Subject: RE: FL: EOC PUI team Questions

Scott –

Runa referred your email to me as we are trying to consolidate our state communication to the extent possible to help expedite responses.

When you say you haven't heard any summaries of private provider calls directly to CDC, I am not sure if you referring to getting testing results from PUIs or knowing that a provider has called to inquire about a patient potentially meeting criteria to be a PUI.

For the former, we have identified that there is an issue with the eLIMS automatic reporting feature. In the interim, until the issue is resolved, we are emailing negative nCoV PCR results to the public health lab submitter email that is included with the specimen. Official reports will follow when the eLIMS issue is resolved. The lab is testing throughout the weekend and we email the negative results out as soon as we get them.

If your question is about providers that might have called about a potential PUI, when that occurs, the provider is being instructed to contact the health department.

If I have not answered your question or if you have additional questions, don't hesitate to reach out.

Thanks,
Alicia Budd

Hi Runa,
What are the working hours of the EOC PUI team? FL has been waiting in a call on a PUI since around 8pm last night.

Also, when does CDC anticipate ending the request to call for every PUI?

Sincerely

Hi Mr. McGough,
I wanted to update you about the situation with Royal Caribbean and the flights from Chile and Brazil

1. There has been no movement on any flights from Brazil
2. AT 6:30 PM EST, Ms. Kalisch from Royal Caribbean emailed us to tell us that the Government of Chile had put a hold on their flights
3. At around 6:44 PM, I received a call from Dr. Rivkees, the Florida Surgeon General who told me that the Governor was not going to allow any flights to land and disembark passengers in Miami until there was a solid plan articulated by the Cruise company.
4. Right after that call we notified the State Department and copied DHS. We also notified Eleni Kalisch and told her to contact the State of Florida to coordinate a plan(we gave her the relevant phone numbers)
5. At approximately 7:30 Eleni Kalisch emailed that the flight from Chile was going to proceed, but she never responded about contacting Florida state or local authorities despite multiple emails from CDC telling her to do so
6. At 10:07 she told us that the flight would be departing Chile at 12:10 AM local time and arriving in Miami at 9:10 AM EST

Attached is the last email chain starting at 10:20 when Eleni told us there is a slight change of plans which states that CDC will be screening her passengers. We have told her multiple times that CDC will not be screening passengers. We asked her to contact us by phone right away (11PM), but she has not done so. We believe that the flight may have already departed and we are concerned that

AMERICAN OVERSIGHT

no one has signed off on this from Florida and that a clear and reasonable plan has not been sent any of us.

Dear Eleni,
Please clarify your request and the plan – which passengers are you referring to? The air ambulance passengers or the ones who are not ill and are coming in the larger charter?

As I wrote earlier, CDC will not be conducting any health screening. For the passengers who are not arriving by air ambulance, CBP/CWMD would screen the passengers based on their own protocol. CDC Quarantine Station staff will be available to respond to any illness events, as requested by CBP.

For the air ambulance, they need assessment – I understood that you have made arrangements with Dr. Barth Green/University of Miami, who is not affiliated with CDC. He/his team would make an assessment of those 6 individuals.

Michelle –

Slight change of plans. Upon arrival at MIA, Royal Caribbean will now be arranging individual charter flights for the passengers who are cleared by CDC to return to their home cities/states.

Our team has asked that CDC provide something in writing tomorrow that we can provide to the charter companies indicating that the passenger(s) boarding the charter flights have been cleared to fly commercially. We do not want the charters to deny boarding to these passengers simply because they have arrived in MIA from a cruise ship.

Thanks,

Eleni

Subject: [EXTERNAL] Re: Royal Caribbean Ships off Brazil/Chile

Sorry - now with Eleni from RC. Again, due-outs are:

- State - send CDC global ship tracking list; create small-group email distro;
- CDC - send Royal Caribbean and Amy Dubois/HHS protocols for screening; Make determination on screening protocols for passengers from a "healthy" ship
- Royal Caribbean - send #s of Canadians to CDC; update on infection status; send manifests for four ships

Tyler

All -

Thank you for joining the call today. Leah - I don't believe I have everyone from CDC who was on the call, including Rachel - please add if that's the case.

I've listed the do-outs that I'm tracking below, and this chain can serve as the new, smaller group of folks working on the Brazil/Chile RC ships.

- State - send CDC global ship tracking list; create small-group email distro;
- CDC - send Royal Caribbean and Amy Dubois/HHS protocols for screening; Make determination on screening protocols for passengers from a "healthy" ship
- Royal Caribbean - send #s of Canadians to CDC; update on infection status; send manifests for four ships

To: Hansen, Sabrina (CDC/DDPHSIS/CSTLTS/DPPS); Wallace, Marla D.
Cc: Blackmore, Carina (CDC flhealth.gov); DSLRCrisisCoag (CDC)
Subject: RE: Florida Hurricane Crisis CoAg Vector Control Project
Date: Friday, February 14, 2020 1:13:28 PM

Hi Marla,

Hope all is well. Thank you for your message. It's clear you have done your due diligence in reviewing LA's vector project needs and are proposing some alternative use of funds.

To be clear, are you clearing the idea of a redirection of funds towards the activities you mentioned below? I know you mentioned the funds are already in the correct budget category, but it is a matter of altering the activities.

In that's the case, it would be helpful to have specifics - a sheet outlining the previous activities and how much funds were involved, and then then where the money is going to (new activities). Please also provide vendor quotes and specific justification, as you laid out below, on official letter head, similar to what is typically done in an amendment/redirection.

In other words, we need to see clearly see what the money was originally approved for, and how much, and where the money is going toward now, how much, justifications, and associated quotes… Based on that, we will review and get the necessary prior approval, and if approved, have the appropriate changes documented in GMM.

Please let me know if this makes sense. Thank you!

Kind regards,
Krunal Sevak (Kevin) MBA, MPH

Subject: Florida Hurricane Crisis CoAg Vector Control Project

Sabrina,

Although the funding in the correct category of contractual we have a few question regarding approval of some projects within Vector Control.

A few of the mosquito control districts would like to purchase trailers to use for outreach and education of the public. I have read the guidance and did not see anything that prohibited this.

We would also like to contract again with the University of Florida Institute of Food and Agricultural Sciences Center for Public Issues and Education in Agriculture and Natural Resources (PIE Center) to create materials designed to educate the public about mosquito control in a simplified, understandable format that would increase public understanding of scientific information related to mosquito control. The PIE Center conducted focus groups on the public's and local officials' knowledge and perception of mosquito control, and the findings were used to create messages used in the Prevent & Protect project (https://preventmosquitoes.org/). PIE Center was able to create two toolkits (mosquito control and emergency response), infographics and information sheets, lesson plans, as well as social media plans, and conducted some preliminary evaluations of the materials. As the next step for this project, PIE Center plans to use this funding to conduct more in-depth evaluations of the materials, identify best methods of facilitating education about mosquito control topics, increase training for teachers and other groups, and develop an online mosquito control communication training program to share best practices and developed tools. The previous contract was using ELC Zika funding.

We feel like it would fit under Domain 5: Strengthen Countermeasures and Mitigation. The funding being provided to the mosquito control programs under that domain specifically mentions: These funds would help local jurisdictions in preventing transmission of endemic and exotic arboviruses by using evidence based, best management practices which can also include source reduction, communication, and public education.

Please feel to email or call me if you have any additional questions or concerns.

AMERICAN OVERSIGHT

From:	Wallace, Marla D.
To:	Sevak, Krunal (CDC/DDPHSIS/CSTLTS/DPPS); Hansen, Sabrina (CDC/DDPHSIS/CSTLTS/DPPS)
Cc:	Blackmore, Carina; DSLRCrisisCoag (CDC); Clark, Marah; Stanek, Danielle R; Morrison, Andrea
Subject:	RE: Florida Hurricane Crisis CoAg Vector Control Project
Date:	Friday, February 14, 2020 1:49:13 PM

The PIE Center Project is $90,000 and would come from the Mosquito Control Districts funding of $2,706,643. Which is a little more than 3% of 2.7 million and 1.6% of the total award for Vector Control.

The funding for the trailers is also part of the Mosquito Control Districts funding. This funding has already been allocated to 2 of the districts. They reached out to us see if trailers would be allowable in the grant. We can reach back out to have them submit the quotes and specifications. The activity outreach and education is already an approved activity within the Mosquito Control Districts Project.

Have a nice weekend.

Hi Marla,

Hope all is well. Thank you for your message. It's clear you have done your due diligence in reviewing **LA**'s vector project needs and are proposing some alternative use of funds. **Do you means FL?**

To be clear, are you clearing the idea of a redirection of funds towards the activities you mentioned below? I know you mentioned the funds are already in the correct budget category, but it is a matter of altering the activities.

In that's the case, it would be helpful to have specifics - a sheet outlining the previous activities and how much

AMERICAN OVERSIGHT

funds were involved, and then then where the money is going to (new activities). Please also provide vendor quotes and specific justification, as you laid out below, on official letter head, similar to what is typically done in an amendment/redirection.

In other words, we need to see clearly see what the money was originally approved for, and how much, and where the money is going toward now, how much, justifications, and associated quotes… Based on that, we will review and get the necessary prior approval, and if approved, have the appropriate changes documented in GMM.

Please let me know if this makes sense. Thank you!

Subject: Florida Hurricane Crisis CoAg Vector Control Project

Sabrina,

Although the funding in the correct category of contractual we have a few question regarding approval of some projects within Vector Control.

A few of the mosquito control districts would like to purchase trailers to use for outreach and education of the public. I have read the guidance and did not see anything that prohibited this.

We would also like to contract again with the University of Florida Institute of Food and Agricultural Sciences Center for Public Issues and Education in Agriculture and Natural Resources (PIE Center) to create materials designed to educate the public about mosquito control in a simplified, understandable format that would increase public understanding of scientific information related to mosquito control. The PIE Center conducted focus groups on the public's and local officials' knowledge and perception of mosquito control, and the findings were used to create messages used in the Prevent & Protect project (https://preventmosquitoes.org/). PIE Center was able to create two toolkits (mosquito control and emergency response), infographics and information sheets, lesson plans, as well as social media plans, and conducted some preliminary evaluations of the materials. As the next step for this project, PIE Center plans to use this funding to conduct more in-depth evaluations of the materials, identify best methods of facilitating education about mosquito control topics, increase training for teachers and other groups, and develop an online mosquito control communication training program to share best practices and developed tools. The previous contract was using ELC Zika funding.

We feel like it would fit under Domain 5: Strengthen Countermeasures and Mitigation. The funding being provided to the mosquito control programs under that domain specifically mentions: These funds would help local jurisdictions in preventing transmission of endemic and exotic arboviruses by using evidence based, best management practices which can also include source reduction, communication, and public education.

Please feel to email or call me if you have any additional questions or concerns.

Thank you, Marla. I appreciate the additional details. I believe both activities for **FL** are allowable, trailers and educational material, but because it is equipment, it will have to have prior approval in GMM. That is why I am I requesting the additional information/quotes now rather than later in the review process. Finally, as you are probably aware- FL's budget narrative and workplan will also have to reflect these new activities and should also be submitted accordingly. I hope that helps clarify. Please don't hesitate to reach out with any questions.

Thanks again and hope you have a great weekend.

Good afternoon All,

The following is a breakdown and information from the two programs requesting to purchase a trailer. I was misinformed on the purpose for one of the trailers as they are not both for outreach/education. One plans to use the trailer to move equipment around the county, increasing their capacity in post storm treatment response. The other is interested in using the trailer to educate their constituents. Please see the information below for cost approximations, size, and use details.

Hernando:
The trailer would be used to transport ATV's equipped with larviciding/adulticiding equipment as the A1 was purchased last year is loaded on their 6 x 12 trailer now. Therefore, they need another transport trailer. They're looking at a 6 x 14 or so, estimated cost from $1300-$1900 without a side gate. If they go for a side gate it could go up to $2500. The cost is certainly within their 10k allotment from year two distribution.

Pasco:
The cost for the trailer alone was $9363. Designing the trailer and customizing it to meet their needs is something they will be working on in the upcoming months. Estimates could be another $4000 in order for them to design the interior (adding shelving, cabinets, flooring, etc.), customize the exterior paint/wrap, add a generator, and finally, purchasing the educational material (microscope, TV, artwork, banners, etc.). So, overall, the total cost of the education trailer is approximately $14000.

The education trailer will be used to showcase how Pasco County Mosquito Control District proactively uses integrated mosquito management strategies to reduce pestiferous mosquito populations and protect residents from mosquito-borne diseases. This educational tool will be fun and interactive, designed to educate children and adult audiences by providing outreach services to area school districts, libraries, civic organizations, and other community groups.

The specs on the trailer;

- 8.5' x 24' V-nose, enclosed trailer
- 2 – 7000lb axels
- 84" interior height
- Rear and side ramps (instead of full doors)
- 4" x 4" concession window

I hope this information helps in obtaining needed approval and amending the current workplan.

Subject: Follow up to Illness in Passenger

Good morning,

Based on the travel history and a lack of epidemiological risk for the passenger who was transported to the hospital this morning, and per a consultation with our Quarantine Medical Officer, this is NOT considered a patient under investigation for COVID-19.

AMERICAN OVERSIGHT

Our current guidelines require both symptoms AND either travel to China in the past 14 days OR close contact with a laboratory-confirmed COVID-19 patient. Additionally, the passenger has only been to Argentina, which currently does not have known community spread of COVID-19. (https://www.cdc.gov/coronavirus/2019-ncov/hcp/clinical-criteria.html)

To ensure that this does not need additional public health intervention, and because there are other illnesses of public health concern, such as influenza, the passenger is being assessed at the hospital, and we will follow up in coordination with the Florida Department of Health.

If there are any changes to the above information, we will communicate this to you as soon as possible.

Thank you,

Michelle

Date:	Friday, February 7, 2020 3:25:05 PM

Closed, not PUI.

Summary of call:

Concentra clinician call (Tampa airport, Jorge Trujillo) about a flight attendant who had contact with an ill passenger on 2/2/20. The passenger had arrived from China on 12/21. Not ill. On 2/2 they shared a flight during which the traveler (with history of December travel from China) developed some dizziness and almost lost consciousness, and was attended to by the flight attendant. Upon arrival she was better. The flight attendant developed chills, cough, with mucous on 2/3 with hot feeling (no temp taken). On 2/5 he also developed dizziness, continued cough. On 2/6 had some nausea, with continued cough. On 2/7 no further cough; was recommended to see contractor health clinic in the Tampa airport (Concentra).

Dr Trujillo contacted the FL HD.

Discussed PUI definition and current unknowns of possible asymptomatic carriage., FL

Subject: Follow-up from call with facility

Hi Scott,

A quick summary of today's call with Dr. Gordillo (cc'd here)

1. The facility is rapidly running out of AIIR capacity given their high suspicion for COVID-19 in

AMERICAN OVERSIGHT

the community. They have some limited ability to create some negative pressure rooms in their ICU and ER but these rooms will have a shared air space among them which not allow them to mix PUIs with true cases. They also asked about the option of portable isolation units such as a tent. Our CDC NIOSH colleagues would know the most about this option. I have emailed them to request a call with the facility hopefully later today.

2. The other concern the facility had was regarding the speed of testing. Scott-I will defer that question to you. However, they did wonder if CDC lab technical support would be an option to help them build up their own in-house test. Again I defer this totally to FL, and I don't know if this would even be an option from the CDC side. However, I am happy to inquire on our side if you are interested.

Happy to chat.

Best,
Elizabeth

Subject: RE: Follow-up on modeling and social distancing

Thanks, Henry and nice to talk with you Scott. As promised, I want to introduce you to Dr, Martin Meltzer.

Martin – Scott is the State Surgeon General of Florida and interested in planning for medical surge needs, I talked about your current plans to create tools for supporting this work. Wonder if you might have time to talk with him, as you are much more eloquent on your work than me!

Thanks

Scott,

Jay said you have a couple of questions.

- I am connecting you to Joe Bresee, 404 421 5648, who has wide visibility on the modeling activities at CDC and can help answer your questions.

- The evidence base for social distancing is best found in the 2017 Community Mitigation Guidelines to Prevent Pandemic Influenza.

Subject: Time Sensitive Request Due 3/3/2020: Request for Primary and Secondary Point of Contact for any Supply Chain Issues within your State.

Greetings PHEP Directors & State Epidemiologists –

The outbreak of COVID-19 in China has led to a disruption in the global supply chain of personal protective equipment (PPE). CDC recognizes that healthcare facilities may experience temporary shortages even if they do not care for patients with COVID-19. CDC has released guidance for optimizing the use of N95 respirators, which includes some recommendations that may be applicable to other types of PPE, including surgical masks. CDC also has guidance regarding who needs and does not need PPE to help prevent excessive use of PPE.

As you are aware, this is a delicate system with many factors. When CDC receives notifications from healthcare systems about supply chain shortages, we encourage the Healthcare Coalition Partners to work together to problem solve within the coalition and/or wider state system. Further we encourage the healthcare systems to reach out to the state health department to collaborate and problem solve.

We have heard from the healthcare system partners that have contacted us that they are unsure whom to contact in the state health department about supply chain shortages in their facilities. As a way to help mitigate this, **we are asking you to reply to eocsctfmccmlno@cdc.gov no later than March 3, 2020, with an identified primary and secondary point of contact for any supply chain issues within your state.**

Please provide the following information:

>
> We're working through the details, but this is a scenario we have been preparing for, and is not unexpected. If we were able to activate them under 502(f) authority, they would be eligible for federal benefits instead of the state's Workman's Comp, which would be a better scenario for the Soldier and the State of Florida. If they get ill from the virus and require extensive treatment, the federal benefits afforded by a 502(f) activation could be substantial. The attached info paper discusses the issue in greater detail.
>

Subject: FW: ITF NCOV Daily Update - 02-12-2020

Dear Polio deployers,

We have heard from many of you that nCOV/COVID-19 has become a concern in many of the countries where you are deployed. I wanted to forward the below email to you so that you may stay informed. Please note the final section of the email below, containing information that is public and may be shared with partners.

Kind regards
Neha Sikka

Subject: ITF NCOV Daily Update - 02-12-2020

Greetings colleagues: This is the nCoV ITF Daily Update for February 12, 2020.

If you have questions that you would like to have answered in these Daily Updates, please send them to the International Task Force at eocevent223@cdc.gov.

> ***PLEASE NOTE:*** *The nCoV outbreak is a rapidly evolving situation. We are sharing information with you as we receive it, but remain mindful that known information may*

AMERICAN OVERSIGHT

change quickly.

Information shared on these updates will come from a variety of sources. We will endeavor to ensure that the source and 'sharability' of each document is noted. Any document that is located on a public website (i.e. it is a link in this email) can be shared freely as long as properly attributed. Any document cleared for distribution by the CDC JIC will be so labeled and can be shared as official CDC guidance. There will, however, be some documents that are for internal CDC use only. Please be mindful not to disseminate uncleared and internal-use materials. ***Please do not forward this entire email to non-CDC recipients.***

We are maintaining a repository of all materials disseminated through the Daily Update on a **ITF SharePoint site**, found **here**. The **COVID-19 Communications SharePoint Site** with CDC Response Key Messages/Key Points is available **here**.

Talking Points

- No updates today

News & Updates

- The WHO has issued an official name of the 2019 novel coronavirus, COVID-19, which CDC has adopted and will implement on all guidance and websites.
- The Lancet has published a retrospective review of nine pregnant women with COVID-19 pneumonia; in his small group, there was no evidence of vertical transmission of COVID-19 , attached (PDF document, **Public**)
- The following social media links have gone live, and will be maintained in real-time with the most up-to-date information
    - Facebook: https://www.facebook.com/CDC/videos/794433791055151/
    - Twitter handle: @CDCgov: https://twitter.com/CDCgov/status/1227615594163449856
    - Instagram: https://www.instagram.com/p/B8eMt2uHZod/
- WHO's SitRep for February 12, 2020 is attached (PDF document, **Public**)
- Today's communication surveillance report is attached (PDF document, **CDC-Internal**)

Guidance Documents

Response Planning

- State Department guidance on foreign engagement for COVID-19 was sent out earlier today for your situational awareness.

Surveillance and Case/Contact Investigation

- No updates today

Traveler Screening & Travel Notices

AMERICAN OVERSIGHT

- WHO published today "Key considerations for repatriation and quarantine of travelers in relation to the outbreak of novel coronavirus 2019-nCoV" at: https://www.who.int/ith/Repatriation_Quarantine_nCoV-key-considerations_HQ-final11Feb.pdf?ua=1

PPE & Infection Control

- The CDC has released a **DRAFT** version of the "Interim guidance for public health personnel evaluating persons under investigation (PUIs) and asymptomatic close contacts of confirmed cases at their home". This document lays out the precautions that public health professionals must take when evaluating PUIs in their own homes (PDF document, **CDC-Internal**)
- The CDC has centralized all information pertaining to the PPE recommended for healthcare workers, including "Strategies for Optimizing Supply of N95 Respirators", at: https://www.cdc.gov/coronavirus/2019-ncov/hcp/healthcare-supply-ppe.html

Laboratory Support

- Update on the status of the CDC 2019-nCoV Real-Time RT-PCR test kit:
    - We have learned that one of the CDC 2019-nCoV Real-Time RT-PCR Diagnostic Panel reagents, N3, is not performing as expected.
    - All CDC reagent kit orders are now on a quality hold until the new N3 reagent can be manufactured, validated, and distributed to the IRR. We appreciate your patience during this time.
    - If you have urgent need, we encourage you to consider other diagnostic options until this issue is resolved and your order is received. Please contact us if you have further questions or concerns.

Risk Communications

Subject: RE: Connection - Princess with State of Florida Comms

Good Day Paul and Kara,

Thank you kindly for reaching out today.

As per telephonic guidance received the evening of 12 March 2020 from Alberto Moscoso and team at Florida Department of Health, as well as Cindy Friedman and Paul Weidle from US CDC, it was recommended that an email notification to be sent to individuals with travel history aboard Sky Princess voyage A [22-29 February 2020] and voyage B [29 February – 7 March]. Attached are the email notifications sent on 13 March 2020.

Thanks,

Dear Subcommittee on Insular Affairs Members & Meeting Participants –

AMERICAN OVERSIGHT

Well, change is a constant!! Given that we have a last minute request from the White House for our members to brief officials on COVID-19 while they are in town, the meeting of the Subcommittee on Insular Affairs held during Washington Week will be cancelled this year. However, in the absence of the full committee meeting, Cendra and I would still appreciate having a working session with our partners and staff not traveling to the White House tomorrow to further our priorities and action steps for the coming year. It is critical that we keep this work moving. I have emailed these individuals separately.

Apologies for multiple emails.

Thanks,
Karl

Subject: Materials & Time Change for Subcommittee on IA During ASTHO WA Week

Dear Subcommittee on Insular Affairs Members & Meeting Participants,

On behalf of Subcommittee Chair Esther Muna, CNMI and ASTHO CEO Mike Fraser, we welcome you

AMERICAN OVERSIGHT

to Washington Week and thank you for your active engagement and participation! Please note our meeting has been changed to the following date and time:

Tuesday, February 25th, 2020
4:00 – 5:30 pm ET
Madison Hotel – Adams B
1177 15th Street, NW
Washington, DC 20005

A calendar invite will follow.

Attached and below please find materials for our meeting. During our time together, we will re-visit the priorities established during last year's meeting, hear about progress made on these, and define action steps and priorities for the coming year. Also, please note that during or after the Tuesday dinner, those of us visiting on the Hill Wednesday and engaging in meetings with the Administration on Thursday will huddle to hone talking points.

https://scholarlycommons.pacific.edu/pjh/vol2/iss1/1/

The Insular Affairs Subcommittee to the ASTHO Government Affairs Policy Committee was formed in 2018 to identify the unique policy needs and priorities of the Pacific and Atlantic jurisdictions. The subcommittee provides a forum for ASTHO's members to exchange information on policy challenges and solutions within the insular areas. Additionally, the subcommittee provides recommendations to the full committee on policy priorities.

See you soon!
Karl

The Insular Affairs Subcommittee to the ASTHO Government Affairs Policy Committee was formed in 2018 to identify the unique policy needs and priorities of the Pacific and Atlantic jurisdictions. The subcommittee provides a forum for ASTHO's members to exchange information on policy challenges and solutions within the insular areas. Additionally, the subcommittee provides recommendations to the full committee on policy priorities.

See you soon!

Date:	Monday, February 24, 2020 11:59:34 AM
Attachments:	image001.png

Dear Subcommittee on Insular Affairs Members & Meeting Participants –

Well, change is a constant!! Given that we have a last minute request from the White House for our members to brief officials on COVID-19 while they are in town, the meeting of the Subcommittee on Insular Affairs held during Washington Week will be cancelled this year. However, in the absence of the full committee meeting, Cendra and I would still appreciate having a working session with our partners and staff not traveling to the White House tomorrow to further our priorities and action steps for the coming year. It is critical that we keep this work moving. I have emailed these individuals separately.

Apologies for multiple emails.

Thanks,
Karl

Subject: Materials & Time Change for Subcommittee on IA During ASTHO WA Week

Dear Subcommittee on Insular Affairs Members & Meeting Participants,

On behalf of Subcommittee Chair Esther Muna, CNMI and ASTHO CEO Mike Fraser, we welcome you to Washington Week and thank you for your active engagement and participation! Please note our meeting has been changed to the following date and time:

Tuesday, February 25th, 2020
4:00 – 5:30 pm ET
Madison Hotel – Adams B
1177 15th Street, NW
Washington, DC 20005

A calendar invite will follow.

Attached and below please find materials for our meeting. During our time together, we will re-visit the priorities established during last year's meeting, hear about progress made on these, and define action steps and priorities for the coming year. Also, please note that during or after the Tuesday dinner, those of us visiting on the Hill Wednesday and engaging in meetings with the Administration on Thursday will huddle to hone talking points.

Thanks to all who attended the BAC meeting/ conference call today. It was important to maintain continuity even in these difficult times! Glad we were able to debrief about the Super Bowl LIV and learn or review basics about COVID-19. Also, it's great to know that BioWatch has offered its assets to assist with COVID-19 testing. We are very thankful about that offer!

Hi Tim, The good news is you are coming right at the best time. Expect to be plugged into the Coronavirus response from day one. The bad news is that tomorrow morning will likely be a tad chaotic. We may have our two first cases confirmed tomorrow and we have just declared an emergency. I have a meeting between 830-9 am. It may drag out a little. I will try to meet you at 8 and we will get your badge and computer etc set up started. Then we will all get together as soon as we have a chance. Hopefully shortly after 9. Just wanted to give you a heads up and wish you a warm welcome :). Carina

Subject: MS Marina (Oceania)

Hi Joe – are you tracking the MS Marina (Oceania)? I'm tracking 653 Amcits on board, COVID(+) cases on ship, headed to Miami but no ports there open. This is going to be a problem soon. We're getting inquiries from the Australians and Andorrans. This is the latest I have:

18MAR: Indications that an Oceania cruise ship will be arriving at Port of Miami sometime next week with various COVID-19 positives on it. Consular Affairs from the Australian Embassy contacted to say they had been notified overnight that the MS Marina (Oceania) is returning to Miami from South America via the Panama Canal after it was denied docking by several countries. The latest advice the Embassy has is that it is passing through the Canal could take 5 or 6 days. Australian Embassy in Mexico and Honorary Consul in Panama are trying to assist at least 49 Australians on board - some of whom are starting to run short of medications etc. - but are having difficulty contacting the crew and Oceania's agents in Panama. CONS provided them with the contact for Norwegian cruise lines which is a parent company of Oceania. OFM indicates Port of Miami is not aware of the ship coming to Miami and questioned where it would even dock as all available ports are occupied. OFM in touch with Norwegian.

AMERICAN OVERSIGHT

To: Lamana, Joseph (OS/ASPR/EMMO) <Joseph.Lamana@hhs.gov>
Subject: MS Marina (Oceania)

Hi Joe – are you tracking the MS Marina (Oceania)? I'm tracking 653 Amcits on board, COVID(+) cases on ship, headed to Miami but no ports there open. This is going to be a problem soon. We're getting inquiries from the Australians and Andorrans. This is the latest I have:

18MAR: Indications that an Oceania cruise ship will be arriving at Port of Miami sometime next week with various COVID-19 positives on it. Consular Affairs from the Australian Embassy contacted to say they had been notified overnight that the MS Marina (Oceania) is returning to Miami from South America via the Panama Canal after it was denied docking by several countries. The latest advice the Embassy has is that it is passing through the Canal could take 5 or 6 days. Australian Embassy in Mexico and Honorary Consul in Panama are trying to assist at least 49 Australians on board - some of whom are starting to run short of medications etc. - but are having difficulty contacting the crew and Oceania's agents in Panama. CONS provided them with the contact for Norwegian cruise lines which is a parent company of Oceania. OFM indicates Port of Miami is not aware of the ship coming to Miami and questioned where it would even dock as all available ports are occupied. OFM in touch with Norwegian.

AMERICAN OVERSIGHT

Subject: RE: MS Marina (Oceania) - awareness???
Date: Friday, March 20, 2020 7:30:18 AM

Jeanne,

Passed yesterday to Ashley and ESF-8 that vessel is off Panama and is tentative for arrival in Miami on March 23. Will keep tracking this one.

v/r,

John

Subject: NCHPAD Home workout toolkit

Good morning, all:

Please find attached NCHPAD's Inclusive Home Workout Toolkit, and please feel free to share the content with your networks.

Thanks, and please let me know if you have any questions.

Stay happy and healthy!

-Justin

Subject:	RE: OHHABS Data Transfer
Date:	Friday, February 7, 2020 9:10:57 AM
Attachments:	OHHABS Environmental Form Data Dictionary 2-7-2020.xlsx

Virginia, Gabriella

We made some great progress on the OHHABS data dictionary descriptions and identifying ways to facilitate uploads to OHHABS. Please see attachment for the latest revisions. Elke has done a great job updating the spreadsheet since the last discussion including adding a couple of columns: CDC Follow-up questions and remaining DOH Action Items.

We would like to have another conference call to finish the review. I will send out a Doodle poll soon for us to pick a day and time that work.

Thanks.

AMERICAN OVERSIGHT

	D	E	F
1	Variable Name	Variable Description	Data Format
2	CDCReportID	The CDCReportID is automatically assigned by the system and links forms across all tables in the relational database to a single OHHABS report. Multiple instances of the same CDCReportID within a table refer to multiple entries for one record (e.g., may include symptom data reported for multiple human cases).	Number
3	CDCFormID	The CDCFormID is automatically assigned by the system and links information from a single form across all tables in the relational database. Multiple instances of the same CDCFormID within a table refer to multiple entries for one record (e.g., one form with two laboratory results).	Number
4	StateReportID	The StateReportID is assigned by the reporting site (e.g., state). The StateReportID must be unique within each reporting site. However, the StateReportID is not unique across all reporting sites (i.e., OHHABS reports with the same StateReportID may exist in all reporting sites, but OHHABS reports in the same reporting site cannot have the same StateReportID).	Text
5	EnDateCreated	The date that the environmental form was created.	Date
6	EnFormAuthor	The author of the environmental form.	Text
7	EnBloomDate	The date that an algal bloom was observed.	Date
8	EnNotificationDate	The date that a local, territorial, tribal, or state health department was notified of the algal bloom.	Date
9	EnNoBloomDate	If no bloom was observed, this field indicates why a bloom date was not observed.	Text
10	EnEventClassification	Suspect or confirmed.	
11	EnState	The state or jurisdiction a bloom or event occurred.	Text
12	EnWaterQualOtherState	Indicates if a bloom or event affected the water quality of other states.	Number

2	(################)/15		
3	(################)/15		
4	(Text)/50	Do we know what we have used in the past? Is this alpha-numeric? Does the module to upload into the OHHABS auto populate this, or is this just for our internal tracking purposes? If so, should we create a standardized format? [YY]-[DEP OBJECT ID]. Also, what is considered a "report" or a "reporting site"?	Need clarification from CDC; We can have multiple samples from one water body (like Lake Okeechobee). Also blooms move around so it might be the same bloom at different distinct locations.
5	(MM/DD/YYYY)/10		
6	(Text)/80	FirstName LastName? Any specific format preferences (Initials, all caps)	Need clarification from CDC; would think firstname and last name should be separate entry fields.
7	(MM/DD/YYYY)/10	We can pull this from our Excel tracking sheet. Need clarification from CDC whether they want only bloom observation date here. What about if a bloom was not seen, a sample was taken, and toxins were detected? Since this is a required field, our recommendation would be to include the site visit date regardless of whether a bloom was seen. Not sure if the "EnNoBloomDate" field influences what we put here. See the notes for that data field.	Need clarification from CDC.
8	(MM/DD/YYYY)/10	We can pull this from our Excel tracking sheet. Clarify with CDC that the date we will use here is when state level notifies the county level that a caution or alert sign needs to be placed.	Need clarification from CDC.
9	(Text)/50	Check with CDC about intent of this field. Would this be where we would put those where a bloom was not observed but toxins were detected? I see on the form the suggested choices include "Other evidence of harmful algal/algae toxicity" which would fit the scenario mentioned above. Need to know CDC's preference. Also, mention to CDC that the form says "algal" but the pull-down list populates the word as "algae".	Why a bloom was not observed? Not sure about what to say as we don't evaluate that.
10		How do we want to make this decision? Bloom vs. toxins found?	I believe that CDC has criteria for suspect or confirmed blooms; will need to check with CDC.
11	(Text)/50	"Florida"

13	(Text)/50	Is there a list of these? What about small lakes? Would we use the Water Body ID (WBID) number and associated name as assigned by DEP?	I agree that WBID would be good; there are multiple lakes with same name in Florida.
14	(Text)/50	Similar to question above.	
15	(Text)/50	Similar to question above.	
16	(Text)/50	This would need some automation using GIS or some other method. That is not a field we currently capture.	This might be a problem with larger lakes such as Lake O. In what direction from the lake? There are a lot of small towns near lakes but definitely not cities.
17	(DMS or DD)/ 10	DD	
18	(Text)/50	NA	
19	(Text)/50	NA	
20	(+/-##.######)/10	We can pull this from our Excel tracking sheet	
21	(+/- ###.######)/11	We can pull this from our Excel tracking sheet	
22	(Text)/50	Options like: Canal, Lake/Reservoir/Impoundment, Ocean, Pond, River/Stream, Spring, Other, Unknown. We could look into whether this could be automated when linking to the WBID information. That is a data field stored in the WBID dataset.	
23	(Text)/50	Options are: Fresh, Brackish, Salt. We can make educated guesses, but am wondering if this is a dataset that DEP may have that might tie to WBID.	Will need to check with FDEP about salinity measurements. They are not on the map data from their website.
24	(Text)/100	We can pull this from our Excel tracking sheet	
25	(Text)/50	Florida	
26	(Text)/100		
27	(Text)/50	Looks like there are limited choices. Verify with CDC that our correct choice is "Region 03 - South Atlantic -Gulf". If we link by WBID, we could bet more detailed HUC numbers (03080102 for example).	Confirm with CDC on choice for Florida.
28	(Text)/50	Options that seem relevent are: Public drinking water system, Recreation, None, Unknown, Other-describe in remarks. Not sure how we will automate this criteria.	Can this be made to be a drop down? This might take a lot of work. Could it be done via GIS land use maps?
29	(Text)/50	Choices are: Health advisory, No contact warning, water body closure (recreational activity), Water body closure (fish/shellfish), other. Since we do not issue "advisories" would we choose "No contact warning" or "other"?	Discuss with CDC that our system does not match drop downs; can use have qualifiers to selections for Florida?
30	(0="No", 1="Yes",7="Unknown", Null/Blank="No Response")/1	Depends on what we choose in EnAdvisoryType.	

AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

	H	I	J
1	Internal	CDC	Comments from January 7, 2020 Call
2			
3			
4	Do we know what we have used in the past? We can have multiple samples from one water body (like Lake Okeechobee). Also blooms move around so it might be the same bloom at different distinct locations.	Is this alpha-numeric? Does the module to upload into the OHHABS auto populate this, or is this just for our internal tracking purposes? If so, should we create a standardized format? [YY]-[DEP OBJECT ID]. Also, what is considered a "report" or a "reporting site"?	Can use what state prefers; don't need state ID; If bloom moves around, would say it's the same event; uncertain how to document with blooms that move around in large lakes; Event based; If sampled multiple times, would be single state ID and event with multiple samples. If get observation of bloom but not confirmed, don't need to enter. Lab confirmation is best.
5			
6		FirstName LastName? Any specific format preferences (Initials, all caps) May need separate entry fields for first and last name.	Its based on the permission structure; auto populated.
7	We can pull this from our Excel tracking sheet.	Need to find out whether CDC wants only bloom observation date here. What if a bloom was not seen, a sample was taken, and toxins were detected? Since this is a required field, FDOH recommends to include the site visit date regardless of whether a bloom was seen. Not sure if the "EnNoBloomDate" field influences what we put here. See the notes for that data field.	Visual and lab confirmation preferred; If toxins detected, would be entered as sampling date
8	We can pull this from our Excel tracking sheet.	Clarify with CDC that the date we will use here is when state level notifies the DOH county entity that a caution or alert sign needs to be placed.	When agency gets notified that might be a bloom; could be citizen, could be from agency staff.
9	Why a bloom was not observed? Not sure about what to say as we don't evaluate that.	Check with CDC about intent of this field. Would this be where we would put events where a bloom was not observed but toxins were detected? Suggested choices include "Other evidence of harmful algal/algae toxicity" which would fit the scenario mentioned above. Need to know CDC's preference. Also, the form says "algal" but the pull-down list populates the word as "algae".	Might be used for non-cyano blooms; such as ciguatera;not date field but drop down; other evidence available adds flexibilty for response.
10		Need to check with CDC for possible criteria for suspect or confirmed blooms. One potential might be to differentiate between those where only a bloom was seen visually (suspect) and sites where toxins were detected (confirmed).	To confirm bloom: can have lab confirmation such as toxins, microscopic evaluation; suspect could also be from reported health impacts; state report id will link animal, human illnesses to environmental report.
11	Value = "Florida"		
12	Most will be null		

AMERICAN OVERSIGHT

	K	L
1	CDC Follow-up Questions	Remaining DOH Action Items
2		
3		
4	None	Determine format. Suggestion: FL-[YY]-[WBID] Use WBID to classify "event" so we can look at the area throughout the bloom from environmental, human, and animal cases. What do we do with December samples that span two years? Suggest to go with initial year of sample.
5		
6	None	
7	None	Use the sample/field visit date here
8	None	Need to verify with DEP if the Field "REQUEST ID" in the spreadsheet from Dave Whiting includes the request date. Example: RQ-2018-10-01-81, we could extract the date 10/1/2018.
9	None	We would generally leave this blank unless the other two date fields above are unknown.
10	None	Conditions for both choices: **Confirm**: lab confirmation of toxins, toxins detected in microscopic evaluation, visual bloom noted **Suspect**: reported health impacts, satellite data

13	I agree that WBID (Water body ID number) would be good; there are multiple lakes with same name in Florida.	Is there a list of these? What about small lakes? Could we use the WBID number and associated name as assigned by DEP?	Can use state ID and water body names.
14		Similar to question above.	
15		Similar to question above.	
16	This would need some automation using GIS or some other method. That is not a field we currently capture.	This might be a problem with larger lakes such as Lake O. Could one approach be to geographically identify the nearest city/town as the crow flies?	Can use GIS but with big lakes; but might not need to do; not required field; would use if can be automated.
17	Value = DD		
18	NA		
19	NA		
20	We can pull this from our Excel tracking sheet		
21	We can pull this from our Excel tracking sheet		
22	Options like: Canal, Lake/Reservoir/Impoundment, Ocean, Pond, River/Stream, Spring, Other, Unknown. We could look into whether this could be automated when linking to the WBID information. That is a data field stored in the WBID dataset.	Is CDC OK with us using the WBID dataset to gather this information? That is a data field stored in the WBID dataset.	
23	Options are: Fresh, Brackish, Salt. We can make educated guesses, but am wondering if this is a dataset that DEP may have that might tie to WBID. Will need to check with FDEP about salinity measurements. They are not on the map data from their website.		
24	We can pull this from our Excel tracking sheet		
25	Value = Florida		
26			
27		Verify with CDC that our correct choice is "Region 03 - South Atlantic -Gulf". If we link by WBID, we could get more detailed HUC numbers (03080102 for example).	Yes. Used for looking at national landscape; large scale view.
28	Options that seem relevent are: Public drinking water system, Recreation, None, Unknown, Other-describe in remarks. Not sure how we will automate this criteria. Can this be made to be a drop down? This might take a lot of work. Could it be done via GIS land use maps?	How critical is this field for CDC reporting? We will look into how we could get that information, but it may be difficult.	Longer term goal

	H	I	J
29	Choices are: Health advisory, No contact warning, water body closure (recreational activity), Water body closure (fish/shellfish), other. Since we do not issue "advisories" would we choose "No contact warning" or "other"?	Discuss with CDC that the FDOH process does not match drop down choices. FDOH does not issue "advisories" but "caution" and "alert". Can we change the options for this pull-down list to make them specific for Florida?	What is the rationale for putting up the caution? Alert? Based on what is known; alert is for toxin presence; CDC will discuss internally; might compare with past interpretations.
30		This ties to the question from the previous field. What is CDC's preference?	
31	Value = "Health Department"		
32	We can pull this from our Excel tracking sheet if CDC approves our suggestion.	Check with CDC if it is OK for FDOH to use "Bloom observed and toxin detected" and other similar variations and if there is any standardization to this field they would like. Here are the values we could use: "Bloom Present, No Toxin Data" "Toxins Found, No Bloom Present" "Both Bloom and Toxins Found" "Toxins Found but Subsequent Sampling Data Show No Toxins" [this last option leads to one of the overall questions about modifying existing records and if that is something CDC wants]	
33	We can pull this from our Excel tracking sheet. We would use the date we notified the CHD.		
34	We should decide how to report this, when we notify CHD of an AlertLift or when CHD removes the signage?	Does CDC have any preference on how to report this; when FDOH notifies (FDOH County Health Department (CHD)) of an AlertLift or when a CHD removes the signage?	
35	We can pull this from our Excel tracking sheet		
36	We can pull this from our Excel tracking sheet		
37	We can pull this from our Excel tracking sheet. If "bloom observed" then "Yes"		
38	No data		
39	No data		
40	No data		
41	No data		
42	No data		
43	This would be "Raw/Ambient water"		
44	Wonder if we can get this level of detail from DEP? I seem to remember the Caspio data having info on sample reason that was pulled from a DEP data source. Or we can use "Monitoring" for all.		
45		Any preference on what FDOH puts here? Would we select "Algae" and "Algal toxins"? Or just "Algal toxins"?

68				GENERAL QUESTIONS

AMERICAN OVERSIGHT

	H	I	J
47		Options include "Cyanobacteria" and "Toxin". Would FDOH split them all out (Microcystin; Anatoxin-a; Cylindrospermopsin; Saxitoxin/Paralytic Shellfish Toxins) and list the results for all in individual columns? Seems like the best way to show all the toxins and associated results. Need clarification on whether "Toxin" is the best option for Anatoxin-a; Cylindrospermopsin; and Saxitoxin/Paralytic Shellfish Toxins. Or are some of those Cyanobacteria?	
48	We can automate this once we determine how we will do the EnClassification.		
49	We can automate this once we determine how we will do the EnClassification.		
50	No data		
51		Would "Surface water sample" suffice, or should we concatenate the EnWaterType result into this field. Not sure what level of detail is good here.	
52	Can pull this from the Excel tracking sheet		
53	Can pull this from the Excel tracking sheet		
54	Need clarification from DEP on what test types they do for these results. ELISA? Might be an issue if private or university based lab result is utilized; there may be differences in testing methodologies.		
55	Can pull this from the Excel tracking sheet		
56	Can pull this from the Excel tracking sheet		
57		Data that comes to FDOH has time reported in military time format. Is that OK or do we need to modify the format?	
58			
59	Water for the majority

Subject: FW: Outreach: COVID-19 Collaborative Syndromic Surveillance

Scott

I know you are buried under a lot of COVID 19 related work, but I wanted to bring back to your attention our request for your participation on syndromic surveillance.
We raised this topic at SHP call a few weeks back and I highlighted again when I had the chance to address the SHO in DC.
I know ASTHO sent you a couple of weeks an email with a specific request on this topic. Hopefully you will be able to join the other 30 that already agreed

I would be happy to connect you to NSSP team doing the work if you need more detail

Here are a few bullets describing the work to date:

1. **Community Outreach**: Twenty-nine jurisdictions are currently sharing syndromic data with CDC for COVID-19 surveillance. NSSP staff are actively engaged with staff from other states who are interested but have questions, concerns, or need a new DUA.

2. **Developing queries** to identify potentially relevant visits from the emergency department data: NSSP staff are developing two COVID-19 queries, one focused on chief complaint narratives and one focused on discharge diagnosis codes. Queries are shared with the community of practice via Slack and discussed on calls among community partners. The discharge-diagnosis based query has been developed and incorporated into ESSENCE. The chief-complaint query is being refined using site specific data shared with NSSP and the team is exploring the utility of including triage notes as part of this effort.

3. **Methods for tracking trends** of persons exhibiting symptoms consistent with COVID-19:

AMERICAN OVERSIGHT

Development effort is focused on reducing the effect of influenza and other non-coronavirus etiologies. The influenza query using discharge diagnosis has been developed to help negate confirmed influenza in the COVID-19 query using site-specific data that has been shared with NSSP.

4. **Developing approaches for querying emergency department data** to analyze records for persons under isolation and with infectious disease. A query was shared with the Community of Practice via Slack and was revised. The community is using the query. Some noted a large increase in patients under isolation, and others noted a small increase. The community said this is helpful for identifying severe illness.

5. **Developing reports and dashboards** that can be shared in ESSENCE to aid state and local users in tracking trends and active case finding. The dashboard will update in real-time with the level of data accessible to each user. Development is dependent on completion of queries/syndromes identified above. The addition of newly shared data will accelerate development of this ESSENCE dashboard by enabling NSSP staff to test functionality that will be accessible to state and local jurisdictions.

6. **Developing reports for the CDC EOC** on national and HHS-region-level syndromic summaries. Also working on state-level summaries for sites sharing data. The report will be shared with participating states for approval before sharing with the CDC EOC.

Dr. Chapman,

We will need the entire FFPE block. The block will be returned to the submitter after the case is finalized but please note, the block may be depleted during testing. For evaluation of Leishmania, the infectious diseases pathology branch (IDPB) performs immunohistochemistry. The DNA is extracted here (at IDPB) and then sent to the Div. of Parasitic Diseases (DPD) for PCR analysis.

Thank you for your understanding.

Regards,
Eddy

AMERICAN OVERSIGHT

Dear all,

We plan to cut tissue scrolls from a FFPE block of bone marrow aspirate that has not been decaled.

I will send the scrolls to the Florida Department of Public Health with the CDC requisition.

I assume that the Florida Dept of Health will then send them to the infectious disease pathology branch within the CDC.

Please confirm that this is appropriate.

Thank you.

Good morning Dr. Cohen

The FL Department of Public Health prefers that specimens for leishmaniasis are routed through their state Public Health Laboratory for shipment to CDC. I'm connecting you with Drs. Danielle Stanek (Danielle.Stanek@flhealth.gov) and Carina Blackmore (carina.blackmore@flhealth.gov) from the FL Department of Health who will provide additional guidance on how to submit the specimen to their state public health lab.

This email serves as approval to submit fixed tissue to IDPB (***through your state health department***) for testing. Please enclose with your submission:

- A copy of the path report
- Recent ID consult note or other similar clinical note on the patient that might include information on presentation, course, testing performed, treatment provided and any medical history
- Information on travel history and/or country of birth
- History of insect bites

Regards,

Tina Benoit, MPH

Hi Dr. Cohen,

The pathologist on service this week (Dr. Eduard Matkovic) and epidemiologist (Tina Benoit) have been cc'd on your query and should be responding to you.

Note: this email and it's attachments are specific only to paraffin block(s) or wet formalin-fixed tissues intended for testing by our branch (IDPB) and do not apply to any unfixed tissues or other specimens being submitted to Dr. Yvonne Qvarnstrom's Leishmania lab.

AMERICAN OVERSIGHT

WARNING (per CDC's Mail Services): After September 30th, 2019, mail received with an incorrect or outdated mailstop will be returned to the sender with no exceptions. For our branch (IDPB), the new mailstop is "**MS: H18-SB**" as shown in section D of the attached guidelines.
If approved, please see the attached IDPB General Guidelines for Specimen Submission PDF and submit one hardcopy (per case) of the attached required electronically completed pre-populated CDC 50.34 form with the formalin-fixed wet tissues and/or formalin-fixed paraffin-embedded tissue blocks at ambient temperature. Paraffin-embedded tissue blocks are preferred if formalin-fixation of the wet tissues has exceeded 2 weeks; and, tissue scrolls or unstained slides are not accepted for PCR testing per IDPB's protocols. Select Test Order Code CDC-10365. Enter any test specifics in the Comments section on page 2.
Note, for human cases from the USA, the attached CDC 50.34 form has been pre-populated for your convenience with the correct Test Order Code and Public Health Lab contact information. Do not change or delete this information. Receipt of incorrect information in these sections can lead to a delay in testing.

Testing subject to CLIA regulations requires two primary patient identifiers (i.e., patient first and last name, date of birth, unique patient identifier from time of collection, such as medical record number) on the specimen container and on the test requisition

The course of testing will be determined by the clinical history, the histopathology observed, and the availability of specimens. Scant tissue is subject to depletion during the course of testing.
Please first inform/consult your City/State Health Department about this case, as specimens are normally required to be routed through them http://www.cdc.gov/laboratory/specimen-submission/who-may-submit-specimens.html. Dr. Danielle Stanek has been cc'd.
Thank you,
Pathology Team

Subject: RE: Possible Leishmaniasis Patient

Ok, if we are going to proceed with fixed tissue, that will actually have to be submitted through our Infectious Diseases Pathology Branch, because they have the protocol for extracting DNA from tissue blocks. I've cc'ed our colleagues over there, they can provide guidance for their submission process, which differs from ours.

If you are able to get fresh tissue, that specimen can be sent to us. If so, let me know and I'll ship you some vials of our transport/culture medium prior to the procedure.

Sorry for the complexity, this is one of our most complicated diseases to test, particularly because it can arise in so many tissue types.

Best,
DPDx

Ok thanks! We can do PCR from fixed tissue, though that's not optimal because the time in formalin reduces our chance of success. If we can get fresh tissue, that lets us attempt culture, PCR and microscopy as described below.

Hello Dr. Cohen,

If possible, please send an aliquot of the bone marrow (0.5mL or more would be ideal). We can prepare a stained smear for microscopic analysis, perform PCR for Leishmania detection and species identification, and attempt to culture the parasites if they are present. The bone marrow should be sent chilled but not frozen, for weekday delivery, to the address below. Please also complete and print the attached specimen submission form, and send it with the patient sample.

CDC STAT Lab

Hi Scott,

That's great to know you learn about C. gattii meningitis cases through your reportable disease system. I know Shawn Lockhart would be glad to receive any isolates (he may get them already?).

I'd be happy to set up a conference call on C. gattii… would tomorrow, Friday, or the week of the 24th work for you? I'm sure you're busy with COVID work these days. Please let us know if any particular dates/times work well for you.

Danielle, to answer your question, our information on these cases is so anecdotal at this point, but Pete Pappas at UAB says he sees quite a bit of pulmonary disease from the southern part of the state. Hard to know at this point.

Thanks,
Brendan

Thank you!
Please proceed as is routine for your BOOTS investigation and keep us in the loop.
As for *C. gattii* in FL, we primarily detect cases through our mycotic and bacterial meningitis reportable disease category. Therefore we are missing the other clinical manifestations, which are likely more common. The numbers of reported *C. gattii* meningitis are small, single digits per year, but we too have detected a small increase over the past 5 years or so. We do have all of our available *C. gattii* isolates send to your lab for reference.
Perhaps we should have a discussion about how best we could contribute to understanding this potentially emerging fungal disease in Florida.

Sincerely,

Scott Pritchard, MPH

Subject: RE: Potential Donor Derived Infection Investigation

Thanks Scott.

I wanted to mention a few quick follow-up items to David's email.

You all might know already, but our experience varies by state, so I thought I'd say that CDC's Blood, Organ, and Other Tissue Safety (BOOTS) office asks us to investigate potential donor-derived investigations caused by fungi under an agreement with the United Network for Organ Sharing. They ask us to contact transplant centers directly, which is not something we'd do for any other type of investigation. If you all would prefer we proceed differently, please let us know.

I also wanted to mention that we've been hearing from ID docs in the South that they seem to be seeing a recent increase in *Cryptococcus gattii* infections, including in people without severe immunocompromise. Most Cryptococcus infections in the South are typically caused by *C. neoformans*, although *C. gattii* is known to be endemic at low levels. We're lacking hard data on the subject, but their impressions are that most recent cases have occurred in people from the coastal plain, specifically south Alabama, south Georgia, and Florida. We're not sure why that would be, but this fungus lives in the environment, so there could be something new going on. For example, a specific strain of C. gattii emerged in the Pacific Northwest about 10-20 years ago. I know this disease isn't reportable in your state but I thought I'd give you a heads up in case you hear of anything. We'll certainly do the same.

Please don't hesitate to reach out if we can provide further info.

Best,
Brendan

Hi Dr. Blackmore,

I hope you are well.

I wanted to get in touch with you with a follow-up of this case. We will be requesting the hospital that took care of the deceased recipient to send us a sample of the cultured isolate of the cryptococcus species. Different states have different regulations for how samples such as this can be sent to the CDC, and I wanted to touch base with you before I ask the hospital to send the sample. Would it be okay for the hospital to send the sample to CDC directly, or would it be better for the sample to be routed through the FL state laboratory?

Thank you.

Subject: RE: Potential Donor Derived Infection Investigation

Thank you!
Please proceed as is routine for your BOOTS investigation and keep us in the loop.
As for *C. gattii* in FL, we primarily detect cases through our mycotic and bacterial meningitis reportable disease category. Therefore we are missing the other clinical manifestations, which are likely more common. The numbers of reported *C. gattii* meningitis are small, single digits per year, but we too have detected a small increase over the past 5 years or so. We do have all of our available *C. gattii* isolates send to your lab for reference.
Perhaps we should have a discussion about how best we could contribute to understanding this potentially emerging fungal disease in Florida.

Sincerely,

Scott Pritchard, MPH

Subject: RE: Potential Donor Derived Infection Investigation

Thanks Scott.

I wanted to mention a few quick follow-up items to David's email.

You all might know already, but our experience varies by state, so I thought I'd say that CDC's Blood, Organ, and Other Tissue Safety (BOOTS) office asks us to investigate potential donor-derived investigations caused by fungi under an agreement with the United Network for Organ Sharing. They ask us to contact transplant centers directly, which is not something we'd do for any other type of investigation. If you all would prefer we proceed differently, please let us know.

I also wanted to mention that we've been hearing from ID docs in the South that they seem to be seeing a recent increase in *Cryptococcus gattii* infections, including in people without severe immunocompromise. Most Cryptococcus infections in the South are typically caused by *C. neoformans*, although *C. gattii* is known to be endemic at low levels. We're lacking hard data on the subject, but their impressions are that most recent cases have occurred in people from the coastal plain, specifically south Alabama, south Georgia, and Florida. We're not sure why that would be, but this fungus lives in the environment, so there could be something new going on. For example, a specific strain of C. gattii emerged in the Pacific Northwest about 10-20 years ago. I know this disease isn't reportable in your state but I thought I'd give you a heads up in case you hear of anything. We'll certainly do the same.

Please don't hesitate to reach out if we can provide further info.

Best,
Brendan

Hi David, Our process is to submit the isolate the our Bureau of Public Health Laboratories to be forwarded to CDC.
Our Jacksonville location has experience receiving *C. gattii* isolates to CDCs mycotics lab.
The submitter will need to complete our lab form. http://www.floridahealth.gov/programs-and-services/public-health-laboratories/forms-publications/_documents/DH1847--rev-5-13.pdf

The submitter can reach out to Kelly Tomson or Marie-Claire Rowlinson at 904-791-1500 for more information.

Hi Dr. Blackmore,

I hope you are well.

I wanted to get in touch with you with a follow-up of this case. We will be requesting the hospital that took care of the deceased recipient to send us a sample of the cultured isolate of the cryptococcus species. Different states have different regulations for how samples such as this can be sent to the CDC, and I wanted to touch base with you before I ask the hospital to send the sample. Would it be okay for the hospital to send the sample to CDC directly, or would it be better for the sample to be routed through the FL state laboratory?

Thank you.

Hello Dr. Blackmore,

This is David Oh from CDC Mycotics Branch. I wanted to send you a brief email to let you know that we were made aware of a kidney transplant recipient in Florida who suddenly expired about 3 months post-transplant, with Cryptococcus Gattii identified. I wanted to make sure to keep you in the loop. I do not know much about this case yet, but we work with DTAC and will help investigate this case and put together a report. I will update you as I learn more.

Please do not hesitate to let me know if you have any questions.

Thank you.

Cc:	Tomson, Kelly F
Subject:	RE: Potential Donor Derived Infection Investigation
Date:	Friday, February 14, 2020 7:53:26 AM
Attachments:	form-50-34.pdf

Hi Marie-Claire,

Thanks again for all your help with this potential DDI investigation! As we discussed, here are the instructions for sending the sample to CDC once you receive the sample from the hospital.

--Please complete one 50.34 form (attached), as completely as possible, and include in the shipment. We use this form's barcode to accession isolates into our LIMS system.

--Under Lab examination Requested, please fill in:
Test order code: CDC-10179
Suspected agent: Cryptococcus Gattii
At CDC, bring to the attention of: Elizabeth Berkow

--Please mention MLST and WGS in the comments

--As for the actual isolate, we require 2 identifiers on the isolate. These can be things like patient information (DOB, patient last name), medical record number, or a unique number that you've created to distinguish between isolates. These 2 identifiers must also be present on the 50.34 form. Failure to meet our 2 identifier requirement may result in testing delays or rejection of submission.

--Shipments should be addressed to the following:
Centers for Disease Control and Prevention
1600 Clifton Road
DASH Unit 37
Attn: ELIZABETH BERKOW -- MDB Fungal Diseases Laboratory
Atlanta, GA 30329

Again, thanks so much for your help and please feel free to reach out to me with any questions (650 669 7292).

David

Hi Scott,

Sorry if others have reached out, but wanted to make sure we followed up. CDC and other states have put out a lot of communication in the last few days about both travel and unknown exposure related COVID-19 cases that I'm happy to share.

I can also let you know that other states will be putting out communication this weekend about cases they've identified through testing.

Thanks,
Kristen

AMERICAN OVERSIGHT

Hi Kristen, Conne, and Erin,

Scott Pritchard at the DOH in Florida will be coordinating the press for their two presumptive positive COVID-19 cases. Can you please coordinate with Scott regarding press? They will likely wait until CDC confirmation, but want to plan ahead in case they need to go public earlier as contacts and HCWs will be notified before CDC confirmation. Can you connect with Scott about this?

Quick summaries are:
NCoVID: FL 2785091
63 year old male with unknown exposure who is in the ICU.

NCoVID: FL 2785125
29 year old female with travel to Europe who is at home in isolation.

Best,
Katherine

Subject: Press release planning for Florida

Hi Kristen, Conne, and Erin,

AMERICAN OVERSIGHT

Scott Pritchard at the DOH in Florida will be coordinating the press for their two presumptive positive COVID-19 cases. Can you please coordinate with Scott regarding press? They will likely wait until CDC confirmation, but want to plan ahead in case they need to go public earlier as contacts and HCWs will be notified before CDC confirmation. Can you connect with Scott about this?

Quick summaries are:
NCoVID: FL 2785091
63 year old male with unknown exposure who is in the ICU.

NCoVID: FL 2785125
29 year old female with travel to Europe who is at home in isolation.

Best,
Katherine

Thanks, Scott.

Kristen,

I really appreciate your reaching out. We have updated our website to reflect Florida test results and PUIs: www.FloridaHealth.gov/COVID-19

I would certainly be grateful for whatever information you are able to share. Situational awareness is always a priority.

Is there anything else I can provide on my end to support your mission?

Subject: remote TA call from CDC - COVID-19

Hi Dr. Blackmore,

I am working to set up a follow up TA call to assist with your questions related to the cruise ship port. Can you let me know some times that work for you today?

Thanks,

Chris

Importance: High

Hello Norma.

You may recall, your office and I held a call with Dr. Yesinia and her staff late last year to discuss secretarial priorities.
Please accept this cell # for regional director John McGough, (202) 774-7692, in the event she may need to reach him on a pressing matter regarding the coronavirus. Also, I am requesting her cell, in the event we need to do the same, for the spreadsheet we are developing. We will not bother her, otherwise.

Morning, team –
I'm back and relatively alive after a bout of the flu. I wanted to check in with the team – who all from FL DOH will be attending Vector Week? I think that'll be a good way for us to get together and chat in person about funding strategy for ELC BP2. We can call in folks that will not be in attendance in person.

Where: Skype line 855-348-8390 / 2855050

FL DOH has funding in the following buckets:

1. ELC BP1 (19-20) PMS: $40,233.07
    a. ELC Yellow Fever PMS: _____
2. ELC Zika NCE PMS: $105,790.75
3. Hurricane PMS: $921,483.93 REDCap: $1,750,512

Let's focus the conversation on…

- Progress of spenddown
- Key challenges in spenddown
- At-risk activities or projects
- Priorities for any redirection

Blocked off an hour in case we need the full time.

I am sorry but I am not sure any of these times will work great for me. I am traveling and have several extra CoV calls. The best time is probably Friday at 2. I could reschedule the meeting I have then. Marah is the lead for the hurricane vector funds so if we are to talk about that funding she should be on the line.

Subject: RE: Request for reschedule : FL DOH - ELC/Hurricane

Good morning,
Looks like the CDC team would like to have a brief call prior to vector week, and then follow it up with a brief 30 min 1:1 meeting during vector week later. Would you all be available during one of the following dates/times? I'll block it off for a full hour, but we may not use all of it.

- Monday, Feb 10 2 pm – 3 pm ET
- Tuesday, Feb 11 11 am – 1 pm ET*
- Tuesday, Feb 11 2 pm – 3 pm ET*
- Wednesday, Feb 12 4 pm – 5 pm ET
- Thursday, Feb 13 2 pm – 3 pm ET
- Friday, Feb 14 2 pm – 3 pm ET

*There is a standing monthly FL hurricane call on Feb 11th between 1 pm – 2 pm. We just want to go over the funding streams in depth with the FL DOH team without FDACS on the line and to give us adequate room to talk about funding strategy for FL DOH within the ELC for BP2.

Let us know what will work best for you all. Thanks!

CDCHAN-00430

Information and Guidance about Global Travel on Cruise Ships, Including River Cruises, due to Coronavirus Disease 2019 (COVID-19)

Summary
The Centers for Disease Control and Prevention (CDC) recommends all persons defer any travel on cruise ships, including river cruises, worldwide because of the increased risk of SARS-CoV-2 transmission onboard ships. Deferring travel is especially important for older adults and all people with serious chronic medical conditions (such as heart disease, diabetes or lung disease), because of their increased risk for severe disease. This health update provides information to clinicians and state and local health departments about the current coronavirus disease 2019 (COVID-19) situation and the risks associated with travel on cruise ships, including river cruises.

Background
Cruise ship passengers, including those who take river cruises, are at increased risk of exposure to SARS-CoV-2, the virus that causes COVID-19. In the past month, there have been reports of outbreaks of COVID-19 among passengers and crew on cruises. Recent examples include 696 cases and 8 deaths on the *Diamond Princess* cruise ship in Japan, 28 cases on the *Grand Princess* cruise ship in the United States, and at least 60 cases in 15 states associated with multiple Nile River voyages in Egypt as of March 14, 2020. Illness onset occurred both onboard ships and after passengers returned to the United States. The proximity of passengers and crew on small ships and boats traveling on rivers may result in an even higher number of COVID-19 infections.

Recommendations for Clinicians
Ask all patients about their planned or recent cruise ship travel, including river cruises.

1. Pre-travel advice
   a. Advise patients to defer all cruise ship travel, including river cruises, worldwide.
   b. Explain that their return travel to the United States may be impacted, and formal quarantine procedures may be implemented if confirmed cases are identified on board.
   c. Explain that appropriate medical care or medical evacuation may not be available internationally.
   d. Explain that some countries may refuse docking or disembarkation if there are known or suspected cases on board.
   e. For patients who still intend to cruise, advise them to
      i. Stay in their cabin and notify the onboard medical center immediately if they get sick with fever, new or worsening cough, or trouble breathing during their cruise.
      ii. Stay home for 14 days after returning from travel, practice social distancing, and monitor their health both during travel and after they return. Social distancing means staying out of crowded places, avoiding group gatherings, and maintaining distance (approximately 6 feet or 2 meters) from others, when possible.
2. Post-travel management
   a. Tell patients to follow CDC's guidance on steps to prevent the spread of COVID-19 (https://www.cdc.gov/coronavirus/2019-ncov/about/steps-when-sick.html) if they develop acute febrile or respiratory illness after travel.

AMERICAN OVERSIGHT

b. Implement recommended infection prevention and control practices (https://www.cdc.gov/coronavirus/2019-ncov/infection-control/control-recommendations.html) if you suspect a patient has COVID-19.
c. Immediately notify the local health department (https://www.naccho.org/membership/lhd-directory) if a patient meets clinical and epidemiologic criteria for a person under investigation (PUI) (https://www.cdc.gov/coronavirus/2019-nCoV/hcp/clinical-criteria.html) for COVID-19 and test as appropriate.

Recommendations for State and Local Health Departments

Check *The Epidemic Information Exchange* (*Epi-X*) notification system for information on COVID-19 cases on cruise ships and river cruises. In accordance with the Level 3 travel warning (https://wwwnc.cdc.gov/travel/notices/warning/coronavirus-cruise-ship) for cruise ships, cruise travelers should stay home for 14 days after returning from travel, monitor their health, and practice social distancing.

For More Information

State and local health departments can contact CDC's Emergency Operations Center (EOC) at 770-488-7100 for assistance with obtaining, storing, and shipping appropriate specimens to CDC for testing, including after hours, weekends, or holidays.

The Centers for Disease Control and Prevention (CDC) protects people's health and safety by preventing and controlling diseases and injuries; enhances health decisions by providing credible information on critical health issues; and promotes healthy living through strong partnerships with local, national, and international organizations.

De'Lisa

Thanks we will review. We do have a few vacancies at this time in the Lab, Surveillance Systems, Epi Food & Water and Vector Borne. On added note I am preparing out budget request from Project E to help assist with our COVID-19 response. Ad indicated we are applying for the 874K that was approved but unfunded.

To clarify we just need a cover letter signed by Dr. Blackmore and the detailed budget. These documents will be emailed to the ELC Mailbox and a courtesy copy to you. Should the letter be addressed to you, Angelica or the Grants Management (OGS) Official.

Thanks

Marla

Subject: Second Quarter PMS Report
Importance: High

Good afternoon,

AMERICAN OVERSIGHT

I am sending you the attached PDF file, which is your jurisdiction's Payment Management System (PMS) Quarter 2 (Q2) Report. This Q2 report covers transactions reported from August 1 through October 31 (Q1), and expenditures from November 1 through January 31, 2020 (Q2). The intent of sharing these quarterly reports is to increase your awareness and provide you with resources to have informed conversations with your financial office.

A few things to point out when reviewing the attached PMS report:

1. PMS does track charges and spending but is only as accurate as the data being entered, as well as the frequency.

2. The attached report shows base funding as well as special funding (Ebola & Hurricane). If you received special funding, you will see suffixes in the document number.
    a. '-19EBLA' is the designation for Ebola funds.
    b. '-19HURR' is the designation for Hurricane funds.

3. Columns to focus on when reviewing:
    a. 'Percentage of Total Charged Against Account' column shows the percentage of funds charged against what was awarded.
    b. 'Percentage of Total Paid Out' column shows the percentage of funds paid out against what was awarded.
    c. Given that we are 50% into Budget Period 1, the charged &/or disbursement should be showing relative spending progress.
        i. On average, ELC awards are comprised of over 70% personnel costs so, if all positions are filled, then a good portion of Q2 funding should be charged &/or disbursed.
        ii. Things like contracts may not be invoiced until work is completed which could result in an artificially lower amount being expended.

Again, the intent of sharing this information is to help with the monitoring and managing of ELC funds.

Feel free to contact me with any questions or concerns.

Subject: RE: Sentinel Chicken Program Important Update

Date: Thursday, March 12, 2020 1:05:07 PM

Good afternoon Mosquito Control Arboviral Surveillance Coordinators and Directors,

After speaking with Dr. Stanek, the following is suggested for mosquito control programs currently and planning to start their sentinel chicken surveillance programs for the year based on the email from the FDOH Tampa Laboratory:

1. If you have already started your program, do not continue bleeding chickens, but maintain your flocks. Once the FDOH lab is able to start testing samples, they will contact you to start back up again. At that point, the chickens will be considered NEW birds and tested as such.
2. If you are only in the planning stages and preparing to launch the program in the upcoming months, hold off until you receive the go ahead from the lab or FDOH arbovirus coordinators to implement your program for the year.

Having been responsible for arboviral surveillance previously, I truly understand the significance of the data this testing provides and the impacts this can have on your program's proactive response.

AMERICAN OVERSIGHT

The FDOH laboratories understands the importance of sentinel sera testing for endemic mosquito borne viruses and this was not an easy decision for them to make. ***Please trust that they are doing everything possible to increase lab capacity and will be providing more guidance as they move forward. Your support of this decision is appreciated.***

Subject: Sentinel Chicken Program Important Update

Good Morning Sentinel Chicken Program Participants,

Our laboratory and epidemiology leadership have decided to suspend Sentinel Chicken Testing effective immediately. At this time, all personnel are need to help perform COVID-19 testing. For the next seven weeks or until further notice, we will not be performing HAI, ELISA, PRNT, and mosquito pool testing. Specimens received today or tomorrow will not be processed. Please send me an e-mail so that I know what you would like us to do with those specimens. We will notify you when we are able to resume testing.

Reports:

1. This Friday, March 13, 2020 the regular HAI report will be e-mailed.
2. Tuesday, March 17, 2020 the IgM ELISA report will be e-mailed.
3. Wednesday, March 18, 2020 the PRNT report (for February specimens) will be e-mailed.

Please understand that we are doing what is best to promote, protect, and improve the health of all people in the state. Please contact me, if you have any questions or concerns.

Thank you,

Maribel

IMPORTANT: It is imperative that you save, print, or archive this email for future reference/correspondence.
Dr. Stephen White,
This is to notify you that IDPB received 1 block and 1 stained slide on A.F. (MRF20000021, UB20-97) on 02/12/20.
If you have any questions, refer to IDPB case **2020-0171** when contacting the case pathologist, **Dr. Eduard Matkovic**.

Eduard Matkovic, M.D. | Pathology Fellow | Tel 404-639-0549 | Fax 404-639-3043 | Eduard Matkovic@cdc hhs gov |
Centers for Disease Control and Prevention | Infectious Diseases Pathology Branch (IDPB) | 1600 Clifton Rd NE, MS H18-SB | Atlanta, GA 30329-4027 |

Report Password: the password to open the password protected Pathology Report PDF (Preliminary/Final/Addendum) for this case will be provided in a separate email after you receive the Final Pathology Report Email and will be a unique 12 digit number. If additional specimens are subsequently received on the same case by IDPB, the password will remain unchanged. Animal case reports will not have password protection.

Specimen Receipt Notice: the official contact(s) at the Health Departments (if known) will be cc'd on IDPB's Specimen Receipt Notice emails, in addition to cc'ing other case specific relevant parties. The same official contact(s) at the Health Departments (if known) will continue to receive IDPB's Final Pathology Reports once finalized.

ePathology Service: IDPB now offers telepathology consu tation through our ePathology service. This is not a substitute for diagnostic testing by our laboratory, but facilitates rapid initial evaluation of images or scanned slides prior to submission of case materials for testing. Please visit the ePathology website at http //www.cdc.gov/ncezid/dhcpp/idpb/epathology/index.html for more information.

Report Password: the password to open the password protected Pathology Report PDF (Preliminary/Final/Addendum) for this case will be provided in a separate email after you receive the Final Pathology Report Email and will be a unique 12 digit number. If additional specimens are subsequently received on the same case by IDPB, the password will remain unchanged. Animal case reports will not have password protection.

Specimen Receipt Notice: the official contact(s) at the Health Departments (if known) will be cc'd on IDPB's Specimen Receipt Notice emails, in addition to cc'ing other case specific relevant parties. The same official contact(s) at the Health Departments (if known) will continue to receive IDPB's Final Pathology Reports once finalized.

ePathology Service: IDPB now offers telepathology consultation through our ePathology service. This is not a substitute for diagnostic testing by our laboratory, but facilitates rapid initial evaluation of images or scanned slides prior to submission of case materials for testing. Please visit the ePathology website at http://www.cdc.gov/ncezid/dhcpp/idpb/epathology/index.html for more information.

To: CDC IMS 2019 NCOV Response PUI <eocevent185@cdc.gov>; Pritchard, Scott <Scott.Pritchard@flhealth.gov>; CDC IMS Logistics Transportation <eocevent306@cdc.gov>; Hyde, Allen W. (CDC/DDPHSIS/CPR/DEO) <fnb4@cdc.gov>; Schneider, Eileen (CDC/DDID/NCIRD/DVD) <ees2@cdc.gov>; CDC IMS 2019 NCOV Response PUI <eocevent185@cdc.gov>
Subject: PUI ID# 0001287

Hello Scott:

Thank you for contacting CDC about the patient under investigation (PUI) for novel coronavirus (COVID-19). Please find summary information below to help assist in the PUI evaluation and specimen referral.

Summary

38 yo male who resides in China (Guangzhou City) came to US on 2/3. on 2/15 he developed cough, congestion, rash and subjective fever. Patient presented to ED for evaluation. Decision made to admit patient but patient signed himself out AMA. Specimen x 3 were collected prior to his signing himself out. Denied other risk factors (travel to Wuhan or Hubei province; contacts to a known case).

CDC COVID-19 ID #0001287

POC Details

Name: Scott Pritchard

Location: Florida

Phone: 850-251-5558

Email: scott.pritchard@flhealth.gov

Additional information

Guidance for health departments to submit PUI information to CDC can be found here.

AMERICAN OVERSIGHT

Include the CDC COVID-19 ID issued to you by CDC in the top right box and on all specimen forms. The PUI form should be submitted as soon as able and need not wait for specimen shipping. Instructions on how to submit the PUI form are located at the top of the form.

Laboratory testing: At this time, CDC requests referral of NP swab (VTM) and OP swab (VTM) specimens. A sputum (sterile container) specimen should also be sent if a productive cough is present. The NP and OP swabs should be placed in separate VTM vials. Serum specimens are not needed at this time for PUI testing.

Specimens should be packed according to International Air Transport Association (IATA) regulations. Shipments from outside of the United States may require an importation permit that can be obtained from the CDC. For specific instructions, see the "Packing, Shipping, and Transport" section from this CDC website.

Please see the attached *2019 Novel Coronavirus (nCoV) Specimen Submission Guidelines* for detailed guidance on specimen shipment, packaging, and documentation. Please ensure that the patient information on the specimen tube exactly matches the 50.34 DASH Form, or the CDC may have to reject the specimen or testing may be delayed.

For questions about specimen collection or completing the 50.34 Form, please see https://www.cdc.gov/laboratory/specimen-submission/help-faqs.html.

Precautions: For healthcare personnel, we recommend the following guidance: https://www.cdc.gov/coronavirus/2019-nCoV/infection-control.html If the PUI seeks healthcare, CDC recommends they alert providers in advance for adequate infection control preparations.

If the PUI is under home care, please consider the following CDC guidance: https://www.cdc.gov/coronavirus/2019-ncov/guidance-home-care.html

Please let us know if you have any additional questions or concerns. For urgent inquiries, please contact the CDC Emergency Operations Center at 770-488-7100.

Thank you,

CDC IMS 2019 NCOV Response PUI Team

From:	CDC IMS State Coordination Task Force (SCTF) Operations
To:	CDC IMS State Coordination Task Force (SCTF) Lead
Subject:	RE: State Health Official & State Epi Touchbase
Date:	Thursday, February 27, 2020 7:29:40 PM
Attachments:	DRAFT - Home Q or Iso Considerations v5.4_2.27.20.pdf

Good Evening Colleagues,

As a follow-up to today's state health official and state epidemiologist touchbase, please find the **DRAFT** "Home Containment for Persons Exposed to (Quarantine) or Infected with (Isolation) COVID-19 Coronavirus" guidance attached to this email. In addition, please be mindful this is a working document. As we learn more through science and the duration of the COVID-19 response, we anticipate adjusting the guidance accordingly.

Lastly, please take a moment to review the guidance and provide feedback to preparedness@cdc.gov. We are aware many jurisdictions are currently doing home containment planning. Subject matter experts at CDC wanted to provide draft guidance to assist you with your planning efforts. At this time, we are only sharing this guidance with the participants of state health official and state epidemiologist touchbase. Please let us know if you have any questions. Thank you.

CDC State Coordination Task Force (SCTF) - Operations
eocsctfops@cdc.gov
https://www.cdc.gov/coronavirus/novel-coronavirus-2019.html

(Sent by BCC to state health officials and State epidemiologists)

AMERICAN OVERSIGHT

Home Containment for Persons Exposed to (Quarantine) or Infected with (Isolation) COVID-19 Coronavirus

"Home containment" is a strategy to separate asymptomatic individuals who may have been exposed to COVID-19 or those who are mildly ill with symptoms of COVID-19 and do not require hospitalization, from the rest of the community. Home containment for persons exposed to, or infected with, COVID-19 can safely be used to reduce transmission, may be required based on practical logistical issues, and should be considered if the person can be safely transported home and state and local authorities are able to accept monitoring responsibility for the person. Logistical challenges exist for implementation of home containment, including the need for persons practicing social distancing to access basic provisions such as food, the loss of income for hourly wage workers expected to stay home from work, and the need for routine healthcare for individuals with underlying medical conditions.

Home containment (quarantine or isolation) for persons exposed to (**Q**uarantine) or infected with (**I**solation) COVID-19 should be considered if the person can be safely transported home for monitoring by state and local authorities.

Home Quarantine

For persons exposed to the COVID-19 coronavirus, quarantine (i.e., separation from unexposed persons) at home for a period of 14 days after the most recent exposure can be considered when the following criteria are met:

Transport

- Must be asymptomatic (i.e. afebrile with no respiratory symptoms)
- Must use State, local or Federally approved transportation mode from initial holding location to home location for quarantine. This may include:
    - Direct commercial air carrier may be considered from US arrival port of entry to home airport
    - Non-commercial ground transportation (for persons living locally or within driving distance). Ground transportation recommended via a privately owned or state-owned vehicle. Do not recommend use of privately-owned commercial transport services like Uber, Lyft, or taxis
    - Other Federal or State/local approved transportation
- Must be able to travel directly home without requiring multiple stops or any overnight stays
- Follow recommended infection control practices while enroute*:
    - Should practice social distancing and avoid congregate settings as much as possible
    - Follow recommended infection control practices:
        - Practice good respiratory hygiene including maintaining good hand hygiene using soap/water or alcohol-based hand gel, covering cough etc.

AMERICAN OVERSIGHT

- Surgical facemasks should be provided by the transferring authorities for the traveler to put on should they develop fever or respiratory symptoms during transport
- If traveling in a ground conveyance, surgical facemasks should be provided by the transferring authorities for the driver (or other passengers of the vehicle such as family members) to put on should a traveler develop fever or respiratory symptoms
- If symptoms develop enroute, the traveler or operator of the conveyance should notify relevant Federal (e.g. arrival POE Q station) and State/local authorities as soon as possible

**Note, the recommended approach for transportation and PPE requirements may be different for special groups who have been exposed to the COVID-19 virus (e.g. cohorts with exposures that are known to result in high attack rates would not be allowed to use commercial transportation*)

- CDC must be consulted and approve of any transportation that involves crossing state lines as Federal conditional release bridging orders may be required

Housing

- State and local health jurisdictions and state/local political leadership where housing is located implement quarantine and monitoring responsibilities. For persons under Federal quarantine orders, those orders will be rescinded upon arrival to housing location and assumed by the local or state jurisdiction's authority
- Home/location for home containment quarantine has been assessed by state or local authorities and deemed appropriate. Requirements include:
  - ability to maintain social distancing from any non-exposed members in household,
  - use of an unshared bedroom/bathroom from non-exposed household members,
  - no non-exposed persons present in household who would be at high risk for severe disease if exposed to Covid-19
- The person in quarantine should remain at home during the period of quarantine. Delivery of food and other essentials should be assured
- State or local authorities monitoring individual should assure there is a medical facility available that can provide the appropriate isolation and care of the individual should they become ill and require hospitalization for care
- State/Local and Federal authorities must be notified by the traveler or the conveyance operator when they arrive at housing location
- State/local authorities should refer to CDC guidance on movement and monitoring as published at: https://www.cdc.gov/coronavirus/2019-ncov/php/risk-assessment.html

Home Isolation

For persons infected with COVID-19 coronavirus who have no or only mild symptoms, or during recovery after release from hospital, isolation (i.e., separation from uninfected persons) at home until after 2

AMERICAN OVERSIGHT

negative tests collected at least 24 hour apart on both oropharyngeal (OP) *and* nasopharyngeal swabs, can be considered when the following criteria are met:

Transport

- Must use State/Local or Federally approved transportation to arrive at destination. This may include:
    - Non-commercial ground transportation for persons living locally or within a reasonable driving distance. Ground transportation may be via a privately owned or state-owned vehicle, or ambulance, but not via privately-owned commercial transport services like Uber, Lyft or taxis
    - Federally approved, non-commercial air transportation or medical evacuation flight
- Must wear a surgical facemask during transport. Additional facemasks should be available should one become wet/dirty and must be changed
- Other person(s) in transport (e.g. driver) should wear a surgical facemask and try to maintain a 6 ft distance from transported individual. CDC has issued guidelines for patients transported by ambulance Interim Guidance for Emergency Medical Services (EMS) Systems and 911 Public Safety Answering Points (PSAPs) for COVID-19 in the United States. This guidance includes recommendations for cleaning EMS transport vehicles following use.
- Practice good respiratory hygiene including maintaining good hand hygiene using soap/water or alcohol-based hand gel, covering cough, etc.
- Must be transported directly home without multiple stops or any overnight stays
- While in transit, should avoid public locations. If the individual(s) must enter a public location (e.g. to use the restroom), duration of visit should be kept to a minimum, and the individual(s) must wear a surgical mask. Waste can be disposed of in regular trash receptacles.
- CDC must be consulted and approve of any transportation that crosses state lines as Federal conditional release bridging orders may be required

Housing

- State and local health jurisdictions and state/local political leadership where housing is located implement isolation and monitoring responsibilities. Federal isolation orders will be rescinded upon arrival to location and care assumed by local or state jurisdiction
- The person in isolation should remain at home until released by state/local health authorities. Delivery of food and other essentials should be assured
- Location for isolation has been assessed by state or local authorities and deemed appropriate for use per the existing guidance for home isolation of COVID-19 patients. Guidance on assessment of the home for isolation can be found at: https://www.cdc.gov/coronavirus/2019-ncov/hcp/guidance-home-care.html?CDC_AA_refVal=https%3A%2F%2Fwww.cdc.gov%2Fcoronavirus%2F2019-ncov%2Fguidance-home-care.html
- State or local authorities should assure there is a medical facility available that can provide the appropriate isolation and care of the individual should their clinical condition worsen, and they require hospitalization for care
- State/Local and Federal authorities must be notified by the traveler or the conveyance operator when they arrive at housing location

DRAFT: pre-decisional, deliberative

AMERICAN OVERSIGHT

- State or local authorities must have appropriate plans in place for specimen collection and shipping and notification of results
- State/local authorities should refer to CDC guidance on movement and monitoring as published at: https://www.cdc.gov/coronavirus/2019-ncov/php/risk-assessment.html

Subject:	Re: Status of Chile charter (Silver Express pax)
Date:	Wednesday, March 18, 2020 9:13:17 AM

From Eleni:

The Latam charter from Chile is scheduled to arrive MIA at 11:30AM. We are arranging charters for this afternoon for non-Floridians to return them to airports closer to their homes. I have reached out to DOT to see if we can continue the Latam charter aircraft on to another airport and am awaiting guidance.

Subject: Status of Chile charter (Silver Express pax)

I am slimming the chain to take our overseas colleagues off for right now. Please add DHS and others in the US as needed. Adding the State Department COVID coordination unit and consular reps.

Eleni - we understand the charter from Chile is scheduled to land in MIA between 1200-1300 EDT, and that FL state authorities have said non FL residents will not be allowed to continue onward to home unless moved to another charter.

Can you give us the latest? We are concerned both about Amcits on this flight as well as future charters by RC or other charters seeking to land in FL.

Thanks - Doug

Subject: RE: [EXTERNAL] Re: Royal Caribbean Ships off Brazil/Chile

Dear Eleni,
Please clarify your request and the plan – which passengers are you referring to? The air ambulance passengers or the ones who are not ill and are coming in the larger charter?

As I wrote earlier, CDC will not be conducting any health screening. For the passengers who are not arriving by air ambulance, CBP/CWMD would screen the passengers based on their own protocol. CDC Quarantine Station staff will be available to respond to any illness events, as requested by CBP.

For the air ambulance, they need assessment – I understood that you have made arrangements with Dr. Barth Green/University of Miami, who is not affiliated with CDC. He/his team would make an assessment of those 6 individuals.

Michelle –

Slight change of plans. Upon arrival at MIA, Royal Caribbean will now be arranging individual charter flights for the passengers who are cleared by CDC to return to their home cities/states.

AMERICAN OVERSIGHT

Our team has asked that CDC provide something in writing tomorrow that we can provide to the charter companies indicating that the passenger(s) boarding the charter flights have been cleared to fly commercially. We do not want the charters to deny boarding to these passengers simply because they have arrived in MIA from a cruise ship.

Thanks,

Eleni

Sorry - now with Eleni from RC. Again, due-outs are:

- State - send CDC global ship tracking list; create small-group email distro;
- CDC - send Royal Caribbean and Amy Dubois/HHS protocols for screening; Make determination on screening protocols for passengers from a "healthy" ship
- Royal Caribbean - send #s of Canadians to CDC; update on infection status; send manifests for four ships

AMERICAN OVERSIGHT

Thank you for joining the call today. Leah - I don't believe I have everyone from CDC who was on the call, including Rachel - please add if that's the case.

I've listed the do-outs that I'm tracking below, and this chain can serve as the new, smaller group of folks working on the Brazil/Chile RC ships.

- State - send CDC global ship tracking list; create small-group email distro;
- CDC - send Royal Caribbean and Amy Dubois/HHS protocols for screening; Make determination on screening protocols for passengers from a "healthy" ship
- Royal Caribbean - send #s of Canadians to CDC; update on infection status; send manifests for four ships

Dear NASPHV Colleagues,

I would like to follow up on the status of your leadership review and approval of the 3rd edition *CIFOR Guidelines*. If your leadership has not yet completed their review, Craig and I welcome any comments or edits that you may have compiled up to this point. As CDC is very keen on obtaining our printing goal below, we ask that you provide these comments or edits as soon as possible and to keep us informed of your internal approval status.

Once more, I have provided you with a copy for review. Please let me know if you have any questions or need any assistance!

Sincerely,

India

Subject: Third Edition CIFOR Guidelines for Foodborne Outbreak Response Final Draft for Association Approval
Importance: High

Sent to Members of the CIFOR Council

Dear CIFOR Colleagues,

We are happy to announce the final draft of *The CIFOR Guidelines for Foodborne Outbreak Response* (3rd. Edition) is now available for CIFOR member association approvals!

As an update, the Guidelines were available on the CIFOR website for public commenting from November 6th through December 1st, 2019. In total, we received comments from five individuals. These comments primarily consisted of format changes, graphics requests and minor technical edits. Currently, we are working with a graphic design firm to produce a cover and modify the visual aspects of the Guidelines. The firm estimates that the design work will take 3-4 weeks to complete and our publishing timeline is as follows:

- We expect to have cover designs produced by **mid to late January** and will ask CIFOR Council members to vote. If you have any suggestions for design ideas, we welcome your input.
    - In **early January**, we will be reaching out to obtain high-resolution versions of your agency's graphics placed throughout the Guidelines.
- This design firm also has printing capabilities and estimates that printing will take approximately 3 weeks to complete. Depending on how quickly approvals are obtained, this has our final printing taking place in **late February.**

AMERICAN OVERSIGHT

- Our overall goal is to have books in hand at InFORM in **Early March** or shortly thereafter.

In the interim, we are asking that members provide their organizations with a copy of the draft (attached) to obtain appropriate leadership approvals prior to publication. Once obtained, please provide CSTE with a confirmation of approval. We are asking that approvals be obtained no later than **Friday, February 7th, 2020**. *Please note: This draft does not contain the foreword nor any appendices*.

To better assist with organizational approvals, we have listed below the most significant, high-level changes to the Guidelines:

- Content:
  - WGS and CIDT issues are discussed.
  - Integration of consumer complaint systems with pathogen-specific surveillance are discussed.
  - Importance of sub-cluster investigations and epidemiologic tracebacks are emphasized.
  - Importance of environmental assessments are emphasized.
  - Importance of after-action reviews are emphasized.
  - More coordinated inclusion of communications sections.
  - Elimination of CIFOR metrics, better referencing of existing program metrics.
- Format:
  - More functional, easier-to-use format.
  - Reorganization of chapters into foundational (1-3) and operational (4-8).
  - Streamlined organization of chapters and less redundancy between chapters.
  - Chapter summary points to highlight content of each chapter.

As always, please let us know if you have any questions. Thank you all for your hard work! Please have a safe and happy New Year!

Sincerely,
India

Chapter 1 The Evolving Challenge of Foodborne Outbreak Response

1.0 Introduction

1.1 The Burden of Foodborne Illness in the United States

1.2 Growing Complexity of the Food Supply

1.3 Enhanced U.S. Foodborne Illness Surveillance Systems

1.4 Foodborne Outbreak Response and Systems Change

Chapter 2 Legal Preparedness for the Surveillance and Control of Foodborne Illness Outbreaks

2.0 Introduction

2.1 Public Health Legal Preparedness

2.2 Legal Framework for Surveillance and Disease Reporting

2.3 Protection of Confidentiality and Authority to Access Records

2.4 Legal Framework to Prevent or Mitigate Foodborne Illness Outbreaks

2.5 Evolving Legal Issues

2.6 Public Health Investigations as the Basis for Further Action

2.7 CIFOR Legal Preparedness Resources

Chapter 3 Planning and Preparation: Building Teams

3.0 Introduction

3.1 Roles

3.2 Outbreak Investigation and Control Team

3.3 Planning to Rapidly Expand and Contract Investigation and Control Team Structure

3.4 Response Resources

3.5 Communication Plans

3.6 Planning for Recovery and Follow-Up

Chapter 4 Foodborne Illness Surveillance and Outbreak Detection

4.0 Introduction

4.1 Pathogen-Specific Surveillance

4.2 Complaint Systems

4.3 Syndromic Surveillance

AMERICAN OVERSIGHT

Chapter 5 Cluster and Outbreak Investigation

5.0 Introduction

5.1 Outbreak Investigation Initiation

5.2 Define and Find Cases

5.3 Generate Hypotheses about Likely Sources

5.4 Test Hypotheses

5.5 Evaluate Evidence to Solve Point of Contamination and Source of the Food

5.6 Implement Control Measures, Investigation Close-Out, and Reporting

Chapter 6 Control Measures and Prevention

6.0 Introduction

6.1 Information-Based Decision Making

6.2 Communications With the Public

6.3 Communications With Response Partners and Stakeholders

6.4 Control Measures

6.5 Outbreaks Involving Commercially Distributed Foods

6.6 Outbreak Wrap-up Activities

Chapter 7 Special Considerations for Multijurisdictional Outbreaks

7.0 Introduction

7.1 Categories and Frequency of Multijurisdictional Outbreaks

7.2 Multijurisdictional Outbreak Detection

7.3 Identifying and Investigating Sub-Clusters

7.4 Coordination of Multijurisdictional Investigations

7.5 Multijurisdictional Outbreak Investigation After-Action Reports and Reporting to NORS

Chapter 8 Performance Metrics for Foodborne Illness Programs

8.0 Introduction

8.1 Purpose and Intended Use

8.2 Performance Metrics

Appendices

AMERICAN OVERSIGHT

Chapter 1: The Evolving Challenge of Foodborne Illness Outbreak Response

Chapter summary points

- Foodborne illness strikes tens of millions, hospitalizes more than 100,000, and kills an estimated 3,000 people in the United States each year.
- The U.S. diet has changed in response to numerous factors creating new food-safety challenges.
- Important advances in clinical laboratory techniques and public health approaches to detect and investigate clusters of illness are being used to better define the scope and nature of foodborne illness.
- Information systems and food-supply investigation techniques are developing to enhance our ability to trace contaminated foods, identify and control contamination sources, and remove contaminated food from circulation.
- Industry-driven and regulatory food-safety standards are being changed to better address risks identified by foodborne illness outbreak investigations to prevent similar outbreaks.

URLs in this chapter are valid as of July 11, 2019.

DRAFT

AMERICAN OVERSIGHT

1.0 Introduction

Outbreaks of foodborne illness and their detection, investigation, and control are functions of several constantly changing factors. The U.S. diet has changed in response to public health recommendations; economics of food production and distribution; and the growing demands for convenience in food service, as well as diversity and freshness of foods in the marketplace. Important advances have been made in clinical laboratory techniques to diagnose foodborne illnesses and in public health approaches to detect and investigate clusters of illness. Information systems are developing to enhance our ability to trace contaminated food and eliminate it from circulation and to glean lessons learned from these investigations to prevent similar outbreaks. In addition, industry-driven and regulatory food-safety standards are being changed to better address risks identified by foodborne illness outbreak investigations to prevent similar outbreaks.

This chapter provides an overview of these ever-changing factors. Subsequent chapters detail specific approaches used by investigators.

1.1 The Burden of Foodborne Illness in the United States

1.1.1 In 2011, the Centers for Disease Control and Prevention (CDC) estimated that each year in the United States 47.8 million illnesses, resulting in 128,000 hospitalizations and 3,000 deaths, were attributable to contaminated food (*1, 2*). Of these illnesses, 9.4 million are caused by 31 known agents of foodborne illness, and the remaining 38.4 million by unspecified agents. Tracking overall changes in the burden of foodborne illness from year to year is not currently possible, but trends are evident in known foodborne illnesses tracked by FoodNet (https://wwwn.cdc.gov/foodnetfast). Most notably, the incidence of *Escherichia coli* O157:H7 infections dropped from approximately 2.5 cases per 100,000 population during the mid-1990s to fewer than 1 case per 100,000 by the mid-2000s, accomplishing a goal of Healthy People 2010. Following early declines in the incidence of *Listeria* and *Campylobacter* infections, rates remained stable throughout the 2000s, whereas the incidence of *Vibrio* infections increased. Overall rates of *Salmonella* infections remained stable; the incidence of infection by serotypes Typhimurium and Heidelberg decreased; and infection by serotypes Enteritidis, Javiana, and the monophasic variant of Typhimurium, serotype I 4,[5],12:i:-, increased (*3*).

Because not all illnesses caused by foodborne pathogens are individually reportable, recognition of other pathogen-specific trends relies on surveillance of foodborne illness outbreaks. CDC's National Outbreaks Reporting System (NORS) logged 20,854 outbreaks comprising 403,110 illnesses, 16,517 hospitalizations, and 392 deaths during 1998–2017 (https://wwwn.cdc.gov/norsdashboard/). Reporting of foodborne illness outbreaks caused by norovirus increased during 1998–2004, but since 2010, annual totals have varied little, hovering around 300 per year. A comparison of etiologies causing single-agent outbreaks during 2012–2017 with those during 2002–2011 showed that outbreaks caused by agents associated with poor food-holding practices in commercial food-service establishments decreased: *Bacillus cereus*, down from an average of 17 outbreaks per year to 10 per year; *Clostridium perfringens*, from 40 to 32 per year; scombroid or histamine, from 23 to 17 per year; and *Staphylococcus aureus*, from 27 to 12 per year. These changes most likely represent actual reductions in outbreak occurrence

AMERICAN OVERSIGHT

because the percentage of reported outbreaks for which no etiologic agent was identified dropped from 59% in 1998 to 23% in 2017 (*4*).

1.1.2 In 2014, the U.S. Department of Agriculture's Economic Research Service (USDA–ERS) estimated the average annual economic burden of foodborne illness at $15.5 billion (*5*). USDA–ERS based this burden on cost estimates of foodborne illness caused by 15 major pathogens in the United States (Table 1.1). These 15 pathogens account for 95% of illnesses and deaths from foodborne illness acquired in the United States for which a pathogen was identified. These estimates include costs associated with medical treatment of acute and chronic illness, lost wages of persons who recovered, and costs associated with premature deaths.

Table 1.1. Estimated Annual Cost of Foodborne Illness, Total Number of Cases Identified, and Average Cost per Case Identified, United States, 2013

Pathogen	Total Cost	Total Cases Identified	Cost per Case
Vibrio vulnificus	$319,900,000	96	$3,332,000
Listeria monocytogenes	$2,834,400,000	1,591	$1,782,000
Toxoplasma gondii	$3,304,000,000	86,686	$38,100
Vibrio spp. (other noncholera)	$72,800,000	17,564	$8,100
Shiga toxin–producing *Escherichia coli* O157	$271,400,000	63,153	$4,300
Salmonella spp. (nontyphoidal)	$3,666,600,000	1,027,561	$3,600
Yersinia enterocolitica	$278,000,000	97,656	$2,900
Campylobacter spp.	$1,928,800,000	845,024	$2,300
Vibrio parahaemolyticus	$40,700,000	34,664	$1,200
Shigella (all species)	$138,000,000	131,254	$1,100
Cryptosporidium parvum	$51,800,000	57,616	$900
Norovirus	$2,255,800,000	5,461,731	$410
Clostridium perfringens	$342,700,000	965,958	$360
Non-O157 Shiga toxin–producing *E. coli*	$27,400,000	112,752	$240
Cyclospora cayetanensis	$2,300,000	11,407	$200

AMERICAN OVERSIGHT

1.1.3 The impact of foodborne illness on the food industry varies greatly, and the costs seldom are limited to one company. This impact is evident when the distribution network of the food supply is considered. The impacts of recalls on the food industry are far-reaching, in some cases topping $10 million in direct costs.

Direct costs of recalls include notification of regulators, supply chain, and consumers; product retrieval, storage, and destruction; unsalable product; and the additional labor associated with these activities. These direct costs do not include litigation, increased regulatory compliance, and the impact to the company's market value and brand reputation.

The outbreak of *E. coli* O157:H7 associated with romaine lettuce grown in the Yuma, Arizona, growing region in April 2018 provides a good example of the indirect costs to the industry associated with lost sales and brand damage. This outbreak sickened 210 people in 36 states. During the week that followed the initial news of the outbreak, sales of romaine lettuce fell 20% (*6*). In addition, data from Nielsen also showed marked drops in sales of iceberg lettuce, red leaf lettuce, and endive. The impact of a second, although unrelated, outbreak of *E. coli* O157:H7 associated with romaine lettuce in November 2018 (*7*) was even more dramatic because CDC advised consumers to avoid eating romaine lettuce from any source in an effort to remove potentially contaminated romaine from commercial distribution channels.

With a more comprehensive accounting of potential costs, researchers at the Johns Hopkins Bloomberg School of Public Health suggested that the cost to a restaurant for a single foodborne illness outbreak can range from $4,000 to $2.6 million, depending on the pathogen, type of restaurant involved, and size of the outbreak. For example, a foodborne illness outbreak in which five people became sick in a fast food restaurant would result in costs of approximately $4,000 if there was no loss in revenue and no lawsuits, legal fees, or fines. In contrast, a single outbreak of listeriosis involving 250 persons in a fine dining restaurant could cost upwards of $2.6 million in lost sales, lawsuits, legal fees, fines, and higher insurance premiums (*8*).

1.2 Growing Complexity of the Food Supply

U.S. food-consumption patterns change continuously. Changes in diets and food preferences have resulted in a greater demand for a broader variety of fruits, vegetables, and other foods. Moreover, Americans expect to consume these foods year-round, driving importation from areas of the world with the growing seasons necessary to meet U.S. demand. Meeting global supply-chain demands also has increased the complexity and logistics of how food is transported from farm to fork.

1.2.1 A major indicator of changing diets is the consumption of fresh fruits and vegetables. Since 1996, loss-adjusted per capita availability of fresh fruit increased 7% from 55 to 59 pounds (*9*). Consumption of fresh vegetables increased only marginally from 68 to 70 pounds per person. During the same time, per capita consumption of chicken increased 30% from 40 to 52 pounds, whereas that of beef declined 17% from 49 to 41 pounds (*9*). Within the arena of fresh produce, consumption of head lettuce declined 34% from 12 to 8 pounds per capita, whereas consumption of romaine and leaf lettuce doubled from 3 to 6 pounds per capita, and consumption of fresh spinach nearly tripled from 0.3 to 0.9

AMERICAN OVERSIGHT

pounds per capita. Consumption of fresh berries also increased substantially. The general pattern of these dietary changes reflects public health recommendations toward healthier eating (*9*).

The food industry has met this demand through routine importation of items once considered out of season or exotic. According to reports by USDA–ERS (*10*), the proportion of imported fresh fruits increased from 39% in 1996 to 53% in 2016. Excluding bananas, for which there is no domestic production, the share of imported fruits increased from 16% to 38%. Similarly, the percentage of imported fresh vegetables increased from 14% to 31%. Although a high proportion of some fresh produce items, such as mango and papaya, always have been imported, an increasingly more conventional produce items are also imported. For example, the percentage of imported avocadoes increased from approximately 14% in 1996 to 89% in 2016, and that of blueberries increased from 24% to 57% during that same period (*10*).

The safety of imported food products depends largely on the public health and food-safety systems of other countries. Recent analyses of foodborne illness outbreaks reported to CDC support the existence of food-safety problems in other countries. During 1996–2014, the number of confirmed foodborne illness outbreaks associated with imported foods increased from 3 per year to 18 per year. *Salmonella* and *Cyclospora* accounted for about one third of the outbreaks and 75% of cases, most due to contaminated produce from Latin America (*10*).

1.2.2 Culinary preferences for undercooked or raw foods also contribute to more frequent infections and outbreaks caused by the microorganisms associated with these foods. These include classical outbreaks of Shiga toxin–producing *E. coli* (STEC), *Salmonella*, *Campylobacter*, and *Listeria* infections associated with raw milk and raw milk cheeses; *Salmonella* associated with raw tuna in sushi; and *Campylobacter* and *Salmonella* in minimally processed liver pates. A corresponding trend for raw pet foods made from meat and poultry products also has led to outbreaks among people from handling the raw pet food, exposure to ill animals, or environmental contamination in the household.

Foodborne illnesses also can be associated with ingestion of products not typically thought of as food. During 2017–2018, kratom, a tree leaf with stimulant and opioid properties, caused illness by a variety of *Salmonella* serotypes. Smoking marijuana caused an outbreak of salmonellosis in 1981 (*11*); and a cannabis-associated toxidrome among four persons who attended the August 2014 Denver County Fair was associated with consumption of chocolate bars obtained at the “LoveAll” booth at the fair’s “Pot Pavilion” (*12*). The full legalization of cannabis products in at least nine other states and the District of Columbia since 2014 and associated sales of cannabis-infused edibles could lead to more foodborne illness outbreaks.

1.2.3 Changes in how food is cultivated or raised, processed, and distributed and where, how, and by whom food is prepared also contribute to changing patterns of foodborne illness. The demand for processed and ready-to-eat foods has led to the industrialization of food production with increasingly intense agricultural practices and broadening distribution of food products. Changes in agricultural, processing, or packaging methods might facilitate bacterial contamination or growth. Large multistate STEC outbreaks associated with leafy green vegetables reflect the challenges of intensive animal and

AMERICAN OVERSIGHT

fresh produce production in a shared environment. The scale of these operations magnifies the impact of food-safety system failures, resulting in thousands of exposures and potential illnesses across multiple states, and even multiple countries.

Increasingly complex food-distribution systems span the globe. Products move from farm to fork through a network of farms, processors, manufacturers, packers, importers, brokers, storage facilities, distribution centers, and retail outlets. In some instances, food from a farm can change hands more than 10 times before it reaches a consumer. These complex supply chains are maintained by a wide variety of record-keeping systems; outbreak investigators charged with tracing foods back through the supply chain are left to decode these systems and piece together, step by step, how a food reached its final destination.

At the same time, a counter-trend promoting local food sources and small-scale farm-to table distribution networks (sometimes termed the "locavore movement" or "community-supported agriculture") has emerged. The number of small food producers and direct-to-consumer marketing avenues (e.g., farmer's markets, farm stands, farm-to-school programs, and "pick-your-own" operations) also has risen. According to national agriculture census data, from 1997 to 2017, direct sales of agricultural products to the public increased by 374%, compared with an increase of 93% for all agricultural sales. During the same period, the number of farms selling directly to consumers increased by 18%, compared with an 8% decrease in the total number of farms (*13*). In addition, most states have "cottage food" laws, allowing small producers to cook, can, or pickle outside of licensed kitchens certain foods that are typically considered low-risk.

The effect of increased consumption of locally produced foods is yet to be determined, but the consequences of eating unsafe food apply to both small and large producers. For an individual, it is equally as bad to get STEC infection from farm-fresh strawberries harvested from a local field frequented by wild deer as it is to get STEC infection from romaine lettuce shipped hundreds of miles after contamination with runoff from a cattle feed lot. Although a small producer's limited distribution system might affect fewer people, implementing improved food-safety measures might be more challenging for the small producer. In addition, farm direct sales (i.e., farmers selling produce, eggs, and other foods they produced directly to retail customers, such as through farmers' markets and farm stands) are not included among food facilities in the 2011 Food Modernization and Safety Act (FMSA) (*14*). In some states and local jurisdictions, these sales have been exempted from food-safety regulations that pertain to other food facilities.

By whom and where our food is prepared also plays a role in foodborne illness occurrence and outbreaks. Americans increasingly eat away from home, spending more than 50% of food dollars away from home, since 2010 (*15*). During this period, there was considerable growth in limited service "fast casual" restaurants that featured more complex food handling than traditional fast-food restaurants. The increased number of meals eaten away from home most likely influenced the increase in foodborne illness. In an analysis of foodborne illness outbreaks reported to CDC during 2009–2017, 62% were associated with restaurants (4, 16). In addition, studies of sporadic and outbreak-associated foodborne illness, including infection with STEC O157, *Salmonella enterica* serotypes Enteritidis and Typhimurium,

AMERICAN OVERSIGHT

and *Campylobacter jejuni* suggest that commercial food-service establishments, such as restaurants, play an important role in foodborne illness in the United States (*17*).

Finally, the growing e-commerce in delivery of groceries and restaurant food directly to consumers' homes provides foodborne illness investigators with opportunities for verifying food purchases and dates. Whether an increased risk for illness accompanies these means of food distribution remains to be determined.

1.3 Enhanced U.S. Foodborne Illness Surveillance Systems

A variety of surveillance systems have been developed to identify foodborne illness and detect outbreaks. Some systems focus on specific pathogens likely to be transmitted through food and have been used extensively for decades. More recently, new surveillance methods have emerged that provide data on food vehicles, settings, pathogens, contributing factors, and environmental antecedents. Effective surveillance to track cases of foodborne illness and outbreaks is critical to developing effective control strategies.

1.3.1 Changes in surveillance for human illness have affected how outbreaks are detected (Chapter 4) and investigated (Chapter 5). All states and territories have legal requirements for the reporting of certain illnesses and conditions, including illnesses likely to be foodborne (e.g., salmonellosis, campylobacteriosis, and STEC infection), by healthcare providers and laboratories to the local, state, or territorial public health agency (Chapter 2). Local and state agencies also receive and respond to complaints of illness directly from the public. The adoption of new testing methods in clinical and public health laboratories, as well as improved information management systems and social media, are transforming surveillance activities.

- Molecular subtyping by public health laboratories has been the basis for national pathogen-specific surveillance since the initiation of PulseNet in 1996. The use of pulsed-field gel electrophoresis (PFGE) increased the ability to link isolates from distant locations and thereby to infer epidemiologic relatedness; PFGE revolutionized the detection and investigation of foodborne illness outbreaks and led to prevention of illnesses. However, PFGE provided limited information about the organism itself. Rapid bacterial sequencing technology and the informatics tools needed to accommodate whole-genome sequencing (WGS) have been developed and in 2019 rapidly deployed to public health laboratories across the United States. On July 15, 2019, WGS replaced PFGE as the primary molecular subtyping tool for pathogen-specific surveillance.
- Concurrent with the development of WGS to improve molecular subtyping, clinical laboratories have moved away from traditional fecal culture in favor of culture-independent diagnostic tests (CIDTs). These methods can rapidly identify pathogens and expedite treatment decisions, but they do not yield the bacterial isolates required by public health officials. Many public health jurisdictions require submission of CIDT-positive specimens for subsequent culture and subtyping—but this shifts the burden of isolation from the clinical laboratory to the public health laboratory and delays cluster recognition. Conversely, CIDTs may be more sensitive and offer the prospect of detecting pathogens (e.g., enterotoxigenic *E. coli*) that may elude detection by culture.

AMERICAN OVERSIGHT

- Although newer technologies sometimes lead to delayed recognition of clusters and reduced cluster sizes, improved epidemiologic investigation practices have been developed. These include the standardization of common data elements for interviewing case-patients, use of standardized hypothesis-generating questionnaires, increased use of consumer product purchase (e.g., "shopper card") data, aggregation of case-patient exposures and comparison with population reference standards, and improved subcluster investigation and informational traceback methods to improve the specificity of exposure assessments.
- The principles of foodborne illness complaint surveillance are being standardized (Chapter 4). The value of using electronic databases to review and analyze complaints and to link complaints with pathogen-specific surveillance systems has been demonstrated. Numerous social media platforms have been evaluated to assess their potential utility to enhance conventional complaint surveillance. To the extent these can facilitate linking illnesses with exposure, rather than just reinforcing the "last meal eaten" bias, they may warrant attention from public health agencies.
- Standards and procedures for outbreak reporting have been developed for NORS. NORS supports outbreak reporting from state, local, and territorial health departments in the United States. NORS Dashboard is a public-facing, web-based tool containing limited and cleaned NORS data that can be filtered using an interactive interface that produces summary data, statistics, and a variety of graphs based on user preferences (https://wwwn.cdc.gov/norsdashboard/www.cdc.gov/fdoss/nors-dashboard.html). CDC, USDA's Food Safety and Inspection Service (FSIS), Food and Drug Administration (FDA), and other investigating agencies analyze these data to improve understanding of the impact of foodborne illness outbreaks on human health and of the pathogens, foods, and settings involved in these outbreaks.
- Specialized surveillance networks have been developed for specific pathogens. For example, CaliciNet is a norovirus outbreak surveillance network of local, state, and federal public health laboratories. Network partners perform viral sequencing and upload sequences into CaliciNet to monitor circulating strains, and identify newly emerging norovirus strains. CryptoNet, the first U.S. national molecular tracking system for a parasitic infection, was formally launched in 2015 to collect specimens and to characterize the molecular epidemiology of infection by *Cryptosporidium* spp., only some of which are pathogenic for humans but which are typically indistinguishable morphologically.

1.3.2 Surveillance for food-preparation hazards and environmental assessments of outbreaks have been developed to identify root causes (Chapter 5) and improve preventive controls (Chapter 6). Routine food-safety inspections are conducted for all licensed food-service establishments by approximately 3,000 local and 75 state and territorial agencies. Although traditionally conducted to ensure that food-service establishments were operating within the provisions of state food codes, many of which are adopted from the FDA Model Food Code (*18*), inspection results are being increasingly displayed at the point of service or online to provide information to consumers about potential food-safety risks. A growing body of evidence suggests that such public disclosure of inspection results might improve restaurant inspection results and reduce the risk for illness transmission to patrons.

- To standardize assessment of retail food risk factors**,** FDA initiated the Retail Food Risk Factor Study to measure practices and behaviors commonly identified as contributing factors in foodborne illness outbreaks (*19*). Data from the initial study, collected during 1998, 2003, and

AMERICAN OVERSIGHT

2008, documented progress toward the goal of reducing contributing factors (https://www.cdc.gov/nceh/ehs/nears/cf-definitions.htm) at retail establishments: five of the nine facility types showed a statistically significant improvement in compliance for all 42 contributing factors during the study period. A second round of the Retail Food Study was initiated in 2013 to assess food-protection manager certification and food-safety management systems. In restaurants, having a well-developed and documented food-safety management systems was associated with fewer food-safety items out of compliance (*20*).

- The Environmental Health Specialists Network (EHS-Net) of environmental health specialists and epidemiologists from local and state health departments, FDA, FSIS, USDA's Food and Nutrition Service, and CDC developed the National Environmental Assessment Reporting System (NEARS) to systematically monitor and evaluate root causes of foodborne illness outbreaks, including contributing risk factors and environmental antecedents. This system is cross-referenced with NORS and collects information from detailed environmental assessments on factors contributing to the outbreak and the underlying conditions that led to it. The information collected through NEARS can inform hypothesis generation about antecedents to foodborne illness outbreaks and strengthen the ability of food-control authorities to formulate and evaluate the effectiveness of food-safety actions.

1.3.3 The food supply and associated environments are tested by local, state, and federal regulatory officials and the food industry. Food testing is a tool used to assess whether an establishment's food-safety system is functioning adequately to address hazards in food production and manufacturing and prevent foodborne illnesses. Food and environmental testing data, including molecular subtyping data, can be used to inform hypothesis generation during outbreaks. Food testing data also can be used to estimate the fraction of selected foodborne illnesses caused by specific food sources, to assess changes in food contamination over time, and to assess the success of regulatory measures. Foodborne pathogens of interest that are isolated from food or from animal or environmental sources during various government testing programs are being characterized by WGS and the sequence data added to FDA's GenomeTrakr BioProjects housed at NIH NCBI, where they can be compared with data from human isolates directly on NCBI Pathogen Browser and/or in the CDC-PulseNet National Database.No formal framework exists to link industrywide testing to public health surveillance data. Mechanisms have been discussed that would provide access to aggregated, or blinded industry data to avoid regulatory penalties to individual companies.

To ensure technical competence and the ability to generate reliable data, food testing laboratories within FDA and FSIS maintain accreditation in the International Organization for Standardization/International Electrotechnical Commission 17025 standard—the main international standard used by testing and calibration laboratories. Additionally, FDA is leading an effort to bring state human and animal food testing laboratories into International Organization for Standardization/International Electrotechnical Commission 17025 accreditation to enhance efforts to protect the food supply. Data generated by accredited laboratories will be made available for consideration during FDA enforcement actions, as well as for surveillance purposes and during local, state, or federal response to foodborne illness outbreaks. Laboratory accreditation also will assist state manufactured food-regulatory programs in achieving conformance with the Manufactured Food Regulatory Program Standards.

AMERICAN OVERSIGHT

1.4 Foodborne Illness Outbreak Response and System Change

1.4.1 Although foodborne illness surveillance and response are rooted in individual states' laws, the growing trend in multistate outbreaks associated with widely distributed foods requires increasing standardization of methods, integration of activities, and federal support and oversight. In response to the emergence of *E. coli* O157:H7 and other foodborne pathogens during the 1990s, CDC developed the active surveillance network FoodNet, with funding assistance from FSIS, to conduct comprehensive surveillance of diagnosed illnesses within defined populations to assess and monitor trends in the burden of illness associated with specific agents. Simultaneously, CDC established the national molecular subtyping network PulseNet to improve laboratory-based surveillance for bacterial pathogens routinely detected by clinical laboratories. PulseNet increased detection of multistate outbreaks, and FoodNet provided a framework to interpret the impact of food system changes in response to improved outbreak detection and regulatory activity.

In 2005, CIFOR was established to identify barriers to effective surveillance and investigation of foodborne illnesses and outbreaks. One of the first CIFOR projects was to develop guidelines for outbreak detection and response. The First Edition of the CIFOR Guidelines, published in 2009, established model practices for foodborne disease surveillance at local and state levels, with specific reference to coordination of multijurisdictional outbreaks investigations and development of performance indicators to measure the effectiveness of surveillance activities. The Second Edition of the Guidelines was published in 2014.

