- To address stakeholder concerns regarding the transportation and use of cyanide, there is no secondary recovery of gold from the pyritic tailings using a cyanide leach.

The Project adopts a design-for-closure philosophy that considers closure and post-closure site management requirements during all operating phases. Examples include:

- Segregated storage facilities for bulk and pyritic tailings. Bulk tailings will remain in place at closure.
- A lined pyritic TSF. Potentially acid generating (PAG) and metal leaching (ML) waste rock will be stored with pyritic tailings in the lined pyritic TSF during operations. At closure the stored waste rock will be backhauled to the pit and the pyritic tailings pumped to the pit for sub-aqueous storage in the pit lake. Storage of PAG/ML waste rock and pyritic tailings within the pit lake will avoid post-closure management of the pyritic TSF.

The Project will develop a comprehensive water management plan that strategically discharges surplus treated water to downgradient streams in a manner that reduces the effect of stream flow fluctuations and minimizes impacts to fish habitat.

1.4. Project Areas

The Project is located in a sparsely populated region of southwest Alaska near Iliamna Lake, within the Lake and Peninsula and Kenai Peninsula boroughs (Figure 1-1). The Project comprises four primary areas: the mine site at the Pebble Deposit location, the port site at Amakdedori on Cook Inlet, the transportation corridor connecting these two sites, and a natural gas pipeline connecting to existing infrastructure on the Kenai Peninsula.

AMERICAN OVERSIGHT

The transportation corridor consists of a road from the mine site to a ferry terminal on the north shore of Iliamna Lake, a ferry route across Iliamna Lake to a landing on the south shore near the village of Kokhanok, and a road continuing southeast to the Amakdedori Port. Additional surface roads will connect the mine site to the villages of Iliamna, Newhalen, and Kokhanok (Figure 1-2). The gas pipeline will tie in to existing gas supply infrastructure at Anchor Point on the Kenai Peninsula, cross Cook Inlet, and parallel the transportation corridor to the mine site (Figure 1-1 and Figure 1-2).

The Bristol Bay watershed encompasses approximately 41,900 square miles and is defined by the Aleutian Range to the east and southeast, the Kuskokwim Mountains to the west, and a range of hills to the north that separate it from the Kuskokwim River watershed. The largest rivers that drain into Bristol Bay are the Nushagak and Kvichak rivers, which together drain 49 percent of the Bristol Bay watershed, or approximately 20,000 square miles (Figure 1-3).

1.4.1. Mine Site

The Pebble Deposit is located under rolling, permafrost-free terrain in the Iliamna region of southwest Alaska, approximately 200 miles southwest of Anchorage and 60 miles west of Cook Inlet. The closest communities are the villages of Iliamna, Newhalen, and Nondalton, each approximately 17 miles from the Pebble Deposit (Figure 1-2).

The fully developed mine site will include the open pit, bulk TSF, pyritic TSF, overburden stockpiles, material sites, water management ponds (WMPs), milling and processing facilities, and supporting infrastructure such as the power plant, water treatment plants, camp facilities, and storage facilities (Figure 1-4).

The site is currently undeveloped and not served by any transportation or utility infrastructure.

1.4.2. Amakdedori Port and Lightering Locations

The port site (Figure 1-5) will be located near Amakdedori Creek on the western shore of Cook Inlet, approximately 190 miles southwest of Anchorage and approximately 95 miles southwest of Homer.

The port site will include shore-based and marine facilities for the shipment of concentrate, freight, and fuel for the Project. The shore-based facilities will include separate facilities for the receipt and storage of containers for concentrate and freight. Other facilities will include fuel storage and transfer facilities, power generation and distribution facilities, maintenance facilities, employee accommodations, and offices.

The natural gas pipeline from the Kenai Peninsula will come ashore at the Amakdedori Port. An offtake will distribute natural gas to the port power generation facility.

The marine component includes an earthen access causeway extending out to a marine jetty located in 15 feet of natural water depth. One side of the jetty will be occupied by a roll-on/roll-off barge access berth; a separate berth for loading lightering barges will be located on the opposite side.

AMERICAN OVERSIGHT

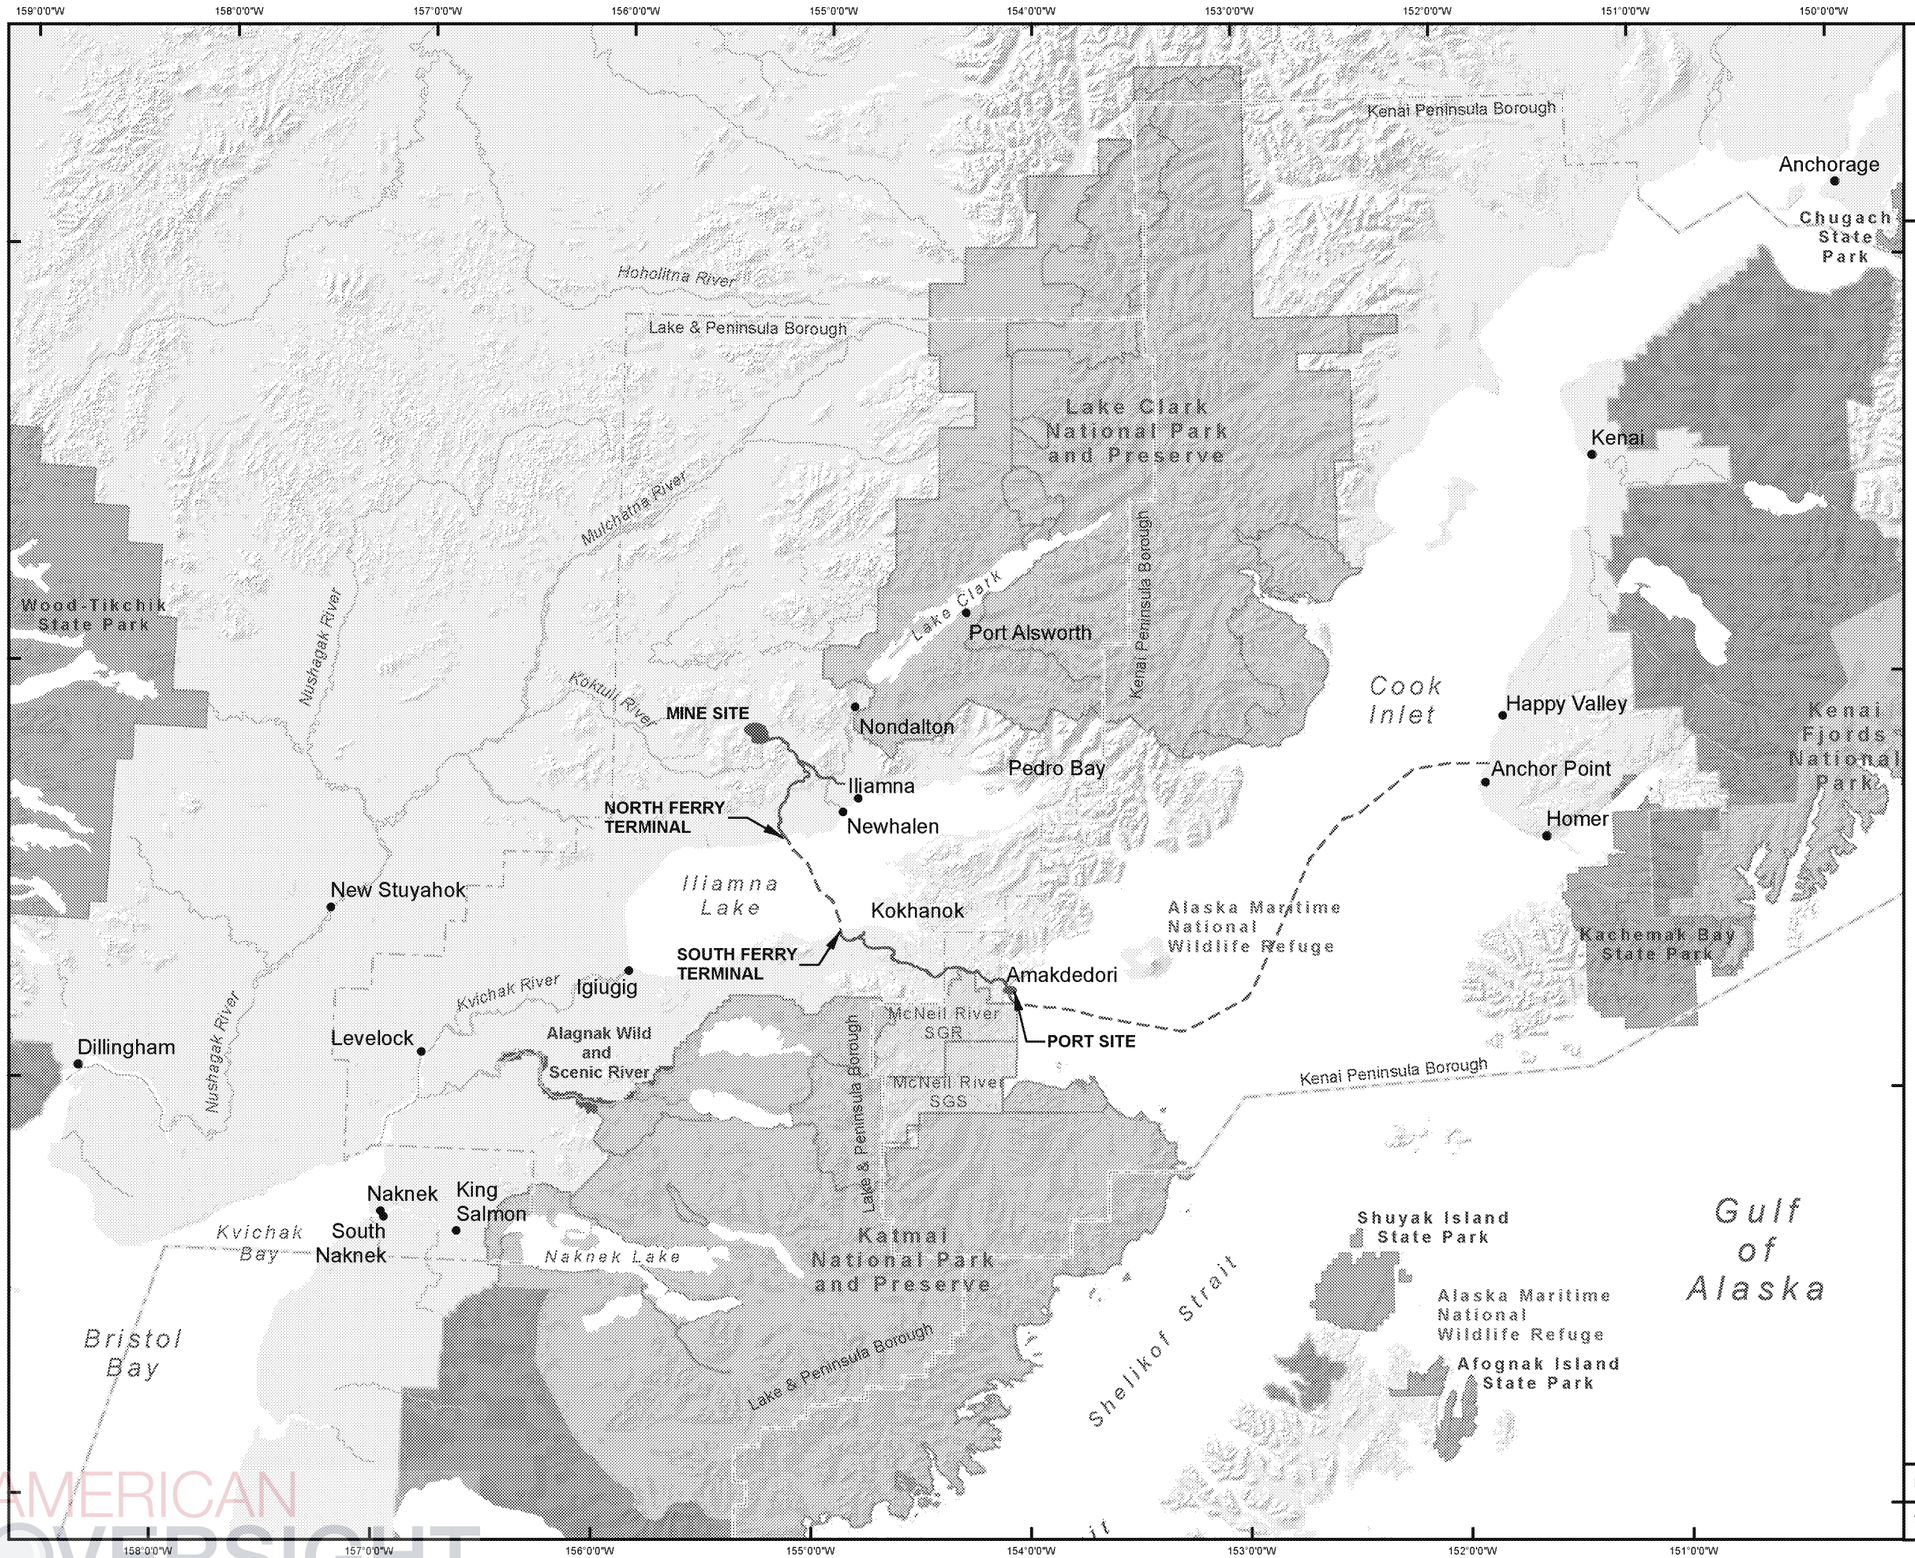
EPA-0135-0004740

The port site area is currently undeveloped and not served by any transportation or utility infrastructure.

Copper-gold concentrate containers will be loaded onto lightering barges at the Amakdedori Port and then transported to one of two lightering locations (Figure 1-5) for transfer to bulk carriers. The primary lightering location is approximately 12 miles offshore due east of the proposed Amakdedori port, the alternative lightering location is approximately 18 miles east-northeast of the proposed Amakdedori port between Augustine Island and the mainland. Wave heights in this area are reduced by Augustine Island and it would be used when required by sea conditions.

1.4.3. Transportation Corridor

The transportation corridor, which will connect the mine site to the Amakdedori Port on Cook Inlet, has three main components (Figure 1-2):



- A private, unpaved two-lane road extending 30 miles south from the mine site to a ferry terminal on the north shore of Iliamna Lake;
- An ice-breaking ferry to transport materials, equipment, and concentrate 18 miles across Iliamna Lake to a ferry terminal on the south shore near the village of Kokhanok; and
- A private, unpaved two-lane road extending 35 miles southeast from the South Ferry Terminal to the Amakdedori Port on Cook Inlet.

Separate roads will connect the transportation corridor to the villages of Iliamna, Newhalen, and Kokhanok. Apart from a small network of local roads near the villages, the transportation corridor area is undeveloped.

1.4.4. Natural Gas Pipeline Corridor

Natural gas, sourced through the existing natural gas supply infrastructure for the Cook Inlet area, will be the primary energy source for the Pebble Project. The gas pipeline alignment (Figure 1-1) will connect to existing infrastructure north of Anchor Point. Gas will be taken from the existing pipeline along the Sterling Highway and sent to a compressor station. From the compressor station, the pipeline heads southwest across Cook Inlet, before turning west to a landfall at the Amakdedori Port. The pipeline then follows the transportation corridor from the port to the mine site, including across Iliamna Lake on the lake bed.

AMERICAN OVERSIGHT

1.5. Land Ownership and Mineral Rights

The Pebble Deposit is located on patented state land specifically designated for mineral exploration and development. The Pebble Deposit straddles parts of three management units described in the Alaska Department of Natural Resources (ADNR) 2005 *Bristol Bay Area Plan* (amended 2013). These management units, known as R06-23 (Pebble), R06-24 (Pebble Streams), and R10-02 (Pebble 2), total 110,080 acres and are designated for minerals extraction. This designation allows for mineral exploration and development with oversight from ADNR. The management intent for all three units also stresses the need to protect the anadromous fish streams in the upper Koktuli River corridor and to minimize or avoid effects from mining on habitat and recreational activities near the upper reaches of UTC.

The Pebble Deposit lies within a 417-square-mile claim block held by subsidiaries of PLP and by a subsidiary of PLP's parent company, Northern Dynasty. Neither PLP nor Northern Dynasty currently owns surface rights associated with these mineral claims. All lands within the claim block are owned by the State of Alaska. Surface rights may be acquired from the state government once areas required for mine development have been determined and permits awarded.

The transportation corridor crosses both state land and land patented under the Alaska Native Claims Settlement Act (ANCSA). Further detail is provided in Section 2.2.

1.6. Climate

The climate in the area of the Pebble Deposit/mine site is transitional. Winters are characterized by a continental climate as frozen waterbodies and sea ice in Bristol Bay create a land-like mass, while summers have a maritime climate due to the influence of the open water of Iliamna Lake and, to a lesser extent, the Bering Sea, Bristol Bay, and Cook Inlet. Mean monthly temperatures range from about 55 degrees Fahrenheit (°F) in summer to 2°F in winter. Precipitation in the NFK drainage averages approximately 57.4 inches per year and in the South Fork Koktuli River (SFK) drainage averages approximately 50.8 inches per year. About one-third of this precipitation falls as snow. The wettest months are August through October. White-out conditions and wind storms or periods of poor light/visibility can be expected in winter.

Winter weather systems, consisting of cool to cold saturated air, typically travel into the region from the Bering Sea (west), along the Aleutian Island chain (southwest) and the Gulf of Alaska (south), resulting in frequent clouds, rain, and snow. Less frequent incursions of frigid, stable Arctic air masses produce shorter periods of clear, but very cold conditions. During summer, warm air masses from interior Alaska can cause atmospheric instability, which results in cumulus clouds and thunderstorm activity.

1.7. Deposit Geology

The Pebble Deposit is hosted by Mesozoic, volcanically derived sedimentary rocks, called flysch, of the Kahiltna terrane, as well as a variety of intrusive igneous rocks emplaced into the flysch between approximately 99 and 90 million years ago during the mid-Cretaceous Period. Between 99 and 96 million years ago, early intrusions into the flysch comprised alkalic syenite to biotite

AMERICAN OVERSIGHT

EPA-0135-0004747

pyroxenite bodies, along with subalkalic diorite and granodiorite sills. Kaskanak Suite intrusions were emplaced approximately 90 million years ago and are the most important igneous event in the area. The suite comprises a granodiorite batholith that is exposed west of, but extends beneath, the Pebble Deposit, as well as several smaller intrusive granodiorite apophyses that emanate from the underlying batholith; collectively these Kaskanak intrusions drove the large magmatic-hydrothermal system that formed the Pebble Deposit.

The Pebble Deposit is classified as a porphyry copper deposit and is hosted by the intrusive and sedimentary rock types described above. Copper, gold, molybdenum, and other metals were transported by hot fluids that emanated from the 90-million-year-old magmas as they cooled, and precipitated mostly as sulfide minerals in fractures, now preserved as veins, and as disseminations in the spaces between silicate minerals in the host rocks. The effects of the hot fluids are reflected by widespread hydrothermal alteration whereby some minerals originally present in host rocks were dissolved and replaced with suites of new minerals.

During the Late Cretaceous and Early Tertiary periods, the Pebble Deposit was uplifted by regional tectonic forces and eroded. The exposed deposit was rapidly covered by the Copper Lake Formation, a thick sequence of fine- to coarse-grained clastic sedimentary rocks and interbedded volcanic rocks. At a later point in the Tertiary Period, the eastern part of the Pebble Deposit was dropped up to 3,000 feet along normal faults into the East Graben, a structure that was progressively infilled by basalts, andesites, and subordinate clastic sediments as it grew. The Pebble Deposit and its host rocks were later tilted approximately 20 degrees to the east. The deposit was again uplifted in the later Tertiary Period, and its western part was scoured by Pleistocene glaciers that deposited a veneer of till, glacio-lacustrine, and outwash deposits that are mostly tens of feet thick or less, but which rarely are up to 300 feet thick in the vicinity of the Pebble Deposit. The present geometry of the Pebble Deposit comprises the West Zone, which is covered by thin glacial till and exposed in one small outcrop; the East Zone, which remains concealed by an eastward-thickening wedge of the Copper Lake Formation as well as overlying glacial till; and mineralization that extends an undetermined distance farther to the east but at great depth below the East Graben.

1.8. Resource

The current combined measured and indicated resource estimate for the total Pebble Deposit is approximately 7.1 billion tons containing 57 billion pounds of copper, 70 million ounces of gold, 344 million ounces of silver, and 3.42 billion pounds of molybdenum. In addition, the inferred component of the total deposit is approximately 4.9 billion tons, with 24.5 billion pounds of copper, 36 million ounces of gold, 170 million ounces of silver, and 2.2 billion pounds of molybdenum. The Pebble Deposit also contains important quantities of palladium and rhenium.

The Project will mine approximately 1.3 billion tons of mineralized material (measured, indicated, and inferred) over the 20-year mine life containing 7.4 billion pounds of copper, 398 million pounds of molybdenum, and 12.1 million ounces of gold. The metal content of the reported total resource and the 20-year open pit is presented in Table 1-1.

AMERICAN OVERSIGHT

EPA-0135-0004748

AMERICAN OVERSIGHT

2. PROJECT SETTING

The environmental resources of the area surrounding the Pebble Deposit have been studied extensively by PLP. The *Pebble Project Environmental Baseline Document, 2004 through 2008*, which is available online at www.pebbleresearch.com, provides a complete report of environmental baseline studies conducted during those years. Pebble Project supplemental baseline data reports (2009-2013) provide data supplemental to the environmental baseline report and will accompany permit applications as appropriate.

2.1. MINE SITE

2.1.1. Physiography

The geographic location of the Pebble Deposit is described in Table 2-1.

Table 2-1. Pebble Deposit Geographic References

Item	Value
Pebble Deposit Centroid	59° 53' 51" N; 155° 18' 03" W
USGS Quadrangles	Iliamna D-6, D-7
Elevation:	
Minimum	775 ft amsl (SFK valley)
Maximum	2,760 ft amsl (Kaskanak Mountain)
Distance from:	
Cook Inlet	65 miles W
Iliamna Lake	16 miles N
Bristol Bay	100 miles W

amsl = above mean sea level
USGS = U.S. Geological Survey

The Pebble Deposit is located in the Nushagak-Big River Hills physiographic region. The area consists of low, rolling hills separated by wide, shallow valleys. Elevations range from approximately 775 feet in the SFK valley up to 2,760 feet on Kaskanak Mountain. Glacial and fluvial sediment of varying thickness covers most of the study area at elevations below approximately 1,400 feet, whereas the ridges and hills above 1,400 feet generally exhibit exposed bedrock or have thin veneers of surficial material. The hills tend to be moderately sloped with rounded tops. The valley bottoms are generally flat. No permafrost has been identified to date in the project area.

AMERICAN OVERSIGHT

2.1.2. Ecology

The Pebble Deposit area is ecologically diverse, with rivers, tundra, marshy lowlands, and ponds. Much of the land is covered by alpine tundra, shrubs, wetland and scrub communities, or areas of mixed broadleaf and spruce trees, depending on elevation and location.

Rivers near the Pebble Deposit provide habitat for five species of anadromous Pacific salmon. Rainbow trout and other species of fish, such as Dolly Varden and Arctic grayling, are also present. The streams in this area contain many features that support fish spawning and rearing, including complex off-channel habitats, river gravel that promotes spawning, beaver ponds, and combinations of run/glides and riffles. A higher diversity of species and abundance of fish, as well as the most spawning and rearing activity, is found in the lower and middle reaches of these streams, not in the headwater reaches at the Pebble Deposit site.

Various raptors and more than 40 species of water birds are found in the mine area and 22 species have been confirmed as breeding there. The many species of mammals that inhabit this region, while ecologically and economically important, are not particularly abundant. There are moderate densities of brown bear and low densities of black bear, moose, coyotes, wolves, river otters, and wolverines. The mine site is within the historical range of the Mulchatna caribou herd, but radio telemetry and aerial transect surveys suggest that high-density use of the area occurs only during the summer post-calving season when caribou move through the western edge of the project area. No habitat in the mine area has been classified as high value for caribou.

2.1.3. Hydrology

The Pebble Deposit straddles the upper reaches of the SFK and UTC drainages (Figure 2-1). The headwaters of the NFK are immediately north of the Pebble Deposit. The SFK drains south from the Pebble Deposit area, and then west and northwest, where it joins the NFK, which flows west from the Pebble Deposit area. At the confluence, these streams form the Koktuli River, which flows into the Mulchatna River, a tributary to the Nushagak River. The Nushagak River flows into Bristol Bay near the city of Dillingham. Upper Talarik Creek flows south from the Pebble Deposit area and then southwest into Iliamna Lake, which is the source of the Kvichak River.

2.1.3.1 Koktuli River

The NFK and SFK are two of 24 tributaries of similar or larger size in the 315-mile-long Nushagak River system. The north and south forks of the Koktuli River flow for 36 and 40 miles, respectively, to the main stem Koktuli River. The Koktuli River flows for approximately 39 miles before entering the Mulchatna River, which flows another 44 miles before entering the Nushagak River. The Nushagak River flows about 110 miles before it empties into Bristol Bay southwest of Dillingham (Figure 1-1). The total distances from the NFK and SFK headwaters to Bristol Bay are 228 miles and 232 miles, respectively.

AMERICAN OVERSIGHT

2.1.3.2 Kvichak River

The UTC drainage is in the 225-mile-long Kvichak River system. The headwaters of the Kvichak River system are approximately 109 miles northeast of the Pebble Deposit at the source of the Tlikakila River at Lake Clark Pass. UTC flows approximately 39 miles to Iliamna Lake (Figure 2-1). The lake empties into the Kvichak River, which flows approximately 70 miles to Bristol Bay. The total distance from the headwaters of UTC, across the lake, and to Bristol Bay is approximately 140 miles.

2.2. TRANSPORTATION CORRIDOR

The transportation corridor connects the Amakdedori Port to the mine site. It will include a private two-lane access road between the Amakdedori Port and the South Ferry Terminal on Iliamna Lake west of Kokhanok; a similar access road between the North Ferry Terminal on the north shore of Iliamna Lake and the mine site; and a purpose-built ice-breaking ferry connecting the two ferry terminals. The natural gas pipeline will parallel the transportation corridor from the port site to the mine site. Additional spur roads will be built to connect the access road to the villages of Iliamna, Newhalen, and Kokhanok. Approximately 65 percent of the corridor land is owned by the State of Alaska, with the remaining 35 percent divided among various ANCSA corporations, as shown in Table 2-2 and Figure 2-2.

Table 2-2. Transportation Corridor Land Ownership[a]

Land Ownership	Road Segments (Miles)	Percentage
Access Road	Total miles: 66	
State of Alaska	43	65
Alaska Peninsula Corporation	23	35
Iliamna Airport Spur	Total miles: 7	
State of Alaska	4	55
Iliamna Natives Limited	3	45
Iliamna Lake Crossing	Total Miles: 18	
State of Alaska	18	100
Kokhanok Airport Spur	Total miles: 1.5	
Alaska Peninsula Corporation	1.5	100
Total Road Miles	**75**	
Total Corridor Miles	**93**	

[a] Distances presented are approximate and have been rounded for ease of reference.

2.2.1. Physiography

The geographic location of the transportation corridor is described in Table 2-3.

AMERICAN OVERSIGHT

EPA-0135-0004752

Table 2-3. Transportation Corridor Geographic References

Item	Value
USGS Quadrangles	Iliamna B-3, B-4, B-5, B-6 Iliamna C-6 Iliamna D-6, D-7
Elevation:	
Minimum	Near sea level (Amakdedori Port)
Maximum	1,700 ft (leaving mine site)

The transportation corridor is located within three physiographic divisions: Nushagak-Big River Hills, Nushagak-Bristol Bay Lowlands, and Aleutian Range. The terrain includes a range of types, from flat to moderately undulating near the Pebble Deposit, gently sloping and colluvial terrain along the north shore of Iliamna Lake, and mountainside slopes to narrow valley bottoms through the Aleutian Range. No permafrost has been identified in the transportation corridor.

2.2.2. Ecology

Much of the land at lower elevations south of Iliamna Lake is covered by dwarf shrub and broadleaf forest communities. At higher elevations where shallow bedrock occurs, dwarf shrub and alder shrub communities are prevalent. Wetland habitats are common in depressional areas, valley bottoms, and on slope benches and include wet meadows and scrub-shrub communities. Vegetation communities within the transportation corridor north of Iliamna Lake primarily consist of dwarf shrub, spruce woodland, mixed broadleaf and spruce forest, and shrubs. Wetland habitats dominated by willow shrub communities are common on floodplains of streams, while wet meadows and mixed shrub wetlands are common at toe slopes where groundwater discharge occurs.

Rivers along the transportation corridor provide habitat for five species of anadromous Pacific salmon. Rainbow trout and other species of fish, such as Dolly Varden and Arctic grayling, are also present.

Forest and wetland habitats in the transportation corridor support types of wildlife similar to those at the mine site. Brown bear density is somewhat higher in the transportation corridor, with densities increasing as the corridor approaches the coast. Black bears occur in very low densities along the transportation corridor. Small numbers of caribou from the Mulchatna herd may be found foraging at higher elevations following calving within the transportation corridor north of Iliamna Lake. The transportation corridor contains migratory stopover and breeding habitats for many species of songbirds, raptors, and waterfowl.

AMERICAN OVERSIGHT

EPA-0135-0004753

2.2.3. Hydrology

The 84-mile-long access corridor crosses numerous streams within the Bristol Bay and Cook Inlet watersheds. The corridor originates in the Nushagak watershed at the mine site and traverses the Kvichak watershed; both are within the greater Bristol Bay watershed. The corridor terminates in the Tuxedni-Kamishak Bays watershed of the greater Cook Inlet watershed.

2.3. AMAKDEDORI PORT

2.3.1. Physiography

The port site is located just north of the mouth of Amakdedori Creek on the shore of Cook Inlet in the northern part of the Aleutian Range physiographic division. Topography is generally flat with dunes located closer to the gravel beach shoreline of Cook Inlet. The port location is in the Iliamna B-3 USGS Quadrangle.

2.3.2. Ecology

The western shorelines from Kameshak Bay north to Iniskin Bay are composed of diverse habitats, including steep rocky cliffs, cobble or pebble beaches, and extensive sand/mud flats. Eelgrass is found at a number of locations and habitats; eelgrass, along with macroalgae, is an important substrate for spawning Pacific herring. Much of the land is well-drained and covered by dwarf shrub communities with inclusions of alder shrub and grass-herb communities. Wetland habitats consisting of wet meadows and shrub communities are limited to the northwestern extent of the port site where groundwater discharge occurs and areas within the floodplain of Amakdedori Creek.

Preliminary data gathered at Amakdedori beach in 2013 indicate that Pacific herring are the predominant species present in the nearshore environment, with smaller populations of Dolly Varden and pink salmon. The port site is located within critical habitat for the Cook Inlet Beluga Whale and the Northern Sea Otter Southwest Distinct Population Segment (DPS). Cook Inlet Beluga Whale critical habitat includes nearshore waters out to two nautical miles and comprise important foraging areas in fall and winter. Northern Sea Otter critical habitat includes foraging areas and escape habitat from marine mammal predators found in Kamishak Bay.

2.3.3. Hydrology

The Cook Inlet basin is an expansive watershed surrounding the 180-mile-long Cook Inlet waterbody. Covering more than 38,000 square miles of southern Alaska, it receives water from six major watersheds and many smaller ones. More than ten percent of the basin is covered by glaciers and suspended sediment loading in glacier fed rivers without lakes is significant, leading to a high suspended sediment load in portions of Cook Inlet.

Lower Cook Inlet is connected to the Pacific Ocean southwest through Shelikof Strait, and southeast by the Gulf of Alaska and demonstrates complex circulation on variable timescales. The region has the fourth largest tidal range in the world; tidal fluctuations in Kamishak Bay average 13 feet. When the tide drops from mean high to mean low water, the inlet loses almost 10 percent of

AMERICAN OVERSIGHT

its volume, and exposes approximately 8 percent of its surface area. Most of these tidally exposed areas are in the arms at the north end of Cook Inlet and along the west side of the waterbody.

2.4. Natural Gas Pipeline Corridor

The natural gas pipeline connects the mine site and the port site to the Cook Inlet gas supply infrastructure. It ties to an existing pipeline near Anchor Point on the Kenai Peninsula, connecting to a compressor station, which is located on private land owned by the University of Alaska. The pipeline then crosses state and federal Outer Continental Shelf (OCS) waters in Cook Inlet to the Amakdedori Port before following the transportation corridor to the mine site (see Table 2-4).

Table 2-4. Natural Gas Pipeline Land Ownership[a]

Land Ownership	Road Segments (miles)	Percentage
Cook Inlet Crossing	Total miles: 104	
State of Alaska	24	23
Federal Waters – Alaska OCS	80	77
Iliamna Lake Crossing	Total miles: 18	
State of Alaska	18	100
Transportation Corridor Parallels	Total miles: 66	
State of Alaska	43	65
Alaska Peninsula Corporation	23	35
Total Miles	**188**	

[a] Distances presented are approximate and have been rounded for ease of reference.

2.4.1. Physiography

The geographic location of the initial portion of the natural gas pipeline corridor is defined in Table 2-5. The remainder is the same as the transportation corridor.

AMERICAN OVERSIGHT

Table 2-5. Natural Gas Pipeline Geographic References

Item	Value[a]
USGS Quadrangles	Iliamna B-2 Seldovia D-5
Elevation:	
Minimum	-230 ft
Maximum	1,700 ft

[a] All references in Table 2-3 apply to the natural gas pipeline, but are excluded from this table.

The pipeline is located in four physiographic regions—the Nushagak-Big River Hills, the Nushagak-Bristol Bay Lowlands, the Aleutian Range, and the Cook Inlet-Susitna Lowlands. The terrain includes a range of types, from flat to moderately undulating near the Pebble Deposit/mine site, gently sloping and colluvial terrain along the north shore of Iliamna Lake, mountainside slopes to narrow valley bottoms through the Aleutian Range, and coastal lowlands around Cook Inlet. No permafrost has been identified in the pipeline corridor.

2.4.2. Ecology

The Cook Inlet region is composed of marine, coastal, and estuarine habitats. Pelagic waters within Cook Inlet are influenced by riverine and marine inputs resulting in salinity gradients and horizontal mixing throughout the inlet. Deeper waters of Cook Inlet are characterized by highly variable conditions, ranging from large boulders beds, to dune fields, and unconsolidated sediments on a smooth bottom. Strong tidal currents are present. The variety of habitats in the region support lower trophic organisms, fish, shellfish, marine mammals, and birds. Fish and shellfish are important components of the Cook Inlet food web, as they feed on lower trophic organisms such as plankton, and serve as prey for other fish, birds, and marine mammals.

The Cook Inlet region is a migratory corridor and juvenile rearing area for all five species of Pacific salmon, Dolly Varden, and steelhead trout, which spawn in rivers and streams throughout the region. Nineteen marine mammal species known to occur in Cook Inlet, including the Cook Inlet Beluga whale, which use nearshore waters for feeding in fall and winter. A large seabird nesting colony lies within Kamishak Bay on the western shore of lower Cook Inlet. As outlined in Section 2.3.2 coastal areas of western Cook Inlet, including Kamishak Bay, include critical habitat for the Cook Inlet beluga whale and the Cook Inlet northern sea otter.

2.4.3. Hydrology

See section 2.3.3 for a discussion of Cook Inlet hydrology.

AMERICAN OVERSIGHT

2.5. State and Federal Interest Lands

Several state and federally managed lands lie within a 100-mile radius of the mine site or Amakdedori Port (Figure 2-2). Two large national park units—Katmai National Park and Preserve and Lake Clark National Park and Preserve—lie to the south and northeast of the mine site, respectively. Both parks straddle the Bristol Bay/Cook Inlet watershed divide, although most recreational use in both parks occurs in the Bristol Bay drainage, west of the divide. The Alagnak Wild and Scenic River flows west from Katmai National Park and Preserve and into the Kvichak River, which flows into Bristol Bay. The McNeil River State Game Refuge and Sanctuary, which lies north of Katmai National Park and Preserve, is in the Cook Inlet watershed. West of the mine site is Wood-Tikchik State Park, which is in the Bristol Bay watershed.

2.6. Local and Regional Communities

The Pebble Deposit is located in southwest Alaska's Lake and Peninsula Borough, home to an estimated 1,600 people in 18 local villages. Distances to various communities are shown in Figure 1-1. At more than 30,000 square miles, the Lake and Peninsula Borough is among the least densely populated boroughs or counties in the country. There are no roads into the borough, and few roads within it, contributing to an extremely high-cost of living and limited job and other economic opportunities for local residents.

The communities closest to the mine site are Nondalton, Iliamna, and Newhalen. Igiugig, Pedro Bay, and Kokhanok, on the southern shore of Iliamna Lake, are also proximal to transportation infrastructure proposed for the Project. While PLP has generated employment for residents of villages throughout the Lake and Peninsula Borough and broader Bristol Bay region over the past decade, those communities surrounding Iliamna Lake have provided the greatest proportion of the local workforce.

With project infrastructure planned to connect the proposed mine site to the villages of Iliamna, Newhalen, and Kokhanok, residents of these and other communities are expected to continue to continue playing an important role in staffing the Project in the future.

The Bristol Bay Borough is the only other organized borough in the Bristol Bay region, with some 900 full-time residents in three villages. A significant portion of the Bristol Bay region is not contained within an organized borough; the Dillingham Census Area comprises 11 different communities. A total of about 7,500 people call the Bristol Bay region home, with the largest population centers in Dillingham, King Salmon, and Naknek.

Most Bristol Bay villages have fewer than 150–200 full-time residents. A majority of the population is of Alaska Native descent and Yup'ik or Dena'ina heritage. Virtually all of the region's residents participate to some degree in subsistence fishing, hunting, and gathering activities. Subsistence is central to Alaska Native culture and provides an important food source for local residents.

There are 13 incorporated first- and second-class cities in the Bristol Bay region and 31 tribal entities recognized by the U.S. Bureau of Indian Affairs. There are also 24 Alaska Native Village Corporations created under the ANCSA, two of which – Alaska Peninsula Corporation and

AMERICAN OVERSIGHT

Iliamna Natives Limited – hold surface rights for significant areas of land near the Pebble Deposit and along the proposed transportation infrastructure corridor.

The commercial fishing, guiding, and tourism-related sectors provide many jobs in the region, but the work is highly seasonal; year-round employment is the exception rather than the norm. A lack of employment and economic opportunity has contributed to a declining population in many Lake and Peninsula Borough and regional villages, resulting in the closure of several schools over the past decade.

2.7. Legal Description

The legal description of lands on which major project elements will be located is shown in Table 2-6. Sections are within the Seward Meridian Survey of the Public Land Survey System.

Table 2-6. Project Location (Public Land Survey System)

3. PROJECT COMPONENTS AND OPERATIONS

This section describes the various project components and the operations associated with those components through the active life of the Project. Construction will last for approximately four years, followed by a commissioning period and 20 years of mineral processing. Mining preproduction will start during construction with removal of overburden and waste rock material and active mining from the pit will continue through the 20-year operations period. Figure 1-4 shows the layout of the mine site, including the major facilities and site infrastructure.

3.1. SUMMARY PROJECT INFORMATION

A summary of mining and process related information is shown in Table 3-1.

Table 3-1. Summary Project Information[a]

Item	Value
General Operation	
Construction	4 years
Open pit mining	20 years
Total project operations	20 years
Daily schedule	24 hours
Annual schedule	365 days
Mine Operation	
Preproduction mined volume	33 million tons
Average annual mining rate	70 million tons
Operations mined volume	1,440 million tons
Mine life strip ratio	0.12:1 (waste: mineralized material)
Open pit dimensions	6,800 x 5,600 ft, 1,970 ft deep
Process Operation	
Daily process rate	180,000 tons
Annual process volume	66 million tons
Copper-gold concentrate	613,000 tons per year (average)
Molybdenum concentrate	15,000 tons per year (average)
Pyritic Tailings Storage Facility	
Approximate capacity (tailings)	155 million tons
Approximate capacity (PAG waste)	50 million tons
South embankment (height)	305 feet
North embankment (height)	425 feet
East embankment	315 feet

AMERICAN OVERSIGHT

Item	Value
Bulk Tailings Storage Facility	
Approximate capacity	1,140 million tons
Main embankment (height)	545 feet
South embankment (height)	300 feet
Main Water Management Pond	
Approximate capacity	2,450 M cubic feet (56,300 ac-ft)
Embankment height	190 feet

[a] Design criteria as presented are approximate and have been averaged and rounded as appropriate for ease of reference.

3.2. MINING

3.2.1. Methods and Phasing

The Pebble Mine will be a conventional drill, blast, truck, and shovel operation with an average mining rate of 70 million tons per year and an overall stripping ratio of 0.12 ton of waste per ton of mineralized material.

The open pit will be developed in stages, with each stage expanding the area and deepening the previous stage. The final dimensions of the open pit will be approximately 6,800 feet long and 5,600 feet wide, with depths to 1,970 feet.

Mining will occur in two phases – Preproduction and Production.

The mine operation will commence during the last year of the Preproduction Phase and extend for 20 years during the Production Phase. During this period, 1,300 million tons of mineralized rock and 150 million tons of waste rock and overburden will be mined. Non-potentially acid generating (NPAG) waste rock will be used in construction of the tailings embankments. The PAG waste rock will be stored in the pyritic TSF until closure, when it will be back-hauled into the open pit. Fine- and coarse-grained soils will be stored southwest of the pit and north of the TSF embankments and will be used for reclamation during mine closure.

The Preproduction Phase consists of dewatering the pit area and mining of non-economic materials overlying the mineralized material from the initial stage of the open pit. Dewatering will begin approximately one year before the start of Preproduction mining. Approximately 33 million tons of material will be mined during this phase (Table 3-2).

Table 3-2. Mined Material—Preproduction Phase

Material Type	Quantity
Overburden	21.5 million tons
PAG waste rock	11.6 million tons

AMERICAN OVERSIGHT

The Production Phase encompasses the period during which economic-grade mineralized material will be fed to the metallurgical process plant that produces concentrates for shipment and sale. The Production Phase is planned to last for 20 years. Mineralized material will be mined and be fed through the process plant at a rate of 180,000 tons/day. The open pit will be mined in a sequence of increasingly larger and deeper stages. Approximately 1.4 billion tons of material are planned to be mined during the Production Phase (Table 3-3).

Table 3-3. Mined Material—Production Phase

Material Type	Quantity
Overburden	68 million tons
Mineralized material process plant feed	1,291 million tons
NPAG waste rock	13 million tons
PAG waste rock	39 million tons

3.2.2. Blasting

Most open pit blasting will be conducted using emulsion blasting agents manufactured on site. In dry conditions, a blend of ammonium nitrate and fuel oil (ANFO) can be used as the blasting agent. However, most ammonium nitrate will be converted to an emulsion blasting agent because of its higher density and superior water resistance. Initial operations during the Preproduction Phase may use pre-packed emulsion blasting agents or a mobile bulk emulsion manufacturing plant. After the explosives plant is completed, the emulsion-based ANFO explosive will be used as the primary blasting agent.

The ANFO will be stored separately as a safety precaution. All explosive magazines will be constructed and operated to meet mine safety and health regulations. The ammonium nitrate solution will be mixed with diesel fuel and emulsifying agents in a mobile mixing unit on the mining bench where blasting is to take place. The emulsion will become a blasting agent only once it is sensitized using the sensitizing agent while in the drill hole.

Based on knowledge of the rock types in the Pebble Deposit, blasting will require an average powder factor of approximately 0.5 pound per ton of rock. Blasting events during the Preproduction Phase will occur approximately once per day. The frequency will increase during the Production Phase, with events occurring as often as twice per day.

3.2.3. Waste Rock and Overburden Storage

Waste rock is mined material with a mineral content below an economically recoverable level that is removed from the open pit, exposing the higher-grade production material. Waste rock will be segregated by its potential to generate acid. NPAG and non-ML waste rock may be used for embankment construction. PAG and ML waste rock will be stored in the pyritic TSF until mine closure, when it will be back-hauled into the open pit. Quantities of material mined are outlined in Table 3-1 and Table Table 3-2 above.

AMERICAN OVERSIGHT

During the Preproduction Phase, approximately 33 million tons of non-mineralized and mineralized material will be removed from the open pit. Non-mineralized waste and overburden will be stockpiled or used in construction, mineralized waste will be stockpiled and relocated to the pyritic TSF once complete, or if grades are sufficient, stockpiled for milling once the mill is complete. Material will be stockpiled within the pit footprint, or in designated stockpiles as appropriate.

Overburden is the unconsolidated material lying at the surface. At the Pebble Deposit, the overburden depth ranges from 0 to 140 feet. Overburden removal will commence during the Preproduction Phase and will recur periodically during the Production Phase at the start of each pit stage. The overburden will be segregated and stockpiled in a dedicated location southwest of the open pit. A berm built of non-mineralized rock will surround the overburden to contain the material and increase stability. Overburden materials deemed suitable will be used for construction. Fine- and coarse-grained soils suitable for plant growth will be stockpiled for later use as growth medium during reclamation. Growth medium stockpiles will be stored at various locations around the mine site and stabilized to minimize erosion potential.

3.2.4. Equipment

The Project will use the most efficient mining equipment available in the production fleet to minimize fuel consumption per ton of rock moved. Most mining equipment will be diesel-powered. This production fleet will be supported by a fleet of smaller equipment for overburden removal and other specific tasks for which the larger units are not well-suited. Equipment requirements will increase over the life of the mine to reflect increased production volumes and longer cycle times for haul trucks as the pit is lowered (Table 3-4). All fleet equipment will be routinely maintained to ensure optimal performance and minimize the potential for spills and failures. Mobile equipment (haul trucks and wheel loaders) will be serviced in the truck shop; track-bound equipment (shovels, excavators, drills, and dozers) will be serviced in the field under appropriate spill prevention protocols.

Table 3-4. Production Phase Equipment

Equipment Unit	Class	Year 1 Quantity	Average Quantity	Peak Quantity
Electric shovel	73 cy	1	2	2
Diesel hydraulic shovel	53 cy	1	1	1
Wheel loader	53 cy	1	1	1
Electric drill	12.25 in	1	2	2
Diesel drill	12.25 in	1	1	1
Diesel drill	6.5 in	1	1	1
Diesel haul truck	400 ton	7	11	17
Diesel haul truck	150 ton	5	5	5

cy = cubic yards

AMERICAN OVERSIGHT

Track-mounted electric shovels will be the primary equipment unit used to load blasted rock into haul trucks. Each electric shovel is capable of mining at a sustained rate of approximately 30 million tons per year. Diesel hydraulic shovels, due to their greater flexibility, will be used to augment excavation capacity, depending on the mining application.

Wheel loaders are highly mobile, can be rapidly deployed to specific mining conditions, and are highly flexible in their application. Diesel off-highway haul trucks will be used to transport the fragmented mineralized material to the crusher.

Track-mounted drill rigs are used to drill blast holes into the waste rock and mineralized material prior to blasting. Hole diameters will vary between 6 and 12 inches. Drill rigs may be either electrically powered, as is the case for the larger units, or diesel powered.

This equipment will be supported by a large fleet of ancillary equipment, including track and wheel dozers for surface preparation, graders for construction and road maintenance, water trucks for dust suppression, maintenance equipment, and light vehicles for personnel transport. Other equipment, such as lighting plants, will be used to improve operational safety and efficiency.

3.2.5. Mining Supplies and Materials

Fuel, lubricants, tires, and blasting agents (Table 3-5) will be the primary materials used in mining.

Table 3-5. Mining Supplies

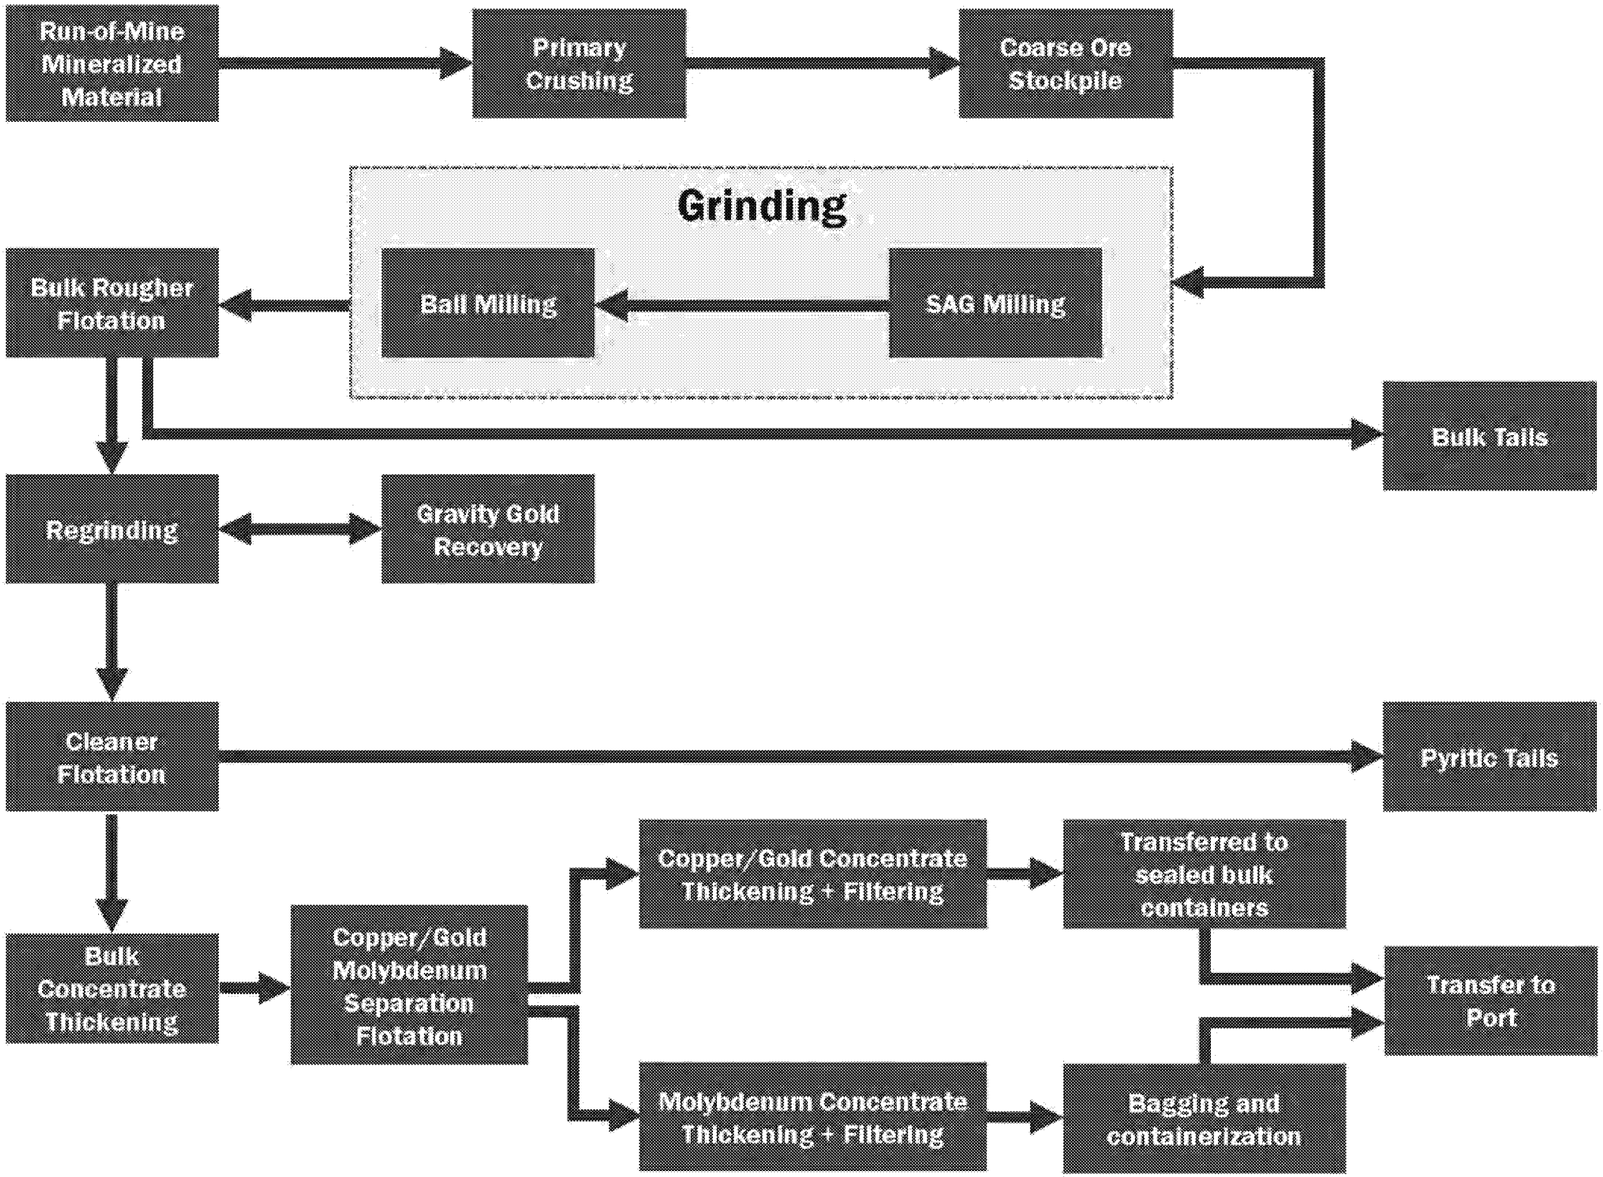
Consumable	Use	Shipping
Diesel fuel	Vehicles and blasting	6,350-gallon ISO tank-containers
Lubricants	Vehicles and equipment	Drums and totes in containers
Ammonium nitrate prill	Blasting	Bulk containers
Primers, detonators, and detonating cord	Blasting	Specialized packaging as required
Blasting emulsion ingredients	Blasting	Specialized packaging as required
Packaged explosives	Blasting	Specialized packaging as required
Haulage truck & other tires	Vehicles	Bulk containers/break bulk
Ground-engaging tools	Drilling and loading	Bulk containers

ISO = International Organization for Standardization

3.3. Mineral Processing

Mineral processing facilities will be located at the mine site. Blasted mineralized material from the open pit will be fed to a crushing plant to reduce the maximum particle size to approximately six inches. This crushed material will be conveyed to a coarse ore stockpile, which in turn feeds a grinding plant within the process plant. In the grinding plant, semi-autogenous grinding (SAG) mills and ball mills further reduce the plant feed to the consistency of very fine sand. The next step is froth flotation, in which the copper and molybdenum minerals are separated from the remaining material to produce concentrates. The concentrates are then filtered for shipment. Gravity

AMERICAN OVERSIGHT



concentrators will be placed at strategic locations to recover free gold, which will be shipped off site for refining.

The copper-gold concentrate will be loaded into covered bulk shipping containers; the molybdenum concentrate will be packaged in bulk bags and loaded into shipping containers. Other economically valuable minerals (palladium and rhenium) will be present in the concentrates and may be recovered at the refineries. Figure 3-1 shows the process flowsheet.

The concentrate containers will be transported by truck to the Amakdedori Port on Cook Inlet. The contents of the copper-gold concentrate containers will be directly unloaded into the holds of Handysize bulk carriers for shipment, while the molybdenum containers will be loaded directly onto barges or other ships.

Over the life of the Project, approximately 1.3 billion tons of mineralized material will be fed to the process plant at a rate of 180,000 tons/day. On average, the process plant will produce approximately 613,000 tons of copper-gold concentrate per year, containing approximately 318 million pounds of copper, 362,000 ounces of gold and 1.8 million ounces of silver, and approximately 15,000 tons of molybdenum concentrate, containing about 14 million pounds of molybdenum.

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

FIGURE 3-1
Process Flow Sheet

File: PLP_PD_ProcessFlowSheet.mxd	Date: 12/15/2017
Version: 1	Author: HDR

AMERICAN OVERSIGHT

3.3.1. Crushing

3.3.1.1 Primary Crushing

Mineralized material from the open pit will be delivered by 400-ton haul trucks to primary gyratory crushers located adjacent to the rim of the open pit. The crushers will reduce the mineralized material to a maximum size of six inches. The crushed mineralized material from both crushers is delivered via a single, covered, overland conveyor to the coarse ore stockpile.

3.3.1.2 Coarse Ore Stockpile

The coarse ore stockpile is contained within a covered steel frame building to minimize fugitive dust emissions and control mineralized material exposure to precipitation. The stockpile provides surge capacity between the crushers and the process plant, improving the efficiency of the latter and enabling it to operate if the feed from the crushers is not available.

The stockpiled material will be reclaimed by apron feeders mounted below the pile that deliver it onto two conveyor belts feeding the SAG mills. Baghouse-type dust collectors will be provided at each transfer point to control fugitive dust emissions. Water will be added to the process at the SAG mill, thereby eliminating the need for additional baghouses. A sump will be located in each reclaim tunnel to collect any excess water; however, such drainage is likely to be minimal, as it is preferable to handle coarse material dry to prevent freezing during cold conditions. An escape tunnel also will be provided for worker safety, with ventilation as required.

3.3.2. Grinding

The primary grinding circuit will use two parallel, 40-foot-diameter SAG mills and associated ball mills to grind mineralized material to the finer consistency necessary to separate the valuable minerals. Steel balls are added to the SAG mill to aid in grinding the mineralized material. Coarse mineralized material, water, and lime are fed into the SAG mills and the mineralized material is retained within the SAG mills by grates until the particles reach a maximum size of one to two inches.

Discharge from each SAG mill will be screened to remove larger particles ranging from one to two inches ("pebbles"). Material passing through the screens will be sent to the ball mills while the large particles will be conveyed to the pebble-crushing facility where they will be crushed and re-introduced to the SAG mill.

The next grinding step is ball milling. Ball mills have a lower diameter-to-length ratio than SAG mills and use a higher percentage of smaller steel balls compared to SAG mills, allowing them to grind the feed to a finer size. Two ball mills will be matched with each SAG mill.

The slurry from the ball mills will be pumped into the hydro-cyclones, which separate the finer material from the larger material through centrifugal force. The slurry with the coarser material will be recycled back to the ball mills for additional grinding. The slurry containing the finer material will be pumped to the flotation cells. Grinding circuit slurry pH levels will be adjusted to 8.5 by

AMERICAN OVERSIGHT

EPA-0135-0004769

adding lime slurry to minimize corrosion on the mill liners and promote efficient mixing prior to flotation.

3.3.3. Concentrate Production

Copper-gold and molybdenum concentrates will be produced via flotation, which will separate the metal sulfides from pyrite and non-economic minerals. Two tailings streams will be produced: bulk tailings and pyritic tailings.

3.3.3.1 Bulk Rougher Flotation

The rougher flotation circuit is designed to separate the sulfide minerals, predominantly copper, molybdenum, and iron sulfides (pyrite) within the process plant feed from the non-sulfide minerals. Slurry from the ball mills is split between two banks of bulk rougher flotation cells. Reagents added to the slurry promote mineral separation by inducing mineral particles to attach to air bubbles created by blowing air through the flotation cells. Additional reagents are added to promote froth bubble stability. This froth, with the mineral particles attached, rises to the surface and is collected as a bulk rougher concentrate for the next phase of flotation.

Bulk rougher concentrate slurry is then routed to the regrind circuit. Material that does not float – the bulk flotation tailings from which most of the sulfide minerals have been removed – will be pumped to two tailings thickeners.

3.3.3.2 Regrind

The bulk rougher concentrate is reground to sufficiently liberate minerals and enable the separation of the copper-molybdenum sulfide minerals from iron and other sulfides, thus producing concentrates with commercially acceptable grades. A gravity gold recovery circuit is attached to the regrind circuit to recover free gold that might otherwise be lost.

3.3.3.3 Cleaning

Reground bulk rougher concentrates will be upgraded through a two-stage cleaning process. The concentrate from the cleaning process will report to copper-molybdenum separation, while the tailings will report to the pyritic tailings thickener for thickening prior to pumping to the pyritic tailings storage cell in the TSF. The same reagents used in the rougher flotation circuit will be used in the cleaning circuit, with additional reagents used to aid in the suppression of gangue minerals. The cleaning stage is operated at an elevated pH—through lime addition—to suppress pyritic minerals, which would lower the grade of final concentrates.

3.3.3.4 Bulk Concentrate Thickener

Water will be removed from the bulk concentrate in a conventional thickener. This will remove as much of the bulk flotation reagents as possible before the slurry enters the copper-gold/molybdenum separation circuit, thus increasing separation process efficiency. Reagents will be recycled to the rougher process with the thickener overflow. The resulting slurry will contain 50 percent solids by weight and will go forward to copper-gold/molybdenum separation.

AMERICAN OVERSIGHT

3.3.3.5 Copper-Gold/Molybdenum Separation Flotation

The final flotation process is designed to separate copper-gold and molybdenum concentrates by adding reagents. The concentrate from the separation stage is the molybdenum concentrate, while the tailings comprise the final copper-gold concentrate.

3.3.3.6 Concentrate Dewatering, Filtration, and Packaging

The upgraded copper-gold concentrate will be thickened to 55 percent solids by weight in a high-rate thickener. The thickener overflow will return to various circuits for use as process water. The thickener underflow will be fed to a pressure filter to reduce the moisture to approximately eight percent. The filter product will be conveyed to specialized bulk cargo containers with removable locking lids that prevent dust emissions and incidental spills while maintaining product quality through the logistics chain.

The molybdenum concentrate will be thickened in a high-rate thickener to 55 percent solids by weight. The thickener underflow will be pumped to the molybdenum concentrate filter press, where the moisture content will be reduced to 12 percent. The filtered concentrate will be further dewatered by a dryer to five percent moisture before being bagged, containerized, and shipped offshore.

3.3.4. Processing Reagents and Materials

Table 3-6 provides a list of commonly used reagents for this type of process, along with their typical packaging for transportation. The final reagent list will be determined during detailed design.

Table 3-6. Processing Reagents and Materials

Reagent	Use	Shipping/Preparation
Calcium Oxide (quick lime)	pH modifier; depresses pyrite in the copper-molybdenum flotation process.	Calcium oxide pebbles (80 percent) shipped in specially adapted shipping containers. Pebbles will be crushed and mixed with water to form lime slurry at the lime plant.
Sodium Ethyl Xanthate	Copper collector; used in the rougher flotation circuit.	Pelletized reagent shipped in 1-ton bags. Mixed with process water to form 20 percent solution and stored in collector storage tank. Mix and storage tanks vented externally with fans.
Fuel Oil (Diesel)	Used in the flotation process.	Shipped in tanker trucks and stored in the main head tank in the copper-molybdenum concentrator area.
Sodium Hydrogen Sulfide (NaHS)	Copper depressant used in the copper-molybdenum separation processes.	Pelletized reagent shipped in 1-ton bags. Mixed with process water to form 20 percent solution and stored in the NaHS storage tank.

AMERICAN OVERSIGHT

Reagent	Use	Shipping/Preparation
Carboxy Methyl Cellulose	Depressant; anionic polymer used to depress clay and related gangue material in the bulk cleaner flotation circuit.	Pelletized reagent shipped in 1-ton bags. Mixed with process water in the agitated dispersant tank to form 20 percent solution and stored in dispersant storage tank.
Methyl Isobutyl Carbinol	Frother; maintains air bubbles in the flotation circuits.	Shipped in 20-foot specialized ISO containers and stored in the frother storage tank.
Depressant (sodium silicate)	Clay or silica gangue mineral depressant used in the copper-molybdenum separation process.	Pelletized reagent shipped in 1-ton bags. Mixed with process water to form 20 percent solution and stored in the sodium silicate storage tank.
Anionic polyacrylamide	Thickener aid.	Pelletized reagent shipped in 1-ton bags. Vendor package preparation system composed of a bag breaking enclosure to contain dust, dry flocculent metering, and a wet jet system to combine treated water with the powdered flocculent in an agitated tank for maturation. Prepared in small batches and transferred to a flocculent storage tank.
Polyacrilic acid	Antiscalant for the lime production process.	Viscous pale amber liquid shipped in 35-cubic-foot specialized container tanks within protected rectangular framework.
Nitrogen	Nitrogen used in the molybdenum flotation circuit to depress copper sulfides.	Nitrogen will be provided by a vendor-supplied pressure swing adsorption nitrogen plant. This equipment separates nitrogen from air for use in the mineral-process plant.

3.3.5. Process Water Supply System

Process water will be drawn from the main WMP and the tailings thickener overflow streams. The primary process water source is the bulk tailings thickener overflow. Precipitation runoff will either be diverted by non-contact water diversion channels, or collected in sediment ponds as appropriate, and pumped to the main WMP. Some treated water will be diverted to the process for pump glands and other similar applications.

3.3.6. Tailings Production

Processing mineralized material to recover copper, gold, and molybdenum will produce two types of tailings: bulk flotation and pyritic. Bulk flotation tailings will be pumped to the bulk tailings thickener, where flocculant will be added as necessary to help the settling process. Tailings

AMERICAN OVERSIGHT

thickener underflow, at approximately 55 percent solids, will be pumped to the bulk TSF. The pyritic tailings will be thickened, mixed with WTP sludge, and pumped to the pyritic TSF. The overflow streams from each thickener will be returned to the process. Supernatant water in the bulk and pyritic TSFs will be reclaimed to the mill site WMP. Some of this water will be pumped to the process water tank for re-use in the process plant. Any surplus water will be treated in the WTP and discharged.

3.4. TAILINGS STORAGE FACILITIES

Separate TSFs will be constructed for the bulk and pyritic tailings located primarily within the NFK watershed (Figure 1-4). Total TSF capacity will be sufficient to store the 20-year mine life tailings volume (1.3 billion tons). Approximately 88 percent 1,140 million tons) of the tailings will be bulk tailings, and approximately 12 percent (155 million tons) will be pyritic tailings.

The unlined bulk TSF has two embankments, the main and south embankments. The pyritic TSF will be lined and has three embankments – north, south, and east.

Starter embankments for both facilities will be constructed as part of the initial TSF construction. The main embankment of the bulk TSF will function as a permeable structure to maintain a depressed phreatic surface in the embankment and in the tailings mass in proximity to the embankment. A basin underdrain system will be constructed at various locations throughout the bulk TSF basin to provide preferred drainage paths for seepage flows. The pyritic TSF will be a fully lined facility.

The pyritic TSF, which will also contain the PAG waste, will have a full water cover during operations, while the bulk tailings cell will have a relatively small supernatant pond, located away from the embankments, to promote large tailings beach development upstream of the embankments.

The bulk TSF downstream embankment slopes will be maintained at approximately 2.6H:1V (horizontal:vertical), including buttresses established at the downstream toe of the main embankment. The final embankment crest elevation will be approximately 1,730 feet above sea level for bulk TSF. Embankment heights, as measured from lowest downstream slope elevation, will be 545 feet (main) and 300 feet (south).

The pyritic TSF embankment slopes will be maintained at 2.6H:1V. The final crest elevation will be 1,710 feet above sea level. The north embankment height will be 425 feet, the south embankment height will be 305 feet, and the east embankment height will be 315 feet.

3.4.1. Siting Criteria

PLP conducted a multi-year, multi-disciplinary evaluation to select TSF locations that meet all engineering and environmental goals while allowing for cost-effective integration into the site waste and water management plans. During this evaluation, more than 35 tailings disposal options were tested against a range of siting criteria, including:

AMERICAN OVERSIGHT

- **Minimize potential impact to environmental resources.** The selected sites are within valleys supporting mixed uplands and wetland shrub/herbaceous shrub. The valleys include tributaries to the NFK that have experienced intermittent flows. Index counts indicate lower fish presence than at other locations. Potential impacts to waterfowl are likewise reduced by avoiding areas with high-value habitats for nesting, breeding, molting, or migration.
- **Provide adequate storage capacity.** The sites will accommodate tailings for the 20-year life of the Project.
- **Reasonable proximity.** The sites minimize the distance to the process plant, which reduces power consumption and the overall project footprint.
- **Facilitate closure.** Segregating the pyritic tailings and PAG waste allows for placement of both in the pit at the end of the mine life, thus eliminating this structure from the long-term closure plan.

3.4.2. Design Criteria

The TSFs will be designed to meet or exceed the standards of the updated 2017 *Guidelines for Cooperation with the Alaska Dam Safety Program* (ADSP) prepared by ADNR. The TSFs will be designed to the standards of a Class I hazard potential dam (the highest classification).

The final TSF designs will incorporate the following:

- Permanent, secure, and total confinement of bulk tailings solids within an engineered disposal facility.
- Secure, and total confinement of pyritic tailings and PAG waste rock within a fully lined, engineered facility, with these materials relocated to the pit at closure.
- Control, collection, and recovery of tailings water from within the tailings impoundments for recycling to the process plant operations as process water, or treatment prior to discharge to the environment.
- Providing seepage collection systems below the impoundment structures to prevent adverse downstream water quality impacts.
- The inclusion of sufficient freeboard within the bulk TSF that the entire volume of the Inflow Design Flood (IDF) will not flood the entire tailings beach, maintaining the beach between the maximum operating pond and the bulk TSF embankments.
- Limiting the volume of stored water within the bulk TSF and keeping the operating pond away from the dam face.
- Maintaining the pyritic tails and PAG waste in a sub-aqueous state to prevent oxidation.
- The consideration of long-term closure management at all stages of the TSF design process.

AMERICAN OVERSIGHT

- The inclusion of monitoring instrumentation for all aspects of the facility during operations and after closure.
- The design includes flattened slopes to increase the static factor of safety.

3.4.3. Tailings Deposition

Each tailings stream will be delivered to its respective TSF using two pump stations, one located in the process plant and one booster station positioned approximately mid-way along the pipeline route. The bulk tailings will be discharged via spigots spaced at regular intervals along the interior perimeter of the bulk tailings cell to promote beach development, which will allow the supernatant pond to be maintained away from the main embankment.

PAG waste rock will be placed in a ring around the interior of the pyritic TSF. Pyritic tailings from the cleaner scavenger flotation circuit will be discharged into the pyritic TSF at sub-aqueous discharge points, with the level maintained just below the upper bench level for the PAG waste being stored. The sub-aqueous discharge is necessary to prevent oxidation and potential acid generation.

3.4.4. Construction

A "Certificate of Approval to Construct a Dam" is required from ADNR for the construction of impounding structures meeting the minimum height or impounding thresholds. The TSFs, seepage collection ponds, and WMPs will be jurisdictional dam structures regulated by ADSP. The certificate will include any special conditions or limitations on the construction.

The embankments will be constructed using suitable rockfill or earthfill materials, including quarried rock, NPAG and non-ML waste rock excavated from the open pit, if available, and stripped overburden.

3.4.4.1 Bulk TSF

Main Embankment

The main embankment will be constructed using the centerline construction method with local borrow materials. The centerline construction method provides a high level of embankment stability while reducing the embankment material requirements associated with the downstream method.

The embankment foundation will be prepared by removing overburden materials to competent bedrock prior to the placing structural fill materials. Construction begins with a cofferdam to capture upstream runoff during starter embankment construction. The starter embankment will be constructed to a height of approximately 265 feet and provide capacity to store tailings for the first 24 months of operation.

The material for the starter embankments will be sourced from a quarry located within the impoundment area. The bulk TSF embankments will be raised progressively during the mine life.

AMERICAN OVERSIGHT

After the quarry within the impoundment is inundated with tailings, material will be sourced from two quarries immediately west and east of the impoundment.

The earthfill/rockfill embankment will include engineered filter zones and a crushed or processed aggregate drain at the topographic low point. This drain will provide a preferable seepage path from the tailings mass to downstream of the embankment toe. Additional underdrains running parallel to the embankment will allow for drainage of seepage collected along the embankment.

South Embankment

The south embankment will be constructed using the downstream construction method to facilitate lining of the upstream face, which is constructed at a 3H:1V slope. The downstream slope will be at 2.6H:1V. Overburden materials will be removed to competent bedrock below the embankment. The earthfill/rockfill embankment will include engineered filter zones and a grout curtain to reduce seepage below the embankment.

3.4.4.2 Pyritic TSF

The embankments will be constructed using the downstream method with an overall downstream slope of 2.6H:1V. The embankments will be constructed using select borrow materials and include a liner bedding layer, overlain by a liner, on the upstream slope and over the entire internal basin. Basin underdrains will collect and convey any seepage to the downstream seepage collection ponds.

3.4.4.3 Main Water Collection Pond

The Main Water Management Pond is the primary water management structure at the mine site. It will be a fully lined facility and constructed using quarried rockfill materials. The embankment is approximately 190 ft high with an overall downstream slope of approximately 2H:1V and an upstream slope of 3H:1V to accommodate the liner. It will be constructed to its final height during the initial construction period. The Main Water Management Pond embankment design concept requires that any potential weak foundation conditions encountered in the overburden materials are addressed by excavating that material. Any potential mitigation requirements (including the removal of the overburden if required) will be addressed based on the geotechnical and hydrogeological information collected for the area during site investigations.

3.4.4.4 TSF Embankment Lifts

TSF embankments will be constructed in stages throughout the life of the Project, with each stage providing the required capacity until the next stage is completed. A 'Certificate of Approval to Modify a Dam' is required from ADSP for each construction lift. Planned embankment raises will be evaluated each year and sized according to a review of the process plant throughput, actual tailings settled densities (TSF ponds are typically sounded to establish the size of the supernatant pond and the density of the deposited tailings in the TSF), and water storage requirements.

AMERICAN OVERSIGHT

3.4.5. Freeboard Allowance

All stages of embankment design include a freeboard allowance above the maximum operating TSF pond level and tailings beach. The freeboard allowance includes containment of the IDF and wave run-up protection, as well as an allowance for post-seismic embankment settlement. The IDF for the facility has been selected as the Probable Maximum Flood (PMF).

The embankment freeboard requirements will be reviewed as part of each dam lift and dam safety review, and will be adjusted, as required to reflect actual mine water management conditions.

3.4.6. Surface Water

The IDF is the primary hydrologic input to the TSF design. The IDF for the TSF, pyritic TSF, and the main WMP is the PMF. The design PMF volume is based on the 24-hour Probable Maximum Precipitation (PMP) event, plus the snow water equivalent from a 1-in-100-year snowpack. Available storage, or freeboard, will always be maintained within the storage facilities to account for the IDF. Maximum operating conditions will not encroach on the freeboard allowance.

Pumps located at the bulk tailings cell supernatant pond will control the water level by transferring excess water to either the seepage control pond or the main WMP.

The pyritic TSF will be a fully lined, water retention facility. The primary means of controlling the water level within pyritic TSF will be by pumping from this cell to the main WMP or the mill.

The main WMP will be a fully lined, water retention facility used to store surplus water for milling, or for managing surplus water from other impoundment and seepage structures. The primary means of controlling the water level in the main WMP is by pumping to the mill or treating surplus water and discharging to the environment.

3.4.7. Seepage

The main embankment of the bulk TSF will be designed to promote seepage to the seepage collection pond, thereby minimizing the volume of water contained within the impoundment.

For the other embankments, seepage controls will include grout curtains, liners, and low-permeability zones. The low-permeability zones, in conjunction with the low-permeability tailings mass, will function as the primary seepage control barriers of the internal and east embankments.

The seepage management system will also include seepage control measures downstream of the TSF embankments. These include seepage recycle ponds with grout curtains and low-permeability core zones, and downstream monitoring wells. Embankment runoff and TSF seepage collecting in the downstream seepage collection ponds will ultimately be transferred to the main WMP to be used in mining operations or treated for discharge.

3.5. Mine Site Infrastructure

Due to the remote location and the absence of existing infrastructure, the Project will be required to provide basic infrastructure, as well as the support facilities typically associated with mining

AMERICAN OVERSIGHT

operations. These facilities require reasonable access from the Pebble Deposit, and they have been situated foremost for stability and safety. Figure 1-4 shows the mine site layout.

3.5.1. Power Generation and Distribution

There is no existing power infrastructure in the Project vicinity. All required generating capacity, distribution infrastructure, and backup power will be developed by the Project.

To meet the projected power requirement while providing sufficient peaking capacity and N+1 redundancy (one generating unit held in reserve for maintenance or emergency use) will require a plant with an installed nameplate capacity of 270 MW. The plant will use high-efficiency combustion turbine generators operating in a combined-cycle configuration. The units would be fired by natural gas provided to the site via pipeline. Design-appropriate controls will be used to manage airborne emissions and meet Alaska Department of Environmental Conservation (ADEC) air quality criteria and best management practices (BMPs). Unused waste heat will be rejected through a closed-loop, water cooled system that circulates water through the steam condenser to a mechanical draft cooling tower.

The various mine load centers would be serviced by a 69-kilovolt distribution system using a gas-insulated switchgear system located at the power plant.

Emergency backup power for the mine site will be provided by both standby and prime-rated diesel generators connected into electrical equipment at areas where power is required to ensure personnel safety, avoid the release of contaminants to the environment, and allow for the managed shutdown and/or ongoing operation of process-related equipment.

3.5.2. Heating

Waste heat from the power plant will be used to heat mine site buildings and supply process heating to the water treatment plant. Low-pressure steam, via heat exchangers, will heat a closed-loop glycol system that distributes heat to various buildings. Warm water from the steam condenser discharge will be routed to the water treatment plant to provide process heating.

3.5.3. Shops

The truck shop complex will house a light-vehicle maintenance garage, a heavy-duty shop that can accommodate 400-ton trucks, a truck wash building, a tire shop and a fabrication and welding shop. The layout is designed to maintain optimal traffic flow and minimize the overall complex footprint. An oil-water separation system will be designed for water collected from the wash facility and floor drains.

3.5.4. On-site Access Roads

There will be several access roads within the mine site area, including a road from the gatehouse to the mine site and secondary roads linking with the various facilities around the mine. Roads will be sized according to the operating requirements and the types of equipment using them.

AMERICAN OVERSIGHT

3.5.5. Personnel Camp

The first camp to be constructed at the mine site will be a 250-person fabric-type camp to support early site construction activities and throughout the Preproduction Phase as required for seasonal peak overflows. The main construction camp will be built in a double-occupancy configuration to accommodate 1,700 workers. This facility will later be refurbished for 850 permanent single-occupancy rooms for the operations phase. The camp will include dormitories, kitchen and dining facilities, incinerator, recreation facilities, check-in and check-out areas, administrative offices and first aid facilities.

The mine will operate on a fly-in, fly-out basis, except for those personnel residing in the communities connected to the access road corridor. Non-resident personnel will be flown in and out of the Iliamna Airport and transported to the site by road. Workers will remain on site throughout their work period. Site rules will prohibit hunting, fishing, or gathering while on site to minimize impacts to local subsistence resources.

3.5.6. Potable Water Supply

A series of groundwater wells located north of the mine site will supply potable water to the mine site. Preliminary tests indicate that minimal water treatment will be required. Treatment will likely include multimedia filtration, chlorination with sodium hypochlorite, and pH adjustment with sodium hydroxide. The treatment plants will be designed to meet federal and state drinking water quality standards.

Potable water will be distributed through a pump and piping network to supply fresh water to holding tanks at the personnel camp and process plant. Holding tank capacity will be sufficient for a 24-hour supply. Diesel-fired backup pumps will also be installed to provide potable water during an electrical outage.

3.5.7. Communications

Communications to site will be via fiber optic cable with satellite backup for critical systems. The fiber optic cable will connect to existing fiber optic infrastructure in the region or a dedicated fiber optic cable laid in conjunction with the gas pipeline.

The process plant communication system will use a dedicated ethernet network to support mine process control system communications. A separate network will connect various main components of the fire-detection and alarming system. Closed-circuit television, access control, and voice over internet protocol telephone systems will be integrated with the local area network. Mine operations will use two-way radios, cell phones, and similar equipment for communications.

3.5.8. Laboratories

Two laboratories will operate at the mine site during the Production Phase.

Staff affiliated with the process plant will operate the metallurgical laboratory to support process plant operations. This work will include routine operations support tests to confirm the metallurgical response of near-term plant feed, and development analysis to evaluate alternate

AMERICAN OVERSIGHT

treatment strategies. The laboratory will use state-of-the-art equipment and have fully equipped facilities for sample receiving and storage, sample preparation, and flotation.

The assay laboratory will be equipped with the necessary analytical instruments to provide routine assays to support mine and process plant operations. Some environmental samples will also be tested in this laboratory, although many of these samples will likely be submitted to external, third party laboratories.

Each laboratory will be equipped with fume hoods (with exhaust treatment, if required) and drains connected to a central receiving tank. Chemical wastes will be disposed of in accordance with all applicable laws and regulations.

3.5.9. Fire and Emergency Response

The mine site, Amakdedori Port site, and both ferry terminals will be equipped for fire and emergency response. Water for fire suppression will be stored within the freshwater supply tanks at the mine and port and distributed via an insulated pipeline system that meets all pertinent code requirements. A fire truck and ambulance will be located at the mine site. An ambulance will be located at the Amakdedori Port and a pump truck will be used to deliver fire suppression water. A senior member of the safety and health management team, with appropriate training and experience, will have designated responsibility for emergency response. Emergency response teams at the mine and Amakdedori Port sites will be staffed by volunteers and will be trained in fire suppression and mine rescue in accordance with regulations.

Both the mine and Amakdedori Port site will be staffed with an emergency medical technician to provide advanced medical care; appropriate facilities will be established at both locations. As necessary, this person may draw on the capabilities of the existing clinic in Iliamna. Arrangements will be made in advance for emergency evacuation via the airports in Iliamna and Kokhanok. Designated locations for helicopter pads will be defined at the mine and Amakdedori Port sites.

Equipment will be installed at the mine site, Amakdedori Port, and the two ferry terminals to deal with oil spills; crews will be appropriately trained for such response.

3.6. Material Management and Supply

General supplies and bulk reagents will typically be stored in, or adjacent to, the areas where they will be used. The location of the explosives storage and emulsion manufacturing plant is based on the need to minimize transfer distances and to provide a safety buffer between the explosives plant and other facilities. Descriptions of mining and process related supplies are provided in Table 3-5 and Table 3-6. Average annual quantities of fuel, mining, milling, and miscellaneous consumables are listed in Table 3-7.

AMERICAN OVERSIGHT

EPA-0135-0004780

Table 3-7. Supply Quantities

Supply	Average Annual Quantity
Fuel	16 million gallons
Ammonium Nitrate	17,500 tons
Grinding Media, Reagents, and Miscellaneous Supplies	250,000 tons

3.6.1. Diesel Fuel

Diesel fuel to support the mining operation, as well as the trucking and ferry logistics systems, will be imported to the Amakdedori Port using marine barges. The expected maximum parcel size for delivery is four million gallons, which will allow for extended periods between shipments in winter months. The Amakdedori Port will accommodate sufficient bulk fuel storage to provide one month of buffer and allow for the offloading of bulk fuel carriers.

Diesel fuel will be transferred from the Amakdedori Port to the mine site using ISO tank-container units, which have a capacity of 6,350 gallons. These units will be loaded at the port and transported by truck and ferry to the mine site. These tank-containers will also be used for local fuel distribution at the ferry terminal sites and for fuelling the ferry itself. Additional containers will be stored at the mine site and ferry terminals to provide for a fuel reserve in the event of a supply disruption.

The main mine site fuel storage area will contain fuel tanks in a dual-lined and bermed area designed to meet regulatory requirements. Sump and truck pump-out facilities will be installed to handle any spills. There will also be pump systems for delivering fuel to the rest of the mine site. Dispensing lines will have automatic shutoff devices, and spill response supplies will be stored and maintained on site wherever fuel will be dispensed.

Fuel will be dispensed to a pump house located in a fuel storage area for fueling light vehicles. It will also be dispensed to the fuel tanks in the truck shop complex, which are used for fueling mining equipment. These tanks will also be in a lined and bermed secondary containment area.

3.6.2. Lubricants

Lubricants will be packaged in drums and/or totes and stored on site within a secondary containment area.

3.6.3. Explosives

The materials used to manufacture blasting agents include ammonium nitrate prill, fuel oil, emulsifying agents, and sensitizing agents (gaseous). The containers used to transport the prill will be offloaded, using a container tilter, to a bucket elevator, which will unload the prill to three silos, each sized for 150,000 pounds. As a safety precaution, ammonium nitrate prill will be stored and prepared for use at a location approximately 0.75 mile southeast of the final pit rim. Electrical delay detonators and primers will be stored in the same general area, but in a separate magazine

AMERICAN OVERSIGHT

located apart from each other and separate from the prill. All facilities will be constructed and operated to meet mine safety and health regulations as set forth in 30 CFR 77.1301.

Other explosives required for the mining operation include detonating cord, which connects to each blast hole and fires a detonator, initiating the explosion in each blast hole. The detonators, in turn, fire explosive primers, which propagate the explosion to the blasting agent. Small amounts of pre-packaged blasting agents and minor amounts of other explosives may be used for specific purposes.

3.6.4. Reagents

Reagents will arrive at the mine site by truck in 20-ton containers, depending on the reagent. They will be stored in a secure bulk reagent storage area and segregated according to compatible characteristics. The reagent storage area will be sufficient to maintain a two-month supply at the mine site. As needed, reagents will be loaded onto a truck and delivered to the appropriate reagent receiving area.

Reagents will be used in very low concentrations throughout the mineral processing plant and are primarily consumed in the process; low residual reagent quantities remain in the tailings stream and will be disposed in the TSF where they will be diluted and decompose.

The metallurgical and assay laboratories will also use small amounts of reagents. Any hazardous reagents imported for testing will be transported, handled, stored, reported, and disposed of as required by law, in accordance with manufacturers' instructions, and consistent with industry best practices.

3.7. Waste Management and Disposal

3.7.1. Used or Damaged Parts

Used tires and rubber products will be reused to the extent practicable. Additional used tires, along with other damaged parts and worn pipes, will be packaged and back-loaded into empty containers for shipment and disposal off site. Wood pallets and packaging will be incinerated with domestic waste. Scrap steel, such as broken grinding balls and used mill liners, truck body liners and ground engaging tools, will be shipped off-site to appropriate disposal sites.

3.7.2. Laboratory Waste

Most inorganic aqueous wastes from the metallurgical and assay laboratories will be collected in a sump, with the remainder routed to the domestic sewage treatment plant. Fugitive organics will be skimmed from the surface of the sump prior to discharging the aqueous portion to the and main WMP. Generally, non-aqueous waste will be collected in specific and separate bulk containers before being returned to an appropriate place in the plant. If there is no suitable place in the main plant, it will be sent to the general waste storage area where it will be packaged and sent off site for disposal at an appropriate facility.

AMERICAN OVERSIGHT

3.7.3. Waste Oils

Waste oil will be reused as fuel in used oil heaters to augment heating in the truck shop and/or other buildings on site. Waste oils not suitable for burning, including lubricants, will be collected into drums, sealed, and stored in containers for shipment to be recycled or disposed of off-site at an approved facility.

3.7.4. Truck Wash Wastewater

Water from the truck wash will be routed to the main WMP for use in the mill and processing plan or treated for discharge.

3.7.5. Reagent Packaging

Reagent packaging will include wooden boxes, bulk poly-propylene containers, bulk bags, laboratory packaging, and/or glass containers. Spent reagent packaging will be evaluated against applicable regulations, permits and health and safety plans for possible incineration in the on-site incinerator. Glass containers will be rinsed and packed for removal and disposal off site. Broken sharp products will be collected and packaged appropriately for removal and disposal off site.

3.7.6. Hazardous Waste

Miscellaneous hazardous wastes that may accumulate on site, such as paint, used solvents, and empty reagent containers with residual chemicals, will be managed and shipped off site to approved facilities according to applicable BMPs and regulations.

3.7.7. Nuclear Instrumentation

Nuclear instrumentation such as densitometers will be shipped off site to approved facilities in accordance with applicable BMPs and regulations.

3.7.8. Domestic Refuse

Domestic refuse from the camp kitchen, living quarters, and administration block will be disposed of on site in a permitted landfill, or shipped off-site to appropriate disposal sites. Some wastes, including putrescible wastes, will be incinerated on site, and the remaining ashes will be disposed of in accordance with applicable BMPs and regulations.

3.7.9. Sewage and Domestic Wastewater Disposal

Separate sewage treatment plants will be located at the camp and the process plant. Plans for each plant will be reviewed and approved by ADEC prior to construction.

Personnel accommodations will produce grey water from the kitchen, showers, and laundry facilities that will be treated in a water treatment plant (WTP). The WTP will be designed to remove biological oxygen demand, total suspended solids (TSS), total phosphate, total nitrogen, and ammonia to meet ADEC domestic waste-discharge criteria. Treated water will be discharged to the TSF.

AMERICAN OVERSIGHT

The process plant sewage WTP will receive effluent that may have metallic residues from the workers' change house and associated laundry. This WTP will be designed for metals removal in addition to biological oxygen demand, TSS, total phosphate, total nitrogen, and ammonia to meet ADEC domestic waste-discharge criteria. The treated water will be discharged to the TSF.

Sludge from both plants will be stabilized and disposed of on site.

3.8. Transportation Corridor

The location of the Pebble Project mine site is physically separated from the marine terminal location by Iliamna Lake, which is roughly 75 miles long and up to 20 miles across, with no existing roadway networks around it. To avoid the environmental impact of constructing new roads around the lake, an all-season ice-breaking ferry will be used to cross the lake between ferry landings on each shore, which are connected to the mine site and Amakdedori Port by access roads.

The transportation corridor was designed to avoid wetlands where feasible, minimize disturbance area, minimize stream crossings, avoid geological and avalanche hazards, avoid culturally significant sites, minimize effects on subsistence hunting and gathering, optimize the alignment for the best soil and geotechnical conditions, and minimize road grades.

The main access road will run southward from the mine site to the north shore of Iliamna Lake. Ferry terminals will be located on the north and south shores. From the south shore, the access road will run to the marine port site on Cook Inlet at Amakdedori. Spur roads will connect to the villages of Iliamna, Newhalen, and Kokhanok (Figure 1-2).

3.8.1. Road Design

The main access road will be a private 30-foot-wide gravel road, which will enable two-way traffic, and will be capable of supporting anticipated development and operational activities during construction and truck haulage of concentrate from the mine to the port.

The access roads will include eight bridges, six of which will be single-span, two-lane bridges that range in length from approximately 90 to 170 feet. There will be one large (550 feet) multi-span, two-lane bridge across the Newhalen River and one large (455 feet) multi-span, two-lane bridge across the Gibraltar River. Road culverts at stream crossings are divided into categories based on whether the streams are fish bearing. Culverts at streams without fish will be designed and sized for drainage only, in accordance with ADOT&PF standards. Culverts at streams with fish will be designed and sized for fish passage in accordance with ADOT&PF and Alaska Department of Fish and Game (ADF&G) standards.

A natural gas pipeline and fiber optic cable will be buried adjacent to the main access road. For river crossings, the gas pipeline will either use horizontal directional drilling or be attached to the bridge structures.

AMERICAN OVERSIGHT

EPA-0135-0004784

3.8.2. Iliamna Lake Ferry

A custom designed ferry will transit Iliamna Lake between the North and South ferry terminals, carrying inbound supplies from the Amakdedori Port to the mine site and returning with copper-gold and molybdenum concentrates, backhauled waste, and empty containers. The one-way ferry trip is about 18 miles and will take approximately three hours to complete in ice conditions, or 1.5 hours in open water. On average, one round trip per day across the lake will be required.

The vessel is designed to operate year-round, in all ice conditions. Cargo will be carried on the vessel deck. The vessel is symmetrical forward and aft with two icebreaking bows, allowing operation in open water or ice in either direction without the need to turn the vessel around at each terminal. Each bow will be fitted with a ramp that provides access to shore. The diesel-electric propulsion system has four azimuthing propellers providing 100 percent thrust over a full 360 degrees, which will provide propulsion, station keeping in all wind conditions, and ice management (clearing ice away from the hull) when needed. Accommodation for 12 crew members is included on the vessel.

The generator engines comply with the highest applicable U.S. Environmental Protection Agency (EPA) emission standards. The hull is subdivided by watertight bulkheads so that even if one compartment is damaged and flooded, the vessel will remain afloat, upright and stable, and operational, capable to return to shore facilities for repairs. Fuel and other potential contaminants will be stored in tanks inside the hull and away from the shell to prevent spills in the unlikely event of damage to any of the hull's compartments.

Bilge water will be pumped through oil-water separation equipment installed on the vessel and then discharged back to Iliamna Lake. The sludge from the system will be transferred to a shore storage tank and ultimately transported to the mine site for disposal in the mine site incinerator.

The ferry terminals will initially serve as trans-shipment points for construction barge traffic across Iliamna Lake, using small temporary barges until the ferry is assembled. The south ferry terminal site includes the ferry assembly site. The ferry will be assembled from pre-fabricated components barged to the Amakdedori Port and then transported across the road. The vessel will be assembled in a cradle that rests on a series of heavy rails. Once assembled, the cradle will be pushed along the rails into the lake until the ferry floats away. The cradle will then be retrieved. The assembly site will remain intact to enable regular vessel surveys and maintenance as required.

The permanent facilities at the ferry terminals include container handling and storage facilities, office and maintenance buildings, and local power supply. Each ferry terminal facility will have space for a minimum of two days of storage of the average concentrate container traffic. The patio surface will be finished as semi-permeable gravel. An access ramp will be built out from shore as a rock and aggregate causeway structure to provide approximately 40 feet of roadway surface for trucks and forklifts to access the ferry.

During normal operations the ferry will be moored with a pair of lines to bollards at the end of the causeway. The vessel drive equipment will maintain the ferry in place during loading and unloading, even during high wind conditions. When the ferry is parked it will be moored to a set of

AMERICAN OVERSIGHT

buoys outside of the causeway. The design of these structures will allow for the engines to be turned off while also maintaining vessel security.

3.8.3. Transportation Corridor Traffic

To facilitate efficient cargo movement and optimize ferry space, most material will be transported in shipping containers. At each ferry terminal, a container yard with forklift trucks will be provided to stage empty and loaded containers for loading on/off the ferry, and truck transfer. Some cargo will be handled as break-bulk if it does not fit into containers.

Inbound Project cargo and consumables will be transported using standard ISO containers for ocean freight (either 20- or 40-foot size). Diesel fuel will be transferred from the Amakdedori Port to the mine site using ISO tank-container units, which have a capacity of 6,350 gallons. Copper-gold concentrate will be loaded into specialized bulk cargo containers, each containing about 38 tons of concentrate, with removable locking lids. Truck/trailer units will be designed to haul up to three loaded containers per trip.

Daily transportation of concentrate, fuel, reagents and consumables will require up to 35 round trips per day for each leg of the road, including three loads of fuel per day. The ferry will require one round trip across the lake per day.

3.9. Amakdedori Port and Lightering Locations

Incoming supplies such as equipment, reagents, and fuel will be barged to the Amakdedori Port and then transported by truck to the mine site. To a lesser extent, some supplies, such as perishable food, may be transported by air to the Iliamna Airport and trucked to the mine site. Concentrate in specialized containers will be lightered by barge from the Amakdedori Port to Handysize bulk carriers at offshore mooring points. The port facilities layout is shown in Figure 1-5. The proposed lightering location and an alternate that might be used under certain sea conditions are also shown in Figure 1-5.

3.9.1. Port Design

The Amakdedori Port will include shore-based facilities to receive and store containers and fuel, as well as two, 2-MW dual-fuel natural gas/diesel power generators, maintenance facilities, employee accommodations, and offices. The shore-based complex will be constructed on an engineered fill pad at an elevation sufficient to address tidal surge from major storms and potential tsunamis.

The marine component includes an earthen access causeway extending out to a marine jetty located in 15 feet of natural water depth. On one side will be a roll-on/roll-off barge access berth and a separate berth on the opposite side for the lightering barges. The jetty is expected to be constructed as a sheet pile cell structure filled with granular material. A floating dock, on the jetty but separate from the cargo handling berths, will be provided for ice-breaking tug moorage.

AMERICAN OVERSIGHT

3.9.2. Port Operations

Copper-gold concentrate will be transported from the mine site to the Amakdedori Port by truck in covered bulk cargo containers and stored between vessel sailings on a dedicated laydown pad adjacent to the jetty. The containers will be transported by barge to alongside the bulk carriers at the mooring points, and then lifted by crane into the open hold of the receiving ship. Once inside the hold, the container lid will be opened and the container turned upside down to unload the concentrate into the ship's hold. The container will be lowered as close as possible to the bottom of the hold to minimize the drop distance and the potential for dust generation during ship loading. About ten trips by the lightering barges will be required to load a bulk carrier, which would be anchored for four to five days at the lightering location. The bulk carrier ships will transport the concentrate to out of state smelters. This containerized bulk handling system minimizes dust emissions and the risk of spills.

The empty containers will be cleaned of any residue on the outside while at the port, and then returned to the laydown pad. They will then be returned to the mine site and reused for transporting concentrate.

Up to 27 Handysize ships will be required annually to transport concentrate. Up to 33 marine line-haul barge loads of supplies and consumables will be required annually. Two ice-breaking tug boats will be used to support marine facility operations.

3.10. Natural Gas Pipeline

Natural gas will be supplied to the Amakdedori Port and the mine site by pipeline (Figure 1-1). The pipeline will connect to the existing gas pipeline infrastructure near Anchor Point on the Kenai Peninsula and will be designed to provide a gross flow rate of approximately 50 million standard cubic feet per day. A fiber optic cable will be ploughed in, or buried in a shallow trench, adjacent to the pipeline.

A metering station will be constructed at the offtake point that connects to a compressor station located on a land parcel on the east side of the Sterling Highway. The steel pipeline will be designed to meet all required codes and will be a nominal 12 inches in diameter.

The compressor station will feed a 104-mile subsea pipeline that will be constructed using heavy wall nominal 12-inch-diameter pipe designed to have negative buoyancy and provide erosion protection against tidal currents. Horizontal directional drilling will be used to install pipe segments from the compressor station out into waters that are deep enough to avoid navigation hazards. From this point, the heavy wall pipe will be laid on the sea floor and anchored or supported as required.

The pipeline will come ashore at the Amakdedori Port, where natural gas will be fed to the port site power station and used for site heating. The distance from the Amakdedori Port to the mine site is approximately 81 miles and will consist of three sections. The first section will follow the access road to the South Ferry Terminal. The pipeline will be buried in a trench adjacent to the road prism. At the South Ferry Terminal, gas will be fed from the pipeline to the facilities for

AMERICAN OVERSIGHT

EPA-0135-0004787

power supply and facility heat. At this point, the pipeline will enter Iliamna Lake for the next section, an approximate 18-mile lake crossing. The design of this section of the pipe, transitions, and burial will be similar to the Cook Inlet crossing. The pipeline will come ashore at the North Ferry Terminal. Natural gas will be used to provide power and heat at ferry terminal facilities. From this point, the pipeline will follow the road route 28 miles to the mine site.

Long-term corrosion protection and control will be provided by an external coating on the pipeline and components, combined with an impressed current and/or galvanic current cathodic protection system. The cathodic protection system will be installed and activated, as soon as is practical, after pipe installation to maximize the effect of corrosion protection. Anode bed and rectifier locations will be determined based on specific local conditions and field observations. Metering stations and pig launching and receiving facilities would be located at the compressor stations and offtake points as appropriate. Mainline sectionalizing valves will be installed as required by code, with a spacing of no more than 20 miles for the onshore sections of the pipeline.

AMERICAN OVERSIGHT

EPA-0135-0004788

4. WATER MANAGEMENT

PLP recognizes the importance of effectively managing water resources in the area surrounding the Pebble Deposit and will implement a comprehensive water management program that will minimize impacts to water flow and quality, and will minimize and mitigate impacts associated with all waters affected or used by the Project.

4.1. MINE SITE

The main objective of water management at the mine site is to manage, in an environmentally responsible manner, water that originates within the project area while providing an adequate water supply for operations. A primary design consideration is to ensure that all contact water that requires treatment prior to release to the environment will be effectively managed. This includes carefully assessing the Project facility layout, process requirements, area topography, hydrometeorology, aquatic habitat/resources, and regulatory discharge requirements for managing surplus water

All runoff water contacting the facilities at the mine site and water pumped from the open pit will be captured to protect the overall downstream water quality. The ultimate Project design will incorporate a detailed analysis of water collection and management, including quantity and quality estimates, water treatment options, water management facility design, and strategic discharge of treated water. The water management plan will enable the plant to operate without requiring additional water from off-site sources. Mine site water management systems will be designed for the entire life cycle of the Project, from initial construction through the preproduction phase, operation, and closure.

