The road and pipeline would cross 9 anadromous and 35 resident fish streams (Appendix K3.24). In some locations, such as culvert crossings, the road/pipeline footprint would impact riparian and floodplain connectivity in the 100-year floodplain. This could reduce allochthonous inputs and downstream productivity, and would be permanent for the life of the project. Culverts would be designed and installed in accordance with ADOT&PF and ADF&G standards to provide fish passage for all life stages. Other BMPs, such as road fill drain culverts, may be considered to maintain floodplain connectivity. Because of the available riparian habitat that would not be impacted throughout the watersheds, the impacts from the transportation corridor would be expected to be of short duration.

Iliamna Lake Pipeline

HDD would be used to install the pipeline segments from the lakeshore into waters deep enough to avoid navigational hazards, then laid and secured on the lake bottom. Approximately 2.18 acres of the approximately 647,000 acres of available benthic habitat in Iliamna Lake would be permanently impacted.

Ferry Terminal and Operation

Docking facilities for the ice-breaking ferry at the north and south ferry terminals are expected to include rock and gravel ramps extending approximately 40 feet into Iliamna Lake. Consequently, there would be short-term, indirect disturbance effects from ramp construction along the shoreline; and permanent, direct impacts due to loss of approximately 1 acre of benthic habitat under the terminal's footprint. Because of the quantity of available benthic habitat (approximately 234 miles of shoreline/647,000 acres), there would be no anticipated impacts to the overall productivity of Iliamna Lake.

AMERICAN OVERSIGHT

Amakdedori Port

The port site would permanently impact 14 acres of benthic habitat. Because of the existing 30 million acres of available benthic habitat in Cook Inlet, there would be no anticipated impacts to the overall benthic productivity in Cook Inlet.

4.24.2.5 Stream Sedimentation and Turbidity

The effects of stream sedimentation on fish could occur during all three phases of the project: construction, operations, and closure/post-closure. Mine site activities have the potential to release particulates and sediment into drainages and tributaries from a range of activities and sources, including:

- Soil disturbance, compaction, and vegetation removal;
- Wetland in-filling that reduces sediment retention and exposes soils to erosive forces of wind and/or water;
- Stream erosion from increased flows released as a result of inter-basin diversions and transfers;
- Rock fracturing/processing activities; and
- Runoff from constructed roads, pipeline, and materials sites.

Sedimentation is known to affect the quality and quantity of aquatic habitat. Fine sediments in streams are associated with degradation of salmonid spawning habitat quality, and can affect the survival of incubating eggs; inhibit fry emergence; reduce instream cover and overwintering refuge for juvenile fish; reduce overall fish-carrying capacity; and decrease fish food (BMI) availability (Limpinsel et al. 2017). Although sediment transport and deposition are natural stream processes, major disruptions of the stream system and its functions could occur when sediment delivery is substantially changed, or when the ability or capacity of the stream to transport sediment is altered due to natural events or human activities. Erosion and sedimentation also may elevate turbidity, which can adversely affect fish feeding, growth, and survival (Lloyd 1987).

Elevated turbidity in streams from suspended sediments can have adverse impacts on fish and other aquatic organisms through several mechanisms, such as reduced foraging efficiency of drift-feeding fish, elevated water temperature through increased light absorption, reduced primary production, and damage to gill membranes under conditions of severe turbidity (Bash et al. 2001; Newcombe and Jensen 1996).

The mine site construction would disturb 8,130 acres of surface soil. Components of the mine site that could release sediment into waterways include the 13 embankments for various stockpiles (TSF, overburden, etc.) and ponds (seepage, sedimentation, and water management); parking, laydown and construction sites; materials sites; and haul, access, and service roads. During construction and operation of the mine, surface runoff would be captured by drainage ditches that would route runoff into ponds for treatment at one of two water treatment facilities before discharge into downstream waters. Likewise, seepage from stockpiles would drain into ponds for subsequent treatment and discharge.

The magnitude of stream sedimentation that could result from such disturbance would depend on the effectiveness of required state-of-the-process BMPs under stormwater pollution prevention regulations implemented, monitored, and maintained during all phases of the project. BMPs are designed to mitigate the intensity of surface runoff, erosion, and sediment loads in stream channels. A range of BMPs, including silt fences, bale check dams, sediment retention basins, cross bars and ditches, runoff interception and diversions, gabions and sediment traps,

AMERICAN OVERSIGHT

mulching of disturbed surfaces and stockpiles, and other measures, would be implemented and monitored along the mine site road corridors and at all bridge and culvert crossings to ensure minimization of potential impacts from erosion and sedimentation. BMPs would also be employed to minimize impacts of surface runoff and erosion at materials sites.

Measurable changes in the quality and character of aquatic habitat from sedimentation would be likely, although impacts are expected to be limited to the mine site and road corridor footprint and immediate downstream areas in the NFK, SFK, and UTC drainages. The duration of sedimentation impacts is likely to be temporary and of short duration. Permit-required monitoring of fine sediments deposited in spawning gravel would identify any degradation in spawning habitat quality and sources of potential impact.

Mine Site

Development and operation of the mine site and its associated facilities (e.g., roads, embankments, and housing) are expected to result in increased surface runoff, which—if not captured and re-routed to treatment facilities—can lead to elevated turbidity in adjacent stream channels. Increased turbidity of discharge effluent may result if treatment of captured water in sediment and seepage ponds is not successful in removing all suspended sediments. Turbidity may also occur due to dissolved solids, which can alter color in treated discharge water. BMPs would be implemented and maintained during construction and maintenance of all mine facilities to minimize surface runoff. All effluent discharged from water treatment plants would be subject to water quality criteria dictated by discharge permits. Treated water would be discharged through buried infiltration chambers designed to provide energy dissipation, erosion control, and freeze protection. Sampling at water discharge locations at all three principal tributaries would monitor any changes in turbidity over background levels, and would identify any out-of-permit conditions and initiate remediation procedures. Impacts to turbidity would most likely be within the mine site footprint; particularly when extreme weather events coincide with ground-disturbance activities.

Transportation Corridor

Road construction, maintenance, and use can result in short- and long-term impacts to streams and drainages from increased surface erosion and deposition of fine sediments; alteration of water temperature; delays or barriers to fish migration at culverts; changes in streamflow and hydrologic processes; and introduction of invasive plant species (Limpinsel et al. 2017). Surface erosion can also result from clearing and grading activities and from poorly surfaced or maintained roads with steep grades, high traffic volume, and insufficient stormwater management facilities. Accumulations of fine sediments in streams have been associated with decreased fry emergence, reductions in winter carrying capacity and benthic production, and changes in species composition in benthic invertebrate communities (NMFS 2011a).

The proposed road would be constructed through existing bedrock and glacial fluvial surface geology using locally processed materials with low erosion potential. Therefore, the indirect effects of erosion and sedimentation are expected to be limited to bridge or culvert crossings. Construction-related sedimentation is expected to be temporary in nature due to permit stipulations and timing windows. Additional monitoring, BMPs, and maintenance standards may be required by ROW lease stipulations from the respective landowners.

The proposed design of the natural gas pipeline would be within the prism of the access road, and attached to bridges at river crossings. This configuration would reduce the risk of ponding, interception of surface water flows, and sedimentation, as related to the pipeline ditch.

AMERICAN OVERSIGHT

Operations are expected to require 35 truck round trips per day, which would result in dust impacts in proximity to roads, including at stream crossings. Implementation of dust suppression and enforcement of slow speed limits at all stream crossings would minimize dust-related impacts to aquatic ecosystems. Impacts are expected to extend through the life of the project.

Road and Pipeline

Potential impacts on stream turbidity are not expected to occur at bridge or culvert crossings, except temporarily during construction. The impact is expected to be localized to the immediate location of the drainage structure. Bridge and culvert construction activities in anadromous waters would occur from May 15 to June 15 to avoid impact to migrating salmon, according to ADF&G criteria. As stated above, routine inspection and maintenance of culverts, bridges, and roads would be regularly conducted, in compliance with permit conditions to ensure that drainage-structure–related erosion, wash-out, or debris blockage do not result in impacts to water quality or downstream habitat.

Ferry Terminals

Docking facilities for the ice-breaking ferry at the north and south ferry terminals are expected to include rock and gravel ramps extending approximately 40 feet into Iliamna Lake. Consequently, there would be localized, short-duration turbidity effects on fish and benthic organisms during construction.

Amakdedori Port

Temporary increases in turbidity would occur during construction of the Amakdedori Port. Turbidity and deposition of suspended sediments in the nearshore environment at the port site could impact marine benthos. Temporary effects on both migratory and non-migratory marine fish species may also occur, particularly for benthic fish species expected to inhabit the immediate area. Sediment deposition on aquatic vegetation could also reduce potential spawning habitat for species such as Pacific herring. Any impacts from port construction are expected to be of short duration, and localized to the area of disturbance.

4.24.2.6 Fish Migration

Mine Site

The mine site service and haul roads would cross seven fish-bearing streams, not including road crossings where channels enter stockpile embankments or the open pit (Figure 4.24-1). Two of the stream crossings involve anadromous streams, four cross non-resident salmonid streams, and one crosses a sculpin-bearing stream. The anadromous crossing in the NFK drainage is over a branch of Tributary 1.19 that would be permanently blocked to anadromous fish during project construction and operations. The second anadromous crossing is in the headwaters of the mainstem SFK, approximately 1,000 feet below the southern edge of the mine pit. Implementation of BMPs that would minimize the magnitude of impact on fish migration resulting from such disturbances would depend on the effectiveness of BMPs. The seven culverts would be designed and sized for fish passage according to ADF&G standards.

Transportation Corridor

Road and Pipeline

AMERICAN OVERSIGHT

Potential impacts on fish passage are not expected to occur at bridge crossings, except temporarily during bridge construction. Bridge, pipeline, and culvert construction activities in anadromous waters would occur from May 15 to June 15 to avoid impact to migrating salmon, according to ADF&G criteria. Infrequent barriers to fish passage could occur at culverts due to temporary blockage. The impact is expected to be localized, and temporary in nature. Routine inspection and maintenance of culverts, bridges, and roads would be regularly conducted and reported, in compliance with permit conditions, to ensure that culvert-related erosion, wash-out, or debris blockage do not result in acute or chronic impacts to fish passage or downstream habitat.

Ferry Terminal

As stated above, docking facilities for the ice-breaking ferry at the north and south ferry terminals are expected to include rock and gravel ramps extending approximately 40 feet into Iliamna Lake. There are no anticipated impacts to fish migration associated with these structures due to existing migratory habitat available in Iliamna Lake.

Amakdedori Port

There are no anticipated impacts to fish migration associated with the port structure due to existing migratory habitat available along the shores of Cook Inlet.

Natural Gas Pipeline

The pipeline has the potential to hinder migrations of marine invertebrates (e.g., crabs) but impacts are expected to be minimal and occur at the individual level.

4.24.2.7 Water Temperature

Construction and operations of the mine site may lead to changes in several water quality parameters in area streams that have the potential to impact fish. The ADEC (2009) standards for water temperature criteria associated with growth and propagation of fish, shellfish, and other aquatic life and wildlife in freshwater state that at no time should maximum water temperatures exceed 20 degrees Celsius (°C), with the following life-stage specific maxima: 15°C for migration and rearing, and 13°C for spawning and egg incubation. Ambient water temperatures monitored from 2004 to 2009 frequently exceeded the ADEC 15°C criteria in many stream reaches (ADEC 2009). In each year of study, the daily maximum water temperature in the NFK immediately upstream of the mine site exceeded the 20°C criteria on about 28 percent of all instantaneous readings during the summer months. The lower temperature thresholds for migration and rearing (15°C) were exceeded on 78 percent of summer readings; and the spawning and egg incubation criteria (13°C) were exceeded on 89 percent of summer readings.

Summer baseline water temperatures also exceeded ADEC thresholds in several reaches of the SFK, and to a lesser degree in the UTC. Maximum daily water temperatures exceeded the general 20°C criteria in 17 percent of measurements at multiple stations in the SFK, but daily maxima remained below the threshold in the UTC. Exceedance percentages for the 15°C migration and rearing thresholds for the SFK and UTC were 76 percent and 44 percent, respectively; whereas comparable exceedance values for the 13°C spawning and egg incubation criteria were 93 percent of summer readings in the SFK, and 59 percent of readings in the UTC.