During this time, CDC began providing dedicated funding to state-level support foodborne illness outbreak response through Epidemiology and Laboratory Capacity grants. This led to development of several CDC programs: OutbreakNet, CDC's Foodborne Diseases Centers for Outbreak Response Enhancement (FoodCORE), and the Integrated Food Safety Centers of Excellence and OutbreakNet Enhanced (OBNE). The CDC Integrated Food Safety Centers of Excellence were created by FSMA. These programs are intended to work together to enhance the development and evaluation of foodborne illness surveillance and outbreak response activities across the United States.

In conjunction with CDC's investments in the performance of public health agencies, FDA has used additional resources provided by FSMA to develop a network of Rapid Response Teams to enhance coordination between public health and food-regulatory agencies at the state level and formed a Coordinated Outbreak Response and Evaluation (CORE) Network to centralize coordination of outbreak response activities within FDA. FSIS has developed parallel outbreak response capacity (Chapter 3).

With a stated goal of building an Integrated Food Safety System, FDA established the Partnership for Food Protection in 2008, bringing together local, state, territorial, tribal, and federal representatives with expertise in food; feed; epidemiology; laboratory; and animal, environmental, and public health. The Partnership for Food Protection brings the collective expertise of the above stakeholders to work on projects that enhance human and animal food safety in the United States.

Coordination of activities on the federal level is accomplished through mutual liaisons between agencies, and joint participation in the Intergovernment Food Safety Analytics Collaboration which seeks to improve the use of outbreak surveillance in foodborne illness attribution models and thus better guide food-safety regulation. Chapter 3 details the agencies currently involved in foodborne illness

AMERICAN OVERSIGHT

outbreak response, along with their respective roles and responsibilities. Issues posed in the response to multijurisdictional outbreaks are discussed in Chapter 7.

1.4.2 Food-safety standards are changing to better control food-safety risks identified by foodborne illness outbreak investigations. Both industry-driven standards (e.g., from the Global Food Safety Initiative, https://www.mygfsi.com/about-us/about-gfsi/what-is-gfsi.html) and government-driven regulatory requirements are being updated to identify and manage food-safety hazards more rapidly. Examples of noteworthy regulatory changes in the United States include

- The 2011 FSMA—the first major reform of the FDA's food-safety authority since the 1938 enactment of the Food, Drug, and Cosmetic Act. Since the Second Edition of the CIFOR Guidelines, some key provisions of FSMA have been rolled out in seven federal regulations (Chapter 2), which provide FDA with additional legal authorities and resources to strengthen food-safety systems. They enable FDA and its food-safety partners, to focus on preventing food-safety problems and to address food-safety risks more rapidly when they are identified. FSMA and its associated regulations grant FDA substantial new authority to protect food all along the farm-to-fork line, covering preventive controls, inspections, laboratory testing, product tracing, mandatory recall authority, importer accountability, authority to deny entry to the U.S. market, state and local capacity building, and other areas.
- Since enactment of its Pathogen Reduction, Hazard Analysis and Critical Control Point Systems rule to reduce risks associated with meat and poultry in 1996, FSIS has continued to address food-safety hazards. In 2011, FSIS established raw poultry performance standards for *Campylobacter* and updated existing ones for *Salmonella*. In 2012, FSIS added six non-O157 STEC serogroups as "adulterants" in raw beef. In 2015, after agency investigators noted they often were impeded in efforts to trace ground beef to its source during outbreak investigations and in response to STEC-positive sample results, FSIS required its regulated establishments and retail stores to maintain detailed records to identify all ground-beef source materials.

In summary, the foods we eat and the processes by which they are produced, distributed, and prepared; the means for diagnosing illness and detecting outbreaks; the methods whereby outbreaks are investigated; and the response of government and private partners are always changing. The following chapters provide updated guidance to responders with these changes in mind. The final chapter (Chapter 8) provides and references metrics for evaluating an agency's progress toward optimizing its response to foodborne illness outbreaks.

AMERICAN OVERSIGHT

Chapter 2: Legal Preparedness for the Surveillance, Investigation, and Control of Foodborne Illness Outbreaks

Chapter Summary Points

- The authority to identify, investigate, and control foodborne illness outbreaks is shared across local, state, and federal, governments and requires ongoing cooperation. Legal preparedness is the assurance that agencies and jurisdictions are equipped with sufficient legal authorities to conduct effective disease surveillance and control and have staff trained to use these authorities.
- Local and state statutes and regulations authorize the reporting and investigation of foodborne illnesses. The communicable disease control regulatory process is often used to specify diseases and conditions to be reported, the information to be reported, and the process for making a report. State laws and regulations also address the confidentiality of disease reports and enforcement of reporting requirements.
- Local and state agencies need to regularly access confidential records when investigating reports of foodborne illness. They must navigate differing local, state, and federal legal authorities and requirements as they seek to access and share information with other government agencies and respond to media inquiries.
- Shared goals of the public and private sectors are to prevent as many outbreaks as possible and to mitigate those that occur. In the public sector, local, state, and federal agencies accomplish those goals by working independently and together to exercise their legal authorities to, among other things, inspect, seize or destroy foods, and close establishments.
- Although reporting, surveillance, and mitigation of foodborne illness outbreaks are well established in local, state, and federal law, issues continue to arise that demonstrate differences among state and federal laws and the need for ongoing communication and collaboration among state, local, and federal officials who are united in the common goal of protecting the public's health.
- During foodborne illness investigations, public officials may find issues that require the initiation of administrative actions or even civil or criminal proceedings. Data collected during a foodborne illness investigation can become the basis for further action by local, state, and federal agencies.

URLs and email addresses in this chapter are valid as of July 3, 2019.

AMERICAN OVERSIGHT

FL-DOH-20-0673-A-006086

2.0 Introduction

2.0.1 Understanding and appropriately using law is a fundamental part of protecting the public's health from foodborne illness. Local, state, and federal government agencies share the authority to identify, investigate, and control foodborne illness outbreaks, but each level of government and each agency within it has specific roles, responsibilities, and legal authorities. The success of a public agency's efforts to combat foodborne illness also greatly depends on its cooperation and communication with multiple parties in the food, agriculture, healthcare, and laboratory sectors. Ultimately, the goal is to become more effective at protecting public health and preventing disease by leveraging legal authorities across local, state, and federal jurisdictions.

2.0.2 This chapter addresses legal preparedness in the various aspects of foodborne illness outbreak surveillance and control—reporting, surveillance, investigation, mitigation, and prevention—through the perspective of local, state, and federal agencies. It also discusses critical issues that arise during outbreak investigations, such as confidentiality of data and use of public health investigations as the basis for regulatory actions or criminal prosecutions.

2.1 Public Health Legal Preparedness

Legal preparedness is an indispensable part of a comprehensive preparedness plan for public health threats. The Centers for Disease Control and Prevention (CDC) defines public health legal preparedness as the attainment by a public health agency or system of specified legal benchmarks or standards of preparedness for specified public health concerns (*1*). Public health legal preparedness has four core elements:

- Laws and legal authorities;
- Competency in understanding and using law;
- Coordination across sectors and jurisdictions in the implementation of law; and
- Information about best practices in using law for public health purposes.

These core elements apply to all areas of public health, especially in the areas of food safety and foodborne illness outbreaks. Because the U.S. food system is highly complex, public health, food, and agriculture officials responding to foodborne illness outbreaks face the challenge of rapidly gathering and processing information to identify and mitigate the source of an outbreak while protecting confidentiality and preserving rights.

2.1.1 Legal preparedness within the context of surveillance, investigation, and control of foodborne illness outbreaks requires state and local officials to ensure their agencies and jurisdictions have the following:

- Laws and legal authorities needed to conduct all functions essential to effective surveillance, investigation, and control (e.g., reporting, enforcement, prevention, mitigation, investigation, and regulation).
- Trained professional staff with demonstrated competency in applying relevant laws.

AMERICAN OVERSIGHT

- Mutual aid agreements or memoranda of understanding in place to facilitate investigation and response across jurisdictions and agencies.
- Access to information about model practices in using relevant legal authorities and applying them.

The adequacy of local and state legal preparedness for foodborne illness outbreaks also should be evaluated regularly through exercises and after-action reviews from actual outbreaks.

As part of ensuring their jurisdictions' legal preparedness, local and state officials should consult with their legal counsel (Box 2.1) and with counterparts in other government agencies that have authority relevant to ensuring successful surveillance and control of foodborne illness outbreaks. These include food and agriculture regulatory and law enforcement agencies, legal counsel to local and state governments, and local and state courts and court administrators.

Box 2.1. Partnering with Your Agency's Attorney (2)

To prepare for an outbreak:

Meet with your agency's attorney to discuss specific legal authority and responsibilities contained in local, state, and federal law relative to disease reporting, investigations, and food-regulatory actions (e.g., permit suspension and closure, employee restrictions).

Identify outbreak settings or conditions for which legal assistance might be needed.

Outbreak settings or conditions for which legal assistance might be needed (2):

There is a reasonable chance the public's health is or might be threatened without specific public health intervention.

Your ability and authority to address the situation is unclear.

The event or circumstance could expose your agency or organization to potential liability, or political pressure.

In an outbreak situation in which you might need legal assistance:

Contact your agency's attorney as soon as possible for legal input.

Be candid and open; give all the facts—don't allow for surprises.

Proactively include your agency's attorney in discussions rather than seeking ratification of decisions later.

If you do not understand or you disagree with the advice provided by your agency's attorney, ask for clarification or discuss other options with him or her rather than requesting different advice from another attorney.

Private organizations also must be aware of their legal duties regarding food safety and disease reporting). These duties vary by state. Relevant private entities include private laboratories, food firms, hospitals, and other health institution food services. Food-industry entities should be prepared to address both regulatory requirements and the way these requirements might affect their internal policies on sharing information (*3*). Where possible, both public and private entities should be included in foodborne illness exercises to test their understanding of their legal authority and duties related to outbreaks.

2.1.2 As government entities, public health, food, and agriculture agencies operate within the context of the U.S. Constitution, state constitutions, federal and state statutes and regulations, local charters

AMERICAN OVERSIGHT

and ordinances, court decisions, and more. Thus, these agencies are empowered and limited within this context and must navigate the country's foundational legal principles, i.e.,

- **A system of checks and balances.** Public health, food, and agriculture agencies belong to the Executive Branch and are broadly charged with implementing laws enacted by the legislature and interpreted by the courts.
- **Federalism.** The U.S. Constitution enumerates specified powers for the federal government and reserves other powers to the states (tribes are autonomous or sovereign bodies). In addition, state and local governments possess inherent police powers to protect the health and safety of the public.
- **Protection for civil liberties and property rights.** The Fourth, Fifth, and Fourteenth Amendments protect citizens from unreasonable searches and from deprivation of life, liberty, and private property without due process of law. State constitutions, statutory law, and court rulings provide additional protections relevant to the conduct of foodborne illness surveillance and operations by public agencies.

2.1.3 The legal authority supporting local and state public health agencies' role in the protection and promotion of the public's health stems from constitutional, statutory, regulatory, and judicial case law, as well as from the general police powers. However, these powers are not unlimited. Important legal parameters for public health authority and practice were articulated in the foundational 1905 U.S. Supreme Court ruling in *Jacobson v. Massachusetts* (*4*):

- With compelling reason, individual liberties can be subordinated to the well-being of the community.
- The police power of the state authorizes issuance and enforcement of reasonable regulations to protect the health of the community.
- Courts defer to the authority that legislative bodies give to public health agencies if that authority is exercised on the basis of persuasive public health and medical evidence.
- Public health agencies cannot act in an arbitrary manner or pose unreasonable risks for harm.

In general, these parameters apply to state and local public health agencies' surveillance and control of foodborne illness outbreaks. Those activities, however, are further authorized and conditioned by the statutes, regulations, ordinances, and case law of the individual jurisdictions. Some of these laws relate specifically to foodborne illnesses, but in many jurisdictions, public health agencies rely on laws (state statutes and local ordinances) that authorize surveillance for infectious diseases generally.

2.1.4 CDC operates under congressionally enacted statutory law and, especially in the case of foodborne illness surveillance, under provisions of the Public Health Service Act (*5*). CDC is not authorized to mandate reporting of diseases and conditions by state and local governments or by private entities. However, states do mandate reporting pursuant to state laws.

Among many other provisions, the Public Health Service Act authorizes CDC to gather data on nationally notifiable diseases pursuant to guidelines CDC develops in partnership with state and local public health agencies and professional societies. Many of these data come from state and local public health agencies. CDC partners with the Council of State and Territorial Epidemiologists to establish (and modify as needed) case definitions for diseases. These guidelines and case definitions, however, are not legally binding. States have the autonomy to adopt these Council of State and Territorial Epidemiologists–

AMERICAN OVERSIGHT

developed case definitions or develop their own definitions for use in their states. CDC does not collect personal identifiers on routine surveillance data that it receives from public health departments.

The Public Health Service Act also authorizes CDC to perform laboratory tests on specimens received from state and local governments (and from other sources) to identify pathogens, confirm serotypes or molecular subtypes, perform diagnostic assays, and report findings to appropriate state and local health departments. Virtually all enteric illness specimens tested in CDC laboratories are initially tested in state or local public health laboratories.

Additionally, CDC may participate in an outbreak investigation within a state if invited by the state. Multistate investigations are typically led by CDC or the state health department where most of the cases occurred.

2.2 Legal Framework for Surveillance and Disease Reporting

Investigation of enteric illnesses to determine the source of exposure, risk factors for infection, and contacts of a person with a contagious disease is usually considered part of surveillance and disease control activities authorized by local and state statutes. Likewise, state and local authority to mandate disease reports arises from state law. The regulatory process is used to specify diseases and conditions to be reported, the information to be reported about a case, and the process for making a report. State laws and regulations also address the confidentiality of disease reports and enforcement of reporting requirements (Box 2.2).

Box 2.2. Communication with Laboratories and Hospitals

Ongoing communication arrangements should be established with national or regional commercial and clinical laboratories to ensure that the investigating agencies receive results for relevant cases, even when those tests are conducted out of state. Similar communication channels also should be established with in-state and out-of-state hospitals that serve a population within the community affected by the outbreak.

2.2.1 Local and state health agencies learn about foodborne illnesses through a variety of sources that vary in reliability and traceability. As discussed further in Chapter 4, these include

- Reports through the state's mandatory disease and conditions reporting system;
- Surveillance reports for enteric pathogens;
- Requests for antitoxin for botulism;
- Reports of food poisoning or gastrointestinal illness in individuals or defined groups, such as diarrhea and vomiting among residents of a nursing home or hospital, attendees at schools or childcare centers, or attendees at a work-related meeting;
- Reports to poison control centers;
- Reports of enteric illness suspected of being caused intentionally;

AMERICAN OVERSIGHT

- Complaints of suspected foodborne illness or alleged exposure to contaminated, adulterated, or improperly cooked food purchased from stores or in restaurants and reported voluntarily by the public;
- Syndromic surveillance using de-identified emergency department or pharmacy data; and
- Reports directly from the food industry of consumer complaints of illness.

2.2.2 The state legislature generally gives broad statutory authority to the state health department to collect information and to require reports of diseases, conditions, and outbreaks of public health importance. Generally, the state legislature also gives the state health department the authority to adopt rules or regulations that specify which diseases or conditions must be reported, who must report them, and how to report (Table 2.1). The list of reportable diseases and conditions and laboratory findings is maintained and updated by epidemiologists and health officers in state and local agencies, with review and approval by the body overseeing the health department.

In addition to broad authority, states typically have several disease-specific statutes, such as those for human immunodeficiency virus/acquired immunodeficiency syndrome, tuberculosis, and vaccine-preventable diseases, which authorize surveillance and control activities. All states also have statutes addressing reporting and response to bioterrorism incidents.

DRAFT

AMERICAN OVERSIGHT

Table 2.1. Reporting Processes Typically Specified by Statutes and Regulations

Process	Requirement	Comment

Sources of reports	The usual sources of mandatory reports are
	● Laboratories
	  ○ Hospital-based laboratories;
	  ○ Clinical laboratories;
	  ○ National or regional commercial referral laboratories;
	  ○ Local or state health department laboratories; and
	  ○ CDC laboratories;
	● Health care institutions
	  ○ Hospitals (e.g., hospitalized patients reported by infection control practitioners);
	  ○ Emergency departments; and
	  ○ Long-term–care facilities or nursing homes;
	● Physicians;
	● Schools and childcare centers;
	● Food establishments (e.g., restaurants); and
	Other state health departments.
		The source of a report does not affect the legal status of the information; if it is required information, it is protected by statutes and regulations.
		
		Conversely, reports to the agency of an illness not listed as a reportable condition might not be subject to disease surveillance regulations and confidentiality protections.

Time frame and content of reports	Statutes and regulations usually specify the following aspects of disease reports: ● Time frame for reporting (e.g., within 7 days after diagnosis, within 24 hours after diagnosis, immediately); and ● Information to be reported (e.g., diagnosis; personal identifying and locating information; date of onset or diagnosis regardless of whether the case is suspected or confirmed).	
Reporting methods	A state or municipality can use a variety of methods for reporting. Specifics vary from one locale to another. These methods include ● Internet-based, highly secure disease reporting to websites maintained by state or local public health agencies; ● Reports sent by email; ● Automatic electronic submission through health information exchange; ● Telephone; and/or ● Hard copy (fax or mail).	
Required submission of laboratory specimens	Many public health agencies have adopted regulations that require laboratories to submit isolates of specific pathogens to a state or local health department laboratory for further confirmatory and/or genomic testing, such as pulsed-field gel electrophoresis and/or whole-genome sequencing, to improve surveillance for foodborne disease (see also 6).When the clinical laboratory does not obtain	In some locales, voluntary submission of specimens achieves the same goal.

DRAFT

AMERICAN OVERSIGHT

FL-DOH-20-0673-A-006092

	isolates, some states require or request submission of primary clinical material or enrichment broths. The regulations often include a time frame for submission of such materials. With the increasing development and use in clinical settings of culture-independent diagnostic tests (CIDT), which do not produce an isolate, there is growing concern that the supply of isolates to health departments will be depleted, hindering public health surveillance activities. To address these concerns, states have begun to amend their laws. A few states have added language that gives specific submission instructions to a clinical laboratory that has used CIDT methods to make a diagnosis. Other states have expanded their list of acceptable materials for submission beyond only an "isolate" to include "specimen," "primary clinical material," "enrichment broths," and other alternative materials to submit if the preferred isolate is not available. States may continue to amend their disease reporting laws, in various ways to fit the needs of the jurisdiction, as CIDT continues to develop for a broader number of pathogens."	

DRAFT

AMERICAN OVERSIGHT

2.2.3 Reliable reporting by persons and institutions mandated to submit disease reports is the foundation of the reporting system. When enteric illnesses are not reported, a foodborne illness outbreak may be missed. Because of the problem of nonreporting, redundant reporting systems have been established to ensure a case will be reported (e.g., a *Salmonella* infection might be separately reported by physicians, laboratories, and healthcare institutions). Because health agencies want to encourage compliance, ongoing education and communication with persons and institutions mandated to report is imperative to reinforce the importance of reporting requirements.

Education is the preferred method to obtain reporting compliance, but when violations arise, statutes and regulations mandating disease reporting also contain enforcement and penalty provisions. Depending on the jurisdiction and the frequency and severity of nonreporting, sanctions can range from notification to a state licensure board to civil fines and/or criminal penalties.

Reporting may be difficult to enforce with a laboratory or healthcare provider outside an agency's jurisdiction, such as when a state seeks reports from a reference laboratory located in another state. In that situation, lack of reporting usually results from misunderstanding of how to report. Occasionally a laboratory will assert that it complies with requirements of the public health agency in the state in which it is physically located—which might or might not require reporting of the specific disease, infection, or laboratory result. Again, ongoing communication with the parties required to report and coordination with the state health agency in the parties' home state can improve reporting.

2.3 Protection of Confidentiality and Authority to Access Records

State and local health agencies need to regularly access confidential records when investigating reports of foodborne illness. However, when doing so, federal and state laws mandate the protection of confidential personal information during these public health investigations.

Typically, the broad authority to conduct surveillance includes authority to investigate and control diseases of public health significance, including review of relevant and pertinent medical and laboratory records and reports (i.e., information that is not necessarily included in the basic case report). Although medical and laboratory staff might be concerned about potential violations of federal Health Insurance Portability and Accountability Act (HIPAA) (*7*) and state privacy laws in releasing records, exceptions for public health and other government agencies allow access to records. Consulting with an agency attorney is advisable whenever questions or concerns arise about accessing or disclosing confidential information (Box 2.3).

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-006094

Box 2.3. Prepare for Questions about Authority to Access Information

Staff in an organization that might be required to provide information to local, state, and federal officials about foodborne illnesses and outbreaks might not be familiar with the authority of government officials to access individually identifying and other privacy-restricted information under certain provisions of state and/or federal law.

These organizations might include those (e.g., childcare, elder care) that, depending on state law, might not have routine interaction with disease reporting and outbreak investigation systems.

Consult with your agency's attorney to prepare memorandum or information sheets tailored to different types of organizations that specify state and federal authority to access information.

2.3.1 HIPAA and its associated regulations limit access to a person's protected health information (PHI) (*7, 8*). PHI is information that can be used to individually identify a person through demographic data, diagnosis, treatment, or payment for treatment (*9*).

Important exceptions to HIPAA allow public health and other government agencies to access PHI, including

- **Required by Law.** Entities covered by HIPAA (e.g., doctors, healthcare plans) may use and disclose PHI without individual authorization if required by law (e.g., statute, regulation, or court order).
- **Public Health Activities.** Covered entities may disclose PHI under several circumstances related to public health activities, including
  - Public health authorities authorized by law to collect or receive information for preventing or controlling disease, injury, or disability;
  - Persons who might have been exposed to or contracted a communicable disease when notification is authorized by law; or
  - Entities subject to Food and Drug Administration (FDA) regulation for purposes such as tracking products or product recalls.

These exceptions in effect authorize a covered entity (e.g., doctor) to disclose otherwise confidential PHI. Explaining these exceptions to physicians or their staff often results in better compliance with reporting requirements. HIPAA does not restrict the use of de-identified information, which does not identify a person or provide a basis for identification (*10*).

2.3.2 Local and state health agency staff must know the requirements of their freedom of information laws and the exemptions from them. Personal identifying information (PII) (e.g., name, age, sex, race, ethnicity, residence, or date of diagnosis) in disease reports and investigation records is generally confidential and exempt from disclosure in response to freedom of information requests. Each state can define what it considers to be PII. The goal is to avoid releasing data that make it possible to directly or indirectly identify the affected person if the released data are combined with other information. When there are a large number of cases, it might be possible to release data *other than names and residences* in response to freedom of information requests. When there are too few cases

AMERICAN OVERSIGHT

among the population of a given area, an agency might have a policy of not releasing data to guard against potential identification of an individual person. This determination should be made in each instance in conjunction with agency epidemiologists, statisticians, and attorneys.

In addition to potential restrictions on sharing PII, state laws might restrict sharing of other types of information, such as confidential commercial information and predecisional/deliberative information. Furthermore, the federal Privacy Act can restrict the sharing of certain personal privacy information (PPI) by federal agencies (*11*).

Occasionally a public health agency must respond to a media inquiry in which the media have learned the identity of a particular case from another source. The agency's response to the media inquiry must be carefully structured to avoid unintentional confirmation of the patient's identity. Preparing final outbreak investigation summary reports without any PII can hasten and simplify release of those reports to attorneys or media.

2.3.3 A public health agency may be restricted from sharing PPI with other government agencies without the consent of the reported person. However, these restrictions are subject to several exceptions:

- Local and state health agencies are generally permitted to share information with other state, local, and federal agencies to confirm and track cases.
- Many state statutes contain an exception for sharing information when, in the agency's judgment, sharing is necessary to protect public health.
- Virtually every state has an exception for sharing information with law enforcement agencies for investigation of intentional contamination or a bioterrorism incident.

2.3.4 The U.S. Department of Health and Human Services (DHHS), FDA, has formalized arrangements for information sharing with local and state regulatory agencies. FDA provides nonpublic information to state and local agencies under 20.88 agreements (*12*) and to certain state and local officials who have been commissioned by FDA (Box 2.4).

- 20.88 agreements are authorized under 21 CFR 20.88. 20.88 agreements allow FDA to share certain nonpublic information with state and local government officials. These agreements allow for the sharing of confidential commercial information, PPI, and predecisional information (PDI), and predeliberative information but not trade secret information. The receiving agency must commit to keep this information confidential (*12,13*). FDA offers several types of 20.88 agreements:
    - Single-Signature Long-Term Information Sharing Agreements (Food and Feed, Pharmacy Compounding, Drug Security) (Long-Term 20.88) allows for the sharing of nonpublic information proactively or on request related to food, animal food, cosmetics, pharmacy compounding, drug security with all employees who report to the signatory.
    - Case-Specific 20.88 allows for the sharing of nonpublic information related to a particular incident involving an FDA-related industry (e.g., food, drugs, devises, biologics). A Case-Specific 20.88 can be expedited if FDA is made aware of the need for urgent processing. Each employee who will need access to the information must sign.
    - 20.88 with Associations allows for proactive or upon request sharing of nonpublic deliberative processes and predecisional information only. Examples may include draft rules and/or draft guidance.

AMERICAN OVERSIGHT

- **Commissioning.** FDA's commissioning process enables a state or local health, food, or drug official to be commissioned as an officer of DHHS (*14*). Commissioned officials may receive nonpublic information solely for the purpose of their work on behalf of FDA as a commissioned official. They may generally disclose that information to other FDA-commissioned officials (in their capacity as FDA commissioned officials) and FDA employees (*15*). Such information remains FDA information. Commissioning also authorizes state or local officials to conduct inspections under the Federal Food, Drug, and Cosmetic Act (FFDCA) (*16*).

2.3.5 The U.S. Department of Agriculture (USDA) Food Safety and Inspection Service (FSIS) has a process for sharing information with government partners. FSIS Directive 2620.5 addresses "procedures needed to share information concerning FSIS regulated products with State or local agencies, foreign government officials, and international organizations responsible for food inspection programs and laboratories" (*17*). To request outbreak-related information from FSIS, send an email to FoodborneDiseaseReports@usda.gov.

Box 2.4. Cross-Jurisdiction and Cross-Sector Coordination
Effective reporting of foodborne illness cases hinges on coordinated reporting across jurisdictions (e.g., local, state, tribal, and federal governments) and across sectors (e.g., healthcare and public health). Local and state health officials should periodically assess the need for memoranda of agreement (or other legal agreements) with partners in other jurisdictions and sectors to ensure timely and effective reporting. CDC has created several resources for assessing and improving cross-jurisdictional and cross-sector coordination (*18,19*).

2.4 Legal Framework to Prevent or Mitigate Foodborne Illness Outbreaks

Shared goals of the public and private sectors are to prevent as many outbreaks as possible and to mitigate those that do occur. Changes in technology and food production have brought opportunities and challenges. Improvements in laboratory and communication technologies have enabled agencies to link cases that previously were thought to be sporadic and to identify and address implicated foods and sources. However, with continued globalization of food-production industries, more multistate and international foodborne illness outbreaks are being discovered, thus expanding the focus of outbreak investigations and control measures. This section reviews the roles of local, state, and federal, agencies and the legal authorities empowering them to act.

2.4.1 U.S. law authorizes several federal agencies to undertake regulatory and nonregulatory actions over food safety at various stages on the continuum of food production, importation, processing, transportation, storage, and sale. Agencies regulating food have the authority to inspect, recall, and seize unsafe foods. All agencies coordinate and collaborate with states and localities in the prevention of foodborne illness and in multistate investigations. This section focuses on CDC, FDA, USDA, and the Environmental Protection Agency (EPA) and their legal authority related to food safety (see Chapter 3 for each federal agency's roles and resources).

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-006097

- **DHHS, CDC**
  The Public Health Service Act (*5*) authorizes CDC to identify and monitor foodborne diseases and to investigate foodborne illness outbreaks in coordination with local and state health agencies. CDC can lead investigations into multistate foodborne illness outbreaks and, when invited, work in partnership with the state where the most cases have occurred.

- **DHHS, FDA**
  The FFDCA (*16*) authorizes FDA to regulate domestic and imported food, except meat, poultry, and processed egg products (i.e., frozen, dried, and liquid eggs), which are regulated by USDA.

  - **FFDCA**
    The primary legislation by which FDA exercises authority over food is the FFDCA. A goal of FDA is to prevent contamination of food products before distribution. FFDCA also empowers FDA to pursue

    - Voluntary compliance through the issuance of inspectional observations, untitled letters and warning letters;
    - Civil action, such as an injunction to prevent future violations of the FFDCA (e.g., continued distribution of adulterated food);
    - Seizure action to remove specific lots of adulterated food;
    - Mandatory recall of food that presents a certain risk to public health;
    - Criminal action against an individual or company that violates the FFDCA such as by causing food to become adulterated by inadequate processing and handling;
    - Administrative detention of certain food for up to 30 days; and
    - Suspension of the registration of a facility so that food from the facility cannot be introduced into commerce.

    In some circumstances, FDA's authority under the FFDCA is limited by the requirement that food be in interstate commerce. However, under both the FFDCA and the Public Health Service Act, FDA can regulate intrastate commerce in certain instances. Even when authority exists for FDA action, relying on state agency action might be faster when state authorities are more expansive or flexible than FDA's authorities.

    Amendments to the FFDCA in 2007 require registered food facilities that manufacture, process, pack, or hold food for human or animal consumption in the United States to report to FDA's Reportable Food Registry when a reasonable probability exists that the use of, or exposure to, an item of food will cause serious adverse health consequences or death to humans or animals (*20*). FFDCA was further amended in 2011 by the Food Safety Modernization Act (*21*).

  - **FDA Food Safety Modernization Act**
    The FDA Food Safety Modernization Act (FSMA), signed into law in January 2011, amended the FFDCA to enhance the federal government's ability to prevent and respond to contamination in the food supply (*21*). The law addresses prevention, inspection, compliance, and response activities.

AMERICAN OVERSIGHT

FDA, the agency primarily responsible for implementing FSMA, has developed a series of rules and guidance documents to address the law's requirements. As of April 2018, FDA has finalized the following rules:

- Current Good Manufacturing Practice, Hazard Analysis, and Risk-Based Preventive Controls for Human Food (*22,23*).
- Current Good Manufacturing Practice, Hazard Analysis, and Risk-Based Preventive Controls for Food for Animals (*24,25*).
- Foreign Supplier Verification Programs (*26,27*).
- Mitigation Strategies to Protect Food Against Intentional Adulteration (*28,29*).
- Sanitary Transportation of Human and Animal Food (*30,31*).
- Standards for the Growing, Harvesting, Packing, and Holding of Produce for Human Consumption (*32,33*).
- Accredited Third-Party Certification (*34,35*).

FDA has also implemented a Voluntary Qualified Importer Program (*36*). It is a fee-based, voluntary program that provides importers meeting specified criteria with expedited review and import entry of human and animal foods. In addition to rules, FDA has issued multiple guidance documents regarding implementation of FSMA and its rules. The FDA website (https://www.fda.gov/Food/GuidanceRegulation/FSMA/default.htm) provides details about the law, rules and updates on the status of FSMA implementation.

- **FDA Food Code**
  Although the FDA Food Code is not a federal law or regulation, this model code may be adopted or adapted by states, tribes, and localities as the basis for their jurisdictions' food-safety rules for retail and food-service establishments (e.g., restaurants, grocery stores, institutions) (*37*). The Food Code assists jurisdictions in updating their rules to be consistent with federal food-safety policy, although each jurisdiction undergoes its own rulemaking process to adapt the code to fit the jurisdiction's legal framework. Currently, FDA revises the Food Code every 4 years.

- **USDA, FSIS**
  FSIS has the legal authority to regulate meat, poultry, and egg products on the basis of the following statutes:
  - Federal Meat Inspection Act (*38*).
  - Poultry Products Inspection Act (*39*).
  - Egg Products Inspection Act (*40*).

  Each of these Acts is intended to protect the health and welfare of the consuming public by preventing the introduction of adulterated or misbranded meat, poultry, or egg products in interstate commerce. In addition, in states that do not have meat or poultry inspection programs "at least equal to" the federal programs, Federal Meat Inspection Act and Poultry Products Inspection Act provide for federal regulation and inspection of wholly intrastate operations and transactions to

AMERICAN OVERSIGHT

the same extent as if such operations and transactions were conducted in interstate or foreign commerce.

In carrying out its duties under these Acts, FSIS may pursue the following actions:

- Regulatory action for federally inspected facilities, such as retention of product, withholding actions, and notices of intended enforcement, suspension, or withdrawal;
- Civil action, such as an injunction to prevent future violations of the Acts (e.g., continued distribution of adulterated or misbranded products);
- Detention and seizure action to remove specific products from commerce;
- Criminal action against an individual or company that violates the Acts; or
- Voluntary compliance through notices of warning.

Specifically, in response to a foodborne illness outbreak, if a basis exists to conclude that a FSIS-regulated product contains a pathogen or is otherwise harmful to human health, and an outbreak investigation has identified a specific product, FSIS may recommend a product recall (*41*). A recall is a firm's action to remove a product from commerce to protect the public from consuming misbranded or adulterated products. Although it is a firm's decision to recall a product, FSIS coordinates with the firm to ensure it has properly identified and removed the recalled product from commerce by verifying the effectiveness of the firm's recall activities. FSIS also notifies the public about product recalls.

Alternatively, if after review of investigative findings, a basis exists for FSIS to conclude that a FSIS-regulated product contains a pathogen or is otherwise harmful to human health, but the investigation has not identified a product that can be recalled (e.g., no specific brand name of product identified), then FSIS may issue a public health alert (*41*).

Further, depending on the evidence collected, and how strongly human illness is linked to a FSIS-regulated product, FSIS may take actions other than recommending a product recall or issuing public health alert. These actions may include increasing or enhancing inspection activities; increasing the frequency of microbial testing; conducting a Public Health Risk Evaluation; performing an in-plant Food Safety Assessment; or taking any of the actions listed above, such as effecting a regulatory control action or detaining and/or seizing product (*41*).

- **USDA, Animal and Plant Inspection Service (APHIS)**
  APHIS is charged with protecting animal and plant resources from agriculture pests and diseases, including those that impact public health. APHIS operates under multiple statues, including
  - **Animal Health Protection Act.** This Act authorizes the prevention, detection, control, and elimination of diseases and pests in animals to protect animal health, public health and welfare, and economic and environmental concerns (*42*).
  - **Plant Protection Act.** This Act permits regulation to prevent the introduction or dissemination of plant pests in the United States, including certain biological control organisms (*43*).

- **EPA**
  EPA establishes the limits for pesticide residues in foods under the Food Quality Protection Act (*44*). EPA is also authorized to set standards for drinking water in the Safe Drinking Water Act (*45*).

AMERICAN OVERSIGHT

2.4.2 State public health, agriculture, and food and drug agencies each play a role in mitigating and preventing outbreaks of foodborne illness. Each agency operates under one or more specific statutory and regulatory authorities. How these roles and authorities are structured and the assignment of responsibilities between the state and its localities vary by state. Local health departments in general operate under two frameworks: independent home rule and delegated authority.

State and/or local agencies are authorized to undertake a range of actions to mitigate and prevent outbreaks, including

- Requiring changes in food preparation;
- Temporarily removing persons with infectious illnesses from the workplace;
- Embargoing, seizing, or destroying contaminated food or requiring removal of contaminated lots from retail stores;
- Closing food establishments representing an imminent public health threat; and
- Issuing press releases

These actions are taken through agency authority granted by statute and implemented through rules or through administrative orders. In issuing an administrative order closing a restaurant, for example, such an order should contain time limits for the closure and specify the conditions that would permit the restaurant to reopen. If necessary, agencies can seek enforcement of their administrative orders through the court.

2.5 Evolving Legal Issues

Even though reporting, surveillance, and mitigation of foodborne disease outbreaks is well established in state and federal law, issues continue to arise that demonstrate differences in state and federal law. Such issues further demonstrate the ongoing need for communication and collaboration among local, state, and federal officials who are united in the common goal of protecting the public's health.

2.5.1 Food sovereignty initiatives are based on the idea that people should have the ability to democratically control their own food and agriculture policies. For some groups, the concept is tied to reducing poverty and providing healthy food through ecologically sound and sustainable metrics. These groups also focus on strategies to resist and dismantle corporate food production and increase local food production and control. For other groups, deregulation is the primary focus of food sovereignty laws.

For example, Maine enacted a law in October 2017 authorizing municipalities to "adopt ordinances regarding local food systems and community self-governance that set forth provisions that apply exclusively to direct producer-to-consumer food exchanges and other traditional foodways" (*46*). The provisions essentially remove state oversight from certain food-production areas. The state, however, retains authority to implement and enforce rules related to the inspection of meat and poultry producers. This version of the statute took effect after USDA questioned whether the original version of the law would have enabled Maine to maintain its "at least equal to" status and continue to operate its

AMERICAN OVERSIGHT

meat and poultry inspection programs. The law also requires that anyone who "grows, produces, processes or prepares food or food products intended for any wholesale distribution or retail distribution outside of" a municipality to comply with state and federal food-safety laws, rules, and regulations (*46*).

2.5.2 While acknowledging the differing positions of the federal government and many states on the legality of marijuana use for medical and nonmedical purposes, food-safety concerns exist that are related to the incorporation of marijuana, hemp derivatives, and cannabidiol in food (edibles). States are continuing to work on the application of food-safety laws to the producers of such edibles. Some states subject those who produce edibles to state food worker restrictions and/or to local and state kitchen-related health and safety standards used for retail food establishments.

2.5.3 Cottage food laws collectively refer to state laws and regulations that allow for the sale, with restrictions, of certain foods produced in private homes. The foods eligible for sale typically are considered safe from bacterial contamination and do not require time or temperature safety measures for production and/or storage (*47*). Examples include baked goods, candies, condiments, preserves, and dry mixes. Cottage food laws are viewed as promoting economic opportunities for home- and farm-based food businesses, while providing some regulatory safeguards of these businesses. As of June 2018, 49 states and the District of Columbia have some type of cottage food law; New Jersey does not have such a law (*48,49*).

Although cottage food laws vary among states, these laws generally address the types of foods permitted to be sold, who can sell, limits on sales, and labeling licensing, permitting and/or inspection requirements (*50*). In many states efforts are ongoing to expand the permitted foods or alter restrictions on sales. Any move to change existing cottage food laws, either by expanding them or adding limitations, should be done so with food safety and the public's health in mind.

2.6 Public Health Investigations as the Basis for Further Action

The goal of a foodborne illness outbreak investigation is to identify and control the source of the outbreak. In the course of the investigation, officials may find issues that require the initiation of regulatory or administrative actions or even civil or criminal proceedings.

2.6.1 Data collected during a public health investigation can become the basis for further action by the health agency or other state and federal agencies. For example, if epidemiologic and laboratory data provide evidence linking illness to consumption of a particular food, an informational traceback investigation can result to identify the source of that food. Given the national and international scope of food production, the informational and regulatory traceback investigations might involve multiple state and federal regulatory agencies. Violations of federal or state law that are identified during a regulatory traceback investigation may lead to further action, such as seizure of the implicated foods or injunctive remedies.

Local and state agencies also can initiate administrative actions over persons or businesses that violate state or local regulations. For example, if a restaurant has repeated food handling or food storage violations, it may be subject to administrative hearings leading to suspension or revocation of its food-service license.

AMERICAN OVERSIGHT

2.6.2 If during an investigation it is suspected or confirmed that a foodborne illness outbreak was caused because of criminally negligent behavior, intentional contamination or bioterrorism, additional state criminal, antiterrorism, and emergency response laws will enhance or dictate the course of the outbreak investigation and response. If the outbreak is multistate, then federal response resources and laws apply, and local and state public health agencies must work closely with other state and federal agencies.

Joint investigations by public health, food, agriculture, and law enforcement agencies can be hindered by the different legal powers and investigatory practices each agency brings to such an event. For example, officials from public health agencies are authorized to collect and test samples to determine their public health threat, whereas law enforcement officials can consider samples subject to seizure as evidence. Public health, food, agriculture, and law enforcement officials all must conform to constitutional standards (e.g., Fourth and Fifth Amendments) about collection of evidence, especially in situations requiring a joint investigation. Laboratory specimens collected for regulatory purposes must be collected and submitted using procedures that ensure the chain-of-custody of the specimen is admissible in court (*51*). Chain-of-custody is a process that may be followed for evidence to be legally defensible and includes the following main elements: properly identifying the evidence, a neutral evidence collector, tamper-proofing and securing evidence at the collection site, and keeping physical control of the evidence.

Local and state officials, in collaboration with law enforcement agencies, should periodically assess the need for memoranda of understanding to clarify the roles of public health, food, agriculture, and law enforcement agencies in conducting joint investigations. Local and state officials who have roles in investigating foodborne illness outbreaks should understand and demonstrate competence in applying their legal authorities in conducting joint investigations. Resources for improving competency in joint investigations include CDC training curricula (*52*) and sample memoranda of understanding (*53*).

2.7 CIFOR Legal Preparedness Resources

CIFOR has created several resource documents to further assist local and state public health agencies in improving their legal preparedness to conduct surveillance for foodborne illness and respond to outbreaks within their jurisdictions and across multiple states and other jurisdictional boundaries. The CIFOR Law Project created the following three documents, each designed to address a discrete, but related, research need and audience.

- **Analysis of State Legal Authorities for Foodborne Disease Detection and Outbreak Response**. This document describes and analyzes the types of state legal authorities available to conduct foodborne illness surveillance and outbreak response activities. It highlights the patchwork of state laws and regulations across several topic areas—public health, communicable disease, food safety, food regulation, agriculture, environmental health, and general government authority—on which public health professionals and their legal counsel must rely to accomplish foodborne illness surveillance and outbreak response activities.
- **Practitioners' Handbook on Legal Authorities for Foodborne Disease Detection and Outbreak Response**. This document is a practical guide for public health professionals who perform key roles in foodborne illness surveillance and outbreak response. The handbook presents information and resources for practitioners charged with implementing their jurisdiction's legal authorities related to foodborne disease events. The handbook is a primer on the array of possible legal authorities (e.g.,

AMERICAN OVERSIGHT

communicable disease laws, food-safety laws) that might be available and provides practitioners with checklists for identifying relevant agency actors and laws within their jurisdictions.

- **Menu of Legal Options for Foodborne Disease Detection and Outbreak Response**. This document provides a menu of legal options for state public health officials and policy makers to consider when reviewing their jurisdiction's legal authorities to conduct foodborne illness surveillance and outbreak response actions. The menu includes legal provisions relevant to activities conducted during foodborne illness surveillance and outbreak response—outbreak detection, outbreak investigation, outbreak control, and outbreak documentation. It is intended to be a resource for states to use in filling gaps and clarifying or enhancing their legal authorities.

All the documents are available through the CIFOR website: https://cifor.us/products/law-project

DRAFT

AMERICAN OVERSIGHT

Chapter 3: Planning and Preparation: Building Teams

Chapter Summary Points

- This chapter describes the roles of the core outbreak investigation and control team members and major agencies and partners involved in foodborne illness outbreak response and highlights the resources, processes, and relationships that should be in place before an outbreak.
- Agency plans, training programs, and response partner working relationships must anticipate the need to rapidly expand and contract the scope and structure of investigation and control teams to address changing conditions.
- Key roles in outbreak detection and response include epidemiology, environmental health and public health, food testing, and regulatory laboratory practice.
- A core team should be involved in all outbreak investigation and control efforts, giving consistency to investigations, serving as the focal point for coordinating multidisciplinary and/or multiagency tasks, and enabling development of effective working relationships with external partners and advanced expertise among staff.

URLs in this chapter are valid as of August 7, 2019.

AMERICAN OVERSIGHT

3.0 Introduction

3.0.1 This chapter describes the roles of the core outbreak investigation and control team members, major agencies, and partners involved in foodborne illness outbreak response and highlights the resources, processes, and relationships that should be in place before an outbreak. Agencies must be prepared to mount and participate in effective single-agency and multiagency responses to incidents ranging from local to potentially national in scope. The authority to identify, investigate, and control foodborne illness outbreaks is shared across local, state, territorial, tribal, and federal government agencies. Each agency at every level of government has specific roles and responsibilities.

3.0.2 Agency plans, training programs, and response partner working relationships must anticipate the need to rapidly expand and contract the scope and structure of investigation and control teams to address changing conditions. All agencies should maintain standard procedures and all-hazards emergency operations plans identifying the mechanisms for conducting routine and nonroutine investigations and responses. This chapter promotes practices that have been helpful in developing effective multidisciplinary foodborne illness investigation and control teams and provides links to related topics. These Guidelines contain detailed information about outbreak investigation and response. All responsible agencies should regularly work with their attorneys to anticipate legal issues that can arise during foodborne illness outbreak investigation and control. (See Chapter 2 for details about legal preparedness and the CIFOR law project that provides additional tools to help agencies and jurisdictions improve legal preparedness.)

3.1 Roles

3.1.1 Key roles in outbreak detection and response include epidemiology, environmental health, and laboratory. These roles are distributed across the multiple entities—more than 3,000 local health departments, more than 50 state and territorial health departments, other state agencies, tribal organizations, and several federal agencies—that interact in a complex system to detect and respond to enteric and other human and animal foodborne illnesses. These roles include conducting surveillance to detect outbreaks through complaint-based, pathogen-specific, or other forms of surveillance (Chapter 4) and rapidly conducting outbreak investigation activities to identify the mode of transmission and vehicle (Chapter 5) and determine the potential for ongoing transmission and need for control procedures (Table 5.1 in Chapter 5; Chapter 6).

3.1.2 Agencies' roles, responsibilities, and resources influence outbreak responses. The nature of the outbreak, including the type of pathogen or contaminant, severity of illness, suspected or implicated vehicle, number and location of affected persons, geographic jurisdictions involved, and local and state food safety rules and laws (Chapter 2) determine the individuals, disciplines (further discussed in section 3.2), and types of agencies that need to be involved. (Table 7.3 in Chapter 7 provides detailed information about multijurisdictional outbreak identification methods and required notification steps, by agency level).

Each agency's response plan should include its likely role in a foodborne illness outbreak investigation,

AMERICAN OVERSIGHT

staff (or positions) that may be involved, contact information for relevant external agencies, and communication and escalation procedures for working with those agencies.

3.1.3 Local and state (Table 3.1) and federal (Table 3.2) levels, other important cross-agency programs (Table 3.3), and nongovernment, industry and academic partners (Table 3.4) contribute to foodborne illness investigation and outbreak response.

For local and state agencies, responsibilities vary depending on a state's organizational, legal, and regulatory structure; the distribution of responsibilities across different types of local and state agencies; and the size and capacity of the local agencies. Responsibilities for federal agencies follow regulatory jurisdictions for Food and Drug Administration (FDA) and the U.S. Department of Agriculture's (USDA's) Food Safety Inspection Service (FSIS), and public health surveillance and disease control mandates for the Centers for Disease Control and Prevention (CDC).

In addition to these primary federal agencies, several other federal jurisdictions may be relevant to outbreak investigations. The National Park Service may have exclusive or shared jurisdiction with state and local agencies depending on legislation designating the specific park. Local and state agencies whose jurisdiction contains or adjoins a national park should establish relationships with the National Park Service Office of Public Health. On many other types of federal lands, state laws apply, but federal agencies may have overlapping responsibilities. The Department of Defense has autonomous authority over U.S. military bases, facilities (including food production, food service, and healthcare facilities), and vehicles.

Indigenous tribes have complete sovereignty and are completely autonomous. Investigations on tribal land may be conducted by tribal health staff, Indian Health Service staff, or state or local health agencies, but nontribal entities can become involved in an investigation only at the tribe's request. Memoranda of understanding may establish lines of communication and reciprocal support during public health emergencies.

Law enforcement agencies at multiple levels will become involved in an investigation if intentional contamination of food or other criminal activity is suspected. Agencies responsible for controlling foodborne illness outbreaks should establish relationships and communication pathways with law enforcement agencies before any outbreak.

AMERICAN OVERSIGHT

Table 3.1. Examples of Typical Foodborne Outbreak Investigation Roles, Responsibilities, and Contributions of Local and State Agencies*

Agency	Roles, Responsibilities, and Contributions
Local health agencies and laboratories	Responsible for local policies to protect public health: ● Maintain communication and working networks with local populations and community businesses, healthcare providers and community organizations, and other local resources. ● Regulate and inspect food service establishments and educate food workers about food safety. ● Conduct complaint-based, pathogen-specific, and other forms of surveillance to identify local outbreaks. ● Investigate and control potential foodborne illnesses using local authorities, policies, and resources. ● Manage local public risk communication during foodborne outbreaks. ● Coordinate investigation and communication activities with other agencies and response partners during multijurisdictional outbreaks. ● Conduct after-action reviews to improve investigation effectiveness and prevent future outbreaks from the same causes.
State health department and laboratories	Responsible for statewide public health protection: • Conduct statewide pathogen-specific surveillance; some states may also coordinate statewide complaint-based surveillance. • Provide technical assistance and surge capacity for local and state response partner agencies as needed; conduct investigations in local areas without local health agency jurisdiction. • Conduct and coordinate statewide or multijurisdictional investigations of outbreaks of human illness, including foodborne illness outbreaks. • Manage statewide public risk communication during foodborne illness outbreaks. • Serve as liaison with nongovernment response partners and stakeholders, including healthcare providers and food industry representatives. • Provide legal support for outbreak investigation and control activities. • Conduct after-action reviews to improve investigation effectiveness and prevent future outbreaks from the same causes.
State food safety regulatory authorities and laboratories†	Responsible for statewide policies to protect food safety: ● Conduct routine regulatory inspections and activities for food establishments under their jurisdiction. ● Maintain 1) knowledge of food industry practices in their jurisdiction and 2) working relationships with food industry managers, associations, and technical experts. ● Conduct investigations of food producers, food establishments, and food supply chains within their jurisdiction, including product tracing investigations (traceback, traceforward), environmental health assessments, sampling, and implementation of regulatory control measures. ● Provide technical assistance and surge capacity for local and state response partner agencies as needed. ● Coordinate response actions with local, state, and national food supply stakeholders and response partners, including law enforcement for instances of suspected intentional contamination. ● Conduct after-action reviews to improve investigation effectiveness and prevent future outbreaks from the same causes.

*The three core disciplines involved in foodborne outbreaks—epidemiology, environmental health/food regulatory program, and laboratory—may be housed in the same agency at the state or local level.
†Agencies with different names (e.g., Department of Agriculture, Health, or Environmental Health) may carry out these roles.

AMERICAN OVERSIGHT

Table 3.2. Examples of Typical Foodborne Illness Outbreak Investigation Roles, Responsibilities, and Contributions of Primary Federal Agencies

Agency	Roles, Responsibilities, and Contributions
U.S. Food and Drug Administration (FDA, DHHS)	Responsible for investigation and regulation of most foods moving in interstate commerce (except products regulated by the U.S. Department of Agriculture [USDA] Food Safety and Inspection Service [FSIS]) (Appendix __.__): ● Perform regulatory activities, including facility registration, routine risk-based inspections, limited food supply surveillance testing, and compliance and enforcement. ● Publish voluntary regulatory food safety standards for food service and retail food establishments (the model FDA Food Code) (*1*). ● Coordinate and collaborate with international food regulatory agencies, and support capacity building and training in product-related aspects of investigation and laboratory methods pertaining to foods that FDA regulates. ● Conduct outbreak investigations: The Coordinated Outbreak Response and Evaluation network (CORE) (*2*) for investigations of human illness potentially linked to human food, the Center for Veterinary Medicine for human illness potentially linked to animal food or feed, and the Office of Emergency Operations. ● Coordinate with states on informational product tracing for use as part of exposure assessments in epidemiologic studies potentially linked to FDA-regulated products. ● Conduct investigations and environmental health assessments of food establishments under their jurisdiction in coordination with other government partner agencies. ● Conduct laboratory testing of product(s) obtained from commerce, consumer homes, or production. ● Coordinate communication with states and with other federal agencies, particularly CDC, during foodborne outbreak investigations. ● Implement short- and long-term control measures and follow-up activities as needed to protect public health consistent with regulatory authorities. ● Conduct after-action reviews
FSIS, USDA	Responsible for ensuring that meat, poultry, and processed egg products are safe, wholesome, and accurately labeled: ● Perform inspection and regulatory activities to ensure industry compliance with applicable laws, pathogen reduction and hazard analysis and critical control point system regulations and other regulations, robust food supply surveillance testing, and compliance and enforcement. ● Perform scientific and technical assessments of known and emergent hazards, including quantitative microbial risk assessments. ● Conduct outbreak investigations: In-establishment inspectors at FSIS-regulated establishments with operational knowledge of industry food safety systems (Office of Field Operations); In-commerce field investigators with expertise in sample collection and informational traceback (Office of Investigation, Enforcement, and Audit); and public health science personnel with expertise in performing epidemiologic and environmental assessments (Office of Public Health Science). ● Perform informational traceback for use as part of exposure assessments in epidemiologic studies potentially linked to FSIS-regulated products, coordinating with states, where possible. ● Conduct investigations and environmental assessments of FSIS-regulated establishments and in-commerce facilities in coordination with other government partner agencies. ● Conduct laboratory testing of product(s) collected from commerce, consumer

AMERICAN OVERSIGHT

	homes, or production. ● Assess testing results from non-FSIS laboratories to determine whether they can be used to support FSIS outbreak response. ● Coordinate communication and exchange information with states and other federal agencies, particularly CDC, during foodborne outbreak investigations. ● Implement short- and long-term control measures and follow up activities as needed to protect public health consistent with regulatory authorities. ● Conduct after-action reviews.
CDC, DHHS	Responsible for conducting or coordinating surveillance for human illnesses caused by pathogens commonly transmitted through food and for outbreaks of foodborne illnesses of any cause: ● Lead and support national surveillance, communication and disease investigation networks, including National Notifiable Disease Surveillance System (NNDSS), Foodborne Diseases Active Surveillance Network (FoodNet), The National Molecular Subtyping Network for Foodborne Disease Surveillance (PulseNet), NEARS National Environmental Assessment Reporting System, Foodborne Disease Outbreak Surveillance System (FDOSS), National Outbreak Reporting System (NORS), Foodborne Disease Centers for Outbreak Response Enhancement (FoodCORE), the Integrated Food Safety Centers of Excellence (COE), Norovirus Laboratory Surveillance Network (CaliciNet), and Norovirus Sentinel Testing and Tracking (NoroSTAT). ● Develop and implement better tools for collecting and analyzing public health surveillance and outbreak-associated information. ● Improve and standardize laboratory testing methods of clinical specimens for foodborne illness pathogens, including resources to develop new testing methods. ● Provide training in epidemiologic and environmental health investigation and laboratory methods related to human enteric disease surveillance as mandated by the Food Safety Modernization Act (*3*) through the Centers of Excellence and under other longstanding CDC roles. ● Conduct outbreak investigations: o Provide clinical, epidemiologic, and laboratory expertise in pathogens of public health importance; epidemiologic and environmental health expertise to assist with cluster evaluation and outbreak investigations; expertise in water systems and large-volume water sample collection. o Provide leadership, coordination, logistical support, surge capacity, and centralized data collection and analysis for multistate outbreaks. o Coordinate communication with collaborating state and local agencies, other federal agencies, and international partners. o Provide advanced laboratory testing of clinical specimens (and occasionally consumer-held food products), including identification of new or rare disease agents. ● Lead after-action review of human health investigation component of multistate outbreak investigations.

AMERICAN OVERSIGHT

Table 3.3. Examples of Typical Foodborne Outbreak Investigation Roles, Responsibilities, and Contributions of Cross-Agency Programs

Program	Roles, Responsibilities, Resources, and Contribution
Rapid Response Teams (RRT)	Responsible for implementing partnership between the Food and Drug Administration (FDA) and state programs to build food safety infrastructure and integrated rapid response for all-hazards human and animal food emergencies: ● Maintain and promote RRT Best Practices Manual (*4*) ○ Food outbreak and all-hazard human and animal food emergency response procedures, specific disease agents, epidemiologic and environmental outbreak investigation, informational traceback and implicated product traceforward. ○ Collection of environmental and food samples for chemical, radiologic, physical, and microbial contaminant analysis. ● Provide training in outbreak response methods for local health agencies. ● Conduct outbreak investigations. The RRT serves as the Outbreak Investigation and Control Team for multijurisdictional and state-level outbreaks: ○ Lead, assist, and support investigations conducting facility inspections; informational traceback investigations; and food recalls that involve food products (manufactured, commercially produced, and retail) through consultation with health department investigators, federal food safety agency partners, and food industry firms. ○ Initiate chain-of-custody, quality assurance, and safety procedures when collecting and submitting food samples to support regulatory response.
Food Emergency Response Network	Responsible for prevention, preparedness, response, and recovery activities (*5*): ● Maintain an integrated network of local, state, and federal laboratories across the United States that are capable of rapid response to food-related emergencies and attacks on the U.S. food supply. ● Detect and identify biological, chemical, and radiologic agents in food, and provide food testing surge capacity during national emergencies.

AMERICAN OVERSIGHT

Table 3.4. Examples of Typical Foodborne Outbreak Investigation Roles, Responsibilities, and Contributions of Nongovernment, Industry, and Academic Partners

Partner	Roles, Responsibilities, and Contributions

Healthcare Providers	Responsible for appropriate testing, provision of patient care, and reporting of required illnesses and conditions:
	● Maintain supplies (specimen collection kits) and trained staff to support outbreak investigations.
	● Speed detection, investigation, and control of foodborne illness outbreaks by
	  ○ Gathering of preliminary exposure and clinical history.
	  ○ Early recognition and reporting of possible outbreaks.
	  ○ Timely collection and submission of appropriate specimens for testing.
	  ○ Application of infection control measures.
	● Provide appropriate patient education and information to prevent further spread of disease.

Industry*	Responsible for maintaining the safety of food offered to the public:
	● Firm Level: A specific point of sale, distributor, manufacturer, processor, or farm that is directly impacted by an ongoing outbreak investigation.
	  ○ Have detailed knowledge about the firm's processes and organizational culture that are key to understanding possible
	  ▪ Point(s) of contamination.
	  ▪ Contributing factors.
	  ▪ Underlying environmental root cause(s) (i.e., antecedent[s], underlying reason[s]) that lead to outbreaks.
	  ○ Communicate with employees, suppliers, government agencies, and customers during outbreaks.
	  ○ Implement control measures that can stop the current outbreak and prevent reoccurrence.
	  ▪ Firm level controls, e.g., employee restrictions/exclusion, food process changes.
	  ▪ In-distribution controls: cease distribution and initiate recalls
	  See CIFOR Industry Guidelines for further details relevant to the food service and retail food sectors (https://cifor.us/products/industry).
	● Commodity-Specific and Regional Levels: Groups and associations focused on a specific commodity or product
	  ○ Can provide expertise on how the commodities or products are grown, processed, manufactured, packed, distributed, and served.
	  ○ Discussions with this level of industry can help investigators better understand how to investigate contamination issues.
	  ○ Have preexisting networks that can be used to
	  ▪ Gather and provide information needed during the investigation.
	  ▪ Communicate the findings of outbreak investigations to relevant individuals and entities.
	  ▪ Build consensus regarding changes needed to protect public health and consumer confidence in their products.
	● National Level**:** Groups and associations that represent many food-related entities at the national level:
	  ○ Can provide expertise on how a range of food products are grown, processed, manufactured, packed, distributed, and served.
	  ○ Ongoing collaboration and partnership with these groups is important for changes to laws, regulations, policies, and initiatives that impact industries nationally.

Academic centers	Responsible for providing technical assistance, training, and specialized laboratory support:

AMERICAN OVERSIGHT

- Publish research results to help inform future outbreak investigations and implement control measures (e.g., NoroCORE) (*6*).
- Conduct special laboratory analyses or provide additional resources.
- Conduct applied food safety research to expand results of investigations.

*Partnerships with individuals and entities at each level should be well-established, and discussions should be ongoing, not occur just during an outbreak crisis.

3.2 Outbreak Investigation and Control Team

The responsibility for investigating foodborne illness outbreaks and implementing control measures rests on a team of people who each contribute different knowledge and skills. Depending on the size and scope of the investigation, the size of the team varies from a few people to hundreds. In smaller investigations, individuals may fulfill multiple roles concurrently. Regardless of the size or complexity of an individual investigation, investigation and control teams must be able to synthesize information from a variety of sources as they investigate individual cases, clusters, and outbreaks.

Job titles alone might not accurately indicate who does what. Team members' assigned tasks and their knowledge and skills define their roles. Members may come from different programs within an agency or from different agencies. Composition of the outbreak investigation and control team varies depending on the specifics of the outbreak. In many investigations, roles are defined relatively informally and may change as the investigation unfolds. In other investigations, roles are mapped to the formal structure of the National Incident Management System, which government agencies and Rapid Response Teams use (see Section 7.2.3 for specifics about the National Incident Management System and Incident Command System [ICS]) (*7*). The composition of core outbreak investigation and control team should be determined before any outbreaks.

3.2.1 A core team should be involved in all outbreak investigation and control efforts, giving consistency to investigations, serving as the focal point for coordinating multidisciplinary and/or multiagency tasks, and enabling development of effective working relationships with external partners and advanced expertise among staff. The approach for structuring an investigation and control team will not look the same for all agencies. In small agencies with limited outbreaks, this might be accomplished by designating a few people who receive outbreak response training. In large agencies responding to more frequent and/or complex outbreaks, this might be a dedicated outbreak response team of epidemiologists, environmental health specialist, environmental scientists, and laboratorians who train and work together.

- *Team leader*: Sets and enforces priorities; coordinates all activities associated with the investigation; serves as the point of contact about the investigation; coordinates content of messages to the public through the public information officer; communicates with other organizations involved in the investigation; communicates recommended course of action determined by team to agency decision-makers.
- *Epidemiologist*: Identifies and interviews case-patients; develops hypotheses and strategies to test them; plans epidemiologic studies; re-interviews case-patients and healthy controls; provides insights and guidance to environmental health specialists (and federal regulatory

AMERICAN OVERSIGHT

partners) on cases and clusters for informational traceback, collects and analyzes investigation data using statistical analyses or collaborating with a statistician; reports results; collects clinical specimens; coordinates testing of clinical specimens and environmental samples; consults and coordinates with environmental and laboratory investigators.

- *Environmental health specialist*: Investigates food preparation sites across the food chain; reviews food inventory and food distribution records for informational traceback investigations in epidemiologic studies; collects environmental and food samples, maintaining chain-of-custody and coordinates testing with laboratorian; interviews food workers and managers; reviews food preparation and food handling records; observes and maps food flow, reviews firm's inspectional and enforcement records for prior food safety history; conducts environmental health assessments to determine contributing factors and environmental root causes (i.e., antecedent[s], underlying reason[s]).
- *Laboratorian*: Analyzes clinical specimens, food and environmental samples (depending on the state, the food and environmental samples may be tested in different laboratories than the clinical specimens); interprets test results and suggests follow-up testing; reports results; coordinates testing among laboratories; advises other team members about sampling requirements and testing, including collection, handling, storage, and transport of specimens; communicates laboratory testing methods and results and the maintenance of chain-of-custody to FSIS and FDA investigators or other food regulatory agency gathering evidence of food product adulteration.
- *Public information officer*: Develops general and specific messages for the public through the media; responds to media inquiries or identifies the appropriate spokesperson; coordinates communication with multiple agencies; disseminates information about outbreak status and overall policies, goals, and objectives to widespread and diverse audiences that include the executive and legislative branches of the government; local governments; the general public; and the local, state, and national news media.

Additional team members with other expertise may be needed, depending on the unique characteristics of the illness or outbreak.

3.2.2 Team members should have the expertise and training needed to competently fulfill assigned responsibilities and tasks for the types of outbreaks they will be expected to investigate and control. They should understand the roles of the other team members, be able to recognize when an outbreak response exceeds agency resources, and know how to expand the investigation team and request additional resources when needed. Training and procedures should anticipate and address how response team members will manage increased coordination and communication workloads when outbreak investigations rapidly escalate. Ongoing training is critical for all members of the outbreak investigation and control team to ensure they are proficient at performing their assigned duties.

At a minimum, the outbreak investigation and control team should have training in specific protocols for routinely assigned tasks. The training should include continuing education to maintain and improve skills within their specialty and specific training in the agency's outbreak response protocols and the member's role on the team.

For a smaller agency with a limited number of outbreak investigations, special training opportunities

AMERICAN OVERSIGHT

should be arranged. Consider the use of webinar technology where little or no opportunity exists for travel. The CDC-supported Integrated Food Safety Centers of Excellence have approximately 150 tools and training courses available online at no charge.

- Ensure all team members have a common understanding of the primary goal for outbreak response, which is to implement control measures as quickly as possible to prevent additional illness.
- Provide team members with continuing education and training opportunities, including cross-training/joint training.
- Conduct regional training with multiple agencies, including tabletop exercises. Such training can help identify problems that might arise during a multijurisdictional outbreak.
- Offer just-in-time training to refresh the knowledge and skills of staff who do not routinely perform assigned tasks.
- Identify opportunities to collaborate with representatives of the food industry in training exercises, to foster understanding and develop communication strategies that can help streamline actual outbreak investigations.
- Use outbreak investigations as training opportunities to develop individual and organizational skills.

3.3 Planning to Rapidly Expand and Contract Investigation and Control Team Structure

Agency plans must anticipate the need to rapidly expand and contract the size and structure of investigation and control teams to address changing conditions, including to participate in multiagency investigation and control teams (Chapter 7).

3.3.1 The following practices can be used to scale up (escalate) and down (de-escalate) investigation and control teams to meet the often rapidly changing needs of an outbreak response.

- Ensure foodborne outbreak investigation team plans and procedures are updated regularly.
- Determine jurisdiction; investigations may require management in multiple jurisdictions.
- Identify criteria (triggers) used to indicate when the needs of investigation and control teams exceed agency resources, such as
    - Size of the outbreak.
    - Likelihood that resources will be exceeded.
    - New or rapidly emerging incident.
    - Long duration of incident.
- Identify resources that can be tapped for surge, and develop relationships and plans to facilitate quick access to these resources should the need arise. For example:
    - Cross-train persons from within the agency or from other organizations—such as other branches of government, university students, volunteers (e.g., Medical Reserve Corps)—who have adequate skills or knowledge and would be willing to help conduct interviews or provide other support during a large-scale outbreak.
    - Establish Memorandums of Understanding, Mutual Aid, or other agreements along with plans, procedures, communication strategies, and protocols before a foodborne illness outbreak.

AMERICAN OVERSIGHT

- Consider using ICS principles and organizational structures, as appropriate, to manage outbreak responses—especially those that cannot effectively be managed using the agency's standard operating procedures and chain of command.

3.3.2 Agencies involved in foodborne illness outbreak investigation and response should decide in advance whether and how to apply an ICS and, if applicable, incorporate the ICS into their response planning. Such planning should be coordinated with all other agencies that may be drawn into the investigation and response over time. Many foodborne illness outbreak investigations do not require formal activation of ICS, but outbreak investigation and control teams will benefit from training in ICS principles and methods (Chapter 7).

3.4 Response Resources

A critical aspect of preparing to investigate a foodborne illness outbreak is assembling the necessary resources; supplies, equipment, people, and outbreak investigation–related documents (some accessible via reference materials or pertinent databases) to ensure that everything needed in the investigation and response is quickly available. This enables the outbreak investigation and control team to move rapidly into the field.

3.4.1 Identify staff to support the Outbreak Investigation Team.

- *Administrative staff*: Support personnel to make phone calls, answer incoming calls from concerned members of the public, assist in travel arrangements and other logistics, enter data into a database, copy paperwork, and other administrative work.
- *Executive and financial staff*: Executive staff to guide response priorities and objectives, facilitate communication and role changes, and financial staff to release funds, track expenditures, and assist in procurement of supplies and equipment.
- *Legal counsel*

3.4.2 Develop field investigation or "go" kits for environmental health investigators, including sampling utensils, thermometers, fecal collection kits, and appropriate forms (Box 3.1.). Ensure that relevant field investigators have access to these kits and are aware of where they are located and that the kits are available at all times. Foodborne illness outbreak investigation kits should be maintained in ready-to-use condition, with sterile sampling supplies, containers and implements. Establish, maintain, and review or verify inventory regularly. (Detailed information about kits and sample lists are included at the CIFOR Clearinghouse, https://www.cifor.us/clearinghouse and in the International Association for Food Protection *Procedures to Investigate Foodborne Illness* (http://www.foodprotection.org/publications/other-publications/). Procedures for routinely reviewing and replacing missing or outdated supplies and equipment should be part of an agency's outbreak response protocol.

AMERICAN OVERSIGHT

Box 3.1. Example Supplies for Outbreak Investigation Go-Kits

Personal protective equipment to ensure safety and aseptic sampling techniques.

Sterile and wrapped sample-collection supplies (e.g., gloves, spoons, scoops, tongue-depressor blades, spatulas, spongesticks, swabs, knives).

Sterile sample containers (e.g., plastic bags, wide-mouth plastic and glass jars with screw caps, bottles, sterile sampling bags) and mailing instructions.

Sterile fecal sample kits for food workers or case-patients.

Sterilizing and sanitizing agents (e.g., 95% ethyl alcohol, sodium or calcium hypochlorite, alcohol swabs), hand sanitizers, and sanitizer test strips.

Equipment to determine food characteristics (e.g., pH, water activity, sugar content).

Temperature-checking probes and backups.

Refrigerants (e.g., ice packs), insulated containers.

Labeling and sealing equipment (e.g., fine-point or felt-tip permanent marking pen, roll of adhesive or masking tape, waterproof labels or tags, custody tape).

Shipping boxes/coolers, prepaid shipping labels, and forms.

Forms, including sample collection and blank laboratory submission forms, chain-of-custody and other forms for documenting activities.

Camera or other method to visually document the investigation.

Trash bags for the waste generated during the investigation (always take your trash with you).

In addition to the sampling supplies, ensure that staff have access to radios and other team communication devices appropriate to the response situation, including

- Capabilities and equipment for conference calls.
- Multiple phone lines.
- Computers, laptops, software (e.g., data entry, statistical), extension cords, multioutlet power strip surge protector, portable printers, paper, graph paper, pens, clipboards, camera.

3.4.3 Make sure investigation and control team members have access to necessary documents and forms and be trained to use them appropriately in a response situation. These include

- Chain-of-custody forms.
- Foodborne illness complaint worksheets.
- Blank disease-specific case report forms.
- Laboratory test requisition forms.
- Standardized outbreak questionnaires (available at https://www.cdc.gov/foodsafety/outbreaks/surveillance-reporting/investigation-toolkit.html).
- Environmental health assessment forms, such as hand hygiene assessment (examples available at https://www.cdc.gov/nceh/ehs/EHSNet).

AMERICAN OVERSIGHT

- Shipping protocols, forms and required prepaid labels

These and other sample documents are available from the CIFOR Clearinghouse at https://cifor.us/clearinghouse.

3.4.4 Team members must have access and are trained (if applicable) to use key databases, communication platforms, and other resources before an outbreak. Although not exhaustive, the following databases, listservs, and other systems are recommended:

- CDC Foodborne Outbreak listserv.
- PulseNet SharePoint website.
- SEDRIC.
- NCBI Pipeline.

3.4.5 Assemble a reference library (including online resources) with information about foodborne illnesses, enteric illnesses, and control measures. Where possible, include electronic resources that can be accessed by laptop computers or mobile devices during field investigations. Regularly review and update the contents of this reference library.

- Books, Web resources for support during outbreak (e.g., CDC's Diseases and Conditions A–Z index, FDA's Bad Bug Book).
- Latest version of the American Public Health Association's *Control of Communicable Diseases Manual* (*8*).
- *Procedures to Investigate Foodborne Illness* by the International Association for Food Protection (*9*).
- *Investigating Foodborne Disease Outbreaks* by the World Health Organization (*10*).
- FDA's *Investigations Operations Manual* (*11*).
- FSIS online resources
  - Template for Including FSIS in Foodborne Illness Outbreak Response Procedures: www.fsis.usda.gov/OutbreakProcedures.
  - Information Helpful to FSIS During Foodborne Illness Investigations: www.fsis.usda.gov/InvestigationInfo.
  - Resources for Public Health Partners: Foodborne Illness Investigation: www.fsis.usda.gov/PHPartners.
- Integrated Food Safety Centers of Excellence all products website: https://coefoodsafetytools.org/AllCoEProducts.aspx.
- CIFOR Guidelines: https://cifor.us/products/guidelines.

3.5 Communication Plans

Good communication is one of the most important factors in successful outbreak investigation and control. At all points in the outbreak continuum—from detection through investigation and response to debriefing—communication is critical. Without it, investigations and responses can be delayed, uncoordinated, and ineffective. Furthermore, good communication can help allay agency management and public concerns and improve industry support for actions to control outbreaks. To promote better outcomes, use the time before and between outbreaks to lay the groundwork for communication, such as developing and updating contact lists, defining communication processes, establishing relationships

AMERICAN OVERSIGHT

with key persons internal and external to the agency, and determining how confidential information will be stored, and whether and how it can be shared.

Although the following practices for communication are all recommended, full implementation may not be possible in some jurisdictions because of resource limitation. Implementing as many as possible as completely as possible will improve communication.

3.5.1 Prepare a list of people in the agency who should be contacted in the event of an outbreak, including backups, and contact people in external agencies (adjacent local, territorial, state, tribal, and federal agencies). Ensure the list includes after-hours and weekend contact information, and update it regularly.

Assemble a contact list of resource persons who have expertise in specific disease agents and investigation methods with primary phone numbers and alternates, cell phone numbers, 24-hour numbers, home phone numbers, email, fax numbers, and addresses) of

- Core members of the outbreak investigation and control team.
- Other officials inside the agency, such as the chief of the epidemiology unit, director of the public health laboratory, director of environmental health, public health information officer, and the agency director.
- Critical contacts in other government agencies.
- Important food industry contacts, including trade associations (e.g., National Restaurant Association).
- Key healthcare provider contacts.
- Laboratory contacts.
- Primary media contacts.

3.5.2 Define a formal communication process for the outbreak investigation and control team to use during outbreaks. Anticipate what information and data response partners and agency leadership need, and at what frequency, to maintain situational awareness and guide decision-making about investigation and control measures. Options include daily meetings, daily phone calls, and email updates. Developing a consistent approach to internal communications during an outbreak helps everyone on the team know what to expect.

- Identify the persons responsible for communication on behalf of their organizational unit (epidemiology, environmental health, laboratory) and for the outbreak investigation and control team. Communicators must be brought in early as the outbreak develops for a more efficient response.
- Determine how nonpublic information will be saved and whether and how it can be shared. Local and state agencies can receive certain types of confidential information from FDA under a 20.88 information sharing agreement (*12,13*) (Chapter 7.3).
- Distribute a list of the agency's contacts to other agencies, and obtain their contacts.
- Establish processes for participating in multiagency, multijurisdictional conference calls, and train staff in appropriate conference call etiquette.
- Establish procedures for coordinating communication with the following entities to provide consistent messaging and accurate information flow:
    - Local, state, and federal authorities.
    - Local organizations, food industry, and other professional groups (including healthcare

AMERICAN OVERSIGHT

providers).
    - The public.
    - The media.
- Create templates for communications with the public (e.g., press releases, fact sheets), focusing on the most common foodborne illnesses. Sample materials are available at the CIFOR Clearinghouse (https://www.cifor.us/clearinghouse).
- Create and test online tools to communicate with the public (e.g., blast emails, surveys, social media).
- Guide staff on how to respond to and communicate during conflict situations, such as with upset food service workers, food protection managers, and members of the public.
- Identify people with clinical training, such as public health nurses or medical epidemiologists, to communicate with case-patients about the outbreak and actions they should take to protect their health and their family's health.
- Identify a person from an agency to talk to the media, ideally someone trained in media relations or a public information officer. Establish procedures for coordinating communication with the media to provide consistent messaging and accurate information flow.

3.6 Planning for Recovery and Follow-Up

Part of preparing for outbreak response is planning for the recovery and follow-up stages. This planning helps ensure appropriate actions are taken after each outbreak and helps identify and correct problems to prevent future outbreaks from the same causes. Establish a process to conduct hot-washes so participants can provide feedback. Create after-action reports that identify lessons learned and action items for follow-up, including ways to improve. Report the root cause(s) of the outbreak and other key investigation findings to national foodborne outbreak and response databases, such as the National Outbreak Reporting System and the National Environmental Assessment. Reporting System (Chapter 6).

AMERICAN OVERSIGHT

Chapter 4: Foodborne Illness Surveillance and Outbreak Detection

Chapter Summary Points

- Two general methods are used to detect most outbreaks: pathogen-specific surveillance and complaint systems.
- Recent technology changes have altered foodborne illness surveillance, including culture-independent diagnostic testing (CIDT) and whole-genome sequencing (WGS).
  - Molecular multitarget CIDTs that can detect up to 22 pathogens in an hour are replacing enteric pathogen culture in many clinical laboratories, shifting the burden of isolating bacteria for subtype and other characterization to public health laboratories.
  - WGS offers major improvements over traditional subtyping methods but currently takes longer than pulsed-field gel electrophoresis to complete, leading to potential delays in identification of clusters.
- The usefulness of consumer complaint systems to identify outbreaks is based either on 1) the ability of groups with a common exposure to self-identify illness and link it to the exposure or 2) the ability of the complaint system to independently link multiple independent complaints to a common source.
  - To complement the review of individual complaints and patterns of complaints detected through the foodborne illness complaint system, communicable disease surveillance staff should conduct standard interviews for foodborne illness detected through pathogen-specific surveillance (e.g., *Salmonella* and Shiga toxin–producing *Escherichia coli*).
  - Regardless of who receives the complaint or how the complaint is received (phone, online), the complaint should be evaluated for the likelihood of a foodborne illness or outbreak associated with the establishment that is the subject of the complainant or other establishments identified in the food history.

URLs in this chapter are valid as of August 13, 2019.

AMERICAN OVERSIGHT

4.0 Introduction

4.0.1 Foodborne illness surveillance identifies clusters of illness that may be caused by a common food source. This chapter reviews major features, strengths, and limitations of surveillance methods and provides recommendations for increasing the effectiveness of each. In practice, detecting individual foodborne illness outbreaks involves multiple approaches. However, in general, two methods are used to detect most outbreaks: pathogen-specific surveillance and complaint systems (Table 4.1). A third method, syndromic surveillance, is used in some jurisdictions, but its role in detecting foodborne illness outbreaks is limited.

- **Pathogen-specific surveillance:** Healthcare providers and laboratorians report individual cases of illness when selected pathogens, such as *Salmonella enterica* and *Escherichia coli* O157:H7, or specific clinical syndromes, such as hemolytic uremic syndrome and botulism, are identified. Public health professionals gather exposure information through interviews with case-patients.
- **Complaint systems:** Healthcare providers or the public identify and report suspected illness clusters (group notifications) or individual complaints. Exposure information is acquired by interviews with ill people.
- **Syndromic surveillance:** This surveillance method generally involves systematic (usually automated) gathering of data on nonspecific health indicators that might reflect increases in illness, such as purchase of loperamide (an antidiarrheal agent), visits to emergency departments for diarrheal complaints, or calls to poison control hotlines. Exposure information is not routinely collected.

Although these methods are presented separately for descriptive purposes, they are most effective when used together and integrated with food, veterinary, and environmental monitoring programs (Chapters 4 and 5). The range of possible food vehicles detectable through foodborne illness surveillance includes all food or other substances contaminated at any link in the chain from production to ingestion. Foodborne illness surveillance complements regulatory and commercial monitoring programs by providing primary feedback on the effectiveness of prevention programs.

4.0.2 This chapter highlights how recent technology changes have altered foodborne illness surveillance; including the use of culture-independent diagnostic testing (CIDT) and whole-genome sequencing (WGS). Molecular multitarget CIDTs can detect up to 22 pathogens in an hour, which makes them very attractive for clinical laboratories (*1*). Molecular multitarget CIDTs are replacing enteric pathogen culture in many clinical laboratories. The use of CIDTs in clinical laboratories shifts the burden of isolating bacteria for subtype and other characterization to public health laboratories (PHLs). Another major change is the advancement of WGS at PHLs. WGS has replaced traditional methods used at PHLs, such as serotyping and subtyping by pulsed-field gel electrophoresis (PFGE), for the primary foodborne pathogens under routine surveillance.

DRAFT

AMERICAN OVERSIGHT

Table 4.1. Comparison of Foodborne Illness Surveillance Systems

Functional Characteristic of Method	Surveillance Method			
		Complaint		
	Pathogen-Specific	Group Notification	Individual Complaint	Syndromic
Inherent speed of outbreak detection	Relatively slow	Fast	Fast	Variable*
Sensitivity to widespread, low-level contamination events (best practices used)	High	Intermediate	Intermediate	Low†
Types of outbreaks (etiology) that method can potentially detect	Limited to clinically suspected or laboratory-confirmed diseases under surveillance	Any‡	Any, although effectiveness limited to agents with short incubation periods‡	Limited to syndromes (or indicators) under surveillance
Initial outbreak signal (at public health level)	Cluster of cases in space or time with common agent	Report of group illnesses recognized by healthcare provider, laboratory, or the public	Multiple independent reports with common exposures in space or time or unique clinical presentation recognized by the agency receiving the reports	Trend in health indicator different from expected, space/time clusters of diagnosed cases
No. cases needed to create initial signal	Low to moderate	Low	Low to moderate	High§
Signal-to-noise ratio	High¶ (after interview of case-patients and collection of appropriate food history). Even higher when combined with subtyping	High¶ (after interview of case-patients and collection of appropriate food history)	Low to moderate (after interview of case-patients and collection of appropriate food history)	Low**

DRAFT

AMERICAN OVERSIGHT

*An advantage in speed is limited mainly to nonspecific health indicators (preclinical and clinical prediagnostic data). Data must be analyzed, and a follow-up investigation is required, including comparison with standard surveillance, before public health action can be taken.
†Sensitivity is higher for rare, specific syndromes, such as botulism-like syndrome.
‡Although outbreaks can be detected without an identified etiology, linking multiple outbreaks to a common source may require agent information.
§The number of cases needed to create a meaningful signal is related to the specificity of the indicator. Indicators that offer an advantage in speed also tend to have low specificity.
¶A high signal-to-noise ratio means that even a small number of cases stand out against a quiet background. A low ratio means a cluster of cases or events is difficult to perceive because it is lost in the many other similar cases or events happening simultaneously—similar to a weak radio signal lost in static noise. The signal-to-noise ratio for syndromic surveillance is lowest for nonspecific health indicators, such as loperamide use or visits to the emergency department with diarrheal disease complaints. The ratio increases with increasing specificity of agent or syndrome information. For highly specific, rare syndromes, such as botulism-like syndrome, the signal-to-noise ratio would approach that of pathogen-specific surveillance.
**Exposure histories are not typically obtained.

AMERICAN OVERSIGHT

4.1 Pathogen-Specific Surveillance

4.1.1 The purpose of pathogen-specific surveillance is to systematically collect, analyze, and disseminate information about laboratory-confirmed illnesses or well-defined syndromes as part of prevention and control activities. Surveillance for typhoid fever began in 1912 and was extended to all *Salmonella* spp. in 1942. National serotype-based surveillance of *Salmonella* began in 1963, making it one of the oldest pathogen-specific surveillance programs and the oldest PHL subtype-based surveillance system. The usefulness of pathogen-specific surveillance is related to the specificity with which agents are classified (i.e., use of subtyping and method), enabling grouping of individual cases of illness with other cases most likely to share a common food source or other exposure (Box 4.1). The utility of bacterial surveillance increased during the 1990s with the development of PulseNet and molecular subtyping of selected foodborne pathogens, including *Salmonella*, Shiga toxin–producing *E. coli* (STEC) O157:H7, *Shigella*, and *Listeria*. Additional gains in usefulness are anticipated with the adoption of WGS in 2019.

Box 4.1. Selected Nationally Notifiable Diseases that Can be Foodborne

- Anthrax (gastrointestinal)
- Botulism, foodborne
- Campyobacteriosis
- Cholera
- Cryptosporidiosis
- Cyclosporiasis
- Giardiasis
- Hemolytic uremic syndrome, postdiarrheal
- Hepatitis A virus infection, acute
- Listeriosis
- Salmonellosis
- Shiga toxin–producing *Escherichia coli* infection
- Shigellosis
- Trichinellosis (trichinosis)
- Typhoid fever
- *Vibrio* infection

In addition, the following are nationally notifiable:

- Foodborne illness outbreaks
- Waterborne illness outbreaks

AMERICAN OVERSIGHT

4.1.2 Most illnesses included under pathogen-specific surveillance are reportable (i.e., notifiable) diseases. State or local health agencies establish criteria for voluntary or mandatory reporting of infectious illnesses, including those that might be foodborne (Box 4.1). These criteria describe the illnesses to report, to whom, how, and in what timeframe. For this type of surveillance, illnesses are defined by specific laboratory findings or by well-defined syndromes, such as hemolytic uremic syndrome.

- **Illnesses are reported primarily by laboratories, medical staff (e.g., physicians, infection-control practitioners, medical records clerks), or both.** Reports can be automatically generated from an electronic medical record or laboratory information system or reported through a secure website. Legacy systems, such as telephone, mail, or fax reporting, also are used but are slower and more labor intensive and error prone.
- **Isolates or other clinical materials are forwarded from clinical laboratories serving primary healthcare facilities to PHLs** for confirmation and further characterization, as required by state laws or regulations or as requested by the local jurisdiction.

  Molecular multitarget CIDTs are replacing enteric pathogen culture in many clinical laboratories. Many clinical laboratories that perform enteric pathogen detection using CIDTs do not culture the pathogens identified by the CIDT. Instead, the clinical laboratory sends the specimen to the PHL to perform culture to obtain an isolate for further testing, which is important for foodborne disease surveillance.

  It is imperative that clinical laboratories send the specimens in a transport media (i.e., Cary Blair) to PHLs immediately to improve the chances of isolating the pathogen. Immediate transport of specimens also helps identify potential clusters as soon as possible. The Association of Public Health Laboratories has produced guidelines for specimen submission for optimal isolate recovery from specimens that test positive for pathogens by CIDTs (*2*).

4.1.3 Laboratory staff record receipt of samples at the PHL and enter sample information into the laboratory information management system, or LIMS. This process facilitates downstream information sharing with investigation partners. Patient information submitted with the sample may be provided to the epidemiology department for comparison with information from cases already reported and to enable reconciliation of case reports and laboratory samples and identification of previously unreported cases.

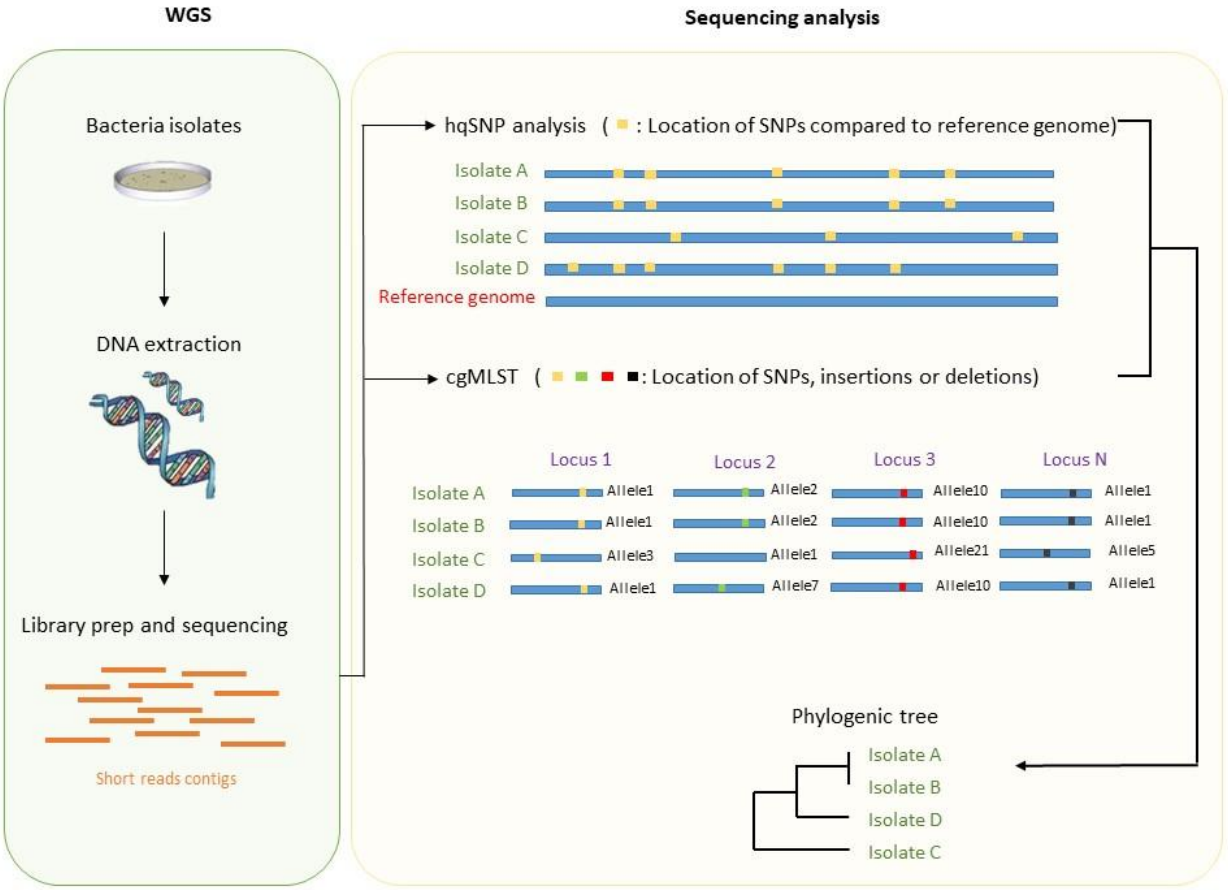
- If CIDTs have been used to detect the pathogen in the clinical laboratory, and a specimen is submitted, the PHL attempts to isolate that pathogen.
- Once the isolated pathogen is identified, it is further characterized (e.g., by serotyping, virulence assays, molecular subtyping, or antimicrobial susceptibility tests).
- WGS and PFGE (if conducted at the state level) data, along with accompanying metadata, are uploaded to local and national PulseNet databases. Consolidated daily reports, such as subtype frequency reports, often are used to facilitate cluster recognition. These reports may be automatically generated by laboratory or epidemiology information systems, extracted from the PulseNet database, or extracted from the System for Enteric Disease Response, Investigation and Coordination.

AMERICAN OVERSIGHT

- Specimen data (including detailed subtyping results) are uploaded to national surveillance systems, such as Laboratory-based Enteric-Diseases Surveillance).
- PHLs issue reports either singly or in groups to the epidemiology department either through electronic systems such as laboratory information management system submission to the epidemiology database or manual entry. Reports also may be issued to submitters as permitted by local policies.
- Rapid identification of clusters in the laboratory and communication of the cluster to foodborne illness epidemiologists is vital to outbreak detection. Case cluster data are enhanced by inclusion of information about matching isolates or outbreaks through PulseNet from other jurisdictions and by matching isolates from food, animal, or environmental monitoring tests that provide information for hypothesis generation.

4.1.4 WGS has replaced traditional methods used at PHLs, such as serotyping using antiserum and subtyping PFGE. PFGE has been the predominant subtyping method for PulseNet since its inception but was replaced by WGS in 2019 (*3*).

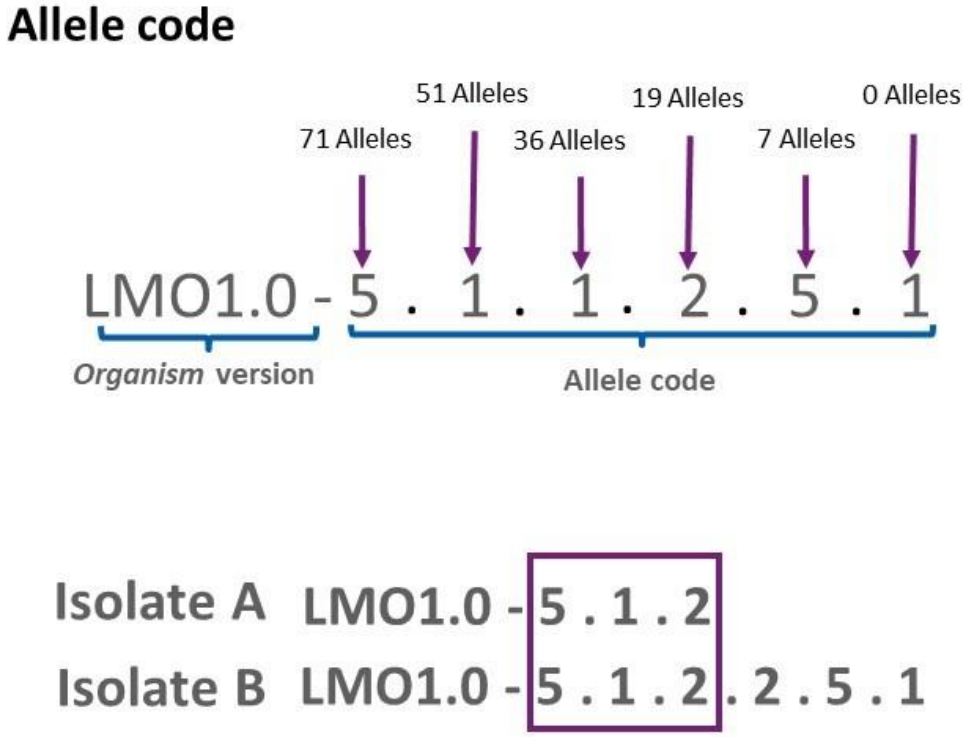
- Subtypes, serotypes, virulence factors, and antibiotic resistance genes can be predicted from WGS data.
- WGS data generated from isolates are analyzed to compare isolate relatedness (Figure 4.1). Generally, this comparison is done using the complementary approaches of high-quality single-nucleotide polymorphism (hqSNP) analysis and core or whole-genome multilocus sequence typing (cg/wgMLST). hqSNP analysis identifies differences in single base pairs between closely related isolates, whereas cg/wgMLST analysis relies on a database of all potential genes, or loci, for a particular enteric pathogen. cgMLST looks at those genes in common between all isolates being compared and primarily is used for surveillance and outbreak detection, whereas wgMLST looks at both the genes in common and those that represent the diversity of the strains and is used to further characterize isolates that are related and part of a cluster. Both of these approaches identify differences between compared isolates and can be used to assign a threshold of genetic relatedness between isolates. For hqSNP isolates, the threshold of relatedness is a number of SNP, or base pair, differences; for cg/wgMLST it is the number of allele, or gene, differences. Both methods can produce a phylogenetic tree, which aids in interpretation of results.
- There are no clearly established rules for what constitutes a cluster by WGS. Currently, PulseNet uses a definition of at least 3 cases within a 60-day window with 0–10 allele differences, where at least 2 of the cases differ by 5 or fewer alleles. PHLs may consider a narrower definition (such as 0–5 alleles) to reduce the number of clusters that need to be investigated and to focus investigation resources. Similar to PFGE, there can be common sequence types or rare sequence types, which should be considered during cluster investigations. In addition, if the outbreak occurs over a long period or is zoonotic, more allele differences are detected than in an outbreak representing a point source contamination event. When an outbreak source is contaminated with multiple diverse sequence types, known as a polyclonal outbreak, sequence data may be used to identify multiple independent clusters, which can then be used to identify the polyclonal outbreak. One strategy is to use a narrow cluster definition to identify clusters. That strategy will reduce the number of



AMERICAN OVERSIGHT

misclassified cases and will increase the measure of association. Once an outbreak is identified, the cluster definition can be expanded to identify addition cases that were missed because of the initial stringent cluster definition.

- cgMLST analyses are built from a stable database of genes so a pattern name, or allele code, can be assigned to the sequence data (Figure 4.2). Allele codes are built from a single linkage tree of all isolates for an organism, and cutoffs are set along certain points, which represent percentage similarity cutoffs, along the tree that produce a stable nomenclature and provide enough resolution to identify potential outbreak clusters. Using the allele code, which is a string of 5–7 numbers, similar to a ZIP code, closely related isolates can be identified and historic frequencies can be tracked. Each shared number along the allele code indicates the genetic relatedness of the isolates. For example, isolates A and B that have the same allele code, 1.1.1.1.1, are closely genetically related; a new isolate, isolate C, that has allele code 1.1.1.1.2 is more closely related than isolate D, with allele code 1.1.1.2.2. Additionally, the allele code can be used to identify clusters and combined with other information predicted from the WGS data, including virulence, serotype, and predicted antibiotic resistance, can be used to prioritize cluster follow-up as part of the triage process.
- WGS data can be used to identify an organism, predict serotype and antibiotic resistance, and identify virulence genes. There are several tools for conducting these analyses, including tools available through the PulseNet database system.
- Although WGS offers major improvements over traditional subtyping methods and enables PHLs to have more efficient workflows, some challenges exist to using this technology in public health practice.. WGS takes longer than PFGE to complete (a minimum of 4 days for WGS vs. 1 day for PFGE). In addition, if WGS replaces traditional serotyping methods, identification of clusters is delayed. PHLs need to perform WGS in a timely manner to ensure clusters are identified as soon as possible, which can be difficult to do in a cost-efficient manner if the testing level of a jurisdiction is low.



AMERICAN OVERSIGHT

Figure 4.1. Depiction of Whole-Genome Sequencing (WGS) and Sequencing Analysis. WGS starts with extracted DNA from isolated bacteria. Library preparation is then performed by sequencing, which creates millions of short reads. The reads are combined to create long strands of DNA. DNA from one bacterium can be compared with others using the complementary approaches of high-quality single-nucleotide polymorphism (hqSNP) analysis and core genome multilocus sequence typing (cgMLST). hqSNP analysis identifies differences in single base pairs among closely related isolates, and the cgMLST analysis relies on a database of all potential genes, or loci, for a particular enteric pathogen. Both approaches identify differences between compared isolates and can be used to assign a threshold of genetic relatedness between isolates: for hqSNP isolates, it is a number of SNP, or base pair, differences; and for cgMLST, it is the number of allele, or gene, differences. A phylogenetic tree can be used to visualize the genetic differences using either SNP-based testing or cgMLST.

AMERICAN OVERSIGHT

Figure 4.2. Depiction of Allele Code Assembly. Nomenclature is organism-specific with different thresholds for the digits. Organism-specific allele codes are built from a string of 5–7 numbers, similar to a ZIP code. Each shared number along the allele code indicates the genetic relatedness of the isolates. When sequences have partial names, they are singletons in clusters below their last digit. For example, isolates A and B are *Listeria monocytogenes* isolates that are approximately within 36 and 19 alleles of each other.

4.1.5 Case-patients are usually interviewed one or more times about potential exposures and additional clinical and demographic information. Routine collection of detailed exposure information as soon as possible after reporting (either CIDT- or culture-positive result) maximizes exposure recall, provides a basis for rapid cluster investigation, is critical to the environmental investigation, and is strongly recommended for high-consequence enteric pathogens, such as STEC O157:H7, *Salmonella*, and *Listeria monocytogenes*.

AMERICAN OVERSIGHT

- The scope of routine interviews varies by jurisdiction, agent, and type of test result. Initial interviews typically cover basic descriptive information and exposures of local importance, such as attendance at a childcare facility, occupation as a food worker, and medical follow-up information. Whereas many local agencies collect information about a limited set of high-risk exposures, where resources are limited, detailed exposure interviews might be collected only when clusters are investigated or outbreaks are recognized (Chapter 5).

Information the public health agency receives through multiple avenues, including basic clinical and demographic data from individual case-patients of specific laboratory-confirmed illness or well-defined syndromes, is reconciled and linked with case isolates or other clinical materials received in the PHL. Reconciled case reports are forwarded to higher jurisdictional levels (local health agency to state agency, state agency to federal agency) by a variety of mechanisms. In general, records are redacted (stripped of individual identifiers) when they are sent outside the reporting states.

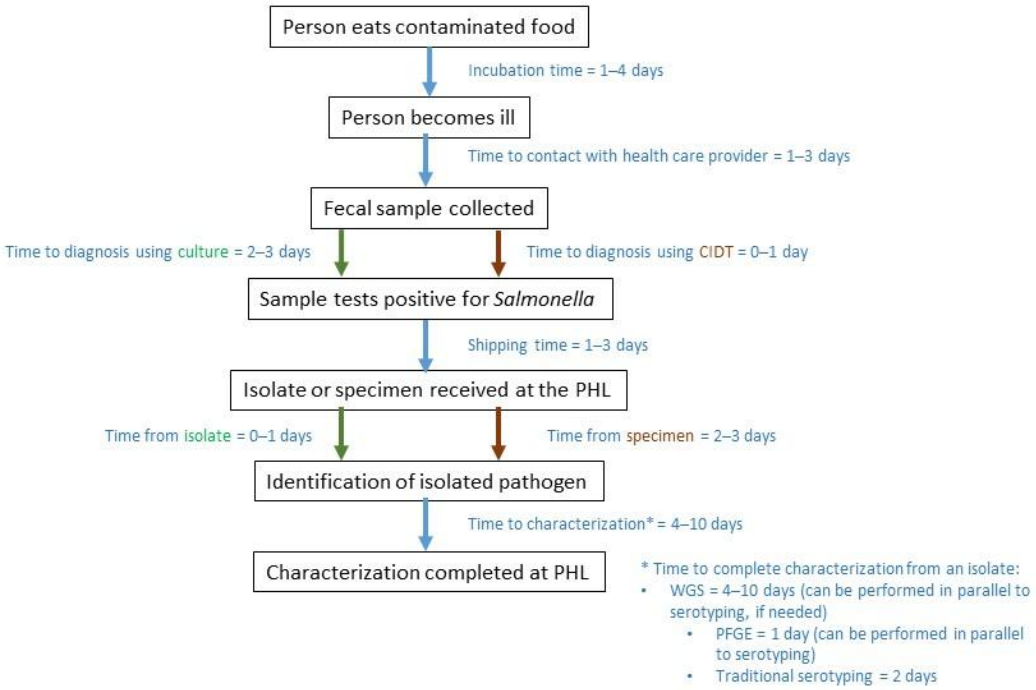
4.1.6 Initial cluster identification and cluster assessment might occur as two processes conducted, respectively, by the laboratory and epidemiology departments or might occur as a single process within epidemiology. Agent, time, and place are examined individually and in combination to identify possibly significant clusters or trends. This is the critical first step in hypothesis generation. Clusters of unusual exposures, exposure frequencies, demographic distributions (e.g., predominance of cases in a particular age group), or connection to food, animal, or environmental monitoring studies might be identified. Clusters of cases are examined as a group and, if a common exposure seems likely, are investigated further (Chapter 5). In some jurisdictions, cluster detection and triage are a laboratory function (see section 4.2.5).

- A cluster is defined as two or more cases of disease linked by place, time, pathogen subtype, or other characteristic. Isolates closely related by genetic subtyping are more likely than isolates that are not closely related by genetic subtyping to share a common source.
- Clusters may be more or less recognizable and more or less actionable. This chapter focuses on case clusters and outbreaks, but for some high-consequence agents or syndromes (e.g., botulism or paralytic shellfish poisoning), even a single case might merit a prompt and aggressive public health response.
- Clusters are common, and pursuing them all with equal vigor is not practical or productive. Laboratory staff often identify clusters when they detect an increase of a specific subtype or serotype. Incoming surveillance data are evaluated for unusual case counts based on historical frequencies (accounting for seasonality), the severity of disease, and molecular matches between human cases and food or animal monitoring samples In general, cases clustered over a relatively short period are more likely to indicate an outbreak. The time window used to delimit clusters varies by agent. For example, a wider window is used to evaluate clustering of listeriosis cases than to evaluate salmonellosis cases because of differences in the natural history of each disease.
- Although cluster recognition software, such as SaTScan™, cumulative summary (cusum) outbreak detection algorithms, and query algorithms in the System for Enteric Disease Response, Investigation and Coordination, have been developed, none have yet been validated for broad-based enteric disease data. The decision to report or pursue a cluster is an important part of the outbreak detection process but not one that is easily distilled into simple best practices. For many

AMERICAN OVERSIGHT

organisms, clusters identified by WGS are more indicative of a close genetic relationship and epidemiologic relatedness than are clusters identified by PFGE. An increase in frequency of a strain is only one indication of a potentially significant cluster. Furthermore, absence of an increase in case numbers from expected values does not rule out significance.

4.1.7 The timeline for pathogen-specific surveillance covers a series of events from the time a person is infected through the time public health officials determine that person is part of a disease cluster. The time from infection to cluster detection is one of the limiting factors of pathogen-specific surveillance. Minimizing delays by streamlining the individual processes improves the likelihood of overall success. A sample timeline for *Salmonella* case reporting is presented in Figure 4.3.



- **Incubation time:** the time from ingestion of a contaminated food to beginning of symptoms. For *Salmonella*, this typically is 1–4 days, sometimes longer. For more information about incubation times of foodborne pathogens see the Outbreaks of Undetermined Etiology (OUE) Agent list from the CIFOR website (https://cifor.us).
- **Time to contact with healthcare provider or doctor:** the time from the first symptom to medical care (when a fecal sample will ideally be collected for laboratory testing). This time may be an additional 1–3 days, sometimes longer.
- **Time to diagnosis:** the time from provision of a sample to laboratory identification of the agent in the sample as *Salmonella*. CIDT tests often produces same-day results, whereas culture-based diagnostic methods take 2–3 days.
- **Sample/isolate shipping time:** the time required to ship the *Salmonella* isolate or positive specimen from the initial testing laboratory to the public health authorities who will perform serotyping and subtyping. This usually takes 1–3 days or longer, depending on transportation arrangements within a state and distance between the clinical laboratory and the public health department. Diagnostic laboratories are not required by law in many jurisdictions to forward *Salmonella* isolates to PHLs, and not all diagnostic laboratories forward any isolates unless specifically requested to do so. When a laboratory does submit an isolate or specimen to public health, the timeframe for submission is often based on convenience and cost effectiveness rather than public health considerations.
- **Confirming isolated pathogen**: The time after a sample has tested positive for *Salmonella* to isolation and confirmation of *Salmonella*. Specimens identified as *Salmonella* by CIDTs require culture to Isolate the organism from clinical samples that were used to perform CIDT, which takes 2–3 days. If culture-based methods are used at the clinical laboratory, the isolated bacteria is confirmed at the PHL, which takes 1 day.
- **Time to pathogen characterization:** The time required for the state public health authorities to serotype and to perform subtyping on the *Salmonella* isolate and compare it with the outbreak pattern. Serotyping typically takes 3 working days but can take longer. PFGE can be accomplished in 1 working day (24 hours), whereas WGS can take as little as 4 working days. However, many PHLs have limited staff and space and experience multiple emergencies simultaneously. In practice, serotyping and PFGE or WGS subtyping may take several days to several weeks in extreme cases. Data derived from WGS can be used to determine the serotype and subtype and predict the antibiotic resistance profile of an isolate, thereby streamlining laboratory processes into a single workflow. However, completion of WGS will be longer than traditional workflows. Additionally, most or all PHLs will have to perform some batching to reduce the cost of the sequencing. Batching

AMERICAN OVERSIGHT

should be minimized as much as possible, however, because faster turnaround for pathogen characterization is highly desirable.

- The total time from onset of illness to confirmation of the case as part of an outbreak is typically 2–3 weeks.

Figure 4.3. Sample Timeline for *Salmonella* Case Reporting*

*Abbreviations: CIDT, culture-independent diagnostic testing; PFGE, pulsed-field gel electrophoresis; PHL, public health laboratory; WGS, whole-genome sequencing.

4.1.8 Routine testing for specific pathogens of food in production is conducted as part of larger food-safety verification programs operated by the Food and Drug Administration (FDA), U.S. Department of Agriculture (USDA), and state agriculture agencies.

- WGS is routinely performed on food isolates from FDA- and USDA-regulated products as part of the GenomeTrakr program, and the sequence data and limited metadata are uploaded to a genomic database housed at the National Institutes of Health, National Center for Biotechnology Information (NCBI). On NCBI, GenomeTrakr sequences are compared with sequences from the Centers for

AMERICAN OVERSIGHT

Disease Control and Prevention and other federal, academic, and international public health agencies; closely related isolates identified on the NCBI Pathogen Detection Portal (*4*) can be potential leads for cluster sources.

- Incorporating this routine food or animal monitoring or regulatory surveillance test data into the disease surveillance information stream enhances hypothesis generation and improves the sensitivity and timeliness of outbreak detection. In the United States, data streams from human disease surveillance, food-testing programs, environmental sources, and selected live-animal testing are co-mingled in the PulseNet database; however, important product details might not be readily available.

4.1.9 A key strength of pathogen-specific surveillance is its ability to detect widespread disease clusters initially linked only by a common agent. Most national and international foodborne disease outbreaks are detected in this manner.

Combining specific exposure information with case information from clusters recognized though complaints makes pathogen-specific surveillance the most sensitive method for detecting unforeseen problems in food- and water-supply systems caused by the agents under surveillance. The specificity of agent or syndrome information combined with specific exposure information obtained by interviews enables the positive association of small numbers of cases with exposures.

4.1.10 A key limitation of pathogen-specific surveillance is that it works only for diseases detected by routine testing and reported to a public health agency.

- Pathogen-specific surveillance is relatively slow because of the many steps required (Figure 4.1).
- Subtype-specific surveillance requires an isolate, which is challenging because of the use of CIDTs in clinical laboratories.

4.2 Complaint Systems

Consumer complaint systems are an effective surveillance tool for detecting a variety of food-related incidents, including reportable pathogens. Notification or complaint systems are intended to provide agencies with a tool for documenting, evaluating, and responding to reports from the community about possible foodborne disease events. The information maintained in these systems also helps to conduct prevention and control activities.

4.2.1 The usefulness of consumer complaint systems to identify outbreaks is based on 1) the ability of groups with a common exposure to self-identify illness and link it to the exposure or 2) the ability of the complaint system to independently link multiple independent complaints to a common source. Complaints involving multiple households, instances of multiple independent complaints about the same food establishment, reports of clusters of illness, and complaints involving multiple people in the same household that suggest an exposure outside the home often indicate an outbreak and should be evaluated to determine whether an investigation is warranted. In the absence of common, suspicious exposures shared by two or more case-patients, complaints of individual illness with nonspecific

AMERICAN OVERSIGHT

symptoms—such as diarrhea or vomiting—generally are not worth pursuing. Thus, sufficient exposure information about every independent complaint should be collected because reported exposures might become more significant when also reported by subsequent complainants. Complaint reporting involves passive collection of reports of possible foodborne illness from individuals or groups, such as the following:

- Reports from any individual or group who observes a pattern of illness affecting a group of people, usually after a common exposure: Examples include reports of illness among multiple persons eating at the same restaurant or attending the same event and reports from healthcare providers of unusual patterns of illness, such as multiple patients with bloody diarrhea in a short time span.
- Multiple independent complaints about illness in single persons or households. Group illness and independent complaints can be used together and linked with data obtained through pathogen-specific surveillance. In contrast to pathogen-specific surveillance, complaint reporting does not require identification of a specific agent or syndrome or contact with the healthcare system.

4.2.2 Detection of outbreaks based on multiple individual complaints requires a system for recording complaints and comparing food histories and other exposures reported by individuals.

All complaints require some level of follow-up. A telephone caller should be given some expectation for what follow-up is likely. A person sending a complaint by text, email, or online reporting system should be notified the complaint was received.

- Document complaints received by telephone with a standard intake form to record complainant information. Complaints received through other formats may warrant additional follow-up to fully document the complaint.
- Questions should cover name and contact information of the caller, detailed illness information (including exact time of symptom onset and recovery), suspected food product and product packaging information (if applicable), name and location of retail or restaurant establishment, names and contact information of other members of the dining party (if applicable), and all potentially relevant nonfood exposures.
- When illness is limited to a single person or members of a single household, obtain food history for the 3 days before onset that focuses on meals eaten outside of the home. People often identify an incorrect exposure as the cause of their illness, often attributing it to the last thing they ate. However, only one in five complaints with a known etiology is caused by an agent with an incubation period shorter than 24 hours.
    - A food history of at least 3 days before illness onset should be collected for individual complaints because common exposures are the sole mechanism to link cases. A standardized form that includes both food and nonfood exposures is preferred.
    - Complaint systems that rely on Web-based reporting or other means of self-reporting should also ask for a 3-day food history, with emphasis on meals eaten outside the home; and should request contact information in case additional information is needed.
    - Efforts to capture complaints using social media should incorporate a link to online reporting, an online survey, or a phone number to the health department.

AMERICAN OVERSIGHT

    - Given the ubiquity of norovirus infections, pay particular attention to exposures in the 24–48 hours before onset whenever norovirus is suspected. As more information about the likely etiologic agent is collected, this approach can be modified.
    - The complaint and subsequent interviews can lead to a hypothesis about the pathogen that leads to a different time frame for the exposure history (e.g., vomiting leads to a different hypothesis and exposure history time frame than does bloody diarrhea).
- When illness is reported among members of multiple households, collect information only for meals in common to members of the different households. Attempt to contact and interview ill meal companions reported by the original caller about symptoms and food consumption.
    - Focus interviews on the event shared by members of the group. However, be aware they might have more than one event in common, and explore that possibility.
    - Ask about other possible exposures for the interviewee or for others he or she might have contacted, such as childcare attendance, employment as a food worker, or ill family members.
- Enter all information collected into the complaint database. Review interview data regularly to look for trends or commonalities. As part of the review of the data, consider running reports showing frequencies of specific restaurants or other exposures (such as recreational water venues).
- Set up the reporting process so all reports go through one person or one person routinely reviews reports. Centralization of the reporting or review process increases the likelihood that patterns among individual complaints and seemingly unrelated outbreaks will be detected.

4.2.3 To complement the review of individual complaints and patterns of complaints detected through the foodborne illness complaint system, conduct standard interviews for foodborne illness cases detected through pathogen-specific surveillance (e.g., *Salmonella* and STEC). Enter all food establishments at which affected persons reported eating within the 7 days before illness onset into the complaint database. Routinely examine a list of restaurants reported by complainants and case-patients in pathogen-specific surveillance to search for common establishments.

Complaint data and results of pathogen-specific surveillance are much easier to link if complaint systems are centralized at the same jurisdictional level as pathogen-specific disease surveillance. The link of data from pathogen-specific and complaint surveillance systems can occur at the level of the local health agency or between individual city-based environmental health staff and county-based communicable disease program or at the state level. Such a shared/centralized system should enhance the ability of agencies to detect and respond to possible foodborne outbreaks but should not prevent any participating jurisdiction from fulfilling whatever role is required by law or is determined to be necessary to protect health in the jurisdiction's area.

4.2.4 Environmental health assessment and follow-up is generally managed by environmental health staff at local health departments that also license and inspect restaurants and other food-service establishments.

In jurisdictions where visits are not required to every restaurant named in illness complaints, the investigation and control team must decide whether investigation of a commercial food establishment is likely to be beneficial. To make this decision, consider details of the complainant's illness and the foods eaten at the establishment (Box 4.2).

AMERICAN OVERSIGHT

- If communicable disease surveillance staff receive the complaint, they should immediately share the complaint information with the responsible environmental health staff.
- Regardless of who receives the complaint or how the complaint is received (e.g., phone, online), the complaint should be evaluated for the likelihood of a foodborne illness or outbreak associated with the establishment that is the subject of the complaint or with other establishments listed in the food history. In addition, environmental health staff should review the establishment's inspection history, contact the establishment's manager, and determine the value of conducting an environmental assessment. Additional steps, such as an inspection, may be unnecessary if the complaint involves only one person (or persons in one household) and the illness reported is inconsistent with an exposure at the restaurant that is the subject of the complaint.
- All jurisdictions should have a process to ensure that complaints outside that jurisdiction are forwarded to the proper authority. This process includes forwarding complaints between local health agencies, between local health agencies and state departments of agriculture or health, and between local health agencies and state agencies and federal agencies: USDA's Food Safety and Inspection Service (FSIS) for meat, poultry, and egg product–related complaints and FDA for complaints related to other food items.
- Nongovernment complaint systems that do not share all information with the appropriate jurisdiction(s) and that do not have the authority to investigate the complaint (inspect the establishment or conduct an epidemiologic investigation) are not useful if the goal is to protect the public's health. Such systems should clearly state that the complaint is not being filed with an agency that can act on the complaint and should refer the complainant to the appropriate jurisdiction.