4.1.1. Water Balance Model

The foundation of the water management program is the water balance. The Pebble Water Balance Model is comprised of three primary modules: the Watershed Module, the Groundwater Module, and the Mine Plan Module. These three modules, which are all numerical water balance models, are very different, yet complementary. They collectively provide the means of quantifying the numerous water flows in the streams, in the ground, and in the various pipes, ponds, and mine structures associated with the mine development. The Watershed Module focuses on water flows throughout the NFK, SFK, and UTC drainages. The Groundwater Module focuses on the detailed simulation and understanding of groundwater flows within those drainages, and serves to inform the watershed module, and vice versa. The Mine Plan Module focuses on mine site water inflows and uses.

Complementing the water balance modules is an instream fish habitat-flow model, which was used to assess the effects of changes in water flow to the fish habitat in the adjacent streams.

4.1.1.1 Watershed Module

The Watershed Module for the NFK, SFK, and UTC drainages considers both surface and groundwater. This module incorporates all key components of the hydrologic cycle, including

AMERICAN OVERSIGHT

precipitation as rain and snow, evaporation, sublimation, runoff, surface storage, and groundwater recharge, discharge, and storage. The primary input is monthly precipitation and temperature data collected at the Iliamna Airport from 1942 through 2017. The model was calibrated to measured site flow data collected at various locations in all three drainages over a nine-year period. The Watershed Module also provided input for the instream fish habitat-flow model, as well as the initial boundary parameters associated with groundwater recharge and runoff conditions for the groundwater module.

4.1.1.2 Groundwater Module

The Groundwater Module focuses on the sub-surface movement of water within the NFK, SFK, and UTC drainages. It models hydrogeological conditions in a more sophisticated and detailed manner than the Watershed Module, and its outputs provide a check of reasonableness for the Watershed Module. In addition, the Groundwater Module simulates groundwater flow rates and groundwater-surface water interactions throughout the study area, whereas the Watershed Module considers surface and groundwater flow rates only at the streamflow gaging stations.

4.1.1.3 Mine Plan Module

The Mine Plan Module focuses on water movement within the Pebble Project footprint area. The Mine Plan Module is a site-wide water balance and considers all mine facilities including the bulk TSF, pyritic TSF, open pit, process plant, and the WMPs. This module tracks water movement throughout the Pebble Project footprint area including runoff from the mine facilities, water contained in the ore, groundwater inflows, evaporation and water stored in the tailings voids.

The Mine Plan Module is used to predict the flow regime on the mine site and whether there is a water surplus or deficit. It will also be used to estimate the water storage capacity requirements for the mine under normal operating conditions.

4.1.1.4 Physical Habitat Simulation System (PHABSIM) Instream-flow Model

The PHABSIM model is an integral component of the site water balance design and is used to determine the most effective way of releasing the treated contact water that is surplus to the project needs. This model assesses the effects of changes in water flow to the instream fish habitat in streams downstream of the project site. It quantifies the areal extent of specific habitat changes that result from changes in flow throughout the year:

- for each of the three streams in the area (NFK, SFK, and UTC),
- at multiple locations throughout the whole length of each stream,
- for different salmon and resident fish species within each stream, and
- for different life history stages of each species.

Output from the model, together with a consideration of site-specific fish production limiting factors, will be used to inform and optimize the discharge of water from the site to minimize the effects of reduced flow and/or enhance instream fish habitat below the discharge points.

AMERICAN OVERSIGHT

4.1.2. Preproduction Phase

The water management and sediment control plan during the preproduction phase consists of multiple aspects that will focus on minimizing contact water volumes. Runoff and associated sediment control measures will be managed with BMPs and adaptive control strategies. Where water cannot be diverted, it will be collected, treated, and discharged.

4.1.2.1 Water Management Plan

The water management plan during the Preproduction Phase can be summarized as follows:

- Water diversion, collection, and treatment systems will be installed around the site to address the effect of construction ground disturbance.
- Water management and sediment control structural BMPs, including temporary settling basins and silt fences, will be installed to accommodate the initial mine site construction.
- Among the first permanent facilities to be constructed will be the water management structures that will be maintained for use in adaptive management during operations, such as diversion and runoff collection ditches to minimize water contact with disturbed surfaces, and sediment control measures such as settling ponds to stop sediment from reaching downstream water courses.
- Preproduction Phase mining cannot commence until the water table in the open pit area has been lowered by groundwater pumping. The open pit dewatering system will be installed prior to Preproduction Phase mining to provide sufficient time to draw down the water table in the area. This will allow uninterrupted overburden removal in preparation for production mining of mineralized material. A series of dewatering wells will be drilled into and around the perimeter of the open pit, with the exact well number and location determined by testing the overburden aquifers. The number of wells will include an allowance for wells with poor or no water yields and wells lost through sanding, equipment loss, or other interference with water production. Pump sizes for each well will be based on well-specific yields. Water will be discharged to the environment if it meets water quality criteria; otherwise, it will be treated in a modular water treatment plant prior to discharge.

Design considerations for the Preproduction Phase water management structures include the following:

- Diversion channels, berms, and collection ditches, will be sized for the 100-year, 24-hour rainfall event.
- Diversion channels, berms, and collection ditches will be constructed with erosion-control features, such as geotextile or riprap lining, as appropriate, for site-specific condition. Energy dissipation structures, such as spill basins or similar control

AMERICAN OVERSIGHT

measures, will be included where required to reduce erosion at the outlets of the diversion channels and collection ditches.

- Sediment control ponds will be sized to attenuate and treat up to the 10-year, 24-hour rainfall event volume and to safely manage the 100-year, 24-hour rainfall event.
- Water management and sediment control ponds will be constructed using non-PAG rock and earthen fill embankments.
- A temporary cofferdam will be constructed upstream of the main TSF embankment to manage water during the initial construction phase. Runoff from the undisturbed upstream catchment will be collected behind the cofferdam will be pumped downstream of all construction activities and released within the same watershed.

4.1.2.2 Water Treatment

Minimal water storage will be available on site until initial construction activities are completed. Therefore, prior to completion of the TSF embankments and water management structures, all water that does not meet water quality standards will be treated and released. Water from the following sources and activities are expected to require treatment prior to release:

- Preproduction Phase pit dewatering (dewatering of the overburden aquifer near the pit may require treatment).
- Water, primarily from precipitation, accumulating in the open pit during Preproduction Phase mining.
- Runoff from TSF embankment construction.
- Runoff from excavation for site infrastructure such as the process plant, camps, power plant, or storage areas will be routed to settling ponds prior to release.
- Prior to the operations WTPs being brought on-line, modular WTPs will be used to treat contact water that does not meet discharge requirements.

4.1.3. Production Phase

The water management and sediment control plan during the Production Phase focuses on minimizing contact water. Runoff and associated sediment control measures will be managed with BMPs and adaptive control strategies. Where water cannot be diverted, it will be collected for use in the mining process or treated and discharged.

4.1.3.1 Water Management Plan

The water management plan during the Production Phase can be summarized as follows (Figure 4-1 shows a simplified schematic of the site water balance):

- Water collected from the pit dewatering wells and the open pit will be pumped to the open pit water management pond (WMP). From there, water will be pumped to the open pit WTP for treatment and discharge. WTP sludge will be directed to the

AMERICAN OVERSIGHT

process plant where it will be added to the pyritic TSF via the pyritic tailings slurry line.

- Bulk tailings slurry from the mill will be directed to the bulk TSF. Additionally, precipitation and runoff water will collect in the TSF. The bulk TSF will maintain a small operating pond.

- The main bulk TSF embankment will operate as a flow-through facility. Water collecting in the bulk tailings storage cell will flow through the embankment to the main embankment seepage collection pond. From there, water will either be directed to the main WMP for use in the mill or to the main WTP for treatment and discharge. Any excess surface water in the bulk tailings TSF will be pumped to the main WMP.

- Contact water will be pumped to the main WMP. Water treatment by-product sludge and reject water will be directed to the process plant and added to the pyritic TSF via the pyritic tailings slurry line. A portion of the treated water from the main WTP will be returned for use in the process plant and power plant cooling towers.

- Pyritic tailings slurry from the mill will be directed to the lined pyritic TSF. Additionally, precipitation and runoff water will collect in the pyritic TSF. A pond will be maintained in the pyritic TSF, fully submerging the pyritic tailings and all but the upper lift of the PAG waste rock. Excess water from the pyritic TSF will be pumped to the main WMP.

- A water surplus for the Production Phase is anticipated under normal and wetter-than-normal climatic conditions. Although the mine site will have a water surplus, the water volume available to discharge will be less than the pre-mine flows within the mine footprint as some water will be consumed in the tailings voids and some will be lost to evaporation and other minor uses. The site water surplus will vary during operations as the mine footprint expands and additional site runoff is collected. The annual average surplus is estimated at approximately 29 cubic feet per second (cfs) for the maximum mine site footprint. Surplus water will be treated and discharged throughout the year.

- The accuracy of water balance models is limited by many factors, including the stochastic nature of the inputs and the potential effects of climate change. In recognition of these limitations, an adaptive water management strategy is planned. Adaptive water management includes the ability to provide additional temporary water storage capacity in the TSFs, to provide surplus storage capacity within the WMPs, and to provide for expansion of the WTP treatment rate by building in excess capacity. In addition to the redundancy built into the pumping and treatment systems, additional storage capacity is available under extreme flood conditions by directing water to the open pit, allowing it to flood until the pumping and treatment systems can restore the water stored in the system to its design level.

AMERICAN OVERSIGHT

- A comprehensive water management system will be implemented to monitor water quantity and quality. All discharged waters will be monitored for compliance with state and federal permit requirements. Water from both water treatment plants will be strategically discharged to optimize fish habitat in the downstream reaches of nearby streams. Discharge locations for the treated water have been identified in the NFK, SFK, and UTC. The treated water discharge will be distributed to these locations in a manner that best optimizes downstream aquatic habitat conditions. Optimal conditions will be determined using a Physical Habitat Simulation System (PHABSIM) habitat instream-flow model and in accordance with ADEC and Alaska Department of Fish and Game (ADF&G) permit conditions.

Design considerations for the Production Phase water management include the following elements:

- Diversion channels, berms, and collection ditches will be sized for the 100-year, 24-hour rainfall event.
- Diversion channels, berms, and collection ditches will be constructed with erosion-control features, such as geotextile or riprap lining, as appropriate, for site-specific conditions. Energy dissipation structures, such as spill basins or similar control measures, will be included where required to reduce erosion at the outlets of the diversion channels and collection ditches.
- Sediment control ponds will be sized to attenuate and treat up to the 10-year, 24-hour storm event volume and to safely manage the 100-year, 24-hour rainfall event.
- Water management and sediment control ponds will be constructed using non-mineralized rock and earthen fill embankments.
- IDF for all WMPs will be the 100-year, 24-hour rainfall event; IDF for the TSFs and main WMP will be the 24-hour PMP plus the 100-year snow pack equivalent water volume.
- Surplus water will be treated to meet the specified water quality criteria prior to discharge.

Water collection, management, and transfer will be accomplished through a system of water management channels, ponds, and pump and pipeline configurations. These systems will be designed to handle the large flows that occur during spring freshet and late summer/fall rains. Spare parts for pump systems will be maintained on site to maintain continuous and effective water management. Leak detection systems that report to a central control system will be employed, as will monitoring systems to control pump cycling, high and low water-level switches, no-flow (or low-flow) alarms, vibration overheating alarms, and other systems as appropriate to monitor water management systems.

4.1.3.2 Water Treatment

Water collected around the mine area and Amakdedori Port site will require treatment prior to discharge to the environment. Treatment methods will include a mixture of settling for sediment removal, chemical additions to precipitate trace elements, filtration, reverse osmosis, and evaporation to meet final discharge criteria.

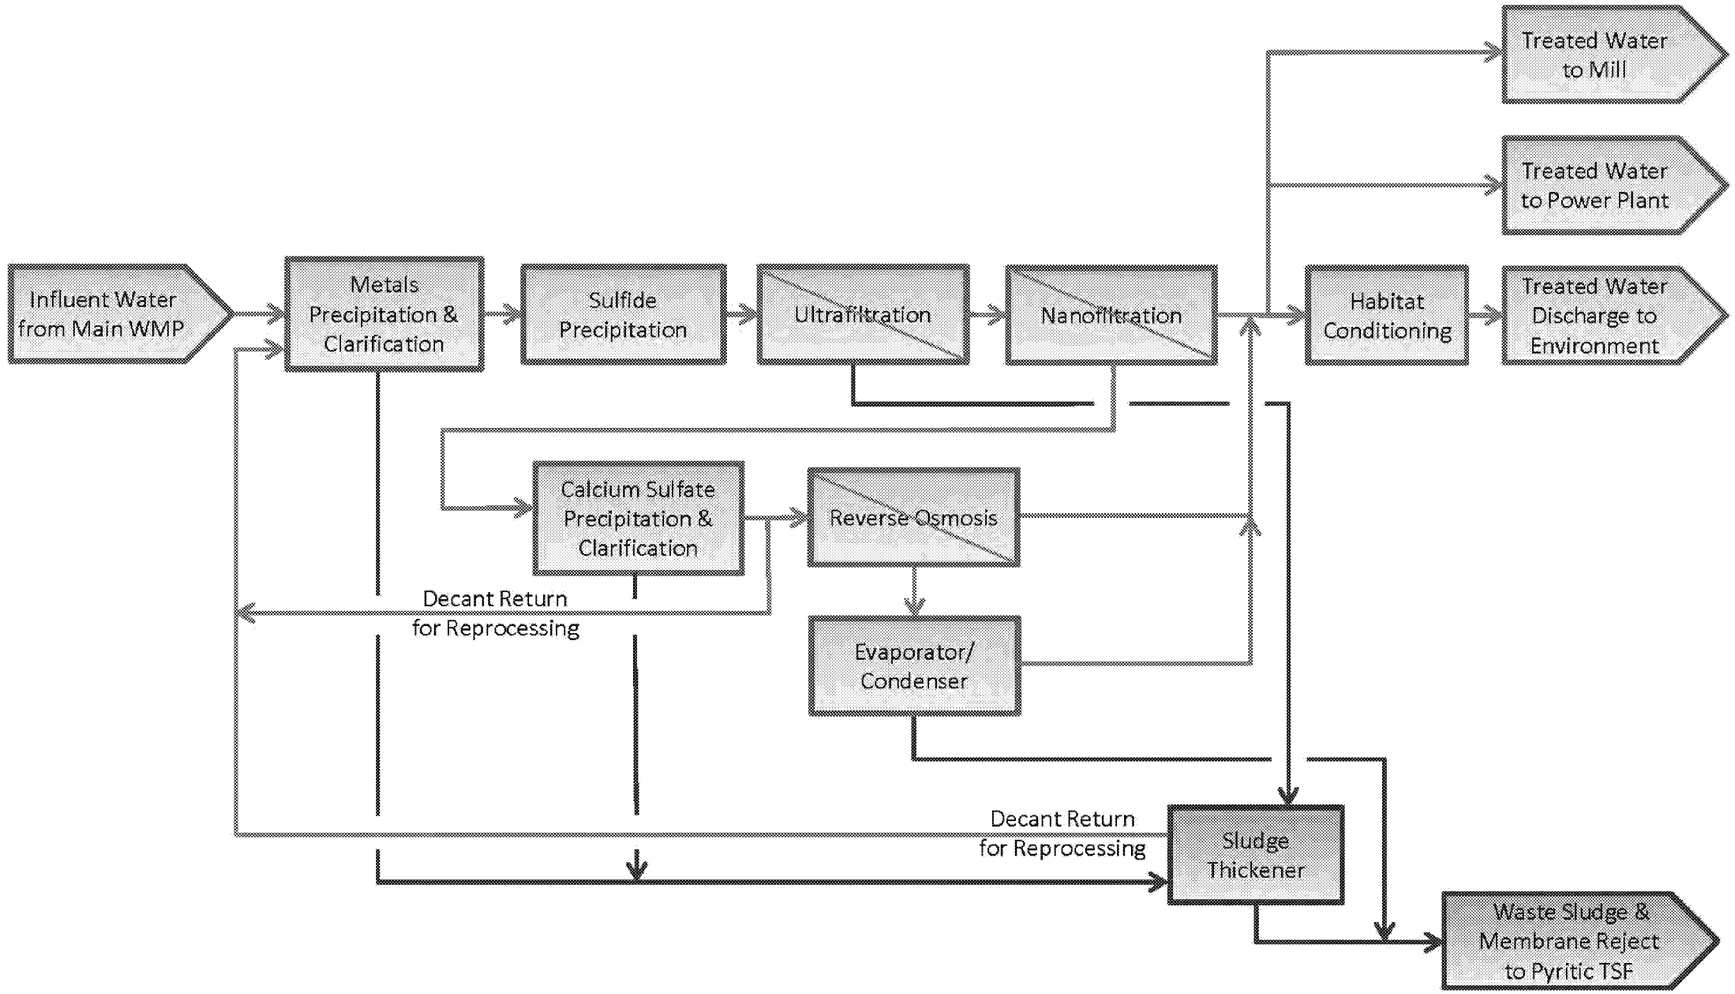
The mine area will have two water treatment plants: the main WTP and the open pit WTP. Both will be constructed with multiple, independent treatment trains, which will enable ongoing water treatment during mechanical interruption of any one train.

Main Water Treatment Plant

The main WTP will treat water from the main WMP. Figure 4-2 shows a simplified schematic of the treatment process. Key treatment steps occur in the following sequence:

1. Dissolved metals will be oxidized with air, ferric sulfate, and potassium permanganate, followed by co-precipitation with lime. Flocculators/clarifiers will be used to separate out the co-precipitated solids.
2. The clarified water will flow into a membrane feed tank, where sodium hydrogen sulfide or an organosulfide will be added to complete the precipitation process. Supplemental lime and sulfuric acid will be added as needed to maintain the water pH for optimal precipitation and membrane feed.
3. Ultrafiltration (UF) membranes will be used to filter precipitated metals and protect downstream high-pressure membranes.
4. Nanofiltration (NF) membranes will provide additional metals removal as well as removal of TDS and sulfate. Permeate from the NF membranes may require alkalinity adjustment prior to discharge.
5. Reject from the NF membranes will have a high concentration of dissolved sulfate and other divalent ions. To prevent overloading the mine water balance with dissolved sulfate, sulfate must be precipitated from the reject before transferring to the pyritic TSF. Sulfate from the NF reject will be precipitated as calcium sulfate with a lime softening process. The calcium sulfate sludge will be transferred to the pyritic TSF. Based on the expected pH in the pyritic TSF, the calcium sulfate sludge is not expected to re-dissolve.
6. Decant from the calcium sulfate precipitation process will contain high levels of TDS, a portion of which will need to be removed from the WTP process to avoid continual buildup. It will be necessary to split the decant stream as follows:
    a. Approximately three-quarters of the decant stream will be returned to the beginning of the WTP for reprocessing.
    b. The remainder of the decant stream will be concentrated with RO membranes. RO permeate is blended with treated water from the NF membranes (step 4) for discharge. RO reject will be sent to evaporators for further concentration

AMERICAN OVERSIGHT



of TDS. The evaporators will yield a liquid stream of concentrated TDS and evaporate. The liquid stream of concentrated TDS will be transferred to the pyritic TSF. The evaporate is condensed and the condensate blended with treated water from the NF membranes (step 4) for discharge.

Open Pit Water Treatment Plant

The open pit WTP will treat water from the open pit WMP with treatment plant processes commonly used in the mining industry around the world. Figure 4-3 shows a simplified schematic of the treatment process. Major treatment steps are outlined in sequence below.

1. Dissolved metals will be oxidized with potassium permanganate, followed by co-precipitation with ferric chloride. Hydrochloric acid and sodium hydroxide or lime will be added as needed to maintain the water pH for optimal precipitation. Flocculators/clarifiers will be used to separate out the co-precipitated solids.
2. Clarified water will then be treated with sodium hydrogen sulfide, sodium hydroxide or lime, and ferrous sulfate to further co-precipitate remaining metals under reducing conditions. Clarifier solids will be thickened and transferred to the pyritic TSF.
3. Water from the sulfide reaction tanks will be filtered with UF membranes to remove precipitated metals. Reject from the UF membranes will be thickened and transferred to the pyritic TSF.
4. A portion of the UF membrane permeate water will be treated with RO membranes to further remove selenium to a concentration that is safely below the discharge limit. Permeate from the RO will be recombined with the main effluent stream for discharge to the environment.
5. Reject brine from the RO, which will be high in soluble selenium, will be further treated with a biological reactor to enable separation of selenium as a solid. Discharge from the biological reactor will be transferred to the flocculators/clarifiers (step 1) for separation of selenium solids, which are thickened with the rest of the clarifier solids and transferred to the pyritic TSF.

4.1.4. Closure/Post-Closure Phase

Closure and post-closure water management addresses both the immediate physical closure of the site and associated reclamation activities, as well as the long-term post-closure period and associated maintenance and monitoring activities. Additional details on reclamation and closure are provided in Section 6.

4.1.4.1 Water Management Plan

The water management plan during the closure and post-closure phases can be summarized as follows:

- Years 0-15
  - The open pit WTP is reconfigured to treat contact water.
  - Excess and seepage water from the bulk TSF is pumped to the main WMP.
  - Seepage water from the pyritic TSF is pumped to the main WMP.
  - Surplus water from the main WMP is treated at the main WTP and release to the downstream environment.
  - Surplus water from the open pit is pumped to the open pit WTP to maintain the placement of the PAG waste rock in the dry.
  - Treated water from the open pit WTP is released to the downstream environment
  - The open pit WMP is reclaimed.
- Years 16 until the pit is full (approximately Year 20).
  - The main WTP is decommissioned once it is no longer required.
  - The pyritic TSF and associated seepage collection ponds are reclaimed and surface water runoff from the area is discharged to the downstream environment.
  - The main WMP is reclaimed and surface water runoff from the area is discharged to the downstream environment.
  - Bulk TSF and seepage collection pond water is pumped to the open pit.
  - The open pit fills to the maximum management level.
  - The basis for the current analysis is that no water will be treated during this phase, however an adaptive management strategy would be utilized, and water would be directed to the open pit WTP for treatment and release if required to maintain downstream flows.
- Year 20 until the bulk TSF consolidation is complete (approximately Year 50).
  - Bulk TSF seepage and runoff water is pumped to the open pit.
  - Water levels in the open pit are maintained below the main management level by treating and releasing surplus water from the open pit.
- Post Closure
  - Runoff water is directly discharged from the reclaimed bulk TSF to the NFK catchment once it has been demonstrated to meet water quality criteria.

AMERICAN OVERSIGHT

- Bulk TSF seepage water is pumped to the open pit.
- Water levels in the open pit are maintained below the main management level by treating and releasing surplus water from the open pit.

4.1.4.2 Water Treatment

Water treatment during this phase will utilize the facilities as outlined in Section 4.1.4.1. Water quality will be closely monitored, and changes and adjustments to the treatment process will be made as needed. The reclamation and closure bond package will include provisions for periodic replacement of water treatment facilities and ongoing operating and monitoring costs over the long-term, post-closure period.

4.2. AMAKDEDORI PORT

The WTP at the Amakdedori Port will treat surface runoff from the port facilities, including truck wash bays. The treatment process will include dissolved metal oxidation using potassium permanganate, followed by co-precipitation with ferric chloride. Water from the co-precipitated solids will flow into flocculators/clarifiers to separate out solids. The clarified water will then be treated with sodium hydrogen sulfide, sodium hydroxide and ferrous sulfate to further co-precipitate remaining metals under reducing conditions. The solids that are removed will be thickened and disposed of appropriately. The treated water will be suitable for discharge.

A potable WTP and a sewage treatment plant will also be located at the port site.

AMERICAN OVERSIGHT

5. PROJECT CONSTRUCTION

The Project will take approximately four years to construct. Construction will occur on the four main project components – mine site, transportation corridor, Amakdedori Port, and natural gas line across Cook Inlet, with the focus shifting between these components depending on the stage of construction. Several temporary elements will be built during the Preproduction Phase to facilitate construction of the permanent facilities. These temporary facilities will be either repurposed or removed and reclaimed when construction is complete.

5.1. CONSTRUCTION OVERVIEW

5.1.1. Site Access

Key first steps will be to establish transportation infrastructure to access the site, to install those environmental protection systems that will service the Preproduction Phase, and to construct temporary facilities that enable the construction crews to live and work at the sites.

The initial construction effort will be at the Amakdedori Port. A beachhead will be established using small landing craft style barges for access. As described more fully below, it will consist of a temporary camp, environmental protection features, the port site airstrip, and service facilities. Temporary diesel generators will be used for power supply. While this work is underway, crews will be housed on vessels moored near the site.

A temporary road will be constructed within the permanent alignment from the established beachhead to the first material site, approximately three miles from the port site. This material will be used to expand the pads for facilities. Pioneer road construction will continue during this phase, extending the road toward the South Ferry Terminal near Kokhanok.

Larger equipment will be landed once the completed jetty is in place, allowing full-scale road construction to commence. The goal will be to establish a connection to the south shore of Iliamna Lake to facilitate construction of a temporary barge landing site near Kokhanok and to build the road to the east abutment of the crossing of the Gibraltar River.

With access gained to Iliamna Lake, small barging equipment will be used on the lake to establish beachheads at the two ferry terminal sites, in a process similar to the one used at the Amakdedori Port. Commercial operators utilizing existing access through Pile Bay at the east of Iliamna Lake and the road connecting to Williamsport on Cook Inlet may be used to support the beachheads.

The beachheads at the ferry terminal sites will enable road construction to advance from those points. Temporary bridges will be used at the smaller crossings, while the major crossings at the Gibraltar River and the Newhalen River will have to be constructed to their full size because of the spans required. These larger spans will be completed during the second construction year.

Initial access to the mine site should be complete within one year.

AMERICAN OVERSIGHT

A key component of the construction plan is to establish year-round access across Iliamna Lake using the permanent ice-breaking ferry. Fabrication of the ferry components will commence off-site early in the Preproduction Phase. Once the South Ferry Terminal has been established, preparation of the ferry construction facility will begin and the pre-fabricated components will be delivered to site. The goal is to have the ferry constructed and launched during the second construction year.

5.1.2. Mine Site

Construction activities will commence at the mine site with completion of the initial access and the construction of temporary accommodation and service facilities. Earthworks will be the primary initial activity. The level of this activity will expand over the next year, with structure construction commencing as the associated earthworks are complete. The focus will be on establishing the process and power plant sites, the open pit WMP, the main WMP, the pyritic TSF, and the bulk TSF. Support facilities, such as accommodations, fuel storage, and power generation, will expand as the site activity increases. Laydown areas and access roads for construction will be placed within the future footprint of the open pit to minimize impacts.

Following on from this, process plant and power plant foundations will be well advanced and equipment deliveries commenced. The accommodations facility will be completed for construction and access roads built. The initial bulk TSF main embankment construction will be well advanced, with the goal of ensuring that at least one year's worth of water is stored to facilitate process plant startup.

The later construction years will entail significant activity at the site. During this period, the bulk TSF main embankment will be completed, the process plant building erected, and pyritic TSF foundation and liner installed. The WTPs will be ready for initial use and the power plant construction advanced. The initial open pit development will commence with mine service facilities constructed and initial pit dewatering systems installed and operating. Production mining equipment will be delivered and commissioned as required. WMPs will be constructed during the third year.

A major activity during the final year of construction will be the open pit Preproduction Phase mining. The remaining process and power plant construction will be completed, as will the remaining embankments in the TSF.

5.1.3. Gas Pipeline

The natural gas line installation will be the other major activity occurring during the second and third construction years. Three separate centers will comprise this overall pipeline: the compressor station and transition section on the Kenai Peninsula, the marine section between the Kenai Peninsula and the Amakdedori Port, and the overland/Iliamna Lake section paralleling the access road. These activities can generally proceed independently of each other, with a target of having natural gas to the mine site by the end of the third construction year.

AMERICAN OVERSIGHT

EPA-0135-0004803

5.2. Commissioning Overview

Following construction, the process plant undergoes the following activities to transfer the project from a construction site to a fully operational process plant.

5.2.1. Construction Completion

In the lead up to the completion of the construction phases, pipelines will be pressure tested and all mechanical, civil, structural and electrical installations will be checked to ensure that they are installed according to design and can operate safely. The completions process includes structured and rigorous Quality Assessment and Quality Control procedures to resolve any remaining construction issues prior to pre-commissioning.

5.2.2. Pre-commissioning

This phase involves the testing and inspection of individual plant sub-systems, and associated equipment and facilities to confirm that they are safe and ready for the wet commissioning stage. This includes things such as motor rotations, testing and energisation of power and control systems, field instrument calibrations and adjustments, verification of safety devices and alarms, and first fills of lubricants. Testing of safety systems may involve unit process emergency procedures and live testing.

5.2.3. Wet Commissioning

During wet commissioning, plant operations are simulated, using water where applicable, to test equipment, piping, instrumentation and control systems, and interlocking to the maximum extent possible prior to the introduction of mineralized material. The water testing will check that fluid systems perform to their design intent and meet their design specifications prior to the introduction of mineralized material during process commissioning.

5.2.4. Process Commissioning

This phase comprises the initial operation of the plant facilities using mineralized material and process reagents. The objective is to have the process plant operating in a steady and consistent manner prior to the ramp-up phase. During this phase, differing results or any unforeseen issues with the scale up from test work to full-scale operation of the process plant will be identified. During this phase, plant or infrastructure modifications, or process reconfiguration, may be required to improve the process or enhance efficiency.

5.2.5. Ramp Up

The ramp-up phase may last several months, during which the process plant will be ramped up to its full design capacity and performance levels. This phase may also entail infrastructure modifications or process reconfiguration as identified by the commissioning and operations teams.

AMERICAN OVERSIGHT

5.3. TEMPORARY FACILITIES

Many of the facilities installed during initial construction activities will be converted to permanent use. However, a number of these will be decommissioned and removed during or following construction.

The initial construction camps at the Amakdedori Port and mine site will likely be fabric-covered or transportable facilities. The construction camp at the mine will be located near the mill laydown area. The construction camp at the port will be located in an area that will be used for port operations and will not require a separate footprint. The Amakdedori Port temporary camp will house the crews for the pioneer road construction. Once the road is through to Iliamna Lake, the existing camp at Kokhanok will be utilized for road crews and for the crew establishing the ferry landings.

Temporary camps will be established at the ferry landings to support road construction and, at the south ferry landing, assembly of the ferry. These camps will remain in place until the natural gas line construction is complete. The north ferry landing camp will likely be augmented using existing facilities in Iliamna and Newhalen. During the exploration phase, PLP employed more than 200 staff in Iliamna/Newhalen in these existing accommodations. Until the access road crossing the Newhalen River is complete, the crews will be shuttled to their workplaces by boat or by helicopter.

The temporary construction camp at the mine site will be expanded during the initial phase of construction at this location. Construction crews will utilize this camp and the permanent accommodations complex when it is complete. As construction is completed and crew sizes reduce, they will transition to the temporary camp only. This will enable the accommodations complex to be refurbished to single-room occupancy for the mine operations staff.

All temporary construction facilities will be removed after construction, and the sites, unless being used for permanent facilities, will be reclaimed.

5.4. ENVIRONMENTAL PROTECTIONS DURING CONSTRUCTION

5.4.1. Wastewater and Stormwater

Appropriate ADEC discharge permits or authorizations under general permits will be obtained for all wastewater discharges prior to construction. Stormwater runoff will be properly controlled at all construction sites using structural and non-structural BMPs. No construction will begin without coverage under applicable ADEC general stormwater permits and an approved stormwater pollution prevention plan. Routine inspections and monitoring will ensure the proper functioning of all stormwater BMPs throughout the construction period.

5.4.2. Fuel Management

Fuel management will include appropriate containment and practices, in accordance with ADEC and EPA regulations and approved spill prevention and response plans. Construction equipment

AMERICAN OVERSIGHT

and construction-camp power generation will use diesel fuel. Diesel storage will include a variety of tank types and sizes ranging from approximately 10,000 to 50,000 gallons. Aviation fuel for helicopters will be stored at the mine site, Amakdedori Port, and other satellite locations as necessary. Fuel will be distributed to the smaller camps and individual work sites from the main storage locations by fuel truck.

5.4.3. Wildlife Management

Protocols will be developed with the U.S. Fish and Wildlife Service and the National Marine Fisheries Service to protect marine mammals from high noise-generating activities at the port sites. Observers will be employed to determine marine mammal presence during construction, and mitigation measures will be established by the appropriate regulatory agency through the permitting process. The U.S. Fish and Wildlife's national bald eagle management guidelines will be followed to minimize any potential for disturbance or impacts. A nest relocation or non-purposeful take permit will be requested only when work cannot be limited in the vicinity of a protected nest.

5.4.3.1 Environmental Construction Windows

Work in anadromous fish streams and in Iliamna Lake will comply with Anadromous Fish Act regulations and ADF&G guidance. Resident fish will require site-specific protections under the Alaska Fish Passage Act. Stream surveys conducted as part of the environmental baseline studies will inform the establishment of permit conditions. Mitigation measures will be determined during the permitting process.

Ground-clearing activities will be conducted prior to construction work and will be timed to avoid bird-nesting periods in accordance with the U.S. Fish and Wildlife Service's Migratory Bird Treaty Act guidance. Nesting periods are generally spring and summer but vary according to habitats and species.

5.4.3.2 Helicopter Protocols

PLP protocols to ensure that helicopters and fixed-wing planes do not harass wildlife have been well established during the exploration phase of the project. These protocols, listed below, will remain in place throughout construction and the life of the mine.

- Do not harass or pursue wildlife.
- Fly 500 feet above ground level or higher when possible and safe to do so.
- When wildlife (especially bears, caribou, moose, wolves, raptor nests, flocks of waterfowl, seabirds, or marine mammals) are observed, avoid flying directly overhead and maximize lateral distance as quickly as possible.

5.4.3.3 Hunting and Fishing Restrictions

PLP employees and contractors will not be allowed to fish, hunt, or gather while on their work rotation during the construction and operation of the Pebble Project facilities.

AMERICAN OVERSIGHT

EPA-0135-0004806

6. CLOSURE AND RECLAMATION

PLP's core operating principles are governed by a commitment to conduct all mining operations, including reclamation and closure, in a manner that adheres to socially and environmentally responsible stewardship while maximizing benefits to state and local stakeholders. PLP has adopted a philosophy of "design for closure" in the development of the Project that incorporates closure and long-term post-closure water management considerations into all aspects of the project design to ensure that all regulatory requirements, as well as private landowner obligations, are met at closure.

Considerations incorporated into the project design include:

- A separate pyritic TSF allows potentially acid generating tailings and PAG/ML waste rock to be relocated into the open pit and stored sub-aqueously during closure, preventing acid mine generation from this material and allowing reclamation of the pyritic TSF footprint.
- Quarried and waste rock will be geochemically tested prior to being used in construction to avoid the potential for contaminated drainage during operations and post-closure.
- Growth media and overburden will be salvaged during construction for use as growth medium during reclamation.
- TSF embankment slopes will be 2.6H:1V to provide long-term stability and facilitate the placement of growth medium.
- The overall project footprint will be minimized to facilitate physical closure and post-closure water management.

Reclamation and closure of the Project falls under the jurisdiction of the ADNR Division of Mining, Land, and Water, and the ADEC. The Alaska Reclamation Act (Alaska Statute 27.19) is administered by the ADNR; it applies to state, federal, municipal, and private land and water subject to mining operations. Except as provided in an exemption for small operations, a miner may not engage in a mining operation until the ADNR has approved a reclamation plan for the operation. The landowner participates in the planning process with regard to determining and concurring with the designated post-mining land use.

6.1. PHYSICAL RECLAMATION AND CLOSURE

The physical site closure work will commence as operations end.

- Active mining and pit dewatering will stop. Pit water levels will be maintained to provide safe access for placement of pyritic tailings and PAG waste rock.
- Pyritic tailings and PAG waste rock will be placed into the pit for long term storage below water. Once the material has been transferred to the open pit, the water will be allowed to rise to the maximum management level. The mill, pyritic TSF, main WMP,

AMERICAN OVERSIGHT

and other infrastructure not required for post-closure will be removed and/or reclaimed.

- The bulk tailings will have a dry closure and be allowed to fully consolidate. Once runoff is demonstrated to meet water quality criteria it will be directly discharged to the NFK catchment area. Bulk TSF seepage water will be pumped to the open pit.
- The open pit water level will be maintained at a level to insure inward flow of surrounding groundwater and prevent contact water from getting into the groundwater.
- Once physical closure activities are completed, site access infrastructure will be reconfigured to support long-term post closure activities.

All mill and support facilities not required for post-closure, including the pyritic TSF, main WMP, and open pit WMP embankments and liners, will be dismantled and removed. Concrete pads and foundations will be broken up so that they do not act as an impermeable impediment to water flows. Inert materials will be disposed of in an on-site monofill that will be sited within the disturbed footprint, while others will be shipped off site for disposal as appropriate. Disturbed areas will be recontoured, graded, ripped, and scarified. Top soil and growth media will be placed as needed, and sites will be seeded for revegetation. Surface runoff from the disturbed areas will be collected and either treated in the WTPs or directed to the pit lake until it is found to be suitable for direct discharge to the downstream drainages.

A spillway will be constructed from the bulk TSF. Late in the operating phase, tails in the bulk TSF will be spigoted to allow for surface drainage toward the closure spillway. As milling operations cease, free water will be pumped from the surface of the bulk tails, and they will be allowed to consolidate until the surface is suitable for equipment traffic on the surface. The tails will be re-graded as needed to facilitate drainage. A capillary break and growth media will be placed over the surface of the tails prior to seeding for revegetation. Growth media will also be placed on the bulk TSF embankments prior to seeding for revegetation.

Seepage water from the bulk TSF embankment seepage collection systems will be collected and directed to the pit lake.

The road system will be retained as long as required for the transport of bulk supplies needed for long-term post-closure water treatment and monitoring. The Iliamna Lake ferry facilities will be removed, and all supplies will be transported across the lake utilizing a summer barging operation. The Amakdedori Port facilities will be removed, except for those required to support shallow draft tug and barge access to the dock for the transfer of bulk supplies. The natural gas pipeline will be maintained until such time as it is no longer required to provide energy to the project site. If no longer required, the pipeline will be pigged and cleaned before being abandoned in place. Surface facilities associated with the pipeline will be removed and reclaimed.

AMERICAN OVERSIGHT

EPA-0135-0004808

6.2. Post-Closure Management

The pit lake will fill during the closure period. Surface runoff from the walls will result in leaching of accumulated metals from the walls. Water quality is expected to be acidic with elevated metals due to overall oxidation of the pit walls. Pit lake water quality will be monitored, and appropriate precautions will be taken to manage wildlife activity on the lake. Once the level of the pit lake has risen to about 890 feet elevation, water will be pumped from the pit, treated as required, and discharged to the environment. By maintaining the water level at this elevation, which is at least 50 feet below the elevation at which groundwater flow would be directed outward from the open pit, upset conditions resulting in an unplanned discharge can be avoided, as there is time to address any problems with the WTP before flows reverse.

Long-term discharge from the bulk TSF seepage collection systems will be pumped to the pit lake.

6.3. Financial Assurance

Prior to commencing construction, the Project Reclamation and Closure Plan approval and associated financial assurance mechanisms will need to be in place. The Reclamation and Closure Plan and financial assurance obligations will be updated on a 5-year cycle in accordance with regulatory requirements to address any changes in closure and post-closure requirements and cost obligations.

A detailed reclamation and closure cost model will be developed to address all costs required for both the physical closure of the Project and the funding of long-term post closure monitoring, water treatment, and site maintenance. The estimate will include the costs of closure planning and design, and mobilization of third-party equipment to site; detailed estimates of equipment and labor requirements for physical closure; capital, sustaining capital, and operating costs for water treatment and other long-term post-closure operations; and appropriate indirect costs and contingencies developed following ADNR guidance.

AMERICAN OVERSIGHT

7. ENVIRONMENTAL PERMITTING

Numerous environmental permits and plans will be required by federal, state, and local agencies. PLP will work with applicable permitting agencies and the State of Alaska large mine permitting team to provide complete permit applications in an orderly manner.

Because the Pebble Project involves a federal permit—U.S. Army Corps of Engineers Section 404/10 permit for the filling of wetlands and placement of structures in navigable waters—the provisions of NEPA will apply to this Project. There are provisions within NEPA, as well as within the permitting processes for many of the individual permits, that will provide for public review and comment on the Project.

Table 7-1 lists the types of permits that are expected to be required for the Pebble Project. Multiple permits of certain types may have to be applied for to accommodate the full scope of facilities.

Table 7-1. Environmental Permits Required for the Pebble Project

Agency	Approval Type	Project-related Examples
Federal		
BATF	License to Transport Explosives	Construction explosives acquisition and use
	Permit and License for Use of Explosives	Construction explosives acquisition and use
BSEE	Right-of-Way Authorization for Natural Gas Pipeline	Subsea natural gas pipeline in OCS waters
DHS	Airport Security Operations Plan	Iliamna Airport
	Port Facility Security Coordinator Certification	Port site
	Port Security Operations Plan	Port site
EPA	Facility Response Plan (required to be submitted to EPA, however EPA does not provide plan approvals)	Fuel storage facilities, fuel transport on the mine roadway
	RCRA Registration for Identification Number	Storage and disposal of hazardous wastes
	Spill Prevention, Control, and Countermeasure (SPCC) Plan (SPCC plans are not required to be submitted or approved by EPA. The plan will be reviewed and certified by a Professional Engineer licensed in Alaska)	Fuel storage facilities

AMERICAN OVERSIGHT

Agency	Approval Type	Project-related Examples
FAA	Notice of Controlled Firing Area for Blasting	Construction and mining blasting activity
FCC	Radio License	Radios
MSHA	Mine Identification Number	Mine site
	Notification of Legal Identity	Mine site
NMFS	Magnuson-Stevens Fishery Conservation and Management Act Consultation documentation	Necessary in areas where mine, road, or port site activity affect essential fish habitat
USACE	Clean Water Act Section 404 permit for Discharge of Dredge or Fill Material into Waters of the U.S.	Fill into wetlands for a variety of facilities at the mine, road, pipelines, port site
	Rivers and Harbors Act Section 10 Construction of any structure in or over any Navigable Waters of the U.S.	Road bridges and causeway; port site docking and ship-loading facilities and maintenance dredging.
USCG	Clean Water Act Section 10 Permit for construction of any structure in or over any Navigable Water of the U.S.	Road bridges and causeway; port site docking and ship-loading facilities and maintenance dredging
	Facility Response Plan	Fuel storage facilities
	Fuel Offloading Plan; Person in Charge Certification	Offloading fuel from barges at the port
	Hazardous Cargo Offloading Plan; Port Operations Manual Approval	Offloading hazardous cargo from ships
	Navigation Lighting and Marking Aids Permit	Port facilities
	Rivers and Harbors Act Section 9 Construction Permit for a Bridge or Causeway across Navigable Waters	Bridges along road
USDOT	Registration for Identification Number to Transport Hazardous Wastes	Transport of hazardous wastes to approved disposal site
USFWS	Bald and Golden Eagle Protection Act Programmatic Take Permit	May be necessary in areas where mine, road, or port site activity may disturb eagles
	Migratory Bird Treaty Act Consultation documentation	May be necessary in areas where mine, road, or port site activity may disturb migratory birds

AMERICAN OVERSIGHT

EPA-0135-0004811

Agency	Approval Type	Project-related Examples
USFWS/NMFS	Endangered Species Act Incidental Take Authorization	May be necessary at the port site and for sub-sea pipeline construction where activities could disturb northern sea otter, Beluga whale, Steller sea lion, Steller's eider
	Marine Mammal Protection Act Incidental Take Authorization; Letter of Authorization	May be necessary at port site where activities could disturb northern sea otter, Beluga whale, Steller sea lion, harbor seal, Dall's porpoise
State		
ADEC	Alaska Solid Waste Program Integrated Waste Management Permit/Plan Approval	Tailings disposal, waste rock disposal, landfills
	Alaska Solid Waste Program Solid Waste Disposal Permit; Open Burn Permit	Construction waste material disposal
	Approval to Construct and Operate a Public Water Supply System	Mine and port, and construction camps
	Clean Air Act Air Quality Control Permit to Construct and Operate – Prevention of Significant Deterioration	Power plant and other non-mobile air emissions; fugitive dust; applicable to mine, road, and port
	Clean Air Act Title V Operating Permit	Power plant and other non-mobile air emissions; fugitive dust; applicable to mine and road
	Clean Air Act Title I Operating Permit	Non-mobile air emissions; stationary sources, fugitive dust; applicable to port and Kenai compressor station
	Clean Water Act Section 402 Alaska Pollutant Discharge Elimination System Water Discharge Permit	"End of Pipe" water discharges from water treatment plants at the mine, along with domestic water treatment plants at the mine and port
	Clean Water Act Section 402 Stormwater Construction and Multi-Sector General Permit; Stormwater Discharge Pollution Prevention Plan	Surface water runoff discharges at mine, road, and port site
	Food Sanitation Permit	Mine and port, and construction camps

AMERICAN OVERSIGHT

EPA-0135-0004812

Agency	Approval Type	Project-related Examples
	Oil Discharge Prevention and Contingency Plan (ODPCP or "C" Plan)	Fuel storage and transfer facilities, port and mine
ADF&G	Fish collection permits for monitoring	May be necessary for long-term monitoring
	Fish Habitat Permit	Water withdrawal in an anadromous fish waterbody, stream diversion, installation of culverts and bridges
ADNR	Alaska Dam Safety Program Certificate of Approval to Construct a Dam	Tailings dam, seepage control dams
	Alaska Dam Safety Program Certificate of Approval to Operate a Dam	Tailings dam, seepage control dams
	Lease of other State Lands	Any miscellaneous other state lands to be used by the Pebble Project – none identified at this time
	Material Sale on State Land	Materials removed from quarry sites for construction
	Mill Site Permit	All facilities on state lands
	Mining license	All facilities on state lands
	Miscellaneous Land Use Permit	All facilities on state lands
	National Historic Preservation Act Section 106 Review	Area of Potential Effect
	Pipeline Right-of-Way permit	Natural gas pipeline between the mine and port and in state waters
	Powerline Right-of-Way permit	Powerlines to support electric power distribution
	Road Right-of-Way permit	Road between mine and port site
	Temporary Water Use Permit; Permit to Appropriate Water	Surface and groundwater flow reductions
	Tidelands Lease	Port structures below high tide line
	Upland Mining Lease	All facilities on state lands
ADOL	Certificate of Inspection for Fired and Unfired Pressure Vessels	
ADOT&PF	Driveway Permit	Road
	Utility Permit on Right-of-Way	Natural gas pipeline on the Kenai Peninsula

AMERICAN OVERSIGHT

Agency	Approval Type	Project-related Examples
ADPS	Approval to Transport Hazardous Materials	Transport of hazardous materials along the road
	Life and Fire Safety Plan Check	Mine and port
	State Fire Marshall Plan Review Certificate of Approval	For each individual building
Local		
KPB	Conditional Use Permit	
	Floodplain Development Permit	
	Multi-Agency Permit Application	
L&PB	Lake and Peninsula Borough Development Permit	Mine and road area within the Lake and Peninsula Borough

AMERICAN OVERSIGHT

4.0 ENVIRONMENTAL CONSEQUENCES

4.1 INTRODUCTION

Chapter 4, Environmental Consequences, describes the potential impacts on the environmental resources addressed in Chapter 3, Affected Environment, that would occur under the No Action Alternative, the Applicant's Proposed Alternative, and other action alternatives.

Each of the resource sections in Chapter 4 (Section 4.2 through Section 4.26) discusses:

- Direct and indirect impacts characterized by four factors of analysis (see "Types of Effects Considered" and "Impact Characterization [Four Factors]" sections below) of each alternative, for each resource described in Chapter 3, Section 3.2 to Section 3.26.
- Cumulative effects to each resource for each alternative.

A discussion of other resources or topics that are not specifically addressed in Section 4.2 through Section 4.26 is included below in the "Other Resources or Topics" section. Chapter 4 also includes Section 4.27, Spill Risk, which analyzes diesel, concentrate, reagent, and tailings spill scenarios.

In this document, the terms "effect" and "impact" have the same meaning and are used interchangeably.

4.1.1 Impact Characterization (Four Factors)

Adverse and beneficial effects of the project were evaluated and described for each of the resources. Each resource section provides context for analyzing impacts by considering them generally in relation to four dimensions:

Magnitude: The intensity of the impact.

Duration: How long the impact would be expected to occur or last.

Geographic extent: Where the impact would be expected to occur.

Potential: How likely the impact is to occur.

Not every resource considers every dimension. The level of quantified or qualified information presented is appropriate to the context of the resource. In each of the resource subsections, the methods applied for analysis are described.

Project component values, such as road lengths and pad acreage, are approximations based on best available data. Due to differences in data processing systems (e.g., Geographic Information System [GIS]) and methodologies (e.g., number rounding), the values presented in the Environmental Impact Statement (EIS) may differ slightly from values presented in other project-related documents, such as permit drawings. These differences have been reviewed, and were determined to be unimportant to the analysis, as well as to the overall permitting process.

See Section 3.1, Introduction to Affected Environment, for a description of project components and project area terms.

AMERICAN OVERSIGHT

4.1.2 Time Periods (Phases)

Impacts on some resources may vary depending on the phase of the proposed project. Accordingly, the impact assessment was divided into three time periods:

Construction phase: The period of construction of mine infrastructure prior to operations.

Operations phase: The 20-year period of mine operations.

Closure or post-closure phase: Any activity occurring after mine operations cease.

Division of analysis into these three time periods works well for some resources, but is less relevant for others, such as socioeconomics or recreation.

4.1.3 Types of Effects Considered

The National Environmental Policy Act (NEPA) requires three types of impacts to be evaluated. These include direct, indirect, and cumulative impacts as defined below.

Direct Effects: Effects caused by the action and occurring at the same time and place (40 Code of Federal Regulations [CFR] 1508.8). Limited to the proposed action and alternatives.

Indirect Effects: Effects that are "caused by an action and are later in time or farther removed, but are still reasonably likely. Indirect impacts may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems" (40 CFR 1508.8). Indirect effects are caused by the project, but do not occur at the same time or place as the direct effects. Limited to the proposed action and alternatives.

Cumulative Effects: Additive or interactive effects that would result from the incremental impact of the proposed action when added to other past, present, and reasonably foreseeable future actions (RFFAs) regardless of what agency (federal or non-federal) or person undertakes such other actions (40 CFR 1508.7). This includes incremental impacts of the proposed action and alternatives when added to other past, present, and RFFAs. Interactive effects may be either greater or less than the sum of the individual effects; therefore, the action's contribution to the cumulative case could increase or decrease the net effects. Assessing the cumulative impacts from multiple projects/activities requires considering the impacts of their combined potential area of effects and associated actions. It also requires a logical nexus with the potential effects of the proposed action.

Past actions include activities that may have been initiated in the past, but could also involve present operations such as infrastructure development and non-mining related actions. They may have lingering effects in degrading the environment or may influence trends in the physical, biological, or social environment.

Present actions include mining projects and related activities that may have just come online or are currently underway and are causing impacts. They may also include other non-mining related projects, such as transportation, oil and gas development, or community development that are currently in progress.

For this analysis, RFFAs are existing plans, permit applications, and fiscal appropriations that are external to the proposed action, and likely (or reasonably certain) to occur. See Table 4.1-1 for a comprehensive list of potential RFFAs that were examined for this project. Actions are considered reasonably foreseeable if they are proximate to the project area and are anticipated to enter the permitting process in the next 5 years, are identified in planning documents as scheduled for development, or if significant resources have been committed to the proposed

AMERICAN OVERSIGHT

action. Proximity is based on natural geographic boundaries of potentially affected resources and the period of time that the project's impacts would persist.

Direct, indirect, and cumulative impacts are analyzed in each of the resource sections in Chapter 4. Cumulative effects are described in a separate subsection in each resource section for the proposed action and, if applicable, other action alternatives, based on applicable RFFAs listed in Table 4.1-1 that were evaluated as being "reasonably foreseeable."

4.1.3.1 Past and Present Actions

Past and present actions that have either lingering effects or influence trends in the environment with a nexus to the project are relatively limited, and are described below.

Commercial and Subsistence Harvest of Fish and Wildlife. Past and present harvest of fish and wildlife for commercial and subsistence purposes put some degree of pressure on those resources. While commercial fishing in the Bristol Watershed started in the 1880s, the period from the turn of that century through the adoption of Alaska Limited Entry Act by the State of Alaska in 1972, saw incremental changes in both fishing technology and the understanding of the salmon fishery resource. It was likely that there were historic instances of overharvest, with implications for the overall salmon resource. Similarly, local residents have historically harvested fish and wildlife in pursuit of traditional subsistence activities. However, fish and wildlife resources are managed by the Alaska Department of Fish and Game (ADF&G) and federal land managers to maintain sustainable populations, and there are no long-term adverse effects or trends affecting the resource.

Commercial Recreation and Tourism. Southwest Alaska, including the Bristol Bay region and the area around the project, is renowned for sport fishing, hunting, boating, and wildlife viewing opportunities, and there is a long history of these activities in area. Similar to commercial fishing, the sport harvest of fish and game is managed by ADF&G and federal land managers to maintain sustainable populations, and there are no long-term adverse effects or trends affecting the resource. These activities take place primarily from late spring to early fall, and there may be small plane, helicopter, and boat traffic associated with access that can contribute to the disturbance of wildlife, as well as recreation and subsistence activity experience.

Mining Exploration Activities. There are a number of mineral claims and resources in the Bristol Bay watershed that have been subject to mineral exploration activities. Exploration activities have been intermittent, depending on the specific claim or resources, and there has been small plane, helicopter, and boat traffic associated with exploration that can contribute to the disturbance of wildlife, as well as recreation and subsistence activity experience. In the immediate area of the project, there has been no mineral production activity that has had lingering adverse effects on the environment.

Williamsport-Pile Bay Road. Construction of the Williamsport-Pile Bay Road in the 1930s provided access between Cook Inlet and the Bristol Bay via a 15.5 mile road to Iliamna Lake and down the Kvichak River. The road allows transportation of fishing vessels bound for Bristol Bay commercial fisheries, as well as some goods and supplies for lake and river communities, contributing to road and lake traffic during the summer season. The road is owned and maintained by the State of Alaska.

4.1.3.2 Reasonably Foreseeable Future Actions Considered

The following categories of reasonably foreseeable future activities were considered for the cumulative effects analysis:

- Mineral Exploration and Mining

AMERICAN OVERSIGHT

- Oil and Gas Exploration and Development
- Transportation and Infrastructure
- Energy and Utilities
- Commercial Fishing
- Subsistence
- Tourism, Recreation, Hunting and Fishing
- Scientific Research and Surveys
- Contaminated Sites and Industrial Pollutants

With regard to mineral and oil and gas resources, a distinction was made between exploration and development activities. Many of the mineral projects assessed are on lands open to mineral entry and have been the subject of exploration activities for over 30 years, but have not been developed. Similarly, oil and gas lease sales have been held in waters of Cook Inlet for over 50 years, but not all exploration activities have led to oil and gas development. The decision to take resources from exploration to development depends on many factors.

Activities associated with commercial and subsistence harvest, viewing, and scientific study of fish and wildlife have the potential to contribute to cumulative effects of developing the project. Effects can include mortality and injury on an individual and population level, and disturbance and changes in distribution and migration, which can affect availability to various users.

Events such as large oil spills, chronic pollution, and historic contaminated sites can contribute to cumulative effects in several ways. Effects can include mortality and injury to fish on an individual and population level, avoidance and changes in distribution and migration, and contamination with regard to human consumption by subsistence, commercial, and recreational harvesters.

Finally, climate change and other changes in the natural environment can contribute to cumulative effects through past, present, and RFFAs. The way in which this EIS addresses climate change is discussed in Section 3.1, Introduction to Affected Environment.

The following parameters are used to identify potential reasonably foreseeable future activities for the cumulative effects analysis:

- Geographic timeframe. Typically only projects with dedicated funding, currently in or scheduled to undergo federal, state, or local permitting, and with a medium to high probability of occurring, are included. However, the USACE has determined that expansion of the Pebble Project to develop 55 percent of its reserves over a 78 year period, as outlined in the Wardrop 2011 Preliminary Assessment Technical Report, will be analyzed under the cumulative effects analysis (see Table 4.1-1 for further discussion). Therefore, other reasonably foreseeable future activities that may occur in the 78 year time period will also be considered. However, in order to be considered reasonably foreseeable within this time frame, potential RFFAs need to meet the subsequent criteria.
- Projects located on lands open to mineral entry or development. When lands are classified as open to mineral development, it facilitates obtaining permits and other approvals for exploration and development activities. However, in order to be considered reasonably foreseeable for development within this time frame, potential reasonably foreseeable future actions need to meet the subsequent criteria.
- Projects with dedicated funding, currently in the permitting process, undergoing a state or federal environmental assessment, or listed in a planning document with a specific time frame for development. Projects may be considered reasonably

AMERICAN OVERSIGHT

foreseeable for development if they have dedicated funding and a schedule for development; have federal, state, or local permit applications under review or approved; are currently being evaluated through a federal NEPA compliance effort of State Best Interest Finding Effort; or are identified in a planning document (such as scheduled lease sales) with a specific project description and time frame for development. However, potential projects on land open to mineral entry or classified to allow mining are not considered reasonably foreseeable without meeting additional criteria described in this section.

- Information to support the feasibility of development has been documented. The project has conducted extensive exploratory drilling and analysis in order to compile information on mineral reserves in terms of measured, indicated, and inferred resources, along with characterization of the grades of ore in the deposit (Wardrop 2011). Estimated costs associated with developing the deposit were also prepared for three development scenarios, although that information was based on a different project configuration and is several years old. The potential feasibility for development of other projects is evaluated based on the published information on result of drilling and delineation of measured, indicated, inferred, and grade of reserves. To the extent they are available, estimated costs associated with development are also assessed.
- Proximity to the project infrastructure and factors affecting co-use by other parties. The question of whether development of the project would facilitate development of other nearby mineral deposits depends in part on proximity to the project and ability to use project infrastructure. Construction of access to project transportation infrastructure is expensive and also depends on land ownership access and sensitivity of environmental resources along the access route. Project infrastructure would be privately funded and co-use of mining and port facilities dependent on permission from Pebble Limited Partnership (PLP). While the access road would be privately funded on State land, the State of Alaska would likely require allowing access to other mineral deposit owners if an agreement could be reached with PLP regarding operation and maintenance costs, based on the precedent set in state permit conditions for granting Pogo Mine Access (S. Buckley, personal communication 2018).
- Geographic nexus with the direct and indirect effects of project development on specific resources evaluated in the EIS. Along with the factors previously described, there would need to be interactive and synergistic effects of an RFFA on resources directly and indirectly affected by development of the project in a specific geographic range that varies by resource.

AMERICAN OVERSIGHT

Table 4.1-1: Potential RFFAs Evaluated for Cumulative Effects

Potential Mineral Deposits in Southwest and Southcentral Alaska				
Prospect, Project, or Activity	**Description**	**Status**	**References**	**Reasonably Foreseeable?**
Pebble Project – develop 55% of delineated resources over a 78-year period	Expansion of the Pebble Project to develop 55% of its reserves over a 78-year period, as outlined in the Wardrop 2011 Preliminary Assessment Technical Report. It would likely use the same transportation facilities, power plant, and natural gas pipeline facilities, but would need additional tailing storage and possibly processing facilities. It is not part of the proposed action and would require additional permits and separate NEPA compliance.	Potential project expansion. Expansion identified as option in Wardrop 2011 report and analyzed in the Environmental Protection Agency (EPA) Watershed Assessment (EPA 2014) on the basis of lands being classified as open for mineral exploration and development and assuming access to Pebble Project infrastructure.	Wardrop 2011	Yes - for continued exploration and development. The Pebble Project has conducted extensive exploratory drilling and analysis in order to compile a feasibility assessment level on information on mineral reserves in terms of measured, indicated, and inferred resources, along with characterization of the grades component ore in the deposit (Wardrop 2011). If permitted, the project processing and transportation infrastructure would be in place, and development of 55% of the Pebble Project resources is considered reasonably foreseeable in the 78-year time frame outlined in Wardrop 2011.
Pebble South	A 142 square kilometer (km^2) porphyry copper deposit/claim ~15 kilometers (km) southwest of Pebble Deposit. Prospect is part of the PLP/Northern Dynasty Minerals (NDM) Limited (Ltd.) claim block and includes the 38 and 308 zone prospects. Primary additional development would include the mine pit, mineral processing, tailings storage and waste rock areas, and a new transportation corridor to existing Pebble Project transportation system, power supply, and natural gas infrastructure.	Potential project expansion. Expansion identified as option in Wardrop 2011 report and analyzed in for cumulative effects in the EPA Watershed Assessment based on land classification of the deposit and assuming access to Pebble Project infrastructure.	EPA 2014	Yes - for further exploration. No - for development. Resource delineation has not progressed sufficiently to forecast development, is not subject to development permitting or in a planning document, and is not considered reasonably foreseeable within the 78-year time frame. Note: Because claims are currently owned by NDM Ltd., if future drilling and resource delineation indicate that it is feasible to develop the project, it is possible that construction and operations could access and utilize the Pebble Project transportation system.

AMERICAN OVERSIGHT

Table 4.1-1: Potential RFFAs Evaluated for Cumulative Effects

Potential Mineral Deposits in Southwest and Southcentral Alaska				
Prospect, Project, or Activity	**Description**	**Status**	**References**	**Reasonably Foreseeable?**
Big Chunk South	A 119 km² porphyry copper deposit/claim ~20 km north of the Pebble project area. The claim block is entirely in the Chulitna River drainage, which flows into Lake Clark National Park and Preserve. Potential development includes Tailings Storage Facilities (TSFs), mill, and other facilities for mining. Multiple build-out scenarios.	Undergone some airborne surveys and limited drilling to delineate the resource. Claims transferred to NDM Ltd. in 2014. Analyzed for cumulative effects in the EPA Watershed Assessment (EPA 2014) based on land classification of the deposit and assuming access to Pebble Project infrastructure.	EPA 2014	Yes - for further exploration. No - for development. Resource delineation has not progressed sufficiently to forecast development is not subject to development permitting or in a planning document, and is not considered reasonably foreseeable in the 78-year time frame. Note: Because claims are currently owned by NDM Ltd., if future drilling and resource delineation indicate that it is feasible to develop the project, it is possible that construction and operations could access and use the Pebble Project transportation system.
Big Chunk North	Porphyry copper deposit ~34 km northwest of the Pebble project area. The claim block straddles the drainage divide between the Nushagak and Kvichak River watersheds. Potential development would include TSFs, mill, and other facilities for mining.	Claims transferred to NDM Ltd. in 2014. Analyzed for cumulative effects in the EPA Watershed Assessment based on land classification of the deposit and assuming access to Pebble Project infrastructure.	EPA 2014	Yes - for further exploration. No - for development. Resource delineation has not progressed sufficiently to forecast development, is not subject to development permitting or in a planning document, and is not considered reasonably foreseeable in the 78-year time frame. Note: Because claims are currently owned by NDM Ltd., if future drilling and resource delineation indicate that it is feasible to develop the project, it is possible that construction and operations could access and utilize the Pebble Project transportation system.
Fog Lake	Gold, copper in volcanic rocks	As of 2008, exploration	EPA 2014	Yes - for further exploration.

Prospect, Project, or Activity	**Description**	**Status**	**References**	**Reasonably Foreseeable?**
	Project infrastructure.			Shotgun prospect is considered reasonably foreseeable in the 78-year time frame.
Johnson Tract	Gold rich poly-metallic deposit located roughly 80 miles east of the Pebble Project, owned by Cook Inlet Region, Incorporation (CIRI) and subject to an exploration agreement with Constantine Metals Resources Ltd. CIRI has access rights through Lake Clark National Park and Preserve to a port site at Tuxedni Bay on Cook Inlet.	Discovered by Anaconda in 1982, 90 holes have been drilled but no exploration has occurred in more than 20 years. Constantine Metals has agreed to resume exploration and take the project to the point of evaluating feasibility of developing the mine.		Yes - for further exploration. No - for development. Resource delineation has not progressed sufficiently, is not subject to development permitting or in a planning document, and is not considered reasonably foreseeable in the 78-year time frame.
Copper Joe	Porphyry copper located significantly north of the Pebble Project, in close proximity to the Whistler Deposit.	Kiska Metals / First Quantum Minerals Ltd. conducted exploration work in 2016.		Yes - for further exploration. No - for development. Resource delineation has not progressed sufficiently, is not subject to development permitting or in a planning document, and is not considered reasonably foreseeable in the 78-year time frame. In addition, there is no geographic nexus with the Pebble Project.
Proposed Mining and Mineral Projects in Southwestern and Southcentral Alaska				
Donlin Gold	Open pit hard rock mine in the Kuskokwim River watershed, 277 miles west of Anchorage. The proposed mine would have a total footprint of approximately 16,300 acres. Includes a 312-mile long pipeline to carry natural gas from Cook Inlet to the mine site.	Final EIS issued in April 2018. USACE and Bureau of Land Management (BLM) have issued a Joint Record of Decision (JROD) granting major federal permits.	USACE 2018	Yes – for further exploration. Yes - for development. Final EIS on the project has been completed and the JROD was signed in August 2018. The project is considered reasonably foreseeable in the 78-year time frame.
Diamond Point Rock Quarry	Proposed granite quarry project near the convergence of Cottonwood and	An application for development of a rock	USACE 2010	Yes – for development. Reserves of quarry rock have been

Proposed coastal infrastructure includes constructing a 20 acre fill for staging equipment, stockpiling aggregate, and barge loading facilities.		estimated and a permit application was filed for development. The project is considered reasonably foreseeable in the 78-year time frame.
Potential Oil and Gas Exploration and Development				
Project/Activity	**Description**	**Status**	**References**	**Reasonably Foreseeable?**
Alaska Stand Alone Pipeline Project	Proposed 737-mile natural gas pipeline from Prudhoe Bay to Point McKenzie, Alaska. The project involves the construction of a liquefied matural gas (LNG) extraction plant on the western side of Cook Inlet at Point McKenzie.	A Final EIS was completed in 2018. A ROD is expected soon.	Alaska Stand Alone Pipeline (ASAP) 2018	Yes – for development. The project is considered reasonably foreseeable in the 78-year time frame. However, it would not be built if the Alaska LNG project is funded for development.
Alaska Liquefied Natural Gas Project (Alaska LNG)	Proposed 800-mile natural gas line from Prudhoe Bay to Nikiski, where the gas will be liquefied and shipped to foreign markets. Involves a natural gas pipeline crossing Cook Inlet and will result in increased marine traffic in Cook Inlet.	Federal Regulatory Energy Commission (FERC) application filed. A Draft EIS is under development for release in 2019; a Final EIS would be released in 2020. Construction would begin after 2020. The project does not have funding to proceed.	Alaska LNG 2018	Yes – for development. While funding for development is not currently available, the project is considered reasonably foreseeable in the 78-year time frame.
Drift River Oil Pipeline Transportation Project	Proposes to repurpose an existing natural gas pipeline crossing Cook Inlet to an oil pipeline. Involves the installation of 9 miles of new cross-inlet pipeline between Beluga and	Project is in the permitting phase. Decommissioning of the Drift River Terminal was initiated in 2017.	KDLL, Public Radio for Central Kenai, 2018	Yes – for development. The project is in the permitting phase and scheduled for execution. It is considered reasonably foreseeable in the 78-year time

Potential Mineral Deposits in Southwest and Southcentral Alaska				
Prospect, Project, or Activity	**Description**	**Status**	**References**	**Reasonably Foreseeable?**
	Nikiski.			frame.
Cook Inlet Oil and Gas Lease Sales	In 2015, the Alaska Oil and Gas Association estimated there were 600 million barrels of recoverable oil and 19 trillion cubic feet of recoverable natural gas in Cook Inlet. There are a total of 16 platforms with 8 operators as of 2016. Exploration activities continue with future development anticipated. The Bureau of Ocean and Energy Management is responsible for leasing oil and gas in federal waters, and ADNR has the same responsibility for state waters.	In 2017, Federal Lease 244 resulted in bids for 14 tracts in Cook Inlet. Federal Lease Sale 258 for Cook Inlet is scheduled for 2021. ADNR released a preliminary Best Interest Finding on the Cook Inlet Area-wide Oil and Gas Lease Sale in June 2018. Oil and gas exploration and development activities in Cook Inlet are ongoing and likely to continue.	BOEM 2018	Yes – for exploration. Yes – for development.
Hydrocarbon Exploration Licensing and Leasing Program	ADNR, Lake and Peninsula Borough (LPB), Bristol Bay Borough, and Aleutians East Borough have signed a Memorandum of Understanding (MOU) in support of oil and gas lease sales and licensing on state land in the analysis area. Similar MOUs exist between ADNR and the Aleut Regional Native Corporation and Bristol Bay Native Corporation.	Exploration underway.	Bristol Bay Area Plan for State Lands 2015	Yes – for exploration. No – for development. Exploration activities are underway, but given the lack of previous oil and development in the region, development and production are not reasonably foreseeable in the 78-year time frame.
Transportation and Infrastructure				
LPB Transportation Projects	Several road improvement and new transportation corridors currently being studied. Studies include the Williamsport-Pile Bay road upgrade, Nondalton–Iliamna River Road Corridor and Bridge, Kaskanak Road /Cook Inlet to Bristol Bay (Igiugig).	Ongoing.	LPB Comprehensive Plan 2017	Yes – for development. These projects are considered reasonably foreseeable in the 78-year time frame.

AMERICAN OVERSIGHT

Table 4.1-1: Potential RFFAs Evaluated for Cumulative Effects

Potential Mineral Deposits in Southwest and Southcentral Alaska				
Prospect, Project, or Activity	**Description**	**Status**	**References**	**Reasonably Foreseeable?**
LPB Community Development and Capital Improvement Projects	Village infrastructure development projects including power plant upgrades, sewer and water improvement projects, transmission upgrades and energy efficiency initiatives.	Ongoing. List of projects from LPB 2017 capital improvement projects.	LPB Comprehensive Plan 2017	Yes – for development. These projects are considered reasonably foreseeable in the 78-year time frame.
Rural Alaska Village Grant Program	US Department of Agriculture Rural Development program to improve rural sanitization. Grant money used to improve water and sanitation services.	Ongoing	USDA Rural Development 2018	Yes – for development These projects are considered small-scale community improvements.
Energy and Utilities				
Lake and Peninsula Borough and other regional Renewable Energy Initiatives	LPB and other communities and electrical generation cooperatives are studying renewable energy projects to help combat high fuel costs. Studies include wind, hydroelectric, river, and tidal energy alternatives. Igiugig has a permit for a removable in-river power generation facility in the Kvichak River.	Studies ongoing. Igiugig has been installing its pontoon-mounted power generator annually in the Kvichak River. The Tazimina Run of River Hydro Project upgrade has been completed, 12 miles northeast of the village of Iliamna The village of Kokhanok has received funding to refurbish its existing wind diesel power plant.	LPB Comprehensive Plan 2017	Yes – for development. These projects are considered reasonably foreseeable in the 78-year time frame.
Nushagak Electric Cooperative Village Intertie Project	The Nuyakuk Run of River Hydro Project would connect the communities of Dillingham, Levelok, New Stuyahok, Koliganek, Aleknagik, and Ekwok with power and fiber optics with operation projected for 2024.	Nushagak Cooperative has submitted a preliminary permit application to FERC for their hydro project on the Nuyakuk River in Wood Tikchik State Park. Pedro Bay is pursuing permitting for the Knutson	US Department of Energy FERC 2018 (83 FR 15826)	Yes - for development. This project is considered reasonably foreseeable in the 78-year time frame.

AMERICAN OVERSIGHT

		Creek Run of River Hydroelectric Project.		
Commercial Fishing				
Bristol Bay - Nushagak and Naknek/Kvichak State Management Districts - Salmon Lower Cook Inlet Management Area - Salmon and Herring	Continued stock assessment and allocation decisions under existing management plans.	Ongoing. Anticipate a continuation of commercial fishing in the analysis area.	ADF&G Commercial Fishing Management Reports 2018	These actions will occur in response to annual stock assessments and direction from management plans.
Subsistence Activities				
Villages of Iliamna, Newhalen, Pedro Bay, Port Alsworth, Nondalton, Igiugig, Kokhanok, Koliganek, Levelock, New Stuyahok, King Salmon, Naknek, Aleknagik, Clarks Point, Manokotak, Dillingham, Ninilchik, and Seldovia	Past, present, and foreseeable subsistence activities are described in Section 3.9, Subsistence.	Ongoing. Anticipate a continuation of subsistence practices within the analysis area.	See Section 3.9, Subsistence.	Subsistence harvest of fish, wildlife, and plants will continue for the foreseeable future.
Tourism, Recreation, Hunting and Fishing				
National Parks and Preserves Wildlife Refuges State of Alaska Special Management Areas Alaska Native	Hiking, camping, wildlife viewing and photography. Sport fishing is the primary recreational activity that occurs in the EIS analysis area. Hunting, primarily for moose, caribou, and bear, is a major recreation activity in the region.	Activities are expected to continue in the EIS analysis area.		Tourism, recreation, hunting, and fishing will continue for the foreseeable future.

AMERICAN OVERSIGHT

Table 4.1-1: Potential RFFAs Evaluated for Cumulative Effects

Potential Mineral Deposits in Southwest and Southcentral Alaska				
Prospect, Project, or Activity	**Description**	**Status**	**References**	**Reasonably Foreseeable?**
Corporation Lands				
Industrial Pollutants and Contaminated Sites				
Communities in project area	Identified sites with low levels of contamination have been identified in many Alaskan communities. Communities with site entries in the immediate vicinity of the project include Nondalton, Iliamna, Pedro Bay, Newhalen, and New Stuyahok. Many of the sites are associated with fuel storage tanks/power generation	Many of the sites in the Alaska Department of Environmental Conservation database have been cleaned up. The primary potential nexus with activities proposed by the Pebble Project would be in communities where Pebble proposes construction and operations support activities.	ADEC 2018	There is a potential for interaction with contaminated sites in Iliamna.
Scientific Surveys and Research				
Federal, state, institutional, and private surveys and research	Scientific surveys and research conducted by government, institutional, and private parties have the potential to disturb wildlife, as well as interfere with subsistence and recreational activities and experience. Activities conducted by aircraft typically have created the most potential for conflict.	While some agencies and organizations conduct annual surveys, others are difficult to forecast.		There is a potential to disturb wildlife, and for interaction with subsistence and recreational activities and experience.

AMERICAN OVERSIGHT

4.1.4 Issues Selected for Analysis

The US Army Corps of Engineers (USACE) and cooperating agencies selected substantive impact topics for further analysis, and eliminated others from evaluation. Based on scoping comments, issues were selected for analysis, and are organized by social, physical, or biological environment.

These issues are briefly described in this section and documented as Statements of Concern in the Scoping Report (Appendix A). Comments indicated that the EIS should analyze impacts on:

Social Resources:

- Socioeconomics
- Subsistence
- Traditional way of life
- Archaeological and cultural resources
- Land ownership, management, and use
- Transportation and navigation
- Recreation
- Environmental justice
- Public health and safety
- Visual resources
- Wilderness characteristics
- Food and fiber

Physical Resources:

- Air quality
- Geology and seismic activity
- Surface and groundwater hydrology impacts
- Noise impacts
- Hazardous materials stored and transported to and from the mine site
- Natural gas supply and pipeline safety
- Tailings dam
- Water quality and quantity

Biological Resources:

- Vegetation and ecosystems
- Fish and aquatic resources
- Wetlands and special aquatic sites
- Wildlife, birds, and mammals
- ESA-listed threatened and endangered species

Other Concerns:

- Climate change
- Invasive species
- Fuel spill risks and releases

AMERICAN OVERSIGHT

4.1.5 Other Resources or Topics

This section provides a summary of analysis of other resources or topics that are not addressed specifically in Section 4.2 through Section 4.27.

4.1.5.1 Conservation (33 CFR 320.4[a], [m], [n])

Conservation is a broadly defined concept that typically includes the wise and efficient use, management, and protection of a natural resource; avoidance of wasteful or unnecessary use of the resource; and sustainability of the resource for future or alternate use. The conservation aspects of a large mineral resource extraction project are multi-faceted and complex. They involve the efficient extraction and use of copper, gold, and molybdenum minerals, temporary and permanent losses or gains in other affected resources, and a variable duration of impacts on those resources.

Overall, the project will result in adverse short-term impacts on natural resource conservation, and in variable (generally adverse to neutral) long-term effects on natural resource conservation; including mineral resources, fish and wildlife, water supply, wetlands, and energy. Supporting discussions regarding impacts on the conservation of each of these resources are provided in other appropriate sections of this EIS. Project-related impacts on the conservation of each of these resources will vary in intensity and duration; many of the effects will be temporary.

4.1.5.2 Energy Needs (33 CFR 320.4[n])

Energy conservation and development are major national objectives. The project is not an energy production facility, but will have effects on energy needs. There is no existing power infrastructure in the project vicinity. Due to the remote location and lack of current infrastructure, the project would be required to provide basic infrastructure in addition to support facilities typically associated with mining operations. The project will create new base load electric demand for ore extraction and processing. The peak electrical load for the project will be approximately 270 megawatts (MW). Project energy requirements represent additional base and peak load electrical demand. Various mine load centers would be serviced by a 69 kilovolt distribution system using a gas-insulated switchgear system located at the power plant. Waste heat from the power plant would be used to heat buildings and supply process heating to the water treatment plant.

Natural gas sourced through the existing natural gas supply infrastructure will be the primary energy source for the project. Natural gas pipeline infrastructure would include a compressor station on the Kenai Peninsula side, and a second compressor station located at a Cook Inlet port site. The port site would include two 2 MW natural gas power generators with an emergency diesel generator. Natural gas would be fed to the port site power station to be used for heating. A lake ferry would include generator engines. The mooring system design would allow engines to be turned off while parked.

4.1.5.3 Mineral Needs

Society has demands and uses for molybdenum, copper, and gold, and for the mining of these resources. PLP's stated purpose for the project is to provide for increased domestic copper, gold, and molybdenum production to meet world demand. PLP presented information demonstrating that these minerals are important precious metal used worldwide for electronics, jewelry, currency/bullion, and medical purposes. Direct mining products include copper concentrates, molybdenum concentrate, and gravity-recovered gold. The project will ultimately result in production of molybdenum, copper, and gold. These metals are highly conductive to

AMERICAN OVERSIGHT

electricity and are used in electrical wiring in some high-energy applications, circuitry, and other uses; they are more efficient than other metals for these applications.

The project represents a needed exploitation and use of these metals, but also represents an irretrievable and irreversible commitment of the use of copper, gold, and molybdenum ore resources. The project will result in a short-term, beneficial effect on mineral needs.

4.1.5.4 General Environmental Concerns (33 CFR 320.4[a][1] and 33 CFR 320.4[p])

During the formal scoping period, many issue-specific comments were received from the public as well as local, state, and federal agencies. Concerns addressed under "general environmental concerns" include those not addressed elsewhere. The USACE has identified climate change and traditional ecological knowledge (TEK) as matters of general environmental concern not addressed in a specific resource section. Discussion of both of these topics is integrated into the descriptions in Chapter 3, and the analysis in Chapter 4; see Section 3.1, Introduction to Affected Environment, for information on how these topics were discussed and analyzed.

[Provide summary of TEK and climate change analysis, as applicable, after completion of Chapters 3 and 4].

4.1.6 Unavoidable Adverse Effects

The Council on Environmental Quality (CE!Q) guidelines require agencies to evaluate "any adverse environmental effects which cannot be avoided should the proposal be implemented" (40 CFR 1502.16). Unavoidable adverse effects are those remaining after the project has complied with applicable stipulations and mitigation measures. A detailed discussion of beneficial and adverse effects is presented for each resource in Section 4.2 through Section 4.26. Unavoidable adverse impacts to resources in the EIS analysis area are described below.

4.1.7 Irreversible and Irretrievable Commitment of Resources

CEQ guidelines require an evaluation of "any irreversible or irretrievable commitments of resources which would be involved in the proposal should it be implemented" (40 CFR 1502.16). A commitment of resources is irreversible when the impacts of the proposed action or alternatives would limit the future options for use of the resource. This applies primarily to non-renewable resources or to processes or resources that are renewable over long periods of time. Irretrievable commitments apply to loss of production or use of renewable resources. These opportunities are foregone for the period of the proposed action, during which the resource cannot be used. These decisions are reversible, but the utilization opportunities foregone are irretrievable. Irreversible and irretrievable commitments of resources for the alternatives analyzed in this EIS include:

- Ground disturbance, particularly due to project construction and operations, would cause irreversible impacts including land to be permanently altered, soils and bedrock to be permanently displaced, vegetation to be permanently removed, and wetlands to be permanently altered or filled. Any inadvertent effects to cultural resources or historic property would also result in an irreversible commitment of resources.
- Incidental or induced mortality of fish and wildlife resulting from project construction and operations, as well as any reduction in habitat value, could result in localized irretrievable commitment of these resources during the life of the project. Subsistence harvesting and recreational activity in areas occupied by facilities would not be possible during the life of the project, resulting in an irretrievable commitment of related resources.

AMERICAN OVERSIGHT

- Funds and labor would be irretrievably committed for project permitting and development.
- Consumption of renewable and non-renewable resources would be required for infrastructure development, including metals, aggregate, cement, wood, and other materials.
- Non-renewable resources (e.g., gasoline, diesel, natural gas, and electrical power generated from these fuels) would be irreversibly committed for project construction, operations, and closure. Fuels would be required to operate aircraft, motor vehicles, barges, vessels, machinery, and mining equipment.
- Water would be irretrievably committed for milling and processing.

4.1.8 Financial Assurance and Bonding

The State of Alaska will require financial assurance to ensure completion of reclamation and closure activities, including long-term post-closure management requirements, and for management of wastes to prevent water pollution.

PLP would be required to fully bond the project upfront, and would meet financial assurance obligations as the trust is being funded to the amount approved by the Alaska Department of Environmental Conservation and Alaska Department of Natural Resources (ADNR) (e.g., through a letter of credit or surety bond).

Prior to commencing construction, the PLP would develop and submit for approval a Project Reclamation and Closure Plan. PLP would also have associated financial assurance mechanisms in place. The Reclamation and Closure Plan and financial assurance obligations would be updated on a 5-year cycle in accordance with regulatory requirements to address any changes in closure and post-closure requirements and cost obligations.

PLP would develop a detailed reclamation and closure cost model to address all costs required for both the physical closure of the project and the funding of long-term post closure monitoring, water treatment, and site maintenance. The estimate would include the costs of closure planning and design, and mobilization of third-party equipment to site; detailed estimates of equipment and labor requirements for physical closure; capital, sustaining capital, and operating costs for water treatment and other long-term post-closure operations; and appropriate indirect costs and contingencies developed following ADNR guidance.

AMERICAN OVERSIGHT

From: James Fueg, Pebble Limited Partnership

To: Shane McCoy, US Army Corps of Engineers

Date: May 11th, 2018

Technical Note on Updates to PLP's Proposed Project

Since submittal of Pebble Limited Partnership's (PLP) Department of the Army Permit Application on December 22nd, 2017 PLP has continued to refine the proposed project by advancing engineering design and looking for practicable opportunities to further avoid and minimize potential adverse impacts. Additionally, PLP paid close attention to the ongoing public process regarding the project, reviewing both informal public comments and those submitted through the ongoing US Army Corps of Engineers (USACE) scoping process.

As a result of this work PLP has made several updates to the proposed project that we believe further enhance environmental protections through operations and closure, further reduce project impacts, and further allow for regional stakeholders to benefit from the project. This memo outlines the updates to the proposed project.

Project Updates

The following updates are described in this section:

1) Mining and milling schedule
2) Tailings storage facility layout
3) Main water management pond size and location
4) Natural gas pipeline throughput alignment, and origin
5) Amakdedori port and concentrate loading

Mining and Milling Schedule

The original project had a peak mining rate of 90 million tons per year and a milling rate of 160,000 tons per day. Under this operating schedule the stockpiling of low grade ore (LGO) to feed the mill in later years was required, with the stockpile size peaking at 330 million tons. For the updated project the peak mining rate has been reduced to approximately 75 million tons per year and the milling rate has been increased to 180,000 tons per day, removing the requirement for the storage of large volumes of low grade ore during the first fourteen years of operation. These changes will not result in any substantive changes to the footprint associated with the mill and ancillary facilities.

Because of these changes, the following changes to the overall operating plan occur:

AMERICAN OVERSIGHT

1) The project operating life remains unchanged at twenty years, but mining and milling operations will both continue for the full twenty-year operating life of the project.
2) Total tons mined will increase to approximately 1.5 billion tons, of which approximately 1.3 billion tons is ore and 200 million tons is waste. Waste rock is either utilized to construct the tailings dams, or stored through operations for placement back into the pit at closure.
3) Tailings tonnages increase to approximately 1,150 million tons of bulk tails and approximately 150 million tons of pyritic tails.
4) Pit dimensions will increase slightly and the pit outline will change. The location of the open pit water management pond will move to the south.
5) To accommodate the increased mill throughput the powerplant installed nameplate capacity will increase to 270 MW.
6) Annual concentrate production will increase to approximately 660,000 tons of copper-gold concentrate and approximately 16,500 tons of molybdenum concentrate. This will result in an approximately 10% increase in some associated road and marine traffic, specifically:
    - Up to 27 Handysize ships for concentrate transport
    - Up to 33 marine line haul barges of supplies
    - Up to 39 truck round trips per day
    - Average annual fuel requirements will decrease to 12-15 million gallons annually.
    - Lake ferry round trips will not increase and will remain at one per day on average.

These changes provide the following advantages:

1) The need for construction of a large lined pad for the long-term storage of low grade ore is removed. Removal of this facility allows the location to be used for other purposes.
2) Above ground storage of the PAG low grade ore resulted in the requirement to treat significant amounts of poor quality run-off water and seepage collected from the LGO stockpile. Removal of the LGO will facilitate water treatment during operations.
3) Annual mobile equipment and fuel requirements are reduced due to the reduction in the peak mining rate and the removal of ore re-handling for the low-grade material, with associated reductions in emissions from mobile equipment.

Tailings Storage Facility (TSF) Layout

The original TSF design consisted of a single facility with separate cells for the bulk and pyritic tails located in the North Fork Koktuli (NFK) West site. The updated design consists of an unlined bulk TSF located in the NFK West site, with a separate lined pyritic TSF located in the NFK East site, which will also be used to store potentially acid generating (PAG) waste sub aqueously during operations. The bulk TSF southern embankment is moved approximately 2000 feet to the south to take better advantage of the existing terrain for the embankment construction. The main (northern) embankment of the bulk TSF remains a flow-through design to facilitate water management within the bulk TSF.

These changes provide the following advantages:

1) Location of the pyritic tails and PAG waste in a separate facility located closer to the open pit will facilitate the placement of PAG waste and pyritic tails back into the pit at closure. Following

AMERICAN OVERSIGHT

the cessation of operations, the pyritic tails and PAG waste will be relocated to the bottom of the open pit for permanent subaqueous storage below ground level, the pyritic TSF embankments will be breached, the liner will be removed, and the facility will be reclaimed. This provides three important long-term safeguards:

   a. The need for perpetual maintenance and water treatment of the pyritic facility is eliminated.
   b. Storage of the pyritic tails below ground level eliminates all potential for downstream failure impacts associated with the pyritic tails storage after closure.
   c. Storage of the pyritic tails and PAG waste rock below water at the bottom of the pit is the best means of providing for long term prevention of acid generation.

2) Location of the tails in two separate facilities significantly reduces overall embankment heights associated with the facilities and thereby reduces the amount of fill required to construct the facility.
3) The reduced embankment sizes and the additional waste rock from the pit available for use in embankment construction results in a reduction in the amount of quarry rock needed for construction.

Main Water Management Pond Size and Location

The original layout had two collocated water management ponds (WMPs): the main WMP and the LGO WMP north of the LGO stockpile. These facilities have been replaced by a single, significantly larger, main WMP located in the NFK North site. This facility would be fully lined and constructed using rock fill embankments like the TSFs. Following the cessation of operations and once the facility is no longer needed for water storage prior to treatment, the embankments would be breached, the liner would be removed, and the facility would be reclaimed.

These changes provide the following advantages:

1) The ability to store significant additional process contact water separate from the TSF facilities. This change has further improved the project's ability to deal with multi-year climatic precipitation variability.
2) Maintaining a conservative maximum normal operating level for the main WMP provides significant capacity for additional water storage in the event of water treatment facility problems or extreme precipitation events.
3) Maintaining adequate minimum storage levels within the main WMP will provide additional certainty for the supply of process water during dry conditions.
4) The large storage volume available will allow for flexibility in water treatment and release and improve the ability to optimize discharges and minimize downstream impacts.

Natural Gas Pipeline Throughput, Alignment, and Origin

Ongoing work on the natural gas pipeline alignment and engineering design have led to the conclusion that a 10-inch diameter pipeline is not optimal. This is driven by several considerations:

1) The increase in mill throughput that requires more power.
2) The potential for use of LNG (produced at site from natural gas) as a future truck fuel.

AMERICAN OVERSIGHT

3) Accommodation for potential regional energy requirements given that this this will be an open access pipeline (most likely a contract carrier).
4) The associated compression requirements and line operating pressures are not optimal with a 10-inch line.

The current design utilized a 12-inch pipeline for the marine and lake portions of the alignment for buoyancy reasons. Th updated design incorporates a 12-inch diameter line for the marine, lake, and land portions of alignment. This results in a reduction in compression requirements and associated air and noise emissions, without any increase in the ROW footprint.

The proposed method for the installation of the deep-water (at least 12 feet or deeper) portions of the natural gas pipeline has been modified to use heavy-wall and/or concrete coated pipe and placement over the existing bottom surface, rather than placement of the pipe in a trench such that the top of the pipe is below the natural bottom. The use of heavy wall pipe to address pipe protection:

1) Meets code requirements for the Pipeline and Hazardous Materials Safety Agency (PHMSA).
2) Better addresses pipeline protection in consideration of Cook Inlet's tide and current conditions.
3) Is consistent with techniques used on other Cook Inlet pipelines.
4) Minimizes impacts associated with trenching the sea and lake bottom during construction.

Several changes have also been made, or are being considered, to the proposed pipeline alignment. These changes will be further refined and confirmed by fieldwork proposed for this summer.

1) The pipeline origin point is now at the compressor station location north of Anchor Point. Further discussion with gas pipeline operators on the Kenai confirmed that the existing pipeline network currently extends far enough south along the Sterling Highway and has sufficient excess capacity to supply gas directly to the proposed compressor station location north of Anchor Point, removing the requirement for the first nine miles of pipeline construction along the Sterling Highway ad reducing the overall pipeline length and associated footprint.
2) In addition to the proposed pipeline route that starts with an HDD from the compressor location directly into Cook Inlet, PLP is evaluating an alternative route that utilizes an alignment that runs down the Sterling Highway from the compressor station to the Anchor River Recreation Area and then out into Cook Inlet utilizing a trench located adjacent to the road through the recreation area, removing the need for an HDD off the bluff. A final decision on the preferred alignment will be made following additional fieldwork this summer.
3) The alignment has been routed further to the south of Augustine Island to address potential pipeline geohazard concerns related to Augustine Volcano. Additional adjustments to the offshore alignment are anticipated as the ongoing geophysical data collection advances.

Amakdedori Port and Concentrate Loading

Ongoing engineering and logistical studies now support a conclusion that the shipment of concentrate from the Amakdedori port site can be accomplished using barges to lighter the concentrate containers to deeper water. The bulk carrier would anchor at established mooring points and the containers would be unloaded directly into the hold of the bulk carrier using a crane mounted on the barge. Two locations for lightering have been identified:

AMERICAN OVERSIGHT

1) Approximately 12 miles offshore due east of the proposed Amakdedori port. This would be the primary lightering location.
2) Approximately 18 miles east-northeastof the proposed Amakdedori port between Augustine Island and the mainland. Wave heights in this area are reduced by Augustine Island and it would be used when required by sea conditions.

Both locations are located outside of the designated Beluga Whale and Cook Inlet Sea Otter critical habitat.

Two or three lightering vessels (depending on the location) would be required to move concentrate between the port and ship. About ten trips by the lightering vessels would be required to load the bulk carrier, which would be anchored for four to five days at the lightering location. The containers would be picked up using a crane mounted on the lightering vessel, dumped into the hold of the bulk carrier, and then returned to the deck of the lightering vessel. Loading would be interrupted when sea and weather conditions preclude operations. All consumables and fuel for the operation would be barged directly into the Amakdedori Port using marine line haul barges. No lightering of fuel or supplies would be required.

These changes provide the following advantages:

1) The requirement for dredging and subsequent maintenance dredging of a deep-water access channel is eliminated.
2) The requirement to store up to 20 million cubic yards of dredged material at the Amakdedori port site is eliminated.
3) Bulk carrier navigation and handling requirements are simplified as they no longer have to transit the access channel and maneuver in the turning basin.

PLP will continue to investigate options for a restricted access (high tide only) port facility to reduce dredging requirements to address the questions raised in RFI-033.

Conclusion

PLP believes that the outlined updates to the proposed project will further enhance environmental protections through operations and closure, further reduce project impacts, and preserve potential for regional stakeholders to benefit from the project. Please feel free to contact me if there are any questions regarding these changes or any additional information that is required.

AMERICAN OVERSIGHT

3.0 AFFECTED ENVIRONMENT

3.1 INTRODUCTION

Chapter 3 describes the existing environment that would be affected by the proposed project and alternatives under consideration in this Environmental Impact Statement (EIS). This chapter is intended to help the lay reader and agency decision maker find the information they need to evaluate the affected environment and understand the impacts and consequences discussed in Chapter 4.

Each of the 25 resource sections in Chapter 3 discusses:

- The types of potential impacts typically associated with the proposed project for that resource;
- The EIS analysis area for that resource (consistent with the project area unless otherwise specified; for some resources, the EIS analysis area is larger than the project area because potential effects extend beyond the project boundary);
- The applicable regulations, in context of the resource; and
- The overall existing condition of the resource, including the natural and physical environment.

A brief description of general project physical setting and other resources is included below.

3.1.1 Physical Setting

3.1.1.1 Location

The proposed Pebble Project location is primarily within the Bristol Bay watershed in southwest Alaska, a rolling, permafrost-free terrain, approximately 200 miles southwest of Anchorage and 60 miles west of Cook Inlet. The closest communities are Iliamna, Newhalen, and Nondalton, each approximately 17 miles from the Pebble Project deposit location. The Bristol Bay watershed encompasses approximately 41,900 square miles (mi^2) and is defined by the Aleutian Range to the east and southeast, the Kuskokwim Mountains to the west, and a range of hills to the north that separate it from the Kuskokwim River watershed. The largest rivers that drain into Bristol Bay are the Nushagak and Kvichak rivers, which together drain 49 percent of the Bristol Bay watershed, or approximately 20,000 mi^2. A portion of the proposed Pebble Project is located within the Cook Inlet watershed, which encompasses the city of Anchorage and various communities on the Kenai Peninsula and around the Cook Inlet coastal shoreline.

3.1.1.2 Climate & Meteorology

The climate in the area of the proposed Mine Site is transitional. Winters are characterized by a continental climate as frozen waterbodies and sea ice in Bristol Bay create a land-like mass, while summers have a maritime climate due to the influence of the open water of Iliamna Lake and, to a lesser extent, the Bering Sea, Bristol Bay, and Cook Inlet.

Mean monthly temperatures range from about 55 degrees Fahrenheit (°F) in summer to 2°F in winter. Precipitation in the North Fork Koktuli (NFK) River drainage averages approximately 57.4 inches per year, and 50.8 inches per year in the South Fork Koktuli River (SFK). About one-third of this precipitation falls as snow. The wettest months are August through October. White-out conditions and wind storms or periods of poor light/visibility occur in winter.

AMERICAN OVERSIGHT

Winter weather systems, consisting of cool to cold saturated air, typically travel into the region from the Bering Sea (west), along the Aleutian Island chain (southwest) and the Gulf of Alaska (south), resulting in frequent clouds, rain, and snow. Less frequent incursions of frigid, stable arctic air masses produce shorter periods of clear, but very cold conditions. During summer, warm air masses from Interior Alaska can cause atmospheric instability, which results in cumulus clouds and thunderstorm activity. No permafrost has been identified to date in the project area.

3.1.1.3 Topography

The area consists of low, rolling hills separated by wide, shallow valleys. Elevations range from approximately 775 feet in the SFK valley up to 2,760 feet on Kaskanak Mountain. Glacial and fluvial sediment of varying thickness covers most of the area at elevations below approximately 1,400 feet, while ridges and hills above 1,400 feet generally exhibit exposed bedrock or have thin veneers of surficial material. Hills are generally moderately sloped with rounded tops, and valley bottoms are generally flat.

The terrain includes a range of types, from flat to moderately undulating near the Mine Site, gently sloping and colluvial terrain along the north shore of Iliamna Lake, and mountainside slopes to narrow valley bottoms through the Aleutian Range. No permafrost has been identified in the Transportation Corridor. The corridor spans the Nushagak watershed at the Mine Site and traverses the Kvichak watershed, both within the greater Bristol Bay watershed. The corridor continues through the Tuxedni-Kamishak Bay's watershed of the greater Cook Inlet watershed.

The Amakdedori Port site is located just north of the mouth of Amakdedori Creek on the shore of Cook Inlet in the northern part of the Aleutian Range physiographic division. Topography is generally flat with dunes located closer to the gravel beach shoreline of Cook Inlet.

The geographic location of the first portion of natural gas pipeline corridor is located on the Kenai Peninsula, and crosses Cook Inlet. The remainder is the same as the Transportation Corridor. The terrain includes a range of types, from flat to moderately undulating near the Mine Site, gently sloping and colluvial terrain along the north shore of Iliamna Lake, mountainside slopes to narrow valley bottoms through the Aleutian Range, and coastal lowlands around Cook Inlet.

3.1.1.4 Land Cover

The Mine Site and Pebble Deposit area is ecologically diverse, with rivers, tundra, marshy lowlands, and ponds. Much of the land is covered by alpine tundra, shrubs, wetland and scrub communities, or areas of mixed broadleaf and spruce trees, depending on elevation and location. Much of the land at lower elevations south of Iliamna Lake is covered by dwarf shrub and broadleaf forest communities. At higher elevations where shallow bedrock occurs, dwarf shrub and alder shrub communities are prevalent. Wetland habitats are common in depressional areas, valley bottoms, and on slope benches and include wet meadows and scrub-shrub communities.

Vegetation communities within the Transportation Corridor north of Iliamna Lake primarily consist of dwarf shrub, spruce woodland, mixed broadleaf and spruce forest, and shrubs. Wetland habitats dominated by willow shrub communities are common on floodplains of streams, while wet meadows and mixed shrub wetlands are common at toe slopes where groundwater discharge occurs. The Transportation Corridor crosses numerous streams within the Bristol Bay and Cook Inlet watersheds.

AMERICAN OVERSIGHT

The western shorelines from Kameshak Bay north to Iniskin Bay are composed of diverse habitats, including steep rocky cliffs, cobble or pebble beaches, and extensive sand/mud flats. Eelgrass is found at a number of locations and habitats; eelgrass, along with macroalgae, is an important substrate for spawning Pacific herring. Much of the land is well-drained and covered by dwarf shrub communities with inclusions of alder shrub and grass-herb communities. Wetland habitats consisting of wet meadows and shrub communities are limited to the northwestern extent of the port site where groundwater discharge occurs and areas within the floodplain of Amakdedori Creek.

The Cook Inlet region is composed of marine, coastal, and estuarine habitats. Pelagic waters within Cook Inlet are influenced by riverine and marine inputs resulting in salinity gradients and horizontal mixing throughout the inlet. Deeper waters of Cook Inlet are characterized by unconsolidated sediments on a smooth bottom and strong tidal currents. The variety of habitats in the region support lower trophic organisms, fish, shellfish, marine mammals, and birds. Fish and shellfish are important components of the Cook Inlet food web, as they feed on lower trophic organisms such as plankton, and serve as prey for other fish, birds, and marine mammals.

3.1.1.5 Hydrology

The Pebble Deposit straddles the upper reaches of the SFK and Upper Talarik Creek (UTC) drainages. The headwaters of the NFK are immediately north of the Pebble Deposit. The SFK drains south from the Pebble Deposit area, and then west and northwest, where it joins the NFK, which flows west from the Pebble Deposit area. At the confluence, these streams form the Koktuli River, which flows into the Mulchatna River, a tributary to the Nushagak River. The Nushagak River flows into Bristol Bay near the city of Dillingham. Upper Talarik Creek flows south from the Pebble Deposit area and then southwest into Iliamna Lake, which is the source of the Kvichak River.

