behaviors, including negative statements on social media about groups of people, or exclusion of people who pose no risk from regular activities.
        - Be cautious about the images that are shared. Make sure they do not reinforce stereotypes.
        - Engage with stigmatized groups in person and through media channels including news media and social media.
- Share the need for social support for people who have returned from China or are worried about friends or relatives in the affected region.

AMERICAN OVERSIGHT

TRAVEL

Travel from China:

- President Trump issued a Presidential Proclamation on January 31, to implement temporary measures to increase our abilities to detect and contain the novel coronavirus proactively and aggressively.
- The proclamation took effect at 5 p.m. EST, Sunday, February 2.
- The proclamation suspends entry to the United States of foreign nationals who have been in China (excluding Hong Kong and Macau) in the past 14 days. There are some exemptions, including for immediate family members of US citizens and legal permanent residents. (Hereafter referred to as "American citizens and exempted persons.")
- In addition:
    - All American citizens and exempted persons coming from China will be directed to ("**funneled to"**) one of 11 US airports.
    - American citizens and exempted persons who have been in Hubei province in the previous 14 days will have an additional health assessment (screened for fever, cough, or difficulty breathing).
        - If symptomatic, American citizens and exempted persons will be transferred for further medical evaluation. (They will not be able to complete their itinerary.)
        - If asymptomatic, American citizens and exempted persons will be subject to a mandatory quarantine at or near that location until 14 days after they left Hubei Province. (They will not be able to complete their itinerary.)
    - American citizens and exempted persons who have been in other parts of mainland China (outside of Hubei Province) in the previous 14 days will have an additional health assessment (screened for fever, cough, or difficulty breathing).
        - If symptomatic, American citizens and exempted persons will be transferred for medical evaluation. (They will not be able to complete their itinerary at that time.)
        - If asymptomatic, American citizens and exempted persons will be allowed to reach their final destination and, after arrival, will self-monitor under public health supervision for 14 days.
- The 11 airports where travelers are being funneled include:
    - John F. Kennedy International Airport (JFK), New York
    - Chicago O'Hare International Airport (ORD), Illinois
    - San Francisco International Airport (SFO), California
    - Seattle-Tacoma International Airport (SEA), Washington
    - Daniel K. Inouye International Airport (HNL), Hawaii
    - Los Angeles International Airport (LAX), California
    - Hartsfield-Jackson Atlanta International Airport (ATL), Georgia
    - Washington-Dulles International Airport (IAD), Virginia
    - Newark Liberty International Airport (EWR), New Jersey

AMERICAN OVERSIGHT

    - Dallas/Fort Worth International Airport (DFW), Texas
    - Detroit Metropolitan Airport (DTW), Michigan
- As of February 23, about 45,000 people have been screened at US airports.

Travel Notices and Advisories:

- On January 27, CDC issued a level 3 Travel Health Notice for China recommending that all travelers avoid non-essential travel (this does not include the Special Administrative Regions of Hong Kong and Macau, or the island of Taiwan).
- On January 30, the US State Department issued a level 4 travel advisory, their highest threat level, requesting Americans not to travel to China because of the public health threat posed by COVID-19.
- On February 19, CDC issued a travel notice for Hong Kong, recommending that travelers practice usual precautions (Level 1).
- On February 22, CDC issued travel notices for Japan and South Korea, recommending that travelers practice enhanced precautions (Level 2). Older adults and those with chronic medical conditions should consider postponing nonessential travel to these countries.
- On February 23, CDC issued travel notices for Iran and Italy, recommending that travelers practice usual precautions (Level 1).
- CDC recommends that all travelers reconsider cruise ship voyages into or within Asia at this time.
    - CDC's recommendation is consistent with guidance from the U.S. Department of State.

Repatriation flights and quarantine orders:

- CDC has supported the Department of State in the safe and expedient ordered departure of US citizens and residents affected by outbreaks of COVID-19.
- Five chartered flights returned passengers from Wuhan City, China.
- Most recently, passengers from a cruise ship docked in Japan are in the process of being repatriated. (See section: *Diamond Princess*)
- The Department of Health and Human Services (DHHS) Secretary, under statutory authority, issued federal quarantine orders to all such passengers entering the United States.
    - The quarantine period is for 14 days.
    - The quarantine is a precautionary and preventive step to maximize the containment of the virus in the interest of the health of the American public.
    - This quarantine order also serves to protect the health of the repatriated persons, their families, and their communities.
- Medical staff monitor the health of each traveler, including temperature checks and observation for respiratory symptoms.
- CDC works with state and local public health departments and/or HHS's Incident Management Team (IMT) to transport any passenger exhibiting symptoms to a hospital for further evaluation.
- At the end of the 14-day period, people who have not developed symptoms have their quarantine order lifted and are free to return home.

AMERICAN OVERSIGHT

- Almost all people from the Wuhan flights who were quarantined have fulfilled their 14-day quarantine period and have been released.

***Diamond Princess*:**

- CDC supported the Department of State-led mission to repatriate US citizens returning to the United States from Japan who were aboard the *Diamond Princess* cruise ship.