Although the water temperature regimes in the project area frequently exceeded the ADEC criteria during the 2004-2009 sampling period, adult and juvenile salmon and resident trout

AMERICAN OVERSIGHT

remained abundant. However, any reduction in streamflows during the summer base-flow period may have a direct impact on salmonids through increased water temperatures; and potentially, through decreased temperatures during the winter base-flow period. Direct impacts could affect egg/fry incubation and availability of prey species during low-flow events. Although the water temperature regimes in the project area frequently exceeded the ADEC criteria during the 2004-2009 sampling period, adult and juvenile salmon and resident trout remained abundant. Impacts associated with changes in water temperature are discussed below by drainage area.

North Fork Koktuli River

Average changes in water temperature are expected to increase approximately 1.2 degrees Celsius (°C) during summer, and 2.8°C during winter within 0.5 mile downstream of the water discharge location. As described in Chapter 3, Affected Environment, Chinook and other salmon species have been observed spawning in this reach of the NFK. Modeled discharges indicate that water temperatures would not exceed ADEC's temperature threshold for spawning fish of 13°C for the summer months during mine operations and closure. Baseline winter water temperatures in this reach are just above 0°C. A 2.8°C increase in surface water temperature would be well below the ADEC threshold, and would not be expected to adversely impact incubating eggs, juveniles, or other overwintering resident fish.

South Fork Koktuli River

Average changes in water temperature are expected to decrease approximately 0.15°C during summer, with no change in winter water temperatures 1 mile downstream of the water discharge location. Sockeye and coho salmon have been documented using this reach of the SFK and Frying Pan Lake as rearing habitat. A decrease of 0.15°C in water temperature would not be expected to adversely impact rearing fish.

Upper Talarik Creek

Average changes in water temperature are expected to increase approximately 0.12°C during summer and 0.54°C in winter 3 miles downstream of the water discharge location. As described in Chapter 3, Affected Environment, Chinook, sockeye, and coho salmon use this reach of the UTC for spawning and rearing. Modeled discharges indicate that water temperatures would not exceed ADEC's temperature threshold for spawning fish of 13°C for the summer months during mine operations and closure (2018 PLP-RFI 047). Baseline winter water temperatures in this reach are just above 0°C. A 0.54°C increase in surface water temperature would be well below the ADEC threshold, and would not be expected to adversely impact incubating eggs, juveniles, or other overwintering resident fish.

Water Chemistry

Baseline natural water quality conditions have been documented throughout the project area, and can be referenced in the EBD Section 4.18, Water and Sediment Quality. Water would be treated prior to discharge into NFK, SKF, and UTC in compliance with applicable water quality standards established to protect aquatic life, as specified in the APDES permit described in Section 4.18, Water and Sediment Quality. Treated water would be discharged to buried infiltration chambers designed to provide energy dissipation, erosion control, and freeze protection. Compliance monitoring during construction, operations, and closure would assure water quality standards are maintained to protect fisheries resources. Any water chemistry impacts to fish and other aquatic life would not be measurable.

AMERICAN OVERSIGHT

Metals concentrations in surface water would be expected to increase 0.11 – 0.66% due to fugitive dust deposition. Surface water quality at the open pit and main Water Management Ponds (WMPs) would exceed water quality standards. As described in Appendix K4.18, both WTP#1 and WTP#2 would utilize treatment plant processes commonly used in the mining and other industries around the world. Key treatment steps for both WTPs would include dissolved metals oxidization, co-precipitation, clarification, ultrafiltration, and reverse osmosis (RO) (Figures 2-10 and 2-11). The open pit WTP would also include biological selenium removal, and the main WTP would also include nanofiltration through high-pressure membranes (expected to remove selenium and other salts) and multi-stage calcium sulfate precipitation with a lime softening process. Clarifier solids filter backwash from both WTPs would be thickened/evaporated and transferred to the pyritic TSF (HDR 2018a; PLP 2018d, 2018-RFI 021d).

The ADEC regulates wastewater discharges from hard-rock mining facilities through various permits, including:

- Alaska Pollutant Discharge Elimination System (APDES) Individual Permit for point source discharge into WOTUS
- Integrated Waste Management Permit for solid waste disposal and wastewater discharge not into WOTUS
- APDES Multi-Sector General Permit for storm water discharge
- Domestic Wastewater Discharge Permit.

State of Alaska regulations require that the condition of these permits ensure compliance with the state water quality standards that are based on the use classification for the water body receiving discharge, and the state's anti-degradation policy. Some water bodies may also have site-specific water quality criterion. For constituents that exceed criteria in background surface water and groundwater (Section 3.18.1, Appendix K3.18), there are currently no plans to incorporate site-specific background levels of constituents into discharge limits (ADEC 2018-RFI 064a).

4.24.2.8 Essential Fish Habitat

[NOTE: EFH ASSESSMENT CURRENTLY UNDER WAY. EFH WILL BE INCLUDED IN THE DRAFT EIS].

Summer Only Ferry Operations Variant

The summer only ferry options variant is described in Chapter 2, Alternatives. Potential impacts associated with this variant would be similar to those described under Alternative 1.

Kokhanok East Ferry Terminal Variant

The route into Kokhanok East avoids the requirement for a bridge across the Gibraltar River, a major river crossing under Alternative 1. Potential impacts to fish and aquatic habitat in the Gibraltar River would be reduced under this variant. Potential impacts to fish and aquatic habitat for the eight streams crossed by this route would be similar to impacts described under Alternative 1, transportation corridor. Potential impacts associated with the ferry terminal location on Illiamna Lake would be similar to those described under Alternative 1.

Pile Supported Dock Variant

The pile supported dock variant is described in Chapter 2, Alternatives. Under this variant, less benthic habitat would be potentially impacted in Cook Inlet due to the smaller port footprint.

AMERICAN OVERSIGHT

4.24.3 Action Alternative 2 – North Road and Ferry

4.24.3.1 Mine Site

Impacts would be similar to those described in Alternative 1.

4.24.3.2 Transportation Corridor

The Alternative 2 road alignment crosses the same number of anadromous fish streams, but 28 fewer resident fish streams than Alternative 1; consequently, there would be less permanent impacts to fish habitat. Short-duration, localized impacts to habitat and water quality during construction would be similar to Alternative 1. Ferry operations from Eagle Bay to Pile Bay would have similar impacts to fish and fish habitat as ferry operations described under Alternative 1.

Summer-Only Ferry Variant

Ferry operations from Eagle Bay to Pile Bay would have similar impacts to fish and fish habitat as ferry operations described under Alternative 1.

4.24.3.3 Diamond Point Port

Construction of dock facilities at Diamond Point would have a greater spatial and temporal direct impact on marine fisheries and benthic invertebrates than Alternative 1, because the footprint of these structures would cover roughly 90 more acres of benthic habitat than the Amakdedori port (PLP 2018-RFI 072). Dredging of the approximately 650,000-cubic-yard marine substrate at the Diamond Point location would be required to achieve a 20-foot depth of water required for operations. Benthic organisms within the footprint of the dock facilities and dredge channel would experience direct impacts and mortality for the life of the project. Short-term turbidity and sedimentation could impact fish migration and spawning substrates during construction. Noise impacts from sheet-pile installation during construction could cause injury or mortality to fish and benthic organisms.

Maintenance dredging over 2 decades of the mine life would impact an area of approximately 60 acres. These activities would impact benthic organisms, and temporarily increase turbidity and suspended sediment in the water column, which would be redeposited on marine substrate, effects that would not occur under Alternative 1. The extent of these effects could range from localized, to beyond the mouth of Iliamna Bay, depending on tides and wave conditions.

Pile-Supported Dock Variant

Construction of a pile-supported dock at Diamond Point would result in less direct impact to benthic habitat and organisms than a fill causeway, because piles would be driven through vibratory and hammer methods, and require no fill (PLP 2018-RFI 072). Noise impacts from pile installation during construction could cause injury or mortality to fish and benthic organisms. Short-duration and limited suspended sediment impacts would be expected to occur during construction of the pile structure.

4.24.3.4 Natural Gas Pipeline Corridor

Impacts to fish habitat and water quality would be the same as described under Alternative 1 for the portion of the pipeline beginning on the Kenai Peninsula and crossing Cook Inlet to Kamishak Bay. Impacts would be the same as described under Alternative 3–transportation Corridor for the portion from Diamond Point to the mine site.

AMERICAN OVERSIGHT

The pipeline corridor through Ursus Cove to Diamond Point would cross two additional anadromous fish stream crossings with associated impacts to fish and fish habitat similar to other sections of the natural gas pipeline corridor. Additionally, the pipeline trench has the potential to impact benthic and intertidal habitats in Ursus Cove during construction.

4.24.4 Action Alternative 3 – North Road Only

Under Alternative 3, impacts to the pipeline corridor would be the same as those described under Alternative 2. The following section describes impacts for the mine, transportation corridor, and port that would be different under Alternative 3.

4.24.4.1 Mine Site

Under Alternative 3, impacts to the mine site would be the same as described under Alternative 1.

Concentrate Pipeline Variant. The concentrate pipeline from the mine to the port under this alternative would require an electric pump station at the mine site, which would require a small increase in fill placement over stream substrate in an NFK east tributary (PLP 2018-RFI 066). This alternative would also reduce the amount water treatment plant water released at discharge locations at the mine site by approximately 1 to 2 percent (PLP 2018-RFI 066), which could result in slight reductions of temperature effects, aquatic habitat availability, and turbidity or erosional effects at treated water discharge locations.

4.24.4.2 Transportation Corridor

While Alternative 3 would increase the project footprint, fisheries impacts associated with the ferry crossing of Iliamna Lake would be eliminated. The North Road Only route would result in an increase of 15 anadromous stream crossings, and a reduction of four resident stream crossings relative to Alternative 1, with a corresponding increase in fish habitat and riparian wetlands impacts (described under Alternative 1).

4.24.4.3 Diamond Point Port

Under Alternative 3, impacts to the port site would be the same as described under Alternative 2.

4.24.4.4 Natural Gas Pipeline

Impacts to fish habitat and water quality would be the same as described under Alternative 1 for the portion of the pipeline beginning on the Kenai Peninsula and crossing Cook Inlet to Kamishak Bay. Impacts would be the same as described under Alternative 3 – transportation corridor for the natural gas pipeline portion from Diamond Point to the mine site.

Concentrate Pipeline Variant. Inclusion of a concentrate pipeline under this alternative would result in a slightly greater impact to fish and fish habitat than Alternative 3 without the concentrate pipeline. The concentrate pipeline would be buried at the same time as road construction, and the road corridor widened by less than 10 percent for inclusion of the pipeline, which could result in a marginal increase in water quality impacts during construction and fill placement over riparian wetlands. Because only the molybdenum concentrate (2.5 percent of the total concentrate production) would be trucked from the mine site to the port, a large reduction in road traffic would be anticipated, thereby reducing some potential impacts from dust, erosion, and runoff.

AMERICAN OVERSIGHT

4.24.5 Summary of Key Issues

Table 4.24-5: Summary of Key Issues for Fish and Aquatics

Impact Causing Project Component	Alternative 1 and Variants	Alternative 2 and Variants	Alternative 3 and Variants
Mine Site			
Mine Site Construction and Operations	**Aquatic Habitat:** **NFK**: Permanent loss of 6.2 miles of anadromous fish stream habitat and 12.7 miles of resident fish stream habitat. **SFK**: Permanent loss of 1.1 miles of resident fish stream habitat Permanent effects to instream habitat downstream of mine site during operations and closure due to reduced stream flows. Permanent loss of 276 acres of riparian habitat functions within mine site footprint. **NFK**: Average temperature changes due to water discharge would be expected to be approximately 1.2 C (summer) and 2.8 C (winter) ½ mile downstream of discharge point. **SFK**: Average temperature changes due to water discharge would be expected to be approximately -0.15 C (summer) 1 mile downstream of discharge point. **UTC:** Average temperature changes due to water discharge would be expected to be approximately 0.12 C (summer) and 0.54 C (winter) 3 miles downstream of discharge point. Metals concentrations in surface water would be	Impacts similar to those of Alternative 1. 45 to 60% increase in fill required, increasing impacts associated with larger fill volume/footprints, including potential for increased erosion and surface water turbidity impacting aquatic habitat and organisms.	Impacts similar to those of Alternative 1. **Concentrate Pipeline Variant** – mine site footprint increased by 0.7 acre with potential impact on aquatic habitat. Concentrate pipeline variant – estimated decreased discharge volume by 1-2% at discharge locations. Potential reduction in effects on aquatic habitat and organisms.

AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

4.24.6 Cumulative Effects

Past, present, and reasonably foreseeable future actions (RFFAs) in the cumulative impact study area have the potential to contribute cumulatively to aquatic resource impacts. Section 4.1, Impact Assessment Framework, details the past, present, and RFFAs considered for evaluation. Several of the RFFAs detailed in Section 4.1 are considered to have no potential for cumulatively impacting aquatic resources in the study area. These would include non-industrialized point source activities that are unlikely to result in any appreciable impact beyond a temporary basis (e.g., tourism, recreation, and hunting). Other RFFAs removed from further consideration include those sufficiently distant from the study area to eliminate infrastructure co-use by other parties (e.g., Donlin, Copper Joe).

RFFAs that could contribute cumulatively to aquatic resource impacts, and are therefore considered in this analysis, are those activities that would occur in the Nushagak River or Kvichak River drainages, or in other waterbodies intersected by the transportation corridor in the Cook Inlet drainage. RFFAs, combined with natural events, have the potential to contribute to adverse effects on aquatic resources by altering flow regimes and drainage patterns; direct habitat loss; diminishing water quality from riverbank erosion, turbidity, and sedimentation; changes in water chemistry; and degrading the extent of productive habitat conditions.

The following RFFAs identified in Section 4.1, Impact Assessment Framework, were carried forward in this analysis based on their potential to impact aquatic resources in the analysis area:

- Pebble project buildout – develop 55 percent of the resource over a 78-year period
- Pebble South/PEB*
- Big Chunk South*
- Big Chunk North*
- Fog Lake*
- Groundhog*
- Shotgun
- Alaska Stand Alone Pipeline
- Alaska LNG Project
- Drift River Oil Facility Demobilization
- Cook Inlet Oil and Gas Sales
- Lake and Pen Borough Transportation and Renewable Energy Initiatives
- Nushagak Electric CO-OP Village Intertie Project
- Diamond Point Rock Quarry

**Indicates exploration activities only.*

The most important potential future actions included in this analysis are those that are likely to contribute to aquatic resource conditions, and are regionally common to the project. Because development at remote locations can be financially prohibitive, RFFAs in proximity to the project that could potentially minimize costs through co-use of project infrastructure are also considered important in this analysis.

The Pebble Project buildout and commercialization of the Shotgun prospect are the only mineral deposit RFFAs considered for exploration and development. All other mineral deposit RFFAs are considered for exploration only. The Pebble Project buildout is the most notable RFFA, and would result in additional development not included under Alternative 1:

- Increased pit footprint
- Increased TSF and waste rock storage capacity
- Additional processing infrastructure

AMERICAN OVERSIGHT

- Construction of a new port site with diesel fuel and concentrate pipeline(s) extending to the mine site.

The additional acreage of disturbance at the mine site would be greater than Alternatives 1 and 2 combined, based on infrastructure build-out at the mine site. The build-out would correspond to an increase in magnitude and local extent of disturbance impacts and potential for aquatic resource impacts would increase, and would be greater than Alternatives 1 and 2 combined. Additional design features to capture and treat impacted water and waste streams would be necessary to manage mine site impacts. Also, the addition of a diesel fuel line would increase the likelihood of hydrocarbon spills along and at the terminals of the pipeline, potentially contributing to the cumulative impact of spills on aquatic resources.

Development of the Shotgun prospect could reduce fish habitat. The Shotgun prospect would not physically overlap with the Pebble project area, and the cumulative impact in the common areas of the lower Nushagak watershed would be expected to be minimal if BMPs are applied, and engineering design features achieve the anticipated water quality controls.

Some limited RFFAs associated with mineral exploration activities (e.g., Pebble South, Big Chunk North, Big Chunk South, Fog Lake, and Groundhog) could have some limited aquatic resource impacts, primarily water quality, in watersheds common to the project (e.g., drill pads, camps); however, they would be seasonally sporadic, temporary, and localized, based on remoteness. Although exploration activities are considered to have minimal cumulative impacts to soil resources, there could be potential for greater surface water and substrate impacts from future development through transportation infrastructure co-use with the project.

The footprint of the Diamond Point rock quarry coincides with the Diamond Point port footprint under Alternatives 2 and 3. Cumulative impacts would be limited to a potential increase in localized aquatic resource impacts from commonly shared project footprints with the quarry site under Alternatives 2 and 3.

Cook Inlet RFFAs, including Alaska Stand Alone Project, Alaska LNG, and Cook Inlet lease sales, would increase shipping traffic, and result in temporary disturbance to aquatic resources. Loss of fish habitat associated with new ports and drill rigs would be minimal in the context of Cook Inlet. Construction and operations of these projects would increase the likelihood of a spill; however, this is considered unlikely. Temporary effects from sedimentation during construction are likely, but expected to be minimal.

Overall, the magnitude of cumulative impacts to aquatic resources from RFFAs in general would be expected to be minimal, with the exception of RFFA activities in the immediate mine site (e.g., Pebble Project buildout). The cumulative effects in the mine site footprint, expanded to include buildout development, would increase; but it is expected that controls would be in place to manage those impacts to mitigate adverse effects on aquatic resources.

AMERICAN OVERSIGHT

Note to Reviewers

This section is an early stage preliminary draft, and has been prepared prior to the completion of scoping for the purpose of setting analytical direction and facilitating the project schedule for completing the EIS.

As an initial draft, it is incomplete in many ways, and contains numerous placeholders to be addressed as more information becomes available. The Scoping Comment Period has not closed, Alternatives to the Proposed Action have not been formally identified, information needed to complete the analysis is not yet fully available and in the process of being requested from the applicant, and the approach for topics such as spills/dam failures, traditional knowledge and cumulative effects has not been settled. In addition, supporting analysis and logic for determination of potential environmental consequences have not been fully developed. This draft is intended to frame the eventual section, and in doing so, allow USACE to see the intended topics and content for the eventual completed sections. Notes are included in many sections to identify where the analysis is incomplete.

4.7 CULTURAL RESOURCES

4.7.1 No Action Alternative

Under the No Action Alternative, the Pebble Project would not be developed at the Mine Site, and construction of Amakdedori Port, the Transportation and Natural Gas Pipeline corridors, and associated infrastructure would not be approved or permitted. The Programmatic Agreement (PA) for the project would not be executed, but the regular process for complying with Section 106 of the National Historic Preservation Act (NHPA) would apply to any other projects in the area that require federal authorization. No direct, indirect, or cumulative impacts on cultural resources would result from implementation of the No Action Alternative.

4.7.2 Action Alternative 1 – Applicant's Proposed Alternative

This section discusses the environmental consequences of construction, operation, and closure of the mine on cultural resources. Cultural resource types discussed in this section are defined broadly as described in the affected environment section (Section 3.7, Cultural Resources). Cultural resources may include prehistoric and historic period ~~archaeology~~ archaeological sites, Traditional Cultural Properties (TCPs), locations or sites associated with place names in the oral history or cosmology of Indian tribes, including Alaska Native Villages and Regional or Village Corporations, as those terms are defined in the Alaska Native Claims Settlement Act, and of other ethnic and cultural groups, traditional resource collecting areas (subsistence), sacred or religious sites, and historic-era sites such as cabins or shipwrecks.

None of the identified cultural resource sites have been evaluated to determine whether they are eligible for listing in the National Register of Historic Places (NRHP); therefore, for purposes of this analysis, all known sites have been assumed to be eligible for the NRHP. Potential effects on cultural resources were evaluated primarily by using geographical information system (GIS) spatial analysis to compare the locations of cultural resources to the proposed locations of project facilities. When cultural resources are identified within the project footprint, the type of activity proposed for the specific location of the cultural resources is assessed to consider the potential direct, indirect, and cumulative effects.

Not all project components have been inventoried for cultural resources during the baseline studies completed by Pebble Limited Partnership (PLP) between 2004 and 2012; to date, only the Mine Site has been subjected to cultural resource field investigations. The completed

Comment [ACHP-JTE1]: To reiterate the distinction between cultural resources and Historic Properties, best to reiterate Definition of Historic Properties here. Best to refer to the definition in the Section 106 regulations at 36 CFR §800.16(l) or to any clarification provided in Chapter 3.7.

Comment [ACHP-JTE2]: Does this mean Corps intends to treat them as eligible for the purposes of Section 106? If so, has SHPO concurred with this?

Comment [ACHP-JTE3]: APE may appropriately extend beyond the project footprint.

AMERICAN OVERSIGHT

investigations, however, do include background literature and file reviews for a broader regional area. Based on those documents, the baseline studies suggest that no additional cultural resource investigations have occurred in the project area beyond those completed by PLP. The absence of surveys for some project components necessarily limits the analysis of environmental consequences and the ability to forecast indirect and cumulative effects on cultural resources.

[Note: More information is pending additional cultural surveys, as requested in RFI 25.]

The lack of cultural resource survey data in certain areas is one reason for completing a PA for the project. PLP will develop a PA in consultation with the Alaska State Historic Preservation Office (SHPO), federally recognized tribal governments (Tribes), and other consulting parties. The PA will outline ongoing consultation efforts and establish the requirements and process for an additional field inventory, NRHP evaluations, and subsequent mitigation measures (including site avoidance if possible).

For sites with unresolved eligibility status, further work is required to determine significance levels and develop NRHP eligibility recommendations for review and concurrence by the SHPO. The process for completing ongoing evaluations would be captured in the PA.

In summary, new construction and associated ground-disturbing activities in all four project component areas (the Mine Site, Amakdedori Port, the Transportation Corridor, and the Natural Gas Pipeline Corridor) could result in direct and indirect effects under the National Environmental Policy Act (NEPA) and adverse effects to historic properties under Section 106 (to use NHPA terms). Direct effects on cultural resources ~~are considered to be~~can include the destruction or burial of, or other damage to or alteration of, cultural resources resulting from ground-disturbing actions or construction and operation of mine facilities. Development of the mine would result in the physical destruction of or damage to cultural resources and would irreversibly alter the characteristics that ~~qualify~~ might qualify these ~~sites~~ cultural resources for inclusion in the NRHP. Indirect effects are those that occur later in time or are further removed in distance from the action, such as a change in setting or context or the increased access to archaeological sites that would result from constructing the mine access road.

The project would also introduce new visual, atmospheric, and audible elements that might diminish the significance of cultural resources. Sites would be subject to increased public use (including use by mine personnel) and potential damage. Some effects may be both direct and indirect. For example, the introduction of visual, atmospheric, or audible elements could immediately diminish the qualities of a cultural resource site that contribute to its significance, and could diminish the use or function of the site in the future.

The EIS analysis area for cultural resources is larger than the area of expected ground disturbance, to account for both potential direct and indirect effects of the project. The EIS analysis area and the Area of Potential Effect (APE) would be defined to account for both direct and indirect effects. Once defined, the APE will distinguish between areas of direct impacts and surrounding areas that likely would be subject only to indirect effects. Given the size of the area where indirect effects will be considered, more cultural resource sites in that area that are not currently discussed in Section 3.7, Cultural Resources, may be added. No formal consultation has occurred between PLP and the SHPO or other interested parties regarding the definition and delineation of the project's APE, but consultation would take place before PLP could proceed with the project.

Both NEPA and the NHPA offer methods for identifying measures to avoid or minimize impacts on cultural resources. For example, PLP may choose to redesign the project to avoid impacts on sites in the project footprint. If impacts are not avoidable, mitigation would be required and

Comment [ACHP-JTE4]: This chapter should also characterize identification effort that still needs to be carried out and status/timing of such efforts, or reference the characterization that should be added to Chapter 3.