The NFK and SFK are two of 24 tributaries of similar or larger size in the 315-mile long Nushagak River system. The north and south forks of the Koktuli River flow for 36 and 40 miles, respectively, to the main stem Koktuli River. The Koktuli River flows for approximately 39 miles before entering the Mulchatna River, which flows another 44 miles before entering the Nushagak River. The Nushagak River flows about 110 miles before it empties into Bristol Bay southwest of Dillingham. The total distances from the NFK and SFK headwaters to Bristol Bay are 228 miles and 232 miles, respectively.

The UTC drainage is in the 225-mile-long Kvichak River system. The headwaters of the Kvichak River system are approximately 109 miles northeast of the Pebble Deposit at the source of the Tlikakila River at Lake Clark Pass. UTC flows approximately 39 miles to Iliamna Lake. The lake empties into the Kvichak River, which flows approximately 70 miles to Bristol Bay. The total distance from the headwaters of UTC, across the lake, and to Bristol Bay is approximately 140 miles.

The Cook Inlet basin is an expansive watershed surrounding the 180-mile-long Cook Inlet waterbody. Covering more than 38,000 mi^2 of southern Alaska, it receives water from six major watersheds and many smaller ones. More than 10 percent of the basin is covered by glaciers and suspended sediment loading in glacier fed rivers without lakes is significant, leading to a high suspended sediment load in portions of Cook Inlet. Lower Cook Inlet is connected to the Pacific Ocean southwest through Shelikof Strait, and southeast by the Gulf of Alaska and demonstrates complex circulation on variable timescales. The region has the fourth largest tidal range in the world; tidal fluctuations in Kamishak Bay average 13 feet. When the tide drops from mean high to mean low water, the inlet loses almost 10 percent of its volume, and exposes

AMERICAN OVERSIGHT

approximately eight percent of its surface area. Most of these tidally exposed areas are in the arms at the north end of Cook Inlet and along the west side of the waterbody.

3.1.2 Other Resources

3.1.2.1 Conservation *(33 CFR 320.4[a], [m], [n])*

Conservation is a broadly defined concept that typically includes the wise and efficient use, management, and protection of a natural resource; avoidance of wasteful or unnecessary use of the resource; and sustainability of the resource for a future or alternate use. The conservation aspects of a large mineral resource extraction project are multi-faceted and complex. They involve the efficient extraction and use of copper, gold, and molybdenum minerals, temporary and permanent losses or gains in other affected resources, and a variable duration of impacts on those resources. Some of the adverse impacts are partially or wholly reversible, such that the resource values that were temporarily altered can return over time for future conservation and sustainable use.

Society has demands and uses for copper, gold and molybdenum, and for the mining of these resources. The project represents a needed exploitation and use of these metals but also represents an irretrievable and irreversible commitment of the use of copper, gold, and molybdenum ore resources.

[Note: Conservation needs in the project area will be further defined at a later time.]

3.1.2.2 General Environmental Concerns *(33 CFR 320.4[a][1] and 33 CFR 320.4[p])*

Concerns addressed under "general environmental concerns" include those not addressed elsewhere. The USACE has identified matters of general environmental concern not addressed in a specific public interest topic and has chosen to address these topics in this section. The project will result in short-term and long-term effects on general environmental concerns.

[Note: General environmental concerns in the project area will be further defined at a later time.]

3.1.2.3 Energy Needs *(33 CFR 320.4[n])*

Energy conservation and development are major national objectives. The project is not an energy production facility, but will have effects on energy needs. There is no existing power infrastructure in the project vicinity. Due to the remote location and lack of current infrastructure, the project would be required to provide basic infrastructure as well as support facilities typically associated with mining operations. The project will create new base load electric demand for ore extraction and processing. The peak electrical load for the project will be approximately 230 megawatts. Project energy requirements represent additional base and peak load electrical demand. Various mine load centers would be serviced by a 69-kilovolt distribution system using a gas-insulated switchgear system located at the power plant. Waste heat from the power plant would be used to heat Mine Site buildings and supply process heating to the water treatment plant.

Natural gas sourced through the existing natural gas supply infrastructure will be the primary energy source for the project. The Natural Gas Pipeline Corridor would include a compressor station near Anchor Point. A second compressor station would be located at the Amakdedori Port site. The Amakdedori Port would include two 2-MW natural gas power generators with an emergency diesel generator. Natural gas would be fed to the port site power station to be used for heating. A second gas-fired compressor station would be located at the port site. The Iliamna

AMERICAN OVERSIGHT

Lake ferry would include generator engines. The mooring system design would allow engines to be turned off while parked.

The project will result in production of copper and gold. These metals are highly conductive to electricity and are used in electrical wiring in some high-energy applications, circuitry, and other uses; they are more efficient than other metals for these applications.

[Note: Energy needs in the project area will be further defined at a later time.]

3.1.2.4 Effects of Climate Change on the Project Area

[Note: Implications of climate change for the environmental effects of the proposed action in the project area will be further defined at a later time.]

Additional climate change trends are discussed as appropriate to the resource in Chapter 3. See Section 3.20, Air Quality, for information on the effect of the proposed action on climate change as indicated by GHG emissions. Effects on the proposed project infrastructure from climate change are discussed in appropriate Chapter 3 sections.

AMERICAN OVERSIGHT

3.5 RECREATION

The region around the project area is, for the most part, remote and undeveloped. These lands and waters support a wide variety of dispersed recreation activities including sport and trophy hunting, hiking, camping, and snowmachining. The premier recreation activity in this area is sport fishing which draws many anglers from Alaska and beyond to lodges, lakes, rivers, and estuaries in the region in search of freshwater, saltwater, and anadromous fish. Due to the economic importance of fishing in this region, recreational and commercial fishing are discussed in a separate section. See Section 3.6, Commercial and Recreational Fishing for more information.

3.5.1 Recreation Management

3.5.1.1 Federal Lands

National Parks Service

The following section provides information on the management of the three National Park Service (NPS) units within the regional recreation area of the project. Commercial use of all three units are subject to commercial use authorizations (CUAs), which authorize suitable commercial services to park visitors (NPS 2018c). CUAs may not exceed two years per term and provide for incidental use of the park by commercial service operators where services originate and terminate outside of the park boundary (NPS 2018c). CUAs are authorized under Section 418 of the National Parks Omnibus Management Act of 1998, Public Law 105-391 (NPS 2018c).

Lake Clark National Park and Preserve

Lake Clark National Park and Preserve is managed according to the 1984 General Management Plan for the park and a 2014 amendment to this plan. The 1984 General Management Plan contains a management concept for visitor access, recreation and use within the park unit, including development, access, commercial use, visitor use, visitor information, and interpretive materials (NPS 1984). The 2014 amendment expanded visitor activities and interpretive services. The amendment included designating some existing cabins for public use, designating an informal water route on Lake Clark, providing a few improved visitor facilities, and providing limited new commercial services (NPS 2014).

The most current Superintendent's Compendium includes the designations, closures, permit requirements and other restrictions that have been adopted under the superintendent's discretionary authority (NPS 2017a).

There are currently 87 visitor service providers (CUA holders and concessioners) within this NPS unit for the following activities: air taxi, water taxi, backpacking/overnight camping, boating trips, bear viewing, group camping, hiking/walking tours, big game transport, incidental hunt transport, kayak tours, mountaineering, paddleboarding, photography, sportfishing, sport hunting, skiing, and snowshoeing (NPS 2018m).

Katmai National Park and Preserve

Katmai National Park and Preserve is managed under a variety of management plans. The 1986 General Management Plan discusses management of park access and circulation, visitor use and services, and potential development within the park unit (NPS 1986). The 2009 Long

AMERICAN OVERSIGHT

Range Interpretive Plan describes desired visitor experiences, existing interpretive resources, and includes recommendations to achieve the desired future interpretive program as well as implementation priorities (NPS 2009). The 2014-2018 Strategic Plan includes five year goals and strategies for management of three NPS units (NPS 2013). Similar to Lake Clark National Park and Preserve, the most current Superintendent's Compendium lists the designations, restrictions, closures, and permit requirements adopted under the superintendent's discretionary authority (NPS 2017b). The 2017 Compendium for Katmai National Park and Preserve also covers the Aniakchak National Monument and Preserve and Alagnak Wild River (NPS 2017b).

There are currently 122 visitor service providers (CUA holders and concessioners) within this NPS unit for the following activities: air taxi, backpacking/overnight camping, boating trips, bear viewing, charter boat service, group camping, hiking/walking tours, big game transport, incidental hunt transport, kayak tours, lodging and food service, photography, sportfishing, and sport hunting (NPS 2018g).

Alagnak Wild River

There are several management plans that discuss recreation within Alagnak Wild River. The 1983 Management Plan contains management objectives for visitor use and interpretation including access, accommodating hunting, and encouraging activities compatible with the natural environment (NPS 1983). The 2009 Long Range Interpretive Plan and 2014-2018 Strategic Plan described above under Katmai National Park and Preserve also apply to Alagnak Wild River (NPS 2009, NPS 2013).

There are currently 21 visitor service providers (CUA holders and concessioners) within this NPS unit for the following activities: air taxi, backpacking/overnight camping, boating trips, bear viewing, group camping, hiking/walking tours, photography, and sportfishing (NPS 2018d).

US Fish and Wildlife Service

Alaska Maritime National Wildlife Refuge

The Alaska Maritime National Wildlife Refuge (NWR) is managed by a comprehensive plan (USFWS 1988). The five purposes of the refuge (conservation, treaty obligations, subsistence use, scientific research, and water quality/quantity) protect of the wildlife resources that visitors go to see in the refuge for recreation. As stated in the Land Protection Plan for the NWR, "the Alaska Maritime Refuge is managed to conserve native fish and wildlife populations and their habitats, while providing opportunities for subsistence, compatible types of recreation, and research" (USFWS 2011). Some uses of the NWR, including commercial guides and outfitters, transporters such as water and air taxis and charters, cabins, and long-term tent camps require a special use permit from the USFWS. General public use of the NWR for hunting, wildlife viewing, photography, interpretation/environmental education, hiking, and camping do not require a special use permit (USFWS 2014b).

BLM

The BLM lands within the region are under the management of the Anchorage Field Office and are part of the Iliamna East planning block under the Bay Resource Management Plan (RMP) (BLM 2008b). Only one BLM tract within the Iliamna East area is unencumbered; the remainder of the BLM parcels are selected by the state, ANCSA corporations, or both (BLM 2008b). BLM manages these parcels until they are conveyed and is required to seek and consider comments from the relevant Native Corporation for any authorization to use Native-selected lands (Kevin Waring and Associates 2011). RMP recommendations for management of ANCSA selected

AMERICAN OVERSIGHT

lands would be implemented by BLM only if the land selections were relinquished to the federal government (Kevin Waring and Associates 2011).

Pertinent recreation management direction in the RMP includes:

- management of all unencumbered and selected lands (until they are conveyed) as semi-primitive motorized;
- opportunities for commercial recreation will be provided consistent with area objectives for recreation management;
- lands would be managed for dispersed recreation use and no facilities would be developed; and
- camping associated with commercial activities would be prohibited without BLM written authorization, though short-term camping not associated with commercial activities would be allowed for less than 14 days in one location (BLM 2008a).

3.5.1.2 State Lands

Alaska Department of Fish and Game

McNeil River State Game Refuge and Sanctuary

The 2008 Management Plan for the McNeil River State Game Refuge and Sanctuary includes statutory goals for the sanctuary and refuge, as well as policies regarding recreational topics such as access, information and education, recreation activities, camping, structures, boat storage, and trails (ADF&G 2008). Under Alaska Statute (AS) 16.20.162, access permits are required for entry into the McNeil River State Game Sanctuary. Permits are required for bear viewing, special access to the sanctuary (e.g., for scientific, educational and media purposes), transporters, and activities in the sanctuary other than viewing bears (non-viewing permits) (ADF&G 2018e).

Alaska Department of Natural Resources

Bristol Bay Area Plan

The Bristol Bay Area Plan covers state lands just inland of Cook Inlet west to Bristol Bay. The plan includes chapters on the goals and management guidelines for public recreation and tourism as well as public access. The project area is within Regions 6, 8, 9 and 10 of the plan area. In Region 6, the project area, specifically the Mine Area and a portion of the Transportation Corridor, would be within Units 23 and 24, both of which are designated Minerals, which is given to areas associated with significant resources that may experience minerals exploration or development. Permanent facilities related to commercial recreation are prohibited in Unit 23 (ADNR 2013).

In Region 9, the project area, specifically the Transportation Corridor, is within Units 7 and 7A. Unit 7 is designated General Use and is to be managed for a variety of uses, including dispersed recreation. General Use areas are not intended for intensive forms of development other than occasionally and at specific sites, usually associated with mining, oil and gas exploration or recreation. Unit 7A is designated as Habitat for protection of moose wintering habitat. The plan notes that development is not appropriate in this unit, other than utility, communication, road/bridge, or other public service-related development (ADNR 2013).

In Region 10, the project area, specifically the Transportation Corridor, is within Units 1 and 2. Unit 1 is designated General Use and is to be managed for a variety of uses including public

AMERICAN OVERSIGHT

recreation and tourism. Unit 2 is designated Minerals and Habitat. The plan specifically notes that the "general resource management intent for the Pebble Copper area is to consider mineral exploration and development, while ensuring the protection of important habitat areas." Specifically, upper Talarik Creek, in both Units 1 and 2, is to be protected for its recreation, habitat, and water resource values. Permanent commercial recreation-related facilities are prohibited in Unit 2. The plan also notes that impacts to dispersed recreation along Talarik Creek should be avoided in Unit 2 (ADNR 2013).

Lower Talarik Creek Special Use Area

The Lower Talarik Creek Special Use Area was established in 1999 and within this area the state has limited commercial recreation activities to day use only with registration. From August through October, camping for personal noncommercial use within this area is only allowed for no more than five days in a designated area adjacent to the ADF&G cabin (ADNR 2013).

Kenai Area Plan

The Kenai Area Plan covers state lands on the Kenai Peninsula and the west side of Cook Inlet. The plan documents the land management intent for the applicable lands and includes chapters on the goals and management guidelines for public recreation and tourism as well as trails and access. The project area is within Regions 7 and Region 12 of the plan area. In Region 12, the project area is within Unit 592, which is designated Habitat and will remain in state ownership. There is no mention of recreation use of this area. The project would also pass near Augustine Island. The island itself is under an Interagency Land Management Assignment to the University of Alaska for research and will be managed for scientific and education purposes. The plan states that any authorized recreation uses of the island should minimize impacts on research opportunities and natural processes on the island. Immediately south of the island, state lands are within unit 522A. The plan designates this unit as Public Recreation and Tourism and notes that these areas attract recreationists that range throughout the area and may have a high potential for dispersed recreation because of desirable recreation conditions (ADNR 2001).

3.5.1.3 Local Lands

Alaska Native Corporations Lands and Native Allotments

Land owned by Native corporations or and within Native Allotments are considered to be private property and therefore are not open for public recreation use. Permission and/or permits for access and seasonal recreation use of these lands must be obtained from the landowner.

3.5.2 Regional Recreation

For the purposes of this section, the region around the project site is defined as the area from Lake Clark National Park and Preserve south to Katmai National Park and Preserve and from the Mulchatna River east to the western Kenai Peninsula. Refer to Figure 3.2-01 for generalized land status.

The region around the project site is generally inaccessible by road, except for the Kenai Peninsula area near the east end of the gas pipeline. There is a limited road system that connects Iliamna with Newhalen and supports sports fishing activities and lodges. The few developed public recreation facilities that are present in the area are generally accessed via air or water. The main public recreation areas within region include the Nushagak River and the Mulchatna River, Lake Clark National Park and Preserve and Katmai National Park and Preserve, Alagnak Wild River, Alaska Maritime National Wildlife Refuge, McNeil River State

AMERICAN OVERSIGHT

Game Sanctuary and Refuge, scattered Bureau of Land Management (BLM) and State lands, and two state park units on the Kenai Peninsula.

The Nushagak River and the Mulchatna River headwaters are west of the Mine Site and managed by the Alaska Department of Natural Resources (ADNR 2005).

Lake Clark National Park and Preserve is about 15 miles northeast of the Mine Area and is not accessible by road. The park covers the eastern two-thirds of the park unit and the preserve is a north-to-south strip of land adjacent to the western side of the national park. Most of the park is designated wilderness and is the sixth largest park unit in the nation. Within the general park/preserve boundary, there are private inholdings (privately owned or selected by Alaska Native Claims Settlement Act [ANCSA] village or regional corporations) around the southwest third of Lake Clark, including the community of Port Alsworth, around Lower Tazimina Lake, and near the Cook Inlet coast (Kevin Waring and Associates 2011).

Katmai National Park and Preserve is located south of the project area. This NPS unit is primarily national park with the preserve located adjacent to the western part of the northern boundary of the park. Most of the park is designated wilderness and the park/preserve is the fifth largest park unit in the nation. There are also over 20,000 acres of privately-owned lands within the unit (Kevin Waring and Associates 2011).

The Alagnak Wild River consists of 67 miles of river corridor that is mostly (93 percent) federally owned, with some privately-owned Native allotments and other private inholdings within the river corridor. The Wild River begins downstream of Kukaklek Lake and flows westward, though the last 12 miles of the Alagnak River are outside the designated corridor. The River was designated a Wild River in 1980, and there is no road access to it (Kevin Waring and Associates 2011).

The Alaska Maritime National Wildlife Refuge (NWR) includes 3.4 million acres (USFWS 2013) from Forrester Island in southeastern Alaska to the tip of the Aleutian chain and almost to Utqiagvik on the Arctic Ocean (USFWS 2011). Within the project area, several islands in Cook Inlet are within the NWR.

The BLM lands within the region are scattered north, east and south of Iliamna Lake. Most of the BLM lands in the region have been selected by the state, ANCSA corporations, or both; there is only one small parcel tract that is unencumbered, which is located west of Lake Clark, 25 miles northeast of the Mine Area (Kevin Waring and Associates 2011).

The McNeil River State Game Sanctuary and Refuge is located immediately north and east of Katmai National Park and Preserve, south of Iliamna Lake, and inland of Kamishak Bay. The refuge portion of McNeil is located north of McNeil Falls and Camp and adjacent to Katmai National Preserve, while the sanctuary portion includes the visitor facilities for brown bear viewing at McNeil Falls and Camp and is adjacent to Katmai National Park.

On the Kenai Peninsula, there are two state park-managed recreation areas. One is a 60-acre state recreation site (Stariski) located five miles north of Anchor Point, and the other is the larger Anchor River State Recreation Area, at the mouth of the Anchor River. Both sites are accessible via the Sterling Highway.

There are also various state-owned land parcels and tracts throughout the project area that are primarily managed for minerals, habitat, and general use, which includes recreation.

3.5.2.1 Recreation Opportunities

The following subsections describe the main recreation opportunities and activities that occur within the region surrounding the project. .

AMERICAN OVERSIGHT

Sport Fishing

Sport fishing is the primary recreational activity that occurs in the EIS analysis area. Rivers like the Nushagak, Mulchatna, and the Kvichak, and Iliamna Lake support recreational fishing for species of salmon, rainbow trout, and other freshwater fish. The sport fishing use is increasing in the area; much public use is guided, with operators flying their clients to a place for the day from nearby lodges or base use out of camps established nearby. Sport fishing is managed by the Alaska Department of Fish and Game (ADF&G) through a permit system.

For information on recreational lodges and guiding operations, see Section 3.6, Recreational and Commercial Fisheries.

Sport Hunting and Trapping

Hunting, primarily for moose, caribou, and bear, is a major recreation activity within the region (Kevin Waring and Associates 2011). Much of the region is open to hunting, except Lake Clark National Park, Katmai National Park, and McNeil River State Game Sanctuary. However, hunting and trapping are allowed within the Lake Clark National Preserve, Katmai National Preserve and McNeil River State Game Refuge (ADF&G 2018e, NPS 2017g, NPS 2018v). Hunting and trapping are also allowed within the Alagnak Wild River and on certain islands within the Alaska Maritime NWR (NPS 2016a, USFWS 2014a). BLM lands are open to hunting, as are state-owned lands unless otherwise restricted by the ADF&G, which manages hunting in Alaska. Hunting on private property, including on village corporation lands and Native allotments, requires landowner permission.

The NPS and State of Alaska cooperatively manage wildlife resources within the three regional NPS units (Lake Clark, Katmai, Alagnak Wild River), and hunters in these units must follow current state hunting regulations and must have all required licenses and permits (NPS 2018v, NPS 2017g, NPS 2016a). The Lake Clark National Preserve is divided into three authorized hunting guide areas and there are currently two concessioners authorized to guide sport hunters in these areas (NPS 2017g). There are also two concessioners authorized to guide sport hunters at Katmai National Preserve (NPS 2018l). The McNeil River State Game Refuge is open to hunting and trapping of species except brown bears (ADF&G 2018e).

As noted in the BLM Bay Proposed RMP/Final EIS, “the BLM-managed portion of the upper Iliamna Lake region has world class recreational values, primary sport fishing and hunting”. Commercial guides under permit with the BLM frequent this area (BLM 2007).

The region is within Game Management Units 9 (most of the region) and 15C (Kenai Peninsula). The project area is specifically within Game Management Units (GMUs) 9B and 15C. The species hunted in GMU 9 include brown/grizzly bear, caribou, Dall sheep, moose, wolf and wolverine. Species hunted in GMU 15 include black bear, brown/grizzly bear, caribou, Dall sheep, moose, mountain goat, wolf and wolverine. In these two GMUs, non-resident sport hunters need a licensed hunting guide or hunt with an Alaska resident who is a close relative for brown bear, mountain goat, and Dall sheep.

Hunting seasons for the species available in these two GMUs vary. Table 3.5-1 lists the hunting seasons for each species by GMU.

AMERICAN OVERSIGHT

Table 3.5-1: General Hunting Season for Game Management Units 9B and 15C

Species	General Hunting Season*	
	GMU 9B	GMU 15C
Black bear	No closed season	No closed season
Brown/Grizzly bear	September 20 to October 21	September 1 to May 31
Caribou	August 1 to March 31	No open season
Mountain goat	NA	August 10 to October 15 and November 1-14
Moose	Resident: September 1 to September 15 Nonresident: September 5 to September 15	August 25 to September 30
Dall sheep	August 10 to September 20	August 1 to August 5, August 10-September 20
Wolf	August 10 to June 30	August 10 to April 30
Wolverine	September 1 to March 31	September 1 to March 31

Source: ADF&G 2017
*These are general seasons; specific seasons by sex/age/location are not presented here.

Water-Related Recreation (Boating)

Various forms of boating, including canoeing, kayaking, rafting and power boating, are popular within most recreation areas in the region. River kayaking and rafting opportunities abound in Lake Clark and Katmai national parks. The three Wild Rivers in Lake Clark National Park and Preserve (Chilikadrotna, Mulchatna, and Tlikakila rivers) are popular for rafting (NPS 2016e). The 80-mile Savonoski Loop out of Brooks Camp is a popular canoeing and kayaking route in Katmai National Park and Preserve (NPS 2018t). This park also has several popular rafting waterways. Both whitewater and non-whitewater river boating opportunities are available in both park units.

On Alagnak Wild River, whitewater and non-whitewater boating opportunities are also available. Trips often begin at Nonvianuk or Kukaklek Lakes with several take-outs available along the lower 30 miles of river (NPS 2015a).

Boating occurs on the Mulchatna River all the way to its confluence with the Nushagak River. The Koktuli River is also floated to its confluence with the Mulchatna River, both by individuals and as guided float trips.

River-based boating opportunities vary based on season, amount of rainfall and temperatures. Generally, river levels are lowest in spring and increase through spring and early summer as spring rains fall and snowmelt occurs with river levels generally peaking in July and then declining into the fall (NPS 2015a).

Due to lack of road access to the region, and because many visitors travel to the area by small plane, boating equipment that can be brought to the region by visitors is limited. Guided trips are available through approved concessioners in the national parks and via other companies in and around the region.

Lake boating opportunities occur during the ice free season, and are available on several lakes in both Lake Clark and Katmai National Parks and Preserves. Motorboating opportunities are available at Lake Clark and Crescent Lake in Lake Clark National Park and Preserve and Naknek Lake in Katmai National Park and Preserve (NPS 2017h, NPS 2018t). Due to the

AMERICAN OVERSIGHT

difficulty in getting motorboats to other lakes, motorboating is generally limited to these lakes (NPS 2017h). Lodges and commercial operators provide boat trips, charters, or rentals on these lakes. All three lakes are popular destinations for visitors. There are 10 companies authorized to provide boating trips within Lake Clark National Park and Preserve, three companies authorized for kayak tours, one company authorized for paddleboarding, and one company authorized as a water taxi (NPS 2018o, p, q, r). The Lake Camp area at Naknek Lake in Katmai National Park and Preserve is accessible via the road from King Salmon and contains a boat ramp, parking area, picnic area and restrooms (NPS 2018t). Within Katmai National Park and Preserve, there are 11 companies authorized to provide boating trips, six companies to provide charter boat services, and three companies authorized to provide kayak tours (NPS 2018i, j, k).

McNeil State Game Refuge is open to boating (ADF&G 2018e).

Powerboating, canoeing, and kayaking opportunities are available on Cook Inlet and particularly along the inlet edges such as along the Lake Clark National Park and Preserve where there are also bear viewing opportunities.

Boating opportunities are also available at Iliamna Lake, Alaska's largest body of freshwater (Van Lanen 2012), though most use of the lake is for sportfishing. Access is available from Iliamna and Newhalen.

Kayaking and boating opportunities are also available on the east side of the Cook Inlet near the terminus of the gas pipeline at the Anchor River State Recreation Area. Tractor-assisted boat launching is available at this location. These occur primarily during the summer months.

Wildlife and Nature Viewing

The region surrounding the project area offers highly valued opportunities for wildlife and nature viewing. The most popular wildlife viewing activity in the region is brown bear viewing, both inland and along the Cook Inlet, with the best opportunities provided at food-rich locations, such as major salmon rivers and along the Cook Inlet shoreline. Bear viewing is especially popular at Lake Clark and Katmai national parks, and McNeil State Game Refuge and Sanctuary. Popular locations for bear viewing at Lake Clark National Park and Preserve include Chinitna Bay, Crescent Lake, Silver Salmon Creek, Shelter Creek, and Tuxedni Bay (NPS 2017c). Katmai has many food-rich areas where bears tend to congregate, such as Brooks Camp, in the preserve, and along the Cook Inlet coast. Bears can be found in the Katmai backcountry as well feeding on sedges, clams and salmon (NPS 2018s).

McNeil State Game Refuge and Sanctuary was designated a wildlife sanctuary in 1967 to protect the world's largest concentration of wild brown bears (ADF&G 2018b). McNeil River Falls are located about a mile from the mouth of McNeil River and slow the movement of salmon heading upstream to spawning grounds, causing salmon to congregate at the falls (ADF&G 2018d). Large numbers of brown bears can be seen at McNeil State Game Refuge and Sanctuary in early July through mid-August (ADF&G 2018d).

Notable bird watching opportunities are also available at most recreation areas within the region. Raptors, waterfowl, seabirds, shorebirds, songbirds, and upland birds can be found throughout the region. For instance, 187 species of birds have been documented at Lake Clark National Park and Preserve (NPS 2017d) and millions of sea birds, endemics, and birds from Asia can be found within the Alaska Maritime NWR (USFWS 2016).

Though bear viewing opportunities are world-class within the region, opportunities for viewing other wildlife species are also available at all of the recreation areas within the region. For instance at McNeil State Game Refuge and Sanctuary, harbor seals, moose, caribou, wolves, and wolverines, red foxes, and arctic ground squirrels can also be seen (ADF&G 2018b). There

AMERICAN OVERSIGHT

are also wildlife viewing opportunities at Iliamna Lake, which contains a rare population of freshwater seals (Van Lanen 2012, ADNR 2013).

Other nature- and wildlife-related opportunities available within the region include nature photography, beach combing, clam digging, and berrypicking (Lake and Peninsula Borough 2018). Often these activities are combined with activities such as bear viewing, sightseeing, backpacking, hiking, camping, etc. during the summer and fall.

Flightseeing/Sightseeing

Due to the lack of road access in the region and the heavy use of small planes and floatplanes for transportation, there are many opportunities for flightseeing in the region. Flightseeing, or sightseeing by plane, is an effective way to see the broader landscapes of the region and even see wildlife and bird species, particularly within the two national park units, and occur primarily during the summer months from June through September. There are many authorized concessioners that offer flightseeing opportunities in Lake Clark and Katmai national parks, with most operators originating out of Anchorage, Homer, King Salmon, Kodiak and Soldotna (NPS 2018n, NPS 2018h). Many air taxis also provide flightseeing tours (NPS 2016c).

Camping/Backpacking/Hiking

Due to the relative lack of developed facilities or trails, and large expanses of wilderness, backcountry recreation activities such as backcountry camping, backpacking, and wilderness hiking are popular within the two national park units. There are also developed camping opportunities at both national parks. Between the two parks, there are very few developed trail opportunities, with less than 5 miles of trail in Katmai National Park and 6.8 miles of trail within Lake Clark National Park (NPS 2016b, NPS Undated 2).

Primitive camping opportunities are also provided within Alagnak Wild River (NPS 2015b). Developed, though low impact, camping and hiking opportunities are available within McNeil State Game Refuge and Sanctuary (ADF&G 2018c).

Camping is allowed on most of the Alaska Maritime NWR though no developed campgrounds exist within the NWR (USFWS 2014c).

Camping related to commercial activities is prohibited on BLM lands without written authorization from BLM. Short-term camping (less than 14 days in one location) not associated with commercial use is allowed.

On state land, access, travel, improvements and structures, and other miscellaneous uses are generally allowed and managed by the Division of Mining, Land and Water.

Camping is also available on the east side of the Cook Inlet near the terminus of the gas pipeline at the Stariski State Recreational Site and Anchor River State Recreation Area, which also offers hiking opportunities.

Due to harsh winter weather conditions within the region, camping, backpacking, and hiking activities are generally conducted during the summer months, from June through September.

Other Opportunities

Biking on ice using fat tire bikes is a new winter use in Lake Clark National Park and Preserve. There is currently no restriction on bike use within the park (NPS 2016d). Other winter activities include cross-country skiing, snowshoeing, trekking, and riding snowmachines.

AMERICAN OVERSIGHT

3.5.2.2 Recreation Facilities

Commercial Lodges

Commercial lodges are the main form of lodging within the region due to the lack of consistent visitation to support hotels and motels. There are clusters of commercial lodges at Port Alsworth, King Salmon, Naknek, Iliamna/Newhalen, Homer, Pedro Bay, and Kokhanok, as well as along the Kvichak, Mulchatna, and Alagnak rivers (ADNR 2013). There are also commercial lodges scattered around the region on private inholdings within Lake Clark and Katmai national parks (NPS 2017f, NPS 2015d). Often commercial lodges also provide guide services for hunting, fishing, and other recreation activities on private property, Native corporation land, and/or on public lands. Therefore, commercial lodges provide a home base for many recreationists and a starting point for trips onto public lands. Please see Section 3.6, Recreation and Commercial Fisheries for more details on the commercial lodges present within the region.

Public Recreation Facilities

Public recreation facilities within the region include lodges, campgrounds, cabins, a primitive camping area, trails, and visitor centers. The only public lodge facilities within the region are located at Katmai National Park. There are two lodges in the park, Brooks Lodge and Grosvenor Lodge, both operated by a concessioner (NPS 2015d). In addition to a lodge, Brooks Camp contains a campground for 60 people, a visitor center, ranger station, and an auditorium with daily ranger-led programs. Facilities at Brooks Camp are available from June 1 to September 18 (NPS 2018u). There is also a six-person public use cabin, Fures Cabin, on the Bay of Islands on Naknek Lake within Katmai National Park that is available from June 1 to September 17 (NPS 2015c). There are 5 miles of trail within the national park and one scenic overlook. The Lake Camp area at Naknek Lake in Katmai National Park and Preserve contains a boat ramp, parking area, picnic area and restrooms (NPS 2018t).

Developed facilities at Lake Clark National Park include a cabin and primitive camping area. The Priest Rock Public Use Cabin is a historic log cabin for six people on the north shore of Lake Clark and is accessible by float plane or boat (NPS 2017i). The Hope Creek Primitive Camping Area is located at Upper Twin Lake near the Proenneke Historic Site and does not provide any services (NPS 2017f). The maintained trails in the park are the Tanalian Trails that begin in Port Alsworth and continue to Tanalian Falls or Tanalian Mountain (NPS 2017e).

There are no developed facilities within the Alagnak Wild River, but the U.S. Fish and Wildlife Service (USFWS) has a visitor center nearby in King Salmon.

McNeil Camp at McNeil State Game Sanctuary provides 14 campsites, a public use cook cabin for food storage and cooking, restrooms, a washhouse and staff facilities (ADFG 2018c).

The Alaska Maritime NWR does not contain any recreation facilities in the region other than a visitor center in Homer (USFWS 2014c).

There are no developed facilities on BLM lands (unencumbered or selected).

The two state park units on the Kenai Peninsula near the terminus of the gas pipeline both contain camping and picnicking facilities. There are 13 campsites and some picnic sites at Stariski State Recreational Site and 186 campsites total in five separate campgrounds at Anchor River State Recreation Area, along with 20 picnic sites and a boat launch.

AMERICAN OVERSIGHT

3.5.2.3 Recreation Access

Overland Access

Road access to or within the public recreation areas in the region is limited to outside of and within Katmai National Park, in the vicinity of Iliamna/Newhalen, and from the Sterling Highway from Soldotna to Homer on the east side of the region. There are unpaved and paved (the Alaska Peninsula Highway) roads between the town of Naknek (located west of the park) and Lake Camp on Naknek Lake within the park (NPS Undated 1). These roads allow access from nearby towns to the boat ramp facility within the park on Naknek Lake. There is also an unpaved road from Brooks Camp to the Valley of Ten Thousand Smokes viewpoint at the Three Forks Overlook (NPS Undated 1). Daily bus tours are provided from Brooks Camp to the overlook when Brooks Camp is open (June 1 to September 18) by the Brooks Camp concessioner (NPS 2018u).

On the east side of the region, the Sterling Highway provides road access to the Stariski State Recreational Site and Anchor River State Recreation Area on the Kenai Peninsula.

Locally within the project area, skiffs, all-terrain vehicles (ATVs), and trucks are the primary modes of local surface transportation around Iliamna Lake (ADNR 2013).

Water-Based Access

Inland of Cook Inlet, water-based access to public recreation areas occurs on major rivers and lakes. Small boats can travel up the Naknek River to Lake Camp in Katmai National Park and boats can travel the Alagnak Wild River as well (Kevin Waring and Associates 2011; NPS 2015a). Lake Clark and Naknek Lake provide water-based access to portions of Lake Clark and Katmai national parks, respectively. Water-based access can also be provided at Iliamna and Nondalton. Within and along the shoreline of Cook Inlet, water-based access is essential to reaching public recreation destinations such as the eastern portions of Lake Clark and Katmai national parks and the Alaska Maritime NWR. Commercial boat operators need to be authorized to operate in the three NPS units and Alaska Maritime NWR (NPS 2018i, NPS 2018o, NPS 2018f, USFWS 2014b).

Air-based Access

Air-based travel via small plane or floatplane is the main form of access to recreation areas in the region, primarily from Anchorage, Homer, Iliamna, King Salmon, Port Alsworth, Kodiak, Dillingham, and Soldotna. Airport facilities located near the project area include Iliamna, Igiugig, Levelock, Big Mountain, Koggiung, Kvichak/Diamond J, Kokhanok, and Pedro Bay (DNR 2013). Only certain air taxi services are allowed to operate within the three NPS units, McNeil State Game Refuge and Sanctuary, and Alaska Maritime NWR (NPS 2018h, NPS 2018n, NPS 2018e, USFWS 2014b, ADF&G 2018f). Different air taxi providers can land on different surfaces depending on the landing gear of the plane (e.g., floats/amphibious gear, wheels, skis/wheeled skis) and therefore have various seasons and conditions in which they can operate.

3.5.2.4 Recreation Settings

Apart from a few developed sites previously described, the regional public recreation areas generally provide a primitive, remote recreation setting where solitude is common and there are no lights or sounds from human development. In popular areas (primarily popular bear viewing locations), the few developed sites such as Lake and Brooks camps, and areas closer to villages/towns, the recreation setting may include views of limited human development and other visitors, though the setting is still primarily remote and primitive.

AMERICAN OVERSIGHT

3.5.2.5 Recreation Use and Users

Given the lack of easy access and limited, dispersed development within the region, overall recreation use is estimated to be relatively low for all public recreation areas in the region. The Bristol Bay Area Plan notes that southwest Alaska shows among the lowest level of tourism compared to other areas of the state in general, with only 17 percent of visitors to Alaska traveling to southwest Alaska and only three percent traveling to southwest Alaska as their sole destination, with the majority of these visits to Katmai National Park and Wood-Tikchik State Park (ADNR 2013).

Between 2008 and 2017, Katmai National Park and Preserve has seen an average of 36,825 visitors per year. During the same period, Lake Clark National Park and Preserve averaged 13,402 visitors per year. According to monthly visitation data, peak use of these two areas is from June to September, when the majority of annual use occurs, especially at Katmai National Park and Preserve where 97 to 100 percent of the park's visitation occurs during these months. In the last six years, about 80 percent or more of the visitation to Lake Clark National Park and Preserve has been during the peak season (June to September). These months are the peak season months for the entire region due primarily to the accessibility, weather conditions, and wildlife present during these months. The Long Range Interpretive Plan for Katmai National Park and Preserve notes that most of the park's visitors participate in two primary activities, bear viewing and sport fishing, and there are virtually no drop-in visitors due to the effort needed to reach the park (NPS 2009).

The number of bear-viewing visitors at McNeil River Camp was an average of 178 people per year between 2008 and 2017. The number of bear-viewing visitors at McNeil River Camp is capped at 257 visitors per year. In 2017, there were 1,092 user days (the participation in a recreation activity at a given resource during a 24-hour period by one person) associated with the bear-viewing program at McNeil River Camp in McNeil State Game Refuge and Sanctuary and another 513 user days reported by guides or the public using the Kamishak River and Chenik Creek areas of the refuge and sanctuary, primarily for fishing and bear viewing (ADF&G 2018a). The annual visitation to the Kamishak River and Chenik Lake areas likely varies due to the number of commercial transporter permits issued and used at each of these areas each year. There are no visitation estimates available for Alagnak Wild River, Alaska Maritime NWR, BLM lands or state lands/park sites.

Overall, due to the remoteness and lack of easy access and lodging facilities, it is expensive to visit the recreation areas within the region. As stated in the Alaska Maritime NWR Land Protection Plan, "recreational use is limited by the difficult logistics and expense of visiting remote islands. However, it is possible that the demand for visitor services will increase in the future as adventure travel becomes increasingly popular" (USFWS 2011). This may be true for other areas as well.

AMERICAN OVERSIGHT

AESTHETICS AND VISUAL RESOURCES

This section describes the aesthetics and visual recourse baseline conditions, the management framework as it relates to these resources, the visual setting and landscape character of the area, and important viewing locations and viewers in the area.

Land use and management plans are used to guide the discussion of landscape character, subsistence activities, recreation and landscape setting to describe the importance and function of the visual resource attributes. Additional details on recreational and subsistence uses of lands within the EIS analysis area are found in the related Sections 3.4, Subsistence, and Section 3.7, Recreation.

3.1.1 EIS Analysis Area

The visual resources analysis area extends eastward from Happy Valley on the Kenai Peninsula of Bristol Bay and Cook Inlet drainages to the eastern side of the Insikin Peninsula, encompassing Iliamna Lake and the surrounding communities (Figure 3.11-1). The analysis area consists of a viewshed of a 50-mile radius from the Mine Site; 15-mile radius from the ferry terminals, 20-mile buffer from the Transportation Corridor and Natural Gas Pipeline, and 25-mile radius around Amakdedori Port. The analysis area for aesthetic and visual resources was developed to address indicators of change including potential direct and indirect effects to landscape character (including naturalness), recreation setting, cultural and historic setting, subsistence activities, and socioeconomics (tourism).

[Note: Figure 3.11-1 is under development and will include geographic locations of visual importance.]

3.1.2 Methods for Establishing Baseline Conditions

Data collection was implemented across the analysis area as part of the project's environmental baseline study program. The area was evaluated using both desk top and field observation and considered impacts over four seasons. Components supporting this study include: viewshed modeling of major project components (Mine Site, access roads, Amakdedori Port, Natural Gas Pipeline right-of-way, and north and south ferry terminals at Iliamna Lake), interdisciplinary coordination, identification of Key Viewing Areas (KVAs), characterization of viewer groups and related sensitivity to change in landscape character, and baseline data collection on visual and aesthetic resources (visual quality, visual distance zones).

Baseline visual resource conditions were established by: 1) implementing a viewshed analysis; 2) completing a regulatory and management review to establish areas where visual resources are managed by federal, state, or local planning documents; and, 3) assessing visual resource attributes, potential viewer groups, and visual distance zones (visibility) within the analysis area.

Locations from which the project could be seen within the analysis area were determined by implementing a viewshed analysis using geographic information system (GIS). This analysis determines project visibility based on the relationship between topography, height of project components, average eye height of the viewer, and height of vegetation. The resulting "seen area" or viewshed represents area that may contain views of proposed project features. However, it does not represent any measure of detectability of these features.

[Note: Specifics of the viewshed analysis are pending RFI 34]

AMERICAN OVERSIGHT

Figure 3.11-1: Title

AMERICAN OVERSIGHT

The viewshed analysis was also used to assess how project features would be seen within the larger context of the analysis area. For example, viewers moving through the landscape may experience intermittent views of proposed project components where topography is variable and more prolonged views where topography is flat.

The regulatory and management framework review included federal, state, and local planning documents for planning areas with a geographic nexus to the project area. The review focused on identifying specific regulations or planning objectives pertaining to visual resources or scenery management.

Visual resource attributes were assessed by first dividing the analysis area into geographic units defined by prevailing physiography (Wahrhaftig 1969), then assessing landscape character in each geographic unit. Landscape character attributes were described in terms of landscape character typology the basic elements of form, line, color, and texture of prevailing landform, water, vegetation, and cultural modification. This approach was applied across the analysis area to ensure that baseline data in visual resources was collected consistently across all jurisdictions.

Viewer groups were identified through coordination with recreation, cultural, and subsistence resources, and review of scoping comments. These sources were used to understand how specific locations within the analysis area are used, and the types of viewer groups that may be associated with those uses. Characteristics of identified viewer groups, such as seasonality, amount of use, and predominant viewer activity were in this inventory.

Project visibility, or distance zones, was assessed by subdividing into three zones based on relative distance from travel routes or observation points. Common travel routes included common commercial flight paths and common local flight paths. Distance zones were classified as: foreground (0 to 1/2 mile from view point), middle ground (1/2 to 5 miles), and background (over 5 miles). Visual clarity applies to all distance zones.

3.1.3 Viewshed Analysis

[Note: Information regarding the viewshed analysis is pending RFI 34]

3.1.4 Regulatory and Management Framework

The project area is set within the Alaska Department of Natural Resources Bristol Bay and Kenai Planning Units (ADNR 2013; ADNR 2000). These areas are managed per the Bristol Bay Area Plan (ADNR 2013) and the Kenai Area Plan (ADNR 2000) to “maintain the quality and diversity of the natural environment and protect heritage resources and the character and lifestyle of the community.”

The project area also considers lands owned by seven Alaska Native Claims Settlement Act (ANSCA) corporations. ANSCA does not provide provisions for the protection or management of visual resources.

3.1.5 Landscape Character

The landscape setting within the visual resources analysis area includes mountain ranges surrounded by river valleys, rivers, shrub tundra, marshy lowlands, wetlands, coastal shoreline, estuaries and ocean inlet environments. Primary river drainages intersecting the analysis area include the Mulchatna, the Nushagak, and Koktuli rivers. While the Mulchatna and the Nushagak have been federally determined as “navigable,” the Koktuli has been determined navigable by the state. The waterways provide access to remote recreation and subsistence areas. Human development within the analysis area is generally limited to areas in and around

AMERICAN OVERSIGHT

geographically isolated communities, and small fishing and hunting lodges. Development includes roads, airstrips, and docks.

The visual resources analysis area falls within portions of four different physiographic units: Nushagak – Big Hills, Nushagak – Bristol Bay Lowland, Aleutian Range, and Alaska Range (USGS 1965). The landscape character of each physiographic unit is influenced by the fluvial geomorphologic, hydrologic, vegetation cover, elevation and landforms within each area, as described below.

3.1.5.1 Physiographic Units

The **Nushagak—Big River Hills** are characterized by flat-topped ridges ranging in elevation from 1,500 feet to the west, 2,500 feet to the east, and 4,200 feet to the north. The Big River Hills unit drains to the Kuskokwim River from primary tributaries. The southern section of the physiographic unit drains to the Mulchatna and Nushagak rivers. Vegetation communities consist of spruce, birch and cottonwoods along riparian corridors (USGS 1969, ADNR 2005).

The **Nushagak—Bristol Bay Lowland** is dotted with moraine lakes rising from sea-level to an altitude of 300 to 500 feet at its high point. Linear narrow belts of elevated topography enclose large glacial lakes fed by upland hydrology. The lowland is drained by the Nushagak and other rivers flowing to the estuaries of Bristol Bay. This physiographic unit is of the marine phase of the tundra climate with mild winters and short cool summers. Dominant vegetation includes moist wet tundra plant communities. Standing water, mosses, sedges, and low-growing shrubs cover the landscape with clumping stands of alder, willow, and patches of stunted spruce and birch growing along the riparian edges of major streams and rivers (USGS 1969, Baily 1995).

The **Aleutian Range** consists of heavily glaciated U-shaped valleys, rugged ridges and mountain peaks anchored between the Pacific Ocean and the Bearing Sea. It runs west to Aleutian Island with an elevation ranging from 1,000 to 4,000 feet. The Aleutian Range is flanked by large volcanic peaks elevating upward to 8,500 feet. Steep rivers drain south to the Pacific Ocean while braded meandering rivers run slowly to the Bearing Sea. The west end of the Aleutian Range drains into the Bristol Bay Lowland feeding hundreds of small lakes and ponds. Vegetation is sparse consisting of spruce, birch and cottonwoods along riparian corridors and a spattering of open low shrub tundra as the elevation increases (USGS 1969, Gates 2018, EB 2015).

To the east, the **Alaska Range** connects with the Aleutian Range between Iliamna Lake and Mount Spurr. The mountain range extends over 600 miles to the Canadian border. The heavily glaciated mountain ranges average between 7,000 to 10,000 feet in elevation with a number of peaks exceeding 10,000 feet. The Alaska Mountain range is the divide for rivers flowing from the Yukon Territory south to the Gulf of Alaska. The southern section drains through glacial streams to the Kuskokwim River and to the Nushagak or Kvichak rivers and eventually flowing into Cook Inlet (USGS 1969, EB 2015).

3.1.6 Landscape Setting

3.1.6.1 Mine Site

The proposed Mine Site would be located within the southern section of the Nushagak – Big River Hills physiographic unit. The landscape is large in scale, with views from ridge tops largely panoramic; however there is more enclosure in drainages and low elevation areas. Topography is dominated by numerous rounded hills that appear as consistent and well-defined by the converging lines of drainages. As elevation increases, trees become stunted and vegetation becomes intermixed with short alpine tundra and exposed rock outcrops.

AMERICAN OVERSIGHT

The upper sections of Talarik Creek and Koktuli rivers meander through eroded, braided wetlands and tundra flowing into Iliamna Lake to the Kvichak River before draining to into Bristol Bay. The Talarik Creek floodplain is characterized by exposed flat grasslands and low sand dune created from strong winds with little diversity of vegetation. These river systems not only provide habitat for salmon but important travel routes to remotes areas for subsistence uses in the summer and winter.

The four major mountains located near the Mine Site are Sharp Mountain, Pig Mountain, Kaskanak Mountain, and Groundhog Mountain. All of these mountains are focal from neighboring Iliamna Lake and rising to an elevation of 3,500 feet. The rounded tops and linear traverse of the mountain set a distinct backdrop to the ground moraines, sediment deposits and alluvial fans that make up the basis of the landscape.

Viewer groups in this area are limited to individuals engaged in subsistence or recreation and tourism activities, and exposure is low due to remoteness of area and lack of access and infrastructure. These individuals experience the landscape from fixed points while fishing or viewing wildlife and can be transient as they move through the landscape on foot, snowmachine, or aircraft. Small aircraft are used to provide access for fishing and hunting areas and to a lesser extent, provide tours for nature viewing. Areas on the flight paths provide an expansive view of the landscape settings. During winter months, overland travel (via snowmachine) is more common as the ground is frozen.

3.1.6.2 Transportation Corridor

The proposed transportation corridor is a linear system that cuts through the Nushagak – Big River Hills, and Nushagak – Bristol Bay Lowland physiographic units.

Iliamna Lake sits within the Bristol Bay Lowlands southwest of Lake Clark National Park and Preserve and the northwestern edge of the Alaska Range. Iliamna Lake is approximately 100 miles long by 30 miles wide and is the largest fresh water lake in Alaska. The shallow shoreline is made up of long fine edges, meandering inlets and checkered islands. The low topographic relief provides extensive panoramic views extending across the tundra to Iliamna Lake. Within the immediate foreground the wet shrub tundra presents limited obstruction to vast views of the surrounding landscape. To the west is the Bristol Bay lowlands made of wet shrub tundra, marsh lands and hundreds of small lakes. Northern views feature the rounded mountains of the Nushagak–Big River Hills.

From Iliamna Lake the viewing position is either from the shoreline or from a boat on the water. Access to the surrounding landscape for commercial, subsistence and recreation uses are through the main airport and community of Iliamna. Air transportation is the dominant form of travel in the area. From the elevated position within an aircraft the viewer can relate to the expansive undisturbed landscape setting.

Flowing into Iliamna Lake from the north is the Lower Talarik Creek. The State of Alaska established the Lower Talarik Creek Special Use Area in 1999 as a high value resource for fish and wildlife habitat and subsistence harvest as well as local and commercial recreation.

Lake Clark National Park and Preserve is located at the northwestern edge of the Alaska Range to the south east of the Pebble Mine Project access road. The park is the start of the long string of mountains tied together through glaciers and snow covered peaks. The features are viewed by aircraft while traveling in and out of the park, and local communities.

Roadhouse Mountain is a popular summer hiking route that is located to the southwest of the Mine Site along the border of Lake Clark National Park and Preserve and the north end of Iliamna Lake. Expansive 360 degree panoramic views dominate the viewer experiment from the

AMERICAN OVERSIGHT

top of Roadhouse Mountain. Significant visual features include Iliamna Lake and its district shoreline. The marshy wet lowlands and the river valleys of the Nushagak – Big River Hills dominate the foreground view while Sharp, Groundhog and Kaskanak mountains frame the background views.

Lake Clark National Park and Preserve contains recreation and commercial recreation services. Hiking to the view point at the top of Roadhouse Mountain is a popular activity within the park providing expansive views of the surrounding area.

3.1.6.3 Amakdedori Port

The proposed Amakdedori Port site is located on State lands designated for habitat use in the Kenai Borough area boundary. The area located to the northern end of the Aleutian Range is considered wet shrub tundra collecting runoff forming wet meadows, bogs, and hundreds of small lakes.

This area is noteworthy because of its close proximity to the Katmai National Park and Preserve, the McNeil River State Game Sanctuary, and Kamishak Bay and the steep mountain Peaks of Katmai National Park.

As described in Section 3.5, Recreation, the McNeil State Game Refuge and Sanctuary is a premier destination for bear viewing and is home to the largest bear populations in Alaska. McNeil River Falls, which is located about a mile from the mouth of the McNeil River, slows the movement of salmon. Large numbers of brown bears can be seen at McNeil State Game Refuge and Sanctuary in early July through mid-August (ADF&G 2018d).

Viewer positons take into account the elevation and whether the viewer is in a fixed or a moving status. Private outfitters run single and multi-day commercial tours to the Kenai National Park and Preserve from May through September. Single day adventures tours are offered from as far away as Anchorage and as close as Homer.

Single day tours are almost exclusively accessed through aircraft. Visitors are flown into the park over the proposed project area to access bear viewing locations along the coastline, within the estuaries and up the streams corridors and over the Glaciers of Four Peaks Mountain. Multiday commercial tours either stage outside the park on large boats within Kamishak Bay or at lodges within the Park.

3.1.6.4 Natural Gas Pipeline

The Pipeline interfaces with the entire physiographic unit system tying the Cook Inlet – Susitna Lowlands to the Nushagak – Big River Hills. The Sterling Highway winds its way along the steep shoreline of Susitna Lowlands terminating in the town of Homer. Vast panoramic views of the Cook Inlet and the rocky beaches are consistent along this linear corridor. The area is populated with residents, recreationists and tourists and commercial operators utilizing the Cook Inlet and Kenai Peninsula as base to access the natural and remote setting of Bristol Bay, Iliamna Lake and the National Parks and Preserves.

Viewer groups on the Kenai Peninsula are more apt to interact with the linear Pipeline due to the relative increase in population and the position along the Sterling Highway. The popular travel corridor brings many tourists during the summer months.

3.1.6.5 Viewer Groups and Visual Sensitivity

There is seasonal variation in the number and type of viewers within the analysis area. According to Section 3.5, Recreation, a majority of visitors come to experience the “naturalness”

AMERICAN OVERSIGHT

and "abundance of resources" from May through October. This seasonal access corresponds with fishing and hunting activities and is the high season for recreation, tourism and subsistence activities. Access to fishing and hunting grounds for recreation and subsistence use is from air travel, boat and off road vehicles.

Although the majority of recreation and tourism occurs in the summer, ongoing subsistence activity and inter-village travel occurs in the winter. As the marshy grounds freeze, travel via snowmachine provides access to areas not available in the warmer seasons. Commercial activities consist of fisheries, recreation, and tourism.

As shown in Figure 3.2-01A, the Alagnak River is designated as a Wild River. The Alagnak River is located to the about 30 miles west of the proposed mine site and 10 miles from Iliamna Lake. The Alagnak provides some of the most remote and scenic traditional Alaska experience in the area. The Alagnak River is accessed by aircraft and from the east side of the Katmai National Park and Preserve. The river has a reputation of being a world-class fishery and is considered to be one of the most popular fly-in fishing destinations in southwest Alaska.

Commercial recreation fishing lodges and camps are located on the Kvichak and Alagnak Rivers. Several lodges on the main stem of the Alagnak, at the outlet of Nonvianuk Lake, and one on the Kulik River provide guided fishing services. Together these lodges support the majority of the visitation for fishing in the area. Access to the fishing lodges and camps are through aircraft or motorized boat transportation. The elevated position provides a contextual experience, allowing the viewer to see broad expanses of the landscape.

Viewer groups within the analysis area include local residents and communities, and those engaging in subsistence activities, recreationists, and travellers.

Local Communities. Local Communities are located throughout the analysis area. Communities along the shoreline of Iliamna Lake consist of Iliamna, Newhalen, Pedro Bay, Kokhanok, and Igiugig. To the north at the edge of Lake Clark National Park and Preserve is the town of Nondalton. The landscape is dominated by vast panoramic views of Iliamna Lake, with a backdrop of the mountains of the Big River Hills.

Subsistence Areas. See Section 3.9, Food and Fiber Production – Subsistence, for subsistence activity locations. Summer access to these areas is primarily by boat and aircraft, while in winter travel follows the frozen rivers and tundra by snowmachine. Air travel is also prevalent in the throughout the year.

Recreation Areas. Recreation extends from the fishing camps along Iliamna Lake into Lake Clark National Park and Preserve, Katmai National Park and Preserve, and up the Koktuli River Watershed and into the tundra of the Big River Hills. Outfitters provide guide service from fishing and hunting camps to remote locations within the Big River Hills and fishing areas on Iliamna Lake, and Kamishak Bay within the Cook Inlet.

Transportation Routes. Several transportation routes used by industry, local communities, and subsistence and recreation users are limited to air travel and boat. Short unimproved roads connect the communities of Newhalen and Iliamna to Nondalton.

Air Travel. Low-altitude local aircraft may fly over the project area during scheduled air service or en route to remote communities or hunting/fishing destinations.

3.1.6.6 Key Observation Points

Key Observation Points (KOPs) representing common and/or sensitive viewer locations were established within the analysis area. These locations represent point-based (vistas), linear (roadways), and area-based viewer locations characterized by residential, subsistence or

AMERICAN OVERSIGHT

recreational uses discussed above. The KOPs were used as standard locations from which to describe existing visual resources at a localized scale, and to assess potential effects that may result from the proposed project. KOPs are described in Table 3.11-1 by viewer group. Note that more than one viewer group may use an area represented by a KOP.

Table 3.11-1: Key Observation Points

Number	Location (Physiographic Zones and estimated Lat/Long)	Analysis Factors	Viewer Sensitivity	Viewer Duration
1	• Kenai • 59°56'4.13"N 151°44'48.51"W • Deep Creek State Recreation Area	Natural gas pipeline shoreline infrastructure	• Foreground, middle ground • Low to moderate visual sensitivity • Focal as the Pipeline follows the scenic Sterling Highway	Intermittent
2	• Kenai • 59°46'40.41"N 151°51'52.06"W • Anchor Point State Recreation Area	Natural gas shoreline infrastructure	• Foreground • Potential for high sensitivity • Visibility: focal; dominant Pipeline and substation • Recommended as a KVA	Intermittent
3	• Kenai • 59°30'50.09"N 153°16'41.31"W Kamishak Bay Augustine Island North	Amakdedori Port facilities; increased shipping traffic	• Immediate foreground, middle ground • High sensitivity • Visibility: focal; co-dominant Augustine Island • Recommended as a linear KVA approach by boat to the KVA	Prolonged
4	• Kenai • 59°13'47.27"N 153°37'27.40"W • Kamishak Bay Augustine Island South	Amakdedori Port facilities; increased shipping traffic	• Immediate foreground, middle ground • High sensitivity • Visibility: focal; co-dominant with background views of the McNeil River Wildlife Refuge, Augustine Island and glacial mountain peaks • Recommended as a linear KVA – approach by boat to the KVA	Prolonged
5	• Kenai • 59°15'35.49"N 154° 8'22.11"W • Nordyke Islands Adjacent to McNeil River State Game Sanctuary (SGS) and State Game Refuge (SGR)	Amakdedori Port facilities; increased shipping traffic	• Foreground and middle ground • Moderate to high sensitivity • Recommended as a linear KVA – approach by boat to the KVA	Prolonged

AMERICAN OVERSIGHT

3.14 SOILS

This section describes the affected environment and current conditions related to three soil subresources:

1. Soil types and disturbance/removal;
2. Erosion; and
3. Soil chemical quality (Mine Site only).

Available literature directly associated with the Mine Site and Transportation Corridor components is limited to the Exploratory Soil Survey of Alaska (ESS), which was completed by the U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS; formerly known as the Soil Conservation Service) (Rieger et al. 1979). Literature provided by the NRCS generally covers a variety of baseline soil data intended to assist in land resource planning and management, including classifications based on soil taxonomy, drainage, slopes, vegetative growth potential, and suitability for various land uses and development.

The ESS is not sufficient for site-specific interpretations, but is useful as a general soils map. Soil taxonomy is periodically updated; therefore, some information provided in the ESS does not translate directly to the current 2006 classification system, *Keys to Soil Taxonomy, 10th edition* (Soil Survey Staff 2006). For example, two additional soil orders, which represent the highest categorical level, have been added since the ESS in 1979. Both additional soil orders occur in the project area: Andisols and Gelisols. Where applicable, soil descriptions from the ESS have been translated to current 2006 classification system equivalents (3PPI 2011). Corresponding equivalents are based on available ESS descriptions and extrapolations from other nearby studies for the village of Nondalton and Chisik Island (Table 3.14-1).

Table 3.14-1: Corresponding ESS and 2006 Classifications for Applicable Soils

ESS Map Units	1979 Classification	2006 Classification
HY4, SO11, IA7	Pergelic cryofibrists	Typic fibristels
SO11	Humic cryothods	Typic humicryods
IA7, IA9	Typic crandepts	Typic haplocryands Typic vitricryands

Notes:
ESS = Exploratory Soil Survey of Alaska
Source: Excerpt from Pebble Project EBD 2004 through 2008, Chapter 5. Soils, Table 5-2.

Descriptions of unconsolidated overburden at the Mine Site and other project components are provided in Section 3.15-Geohazards.

3.14.1 Common Soil Conditions

Common soil conditions that are considered to have minimal or no significance in the project area include permafrost occurrence and documented soil impairments from anthropogenic sources.

3.14.1.1 Permafrost

[Note: Section may be updated pending RFI information.]

AMERICAN OVERSIGHT

To date, investigations and exploration programs in the project area (including all project components) have not reported permafrost. Permafrost may discretely occur in the project area; however, occurrence is presumed to be relict permafrost from prior glacial periods (Knight Piésold 2011).

Portions of the project area are near the reported southern limit of sporadic permafrost, which varies from 0 to 50 percent of the landscape subsurface (Ferrians 1965). More recent estimates indicate isolated permafrost distribution that coincides with project components on the western side of Cook Inlet (Jorgenson et al. 2008). Isolated permafrost varies from greater than 0 to 10 percent of the landscape subsurface. No permafrost occurrence is anticipated to coincide with project infrastructure on the eastern side of Cook Inlet. An assessment of existing thermokarst landscape features and future areas susceptible to thermokarst processes in the project footprint are generally considered low in coverage (Olefeldt et al. 2016). Thermokarst features are the result of permafrost freeze and thaw processes that create distinctive landforms; however, these features can also be residual expressions of where permafrost no longer exists.

Frozen ground conditions have been observed in near-surface soils in a few test pits and soil borings, but conditions were indiscernible from active layer processes that freeze and thaw annually at depths of up to 10 feet. Thermistor string (i.e., ground temperature) measurements from within the Mine Site study area reported a mean temperature of 39.1 degrees Fahrenheit (°F). Groundwater temperature measurements from the deposit area were also above freezing throughout the year. Although such conditions do not preclude the discrete occurrence of permafrost, current conditions do not support permafrost aggradation (e.g., development) or significant occurrence. Where present, relict permafrost is likely limited to areas where one or more favorable conditions exist, including shaded areas and north-facing slopes; poorly drained shallow surface soils overlain with insulative organics; and deep, coarse-grained soils (3PPI 2011). Based on information provided in the ESS, principal components associated with Pergelic Cryofibrists (HY4) and Typic Cryandepts (IA7) soil types in the project footprint may coincide with relict permafrost occurrence in areas of very poorly drained organic soils (e.g., fibrous sedge and muskeg) of nearly level association that include depressions and valley bottoms.

3.14.1.2 Soil Impairments

A review was conducted of the Alaska Department of Environmental Conservation (ADEC) Contaminated Sites Program database. The database lists known contaminated sites and leaking underground storage tanks throughout Alaska. The database provides information regarding the type of contaminant released to the environment, the type(s) of media (air, water, soil, and rock) affected by the contaminant, the potential responsible party for the documented release, and the location where the release occurred (ADEC 2018a). One contaminated site (ADEC File Number 2333.38.031) is within 0.25 mile of the pipeline alignment on the eastern side of Cook Inlet. The nature of the release involved a 200-gallon fuel oil spill at a private residence. Based on the release description, impairments to soils within the project footprint are not likely.

[Note: Section may be updated pending RFI 011 information.]

AMERICAN OVERSIGHT

3.14.2 Mine Site

3.14.2.1 Soil Types

Each soil map unit (Figure 3.14-1) denotes the major soils components and one or more minor components. Because of the map scale, the minor components were not mapped separately. The soil types (i.e., primary principal component) and the corresponding acreages associated with the Mine Site are listed below.

- IA9 Typic Cryandepts – 4,960 acres: Very gravelly, hilly to steep association. Soils are well-drained, strongly acidic, and formed in volcanic material with a thin surface cover of decomposed plant matter mixed with volcanic ash. Common vegetation includes alder, grasses, or low shrubs.
- IA7 Typic Cryandepts – 1,915 acres: Very gravelly, nearly level to rolling Peregelic Cryofibrists, nearly level association. Soils are also associated with rolling plains bordering Iliamna Lake and rolling ground moraines, terminal moraines, outwash plains, and paleo beach ridges, small lakes, and muskegs. Typic Cryandepts are well-drained, acidic, and formed in shallow volcanic material over gravelly glacial material dominated by low-tundra vegetative species. Shallow permafrost can reportedly be associated with a Pergelic Cryofibrists component (where present) consisting of sedge peat muskegs and coarse acid moss.

AMERICAN OVERSIGHT

Figure 3.14-1: Soil Types Associated with Mine Site and Transportation Components

AMERICAN OVERSIGHT

3.14.2.2 Erosion

Erosion resulting from surface and subsurface soil disturbances would be attributed to both wind and hydraulic processes. Exposed finer-grained soils are generally more susceptible to removal and transport by wind. Flowing water over ground surfaces results in hydraulic erosion that also removes and transports soils. Downslope movement of surface materials from other slope instability processes (e.g., landslides, solifluction) are presented in Section 3.15-Geohazards.

Numerous conditions can influence a soils' susceptibility to wind and hydraulic erosion. Such conditions include weather (e.g., wind, precipitation), season (e.g., ground freeze), soil type and slope angles, and severity of disturbance. In most circumstances, soil disturbances and subsequent exposure would accelerate erosion by wind and water. Possible consequences of erosion include sediment loading in surface water runoff, and alteration of soil profile characteristics and ecological communities.

Measures of soil susceptibility to wind erosion provided by NRCS include (where present) a "hazard of erosion" description and a published wind erodibility group (WEG) value; hazard of erosion descriptions range from none (i.e., N/A) to slight, moderate, and severe. The WEG is based on soil surface layer characteristics, and ranges between 1 and 8. Soils most susceptible to wind erosion have a WEG value of 1, while those least susceptible (e.g., bedrock, frozen soils, or saturated soils) would have a WEG value of 8. Neither of these soil erosion descriptors for wind is provided in the ESS.

Multiple conditions can influence hydraulic erosion, including specific soil properties such as texture, cohesion and vegetative cover, as well as seasonal conditions, precipitation, slope angle and length, and flow velocities. Finer-grained soil types such as silt and sand are generally more susceptible to erosion than gravels and coarser material.

Measures of soil susceptibility to hydraulic erosion provided by NRCS include (where present) a "hazard of erosion" description and K-factor values (erosion factor values); hazard of erosion descriptions range from none to slight, moderate, and severe. The K-factor is a relative index of soil susceptibility removal and transport due to runoff. Where available, erosion factor (Kw) was preferentially used to evaluate hydraulic erosion susceptibility. The Kw value indicates the erodibility of the whole soil. K-factor values are grouped into 14 classes ranging from 0.02 to 0.69. Higher values correspond to increased erosion vulnerability. Erosion factor values (K) that are indicative of increased erosion rates and runoff susceptibility are generally greater than 0.4 (IWR 2002). None of these soil erosion descriptors for water are provided in the ESS.

The ESS does not provide wind and water erosion descriptors (i.e., suitability ratings) for all soil types; and where present, are limited to unique physical conditions or soil types. None were listed for map units corresponding to the Mine Site; however, inferences can be made assuming surface cover is removed or disturbed. Both soil types are associated with the presence of alternating layers of finer-grained volcanic ash with coarser gravel materials. Fine-grained volcanic ash constituents would be more susceptible to erosion by both water and wind relative to coarser gravel materials (where present). Wind erosion susceptibility is anticipated to be similar for both soil conditions in the Mine Site area. Erosion by water would be greater for soils on hilly to steep associations (i.e., IA9), in comparison to nearly level or rolling terrain (i.e., IA7).

[Note: Section above may be updated pending updated project description information.]

AMERICAN OVERSIGHT

3.14.2.3 Soil Chemistry

A baseline soil chemistry description is provided for the Mine Site to compare anticipated effects resulting from the deposition of fugitive dust from sources of concern. Fugitive dust sources of concern at the Mine Site include mining operations; material (e.g., rock) storage, processing, and handling (including concentrate); tailings storage; and repurposing materials derived from the Mine Site (e.g., aggregates).

Upland soil chemistry baseline data are not included in this discussion for the Transportation Corridor and Natural Gas Pipeline Corridor. Neither of these components under planned operations have significant mechanisms or chemical sources that could result in adverse impacts to soil conditions. Potential sources that could impact soils associated with these components may include dust from road bed aggregates or transported concentrates, but neither is considered a significant mechanism or source. Material (e.g., aggregate) sites in the Transportation Corridor and Natural Gas Pipeline Corridor are well outside the Pebble Deposit. Therefore, pending material suitability evaluations, the material sources are not expected to introduce significant chemical impairments to soil. Transportation of concentrates from the Mine Site will be in sealed containers with locking lids, and transfers would be conducted at offshore facilities. Furthermore, surface soil conditions associated with the Transportation Corridor and Natural Gas Pipeline Corridor are chemically consistent with those described for the Mine Site study area (SLR Alaska Inc. et al. 2011a).

A total of 237 primary surface soil samples was collected from 117 locations in the Mine Site study area to evaluate naturally occurring constituents (NOCs) (Figure 3.14-2). Surface samples were collected to a depth of 0.5 foot. The presence of trace elements, cyanide, and sodium was analyzed at 237 surface soil locations; anions and cations at 235 degree surface sample locations; petroleum hydrocarbons as diesel-range organics (DRO) and residual-range organics (RRO) at 23 surface soil locations; and total organic carbon (TOC) at 53 surface sample locations. The sample locations were considered representative of undisturbed baseline conditions. A list of NOCs (i.e., analytes) evaluated as part of the surface soil studies is presented in Table 3.14-2 and Table 3.14-3.

All trace elements (mostly metals) evaluated were detected in some of the surface samples above detection limits. Although reported concentrations of most NOCs were generally low and consistent with undeveloped areas of Bristol Bay drainages, some locations reported elevated NOCs at levels considered adverse in literature. Variations in up to 16 different landform types and seven different habitat types reportedly influenced the ranges of elemental concentrations throughout the study area (SLR Alaska Inc. et al. 2011b).

Iron and aluminum are the most abundant elements reported throughout the Mine Site study area surface soils, followed by calcium and magnesium (Table 3.14-2). Concentrations of other trace elements were substantially lower. Trace elements with the lowest average concentrations included mercury and silver. The relative distribution of trace elements in the Mine Site study area surface soils is generally consistent with those reported across the United States, based on published U.S. Geological Survey evaluations. Comparison of co-located shallow subsurface soil sample results (i.e., 18 inches in depth) reported similar relative and mean concentrations of trace elements; however, less variability among sample locations was observed (where present). Notable deviations include those associated with bismuth and mercury. The mean concentration of bismuth and mercury in surface soil is 13 and two times greater, respectively, than shallow subsurface soil (SLR Alaska Inc. et al. 2011a).

Anions and cations evaluated in surface soil samples included chloride, cyanide, fluoride, sulfate, ammonia (as nitrogen) and sodium. The highest mean concentration among evaluated

AMERICAN OVERSIGHT

ions was ammonia, followed by sodium. The lowest mean concentration among evaluated ions was cyanide. Depth-based variations in ion concentrations were apparent based on comparison to co-located shallow subsurface soil sample results. Mean concentrations of cyanide and ammonia were greater in surface samples, while mean sulfate concentrations were greater in shallow subsurface samples (SLR Alaska Inc. et al. 2011a).

RRO hydrocarbons were detected at all 23 surface sample locations, and DRO was detected at 13 surface sample locations. Mean concentrations of 209 milligrams per kilogram (mg/kg) and 2,028 mg/kg were reported for DRO and RRO, respectively (Table 3.14-3). The elevated presence and wide range of reported hydrocarbon concentrations are attributed to naturally occurring biogenic sources, based on absence of prior disturbances, analytical fingerprint methods, and presence of TOC (SLR Alaska Inc. et al. 2011b). Similarly, mean hydrocarbon concentrations in corresponding shallow subsurface samples (where present) were significantly lower due to the absence of biogenic influences (SLR Alaska Inc. et al. 2011a).

Similar to hydrocarbons, reported TOC concentrations varied significantly. TOC concentrations varied from 0.36 percent to 65.1 percent among surface soil locations. The wide range is attributed to variable quantities of organic material retained in sampled matrices during collection. A mean TOC concentration of 6.51 percent was reported for the Mine Site study area. Mean TOC concentrations in corresponding shallow subsurface samples (where present) were also lower due to a diminished presence of biogenic influences (SLR Alaska Inc. et al. 2011a).

Because arsenic, copper, and lead are considered key trace elements associated with the deposit, additional depth-based statistical evaluation and temporal variation in concentrations at select sample locations were performed. No significant findings were identified through these activities (SLR Alaska Inc. et al. 2011a). Fugitive dust concerns associated with the Mine Site are further evaluated in Chapter 4, Environmental Consequences.

EPA-0135-0004909

3.14.3 Transportation Corridor and Amakdedori Port

3.14.3.1 Soil Types

Because land-based portions of the Natural Gas Pipeline Corridor on the western side of Cook Inlet would be buried in the road bed prism of the Transportation Corridor, soil types for both the Transportation and Natural Gas Pipeline corridors are collectively described in this section, in addition to those present at the Amakdedori Port.

The ESS recognized five soil map units in the Transportation Corridor study area within the Bristol Bay region. The map units are delineated on Figure 3.14-1 and are described below.

The soil types and the corresponding acreages associated with transportation components are as follows:

- IA7 Typic Cryandepts – 443 acres (see Section 3.14.1.2-Soil Impairments for description);
- IA9 Typic Cryandepts – 210 acres (see Section 3.14.1.2-Soil Impairments for description)
- IA17 Dystric Lithic Cryandepts – 640 acres: Hilly to steep association. Soils are associated with low hill and ridges bordering mountainous areas. Well-drained loamy soils are formed in thixotropic ash over shallow (20 inches) metamorphic bedrock or gravelly till, and overlain with a thin layer of organic material.
- HY4 Pergelic Cryofibrists – 32 acres: Nearly level association. Soils are associated with nearly level, broad, wet lowlands near lakes and coastal margins. Organic-rich sedge and moss (i.e., muskeg) soils underlain by silt and sand mixtures are poorly drained and can reportedly be associated with the presence of shallow permafrost. Vegetation includes water-tolerant sedges, low shrubs, and black spruce.

The Amakdedori Port site is on the western shore of Cook Inlet north of Amakdedori Creek; is generally level; and includes upland (shore-based) soil types that transition seaward to intertidal dunes and a gravel-lined shoreline. Soil types associated with the Amakdedori Port and immediate area are limited to soil map unit IA17.

3.14.3.2 Erosion

The ESS does not provide wind and water erosion descriptors (i.e., suitability ratings) for all soil types, and where present, are limited to unique physical conditions or soil types. None were listed for map units corresponding to the Transportation Corridor; however, generalized inferences can be made assuming surface cover is removed or disturbed. Soil conditions associated with soil map unit IA17 are likely the most susceptible to wind and hydraulic erosion processes in the Transportation Corridor (including Amakdedori Port). This is attributed to the presence of finer-grained, loamy materials overlying shallow bedrock on hilly to steep slopes. Soils associated with soil map unit IA9 would also be more susceptible to hydraulic erosion, based on the occurrence in hilly to steep terrain. Soils associated with soil map units IA7 and HY4 are likely the least susceptible to hydraulic erosion in the Transportation Corridor, based on associations with nearly level terrain. However, information provided in the ESS is broadly based, and is not intended to be used for site-specific information.

3.14.4 Natural Gas Pipeline Corridor

[Note: Section may be updated pending updated project description information.]

AMERICAN OVERSIGHT

3.14.4.1 Soil Types

The Natural Gas Pipeline Corridor on the eastern side of Cook Inlet extends from Alaska Department of Transportation & Public Facilities (ADOT&PF) land north of Anchor Point to tie in with an existing pipeline near Happy Valley, and parallels the Sterling Highway right-of-way (ROW). The most detailed resource for soil data along this pipeline segment is the USDA NRCS Soil Survey of Western Kenai Peninsula Area, Alaska. A total of 11 detailed soil map units coincides with the pipeline footprint (Figure 3.14-3). The soil descriptions provided below address soil map units that cover more than 1 acre of the 30-foot-wide operational corridor ROW footprint. Soil map units that cover less than 1 acre are also provided, with water and wind erosion descriptors only.

- 572 – Island silt loam, forested, 0 to 8 percent slopes, 15 acres: Medial over loamy, amorphic over mixed, superactive Pachic Fulvicryands. Soils are associated with till plains supporting a lutz spruce forest with willow and bluejoint reedgrass understory. Soils consist of a very fine sandy loam, silt loam overlain by a thin interval of plant material. Soils are well–drained with no flooding or ponding, with a slight hazard of erosion for water, but severe by wind.
- 640 – Qutal silt loam, 0 to 4 percent slopes, 8 acres: Medial over loamy, amorphic over mixed, superactive Aquandic Haplocryods. Soils are associated with moraines on till plains and depressions on till plains dominated by a spruce-birch forest spruce-willow community. Soils consist of very gravelly sand overlain with silt loam and a thin interval of decomposed plant material. Soils are somewhat poorly drained with no flooding or ponding, with a slight hazard of erosion for water, but severe by wind.
- 617 – Mutnala silt loam, 0 to 4 percent slopes, 6 acres: Medial over loamy, amorphic over mixed, superactive Andic Haplocryods. Soils are associated with moraines on till plains dominated by spruce-birch forest. Soils consist of gravelly sandy loam overlain with silt loam and decomposed plant material. Soils are well–drained with no flooding or ponding, with a slight hazard of erosion for water, but severe by wind.
- 568 – Island silt loam, 0 to 4 percent slopes, 3 acres: Medial over loamy, amorphic over mixed, superactive Pachic Fulvicryands. Soils are associated with till plains dominated by shallow kettles. Soils consist of gravelly sandy loam overlain with silt loam and a thin interval of decomposed plant material. Soils are well-drained with no flooding or ponding with a slight hazard of erosion for water, but severe by wind.
- 570 – Island silt loam, 8 to 15 percent slopes, 1 acre; severe hazard of erosion for water and wind; well-drained.
- 611 – Killey and Moose River soils, 0 to 2 percent slopes, 1 acre; slight hazard of erosion for water, severe by wind; poorly drained.
- 618 – Mutnala silt loam, 4 to 8 percent slopes, 1 acre; moderate hazard of erosion for water, severe by wind; well-drained.
- 619 – Mutnala silt loam, 8 to 15 percent slopes, 1 acre; severe hazard of erosion for water and wind; well–drained.
- 698 - Tuxedni silt loam, warm, 0 to 8 percent, 1 acre; slight hazard of erosion for water, severe by wind; somewhat poorly drained.
- 706 – Whitsol silt loam, 0 to 4 percent slopes, 1 acre; slight hazard of erosion for water, severe by wind; well-drained.
- 707 – Whitsol silt loam, 4 to 8 percent slopes, 1 acre; moderate hazard of erosion for water, severe by wind; well-drained.

AMERICAN OVERSIGHT

3.14.4.2 Erosion

Available NRCS data for the area include a land capability classification. This classification provides a general suitability index for agriculture or farming (USDA 2005). Land capability classifications for all soils in the pipeline footprint are considered to have severe limitations.

Soils in the pipeline footprint are predominantly susceptible to wind erosion, assuming disturbance and removal of surface cover. All soil map units greater than 1 acre have a severe hazard of erosion rating for wind, and WEG ratings of 2 that correspond to highly erodible soils. All soil map units greater than 1 acre are considerably less susceptible to erosion by water, with hazard of erosion ratings of "slight." This corresponds to erosion factors (Kw) ranging from 0.24 to 0.47.

AMERICAN OVERSIGHT

3.17 HYDROGEOLOGY

The project area is in a sparsely populated area of southwestern Alaska near Iliamna Lake, and comprises four primary components with diverse hydrogeological settings: the Mine Site where the Pebble Deposit is located, a Transportation Corridor, a Natural Gas Pipeline, and a port site at Amakdedori on Cook Inlet. A description of groundwater flow processes and the hydrogeology of each of these areas are provided below. Permafrost is not found in the project area.

3.17.1 Mine Site

This section focuses on existing groundwater conditions in areas of the Mine Site that are anticipated to be the most affected by project activities. The open pit and associated dewatering pose the most significant risk to groundwater quantity, because the pit would be relatively large and deep, requiring extraction of water to allow for mining operations. Dewatering would create a relatively large zone of influence around the open pit, in which groundwater levels and groundwater, surface water interactions, and surface water flows would be affected. Groundwater withdrawal for potable water supply or mineral processing may also influence groundwater and surface water levels and flow. Groundwater seepage and flow pathways away from the tailings storage facility (TSF), low-grade ore (LGO) stockpile, and water management ponds are also of concern with regard to potential contaminant migration. An evaluation of existing groundwater quality is provided in Section 3.18-Water Quality.

The physiography and geology of the Mine Site are presented in Section 3.13-Geology, and are summarized here to describe the hydrogeologic setting. The Pebble Deposit area straddles a watershed divide between the headwaters of the South Fork Koktuli River and Upper Talarik Creek, and is primarily on an east-facing slope and valley floor ranging in elevation from 950 feet to 1,400 feet.

Bedrock includes a mixture of mineralized sedimentary, volcanic, and intrusive rocks, which are overlain by overburden on both the eastern and western sides, as shown on Figure 3.13-1 and Figure 3.13-2. The mineralized bedrock is overlain by Tertiary sedimentary rocks on the eastern side of the Mine Site, which form a wedge that thickens toward the east to approximately 1,500 feet. Further east, where the Tertiary sedimentary rocks have been downthrown by approximately 4,000 feet, a narrow graben structure has been filled with volcanic flows. West of the graben is a well-cemented conglomerate overlain by interbedded sedimentary and volcanic rocks. The definition of the bedrock surface was established through drilling at the Mine Site between 2004 and 2012 (Schlumberger 2011, 2015).

The surficial geology in the Iliamna Quadrangle has previously been described by Detterman and Reed (1973) and Detterman (1986). In the Mine Site analysis area, the surficial deposits have been described by Hamilton and Klieforth (2010), and are discussed in detail in Schlumberger (2011). More recent drilling investigations have resulted in minor refinements to surficial geology in Schlumberger (2015), which are reflected on Figure 3.13-2. The overburden at the Mine Site consists primarily of interbedded glaciolacustrine and glaciofluvial sediments.

3.17.1.1 Groundwater Flow Processes

Inputs to the groundwater flow system include precipitation (groundwater recharge) and leakage from surface water features. The primary outputs from the groundwater flow system at the Mine Site include discharge to surface water features and springs. The water table is generally a subdued replica of ground surface topography, whereby it is deepest below ridge tops, and near ground surface in valley bottoms.

AMERICAN OVERSIGHT

Precipitation is primarily the result of marine storm systems, which are greatest from late summer to early winter. Precipitation is greater on upland areas than in lowland areas due to orographic effects. The measured long-term average annual precipitation is approximately 27 inches at the Iliamna Airport, and is estimated to be on the order of 50 inches near the Pebble Deposit. Additional climate data are provided in Section 3.20-Air Quality.

Groundwater generally flows from upland areas to valley bottoms according to horizontal and vertical hydraulic gradients, eventually discharging to surface water features. Upper-elevation seeps have been observed in some areas due to the presence of fine-grained deposits in valley bottoms, which restrict groundwater discharge. The majority of the groundwater flow is in the most permeable deposits, which include valley bottom outwash sands and gravels, and the uppermost 50 feet of bedrock that is highly fractured due to physical and chemical weathering since retreat of the glaciers in the area. Groundwater flow in deep bedrock is limited by lower hydraulic conductivity. Although higher-permeability faults and fractures have been identified, the flow pathways along the faults are localized and appear to terminate in the study area. Therefore, they are not anticipated to function as preferential groundwater flow pathways at the regional scale.

3.17.1.2 Hydrogeological Characterization

The objectives of the hydrogeological characterization program at the Mine Site (Schlumberger 2011, 2015) were to characterize the existing groundwater flow regime in the study area, and define how the local groundwater flow regime interacts with the regional groundwater flow system. A complementary objective was to evaluate the nature and degree of interactions between groundwater and surface water to inform the understanding of aquatic, fish resource, and wetlands habitat. To meet these objectives, a significant amount of hydrogeological characterization work has been undertaken. The results of these characterization programs form the basis for a baseline groundwater flow model and a water balance and water quality model.

Hydrogeological data were collected during the course of several field programs between 2004 and 2012, which involved logging of borings, installation of pumping wells, piezometers, and monitoring wells, permeability testing, streamflow gauging, monitoring of meteoric inputs and routine monitoring of groundwater levels, and collection of streamflow and groundwater quality data (Figure 3.17-1).

Boreholes were advanced using a variety of drilling techniques, including mud rotary, air rotary ODEX, and rotary sonic, with sampling and logging conducted according to standard methods defined by the American Society for Testing and Materials (ASTM), and consistent with best industry practice.

Instrumentation installed prior to 2008 included the following: 39 nested monitoring wells at 21 locations, 240 nested piezometers at 103 locations, 216 single piezometers, one deep multi-level groundwater instrumentation system, nine cross-hole aquifer test wells at eight locations, and 70 piezometers installed as part of the wetlands program. In 2011, an additional 43 boreholes were drilled in the deposit area for geotechnical purposes, and several response tests were conducted to determine bedrock permeability. In 2012, an additional 18 boreholes were drilled to further investigate hydrogeology.

Piezometers were installed to depths of up to 232 feet below ground surface to collect information on stratigraphy, hydraulic conductivity, and groundwater levels at each site. Vertical groundwater gradients were also characterized where a cluster of piezometers was installed near the same location. A number of piezometers were also installed as part of the geotechnical characterization program for the purposes of water level monitoring and permeability testing.

AMERICAN OVERSIGHT

Note: Figure under development, GIS data requested in RFI.

AMERICAN OVERSIGHT

Between 2004 and 2008, a total of nine pumping wells was installed using air rotary drilling techniques and telescopic well screens targeting the most permeable features encountered during drilling. In 2012, a further four pumping wells were installed using sonic drilling techniques to understand the requirements for pit dewatering, but these wells have not yet been tested.

[Note: RFI 019 requests groundwater model results based on the proposed mine plan in PLP (2017). This section will be updated after receipt of response with data collected since 2012 that may be incorporated into the current groundwater model.]

Single-well response tests were completed by displacing groundwater in the well and monitoring recovery until water levels stabilized. Prior to commencement of each test, static water levels were measured, and pressure transducers installed. Falling and rising head slug tests were conducted on monitoring wells and piezometers to determine the hydraulic conductivity of the surrounding overburden or bedrock formations.

In 2006, a multi-level piezometer system (WB-1) was installed in the Pebble Deposit area in a borehole drilled to a depth of 4,050 feet for mineral exploration purposes. After flushing the borehole, an assembly of 50 hydraulic head measurement ports and 24 sampling ports were installed to facilitate monthly monitoring of hydraulic head and groundwater quality to significant depths below the deposit. Cross-hole testing was also completed to allow for measurement of hydraulic conductivity for a larger volume of rock, as compared to response testing and packer testing.

In 2010, an additional multi-level piezometer system (WB-3) was installed to a depth of approximately 600 feet to improve characterization of the area between tributaries NK1.190 and SK1.190. The primary objective was to characterize groundwater levels and gradients, and confirm groundwater flow directions. In 2012, a third multilevel system (WB-4) was installed in the pre-Tertiary bedrock in the western portion of the Pebble Deposit area to a depth of 2,250 feet. The primary objective was to characterize groundwater levels and gradients in the deposit area.

Larger-scale pumping tests were conducted in three areas, including the area around the Pebble Deposit, at four locations downgradient of the Pebble Deposit near the South Fork Koktuli River, and in the North Fork Koktuli drainage area. Pumping tests were conducted in both overburden and bedrock using air lift pumping techniques for between 6 and 24 hours. Step tests were completed to determine the specific capacity of the pumping wells and a pumping rate for the constant-rate tests. Water levels and pumping well discharge were monitored in both the pumping wells and nearby monitoring wells using pressure transducers and manual water level meters during both pumping and recovery phases to allow for determination of aquifer properties.

Monthly water level monitoring was conducted in monitoring wells from 2005 through 2012 using manual water level probes; or calculated based on piezometric pressure measurements by vibrating wire piezometers, and at measurement ports in the multi-level piezometer systems.

In support of the characterization of the physical groundwater flow system, a groundwater quality characterization program was also conducted. The program involved sampling of groundwater and seepage quality on a quarterly schedule, and is described in Section 3.18-Water Quality. Field chemistry and flow measurements were collected at weirs to support development of the site water balance and water quality modeling.

AMERICAN OVERSIGHT

Hydrostratigraphic Units

Twenty-six cross-sections were produced to illustrate the distribution of hydrogeologic units in overburden (Schlumberger 2015: Appendix 8.1B]). Four of these cross-sections are shown on Figure 3.17-2 through Figure 3.17-5 to provide a representative depiction of these units at the Mine Site. In addition, a groundwater contour map is provided on Figure 3.17-6 to illustrate flow patterns described below. The cross-sections illustrate that the surficial geology is variable—both laterally, and with depth—which is consistent with regional geologic mapping. The distribution and characteristics of the overburden and bedrock aquifers in the study area are summarized in Table 3.17-1.

Table 3.17-1: Summary of Hydrostratigraphic Units

Drainage/ Catchment	Area/ Sub-Catchment (*Project Facility*)	Overburden or Bedrock	Aquifers	Description
South Fork Koktuli Drainage	Pebble Deposit Area (*Open Pit*)	Overburden	Surficial Aquifer (multiple)	Clean sand; sand and gravel.
			Intermediate Aquifer	Sand and gravel between silty deposits.
			Deep Aquifer	Not described.
		Bedrock	Weathered Bedrock Aquifer	Uppermost 10 to 50 feet of bedrock. Felsenmeer[1] where exposed.
			Upper Bedrock Aquifer	Below weathered bedrock, from 50 to 600 feet in depth.
			Fault Zones	Functions as both conduits and barriers to groundwater flow.
	Frying Pan Lake Area (*South WTP Discharge*)	Overburden	Surficial Aquifer (multiple)	Clean sand; sand and gravel.
			Intermediate Aquifer	Sand and gravel between silty deposits.
			Deep Aquifer	Sand and gravel overlying bedrock thickens toward Frying Pan Lake.
		Bedrock	Weathered Bedrock Aquifer	Uppermost 10 to 30 feet of bedrock.
	South Fork Koktuli Flats	Overburden	South Fork Koktuli Valley Aquifer	Clean sand and gravel moraine from silty terminal moraines downstream of Frying Pan Lake. Continuous with outwash, terrace, and alluvial sand and gravel deposits in valley to west.
			South Fork Koktuli Channel Aquifer	Gravels of alluvial and glaciofluvial origin along the channel from downstream of Frying Pan Lake to bedrock high to the east.
			MW11 Aquifer	Sand and gravel near monitoring well MW11.
			Surficial Aquifer	Outwash sand and gravel between South Fork Koktuli River and slope of Upper Talarik Creek Valley.
			Intermediate Aquifer	Below surficial aquifer; conveys majority of flow from South Fork Koktuli River Aquifer and MW11 Aquifer to Upper Talarik Creek Tributary UT1.190[2].
			Deep Aquifer	Sand and gravel; silty sand.
	South Fork Koktuli Discharge Area	Overburden	South Fork Koktuli Valley Aquifer	Outwash sands and gravels; terrace gravels; alluvium. Extends from approximately 1 mile upstream of the confluence of the South Fork Koktuli River and SK1.190 to approximately 2.4 miles downstream.
North Fork Koktuli Drainage	Big Wiggly Basin	Overburden	Surficial Aquifer	Sand and gravel. Limited characterization of lateral and vertical extent.

1. Frost-weathered boulders at the surface.
2. Numbered tributaries named for stream gaging stations (See Figure 3.16-3).

The Frying Pan Lake area and the upper reaches of tributary UT1.190 are characterized by thick, silty layers. In contrast, silty layers are absent from the area along the South Fork Koktuli River south of Frying Pan Lake, and overburden consists of sand and gravel. Overburden is relatively thin and permeable beneath most valley floors, with valley walls dominated by colluvium and shallow bedrock, with the exception of some localized thin till deposits. The

AMERICAN OVERSIGHT

uppermost portion of the bedrock is typically fractured and able to yield moderate to large quantities of groundwater. Although fractures and faults are widespread in the deeper bedrock, the features are often infilled with fine-grained fault gouge and offset relative to one another. This has created a compartmentalized system of groundwater flow, thereby limiting the flow of regional groundwater through the area.

In the North Fork Koktuli River drainage for tributary NK1.190, overburden is relatively thin on the valley floor, and thicker on the lower slopes of the valley sides. Groundwater recharges on the upper slopes and migrates downslope toward the valley floor, with sustained discharge to numerous seeps at a range of elevations. The calculated average groundwater recharge rate is 11 inches per year. The relatively thin overburden on the valley bottom is inferred to limit groundwater discharge from the catchment, and most of the drainage is inferred to occur via surface discharge to the stream channel. Groundwater recharge in this area is anticipated to be low. Upstream of stream gauge NK1.00C, the headwater catchment for the North Fork Koktuli River is overlain by glacial drift and materials deposited under glacial lakes that have resulted in relatively thin but laterally continuous aquifers. A terminal glacial moraine is near the confluence of the main stem and tributary NK1.190. At this location, the surficial deposits transition to coarser glacial outwash materials that allow the North Fork Koktuli River to exchange water with the underlying aquifer.

In the South Fork Koktuli River drainage near the Pebble Deposit, there is groundwater discharge to the valley floor in relatively low-permeability silty sand and gravel deposits that are approximately 100 feet thick, with the exception of the eastern side of the catchment where a deeper bedrock channel is present. Groundwater gradients are vertically upward with a minimal horizontal component, indicating that groundwater in the vicinity of the Pebble Deposit discharges to the upper reaches of the South Fork Koktuli River near the deposit, and is unlikely to flow across groundwater divides or migrate appreciable distances down the valley. The calculated average groundwater recharge rate is 23 inches per year.

Bedrock near the Pebble Deposit has been extensively investigated. In this area, the uppermost 10 to 50 feet of bedrock is highly fractured and is much more permeable than the underlying bedrock. Deeper bedrock is less weathered and exhibits lower hydraulic conductivity values to depths of at least 500 feet. The groundwater flow system in this area is fed by groundwater recharge, which flows primarily through the overburden and shallow fractured bedrock prior to discharge to the South Fork Koktuli River.

South of the Pebble Deposit, the overburden materials thicken toward Frying Pan Lake. Groundwater elevations in shallow bedrock exhibit stronger seasonal fluctuations than the overlying sand and gravel. Groundwater gradients are upward following periods of groundwater recharge (i.e., snowmelt or rainfall) in the upland areas, and downward during the months prior to seasonal recharge events. This supports the conceptual model of groundwater flow involving recharge to the exposed fractured bedrock aquifer in upland areas, with subsequent migration toward valley bottoms, where the groundwater is eventually discharged to overlying surficial deposits or streams. A bedrock high and the presence of low-permeability sediments at the downstream end of Frying Pan Lake generally limits discharge from Frying Pan Lake to the underlying groundwater flow system. Groundwater gradients near the lake indicate shallow water levels and upward groundwater movement (groundwater discharge) toward the lake, while water levels downstream of the lake are up to 60 feet below the overlying stream, indicating strong downward groundwater gradients and losses from the stream. The results of groundwater level monitoring and a water balance assessment indicate that approximately two-thirds of the groundwater flowing through the aquifer downstream of Frying Pan Lake remains in the South Fork Koktuli River drainage, while the remaining one-third of the

AMERICAN OVERSIGHT

groundwater crosses the surface water divide and contributes to groundwater flow in UT1.190, and discharges to Upper Talarik Creek.

In the Upper Talarik Creek drainage, precipitation infiltrates the upper hillslopes and migrates downslope in the highly fractured shallow bedrock unit. The calculated average groundwater recharge rate is 16 inches per year. Where downslope groundwater movement is restricted by low-permeability sediments or discontinuities in the flow system, groundwater discharges to ground surface as springs. Springs are abundant in this drainage, and often occur at locations high on the hillslopes. Overburden deposits are variable in this drainage, and include silty sand and gravel to clean sand in the upper portion of the drainage. In the intermediate reaches of the drainage between UT1.135 and UT1.190, a large area has been filled with deltaic, glacial outwash, ice-contact sands, and sand and gravel. This area is inferred to be a groundwater recharge area. Tributary UT1.190 joins the Upper Talarik Creek drainage downstream of the groundwater recharge area, and is inferred to transmit the majority of groundwater that migrates across the surface water drainage from the South Fork Koktuli River drainage area. Most of the groundwater moves downgradient in the sand and gravel units and the weathered upper bedrock. Steep vertical gradients have been observed in some areas, suggesting the presence of fine sediments that restrict downward movement of groundwater.

Aquifer Properties: Hydraulic Conductivity and Specific Storage

Table 3.17-2 and Figures 3.17-6 through 3.17-8 provide a summary of hydraulic conductivity testing conducted at the Mine Site, based on individual testing results presented in Schlumberger (2015).

Table 3.17-2: Summary of Hydraulic Conductivity Testing Results

Hydrostratigraphic Unit	Statistic	Hydraulic Conductivity (m/s)				
		Pebble Deposit Area	Frying Pan Lake Area	South Fork Koktuli Area	North Fork Koktuli Area	Upper Talarik Area

AMERICAN OVERSIGHT

Figure 3.17-7: Hydraulic Conductivity Measurements in Pebble Deposit Area

AMERICAN OVERSIGHT

Figure 3.17-8: Hydraulic Conductivity Measurements Outside Pebble Deposit Area

AMERICAN OVERSIGHT

Figure 3.17-9: Hydraulic Conductivity Profile for Deep Bedrock

AMERICAN OVERSIGHT

Based on a total of 110 response tests, the hydraulic conductivity of overburden ranges from $7.8x10^{-9}$ to $1.78x10^{-3}$ meters per second (m/s) in the Mine Site. The hydraulic conductivity of overburden is similar throughout the Mine Site, with geometric mean values between $1.05x10^{-5}$ m/s and 1.0x10-4 m/s for each area. Hydraulic conductivity values for overburden materials in the Pebble Deposit and Upper Talarik areas were an order of magnitude lower than those measured in the rest of the Mine Site, based on the median values, likely due to the presence of silty glacial deposits in this area.

Based on a total of 140 response tests, the hydraulic conductivity of bedrock ranges from $9.4x10^{-9}$ to $3.0x10^{-3}$ m/s in the Mine Site. Similar to overburden, the hydraulic conductivity of the bedrock is about the same throughout the Mine Site, with geometric mean values between $9.7x10^{-7}$ and $2.0x10^{-5}$ m/s. Hydraulic conductivity values for bedrock in the Pebble Deposit and South Fork Koktuli areas are about 1 to 2 orders of magnitude higher than those measured in the North Fork Koktuli and Upper Talarik areas, possibly due to the presence of batholith granodiorite in parts of these areas.

Hydraulic conductivities range across 14 orders of magnitude in nature. Therefore, differences of 1 to 2 orders of magnitude are not considered large, and indicate that the overburden and bedrock are relatively homogeneous overall across the Mine Site.

Larger-scale hydraulic conductivity values were also assessed by conducting a total of nine pumping tests, and found that the hydraulic conductivity of overburden was almost 10 times higher than values derived from response tests (Schlumberger 2011). Pumping rates ranged from approximately 10 to 356 gallons per minute (gpm), and water level responses were observed at significant distances from the pumping well, allowing for a more robust analysis of transmissivity (hydraulic conductivity) and storativity (specific yield) parameters for individual aquifers than possible using response testing and packer testing alone. Detailed analyses and results are presented in Schlumberger (2011: Table 8.1-6). Calculated transmissivity values ranged from $8.0x10^{-5}$ to $1.1x10^{-1}$ m/s, indicating the aquifers are capable of conveying moderate to large quantities of groundwater. Calculated storativity values ranged from $1x10^{-5}$ to $2.5x10^{-2}$, which indicates the ability of individual aquifers to store water is moderate to high overall, but is limited for some aquifers. This indicates that response testing underestimates the hydraulic conductivity of the aquifer, which may be due to restrictions placed on pumping associated with the well screen, surrounding sand filter pack, and/or borehole damage during drilling. Pumping test results for wells completed in bedrock were similar to those for response tests.