AMERICAN OVERSIGHT

Box 4.2. Considerations for Investigating a Commercial Food Establishment

In the following situations, investigation of a named commercial food establishment might be warranted:

The confirmed diagnosis and/or clinical symptoms are consistent with the foods eaten and the timing of illness onset (e.g., a person in whom salmonellosis is diagnosed reports eating incompletely cooked eggs 2 days before becoming ill).

The complainant observed specific food-preparation or serving procedures likely to lead to a food safety problem at the establishment.

Two or more persons with a similar illness or diagnosis implicate a food, meal, or establishment and have no other shared food history or evident source of exposure.

Regular review of individual complaints is critical to recognizing that multiple persons have a similar illness or diagnosis and share a common exposure.

Clues that a follow-up investigation of a food establishment is unlikely to be productive include

Confirmed diagnoses and/or clinical symptoms that are not consistent with the foods eaten at the establishment and/or the onset of illness (e.g., bloody diarrhea associated with a well-cooked hamburger eaten the night before illness onset).

Signs and symptoms (or confirmed diagnoses) among affected persons that suggest they might not have the same illness.

4.2.5 Collection and testing of clinical specimens and food samples related to group illness. PHL activities are essential for determining etiology, linking separate events during the investigation, and monitoring the efficacy of control measures (Chapters 5 and 6).

- Because of public health laboratory testing, links may be seen across jurisdictional boundaries and beyond; even national outbreaks may then be detected.
    - For instance, an outbreak associated with a particular restaurant may come to the attention of authorities solely on the basis of a report by a customer who observed illnesses among multiple fellow patrons. Laboratory testing and identification of *Salmonella* Typhimurium can result in refinement of the case definition used in this investigation, in additional testing and restrictions for workers found to be carriers, or in connecting this outbreak with other outbreaks (concurrent or historic) from a contaminated commodity.
- Obtain clinical specimens from at least five members of the ill group. Collect specimens as soon as possible after illness onset. For certain etiologies, clinical specimens need to be collected while the

AMERICAN OVERSIGHT

patient is still ill (bacterial intoxications); for many etiologies (norovirus, bacterial pathogens), specimens can be collected days after illness recovery. Clinical specimens should be tested as soon as possible- some test types such as syndromic panels (commercially available tests that simultaneously tests for common bacterial, viral, and parasitic pathogens) require testing within 4 days or specimen collection for the results to be valid.
    - Because complaint systems are the primary tool for detecting outbreaks caused by pathogen not under surveillance, the clinical presentation and epidemiologic data should direct the testing priorities.
    - A number of references are available to help ascertain the etiology of an outbreak, e.g., CIFOR's Outbreak of Undetermined Etiology agent tables and interactive tool (*5*), Diagnosis and Management of Foodborne Illnesses, A Primer for Physicians and Other Health Care Professionals (*6*), and 2017 Infectious Diseases Society of America Clinical Practice Guidelines for the Diagnosis and Management of Infectious Diarrhea (*7*).
- If the presumed exposure involves food at a catered event, collect and store food from the implicated event, if feasible.
- Conduct all sampling using legally defensible procedures (e.g., chain-of-custody) and using protocols as guided by the laboratory that will conduct the analysis. Samples should be analyzed within 48 hours after receipt; however, generally test the food only after epidemiologic implication or identification of specific food-safety problems through an environmental health assessment. If the epidemiologic investigation is ongoing and a specific food item has not been implicated or is not suspected yet, food should be stored. Consideration include the following:
- Storage under refrigeration can be longer than 48 hours, if necessary, but the length of the storage period is food-dependent. Because certain bacteria (e.g., *Campylobacter jejuni*) die when frozen, affecting laboratory results, immediate examination of samples without freezing is encouraged.
    - Perishable foods should be frozen (–40^{o}C to –80^{o}C).
    - Food samples that are frozen when collected should remain frozen until examined.
    - Food samples can be collected as part of the process of removing suspected food from service.

If food testing is determined to be necessary—for example, if a food has been epidemiologically implicated—official reference testing methods must be used at a minimum for regulated products (e.g., pasteurized eggs or commercially distributed beef).

Note: Food testing has inherent limitations because most testing is agent-specific, and demonstration of an agent in food is not always possible or necessary before implementation of public health action. Detection of microbes or toxins in food is most important for outbreaks involving preformed toxins, such as enterotoxins of *Staphylococcus aureus* or *Bacillus cereus*, where detection of toxin or toxin-producing organisms in human specimens frequently is problematic. In addition, organisms such as *S. aureus* and *Clostridium perfringens*, which are commonly found in the human intestinal tract, can confound interpretation of culture results.

Furthermore, food-testing results are often difficult to interpret. Samples collected during an investigation might not represent food ingested when the outbreak occurred. Subsequent handling or processing of food might result in the death of microorganisms, multiplication of microorganisms

AMERICAN OVERSIGHT

originally present in low levels, or introduction of new contaminants. If the food is not uniformly contaminated, the sample collected might miss the contaminated portion. Finally, because food usually is not sterile, microorganisms can be isolated from samples but not be responsible for the illness under investigation. Thus, food testing should not be routinely undertaken but should instead be based on meaningful associations identified through data analysis of interviews with suspected case-patients or during environmental health assessments at the implicated food-service establishment.

4.2.6 A key strength of complaint systems is their ability to detect outbreaks from any cause, known or unknown. Thus, the complaint system is one of the best methods for detecting nonreportable pathogens and new or reemerging agents. Recent examples include recognition of sapovirus as a significant agent in norovirus-like outbreaks [*8*] identification of *Arcobacter butzleri* as the likely agent in an outbreak of gastroenteritis at an event [*9*], and atypical enteropathogenic *E. coli* at a restaurant (*10*). In one study, consumer complaint surveillance alone led to detection of 79% of confirmed foodborne outbreaks, including most norovirus outbreaks (*11*).

- For event-related complaints, food items eaten and other exposures are easily determined because items consumed at the event can be identified by menus or other means and specifically included in the interview.
- Complaint surveillance systems are inherently faster than pathogen-specific surveillance because the chain of events related to laboratory testing and reporting is not required. Exposure information gained through patient interviews has the potential for being high quality because patient recall is highest close to the exposure event.
- Because of the relatively limited number of exposures to consider, investigations of event-related notifications can be pivotal to solving widespread outbreaks detected through pathogen-specific surveillance. For example, a norovirus outbreak associated with contaminated imported raspberries used in commercially distributed ice cream was initially identified from complaints as multiple independent outbreaks (*12*). Complaint systems are key in identifying intentional contamination events that would not be detected in pathogen-specific surveillance, for example, an outbreak of methomyl poisoning caused by intentionally contaminated salsa at a restaurant (*13*).

4.2.7 The value of single complaints of possible cases of foodborne disease in detecting outbreaks is limited by a lack of exposure information to link to any other cases and by the lack of specific agent or disease information to exclude unrelated cases. The illness reported by individuals might or might not be foodborne, and illness presentation might or might not be typical.

- Without a detailed food history (either from the initial report or follow-up interview), surveillance of independent complaints is sensitive only for short incubation (generally chemical- or toxin-mediated) illness or illness with unique symptoms because most people associate illness with the last meal eaten before onset of symptoms, they are likely to be correct only for exposures with short incubation times. This is not a limitation if full interviews are conducted.
- Notification of illness in groups generally is less sensitive to widespread low-level contamination events than is pathogen-specific surveillance because recognition of a person–place–time connection among case-patients by a healthcare provider or member of the community is required.

AMERICAN OVERSIGHT

- These limitations can be minimized by
  - Collecting a food history for the 3 days before illness onset to detect outbreaks caused by etiologic agents with longer incubations than bacterial toxins.
  - Looking for commonalities between the complete food histories for all complaints with case-patient interviews from pathogen-specific surveillance.
  - Promptly forwarding all complaint to the jurisdictions of establishments mentioned in the food histories for prompt follow-up and/or gathering of additional pertinent information.

4.2.8 Improve communication and cooperation among agencies that receive illness complaints. Consumers may submit complaints to multiple organizations and agencies, such as poison control centers, agricultural agencies, facility-licensing agencies, grocery stores, and online platforms and social media sites.

- Identify the agencies/organizations in the community that are likely to receive complaints. Establish regular communication between agencies that receive illness complaints, epidemiology staff, and laboratory staff. Always keep contact information current. Because complaints might be made to multiple agencies, having a robust method of sharing information is important. If possible, set up a database that public health agencies can access and review. Information-sharing is particularly important in adjacent jurisdictions.
- Check complaint information against national databases, such as the USDA FSIS Consumer Complaint Monitoring System (CCMS). Consumers can report complaints to CCMS by contacting the FSIS Meat and Poultry Hotline (1-888-MPHotline [1-888-674-6854]) or using the FSIS online complaint reporting system, the Electronic Consumer Complaint Form (https://foodcomplaint.fsis.usda.gov/eccf).

4.2.9 To increase surveillance sensitivity, remove barriers to reporting by making the reporting process as simple as possible for the public. For example, provide one 24/7 toll-free telephone number or an online reporting form. Such systems enable callers to leave information that public health staff can check later.

Promote reporting by routine press releases that educate the public about food safety, and advertise the contact phone number or website for reports of illness. Use a telephone number that easily can be remembered or found online. Train food managers and workers about the importance of reporting unusual patterns of illness among workers or customers and Food Code requirements for disease reporting (*14*). Communicate the value of such reporting, not just to protect public health, but also to protect food establishments from unfounded allegations of foodborne illness.

4.3 Syndromic Surveillance

The concept of syndromic surveillance was developed in the 1990s and expanded after the 2001 postal system anthrax attacks in an attempt to improve readiness for bioterrorism.

AMERICAN OVERSIGHT

The utility of syndromic surveillance for nonspecific health indicators for foodborne illness surveillance and outbreak investigation is very limited. In theory, the electronic collection of such indicators could permit rapid detection of major trends, including outbreaks. In practice, the right mix of sensitivity and specificity has proven difficult to find, and the utility of such systems might be marginal. Surveillance for highly specific syndromes, such as hemolytic uremic syndrome or botulism, is a critical public health function.

- Some groups (e.g., public health agencies, academic researchers, nongovernment organizations) monitor social media to identify potential outbreaks. The effectiveness of the use of social media tools to identify outbreaks is still being evaluated but may be useful to enhance traditional complaint systems.
- In theory, syndromic surveillance can be used as a tool to identify cases during an outbreak of an emerging or rare pathogen before laboratory testing protocols have been put into place or results have been received.
- Syndromic surveillance can help identify general enteric disease trends in a community (e.g., norovirus activity levels) to craft targeted prevention messaging (e.g., remind food-service establishments to exclude ill food-service employees).

Syndromic surveillance typically relies on automated extraction of health information, such as school and work absenteeism, posts or complaints on social media sites, emergency department chief complaint, lab test orders, or hospital discharge codes (ICD-10). Epidemiology or emergency preparedness groups evaluate alerts triggered by the syndromic surveillance system, and interview case-patients to determine whether the alert represents a true outbreak.

4.3.1 Potential strengths of syndromic surveillance include the use of nonspecific health indicators to identify clusters of disease before definitive diagnosis and reporting.

- Syndromic surveillance may be able to detect large undiagnosed events, such as an increase in gastrointestinal illness among persons of all ages consistent with norovirus or an increase in diarrheal illness among young children consistent with rotavirus, and It may be helpful for monitoring health status after a natural disaster, if other surveillance systems are temporarily unavailable.

4.3.2 The lack of specificity for most syndromic surveillance indicators in the area of foodborne disease is a limitation that makes for an unfavorable signal-to-noise ratio, meaning that only the largest events would be detected, and many false-positive signals would be expected.

- Responding to false-positive signals substantially drains an agency's resources.
- Syndromic surveillance cannot replace routine surveillance.

The ultimate measure of success for any surveillance system is outbreaks detected. Because the usefulness of syndromic surveillance for detecting foodborne disease events is limited, additional investment would compete for resources with under-resourced standard surveillance systems;

AMERICAN OVERSIGHT

therefore, it should be used only under very special circumstances when routine surveillance is not possible.

AMERICAN OVERSIGHT

Chapter 5: Cluster and Outbreak Investigation

Chapter Summary Points

- Outbreak investigations are conducted to rapidly identify the source of contamination and take action to prevent additional illnesses. These investigations require effective and timely integration of three types of data:
    - Epidemiologic data that describe illness distributions and reveal common exposures;
    - Informational traceback and environmental assessment data that identify common contamination points and factors in the distribution chain; and
    - Testing data that identify outbreak-associated strains in implicated foods or in environmental samples linked to the foods.
- How a potential outbreak of foodborne illness is initially recognized determines approaches taken to investigate.
    - Complaints identifying multiple illnesses associated with a common event or establishment will lead to an investigation to identify the agent and the mode(s) of transmission. Although most of these investigations will be local, some will be subclusters of larger, multijurisdictional outbreaks.
    - Clusters of cases identified through laboratory-based surveillance at the local or state level will lead to investigations to determine the mode of transmission or source of contamination. Multistate clusters of these cases suggest a commercially distributed food source.
    - Identification of a foodborne pathogen in a commercially distributed food product will lead to a search for illnesses caused by the same organism and an investigation to determine whether the food item was the source of the illness.
- A priority for all investigations is to establish the basis for implementing control measures to stop transmission and prevent additional illnesses.

DRAFT

AMERICAN OVERSIGHT

5.0 Introduction

5.0.1 Outbreak investigations can help prevent illnesses. This chapter helps investigators quickly and accurately conduct the various steps of an investigation.

These steps are

- Detecting a possible outbreak (Chapter 4).
- Defining and finding cases.
- Generating hypotheses about likely sources.
- Testing hypotheses and evaluating evidence.
- Finding contamination sources.
- Controlling the outbreak (Chapter 6).

Because outbreak investigations are dynamic, multiple steps can occur simultaneously. In addition, as the outbreak investigation progresses, steps might need to be repeated.

When a potential foodborne illness outbreak is first detected or reported, investigators will not know whether the illness is foodborne, waterborne, or attributable to other causes. Investigators must keep an open mind in the early stages of the investigation to ensure that potential causes are not prematurely ruled out. Even though these Guidelines focus on foodborne illness, many of the investigation methods described in this chapter apply to a variety of enteric and other illnesses, regardless of source of contamination.

5.0.2 Recent developments in laboratory and epidemiologic methods impact cluster and outbreak investigation methods.

- Whole-genome sequencing (WGS) used by public health laboratories increases the specificity of pathogen-specific surveillance because case-patients with isolates that have the same DNA fingerprint are more likely to share a common source (Chapter 4). In addition, WGS increases confidence in the relationships between pathogens isolated from food/environments and historical samples, which provides better opportunities to identify outbreaks through food and environmental surveillance sampling. However, WGS may increase the timeline for public health laboratories to characterize foodborne pathogens and thus delay the identification of clusters of cases that warrant investigation.
- Culture-independent diagnostic tests (CIDTs) used by clinical laboratories provide rapid test results but require follow-up culture to produce an isolate for WGS. CIDTs might increase the number of cases reported and decrease the timeline from onset of illness to report but also reduce the proportion of isolates available for WGS and increase the timeline for conducting WGS. CIDTs used by public health agencies may enhance additional case finding in an outbreak investigation by rapidly identifying the agent in fecal samples from suspected case-patients.
- Enhanced use of new exposure assessment methods streamlines epidemiologic investigations to identify common sources for clusters and determine whether they constitute foodborne illness outbreaks.

For purposes of outbreak reporting, the National Outbreak Reporting System (https://www.cdc.gov/nors/downloads/guidance.pdf) distinguishes the definitions of a foodborne illness outbreak and a cluster as follows:

AMERICAN OVERSIGHT

- An *outbreak* is two or more cases of similar illness associated with a common exposure.
- A *cluster* is two or more cases of similar illness that are suspected to be associated with a common exposure, but investigators are unable to identify a shared food, animal, venue, or experience among ill persons.

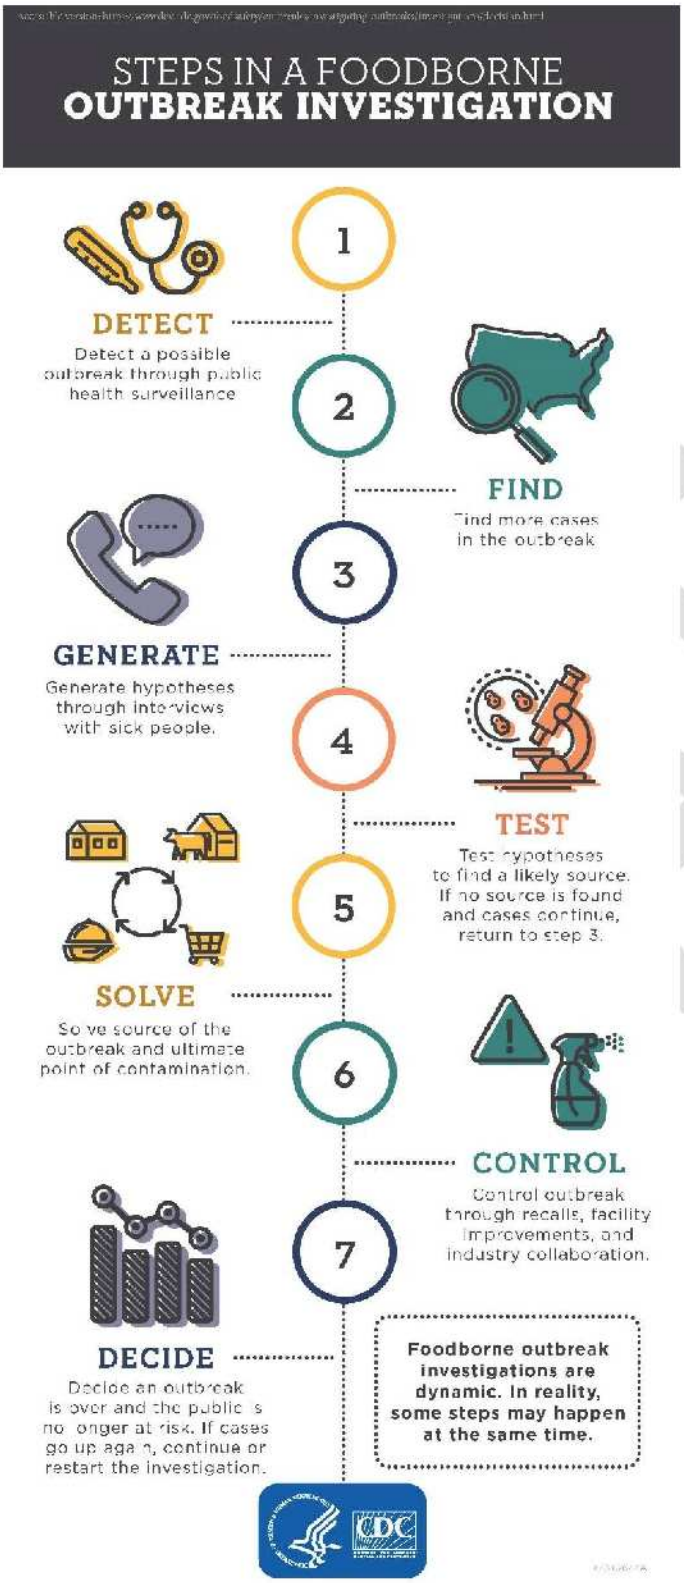
Outbreak and cluster definitions vary by jurisdiction.

Regardless of how clusters are defined for surveillance purposes, the investigations needed to identify a common exposure include multiple, interrelated epidemiologic, environmental, and laboratory activities (Table 5.1, Figure 5.1).

5.1 Outbreak Investigation Initiation

5.1.1 Alert outbreak investigation and control team leaders as soon as a possible outbreak is identified. Outbreaks are detected in several principle ways (Chapter 4). However, a common initial approach is to review descriptive features of the outbreak setting and relevant background information about the etiologic agent, establishment, or event:

- Most local investigations require coordination between epidemiologists, environmental health specialists, and public health laboratorians within the jurisdiction of the cases, event, or establishment.
- Multistate clusters also require communication and coordination of activities between local, state, and federal agencies to rapidly investigate a suspected vehicle (Chapter 7).



5.1.2 Assess the priority of the outbreak investigation. Although any outbreak might warrant investigation, give highest priority for investigation to outbreaks that

- Have a high public health impact:
  - Cause severe or life-threatening illness, such as infection with *Escherichia coli* O157:H7, *Listeria monocytogenes*, or botulism;
  - Affect populations at high risk for complications of the illness (e.g., infants, elderly persons, immunocompromised persons); or
  - Affect a large number of persons.
- Appear to be ongoing:
  - May be associated with food-service establishment in which ill food workers provide a continuing source of infection.
  - May be associated with a commercially distributed food product that is still being consumed.

If the scale or complexity of an outbreak investigation is likely to overwhelm agency resources, the agency should request assistance as soon as possible for the additional resources and expertise required to respond to it (Chapter 3).

AMERICAN OVERSIGHT

Figure 5.1. Steps in a Foodborne Illness Outbreak Investigation

AMERICAN OVERSIGHT

5.1.3 Assemble and brief the outbreak investigation and control team. Open communication between investigation members to plan, conduct, and evaluate outbreak investigation activities is critical to the success of the investigation.

- Investigation and control team leaders should assess the availability of staff to conduct the investigation. In particular, the team leader should ensure the presence of adequate staffing to interview case-patients within 24–48 hours. If sufficient staff are not available, request external assistance to conduct interviews.
- Outbreak investigation and control staff should be briefed on the outbreak, and their individual roles in the investigation. Ensure that all members of the investigation team—epidemiologists, laboratorians, and environmental health specialists—are familiar with and follow relevant state and federal laws and data handling practices.
- For outbreaks involving multiple jurisdictions, the outbreak investigation and control team should include members from all agencies participating in the investigation (Chapter 7).

5.1.4 Ensure that leadership of the investigation reflects the focus of investigation activities, which may change over time. During an investigation, the focus of activities may shift among the following:

- Laboratory studies to identify an agent, including microbiologic studies and applied food-safety research.
- Epidemiologic studies to identify transmission routes, exposure sources, or food vehicles and risk factors for illness.
- Regulatory investigations of food-production sources and distribution chains to identify where, during production or distribution of the food, contamination occurred and facilitate recall of food items.
- Environmental assessments of food production, processing, and service facilities to identify routes of contamination, contributing factors, and environmental antecedents;
- Communication of investigation findings to the public and the food industry to support control and prevention measures.

5.1.5 Coordinate activities and set up good lines of communication between individuals and agencies involved in the investigation (Chapter 3, Chapter 7).

Investigations are rarely linear (Figure 5.1). Although the steps for investigating outbreaks follow a logical process—from determining whether an outbreak is occurring to identifying and controlling the source—most investigations feature multiple concurrent steps. Maintaining close communication and coordination among members of the outbreak investigation team is the best way to ensure that concurrent activities do not interfere with each other and important investigation steps are not forgotten.

5.1.6 Establish goals and objectives for the investigation. The primary goal for most investigations is to obtain enough information to implement specific interventions to stop the outbreak. The results of the investigation also should provide information to prevent a similar outbreak from occurring in the future. Secondary goals are to increase knowledge of the epidemiology and control of foodborne illnesses. Unanswered questions about the etiologic agent, the mode of transmission, or contributing factors should be identified and included in the investigation to add to the public health knowledge base.

AMERICAN OVERSIGHT

Objectives for meeting these goals vary by type of outbreak.

- **Complaints identifying multiple illnesses associated with a common event or establishment** will lead to an investigation to identify the agent and the mode(s) of transmission. Most of these investigations will be local and require coordination between epidemiologists, environmental health specialists, and public health laboratorians within the jurisdiction of the event or establishment. Case-patients need to be rapidly interviewed to confirm illness and exposure details that may suggest a likely etiology and potential source of exposure. Environmental health specialists, guided by descriptive epidemiology, need to assess food-handling practices and food worker health and hygiene habits at the establishment. Public health laboratories need to test clinical specimens to confirm the etiology of the outbreak based on the description of signs, symptoms, and incubation periods (CIFOR Outbreaks of Undetermined Etiology Guidelines [*1*]). If the source of contamination was determined to be upstream from the establishment, the outbreak could involve multiple locations and require a multijurisdictional investigation (Chapter 7).
- **Clusters of cases identified through laboratory-based surveillance** at the local or state level will lead to investigations to determine the mode of transmission or source of contamination. Case-patients need to be rapidly interviewed with a thorough exposure assessment questionnaire to identify potentially common exposures or likely routes of transmission. Environmental health specialists and food regulators need to be prepared to help investigate subclusters associated with food establishments and to initiate product tracing for suspected food exposures. Public health laboratories need to rapidly confirm additional cases, and food-regulatory laboratories need to prepare to rapidly test suspected food products.
- **Multistate clusters of cases** suggest a commercially distributed food source (Chapter 7). Product tracing may be needed for successful exposure assessment. Communication and coordination of activities between local, state, and federal agencies must be established at the onset of the investigation.
- **Identification of a foodborne pathogen in a commercially distributed food product** will lead to a search for illnesses caused by the same organism and an investigation to determine whether the food item was the source of the illness. This type of outbreak presentation will most likely increase with the use of WGS to link isolates from food or environmental samples with cases identified through pathogen-specific surveillance. In all instances, investigating the possible link between contaminated food product and illnesses requires multijurisdictional investigation to assess the likelihood the cases are attributable to the suspected food exposure.

5.2 Define and Find Cases

5.2.1 Developing case definitions. Initially, case definitions reflect the cluster recognition methods.

- A cluster of illnesses linked to foodborne illness complaints most likely will be defined by similar features of the illness and by common suspected source of exposure, such as time, place, or person. As case-patients are interviewed, a distinctive clinical profile may emerge that suggests an etiology. If testing of clinical specimens confirms an agent, the features of that agent can be used to establish a clinical case definition.
- Clusters of cases identified by pathogen-specific surveillance are usually defined by common phenotypic or molecular characteristics (serotype, pulsed-field gel electrophoresis [PFGE] pattern, WGS), time

AMERICAN OVERSIGHT

frame when the cases occurred, and geographic distribution of the cases. CIDTs are a challenge to this approach. Although the initial CIDT-positive result may be available within a few days after onset of illness, the need to perform culture and then subtype the isolate means that some cases will not be subtyped, and the timeline will be longer for those that are cultured and subtyped.

- **During the early stages of the investigation, case definitions should be made specific to increase the likelihood that the detected cases share a common exposure.** Including unrelated cases in an outbreak investigation makes recognizing a common exposure more difficult and dilutes observed measures of association in analytic studies. For example, in an outbreak of salmonellosis, case-patients may share common symptoms of diarrhea and fever and all their illnesses might be caused by isolates with the same serotype that have a distinctive PFGE pattern and are closely related by WGS. Each of these additional points of identity increases the likelihood that the cases are related and the source may be identified.
- **After a common source has been identified, changing the case definition might be necessary or desirable to better assess the magnitude of the outbreak.** A change might be needed when additional pathogens, or strains of a pathogen, are linked to the same source. Although outbreaks are detected through monoclonal surveillance for highly defined clusters, many food-contamination events are polyclonal, i.e., involve multiple strains of pathogenic bacteria. The true nature of these events is usually not discovered until late in the investigation. In addition, after a common source has been identified, accounting for illnesses that occurred after exposure to the source that were not confirmed but had similar clinical characteristics to the confirmed cases can help provide a better estimate of the size, scope, and public health impact of the outbreak.

5.2.2 Reviewing current surveillance systems for illnesses that meet the case definition. Once a case definition has been established, investigators should search for more illnesses related to the outbreak.

- **For clusters of illnesses reported through complaints, review complaint logs or databases to find other complaints that identify exposure to the suspected event or establishment.** Although many complainants focus on their most recent exposure, reviewing all exposures in a 3-day food history could link unrecognized cases to the outbreak. A 3-day history may not cover the exposure window for all cases, but it covers the most common foodborne illness incubation periods and saves resources.

  In addition, if the confirmed etiology of the complaint-based outbreak is *Salmonella*, Shiga toxin–producing *E. coli*, or other foodborne pathogen for which case-patients are routinely interviewed, reviewing all exposures for case-patients interviewed during the likely outbreak period could link unrecognized cases to the outbreak.

- **For clusters identified through laboratory-based surveillance, review regular surveillance reports and laboratory reports**. In addition, for restaurants and retailers identified in the relevant exposure window, review the complaint database to identify potential subclusters of cases.

5.2.3 Supplement case-finding activities. Ask local clinical and laboratory professionals to report cases as soon as they suspect the diagnosis, alert health officials in surrounding areas to watch for illnesses that might be related, and survey groups that may have been exposed.

5.2.4 Plot Cases on an Epidemic Curve to Track Illnesses Over Time

The epidemic curve (epi curve) shows progression of an active outbreak over time. The horizontal axis (x-axis) is the date a person became ill (date of onset). The vertical axis (y-axis) is the number of persons

AMERICAN OVERSIGHT

who became ill on each date. These numbers are updated as new data come in and thus are subject to change. The epi curve is complex and incomplete. Several issues are important in understanding it:

- An inherent delay exists between the date of illness onset and the date the case is reported to public health authorities. For example, for *Salmonella* infections, this delay is typically is 2–3 weeks. Therefore, a person who became ill last week is unlikely to have been reported yet, and a person who became ill 3 weeks ago might just now be reported. (See Salmonella Outbreak Investigations: Timeline for Reporting Cases [Chapter 4, Figure 4.1].)
- Some cases are background cases of illness that most likely would have occurred even without an outbreak; therefore, determining exactly which case is the first in an outbreak is difficult. Epidemiologists typically focus on the first recognized cluster or group of cases rather than on the first case. Because of the inherent reporting delay, a cluster sometimes is not detected until several weeks after people became ill.
- For some cases, date of illness onset is not known because of the delay between reporting and case-patient interview. Sometimes an interview never occurs. If the date an ill person brought his or her specimen to the laboratory for testing is known, date of illness onset can be estimated as 3 days before that.
- Determining when cases start to decline can be difficult because of the reporting delay but becomes clearer as time passes.
- Because of the reporting delay, determining the end of an outbreak can be difficult. The curve for the most recent 3 weeks always makes the outbreak appear to be ending, even it is ongoing. The full shape of the curve is clear only after the outbreak ends.

5.3 Generate Hypotheses about Likely Sources

To narrow the focus of an investigation and most effectively use time and resources, investigators should begin to generate hypotheses about potential sources of the outbreak during the earliest stages of the investigation and refine them as they receive information. Hypotheses may emerge from common case characteristics, shared exposures, or historical information about the agent. The process comprises several key steps.

5.3.1 Review demographic information, including age, sex, and geographic and temporal distributions of case-patients. The Centers for Disease Control and Prevention (CDC) developed the System for Enteric Disease Response, Investigation, and Coordination to help organize and visualize cluster-associated data (*2*). Patterns in the distributions of these characteristics may suggest possible sources. On a local level, case surveillance data should be reviewed with data from foodborne illness complaints.

5.3.2 Review previous exposure sources linked to the agent. Identify previous vehicles associated with outbreaks and isolation of the agent from food items or food-production environments. However, avoid focusing only on historic sources because they could miss a new or previously unknown source.

5.3.3 Use standardized data collection forms, and compile data from case-patient interviews. CDC, in collaboration with states, developed a National Hypothesis Generating Questionnaire (NHGQ) to collect information on a broad range of food and nonfood exposures (http://cifor.us/downloads/clearinghouse/NHGQ_v2_OMB0920_0997.pdf).

AMERICAN OVERSIGHT

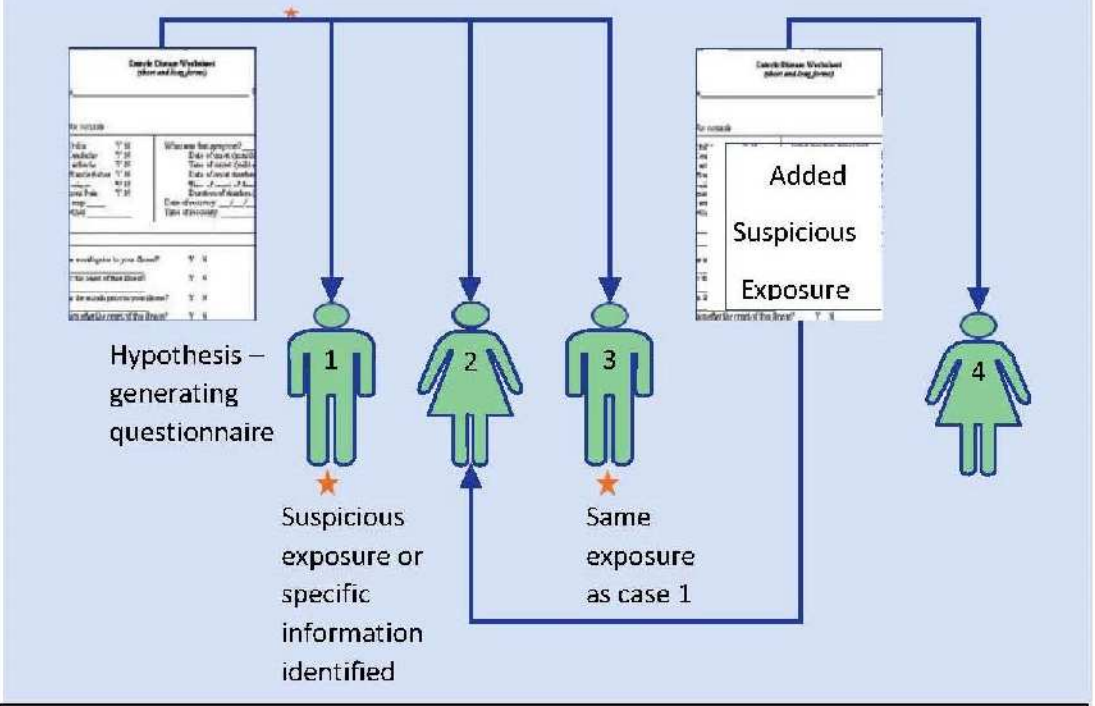
The NHGQ contains a mix of closed- and open-ended questions designed to elicit likely exposure sources. However, the NHGQ cannot capture detailed source information about all possible exposures, and supplemental approaches may be needed. A key to identifying the source of an outbreak is to collect detailed information on both the food item and its source for as many cases as possible as early in the process as possible.

When conducting hypothesis-generating interviews, use the following interview techniques to improve food recall:

- Question case-patients as soon as possible after their illnesses are reported.
- Encourage them to remember information by asking them to elaborate on where they ate, with whom they ate, and events associated with the meals. Ask them to look at a calendar from the appropriate time periods to jog their memory.
- Interview persons who prepared meals during the period of interest.
- Ask case-patients whether they keep cash register or credit card receipts, or review online banking or bank statements to indicate where or what they ate. Purchase receipts can often be reproduced if the case-patient paid with a credit card.
- If the case-patient uses a grocery store shopper card, ask permission to obtain purchase records for a specified time period. Some grocery chains readily cooperate with these requests; others require additional documentation, which delays investigation.
- Use a structured list of the places where people might get food to encourage case-patients to think about possible exposures other than restaurants and grocery stores. The list could include food pantries, farmers markets, conferences and meetings, caterers, and meal delivery services.

5.3.4 Use a dynamic cluster investigation process to generate and develop hypotheses. In the dynamic cluster investigation model, initial case-patients within a recognized cluster are interviewed with a detailed exposure history questionnaire. As suspicious exposures are identified during interviews, the initial case-patients are systematically reinterviewed to uniformly assess these suspicious exposures. Newly reported case-patients also will be asked specifically about these exposures (Figure 5.2).

On the basis of this information, investigators can identify possible exposures for further evaluation by epidemiologic, laboratory, or environmental studies. These should include the review of specific information about establishments/products of interest:



- Guest lists for common events reported by case-patients.
- Historical information on firms or food items of interest.
- Recipe and ingredient lists for common menu items.
- Shopper card data or reproduced receipts from credit card purchases to compare grocery store or online meal purchases

In practice, the generation and testing of hypotheses is an iterative process, and the hypothesis is modified as more information is obtained.

Figure 5.2. Dynamic Cluster Investigation

AMERICAN OVERSIGHT

Figure 5.2. Dynamic cluster investigation

In this model, case-patients are interviewed with a detailed hypothesis-generating questionnaire. Specific exposures shared by multiple cases might surface that are suspicious because the involve commodities not commonly eaten, or involve specific brands of a commonly eaten food item. Because the original questionnaire might not have captured these exposures, specific questions should be added to the questionnaire for future use, and to systematically re-interview cases to assess the suspicious sources discovered during the investigation process.

5.3.5 Investigate subclusters. When a group of case-patients within a cluster identifies exposure to the same individual point of service, such as a restaurant, cafeteria, grocery store, or institution, this group of cases is termed a subcluster and represents an invaluable opportunity to solve the outbreak because the outbreak vehicle was most likely served or sold by the common establishment. Thus, subcluster investigations represent a hybrid of hypothesis-generating and hypothesis-testing approaches and are a useful model of the general approach to outbreak investigations.

- **Commit all available resources to rapidly and comprehensively investigate such a subcluster to increase the investigation's likelihood of success.** If resources are not available to conduct an investigation fully and rapidly, seek assistance from other agencies.
- **Ascertain additional cases associated with subcluster locations.** In their initial interview, ask all newly identified case-patients within a cluster to identify all dining locations at which they ate during the exposure period. Case-patients often do not recall eating at some locations outside the home when asked open ended questions on initial interview (e.g., "What restaurants did you eat at?"). Ask all newly identified case-patients in a cluster specifically about the list of dining locations

AMERICAN OVERSIGHT

named by previously interviewed persons. Ascertain additional subcluster cases by contacting additional patrons of the subcluster establishment (e.g., through credit card receipts, online orders, or reservations).

- **Once a subcluster is identified, reinterview previously interviewed case-patients and ask specifically about the subcluster establishment.** Ask all newly identified cluster case-patients specifically about the subcluster establishment during their first interview. Ask them to check credit/debit card statements to improve recall. Obtain and analyze shopper card records for cases linked to common grocery store chains; grocery store receipts also can often be reproduced if the purchase was made with a credit card, even for a store without a shopper card program. Pinpointing the purchase date and meal date to the extent feasible is important. (If a receipt or credit card statement is not available, record the case-patient's level of confidence about the purchase or meal date.)
- **Gather detailed food-consumption data for subcluster cases.** Interview case-patients using the subcluster establishment's menu or, if an event cohort with a limited discrete menu is identified, a more defined menu.
    - Ask case-patients about additions or subtractions to the menu item(s) they ordered.
    - Interview the establishment manager and/or chef to obtain ingredient lists for menu items.
    - Compile a frequency distribution of ingredients consumed by case-patients. Include every ingredient consumed by at least one case-patient.
- **Conduct an analytical study at the subcluster establishment.** Conduct an ingredient-specific case–control study. There is no rule as to a minimum number of cases necessary to initiate such a study, but it is reasonable to do so with as few as three cases.
    - Identify additional cases and enroll controls by
        - Asking case-patients for meal companions;
- Obtaining credit card receipts, reservation lists, takeout orders, and/or lists of workers or students (if a school cafeteria) for patrons who dined at the establishment on the implicated meal dates.
    - Ascertain additional cases (and increase the number of controls) to increase the likelihood of meaningful results and your confidence in those results.
    - Make the clinical case definition specific for the pathogen of interest (e.g., for *Salmonella* use "fever and diarrhea" or "diarrhea duration ≥3 days") to minimize the likelihood that unrelated illness will dilute associations.
    - **Include every plausible ingredient** in the study. Be systematic—do not focus solely on one or two ingredients case-patients commonly reported. Some ingredients (e.g., spices, garnishes) may be used in multiple menu items and thus could be overlooked.
    - **Trace back suspected vehicle(s).** If there are multiple subclusters (i.e., multiple points of service), trace back ingredients implicated in analytic studies or, if analytic studies cannot be done, ingredients that case-patients most frequently consumed. Do not exclude food ingredients from an analytic study based on apparent differences in distributors for ingredients used by the subcluster establishments because commonalities in the source of food items might not occur until farther back in the distribution chain.
- **Link subclusters in multistate outbreak to look for common distribution links between establishments** (possible even if there are too few cases for a case–control study). Traceback of individual cases also can provide important information to corroborate subcluster data.

AMERICAN OVERSIGHT

5.3.6 Maintain open, regular communication between public health and regulatory partners to discuss new or updated information about the epidemiologic investigation and food/establishment findings.

5.4 Test Hypotheses

Much of the work of outbreak investigations involves developing sound hypotheses that explain the patterns of illnesses observed. Testing these hypotheses requires epidemiologic analysis of common exposures, typically combined with informational traceback and environmental assessment data that identify common contamination points in the distribution chain and testing data that identify outbreak-associated strains in implicated foods or in environmental samples linked to the foods.

5.4.1 Analytic studies: characteristics, use, and limitations. Epidemiologic studies to analyze the association between illness and exposures take different forms depending on the setting of the outbreak, number of cases reported, and public health resources available. In recent years, approaches to using these study methods have evolved that have resulted in fewer large community case–control studies. Instead, investigators now often use case-aggregation methods with comparisons to reference data or, for very specific product identification (e.g., brand names and lot numbers), direct intervention with no analytic study whatsoever.

- **Cohort study.** Cohort studies are limited to outbreaks with defined exposure settings in which exposed persons can be identified without respect to illness status, e.g,, a banquet with a defined guest list. Interviewing persons without respect to their illness status enables determination of attack rates to assess the magnitude of the outbreak and calculation of relative risks for individual exposures. Because many of these settings involve a defined menu and guest list, developing an online survey to rapidly collect illness and exposure information might be possible.
- **Establishment-specific case–control study**. In defined setting outbreaks where it is more feasible to identify individual cases than groups of exposed persons, conduct an establishment-specific case–control study (similar to a subcluster study).
- **Community case–control study.** Community case–control studies are a staple of outbreak investigations. Comparing food exposures among case-patients in an outbreak with food exposures among healthy controls has great power to identify foods associated with the illnesses. For example, in a nationwide outbreak of *Salmonella* associated with commercially distributed ice cream, the source was identified based on interviews of 15 case-patients and 15 community controls (*3*). Although results of the case–control study implicated an exposure source within 3 days after initiating the case–control study, regulatory testing to confirm the source of contamination required an additional 10 days.
    - Having a stringent case definition is important to reduce the likelihood of including unrelated cases in the study. Because unrelated cases would not share the same exposure source, they would reduce the apparent odds ratio, and make it difficult to implicate the exposure source. WGS subtyping enables stringent case definitions. Along with specific case definitions, having detailed exposure source information is critical.

      Despite their empirical usefulness, large community-based case–control studies are no longer routinely conducted in outbreak investigations. Recruiting suitable controls because of the changing demographics of telephone use is increasingly difficult. Thus, they have become too expensive to conduct and can be too slow to produce actionable results.

AMERICAN OVERSIGHT

- **Case–case comparison studies.** Case–case comparison studies provide many of the same benefits as community case–control studies but are logistically easier to conduct. Molecular subtype–specific surveillance based on PFGE or WGS makes it possible to compare cases caused by an outbreak-associated strain with cases caused by unrelated strains. Because cases caused by unrelated strains have many different sources of exposure, they make an efficient control group. When persons with sporadic cases are routinely interviewed with detailed food-exposure questionnaires, case–case comparison studies can be conducted. For example, in the 2011 outbreak of listeriosis identified by the Colorado Department of Public Health and Environment, cantaloupe was implicated by comparing exposures from reported outbreak-associated case-patients to aggregated exposures of nationally reported cases collected by CDC's *Listeria* Initiative (*4*).

  Case–case comparisons produce the same measures of association as case–control studies and are interpreted the same way. The increased stringency of WGS to discriminate outbreak-associated from unrelated cases makes case–case comparisons a desirable alternative to case–control studies when aggregate case exposure data are available.

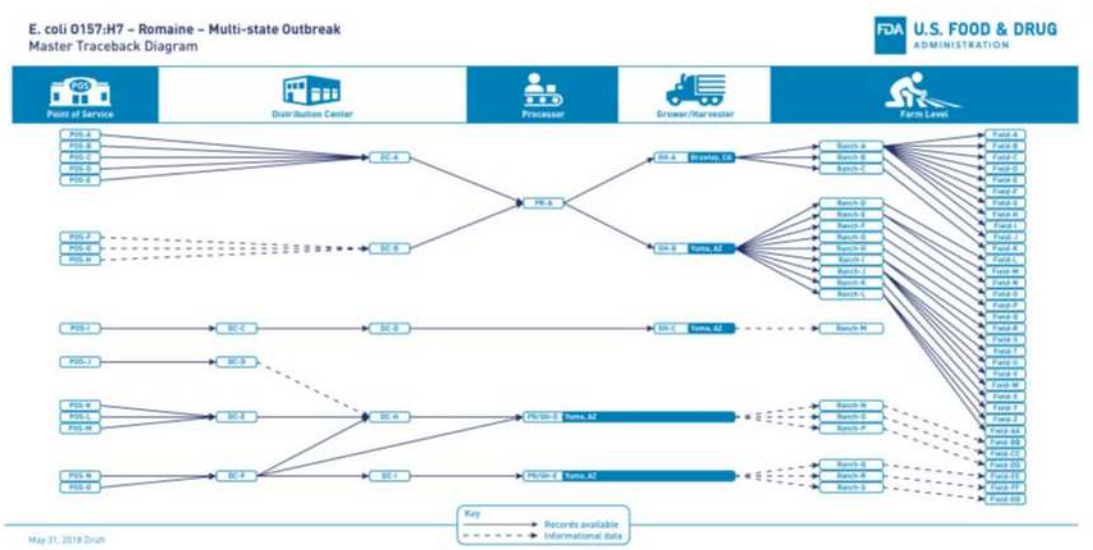
- **Case series with binomial exposure assessments.** The use of case series with binomial exposure assessments was pioneered by the late Bill Keene at the Oregon Health Authority, who also developed a simple binomial calculator to test the significance of differences between case and population exposure proportions. Like the other analytic study methods, it requires that outbreak-associated case-patients to be systematically interviewed using a detailed exposure questionnaire. However, instead of comparing case exposure histories with community controls or unrelated cases, the case exposures are compared with an expected value based on population survey data. FoodNet's Atlas of Exposures (*5*) has been the most commonly used source of population exposure data. However, changing food consumption patterns limit the usefulness of 2006 Atlas data for some exposures. A survey to collect updated population exposure data was conducted in December 2017 through July 2019. Identifying current, local population exposure data is preferred. The Oregon Health Authority is compiling multistate sporadic *Salmonella* case exposure data known as Project Hg, for case–case binomial comparisons (6).

  The binomial comparison functions as advanced hypothesis generation. It identifies associations that must be confirmed by product source tracing and corroborated by other investigation findings. Statistically, binomial comparisons emulate very large case–control studies. Results must be cautiously interpreted to avoid spuriously significant results that could lead to errors in identifying the source of an outbreak.

For all analytical studies the significance of results depends on the strength of the association and the size of the study. Thus, studies with large numbers of cases are more likely than studies with few cases to yield statistically significant results. However, the goal of outbreak investigations is to rapidly identify the source to prevent additional cases. In this regard, WGS will improve the efficiency of these studies by providing precise case definitions. Increasing the specificity of food exposures will similarly increase the efficiency of the study. However, with WGS, the expected increase in small cluster investigations limits the usefulness of any of these study designs to produce "significant" results. For clusters involving fewer than five cases, product source tracing and corroborating evidence are needed to confirm the source.

AMERICAN OVERSIGHT

5.4.2 Product tracing. Tracing the source of food items or ingredients through distribution to source of production can be critical to identifying epidemiologic links among cases or ruling them out. For nonbranded commodities, such as produce items, the identification of a common point in multiple distribution pathways that provided a suspected product to case-patients may identify the point where the food(s) became contaminated (Figure 5.3). An onsite environmental assessment of this point (farm, ingredient supplier, processor, restaurant) can then be conducted to identify the contributing factors and environmental antecedents that caused the outbreak. Once the source is identified, tracing products forward through distribution can help identify additional cases or help remove contaminated product from the marketplace. Product tracing is an important tool to inform the epidemiologic investigation, test the hypothesis, and control the outbreak.



Two types of product tracing tools can be used to investigate outbreaks. **Traceback** investigations are used to trace a product suspected to cause the outbreak through the supply chain to determine whether it converges on a common source or supplier. Once a common source or supplier of the contaminated product is identified, **traceforward** investigations are used to determine other locations that received the contaminated product. Both traceback and traceforward activities can be conducted as informational or regulatory endeavors. Informational product tracing needs to be conducted quickly to be incorporated into the epidemiologic studies. Formal regulatory product tracing may be subsequently needed to confirm the distribution of implicated products.

Traceback Investigations. Traceback investigations begin at the point of service where a case-patient was exposed to the product. Informational, traceback investigations are conducted to help inform the epidemiologic investigation and can be the final step in confirming the outbreak vehicle (http://mnfoodsafetycoe.umn.edu/wp-content/uploads/2015/10/Product-Tracing-in-Epidemiologic-Investigations.pdf).

- If two or more case-patients report the same point of service, specific information must be collected from this subcluster so a traceback investigation can be initiated.
  - Ideal subclusters contain case-patients who can provide the following information: precise illness onset dates, exposure dates to the product of interest, and relative certainty about what foods they ate before illness onset.
  - Traceback of individual cases can provide important information to corroborate subcluster data.
- As informational tracebacks progress and a single product of interest is identified, regulatory traceback can be performed if necessary to assist in confirming the vehicle. These regulatory tracebacks enable detailed record collection and documentation of the product of interest through the supply chain.
- Once an informational traceback is initiated, specific information is necessary from the case-patients within the subcluster and from the point of sale. As the traceback continues, establishment types will change and questions about the handling of the product of interest, time frames, and available record need to be amended accordingly.

Figure 5.3. Exposure Distribution Pathways Documented During Informational Traceback of Romaine Lettuce during an *Escherichia coli* O157:H7 Outbreak. Romaine lettuce from multiple growers in the Yuma, Arizona, growing region were implicated as the source of the outbreak. The lack of association with a single grower ultimately reflected the use of contaminated surface water by multiple growers (*7*).

AMERICAN OVERSIGHT

Information collected from each subcluster serves as one leg of the overall traceback investigation. Distribution chains from multiple traceback legs are documented and compared to identify commonalities. Convergence of multiple legs of a traceback on a specific facility assists in targeting resources for environmental assessments, inspections, and/or sampling. In addition, information from the traceback is continuously evaluated as part of the evidence for the overall outbreak investigation; convergence reinforces the hypothesis generated by the epidemiologic investigation.

Informational traceback investigations continue until the product of interest is followed as far back through the supply chain as possible. Interpretation of the traceback can be challenging and should not be done without consideration of the epidemiologic, laboratory, and environmental information collected during the investigation. If no convergence on a single supplier is identified, reevaluate the hypothesis. Informational tracebacks are challenging and can be limited by a case-patient's ability to accurately remember his or her food history, poor record-keeping, lack of common product identifiers through the supply chain, co-mingling, and many other factors. Therefore, lack of convergence of a traceback does not necessarily rule out a vehicle as the source of the outbreak.

Important information for initiation of informational tracebacks:

- **Subcluster information**
  - Exposure dates to product at point of sale (including location name and address).
  - Identification of specific menu items or purchases.
  - Documentation of purchase of product (e.g., credit card, shopper card).
- **Point-of-sale information**
  - List of ingredients in menu items or purchases of interest.
  - Time frame of interest for distribution record collection (determined by considering case-patient exposure dates, product shelf life, shipment frequency, and other pertinent factors).
  - Identity of all suppliers of the product of interest to the point of sale.
  - Frequency the product of interest is ordered by the point of sale.
  - Product handling and inventory management in the facility (example: First in First Out).
  - Point of sale handling of shipments and documentation of receipt of the product of interest.

AMERICAN OVERSIGHT

- Storage and transportation practices, potential cross contamination; products with common source materials.
- Distribution records (e.g., invoices, order forms, bills-of-lading) for the time frame of interest that are available at the point of service/sale. Note gaps in or concerns about record keeping.

Traceforward investigations. Tracing products forward in the supply chain can determine where contaminated products were distributed and enable their removal from the supply chain (Chapter 6). Traceforward investigations also are an important tool to identify additional case-patients who were exposed to contaminated products. In the hypothesis-testing phase of an outbreak investigation, tracing a suspected product forward can identify additional points of sale that received the suspected product. Enhanced surveillance efforts in areas where suspected products were distributed can be an effective way of identifying new clinical cases. Linking points of sale of suspected products with additional clinical cases provides additional evidence about the outbreak source.

Communication of product tracing information. Product tracing is always multijurisdictional and requires strong collaboration between public health and regulatory agencies. Predetermined lines of communication should be in place to effectively move information between the necessary parties. Updates on the epidemiologic investigation being conducted by the public health agency may greatly impact the traceback being conducted by the regulatory agency and vice versa.

Special considerations need to be given to distribution information collected by regulatory agencies because it may be protected from disclosure by confidentiality agreements. Investigational partners should have agreements in place to allow for the lawful exchange of the information (Chapters 3 and 7).

5.4.2 **Environmental assessments.** When a food-production, food-processing, or food-service establishment is identified as being associated with a foodborne illness outbreak, environmental health and/or regulatory officials should conduct an environmental assessment. To stop the current outbreak and prevent future ones, investigators must identify both how (contributing factors) and why (environmental antecedents/root causes) the food became contaminated so effective controls can be put in place (Table 5.2).

Table 5.2. Differences between Routine Inspections and Environmental Assessments

Routine Inspection	Environmental Assessment
• Nontargeted • Regularly scheduled • Snapshot of current day • Code/regulation-based • Assessment of current conditions • Identification of violations	• Targeted • Response to an outbreak • Focus on the past • Outbreak information-based • Examination of processes and problems during outbreak • Identification of system failures • Identification of underlying factors that enable the system failure

An environmental assessment is a systematic, detailed, science-based evaluation of environmental factors that contributed to the introduction and/or transmission of agents that cause an illness in an outbreak. Environmental assessments are conducted in response to an outbreak and address specific food and process(es) to identify the outbreak's cause. The environmental assessment is guided by

AMERICAN OVERSIGHT

epidemiologic and laboratory information and examines how the causative agent, host factors, and environmental conditions interacted to result in the system failure and people becoming ill.

Goals of an environmental assessment:

- **Identify contributing factors**
  - Factors that introduce or otherwise permit contamination and relate to how the agent got onto or into the food vehicle.
  - Factors that enable proliferation or growth of the agent and relate to how the bacterial agent could increase in numbers and/or produce toxins before the vehicle was ingested.
  - Factors that enable survival or fail to inactivate the contaminants and refer to processes or steps that should have eliminated or reduced the microbial agent.
- **Identify environmental antecedents (root causes) that enabled the system failure**
  - Assessing the internal system components (e.g., people, equipment, processes, foods, and economics) and their effect on allowing the system failure to occur
  - Identifying and address root causes of outbreaks that appear to be part of a pattern.

Five main steps in conducting an environmental assessment:

- **Plan and prepare:** Members of the outbreak investigation team review epidemiologic information, product tracing information, laboratory results, and food facility information. Roles and responsibilities, intended outcomes, sampling plans, and ways the team will communicate during the site visit should be determined at this step.
- **Visit the site:** Observe the facility, and evaluate its practices. Collect records and samples pertinent to the investigation. Information that can be collected as part of the visit includes
  - How food moves through the establishment (physical flow diagram).
  - How food is processed and handled within the establishment (process flow diagram).
  - Policy and procedures in place at the establishments and interviews with responsible parties about the execution of policies and procedures.
  - Ill employee records.
  - Sales records for the suspected food item.
  - Employee interviews.
  - Product coding and distribution information if food is suspected to have arrived at the facility contaminated.
- **Assess information:** Review information to identify the outbreak's contributing factors and environmental antecedents.
- **Recommend prevention and control strategies:** Control strategies reflect steps that should be taken immediately to stop the outbreak and prevent further spread of the agent. Longer term strategies reduce the likelihood of future outbreaks at this type of establishment (Chapter 6).
- **Complete the report:** Prepare a summary of the findings that includes detailed diagrams, descriptions, and results. Incorporate this report into the outbreak investigation report.

The timing of an environmental assessment depends largely on the specifics of the outbreak and available information but should be initiated as soon as possible (ideally an initial site visit within 24–48 hours after identification of the establishment). Early investigation and collection of food and environmental specimens will best reflect the conditions at the time of the outbreak. In addition, possible food vehicles can be discarded or grow old, and persons involved in the production,

AMERICAN OVERSIGHT

processing, storage, transportation, or preparation of the item can change their practices and procedures. If investigators have identified a common location and a profile of symptoms among ill persons that indicates whether the illness agent is likely to be viral, bacterial, toxic, or chemical, they often can begin an environmental assessment based on possible factors more likely to be associated with that illness-causing agent. As more information becomes available, investigators may need to make additional trips to the establishment to investigate the additional lines of inquiry.

Communication of environmental assessment findings is vital. Share results of the environmental assessments with the outbreak investigation team as soon as possible. This information may change the course of the investigation or confirm the suspected food item causing the outbreak. Sharing findings with industry partners on the contributing factors and environmental antecedents that led to contamination is key to improving hazard identification and implementing control measures (*8*).

5.4.4 Laboratory testing of food products and environments. Targeted sampling of food items and environments of interest in the outbreak investigation can help confirm the food causing illness. Targeted sampling occurs when partners working on the epidemiologic and traceback investigations share information about products and establishments of interest. Coordinate with the testing laboratory, and consider sampling products and storing appropriately for potential future testing to reduce the chance the product of interest will be unavailable for sampling later.

- Sampling products of interest early in the epidemiologic investigation can help quickly bring an investigation together, especially if the products of interest are shelf stable. In 2017, state and local authorities sampled soy nut butter reported by case-patients associated with an outbreak of *E. coli* O157:H7 (*9*). The positive samples generated by that early sampling was used as evidence to suspend the registration of the facility manufacturing the product. Not all product sampling occurs at the outset of an investigation. Traceback investigations can identify locations along the supply chain to collect samples.
- Food and environmental sampling enables investigators to directly test hypotheses generated during an investigation, often picking up where analytic studies leave off. By gathering information about items of interest (such as food items or ingredients commonly consumed at a restaurant in question; animals to which case-patients were exposed before illness; or other less common environmental exposures, such as contaminated milk crates), investigators can target very specific items or areas to sample for microbiologic testing. When combined with the case series with binomial exposure assessments, such testing can quickly hone a list of suspected products to a single source.
- Sampling also can be used to illuminate the root cause of product contamination, especially when done in partnership with the grower or product manufacturer. Pathogens such as *Salmonella* and *L. monocytogenes* are known to persist in manufacturing and processing environments. Identification of a pathogen in a processing environment that was linked by epidemiologic and traceback information to clinical cases supports confirmation of the outbreak vehicle.
- WGS is being used to perform molecular subtyping on pathogens recovered from foods and environments impacting foods. The high resolution of WGS increases confidence in the relatedness of pathogens from products and environments to clinical samples. Food or environmental samples that are closely related by WGS can launch retrospective outbreak investigations, in which laboratory evidence from the products or environments drives the epidemiologic investigation. Retrospective outbreak investigations often lead to the swift identification of the outbreak source.

AMERICAN OVERSIGHT

5.4.5 Coordination of epidemiologic, traceback, and sampling activities. Whether the outbreak is restricted to one jurisdiction or involves multiple jurisdictions, notification and updates should be provided to other interested agencies following the Special Considerations for Multijurisdictional Investigations (Chapter 7).

- Arrange for the outbreak investigation and control team to meet daily and to regularly update the entire outbreak control team. In particular, if the outbreak has gained public attention, the public information officer needs to prepare a daily update for the media.
- During investigation of outbreaks involving events or establishments, maintaining close collaboration between epidemiology and environmental health is particularly important. Interview results from persons who attended the event or patronized the establishment will help environmental health specialists focus their environmental assessments by identifying likely agents and food vehicles. Similarly, results of interviews of food workers and reviews of food preparation can identify important differences in exposure potential that should be distinguished in interviews of persons attending the event or patronizing the establishment. For example, environmental health investigators might determine that food items prepared only on certain days or by certain food workers are likely to be risky. These refinements also can help establish the need for or advisability of collecting fecal samples from food workers or food and environmental samples from the establishment.
- During the earliest stages of the investigation, patrons need to be interviewed rapidly. However, the focus of outbreak activities is likely to shift to interviews of food workers, environmental assessments of the establishment, and review of food-preparation procedures as the investigation progresses.
- During investigation of outbreaks detected by pathogen-specific surveillance, the public health laboratory needs to immediately forward case information to epidemiologists for every new potentially outbreak-associated case they receive. Doing so ensures rapid enrollment of new cases in the outbreak investigation studies. Similarly, as investigators acquire information from case-patients about exposures in restaurants and other licensed facilities, they should rapidly forward that information to environmental health specialists to ensure rapid identification of commodity ingredients and their distribution sources.
- During the early stages of an investigation, efforts to identify mode of transmission and food vehicle require close coordination of the outbreak team under the leadership of epidemiology. After identification of a likely food vehicle, efforts to identify the source of contamination and contributing factors require engagement of local, state, or federal food-regulatory programs. As the investigation proceeds, the outbreak investigation and control team should always consider whether any information indicates the outbreak might be multijurisdictional (Chapter 7).

5.5 Evaluate Evidence to Solve Point of Contamination and Source of the Food

AMERICAN OVERSIGHT

5.5.1 Evaluate evidence. Identifying the source of contamination and taking action to prevent additional illnesses requires effective and timely integration of three types of data:

- Epidemiologic data that describe illness distributions and enable analysis of common exposures.
- Traceback and environmental assessment data that identify common contamination points in the distribution chain.
- Testing data that identify outbreak-associated strains in implicated foods or in environmental samples linked to the foods.

Evidence from each of these pillars of the outbreak investigation is evaluated in concert to determine whether the data support the conclusion that a suspected food or other exposure caused the outbreak. Investigators typically determine that they have identified the likely source of the outbreak when they have clear and convincing evidence from two pillars. In rare instances, data from one pillar alone might be sufficient to determine the likely source of an outbreak (e.g., complaints or point source clusters linked to a meal or single event). In investigations of products with a short shelf life (e.g., unpasteurized milk or leafy greens), conducting testing on products during the likely period of contamination might be impossible and investigators must rely on evidence from the other pillars to determine the likely source of the outbreak.

5.5.2 Solve point of contamination and source of the food. The outbreak investigator's job is to use all available information to construct a coherent narrative of what happened and why. This begins with the initial detection of the outbreak and formation of hypotheses based on the agent's ecology, microbiology, and mechanisms of transmission in addition to the descriptive epidemiology of reported cases. Results of subsequent analytic studies (e.g., cohort or case–control study results) must be integrated with results of product tracing, food worker interviews, environmental assessments, and food-product and environmental testing. When all of these data elements support and explain the primary hypothesis, investigations can draw very strong conclusions (Box 5.1).

DRAFT

AMERICAN OVERSIGHT

Box 5.1. Questions to Consider When Associating an Exposure with an Outbreak

Strength of association

- How strong was the association between illness and the implicated item? (The strength of the association increases with the size of the odds ratio or relative risk: 1 = no association; <5 = relatively weak association; 5–10 = relatively strong association; >10 = very strong association.)
- Was the finding statistically significant? (<0.05 is a traditional cutoff p value, but in small studies, even relatively strong associations might not reach this level of significance. Conversely, in large studies examining many exposures, relatively weak associations might reach this level of significance by chance or as an effect of confounding.)
- Were most ill persons exposed to the implicated item? "Yes" is desirable but might not always be apparent if the implicated item is an ingredient in multiple food items.)

Timing

- Did the exposure to the implicated item precede illness by enough time for a reasonable incubation period?
- Do the time windows obtained during traceback and traceforward investigations correlate with reported dates of production, distribution, and purchase of the implicated item?

Dose–response effects

- If assessed, were persons with greater exposure to the implicated item more likely to become ill or have more severe clinical manifestations?

Plausibility

- Is the association consistent with historical experience with this or similar pathogens? Can investigators develop a rational explanation for opportunities for contamination, survival, and proliferation of the pathogen in the implicated item? (If otherwise strong and consistent results cannot be readily explained, the outbreak might herald emergence of a new hazard, which will require additional studies to confirm.)
- Is the geographic location of ill persons consistent with the distribution of the implicated item? (Discrepancies might be explained by gaps in surveillance, product distribution data, or involvement of additional food products.)

Consistency with other studies

- Studies associated with current investigation
    - Do the results of traceback and traceforward investigations suggest a common source?
    - Have environmental health assessments identified problems in the production, transport, storage, or preparation of the implicated item that would enable contamination, survival, and proliferation of the pathogen in that item?
    - If the pathogen was isolated from ill persons and from the implicated item, do subtyping results (e.g., WGS analysis) confirm the association?
- Studies not associated with current investigation
    - Is the association between the pathogen and the implicated item consistent with other investigations of this pathogen?

AMERICAN OVERSIGHT

Outbreak investigators should be open to new developments and new twists to old problems. New hazards are frequently identified through outbreak investigations. However, they should be wary of explanations that depend on implausible scenarios.

5.6 Implement Control Measures, Investigation Closeout, and Reporting

5.6.1 Deciding an outbreak is over (Chapter 6). Outbreaks end when cases are no longer detected or reported. Outbreak investigations can continue after the outbreak ends, given product tracing and observations on practices at suspected firms may take longer to obtain. In addition, control measures need to be evaluated if the source of the outbreak was identified. For outbreaks where the source has not been identified, consideration to the prioritization of resources and expected outcome of the investigation should be considered before continuing investigational activities. Experience reminds us—again and again, unfortunately—that even seemingly well-executed investigations can be inconclusive. Small sample sizes, multivehicle situations, "stealth" food items that may not be recognized, and foods with high background rates of consumption are only some of the factors that can reduce the effectiveness of standard epidemiologic methods and make investigations extremely difficult.

AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

Table 5.1. Objectives and Investigation Activities that Can Be Conducted During Epidemiologic, Environmental Health, and Public Health Laboratory Investigations of Foodborne Illness Outbreaks*

Objective	Epidemiology	Environmental Health	Public Health and/or Food Testing Regulatory Laboratory
Identify etiologic agent.	If outbreak is associated with event or establishment:		
	• Contact healthcare providers of case-patients who have sought medical attention. • Interview case-patients to characterize symptoms, incubation period, and duration of illness. • Obtain fecal specimens from case-patients. • Determine whether symptoms, incubation period, or duration of illness suggest a likely pathogen. • Establish case definition based on confirmed diagnosis or clinical profile of cases.	• Interview management to determine whether it has noticed any ill employees or any circumstances that could cause a foodborne illness. • Interview food workers to determine illness. This activity also could be conducted by nursing/healthcare staff. • Obtain fecal specimens from ill or all food workers. This activity could also be conducted by nursing/healthcare staff. • Obtain and store samples of implicated and suspected food items and ingredients. • Determine whether setting or food item suggests a likely pathogen.	• Contact clinical laboratories that might have performed primary testing on case-patients, and obtain specimens or isolates. • Test fecal samples to identify agent. • Test samples of implicated food items to identify agent. • Subtype all isolates as soon as possible after receipt.
	If outbreak is identified by pathogen-specific surveillance: Agent is known.		
Identify persons at risk, and determine size and scope of outbreak.	If outbreak is associated with event or establishment:		
	• Obtain from event organizer a list of persons attending event or, if possible, list of persons patronizing the establishment during the outbreak period. • Interview persons who attended event or patronized establishment to determine attack rates by time. • Contact healthcare providers to identify additional persons seeking medical care	• Obtain list of reservations for establishment, credit card receipts, receipts for takeout orders, inventory of foods ordered at establishment, or guest lists for events. Where possible, obtain information electronically.	• Contact clinical laboratories to identify additional fecal specimens being tested.

AMERICAN OVERSIGHT

	whose illnesses meet the case definition. • If identified agent is reportable, review recently reported cases to identify possible exposures to event or establishment.		
	If outbreak identified by pathogen-specific surveillance:		
	• Alert healthcare providers of possible outbreak to identify additional persons seeking medical care, and review laboratory reports and medical charts at hospitals or physicians' offices to identify possible cases. • Ask case-patients if they know of others who are similarly ill. • Depending on nature of outbreak, take additional steps as warranted.For example, review employee or school absences, review death certificates, survey population affected, or directly ask members of the public to contact the health department if they have the illness under investigation.	• Review foodborne illness complaints to identify undiagnosed cases that could be linked to outbreak. • Contact restaurants, grocery stores, or other points of final service visited by multiple case-patients to identify employee illnesses or foodborne illness complaints from patrons.	• Contact clinical laboratories to identify additional fecal specimens being tested. • Prioritize referral and subtyping of outbreak pathogen.
Identify mode of transmission and vehicle.	If outbreak is associated with event or establishment:		
	• Determine appropriate analytical study approach. • Interview identified case-patients and controls or well meal companions about all common exposure sources. • Calculate measures of association for specific exposures, appropriate to study design (i.e., odds ratios for case–control study or attack rates and relative risks for cohort study).	• Obtain menu from establishment or event. • Interview food workers to determine food-preparation responsibilities. • Reconstruct food flow for implicated meal or food item. • Identify contributing factors and environmental antecedents. • Obtain samples of implicated food. • Obtain environmental samples from food contact surfaces or possible environmental reservoirs.	• Test implicated food and environmental samples to confirm presence of agent. • Subtype all isolates as soon as possible after receipt. • Conduct applied food-safety research to determine ability of agent to survive or multiply in implicated vehicle and how vehicle might have become contaminated.
	If outbreak identified by pathogen-specific surveillance:		

AMERICAN OVERSIGHT

	• Interview case-patients as soon as possible with standardized detailed exposure history questionnaire to identify possible common exposures. • Establish case definition on the basis of characteristics of agent that led to detection of outbreak. • Characterize cases by person, place, and time, and evaluate this descriptive epidemiology to identify patterns possibly associated with particular food items or diets. • Compare detailed exposure history questionnaire frequencies against known or estimated background exposure rates, to identify suspected food item. • Interview nonill community controls or nonoutbreak-associated ill persons to obtain detailed exposure information to be used in a case-comparison analysis of exposures. • Obtain shopper card information to identify and verify grocery purchases and possibly determine background rates of purchase of item. • Document brand names and product code information for prepackaged food items. • Analyze exposure information comparing cases to relevant comparison groups (e.g., nonill controls or cases not associated with outbreak) to implicate food item or nonfood exposure source.	• Contact restaurants, grocery stores, or other locations identified by multiple case-patients to verify menu choices, identify ingredients, and identify distributors and/or source(s) for ingredients and/or food items of interest. • Obtain samples of suspected food items. Work with appropriate regulatory authority to ensure that food samples are collected and maintained with appropriate chain of custody. This will help the regulatory authority to take appropriate regulatory action. • Conduct an informational traceback to determine whether a suspected food vehicle from multiple case-patientss has a distribution or other point in common. • If specific food item or ingredient is implicated, conduct formal regulatory traceback.	• Store collected food samples, pending results of epidemiologic analyses. • Culture implicated food samples to confirm presence of agent. • Conduct whole-genome sequencing to further characterize pathogen as necessary for investigation. • Conduct applied food-safety research to determine ability of agent to survive or multiply in implicated vehicle and how vehicle might have become contaminated.
Identify source of contamination.	If outbreak is associated with event or establishment:		
	• Combine descriptive and analytical	• Interview food workers to	• Evaluate results of all

AMERICAN OVERSIGHT

	epidemiology results to develop a model for the outbreak.	determine food-preparation responsibilities. ● Reconstruct food flow for implicated meal or food item. ● Evaluate food flow for implicated meal or food item to identify contamination event at point of preparation or service. ● If no contamination event identified, trace source of ingredients of implicated food item back through distribution to point where a contamination event can be identified or, if no contamination events can be identified during distribution, to source of production.	outbreak-associated culture subtyping to highlight possible relations among isolates from clinical, food, and environmental samples. ● Conduct applied food-safety research to determine how vehicle might have become contaminated.
If outbreak is identified by pathogen-specific surveillance:			
	● Combine descriptive and analytical epidemiology results to develop a model for outbreak.	● Trace source of implicated food item or ingredients through distribution to point where a contamination event can be identified or to source of production if no contamination events can be identified during distribution. ● Conduct environmental assessment of likely source of contamination, including ○ Reconstruct food flow for implicated food item. ○ Interview food workers to determine food-preparation responsibilities and practices before exposure. ○ Obtain samples of implicated food or ingredients. ○ Obtain environmental samples from food contact surfaces or potential	● Evaluate results to highlight possible relations among isolates from clinical, food, and environmental samples. ● Conduct applied food-safety research to examine likely sources of contamination. ● Work with appropriate regulatory authority to ensure that food samples are collected and maintained with appropriate chain of custody. This will help the regulatory authority to take appropriate regulatory action.

AMERICAN OVERSIGHT

	environmental reservoirs.		
Identify contributing factors and antecedents (root causes)	If outbreak is associated with event or establishment:		
	• Summarize information to identify confirmed or suspected agent. • Summarize information to identify confirmed or suspected food vehicle.	• Evaluate results of environmental assessment, given identification of agent and results of epidemiologic investigation, to identify factors most likely to have contributed to outbreak and their environmental antecedents.	• Summarize information about testing results from clinical, food, and environmental samples.
	If outbreak is identified by pathogen-specific surveillance:		
	• Summarize information to identify confirmed or suspected food vehicle.	• Evaluate results of environmental assessment, given identification of agent and results of epidemiologic investigation, to identify contributing factors and antecedents.	• Summarize information about testing results from clinical, food, and environmental samples. • Provide background statistics on pathogen prevalence.
Determine potential for ongoing transmission and need for abatement procedures.	If outbreak is associated with event or establishment:		
	• On the basis of agent, incubation period, and likelihood of secondary spread, create epidemic curve, and evaluate the course of the outbreak to determine whether additional cases may still be occurring. • If outbreak appears to be ongoing, review possible control measures in collaboration with environmental health specialists.	• Implement control measures to prevent further exposures: ○ Verify that all food workers who pose a risk for transmission have been excluded or restricted, as appropriate. ○ Verify that potentially contaminated foods have been properly disposed of. ○ Verify that food contact surfaces and potential environmental reservoirs have been adequately cleaned and sanitized. ○ Train staff in safe food-preparation practices. ○ Modify food-production and food-	• Assess status of completed and pending testing to identify gaps that suggest a potential for ongoing transmission.

AMERICAN OVERSIGHT

	preparation processes with appropriate preventive controls. ○ Modify menu. ● If any of these measures cannot be verified, review additional control measures, or if further exposure appears likely, alert public or close premises.	
If outbreak is identified by pathogen-specific surveillance:		
● Create and evaluate epidemic curve to determine whether additional cases might still be occurring. ● If outbreak appears to be ongoing, continue surveillance, and review potential abatement procedures.	● Verify that food workers who might have been infected during outbreak and who pose a risk for transmission have been excluded or restricted, as appropriate. ● Verify that potentially contaminated foods have been removed from distribution. ● Train staff on safe food-preparation practices. ● Modify food-production and food-preparation processes by implementing appropriate preventive controls. ● Modify menu.	● Assess status of completed and pending testing to identify gaps that may suggest a potential for ongoing transmission.

*The table format highlights the major objectives of the investigation to help ensure coordination among epidemiologists, environmental health specialists, and laboratorians in meeting each objective. The assignment of investigation responsibilities to a particular discipline within each table is not intended to be prescriptive. The actual responsibilities for an individual vary by the practices of the jurisdiction responsible for the investigation, roles defined in the outbreak investigation and control team, and resources.

AMERICAN OVERSIGHT

Chapter 6: Control Measures and Prevention

Chapter Summary Points

- Effective control measures include a combination of immediate controls to stop the current outbreak and longer term controls to prevent future outbreaks.
- Effective and timely information sharing among investigation and response partner agencies, impacted food industries, and the public is essential to control foodborne illness outbreaks.
- Appropriate control measures vary depending on whether the implicated food was contaminated
  - At a single local food-service or retail food establishment, or
  - Before being commercially distributed.
- Three strategies used to stop foodborne illness outbreaks are
  - Controlling contaminated foods at their source.
  - Controlling contaminated food products that have left the source (e.g., recalls).
  - Preventing secondary spread of infection.
- To identify appropriate control measures, information from different sources, such as epidemiology, laboratory, and environmental health should be integrated into the outbreak response.
- General control measures are often followed up with more specific controls as investigators learn more about the source(s), contributing factor(s) and root cause(s) (i.e., antecedents, underlying reasons) of the outbreak.
- Investigation and control teams should use the after-action review processes to:
  - Assess the strengths and limitations of past responses.
  - Identify action steps to improve future responses.
  - Track corrective actions using the organization's continuous process improvement programs.
  - Prevent outbreak recurrence by applying lessons learned regarding root cause and contributing factors.
- Foodborne illness investigation reports are used to accurately document actions and conclusions to improve future investigation practices and make changes to prevent future outbreaks.

URLs in this chapter are valid as of July 29, 2019.

DRAFT

AMERICAN OVERSIGHT

6.0 Introduction

6.0.1 The purposes of outbreak investigations are to stop the current outbreak, determine how contamination occurred, and implement measures to prevent future outbreaks by addressing the root cause(s) in the implicated, and potentially other, facilities. Whereas the investigation is critical for understanding the cause, effective and timely control measures are critical for stopping the outbreak and preventing reoccurrence of illness. Identifying the root cause(s) of foodborne illness improves the effectiveness of prevention efforts.

The rapid and accurate response to foodborne illness is critical.

Investigators from all three primary disciplines (epidemiology, environmental health, and laboratory) must quickly assess information and identify suspected foods or facilities to prevent additional illnesses.

There are generally two types of foodborne disease outbreaks, and each requires different control measures.

- **Local outbreaks** may be associated with food-preparation errors or contamination of food by food workers at the site of preparation or distribution, e.g., foods prepared at home, food-service, and retail food establishments. Local outbreaks typically are controlled through local actions.
- Outbreaks associated with contaminated **commercially distributed foods** may originate from a commercial food manufacturer or agricultural commodity distributed to multiple sites. The resulting foodborne illness may be linked to a variety of food establishments or to foods prepared in the home. These outbreaks are usually multijurisdictional and require coordinated intervention by local, state, territorial, tribal, and federal agencies and the industry.

6.0.2 Effective communication between team members and with other response partners is essential during all phases of the investigation to ensure opportunities to quickly implement or improve control measures are not missed. The exchange of specific actionable information is paramount to success. Communication within the response team and with other stakeholders during an outbreak response is of primary importance. For all foodborne illness outbreaks, early sharing of information between epidemiologists, laboratory staff, and environmental health specialists is critical to determine what control measures to implement to prevent foodborne illness. Timely food-supply investigations, such as product tracing and environmental assessments, can better define the food vehicle(s) that need to be controlled and identify the contributing factors and environmental root causes that led to foodborne illness (Chapter 5).

6.1 Information-Based Decision Making

6.1.1 Investigation and control teams should be prepared to act at any point in the investigation when credible information identifies opportunities to control or mitigate disease transmission. Controls can be implemented concurrently with product tracing (i.e., traceback, traceforward) investigations, environmental assessments, or other investigative processes. Waiting for laboratory results, medical diagnosis confirmation, or implication of a specific food may not be necessary before implementation of initial control measures to prevent additional exposures.

AMERICAN OVERSIGHT

Control measures typically progress from general to specific as investigations gather more information and should be implemented immediately whenever their need becomes apparent. General precautionary control measures that have high potential for public health benefit and low impact on business operations are usually not controversial and can be implemented relatively quickly in the field by the regulatory authority. Examples include holding a suspected nonperishable food from sale or screening for and excluding an ill employee. Decisions to implement more costly controls, such as recalling a food from distribution or closing a facility, should be based on clear and convincing evidence that food from the facility caused illness or that an imminent hazard to health exists. These decisions should involve input from the entire response team, including risk communication specialists and legal advisors (Chapter 2). Depending on the complexity of the outbreak, input from federal agencies, trade associations, or other industry and academic experts may be necessary.

6.1.2 Investigation and control teams should use a systematic process to evaluate information and regularly reassess control measure decisions. Sometimes the type of control measures needed to stop an outbreak is readily apparent early in the investigation (e.g., significant food temperature or risk factor violations). More commonly, however, key information is initially unavailable about the source, contributing factors, and root causes of foodborne illness outbreaks.

Typical steps in the evaluation include the following:

- Send a team to the likely source as soon as possible.
- Inform and involve the owner or manager of the implicated establishment.
- Assess potential risks on the basis of information provided by each discipline.
- Assess availability of resources needed to implement controls (e.g., legal authorities, equipment, and staff).
- Identify priority control measures, and clarify expectations among team members about the timeliness and completeness of control efforts.
- Implement control measures.
- Reassess and adjust control measures as additional information is gathered.

The quality of information is related to multiple factors (Chapter 5). Evaluate epidemiologic, laboratory, environmental health, and other evidence together to determine the degree to which the integrated data are consistent with each other, biologically plausible, and sufficiently strong to support implementation of control measures.

6.1.3 Investigation and control teams must balance the likelihood that control measures will prevent further illness against other consequences (Box 6.1). Inaction or delayed action in the face of ongoing exposure can result in additional illnesses. Conversely, aggressive control interventions, such as recalling food or closing a food establishment, can have legal or economic consequences for food workers, employers, communities, and entire food industries. Investigation and control team members should not delayinitiating steps to protect public health if available information indicates the need to act.

AMERICAN OVERSIGHT

Box 6.1. Questions to Address when Considering Control Options

Is the contaminant causing the disease highly pathogenic, virulent, or toxic? Are susceptible populations exposed?

Is the causative microorganism highly infectious and likely to be a source of secondary infections in the community?

How effective, and how costly, is the proposed control measure likely to be?

Who would play a role in implementing the control (government agency, food industry, or others)? What information will they need to act?

Is a narrow, focused action possible—such as recalling a specific group of products or notifying only the persons most likely to have been exposed—rather than a more general recommendation to avoid consuming a general category of food or notifying the public?

Will the actions affect only one business or an entire industry? How much economic or operational burden will be placed on the public who will need to respond on the basis of the proposed action?

As they ponder these questions, investigation and control team members must recognize that a rapid response is critical if the threat of serious illness and death is ongoing.

6.2 Communications With the Public

Agencies should anticipate, prepare for, and allocate resources to respond to and manage public concerns related to any public health messaging about the investigation. All members of the outbreak investigation and control team (epidemiology, environmental health, and laboratory) and health department leadership should provide input into the decision to make a public notification (Box 6.2)

DRAFT

AMERICAN OVERSIGHT

Box 6.2. Questions to Address when Considering Whether Public Notification is Necessary

What is the potential severity of disease and risk for additional illnesses (e.g., secondary infections in the community?

Is medical treatment necessary for persons who might have been exposed to the etiologic agent? If so, urgent public notification is critical.

Is public reporting of suspected illness necessary to determine the scope of the outbreak? If so, public notification might be appropriate.

Does risk for exposure still exist? People take food home from restaurants, so public notification still might be appropriate.

Are large numbers of unknown persons likely to be ill with highly infectious agents, such as norovirus or *Shigella*? If so, an advisory that ill persons should stay out of work or restrict activities may help prevent secondary transmission at other food establishments, day care, and healthcare facilities.

Is the source of the outbreak past its shelf life so no further risk exists to the public? If so, public notification may not be needed.

6.2.1 Messages to the public about foodborne disease outbreaks should follow best practices for risk communication and provide objective, fact-based information about the outbreak.

- Ideally, before an outbreak occurs, prepare templates for public messages and have them reviewed by appropriate staff, including legal counsel. Use the templates consistently during the investigation. For examples of communication templates, see the CIFOR Clearinghouse (https://cifor.us/clearinghouse/cifor-toolkit-focus-area-3-communications).
- Follow agency communication protocols. Prepare communication following the agency's risk communication protocols. Seek assistance from the agency public information officer or the public information officer at another agency if the agency with jurisdictional responsibility does not have this resource.
- Provide information about the disease, including symptoms, mode of transmission, prevention, and actions to take if illness occurs.
- Include information about what is known, what is not known, and what officials are doing to learn more.
- Do not speculate about the outbreak. Sharing preliminary or unconfirmed information with the public may result in undue worry if there is no definite action to be taken (i.e., avoidance of a certain food). Such announcements often result in inquiries from concerned citizens and the media, and the resulting expanded workload can rapidly divert resources from the investigation and control team and increase pressure to quickly name the source of the outbreak.

AMERICAN OVERSIGHT

- Ensure that officials prepare talking points to respond to media inquiries and social media questions, if needed. The Colorado Integrated Food Safety Center of Excellence developed the Communications Toolkit: Media Relations to help agencies work constructively with the media during foodborne illness outbreaks (*1*).
- Work closely with public information officers to ensure that consistent messaging is used to answer inquiries. This collaboration can reduce the potential for confusion or panic among consumers and industry.
- Maintain effective, accurate, and consistent communication with other agencies (i.e., local, state, territorial, tribal, and federal) involved in, or impacted by, the investigation.

6.2.2 Notify the public when actionable information is available that the public can act on to prevent additional illness (Box 6.3)**.** Attempt to reach all members of the population at risk, including non–English-speaking and low-literacy populations.

- Means of notification depend on the public health risk and the target population and might include press releases, radio, television, fax, telephone, text messaging, email, Web posting, social media, or letters.
- Provide clear and actionable information about how to handle a suspected product (discard, special preparation instructions, or return to place of purchase) or whether the local jurisdiction is interested in obtaining the product from households that still have it.
- Consider notifying area clinicians and healthcare facilities if an increase is expected in the number of people seeking healthcare after public notification.

DRAFT

AMERICAN OVERSIGHT

Box 6.3. Notifying the Public About Actionable Information

Early public announcements should reinforce basic food safety messages and inform the public about how to contact appropriate authorities to report suspected foodborne illnesses.

Educational materials on food safety targeted at the public are available from the Partnership for Food Safety Education (http://www.fightbac.org) and the Centers for Disease Control and Prevention's Food Safety website (https://www.cdc.gov/foodsafety). The following specific food safety messages are important to communicate to the public.

Personal protection from disease outbreak:

- Thoroughly wash hands with soap and warm water after using the bathroom and before preparing or eating food. Also wash hands after changing diapers, assisting a child at the toilet, and handling animals or animal waste. Hand washing is the single most important measure to protect the public's health.
- At home or at a social gathering (e.g., potluck dinner), avoid eating food that has not been handled properly (e.g., hot food that has not been kept hot, cold food that has not been kept cold).

Proper food preparation:

- Thoroughly cook food; keep hot food hot and cold food cold; thoroughly clean all food-preparation surfaces and utensils with soap and water; avoid contaminating food that will not be cooked, such as salads, with food that must be cooked, such as raw meat or chicken products; and wash hands frequently with soap and water.
- If you are ill with diarrhea or vomiting, do not prepare food for others until at least 72 hours after you are free of diarrhea or vomiting.
- Wash hands before and during food preparation.

Actions if someone in the household or childcare, or institutional setting has diarrhea or vomiting:

- If norovirus is involved, emphasize the importance of thorough cleaning and sanitation of high-risk transmission surfaces, such as toilet seats and flush handles, washbasin taps, and washroom door handles.

Appropriate community guidance, references, and educational materials are available at https://www.cdc.gov/norovirus/preventing-infection.html.

6.2.3 If public notification is expected to generate considerable public concern and/or media inquiries, consider setting up an emergency hotline for the public and media. Train people answering the phones to give consistent responses. Give them talking points or frequently asked questions and answers. Consider staffing the hotline after hours to answer phones after the early evening news or to respond to questions posed on social media.

AMERICAN OVERSIGHT

6.3 Communications With Response Partners and Stakeholders

Early communication with healthcare providers, the food industry involved, and others impacted by the outbreak can increase case detection, reduce the risk for secondary transmission, and help identify the source of contamination. If the pathogen causing enteric illnesses is known, use of general communicable disease control measures may limit further spread, even before the mode of transmission is clear or a food or facility has been implicated. Control measures at this point typically focus on preventing secondary spread by known cases and communicating with healthcare providers and the public about precautionary measures they can take to prevent illness transmission of the identified pathogen.

6.3.1. Effective communication with other agencies involved in the investigation or potentially impacted by the response helps staff from multiple agencies take timely actions to prevent further illnesses. During multistate outbreaks, others involved might include agencies and organizations at the local, state, territorial, tribal, and federal public health and regulatory levels (Chapter 7). A consistent public message alleviates confusion and reduces the potential for panic among consumers.

6.3.2 Communications with healthcare providers should include reminders and instructions to be shared with ill persons about personal hygiene, ways to avoid spreading infection, and infection control precautions for hospitalized patients and residents of long-term–care facilities. Instruct healthcare providers to report suspected illness to local health departments for follow-up and interviews, especially when ill persons work in settings where the risk for disease transmission is most likely, such as in food establishments and childcare and healthcare facilities. Advise healthcare providers about whether to collect clinical samples for analysis, if indicated.

6.3.3 Early communication with impacted food establishments, commodity groups, or food industries likely impacted by the public notification can assist them to

- Prepare for media enquiries.
- Consider how they can cooperate with the investigation to identify the cause(s).

Implement control measures to prevent further cases.

Food-industry representatives often have detailed knowledge about typical food-handling, storage, and distribution practices that can guide investigation and control efforts. Early sharing of clear, credible, and objective information often motivates firms to voluntarily bolster efforts to comply with standard food safety and communicable disease control measures, such as

- Excluding or restricting ill persons from food handling.
- Eliminating bare-hand contact with ready-to-eat foods.
- Proper handwashing.
- Thorough cooking.
- Effective cleaning and sanitizing procedures.

It is often helpful to provide a written summary identifying key information, including the type of agent (viral, bacterial, chemical, toxic), the exposure time period (particularly if exposure is potentially ongoing), and whether a single point source or multiple different exposures most likely caused the illnesses.

AMERICAN OVERSIGHT

The Communications Toolkit: Industry Relations developed by the Colorado Integrated Food Safety Center of Excellence is an example of resources available to help agencies communicate effectively with the food industry during foodborne illness outbreaks (*1*).

6.4 Control Measures

Although most reported foodborne illness outbreaks are investigated and controlled at the local level, site-specific food-safety controls may be needed at multiple points along the distribution network and in the impacted communities (Figure 6.1).

DRAFT

AMERICAN OVERSIGHT

Figure 6.1. Controlling the Source and Communicating with the Public

At the source:

Stop further production of contaminated food at the implicated food establishment.

Control any contaminated food remaining at the establishment.

In distribution:

Remove contaminated food from commercial distribution.

In the community:

Notify the public not to consume contaminated products that may be in their homes.

Appropriate control measures vary depending on whether the implicated food is associated with a food-service/retail food establishment or is a manufactured food that has been commercially distributed. The outbreak response team must determine as soon as possible whether one facility or multiple facilities are involved.

AMERICAN OVERSIGHT

6.4.1 Implement initial control measures at an implicated facility on the basis of investigation findings and review of what is known about other outbreaks caused by the agent and the food establishment's food-safety history. Credible epidemiologic, laboratory, and environmental health evidence can support early implementation of nonspecific control measures at an implicated facility, even though a specific food has not yet been identified.

- Adjust control measures on the basis of knowledge of the agent and whether a food item is suspected. An outbreak caused by *Clostridium perfringens* has very different contributing factors and control measures than one caused by norovirus. Controls for a *C. perfringens* outbreak focus on time and temperature for food safety, including rapid cooling, proper hot holding, and reheating. Controls for a norovirus outbreak focus on identifying and excluding ill employees. Also ensure proper hand-washing, no bare-hand contact of ready-to-eat foods, disposal or embargo of ready-to-eat foods when bare-hand contact occurs and thorough cooking is not possible, enhanced cleaning and sanitizing procedures, and (possibly) changes in the source of suspected high-risk foods used in the facility. Focusing on pathways commonly linked to the agent are most likely to identify and address the root causes of the outbreak.
- Review the establishment's history for recurring foodborne illness risk factors, previous outbreaks, illness complaints, recall, positive food samples, and correction of serious food-safety hazards. This information can indicate management's capability and willingness to consistently maintain food-safety controls. Understanding the facility's existing level of active managerial or process control can guide how the investigation and control team works with management to implement changes needed to address contributing factors and the environmental root causes that led to the outbreak.

6.4.2 Coordinate onsite investigation, environmental assessment, and control measures at the implicated facility. Most foodborne illness outbreaks are local events investigated and controlled by staff from local public health agencies. For large-scale or multijurisdictional outbreaks, staff from multiple disciplines or agencies may be involved. Staff should identify investigation and control objectives and clarify agency roles and responsibilities before arriving at the implicated food establishment. Initial clarification of both types of objectives helps ensure that appropriate staff visit the facility.

- A team approach is often needed to effectively conduct the onsite investigation and implement control measures. When conducting any environmental assessment, at least two environmental health specialists should be deployed in the field to ensure both investigative and control measure objectives are achieved. Environmental assessment teams visiting facilities for the first time must often simultaneously seek to complete multiple objectives. A few examples include communicating with firm management to enlist its cooperation, ensuring the safety of foods being served/sold, placing seizures/embargoes/holds on implicated or suspected foods or leftovers, interviewing food workers, assessing foods served and processes during the period of interest, and collecting documents and samples as needed.
- Rapid initial assessments to identify conditions requiring immediate control measures should be coordinated with ongoing investigation activities. Effective control measures address both the contributing factors that resulted in foodborne illness (what went wrong) and the root cause(s) of the outbreak (why it went wrong at this location).

AMERICAN OVERSIGHT

6.4.3 Gather samples while they are still available. Early collection of samples while they are still available can greatly aid in determining the root causes of foodborne illness (Chapter 5). Discarding suspected food can help stop the outbreak, but isolating the etiologic agent from the food provides the most convincing evidence a food was the source of the outbreak. Use both epidemiologic data and guidance from the laboratory to inform decisions about what samples to collect and how to handle them.

6.4.4 Control measures for localized events associated with a single food-service or retail food establishment will usually be established by local public health agencies or state and local food-regulatory agencies.

Although all of the following control measures are recommended, some may be more appropriate than others in specific outbreaks, and full implementation might not be possible in some jurisdictions. Implementing the most appropriate control measures as completely and promptly as possible improves the effectiveness of those measures. Before using any control measure, the environmental health/regulatory specialist must understand applicable laws and procedures for implementing them (Chapter 2).

- **Inform and engage facility management in implementing controls.** Environmental health specialists should work with the food establishment's person-in- charge (PIC) to implement active managerial controls and create a risk-control plan or consent agreement. Active involvement of the PIC uses his or her expertise and often increases commitment to implement controls to stop the current outbreak and prevent additional outbreaks. The CIFOR Industry Guidelines outlines, clarifies, and explains the recommended role of owners, operators, and managers of food establishments in a foodborne illness outbreak investigation (*2*).
- **Remove food from sale or prevent consumption.** If evidence from the epidemiologic, laboratory, and environmental assessment/root cause analysis supports the action, implicated or potentially unsafe foods should be embargoed, seized, placed under regulatory hold, or otherwise removed from service or sale. Fully document the information that led to the decision and the process used to make the decision. Issuing a written hold or embargo order establishes clear expectation and regulatory requirements and prevents the establishment owner from serving or destroying the food before the investigation is complete.
- **Clean and sanitize.** If evidence from the outbreak investigation identifies the potential for onsite contamination during the outbreak, the environmental health specialist must ensure involved equipment and areas of the facility are thoroughly cleaned and sanitized. This process includes disassembling all equipment and retraining staff on proper cleaning and maintenance procedures for the equipment. The cleaning and sanitizing process is particularly important if *Salmonella*, *Listeria monocytogenes*, or norovirus contamination of food is suspected. Industry guidance documents are identified under references.
- **Train food managers and workers.** Assess to what degree the presence of food-safety risks is due to inadequate food worker knowledge, inadequate supervision, or lack of active managerial control. Ensure the firm's food-safety management system is adequate to ensure that managers and food workers receive consistent food-safety training appropriate for their job duties. Ensure remedial training is provided, as needed so that food managers and workers have a functional understanding of the disease (e.g., symptoms, modes of transmission) and the food-safety practices (e.g., use of

AMERICAN OVERSIGHT

procedures for rapid cooling and thorough cooking and reheating of foods) needed to stop the outbreak and prevent recurrence.

- **Modify a food process.** Assess food-production or food-preparation processes at the establishment using both investigation findings and the best available scientific information. Examples of critical steps and controls include process times, temperatures, parameters (pH, water activity level), and label instructions. Implement changes needed to consistently prevent contamination of food or the survival and proliferation of disease-causing microorganisms.
- **Modify the menu**. Eliminate implicated foods from the menu until adequate control measures are in place to ensure food safety. For example, if shell eggs are implicated, remove all foods that contain shell eggs, and substitute pasteurized egg product until the investigation is complete and proper controls are in place.
- **Remove infected food workers.** Ensure that ill or infected food workers are excluded from the workplace or restricted in accordance with the Food Code (*3*) or other regulatory requirements unless evidence gathered by the investigation team indicates that a longer exclusion period is needed (e.g., evidence exists of ongoing norovirus transmission within the food establishment). Because many food workers are employed by more than one food establishment, ensure ill workers are excluded or restricted from all food establishments where they work.
    - Food establishment management should conduct daily monitoring of worker health to prevent further contamination of food by ill or infected workers. For example,
        - A person ill with vomiting or diarrhea should be excluded from the facility.
        - Pathogen-specific guidance and other information about restricting and excluding food workers is available in the latest version of the Food and Drug Administration (FDA) Food Code (*3*).
    - In *Salmonella* and *Shigella* outbreaks, fecal samples should be analyzed for the pathogen because of the likelihood of asymptomatic but infectious food workers. Restricting activities of food workers who do not comply with the request might be necessary.
    - Excluding ill food workers is not as simple as it might seem. Food workers may be reluctant to inform managers of illness because of fear of lost wages, reprisal, or leaving their co-workers short-handed. Conversely, managers underappreciating the risk to public health and their firm's economic viability may be reluctant to relieve food workers of their duties or may themselves work while ill.
    - Facilities with a strong food-safety culture ensure that both managers and food workers are well informed about alternatives to coming to work while sick, including alternate jobs that ill food workers can perform and allowing ill employees to trade for shifts when their exclusion has been lifted.
- **Use risk-control plans.** Written risk-control plans or other agreements are used to identify and focus control measures that establishments need for safe operation. Important aspects of these plans include
    - Process changes, such as recipe adjustments or development of a Hazard Analysis and Critical Control Point plan.
    - Worker training.
    - Adequate oversight measures to ensure workers follow proper procedures.

  Plans may require

AMERICAN OVERSIGHT

- Increased focus on regulatory requirements (e.g., additional measures to ensure appropriate handwashing by all employees).
- Additional measures above and beyond regulatory minimum requirements (e.g., extra temperature checks and logging of temperature).

- **Close food establishments.** Facilities that cannot safely remain in operation must be closed in accordance with applicable local and/or state regulations. A facility linked to an ongoing foodborne illness outbreak, in which significant noncompliance with regulatory food-safety standards is documented, is an imminent or substantial health hazard.
- **Communicate findings**. Effective communication of the evidence gathered by the investigation and control team can be a powerful motivator for establishment management to close or significantly modify operations. Voluntary actions are often the most efficient and timely way to reduce risks to the public. If the owner cannot or will not take immediate corrective action to eliminate ongoing food-safety hazards, mandatory closing of the premises may be necessary.
- **Notify the public.** As control measures are implemented at the source, public notification can be an effective way to prevent additional illnesses and further disease transmission, but it must be used judiciously. If the outbreak involves only one facility, carefully consider whether public notification is truly necessary. See 6.2 for details.
- **Monitor control measures.** The strategy for monitoring short- and long-term correction of the factors within the food establishment that caused the outbreak should be identified in writing. Food establishments should integrate monitoring steps into their food-safety management systems (e.g., Active Managerial Control), and regulatory officials should provide the facility with timely follow up inspections so the effectiveness of control measures can be assessed, modified, or removed when appropriate. Public health officials should maintain enhanced surveillance of potentially exposed populations to ensure controls are effective, secondary spread of infections is not occurring, and systems are in place to prevent reoccurrence.

6.5 Outbreaks Involving Commercially Distributed Foods

6.5.1. Control measures associated with commercially distributed foods typically require coordination of multiple agencies across jurisdictional levels, especially when an implicated food item is subject to recall (Chapter 7)**.** Careful coordination of control measures at the food-manufacturing facility, in distribution channels, and in consumer homes often is needed to stop outbreaks linked to commercially distributed foods. Food manufacturers can range from small facilities with limited local distribution to large, complex facilities capable of producing huge quantities of diverse products daily. Although contaminated products may still be stored onsite at the manufacturing facility, the probability is much higher that they have moved through various points of often complex distribution networks that can span the globe and include a wide range of locations, including; warehouses, distributors, retail establishments, consumer homes, and food banks. Timely product tracing investigations often identify the point in the production and distribution process where the implicated food became contaminated and where contaminated products may have been distributed after that (Chapter 5). The type of food products involved and the extent of their distribution often determine which regulatory agency leads the implementation and coordination of control measures.

AMERICAN OVERSIGHT

- **Implement onsite controls at the food-manufacturing facility.** Depending on the scope of the outbreak and probable point of contamination, most of the specific onsite control measures for food-service and retail food establishments also will be appropriate to control contaminated foods and food-safety risks at other points in food-supply chains where contamination was introduced. Given the size and complexity of many of these establishments, timely sharing of the most specific and accurate information available (e.g., product descriptions, lot codes, and periods of interest) is vital to focusing control measures where they are most needed.
- **Determine whether a food recall is needed.** Public health and food-regulatory agencies need to determine whether the contaminated product is still in distribution or consumer homes and, if so, decide how contaminated products can most effectively be removed from the market and consumers notified when appropriate (Box 6.4).

Food firms have the primary legal responsibility to initiate and conduct effective food recalls. If the food-regulatory agency has adequate information to implicate and accurately identify a contaminated food item, that agency will take the lead on working with the manufacturer to initiate recall activities. Consider the capabilities of the firm and involved agencies to: notify the public when appropriate, conduct recalls, and verify their effectiveness. Past recall experience and prior recall planning are often good indicators of likely future performance by the manufacturer.

DRAFT

AMERICAN OVERSIGHT

Box 6.4. Considerations for Whether to Remove Food from Distribution

Questions to Ask

Is risk to consumers ongoing?

Is the product still in distribution based on product tracing information (Chapter 5)?

Is the product likely to still be in the homes of consumers?

Do the combined epidemiologic, laboratory, and environmental health data support removing food from the market?

Remove the food if

Specific exposure information links the illness with consumption of that food (e.g., through a quality analytic study or other epidemiologic method), even if the pathogen has not been isolated from the food. OR

Definitive lab results show the outbreak pathogen is present in the product. The results must be based on a food sample that is representative of the food eaten by case-patients and has been handled properly to avoid cross-contamination. OR

An investigation at the source reveals adulterated products or other conditions that pose an imminent hazard to health. OR

Epidemiologic association is not significant, but the pathogen, chemical, or other contaminant is so hazardous that the risk to the public is very high (e.g., botulism). Under these circumstances, there may be no analytic controlled studies, but if the descriptive epidemiology (e.g., demographic characteristics of case-patients, geographic distribution, or illness onset) suggests an association between the disease and the suspected food, then removing food from the market might be warranted, even in the absence of confirmed laboratory findings.

- **Contact the federal or state regulatory agency that has jurisdiction over the product.** FDA regulates the safety of most foods moving in interstate commerce, except meat, poultry, farm raised catfish, and most out-of-shell egg products (which are regulated by the U.S. Department of Agriculture's Food Safety and Inspection Service [FSIS]) (Chapter 3).

Both FDA and FSIS have developed informational websites to assist their investigation and response partners. FDA developed a general website (*4*) with Resources for Regulatory Partners, and FSIS developed a website with resources for its investigation partner agencies to improve communication and sharing of information during foodborne illness outbreak investigations (*5*).

- **Initiating a recall.** State agencies, FDA, FSIS, and the Centers for Disease Control and Prevention (CDC), often contact the manufacturer seeking to obtain its cooperation in initiating a food recall. In addition,

AMERICAN OVERSIGHT

the regulatory authority and/or the manufacturer may ask retail facilities to remove the product from their shelves and ask distributors to withhold the product from distribution.

Quickly determining the extent of a recall needed in a large manufacturing plant with multiple processing lines can be difficult. Although industry often wants to limit the recall to the production lots implicated in illnesses, the conditions or extent of contamination observed within the facility may warrant a more comprehensive recall. Was an ingredient identified as a possible source of illness used in multiple food processes? Often, implicated lots will be recalled while a hold is placed on other products until their safety can be determined through an environmental assessment and product sampling. Because recalls often expand as more contaminated products are identified, some processors will voluntarily recall or be compelled to recall all suspected product to avoid the negative publicity and the economic impact associated with multiple recalls of their products.

Recall of food at the processor level generally requires federal and/or state action. In some jurisdictions, the local health jurisdiction will embargo (impound) the food (tagging the food to make sure it is not moved or sold, or ordering it destroyed). Under the Food Safety Modernization Act (*6*), FDA can order the embargo of food for up to 30 days without a court order.

- **Remove product from distribution.** Once a decision is made to remove food from the distribution, the food must be removed as quickly and efficiently as possible (Box 6.5). Foods with short shelf lives (e.g., fresh produce, dairy products) generally are consumed within the shelf life or discarded. Foods with longer shelf lives, especially frozen foods and foods that may be frozen, will be available for extended periods of time. Prevent additional exposure by ensuring effective recall practices and public notification.

  Conduct product tracing (traceback, traceforward) investigations to better learn where contaminated products were distributed and how contaminated products were used. For example, a contaminated food may have been used as an ingredient in food(s) that were not subsequently treated to destroy the contaminant, and additional recalls may be necessary. An ingredient also may be indicated if a large number of illnesses are not linked to the foods from one implicated facility.

DRAFT

AMERICAN OVERSIGHT

Box 6.5. Steps to Improve the Effectiveness of Recall Measures and Industry Response

Conduct recall effectiveness checks to assess whether efforts to remove products from distribution channels work.

Share distribution lists of recalled foods among government agencies and with the public

Develop a list of verification or control measures to implement immediately when an outbreak- related or illness-related recall has been identified.

Identify industry needs and develop guidance for

Interacting with public health or agriculture officials investigating an outbreak. Provide retailers and manufacturers with 24/7 contact numbers and emails for regulators at the local, state, and federal levels, including FDA and USDA's Food Safety and Inspection Service.

Providing timely notification of customers, appropriate government agencies, and the public of recalls involving particularly hazardous contaminants.

Mitigating the impact of an outbreak- related or illness-related recalls. Examples: clean out the display cases, follow destruction for recalled product, recommended practices for disposing of returned product.

Develop guidance for communicating with the news media, including the preparation of talking points to answer inquiries. Have a plan for coordinating a news media telebriefing or video briefing, if needed. Identify a spokesperson.

Develop standard templates for press releases and social media messages for use during an outbreak that follow best practices for crisis and emergency risk communication (https://emergency.cdc.gov/cerc).

Detailed information and sample forms for use by food establishments are included in the "CIFOR Foodborne Illness Response Guidelines for Owners, Operators and Managers of Food Establishments" (*7*).

- **Food regulators should consider ways to immediately notify food facilities in their jurisdiction through text messaging, email, blast fax, or phone calls of recalls associated with high severity hazards (e.g., botulism associated with under processed canned foods) that have a reasonable probability of still being in commercial distribution.** Identifying subcategories of facilities is highly recommended so notices can be targeted to specific facilities (e.g., notices of a seafood recall sent specifically to seafood retail establishments). This process should include food bank donation centers and other sites that might have received food donations.
- **If any distributors or retailers refuse to remove the food, issuance of a public health warning and order to require action might be necessary.** The appropriate agency for this action depends on the type of food and etiologic agent. Passage of the Food Safety Modernization Act gave the FDA the authority to order a responsible firm to recall a human or animal food when FDA determines that 1) there is a

AMERICAN OVERSIGHT

reasonable probability that the food is adulterated or misbranded and 2) consumption would cause serious adverse health consequences or death to humans or animals.

- **The agency/jurisdiction should monitor to ensure the recall is effective in stopping illnesses and food is completely removed.** Are illnesses continuing after the recall? If so, why? Is there another contaminated product or lot number that has not been recalled? Was the product purchased after the recall? If so, from where? Was the consumer aware of the recall notice?
- **Assessing recall effectiveness requires close cooperation among local, state, territorial, tribal, and federal agencies to accomplish risk-based recall effectiveness checks across the distribution system.** For example: many large-volume retailers routinely sell product to smaller retailers that may use cash for purchases. Participating in recall effectiveness checks can help local and state agency staff maintain proficiency in tracing contaminated products from the source(s) throughout distribution chains. If the product is not immediately removed, determine why.
    - Did the manufacturer notify the distributor of the recall?
    - Did the distributor notify retailers of the recall?
    - Was the recall information clear and complete, including all lot numbers, use-by dates, bar codes?
    - Did notifications occur but no action was taken?
    - Was returned recalled product diverted and sold elsewhere?
    - If the recall is not effective, notify appropriate state, federal, and neighboring health and food-regulatory agencies.
    - Issue a public advisory if needed.
- **Post-recall reporting by the food business or manufacturer.** If a food business or manufacturer recalls a product, it should prepare interim and final reports about the recall. The contents of these reports are used to determine the need for further recall actions. The reports should include copies of all notices distributed to the public and through the distribution chain, as well as the following information:
    - Circumstances leading to the recall and actions taken.
    - Extent of distribution of the suspected food (documentation that can support traceforward investigations).
    - Result of recall (percentage of suspected food recovered).
    - Method of disposal or reprocessing of suspected food.
    - Difficulties experienced in recall and actions taken to prevent recurrence of food-safety problems and any recall difficulties.

6.6 Outbreak Wrap-up Activities

6.6.1 Most outbreaks are considered over when two or more incubation periods of the etiologic agent have passed with no new cases. However, outbreak investigation and control activities should not cease when new cases of human illnesses cease to be identified. Clusters with low attack rates and cases from some sources might appear intermittently for years. This is especially common with agricultural products, such as romaine lettuce, where outbreaks have occurred each year, around the same time of year, when products are harvested from the same contaminated farms. PulseNet data should be

AMERICAN OVERSIGHT

reviewed and monitored to make certain control measures have been effective in preventing additional illnesses.

The outbreak is truly over when the source has been identified and controlled so it cannot cause additional illnesses. To prevent additional illnesses and future outbreaks, it is vital that investigation and control teams learn why the outbreak occurred so effective controls can be applied to address the contributing factors and root cause(s). Sharing lessons learned from each outbreak with the food industry in that sector or commodity group can prevent future outbreaks in other locations.

6.6.2 Restrictions put in place to prevent additional illnesses may be removed when no further risk to the public exists, such as when

- Risk factors in the facility have been eliminated and an effective system has been put in place to prevent their reoccurrence.
- Ill food workers have recovered and are no longer shedding pathogens (refer to the FDA Food Code for specific recommendations on restricted/excluded employees).
- Tests indicate no further contamination within the facility.
- Employees have been trained on proper methods to avoid the contributing factor(s) of foodborne illness.
- Managerial controls are implemented and integrated within day-to-day operations and the facility's operational culture (culture of food safety).

6.6.3 Monitoring plans should be developed to ensure the effective control of the outbreak.

- **Monitor the population at risk** for signs and symptoms of the foodborne illness to ensure the outbreak has ended and the source of illness has been eliminated. Epidemiologists and communicable disease control staff should consider conducting active surveillance, working with healthcare providers to increase their identification of associated cases, and collecting fecal samples from the population at risk. Monitor the Whole Genome Sequence (WGS)– PulseNet database to assess whether closely related cases have occurred in the region or nationally. An outbreak at a food establishment may be caused by a contaminated food ingredient or product that they received. Also monitor WGS-PulseNet over the next year for matching cases. *Listeria*, *Salmonella*, and Shiga toxin–producing *Escherichia coli* outbreaks often reoccur from the same source. Another outbreak could recur the following year around the same time if contaminated produce from certain farms with unsafe water is the source.
- **Monitor the implicated foods or food establishments** to ensure agreed-to changes in food-safety management systems are maintained and that no additional contamination is occurring.
    - Identify needed changes in writing, such as with a Risk Control Plan or Standard Operating Procedure.
    - Maintain communication with managers of the implicated food establishment and give them additional information if it becomes available.
    - Increase the number of risk-based inspections at the implicated food establishment and sampling of implicated foods, as needed, to monitor the firm's development and implementation of preventive controls.

AMERICAN OVERSIGHT

Outdated, unsafe practices often are difficult to change, and new practices might need to be reinforced multiple times before they become routine. Consider customized training to support the desired behavioral change. Determine whether behavioral change has occurred long term. Consider requiring that the establishment or firm hire a consultant to assist in developing safe systems and in monitoring if the facility has a history of unsafe practices.

6.6.4 Outbreak investigation and control teams should routinely meet and review all aspects of the investigation. Processes that systematically review investigation and control efforts after the response is over have two primary goals (Box 6.6):

1. Improve the effectiveness of future investigations and responses.
2. Prevent recurrence at the facility or in similar types of food operations.

Assessments of the effectiveness of the investigation and control efforts should maintain a balanced approach that identifies strengths to be built upon and areas of improvement to be addressed. The complexity of the review depends on the size and complexity of the outbreak. For a small outbreak associated with a single facility or event, a quick meeting and short written summary may be sufficient.

Box 6.6. Goals of Formal After-Action Meeting

Improve the effectiveness of future investigations and responses:

Clarify resource needs, structural changes, or training needs to improve future outbreak response.

Identify factors that compromised the investigations, and seek solutions.

Identify necessary changes to current investigation and control guidelines and development of new guidelines or protocols as required.

Discuss any legal issues that might have arisen and the need for new laws to strengthen response (Chapter 2).

Prevent recurrence at this facility or in similar types of food operations:

Identify the contributing factors and environmental root causes of the outbreak and measures (preventive controls) to prevent additional outbreaks at this and other food establishments.

Determine whether others need to be notified of lessons learned from the investigation to prevent outbreaks elsewhere.

Identify the long-term and structural control measures, develop a plan for their implementation, and determine surveillance and follow-up needed to ensure an outbreak does not reoccur.

Assess the effectiveness of outbreak control measures and difficulties in implementing them.

Assess whether further scientific studies should be conducted.

AMERICAN OVERSIGHT

For a large outbreak involving multiple agencies, a series of meetings resulting in a formal after-action report is appropriate.

Two types of meetings can be used as part of effective after-action review processes:

- **Hot wash/debriefings** involve investigation and control team members to gather input within 1–2 weeks after the investigation's completion while it is fresh in responders' minds. These are often less formal and single-agency in nature. Examples of typical agenda items include
    - What went well?
    - What did not go well?
    - What resources were needed that were unavailable?
    - What will be done differently next time?
    - What follow-up is needed from root-cause analysis to ensure this does not happen again (Action Plan: who will do what by when)?

- **After-action review meetings** often involve response team members, response partners, and sometimes stakeholders. These meetings are more formal, systematic, and comprehensive and, because of the need to coordinate schedules and information sharing, might occur 1–2 months after the response.

Effective after-action review processes result from planning and the intentional dedication of resources to support these meetings. Share written summaries of each meeting with attendees and interested response partners. Lessons learned from outbreaks should be communicated appropriately so they can promote improvement; even the best lessons learned have minimal impact if they are not shared with relevant partners and stakeholders. Link formal action items identified by the process to the agency's continuous process improvement program(s) to ensure appropriate accountability for tracking and correction.

If additional information becomes available in the weeks or months after the outbreak and the official after-action meeting, disseminate that information to the outbreak investigation and control team and appropriate external partners.

6.6.5 Prepare reports for all outbreaks. The report complexity depends on the size of the outbreak. For small outbreaks, a simple summary (following a template established by the agency) should suffice. Use the report to educate staff and share important investigation findings with others. When combined with other reports, this information can help identify trends across outbreaks that can be useful in future investigations.

Use outbreak reports as an opportunity for continuous quality improvement. If all the after-action reports cite the same areas for improvement, then nothing is being corrected. Outbreak investigation reports provide an opportunity to document both lessons learned during the investigation and the investigation's results.