Comment [ACHP-JTE5]: What is the anticipated timing for development of a PA. When will it start? What is the status of the Section 106 review?

Comment [ACHP-JTE6]: Even if a PA will be developed to do this, a general outline of what the federal agencies think is needed should be provided in this chapter, or in chapter 3.

Comment [ACHP-JTE7]: Why assume all known sites are eligible, as referenced on p. 4.7.1 if evaluations will be ongoing? What is the purpose of stating that all known sites have been assumed to be eligible?

Formatted: Highlight

Comment [ACHP-JTE8]: According to the timing requirements in the Section 106 regulations, a federal agency must complete Section 106 prior to approving an undertaking and allowing it to begin. Executing a PA can conclude the Section 106 review as long as it contains protocols to complete the steps in the Section 106 review that have not been finalized. A PA can't really be executed before the APE is delineated. The APE can change as the review proceeds.

AMERICAN OVERSIGHT

the PA would define specific stipulations that would govern appropriate mitigation outcomes. Mitigation may include data recovery. In that case, the PA would define specific stipulations for crafting a research design and data recovery plans involving review and consultation with the SHPO, Tribes, and other signatory parties. Archaeological monitoring may also be involved, which would entail the development of an archaeological monitoring plan approved by the SHPO and other consulting parties. Consultation with Tribes under Section 106 of the NHPA has also not been initiated with the specific objective of investigating the presence or absence of TCPs, sacred sites, place names, and other areas of importance to Tribes.

Formatted: Highlight

[Note: The GIS data set for place names and subsistence use areas has not yet been integrated into this analysis. An RFI is being developed to get this data from PLP consultants.]

The data available and methods used for the cultural resource inventory in the Mine Site area are adequate to reasonably evaluate foreseeable significant and adverse effects on cultural resources. However, the data are insufficient at this time to derive reasonable evaluations of impacts on cultural resources at Amakdedori Port and in the Transportation and Natural Gas Pipeline corridors. Further work is needed to better frame a reasonable assessment of environmental consequences for these components.

Comment [ACHP-JTE9]: How do we know? Has the work been done to identify indirect effects from construction and operation of the mine site?.

[Note: More information is pending additional cultural surveys, as requested in RFI 25.]

4.7.2.1 Mine Site

Only one previously recorded archaeological resource exists within the footprint of the mine study area footprint. Site ILI-00251 would be within the main embankment of the seepage collection pond at the tailings storage facility. An additional site, ILI-00218, would be located within 0.5 mile of the mine facility footprint.

Site ILI-00251 would be directly affected by the project. Construction of the main embankment of the seepage collection pond at the tailings storage facility would result in the destruction of this site. Site ILI-000218 would be subject to indirect effects, including increased access to the area during mine construction. This site is an isolated lithic. Because ILI-00218 is a single prehistoric artifact, indirect effects would likely be minimal. Neither resource at the Mine Site is likely eligible for listing in the NRHP, although no determination has been completed.

Comment [ACHP-JTE10]: Are isolates considered archaeological sites in Alaska???? Is this site considered eligible for the NRHP???

4.7.2.2 Amakdedori Port

No cultural resource sites have been identified within the footprint of the Amakdedori Port project component, largely because of the lack of in-depth background research or field inventories at this location. Two sites are present in the vicinity: ILI-00044 and ILI-00291.

Comment [ACHP-JTE11]: It would be more accurate and clear for readers if this started out by clearly stating that no surveys have yet been carried out! It's important to avoid the confusion that can develop as a result of lack of clarity.

Formatted: Highlight

Site ILI-00044, Amakdedori Village, has not been fully surveyed and distinct site boundaries have not been established. This site would be subject to indirect project effects, including increased site access and visual effects caused by an alteration of the site's viewshed. If a site survey defined boundaries that extend within the project area, there may result in direct impacts on the site.

Site ILI-00291, a historic shipwreck, has not been identified in the field. If underwater archaeological investigations locate the site within the project area, it could result in direct impacts. However, depending on the location of this site, indirect effects may result from increased sedimentation or subsurface wave action caused by placement of pilings for the causeway and shipping channel.

[Note: More information is pending additional cultural surveys, as requested in RFI 25.]

AMERICAN OVERSIGHT

4.7.2.3 Transportation Corridor

No cultural resources have been identified in the Transportation Corridor, although two sites exist in the vicinity of Amakdedori Port as discussed above. Approximately 10 more sites would be present within 1 mile of the Transportation Corridor. These include a cluster of sites near Kokhanok and proximal to the south shore of Iliamna Lake, and isolated sites near the north end of the mine access road at its entrance to the Mine Site. These sites include a mix of historic-era buildings and prehistoric archaeology sites.

Formatted: Highlight

If sites are identified in the road construction corridor (including the ferry terminal locations) they may be damaged or destroyed by ground-disturbing activities and subject to significant direct effects.

The 10 cultural resource sites within roughly 1 mile of the Transportation Corridor would be subject to indirect effects resulting from road construction. These effects include increased access that would raise the potential for site damage by dispersed human activity and visual effects caused by alteration of the viewshed from construction of a new road and ferry terminals. Indirect effects on these sites would be minimal. There are historic structures in Kokhanok that would be susceptible to indirect visual effects. Further analysis is required to assess whether setting and feeling are character-defining qualities that make these historic-era buildings significant and whether introducing new visual elements in the vicinity would have an adverse effect (to use NHPA terms) on these qualities. The potential for indirect effects is greater for the historic built environment than for surficial or buried archaeological sites.

Comment [ACHP-JTE12]: Visual effects are not usually considered adverse effects for archaeological sites, unless the site is eligible under criteria other than d and the context and setting are characteristics of the property that contribute to its significance and eligibility for inclusion on the NRHP.

4.7.2.4 Natural Gas Pipeline Corridor

For the purpose of the impact analysis, the Natural Gas Pipeline Corridor consists of three distinct segments: the land-based site of the compressor station on the east side of Cook Inlet; the Cook Inlet crossing, where the proposed pipeline would be submerged; and the pipeline from Amakdedori Port to the Mine Site.

No cultural resource sites have been identified in the corridor of the land-based segment on the east side of Cook Inlet; however, analysis is still underway to determine whether this area has been fully surveyed. If an additional survey or research identifies any cultural resource sites at the location of the compressor station, such sites may be subject to direct effects, and the neighboring sites would be subject to indirect effects. However, it is anticipated that indirect effects would be temporary and minimal because construction would not result in appreciable changes to viewsheds.

No underwater archaeological investigations have been conducted for the alignment of the submerged pipeline beneath Cook Inlet. Project construction would directly affect any shipwrecks or other cultural resource sites within the alignment. Sites situated adjacent to the pipeline route beneath Cook Inlet may be subject to indirect effects from subsurface wave action and sediment disturbance, but these types of indirect effects would be anticipated to be minimal and unlikely.

The segment of the Natural Gas Pipeline Corridor from Amakdedori Port to the Mine Site would be co-located with the Transportation Corridor; thus, the preceding effects discussion also applies here. However, development of this project component is less likely than development of the Transportation Corridor to result in indirect effects, because the pipeline would be buried. Indirect effects along the Transportation Corridor would be attributable to road construction, not to the pipeline component.

USACE-Regional Regulatory Division
Alaska District, U.S. Army Corps of Engineers
P.O. Box 6898
JBER, AK 99506-0898

Ref: ACHP comments on pre-draft sub-Chapter 4.1 and sub-Chapter 4.7, Pebbles Mine Project EIS
DA permit application POA-2017-271
Lake and Peninsula Borough, Kenai Peninsula Borough, Alaska

Dear Ms. Newman:

The Advisory Council on Historic Preservation (ACHP) is providing initial comments on the pre-draft versions of sub-Chapter 4.1: *Approach To Environmental Analysis* and sub-Chapter 4.7: *Cultural Resources* of Chapter 4: *Environmental Consequences* for the Environmental Impact Statement (EIS) being developed by the Corps of Engineers, Alaska District (Corps) for the Pebbles Mine Project in Alaska. The ACHP has made comments and edits in red-line strike-out in the text (enclosed). We also provide a summary of our comments in this letter. Overall, it is our opinion that the pre-drafts of sub-Chapters 4.1 and 4.7 are preliminary and need significant revisions and additions.

As characterized in the draft itself, sub-Chapter 4.1 is an "early stage preliminary draft." Based on our review, ACHP has no specific comments at this time. As noted in our previous comments on sub-Chapter 3.7, the current version of sub-Chapter 4.7 appears to conflate cultural resources, as defined in the National Environmental Policy Act (NEPA), and historic properties, as defined in Section 106 of the National Historic Preservation Act (NHPA) (54 U.S.C. § 300101 et seq.) and its implementing regulations, "Protection of Historic Properties" (36 C.F.R. Part 800). The ACHP reiterates the importance of making the distinction between cultural resources and historic properties in this chapter. This sub-Chapter should either include reference to the definition in the Section 106 regulations at 36 C.F.R. §800.16(l) or to any clarification that will be included in sub-Chapter 3.7. The definition of cultural resources should be clarified to include: prehistoric and historic period archaeological sites, Traditional Cultural Properties (TCPs) including landscapes, locations or sites associated with place names in the oral history or cosmology of Indian tribes and of other ethnic and cultural groups, traditional resource collecting areas (subsistence), sacred or religious sites, and historic-era sites such as cabins or shipwrecks.

In this sub-Chapter, the Corps should characterize the identification effort for historic properties that may be affected in the Area of Potential Effects (APE) that still needs to be implemented and the status and timing of such efforts. Alternatively, the Corps may reference the characterization that we recommended be added to sub-Chapter 3. It is important to remember that the APE may appropriately extend beyond the project footprint. While a Programmatic Agreement (PA) may provide for a phased identification effort, a general outline of what the federal agencies think is appropriate to identify and evaluate historic

AMERICAN OVERSIGHT

properties should be included in this sub-chapter, or in sub-Chapter 3, and referenced here. That general outline should include the current status of the Section 106 review and the anticipated timing for development of a PA. It should also clarify when the federal agencies will begin consultation with tribes under Section 106 for the identification of properties of religious and cultural significance to them.

At the outset of each section covering the four project component areas of the undertaking, the Corps should clearly indicate whether sufficient background research and any surveys to identify historic properties have been carried out. We also note references to potential visual effects to archaeological sites. The Corps should keep in mind that visual effects are not usually considered adverse effects for archaeological sites, unless the site is eligible under criteria other than Criterion d and the context and setting are characteristics of the property that contribute to its significance and eligibility for inclusion on the National Register of Historic Places. Once properties are evaluated for eligibility, it is important for the Corps to clearly state the significance and elements of integrity for any identified historic properties. That will allow the Corps and the consulting parties to better apply the criteria of adverse effect in accordance with 36 C.F.R. § 800.5(a), and consider appropriate avoidance, minimization and mitigation strategies.

Finally, ACHP recommends again that the federal agencies and their contractors developing the drafts of the EIS should refer to *NEPA and NHPA: A Handbook for Integrating NEPA and Section 106* issued by the ACHP and the Council on Environmental Quality (CEQ) in March 2013 for guidance regarding how to better integrate the requirements of Section 106 and the NEPA review process. It is available at: https://www.achp.gov/digital-library-section-106-landing/nepa-and-nhpa-handbook-integrating-nepa-and-section-106.

The ACHP provides these comments to assist the Corps, other federal agencies, the Alaska SHPO, Indian tribes, and other consulting parties in the development of the EIS and compliance with Section 106 for the Pebbles Mine project. Should you have any questions or wish to discuss the comments we have provided, please contact John T. Eddins, PhD at 202-517-0211, or by e-mail at jeddins@achp.gov.

Sincerely,

Jaime Loichinger

Shane,
Please see attached for a letter summarizing NPS comments on the sections assigned for review. Please contact me if you have any questions or need additional information regarding our comments. Thank you!