Hydraulic conductivity values were also measured by conducting borehole packer testing and Lugeon tests as part of geotechnical investigations to depths of up to 4,500 feet near the Pebble Deposit, and at depths of up to 400 feet outside of the deposit area. The highest values were typically measured in the upper 500 feet, but similar values were also measured at considerable depths. Overall, bedrock hydraulic conductivity values are lower at depth than shallow bedrock in the deposit area.

Deep bedrock was investigated through the installation of three Westbay multi-level groundwater monitoring systems (WB-1, WB-3, and WB-4) at three locations to depths of 4,054 feet, 600 feet and 2,250 feet, respectively.

Groundwater Flow Systems

Groundwater level monitoring and interpreted contours revealed the presence of three groundwater divides in the study area (Figure 3.17-6). One divide is between the Upper Talarik Creek drainage and the North Fork Koktuli drainage. A second divide is near the Pebble Deposit between the South Fork Koktuli River drainage and the Upper Talarik Creek drainage. A third divide is between the South Fork Koktuli River drainage and the tributary UT1.190 drainage.

AMERICAN OVERSIGHT

Although the groundwater divides generally align with surface water drainage divides, there is evidence of some interbasin groundwater exchange from the North Fork Koktuli drainage to the Upper Talarik Creek drainage, and from the South Fork Koktuli drainage to the UT1.190 basin.

Hydrographs for two representative monitoring locations are presented on Figure 3.17-10 and Figure 3.17-11 to illustrate seasonal and vertical groundwater level fluctuations. These examples are in the South Koktuli Flats and Pebble Deposit areas, respectively, and show groundwater levels from three to four different screened intervals over a 9-year period compared to precipitation and stream flow.

The water table typically lies at the greatest depths below upland areas, and is near the surface in valley bottoms. The lowest groundwater levels were typically recorded in late winter immediately prior to spring freshet, while the highest water levels were typically observed during spring freshet or during fall rains, with water levels fluctuating on the order of 10 feet to 20 feet seasonally. Vertical groundwater gradients were found to be variable in both time and with depth, and generally support the conceptual model of compartmentalized groundwater flow. Similar to groundwater levels, measured discharge from seeps varied by a factor of between 3 and 10 seasonally, with a median flow of 44 gpm.

Based on the results of tritium analysis, the majority of the groundwater in Mine Site aquifers likely recharged after 1972, which indicates that groundwater moves through the aquifers relatively quickly. This interpretation is supported by the measurement of relatively high hydraulic conductivities in overburden and shallow bedrock, and the seasonal behavior of groundwater levels in response to rainfall and snowmelt.

3.17.1.3 Site Water Balance Model

A site water balance model (WBM) was developed to inform the characterization of site hydrology, understand the nature and extent of groundwater-surface water interactions, and provide estimates of groundwater recharge for use during calibration of the Mine Site groundwater model. A detailed description of the model is provided in Schlumberger (2011: Appendix 8.1I). The model was also used to validate the meteoric data and the variability in precipitation across the site. Continuous streamflow records from a total of 12 gauging stations were used to calibrate the model for the period of time between 2004 and 2008. Sub-catchments were delineated and drainage areas calculated for each gauging station. Inputs to the model and calibration are further described in Section 3.16-Surface Water Resources.

The results of the WBM indicate that groundwater recharge varies from 11 to 23 inches per year for the North Fork Koktuli, Upper Talarik, and South Fork Koktuli drainages. The majority of groundwater that recharges in each catchment tends to discharge to surface within the same drainage, with the exception of the inter-catchment transfer of approximately 6 inches per year that occurs between the South Fork Koktuli River and Upper Talarik Creek drainages. Ongoing efforts are focused on validating and recalibrating the site WBM using data collected since 2008.

[Note: RFI 019 requests WBM predictions based on the proposed mine plan in PLP (2017). Following receipt of RFI response, this section will be updated with data collected since 2012 that may be incorporated into the current model.]

3.17.1.4 Mite Site Grounderwater Model

A numerical groundwater model was developed to simulate baseline groundwater conditions as described in detail in Schlumberger (2011: Appendix 8.1J). The model was calibrated to total recharge and discharge rates obtained from the WBM, described above. The total groundwater recharge and discharge calculated by the WBM includes meteoric recharge and losses from streams to the underlying groundwater flow system. The groundwater model was calibrated to observed groundwater elevations, estimated groundwater recharge, and estimated groundwater discharge obtained from the WBM.

The groundwater model domain encompasses the majority of the Mine Site and sub-catchments that were included in the WBM. The complex site geology was translated into the groundwater model using a five-layer structure, with three layers to represent variably thick overburden units, one layer to represent the uppermost 50 feet of bedrock, and one layer for the underlying bedrock to an elevation of -200 feet mean sea level.

Because groundwater levels and flow exhibit strong seasonality, the model was developed as a transient model with a simulation period of 37 months, from December 2004 to December 2007, to coincide with the WBM. The primary objective was to simulate the behavior of the groundwater flow system in the upper reaches of the South Fork Koktuli River, the upper reach of Talarik Creek, Upper Talarik Creek tributary UT1.190, and the upper reaches of the North Fork Koktuli River. The calibration effort was focused on the South Fork Koktuli River area, where data are most abundant.

The calibrated groundwater model produced water table elevations that follow the same general pattern as field measurements, and also reproduced inter-catchment flows between the South Fork Koktuli River catchment and Upper Talarik Creek catchment UT1.190. A total of 220 piezometers with up to 35 measurements prior to 2008 each was used to calibrate hydraulic

AMERICAN OVERSIGHT

heads and calculate hydraulic head residuals to judge the calibration of the model. Focus was placed on calibrating the model to periods of time when the aquifer was stressed during pumping tests.

Simulated groundwater elevations were very similar to measured groundwater elevations, as shown in Schlumberger (2011: Figure 8.1-20), whereby an ideal calibration is represented by equivalent modeled and measured hydraulic heads to produce a straight line. Hydraulic heads in bedrock beneath upland areas are predicted to be slightly lower by the model than measurements. When plotted over time, hydraulic head residuals continually increased in some areas, highlighting opportunities for model refinement; while in other areas, the model produced uniform residuals over the simulation period.

Calculated calibration statistics produced a Root Mean Squared Error (RMSE) of 3 percent, with values ranging between 4 and 12 percent for the focus areas of calibration, suggesting that calibration could be improved in the South Fork Koktuli discharge and tributary UT1.190 areas. RMSE values ranged from 5 to 25 percent for areas in the model domain that were not the focus of calibration. Lower RMSE values generally indicate a good match between the model and actual field data. The largest errors at the Mine Site typically occurred in the bedrock layers. The model was generally able to reproduce measurements of groundwater elevations over time, but was unable to reproduce the range of measured seasonal hydraulic head fluctuations near Frying Pan Lake, where fine sediments may not be adequately reflected in the numerical groundwater model. Although the average direction of vertical flow between overburden and bedrock was well simulated by the model, the seasonality of vertical hydraulic head differences was not well replicated by the model, and will be the focus of the next phase of calibration.

Recharge and discharge rates estimated by the groundwater model agreed fairly well with estimates calculated in the WBM. However, additional refinements are planned for some areas in the South Fork Koktuli River catchment where the WBM and groundwater model were not in agreement. The groundwater model simulates the exchange of water between streams and groundwater, and model estimates were compared with streamflow measurements during periods of time when flows were low, and primarily groundwater-derived. Overall, the groundwater model was able to reproduce measured hydraulic head calibration targets, and was in general agreement with recharge rates, inter-catchment flows, and local groundwater discharge rates estimated by the WBM with a reasonable degree of accuracy.

Schlumberger (2011) indicates that a refined numerical groundwater model is currently being developed to capture geologic information collected since 2008, and to better reflect groundwater-surface water interactions. The model will be calibrated to streamflow during low-flow periods and water levels collected in 2009 and 2010. Overall, there will be an effort to improve the calibration to transient fluctuations in water levels and vertical gradients. The updated modeling will involve a sensitivity analysis, and the predictive ability of the model will be validated using data collected in 2011 and 2012.

[Note: RFI 019 requests groundwater predictions based on the proposed mine plan in PLP (2017). Following receipt of RFI response, this section will be updated with more recent data that may be incorporated into the current model.]

3.17.1.5 Groundwater and Surface Water Interaction

Groundwater and surface water interaction was characterized based on detailed streamflow surveys and the site-wide WBM. The flow surveys were completed during periods of low streamflow, and are described in detail in Knight Piésold (2015). These surveys included eight gauges in the North Fork Koktuli River catchment, 12 gauges in the South Fork Koktuli River catchment, and 12 gauges in the Upper Talarik Creek catchment. Based on the results of the

AMERICAN OVERSIGHT

streamflow surveys, gaining and losing stream reaches were identified, and possible explanations for the variability in flows between gauges were provided. The majority of the stream reaches were found to be receiving groundwater discharge from the underlying aquifer (i.e., gaining). However, the North Fork Koktuli River was found to be losing water to the underlying aquifer between gauges NK100B and NK100LF1. The South Fork Koktuli River was found to be losing water to the underlying aquifer(s) from SK100G to SK100F, from SK100F to SK100C, and from SK100B to SK100LF10.

3.17.2 Transportation Corridor and Amakdedori Port

3.17.2.1 Hydrogeological Characterization

The sections below summarize baseline hydrogeological data, where available, across the 84-mile-long Transportation Corridor, spur roads, and Amakdedori Port. The road corridor spans multiple watersheds, from its starting point at the southeastern edge of the Nushagak watershed in the Mine Site, across the greater Kvichak watershed (including Iliamna Lake) to the Aleutian Range watershed divide, and finally entering the greater Cook Inlet watershed east of the divide.

The hydrogeology in the watersheds surrounding the Mine Site is well characterized, as described in Section 3.17.1.2. The northernmost segment of the Transportation Corridor (northern half of the Mine Access Road) is in the well-studied Upper Talarik Creek (UTC) watershed, for which abundant data are available. Limited data are available for the southern segment of the Mine Access Road. No known hydrogeological investigations have been conducted along the South Access Road or Amakdedori Port.

Climatic factors influencing groundwater across the corridor are the same or similar to those described above for the Mine Site. There are no glaciers in the road corridor watersheds. There is no known permafrost in the Transportation Corridor; however, permafrost has been observed in the general area (Detterman and Reed 1973), and may be present at depth in isolated zones, such as on north-facing slopes. Section 3.14-Soils further addresses permafrost.

Hydrostratigraphic Units

The road corridor begins at the Mine Site, which straddles the watershed divide between the SFK and UTC watersheds. The hydrostratigraphic units in the watersheds surrounding the Mine Site are well defined, as described in Section 3.17.1.2. Glacial sands and gravels generally host multiple, very active surficial and intermediate aquifers, while the uppermost 10 to 50 feet of weathered bedrock hosts less active aquifers in most areas (Schlumberger 2015: Appendix 8.1B).The northern half of the Mine Access Road is mostly in the UTC watershed, where groundwater is stored in surficial aquifers of glacial sediment and in fractured shallow bedrock.

The southern half of the Mine Access Road parallels First Creek, a tributary basin that drains southward into the main UTC catchment about 4 miles upgradient of Iliamna Lake. Hydrogeologic data for this southern half of the Mine Access Road are limited. Bedrock and surficial geology along this stretch of the Mine Access Road are similar to the corridor to the north, with Tertiary volcanic bedrock and thick deposits of surficial glacial sediments. Based on the similar geologic setting and topography across the Mine Access Road, it is likely that hydrostratigraphic units are likewise similar here. Permeable sands and gravels, which make up the abundant glacial till and outwash across this stretch of the Mine Access Road, as well as lake terrace and beach deposits within 1 to 2 miles of the North Ferry Terminal (Detterman and Reed 1973), likely host surficial and/or intermediate aquifers. It is possible that weathered bedrock stores additional groundwater at depth.

AMERICAN OVERSIGHT

No known hydrogeological investigations have been conducted south of Iliamna Lake, and hydrostratigraphic units have not been defined for this area. Lake terrace and beach deposits that occur in the South Ferry Terminal area (Detterman and Reed 1973) likely host shallow groundwater. The geologic environment along the rest of the South Access Road and the Kokhanok Airport Spur Road is somewhat distinct from that north of Iliamna Lake. Jurassic age intrusive bedrock is commonly exposed at the surface, and glacial sediments are less abundant. The water table approaches the surface in lowland areas, as evidenced by abundant kettle ponds and wetlands. Glacial deposits are significantly thinner along the South Access Road corridor compared to the Mine Access Road, but likely host shallow aquifers where present (Glass 1999). Shallow groundwater is likely present in surficial alluvium, alluvial fan, marine terrace, and beach deposits near Amakdedori Port (Detterman and Reed 1973). The degree of weathering and fracturing in bedrock is not well known along the South Access Road, and it is unknown if bedrock fractures host significant groundwater. It is also unknown if local fault zones host groundwater, or if they contain fine-grained breccias that may impede groundwater migration.

Aquifer Properties: Hydraulic Conductivity and Specific Storage

The aquifer properties in the northernmost segment of the Transportation Corridor near the Mine Site have been extensively studied, as described in Section 3.17.1.2. The northern half of the Mine Access Road is in the UTC watershed, where groundwater is held in surficial aquifers of glacial sediments and in fractured shallow bedrock. Hydraulic conductivities in surficial aquifers of the upper UTC watershed range from 2x10-6 to 4x10-5 m/s, and hydraulic conductivities in shallow bedrock in this area range from 2x10-7 to 2x10-5 m/s (Schlumberger 2013).

Continuing south, the corridor parallels the First Creek tributary basin, which drains southward into the main UTC basin above Iliamna Lake. No detailed studies have been conducted on aquifer properties here, but a similar geologic setting would suggest that groundwater storage occurs in both surficial sedimentary aquifers and fractured bedrock, as it does farther north. Hydraulic conductivity and storage capacity can vary significantly laterally, but especially in surficial glacial sediment aquifers.

No data on hydraulic conductivity or aquifer storage are available along the Transportation Corridor south of Iliamna Lake.

Groundwater Flow Systems

The groundwater flow systems in the northernmost corridor have been shown to have complex surface water/groundwater interactions (Schlumberger 2013). The UTC drainage basin has both gaining and losing reaches as groundwater migrates generally southeast across the area. Farther south along the Mine Access Road, the water table remains near the ground surface in lowland areas, and groundwater/surface water exchanges likely occur, as has been demonstrated in and around the Mine Site. Existing data and regional groundwater trends suggest a generally southward flow of groundwater along the southern half of the Mine Access Road (Schlumberger 2015: Appendix 8.1B).

There are no known studies on groundwater flow in the Transportation Corridor south of Iliamna Lake. Groundwater flow along the South Access Road corridor likely parallels surficial flow, following general hydrologic trends. In the Kvichak watershed, groundwater is expected to flow northwesterly toward Iliamna Lake. Across the Aleutian Range divide in the Tuxedni-Kamishak watershed, groundwater would likely flow southeasterly towards Kamishak Bay. Near Amakdedori Port, shallow groundwater in surficial deposits and bedrock (where present) likely

AMERICAN OVERSIGHT

flows from side hill slopes towards Amakdedori Creek and swamp deposits near the southern end of the road, then parallels creek flow south and southeast towards Kamishak Bay. Groundwater flow beneath beach deposits at the port site may have a diurnal directional component due to large tidal fluctuations.

3.17.3 Pipeline Corridor

No specific studies have been conducted on hydrostratigraphic units, aquifer properties, or groundwater flow systems in the Natural Gas Pipeline Corridor. Data for the hydrogeology of the Pipeline Corridor are the same as those discussed above for the Transportation Corridor, with the exception of the Cook Inlet crossing and the segment of corridor along the Kenai Peninsula. Groundwater beneath Kenai Peninsula is known to occur in multiple aquifers in thick glacial and alluvial deposits above Tertiary sedimentary bedrock (Karlstrom 1964, Nelson and Johnson 1981). Groundwater flow is generally to the west towards Cook Inlet, and seeps commonly occur along Cook Inlet bluff, where fine-grained glacial lake deposits form aquitards and support perched groundwater zones.

[Note: Recent project updates no longer include pipeline construction along the 9-mile stretch south of Happy Valley. This section will be updated in order to describe groundwater characteristics within the revised pipeline corridor.]

3.17.4 Groundwater Use

Most Bristol Bay communities rely on groundwater wells for their drinking water supply, including the nearby communities of Iliamna, Nondalton, and Newhalen (ADEC 2018; ADNR 2018). With the exception of wells in these local communities and exploration wells the Mine Site area, the project area encompasses remote regions with no documented groundwater use. There are no public wells in the Mine Site, and no known wells of any type in the Transportation and Natural Gas Pipeline corridors, or at the Amakdedori Port site (ADNR 2018).

Abundant groundwater wells have been installed by PLP across the Mine Site area for collecting data on aquifer properties, site water balance, and water quality (Schlumberger 2011, 2015). In the project area, groundwater use is currently limited to such sampling and hydrogeologic testing at the PLP wells. PLP has received multiple Temporary Water Use Permits (TWUPs) for exploration activities between 2004 and 2013. The TWUPs give PLP permission to withdraw up to a set number of gallons of water per day, up to a specified annual limit, from specified sources, mostly groundwater wells.

The Applicant's proposed project would include installation of potable groundwater water wells on the northern side of the Mine Site to serve mine site personnel. PLP has tested the groundwater quality at this site, with results showing that minimal water treatment would be required to develop the wells for a drinking water source (PLP 2017).

3.18 WATER QUALITY AND GEOCHEMISTRY

3.18.1 Surface Water Quality Criteria

On February 27, 2004, the U.S. Environmental Protection Agency (EPA) partially approved revisions to Alaska Water Quality Standards (WQS), while taking no action on Alaska's proposed acute and chronic freshwater aquatic life criteria for mercury and selenium. Therefore, the new aquatic life criteria for mercury and selenium will not be in effect for CWA purposes until a decision is made by EPA about whether these criteria can be approved. In the interim, the previously approved aquatic life criteria for mercury (2.4 micrograms per liter [µg/l] acute and 0.012 µg/l chronic, both as total recoverable) and selenium (20 µg/l acute and 5 µg/l chronic, both as total recoverable) will remain the applicable CWA standards (65 Federal Regulations [FR] 24643).

In instances where the Alaska WQS have been approved by EPA, water quality in this section is described in relation to Alaska WQS, which include use classifications, numeric and narrative water quality criteria, and an anti-degradation policy. The usage classification system designates the beneficial uses that each waterbody within the state of Alaska is expected to support. In Alaska, all waterbodies are designated for all protected water use classes unless otherwise stated (18 Alaska Administrative Code [AAC] 70.050). The water quality data presented in this section are compared to the most stringent applicable State of Alaska water quality standards (for all designated water uses).

For most parameters, the most stringent criteria are the aquatic life criteria for fresh water. However, the most stringent criteria for antimony, arsenic, nitrate, and sulfate are for drinking water (ADEC 2008a; ADEC 2012d). The most stringent criterion for manganese is based on human health for consumption of drinking water and aquatic organisms (ADEC 2008a). The most stringent criteria for boron and cobalt are based on irrigation use (ADEC 2008a).

Criteria for some dissolved metals, including cadmium, chromium, copper, lead, nickel, silver, and zinc, are hardness-dependent, meaning that the acceptable concentrations of these metals depend on the hardness of the water. Hardness is a measure of the concentration of polyvalent cations, such as calcium (Ca^{2+}) and magnesium (Mg^{2+}), in the water. The polyvalent cations that contribute to water hardness reduce the bioavailability of certain trace metals by competing with the trace metal ions for binding sites within organisms. The extent of this effect varies according to which dissolved metals are present, and their oxidation states. To account for the influence of water hardness on the bioavailability and potential toxicity of certain dissolved metals, the numeric water quality criteria for those metals are calculated so that the allowable concentrations of the metals increase in proportion to the hardness of the water (ADEC 2008a). Therefore, the numeric water quality criteria for hardness-dependent parameters vary depending on the measured (or predicted) hardness value for the matrix water.

The Alaska Department of Environmental Conservation (ADEC) numeric water quality standard for ammonia depends on both the temperature and the pH of the matrix water, but not hardness.

3.18.2 Groundwater Quality Criteria

As specified in 18 AAC 70.050(a)(2), groundwater is protected for all uses in Class (1)(A), including drinking, culinary, and food processing; agriculture, including irrigation and stock watering; aquaculture; and industrial uses. Although ADEC does not regulate groundwater directly, they do regulate contaminated sites and underground storage tanks that may affect groundwater quality, and establish WQS that serve to protect groundwater.

AMERICAN OVERSIGHT

Drinking water from groundwater sources is regulated by 18 AAC 80 (ADEC 2012c) and by EPA (2013k, 2017c). EPA sets standards for approximately 90 contaminants in drinking water. These standards include National Primary Drinking Water Regulations, which set legally enforceable Maximum Contaminant Levels (MCLs) that apply to public water systems. Primary standards protect public health by limiting the levels of contaminants in drinking water. Secondary Drinking Water Standards are unenforceable federal guidelines regarding taste, odor, color, and certain other effects of drinking water. EPA MCLs for certain constituents (e.g., aluminum, chloride, iron, manganese, pH, sulfate, total dissolved solids [TDS], and zinc) are Secondary Drinking Water Regulations that set non-mandatory water quality standards. EPA recommends them to the states as reasonable goals, but federal law does not require compliance with them.

3.18.3 Sediment Quality Criteria

There are no regulations established for chemical concentrations in sediment. Sediment Quality Guidelines (SQGs) recommended by ADEC (2013d), as well as other sediment quality criteria used for comparison purposes in project studies, are discussed below, and focus on the Mine Site.

The sections regarding sediment quality address existing baseline characteristics of the substrate in ponds, lakes, rivers, streams, and the seafloor within the project area, where documented. See Section 3.22, Wetlands/Special Aquatic Sites and Waterbodies, for a discussion of wetlands substrate.

Waterbody substrates are included under "waters of the U.S." as defined in the Clean Water Act (CWA), and therefore are protected under CWA 404(b)(1); Subpart C, 230.20, Substrate. A determination of potential project impacts on waterbody substrates is addressed in Environmental Consequences Section 4.18., Water Quality, and Section 4.22, Wetlands/ Special Aquatic Sites and Waterbodies. Those sections include information on tailings and dredge spoils storage, as pertinent to CWA 404(b)(1).

Waterbody substrate data are limited within the project area. Baseline physical and chemical data on substrate/sediment from the major drainages and other waterbodies in the project area, including wetlands, were collected between 2004 and 2008 (Knight Piésold 2011; SLR Alaska 2011; R2 et al. 2011; HDR Alaska 2011; SLR Alaska et al. 2011; Three Parameters Plus and HDR 2011). The National Uranium Resource Evaluation (NURE) program collected a variety of substrate samples across the region in 1977 (Grossman 1998). NURE data include very basic physical substrate descriptions and thorough chemical analyses, as well as reporting of potential contaminant sources, and are included below.

3.18.4 Mine Site Area

The Mine Site would consist of an open pit; waste rock stockpiles; tailings storage facility (TSF); low-grade ore (LGO) stockpile; the mill and concentration facilities; and warehouses, offices, and housing. Of these Mine Site components, the open pit, LGO and waste rock stockpiles, and tailings pose the most significant risk to water quality because they expose fresh rock to oxidation and leaching processes that may generate acidic drainage and leach metals. ADNR (2014) states in their Overview of the Process for Large Mine Permitting in Alaska that "rock chemistry drives water quality and mine design."

Figure 3.18-1 depicts the mine site analysis area and extent of current surface water quality data.

AMERICAN OVERSIGHT

Figure 3.18-1: Locations of Water Quality Data

[Note: RFI in preparation for GIS data to prepare comprehensive figure with all surface water quality data locations] Figure will be based on EBD Figures 9.0-2 through Figure 9.0-6 from EBD, Chapter 9.

AMERICAN OVERSIGHT

The Pebble Deposit is a copper-gold-molybdenum porphyry deposit. The deposit formed about 90 million years ago, when older sedimentary and igneous rocks were intruded by a granitic magma laden with hot fluids carrying dissolved copper, gold, molybdenum, and silver, as well as quantities of rhenium and palladium. As the fluids cooled, concentrations of sulfide minerals, chalcopyrite (CuFeS¬2), molybdenite (MoS2), and pyrite (FeS2), hosting the copper, molybdenum, gold, and silver metals, precipitated in quartz veins and disseminated throughout the granitic and adjacent sedimentary and igneous rocks.

3.18.4.1 Geochemical Processes

In the natural environment, rocks are broken down into soil through exposure to air and water in a process called weathering. During weathering, minerals comprising the rocks react with air (oxidation) and water (dissolving into solution) to release some of their constituents (ions) into the surrounding environment. In many cases, the primary (original) minerals are transformed into secondary minerals during this process. The ions that go into solution may be transported away by overland runoff, streams, and groundwater. Therefore, weathering has a large influence on water quality. If a mineralized deposit is buried beneath other rocks, sediment, and soil, it naturally weathers very slowly. However, when a mineralized deposit is excavated during mining, the weathering process can increase substantially because previously unexposed rocks are broken up and exposed to rain, snow, and air at the surface.

Both ore and non-ore rocks contain minerals (typically pyrite, FeS2) that can produce acid during weathering. The sulfur in pyrite reacts with oxygen and water to form sulfuric acid (H2SO4) through the reaction: FeS2 +15/4 O2 +7/2 H2O = 2H2SO4 + Fe(OH)3. The resulting acidic water is known as acid rock drainage (ARD), which accelerates the weathering process. Metals and other potentially harmful constituents can also be released during weathering in a process called metal leaching (ML). Most metals are released more rapidly in acidic water. However, some other constituents, including metalloids such as arsenic, molybdenum, and selenium, and salts such as sulfate, can be released into the environment even if the water draining the rock has a neutral or basic pH (Smith 2007). The rate of acid generation is counteracted by minerals that neutralize the acid (such as calcite, CaCO3). The neutralization is generated through a reaction of calcite with the sulfuric acid: CaCO3 + H2SO4 = Ca2+ + SO42- + H2O + CO2. Acidification is typically delayed until the neutralizing minerals are exhausted.

The task of geochemical characterization at the proposed Mine Site is to identify the potential of the rocks in and surrounding the mineralized deposit to produce ARD and/or ML that could affect water quality in surface water and/or groundwater. The characterization process involves studies of the mineralogy of the rocks, the quantities of minerals with potential to generate or neutralize acid, the amounts of leachable constituents in the rocks, and the rates of weathering and release of these minerals and constituents expected during mining, and after mining ceases. Geochemical characterization was undertaken as part of environmental baseline studies over a number of years to evaluate the potential for ARD and/or ML for the Pebble Project. A brief summary of the results of these studies follows. Geochemical results described below are largely sourced from Chapter 11 Geochemical Characterization, Bristol Bay Drainages, of the Pebble Mine Environmental Baseline Document (SRK 2011).

3.18.4.2 Geochemical Characterization

The objectives of the geochemical characterization program were to predict the weathering and leaching behavior of rock, tailings, and other materials that would be produced during mining and processing. The data produced from geochemical testing are used to predict the chemistry of waters that contact the rock exposed in the open pit, stockpiled as LGO to be used later, or disposed as waste rock and tailings, and determine their ARD/ML potential.

AMERICAN OVERSIGHT

Samples for geochemical testing were selected from the numerous exploration cores drilled to outline the deposit. The samples included all the main Pebble Deposit rock types, and adjacent rock types that might be removed during mining. As of 2012, the program had included analysis of over 1,000 rock samples from the Pebble Deposit, and 26 samples of overburden materials. In addition, almost 60 tailings samples from test processing of ore composites have also been characterized (49 samples plus various quality control samples). To date, limited testing has been performed on the representative concentrate, because possible designs for a metallurgical process are still at an investigative stage.

The rock samples were tested for mineral abundance using transmitted and reflected light microscopy, and ARD potential, bulk chemical composition, and constituent mobility. Geochemical tests have included acid-base accounting (ABA), sequential net acid generation, shake flask extractions, meteoric water mobility, humidity cells, subaqueous (saturated) leach columns, and on-site field weathering (barrel and bag) tests to evaluate rates of oxidation, acid generation, acid neutralization, and element leaching.

In some mineralized deposits, rock type alone can be a good indicator of whether a rock will potentially produce ARD and/or ML. There are two main geological divisions at the proposed mine site. The mineralization is hosted by sedimentary and volcanic rocks of pre-Tertiary age. After the pre-Tertiary occurrence of mineralization, those rocks were partially eroded, then covered by other sedimentary and volcanic rock later in the Tertiary period. The later-Tertiary-age rocks at the Mine Site generally do not contain copper, gold, or other metals in formats that would be economically viable to recover at the present time.

ABA has determined that the pre-Tertiary mineralized rocks at the proposed mine site are predominantly Potentially Acid Generating (PAG). The acid-generating potential (AP) in these rocks is relatively high, as indicated by the total sulfur content of greater than 1percent, and the neutralization potential (NP) of these rocks is limited. In contrast, the majority of the Tertiary-age rocks that comprise the cover and overburden materials at the proposed mine site have sulfur concentrations of less than 0.1percent, which indicates low AP. The cover and overburden rocks also contain significant NP. As a result of the low AP and high NP in the cover and overburden, these materials are generally considered Non-potentially Acid Generating (NAG).

Most of the older pre-Tertiary sedimentary and igneous rocks hosting the Pebble Deposit were found to be PAG. The acid potential is largely derived from oxidation of pyrite and characterized by more than 1 percent sulfur content. The NP of the pre-Tertiary rock is limited. The majority of the younger Tertiary rocks and glacial overburden materials have low sulfur content (less than 0.1 percent) and significant NP. These materials are typically classified NAG.

To develop an understanding of weathering and leaching processes that might affect rocks exposed during mining (e.g., pit walls, stockpiled materials, and waste rock), additional laboratory and field geochemical tests were conducted. Laboratory tests included humidity cell tests and saturated columns. Humidity cell test data allow interpretation of long-term acid generation potential and neutralization rates. Humidity cell tests also confirm ABA criteria for segregating PAG from NAG rocks and waste, based on the NP to AP ratio. The NP/AP ratio that distinguishes PAG and NAG is 1.6, and is applicable to pre-Tertiary, Tertiary, and overburden materials.

The humidity cell tests also help to estimate the potential lag or delay in the onset of ARD. The delay occurs because acid-neutralizing minerals (e.g., calcite, feldspars, and micas) are not depleted instantly as acid is formed, but are consumed at different rates depending on their reactivity and abundance. Results show that rocks with low NP/AP ratios (less than 0.1) have little neutralization potential and are likely to generate acid within a few years. Rocks with NP/AP ratios of 1 have higher neutralization potential, which delays the onset of acid generation

AMERICAN OVERSIGHT

to more than 20 years. Paste pH results for aged rock cores stored at the site suggest that acidification maybe delayed up to 40 years. Given differences in the test conditions, laboratory and field test suggest that oxidized pre-Tertiary mineralized rock may take up to several decades for acidification to occur.

Element release rates indicated by kinetic tests were mainly a function of leachate pH rather than the element content of the samples. Leaching of copper accelerated as pH decreased; therefore, the potential for metal release is linked to the potential for acid generation, and ABA data can be used to assess the potential for copper leaching. However, for some elements (e.g., arsenic, molybdenum, and selenium), release is significant under neutral pH conditions. Tests on some samples of Tertiary rock showed relatively elevated leaching of these elements under non-acidic conditions.

Ore processing based on a conventional flotation process to recover chalcopyrite and molybdenite, the primary copper and molybdenum minerals, followed by treatment of pyrite to recover gold, will result in a low sulfide bulk tailing concentrate and a high-sulfide (pyrite-rich) tailing concentrate, respectively. Low sulfide tailings are expected to have low potential to generate ARD, provided the sulfide mineral content is less than about 0.2 percent. Element leaching from the low sulfide tailings occurred at low rates, and process supernatants were found to contain low levels of potential constituents relative to water quality standards. The pyrite concentrate tails are expected to be PAG, and are likely to leach metals at higher concentrations.

Because of the geochemical variability in the rocks, assessment of impacts resulting from geochemical processes requires consideration of the disposition and fate of the material that would be mined each year. The annual area mined can be estimated by developing a block model. (The block model is a computer model that shows the three-dimensional location of each type of rock and the likely order of mining.) Rock material is assessed based on whether the material would take a long time to react – developing acid or losing neutralizing potential – and whether the material would be processed to end up in tailings or set aside as waste rock, in order to design waste management strategies.

Based on the results obtained from integrating the geochemical studies with the block model, the majority of the rocks that would be mined from the deposit do not have the potential for acid generation, and could be considered substantially acid neutralizing. However, some rocks do have the potential to leach certain constituents; mainly, arsenic and sulfate. These results, and their influence on the existing baseline water quality at the site of the proposed mine, will be discussed in more detail in the next few sections.

3.18.4.3 Surface Water Quality

The Pebble Deposit is located in the headwaters of the Upper Talarik Creek (UTC) drainage and the South Fork Koktuli (SFK) River drainage, and adjacent to the headwaters of the North Fork Koktuli (NFK) River drainage. The NFK River drainage is immediately north of the project area. The Kasanak Creek (KC) drainage lies south of the SFK River drainage.

A water quality study was conducted to quantify chemical and physical parameters that describe the quality of the water in the Mine Site, and other areas that would potentially be impacted by the proposed action and alternatives. Water quality data were collected for rivers, lakes, and seeps in the project area, and throughout a 965-square-mile area that includes the NFK River, the SFK River, and UTC.

A comprehensive network of sampling stations was established in the project area for sampling surface water from streams, lakes, and seeps. Stream samples were collected from 44 locations

AMERICAN OVERSIGHT

during 50 sampling events from April 2004 through December 2008. Lake and pond samples were collected from 19 lakes once or twice per year during 2006 and 2007. Seep samples were collected from 11 to 127 sample locations, depending on the year, two to five times per year.

Altogether, between 2004 and 2008, over 1,000 samples were collected from streams, more than 600 samples from seeps, and approximately 50 samples from lakes. Additional samples were also collected during the supplementary water quality study period, which occurred from 2008 and 2013.

Results of analyses of samples collected from surface water resources in the project area indicate that the baseline surface water resources can generally be characterized as cool, clear waters with near-neutral pH that were well oxygenated, low in alkalinity, and generally low in nutrients and other trace elements. Water types ranged from calcium-magnesium-sodium-bicarbonate to calcium-magnesium-sodium-sulfate. Water quality occasionally exceeded the maximum criteria for concentrations of various trace elements. Additionally, cyanide was occasionally present in detectable concentrations, and there were consistently detectable concentrations of dissolved organic carbon. Concentrations of petroleum hydrocarbons, polychlorinated biphenyls (PCBs), and pesticides were all below the applicable limits of detection (LODs) for the analyses.

Some differences in water quality between watersheds and some trends in water quality along streams were noted. Sulfate, copper, zinc, nickel, and molybdenum concentrations were greatest in the SFK, consistent with the headwaters of this river passing through the deposit area, and multiple sample locations present in this area. Significantly higher concentrations of copper, molybdenum, nickel, zinc, and sulfate were present in the SFK than in the NFK, consistent with the SFK's proximity to the deposit area. Total dissolved solids (TDS), pH, sodium, alkalinity, hardness, nitrogen (total nitrate+nitrite), and nickel concentrations were greatest in the UTC drainage. The uppermost reach of UTC passes through a portion of the general deposit area, and also had significantly higher concentrations of all of these naturally occurring constituents, except copper, than in the NFK. Total suspended solids (TSS), potassium, chloride, iron, and arsenic concentrations were highest in KC, while cadmium and lead concentrations were highest in the NFK drainage. These characteristics of KC and NFK likely indicate that these parameters are unrelated to the deposit area, and represent water quality signatures that are distinct from the other drainage areas. The following paragraphs discuss some of the specifics of the sample results and trends.

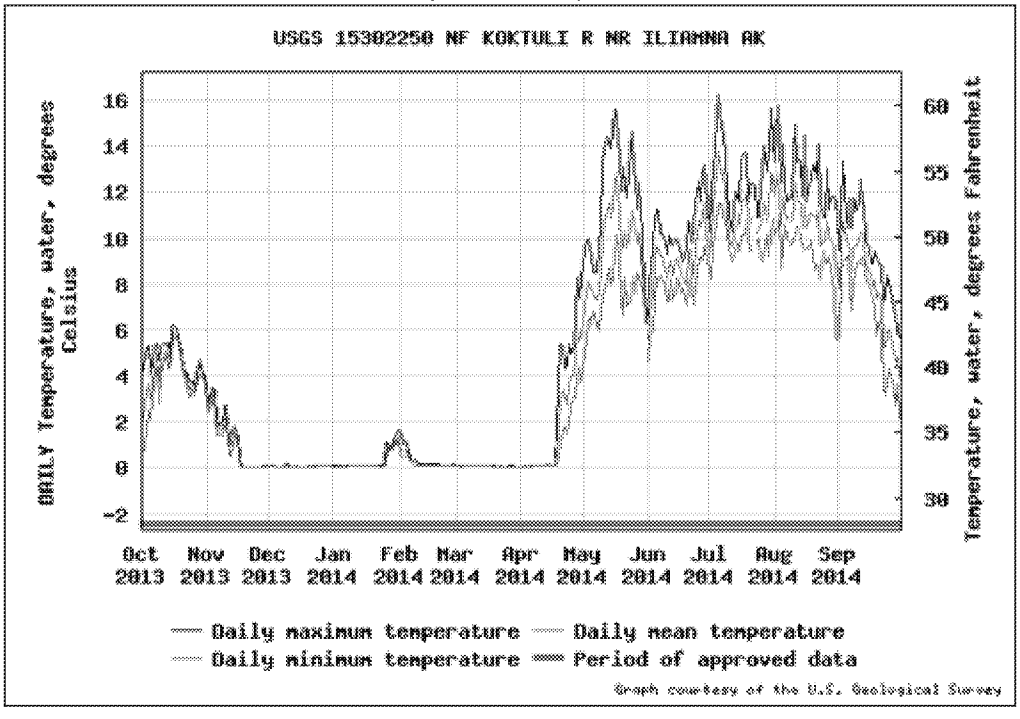
The mean levels for TDS in streams, by watershed, ranged from 37 to 51 milligrams per liter (mg/L), which is 10 percent or less of the most stringent ADEC water quality maximum criterion. Of the three streams that originate close to the deposit area, the UTC and SFK had significantly higher TDS levels than the NFK. Furthermore, a decrease in the TDS levels with distance along the stream was more pronounced in the SFK and UTC watersheds than in the NFK watershed.

Higher TDS in the UTC and SFK watersheds with decreasing trends downstream were expected, because the deposit area lies within their watersheds, and the oxidation of sulfide minerals associated with the deposit would release dissolved solids. The mean levels for TDS in lakes and seeps were similar to those for streams, with values of 49 and 42 mg/L, respectively.

The highest value for TSS was in KC, and the lowest was in the NFK. The mean for TSS in lakes and seeps was similar to that for streams.

The pH values in surface water were close to neutral. The mean pH for streams, by watershed, ranged from 6.7 to 7.0. Therefore, even though the oxidation of sulfide minerals was expected to be releasing acid in the deposit area, carbonate minerals appear to provide effective pH buffering. The mean pH values for lakes and seeps were 7.2 and 6.5, respectively. Although the

AMERICAN OVERSIGHT



mean pH values fell within the range for pH specified in the most stringent ADEC criterion, 34 percent of all individual water quality samples did not meet the water quality criteria for pH. The frequency of this trend in seeps was at least double that of streams, depending on the watershed.

The alkalinity of the surface water samples was low. The mean alkalinity for streams, by watershed, ranged from 17 to 32 mg/L. The mean alkalinity for lakes and seeps was 19 and 23 mg/L, respectively. Alkalinity was the parameter that was most frequently detected outside the range of the most stringent ADEC criterion. In all, 43 percent of all surface water samples were below the most stringent ADEC minimum criterion for alkalinity. The frequency with which alkalinity values for lakes and seeps were below the minimum criterion was 10 to 20 percent higher than the frequency for streams.

Temperature

The mean water temperature in streams ranged from 4.0 to 4.8 degrees Celsius (°C), depending on the watershed. The coefficient of variation was close to 1 for each watershed. In other words, the standard deviation of the temperature values measured in each watershed was approximately equal to the mean of the values, indicating a high level of variability.

Figure 3.18-2: Daily water temperatures in the NFK at 59°50'35.4"N, 155°42'58.9"W, 3.5 miles upstream from the mouth, and 28.5 miles northwest of Iliamna. The temperature record shows the pattern in water temperatures over the period of 1 year from October 2013 to September 2014. (USGS 2018).

[Note: Figure 3.18-2 will be prepared as .pdf]

The lakes were considerably warmer, with a mean temperature of 12°C, and the seeps were slightly cooler, with a mean temperature of 3.4°C.

AMERICAN OVERSIGHT

Dissolved Oxygen

Dissolved oxygen (DO) concentrations in streams were very similar in all watersheds, with mean concentrations that ranged from 10.2 to 10.5 mg/L. These values are close to the theoretical solubility of oxygen of 12.3 mg/L at 900 feet amsl, and a water temperature of 4°C. Although most samples indicated high DO, 7 percent of the samples had DO concentrations lower than the most stringent ADEC minimum criterion.

Major Ions

The water type of most samples from the streams ranged from calcium-magnesium-sodium-bicarbonate to calcium-magnesium-sodium-bicarbonate-sulfate. The cation composition was dominated by calcium and was relatively consistent. The anion composition had a wider range, with most stream samples being dominated by carbonate. The average water type of the lakes and seeps was generally the same as the streams; however, the seeps had a slightly greater range of water types, and the distribution of water types was slightly different. Specifically, the seeps included samples with a higher proportion of sulfate, and the samples also were distributed more evenly across the spectrum of anion composition, rather than being weighted toward the bicarbonate end of the spectrum.

Nutrients

Nutrients, which included total ammonia, nitrate+nitrite, total phosphorous, and orthophosphate, had generally low concentrations, especially in lakes and seeps. Orthophosphate was generally not present at detectable levels, with one exception in the KC watershed. Total ammonia was detected in 19 to 36 percent of all surface water samples, and mean concentrations ranged from 0.03 to 0.05 mg/L, depending on whether the samples were from streams, lakes, or seeps. Nitrate+nitrite and phosphorous were detected in 66 to 98 percent of all surface water samples. Mean concentrations of nitrate+nitrite ranged from 0.1 to 0.3 mg/L, and mean concentrations of total phosphorous ranged from 0.02 to 0.04 mg/L. None of the nutrient concentrations exceeded the most stringent ADEC maximum criterion. The coefficients of variation for nutrients were high compared to most other parameters, often in the range of 1 to 2.

Trace Elements

The trace elements aluminum, antimony, arsenic, barium, cadmium, copper, iron, lead, manganese, molybdenum, mercury, nickel, and zinc were detected in surface water, although at low concentrations. The frequency of detection depended on the watershed, and on whether the sample was collected from a stream, a lake, or a seep. Total and dissolved aluminum, barium, copper, iron, manganese, and molybdenum were typically the most frequently detected trace elements in the streams and lakes; the frequency of detection generally ranged from 85 to 100 percent. The most frequently detected elements in the seeps were generally the same as those for the streams and lakes, but the frequency of detection was lower in the seeps (53 to 99 percent, rather than 85 to 100 percent). Exceptions to this general pattern included a frequency of detection for total and dissolved arsenic in KC of more than 98 percent.

The trace elements arsenic, lead, nickel, and zinc had an intermediate frequency of detection, with the exception of zinc, which had a higher frequency of detection (98 percent) in lakes.

Cadmium had the lowest frequency of detection. Some trace element concentrations in stream samples exceeded the most stringent ADEC maximum criteria. Copper from the SFK watershed exceeded the water quality criterion most frequently, with total copper exceeding the criterion in 42 percent of samples, and dissolved copper exceeding the criterion in 34 percent of samples. In contrast, copper had one of the lowest frequencies of exceedance in other watersheds. The

AMERICAN OVERSIGHT

relatively high frequency of exceedance in the SFK watershed is probably related to the proximity of the deposit. Total aluminum exceeded the most stringent ADEC maximum criterion in 12 to 22 percent of the stream samples from the SFK, UTC, and KC watersheds; and in 6 percent of the samples from the NFK watershed. In contrast, dissolved aluminum exceeded the criterion in only 1 percent of the stream samples, and only in the UTC watershed; therefore, aluminum exceedances seem to be almost exclusively associated with suspended solids. Total lead exceeded the most stringent criterion in 8 to 16 percent of the stream samples, and was generally the next most frequently exceeded criterion after total aluminum. Dissolved lead exceeded the criterion in 1 to 6 percent of the stream samples, and was second only to copper for frequency of exceedance for dissolved elements. Total manganese exceeded the criterion in 15 percent of the stream samples from the SFK and UTC watersheds, in 3 percent of the samples from the NFK watershed, and in none of the samples from the KC watershed. Similar to aluminum, manganese exceedances appear to be associated with suspended solids.

Concentrations of total antimony, cadmium, iron, mercury, and zinc for the stream samples rarely exceeded the criteria (0.3 to 4 percent).

In samples from lakes and seeps, exceedances of the most stringent maximum criteria included total and dissolved aluminum, total and dissolved copper, total and dissolved iron, total and dissolved nickel, total and dissolved lead, total and dissolved cadmium, and dissolved manganese.

Cyanide was occasionally detected in the surface water samples. Total cyanide was detected in 2 to 15 percent of all samples, and weak acid dissociable cyanide was detected in 5 to 13 percent of all samples, depending on whether the samples were collected from streams, lakes, or seeps. Concentrations of weak acid dissociable cyanide in samples were compared with the most stringent ADEC maximum criterion, and exceeded this criterion in 1 to 3 percent of the stream samples, depending on the watershed.

Dissolved organic carbon was detected in 93 to 100 percent of the stream samples, and the mean concentrations ranged from 1 to 2 mg/L, depending on the watershed.

Concentrations of petroleum hydrocarbons, volatile and semi-volatile organic compounds, polychlorinated biphenyls, and pesticides were not detectable above the method reporting limit.

3.18.4.4 Groundwater Quality

Thirty-nine groundwater monitor wells with depths up to 200 feet below ground surface were installed in the project area (Note: Information to be updated based on Supplemental EBD). One deep drill hole (DH-8417) was used for sampling at depths ranging from 640 to 4,050 feet. The results for groundwater are discussed here as median values for individual wells. Most groundwater samples from depths of 200 feet or less were typically characterized by median levels of TDS less than 100 mg/L (comparable to surface water), median pH values between 5.8 and 7.4, median DO concentrations greater than 8 mg/L, and concentrations of trace elements below the most stringent ADEC water quality maximum criteria. Concentrations of TDS in groundwater generally decreased with distance from the deposit area. Monitor well MW-14D in the SFK watershed was the only well with a relatively high TDS level that was not consistent with this general pattern. Most of the groundwater samples had a composition that ranged from calcium-bicarbonate to calcium-magnesium-bicarbonate to calcium-sodium-bicarbonate. Some samples from relatively close to the deposit area had a higher proportion of sulfate, suggesting that the groundwater in this area is influenced by oxidation of the sulfide minerals that are associated with the deposit. As the sulfide minerals oxidize, iron, sulfate acid, and probably trace elements are released. The acid is neutralized by carbonate minerals such as calcite and dolomite, which release calcium, magnesium, manganese, carbonate, and usually some trace

AMERICAN OVERSIGHT

elements. This series of geochemical reactions increases the concentration of TDS and the proportion of sulfate in the groundwater.

Although sulfides appear to be oxidizing in the deposit area, the groundwater is not acidic. The lowest median pH values were 4.9 and 5.3. All other median pH values were greater than 5.8. Eight of the wells (six completed in overburden, two in bedrock) had median pH values greater than 7.0, and three of these wells (all completed in overburden) had the highest median TDS concentrations.

The DO measured in the groundwater was usually quite high. Twenty-seven of the 39 wells had median DO concentrations of 8 mg/L or greater.

The wells with relatively high TDS also generally had relatively high concentrations of arsenic, barium, and molybdenum compared with other wells in the analysis area. All of the wells with more than two trace metals at relatively high concentrations were located closer to the deposit area.

Some systematic differences in concentrations were observed with depth, as indicated by the differences in concentration between wells that were completed in overburden and those that were completed in bedrock. Specifically, the concentrations of antimony, arsenic, copper, iron, manganese, and molybdenum tended to be higher in wells in bedrock than in wells in overburden. Conversely, the concentrations of DO and nickel tended to be lower in wells in bedrock than in wells in overburden.

3.18.4.5 Sediment Quality

Physical Substrate and Sediment Description

Waterbody substrate data coverage within the Mine Site includes the SFK, the NFK, and UTC. Streambed sediment from these drainages is dominated by medium to coarse gravels to small cobbles, with boulders present in stretches of rapids. In areas of low water velocity and pools, sands and silts are more common, and organic sediments are present in some areas (Knight Piésold 2011; R2 et al. 2011). The NURE program collected a variety of substrate samples across the region in 1977 (Grossman 1998). NURE data include basic physical substrate descriptions and thorough chemical analyses, as well as reporting evidence for potential local contaminant sources. Twelve samples of pond substrate collected by NURE within approximately 20 miles of the Mine Site were all reported as mud/fine sediment (Grossman 1998). Limited data from the shores of Frying Pan Lake show a sand, silt, and gravel substrate (R2 et al. 2011).

Chemical Substrate and Sediment Quality

Between 2004 and 2007, 198 samples of sediment from lakes, ponds, seeps, and major and minor drainages in the analysis area were sampled and analyzed for their content of naturally occurring trace elements, anions, and cations (SLR Alaska 2011). Of the 26 trace elements for which samples were analyzed, all were present above detection limits in at least some of the samples, with aluminum, iron, calcium, and magnesium present at substantially higher concentrations than the other elements. Mercury content of sediment samples was the lowest level detected, at a mean concentration of 0.040 milligrams per kilogram (mg/kg). Comparing sediment from the major drainages, copper was the only element showing significant variation, likely due to the difference in rock composition across the drainages. Copper concentrations were particularly high in substrate of the SFK, likely due to copper-rich bedrock at the headwaters. Sediments from ponds and minor drainages in the Mine Site area showed higher concentrations of anions and cations such as sulfate, ammonia, and sodium than did other

AMERICAN OVERSIGHT

waterbodies. Total cyanide concentrations were the lowest of the analyzed anions on average, with a mean concentration of 0.39 mg/kg (SLR Alaska 2011). Of the 12 pond substrate samples analyzed by the NURE within 20 miles of the Mine Site area, none showed evidence of contamination (Grossman 1998).

3.18.5 Amakdedori Port

The port site is just north of the mouth of Amakdedori Creek on the western shore of Cook Inlet. The Cook Inlet basin is an expansive watershed surrounding the 180-mile-long Cook Inlet waterbody. Covering more than 38,000 square miles of southern Alaska, it receives water from six major watersheds and many smaller ones. More than 10 percent of the basin is covered by glaciers, and suspended sediment loading in glacier-fed rivers without lakes is significant, leading to a high suspended sediment load in portions of Cook Inlet.

Lower Cook Inlet is connected to the Pacific Ocean southwest through Shelikof Strait, and southeast by the Gulf of Alaska, and demonstrates complex circulation patterns. The region has the fourth largest tidal range in the world; tidal fluctuations in Kamishak Bay average 13 feet. When the tide drops from mean high to mean low water, the inlet loses almost 10 percent of its volume, and exposes approximately 8 percent of its surface area. Most of these tidally exposed areas are in the arms, at the north end of Cook Inlet and along the west side of the waterbody.

3.18.5.1 Surface Water Quality

The area surrounding Cook Inlet is the most populated and industrialized region of Alaska. Therefore, its waters are influenced by urban (and a small amount of agricultural) runoff, oil and gas activities (accidental spills, discharges of drilling muds and cuttings, production waters, and deck drainage), effluent from municipal wastewater treatment facilities, oil and other chemical spills, offal from seafood processing, and other regulated discharges (NMFS 2016).

Water quality in the Iliamna/Iniskin Estuary during the period from 2004 through 2008 appeared to be dominated by tidal exchange with Cook Inlet and Kamishak Bay, with smaller, localized effects from freshwater inputs and local wind waves. Observed gradients in salinity between the inner (lower salinity) and outer (higher salinity) portions of Iliamna Bay are consistent with this conclusion. Average salinity was observed to decrease from the outer stations of Iliamna Bay to the inner stations. This is likely a result of freshwater inputs at the head of Iliamna Bay. Salinity decreases from spring to late summer, and increases again in the fall, thereby providing an additional indicator of the influence of regional water on the bays. A certain amount of stratification was observed during both the spring snowmelt season and during the warmer summer months, particularly during calmer weather and in more sheltered portions of the bays.

Snowmelt or significant rain events create a freshwater surface lens a few centimeters deep in areas adjacent to freshwater inputs; these lenses rapidly diminish as a result of tidal and wind driven mixing.

Analysis of available data indicates that turbidity is generally moderate, and does not exhibit any obvious trends that indicate point-source inputs. On a monthly basis, average turbidity remained relatively constant over the analysis period, generally ranging between 3.1 and 13.0 Nephelometric Turbidity Units.

Analyses of hydrocarbon concentrations in marine water from the Iliamna/Iniskin Estuary in 2004, and of metal and trace element concentrations in 2008, showed little to no connection to anthropogenic effects. Concentrations of all inorganic constituents were less than water quality maximum criteria recommended by the EPA and others for marine habitat, many by orders of

AMERICAN OVERSIGHT

magnitude. Organic constituents were similarly at low levels, and appeared to be derived from biologic, petrogenic, and anthropogenic sources.

The data provide some support for a relationship between increased concentrations of inorganic constituents and TSS, but demonstrate no strong patterns with respect to depth in the water column, to geography, or to tidal elevation.

Data analyses show the marine waters of the Iliamna/Iniskin Estuary to be high-quality habitat for marine biota. For example, waters free from toxins or other agents of a type or amount harmful to Cook Inlet beluga whales are considered a principal component of the Cook Inlet beluga whale critical habitat in the Amakdedori Port area. The National Marine Fisheries Service (NMFS; 2016) discussed that the comparatively low levels of contaminants documented in Cook Inlet belugas, as well as in chemical analyses of water and dredged sediments, suggest that the relative concern of known and tested contaminants to Cook Inlet belugas is most likely low.

3.18.5.2 Groundwater Quality

A large aquifer system is found beneath much of the Cook Inlet region, including the Amakdedori Port area. Groundwater also occurs in saturated fractures in the bedrock, and provides most of the water in streams near the port area during winter (Glass 1999). Aquifers are primarily situated within glacial till, glacial outwash, and fluvial deposits overlying sedimentary and low-grade metamorphic bedrock. Glacial deposit aquifers have been described as "irregular in distribution and highly variable both in composition and in their ability to provide water to wells" (Brabets 1999).

3.18.5.3 Sediment Quality

Physical Substrate and Sediment Description

Amakdedori Port would be constructed on the southwestern shore of Lower Cook Inlet, on Kamishak Bay. Significant dredging of shallow offshore sediments would be required for construction of a marine vessel channel (estimated initial dredge volume of 10,000,000 cubic yards), and maintenance dredging of the channel would continue throughout two decades of production at the mine (PLP 2017). Placement of dredged sediments is subject to CWA (404)(b)(1), and is addressed in Section 4.18.X.

No known offshore sediment sampling has been conducted to date at the port site. Sediment samples from the estuarine environments of Iliamna and Iniskin bays, about 30 miles northeast of the port site, revealed substrates of fine sediment (SLR Alaska et al. 2011). Offshore sediments at the port site would likely be more coarse-grained than the estuarine substrate, because of the strong current and tidal influences of the open water environment, which tend to keep fine sediments in suspension. Geophysical surveys and sediment sampling in Kamishak Bay are scheduled for the 2018 field season to characterize dredge spoils that would be generated from development of the port site (PLP 2018). This section will be updated as new data are received.

Studies from other sites within Upper and Lower Cook Inlet have provided a general characterization of seafloor substrate and sediment properties. Lower Cook Inlet is a tidal embayment with a substrate of abundant glacial sediments, predominantly cobbles, pebbles and sand, with minor amounts of silt and clay (Sharma and Burrell 1970). Large ice-rafted boulders are also present in some areas (Thurston and Choromanski 1994). Over 40,000,000 tons of sediment are discharged per year into the inlet by the surrounding major drainages (Rember and Trefry 2005). Sediment transport in some areas of Upper Cook Inlet has been shown to be exceptionally high, with 10,000 to 100,000+ cubic yards of sediment moving in and

AMERICAN OVERSIGHT

out of the Port of Anchorage area in a matter of days or weeks (USACE 2013). A combination of shallow water, high tidal fluctuations, and strong currents constantly mobilize seafloor sediments in the inlet, keeping sediments in suspension, resulting in highly turbid water, and inhibiting deposition of fine-grained sediments (Rember and Trefry 2005). Fine sediments introduced by major rivers feeding into Upper Cook Inlet are carried in suspension, and have been shown to be deposited as far as 150 miles south in Lower Cook Inlet (ADL 2001).

Waterbody substrate data from the onshore environment at the Amakdedori Port site are limited. Sediment from two ponds, one about 0.5 mile north and the other approximately 3 miles south, was described as mud/fine (Grossman 1998).

Chemical Substrate and Sediment Quality

Although numerous studies have been conducted on water quality in Cook Inlet, data on sediment quality in the inlet are sparse. Limited data from dredging operations and sediment sampling in Cook Inlet suggest that sediments generally have low concentrations of contaminants and potential toxins (USACE 2013; ADL 2001). Low levels of hydrocarbons have been detected at multiple sites in the inlet, potentially connected with offshore oil development, past oil spills, or natural oil seeps. Glacial sediments, which are continually transported into the inlet by the major drainages, may contain associated metals and hydrocarbons. Municipal discharges and seafood processing also contribute potential contaminants to Cook Inlet substrate. Extreme tidal fluctuations and strong currents constantly disperse and dilute potential pollutants in the inlet (ADL 2001).

No known sediment sampling has been conducted to date at the proposed port site. Sediment sampling in Kamishak Bay is scheduled for the 2018 field season to characterize dredge spoils (PLP 2018). This section will be updated as new data are received. Samples of fine sediment were collected from the offshore estuarine environments of Iliamna and Iniskin bays, 30 miles northeast of the port site. Some of the samples showed arsenic, copper, nickel and zinc levels higher than the threshold of biological response, and measurable hydrocarbons. There is no significant development in the area, but there is minor marine vessel traffic from Williamsport at the head of Iliamna Bay. Estuarine sediments are generally more fine-grained than what is expected at the offshore Amakdedori Port site, which is more exposed to open water. Fine grained sediments generally retain chemical pollutants more than coarse-grained sediments, due to higher surface area to volume ratios.

Chemical substrate data from the onshore environment at the Amakdedori Port site are limited. Sediment from two ponds, one within 0.5 mile to the north and one about 3 miles south of the port site, were analyzed by NURE and were reported to have no contamination source (Grossman 1998).

3.18.6 Transportation Corridor

The Transportation Corridor would connect the Amakdedori Port site to the Mine Site. The corridor would include a private double-lane access road between the Amakdedori Port and the South Ferry Terminal on Iliamna Lake west of Kokhanok; a similar access road between the North Ferry Terminal on the north shore of Iliamna Lake and the mine site; and a purpose-built ice-breaking ferry connecting the two ferry terminals. The Natural Gas Pipeline would parallel The Transportation Corridor from the Amakdedori Port site to the Mine Site. Additional spur roads would be built to connect the access road to the villages of Iliamna, Newhalen, and Kokhanok.

The 84-mile-long access corridor would cross numerous streams within the Bristol Bay and Cook Inlet watersheds. The corridor originates in the Nushagak watershed at the Mine Site, and

AMERICAN OVERSIGHT

traverses the Kvichak watershed; both are within the greater Bristol Bay watershed. The corridor terminates in the Tuxedni-Kamishak bays watershed of the greater Cook Inlet watershed.

3.18.6.1 Surface Water Quality

Sixteen surface water sampling stations were established and sampled in the Transportation Corridor analysis area during 2004 and 2005. The surface water sampled at these stations was characterized by low levels of TDS (2 to 126 mg/L), mostly near-neutral pH (4.6 to 8.8), and high DO concentrations (9 to 19 mg/L). During months when surface water samples were collected, the temperature ranged from 0.1ºC to 23ºC. The full annual range of water temperatures could not be characterized because samples were not collected during November, December, or January. The cation composition of the water samples was dominated by calcium. The anion composition was typically dominated by bicarbonate, but some samples were dominated by sulfate. The water composition at most stations was consistent between sampling events, but a few stations had an anion composition that varied over time. Concentrations of nutrients were low; specifically, most ammonia and phosphorous concentrations were below the method reporting limit. Total nitrate+nitrite averaged 1 mg/L. Concentrations of the trace elements aluminum, copper, lead, and zinc were above the most stringent ADEC maximum criterion in a few cases.

Iliamna Lake

The sample data suggest that Iliamna Lake has water quality conditions similar to the natural conditions of other regional lakes. Only aluminum, copper, iron, lead, manganese, zinc, and alkalinity were detected at concentrations that were outside the most stringent ADEC water quality criteria. Cation and anion dominance was generally characteristic for temperate lakes. Concentrations of major ions did not vary with depth, suggesting that the water at the sampling sites were well mixed. The concentrations of several major ions and TDS were lower earlier in the summer, peaked in September, and declined again in October. These temporary increases may be associated with the influence of inflow from streams and precipitation.

3.18.6.2 Sediment Quality

The Transportation Corridor crosses numerous streams in the Bristol Bay and Cook Inlet watersheds, and includes an 18-mile traverse of Iliamna Lake. Substrate sediments intersected include a wide range of fine to coarse sediments, with little to no known existing contamination (Grossman 1998). Sediments at the northern end of the corridor overlap with those of the Mine Site. Please see discussion of data in Section 3.18.4, Mine Site.

The Transportation Corridor crosses numerous streams in the Bristol Bay and Cook Inlet watersheds, and includes an 18-mile traverse of Iliamna Lake. Substrate sediments intersected include a wide range of fine to coarse sediments, with little to no known existing contamination (Grossman 1998). Sediments at the northern end of the corridor overlap with those of the Mine Site. Please see discussion of data in Section 3.18.4, Mine Site.

Physical Substrate and Sediment Description

Mine Access Road and Iliamna Spur Road

The Mine Access Road would include a bridge over UTC, and the Iliamna Spur Road includes a bridge across the Newhalen River. General data for UTC substrate (not site-specific to bridge crossing) shows medium to coarse gravels to small cobbles, with some boulders, sands, and silts (Knight Piésold 2011; R2 et al. 2011) No data are currently available on stream or pond

AMERICAN OVERSIGHT

substrates crossed by the Mine Access Road or Iliamna Spur Road bridges. [Note: Additional information on substrates has been requested in RFI 036; section to be revised when received.].

Iliamna Lake

A small number of nearshore and deeper water sediment samples from Iliamna Lake were collected between 2004 and 2008. No specific sediment descriptions were provided, except that sediment analyzed was fine-grained material (HDR Alaska 2011). Additional sediment sampling from Iliamna Lake is scheduled for the 2018 field season (PLP 2018). This section will be augmented with new data as they are available.

Southern Access Road

The Southern Access Road traverses five bridges, including the Gibraltar River Bridge, Unnamed Creeks 1, 2, and 3 Bridges, and Bridge Lake Bridge. No data are currently available on stream substrate for these drainages. [Note: Additional information on substrates has been requested in RFI 036; section to be revised when received.]. Samples of substrate from four ponds within approximately 5 miles of the Southern Access Road were all recorded as mud/fine sediment (Grossman 1998).

Chemical Substrate and Sediment Quality

Mine Access Road

Of the 12 pond substrate samples analyzed by NURE within approximately 20 miles of the Mine Access Road, none showed evidence of contamination (Grossman 1998).

Iliamna Lake

A small number of nearshore and deeper water sediment samples from Iliamna Lake were analyzed for trace elements (HDR Alaska 2011). Sediment data showed levels for copper, lead, aluminum, iron, and manganese that were outside the ADEC freshwater criteria. This is likely due to the highly mineralized local geology, and is similar to chemistry in other area lakes. Additional sediment sampling from Iliamna Lake is scheduled for the 2018 field season (PLP 2018). This section will be augmented with new data as they are available.

Southern Access Road

Of the four pond substrate samples analyzed by NURE within approximately 5 miles of the Southern Access Road; none showed any evidence of contamination (Grossman 1998).

3.18.7 Natural Gas Pipeline Corridor

The Natural Gas Pipeline would parallel the Transportation Corridor from the Amakdedori Port site to the Mine Site. The surface water, groundwater, and sediment resources within the Natural Gas Pipeline Corridor are a subset of those resources that are within the Transportation Corridor, with the addition of the short stretch of pipeline that would be constructed along the western shore of the Kenai Peninsula and the subsea pipeline in Cook Inlet.

AMERICAN OVERSIGHT

3.18.7.1 Physical Substrate and Sediment Description

Kenai Peninsula

Potential waterbody crossings along the Kenai Peninsula stretch of the Natural Gas Pipeline Corridor would be limited to minor drainages. Limited sediment sampling from one stream in the area reveals a substrate of fine-grained sediment (Grossman 1998).

Cook Inlet

A general description of Cook Inlet physical substrate and sediment is provided under Section 3.18.5, Amakdedori Port, above. As the Natural Gas Pipeline Corridor traverses 94 miles across Cook Inlet, and publically available information regarding the substrate of CI in this area is sparse, at best. Additional discussion of deeper offshore sediments in Cook Inlet will be included here if data become available.

Water depths in the center of Cook Inlet range from about 50 to over 500 feet (NOAA nautical chart #16660). Numerous oil and natural gas pipelines currently span the bottom of Cook Inlet. Pipeline damage has previously been documented from boulders mobilized on the seafloor by strong tides and currents.

3.18.7.2 Chemical Substrate and Sediment Quality

Kenai Peninsula

Potential waterbody crossings along the Kenai Peninsula stretch of the Natural Gas Pipeline Corridor would be limited to minor drainages. Sediment sampled from one stream in the area did not show evidence of contamination (Grossman 1998).

Cook Inlet

No known sediment quality data are currently available for the Natural Gas Pipeline Corridor Cook Inlet crossing. Sediment sampling at the proposed Amakdedori Port site in Kamishak Bay, 2 miles south of the western terminus of the proposed pipeline Inlet crossing, is scheduled for the 2018 field season (PLP 2018). Seafloor substrate in Lower Cook Inlet generally has low toxicity (ADL 2001).

3.22 WETLANDS / SPECIAL AQUATIC SITES AND WATERBODIES

This section addresses the existing conditions of wetlands/special aquatic sites and waterbodies in the Environmental Impact Statement (EIS) Analysis Area. The Analysis Area for wetlands and waterbodies encompasses the major watersheds that could potentially be directly or indirectly impacted by the Pebble Project. These watersheds are defined by the United States Geologic Survey (USGS) Hydrologic Unit Code (HUC) level 5, designated as HUC 10 watersheds. There are a total of nine HUC 10 watersheds that make up the analysis area, with a total area of approximately 6,420,000 acres. Detailed information on all wetlands and waterbodies within this large area is not available. A subset of this area was therefore chosen for detailed study and mapping, referred to hereafter as the "mapping area." The mapping area is comprised of four subsets that correlate to the main project components: the Mine Site mapping area, the Transportation/Natural Gas Pipeline Corridor mapping area, the Amakdedori Port mapping area, and the Natural Gas Pipeline Corridor mapping area (Figure 3.22-1 through Figure 3.22-6). The mapping area exceeds project area, the area of the direct project disturbance footprint.

The description of wetlands and waterbodies in the mapping areas is based on information provided in Chapters 14 and 39 of the Environmental Baseline Document (EBD) (3PPI and HDR 2011, HDR and 3PPI 2011), as well as more recent information provided in the Preliminary Jurisdictional Determination (PJD) Report (HDR 2018) (Appendix J) and associated Geographic Information System (GIS) database that reflects changes in the project area since publication of the EBD. The analysis of environmental consequences in Chapter 4 makes use of publically available environmental data for the component watersheds within the analysis area in order to contextualize project impacts.

Wetlands and waterbodies encompass a number of disciplines that are addressed more fully in other sections of this EIS, including soils (Section 3.14), hydrology (Sections 3.16 and 3.17), and vegetation (Section 3.26). Wetland and waterbody functions and values that overlap with and are developed in other sections include water and sediment quality (Section 3.18), wildlife values and threatened and endangered species (Sections 3.23 and 3.25), aquatic species habitat (Sections 3.23, 3.24, and 3.25), and food and fiber production (subsistence) (Section 3.9).

The affected environment for wetlands and waterbodies includes vegetated wetlands, ponds, lakes, streams, rivers and marine waters that may be directly or indirectly affected by the project. Wetlands and waterbodies will be described in terms of the extent and characteristics of predominant types found in the main project component mapping areas.

3.22.1 Substrate (Wetlands)

Wetlands and waterbodies are considered "waters of the U.S.," which are defined in the Clean Water Act as "surface waters, including streams, streambeds, rivers, lakes, reservoirs, arroyos, washes, and other ephemeral watercourses and wetlands" (33 Code of Federal Regulations [CFR] Part 328.3[a]). Special aquatic sites are a subset of waters of the U.S. that are large or small areas possessing special ecological characteristics of productivity, habitat, wildlife protection, or other important and easily disrupted ecological values (40 CFR 230.3). Special aquatic sites present in the vicinity of the analysis area include wetlands (defined below), mud flats, vegetated shallows, and riffle and pool complexes.

Mud flats occur in some of the intertidal portions of Cook Inlet. They are composed of fine sediments and organic material, and are either unvegetated or vegetated only by algal mats. They have not been documented in the mapping area, as the intertidal zone is composed mostly of sand and gravel. Vegetated shallows are permanently inundated areas that support

AMERICAN OVERSIGHT

rooted aquatic vegetation. They include some of the aquatic bed types defined by the National Wetland Inventory (NWI) system (described below) occurring in freshwater ponds and lake margins. These are of very limited extent in the mapping area, and are described together with other vegetated wetlands. Eelgrass beds are a relatively common type of vegetated shallows that do occur in parts of the nearshore environment of Cook Inlet. However, they have not been documented within the mapping area.

Riffle and pool complexes occur in steep gradient sections of streams within the mapping area. Riffles are defined by rapid flow over a coarse substrate that produces high levels of dissolved oxygen in the water. Pools are deeper, slower sections of water with a finer substrate. Major streams in the analysis area have been characterized for habitat types, including riffle and pool habitats and associated fish resources (R2 Resource Consultants et al. 2011). Baseline mapping of streams did not specifically identify riffle and pool complexes in the mapping area. Streams were characterized mainly by flow regime (lower perennial, upper perennial and intermittent). Riffle and pool complexes would be expected to occur most frequently in the upper perennial and intermittent zones where stream beds are predominantly gravel or coarser. Stream morphology and associated fish habitat in the analysis area is addressed in Section 3.24 of this EIS.

Wetlands are special aquatic sites defined as, “those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions” (33 CFR 328.3[b]). Unvegetated areas such as streams, ponds, and lakes are not considered “wetlands” under this definition.

Wetland determinations followed guidance from the U.S. Army Corps of Engineers (USACE). Wetland determinations from 2004 through 2008 were based on the 1987 Wetland Delineation Manual (USACE 1987), while determinations after 2013 were based on the 1987 Manual in conjunction with the 2007 Alaska Regional Supplement (USACE 2007). Both manuals use field indicators to determine presence of vegetation, soils and hydrology characteristic of wetlands. Detailed descriptions of the field indicators used for wetland determinations in the mapping area are provided in Chapters 14 and 39 of the EBD (3PPI and HDR 2011, HDR and 3PPI 2011), and in the PJD Report (HDR 2018).

3.22.2 Analysis Methodology (Categories, Classes, and Functions)

The wetlands and waterbodies mapping area for the Pebble Project encompass approximately 45,000 acres. To facilitate wetlands and waterbody mapping, a GIS database was constructed that incorporates several project-specific layers, including existing NWI mapping, USGS topographic mapping, land use and land cover mapping, existing vegetation mapping, soil survey data from the Natural Resources Conservation Service (NRCS), and several sources of aerial and Light Detection and Ranging (LiDAR) imagery.

Field survey protocols were developed to collect pertinent field data over several growing seasons (2004-2008, 2013 and 2017). A total of 684 wetland determination field plots were surveyed. Detailed information on vegetation, soils, and hydrology were collected at each plot. Additional photo and data points were collected at waterbodies and stream crossings. Additional vegetation data was also collected to support vegetation type classification and mapping. Field data was recorded on Global Positioning System (GPS) units, digital cameras, field forms and field notebooks. Field data was used in GIS with other data layers, to digitally map wetland and waterbody polygons.

Mapping was digitized on aerial photography at a scale between 1:1,200 and 1:1,500, for wetlands, and 1:400 for open water. Mapping of wetlands relied heavily on interpretation of

AMERICAN OVERSIGHT

"photographic signatures" associated with vegetation types (see Appendix C in HDR 2018,) (see PJD included as Appendix J). Interpretation of topography was also important in mapping wetlands and waterbodies. Topographic depressions, toeslopes and flat areas were often associated with wetlands, while convex slopes were indicative of potential uplands. Topography was also used to assess potential hydrologic connections between wetlands and surface waters, and to determine potential locations of groundwater seeps.

Each mapped wetland and waterbody polygon was further characterized using three classification systems. All polygons were first assigned a vegetation type based on the Alaska Vegetation Classification (Viereck et al. 1992), supplemented by Wibbenmeyer et al. (1982). Vegetation classification and mapping is discussed in detail in Section 3.26 of this EIS. Wetland and waterbody polygons were also classified based on NWI class (Cowardin et al. 1979) and Hydrogeomorphic (HGM) class (Brinson 1993), described below.

Field studies and mapping conducted as part of the environmental baseline program encompassed the portion of the mapping area within the Bristol Bay watershed, and the west side of the Cook Inlet watershed. This includes the Mine Site, the Transportation/Natural Gas Pipeline Corridor (including the ferry terminals and pipeline crossing at Iliamna Lake), and the Amakdedori Port. The pipeline crossing of Cook Inlet and the pipeline corridor and compressor station on the Kenai Peninsula were not included in the field studies and mapping prepared for the Pebble Project. Therefore, this analysis makes use of existing wetlands mapping that is publically available, primarily the Cook Inlet Lowlands wetland mapping prepared by the Kenai Watershed Forum (Gracz 2013). Wetlands were mapped on the Kenai Peninsula using stereo-paired aerial photography at a scale of 1:24,000, in conjunction with NWI maps and NRCS soils data. Approximately 10 to 20 percent of the wetland polygons were field checked.

The Cook Inlet Lowlands mapping utilized a project-specific wetland classification system (Gracz 2014). The system is largely based on hydrologic and geomorphologic factors, and is therefore similar to the HGM method. In order to make the data comparable to the data collected for the Pebble Project, the Cook Inlet wetland classes were reclassified with the best-corresponding HGM and NWI classes.

Pebble Limited Partnership (PLP) submitted geodatabases with the wetland and waterbody mapping to the USACE in December 2017 with a request for a PJD for the Pebble Project. The USACE issued their PJD on March 20, 2018, confirming the wetland and waterbody mapping.

3.22.2.1 National Wetland Inventory Classification

The NWI classification system has been used by the U.S. Fish and Wildlife Service since 1979 to classify and map wetlands and deepwater habitats throughout the U.S. Under this classification scheme, wetlands and deepwater habitats are grouped into systems based on shared hydrologic conditions. NWI systems occurring in the mapping area are palustrine, lacustrine, riverine, and marine.

Most vegetated wetlands within the mapping area classify as palustrine, which is further subdivided by dominant vegetation growth forms (trees, shrubs, emergent herbaceous, aquatic herbaceous, or moss/lichen) or bed type (for non-vegetated ponds less than 20 acres). Palustrine forested wetlands occur in a very small portion of the mapping area. These are represented primarily by broad leaved deciduous forests (PFO1) confined to valley bottoms. Primary tree species include alders (*Alnus incana, A. viridis*), various willows (*Salix sp.*), and balsam poplar (*Populus balsamifera*).

Palustrine scrub-shrub wetlands are the dominant NWI class in the mapping area. These include wetlands dominated by broad leaved deciduous shrubs (PSS1) such as birches *(Betula*

AMERICAN OVERSIGHT

glandulosa, B. nana), and willows; broad leaved evergreen shrubs (PSS3) such as sweetgale (*Myrica gale*), Labrador-tea (*Rhododendron tomentosum, R. groenlandicum*), bog-rosemary (*Andromeda polifolia*), black crowberry (*Empetrum nigrum*), and northern mountain-cranberry (*Vaccinium vitis-idaea*); and needle leaved evergreen shrubs (PSS4) represented by stunted black spruce (*Picea mariana*).

Palustrine emergent wetlands (PEM1) make up the second-most dominant NWI class in the mapping area. These include wetlands dominated by a large number of persistent, herbaceous species adapted to a wide range of saturation or non-permanent flooding. Common plants in the mapping area include bluejoint (*Calamagrostis canadanesis*), numerous sedges, rushes (*Juncus sp.*), horsetails (*Equisetum sp.*), cotton-grasses (*Eriophorum sp.*), and numerous other grasses and forbs.

Palustrine aquatic bed wetlands (PAB3) occur in small ponds and other semipermanently to permanently flooded areas. They are dominated by rooted, aquatic herbaceous species such as yellow pond-lily (*Nuphar luteum*) and pondweeds (*Potamogeton sp.*).

Waterbodies larger than 20 acres situated in depressions are classified as lacustrine, which are generally unvegetated but may include aquatic herbaceous species. Waterbodies contained within a channel (rivers and streams) are classified as riverine. Riverine classes are subdivided by flow regime (lower perennial, upper perennial and intermittent) and are mostly unvegetated in the mapping area. The marine system is mapped on shorelines of Cook Inlet, and is subdivided based on tidal regime (subtidal or intertidal).

NWI classification for the Pebble Project also utilized water regime modifiers for each polygon. Water regimes included temporarily flooded, saturated, seasonally flooded, semipermanently flooded, and permanently flooded. Water regimes are often difficult to determine based on a single field observation during one time of the year. Interpreting water regimes from aerial photography is also particularly difficult unless photography from multiple years and seasons are available. For these reasons, NWI water regime modifiers are not used in the analysis for this EIS.

3.22.2.2 Hydrogeomorphic Classification

The HGM classification groups wetlands into categories based on the geomorphic and hydrologic characteristics that control many wetland functions. HGM classes observed in the mapping area include slope, riverine, depressional, flats and lacustrine fringe wetlands. Two additional HGM types were described for waterbodies in the Pebble Project: lacustrine waters and riverine channel waters. Estuarine/coastal fringe wetlands (e.g., salt marshes) occur along some of the tidally influenced shorelines of Cook Inlet and its estuaries, but have not been described in the mapping area (HDR and 3PPI 2011). Marine waters are described as either subtidal or intertidal, depending on whether they are normally flooded or exposed during periods of low tide. HGM classes are described below.

Slope Wetlands are the most common wetlands in the mapping area, occurring on hill or valley slopes where groundwater "daylights" and begins running along the surface, or immediately below the soil surface. While groundwater discharge is the primary water source, surface flow and precipitation also contribute water. Water in these wetlands flows in one direction only (i.e., down the slope), and the gradient is steep enough that the water is not impounded. The "downhill" side of the wetland is always the point of lowest elevation in the wetland. Water is lost through subsurface and surface outflow and evapotranspiration. Slope wetlands in the mapping area commonly occur as seeps on footslopes and toeslopes, and as headwaters and drainage ways in steep to rolling terrain where stream channels have not yet formed. Slope wetlands also occur as fens and string bogs.

AMERICAN OVERSIGHT

Riverine Wetlands are the second-most common wetlands in the mapping area, occurring in valleys associated with stream or river channels. They lie in active floodplains and riparian corridors and have important hydrologic links to the water dynamics of the river or stream. The distinguishing characteristic of riverine wetlands is that they are flooded by overbank flow from the stream or river at least every other year. Subsurface hyporheic flow, groundwater discharge, overland flow and precipitation can also provide important seasonal inputs. Water loss is through flow returning to the channel, subsurface discharge to the channel, seepage to groundwater, and evapotranspiration. Riverine wetlands range from broad floodplains along large meandering rivers to narrow zones along higher gradient rivers and streams. Riverine wetlands are often modified by beaver activity.

Riverine Channel includes wetlands and waters contained within the active channel of intermittent or perennial streams or rivers. Both bare and vegetated sand and gravel bars, and flowing waters with or without aquatic vegetation are included. The outer extent of the channels is defined by the ordinary high water mark (OHWM).

Depressional Wetlands occur in depressions where elevations within the wetland are lower than in the surrounding landscape. The shapes of depressional wetlands vary, but in all cases, the movement of surface water and shallow subsurface water is toward the lowest point in the depression. The depression may have an outlet, but the lowest point in the wetland is somewhere within the boundary, not at the outlet. Water sources include precipitation, groundwater discharge, and surface flow often with seasonal vertical fluctuations. Water loss is through intermittent or perennial outflow, evapotranspiration or seepage to groundwater. In the mapping area, depressional wetlands occur as abandoned river features on terraces (oxbows) above active floodplains or as kettles on moraine landforms. Depressional wetlands are often embedded within other HGM wetland classes.

Flats Wetlands occur in topographically flat or very gently sloping areas that are hydrologically isolated from surrounding ground or surface water. Precipitation provides the dominant source of water, with water loss from evapotranspiration, overland flow, and seepage to groundwater. In the mapping area, flats wetlands may occur on either mineral soil or accreted organic matter similar to extensive peatlands. They are present on broad ridgetops, glacial outwash terraces and remnant glacial lake beds. They may transition to slope wetlands at topographic breaks associated with groundwater discharge.

Lacustrine Fringe Wetlands occur next to lakes that maintain the water table in these wetlands; surface flow is bi-directional. Additional water sources are precipitation and groundwater discharge. Water loss is through flow returning to the lake and by evapotranspiration. These wetlands are of limited extent in the mapping area.

Lacustrine Waters include the unvegetated water in lakes that are greater than 20 acres in size or at least 6.6 feet deep at low water. The upper extent of this type is defined by the OHWM on the shore. Open water depressions that do not meet the size requirements of lakes are classified as ponds for this analysis.

3.22.2.3 Wetland Functions and Values

Wetlands provide numerous ecosystem services or functions that are considered valuable to society. They support numerous species of plants and provide necessary habitat for fish, wildlife, and insects throughout various stages of their life cycles. Wetlands provide feeding, breeding, rearing, and cover habitat for numerous animals. Wetlands also act as filters while providing flood control, sedimentation, erosion control, and the stabilization of shorelines (USACE 2009; Magee and Hollands 1998).

AMERICAN OVERSIGHT

A wetland functional assessment will be prepared as part of the permitting process for the Pebble Project, and is typically used to quantify wetland impacts and corresponding compensatory mitigation needs (USACE 2016). This section provides only a very general, qualitative overview of wetland functions in the mapping area based on the NWI and HGM classifications. Wetland functional capacity varies greatly depending on position in the watershed and linkages to other habitats, so a particular wetland polygon of a given class may not provide the same level of functions as others in the same class.

In particular, the following characteristics are considered indicative of high-functioning wetlands in the mapping area:

- Provide habitat for threatened or endangered species (see Section 3.25, Threatened and Endangered Species [TES], for information on TES species), or provide habitat for sensitive or important fish, wildlife, birds, or plant species;
- Are regionally scarce, or rare and high quality, within a given region. For example, forested wetlands, often found near streams, account for less than one percent of wetlands in the mapping area, but provide important food and cover for wildlife, and woody inputs important for stream dynamics; or
- Are undisturbed and difficult or impossible to replace within a lifetime such as certain bogs and fens with their unique plant communities that may take centuries to develop. Bogs make up approximately 12 percent of wetlands in the mapping area. Bog vegetation types include: ericaceous shrub bog, open dwarf birch bog-ericaceous shrub bog, and open sweetgale-graminoid bog (Viereck et al. 1992). Bogs, which occur primarily on flats and slope HGM positions, have also been shown to contribute substantially to stream base flows (Gracz 2017).

In addition to the ecosystem functions provided by wetlands, certain wetland types and locations are valued by Alaska Natives for their subsistence value (Hall et al. 1994; Jernigan n.d.). Some culturally important plants found mainly in wetlands include blueberries, cranberries, Labrador tea, and willows.

Primary wetland functions generally associated with each wetland class are described below.

Forested Wetlands – provide modification of flood flows, shoreline stabilization, water quality improvement, organic matter production and export, wildlife cover and browse, and fish habitat through cover and shade.

Scrub-Shrub Wetlands – tall shrubs provide water quality and shoreline stabilization functions similar to forested wetlands, and high quality wildlife browse (willows).

Emergent and Aquatic Bed Wetlands – persistent herbaceous vegetation provides removal of sediments and nutrients, production and export of organic matter, and habitat for aquatic invertebrates, fish, waterfowl and wetland-associated mammals (beavers and river otters).

Slope Wetlands – modification of groundwater discharge, mediation of surface and subsurface flows to other wetlands, and support of stream base flows which indirectly supports seasonal fish habitat.

Riverine Wetlands – floodwater storage, modification of stream flows, water quality improvement, and general fish habitat.

Depressional Wetlands – groundwater recharge, floodwater storage, and water quality improvement.

AMERICAN OVERSIGHT

Flats Wetlands – surface water storage, mediation of surface and subsurface flow to other wetlands and streams, production and export of organic matter, and maintenance of characteristic plant communities (bogs and fens).

Lacustrine Fringe Wetlands – floodwater storage, water quality improvement, shoreline stabilization, and habitat for aquatic invertebrates, fish, and waterfowl.

3.22.3 Wetlands in the Mapping Area

Approximately 35 percent of the mapping area was determined to be a wetland or waterbody, and assumed to be subject to USACE jurisdiction. Total vegetated wetland area was calculated as approximately 10,048 acres (22 percent). Statewide, approximately 43 percent of Alaska is estimated to be wetland (Hall et al. 1994). Many of the wetland polygons mapped for the Pebble Project contain inclusions of uplands. These "mosaics" occur in landscapes with often complex microtopography where wetland and upland components are too closely associated to be easily mapped separately (USACE 2007). During the mapping, wetland scientists estimated the proportion of wetland versus upland in each mosaic polygon, ranging from 10 to 90 percent wetland. Almost half of the wetland polygon area in the mapping area was mapped as mosaics. Scrub-shrub and forested wetlands were more often mapped as mosaics compared to emergent wetlands. For this analysis, all mosaics have been calculated as 100 percent wetland.

The majority of the mapping area is within the Bristol Bay drainage. This includes the Mine Site and supporting infrastructure, the mine access road and pipeline corridor from Iliamna Lake, the north and south ferry terminals on Iliamna Lake, and much of the south access road and gas pipeline corridor from the watershed divide to the south ferry terminal. The rest of the south access road and gas pipeline corridor, as well as Amakdedori Port, and the pipeline corridor on the Kenai Peninsula are within the Cook Inlet drainage. Wetland and waterbody areas and proportions are shown in Table 3.22-1.

A total of 50 different NWI types were observed and mapped across the entire wetland mapping area. For purposes of this analysis, these have been summarized into ten functionally similar groups (Table 3.22-2).

[Note: Numbers at this time throughout this section may not reconcile exactly with numbers presented in Section 3.26-Vegetation, due to refinements in the specific project area.]

Table 3.22-1: Wetland and Waterbody Comparisons by Project Component

Project Component	Mapping Area (acres)	Wetland (acres)	Wetland (%)	Waterbodies (acres)	Waterbodies (%)
Mine Site	20,526	7,067	34	503	2
Transportation/Natural Gas Pipeline Corridor[1]	20,127	2,930	15	1,275	6
Amakdedori Port	3,973	49	1	3,425	86
Natural Gas Pipeline Corridor[2]	377	2	1	341	91
Totals	45,003	10,048	22	5,544	12

Notes:

Acres and proportions of the various NWI groups across the entire mapping area are provided in Figure 3.22-7. Broad Leaved Deciduous Shrubs, Marine Subtidal, and Herbaceous NWI groups combined make up approximately 88 percent of the mapping area. The acres and proportions of NWI vegetated wetland groups are provided in Figure 3.22-8. The Broad Leaved Deciduous Shrubs group makes up approximately 73 percent of all vegetated wetlands. Primary shrubs in this group include numerous willow species (e.g., *Salix pulchra, S. barcayi, S. alaxensis*), birches (*Betula nana* and others), and blueberries (*Vacinnium uliginosum* and others). It should be noted, however, that this group often included secondary vegetation types within its mapping units (Table 3.22-2). These included Needle Leaved Evergreen Shrubs (black spruce), Broad Leaved Evergreen Shrubs, Deciduous and Evergreen Forests, Herbaceous, and Moss-Lichen. In addition, the Broad Leaved Deciduous Shrubs group represents several water regimes.

Acres and proportions of HGM classes across the mapping area are shown in Figure 3.22-9. Slope wetlands make up 75 percent of all wetlands in the mapping area. Photographs of representative wetlands and waterbodies in the mapping area are provided in Figure 3.22-10.

3.22.4 Mine Site Affected Environment

The mapping area for the Mine Site is approximately 20,526 acres. It was selected to provide coverage of potential development areas and alternative development areas as well as additional surrounding area to provide comparative context (3PPI and HDR 2011). The fully developed Mine Site would include an open pit, TSF, power plant, water treatment plants, and milling/processing facilities as well as supporting infrastructure. The watershed divide between the South Fork Koktuli River and Upper Talarik Creek is close to the dividing line between the Transportation/Natural Gas Pipeline Corridor mapping area and the Mine Site mapping area. The Mine Site encompasses the upper watersheds of both the North Fork and South Fork Koktuli River, which flows into Bristol Bay via the Mulchatna and Nushagak rivers. It also includes a small portion of the Upper Talarik Creek watershed. The mapping area is composed of glaciated, volcanic-ash influenced, hills and valleys free of permafrost.

Thirty-seven percent of the Mine Site mapping area is wetlands or waterbodies, comprised predominantly of broad leaved deciduous shrub wetlands (PSS1) in slope geomorphic positions (63 percent) (Table 3.22-3, Figure 3.22-11). These occur on both mineral and organic soils. Water regime is usually saturated, but also includes shallow flooding or ponding on very gradual slopes and in small swales and depressions located on the slopes. Although dominated by a deciduous shrub layer (willows, birches, blueberries), they usually also include small evergreen shrubs, with or without herbaceous wetland species. Bogs and fens co-dominated by ericaceous shrubs occur on slopes and organic flats. The broad leaved deciduous shrub NWI group makes up 73 percent of the vegetated wetlands at the Mine Site. The slope HGM class accounts for 87 percent of the vegetated wetlands.

Herbaceous wetlands (PEM1) make up 21 percent of the Mine Site wetlands or waterbodies. These occur in seasonally to semi-permanently flooded depressions and shorelines, and on wetter positions on slopes and flats. Some 30 species of wetland sedges were observed in the mapping area and provide the dominant cover. Some of these sedges, along with cotton-grasses (*Eriophorum sp.*), form pronounced tussocks communities. Bluejoint (*Calamagrostis canadensis*) and horsetails (*Equisetum sp.*) are other locally common herbaceous wetland species.

Riverine wetlands occur along the north and south forks of the Koktuli River, as well as several smaller streams, making up six percent of the Mine Site wetlands and waterbodies. These are mostly seasonally flooded, deciduous shrub wetlands and sedge marshes. Aquatic bed wetlands occurred in depressions and ponded areas of slopes, accounting for less than one percent of wetlands and waterbodies. Deciduous forested wetlands were absent at the Mine Site.

Waterbodies accounted for seven percent of the Mine Site wetlands and waterbodies. Waterbodies included both perennial and intermittent stream channels, lakes, and ponds.

Human-caused soil or vegetation disturbance in the Mine Site mapping area was minimal and appeared to be limited to four-wheeler trails or campsites (3PPI and HDR 2011). Drill pads and other temporary disturbance from project exploration were not observed to alter wetland status or characteristics.

AMERICAN OVERSIGHT

Table 3.22-3: Mine Site Mapping Area Calculation of NWI Groups by HGM Classes

AMERICAN OVERSIGHT

Figure 3.22-11: NWI Groups and HGM Classes at the Mine Site Mapping Area

3.22.5 Transportation/Natural Gas Pipeline Corridor Affected Environment

The mapping area for the Transportation/Natural Gas Pipeline Corridor is approximately 20,128 acres. The mapping area is generally 2,000 feet wide, centered on the proposed road centerline. It ranges up to 8,000-feet wide for approximately 8 miles on the north side of Iliamna Lake to account for other potential road alignments in this area. The corridor includes the Mine Access Road (29 miles) from the Mine Site to the north ferry terminal at Iliamna Lake, an 18-mile crossing of the lake to the south ferry terminal, and the South Access Road (37 miles)

AMERICAN OVERSIGHT

between the lake and Amakdedori Port on Cook Inlet. It also includes spur roads to Iliamna Airport (7 miles) and Kokhanok Airport (1 mile). The roads would have a 30-foot wide top width to enable two-way traffic. The pipeline would be buried adjacent to the road bed shoulder, and would either be routed under stream crossings or attached to bridge crossings. The pipeline would cross Iliamna Lake on the lake bed.

The transportation and pipeline corridor crosses numerous streams that feed into Iliamna Lake, which is connected to Bristol Bay via the Kvichak River. The major Bristol Bay watersheds include Upper Talarik Creek, Newhalen River on the north side of Iliamna Lake, Gibraltar Lake on the south side, and Iliamna Lake watershed on both sides of the lake. The major watershed draining to Cook Inlet is the Amakdedori Creek-Kamishak Bay watershed. The transportation and pipeline mapping area is dominated by glaciated, volcanic ash-influenced, mountains, hills, plains and valleys that are free of permafrost.

Twenty-one percent of the transportation and pipeline corridor mapping area is wetlands or waterbodies, comprised predominantly of broad leaved deciduous shrub wetlands (PSS1) in slope geomorphic positions (33 percent) (Table 3.22-4, Figure 3.22-12). These occur on both mineral and organic soils. Water regime is usually saturated, but also includes shallow flooding or ponding on very gradual slopes and in small swales and depressions located on the slopes. Although dominated by a deciduous shrub layer (willows, birches, blueberries), they usually also include small evergreen shrubs, with or without herbaceous wetland species. Bogs and fens co-dominated by ericaceous shrubs occur on slopes and organic flats. Evergreen shrub wetlands (PSS3, PSS4) account for 2 percent of wetlands and waterbodies, and occur primarily on slopes. The broad leaved deciduous shrub NWI group makes up 70 percent of the vegetated wetlands in the mapping area. The slope HGM class accounts for 70 percent of the vegetated wetlands.

Herbaceous wetlands (PEM1) make up 18 percent of the transportation and pipeline corridor wetlands and waterbodies. These occur in seasonally to semi-permanently flooded depressions and shorelines, and on wetter positions on slopes and flats. Some 30 species of wetland sedges were observed in the mapping area and provide the dominant cover. Some of these sedges, along with cotton-grasses (*Eriophorum sp.*), form pronounced tussocks communities. Bluejoint (*Calamagrostis canadensis*) and horsetails (*Equisetum sp.*) are other locally common herbaceous wetland species.

Riverine wetlands occur primarily along Upper Talarik Creek and Newhalen River, making up 17 percent of the mapping area wetlands and waterbodies. These are mostly seasonally flooded, deciduous shrub wetlands and sedge marshes. Deciduous forested wetlands and aquatic bed wetlands each accounted for less than one percent of the mapping area wetlands and waterbodies.

Waterbodies accounted for 30 percent of the transportation and pipeline corridor mapping area wetlands and waterbodies. Waterbodies included both perennial and intermittent stream channels, lakes and ponds.

Human-caused soil or vegetation disturbance in the transportation and pipeline corridor mapping area was minimal and appeared to be limited to four-wheeler trails, roads and building pads near the village of Iliamna, Kokhanok Airport, and the shore of Iliamna Lake.

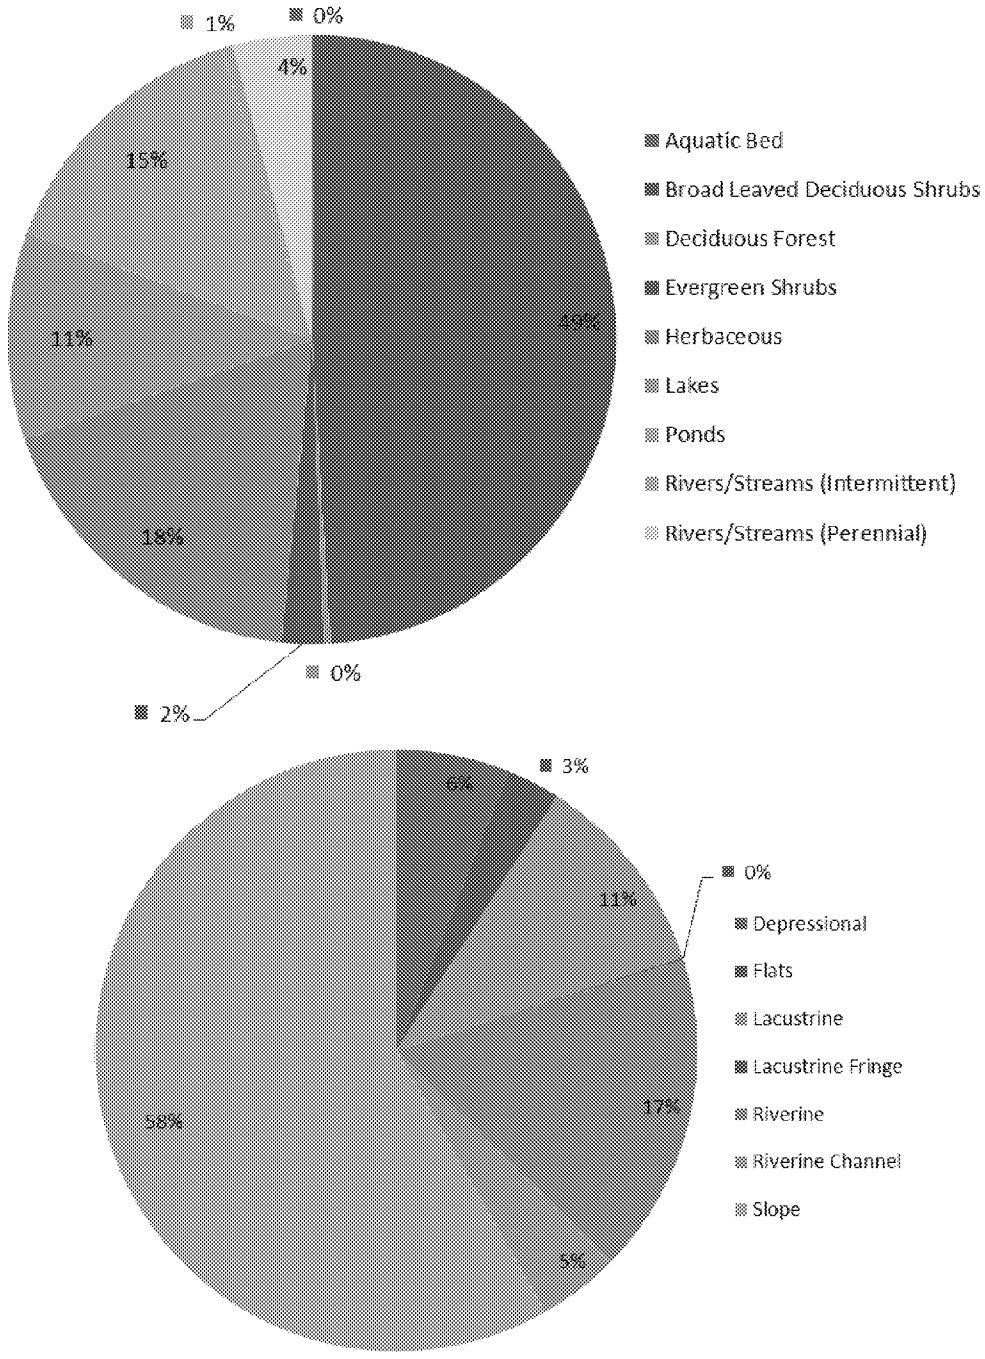
Totals								20,128	100

Notes:



1 Includes percentage of all wetlands and waterbodies within the Mine Site mapping area.

2 The Mine Site mapping area overlaps with approximately 5 miles of the Transportation/Natural Gas Pipeline Corridor. That acreage is included here rather than in the Transportation/Natural Gas Pipeline Corridor mapping area.