Well-conducted and documented outbreak investigations guide prevention efforts by identifying foods at risk for contamination, locations within food-supply chains where contamination is introduced, factors directly contributing to contamination, and the root causes)

AMERICAN OVERSIGHT

The final report for a large outbreak should be comprehensive, provide information by all team participants, and be disseminated to all participating organizations. Sample outbreak and after-action reports are available at the CIFOR Clearinghouse (*7*).

1. Given that reports, especially those for large outbreaks, are likely to be subject to Freedom of Information Act (*8*) requests, they should be written with public disclosure in mind. The reports should not identify individuals or other protected information unless necessary and legally defensible. Proper care in writing the report will save time redacting information when the report is released to the public. Some jurisdictions allow or mandate the inclusion of identifying information, so review state and local laws and policies.
2. Submit a final report of the outbreak to CDC's National Outbreak Reporting System and National Environmental Assessment Reporting System databases (*9,10*). FDA-funded Rapid Response Teams have uploaded after-action reports into FoodSHIELD (*11*).

Control of contributing factors without addressing the root cause for their presence in the facility can result in a repetitive cycle of short-term correction followed by gradual loss of food-safety controls and outbreak recurrence. Sharing the root causes of outbreaks enables a broad range of food-safety stakeholders (e.g., agencies, food industries, academic institutions, and consumers) to coordinate work within their respective spheres of influence to strengthen food-safety systems worldwide.

6.6.6 The outbreak investigation findings may indicate the need for future research. For example, investigators may determine that for certain pathogens in certain foods, standard control measures do not seem effective or routine handling practices and their role in outbreaks are not completely understood. The food-safety or public health agency or research centers should consider such observations for in-depth study. Regular review of reports of foodborne illness outbreak investigations can identify important trends and areas of undercontrolled risks. Questions raised by stakeholders and researchers include

- How common is this pathogen as identified to the subtyping level by WGS?
- Is there a recurring pattern every year around the same time?
- Is there a high baseline in this region of the country that may indicate an ongoing source that needs to be identified and eliminated?

6.6.7 If unusual findings characterized the outbreak (e.g., unusual exposure, presence of a pathogen in a food where it had not previously been reported or by the magnitude of the outbreak) or new methods were used in its investigation, disseminate the report more widely (e.g., through Epi-X, *MMWR*, or other national forum; peer-reviewed journals)**.** Publish important lessons learned (such as new investigation methods that proved particularly helpful, control measures that seemed particularly effective, actions taken that seemed to shorten the outbreak) in an appropriate national forum.

6.6.8 An outbreak can identify the need for broad education of the public; the food-service, retail, food processing, and agricultural industries; food-safety regulators; or healthcare providers. Public outreach, including public service announcements, can remind the public about food-preparation precautions. National training programs for food workers and managers are regularly revised to reflect current understanding of the root causes of foodborne illness. Food-safety management systems

AMERICAN OVERSIGHT

increasingly hold managers accountable for ensuring that training of food workers is appropriate for assigned job responsibilities. Healthcare providers might need continuing education focused on diagnosing, treating, or reporting foodborne diseases. Such actions can help prevent future outbreaks or reduce the number of cases or severity of illness during an outbreak.

Trade associations, food-industry organizations, and national conferences often request presentations on outbreak investigations. These events provide an opportunity to educate representatives of the food industry, colleagues, and others about investigation procedures, outbreak management, preventive controls, and CIFOR.

6.6.9 Information gained during an outbreak is used to identify the need for new public health or regulatory policy at the local, state, territorial, tribal, or federal level. Different inspection practices, source controls, surveillance procedures, or recall process controls have been established on the basis of well documented investigation reports.

Ongoing and regular review of outbreak investigation reports, research, and industry practices identifies the need for new policy. FDA regularly updates the Food Code (*3*) to better address the leading foodborne illness risk factors identified by epidemiologic outbreak data. For example, an analysis of outbreaks by the Environmental Health Specialist Network identified an association between not having a manager certified in food safety and outbreaks (*12*). Similarly, FDA found an association between the presence of certain foodborne illness risk factors and the lack of a certified manager (*13*). These findings led to changing the FDA Food Code to require the person in charge of most retail and food-service establishments, those posing more than a minimal foodborne illness risk, be a Certified Food Protection Manager.

Consult other public health and environmental health agencies to determine whether concurrence exists on the need for new policy. If so, present the issue to the appropriate jurisdictional authority by using the appropriate policy development processes.

Chapter 7: Special Considerations for Multijurisdictional Outbreaks

Chapter Summary Points

- A multijurisdictional outbreak of foodborne illness requires the resources of more than one local, state, territorial, tribal, or federal public health or food regulatory agency to detect, investigate, or control.
- Recognition of outbreaks with multistate exposures will continue to increase with implementation of whole-genome sequencing in foodborne illness surveillance.
- Special efforts may be needed to
  - Help agencies recognize when a multijurisdictional outbreak is occurring and then identify and engage key partners in the investigation.
  - Improve communication and coordination among agencies at all levels of government that are investigating multijurisdictional outbreaks.
  - Increase the speed and effectiveness of investigating and controlling multijurisdictional outbreaks.

URLs in this chapter are valid as of August 28, 2019.

DRAFT

AMERICAN OVERSIGHT

7.0 Introduction

Multijurisdictional investigations range from different agencies and departments at a local level collaborating on a simple investigation to a large multistate outbreak with the potential identification of imported foods. As the number of agencies and levels of organizations across jurisdictions increases, the need for special efforts to maintain effective communication and coordination increases as well. (See Chapter 5 for general approaches to investigating clusters and outbreaks of foodborne illnesses.)

7.1 Categories and Frequency of Multijurisdictional Outbreaks

A multijurisdictional outbreak of foodborne illness requires the resources of more than one local, state, territorial, tribal, or federal public health or food regulatory agency to detect, investigate, or control the pathogen in question (Box 7.1). For some, such as multistate outbreaks identified through PulseNet surveillance, the multijurisdictional nature of the outbreak may be readily apparent. For others, it may emerge during the investigation. Special efforts may be needed to help agencies recognize a multijurisdictional outbreak and then to identify and engage key partners in the investigation.

The passage of the Food Safety Modernization Act (*1*) in 2011 gave new authorities to the Food and Drug Administration (FDA) and provided a mandate to enhance surveillance and response capacity at local, state, territorial, tribal, and federal levels. Combined with the development and implementation of whole-genome sequencing (WGS), these investments in foodborne disease surveillance have increased the number of outbreaks recognized as multijurisdictional (Table 7.1). For example, during 2006–2010, 1.7% of all foodborne illness outbreaks reported to the Centers for Disease Control and Prevention (CDC) National Outbreak Reporting System [NORS] involved multistate exposures and many more affected residents of multiple states or counties (*2*). During 2011–2016 the percentage of outbreaks with multistate exposures doubled to 3.4% (*3*). In particular, 22.0% of *Escherichia coli* O157:H7 outbreaks and 11.5% of *Salmonella* outbreaks involved multistate exposures, discovered largely through PulseNet (*3*). Thus, for these most important foodborne pathogens, the need for multijurisdictional coordination should be anticipated during the earliest stages of an investigation.

Box 7.1. Categories of Multijurisdictional Outbreaks

- Outbreaks affecting multiple local health jurisdictions (e.g., city, county, town) within the same state.
- Outbreaks involving multiple states.
- Outbreaks involving multiple countries.
- Outbreaks affecting multiple distinct agencies (e.g., public health, food regulatory, emergency management).
- Outbreaks, regardless of jurisdiction, caused by highly pathogenic or unusual agents (e.g., *Clostridium botulinum*) that require specialized laboratory testing, investigation procedures, or treatment.
- Outbreaks in which the suspected or implicated vehicle is a commercially distributed, processed, or ready-to-eat food contaminated before the point of service.

AMERICAN OVERSIGHT

- Outbreaks involving large numbers of cases that may require additional resources to investigate.
- Outbreaks in which intentional contamination is suspected.

Specifically related to multijurisdictional outbreaks, recent investments have been made to

- Improve coordination and data-sharing between public health partners and the public.
- Increase state and local participation in national surveillance networks.
- Expand and integrate national surveillance systems.
- Enhance laboratory and epidemiologic methods for agent identification and outbreak detection and investigation.

Coordinating offices for foodborne illness investigations in the three primary federal agencies include

- CDC: Outbreak Response and Prevention Branch (Division of Foodborne, Waterborne, and Environmental Diseases, National Center for Emerging and Zoonotic Infectious Diseases).
- FDA: Coordinated Outbreak Response and Evaluation Network (CORE).
- U.S. Department of Agriculture (USDA) Food Safety and Inspection Service (FSIS): Applied Epidemiology Staff.

Table 7.1. Number of outbreaks with multistate exposure, multistate residents, multicounty exposure, and multicounty residents, by etiology, United States, 2011–2016 (*3*)

Etiology and Agent	No. Total Outbreaks	Multistate Exposure	Multistate Residents	Multicounty Exposure	Multicounty Residents
Confirmed etiology	2,454	154	324	150	646
Escherichia coli O157:H7	100	22	14	23	26
Salmonella	748	86	107	74	207
Clostridium perfringens	89	0	8	0	26
Staphylococcus aureus	30	0	3	1	6
Hepatitis A virus	12	2	2	2	3
Norovirus	894	2	127	14	274
Other	581	42	63	36	104
Suspected etiology	1,153	5	120	8	153
Unknown etiology	1,292	1	118	14	165
Multiple etiologies	430	23	81	10	76
Total	**5,329**	**183**	**643**	**182**	**1,040**

7.2 Multijurisdictional Outbreak Detection

7.2.1 Multijurisdictional outbreaks may be detected at local, state, territorial, tribal, or federal levels. Outbreaks detected at the local level through investigations of consumer complaints, individual cases, or case clusters of reportable foodborne illnesses (Chapter 4) may identify common-source outbreaks or multiple subclusters of illnesses that implicate or suggest likely contamination of food before the point of service.

Detection of multijurisdictional outbreaks at a state level may result from an increase of sporadic infections with common subtype characteristics identified, investigation of subclusters of illnesses that

AMERICAN OVERSIGHT

identify a possible association with multiple food service establishments, or the linking of multiple, discrete common-source outbreaks by common agent, food, or water.

Similarly, national increases of infections with common subtype characteristics identified; identification of subclusters of illnesses associated with multiple restaurants or food service establishments in multiple states; and linkage of multiple, discrete common-source outbreaks in multiple states would lead to a multijurisdictional outbreak investigation.

Detection of a pathogen, such as *Listeria monocytogenes*, Shiga toxin–producing *E. coli*, or *Salmonella*, from a food item that resulted from testing by a federal or state food regulatory agency would lead to a search for human illnesses caused by the same organism with common subtype characteristics. Multijurisdictional investigation of infections with common subtype characteristics would be conducted to determine whether they were part of an outbreak.

7.2.2 When findings indicate that multiple jurisdictions might be involved in an investigation, additional communication and coordination are needed (Table 7.2). With initiation of an investigation of a potential multijurisdictional outbreak, a local agency should ensure notification of the state health department and other local agencies, as appropriate, and provide subsequent updates in accordance with state procedures to ensure coordination between epidemiology, environmental health, and the public health laboratory.

Detection of multijurisdictional outbreaks at a state level requires notification of affected county and city health departments. CDC and state and federal food regulatory agencies need to be notified of subclusters or linked common-source outbreaks. For example, FDA has established its CORE Network to respond to outbreaks. FSIS has developed a template for including FSIS in foodborne illness outbreak response procedures (*4*). Notify FSIS of outbreaks potentially associated with FSIS-regulated products by sending an email to FoodborneDiseaseReports@usda.gov and to the appropriate regional contact in the FSIS Office of Enforcement, Investigation, and Audit (https://www.fsis.usda.gov/wps/portal/informational/districtoffices#oiea).

Detection of multijurisdictional outbreaks at a national level requires notification of appropriate state and federal food regulatory agencies and state health departments of an increase in apparently sporadic infections, subclusters, or linked common-source outbreaks. In these events, states typically notify local agencies of the outbreak and the need for their assistance in conducting the investigation. Of particular importance are requests to interview case-patients as soon as possible using a detailed exposure questionnaire to obtain detailed food and environmental exposure histories, including product brand and retail source.

7.2.3 Assemble and brief the outbreak and investigation control team. Open communication between investigation team members to plan, conduct, and evaluate outbreak investigation activities is critical to the success of the investigation (Chapter 5). For multijurisdictional investigations, the outbreak investigation and control team should include members from all agencies participating in the investigation (Chapter 3, Tables 3.1 and 3.2). Agency preparedness plans should be in place to facilitate rapid identification and notification of these key partners. In addition, many health departments have an incident command system (ICS) that guide outbreak response (Box 7.2). Historically, investigations of multijurisdictional foodborne illness outbreaks have not required formal activation of ICS. However, federal regulatory agencies use ICS for their response to outbreak incidents.

DRAFT
AMERICAN OVERSIGHT
FL-DOH-20-0673-A-006209

Box 7.2. Use of Incident Command Systems

An incident command system (ICS) is the nationally recognized way that diverse individuals, agencies, and the private sector plan to work together to command, coordinate, and communicate during emergencies. Agencies responding to a public health emergency or foodborne outbreak can use ICS principles to help manage responses. ICS principles provide the flexibility needed to manage a wide range of foodborne illness outbreak responses, including single agency and multiagency outbreak investigation and control teams.

ICS provides for internal communications among primary event responders, public information officers, and security/safety officers and for external liaison with various organizations. Key features for foodborne outbreak investigation and control teams include the following:

- Standardized but flexible organizational structure.
- Clearly defined and standardized roles and responsibilities.
- Formal and systematic planning approach.
- Coordinated response team, stakeholder, and public communications.
- Formal mechanisms for managing transitions from routine to nonroutine responses by expanding and contracting response team structure and resources as needed.

These features provide a predictable framework that can bring order to potentially chaotic situations when standard agency operating procedures and routine chain of command are inadequate to address the needs of an incident.

Because outbreak investigation staff may be physically located in different agencies in several different cities or states, briefings may need to be conducted by teleconference or webinar. All members of the of the investigation team—epidemiologists, environmental health specialists, laboratorians, and food regulators—need to be familiar with and follow relevant state and federal laws, terms of any memorandum of understanding between agencies, and data-handling practices.

7.3 Identifying and Investigating Subclusters

Subclusters are groups of cases within a larger defined cluster for which exposure to the same individual points of service, such as a restaurant, cafeteria, grocery store, or institution, is identified. Subcluster investigations provide an invaluable opportunity to solve an outbreak because the outbreak vehicle was most likely served by the common establishment (Chapter 5). Although subclusters have traditionally been identified within clusters of cases defined by a common serotype, pulsed-field gel electrophoresis pattern, or closely related genomic sequence, successful subcluster investigations also have been conducted during *Cyclospora* outbreaks, where no subtyping of the outbreak strain characteristics was possible.

In multijurisdictional investigations, make special efforts to identify potential subclusters across the geographic distribution of outbreak cases and to prioritize the coordination of subcluster investigations and tracing of common food exposures associated with the subclusters. If not previously established, a coordinating office (or individual) for subcluster investigations should be empowered to prioritize collection, organization, and dissemination of subcluster data.

AMERICAN OVERSIGHT

7.4 Coordinating Multijurisdictional Investigations

Coordinating a multijurisdictional investigation might require establishment of a coordinating office to collect, organize, and disseminate data from the investigation. Depending on the scope and nature of the multijurisdictional event, the coordinating office might be located at a local or state public health or food regulatory agency or at CDC, FDA, or FSIS.

Several principles guide decision about where to locate the coordinating office for a given multijurisdictional investigation. The primary goal is to avoid interagency conflict about coordination that might distract from prompt conduct of the investigation and to present unified, consistent messages to the public.

- Outbreaks are most efficiently investigated as close to the source as possible. In general, investigations should be coordinated at the level at which the outbreak originally was detected and investigated. This is likely to be where most relevant investigation materials will reside, which can facilitate organization and analysis of data. An outbreak involving several local health agencies might best be coordinated by a lead local agency. Similarly, investigation of a multistate outbreak with most cases in one or a few adjacent states might best be coordinated by a lead state agency. Investigations of outbreaks of more widely dispersed cases identified through pathogen-specific surveillance might best be coordinated by CDC.
- The coordinating office must have sufficient resources, expertise, and legal authority to collect, organize, and disseminate data from the investigation. Local agencies might not have sufficient resources to effectively coordinate a multijurisdictional investigation, or state rules might assign jurisdiction over multicounty investigations to the state health department. In these situations, the coordinating office should be located at the state level. In multistate investigations, the coordinating office should be located at CDC if no individual state is prepared to do so. In multistate investigations led by an individual state, CDC should support the investigation in coordination with the lead agency.
- Investigations of the food contamination phase should be coordinated within food regulatory agencies. In addition to food regulatory agencies' greater expertise and experience with these investigations, rules governing the collection of product manufacturing and distribution information might dictate that authorized food regulatory agencies not share that information with outbreak investigators in other agencies.

7.4.1 Outbreak investigations progress through phases of activity, and leadership of the investigation should reflect the focus of the investigation at the time. Investigations initiated at a local level are handled in accordance with routine policies and procedures under local agency leadership unless otherwise specified by state procedures. The level of state involvement depends on local or state protocols.

During investigations that require active participation from multiple local agencies and state agencies, a state agency needs to coordinate among the epidemiology, environmental health, and laboratory components of the investigation at the state level and ensure that state epidemiology, environmental health, and laboratory programs communicate and coordinate activities with counterparts at the local and federal levels. Typically, epidemiologic efforts to characterize the outbreak by person, place, and

AMERICAN OVERSIGHT

time dominate the early stages of an investigation. Efforts to identify the mode of transmission and food vehicle begin to incorporate environmental health specialists and food regulators. Determining contributing factors and environmental antecedents, conducting regulatory tracebacks, and implementing control measures move the investigation into the food regulatory realm. Transition of leadership within the outbreak control team should be planned in advance by consensus and communicated to the entire team.

During investigations of national significance, federal agencies need to coordinate the epidemiology, environmental health, and laboratory components of the investigation at the federal level and ensure that federal epidemiology, environmental health, and laboratory programs are communicating and coordinating activities with their counterparts at the state and local levels.

7.4.2 Communication and coordination plans should reflect the focus of the investigation at the time. Investigations initiated at a local level require information sharing and coordination among multiple local agencies under local agency leadership unless otherwise specified by state procedures. The state receives information and provides consultation.

When the resources of one or more local jurisdictions cannot adequately respond to events by following routine procedures, the state should provide response coordination, consultation, and information sharing. On the basis of established procedures, emergency management systems, possibly including ICS, might be activated at the local—or possibly state—level. Federal agencies are notified and involved depending on product type and distribution.

Multistate outbreaks and outbreaks associated with regionally or nationally distributed food products involve a transition from state to national significance. These outbreaks might require regional or national resources. Although they require active participation from multiple local agencies and state response coordination, consultation, and information sharing, they also might require federal agency leadership, depending on the capabilities and willingness of the states involved.

Sharing of information between public health and food regulatory agencies is critical to the effectiveness of multijurisdictional investigations. Ensuring the facilitation of rapid and open information sharing can greatly enhance the efficiency and effectiveness of multijurisdictional investigations. Because these activities build on each other, establishing information-sharing protocols during the earliest stages of the investigation is critical. State, local, and federal public health officials should ensure that their agencies have the legal authorities needed to share information and that their professional staff understand those authorities (Chapter 2). Unless state and local public health officials have been commissioned to receive confidential information from FDA, they might need to work directly with the establishment implicated in the outbreak to obtain those data (Chapters 2 and 3). FDA's Office of Partnerships has a commissioning and credentialing program that enables the sharing of commercial confidential information to Commissioned Officials and/or signatories of Confidentiality Agreements (Chapter 2.3.4).

Identifying the source of a multijurisdictional outbreak is a collaborative process among local, state, and federal agencies and industry. Individual food companies and trade associations should be engaged early on to help with the investigation. Industry collaborators might be able to provide important information about food product identities, formulations, and distribution patterns that can improve hypothesis generation and assist in informational tracebacks to aid hypothesis testing. Early

AMERICAN OVERSIGHT

engagement of industry also can facilitate control measures by enabling affected industries to implement orderly product withdrawal or recall procedures.

Release of public information about the outbreak should be coordinated with the lead investigating agency when feasible. Although the public and news media are not aware of most outbreak investigations, the results of investigations are public information. In addition, responding to media attention is important to address public concerns about the outbreak. Although individual agencies participating in the investigation might be obligated to provide the perspective of their own leadership when responding to media inquiries, a coordinated communications plan can help provide a consistent, unified message about the progress of the investigation, the source of the outbreak, or any prevention activities that the public can do to protect itself. Coordinating communications with the media is particularly important when media attention is needed for public action to avoid exposure to a specific contamination source, such as a recalled food product.

7.4.3 Use standardized data-collection forms and centralize compilation of data from case-patient interviews. The National Hypothesis Generating Questionnaire (NHGQ) can be used to collect information on a broad range of food and nonfood exposures (http://cifor.us/downloads/clearinghouse/NHGQ_v2_OMB0920_0997.pdf) during the early stages of an outbreak investigation (Chapter 5). As hypotheses develop and are refined, an outbreak-specific questionnaire can be developed to systematically collect data from the various states or local jurisdictions contributing to the investigation. Collecting detailed information on both the food item and its source as early in the process as possible is key to identifying the source of an outbreak. Thus, ensuring that all agencies participating in the investigation use the same outbreak-specific questionnaire is important. In addition, if sufficient staff are not available to rapidly conduct interviews, agencies should request external assistance to conduct interviews. Compiling data from case-patient interviews in a central location where they can be reviewed in aggregate will facilitate recognition of suspected food items, particularly when an unusual or new food item may be involved.

7.4.4 Coordinate informational tracebacks to identify suspected vehicles and guide sampling activities. Tracing the source of food items or ingredients through distribution to source of production can be critical to identifying epidemiologic links among cases or ruling them out (Chapter 5).

Multijurisdictional investigations increase the importance of product tracing because they can triangulate among multiple distribution pathways that may link geographically dispersed cases. Thus, coordinating traceback investigation across the outbreak should be prioritized. The coordinating office (or individual) for traceback investigations should be empowered to prioritize collection, organization, and dissemination of traceback data to determine whether it converges on a common source or supplier. Because this information can be critical to identifying epidemiologic links, results should be shared, as they develop, with epidemiologists, which will enable epidemiologists to have meaningful input in exposure selection and interpretation to help guide future directions for the investigation (*5*).

Identification of a common source or supplier can facilitate sampling activities to confirm contamination of the product and the potential source of the contamination.

AMERICAN OVERSIGHT

7.5 Multijurisdictional Outbreak Investigation After-Action Reports and Reporting to NORS

The lead agency(ies) coordinating the investigation should hold a conference call 1–3 months after the initial investigation ends to review lessons learned and to update participants about findings, conclusions, and actions taken (Chapter 6). After the conference call, they should prepare an after-action report to summarize the effectiveness of communication and coordination among jurisdictions, identify specific gaps or problems that arose during the investigation, and communicate lessons learned regarding root cause and contributing factors.

All participating agencies should have the opportunity to review and comment on the report before it is more widely distributed. The lead agency(ies) should review after-action reports periodically to determine whether common problems regarding investigation, response, or root cause are recurring over time; this review can help with an agency's quality improvement and prevention efforts.

Individual states should report all multijurisdictional investigations to NORS. They should indicate the multijurisdictional nature of the investigation by completing appropriate data fields in the NORS report form. CDC will consolidate Individual state reports as part of a multistate outbreak report. In addition, FDA and FSIS write a summary report of each investigation in which they participated.

DRAFT

AMERICAN OVERSIGHT

Table 7.2. Multijurisdictional Outbreak Identification Methods and Required Notification steps, by Agency Level

Outbreak Identification Method	Required Notification Steps
Local level	
● Common-source outbreak identified with cases among persons who reside in other local jurisdictions.	● Notify affected jurisdictions to request assistance to contact and interview case-patients in other jurisdictions.
● Common-source outbreak identified with exposures in another jurisdiction.	● Notify the affected jurisdiction immediately.
● Common-source outbreak identified in one jurisdiction, investigation implicates food item contaminated before the point of service. ● Subcluster of illnesses associated with restaurants or food service establishments.	● Notify appropriate state and federal food regulatory agencies about probable contaminated food vehicle, or subcluster. ● Notify affected county and city health departments, state health department, and Centers for Disease Control and Prevention (CDC).
State level	
● Statewide increase identified in infections with common subtype characteristics. ● Subclusters of illnesses associated with multiple restaurants or food service establishments. ● Common-source outbreaks in multiple local jurisdictions linked by common agent, food, or water.	● Notify affected county and city health departments and CDC. ● Notify appropriate state and federal food regulatory agencies of subclusters or linked common-source outbreaks.
Federal level	
● National increase identified in infections with common subtype characteristics. ● Subclusters of illnesses associated with multiple restaurants or food service establishments in multiple states. ● Common-source outbreaks in multiple states linked by common agent, food, or water.	● Notify appropriate state and federal food regulatory agencies, and state health departments of increase in infections, subclusters, or linked common-source outbreaks.
● Food item tested positive by federal or state food regulatory agency linked to apparently sporadic infections with common subtype characteristics.	● Notify CDC, affected state health departments, and other state and federal food regulatory agencies.

Chapter 8: Performance Metrics for Foodborne Illness Programs

Chapter Summary Points

- Evaluating the timeliness and effectiveness of surveillance, investigation, and control of foodborne illnesses and outbreaks is critical to improving these activities at the local, state, territorial, tribal, and national levels.
- Numerous programs involved in foodborne illness outbreak detection, investigation, and response have developed and routinely use metrics to assess their work and measure performance.
- The aggregation of data at state, regional, or national levels could provide a comprehensive overview of foodborne illness surveillance and control programs, rather than a system for ranking them.

URLs and email addresses in this chapter are valid as of July 9, 2019.

DRAFT

AMERICAN OVERSIGHT

8.0 Introduction

Surveillance and investigation of foodborne illnesses and outbreaks are essential for controlling and preventing foodborne illnesses. Multiple entities—more than 3,000 local health departments; 50 state and numerous territorial and tribal health departments; and several federal agencies—interact in a complex system covering surveillance for, detection of, and response to enteric and other foodborne illnesses and outbreaks.

Evaluating the timeliness and effectiveness of surveillance, investigation, and control of foodborne illnesses and outbreaks is critical to improving these activities at all levels. Since the publication of the Second Edition of the CIFOR Guidelines, the use of performance metrics by various food-safety programs and agencies has increased. Performance metrics enable a program to assess processes and identify opportunities to improve processes. This Third Edition of the CIFOR Guidelines draws heavily on the experiences of other programs in developing and using performance metrics.

Performance metrics are commonly associated with quality improvement initiatives, including accreditation and capacity building. The types of performance metrics, and how they are developed and implemented, are often determined by the type of program or initiative in which a jurisdiction is participating. Quality improvement literature and programmatic experience has shown that

- The most meaningful performance metrics are tied directly to a program's activities;
- Metrics promote a common understanding of the key elements of foodborne illness surveillance and control activities across local, state, territorial, tribal, and federal public health agencies;
- Using a framework (like the one presented in this chapter) can save time and resources by describing what types of activities could be measured, but programs or jurisdictions will need to determine how to measure components in a way that is meaningful for their purposes;
- Process-based metrics are often easier to design and implement, whereas multifactorial outcome metrics can be more challenging;
- Evaluating performance metric data over time can enable programs or jurisdictions to evaluate the impact of changes in practice and target additional activities for ongoing improvement efforts; and
- Metrics can elucidate successes and identify gaps in the detection, investigation, prevention, and control of sporadic foodborne illnesses and outbreaks.

8.1 Purpose and Intended Use

Numerous programs involved in foodborne illness outbreak detection, investigation, and response have developed and use metrics for routine program evaluation (Table 8.1). The combined experience of these programs was used to develop the performance metrics in Table 8.2. URLs for each program's complete list of metrics are available on the CIFOR website. In addition, an updated version of the longer tables from the Second Edition of the Guidelines is included in the Appendix of the Guidelines().

The metrics are a curated list of the most important metrics that programs can use to assess their work and measure performance in activities related to surveillance, investigation, and control of foodborne illnesses and outbreaks.

DRAFT

AMERICAN OVERSIGHT

FL-DOH-20-0673-A-006218

Foodborne illness and outbreak investigations are multidisciplinary, but different agencies use staff in varying disciplines or areas of expertise to perform surveillance, investigation, and control activities. Thus, categories of environmental health, laboratory, and epidemiology are used solely for the organization of the metrics, not to suggest which staff should perform the specific duties within an agency. In other words, not every metric applies to every agency; for example, some laboratory metrics may not be relevant to local public health agencies.

Users can evaluate their performance metric data over multiple time points, when those data are available. Additionally, users can compare their data to the summary data from other programs or agencies to determine where improvements might be realistic. Neither target ranges nor participant data are intended to be used as scorecards or performance standards. Defining the level of performance expected from foodborne illness and outbreak surveillance, investigation, and control programs exceeds the scope of these Guidelines. The aggregation of data at state, regional, or national levels could provide a comprehensive overview of foodborne illness surveillance and control programs, rather than a system for ranking them.

Table 8.1. Programs with Performance Metrics

Host Agency	Program	About the Program
Centers for Disease Control and Prevention (CDC)	Foodborne Diseases Centers for Outbreak Response Enhancement (FoodCORE)	FoodCORE centers collaborate to develop new and better methods to detect, investigate, respond to, and control multistate outbreaks of foodborne illness. They focus primarily on outbreaks caused by bacteria, including *Salmonella*, Shiga toxin–producing *Escherichia coli* (STEC), and *Listeria*.
CDC	OutbreakNet Enhanced	OutbreakNet Enhanced supports local and state health departments to improve their capacity to detect, investigate, control, and respond to enteric illness outbreaks. OutbreakNet Enhanced sites collaborate with each other and CDC to share experiences and insights that help improve enteric illness outbreak response. OutbreakNet Enhanced activities focus on improving detection and rapid interviewing *Salmonella*, STEC, and *Listeria* case-patients and of persons with enteric illness caused by pathogens that demonstrate antimicrobial resistance.
CDC	National Environmental Assessment Reporting System (NEARS)	NEARS is a Web-based surveillance system that local and state health departments use to report environmental assessment data from foodborne illness outbreak investigations. NEARS helps the national food-safety system by providing critical data from environmental assessments to prevent and reduce future outbreaks.
CDC	National Outbreak Reporting System (NORS)	NORS is a Web-based platform launched in 2009. It is used by local, state, and territorial health departments to report to CDC all waterborne and foodborne illness outbreaks and enteric disease outbreaks transmitted by contact with

AMERICAN OVERSIGHT

		environmental sources, infected persons or animals, or unknown modes.
Food and Drug Administration (FDA)	Rapid Response Teams (RRTs)	RRTs are multiagency, multidisciplinary teams that operate using Incident Command System/National Incident Management System principles and a Unified Command structure to respond to human and animal food emergencies. RRTs are housed in food-regulatory agencies.
FDA	Voluntary National Retail Food Regulatory Program Standards (Retail Program Standards)	The Retail Program Standards define what constitutes a highly effective and responsive program for regulating food-service and retail food establishments. The Retail Program Standards are intended to reinforce proper sanitation (good retail practices) and operational and environmental prerequisite programs while encouraging regulatory agencies and industry to focus on the factors that cause and contribute to foodborne illness, with the ultimate goal of reducing the occurrence of those factors.
FDA	Manufactured Foods Regulatory Program Standards (MFRPS)	The MFRPS are a critical component in establishing the national Integrated Food Safety System. The goal of the MFRPS is to implement a nationally integrated, risk-based, food-safety system focused on protecting public health. The MFRPS establish a uniform basis for measuring and improving the performance of prevention, intervention, and response activities of manufactured food-regulatory programs. Development and implementation of the standards help state and federal programs better direct their regulatory activities toward reducing foodborne illness.
U.D. Department of Agriculture–Food Safety and Inspection Service (FSIS)	Public Health Indicators (from FSIS 2017–2021 Strategic Plan)	The mission of FSIS is to protect the public's health by ensuring the safety of meat, poultry, and processed egg products. FSIS has developed plans and resources to strengthen collaborative relationships with outbreak investigation partners.

8.2 Performance Metrics

The remainder of this chapter focuses on Table 8.2, which includes 21 metrics organized by discipline: environmental health, epidemiology, and laboratory. As noted above, the disciplines listed are for organizational purposes, not to suggest which staff should conduct certain portions of outbreak investigations. Within the epidemiology section, metrics are grouped by investigations typically initiated from laboratory surveillance data and investigations typically initiated from complaint data (see Chapter 4).

Details on calculating a particular metric are available on the websites of the programs that produced the metrics, as are other metrics from these groups that might be relevant to their programs. The original source metrics also may provide additional instructions, summary data from implementation of

AMERICAN OVERSIGHT

the metrics, and examples of how the metrics have been used to guide planning and evaluation activities.

Agencies that frequently use metrics (Table 8.1) have extensive metrics but do not capture every component of foodborne illness surveillance and control programs. Table 8.3 presents additional metrics that are not currently available from the referenced programs but may be valuable for agencies to examine. Because these metrics are not routinely collected by programs, users may need to create standardized definitions to calculate the metrics.

Table 8.2. Foodborne Illness Performance Metrics from Existing Programs

Category	Performance Metric	Source of Metric
Environmental health	The program maintains logs or databases for all complaint or referral reports from other sources alleging food-related illness, food-related injury, or unintentional food contamination. The final disposition for each complaint is recorded in the database or log and is filed in, or linked to, the establishment record for retrieval purposes.	Voluntary National Retail Food Regulatory Program Standards, https://www.fda.gov/Food/GuidanceRegulation/RetailFoodProtection/ProgramStandards/ucm245409.htm
	Percentage of outbreak investigations that included an environmental assessment.	National Environmental Assessment Reporting System (NEARS), https://www.cdc.gov/nceh/ehs/nears/resources.htm
	Percentage of outbreak investigations that identified a contributing factor.	NEARS, https://www.cdc.gov/nceh/ehs/nears/resources.htm
	Average number of days between date the outbreak establishment was identified for an environmental assessment and date of the establishment observation.	NEARS, https://www.cdc.gov/nceh/ehs/nears/resources.htm
	Percentage of traceback investigations that successfully result in identification of an implicated food.	Rapid Response Teams (RRTs), https://www.fda.gov/ForFederalStateandLocalOfficials/ProgramsInitiatives/ucm475021.htm#Manual
	Percentage of outbreaks reported to NEARS.	NEARS, https://www.cdc.gov/nceh/ehs/nears/resources.htm
Epidemiology	Percentage of confirmed cases with exposure history obtained for *Salmonella*, Shiga toxin–producing *Escherichia coli* (STEC), and *Listeria*. Time from *Salmonella*, STEC, and *Listeria* isolate receipt (or recovery) at public health laboratory to sharing of whole-genome sequences with national database.	FoodCORE, https://www.cdc.gov/foodcore/metrics/ssl-metrics.html OBNE, https://www.cdc.gov/foodsafety/outbreaknetenhanced/metrics.html

DRAFT

AMERICAN OVERSIGHT

Table 8.3. Additional Performance Metrics to Assess Response Effectiveness

Category	Performance Metric
Environmental health	Program maintenance of complaint data in an electronic manner that can be queried. Number of complaints received and rate of complaints per 100,000 population in the jurisdiction. Number of outbreaks detected from complaints and rate of outbreaks per 1,000 complaints. Percentage of investigations reported to federal regulatory agencies within 72 hours after the suspected vehicle is identified. Median number of days from initiation of investigations to implementation of control measures
Epidemiology	Median number of days from initiation of *Salmonella*, Shiga toxin–producing *Escherichia coli* (STEC), and *Listeria* investigations to identification of source Foodborne illness outbreak rate: number of foodborne outbreaks reported (all agents) per 1,000,000 population. Number of foodborne outbreaks reported (*Salmonella*, STEC, and *Listeria*) per 1,000 cases Percentage of outbreaks for which etiology is identified.
Laboratory	Number and percentage of *Salmonella*, STEC, and *Listeria* isolates/clinical specimens submitted to the public health laboratory from cases diagnosed by culture-independent diagnostic testing at the clinical laboratory. Percentage recovery of *Salmonella* and STEC isolates from culture-independent diagnostic test positive specimens received at the public hHealth Laboratory.

**Add accompanying table on CIFOR website with direct links to each metric source, including available data from program.

AMERICAN OVERSIGHT

From: Blackmore, Carina
To: Mainzer, Hugh (CDC/DDPHSIS/CPR/DSLR)
Subject: Re: Tim Doyle will be on Board with CPR/DSLR effective Sunday and should be reporting to FL next week
Date: Thursday, February 27, 2020 3:26:37 PM

Hi Hugh. Delighted to see the news about Dr Philip. Have great respect for her. Drs B and D also seem to be skilled, thoughtful, practical and personable people.
Yes We are very excited to have Tim on boa d next week and expect to immediately plug him in to our Corona response effort. Not a day too soon! Carina

Subject: Tim Doyle will be on Board with CPR/DSLR effective Sunday and should be reporting to FL next week

Hi Carina-
Tim is on his way to you.
On the information exchange side and not related to COVID 19- we just received the following note from Dr Redfield….
With the addition of Dr Philip, there are an increasing number of former senior state health officials joining CDC at executive ranks. This now includes Dr Butler from Alaska, Dr Dreyzhner from Tennessee, Dr Montero from New Hampshire. This may mark a new trend toward increased responsiveness to the public health issues and priorities of SLTT jurisdictions.
Cheers

Hugh

I am pleased to announce that **Celeste Philip, MD, MPH**, has been selected as CDC's Deputy Director for Non-Infectious Diseases.

Dr. Philip brings a wealth of public health management, knowledge, and experience as a physician to the agency. She most recently served as Health Officer for the Sonoma County Department of Health Services in Santa Rosa, California, where she oversaw the public health division during a period of unprecedented response efforts, including the Kincade Fire, numerous public safety power shut-offs, and health service provisions for a large number of people experiencing homelessness. Previously, she was appointed by the Governor of Florida to serve as Florida's Surgeon General and Secretary of Health from 2016-2018. In this role, she managed a $3 billion budget and more than 13,000 full-time employees. She led the state-wide response to the Zika virus; directed the state's Emergency Support Function—Public Health and Medical Services (ESF8)—during five hurricanes, including Irma (2017) and Michael (2018); and guided the redesign of the state's HIV program to provide pre-exposure prophylaxis (PrEP) in all 67 counties. From 2013-2016, Dr. Philip served as Florida's Deputy Secretary for Health and Deputy State Health Officer for Children's Medical Services. During her tenure, she brokered the negotiation of settlement terms to end 10 years of litigation

AMERICAN OVERSIGHT

against the State of Florida over Title XIX; the settlement helped to build bridges and led to statewide collaborations on immunizations, mental health, adverse childhood experiences, and opioid policy with clinician groups.

Her professional training includes serving as an EIS Officer from 2006-2008, with the Division of Nutrition, Physical Activity, and Obesity, National Center for Chronic Disease Prevention and Health Promotion; and completing CDC's Preventive Medicine Residency as a Lieutenant Commander in the US Public Health Service with the Florida Department of Health in Polk County (Bartow, Florida).

Dr. Philip received a bachelor's degree from Howard University (magna cum laude), and both a Master of Public Health degree in maternal and child health and a Doctor of Medicine degree from Loma Linda University in California. She is certified by the American Board of Preventive Medicine and the American Board of Family Medicine and holds medical licenses in both Florida and California.

Dr. Philip has been recognized as the Loma Linda University School of Public Health Alumnus of the Year, the Florida Outstanding Woman in Public Health by the University of South Florida, and as a Trustee Scholar by Howard University. She has also received the American Cancer Society's Southeast Region Impact Award, an Outstanding Unit Citation for CDC's H1N1 response, the MacKenzie Foundation Award, the Selma Andrews Award in Public Health, and both the Special Act or Service Award and the On the Spot Award from the National Library of Medicine.

She has also given numerous public health presentations, published medical journal articles, and served on many boards, advisory councils, and volunteer positions over the course of her career.

Please join me in welcoming Dr. Philip as she returns to CDC in her new role, starting March 30, 2020, as Deputy Director for Non-Infectious Diseases.

I would also like to express my gratitude to both Anne Schuchat, MD (RADM, USPHS, RET) and Ileana Arias, PhD for serving as Acting Deputy Director for Non-Infectious Diseases. Thank you both for supporting our mission to see the possible in public health.

Sincerely,

Robert R. Redfield, MD
Director, CDC, and
Administrator, ATSDR

Hi Carina
Just coming back from leave. My understanding is that Tim is starting a few transition weeks with our FSB team getting oriented to the CEFO program and also supporting the corona virus state coordination task force. When I departed on Feb 10, He was still slated to start with you on March 1- but will hopefully have a good understanding of State issues and priorities related to recent corona virus events.

Subject: Time Sensitive Request – Verification for DCIPHER User Access for 2019-nCoV (Florida)

Good Morning,

In preparation for data entry regarding 2019-nCoV Movement and Monitoring for EpiX notification of travelers, we are providing you a list of people currently credentialed for DCIPHER in your jurisdiction.

Please review the names below and indicate in the column labeled **Grant access to 2019-nCoV** those people you want to access the 2019 nCoV database. Please respond as soon as possible, your information is necessary to grant access. We will use your response to **turn on access** for the designated staff.

Greetings PHEP Directors and State Epidemiologists,

As we prepare to use DCIPHER for the 2019-nCoV response (e.g., data collection, transmission, and data sharing), we are seeking additional information about the type of access for the users you previously identified for the nCoV 2019 DCIPHER platform.

The "access group" options are described here:

1. **Access to DCIPHER to VIEW (only) data**. Role allows individual to see a view of different reports and analyses for their jurisdiction's information and any aggregate national report that may be created.
2. **Access to DCIPHER for DATA ENTRY and EDITING**. Role allows individual to directly enter information into DCIPHER, edit data, see all data associated with the jurisdiction, in addition to viewing/creating different reports and analyses.

In the attachment, please complete information in the last two columns (epi and monitoring), select either **view** or **data entry/editing** for each user.

Please return your response to eocsctftfcoord@cdc.gov as soon as possible so we can configure the platform to support your jurisdictions' access requests.

Warm Regards,

Subject: Re: Time Sensitive Request: DCIPHER Rights for the two 2019-nCoV modules (Florida)
Date: Saturday, February 15, 2020 11:24:11 AM
Attachments: Florida.xlsx

Greetings PHEP Directors and State Epidemiologists,

We are following up with the request below. Once we have received your submission access will be granted for 2019-nCoV database. Please respond as soon as possible, your information is necessary to grant access. We will use your response to **turn on access** for the designated staff.

As a reminder, please consult with your state Epi and state Lab counterparts to ensure we provide access to all staff in your jurisdiction that might need to enter data for various aspects of the response.

If you have any questions please contact eocsctftfcoord@cdc.gov.

Thank you,

State Coordination Task Force (SCTF)
Regional Coordination Team - eocsctftfcoord@cdc.gov

Subject: Time Sensitive Request: DCIPHER Rights for the two 2019-nCoV modules (Florida)

Greetings PHEP Directors and State Epidemiologists,

As we prepare to use DCIPHER for the 2019-nCoV response (e.g., data collection, transmission, and data sharing), we are seeking additional information about the type of access for the users you previously identified for the nCoV 2019 DCIPHER platform.

The “access group” options are described here:

AMERICAN OVERSIGHT

1. **Access to DCIPHER to <u>VIEW</u> (only) data**. Role allows individual to see a view of different reports and analyses for their jurisdiction's information and any aggregate national report that may be created.
2. **Access to DCIPHER for <u>DATA ENTRY and EDITING</u>**. Role allows individual to directly enter information into DCIPHER, edit data, see all data associated with the jurisdiction, in addition to viewing/creating different reports and analyses.

In the attachment, please complete information in the last two columns (epi and monitoring), select either **view** or **data entry/editing** for each user.

Please return your response to eocsctftfcoord@cdc.gov as soon as possible so we can configure the platform to support your jurisdictions' access requests.

Warm Regards,

State Coordination Task Force (SCTF)
Regional Coordination Team - eocsctftfcoord@cdc.gov

Subject: Updated IPC Guidance

Hi Scott,

The new **Interim Infection Prevention and Control Recommendations for Patients with Suspected or Confirmed Coronavirus Disease 2019 (COVID-19) in Healthcare Settings** has been released and can be found at this link: https://www.cdc.gov/coronavirus/2019-ncov/infection-control/control-recommendations.html

Biggest changes to highlight:

1. **PPE recommendations:**
    a. Based upon local and regional supplies, facemasks are an acceptable alternative when the supply chain of respirators cannot meet the demand. During this time, available respirators should be prioritized for procedures that are likely to generate respiratory aerosols, which would pose the highest exposure risk to healthcare personnel (HCP). When the supply chain has been restored, facilities should return to the use of respirators.
    b. Eye protection, gloves, and gowns continue to be recommended. If gown shortages are experienced, they should be for aerosol-generating procedures, care activities where splashes and sprays are anticipated, and high-contact patient care activities that provide opportunities for transfer of pathogens to the hands and clothing of HCP. Additional guidance is given regarding how to extend the use of respirators, facemasks, and eye protection as well on PPE shortages.
    c. Increased emphasis on the implementation of early source control measures such as putting a facemask on patients presenting with symptoms of respiratory infection.
2. **Rooming:**

AMERICAN OVERSIGHT

a. Airborne Infection Isolation Rooms (AIIRs) should be reserved for patients undergoing aerosol-generating procedures.
b. Patients with known or suspected COVID-19 can be cared for in a single-person room with the door closed.
c. Facilities could consider designating entire units with dedicated HCP to care for those with known or suspected HCP which will also help facilitate the extended use of respirators, facemasks, and eye protection.

3. **Additional consideration during times of wide spread community transmission:** Additional language regarding this has been added under the minimizing exposure and visitor sections.

Always happy to chat.

Best,
Elizabeth

Subject: Urgent Request for Information: Top State/Territorial Health Official (example, Secretary, Minister or Commissioner of Health)

Good Morning,

CDC Incident Management has asked the State Coordination Task Force for contact information of the **top health official** in each jurisdiction to expedite outreach in the event of an emergencies and to provide COVID-19 updates as expeditiously as possible. To accomplish this task, I am reaching out to the SHO/THO Assistant with a cc to the SHO/THO. This information will be used in tandem with the information we have for the SHO/THO maintained by ASTHO. You all are in a great position to assist us!

We know that in many cases the top health official is the SHO/THO. If that case is , just **reply** to this email that they are the **same**.

For those where there is a person who is more senior to the SHO/THO (as a reminder, we are looking for the most senior health official), please complete the following information:

State/Territory	Highest Health Official (i.e. Commissioner/ Minister/Secretary) Name (including degrees as appropriate)	Title	Phone Number (Please provide a **number or** numbers where we can reach out ***after hour*** should the need arise for COVID-19)	Email	Executive Assistant Name	Phone Number	Email
Republic of Palau	Emais Roberts, MD, FACS Ministry of Health Degrees: BS-Visual Science MD-Medicine Medical Training: General Surgery Residency Integrated Surgical Residency Trauma-Burns Resident Surgeon	Minister of Health	680 488-2552/3 680 775-4321	emais.roberts@palauhealth.org	Lalie Ikluk Omengkar D. Wally	680 775-5257 680 775-0000	lalie.ikluk@palauhealth.org omengkar.wally@palauhealth.org

Due to the nature of this **urgent request**, respond by **COB today**.

Thank you so much for your assistance.

If you have questions or concerns, please contact me.

Subject: Urgent Time Sensitive: Requesting 24/7 Phone Contact Information for COVID-19 Returning Travelers

Good Morning,

We need your help, please.

CDC is finalizing the COVID-19 Check and Report (CARE) booklets that will be given to passengers entering the United States who have traveled from China and will be self-monitoring.

We will be providing China travelers with a phone number to contact their state health department if they have questions or develop symptoms.

Please provide the **telephone number** travelers should contact for your state that is staffed 24/7 by COB today.

Thank you
State Coordination Task Force

Subject: Urgent Time Sensitive: Requesting 24/7 Phone Contact Information for COVID-19 Returning Travelers

Good Morning,

We need your help, please.

CDC is finalizing the COVID-19 Check and Report (CARE) booklets that will be given to passengers entering the United States who have traveled from China and will be self-monitoring.

We will be providing China travelers with a phone number to contact their state health department if they have questions or develop symptoms.

Please provide the **telephone number** travelers should contact for your state that is staffed 24/7 by COB today.

Thank you

Hi Carina
I hope you're doing well.

Just a friendly reminder if you could at your earliest convenience send the slides for your presentation for Vector Week's Tuesday afternoon's session on dengue to cjohnstone@alakaina.com (so she can load them ahead of time) with a copy to me along with a short bio, we'd much appreciate it.

See you next week.

Best regards,
Steve

AMERICAN OVERSIGHT

Hello Speakers for the Dengue Prevention and Control Session on Tuesday afternoon, February 25, 2020–

I want to thank you all again for agreeing to participate in this session. I think the audience will be excited about and learn a lot from what you all have to say!

Below is what we currently have you planning to talk about --- if your content is significantly different, please let us know as soon as possible!

1. *World Mosquito Program, Wolbachia replacement intervention trials (Steven Kern) ~20 min*

2. *Communities Organized to Prevent Arboviruses, Wolbachia Suppression Randomized Clinical Trial in Puerto Rico (Gabriela Paz-Bailey) ~20 min*

3. *Florida 2019 Dengue Outbreak Epidemiology and Response (Carina Blackmore) ~20 min*

Finally, if you all could send this information as well, it would be very helpful as we introduce each of you. A very short bio would also be helpful but not required – please don't make anything for this – if you have something already prepared, that is great!

a. Full name
b. Job title
c. Credentials
d. Name of organization

As noted below, if you can send your slides ahead of time to cjohnstone@alakaina.com, it would facilitate the logistics of loading of the presentations.

Looking forward to seeing you all in a couple of weeks.

Thanks again ~
Steve

VECTOR WEEK 2020: SPEAKER GUIDANCE

-
-

Thank you for participating in Vector Week 2020 as a conference speaker!

Your presentation is included in **Session #8, Emerging Issues in Mosquito Borne Diseases**. The session is scheduled for Wednesday February 26, 2020, 10:00-11:15am in Salon II & III at the University Hilton in Fort Collins, CO.

Presentation time: 20 minutes
Speakers in session: 3
Moderator(s) (cc'd here): Ann Powers, Steve Waterman

Please send your presentation slides to cjohnstone@alakaina.com by **February 14, 2020.** This will enable the conference staff to pre-load your presentation onto the computer in your session room. Additionally, your session moderator(s) will likely be contacting you with additional information. Please contact them for questions relating to this session.

If you haven't yet registered for Vector Week, please email cdcvectorweek@cdc.gov.

Thanks again for participating in Vector Week 2020 and we look forward to seeing you at the conference!

Sincerely,
The Vector Week Steering Committee

Federal Emergency Management Agency

[Internal Agency Docket No. FEMA-3385-EM]

[Docket ID FEMA-2017-0001]

Florida; Emergency and Related Determinations

AGENCY: Federal Emergency Management Agency, DHS.

ACTION: Notice.

SUMMARY: This is a notice of the Presidential declaration of an emergency for the State of Florida (FEMA-3385-EM), dated September 5, 2017, and related determinations.

DATE: The declaration was issued September 5, 2017.

FOR FURTHER INFORMATION CONTACT: Dean Webster, Office of Response and Recovery, Federal Emergency Management Agency, 500 C Street, SW, Washington, DC 20472, (202) 646-2833.

SUPPLEMENTARY INFORMATION: Notice is hereby given that on September 5, 2017, the President issued an emergency declaration under the authority of the Robert T. Stafford Disaster Relief and Emergency Assistance Act, 42 U.S.C. 5121-5207 (the Stafford Act), as follows:

AMERICAN OVERSIGHT

State Role

- Department of Emergency Management
  - Coordinates local assistance requests through WebEOC
  - Coordinates with federal partners
  - Activates Memoranda of Understanding
- Florida Department of Agriculture and Consumer Services (FDACS)
  - Contacts local mosquito control or county officials
  - Collects surveillance data and provides technical assistance
  - Coordinates with Florida Department of Environmental Protection if spraying on state lands
  - Works with pesticide application contractors
- Florida Department of Health (FDOH)
  - Local health department letter, technical assistance if needed

AMERICAN OVERSIGHT

Local Role

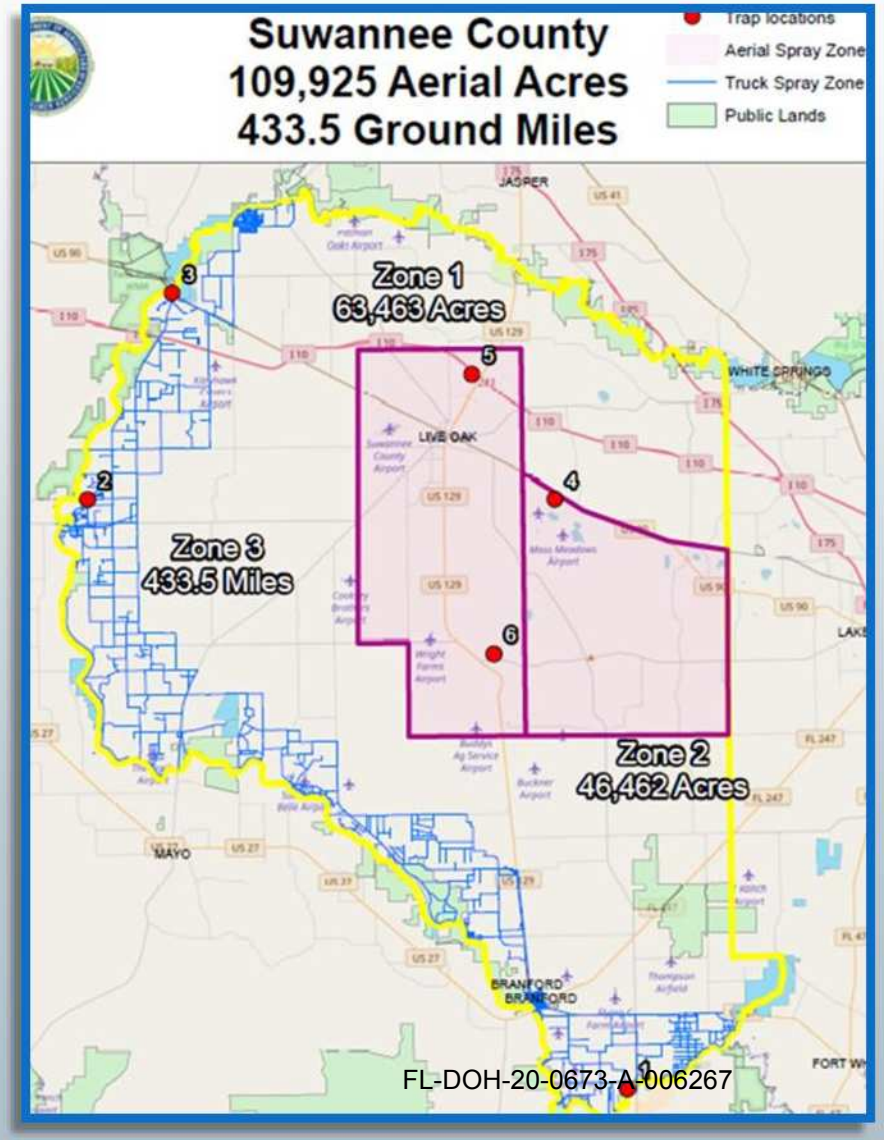
- Documentation required for Public Assistance Request
  - A letter from the County Health Department indicating a serious health threat or mosquito nuisance exists that hampers recovery efforts
  - Trap data that verifies the increase in mosquito populations
  - Three years of baseline data from non-event years
  - Maps showing the areas affected and in need of treatment

AMERICAN OVERSIGHT

Surveillance and Treatment

Florida Administrative Code 5E-13.036: surveillance activities must detect an increase in the mosquito population above a predetermined baseline prior to conducting adulticide activities

- > 50% above baseline is an indication of the potential for transmission of mosquito-borne disease
- A quantifiable and sustained increase can hamper recover efforts in post-storm cleanup efforts
  - Increase in species distribution and relative abundance to justify treatment
    - > 25 adult mosquitoes/trap/trap night
  - Increase in constituent complaints and service requests



FL-DOH-20-0673-A-006266

AMERICAN OVERSIGHT

Identifying Trap Locations

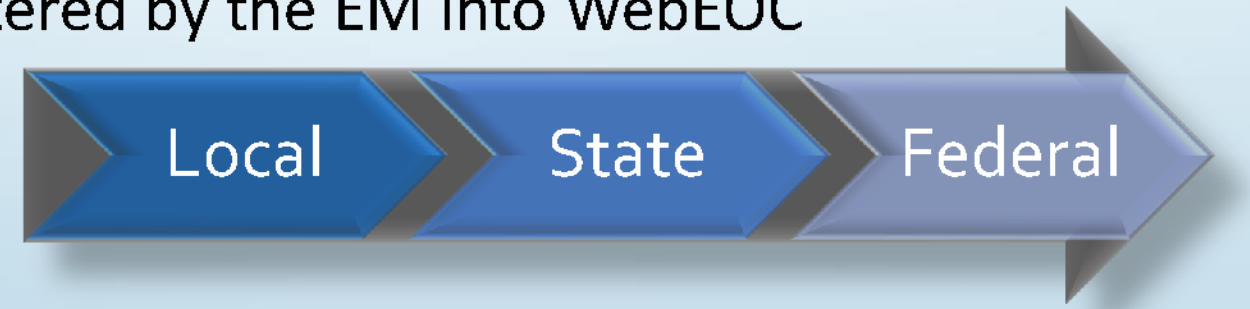
- All traps are deployed within treatment zones
- FEMA requires minimum of 5 traps per county
- Each aerial spray zone should have at least 1 CDC Light Trap
  - If less than 3 zones, traps should be distributed as evenly as possible within zones; not on the edge of zones

AMERICAN OVERSIGHT

CDC Light Trap

AMERICAN OVERSIGHT

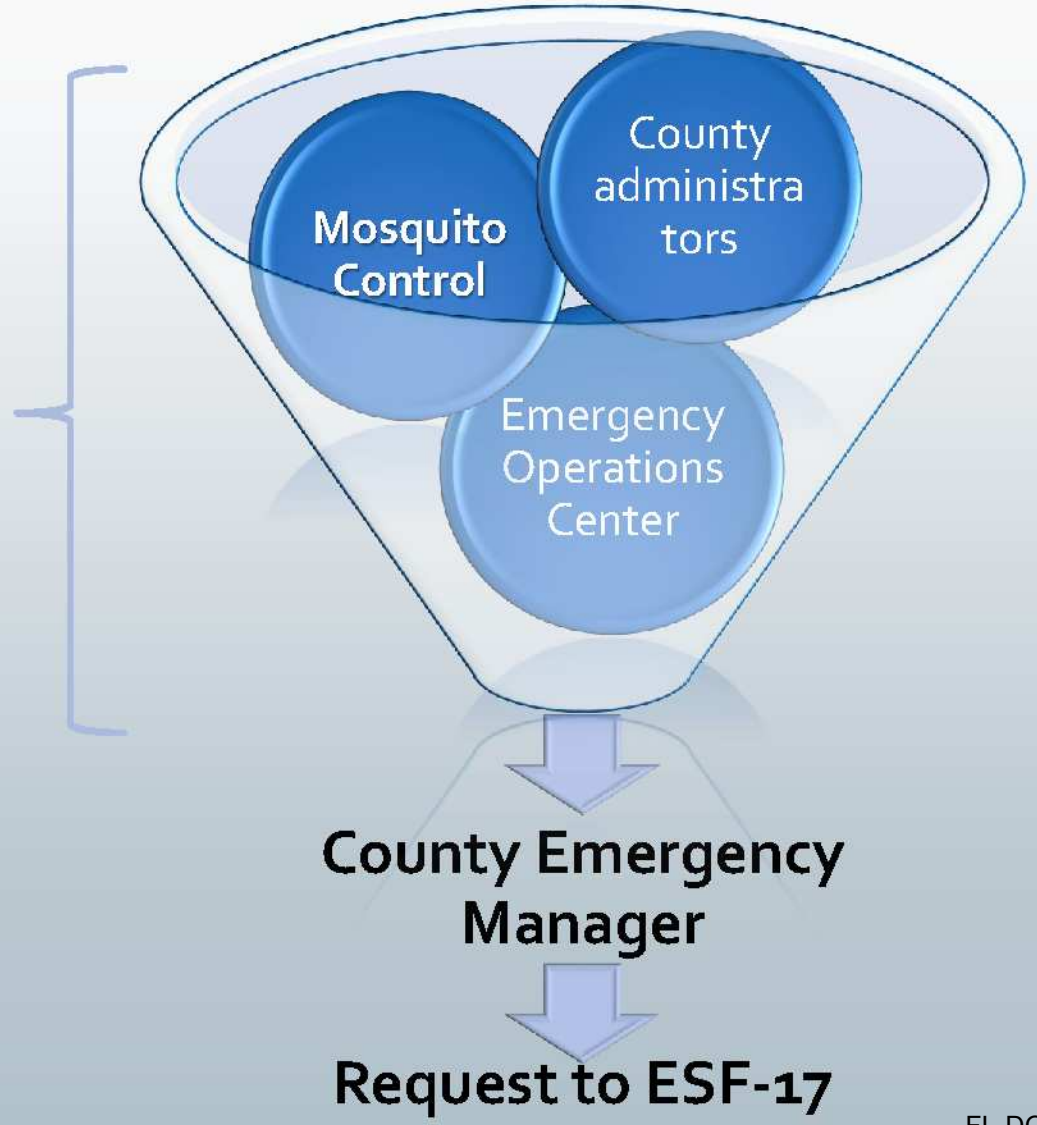
Post-treatment Surveillance



- **Conducted again to assess effectiveness of the treatment**
  - Traps are deployed again the day after treatment is completed
  - Traps are placed in exact geographical location as pre-treatment surveillance
  - Methods are the same as pre-treatment surveillance
    - Trap deployment form
    - Trap set-up
    - Timing of deployment and retrieval

AMERICAN OVERSIGHT

Ground Zero for Mosquito Abatement



- Everything begins at the local level!
  - Emergency Management (EM) communicates with local mosquito control to determine capabilities for post-storm abatement.
    - If a county does not require assistance, then expenses associated with post-storm treatment can be submitted through FEMA directly
    - If a county requires assistance, then requests must be entered by the EM into WebEOC

AMERICAN OVERSIGHT

Hierarchy

Open communication between local agencies to ensure a unified message is sent to the County Emergency Manager

AMERICAN OVERSIGHT

County Notifications

- FDACS requires written verification that the county has made adequate efforts in notifying its constituents prior to initiation of treatment:
  - Local law enforcement, emergency operations, fire departments, department of health, agriculture extension agents, newspaper, radio, television, and social media
  - Local apiaries, aquaculture, and those who may be chemically sensitive
  - Notifications are "weather pending" and may need to be updated based on schedule of treatment

AMERICAN OVERSIGHT

Notifications

Subject: Florida State Beekeepers note of thanks

On behalf of the Florida beekeepers, I wish to express our a
about mosquito spraying after hurricane Irma. Your timely
to beekeepers in the counties designated for aerial sprayin
beekeepers can use to take precautionary action when and
10 FSBA sent 4370 mosquito spray information emails to Fl
makes Fl agriculture work.

Thanks for your support

Bureau of Scientific Evaluation and Technical Assistance
Division of Agricultural Environmental Services

AMERICAN OVERSIGHT

Since our experience when WVN first arrived in FL in 2001, we created the Mosquito Control Incident Response Team. We also worked with FEMA to create their national policy on this.

We've worked to assist FL counties with Assembling baseline population data
Pre-treatment surveillance
Trap evaluation
Mapping of treatment zones
Public notification
Contracted applications
Post-treatment surveillance
Data analysis

Please note: **FDACS DOES NOT** conduct the actual treatments. The work is contracted out to applicable vendors. Also, **FDACS DOES NOT** provide direct reimbursement for work completed by the MCP. We are not set up as a mechanism to complete mosquito control.

AMERICAN OVERSIGHT

Mosquito Control Incidence Response Team

- Activated 10 times since 2001
  - Organized treatment of over 11 million acres
  - Aerial and truck
- West Nile virus, Zika and Dengue virus response
- Flooding from hurricanes
  - Wide area spraying to combat pestiferous species

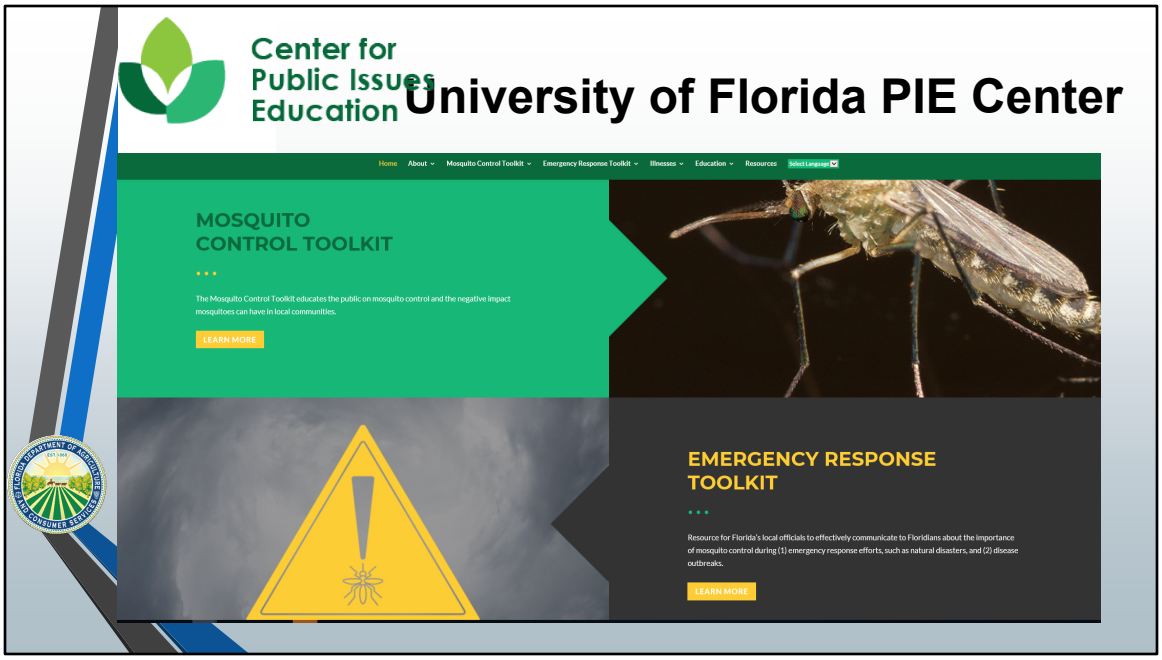
FDACS has a history of emergency response for mosquito control. When WNV first came to FL in 2001, the Department was involved in wide area ground and aerial adulticide campaigns, combating Culex vector species in North FL.

In response to flooding from tropical storms or hurricanes, the department has also provided emergency wide area adulticide applications to fight pestiferous mosquito species that hamper cleanup and recovery efforts. FDACS has developed the MCIRT, which follows the incident command structure and has been activated 7 times since 2001, organizing the treatment of over 11 million acres collectively!

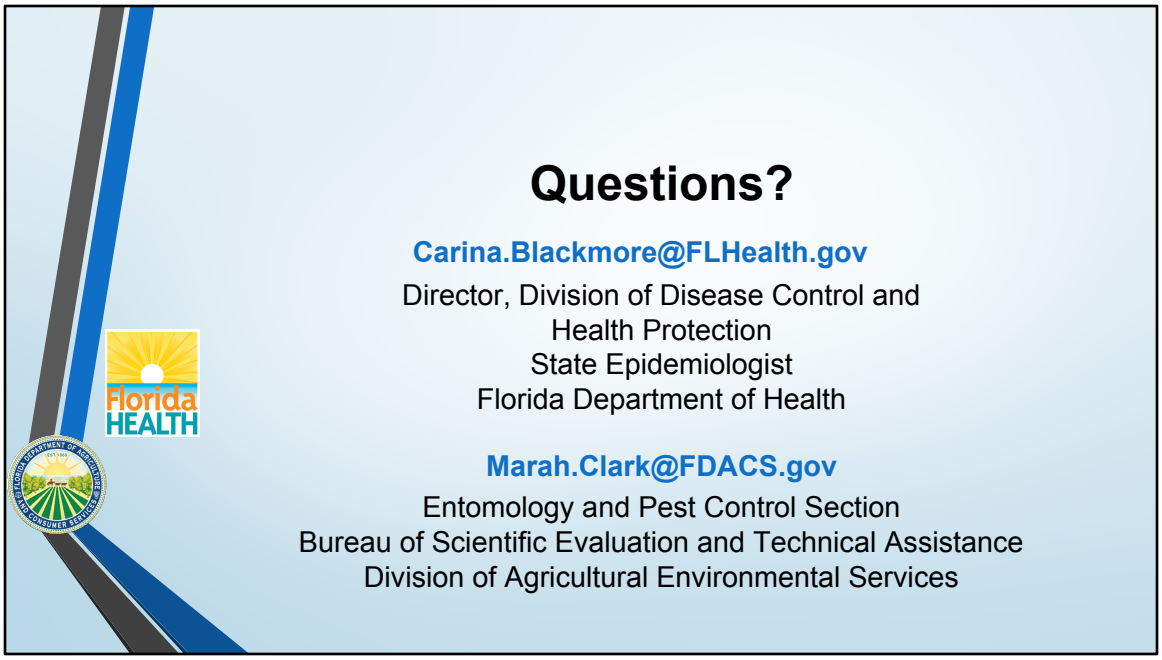
In 2016, we used a modified version of our previous emergency response to form a Zika vector control task force that was deployed in Taylor county, twice in Okee, and in Broward county we provided surveillance assistance. In highlands county earlier in 2017, we provided assistance to respond to a DENV case.

AMERICAN OVERSIGHT

Response– Hurricane Michael



- 7 counties requested assistance
- 25 Division personnel participated
- 781,210 acres treated aerially with Dibrom
- $1,566,860.81 expended



All treatments were conducted by air. Ground treatments were not conducted. The outcome of the MCIRT response for Hurricane Michael

Hello Speakers for the Dengue Prevention and Control Session on Tuesday afternoon, February 25, 2020–

I want to thank you all again for agreeing to participate in this session. I think the audience will be excited about and learn a lot from what you all have to say!

Below is what we currently have you planning to talk about --- if your content is significantly different, please let us know as soon as possible!

1. *World Mosquito Program, Wolbachia replacement intervention trials (Steven Kern) ~20 min*

2. *Communities Organized to Prevent Arboviruses, Wolbachia Suppression Randomized Clinical Trial in Puerto Rico (Gabriela Paz-Bailey) ~20 min*

3. Florida 2019 Dengue Outbreak Epidemiology and Response (Carina Blackmore) ~20 min

Finally, if you all could send this information as well, it would be very helpful as we introduce each of you. A very short bio would also be helpful but not required – please don't make anything for this – if you have something already prepared, that is great!

a. Full name
b. Job title
c. Credentials
d. Name of organization

As noted below, if you can send your slides ahead of time to cjohnstone@alakaina.com, it would facilitate the logistics of loading of the presentations.

Looking forward to seeing you all in a couple of weeks.

Thanks again ~
Steve

VECTOR WEEK 2020: SPEAKER GUIDANCE

-
-

Thank you for participating in Vector Week 2020 as a conference speaker!

Your presentation is included in **Session #8, Emerging Issues in Mosquito Borne Diseases**. The session is scheduled for Wednesday February 26, 2020, 10:00-11:15am in Salon II & III at the University Hilton in Fort Collins, CO.

Presentation time: 20 minutes
Speakers in session: 3
Moderator(s) (cc'd here): Ann Powers, Steve Waterman

Please send your presentation slides to cjohnstone@alakaina.com by **February 14, 2020.** This will enable the conference staff to pre-load your presentation onto the computer in your session room. Additionally, your session moderator(s) will likely be contacting you with additional information. Please contact them for questions relating to this session.

If you haven't yet registered for Vector Week, please email cdcvectorweek@cdc.gov.

Thanks again for participating in Vector Week 2020 and we look forward to seeing you at the conference!

Sincerely,
The Vector Week Steering Committee

Arboviruses are RNA viruses, and the main ones that we do surveillance for here in Florida fall into 2 genera: flavivirus and alphavirus. The flaviviruses include St. Louis Encephalitis (SLE), West Nile (WN) virus, and Dengue virus. The alphaviruses include Eastern Equine Encephalitis (EEE) virus, and Highlands J (HJ).

I am giving two different presentations. I didn't mean to send the emergency preparedness slides to you… I sent the dengue presentation to Steve. I sent a different presentation (the emergency preparedness presentation) to Nga. Didn't understand you needed to upload these so first sent a pdf, then sent the ppt to her but had to divide into a and b. Together they should be the same file as the emergency preparedness pdf. Does that make more sense. You can remove the draft watermark.

Abstract. Dengue, a mosquito-borne viral disease, is increasingly being identified as a cause of outbreaks in the United States. During July–December 2013, a total of three south Texas counties reported 53 laboratory-confirmed dengue cases; 26 were locally acquired, constituting the largest outbreak in Texas since 2005. Because dengue outbreaks are expected to continue in south Texas and early case identification and timely treatment can reduce mortality, we sought to determine clinicians' knowledge of dengue and its clinical management. A survey was sent to 2,375 south Texas clinicians; 217 (9%) completed the survey. Approximately half of participants demonstrated knowledge needed to identify dengue cases, including symptoms (56%), early indicators of shock (54%), or timing of thrombocytopenia (48%). Fewer than 20% correctly identified all prevention messages, severe dengue warning signs, or circumstances in which a dengue patient should return for care. Knowledge of clinical management was limited; few participants correctly identified scenarios when plasma leakage occurred (10%) or a crystalloid solution was indicated (7%); however, 45% correctly identified when a blood transfusion was indicated. Because of the ongoing threat of dengue, we recommend clinicians in south Texas receive dengue clinical management training.

INTRODUCTION

Dengue is a mosquito-borne acute febrile illness that is caused by one of four dengue viruses (DENV-1, 2, 3, and 4).[1] Dengue is endemic throughout the tropics and subtropics worldwide, including the Americas where the incidence of dengue has increased greater than 4-fold during the last three decades.[2] During the same period, the region has experienced an increase in both frequency of dengue outbreaks and disease severity.

In the United States, dengue is endemic in the territories of Puerto Rico and the U.S. Virgin Islands.[3] The majority of dengue cases identified in the 50 states are travel associated, and dengue is the leading cause of febrile illness among U.S. travelers returning from southeast Asia, Latin America, and the Caribbean.[4] Travel-associated dengue cases have led to outbreaks with local DENV transmission in Hawaii,[5] Florida,[6] and Texas.[7,8] Since 1980, Texas border communities have experienced multiple dengue outbreaks concurrent with epidemics in Mexico.[8–10] The possibility of dengue outbreaks in Texas is a continual threat because of its proximity to Mexico, substantial cross-border traffic, presence of *Aedes aegypti* mosquitoes,[11] and a predominantly nonimmune U.S. population.

Although the majority of DENV infections result in asymptomatic infection or mild acute febrile illness, a limited number (~5%) of symptomatic infected persons will develop severe dengue, a potentially life-threatening illness with a vascular leakage syndrome resulting in hypovolemic shock and hemorrhage.[12–14] Fatality rates for hospitalized patients with severe dengue can be as high as 10%; however, studies have reported that mortality rates can be reduced to < 0.5% with early case identification and timely initiation of correct clinical management.[1,15,16]

During May–October 2013, the Mexican state of Tamaulipas, which borders Texas, experienced a dengue epidemic and ~5,500 suspected dengue cases were reported.[17] During the same period in Texas, 53 laboratory-confirmed dengue cases (median patient age = 28 years, range = 1–85 years) were detected in south Texas border counties; 26 (49%) were locally acquired.[18] Although sporadic cases of dengue have been detected in south Texas during past decades, this outbreak was the largest since the 2005 outbreak in Brownsville, TX.[9,19] Because of the substantial increase in dengue cases reported along the United States–Mexico border, the Texas state and local public health officials partnered with Centers for Disease Control and Prevention (CDC) to develop strategies to reduce morbidity and mortality associated with dengue. One objective was to survey local Texas clinicians' knowledge of dengue and its clinical management to guide intervention strategies.

MATERIALS AND METHODS

Physicians, physician extenders (nurse practitioners [NPs], and physician assistants [PAs]) practicing medicine in the Texas counties of Cameron, Hidalgo, Starr, Willacy, and Zapata (collectively known as south Texas) were invited by e-mail to participate in the dengue clinical survey. We also invited clinicians from the Houston metropolitan area (HMA) to participate because of identification of both locally acquired and travel-associated dengue cases in the HMA.[20] We specifically sought participation from clinicians in general practice, family medicine, internal medicine, pediatrics, emergency medicine, infectious disease, hematology, obstetrics, and intensive care, because these medical specialties might be more likely to encounter a patient with dengue.

We developed our survey instrument by using multiple data sources to formulate the survey questions. We conducted key informant interviews with treating clinicians and

a medical record review of confirmed and suspected dengue patients at south Texas hospitals to identify clinical management practices and whether these practices varied from the World Health Organization 2009 dengue guidelines[21]. Findings of deficiencies in recommended clinical management practices (e.g., failure to recognize dengue and warning signs for developing severe dengue, inaccurate understanding of dengue diagnostics, and use of nonsteroidal anti-inflammatory drugs [NSAIDs]) were used to develop survey questions.

The 28-question survey included 10 optional demographic questions and 18 technical questions. The technical questions were divided into three knowledge areas, including dengue prevention messages and anticipatory guidance, clinical presentation and course, and dengue clinical management. We also asked questions to assess clinical practice habits. We piloted the survey to assess for clarity and level of difficulty by using a convenience sample of nine physicians and incorporated feedback. The survey was administered online through SurveyMonkey® (SurveyMonkey, Palo Alto, CA).[22] Answering all technical questions was required to advance and complete the survey. After survey completion, participants were redirected to a webpage that provided the correct answers with explanations. Participants had the option to redirect to the CDC dengue website (http://www.cdc.gov/dengue) for additional information. Data were analyzed using IBM SPSS Statistics for Windows (Version 20.0; IBM Corporation, Armonk, NY) and difference in responses among groups was analyzed using Pearson's χ^2 test. Time in practice was analyzed using clinicians in practice > 30 years as the comparator. Some of the 18 technical questions had multiple correct answers, so each answer was treated like a true or false question. We decided a priori to exclude surveys from clinicians who were no longer practicing clinical medicine, practicing outside the catchment area, and did not return complete survey instruments. We chose to exclude the first and second categories of clinicians since our goal was to evaluate clinical decision-making in dengue-prone areas.

Potential participants included all members of local medical societies in south Texas and HMA. In addition, we partnered with the two major health systems in HMA to distribute our survey via e-mail to their clinician employees. All participants were invited via e-mail either through their membership with a local medical society or in the case of the HMA clinicians; many received an invitation from their employer. We were unable to access a list of all licensed clinicians in the catchment area. A letter of endorsement from the Regional Medical Director of south Texas was included with the e-mail containing the survey website link. As an incentive, participants completing the survey were entered in a drawing to win a tablet device provided by the CDC U.S. Mexico Unit. Participants were asked to complete the survey within 2 weeks; a reminder e-mail was sent after the first week had passed, if the survey had not been completed.

This survey was reviewed by CDC for human subjects protection, and was deemed to be nonresearch.

RESULTS

The survey was sent to 2,375 clinicians, including 1,410 (59%) physicians, 400 (17%) NPs, and 565 (24%) PAs (Figure 1). A total of 339 (14%) clinicians responded, although 71 (21%) did not complete all the technical questions and were excluded from analysis. Of 268 completed surveys, 51 (15%) were excluded because the participant was either not active in direct patient care or practiced outside of the defined catchment area. Data from the remaining 217 (9%) surveys were included in our analysis.

Response rates differed by the following geography and clinician type: HMA physicians had the highest response rate (16%), followed by HMA physician extenders (15%), south Texas physician extenders (8%), and south Texas physicians (4%). Participants from all regions were approximately equally split between physicians (54%) and physician extenders (46%) (Table 1). The majority (73%) of participants had been in practice for ≤ 20 years and reported working in an outpatient setting (86%). The majority (90%) of participants practiced in a primary care specialty, and a substantial number (42%) were pediatricians. The majority (81%) of participants had never diagnosed a case of dengue; 25 (12%) participants had diagnosed 1–4 cases. Seven (3%) participants (all south Texas physicians) reported having diagnosed > 20 dengue cases during their career; the majority of these participants were trained in infectious disease. Deficiencies in knowledge of dengue

were present among all groups, and no differences were noted among specialties.

Knowledge of anticipatory guidance and prevention messages. Participant knowledge of anticipatory guidance (education about expected dengue clinical course) and prevention messages did not vary by duration of practice (Table 2), but did vary by level of clinical experience with dengue patients (Table 3). Only a limited number of participants (6%) correctly identified two of two prevention messages (Table 4). Although nearly all (99%) participants knew that avoidance of mosquito bites is necessary to avoid dengue, only 38% correctly identified that febrile dengue patients should take precautions to avoid mosquito bites to prevent transmitting DENV to household members or neighbors. Participants who reported having diagnosed ≥ 1 case of dengue (i.e., dengue-experienced clinicians) were more likely than those who had never diagnosed a case (i.e., dengue-inexperienced clinicians) to identify both of these prevention messages (21% versus 2%, $P = 0.001$; Table 3).

Fewer than 1% of participants correctly identified all warning signs for severe dengue (Table 4), and the majority (59%) did not recognize severe abdominal pain as a warning sign for severe dengue. Dengue-experienced clinicians did not perform better than dengue-inexperienced clinicians in identifying warning signs (Table 3). Approximately one-fifth (19%) of participants were able to correctly identify all three situations that should prompt a patient with suspected dengue to return for care (e.g., persistent vomiting, drowsiness or lethargy, or hematemesis) (Table 4); dengue-experienced clinicians were more likely than dengue-inexperienced clinicians to correctly identify all three situations (34% versus 15%, $P = 0.006$; Table 3). The majority (70%) of participants correctly reported avoidance of administering NSAIDs (Table 4), although dengue-experienced clinicians were more likely to report doing so than dengue-inexperienced clinicians (84% versus 68%, $P = 0.041$; Table 3).

Knowledge of clinical presentation and course. Participant knowledge concerning clinical presentation and course of dengue did not vary by duration of medical practice or level of clinical experience with dengue patients (Tables 2 and 3). Approximately half (56%) of participants were able to identify all clinical signs and symptoms of dengue presentation (Table 4). A greater number (65%) of participants were able to correctly identify when plasma leakage might occur than were able to correctly identify when thrombocytopenia might be expected (46%). Approximately half (54%) of participants correctly identified tachycardia in the absence of fever or delayed capillary refill as the best early indicator of shock.

Knowledge of dengue clinical management. Participant knowledge of dengue clinical management varied somewhat by duration of practice (Table 2), but not by level of clinical experience with dengue patients (Table 3). A limited number (10%) of participants correctly identified two ways to detect clinically significant plasma leakage (i.e., a 20%

*Not mutually exclusive categories.

increase of hematocrit above baseline level and chest radiograph with lateral decubitus view to identify pleural effusion) (Table 4). Only 7% correctly identified all three indications for intravenous crystalloids in dengue patients (i.e., initial fluid resuscitation for suspected dengue patient with hypotension, high hematocrit or tachycardia, and low urine output) (Table 4). Approximately half (55%) of participants recognized that intravenous crystalloids should be used as the initial fluid replacement in dengue patients with elevated hematocrit. Dengue-experienced clinicians were more likely than dengue-inexperienced clinicians to correctly identify this indication (76% versus 51%, $P = 0.005$; Table 3). Approximately one-fourth (26%) of all participants failed to recognize the need for blood transfusion instead of intravenous crystalloids in dengue patients with clinically significant bleeding (Table 4). The majority (61%) of participants knew that anti-DENV IgM antibodies are first detectable on days 3–5 after illness onset.

Dengue patients can present for medical care at any point during or after illness, and clinicians should anticipate the need for hospital admission and safe discharge. When presented with four possible scenarios for safe hospital discharge, dengue-experienced clinicians were more likely to take into consideration comorbidities (e.g., diabetes) than dengue-inexperienced clinicians (61% versus 39%, $P = 0.016$; Table 3). Numerous participants (40%) did not know that hemoconcentration is an indication for further monitoring (Table 4).

Clinical practice. Corticosteroid use in the management of dengue patients was correctly low (3%) among all participants (Table 2); a higher proportion of clinicians practicing ≥ 30 years reported prescribing corticosteroid use than those practicing < 30 years (13% versus 1% for < 10 years, $P = 0.005$; 13% versus 2% for 11–30 years of practice, $P = 0.018$; Table 3). A higher proportion of dengue-experienced clinicians reportedly ordered diagnostic tests for all suspected dengue patients than clinicians without dengue experience (74% versus 45%, $P = 0.001$; Table 4). In a similar way, a higher proportion of physicians reportedly ordered diagnostic tests for all suspected dengue patients compared with physician extenders (73% and 50% for south Texas and HMA physicians, respectively, versus 48% and 41% for south Texas and HMA physician extenders, respectively; $P = 0.030$ (Table 4). The majority (78%) of participants correctly identified that dengue is a reportable disease in Texas, and that suspected and confirmed cases should be reported to the health department within 1 week (Table 2).

DISCUSSION

This survey among HMA and south Texas clinicians revealed critical knowledge gaps of dengue and its clinical management. Overall knowledge of anticipatory guidance and prevention messages for dengue and its clinical management was low among all participants regardless of clinician type, years of practice, and experience managing

dengue patients. However, numerous clinicians did report correctly avoiding NSAIDS and ordering dengue diagnostic testing for patients suspected of having dengue. Participants understood dengue clinical presentation and course. Specific differences were noted between physicians and physician extenders in the identification of early indicators of shock and indications for blood transfusion. Physician extenders performed better concerning questions related to dengue identification than questions concerning inpatient clinical management, which might be related to training and practice sites (physician extenders may be more commonly involved in primary care versus specialty training). In addition, those in clinical practice > 10 years were more likely to identify the indications for blood transfusion in dengue patients than those practicing ≤ 10 years. Participants in clinical practice > 30 years were less likely to recognize scenarios of plasma leakage and more likely to prescribe corticosteroids to dengue patients than those practicing ≤ 30 years.

This survey was subject to multiple limitations, including participants' response and survey completion rates were low and varied with regard to specialty and geographic region. Specifically, HMA clinicians were more likely to participate, which might be attributable to differing recruitment methods in HMA and south Texas (i.e., the former received survey invitations from their employer and the latter from local medical societies). Second, the number of participating physicians from south Texas was low and prevented direct comparisons between groups. Third, less knowledge of inpatient clinical management might be attributable to an overrepresentation of outpatient clinicians. Fourth, the survey did not allow participants to leave any question blank, forcing a response to maximize the number of completed surveys for analysis but may have skewed the sample toward those with more knowledge on dengue. Fifth, the sampling method may have selected for clinicians with more interest in dengue and potentially biasing toward those with more dengue knowledge. Finally, we were unable to describe clinicians who did not complete the survey, which limited our ability to fully account for bias.

Response rates in clinician surveys have traditionally been poor with the best response rates being roughly 40–50%.[23] Despite the low response rate, clear deficiencies in knowledge about dengue were evident among all participants. Given the abovementioned limitations and biases, it is possible that knowledge was skewed toward those with greater dengue interest and knowledge, magnifying knowledge deficiencies. Clinicians who reported experience in diagnosing and managing dengue, albeit with a limited number of patients, still scored poorly. We identified knowledge gaps reported from similar clinical surveys administered in dengue-endemic areas; clinicians lacked knowledge about dengue clinical characteristics,[24] severe disease warning signs, discharge criteria,[25] and prevention methods.[26] Limited recognition of the critical phase of disease by clinicians was also demonstrated in

a survey conducted in Puerto Rico.[16] These surveys were conducted in endemic areas and reported higher response rates than our survey. However, it is likely that physicians working in areas which see only sporadic dengue (such as south Texas) have less knowledge about dengue, especially since U.S. medical education often lacks tropical medicine training.

These findings highlight a need for clinical management training for U.S. clinicians across all points of care in regions likely to treat dengue patients. Training is especially important in south Texas, because studies have demonstrated a continued risk for dengue outbreaks attributable to a highly mobile and susceptible population, regular DENV introduction, and presence of competent mosquito vectors in south Texas.[11] Further, all four DENV have been reported in the region, thereby increasing risk for secondary infections among the susceptible resident U.S. population.[9] Because dengue patients experiencing secondary DENV infection are associated with increased risk for developing severe dengue, compared with patients with primary infection,[1] future outbreaks in south Texas might be associated with increased incidence of severe dengue.[8]

Focus on clinician training and education in areas at risk for DENV transmission or among clinicians who serve at-risk travelers is an important public health strategy to decrease morbidity and mortality associated with dengue. Previous physician trainings on dengue clinical management in Puerto Rico demonstrated improved management of hospitalized dengue patients after the implementation of a classroom-style physician training course.[27] Medical curriculum should emphasize identified knowledge gaps, including warning signs for severe dengue and the clinical management of severe dengue. Online curriculum such as the CDC's Dengue Clinical Management Course (http://www.cdc.gov/dengue/training/cme.html) is an attractive option for education with free continuing medical education. Clinicians in Texas might also benefit from cross-border collaboration with clinicians in Mexico who have extensive dengue experience; possible projects might include clinical exchange programs or clinical research collaboration.

Abstract

Background: Detection of local dengue transmission requires an aware and engaged medical community, as health care providers are the front line of public health surveillance. To assess the knowledge, attitude, and practice about dengue, an online survey was distributed among Arizona health care providers during 2014 and 2015.

Materials and Methods: The survey consisted of a total of 10 knowledge, attitude, and practice questions divided as follows: 5 knowledge questions, 2 attitude questions, and 3 practice questions. The link to the Qualtrics survey was distributed through the Arizona Health Alert Network to a total of 4582 e-mail addresses, of which 335 participants opened the survey, and 196 completed and submitted their responses.

Results: Less than half the respondents reported choosing the right dengue diagnostic test (40.4%) or understanding the epidemiology of dengue in Arizona (40.9%). Slightly more than half the respondents reported frequently asking for travel history (59%), and three-fourth of them would notify the local health department on suspicion of a dengue patient (76.1%). Survey score was associated with providers specialized in infectious diseases (1.88, 95% CI: 0.42–3.33, $p = 0.01$), medical doctors or doctors of osteopathic medicine (1.82, 95% CI: 0.98–2.65, $p < 0.0001$), and respondents who reported to have heard about the increase in dengue cases in Sonora (Mexico) in fall 2014 (1.51, 95% CI: 0.67–2.34, $p = 0.0005$), indicating better survey performance.

Conclusions: These results indicate that education for health care providers on dengue should be improved particularly among general practice noninfectious disease providers who might be the first point of care for dengue patients. Findings suggest that additional training on clinical management, asking travel history, and notifying the local health department on suspicion of a dengue patient are needed.

Keywords: dengue, Arizona, Mexico, knowledge, arboviral diseases

Introduction

Dengue viruses can cause serious and potentially fatal acute febrile illness. An estimated 390 million cases of dengue infection occur annually worldwide (Bhatt et al. 2013), with infections increasing nearly 30-fold in the past 50 years (WHO 2009). An estimated 500,000 of these infections are cases of severe dengue, and 22,000 result in fatalities annually (Brady et al. 2012, Bhatt et al. 2013). Dengue is caused by infection with any one of four viral serotypes: DENV-I, DENV-II, DENV-III, or DENV-IV, which are transmitted by *Aedes* (*Ae.*) species mosquitoes, primarily *Aedes aegypti* and *Aedes albopictus*.

In the United States, dengue outbreaks have occurred in the last 15 years in Florida (CDC 2010), Texas (Abell et al. 2007, Thomas et al. 2016), and Hawaii (Johnston et al. 2016). The disease is endemic in Mexico, with the annual number of dengue cases increasing from 1714 cases in 2000 to 15,424 in 2011 (Dantes et al. 2014). The Mexican state of Sonora, which borders Arizona, has also seen an increase in the number of dengue cases in 2010 and in 2014, when it reached an incidence of 100 cases per 100,000 population (DGE 2014).

Beginning in September 2014, an increase in locally acquired dengue cases in Sonora, Mexico, was reported in the border region with Arizona. Between December 2014 and

January 2015, a binational dengue outbreak was identified, with 52 cases detected in San Luis Rio Colorado, Sonora, and 70 cases reported in the neighboring Arizona border county of Yuma (Jones et al. 2016). This outbreak represented a ninefold increase in reported cases among Arizona residents compared with 10 dengue cases reported in 2010 and 2012 (1994–2009 median of 2 cases annually). Despite the increase in cases, no locally acquired cases in Arizona were identified as all cases reported travel to Mexico within 14 days before symptom onset (Jones et al. 2016).

Arizona is home to a dengue-competent mosquito vector, *Ae. aegypti*, which is known to be well-established across parts of the state (ADHS 2016). Although the complete range of *Ae. aegypti* in Arizona is unknown, current and historical data suggest substantial establishment in central and southern Arizona, including the Arizona-Sonora border region. The mosquito's presence in Arizona, along with the northward expansion of dengue virus infections toward the border, enhances the likelihood of both locally acquired and travel-associated dengue cases in Arizona. Early detection of locally acquired cases is particularly important, to promptly initiate a public and environmental health response to avoid the spread of the disease in Arizona. Identification of locally acquired dengue cases requires an aware and engaged medical community; as the front line of public health surveillance, health care providers start the process of outbreak investigation and control by reporting suspected cases to local public health officials. To detect locally acquired cases, health care providers should have detailed knowledge of dengue epidemiology, symptoms, appropriate diagnostic tests, and reporting procedures.

To better understand the knowledge and behaviors of health care providers in Arizona with respect to dengue, we administered a knowledge, attitudes, and practices (KAP) survey to Arizona providers between December 2014 and March 2015, starting soon after the identification of the binational dengue outbreak in Yuma County. The goals of this survey were to assess providers' knowledge of dengue epidemiology, symptoms and transmission, confidence in diagnosing and treating the disease, and practices when treating a patient with suspected dengue virus infection. A few studies have been published on the knowledge, attitudes, or practices of providers with respect to dengue in the United States, specifically in Puerto Rico (Tomashek et al. 2014), in Florida (Doblecki-Lewis et al. 2016), and in Texas (Adam et al. 2017). However, our study is unique as it surveyed physicians in Arizona, a state that has not yet reported local dengue transmission, but that is at high risk of dengue emergence.

Materials and Methods

The survey consisted of a total of 10 multiple choice KAP questions divided as follows: 5 knowledge questions (clinical symptoms, transmission, diagnosis, treatment, and epidemiology), 2 attitude questions (confidence in diagnosis and treatment), and 3 practice questions (reporting, asking for travel history, and ordering of laboratory testing). In addition, an eight-question demographics section gathered information about the participants' county of practice, number of years practicing in Arizona, patient demographics, medical specialty, and type of health care practice.

Qualtrics software (Qualtrics, Provo, UT) was used to collect responses. A link to the survey was distributed thrice through the Arizona Health Alert Network, a tool used by the Arizona Department of Health Services (ADHS) to distribute important alerts to public health officials and health care professionals and to ADHS Division of Licensing e-mail lists, in December 2014, January 2015, and March 2015. These lists had a total of 4582 e-mail addresses, which included: $\sim$3000 points of contacts for licensed medical facilities, 1128 independent health care providers, 12 medical organizations, 250 hospital infection preventionists, and 192 emergency department directors. However, it is difficult to accurately determine the number of unique providers reached as some e-mails might have reached nonclinical or nonpracticing health care workers and some organizations might have further disseminated the link to their individual members.

This project was evaluated by the Arizona Human Subjects Review Board and found to be a nonresearch activity (HSRB 16-0042).

By the end of the survey period, 335 participants had opened the survey, and 196 completed and submitted their responses, corresponding to a 4.3% response rate (196/4582). Only respondents involved in direct patient care were included in the analysis ($n=188$), excluding, for example, medical students and pharmacists. Differences in clinical degree type were analyzed by grouping doctors of medicine (MDs) or doctors of osteopathic medicine (DOs) ($n=106$) and nurse practitioners (NPs) or physician assistants (PAs) ($n=39$); registered nurses or nurses holding a bachelor of science in nursing ($n=15$) and respondents with other or missing degrees ($n=6$ and 22, respectively) were excluded from this component of the analysis due to the small numbers of these respondents.

To analyze a respondent's overall performance, each answer to the 10 KAP questions was given a point value of 1 (inadequate knowledge), 2 (adequate knowledge), or 3 (high knowledge) (see Supplementary Table S1 for details); an overall KAP score, ranging from 10 to 30, was calculated for each respondent as the sum of points from the 10 questions. For categorical variables, chi-squared test or Fisher's exact tests (for $n<21$) were used to identify differences. *t*-Tests were used for comparisons of mean KAP scores between degrees or other characteristics. Associations with $p<0.05$ were considered significant. Stepwise multivariate linear regression was used to identify independent predictors of KAP score, and predictors with $p<0.05$ were retained in the final model. Data were analyzed using SAS 9.3 software (Institute, Inc., Cary, NC).

Results

Of the 188 respondents included in the final analysis, the majority ($n=106$, 64%) were MDs or DOs; 22 had missing degrees. The most commonly reported specialties were family medicine (24%), pediatric medicine (18%), or emergency medicine (15%); practice locations were mainly private offices or clinics (48%) or hospitals (32%) (Table 1). The majority of the participants had practiced in Arizona for more than 10 years (57%), practiced in an urban county (73%), and practiced in a county not bordering Sonora, Mexico (65%). Participants were located throughout Arizona (11 of 15

[b]CDC/NNDSS Clinical dengue case definition: fever as reported by the patient or health care provider and the presence of one or more of the following signs and symptoms: nausea/vomiting, rash, aches and pains, tourniquet test positive, leukopenia (a total white blood cell count of $<5000/mm^3$), or any warning sign for severe dengue (abdominal pain or tenderness, persistent vomiting, extravascular fluid accumulation, mucosal bleeding at any site, liver enlargement >2 cm, increasing hematocrit concurrent with rapid decrease in platelet count) (WHO, 2009).

DO, doctor of osteopathic medicine; MD, doctor of medicine; NP, nurse practitioner; PA, physician assistant; RN, registered nurse; BSN, bachelor of science in nursing.

counties), although the majority were from Maricopa (42%) and Pima (31%) counties (Fig. 1). Maricopa and Pima counties are the most populated counties in Arizona, making up ~60% and 15% of the state's population, respectively, and are home to the top 2 most populated cities in the state (Phoenix and Tucson). Both cities are only a few hours away from the United States–Mexico border (181 miles for Phoenix and 68 miles for Tucson), so the population at risk of acquiring dengue from across the border and importing the disease in the state is potentially very high.

Half of respondents reported a low proportion (1–24%) of primarily Spanish speaking patients; only 10% reported that >50% of their patients were primarily Spanish speaking. Approximately 11% of respondents reported serving a predominantly Native American population. Few (9%) reported seeing a patient in the past year that met the CDC/NNDSS clinical dengue case definition ["acute onset of fever plus two or more of the following signs or symptoms: headache, retro-orbital pain, myalgia, arthralgia, rash, hemorrhagic manifestation, leukopenia, and not fitting another diagnosis" (NNDSS 2010); Table 1].

In questions about knowledge of dengue symptoms and transmission, the majority of respondents correctly identified common symptoms of dengue (88% identified fever and 56% hemorrhagic manifestations), the correct route of transmission (89% reporting mosquito bite as possible transmission route), and appropriate treatment (64% reporting intravenous [IV] fluids) (Table 2). Respondents were less knowledgeable about geographic areas with active dengue transmission and clinical and laboratory diagnostic techniques (Fig. 2 and Table 2). Specifically, 41% of the respondents incorrectly reported that the Arizona border region (*e.g.*, Yuma, AZ; Nogales, AZ; Douglas, AZ) was endemic for dengue virus; this region has reported only travel-associated cases to date. There was also a notable lack of knowledge about the appropriate diagnostic methods for dengue virus infection, with ~60% of respondents unable to identify that ELISA (IgM/IgG) should be used ≥5 days after symptom onset and PCR should be used <5 days from symptom onset (Table 2). Participants also reported low confidence in diagnosis and treatment of patients with dengue virus infection, regardless of whether it was a mild case (35% confidence in diagnosis and 44% confidence in treatment) or a severe case (44% and 26% confidence for diagnosis and treatment, respectively). More than half of respondents reported that they regularly asked patients about travel history (60%) and would notify public health partners about suspected dengue cases (76%) (Fig. 2 and Table 2).

When results were compared by respondents' degree, DO/MDs had higher scores than NP/PAs in the knowledge and attitude questions. Specifically, NP/PAs less frequently identified hemorrhagic manifestations as a sign or symptom of dengue (33% vs. 68%, $p < 0.001$) (Table 3). They also less frequently reported that dengue can be transmitted through blood transfusions (36% vs. 61%, $p = 0.006$) or *in utero* (20% vs. 42%, $p = 0.011$). The correct diagnostic tests were less frequently reported by NP/PAs than by DO/MDs (13% vs. 55%, $p < 0.001$) and IV fluids less frequently recognized as a common dengue treatment (56% vs. 74%, $p = 0.03$). The KAP score was significantly different between DO/MDs and NP/PAs, with DO/MDs performing better (mean of 20.19, 95% CI 19.5–20.8 for DO/MDs vs. 17.70, 95% CI 16.8–18.5 for NP/PAs, *t*-test $p < 0.001$).

AMERICAN OVERSIGHT

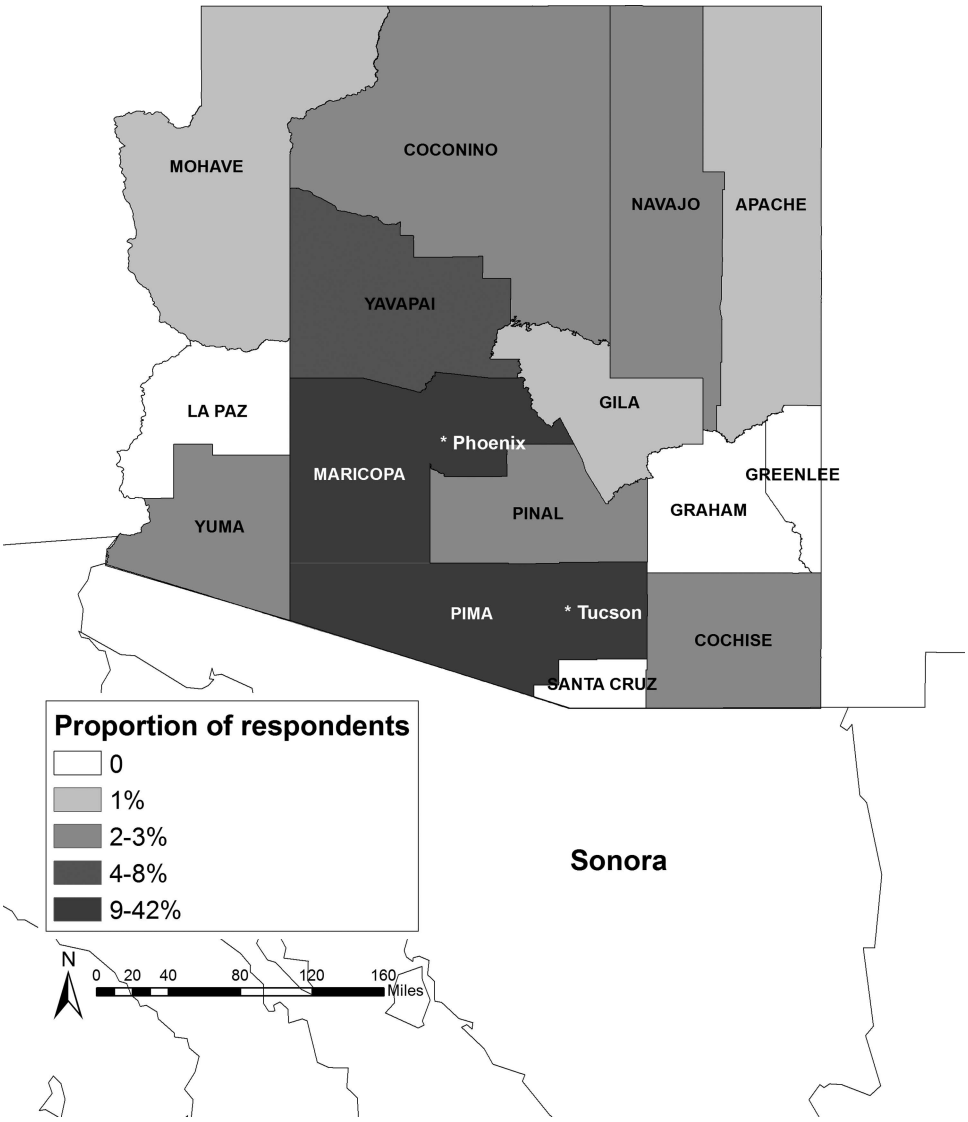

FIG. 1. Map of Arizona showing the percentage of survey respondents by county of practice.

Providers who reported hearing about the increase in dengue cases in Sonora, Mexico, in fall 2014 performed overall better than those who had not ($n = 101$, mean KAP score 17.3, 95% CI 16.8–17.8 vs. mean 15.4, 95% CI 14.6–16.1, *t*-test $p = 0.01$). Specifically, this group of providers more frequently identified the correct diagnostic tests (50% vs. 30%, $p < 0.001$), correctly reported IV fluids as common treatment for dengue (75% vs. 52%, $p = 0.001$), more frequently asked patients for travel history (70.2% vs. 46.4%, $p = 0.001$), and would notify the local health department about a patient with suspected dengue virus infection (84% vs. 68%, $p = 0.009$) (Table 4). However, this group also more frequently believed, incorrectly, that dengue virus can be locally acquired on the Arizona side of the United States–Mexico border region (56% vs. 23%, $p < 0.0001$). When asked about sources of the information regarding the increase in dengue cases in Sonora, the Arizona Health Alert Network (37/101) was most frequently mentioned, followed by the local health department (36/101), the mass media (34/101), and the local hospital (21/101).

Respondents serving predominantly Native American populations more commonly reported the belief that dengue virus can be transmitted through close personal contact (21.0% vs. 5.3%, $p = 0.03$).

When analyzing the overall performance of the 188 respondents, three factors were identified as independent predictors of KAP score. These were: specializing in infectious diseases (parameter estimate = 1.88, 95% CI 0.42–3.33, $p = 0.01$), being a DO/MD (parameter estimate = 1.82, 95% CI 0.98–2.65, $p < 0.0001$), and having heard of the increase in dengue cases in Sonora (Mexico) in fall 2014 (parameter estimate = 1.51, 95% CI 0.67–2.34, $p = 0.0005$).

Among DO/MDs, predictors of KAP score were: specializing in infectious diseases (parameter estimate = 1.90, 95% CI 0.25–3.55, $p = 0.024$) and having seen patients meeting the dengue clinical case definition in the previous year (parameter estimate = 2.20, 95% CI 0.52–3.89, $p = 0.01$). Among NP/PAs, practicing in border counties was the only predictor of KAP score (parameter estimate = 2.98, 95% CI 0.61–5.36, $p = 0.015$). NP/PAs practicing in border counties had

Confident to diagnose mild dengue	65 (34.6)
Confident to diagnose severe dengue	83 (44.1)
Treatment attitude	
Confident to treat mild dengue	82 (43.6)
Confident to treat severe dengue	49 (26.1)
Practice	
Frequently ask patients for travel history	111 (59.0)
Would notify the local health department on suspicion of a dengue patient	143 (76.1)
Would order confirmatory laboratory tests on 100% of suspect dengue patients	5 (2.7)

[a]Multiple answers allowed.
IV, intravenous.

a significantly higher mean KAP score than their counterparts practicing in nonborder counties (mean KAP score 17.6, 95% CI 16.9–18.2, vs. 14.6, 95% CI 13.7–15.6, $p = 0.02$). Interestingly, this group of providers did not report seeing any patients meeting the clinical case definition for dengue since October 2014, nor did they have more years of practice, or report hearing more often about the increase of dengue in Sonora than NP/PAs from nonborder counties.

Discussion

The results of our survey suggest that responding Arizona practitioners tend to be aware of and have some basic knowledge about dengue. However, incorrect responses were sometimes reported, suggesting that education on these topics is still important. In addition, most respondents did not feel confident in diagnosing or treating dengue and had poor knowledge of the appropriate diagnostic tests to perform. The analysis also revealed that practices important from a public health perspective, such as reporting suspect cases to public health officials or asking for travel history, are not performed widely enough.

One surprising finding was the misconception that the Arizona border region is endemic for dengue virus, whereas only travel-associated cases have been reported to date. Providers possessing this misconception might not recognize the urgency of reporting potentially locally acquired cases to public health officials.

Some results of this study were expected, such as findings that respondents who specialized in infectious diseases or who were aware of the increase in the dengue cases in Sonora would have higher overall scores, as providers more trained or informed will likely know more about the disease. Similarly, the observation that participating DO/MDs performed better than NP/PAs may be related to the more extensive and comprehensive nature of the curriculum. Some observations from this analysis suggest that factors in addition to educational background could influence dengue knowledge in these two groups, as predictors of KAP score were having seen a patient with dengue-compatible symptoms since October 2014 for DO/MDs and practicing in border counties for NP/PAs. These findings may be helpful in tailoring education and training on dengue to different subgroups of health professionals.

Conclusions

Overall, the results from this survey indicate that education for health care providers on dengue should be improved particularly among noninfectious disease providers in general practice who might be the first point of care for dengue patients. Among all topics, findings suggest that additional training on dengue clinical management is needed. The epidemiology of dengue in Arizona (including the difference between locally acquired and travel-associated cases) should also be highlighted, stressing the importance of asking for travel history, as well as notifying the local health department on suspicion of a dengue patient, as required by rule (A.A.C. R9-6-202).

This KAP survey had several limitations. The main limitation is likely the low response rate and the difficulty in calculating it accurately. As a result, the presence of some selection bias is possible as survey respondents often represent those more interested or more knowledgeable about a topic. This decreases the representativeness and the generalizability of our results to all Arizona providers. In addition, survey questions could also have been misinterpreted, with possible impact on the validity and reliability of the information collected; however, we tried to minimize misinterpretation by carefully drafting the questions and piloting the survey with providers before dissemination. Despite these limitations, this work represents one of the first surveys of health care providers in the United States in a region at high risk of dengue emergence and elicited responses from providers with diverse backgrounds and geographic range.

As clinicians tend to be unfamiliar with newly emerging infectious diseases, that this and similar studies found mostly low levels of confidence in treating or diagnosing dengue is not surprising (Tomashek et al. 2014, Adam et al. 2017). However, the potential for fatal outcomes without proper fluid management, the importance of timely reporting of dengue cases to public health officials, and the potential for locally acquired cases in Arizona requiring response underscore the importance of, at a minimum, health care providers being aware of the symptoms of dengue virus infection, knowing which diagnostic tests to select, and alerting public health partners about suspected cases.

Since the administration of this dengue KAP survey, chikungunya and Zika viruses have also rapidly emerged throughout the Americas, raising the additional threat of the spread of these viruses into Arizona *Aedes* mosquito populations. While this survey was specific for dengue, some of these results are relevant to chikungunya and possibly Zika, although with heightened media and medical attention to Zika, providers may now be more familiar with Zika than dengue. Knowledge of both diseases is critical, as dengue and

Table 4. Differences in Dengue Knowledge, Attitude, and Practice Between Respondents Who Heard About the Increase in Dengue Cases in Sonora (Mexico) in Fall 2014 Versus Those Who Had Not ($N = 185$)

AMERICAN OVERSIGHT

Zika present as similar acute febrile or rash illnesses, have different clinical management, and can be difficult to diagnostically distinguish by serologic tests. These disease features further highlight the importance of effective strategies for training providers about emerging infectious diseases, such as the use of CDC online continuing education (CDC TRAIN 2017) or similar methods.

Hi Carina
I'm sure you and others have done work on dengue clinical education for physicians in Florida. Do you have anything written up such as was done in Texas and Arizona regarding knowledge gaps?

Thanks.

I am giving two different presentations. I didn't mean to send the emergency preparedness slides to you… I sent the dengue presentation to Steve. I sent a different presentation (the emergency preparedness presentation) to Nga. Didn't understand you needed to upload these so first sent a pdf, then sent the ppt to her but had to divide into a and b. Together they should be the same file as the emergency preparedness pdf. Does that make more sense. You can remove the draft watermark.

VECTOR WEEK 2020: SPEAKER GUIDANCE

AMERICAN OVERSIGHT

-
-

Thank you for participating in Vector Week 2020 as a conference speaker!

Your presentation is included in **Session #8, Emerging Issues in Mosquito Borne Diseases**. The session is scheduled for Wednesday February 26, 2020, 10:00-11:15am in Salon II & III at the University Hilton in Fort Collins, CO.

Presentation time: 20 minutes
Speakers in session: 3
Moderator(s) (cc'd here): Ann Powers, Steve Waterman

Please send your presentation slides to cjohnstone@alakaina.com by **February 14, 2020.** This will enable the conference staff to pre-load your presentation onto the computer in your session room. Additionally, your session moderator(s) will likely be contacting you with additional information. Please contact them for questions relating to this session.

If you haven't yet registered for Vector Week, please email cdcvectorweek@cdc.gov.

Thanks again for participating in Vector Week 2020 and we look forward to seeing you at the conference!

Sincerely,
The Vector Week Steering Committee

RESEARCH ARTICLE Open Access

Knowledge, attitudes, and practices of Florida physicians regarding dengue before and after an educational intervention

Susanne Doblecki-Lewis[1*], Aileen Chang[2], Renee Jiddou-Yaldoo[3], Kay M. Tomashek[4], Danielle Stanek[5], Leena Anil[6] and Paola Lichtenberger[7]

Abstract

Background: Failure to recognize and appropriately manage dengue early in the clinical course may result in late initiation of supportive treatment for severe disease. In Florida, travel-related and autochthonous dengue occur and are likely under-recognized. The objective of this study was to evaluate physician knowledge of dengue and its management before and after an educational intervention in Florida.

Methods: From 2012–13 we conducted 14 grand-rounds style lectures on dengue clinical management attended by 413 physicians, and analyzed data from the pre- and post-tests.

Results: Of those attending, 231 and 220 completed the pre-and post-tests, respectively. Overall, the mean pre-test score for knowledge-based questions was 74.3 and average post-test score was 94.2 %, indicating a mean increase of 19.9 % ($P < 0.0001$, 95 % CI 17.7–22.4). Reported confidence in dengue recognition and management also increased. Non-US trained physicians and those who had treated more than ten dengue cases performed significantly better in the pre-test. Post-test scores did not differ by subgroup.

Conclusions: The train-the-trainer approach with grand-rounds style presentations appear to be an effective intervention to improve knowledge of dengue among physicians.

Keywords: Dengue, Clinical practice, Physician training, Evaluation, Survey

Background

Dengue is a mosquito-transmitted viral disease that is endemic throughout the subtropics and tropics worldwide. Clinical manifestations range from a mild acute febrile illness to a severe life-threatening disease with a plasma leakage syndrome resulting in hypovolemic shock and hemorrhage [1]. Prior to 1940, dengue outbreaks occurred regularly in Florida including approximately 15,000 cases from 1934–1935. Locally-acquired dengue was not reported again in Florida until 2009–2010 when 88 cases were detected in Monroe County, Florida [2–4]. Since that time, a few sporadic locally-acquired dengue cases have been reported from other Florida counties including an outbreak in Martin County in 2013 [5].

Florida is at risk for dengue outbreaks with locally acquired dengue cases because of its largely non-immune population, an abundance of the mosquito vectors, *Aedes aegypti* and *Aedes albopictus*, and importation of dengue virus via viremic tourists and residents returning from neighboring dengue-endemic areas including Mexico, Central and South American, and the Caribbean. In fact, the majority of dengue cases reported in Florida are travel-associated cases [3]. Florida is a leading reporter of travel-associated dengue cases among the U.S. states and in 2015, Florida was second only to California [6]. Travel-associated cases may result in subsequent autochthonous transmission [2, 5, 7].