Sent via email

Dear Mr. McCoy,

The National Park Service appreciates the opportunity to provide review comments on the Chapter 4 Pre-Draft Sections of the Pebble Project Environmental Impact Statement. As requested, we reviewed Section 4.5 Recreation, Section 4.9 Food and Fiber Production – Subsistence, and Section 4.11 Aesthetics and Visual Resources. The early review of these sections was very useful; we understand that the chapters are under development. Our comments largely focus on clarifications, corrections, and suggestions for incorporating additional references. We have provided a substantial list of additional references related to fisheries and aquatic resources, as our comments on the recreation and subsistence sections are dependent on analysis in the fisheries section.

Regarding Section 4.5 Recreation, data on recreation use associated with commercial use authorizations (e.g. guided fishing and bear viewing) has not been incorporated. In particular, in Section 4.5.2.2 consider potential impacts to bear viewing and other commercial recreation uses in the southern part of the Lake Clark National Park and Preserve coast and the visual impact on those activities from construction and operation of the Amakdedori port. Recreation activities from Homer across to Katmai National Park and Preserve could be affected.

The description of the affected environment in Section 3.5 identifies numerous management areas (federal, state, and local lands) lands and many types of recreation activities. The analysis in Section 4.5 does not clearly summarize impacts by management area and recreation type.

Regarding Section 4.11 Aesthetics and Visual Resources, views from the air are mentioned for the port and transportation components of the proposed action; aerial views of the mine site should also be included in the analysis (Section 4.11.3.1). The analysis should also consider visual impacts of Amakdedori Port on the Kamishak Bay coastline of Katmai National Park and Preserve (Section 4.11.3.2).

As was the case in Chapter 3, the bulk of our comments are related to Section 4.9 Food and Fiber Production. The title to this section is misleading. As stated in our previous

AMERICAN OVERSIGHT

comments, the title of the section should be changed to Subsistence. Subsistence is more than food and fiber production; it includes a strong cultural component. The NPS recognizes that subsistence is a way of life:

> The term, "subsistence," encompasses more than just food on the table. It involves the fundamentals of identity and culture, including the customs, traditions, values and beliefs that make Alaska Native peoples and rural communities unique. The subsistence way of life is rooted in a strong sense of place that extends back through the generations. It involves the social and economic ties that bind families and communities together. And, most importantly, it endures over time through the passing of traditional knowledge from one generation to the next (NPS 2017).

Similarly, the concluding sentence of Section 4.9.1 should be changed to: "There would be no additional direct or indirect effects on subsistence production."

In Section 4.9.1, is it possible that subsistence resource availability could increase under this alternative? If local employment would not continue, would the extensive exploration activities (including drilling, blasting, helicopter transport, etc.) also cease? Under this alternative, noise levels would decline and wildlife used for subsistence may frequent the exploration areas.

In Section 4.9.2.1 Resource Availability, please analyze potential increases in fishing and hunting pressure in areas less affected by mining activities. Subsistence users displaced from the proposed project areas would have to compete with traditional users of other areas. This pattern may also affect resource abundance. An overall decrease in available subsistence resource habitat could affect overall resource capacity and availability of resources.

The analysis should also look at the impact of construction of the underwater gas line and port to salmon and clam species in Cook Inlet and the subsistence setnetting and clamming that occurs on the western side of the inlet. The analysis mentions the traditional use of many species around the mine site and transportation corridor, but it should also look at the migratory patterns for the key subsistence species to understand how both the mine and transportation corridor could affect breeding and migration.

Other very important subsistence resources in the area include humpback whitefish, berries (high and low bush cranberries, cloudberries), swans, mallards, and other waterfowl species. In addition to a broader discussion of fugitive dust from construction, roadways, and mining activities, the analysis should also focus on windblown contaminants from tailings facilities.

Without review of Section 4.23, Wildlife Values, the conclusion that during the closure phase the pit lake would pose low risk to birds and other wildlife is an unsupported broad generalization. What will be the likely chemical composition of the pit water? What evidence indicates there will not be leakage to local water sources, including salmon spawning and rearing systems?

In Section 4.9.2.2 Changes in Access to Resources, more detailed analysis is needed to weigh the negative effects of restricted access for subsistence users and the positive

AMERICAN OVERSIGHT

effects of access roads and travel by ferry for the subsistence users. The analysis must also consider the increased pressure on subsistence resources by increasing access in certain areas.

Section 4.9.2.3 Changes in Competition for Resources does not consider subsistence users displaced from the proposed project area travelling outside their traditional use areas to harvest resources. Increased competition for resources with other subsistence users may occur due to displacement and reduction in overall area available for subsistence.

Section 4.9.2.4 Changes in Sociocultural Conditions does not acknowledge potential sociocultural changes due to the year-round employment effects and the close connection between commercial fishing and subsistence fishing. Commercial fishing is a major employer in the affected communities. For many families, subsistence fishing is closely coordinated with commercial fishing as the same boats and gear are often used for both commercial and subsistence fishing. If local residents move from seasonal commercial fishing to year-round project employment, they may lose access to boats and gear for subsistence fishing.

In Section 4.9.2.5 Cumulative Effects, what would be the cumulative impact on subsistence as a way of life embedded in culture, or what is the effect of the loss of traditional knowledge, traditions, or sharing? The proposed action would occur for more than a generation.

The analysis of long-term effects can benefit from past studies of the potential impacts of oil development in Alaska. In the 1980s, the Bureau of Energy Management (then Minerals Management Service) conducted several studies concerning the potential impacts of offshore oil development in coastal Alaska, including communities on the Alaska Peninsula, Cook Inlet, and Bristol Bay, which are in the study area for the proposed Pebble Mine project. Some of the studies of the impacts on subsistence uses following the 1989 Exxon Valdez Oil Spill may also be helpful in analysis of long-term impacts. This document summarizes a number of impact assessment projects:

Subject: EPA Comments on Preliminary Draft Chapter 3 Sections
Attachments: EPA Comments Pebble Pre-draft Ch 3 070518.docx

Hello Shane,
Please find EPA's comments on Preliminary Draft Chapter 3 Sections 3.1 Introduction, 3.5 Recreation, 3.11 Aesthetics and Visual Resources, 3.14 Soils, 3.17 Hydrogeology, 3.18 Water Quality and Geochemistry, and 3.22 Wetlands / Special Aquatic Sites and Waterbodies attached. Please let me know if you have any questions on these comments.
We will provide comments on Sections 3.16 Surface Water Resources and 3.26 Vegetation, which we received after the other sections, as soon as we are able, but no later than July 27.
Thank you,
Molly

EPA Cooperating Agency Review Comments
Pebble Project EIS Preliminary Draft Chapter 3
Sections 3.1, 3.5, 3.11, 3.14, 3.16, 3.17, 3.18, 3.22, 3.26
7/5/18

Thank you for the opportunity to review early versions of Sections 3.1 Introduction, 3.5 Recreation, 3.11 Aesthetics and Visual Resources, 3.14 Soils, 3.16 Surface Water Resources, 3.17 Hydrogeology, 3.18 Water Quality and Geochemistry, 3.22 Wetlands / Special Aquatic Sites and Waterbodies, and 3.26 Vegetation of the Preliminary Draft Chapter 3, in accordance with our defined role as a Cooperating Agency for the Pebble Project EIS. Our comments are provided for each section below. Because we did not receive the text for Sections 3.16 and 3.26 until June 27, we have not completed our review of these sections. We will send you comments on the two remaining sections no later than July 27.

If you have any questions regarding the EPA's comments below, please contact Molly Vaughan at 907-271-1215 or vaughan.molly@epa.gov, and she can provide clarity or put you in touch with the appropriate technical expert for that comment as needed.

We look forward to working with you on updates to Chapter 3.

3.1 Introduction

Page 3.1-5, Section 3.1.2.3: We recommend revising the last paragraph so that it is clear that the project would result in copper concentrates, molybdenum concentrate, and gravity-recovered gold. As written, it implies that primary copper and gold would be produced.

3.5 Recreation

Page 3.5-1, Section 3.5.1 Recreation Management: We recommend including maps showing the location of each of the recreation areas relative to the proposed project.

Page 3.5-4 to 3.5-5, Section 3.5.2 Regional Recreation: We recommend that text in paragraphs 2-11 of this section, generally describing the location of each of the managed recreation areas, be moved to the beginning of the recreation section and integrated with section 3.5.1. This would provide the reader with a better orientation to the various managed recreation areas in the region.

3.11 Aesthetics and Visual Resources

No Comments

3.14 Soils

No Comments

3.16 Surface Water Resources

EPA received the text for this section on 6/27, and will provide our comments on or before 7/27.

AMERICAN OVERSIGHT

3.17 Hydrogeology

Note: Page numbers in the comments below refer to the .pdf page numbers since there appeared to be errors in the written page numbers.

General: Reviewing individual resource sections in isolation (without other referenced EIS sections or reference materials) was challenging, particularly when trying to assess the descriptions and outputs of Water Balance and Groundwater Models (3.17.1.3 and 3.17.1.4). Our review found some of the sub-sections difficult to follow since the document referenced other sections (e.g., Section 3.16 was not initially provided) and documents not provided for more detailed information. We recommend that it would be helpful to provide all sections of the document to cooperating agencies as reference during review of designated sections where there are cross-references within the document. In addition, please provide the list of resources and references cited, as this would enable reviewers to capture the overall aspects of the study and provide more meaningful comments.

General: We recommend providing summary results (and model descriptions) in appropriate sub-sections as tables, which would provide the information in the Groundwater Hydrogeology section more clearly and easily understood.

General: We recommend that the document describe how the monitoring locations were selected and the adequacy of the groundwater monitoring locations, data collection, and subsequent assessment as a basis for evaluating environmental impacts of the project and alternatives.

Pages 1 - 2, Sections 3.17.1.1 Groundwater Flow Processes and 3.17.1.2 Hydrogeological Characterization: We recommend that the EIS include a Conceptual Hydrogeologic Model illustration, including flow patterns and areas of surface water/groundwater interaction, where known. The document also discusses a conceptual model of compartmentalized groundwater flow, which we recommend be illustrated in a Figure. Such figures will enable the reader to better visualize and understand the text descriptions of the system and model. We also recommend that this section include or reference a summary table of baseline monitoring wells details that could be specific to each area/aquifer system.

Page 2, Section 3.17.1.2: We recommend that the EIS include the official classifications of underlying aquifers (designated by the State) including identifying underground sources of drinking water, as well as disclose the nearest drinking water protection areas/drinking water wells/surface water intakes. (see also comment on Section 3.17.4).

Page 2, Section 3.17.1.2: It is unclear whether the baseline groundwater flow, water balance and water quality models referenced here are stand-alone documents. We recommend that you clarify for the reader and explain where the documents can be viewed. We also request an opportunity to review these documents during EIS development, pursuant to our role as a cooperating agency. In addition, please clarify whether these models have been updated with more recently available data, as the data sets described in this section are from 2004-2012.

Page 4, Section 3.17.1.2. The document refers to pumping tests conducted in the area around the Pebble Deposit and locations downgradient. We recommend that the EIS include the simulated drawdowns from pumping tests and/or dewatering.

AMERICAN OVERSIGHT

Page 4, Section 3.17.1.2. Please provide WB-1, WB-3 and WB-4 locations, well details and data summaries (pumping test observations/results, sampling results).

Pages 6-9, Figures 3.17-2 through 3.17-5: We recommend that the cross section figures distinguish the weathered bedrock, fractured bedrock and competent bedrock layers, where known. We also recommend that the figures include a location map relevant to the cross section's line of travel. Please also clarify what is meant by "Model Layer Surfaces," which appears in the figure legend box but is not defined.

Page 10, Figure 3.17-6: We recommend including the individual monitoring points/elevations used to develop the Shallow Groundwater Contours in this figure. Also, please explain if these contours include surface water elevations/interactions.

Page 11, Table 3-17.1: We recommend including additional information in this table, such as the existing aquifer systems' relevant hydrogeologic parameters. We also recommend that the extent of the individual hydrostratigraphic units identified in this table could be illustrated on aerial view figures, and could be identified on the cross-sections in Figures 3.17-2 through 3.17-5.