AMERICAN OVERSIGHT

Figure 3.22-12: NWI Groups and HGM Classes at the Transportation/Natural Gas Pipeline Corridor Mapping Area

3.22.6 Amakdedori Port Affected Environment

The mapping area for Amakdedori Port is approximately 3,973 acres. The proposed port would be located on the shore of Kamishak Bay, Cook Inlet, near Amakdedori Creek. It would include shore-based facilities to receive and store shipping containers and fuel, as well as power generation equipment, a natural gas compressor station, maintenance facilities, employee accommodations, and offices. Waterside improvements would consist of an earthen access causeway extending out to a marine dock. A dredged channel would follow a navigation route

AMERICAN OVERSIGHT

approximately 4.2 miles out to deep water. Dredged material would be stockpiled on uplands behind the marine terminal.

Marine waters make up the vast majority of the mapping area (86 percent) (Table 3.22-5). These are dominantly subtidal, deep water habitats. Cook Inlet has a very large tidal fluctuation, regularly reaching 25 feet or more. At low tide, areas of mud flats and cobble and gravel shores are exposed. These intertidal habitats make up approximately 1 percent of the mapping area.

Vegetated wetlands account for only one percent of the mapping area, but nine percent of the non-marine habitats. Herbaceous and deciduous shrub wetlands make up approximately 50 percent and 43 percent, respectively, of the wetlands and waterbodies in the mapping area (Figure 3.22-13). Almost all (98 percent) of the wetlands and waterbodies were on the slope HGM class. Non-marine waterbodies include ponds and perennial and intermittent stream channels, which make up approximately 7 percent of the wetlands and waterbodies in the mapping area.

AMERICAN OVERSIGHT

Figure 3.22-13:Non-Marine NWI Groups at the Amakdedori Port Mapping Area

3.22.7 Natural Gas Pipeline Corridor Affected Environment – Kenai Peninsula/Cook Inlet

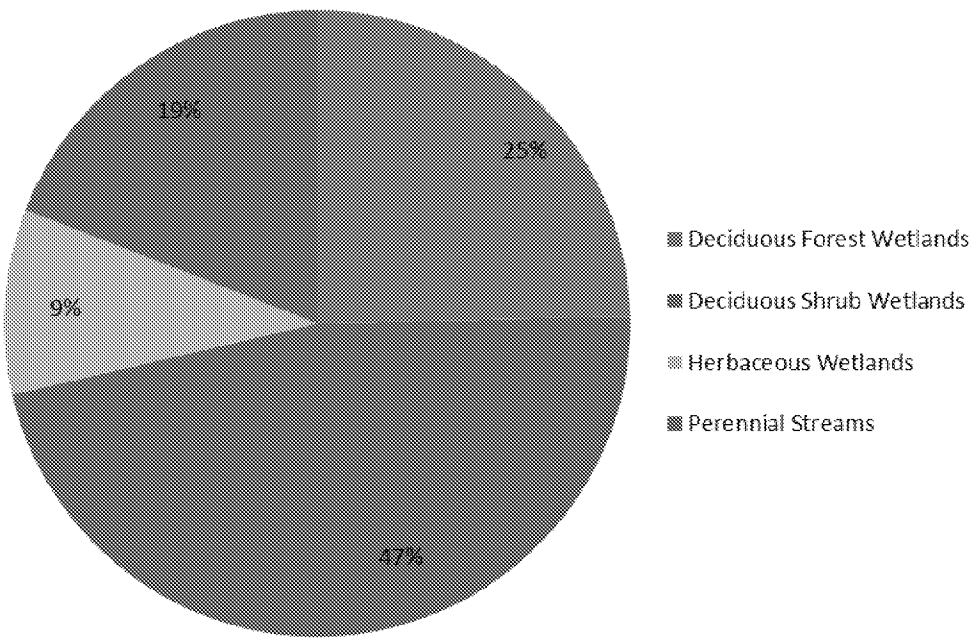
The mapping area for the Natural Gas Pipeline Corridor on the Kenai Peninsula and across Cook Inlet is approximately 377 acres. This includes a 30-foot wide corridor to account for temporary construction impacts. A buried steel pipeline, 10 to 12 inches in diameter, would connect to an existing pipeline near Happy Valley on the Kenai Peninsula, and run for approximately 10 miles along the Sterling Highway right-of-way to Cook Inlet. The pipeline would then cross the sea floor of Cook Inlet for approximately 94 miles to Amakdedori Port. Beginning at the port, the pipeline would be located within the Transportation/Natural Gas Pipeline Corridor, which is discussed above.

[Note: configuration of the pipeline on the Kenai Peninsula may change, pending project design updates.]

The pipeline mapping area is located within the Lower Kenai Peninsula watershed. This area includes permafrost-free, coastal lowlands with rolling glacial till and outwash plains. Cook Inlet is characterized by nearshore and deep water habitats with unconsolidated sediments on a smooth bottom and strong tidal currents. Numerous tributary basins with active glaciers contribute to high suspended sediment load in portions of Cook Inlet.

Ninety-one percent of the Natural Gas Pipeline Corridor mapping area occurs in marine waters of Cook Inlet, predominantly subtidal waters with an unconsolidated cobble-gravel bottom (M1UBL). The terrestrial portion of the mapping area is predominantly uplands; wetlands and streams cover approximately two acres (five percent). Broad leaved deciduous shrub wetlands (PSS1) in depressional geomorphic positions account for approximately one-half of the wetlands (Table 3.22-6, Figure 3.22-14). Forested wetlands on slopes are the second most abundant wetland type (25 percent). Waterbodies are limited to perennial stream channels (R2UB, R3UB).

AMERICAN OVERSIGHT



Human-caused soil or vegetation disturbance was not mapped for the pipeline corridor mapping area. Disturbance is expected to be common, given the location within the right-of-way of Sterling Highway.

MEMORANDUM

SUBJECT: Request for Reimbursement of Airfare/Lodging paid for with personal check

FROM: Mark Douglas
Environmental Scientist

THRU: Krista Mendelman
Unit Manager, Aquatic Resources Unit
Office of Environmental Review and Assessment

TO: Gregory Luebbering
Supervisory Accountant, CFC

I am requesting reimbursement in the amount of $1,434.00 for airfare and lodging (which includes meals) to Iliamna and the Pebble Mine site for 07/09/18 - 07/11/18, paid for by personal check.

The Pebble Partnership does not allow just any flight service to fly out to the mine site. The have a contract for air services with specific vendors and make those arrangements for travelers.

Lodging is extremely limited in Iliamna. the Pebble Partnership has an agreement with certain lodges to provide lodging and meals to folks coming out there.

The Pebble Partnership is not set up to take credit cards (personal or government). The only option for payment is by personal check or cash.

Subject: Revised comment date for Chapter 3 and 4 sections to 31 August 2018

Cooperating Agencies,

Last week it came to my attention that I inadvertently omitted to distribute some sections of draft Chapters 3 and 4 to some cooperators. I had originally asked that cooperators submit comments on these draft chapters by 31 July for Chapter 4 and July 5 for comments for Chapter 3.

Given my oversight, I am now asking that the review for both Chapters 3 and 4 sections be submitted by August 31, 2018. This will also mean that the robust technical discussions will occur in October.

I would like to remind everyone, that at this stage of the development of the analysis, I am asking that your review be at a high level; meaning that we are asking your teams to identify gaps (did we miss something?). The team developing the sections will review the comments and may be reaching out to you for clarity. A more in detail review will be expected in October when the team has incorporated additional information based on your input and data gathered by the teams.

As we are all aware, there are many moving parts to any EIS and it is difficult to keep all things on track. I would greatly appreciate any issues being brought directly to my attention as soon as you identify them. Please email me or call me directly if you have concerns or questions about the flow of information so we can collaboratively ensure that errors are caught and corrected as soon as possible.

Subject: REVIEW REQUEST and additional documents loaded to Sharepoint

Hello Team,
The Corps distributed some additional information to cooperating agencies related to yesterday's Cooperating Agency meeting here in Anchorage, and I have added these materials to the Sharepoint site, in the "Materials for 6-6-18 Cooperating Agency Meeting" folder. Most of the information is for awareness only, but our review has been requested on two items:

1) the Preliminary Scoping Report

Internal Website/ Ex. 6

2) selected sections of Pre-Draft Chapter 3

Internal Website/ Ex. 6

Your review is being requested on specific materials (listed below), but feel free to also review the remainder of the materials if you wish.

- Preliminary Scoping Report: **Molly/Patty** – comments due to Molly **June 20**

AMERICAN OVERSIGHT

This document addresses scoping comments received to date, but will be updated following the close of the public scoping period.

- Pre-Draft Chapter 3 Sections – comments due to Molly **June 25** (specific section assignments below)
  These documents are first drafts of each resource section Affected Environment, and will also be updated following the close of public scoping and based on cooperating agency input. It is not clear whether cooperators will have an opportunity to review a second iteration prior to publication of the Draft EIS, so a thorough review at this stage is critical.

  The Corps has requested that our review focus on what is missing or any inaccuracies (don't worry about formatting, grammar, etc.). Where we identify something missing/innacurate, we are asked to be very specific in our recommendation. If you identify missing information in your review, first check the RFIs and Responses to Date

  Internal Website/ Ex. 6

  If there is a RFI/response that addresses your concern, then please note that in your comment. If not, then please include in your comment: (1) the information gap, (2) a reference where additional information can be found, and (3) what from that reference should be added, with as much specificity as possible – suggested text would be helpful.

  Please identify the sub-section and page number for each of your comments.

  Here are specific assignments for the review request. Most sections include a word document as well as some associated figures in pdf form.

- 3.1 Intro – **Molly**
- 3.5 Recreation – **Mark/Palmer/Molly**
- 3.11 Aesthetics – **Mark/Palmer/Molly**
- 3.14 Soils – **Mark/Palmer**
- 3.16 Surface Water Hydrology (note, we received figures but not text, and are following up) – **Tim/Mark/Palmer/Muluken**
- 3.17 Groundwater Hydrology – **Tim/Mark/Palmer/Muluken**
- 3.18 Water and Sediment Quality – **Cindi/Tim/Chris**
- 3.22 Wetlands/ Special Aquatic Sites – **Mark/Palmer**
- 3.26 Vegetation (note, we received figures but not text, and are following up) – **Mark/Palmer**

Please let me know if you have any questions. Thank you for your assistance with this review.
Regards,
Molly

Subject: Pebble NEPA/permitting team - documents for awareness review

Pebble NEPA/permitting team –

The Corps has started sending us, and other cooperating agencies, information generated by PLP and the third-party EIS contractor (AECOM). This information includes AECOM's requests (to PLP) for additional information (RFAIs) and PLP's responses. The Corps has begun adding theses RFAIs to the public EIS website. Molly and I will add this information to our SharePoint site as well.
The Corps has submitted this information to us and requested an awareness review, but is not requesting written comments.

For now, I want to bring your attention to two documents, attached:
1 – PLP Updates to the Proposed Project - PLP has made some updates to the project description. Please review this document so that you are aware of the changes. Some of these changes could impact parts of our scoping letter (e.g., use of lightering and elimination of dredging).
2 – PLP Technical Note on Project Options and Screening Criteria – This document summarizes screening criteria and options used by PLP to develop its current project description. I expect the Corps will consider this information during alternatives development. Please review this document for awareness.

We will discuss these documents during our next team meeting on May 24, and I can provide more context. In the meantime, please let me know if you have questions.

Thanks-
Patty

Krista or Mary Anne,

Attached is the form Pebble sent for the site visit in July. Please sign it and send it back **Personal Matters / Ex. 6** but if you are able to sign it on Friday **Personal Phone / Ex. 6** to let me know it's ready and I'll log in and send it on to Pebble.

Thanks!

Hi Molly –

Thanks for the opportunity to review. My comments are attached. I have a problem in that I always fix nits if I see them ☺ but you should take it or leave it. I also flagged a couple places for you where you should edit the sentence b/c it isn't clear.

AMERICAN OVERSIGHT

Hi Ashley,
I am so sorry for the delay in getting these comments to you for review. If you will no longer be able to complete your review Friday, please let me know. I also apologize that some of the comments (particularly the last couple pages) are still a bit rough. So, please don't feel that you have to edit grammar, punctuation, etc., as I will do another read-through for that before sending this to Jill.

Patty – I've copied you here as well, so you can decide if you would prefer to do your final review of the compiled comments now, or at the same time as Jill's review.

Thank you very much in advance for your review!

Subject: FW: Field Logistics

Hi Mark,

Our arrangements:
Iliamna Air Taxi Inc:
Arrival time @ Iliamna: July 9 (Monday) at 0900.
Departure time: July 11 @ 4:30 p.m.

Corps will disburse the company directly for hotel/helicopter costs.
Hotel:
Check in July 9th
Check out July 11th

Meals:
July 9th (- Diner)
July 10th (all meals)
July11th (breakfast & lunch).

Rooms are reserve through Tim Harvey:
Meals are cafeteria style. For our arrival day, we will bring our lunch. For the remaining days they will make a bag lunch at breakfast to bring with us to the field.

Company will provide in-town transportation to/from the airport each day in one of their vehicles. Work days are 12 hours, with 10 in the field and one hour on either end for muster, briefings, etc. Crews normally do not return to base during the work day unless weather limits flight operations. Low clouds and/or high winds are typically the only conditions that will restrict helicopter travel.

No firearms are permitted at any Pebble facility or in helicopters. Trained bear guards will be provided with each crew. Guards are in constant radio contact with site operations. Alcohol is prohibited at any Pebble facility.

Safety training and site orientation will take place as soon as we arrive. That should take about an hour, followed by a 20-minute helicopter safety briefing. They provide basic PPE (safety goggles, high visibility vest, hearing protection). You are welcome to bring your own as long as the operations manager approves. Field gear requirements are what we would normally bring.

Accommodations are 150/person/day. They will invoice you after your trip. their site staff does not have the ability to accept payments. Helicopter time will likewise be invoiced to you based on the per seat cost and number of flight hours logged. Cost may vary depending on which helicopter is available.

AMERICAN OVERSIGHT

Note to Reviewers

This section is an early stage preliminary draft, and has been prepared prior to the completion of scoping for the purpose of setting analytical direction and facilitating the project schedule for completing the EIS.

As an initial draft, it is incomplete in many ways, and contains numerous placeholders to be addressed as more information becomes available. The Scoping Comment Period has not closed, Alternatives to the Proposed Action have not been formally identified, information needed to complete the analysis is not yet fully available and in the process of being requested from the applicant, and the approach for topics such as spills/dam failures, traditional knowledge and cumulative effects has not been settled. In addition, supporting analysis and logic for determination of potential environmental consequences have not been fully developed. This draft is intended to frame the eventual section, and in doing so, allow USACE to see the intended topics and content for the eventual completed sections. Notes are included in many sections to identify where the analysis is incomplete.

4.22 WETLANDS/SPECIAL AQUATIC SITES

The project has the potential to result in the following direct and indirect effects to wetlands/special aquatic sites and waterbodies (henceforth, referred to as "wetlands"):

- Direct impacts from removal of wetland vegetation and soil
- Indirect impacts from:
  - Disruption of wetland hydrology
  - Alteration of surface water quantity or distribution
  - Alteration of subsurface water quantity and distribution
  - Erosion and sedimentation.

Project impacts have been assessed by watershed to place the impacts in an ecological context. U.S. Geological Survey (USGS) Hydrologic Unit Code Tenth Level (HUC10) watersheds have been used for this purpose, and define the environmental impact statement (EIS) analysis area for wetlands. Impact assessments were considered, analyzed, and determined from the perspective of overall regional Alaskan vegetation affected. To contextualize project impacts, the analysis for vegetation applied publicly available environmental data for the EIS analysis area for the nine HUC10 watersheds that could potentially be directly or indirectly affected.

The magnitude of impacts to wetlands were assessed in terms of percent of disturbance area to high-value wetlands or greater proportions of low-value wetlands in the EIS analysis area. Magnitude would be less for disturbance areas below five percent, and would be greater for disturbance areas above five percent, with greatest intensity for disturbance areas above 25 percent. Some areas of wetlands would be reclaimed, and some would not. The duration of impacts would be temporary, meaning wetland functions would be reduced during the construction phase; or permanent, meaning reduction or elimination of wetlands functions would occur after the construction phase, through the operations and into the closure and post-closure phase. The extent of impacts would be limited to areas of the project area in which wetlands would be removed or disturbed, or would affect wetlands outside of the project area, within one or more HUC 10 watersheds.

To assess the relative magnitude and extent of impacts, the relative proportion of common wetland types in each watershed was estimated. The National Wetland Inventory (NWI) mapping covers only about one-fourth of the watershed area, and was therefore not sufficient for this effort. The uniform vegetation mapping provided by the Alaska Center for Conservation Science (ACCS)

AMERICAN OVERSIGHT

provided the best available spatial data for estimating wetland coverage for the HUC10 watersheds.

Vegetation class descriptions from the Vegetation Map and Classification guidebooks (Boggs et al. 2016a, 2016b) were reviewed. Vegetation classes mapped in the watersheds were assigned to one of the following types in a crosswalk for comparison with wetlands mapped for the project: upland, forested wetland, shrub wetland, herbaceous wetland, aquatic bed wetland, or waterbody.

The descriptions of herbaceous vegetation classes included wetland status; therefore, these vegetation classes were directly crosswalked to herbaceous wetland or upland. The woody vegetation classes lacked wetland status, so it was not possible to directly crosswalk types. Because forested vegetation types were uncommon, an assignment was made for each mapped unit based on site characteristics.

Shrub vegetation classes were common; a shrub vegetation class was assigned to wetland or upland based on a review of site characteristics. The dwarf shrub class in particular was not broken out in the mapping to differentiate dry sites from wet sites. Therefore, the acreages and percentages for each watershed are used here for comparison purposes, and should be considered an approximation of the actual extent of wetlands.

4.22.1 No Action Alternative

Under the No Action Alternative the Pebble Project would not be constructed, and no new impacts to wetlands would occur.

4.22.2 Action Alternative 1 – Applicant's Proposed Alternative

4.22.2.1 Mine Site Direct Impacts

[Note: Section to be revised with updated numbers and descriptions based on updated project description.]

[Note: Temporary versus permanent impacts will be refined in all text and tables pending an updated project description].

Most project-related direct impacts to wetlands would be initiated during the construction phase and would result in temporary or permanent loss of wetlands or alteration in wetland functions. Primary direct construction-related impacts to wetlands and waterbodies would include:

- Clearing and removal of wetland vegetation
- Placement of fill in wetlands and waterbodies
- Excavation that eliminates wetlands and waterbodies
- Compaction, rutting, and mixing of wetland soils.

Excavation of the open pit, quarries, and sediment ponds and filling within the tailings storage facility (TSF) and stockpiles would occur throughout the active life of the mine. The maximum extents of all surface disturbance impacts were used to evaluate direct wetlands impacts for the Mine Site. Some wetland reclamation would begin shortly after the start of construction and would continue throughout operations and closure.

A total of 3,191 acres of wetlands and waterbodies would be directly affected by the proposed Mine Site facilities (Table 4.22-1). The greatest impacts would occur from the bulk tailings storage cell (1,083 acres), the TSF (548 acres), the open pit (178 acres), and the haul road (162 acres).

Within the Mine Site, most impacts to wetlands (XX acres) would occur within one of the HUC10 watersheds, named the "Headwaters Koktuli River watershed" (Figure 4.22-1; Table 4.22-1). Less

AMERICAN OVERSIGHT

than 10 of impacts to wetlands and waters would occur within the Upper Talarik Creek Watershed (Table 4.22-1). Direct impacts in these watersheds would affect primarily deciduous shrub wetlands on slopes (XX percent and XX percent, respectively) and herbaceous wetlands on slopes (XX percent and XX percent, respectively). Previous disturbance to wetlands in this area is minimal. Facilities have been sited to avoid and minimize wetland impacts and allow efficient reclamation of disturbed areas.

[Note: The above sections will be updated with an updated project footprint.]

Excavation, filling, and clearing of wetlands would alter or remove their capacity to provide hydrologic, biogeochemical, and biological functions. Construction-related disturbances may alter wetland modification of groundwater functions (recharge and discharge), and would decrease stormwater and floodwater storage and modification of streamflow functions by decreasing the wetlands' potential to dissipate energy and reduce peak flows. These altered hydrologic functions would extend to the streams connected to or downstream from the affected wetlands. See Section 4.16, Surface Water Hydrology, for a discussion of surface water hydrology impacts.

Construction on or through wetlands would decrease or remove the wetlands' potential to improve water quality by preventing erosion and settling sediments. Sediment barriers and erosion control planning would mitigate the loss of this wetland function. Vegetation clearing with no soil disturbance reduces the wetlands' ability to modify water quality and its contribution to the abundance and diversity of wetland fauna. It also may reduce the export of detritus and contribution to the abundance and diversity of wetland flora functions, depending on the extent of vegetation being cleared.

The Headwaters Koktuli River watershed is estimated to contain approximately 56,000 acres of wetlands and waterbodies (33 percent of the watershed). Approximately 45,000 acres (26 percent of the watershed), are shrub wetlands and 9,000 acres (five percent) are herbaceous wetlands. Forested wetlands (39 acres) and aquatic bed wetlands (132 acres) each cover less than one percent. Mine Site activities would affect 2,460 acres of shrub wetlands and 657 acres of herbaceous wetlands within the Headwaters Koktuli River watershed (Table 4.22-1). This represents approximately five percent and seven percent, respectively, of shrub and herbaceous wetlands in the watershed. No forested wetlands and one acre of aquatic bed wetlands would be affected.

[Note: Information on specifics of unique, rare, or high-value wetlands types will be added in a later version.]

Riverine wetlands are another potentially high-value wetland type because of their numerous functions, especially fish and wildlife habitat functions. A total of 176 acres of riverine HGM class wetlands in the Headwaters Koktuli River watershed would be affected by activities at the Mine Site. The extent of riverine wetlands in the watershed is not known. They account for approximately six percent of the Mine Site mapping area. The watershed contains the North Fork and South Fork Koktuli River and their numerous tributaries. It is expected that riverine wetlands would account for at least six percent of the watershed as a whole, or approximately 10,000 acres. Therefore, the area of impacts from Mine Site activities would represent approximately two percent of all riverine wetlands in the watershed. Less than one acre of riverine HGM class wetlands in the Upper Talarik Creek Watershed would be affected by activities at the Mine Site.

AMERICAN OVERSIGHT

Reclamation

Pebble Limited Partnership (PLP) has incorporated requirements for mine closure and long-term water management into the design of the project. During the permitting phase, a reclamation plan would be developed that would include reclamation of wetlands where feasible. The discussion below is based on generally accepted wetland reclamation practices for mine sites in Alaska. PLP has also provided some conceptual-level information on reclamation in its application and in subsequent responses to requests for information.

The Alaska Department of Natural Resources (ADNR) approves reclamation plans and associated financial assurances before construction. In its project description for the Department of the Army Application (December 2017), PLP has identified some of the design elements that would facilitate successful reclamation during and after the closure phase:

- Quarried and waste rock would be geochemically tested prior to being used in construction to avoid the potential for contaminated drainage during operations and post-closure.
- Topsoil and overburden would be salvaged during construction for use as growth medium during reclamation.
- TSF embankment slopes would be designed to provide long-term stability and facilitate the placement of growth medium.
- The overall project footprint would be minimized to facilitate physical closure and post-closure water management.

[Note: This section will be updated with information from RFI 024.]

Material sites constructed in valley bottoms or lowland sites are candidates to be reclaimed to create new ponds with emergent wetlands where sufficient water quality and hydrology are available. Final contouring around created ponds could focus on providing habitat at the water's edge and a complex interspersion between wetland and upland vegetation. Moderate to steeply sloping wetland or upland mosaics with wetland inclusions would be less feasible to restore to wetlands because of the marginal hydrology, and some fills may not be removed in these areas. Marginal wetland hydrology would be expected in areas where excavations and road cuts through colluvium and rock have reduced overland sheet flow.

Shrub wetland successional processes, generally initiated by natural disturbances such as wildland fires, gradually reestablish typical vegetation and eventually hydrologic characteristics. When construction disturbs wetlands, successional processes may be prolonged or may not occur. Construction disturbances differ from natural disturbances in that the organic mat and organic soil horizons are often removed completely, which removes seedbeds, and reduces surface and subsurface water storage capacity. The timing and extent of recovery likely depend on the intensity, extent, and duration of the disturbance. The time required for wetlands to return to pre-disturbance soil moisture and original vegetation cover has not been well documented in western Alaska.

Development of self-sustaining wetland plant communities on previously disturbed Alaska wetlands may occur within 10 to 30 years, but may be slowed in gravelly or sandy soils, and by years with failed seedling establishment or seed production. Revegetation success may be enhanced by conducting careful planning and management; minimizing disturbance; segregating and protecting materials to be used during reclamation; using the appropriate seed mixture and seeding rates; and monitoring for erosion and revegetation success.

Reclamation of wetland conditions may be complicated in areas where less permeable layers have been breached or removed. This would alter surface hydrology, causing previous wetland

AMERICAN OVERSIGHT

areas to drain. In these situations, restored wetlands are likely to differ in type and functional capacity from the original wetlands for decades to centuries.

Surface water resources available to wetlands would continue to be altered in distribution and abundance with an estimated return to within XX percent of predevelopment streamflows at the downstream end of the mine development (see Section 4.16, Surface Water Hydrology). These changes in surface water distribution and abundance could cause some wetlands to dry up while others would be inundated or become wetter.

The pit lake would continue to fill for a period of several decades post-closure. Once the water level reaches elevation 890 feet, water would be pumped from the pit. This elevation is at least 50 feet below the elevation at which groundwater flow would be directed outward from the open pit. As a result, a new equilibrium groundwater level would become established around the pit. Wetlands and streams above the pit lake level would potentially lose groundwater to the cone of depression created by the pit lake. This may result in long-term wetland and streamflow effects. Groundwater modeling would be used to assess potential wetland and stream dewatering, and to identify those wetlands and functions that are likely to be affected (see Section 4.17, Groundwater Hydrology, for details).

[Note: The above sections will be updated with an updated project footprint.]

4.22.2.2 Mine Site Indirect Impacts

[Note: Information on this topic to be added at a later time].

Fugitive Dust

[Note: Information on this topic to be added at a later time].

Dewatering

[Note: Information on this topic to be added at a later time].

4.22.2.3 Amakdedori Port Direct Impacts

[Note: This section to be updated with revised project description information.]

Construction of Amakdedori Port would directly affect less than one acre of intertidal waters and 109 acres of subtidal waters in the Amakdedori Creek-Frontal Kamishak Bay watershed and 271 acres of subtidal waters in the Cook Inlet watershed (Table 4.22-2). The port terminal and associated facilities would be sited and designed to avoid most wetlands. Previous disturbance to wetlands or waterbodies in this area is minimal.

The Amakdedori Port facilities would be removed during closure, except for those required to support shallow draft tug and barge access to the dock for the transfer of bulk supplies. Disturbed areas would be recontoured, graded, ripped, and scarified. Topsoil and growth media would be placed as needed, and surfaces would be seeded for revegetation.

4.22.2.5 Transportation Corridor and Natural Gas Pipeline Corridor Direct Impacts

[Note: This section to be updated with revised project description information. Temporary versus permanent impacts will be addressed at that time, and a table with direct temporary impacts for the Natural Gas Pipeline Corridor will be included.]

Locations West of Cook Inlet

Construction of the Transportation and Natural Gas Pipeline corridors from Amakdedori Port to the Mine Site would directly and permanently affect XX acres of wetlands (Table 4.22-3). The south access road between the port and the south ferry terminal at Iliamna Lake would affect XX acres. The mine access road from the north ferry terminal to the mine site would affect ## acres of wetlands and waterbodies. The remaining XX acres of impacts would be from the Iliamna and Kokhanok Airport spur roads, material sites, and ferry landings.

Impacts would be permanent because the road would remain to facilitate long-term post-closure water treatment and monitoring. Previous disturbance to wetlands in this area is minimal. The corridor has been sited to avoid and minimize wetland impacts and allow for efficient reclamation of disturbed areas.

A total of XX miles of streams would be directly affected by construction, including XX miles of perennial streams and XX miles of intermittent streams (Table 4.22-3). The larger streams with a width at ordinary high water (OHW) of 16 feet or greater would be bridged. Bridge locations are shown in Figure 4.22-2. Site-specific designs have been developed for bridges. Smaller stream

AMERICAN OVERSIGHT

crossings would use a series of standardized, conceptual culvert design categories based on stream width and fish presence. See Section 4.16, Surface Water Hydrology, for a discussion of surface water hydrology impacts.

Activities in the Transportation and Natural Gas Pipeline corridors would affect wetlands in five HUC10 watersheds. The highest number of acres impacted (XX acres) would occur in the Upper Talarik Creek watershed (Figure 4.22-2; Table 4.22-3). Direct impacts in this watershed would affect primarily deciduous shrub wetlands on slopes (XX percent) and flats (XX percent), and along streams (XX percent).

The Upper Talarik Creek watershed is estimated to contain approximately 34,000 acres of wetlands and waterbodies (39 percent of the watershed). Approximately 31,000 acres (35 percent of the watershed) are shrub wetlands, and 1,200 acres (one percent) are herbaceous wetlands. Forested wetlands (636 acres) and aquatic bed wetlands (eight acres) each cover less than 1 percent. Activities in the Transportation and Natural Gas Pipeline corridors and in a small portion of the Mine Site would affect XX acres of shrub wetlands and XX acres of herbaceous wetlands in the Upper Talarik Creek watershed, which is estimated to be less than one percent of shrub and herbaceous wetlands in the watershed. No forested or aquatic bed wetlands would be affected.

Based on vegetation and wetland mapping for the project, five acres of bog vegetation would be affected by activities in the Transportation and Natural Gas Pipeline corridors in the Upper Talarik Creek watershed. The extent of bog vegetation in the watershed is not known.

A total of XX acres of riverine wetlands would be affected by activities in the Transportation and Natural Gas Pipeline corridors in the Upper Talarik Creek watershed (Table 4.22-3). The extent of riverine wetlands in the watershed is not known. They account for approximately four percent of the Transportation and Natural Gas Pipeline corridor mapping areas. Riverine wetlands are estimated to account for approximately four percent of the watershed as a whole, or 3,500 acres. The corridor impacts, therefore, would represent less than two percent of all riverine wetlands in the watershed.

Wetland and waterbody impacts in the other four watersheds would be relatively low from a watershed perspective. The Iliamna Lake watershed, excluding the lake itself, has an estimated 180,000 acres of wetlands and waterbodies (33 percent of the watershed). The project would result in direct impacts on XX acres of slope wetlands and one acre of riverine wetlands (Table 4.22-3). The Newhalen River watershed has an estimated 35,000 acres of wetlands and waterbodies (29 percent of the watershed); one acre of slope wetlands would be directly affected. The Gibraltar Lake watershed has an estimated 34,000 acres of wetlands and waterbodies (41 percent of the watershed); nine acres of slope wetlands would be directly affected. The Amakdedori Creek–Frontal Kamishak Bay watershed has an estimated 77,000 acres of wetlands and waterbodies (44 percent of the watershed); 15 acres of slope wetlands and one acre of riverine channel would be directly affected (Table 4.22-3). The Transportation Corridor does enter the Paint River watershed for a very short distance, but no wetland or waterbody impacts are anticipated.

[Note: Table to be updated with revised project description information.]

AMERICAN OVERSIGHT

Figure 4.22-2: Upper Talarik Creek Watershed Impacts

[Note: Figure under development]

AMERICAN OVERSIGHT

Locations East of Cook Inlet

[Note: The following section to be updated with revised project description information.]

Activities in the Natural Gas Pipeline Corridor on the Kenai Peninsula would affect wetlands and waterbodies in the Stariski Creek–Frontal Cook Inlet watershed (Figure 4.22-3). Direct impacts on this watershed would affect primarily shrub wetlands.

The pipeline would cross approximately 94 miles of Cook Inlet, between Anchor Point and Amakdedori Port. Horizontal directional drilling would be used to install pipe segments from the compressor station out into waters that are deep enough to avoid navigation hazards. From this point, the pipe would be installed in a trench out to a water depth of 200 feet, and then laid on the sea floor. Direct temporary impacts on approximately 340 acres of marine subtidal waters and less than one acre of intertidal waters would occur (Table 4.22-4). The compressor station at Anchor Point would be located in an area that would avoid wetland impacts.

Reclamation

The road system would be retained as long as required for the transport of bulk supplies needed for long-term post-closure water treatment and monitoring. Once no longer needed, the road system would be reclaimed. Disturbed areas would be recontoured, graded, ripped, and scarified. Topsoil and growth media would be placed as needed, and surfaces would be seeded for revegetation. The Iliamna Lake ferry facilities would be removed during closure. Once it is no longer required to provide energy to the Mine Site, the natural gas pipeline would be pigged and cleaned before being abandoned in place. Surface facilities associated with the pipeline would be removed and reclaimed.

During closure and post-closure, wetlands would be reestablished wherever practicable. The geographic extent of direct and indirect effects would affect five HUC10 watersheds, but the majority of impacts (54 percent) would occur in the Upper Talarik Creek watershed, in the Bristol Bay basin. Most impacts throughout all watersheds would be on shrub (59 percent) and herbaceous (18 percent) wetlands on slopes, which are common throughout the region. There would be some impacts on riverine wetlands (eight acres) that are important for fish habitat, although this represents a relatively small portion of riverine wetlands across all watersheds.

FY 2019 CONGRESSIONAL HEARING
BRISTOL BAY PEBBLE MINE CWA SECTION 404(c) REVIEW

QUESTION: Why didn't EPA withdraw its 2014 CWA Section 404(c) Proposed Determination?

ANSWER:

- On January 26, 2018, EPA issued a decision that suspends the proceeding to withdraw the Proposed Determination (PD) and leaves that Determination in place pending consideration of any other information that is relevant to the protection of the world-class fisheries contained in the Bristol Bay watershed, in light of the CWA Section 404 permit application that Pebble Limited Partnership (Pebble) has now submitted to the Corps.
- EPA's January 2018 decision neither deters nor derails the Corps' review of Pebble's Section 404 permit application, which is currently ongoing. Pebble continues to enjoy the protection of due process and the right to proceed.
- In making the decision regarding whether to withdraw the 2014 PD at this time, the EPA considered its relevant statutory authority, applicable regulations, and the input it received as part of the tribal consultation, ANCSA Corporation consultation, and public comment periods regarding the Agency's reasons for its proposed withdrawal, as well as recent developments, including Pebble's submittal of a Section 404 permit application to the U.S. Army Corps of Engineers in December of 2017.
- The EPA received more than one million public comments regarding its proposal to withdraw the 2014 PD, the overwhelming majority of which expressed opposition to withdrawal.

BACKGROUND:

- Since 2001, Northern Dynasty Minerals and its subsidiary Pebble have been planning a large-scale open pit mine at the Pebble deposit in the Bristol Bay watershed. The Bristol Bay watershed in southwest Alaska supports the largest sockeye salmon fishery in the world. The fishery is valued at $1.5 billion annually, supports about 14,000 jobs and has served as a significant subsistence fishery for Alaska Natives for over 4000 years.
- EPA's July 2014 CWA 404(c) PD outlines potential restrictions to limit the extent of salmon-supporting streams and wetlands that could be destroyed or degraded from the discharge of dredged or fill material related to mining the Pebble deposit.
- Pebble Lawsuits: In 2014 Pebble filed three lawsuits against EPA relating to EPA's work in the Bristol Bay watershed. A preliminary injunction associated with one of these lawsuits halted EPA's 404(c) review in November 2014. On May 11, 2017, Pebble and EPA reached a settlement agreement resolving the remaining lawsuits.
- As part of the settlement agreement, EPA agreed to initiate a process to propose to withdraw its 2014 CWA 404(c) PD.
- In December 2017, Pebble submitted its CWA Section 404 permit application to the Army Corps proposing to develop a mine at the Pebble deposit and the Corps initiated its Section 404 permit review and NEPA review processes.
- On January 26, 2018, the EPA made a decision to suspend the withdrawal of its 2014 CWA 404(c) PD regarding a potential mine at the Pebble deposit.

Lee and Crystal,

I hope all is well. I'm writing today to request a meeting with you, Lee, for a group of Alaskan Native leaders that will be in Washington on November 13 and 14 to discuss issues related to the Pebble Mine. The group will include:

Brad Angasan Alaska Peninsula Corporation

Ventura Samaniego Kijik Corporation

Lisa Reimers Iliamna Development Corporation

Sue Anelon Iliamna Natives Limited

Chasity Anelon Pebble Employee/ Iliamna Resident

AMERICAN OVERSIGHT

This group will be meeting with the Alaska delegation, with other members and staff in Congress, and with representatives of the Administration (at EPA, Interior and elsewhere).

I'm hoping we can find some time for this group on one of those two days. Let me know if that might work, or if you need anything else from me.

Best wishes,

Peter

Matt – The attached includes minor changes requested by the Corps as part of the HAC QFR process OCFO is running. This version will be sent to OMB for final clearance.

You should probably have the HEC responses be consistent.

Matt,

Sorry we are a little late on this. Our responses are attached. I do not believe that our office coordinated our responses with the Corps, but I will reach out to them to doublecheck. Let me know if you have any questions.

Subject: By noon Friday: Help respond to QFRs from April 26 Administrator HEC hearing (?s on 404(c), WIFIA, lead/LCR, PFAS)

Ann, Tim, and Greg,

First – I'm sending this to all three of you because I'm not sure if this best flows through the special assistant or budget channels, especially given the SAC hearing the same day. We'll defer to you on that.

AMERICAN OVERSIGHT

Attached are Questions for the Record that recently came in from House Energy & Commerce after the Administrator's April 26 budget hearing. I've attached both the full set (for your context) and the OW-specific questions (which is probably the only attachment you need to forward to the offices – but defer to you on that). You can disregard any of the office assignments in the longer document that conflict with the shorter doc.

The attached subset has questions on **404(c), WIFIA, lead & LCR, and PFAS**. You'll see that Deliberative Process / Ex. 5

Deliberative Process / Ex. 5

Please send us proposed, cleared responses by noon Friday; our OCIR team is hoping to get all the responses compiled by the end of the week. Let us know if there's any way we can help.

Thanks,
Matt

John,
I need 4 or 5 high level talking points for the Administrator on Pebble by 2:00 pm. Generally that Pebble has submitted a permit, we are working with the COE on the scope of the EIS, we are waiting to see what the actual mine might look like as part of the EIS/404 permit process before moving ahead with additional comments and anything else you think relevant.

AMERICAN OVERSIGHT

Date: June 13, 2018

Pebble Talking Points

- In December 2017, Pebble submitted its CWA Section 404 permit application to the Army Corps of Engineers proposing to develop a mine at the Pebble deposit.
- In January 2018, the Corps issued a public notice that provided Pebble's permit application to the public and stated that an Environmental Impact Statement (EIS) will be required as part of its permit review process consistent with National Environmental Policy Act (NEPA).
- At the invitation of the Corps, the EPA has agreed to be a cooperating agency in the Corps' EIS process and we are currently working with the Corps on the scoping phase of the EIS process.
- The Corps currently estimates that a draft EIS will be ready for public notice and comment by mid to late spring of 2019.
- On January 26, 2018, EPA issued its decision to suspend the proceeding to withdraw its 2014 CWA Section 404(c) Proposed Determination regarding the Pebble deposit and leave that Determination in place pending consideration of any other information that is relevant to the protection of the world-class fisheries contained in the Bristol Bay watershed, in light of the CWA Section 404 permit application that Pebble has now submitted to the Corps.
- EPA's January 2018 decision neither deters nor derails the Corps' review of Pebble's Section 404 permit application, which is currently ongoing. Pebble continues to enjoy the protection of due process and the right to proceed.

<u>Additional Background from R10</u>

- On May 25th, Quantum Minerals pulled out of the project. They had pledged $150 M in return for 50% equity.
- Tom Collier visited R10 last week to discuss the project. They are working on other investors. They are also looking at projects within the Bristol Bay Region to improve Public Relations, such as power projects, gas pipeline to villages, or a contribution to a fund that would act as insurance for fisherman during poor salmon returns.
- Bryce Edgmon, Speaker of the House for Alaska State Legislature, recently wrote a letter criticizing the Corps process in the Pebble Limited Partnership permitting process.

AMERICAN OVERSIGHT

Location:	1201 Constitution Ave NW, Washington DC 20004; Please call 202-564-5700 for escort; 3233 WJCE
Start:	Wed 11/14/2018 9:30 AM
End:	Wed 11/14/2018 10:15 AM
Show Time As:	Tentative
Recurrence:	(none)
Meeting Status:	Tentatively accepted
Organizer:	Forsgren, Lee
Required Attendees:	peterrobertson@pebblepartnership.com; Gude, Karen; Frazer, Brian; Goodin, John
Optional Attendees:	Penman, Crystal

Lee and Crystal,

I hope all is well. I'm writing today to request a meeting with you, Lee, for a group of Alaskan Native leaders that will be in Washington on November 13 and 14 to discuss issues related to the Pebble Mine. The group will include:

Brad Angasan Alaska Peninsula Corporation

Ventura Samaniego Kijik Corporation

Lisa Reimers Iliamna Development Corporation

Sue Anelon Iliamna Natives Limited

Chasity Anelon Pebble Employee/ Iliamna Resident

Rhiannon Nanalook Pebble Employee/ Iliamna Resident

Shannon Johnson South Central foundation Clinic & Lake and Peninsula School Board

This group will be meeting with the Alaska delegation, with other members and staff in Congress, and with representatives of the Administration (at EPA, Interior and elsewhere).

AMERICAN OVERSIGHT

I'm hoping we can find some time for this group on one of those two days. Let me know if that might work, or if you need anything else from me.

Lee,

Please find the Administrator's talking points for next week's hearings attached. The majority of the bullets were pulled

Deliberative Process / Ex. 5

I'd like to draw your attention to three edits that resulted from this process.

Non-Responsive: Unrelated to Bristol Bay/Pebble Mine

Please do not hesitate to follow up with me, Tim, or Greg with any questions.

Best,

Danny Giddings

Bristol Bay-Pebble Mine CWA Sec. 404(c) Review

- EPA published its proposal to withdraw its CWA Section 404 (c) Proposed Determination (PD) in July 2017 and took public comment, held two public hearings in the Bristol Bay region, and consulted with tribal governments and Alaska Native Claims Settlement Act (ANCSA) Corporations from the Bristol Bay region.
- After reviewing all of the input and taking into consideration the recent developments regarding the submittal of Pebble Limited Partnership's (PLP) permit application, EPA has decided to suspend the withdrawal of the Proposed Determination at this time. This decision

AMERICAN OVERSIGHT

neither deters nor derails the application process of PLP's proposed project and proponents continue to enjoy the protection of due process and the right to proceed.

Henry,

I wanted to thank you again for meeting with my CEO Tom Collier and me last month.

I've also just spoken with Steve Owens about your conversation, and am wondering whether you and I can follow up with a short phone call.

I'm happy to do it at nearly any time, including well after regular work hours if that best accommodates your busy daytime schedule. Let me know what might work best for you.

Thanks so much.

Sincerely,

Peter Robertson

Lee, this is the meeting I mentioned to you last week. If you can make it, that would be great. If not, please let me know whom else I should ask. As we discussed as well, please let the appropriate entities opposed to the mine know that I am meeting with Pebble, and if they'd like a meeting I am open to one.

Thanks

Henry

AMERICAN OVERSIGHT

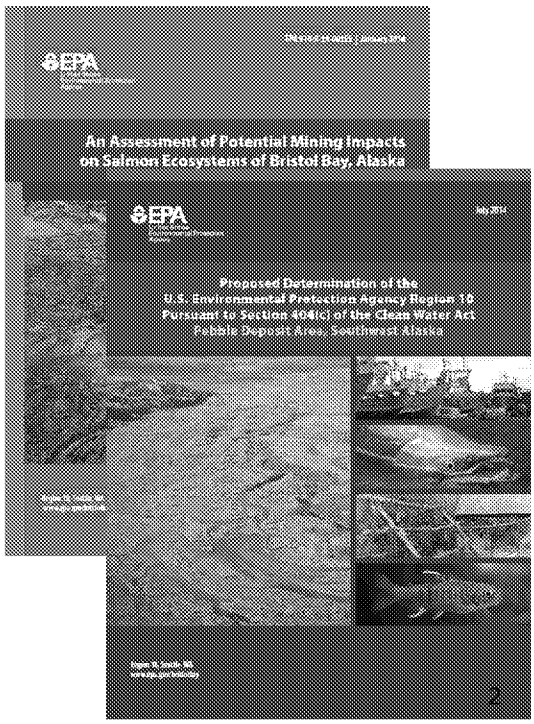
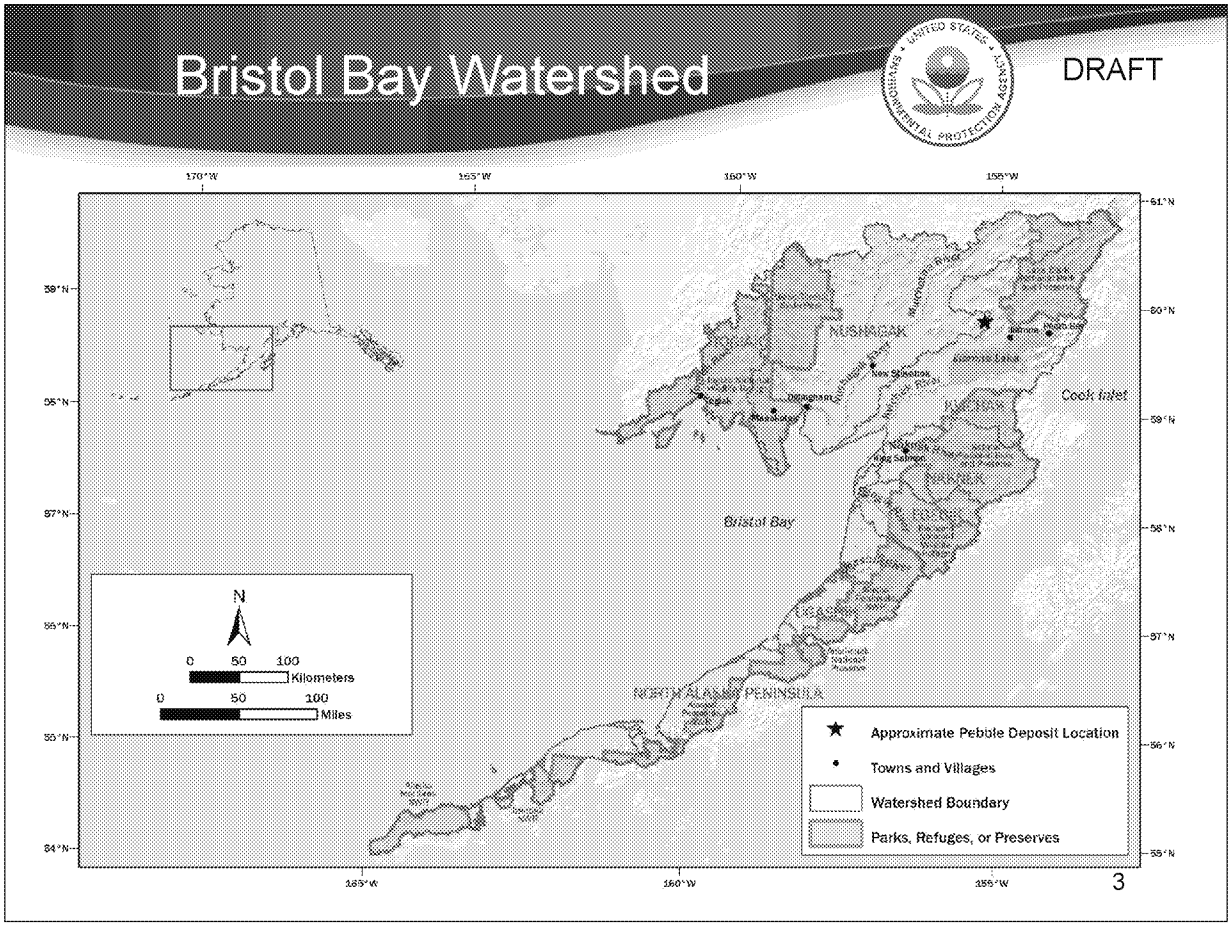
EPA's Work in the Bristol Bay Watershed



Presentation for EPA's Acting Assistant Administrator
Henry Darwin
July 27, 2018

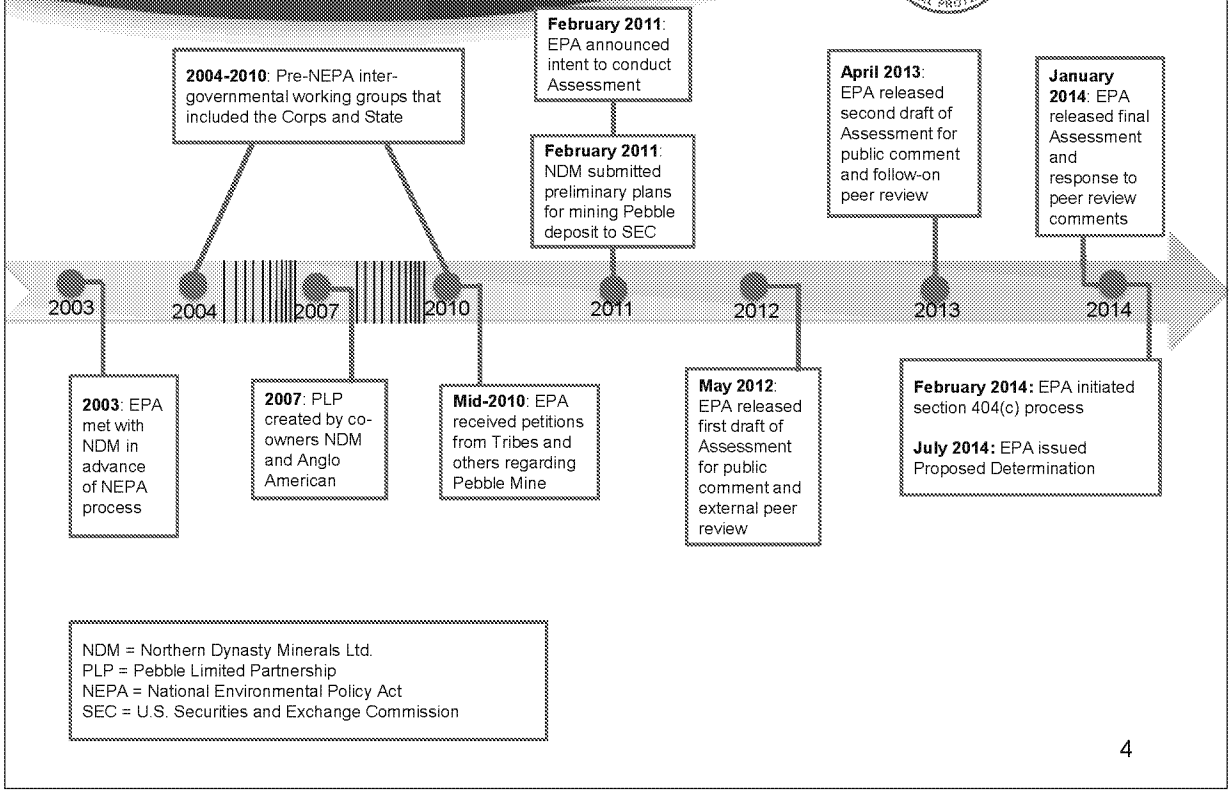
AMERICAN OVERSIGHT



Overview

DRAFT

- EPA's Involvement History
- Science
- Section 404(c) Regulatory Response
- Section 404 Permitting and NEPA

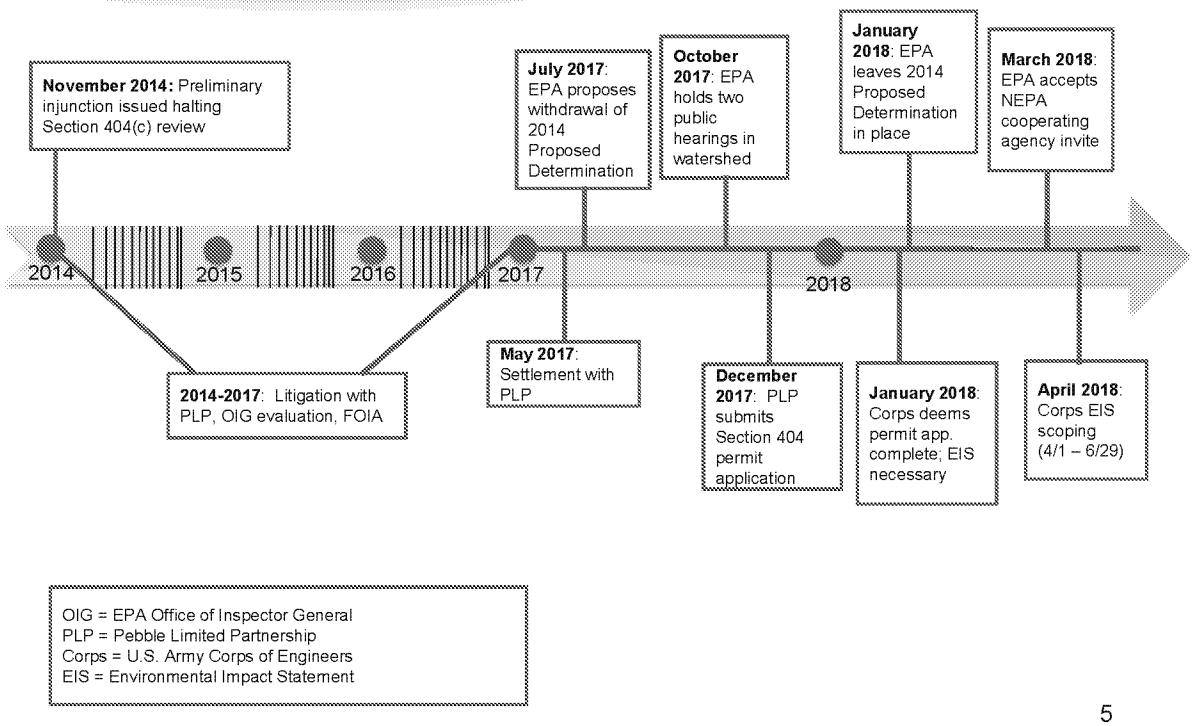


AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

Timeline 2003 - 2014

DRAFT



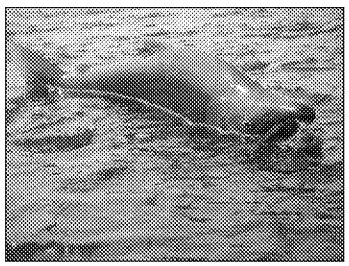
NDM = Northern Dynasty Minerals Ltd.
PLP = Pebble Limited Partnership
NEPA = National Environmental Policy Act
SEC = U.S. Securities and Exchange Commission

AMERICAN OVERSIGHT

Timeline 2014 - Present

DRAFT

OIG = EPA Office of Inspector General
PLP = Pebble Limited Partnership
Corps = U.S. Army Corps of Engineers
EIS = Environmental Impact Statement



AMERICAN OVERSIGHT

Bristol Bay Watershed Assessment

DRAFT

- Purpose:
  - Characterize the biological and mineral resources of the Bristol Bay watershed
  - Increase understanding of the potential impacts of large-scale mining on the region's fish resources
  - Inform future decision-making

- Scientific Ecological Risk Assessment evaluating potential impacts associated with:
  - Large-scale mine construction and operation
  - Accidents and failures

- Three-year scientific assessment effort
  - Independent external peer review
  - Stakeholder and public engagement
    - 8 public meetings
    - 2 rounds of public comment – over 1.1 million comments
  - Tribal consultations

AMERICAN OVERSIGHT

Bristol Bay Watershed Resources

DRAFT

Biological Resources:

- Bristol Bay produces almost half of world's sockeye salmon
- Kvichak watershed world's largest producer of sockeye salmon
- Nushagak watershed frequently at or near world's largest producer of Chinook salmon

Biological Resources Support:

- 14,000 jobs, generates $480 million annually in direct economic expenditures and sales
  - Salmon fishery valued at $1.5 billion annually
- 4,000-year-old subsistence fishery for Alaska Natives

Geological Resources:

- At least 10 claims with more than minimal exploration, including Pebble.
- Pebble deposit: low-grade, with copper, gold, and molybdenum
- According to NDM, Pebble could:
  - Be largest mine of its type in North America
  - Produce 3,000 jobs in AK
  - Contribute $2.7 billion to US GDP annually
- Economics of mining the Pebble deposit are speculative
- Since 2001, five major mining companies have walked away from Pebble project

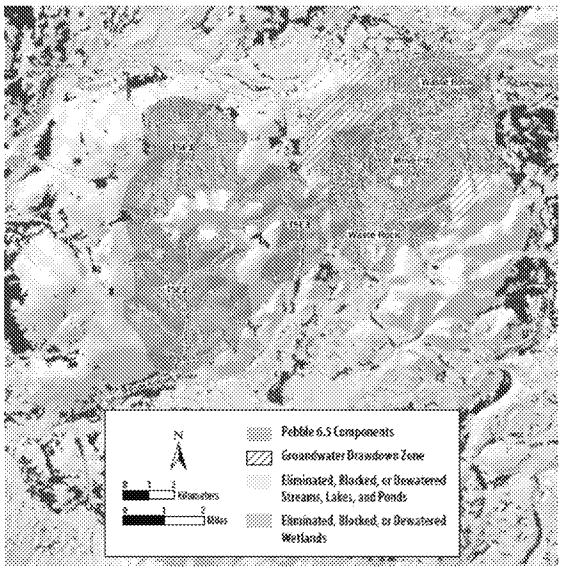
AMERICAN OVERSIGHT

Bristol Bay Watershed Assessment

- Mining scenarios informed by NDM plans submitted to U.S. Securities and Exchange Commission (SEC) in 2011
- Uses 3 potential stages of mine development at Pebble deposit
  - 0.25-billion-ton mine (worldwide median size porphyry copper deposit)
  - 2.0-billion-ton mine (smallest mine size proposed by NDM to SEC)
  - 6.5-billion-ton mine (largest mine size proposed by NDM to SEC)
- NDM says deposit is nearly 12 billion tons

AMERICAN OVERSIGHT

Bristol Bay Watershed Assessment



DRAFT

Mine Footprint Impacts:

- 24-94 miles of salmon-supporting streams destroyed
- 1,300-5,350 acres of wetlands, ponds, lakes destroyed
- 9-33 miles of salmon-supporting streams with altered streamflow likely to affect ecosystem structure and function

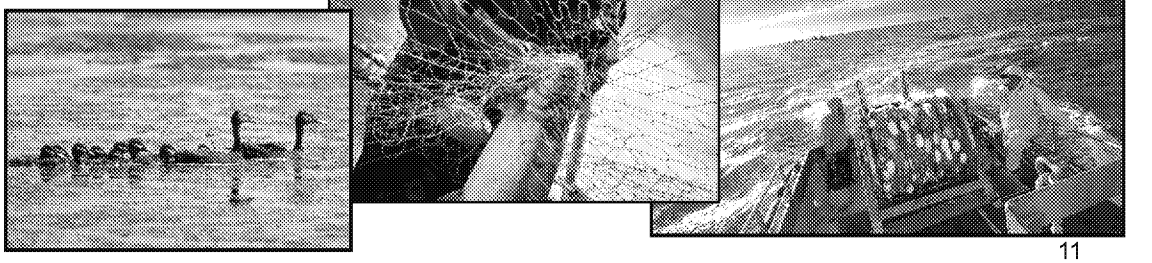
Other Impacts:

- Tailings dams need maintenance in perpetuity
- Routine operations and accidents would increase impacts on salmon habitat quality, both at the mining site and along the 86-mile transportation corridor.

AMERICAN OVERSIGHT

Clean Water Act Section 404

DRAFT



- § 404(a) authorizes the Secretary of the Army to issue **permits**
  - For the discharge of dredged or fill material into waters of the U.S. at specified disposal sites
- § 404(b) directs the Secretary of the Army to apply **environmental criteria** developed by EPA when specifying disposal sites
  - § 404(b)(1) Guidelines [40 CFR Part 230]
- § 404(c) authorizes EPA to prohibit, deny or restrict (withdraw) the placement of dredged or fill material at defined sites in waters of the U.S.

AMERICAN OVERSIGHT

Limits of Section 404(c)

DRAFT

- **Whenever** it determines, after notice and opportunity for public hearing, that the discharge of such materials into such area will have an **unacceptable adverse effect(s)** on:
  - Municipal water supplies; or
  - Shellfish beds and **fishery areas**; or
  - Wildlife; or
  - Recreation areas.

AMERICAN OVERSIGHT

Pebble Deposit 404(c) Process

DRAFT

Step 1

- 2/28/14: **Initiation by EPA Region 10 – "15-day letter"**
- Consulted with Corps, NDM/PLP, and State

Step 2

- 7/18/14: **Proposed Determination** released (PD) by EPA Region 10
- 8/12-15/14: 7 public hearings in Alaska
- > 670,000 written comments; > 99% (86% unique) supported Proposed Determination

Step 3

- EPA Region 10 will review the public comments
- EPA Region 10 will withdraw PD *or* prepare **Recommended Determination** (RD)

Step 4

- **Final Determination (FD) by EPA Assistant Administrator for Water**
- Consult again with Corps, NDM/PLP, and State
- Within 60 days of receipt of RD, issue FD affirming, modifying, or rescinding RD

AMERICAN OVERSIGHT

What Are the Proposed Restrictions?

DRAFT

Restrict the discharge of dredged or fill material related to mining the Pebble deposit into waters of the U.S. that would, individually or collectively, result in the following:

1. **Loss of Streams.**
   a. The loss of 5 or more linear miles of streams with documented anadromous fish occurrence; **or**
   b. The loss of 19 or more linear miles of streams where anadromous fish are not currently documented, but that are tributaries of streams with documented anadromous fish occurrence; **or**

2. **Loss of Wetlands, Lakes, and Ponds.** The loss of 1,100 or more acres of wetlands, lakes, and ponds contiguous with either streams with documented anadromous fish occurrence or tributaries of those streams; **or**

3. **Streamflow Alterations.** Streamflow alterations greater than 20% of daily flow in 9 or more linear miles of streams with documented anadromous fish occurrence

AMERICAN OVERSIGHT

Response to Section 404(c) Proceeding

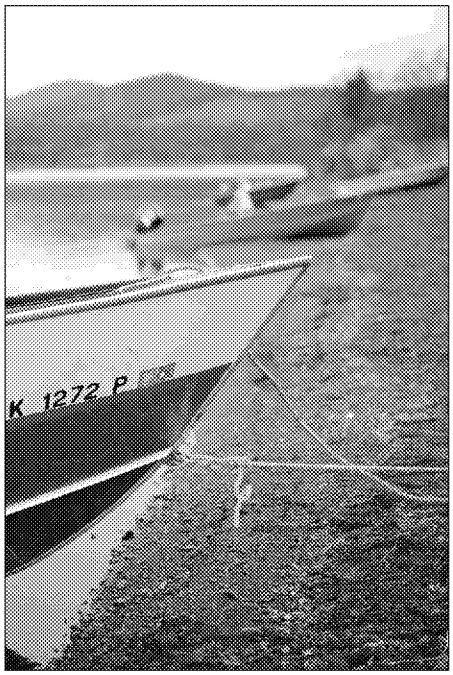
DRAFT

- Office of Inspector General (OIG) Review
  - 17-month in-depth evaluation found no evidence of bias or a pre-determined outcome
  - Possible misuse of position for retired Region 10 employee noted
- PLP broad Freedom of Information Act (FOIA) requests
  - Approximately 18,000 documents produced
- PLP filed three lawsuits in 2014
  - Administrative Procedure Act (APA) challenge to initiation of 404(c) process
  - FOIA litigation
  - Federal Advisory Committee Act (FACA) litigation
- May 2017 settlement agreement
  - Resolved FOIA and FACA litigation and PLP's outstanding FOIA requests

AMERICAN OVERSIGHT

Settlement Agreement

DRAFT



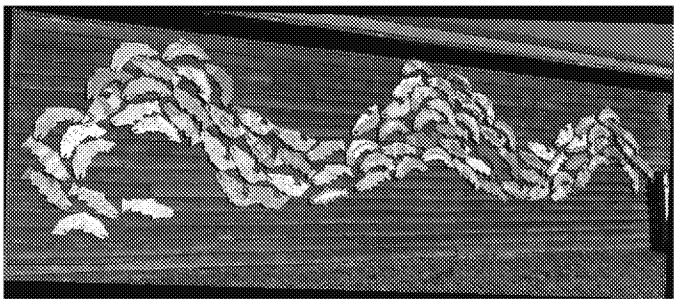
- Key terms of the May 11, 2017 settlement agreement between PLP and EPA:
  - EPA may use its Bristol Bay Watershed Assessment without limitation
  - EPA agrees to initiate a process to propose to withdraw its 2014 Proposed Determination by July 11, 2017
  - EPA agrees not to forward a Recommended Determination (the next step in the 404(c) review process) to EPA HQ until a Final EIS is noticed for the project or May 11, 2021, whichever is earlier
  - PLP drops remaining lawsuits and fee requests against EPA and agrees to file no new FOIA requests during the 2.5- to 4-year hiatus period

AMERICAN OVERSIGHT

Proposal to Withdraw 2014 Proposed Determination

DRAFT

- July 2017: Withdrawal proposed based on policy rationale
  - EPA did not solicit comment on the proposed restrictions or on science or technical information underlying the Proposed Determination
- Outreach and Consultation
  - Proposal generated >1 million comments (~99% opposed)
  - 2 public hearings in watershed
  - Tribal and ANCSA Consultation
    - 16 tribal governments and 1 ANCSA Regional Corp. opposed
    - 1 tribal government and 2 ANCSA Village Corps. supported



AMERICAN OVERSIGHT

Section 404(c) Next Steps

DRAFT

- In January 2018 EPA decided not to withdraw and suspended Section 404(c) process pending further review

- Settlement agreement obligations
  - EPA can issue a new/modified Proposed Determination at any time
  - EPA Region 10 cannot forward a Recommended Determination to EPA HQ until May of 2021 or until a final EIS is noticed, whichever comes first

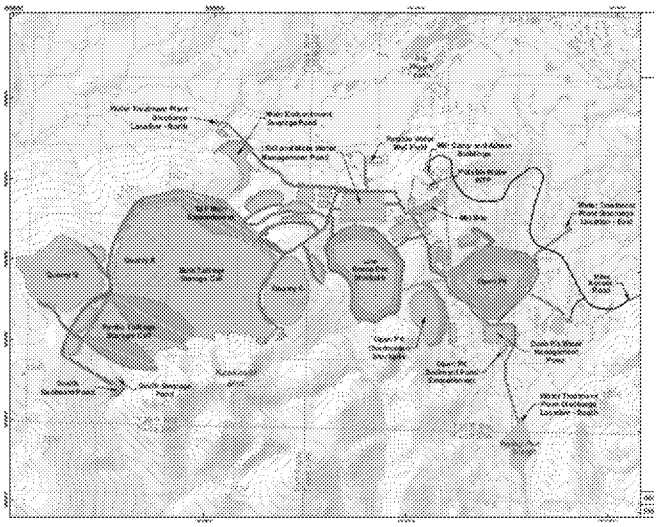
AMERICAN OVERSIGHT

2017 Permit Application

DRAFT

- PLP filed Department of Army (DA) permit application to the Corps in December 2017
  - Includes CWA 404 and RHA Section 10
  - Includes Project Description: mine, power supply, transportation
- Corps deemed application sufficient to begin NEPA

Pebble deposit area



AMERICAN OVERSIGHT

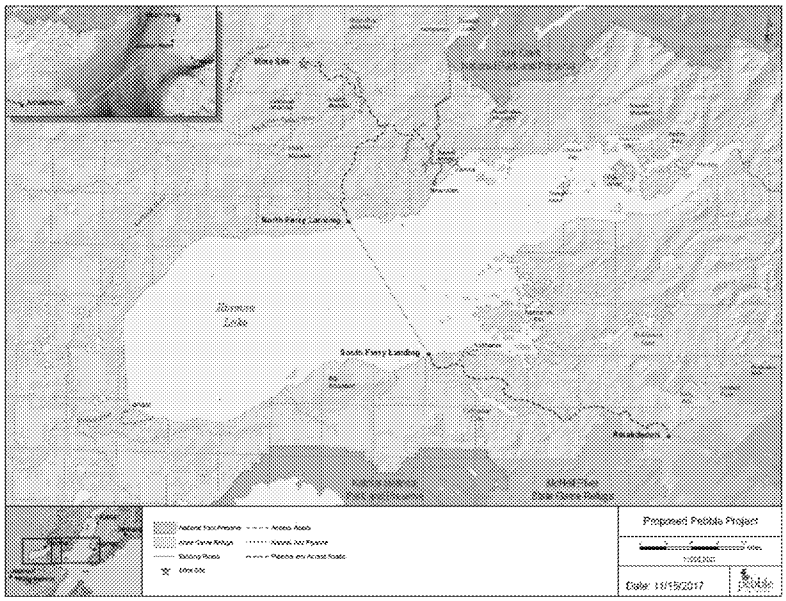
Project Description

DRAFT

Mine Site

- 1.3 billion tons of ore mined over 20 years
- 160,000 tons/day of ore processed to produce:
  - Copper concentrate
  - Molybdenum concentrate
  - Gold via gravity separation
- Open pit mine, ore storage pile, 2 tailings impoundments
- 2 water treatment plants and 3 discharge outfalls
- Closure
  - PAG waste rock & pyritic tailings backfilled into open pit
  - Dry closure of bulk tailings
  - Long-term water treatment

AMERICAN OVERSIGHT



Project Description

Power

- 230 - 270 MW power plant at mine site
- 188 mile natural gas pipeline

Transportation

- 65 miles of roads
- Ferry across Lake Illiamna
- Cook Inlet port site

AMERICAN OVERSIGHT

Project Description

DRAFT

- Proposed mine is:
  - Smaller than 2011 Preliminary Assessment to SEC
  - Larger than the EPA Assessment's 0.25 billion ton mine scenario, which is the basis for the 2014 Proposed Determination

2014 Proposed Determination
Loss of 5 or more miles of streams with anadromous fish; or
Loss of 19 or more miles of streams that are tributaries of anadromous fish streams; or
Loss of 1100 or more acres of wetlands, lakes and ponds contiguous with streams or tributaries to streams that have anadromous fish; or
Stream flow alteration > 20% of daily flow in 9 or more miles of streams with anadromous fish

2017 DA Application	
component	**wetlands filled**
Mine site	3190
Transportation (roads, ferry terminals, port)	480
Pipeline	408
TOTAL	4078

- Differences from 2011 Preliminary Assessment and EPA's Assessment:
  - Less waste rock mined
  - No cyanide leaching
  - Liners (pyritic tailings)
  - Advanced water treatment and "Physical Habitat Simulation System" to mitigate dewatering
  - Compensatory mitigation - TBD
- Project description could evolve during EIS and 404 review

AMERICAN OVERSIGHT

Initial Corps NEPA & 404 Process

DRAFT

- Corps issued informational Public Notice of application (January 5, 2018)
  - Did not request public comment at this time
- Corps Cooperating Agency Plan specifies agency involvement.
  - EPA's cooperating agency involvement is limited to Section 404(b)(1) issues
- EIS scoping occurred April 1 through June 29
  - EPA submitted scoping letter
- Corps is developing preliminary EIS sections
  - EPA reviewing and providing comments where requested

AMERICAN OVERSIGHT

Corps NEPA Schedule

DRAFT

- Corps EIS schedule:
  - Draft EIS – January 2019
  - Final EIS – late 2019
  - Record of Decision – early 2020
- PLP has requested inclusion of the project in FAST 41 infrastructure & critical minerals streamlining

Corps' Pebble website
https://pebbleprojecteis.com/

AMERICAN OVERSIGHT

NEPA Cooperating Agencies

DRAFT

- Federal
  - DOT Pipeline and Hazardous Materials Safety Administration
  - US Coast Guard
  - DOI Bureau of Safety and Environmental Enforcement
  - US Fish and Wildlife Service
  - National Park Service
  - Advisory Council on Historic Preservation
  - EPA
- State
  - Alaska Department of Natural Resources Office of Project Management and Permitting coordinates state agencies (ADNR, ADEC, ADFG, SHPO)
- Local Governments
  - Lake & Peninsula Borough & Kenai Peninsula Borough
- Tribes
  - Curyung Tribal Council
  - Nondalton Tribal Council

AMERICAN OVERSIGHT

EPA Response to Permit Application

DRAFT

- EPA Role
  - NEPA
    - Cooperating agency
    - CAA 309 review of the Draft EIS
  - Clean Water Act
    - CWA 404 permit application & 404(b)(1) review
    - Oversight of State CWA 402 Alaska Pollutant Discharge Elimination System Permit
  - Clean Air Act
    - Oversight of State Air Quality Permit
- EPA has developed a cross-programmatic, multi-disciplinary team

AMERICAN OVERSIGHT

EPA Pebble Teams

DRAFT

R10 Management Team
- David Allnutt, OERA Director
- Krista Mendelman, Acting ARU Manager
- Jill Nogi, NEPA Unit Manager

Lee and Crystal,

AMERICAN OVERSIGHT

I hope all is well. I'm writing today to request a meeting with you, Lee, for a group of Alaskan Native leaders that will be in Washington on November 13 and 14 to discuss issues related to the Pebble Mine. The group will include:

Brad Angasan Alaska Peninsula Corporation
Ventura Samaniego Kijik Corporation
Lisa Reimers Iliamna Development Corporation
Sue Anelon Iliamna Natives Limited
Chasity Anelon Pebble Employee/ Iliamna Resident
Rhiannon Nanalook Pebble Employee/ Iliamna Resident
Shannon Johnson South Central foundation Clinic & Lake and Peninsula School Board

This group will be meeting with the Alaska delegation, with other members and staff in Congress, and with representatives of the Administration (at EPA, Interior and elsewhere).

I'm hoping we can find some time for this group on one of those two days. Let me know if that might work, or if you need anything else from me.

Best wishes,

Peter

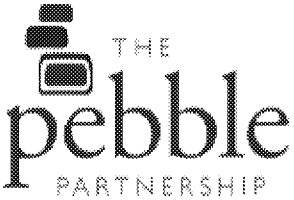
Dear Lee and Crystal,

I hope all is well. I'm reaching out to you because a group of Alaskan natives is coming to Washington for meetings on June 5 and 6 regarding the Pebble mine. They are hopeful that Lee would have time to meet with them. At this point, their schedule is free on both days, except for 1:00 on the 6th, when they meet with Representative Young.

The group includes:



Abe Williams – PLP Employee, Commerical Fisherman, BBNC Shareholder, Grew up in Bristol Bay
Brad Angasan – VP of Corporate Affairs for Alaska Peninsula Corporation
Ventura Samaniego – President & CEO of Kijik Corporation
Margie Olympic – PLP Site Staff & Newhalen Tribal Member
Henry Olympic – President of Newhalen of Tribal Council.

Can you let me know if Lee has has time on either of those days?

Thanks.

Peter

Deliberative Process / Ex. 5

Question 4:
Also, we did find a few articles quoting Lee as a Congressional staffer in the early 1990s when one of the big policy issues in Alaska was whether or not compensatory mitigation should be required. (As I'm sure you know, compensatory mitigation is a potential obstacle for Pebble Mine). We wanted to let you know what they are before we run them, and give you the opportunity to comment—we understand that his views may have changed over the past 30 years. They are:

- To *Investors Business Daily* in 1993:
  - "They always show you in pictures nice marches, but most of what we're talking about any self-respecting duck would refuse to land on."
  - (About a bill that would have required compensatory mitigation requirements to be uniform nationwide), Lee said it was "terribly ironic and a little bit hypocritical" because Alaska was still developing while the lower 48 states had destroyed wetlands for 200 years prior to passage of the Clean Water Act.
  - "It's even more atrocious when you consider that the federal government has locked up over 80 million acres" in Alaska through National Parks and wildlife refuges, he said. "We could never reach the level California already has. For us to be subjected to de facto federal land use planning by federal bureaucrats because California has not done a good job is fundamentally unfair."
  - "Most of our permits are for people trying to build driveways or garages and the worst that happens is the ducks move 30 feet."
- To *Policy Review* in 1991:
  - (Speaking about President George H.W. Bush's 'no net loss of wetlands' policy): "We had more calls (from Alaska) related to (that) in the first few days than we had during the first few days of the Exxon Valdez oil spill."

Hi Ann:

We can have Chris participate by phone. I'll provide him with the number so he can just call in. I will also add the other names to the invitation.

A one-pager is perfectly fine. Again, if there is anything we can read ahead of time, perhaps a particularly good article or website, we would be happy to do a little homework.

Thanks,
Kevin

AMERICAN OVERSIGHT

Thanks Kevin. One question for you and Henry is whether you want to open the phone line for R10, Chris Hladick, to participate. Other than that if you could add David Fotouhi, John Goodin and Brian Frazer to the invite, that would be great.

We'll likely update a previously prepared one-pager for this briefing. If henry has a preferred format, please let me know.

Hi Lee:

I hope your week is starting well. I just sent a meeting request to you for a briefing for Henry on Pebble Mine. Due to **Deliberative Process / Ex. 5** At the meeting, please provide some background, the current status, and any upcoming decision points. Also, if you have any short documents that you would recommend we read before the briefing, please send those along to me.

I appreciate your assistance with this and look forward to seeing you on Friday.

Best,
Kevin

Subject: Top level talking points on Pebble

John,
I need 4 or 5 high level talking points for the Administrator on Pebble by 2:00 pm. Generally that Pebble has submitted a permit, we are working with the COE on the scope of the EIS, we are waiting to see what the actual mine might look like as part of the EIS/404 permit process before moving ahead with additional comments and anything else you think relevant.

AMERICAN OVERSIGHT

Date: June 13, 2018

Pebble Talking Points

- In December 2017, Pebble submitted its CWA Section 404 permit application to the Army Corps of Engineers proposing to develop a mine at the Pebble deposit.
- In January 2018, the Corps issued a public notice that provided Pebble's permit application to the public and stated that an EIS will be required as part of its permit review process consistent with NEPA.
- At the invitation of the Corps, EPA has agreed to be a cooperating agency in the Corps' EIS process and we are currently working with the Corps on the scoping phase of the EIS process.
- The Corps currently estimates that a draft EIS will be ready by mid to late spring of 2019.
- On January 26, 2018, EPA issued its decision to suspend the proceeding to withdraw its 2014 CWA Section 404(c) Proposed Determination regarding the Pebble deposit and leave that Determination in place pending consideration of any other information that is relevant to the protection of the world-class fisheries contained in the Bristol Bay watershed, in light of the CWA Section 404 permit application that Pebble has now submitted to the Corps.
- EPA's January 2018 decision neither deters nor derails the Corps' review of Pebble's Section 404 permit application, which is currently ongoing. Pebble continues to enjoy the protection of due process and the right to proceed.

FYI - Pebble sent the attached two letters to Pruitt this week. Ryan Jackson forwarded both to Lee F and David F. OGC shared them with us.

The letters are critical of the January 2018 decision not to withdraw the PD and argue it should be reconsidered and rehash past Pebble criticisms of the BBWA and PD.

Just wanted you to be aware in case they come up. Not clear if they will be put into CMS.

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

April 24, 2018

The Honorable Scott Pruitt
Administrator
United States Environmental Protection Agency
1200 Pennsylvania Avenue, NW
Washington, DC 20460

Dear Administrator Pruitt:

It is our understanding that you appeared before a group of non-governmental organizations and others last Wednesday, April 11, 2018. During the course of that meeting, you responded to a question about your decision to leave in place the Obama-era regulatory overreach and unprecedented preemptive 404(c) veto imposed on the Pebble mine.

We heard from several people who attended that meeting, who are very concerned about the EPA's use of a 404(c) preemptive veto, about your comments on Pebble and suspending the withdrawal of the "Proposed Determination."

According to participants, you also said we could bring new information about the mine to you. We appreciate your willingness to listen and respectfully request a meeting to do so. We will contact your staff to set up such a meeting. In advance of that discussion, we believe it is important to provide you with accurate information and provide our perspective on some of the issues you cited.

Flawed and Biased Science Was Created by Obama EPA to Justify Unprecedented 404(c) Action.

You noted that the decision was based on the data before you. You stated that the mine was in an area with two rivers, and that the mine could impact millions of fish. We assume that in making these statements, you are relying on the Bristol Bay Watershed Assessment ("BBWA"). That report was developed by the Obama Administration to support a predetermined decision to veto the Pebble Mine through an unprecedented

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

process before a permit application – containing an actual mine plan and other important aspects, such as proposed mitigation – had even been submitted for review. This discredited Obama EPA science is wholly insufficient to support making any regulatory decision, especially one of this significance, and that point was made by a number of EPA's own peer reviewers of the BBWA.

Moreover, The BBWA is an outdated, severely flawed study that used hypothetical mine plans in assessing potential impacts to the region. When EPA prepared the BBWA, it is important to remember that Pebble had never filed a mine plan or a Section 404 permit application. The BBWA assumed we would be in two river systems. As our permit application makes clear, major mining operations are only in one watershed. Pebble Project, Department of the Army, Application for Permit, POA-2017-271, p. 31, found at https://pebbleprojecteis.com/documents/background.

Former Senator and Secretary of Defense William Cohen undertook an independent review of EPA's actions. Among other things, he found that "EPA relied upon the BBWA in its Proposed Determination but acknowledged that there were significant gaps in its assessment and that it was not designed to duplicate or replace the Permit/NEPA Process." http://files.cohengroup.net/Final/Final-Report-with-Appendices-compressed.pdf.

The U.S. House of Representative's Committee on Science, Space, and Technology extensively reviewed the process used to veto the mine and the so-called science developed to support that process. The Chairman of the Committee wrote: "EPA employees colluded with third party Pebble Mine opponents. They sought to deliberately establish a record that pointed to one outcome: the Pebble Mine will be excluded from the regular permitting process and should be stopped." https://science.house.gov/sites/republicans.science.house.gov/files/documents/HHRG-114-SY-WState-S000583-20160428.pdf. The Committee also "determined that the pre-emptive action taken for the Pebble Mine Project was unprecedented under the Clean Water Act and was justified by a questionable assessment that relied on predetermined conclusions developed by EPA officials." https://science.house.gov/sites/republicans.science.house.gov/files/documents/02.22.17%20SST%20Letter%20to%20EPA%20Administrator%20Pruitt.pdf. Finally, the Committee found "that EPA employees inappropriately assisted outside groups in petitioning the

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

agency to change the way they operate and use Section 404(c) to stop this project." https://science.house.gov/sites/republicans.science.house.gov/files/documents/02.22.17%20SST%20Letter%20to%20EPA%20Administrator%20Pruitt.pdf. The U.S. House Committee on Oversight and Government Reform came to a similar conclusion, stating in a November 2015 report "that EPA employees had inappropriate contact with outside groups and failed to conduct an impartial, fact-based review of the proposed Pebble mine." https://oversight.house.gov/wp-content/uploads/2015/11/Bristol-Bay-Pebble-Mine-Staff-Findings-Nov-2015-Final.pdf.

The Actual Pebble Mine Plan, Designed for Sustainability.

As our permit application sets out, "[t]he layout was designed to consolidate the majority of the site infrastructure in a single drainage, the North Fork Koktuli, and avoid the placement of waste rock or tailings in the Upper Talarik Creek drainage." Pebble Project, Department of the Army, Application for Permit, POA-2017-271, p. 31, found at https://pebbleprojecteis.com/documents/background. I took those steps explicitly for sustainability purposes, because the Upper Talarik Creek supports significantly greater numbers of salmon than does the North Fork Koktuli. However, your statement that "millions of salmon" occupy this area is simply incorrect. The average escapement of salmon (*i.e.*, those that return to these streams to spawn) for the years 2004-2009 is about 65,000 salmon/year.

This single point most perfectly exemplifies why this veto raises such serious concerns. President Obama's EPA initiated a preemptive veto, and the decision to leave it in place is evidently based on "facts" that our permit application and other data show are simply not true.

No Consultation with Project Proponent.

We understand that you stated that you sent "political advisers" to the area to investigate. While these Agency employees did attend public hearings, they did not speak with anyone from Pebble while in the state. It seems that if they wanted to get a comprehensive understanding of the issues involved, a meeting with the project proponent would have been advisable. We would have, of course, welcomed such a meeting.

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

Withdrawal of Proposed Veto is Clearly a Discretionary Action.

We understand the concern that you could be sued if you withdrew the Obama-era proposed preemptive veto by a suit alleging that your decision was arbitrary and capricious under the Administrative Procedure Act. Such suits are common, and we understand why you would be concerned about such a suit. Such a case has no merit and would likely be thrown out by any court. The decision to initiate a veto or not to do so is entirely in your discretion. The case law on such actions is solid – they are not reviewable. In addition to being entirely within your discretion, a decision to withdraw the veto would not be final agency action, and therefore not subject to review by courts. We have attached a memorandum that addresses this issue. *See*, Attachment 1.

If you are concerned about any mining in the area, as some meeting participants indicated to us, it is important to remember that the Obama EPA acknowledged in the BBWA that a mine smaller than their .25 hypothetical mine would be allowed to go through the permitting process. Therefore, even the Obama Administration is on record as stating that some mine in the area could be approved.

Continued Denial of Due Process.

Just because Pebble can go through permitting, that does not mean that the project has due process. While the U.S. Army Corps of Engineers is reviewing our permit application, it cannot issue a permit while the proposed veto is still pending because the regulations prevent them from doing so. *See*, 33 CFR Sec. 323.6(b). This "overhang" represents a clear denial of due process and does not reflect the rule of law. We should not be subject to a requirement that a veto must be withdrawn before we can receive a permit. That was clearly not the way Congress designed the Clean Water Act, nor was it the intent of the settlement agreement we have with the Agency.

An Adverse Precedent for Resource Development in the U.S.

Many of your ardent supporters understand that the precedent purposely left in place can and likely will be cited by future administrations as justification for action on other projects. Environmentalists understand that it may take only a proposed, preemptive veto to stop a development project, thus weaponizing the 404(c) veto process. Such administrations could use the 404(c) authority to initiate one, or dozens, or hundreds of

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

proposed preemptive vetoes. These vetoes could prevent permits from ever being issued whether EPA finalizes those vetoes or not. Because proposed vetoes are not final agency actions, project proponents would not be able to obtain judicial review of those proposed preemptive vetoes. EPA will have created a 'Catch 22' that could effectively stymie development. This seems inconsistent with your successful record of regulatory reform at the EPA.

This action also is completely inconsistent with the policy position articulated by President Trump on EPA's appropriate role on such matters. As you know, in the recent proposal to Congress concerning infrastructure financing and project streamlining, President Trump has proposed to repeal Section 404(c) of the Clean Water Act in its entirety.

Pebble Did Legally Challenge EPA's Authority.

Participants report that you said Pebble had not sued the Agency attacking EPA's authority to issue a preemptive veto. In fact, we did attack in court the statutory authority to issue such vetoes. The court dismissed the suit as not ripe because there was no final agency action. Interestingly, the Federal judge in Alaska hearing the three cases we filed requested briefing on both the merits and on the ripeness issue simultaneously. *See,* Attachment 2. We believe that the argument that the Agency lacks statutory authority to promulgate a preemptive veto is strong, and we commend these arguments to your attention.

The "proposed determination" left in place is exactly the same preemptive veto proposed by the Obama Administration. It is NOT based on an examination of our proposed mine plan, nor does it have a robust environmental impact statement to support it. Withdrawing this flawed preemptive veto does not prevent you from initiating a new one at the proper point in the process if you choose to do so, based on a full administrative record. Continuing with the Obama-era flawed veto, based on a discredited Bristol Bay Assessment, is to continue a preemptive veto.

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

We look forward to discussing these issues with you further, and will be pleased to fully describe the mine plan that we have submitted for review, when we meet.

Sincerely,

Tom Collier
CEO

AMERICAN OVERSIGHT

Attachment 1

AMERICAN OVERSIGHT

Judicial Review of Withdrawal of Proposed Determination

- EPA would likely prevail on an APA or citizen suit challenging its decision to withdraw the Proposed Determination without reviewing public comments.

    - Under either APA, or CWA's citizen suit provision, a plaintiff seeking to challenge the withdrawal of EPA's Proposed Determination has to demonstrate that it is challenging a *nondiscretionary* duty. *See* 5 U.S.C. 701(a) (APA grants a court jurisdiction to review actions taken by an agency except to the extent "agency action is committed to agency discretion by law"); 33 U.S.C. § 1365 (citizen suits may be brought where there is an alleged "failure … to perform any act or duty under this Act which is not discretionary with the Administrator").

    - We have not found any case challenging EPA's decision to withdraw a Proposed Determination. However, several courts have dismissed suits claiming that EPA improperly failed to exercise its Section 404(c) authority, holding that such authority is committed to the discretion of the agency. The reasoning of these cases is persuasive here.

        - In *Preserve Endangered Areas of Cobb's History, Inc. v. United States Army Corps of Engineers*, 87 F.3d 1242, 1249-50 (11th Cir.1996), plaintiffs brought a CWA citizen suit against EPA for failing to veto the Corps' issuance of a 404 permit. The court dismissed the claim, holding that EPA's authority to veto a section 404 permit is discretionary. The court summarized the various reasons why Section 404(c) is best viewed as discretionary, including the statute's use of the word "authorized" in Section 404(c). *See* 33 U.S.C. § 1344(c) (the "Administrator is authorized to prohibit . . . and authorized to deny or restrict the use of any defined area for specification . . . ."). The court found that the use of the term "authorized" (as opposed to "shall") suggests a discretionary function. The court also pointed out that the discretionary nature of the EPA's veto authority is also the interpretation adopted by the agency, as seen in its regulations, which use the permissive "may," as opposed to the mandatory "must" or "shall." *See* 40 C.F.R. § 231.1(a) ("Under section 404(c), the Administrator may exercise a veto over the specification by the U.S. Army Corps of Engineers or by a state of a site for the discharge of dredged or fill material.").

        - Numerous courts have agreed with this reasoning. *See also Hill v. Boy*, 144 F.3d 1446, 1449 n. 7 (11th Cir. 1998) (upholding dismissal of citizen suit against EPA and the Corps for failing to use their authority to veto the Corps' issuance of a section 404 permit because authority to veto a section 404 permit is discretionary); *City of Olmstead Falls v. EPA*, 266 F. Supp. 2d 718, 722-23 (N.D. Ohio 2003) (court lacked jurisdiction under APA to review EPA's decision not to veto the Corps' decision to issue a Section

AMERICAN OVERSIGHT

404 permit because the EPA's "veto power as set forth in Section 404(c) is discretionary").

- Other courts have also noted in dicta that the use of Section 404(c) is discretionary. *See Mingo Logan Coal Co. v. EPA*, 70 F. Supp. 3d 151, 166 (D.D.C. 2014) (noting "section 404(c) contains *permissive, discretionary* language") (emphasis added); *Ctr. for Biological Diversity v. United States Army Corps of Engineers*, No. CV 14-1667, 2015 U.S. Dist. LEXIS 76653 at *8 (C.D. Cal. Feb. 4, 2015) (EPA "has the *discretionary* authority to veto that decision if it makes certain findings regarding the adverse effects of the permitted action.") (emphasis added).

- Despite this case law, two courts have permitted suits against EPA where the agency chose not to initiate a veto.

    - Relying on a Fourth Circuit case that held generally that EPA's ultimate responsibility for the protection of wetlands under the CWA was a non-discretionary duty, *Nat'l Wildlife Fed'n v. Hanson*, 859 F.2d 313 (4th Cir. 1988), one district court held that a plaintiff can maintain a suit where the "Administrator fails to exercise the duty of oversight imposed by" Section 404(c). *See South Carolina Coastal Conservation League v. United States Army Corps of Engineers*, No. 2:07-3802-PMD, 2008 U.S. Dist. LEXIS 69499 (D. S.C. Sept. 11, 2008).

    - In *Alliance to Save the Mattaponi v. United States Army Corps of Engineers*, 515 F. Supp. 2d 1 (D.D.C. 2007), the district court dismissed plaintiff's citizen suit alleging that EPA failed to veto a Corps permit, holding that "this veto power … is discretionary." However, it concluded that plaintiff's APA claim survived because the CWA provides a standard by which to judge EPA's discretion – whether the discharge will have an unacceptable adverse effect. Because in this case EPA had not based its decision on this standard, the court ultimately found that EPA had acted arbitrarily and capriciously, *Alliance to Save the Mattaponi v. United States Army Corps of Engineers*, 606 F. Supp. 2d 121 (D.D.C. 2009).

IN THE UNITED STATES DISTRICT COURT

FOR THE DISTRICT OF ALASKA

PEBBLE LIMITED PARTNERSHIP and ALASKA PENINSULA CORPORATION,

Plaintiffs,

and

STATE OF ALASKA,

Intervenor-Plaintiff,

vs.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY, and DENNIS J. McLERRAN, in his official capacity as Regional Administrator of EPA Region 10,

Defendants.

No. 3:14-CV-0097-HRH

ORDER

Case Status

A status and scheduling conference was held in this case on July 11, 2014.

The court minutes of the foregoing conference are supplemented as follows for purposes of scheduling clarity.

Plaintiffs moved for reconsideration[1] of the court's order of July 7, 2014,[2] granting UTBB's motion to intervene. Plaintiff has responded to the motion for reconsideration.[3]

[1]Docket No. 71.

[2]Docket No. 69.

[3]Docket No. 72.

AMERICAN OVERSIGHT

EPA-0135-0005214

Reconsideration is granted. The court's July 7, 2014, order granting intervention is vacated. The court will entertain opposition to UTBB's motion to intervene if filed on or before July 18, 2014. Any reply shall be served and filed on or before July 23, 2014.

Nunamta Aulukestai has moved to intervene.[4] Any opposition to that motion shall be served and filed on or before July 18, 2014. Replies may be served and filed on or before July 23, 2014.

The defendants propose to file a motion to dismiss. That motion shall also be served and filed on or before August 11, 2014. Usual response and reply times shall be observed.

Defendants' response to plaintiffs' motion for preliminary injunction is currently due July 28, 2014.[5] A second motion for preliminary injunction by intervenor-plaintiff State of Alaska has been filed.[6] The time for defendants to respond to both motions for preliminary injunction is extended to August 11, 2014. Usual reply times shall be observed.

Defendants' response to the two motions for preliminary injunction may be consolidated, but the defendants' proposed motion to dismiss shall be separately briefed.

After consultation with counsel, the court has determined to invoke the provisions of Rule 65(a)(2), Federal Rules of Civil Procedure, which permits a court to consolidate proceedings on the merits of a case with proceedings on motion for preliminary injunction. That is, the court intends taking up first defendants' motion to dismiss and then the construction of § 404(c) of the Clean Water Act, 33 U.S.C. § 1344(c), and the State of Alaska's arguments based upon the Alaska Statehood Act, Pub. L. No. 85-508, 72 Stat. 339 (1958). The defendants' response to the motions for preliminary injunctions, as well as replies on those motions, should focus upon these legal issues. It is the court's perception that if the defendants' motion to dismiss is not dispositive of the case, a decision on the merits of the

THE pebble PARTNERSHIP

April 25, 2018

VIA ELECTRONIC MAIL

The Honorable Scott Pruitt
Administrator
U.S. Environmental Protection Agency
1200 Pennsylvania Avenue, NW
Washington, DC 20460

Re: EPA's Continued Reliance on the Bristol Bay Watershed Assessment

Dear Administrator Pruitt,

I am writing in response to your decision in January to suspend the withdrawal of the Proposed Determination to restrict the discharge of dredged or fill material in Alaska's Bristol Bay watershed related to the Pebble deposit. Your decision was surprising and disappointing, especially in light of your public statements during your confirmation hearing affirming that preemptive federal vetoes – which the Proposed Determination unquestionably is – "could undermine both the administrative process and rule of law."[1] But even more concerning is the fact that your decision is based entirely and misguidedly upon the Bristol Bay Watershed Assessment ("BBWA"), a flawed and biased study that remains EPA's only attempt to evaluate the environmental impacts of a potential Pebble mine. Despite what some in EPA may have led you to believe, it is highly inaccurate to conclude "that any mining projects in the region will likely pose a risk to [Bristol Bay's] abundant natural resources."[2] That conclusion was in fact the starting point for the previous Administration's approach to the Pebble matter, and the BBWA was merely a tool to fulfill it. The document is the result of an unfair, pre-determined process and shoddy scientific work by "scientists" of questionable reputation determined to kill the Pebble mine at all costs. As the attached materials demonstrate in even greater detail, the BBWA is the ultimate example of bad science, and I encourage you to carefully examine EPA's record and consider allowing the normal legal permit application process to unfold without the cloud cast by a study as woefully inadequate as the BBWA.

The BBWA Sprung from Early EPA Efforts to Veto Pebble

Although EPA has repeatedly touted a petition purportedly submitted by six Alaska Native Tribes as the impetus for action in Bristol Bay, that petition was in fact the result of collusion between an EPA employee and the Tribes' attorney. That employee, Phil North, had

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

been vocally advocating within EPA for a veto of the Pebble mine as early as 2009, and by 2010 had recruited at least two high-ranking EPA Region 10 officials to his cause. Officials in the region began drafting policy memoranda and budgets preparing for a veto and even convinced U.S. Fish and Wildlife Service employees to join the efforts. By the time the tribal petition was submitted in June 2010, which EPA's Inspector General concluded was the result of a "possible misuse of position," the Agency already had a running start on its veto efforts.

The BBWA Process Was Designed from the Start to Justify a Pebble Veto

The BBWA was never meant to be an objective study of the effects of copper mining on Bristol Bay. All of EPA's words and actions prove this. A 2010 memorandum outlined steps EPA could take to provide the appearance of public involvement to "deflect political backlash" and "derail opposition." Knowing that it needed a scientific record but unwilling to engage in a comprehensive and statutorily-required environmental impact statement upon Pebble's submission of a permit application, EPA instead developed a plan for its own "information gathering and analysis…in order to support a decision to formally initiate…404(c)." And when Senator Lisa Murkowski of Alaska suggested that EPA's decision to conduct the BBWA in February 2011 meant no pre-emptive action would occur until all the science had been evaluated, an EPA official stated "her statement would suggest no 404(c) would be done until all the science is in (EIS?). Obviously, that's not what we have in mind…"

EPA's close collaboration with environmental activists further demonstrate its bias. EPA officials communicated hundreds of times with anti-Pebble activists and scientists to share information, technical studies, and public relations strategies. One EPA employee even shared an outline of the BBWA with an anti-Pebble scientist a year before it was even announced. In particular, EPA became obsessed with a biased risk assessment conducted by The Nature Conservancy and scheduled several briefings to determine how that study could support EPA's efforts. All these communications stand in stark contrast to EPA's treatment of Pebble, as then-Administrator Lisa Jackson repeatedly refused to meet with Alaska Native interests close to the proposed mine that support due process for the project.

The BBWA Evaluates Fake, Unpermittable Mines to Bolster EPA's Case against Pebble

The BBWA analyzed hypothetical and implausible mine designs that did not reflect modern engineering or environmental standards. EPA knew that doing so would result in exaggerated environmental impacts and overstated risks, ensuring it could justify its preordained pre-emptive action. For example, any mine of Pebble's size would necessarily involve compensatory mitigation, which EPA's hypothetical mines conspicuously omitted. Peer reviewers noted this weakness, stating that the overall utility of the BBWA was "questionable" because of the inherent uncertainty involved with studying hypothetical design plans.

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

The BBWA is Rife with Fake Science

EPA stacked the BBWA deck with anti-Pebble personnel and material. Richard Parkin, who not only admitted under oath to favoring a preemptive Pebble veto but also stated in a public meeting that politics were "as big or [a] bigger factor" than science in a Pebble decision, was installed as BBWA team leader. Phil North, fresh off his secret collusion that resulted in the tribal petition, was the BBWA's "technical lead." From outside EPA, the Agency brought in several other anti-Pebble extremists, most notably Ann Maest, who admitted in litigation related to the infamous *Chevron* case in Ecuador to having falsified scientific reports to fit her preferred, anti-development agenda. In perhaps its most brazen move, EPA carefully selected seven vehemently anti-Pebble studies and subjected them to an unannounced peer review so that their conclusions could be included in the BBWA.

Not surprisingly, these selections led to biased results, which peer reviewers repeatedly questioned, even concluding that the BBWA's conclusions were "not appropriate for a document that is intended to provide a scientific and technical foundation for future decision making." To further the bias of the BBWA's contents, EPA completely ignored the comprehensive environmental baseline studies that Pebble had conducted, the result of eight years of evaluation by 35 professional organizations and comprising about 27,000 pages and $150 million in investment.