While physicians in endemic areas are likely to consider dengue in the differential diagnosis of a patient presenting with an acute febrile illness [8], dengue may

AMERICAN OVERSIGHT

FL-DOH-20-0673-A-006351

not be considered in non-endemic areas, leading to under-diagnosis [9]. In the Key West 2009–2010 outbreak, initial cases were attributed by local physicians to non-specific viral illness and the diagnosis of dengue was not considered [4]. Similarly, in a 1999 dengue outbreak in Laredo, Texas, most patients identified as having a recent dengue infection by serologic diagnostic tests were initially given a clinical diagnosis of non-specific viral syndrome and not dengue [9].

Early recognition of dengue cases and timely initiation of appropriate supportive care is critical because it has been shown to reduce medical complications and mortality among patients with severe dengue [10–14]. As there is no licensed vaccine in the United States to prevent dengue or antiviral medication to prevent the development of severe disease manifestations, educating clinicians on the recognition and clinical management of dengue is an important public health strategy [7]. Educating physicians regarding standard clinical management protocols including how to identify e severe dengue have been demonstrated to reduce the case fatality rate associated with dengue hemorrhagic syndrome [14].

Train-the-trainer interventions, in which a small group of individuals receive in-depth training with the intent to further disseminate information to a broader audience, have been used to train emergency room providers in management of sickle cell disease, improve recognition and treatment of chronic fatigue syndrome, and educate physicians in Puerto Rico in response to a dengue outbreak in 2010 [8, 15, 16]. These interventions allow rapid scale-up of training initiatives and offer promise for rapid dissemination of expert-level content delivered in a local context by physicians within the area.

In response to an increase in travel-associated dengue cases and two outbreaks with several locally acquired dengue cases, the Florida Department of Health (FDOH) in collaboration with University of Miami and the Centers for Disease Control and Prevention (CDC) Dengue Branch developed a train-the-trainer initiative to offer grand rounds-style presentations with continuing medical education (CME) credit for Florida physicians with the goal of increasing early recognition and standardizing treatment of dengue cases. This paper describes the initiative and results from the pre- and post-training evaluation of attendees' knowledge of dengue.

Methods

Study design

This study involved an evaluation of physician knowledge, attitudes, and practices regarding dengue before and after the educational intervention.

Train-the-trainer symposium

CDC training materials that were used to train physician master trainers in Puerto Rico in 2010 were adapted [8, 17], and used to conduct a one-day, intensive training symposium hosted at the University of Miami. Symposium attendees included a select group of ten physicians from four counties in southern Florida who had prior clinical experience and interest in dengue. The symposium included presentations on the epidemiology, clinical presentation, laboratory diagnosis, reporting requirements, and clinical management of dengue.

Educational intervention

Following the symposium, a one-hour grand-rounds style presentation was developed using the CDC training materials. The presentation offered an overview of dengue clinical characteristics, diagnosis, monitoring, reporting, and treatment. The physicians attending the training symposium delivered the presentations as part of weekly grand rounds activities at venues within major hospital networks and practices throughout Florida. Participants in the grand rounds sessions were self-selected. One CME credit was offered to attendees of the grand-rounds presentations.

Evaluation of physician knowledge, attitudes, and practices

To assess physician knowledge and attitudes and practices regarding dengue, a two page, 20-item questionnaire was administered before each presentation and identical questions were repeated after the presentation. The questionnaire assessed participant's knowledge of dengue virus and its transmission and the epidemiology, diagnosis, reporting, and clinical management of dengue. Questions regarding knowledge and practice were multiple choice questions. The instrument also asked participants for their opinion on the relevance of dengue in their medical practice and confidence in their ability to diagnose and treat dengue patients. These were assessed on a zero to ten scale with zero indicating "no confidence or relevance at all" and ten "very confident/very relevant." Demographic information including age, years in practice, medical specialty, and location of medical school training was obtained in the pre-test. To preserve confidentiality, pre- and post-tests were not linked. Only those completing the pre-test were asked to complete the post-test.

Ethics and informed consent

The study protocol was reviewed and approved by the University of Miami Institutional Review Board (study #20120015). A waiver of written informed consent was granted by the Institutional Review Board. A verbal consent script was presented at the beginning of the

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-006352

presentation and attendees were informed that completion of the survey was construed as consent to participate. All attendees were offered the option of not participating.

Analysis

We conducted a descriptive analysis of participant demographics characteristics, and compared pre- and post-tests findings overall and by demographic groups. The mean percentage of questions correctly answered in the pre- and post-tests were compared using the unpaired student's *t*-test. For individual items of interest, pre- and post-test responses were compared using the z-test for comparison of proportion of respondents correctly answering the question and the student's *t*-test with Satterthwaite method for unequal variances for continuous scale responses. Statistical differences in baseline (pre-test) scores were tested using analysis of variance and Tukey's post-hoc test. The relationship between continuous variables was calculated using Pearson correlation coefficient. Paper questionnaires were completed in-person. Data analysis was conducted using SAS (v. 9.3; SAS Institute Inc., Cary, North Carolina) and graphs were produced in Microsoft Excel (Microsoft Corp., Redmond, WA).

Results

A total of 413 physicians attended 14 dengue grand-rounds presentations offered in Florida between January 2012 and October 2013. Of these, 231 (55.9 %) completed the pre-test and 220 (53.3 %) also completed the post-test assessment. More than half of all pre-test respondents were reportedly Internal Medicine physicians (42.9 %) or Pediatricians (13.4 %) (Table 1). The majority (68.4 %) of respondents were in practice for 0–5 years while 21.2 % were in practice for more than 10 years. Slightly more than half (54.5 %) of respondents reportedly attended medical school in the United States (U.S.) while 43 % attended medical school in Central America, South America, or the Caribbean. Most (62.3 %) respondents indicated they had never diagnosed a case of dengue; however, nearly one-third of respondents had diagnosed at least one dengue case. Non-U.S. educated physicians were significantly more likely to report having diagnosed at least one dengue case in their career ($p < 0.0001$).

No Answer	18	7.8
Medical School	*N*	(%)
In United States	126	54.5
Oustide U.S.	99	42.9
Other/No Answer	6	2.6

Overall, the mean pre-test score for the knowledge-based questions was 74.3 % and the average post-test score was 94.2 %, indicating a mean increase of 19.9 % ($P < 0.0001$, 95 % CI 17.7–22.4) (Table 2). The lowest scoring questions in the pre-test involved identification of clinically significant plasma leakage as the cardinal feature distinguishing severe dengue from dengue (27.3 % correct) and identification of the 1–2 day period after defervescence as the critical phase for development of severe manifestations (40.8 %). High scoring questions included identification of mosquitoes as the vector (98.7 %) and correct management of a patient with warning signs for severe dengue during the critical phase (91.5 %). Scores for all knowledge questions increased from pre-test to post-test assessment.

Reported self-confidence in ability to recognize dengue cases increased significantly from pre- to post-test assessment from a mean of score of 4.1 to 7.0, respectively (Table 2). Similarly, confidence in ability to treat dengue cases increased from a mean of 3.9 in the pre-test to 7.2 in the post-test. The assessment of the course relevance to the respondent's practice increased from 6.9 to 8.3 from pre- to post-test. Greater confidence in recognition and treatment of dengue prior to the presentation were significantly associated with better performance on the pre-test ($r = 0.34$, $p < 0.001$ for recognition; $r = 0.35$, $p < 0.001$ for treatment). Perceived relevance to their own medical practice also demonstrated a weak but significant correlation with pre-test scores ($r = 0.18$, $p < 0.007$).

AMERICAN OVERSIGHT

Table 2 Physician survey test results before and after attending training

Test responses mean (SD)	Pre-test	Post-test	*p*-value[a]
	n = 231	*n* = 220	
Overall mean number of questions correct	74.3 (14.1)	94.2 (8.7)	<0.001
Knowledge Responses (% who correctly identified)			
Background			
Type of organism that causes dengue is a virus	192/230 (83.5 %)	219/221 (99.1 %)	<0.001
Vector of the disease is a mosquito	227/229 (99.1 %)	221/221 (100 %)	0.16
Infection with one serotype gives lifelong immunity to that serotype	197/224 (83.2 %)	201/215 (93.5 %)	0.05
Intrinsic incubation period within the human	188/226 (83.2 %)	201/218 (92.2 %)	<0.001
Diagnosis			
Cardinal feature distinguishing severe dengue from non-severe cases	60/220 (27.3 %)	198/218 (90.8 %)	<0.001
Timing of the critical phase in dengue	89/218 (40.8 %)	197/215 (91.6 %)	<0.001
Optimal timing to send sample for PCR laboratory diagnosis	132/213 (62.0 %)	178/209 (85.2 %)	<0.001
Management			
Medication used for fever control in a suspected dengue patient	150/223 (67.3 %)	200/215 (93.0 %)	<0.001
Most appropriate treatment for a dengue patient	203/224 (90.6 %)	221/221 (100 %)	<0.001
Management of a suspected dengue patient with warning signs	205/224 (91.5 %)	210/219 (95.9 %)	0.06
Fatality rate with proper recognition and early treatment	133/222 (59.9 %)	194/215 (90.2 %)	<0.001

Relevance of dengue in their clinical practice (*n* = 215)	6.9 (2.8)	8.3 (1.9)	<0.001

[a]Comparison using paired, Students *t*-test with an alpha set to 0.05

Average test scores varied by respondent demographic characteristics. Respondents trained at a non-U.S. medical school had higher pre-test scores compared with those educated in the U.S. (76.7 % vs. 72.7 %; $p = 0.036$). Similarly, those who reported diagnosing more than 10 cases of dengue had higher pre-test scores than those who reported having never diagnosed a dengue case (83.8 % vs. 72.0 %; $p = 0.0003$). Respondents who reportedly had never diagnosed a patient with dengue had a significantly greater increase in test score from pre-to post-test compared with those who had diagnosed the most cases (+23.0 % vs. +6.8 %; $p < 0.0001$); post-test scores were not significantly different by number of dengue cases diagnosed. Pre-test and post-test scores did not significantly differ by years in practice.

Discussion

In our assessment of Florida physicians attending a grand-rounds style presentation on dengue, we found wide variability in baseline knowledge and confidence regarding dengue diagnosis and management. For example, physicians trained at non-U.S. medical schools, in areas where dengue is endemic, reportedly had more experience diagnosing dengue and scored significantly higher on the pre-test than U.S. medical school graduates and those who had never diagnosed a case of dengue. Physician pre-test confidence regarding dengue diagnosis and treatment was also low at baseline, however those with higher pre- test scores tended to report higher levels of confidence.

Knowledge presented in this format appeared to be at a level accessible to practicing physicians with or without prior experience with the disease, and was successful in increasing knowledge and confidence regarding the essential features of diagnosis and treatment of dengue. For example, despite lower baseline knowledge, physicians with no clinical experience with dengue patients and those educated in U.S. medical schools made significantly greater gains from pre-test to post-test than more experienced physicians trained in non U.S. medical schools. In fact, post-test scores did not differ by demographic characteristics and overall test scores were high. In addition, perceived relevance to practice and confidence regarding dengue diagnosis and treatment demonstrated significant gains following the presentation indicating an improved

AMERICAN OVERSIGHT
FL-DOH-20-0673-A-006354

recognition of the importance of dengue among Florida physician attendees.

The finding of differences in dengue knowledge by location of medical school is not unexpected given the small number of dengue cases likely to be encountered by a U.S. medical student during their clinical rotations and the lack of consistent inclusion of tropical medicine education in U.S. medical school curricula [18]. However, physician surveys in areas where dengue is endemic and commonly diagnosed have also demonstrated lack of concordance of practice with available guidelines, lack of recognition of the critical phase of illness, and suboptimal compliance with Department of Health case reporting requirements [8, 19, 20]. Of concern, the recognition of the critical phase of infection in which symptoms may dramatically worsen and correct identification of warning signs were content areas frequently missed in our baseline survey as well as in a recent physician survey conducted in Puerto Rico [8]. Early identification of the warning signs for development of severe dengue can result in more appropriate monitoring and intensive supportive care for more severe symptoms, interventions that have been demonstrated to decrease morbidity and mortality [10–14].

Limitations of this study include non-completion of surveys from some attendees and lack of long-term follow-up to determine retention of knowledge gained. Additionally, while only those participating in the pre-intervention survey were asked to complete the post-intervention survey, the pre- and post-intervention surveys were not individually linked and demographic information was collected only in the pre-intervention survey. Thus, there is the possibility that the individuals completing the post-intervention survey may have differed from those completing the pre-intervention survey. In addition, our study did not investigate if the increase in knowledge and change in attitude demonstrated by respondents led to a change in clinical practice, improved case recognition, or increased testing of suspected cases among attendees. Nevertheless, this assessment and educational program was successful in assessing baseline knowledge of Florida physicians and in disseminating information regarding a locally important disease to many physicians over a short period of time.

Conclusions

Within the continental United States, Florida is one of the states with both a significant number of imported cases of dengue as well as autochthonous transmission [2]. Early recognition and timely, appropriate treatment of dengue is the cornerstone of public health efforts to mitigate local transmission and optimize patients' clinical outcomes [7]. Ensuring that Florida physicians know how to recognize potential dengue cases, order appropriate diagnostic tests, and notify public health officials is therefore a priority for any dengue response plan. Further, clinician awareness of the clinical course of dengue including the timing of the critical phase is necessary to offer correct anticipatory guidance for dengue patients and make timely referrals for patients demonstrating warning signs of severe dengue. With increasing international travel and resultant globalization of communicable diseases, there is a need for expanded training for U.S. physicians in the management of tropical diseases [21]. Expanding the traditional medical school curricula to address common emerging tropical diseases affecting travelers and new immigrants may be warranted [22–24]. The train-the-trainer approach and grand-rounds style presentations appear to be an effective intervention to improve knowledge, confidence, and awareness of the importance of tropical diseases that affect Floridians.

Ethics approval and consent to participate

The study protocol was reviewed and approved by the University of Miami Institutional Review Board (study #20120015). Verbal consent was obtained from each participant prior to survey completion. A waiver of written informed consent was granted by the Institutional Review Board.

Consent for publication

Authors' contributions

SD-L and PL conceived of the study, participated in the design of the survey instruments, analyzed the data, and wrote the manuscript. AC participated in study design, survey implementation, and data analysis. RJ-Y participated in study design including instrument development, survey implementation, and analysis. KT participated in the design of the training sessions, data analysis and manuscript revisions. DS participated in the design of the training sessions and development of survey instruments. LA participated in the study design and design of training sessions. All authors read and approved the final manuscript.

Acknowledgments

We thank all the staff at CDC Dengue Branch who developed the training materials, as well as the master physician trainers who reviewed and pilot tested the materials. Special thanks to Dr. Eduardo Ochoa for his assistance in training the Florida master trainers. Finally, we acknowledge the participating hospital staff and administrators, especially the physicians who participated in the trainings.

Hi Carina
I hope you're doing well.

Just a friendly reminder if you could at your earliest convenience send the slides for your presentation for Vector Week's Tuesday afternoon's session on dengue to cjohnstone@alakaina.com (so she can load them ahead of time) with a copy to me along with a short bio, we'd much appreciate it.

See you next week.

Best regards,
Steve

Hello Speakers for the Dengue Prevention and Control Session on Tuesday afternoon, February 25, 2020–

I want to thank you all again for agreeing to participate in this session. I think the audience will be excited about and learn a lot from what you all have to say!

Below is what we currently have you planning to talk about --- if your content is significantly different, please let us know as soon as possible!

1. *World Mosquito Program, Wolbachia replacement intervention trials (Steven Kern) ~20 min*

2. *Communities Organized to Prevent Arboviruses, Wolbachia Suppression Randomized Clinical Trial in Puerto Rico (Gabriela Paz-Bailey) ~20 min*

3. Florida 2019 Dengue Outbreak Epidemiology and Response (Carina Blackmore) ~20 min

Finally, if you all could send this information as well, it would be very helpful as we introduce each of you. A very short bio would also be helpful but not required – please don't make anything for this – if you have something already prepared, that is great!

a. Full name
b. Job title

AMERICAN OVERSIGHT

c. Credentials
d. Name of organization

As noted below, if you can send your slides ahead of time to cjohnstone@alakaina.com, it would facilitate the logistics of loading of the presentations.

Looking forward to seeing you all in a couple of weeks.

Thanks again ~
Steve

VECTOR WEEK 2020: SPEAKER GUIDANCE

-
-

Thank you for participating in Vector Week 2020 as a conference speaker!

Your presentation is included in **Session #8, Emerging Issues in Mosquito Borne Diseases**. The session is scheduled for Wednesday February 26, 2020, 10:00-11:15am in Salon II & III at the University Hilton in Fort Collins, CO.

Presentation time: 20 minutes
Speakers in session: 3
Moderator(s) (cc'd here): Ann Powers, Steve Waterman

AMERICAN OVERSIGHT

Please send your presentation slides to cjohnstone@alakaina.com by **February 14, 2020.** This will enable the conference staff to pre-load your presentation onto the computer in your session room. Additionally, your session moderator(s) will likely be contacting you with additional information. Please contact them for questions relating to this session.

If you haven't yet registered for Vector Week, please email cdcvectorweek@cdc.gov.

Thanks again for participating in Vector Week 2020 and we look forward to seeing you at the conference!

Sincerely,
The Vector Week Steering Committee

Arboviruses are RNA viruses, and the main ones that we do surveillance for here in Florida fall into 2 genera: flavivirus and alphavirus. The flaviviruses include St. Louis Encephalitis (SLE), West Nile (WN) virus, and Dengue virus. The alphaviruses include Eastern Equine Encephalitis (EEE) virus, and Highlands J (HJ).

DRAFT

AMERICAN OVERSIGHT

From: Vuong, Nga (CDC/DDID/NCEZID/DVBD)
To: Robinson,Laura (DSHS); Harris, Angela (CDC/DDID/NCEZID/DVBD); Baker, Molly; Blackmore, Carina (CDC flhealth.gov); jli@naccho.org (CDC naccho.org); Chelsea Gridley-Smith; kdolan@astho.org; Staples, J. Erin (CDC/DDID/NCEZID/DVBD)
Cc: Garcia,Imelda M (DSHS); Aldridge,Tiffany (DSHS)
Subject: RE: Vector Week Speaker Guidance
Date: Tuesday, February 11, 2020 10:56:52 AM

Morning, team –
Thanks again for joining Angi and I on the speakers call yesterday. Here's the outline/flow of presentations for Session 16:

Name	Presentation
Erin Staples	Title: CDC-developed Arboviral Response Plans Focus: Overview of the CDC response plans – possible review of future plans in development too.
Carina Blackmore	Title: Emergency Mosquito Control in FL Focus: Structure of FL for emergency response to mosq disaster and outbreak.
Laura Robinson	Title: Hurricane and Flooding Mosquito Response in Texas Focus: Structure of TX for emergency response focused on hurricane and flooding events.
Kathy Dolan	Title: Resources and Tools to Enhance State Capacity for Vector-Borne Disease Response Focus: Overview of tools and resources for SHDs – Highlight of ASTHO developed tools incl. PH Confronts the Mosquito.
Jennifer Li	Title: Vector-Borne Diseases Preparedness for Locals Focus: Resources and tools to vector programs – being more prepared to detect VBD threats/respond to outbreaks. Recommendations to integrate overall prep structure. NACCHO toolbox.

Notes:

- Please send your presentation slides to cjohnstone@alakaina.com by **February 14, 2020.**
- Send your name, occupation title, organization to Molly, Angi, and I as soon as possible. We'll use this to assist Molly in introducing the speakers.
- Arrive 10 minutes before the presentation. Sit at the front of the room.

Please reach out to Molly, Angi, and I if you have any further questions. See you all in Fort Collins in 2 weeks!

Thanks,
Nga

VECTOR WEEK 2020: SPEAKER GUIDANCE

-
-

Thank you for participating in Vector Week 2020 as a conference speaker!

AMERICAN OVERSIGHT

Your presentation is included in **Session #16, Emergency Response Plans**. The session is scheduled for Thursday February 27, 2020, 8:30-9:45am in Breakout Room A (Salon III, IV & VI) at the University Hilton in Fort Collins, CO.

Presentation time: 10-12 minutes
Speakers in session: 5
Moderator(s) (cc'd here): Angela Harris, Nga Vuong, Molly Baker

Please send your presentation slides to cjohnstone@alakaina.com by **February 14, 2020.** This will enable the conference staff to pre-load your presentation onto the computer in your session room. Additionally, your session moderator(s) will likely be contacting you with additional information. Please contact them for questions relating to this session.

If you haven't yet registered for Vector Week, please email cdcvectorweek@cdc.gov.

Thanks again for participating in Vector Week 2020 and we look forward to seeing you at the conference!

Sincerely,
The Vector Week Steering Committee

Subject:	RE: WHO/CDC ZIKV IPD Consortium Presentation
Date:	Friday, February 28, 2020 6:14:30 AM
Attachments:	ZIKV IPD-MA Protocol_BMJ Open.pdf LOA_ZIKV IPD Consortium IPD-MA_UPDATED March 2019_CDC SPECIFIC.docx

Dear USZPIR partners,

Many thanks to everyone who was able to attend the presentation on the ZIKV IPD Consortium-led individual participant data meta-analysis (IPD-MA) of cohorts of pregnant women and their infants and children.

Please find the protocol for the ZIKV IPD-MA and the Letter of Agreement (LoA) for data sharing and authorship, which includes the amendments that were requested by US-CDC and DHHS.

Please let us know if there are any follow-up questions. We would also be happy to host a presentation with your specific team if that would be useful.

AMERICAN OVERSIGHT

Because the ZIKV IPD-MA will use de-identified data for the same objectives for which that data was collected, the IPD-MA was deemed exempt from ethical review by the WHO Ethics Review Committee. As mentioned on the call, USZPIR sites that wish to participate in the IPD-MA would need to review and sign the LoA for data sharing and authorship, but the de-identified data for that specific site would be uploaded to the WHO e-Archive system from the existing USZPIR dataset rather than the participating site.

Thank you again!

Lauren Maxwell

Lauren Maxwell, PhD, MPH

Subject: WHO/CDC ZIKV IPD Consortium Presentation
When: Wednesday, February 26, 2020 2:00 PM-2:30 PM (UTC-05:00) Eastern Time (US & Canada).
Where: Skype Meeting

***Updated to include presentation slides (attached**).

Dear USZPIR partners,

We invite you to attend a presentation by Lauren Maxwell, Project Manager for the ZIKV IPD Consortium with WHO. Dr. Maxwell will be discussing the current and future efforts of the Individual Participant Data Meta-Analysis (IPD-MA) lead by WHO. This project involves plans to pool data on various cohorts to do a series of analyses related to Zika and pregnancy and could be of interest to jurisdictions who participated in the USZPIR at any time.

AMERICAN OVERSIGHT

Letter of Agreement
Regarding
Data Sharing, Use and Publication of Results
Relating to:

"Understanding the relation between Zika virus infection during pregnancy and adverse fetal, infant, and child outcomes: a protocol for a systematic review and individual participant data meta-analysis of longitudinal studies of pregnant women and their infants and children*" (the "**Protocol**")*

This Letter of Agreement is between the World Health Organization ("**WHO**") and [INSERT NAME OF INVESTIGATOR] on behalf of [INSERT NAME OF INSTITUTION] (the "**Institution**"). WHO and the Institution are hereinafter referred to each as a "**Party**" and together as the "**Parties**".

1. Background and purpose

1.1 The Parties enter into this Letter of Agreement to collaborate regarding the activities and study described in the Protocol (the "**Research Activities**"), and pursuant to the terms of this Letter of Agreement, the Institution will provide one or more de-identified, participant-level data set(s), data dictionary(ies), and variable code list(s) (the "**Data**") to WHO for the performance of the Research Activities. This Letter of Agreement also addresses, among other things, the ownership, transfer, use and publication of results relating to the Data and the Research Activities.

1.2 The ZIKV IPD Consortium is a global collaboration of Zika Virus (ZIKV) researchers whose purpose is to use individual participant data meta-analysis (IPD-MA) to address extant questions related to the relation between ZIKV infection and adverse maternal and child health outcomes. WHO and the Institution are members of the ZIKV IPD Consortium.

1.3 All parties participating with WHO in the Research Activities by contributing data sets to WHO for analysis are also members of the ZIKV IPD Consortium, and each such party is required to enter into a Letter of Agreement with WHO materially similar to this Letter of Agreement to participate in the Research Activities.

1.4 Emory and Heidelberg Universities have been contracted by WHO to create the meta-analysis dataset of all submitted data by ZIKV IPD Consortium members to WHO in connection with the Research Activities (the "**Meta-Analysis Dataset**"). The Meta-Analysis Dataset will only include de-identified an anonymized information and will not contain any personally identifiable information or personal data.

2. Cooperation regarding the Research Activities

2.1 WHO and the Institution agree to collaborate on the Research Activities according to the terms of this Letter of Agreement and those set out in the Protocol, attached as **Annex 1**.

2.2 The date by which the Research Activities are expected be completed and any manuscripts prepared and submitted (the "**Completion Date**") will be agreed by the ZIKV IPD Consortium. Unless otherwise agreed (see section 3.4.2, below), WHO will complete the Research Activities and destroy the Data received from the Institution and

AMERICAN OVERSIGHT

remove the Institution's data from the Meta-Analysis Dataset by the Completion Date and will provide certification of the destruction. The tentative Completion Date is 1 January 2026.

3. Data and dataset ownership and use

3.1 The Institution represents that it owns all rights in the Data and/or has the legal authority to share the Data.

3.2 Except as expressly provided in this Letter of Agreement, WHO does not hold, and is not granted under this Letter of Agreement, any rights in the Data, whether in implementing the Research Activities or otherwise.

3.3 Parties agree that the Data provided by Institution is public domain material. Institution shall maintain full rights to re-use the content and material it provides for any and all Institution purposes, and/or to share with other collaborators or requestors. Subject to the Institution's ownership or other rights in the Data and ability to re-use and share set out above, and the similar ownership or other rights of other members of the ZIKV IPD Consortium providing other data sets to WHO for the Research Activities, WHO will own all rights in the meta-analysis dataset and the analysis resulting from the Research Activities.

3.4 In addition to use in support of the Research Activities, and notwithstanding anything to the contrary in this Letter of Agreement, the Institution agrees and acknowledges that WHO is entitled to:

3.4.1 use, and allow third parties to use, the results of the Research Activities (including the Meta-Analysis Dataset) for normative guidance to countries until the agreed-upon Completion Date; and

3.4.2 if the Instution so agrees by signing below, allow the third parties (including, without limitation, Institutional members of the ZIKV IPD Consortium and institutions which have not committed data to the ZIKV IPD Consortium effort) to access the Meta-Analysis Dataset, subject to the following conditions:

3.4.2.1 The proposed recipient of the Meta-Analysis Dataset has provided to WHO a research protocol for which the proposed recipient is the sponsor, and the ZIKV IPD Consortium Data Access Committee (a group of cohort PIs and/or MoH officials who agree to oversee requests for access to the Meta-Analysis Dataset and associated codebooks) has decided that the research protocol is not duplicative of existing research protocols and is clinically relevant;

3.4.2.2 The proposed recipient of the Meta-Analysis Dataset has provided to WHO documentation of ethics committee review and approval of the aforementioned research protocol; and

3.4.2.3 The entry into a Data Access and Authorship Agreement between WHO and the proposed recipient of the Meta-Analysis Dataset which includes, without limitations terms for secure data transfer and storage, use of the Meta-Analysis Dataset by the recipient (only for conducting prespecified,

AMERICAN OVERSIGHT

approved-upon analyses), and authorship citation for the ZIKV IPD Consortium members who created the Meta-Analysis Dataset or whose data is included in the proposed analysis.

4. Undertakings of WHO

4.1 The WHO Research Ethics Review Committee has deemed this analysis exempt from Ethical Review.

4.2 In implementing the Research Activities, WHO will:

4.2.1 Not attempt to identify or contact research participants included in the Data;

4.2.2 Respect the confidentiality of the Data, including that WHO will take all reasonable measures to ensure that the Data will only be used for the Research Activities and will only be disclosed to those persons who need to receive the Data for the Research Activities;

4.2.3 WHO will transmit Data to the data synthesis groups at Emory and Heidelberg Universities securely, using secure file transfer protocol;

4.2.4 WHO will maintain the Data in a secure location on a password-protected, WHO-internal network protected by standard encoding and the WHO firewall for the duration of the project; and

4.2.5 WHO will require Emory and Heidelberg Universities to enter into a contractual commitment to maintain the Data in a secure location on a password-protected, internal network protected by standard encoding and by the Emory and Heidelberg University firewalls during the creation of the synthesized dataset (two years from the date that the data is received by WHO); and

4.2.6 Only perform analysis of the Data that addresses the objectives specified in the Protocol (with the exception of using the Data to provide normative guidance to countries, as cited in 3.4). Any additional analyses of the Data deemed necessary to meet the objectives of the Protocol will be performed by WHO only after it has received approval from the Institution and all other members of the ZIKV IPD Consortium whose data would be involved in such additional analyses, if any. Approval of any such additional analyses will be assumed if the Institution does not reply to WHO's request within 10 working days. Notwithstanding the foregoing, additional analyses of the Data which would address completely novel objectives not included in the Protocol must be affirmatively approved by the Institution.

4.3 With respect to preparation of the dataset for the Research Activities, WHO will assess the Data for irregularities and review the distribution of the Data with the Institution. Once the WHO has resolved any irregularities in the data with the Institution (i.e. discrepancies between the Data received and any published reports of the Data), WHO will return a copy of the Data to the Institution in the "cleaned" format. WHO will retain its copy of such "cleaned" Data for the purposes provided herein.

AMERICAN OVERSIGHT

4.4 As part of its implementation of the Research Activities, WHO will:

4.4.1 Keep a detailed record of the formation of the Meta-Analysis Dataset;

4.4.2 Seek feedback on data synthesis questions (i.e., combining results from different diagnostic tests) from an expert panel of scientists and researchers decided upon by the ZIKV IPD Consortium;

4.4.3 Inform the Institution and other ZIKV IPD Consortium members of decisions made during the data synthesis process through monthly telephone or email updates; and

4.4.4 Share results of analyses with the Institution and all members of the ZIKV IPD-MA Consortium through monthly telephone or email updates.

4.5 With respect to the Meta-Analysis Dataset, WHO will:

4.5.1 Publish the requirements that need to be met to apply for and, pending approval, access the Meta-Analysis Dataset;

4.5.2 Keep a record of approved access to the Meta-Analysis Dataset;

4.5.3 Facilitate the ZIKV IPD Consortium Data Access Committee's remotely hosted, quarterly meetings to review eligible requests to access the Meta-Analysis Dataset; and

4.5.4 Transmit the Meta-Analysis Dataset to approved users pursuant to the terms of this Agreement through a secure file transfer protocol.

5. Undertakings of the Institution

5.1 The Institution represents that:

5.1.1 It has obtained all rights and permissions necessary to transfer the Data to WHO and for WHO to implement the Research Activities and all other activities relating to the Data as described herein, including, without limitation, in Article 3.4;

5.1.2 The Data have been collected from clinical trials, observational studies, or surveillance systems that have been conducted in accordance with all applicable laws;

5.1.3 The individual(s) to whom the Data relate have provided their 'informed consent' to participate in the study wherein their data was collected if required by, and in accordance with, applicable laws.

5.2 Prior to transmitting the Data to WHO, the Institution will:

AMERICAN OVERSIGHT

5.2.1 Verify whether approval from their local/relevant Ethics Review Committee is required for the use of the Data in the Research Activities, and if that approval is required, obtain it; and

5.2.2 Anonymize all participant-level data in the Data, pursuant to agreed standards, to remove all information in the Data that could be used to identify research participants.

5.3 The Institution will transmit the Data to WHO securely, using secure file transfer protocol.

5.4 The Institution will avoid providing to WHO or any other ZIKV IPD Consortium member any information relating to the Data or the Research Activities that relates to a natural person, which, either directly or indirectly, in combination with other information available or likely to be available to WHO, can identify such natural person.

5.5 The Institution will participate in the ZIKV IPD Consortium and the Research Activities pursuant to the Protocol, the terms of this Letter of Agreement, and any other participation modalities agreed by the ZIKV IPD Consortium members.

6. Authorship and publications

6.1 WHO will prepare manuscript(s) of the results of the Research Activities for publication, pursuant to the terms of the Protocol, and publish such manuscripts pursuant to WHO's rules and regulations, including its policy on open access, as contained at: http://www.who.int/about/policy/en/. WHO may further use the results of the Research Activities to update relevant WHO recommendations and develop any guidelines, including publication thereof, and may further publish those results.

6.2 WHO will provide all publications relating to the Research Activities, including all preliminary and final results of analyses performed by WHO in coordination with ZIKV IPD Consortium membership and all public reports of results or manuscripts, to all members ZIKV IPD Consortium (including the Institution) for review. WHO will provide such review publications at least fifteen (15) working days (seven (7) days for abstracts) before a proposed publication is submitted to any editor, publisher, referee or meeting organizer. In the absence of an objection by any member of the ZIKV IPD Consortium within that 15 day period (or 7 days as the case may be) concerning prejudice to its proprietary rights, the publication may proceed.

6.3 If a manuscript of the Research Activities is submitted for publication, WHO will in all events retain the Data until the peer review process is completed, and then for one year after publication to ensure sufficient time to address any required responses to the findings (e.g., letters to the editor).

6.4 WHO will ensure that all publications relating to the Research Activities will appropriately acknowledge WHO, the Institution, and all other participating institutions. The "ZIKV IPD Consortium" will be listed as the author of the manuscripts associated with Objectives 1-4 in the Protocol. Individual authors will be listed in alphabetical order at the end of the publication. The manuscripts associated with Objectives 3 and 4 will have separate groups for the writing committee and for institutions that contribute data to the analyses. The corresponding author will be a representative of WHO. The

AMERICAN OVERSIGHT

number of authors listed from each site will be decided by a majority vote that includes all sites or studies that contribute data to the proposed analyses.

7. Confidentiality and disclosure

7.1 As noted in Section 3.2, Data provided by Institution is public domain and may be re-used and shared by Institution, consistent with applicable law. However, Parties agree that either party may disclose or receive confidential information under this Letter of Agreement. All confidential information exchanged between the Parties must conspicuously bear the words “Confidential Information” or “Confidential.” Confidential Information exchanged orally or through observation must be reduced to writing and marked “Confidential Information” or “Confidential” within 30 days after disclosure to be considered confidential information.

7.2 The results of the Research Activities will be disclosed pursuant to the agreed publication and dissemination means as set forth in the Protocol and this Letter of Agreement. The Parties shall maintain the confidentiality of all results relating from the Research Activities, including all preliminary results and draft manuscripts, to the extent allowed by law. Without limiting the foregoing, the Institution agrees, prior to publishing (including posting on the Internet), presenting in any public forum, or otherwise disseminating through any medium any results of the Research Activities, to ensure the ZIKV IPD Consortium membership has the opportunity to review the proposed publication, presentation or dissemination to assure that confidential information is used consistent with this Letter of Agreement and applicable law.

7.3 The obligations of confidentiality and restrictions on use contained in this Letter of Agreement will continue without termination, commencing on the date of disclosure.

7.4 The obligations of confidentiality and restrictions on use contained in this Letter of Agreement shall not apply to any confidential information (including the Data) which the disclosing Party is clearly able to demonstrate:

7.4.1 was lawfully in its possession and known to it prior to disclosure hereunder, as evidenced by documents antedating the date of disclosure;

7.4.2 was in the public domain or the subject of public knowledge at the time of disclosure by the disclosing Party;

7.4.3 becomes part of the public domain or the subject of public knowledge through no fault of the disclosing Party;

7.4.4 becomes available to the disclosing Party from a third party not in breach of a legal obligation of confidentiality in respect thereof;

7.4.5 was subsequently and independently developed by or on behalf of the disclosing Party, as shown by written records, by persons who had no knowledge of such confidential information; or

7.4.6 is required to be disclosed by law, provided that the disclosing Party will immediately notify the non-disclosing Party in writing of such obligation and shall

AMERICAN OVERSIGHT

provide adequate opportunity to the non-disclosing Party to object to such disclosure or request confidential treatment thereof.

8. Other matters

8.1 This Letter of Agreement will enter into force on the date of last signature and shall continue until completion of the Research Activities and all ancillary activities (which is anticipated to be on or near the Completion Date), unless earlier terminated pursuant to its terms.

8.2 Either Party may withdraw its agreement to participate in the Research Activities and thereby terminate this Letter of Agreement at any time by written notice to the other Party stating the basis for such termination, provided, however, that the Institution may not terminate its participation in the Research Activities or this Agreement, or withhold any consent required under this Agreement (including any consent to publication), on the basis of disapproval or disagreement with the results of the Research Activities, subject to the orderly conclusion of any activities then ongoing.

8.3 Neither Party shall use the other Party's name (or any abbreviation thereof) and/or emblem in any statement or material of an advertising or promotional nature, without the prior written approval of the other Party. The Parties acknowledge that, as Institution is an agency of the United States Government, Institution is subject to the United States Freedom of Information Act, 5 U.S.C. Section 552, as amended.

8.4 Any dispute relating to the interpretation or application of this Letter of Agreement shall, unless amicably settled, be subject to conciliation, to the extent consistent with applicable law.

8.5 Nothing contained herein shall be construed as a waiver of any of the privileges and immunities enjoyed by WHO under national or international law, and/or as submitting WHO to any national court jurisdiction.

AMERICAN OVERSIGHT

IN WITNESS WHEREOF, the Parties have caused this Letter of Agreement to be executed by their duly authorized representatives on the date written below.

Agreed by **the World Health Organization:**

_____ _____

Dr. Ian Askew Date
Director, Reproductive Health and Research
(includes the UNDP/UNFPA/UNICEF/WHO/ World Bank Special Programme – HRP)

Regarding data sharing between the WHO and the Institution for the analyses specified in the Protocol:

Agreed by **the Institution:**

_____ _____

[INSERT NAME OF SIGNATORY HERE] Date
[INSERT TITLE OF SIGNATORY HERE]

Regarding data sharing between the WHO and eligible third parties as outlined in Section 3.4.2 of this Letter of Agreement:

*Inclusion of the Data in the Meta-Analysis Dataset that can be accessed by eligible third parties (including, without limitation, Institutional members of the ZIKV IPD Consortium and institutions which have not committed data to the ZIKV IPD Consortium effort) for analyses other than those described in the Protocol, subject to the conditions outlined in **Section 3.4.2** of this Letter of Agreement*

Agreed by **the Institution**:

_____ _____

[INSERT NAME OF SIGNATORY HERE] Date
[INSERT TITLE OF SIGNATORY HERE]

ABSTRACT

Introduction Zika virus (ZIKV) infection during pregnancy is a known cause of microcephaly and other congenital and developmental anomalies. In the absence of a ZIKV vaccine or prophylactics, principal investigators (PIs) and international leaders in ZIKV research have formed the ZIKV Individual Participant Data (IPD) Consortium to identify, collect and synthesise IPD from longitudinal studies of pregnant women that measure ZIKV infection during pregnancy and fetal, infant or child outcomes.

Methods and analysis We will identify eligible studies through the ZIKV IPD Consortium membership and a systematic review and invite study PIs to participate in the IPD meta-analysis (IPD-MA). We will use the combined dataset to estimate the relative and absolute risk of congenital Zika syndrome (CZS), including microcephaly and late symptomatic congenital infections; identify and explore sources of heterogeneity in those estimates and develop and validate a risk prediction model to identify the pregnancies at the highest risk of CZS or adverse developmental outcomes. The variable accuracy of diagnostic assays and differences in exposure and outcome definitions means that included studies will have a higher level of systematic variability, a component of measurement error, than an IPD-MA of studies of an established pathogen. We will use expert testimony, existing internal and external diagnostic accuracy validation studies and laboratory external quality assessments to inform the distribution of measurement error in our models. We will apply both Bayesian and frequentist methods to directly account for these and other sources of uncertainty.

Ethics and dissemination The IPD-MA was deemed exempt from ethical review. We will convene a group of patient advocates to evaluate the ethical implications and utility of the risk stratification tool. Findings from these

AMERICAN OVERSIGHT BMJ

FLDOH-20-0673-A-006420

analyses will be shared via national and international conferences and through publication in open access, peer-reviewed journals.
Trial registration number PROSPERO International prospective register of systematic reviews (CRD42017068915).

Strengths and limitations of this study

- This is one of the first applications of an individual participant data meta-analysis (IPD-MA) to address public health concerns in the context of an emerging pathogen. Lessons learnt from this IPD-MA may facilitate the formation of research collaborations to inform the public health response to future epidemics.
- By using a diversity of populations to develop and validate the risk prediction tool that identifies pregnancies at the highest risk of congenital Zika syndrome, the IPD-MA provides a real opportunity to help inform how clinicians and laboratory scientists communicate Zika virus (ZIKV) results to pregnant women and their families.
- There is a high degree of variability in the accuracy of diagnostic assays for ZIKV, coinfection and outcome ascertainment. Addressing this variability will be a challenge and ultimately a limitation of the accuracy of IPD-MA results.
- There is no gold standard diagnostic assay to detect ZIKV infection during pregnancy and few studies have been able to measure fetal infection. The statistical methods traditionally used to account for measurement error in IPD-MA need to be adapted to account for the myriad, correlated sources of uncertainty that arise in the synthesis of participant-level data from studies that arise in the context of an emerging pathogen.

INTRODUCTION

Zika virus (ZIKV) infection during pregnancy is an acknowledged cause of microcephaly and other forms of fetal brain defects and disability.[1 2] ZIKV is an arbovirus in the genus Flavivirus that is usually transmitted through the female *Aedes aegypti* mosquito. *Aedes aegypti* is also the main vector for dengue (DENV), urban yellow fever (YF) and chikungunya viruses. The Asian strain of ZIKV has been shown to replicate in the placenta and fetal brain;[3] ZIKV transmitted from mother to fetus during pregnancy may have a detrimental effect on fetal brain development.[4–6] Microcephaly, generally defined as a 2–3 SD reduction from the mean head circumference,[7 8] is caused by infections during pregnancy, maternal diet, drug abuse, genetic factors or environmental exposures.[9 10] Microcephaly (congenital or acquired) may be associated with developmental delays: intellectual, hearing and visual impairment and epilepsy.[11] The causal relation between ZIKV and a spectrum of fetal anomalies that includes microcephaly, now known as congenital Zika syndrome (CZS),[12] has been supported through several case-control;[13 14] cohort[15 16] and surveillance studies;[17] animal and cell studies[18] and through two systematic reviews of the evidence for causality that considered all study designs.[1 2] The relation between ZIKV infection during pregnancy and miscarriage (pregnancy loss <20 weeks gestation) and fetal loss (pregnancy loss ≥20 weeks gestation) is still under investigation.

Prior to the 2013–2016 epidemic waves, ZIKV infection was known clinically as a mild illness characterised by symptoms shared with other arboviruses, including maculopapular rash, headache, fever, non-purulent conjunctivitis and/or joint and muscle pain.[19] During the 2015–2016 ZIKV outbreak in Brazil, which extended to a number of other Latin American countries, there was a sharp increase in reports of microcephaly and other neonatal neurological conditions and in Guillain-Barré syndrome (GBS),[20–22] an autoimmune neurological disorder. Subsequent analysis of medical records collected during and after the 2013–2014 ZIKV outbreak in French Polynesia identified several ZIKV-linked pregnancies that had not been recorded earlier because they ended in elective abortion or stillbirth. The reanalysis of medical records indicated that the prevalence of both microcephaly and GBS had increased in the wake of the outbreak in French Polynesia.[23 24] The Pan American Health Organization (PAHO) issued a ZIKV Epidemiological Alert for Member States on 7 May 2015,[25] the Brazilian Ministry of Health (MOH) declared a national public health emergency due to the time and cluster of microcephaly cases identified in Northeastern Brazil on 12 November 2015[26] and the WHO declared that the clusters of microcephaly and related neurological complications represented a Public Health Emergency of International Concern on 1 February 2016.[27]

ZIKV presents myriad challenges from an epidemiological, virological, diagnostic and outbreak control perspective. Diagnosing ZIKV infection is complicated by the absence of symptoms in most cases or the presence of non-specific symptoms; cross-reactivity with DENV;[28 29] the short window for diagnosing acute infection and the lack of point-of-care diagnostics.[30] Recent research suggests that the relation between ZIKV infection during pregnancy and fetopathology may vary by virus genotype or lineage; primary versus secondary infection[31] and DENV-immune status and genotype in the presence of coinfection.[29 32 33] The unequal spatial distribution of microcephaly cases has been discussed extensively.[34–36] These differences may be related to population-level differences in baseline risk of adverse fetal outcomes (clinically important heterogeneity), differences in study design (eg, inclusion criteria; measurement of important cofactors) or to measurement error, defined as the difference between the observed and actual level of a given variable. Laboratory confirmation of ZIKV infection and coinfection differs by diagnostic algorithms (eg, definition of positive and negative ZIKV diagnostic assay results); factors that affect the regularity of testing (eg, provision of incentives, distance from testing centre, differences across protocols); population-specific distribution of related coinfections; differing levels of training of laboratory staff and the accessibility of materials and technology (eg, ultrasound, immunoassays, reliability panels), among other factors. In addition to documented difficulties in accurately measuring infant head circumference, measurement standards for identifying microcephaly differ across populations

AMERICAN OVERSIGHT

and standards themselves may not appropriately classify reduced or enlarged head circumference.[37 38]

Our limited understanding of the absolute risk of adverse fetal, infant and child outcomes in ZIKV-infected mothers led to calls from several governments suggesting that women avoid becoming pregnant for as long as 2 years.[39 40] ZIKV disproportionately affects low-income populations residing in areas with poor living conditions.[41] The impetus placed on women to delay pregnancy as a ZIKV control measure is complicated by the limited access to contraception and safe abortion in many of the countries and regions with the highest burden of ZIKV-related microcephaly.[42 43] Identifying the risk factors for CZS is a global health priority and central for prioritising resource allocation for vector control and effective and targeted family planning interventions and for improving risk counselling for ZIKV-infected pregnant women or women planning a pregnancy in endemic areas.

Rationale for the individual participant data meta-analysis of longitudinal studies of pregnant women

Individual participant data meta-analysis (IPD-MA) is the quantitative synthesis of participant-level data from included studies, while appropriately accounting for the clustering of information at the study level. The proposed IPD-MA will combine deidentified, participant-level cohort data from different populations of pregnant women to identify and quantify the relative importance of different predictors of CZS. Individual participant data (IPD) have a number of analytic benefits over aggregate data meta-analysis (AD-MA), a form of knowledge synthesis that combines study-level measures of effect.[44 45] IPD facilitate the assessment of effect measure modification, the development and validation of risk prediction models, and the application of a unified analytic approach. In addition to using the same statistical model across studies, with IPD we can apply the same or similar exclusion criteria, diagnostic algorithms, methods for addressing missing data and confounding and conduct the same types of sensitivity analyses needed to explore unexplained within- and between-study heterogeneity.

Increased precision of estimates

Timely, accurate and reliable predictions are predicated on well-designed studies that minimise the risk of bias, adequate sample size and the inclusion of a diversity of populations. Adequate sample size is crucial for precise estimation of the risk of CZS within important subgroups (eg, women infected during the first trimester; pregnant women with previous or concurrent DENV, CHIKV and STORCH (syphilis, toxoplasmosis, rubella, cytomegalovirus and herpes) pathogen exposure). Vector control measures, including pesticides, public education campaigns, the use of drones to detect standing water and the introduction of sterilised male vectors to reduce *Aedes aegypti* populations, have been implemented in the wake of the 2015/2016 ZIKV epidemics.[46–48] Fortunately, these measures, in combination with other factors that are currently being investigated, seem to have reduced the numbers of ZIKV infections during the 2017/2018 epidemic cycle. While many studies have followed infants to the end of their first year, certain developmental milestones can only be assessed after age 2[49] or when a child reaches school age. Leveraging limited data from studies with extended follow-up of ZIKV-infected and non-infected women will be essential for estimating the risk of more subtle, long-term effects of ZIKV infection during pregnancy. By combining data from individual studies, the proposed IPD-MA will improve the precision of risk estimates.

Identify and quantify the relative importance of effect measure modifiers

The benefits of using IPD rather than AD to assess effect measure modification and interaction are myriad.[50] In a one-stage analysis with IPD, subject level data are meta-analysed using the exact binomial distribution; in a two-stage analysis of IPD or AD, study-level outcome measures are combined assuming asymptomatic normality.[51] In a one-stage analysis of IPD, study-level and individual-level sources of heterogeneity can be assessed concurrently and IPD are better able to identify heterogeneity in the context of rare events or small studies.[50 52] Individual studies are often powered to detect the overall effect of the exposure rather than subgroup effects. Due to variations in the characteristics of the affected populations and in the potential confounders and effect modifiers measured by different studies, it is unlikely that individual studies will be powered to definitively quantify the importance of different sources of heterogeneity in the relation between ZIKV infection during pregnancy and adverse fetal, infant or child outcomes.

Clinical risk prediction to inform decision-making and resource allocation

While there are a number of vaccine trials underway,[53] the development of a ZIKV vaccine is complicated by the necessity of testing the vaccine in pregnant women; assessing whether the vaccine is associated with development of GBS; the difficulties inherent in developing an arbovirus vaccine;[46 54–56] findings from in vivo studies that indicate cross-reactivity between ZIKV and DENV or West Nile virus is related to antibody-dependent enhancement of ZIKV infection;[55 57 58] and by the potential use of prevention of infection as a vaccine efficacy endpoint.[59] In this context, identifying the pregnancies at the highest risk of adverse neonatal and later developmental outcomes is critical for effective resource allocation and prevention strategies. We will use participant-level data to develop and externally validate clinical risk prediction models to facilitate the identification of pregnancies that are most likely to result in ZIKV-related adverse fetal or infant outcomes and longer-term developmental delays.

AMERICAN OVERSIGHT

Standardisation and cross-national partnerships to inform the public health response to emerging pathogens

Formation of the ZIKV IPD Consortium

The ZIKV IPD Consortium is a global collaboration designed to streamline the international response to ZIKV. To facilitate cross-country analyses and a coordinated response to ZIKV, representatives from WHO, PAHO, the US Centers for Disease Control and Prevention (CDC), the National Institutes of Health (NIH), the National Institute of Allergy and Infectious Diseases (NIAID), Institut national de la santé et de la recherche médicale (INSERM), Institut Pasteur, and the networks of Fundação Oswaldo Cruz (Fiocruz), Grupo de Pesquisa da Epidemia da Microcefalia (MERG)/ZikaPlan, ZIKAlliance, ZIKAction, the Consortium for the Standardization of Influenza Seroepidemiology (CONSISE) and International Severe Acute Respiratory and Emerging Infection Consortium (ISARIC) have developed a standardised protocol for cohorts of pregnant women and their infants exposed to ZIKV to facilitate the proposed IPD-MA; identified existing or planned cohorts and prospectively introduced cohort principal investigators (PI)s and MOH officials to the methodological and public health benefits related to IPD-MA in the context of Zika. Many of the longitudinal studies and surveillance systems identified to date through the review of country-level registries, existing literature reviews and ZIKV IPD Consortium membership have agreed to contribute deidentified, participant level data to the analysis. A complete list of the studies and surveillance systems who have agreed to contribute data to the ZIKV IPD Consortium led IPD-MA is included in online supplementary table 1.

Standardised protocols for cohorts of pregnant women and their infants

A multiplicity of mechanisms for exposure and outcome ascertainment as well as differences in the measurement of important cofactors are known challenges for the meta-analysis of data from individual research studies. To minimise the potential for heterogeneity caused by differences in study inclusion criteria and the measurement of ZIKV, infant outcomes and important cofactors, WHO/PAHO, Institut Pasteur, Fiocruz, CONSISE and ISARIC convened an international meeting of ZIKV researchers and MOH officials in June 2016 to develop standardised protocols and data collection instruments for cohort studies of pregnant women and newborns and other ZIKV-related studies.[60] Standardisation of protocols and data collection instruments was intended to minimise differences in case ascertainment and data collection methods to facilitate data synthesis and the identification of sources of heterogeneity in the relation between congenital Zika infection and adverse fetal, infant and child outcomes. The protocols were made available on WHO website in October 2016 (http://www.who.int/reproductivehealth/zika/en). The standardised protocols do not include detailed guidance on laboratory methods, but testing algorithms were developed by an expert panel and made available on the WHO website in March 2016 (http://www.who.int/csr/resources/publications/zika/laboratory-testing/en/). The IPD-MA will need to account for the between-study and within-study differences in diagnostic assays and testing algorithms.

OBJECTIVES OF THE IPD-MA

1. Estimate the absolute and relative risks of fetal infection; miscarriage (<20 weeks gestation), fetal loss (≥20 weeks gestation), microcephaly and other manifestations of CZS and later developmental delays for women who do and do not experience ZIKV infection during pregnancy.
2. Identify factors that modify women's risk of adverse ZIKV-related fetal, infant and child outcomes and infants' risk of infection (eg, gestational age at time of infection, clinical or subclinical illness, concurrent or prior arbovirus exposure, other congenital infections and other posited effect measure modifiers).
3. Use information on the relative importance of different effect measure modifiers identified in Objective 2 to decompose the total effect of ZIKV infection during pregnancy on adverse fetal, infant and child outcomes into (1) the direct effect of ZIKV; (2) the indirect effect of ZIKV as mediated by the effect measure modifier of interest (eg, DENV, CHIKV or STORCH pathogens) and (3) the effect of the interaction between ZIKV and the mediator of interest.
4. Develop and validate a risk prediction tool to identify pregnant women at a high risk of an adverse ZIKV-related outcome and to inform couples planning a pregnancy, healthcare providers and/or resource mobilisation (eg, vector control strategies; antenatal care; open access to contraception).

METHODS AND ANALYSIS

This protocol has been drafted in accordance with the PRISMA-P Statement (online supplementary table 2).[61] The proposed systematic review and meta-analysis will follow the PRISMA-IPD guidelines for the systematic review of non-randomised studies.[62]

Step 1. Study identification

Eligibility criteria

Eligible studies will use a longitudinal design where ZIKV infection is measured in pregnant women prior to outcome ascertainment. Eligible studies may include cohort studies, case-cohort studies, randomised control trials or active surveillance systems, regardless of publication status. Studies may enrol symptomatic and/or asymptomatic women prior to or following a confirmed pregnancy. Included studies and active surveillance systems will test women for ZIKV infection during pregnancy, follow women until the end of pregnancy and assess for CZS or related fetal, infant or child outcomes (see table 1). We will exclude studies with fewer than 10

Table 1 Participant-level variables of interest

Exposure	Maternal ZIKV infection (diagnosis: confirmed, probable, unlikely; primary, secondary, naïve; viral load)
	Fetal or placental ZIKV infection (diagnosis: confirmed, probable, unlikely; primary, secondary, naïve; viral load)*
Primary outcomes	Miscarriage (<20 weeks gestation)
	Fetal loss (≥20 weeks gestation)
	Microcephaly (diagnosis: severe microcephaly, microcephaly, normocephaly, macrocephaly; Z-score)
	CZS (diagnosis: confirmed, probable, unlikely)
Secondary fetal outcomes†	Induced abortion with microcephaly (diagnosis: confirmed, probable, unlikely)
	Early fetal death (20–27 weeks gestation)
	Late fetal death (≥28 weeks gestation)
	Late fetal death (≥28 weeks gestation) with microcephaly
	Placental insufficiency (diagnosis: confirmed, probable, unlikely)‡
	Intrauterine growth restriction
Secondary infant outcomes†	Postnatal microcephaly (diagnosis: severe microcephaly, microcephaly, normocephaly, macrocephaly; Z-score)
	Gestational age at birth
	Birth weight (diagnosis: normal birth weight; low birth weight; very low birth weight; extremely low birth weight; Z-score)
	Craniofacial disproportion
	Neuroimaging abnormalities (intracranial calcification, lissencephaly, hydranencephaly, porencephaly, ventriculomegaly, posterior fossa abnormalities, cerebellar hypoplasia, corpus callosal and vermian dysgenesis; focal cortical dysplasia)
	Postnatal intraventricular haemorrhage
	Motor abnormalities (hypotonia, hypertonia, hyperreflexia, spasticity, clonus, extrapyramidal symptoms)§
	Seizures, epilepsy§
	Ocular abnormalities (blindness, other)§
	Congenital deafness or hearing loss§
	Congenital contractures (arthrogryposis, unilateral or bilateral clubfoot)
	Other non-neurological congenital abnormalities
Secondary outcomes detected after the infant period¶	Cortical auditory processing
	Neurodevelopment (expressive and receptive language, fine and gross motor skills, attention and executive function, memory and learning, socioemotional development, overall neurodevelopmental score)
	Vision (Cardiff test)
Posited confounders	Demographic factors (age, education, marital status, racial/ethnic group; BMI)
	Socioeconomic factors
	Maternal smoking, illicit drug and alcohol use
	Maternal prescription drug use, vaccination
	Maternal experience of violence during pregnancy; infant or child exposure to intimate partner violence[127]
	Workplace or environmental exposures to teratogenic substances (eg, maternal exposure to lead, mercury)

Continued

Table 1 Continued

Potential effect measure modifiers	Genetic anomalies, metabolic disorders, perinatal brain injury
	Gestational age, term at birth
	Timing of infection during pregnancy
	Clinical/subclinical illness
	Viral genotype and load
	Concurrent or prior flavivirus or alphavirus infection
	Maternal history of YF or JE vaccination
	Maternal immunosuppressive conditions, disorders, comorbidities (eg, chronic hypertension, diabetes) or pregnancy-related conditions (eg, pre-eclampsia, gestational diabetes)
	Intrauterine exposure to STORCH pathogens
	Maternal malnutrition
	Presence and severity of maternal and infant clinical symptoms

*Fetal ZIKV infection will be considered as both an exposure and an outcome; definition of fetal infection will be based on clinical and radiological criteria defined by an expert panel.
†Both with and without microcephaly.
‡As estimated by antenatal consequences of placental insufficiency, including fetal growth restriction, oligohydramnios, non-reassuring fetal heart rate tracing or small for gestational age at birth as markers of placental insufficiency.
§May also be detected after the infant period.
¶As measured by the Bayley Scale;[128] Ages and Stages;[129] INTERGROWTH-21st Neurodevelopmental Assessment.[49]
BMI, body mass index; CZS, congenital Zika syndrome; JE, Japanese encephalitis; STORCH, syphilis, toxoplasmosis, rubella, cytomegalovirus and herpes; YF, yellow fever virus; ZIKV, Zika virus

participants and limit included surveillance systems to those that capture country or territory-level active surveillance data (ie, individual hospital active surveillance data will not be included). Before sharing participant-level data, research studies will be asked to provide documentation of ethics review.

Information sources

ZIKV IPD Consortium

We anticipate that most eligible studies will have been identified through the efforts of the ZIKV IPD Consortium. The Consortium is an international initiative that is meant to include the PIs from all planned, ongoing or completed ZIKV longitudinal studies at the time of this review. We have searched clinical trials and ZIKV-related databases[63] (online supplementary table 3) to identify existing or planned longitudinal studies. We have circulated the list of ongoing or planned ZIKV-related longitudinal studies of pregnant women to MOH Officials in countries with autochthone ZIKV transmission and to PIs of ZIKV cohorts and asked them to update the list as necessary.

Systematic review

We will perform a systematic search of biomedical databases for published longitudinal studies and protocols. The search strategy is based on Medical Subject Headings (MeSH) and text-based search terms for ZIKV, pregnant women, infants and children. The search strategy was developed in collaboration with an information scientist and adapted for the following electronic databases: Embase (Medline), Embase (Ovid) and SCOPUS (see online supplementary text 1 for the search strategy for Embase (Medline and Ovid). We also will search the additional databases listed in online supplementary table 3 and review the reference lists of published systematic reviews and the list of studies produced by a living systematic review of ZIKV studies conducted by the University of Bern[64] to identify additional studies. After removing duplicates from the list of identified studies, two reviewers will independently screen the title and abstracts of included studies to identify longitudinal studies or active surveillance systems that measure ZIKV infection during pregnancy and subsequent fetal, infant or child outcomes. Disagreements about study inclusion will be resolved by consensus.

Collection of study-level data

We will contact the PIs of eligible studies identified through either the ZIKV IPD Consortium or the electronic searches to invite them to take part in the IPD-MA and ask them to provide a copy of their study protocol. We will develop and pilot an electronic data extraction form to record study-level characteristics for all eligible studies, regardless of whether study PIs agree to participate in the IPD-MA. Two reviewers will independently review protocols and study-related publications to extract data on study design; study population; enrolment, follow-up and laboratory procedures; assay and specimen type; criteria used to define ZIKV infection and timing of infection and exposure, cofactor and outcome ascertainment for all eligible studies. We will ask study PIs for clarification if there are outstanding questions or disagreements regarding study-level data.

Step 2. Collection, review and synthesis of deidentified, participant-level data

We will contact the PIs and authors of studies that meet our inclusion criteria to request deidentified, participant-level data on select variables and the associated surveys and data dictionaries or codebooks. If study data have been imputed, we will request both the original and imputed data so that we can apply consistent imputation methods across studies and review the imputed dataset for validation purposes. To reduce the burden on individual studies and ensure clear documentation of all steps in the creation of the synthesised dataset, we will use the study codebooks or data dictionaries to develop study-specific code in the statistical language used by the study data manager that selects only the study variables required for the proposed analyses and removes information that could be used to identify individual participants. The study's data manager will apply the code to the original dataset. The deidentified, participant-level data will be transferred from the study site to Emory University, which will serve as the WHO data synthesis partner centre, using secure file transfer protocol and will be protected on a secure server with standard encryption and by the Emory University firewall. Data synthesis-related decisions will be reviewed by a ZIKV IPD Consortium membership and will be recorded using Jupyter Notebook.[65] Researchers who are unable or unwilling to provide their participant data after at least four attempts at contact by the project team over a period of 6 months will be excluded from the IPD-MA and we will report the reason for their exclusion. When IPD are not available for a given study, we will extract study-level effect estimates from any publications to compare study-level estimates from all eligible studies, whether or not they provide data for the IPD-MA.

Variables of interest

Despite efforts to develop protocols that can be applied across studies, there will be significant cross-study heterogeneity in how congenital Zika infection, cofactors and outcomes are measured and reported. Exposure, outcome variables and posited confounders and effect measure modifiers are listed in table 1. Where possible, ZIKV and other infections (eg, DENV, CHIKV, STORCH pathogens) will be modelled as time-varying, rather than time-fixed covariates. Given that the case definitions for microcephaly have changed over time (and may change during the course of included studies), we will allow for the coding of variables with different definitions (ie, WHO fetal growth chart,[66] Fenton scale,[67] INTERGROWTH 21st Project[49]). We will ask studies for data on the continuous measures used to make diagnoses (eg, viral load;

AMERICAN OVERSIGHT

head circumference) rather than just the diagnoses themselves (eg, maternal ZIKV infection, microcephaly). Using continuous variables will allow us to test the sensitivity of results to the application of different cutoffs and the reference standards used to generate Z-scores. Definitions for miscarriage, fetal loss and other pregnancy outcomes vary across countries. We will explore the sensitivity of project findings to different outcome definitions.

Assessing the integrity of deidentified, participant-level data

We will review the distribution of variables to identify potential outliers and to assess the proportion missing within each study. We will discuss the distribution of key variables with the study data manager to identify and address any inconsistencies. If there has been a publication related to a given longitudinal study, we will attempt to replicate table 1 presented in the publication and will resolve any inconsistencies with the data manager.

Synthesis of participant-level data

Given that these longitudinal studies and active surveillance systems are part of the global research response to an emerging pathogen, there is a high degree of variability in the data that have been collected across studies and the algorithms that have been applied to define ZIKV exposure, symptoms, components of CZS and so on. Where possible, we will ask studies for the individual factors (ie, fever, rash) that were used to define certain parameters (ie, clinical infection) to ensure cross-study consistency in composite markers. Similarly, we will combine the data inputs for exposure, cofactor and outcome classification algorithms to reduce cross-study differences in the classification of important factors.

Critical review of study quality

We will use the Cochrane Methodological Quality Assessment of Observational Studies[68] and the Q-Coh tool[69] to help describe the risk of bias within non-randomised studies and will apply the Cochrane Risk of Bias 2.0 tool to assess the risk of bias in randomised controlled trails.[70] Rather than using a score-based bias assessment, a panel that includes experts on the evaluation of laboratory assays and external quality assessment (EQA); obstetrics and perinatal epidemiology will provide a detailed description of the role of selection, confounding and measurement-related biases within studies.

Step 3. Statistical analyses

Objectives 1 and 2

Estimate the absolute and relative risks of adverse ZIKV-related fetal, infant and child outcomes; identify and quantify relative importance of sources of heterogeneity

Estimating the absolute risk of CZS by the gestational age of the fetus at the time of infection is as important as it is difficult. Early in the outbreak, cohort studies limited enrolment to symptomatic pregnant women. While an estimated 50%–70% of infections are subclinical, when symptoms are detected they generally appear 3–14 days after infection.[71] For asymptomatic infections, the gestational age of infection is interval censored because it is defined by the last negative and first positive tests for ZIKV. Rather than using the midpoint between the last negative and first positive ZIKV test, which is known to be biased, we will impute the trimester or week that asymptomatic infections occurred using methods that are routinely applied in studies with interval censored covariates in the field of perinatal research.[72 73] In table 2, we present sample definitions for the absolute risk of fetal and infant outcomes. These definitions will be reviewed prior to analysis and publication and we will assess the sensitivity of our results to the definition applied. Later developmental outcomes (eg, neurodevelopment, cortical auditory processing), listed in table 1 as secondary outcomes, will follow a fetuses-at-risk approach.[74] We will apply censoring to account for competing risks where necessary.

We will apply mixed binomial models for binary outcomes, and multinomial models for categorical outcomes, with a logit link to provide estimates for each measure of absolute risk by week or trimester of congenital infection. Because of the differences in baseline risks across populations, pooling measures of absolute risk

Table 2 Definitions applied to estimation of absolute risk of primary fetal and infant outcomes

Outcome	Numerator	Denominator
Miscarriage	Number of miscarriages (pregnancy loss prior to 20 weeks gestation)	Total number of pregnancies
Early fetal death	Number of pregnancies lost between 20 and 27 weeks gestation	Total number of pregnancies carried to 20 weeks gestation
Late fetal death	Number or pregnancies lost at or following 28 weeks gestation	Total number of pregnancies carried to 28 weeks gestation
Microcephaly	Number of microcephaly cases	Total number of pregnancies carried to ≥24 weeks gestation, when microcephaly can be assessed by ultrasound in ZIKV-infected mothers,[38] we will consider all pregnancies regardless of whether the pregnancy results in a live birth

ZIKV, Zika virus.

AMERICAN OVERSIGHT

across studies may not be clinically relevant and can even be misleading.[75] We will combine study-level estimates of absolute risk through: (1) a one-stage meta-analysis (mixed binomial or multinomial model with a log link) that includes study-level sources of heterogeneity and a separate intercept for each study to account for additional cross-study differences in baseline risk and (2) a forest plot of study-level estimates of absolute risk that does not include a summary meta-analytic estimate.

Absolute measures of effect are considered more important for informing clinical practice than relative measures.[76] We will conduct both (1) a one-stage meta-analysis where we estimate the relative risk of the aforementioned outcomes of interest by congenital Zika infection across studies and (2) a two-stage meta-analysis where we estimate the relative risk in each study and combine study-level measures using random effects meta-analysis to allow the underlying true effect to vary across studies.[77] In the one-stage models, we will include study-specific intercepts to quantify and account for between-study variation in baseline risk. We will use random slopes to allow the relation between certain cofactors and the risk of CZS to vary across populations.

Combining absolute measures of effect, like the risk difference, across studies may mask important differences in the baseline risk.[78] We will present estimates of the risk difference in a forest plot of study-level estimates without presenting a summary meta-analytic estimate. In both the one-stage and two-stage analyses, we will use log binomial regression models to estimate the relative risk of each binary outcome and will use log Poisson regression to estimate the relative risk if log binomial models fail to converge.[79 80] In the two-stage models, we will assess the potential for non-linear relationships between continuous exposures (viral load) and covariates (eg, gestational age, maternal age) by using the Akaike information criteria to compare restricted cubic splines with three knots to exponential, quadratic and linear terms. In the one-stage models, we will use generalised additive mixed models (GAMMs) to assess potential non-linearities as the GAMM random smoothing parameter addresses the bias/variance trade-off by penalising the added complexity from non-linear terms while accounting for between-study variation in non-linear effects.[81]

Joint estimation of multiple nested or otherwise related outcomes (multivariate meta-analysis)

Not all studies will have measured all primary or secondary outcomes of interest. For example, most studies will have measured ventriculomegaly, but may not include values for intracranial calcification or ocular abnormalities.[9] This analysis is intended to increase the precision of estimates of the spectrum of CZS abnormalities. Studies that do not include the measurement of a given outcome will necessarily be excluded from univariate estimates of that outcome, but will be included in multivariate models that estimate the joint probability of related outcomes. In the multivariate models, we will assume that the outcomes that are excluded from certain studies are missing at random and will incorporate studies by setting the missing observations and within-study correlations between outcomes to zero and will set the within-study variance to a very high number such that the artificial value that acts as a substitute for the missing outcome will have a negligible effect on the meta-analytic estimate from the multivariate model.[82] Alternatively, under a Bayesian framework, we will model a joint distribution for studies providing multiple outcomes and a univariate distribution for studies providing a single outcome without needing to address the missing within-study correlations and variance for studies with only one outcome.[83] The secondary outcomes that will be included in the multivariate analysis are listed in table 1.

We will compare generalised linear mixed models (GLMMs) where we use one model to analyse nested or otherwise related outcomes to the standard univariate approach where we apply a separate model to analyse each outcome. Multivariate meta-analysis allows for the estimation of joint probabilities across multiple outcomes and accounts for cross-study and within-study correlation between related outcomes.[82 84] Modelling several outcomes simultaneously improves the precision over univariate models by sharing information about heterogeneity and the average effect of the treatment which may facilitate inference about the relation between different CZS-related outcomes[82 85 86] (ie, vermian dysgenesis and ocular abnormalities).

Multivariate model to combine estimates from fully and partially adjusted studies

A number of longitudinal studies will not include the minimal sufficient set of confounders. Estimates from partially adjusted studies (that are missing values for important confounders) will be combined with fully adjusted estimates in a one-stage multivariate meta-analysis. The one-stage multivariate model allows us to borrow information from partially adjusted studies with different sets of confounders while ensuring that we control for important confounders.[82 85]

Special considerations for the meta-analysis of cohort studies with rare events

Two-stage meta-analytic methods are based on large sample approximations and may be unsuitable in the context of CZS, which can be considered a rare event.[87 88] Two-stage meta-analysis may be biased when small studies are included, the effect of an exposure is very large or the outcome is rare, all of which may affect this analysis.[89] We will highlight any instances when the two-stage meta-analytic estimates may be biased by the aforementioned issues and will limit our inference to one-stage analyses in those cases. If we have a number of longitudinal studies with zero events, we will focus our inference on a one-stage approach to avoid reliance on large sample approximations.

AMERICAN OVERSIGHT

Assessment of study-level and participant-level heterogeneity

Separating within-study and between-study heterogeneity is central to assessing participant-level heterogeneity and to understanding the relative importance of different potential effect measure modifiers.[50] We are only able to separate within-study and between-study heterogeneity across studies that include both levels of the effect measure modifier of interest. The presence of clinical illness may be related to disease course through viral load or be a marker for the strength of the immune system's response to infection. We will conduct a one-stage analysis of longitudinal studies that include both symptomatic and asymptomatic women to assess whether the risk of CZS or of the most severe effects of congenital infection (miscarriage, fetal loss) differs for clinical and subclinical infections. Between-study heterogeneity is reflective of study-level differences, while within-study heterogeneity may be indicative of clinically important differences. We will mean centre covariates included in the interaction terms at the study level to separate between-study and within-study heterogeneity in our one-stage meta-analytic estimates of how prior or co-infection with alpha or flaviviruses or STORCH pathogens modifies the effect of ZIKV infection.[90]

Heterogeneity in effect estimates will arise from clinically important differences between congenital infections or women (effect measure modification) and from study-level differences in exposure and outcome ascertainment (measurement error). With IPD, we are able to jointly assess study-level and participant-level heterogeneity.[52] We will incorporate participant-level interaction terms in a one-stage analysis that includes random intercepts to account for unmeasured study-level factors. We will consider random slopes for certain covariates to allow for between-study variation in covariate effects across studies. Given the difficulty in assessing the total df in mixed models, we will apply bootstrapping to assess the approximate confidence intervals of the pooled interaction terms. We will present the analysis of effect measure modifiers in accordance with the revised STROBE guidelines.[91]

Based on our review of research protocols for planned or ongoing cohort studies, we expect to include data from longitudinal studies with different enrolment criteria, exposure and outcome ascertainment, diagnostic assays for prior-infections or coinfections and measurement of important cofactors. We will include measures of study-level sources of heterogeneity (eg, diagnostic assay, outcome definitions) as covariates in the one-stage regression to assess the variance explained by these factors. We will perform a sensitivity analysis where we limit our inference to studies with similar inclusion criteria and exposure, cofactor and outcome ascertainment to reduce spurious cross-study heterogeneity. While two-stage analyses of interaction effects that fail to separate between-study and within-study heterogeneity are subject to ecological bias[90] and our inference about the importance of interaction terms will primarily be derived from one-stage analyses, we will use a two-stage analysis to compare the magnitude of the interaction effects across studies. The interaction between certain cofactors and ZIKV exposure may not be consistent across studies. In the first stage of the two-stage analysis, we will use the likelihood ratio test ($p<0.05$) to assess the importance of including interaction terms within each study. Individual cohort studies may not have the sample size needed to detect clinically important interactions between ZIKV and important cofactors. We will also assess whether a certain interaction is consistent across studies, while not necessarily statistically significant within individual studies.

Meta-regression and subgroup analyses have limited power to detect interactions and can only be used to make inference about the relation between the exposure and study-level, average values of participant characteristics.[89 92] Studies that are not willing or able to provide participant-level data may differ importantly from longitudinal studies whose data is included in the IPD-MA. We will apply subgroup analysis to a two-stage analysis of effect estimates from studies included in the IPD-MA and published estimates from studies that did not participate in the IPD-MA to assess whether study-level variation in recruitment and enrolment criteria, exposure and outcome ascertainment and measurement of coinfections and other cofactors are important sources of heterogeneity in the pooled estimates. Some sources of heterogeneity (eg, vector density and feeding patterns; DENV serotype) may not be measured and should be considered in sensitivity analyses.

Objective 3

Use information on the relative importance of different effect measure modifiers identified in Objective 2 to decompose the total effect of ZIKV infection during pregnancy on adverse fetal, infant and child outcomes

Some studies suggest that antibody-dependent enhancement related to concurrent or prior DENV infection or Japanese encephalitis vaccination may modify the effect of ZIKV infection on fetal development. Both the timing of exposure to DENV and DENV serotype may contribute to regional differences in the strength of the relation between ZIKV infection and CZS.[28 32] If we find evidence in the literature that the effect measure modifier identified in Objective 2 (eg, DENV) may affect the outcome (eg, CZS), we will apply inverse probability of treatment weighted-marginal structural models to decompose the total effect of ZIKV on the outcome of interest into the direct effects of ZIKV infection, the effect of ZIKV infection mediated by the posited effect measure modifier and the effect of the interaction between ZIKV and the effect measure modifier.[93 94]

Objective 4

Develop and validate a risk prediction tool to inform decision making by pregnant women, couples planning a pregnancy and healthcare providers and/or resource mobilisation

We will fit one-stage logistic regression models with random intercepts to account for differences in the

AMERICAN OVERSIGHT

baseline risk within each study. We will apply group Lasso regression[95] to identify the prognostic variables that predict progression to miscarriage, fetal loss and microcephaly. Lasso regression is implemented using L1-penalised estimation. The application of group Lasso ensures that the algorithm selects all levels of categorical variables by treating corresponding dummy variables as a group instead of allowing the model to only select certain levels of categorical variables.[96 97] The L-1 penalty term allows for concurrent consideration of predictors and shrinkage, which facilitates variable selection in the context of high dimensional data.[98] We will standardise included variables so that all variables use the same scale. We will adopt cross-validation on the study level to select the optimal tuning parameter (λ) and will adopt restricted maximum likelihood (REML) to estimate the variance-covariance matrix of the study-level random effects.

Not all studies will have the resources to implement the most accurate and reliable ZIKV-related diagnostic tools. As part of the data synthesis, we will identify the exposure and cofactor diagnostic methods that are most commonly applied. As a sensitivity analysis, we will use these diagnostic methods to develop a risk prediction model so that the model can be applied in regular clinical practice.

Development and external validation of the prediction model

We will apply internal-external cross-validation where we rotate the cohort that is used for external validation to improve the model's predictive ability.[99] For example, given k cohort studies, we will use k-1 cohort studies to develop the prediction model and will validate model performance by applying the prediction model to a cohort that was not used to develop the prediction model. Internal-external cross-validation allows for the use of all available data for model development and validation which improves model performance and generalisability.[100]

Evaluation of model performance

We will generate receiver operating characteristic (ROC) curves[101 102] in the cohort that was not used to develop the prediction model to estimate the model's true-positive (sensitivity) versus false-positive (1-specificity) rate for each binary outcome. These curves will then be summarised using the area under the ROC curve (AUC). In some instances, the pregnant woman or couple planning a pregnancy may prefer a more sensitive rather than a more specific model. We will present a range of cut-off values that maximise sensitivity, specificity or both sensitivity and specificity to facilitate decision making by pregnant women or couples planning a pregnancy. We will assess the extent to which these thresholds yield consistent sensitivity and specificity across different regions and populations. We will use calibration plots to compare the observed and predicted probability of the outcome of interest within risk quintiles and summarise these plots by calculating the total ratio of observed versus expected events (O:E ratio) and the calibration slope. Internal-external cross-validation of k studies will result in kAUCs, O:E ratios and calibration slopes. We will apply random effects meta-analysis to combine estimates of the discrimination and calibration of the kpredictive models. We will assess model calibration and discrimination and choose the model with the best properties.[99 103] We will use bootstrap validation to evaluate model optimism and will follow the TRIPOD statement guidelines for reporting the final prediction models.[104]

Step 4. Quantitative bias analysis

Given the complexity and level of measurement error, we will conduct a quantitative bias analysis under a Bayesian framework where we use a combination of expert opinion, laboratory EQA and external and internal assessment of the relative accuracy of diagnostic assays and other methods for cofactor and outcome ascertainment to inform the prior distributions of bias parameters. Where possible, we will apply frequentist methods for quantitative bias analysis[105] as a sensitivity analysis and will use the GRADE criteria[106] to compare the quality of the evidence from Bayesian and frequentist models, with a focus on how imprecision, inconsistency, indirectness, magnitude of effect differ in the Bayesian and frequentist approaches to addressing the myriad sources of bias expected to affect these analyses.

Selection bias

Studies or surveillance systems that only recruit or test symptomatic pregnant women or studies that only enrolled pregnant women who tested positive for ZIKV infection are affected by selection bias because selection into the study is associated with the exposure.[63] This situation is similar to the inclusion of a single treatment arm in a randomised controlled trial. Although data from studies that only enrol pregnant women who test positive for ZIKV cannot directly inform estimates of the causal effect of ZIKV, these data can inform the development of prediction models because they contain information on the prognosis of ZIKV positive women. Longitudinal studies that restrict enrolment to ZIKV positive pregnant women may also increase the precision of relative treatment effects by providing more events within ZIKV-exposed pregnant women. Longitudinal studies have reported that women who perceive their infants as unaffected by CZS are less likely to participate in follow-up. We will consider matching on the propensity score or the use of inverse probability of censoring weights[107] and prognostic score analysis[108] to account for measured determinants of differential loss to follow-up in the aetiological and prognostic models, respectively. Selection bias can be induced when we inappropriately adjust for a time-varying confounder affected by prior exposure (a confounder that also acts to mediate the relation between ZIKV infection and adverse fetal, infant or child outcomes). We will use G-computation methods to appropriately adjust for time-dependent confounders affected by prior exposure.[109]

AMERICAN OVERSIGHT

Confounding bias

We will adjust for confounders that are unlikely to mediate the causal relation between infection during pregnancy and adverse infant outcomes (table 1). We will estimate each participant's likelihood of being infected during pregnancy, conditional on the study group and important confounders, to identify possible violations of the positivity assumption. In sensitivity analyses, we will apply propensity score matching within studies to ensure that important confounders are adequately balanced across exposure groups. Despite the prospective, collaborative development of a standardised research protocol for ZIKV cohort studies of pregnant women, confounders and effect measure modifiers may be defined differently across studies or not measured in certain studies. We will develop a detailed codebook that reflects the heterogeneity in confounder definitions and report on this heterogeneity in our analyses.

Measurement (ie, detection, misclassification) bias

Despite efforts to harmonise case definitions across studies with the prospective development of a standardised protocol for cohorts of pregnant women and their infants,[60] the case definitions, diagnostic tools and algorithms used to ascertain ZIKV infection, cofactors and CZS-associated outcomes vary across studies.[110] The literature on the accuracy of ZIKV-related and DENV-related assays is evolving rapidly.[30 111] Prior to initiating our analyses, we will synthesise the current evidence on the sensitivity and specificity of different assays for ZIKV diagnosis, for the assessment of concurrent or prior DENV infections and for estimating the time of infection, among other relevant factors. The WHO standardised protocol for ZIKV-related cohorts of pregnant women includes WHO recommendations on the screening and assessment of neonates and infants with intrauterine ZIKV exposure;[112] we will compare study-level outcome definitions with the standardised WHO definitions. The role of heterogeneity related to case definitions and diagnostic tools will be explored through both frequentist and Bayesian methods. In the frequentist approach, we will: (1) include categorical or continuous markers of sensitivity and specificity of diagnostic tools as study-level covariates in the one-stage analyses and (2) apply diagnostic tool specific-subgroup analysis to both the one-stage and two-stage meta-analysis of effect measures from different studies. In the Bayesian approach, we will use a combination of expert opinion and data from external and internal validation studies to inform the probability distributions of bias parameters.[113]

Missing data

Missing data at the study level, as when confounders are not measured in certain studies, is a well-known challenge of IPD-MA[114 115] and a likely source of residual confounding. In keeping with current recommendations for addressing missingness in IPD-MA, we will apply new methods for multilevel multiple imputation to account for missing values.[116] As a sensitivity analysis, we will impute missing participant-level data in each study separately and use multivariate meta-analysis to combine data across studies that have and have not measured important host-level and environmental-level cofactors.

Publication bias

IPD-MA may have a lower risk of publication bias than AD-MA because they include data from unpublished studies.[114] We have tried to ensure that the ZIKV IPD Consortium includes representatives from all of the academic and government institutions responsible for planned or ongoing ZIKV-related longitudinal studies of pregnant women and their infants. We expect that Consortium members will identify most ZIKV longitudinal studies and active surveillance systems of pregnant women and their infants, regardless of publication status, and we will conduct a systematic review to identify additional longitudinal studies and active surveillance systems. The degree of publication bias will be assessed visually by reviewing the asymmetry of study-level estimates from published and unpublished studies using funnel plots that compare log RR to the corresponding studies' sample size.[117]

We will convene a group of patient advocates to evaluate the ethical implications and utility of the risk stratification tool.

DISCUSSION

The application of IPD-MA to an emerging pathogen presents an important opportunity to harness global collaboration to inform the development of recommendations for pregnant women, couples planning a pregnancy and public health practitioners. While IPD-MA offers real benefits compared with AD-MA or to the inference possible with individual cohort studies, the ability of IPD-MA to inform public health practice is directly related to the quality of the exposure, cofactor and outcome ascertainment in the original cohort studies. Statistical methods for IPD-MA were developed in the context of clinical research and randomised control trials. These methods needs to be adapted to account for the myriad sources of uncertainty and bias that affect observational research, especially for field epidemiology studies conducted as part of the research response to unknown or emerging pathogens.

Historically, arboviruses and other neglected tropical diseases have been understudied because the burden of disease falls on under resourced populations in the Global South.[118] In the context of ZIKV, the unequal distribution of risk is coupled with inequities in access to preventative measures like modern contraception and to critical clinical and therapeutic care for infants affected by microcephaly and ZIKV-related neurological disorders. Each case of microcephaly is associated with a loss of 29.95 disability adjusted life years (DALYs) and treatment costs ranging from US$91K to US$1 million.[119] To put these figures into perspective, the yearly per capita

AMERICAN OVERSIGHT
FLDOH 20-0673A-000431

income in Pernambuco, the Brazilian state with one of the highest burdens of CZS, is US$3471.[120]

There is no vaccine for ZIKV and the only treatment is supportive.[58] There have been numerous calls for data sharing[121 122] and cooperation between governments and academic institutions,[54 123] and public and private charities have pledged significant financial support to improve our understanding of ZIKV epidemiology and to develop a vaccine or small molecule prophylaxis to decrease the risk of infection. In the wake of the Ebola epidemic, the global response to ZIKV has been characterised by unprecedented levels of international cooperation. In the absence of a ZIKV vaccine or prophylaxis, international leaders in ZIKV research have formed the ZIKV IPD Consortium to identify, collect and synthesise IPD from longitudinal studies of pregnant women that measure ZIKV infection during pregnancy and fetal, infant and child outcomes. These data will be used to quantify the absolute risk of ZIKV-related pregnancy complications with the goal of aiding women and their families in making difficult reproductive decisions and with helping public health systems prevent and quantify the burden of congenital Zika infection.

Challenges of developing and conducting an individual participant data-meta-analysis in the context of an emerging pathogen

Ideally, researchers prespecify confounders, effect measure modifiers and plans for subgroup or sensitivity analyses in their research protocol. In the context of Zika, our understanding of the virus is changing so rapidly that analysis plans may change significantly despite our best efforts to review the latest evidence on transmission, immunological response, diagnostic assays, vector biology and basic ZIKV epidemiology. Our ability to appropriately account for measurement error will play a critical role in the accuracy of estimates for the risk of CZS and other adverse fetal, infant and child outcomes. This is one of the first instances where an IPD-MA has been used to address public health concerns in the context of an emerging pathogen. We expect that best practices and lessons learnt from this IPD-MA can be used to facilitate the formation of research collaborations to streamline the public health response to future epidemics.

Patient and public involvement

In keeping with guidelines for public involvement in research,[124] knowledge users (ie, women of reproductive age and their families, clinicians) will be consulted at each stage of this research. The research question and protocol were designed with feedback from clinicians who treat pregnant women in ZIKV-endemic areas and infants and children affected by CZS. Focus groups that include women of reproductive age in ZIKV-endemic areas will be used to evaluate the ethical implications and utility of the risk stratification tool in three countries.

ETHICS AND DISSEMINATION

This IPD-MA protocol has been deemed exempt from ethical review by the WHO Ethics Review Committee and the Emory University Institutional Review Board. Individual longitudinal studies will provide documentation of ethics review prior to sharing their deidentified, participant-level data. The WHO has developed guidance for data sharing in public health emergencies or in the context of emerging pathogens.[125] Sharing deidentified data for IPD-MA is generally considered exempt from ethical review if the objectives of the IPD-MA are in keeping with the objectives of the original studies.[126] Individual research studies and consortia will secure additional ethics review and/or legal guidance on the sharing of deidentified, subject-level data as needed. The results of this analysis will be published under the ZIKV IPD Consortium name and will include a list of the names of key investigators from each study that contributed data for that analysis and researchers who contributed to the analysis or writing at the end of the publication. Findings from the proposed analysis will be shared via national and international conferences; existing platforms for dissemination of ZIKV-related research (eg, The Global Health Network) and through publication in open access, peer-reviewed journals.

Vector Week Update:

SIT: Florida has two programs implementing Sterile Insect Technique targeting the *Aedes aegypti* mosquito with assistance from the CDC grant funding. Despite the delay in receiving funding, both programs have made progress to start releasing sterile males in cities in both the northeast and southwest regions of the state.

Insecticide Resistance: In the past few years, insecticide resistance testing for disease vectoring mosquitoes has become an important part of Florida's mosquito control programs. Funding has allowed the Florida Medical Entomology Laboratory to not only continue testing Aedes aegypti and Aedes albopictus mosquitoes, but to expand testing to a Culex species mosquito. Since July 2019, mosquito control programs have been submitted eggs and testing for both pyrethroid and organophosphate mosquito adulticides.

I am working on the spreadsheet and hope to have it in by COB. I have been in training this week and several programs have been slow in providing requested info.

Thanks!

Marah

Hi Marah,

Just a note to check on your Y2Q2 submission and success story highlight. Do you anticipate sending to us by tomorrow?

I am going to be out of the office Feb. 10-19, so I just wanted to see where things are and finalize what I can before being out.

Thanks!
Danielle

Hey Marah,

Great to hear that! Feel free to send separate ones and we'll try to fit them both in.

Thank you! Let me know if you need anything from me!

Good afternoon!

I am working to get the information assembled. I am hoping to have everything together by the end of the week, but some of my programs are slow in sending me the requested information.

As for highlights, I will try to send you a quick blurb on the SIT and possibly mosquito resistance testing. Would these be separate or should they be in the same blurb? (We finally have some forward action on our Novel MC project!)

Subject: Y2Q2 Submission Reminder, Request

Hi Marah & Carina!

This is a friendly reminder to submit your completed Y2Q2 quarterly performance measure data collection tool by Friday January 31, 2020. If you need additional time, please submit no later than Friday February 7, 2020. Please email your completed Excel template as well as any relevant attachments to me and cc KCZ2@cdc.gov and Jeff Borchert gqx1@cdc.gov when submitting.

In addition, ICF will be developing a poster for Vector Week highlighting the accomplishments of the Hurricane Supplemental Funding thus far. We will be presenting data at the aggregate level with the exception of success stories that we would like to highlight from each state/territory. If there is a specific accomplishment you would like to highlight, we are asking that you develop a 3-4 sentence blurb summarizing the accomplishment along with the specific activity in your workplan to which it aligns. If you are unable to develop a blurb, we can pull from your progress submissions and develop a summary

AMERICAN OVERSIGHT

and share with you for approval. Feel free to provide this information when sending in your Y2Q2 data submission. If you would like us to develop a summary for you, please let us know by COB this Friday January 31, 2020.

If you have any questions or need any assistance completing your data collection tool, please don't hesitate to contact me.

Thank you,
Danielle

Subject: Y2Q2 Submission Reminder, Request

Hi Marah & Carina!

This is a friendly reminder to submit your completed Y2Q2 quarterly performance measure data collection tool by Friday January 31, 2020. If you need additional time, please submit no later than Friday February 7, 2020. Please email your completed Excel template as well as any relevant attachments to me and cc KCZ2@cdc.gov and Jeff Borchert gqx1@cdc.gov when submitting.

In addition, ICF will be developing a poster for Vector Week highlighting the accomplishments of the Hurricane Supplemental Funding thus far. We will be presenting data at the aggregate level with the exception of success stories that we would like to highlight from each state/territory. If there is a specific accomplishment you would like to highlight, we are asking that you develop a 3-4 sentence blurb summarizing the accomplishment along with the specific activity in your workplan to which it aligns. If you are unable to develop a blurb, we can pull from your progress submissions and develop a summary and share with you for approval. Feel free to provide this information when sending in your Y2Q2 data submission. If you would like us to develop a summary for you, please let us know by COB this Friday January 31, 2020.

If you have any questions or need any assistance completing your data collection tool, please don't hesitate to contact me.

Thank you,
Danielle

Subject:	Reminder -- Register for Feb 13 Comm Networking Call: Using Audience Research to Inform Communication Activities
Date:	Tuesday, February 11, 2020 2:49:01 PM

Dear State and Community Health Media/Communication Contacts,

This is a reminder of our next communication networking call on **Thursday, February 13 at 2:00pm ET**. We will share new audience research and discuss how you can use in your communication activities.

You must register using the link provided below to get the webinar log-on details. Details on how to join will come in a separate email.

Warm regards,
DNPAO Strategic Communication Team
DNPAOCommTA@cdc.gov

Please join CDC's Division of Nutrition, Physical Activity, and Obesity for the following Networking Call:

"Using Audience Research to Inform Communication Activities"

Thursday, February 13, 2020
2:00-3:30 pm EDT

Who should participate?

Principal Investigators, Program Managers, communication staff, and other interested staff
**Principal Investigators – please forward this invitation to other staff working on communication activities.*

How do I connect?

Participants must register for this event.

Let us know if you have any accessibility accommodations (e.g., captioning) by February 11.

What will the networking call cover?

AMERICAN OVERSIGHT

The networking call will cover:

- Audience research findings conducted by CDC's Division of Nutrition, Physical Activity, and Obesity
- Ways state and local public health programs can apply the audience research to their work

Who are the presenters and panelists?

Presenters and panelists will include recipients along with staff and contractors from CDC/DNPAO's Strategic Communication Team.

- Suzi Gates, DNPAO Strategic Communication Team
- Shea Van Horn, FHI 360 Contractor, DNPAO Strategic Communication Team
- Rebecca Ledsky, FHI 360 Contractor, DNPAO Strategic Communication Team
- Thomas Lehman, FHI 360 Contractor, DNPAO Strategic Communication Team
- Maureen Spence, New York State Department of Health
- Jasmine Deskins, Marion County Public Health Department
- Emily DeWitt, University of Kentucky

Hints and reminders for the event

1. Register to get event login details.
2. Check your connection and Adobe Connect access the day before the session.
3. Contact your organization's IT staff if you have trouble accessing Adobe Connect.
4. Visit Adobe Connect Support if you need help.
5. Log onto **Adobe Connect (website)** and **phone** line 10 minutes before the start time.

Subject: Reminder: COVID-19 Call Today, 1:45 PM EST
Date: Friday, February 14, 2020 12:37:47 PM

Just a reminder if you haven't registered for today's COVID-19 federal update call:

Please join us for a national briefing call **TODAY, Friday, February 14 at 1:45 p.m. Eastern Time** on the President's Coronavirus Task Force **(Please register, see link below).** The national briefing call will include updates from the U.S. Department of Health & Human Services and Centers for Disease Control & Prevention (CDC) along with our Federal partners at U.S. Department of Homeland Security, U.S. Department of Transportation, and the State Department. This national briefing call will provide an update from the Federal government and our ongoing partnership with State and local jurisdictions.

Additional Information

- You can find more information and resources at the CDC website here: https://www.cdc.gov/coronavirus/.
- **NEW: Excerpts from Secretary Azar's interviews with CNN and CNBC**

Briefing Call Details
Date: Friday, February 14
Time: 1:45 p.m. Eastern Time
Call-In Information: LINK *(Participants will receive instructions on accessing the conference after RSVPing to the link)*

What The Admin Is Saying | HHS Secretary Alex Azar Discusses the Coronavirus on CNN and CNBC

Secretary Azar provided an update on the coronavirus and the administration's aggressive efforts to protect the health and safety of Americans.

PROTECTING THE HEALTH AND SAFETY OF THE AMERICAN PEOPLE

AZAR: "We're working aggressively across the whole of government to protect the health and safety of the American people and using the time that we have bought through our very aggressive, multilayered approaches of public health to prepare."

AZAR: "This is about protecting America's borders and allowing us the time to continue our proactive preparations."

AZAR: "People who are not U.S. citizens or permanent residents of the United States may not enter the United States if they have been in China in the previous 14 days.

AMERICAN OVERSIGHT

Once they've been out of China for that 14-day incubation period, they are welcome as always into the United States."

AZAR: "Americans coming back who have been in China in the previous 14 days, we ask them to both funnel to 11 airport ports of entry where they can be inspected, surveilled, and we ask them voluntarily to isolate themselves at home for 14 days. If they've been in the hot zone, which is an increasingly diminishing number of people who've been in Hubei province in the previous 14 days, we will actually quarantine them for that 14-day period."

IDENTIFYING AND MONITORING CASES

AZAR: "We are proactively planning now to prevent further spread in the U.S., but also to conduct aggressive surveillance, to have an early warning system. Our public health system's the best in the world, and it's working. That system is what identified the 15 cases that we have."

AZAR: "The 15 cases that we have were identified by our public health system. We immediately alerted our hospitals, our doctors, our public health departments, of the symptoms and of the connection to China. And so we have been scanning and surveilling from day one on this."

AZAR: "One of the things that we did – the CDC – within a week of getting the genetic sequencing, developed a test, we had a diagnostic there at CDC. We've now deployed that around the country in over 170 public health labs."

AZAR: "We're taking an important measure that we announced yesterday, which is we are using our flu surveillance network in Seattle, San Francisco, L.A., Chicago and New York, where individuals who present with flu-like, or China coronavirus-like symptoms will be tested not just for flu, but also tested for China coronavirus. That way we have an early warning system."

IMPACT WITHIN THE UNITED STATES

AZAR: "The risk to the average American is very low right now. Let's remember, we have 15 confirmed cases here in the United States – all of whom were either traveling in Hubei province, where Wuhan is, or had a direct intimate personal contact with an individual who was there."

AZAR: "They should be more worried about flu and regular cold season, in terms of taking precautions like washing their hands, coughing into their arms, and not touching their face."

AZAR: "So far, we're seeing very limited impact here in the United States, but that could change at any time. We're working to prevent that from happening, to keep that risk low, and we're working to proactively prepare with states, local governments, and the private sector."

AMERICAN OVERSIGHT

COOPERATION WITH CHINA

AZAR: "The World Health Organization must insist that China be transparent and fully cooperative, as they would insist on the United States or any other country."

AZAR: "It is very important that the World Health Organization hold China to account for transparency and cooperation, as they would any other country, including the United States."

AZAR: "The World Health Organization, we believe, has secured agreement to deploy a W.H.O. team with our U.S. public health experts as part of that team. We are ready to go. And we are waiting for final clearance from the Chinese government to make that happen."

AZAR: "We need to get this team that I have offered now for 39 days of CDC experts. We've got to get them into China and they've got to be given access to data, genetic sequences, run the studies to get answers to the key questions."

AZAR: "They have got to be able to work shoulder to shoulder with their Chinese scientific colleagues – looking at raw data, running the studies, looking at genetic sequences, doing the virology and epidemiology that is their mission – or it won't be a useful mission."

Subject:	Reminder: Help CDC Improve its Project Officer Support
Date:	Wednesday, February 5, 2020 10:26:35 AM
Attachments:	Survey Distribution Instructions.pdf

Dear Senior Deputies,

This email is another request for action and a follow-up to the survey launched on Tuesday, January 14th (announcement email is attached). For those of you who have already distributed this evaluation to the appropriate points of contact within your agency, we appreciate your support. At this time we ask that you remind your staff about this survey by simply forwarding the survey invitation to the primary staff working on the select cooperative agreements or grants within your health department.

As a reminder, ASTHO is partnering with the Centers for Disease Control and Prevention (CDC) to evaluate satisfaction with the services and support provided by CDC project officers on select cooperative agreements and grants. CDC management will use the results to identify and implement strategies for improving CDC project officer support to state health departments.

This survey should be completed by health agency staff who work on and serve as the primary point of contact for the CDC project officer for select CDC-funded cooperative agreements or grants (full list of selected cooperative agreements/grants is attached).

Our ask of you: Please remind your staff about this survey by forwarding the survey invitation to the primary staff working on the select cooperative agreements or grants within your health department for their response. The invitation content to request participation is provided below the signature on this email. Feel free to directly forward this email to the intended recipients or create a new outreach message using the content below.

Thank you for your assistance.

EMAIL FOR SURVEY RESPONDENT:

Instructions for survey respondent: The Association of State and Territorial Health Officials

AMERICAN OVERSIGHT

(ASTHO), in partnership with the Centers for Disease Control and Prevention (CDC), Center for State, Tribal, Local, and Territorial Support is administering an assessment to health departments in all 50 states and the District of Columbia related to satisfaction with the services and support provided by CDC project officers.

Results from the assessment will be used by CDC to improve project officer support to state health agencies. Participation is voluntary, and your feedback will inform continued project officer development and training.

In order to participate in this voluntary assessment, please click the hyperlink provided in this email to be redirected to the web-based assessment. The assessment should take no longer than 25 minutes to complete. All responses are immediately saved and can be changed at any time. However, once the assessment is submitted, you will be unable to modify any responses. Also, you are not required to complete the assessment in one sitting. When finished responding to all relevant questions, click the **SUBMIT** button at the end of the assessment to submit your responses.

Information collected will be kept on secure, password protected servers accessible only to ASTHO project team members. All information you provided will be analyzed and reported in the aggregate with no identifying information attached.

Follow this link to the Assessment: Take the Assessment

Please submit responses to this assessment no later than February 27, 2020.

Note: The survey is designed for respondents to consider only one project officer within each selected cooperative agreement and grant. If your agency has more than one project officer for the Cancer Prevention and Control Programs for State, Territorial, and Tribal Organizations (DP17-1701), we invite your agency's appropriate point of contact to complete separate survey entries for each project officer.

Additionally, a few of the HIV, Viral Hepatitis, TB, and STD cooperative agreements have been updated with the current cooperative agreement numbers. The updated names and numbers are in the attached survey distribution instructions. If you already submitted responses under a prior cooperative agreement number you do not need to re-submit.

If you experience problems with the web-based assessment or have any questions, please contact Allen Rakotoniaina at researchandevaluation@astho.org for technical assistance.

Thank you in advance for your participation.

Survey announcement shared with ASTHO's Senior Deputy Peer Network on Thursday, January 19th

Dear Senior Deputies,

ASTHO is partnering with the Centers for Disease Control and Prevention (CDC) to evaluate satisfaction with the services and support provided by CDC project officers on select cooperative agreements. CDC management will use the results to identify and implement strategies for improving CDC project officer support to state health departments.

To capture this information, ASTHO will be fielding a survey on Tuesday, January 14 inviting the primary program staff who work on ***and*** *serve as the primary point of contact with the CDC project officer for the select CDC-funded cooperative agreements or grants listed below to share their feedback.*

As your agency's senior deputy, you will receive an invitation to complete the survey and we ask that you ***please forward the invitation to the primary staff working on the various cooperative agreements*** *for their response. The respondents to the survey should be the primary staff working on each of the listed cooperative agreements.*

Responses will remain confidential, and data will be analyzed and aggregated by ASTHO. Results will be used by CDC to inform future training and identification of best practices and opportunities for improvement in the support provided by CDC to state health departments.

Questions about the project?

For questions about the project or survey, contact Emily Peterman, Director of Research & Evaluation (epeterman@astho.org).

Good Afternoon Dr. Rivkees,

I am following up on a message you recently sent Dr. Montero.

Attached are two documents to address your request. The Global Migration Task Force provided the cleaning guidance. They also provided quarantine-related talking points. Please feel free to use the talking points in conjunction with the hotel cleaning guidance as appropriate.

I have also included a document that was recently added to the CDC guidance documents that helps in the assessment of a travelers risk for developing infection. The newest guidance documents are highlighted in the "What's New" section at the following CDC website https://www.cdc.gov/coronavirus/2019-ncov/index.html .

Please let me know if we can be of further assistance.

Interim Cleaning Recommendations Related to People with Exposures to 2019 Novel Coronavirus Under Observation while Quarantined in Non-Home Residential Settings

Background

Current knowledge about how 2019-nCoV spreads is based on what is known about early cases of 2019-nCoV infection and what is known about similar coronaviruses such as SARS and MERS. Most often, spread from person-to-person happens among close contacts (within about 6 feet). People with certain types of exposure to 2019-nCoV may be housed and quarantined for observation until 14 days after their exposure. The purpose of the observation period is to ensure they don't develop symptoms and potentially infect others during this time. Quarantine means people exposed to an infectious disease are separated from others during the observation period to prevent possible spread of infection. Some people stay at home for the observation period, but others may be housed either separately or in groups in other residential settings. This guidance addresses those individuals housed in designated, non-home residential settings.

Purpose

This guidance is intended to address recommended cleaning and disinfection practices for non-home residential quarantine locations, as well as associated worker protection practices according to expected job tasks.

General Recommendations for Non-home Residential Settings Housing People Exposed to 2019-nCoV

- Employers should educate workers performing cleaning, laundry, and trash pick-up activities to recognize the signs and symptoms of 2019-nCoV and provide instructions on what to do if they develop signs and symptoms.
- Workers should observe their health (fever or symptoms of respiratory illness) for 14 days beginning after the last time they had possible exposure to 2019-nCoV. Workers should be instructed that if they develop a fever (100.4°F or higher), cough, or have difficulty breathing, symptoms should be reported to their supervisor and the local health department. The health department will provide guidance on what actions need to be taken.
- Employers should develop policies for worker protection and provide training to all workers on site prior to providing cleaning tasks. Training should include an understanding of when to use personal protective equipment (PPE), what PPE is necessary, how to properly don (put on), use, and doff (take off) PPE, and how to properly dispose of PPE.
- Hand hygiene should be performed often including upon removal of disposable gloves by washing hands with soap and water for at least 20 seconds or using an alcohol-based hand sanitizer that contains 60 to 95% alcohol.
- Workers should report breaches in PPE (e.g., tear in gloves) or any potential exposures to their supervisor.

DRAFT

AMERICAN OVERSIGHT

- Employers must comply with OSHA's standards on Bloodborne Pathogens (29 CFR 1910.1030), PPE (29 CFR 1910.132), and other requirements, including those established by state plans, whenever such requirements apply
- For cleaning and disinfection chemicals, always follow the manufacturer's instructions (e.g., concentration, application method and contact time, PPE use) being used.

Activities During the 14-Day Observation Period

Cleaning staff should be aware that people under observation during the 14-day observation period after exposure to 2019-nCoV may be infectious. For example, after they have been medically evaluated, symptomatic people who are not sick enough to stay in the hospital might go back to their quarantine location (e.g., hotel) to wait for laboratory results.

Because cleaning staff will not by themselves know which of the people under observation may be infectious and which are not, cleaning of rooms in non-home residential settings, once rooms are vacated, should proceed only after consultation with public health officials. Before the rooms are cleaned, local public health departments should determine if rooms were occupied by potentially infectious people and advise if enhanced cleaning is therefore recommended.

- Individuals being observed under quarantine should remain in their rooms.
- Access to rooms where quarantined individuals are housed should be restricted to authorized public health officials.
- Cleaning staff should not enter the rooms of individuals who are quarantined.
- Consider placing two carts, or something similar, outside the occupant's room; one to set "clean" materials on and one to set "used" materials on. Carts should be labeled. Used materials for disposal and laundry should be set on the cart labeled as "dirty" materials. Meals, clean sheets/towels and toiletries should be set on the cart labeled as "clean."
- Occupants of the rooms should place used towels and bedding that need to be laundered in a sturdy, leak-proof (e.g., plastic) bag that is tied shut and not re-opened while being transported to the laundry facility.
- Bagged laundry should be transported to the laundry facility on a cart or something similar and contents carefully unloaded into machine with minimal agitation. The used bag carrying the laundry should be discarded as regular solid waste (e.g., municipal trash) as it is not considered biohazardous or regulated medical waste.
- Disposable meal containers, cups, and utensils should be used, and discarded as trash.
- If a room occupant wishes to clean their room, regular cleaning products should be supplied for them.

Cleaning After the Room is Vacated if Person Remained Asymptomatic

Cleaning staff should follow normal preventive actions while at work and at home to help prevent the spread of respiratory viruses (such as seasonal flu), including recommended hand hygiene and avoiding touching eyes, nose, or mouth with unwashed hands. These recommendations will be updated if additional information becomes available.

DRAFT

AMERICAN OVERSIGHT

- Clean all “high-touch” surfaces (e.g., counters, tabletops, doorknobs, light switches, bathroom fixtures, toilets, phones, keyboards, tablets, and bedside tables) according to routine cleaning practices using regular cleaning products.
- No additional PPE (beyond what is normally worn by housekeeping staff) is necessary for handling luggage and cargo.
- No additional PPE is required beyond what is normally worn for regular housekeeping activities.
- Management of laundry and waste should be handled in accordance with routine procedures.

Cleaning After the Room Is Vacated if a Symptomatic Person Was Present in the Room (Enhanced Cleaning)

Standard practice for pathogens spread by the airborne route (e.g., measles, tuberculosis) is to restrict unprotected (e.g., no respiratory protection) individuals from entering a vacated room until sufficient time has elapsed for enough air changes to remove potentially infectious particles (more information on clearance rates under differing ventilation conditions is available). We do not yet know how long 2019-nCoV remains infectious in the air. In the interim, it is reasonable to apply a similar time period before entering the sick person’s room without respiratory protection as that used for other pathogens spread by the airborne route (e.g., measles).

Cleaning recommendations are based on existing CDC infection control guidance for preventing 2019-nCoV from spreading to others in homes and residential communities. This guidance contains information on how to clean surfaces in the community setting where a person confirmed to have, or being evaluated for, 2019-nCoV infection has been present.

Disinfectant products with EPA-approved emerging viral pathogens claims are recommended for use against 2019-nCoV. This claim or a similar claim, will be made only through the following communications outlets: technical literature distributed exclusively to health care facilities, physicians, nurses and public health officials, “1-800” consumer information services, social media sites and company websites (non-label related). These products can be identified by the following claim:

- [Product name] has demonstrated effectiveness against viruses similar to 2019-nCoV on hard non-porous surfaces. Therefore, this product can be used against 2019-nCoV when used in accordance with the directions for use against [name of supporting virus] on hard, non-porous surfaces.”
    - Specific claims for “2019-nCoV” will not appear on the product or master label.
    - Additional information about EPA-approved emerging viral pathogens claims can be found here: https://www.epa.gov/pesticide-registration/emerging-viral-pathogen-guidance-antimicrobial-pesticides
    - If there are no available EPA-registered products that have an approved emerging viral pathogen claim for 2019-nCoV, products with label claims against human coronaviruses should be used according to label instructions.

DRAFT

AMERICAN OVERSIGHT

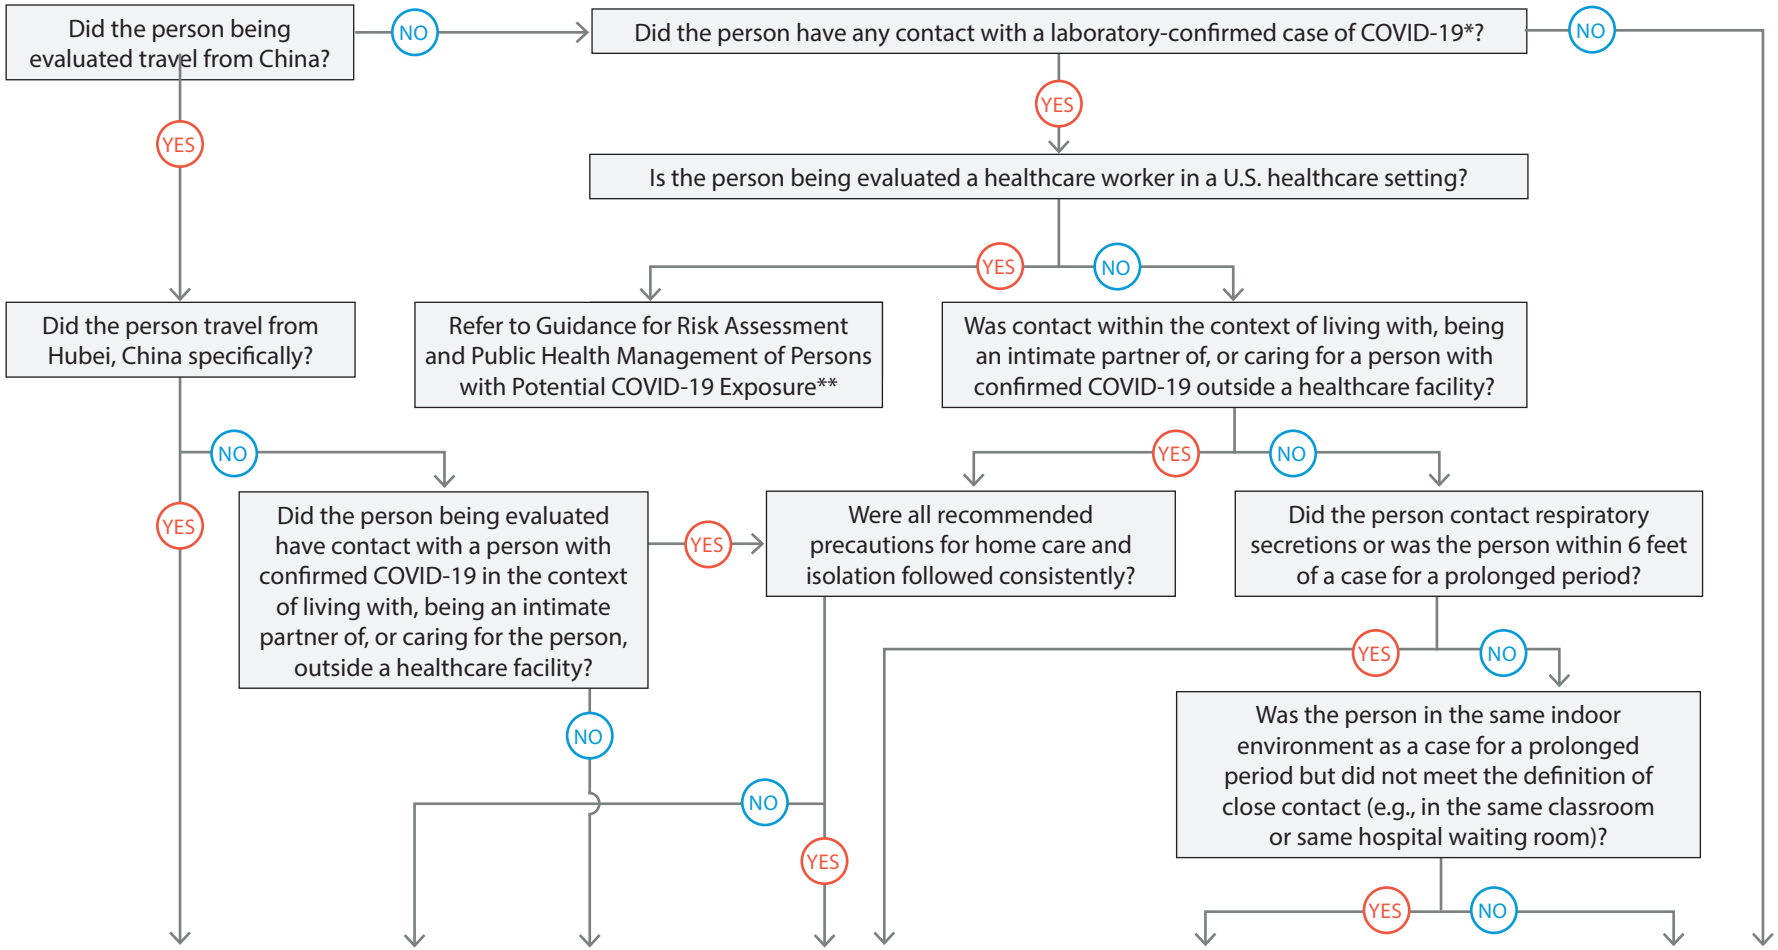
- In addition to disposable gloves used during routine cleaning, disposable gowns should be worn when cleaning quarantine locations after identification of someone as symptomatic during the 14-day observation period. PPE should be compatible with the disinfectant products being used; additional PPE might be required based on the cleaning/disinfection products being used and whether or not there is a risk for splash. Gloves and gowns should be removed carefully to avoid cross-contamination of themselves and the surrounding area.
- Hand hygiene should be performed upon removal and disposal of gloves by washing hands often with soap and water for at least 20 seconds or using an alcohol-based hand sanitizer that contains 60 to 95% alcohol.

Clean and disinfect all “high-touch” surfaces in quarantine locations (e.g., counters, tabletops, doorknobs, light switches, bathroom fixtures, toilets, phones, keyboards, tablets, and bedside tables)
according to instructions described for the EPA-registered product above.

If visible contamination (e.g., a body substance such as blood or body fluids) is present, the basic principles for blood or body substance spill management are outlined in the United States Occupational Safety and Health Administration (OSHA) Bloodborne Pathogen Standard. CDC guidelines recommend removal of bulk spill matter, cleaning the site, and then disinfecting the site with the above EPA-registered disinfectant. For soft (porous) surfaces such as carpeted floor, rugs, and drapes, remove visible contamination if present, and launder in accordance with the manufacturer’s instructions. Clean and disinfect unremovable materials with products mentioned above and allow to air dry.