Page 13, Section 3.17.1.2. Regarding: "The results of groundwater level monitoring and a water balance assessment indicate that approximately two-thirds of the groundwater flowing through the aquifer downstream of Frying Pan Lake remains in the South Fork Koktuli River drainage, while the remaining one-third of the groundwater crosses the surface water divide and contributes to groundwater flow in UT1.190, and discharges to Upper Talarik Creek." We recommend that this be illustrated on a figure for clarity. In addition, please explain whether seasonal variations were taken into consideration.

Page 13, Section 3.17.1.2. This section discusses average groundwater recharge rates in different drainages. We recommend that the document also disclose the range of groundwater recharge rates.

Page 18, Section 3.17.1.2 Aquifer Properties, ¶ 3: The section notes that hydraulic conductivities range across 14 orders of magnitude in nature and that differences of 1 to 2 orders of magnitude are not considered large. It appears that this would indicate that the overburden and bedrock are relatively heterogeneous overall across the Mine Site, rather than homogeneous as stated. Please clarify.

Page 18, Section 3.17.1.2, Aquifer Properties ¶ 4: Please clarify whether the aquifer parameters as presented in Schlumberger 2011 (Table 8.1-6) have been determined adequate for use in the EIS, and summarize any uncertainties. Please also discuss what was done with the testing purge waters.

Page 19, Section 3.17.1.2, Groundwater Flow Systems ¶ 1: Regarding: "There is evidence of some inter-basin groundwater exchange from the North Fork Koktuli drainage to the Upper Talarik Creek drainage, and from the South Fork Koktuli drainage to the UT1.190 basin." Please provide detail on the source and nature of this evidence.

Figures 3.17-7, 3.17-9, 3.17-10 and 3.17-11: We recommend that the document include additional data (locations, well details) relevant to the wells used to develop the hydraulic conductivity measurements depicted on Figures 3.17-7 and 3.17-9. We also recommend including a well location map relevant to level measurements in Figures 3.17-10 and 3.17-11. Please clarify whether well WB-1 was the only measurement point used to assess conductivity in deep bedrock.

AMERICAN OVERSIGHT

Page 19, Section 3.17.1.2, Groundwater Flow Systems: It appears that discharge was measured from numerous seeps. Please provide the details of the discharge measurements (i.e. locations, summary of measurements, field observations).

Page 19, Section 3.17.1.2, Groundwater Flow Systems Seasonal variability of groundwater is discussed in this section. Please describe how this seasonal variability was determined and how it will be accounted for in predictive modeling.

Page 23, Section 3.17.1.3/4 Site Water Balance Model/Mine Site Groundwater Model: Please discuss whether a detailed analysis of the site Water Balance Model (WBM), provided in Schlumberger 2011 (Appendix 8.1I) and numerical groundwater model (Schlumberger 2011: Appendix 8.1J), has occurred in order to determine the adequacy of the models for characterization of baseline conditions and use in assessing impacts. In addition, please explain whether the calibration period between 2004 and 2008 is considered sufficient to represent current climate conditions. Please see the "Predictive Modeling" section of our EIS scoping comments submitted to the Corps on June 29, 2018 which included recommendations related to environmental and predictive modeling. Our scoping comments referred to EPA's Council for Regulatory Environmental Modeling *Guidance on the Development, Evaluation, and Application of Environmental Models* (2009). This guidance provides recommendations on model analysis and documentation. We recommend that the EIS provide or reference documentation of model analysis consistent with this guidance, including discussion of the extent to which models met objectives and any limitations and uncertainties associated with model input parameters, assumptions, and outcomes.

Page 23, Section 3.17.1.4: Regarding: "Focus was placed on calibrating the model to periods of time when the aquifer was stressed during pumping tests." We recommend that the document provide details regarding the calibration of the model, so that model adequacy can be understood.

Page 23, Section 3.17.1.5: Regarding: "Based on results of the streamflow surveys, gaining and losing stream reaches were identified, and possible explanations for the variability in flows between gauges were provided. The majority of the stream reaches were found to be receiving groundwater discharge from the underlying aquifer (i.e., gaining)." Please provide more specificity on the location of the gaining and losing reaches. A figure may be helpful. If this information is provided in Section 3.16, then we recommend adding a reference to where it can be found in that section.

Page 24, 3.17.2 Transportation Corridor and Amakdedori Port: Please provide a figure showing the hydrostratigraphic units of this area. In addition, the document notes that no known hydrogeological investigations have been conducted along the South Access Road or Amakdedori Port. We recommend that the hydrostratigraphic units south of Iliamna Lake be characterized and the information disclosed and evaluated in the EIS.

Page 26, 3.17.4 Groundwater Use: The document notes that most Bristol Bay communities rely on groundwater wells for their drinking water supply. We recommend that the EIS discuss the number of private domestic and/or public water supply wells and their proximity to the project. We also recommend identifying any source water protection zones designated by the State of Alaska, or noting if there are none in the project area. Inclusion of a map showing the locations of drinking water wells within and around the project area would be helpful.

Page 26, 3.17.4 Groundwater Use: According to the document, PLP has tested the groundwater quality at the mine site, with results showing that minimal water treatment would be required to develop the

AMERICAN OVERSIGHT

wells for a drinking water source (PLP 2017). Please provide a reference to the tables that we recommend be added to Section 3.18.4.4 (Groundwater Quality) that support the conclusion that minimal treatment would be required. We also recommend that the description of any drinking water treatment that is required be included in the project description.

3.18 Water Quality and Geochemistry

General: We recommend including information on how baseline data, including the baseline water quality data and results from the humidity cell tests, are being incorporated in predictive water quality models. We recommend that the outputs from the water quality models will need to provide results on a time-step that is applicable to existing water quality criteria. Uncertainty and sensitivity analysis will both need to be performed as part of water quality model predictions. It may help to see our earlier recommendations related to environmental and predictive modeling (sections 3.17.3/3.17.4).

General: We recommend that this section would benefit from the addition of data summary tables, including those for site specific baseline conditions. Data compilation tables are typically included in EISs in order to disclose the baseline data collected which supports data adequacy determinations and the summary discussions and statistics in the text.

Page 1, 3.18.1 ¶ 3: We recommend providing additional explanation to support the statement that "for most parameters, the most stringent criteria are the aquatic life criteria for fresh water." We also recommend adding a table that provides the surface water quality criteria for all parameters assessed.

Page 1, 3.18.1 ¶¶ 4 and 5: We note that the document uses the undefined term "matrix water," for example, in the following sentences: "Therefore, the numeric water quality criteria for hardness-dependent parameters vary depending on the measured (or predicted) hardness value for the matrix water" and "The Alaska Department of Environmental Conservation (ADEC) numeric water quality standard for ammonia depends on both the temperature and the pH of the matrix water, but not hardness." We recommend adding the definition of the term "matrix water," as it is currently difficult to determine whether these statements are true in all circumstances. If the discussion is about determining whether the receiving water is meeting water quality standards (WQS), then it may be true, although adding a point-source discharge to those receiving waters and calling the mixed water the "matrix" may also make these statements inaccurate. When ADEC determines whether an effluent meets the WQS for a hardness based parameter, the 15th percentile hardness of the receiving water is used to determine the WQS that must be achieved – not any mixed matrix. For ammonia, the values used are the 85th percentile of the receiving water values for pH and temperature. Therefore, we recommend that the EIS define "matrix water" or include additional explanation. For further information, see Section 2.2. of the *Alaska Pollutant Discharge Elimination System (APDES) Permits Reasonable Potential Analysis and Effluent Limits Development Guide,* June 30, 2014.

Page 1, 3.18.2: We recommend including a table that provides the groundwater quality standards for all parameters assessed.

Page 1, 3.18.2 ¶ 1: The document includes the statement that "Although ADEC does not regulate groundwater directly. . ." We note that ADEC does regulate discharges to groundwater under 18 AAC 72. In particular, 18 AAC 72.500(a) requires that "In addition to the plan approval required by 18 AAC 72.600, a person who disposes of nondomestic wastewater into or onto land, surface water, or groundwater in this state must have a permit issued by the Department under this chapter or under 18

AMERICAN OVERSIGHT

AAC 83 for that disposal." A similar statement is made for the disposal of domestic wastewater in 18 AAC 72.010(a). We recommend that this section be revised to properly characterize the applicability of 18 AAC 72 for discharges to groundwater.

Page 2, 3.18.2 ¶ 2: The document states, "These standards include National Primary Drinking Water Regulations, which set legally enforceable Maximum Contaminant Levels (MCLs) that apply to public water systems." We note that the national drinking water MCLs are not applicable to Alaska until they are adopted into 18 AAC 80, so therefore we recommend revising the chapter to characterize the applicable state standards.

Page 4, 3.18.4.1 Geochemical Processes: This section primarily relies upon geochemical results from Chapter 11 (Geochemical Characterization, Bristol Bay Drainages) of the Pebble Mine Environmental Baseline Document (SRK 2011). We recommend that the EIS disclose the results of the Corps' data gap analysis and determination regarding whether this report is sufficient for establishing the geochemical baseline for the EIS.

Page 5, Section 3.18.4.2: Regarding: "Samples for geochemical testing were selected from the numerous exploration cores drilled to outline the deposit." Understanding the representativeness of the samples used for geochemical testing is a critical aspect of the evaluation. We recommend that describing the sample representativeness can be accomplished by providing a summary table that shows the major rock types that occur in the ore deposit, their percent abundance, the number of samples of that rock types tested, and the percent of the total samples analyzed per rock type. We also note that deviations between the occurrence of rock types and the geochemical testing may be acceptable if the additional focus/characterization is on rock types that are expected to disproportionately contribute to Acid Rock Drainage /Metals Leaching.

Page 5, Section 3.18.4.2. Regarding: "The NP/AP [neutralization potential / acid-generating potential] ratio that distinguishes PAG [potentially acid generating] and NAG [non-potentially acid generating] is 1.6." We recommend that the document provide a rationale for the 1.6 value. We note that other contemporary mine projects have used values of 3 or even 4 in distinguishing PAG and NAG. We recommend, given the importance of distinguishing PAG from NAG, including a clear rationale for the selection of the ratio value used in the EIS.

Page 5, Section 3.18.4.2. Regarding: "Results show that rocks with low NP/AP ratios (less than 0.1) have little neutralization potential and are likely to generate acid within a few years. Rocks with NP/AP ratios of 1 have higher neutralization potential, which delays the onset of acid generation to more than 20 years." These are important statements and would benefit from additional information provided. For example, we recommend clarifying how the time periods of "a few years" to >20 years were determined; whether this is based on the results of geochemical modeling; what percentage of the material fell into the two categories of <0.1 and 1 NP/AP; and how acid generation is being defined for these purposes. We also recommend that the EIS provide information on ML in addition to the ARD information.

Page 5, Section 3.18.4.2. Regarding: "Paste pH results for aged rock cores stored at the site suggest that acidification may be delayed up to 40 years." We recommend that the EIS include information on the specific rock types that these cores represent and how the value of 40 years was determined.

Page 6, Section 3.18.4.2. Regarding: "Element release rates indicated by kinetic tests were mainly a function of leachate pH rather than the element content of the samples." We recommend that the EIS

AMERICAN OVERSIGHT

clarify whether this statement applies to all elements and provide information on the analysis used to determine the role of pH in element release rates.

Page 6, Section 3.18.4.2. Regarding: "Leaching of copper accelerated as pH decreased; therefore, the potential for metal release is linked to the potential for acid generation, and ABA data can be used to assess the potential for copper leaching." We note that while the rate of leaching increased with decreasing pH, there may still be environmental concerns with the levels of copper release under neutral pH conditions. We recommend that additional information be provided on how copper leach rates change as a function of pH. Furthermore, we recommend that the EIS clarify whether copper behaves similarly regardless of the rock type, or whether leaching is different among rock types. In general, we recommend providing more information on the representativeness of the above statement.

Page 6, Section 3.18.4.2. Regarding: "Ore processing based on a conventional flotation process to recover chalcopyrite and molybdenite, the primary copper and molybdenum minerals, followed by treatment of pyrite to recover gold, will result in a low sulfide bulk tailing concentrate and a high-sulfide (pyrite-rich) tailing concentrate, respectively. Low sulfide tailings are expected to have low potential to generate ARD, provided the sulfide mineral content is less than about 0.2 percent." On page 5, the draft chapter states that "To date, limited testing has been performed on the representative concentrate, because possible designs for a metallurgical process are still at an investigative stage." Since the processing designs are still in the investigative stage, we recommend that the EIS describe whether the tailings that were used for ARD testing are representative of the current project processing flowsheet and any data limitations or uncertainties associated with the tailings ARD testing.