EPA Even Tried to Short-Circuit the BBWA's Peer Review to Conceal its Flaws

EPA designed a peer review process that was contrary to its own regulations and guidelines so the many flaws in its BBWA study would remain hidden. For example, EPA officials had excessive contact with peer reviewers during the review period and limited oral and written submissions during public peer review meetings. When the second draft of the BBWA expanded from 339 pages to 618, and included an entirely new hypothetical mine scenario, EPA ignored requests that it conduct a full peer review of the new document. Several peer reviewers complained that the time given to review the Assessment was far too short to enable them to reach sound conclusions.

* * *

It is thus no surprise that virtually every independent investigation of EPA's conduct with respect to Pebble and the BBWA has concluded that there was wrongdoing. The U.S. House Committee on Oversight and Government Reform concluded that "EPA employees had inappropriate contact with outside groups and failed to conduct an impartial, fact-based review of the proposed Pebble mine" and that the pre-emptive veto was "without legal basis." Former U.S. Senator and Secretary of Defense William Cohen determined that the circumstances "raise serious concerns as to whether EPA orchestrated the process to reach a predetermined outcome; had inappropriately close relationships with anti-mine advocates; and was candid about its

3201 C Street, Suite 604 | Anchorage, AK 99503 | 907-339-3600 phone | 1-877-450-2600 toll-free | 907-339-3601 fax | www.pebblepartnership.com

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

decision-making process." A federal court in Alaska granted a preliminary injunction halting all EPA work on the 404(c) veto after seeing just a fraction of the evidence of EPA misconduct. And the U.S. House Committee on Science, Space, and Technology found EPA's actions rife with misconduct and "determined that the pre-emptive action taken for the Pebble Mine Project was unprecedented under the Clean Water Act and was justified by a questionable assessment that relied on predetermined conclusions developed by EPA officials."

In addition to the BBWA's obvious flaws, the use of a preemptive veto under Section 404(c) of the Clean Water Act sets a dangerous precedent. In the history of the Clean Water Act, EPA has only exercised its veto authority 13 times. In each instance, EPA invoked Section 404(c) only after receipt of a permit application that described the scope and details of the project being proposed, the anticipated environmental impact, and techniques to be employed to mitigate or control that impact. EPA's campaign against Pebble throws that entire process into uncertainty, unsettling the legitimate business expectations of potential developers. By going its own way, EPA has sent the message, in the words of the National Mining Association, that "it can do whatever it wants. If it can decide to (preemptively veto a project) for this industry, there is no reason it can't ignore the legal process and preempt other projects from going forward."

In light of this overwhelming record and potentially catastrophic precedent, I strongly urge you to reconsider your reliance on such an obviously flawed study. You have not been shy to point out the errors made in the previous Administration's environmental policies and overreach. This is another opportunity for you to restore the rule of law and sound scientific analysis into environmental decision-making.

Sincerely,

Thomas C. Collier
CEO

Hi Lee:

I hope your week is starting well. I just sent a meeting request to you for a briefing for Henry on Pebble Mine. Due to **Deliberative Process / Ex. 5** At the meeting, please provide some background, the current status, and any upcoming decision points. Also, if you have any short documents that you would recommend we read before the briefing, please send those along to me.

I appreciate your assistance with this and look forward to seeing you on Friday.

Best,
Kevin

John,
I need 4 or 5 high level talking points for the Administrator on Pebble by 2:00 pm. Generally that Pebble has submitted a permit, we are working with the COE on the scope of the EIS, we are waiting to see what the actual mine might look like as part of the EIS/404 permit process before moving ahead with additional comments and anything else you think relevant.

AMERICAN OVERSIGHT

Date: June 13, 2018

Pebble Talking Points

- In December 2017, Pebble submitted its CWA Section 404 permit application to the Army Corps of Engineers proposing to develop a mine at the Pebble deposit.
- In January 2018, the Corps issued a public notice that provided Pebble's permit application to the public and stated that an EIS will be required as part of its permit review process consistent with NEPA.
- At the invitation of the Corps, EPA has agreed to be a cooperating agency in the Corps' EIS process and we are currently working with the Corps on the scoping phase of the EIS process.
- The Corps currently estimates that a draft EIS will be ready by mid to late spring of 2019.
- On January 26, 2018, EPA issued its decision to suspend the proceeding to withdraw its 2014 CWA Section 404(c) Proposed Determination regarding the Pebble deposit and leave that Determination in place pending consideration of any other information that is relevant to the protection of the world-class fisheries contained in the Bristol Bay watershed, in light of the CWA Section 404 permit application that Pebble has now submitted to the Corps.
- EPA's January 2018 decision neither deters nor derails the Corps' review of Pebble's Section 404 permit application, which is currently ongoing. Pebble continues to enjoy the protection of due process and the right to proceed.

Lee and Crystal,

We have had a change to the group of Native Alaskans that are visiting this week. Abe Williams and Margie Olympic are no longer able to come. The group still includes:

- Brad Angasan, President & CEO of Alaska Peninsula Corporation *(Represents Port Heiden, South Naknek, Ugashik, Kokhanok & Newhalen);*
- Ventura Samaniego, President & CEP of Kijik Corporation *(Represents Lake Clark area & Six Mile Lake); and*
- Henry Olympic, President of Newhalen Tribal Council *(Represents Newhalen).*

They will be accompanied by me and by Shalon Harrington, Chief of Staff for the Pebble LImited Partnership.

Please let me know if you have any questions. We look forward to seeing you.

Sincerely,

Peter

AMERICAN OVERSIGHT

Lee and Crystal,

We have had a change to the group of Native Alaskans that are visiting this week. Abe Williams and Margie Olympic are no longer able to come. The group still includes:

- Brad Angasan, President & CEO of Alaska Peninsula Corporation *(Represents Port Heiden, South Naknek, Ugashik, Kokhanok & Newhalen);*
- Ventura Samaniego, President & CEP of Kijik Corporation *(Represents Lake Clark area & Six Mile Lake); and*
- Henry Olympic, President of Newhalen Tribal Council *(Represents Newhalen).*

They will be accompanied by me and by Shalon Harrington, Chief of Staff for the Pebble LImited Partnership.

Please let me know if you have any questions. We look forward to seeing you.

Sincerely,

Peter

Subject: FYI - 2 letters from Pebble to Pruitt this week

FYI - Pebble sent the attached two letters to Pruitt this week. Ryan Jackson forwarded both to Lee F and David F. OGC shared them with us.

The letters are critical of the January 2018 decision not to withdraw the PD and argue it should be reconsidered and rehash past Pebble criticisms of the BBWA and PD.

Just wanted you to be aware in case they come up. Not clear if they will be put into CMS.

Subject: Pebble

Deputy Assistant Administrator Forsgren,

I'm very concerned about former Administrator Pruitt's directive that the EPA start looking at curtailing its authority under section 404(c). At the same time the Pebble mine's application is moving forward to a draft Environmental Impact Statement.

What are we doing to reinforce our authority under section 404 (c) to stop this monstrosity from happening?? And if EPA does somehow prohibit itself from vetoing a mine, what is your plan to stop Pebble? I'm very concerned they will just say whatever they need to the Army Corps to get a clean EIS, and then the calls will grow louder to lift the PD. But we have said time & again: Wrong Mine, Wrong Place and they won't listen! You are our only hope here.

Looking forward to your reply.

John

Pebble Talking Points

- In December 2017, Pebble submitted its CWA Section 404 permit application to the Army Corps of Engineers proposing to develop a mine at the Pebble deposit.
- In January 2018, the Corps issued a public notice that provided Pebble's permit application to the public and stated that an EIS will be required as part of its permit review process consistent with NEPA.
- At the invitation of the Corps, EPA has agreed to be a cooperating agency in the Corps' EIS process and we are currently working with the Corps on the scoping phase of the EIS process.
- The Corps currently estimates that a draft EIS will be ready for public notice and comment by mid to late spring of 2019.
- On January 26, 2018, EPA issued its decision to suspend the proceeding to withdraw its 2014 CWA Section 404(c) Proposed Determination regarding the Pebble deposit and leave that Determination in place pending consideration of any other information that is relevant to the protection of the world-class fisheries contained in the Bristol Bay watershed, in light of the CWA Section 404 permit application that Pebble has now submitted to the Corps.
- EPA's January 2018 decision neither deters nor derails the Corps' review of Pebble's Section 404 permit application, which is currently ongoing. Pebble continues to enjoy the protection of due process and the right to proceed.
- In a June 26, 2018 memo, Administrator Pruitt directed EPA's Office of Water to revise its regulations regarding the use of its Section 404(c) authority. The memo requested that the rulemaking consider implementing a number of limitations on EPA's use of its 404(c) authority, including eliminating initiation of 404(c) actions before a permit application has been submitted to the Corps. **Deliberative Process / Ex. 5**

Hi Palmer –

We have an urgent request from the Administrator's Office to provide a few talking points for a meeting with Senator Murkowski tomorrow. Do you have anything you can share on the Alaska MOU -- specifically what we heard from stakeholders last month and next steps? I can pull from the press release for general TPs.

We are also looking for a few points on Bristol Bay – do you have a one-pager that is up to date?

Thanks,
Paige

John,

Brian has not heard back from Lee on this yet so we may need to raise tomorrow. I will wait to hear from Brian this evening and if Lee doesn't get back to him, will send it first thing in the morning.

Best,
Patrick

Hi Patrick,

I sent this email to Lee earlier today. If I don't hear back from him, can you add this a late addition to tomorrow's TPs for John? I will let you know by the morning if Lee replies back to me.

Thanks.

AMERICAN OVERSIGHT

From: John Clarke **Personal Email / Ex. 6**
Sent: Monday, July 16, 2018 3:13 PM
To: Forsgren, Lee <Forsgren.Lee@epa.gov>
Subject: Pebble

Deputy Assistant Administrator Forsgren,

I'm very concerned about former Administrator Pruitt's directive that the EPA start looking at curtailing its authority under section 404(c). At the same time the Pebble mine's application is moving forward to a draft Environmental Impact Statement.

What are we doing to reinforce our authority under section 404 (c) to stop this monstrosity from happening?? And if EPA does somehow prohibit itself from vetoing a mine, what is your plan to stop Pebble? I'm very concerned they will just say whatever they need to the Army Corps to get a clean EIS, and then the calls will grow louder to lift the PD. But we have said time & again: Wrong Mine, Wrong Place and they won't listen! You are our only hope here.

Looking forward to your reply.

John

John,

Attached please find a draft of the NACWA Talking Points. Please feel free to mark up a hard copy tomorrow-Thursday and I can incorporate your changes on Friday while you are retreating. ☺

If you think we are close enough, I will plan to send a draft copy to Paige tomorrow in response to her ASAP request.

Hope the Wetlands meeting went well yesterday!

Bristol Bay/Pebble Mine	NEPA: The Corps EIS scoping period is from April 1 to June 29, 2018. EPA has accepted the Corps' invitation to serve as a cooperating agency during EIS development. 404(c): EPA announced in the Federal Register on 2/28/18 its decision not to withdraw at this time the EPA Region 10 Proposed Determination (proposed restrictions) that was issued pursuant to Section 404(c) of the Clean Water Act. EPA intends at a future time to solicit public comment on what further steps, if any, the Agency should take under Section 404(c).	The Pebble Project involves a large copper-gold-molybdenum deposit located 200 miles southwest of Anchorage on State land. It includes a large open-pit mine, processing facility, and tailings disposal facilities at the mine site and access roads, natural gas pipeline, and port sites on Lake Iliamna and Cook Inlet. The Project Applicant (Pebble Limited Partnership) has submitted a CWA 404 application and the NEPA and CWA 404 permit processes have begun. In May of 2017, EPA entered into a settlement agreement with the Pebble Limited Partnership to resolve litigation from 2014. One of the key terms of the settlement agreement is that EPA agrees that it will not move to the next step in its CWA Section 404(c) process, which would be to issue a recommended determination (determination steps are: proposed, recommended, final), if such a decision is made, until May of 2021 or until the U.S. Army Corps of Engineers issues its final EIS, whichever comes first. For more information, visit EPA's Bristol Bay webpage: https://www.epa.gov/bristolbay, or, the Corps' project EIS website http://pebbleprojecteis.com/#/	The Corps' extended the EIS public comment scoping period which began on April 1 by an additional 60-days. The scoping period ends on June 29, 2018. The Corps estimated schedule is for a draft EIS in 2019.	Patty McGrath (EPA Region 10 Mining Advisor), McGrath.patricia@epa.gov; Erik Peterson (Bristol Bay 404c Team Project Manager), peterson.erik@epa.gov;

	Oregon	HIGH PRIORITY PROJECTS FOR TRIBES		
Project Name	**State of Action**	**Project Description**	**Public Comment Period**	**Contact**
Columbia River Crossing (CRC)	The Oregon Legislature did not reinstate construction funds for the CRC I-5 Bridge Replacement project and the project office is now closed. In April 2017, the State of WA Senate passed a bill indicating renewed interest in the CRC.	This project proposed a replacement bridge where I-5 crosses the Columbia River between Vancouver and Portland. On Dec. 7, 2011, the Federal Highway Administration and Federal Transit Administration signed a record of decision for the Columbia River Crossing project. Federal transportation agencies have given formal approval for the CRC plan with this decision, which validates the technical and public process to date and allows final design and construction planning to occur. Funding for the project has not been provide by State of WA. So project is in suspense. http://www.columbiarivercrossing.org/		Elaine Somers (Environmental Review) somers.elaine@epa.gov Yvonne Vallette (Clean Water Act §404) vallette.yvonne@epa.gov
Columbia River System Operations EIS	Between Scoping and Draft EIS	On September 30, 2016 the Corps, BPA and BOR jointly published a notice of intent to prepare an EIS on the system operation and maintenance of the 14 federal dams and related facilities in the Columbia River basin. The proposed Columbia River System Operations EIS will assess and update the approach for long-term system operations and configuration. The Action Agencies will evaluate a range of alternatives in the EIS that consider different system operations and additional structural modifications to existing projects to improve fish passage including breaching one or more dams. The EIS will also identify measures to avoid, offset or minimize impacts to resources affected by system operations and configuration.	Scoping period closed in March of 2017. EPA issued scoping comments. EPA has agreed to serve as a cooperating. The MOU to support cooperating agency status is still under development	Teresa Kubo (Environmental Review) kubo.teresa@epa.gov

RTOC Standing Issues – EPA Updates (June 2018)

Pebble Mine/404(c)

(EPA Contacts: Patty McGrath and Erik Peterson)

404(c): On May 11, 2017, EPA entered into a settlement agreement with the Pebble Limited Partnership (Pebble) to resolve litigation from 2014. As part of the settlement agreement, EPA agreed to propose to withdraw the EPA Region 10 Proposed Determination (proposed restrictions) that was issued pursuant to Section 404(c) of the Clean Water Act. On February 28, 2018, EPA announced in the Federal Register its decision not to withdraw its 2014 Proposed Determination at this time. EPA intends at a future time to solicit public comment on what further steps, if any, the Agency should take under Section 404(c).

In addition, now that Pebble has submitted its permit application to the U.S. Army Corps of Engineers, pursuant to the settlement agreement, EPA will not move to the next step in its CWA Section 404(c) process, which would be for EPA R10 to forward a signed Recommended Determination to EPA HQ (Determination steps are: Proposed, Recommended, Final), if such a decision is made, until May of 2021 or until EPA publishes a notice of the U.S. Army Corps of Engineers' final environmental impact statement (EIS) for Pebble's permit application, whichever comes first. For more information, see EPA's Bristol Bay webpage: https://www.epa.gov/bristolbay.

NEPA: EPA has accepted the Corps' invitation to serve as a cooperating agency during EIS development for the Pebble project.

The Corps began a 30-day scoping period for public comment on April 1, 2018 and has since extended the scoping period by 60 days to end on June 29, 2018. The scoping period is a time for the public and agencies to comment on the scope of the EIS. For more information on the EIS and 404 permit application, visit the Corps' project's EIS website http://pebbleprojecteis.com/#/.

Dunleavy announces environmental, health commissioners

- Monday, November 26, 2018 6:20pm

AMERICAN OVERSIGHT

Alaska Gov.-elect Mike Dunleavy's pick to lead the Department of Environmental Conservation has a resource development background. His pick for health commissioner is a workforce development company executive.

Dunleavy, a Republican former state senator, in a statement said the status quo "came to a screeching halt" with his election. He said his appointees with help deliver state services in "innovative ways.

Dunleavy takes office Dec. 3. Among the appointments he announced Monday were Jason Brune as Environmental Conservation commissioner and Adam Crum as health commissioner.

Brune is a former executive director of the Resource Development Council who worked in public affairs for a former partner in the Pebble Mine project. He most recently has worked for the Alaska Native corporation Cook Inlet Region, Inc., as senior director of land and resources.

Crum's bio, released by Dunleavy's transition, says he has degrees in psychology and public health. Crum told The Associated Press he is not a "health care policy guy" but is experienced in putting together and leading teams and working on projects.

He said there are talented people working in the state Department of Health and Social Services.

Crum, who said he applied for the job, is executive vice president with Northern Industrial Training LLC.

In his new role, he said a focus will be on "people, not programs," to make sure services are provided to those who need them most. Dunleavy has said he wants to review the state's Medicaid program to see if it's sustainable.

Becky Hultberg, president and CEO of the Alaska State Hospital and Nursing Home Association, said it's a bit unusual to hire someone who hasn't worked directly in the industry. But she said the department is big and complex and requires a leader with strong management skills. If Crum has those skills and surrounds himself with people who understand the complexities of health care, she said he could be a strong leader.

"I think we need to give him the benefit of the doubt," said Hultberg, a former state commissioner of Administration who remembers being called inexperienced. She said her agency got things done because of the talent on her team.

Dunleavy named Jonathan Quick his pick for commissioner of the Department of Administration and Donna Arduin as his budget director.

Arduin has worked with other Republican governors across the country, including as budget director for former Florida Gov. Jeb Bush.

The three commissioner picks are subject to legislative confirmation.

This is an Associated Press article by Becky Bohrer.

> >
> > I anticipate that EPA will be asked to weigh in over the next few months on the expected environmental impacts of the project, and it would be good to hear your perspectives as we prepare for these communications. EPA has been involved in various Clean Water Act and NEPA aspects of this project for more than a decade, and we would be happy to provide you with background on these efforts as well as on anticipated future actions. Similar briefings were provided in 2017 to members of the transition team and to political leadership of HQ's water and NEPA programs. I understand that you met with Tom Collier in August to hear his perspectives on the project, and we expect that other pro- and anti-mine interests will be reaching out to you as well. Because the acting Administrator is currently recused from participating in this matter, we'd like to offer you an overview of the project and EPA's role.

AMERICAN OVERSIGHT

As you're probably aware, Administrator Pruitt issued – but later suspended – a proposal to withdraw a 2014 Clean Water Act "proposed determination" that would have imposed certain restrictions on development of the Pebble deposit. Meanwhile, the Army Corps of Engineers is currently developing an environmental impact statement and considering an application for a Clean Water Act permit necessary to develop the mine. We anticipate that EPA will be asked to review and comment on both the EIS and the permit application in 2019. These reviews are likely to involve staff from Region 10 as well as from HQ's offices of water, policy, and general counsel.

The Corps is currently expecting to issue its draft EIS for public review and comment in January, so both Lee Forsgren and I believe a briefing in November or December would be timely.

Subject: Letter to the Administrator

Ryan,

AMERICAN OVERSIGHT

I'm attaching a letter to Administrator Pruitt to this email. I would appreciate it if you could bring this to his attention. He spoke a couple of weeks ago to a group of conservative organizations. During that meeting, he was asked about the Pebble preemptive veto. His answers were conveyed to us, and this letter reacts to some of the things he said.

One of the things he said was that he was willing to hear new information about Pebble. This letter contains information which the Administrator clearly has not heard before. It also contains a request to meet with him so that we can discuss these matters in greater detail. Anything you can do to help facilitate such a meeting would, of course, be greatly appreciated.

Look forward to hearing from you.

Best,

Peter

AMERICAN OVERSIGHT

Ryan,

I'm attaching a letter to Administrator Pruitt to this email. I would appreciate it if you could bring this to his attention. He spoke a couple of weeks ago to a group of conservative organizations. During that meeting, he was asked about the Pebble preemptive veto. His answers were conveyed to us, and this letter reacts to some of the things he said.

One of the things he said was that he was willing to hear new information about Pebble. This letter contains information which the Administrator clearly has not heard before. It also contains a request to meet with him so that we can discuss these matters in greater detail. Anything you can do to help facilitate such a meeting would, of course, be greatly appreciated.

Look forward to hearing from you.

Best,

Peter

Hi Chris and Michelle-
Palmer informed us of a briefing tomorrow related to Pebble. The briefing materials are those used to brief Sue Detwiler on Monday.
It looks like Chris has been invited. Will you be able to participate? Please let me know if you need any support or have questions.
Patty

Subject: FW: AOO director briefing materials

Folks:

I just wanted to give you a heads-up that the materials that you used to brief the new AOO will be used tomorrow to brief Henry Darwin, EPA's chief of operations.

It is my understanding that Lee Forsgren will be leading the briefing and John Goodin and Brian Frazer from OWOW will be present as well. Brian indicated that Chris Hladick has also been invited but it is not clear that he has accepted this invite.

That is basically all I know about this briefing.

-Palmer

All-
The purpose of this meeting is to discuss our thoughts/comments on Pebble PDEIS sections related to surface water and groundwater quality, hydrology, and hydrogeology before we submit comments to the Corps. In particular, I am interested in your thoughts on the modeling efforts and sufficiency at characterizing potential impacts. I know that you all might not have completed your reviews yet, but want to discuss initial thoughts.
Thanks - Patty

Start: 11/20/2018 8:30:00 PM
End: 11/20/2018 9:30:00 PM

Recurrence: (none)

BB 404c Team,

I propose we meet on 11/20. See agenda below. Happy to hear feedback on the agenda.

Also, I'd like to discontinue sending the emails with the agenda. **Attorney Client / Ex. 5** and would prefer to add the agenda to the calendar invite. I will however try not to change it too many times, and I will either add an agenda to the calendar invite or send an update/cancel proposal at least the day before our team meeting. In other words, if this calendar event has not been canceled and has an agenda then we are planning on having the call. As we have been doing, review the agenda to determine relevance for you and your level of interest.

A huge ongoing thank you for your engagement on this important project.

Agenda

NEPA/404c coordination

Competitive Enterprise Institute Information Quality Act Request for Correction or Withdrawal Regarding Bristol Bay Watershed Assessment

FOIA
- E&E News (011614)
- McKeaver FOIA Lawsuit
- Trustees for Alaska 2 (0135)
- HQ FOIA Role

Congressional correspondence
- Western Caucus (Gosar et al) – Forsgren signed final sent 9/16/18
- Lamar Smith – nearly identical Forsgren signed final sent 10/18/18
- DeFazio and Carper – in process

June 2018 memo on 404c regulation revisions

External meeting
- 11/14/18 Forsgren, PLP and other BB stakeholders

All-
The purpose of this meeting is to discuss our thoughts/comments on Pebble PDEIS sections related to surface water and groundwater quality, hydrology, and hydrogeology before we submit comments to the Corps. In particular, I am interested in your thoughts on the modeling efforts and sufficiency at characterizing potential impacts. I know that you all might not have completed your reviews yet, but want to discuss initial thoughts.
Thanks - Patty

Subject: Pebble EIS water management plans and modeling

As discussed during our meeting this morning, below is a link to the Pebble Project EIS website where you will find the water management plans and modeling reports. Most of this will be found in responses to RFI 19 (including 19a, 19b, 19c, and 19d) and also RFI 21. You can filter the list of documents by searching on "19" or you can look through the entire list of information requests. The reference documents are available on the website as well.

> Hello Team,

AMERICAN OVERSIGHT

The Corps distributed some additional information to cooperating agencies related to yesterday's Cooperating Agency meeting here in Anchorage, and I have added these materials to the Sharepoint site, in the "Materials for 6-6-18 Cooperating Agency Meeting" folder. Most of the information is for awareness only, but our review has been requested on two items:

1) the Preliminary Scoping Report

Internal Website/ Ex. 6

2) selected sections of Pre-Draft Chapter 3

Internal Website/ Ex. 6

Your review is being requested on specific materials (listed below), but feel free to also review the remainder of the materials if you wish.

- Preliminary Scoping Report: **Molly/Patty** – comments due to Molly **June 20**
  This document addresses scoping comments received to date, but will be updated following the close of the public scoping period.

- Pre-Draft Chapter 3 Sections – comments due to Molly **June 25** (specific section assignments below)
  These documents are first drafts of each resource section Affected Environment, and will also be updated following the close of public scoping and based on cooperating agency input. It is not clear whether cooperators will have an opportunity to review a second iteration prior to publication of the Draft EIS, so a thorough review at this stage is critical.

  The Corps has requested that our review focus on what is missing or any inaccuracies (don't worry about formatting, grammar, etc.). Where we identify something missing/innacurate, we are asked to be very specific in our recommendation. If you identify missing information in your review, first check the RFIs and Responses to Date

  Internal Website/ Ex. 6

  If there is a RFI/response that addresses your concern, then please note that in your comment. If not, then please include in your comment: (1) the information gap, (2) a reference where additional information can be found, and (3) what from that reference should be added, with as much specificity as possible – suggested text would be helpful.

  Please identify the sub-section and page number for each of your comments.

  Here are specific assignments for the review request. Most sections include a word document as well as some associated figures in pdf form.

- 3.1 Intro – **Molly**
- 3.5 Recreation – **Mark/Palmer/Molly**
- 3.11 Aesthetics – **Mark/Palmer/Molly**
- 3.14 Soils – **Mark/Palmer**
- 3.16 Surface Water Hydrology (note, we received figures but not text, and are following up) – **Tim/Mark/Palmer/Muluken**
- 3.17 Groundwater Hydrology – **Tim/Mark/Palmer/Muluken**
- 3.18 Water and Sediment Quality – **Cindi/Tim/Chris**
- 3.22 Wetlands/ Special Aquatic Sites – **Mark/Palmer**
- 3.26 Vegetation (note, we received figures but not text, and are following up) – **Mark/Palmer**

Please let me know if you have any questions. Thank you for your assistance with this review.

Subject: Pebble NEPA/permitting team - documents for awareness review

Pebble NEPA/permitting team –

The Corps has started sending us, and other cooperating agencies, information generated by PLP and the third-party EIS contractor (AECOM). This information includes AECOM's requests (to PLP) for additional information (RFAIs) and PLP's responses. The Corps has begun adding theses RFAIs to the public EIS website. Molly and I will add this information to our SharePoint site as well.

AMERICAN OVERSIGHT

The Corps has submitted this information to us and requested an awareness review, but is not requesting written comments.

For now, I want to bring your attention to two documents, attached:
1 – PLP Updates to the Proposed Project - PLP has made some updates to the project description. Please review this document so that you are aware of the changes. Some of these changes could impact parts of our scoping letter (e.g., use of lightering and elimination of dredging).
2 – PLP Technical Note on Project Options and Screening Criteria – This document summarizes screening criteria and options used by PLP to develop its current project description. I expect the Corps will consider this information during alternatives development. Please review this document for awareness.

We will discuss these documents during our next team meeting on May 24, and I can provide more context. In the meantime, please let me know if you have questions.

Thanks-
Patty

Hi Lauren,

I was wondering if you could help set up a one drive folder (and eventually the resulting binder) for Lee's Alaska trip next week? If you are swamped with other stuff, no worries! If you are up for the task, please read on:

Subject: NTWC In-Person Meeting Scheduled for 6/6 at EPA HQ --- Seeking update on Bristol Bay

Palmer and Brittany,

Hi. Hope you are both well. The National Tribal Water Council has scheduled its in-person meeting in DC June 5-7. I'm currently working with the Council and ITEP to draft the agenda for the NTWC-EPA portion of the meeting, which is scheduled for June 6 here at HQ. The NTWC has asked to receive updates on several OW-related efforts, including the latest on Bristol Bay. Understanding that ACOE is lead for reviewing the 404 permit from PLP and the EIS process is currently underway, there might not be too much to new news to share. Would it be possible for someone to give a 5 min (more if needed) summary of the current status of this and to answer any questions the Council may have?

I've attached an INTERNAL DRAFT agenda for the meeting on June 6. If you could please keep it close hold for the moment --- the draft includes my edits/comments to ITEP on their draft agenda, which they have yet to consider as well as my annotated notes on the various session topics from my discussions with ITEP and Ken. Additional changes to the agenda are likely, but this is the best information that I have at the moment. (I anticipate a revised agenda from ITEP within the next week.)

I've tentatively included an update on Bristol Bay within a series of OW Updates from 11:15 – 12:00 on Wednesday, 6/6. I can be flexible on timing, if needed. Also, just for context, and in case it's helpful, Dave Ross has tentatively agreed to kick the meeting off, but I don't anticipate that he will be there for the OW Updates portion of the discussion; it's possible that Benita may attend the OW updates session.

Happy to chat more. Thank you,

Subject: NTWC - Responding to Pebble Project Questions

Hi Karen,

I was asked two questions that I had to follow up on with our R10 contact regarding the Pebble Project/Bristol Bay update I gave today. Below are the answers to be shared with NTWC.

Q1: Did the Army Corps invite tribes to be cooperating agencies in the EIS process?
A1: The Corps did not invite to the tribes to act as cooperating agencies. However, the Corps did receive requests from tribes to be cooperators. The Corps elevated those requests and two tribes are now cooperating agencies in the EIS process.

Q2: Will EPA provide training on the NEPA process as it relates to the mining process?
A2: There is currently no training plan in place, but EPA is open to considering training opportunities if requested. We have a 2016 Region 10 training online for free and available to the public. The three-part, archived training covers (1) Mining Fundamentals, (2) Mining Environmental Concerns and Issues, and (3) Regulatory Process and How the Public and Tribes can Engage. I've provided the web addresses below, and hyperlinked the topic list above. If tribes would like to request additional training opportunities or more information, they can contact Region 10's mining advisor, Patty McGrath, at mcgrath.patricia@epa.gov.

Subject: ACTION: Draft notes from 6-5-18 meeting between Lee and Pebble + AK Native Reps

Russ/Heidi:

On 6/5, you participated in a meeting that Pebble requested with Lee F. Pebble invited a number of AK Native reps who are supportive of the Pebble mine to come and share their thoughts with Lee F. Attached are draft notes from that meeting.

Please let me know if you have any comments by noon on Friday.

Thanks, Palmer

Carrie/Palmer/Ashley – Below is a draft response to David's request. Please let me know if you have any edits/comments:

******

Hi David – Below is a status update of PLP's permit application. I have attached the notice I quoted from just in case you wanted to see it. As you may recall, staff worked on a paper responding to PLP's most recent letters. We wanted to see when might be a good time to send that paper to you.

Heidi

+++++++

- Pebble's permit application is currently in the NEPA scoping phase.
- Substance: The Corps public notice announcing its intent to issue the EIS explained that "[s]coping is conducted to assist in determining the scope of analysis, significant issues and alternatives to be analyzed in depth in the DEIS."
    - The Corps' public notice indicated that the draft EIS will identify a range of alternatives and evaluate reasonable and practicable alternatives, including "the no action alternative, the applicant's proposed alternative, alternative mine locations and mine plans, alternative mining methods and processes, alternatives that may result in avoidance and minimization of impacts, an mitigation measures not in the proposed action."

AMERICAN OVERSIGHT

- The notice identified significant issues that will be analyzed in the draft EIS related to the effects of the proposed Pebble mine and associated infrastructure construction, operation and closure. These significant issues include "wetlands, water quality, air quality, hazardous materials, fish and wildlife, vegetation, cultural resources, food production, land use, needs and welfare of the people (socioeconomics including commercial fishing and tourism), recreation, general environmental concerns, historic properties, navigation, and safety."

- Process: The Corps' public scoping period ends on June 29, 2018.
  - Region 10 is preparing a draft scoping letter.
  - The draft letter will come to headquarters (OW, OFA and OGC) for review June 4th-June 12th.

Non-Responsive: Unrelated to Bristol Bay/Pebble Mine

AMERICAN OVERSIGHT

404 - Related Activity - HQs Engagement

10	Pebble Mine/Bristol Bay Alaska	Copper, Gold, and Molybdenum Porphyry Mine - Pebble Limited Partnership proposes an open pit mine in Soutwest Alaska near Iliamna Lake, within the Bristol Bay watershed. The project includes four primary elements: a mine site, a port at Amakdedori, transportation corridor, and a natural gas pipeline. Neither the amount and type of impacts nor compensatory mitigation has been characterized at this time in the EIS effort.	Palmer Hough (Patty McGrath)						EPA accepted Corps invitation to be a Cooperating Agency on EIS. EPA submitted EIS scoping letter on 6/29/18. Next Action- support development of draft EIS, expected in spring 2019.

Actually, I found the following from last month's Alaska trip prep. Let me know if you have anything to add. Thanks!

Alaska Mitigation Guidance/MOU

Non-Responsive: Unrelated to Bristol Bay/Pebble Mine

Bristol Bay

- EPA published a proposal to withdraw its 2014 CWA Section 404 (c) Proposed Determination in July 2017 and took public comment, held two public hearings in the Bristol Bay region, and consulted with tribal governments and ANCSA Corporations from the Bristol Bay region.
- EPA received more than a million public comments on its withdrawal proposal. The overwhelming majority of these comments expressed opposition to the proposal to withdraw; similar levels of opposition were expressed at the public hearings and during the tribal/ANCSA consultation efforts.
- After reviewing all of the public and tribal input and taking into consideration the recent developments regarding the submittal of Pebble's Section 404 permit application, EPA decided not to withdraw the 2014 Proposed Determination at this time.
- The Army Corps of Engineers has initiated the process to develop an Environmental Impact Statement for Pebble's Section 404 permit application. EPA is a cooperating agency in this EIS process and will decide at a later date what impact, if any, the new permit application has on EPA's 2014 Proposed Determination.

Subject: Talking points due COB today

Hi Palmer –

We have an urgent request from the Administrator's Office to provide a few talking points for a meeting with Senator Murkowski tomorrow. Do you have anything you can share on the Alaska MOU -- specifically what we heard from stakeholders last month and next steps? I can pull from the press release for general TPs.

We are also looking for a few points on Bristol Bay – do you have a one-pager that is up to date?

Thanks,
Paige

Subject: Action: Request for clarification on Pebble lead within the Administrator's office

John/Brian/Russ

Based on the notes from Lee's 11/14 meeting with PLP, it appears that it is again "not clear at this time if the Acting Administrator or Henry Darwin will be the decision-maker."

R10 has asked for clarification regarding whether the Acting Administrator is or is not recused from Pebble matters. The Region has indicated that it needs this clarification in order to know who to target briefing materials for and to advise the RA regarding who the appropriate contact is within the Administrator's office is for this project. The Region is in the midst of reviewing portions of the preliminary draft EIS for Pebble and the Corps/PLP have indicated that they expect to issue a draft EIS as early as January.

Based on all of this activity, the Region is seeking clarity regarding appropriate contacts within the Administrator's office.

Thanks, Palmer

Hey Palmer and Kate,
Great to hear from you! I've been wondering what was up with this, as I hadn't heard anything in months.
My schedule is packed, as I'm sure yours are too. I'll find some time to take a look. Where should I go to access these sections?
Joe

AMERICAN OVERSIGHT

There appear to be a number of sections that speak to fish on the sharepoint site including:

K3.24 FishValues
Sec 3.24 FishValues
Sec 4.24 FishValues
11_09_2018_Sec3.6_Com&RecFish
11_09_2018_AppK3.6_Com&RecFish

Would you and Joe have time in the next two weeks to review these?

Palmer,

While you were out of town a few weeks ago, management requested that we add information about impacts and proposed mitigation (or lack thereof) for each of the projects in the table. Concurrent with the usual review and update can you add some information related impacts and proposed mitigation to Pebble? Pebble may not be at the stage where you have good numbers, but if you do . . .

Thanks!
Chris

Kate is correct (of course!)
The Exhibit 4 comments reference the EBD (PLP 2011), where the PHABSIM approach is described in Chap 15 and associated appendices. The data and rating curves, etc. are in the very lengthy appendices.
So yes, rings a bell but it's been a long time since I've looked at this!
I would assume similar work would be done for the new scenarios/transportation corridors?

Subject: PHABSIM

Joe

Good to catch up with you yesterday. I seem to recall the at some point in time you reviewed a document (that I assume was generated by Pebble) that had some information about PHABSIM. I've been searching in my records for that just to refresh my memory on the tool, and what they may have said about how they plan to use it. I don't think that whatever they shared got into much detail b/c they were never forthcoming about it.

Does this ring any bells?

Thanks, Palmer

Russ/Heidi:

On 6/5, you participated in a meeting that Pebble requested with Lee F. Pebble invited a number of AK Native reps who are supportive of the Pebble mine to come and share their thoughts with Lee F. Attached are draft notes from that meeting.

Please let me know if you have any comments by noon on Friday.

Thanks, Palmer

Mindy

The BB factsheet you sent was from April, I decided to start with the BB factsheet that was finalized for Congressional hearings in May (Dated May 11).

Let me know if you have comments/edits.

Thanks, Palmer

All,

Attached is the most current version of the 404 Activity table. Please review the information associated with your case(s) and update the information accordingly. Please note that some of the write ups have been simplified to convey a quick sound bite to management on what the issue of concern is – see final column. The feedback we are receiving is that the summary needs to be succinct and convey the action/timing.

Thank you in advance for your time and attention,

Chris

Agenda

404(c) Team

Congressional responses (Palmer)

- Western Caucus (Gosar et al) – newly OW-approved, not issued
- DeFazio and Carper – just revised, based on newly OW-approved, not issued Western Caucus response
- Lamar Smith – just drafted, based on newly OW-approved, not issued Western Caucus response

AMERICAN OVERSIGHT

FOIA (Ashley)

- E&E News – new request for unredacted copies
- McKeever FOIA Lawsuit – next steps
- NRDC and CNN – working with the AOs office
- Trustees for Alaska – options for Justin Schwab review
- Trustees for Alaska 2 – new FOIA
- Back-up (Erik)

External Correspondence (Erik)

- Recent activity and approach

Permit Oversight/ NEPA Review Team

Timing a Brittany Bolen briefing?

Site Visits

- July 9 – 11: CWA 404 field verification was completed by Mark Douglas
- July 31: Site visit with some of our NEPA team (Patty, Molly, Tim, Chris) to view the mine site, proposed Lake Iliamna port sites, and portions of the proposed roads

NEPA/EIS document reviews - completed

- Scoping Document: In August we submitted comments on the draft scoping document that describes the significant issues raised in scoping. The final scoping document is available on the Corp's Pebble EIS website.
- Preliminary EIS Sections: In July and August, we reviewed and commented on specific portions of chapter 3 (affected environment) and chapter 4 (environmental consequences) that pertain to our areas of special expertise as identified by the Corps which includes: aesthetics, surface water hydrology, groundwater hydrology, water and sediment quality, wetlands, vegetation)
    - The documents have many placeholders since there have been changes to the proposed action, alternatives have yet to be finalized, and there are numerous substantial requests for additional information where the Corps is awaiting response from PLP.
- Alternatives: On October 3, we submitted comments on draft Appendix B (Alternatives Development Process). Previously we participated in a cooperating agency meeting and provided verbal input on the alternatives development process and some of the potential alternatives.

NEPA/EIS document reviews – upcoming

- The Corps has indicated that they will be sending us draft DEIS sections on 11/9 with comments due by 11/21. We have requested more time for review (30 days review period).

Schedule

- The Corps Pebble EIS website identifies estimated dates for a draft EIS in January 2019 and a final EIS in late 2019.

Subject: Please Review - Pebble Wetlands Sections

Hi Mark and Palmer,
We have received the draft wetlands sections for the Pebble EIS for review, and I have loaded the text and associated figures into the Sharepoint folders. A comment deadline has not yet been provided by the Corps, but I am expecting it to be similar to the new deadline for the other chapters. So, at this point assume that the internal deadline will be somewhere the week of Dec. 10. I will confirm a specific deadline once we hear back from the Corps. As usual, please use the attached comment table for your comments.
Thank you,
Molly

Subject: 3.22 and 4.22 with figures for review (UNCLASSIFIED)

CLASSIFICATION: UNCLASSIFIED

Good Morning,

Attached are the review drafts for Sec3.22 and Sec4.22, Wetlands. There are no technical appendices with these sections.

Sec 3.22 has one standalone PDF figure (attached) and 7 embedded figures. Sec 4.22 has three standalone PDF figures (attached).

Cooperating agencies with special expertise on this section are USACE and EPA. Suspense date for comments will be provided on Monday.

v/r,

Katie McCafferty

Subject: RE: Bristol Bay

Hi David – Below is a status update of PLP's permit application. I have attached the FR notice I quoted from just in case you wanted to see it. Carrie mentioned that the Congressional Western Caucus is coming in for a meeting. I wanted to make sure you were of the attached letter from some Caucus members. OW is currently preparing a draft response. Also, as you may recall, staff worked on a paper responding to PLP's most recent letters. We wanted to see when might be a good time to send that paper to you.

Heidi

++++++++++

- Pebble's permit application is currently in the NEPA scoping phase.
- Substance: The Corps' public notice announcing its intent to issue the EIS explained that "[s]coping is conducted to assist in determining the scope of analysis, significant issues and alternatives to be analyzed in depth in the DEIS."
    - The Corps' public notice indicated that the draft EIS will identify a range of alternatives and evaluate reasonable and practicable alternatives, including "the no action alternative, the applicant's proposed alternative, alternative mine locations and mine plans, alternative mining methods and processes, alternatives that may result in avoidance and minimization of impacts, and mitigation measures not in the proposed action."
    - The notice identified significant issues that will be analyzed in the draft EIS related to the effects of the proposed Pebble mine and associated infrastructure construction, operation and closure. These significant issues include "wetlands, water quality, air quality, hazardous materials, fish and wildlife, vegetation, cultural resources, food production, land use, needs and welfare of the people (socioeconomics including commercial fishing and tourism), recreation, general environmental concerns, historic properties, navigation, and safety."
- Process: The Corps' public scoping period ends on June 29, 2018.
    - Region 10 is preparing a draft scoping letter.
    - The draft letter will come to headquarters (OW, OFA and OGC) for review June 4th-June 12th.

EPA Deputy AAOW Meeting with Pebble
Topic: Review process for Pebble's CWA Section 404 Permit Application
Meeting Date: June 5, 2018
Location: EPA HQ (Washington, DC)
List of Third Party Attendees (including affiliation): • Peter Robertson, Pebble • Brad Angasan, VP of Corporate Affairs for AK Peninsula Corporation • Ventura Samaniego, President and CEO of Kijik Corporation • Henry Olympic, President of Newhalen Tribal Council
Did EPA decide which third parties would attend?: No – meeting at request of Pebble
List of EPA Attendees: • Lee Forsgren (Deputy AAOW) • Russell Kaiser (Chief, Freshwater and Marine Regulatory Branch (FMRB)) • Palmer Hough (Environmental Scientist, FMRB) • Heidi Nalven (OGC)
Agenda: None
Did EPA/Third Party Set the Agenda?: N/A
Did EPA/Third Party Run the Meeting: Pebble ran the meeting and described it as an opportunity for EPA to hear from Alaska Natives who are supportive of the proposed Pebble Mine.
Notes from Discussion (including individual advice/feedback provided to Agency): • Robertson kicked off the meeting and gave the floor to the Alaska Native reps that he invited to participate. Each rep shared thoughts on Pebble mine • Angasan – discussed jobs and other potential economic benefits of a mine at the Pebble deposit and noted the permit review process would be challenging and that Pebble deserved opportunity to go through review process • Ventura – noted that not all AK Native groups oppose Pebble mine, Kijik Corporation is also exploring mining claims and has experienced challenges raising money for its potential mining projects • Olympic – noted that before Pebble many in Newhalen were on welfare and drug use was high, after Pebble there are more work opportunities and more opportunities to support families in Newhalen
Next Steps/Follow-up Discussed: None

EPA drafting rule to curb its veto power — sources

E&E News | August 17, 2018

EPA is working on a regulation to limit the agency's ability to nix water pollution permits.

AMERICAN OVERSIGHT

Agency sources told E&E News the regulation will follow limits outlined in a June memo from former EPA Administrator Scott Pruitt.

Under the Clean Water Act, the Army Corps of Engineers is the permitting agency for dredging and filling in waterways and wetlands, but Section 404(c) of the law grants EPA the ability to restrict or veto permits.

Until Pruitt, EPA policy did not explicitly prevent the agency from moving forward with vetoes before, during or after the permitting process.

The memo forbids EPA from acting before applications are filed with the Army Corps or after a permit is issued (Greenwire, June 27).

Pruitt's action came after years of conservative outrage over the Obama administration's two uses of the veto authority. In the case of the Spruce coal mine in West Virginia, the veto was issued years after the corps' permit was issued. In the case of the Pebble Mine in Alaska, action preceded a mining proposal.

Pruitt's memo earned its own outcry from environmental groups and Democrats.

Following his departure from the agency, Senate Environment and Public Works ranking member Tom Carper (D-Del.) and House Transportation and Infrastructure Committee ranking member Peter DeFazio (D-Ore.) wrote a letter to acting EPA Administrator Andrew Wheeler urging him to rescind the document.

The pair said the memo is "in opposition to the will of Congress" and that Section 404(c) of the Clean Water Act "provides EPA with clear authority" to veto a project whenever the agency determines it would have an unacceptable adverse effect on aquatic resources (E&E Daily, July 20).

EPA sources, who spoke with E&E News on the condition of anonymity, say the agency is planning to submit a proposed rule nixing pre-emptive and retroactive vetoes to the White House for review by the end of December.
Agency officials did not respond to a request for official comment.

Action against Spruce sparked debate, years of litigation and congressional efforts against retroactive vetoes. Ultimately, the U.S. Court of Appeals for the District of Columbia Circuit ruled they were legal under a strict reading of the law.

The debate over pre-emptive vetoes intensified in 2014, when the Obama EPA, relying on a watershed assessment, proposed restrictions to protect Alaska's Bristol Bay from mining. The proposal was made before the company behind the Pebble mine had formally submitted a permit application.

The Trump administration lifted that proposal long enough for Pebble LP to submit its permit application to the Army Corps, but has not completely withdrawn the watershed assessment. That move infuriated Pruitt's conservative allies, who are now taking their case to Wheeler (Greenwire, July 31).

Pebble opponents have called on the acting chief to recuse himself because his former lobbying firm set up the meeting between Pruitt and the mining company just before Pruitt ordered his staff to start the process of tossing the 2014 restrictions — a move he would later abandon. EPA said Wheeler would not be recusing himself from matters involving Pebble.

AMERICAN OVERSIGHT

On Aug. 2, Pebble leaders met with EPA's second in command, Henry Darwin, at agency headquarters in Washington, D.C., according to Darwin's online calendar.

Pebble CEO Tom Collier declined to comment on the meeting, but said a potential rulemaking was not discussed.

"From where I sit," he said, "I think that getting rid of retroactive and pre-emptive vetoes is a smart thing to do, and I hope they follow through with a rulemaking."

It's interesting, they criticize the Obama administration for moving forward on the c action without a 404 permit application from Pebble "containing an actual mine plan and other important aspects, such as proposed mitigation" but they submitted their 404 permit application to the Corps in December with no compensatory mitigation plan.

Subject: Letter to the Administrator

Ryan,

I'm attaching a letter to Administrator Pruitt to this email. I would appreciate it if you could bring this to his attention. He spoke a couple of weeks ago to a group of conservative organizations. During that meeting, he was asked about the Pebble preemptive veto. His answers were conveyed to us, and this letter reacts to some of the things he said.

One of the things he said was that he was willing to hear new information about Pebble. This letter contains information which the Administrator clearly has not heard before. It also contains a request to meet with him so that we can discuss these matters in greater detail. Anything you can do to help facilitate such a meeting would, of course, be greatly appreciated.

Look forward to hearing from you.

Subject: Action: Request for clarification on Pebble lead within the Administrator's office

John/Brian/Russ

Based on the notes from Lee's 11/14 meeting with PLP, it appears that it is again "not clear at this time if the Acting Administrator or Henry Darwin will be the decision-maker."

R10 has asked for clarification regarding whether the Acting Administrator is or is not recused from Pebble matters. The Region has indicated that it needs this clarification in order to know who to target briefing materials for and to advise the RA regarding who the appropriate contact is within the Administrator's office is for this project. The Region is in the midst of reviewing portions of the preliminary draft EIS for Pebble and the Corps/PLP have indicated that they expect to issue a draft EIS as early as January.

Based on all of this activity, the Region is seeking clarity regarding appropriate contacts within the Administrator's office.

Thanks, Palmer

Palmer,

While you were out of town a few weeks ago, management requested that we add information about impacts and proposed mitigation (or lack thereof) for each of the projects in the table. Concurrent with the usual review and update can you add some information related impacts and proposed mitigation to Pebble? Pebble may not be at the stage where you have good numbers, but if you do . . .

Thanks!
Chris

AMERICAN OVERSIGHT

Ryan,

Another letter to the Administrator -- this one on the many flaws of the Bristol Bay Watershed Assessment, which the Administrator is relying on in sustaining the preemptive veto of the Pebble Mine.

Please let me know if you have any questions.

Thanks.

Peter

AMERICAN OVERSIGHT

EPA Deputy AAOW Meeting with Pebble
Topic: Review process for Pebble's CWA Section 404 Permit Application
Meeting Date: June 5, 2018
Location: EPA HQ (Washington, DC)
List of Third Party Attendees (including affiliation): • Peter Robertson, Pebble • Brad Angasan, VP of Corporate Affairs for AK Peninsula Corporation • Ventura Samaniego, President and CEO of Kijik Corporation • Henry Olympic, President of Newhalen Tribal Council
Did EPA decide which third parties would attend?: No – meeting at request of Pebble
List of EPA Attendees: • Lee Forsgren (Deputy AAOW) • Russell Kaiser (Chief, Freshwater and Marine Regulatory Branch (FMRB)) • Palmer Hough (Environmental Scientist, FMRB) • Heidi Nalven (OGC)
Agenda: None
Did EPA/Third Party Set the Agenda?: N/A
Did EPA/Third Party Run the Meeting: Pebble ran the meeting and described it as an opportunity for EPA to hear from Alaska Natives who are supportive of the proposed Pebble Mine.
Notes from Discussion (including individual advice/feedback provided to Agency): • Robertson kicked off the meeting and gave the floor to the Alaska Native reps that he invited to participate. Each rep shared thoughts on Pebble mine • Angasan – discussed jobs and other potential economic benefits of a mine at the Pebble deposit and noted the permit review process would be challenging and that Pebble deserved opportunity to go through review process • Ventura – noted that not all AK Native groups oppose Pebble mine, Kijik Corporation is also exploring mining claims and has experienced challenges raising money for its potential mining projects • Olympic – noted that before Pebble many in Newhalen were on welfare and drug use was high, after Pebble there are more work opportunities and more opportunities to support families in Newhalen
Next Steps/Follow-up Discussed: None

Just to report in **Personal Matters / Ex. 6** from what I can tell from the e-traffic we're privy to, Drew is running the show on giving the Region a final HQ-approved version. And we haven't seen an officially final one.

So maybe Allison can keep an eye out for that, and pass it along after the fact, but I'm guessing your best bet is Drew or the Region. Thanks.

Heidi: CCILO is ok w you sharing OGC/ORC staff level comments w NEPA shop and Drew on Brittany's political team, per below, but wanted to coordinate w you. (All: They are not OGC comments, to be clear, since the document has yet to be processed by our FO, which is very aware of this and the timing.) Thanks.

AMERICAN OVERSIGHT

Project Forecast Report
Updated May 31, 2018

Non-Responsive: Unrelated to Bristol Bay/Pebble Mine

NATIONAL ENVIRONMENTAL POLICY ACT (NEPA) PROJECT COORDINATION:

- **R10/USACE/Pebble Mine/Draft EIS/Anticipated Early 2019 – Litigation Hold**
  - **Background:** In December 2017, Pebble Limited Partnership (PLP) submitted a CWA 404 permit application to the U.S. Army Corps of Engineers (USACE) for development of the Pebble mine project. The USACE will prepare an environmental impact statement (EIS) and initiated scoping on April 1, 2018. The EPA accepted the USACE's invitation to serve as a cooperating agency and to provide special expertise related to Clean Water Act (CWA) Section 404(b)(1) issues. R10's

Deliberative Process / Ex. 5

  - **EPA Involvement:** In 2014, EPA issued the Bristol Bay Watershed Assessment, which assessed potential impacts to aquatic resources from three potential scenarios for mining the Pebble deposit. Also in 2014, based on the available information, including the Watershed Assessment, R10 initiated the CWA 404(c) process and issued a Proposed Determination to restrict the use of certain waters for disposal of

AMERICAN OVERSIGHT

dredged or fill material associated with mining the Pebble deposit. The Proposed Determination was not finalized, and based on a settlement agreement with PLP, the EPA proposed to withdraw the Proposed Determination in July of 2017. In January 2018, after a public review period, the Administrator decided not to withdraw the Proposed Determination at this time and suspended the withdrawal. The EPA is currently involved as a cooperating agency in the NEPA process and will be reviewing the EIS and the CWA 404 application.

- **Status:** The EIS scoping period ends on June 29, 2018. The schedule provided to date indicates that the draft EIS is currently anticipated for review in early 2019.

All-
The purpose of this meeting is to discuss our thoughts/comments on Pebble PDEIS sections related to surface water and groundwater quality, hydrology, and hydrogeology before we submit comments to the Corps. In particular, I am interested in your thoughts on the modeling efforts and sufficiency at characterizing potential impacts. I know that you all might not have completed your reviews yet, but want to discuss initial thoughts.
Thanks - Patty

Bristol Bay - 2018 Funding Needs(1).docx

<!--[endif]-->

Conference Line/Code / Ex. 6

Purpose

Work on BB 2018 funding update for HQ. Due April 6th to Michael Szerlog.

Agenda

Deliberative Process / Ex. 5

Background

Notes from 11/26 BB funds meeting and from 11/27 Peterson and Szerlog meeting

Deliberative Process / Ex. 5

AMERICAN OVERSIGHT

- Michael would like a final memo with basic recommendations on how the region will use the funds by **COB April 6th**

AMERICAN OVERSIGHT

Message

From: Herbst, John [herbst.john@epa.gov]
Sent: 5/10/2018 9:42:56 PM
To: Herbst, John [herbst.john@epa.gov]; McGrath, Patricia [mcgrath.patricia@epa.gov]
Subject: Conversation with Herbst, John

Herbst, John 2:27 PM:
Hello! Does that time on 6/6 work for you to meet with the RTOC?
Herbst, John 2:27 PM:
1:30-3pm AK Time
McGrath, Patricia 2:29 PM:
Hi JR. I dont know. I am still waiting to hear whether I need to be in Anchorage on that day for an all-day Pebble meeting. That should be determined by friday. **Non-Responsive: Unrelated to Bristol Bay/Pebble Mine** **Non-Responsive: Unrelated** I will let you know as soon as I find out more.
Herbst, John 2:30 PM:
thanks! we're working on the draft agenda and getting close to sending it out.
Herbst, John 2:30 PM:
maybe fly down to Juneau on your way back from Anchorage?

Sent: 5/15/2018 10:14:38 PM
To: Fordham, Tami [Fordham.Tami@epa.gov]; McGrath, Patricia [mcgrath.patricia@epa.gov]
Subject: TA for travel to Juneau, AK

Fordham, Tami 11:32 AM:
On the phone with the Extended ET.

McGrath, Patricia 11:35 AM:
ok. wanted to let you know that I am hoping to travel to anchorage for june 6 all-day pebble agency meeting and was hoping to check in with you regarding whether or not to add an extra day for meeting with new AOO director (if she is in place) to talk about mining.

Fordham, Tami 11:36 AM:
She won't be here until June 18th.

Fordham, Tami 11:36 AM:
Would love to see you.

McGrath, Patricia 11:36 AM:
ok. thanks

Fordham, Tami 3:04 PM:
I have to sign off, have a meeting with DRA

Fordham, Tami 3:05 PM:
Is Jim on his way?

Start: 8/23/2018 8:00:00 PM
End: 8/23/2018 9:00:00 PM
Show Time As: Free

Importance: High

Recurrence: Monthly
the fourth Thursday of every 1 month(s) from 1:00 PM to 2:00 PM

Updated meeting room location – 14 Walla Walla

Agenda:

- 7/31 project site visit
- Status of review of EIS sections
- Summary of 8/22 cooperating agency meeting (alternatives discussion)
- Next steps and schedule

Conference Line/Code / Ex. 6

Monthly Pebble permit oversight/NEPA team meeting
Agenda to be sent out before each meeting

Attachments: Pebble EIS Outline_2018.3.19 (002).docx

Hi Ashley – There is a slightly more recent version. The main difference is that it reflects the Corps' final decisions on who would be assigned each section (the version you found included my notes from the discussion at the Cooperating Agency meeting on section assignments in red). I've attached the updated version here in case it is helpful.

Hi –

Do either of you have an updated table of contents for the preliminary draft EIS? I didn't see it on the Sharepoint.

Thanks!

Ashley

Hi Ashley,
I am so sorry for the delay in getting these comments to you for review. If you will no longer be able to complete your review Friday, please let me know. I also apologize that some of the comments (particularly the last couple pages) are still a bit rough. So, please don't feel that you have to edit grammar, punctuation, etc., as I will do another read-through for that before sending this to Jill.

Patty – I've copied you here as well, so you can decide if you would prefer to do your final review of the compiled comments now, or at the same time as Jill's review.

Thank you very much in advance for your review!

Hi Patty –
As you are working through your own review of the draft sections due next week, I wanted to share my comments so far as well. I have reviewed Sections 3.5, 4.5, and 3.1 so far, and will get to 4.1 on Monday.

Deliberative Process / Ex. 5

Thanks,
Molly

Here are my comments on Section 4.1.

I know that they don't want grammatical/typo comments but I can't help myself. I just have to say it must be so exciting working for CE!Q.

Subject: Pebble review request

Hi Cindi and Mark-

We have another short turn around review on a draft section of the Pebble EIS.

Attached is draft Section 4.1, which is the introduction to the Environmental Consequences section. The Corps has requested comments by 10/31. This section identifies past, present, and reasonably foreseeable future actions that will be considered in the cumulative effects analysis in subsequent chapters. We especially appreciate your review of the actions identified and whether there are others that could be missing.

The Corps has requested comments by 10/31. In order to meet this deadline and have management review, if you have time to look at this section, then please send Molly and I comments by COB 10/24.

Let us know if you have questions.

Thanks - Patty

Subject: RE: Draft Bristol Bay Check-in Cancellation and Update

Hi Erik – I thought you wanted updates by mid-day Monday? I had been working on this between meetings and other deadlines today – it has been a chaotic day… I would just leave it and not send another update to him – but so that you are aware… Have a good weekend.

Thanks, Eric! This sounds like a good approach to me. Can I add one bullet point that has not been on anyone's radar for a while but recently I've made good progress on and was going to discuss on Tuesday? David will be aware of the first and second sentences but not the rest.

Bristol Bay Litigation Hold

Attorney Client / Ex. 5

For Trustees – I would add that R10 has finished review of all emails.

Can I also adjust this bullet a bit:
PLP letter, memo to file

Attorney Client Privilege/Deliberative Process Privilege / Ex. 5

Subject: Draft Bristol Bay Check-in Cancellation and Update

Patty, Molly and Ashley,

AMERICAN OVERSIGHT

David Allnutt is working next week but traveling on September 11th. Because he will be traveling, I propose we cancel the 9/11 BB check-in. In place of the meeting, I suggest an update that we would send to the whole invite check-in invite list. Below is a draft update, please provide feedback – ideally no later than mid-day September 10th.

Hello,

Welcome back David! Given that you are out on September 11, we are canceling the check-in and the Bristol Bay Teams have the following update for you. We plan on having the Bristol Bay Check-in on September 25th at 9:00 am PST.

Updates

Permit Oversight/ NEPA Review Team

Preliminary EIS review

- EPA has reviewed and commented on section 3 (affected environment). Currently working on section 4 (environmental consequences)

404(c) Team

FOIA

- NRDC and CNN FOIA: extended until end 9/28/18 as we work on ex-Administrator's office employee non-email electronic records. Making progress.
- Trustees for Alaska FOIA: interim release of Corps equities documents on 8/31 and deadline extended until 10/31/18 to facilitate coordination between R10 and HQ on the remaining documents.

Representative DeFazio and Senator Carper letter response

- This July 2018 letter asks for Wheeler to revoke the June 2018 memo issued by Pruitt, describe his view of proper use of 404(c) and the Mingo Logan case, and, describe current and planned EPA actions regarding Pebble.
- EPA's response was uploaded to CMS for Lee F's signature on 8/27

Interest group letter to EPA

- This 9/6/18 letter to EPA from 15 interest groups (including, for example, the Competitive Enterprise Institute) urges Wheeler to rescind the proposed determination and applauds the June 2018 memo issued by Pruitt.
- If this letter is controlled for a response, HQ will share a draft with R10.

External Meetings

- Henry Darwin met with Pebble representatives the week of 8/2/18. The 404(c) Team uploaded a note of this meeting to our external meetings folder on share point.
- We want to emphasize our interest for external meetings at all levels to be recorded with: topic, date, attendees, agenda and notes.

PLP letter, memo to file

- An OGC clerk has completed a summary of court decisions on challenges to agencies withdrawing proposals.

On Sep 10, 2018, at 2:46 PM, McGrath, Patricia <mcgrath.patricia@epa.gov> wrote:

Dear Shane –

We were surprised to see that notes from the August 22, 2018 Cooperating Agency Meeting on Alternatives Screening were posted to the Corps' Pebble EIS public website. It was our understanding that the Corps would not be making notes from Cooperating Agency meetings publicly available. This understanding came from the January 18, 2018 Cooperating Agency meeting, where Sheila Newman indicated that the Corps did not plan to record interagency conversations unless they are part of a specific decision-making meeting. We were not informed that the August 22nd meeting was a "decision-making meeting," and did not view it as such. Rather we saw it as our first opportunity to hear from the Corps and AECOM how they were specifically conducting alternatives screening and as a brainstorming and Q&A meeting to discuss the alternatives process and preliminary rationale for alternatives considered or dismissed.

In addition, we note that the Cooperating Agency Coordination Plan (6/1/18 version) states "*CAs are encouraged to engage in robust discussion and debate during CA meetings and topical discussions on affected resources. These meetings ensure that all cooperating voices are heard throughout the EIS process and that multiple views can be thoroughly discussed. The USACE will not use the exchange that occurs within these meetings as a substitute for agency position or comments*." By posting the meeting notes on the public website under the heading "Cooperating Agency Scoping Documents," the discussion from the meeting is being presented as agency comments. While the meeting discussion entailed questions and observations from us, it was not reflective of formal agency comments on alternatives. In fact, before submitting written comments, we specifically requested more details related to the rationale for how certain alternatives were developed (or not) and for some alternatives that were dismissed.

We are also concerned that the notes were finalized and made public without an opportunity for Cooperating Agencies to review a draft version of the notes. It is standard practice for NEPA Cooperating Agency meeting notes to be circulated in draft form to meeting participants, and for corrections to be made prior to finalization for the file. For example, we note several omissions from and edits to the meeting notes posted to the website, which we would have provided if given the chance to review. These include:

- A robust discussion from the early part of the meeting regarding how the Corps determined a threshold for economic practicability in the absence of an economic feasibility study, as well as how environmental impact trade-offs were considered, was not included in the notes.
- Regarding Mine Locations and Layout Options, we have the following edits:
    - LOC-001 through LOC-003: Patty McGrath suggested a figure to illustrate and additional discussion to explain why these options have been selected. Patty also asked why the alternatives considered do

AMERICAN OVERSIGHT

not include mining of Pebble East, the high-grade underground deposit. Bill noted that the analysis does not include a larger mine as an alternative, but does analyze it as a cumulative effect.
    - Patty also recommended a figure to illustrate the mine layout options and location options for waste and tailings storage (as was done for the access options) and additional discussion explaining why these particular locations and layouts were identified and dismissed.
    - Patty asked what happens with pyritic tails in the full build-out scenario. Bill noted that an RFAI is pending with Pebble on this question, and they are also looking at EPA's BBWA.
- Regarding Throughput Options, we have the following edits:
    - Patty suggested need for more information backing-up statements about financial return, including for example why 50,000 tpd does not provide "positive financial return".
- Regarding Concentrate Transport, we have the following addition:
    - There was also a request to look at the NPDES New Source Performance Standards no discharge of process waste water requirements and exemptions which would limit the ability to discharge filtered concentrate water.
- Regarding Tailings, we have the following edit:
    - Patty suggested reviewing the ongoing EIS process for the Resolution copper/molybdenum mine in Arizona regarding tailings management techniques and alternatives.

In the future, we respectfully request that the Corps:

1. inform Cooperating Agencies in advance when meetings are being regarded as "decision-making" and notes will be recorded and made publicly available on the project website; and,
2. provide the Cooperating Agencies with an opportunity to review and comment on a draft version of the notes, prior to finalization, any time "official" Cooperating Agency meeting notes are recorded for the file, regardless of whether or not they will be posted to the website.

We are committed to accomplishing a review of draft meeting notes quickly. We think that these steps will ensure a common understanding of meeting purposes and the most accurate representation of our statements in the meeting notes.

Please feel free to call if you wish to discuss.

Best regards-
Patty

Thank you Patty and Ashley.

My edits to the script, which are all copyediting type stuff (e.g., making the Q and A italics instead of highlighted grey, consistent spacing)

Ppt looks good and I agree with Ashley's suggestions for added names for the 404(c) Team.

Hi Erik and Ashley –
Attached is the updated BB presentation and script for the briefing with Sue on July 23. I revised the script in track changes.
Please let me know if you have any comments by COB Monday july 16 so that I can revise and finalize on Tuesday. I will be out of the office next Wednesday through Friday.

Also, Erik can you try to find a Seattle conference room for the briefing? Sue will be here in person.

Thanks - Patty

Hi All-
Thanks for your quick responses related to the request for available dates for a site visit.
Based on the responses, it looks like the only dates that work are:
7/30 (this would mean Sunday travel to Anchorage for Seattle folks)
7/31
8/20 (this would entail Sunday travel to Anchorage for Seattle folks)
8/21

Chris, Tim and Jill - Please confirm that Sunday afternoon/evening travel is acceptable to you in case the 7/30 and 8/20 dates, otherwise I will just forward the two Tuesday dates (7/31 and 8/21) as options.

Subject: Pebble NEPA/permitting team - documents for awareness review

Pebble NEPA/permitting team –

The Corps has started sending us, and other cooperating agencies, information generated by PLP and the third-party EIS contractor (AECOM). This information includes AECOM's requests (to PLP) for additional information (RFAIs) and PLP's responses. The Corps has begun adding theses RFAIs to the public EIS website. Molly and I will add this information to our SharePoint site as well.
The Corps has submitted this information to us and requested an awareness review, but is not requesting written comments.

For now, I want to bring your attention to two documents, attached:
1 – PLP Updates to the Proposed Project - PLP has made some updates to the project description. Please review this document so that you are aware of the changes. **Deliberative Process / Ex. 5** **Deliberative Process / Ex. 5**
2 – PLP Technical Note on Project Options and Screening Criteria – This document summarizes screening criteria and options used by PLP to develop its current project description. I expect the Corps will consider this information during alternatives development. Please review this document for awareness.

We will discuss these documents during our next team meeting on May 24, and I can provide more context. In the meantime, please let me know if you have questions.

Thanks-
Patty

During the UMs mtg this morning (I'm acting), they discussed the presentations slated for the All Staff at MEL in Aug 16th.
They have a slot for Pebble (see attached draft), but you won't be there. They looked at me to possible summarize the recent Site visit/tour, and maybe put a representative picture or two of Site from visit, but also alluded that I may be the only one who could talk more? Were you going to provide a canned presentation suitable for this meeting?

Please advise.

Subject: RE: ARU Staff Transition

Patty,

Thanks so much for this. I do not believe that it was David's intent to have Heather and myself on the sidelines on this, and I was concerned when we were both left out of the loop. In any case, Mark will need help, and I am the only one who can give it to him.

Nonresponsive Discussion of Personal Matters / Ex. 6

Have a great weekend.

Hi Mary Anne-
I just sent you the invite.
Originally the meeting invite included just the leads for each program/resource and I left it to the leads to invite folks designated as support, depending on the agenda topic and their comfort.
I am glad that you will be assisting Mark. I'll also forward an email that I sent to the team earlier today.
Patty

Patty,

I am on the team that David designated for the review of the EIS for Pebble. I would appreciate receiving invitations to the meetings. Mark is not going to be able to go from 0-60 in a week, and I have responsibilities here that I need to meet.

All,

AMERICAN OVERSIGHT

Good morning/afternoon. You are all aware that I transitioned into Gayle Martin's oil and gas-focused position on April 1. I will not have the capacity to continue as the CWA 404 lead for project review of the Pebble project. Mark Douglas has agreed to take on the 404 lead role.

The Region's NEPA scoping letter on the project will be going out shortly, and the timing is right for me to pass the baton to Mark. I have sent him the meeting invitations, and Patti has included him on the group emails. Once he has access to the project website and our internal SharePoint site, he will be good to go. I plan to participate in next week's meetings, but do not anticipate participating in future meetings unless there is some specific need.

Mary Anne will continue in her existing role, working with Mark to track the project review, and coordinating with the 404(c) team.

Thanks,

Hi Mark and Matt,
Would you mind coming up with a very short description of how you might transition the Pebble work from Matt to Mark and send it out to the appropriate folks working on Pebble? Please include a statement about Mary Anne's continued involvement as well. …Just so folks hear it from you both directly.

Thank you,
Krista

Subject: Pebble Draft Ch3 comments

Hi Patty – I've reached my maximum capacity for the day and am turning off my computer. I have completed compiling all of the comments on the preliminary Ch3 sections, and a first cut at editing for organization, consistency, clarity and tone. I think another read-through is definitely needed, but that will have to wait until next week. I will dive back into this Monday, but if you have time Friday and want to begin reviewing, any edits you provide will be much appreciated. I will send you a link to my OneDrive so we are working off the same version. (I cannot manage to make Outlook attach the document as a link this time… it is very frustrating that sometime it attaches one way and sometimes another, and just when I think I have it figured out, it throws me for another loop! Argh. Anyway look for another email coming with the link).
Thanks,
Molly

Patty,

I suggest the following for the agenda. I also suggest they come after yours.

- QFR
- PLP response
- Forsgren and Hladick meeting
- Western Caucus response

Ashley may have more based on last week's work. I propose that you can go ahead and we'll add Ashley's suggestion later if she has one.

Hi Pebble Review Team,
As I explained during today's team meeting, we received word this morning from the Corps (below) that the deadline for comments on the documents we have received for review has been extended to August 31. A huge thank you to all of you for your quick reviews to meet the original very tight turnaround time. As was discussed at the meeting, our plan is to proceed with finalizing our review and sending our comments to the Corps in a reasonably expedient time frame, since much of the effort has already been completed. That said, if there were portions of the document you wanted to take another look at given the extra time, the opportunity is available. I have placed all of the compiled comments received to date on the SharePoint file here:

Internal Website / Ex. 6

If you have additional comments to add, please let me know. I would request those comments by August 7.
Thank you,
Molly

Subject: Revised comment date for Chapter 3 and 4 sections to 31 August 2018

Cooperating Agencies,

Last week it came to my attention that I inadvertently omitted to distribute some sections of draft Chapters 3 and 4 to some cooperators. I had originally asked that cooperators submit comments on these draft chapters by 31 July for Chapter 4 and July 5 for comments for Chapter 3.

Given my oversight, I am now asking that the review for both Chapters 3 and 4 sections be submitted by August 31, 2018. This will also mean that the robust technical discussions will occur in October.

AMERICAN OVERSIGHT

I would like to remind everyone, that at this stage of the development of the analysis, I am asking that your review be at a high level; meaning that we are asking your teams to identify gaps (did we miss something?). The team developing the sections will review the comments and may be reaching out to you for clarity. A more in detail review will be expected in October when the team has incorporated additional information based on your input and data gathered by the teams.

As we are all aware, there are many moving parts to any EIS and it is difficult to keep all things on track. I would greatly appreciate any issues being brought directly to my attention as soon as you identify them. Please email me or call me directly if you have concerns or questions about the flow of information so we can collaboratively ensure that errors are caught and corrected as soon as possible.

Hmm. I thought it was open when I proposed it. Darf.

Yes, if you and Patty get together and add info. to the draft memo that is great and all we need. You could update the memo with what you all think is appropriate and just let me know. Good enough. I'll keep the meeting because it gives a chance to meet with David Allnutt prior to submitting something to Michael Szerlog. It is more of a deadline than a need to all discuss. I would like to send the memo to Michael by the end of the day on the 5th.

Hi Ashley and Garth -

I traded voice messages with Ashley about this issue, but realized that I neglected to forward you this email string.
We are planning two trips to the Pebble project site this summer.
The first is a wetlands delineation field verification trip with the Corps on July 9 - 11. Mark Douglas would participate in that trip.
The second, yet to be scheduled, is a project overview site visit (1 day on-site) attend by four EPA folks from our NEPA team. Both of these visits will involve helicopter time from Iliamna to and around the Pebble site. Mark's visit will involve overnights in Iliamna.

Attorney Client / Ex. 5

Please let me know as soon as possible if you have any concerns or would like to discuss.

Thanks -
Patty

Subject: RE: Field Logistics

Estrella:

I have attached the site services request form that our operations staff need to finalize your arrangements. I went ahead and filled out most. Please review and add your phone number (cell phone preferably) and whether anyone has any food allergies or special needs. You can send the completed form back to me and I will submit it to site. I have requested individual rooms for each of you.

Meals are cafeteria style. For your arrival day, it will be easiest if you can bring your lunch with you. For the remaining days you will make a bag lunch at breakfast to bring with you to the field.

We will provide in-town transportation to/from the airport each day in one of our vehicles. Work days are 12 hours, with 10 in the field and one hour on either end for muster, briefings, etc. Crews normally do not return to base during the work day unless weather limits flight operations. Low clouds and/or high winds are typically the only conditions that will restrict helicopter travel.

No firearms are permitted at any Pebble facility or in helicopters. Trained bear guards will be provided with each crew. Guards are in constant radio contact with site operations. Alcohol is prohibited at any Pebble facility.

Safety training and site orientation will take place as soon as you arrive. That should take about an hour, followed by a 20-minute helicopter safety briefing. We provide basic PPE (safety goggles, high visibility vest, hearing protection). You are welcome to bring your own as long as the operations manager approves. Field gear requirements are what you would normally bring.

Accommodations are 150/person/day. We will invoice you after your trip. Our site staff does not have the ability to accept payments. Helicopter time will likewise be invoiced to you based on the per seat cost and number of flight hours logged. Cost may vary depending on which helicopter is available.

Please let me know if you have any other questions.

Thanks,
Tim

Hi Tim,

I think I left a voice mail and I am wondering if you received it.

In any case, please let me review with you our itinerary:
Arrival time @ Iliamna: July 9 (Monday) at 0900.
Departure time: July 11 @ 4:30 p.m.

Corps will disburse your company directly for hotel/helicopter costs.
Hotel:
Check in July 9th
Check out July 11th

AMERICAN OVERSIGHT

Meals:
July 9th (lunch brown bag - Diner)
July 10th (all meals)
July11th (breakfast & lunch).

Helicopter: as per time-usage logs (coordination field work with HDR at this point).

Truck Rental: We will take your offer of picking us up at the airport on Monday July 9th.

You mentioned we will have safety training upon arrival on July 9th before heading to the field. Please let us know if there is anything else we need to be aware of.

Thank you very much for your help,

Estrella

Subject: Pebble site visit

Hi all-

AMERICAN OVERSIGHT

The purpose of this email is to begin planning our overview visit to the Pebble project site to support our NEPA review.
The visit will entail flying from Anchorage to Ilimana and then taking a helicopter flight from Iliamna to the Pebble site. From the Pebble site we would travel by helicopter to view locations of various mine site facilities. We would return to Illiamna and Anchorage on the same day. Travelers from Seattle should plan on arriving in Anchorage the day before the site visit and leaving Anchorage either on the red eye or, better, the day after the site visit - so, this would entail three travel days.

We will attempt to coordinate with other agencies, but depends on the timing.

Please let me know if you have conflicts during the following dates. Since this trip will take 3-days (except for Molly), please provide me with 3-day choices. Please give me as many options as possible to work from since there will be exploration work at the site and we will need to work with PLP's schedule.

July 24 – 27
July 30 – Aug 3
Aug 13 – 18
Aug 20 – 24

Please send me your responses ASAP and let me know if you have questions.

Thanks - Patty

> 1. Were the tribes invited to be cooperating agencies? If so, did any of them accept?
> 2. Will there be training made available to tribes in Bristol Bay (or Alaska generally) on NEPA and mining, either by Corps or EPA? This was requested by multiple people at the meeting re: Pebble. Apparently R5 does this sort of training when big projects pop up to help potentially affected tribes understand the process and potential impacts better. They have upcoming meetings (annual tribal forum and Statewide environmental forum) where this training could be provided, but also would accept a webinar if it is impossible to schedule an in-person training.

Molly, Tim, and Chris –

Our Pebble site visit is confirmed for July 31. Please submit your TAs ASAP. ARE funding is available for this trip but needs to be obligated.

Following is information for the TAs.

Seattle travelers –
7/30 – fly to Anchorage and stay overnight

All travelers –
7/31:
8 am flight from Anchorage to Iliamna via Illiamna Air Taxi (arrive Iliamna at 9 am)
9:00 – 3:30 – Pebble site visit (mine site, road, ports) - this will entail helicopter time. The cost estimate for the helicopter portion is $1200 per person (note PLP will invoice us for the exact amount)
4:30 – flight from Iliamna back to Anchorage (should arrive in Anchorage at 5:30)

Seattle travelers - you can return to Seattle on 7/31 as there are late flights leaving Anchorage – or overnight and leave Anchorage on 8/1. I will likely leave the morning of 8/1.

Please let Molly and I know if you have questions.

AMERICAN OVERSIGHT

I am also ccing Marla who has been helpful with previous travel to Pebble.

Thanks - Patty

Subject: REVIEW REQUEST and additional documents loaded to Sharepoint

Hello Team,
The Corps distributed some additional information to cooperating agencies related to yesterday's Cooperating Agency meeting here in Anchorage, and I have added these materials to the Sharepoint site, in the "Materials for 6-6-18 Cooperating Agency Meeting" folder. Most of the information is for awareness only, but our review has been requested on two items:

1) the Preliminary Scoping Report

Internal Website/ Ex. 6

2) selected sections of Pre-Draft Chapter 3

Internal Website/ Ex. 6

Your review is being requested on specific materials (listed below), but feel free to also review the remainder of the materials if you wish.

- Preliminary Scoping Report: **Molly/Patty** – comments due to Molly **June 20**
  This document addresses scoping comments received to date, but will be updated following the close of the public scoping period.

- Pre-Draft Chapter 3 Sections – comments due to Molly **June 25** (specific section assignments below)
  These documents are first drafts of each resource section Affected Environment, and will also be updated following the close of public scoping and based on cooperating agency input. It is not clear whether cooperators will have an opportunity to review a second iteration prior to publication of the Draft EIS, so a thorough review at this stage is critical.

AMERICAN OVERSIGHT

The Corps has requested that our review focus on what is missing or any inaccuracies (don't worry about formatting, grammar, etc.). Where we identify something missing/innacurate, we are asked to be very specific in our recommendation. If you identify missing information in your review, first check the RFIs and Responses to Date

Internal Website/ Ex. 6

If there is a RFI/response that addresses your concern, then please note that in your comment. If not, then please include in your comment: (1) the information gap, (2) a reference where additional information can be found, and (3) what from that reference should be added, with as much specificity as possible – suggested text would be helpful.

Please identify the sub-section and page number for each of your comments.

Here are specific assignments for the review request. Most sections include a word document as well as some associated figures in pdf form.

- 3.1 Intro – **Molly**
- 3.5 Recreation – **Mark/Palmer/Molly**
- 3.11 Aesthetics – **Mark/Palmer/Molly**
- 3.14 Soils – **Mark/Palmer**
- 3.16 Surface Water Hydrology (note, we received figures but not text, and are following up) – **Tim/Mark/Palmer/Muluken**
- 3.17 Groundwater Hydrology – **Tim/Mark/Palmer/Muluken**
- 3.18 Water and Sediment Quality – **Cindi/Tim/Chris**
- 3.22 Wetlands/ Special Aquatic Sites – **Mark/Palmer**
- 3.26 Vegetation (note, we received figures but not text, and are following up) – **Mark/Palmer**

Please let me know if you have any questions. Thank you for your assistance with this review.
Regards,
Molly

Subject: Pebble NEPA/permitting team - documents for awareness review

Pebble NEPA/permitting team –

The Corps has started sending us, and other cooperating agencies, information generated by PLP and the third-party EIS contractor (AECOM). This information includes AECOM's requests (to PLP) for additional information (RFAIs) and PLP's responses. The Corps has begun adding theses RFAIs to the public EIS website. Molly and I will add this information to our SharePoint site as well.
The Corps has submitted this information to us and requested an awareness review, but is not requesting written comments.

For now, I want to bring your attention to two documents, attached:
1 – PLP Updates to the Proposed Project - PLP has made some updates to the project description. Please review this document so that you are aware of the changes. Some of these changes could impact parts of our scoping letter (**Deliberative Process / Ex. 5**
2 – PLP Technical Note on Project Options and Screening Criteria – This document summarizes screening criteria and options used by PLP to develop its current project description. I expect the Corps will consider this information during alternatives development. Please review this document for awareness.

We will discuss these documents during our next team meeting on May 24, and I can provide more context. In the meantime, please let me know if you have questions.

Thanks-
Patty

Christine,

Please make July 18th the last OERA Calendar occurrence of the Bristol Bay Check-in. In other words, cancel the OERA Calendar Bristol Bay Check-in starting August 1st.

I have sent new calendar invites for this recurring meeting starting July 31st.

Thank you!

Subject: Feedback Request - Draft Bristol Bay Check-in 7/18 Cancellation Message

Patty, Molly and Ashley,

Linda, Patty and I have discussed the possibility of canceling this Wednesday's, 7/18, Bristol Bay Check-in. We are planning to keep the 7/31 Bristol Bay Check-in with Linda A-C.

I'm writing to confirm with you all that it would be ok to cancel this week's Bristol Bay Check-in with Linda and also to get your feedback on a draft cancellation message. The cancellation message serves as a kind of update in place of a meeting. Please send or edit any updates you would like me to send in the cancellation message by COB today if possible.

Hello,

I'm writing to cancel the 7/18 Bristol Bay Check-in on behalf of the EPA Bristol Bay 404(c) Team and Permit Oversight/NEPA Review Team. See the updates below for awareness of our ongoing Bristol Bay related activities.

Updates

Linda Anderson-Carnahan is acting while David Allnutt is out until September 10th. We will continue Bristol Bay Check-ins with Linda during this time period. Our next scheduled check-in with Linda is for 30 minutes starting at 10 am PST on August 1st.

The 404(c) team is managing equity reviews and preparing non-equities documents for release for the Trustees for Alaska FOIA.

The Permit Oversight/NEPA Review team is reviewing preliminary EIS documents.

An EPA staff visit to the Pebble mine site is planned for 7/30 and 7/31.

AMERICAN OVERSIGHT

A Pebble overview briefing for the new Alaska Operations Office Director is scheduled for July 23rd in Seattle.

Erik Peterson, NEPA Reviewer
U.S. EPA, Region 10
1200 Sixth Avenue, Suite 155
Seattle, Washington 98101-3140

Subject: FW: QUICK TURNAROUND: Reporting of Regional projects that are/will be receiving HQ visibility (due no later than 5/30)

Hi Jennifer and Patty –
More information related to HQ quick turnaround request for you. I wanted to have Candi clarify what needs to be on the report by 9am Pacific/8am AK time tomorrow to meet the deadline. I'm teleworking today so if you want to talk through the request this morning, please feel free to call my work cell at
206-316-0219. We will want to run the Pebble update through Ashley today too. Thanks so much for your help with this! If you are both able to send your edits/additional information to me before you leave the office today, I'll compile and send out to Candi tomorrow morning.

Hope you had a great weekend! Jill

Subject: RE: QUICK TURNAROUND: Reporting of Regional projects that are/will be receiving HQ visibility (due no later than 5/30)

Candi, a few more questions for you. Thank you! I want to make sure whether OFA/OP is mostly interested in the projects for which we anticipate the DEIS to be released (and is that in the next 2 weeks as stated at the top of the report?). The DEIS for Pebble is anticipated this fall on the report that you shared, so not in the next 2 weeks – should it be on here or on a later report? **Non-Responsive: Unrelated to Bristol Bay/Pebble**

Non-Responsive: Unrelated to Bristol Bay/Pebble Mine

AMERICAN OVERSIGHT

Thanks for working with us on this! By the way, a lot of people aren't in today, so there's really only the one day next Tuesday to work on this and get it back to you. I think it will be super helpful to understand what makes the cut for being reported on this forecast report, and how often you will be asking the Regions to update it. Is it once a month, bi-monthly, more often – so that if we know things are happening later in the summer in some cases, would you want those reported now as well?

Jill

AMERICAN OVERSIGHT

We have been tasked to identify projects in the Regions that currently are or potentially will be receiving high-level political HQ review, visibility, and/or coordination. We've provided a template that you can use to report any projects – see below and the draft Project Forecast Report that is attached to this email. In the attachment, some projects have been filled in (R10/USACE/Pebble Mine/DEIS and Non-Responsive: but please feel free to edit this information.

- **Region/Lead Agency/Project Name/EIS type (Draft, Final, Supplement)/Anticipated (insert date)**
  - **Background:**
  - **EPA Involvement:**
  - **Status:**

The sooner that you can provide us this information, the better. The latest that we can receive this info is by **NOON on Wednesday, May 30th (eastern time)**. If you have nothing to report, please let us know so that we can track this.

We really appreciate your assistance on this and apologize for the quick turnaround.

If you have any questions, please let me know.

Many, many thanks again for your help and I hope you have a wonderful weekend!

Hi Bruce,

We've identified a federal post doc that has the expertise and availability to support R10 as a hydrologist. His name is Muluken Muche, and he is a post doc in NERL with two years left on his term. Attached is his resume. I recommend that Patty McGrath reach out to Muluken and arrange a phone call to assess whether his expertise and time constraints will fit within their needs. If R10 decides that Muluken is not the right fit, we can explore other options. Please let me know how it goes.

Thanks,

Susan

Subject: RE: ORD support for Pebble EIS

Thank you Susan;

We very much appreciate your timely response and inreach within ORD on our high priority regional request. I have copied Patty McGrath (Lead), David Allnutt (Office Director) and Jill Nogi (Unit Manager) in our Office of Environmental Review and Assessment.

Patty, Jill, and David;

- Paul Ringold would like to (see attachment):
  Develop fairly formal quarterly progress meetings or discussions to make sure that the work requested and performed is on track and continues to function within the boundaries of our original agreements.

  Discuss the possibility of regional funding to assist ORD technical experts in keeping engaged with the EIS process. This may be particularly important as the experts will be spending only a small fraction of their time on this effort. Having someone to stay engaged with the EIS and with the science requirements and issues involved on their behalf could facilitate the efficient and effective use of their time and effort.

- Although no hydrologist has been identified, Steve Kraemer (NERL) has been suggested as a possible option.

- Additionally, Barb Butler, an author of the Bristol Bay assessment, is willing to assist in areas not mentioned in the original request that might come up in the future, including reviews of water quality data (groundwater or surface water), mining materials testing data (e.g., kinetic and static leaching tests), sampling/analysis design, and mitigation/treatment options for control of water quality (e.g., management of wastes to minimize leaching/seepage issues, fate and transport of constituents in water if mine drainage is formed, and treatment of drainage).

- ORD indicated they do not have travel funds for their staff for this effort.

Let me know if I can be of further help.

Bruce

Subject: FW: ORD support for Pebble EIS
Importance: High

Hi Bruce,

Valerie shared this request with me last week, and I've worked with ORD's Program Support Coordinators to identify ORD staff available to work with R10 on the Pebble Mine EIS. As you know, R10 requested specific people and expertise for the project. I'm happy to report that Joe Ebersole, Michael Kravitz, and Kate Schofield are all available for this effort. Unfortunately, we were not able to identify anyone with the requested hydrology expertise. The hydrologists who worked on the Bristol Bay assessment are no longer with ORD (Jim Wiggington retired and Jason Todd is now with OCSPP).

Additionally, Barb Butler, an author of the Bristol Bay assessment, is willing to assist in other areas (aka, areas not mentioned in the original request) that might come up in the future with respect to this mine site, including reviews of water quality data (groundwater or surface water), mining materials testing data (e.g., kinetic and static leaching tests), sampling/analysis design, and mitigation/treatment options for control of water quality (e.g., management of wastes to minimize leaching/seepage issues, fate and transport of constituents in water if mine drainage is formed, and treatment of drainage).

Finally, Paul Ringold, Joe Ebersole's branch chief, has asked for a follow up conversation with Patty McGrath (or R10's lead on the Pebble Mine EIS, if it is not Patty) to discuss Joe's participation. Paul's specific requests are in the attached email. Also, please note that the attached email chain indicates that Joe is available for up to 10% of his time for two years.

I'm assuming that you'll pass this information onto Patty. Please let me know if you need anything else from me.

Thanks,

Susan

Dear Maggie and Val,

Please find attached the Region 10 technical support request form for assistance. This is a high priority for R10 and we look forward to support starting as soon as possible. Our Regional Mining Advisor has been discussing the specifics with ORD Scientists already so this will not come as a surprise. Let me know of any next steps and how I can assist with the support request.

Bruce

Subject: ORD support for Pebble EIS

Hello Bruce-

AMERICAN OVERSIGHT

Last week I spoke with Scot Hagerthey regarding ORD support for our cooperating agency participation in the Pebble EIS. He acknowledged that ORD folks are interested and available and requested that I send the request for ORD support through you. Can you let me know how you like to see these requests. Is an email from me sufficient? Following is the support that is needed.

Request for ORD Support for Pebble Environmental Impact Statement

The US Army Corps of Engineers is the lead agency in developing an EIS for the Pebble Mine Project in Alaska. The Corps invited EPA to be a cooperating agency to assist the Corps in developing sections of the EIS. In addition, EPA is responsible for reviewing the Draft EIS and the public notice for the CWA 404 permit application. EPA Region 10 has put together a team to accomplish these responsibilities. There are several areas where EPA is requesting support from ORD to bolster EPA's review team and also benefit from ORD's past work in the Bristol Bay watershed where the mine project is located. From 2011 to 2014, EPA Region 10 and EPA's Office of Water worked with ORD in developing the Bristol Bay Watershed Assessment. ORD's experience and understanding of the watershed and potential impacts that could occur during mining will provide needed support to EPA Region 10's NEPA/permit review team in several key areas.

The key areas where we are requesting support are identified below.

Specialty	Summary of Assistance Requested	ORD staff requested
Fisheries	Provide advice to EPA's team on fisheries issues Provide input into EIS scoping letter Review baseline data Recommend aquatic resources impact assessment methodologies Participate in fisheries technical working group Review and provide comments on fisheries sections of the EIS	Joe Ebersole
Hydrology	Provide advice to EPA's team on hydrology issues Review groundwater and surface water hydrology baseline data Recommend impact assessment methodologies and modelling approaches and review results Participate in hydrology technical working group Review and provide comments on hydrology sections of the EIS	The ORD hydrologist that assisted with the Bristol Bay watershed assessment has retired. We do need support in this area and request that ORD identify individuals that can assist.
Transportation	Provide advice to EPA's team on transportation issues Review and provide comments on transportation sections of the EIS	Michael Kravitz
Coordination	Participate in monthly Pebble NEPA/permit team to assist with coordinating ORD support Potentially review sections of the EIS	Kate Schofield

In terms of timing, we are requesting ORDs immediate assistance to help with baseline data review and development of EPA's EIS scoping letter. We expect that assistance will be needed throughout the EIS process, with times of intense activity when documents are being reviewed and times with very little activity. The EIS process will take at least two years. There may be additional areas where we need support as the EIS process moves forward.

Please let me know if you need additional information.
Thanks-

Patty

Good Morning,

Please submit your travel requests as soon as possible.

Your travel preparer will need to change the organization to EPAR10AOO and select the 18 Crossfunding ARE label. If they have any questions please have them call me.

Since you will be traveling on a Pebble arranged helicopter flight you will be invoiced by Pebble and will need to pay them Please check to see if they accept the government travel card as payment. If not, you will need to write them a personal check for the cost. If you have to pay by personal check you will also need to submit a "direct bill/reimbursement" memo along with your voucher. If you need this memo, let me know and I can assist you with the wording.

If you have any questions/concerns, please let me know.

Thank you,
Marla Smith
Management Analyst
EPA/Region 10
Alaska Operations Office

Cc: Smith, Marla J. <Smith.MarlaJ@epa.gov>; Fordham, Tami <Fordham.Tami@epa.gov>
Subject: Pebble site visit

Molly, Tim, and Chris –

Our Pebble site visit is confirmed for July 31. Please submit your TAs ASAP. ARE funding is available for this trip but needs to be obligated.

Following is information for the TAs.

Seattle travelers –
7/30 – fly to Anchorage and stay overnight

All travelers –
7/31:
8 am flight from Anchorage to Iliamna via Illiamna Air Taxi (arrive Iliamna at 9 am)
9:00 – 3:30 – Pebble site visit (mine site, road, ports) - this will entail helicopter time. The cost estimate for the helicopter portion is $1200 per person (note PLP will invoice us for the exact amount)
4:30 – flight from Iliamna back to Anchorage (should arrive in Anchorage at 5:30)

AMERICAN OVERSIGHT

Seattle travelers - you can return to Seattle on 7/31 as there are late flights leaving Anchorage – or overnight and leave Anchorage on 8/1. I will likely leave the morning of 8/1.

Please let Molly and I know if you have questions.

I am also ccing Marla who has been helpful with previous travel to Pebble.

Thanks - Patty

Subject: RE: ORD support for Pebble EIS

Thank you Susan;

We very much appreciate your timely response and inreach within ORD on our high priority regional request. I have copied Patty McGrath (Lead), David Allnutt (Office Director) and Jill Nogi (Unit Manager) in our Office of Environmental Review and Assessment.

Patty, Jill, and David;

- Paul Ringold would like to (see attachment):
  Develop fairly formal quarterly progress meetings or discussions to make sure that the work requested and performed is on track and continues to function within the boundaries of our original agreements.

  Discuss the possibility of regional funding to assist ORD technical experts in keeping engaged with the EIS process. This may be particularly important as the experts will be spending only a small fraction of their time on this effort. Having someone to stay engaged with the EIS and with the science requirements and issues involved on their behalf could facilitate the efficient and effective use of their time and effort.

- Although no hydrologist has been identified, Steve Kraemer (NERL) has been suggested as a possible option.

- Additionally, Barb Butler, an author of the Bristol Bay assessment, is willing to assist in areas not mentioned in the original request that might come up in the future, including reviews of water quality data (groundwater or surface water), mining materials testing data (e.g., kinetic and static leaching tests), sampling/analysis design, and mitigation/treatment options for control of water quality (e.g., management of wastes to minimize leaching/seepage issues, fate and transport of constituents in water if mine drainage is formed, and treatment of drainage).

AMERICAN OVERSIGHT

- ORD indicated they do not have travel funds for their staff for this effort.

Let me know if I can be of further help.

Bruce

Subject: FW: ORD support for Pebble EIS
Importance: High

Hi Bruce,

Valerie shared this request with me last week, and I've worked with ORD's Program Support Coordinators to identify ORD staff available to work with R10 on the Pebble Mine EIS. As you know, R10 requested specific people and expertise for the project. I'm happy to report that Joe Ebersole, Michael Kravitz, and Kate Schofield are all available for this effort. Unfortunately, we were not able to identify anyone with the requested hydrology expertise. The hydrologists who worked on the Bristol Bay assessment are no longer with ORD (Jim Wiggington retired and Jason Todd is now with OCSPP).

Additionally, Barb Butler, an author of the Bristol Bay assessment, is willing to assist in other areas (aka, areas not mentioned in the original request) that might come up in the future with respect to this mine site, including reviews of water quality data (groundwater or surface water), mining materials testing data (e.g., kinetic and static leaching tests), sampling/analysis design, and mitigation/treatment options for control of water quality (e.g., management of wastes to minimize leaching/seepage issues, fate and transport of constituents in water if mine drainage is formed, and treatment of drainage).

Finally, Paul Ringold, Joe Ebersole's branch chief, has asked for a follow up conversation with Patty McGrath (or R10's lead on the Pebble Mine EIS, if it is not Patty) to discuss Joe's participation. Paul's specific requests are in the attached email. Also, please note that the attached email chain indicates that Joe is available for up to 10% of his time for two years.

I'm assuming that you'll pass this information onto Patty. Please let me know if you need anything else from me.

Thanks,

Susan

I would add the following.

FOIA
PLP letter to the Administrator

Whatever overall order you think is fine by me. And, I likely won't be able to call in so I will ask that someone from the 404(c) team to cover. Likely Ashley and/or Palmer.

Also, my sense is that those are our 404(c) items. We are meeting today at 12:30 and if something else comes up I'll let you know. If you want to send the agenda out sooner though I understand. Unlikely that we would have several major things.

Hi Patty,
I don't have any additional items to add, and unfortunately will not be able to attend the meeting tomorrow. I will be on

Personal Matters / Ex. 6

I am still waiting on comments from one associate reviewer, but will definitely have the revised letter to you for review by the end of today. Your allotted time for review in the schedule is through the end of this week (or sometime Monday morning would be okay for me to stay on schedule). Does this timing still work for you?

Thanks,
Molly

Subject: Re: OERA pebble presentation

From the conversation on Monday, Tim offered to talk about some of his pictures from the site visit. Linda knew of briefing materials that you had, Patty, so if Tim can pull some big picture/schedule type slides for covering a few things that could be helpful for some background/context. It's not that much time so thinking about some highlights without a lot of details...

Linda thought Erik could share a few updates from his team as well and I let he Personal Matters / Ex. 6 Personal Matters / Ex. 6 Barry's asked for all materials in advance to share with the whole office With the lit hold, everyone would have to save everything they receive so let's keep thinking about the materials.

Molly I've heard that you can hear the speakers from the lab, but it won't be set up easily for you to share anything from AK. If there's points you think we could share with the office we should work that in to what Tim and/or Erik could be sharing in the 15 minutes.

Thanks,
Jill

Hi Bruce,

We've identified a federal post doc that has the expertise and availability to support R10 as a hydrologist. His name is Muluken Muche, and he is a post doc in NERL with two years left on his term. Attached is his resume. I recommend that Patty McGrath reach out to Muluken and arrange a phone call to assess whether his expertise and time constraints will fit within their needs. If R10 decides that Muluken is not the right fit, we can explore other options. Please let me know how it goes.

Thanks,

Susan

Subject: RE: ORD support for Pebble EIS

Thank you Susan;

We very much appreciate your timely response and inreach within ORD on our high priority regional request. I have copied Patty McGrath (Lead), David Allnutt (Office Director) and Jill Nogi (Unit Manager) in our Office of Environmental Review and Assessment.

Patty, Jill, and David;

- Paul Ringold would like to (see attachment):
  Develop fairly formal quarterly progress meetings or discussions to make sure that the work requested and performed is on track and continues to function within the boundaries of our original agreements.

  Discuss the possibility of regional funding to assist ORD technical experts in keeping engaged with the EIS process. This may be particularly important as the experts will be spending only a small fraction of their time on this effort. Having someone to stay engaged with the EIS and with the science requirements and issues involved on their behalf could facilitate the efficient and effective use of their time and effort.

- Although no hydrologist has been identified, Steve Kraemer (NERL) has been suggested as a possible option.

- Additionally, Barb Butler, an author of the Bristol Bay assessment, is willing to assist in areas not mentioned in the original request that might come up in the future, including reviews of water quality data (groundwater or surface water), mining materials testing data (e.g., kinetic and static leaching tests), sampling/analysis design, and mitigation/treatment options for control of water quality (e.g., management of wastes to minimize leaching/seepage issues, fate and transport of constituents in water if mine drainage is formed, and treatment of drainage).

- ORD indicated they do not have travel funds for their staff for this effort.

Let me know if I can be of further help.