When cleaning is completed, collect soiled material and PPE in a sturdy, leak-proof (e.g., plastic) bag that is tied shut and not reopened. This waste can go to the regular solid waste stream (e.g., municipal trash) as it is not biohazardous or regulated medical waste. Porous materials that will be laundered can be transported to the laundry facility in the same manner. Immediately clean hands with soap and water or an alcohol-based hand sanitizer and avoid touching the face with gloved or unwashed hands.

No additional cleaning is needed for supply and return ventilation registers or filtration systems for the building.



No additional treatment of wastewater is needed before discharge to sanitary sewer.

AMERICAN OVERSIGHT

Coronavirus Disease 2019 (COVID-19) Risk Assessment and Public Health Management Decision Making *Each question refers to within the past 14 days*

U.S. Department of Health and Human Services
Centers for Disease Control and Prevention

	High Risk	Medium Risk	Low Risk	No identifiable risk
Actions for people without symptoms consistent with COVID-19	Remain under quarantine authority; no public activities; daily active monitoring; controlled travel	Stay home; active monitoring or self-monitoring with public health supervision; recommend to not travel	Self observation	None
Actions for people with symptoms consistent with COVID-19	Immediate isolation; medical evaluation guided by PUI definition; pre-notify healthcare services; controlled travel	Immediate isolation; medical evaluation guided by PUI definition; pre-notify healthcare services; controlled travel	Stay home from work or school, avoid contact with others, don't travel. Seek health advice	None; routine medical care

These examples may not cover all potential exposures to laboratory confirmed case of COVID-19. If you are concerned about an exposure that does not align with these categories, please contact the CDC Emergency Operations Center at 1-800-232-4636

*Or a case diagnosed clinically with COVID-19 infection outside of the United States who did not have laboratory testing
**Healthcare provider (HCP) guidance outlines risk categories to determine work exclusion and monitoring procedures. After identifying risk category in the HCP guidance, use the categories outlined here to determine quarantine requirements.

Talking Points for SCTF to State and Local Public Health Officials

Quarantine

Which agency will be responsible for issuing public health orders if a traveler with high-risk exposure (e.g., been in Hubei Province) to COVID-19 is identified at a US port of entry?

State and local authorities have primary jurisdiction for isolation and other public health orders within their respective jurisdictions. Federal public health authority primarily extends to international arrivals at ports of entry and to preventing interstate communicable disease threats. In general, CDC prefers that state or local authorities issue public health orders if the state or local authority is willing and issuance of the order can be accomplished expediently because in most cases housing and monitoring of these individuals will be the responsibility of state or local authorities. Also, if necessary, CDC's order can be issued as an interim measure and rescinded when the state or local authority is ready to issue their order. Decisions regarding the issuance of public health orders will be made on a case-by-case basis in coordination between CDC and the state and local health departments of jurisdiction.

CDC can also issue orders that "bridge" public health orders by two different states if an individual under quarantine is relocated from one state to another.

Where will travelers needing quarantine for high-risk exposures to COVID-19 be housed?

CDC is working with state and local health departments with jurisdiction at the 11 airports receiving passengers from China, to identify locations for housing travelers with high-risk exposures who need to be quarantined. In all cases, housing of quarantined travelers will be discussed with state and local authorities before a quarantine order is issued.

In some situations, conditional release orders that allow individuals subject to quarantine to travel to other parts of a state or to other states by private vehicle may be acceptable in coordination with public health authorities at travelers' final destinations. **Conditional release** defines a set of legally enforceable conditions under which a person may be released from more stringent public health movement restrictions, such as quarantine in a secure facility. These conditions may include public health supervision through in-person visits by a health official or designee, telephone, or any electronic or internet-based means of communication as determined by the CDC Director or state or local health authority. A conditional release order may also place limits on travel or require restriction of a person's movement outside their home.

If a state is unable to get a quarantine order for a non-symptomatic traveler from China outside Hubei Province who arrives at one 11 funneling airports to his or her final destination, would/could CDC use Federal Public health travel restrictions (Do Not Board listing)?

CDC is not recommending quarantine or travel restrictions for travelers from China outside Hubei Province as these travelers are considered medium risk for exposure. CDC acknowledges that state and local jurisdictions may choose to make decisions about isolation,

AMERICAN OVERSIGHT

other public health orders, and monitoring that exceed those recommended in federal guidance; however, federal authority will not be used to enforce these additional restrictions.

What is the expected level of enforcement for travelers returning from Hubei Province who are asymptomatic, but are considered high risk and thus are asked to "self-quarantine" and not engage in any public activities? The concern is health departments don't necessarily know the individual was exposed to the disease just because the individual was in Hubei Province.

CDC has assessed all of Hubei Province as having high risk of exposure based on the high degree of sustained human-to-human transmission in the region. If such individuals are identified at a post of entry, CDC will coordinate with the state or local health department of jurisdiction to issue a quarantine order. If they are identified in a community setting, the state or local health authority may choose to issue a quarantine order based on the individual's willingness to comply with voluntary quarantine.

What documentation will be provided to individuals who are in quarantine to provide to their employers or schools? Who provides this documentation?

Each person quarantined or conditionally released under a federal order receives a copy of the order that specifies the conditions of the order. At the end of the quarantine or conditional release period, the individual received a document rescinding the order.

Will CDC provide a copy of the federal quarantine order to states?
CDC can provide a copy of its template orders upon request. We request that distribution be limited.

Are there recommendations for carrying out mass quarantine of an exposed group (e.g., could they be quarantined in a gym/school setting)?
CDC does not recommend quarantining people in congregate settings such as school gymnasiums. Such settings risk amplifying exposure if someone in the group becomes symptomatic with COVID-19 infection. If state or local jurisdictions are planning for mass quarantine facilities, these facilities should have capacity to quarantine individuals or families in separate rooms.

Flight Crews

What is CDC doing to address risk associated with airline or cargo flight crews who have been in China in the past 14 days?

CDC and the Federal Aviation Administration have issued joint guidance that advises all crew members who have been in China in the past 14 days to self-monitor with supervision by their employer's occupational health program. US-based air crews and those based in other countries (not China) to practice social distancing while on layovers in China and limit their exposure to local populations; crews who follow these recommendations are considered low risk for exposure to COVID-19 and have no restrictions on work or travel as long as they remain asymptomatic. Crews based in China are considered to have medium risk for exposure and recommended to remain in their hotel rooms to the extent possible and practice social

AMERICAN OVERSIGHT

distancing while on layovers in the United States; as long as they are asymptomatic, these crews are not restricted to work on flights into and within the United States.

As an added precaution, China-based crews on passenger flights will have expedited screening upon arrival at a funneling airport. This recommendation is made because these crew have interactions with passengers onboard the airplane and may work on connecting domestic flights within the United States.

How should health departments manage airline or cargo flight crew members who have been in China if they become symptomatic while in the United States, and other crew members who may have been exposed to the ill crew member?

Air carriers have been asked to notify CDC if crew members become symptomatic with acute respiratory illness (a cough, shortness of breath, or a fever) within 14 days of having been in China. The ill crew member or the air carrier should also notify the local health department of jurisdiction. Symptomatic crew members should be excluded from work on flights until cleared by the employer's occupational health program in coordination with public health authorities. If a crew member is diagnosed with laboratory-confirmed COVID-19 and is known to have worked or otherwise traveled by commercial aircraft while symptomatic, CDC will coordinate an aircraft contact investigation with the air carrier, other federal agencies. and state and territorial health departments following usual procedures.

Subject: Revised Agenda: ECHCC General Coalition Meeting

AMERICAN OVERSIGHT

Date:	Wednesday, February 12, 2020 9:47:26 AM
Attachments:	AGENDA 2 13 2020.docx
Importance:	High

On behalf of Ann Hill, please see the revised agenda for the ECHCC General Coalition Meeting.

From: Ann Hill <ann.echcc@gmail.com>
Sent: Wednesday, February 12, 2020 8:28 AM
Subject: ECHCC General Coalition Meeting

Good morning
this will serve as a reminder that there is NO general coalition meeting today in Washington County
The meeting is scheduled for tomorrow THURSDAY FEBRUARY 13 at the coalition offices located at 755 Lovejoy Road, Ft Walton Beach, FL atm 10:00 am CST

We will have items on display to view, a board to suggest requested trainings, an inventory list that the coalition has on hand for distribution during disasters or affiliated events, speakers on Cyber Security, Lean on Me Project, Training and Exercises, report on Influenza and coronavirus, and more

Please make every attempt to appear in person or send someone from your agency if you are busy. Come see the new training room improvements and learn how to use this facility for your meetings.

Agenda is attached for the meeting - at the top, there is the call-in information
Also, remember that this Friday is the deadline for submitting your project ideas to the coalition

Thank you

--

Ann Hill, Executive Director
Emerald Coast Healthcare Coalition
850-585-1679

AMERICAN OVERSIGHT

AGENDA

GENERAL COALITION MEETING

February 13, 2020 at 10:00 am CST – ECHCC office, 755 Lovejoy Road, Ft Walton Beach, FL 32548

Teleconference Information: 1-310-372-7549 Participant Code: 875091

Welcome and Introductions	Ann Hill
Updates on Coalition	Ann Hill Several upcoming Trainings Scheduled
Digital Boardwalk	James Todd, Sales Engineering Manager Cyber Security, Spam emails and more updates
Cyber Liability Insurance	Dawn Grace Underwood Anderson & Associates
Lightsticks for your Security	Phillip Smallcorn Cyalume Technologies (appearing via phone)
Lean on Me Project	Katie Scott DOH – Okaloosa
Emerald Coast Emergency Care Symposium March 11, 12 and 13, 2020	Ann Hill
Upcoming ECHCC Meetings	May 12th Walton EOC (9 am CST) Escambia EOC (130 pm CST)

Subject: Revised Agenda: ECHCC General Coalition Meeting

AMERICAN OVERSIGHT

Date:	Wednesday, February 12, 2020 9:47:21 AM
Attachments:	AGENDA 2 13 2020.docx
Importance:	High

On behalf of Ann Hill, please see the revised agenda for the ECHCC General Coalition Meeting.

From: Ann Hill <ann.echcc@gmail.com>
Sent: Wednesday, February 12, 2020 8:28 AM
Subject: ECHCC General Coalition Meeting

Good morning
this will serve as a reminder that there is NO general coalition meeting today in Washington County
The meeting is scheduled for tomorrow THURSDAY FEBRUARY 13 at the coalition offices located at 755 Lovejoy Road, Ft Walton Beach, FL atm 10:00 am CST

We will have items on display to view, a board to suggest requested trainings, an inventory list that the coalition has on hand for distribution during disasters or affiliated events, speakers on Cyber Security, Lean on Me Project, Training and Exercises, report on Influenza and coronavirus, and more

Please make every attempt to appear in person or send someone from your agency if you are busy. Come see the new training room improvements and learn how to use this facility for your meetings.

Agenda is attached for the meeting - at the top, there is the call-in information
Also, remember that this Friday is the deadline for submitting your project ideas to the coalition

Thank you

--

Ann Hill, Executive Director
Emerald Coast Healthcare Coalition
850-585-1679

Subject: Save-The-Date: PHHSBG Advisory Committee Meeting / Webinar

---

Greetings Preventive Health and Health Services Block Grant Advisory Committee Members,

Please Save-The-Date on your calendars for the next Advisory Committee Meeting to be held Friday, April 24, 2020 from 10:00 A.M – 11:30 A.M. Agenda forthcoming.

The purpose of this meeting is to:

- Discuss the FY 2019-2020 workplan (Public Health Dental Program, Violence and Injury Prevention Program and Chronic Disease Prevention).
- Share updates from the Centers for Disease Control and Prevention

The Florida Department of Health is required to keep record of external membership annually.

For external partners, if you have not done so, please complete the application for membership at this link:
https://apps.floridahealth.gov/bcquestionnaire/

Please do not hesitate to contact our office if you have any questions.

Please be advised, meeting date and time are subject to change based on Covid-19 response efforts. We will keep you updated should any changes occur.

Please join my meeting from your computer, tablet or smartphone.

Subject:	Senior Administration Officials Briefing Call on COVID-19 // Regarding President Trump issuing proclamation under section 212(f) of the Immigration and Nationality Act (INA), restricting travel
Attachments:	image001.png image002.png image003.png image004.png image005.png image006.png

State and Local Leaders,

On Thursday, March 12, at 2:00 p.m. Eastern Time, please join Senior Administration Officials for a briefing call on COVID-19 (coronavirus) regarding President Trump issuing a proclamation under section 212(f) of the Immigration and Nationality Act (INA) to restrict travel to the United States from foreign nationals who have recently been in certain European countries. Additional details can be found below. We will also provide an update on implementing mitigation strategies for communities with local COVID-transmission (A Framework for Mitigation: Implementation of Mitigation Strategies for Communities with Local COVID-19 Transmission <https://www.cdc.gov/coronavirus/2019-ncov/downloads/community-mitigation-strategy.pdf>).

Briefing Call Registration on 212(f) & Community Mitigation Strategies

* Date: Today, Thursday, March 12
* Time: 2:00 PM ET (please note time zone)
* Call-In Registration: CLICK HERE <https://ems9.intellor.com/?do=register&t=1&p=901287>
* Note: You must RSVP to join the call. Upon successful registration, you will receive dial-in details to the email address you use to register. Note that multiple people cannot dial-in using the same registration information.

Below, please find additional information. The White House Office of Intergovernmental Affairs (WH IGA) will continue to share pertinent information as it becomes available. Please do not hesitate to reach out to our office directly if we can be of assistance.

Sincerely,

Zach

The White House Office of Intergovernmental Affairs

Zach Swint

Office of Intergovernmental Affairs

President Donald J. Trump Has Taken Unprecedented Steps to Respond to The Coronavirus and Protect the Health and Safety Of Americans

AMERICAN OVERSIGHT

“Together we are putting into policy a plan to prevent, detect, treat and create a vaccine against coronavirus to save lives in America and the world. America will get it done!” – President Donald J. Trump

President Donald J. Trump signed a Presidential Proclamation, which suspends the entry of most foreign nationals who have been in certain European countries at any point during the 14 days prior to their scheduled arrival to the United States. These countries, known as the Schengen Area, include: Austria, Belgium, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Italy, Latvia, Liechtenstein, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Slovakia, Slovenia, Spain, Sweden, and Switzerland. This does not apply to legal permanent residents, (generally) immediate family members of U.S. citizens, and other individuals who are identified in the proclamation.

Statement from DHS Acting Secretary Chad F. Wolf: “Protecting the American people from threats to their safety is the most important job of the President of the United States. The actions President Trump is taking to deny entry to foreign nationals who have been in affected areas will keep Americans safe and save American lives. I applaud the president for making this tough but necessary decision. While these new travel restrictions will be disruptive to some travelers, this decisive action is needed to protect the American public from further exposure to the potentially deadly coronavirus. In January and February, the Administration issued similar travel restrictions on individuals who had been in China and Iran. That action proved to be effective in slowing the spread of the virus to the U.S., while public health officials prepared. In the next 48 hours, in the interest of public health, I intend to issue a supplemental Notice of Arrivals Restriction requiring U.S. passengers that have been in the Schengen Area to travel through select airports where the U.S. Government has implemented enhanced screening procedures.”

RESTRICTING TRAVEL FROM IMPACTED AREAS: President Donald J. Trump is taking further action to curb the spread of the coronavirus to the United States from other countries.

* President Trump is issuing a proclamation under section 212(f) of the Immigration and Nationality Act (INA) to restrict travel to the United States from foreign nationals who have recently been in certain European countries.

* Section 212(f) of the INA only applies to the movement of human beings, not goods or cargo.

* The restriction applies to foreign nationals who have been in the Schengen Area, 26 countries in Europe with open borders agreements, in the last 14 days.
* Those who are exempt from these restrictions, such as American citizens, will be directed to a limited number of airports where screening can take place.
* There is extensive travel back and forth between Europe that heightens the risk here in the United States.

LOOKING OUT FOR AMERICAN BUSINESSES AND WORKERS: President Donald J. Trump is committed to protecting American businesses and workers from the impacts of coronavirus.

* The President is announcing an economic assistance package to help support businesses and workers who have been harmed by this outbreak.
* President Trump has instructed the Small Business Administration (SBA) to exercise available authority to provide loans to businesses affected by the coronavirus.

* These loans will help overcome disruptions caused by the coronavirus.
* The President is calling on Congress to increase funding for this program by an additional $50 billion.

* The President will be instructing the Department of the Treasury to defer tax payments for certain individuals and businesses negatively impacted by the coronavirus.

* This action will provide more than $200 billion of additional liquidity to the economy.

* President Trump is calling on Congress to immediately pass payroll tax relief.
* The President announced that he will soon be taking emergency action to provide financial relief for workers who are ill, quarantined, or caring for others due to the coronavirus.

* The President also called on Congress to take action to extend this relief for workers.

LEADING AN AGGRESSIVE, WHOLE-OF-GOVERNMENT APPROACH: President Trump has taken unprecedented steps to protect the health of Americans in response to the coronavirus.

* The President is leveraging all of our resources to respond to the coronavirus, bringing together government and private industry in a collaborative response.
* The Trump Administration declared a public health emergency in January to bolster response efforts.
* President Trump took early action to help curb the spread of the virus from other countries to the United States, providing important time for response and preparations.

* In January, President Trump acted quickly to restrict travel from foreign nationals traveling from China.
* In February, the President restricted travel for individuals recently traveling from Iran.
* The Administration put into place mandatory screening for all travelers coming into the country from Italy and South Korea.
* Travel advisories for severely impacted areas like Italy and South Korea have been raised to their highest level.

* Today, the President directed his Administration to make general-use face masks available to our healthcare workers.

* The Administration’s actions will help make millions of general-use respirators available to keep healthcare workers safe and mitigate transmission of the virus.

AMERICAN OVERSIGHT

* President Trump signed into law more than $8 billion to fund response efforts.
* The Administration has taken bold steps to incentivize the development of therapeutics and vaccines to treat and prevent the spread of the coronavirus.
* Working across the public and private sectors, the Trump Administration continues to drastically expand testing capacity.

* More than 1 million tests have been distributed nationwide, with another 4 million tests being shipped out by the end of the week.
* Testing is now available in every State lab in the country and commercial labs are now deploying tests, which will help generate a dramatic increase in availability.

* The Trump Administration has released guidance on how to keep businesses, schools, community gathering places, and families safe.

* From the start, President Trump has made keeping the public informed a top priority.

* The Administration has announced that health plans with health savings accounts will be able to cover coronavirus testing and treatment without co-payments.

ICYMI | Vice President Pence Discusses the Coronavirus Response on the Morning Shows

---

Earlier this morning, Vice President Pence joined Good Morning America, The Today Show, Fox & Friends, New Day, and CBS This Morning to discuss the steps that this administration is taking to combat the coronavirus.

ON ABC's GOOD MORNING AMERICA

WATCH HERE. <https://grabien.com/getmedia.php?id=856365&key=8a068e0e7ba2ceda6bd6ed7452ddb3de>

From very early on, President Trump took decisive action to put the health of the American people first.

"We all have known from the beginning that the coronavirus would continue to spread across this country, and it's one of the reasons why, from very early on, President Trump took decisive action to put the health of the American people first, not only declaring a public health emergency in January, but in that same month he suspended all travel from China -- an unprecedented move -- and quarantined Americans that were returning from the region. Since that time, George, we've -- we've issued travel advisories for areas of South Korea, Italy; screened all persons coming on direct flights. But, frankly, as we watched the epicenter of the coronavirus shift from China and South Korea to Europe, the President thought it was proper for us to impose a 30-day suspension on all travel from continental Europe."

The President, again, made another unprecedented decision in suspending all travel from Europe, because we want to stop the flow of people bringing the coronavirus here.

"The reality is that, really, just two weeks ago, in Italy, there were less than 500 cases and now there's 12,000 cases in Italy, George. We have tens of thousands of people that travel to the United States from Europe every day. Seventy percent of new cases in the world were in Europe. And when we looked yesterday at the -- what was then the 35 states where we had cases, about 30 of them could be traced to contacts with Europe. And so the President, again, made another unprecedented decision in suspending all travel from Europe, because we essentially want -- we essentially want to stop the flow of people bringing the coronavirus here, but then continuing to surge resources, particularly into California, Washington State, New York, and other communities where we've seen community spread. It's a combination of efforts that's being driven by the top health experts in the world on our task force. But the President -- the President showed again yesterday a willingness to take decisive action on multiple levels to protect the American people."

We want to send a very clear message to Americans that if for any reason you believe you've been exposed to the coronavirus, you should not be worried about the cost of testing or treatment.

"We're making steady progress. We're going to continue to make a very clear message to Americans that if for any reason you believe you've been exposed to the coronavirus or you have symptoms, we don't want people to be worried about the cost of testing, to be worried about the cost of treatment… As the President made clear last night, we're working with Congress and exploring actions the President can take to make sure that hourly wage earners know that you can stay home without risking losing a paycheck or losing your job if you feel if you feel that you've been exposed to the coronavirus."

ON NBC's TODAY SHOW

WATCH HERE <https://grabien.com/getmedia.php?id=856357&key=57d8648a9738379794d8d7cc05271db7> .

From early on in this effort, we have addressed the testing issue. We made changes through the FDA that allowed for state labs and hospitals to engage in testing.

"From early on in this effort we've been addressing the testing issue. We made changes through the FDA that allowed for state labs and university hospitals and hospitals to engage in testing. And I'm pleased to report every state lab in America can do testing now. Many university laboratories are doing it. Washington State – the University of Washington is doing extraordinary work. but we are literally working hour by hour to expand the testing and we think the key Savannah is going to be what we call commercial laboratories like LabCorp and Quest who are already spinning up production at the president's direction last week on tests that can be available on a broad basis in the days ahead for the American people. we're making real progress but rest assured we're going to continue to drive forward."

The American people should know that President Trump has no higher priority than the health, safety and well-being of the American people.

"The American people should know that President Trump has no higher priority than the health and safety and wellbeing of the people in this country.

AMERICAN OVERSIGHT

You can go to coronavirus.gov right now to find out what every American can do to keep yourself, your family, your workplace and your school safe. But you can rest assured we're going to focus on communities where we've had community spread, and the President's action yesterday suspending travel from Europe is one more example of how he's putting the health of America first."

ON FOX NEWS' FOX & FRIENDS

WATCH HERE <https://grabien.com/getmedia.php?id=856379&key=cb1ba3743718e73a552d06d4ad66a617> AND HERE <https://grabien.com/getmedia.php?id=856383&key=9e8d30fd728e132040b652f01534deb4> .

The President has called this a whole-of-government approach, but he has also called this is a whole-of-America approach.

"The President, you know, he said this was a whole-of-government approach but he also said this is a whole-of-America approach. So he's brought in business leaders from nursing homes; yesterday, banking; hospitals, and the rest. But one of the things we did that's most important on testing was the President brought in the leaders of the top commercial laboratories in the country who, as we speak, have already approved a test that is being spun up. It's being sent out to market. Quest, LabCorp, the largest commercial laboratories in the country, are working very closely with our administration. We're clearing the red tape out of the way. That's going to be the way that, in the days ahead, we're going to -- we're going to have broad-based testing available all across the country."

We are working together to contain the spread of the coronavirus. And we will get through this.

"Our goal, as the coronavirus spreads in this country -- and the vast majority who would contract it will have flu-like symptoms and recover. Our goal nonetheless is to hold down that overall number as much as possible. And we will do that with the continuing cooperation of American families, schools, businesses, and states. And that's the vision President Trump has. All of us working together will get through this."

We are focusing on supporting efforts at the state and local level in Washington State, and in California. CDC issued strong guidelines for those communities about public activities, large gatherings and at schools. We will continue simply to follow the data on this.

"Make no mistake about it: We are also focusing on supporting efforts at the state and local level in California, in Washington State, and in California. CDC issued very strong guidelines for those communities about public activities, large gatherings, schools. And we'll continue simply to follow the data on this and make strong recommendations where we have what's known as "community spread. But for every American, right now, as the President said last night, it's a good time to use common sense. Wash your hands often. Clean, you know, often-used surfaces. All that information is available at Coronavirus.gov. So we're going to try and mitigate the spread in this country but also prevent, through the President's decisive action last night, people from bringing the coronavirus into the United States any further from Europe."

We are encouraging best practices for every American. We are focusing on communities where we have community spread.

"I want to say to your viewers, just as the President said last night, the risk to the average American of contracting the coronavirus remains low, but we do know that seniors with serious underlying chronic health conditions are particularly vulnerable to very serious outcomes. And so we're encouraging best practices for every American. We're focusing on communities where we have community spread."

Those with a family member who is a senior citizen should support them in engaging in good hygiene and good health practices.

"For any American that's watching today that has a family member or a loved one who's a senior citizen with a serious underlying health condition, this is a very good time to help and to support them to be able to avoid public places, and everyone around them to engage in good hygiene and good practices to protect those that are most vulnerable."

ON CNN's NEW DAY

WATCH HERE <https://grabien.com/getmedia.php?id=856387&key=11a16cd41a35ed71b5740a5915232784> AND HERE <https://grabien.com/getmedia.php?id=856391&key=8c259b68ce8df48e55ad39eaae2c0b4a> .

We have been meeting with industry leaders in one relevant industry after another to ensure that the full resources of America are being brought to bear.

"We're not doing a travel ban as our strategy. The suspending all travel for 30 days from Europe is a part of the strategy. The other part is an aggressive mitigation strategy. I spoke to the governors of New York, Washington State, and California tomorrow -- or yesterday. CDC issued strong guidance to those areas where we have community spread. We've flowed resources. We've flowed support to those areas. And so it's a combination of strategies that the President has employed here. As he says, it's "all hands on deck," "a whole-of-government approach," but it's also a whole-of-America approach. We've literally been meeting with industry leaders in one relevant industry after another to ensure that the full resources of America are being brought to bear."

Any American who is concerned about being exposed to the coronavirus, should call their doctor and get tested.

"Anyone who's looking on today who might be concerned that they were exposed to coronavirus or have symptoms should call their doctor. Their doctor, with any question, can call their state laboratory and be able to find out how they can have a test processed."

We are making steady progress. We don't want anybody to avoid having a test because they are concerned financially.

"But make no mistake about it: We're making steady progress. We've made changes at the FDA in January, at the President's direction. And the American people can be confident we're going to continue to roll out the test. And maybe most significant on that score is that the President brought health insurance companies in last week and they all agreed to waive the co-pays on testing. We expanded testing to Medicare and Medicaid patients. And we also expanded coverage for treatment, and health insurance companies expanded coverage for treatment. We don't want anybody to avoid having a test because they're concerned financially."

The risk to the average American remains low.

"I want people to know that the risk to contracting the coronavirus, according to all of our experts, for the average American remains low. Most people that contract it, will have flu-like symptoms and recover."

AMERICAN OVERSIGHT

ON CBS This Morning

WATCH HERE <https://grabien.com/getmedia.php?id=856403&key=076e051c5bee0accd97969ffc61e1e8a> .

We are going to continue to put in every effort in place to protect the health and safety of the American people.

“The President took the unprecedented step of suspending all travel from China which was the originating country of this virus. We also established travel advisories, and we've been screening passengers on all direct flights from South Korea and Italy. But with the epicenter of this epidemic now moving from China and South Korea to Europe, yesterday the President again took the unprecedented step of suspending all travel from Europe for the next 30 days, and that in combination with our strong mitigation efforts in communities that are experiencing what our experts call community spread, areas of California, Washington State, and New York, we're going to continue to put every effort at home and with regard to these travel restrictions in place to protect the health and safety of the American people.”

In the days ahead, we are going to continue to see the availability of tests at your local doctor and your local pharmacy expand.

“Testing is happening in every state lab in the country. Many university hospitals have taken the FDA test, like the University of Washington, is doing a great job expanding testing capabilities. But the biggest piece on the testing is that our commercial labs that the President brought in last week, companies like Quest and LabCorp, have already had approved a new test that they several days ago had begun to take to market which they can do in a vast and expansive way across the country. And literally in the days ahead, we're going to continue to see the availability of tests at your local doctor, ultimately at your local pharmacy, continue to expand.”

When President Trump learned that 70% of the new cases this week, around the world, were in Europe, he took decisive action to protect the American people.

“Make no mistake about it: All the new cases in the world, this week, 70% of the new cases were in Europe. And the increase has been dramatic. When the President imposed the travel advisory and we began screening all flights, all passengers coming into the United States from Italy two weeks ago, there were roughly 500 coronavirus cases. Now there's 12,000, about 1,000 in Germany, about 1,000 in France. That's the reason why the President essentially said full stop, we're going to suspend all travel, and that American citizens coming home and legal residents will be funneled through 13 different airports. They'll get an initial health screening coming in. But we're going to ask everyone returning to our country to self-quarantine for 14 days.”

Subject:	Senior Administration Officials Briefing Call on COVID-19 // Regarding President Trump issuing proclamation under section 212(f) of the Immigration and Nationality Act (INA), restricting travel
Attachments:	image001.png image002.png image003.png image004.png image005.png image006.png

State and Local Leaders,

On Thursday, March 12, at 2:00 p.m. Eastern Time, please join Senior Administration Officials for a briefing call on COVID-19 (coronavirus) regarding President Trump issuing a proclamation under section 212(f) of the Immigration and Nationality Act (INA) to restrict travel to the United States from foreign nationals who have recently been in certain European countries. Additional details can be found below. We will also provide an update on implementing mitigation strategies for communities with local COVID-transmission (A Framework for Mitigation: Implementation of Mitigation Strategies for Communities with Local COVID-19 Transmission <https://www.cdc.gov/coronavirus/2019-ncov/downloads/community-mitigation-strategy.pdf>).

Briefing Call Registration on 212(f) & Community Mitigation Strategies

* Date: Today, Thursday, March 12
* Time: 2:00 PM ET (please note time zone)
* Call-In Registration: CLICK HERE <https://ems9.intellor.com/?do=register&t=1&p=901287>
* Note: You must RSVP to join the call. Upon successful registration, you will receive dial-in details to the email address you use to register. Note that multiple people cannot dial-in using the same registration information.

Below, please find additional information. The White House Office of Intergovernmental Affairs (WH IGA) will continue to share pertinent information as it becomes available. Please do not hesitate to reach out to our office directly if we can be of assistance.

Sincerely,

Zach

The White House Office of Intergovernmental Affairs

Zach Swint

Office of Intergovernmental Affairs

President Donald J. Trump Has Taken Unprecedented Steps to Respond to The Coronavirus and Protect the Health and Safety Of Americans

AMERICAN OVERSIGHT

“Together we are putting into policy a plan to prevent, detect, treat and create a vaccine against coronavirus to save lives in America and the world. America will get it done!” – President Donald J. Trump

President Donald J. Trump signed a Presidential Proclamation, which suspends the entry of most foreign nationals who have been in certain European countries at any point during the 14 days prior to their scheduled arrival to the United States. These countries, known as the Schengen Area, include: Austria, Belgium, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Italy, Latvia, Liechtenstein, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Slovakia, Slovenia, Spain, Sweden, and Switzerland. This does not apply to legal permanent residents, (generally) immediate family members of U.S. citizens, and other individuals who are identified in the proclamation.

Statement from DHS Acting Secretary Chad F. Wolf: “Protecting the American people from threats to their safety is the most important job of the President of the United States. The actions President Trump is taking to deny entry to foreign nationals who have been in affected areas will keep Americans safe and save American lives. I applaud the president for making this tough but necessary decision. While these new travel restrictions will be disruptive to some travelers, this decisive action is needed to protect the American public from further exposure to the potentially deadly coronavirus. In January and February, the Administration issued similar travel restrictions on individuals who had been in China and Iran. That action proved to be effective in slowing the spread of the virus to the U.S., while public health officials prepared. In the next 48 hours, in the interest of public health, I intend to issue a supplemental Notice of Arrivals Restriction requiring U.S. passengers that have been in the Schengen Area to travel through select airports where the U.S. Government has implemented enhanced screening procedures.”

RESTRICTING TRAVEL FROM IMPACTED AREAS: President Donald J. Trump is taking further action to curb the spread of the coronavirus to the United States from other countries.

* President Trump is issuing a proclamation under section 212(f) of the Immigration and Nationality Act (INA) to restrict travel to the United States from foreign nationals who have recently been in certain European countries.

* Section 212(f) of the INA only applies to the movement of human beings, not goods or cargo.

* The restriction applies to foreign nationals who have been in the Schengen Area, 26 countries in Europe with open borders agreements, in the last 14 days.
* Those who are exempt from these restrictions, such as American citizens, will be directed to a limited number of airports where screening can take place.
* There is extensive travel back and forth between Europe that heightens the risk here in the United States.

LOOKING OUT FOR AMERICAN BUSINESSES AND WORKERS: President Donald J. Trump is committed to protecting American businesses and workers from the impacts of coronavirus.

* The President is announcing an economic assistance package to help support businesses and workers who have been harmed by this outbreak.
* President Trump has instructed the Small Business Administration (SBA) to exercise available authority to provide loans to businesses affected by the coronavirus.

* These loans will help overcome disruptions caused by the coronavirus.
* The President is calling on Congress to increase funding for this program by an additional $50 billion.

* The President will be instructing the Department of the Treasury to defer tax payments for certain individuals and businesses negatively impacted by the coronavirus.

* This action will provide more than $200 billion of additional liquidity to the economy.

* President Trump is calling on Congress to immediately pass payroll tax relief.
* The President announced that he will soon be taking emergency action to provide financial relief for workers who are ill, quarantined, or caring for others due to the coronavirus.

* The President also called on Congress to take action to extend this relief for workers.

LEADING AN AGGRESSIVE, WHOLE-OF-GOVERNMENT APPROACH: President Trump has taken unprecedented steps to protect the health of Americans in response to the coronavirus.

* The President is leveraging all of our resources to respond to the coronavirus, bringing together government and private industry in a collaborative response.
* The Trump Administration declared a public health emergency in January to bolster response efforts.
* President Trump took early action to help curb the spread of the virus from other countries to the United States, providing important time for response and preparations.

* In January, President Trump acted quickly to restrict travel from foreign nationals traveling from China.
* In February, the President restricted travel for individuals recently traveling from Iran.
* The Administration put into place mandatory screening for all travelers coming into the country from Italy and South Korea.
* Travel advisories for severely impacted areas like Italy and South Korea have been raised to their highest level.

* Today, the President directed his Administration to make general-use face masks available to our healthcare workers.

* The Administration’s actions will help make millions of general-use respirators available to keep healthcare workers safe and mitigate transmission of the virus.

AMERICAN OVERSIGHT

* President Trump signed into law more than $8 billion to fund response efforts.
* The Administration has taken bold steps to incentivize the development of therapeutics and vaccines to treat and prevent the spread of the coronavirus.
* Working across the public and private sectors, the Trump Administration continues to drastically expand testing capacity.

* More than 1 million tests have been distributed nationwide, with another 4 million tests being shipped out by the end of the week.
* Testing is now available in every State lab in the country and commercial labs are now deploying tests, which will help generate a dramatic increase in availability.

* The Trump Administration has released guidance on how to keep businesses, schools, community gathering places, and families safe.

* From the start, President Trump has made keeping the public informed a top priority.

* The Administration has announced that health plans with health savings accounts will be able to cover coronavirus testing and treatment without co-payments.

ICYMI | Vice President Pence Discusses the Coronavirus Response on the Morning Shows

---

Earlier this morning, Vice President Pence joined Good Morning America, The Today Show, Fox & Friends, New Day, and CBS This Morning to discuss the steps that this administration is taking to combat the coronavirus.

ON ABC's GOOD MORNING AMERICA

WATCH HERE. <https://grabien.com/getmedia.php?id=856365&key=8a068e0e7ba2ceda6bd6ed7452ddb3de>

From very early on, President Trump took decisive action to put the health of the American people first.

"We all have known from the beginning that the coronavirus would continue to spread across this country, and it's one of the reasons why, from very early on, President Trump took decisive action to put the health of the American people first, not only declaring a public health emergency in January, but in that same month he suspended all travel from China -- an unprecedented move -- and quarantined Americans that were returning from the region. Since that time, George, we've -- we've issued travel advisories for areas of South Korea, Italy; screened all persons coming on direct flights. But, frankly, as we watched the epicenter of the coronavirus shift from China and South Korea to Europe, the President thought it was proper for us to impose a 30-day suspension on all travel from continental Europe."

The President, again, made another unprecedented decision in suspending all travel from Europe, because we want to stop the flow of people bringing the coronavirus here.

"The reality is that, really, just two weeks ago, in Italy, there were less than 500 cases and now there's 12,000 cases in Italy, George. We have tens of thousands of people that travel to the United States from Europe every day. Seventy percent of new cases in the world were in Europe. And when we looked yesterday at the -- what was then the 35 states where we had cases, about 30 of them could be traced to contacts with Europe. And so the President, again, made another unprecedented decision in suspending all travel from Europe, because we essentially want -- we essentially want to stop the flow of people bringing the coronavirus here, but then continuing to surge resources, particularly into California, Washington State, New York, and other communities where we've seen community spread. It's a combination of efforts that's being driven by the top health experts in the world on our task force. But the President -- the President showed again yesterday a willingness to take decisive action on multiple levels to protect the American people."

We want to send a very clear message to Americans that if for any reason you believe you've been exposed to the coronavirus, you should not be worried about the cost of testing or treatment.

"We're making steady progress. We're going to continue to make a very clear message to Americans that if for any reason you believe you've been exposed to the coronavirus or you have symptoms, we don't want people to be worried about the cost of testing, to be worried about the cost of treatment… As the President made clear last night, we're working with Congress and exploring actions the President can take to make sure that hourly wage earners know that you can stay home without risking losing a paycheck or losing your job if you feel if you feel that you've been exposed to the coronavirus."

ON NBC's TODAY SHOW

WATCH HERE <https://grabien.com/getmedia.php?id=856357&key=57d8648a9738379794d8d7cc05271db7> .

From early on in this effort, we have addressed the testing issue. We made changes through the FDA that allowed for state labs and hospitals to engage in testing.

"From early on in this effort we've been addressing the testing issue. We made changes through the FDA that allowed for state labs and university hospitals and hospitals to engage in testing. And I'm pleased to report every state lab in America can do testing now. Many university laboratories are doing it. Washington State – the University of Washington is doing extraordinary work. but we are literally working hour by hour to expand the testing and we think the key Savannah is going to be what we call commercial laboratories like LabCorp and Quest who are already spinning up production at the president's direction last week on tests that can be available on a broad basis in the days ahead for the American people. we're making real progress but rest assured we're going to continue to drive forward."

The American people should know that President Trump has no higher priority than the health, safety and well-being of the American people.

"The American people should know that President Trump has no higher priority than the health and safety and wellbeing of the people in this country.

AMERICAN OVERSIGHT

You can go to coronavirus.gov right now to find out what every American can do to keep yourself, your family, your workplace and your school safe. But you can rest assured we're going to focus on communities where we've had community spread, and the President's action yesterday suspending travel from Europe is one more example of how he's putting the health of America first."

ON FOX NEWS' FOX & FRIENDS

WATCH HERE <https://grabien.com/getmedia.php?id=856379&key=cb1ba3743718e73a552d06d4ad66a617> AND HERE <https://grabien.com/getmedia.php?id=856383&key=9e8d30fd728e132040b652f01534deb4> .

The President has called this a whole-of-government approach, but he has also called this is a whole-of-America approach.

"The President, you know, he said this was a whole-of-government approach but he also said this is a whole-of-America approach. So he's brought in business leaders from nursing homes; yesterday, banking; hospitals, and the rest. But one of the things we did that's most important on testing was the President brought in the leaders of the top commercial laboratories in the country who, as we speak, have already approved a test that is being spun up. It's being sent out to market. Quest, LabCorp, the largest commercial laboratories in the country, are working very closely with our administration. We're clearing the red tape out of the way. That's going to be the way that, in the days ahead, we're going to -- we're going to have broad-based testing available all across the country."

We are working together to contain the spread of the coronavirus. And we will get through this.

"Our goal, as the coronavirus spreads in this country -- and the vast majority who would contract it will have flu-like symptoms and recover. Our goal nonetheless is to hold down that overall number as much as possible. And we will do that with the continuing cooperation of American families, schools, businesses, and states. And that's the vision President Trump has. All of us working together will get through this."

We are focusing on supporting efforts at the state and local level in Washington State, and in California. CDC issued strong guidelines for those communities about public activities, large gatherings and at schools. We will continue simply to follow the data on this.

"Make no mistake about it: We are also focusing on supporting efforts at the state and local level in California, in Washington State, and in California. CDC issued very strong guidelines for those communities about public activities, large gatherings, schools. And we'll continue simply to follow the data on this and make strong recommendations where we have what's known as "community spread. But for every American, right now, as the President said last night, it's a good time to use common sense. Wash your hands often. Clean, you know, often-used surfaces. All that information is available at Coronavirus.gov. So we're going to try and mitigate the spread in this country but also prevent, through the President's decisive action last night, people from bringing the coronavirus into the United States any further from Europe."

We are encouraging best practices for every American. We are focusing on communities where we have community spread.

"I want to say to your viewers, just as the President said last night, the risk to the average American of contracting the coronavirus remains low, but we do know that seniors with serious underlying chronic health conditions are particularly vulnerable to very serious outcomes. And so we're encouraging best practices for every American. We're focusing on communities where we have community spread."

Those with a family member who is a senior citizen should support them in engaging in good hygiene and good health practices.

"For any American that's watching today that has a family member or a loved one who's a senior citizen with a serious underlying health condition, this is a very good time to help and to support them to be able to avoid public places, and everyone around them to engage in good hygiene and good practices to protect those that are most vulnerable."

ON CNN's NEW DAY

WATCH HERE <https://grabien.com/getmedia.php?id=856387&key=11a16cd41a35ed71b5740a5915232784> AND HERE <https://grabien.com/getmedia.php?id=856391&key=8c259b68ce8df48e55ad39eaae2c0b4a> .

We have been meeting with industry leaders in one relevant industry after another to ensure that the full resources of America are being brought to bear.

"We're not doing a travel ban as our strategy. The suspending all travel for 30 days from Europe is a part of the strategy. The other part is an aggressive mitigation strategy. I spoke to the governors of New York, Washington State, and California tomorrow -- or yesterday. CDC issued strong guidance to those areas where we have community spread. We've flowed resources. We've flowed support to those areas. And so it's a combination of strategies that the President has employed here. As he says, it's "all hands on deck," "a whole-of-government approach," but it's also a whole-of-America approach. We've literally been meeting with industry leaders in one relevant industry after another to ensure that the full resources of America are being brought to bear."

Any American who is concerned about being exposed to the coronavirus, should call their doctor and get tested.

"Anyone who's looking on today who might be concerned that they were exposed to coronavirus or have symptoms should call their doctor. Their doctor, with any question, can call their state laboratory and be able to find out how they can have a test processed."

We are making steady progress. We don't want anybody to avoid having a test because they are concerned financially.

"But make no mistake about it: We're making steady progress. We've made changes at the FDA in January, at the President's direction. And the American people can be confident we're going to continue to roll out the test. And maybe most significant on that score is that the President brought health insurance companies in last week and they all agreed to waive the co-pays on testing. We expanded testing to Medicare and Medicaid patients. And we also expanded coverage for treatment, and health insurance companies expanded coverage for treatment. We don't want anybody to avoid having a test because they're concerned financially."

The risk to the average American remains low.

"I want people to know that the risk to contracting the coronavirus, according to all of our experts, for the average American remains low. Most people that contract it, will have flu-like symptoms and recover."

AMERICAN OVERSIGHT

ON CBS This Morning

WATCH HERE <https://grabien.com/getmedia.php?id=856403&key=076e051c5bee0accd97969ffc61e1e8a> .

We are going to continue to put in every effort in place to protect the health and safety of the American people.

“The President took the unprecedented step of suspending all travel from China which was the originating country of this virus. We also established travel advisories, and we've been screening passengers on all direct flights from South Korea and Italy. But with the epicenter of this epidemic now moving from China and South Korea to Europe, yesterday the President again took the unprecedented step of suspending all travel from Europe for the next 30 days, and that in combination with our strong mitigation efforts in communities that are experiencing what our experts call community spread, areas of California, Washington State, and New York, we're going to continue to put every effort at home and with regard to these travel restrictions in place to protect the health and safety of the American people.”

In the days ahead, we are going to continue to see the availability of tests at your local doctor and your local pharmacy expand.

“Testing is happening in every state lab in the country. Many university hospitals have taken the FDA test, like the University of Washington, is doing a great job expanding testing capabilities. But the biggest piece on the testing is that our commercial labs that the President brought in last week, companies like Quest and LabCorp, have already had approved a new test that they several days ago had begun to take to market which they can do in a vast and expansive way across the country. And literally in the days ahead, we're going to continue to see the availability of tests at your local doctor, ultimately at your local pharmacy, continue to expand.”

When President Trump learned that 70% of the new cases this week, around the world, were in Europe, he took decisive action to protect the American people.

“Make no mistake about it: All the new cases in the world, this week, 70% of the new cases were in Europe. And the increase has been dramatic. When the President imposed the travel advisory and we began screening all flights, all passengers coming into the United States from Italy two weeks ago, there were roughly 500 coronavirus cases. Now there's 12,000, about 1,000 in Germany, about 1,000 in France. That's the reason why the President essentially said full stop, we're going to suspend all travel, and that American citizens coming home and legal residents will be funneled through 13 different airports. They'll get an initial health screening coming in. But we're going to ask everyone returning to our country to self-quarantine for 14 days.”

Subject: Sentinel Chicken Program Important Update

Date: Thursday, March 12, 2020 12:05:45 PM

Good Morning Sentinel Chicken Program Participants,

Our laboratory and epidemiology leadership have decided to suspend Sentinel Chicken Testing effective immediately. At this time, all personnel are need to help perform COVID-19 testing. For the next seven weeks or until further notice, we will not be performing HAI, ELISA, PRNT, and mosquito pool testing. Specimens received today or tomorrow will not be processed. Please send me an e-mail so that I know what you would like us to do with those specimens. We will notify you when we are able to resume testing.

Reports:

1. This Friday, March 13, 2020 the regular HAI report will be e-mailed.
2. Tuesday, March 17, 2020 the IgM ELISA report will be e-mailed.
3. Wednesday, March 18, 2020 the PRNT report (for February specimens) will be e-mailed.

AMERICAN OVERSIGHT

Please understand that we are doing what is best to promote, protect, and improve the health of all people in the state. Please contact me, if you have any questions or concerns.

Thank you,

Maribel

Subject:	SEOC Aging and Vulnerable Populations Call

UPDATE: This Call is now only on Tuesday and Thursday. Please distribute to your applicable partners.

Aging and Vulnerable Populations Call

Tuesday and Thursday

4:15 PM to 4:45 PM

Call-In Information

Call-In Number: 888-585-9008

Conference Room ID: 208-305-233

Join the State Emergency Operations Center for a call concerning updates on the State's response to COVID-19.

Standing Agenda

* Situation Updates from the Florida Department of Health
* Briefing from the Agency for Healthcare Administration
* Updates from other State Agencies
* Questions from Partners

Under Florida law, correspondence with the Florida Division of Emergency Management, which is neither confidential nor exempt pursuant to Florida Statutes Chapter 119, is a public record made available upon request.

Attachments:	Site Visit External 2020 Florida_Torres.docx

Dear Dr. Blackmore and Dr. Stanek,

Thank you very much for hosting me for my site visit to FDOH last month to discuss Yari's EIS experience and how the Epidemiology Workforce Branch and FDOH can continue to work together to provide an excellent experience for future EISOs. I really appreciate you spending the day with me and enjoyed meeting you and FDOH staff in person.

Attached is an site visit report summarizing my meetings and the visit. The report is essentially the same as the internal report (I removed the logistics section pertaining to lodging and transportation and revised the wording in several spaces to improve clarity). One item we didn't discuss during the meeting but that has come up internally afterwards was the potential involvement of local health departments to improve field investigation opportunities. Would staff in Miami or Orlando, for example, have interest in setting up an arrangement to host an EISO to assist with field investigations?

Thank you again for meeting me, and please don't hesitate to contact me with questions or comments about the site visit report or any other concerns you have.

Regards,

Suzanne Beavers

AMERICAN OVERSIGHT

Site Visit Report Template

Date: February 10, 2020
To: The Record
From: Suzanne Beavers
Subject: Site Visit to Florida Department of Health

On January 30th, I visited the Florida Department of Health (FDOH) to assess the progress of the current Epidemic Intelligence Service (EIS) Officer, Yari Torres, and to assess the health department's suitability to host another EISO in 2020.

During the site visit, I met with the following people:

Scott Pritchard, MPH (interim director for Acute Disease Investigations)
Megan Gumke, MPH
Prakash Mulay, MBBS MPH
Jim Matthias, MPH (CDC assignee to the Division of STD Prevention)
Samuel Prahlow, MPH
Dr. Carina Blackmore, DVM PhD DACVPM CPM **Primary supervisor**
Dr. Danielle Stanek, DVM DACVPM **Secondary supervisor**
Scott Rivkees, MD **State Surgeon General**

Assignment Overview

The Florida Department of Health is located in Tallahassee, Florida, the state capital. Florida contains 67 counties and has a population of approximately 21 million people. Yari lives about a 5-minute drive from the health department; her location is convenient to shopping and work. She doesn't have trouble with traffic and likes her living location.

Currently, there's nobody at the health department who is an EIS alumnus. She had a former supervisor who was an alumnus who has returned to clinical practice. There are currently no career epidemiology field officers in Tallahassee, though a CEFO (Tim Doyle, who has previously worked at FDOH) will join them soon. Her supervisors are Dr. Danielle Stanek and Dr. Carina Blackmore, both veterinarians. She meets with them regularly. Due to the nature of their positions (Dr. Blackmore is the Director of Medical and Health Services), she often works with Dr. Stanek more closely. However, both supervisors are accessible to her.

FDOH has a CSTE fellow and a Florida EISO (typically an MPH) from the state program (http://www.floridahealth.gov/diseases-and-conditions/disease-reporting-and-management/florida-epidemic-intelligence-service/index.html).

No type of degree is more preferable for this position, although Yari's supervisors feel that someone who is only interested in analysis won't be happy at FL. They said that someone who had broad interests would be best suited for the position. Spanish fluency is helpful but not necessary. Someone who can take direction is helpful. They noted that in Florida the local health departments are sophisticated and the EISO wasn't expected to do as much shoe leather epidemiology as in the past. Yari said that the site has a lot of data to analyze but that she hasn't done a lot of analysis because of her skill set. She said that characteristics that make you

AMERICAN OVERSIGHT

more likely to succeed in this position include communication skills, broad interests, and willingness to ask questions. She said that people who think they're too advanced to do certain tasks won't do well.

Yari has access to SAS and ArcGIS. She can download R if needed. She receives excellent technical support at FDOH. She has an office on the second floor of the building.

EIS Officer, Yari Torres:

Yari has enjoyed her time at FDOH. She has always been given the freedom to participate in investigations that interest her. She has taken call for the health department and always has excellent backup when on call. She has been involved in a variety of types of investigations, which she has appreciated. She has also participated in several trainings while at FDOH, including a media training that compared favorably with that offered at CDC. The state also had a Stephanie Evergreen training she attended.

Yari stated that her assignment started off slowly. She has found it difficult at times to become involved in field investigations. She said involving Scott Pritchard would help her learn more quickly about new outbreaks so she could become involved more quickly. She felt that the fact that the state functioned as a home rule state and that many of the larger investigations occurred a several-hour drive away from her (e.g., in Orlando or Miami) also made it more difficult for her to become involved. She feels that the next EISO will have an easier time because Yari was able to work with a number of people and convince them of the value added of having an EISO to work on projects.

Progress on CALs:

1) Field investigation – CASPER in Florida Keys after Hurricane Irma, *C. auris* investigation, Brucella investigation (complete)
2) Epidemiologic analysis – syphilis retesting (complete)
3) Surveillance evaluation – CO poisoning syndromic surveillance evaluation
4) 30-min oral presentation – cluster of *C. auris* cases, rabies guidelines testing, Florida Environmental Health Association training, Hurricane Michael CASPER (complete)
5) 5-15 min oral presentation – CO syndromic surveillance at CSTE (complete)
6) First-authored scientific manuscript for peer-reviewed journal – case report on rabies virus in cat (not started), CASPER done after Hurricane Irma for MMWR (preclearance)
7) First-authored concise public health update – Rabies virus in Florida (complete)
8) First-author on abstract – CO poisoning syndromic surveillance; Brucella investigation; CASPER in Florida Keys (complete)
9) Communicate complex scientific concepts to a lay audience – on call for general and zoonotic inquiries from the public; gave rabies training; co-led public health merit badge activity for Boy Scouts (complete)
10) Service to the agency – Hurricane Michael ESF-8 volunteer; Salmonella interviews; multiple rabies trainings; *C auris* workgroup (complete)

After EIS, Yari Torres has been accepted to the CDC Preventive Medicine Fellowship program.

AMERICAN OVERSIGHT

Meetings with ....

Scott Pritchard, MPH
Megan Gumke, MPH
Prakash Mulay, MBBS MPH
Jim Matthias, MPH
Samuel Prahlow, MPH
Nikki Sebastian

Jim Matthias (CDC assignee to the Division of STD Prevention) has supervised Yari on her syphilis analysis. The analysis has been challenging, because reportable disease datasets can be difficult. They have continued to hit roadblocks and have found that some of the retests in the dataset might not actually be a retest for syphilis reinfection but a confirmation of the initial positive test. Yari has been doing all the work on this analysis, and Jim has been happy with her analysis. They hope to submit an abstract based on the work, but if not, that would be ok.

Samuel Prahlow has worked on ESSENCE with Yari. He has helped Yari learn syndromic surveillance and has taught her about MERLIN, PRISM, EMS data, Health Information Exchange, and ASPR data on DMATs. Yari understood the systems quickly and asked good questions. She is good at seeing the broader picture. He also worked with Yari on the CASPER and helped with cluster selection. He found her to be thorough and good at understanding the process. He enjoyed seeing her work with Monroe County Health Department and University of Miami in the field during the CASPER.

Prakash Mulay worked with Yari on the CO surveillance project. She came on board right as they were wrapping up Irma surveillance and asking how they could improve surveillance in the future. Yari was asked to quickly complete the surveillance project so had to learn ESSENCE quickly. She did a wonderful job. She worked with several partners (EPHT, CSTE fellow, county health departments) and reviewed her presentations with Prakash and others. She transitioned quickly from infectious (her primary area of expertise prior to EIS) to noninfectious diseases. She also has done interviews in Spanish, which is helpful.

Nikki Sebastian worked with Yari on the *Candida auris* investigation. They needed help with contact screening. Yari was able to help contact facilities and create relationships, scheduling visits, point prevalence surveys, and observations. She helped convince facilities of the importance of the outbreak given that a CDC EISO was participating. She went to the facilities during the day shift and night shift to provide education. At one point a facility staff member arrived late to the presentation on cleaning/disinfection practices. Rather than asking the other staff members attending to explain the presentation to the late staff member, Yari spent extra time to educate the staff member. She helped the Healthcare Associated Infections team increase their capacity. She built relationships with the staff at healthcare facilities, who liked her a lot. She has been open to continuing to answer questions the staff might have about recommendations. The HAI team in Florida is unique in that many staff are in the field. They were looking for subject matter expertise and assistance with their regional response plan. Yari gave them additional resources, ideas, education, creative ways to engage healthcare providers. She also helped them by procuring preexisting *C. auris* Spanish resources.

AMERICAN OVERSIGHT

Scott Pritchard has worked with Yari on measles and Hepatitis A investigations. She has demonstrated the ability to work complex cases. She studies and works up cases better that most people. There are few people he would trust to work up outbreaks, but he would trust Yari. She is thorough and talks to the right people, a “tremendous asset”.

Megan Gumke is a regional epidemiologist responsible for the 18 panhandle counties. She helped Yari understand the county realm vs. the state realm. Yari always wants to understand and learn more so that she would be more effective while taking calls.

Dr. Danielle Stanek and Dr. Carina Blackmore

Yari is an independent, curious thinker. She goes out of her way to obtain professional development opportunities and tries to speak with people who are interested in public health to promote careers in public health. She was very beneficial in securing another EISO for the 2020 class. People in the HD have appreciated her help, as she is a good team worker and empathetic. She listens to feedback and thinks about ways to improve as well as telling her supervisors if she has an added perspective. She has progressed a lot on her presentations.

Her supervisors have found it helpful to have an EISO who will write up their epidemiologic investigations for publication to increase awareness. She has written a document on rabies clinical guidance, which has been helpful.

To finish Yari’s CALs, they think writing up the rabies vaccine failure for cats will be easiest and fastest. We discussed the need for Yari to be done with her CALs at the end of her program or one month afterwards, which is particularly important for Yari given that CAL completion is a PMR requirement.

For the next EISO, they have a bank of projects ready to go. They want to learn the new EISO’s interests and skill set. They will match the EISO with people working on projects of interest. They are interested in a surveillance project on people who are not getting vaccinated.

When talking about ways EWB could better support FDOH, Dr. Blackmore mentioned making sure that the EWB supervisor contacts them about any problems they note with the EIS program. They also noted that epidemiology work at a state HD has changed in that it is much more laptop-based. EWB should continue to educate EISOs so they understand that they will get a field experience but need to be skilled on other areas because they won’t be doing field work often once they are done with EIS. (We discussed the work that EWB does in summer course to manage expectations of incoming EISOs, but I noted that expectation management was more challenging in a year when so many EISOs had participated in EVALI, Ebola, polio, and now coronavirus deployments.) They stated that CDC’s support on the CASPER investigation (Amy Schnall) and Byron’s support with statistics have been helpful.

Scott Rivkies, State Surgeon General

Dr. Stanek, Dr. Blackmore, Yari, and I met briefly with Dr. Rivkies and one of his staff members. We talked about the EIS program, an investigation on Campylobacter in pet food that Yari was working on, and Yari’s experience in Florida. One staff member asked

AMERICAN OVERSIGHT

a question about obtaining an EISO in FL to work on chronic disease. We talked briefly about the past history of chronic disease EISOs in FL.

EISO submitted and supervisor(s) reviewed CAL Reports in eFMS on time (by due date): Yes

Supervisor completed Progress Assessments on time: Yes

EISO completed confidential Host Site Assessment: Yes

Qualifications and Experience of Supervisors
Supervisors have the experience and credentials necessary to supervise EISOs. Yari said she is able to get support from both supervisors. She often works more with Dr. Stanek, as Dr. Blackmore is particularly busy.

Quality of EIS projects/outbreak/field investigation opportunities

At times Yari's opportunities for field investigations have been more limited than she would have liked. No EISO was in the health department in the year prior to her assignment there, so she had to familiarize people with her capabilities and what she could offer to an investigation. In addition, local health departments in Florida have high capacity and perform many investigations without requesting state involvement. Ultimately, Yari has been able to participate in several field investigations. The next EISO should have opportunities as well, her supervisors note, particularly if she is interested in healthcare-associated infections (where they stated they are likely to need help).

Availability of EISO support

She suggested having Scott Pritchard as a formal secondary supervisor or an informal supervisor who has a role in getting the EISO more quickly involved in field investigations. Both her supervisors thought this was a good idea. Having a CEFO come to the state will likely provide the EISO additional opportunities for interaction.

Assignment Strengths

- Broad EIS experience
- Experienced supervisors
- Positive experience with current EISO will likely increase next EISOs ability to get involved in projects

Assignment Potential Weaknesses

- Slow start for field investigations (I suspect geography and high-capacity local health departments play a role here). Involving Scott Pritchard or someone else who can get Yari more quickly looped into opportunities will likely help, as will greater awareness of what an EISO is and does when the 2020 EISO arrives.

AMERICAN OVERSIGHT

Recommendations

- FDOH has prematched with a 2020 EISO. This position offers a lot of opportunity for the EISO, and I'd anticipate the next EISO will have a wide variety of good experiences.
- Involve Scott Pritchard in supervision of the next EISO to promote early involvement in field investigations.

AMERICAN OVERSIGHT

Subject:	SouthCom COVID Exposures
Date:	Thursday, March 12, 2020 5:46:24 PM

Good Afternoon,
Dr. Susan Moran (305-437-1327 and copied) from Southcom reached out to me. She is leading a contact investigation of a reportedly positive COVID-19 case that visited the facility on Sunday. She is currently stratifying risk for around 97 persons. Est 10-20 may be medium risk. During our discussion we developed a plan that I think meets all of our needs.

- Southcom will plan to monitor all medium risk enlisted persons and only reach out if they have persons that need testing.
- They will also, develop a list of medium risk civilians with contact information, and provide to Miami-Dade CHD and you can notify other counties as needed by residence to monitor those folks.
- They will educate all low risk and ask that they call them if they develop illness they will triage and report as needed.

Her colleague Dr. Alexis Bowers(sp?) is also involved and can be reached at 305-437-3916.

Thank you!

Report Password: the password to open the password protected Pathology Report PDF (Preliminary/Final/Addendum) for this case will be provided in a separate email after you receive the Final Pathology Report Email and will be a unique 12 digit number. If additional specimens are subsequently received on the same case by IDPB, the password will remain unchanged. Animal case reports will not have password protection.

Specimen Receipt Notice: the official contact(s) at the Health Departments (if known) will be cc'd on IDPB's Specimen Receipt Notice emails, in addition to cc'ing other case specific relevant parties. The same official contact(s) at the Health Departments (if known) will continue to receive IDPB's Final Pathology Reports once finalized.

ePathology Service: IDPB now offers telepathology consultation through our ePathology service. This is not a substitute for diagnostic testing by our laboratory, but facilitates rapid initial evaluation of images or scanned slides prior to submission of case materials for testing. Please visit the ePathology website at http://www.cdc.gov/ncezid/dhcpp/idpb/epathology/index.html for more information.

To: CDC IMS 2019 NCOV Response PUI <eocevent185@cdc.gov>; Pritchard, Scott <Scott.Pritchard@flhealth.gov>; CDC IMS Logistics Transportation <eocevent306@cdc.gov>; Hyde, Allen W. (CDC/DDPHSIS/CPR/DEO) <fnb4@cdc.gov>; Schneider, Eileen (CDC/DDID/NCIRD/DVD) <ees2@cdc.gov>; CDC IMS 2019 NCOV Response PUI <eocevent185@cdc.gov>
Subject: PUI ID# 0001287

Hello Scott:

Thank you for contacting CDC about the patient under investigation (PUI) for novel coronavirus (COVID-19). Please find summary information below to help assist in the PUI evaluation and specimen referral.

AMERICAN OVERSIGHT

Summary

38 yo male who resides in China (Guangzhou City) came to US on 2/3. on 2/15 he developed cough, congestion, rash and subjective fever. Patient presented to ED for evaluation. Decision made to admit patient but patient signed himself out AMA. Specimen x 3 were collected prior to his signing himself out. Denied other risk factors (travel to Wuhan or Hubei province; contacts to a known case).

CDC COVID-19 ID #0001287

POC Details

Name: Scott Pritchard

Location: Florida

Phone: 850-251-5558

Email: scott.pritchard@flhealth.gov

Additional information

Guidance for health departments to submit PUI information to CDC can be found here. Include the CDC COVID-19 ID issued to you by CDC in the top right box and on all specimen forms. The PUI form should be submitted as soon as able and need not wait for specimen shipping. Instructions on how to submit the PUI form are located at the top of the form.

Laboratory testing: At this time, CDC requests referral of NP swab (VTM) and OP swab (VTM) specimens. A sputum (sterile container) specimen should also be sent if a productive cough is present. The NP and OP swabs should be placed in separate VTM vials. Serum specimens are not needed at this time for PUI testing.

Specimens should be packed according to International Air Transport Association (IATA) regulations. Shipments from outside of the United States may require an importation permit that can be obtained from the CDC. For specific instructions, see the "Packing, Shipping, and Transport" section from this CDC website.

Please see the attached *2019 Novel Coronavirus (nCoV) Specimen Submission Guidelines* for detailed guidance on specimen shipment, packaging, and documentation. Please ensure that the patient information on the specimen tube exactly matches the 50.34 DASH Form, or the

AMERICAN OVERSIGHT

CDC may have to reject the specimen or testing may be delayed.

For questions about specimen collection or completing the 50.34 Form, please see https://www.cdc.gov/laboratory/specimen-submission/help-faqs.html.

Precautions: For healthcare personnel, we recommend the following guidance: https://www.cdc.gov/coronavirus/2019-nCoV/infection-control.html If the PUI seeks healthcare, CDC recommends they alert providers in advance for adequate infection control preparations.

If the PUI is under home care, please consider the following CDC guidance: https://www.cdc.gov/coronavirus/2019-ncov/guidance-home-care.html

Please let us know if you have any additional questions or concerns. For urgent inquiries, please contact the CDC Emergency Operations Center at 770-488-7100.

Thank you,

CDC IMS 2019 NCOV Response PUI Team

AMERICAN OVERSIGHT

Considerations for School Closure

Recommendations on school closure based on available science, reports from other countries and consultation with school health experts.

1. There is a role for school closure in response to school-based cases of COVID-19 for decontamination and contact tracing (few days of closure), in response to significant absenteeism of staff and students (short to medium length, i.e. 2-4 weeks of closure), or as part of a larger community mitigation strategy for jurisdictions with substantial community spread* (medium to long length, i.e. 4-8 weeks or more of closure).

2. Available modeling data indicate that early, short to medium closures do not impact the epi curve of COVID-19 or available health care measures (e.g., hospitalizations). There may be some impact of much longer closures (8 weeks, 20 weeks) further into community spread, but that modelling also shows that other mitigation efforts (e.g., handwashing, home isolation) have more impact on both spread of disease and health care measures. In other countries, those places who closed school (e.g., Hong Kong) have not had more success in reducing spread than those that did not (e.g., Singapore).

3. In places where school closures are necessary, the anticipated academic and economic impacts and unintended impacts on disease outcomes must be planned for and mitigated. Provision of academic support (e.g., tele-ed), alternatives for school-based meals as well as other services (e.g., behavioral and mental health services) for economically and physically vulnerable children, support for families for whom telework and paid sick leave is not available, ensuring that high risk individuals continue to be protected must all be addressed. Special consideration must be given for health care workers so that school closures do not impact their ability to work.

*Substantial community spread is defined as large scale community transmission, health care staffing significantly impacted, multiple cases within communal settings.

AMERICAN OVERSIGHT

School Decision Tree

All Schools Regardless of Community Spread

Confirmed person with COVID-19 in building? → Assess Risk → *Short (potential 2-5 Day) Building Dismissal to Clean/Disinfect/Contact Trace in consultation with local health officials*

No Community Spread

- Prepare
- Teach and reinforce healthy hygiene
- Develop information sharing systems
- Intensify cleaning and disinfection
- Monitor for absenteeism
- Assess group gatherings and events – consider postponing non-critical gatherings and events
- Require sick students and staff stay home
- Establish procedures for someone becoming sick at school

→ *Monitor changes in community spread*

Minimal to Moderate OR Substantial Community Spread

Is community spread Minimal to Moderate or Substantial?

M/M

- Coordinate with local health officials.
- Implement multiple social distancing strategies for gatherings, classrooms, and movement through the building.
- Consider ways to accommodate needs of children and families at high risk.

S

- Coordinate with local health officials.
- Implement multiple social distancing strategies for gatherings, classrooms, and movement through the building WITH EXTENDED SCHOOL DISMISSALS.
- Consider ways to accommodate needs of children and families at high risk.

AMERICAN OVERSIGHT

Factors for Consideration for School Closure

Closing schools early in the spread of disease for a short time (e.g., 2 weeks) will be unlikely to stem the spread of disease or prevent impact on the health care system, while causing significant disruption for families, schools, and those who may be responding to COVID-19 outbreaks in health care settings. It may also increase impact on older adults who care for grandchildren. Waiting to enact school closures until at the correct time in the epidemic (e.g., later in the spread of disease) combined with other social distancing interventions allows for optimal impact despite disruption.

	Factors in favor of school closure	Factors against school closure	Further considerations
In response to school-based case (Less than 1 week closure)	• **Impact on disease** ○ Allows for decontamination ○ Allows time for epidemical evaluation and conact tracing; further action can be scaled based on epi investigation.	• **Impact on disease** ○ Social mixing may still occur outside of school with less ability to monitor, especially among older students.	• May occur frequently during a wide-spread outbreak
Short-term (2 weeks closure)	• **Impact on disease** ○ Allows time for further understanding of the local COVID-19 situation (e.g., community spread) ○ Increases social distancing amongst immediate school community. ○ Gives time for potentially exposed individuals to develop symptoms while not in school • **Impact on families** ○ Children may be less impacted by social isolation from their peers for shorter time frames • **Impact on school** ○ Schools are better prepared for short-term closures because they've been more likely to have experienced those (e.g., for weather)	• **Impact on disease** ○ Modeling data for other respiratory infections where children have higher disease impacts, suggests that early short term closures are not impactful in terms of overall transmission. ○ Social mixing may still occur outside of school with less ability to monitor, especially among older students. ○ Will increase risk to older adults or those with co-morbidities, as almost 40% of US grandparents provide childcare for grandchildren. School closures will likely increase this percentage. • **Impact on families** ○ Key services are interrupted for students (e.g., meals, other social,	• Disproportionate impact of children being out of school whose parents/family members are hourly and low-wage workers • Research from school staff tells us that schools find closures more acceptable when other events, gatherings, and facilities in the community are also closed or cancelled. • Concerns about household mixing of sick and well family members needs to be addressed • Consider non-closure social distancing first (e.g., staggering recess, cancelling assemblies and inter-school events.) • Economic impact if school staff are not paid during school closure must be considered.

AMERICAN OVERSIGHT

	○ Given current timing, some schools may be able to take advantage of spring break closures ○ Provides protection for older staff and students and staff with underlying medical conditions	physical health, and mental health services, after school programs) ○ Economic impact for families because of the costs of childcare and lost wages. There may be a loss of productivity even for parents who are able to telework. ○ Some families may not have capacity for students to participate in distance learning (e.g., no computers, internet access issues) even if provided by school. • **Impact on schools** ○ Potential academic impact because of the disruption to the continuity of learning • **Impact on health care** ○ Available health care workforce is decreased as HCW stay home with children.	
Medium-term (4 weeks closure)	• **Impact on disease** ○ Provides more protection for older staff and students and staff with underlying medical conditions • **Impact on schools** ○ Planned closures of longer periods may be easier for families to plan for than rolling closures with unexpected timing and duration, including possibly last-minute notice	• **Impact on disease** ○ Longer closures may result in more students congregating outside of school (e.g., other students' homes, shopping malls) ○ Will increase risk to older adults or those with co-morbidities, as almost 40% of US grandparents provide childcare for grandchildren. School closures will likely increase this percentage. • **Impact on families** ○ Students who rely on key services (e.g., meals, other social, physical health, and mental health services,	• Disproportionate impact of children being out of school whose parents/family members are hourly and low-wage workers • If a school closes for this length of time, schools must consider ways to continue key services • Research from school staff tells us that schools find closures more acceptable when other events, gatherings, and facilities in the community are also closed or cancelled. • Consider coupling with other social actions to mitigate risk of increased social mixing in other community areas

AMERICAN OVERSIGHT

		after school programs) are put at greater risk ○ Economic impact grows with length of closure; furthermore, this may exacerbate disparities among families at different SES levels (e.g., parents with lower wage jobs may lose jobs) ○ High school seniors likely to lose ability to participate in their prom, graduation etc. ○ Some families may not have capacity for students to participate in distance learning (e.g., no computers, internet access issues) even if provided by school. • **Impact on schools** ○ Significant impact on academic outcomes may occur. Losing one month of learning may prevent students from meeting grade level knowledge and skill expectations and may jeopardize schools' ability to meet standardized testing requirements ○ School staff may be differentially impacted (e.g., hourly workers may be less able to sustain longer closures) • **Impact on health care** ○ Available health care workforce is decreased as HCW stay home with children.	• Because closures are likely to increase anxiety among students, families, and community members, excellent messaging is needed along with the school closure. • Economic impact if school staff are not paid during school closure must be considered.
Long-term (8 weeks, 20 weeks closure)	• **Impact on disease** ○ Modeling data for other respiratory infections where children have	• **Impact on disease** ○ Longer closures may result in more students congregating outside of	• Disproportionate impact of children being out of school for hourly and low-wage workers (compared to salaried

AMERICAN OVERSIGHT

	higher disease impacts, suggests that longer closures are may have greater impact in terms of overall transmission. Provides substantial protection for older staff and students and staff with underlying medical conditions
	• **Impact on schools**
	  ○ Schools without distance learning may see closures of this length as reason to implement distance learning approaches they may not have previously had or used
		school (e.g., other students' homes, shopping malls)
		  ○ Will increase risk to older adults or those with co-morbidities, as almost 40% of US grandparents provide childcare for grandchildren. School closures will likely increase this percentage.
		• **Impact on families**
		  ○ Students who rely on key services (e.g., meals, other social, physical health, and mental health services, after school programs) are put at substantial risk
		  ○ Economic impact grows with length of closure; furthermore, this may exacerbate disparities among families at different SES levels (e.g., parents with lower wage jobs may lose jobs)
		  ○ Student engagement with schools and peers diminishes, which could increase anxiety and other mental health and emotional problems.
		  ○ High school seniors likely to lose ability to participate in their prom, graduation etc.
		• **Impact on schools**
		  ○ Significant impact on academic outcomes will likely occur; losing 2 months of learning is likely to prevent many students from meeting grade level knowledge and skill expectations and will jeopardize schools' ability to meet standardized testing requirements
			workers who may have more flexible leave and telework opportunities)
			• If a school closes for this length of time, schools must consider ways to continue key services
			• Research from school staff tells us that schools find closures more acceptable when other events, gatherings, and facilities in the community are also closed or cancelled.
			• Because closures are likely to increase anxiety among students, families, and community members, excellent messaging is needed along with the school closure.
			• Given current timing, 20 week closures may not impact schools much more substantially than 8 week closures. Many schools end for the year in late May; some continue until mid June.
			• A 20 week scenario could still have substantial impact on parents who need to find summer care for students. If schools are dismissed, one would expect summer camps might be cancelled as well
			• Economic impact if school staff are not paid during school closure must be considered.

AMERICAN OVERSIGHT

		○ Loss of educational progress, even having to add an extra semester or year to graduate or move up a grade ○ Staff within the schools may be differentially impacted (e.g., hourly workers may be less able to sustain longer closures) ○ Maintaining communication with school staff, families, and students becomes substantially more difficult as the school closure lengthens. • **Impact on health care** ○ Available health care workforce is decreased as HCW stay home with children.	

Points for further consideration, regardless of degree of spread or length of potential closure

- Clear rationale, decision-making and communication with all stakeholders is extremely important. Families need to know who is making decisions, what those decisions are and when school-based mitigation efforts are planned to start and end.
- While we have data that can contribute to decisions about when to dismiss schools, there is almost no available data on the right time to re-start schools. We would advise to plan for a length of time and then evaluate based on continued community spread.
- The relationship between state and local education agencies and state and local public health must be strong and communication must be clear and thorough.
- Critical academic infrastructure and service provision must be considered during school closure.

Date:	Wednesday, March 18, 2020 8:59:14 AM

I am slimming the chain to take our overseas colleagues off for right now. Please add DHS and others in the US as needed. Adding the State Department COVID coordination unit and consular reps.

Eleni - we understand the charter from Chile is scheduled to land in MIA between 1200-1300 EDT, and that FL state authorities have said non FL residents will not be allowed to continue onward to home unless moved to another charter.

Can you give us the latest? We are concerned both about Amcits on this flight as well as future charters by RC or other charters seeking to land in FL.

Thanks - Doug

Subject: RE: [EXTERNAL] Re: Royal Caribbean Ships off Brazil/Chile

Dear Eleni,
Please clarify your request and the plan – which passengers are you referring to? The air ambulance passengers or the ones who are not ill and are coming in the larger charter?

As I wrote earlier, CDC will not be conducting any health screening. For the passengers who are not arriving by air ambulance, CBP/CWMD would screen the passengers based on their own protocol. CDC Quarantine Station staff will be available to respond to any illness events, as requested by CBP.

For the air ambulance, they need assessment – I understood that you have made arrangements with Dr. Barth Green/University of Miami, who is not affiliated with CDC. He/his team would make an assessment of those 6 individuals.

Michelle –

Slight change of plans. Upon arrival at MIA, Royal Caribbean will now be arranging individual charter flights for the passengers who are cleared by CDC to return to their home cities/states.

Our team has asked that CDC provide something in writing tomorrow that we can provide to the charter companies indicating that the passenger(s) boarding the charter flights have been cleared to fly commercially. We do not want the charters to deny boarding to these passengers simply because they have arrived in MIA from a cruise ship.

Thanks,

Eleni

Subject: Royal Caribbean Ships off Brazil/Chile

All -

Thank you for joining the call today. Leah - I don't believe I have everyone from CDC who was on the call, including Rachel - please add if that's the case.

I've listed the do-outs that I'm tracking below, and this chain can serve as the new, smaller group of folks working on the Brazil/Chile RC ships.

- State - send CDC global ship tracking list; create small-group email distro;
- CDC - send Royal Caribbean and Amy Dubois/HHS protocols for screening; Make determination on screening protocols for passengers from a "healthy" ship
- Royal Caribbean - send #s of Canadians to CDC; update on infection status; send manifests for four ships

Subject: Survey Extension until March 3rd: Help CDC Improve its Project Officer Support
Date: Monday, February 24, 2020 3:17:24 PM
Attachments: Survey Distribution Instructions.pdf

Dear Colleagues,

I wanted to personally thank you for your participation in this process.

I recognize that many of you are involved with the COVID-19 response and your time is very valuable. Please take this last opportunity to forward this survey on to the appropriate program contacts and encourage your colleagues to provide their honest feedback.

- The assessment should take no longer than 25 minutes to complete.
- Information collected will be kept on secure, password protected servers accessible only to ASTHO project team members. All information you provided will be analyzed and reported in the aggregate with no identifying information attached. So CDC will NOT know the individual State source.

With your programs' input we will better understand which project officer services are successful and those that need improvement. We will use the aggregate data to create best practices and provide training to support CDC efforts to provide outstanding technical assistance to our funding recipients in the future.

Assessment Link: Take the Assessment

I look forward to seeing you in Colorado in July!

Sincerely,

Steve

Subject: Survey Extension until March 3rd: Help CDC Improve its Project Officer Support

Dear Senior Deputies,

This email is another request for action and a follow-up to the CDC Project Officer survey launched in January (announcement email is attached). **Please note the survey has been extended until Tuesday, March 3rd.**

For those of you who have already distributed this evaluation to the appropriate points of contact within your agency, we appreciate your support. At this time we ask that you remind your staff about this survey by simply forwarding the survey invitation to the primary staff working on the select cooperative agreements or grants within your health department.

As a reminder, ASTHO is partnering with the Centers for Disease Control and Prevention (CDC) to evaluate satisfaction with the services and support provided by CDC project officers on select cooperative agreements and grants. CDC management will use the results to identify and implement strategies for improving CDC project officer support to state health departments.

This survey should be completed by health agency staff who work on and serve as the primary point of contact for the CDC project officer for select CDC-funded cooperative agreements or grants (full list of selected cooperative agreements/grants is attached).

Our ask of you: Please remind your staff about this survey by forwarding the survey invitation to the primary staff working on the select cooperative agreements or grants within your health department for their response. The invitation content to request participation is provided below the signature on this email. Feel free to directly forward this email to the intended recipients or create a new outreach message using the content below.

Thank you for your assistance.

EMAIL FOR SURVEY RESPONDENT:

Instructions for survey respondent: The Association of State and Territorial Health Officials

AMERICAN OVERSIGHT

(ASTHO), in partnership with the Centers for Disease Control and Prevention (CDC), Center for State, Tribal, Local, and Territorial Support is administering an assessment to health departments in all 50 states and the District of Columbia related to satisfaction with the services and support provided by CDC project officers.

Results from the assessment will be used by CDC to improve project officer support to state health agencies. Participation is voluntary, and your feedback will inform continued project officer development and training.

In order to participate in this voluntary assessment, please click the hyperlink provided in this email to be redirected to the web-based assessment. The assessment should take no longer than 25 minutes to complete. All responses are immediately saved and can be changed at any time. However, once the assessment is submitted, you will be unable to modify any responses. Also, you are not required to complete the assessment in one sitting. When finished responding to all relevant questions, click the **SUBMIT** button at the end of the assessment to submit your responses.

Information collected will be kept on secure, password protected servers accessible only to ASTHO project team members. All information you provided will be analyzed and reported in the aggregate with no identifying information attached.

Follow this link to the Assessment: Take the Assessment

Please submit responses to this assessment no later than March 3, 2020.

Note: The survey is designed for respondents to consider only one project officer within each selected cooperative agreement and grant. If your agency has more than one project officer for the Cancer Prevention and Control Programs for State, Territorial, and Tribal Organizations (DP17-1701), we invite your agency's appropriate point of contact to complete separate survey entries for each project officer.

Additionally, a few of the HIV, Viral Hepatitis, TB, and STD cooperative agreements have been updated with the current cooperative agreement numbers. The updated names and numbers are in the attached survey distribution instructions. If you already submitted responses under a prior cooperative agreement number you do not need to re-submit.

If you experience problems with the web-based assessment or have any questions, please contact Allen Rakotoniaina at researchandevaluation@astho.org for technical assistance.

Thank you in advance for your participation.

Survey announcement shared with ASTHO's Senior Deputy Peer Network on Thursday, January 19th

Dear Senior Deputies,

ASTHO is partnering with the Centers for Disease Control and Prevention (CDC) to evaluate satisfaction with the services and support provided by CDC project officers on select cooperative agreements. CDC management will use the results to identify and implement strategies for improving CDC project officer support to state health departments.

To capture this information, ASTHO will be fielding a survey on Tuesday, January 14 inviting the primary program staff who work on ***and*** *serve as the primary point of contact with the CDC project officer for the select CDC-funded cooperative agreements or grants listed below to share their feedback.*

As your agency's senior deputy, you will receive an invitation to complete the survey and we ask that you ***please forward the invitation to the primary staff working on the various cooperative agreements*** *for their response. The respondents to the survey should be the primary staff working on each of the listed cooperative agreements.*

Responses will remain confidential, and data will be analyzed and aggregated by ASTHO. Results will be used by CDC to inform future training and identification of best practices and opportunities for improvement in the support provided by CDC to state health departments.

Questions about the project?

For questions about the project or survey, contact Emily Peterman, Director of Research & Evaluation (epeterman@astho.org).

Thank you,

AMERICAN OVERSIGHT

From: Baker, Michael (OS/IEA)
To: Baker, Michael (OS/IEA)
Subject: TELE-TOWN HALL TONIGHT WITH SEC. AZAR
Date: Sunday, March 15, 2020 4:06:54 PM

The HHS Office of Intergovernmental and External Affairs would like to invite you to join a tele-town hall with Secretary Alex Azar **TODAY** at **7:00 PM ET** regarding the testing for COVID-19 in the United States. The call will provide information to state public health officials, clinical laboratories, and healthcare systems to best serve the public health interests of the American public during the COVID-19 emergency. The Secretary will be joined by additional officials who are leading the Administration's efforts to combat COVID-19's spread in the United States.

THIS INVITE SHOULD NOT BE FORWARDED OUTSIDE OF YOUR ORGANIZATION. But, to provide for a robust call, please ensure that the appropriate person from your organization is on the call. Ideally this person will have a grasp of the technical and operational issues of testing for the organization or jurisdiction. If there is an organization that you work with that you believe should receive this invite, please reply directly with that suggestion.

CLICK HERE to register for the call.

Sincerely,
Darcie

Date:	Tuesday, March 17, 2020 6:58:19 PM

Dear State Health Officials –

Thank you so much for listening to HHS on the ASTHO call earlier this evening. As we mentioned, our goal is to increase the synergy between the testing operations that have stood up and the rollout of the HHS testing sites across the country. We hope to highlight locations for testing for COVID-19 everywhere in the nation. If you are willing and able to share the information from testing sites in your states, we would greatly appreciate it. Please find below some of the key pieces of information that we are seeking.

- Facility Name
- Facility Address
    - Street Address
    - City
    - County
    - State
    - Zip code
- Phone Number (if applicable)
- Days/Hours of Operation
- Requirements for Testing, *if any* (i.e. note from physician, age, symptoms, travel)
- Drive-thru, walk-in, or other? (If other, please specify.)

We thank you for your continued partnership and support. ASTHO and its members have always been a key partner of HHS, and we appreciate everything that you do. Please don't hesitate to reach out to me if there are any questions. I can be reached via email or my phone number below.

Thank you!
Michael

AMERICAN OVERSIGHT

From:	Cantrell, Kimberly (CDC/DDPHSIS/CSTLTS/OD)
To:	CDC IMS State Coordination Task Force (SCTF) MCCM LNO
Cc:	CDC IMS State Coordination Task Force (SCTF) TF Coordinations TM
Subject:	Time Sensitive Request Due 3/3/2020: Request for Primary and Secondary Point of Contact for any Supply Chain Issues within your State.
Date:	Friday, February 28, 2020 1:30:41 PM

Greetings PHEP Directors & State Epidemiologists –

The outbreak of COVID-19 in China has led to a disruption in the global supply chain of personal protective equipment (PPE). CDC recognizes that healthcare facilities may experience temporary shortages even if they do not care for patients with COVID-19. CDC has released guidance for optimizing the use of N95 respirators, which includes some recommendations that may be applicable to other types of PPE, including surgical masks. CDC also has guidance regarding who needs and does not need PPE to help prevent excessive use of PPE.

As you are aware, this is a delicate system with many factors. When CDC receives notifications from healthcare systems about supply chain shortages, we encourage the Healthcare Coalition Partners to work together to problem solve within the coalition and/or wider state system. Further we encourage the healthcare systems to reach out to the state health department to collaborate and problem solve.

We have heard from the healthcare system partners that have contacted us that they are unsure whom to contact in the state health department about supply chain shortages in their facilities. As a way to help mitigate this, **we are asking you to reply to eocsctfmccmlno@cdc.gov no later than March 3, 2020, with an identified primary and secondary point of contact for any supply chain issues within your state.**

Please provide the following information:

- **Name/Agency**
- **Title**
- **Email Address**
- **24/7 phone number**

If you have any questions, you may contact Jaime Jones-Wormley, CDC State Coordination Task Force Liaison to the Medical Care and Countermeasures Task Force at eocsctfmccmlno@cdc.gov.

Thank you for your efforts to support the COVID-19 response.

Subject:	Time Sensitive Request: DCIPHER Rights for the two 2019-nCoV modules (Florida)
Date:	Wednesday, February 12, 2020 4:41:31 PM
Attachments:	Florida.xlsx

Greetings PHEP Directors and State Epidemiologists,

As we prepare to use DCIPHER for the 2019-nCoV response (e.g., data collection, transmission, and data sharing), we are seeking additional information about the type of access for the users you previously identified for the nCoV 2019 DCIPHER platform.

The "access group" options are described here:

1. **Access to DCIPHER to VIEW (only) data**. Role allows individual to see a view of different reports and analyses for their jurisdiction's information and any aggregate national report that may be created.
2. **Access to DCIPHER for DATA ENTRY and EDITING**. Role allows individual to directly enter information into DCIPHER, edit data, see all data associated with the jurisdiction, in addition to viewing/creating different reports and analyses.

In the attachment, please complete information in the last two columns (epi and monitoring), select either **view** or **data entry/editing** for each user.

Please return your response to eocsctftfcoord@cdc.gov as soon as possible so we can configure the platform to support your jurisdictions' access requests.

Warm Regards,

State Coordination Task Force (SCTF)

Subject:	Today at 2pm EST_All state call hosted by SCTF re: 2019-nCoV
Date:	Monday, February 3, 2020 11:41:53 AM
Importance:	High

Greetings,
We were just made aware of an all-state call that will be held today at 2pm EST and the topic is the Novel Coronavirus (2019-nCoV). The call is hosted by the CDC State Coordination Task Force (SCTF) and not the ELC; however, the content may be of interest.

The ELC role in our agency's response to this effort is still evolving but we will keep you posted with any information that is relevant to your program and ELC activities.

CDC's 2019 Novel Coronavirus (2019-nCoV) response team will continue a series of national calls from 2 p.m. to 3 p.m. EST on Monday, January 27, to provide state and local partners with the latest information on the novel coronavirus outbreak and U.S. preparedness efforts.

Invited participants include state, local, and territorial preparedness directors, state epidemiologists, state health officials, public health laboratory directors, and nongovernmental partners. Participant information can be found below.

Participant Information

Bridgeline: 1(800)-857-6697
Participant Passcode: 1324420

For your convenience, call series dates are provided below.

- Monday, February 3
- Monday, February 10
- Monday, February 24
- Monday, March 2

Subject: Tools to Support Medicaid and CHIP - COVID-19
Date: Monday, March 23, 2020 1:18:46 PM

Dear Governors and State Health Officials:

The Trump Administration has released new tools to strip away regulatory red tape and unleash new resources to support state Medicaid and Children's Health Insurance Programs (CHIP) during the 2019 Novel Coronavirus (COVID-19) outbreak. Because of the President's bold action in declaring COVID-19 a national emergency, CMS now has a full suite of tools available to maximize responsiveness to state needs. The agency has created four checklists that together will make up a comprehensive Medicaid COVID-19 federal authority checklist to make it easier for states to receive federal waivers and implement flexibilities in their program.

The tools include:

- **1115 Waiver Opportunity and Application Checklist**
- **1135 Waiver Opportunity and Application Checklist**
- **1915(c) Appendix K Template**
- **Medicaid Disaster State Plan Amendment Template**

You can find a copy of the press release here: **https://www.cms.gov/newsroom/press-releases/trump-administration-releases-covid-19-checklists-and-tools-accelerate-relief-state-medicaid-chip**

These tools, and earlier CMS actions in response to the COVID-19 emergency, are all part of ongoing White House Coronavirus Task Force efforts. To keep up with the important work the Task Force is doing in response to COVID-19, please visit **www.coronavirus.gov.** For a complete and updated list of CMS actions, guidance, and other information in response to COVID-19, please visit the, please visit the **Current Emergencies Website.**

Sincerely,

Darcie Johnston, Director
Office of Intergovernmental Affairs
U.S. Department of Health and Human Services

Subject:	TP18-1802 Crisis CoAg: Hurricane Recovery Update
Date:	Monday, March 23, 2020 4:31:52 PM

Dear Colleagues,

CDC is aware that the public health system response to COVID-19 has resulted in many changes that impact hurricane-related projects funded under the TP18-1802 Crisis Cooperative Agreement.

Provided below is additional guidance to ensure maximum flexibility as you navigate necessary modifications to project activities:

1. **Canceling Convenings:** CDC, in accordance with the President's Coronavirus Guidelines for America -- 15 Days to Slow the Spread of Coronavirus (COVID-19), recommends that individuals and organizations cancel or postpone in-person events that consist of 10 people or more throughout the United States for the next 15 days. When feasible, organizers may modify events to be virtual. Please note that this interim guidance is based on what is currently known about the Coronavirus Disease 2019 (COVID-19). CDC will update this interim guidance as needed and as additional information becomes available.
    a. **Costs Incurred for Canceled or Postponed Convenings:** Recipients will be permitted to drawdown funds to cover nonrefundable costs incurred for previously approved Hurricane recovery related activities now canceled or postponed due to COVID-19. Recipients should make every effort to minimize costs associated with activities (i.e., seek reimbursement for flights, negotiate postponing meetings vs canceling, etc.).
    b. **Redirection of Funds:** To accommodate alterations to project activities, recipients may submit a request to redirect funds as needed. Please follow the steps outlined in the attachment *"Redirection of Funds Guidance"* to submit your request and receive prior written approval from CDC. As a reminder:
        i. Redirections that *exceed* 25% or $250,000 (or whichever is less) of the total approved budget should be submitted through GrantSolutions as a ***Budget Redirection Amendment*** which is a formal prior approval action completed by the Grants Management Specialist (GMS).
        ii. Redirections that are *less than* 25% or $250,000 (or whichever is less) of the total approved budget should be submitted in GrantSolutions as

AMERICAN OVERSIGHT

a ***Grant Note*** which should include written prior approval received from relevant Technical Monitor(s).

It is important to note that you <u>may not</u> redirect 1802 Hurricane Crisis funds to COVID-19 response activities. Funds may only be redirected to support other Hurricane recovery related activities and projects that are within scope of the award.

2. **No Cost Extension (NCE) Requests:** Per OMB's memorandum *"Administrative Relief for Recipients and Applicants of Federal Financial Assistance Directly Impacted by the Novel Coronavirus (COVID-19) due to Loss of Operations"* released on March 19th**,** TP18-1802 Hurricane recipients are eligible for a 'No Cost Extension' *up to* twelve (12) months for activities scheduled to end by or before December 31, 2020. Financial and performance reports will be due 90 days following the *end date of the extension*. For guidance on how to submit your request through GrantSolutions, please refer to the attached job aid.

   Along with the required components of NCE request(s), we ask that you also include a statement of how COVID-19 response has impacted the Hurricane-related projects for which extension is being sought. This will serve as formal documentation of the need for an NCE.

Thank you for your continued partnership and all that your organization does to protect our nation's public health. We encourage you to monitor this dynamic situation by visiting www.cdc.gov/COVID19 for the latest information and guidance. Please do not hesitate to reach out to your respective Project Officers with any questions or concerns.

Kind Regards,
Hurricane Crisis Cooperative Agreement Team

Centers for Disease Control and Prevention (CDC)
1600 Clifton Road, Atlanta, GA 30329

Subject:	Tuesday, March 10 - CDC COVID-19 Key Points & Updated Interim Infection Prevention & Control Guidance
Date:	Wednesday, March 11, 2020 1:06:02 AM
Attachments:	CDC_COVID-19_Daily Key Points__3_10_2020 FINAL.pdf

Dear Colleagues,

Please see the attached CDC COVID-19 daily key points from Tuesday, March 10.

We would also like to draw your attention to the **"Interim Infection Prevention and Control Recommendations for Patients with Suspected or Confirmed Coronavirus Disease 2019 (COVID-19) in Healthcare Settings"**. You can reference the guidance here. For your convenience, a summary of the changes are provided below:

- Updated PPE recommendations for the care of patients with known or suspected COVID-19
- Considerations for designating entire units within the facility, with dedicated healthcare personnel (HCP), to care for known or suspected COVID-19 patients and options for extended use of respirators, facemasks, and eye protection on such units.
- Updated recommendations regarding need for an airborne infection isolation room (AIIR).

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Outbreak
March 10, 2020 as of 10:20pm

Updated text is shown in colored text.

SNAPSHOT

- CDC has reported:
  - 647 confirmed and presumptive positive cases of COVID-19
  - 25 COVID-19 related deaths
  - 36 jurisdictions reporting

MAIN KEY POINTS

- There is an expanding global outbreak of respiratory illness called COVID-19 caused by a novel (new) coronavirus.
- Community spread is being detected in a growing number of places, including in the states of California, Washington and New York in the United States.
- There are 647 reported U.S. cases of COVID-19 from 34 states, New York City and the District of Columbia. New states reporting cases since yesterday include Louisiana and Ohio.
- The potential public health threat posed by COVID-19 is high, both globally and to the United States.
- More cases of COVID-19 are expected in the United States in the coming days, including more instances of community spread.
- As the outbreak continues, at some point, widespread transmission of COVID-19 in the United States is expected occur.
- Many people will get sick, but based on what is known about this virus, most people will not develop serious illness.
- Based on data out of China, where this virus first emerged, older adults and persons of all ages who have serious long-term health problems seem to be at higher risk for more serious COVID-19 illness.
  - It's important that people who are at higher risk of serious COVID-19 illness take special precautions to reduce their risk of getting sick.
  - CDC has guidance for what people at higher risk should do at this time.
- Public health efforts at this time are focused concurrently on containing spread of this virus and mitigating the impact of this virus.
- There is no vaccine to protect against COVID-19 and no medications approved to treat it.
- Nonpharmaceutical interventions are actions, apart from getting vaccinated and taking medicine, that people and communities can take to help slow the spread of respiratory illnesses like COVID-19.
- Currently, nonpharmaceutical interventions are the most important response strategy against COVID-19.
- All communities can take measures to reduce the spread of COVID-19. Everyone has a role to play in getting ready and staying healthy.

AMERICAN OVERSIGHT

SITUATION UPDATE

- 647 reported cases of COVID-19 have been detected in Arizona, California, Colorado, Connecticut, Florida, Georgia, Hawaii, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maryland, Massachusetts, Minnesota, Missouri, Nebraska, Nevada, New Hampshire, New Jersey, New York (and New York City), North Carolina, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, Tennessee, Texas, Utah, Vermont, Virginia, Washington, and Wisconsin.
    - 83 of these cases occurred through person-to-person spread.
    - 36 cases occurred in persons who had traveled to international areas with sustained (ongoing) transmission.
    - 528 cases are still being investigated to determine the source of exposure.
- CDC has developed a map of the U.S. that shows affected states and how many COVID-19 cases they have reported.
- Because states are reporting their results directly and publicly, sometimes in near real-time, CDC case counts may be different from what states, local authorities, or media are reporting.
    - In the event of a discrepancy between case counts reported by state or local public health officials versus CDC-reported numbers, the numbers reported by states should be considered the most up to date.
- As of the evening of March 9, there are 79 state and local public health labs in 50 states and the District of Columbia that have successfully verified and are currently using COVID-19 diagnostic tests.
- CDC has developed a map showing which states and territories have one or more laboratories that have successfully verified and are currently using COVID-19 diagnostic tests.
    - This list is provided by the Association of Public Health Laboratories (APHL).
    - The same page includes information on the number of COVID-19 specimens tested.
- As of the evening of March 9, 2020, CDC and local and state public health laboratories had tested a total of 8,854 specimens.
- CDC is reviewing and updating travel notices almost on a daily basis.
- On March 8, CDC recommended travelers, particularly those with underlying health issues, defer all cruise ship travel worldwide.
- CDC also recommends that older adults and travelers with underlying health issues avoid situations that put them at increased risk for more severe disease, including avoiding non-essential travel on long plane trips.

NEW GUIDANCE

- On March 10, CDC published updated Interim Infection Prevention and Control Recommendations for Patients with Suspected or Confirmed COVID-19 in Healthcare Settings.
- Respiratory protection of healthcare workers is a priority and is especially important during aerosol-generating procedures for patients.
- Healthcare facilities are increasingly unable to procure reliable and sufficient infection control supplies, including N95 respirators.
- Because of supply demands associated with the COVID-19 response, CDC is updating its interim COVID-19 infection control guidance for the healthcare setting.
    - The aim of the revised interim guidance is to prioritize the use of N95 respirators and other respiratory protection devices during high-risk procedures, while still protecting

AMERICAN OVERSIGHT

healthcare personnel with facemasks and eye protection during other routine patient care activities in the setting of temporary respirator shortages.
    - This interim guidance aims to support healthcare facilities in practical decision-making at the local level.
    - This guidance also outlines multiple interventions that can be used to enhance protection of healthcare personnel.
- The spread of COVID-19 can be stopped in many ways, such as prompt screening and triage, limiting personnel in the room, hand hygiene, source control, and effective environmental cleaning.
- Employers and healthcare workers should remember the hierarchy of controls.
    - PPE is only one aspect of patient and worker safety and involves a high level of worker involvement and is highly dependent on proper fit and correct use.
    - All healthcare facilities should be reviewing their infection control supply inventories and taking steps to optimize supplies. This is particularly true for facilities that perform aerosol-generating procedures, so that appropriate PPE will be available for high-risk procedures now and as potential COVID-19 cases increase.
- Healthcare administrators should continue to do everything possible to acquire the needed supplies to protect their staff and patients.
    - When the supply chain is restored, facilities with a respiratory protection program should return to use of respirators for patients with known or suspected COVID-19.
    - The anticipated timeline for return to routine levels of PPE is not known.
- CDC has posted information about strategies to optimize the current supply of N95 respirators, including the use of devices that provide higher levels of respiratory protection (e.g., powered air purifying respirators [PAPRs]) when N95s are not available. CDC has also provided a companion checklist to help healthcare facilities prioritize the implementation of the strategies.
- The majority of nursing homes and outpatient clinics, including hemodialysis facilities, do not currently have respiratory protection programs or fit-tested HCP.
    - These facilities would not be able to implement all of the recommended infection control interventions in the previous version of this guidance.
    - Without respiratory protection programs and fit testing, unnecessary transfer of patients with known or suspected COVID-19 to another facility (e.g., acute care hospital) for evaluation and care may occur.
    - In areas with community transmission, acute-care facilities will be quickly overwhelmed by transfers of patients who have only mild illness and do not require hospitalization.

PEOPLE AT HIGHER RISK OF EXPOSURE/INFECTION

- Right now, some people are at higher risk of exposure/infection, including:
    - People in communities where ongoing community spread with the virus that causes COVID-19 has been reported are at elevated though still relatively low risk of exposure.
    - Healthcare workers caring for patients with COVID-19 are at elevated risk of exposure.
    - Close contacts of persons with COVID-19 also are at elevated risk of exposure.
    - Travelers returning from affected international locations where community spread is occurring also are at elevated risk of having been exposed.

AMERICAN OVERSIGHT

PEOPLE AT HIGHER RISK OF SERIOUS COVID-19 ILLNESS

- Early information out of China, where COVID-19 first started, shows that some people are at higher risk of getting very sick from this illness.
- The people who are at greatest risk are those who are older and those who have serious long-term health conditions like diabetes, heart disease, or lung disease.
- This seems to be a disease that affects adults, and older adults, most seriously.
    - Starting at age 60, there is an increasing risk of severe disease and the risk increases with age.
    - The highest risk of serious illness and death is in people older than 80 years.
- People with serious underlying health conditions also are more likely to develop serious outcomes including death.
- Reports out of China that looked at more than 70,000 COVID-19 patients found that about 80% of illness was mild and people recovered. 15% to 20% developed serious illness.
- Of the more than 70,000 cases, only about 2% were in people younger than 19.
- These are early data and more information from countries outside of China, including experience here in the United States, will inform the public health response as time goes on. For now, data suggest that measures should be taken to protect America's oldest population, who are most vulnerable to severe COVID-19 illness.

WHAT YOU CAN DO

- Everyone can do their part to help respond to this emerging public health threat:
    - Individuals and communities should familiarize themselves with recommendations to protect themselves and their community from getting and spreading respiratory illnesses like COVID-19.
    - Older people and people with severe chronic conditions should take special precautions because they are at higher risk of developing serious COVID-19 illness.
    - If you are a healthcare provider, be on the look-out for:
        - People who recently traveled from China or another affected area and who have symptoms associated with COVID-19, and
        - People who have been in close contact with someone with COVID-19 or patients with pneumonia of unknown cause. (Consult the most recent definition for patients under investigation [PUIs].)
    - If you are a healthcare provider or a public health responder caring for a COVID-19 patient, please take care of yourself and follow recommended infection control procedures.
    - If you are a close contact of someone with COVID-19 and develop symptoms of COVID-19, call your healthcare provider and tell them about your symptoms and your exposure. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.
    - If you are a resident in a community where there is ongoing spread of COVID-19 and you develop COVID-19 symptoms, call your healthcare provider and tell them about your symptoms. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.

AMERICAN OVERSIGHT

- For people who are ill with COVID-19, but are not sick enough to be hospitalized, please follow CDC guidance on how to reduce the risk of spreading your illness to others. People who are mildly ill with COVID-19 are able to isolate at home during their illness.
- If you have been in China or another affected area or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus.

CDC ACTIONS

- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States to reduce the spread and the impact of this virus.
- CDC is operationalizing all of its pandemic preparedness and response plans, working on multiple fronts to meet these goals, including specific measures to prepare communities to respond to local transmission of the virus that causes COVID-19.
- Pandemic guidance developed in anticipation of an influenza pandemic is being repurposed and adapted for a COVID-19 pandemic.
- Public health partners are encouraged to review their pandemic preparedness plans at this time.
- CDC is aggressively responding to the global outbreak of COVID-19 and preparing for the potential of community spread in more parts of the United States.
- CDC's Action for Preparing Communities for Potential Spread of COVID-19 include:
    - Preparing first responders, healthcare providers, and health systems
    - Reinforcing state, territorial, and local public health readiness
    - Supporting communities, businesses, and schools

COMMUNITY BASED INTERVENTIONS (AKA COMMUNITY MITIGATION)

- Americans should be prepared for the possibility of a COVID-19 outbreak in their community. Everyone has a role to play.
- Currently, a vaccine is not available for COVID-19. Until a vaccine is developed, community-based interventions, such as school dismissals, event cancellations, social distancing, and plans to work remotely, can help slow the spread of coronavirus.
- Your local public health department and community partners have been preparing for an event like COVID-19 and have plans in place. Now is a good time for businesses, community and faith-based organizations, schools, and health-care systems to reexamine their preparedness plans to make sure they are ready.
- Strong community partnerships between local health departments, the health care sector, faith-based organizations, and other community partners are vital for this response, and will be necessary to prepare for and coordinate if an outbreak occurs.
    - Community-based interventions can be grouped in three categories:
        - Personal protective measures (e.g., voluntary home isolation of ill persons, voluntary home quarantine of exposed household members, covering nose/mouth when coughing or sneezing, hand hygiene, using face masks in community settings when ill)

AMERICAN OVERSIGHT

        - Community measures aimed at increasing social distancing (e.g., school dismissals, social distancing in workplaces, postponing or cancelling mass gatherings)
        - Environmental measures (e.g., routine cleaning of frequently touched surfaces)
    - CDC has recommendations to protect yourself and your community from getting and spreading respiratory illnesses like COVID-19.

For more information please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

NEW GUIDANCE

- On March 10, CDC published updated Interim Infection Prevention and Control Recommendations for Patients with Suspected or Confirmed COVID-19 in Healthcare Settings.
- Respiratory protection of healthcare workers is a priority and is especially important during aerosol-generating procedures for patients.
- Healthcare facilities are increasingly unable to procure reliable and sufficient infection control supplies, including N95 respirators.
- Because of supply demands associated with the COVID-19 response, CDC is updating its interim COVID-19 infection control guidance for the healthcare setting.
    - The aim of the revised interim guidance is to prioritize the use of N95 respirators and other respiratory protection devices during high-risk procedures, while still protecting

AMERICAN OVERSIGHT

healthcare personnel with facemasks and eye protection during other routine patient care activities in the setting of temporary respirator shortages.
    - This interim guidance aims to support healthcare facilities in practical decision-making at the local level.
    - This guidance also outlines multiple interventions that can be used to enhance protection of healthcare personnel.
- The spread of COVID-19 can be stopped in many ways, such as prompt screening and triage, limiting personnel in the room, hand hygiene, source control, and effective environmental cleaning.
- Employers and healthcare workers should remember the hierarchy of controls.
    - PPE is only one aspect of patient and worker safety and involves a high level of worker involvement and is highly dependent on proper fit and correct use.
    - All healthcare facilities should be reviewing their infection control supply inventories and taking steps to optimize supplies. This is particularly true for facilities that perform aerosol-generating procedures, so that appropriate PPE will be available for high-risk procedures now and as potential COVID-19 cases increase.
- Healthcare administrators should continue to do everything possible to acquire the needed supplies to protect their staff and patients.
    - When the supply chain is restored, facilities with a respiratory protection program should return to use of respirators for patients with known or suspected COVID-19.
    - The anticipated timeline for return to routine levels of PPE is not known.
- CDC has posted information about strategies to optimize the current supply of N95 respirators, including the use of devices that provide higher levels of respiratory protection (e.g., powered air purifying respirators [PAPRs]) when N95s are not available. CDC has also provided a companion checklist to help healthcare facilities prioritize the implementation of the strategies.
- The majority of nursing homes and outpatient clinics, including hemodialysis facilities, do not currently have respiratory protection programs or fit-tested HCP.
    - These facilities would not be able to implement all of the recommended infection control interventions in the previous version of this guidance.
    - Without respiratory protection programs and fit testing, unnecessary transfer of patients with known or suspected COVID-19 to another facility (e.g., acute care hospital) for evaluation and care may occur.
    - In areas with community transmission, acute-care facilities will be quickly overwhelmed by transfers of patients who have only mild illness and do not require hospitalization.

PEOPLE AT HIGHER RISK OF EXPOSURE/INFECTION

- Right now, some people are at higher risk of exposure/infection, including:
    - People in communities where ongoing community spread with the virus that causes COVID-19 has been reported are at elevated though still relatively low risk of exposure.
    - Healthcare workers caring for patients with COVID-19 are at elevated risk of exposure.
    - Close contacts of persons with COVID-19 also are at elevated risk of exposure.
    - Travelers returning from affected international locations where community spread is occurring also are at elevated risk of having been exposed.

AMERICAN OVERSIGHT

PEOPLE AT HIGHER RISK OF SERIOUS COVID-19 ILLNESS

- Early information out of China, where COVID-19 first started, shows that some people are at higher risk of getting very sick from this illness.
- The people who are at greatest risk are those who are older and those who have serious long-term health conditions like diabetes, heart disease, or lung disease.
- This seems to be a disease that affects adults, and older adults, most seriously.
    - Starting at age 60, there is an increasing risk of severe disease and the risk increases with age.
    - The highest risk of serious illness and death is in people older than 80 years.
- People with serious underlying health conditions also are more likely to develop serious outcomes including death.
- Reports out of China that looked at more than 70,000 COVID-19 patients found that about 80% of illness was mild and people recovered. 15% to 20% developed serious illness.
- Of the more than 70,000 cases, only about 2% were in people younger than 19.
- These are early data and more information from countries outside of China, including experience here in the United States, will inform the public health response as time goes on. For now, data suggest that measures should be taken to protect America's oldest population, who are most vulnerable to severe COVID-19 illness.

WHAT YOU CAN DO

- Everyone can do their part to help respond to this emerging public health threat:
    - Individuals and communities should familiarize themselves with recommendations to protect themselves and their community from getting and spreading respiratory illnesses like COVID-19.
    - Older people and people with severe chronic conditions should take special precautions because they are at higher risk of developing serious COVID-19 illness.
    - If you are a healthcare provider, be on the look-out for:
        - People who recently traveled from China or another affected area and who have symptoms associated with COVID-19, and
        - People who have been in close contact with someone with COVID-19 or patients with pneumonia of unknown cause. (Consult the most recent definition for patients under investigation [PUIs].)
    - If you are a healthcare provider or a public health responder caring for a COVID-19 patient, please take care of yourself and follow recommended infection control procedures.
    - If you are a close contact of someone with COVID-19 and develop symptoms of COVID-19, call your healthcare provider and tell them about your symptoms and your exposure. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.
    - If you are a resident in a community where there is ongoing spread of COVID-19 and you develop COVID-19 symptoms, call your healthcare provider and tell them about your symptoms. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.

AMERICAN OVERSIGHT

- For people who are ill with COVID-19, but are not sick enough to be hospitalized, please follow CDC guidance on how to reduce the risk of spreading your illness to others. People who are mildly ill with COVID-19 are able to isolate at home during their illness.
- If you have been in China or another affected area or have been exposed to someone sick with COVID-19 in the last 14 days, you will face some limitations on your movement and activity. Please follow instructions during this time. Your cooperation is integral to the ongoing public health response to try to slow spread of this virus.

CDC ACTIONS

- The federal government is working closely with state, local, tribal, and territorial partners, as well as public health partners, to respond to this public health threat.
- The public health response is multi-layered, with the goal of detecting and minimizing introductions of this virus in the United States to reduce the spread and the impact of this virus.
- CDC is operationalizing all of its pandemic preparedness and response plans, working on multiple fronts to meet these goals, including specific measures to prepare communities to respond to local transmission of the virus that causes COVID-19.
- Pandemic guidance developed in anticipation of an influenza pandemic is being repurposed and adapted for a COVID-19 pandemic.
- Public health partners are encouraged to review their pandemic preparedness plans at this time.
- CDC is aggressively responding to the global outbreak of COVID-19 and preparing for the potential of community spread in more parts of the United States.
- CDC's Action for Preparing Communities for Potential Spread of COVID-19 include:
    - Preparing first responders, healthcare providers, and health systems
    - Reinforcing state, territorial, and local public health readiness
    - Supporting communities, businesses, and schools

COMMUNITY BASED INTERVENTIONS (AKA COMMUNITY MITIGATION)

- Americans should be prepared for the possibility of a COVID-19 outbreak in their community. Everyone has a role to play.
- Currently, a vaccine is not available for COVID-19. Until a vaccine is developed, community-based interventions, such as school dismissals, event cancellations, social distancing, and plans to work remotely, can help slow the spread of coronavirus.
- Your local public health department and community partners have been preparing for an event like COVID-19 and have plans in place. Now is a good time for businesses, community and faith-based organizations, schools, and health-care systems to reexamine their preparedness plans to make sure they are ready.
- Strong community partnerships between local health departments, the health care sector, faith-based organizations, and other community partners are vital for this response, and will be necessary to prepare for and coordinate if an outbreak occurs.
    - Community-based interventions can be grouped in three categories:
        - Personal protective measures (e.g., voluntary home isolation of ill persons, voluntary home quarantine of exposed household members, covering nose/mouth when coughing or sneezing, hand hygiene, using face masks in community settings when ill)

AMERICAN OVERSIGHT

        - Community measures aimed at increasing social distancing (e.g., school dismissals, social distancing in workplaces, postponing or cancelling mass gatherings)
        - Environmental measures (e.g., routine cleaning of frequently touched surfaces)
    - CDC has recommendations to protect yourself and your community from getting and spreading respiratory illnesses like COVID-19.

For more information please visit the Coronavirus Disease 2019 Outbreak Page at: www.cdc.gov/COVID19.

AMERICAN OVERSIGHT

From:	State and Local Readiness (CDC)
To:	CDC IMS State Coordination Task Force (SCTF) Lead
Subject:	Tuesday, March 10 - CDC COVID-19 Key Points & Updated Interim Infection Prevention & Control Guidance
Date:	Wednesday, March 11, 2020 1:03:13 AM
Attachments:	CDC_COVID-19_Daily Key Points__3_10_2020 FINAL.pdf

Dear Colleagues,

Please see the attached CDC COVID-19 daily key points from Tuesday, March 10.

We would also like to draw your attention to the **"Interim Infection Prevention and Control Recommendations for Patients with Suspected or Confirmed Coronavirus Disease 2019 (COVID-19) in Healthcare Settings"**. You can reference the guidance here. For your convenience, a summary of the changes are provided below:

- Updated PPE recommendations for the care of patients with known or suspected COVID-19
- Considerations for designating entire units within the facility, with dedicated healthcare personnel (HCP), to care for known or suspected COVID-19 patients and options for extended use of respirators, facemasks, and eye protection on such units.
- Updated recommendations regarding need for an airborne infection isolation room (AIIR).

AMERICAN OVERSIGHT

CDC Daily Key Points
Coronavirus Disease 2019 ("COVID-19") Outbreak
March 10, 2020 as of 10:20pm

Updated text is shown in colored text.

SNAPSHOT

- CDC has reported:
  - 647 confirmed and presumptive positive cases of COVID-19
  - 25 COVID-19 related deaths
  - 36 jurisdictions reporting

MAIN KEY POINTS

- There is an expanding global outbreak of respiratory illness called COVID-19 caused by a novel (new) coronavirus.
- Community spread is being detected in a growing number of places, including in the states of California, Washington and New York in the United States.
- There are 647 reported U.S. cases of COVID-19 from 34 states, New York City and the District of Columbia. New states reporting cases since yesterday include Louisiana and Ohio.
- The potential public health threat posed by COVID-19 is high, both globally and to the United States.
- More cases of COVID-19 are expected in the United States in the coming days, including more instances of community spread.
- As the outbreak continues, at some point, widespread transmission of COVID-19 in the United States is expected occur.
- Many people will get sick, but based on what is known about this virus, most people will not develop serious illness.
- Based on data out of China, where this virus first emerged, older adults and persons of all ages who have serious long-term health problems seem to be at higher risk for more serious COVID-19 illness.
  - It's important that people who are at higher risk of serious COVID-19 illness take special precautions to reduce their risk of getting sick.
  - CDC has guidance for what people at higher risk should do at this time.
- Public health efforts at this time are focused concurrently on containing spread of this virus and mitigating the impact of this virus.
- There is no vaccine to protect against COVID-19 and no medications approved to treat it.
- Nonpharmaceutical interventions are actions, apart from getting vaccinated and taking medicine, that people and communities can take to help slow the spread of respiratory illnesses like COVID-19.
- Currently, nonpharmaceutical interventions are the most important response strategy against COVID-19.
- All communities can take measures to reduce the spread of COVID-19. Everyone has a role to play in getting ready and staying healthy.