Page 6, Section 3.18.4.2. Regarding: "However, for some elements (e.g., arsenic, molybdenum, and selenium), release is significant under neutral pH conditions." Please clarify whether arsenic, molybdenum and selenium are the only elements to which significant release applies or whether there are other minerals/elements with similar properties under neutral pH conditions.

Page 6, Section 3.18.4.2. Regarding: "Element leaching from the low sulfide tailings occurred at low rates, and process supernatants were found to contain low levels of potential constituents relative to water quality standards." Please clarify whether the analytical testing occurred on supernatant water samples that were filtered or unfiltered whole water.

Page 6, Section 3.18.4.2. Regarding: "Rock material is assessed based on whether the material would take a long time to react – developing acid or losing neutralizing potential." We recommend that the EIS provide numerical estimates of the terms "long time" and "acid development" for clarity.

Page 6, Section 3.18.4.2. Regarding: "Based on the results obtained from integrating the geochemical studies with the block model, the majority of the rocks that would be mined from the deposit do not have the potential for acid generation, and could be considered substantially acid neutralizing." We recommend that the EIS explain whether the block model is representative of the current project description mine design.

Page 6, Section 3.18.4.3. Regarding: "A comprehensive network of sampling stations was established in the project area for sampling surface water from streams, lakes, and seeps." We recommend including a figure of these locations. We also recommend the addition of tables that provide summary information for the water quality data collected for each surface water including, for each parameter, range of concentrations, mean, and measure of dispersion etc., and comparison to applicable water quality criteria. These tables could be included along with the text of the section or in a supporting appendix.

AMERICAN OVERSIGHT

Page 6, 3.18.4.3 Surface Water Quality: The document references water quality studies conducted from 2004–2008, and a supplemental study period from 2008–2013. If the data from these studies are compiled in a separate document or documents, we recommend that the EIS provide the reference(s) for ease in reviewing the water quality study data.

Page 7, Section 3.18.4.2: Regarding the statement that "water quality occasionally exceeded the maximum criteria for concentrations of various trace elements." We recommend providing specific information in the EIS for which elements and under what conditions (i.e., baseflow or stormflow) the criteria maximum concentrations are exceeded.

Page 7, Section 3.18.4.3: Regarding: "Additionally, cyanide was occasionally present in detectable concentrations." We recommend providing information in the EIS on the presumed source of the cyanide, since cyanide is not expected to occur in the natural environment.

Page 7, Section 3.18.4.3: Regarding: "Sulfate, copper, zinc, nickel, and molybdenum concentrations were greatest in the SFK, consistent with the headwaters of this river passing through the deposit area, and multiple sample locations present in this area." We recommend that, throughout the document when comparisons between samples are made and one is determined to be larger than the other, the EIS provide the p-value and sample size associated with the analysis that was used to determine differences.

Page 7, Section 3.18.4.3: Regarding: "Significantly higher concentrations of copper, molybdenum, nickel, zinc, and sulfate were present in the SFK than in the NFK." As mentioned above, please provide p-values and sample sizes to support this statement for each element/anion. This recommendation also applies to the rest of the text in this paragraph.

Page 7, Section 3.18.4.3: Regarding: "Furthermore, a decrease in the TDS levels with distance along the stream was more pronounced in the SFK and UTC watersheds than in the NFK watershed. We recommend that the EIS provide information on how the spatial trends between the two watersheds were compared and determined to be significantly different. This recommendation applies to similar text/analysis elsewhere in the document.

Page 7, Section 3.18.4.3: Regarding: "The mean pH for streams, by watershed, ranged from 6.7 to 7.0." Here, as well as elsewhere in the document, we recommend that the EIS provide a measure of the dispersion (e.g. standard deviation, error, etc.) around the mean whenever mean values are presented.

Page 7, Section 3.18.4.3. Regarding: "The pH values in surface water were close to neutral. The mean pH for streams, by watershed, ranged by 6.7 to 7.0. Therefore, even though the oxidation of sulfide minerals was expected to be releasing acid in the deposit area, carbonate minerals appear to provide effective pH buffering." Under current conditions, please clarify whether the sulfide minerals present are exposed to the atmosphere and/or experiencing water level fluctuations. Without additional information, it is reasonable to assume that they are not exposed to the air or experiencing large water level fluctuations and therefore would not necessarily be expected to release ARD. In addition, grain/rock size has a very large influence on ARD generation, therefore the existing orebody/overburden would not be expected to have much ARD, whereas after the material is crushed the increase in surface area may increase ARD potential. As such, the observation of neutral pH conditions under existing conditions does not necessarily provide sufficient information on the effectiveness of the pH buffering capacity of the streams. We recommend that the statement regarding pH buffering capacity be clarified or revised.

AMERICAN OVERSIGHT

Pages 7-8, 3.18.4.3 ¶ 10: Regarding: "Although the mean pH values fell within the range for pH specified in the most stringent ADEC criterion, 34 percent of all individual water quality samples did not meet the water quality criteria for pH." We note that the State of Alaska Water Quality Standard for pH is a range from 6.5 to 8.5. It is not clear from the text whether samples were lower or higher than the range, or some combination. We recommend that the EIS include information on the sample values in relation to the WQS range for pH.

Page 8, Section 3.18.4.3: Temperature data for streams are based on 2013-2014. We recommend that the EIS discuss whether more recent water temperature data will be collected and analyzed to assess potential climate considerations and necessary adaptation measures.

Page 9, Section 3.18.4.3: Regarding: "The trace elements aluminum, antimony, arsenic, barium, cadmium, copper, iron, lead, manganese, molybdenum, mercury, nickel, and zinc were detected in surface water, although at low concentrations." As recommended above, please provide summary information on the concentrations detected in a table.

Page 9, Section 3.18.4.3: Regarding: "Some trace element concentrations in stream samples exceeded the most stringent ADEC maximum criteria." We recommend including information on the hydrologic conditions during which the exceedances occurred and specifically noting if there are any emergent trends.

Page 10, 3.18.4.4 Groundwater: We recommend adding tables that provide summary information for the baseline groundwater quality and geochemistry data collected, including each sample location, each parameter sampled, the range of concentrations, mean, and measure of dispersion around the mean. The tables could be in the text of the section or in a supporting appendix. Please also describe how the baseline data will be incorporated into various prediction models.

Page 10, 3,18.4.4 Groundwater: We recommend that the EIS provide baseline water quality information for existing drinking water wells (public or private) near the project area. This same comment applies throughout the project area (See sections 3.18.5, 3.18.6, 3.18.7). See also our comments regarding drinking water in 3.17.1.2 and 3.17.4.

Page 10, 3.18.4.4 Groundwater: We recommend that the EIS provide explanations regarding the relatively high TDS level in MW-14D, as well as regarding the lowest median pH values of 4.9 – 5.3.

Page 11, 3.18.4.4: Regarding: "Although sulfides appear to be oxidizing in the deposit area, the groundwater is not acidic. The lowest median pH values were 4.9 and 5.3. All other median pH values were greater than 5.8." Based on the information provided, it does not appear that a clear conclusion can be drawn that the groundwater is not acidic. Please revise or expand upon the explanation in the EIS to clarify the current conclusion that even with the low median pH, the groundwater is not acidic.

Page 11, 3.18.4.4 Groundwater: Regarding: "The wells with relatively high TDS also generally had relatively high concentrations of arsenic, barium, and molybdenum compared with other wells in the analysis area." Please clarify whether the high concentrations are based on dissolved (filtered samples) vs. total (unfiltered) analyses.

Page 11, 3.18.4.5 Sediment Quality: We recommend adding tables that provide summary information for the sediment data collected for each surface waterbody, including the range of concentrations, mean,

AMERICAN OVERSIGHT

and measure of dispersion around the mean for each parameter. We recommend that the table could be in the text of the section or in a supporting appendix.

Page 11, Section 3.18.4.5: Regarding: "Between 2004 and 2007, 198 samples of sediment from lakes, ponds, seeps, and major and minor drainages in the analysis area were sampled and analyzed for their content of naturally occurring trace elements, anions, and cations." We recommend that a map showing the sample locations and a table summarizing the concentrations would be helpful to the reader in interpreting the results.

Page 13, 3.18.5.2 Groundwater Quality (Amakdedori Port): We recommend that the EIS discuss whether the large aquifer system under the Amakdedori Port area has been characterized and/or describe any plans to assess baseline aquifer conditions. In addition, please discuss how the data will be incorporated into various prediction models.

Page 14, 3.18.6 Transportation Corridor: See comment above. We recommend that the EIS discuss whether the aquifer system under the transportation corridor area has been characterized and/or describe any plans to assess baseline aquifer conditions. In addition, please discuss how the data will be incorporated into various prediction models.

Page 15, 3.18.6.1: Regarding: "Sixteen surface water sampling stations were established and sampled in the Transportation Corridor analysis area during 2004 and 2005." We note that the transportation corridor envisioned in 2004 (along the north shore of the Lake) is not the same as the currently proposed transportation corridor (crossing the Lake and having roads south of the Lake). We recommend providing an explanation and map that shows the location of the sampling stations in comparison to the proposed transportation corridor. In addition, as recommended for the mine site, please provide tables that summarize the results of the surface water quality monitoring (locations, ranges, seasonality, measure of dispersion, comparison to criteria) and discuss the adequacy of the data collected to represent baseline conditions along the proposed transportation corridor.

Page 15, 3.18.6.1, Iliamna Lake: As recommended above, please provide a table that summarizes the results of the surface water quality samples collected in the Lake.

Page 17, 3.18.7.1 ¶ 1 Regarding: "Additional discussion of deeper offshore sediments in Cook Inlet will be included here if data become available." If the data are necessary to evaluate the structural requirements and environmental impacts of constructing a natural gas pipeline along the bottom of Cook Inlet, we recommend that this data be collected and made available in this section of the EIS.

3.22 Wetlands / Special Aquatic Sites and Waterbodies

General: We note that throughout Section 3.22 there is no discussion of any ephemeral streams present in the study area, although there are discussions of perennial and intermittent streams. We recommend that, if there are ephemeral streams located within the study area, the EIS discuss their functions and values in the relevant subsections. If no ephemeral streams are present, we recommend including a statement to that effect for clarity.

Page 3.22-2, Section 3.22.1, first full paragraph: The section refers to "lower perennial" and "upper perennial" streams for characterization of flow regimes. We recommend that the EIS include a definition or description of the difference between these stream categories.

AMERICAN OVERSIGHT

Page 3.22-6, Section 3.22.2.3, ¶1, first sentence: Please identify the document cited as USACE 2016 for the benefit of the reader.

Page 3.22-6, Section 3.22.2.3, ¶1: The document notes that a wetlands functional assessment will be prepared as part of the permitting process for the project, although the section provides a general qualitative overview of wetland functions. We recommend that the functional analysis be completed prior to the DEIS, so that it may be summarized in the body of the document and attached as an appendix. In addition, we recommend that this paragraph be updated to reflect the recently signed memorandum of agreement between the EPA and the USACE regarding compensatory mitigation in Alaska.

3.26 VEGETATION

EPA received the text for this section on 6/27, and will provide our comments on or before 7/27.