Bruce

Subject: FW: ORD support for Pebble EIS
Importance: High

Hi Bruce,

Valerie shared this request with me last week, and I've worked with ORD's Program Support Coordinators to identify ORD staff available to work with R10 on the Pebble Mine EIS. As you know, R10 requested specific people and expertise for the project. I'm happy to report that Joe Ebersole, Michael Kravitz, and Kate Schofield are all available for this effort. Unfortunately, we were not able to identify anyone with the requested hydrology expertise. The hydrologists who worked on the Bristol Bay assessment are no longer with ORD (Jim Wiggington retired and Jason Todd is now with OCSPP).

Additionally, Barb Butler, an author of the Bristol Bay assessment, is willing to assist in other areas (aka, areas not mentioned in the original request) that might come up in the future with respect to this mine site, including reviews of water quality data (groundwater or surface water), mining materials testing data (e.g., kinetic and static leaching tests), sampling/analysis design, and mitigation/treatment options for control of water quality (e.g., management of wastes to minimize leaching/seepage issues, fate and transport of constituents in water if mine drainage is formed, and treatment of drainage).

Finally, Paul Ringold, Joe Ebersole's branch chief, has asked for a follow up conversation with Patty McGrath (or R10's lead on the Pebble Mine EIS, if it is not Patty) to discuss Joe's participation. Paul's specific requests are in the attached email. Also, please note that the attached email chain indicates that Joe is available for up to 10% of his time for two years.

I'm assuming that you'll pass this information onto Patty. Please let me know if you need anything else from me.

Thanks,

Susan

Subject: ORD support for Pebble EIS

Hello Bruce-

AMERICAN OVERSIGHT

Last week I spoke with Scot Hagerthey regarding ORD support for our cooperating agency participation in the Pebble EIS. He acknowledged that ORD folks are interested and available and requested that I send the request for ORD support through you. Can you let me know how you like to see these requests. Is an email from me sufficient? Following is the support that is needed.

Request for ORD Support for Pebble Environmental Impact Statement

The US Army Corps of Engineers is the lead agency in developing an EIS for the Pebble Mine Project in Alaska. The Corps invited EPA to be a cooperating agency to assist the Corps in developing sections of the EIS. In addition, EPA is responsible for reviewing the Draft EIS and the public notice for the CWA 404 permit application. EPA Region 10 has put together a team to accomplish these responsibilities. There are several areas where EPA is requesting support from ORD to bolster EPA's review team and also benefit from ORD's past work in the Bristol Bay watershed where the mine project is located. From 2011 to 2014, EPA Region 10 and EPA's Office of Water worked with ORD in developing the Bristol Bay Watershed Assessment. ORD's experience and understanding of the watershed and potential impacts that could occur during mining will provide needed support to EPA Region 10's NEPA/permit review team in several key areas.

The key areas where we are requesting support are identified below.

Specialty	Summary of Assistance Requested	ORD staff requested
Fisheries	Provide advice to EPA's team on fisheries issues Provide input into EIS scoping letter Review baseline data Recommend aquatic resources impact assessment methodologies Participate in fisheries technical working group Review and provide comments on fisheries sections of the EIS	Joe Ebersole
Hydrology	Provide advice to EPA's team on hydrology issues Review groundwater and surface water hydrology baseline data Recommend impact assessment methodologies and modelling approaches and review results Participate in hydrology technical working group Review and provide comments on hydrology sections of the EIS	The ORD hydrologist that assisted with the Bristol Bay watershed assessment has retired. We do need support in this area and request that ORD identify individuals that can assist.
Transportation	Provide advice to EPA's team on transportation issues Review and provide comments on transportation sections of the EIS	Michael Kravitz
Coordination	Participate in monthly Pebble NEPA/permit team to assist with coordinating ORD support Potentially review sections of the EIS	Kate Schofield

In terms of timing, we are requesting ORDs immediate assistance to help with baseline data review and development of EPA's EIS scoping letter. We expect that assistance will be needed throughout the EIS process, with times of intense activity when documents are being reviewed and times with very little activity. The EIS process will take at least two years. There may be additional areas where we need support as the EIS process moves forward.

Please let me know if you need additional information.
Thanks-

Patty

Subject: RTOC Standing Issues Table - EPA Updates by 6/1

Hello,

The next EPA Region 10 Tribal Operations Committee (RTOC) quarterly meeting will be held on June 5th- 7th in Juneau, AK. Please provide any updates that you may have to the RTOC Standing Issues **by Friday, June 1st.** These updates will be shared with the RTOC electronically prior to their meeting.

The RTOC Standing Issues is available on OneDrive located at:

Internal Website/ Ex. 6

Let me know if you have any questions or need any additional information about this quarterly RTOC request.

Thanks for your time!

JR

To: McGrath, Patricia [mcgrath.patricia@epa.gov]
Subject: RE: BB check in

Hi Patty,
The only other agenda item I can think of is a welcome to Mark Douglas – I assume he will be attending these calls now as Matt was before?

Regarding the scoping letter status, Jill and I have worked out a revised schedule per David's request to try to finish before the last minute. The plan is for ORC to complete review by COB today and Jill by COB Thursday. This would then bump the director (David and Tami) review to 5/25-6/1 and HQ review to 6/4-6/12. I have already let Megan Barnhart (at OFA) and Palmer know about the planned HQ review time, so they can be ready.

I have not yet had a chance to read the new documents Shane distributed and determine if any changes are needed in the scoping letter, but that is on my to-do list for this week.

Thanks,
Molly

Hi Molly, Erik, and Ashley –

Please let me know if you have agenda items for the check-in meeting tomorrow, in addition to those below:

- Scoping letter status
- PLP project description updates
- June 6 cooperating agency meeting

Thanks –
Patty

Thank you Patty, here are our items as of now. There is some chance that we may have another one, or that one of these won't need to happen – my suggestion would be that we can play that by ear if it happens and you can send these out whenever you want. I would also suggest that the EIS/permitting items come first.

- FOIA
- PLP response
- Congressional Western Caucus response
- HAC QFR response
- FYI correspondence

Subject: 5.16.2018 Mining Team Retreat: updated location
Attachments: WRC Campus.docx; SPD Drawings.docx; 2018 draft Mine Team Retreat (003).docx

Good morning Mining Team,

We are continuing to plan location logistics for the Mine Team Retreat to occur on **Wednesday, May 16.** A DRAFT agenda is attached but please keep in mind this agenda is changing as we continuing to finalize the details.

There has been a location change and the new location of the meeting is detailed below:

NOAA Western Regional Site
7600 Sand Point Way NE,
Seattle, WA 98115

- Conference room located at **Building # 2** (see map) on the lower level of the building with reserved parking only
- Recommended to park in the parking lot in **Building #1**

Food: There is a cafeteria on campus, if you plan on utilizing the campus cafeteria we are requested to do so after 12:30pm PST.

Most folks travelling will be staying downtown. Please record how you will get to the facility at the below link:

Subject: ET Mining Subgroup summary - August 2018
Attachments: ET_miningsubgroup_summary_201808.docx; ETMiningSubgroupCharter_150314.pdf

Dear Mining Team-

Attached is the R10 mining sector summary that was shared with the ET Mining Subgroup during a meeting earlier this week.
As mentioned at the last mining team meeting, I meet with the ET Mining Subgroup quarterly and prepare quarterly updates in advance (and email updates more frequently as needed). The highlighted text in the summary are the issues that were discussed during the meeting – in addition to others that the ET brought up.

Also, a couple of you have asked to see the ET Mining Subgroup Charter, which is attached.

Please let me know if you have questions.

Best regards
Patty

Subject: TAs for September travel

Hi Tina
I want to let you know that my two trips to Alaska in September are cancelled.
The trip for September 18 was for an all day agency meeting associated with the Pebble EIS. The Corps of Engineers cancelled that meeting and is replacing that meeting with a series of 2 hour conference calls.
The trip for the following week was to accompany our NEPA unit manager and new AOO director on a site visit to Pebble.

AMERICAN OVERSIGHT

I appreciate all the work you put into these TAs and wanted to let you know ASAP that these are cancelled. Hopefully the ARE funds can be used for others to travel.

Please let me know if you have questions.

Patty

Patty,

I suggest the following for the agenda. I also suggest they come after yours.

- QFR
- PLP response
- Forsgren and Hladick meeting
- Western Caucus response

Ashley may have more based on last week's work. I propose that you can go ahead and we'll add Ashley's suggestion later if she has one.

Patty:

Flight details for the July trip below. I also checked with our helicopter vendor (Soloy). They do accept credit cards, but since they take so few they add on the 3% fee to your total cost. Happy to do it either way.

Thanks,
Tim

Subject: EPA Tour

Chas:

Can you reserve 5 seats on July 31 for a tour with EPA? Will need to be on the earliest flight out and latest one returning. Also, can you check on the possibility of flying in to Kokhanok in the morning instead of Iliamna? We may try to start the tour there. Will also need an AStar for the full day. Will get you the SSRF shortly.

AMERICAN OVERSIGHT

Thanks,

Tim Havey

Hi Jennifer and Patty –
More information related to HQ quick turnaround request for you. I wanted to have Candi clarify what needs to be on the report by 9am Pacific/8am AK time tomorrow to meet the deadline. I'm teleworking today so if you want to talk through the request this morning, please feel free to call my work cell at 206-316-0219. We will want to run the Pebble update through Ashley today too. Thanks so much for your help with this! If you are both able to send your edits/additional information to me before you leave the office today, I'll compile and send out to Candi tomorrow morning.

Hope you had a great weekend! Jill

Candi, a few more questions for you. Thank you! I want to make sure whether OFA/OP is mostly interested in the projects for which we anticipate the DEIS to be released (and is that in the next 2 weeks as stated at the top of the report?). The DEIS for Pebble is anticipated this fall on the report that you shared, so not in the next 2 weeks – should it be on here or on a later report? **Non-Responsive: Unrelated to Bristol Bay/Pebble Mine**

Non-Responsive: Unrelated to Bristol Bay/Pebble Mine

Thanks for working with us on this! By the way, a lot of people aren't in today, so there's really only the one day next Tuesday to work on this and get it back to you. I think it will be super helpful to understand what makes the cut for being reported on this forecast report, and how often you will be asking the Regions to update it. Is it once a month, bi-monthly, more often – so that if we know things are happening later in the summer in some cases, would you want those reported now as well?

Jill

Subject: Pebble EIS water management plans and modeling

As discussed during our meeting this morning, below is a link to the Pebble Project EIS website where you will find the water management plans and modeling reports. Most of this will be found in responses to RFI 19 (including 19a, 19b, 19c, and 19d) and also RFI 21. You can filter the list of documents by searching on "19" or you can look through the entire list of information requests. The reference documents are available on the website as well.

Subject: Pebble NEPA/permitting team - documents for awareness review

Pebble NEPA/permitting team –

The Corps has started sending us, and other cooperating agencies, information generated by PLP and the third-party EIS contractor (AECOM). This information includes AECOM's requests (to PLP) for additional information (RFAIs) and PLP's responses. The Corps has begun adding theses RFAIs to the public EIS website. Molly and I will add this information to our SharePoint site as well.
The Corps has submitted this information to us and requested an awareness review, but is not requesting written comments.

For now, I want to bring your attention to two documents, attached:
1 – PLP Updates to the Proposed Project - PLP has made some updates to the project description. Please review this document so that you are aware of the changes.

Deliberative Process / Ex. 5

Deliberative Process / Ex. 5

2 – PLP Technical Note on Project Options and Screening Criteria – This document summarizes screening criteria and options used by PLP to develop its current project description. I expect the Corps will consider this information during alternatives development. Please review this document for awareness.

We will discuss these documents during our next team meeting on May 24, and I can provide more context. In the meantime, please let me know if you have questions.

Thanks-
Patty

AMERICAN OVERSIGHT

Hi Ashley and Garth -

I traded voice messages with Ashley about this issue, but realized that I neglected to forward you this email string.
We are planning two trips to the Pebble project site this summer.
The first is a wetlands delineation field verification trip with the Corps on July 9 - 11. Mark Douglas would participate in that trip.
The second, yet to be scheduled, is a project overview site visit (1 day on-site) attend by four EPA folks from our NEPA team. Both of these visits will involve helicopter time from Iliamna to and around the Pebble site. Mark's visit will involve overnights in Iliamna.

Attorney Client Privilege/Deliberative Process Privilege / Ex. 5

Please let me know as soon as possible if you have any concerns or would like to discuss.

Thanks -
Patty

Estrella:

I have attached the site services request form that our operations staff need to finalize your arrangements. I went ahead and filled out most. Please review and add your phone number (cell phone preferably) and whether anyone has any food allergies or special needs. You can send the completed form back to me and I will submit it to site. I have requested individual rooms for each of you.

Meals are cafeteria style. For your arrival day, it will be easiest if you can bring your lunch with you. For the remaining days you will make a bag lunch at breakfast to bring with you to the field.

We will provide in-town transportation to/from the airport each day in one of our vehicles. Work days are 12 hours, with 10 in the field and one hour on either end for muster, briefings, etc. Crews normally do not return to base during the work day unless weather limits flight operations. Low clouds and/or high winds are typically the only conditions that will restrict helicopter travel.

No firearms are permitted at any Pebble facility or in helicopters. Trained bear guards will be provided with each crew. Guards are in constant radio contact with site operations. Alcohol is prohibited at any Pebble facility.

Safety training and site orientation will take place as soon as you arrive. That should take about an hour, followed by a 20-minute helicopter safety briefing. We provide basic PPE (safety goggles, high visibility vest, hearing protection). You are welcome to bring your own as long as the operations manager approves. Field gear requirements are what you would normally bring.

Accommodations are 150/person/day. We will invoice you after your trip. Our site staff does not have the ability to accept payments. Helicopter time will likewise be invoiced to you based on the per seat cost and number of flight hours logged. Cost may vary depending on which helicopter is available.

Please let me know if you have any other questions.

Thanks,
Tim

Subject: Field Logistics

Hi Tim,

I think I left a voice mail and I am wondering if you received it.

In any case, please let me review with you our itinerary:
Arrival time @ Iliamna: July 9 (Monday) at 0900.
Departure time: July 11 @ 4:30 p.m.

Corps will disburse your company directly for hotel/helicopter costs.
Hotel:
Check in July 9th
Check out July 11th

Meals:
July 9th (lunch brown bag - Diner)
July 10th (all meals)
July11th (breakfast & lunch).

Helicopter: as per time-usage logs (coordination field work with HDR at this point).

AMERICAN OVERSIGHT

Truck Rental: We will take your offer of picking us up at the airport on Monday July 9th.

You mentioned we will have safety training upon arrival on July 9th before heading to the field. Please let us know if there is anything else we need to be aware of.

Thank you very much for your help,

Estrella

Subject: pebble site visit

Hi All-
Thanks for your quick responses related to the request for available dates for a site visit.
Based on the responses, it looks like the only dates that work are:
7/30 (this would mean Sunday travel to Anchorage for Seattle folks)
7/31
8/20 (this would entail Sunday travel to Anchorage for Seattle folks)
8/21

Chris, Tim and Jill - Please confirm that Sunday afternoon/evening travel is acceptable to you in case the 7/30 and 8/20 dates, otherwise I will just forward the two Tuesday dates (7/31 and 8/21) as options.

Patty

Yes. The $500 includes both legs. The helicopter time is estimated at $1200 although the exact amount cannot be determined until the day of since it is dependent upon actual time in flight and standby.
Iliamna Air Taxi will accept $500 on gov credit card. Regarding the helicopter, we will be involved by Pebble and will pay them back via check.

Thanks Patty,
So, the Iliamna airfare is 500 for both the leg from Anchorage to Kokhanok, and from Iliamna to Anchorage. Do we know how much the helicopter ride is,- or is that included in the $500.? Also, - Do they accept gov. credit cards that the travelers can pay with that day?

Subject: RE: Pebble site visit

All-
I talked to Pebble. As is being done for Mark Douglas' trip, Pebble has reserved the flights out of Anchorage and has provided our names to Ilimana Air taxi.
Therefore, our seats are already reserved. We will pay Illiamna Air taxi on the day of the flight.

For the site visit we will fly from Anchorage to Kokhanok and board the helicopter there. From Kokhanok we will travel by helicopter over the ports and road route to the mine site and tour the mine site. At the end of the tour we will depart from Iliamna back to Anchorage.

The flight costs for Anchorage-Kokhanok and Iliamna-Anchorage is $500.

Your TAs should note that the 7/31 flights are already reserved and will be paid for on day of flight (airplane) or via invoice afterwards based on exact flight time (helicopter)

Subject: Pebble site visit

Molly, Tim, and Chris –

Our Pebble site visit is confirmed for July 31. Please submit your TAs ASAP. ARE funding is available for this trip but needs to be obligated.

Following is information for the TAs.

Seattle travelers –
7/30 – fly to Anchorage and stay overnight

All travelers –
7/31:
8 am flight from Anchorage to Iliamna via Illiamna Air Taxi (arrive Iliamna at 9 am)
9:00 – 3:30 – Pebble site visit (mine site, road, ports) - this will entail helicopter time. The cost estimate for the helicopter portion is $1200 per person (note PLP will invoice us for the exact amount)
4:30 – flight from Iliamna back to Anchorage (should arrive in Anchorage at 5:30)

Seattle travelers - you can return to Seattle on 7/31 as there are late flights leaving Anchorage – or overnight and leave Anchorage on 8/1. I will likely leave the morning of 8/1.

Please let Molly and I know if you have questions.

I am also ccing Marla who has been helpful with previous travel to Pebble.

Thanks - Patty

Hi Bruce,

We've identified a federal post doc that has the expertise and availability to support R10 as a hydrologist. His name is Muluken Muche, and he is a post doc in NERL with two years left on his term. Attached is his resume. I recommend that Patty McGrath reach out to Muluken and arrange a phone call to assess whether his expertise and time constraints will fit within their needs. If R10 decides that Muluken is not the right fit, we can explore other options. Please let me know how it goes.

Thanks,

Susan

Subject: RE: ORD support for Pebble EIS

Thank you Susan;

We very much appreciate your timely response and inreach within ORD on our high priority regional request. I have copied Patty McGrath (Lead), David Allnutt (Office Director) and Jill Nogi (Unit Manager) in our Office of Environmental Review and Assessment.

Patty, Jill, and David;

- Paul Ringold would like to (see attachment):
  Develop fairly formal quarterly progress meetings or discussions to make sure that the work requested and performed is on track and continues to function within the boundaries of our original agreements.

  Discuss the possibility of regional funding to assist ORD technical experts in keeping engaged with the EIS process. This may be particularly important as the experts will be spending only a small fraction of their time on this effort. Having someone to stay engaged with the EIS and with the science requirements and issues involved on their behalf could facilitate the efficient and effective use of their time and effort.

- Although no hydrologist has been identified, Steve Kraemer (NERL) has been suggested as a possible option.

- Additionally, Barb Butler, an author of the Bristol Bay assessment, is willing to assist in areas not mentioned in the original request that might come up in the future, including reviews of water quality data (groundwater or surface water), mining materials testing data (e.g., kinetic and static leaching tests), sampling/analysis design, and mitigation/treatment options for control of water quality (e.g., management of wastes to minimize leaching/seepage issues, fate and transport of constituents in water if mine drainage is formed, and treatment of drainage).

- ORD indicated they do not have travel funds for their staff for this effort.

Let me know if I can be of further help.

Bruce

Subject: FW: ORD support for Pebble EIS
Importance: High

Hi Bruce,

Valerie shared this request with me last week, and I've worked with ORD's Program Support Coordinators to identify ORD staff available to work with R10 on the Pebble Mine EIS. As you know, R10 requested specific people and expertise for the project. I'm happy to report that Joe Ebersole, Michael Kravitz, and Kate Schofield are all available for this effort. Unfortunately, we were not able to identify anyone with the requested hydrology expertise. The hydrologists who worked on the Bristol Bay assessment are no longer with ORD (Jim Wiggington retired and Jason Todd is now with OCSPP).

Additionally, Barb Butler, an author of the Bristol Bay assessment, is willing to assist in other areas (aka, areas not mentioned in the original request) that might come up in the future with respect to this mine site, including reviews of water quality data (groundwater or surface water), mining materials testing data (e.g., kinetic and static leaching tests), sampling/analysis design, and mitigation/treatment options for control of water quality (e.g., management of wastes to minimize leaching/seepage issues, fate and transport of constituents in water if mine drainage is formed, and treatment of drainage).

Finally, Paul Ringold, Joe Ebersole's branch chief, has asked for a follow up conversation with Patty McGrath (or R10's lead on the Pebble Mine EIS, if it is not Patty) to discuss Joe's participation. Paul's specific requests are in the attached email. Also, please note that the attached email chain indicates that Joe is available for up to 10% of his time for two years.

I'm assuming that you'll pass this information onto Patty. Please let me know if you need anything else from me.

Thanks,

Susan

Dear Maggie and Val,

Please find attached the Region 10 technical support request form for assistance. This is a high priority for R10 and we look forward to support starting as soon as possible. Our Regional Mining Advisor has been discussing the specifics with ORD Scientists already so this will not come as a surprise. Let me know of any next steps and how I can assist with the support request.

Bruce

Subject: ORD support for Pebble EIS

Hello Bruce-

Last week I spoke with Scot Hagerthey regarding ORD support for our cooperating agency participation in the Pebble EIS. He acknowledged that ORD folks are interested and available and requested that I send the request for ORD support through you. Can you let me know how you like to see these requests. Is an email from me sufficient? Following is the support that is needed.

Request for ORD Support for Pebble Environmental Impact Statement

The US Army Corps of Engineers is the lead agency in developing an EIS for the Pebble Mine Project in Alaska. The Corps invited EPA to be a cooperating agency to assist the Corps in developing sections of the EIS. In addition, EPA is responsible for reviewing the Draft EIS and the public notice for the CWA 404 permit application. EPA Region 10 has put together a team to accomplish these responsibilities. There are several areas where EPA is requesting support from ORD to bolster EPA's review team and also benefit from ORD's past work in the Bristol Bay watershed where the mine project is located. From 2011 to 2014, EPA Region 10 and EPA's Office of Water worked with ORD in developing the Bristol Bay Watershed Assessment. ORD's experience and understanding of the watershed and potential impacts that could occur during mining will provide needed support to EPA Region 10's NEPA/permit review team in several key areas.

The key areas where we are requesting support are identified below.

Specialty	Summary of Assistance Requested	ORD staff requested
Fisheries	Provide advice to EPA's team on fisheries issues Provide input into EIS scoping letter Review baseline data Recommend aquatic resources impact assessment methodologies Participate in fisheries technical working group Review and provide comments on fisheries sections of the EIS	Joe Ebersole
Hydrology	Provide advice to EPA's team on hydrology issues Review groundwater and surface water hydrology baseline data Recommend impact assessment methodologies and modelling approaches and review results Participate in hydrology technical working group Review and provide comments on hydrology sections of the EIS	The ORD hydrologist that assisted with the Bristol Bay watershed assessment has retired. We do need support in this area and request that ORD identify individuals that can assist.
Transportation	Provide advice to EPA's team on transportation issues Review and provide comments on transportation sections of the EIS	Michael Kravitz

AMERICAN OVERSIGHT

Coordination	Participate in monthly Pebble NEPA/permit team to assist with coordinating ORD support Potentially review sections of the EIS	Kate Schofield

In terms of timing, we are requesting ORDs immediate assistance to help with baseline data review and development of EPA's EIS scoping letter. We expect that assistance will be needed throughout the EIS process, with times of intense activity when documents are being reviewed and times with very little activity. The EIS process will take at least two years. There may be additional areas where we need support as the EIS process moves forward.

Please let me know if you need additional information.
Thanks-

Patty

Interested parties are hereby notified that a Department of the Army permit application has been received for work in waters of the United States.

SPECIAL PUBLIC NOTICE DATE: March 30, 2018

IDENTIFICATION NUMBER: POA-2017-271

APPLICANT: Pebble Limited Partnership

LOCATION: The project would be located in the Iliamna region of southwest Alaska, approximately 200 miles southwest of Anchorage and 60 miles west of Cook Inlet. The closest communities are the villages of Iliamna, Newhalen, and Nondalton, each approximately 17 miles from the Pebble Deposit.

CONTACT:
For information regarding the proposed project plans and construction, please contact the applicant at:
Pebble Limited Partnership
3201 C Street, Suite 505
Anchorage, Alaska 99503.

For additional information regarding the EIS process (including scoping) please contact:
Mr. Shane McCoy
Program Manager, Regulatory Division
US Army Corps of Engineers, Alaska District CEPOA-RD Post Office Box 6898 JBER, Alaska 99506-0898

Also, please visit our project website at www.PebbleProjectEIS.com.

The full text of this public notice, as well as associated maps and drawings, are available on our website at:

Subject: briefings for sue

Hi Tami-
Just so you know, I will be in Anchorage Office on July 30 (afternoon) and August 1 (most of the day) and could do the Pebble or AK mining briefings for Sue in person then if the week of July 23 does not work.
Alternately I am around much of the week of July 23 in Seattle office – not sure what days you two will be there.

Hi Muluken –
Per our conversation, below are links to information that will assist with your understanding of the proposed Pebble project and some past work done by EPA.

Link to the US Army Corps of Engineers Pebble EIS website. The website describes EIS process. The Department of Army Permit Application, Attachment D, contains the current Project Description.
https://pebbleprojecteis.com/documents/background

Link to EPA's Bristol Bay website. See "Bristol Bay Assessment – Final Report (2014)" for information on some work that EPA did in evaluating potential mining impacts
https://www.epa.gov/bristolbay

Also, below is the contact information for Tim Maley (also cced). Tim will be contacting you further about the project and our needs.

Tim Maley (206) 553-1210

Subject: Pebble EIS

Hello Kate-
I left a message with you several weeks ago regarding the Pebble EIS, requesting ORD's support.
The US Army Corps of Engineers is the lead agency in developing the EIS. EPA is a cooperating agency and will be assisting the Corps in developing portions of the document and we will also be reviewing the EIS per our CAA 309 authorities.
While the Region has put together a multi-disciplinary team, including folks from OW, there are a few areas where we would like additional support. These include fisheries and hydrologic review and modeling.
I understand that you and others that work for ORD provided assistance in these areas during development of the Bristol Bay watershed assessment.

Region 10 is requesting assistance in these areas to support our EIS cooperating agency and review role.

Can we set up a time this week to discuss?

I am the lead for the Region 10 Pebble NEPA/permitting team. Molly Vaughan is our lead NEPA reviewer.

AMERICAN OVERSIGHT

Hi Cindi and Mark-

We have another short turn around review on a draft section of the Pebble EIS.

Attached is draft Section 4.1, which is the introduction to the Environmental Consequences section. The Corps has requested comments by 10/31. This section identifies past, present, and reasonably foreseeable future actions that will be considered in the cumulative effects analysis in subsequent chapters. We especially appreciate your review of the actions identified and whether there are others that could be missing.

The Corps has requested comments by 10/31. In order to meet this deadline and have management review, if you have time to look at this section, then please send Molly and I comments by COB 10/24.

Let us know if you have questions.

Thanks - Patty

Subject: Pebble site visit & Corps/AECOM meeting logistics

Hi Tim, Chris, and Molly –

This email provides logistics for our site visit to Pebble and meeting with the Corps/AECOM next week.

July 30 - Chris, Tim, and I are flying to Anchorage in the morning. The Sheraton does not have an airport shuttle, so I recommend taking a cab to the hotel following arrival. We can check in or drop bags off at the hotel, have a quick lunch, and then head to the AECOM office.
(currently I arrive on a later flight – at 12:53 pm. If I can't change to the earlier flight then go ahead without me and I will meet you at AECOM)

AECOM office address: 700 5th (walking distance from hotel)
Meeting time is 2 -4 (I forwarded the invite). Purpose is to meet and greet their geochem and hydo SMEs and they will provide us an update on the status of the impact assessment for these resources.

After the meeting I will be checking out the AOO jeep for use on the 31st.

July 31 –
6:45 am - Tim, Chris, and Patty to meet in the hotel lobby; Drive AOO jeep to Iliamna Air Taxi (6231 S Airpark Place) for arrival by 7. Molly will meet us there.
7:00 am – Check in for flight to Kokhanok – be prepared to pay for the charter with your gov credit card
8:00 am – Depart for Kokhanok
9:00 am – Arrive Kokhanok
9 – 4 - Safety briefing, helicopter tour of mine site and parts of the access road and Illiamna Lake terminal locations, time will be spent in the helicopter and also on the ground (will be invoiced later for helicopter time)
4:00 pm – Arrive in Iliamna from tour and check in for Iliamna Air Taxi flight back to Anchorage
4:30 pm – flight leaves Iliamna for Anchorage
5:30 pm – Arrive in Anchorage; Patty, Tim, Chris drive jeep back to the hotel

August 1
My flight leaves at 2 pm. I may be able to take Tim and Chris to airport, except I have a 7 am conference call

---

Please check the weather and dress accordingly.
We will need to bring lunches, snacks, water with us on the 31st. We can purchase in Anchorage on Monday.
Also you might want to bring site maps from the project description for reference.

Let me know if you have questions.
Patty

Subject: Bristol Bay - Allnutt Check-in meetings

Patty,

David indicated a preference and a kind of expectation that the bi-weekly Bristol Bay check-ins would move from Wednesdays to Tuesdays. Tuesdays are apparently better for Tami Fordham and also for Linda A-C.

Would you like me to facilitate this change? I'm offering to take over setting up the Bristol Bay check-ins because I have capacity to manage the meeting invites, gather agenda items, share the agenda prior to the meeting, and facilitate, and, because my being on the 14th floor means that it is easier for me to initiate the call. I offer to take over now also because switching days makes for a natural transition, and also the 404(c) work is less than the NEPA/404 work. Trying to be helpful kind of thing.

Hi Molly and Patty,

I'll volunteer to be one of the reviewers for Chapter 5 for parts not covering recommendations for compensatory mitigation, if that's captured at this stage (that's outside my area of experience).

All-
The purpose of this meeting is to discuss our thoughts/comments on Pebble PDEIS sections related to surface water and groundwater quality, hydrology, and hydrogeology before we submit comments to the Corps. In particular, I am interested in your thoughts on the modeling efforts and sufficiency at characterizing potential impacts. I know that you all might not have completed your reviews yet, but want to discuss initial thoughts.
Thanks - Patty

Hi Molly, Jill, Tami, and David-

Suzanne and I talked briefly about adding a few sentences to EPA's Bristol Bay website about our role in the EIS process and a link to the Corps EIS website.

I think that will help direct folks that are used to looking to EPA for information to the Corps website, particularly now that scoping has begun.

Following is some suggested language. Please let me know if you agree that we should include this on our website and if you have any recommended edits to the language. I have also attached the Corps' Newsletter #1 that was recently posted, FYI.

Environmental Impact Statement Process

The U.S. Army Corps of Engineers received a Department of Army permit application and project description from the Pebble Limited Partnership on December 22, 2017 and has determined that an EIS under the National Environmental Policy Act is needed before it makes a decision on the permit application. The Corps is the lead agency in managing the EIS process and developing the EIS. EPA is a cooperating agency in the EIS process, at the invitation of the Corps. The EIS is to evaluate potential impacts of the project on the physical, biological, and social environment.
The Corps initiated public scoping of the EIS on April 1, 2018. Below is link to the Corps EIS website for more information and documents pertaining to the Department of Army permit application and EIS process.

Subject: RE: QUICK TURNAROUND: Reporting of Regional projects that are/will be receiving HQ visibility (due no later than 5/30)

Candi, a few more questions for you. Thank you! I want to make sure whether OFA/OP is mostly interested in the projects for which we anticipate the DEIS to be released (and is that in the next 2 weeks as stated at the top of the report?). The DEIS for Pebble is anticipated this fall on the report that you shared, so not in the next 2 weeks – should it be on here or on a later report? **Non-Responsive: Unrelated to Bristol Bay/Pebble Mine**

Non-Responsive: Unrelated to Bristol Bay/Pebble Mine

Thanks for working with us on this! By the way, a lot of people aren't in today, so there's really only the one day next Tuesday to work on this and get it back to you. I think it will be super helpful to understand what makes the cut for being reported on this forecast report, and how often you will be asking the Regions to update it. Is it once a month, bi-monthly, more often – so that if we know things are happening later in the summer in some cases, would you want those reported now as well?

Jill

Hi Jennifer and Patty –
More information related to HQ quick turnaround request for you. I wanted to have Candi clarify what needs to be on the report by 9am Pacific/8am AK time tomorrow to meet the deadline. I'm teleworking today so if you want to talk through the request this morning, please feel free to call my work cell at
206-316-0219. We will want to run the Pebble update through Ashley today too. Thanks so much for your help with this! If you are both able to send your edits/additional information to me before you leave the office today, I'll compile and send out to Candi tomorrow morning.

Hope you had a great weekend! Jill

involve high-level HQ political coordination or review than those should probably be on the list. If it is too speculative to know right now, than I would leave them off. We can always update this list at a later time.

Right now, I can't state how often this document will need to be updated. But my guess is that it will be monthly to bi-monthly at most. We should know more after we get feedback from the AA – Rob is meeting with her at the end of next week.

Subject: RE: QUICK TURNAROUND: Reporting of Regional projects that are/will be receiving HQ visibility (due no later than 5/30)

Candi, a few more questions for you. Thank you! I want to make sure whether OFA/OP is mostly interested in the projects for which we anticipate the DEIS to be released (and is that in the next 2 weeks as stated at the top of the report?). The DEIS for Pebble is anticipated this fall on the report that you shared, so not in the next 2 weeks – should it be on here or on a later report? A Non-Responsive: Unrelated to Bristol Bay/Pebble Mine

Non-Responsive: Unrelated to Bristol Bay/Pebble Mine

Thanks for working with us on this! By the way, a lot of people aren't in today, so there's really only the one day next Tuesday to work on this and get it back to you. I think it will be super helpful to understand what makes the cut for being reported on this forecast report, and how often you will be asking the Regions to update it. Is it once a month, bi-monthly, more often – so that if we know things are happening later in the summer in some cases, would you want those reported now as well?

Jill

Patty/Jennifer –
This draft project forecasting report was shared this morning with NEPA regional managers. We've been asking questions to get more clarification from Candi on what goes on here, how often it's going to be updated, and other criteria. I'll forward you the list of questions to her next so you can see the conversation. I will forward any other answers I receive in case they are helpful.

I am sharing this with you both because if Pebble is staying on this report, the deadline to get back to Candi is 9am Wednesday am. I looked at what was provided and thought we may want to make additions/changes to what's here. I don't know if there's time to get a lot of people involved, so I'm coming to you as Sector leads. I am also thinking that

Non-Responsive: Unrelated to Bristol Bay/Pebble Mine

Thanks for taking a look and providing me with any revisions/additions etc. All 10 Regions were asked to add info, so I expect that Candi will be compiling what she receives. I am teleworking on Tuesday and back in the office at 7am on Wednesday, so I can share what we have with Candi by 9am as requested.
Talk with you soon!
Jill

Hi Bruce,

We've identified a federal post doc that has the expertise and availability to support R10 as a hydrologist. His name is Muluken Muche, and he is a post doc in NERL with two years left on his term. Attached is his resume. I recommend that Patty McGrath reach out to Muluken and arrange a phone call to assess whether his expertise and time constraints will fit within their needs. If R10 decides that Muluken is not the right fit, we can explore other options. Please let me know how it goes.

Thanks,

Susan

Subject: FW: ORD support for Pebble EIS

Hi Bruce,

We are reaching out across ORD through an additional level to look into this question and will get back to you soon.

Thanks, Valerie

Subject: RE: ORD support for Pebble EIS

Hi Bruce-

Given Susan's message below, will ORD be able to supply a hydrologist with modeling expertise as requested?

Thanks –
Patty

Hi Bruce,

You're very welcome. Just to let you know, ORD did look into whether Steve Kraemer was available for this effort. Unfortunately, he is not available at this time.

Subject: RE: ORD support for Pebble EIS

Thank you Susan;

We very much appreciate your timely response and inreach within ORD on our high priority regional request. I have copied Patty McGrath (Lead), David Allnutt (Office Director) and Jill Nogi (Unit Manager) in our Office of Environmental Review and Assessment.

Patty, Jill, and David;

- Paul Ringold would like to (see attachment):
  Develop fairly formal quarterly progress meetings or discussions to make sure that the work requested and performed is on track and continues to function within the boundaries of our original agreements.

  Discuss the possibility of regional funding to assist ORD technical experts in keeping engaged with the EIS process. This may be particularly important as the experts will be spending only a small fraction of their time on this effort. Having someone to stay engaged with the EIS and with the science requirements and issues involved on their behalf could facilitate the efficient and effective use of their time and effort.

- Although no hydrologist has been identified, Steve Kraemer (NERL) has been suggested as a possible option.

- Additionally, Barb Butler, an author of the Bristol Bay assessment, is willing to assist in areas not mentioned in the original request that might come up in the future, including reviews of water quality data (groundwater or surface water), mining materials testing data (e.g., kinetic and static leaching tests), sampling/analysis design, and mitigation/treatment options for control of water quality (e.g., management of wastes to minimize leaching/seepage issues, fate and transport of constituents in water if mine drainage is formed, and treatment of drainage).

- ORD indicated they do not have travel funds for their staff for this effort.

Let me know if I can be of further help.

Bruce

Subject: FW: ORD support for Pebble EIS
Importance: High

Hi Bruce,

Valerie shared this request with me last week, and I've worked with ORD's Program Support Coordinators to identify ORD staff available to work with R10 on the Pebble Mine EIS. As you know, R10 requested specific people and expertise for the project. I'm happy to report that Joe Ebersole, Michael Kravitz, and Kate Schofield are all available for this effort. Unfortunately, we were not able to identify anyone with the requested hydrology expertise. The hydrologists who worked on the Bristol Bay assessment are no longer with ORD (Jim Wiggington retired and Jason Todd is now with OCSPP).

Additionally, Barb Butler, an author of the Bristol Bay assessment, is willing to assist in other areas (aka, areas not mentioned in the original request) that might come up in the future with respect to this mine site, including reviews of water quality data (groundwater or surface water), mining materials testing data (e.g., kinetic and static leaching tests), sampling/analysis design, and mitigation/treatment options for control of water quality (e.g., management of wastes to minimize leaching/seepage issues, fate and transport of constituents in water if mine drainage is formed, and treatment of drainage).

Finally, Paul Ringold, Joe Ebersole's branch chief, has asked for a follow up conversation with Patty McGrath (or R10's lead on the Pebble Mine EIS, if it is not Patty) to discuss Joe's participation. Paul's specific requests are in the attached email. Also, please note that the attached email chain indicates that Joe is available for up to 10% of his time for two years.

I'm assuming that you'll pass this information onto Patty. Please let me know if you need anything else from me.

Thanks,

Susan

Dear Maggie and Val,

Please find attached the Region 10 technical support request form for assistance. This is a high priority for R10 and we look forward to support starting as soon as possible. Our Regional Mining Advisor has been discussing the specifics with ORD Scientists already so this will not come as a surprise. Let me know of any next steps and how I can assist with the support request.

Bruce

Thanks Patti,

Here is a link to the form that OSP uses (from the R10 Science Steering Council SharePoint)

SUBMIT A TECHNICAL SUPPORT REQUEST:

Request Form - this form (Click HERE) is submitted to OSP who will help find the ORD support if available.

The form is pretty simple – if you need help I can arrange the information you provided into the desired format:

ORD Regional Decision Support Request	
Initiating Region and Division Region 10	**Date**
Contact Information Name: Phone Number: Email:	
Project Title	
Type of Scientific Support Requested ☐ Consultative advice ☐ Workgroup/seminar/committee participation ☐ Document review Other (please specify)	
Description of Science Need – One-time request Background & Problem. Assistance Needed/Research Steps	
Project Milestones and Due Date	
Estimated number of hours required to complete request ☐ 1 – 4 hours ☐ 8 – 16 hours ☐ 4 – 8 hours ☐ >16 hours If >16, please provide an estimate of the hours needed	
Type of expertise needed (e.g., human health risk assessment, aquatic toxicology)	
Have you worked with ORD scientists on this project previously? ☐ Yes ☐ No	
If yes, please list the names of the scientists.

Subject: ORD support for Pebble EIS

Hello Bruce-

Last week I spoke with Scot Hagerthey regarding ORD support for our cooperating agency participation in the Pebble EIS. He acknowledged that ORD folks are interested and available and requested that I send the request for ORD support through you. Can you let me know how you like to see these requests. Is an email from me sufficient? Following is the support that is needed.

Request for ORD Support for Pebble Environmental Impact Statement

The US Army Corps of Engineers is the lead agency in developing an EIS for the Pebble Mine Project in Alaska. The Corps invited EPA to be a cooperating agency to assist the Corps in developing sections of the EIS. In addition, EPA is responsible for reviewing the Draft EIS and the public notice for the CWA 404 permit application. EPA Region 10 has put together a team to accomplish these responsibilities. There are several areas where EPA is requesting support from ORD to bolster EPA's review team and also benefit from ORD's past work in the Bristol Bay watershed where the mine project is located. From 2011 to 2014, EPA Region 10 and EPA's Office of Water worked with ORD in developing the Bristol Bay Watershed Assessment. ORD's experience and understanding of the watershed and potential impacts that could occur during mining will provide needed support to EPA Region 10's NEPA/permit review team in several key areas.

The key areas where we are requesting support are identified below.

Specialty	Summary of Assistance Requested	ORD staff requested
Fisheries	Provide advice to EPA's team on fisheries issues Provide input into EIS scoping letter Review baseline data Recommend aquatic resources impact assessment methodologies Participate in fisheries technical working group Review and provide comments on fisheries sections of the EIS	Joe Ebersole
Hydrology	Provide advice to EPA's team on hydrology issues Review groundwater and surface water hydrology baseline data Recommend impact assessment methodologies and modelling approaches and review results Participate in hydrology technical working group Review and provide comments on hydrology sections of the EIS	The ORD hydrologist that assisted with the Bristol Bay watershed assessment has retired. We do need support in this area and request that ORD identify individuals that can assist.
Transportation	Provide advice to EPA's team on transportation issues Review and provide comments on transportation sections of the EIS	Michael Kravitz

AMERICAN OVERSIGHT

Coordination	Participate in monthly Pebble NEPA/permit team to assist with coordinating ORD support Potentially review sections of the EIS	Kate Schofield

In terms of timing, we are requesting ORDs immediate assistance to help with baseline data review and development of EPA's EIS scoping letter. We expect that assistance will be needed throughout the EIS process, with times of intense activity when documents are being reviewed and times with very little activity. The EIS process will take at least two years. There may be additional areas where we need support as the EIS process moves forward.

Please let me know if you need additional information.
Thanks-

Patty

Hi Molly-

This email provides you with some updates and comments.

Deliberative Process / Ex. 5

Pebble permit team meeting - we had a good team meeting yesterday though not everyone was able to attend. I did commit to us sending to the team: (1) the PP presentation from the CA meeting that lists the alternatives; and (2) draft Chapters 1 and 2 that Shane sent out this week – for context, but not comment. I sent #1 out yesterday. Can you send out Ch 1 and 2 to the team next week?

Deliberative Process / Ex. 5

I will be out next week, but will be able to check emails and return calls sporadically. So feel free to reach out if you want to talk.

Thanks -
Patty

Hi David-
Since the primary purpose of this meeting is to update you, I recommend canceling the meeting. The 404 team meet yesterday and our NEPA/permitting team is meeting tomorrow. Jill is informed on the status of the scoping letter.
I am planning to send a cancellation for this meeting only, unless I hear otherwise.
Patty

Subject: REVIEW REQUEST and additional documents loaded to Sharepoint

Hello Team,
The Corps distributed some additional information to cooperating agencies related to yesterday's Cooperating Agency meeting here in Anchorage, and I have added these materials to the Sharepoint site, in the "Materials for 6-6-18 Cooperating Agency Meeting" folder. Most of the information is for awareness only, but our review has been requested on two items:

1) the Preliminary Scoping Report

Internal Website/ Ex. 6

2) selected sections of Pre-Draft Chapter 3

Internal Website / Ex. 6

AMERICAN OVERSIGHT

Your review is being requested on specific materials (listed below), but feel free to also review the remainder of the materials if you wish.

- Preliminary Scoping Report: **Molly/Patty** – comments due to Molly **June 20**
  This document addresses scoping comments received to date, but will be updated following the close of the public scoping period.

- Pre-Draft Chapter 3 Sections – comments due to Molly **June 25** (specific section assignments below)
  These documents are first drafts of each resource section Affected Environment, and will also be updated following the close of public scoping and based on cooperating agency input. It is not clear whether cooperators will have an opportunity to review a second iteration prior to publication of the Draft EIS, so a thorough review at this stage is critical.

  The Corps has requested that our review focus on what is missing or any inaccuracies (don't worry about formatting, grammar, etc.). Where we identify something missing/innacurate, we are asked to be very specific in our recommendation. If you identify missing information in your review, first check the RFIs and Responses to Date

  Internal Website/ Ex. 6

  If there is a RFI/response that addresses your concern, then please note that in your comment. If not, then please include in your comment: (1) the information gap, (2) a reference where additional information can be found, and (3) what from that reference should be added, with as much specificity as possible – suggested text would be helpful.

  Please identify the sub-section and page number for each of your comments.

  Here are specific assignments for the review request. Most sections include a word document as well as some associated figures in pdf form.

- 3.1 Intro – **Molly**
- 3.5 Recreation – **Mark/Palmer/Molly**
- 3.11 Aesthetics – **Mark/Palmer/Molly**
- 3.14 Soils – **Mark/Palmer**
- 3.16 Surface Water Hydrology (note, we received figures but not text, and are following up) – **Tim/Mark/Palmer/Muluken**
- 3.17 Groundwater Hydrology – **Tim/Mark/Palmer/Muluken**
- 3.18 Water and Sediment Quality – **Cindi/Tim/Chris**
- 3.22 Wetlands/ Special Aquatic Sites – **Mark/Palmer**
- 3.26 Vegetation (note, we received figures but not text, and are following up) – **Mark/Palmer**

Please let me know if you have any questions. Thank you for your assistance with this review.
Regards,
Molly

Subject: Pebble NEPA/permitting team - documents for awareness review

Pebble NEPA/permitting team –

The Corps has started sending us, and other cooperating agencies, information generated by PLP and the third-party EIS contractor (AECOM). This information includes AECOM's requests (to PLP) for additional information (RFAIs) and PLP's responses. The Corps has begun adding theses RFAIs to the public EIS website. Molly and I will add this information to our SharePoint site as well.
The Corps has submitted this information to us and requested an awareness review, but is not requesting written comments.

For now, I want to bring your attention to two documents, attached:
1 – PLP Updates to the Proposed Project - PLP has made some updates to the project description. Please review this document so that you are aware of the changes.

Deliberative Process / Ex. 5

Deliberative Process / Ex. 5

2 – PLP Technical Note on Project Options and Screening Criteria – This document summarizes screening criteria and options used by PLP to develop its current project description. I expect the Corps will consider this information during alternatives development. Please review this document for awareness.

We will discuss these documents during our next team meeting on May 24, and I can provide more context. In the meantime, please let me know if you have questions.

Thanks-

Subject: ORD support for Pebble EIS

Hello Bruce-

Last week I spoke with Scot Hagerthey regarding ORD support for our cooperating agency participation in the Pebble EIS. He acknowledged that ORD folks are interested and available and requested that I send the request for ORD support through you. Can you let me know how you like to see these requests. Is an email from me sufficient? Following is the support that is needed.

Request for ORD Support for Pebble Environmental Impact Statement

The US Army Corps of Engineers is the lead agency in developing an EIS for the Pebble Mine Project in Alaska. The Corps invited EPA to be a cooperating agency to assist the Corps in developing sections of the EIS. In addition, EPA is responsible for reviewing the Draft EIS and the public notice for the CWA 404 permit application. EPA Region 10 has put together a team to accomplish these responsibilities. There are several areas where EPA is requesting support from ORD to bolster EPA's review team and also benefit from ORD's past work in the Bristol Bay watershed where the mine project is located. From 2011 to 2014, EPA Region 10 and EPA's Office of Water worked with ORD in developing the Bristol Bay Watershed Assessment. ORD's experience and understanding of the watershed and potential impacts that could occur during mining will provide needed support to EPA Region 10's NEPA/permit review team in several key areas.

The key areas where we are requesting support are identified below.

AMERICAN OVERSIGHT

Specialty	Summary of Assistance Requested	ORD staff requested
Fisheries	Provide advice to EPA's team on fisheries issues Provide input into EIS scoping letter Review baseline data Recommend aquatic resources impact assessment methodologies Participate in fisheries technical working group Review and provide comments on fisheries sections of the EIS	Joe Ebersole
Hydrology	Provide advice to EPA's team on hydrology issues Review groundwater and surface water hydrology baseline data Recommend impact assessment methodologies and modelling approaches and review results Participate in hydrology technical working group Review and provide comments on hydrology sections of the EIS	The ORD hydrologist that assisted with the Bristol Bay watershed assessment has retired. We do need support in this area and request that ORD identify individuals that can assist.
Transportation	Provide advice to EPA's team on transportation issues Review and provide comments on transportation sections of the EIS	Michael Kravitz
Coordination	Participate in monthly Pebble NEPA/permit team to assist with coordinating ORD support Potentially review sections of the EIS	Kate Schofield

In terms of timing, we are requesting ORDs immediate assistance to help with baseline data review and development of EPA's EIS scoping letter. We expect that assistance will be needed throughout the EIS process, with times of intense activity when documents are being reviewed and times with very little activity. The EIS process will take at least two years. There may be additional areas where we need support as the EIS process moves forward.

Please let me know if you need additional information.
Thanks-

Patty

Hi Molly-
Today was a busy day for me.
I got through section 3.17 of the comment compilation. I will finish on Monday morning. I made my edits in track changes and will be happy to discus with you if you have questions.
Patty

Hi Erik and Ashley –
Attached is the updated BB presentation and script for the briefing with Sue on July 23. I revised the script in track changes.
Please let me know if you have any comments by COB Monday july 16 so that I can revise and finalize on Tuesday. I will be out of the office next Wednesday through Friday.

Also, Erik can you try to find a Seattle conference room for the briefing? Sue will be here in person.

Thanks - Patty

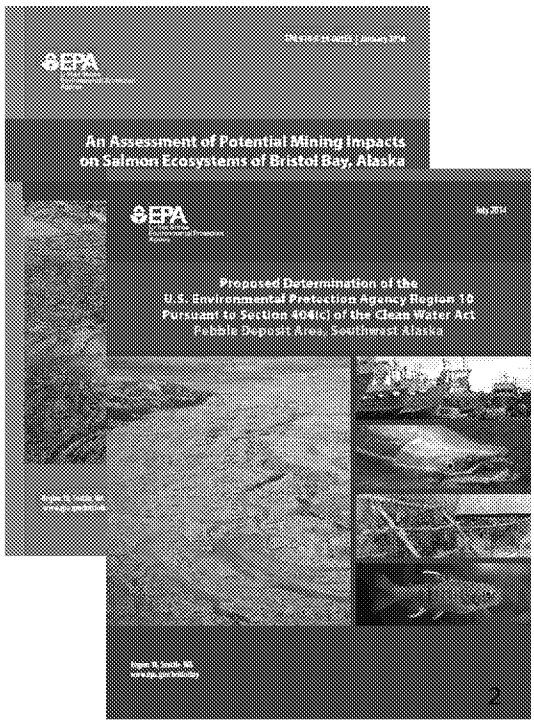
AMERICAN OVERSIGHT

DRAFT

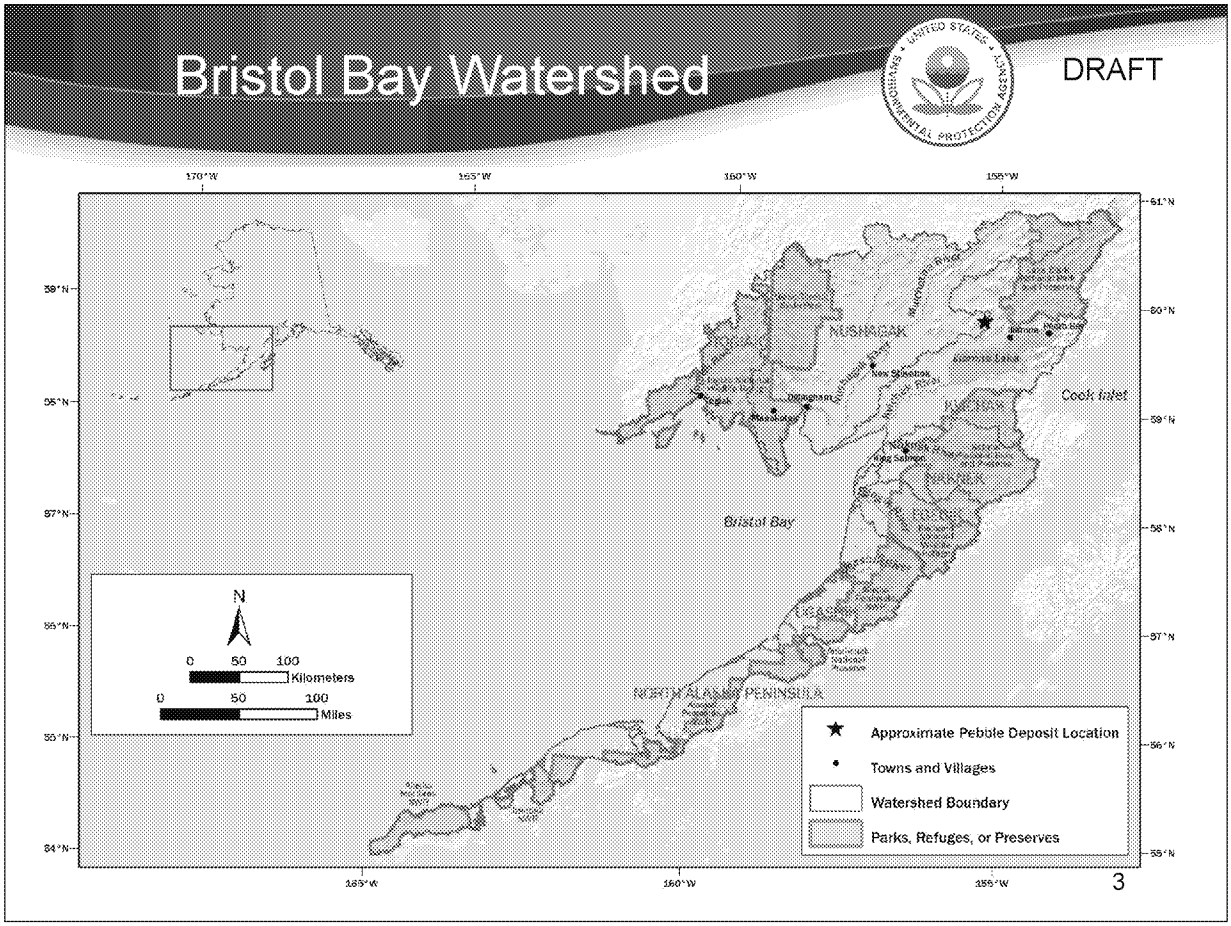
EPA's Work in the Bristol Bay Watershed

Presentation for Alaska Operations Office Director



July 23, 2018

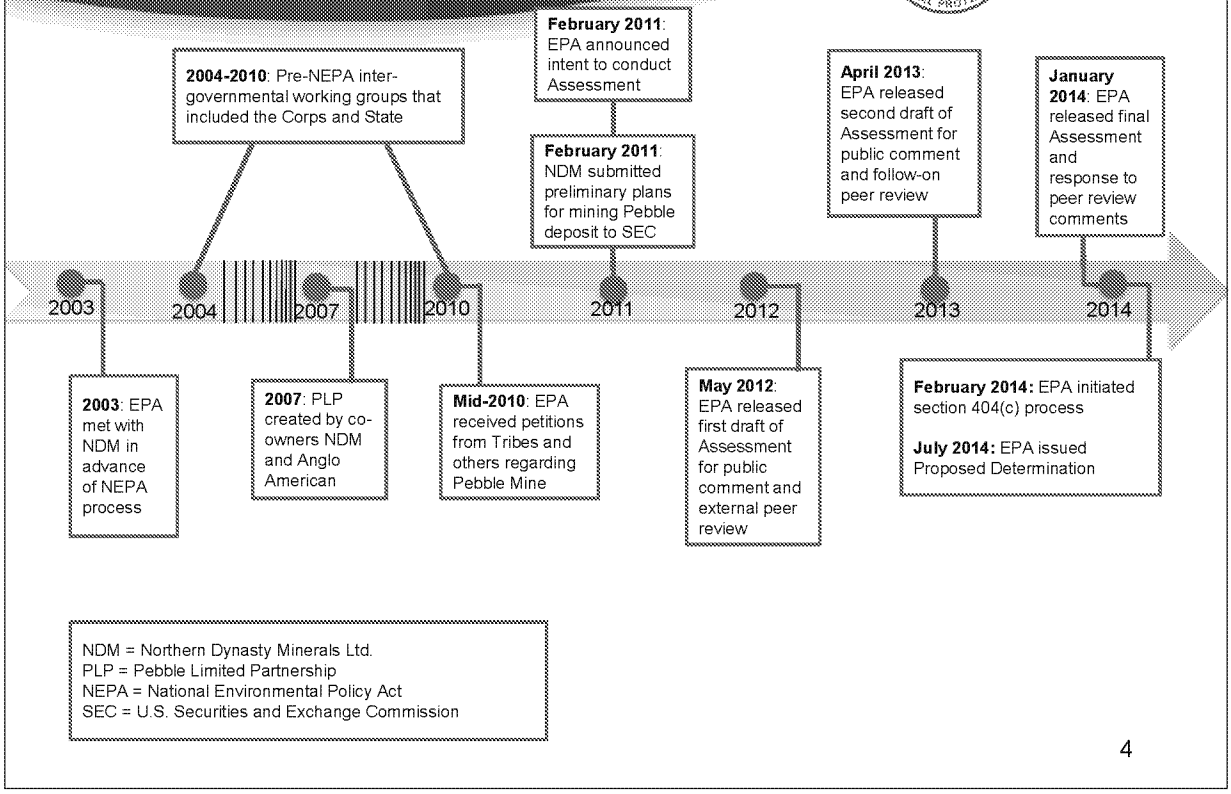
AMERICAN OVERSIGHT



Overview

DRAFT

- EPA's Involvement History
- Science
- Section 404(c) Regulatory Response
- Section 404 Permitting and NEPA

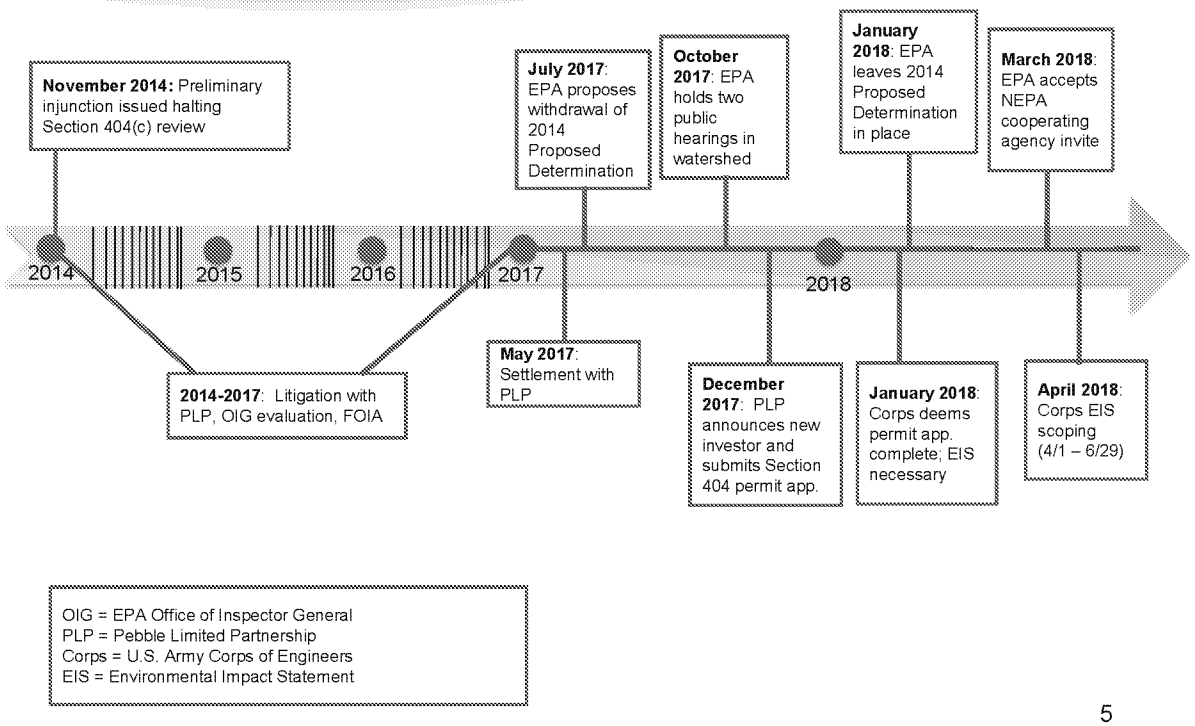


AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

Timeline 2003 - 2014

DRAFT

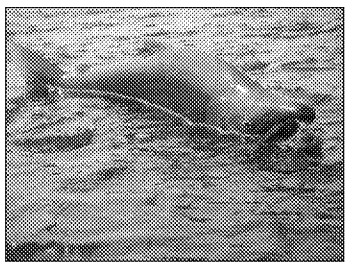


NDM = Northern Dynasty Minerals Ltd.
PLP = Pebble Limited Partnership
NEPA = National Environmental Policy Act
SEC = U.S. Securities and Exchange Commission

AMERICAN OVERSIGHT

Timeline 2014 - Present

DRAFT



OIG = EPA Office of Inspector General
PLP = Pebble Limited Partnership
Corps = U.S. Army Corps of Engineers
EIS = Environmental Impact Statement

AMERICAN OVERSIGHT

Bristol Bay Watershed Assessment

DRAFT

- Purpose:
  - Characterize the biological and mineral resources of the Bristol Bay watershed
  - Increase understanding of the potential impacts of large-scale mining on the region's fish resources
  - Inform future decision-making
- Scientific Ecological Risk Assessment evaluating potential impacts associated with:
  - Large-scale mine construction and operation
  - Accidents and failures

- Three-year scientific assessment effort
  - Independent external peer review
  - Stakeholder and public engagement
    - 8 public meetings
    - 2 rounds of public comment – over 1.1 million comments
  - Tribal consultations

AMERICAN OVERSIGHT

Bristol Bay Watershed Resources

DRAFT

Biological Resources:

- Bristol Bay produces almost half of world's sockeye salmon
- Kvichak watershed world's largest producer of sockeye salmon
- Nushagak watershed frequently at or near world's largest producer of Chinook salmon

Biological Resources Support:

- 14,000 jobs, generates $480 million annually in direct economic expenditures and sales
  - Salmon fishery valued at $1.5 billion annually
- 4,000-year-old subsistence fishery for Alaska Natives

Geological Resources:

- At least 10 claims with more than minimal exploration, including Pebble.
- Pebble deposit: low-grade, with copper, gold, and molybdenum
- According to NDM, Pebble could:
  - Be largest mine of its type in North America
  - Produce 3,000 jobs in AK
  - Contribute $2.7 billion to US GDP annually
- Economics of mining the Pebble deposit are speculative
- Since 2001, four major mining companies have walked away from Pebble project

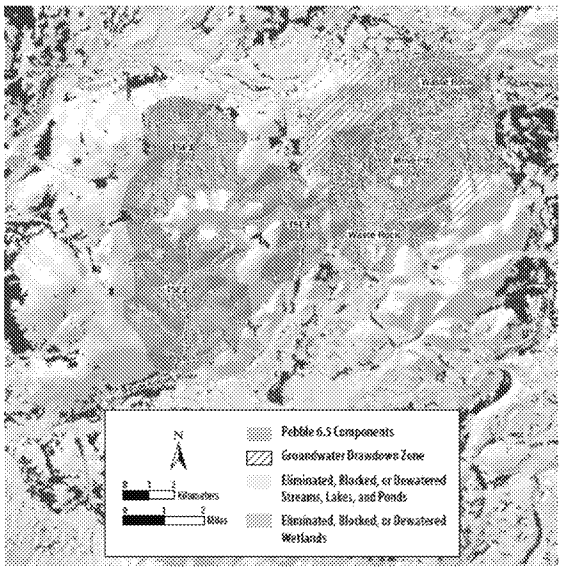
AMERICAN OVERSIGHT

Bristol Bay Watershed Assessment

- Mining scenarios informed by NDM plans submitted to U.S. Securities and Exchange Commission (SEC) in 2011
- Uses 3 potential stages of mine development at Pebble deposit
  - 0.25-billion-ton mine (worldwide median size porphyry copper deposit)
  - 2.0-billion-ton mine (smallest mine size proposed by NDM to SEC)
  - 6.5-billion-ton mine (largest mine size proposed by NDM to SEC)
- NDM says deposit is nearly 12 billion tons

AMERICAN OVERSIGHT

Bristol Bay Watershed Assessment



DRAFT

Mine Footprint Impacts:

- 24-94 miles of salmon-supporting streams destroyed
- 1,300-5,350 acres of wetlands, ponds, lakes destroyed
- 9-33 miles of salmon-supporting streams with altered streamflow likely to affect ecosystem structure and function

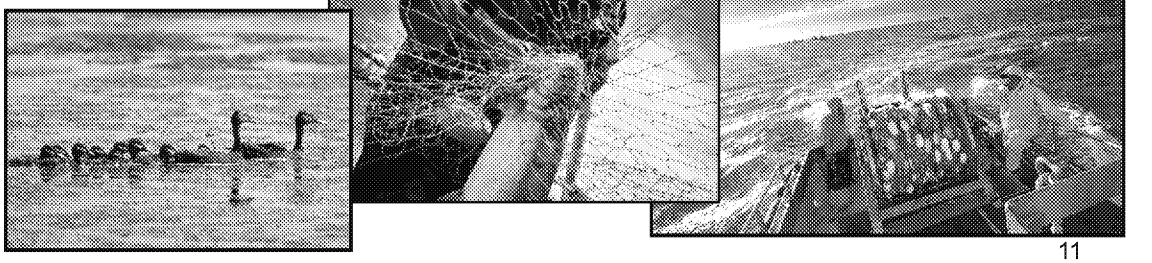
Other Impacts:

- Tailings dams need maintenance in perpetuity
- Routine operations and accidents would increase impacts on salmon habitat quality, both at the mining site and along the 86-mile transportation corridor.

AMERICAN OVERSIGHT

Clean Water Act Section 404

DRAFT



- § 404(a) authorizes the Secretary of the Army to issue **permits**
  - For the discharge of dredged or fill material into waters of the U.S. at specified disposal sites
- § 404(b) directs the Secretary of the Army to apply **environmental criteria** developed by EPA when specifying disposal sites
  - § 404(b)(1) Guidelines [40 CFR Part 230]
- § 404(c) authorizes EPA to prohibit, deny or restrict (withdraw) the placement of dredged or fill material at defined sites in waters of the U.S.

AMERICAN OVERSIGHT

Limits of Section 404(c)

DRAFT

- **Whenever** it determines, after notice and opportunity for public hearing, that the discharge of such materials into such area will have an **unacceptable adverse effect(s)** on:
  - Municipal water supplies; or
  - Shellfish beds and **fishery areas**; or
  - Wildlife; or
  - Recreation areas.

AMERICAN OVERSIGHT

Pebble Deposit 404(c) Process

DRAFT

Step 1

- 2/28/14: **Initiation by EPA Region 10 – "15-day letter"**
- Consulted with Corps, NDM/PLP, and State

Step 2

- 7/18/14: **Proposed Determination** released (PD) by EPA Region 10
- 8/12-15/14: 7 public hearings in Alaska
- > 670,000 written comments; > 99% (86% unique) supported Proposed Determination

Step 3

- EPA Region 10 will review the public comments
- EPA Region 10 will withdraw PD *or* prepare **Recommended Determination** (RD)

Step 4

- **Final Determination (FD) by EPA Assistant Administrator for Water**
- Consult again with Corps, NDM/PLP, and State
- Within 60 days of receipt of RD, issue FD affirming, modifying, or rescinding RD

AMERICAN OVERSIGHT

What Are the Proposed Restrictions?

DRAFT

Restrict the discharge of dredged or fill material related to mining the Pebble deposit into waters of the U.S. that would, individually or collectively, result in the following:

1. **Loss of Streams.**
   a. The loss of 5 or more linear miles of streams with documented anadromous fish occurrence; **or**
   b. The loss of 19 or more linear miles of streams where anadromous fish are not currently documented, but that are tributaries of streams with documented anadromous fish occurrence; **or**

2. **Loss of Wetlands, Lakes, and Ponds.** The loss of 1,100 or more acres of wetlands, lakes, and ponds contiguous with either streams with documented anadromous fish occurrence or tributaries of those streams; **or**

3. **Streamflow Alterations.** Streamflow alterations greater than 20% of daily flow in 9 or more linear miles of streams with documented anadromous fish occurrence

AMERICAN OVERSIGHT

Response to Section 404(c) Proceeding

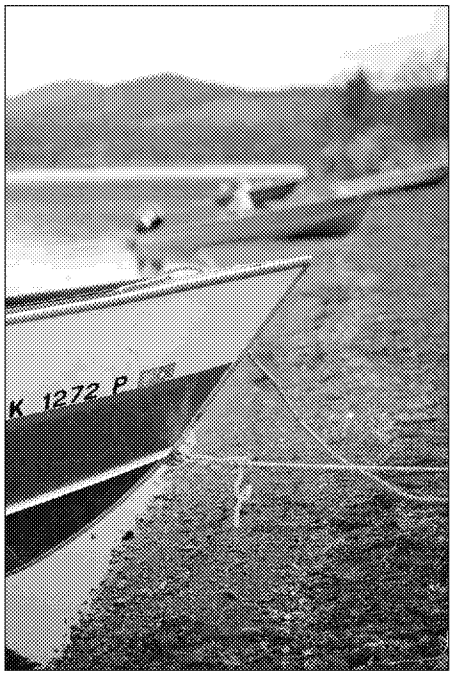
DRAFT

- Office of Inspector General (OIG) Review
  - 17-month in-depth evaluation found no evidence of bias or a pre-determined outcome
  - Possible misuse of position for retired Region 10 employee noted
- PLP broad Freedom of Information Act (FOIA) requests
  - Approximately 18,000 documents produced
- PLP filed three lawsuits in 2014
  - Administrative Procedure Act (APA) challenge to initiation of 404(c) process
  - FOIA litigation
  - Federal Advisory Committee Act (FACA) litigation
- May 2017 settlement agreement
  - Resolved FOIA and FACA litigation and PLP's outstanding FOIA requests

AMERICAN OVERSIGHT

Settlement Agreement

DRAFT



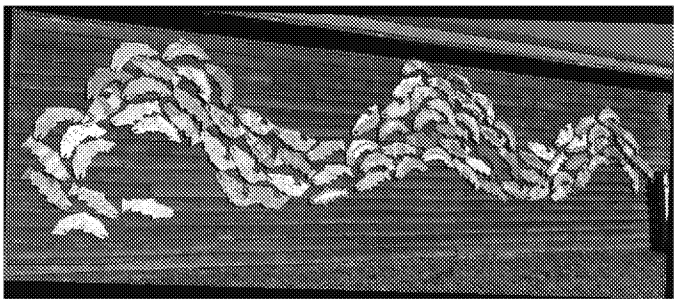
- Key terms of the May 11, 2017 settlement agreement between PLP and EPA:
  - EPA may use its Bristol Bay Watershed Assessment without limitation
  - EPA agrees to initiate a process to propose to withdraw its 2014 Proposed Determination by July 11, 2017
  - EPA agrees not to forward a Recommended Determination (the next step in the 404(c) review process) to EPA HQ until a Final EIS is noticed for the project or May 11, 2021, whichever is earlier
  - PLP drops remaining lawsuits and fee requests against EPA and agrees to file no new FOIA requests during the 2.5- to 4-year hiatus period

AMERICAN OVERSIGHT

Proposal to Withdraw 2014 Proposed Determination

DRAFT

- July 2017: Withdrawal proposed based on policy rationale
  - EPA did not solicit comment on the proposed restrictions or on science or technical information underlying the Proposed Determination
- Outreach and Consultation
  - Proposal generated >1 million comments (~99% opposed)
  - 2 public hearings in watershed
  - Tribal and ANCSA Consultation
    - 16 tribal governments and 1 ANCSA Regional Corp. opposed
    - 1 tribal government and 2 ANCSA Village Corps. supported



AMERICAN OVERSIGHT

Section 404(c) Next Steps

DRAFT

- In January 2018 EPA decided not to withdraw and suspended Section 404(c) process pending further review

- Settlement agreement obligations
  - EPA can issue a new/modified Proposed Determination at any time
  - EPA Region 10 cannot forward a Recommended Determination to EPA HQ until May of 2021 or until a final EIS is noticed, whichever comes first

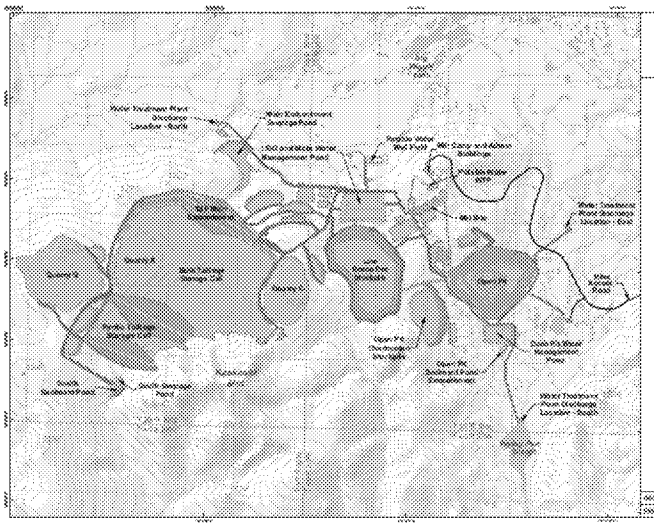
AMERICAN OVERSIGHT

2017 Permit Application

DRAFT

- PLP filed Department of Army (DA) permit application to the Corps in December 2017
  - Includes CWA 404 and RHA Section 10
  - Includes Project Description: mine, power supply, transportation
- Corps deemed application sufficient to begin NEPA

Pebble deposit area



AMERICAN OVERSIGHT

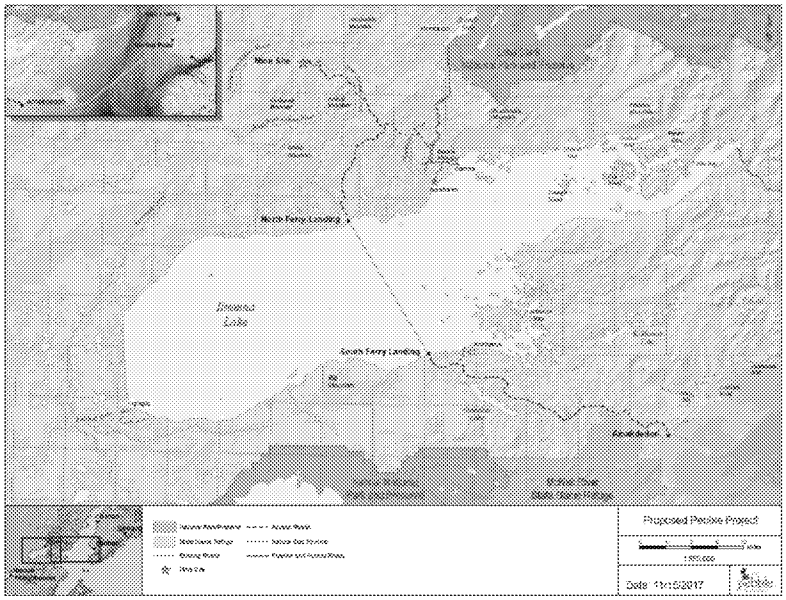
Project Description

DRAFT

Mine Site

- 1.1 billion tons of ore mined over 20 years
- 160,000 tons/day of ore processed to produce:
  - Copper concentrate
  - Molybdenum concentrate
  - Gold via gravity separation
- Open pit mine, ore storage pile, 2 tailings impoundments
- 2 water treatment plants and 3 discharge outfalls
- Closure
  - PAG waste rock backfilled into open pit
  - Dry closure of tailings
  - Long-term water treatment

AMERICAN OVERSIGHT



Project Description

Power

- 230 MW power plant at mine site
- 188 mile natural gas pipeline

Transportation

- 65 miles of roads
- Ferry across Lake Illiamna
- Cook Inlet port site

AMERICAN OVERSIGHT

Project Description

DRAFT

- Proposed mine is:
  - Smaller than 2011 Preliminary Assessment to SEC
  - Larger than the EPA Assessment's 0.25 billion ton mine scenario, which is the basis for the 2014 Proposed Determination

2014 Proposed Determinations
Loss of 5 or more miles of streams with anadromous fish; or
Loss of 19 or more miles of streams that are tributaries of anadromous fish streams; or
Loss of 1100 or more acres of wetlands, lakes and ponds contiguous with streams or tributaries to streams that have anadromous fish; or
Stream flow alteration > 20% of daily flow in 9 or more miles of streams with anadromous fish

2017 DA Application	
component	**wetlands filled**
Mine site	3190
Transportation (roads, ferry terminals, port)	480
Pipeline	408
TOTAL	4078

- Differences from 2011 Preliminary Assessment and EPA's Assessment:
  - Less waste rock mined
  - No cyanide leaching
  - Liners (pyritic tailings)
  - Advanced water treatment and "Physical Habitat Simulation System" to mitigate dewatering
  - Compensatory mitigation - TBD
- Project description could evolve during EIS and 404 review

AMERICAN OVERSIGHT

Initial Corps NEPA & 404 Process

DRAFT

- Corps issued informational Public Notice of application (January 5, 2018)
  - Did not request public comment at this time
- Corps Cooperating Agency Plan specifies agency involvement.
  - EPA's cooperating agency involvement is limited to Section 404(b)(1) issues
- EIS scoping occurred April 1 through June 29
  - EPA submitted scoping letter
- Corps is developing preliminary EIS sections
  - EPA reviewing and providing comments where requested

AMERICAN OVERSIGHT

Corps NEPA Schedule

DRAFT

- Corps EIS schedule:
  - Draft EIS – January 2019
  - Final EIS – late 2019
  - Record of Decision – early 2020
- PLP has requested inclusion of the project in FAST 41 infrastructure & critical minerals streamlining

Corps' Pebble website
https://pebbleprojecteis.com/

AMERICAN OVERSIGHT

Subject: Pebble Ch. 7 and 8

Hi Patty - did you have any comments on Chapter 7 or 8? I believe comments are now due 11/16 based on 28 days from distribution. Ch. 7 is the list of preparers, including cooperating agency representatives. Ch. 8 is the list of organizations that copies of the EIS will be sent to.
The way in which Cooperating Agencies provided their contact information for preparers is all over the board, but ours is more or less consistent with the majority.
--Molly

Subject: EPA's Pebble tribal coordinator

Hi Shane-

As you know EPA has put together a team of folks to accomplish our cooperating agency and permit review and oversight responsibilities. Neverley Wake is the EPA tribal coordinator assigned to our Pebble team. We think it would be beneficial for Neverley to meet with the Corps' tribal coordinator/advisor. I am assuming that is Amanda. The purpose would be to meet & greet so that Amanda knows she can chat with Neverley as needed or if questions come up related to tribal issues. Are you okay with Neverley reaching out to Amanda or vice versa? I believe that Neverley will be attending at least part of the Anchorage scoping meeting.

Below is Neverley' s contact information and she is cced on this email.

Hi Molly –
I made some edits to the comments, primarily for consistency. I also added a few comments on section 4.1 and 4.5 to this table.
I hope to finish reviewing most of the other sections today.
Patty

Hi Patty - here are the draft comments on the last two sections from Mark, for your review. Jill would also like to review the Ch 4 comments before we send them, and is available to review later this week or next, whenever you are finished.
Thanks,
Molly

Subject: RTOC Standing Issues Table - EPA Updates by 9/12

Hello,

The next EPA Region 10 Tribal Operations Committee (RTOC) quarterly meeting will be held on September 18th- 20th here in the EPA Seattle Offices. Please provide any updates that you may have to the RTOC Standing Issues **by Friday, September 12st.** These updates will be shared with the RTOC electronically prior to their meeting.

The RTOC Standing Issues is available on OneDrive located at:

Internal Website/ Ex. 6

Let me know if you have any questions or need any additional information about this quarterly RTOC request.

Also, I want to take a moment to inform you that I will be officially taking over RTOC Coordinator duties for JR on October 1st. I want to announce this as you will be seeing emails from me associated with this work in the future.

Thanks for your time!

Subject: Draft Bristol Bay Check-in Cancellation and Update

Patty, Molly and Ashley,

David Allnutt is working next week but traveling on September 11th. Because he will be traveling, I propose we cancel the 9/11 BB check-in. In place of the meeting, I suggest an update that we would send to the whole invite check-in invite list. Below is a draft update, please provide feedback – ideally no later than mid-day September 10th.

Hello,

Welcome back David! Given that you are out on September 11, we are canceling the check-in and the Bristol Bay Teams have the following update for you. We plan on having the Bristol Bay Check-in on September 25th at 9:00 am PST.

Updates

Permit Oversight/ NEPA Review Team

Scoping Document

- EPA reviewed and commented on the draft scoping document that describes the significant issues raised in scoping. The final scoping document is available on the Corp's Pebble EIS website.

Preliminary EIS review

- EPA reviewed and commented on specific portions of chapter 3 (affected environment) and chapter 4 (environmental consequences) that pertain to our areas of special expertise as identified by the Corps which includes: aesthetics, surface water hydrology, groundwater hydrology, water and sediment quality, wetlands, vegetation
- The documents have many placeholders since there have been changes to the proposed action, alternatives have yet to be developed, and there are numerous substantial requests for additional information where the Corps is awaiting response from PLP.
- It is not clear whether we will be provided with another opportunity to review these chapters before the draft EIS. The Corps has indicated that there will be technical meetings in October/November to discuss comments and the impact assessment.

Alternatives

AMERICAN OVERSIGHT

- The Corps is developing the range of alternatives to be analyzed in the EIS. We participated in a cooperating agency meeting and provided input. During the week of Sept 10, the Corps is to submit a detailed discussion of the alternatives selected for EIS review and rationale for those dismissed.

Site Visits

- July 9 – 11: CWA 404 field verification was completed by Mark Douglas
- July 31: Site visit with some of our NEPA team (Patty, Molly, Tim, Chris) to view the mine site, proposed Lake Iliamna port sites, and portions of the proposed roads.

Schedule

- The Corps Pebble EIS website identifies a draft EIS in January 2019 and a final EIS in late 2019.

404(c) Team

FOIA

- NRDC and CNN FOIA: extended until end 9/28/18 as we work on ex-Administrator's office employee non-email electronic records. Making progress.
- Trustees for Alaska FOIA: interim release of Corps equities documents on 8/31 and deadline extended until 10/31/18 to facilitate coordination between R10 and HQ on the remaining documents.

Representative DeFazio and Senator Carper letter response

- This July 2018 letter asks for Wheeler to revoke the June 2018 memo issued by Pruitt, describe his view of proper use of 404(c) and the Mingo Logan case, and, describe current and planned EPA actions regarding Pebble.
- EPA's response was uploaded to CMS for Lee F's signature on 8/27

Interest group letter to EPA

- This 9/6/18 letter to EPA from 15 interest groups (including, for example, the Competitive Enterprise Institute) urges Wheeler to rescind the proposed determination and applauds the June 2018 memo issued by Pruitt.
- If this letter is controlled for a response, HQ will share a draft with R10.

External Meetings

- Henry Darwin met with Pebble representatives the week of 8/2/18. The 404(c) Team uploaded a note of this meeting to our external meetings folder on share point.
- We want to emphasize our interest for external meetings at all levels to be recorded with: topic, date, attendees, agenda and notes.

PLP letter, memo to file

- An OGC clerk has completed a summary of court decisions on challenges to agencies withdrawing proposals.

Subject: Talking points for michelle Pirzadeh for June RTOC meeting

Good morning Patty;

I'm helping to pull together the talking points for the June RTOC meeting. Below are bullets you provided last time, would you like to update them? My goal is to send them out for review late next week. Michelle has asked us to format them as bullet points, so you will see they changed slightly.

Non-Responsive: Unrelated to Bristol Bay/Pebble

AMERICAN OVERSIGHT

Non-Responsive: Unrelated to Bristol Bay/Pebble

Also, on the last call, Billy Maines, Curyung Tribal Council, asked if there were any Pebble updates, and specifically asked how is it going coordinating with the Corp. Michelle said that the timelines are challenging but we are making it work. He said that Curyung is requesting cooperating agency status, and will also continue to work with them. If there is anything you'd like to share re: Pebble, that would be appreciated.

If it works for you, I have also sent a link to update via OneDrive.

Thanks Patty.

Sent: 5/23/2018 3:59:15 PM
To: Davis, Michelle V. [Davis.MichelleV@epa.gov]
Subject: RE: Talking points for michelle Pirzadeh for June RTOC meeting - Reminder

Hi Michelle –
Following are updated talking points related to Pebble:

Bristol Bay Pebble: Michelle Pirzadeh (Revised and optional) Drafted for April meeting.

- On February 28, 2018, EPA suspended its process to withdraw proposed restrictions on the discharge of dredged or fill material related to mining the Pebble deposit.
- The proposed determinations are in place while EPA receives more information on the potential impacts.
- Eric Peterson is EPA's team lead for this process with Palmer Hough from EPA's Office of Water in DC.

- Pebble Limited Partnership submitted a Clean Water Act 404 permit application to the U.S. Army Corps of Engineers on December 22, 2017, which was accepted.
- The Corps started the NEPA process and will be the lead agency in developing the EIS.
- EPA is a cooperating agency in the EIS process and also has a role in reviewing the CWA 404 application and the State of Alaska's wastewater discharge and air permits.

- Tribes will have an opportunity to provide input into the EIS process during consultation meetings with the Corps and during public comment periods.
- In addition, we understand that the Corps has included two tribal governments as cooperating agencies.
- In April the Corps initiated the EIS scoping public comment period, which ends on June 29. The purpose of the scoping period is for the public to submit comments on the scope of the EIS
- (**Patty McGrath is R10's point of contact related to NEPA and permitting oversight**).

Subject: FW: Talking points for michelle Pirzadeh for June RTOC meeting - Reminder

Good morning Patty;

I'm in the final steps of drafting talking points. The RTOC team, JR, Michael and me are busy with preparations for the June RTOC meeting. As you know, transboundary mining is one of the tribes main concerns in SE. The RTOC Chair, Billy Maines also asked for a Pebble update. Here's what I have from an earlier meeting. Note, the DRA has asked us for a bulleted format, so this may look a little different than you submitted. Please call with questions or concerns. I would like to send the draft points forward for review by tomorrow morning. Best, Michelle

Bristol Bay Pebble: Michelle Pirzadeh (Revised and optional) Drafted for April meeting.

- On February 28, 2018, EPA suspended its process to withdraw proposed restrictions on the discharge of dredged or fill material related to mining the Pebble deposit.

AMERICAN OVERSIGHT

- The proposed determinations are in place while EPA receives more information on the potential impacts.
- Eric Peterson is EPA's team lead for this process with Palmer Hough from EPA's Office of Water in DC.

- Pebble Limited Partnership submitted a Clean Water Act 404 permit application to the U.S. Army Corps of Engineers on December 22, 2017, which was accepted.
- The Corps will begin the NEPA process and development of an Environmental Impact Statement (EIS).
- The Corp is lead agency in developing the EIS and EPA will be a cooperating agency.
- EPA will review the CWA 404 application and the State of Alaska's wastewater discharge and air permits.

- Tribes will have an opportunity to provide input into the EIS process during consultation meetings with the Corps and during public comment periods.
- The first public comment period will be the EIS scoping period which is anticipated to start within the next few months. (**Patty McGrath is R10's point of contact**).

All-
I talked to Pebble. As is being done for Mark Douglas' trip, Pebble has resrverd the flights out of Anchoarge and has provided our names to Ilimana Air taxi.
Therefore, our seats are already reserved. We will pay Illiamna Air taxi on the day of the flight.

For the site visit we will fly from Anchroage to Kokhanok and board the helicopters there. From Kokhanok we will travel by helicopter over the road route to the mine site and toru the mine site. At the end of the tour we will depart from Iliamna back to Anahcorage.

The flight costs for Anchorage-Kokhanok and Iliamna-Acnhorage is $500.

Helicopter costs per below.

Subject: Pebble site visit

Molly, Tim, and Chris –

Our Pebble site visit is confirmed for July 31. Please submit your TAs ASAP. ARE funding is available for this trip but needs to be obligated.

AMERICAN OVERSIGHT

Following is information for the TAs.

Seattle travelers –
7/30 – fly to Anchorage and stay overnight

All travelers –
7/31:
8 am flight from Anchorage to Iliamna via Illiamna Air Taxi (arrive Iliamna at 9 am)
9:00 – 3:30 – Pebble site visit (mine site, road, ports) - this will entail helicopter time. The cost estimate for the helicopter portion is $1200 per person (note PLP will invoice us for the exact amount)
4:30 – flight from Iliamna back to Anchorage (should arrive in Anchorage at 5:30)

Seattle travelers - you can return to Seattle on 7/31 as there are late flights leaving Anchorage – or overnight and leave Anchorage on 8/1. I will likely leave the morning of 8/1.

Please let Molly and I know if you have questions.

I am also ccing Marla who has been helpful with previous travel to Pebble.

Thanks - Patty

Subject: RE: Pebble site visit

All-
I talked to Pebble. As is being done for Mark Douglas' trip, Pebble has reserved the flights out of Anchorage and has provided our names to Ilimana Air taxi.
Therefore, our seats are already reserved. We will pay Illiamna Air taxi on the day of the flight.

For the site visit we will fly from Anchorage to Kokhanok and board the helicopter there. From Kokhanok we will travel by helicopter over the ports and road route to the mine site and tour the mine site. At the end of the tour we will depart from Iliamna back to Anchorage.

The flight costs for Anchorage-Kokhanok and Iliamna-Anchorage is $500.

Helicopter costs per below.

Hi All,

Before you make your travel arrangements, Patty McGrath is going to check with Pebble on the Illiamna Air piece to see if they have already held seats for you.
Patty will let you know asap.

Thanks,
Marla

Hi Chris and Michelle-
Palmer informed us of a briefing tomorrow related to Pebble. The briefing materials are those used to brief Sue Detwiler on Monday.
It looks like Chris has been invited. Please let me know if you need any support or have questions.

Folks:

I just wanted to give you a heads-up that the materials that you used to brief the new AOO will be used tomorrow to brief Henry Darwin, EPA's chief of operations.

It is my understanding that Lee Forsgren will be leading the briefing and John Goodin and Brian Frazer from OWOW will be present as well. Brian indicated that Chris Hladick has also been invited but it is not clear that he has accepted this invite.

That is basically all I know about this briefing.

 Pebble Project Scoping 050818 draft.docx

<!--[endif]-->

Hi Chris,
I have to leave for the day and didn't see any edits from you yet on the Sharepoint site version. So, so make things go more quickly, here is the current version of the document on my OneDrive. I need to send this to Patty ASAP when I come in tomorrow. Please make any edits directly in this document using track changes. As a reminder, the specific section for your review is titled "Marine Environment". It begins in the middle of Page 13 of this version, and ends top of page 15. In particular, please add the appropriate text we've discussed in place of the italicized text on page 14.

If you've already begun edits on another version, no need to switch gears now, just send those to me and I will consolidate in the morning.

Thank you,
Molly

<!--[endif]-->
Chris,
I hope that you are doing well. Molly called this morning with her concern that she needs to keep the scoping letter moving through the internal review process as it needs to go to Patty McGrath today. As per her message below, she needs you to review the section related to dredged material management (pages 13-15) and provide any necessary edits, as well as adding a few sentences to the letter regarding upland disposal. The review schedule is tight and I anticipate that you only need to take about 30 minutes today to assist Molly with this. I know that you have been great about sharing your concerns with the team over the phone, so it should be a pretty easy task for you to complete your contributions to the scoping letter today. If Molly hasn't heard from you by 2pm today, I will need to reach out to Justine to see if she can make the time to provide input related to dredged material management. Justine doesn't have the background with this project however – so she would need to hear from you all about your involvement to date – which could take more time than having you edit it and send it back to Molly.

Please make responding to Molly your first priority when you get in to the office today, and take care of this as soon as you are able.
Thank you!
Jill

Subject: Bristol Bay Check-in
Location: R10Sea-Room-14WallaWalla/R10-Rooms-Service-Center

Start: 10/9/2018 4:00:00 PM
End: 10/9/2018 5:00:00 PM

Recurrence: Weekly
every 2 week(s) on Tuesday from 9:00 AM to 10:00 AM

Agenda

404(c) Team

Congressional responses (Palmer)

- Western Caucus (Gosar et al) – newly OW-approved, not issued
- DeFazio and Carper – just revised, based on newly OW-approved, not issued Western Caucus response
- Lamar Smith – just drafted, based on newly OW-approved, not issued Western Caucus response

FOIA (Ashley)

- E&E News – new request for unredacted copies
- McKeever FOIA Lawsuit – next steps
- NRDC and CNN – working with the AOs office
- Trustees for Alaska – options for Justin Schwab review
- Trustees for Alaska 2 – new FOIA
- Back-up (Erik)

External Correspondence (Erik)

- Recent activity and approach

Permit Oversight/ NEPA Review Team

Timing a Brittany Bolen briefing?

AMERICAN OVERSIGHT

Site Visits

- July 9 – 11: CWA 404 field verification was completed by Mark Douglas
- July 31: Site visit with some of our NEPA team (Patty, Molly, Tim, Chris) to view the mine site, proposed Lake Iliamna port sites, and portions of the proposed roads

NEPA/EIS document reviews - completed

- Scoping Document: In August we submitted comments on the draft scoping document that describes the significant issues raised in scoping. The final scoping document is available on the Corp's Pebble EIS website.
- Preliminary EIS Sections: In July and August, we reviewed and commented on specific portions of chapter 3 (affected environment) and chapter 4 (environmental consequences) that pertain to our areas of special expertise as identified by the Corps which includes: aesthetics, surface water hydrology, groundwater hydrology, water and sediment quality, wetlands, vegetation)
    - The documents have many placeholders since there have been changes to the proposed action, alternatives have yet to be finalized, and there are numerous substantial requests for additional information where the Corps is awaiting response from PLP.
- Alternatives: On October 3, we submitted comments on draft Appendix B (Alternatives Development Process). Previously we participated in a cooperating agency meeting and provided verbal input on the alternatives development process and some of the potential alternatives.

NEPA/EIS document reviews – upcoming

- The Corps has indicated that they will be sending us draft DEIS sections on 11/9 with comments due by 11/21. We have requested more time for review (30 days review period).

Schedule

- The Corps Pebble EIS website identifies estimated dates for a draft EIS in January 2019 and a final EIS in late 2019.

Anderson-Carnahan, Linda 9:44 AM:
Is Theo involved in Pebble??

Nogi, Jill 9:44 AM:
no.

Anderson-Carnahan, Linda 9:46 AM:
Barry put him on the agenda for the all-staff to talk about Pebble.

Nogi, Jill 9:49 AM:
I talked with Barry on Friday and he was taking it off the agenda all together. Patty isn't in town and others that went on the site visit are also away. Patty said that they wouldn't have time to pull things together right now with everything else going on, so I think he's got a revised agenda to share that doesn't have AK on it at all...

Anderson-Carnahan, Linda 9:51 AM:
Getting a little late to be changing the agenda and we had asked people to be here for the all-staff. What is going in place instead? I may talk to Patty.

Non-Responsive: Unrelated to Bristol Bay/Pebble Mine

Importance: High

Hi All

Now that we are coordinating on TWO briefing docs for the RA- reminder that the One Drive doc below needs to be updated with the NEPA info by COB today. Please let me know if you don't have access to this doc. As a reminder- these talking points are being drafted for the RA for:

11-16-18 Meeting of Chris H, RA and Col. Borders, DE, Alaska District, Corps of Engineers

Purpose of the meeting: it's a meet-and-greet between the two senior leaders. Topics to cover: EPA and the Army MOA for Alaska District & Large NEPA Projects (ID'd in Jill's email below- Nanushuk, Pebble, Ambler, Willow and Coastal Plain)

Talking Point Need:
AK MOU Talking Points: The current draft talking points came from a discussion with David Allnutt. *Mark, Matt and Mary Anne:* please review and edit for accuracy. *Jennifer/Molly/Erik*- we also identified specific ongoing project where we'd like more coordination with the Corps on to support our "one federal decision" and aggressive timelines. Feel free to review those and edit for NEPA accuracy!
Large NEPA Projects Talking Points: NEPA team- we need your help in getting these sorted out. An idea- maybe you can use our last "MOU Talking Point" of wanting more coordination to support our "one federal decision" as a way to describe the specific large projects so it ties together?

Process and Timeline to Complete the Talking Points:
We need to have the talking points to the RA's office by 11-13. To meet this timeline:

- ***Staff input on draft talking points- pretty much need this by COB today or 11/5 AM at the latest***
- HQ Coordination on programmatic level (for 404 program, Mary Anne lead; for NEPA, ???)- 11/5ish
- Jill/Rebecca Review- 11/5-11/6
- David and Linda review & edit - 11/7-11/9
- David/Linda submit to RA's office by 11/13

Please let me know if I have missed any steps in the review process.

Thanks!!

Subject: RE: Chu, Rebecca shared "R10 ORA Briefing Paper and Talking Points Chris Meet and Greet with Col Borders" with you.

Hi Becky,
David and I talked on Friday about having bullet points ready for Chris to bring up with the Colonel regarding our efforts/thinking on Nanushuk, Pebble, Ambler, Willow and Coastal Plain – a number of the big NEPA projects in AK. The Corps is the lead on Pebble and Nanushuk and will be coordinating/collaborating with us regarding our 404/aquatic resource related comments on the BLM-led projects on the list. Jennifer Curtis is the lead point of contact for NEPA for Nanushuk and Molly Vaughan is the lead point of contact on the other projects. David had mentioned that he wanted to talk with Chris about everything we pull together prior to the 16th. If we've set 11/6 as the deadline to get it to David and Linda, I would ask that the NEPA leads please have bullet points/talking points ready for me to take a look by Friday 11/2 – and I can help add points to this as well, if needed, by the 6th.

Please also share your one drive link with Molly and Jennifer – Erik is working on the 404(c) team effort but isn't working on the NEPA EIS review, which would be separate talking points for Chris, if we wanted to bring up both. Thanks everyone – we'll be in good shape getting everything together in plenty of time! Your help in developing this is much appreciated. I'm still home sick – so won't be in on Monday but can catch up with folks (hopefully) Tuesday or later.

Jill

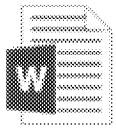
All



The RA is meeting with the new District Engineer at the Alaska District on 11-16. David has asked us to put together some talking points for the RA, and we're going to get these to David and Linda by 11-6. I understand that David spoke with Jill re: talking points specific to Bristol Bay. So including Jill

AMERICAN OVERSIGHT

and Eric if they'd like to join ARU in what we're putting together for Linda/David and the RA.

Matt & Mary Anne- my notes are from our discussions. Feel free to reframe and clean up.

Subject: !REMINDER! We need your Hot Topics for RTOC- extended deadline is COB TOMORROW, TUESDAY 9/11!

Hello.

It's Hot Topics time again! Last Friday's deadline was extended to tomorrow, Tuesday 9/11, so please get them in.

What? 2-3 Hot Topics for RTOC from each office. **1-2 sentences long**. Request them from management or staff. Find them on the internet. Or make them up. Ask yourself, **what's happening related to programs in my office that R10 tribes might benefit from hearing about**? Track it down and write it up. Edit it to 2 sentences. See examples attached.

Thank you for all you do!

Katherine

Subject: Please Review - Pebble Pre-DEIS Sections
Importance: High

Hello Pebble NEPA Team,

AMERICAN OVERSIGHT

We have received several additional sections of the preliminary Draft EIS for review. We have also received many sections as an FYI for which our review is not requested. I have loaded everything I've received to date into the Sharepoint Folder: Preliminary Draft EIS Sections Oct-Nov 2018.

As a reminder, our input at this stage is only requested on the specific sections we were assigned to in the Cooperating Agency plan. Therefore, if your name doesn't appear below with a specific assignment, no review is necessary at this time. However, feel free to take a look at the sections pertaining to your subject matter on the Sharepoint Site if you wish.