AMERICAN OVERSIGHT

SITUATION UPDATE

- 647 reported cases of COVID-19 have been detected in Arizona, California, Colorado, Connecticut, Florida, Georgia, Hawaii, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maryland, Massachusetts, Minnesota, Missouri, Nebraska, Nevada, New Hampshire, New Jersey, New York (and New York City), North Carolina, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, Tennessee, Texas, Utah, Vermont, Virginia, Washington, and Wisconsin.
    - 83 of these cases occurred through person-to-person spread.
    - 36 cases occurred in persons who had traveled to international areas with sustained (ongoing) transmission.
    - 528 cases are still being investigated to determine the source of exposure.
- CDC has developed a map of the U.S. that shows affected states and how many COVID-19 cases they have reported.
- Because states are reporting their results directly and publicly, sometimes in near real-time, CDC case counts may be different from what states, local authorities, or media are reporting.
    - In the event of a discrepancy between case counts reported by state or local public health officials versus CDC-reported numbers, the numbers reported by states should be considered the most up to date.
- As of the evening of March 9, there are 79 state and local public health labs in 50 states and the District of Columbia that have successfully verified and are currently using COVID-19 diagnostic tests.
- CDC has developed a map showing which states and territories have one or more laboratories that have successfully verified and are currently using COVID-19 diagnostic tests.
    - This list is provided by the Association of Public Health Laboratories (APHL).
    - The same page includes information on the number of COVID-19 specimens tested.
- As of the evening of March 9, 2020, CDC and local and state public health laboratories had tested a total of 8,854 specimens.
- CDC is reviewing and updating travel notices almost on a daily basis.
- On March 8, CDC recommended travelers, particularly those with underlying health issues, defer all cruise ship travel worldwide.
- CDC also recommends that older adults and travelers with underlying health issues avoid situations that put them at increased risk for more severe disease, including avoiding non-essential travel on long plane trips.

NEW GUIDANCE

- On March 10, CDC published updated Interim Infection Prevention and Control Recommendations for Patients with Suspected or Confirmed COVID-19 in Healthcare Settings.
- Respiratory protection of healthcare workers is a priority and is especially important during aerosol-generating procedures for patients.
- Healthcare facilities are increasingly unable to procure reliable and sufficient infection control supplies, including N95 respirators.
- Because of supply demands associated with the COVID-19 response, CDC is updating its interim COVID-19 infection control guidance for the healthcare setting.
    - The aim of the revised interim guidance is to prioritize the use of N95 respirators and other respiratory protection devices during high-risk procedures, while still protecting

AMERICAN OVERSIGHT

healthcare personnel with facemasks and eye protection during other routine patient care activities in the setting of temporary respirator shortages.
    - This interim guidance aims to support healthcare facilities in practical decision-making at the local level.
    - This guidance also outlines multiple interventions that can be used to enhance protection of healthcare personnel.
- The spread of COVID-19 can be stopped in many ways, such as prompt screening and triage, limiting personnel in the room, hand hygiene, source control, and effective environmental cleaning.
- Employers and healthcare workers should remember the hierarchy of controls.
    - PPE is only one aspect of patient and worker safety and involves a high level of worker involvement and is highly dependent on proper fit and correct use.
    - All healthcare facilities should be reviewing their infection control supply inventories and taking steps to optimize supplies. This is particularly true for facilities that perform aerosol-generating procedures, so that appropriate PPE will be available for high-risk procedures now and as potential COVID-19 cases increase.
- Healthcare administrators should continue to do everything possible to acquire the needed supplies to protect their staff and patients.
    - When the supply chain is restored, facilities with a respiratory protection program should return to use of respirators for patients with known or suspected COVID-19.
    - The anticipated timeline for return to routine levels of PPE is not known.
- CDC has posted information about strategies to optimize the current supply of N95 respirators, including the use of devices that provide higher levels of respiratory protection (e.g., powered air purifying respirators [PAPRs]) when N95s are not available. CDC has also provided a companion checklist to help healthcare facilities prioritize the implementation of the strategies.
- The majority of nursing homes and outpatient clinics, including hemodialysis facilities, do not currently have respiratory protection programs or fit-tested HCP.
    - These facilities would not be able to implement all of the recommended infection control interventions in the previous version of this guidance.
    - Without respiratory protection programs and fit testing, unnecessary transfer of patients with known or suspected COVID-19 to another facility (e.g., acute care hospital) for evaluation and care may occur.
    - In areas with community transmission, acute-care facilities will be quickly overwhelmed by transfers of patients who have only mild illness and do not require hospitalization.

PEOPLE AT HIGHER RISK OF EXPOSURE/INFECTION

- Right now, some people are at higher risk of exposure/infection, including:
    - People in communities where ongoing community spread with the virus that causes COVID-19 has been reported are at elevated though still relatively low risk of exposure.
    - Healthcare workers caring for patients with COVID-19 are at elevated risk of exposure.
    - Close contacts of persons with COVID-19 also are at elevated risk of exposure.
    - Travelers returning from affected international locations where community spread is occurring also are at elevated risk of having been exposed.

AMERICAN OVERSIGHT

PEOPLE AT HIGHER RISK OF SERIOUS COVID-19 ILLNESS

- Early information out of China, where COVID-19 first started, shows that some people are at higher risk of getting very sick from this illness.
- The people who are at greatest risk are those who are older and those who have serious long-term health conditions like diabetes, heart disease, or lung disease.
- This seems to be a disease that affects adults, and older adults, most seriously.
    - Starting at age 60, there is an increasing risk of severe disease and the risk increases with age.
    - The highest risk of serious illness and death is in people older than 80 years.
- People with serious underlying health conditions also are more likely to develop serious outcomes including death.
- Reports out of China that looked at more than 70,000 COVID-19 patients found that about 80% of illness was mild and people recovered. 15% to 20% developed serious illness.
- Of the more than 70,000 cases, only about 2% were in people younger than 19.
- These are early data and more information from countries outside of China, including experience here in the United States, will inform the public health response as time goes on. For now, data suggest that measures should be taken to protect America's oldest population, who are most vulnerable to severe COVID-19 illness.

WHAT YOU CAN DO

- Everyone can do their part to help respond to this emerging public health threat:
    - Individuals and communities should familiarize themselves with recommendations to protect themselves and their community from getting and spreading respiratory illnesses like COVID-19.
    - Older people and people with severe chronic conditions should take special precautions because they are at higher risk of developing serious COVID-19 illness.
    - If you are a healthcare provider, be on the look-out for:
        - People who recently traveled from China or another affected area and who have symptoms associated with COVID-19, and
        - People who have been in close contact with someone with COVID-19 or patients with pneumonia of unknown cause. (Consult the most recent definition for patients under investigation [PUIs].)
    - If you are a healthcare provider or a public health responder caring for a COVID-19 patient, please take care of yourself and follow recommended infection control procedures.
    - If you are a close contact of someone with COVID-19 and develop symptoms of COVID-19, call your healthcare provider and tell them about your symptoms and your exposure. They will decide whether you need to be tested. Keep in mind that there is no treatment for COVID-19 and people who are mildly ill are able to isolate at home.
    - If you are a resident in a community where there is ongoing spread of COVID-19 and you develop COVID-19 symptoms, call your healthcare provider and tell them about your symptoms. Subject:	Upcoming COCA Call
Date:	Monday, March 23, 2020 10:30:35 AM

Good morning, all:

I hope this message finds each of you doing well.

Please see the below message:

Information for partners

Updated website content now available:

- Are you at higher risk for severe illness: This is an updated landing page.
- People who are at higher risk for severe illness. Based on the data we are seeing, this is the updated list of risk factors for severe illness.

COCA call tomorrow:

COCA Call - CDC Clinician Outreach and Communication Activity

Underlying Medical Conditions and People at Higher Risk for Coronavirus Disease 2019 (COVID-19)

AMERICAN OVERSIGHT

Overview

During this COCA call, presenters will focus on current information about people who are higher risk for COVID-19 complications because of their age or underlying medical conditions, particularly those that are not well-controlled.

Due to the high demand we anticipate for this COCA Call, we encourage participants to consider viewing on Facebook. To see the call live, please click on COCA's Facebook Page.

There will only be a few slides for this COCA Call. Slides will not advance during the presentation portion of this webinar. You can find the slides under the "Call Materials" tab here.

Advanced registration is not required.

If you are unable to attend the live COCA Call, it will be available for viewing on the COCA website a few hours after the live event ends. It will be available for viewing **immediately after** the live event ends at 3:00 P.M. ET on COCA's Facebook page.

Continuing Education will not be offered for this COCA Call.

Date: Tuesday, March 24, 2020
Time: 2:00pm–3:00pm (ET)

You may participate in this COCA Call via the Zoom platform or via Facebook Live.

Please note, the Zoom access links and dial-in information for this COCA Call have been changed. The corrected information is below:

To: CDC IMS State Coordination Task Force (SCTF) Lead
Subject: UPDATE: Grand Princess Quarantine Orders Lifted
Date: Wednesday, March 25, 2020 9:09:43 PM

Dear Colleagues:

This week, CDC will lift quarantine orders for more than 1,300 people who have been quarantined from the Grand Princess cruise ship. As a top priority, CDC's COVID-19 response team will begin transmitting data to states of individuals who tested positive, including the following: contact information, date of test, date of result, and date of release. Many were asymptomatic and chose to be tested voluntarily. In addition, most were released from isolation based on the release of new clinical criteria. However, due to delayed test results from various laboratories processing the samples, some individuals had test results returned after they were released from quarantine. Lastly, following this notification you will begin to receive data on individuals with pending tests or extended quarantine periods. We are working with HHS/ASPR to transmit the results of pending tests to all departed passengers and any additional positive tests to the states.

Feel free to send any questions to preparedness@cdc.gov. Thank you!

Subject:	Updated Guidance for Returning CDC Staff from 2019-nCoV Domestic Field Deployments
Date:	Friday, February 7, 2020 2:44:49 PM

Hello EIS/LLS,

OSSAM, after consulting with infection prevention and control subject matter experts, has updated the February 1, 2020, Guidance for Returning CDC Staff from 2019-nCoV Domestic Field Deployments with more detailed instructions based on new public guidance released by CDC this week.

Please use the new Guidance for Returning CDC Staff from 2019-nCoV Domestic Field Deployments to better understand requirements of CDC staff returning from 2019-nCoV domestic deployments. CDC is currently developing guidance for those returning from overseas deployments.

For all employees returning from China (e.g., on leave), supervisors should follow published CDC guidance found in the new public guidance. This provides important information regarding returning to work for employees who recently arrived in the U.S. from China (e.g., employees categorized as Medium or High risk).

Please contact your Management Officer if you have questions regarding telework or other workplace flexibilities.

Please direct health and safety questions to OSSAM at EOCevent300@cdc.gov.

CDC Daily Key Points — CORRECTED
2019 Novel Coronavirus (2019-nCoV)

January 31, 2020

MAIN KEY POINTS

- There is an expanding outbreak centered in China of respiratory illness caused by a novel (new) coronavirus abbreviated "2019-nCoV."
- This virus is spreading from person-to-person in China. A growing number of counties are reporting cases in travelers from China.
- Some limited person-to-person spread has been reported in countries outside of China. Spread from an infected person who did not have symptoms to another person has been reported as well (i.e., asymptomatic spread).
- On January 31, Health and Human Services Secretary Alex M. Azar II declared a public health emergency for the United States to aid the nation's healthcare community in responding to 2019 novel coronavirus.
- Also on January 31, the President of the United States signed a presidential "Proclamation on Suspension of Entry as Immigrants and Nonimmigrants of Persons who Pose a Risk of Transmitting 2019 Novel Coronavirus."
- Measures were announced at a press briefing by members of the President's Coronavirus Task Force.
- This announcement follows the decision by the International Health Regulations Emergency Committee of the World Health Organization (WHO) to declare the outbreak a "public health emergency of international concern" (PHEIC).
- The situation is rapidly changing and we are monitoring it closely. Guidance will be updated as needed.
- Outbreaks like this – when a new virus is emerging to infect people – are always concerning. Some people might be worried about this virus and how it may impact Americans.
    - While this situation poses a very serious public health threat, CDC believes the immediate risk to the U.S. public continues to be low at this time.
    - Risk also depends on exposure. People exposed to ill persons are at greater risk of infection. (For example, healthcare workers and family members caring for people with 2019-CoV.)
    - However, the situation is evolving, and risk will depend on how well the virus spreads, how widely it spreads, and how sick it makes people.
- CDC has activated its Emergency Operations Center and is implementing an aggressive public health response in collaboration with federal, state and local partners.
- The goal of the ongoing U.S. public health response is to prevent sustained spread of 2019-nCov in this country. Strong measures now may blunt the impact of the virus on the United States.
- The coming days and weeks are likely to bring more confirmed cases of 2019-nCoV in the United States and globally.

SITUATION UPDATE

- On January31, 2020, CDC issued federal quarantine orders to all 195 persons repatriated to the U.S. from Wuhan, China this week under statutory authority of the Health and Human Services Secretary. The quarantine will

AMERICAN OVERSIGHT

last 14 days from when the plane left Wuhan, China. This action is a precautionary and preventive step to maximize the containment of the virus in the interest of the health of the American public.
- A New England Journal of Medicine letter to the Editor on January 30, 2020 reported on a case of 2019-nCoV infection acquired outside of Asia in which transmission appears to have occurred during the incubation period in the index patient.
- To date, 25 international locations (in addition to the U.S.) have reported confirmed cases of 2019-nCoV infection, including most recently Italy, Russia, Sweden and the United Kingdom.
- As of January 31, 2020, 7 infections with 2019-nCoV have been reported in the U.S. in four states – Arizona, California, Illinois, and Washington.
- The 6th infection with nCoV was detected in IL in a contact of the first 2019-nCoV patient and represents the first instance of person-to-person spread in the United States with this virus. The second IL patient reportedly had prolonged and close contact with the first patient.
- CDC is uploading the full genetic sequence of viruses from all U.S. patients into GenBank as they become available.
- CDC is working with state and local health departments on investigations to trace contacts of the U.S. 2019-nCoV patients to detect person-to-person spread.
- CDC will continue to lean forward on public health response efforts to protect Americans. We are working closely with state and local health departments and have teams on standby to deploy if needed. Our public health goal continues to be to protect the health of Americans by preventing community spread with this virus.
- CDC will work through WHO China country office to support Chinese public health counterparts and help improve understanding of this new disease, including learning more about transmissibility and severity. One Beijing-based CDC expert is currently working with WHO in China and additional CDC headquarters experts are being identified and prepared for deployment.

WHAT YOU CAN DO

- While the immediate risk of this new virus to the American public is believed to be low at this time, everyone can do their part to help us respond to this emerging public health threat:
    - It's currently flu and respiratory disease season and CDC recommends getting a flu vaccine, taking everyday preventive actions to help stop the spread of germs, and taking flu antivirals if prescribed.
    - If you are a healthcare provider, be on the look-out for people with who recently traveled from China and fever and respiratory symptoms.
    - If you are a healthcare provider caring for a 2019-nCoV patient, please take care of yourself and follow recommended infection control procedures.
    - For people who may have 2019-nCoV infection, please follow CDC guidance on how to reduce the risk of spreading your illness to others. This guidance in on the CDC website.

AMERICAN OVERSIGHT

- For people who have had close contact with someone infected with 2019-nCoV who develop symptoms, contact your healthcare provider, and tell them about your symptoms and your exposure to a 2019-nCoV patient.

TRAVEL

- On January 31, 2020, the White House 2019 Novel Coronavirus Task Force held a press conference to announce the implementation of new travel policies.

For more information please visit the 2019 Novel Coronavirus Outbreak Page at: https://www.cdc.gov/coronavirus/2019-ncov/index.html

---

May be dupe to some…..apologies

*****The CBTS Task Force updated its guidance for community-based testing sites. Please review and disseminate the attached guidance and fact sheet to help support questions from your state/local health partners.*****

Please see included the criteria and ConOps for operating a Community Based Testing Site. The Criteria outlines simple requirements for remaining in compliance with the program. This step was necessary due to a number of State modifications to the program that introduced compliances issues causing sites to be put on pause or taking off line. The updated ConOp streamlines the CBTS process and reduces potential exposure to the operators.

Regards,
Jeanne

COVID-19 COMMUNITY-BASED TESTING SITES

Concept of Operations Version 2

24MAR20

1

AMERICAN OVERSIGHT

COVID-19 CONTENTS

- Site Establishment and Logistical Support
- Pre-Screening Criteria
- Operations
- Data Requisition Forms
- Laboratory and Shipment Processes
- Resupply Process
- Reporting

AMERICAN OVERSIGHT

COVID-19 PURPOSE, SCOPE AND CRITERIA

Purpose

The purpose of the Concept of Operations is to provide specific operating guidance in the Whole Community approach to planning, establishing, supporting and operating Community-Based Testing Sites (CBTS) in response to COVID-19.

Scope

The CBTS concept provides communities the ability to establish stand alone and mobile test sites in order to service populations and individuals of immediate needs which includes: symptomatic populations consisting healthcare workers and first responders or who within 14 days of symptom onset had close contact with a suspect or laboratory-confirmed COVID-19 patient, and symptomatic individuals from high risk populations.

Criteria

1. Receive supplies from the federal government.
2. Ensure there is at least one United States Public Health Service (USPHS) officer at each site.
3. Use the lab ordering, sampling and packaging process established by the federal government.
4. Use the shipping company chosen by the federal government to pick up and deliver labs to the lab company selected by the federal government.
5. Use the federally contracted Call Center that will contact individuals with their results.

AMERICAN OVERSIGHT

COVID-19

COMMUNITY SITE AND PATIENT TESTING GUIDELINES

Site Location

In order to maximize resources and develop a holistic understanding of positive cases, State, Local, Tribal, and Territory partners, in coordination with Department of Health and Human Services and FEMA established CBTS based on a combination of high risk or affected areas and areas with higher vulnerable populations (I.e. 65+ yo) areas. It is important that sites support a whole community assessment of potentially affected areas. This provides an understanding of the magnitude of the impact within the area. Sites should take into consideration other planning factors such as, vulnerable populations, accessibility, traffic control and other measures that may impact throughput. In addition, sites must be accessible to all potential patients.

Screening Criteria

Priority 1	Priority 2	Priority 3
Hospitalized patients	Patients in long-term care facilities with symptoms	**Critical infrastructure workers with symptoms**
Healthcare facility workers with symptoms	**Patients over age 65 years with symptoms**	**Individuals who do not meet any of the above categories with symptoms**
	Patients with underlying conditions with symptoms	**Healthcare facility workers and first responders**
	First responders with symptoms	**Individuals with mild symptoms in communities experiencing high numbers of COVID-19 hospitalizations**

AMERICAN OVERSIGHT

COVID-19

SITE LOGISTICAL SUPPORT CONSIDERATIONS

The federal government has identified the commitment to support over 40 sites across the United States. States begin testing select healthcare workers involved in direct patient care (hospital staff, clinicians, and long-term care facilities) and first responders and then immediately transition to testing individuals who are at high risk for serious complications [subject to change based on DHHS and CDC guidance].

Logistical Requirements and Support

The federal government has procured a defined list of items required for initial CBTS through the Strategic National Stockpile as well as the private market. Continued logistical site support requirements need to follow the logistical support process flow.

AMERICAN OVERSIGHT

COVID-19

INITIAL FEDERALLY SUPPLIED SUPPLIES
(FOR 1 SITE FOR 1 WEEK)

- Unit = the entire list on the right, which is enough to run 1 testing site for a week of 2,500 tests
- Each Unit will be delivered in 6 different shipments
- If a state is getting 2 units, it will receive 12 shipments, etc.
- States, such as TX, will receive bulk shipment and are required to breakdown shipment to support each location with 1 unit

Initial Shipment: Essential Medical Supplies

Item	Target Quantity	Unit of Measure	Frequency	Supplier
Test Kits (e-swab or UVT)	2,500	Each	Weekly	Federal
Matched standard code-128 barcodes with unique numbers and 10-16 characters (Manreadable)	2,500	Pairs	Weekly	Federal
Non-contact infrared thermometer	4	Each	One-time	Federal
Gloves (Nitrile) *for those with allergies	10,000	Each	Weekly	Federal
Gloves (Latex) 6,700 per size	20,100	Each	Weekly	Federal
Scrub top (all sizes) 100-Medium, 100-Large, 100-2XL	300	Each	Launder	Federal
Scrub pants (all sizes) 100-Medium, 100-Large, 100-2XL	300	Each	Launder	Federal
PAPRs	5	Each	Weekly	Federal
Faceshields	500	Each	Weekly	Federal
N-95 Respirators (S, M, L)	4,480	Each	Weekly	Federal
Surgical Gowns	500	Each	Weekly	Federal
Tyvek Suits - Size L	250	Each	Weekly	Federal
Tyvek Suits - Size XXL	250	Each	Weekly	Federal
Tyvek Pullover Hoods/Shrouds/Headcovers (contingent upon type of PAPRs received/available)	1,000	Each	Weekly	Federal
Goggles (Anti-fog)	300	Each	Weekly	Federal
Tyvek Sleeves	20,000	Each	Weekly	Federal
Red Uline Garbage Cans	10	Each	Weekly	Federal
Biohazard Bags (25/wk x2 = 50 boxes)	50	Boxes	Weekly	Federal
Earloops Surgical Masks	1,000	Each	Weekly	Federal
Plastic Aprons (Not Surgical Aprons)	10,000	Each	Weekly	Federal
Specimen Transport Bag with requisition pouch. 6 x 9" polyethylene specimen bags	2,500	Each	Weekly	Federal
Insulated Foam Shipping Kit - 30 1/4 x 14 1/2 x 16"	1,575	Each	Weekly	Federal
Single-Use Cold Packs - 12 oz	9,450	Each	Weekly	Federal
UN3373 Biological Substance, Category B Air labels	1575	Each	Weekly	Federal
Tamper-Evident Tape, 3" x 110 yds	225	Each	Weekly	Federal
Telatemp Heat Indicator	1,575	Each	Weekly	Federal
Sharps containers	25	Each	Weekly	Federal
Whirl Pak Bags	2,500	Each	Weekly	Federal

Based on PPE reductions, resupply of N-95 masks will be 70 per week, per unit.

Available from National Stockpile

*Potential Shredder Bins **	2	Each	Ongoing	

AMERICAN OVERSIGHT

COVID-19 OPERATIONAL CONSIDERATIONS

States identify specific community needs based on several factors and there are specific operational processes the need to be followed in order to meet our desired end state. These include, but are not limited to, equipment conservation, testing documentation and reporting , laboratory chain of custody and testing protocols.

Specific Site Operational Considerations:

- Accessibility and Functional Capability Requirements to include emotional support animals
- Private and Public Transportation Needs and Throughput
- Adhere to State Regulated Medical Waste Procedures
- Translation services and hearing impaired
- Site Security and Local Emergency Services
- Traffic Control
- Basic Needs for Site Support Personnel (Feeding and Sanitation)
- Operations Communication Capabilities Public Communication
- Water / Feeding for Operators
- Site Support Training Requirements
- Site Sanitation and Safety Considerations
- Patient information daily tracking and reporting mechanism for results
- Training – Safety Officer
- Training – Quality Control Officer
- Recommendations for change of clothes/laundering of clothes worn during operation
- Daily tracking and reporting mechanism for results

AMERICAN OVERSIGHT

logging temp and registration information remains offset

AMERICAN OVERSIGHT

COVID-19

SITE OPERATIONS

Site Operation Process Categories

1. **Site Staff Guidelines:** Provides specific guidance on essential staffing requirements for each site.
2. **Patient Pre-Screening:** Provides guidance on initial patient screening in order to determine if follow-on testing is necessary.
3. **Site Patient Throughput and Support Personnel Responsibility Process:** Describes the recommended process to include specific roles and responsibilities of support personnel and required levels of protection.
4. **Packaging and Lab Processing:** Defines the specific packaging and lab processing requirements that must be followed, these cannot be deviated from due to contractual requirements.

AMERICAN OVERSIGHT

COVID-19 MINIMUM STAFFING RECOMMENDATIONS

USPHS Officers are prepared to be:

- **Site Team Lead:** Responsible for overall coordination of site and process standardization, execution of federal guidelines, and information and data management
- **Site Safety Officer:** Oversees all safety considerations for site operations.
- **Site Quality Control Officer:** Responsible for overseeing Quality Assurance through all test processes - IAW established standards.

Estimated capability (1-lane operation): 12-24 individ
Estimated ~12 vehicles/hr at each station

2-lane operation for vehicles with driver and 1+ passenger(s): 12 (min) – **48** (max) individuals/hour

AMERICAN OVERSIGHT

COVID-19

COMMUNITY-BASED TESTING SITES (CBTS): MODIFIED CONOPS TO INCREASE PAPR USE

ESTIMATED TESTING SITE CAPACITY:

MAXIMUM 250 TESTS PER SITE, PER DAY DUE TO LAB THROUGHPUT

CDC Recommended Pre-Screening Criteria

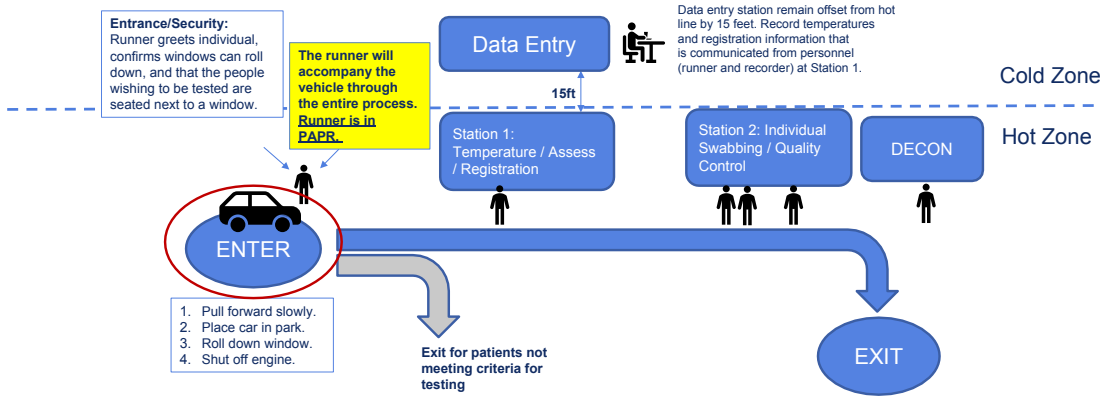
1. **Criteria 1**: Anyone ≥65 years of age with on-site confirmed temperature of 99.6°F or greater **and** presents with respiratory symptoms.
2. **Criteria 2:** First responders, healthcare workers* (regardless of presence of symptoms). *This is only applicable to staff with direct patient contact (not those in administrative roles) or as determined at the state level.

Pre-Screening Process and Instructions

- Patients must bring:
  - Photo ID for all adults needing testing
  - Health insurance card (everyone will be tested regardless if they have insurance)
  - Healthcare or first responder ID
- Instructed not to take fever-reducing medicine within 6-8 hours prior to testing [such as Tylenol (acetaminophen) or Advil (ibuprofen)]
- If the CBTS personnel determine an individual meets the testing criteria, they will be tested. If the person does **NOT** meet the criteria, they will **NOT** be tested and be provided take-home educational material.

Definition of First Responder: Any individual responding to the public health task or mission, as determined by the jurisdiction.

Definition of Healthcare Worker: Any individual working or providing direct patient care in acute or critical settings (hospitals, clinics, long-term care facilities, emergency medicine).



**Regional/State sites can clarify or expand this classification based on needs/demand and adjust accordingly.

Minimum Personnel for 1 Lane Operations	
Entry	Runner: 1 in PAPR
Station 1	Registration: 1 Recorder in N95 respirator , coveralls, gloves. Note: Runner in PAPR takes temperature and passes documentation to patients. Recorder remains offset and records/relays registration information to Data Entry which is 15-ft offset from the vehicle lane.
Data Entry (Offset)	Registration: 2 Recorders. No PPE required.
Station 2	Swabbing: 2 PAX in PAPR QC (Labeling/Packaging): 1 PAX in PAPR
Decontamination	Decontamination Sprayer: 1 PAX in PAPR

AMERICAN OVERSIGHT

COVID-19 SITE LAYOUT

Stations for 1 Lane Process

Modifying the CBTS CONOP to only have two stations exposed to the vehicle/patients and moving those individuals to PAPRs will reduce mask requirements by 61%-98.5%. 61% assumes human error for every test requiring a change of mask every time for the individual wearing the mask. 98.5% assumes 10 errors per individual donning a mask, per day.

- Runner is in PAPR and takes temperature. (Runner stays with vehicle the entire time; guides through process. Goes through decon after vehicle departs and moves back to front.)
- Station 1 personnel includes 1 PAX in N95 mask and goggles to check identification, document/register, and relay registration details to data entry station. (Data Entry personnel (1-2PAX) are not in PPE. Their station is ~15ft offset and remains behind cold line.)
- Station 2 personnel includes 3 PAX in PAPR, i.e. 2 PAX to swab and 1 PAX to QC the sample and package.
- Decon includes 1 PAX in PAPR. Remains there to decon Station 2 personnel and runner with 10% chlorine spray after every interaction.

Total = 5 PAPRs

AMERICAN OVERSIGHT

COVID-19 STATION 1: TEMPERATURE VERIFICATION

Personnel Roles:

1. **Runner(s):** Take and document temperature on collection form (form holds patient ID number)

2. **Runner(s):** Provide document to vehicle providing public health information to include:
   - What should you do while you wait for test results?
   - Monitoring symptoms
   - If you test positive for COVID-19, continue to monitor your symptoms and manage appropriately
   - When can you stop isolating at home?

**Healthcare workers = personnel who are currently working in a healthcare facility, including long-term care facilities.*

Individuals Must Meet one of these Criteria:

Criteria 1:	65 years of age and older with temperature of 99.6F or greater and respiratory symptoms
Criteria 2:	First responders, Healthcare workers* (regardless of symptoms)

Individuals not meeting criteria are asked to leave the line

If you develop symptoms after leaving the site, visit **[URL TBD]** to check if you qualify for testing

AMERICAN OVERSIGHT

COVID-19

STATION 1: INDIVIDUAL REGISTRATION

Personnel Roles:

- **Recorder (1):** Document on written form demographic information for patient(s). Record unique identifier (barcode), site, date and lane number.

First	**Email**	**Form of Identification**
Last	**Address**	**Healthcare or First Responder ID**
Phone	**License Plate**	**Insurance Information**

Note: Information collected may change based on testing company requirements

- **Recorder (2) at Data Entry:** Registers document in electronic data collection tool capturing demographic information for patients to be tested

Unique Identifier (Barcode), Site, Date and Lane Info

Information flow dependent upon state requirements and processes

AMERICAN OVERSIGHT

COVID-19 DATA REQUISITION FORMS

COVID-19 Requisition Form

Excel file to Document Requisition Form D

Recommend sites update certain fields within the form (before printing on-site):

- **Site Location**: If Community-Based Testing Site (CBTS) has a specific name, input this here and keep it consistent throughout duration of testing. Labs will associate samples with this site specifically.
- **Site Address**: Physical location must be added within header to include city, state, zip code.
- Consider pre-populating the month and year within the form. Only date will need to be entered manually on-site
- Print estimated amount needed for operations for the week.

Every field on the attached form **is required** for the labs to be able to successfully process samples (including the fields within the header).

- LABS WILL NOT PROCESS SAMPLE IF ANY PORTION OF THIS FORM IS NOT FILLED OUT.

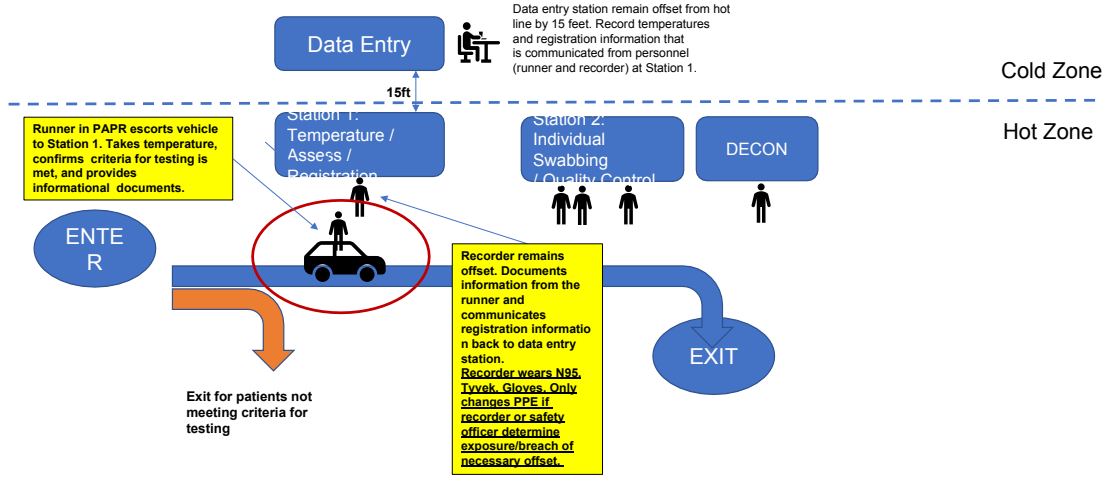
Sites must identify and designate a personnel member to verbally **read** the informed consent and privacy language to individuals (*verbiage is below*) before proceeding with registration and accurately identifying responses at the bottom of the form.

- For any individual requesting translation, utilize resources available, including telephonic. Collaborate with local healthcare network systems if necessary, as many have established contracts and accessibility to this.

Electronic

- This step is conducted electronically, if, and only if, there is a PHS officer on site with a federal computer. In this case, an excel file can be digitally populated with the information collection from the requisition form. This file serves as a failsafe in the event that there is an error on the handwritten document that is provided to the lab.
- The files will be maintained for 14 days. This is sufficient time for the labs to receive the requisition forms, process the results, and for the call center to return these results to the patient and to the state health department.
- The PII will not be shared with anyone with the CBTS process except the labs and the call center.
- If possible, the file will then be printed and include with the associated ULIINE shipment box including the specimens. This will allow the labs to conduct an inventory and ensure the correct number of specimens are within the box. This will also allow the labs to double check the data in case the requisition forms are not legible.
- If printing is not available, you will need to use a marker on the ULINE box to indicate the number of specimens within the box in order for the labs to conduct an inventory. Furthermore, if printing is not available the labs will be provided the site POCs in order to call and validate any illegible data on the requisition forms.

Manual



- Without a PHS with a federal computer, the excel file must be printed and manually updated.
- These forms will be shredded after 14 days. This is sufficient time for the labs to receive the requisition forms, process the results, and for the call center to return these results to the patient and to the state health department.
- This form is not to be shared with anyone other than the lab and the call center if either calls to validate illegible data.
- If possible, make a photo copy and include with the associated ULIINE shipment box including the specimens. This will allow the labs to conduct an inventory and ensure the correct number of specimens are within the box. This will also allow the labs to double check the data in case the requisition forms are not legible.
- If copying is not available, you will need to use a marker on the ULINE box to indicate the number of specimens within the box in order for the labs to conduct an inventory. Furthermore, if printing is not available the labs will be provided the site POCs in order to call and validate any eligible data on the requisition forms.

COVID-19

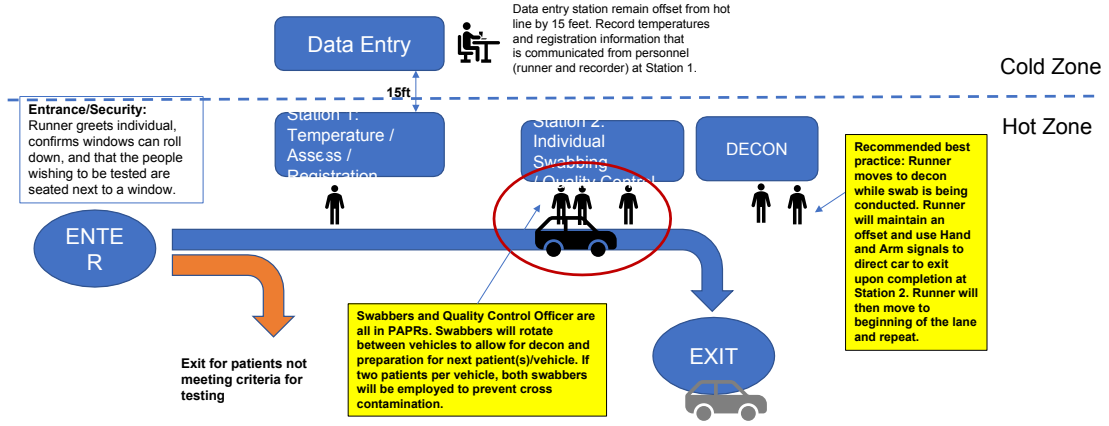
STATION 2: INDIVIDUAL SWABBING AND DOCUMENTATION PROCESS

Collection:

1. **Swabber confirms verbal authorization from passenger**
2. **Swabber confirms no obstruction in nares of person being swabbed (using pen light)**
3. **Swabber collects sample**
4. **Swabber bags collected sample**
    1. Offer tissue or gauze to person being swabbed
    2. Conducts swab
    3. Places swab into proper collection tube and breaks swab as needed
    4. Caps sample tube
    5. Places sealed tube in corresponding sample bag
    6. Places tube, form, and sample bag into a second bag
5. **QC officer verifies that barcodes match on sample tube and individual paperwork**
6. **Sample is deposited in the refrigerator and then transferred to the insulated shipping container with cold pack in telatemp box [must be packed by trained personnel]** **DO NOT FREEZE**
7. **Samples are mailed to corresponding lab twice daily**

AMERICAN OVERSIGHT

COVID-19



STATION 2: INDIVIDUAL SWABBING PROCESS

Primary Swabber	Decontamination Staff	Secondary Swabber	Quality Control Staff	Runner
• Issue individual tissue (clear nasal passage) • Use pen light to check for nasal obstructions. Do not force swab – if an obstruction is encountered, try the other nostril. If both nostrils are obstructed, contact on-site medical provider. • Receive collection tube/swab • Take swab of patient(s) in car • Return swab back into tube • Place barcode on the tube • Insert tube into secondary containment (sample bag) • Receive decontamination wipe to decontaminate the sample bag • Place sample bag onto temporary sample bag staging table • Work with decontamination staff to decontaminate the PAPR • Doff gloves; Don new gloves	• Observe swabbing operation for safety/occupational contamination • Provide decontamination spray without touching the swabber(s) • Assist the swabber during doffing/donning gloves	• Don PPE (i.e., replace gloves) to prepare for next vehicle • Becomes primary swabber for next vehicle	• Collects decontaminated sample bag to ensure sample ID is on the sample tube • Collects collection form from the runner • Verifies patient ID on tube and form is the same • Places form and sample bag in envelope, signs form as chain of custody, places envelope in shipping container • Confirms temperature in cooler stays within range	• Documents temperature on collection form and relevant demographic data • Provides informational documents to patients • Stays with vehicle throughout all 3 stations • Decontaminate PAPR at the Decontamination Station • Returns to Station 1 to prepare for next vehicle after decontaminating /donning new gloves

AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

COVID-19 SPECIMEN TO LABORATORY PROCESS

Sample Test Medium Instructions

Your sampling kits contain Universal Transport Medium (UTM); please read this **CRITICAL** information:

- Storage Considerations:
  - This product must be stored in its original packaging at a temperature between
  - 2-25°C (35.6 - 77°F) until the time of use. Do not overheat or freeze prior to use.
- After collection, the specimen should be stored at 2-8°C (35.6-46.4°F) and processed within 48 hours. The specimens should not be frozen at any time.
- When shipped, sample must remain at 2-8°C (35.6-46.4°F). The sample must **not** be frozen for shipment. For full product package insert instruction: https://www.copanusa.com/wp-content/uploads/2020/02/UTM-Package-Insert.pdf

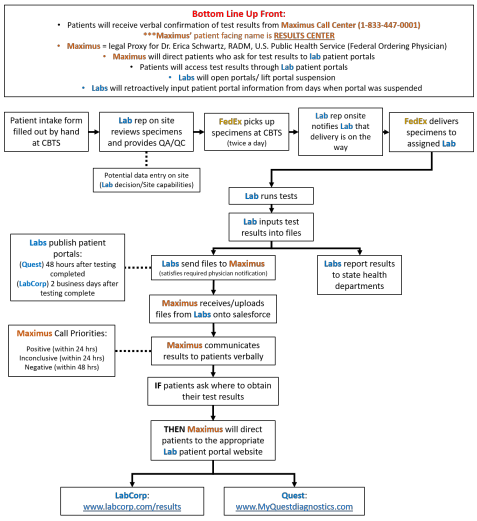
Sample Bar Code Identifier

Each individual being tested will receive a unique sample identification from the contract lab company.

- Two (2) unique adhesive **matched barcodes** will be placed on 1) the sample tube and 2) on the requisition form.
- The completed requisition form with the affixed barcode must be placed inside the bag with the sample tube.
- Site cannot proceed with operations without these barcodes.
- All samples will be identified with **two items**: a unique barcode [federally supplied] and a label with written DOB (MM/DD/YYYY) of individual being tested [which must me locally supplied].
- The barcodes must meet the following specifications:
  - Must have a human readable string (16 character max)
  - Must be Code 128 (barcode standard)

Required supplies have been put on state supply list: paper/printers for forms, barcodes, labels (for DOB on sample), pens.

Shipping Process



- Maintain specimens 35.6-46.4°F prior to shipping. The specimens must be placed in the ULINE boxes and packed with cold packs, then close the box with shipping tape, prior to FEDEX's arrival to the site. DO NOT FREEZE
- ULINE boxes are the only authorized method of shipment. They have a cooler within the cardboard box.
- FEDEX will provide the shipping labels.
- FEDEX will be provided the site POC in order to directly coordinate for pick-up twice a day. When the site confirms they will go live the next day, this triggers the CBTS TF to contact FEDEX and turn-on the contract for pick-up of the specimens twice a day. Failure to notify the CBTS TF that your site is going live, may result in specimens not being picked up on the first day of operation.

COVID-19 PATIENT INTAKE FORM ≠ PATIENT HAS RESULTS

Q: Where/How do I obtain my COVID-19 test results?

A (LabCorp): Your COVID-19 sample was processed by LabCorp. To access your results, you can go to www.labcorp.com/results. Once you arrive at this website, you can Register for an account, or, if you already have an account with LabCorp, you can simply Sign In.

A (Quest): Your COVID-19 sample was processed by Quest Diagnostics. To access your test results, you can go to www.MyQuestdiagnostics.com. Once you arrive at this website, you can Create an Account, or, if you already have an account with Quest Diagnostics, you can simply Sign In.

Q: What information do I need to Create an Account?

A (LabCorp): You will need to enter the following information to create an account:
- First Name, Last Name
- Gender
- DOB
- Address (Street, City, State, Zip Code)
- Phone Number
- Email Address
- SSN

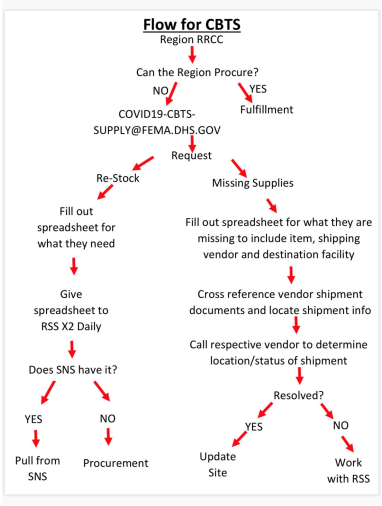
A (Quest): You will need to enter the following information to create an account:
- Full Name
- DOB
- Full Address (including city, state, zip code)
- Phone Number (10-digit)

Q: What information do I need to Sign Into an existing account?

A (LabCorp): You will need to enter the following information to sign into an existing account: your email and the password you created.

A (Quest): You will need to enter the following information to sign into an existing account: the username and password you created.

Q: When will my results be available?



A (LabCorp): Your results will be available on the LabCorp patient portal 2 business days after your results are in

A (Quest): Your results will be available on the Quest patient portal 48 hours after your results are in.

Intended Use of the Handouts Provided to Community-based Testing Sites:

These three documents were developed as resources to hand out to individuals at specific points during their experience at the Community-based Testing Sites. Please review the purpose and instructions for each document.

1) What to Expect At Community-based Testing Sites

Purpose: To give individuals step-by-step instructions of what will occur during their experience at the testing site.

Instructions:

Hand out this document to the people who are in line and below site capacity numbers

2) Information:

Purpose: To provide individuals who, due to capacity issues or not meeting site testing criteria, will not be tested at the site with useful information on what to do next.

Instructions:

Hand out this document to the following:

- people who are in line but will not receive testing because we have exceeded capacity
- people who are in line but will not receive testing because they do not meet site testing requirements

3) Instructions and Test Results sheets (recommend printing double-sided)

Purpose: The instructions sheet provides individuals who have been tested guidance on what to do while they wait for test results and how their test results will be delivered. The tests results sheet provides instructions for what to do if you have tested positive and if you have tested negative.

Instructions:

Hand out this document at the final station and instruct people to keep the paper until they receive the test results.

FEMA

COVID-19
Community-Based Testing Sites (CBTS)

FACT SHEET

States and the private sector have teamed up with the federal government to provide testing to Americans who need it the most. Community-based Testing Sites (CBTSs) are a tool for states, local public health systems and healthcare systems to use as they work together to stop the spread of COVID-19 in their communities.

Criteria

In order for a testing site to qualify as a CBTS, it must:

1. Receive supplies from the federal government.
2. Ensure there is at least one United States Public Health Service (USPHS) officer at each site.
3. Use the lab ordering, sampling and packaging process established by the federal government.
4. Use the shipping company chosen by the federal government to pick up and deliver labs to the lab company selected by the federal government.
5. Use the federally contracted Call Center that will contact individuals with their results.

SCREENING CRITERIA

Priority 1	Priority 2	Priority 3
▪ Hospitalized patients ▪ Healthcare facility workers with symptoms	▪ Patients in long-term care facilities with symptoms ▪ Patients over age 65 years with symptoms ▪ Patients with underlying conditions with symptoms ▪ First responders with symptoms	▪ Critical infrastructure workers with symptoms ▪ Individuals who do not meet any of the above categories with symptoms ▪ Healthcare facility workers and first responders ▪ Individuals with mild symptoms in communities experiencing high numbers of COVID-19 hospitalizations

AMERICAN OVERSIGHT

FEMA

COVID-19
Community-Based Testing Sites (CBTS)

Requirements for Supply

- Sites, states and regions should attempt to procure all supplies, including personal protective equipment (PPE) locally.
- Requests for PPE are consolidated at the regional level through the Regional Response Coordination Center (RRCC).
- Submit one form per CBTS per day. Complete each section of the form to ensure a correct and complete order. Include CBTS location in the subject line of the email. Regions must submit the form to CBTS Task Force by 7pm EST daily.
- Send completed form to COVID19-CBTS-SUPPLY@FEMA.DHA.GOV.

Future Transition Expectations

- Each CBTS will transition USPHS personnel roles and responsibility to local personnel.
- FEMA will work with regional logistical personnel to develop a process to procure all PPE through standing FEMA processes.
- States will be able to send labs for testing to a lab of their choice.
- States will determine if they would like to use a locally run call center or use the regular state notification processes for results.

RFIs

If state and regional leadership are not able to answer a question, submit an RFI to: fema-cbts-rfi@fema.dhs.gov

---

May be dupe to some…..apologies

*****The CBTS Task Force updated its guidance for community-based testing sites. Please review and disseminate the attached guidance and fact sheet to help support questions from your state/local health partners.*****

Please see included the criteria and ConOps for operating a Community Based Testing Site. The Criteria outlines simple requirements for remaining in compliance with the program. This step was necessary due to a number of State modifications to the program that introduced compliances issues causing sites to be put on pause or taking off line. The updated ConOp streamlines the CBTS process and reduces potential exposure to the operators.

Regards,
Jeanne

1

AMERICAN OVERSIGHT

COVID-19

CONTENTS

- Site Establishment and Logistical Support
- Pre-Screening Criteria
- Operations
- Data Requisition Forms
- Laboratory and Shipment Processes
- Resupply Process
- Reporting

AMERICAN OVERSIGHT

COVID-19 PURPOSE, SCOPE AND CRITERIA

Purpose

The purpose of the Concept of Operations is to provide specific operating guidance in the Whole Community approach to planning, establishing, supporting and operating Community-Based Testing Sites (CBTS) in response to COVID-19.

Scope

The CBTS concept provides communities the ability to establish stand alone and mobile test sites in order to service populations and individuals of immediate needs which includes: symptomatic populations consisting healthcare workers and first responders or who within 14 days of symptom onset had close contact with a suspect or laboratory-confirmed COVID-19 patient, and symptomatic individuals from high risk populations.

Criteria

1. Receive supplies from the federal government.
2. Ensure there is at least one United States Public Health Service (USPHS) officer at each site.
3. Use the lab ordering, sampling and packaging process established by the federal government.
4. Use the shipping company chosen by the federal government to pick up and deliver labs to the lab company selected by the federal government.
5. Use the federally contracted Call Center that will contact individuals with their results.

AMERICAN OVERSIGHT

COVID-19

COMMUNITY SITE AND PATIENT TESTING GUIDELINES

Site Location

In order to maximize resources and develop a holistic understanding of positive cases, State, Local, Tribal, and Territory partners, in coordination with Department of Health and Human Services and FEMA established CBTS based on a combination of high risk or affected areas and areas with higher vulnerable populations (I.e. 65+ yo) areas. It is important that sites support a whole community assessment of potentially affected areas. This provides an understanding of the magnitude of the impact within the area. Sites should take into consideration other planning factors such as, vulnerable populations, accessibility, traffic control and other measures that may impact throughput. In addition, sites must be accessible to all potential patients.

Screening Criteria

Priority 1	Priority 2	Priority 3
Hospitalized patients	Patients in long-term care facilities with symptoms	**Critical infrastructure workers with symptoms**
Healthcare facility workers with symptoms	**Patients over age 65 years with symptoms**	**Individuals who do not meet any of the above categories with symptoms**
	Patients with underlying conditions with symptoms	**Healthcare facility workers and first responders**
	First responders with symptoms	**Individuals with mild symptoms in communities experiencing high numbers of COVID-19 hospitalizations**

AMERICAN OVERSIGHT

COVID-19

SITE LOGISTICAL SUPPORT CONSIDERATIONS

The federal government has identified the commitment to support over 40 sites across the United States. States begin testing select healthcare workers involved in direct patient care (hospital staff, clinicians, and long-term care facilities) and first responders and then immediately transition to testing individuals who are at high risk for serious complications [subject to change based on DHHS and CDC guidance].

Logistical Requirements and Support

The federal government has procured a defined list of items required for initial CBTS through the Strategic National Stockpile as well as the private market. Continued logistical site support requirements need to follow the logistical support process flow.

AMERICAN OVERSIGHT

COVID-19

INITIAL FEDERALLY SUPPLIED SUPPLIES
(FOR 1 SITE FOR 1 WEEK)

- Unit = the entire list on the right, which is enough to run 1 testing site for a week of 2,500 tests
- Each Unit will be delivered in 6 different shipments
- If a state is getting 2 units, it will receive 12 shipments, etc.
- States, such as TX, will receive bulk shipment and are required to breakdown shipment to support each location with 1 unit

Initial Shipment: Essential Medical Supplies

Item	Target Quantity	Unit of Measure	Frequency	Supplier
Test Kits (e-swab or UVT)	2,500	Each	Weekly	Federal
Matched standard code-128 barcodes with unique numbers and 10-16 characters (Manreadable)	2,500	Pairs	Weekly	Federal
Non-contact infrared thermometer	4	Each	One-time	Federal
Gloves (Nitrile) *for those with allergies	10,000	Each	Weekly	Federal
Gloves (Latex) 6,700 per size	20,100	Each	Weekly	Federal
Scrub top (all sizes) 100-Medium, 100-Large, 100-2XL	300	Each	Launder	Federal
Scrub pants (all sizes) 100-Medium, 100-Large, 100-2XL	300	Each	Launder	Federal
PAPRs	5	Each	Weekly	Federal
Faceshields	500	Each	Weekly	Federal
N-95 Respirators (S, M, L)	4,480	Each	Weekly	Federal
Surgical Gowns	500	Each	Weekly	Federal
Tyvek Suits - Size L	250	Each	Weekly	Federal
Tyvek Suits - Size XXL	250	Each	Weekly	Federal
Tyvek Pullover Hoods/Shrouds/Headcovers (contingent upon type of PAPRs received/available)	1,000	Each	Weekly	Federal
Goggles (Anti-fog)	300	Each	Weekly	Federal
Tyvek Sleeves	20,000	Each	Weekly	Federal
Red Uline Garbage Cans	10	Each	Weekly	Federal
Biohazard Bags (25/wk x2 = 50 boxes)	50	Boxes	Weekly	Federal
Earloops Surgical Masks	1,000	Each	Weekly	Federal
Plastic Aprons (Not Surgical Aprons)	10,000	Each	Weekly	Federal
Specimen Transport Bag with requisition pouch. 6 x 9" polyethylene specimen bags	2,500	Each	Weekly	Federal
Insulated Foam Shipping Kit - 30 1/4 x 14 1/2 x 16"	1,575	Each	Weekly	Federal
Single-Use Cold Packs - 12 oz	9,450	Each	Weekly	Federal
UN3373 Biological Substance, Category B Air labels	1575	Each	Weekly	Federal
Tamper-Evident Tape, 3" x 110 yds	225	Each	Weekly	Federal
Telatemp Heat Indicator	1,575	Each	Weekly	Federal
Sharps containers	25	Each	Weekly	Federal
Whirl Pak Bags	2,500	Each	Weekly	Federal

Based on PPE reductions, resupply of N-95 masks will be 70 per week, per unit.

Available from National Stockpile

LOGISTICS SUPPORT
(RECOMMENDATIONS, PROVIDED LOCALLY)

Overall Supplies

Item	Estimated Quantity	Unit of Measure	Frequency
Large Tent 19x35 (insulated) w/ Enviornmental Control Unit	5	Each	One-time
Mifi/ Wireless Internet for 10 users	1	Each	Ongoing
Surge Protectors	10	Each	One-time
Extension Cord 25ft	10	Each	One-time
Chalk	10	boxes	One-time
Cablepath Tape	5	rolls	One-time
Fire Extinguishers (A/B/C)	5	Each	One-time
Pallet Jacks	2	Each	One-time
Trash Bags (weekly)	50	boxes	Weekly
Copier/Scanners/Printers	3	Each	One-time
Toner cartridges	3	Each	Re-supply
Duct Tape	4	rolls	One-time
Folding Chairs	50	Each	One-time
Folding Tables	10	Each	One-time
Cross-cut Shredders	2	Each	One-time
Trash cans	8	Each	One-time
EZ Up Tents	6	Each	One-time
White Board	4	Each	One-time
Paper (weekly)	50	Reams	Re-supply
Pens (weekly)	100	Each	Re-supply
Staplers	10	Each	One-time
Folders (weekly)	10	boxes	Re-supply
8' Supersaver™ Players Bench/10W/ Backless/ Portable/ Black	6	Each	One-time
Mobile carts	10	Each	One-time
Mobile shelves	5	Each	One-time
Trade Show Litter Bags	1,000	Each	Weekly
Soap (weekly)	100	Containers	Re-supply
Carboy with spigot	5	Each	One-time
Filing Cabinent 3/4 drawers	4	Each	One-time
Refridgerators (with freezer)	2	Each	One-time
Laptop Computers + chargers	8	Each	One-time
Sharpies (thin point, regular)	200	Each	Re-supply
Whistle	10	Each	One-time
Caution tape	5	rolls	One-time
Safety Cones	100	each	One-time
broomhandle	100	Each	One-time
Safety Vest	25	Each	One-time
SIGN Forward Arrow	2	Each	One-time
SIGN Left Arrow	2	Each	One-time
SIGN Right Arrow	2	Each	One-time
SIGN No Parking	6	Each	One-time

Essential Medical Supplies

Item	Estimated Quantity	Unit of Measure	Frequency
Duct Tape Rolls (for PPE)	50	Each	Weekly
Cavicide Wipes	50	Containers	Weekly
Hand sanitizer	400	Each	Re-supply
Eye wash solution	10	Each	Re-supply
Care Touch Sterile Alcohol Prep Pads (2 Ply) - Alcohol Wipes 600 (weekly)	5	Boxes	Re-supply
Handheld Sprayer, Handheld Sprayer Type, Lawn and Garden Sprayer Application (2-gallon container with pump)	2	Each	One-time
RW Clean 25 oz Green Plastic Spray Bottle - Adjustable Nozzle - 1 count box	10	Each	One-time
Small Hand Mirrors	10	Each	One-time
Bandage Scissors	5	Each	One-time
Foot Tub Plastic Wash Basin - 6 Quart	10	Each	One-time
Buckets (5-gallon)	5	Each	One-time
Trash Pickers	5	Each	One-time
Pen Lights	10	Each	Re-supply
Bleach (weekly)	100	Containers	Re-supply
Chlorine Test Papers (100 Strips) (500 parts per million)	1	Containers	Re-supply
Facial Tissue (100 count)	10	Boxes	Weekly
Disinfecting Station (ETOH and water set-up using bucket/tub) (ex:gatorade cooler filled with alcohol or bleach solution)	7	Each	One-time
Thermometer - anything that does ambien temperature (for coolers)	4	Each	One-time
Deluxe Gauze Dressings 4x4 inch	500	Boxes	Weekly
One of the following:			
1. Rubber Gumboots (various sizes) + decon foot bath**	50	Pairs	One-time
2. Closed-toe clogs (various sizes) with Shoe Covers (if offering Closed-toe clogs)	50	Pairs	Weekly
	2,800	Each	Weekly
3. Bootie (option for personal footwear)	1,500	Each	Weekly
*Cooling vests for swabbers to wear in warm climates.**	12	Each	Re-supply
*Gondola carts**	2	Each	One-time
*Disposable Chemical Suits**	100	Each	Weekly
*Chemical resistant work gloves (all sizes)**	100	Pairs	Weekly
*Socks (mid-calf or higher)**	300	Each	Weekly

**recommended but not critical if unavailable*

Contracted-based Services

Item	Estimated Quantity	Unit of Measure	Frequency	Notes
Biological Waste Service			Ongoing	
Dumpster Service	1	Each	Ongoing	8 Cu/yd or greater Emptied Daily
Portajons w/ Hand Wash Statuon 2 Reg 2 ADA 2 HWS	6	Each	Ongoing	Emptied/ Decon Daily
Retail Fuel Capability	1	Each	Ongoing	Truck w/ in Bed fuel tank for DS2
Fuel	100	gallons	Ongoing	daily requirement for 100 gallons DS2
5K Generator with appropate retail fuel capability	1	Each	Ongoing	
*5 KT Forklift** (can be circumvented with lift gate on transport truck to site)*	1	*Each*	*Ongoing*	
*Potential Shredder Bins **	2	Each	Ongoing	

AMERICAN OVERSIGHT

COVID-19 OPERATIONAL CONSIDERATIONS

States identify specific community needs based on several factors and there are specific operational processes the need to be followed in order to meet our desired end state. These include, but are not limited to, equipment conservation, testing documentation and reporting , laboratory chain of custody and testing protocols.

Specific Site Operational Considerations:

- Accessibility and Functional Capability Requirements to include emotional support animals
- Private and Public Transportation Needs and Throughput
- Adhere to State Regulated Medical Waste Procedures
- Translation services and hearing impaired
- Site Security and Local Emergency Services
- Traffic Control
- Basic Needs for Site Support Personnel (Feeding and Sanitation)
- Operations Communication Capabilities Public Communication
- Water / Feeding for Operators
- Site Support Training Requirements
- Site Sanitation and Safety Considerations
- Patient information daily tracking and reporting mechanism for results
- Training – Safety Officer
- Training – Quality Control Officer
- Recommendations for change of clothes/laundering of clothes worn during operation
- Daily tracking and reporting mechanism for results

AMERICAN OVERSIGHT

COVID-19

SITE HANDOUTS

User Guide for Handouts | What to Expect | Not Meeting Criteria | Test and Result Info Sheet

Intended Use of the Handouts Provided to Community-based Testing Sites:

These three documents were developed as resources to hand out to individuals at specific points during their experience at the Community-based Testing Sites. Please review the purpose and instructions for each document.

1) What to Expect At Community-based Testing Sites

Purpose: To give individuals step-by-step instructions of what will occur during their experience at the testing site.

Instructions:

Hand out this document to the people who are in line and below site capacity numbers

2) Information for Those Not Meeting Criteria:

Purpose: To provide individuals who, due to capacity issues or not meeting site testing criteria, will not be tested at the site with useful information on what to do next.

Instructions:

Hand out this document to the following:

* people who are in line but will not receive testing because we have exceeded capacity
* people who are in line but will not receive testing because they do not meet site testing requirements

3) Instructions and Test Results sheets (recommend printing double-sided)

Purpose: The instructions sheet provides individuals who have been tested guidance on what to do while they wait for test results and how their test results will be delivered. The tests results sheet provides instructions for what to do if you have tested positive and if you have tested negative.

Instructions:

Hand out this document at the final station and instruct people to keep the paper until they receive the test results. a

logging temp and registration information remains offset

COVID-19

SITE OPERATIONS

Site Operation Process Categories

1. **Site Staff Guidelines:** Provides specific guidance on essential staffing requirements for each site.
2. **Patient Pre-Screening:** Provides guidance on initial patient screening in order to determine if follow-on testing is necessary.
3. **Site Patient Throughput and Support Personnel Responsibility Process:** Describes the recommended process to include specific roles and responsibilities of support personnel and required levels of protection.
4. **Packaging and Lab Processing:** Defines the specific packaging and lab processing requirements that must be followed, these cannot be deviated from due to contractual requirements.

AMERICAN OVERSIGHT

COVID-19 MINIMUM STAFFING RECOMMENDATIONS

USPHS Officers are prepared to be:

- **Site Team Lead:** Responsible for overall coordination of site and process standardization, execution of federal guidelines, and information and data management
- **Site Safety Officer:** Oversees all safety considerations for site operations.
- **Site Quality Control Officer:** Responsible for overseeing Quality Assurance through all test processes - IAW established standards.

TESTING STATIONS	STATE CBTS (1-lane operation)	STATE CBTS (2-lane operation)
Greeting/Entry	Runner: 1	Runner: 2
Assessment/Registration	Registration: 1 (+ Runner, who take temperature)	Registration: 2 (+ Runners, who take temperatures)
Data Entry (Offset, No PPE)	Data Entry for Registration: 1	Data Entry for Registration: 2
Sampling	Samplers: 2 QC: 1	Samplers: 4 QC: 2
Decontamination	Decontamination: 1	Decontamination: 2
Admin/Support Staff	Logistics: 2 Safety Officer: 2 Admin/Planning: 1 Team Lead: 1	Logistics: 4 Safety Officer: 2 Admin/Planning: 1 Team Lead: 1 Facilitator: 1 Water Sanitation: 3
Estimated Personnel	**13**	**26**

Estimated capability (1-lane operation): 12-24 individ
Estimated ~12 vehicles/hr at each station

2-lane operation for vehicles with driver and 1+ passenger(s): 12 (min) – **48** (max) individuals/hour

AMERICAN OVERSIGHT

COVID-19

COMMUNITY-BASED TESTING SITES (CBTS): MODIFIED CONOPS TO INCREASE PAPR USE

ESTIMATED TESTING SITE CAPACITY:

MAXIMUM 250 TESTS PER SITE, PER DAY DUE TO LAB THROUGHPUT

CDC Recommended Pre-Screening Criteria

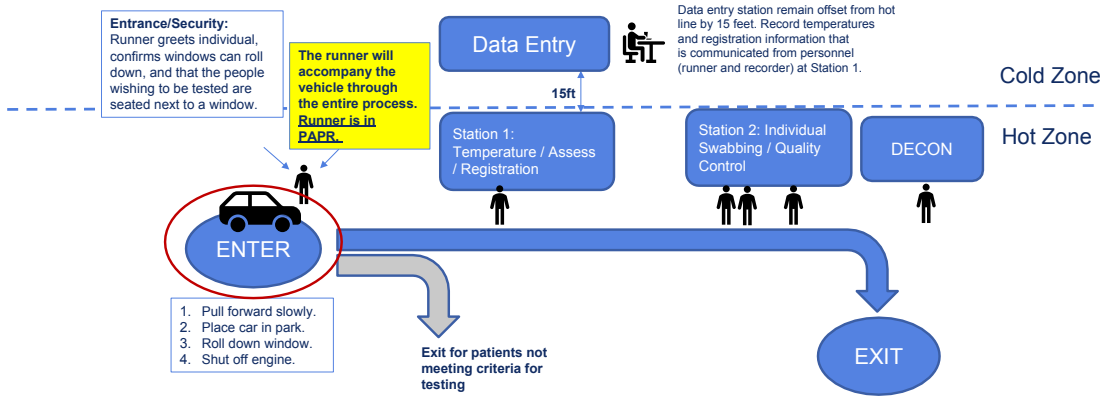
1. **Criteria 1**: Anyone ≥65 years of age with on-site confirmed temperature of 99.6°F or greater **and** presents with respiratory symptoms.
2. **Criteria 2:** First responders, healthcare workers* (regardless of presence of symptoms). *This is only applicable to staff with direct patient contact (not those in administrative roles) or as determined at the state level.

Pre-Screening Process and Instructions

- Patients must bring:
  - Photo ID for all adults needing testing
  - Health insurance card (everyone will be tested regardless if they have insurance)
  - Healthcare or first responder ID
- Instructed not to take fever-reducing medicine within 6-8 hours prior to testing [such as Tylenol (acetaminophen) or Advil (ibuprofen)]
- If the CBTS personnel determine an individual meets the testing criteria, they will be tested. If the person does **NOT** meet the criteria, they will **NOT** be tested and be provided take-home educational material.

Definition of First Responder: Any individual responding to the public health task or mission, as determined by the jurisdiction.

Definition of Healthcare Worker: Any individual working or providing direct patient care in acute or critical settings (hospitals, clinics, long-term care facilities, emergency medicine).



**Regional/State sites can clarify or expand this classification based on needs/demand and adjust accordingly.

Minimum Personnel for 1 Lane Operations	
Entry	Runner: 1 in PAPR
Station 1	Registration: 1 Recorder in N95 respirator , coveralls, gloves. Note: Runner in PAPR takes temperature and passes documentation to patients. Recorder remains offset and records/relays registration information to Data Entry which is 15-ft offset from the vehicle lane.
Data Entry (Offset)	Registration: 2 Recorders. No PPE required.
Station 2	Swabbing: 2 PAX in PAPR QC (Labeling/Packaging): 1 PAX in PAPR
Decontamination	Decontamination Sprayer: 1 PAX in PAPR

AMERICAN OVERSIGHT

COVID-19 SITE LAYOUT

Stations for 1 Lane Process

Modifying the CBTS CONOP to only have two stations exposed to the vehicle/patients and moving those individuals to PAPRs will reduce mask requirements by 61%-98.5%. 61% assumes human error for every test requiring a change of mask every time for the individual wearing the mask. 98.5% assumes 10 errors per individual donning a mask, per day.

- Runner is in PAPR and takes temperature. (Runner stays with vehicle the entire time; guides through process. Goes through decon after vehicle departs and moves back to front.)
- Station 1 personnel includes 1 PAX in N95 mask and goggles to check identification, document/register, and relay registration details to data entry station. (Data Entry personnel (1-2PAX) are not in PPE. Their station is ~15ft offset and remains behind cold line.)
- Station 2 personnel includes 3 PAX in PAPR, i.e. 2 PAX to swab and 1 PAX to QC the sample and package.
- Decon includes 1 PAX in PAPR. Remains there to decon Station 2 personnel and runner with 10% chlorine spray after every interaction.

Total = 5 PAPRs

AMERICAN OVERSIGHT

COVID-19 STATION 1: TEMPERATURE VERIFICATION

Personnel Roles:

1. **Runner(s):** Take and document temperature on collection form (form holds patient ID number)

2. **Runner(s):** Provide document to vehicle providing public health information to include:
   - What should you do while you wait for test results?
   - Monitoring symptoms
   - If you test positive for COVID-19, continue to monitor your symptoms and manage appropriately
   - When can you stop isolating at home?

**Healthcare workers = personnel who are currently working in a healthcare facility, including long-term care facilities.*

Individuals Must Meet one of these Criteria:

Criteria 1:	65 years of age and older with temperature of 99.6F or greater and respiratory symptoms
Criteria 2:	First responders, Healthcare workers* (regardless of symptoms)

Individuals not meeting criteria are asked to leave the line

If you develop symptoms after leaving the site, visit **[URL TBD]** to check if you qualify for testing

AMERICAN OVERSIGHT

COVID-19

STATION 1: INDIVIDUAL REGISTRATION

Personnel Roles:

- **Recorder (1):** Document on written form demographic information for patient(s). Record unique identifier (barcode), site, date and lane number.

First	**Email**	**Form of Identification**
Last	**Address**	**Healthcare or First Responder ID**
Phone	**License Plate**	**Insurance Information**

Note: Information collected may change based on testing company requirements

- **Recorder (2) at Data Entry:** Registers document in electronic data collection tool capturing demographic information for patients to be tested

Unique Identifier (Barcode), Site, Date and Lane Info

Information flow dependent upon state requirements and processes

AMERICAN OVERSIGHT

COVID-19 DATA REQUISITION FORMS

COVID-19 Requisition Form

Excel file to Document Requisition Form D

Recommend sites update certain fields within the form (before printing on-site):

- **Site Location**: If Community-Based Testing Site (CBTS) has a specific name, input this here and keep it consistent throughout duration of testing. Labs will associate samples with this site specifically.
- **Site Address**: Physical location must be added within header to include city, state, zip code.
- Consider pre-populating the month and year within the form. Only date will need to be entered manually on-site
- Print estimated amount needed for operations for the week.

Every field on the attached form **is required** for the labs to be able to successfully process samples (including the fields within the header).

- LABS WILL NOT PROCESS SAMPLE IF ANY PORTION OF THIS FORM IS NOT FILLED OUT.

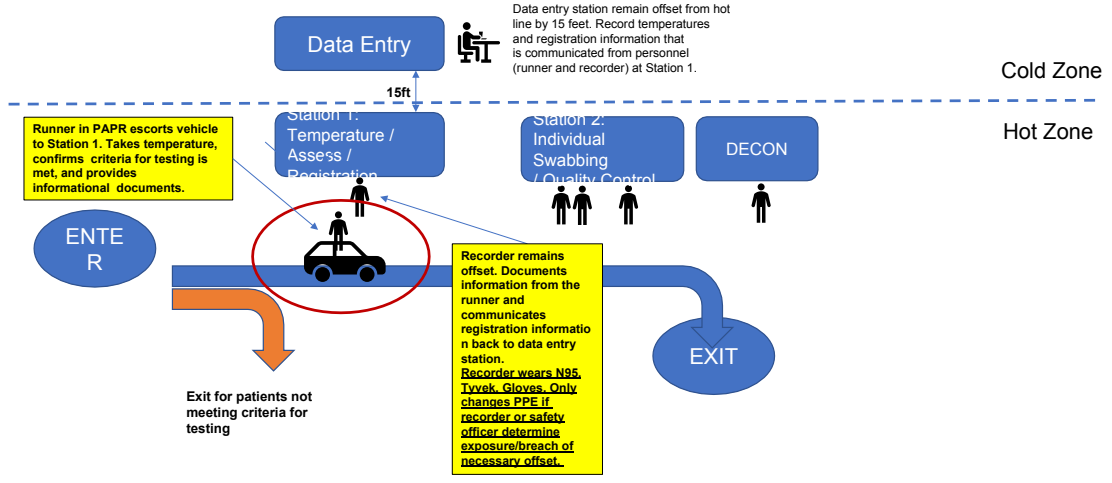
Sites must identify and designate a personnel member to verbally **read** the informed consent and privacy language to individuals (*verbiage is below*) before proceeding with registration and accurately identifying responses at the bottom of the form.

- For any individual requesting translation, utilize resources available, including telephonic. Collaborate with local healthcare network systems if necessary, as many have established contracts and accessibility to this.

Electronic

- This step is conducted electronically, if, and only if, there is a PHS officer on site with a federal computer. In this case, an excel file can be digitally populated with the information collection from the requisition form. This file serves as a failsafe in the event that there is an error on the handwritten document that is provided to the lab.
- The files will be maintained for 14 days. This is sufficient time for the labs to receive the requisition forms, process the results, and for the call center to return these results to the patient and to the state health department.
- The PII will not be shared with anyone with the CBTS process except the labs and the call center.
- If possible, the file will then be printed and include with the associated ULIINE shipment box including the specimens. This will allow the labs to conduct an inventory and ensure the correct number of specimens are within the box. This will also allow the labs to double check the data in case the requisition forms are not legible.
- If printing is not available, you will need to use a marker on the ULINE box to indicate the number of specimens within the box in order for the labs to conduct an inventory. Furthermore, if printing is not available the labs will be provided the site POCs in order to call and validate any illegible data on the requisition forms.

Manual



- Without a PHS with a federal computer, the excel file must be printed and manually updated.
- These forms will be shredded after 14 days. This is sufficient time for the labs to receive the requisition forms, process the results, and for the call center to return these results to the patient and to the state health department.
- This form is not to be shared with anyone other than the lab and the call center if either calls to validate illegible data.
- If possible, make a photo copy and include with the associated ULIINE shipment box including the specimens. This will allow the labs to conduct an inventory and ensure the correct number of specimens are within the box. This will also allow the labs to double check the data in case the requisition forms are not legible.
- If copying is not available, you will need to use a marker on the ULINE box to indicate the number of specimens within the box in order for the labs to conduct an inventory. Furthermore, if printing is not available the labs will be provided the site POCs in order to call and validate any eligible data on the requisition forms.

Total = 5 PAPRs

AMERICAN OVERSIGHT

COVID-19

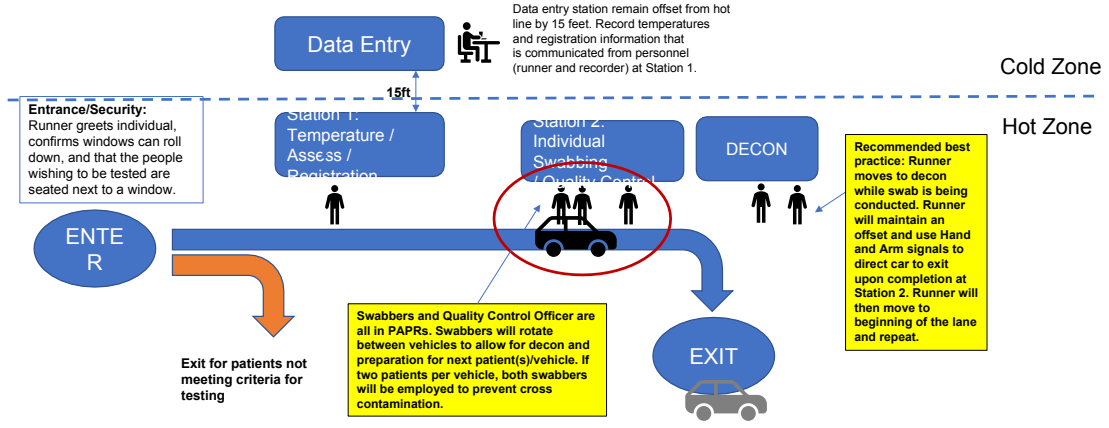
STATION 2: INDIVIDUAL SWABBING AND DOCUMENTATION PROCESS

Collection:

1. **Swabber confirms verbal authorization from passenger**
2. **Swabber confirms no obstruction in nares of person being swabbed (using pen light)**
3. **Swabber collects sample**
4. **Swabber bags collected sample**
    1. Offer tissue or gauze to person being swabbed
    2. Conducts swab
    3. Places swab into proper collection tube and breaks swab as needed
    4. Caps sample tube
    5. Places sealed tube in corresponding sample bag
    6. Places tube, form, and sample bag into a second bag
5. **QC officer verifies that barcodes match on sample tube and individual paperwork**
6. **Sample is deposited in the refrigerator and then transferred to the insulated shipping container with cold pack in telatemp box [must be packed by trained personnel]** **DO NOT FREEZE**
7. **Samples are mailed to corresponding lab twice daily**

AMERICAN OVERSIGHT

COVID-19



STATION 2: INDIVIDUAL SWABBING PROCESS

Primary Swabber	Decontamination Staff	Secondary Swabber	Quality Control Staff	Runner
• Issue individual tissue (clear nasal passage) • Use pen light to check for nasal obstructions. Do not force swab – if an obstruction is encountered, try the other nostril. If both nostrils are obstructed, contact on-site medical provider. • Receive collection tube/swab • Take swab of patient(s) in car • Return swab back into tube • Place barcode on the tube • Insert tube into secondary containment (sample bag) • Receive decontamination wipe to decontaminate the sample bag • Place sample bag onto temporary sample bag staging table • Work with decontamination staff to decontaminate the PAPR • Doff gloves; Don new gloves	• Observe swabbing operation for safety/occupational contamination • Provide decontamination spray without touching the swabber(s) • Assist the swabber during doffing/donning gloves	• Don PPE (i.e., replace gloves) to prepare for next vehicle • Becomes primary swabber for next vehicle	• Collects decontaminated sample bag to ensure sample ID is on the sample tube • Collects collection form from the runner • Verifies patient ID on tube and form is the same • Places form and sample bag in envelope, signs form as chain of custody, places envelope in shipping container • Confirms temperature in cooler stays within range	• Documents temperature on collection form and relevant demographic data • Provides informational documents to patients • Stays with vehicle throughout all 3 stations • Decontaminate PAPR at the Decontamination Station • Returns to Station 1 to prepare for next vehicle after decontaminating /donning new gloves

AMERICAN OVERSIGHT

COVID-19 SPECIMEN TO LABORATORY PROCESS

Sample Test Medium Instructions

Your sampling kits contain Universal Transport Medium (UTM); please read this **CRITICAL** information:

- Storage Considerations:
  - This product must be stored in its original packaging at a temperature between
  - 2-25°C (35.6 - 77°F) until the time of use. Do not overheat or freeze prior to use.
- After collection, the specimen should be stored at 2-8°C (35.6-46.4°F) and processed within 48 hours. The specimens should not be frozen at any time.
- When shipped, sample must remain at 2-8°C (35.6-46.4°F). The sample must **not** be frozen for shipment. For full product package insert instruction: https://www.copanusa.com/wp-content/uploads/2020/02/UTM-Package-Insert.pdf

Sample Bar Code Identifier

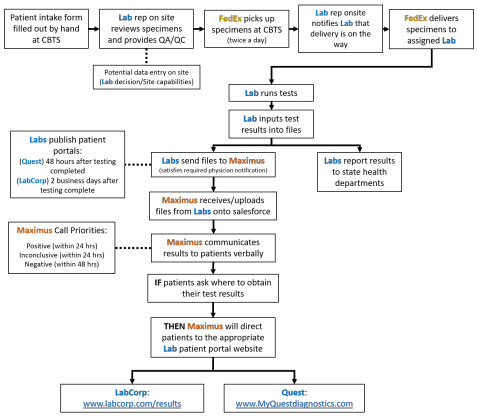
Each individual being tested will receive a unique sample identification from the contract lab company.

- Two (2) unique adhesive **matched barcodes** will be placed on 1) the sample tube and 2) on the requisition form.
- The completed requisition form with the affixed barcode must be placed inside the bag with the sample tube.
- Site cannot proceed with operations without these barcodes.
- All samples will be identified with **two items**: a unique barcode [federally supplied] and a label with written DOB (MM/DD/YYYY) of individual being tested [which must me locally supplied].
- The barcodes must meet the following specifications:
  - Must have a human readable string (16 character max)
  - Must be Code 128 (barcode standard)

Required supplies have been put on state supply list: paper/printers for forms, barcodes, labels (for DOB on sample), pens.

Shipping Process

- Maintain specimens 35.6-46.4°F prior to shipping. The specimens must be placed in the ULINE boxes and packed with cold packs, then close the box with shipping tape, prior to FEDEX's arrival to the site. DO NOT FREEZE
- ULINE boxes are the only authorized method of shipment. They have a cooler within the cardboard box.
- FEDEX will provide the shipping labels.
- FEDEX will be provided the site POC in order to directly coordinate for pick-up twice a day. When the site confirms they will go live the next day, this triggers the CBTS TF to contact FEDEX and turn-on the contract for pick-up of the specimens twice a day. Failure to notify the CBTS TF that your site is going live, may result in specimens not being picked up on the first day of operation.



AMERICAN OVERSIGHT

COVID-19 PATIENT INTAKE FORM ¤ PATIENT HAS RESULTS

Bottom Line Up Front:

- Patients will receive verbal confirmation of test results from **Maximus Call Center (1-833-447-0001)**
  - ***'Maximus'** patient facing name is **RESULTS CENTER**
- **Maximus** = legal Proxy for Dr. Erica Schwartz, RADM, U.S. Public Health Service (Federal Ordering Physician)
  - **Maximus** will direct patients who ask for test results to **lab** patient portals
    - Patients will access test results through **Lab** patient portals
      - **Labs** will open portals/ lift portal suspension
- **Labs** will retroactively input patient portal information from days when portal was suspended

Q: Where/How do I obtain my COVID-19 test results?

A (LabCorp): Your COVID-19 sample was processed by LabCorp. To access your results, you can go to www.labcorp.com/results. Once you arrive at this website, you can Register for an account, or, if you already have an account with LabCorp, you can simply Sign In.

A (Quest): Your COVID-19 sample was processed by Quest Diagnostics. To access your test results, you can go to www.MyQuestdiagnostics.com. Once you arrive at this website, you can Create an Account, or, if you already have an account with Quest Diagnostics, you can simply Sign In.

Q: What information do I need to Create an Account?

A (LabCorp): You will need to enter the following information to create an account:

- First Name, Last Name
- Gender
- DOB
- Address (Street, City, State, Zip Code)
- Phone Number
- Email Address
- SSN

A (Quest): You will need to enter the following information to create an account:

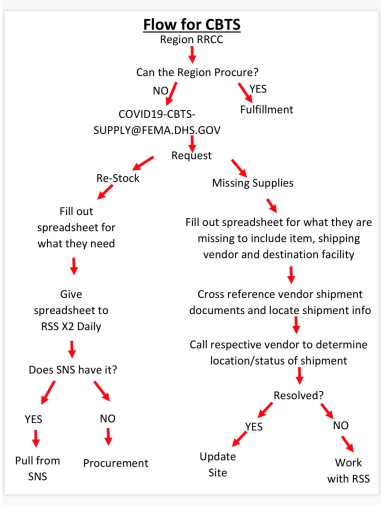
- Full Name
- DOB
- Full Address (including city, state, zip code)
- Phone Number (10-digit)

Q: What information do I need to Sign Into an existing account?

A (LabCorp): You will need to enter the following information to sign into an existing account: your email and the password you created.

A (Quest): You will need to enter the following information to sign into an existing account: the username and password you created.

Q: When will my results be available?



A (LabCorp): Your results will be available on the LabCorp patient portal 2 business days after your results are in

A (Quest): Your results will be available on the Quest patient portal 48 hours after your results are in.

Intended Use of the Handouts Provided to Community-based Testing Sites:

These three documents were developed as resources to hand out to individuals at specific points during their experience at the Community-based Testing Sites. Please review the purpose and instructions for each document.

1) What to Expect At Community-based Testing Sites

Purpose: To give individuals step-by-step instructions of what will occur during their experience at the testing site.

Instructions:

Hand out this document to the people who are in line and below site capacity numbers

2) Information:

Purpose: To provide individuals who, due to capacity issues or not meeting site testing criteria, will not be tested at the site with useful information on what to do next.

Instructions:

Hand out this document to the following:

- people who are in line but will not receive testing because we have exceeded capacity
- people who are in line but will not receive testing because they do not meet site testing requirements

3) Instructions and Test Results sheets (recommend printing double-sided)

Purpose: The instructions sheet provides individuals who have been tested guidance on what to do while they wait for test results and how their test results will be delivered. The tests results sheet provides instructions for what to do if you have tested positive and if you have tested negative.

Instructions:

Hand out this document at the final station and instruct people to keep the paper until they receive the test results.

FEMA

COVID-19
Community-Based Testing Sites (CBTS)

FACT SHEET

States and the private sector have teamed up with the federal government to provide testing to Americans who need it the most. Community-based Testing Sites (CBTSs) are a tool for states, local public health systems and healthcare systems to use as they work together to stop the spread of COVID-19 in their communities.

Criteria

In order for a testing site to qualify as a CBTS, it must:

1. Receive supplies from the federal government.
2. Ensure there is at least one United States Public Health Service (USPHS) officer at each site.
3. Use the lab ordering, sampling and packaging process established by the federal government.
4. Use the shipping company chosen by the federal government to pick up and deliver labs to the lab company selected by the federal government.
5. Use the federally contracted Call Center that will contact individuals with their results.

SCREENING CRITERIA

Priority 1	Priority 2	Priority 3
▪ Hospitalized patients ▪ Healthcare facility workers with symptoms	▪ Patients in long-term care facilities with symptoms ▪ Patients over age 65 years with symptoms ▪ Patients with underlying conditions with symptoms ▪ First responders with symptoms	▪ Critical infrastructure workers with symptoms ▪ Individuals who do not meet any of the above categories with symptoms ▪ Healthcare facility workers and first responders ▪ Individuals with mild symptoms in communities experiencing high numbers of COVID-19 hospitalizations

AMERICAN OVERSIGHT

FEMA

COVID-19
Community-Based Testing Sites (CBTS)

Requirements for Supply

- Sites, states and regions should attempt to procure all supplies, including personal protective equipment (PPE) locally.
- Requests for PPE are consolidated at the regional level through the Regional Response Coordination Center (RRCC).
- Submit one form per CBTS per day. Complete each section of the form to ensure a correct and complete order. Include CBTS location in the subject line of the email. Regions must submit the form to CBTS Task Force by 7pm EST daily.
- Send completed form to COVID19-CBTS-SUPPLY@FEMA.DHA.GOV.

Future Transition Expectations

- Each CBTS will transition USPHS personnel roles and responsibility to local personnel.
- FEMA will work with regional logistical personnel to develop a process to procure all PPE through standing FEMA processes.
- States will be able to send labs for testing to a lab of their choice.
- States will determine if they would like to use a locally run call center or use the regular state notification processes for results.

RFIs

If state and regional leadership are not able to answer a question, submit an RFI to: fema-cbts-rfi@fema.dhs.gov

Subject: Urgent Request for Information: Top State/Territorial Health Official (example, Secretary, Minister or Commissioner of Health)

Date: Monday, March 2, 2020 11:39:34 AM

Good Morning,

CDC Incident Management has asked the State Coordination Task Force for contact information of the **top health official** in each jurisdiction to expedite outreach in the event of an emergencies and to provide COVID-19 updates as expeditiously as possible. To accomplish this task, I am reaching out to the SHO/THO Assistant with a cc to the SHO/THO. This information will be used in tandem with the information we have for the SHO/THO maintained by ASTHO. You all are in a great position to assist us!

We know that in many cases the top health official is the SHO/THO. If that case is , just **reply** to this email that they are the **same**.

For those where there is a person who is more senior to the SHO/THO (as a reminder, we are looking for the most senior health official), please complete the following information:

State/Territory	Highest Health Official (i.e. Commissioner/ Minister/Secretary) Name (including degrees as appropriate)	Title	Phone Number (Please provide a **number or** numbers where we can reach out ***after hour*** should the need arise for COVID-19)	Email	Executive Assistant Name	Phone Number	Email

Due to the nature of this **urgent request**, respond by **COB today**.

Thank you so much for your assistance.

If you have questions or concerns, please contact me.

Subject: URGENT State Health Official Message
Date: Tuesday, March 17, 2020 9:10:23 AM

Dear Colleagues:

As we continue to explore avenues to increase state access to COVID-19 testing, we would like for each state to provide the name of one institution in your jurisdiction that could perform high through-put testing if adequate reagents produced by Roche could be made available. In most instances, this will likely be an academic institution or a large medical center with advance diagnostic testing capacity. Please provide this information to Jay Butler (jcb3@cdc.gov) and Hilary Eiring (vte0@cdc.gov) in the CDC EOC as soon as possible. Thank you!

AMERICAN OVERSIGHT

From: State and Local Readiness (CDC)
To: CDC IMS State Coordination Task Force (SCTF) Lead
Subject: URGENT WEB UPDATE: CDC Mass Gathering Statement
Date: Sunday, March 15, 2020 9:05:46 PM
Importance: High

Dear Colleagues:

Large events and mass gatherings can contribute to the spread of COVID-19 in the United States via travelers who attend these events and introduce the virus to new communities. Examples of large events and mass gatherings include conferences, festivals, parades, concerts, sporting events, weddings, and other types of assemblies. These events can be planned not only by organizations and communities but also by individuals.

Therefore, CDC, in accordance with its guidance for large events and mass gatherings, recommends that for the next 8 weeks, organizers (whether groups or individuals) cancel or postpone in-person events that consist of 50 people or more throughout the United States.

Events of any size should only be continued if they can be carried out with adherence to guidelines for protecting vulnerable populations, hand hygiene, and social distancing. When feasible, organizers could modify events to be virtual.

This recommendation does not apply to the day to day operation of organizations such as schools, institutes of higher learning, or businesses. This recommendation is made in an attempt to reduce introduction of the virus into new communities and to slow the spread of infection in communities already affected by the virus. This recommendation is not intended to supersede the advice of local public health officials.

Please let us know if you have any questions. Thank you.

Subject:	Week 10, 2020 Florida Flu Review
Date:	Wednesday, March 11, 2020 4:18:04 PM
Attachments:	Week 10, 2020 Florida Flu Review.pdf

Good afternoon!

Attached is the week 10, Florida Flu Review.

Week 10 influenza & influenza-like illness (ILI) activity summary:

Activity increased in week 10 and was above peak levels observed in the 2016-17 and 2018-19 seasons. Increases were observed in all regions of the state.

Ten outbreaks were reported, up from nine outbreaks in the previous week. Of the ten outbreaks reported, four were influenza-associated and six were ILI.

Two new influenza-associated pediatric deaths were reported, both in vaccinated individuals with known underlying medical conditions. Twelve influenza-associated pediatric deaths have been reported so far this season; only three children were vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On January 10, 2020, CDC issued a health advisory reminding clinicians to reiterate vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Thank you!

AMERICAN OVERSIGHT

Florida FLU REVIEW

Season: 2019-20

Week 10: 3/1/20-3/7/20

Geographic Spread: **Widespread**

Predominant Strain: **A 2009 (H1N1)**

ILI Activity Trend: **Increasing**

Week 10 influenza & influenza-like illness (ILI) activity summary:

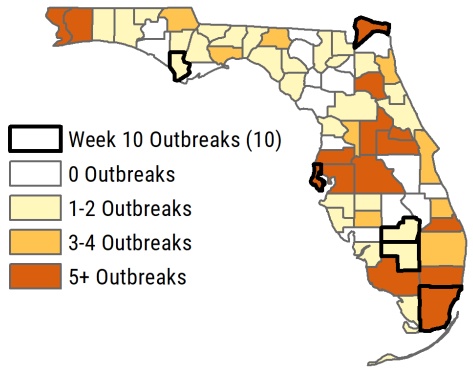
Activity increased in week 10 and was above peak levels observed in the 2016-17 and 2018-19 seasons. Increases were observed in all regions of the state.

Ten outbreaks were reported, up from nine outbreaks in the previous week. Of the ten outbreaks reported, four were influenza-associated and six were ILI.

Two new influenza-associated pediatric deaths were reported, both in vaccinated individuals with known underlying medical conditions. Twelve influenza-associated pediatric deaths have been reported so far this season; only three children were vaccinated for the 2019-20 season.

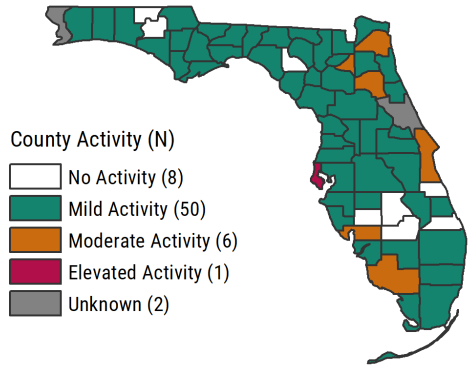
Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults ≥65 years, pregnant women, and people with underlying medical conditions).



On January 10, 2020, CDC issued a health advisory reminding clinicians to reiterate vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:



- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Florida ILI Surveillance System Summary 16

Background

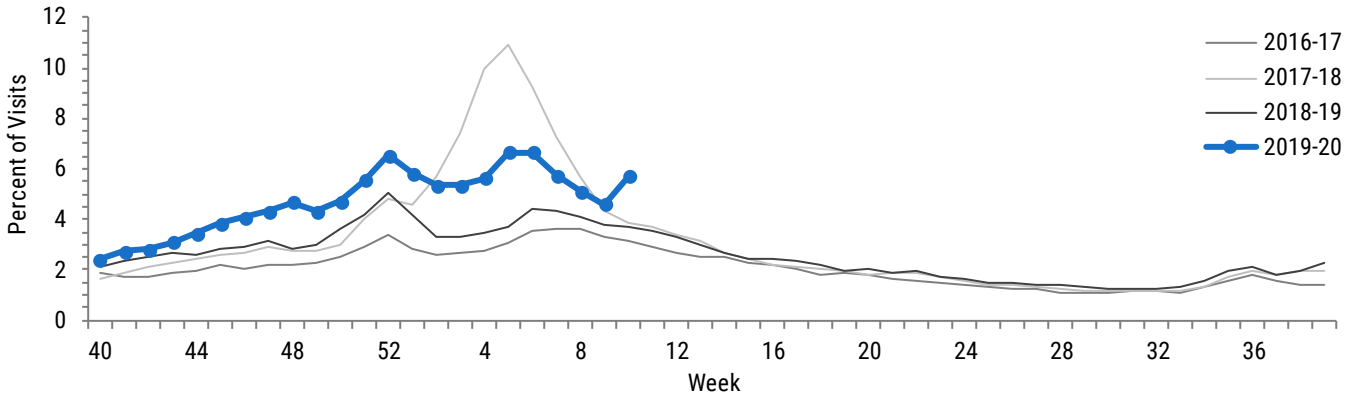
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



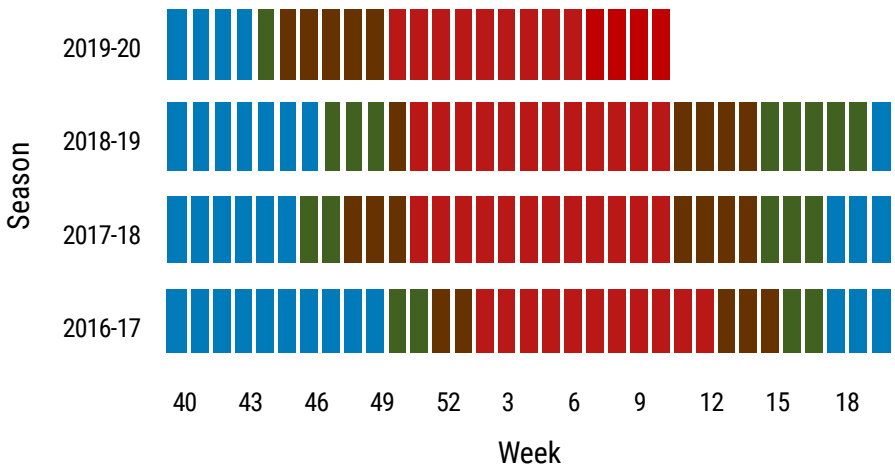
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 10, **the percent of emergency department and urgent care center visits for ILI statewide increased** and was above peak levels observed during the 2016-17 and 2018-19 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=370) statewide for the current season (week 40, 2019 to week 10, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 10, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 10, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

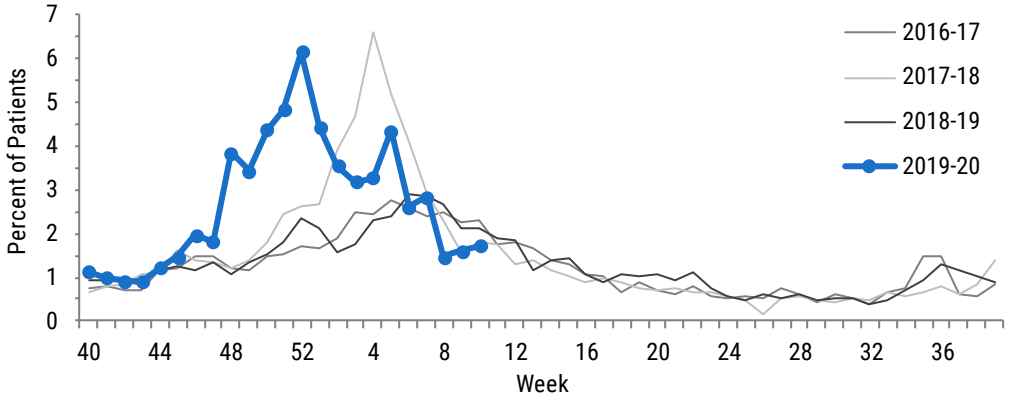
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 10, **the percent of patients with ILI reported by ILINet providers statewide increased** and was within levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=8), week 40, 2016 to week 10, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



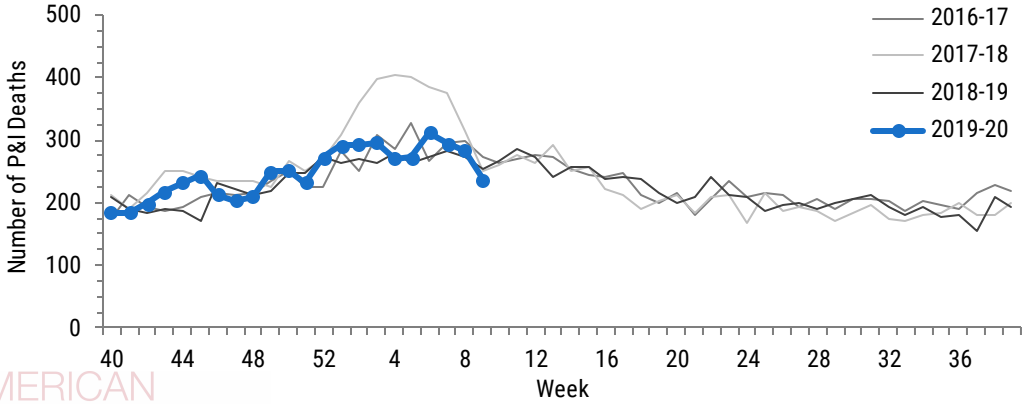


Figure 4: In week 9 (ending 2/29/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was slightly below levels observed at this time in previous seasons.

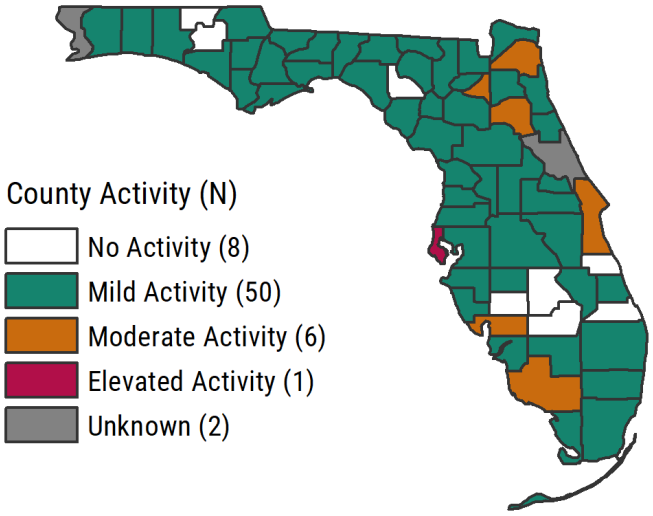
◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 9, 2020.

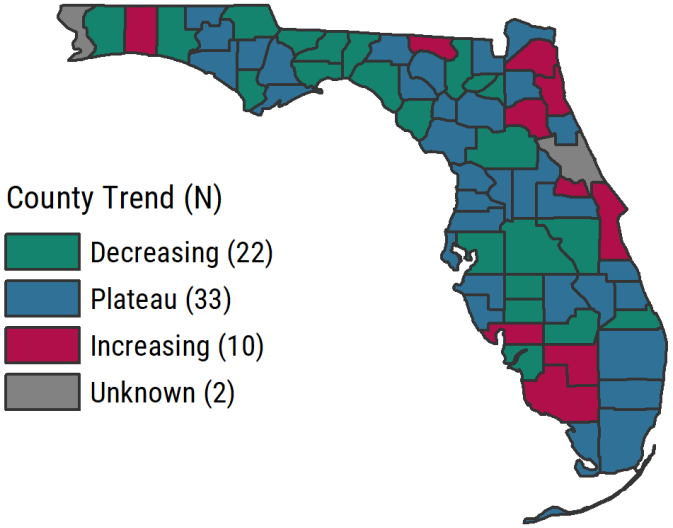
*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 10. Six counties reported **moderate activity,** and one county reported **elevated activity.**





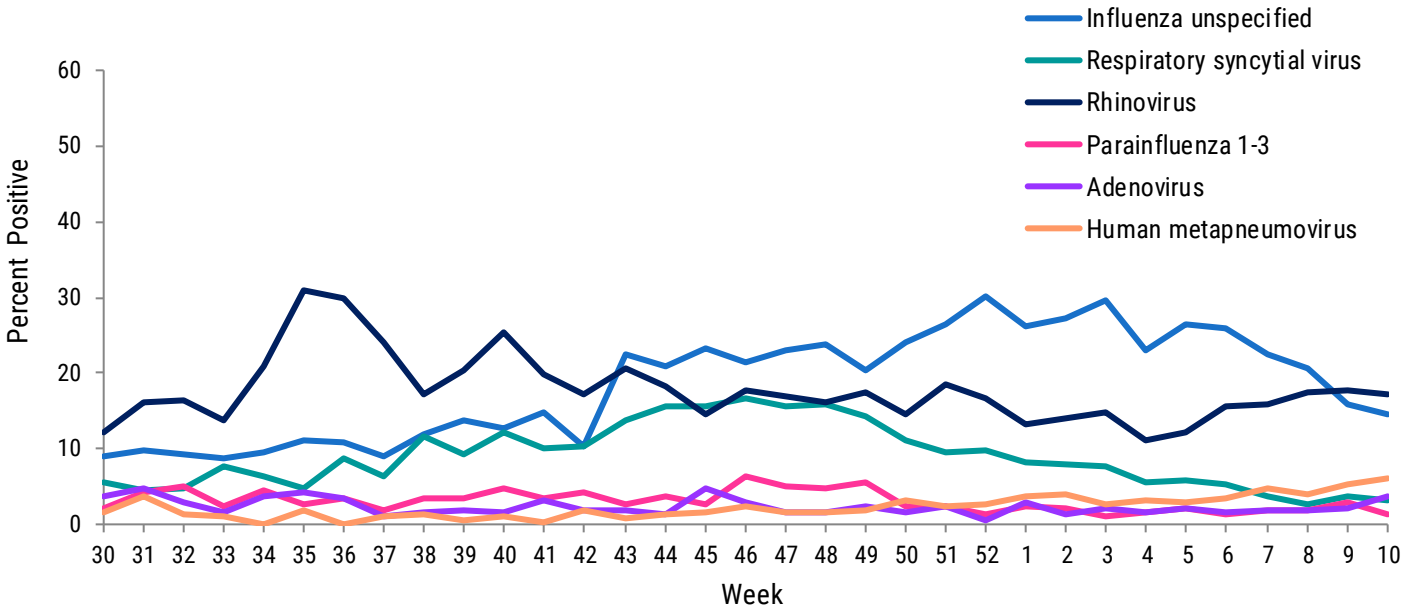


Figure 7: Most counties reported **activity at a plateau** for week 10. Ten counties reported **increasing activity,** and 22 counties reported **decreasing activity**.

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: The **percent of specimens testing positive for influenza decreased** in recent weeks. In week 10, **percent of specimens testing positive for rhinovirus** was higher than other respiratory viruses under surveillance.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=9), week 40, 2019 to week 10, 2020.

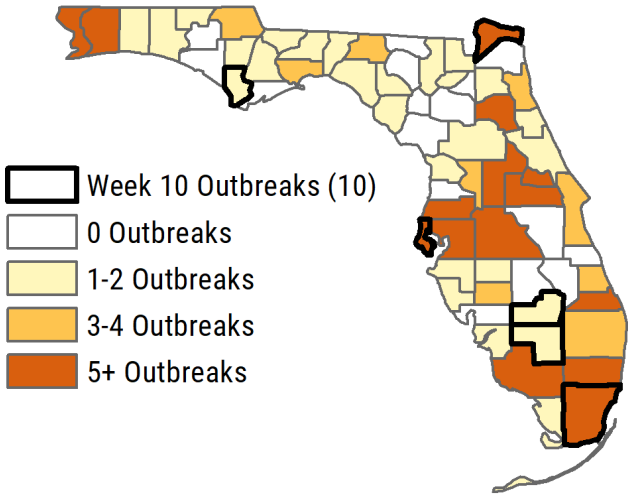
AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

Week 10 Outbreaks at a Glance:

Number Reported:
10 Outbreaks

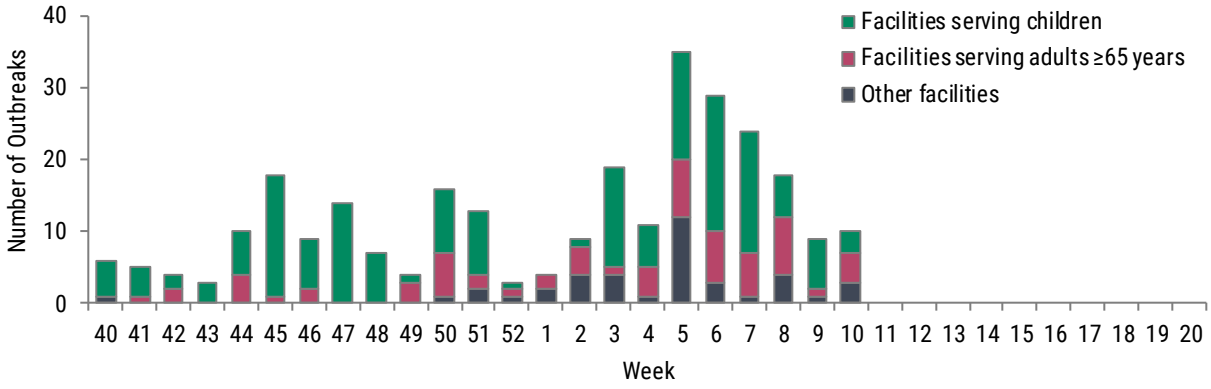
Influenza-Associated:
4 Outbreaks



Severe Outcomes*:
0 Outbreaks

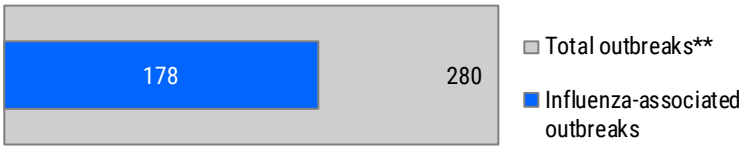
Outbreak Summary:

In week 10, four influenza-associated and six ILI outbreaks were reported, a slight increase from the previous week.



Severe outcomes* were not reported in any of these outbreaks.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities).



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 10 are **outlined in bold.**

Figure 9: In week 10, **four outbreaks** were reported among **facilities serving adults aged ≥65 years, three outbreaks** were reported in **facilities serving children,** and **three outbreaks** were reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 10, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 10, **63.6% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 10, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

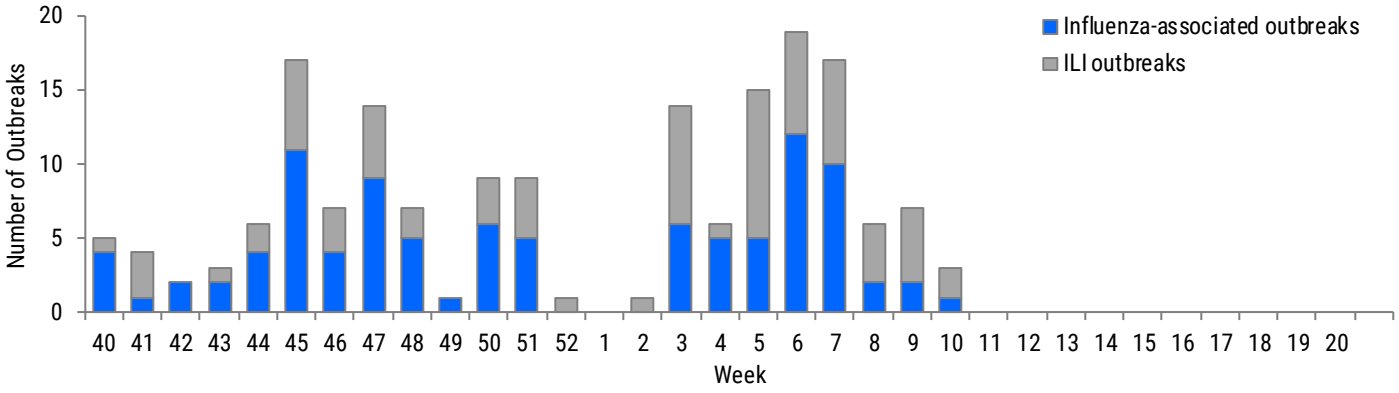
*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

Facilities Serving Children*:



3 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

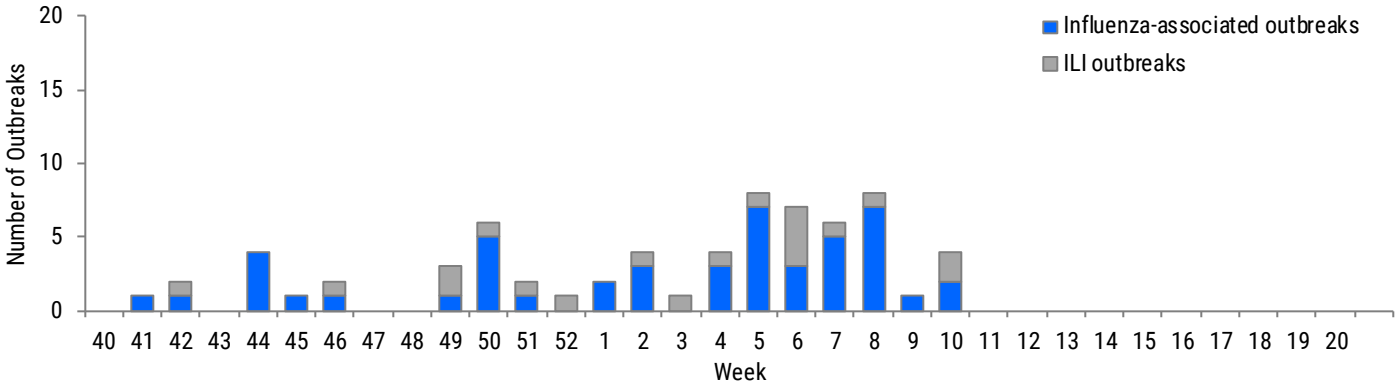
In week 10, three new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 10, **one influenza-associated outbreak** and **two ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 10, 2020.

Facilities Serving Adults ≥65 yrs.**:



4 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 10, four new outbreaks of influenza or ILI were reported among facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

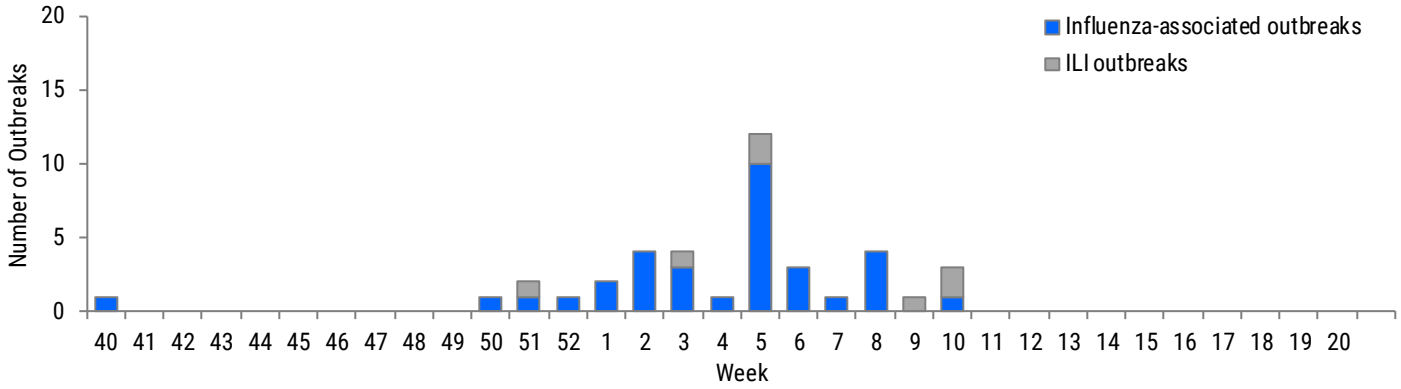
Figure 12: In week 10, **two influenza-associated outbreaks** and **two ILI outbreaks** were reported among **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 10, 2020.

AMERICAN OVERSIGHT

Influenza and ILI Outbreaks

Other Facilities*:



3 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 10, three new outbreaks of influenza or ILI was reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 10, **two ILI outbreaks** and **one influenza-associated outbreak** were reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 10, 2020.