Here are the assignments for specific sections where I would appreciate your review. Note that each subject area includes a section for Chapter 3 (affected environment), Chapter 4 (environmental consequences), as well as one or two supporting technical appendices. Please use the attached comment spreadsheet to assemble your comments, and please send them to me by the date noted for each section below.

- 3.11/4.11/K4.11 Aesthetics – Molly
- 3.14/4.14/K3.14 Soils – Mark/Palmer – due COB 11/27
- 3.16/4.16/K3.16 Surface Water Hydrology – Tim/Mark/Palmer/Muluken/Justine – due COB 11/27
- 3.26/4.26/K3.26 Vegetation – Mark/Palmer – due COB 11/27
- 3.17/4.17/K3.17 Hydrogeology – Tim/Mark/Palmer/Muluken – due COB 11/29
- 3.18/4.18/K3.18/K4.18 Water and Sediment Quality – Cindi/Tim/Chris – due COB 11/29
- (note, we have not yet received the Wetlands sections, which are anticipated to arrive approximately 11/21)

I apologize for the short time available for review, especially given the Thanksgiving holiday in the middle. If this schedule will be impossible for you, please let me know as soon as possible. Also, if you have any questions about the sections you are reviewing or where to focus your review, please don't hesitate to call.

Thank you,
Molly

I have shared the link with Jennifer & Molly (Erik already has access).

On the 404 side: the meeting between the RA and the DE is part of our ongoing effort to implement the MOA signed between the Administrator and the Corps specific to Alaska. It's something that we identified as next steps with HQ, who is tracking this closely. I put together some draft talking points that David, Matt, Linda & I discussed in our meeting. The guidance we received was to keep the talking points concise. For what it's worth.

Personal Matters / Ex. 6 hank you Mary Anne and Matt for helping to clean these up for 404.

Hi Becky,
David and I talked on Friday about having bullet points ready for Chris to bring up with the Colonel regarding our efforts/thinking on Nanushuk, Pebble, Ambler, Willow and Coastal Plain – a number of the big NEPA projects in AK. The Corps is the lead on Pebble and Nanushuk and will be coordinating/collaborating with us regarding our 404/aquatic resource related comments on the BLM-led projects on the list. Jennifer Curtis is the lead point of contact for NEPA for

AMERICAN OVERSIGHT

Nanushuk and Molly Vaughan is the lead point of contact on the other projects. David had mentioned that he wanted to talk with Chris about everything we pull together prior to the 16th. If we've set 11/6 as the deadline to get it to David and Linda, I would ask that the NEPA leads please have bullet points/talking points ready for me to take a look by Friday 11/2 – and I can help add points to this as well, if needed, by the 6th.

Please also share your one drive link with Molly and Jennifer – Erik is working on the 404(c) team effort but isn't working on the NEPA EIS review, which would be separate talking points for Chris, if we wanted to bring up both. Thanks everyone – we'll be in good shape getting everything together in plenty of time! Your help in developing this is much appreciated. **Personal Matters / Ex. 6**

Jill

I cleaned up the 404 side and a quick summary of projects for the purposes of "talking points" (not tons of details there).

The "talking points" on Pebble need some editing. I am deferring to you on that. Placeholders for those areas that are NEPA specific.

Let me know when you have had a chance to edit, and I'll pass on to Linda and David once you are done.

Subject: RE: Bi-Weekly Check in with Molly

Yes, I will look for another time. I have two updates I was going to bring up:

1) I expect to send you the draft comments on the Pebble Preliminary Alternatives this afternoon, for your review if interested. They are due to the Corps Wednesday 10/3

Non-Responsive: Unrelated to Bristol Bay/Pebble Mine

Thanks,
Molly

-----Original Appointment-----
From: Nogi, Jill

To: Vaughan, Molly
Subject: Declined: Bi-Weekly Check in with Molly
When: Monday, October 01, 2018 3:00 PM-3:30 PM (UTC-08:00) Pacific Time (US & Canada).
Where: Molly will call Jill at 3-1841

Molly – can we look to reschedule our call and catch up again some other time soon? I'm working through a FOIA deadline and need to be done today or tomorrow… Sorry about this – I think we're in a good place for now and let's catch up again about FY19 maybe next week, before you come to Seattle…

Thank you!
Jill

Flag: Follow up

Hi Jill – Here are the draft comments on the preliminary Ch3 sections that were shared with EPA for review. These were developed by the review team technical experts, compiled and edited by me, and reviewed by Patty. Please let me know if you have any additional edits, by no later than Thursday morning. Comments are due to the Corps Thursday 7/5.
Thank you,
Molly

Hi Folks,

Just checking in on the Pebble EIS comments letter….

Timing to send to Corps?

Please remember that before we send the letter, we need to talk through the salient points and our potential messages for any press inquiries.

Thanks!

Candi, a few more questions for you. Thank you! I want to make sure whether OFA/OP is mostly interested in the projects for which we anticipate the DEIS to be released (and is that in the next 2 weeks as stated at the top of the report?). The DEIS for Pebble is anticipated this fall on the report that you shared, so not in the next 2 weeks – should it be on here or on a later report?

Non-Responsive: Unrelated to Bristol

Non-Responsive: Unrelated to Bristol Bay/Pebble Mine

Thanks for working with us on this! By the way, a lot of people aren't in today, so there's really only the one day next Tuesday to work on this and get it back to you. I think it will be super helpful to understand what makes the cut for being reported on this forecast report, and how often you will be asking the Regions to update it. Is it once a month, bi-monthly, more often – so that if we know things are happening later in the summer in some cases, would you want those reported now as well?

Jill

Subject: RE: QUICK TURNAROUND: Reporting of Regional projects that are/will be receiving HQ visibility (due no later than 5/30)

Non-Responsive: Unrelated to Bristol Bay/Pebble Mine

Rob did mention that he wanted Pebble listed since the AA is aware of this project.

Non-Responsive: Unrelated to Bristol Bay/Pebble Mine

Right now, I can't state how often this document will need to be updated. But my guess is that it will be monthly to bi-monthly at most. We should know more after we get feedback from the AA – Rob is meeting with her at the end of next week.

AMERICAN OVERSIGHT

Candi, a few more questions for you. Thank you! I want to make sure whether OFA/OP is mostly interested in the projects for which we anticipate the DEIS to be released (and is that in the next 2 weeks as stated at the top of the report?). The DEIS for Pebble is anticipated this fall on the report that you shared, so not in the next 2 weeks – should it be on here or on a later report?

All –

We have been tasked to identify projects in the Regions that currently are or potentially will be receiving high-level political HQ review, visibility, and/or coordination. We've provided a template that you can use to report any projects – see below and the draft Project Forecast Report that is attached to this email. In the attachment, some projects have been filled in (R10/USACE/Pebble Mine/DEIS and R5/USACE/Seven Hills Mine/DEIS), but please feel free to edit this information.

- **Region/Lead Agency/Project Name/EIS type (Draft, Final, Supplement)/Anticipated (insert date)**
  - **Background:**
  - **EPA Involvement:**
  - **Status:**

The sooner that you can provide us this information, the better. The latest that we can receive this info is by **NOON on Wednesday, May 30th (eastern time)**. If you have nothing to report, please let us know so that we can track this.

We really appreciate your assistance on this and apologize for the quick turnaround.

If you have any questions, please let me know.

Many, many thanks again for your help and I hope you have a wonderful weekend!

Hi All-
Thanks for your quick responses related to the request for available dates for a site visit.
Based on the responses, it looks like the only dates that work are:
7/30 (this would mean Sunday travel to Anchorage for Seattle folks)
7/31
8/20 (this would entail Sunday travel to Anchorage for Seattle folks)
8/21

Chris, Tim and Jill - Please confirm that Sunday afternoon/evening travel is acceptable to you in case the 7/30 and 8/20 dates, otherwise I will just forward the two Tuesday dates (7/31 and 8/21) as options.

Subject: Pebble NEPA/permitting team - documents for awareness review

Pebble NEPA/permitting team –

The Corps has started sending us, and other cooperating agencies, information generated by PLP and the third-party EIS contractor (AECOM). This information includes AECOM's requests (to PLP) for additional information (RFAIs) and PLP's responses. The Corps has begun adding theses RFAIs to the public EIS website. Molly and I will add this information to our SharePoint site as well.
The Corps has submitted this information to us and requested an awareness review, but is not requesting written comments.

AMERICAN OVERSIGHT

For now, I want to bring your attention to two documents, attached:
1 – PLP Updates to the Proposed Project - PLP has made some updates to the project description. Please review this document so that you are aware of the changes. Deliberative Process / Ex. 5

Deliberative Process / Ex. 5

2 – PLP Technical Note on Project Options and Screening Criteria – This document summarizes screening criteria and options used by PLP to develop its current project description. I expect the Corps will consider this information during alternatives development. Please review this document for awareness.

We will discuss these documents during our next team meeting on May 24, and I can provide more context. In the meantime, please let me know if you have questions.

Thanks-

Subject: FW: Please Review - current draft of Pebble Letter
Importance: High

Chris,
I hope that you are doing well. Molly called this morning with her concern that she needs to keep the scoping letter moving through the internal review process as it needs to go to Patty McGrath today. As per her message below, she needs you to review the section related to dredged material management (pages 13-15) and provide any necessary edits, as well as adding a few sentences to the letter regarding upland disposal. The review schedule is tight and I anticipate that you only need to take about 30 minutes today to assist Molly with this. I know that you have been great about sharing your concerns with the team over the phone, so it should be a pretty easy task for you to complete your contributions to the scoping letter today. If Molly hasn't heard from you by 2pm today, I will need to reach out to Justine to see if she can make the time to provide input related to dredged material management. Justine doesn't have the background with this project however – so she would need to hear from you all about your involvement to date – which could take more time than having you edit it and send it back to Molly.

Please make responding to Molly your first priority when you get in to the office today, and take care of this as soon as you are able.
Thank you!
Jill

Subject: BB check-in

Hi David-
Personal Matters / Ex. 6 Molly will be providing NEPA/permitting input into the check-in call on Wednesday.

Highlights for this week include:

- Corps extended scoping period to now end on June 29
- Suzanne posted a blurb on our BB site about the EIS and link to Corps' Pebble website. I informed the Corps of this.
- Additional scoping meeting added in New Stuyahok.
- Most cooperating agencies are not participating in the scoping meetings. Exception is the State who will be at the meetings next week. BSEE is attending the Homer and Anchorage meeting. The Corps is providing a conference line. Molly, Neverly, or myself will be calling into the scoping meetings to listen in (except for Homer, Anchorage, and Dillingham). Molly will attend the Anchorage meeting.
- Molly and I had a call with ORD this week. I expect we will get assistance from ORD on fisheries, transportation, and hydrology (though need to verify with hydrologists)
- Molly is off to a good start on our scoping letter
- Based on a call with the Corps today, we will be setting up a 404 strategy meeting between EPA and Corps in May. I will work on that (attendees, agenda, timing, internal strategy) when I return.

Have a good week.
Patty

Internal - Deliberative

Hi team –
Thank you for your review of preliminary draft chapter 2 and for developing our comments. This looks very thorough. You did a nice job preparing our comments. I appreciate the opportunity to review and provide suggestions for consideration. I

Deliberative Process / Ex. 5

Thank you so much for developing the draft agenda, Teresa. It looks really good – I will also think about some potential options/adjustments -- the One Note or CDX demo are both good possibilities if we want/need to swap some topics.

Thanks, too for the action item table – it's going to be so helpful to have it and be able to update over time. I heard the team wanting to keep a standing check in regarding this follow up, will you share it with the team via OneDrive when you have a chance?

Subject: Draft agenda/action items

Hi Jill,

I am attaching my first crack at a draft agenda for the 6th. There are a couple of agenda items that may or may not be timely. If they won't be ready for discussion, another option might be to have Lynne do a OneNote demo for the group. We could also try to set up a demo of the HQ workload tracking system.

I am also attaching a table that outlines action items and leads that were identified during the October retreat.

Non-Responsive: Unrelated to Bristol Bay/Pebble Mine

Take care,

Teresa

Hi Becky,
Thanks for your work on this and for coordinating everyone. I tried saving my recommended language back to your OneDrive site and was told it was locked for editing by another user. So, I don't know if I was successful in saving it to your OneDrive site or not! I am attaching here for your use …. I got it down to 3 pages after accepting all the changes. See what you think and let me know if you want me to work on it any more… I'm on a call from 1-2 and then Personal Matters / Ex. 6 Be back in the office in Seattle tomorrow, so if we hear that David/Linda recommend additional adjustments, I can help you pick it up again on Wednesday (then I'm out Th-Fri this week).

Thanks again,
Jill

Out.

If Chris really doesn't get comments to Molly today on Pebble, I think we have to move forward with what we have and keep to the schedule. **Personal Matters / Ex. 6** and the letter is supposed to be with Patty. Molly mentioned that she's coming to Seattle next week (for Tribal I guess?) and is giving Ashley a few days to review before it comes to me around the end of next week.

Talk with you tomorrow – feel free to let me know if there's anything you would do differently related to these couple of updates. Thanks! Jill

Subject: Bristol Bay - High Level Briefing Preparation
When: Wednesday, November 28, 2018 11:15 AM-12:00 PM (UTC-08:00) Pacific Time (US & Canada).
Where: David's Office and on the phone

Agenda

- Reason for briefing
- For whom
- Main topics
- Timing
- Next steps

I've created a folder to compile relevant information. If you have useful documents (like briefing papers), scripts or previous presentations etc., then I suggest adding them to the briefings folder at the link below. Ok for it to be too many or imperfect for now, goal is to get relevant source material in one place. We'll organize it better as we go along.

BB 404c Team,

I propose we meet on 11/20. See agenda below. Happy to hear feedback on the agenda.

Also, I'd like to discontinue sending the emails with the agenda. I was doing that primarily because of the litigation hold and would prefer to add the agenda to the calendar invite. I will however try not to change it too many times, and I will either add an agenda to the calendar invite or send an update/cancel proposal at least the day before our team meeting. In other words, if this calendar event has not been canceled and has an agenda then we are planning on having the call. As we have been doing, review the agenda to determine relevance for you and your level of interest.

A huge ongoing thank you for your engagement on this important project.

every 2 week(s) on Tuesday from 9:00 AM to 10:00 AM

Agenda

404(c) Team

Congressional responses (Palmer)

- Western Caucus (Gosar et al) – newly OW-approved, not issued
- DeFazio and Carper – just revised, based on newly OW-approved, not issued Western Caucus response
- Lamar Smith – just drafted, based on newly OW-approved, not issued Western Caucus response

FOIA (Ashley)

- E&E News – new request for unredacted copies
- McKeever FOIA Lawsuit – next steps
- NRDC and CNN – working with the AOs office
- Trustees for Alaska – options for Justin Schwab review
- Trustees for Alaska 2 – new FOIA
- Back-up (Erik)

External Correspondence (Erik)

- Recent activity and approach

Permit Oversight/ NEPA Review Team

Timing a Brittany Bolen briefing?

Site Visits

- July 9 – 11: CWA 404 field verification was completed by Mark Douglas
- July 31: Site visit with some of our NEPA team (Patty, Molly, Tim, Chris) to view the mine site, proposed Lake Iliamna port sites, and portions of the proposed roads

NEPA/EIS document reviews - completed

AMERICAN OVERSIGHT

- Scoping Document: In August we submitted comments on the draft scoping document that describes the significant issues raised in scoping. The final scoping document is available on the Corp's Pebble EIS website.
- Preliminary EIS Sections: In July and August, we reviewed and commented on specific portions of chapter 3 (affected environment) and chapter 4 (environmental consequences) that pertain to our areas of special expertise as identified by the Corps which includes: aesthetics, surface water hydrology, groundwater hydrology, water and sediment quality, wetlands, vegetation)
    - The documents have many placeholders since there have been changes to the proposed action, alternatives have yet to be finalized, and there are numerous substantial requests for additional information where the Corps is awaiting response from PLP.
- Alternatives: On October 3, we submitted comments on draft Appendix B (Alternatives Development Process). Previously we participated in a cooperating agency meeting and provided verbal input on the alternatives development process and some of the potential alternatives.

NEPA/EIS document reviews – upcoming

- The Corps has indicated that they will be sending us draft DEIS sections on 11/9 with comments due by 11/21. We have requested more time for review (30 days review period).

Schedule

- The Corps Pebble EIS website identifies estimated dates for a draft EIS in January 2019 and a final EIS in late 2019.

Subject: Bristol Bay - High Level Briefing Preparation
When: Wednesday, November 28, 2018 11:15 AM-12:00 PM (UTC-08:00) Pacific Time (US & Canada).
Where: David's Office and on the phone

Agenda

- Reason for briefing
- For whom
- Main topics
- Timing
- Next steps

I've created a folder to compile relevant information. If you have useful documents (like briefing papers), scripts or previous presentations etc., then I suggest adding them to the briefings folder at the link below. Ok for it to be too many or imperfect for now, goal is to get relevant source material in one place. We'll organize it better as we go along.

Hi Allison,

We wanted to give you a heads up that the Corps has been sending Region 10 preliminary drafts of the DEIS chapters for informal review and comment. The Region is providing comments back at the staff level. The comments will not go back on formal letter head. Given this, OFA is not reviewing. OW is doing a limited review. Ashley is the main legal reviewer for ORC. I am only planning to review any issues raised by Ashley or OW (and not do a review myself).

I should probably add for context that folks decided on this process because the Corps' turn-around is pretty fast (a few weeks) and is largely happening during the holidays. I also understand that this is typical of reviews of preliminary draft EISs.

Subject: Pebble EIS Updates

Hello All,
I have a few updates to share regarding the Pebble EIS.

First, the Corps plans to distribute preliminary drafts of the DEIS chapters for review in November. We expect to receive all chapters by 11/9/18, although sections may be received in advance on a rolling basis. Comments on all sections will be due 11/21/18. This will be a very tight timeframe for review, as management review of our comments will be required, so please plan to review within a few days of receipt – I will provide a specific due date once sections have been received. The Corps has said they will share all sections of the document for context, although our comments are still only requested on those specific sections we have been assigned in the Cooperating Agency Workplan (the same ones we have seen early drafts of so far).

Second, the Corps has distributed a revised project description developed by Pebble. My understanding is that this revised project description aligns with the updates to the project that we learned about earlier this year (e.g., use of lightering at Amakdedori Port), but I have not had time to read it in detail myself. I recommend reading when you have time, as it will help us prepare for review of the draft chapters in November.

Please let me know if you have any questions.
Thank you,

Subject: ARU Staff Transition

All,

Good morning/afternoon. You are all aware that I transitioned into Gayle Martin's oil and gas-focused position on April 1. I will not have the capacity to continue as the CWA 404 lead for project review of the Pebble project. Mark Douglas has agreed to take on the 404 lead role.

The Region's NEPA scoping letter on the project will be going out shortly, and the timing is right for me to pass the baton to Mark. I have sent him the meeting invitations, and Patti has included him on the group emails. Once he has access to the project website and our internal SharePoint site, he will be good to go. I plan to participate in next week's meetings, but do not anticipate participating in future meetings unless there is some specific need.

Mary Anne will continue in her existing role, working with Mark to track the project review, and coordinating with the 404(c) team.

Thanks,

AMERICAN OVERSIGHT

Hi Mark and Matt,
Would you mind coming up with a very short description of how you might transition the Pebble work from Matt to Mark and send it out to the appropriate folks working on Pebble? Please include a statement about Mary Anne's continued involvement as well. …Just so folks hear it from you both directly.

Thank you,
Krista

Hello ASAP Team,
Our comment letter for the ASAP Final SEIS has been finalized, and a pdf of the signed letter is attached for your files. This final version of the letter reflects the edits received from EPA headquarters, per direction from senior management in OFA and OW. Thank you again for all of your assistance in the review of this FSEIS, and throughout the lengthy history of our cooperating agency involvement on this project. If you have any questions regarding the final comments, please feel free to give me a call.
Thank you,
Molly

Regulatory Division
P.O. Box 6898
JBER, Alaska 99506-0898

Dear Mr. McCoy:

The U.S. Environmental Protection Agency has reviewed the U.S. Army Corps of Engineers' March 29, 2018, Notice of Intent initiating the scoping process for the proposed Pebble Project Environmental Impact Statement development (EPA Region 10 Project Number 18-0002-COE). We have also reviewed the additional project information available on the Corps website. The EPA is providing comments for your consideration pursuant to the National Environmental Policy Act, Council on Environmental Quality regulations (40 C.F.R. §§ 1500-1508) and Section 309 of the Clean Air Act. The EPA is also supporting the Corps in EIS development as a cooperating agency, due to our special expertise. We appreciate the opportunity to provide early input in the analysis of the Pebble Project.

The Pebble Limited Partnership (PLP) is proposing to develop the Pebble deposit in southwest Alaska, containing copper, gold, and molybdenum. The proposed project includes an open-pit mine, tailings storage facility, a low-grade ore stockpile, an overburden stockpile, a mill facility, a natural gas-fired power plant, and other mine site facilities. The anticipated throughput at the mill facility is 160,000 tons of ore per day, and the proposed mine operating life is 20 years. The proposed project also includes development of a 188-mile natural gas pipeline across Cook Inlet and Lake Iliamna and two compressor stations used to transport natural gas from the Kenai Peninsula to the mine site. The proposed transportation network includes 65 miles of roads, ferry terminals on the north and south shores of Lake Iliamna for use by an ice-breaking ferry, and the Amakdedori Port on Cook Inlet (including dredging and disposal of up to 20 million cubic yards of dredged material).

The scoping comments that follow are provided to inform the Corps of issues the EPA believes are significant and warrant explicit treatment in the EIS, based on current information. Overall, the EPA encourages the development of an EIS that evaluates and compares a full range of reasonable alternatives and comprehensively discusses the reasonably foreseeable direct, indirect, and cumulative impacts of the proposed action.

The EPA has significant concerns regarding the potential impacts of mining activities near the world-class fisheries of the Bristol Bay Watershed.[1] Many of these concerns have been previously documented in the EPA's 2014 Bristol Bay Watershed Assessment, which evaluated the potential impacts of large-scale mining on the region's fish resources, and in the Agency's 2014 Proposed Determination under

[1] See https://www.epa.gov/bristolbay for more information.

AMERICAN OVERSIGHT

Section 404 of the Clean Water Act. This Proposed Determination proposed restrictions on the discharge of dredged or fill material to waters of the U.S. to protect waters that support fishery areas in and near the Pebble deposit area. Because the Watershed Assessment and the Proposed Determination were completed before PLP submitted its permit application to the Corps, these assessments did not consider and were not based on the specific parameters of PLP's pending proposal. The EIS should thoroughly analyze the potential impacts of PLP's proposal to aquatic and other resources, including the anticipated direct impacts of the proposed action, and the reasonably foreseeable indirect and cumulative impacts. We note that the geographic extent of the proposed project infrastructure is not limited to the Bristol Bay watershed, and we recommend that the EIS analyze all areas of impact from the project, including Cook Inlet.

We appreciate the information provided in the Corps' scoping package, including the list of resources to be analyzed in the EIS, and we agree that the suite of issues presented are appropriate to analyze in detail in the EIS. Our enclosed scoping comments provide our recommendations for analysis of key areas that will be the focus of our review of the project, including natural resource impacts, as well as human health and impacts to communities and federally recognized tribes. Our scoping comments also include recommendations related to: risk analysis and hazardous materials management, including geotechnical stability; analytical tools and methodologies, including predictive modeling of impacts to water, air, fish, and other aquatic resources; mitigation and monitoring; and financial assurance. Identification of these key issues and recommendations is based on the EPA's knowledge of the proposed project as well as our experience with mining projects in Alaska and other Region 10 states.

We appreciate the opportunity to participate early in the planning process for this project and are looking forward to working with you as you develop the EIS. Should you have any questions regarding our comments, please contact Patty McGrath, EPA Region 10 Mining Advisor at (206) 553-6113 or mcgrath.patricia@epa.gov.

Sincerely,

R. David Allnutt
Director

Enclosure:

1. U.S. Environmental Protection Agency Detailed Scoping Comments for the Pebble Project EIS

AMERICAN OVERSIGHT

EPA Region 10 Detailed Scoping Comments for the
Pebble Project Environmental Impact Statement

General Components of NEPA Analysis

Purpose and Need

We recommend that the EIS include a clear and concise statement of the underlying purpose and need for the proposed project, consistent with the implementing regulations for NEPA[2] and the Clean Water Act Section 404(b)(1) Guidelines (Guidelines).[3] In presenting the purpose and need, the EIS should reflect not only the Corps' purpose in responding to the permit application, but also the broader public interest and need for this project. An appropriately defined purpose and need statement is of critical importance to setting up the analysis of a range of reasonable and practicable alternatives in the EIS that will meet the requirements of both NEPA and the Guidelines.

Range of Alternatives

We recommend that the EIS include a range of reasonable alternatives that meet the stated purpose and need for the project, are responsive to the issues identified during the scoping process and through tribal consultation, and include options for avoiding significant environmental impacts. This will ensure that the NEPA analysis provides agency decision makers and the public with information that defines the issues and identifies a clear basis for the choices made among the range of alternatives, as required by NEPA. The EIS should clearly outline the physical design of current and proposed facilities and alternatives (including ore storage sites, waste rock disposal areas, tailings areas, water storage and conveyance facilities, and supporting infrastructure including the transportation corridor, port site, and pipeline).

The EIS should "rigorously explore and objectively evaluate all reasonable alternatives"[4] even if some of them are outside the capability or the jurisdiction of the agency preparing the EIS for the proposed action.[5] This includes identifying the specific criteria that were used to (1) develop the range of reasonable alternatives, (2) eliminate certain alternatives, and (3) identify the agency preferred alternative, as appropriate. In addition, we recommend the EIS provide a clear discussion of the reasons for the elimination of alternatives that are not evaluated in detail.

While NEPA requires the evaluation of *reasonable* alternatives to the proposed action, the Guidelines require the analysis of *practicable*[6] alternatives in order to identify the least environmentally damaging

---

[3] Within the context of the Guidelines, practicable alternatives to the proposed discharge of fill or dredged material are identified "in light of overall project purposes," which is also termed "the basic purpose of the proposed activity." 40 C.F.R. § 230.10(a)(2).
[4] 40 C.F.R. § 1502.14(a).
[5] 40 C.F.R. § 1502.14(c).
[6] An alternative is practicable if it is available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes. 40 C.F.R. § 230.10(a)(2).

AMERICAN OVERSIGHT

practicable alternative (LEDPA), which is the only alternative that can be permitted.[7] The analysis of alternatives for NEPA can provide the information for evaluation of alternatives under the Guidelines.[8] We recommend that the EIS range of alternatives include the practicable alternatives developed for the Guidelines analysis.

In evaluating the proposed project and alternatives, the analysis should include an evaluation of performance and effectiveness, as well as the planned monitoring to ensure efficacy of proposed design features, environmental protection measures, and mitigation.[9]

Regarding mitigation for purposes of NEPA, we recommend that the alternatives analysis include appropriate mitigation measures not already included in the proposed action or alternatives.[10] The EIS should evaluate reasonable alternatives, including mitigation measures, to reduce or minimize adverse impacts to environmental resources. We recommend that, in conducting such an evaluation, the Corps consider:

- The disturbance footprint;
- Habitat value, cultural significance, and risks in siting project components for the proposed mine site components, as well as the port site, transportation corridor, and pipeline components;
- Source control measures (effective management of waste rock and tailings to prevent acid generation and metal leaching) and containment (liners and covers);
- Measures to reduce contact between mine waste materials and surface water and groundwater (such as surface water diversions and liners and covers as recommended above);
- Impacts of pit dewatering on groundwater and stream flows;
- Treatment to promote compliance with water quality standards;
- The physical stability of structures (e.g., pit walls, ore storage and waste rock facilities, tailings facility) during operations and closure, such as considering dry stack tailings;
- Impacts along the pipeline route and transportation corridor, including to Lake Iliamna;
- Impacts from dredged material disposal;
- Impacts to the marine environment at the Amakdedori Port site;
- Air pollutant emissions; and
- Impacts to traditional and cultural uses and resources, including key subsistence species and sites.

Indirect Impacts

We recommend that the EIS include consideration of all reasonably foreseeable indirect effects caused by the action but that may occur later in time or farther removed in distance.[11] The indirect effects analysis "may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural

---

[7] 40 C.F.R. § 230.10(a)
[8] 40 C.F.R. § 230.10(a)(4).
[9] The term mitigation included in this "Range of Alternatives" section is referring to the general term as it applies to NEPA. Compensatory mitigation for purposes under CWA section 404 cannot be used to reduce environmental impacts in the evaluation of the least environmentally damaging practicable alternatives for the purposes of requirements under Section 40 C.F.R. § 230.10(a). *See* 1990 Memorandum of Agreement between Army and EPA concerning the determination of mitigation under CWA section 404(b)(1) Guidelines.

[11] 40 C.F.R. § 1508.8(b).

AMERICAN OVERSIGHT

systems, including ecosystems."[12] While NEPA does not require agencies to engage in speculation, "[t]he EIS must identify all of the indirect effects that are known, and make a good faith effort to explain the effects that are not known but are reasonably foreseeable."[13]

We therefore recommend that the EIS evaluate the expansion and continued operation of the currently proposed project to the extent that the Corps considers it to be a reasonably foreseeable indirect effect of the proposed action. The current proposed Pebble Project description includes mining of approximately 1.1 billion tons of mineralized material, while the 2011 Preliminary Assessment Technical Report[14] estimated that the total Pebble mineral resource may be 11.9 billion tons. It may be reasonable to predict that a mine at the Pebble deposit will eventually operate for longer than 20 years and recover and process additional ore based on the size of the deposit, the significant infrastructure that will be developed under the current project description, and statements made by the Pebble Limited Partnership regarding the potential to examine expanding the mine once initial production has begun on the current proposal.[15] Accordingly, we recommend that the EIS consider the potential impacts associated with reasonably foreseeable mine expansion scenarios, including up to 11.9 billion tons.

In addition, we recommend that the EIS consider the extent to which it is reasonably foreseeable that the proposed transportation corridor and natural gas pipeline may be made accessible to the public and may stimulate additional reasonably foreseeable mining projects in the area, and potential environmental effects associated with that induced mining. Although PLP's current proposal only includes private access to the infrastructure components, public access may be granted in the future. This potential may be different for the different infrastructure elements. For example, if the pipeline is regulated as a common carrier, then public access could be allowed if capacity permits. We recommend that the EIS discuss any reasonably foreseeable future public access to the project's infrastructure components and analyze any reasonably foreseeable indirect effects of this action.

Construction and operation of the project would result in increased vessel traffic in Cook Inlet and on Lake Iliamna because vessels will bring supplies to the site and transport products off-site. In addition to evaluating the direct effects of the increased transportation, we recommend that, if it is reasonably foreseeable that the ports and ferry landings will become available for public use, then any reasonably foreseeable future use of these components should be assessed in the EIS as indirect or cumulative effects. Should the port and ferry terminals remain open following mining, this infrastructure may result in increased use and vessel traffic beyond what PLP is currently proposing.

Indirect project impacts under NEPA can include secondary effects, which are defined by the Guidelines as "effects on the aquatic ecosystem that are associated with the discharge of dredged or fill materials, but do not result from the actual placement of the dredged or fill material."[16] The consideration of secondary effects is necessary for the Guidelines analysis, and examples of potential secondary effects are discussed in the section on aquatic resources below.

"Collier has acknowledged the company might look to expand after initial production commences but contends growing the project would require additional rounds of environmental reviews and permitting that would be independent from any approvals Pebble already had."

[16] 40 C.F.R. § 230.11(h).

AMERICAN OVERSIGHT

Cumulative Impacts

In accordance with NEPA, the cumulative impacts analysis should identify how resources, ecosystems, and communities in the vicinity of the project have already been, or will be affected by, past, present, or reasonably foreseeable future activities in the project area, "regardless of what agency (federal or non-federal) or person undertakes such other actions."[17]

The Guidelines also fundamentally require consideration of reasonably foreseeable cumulative effects in determining whether a project complies with the significant degradation prohibition and to ensure that discharges will not have an unacceptable adverse impact either individually or in combination with known and/or probable impacts of other activities affecting the ecosystems of concern.[18] Cumulative effects are "the changes in an aquatic ecosystem that are attributable to the collective effect of a number of individual discharges of dredged or fill material," which individually may be minor, but cumulatively may result in a "major impairment of the water resources and interfere with the productivity and water quality of existing aquatic ecosystems."[19]

For the cumulative impacts assessment, we recommend that the EIS delineate appropriate geographic boundaries, including natural ecological boundaries whenever possible, as well as consider an appropriate time period for the project's effects. We recommend that resources be characterized in terms of their response to change and capacity to withstand stresses. Trends data should be used to establish a baseline for the affected resources, to evaluate the significance of any historical degradation (e.g., due to exploration activities), and to predict the environmental effects of the project components.

Past, present, and reasonably foreseeable future activities that should be considered in the cumulative impact assessment will vary across the geographic scope of the various mine-site and infrastructure components. Please refer to CEQ's "Considering Cumulative Effects Under the National Environmental Policy Act"[20] and the EPA's "Consideration of Cumulative Impacts in EPA Review of NEPA Documents"[21] for assistance with identifying appropriate boundaries and identifying appropriate past, present, and reasonably foreseeable future projects to include in the analysis.

In particular, we recommend that the cumulative effects analysis consider, but not be limited to, the following activities:

- Past and current exploration activities conducted by PLP and others at the Pebble site;
- Current exploration activities occurring in the Bristol Bay watershed region;
- Reasonably foreseeable expansion and continued operation of the currently proposed project (while this is an indirect effect under NEPA, as discussed above, it is a cumulative effect under the Guidelines);
- Reasonably foreseeable future use of project infrastructure (road, port, pipeline); and,
- Reasonably foreseeable development of additional mining projects as a result of increased exploration activity in the region. Even if those activities are not determined to be indirect effects of the proposed action (as discussed above), they are still reasonably foreseeable.

AMERICAN OVERSIGHT

ENVIRONMENTAL RESOURCE IMPACTS

Aquatic Resources, Including Wetlands, Streams, and Fish

Evaluating Compliance with the Clean Water Act Section 404(b)(1) Guidelines

The Corps' potential CWA Section 404 permitting action is triggering preparation of the EIS. We recommend that the Corps' permitting regulations and the Guidelines therefore provide the context for identifying relevant issues and evaluating alternatives in the EIS.

The Guidelines are the substantive environmental criteria for the evaluation of proposed discharges of dredged or fill material, and applicants must demonstrate compliance with the Guidelines.[22] The EIS is a significant component of the administrative record for the District's permit decision, which can and should provide sufficient information to address compliance with the Guidelines and the Corps' public interest review.[23] Although it is not mandatory, we support the Corps' decision to include of the public interest review factors into the list of issues to be considered in the EIS. This will enable the expected benefits to be balanced against reasonably foreseeable detriments, and all relevant public interest factors to be weighed.

We recommend that the organization of the EIS facilitate the evaluation of the proposed project's compliance with the Guidelines. Issues relevant to compliance with the Guidelines should be addressed explicitly in the EIS where possible. Alternatively, a stand-alone Section 404(b)(1) analysis could be included as its own section of, or appendix to, the EIS. As mentioned above, we recommend that the range of alternatives evaluated in the EIS be sufficient to identify the LEDPA. In addition, we recommend that the final EIS identify which alternative is the LEDPA.

The Guidelines prohibit, for example, the authorization of a proposed discharge that would cause or contribute to the violation of an applicable water quality or toxic effluent standard, jeopardize a listed threatened or endangered species, or impact a marine sanctuary.[24] We recommend that these criteria be used to evaluate and compare alternatives.

The Guidelines also prohibit the authorization of a proposed discharge which will cause or contribute to significant degradation of the aquatic ecosystem.[25] Findings of significant degradation must be based upon specific factual determinations, evaluations, and tests identified in the Guidelines. These include the evaluation of the direct, secondary, and cumulative effects of the proposed discharge and alternatives on specific resources including fish, wildlife, and special aquatic sites. The significant degradation findings must also evaluate the effects to resource characteristics including aquatic ecosystem diversity, productivity, and stability. Evaluating the potential for significant degradation also requires the consideration of effects to human uses or values, including recreational, aesthetic, and economic values. With regard to fisheries, the Guidelines require, for example, an evaluation of effects to all forms and life stages of aquatic organisms in the food web, including fish and the plants and animals on which they feed and depend upon for their needs.[26] The Guidelines also require an evaluation of effects to

---

[22] 40 C.F.R. § 230.12(a)(3)(iv).
[23] See 33 C.F.R. § 320.4.
[24] 40 C.F.R. § 230.10(b).
[25] 40 C.F.R. § 230.10(c).
[26] 40 C.F.R. § 230.31.

AMERICAN OVERSIGHT

recreational and commercial fisheries, which includes harvestable fish, crustaceans, shellfish, and other aquatic organisms used by man.[27] The Corps has proposed including a number of these evaluations in the EIS. We recommend that as many of the specific factual determinations, evaluations, and tests required by the Guidelines as possible be included in the EIS, and be used to evaluate and compare alternatives.

The Guidelines also prohibit any proposed discharge that does not include all appropriate and practicable measures to minimize potential harm to the aquatic ecosystem.[28] Subpart H of the Guidelines identifies numerous possible steps to minimize impacts, including reducing the footprint of the project, using co-location of facilities whenever possible, implementation of best management practices to reduce environmental impacts, configuring the project footprint to reduce or eliminate impacts to higher functioning aquatic resources and other appropriate and practicable measures. Also, as previously discussed, we recommend that the EIS include appropriate minimization measures both as part of the action alternatives and relative to the affected environment. The discussion of minimization measures should include assessment of their likely effectiveness.

Compensatory Mitigation

For unavoidable impacts to wetlands, streams, and other aquatic resources, the Guidelines require appropriate and practicable compensatory mitigation to offset unavoidable environmental impacts associated with discharges permitted under CWA Section 404. We recommend that the EIS consider potential mechanisms to offset likely unavoidable aquatic resource impacts. We also recommend that the EIS include the applicant's proposed compensatory mitigation plan. Compensatory mitigation requirements, including the components of a compensatory mitigation plan, are described in Subpart J of the Guidelines. Pursuant to the Guidelines, the level of detail in the compensatory mitigation plan should be commensurate with the scale and scope of the impacts.

Compensatory mitigation may be provided through purchase of credits from an approved mitigation bank, purchase of credits from an approved in-lieu fee mitigation program, and/or completion of a permittee-responsible compensatory mitigation project(s). Final compensatory mitigation requirements must be commensurate with the amount and type of impact that is associated with a particular Section 404 permit.[29] Compensatory mitigation required by the Guidelines is separate from, and may be in addition to, proposed project impact mitigation under NEPA.

Characterizing the Affected Environment

We recommend that the EIS describe aquatic habitats in the affected environment by resource type using the data sources and classification approaches that provide the greatest resolution possible. For example, if wetlands are mapped using a Cowardin classification, that mapping should be to the smallest identifiable map unit. Likewise, streams should be classified and mapped accordingly. The baseline information for aquatic resources should include their functional condition and integrity. We also recommend that the EIS evaluate the characteristics of the potentially affected aquatic resources, how those characteristics provide fish habitat, and how such habitat could be adversely impacted by the proposed project. Wetlands and streams perform different functions at different rates, and capturing this information is critical for evaluating the potential environmental impacts of the proposed action, alternatives, and reasonably foreseeable actions (exploration and mining) on these resources.

---

[27] 40 C.F.R. § 230.51.
[28] 40 C.F.R. § 230.10(d).
[29] 40 C.F.R. § 230.93(a)(1).

AMERICAN OVERSIGHT

Characterizing the distribution of resident and anadromous fish in potentially affected streams and other aquatic resources is also important, and we recommend the use of data sources such as the Anadromous Waters Catalog[30] and the Alaska Freshwater Fish Inventory[31] to help with this characterization.

Aquatic Resource Impacts Analysis

We recommend that the areal extent (i.e., acreage) of impacts to aquatic resources be quantified in the EIS for both direct and secondary effects. The acreage values for the direct and secondary impact footprints should include the acreage for streams as well as for wetlands, ponds, lakes, mudflats, and other waters. In other words, reported acreage losses should represent the total loss of jurisdictional waters. For streams, the loss of channel length should also be quantified by linear feet and/or miles. Channel length values are a more intuitive metric for some, and facilitate different types of analyses than the acreage values. In addition to the areal or linear extent, impacts to aquatic resources should also be quantified by the expected change in the function these resources perform, including fishery support functions, or change in the condition of the resource.

Direct effects are impacts on aquatic resources within the footprint of the discharge of dredged or fill material. Direct effects at the mine site would include stream and other aquatic resource losses within the footprints of the tailings storage facility, the ore and overburden storage sites, the mine pit, and other mine site facilities described in the permit application. Construction of the transportation and pipeline corridors and port facility will likely involve such discharges as well.

Secondary effects, as defined by the Guidelines, are associated with the discharge of dredged or fill material, but do not result from actual placement of this material. These effects are also considered indirect impacts under NEPA. Examples of secondary effects that should be evaluated in the EIS include the following:

- Elimination of streams and wetlands due to drowning by the tailings impoundment and other mine components;
- Dewatering of streams and other aquatic resources due to pumping of groundwater during open pit mining and filling during closure;
- Fragmentation of aquatic resources due to the placement of the mine pit, ore storage sites, tailings storage facility, and other mine components;
- Degradation of downstream fish habitat due to streamflow alterations resulting from water capture, withdrawal, storage, treatment, or release at the mine site;
- Degradation of downstream fish habitat due to water quality impacts associated with mine construction and operation;
- Degradation of downstream fish habitat due to the loss of important inputs such as nutrients and groundwater from upstream sources;
- Degradation of aquatic resources due to dust deposition from mining and transportation activities.

The evaluation of the proposed project's impacts and alternatives should fully consider the physical, chemical, and biological effects of each of the direct and secondary effects, and should consider incremental changes from these impacts along each stream segment downstream of the impact site.

[30] See https://www.adfg.alaska.gov/sf/SARR/AWC/.
[31] See http://www.adfg.alaska.gov/index.cfm?adfg=ffinventory.main.

AMERICAN OVERSIGHT

Considering the value of the region's commercial, subsistence, and recreational fishery resources, we recommend that the EIS focus on quantifying direct, indirect, and cumulative impacts on resident and anadromous fish and their habitat resulting from losses of streams with documented fish occurrences; losses of headwater source areas of these streams; losses of wetlands, lakes, and ponds; and streamflow alterations. We appreciate that the Corps has made the EPA's 2014 Bristol Bay Watershed Assessment available on the Pebble Project website, and we also recommend that this document be referenced in preparing the EIS.[32]

The losses of stream reaches and adjacent wetlands from dewatering, as well as changes to downstream reaches and adjacent wetlands, may result in physical, chemical, and biological changes which would impact fishery habitat and habitat support. We recommend that the EIS model and consider these impacts compared to baseline conditions, including but not limited to:

- Evaluate changes in water volume in the stream areas of impact, as well as changes in the downstream reaches of the watershed resulting from losses of upstream contributions of water. We recommend that the analysis address seasonal changes to the different stream segment hydrographs, including changes to seasonal temperatures, dissolved oxygen levels, sediment transport capabilities, and any associated changes to sediment grain sizes in the different stream segments;
- Evaluate flow changes in the impacted stream reaches, both from pit dewatering as well as any proposed in-stream discharge points, to assess any potential changes to stream profile, form, and pattern, and to identify any areas of accretion and/or scouring which may reasonably be anticipated. We also recommend that areas of stream incision as a result of flow changes be identified, as well as losses of connectivity to floodplains and riparian wetlands currently connected to the downstream reaches;
- Identify potential changes to nutrient levels, turbidity, and dissolved oxygen, particularly with respect to seasonal patterns in the downstream reaches. We further recommend that both the direct losses of both autochthonous and allochthonous inputs from upstream reaches lost and/or disconnected from wetland and other riparian habitats, as well as the incremental reductions in those inputs in downstream segments throughout the stream reaches and their effects on system-wide primary, secondary, and tertiary production, be evaluated. These analyses should consider the direct changes to downstream habitats as well as changes to fisheries support in the different stream reaches;
- Evaluate decreases in anticipated invertebrate transport and production in downstream segments and those effects on fish production; and
- Evaluate the effects of disconnecting any off-channel habitat both near the areas of direct impact and throughout the downstream reaches, both for losses of allochthonous inputs and also for potential losses of nursery habitat.

We recommend that the direct, indirect, and cumulative impacts of any of these potential physical, chemical, and biological alterations be examined for how they may result in the loss and/or degradation of fish habitat, including alterations with respect to spawning, overwintering, nursery, and migration. Habitat losses that may result from freeze-through or seasonal warming of fish production areas should also be evaluated.

[32] See https://www.epa.gov/bristolbay/bristol-bay-assessment-final-report-2014.

AMERICAN OVERSIGHT

Water Quality and Quantity

Evaluating Impacts to Surface Water and Groundwater Quality and Quantity

Water quality is one of the EPA's principal concerns at mine facilities due to the potential for acid-generating and metal-leaching waste materials (ore, waste rock, tailings, pit walls) that are exposed to the environment and require management over long periods of time. In addition, road construction and operation have the potential to contribute a significant quantity of sediment to streams. We recommend that the EIS characterize baseline surface water and groundwater quality, quantity, and interactions, and evaluate the impacts of all aspects of the proposed operations and alternatives (including pit dewatering and backfilling, tailings management and disposal, water management, and port-site and transportation aspects) on these hydrologic components and describe mitigation for adverse impacts.

Given the potential impacts of the proposed Pebble Project, the EPA recommends that the Corps specifically include in the water resources analysis for the EIS (see also our recommendations for Analysis Tools and Methodologies):

- Characterization of existing groundwater, surface water, springs, and wetland resources within the area of both the project and all potential alternatives, including groundwater levels, flow direction and gradients, and chemistry;
- Development of a hydrogeologic conceptual site model, including:
    - Maps of groundwater, surface water, springs, and wetland resources in the area to be developed or affected;
    - Baseline data on the extent and quality of groundwater, surface water, springs and wetlands;
    - Information on the quantity and location of all aquifers, including Underground Sources of Drinking Water, recharge zones and source water protection areas;
    - Identification of any CWA § 303(d) listed waterbodies and any existing restoration efforts for these waters;
    - Identification and description of all wetlands and surface waters that could be affected by the project and alternatives; where applicable, acreages, channel lengths, habitat types, values and functions of these waters should be identified;
    - Identification and description of hydrologic pathways (e.g., the connectivity of springs or groundwater to surface waters; the connectivity of all streams to each other and to wetlands); and
    - A detailed water balance for the proposed action and each alternative.
- Assessment of which waters may be impacted, the sources and nature of potential impacts (both quality and quantity), specific pollutants likely to impact those waters and a comparison to applicable environmental standards (e.g., surface water and drinking water quality standards);
- Consideration of downstream impacts and potential for changes in metal speciation and bioavailability (in particular, the impacts of copper, which can have adverse effects on salmon at very low concentrations);
- Evaluation of surface water and groundwater use, including maps and source identification of agricultural, domestic, and public water supply wells or intakes; and
- Consideration of effects of seasonality on water quantity and quality impact assessment, including predictions for all phases of the project (construction, operations, and closure).

Anti-degradation

The anti-degradation provisions of the CWA apply to those waterbodies where water quality standards are currently being met. In certain high-quality waters, the anti-degradation provisions prohibit

AMERICAN OVERSIGHT

degrading water quality unless it is determined that allowing lower water quality is necessary to accommodate important economic or social development in the area in which the waters are located.[33] We recommend that the EIS discuss whether and how the CWA anti-degradation requirements could be met.

Water Management and Treatment

We recommend that the EIS describe the plans for water management, treatment, and discharge during all phases of the project (construction, operations, and closure), including plans for long-term water treatment. The EIS should evaluate and disclose the adequacy, reliability, effectiveness, and operational uncertainty associated with proposed operation and closure (long-term) water management and treatment techniques, taking into account seasonality and potential changes associated with future climate scenarios. We also recommend that the analysis characterize chemical compositions and quantities of process waters, mine drainage, storm water, and treated and untreated effluent. This information should be supported by the results of treatability testing. Assumptions used in the analysis should be disclosed and be reasonably conservative. If long-term water treatment is needed, we recommend that the EIS include modeling of predicted stream concentrations of contaminants of concern, both with and without treatment, to evaluate the potential impacts to water quality if the treatment system is not working properly.

The EIS should also identify the Alaska Pollutant Discharge Elimination System (APDES) discharge locations, identify applicable water quality standards, and analyze the likelihood and ability of all discharges to meet applicable standards and the direct, indirect, and cumulative impacts of such discharges to the receiving waters. We recommend that any applicable water quality variance requests, site-specific criteria proposals, and/or any other planned or potential requests for water quality standard revisions also be disclosed in the EIS.

Sediment Management and Stormwater Runoff

Since the project has the potential to cause or contribute to erosion of soils and subsequent sediment loading to nearby surface waters, we recommend that the EIS evaluate construction design and operation practices that will be used to minimize erosion and control stormwater runoff from the mine site, port sites, transportation corridor, and pipeline route. We recommend that the EIS discuss specific mitigation measures that may be necessary or beneficial in preventing and minimizing adverse impacts to water quality and disclose the effectiveness of such measures. We suggest that the Corps consider the Best Management Practices identified by the EPA for mining facilities[34] and specify those that would be suitable and likely implemented at the Pebble Project. We also recommend that the EIS document the project's consistency with applicable APDES stormwater permitting requirements.

Hydrostatic Test Water

Hydrostatic testing will likely be utilized to verify pipeline integrity. We recommend that the EIS identify and describe the location of the water sources required for hydrostatic testing, in terms of surface area, depth, volume, withdrawal rate, and project requirements. For each water source, we recommend that the EIS discuss the presence of any anadromous and/or resident fish species, including discussion of any direct and cumulative impacts to fisheries resources. In addition, we recommend that locations and methods of discharges to land and/or surface waters be specified in the EIS. Emphasis should be placed on minimizing inter-basin transfers of water to the maximum extent practicable, to

[33] 40 C.F.R. § 131.12.

[34] https://www3.epa.gov/npdes/pubs/sector_g_metalmining.pdf.

AMERICAN OVERSIGHT

minimize the risk of mobilizing invasive species. We recommend that the EIS describe the mitigation measures and control devices that would be implemented to minimize environmental impacts.

Marine Environment and Freshwater Lakes

Port Construction and Dredging Impacts

According to the Permit Application Appendix D – Project Description, the Amakdedori Port will require dredging of a channel and turning basin for shipping access to berths. According to the application, annual maintenance dredging will be necessary throughout the life of the port facility. Dredging activities potentially affect habitats and key ecological functions that support recruitment and sustainability of estuarine and marine organisms. We recommend that the EIS:

- Characterize the marine benthic environment and organisms, sediment composition and grain size, etc.;
- Identify any biologically important areas, such as migratory routes, benthic communities, and subsistence areas;
- Evaluate marine dredging, dewatering, transloading (from water to land), placement methods and options (summer and winter), and disposal sites (offshore, nearshore, upland, and open-water), as well as beneficial uses of the dredged material;
- Include and evaluate a sampling and analysis plan, as well as a marine dredging and disposal plan;
- Evaluate the following potential impacts of dredging activities on species and their habitats:
  - Substrate removal and any resulting habitat and species removal (entrainment);
  - Potential changes to estuarine bathymetry, fluvial and tidal energy, and substrate roughness, and any attendant impacts to salinity structure and estuarine circulation;
  - Potential changes to sediment transport processes, including effects on adjacent shorelines;
  - Alteration of sediment composition in and around the dredging site (including changes to the nature and diversity of benthic communities);
  - Local resuspension of sediments and any turbidity increases;
  - Spread of sediments (and any associated contaminants) into the area surrounding the dredging site;
  - Release of sediment-associated nutrients, potential increases in eutrophication and resulting decreases in dissolved oxygen concentrations;
  - Decreased primary production due to reduced transparency of the water column and/or smothering, particularly at in-water disposal sites; and
  - Enhanced bioavailability and ecotoxicological risk of background contaminants and/or chemical or biochemical changes of contaminants;
- Consider implementation of effective mitigation measures to ensure that marine resources and habitats are adequately protected; and
- Incorporate a monitoring plan for marine protected resources and associated habitats to ensure effectiveness of mitigation measures.

Because of the magnitude of the proposal, dredging and disposal operations will need to be carefully planned and scheduled to avoid and minimize impacts to sensitive marine mammals, fish, shellfish, and their habitat at critical spawning and migration periods.

Dredged Material Disposal

According to the Permit Application Appendix D, dredged material will be used to construct the jetty, causeway, and/or the main terminal patio area, if suitable. Excess dredged material will be stockpiled in

AMERICAN OVERSIGHT

an upland location adjacent to the port facilities. The EPA recommends an on-the-ground wetland delineation at the proposed dredged material disposal site to verify whether there are any jurisdictional waters of the United States at this location.

The proposed discharge of dredged material effluent from the confined disposal facility into Kamishak Bay is subject to regulation under Section 404 of the CWA. Thus, the EIS should include sufficient information to support making the required determinations and findings under the Guidelines. For example, Subpart G of the Guidelines includes general evaluation procedures and specific testing procedures to reach the determinations required by 40 C.F.R. § 230.11. The Inland Testing Manual[35] also provides detailed technical guidance on how to evaluate and test dredged material consistent with the Guidelines. In particular, the EPA recommends using the ITM Appendix B, "Guidance for Evaluation of Effluent Discharges from Confined Disposal Facilities."

To support disposal decisions, we recommend that the EIS provide an inventory of the physical and chemical characteristics of the dredged material and an assessment of disposal alternatives. We recommend that the range of dredged material management alternatives include: no action; the proposed action; beneficial uses such as beach nourishment or construction material; a disposal site in internal waters, landward of the Kamishak Bay closing line (regulated under the CWA); and an ocean disposal site seaward of the Kamishak Bay closing line (regulated under the Marine Protection, Research and Sanctuaries Act).

Potential for Ocean Disposal of Dredged Material

Under Section 102 of the MPRSA, the EPA is responsible for designating and managing ocean dumping sites for all materials, including dredged material. The EPA designates ocean disposal sites through rulemaking and sites are published at 40 C.F.R. § 228.15. The EPA bases the designation of an ocean disposal site on environmental studies of a proposed site, studies of regions adjacent to the site, and historical knowledge of the impact of disposal on areas similar to the site in physical, chemical, and biological characteristics. All studies for the evaluation and potential selection of dredged material disposal sites should be conducted in accordance with the criteria for the selection of disposal sites for ocean dumping published in 40 C.F.R. §§ 228.5 and 228.6. The minimum requirements for baseline assessment surveys are found in 40 C.F.R. § 228.13.

The evaluation process includes conducting oceanographic studies to establish the environmental conditions at all alternative locations being considered as potential sites, as well as the area or region encompassing the alternative sites. Results from oceanographic studies and other sources are used to model likely dispersion and deposition of material disposed at the alternative sites and evaluate potential impacts. If there are no practicable alternatives to ocean dumping that will have a less adverse impact on the environment, this information is used to select the best ocean site proposed for designation.

If ocean disposal is to be considered as an alternative, we encourage the Corps to engage early and actively with the EPA to ensure that site selection activities are consistent with the MPRSA and the ocean disposal criteria. The EIS must be adequate for the EPA to ensure that use of the site selected for designation will not likely cause unreasonable degradation to the surrounding marine environment. In addition, only dredged material that is authorized for disposal under the MPRSA and 40 C.F.R. Part 227 may be disposed in an EPA-designated ocean dredged material disposal site.

[35] See https://www.epa.gov/cwa-404/inland-testing-manual.

AMERICAN OVERSIGHT

Impacts of Vessel Traffic

Marine traffic, including barges and other vessels associated with construction and operation of the proposed project, may also result in impacts to the marine environment. For example, vessel traffic may result in potential impacts to marine mammals, including threatened and/or endangered species, and their migration patterns and routes; subsistence, commercial, and recreational fisheries; and other vessel use. We recommend the EIS describe the vessel traffic schedule in Cook Inlet; patterns and marine transportation routes; subsistence, commercial, and recreational fishery resources; and the migration period, patterns, and routes of potentially affected marine mammals, including Cook Inlet Belugas. The direct, indirect and cumulative impacts from vessel traffic on marine mammals, threatened and endangered species, critical habitats, and fishery resources should be analyzed in the EIS, and the EIS should discuss the mitigation measures that would be implemented to minimize such impacts.

Use of the proposed ice-breaking ferry on Lake Iliamna may result in similar impacts to the freshwater lake environment, including the potential for wake impacts to the shoreline. We recommend the EIS analyze the direct, indirect, and cumulative impacts of the year-round use of the lake proposed by the applicant on threatened and/or endangered species, fishery resources, and other lake user groups, and discuss mitigation measures to minimize impacts.

Air Quality

The EPA recommends that the EIS evaluate how the construction and operation of the proposed project and alternatives could affect air quality and what measures may be needed to mitigate potentially significant impacts. Such an evaluation is necessary to ensure compliance with state and federal air quality regulations, and to disclose the potential impacts from temporary or cumulative degradation of air quality. To address potential air quality impacts, the EIS should consider whether the direct, indirect, or cumulative impacts of project-related air emissions would result in any adverse impact on air quality or air quality-related values.

Potential air pollutant concerns for the proposed project include:

- Operation of heavy machinery and equipment, including marine vessels, during construction and operations that result in the emission of fossil fuel combustion exhausts. Such exhausts will include oxides of nitrogen, oxides of sulfur, carbon monoxide, and particulates. The significance of the contribution of project emissions to the formation of secondary particulate matter ($PM_{2.5}$) and ozone should also be evaluated;
- Fugitive dust emissions may be generated from construction and operation of the mine, ancillary facilities, and supporting infrastructure. In addition to human health effects, dust blown from the roadway can settle onto wetlands, vegetation, or waterbodies, impairing their health as well; and
- Hazardous air pollutants may result from fuel combustion and ore processing. The *National Air Toxics Assessment* asserts that numerous human epidemiology studies show increased lung cancer rates associated with diesel exhaust and significant potential for non-cancer health effects (see http://www.epa.gov/ttn/atw/nata). Also, the Control of Emissions of Hazardous Air Pollutants from Mobile Sources Final Rule (66 Fed. Reg. 17,230, March 29, 2001) lists 21 compounds emitted from motor vehicles that are known or suspected to cause cancer or other serious health effects. The EPA recommends the EIS disclose whether hazardous air pollutant emissions would result from project construction and operations, discuss the cancer and non-cancer health effects associated with air toxics and diesel particulate matter, and identify sensitive receptor populations and individuals likely to be exposed to these emissions.

AMERICAN OVERSIGHT

We recommend the following steps for the EIS air quality analysis:

- Characterize the existing conditions to set the context for evaluating project impacts, including:
  - Regional climate and meteorology,
  - Air quality and air quality related values (e.g., visibility),
  - Identification of sensitive receptors in the vicinity;
- Review air quality regulations and any air permitting requirements that apply to the air pollutant sources associated with the project;
- Provide a comprehensive emissions inventory of criteria pollutants (in tons per year), greenhouse gas emissions (in metric tons CO_2 equivalents per year), and significant HAP emissions for all project components (mine site, transportation corridor, port, and pipeline) and project phases; and
- If projected emissions are significant, conduct near-field and far-field air quality modeling to assess project-related air quality and visibility impacts. Also, see our recommendations related to Predictive Modeling, later in this document.

We recommend that the Corps evaluate and incorporate best management practices and mitigation measures into the EIS to reduce emissions of criteria pollutants and HAPs, which also have co-benefits of reducing GHGs. We recommend that the EIS include a comprehensive fugitive dust control plan as well as a construction air pollutant emissions control plan to address reduction of engine emissions.

These recommendations are separate and distinct from, and are not intended as a substitute for compliance with, any additional obligations of the Corps and the project proponent to comply with the federal Clean Air Act and any applicable state or tribal air pollution laws, which may require, among other things, obtaining pre-construction permits and operating permits, compliance with new source performance standards and/or national emission standards for hazardous air pollutants, as well as any applicable state implementation plan (SIP) requirements, including, as applicable to the Corps, the requirements under Section 176 of the Clean Air Act regarding conformity of federal activities to implementation plans approved or promulgated under section 110 of the Clean Air Act.

Climate Adaptation

The EPA recommends that the EIS include a discussion of reasonably foreseeable effects that changes in the climate may have on the proposed project and the project area, including its long term infrastructure. This could help inform the development of measures to improve the resilience of the proposed project. If projected changes could notably exacerbate the environmental impacts of the project, the EPA recommends these impacts also be considered as part of the NEPA analysis.

Fish and Wildlife, including Endangered Species and Essential Fish Habitat

The EPA recommends that the EIS evaluate impacts to fish and wildlife from the proposed project and alternatives. The aquatic resources section above also provides recommendations related to fisheries.

Special consideration should be given to listed and proposed species under the Endangered Species Act and Essential Fish Habitat under the Magnuson Stevens Fishery Conservation and Management Act. NEPA regulations require that, to the fullest extent possible, the EIS be prepared concurrently with

AMERICAN OVERSIGHT

environmental analyses required by the ESA and other environmental laws.[36] Magnuson Stevens Act and ESA implementing regulations also encourage coordination with other environmental reviews.[37, 38]

We recommend that the EIS discuss the species listed and proposed as threatened or endangered under the ESA and the essential fish habitat within the project area (including the pipeline, roads, and port site) and the potentially impacted area surrounding the project. The EIS should describe impacts to ESA species and EFH and discuss the activities proposed to avoid, minimize, mitigate, and monitor listed and proposed species and EFH. We understand that the Corps will develop a biological assessment to evaluate impacts to listed and proposed endangered species and EFH, and recommend that it be included with the draft EIS. We also recommend that the federal action agencies work together to ensure that a single biological assessment is developed that meets all agencies' needs.

National Historic Preservation Act

Section 106 of the National Historic Preservation Act of 1966 requires federal agencies to consider the effects of their actions on historic properties, including those of traditional religious and cultural importance, following regulations in 36 C.F.R. Part 800. The NHPA requires a federal agency, upon determining that activities under its control could affect historic properties, to consult with the appropriate State Historic Preservation Officer /Tribal Historic Preservation Officer. We support the Corps' early engagement with the Advisory Council on Historic Preservation, and we recommend that the EIS discuss any potential impacts to historic properties, including any tribal, cultural, or other treaty resources that are historic properties or traditional cultural properties. In addition, the EIS should identify alternatives and mitigation to avoid significant impacts. Recommendations related to traditional uses and resources that are not historic properties are discussed further below.

Invasive Species

We know that ballast water from barges or vessels can be a major source of non-native species into marine ecosystems. Non-native species can adversely impact the economy and the environment and cause harm to human health. Impacts may include reduction of biodiversity of species inhabiting coastal waters due to competition between non-native and native species for food and resources. We recommend that the EIS discuss potential impacts from non-native invasive species associated with ballast water in vessels that will be utilizing the Amakdedori Port associated with this project and identify mitigation measures to minimize adverse impacts to the marine environment and human health.

SAFETY, RISK ANALYSIS, AND HAZARDOUS MATERIALS MANAGEMENT

Accidents and Failures

An array of spills, accidents, and failures can occur at mining sites. We recommend that the EIS describe the control measures that will be in place to prevent these events from occurring during construction, operations, and closure. To identify these events, we recommend that the Corps evaluate the proposed design and management of the tailings facility, dams, and other structures and evaluate PLP's waste and water management and reclamation plans to determine the project-specific likelihood of different types of accidents and failures. Designs and management plans for the pipeline and transportation components

[36] 40 C.F.R. § 1502.25.
[37] 50 C.F.R. § 600.92 (c), (f).
[38] 50 C.F.R. § 402.06.

AMERICAN OVERSIGHT

(road, ports, shipping) should also be evaluated to determine the probability of accidents and failures. We recommend that the results of these evaluations be documented in the EIS. For those events that are determined to be of low probability but high consequence, we recommend that the EIS evaluate the potential effects of such events on aquatic ecosystems, particularly fishery resources, and other resources. The EIS should also discuss mitigation measures that could minimize the risk or damages of such events.

Physical Stability of Structures

The EIS should assess the likelihood of earthquakes in the region and describe the geotechnical stability of the tailings and waste storage facilities and open pit walls during operations and closure. We recommend including a description of how these facilities are designed and how they would be operated, closed, and monitored to ensure stability. In addition, we recommend that a risk assessment, such as a Failure Modes Effects Analysis, (FMEA) be conducted on each of the tailings dams with the results summarized in the EIS. An FMEA considers potential failure modes and identifies the relative likelihood and consequences of the failure modes, which are key considerations for impact assessment. We recommend that the EIS incorporate mitigation or alternatives to improve stability should the FMEA identify failure modes that are anything other than a tolerable risk.

For the tailings impoundment in particular, we recommend that the Corps require a demonstration that the structure complies with state dam safety criteria and has been designed by qualified persons. In addition, we recommend that the Corps require that the dam be independently reviewed (and modified if indicated by the review)[39]. Given the proposed size of the dams associated with the Pebble project and value of the downstream resources, we believe that an independent review of the dam structure is appropriate. We recommend that the results of the independent review be documented in the EIS in order to support the assessment of geotechnical stability.

As mentioned above in the Range of Alternatives section, we recommend that the Corps consider alternatives to improve physical stability of the tailings, including consideration of filtered tailings (dry stack). We note that consideration of a filtered tailings alternative and assessment of safety and stability via a FMEA and independent review panel are consistent with recommendations of *The Independent Expert Engineering Investigation and Review Panel Report on Mount Polley Tailings Storage Facility Breach* (January 30, 2015). In addition to investigating the cause of the Mount Polley tailings storage facility failure, the Review Panel made recommendations on actions that could be taken to ensure that similar failure does not occur at other mines. We recommend that the Corps consider the Review Panel Report and, in particular, the recommendations related to best available technology for new impoundments, design commitments to support permit applications, and actions to validate the safety of tailings storage facilities.

Hazardous Materials

We recommend that the EIS address the potential direct, indirect, and cumulative impacts of hazardous materials/wastes management and storage from the construction and operation of the proposed project and alternatives. Mining activities may involve the transport of hazardous materials, and we recommend that the EIS disclose the types and amounts of materials that will be used at each step of mining operations. In addition, we recommend that the EIS describe measures that will be taken to minimize the

[39] 33 C.F.R. § 325.1.

AMERICAN OVERSIGHT

chances of an accidental release, emergency measures that will be implemented should such an event occur, and how potential adverse impacts from spills may be mitigated by effective containment and cleanup operations.

We also recommend that potential health impacts to local communities or other project area users be identified, as well as any strategies employed to communicate risks or actual emergencies. As part of this analysis, we recommend that the EIS use scientific and traditional ecological knowledge to describe potential health effects from exposure to hazardous materials and the effects on the palatability of eating potentially contaminated foods.

HUMAN HEALTH AND IMPACTS TO COMMUNITIES

Sociocultural Impacts

It is anticipated that the proposed project will result in employment opportunities for Alaska Native residents, as well as generate local and corporate revenues in the region. While employment opportunities and local revenues generally increase a community's standard of living, there can also be impacts to families, communities, and cultures, especially in areas where residents are participating in traditional cultural practices. Noise and physical structures may disturb and/or displace subsistence wildlife from the project area. Other project impacts may affect a community's ability to access traditional and accustomed subsistence use areas. We recommend that the EIS identify the specific communities, federally recognized tribes, and corporations that could be impacted, both positively and negatively, which will help agency decision makers and the public understand the scope of the potential sociocultural impacts.

We recommend that the sociocultural impacts associated with this project and alternatives be fully evaluated and disclosed in the EIS and include, but not be limited to, the following:

- Socioeconomic Impacts
  - Evaluate potential changes to the region's economy as a result of the mine construction and operation (e.g., changes to commercial fishery, recreational fishery, and tourism sectors).
  - Evaluate impacts associated with economic changes to families, communities, and cultures, including potential changes to those aspects of the area's economy that are currently subsistence-based;
  - Evaluate the potential decline in the region's economy following mine closure; and
  - Evaluate replacement costs of traditional foods if access or availability are impacted by the proposed project.
- Accessibility of Traditional Use Areas
  - Identify community traditional use areas for subsistence, harvesting, hunting and trapping, fishing, travelling, camping, berry picking, and other uses;
  - Describe the potential access limitations to these traditional use areas and their impacts to local communities; and
  - Coordinate with the tribes and communities on options for mitigating impacts associated with accessibility to traditional and accustomed use areas.
- Compatibility of Traditional Use Areas
  - Identify project activities that may conflict with traditional and accustomed uses; and

AMERICAN OVERSIGHT

- Coordinate with the affected tribes and communities to identify mitigation options for avoiding and minimizing conflicts between traditional and accustomed subsistence uses and the construction and operation of this project.

Environmental Justice and Impacted Communities

In compliance with NEPA and Executive Order 12898 on Environmental Justice, actions should be taken to conduct adequate public outreach and participation that ensures that the public and Native American tribes understand possible impacts to their communities and trust resources.

Executive Order 12898 requires each federal agency to identify and address disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations, low-income populations, and Native American tribes.[40] The EPA also considers children, the disabled, the elderly, and those of limited English proficiency to be uniquely vulnerable populations that may be impacted.

The CEQ has developed guidance concerning how to address Environmental Justice in the environmental review process.[41] In accordance with this guidance, the EPA recommends that the EIS address the following points:

- Identify low income, minority, and Alaska Native communities that may be impacted by the project;
- Describe the efforts that have been or will be taken to meaningfully involve and inform affected communities about project decisions and impacts;
- Disclose the results of meaningful involvement efforts, such as community identified impacts;
- Evaluate identified project impacts for their potential to disproportionately impact low income, minority, or Alaska Native communities, relative to a reference community;
- Disclose how potential disproportionate impacts and environmental justice issues have been or will be addressed by the Corps' decision making process;
- Propose mitigation for unavoidable impacts that will or are likely to occur; and
- Include a summary conclusion, sometimes referred to as an "environmental justice determination" that concisely expresses how environmental justice impacts have been appropriately avoided, minimized, or mitigated.

We also recommend that particular attention be given to consideration of the dependence of local communities on local and regional subsistence resources, access to those resources, and perception of the quality of those resources. Additional information and tools for environmental justice analysis can be found on the EPA's website at: https://www.epa.gov/environmentaljustice.

Health Risk or Impact Analysis

The EPA recommends that the Corps undertake a screening process to determine which aspects of health (including but not limited to public, environmental, mental, social, and cultural) could be impacted by the proposed project. Depending on the screening results, an analysis of health effects, such

---

[40] EO 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-income Populations. February 11, 1994.

[41] http://ceq.hss.doe.gov/nepa/regs/ej/justice.pdf.

AMERICAN OVERSIGHT

as a health risk assessment or Health Impact Assessment, may be needed to determine the direct, indirect, and cumulative impacts to health. This analysis may need as much time to complete as the Draft EIS, therefore we recommend that early screening is essential to ensuring a timely analysis. We further recommend that the Corps partner directly with local, state, tribal, and federal health officials to determine the type of analysis needed to assess health impacts and conduct the analysis, and to determine appropriate and effective mitigation of potential health impacts.

Scope of Health Assessment in EIS

In terms of the scope of the health assessment, we recommend that the potential for contaminant exposure and resulting risks be evaluated. In addition, we recommend that the EIS consider how income from new jobs can result in positive or negative health impacts, for example by increasing socioeconomic status or by generating rapid social and community change. We also recommend considering the health impacts of potential changes to traditional way of life from the project, including reduced reliance on a traditional diet due to lack of access and corresponding increased reliance on substitutes.

Data Collection

To appropriately evaluate health impacts, we recommend that specific health data that may not be routinely collected as part of the scoping process may be required. To ensure that the necessary data are available for this evaluation, the Corps may want to involve public health professionals early in the NEPA process. Public health data and expertise for prospective health impact analysis, or for providing input on health issues, may be available from local health departments, tribal health agencies, the Alaska Department of Health and Social Services, or federal public health agencies such as the U.S. Centers for Substances and Disease Registry, or the Indian Health Service.

Methods and Tools

The Health Impact Assessment methodology is a common tool that can be used to assess potential health impacts. HIA is a combination of procedures, methods, and tools that enables systematic analysis of potential positive or negative effects of a policy, plan, program, or project on the health of a population, as well as the distribution of those effects within the population.[42] Depending on available data and potential effects, there are different levels of HIA analysis, and we recommend that the Corps' involve public health professionals in determining the appropriate level of analysis. In addition to evaluating impacts, we recommend that the HIA identify the appropriate actions to manage or mitigate health effects from the proposed project.

Guidelines for conducting an HIA are available from various sources.[43] The World Health Organization has links to many guides.[44] The International Finance Corporation has also developed detailed guidelines for conducting an HIA.[45] In addition, the State of Alaska has developed *Technical Guidance for Health Impact Assessment*, also known as the "Alaska HIA Toolkit".[46]

---

[42] This definition is from the International Association for Impact Assessment (IAIA), which is modified from the World Health Organization's Gothenberg consensus statement (1999).

[43] The EPA does not endorse or recommend use of any single or particular guidance on HIA. These references are provided as general information and to assist permitting agencies with identifying additional resources on HIA.

AMERICAN OVERSIGHT

CONSULTATION AND COORDINATION WITH TRIBAL GOVERNMENTS

Executive Order 13175, Consultation and Coordination with Indian Tribal Governments (November 6, 2000), was issued to establish regular and meaningful consultation and collaboration with tribal officials in the development of federal policies that have tribal implications, and to strengthen the United States' government-to-government relationships with Indian tribes. In addition, pursuant to Public Law 108-119, 118 Stat. 452, as amended by Public Law 108-4217, 188 Stat. 3267, federal agencies are required to consult with Alaska Native Claims Settlement Act corporations on the same basis as Indian tribes under Executive Order 13175. We recommend that the EIS describe the process and outcome of any government-to-government and/or government-to-corporation consultations regarding the Pebble Project, issues that were raised during the tribal consultations and how those issues were addressed.

Cooperating agency involvement establishes a mechanism for addressing intergovernmental issues throughout the EIS development process, and we support the Corps' inclusion of two tribal governments as cooperating agencies. We recommend that the Corps remain open to including other potentially affected tribal governments that have the resources and interest in serving as cooperating agencies for EIS development, consistent with the July 28, 1999, memorandum from CEQ to the heads of federal agencies.

ANALYSIS TOOLS AND METHODOLOGIES

Baseline Data Adequacy

We suggest categorizing and synthesizing existing data to ensure pertinent information is available for review and use in the EIS analysis. We understand that the Corps intends to establish focused workgroups during development of the EIS. We support this approach and recommend that the workgroups include cooperating agency subject matter experts for key areas (air, water, wetlands, fisheries, etc.) to review baseline data for completeness, identify data gaps, and recommend approaches toward resolving those gaps in a timely manner. For example, additional analysis or collection of additional data may be required to characterize the accuracy of best available baseline estimates of resources such as fish populations, groundwater elevations, or wetland extents. Such information will be critical for designing and developing a robust monitoring framework and for assessing impacts during and after project development and comparing those to the baseline.

Geochemistry/Characterization of Ore, Waste Rock, and Tailings

To provide reliable predictions of water quality and impacts to surface water and groundwater due to wastewater and mine waste management, we recommend that the physical and chemical characteristics of the ore, pit walls, waste rock, and tailings should be determined and disclosed in the EIS. Environmental samples used to support projections should represent a range of conditions that currently occur and that could occur in the future as a result of the project, including under potentially altered future climate conditions. Waste materials (ore, waste rock, tailings) used for environmental projections should be representative of the material to be mined and related to the mine plan and proposed processing methods. Physical and chemical characterization should be conducted in a manner that provides environmentally conservative estimates of impacts.

AMERICAN OVERSIGHT

It may be helpful to consider EPA Region 10's Sourcebook for Hardrock Mining for recommendations related to the NEPA analyses of mining projects.[47] We recommend that the following information be utilized to characterize geologic and mineralogy setting/aqueous geochemistry in the baseline environment and impact prediction sections of the EIS:

- Whole rock analysis;
- Mineralogy;
- Drill core descriptions;
- Block model or similar model (a computerized estimate of the quantity and characteristics of ore and waste);
- Available literature on the ore deposit;
- Mineral occurrences (e.g., on fracture surfaces, in groundmass, using hand specimens and thin section) with an emphasis on sulfides and carbonates;
- Acid-base accounting;
- Long-term kinetic testing (including possible startup of test pads if sufficient material and access to site are available);
- Baseline surface and ground water quality and flows (including springs);
- Potentiometric surface for groundwater;
- Hydraulic properties (e.g., hydraulic conductivity, porosity, permeability) of soil, vadose zone, and groundwater aquifers, especially under proposed locations of mine facilities; and
- Hydrogeochemical models for prediction of water quality.

Predictive Modeling

We recommend that predictive modeling be based on a site-specific conceptual model that describes the system boundaries, spatial and temporal scales, hydraulic (for water modeling) and chemical characteristics, sources of data and data gaps, and the mathematical relationships used to describe processes. We also recommend that our suggestions be applied to any environmental and predictive modeling used for assessing impacts in the EIS. The water quality model, in particular, should be capable of predicting both whole water and dissolved fractions of metals/metalloids and should provide temporal predictions that are consistent with the time-steps in applicable water quality criteria.

Any modeling documentation should include:

- Tables of parameter values used in the model;
- Tables and graphs of results;
- Uncertainty and sensitivity analyses;
- Errors associated with both measured and assumed data; and
- Recommendations for further analysis, if applicable.

We recommend that discussions on modeling include a clear statement of the management objectives intended to be achieved by the modeling, the level of analysis required to meet the objectives, and uncertainties associated with modeled outcomes. For your reference, please refer to EPA's guidance that provides recommendations for the effective development, evaluation, and use of models in

[47]U.S. EPA Region 10. 2003. EPA and Hardrock Mining: A Source Book for Industry in the Northwest and Alaska January 2003.

AMERICAN OVERSIGHT

environmental decision making.[48]

We recommend that the EIS use caution in describing absolute outcomes based on modeling. Mathematical modeling used for describing the physical and chemical characteristics of the project site and potential impacts includes a level of uncertainty; understanding these uncertainties and associated risks is necessary for informed decision making. We recommend that the study plan for modeling analysis clearly state the purpose, questions of concern, method, data, and limitations of the model to generate valuable interpretations. We also strongly recommend an appropriately conservative approach be taken with modeling and a range of predictive outcomes be discussed (e.g., most likely case, reasonable worst-case, and reasonable best-case scenarios) that reflect a range of climatic settings and critical input values. Inclusion of a reasonable range of outcomes allows the agencies to make better informed plans for mitigation, adaptive management, and contingencies to respond to reasonably foreseeable adverse impacts.

Traditional Ecological Knowledge

Due to the location of the proposed project and traditional uses of the area, we recommend the identification, inclusion, and integration of traditional ecological knowledge into the EIS analysis, as appropriate. Such anthropological work can include the collection of local and traditional knowledge concerning the affected environment, anticipated impacts from the project, and traditional hunting and land use patterns in the area. We recommend that, in addition to reviewing any pertinent traditional ecological knowledge currently available, additional studies be conducted as necessary to clearly identify concerns and potential impacts, including cumulative impacts, from the proposed project and project alternatives. This information should be reviewed and included in the EIS to the extent possible and utilized in the analysis of potential impacts.

MITIGATION, MONITORING, AND ADAPTIVE MANAGEMENT

Mitigation

CEQ regulations at 40 C.F.R. § 1508.20 define mitigation to include five categories of actions to address impacts. Briefly stated, these are: avoiding, minimizing, rectifying, reducing, and compensating. The regulations at 40 C.F.R. § 1502.14(f), 1502.16(h), and 1508.25 indicate that appropriate mitigation measures should be addressed in an EIS both as part of the analysis of alternatives and in discussions of environmental consequences.

Mitigation is also relevant to evaluating compliance with the Guidelines, which prohibit discharges of dredged or fill material that will cause or contribute to significant degradation of the waters of the United States, and prohibit all discharges *"unless appropriate and practicable steps have been taken which will minimize potential adverse impacts of the discharge on the aquatic ecosystem."*[49] The Guidelines identify numerous types of actions to mitigate potential adverse impacts, which include

[48] Guidance Document on the Development, Evaluation and Application of Environmental Models (PDF). EPA/100/K-09/003. March 2009. http://www.epa.gov/crem/cremlib.html.

[49] 40 C.F.R. § 230.10(d).

AMERICAN OVERSIGHT

measures to avoid, minimize, and compensate for impacts. Avoidance, minimization, and compensation form a "mitigation sequence" that must be followed in order to comply with the Guidelines' requirement that all appropriate and practicable steps be taken to mitigate impacts to aquatic resources.[50] Compensatory mitigation considerations under the Guidelines are discussed further in the section on aquatic resources above.

The EPA recommends that the EIS identify the type of activities that would require mitigation measures during the construction, operation, and closure phases of this project. In addition, we recommend identifying whether implementation of each measure is required by the Corps or any other governmental entity and which entity will be responsible for implementing the measure. To the extent possible, mitigation goals and measurable performance standards should be identified in the EIS to reduce impacts to a particular level or adopted to achieve an environmentally preferable outcome. CEQ guidance on the Appropriate Use of Mitigation and Monitoring seeks to enable agencies to create successful mitigation planning and implementation procedures with robust public involvement and monitoring programs.[51]

Monitoring

Environmental monitoring programs should be designed to assess both impacts from the project and whether implemented mitigation measures are effective. We recommend that the monitoring programs:

- Define the monitoring goals and objectives;
- Provide details to demonstrate that goals and objectives will be achieved such as the parameters to be monitored, monitoring locations and frequency, data analysis, and reporting;
- Discuss actions (contingencies, triggers, adaptive management, corrective actions, etc.) that will be taken based on monitoring results;
- Identify and incorporate controls and pre-project data with quantified bias and precision to enable detection of impacts, success of BMPs, and ability to distinguish these from natural variation; and
- Require regular analysis and reporting of data to oversight agencies, including submittal of a sampling and quality assurance plan for agency approval.

We recommend that the monitoring programs be described in the EIS and that the EIS also discuss public participation, and how the public can get information on mitigation effectiveness and monitoring results.

Adaptive Management Planning

We recommend that the EIS utilize adaptive management and contingency planning to describe the strategy for responding to unforeseen circumstances at the site. The strategy should include "trigger levels" (e.g., exceedance of ecological benchmarks) or observations (e.g., statistically significant trends in indicators, permit violations, water balance problems, changes in discharge or chemistry of springs/seeps) that would set follow-up actions into motion. This strategy or plan should be described so that reviewers may comment on its adequacy. This type of plan, when coupled with the monitoring program, is necessary to mitigate for uncertainties and risks associated with predictions of

[50] 40 C.F.R. § 230.10(a), (d); *See* Memorandum of Agreement between U.S. Department of Army and the Environmental Protection Agency on the Determination of Mitigation Under the Clean Water Act Section 404(b)(1) Guidelines.

AMERICAN OVERSIGHT

environmental outcomes, and will provide an early warning system of unexpected outcomes.

FINANCIAL ASSURANCE

NEPA provides for the disclosure of all information concerning the environmental consequences of a proposed action to agency decision makers and the public before decisions are made and actions are taken. A key component in determining the environmental impacts of a mining project is the effectiveness of the closure and reclamation activities, including long-term water management. In turn, whether any closure and reclamation activities that may be necessary will be adequately funded is key to determining whether those activities will be effective. We therefore recommend that the project's ability to self-fund, and/or any third-party financial assurance mechanisms, be disclosed. Disclosure of the financial assurance amount and mechanism is particularly important for this project given that PLP's proposal includes long term water management and treatment.

We recommend that the draft EIS disclose the estimated costs to reclaim and close the site in a manner that achieves reclamation goals and post-mining land use objectives. The EPA recommends that the final EIS identify proposed financial assurance mechanisms and demonstrate that these mechanisms would ensure that necessary reclamation work is completed.

The EPA is available for further conversations about the level of detail to include in the document. Below are the main elements that we believe should be disclosed in the EIS:

1. Site Reclamation (facility closure, earth moving/stabilization, revegetation, etc.):

- Phases of reclamation;
- Estimated cost (+/- percent) to reclaim and close the site in a manner that achieves reclamation goals and post-mining land use objectives;
- Criteria for determining success of reclamation activities for financial assurance release; and
- Costs associated with implementing contingency measures to address reasonably foreseeable but not specifically predicted outcomes.

2. Long-Term Site Management (post-closure water treatment, mitigation of impacts to aquatic resources, site maintenance, and monitoring):

- Itemized cost estimate (including reasonable contingencies) and appropriate economic variables to calculate the net present value of future expenses; and
- If a trust fund is utilized, address the "mechanics" of the fund, including:
    - Trust fund mechanism (e.g., current value trust, net present value trust, etc.);
    - Requirements for timing of payments into the trust fund;
    - How the Corps would ensure that the trust fund or other financial assurance could not be claimed by a creditor in the case of bankruptcy;
    - Acceptable financial instruments;
    - How trust management fees and taxes will be paid;
    - Identity of the trust fund beneficiaries; and
    - Identity of the operator with responsibility/liability for financial assurance.

Jill and David-

The Corps today issued its NOI to prepare an EIS and its scoping schedule. See links below.
The scoping period runs from April 1 to 30.

Deliberative Process / Ex. 5

Thanks - Patty

Subject: Notice of Intent to Prepare an Environmental Impact Statement (Pebble Limited Partnership)

Interested parties are hereby notified that a Department of the Army permit application has been received for work in waters of the United States.

SPECIAL PUBLIC NOTICE DATE: March 30, 2018

IDENTIFICATION NUMBER: POA-2017-271

AMERICAN OVERSIGHT

APPLICANT: Pebble Limited Partnership

LOCATION: The project would be located in the Iliamna region of southwest Alaska, approximately 200 miles southwest of Anchorage and 60 miles west of Cook Inlet. The closest communities are the villages of Iliamna, Newhalen, and Nondalton, each approximately 17 miles from the Pebble Deposit.

CONTACT:
For information regarding the proposed project plans and construction, please contact the applicant at:
Pebble Limited Partnership
3201 C Street, Suite 505
Anchorage, Alaska 99503.

For additional information regarding the EIS process (including scoping) please contact:
Mr. Shane McCoy
Program Manager, Regulatory Division
US Army Corps of Engineers, Alaska District CEPOA-RD Post Office Box 6898 JBER, Alaska 99506-0898

Also, please visit our project website at www.PebbleProjectEIS.com.

The full text of this public notice, as well as associated maps and drawings, are available on our website at:
http://www.poa.usace.army.mil/Missions/Regulatory/Special-Public-Notices/
(Note: if the above link isn't clickable or part of the link is cut off, please copy and paste the entire URL into your browser's address bar and press Enter)

_____
**NOTICE TO EDITORS: This public notice is provided as background information and is not a request or contract for publication.

U.S. Army Corps of Engineers
Alaska District
Regulatory Division, CEPOA-RD
2204 3rd Street, Post Office Box 6898
JBER, Alaska 99506-0898

The understanding and support of Alaskans is vital to the success of the Regulatory Program. We must work together to protect Alaska's water resources, ensuring their use and enjoyment for future generations, while enabling responsible development.

Hi David – Below is a status update of PLP's permit application. I have attached the FR notice I quoted from just in case you wanted to see it. Carrie mentioned that the Congressional Western Caucus is coming in for a meeting. I wanted to make sure you were of the attached letter from some Caucus members. OW is currently preparing a draft response. Also, as you may recall, staff worked on a paper responding to PLP's most recent letters. We wanted to see when might be a good time to send that paper to you.

Heidi

++++++++++

- Pebble's permit application is currently in the NEPA scoping phase.
- Substance: The Corps' public notice announcing its intent to issue the EIS explained that "[s]coping is conducted to assist in determining the scope of analysis, significant issues and alternatives to be analyzed in depth in the DEIS."
    - The Corps' public notice indicated that the draft EIS will identify a range of alternatives and evaluate reasonable and practicable alternatives, including "the no action alternative, the applicant's proposed alternative, alternative mine locations and mine plans, alternative mining methods and processes, alternatives that may result in avoidance and minimization of impacts, and mitigation measures not in the proposed action."
    - The notice identified significant issues that will be analyzed in the draft EIS related to the effects of the proposed Pebble mine and associated infrastructure construction, operation and closure. These significant issues include "wetlands, water quality, air quality, hazardous materials, fish and wildlife, vegetation, cultural resources, food production, land use, needs and welfare of the people (socioeconomics including commercial fishing and tourism), recreation, general environmental concerns, historic properties, navigation, and safety."
- Process: The Corps' public scoping period ends on June 29, 2018.
    - Region 10 is preparing a draft scoping letter.
    - The draft letter will come to headquarters (OW, OFA and OGC) for review June 4th-June 12th.

Subject: Bristol Bay Check-in Agenda for 8/14/18

Hello,

Tomorrow at 9 am PST, 8/1/18, we will have a Bristol Bay check-in with Linda Anderson-Carnahan. Linda is acting for David Allnutt while he is out.

The purpose of these bi-weekly meetings is for the two Bristol Bay Teams - the Permit Oversight/NEPA Review Team and the 404(c) Team – to check-in with each other and with regional management.

Subject: RE: Bristol Bay Check-in - Propose moving to every other Wednesday at 9:30 am

Patty,

Thank you. There would be conflicts with the second Wednesday starting on February 13th. So, I'll keep it to 9 am to avoid that problem.

Otherwise sounds like Wednesdays are ok for you.

Subject: Bristol Bay Check-in - Propose moving to every other Wednesday at 9:30 am

Patty, Molly and Ashley,

I would like to move the BB check-in with David Allnutt from every other Tuesday at 9:00 am to every other Wednesday at 9:30 am starting November 7th.

Would this be ok with you all?

Wednesday mornings seem better to me because both the teams can have Monday and Tuesdays to figure out what is most important for David, and it will be recent and relevant for that week. 9:30 am is better for me also.

The 404(c) team meets on Tuesdays. In general, we have been meeting once a month given our relatively lower current workload.

To: McGrath, Patricia <mcgrath.patricia@epa.gov>; Palomaki, Ashley <Palomaki.Ashley@epa.gov>; Vaughan, Molly <Vaughan.Molly@epa.gov>
Subject: Draft 10/9/18 Bristol Bay Check-in Agenda

Patty, Ashley and Molly,

Please give feedback on the following draft agenda by 1pm 10/5/18. Thank you!

Patty and Molly, the text below (except the Bolen briefing question) is from the 9/7 update we provided David in-lieu of meeting with him on 9/11.

Draft Agenda

Permit Oversight/ NEPA Review Team

Timing a Brittany Bolen briefing?

Scoping Document

- EPA reviewed and commented on the draft scoping document that describes the significant issues raised in scoping. The final scoping document is available on the Corp's Pebble EIS website.

Preliminary EIS review

- EPA reviewed and commented on specific portions of chapter 3 (affected environment) and chapter 4 (environmental consequences) that pertain to our areas of special expertise as identified by the Corps which includes: aesthetics, surface water hydrology, groundwater hydrology, water and sediment quality, wetlands, vegetation
- The documents have many placeholders since there have been changes to the proposed action, alternatives have yet to be developed, and there are numerous substantial requests for additional information where the Corps is awaiting response from PLP.
- It is not clear whether we will be provided with another opportunity to review these chapters before the draft EIS. The Corps has indicated that there will be technical meetings in October/November to discuss comments and the impact assessment.

AMERICAN OVERSIGHT

Alternatives

- The Corps is developing the range of alternatives to be analyzed in the EIS. We participated in a cooperating agency meeting and provided input. During the week of Sept 10, the Corps is to submit a detailed discussion of the alternatives selected for EIS review and rationale for those dismissed.

Site Visits

- July 9 – 11: CWA 404 field verification was completed by Mark Douglas
- July 31: Site visit with some of our NEPA team (Patty, Molly, Tim, Chris) to view the mine site, proposed Lake Iliamna port sites, and portions of the proposed roads.

Schedule

- The Corps Pebble EIS website identifies a draft EIS in January 2019 and a final EIS in late 2019.

<u>404(c) Team</u>

FOIA

- E&E News – new request for unredacted copies
- McKeever FOIA Lawsuit – next steps
- NRDC and CNN – working with the AOs office
- Trustees for Alaska – options for Justin Schwab review
- Trustees for Alaska 2 – new FOIA
- Back-up?

Congressional responses

- Western Caucus (Gosar et al) – newly OW-approved, not issued
- DeFazio and Carper – just revised, based on newly OW-approved, not issued Western Caucus response
- Lamar Smith – just drafted, based on newly OW-approved, not issued Western Caucus response

External Correspondence

- Recent activity and approach

Subject: please provide comments by 11/30 from the requested CAs (UNCLASSIFIED)

CLASSIFICATION: UNCLASSIFIED

Attached are 4 Word files and 3 PDF files, the review drafts and associated figures of:

Sec3.3/4.3-Needs and Welfare of the People-Socioeconomics (CAs listed as Curyung Tribal Council, Lake and Peninsula Borough, Nondalton Tribal Council, State of Alaska) .There are no figures associated with these two sections.

Sec3.12/4.12-Transportation and Navigation (CAs listed as USACE, USCG, State of Alaska). Section 3.12 has three figures, attached as PDFs.

A four-week review period for CAs gives a return date to AECOM of 11/30/2018.

Subject: RE: Pebble Mine - Justine Barton Comments

Hi Justine,
Thank you so much for reviewing and for these comments. I was specifically hoping you would focus on impacts at the potential port sites, so that is perfect (and I apologize for not reaching out at the beginning of the review period with more specific direction, everything has just been so rushed on this review!). Your comments seem very appropriate and helpful. I have not had time to read the sections myself to see if I have any additional questions for you, but will follow up with you if I do.
Thank you,
Molly

Subject: Pebble Mine - Justine Barton Comments

Hi Molly – My expertise is in the Port facility and dredging and dredged material disposal realm, so my comments are skewed toward those sections of the chapters provided. Since my review area is pretty narrow, I have just a few comments at this point. Could you take a look and see if these are helpful? Please let me know what else I might include that would be of assistance to you in the topic areas I mentioned above. JB

Subject: Please Review - Pebble Pre-DEIS Sections
Importance: High

Hello Pebble NEPA Team,

We have received several additional sections of the preliminary Draft EIS for review. We have also received many sections as an FYI for which our review is not requested. I have loaded everything I've received to date into the Sharepoint Folder: Preliminary Draft EIS Sections Oct-Nov 2018.

As a reminder, our input at this stage is only requested on the specific sections we were assigned to in the Cooperating Agency plan. Therefore, if your name doesn't appear below with a specific assignment, no review is necessary at this time. However, feel free to take a look at the sections pertaining to your subject matter on the Sharepoint Site if you wish.

Here are the assignments for specific sections where I would appreciate your review. Note that each subject area includes a section for Chapter 3 (affected environment), Chapter 4 (environmental consequences), as well as one or two supporting technical appendices. Please use the attached comment spreadsheet to assemble your comments, and please send them to me by the date noted for each section below.

- 3.11/4.11/K4.11 Aesthetics – Molly
- 3.14/4.14/K3.14 Soils – Mark/Palmer – due COB 11/27
- 3.16/4.16/K3.16 Surface Water Hydrology – Tim/Mark/Palmer/Muluken/Justine – due COB 11/27
- 3.26/4.26/K3.26 Vegetation – Mark/Palmer – due COB 11/27
- 3.17/4.17/K3.17 Hydrogeology – Tim/Mark/Palmer/Muluken – due COB 11/29
- 3.18/4.18/K3.18/K4.18 Water and Sediment Quality – Cindi/Tim/Chris – due COB 11/29
- (note, we have not yet received the Wetlands sections, which are anticipated to arrive approximately 11/21)

I apologize for the short time available for review, especially given the Thanksgiving holiday in the middle. If this schedule will be impossible for you, please let me know as soon as possible. Also, if you have any questions about the sections you are reviewing or where to focus your review, please don't hesitate to call.

Thank you,
Molly

Hi Team – Sorry for the short notice, but we are cancelling today's team meeting. We are in the midst of scrambling to finish the scoping letter, due tomorrow, and Patty and I are not available. We will meet next month as scheduled.

Regarding the Chapter 3 Sections – Thank you very much to everyone who provided comments so far. I am working on compiling them, and we will send to the Corps next week. If you are on the reviewer list for the delayed Sections 3.16 and 3.26 that we finally received, please send your comments to me no later than July 20, but sooner would be much appreciated.

Thank you,
Molly

Subject: REVIEW REQUEST and additional documents loaded to Sharepoint

Hello Team,
The Corps distributed some additional information to cooperating agencies related to yesterday's Cooperating Agency meeting here in Anchorage, and I have added these materials to the Sharepoint site, in the "Materials for 6-6-18 Cooperating Agency Meeting" folder. Most of the information is for awareness only, but our review has been requested on two items:

1) the Preliminary Scoping Report
2) **Internal Website / Ex. 6**

Your review is being requested on specific materials (listed below), but feel free to also review the remainder of the materials if you wish.

- Preliminary Scoping Report: **Molly/Patty** – comments due to Molly **June 20**
  This document addresses scoping comments received to date, but will be updated following the close of the public scoping period.

- Pre-Draft Chapter 3 Sections – comments due to Molly **June 25** (specific section assignments below)
  These documents are first drafts of each resource section Affected Environment, and will also be updated following the close of public scoping and based on cooperating agency input. It is not clear whether cooperators will have an opportunity to review a second iteration prior to publication of the Draft EIS, so a thorough review at this stage is critical.

  The Corps has requested that our review focus on what is missing or any inaccuracies (don't worry about formatting, grammar, etc.). Where we identify something missing/innacurate, we are asked to be very specific in our recommendation. If you identify missing information in your review, first check the RFIs and Responses to Date

  Internal Website / Ex. 6

  If there is a RFI/response that addresses your concern, then please note that in your comment. If not, then please include in your comment: (1) the information gap, (2) a reference where additional information can be found, and (3) what from that reference should be added, with as much specificity as possible – suggested text would be helpful.

  Please identify the sub-section and page number for each of your comments.

  Here are specific assignments for the review request. Most sections include a word document as well as some associated figures in pdf form.

- 3.1 Intro – **Molly**
- 3.5 Recreation – **Mark/Palmer/Molly**
- 3.11 Aesthetics – **Mark/Palmer/Molly**
- 3.14 Soils – **Mark/Palmer**
- 3.16 Surface Water Hydrology (note, we received figures but not text, and are following up) – **Tim/Mark/Palmer/Muluken**
- 3.17 Groundwater Hydrology – **Tim/Mark/Palmer/Muluken**

AMERICAN OVERSIGHT

- 3.18 Water and Sediment Quality – **Cindi/Tim/Chris**
- 3.22 Wetlands/ Special Aquatic Sites – **Mark/Palmer**
- 3.26 Vegetation (note, we received figures but not text, and are following up) – **Mark/Palmer**

Please let me know if you have any questions. Thank you for your assistance with this review.
Regards,
Molly

Pebble NEPA/permitting team –

AMERICAN OVERSIGHT

The Corps has started sending us, and other cooperating agencies, information generated by PLP and the third-party EIS contractor (AECOM). This information includes AECOM's requests (to PLP) for additional information (RFAIs) and PLP's responses. The Corps has begun adding theses RFAIs to the public EIS website. Molly and I will add this information to our SharePoint site as well.
The Corps has submitted this information to us and requested an awareness review, but is not requesting written comments.

For now, I want to bring your attention to two documents, attached:
1 – PLP Updates to the Proposed Project - PLP has made some updates to the project description. Please review this document so that you are aware of the changes.

Deliberative Process / Ex. 5

Deliberative Process / Ex. 5

2 – PLP Technical Note on Project Options and Screening Criteria – This document summarizes screening criteria and options used by PLP to develop its current project description. I expect the Corps will consider this information during alternatives development. Please review this document for awareness.

We will discuss these documents during our next team meeting on May 24, and I can provide more context. In the meantime, please let me know if you have questions.

Thanks-
Patty

Subject: Pebble - draft section on TEK for review

Hi Neverley,
We have received a few additional draft sections of the Pebble EIS for review. One of these is a description of the Corps approach to TEK in the EIS. I have not had a chance to review, but didn't want to delay any longer in sending this to you. I am not sure if there is anything in here we would want to comment on, but at a minimum I thought you might want to see if for informational purposes. Please review if you have time, and let me know if you have any comments. Due to the short timeframe provided for review, I would need your comments, if you have any, by COB this Friday (the 26th).
If you have any questions on how this document fits in with the overall EIS, or anything else, please let me know.
Thanks,
Molly