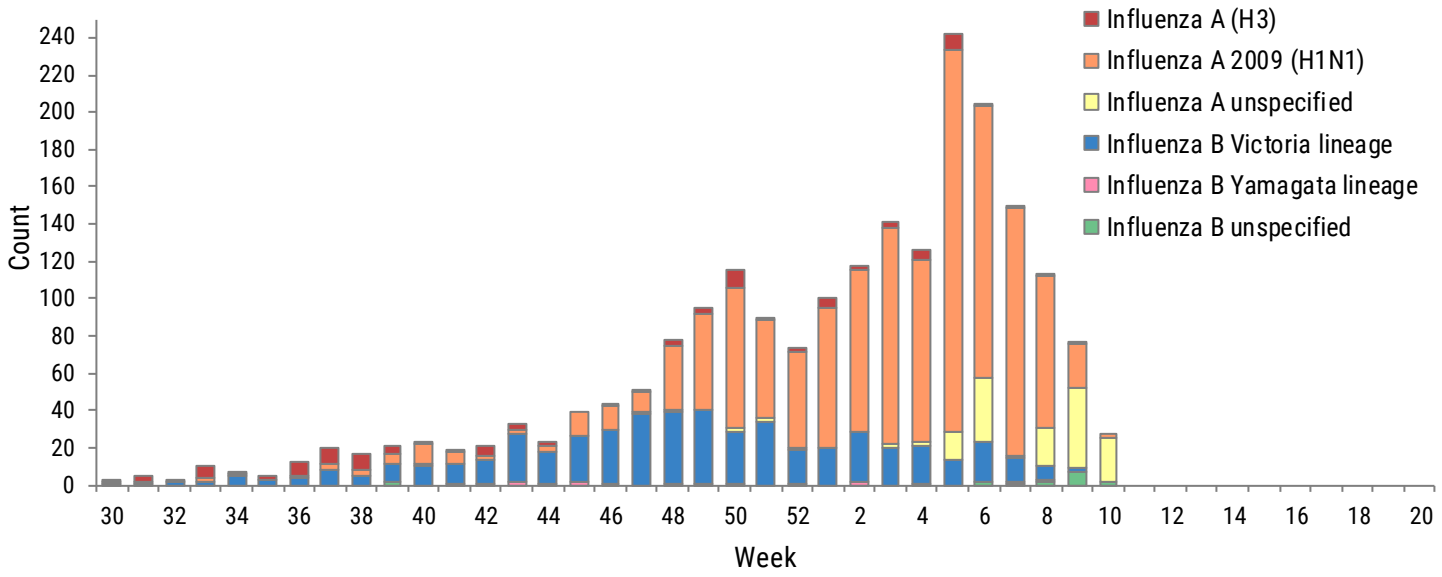


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

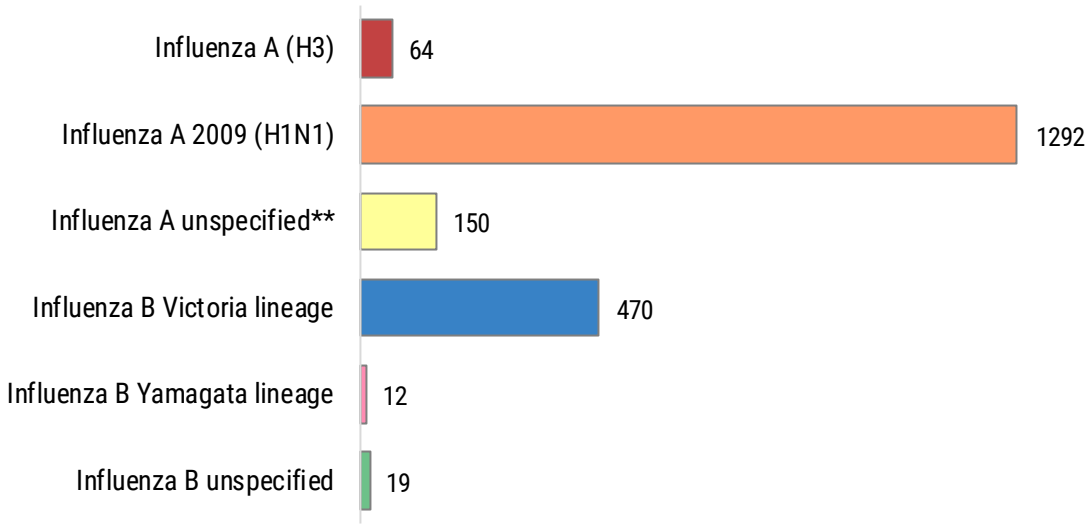
Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	133 (47.5%)	80 influenza-associated outbreaks 53 ILI outbreaks
Child daycares	40 (14.3%)	17 influenza-associated outbreaks 23 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	21 (7.5%)	10 influenza-associated outbreaks 11 ILI outbreaks
Nursing facilities	15 (5.4%)	12 influenza-associated outbreaks 3 ILI outbreaks
Other long-term care facilities	31 (11.1%)	26 influenza-associated outbreaks 5 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	33 (11.8%)	29 influenza-associated outbreaks 4 ILI outbreaks
Hospitals	3 (1.1%)	2 influenza-associated outbreaks 1 ILI outbreak
Additional facility types	4 (1.4%)	2 influenza-associated outbreaks 2 ILI outbreaks
Total	**280 (100.0%)**	**178 influenza-associated outbreaks** **102 ILI outbreaks**

AMERICAN OVERSIGHT



Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 10, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 10, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=370) from week 40, 2016 to week 10, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity increased** during week 10 and was above peak activity observed during the 2016-17 season.

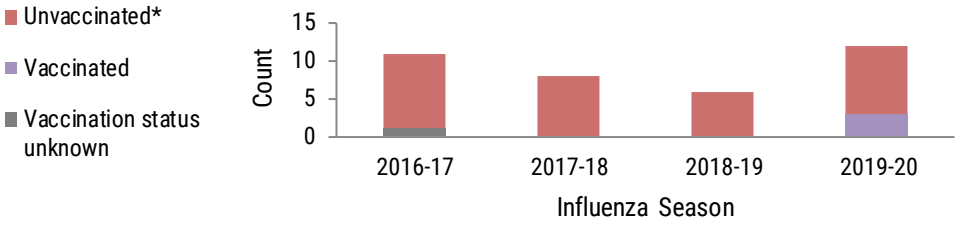
AMERICAN OVERSIGHT

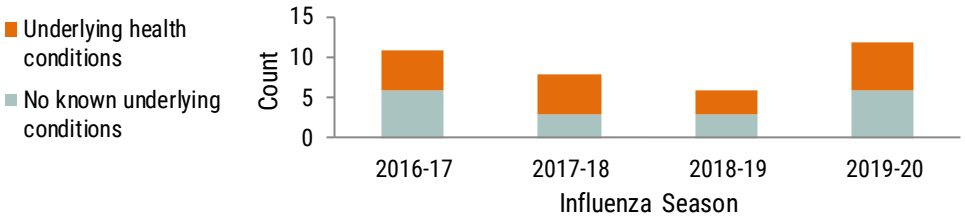
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 10, **the percent of emergency department and urgent care center visits for ILI in children <18 years increased** and was above levels observed at this time during the 2016-17 season.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 10, 2020.

Figures 25-26: In week 10, **two new influenza-associated pediatric deaths were reported**. A total of 12 influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 10, 2020.

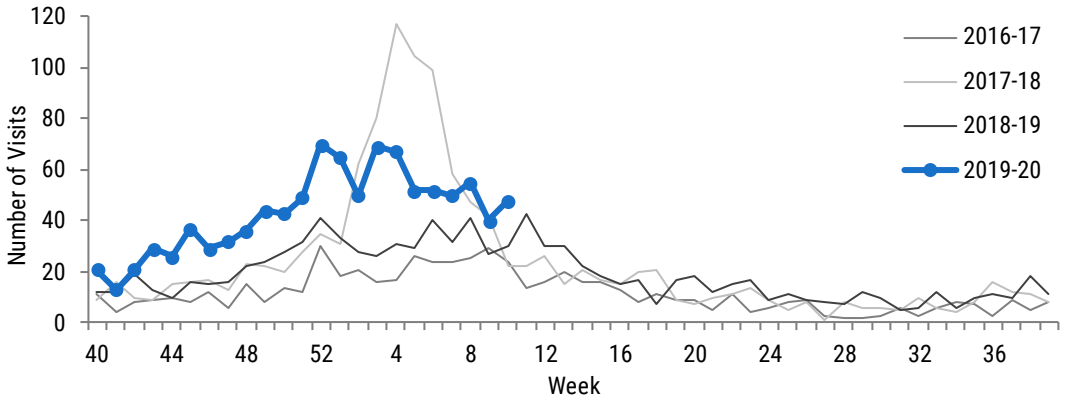
▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 10, 2020.

In week 10, **two new influenza-associated pediatric deaths were reported**. The first death was associated with influenza A 2009 (H1N1) in a child with known underlying medical conditions. The second was associated with influenza B in a child with known underlying medical conditions. Both were vaccinated for the 2019-20 season.

A total of 12 influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in March or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm



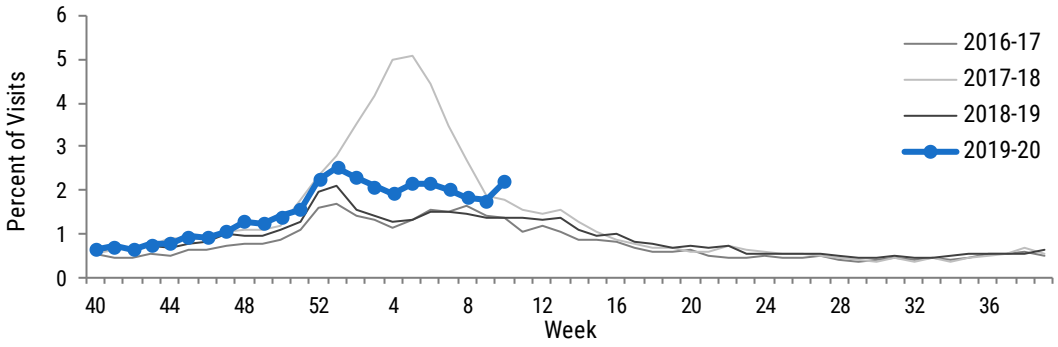
AMERICAN OVERSIGHT

At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 10, the **number of emergency department and urgent care center visits for influenza among pregnant women increased** and was above peak levels observed during the 2016-17 and 2018-19 seasons.



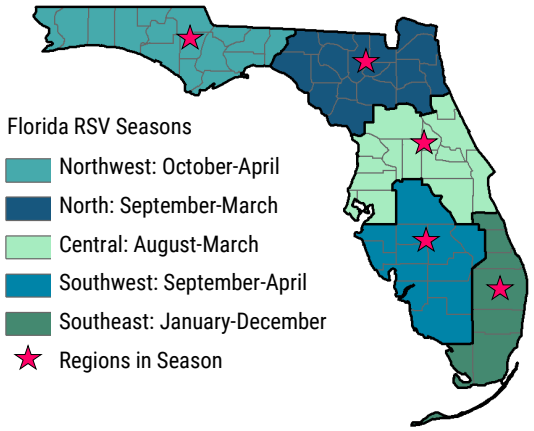
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 10, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 10, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years increased** and was above levels observed at this time during the 2016-17 and 2018-19 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 10, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

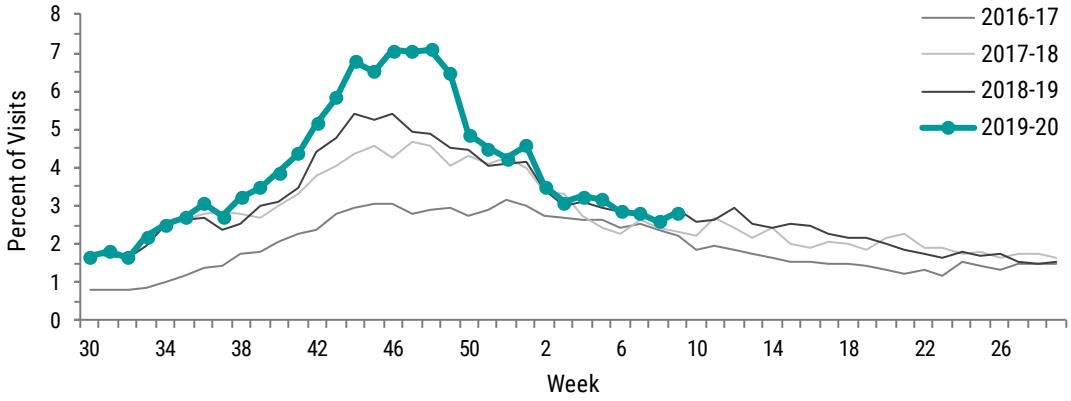
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

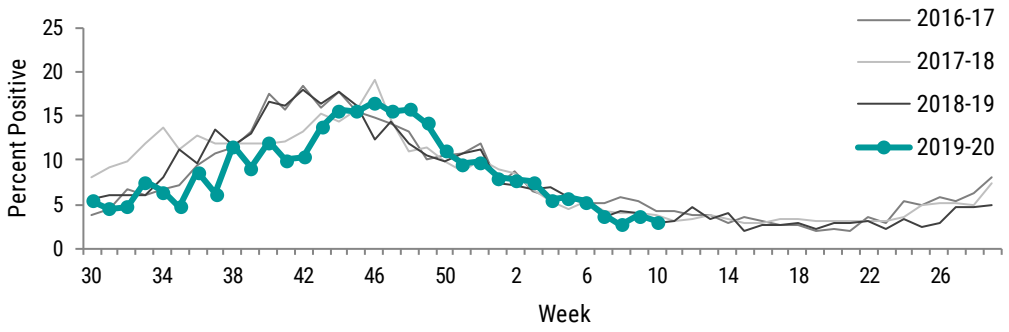
Week 10 (February 23-29, 2020) Activity Summary

In week 10, RSV activity in children <5 years increased and was similar to levels observed at this time in 2019.

No new RSV-associated outbreaks were reported in week 10. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 10, **the percent of emergency department and urgent care center visits for RSV among children <5 years increased** and was similar to levels observed at this time in 2019.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 10, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 10, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
No notable outbreaks were reported in week 10, 2020.							

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=370) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 10, 2020 Florida Flu Review
Date:	Wednesday, March 11, 2020 4:18:09 PM
Attachments:	Week 10, 2020 Florida Flu Review.pdf

Good afternoon!

Attached is the week 10, Florida Flu Review.

Week 10 influenza & influenza-like illness (ILI) activity summary:

Activity increased in week 10 and was above peak levels observed in the 2016-17 and 2018-19 seasons. Increases were observed in all regions of the state.

Ten outbreaks were reported, up from nine outbreaks in the previous week. Of the ten outbreaks reported, four were influenza-associated and six were ILI.

Two new influenza-associated pediatric deaths were reported, both in vaccinated individuals with known underlying medical conditions. Twelve influenza-associated pediatric deaths have been reported so far this season; only three children were vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On January 10, 2020, CDC issued a health advisory reminding clinicians to reiterate vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Thank you!

Florida ILI Surveillance System Summary 16

Background

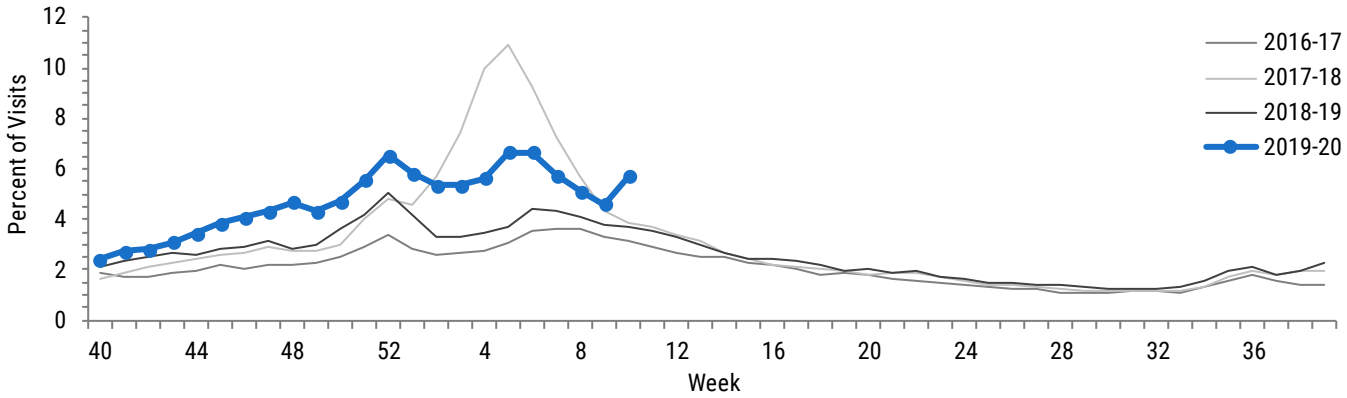
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



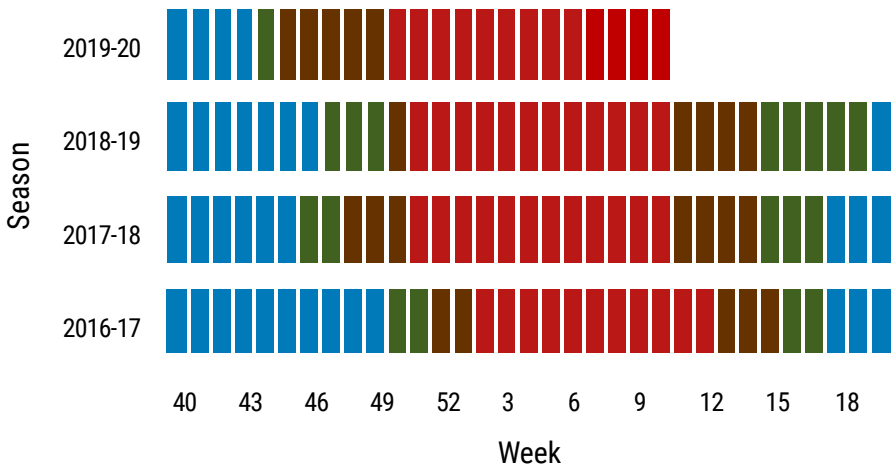
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 10, **the percent of emergency department and urgent care center visits for ILI statewide increased** and was above peak levels observed during the 2016-17 and 2018-19 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=370) statewide for the current season (week 40, 2019 to week 10, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 10, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 10, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

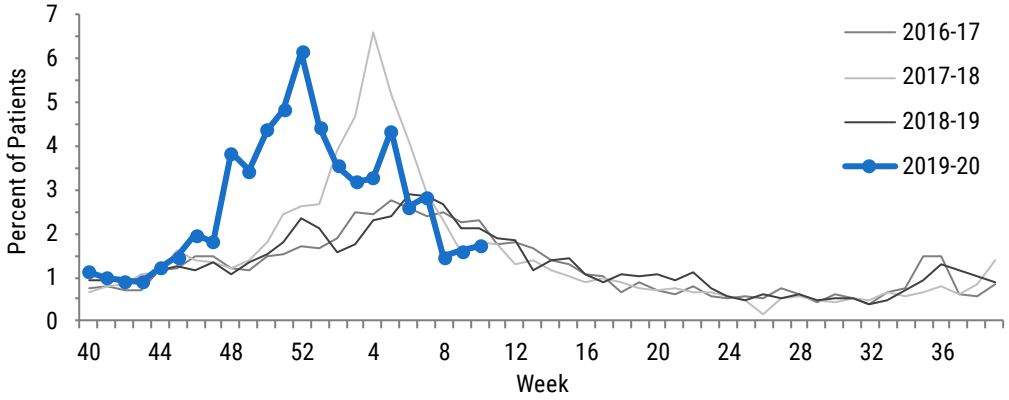
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 10, **the percent of patients with ILI reported by ILINet providers statewide increased** and was within levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=8), week 40, 2016 to week 10, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



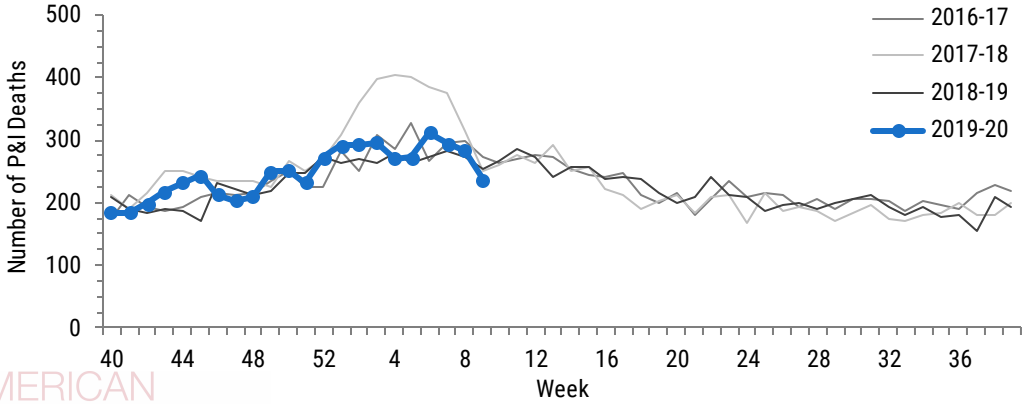


Figure 4: In week 9 (ending 2/29/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was slightly below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 9, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

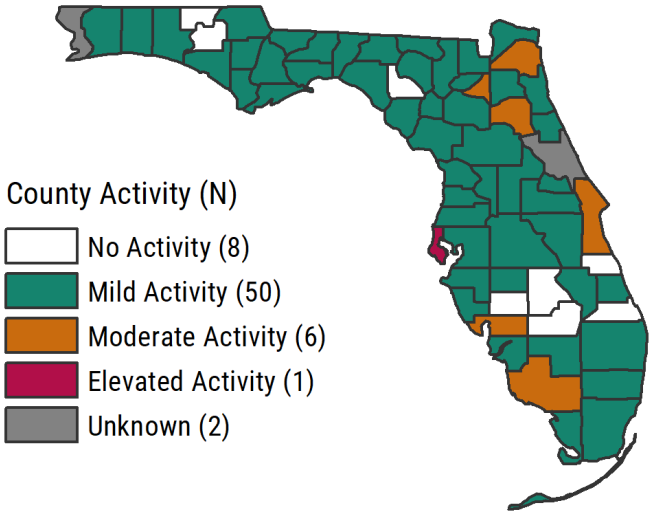
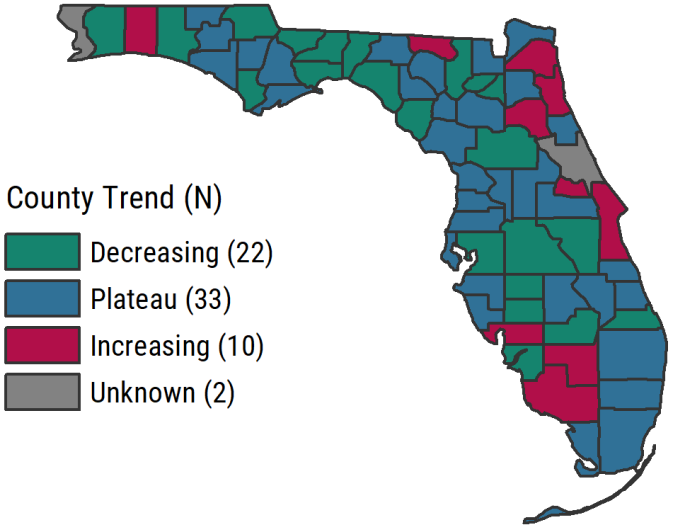
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 10. Six counties reported **moderate activity,** and one county reported **elevated activity.**





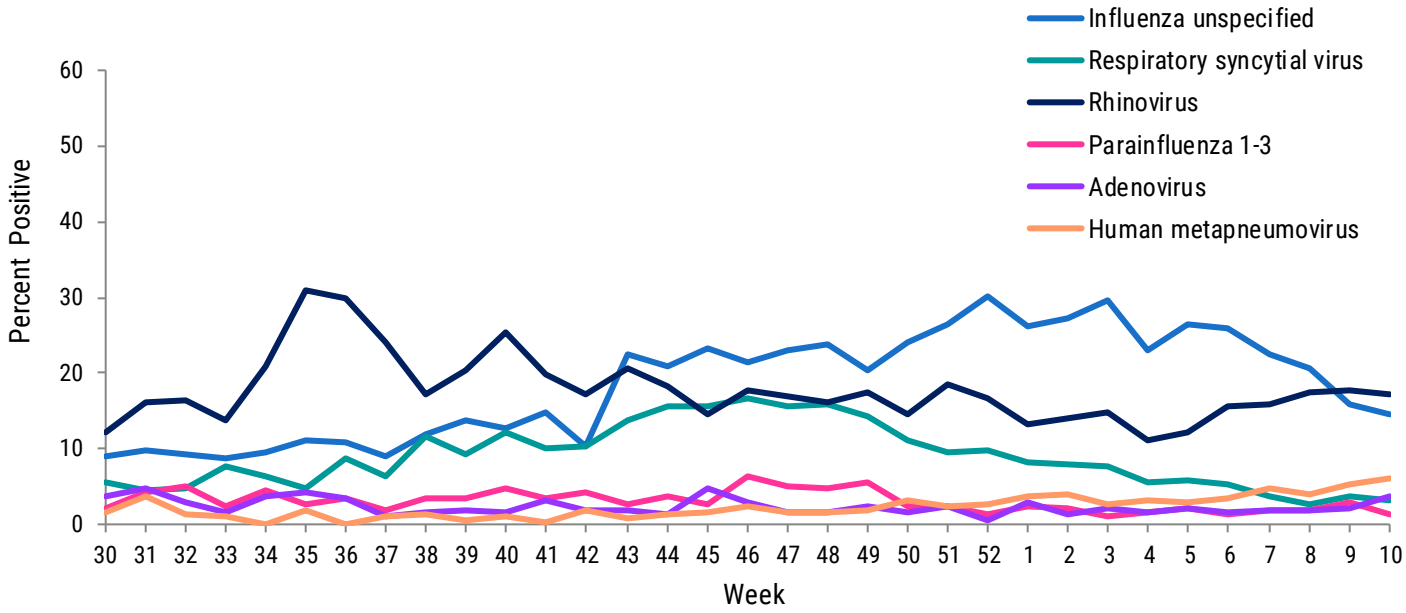


Figure 7: Most counties reported **activity at a plateau** for week 10. Ten counties reported **increasing activity,** and 22 counties reported **decreasing activity**.

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: The **percent of specimens testing positive for influenza decreased** in recent weeks. In week 10, **percent of specimens testing positive for rhinovirus** was higher than other respiratory viruses under surveillance.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=9), week 40, 2019 to week 10, 2020.

AMERICAN OVERSIGHT

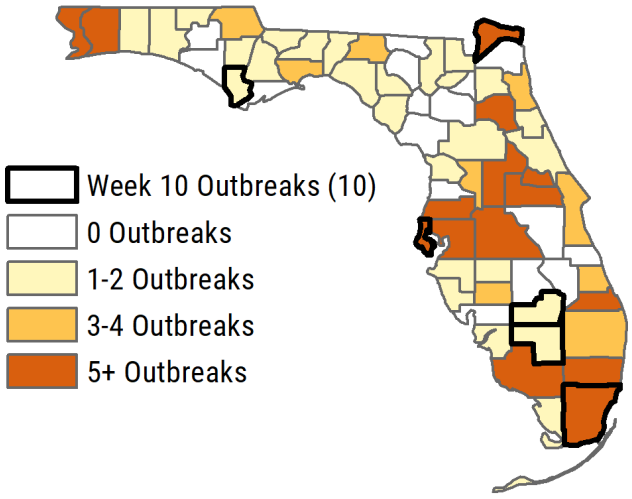
Influenza and ILI Outbreaks

Week 10 Outbreaks at a Glance:

Number Reported:
10 Outbreaks

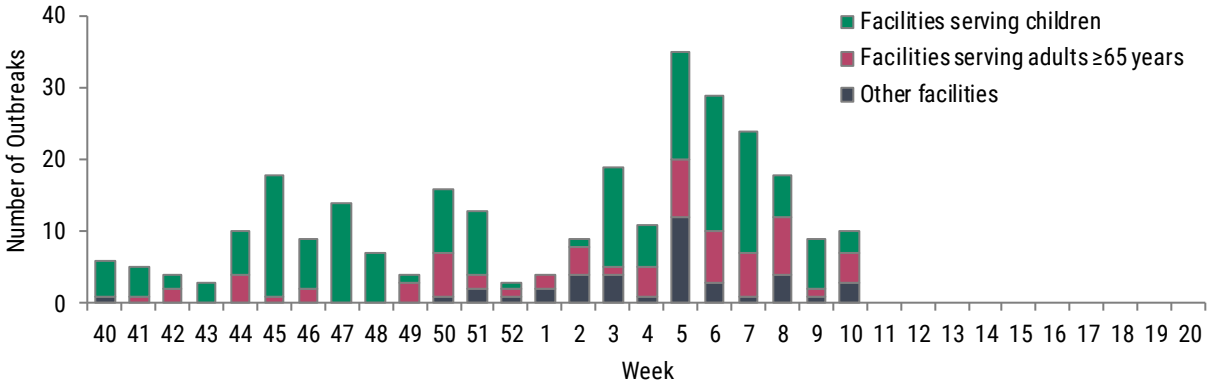
Influenza-Associated:
4 Outbreaks



Severe Outcomes*:
0 Outbreaks

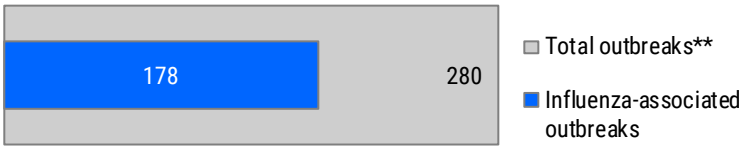
Outbreak Summary:

In week 10, four influenza-associated and six ILI outbreaks were reported, a slight increase from the previous week.



Severe outcomes* were not reported in any of these outbreaks.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities).



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 10 are **outlined in bold.**

Figure 9: In week 10, **four outbreaks** were reported among **facilities serving adults aged ≥65 years, three outbreaks** were reported in **facilities serving children,** and **three outbreaks** were reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 10, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 10, **63.6% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 10, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

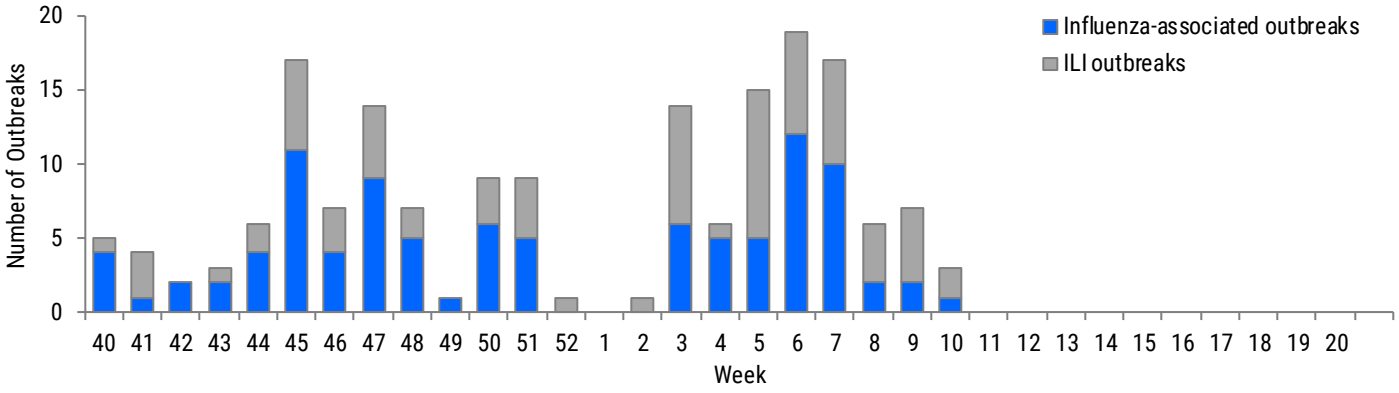
Influenza and ILI Outbreaks

Facilities Serving Children*:



3 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

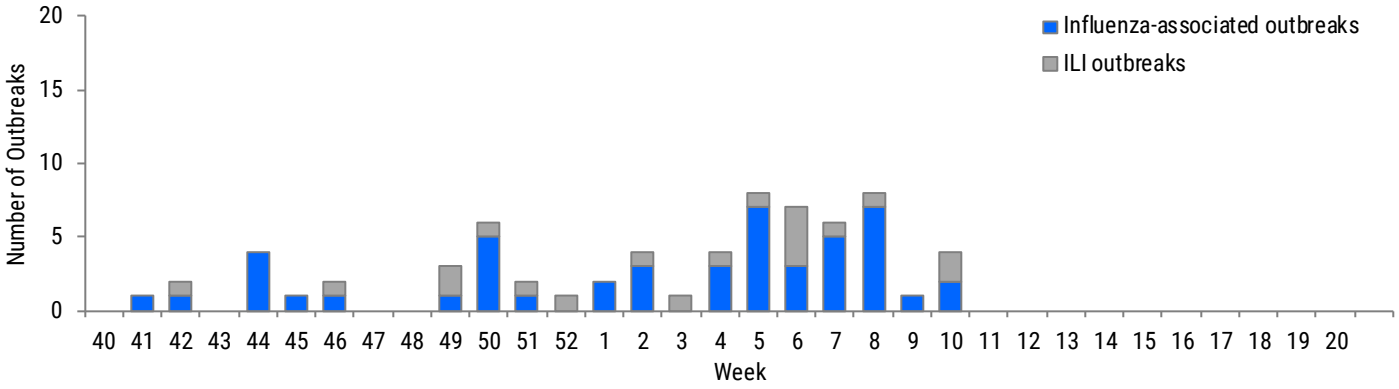
In week 10, three new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 10, **one influenza-associated outbreak** and **two ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 10, 2020.

Facilities Serving Adults ≥65 yrs.**:



4 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 10, four new outbreaks of influenza or ILI were reported among facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 10, **two influenza-associated outbreaks** and **two ILI outbreaks** were reported among **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 10, 2020.

AMERICAN OVERSIGHT

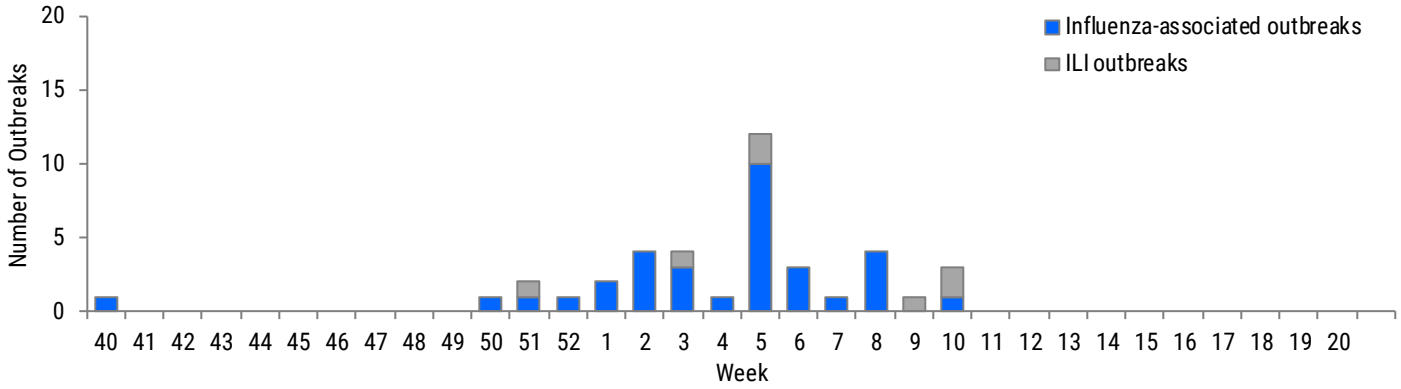
Influenza and ILI Outbreaks

Other Facilities*:



3 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 10, three new outbreaks of influenza or ILI was reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 10, **two ILI outbreaks** and **one influenza-associated outbreak** were reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 10, 2020.

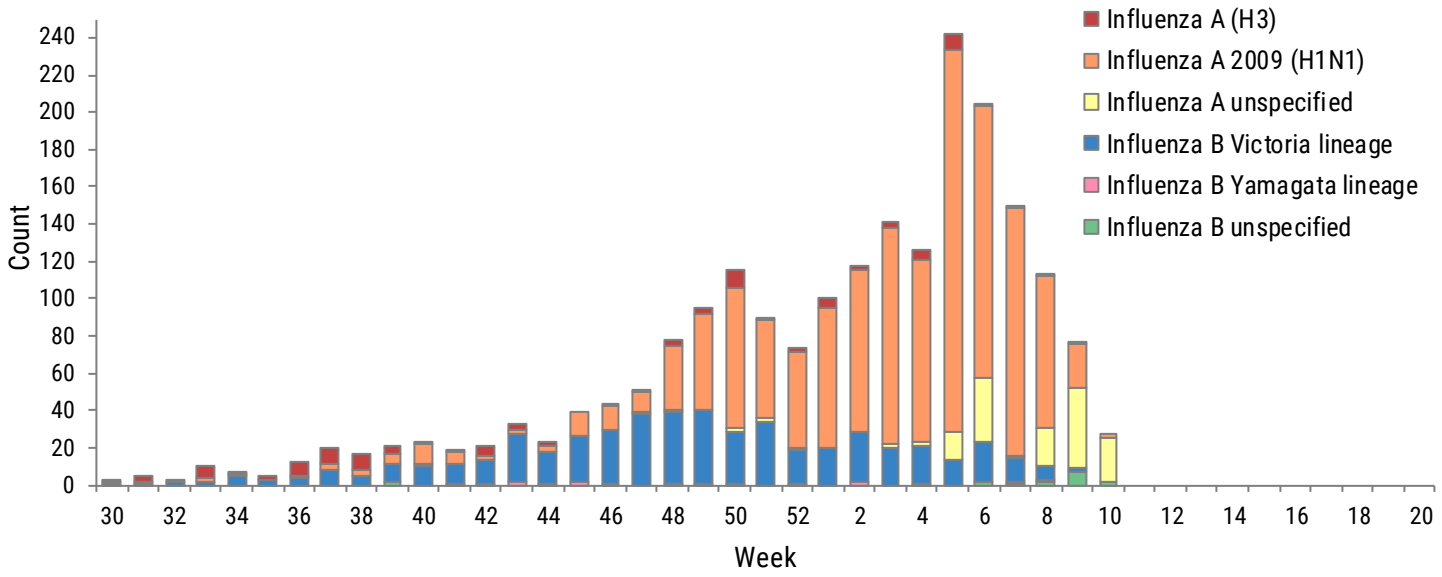


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	133 (47.5%)	80 influenza-associated outbreaks 53 ILI outbreaks
Child daycares	40 (14.3%)	17 influenza-associated outbreaks 23 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	21 (7.5%)	10 influenza-associated outbreaks 11 ILI outbreaks
Nursing facilities	15 (5.4%)	12 influenza-associated outbreaks 3 ILI outbreaks
Other long-term care facilities	31 (11.1%)	26 influenza-associated outbreaks 5 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	33 (11.8%)	29 influenza-associated outbreaks 4 ILI outbreaks
Hospitals	3 (1.1%)	2 influenza-associated outbreaks 1 ILI outbreak
Additional facility types	4 (1.4%)	2 influenza-associated outbreaks 2 ILI outbreaks
Total	**280 (100.0%)**	**178 influenza-associated outbreaks** **102 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 10, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 10, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=370) from week 40, 2016 to week 10, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

Figure 16: In **region 1, ILI activity increased** during week 10 and was above peak activity observed during the 2016-17 season.

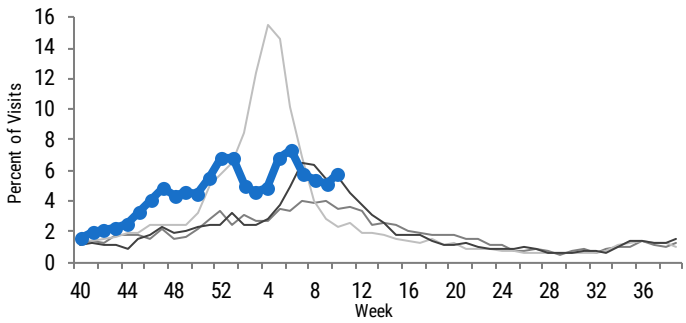

Figure 17: In **region 2, ILI activity increased** during week 10 and was above peak activity observed during the 2016-17 and 2018-19 seasons.

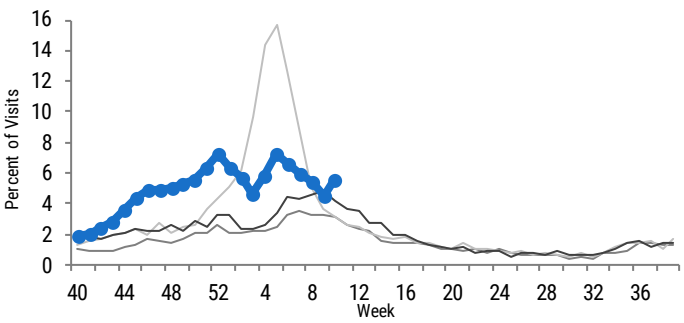

Figure 18: In **region 3, ILI activity increased** during week 10 and was above peak activity observed during the 2016-17 and 2018-19 seasons.

AMERICAN OVERSIGHT

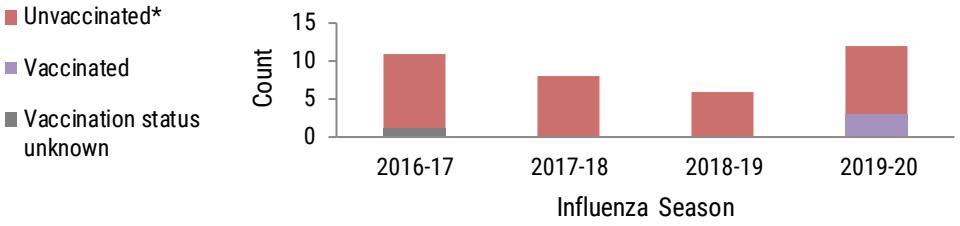
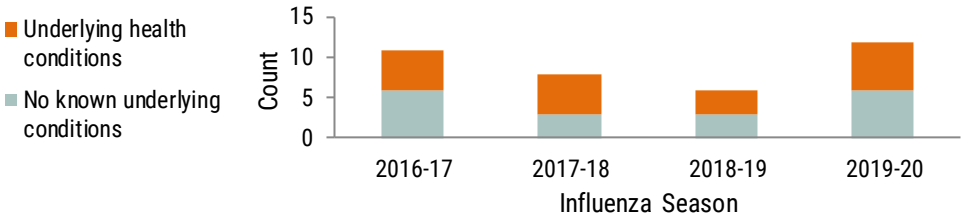
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 10, **the percent of emergency department and urgent care center visits for ILI in children <18 years increased** and was above levels observed at this time during the 2016-17 season.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 10, 2020.

Figures 25-26: In week 10, **two new influenza-associated pediatric deaths were reported**. A total of 12 influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 10, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 10, 2020.

In week 10, **two new influenza-associated pediatric deaths were reported**. The first death was associated with influenza A 2009 (H1N1) in a child with known underlying medical conditions. The second was associated with influenza B in a child with known underlying medical conditions. Both were vaccinated for the 2019-20 season.

A total of 12 influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in March or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm

AMERICAN OVERSIGHT

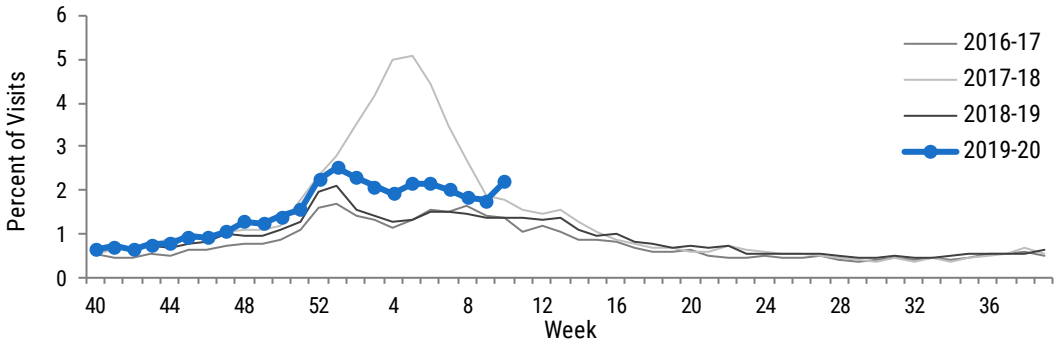
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 10, the **number of emergency department and urgent care center visits for influenza among pregnant women increased** and was above peak levels observed during the 2016-17 and 2018-19 seasons.



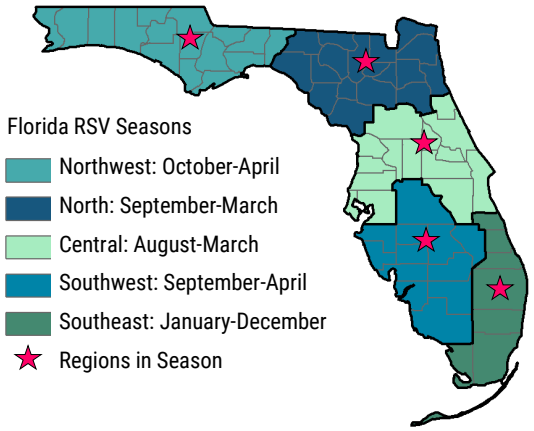
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 10, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 10, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years increased** and was above levels observed at this time during the 2016-17 and 2018-19 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 10, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

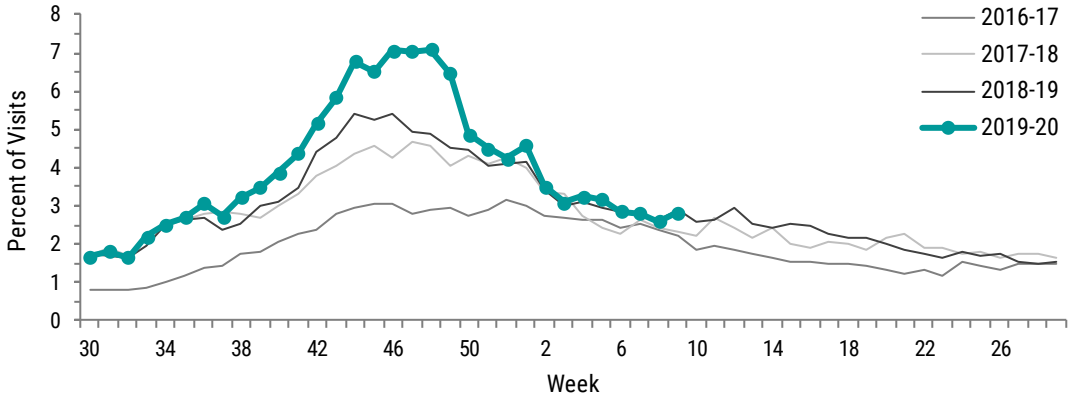
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

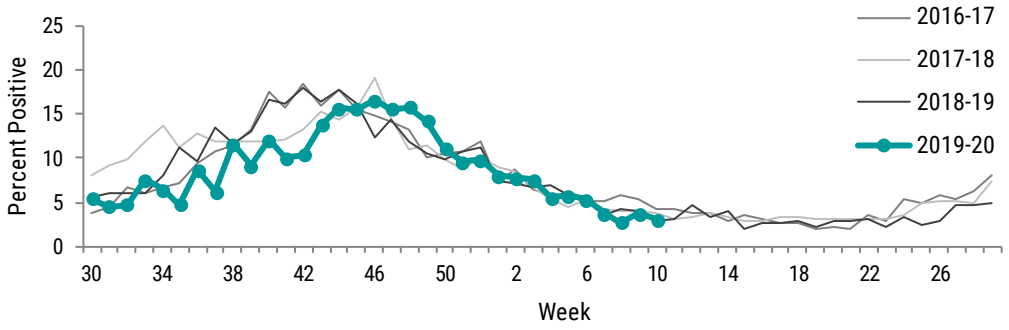
Week 10 (February 23-29, 2020) Activity Summary

In week 10, RSV activity in children <5 years increased and was similar to levels observed at this time in 2019.

No new RSV-associated outbreaks were reported in week 10. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 10, **the percent of emergency department and urgent care center visits for RSV among children <5 years increased** and was similar to levels observed at this time in 2019.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 10, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

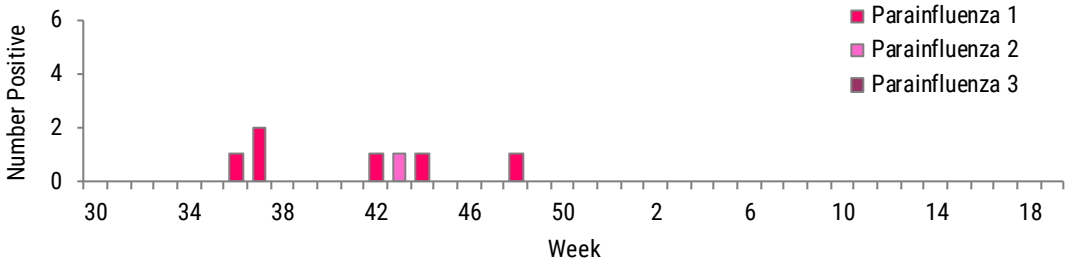
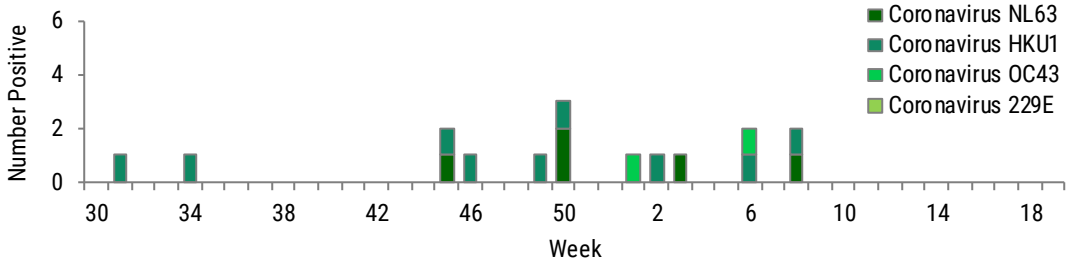
Other Respiratory Virus Surveillance





▲ **Figure 34** shows **the number of unique times a pathogen was associated with a respiratory outbreak** for outbreaks reported from week 30, 2019 to week 10, 2020.

◀ **Figure 35*** shows **the number of PCR-positive laboratory findings for enterovirus unspecified, enterovirus D68, and rhinovirus** by week** among specimens submitted to the Bureau of Public Health Laboratories (BPHL) for extended respiratory panel testing.

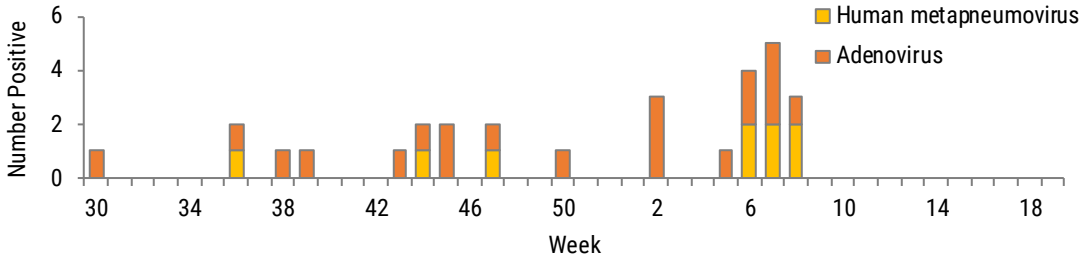


Figure 36* shows **the ▶ number of PCR-positive laboratory findings for parainfluenza 1-3** by week** among specimens submitted to BPHL for extended respiratory panel testing.

◀ **Figure 37*** shows **the number of PCR-positive laboratory findings for seasonal coronaviruses NL63, HKU1, OC43, and 229E** by week** among specimens submitted to BPHL for extended respiratory panel testing.

Figure 38* shows **the ▶ number of PCR-positive laboratory findings for human metapneumovirus and adenovirus** by week** among specimens submitted to BPHL for extended respiratory panel testing.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 10, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
No notable outbreaks were reported in week 10, 2020.							

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=370) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 10, 2020 Florida Flu Review
Date:	Wednesday, March 11, 2020 4:18:09 PM
Attachments:	Week 10, 2020 Florida Flu Review.pdf

Good afternoon!

Attached is the week 10, Florida Flu Review.

Week 10 influenza & influenza-like illness (ILI) activity summary:

Activity increased in week 10 and was above peak levels observed in the 2016-17 and 2018-19 seasons. Increases were observed in all regions of the state.

Ten outbreaks were reported, up from nine outbreaks in the previous week. Of the ten outbreaks reported, four were influenza-associated and six were ILI.

Two new influenza-associated pediatric deaths were reported, both in vaccinated individuals with known underlying medical conditions. Twelve influenza-associated pediatric deaths have been reported so far this season; only three children were vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On January 10, 2020, CDC issued a health advisory reminding clinicians to reiterate vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Thank you!

Florida ILI Surveillance System Summary 16

Background

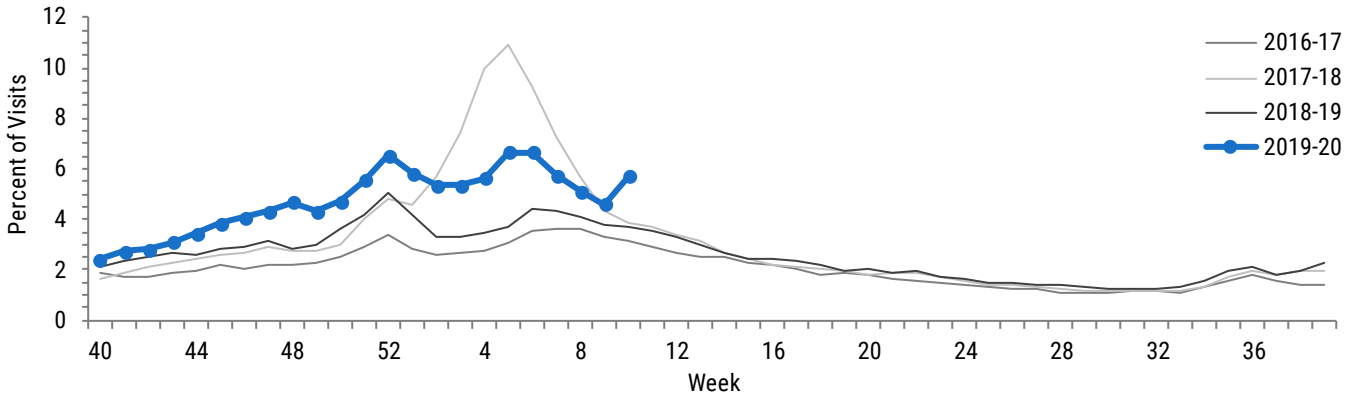
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



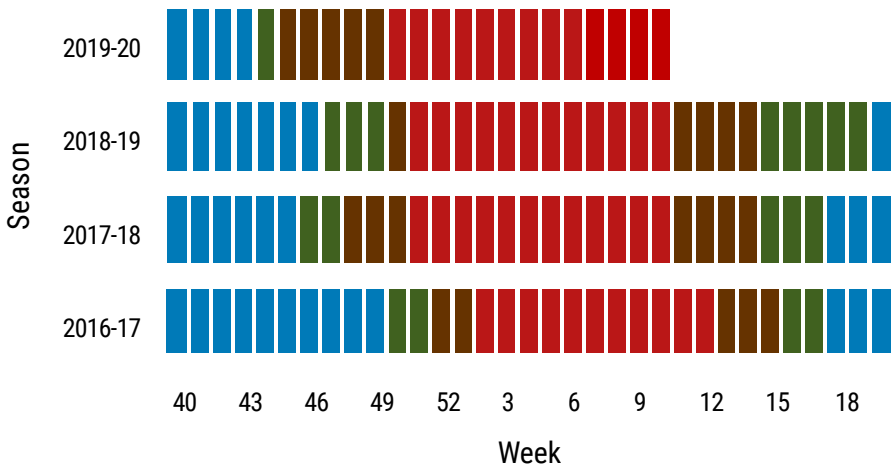
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 10, **the percent of emergency department and urgent care center visits for ILI statewide increased** and was above peak levels observed during the 2016-17 and 2018-19 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=370) statewide for the current season (week 40, 2019 to week 10, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 10, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 10, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

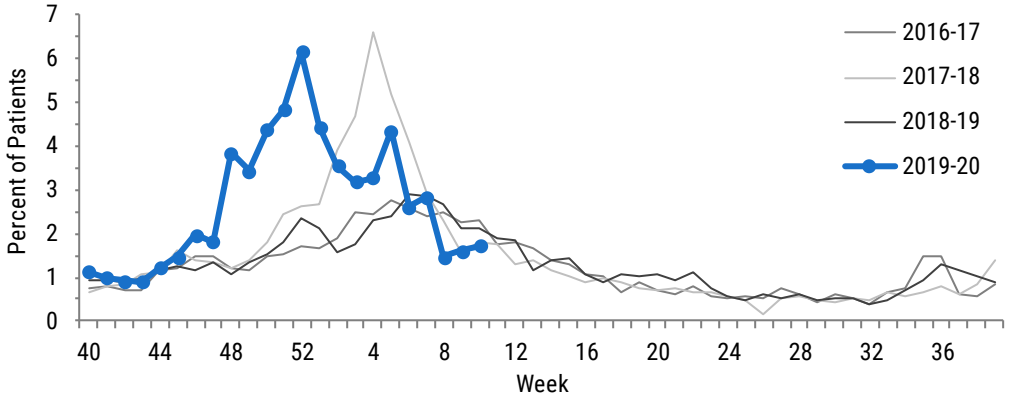
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 10, **the percent of patients with ILI reported by ILINet providers statewide increased** and was within levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=8), week 40, 2016 to week 10, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



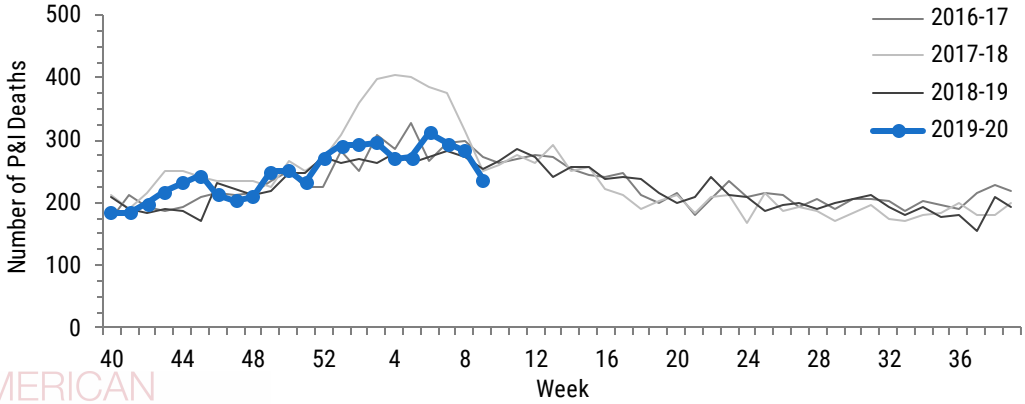


Figure 4: In week 9 (ending 2/29/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was slightly below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 9, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

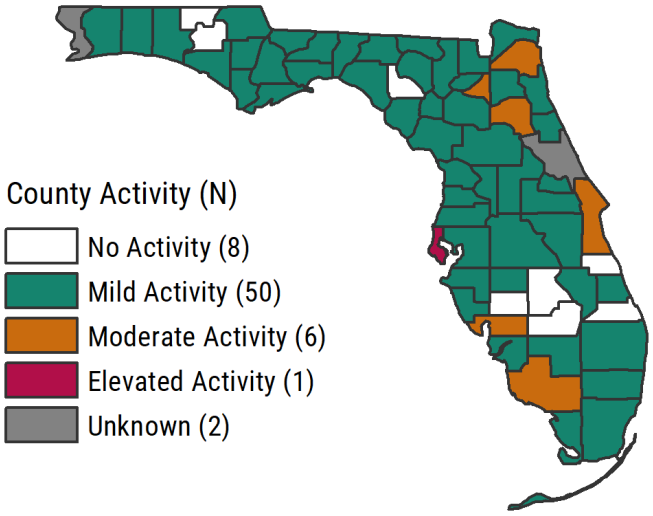
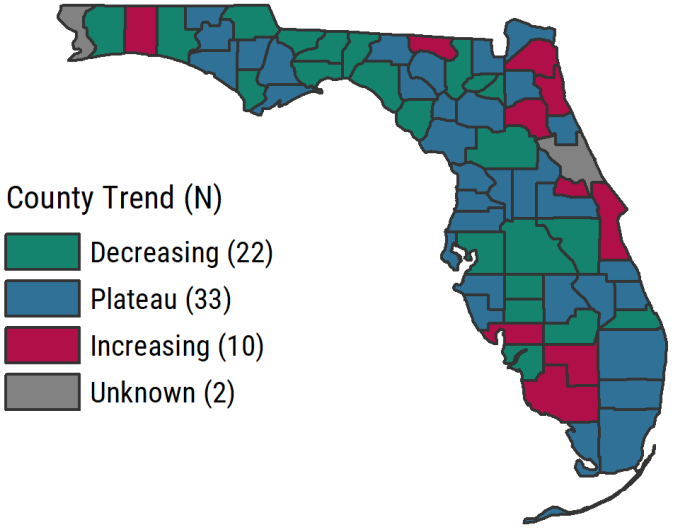
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 10. Six counties reported **moderate activity,** and one county reported **elevated activity.**





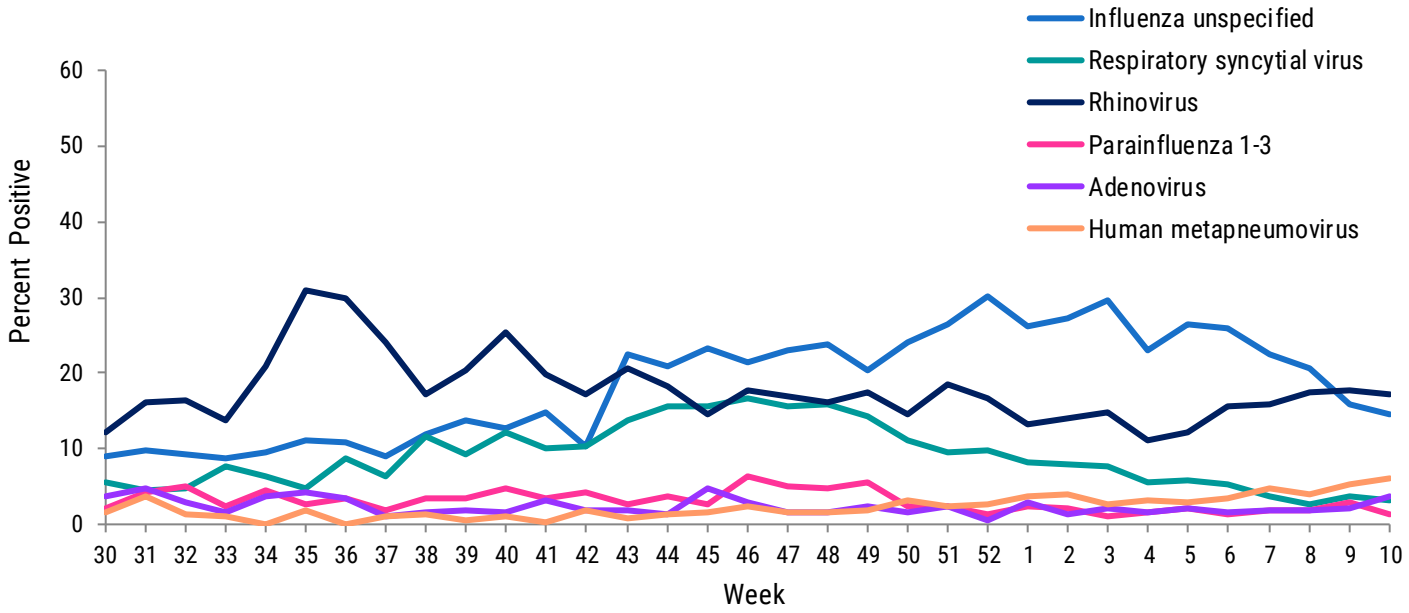


Figure 7: Most counties reported **activity at a plateau** for week 10. Ten counties reported **increasing activity,** and 22 counties reported **decreasing activity**.

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: The **percent of specimens testing positive for influenza decreased** in recent weeks. In week 10, **percent of specimens testing positive for rhinovirus** was higher than other respiratory viruses under surveillance.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=9), week 40, 2019 to week 10, 2020.

AMERICAN OVERSIGHT

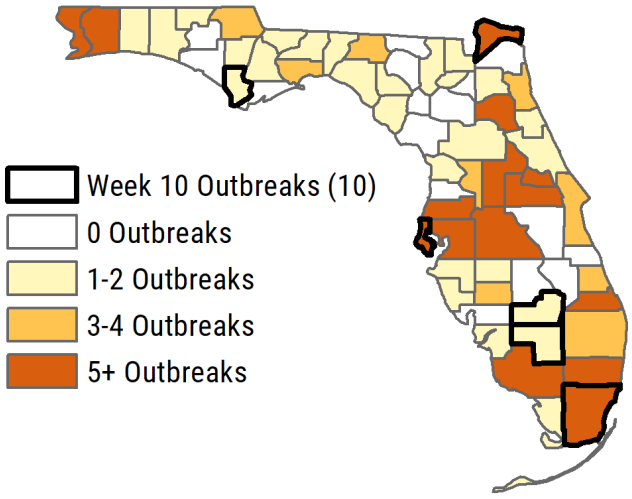
Influenza and ILI Outbreaks

Week 10 Outbreaks at a Glance:

Number Reported:
10 Outbreaks

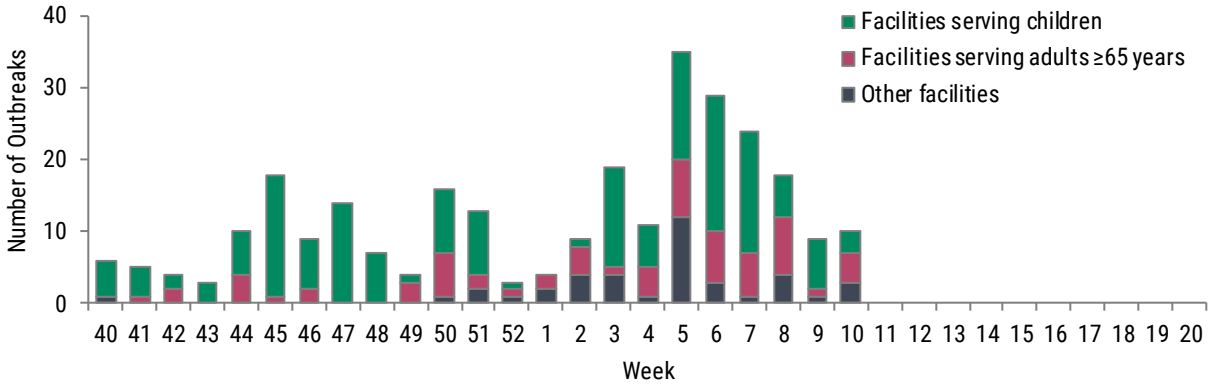
Influenza-Associated:
4 Outbreaks



Severe Outcomes*:
0 Outbreaks

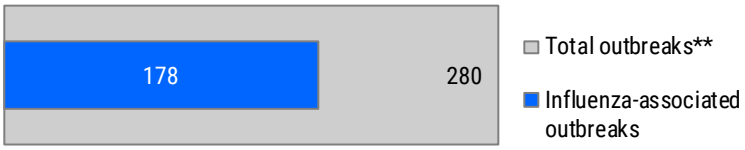
Outbreak Summary:

In week 10, four influenza-associated and six ILI outbreaks were reported, a slight increase from the previous week.



Severe outcomes* were not reported in any of these outbreaks.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities).



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 10 are **outlined in bold.**

Figure 9: In week 10, **four outbreaks** were reported among **facilities serving adults aged ≥65 years, three outbreaks** were reported in **facilities serving children,** and **three outbreaks** were reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 10, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 10, **63.6% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 10, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

AMERICAN OVERSIGHT

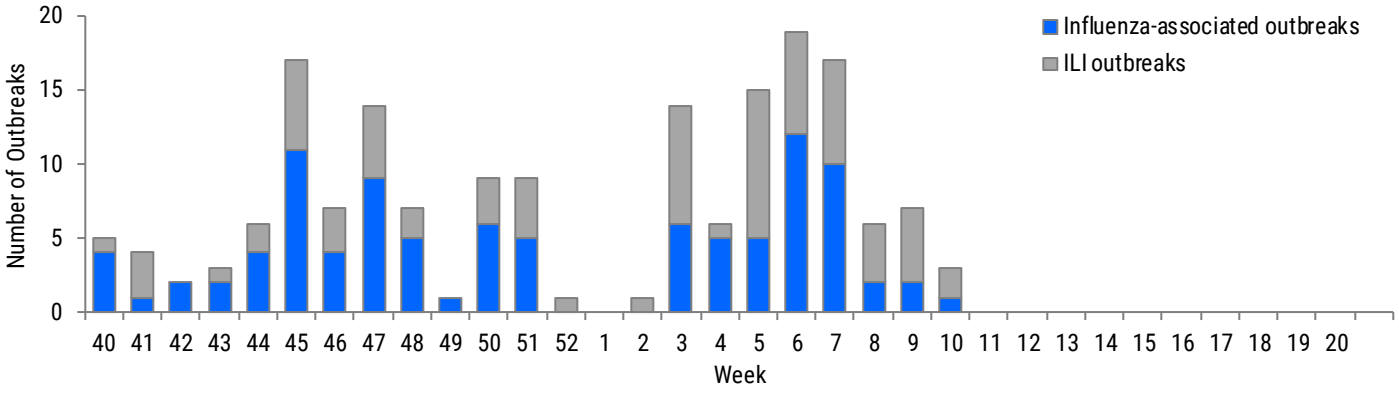
Influenza and ILI Outbreaks

Facilities Serving Children*:



3 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

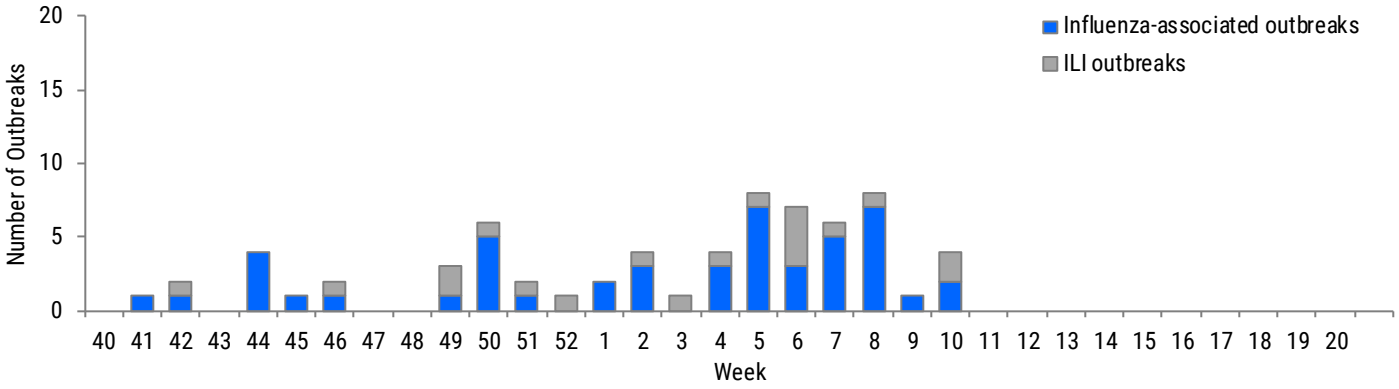
In week 10, three new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 10, **one influenza-associated outbreak** and **two ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 10, 2020.

Facilities Serving Adults ≥65 yrs.**:



4 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 10, four new outbreaks of influenza or ILI were reported among facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 10, **two influenza-associated outbreaks** and **two ILI outbreaks** were reported among **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 10, 2020.

AMERICAN OVERSIGHT

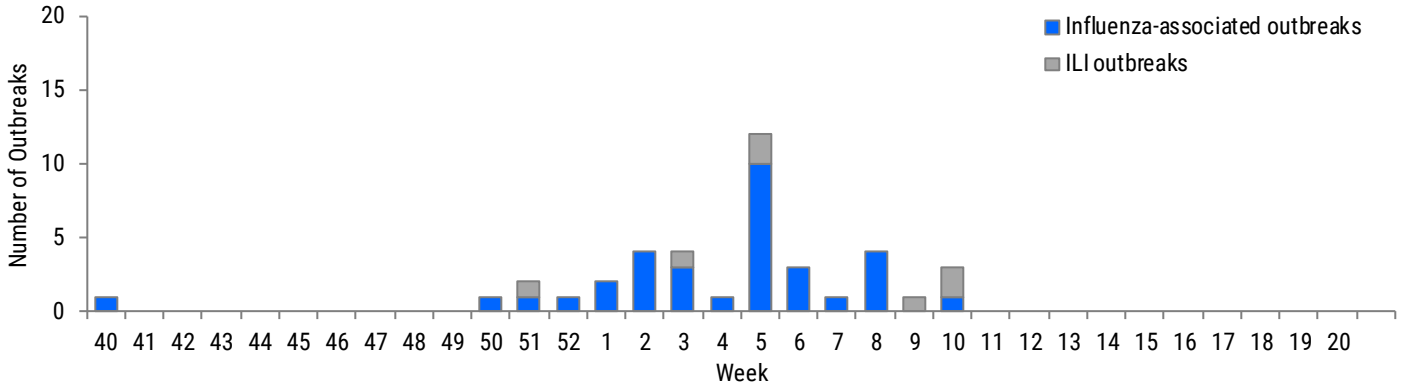
Influenza and ILI Outbreaks

Other Facilities*:



3 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 10, three new outbreaks of influenza or ILI was reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 10, **two ILI outbreaks** and **one influenza-associated outbreak** were reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 10, 2020.

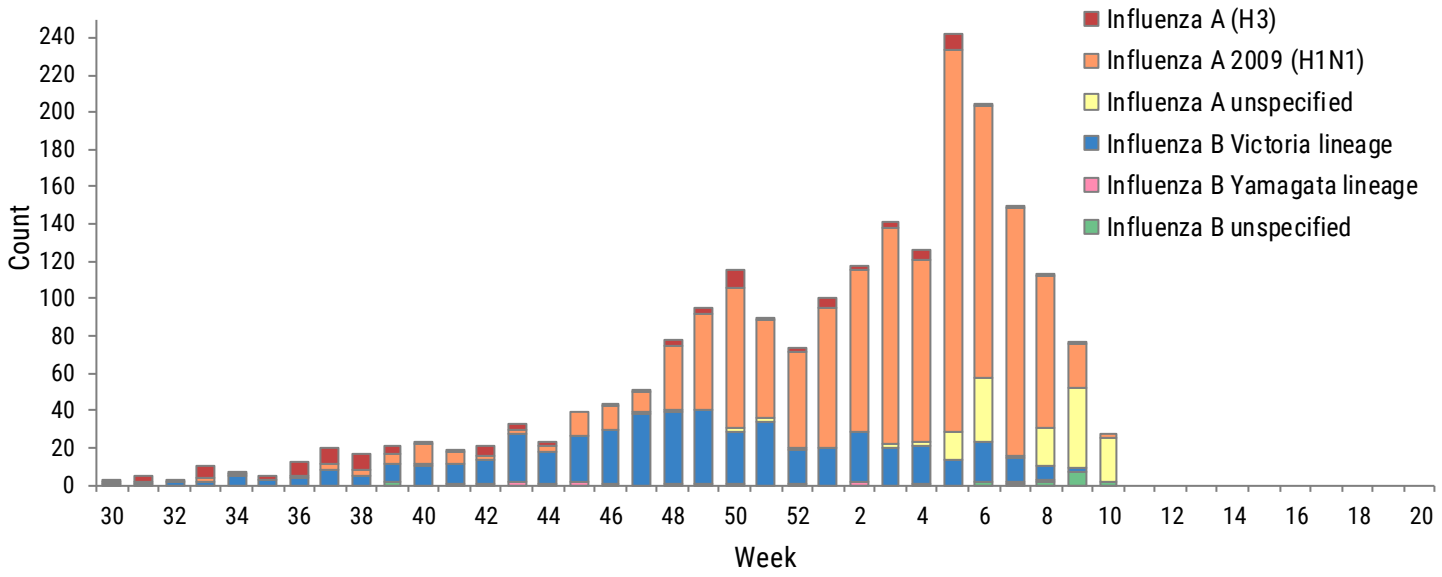


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	133 (47.5%)	80 influenza-associated outbreaks 53 ILI outbreaks
Child daycares	40 (14.3%)	17 influenza-associated outbreaks 23 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	21 (7.5%)	10 influenza-associated outbreaks 11 ILI outbreaks
Nursing facilities	15 (5.4%)	12 influenza-associated outbreaks 3 ILI outbreaks
Other long-term care facilities	31 (11.1%)	26 influenza-associated outbreaks 5 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	33 (11.8%)	29 influenza-associated outbreaks 4 ILI outbreaks
Hospitals	3 (1.1%)	2 influenza-associated outbreaks 1 ILI outbreak
Additional facility types	4 (1.4%)	2 influenza-associated outbreaks 2 ILI outbreaks
Total	**280 (100.0%)**	**178 influenza-associated outbreaks** **102 ILI outbreaks**

AMERICAN OVERSIGHT

Laboratory Surveillance

Figure 14: **Influenza A 2009 (H1N1)** continues to be the most common influenza virus identified at BPHL in recent weeks, and **influenza A 2009 (H1N1)** is the most common influenza subtype detected so far this season. **Influenza B Victoria lineage** was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

▲ **Figure 14** shows the number of **influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL)** by lab-event date,* week 30, 2019 through week 10, 2020.

Figure 15: **Influenza A 2009 (H1N1)** makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, **influenza B Victoria lineage** was the most common strain.

◀ **Figure 15** shows the number of **influenza-positive laboratory results for specimens submitted to BPHL** for the current 2019-20 influenza season, week 40, 2019 through week 10, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

*"Lab event date" is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.

AMERICAN OVERSIGHT

Regional Activity

Figures 16-22 show **the percent of emergency department and urgent care center visits for influenza-like illness (ILI)** at ESSENCE-FL participating facilities (n=370) from week 40, 2016 to week 10, 2020. Data are organized by region (see Figure 23).

2019-20 2018-19 2017-18 2016-17

AMERICAN OVERSIGHT

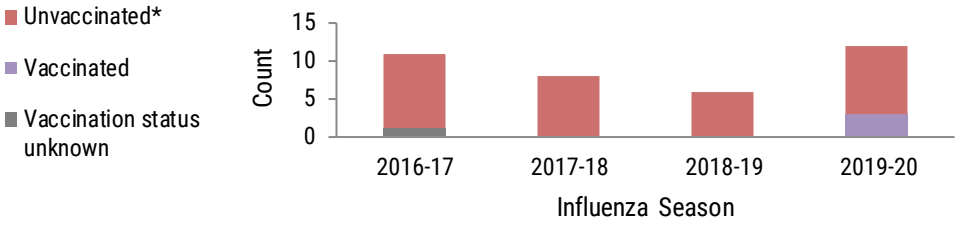
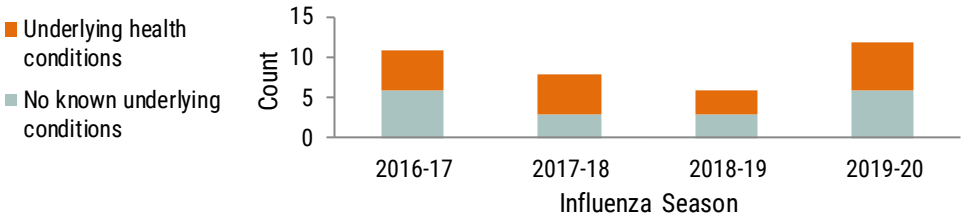
At-Risk Populations

Background: At-Risk Populations, Children



Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 10, **the percent of emergency department and urgent care center visits for ILI in children <18 years increased** and was above levels observed at this time during the 2016-17 season.



◀ **Figure 24** shows **the percent of influenza-like illness (ILI) visits among children <18 years** at emergency department and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 10, 2020.

Figures 25-26: In week 10, **two new influenza-associated pediatric deaths were reported**. A total of 12 influenza-associated pediatric deaths have been reported so far this season.

▲ **Figure 25** shows the number of **influenza-associated pediatric deaths** as reported in Merlin **by vaccination status**, week 40, 2016 to week 10, 2020.

▲ **Figure 26** shows the number of **influenza-associated pediatric deaths** as reported in Merlin by **medical history**, week 40, 2016 to week 10, 2020.

In week 10, **two new influenza-associated pediatric deaths were reported**. The first death was associated with influenza A 2009 (H1N1) in a child with known underlying medical conditions. The second was associated with influenza B in a child with known underlying medical conditions. Both were vaccinated for the 2019-20 season.

A total of 12 influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in March or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child's likelihood of dying from influenza by up to 60%.** For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

*The Advisory Committee on Immunization Practices (ACIP) recommends children aged six months to eight years receive two doses of influenza vaccine administered a minimum of four weeks apart during their first season of vaccination for optimal protection. The Florida Department of Health includes children in this age group who did not receive a second influenza vaccine in this unvaccinated category. To learn more about the ACIP's 2019-20 recommendations, please visit: www.cdc.gov/mmwr/volumes/68/rr/rr6803a1.htm

AMERICAN OVERSIGHT

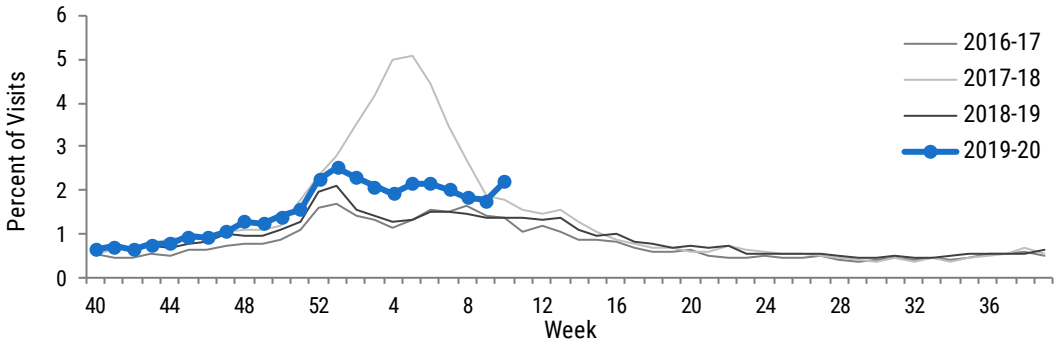
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 10, the **number of emergency department and urgent care center visits for influenza among pregnant women increased** and was above peak levels observed during the 2016-17 and 2018-19 seasons.



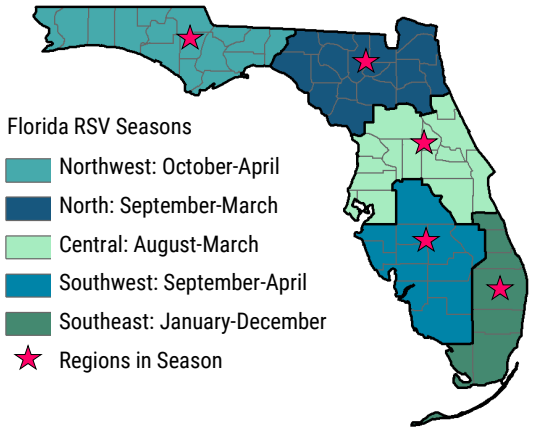
◀ **Figure 27** shows the **number of visits* to emergency departments and urgent care centers with chief complaints of influenza and pregnancy**, as reported in ESSENCE-FL, week 40, 2016 to week 10, 2020.

*This count **underrepresents** the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, **the overall trend** has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 10, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years increased** and was above levels observed at this time during the 2016-17 and 2018-19 seasons.



◀ **Figure 28** shows **the percent of influenza-like illness (ILI) visits among adults ≥65 years old** at emergency departments and urgent care centers, as reported into ESSENCE-FL, week 40, 2016 to week 10, 2020.

AMERICAN OVERSIGHT

Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

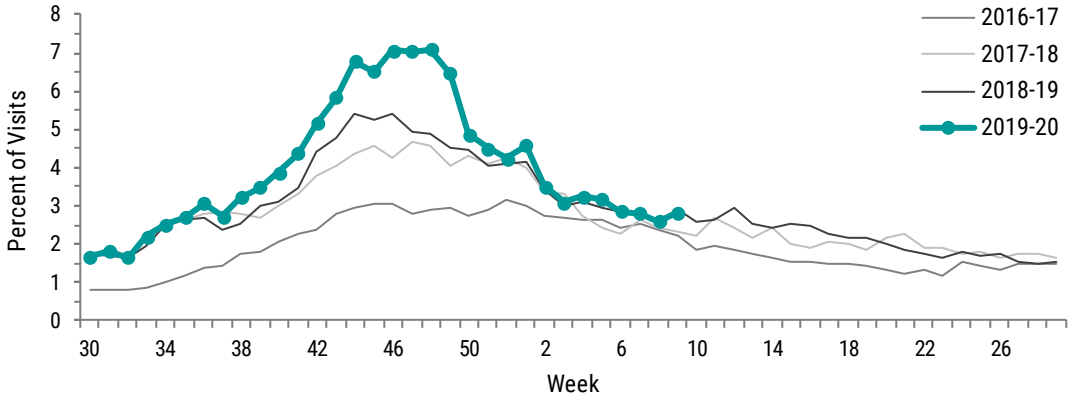
▲ **Figure 29** shows **Florida's RSV regional season breakdown.** Regions that are currently in RSV season are marked with **pink stars.**

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants.

The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida's RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). **Currently, all of Florida's regions are in RSV season.**



To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

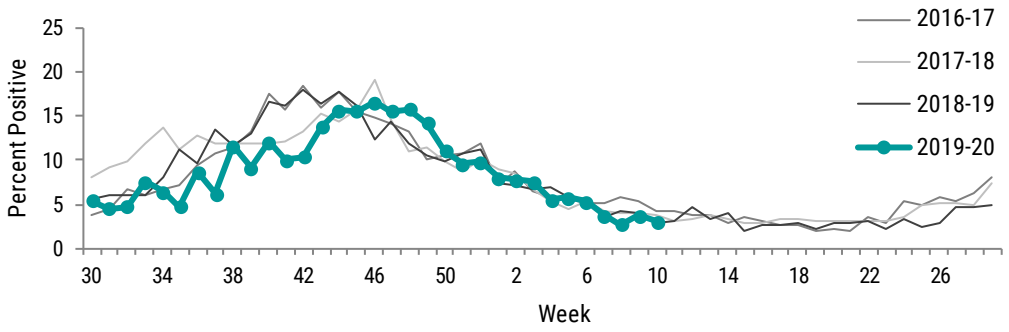
Week 10 (February 23-29, 2020) Activity Summary

In week 10, RSV activity in children <5 years increased and was similar to levels observed at this time in 2019.

No new RSV-associated outbreaks were reported in week 10. A total of nine RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 10, **the percent of emergency department and urgent care center visits for RSV among children <5 years increased** and was similar to levels observed at this time in 2019.

◀ **Figure 30** shows **the percent of emergency department and urgent care center visits with discharge diagnoses that include RSV or RSV-associated illness among children <5 years***, as reported in ESSENCE-FL, week 30, 2016 to week 10, 2020.



*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

AMERICAN OVERSIGHT

RSV Surveillance

Figure 31: In week 10, **the percent of specimens testing positive for RSV decreased.** Levels were similar to those observed at this time in previous seasons.

◀ **Figure 37*** shows **the number of PCR-positive laboratory findings for seasonal coronaviruses NL63, HKU1, OC43, and 229E** by week** among specimens submitted to BPHL for extended respiratory panel testing.

Figure 38* shows **the ▶ number of PCR-positive laboratory findings for human metapneumovirus and adenovirus** by week** among specimens submitted to BPHL for extended respiratory panel testing.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

AMERICAN OVERSIGHT

Summary of Notable Outbreaks

Table 2: Summary of Notable* Influenza-Associated, Respiratory Syncytial Virus (RSV)-Associated, and Influenza-like Illness (ILI) Outbreaks Reported in Week 10, 2020

Setting	County	Number of Cases	Number of Cases Hospitalized	Number of Cases Died	Outbreak Etiology	Control Measures Recommended to Facility Leadership	Investigation Status
No notable outbreaks were reported in week 10, 2020.							

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=370) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For pneumonia and influenza (P&I) mortality surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV on death certificates. Any mention of RSV, syncytial, and bronchiolitis in the death certificate literals, with certain exceptions, is counted as a RSV death. These deaths are also investigated to ensure they meet case definition.

Florida ILINet Data source for figures 2 and 3

ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories for virologic surveillance. For healthcare providers interested in enrolling in ILINet, contact your local county health department.

ILINet is also used as a portal in which the Florida Department of Health reports Florida's geographic spread of influenza each week to the Centers for Disease Control and Prevention (CDC). Geographic spread is not an indication of influenza severity. Geographic spread can be reported as sporadic, local, regional, or widespread.

- Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza has been reported but there is no increase in cases of ILI
- Local: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state
- Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions
- Widespread: outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

County Influenza Activity in EpiGateway Data source for figure 5 and 6

County health department (CHD) epidemiologists report their county's influenza and ILI surveillance data weekly into The Florida Department of Health's EpiGateway website. Data from these reports is used to classify influenza activity as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported by CHDs as available. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Laboratory Viral Respiratory Surveillance Data source for figures 7 and 31

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a CDC surveillance system that captures on eight commonly circulating respiratory viruses as reported by participating laboratories in Florida. NREVSS data are combined with validated electronic laboratory data from Florida laboratories that submit RSV laboratory results via electronic laboratory reporting. Together, this information is used to monitor the temporal and geographic patterns of these viruses.

Outbreak Reporting in Merlin Data source for figures 8-13, 32-34; tables 1 and 2

Outbreak investigations are tracked in Merlin (Florida's reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.

AMERICAN OVERSIGHT

Summary of Included Surveillance Systems Continued

- RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
- Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
- Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child's death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of 'novel influenza A.' Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.

Subject:	Week 10, 2020 Florida Flu Review
Date:	Wednesday, March 11, 2020 4:18:04 PM
Attachments:	Week 10, 2020 Florida Flu Review.pdf

Good afternoon!

Attached is the week 10, Florida Flu Review.

Week 10 influenza & influenza-like illness (ILI) activity summary:

Activity increased in week 10 and was above peak levels observed in the 2016-17 and 2018-19 seasons. Increases were observed in all regions of the state.

Ten outbreaks were reported, up from nine outbreaks in the previous week. Of the ten outbreaks reported, four were influenza-associated and six were ILI.

Two new influenza-associated pediatric deaths were reported, both in vaccinated individuals with known underlying medical conditions. Twelve influenza-associated pediatric deaths have been reported so far this season; only three children were vaccinated for the 2019-20 season.

Influenza A 2009 (H1N1) remained the predominant strain.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. It is especially important for people at higher risk for complications (children, adults =65 years, pregnant women, and people with underlying medical conditions).

On January 10, 2020, CDC issued a health advisory reminding clinicians to reiterate vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Thank you!

Florida ILI Surveillance System Summary 16

Background

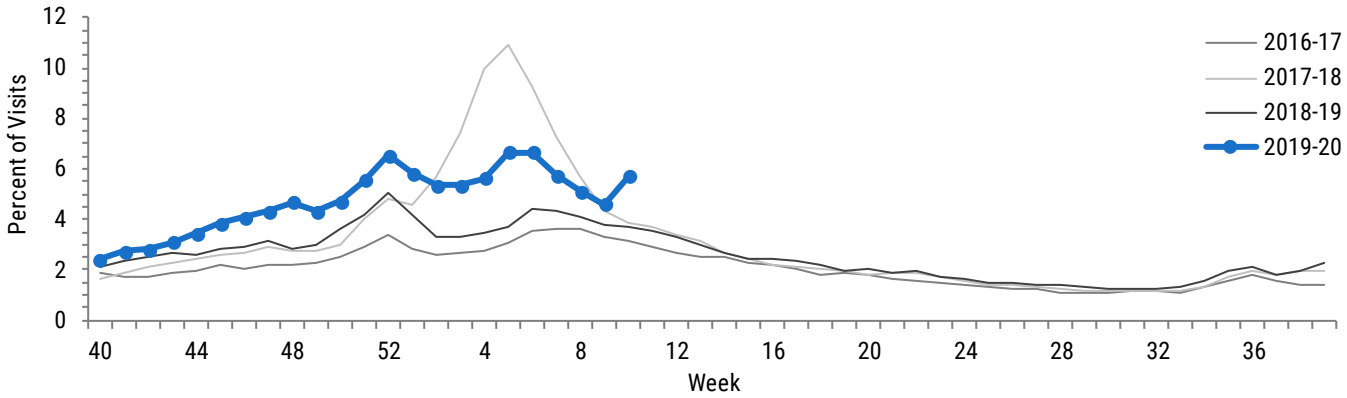
Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.



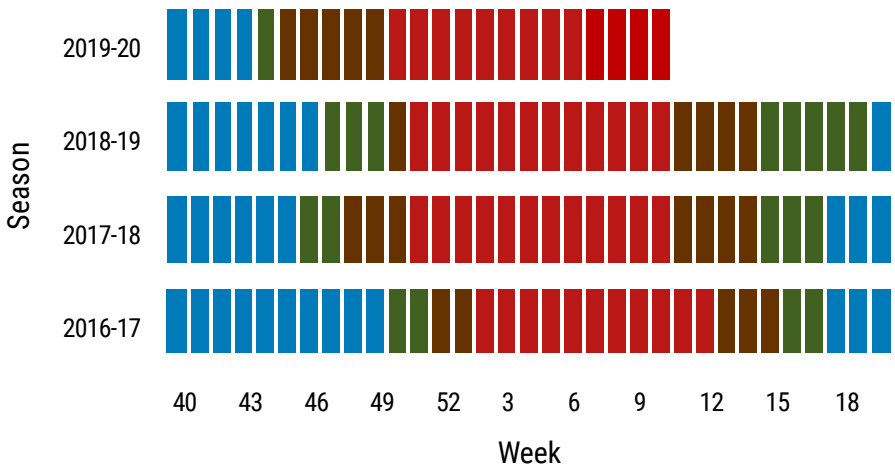
Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. **For more information on Florida's influenza surveillance systems and associated case definitions, see page 16.**

Statewide Activity

Figure 1: In week 10, **the percent of emergency department and urgent care center visits for ILI statewide increased** and was above peak levels observed during the 2016-17 and 2018-19 seasons.



▲ **Figure 1** shows **the percent of visits for ILI** for facilities participating in ESSENCE-FL (n=370) statewide for the current season (week 40, 2019 to week 10, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words "influenza" or "flu," or chief complaints that include the words "fever" and "cough," or "fever" and "sore throat." For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.

AMERICAN OVERSIGHT

Statewide Activity

Figure 2: In week 10, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

◀ **Figure 2** shows Florida's self-reported **geographic spread of influenza** as reported to the Centers for Disease Control and Prevention, week 40, 2016 to week 10, 2020.

Defining geographic spread of influenza:

Sporadic: small numbers of laboratory-confirmed influenza or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state.

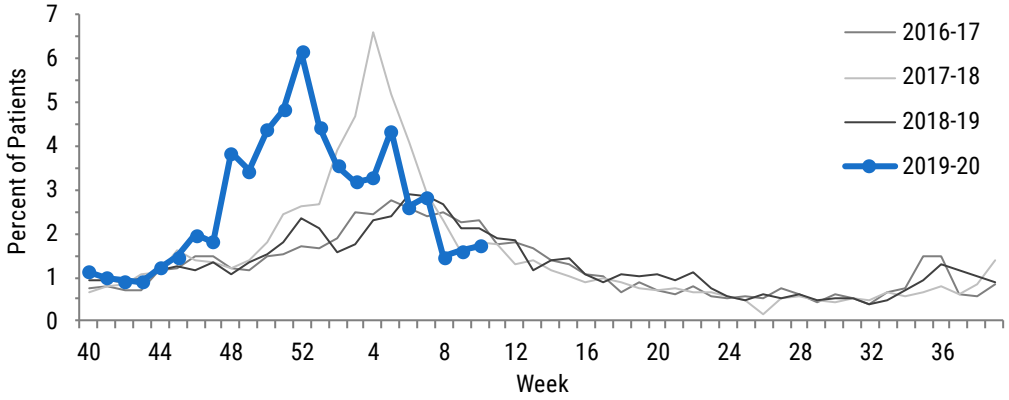
Regional: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 10, **the percent of patients with ILI reported by ILINet providers statewide increased** and was within levels observed during previous seasons. Of note, the number of reporting providers remained low in recent weeks.

Figure 3 shows the **percent of patients with influenza-like illness (ILI)** reported statewide by ILINet providers (n=8), week 40, 2016 to week 10, 2020. ▶

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.



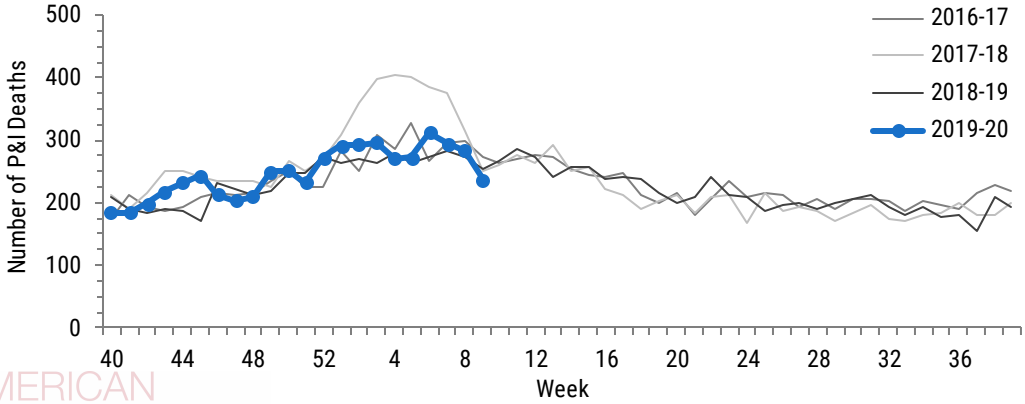


Figure 4: In week 9 (ending 2/29/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was slightly below levels observed at this time in previous seasons.

◀ **Figure 4** shows **pneumonia and influenza (P&I) deaths*** for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2016 to week 9, 2020.

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.

AMERICAN OVERSIGHT

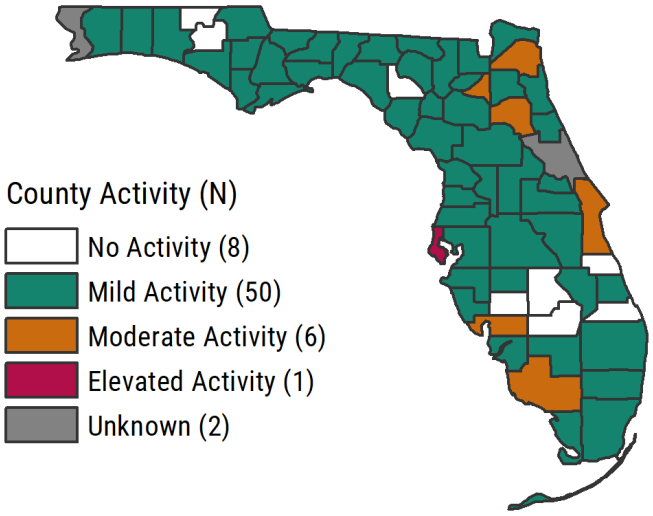
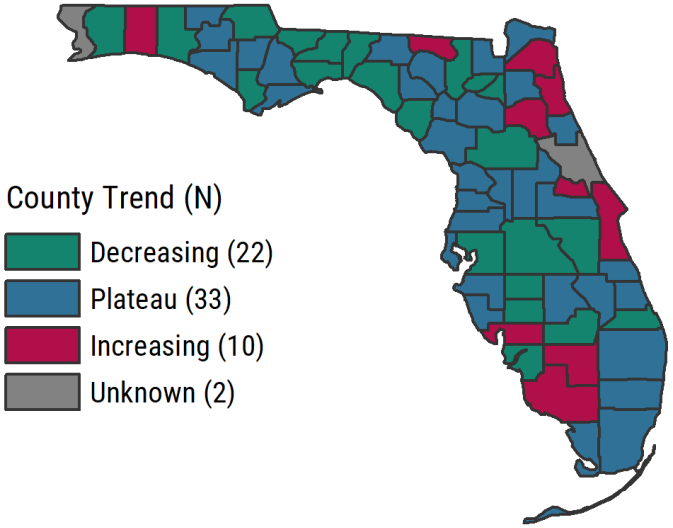
County Influenza Activity

Figure 5: Most counties reported **mild activity** for week 10. Six counties reported **moderate activity,** and one county reported **elevated activity.**





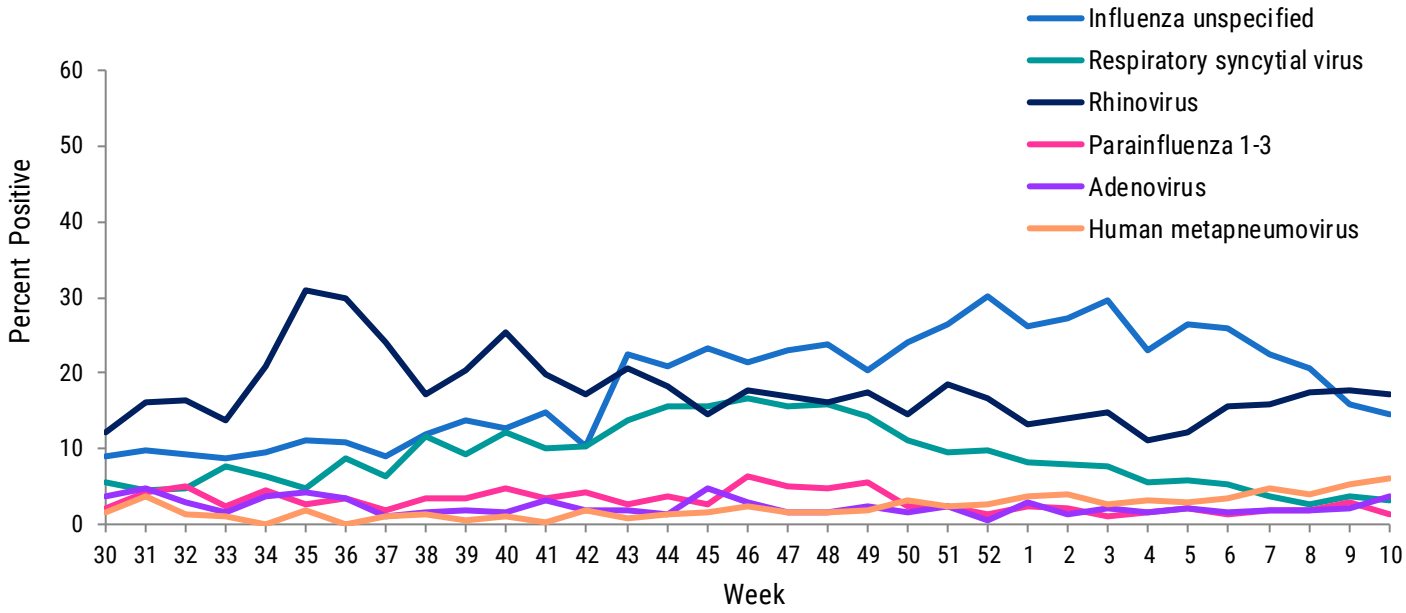


Figure 7: Most counties reported **activity at a plateau** for week 10. Ten counties reported **increasing activity,** and 22 counties reported **decreasing activity**.

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: The **percent of specimens testing positive for influenza decreased** in recent weeks. In week 10, **percent of specimens testing positive for rhinovirus** was higher than other respiratory viruses under surveillance.

▲ **Figure 7** shows **the percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NRVESS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=9), week 40, 2019 to week 10, 2020.

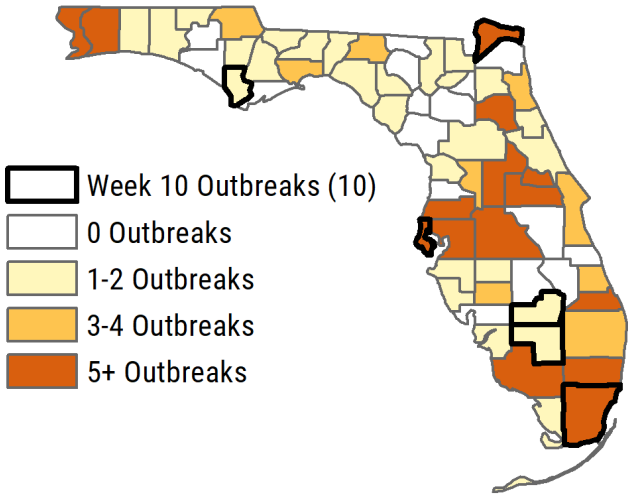
Influenza and ILI Outbreaks

Week 10 Outbreaks at a Glance:

Number Reported:
10 Outbreaks

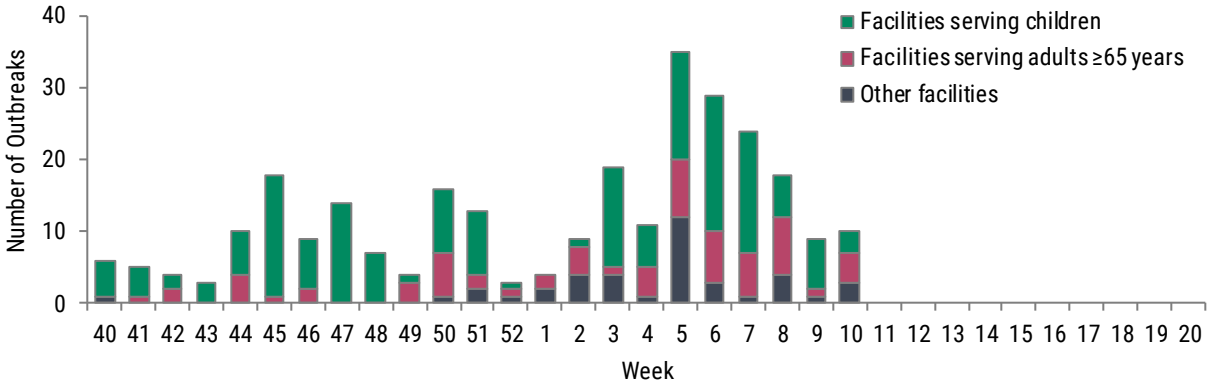
Influenza-Associated:
4 Outbreaks



Severe Outcomes*:
0 Outbreaks

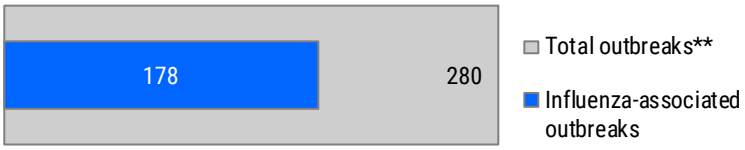
Outbreak Summary:

In week 10, four influenza-associated and six ILI outbreaks were reported, a slight increase from the previous week.



Severe outcomes* were not reported in any of these outbreaks.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities).



▲ **Figure 8** shows **reported influenza or ILI outbreaks by county**. Counties with outbreaks reported in week 10 are **outlined in bold.**

Figure 9: In week 10, **four outbreaks** were reported among **facilities serving adults aged ≥65 years, three outbreaks** were reported in **facilities serving children,** and **three outbreaks** were reported among **other facilities.**

◀ **Figure 9** shows the number of **influenza-associated or ILI outbreaks by week** as reported in Merlin by county health departments, week 40, 2019 to week 10, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10: As of week 10, **63.6% of outbreaks** reported so far this season were **influenza-associated.**

◀ **Figure 10** shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 10, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.

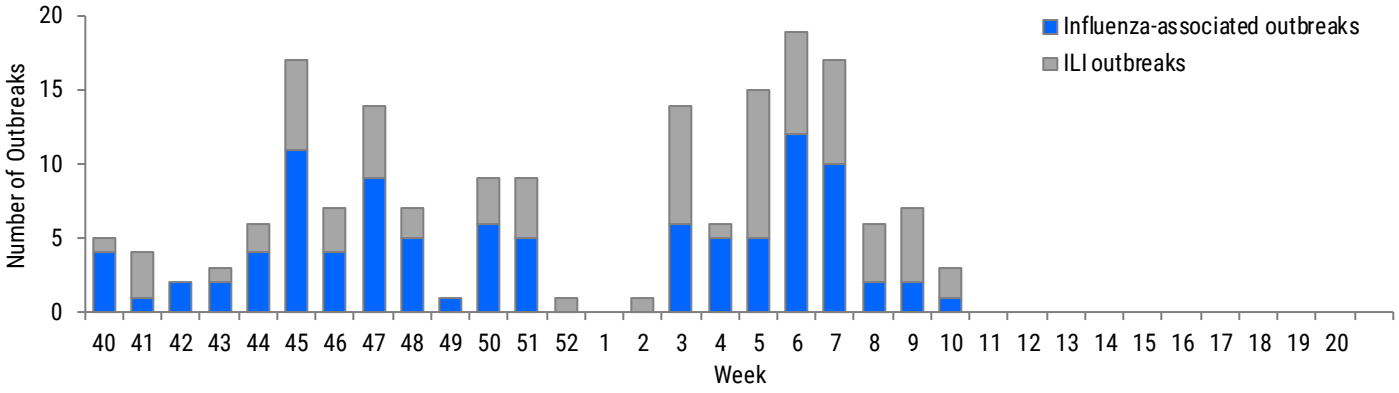
Influenza and ILI Outbreaks

Facilities Serving Children*:



3 Outbreaks

Summary of Outbreaks in Facilities Serving Children:

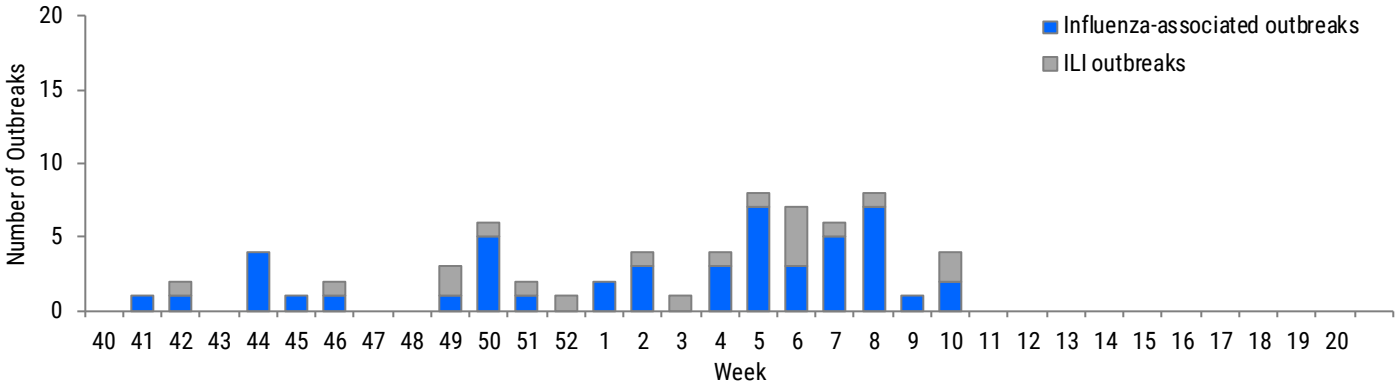
In week 10, three new outbreaks of influenza or ILI were reported in facilities serving children.

*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 10, **one influenza-associated outbreak** and **two ILI outbreaks** were reported in **facilities serving children.**

▲ **Figure 11** shows the number of **influenza-associated or ILI outbreaks in facilities serving children by week** as reported in Merlin by county health departments, week 40, 2019 to week 10, 2020.

Facilities Serving Adults ≥65 yrs.**:



4 Outbreaks

Summary of Outbreaks in Facilities Serving Adults ≥65 years:

In week 10, four new outbreaks of influenza or ILI were reported among facilities serving adults aged ≥65 years.

**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 10, **two influenza-associated outbreaks** and **two ILI outbreaks** were reported among **facilities serving adults ≥65 years.**

▲ **Figure 12** shows the number of **influenza-associated or ILI outbreaks in facilities serving adults aged ≥65 years by week** as reported in Merlin by county health departments, week 40, 2019 to week 10, 2020.

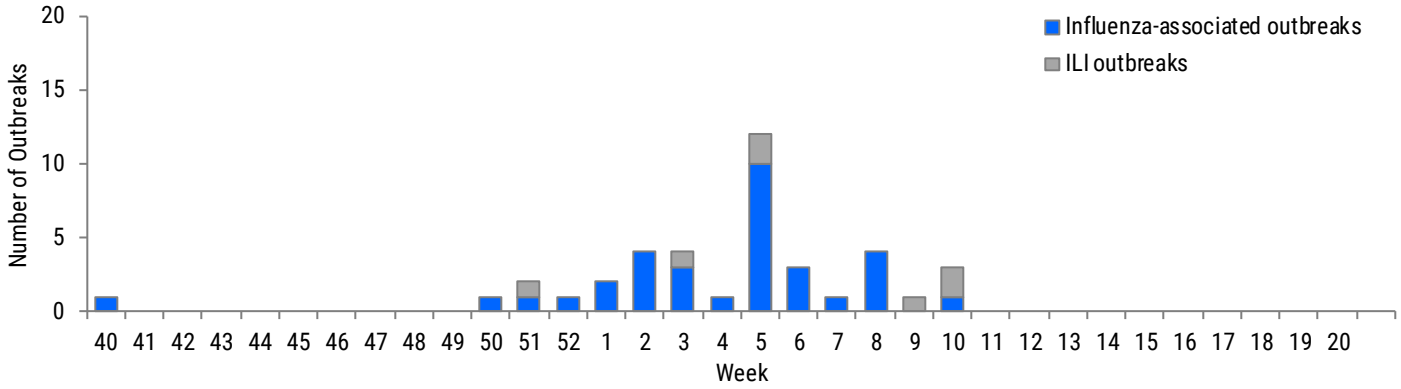
Influenza and ILI Outbreaks

Other Facilities*:



3 Outbreaks

Summary of Outbreaks in Other Facilities:

In week 10, three new outbreaks of influenza or ILI was reported among other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 10, **two ILI outbreaks** and **one influenza-associated outbreak** were reported among **other facilities.**

▲ **Figure 13** shows the number of **influenza-associated or ILI outbreaks in other facilities by week** as reported in Merlin by county health departments, week 40, 2019 to week 10, 2020.

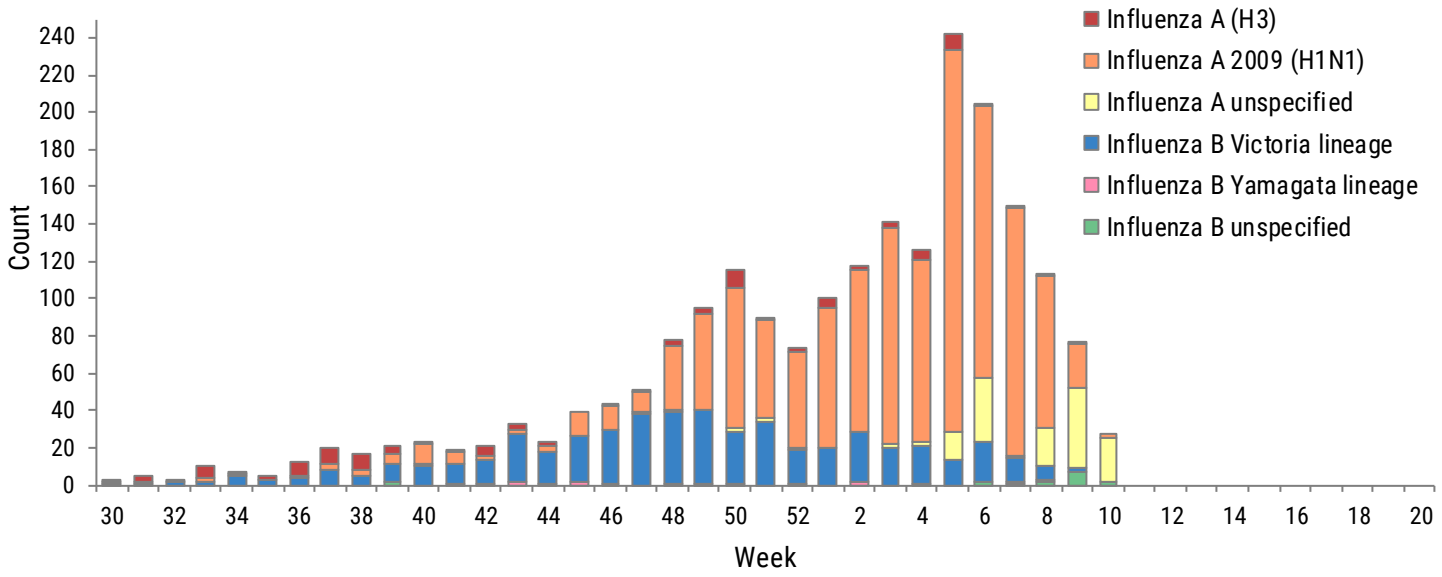


Table 1: Summary of Influenza or ILI Outbreaks Reported During the 2019-20 Season by Setting

Setting	Number of Outbreaks (Percent of Outbreaks)	Number Influenza-Associated or ILI
Primary or secondary schools	133 (47.5%)	80 influenza-associated outbreaks 53 ILI outbreaks
Child daycares	40 (14.3%)	17 influenza-associated outbreaks 23 ILI outbreaks
Camps	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Assisted living facilities	21 (7.5%)	10 influenza-associated outbreaks 11 ILI outbreaks
Nursing facilities	15 (5.4%)	12 influenza-associated outbreaks 3 ILI outbreaks
Other long-term care facilities	31 (11.1%)	26 influenza-associated outbreaks 5 ILI outbreaks
Adult daycares	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Post-secondary schools	0 (0.0%)	0 influenza-associated outbreaks 0 ILI outbreaks
Correctional facilities	33 (11.8%)	29 influenza-associated outbreaks 4 ILI outbreaks
Hospitals	3 (1.1%)	2 influenza-associated outbreaks 1 ILI outbreak
Additional facility types	4 (1.4%)	2 influenza-associated outbreaks 2 ILI outbreaks
Total	**280 (100.0%)**	**178 influenza-associated outbreaks** **102 ILI outbreaks**