AMERICAN OVERSIGHT

3.0 AFFECTED ENVIRONMENT

3.7 CULTURAL RESOURCES

The purpose of this section is to describe cultural resources within the affected environment. NEPA requires that project impacts to cultural resources, considered a subset of the "human environment," be evaluated and disclosed (40 CFR 1508.4). Cultural resources under the National Environmental Policy Act (NEPA) is a broadly defined term that includes all buildings, sites, structures, objects, districts, and landscapes that are considered to have historical or cultural value. A wide range of cultural resource types and related laws and regulations can include, but are not limited to:

- **Historic properties** are defined by the implementing regulations (36 CFR Part 800) for Section 106 (54 U.S.C. § 306108) of the National Historic Preservation Act (NHPA) (54 U.S.C. 300101 et seq.) as "any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places (NRHP) maintained by the Secretary of the Interior. This term includes artifacts, records, and remains that are related to and located within such properties; and properties of traditional religious and cultural importance to an Indian tribe or Native Hawaiian organization and that meet the National Register criteria" (36 C.F.R. § 800.16 [(l)][(1)]). It is important to note that under NEPA, federal agencies must consider impacts to all types of cultural resources, including those that do not meet the definition of historic properties ~~are considered even if they are not NRHP eligible (i.e., designated as "historic properties" per the NHPA).~~ as set forth in the NHPA and its implementing regulations.
- Permitting, construction, operations, and closure of the project will require federal agency compliance with Section 106 of the NHPA (54 U.S.C. § 306108)~~(16 USC Section 470)~~, and its implementing regulations (36 CFR 800), and for the U.S. Army Corps of Engineers' ~~NHPA Section 106~~ also its Procedures for the Protection of Historic Properties~~procedures~~ (33 CFR 325, Appendix C). The Section 106 regulations require federal agencies to make a reasonable and good faith effort to identify historic properties that may be affected by the undertaking within the Area of Potential Effects (APE), determine if an the undertaking will ~~constitute~~ have an adverse effect ~~to identified~~on historic properties, and develop steps to resolve the adverse effect of the undertaking. The federal agencies must carry out all the steps of the Section 106 review in consultation with the State Historic Preservation Officer (SHPO)/Tribal Historic Preservation Officers (THPOs), as appropriate, and other consulting parties, including Indian tribes, which, for purposes of Section 106, includes Alaska Native Villages and Regional or Village Corporations, as those terms are defined in the Alaska Native Claims Settlement Act.~~seek to resolve any adverse effects~~. Consultation with Indian tribes must be carried out in a manner that acknowledges the government to government relationship between federal agencies and Indian tribes. The scope of the identification effort, determinations of eligibility and effect, and steps to resolve adverse effects must be informed by the traditional knowledge of tribes who ascribe significance to such properties, as gathered from ethnohistoric data, oral history, and other types of research. The Corps, other federal agencies, the project proponent, and its consultants must be sensitive to concerns of the tribes regarding the confidentiality of information they share about properties of religious and cultural significance.
-

Comment [ACHP-JTE1]: Consider changing as much of the text as possible to active voice.

Comment [ACHP-JTE2]: Seems to be confusion that conflates cultural resources for the purposes of NEPA and historic properties for the purposes of Section 106. This chapter needs to be reworked to clearly differentiate. It should also be reworked to more clearly differentiate among the requirements of federal statutes and regulations and the requirements of state statutes and regulations.

Comment [ACHP-JTE3]: The first time you reference this citation, use Part. Thereafter, you can leave "Part" out of the citation.

Comment [ACHP-JTE4]: Use parentheses, not brackets.

Comment [ACHP-JTE5]: Permitting is the ***federal action*** that makes the ***construction, operation, and closure*** of the project an ***undertaking*** subject to Section 106 for the federal agency.

Comment [ACHP-JTE6]: There are likely a range of federal actions for the range of federal agencies involved, not limited to the Corps CWA permits, that should be referenced.

Comment [ACHP-JTE7]: The citations only need to be made once in any particular section.

Comment [ACHP-JTE8]: The Corps may also follow Appendix C, but BSEE and USCG do not.

AMERICAN OVERSIGHT

- Cultural resources are evaluated for inclusion in the NRHP based upon established criteria listed in 36 CFR 60. Cultural resources can be determined eligible for inclusion in the NRHP if they possess integrity, the capacity to convey their significant historic associations, and meet one or more of the four criteria for eligibility listed in Title 36, CFR 60:
- The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association; and:
  - are associated with events that have made a significant contribution to the broad patterns of our history (Criterion A); or
  - are associated with the lives or persons significant in our past (Criterion B); or
  - embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction (Criterion C); or
  - have yielded, or may be likely to yield, information important in prehistory and history (Criterion D).

If significant (i.e., NRHP-eligible) resources are identified, then federal agencies are directed to take prudent and feasible measures to avoid or reduce adverse impacts. It should be noted that the terms "impacts," and "effects," for the purposes of the analysis in this EIS, are used interchangeably.

Comment [ACHP-JTE9]: Significant cultural resources for the purposes of NEPA are not always necessarily eligible for inclusion on the NRHP. They are not the same as "historic properties" as defined by NHPA and the Section 106 regulations. Don't confuse. There can/could be "significant cultural resources" for the purposed of NEPA that are not eligible for listing on or listed on the NRHP.

The NRHP describes historic resources as standing or collapsed buildings, unique engineering designs, mines, ranches, and railroad grades that are at least 50 years old, or have achieved significance within the past 50 years. Archaeological resources are prehistoric or historic remains of human lifeways or activities that are at least 50 years old, and include artifact concentrations or scatters, whole or fragmentary tools, rock carvings or paintings, and buildings or structures. Resources types that include broader geographic areas may include cultural landscapes and Traditional Cultural Properties (TCPs).

Comment [ACHP-JTE10]: Re-work to clarify that these are just examples of types or classes of properties that have been included, but it is not an exhaustive listing.

- **A TCP** is defined as a place that is "eligible for inclusion in the National Register because of its association with cultural practices or beliefs of a living community that (a) are rooted in that community's history, and (b) are important in maintaining the continuing cultural identity of the community" (Parker and King 1992). TCPs often represent the location where important traditional events, activities, or cultural observances have taken place in the past, yet remain active in the community's or tribe's cultural practices.

Comment [ACHP-JTE11]: Remember that federal agencies are required to consult with tribes who may ascribe religious and cultural significance to historic properties that may be affected. Some of these properties may fit the definition of TCP and others may not.

- **Native Alaskan cultural items** include human remains, funerary items, sacred objects, and objects of cultural patrimony. The discovery of human remains is subject to Alaska Statutes (AS). For example, AS 11.46.482(a)(3) makes the "intentional and unauthorized destruction or removal of any human remains or the intentional disturbance of a grave," a class C felony; AS 41.35.200, which applies only to State lands, makes the disturbance of "historic, prehistoric and archaeological resources" (including graves, per definition) a class A misdemeanor; and AS 18.50.250, which applies to all lands in Alaska, requires permits for the transport, disinterment, and reinternment of human remains. The project does not currently involve federal lands, so the provisions of the Native American Graves Protection and Repatriation Act are not applicable. However, state level statutes and sensitivity about grave sites warrant

Comment [ACHP-JTE12]: Are human remains characterized as a "cultural item"? Perhaps deal with human remains in a separate section.

AMERICAN OVERSIGHT

the development of Inadvertent Discovery Plans to ensure appropriate treatment of these resources.

- **Archaeological resources** include precontact (i.e., dating to the period in North America predating the arrival of Euroamericans) and historic archaeological sites that may or may not be historic properties. The Alaska Historic Preservation Act (AS 41.35) states that the policy of the State is to preserve and protect the historic, prehistoric, and archaeological resources of Alaska and asserts the State's title to all historic, prehistoric, and archaeological resources situated on land owned or controlled by the State, including tideland and submerged land.
- **Cultural uses of the natural environment** include subsistence, ceremonial, or other religious use of places, plants, animals, and minerals. This may include locales in the project vicinity identified through place names and subsistence research. Types of resources can include Native Alaskan sacred sites that may or may not be considered as TCPs, cultural landscapes, ethnographic landscapes, rural historic landscapes including trails and transportation routes, and historic mining landscapes. The American Indian Religious Freedom Act of 1978 (42 USC Section 1996) requires that federal agencies consider the effects of their actions on cultural resources that are of religious significance to Alaska Natives.
- **Numerous other laws, regulations, and Executive Orders protect cultural resources. Executive Order 13007** – Indian Sacred Sites directs federal agencies to allow Native Americans to worship at sacred sites located on federal property and to avoid adversely affecting such sites to the extent practicable. The Antiquities Act of 1906 (16 USC Section 431) establishes penalties for damage and destruction of antiquities and allows for designation of historic landmarks on federal lands. The Archaeological Resources Protection Act of 1979 (16 USC Section 470) establishes a permit process on public and Native American lands, and provides penalties for violations and damages to archaeological sites. Executive Order 13287 – Preserve America directs federal agencies to build partnerships with local governments, Indian tribes, and the private sector to preserve cultural resources, and improve the stewardship of cultural resources.

Information presented herein is based on a review of data on file at the Alaska Heritage Resources Survey (AHRS) and the series of cultural resources survey reports prepared for the Pebble Limited Partnership (PLP) between 2004 and 2013 by Stephen R. Braund and Associates (SRB&A).

[Note: GIS data from surveys conducted at the mine site were received as part of RFI 26 and will be incorporated into the next draft of this section.]

3.7.1 Area of Potential Effect

Section 106 of the NHPA defines a process for the consideration of effects on historic properties within a project's APE, defined as "the geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties, if any such properties exist" (36 CFR § 800.16(d)). The lead federal agency determines the APE for the undertaking in is determined through consultation among with other federal and state agencies, the AK SHPO, and other interested parties, including tribes who may ascribe religious and cultural significance to properties that may be affected. An APE has not yet been defined for the project. Agency consultation under Section 106 and cultural resource surveys to-date have focused on specific locations of proposed ground disturbing actions associated with mine exploration (e.g., drill pads, placement of communication and meteorological stations) and annually reviewing the cultural field survey methodology.

Comment [ACHP-JTE13]: This does not fit grammatically

AMERICAN OVERSIGHT

In complying with Section 106 of the NHPA, federal agencies are required to make a reasonable and good faith effort to identify historic properties that may be affected by the undertaking. The scope of the identification effort, including the APE, will be developed in consultation with the Alaska State Historic Preservation Officer (SHPO), Indian tribes, which, for purposes of Section 106, includes Alaska Native Villages and Regional or Village Corporations, as those terms are defined in the Alaska Native Claims Settlement Act, the proponent, and other consulting parties.

~~In the absence of formal consultation associated with a Programmatic Agreement and a project-wide, defined APE,~~ this section reviews sites identified within the project component boundaries (Mine Site, Transportation Corridor, Natural Gas Pipeline, and Amakdedori Port). These components present the geographic area of analysis which will facilitate consultation among agencies, consulting parties in the Section 106 review, and other interested parties in defining the project's APE and assessing impacts on cultural resources. This geographic extent and the analysis of indirect and cumulative effects of the project on cultural resources will be revisited once the APE is finalized.

Typically, indirect effects occur to cultural resources through increased use or visual effects on resources that are valued for their context, setting, association, or similar aspects of integrity. The final APE will be determined through consultation and may result in variations to the number and type of cultural resources discussed herein.

While the previous field surveys cover the majority of the Mine Site, most all of the other project components remain unsurveyed, including lands in the Transportation Corridor and at Amakdedori Port. Background research for cultural resources was previously completed for the entire Expanded Cook Inlet Baseline Study Area (ECIBSA) which encompassed the proposed port and part of the Transportation Corridor. Field investigations primarily involved survey of select locations in the vicinity of Y Valley and Sunday Creek, well north of the current Amakdedori Port location. Two areas were surveyed near Amakdedori for the siting of communications towers. The previous investigations reviewed the potential for near-shore shipwrecks, though a comprehensive marine archaeological review has not been completed for the natural gas pipeline route or for the off-shore components of the port facilities. Additional field surveys and consultation between the agencies and tribes could identify additional resources that have not yet been documented for the project. This section, therefore, discusses cultural resources known to be present based on the previous studies completed by SRB&A. It should also be noted that Section 3.9, Food and Fiber Production – Subsistence, presents a discussion of traditional subsistence practices within the region.

[Note: RFI 26 notes that cultural resource surveys will be completed for the Amakdedori Port site and a desktop investigation will be done for the Transportation Corridor in summer 2018. Results of that work will be included in a future draft of this section.]

3.7.2 Cultural Context

The area of analysis for cultural context covers a broad and complex range of prehistoric traditions, ethnographic regions, and historic periods. The cultural context is presented in two summary archaeology survey summary reports prepared by SRB&A (SRB&A 2011; 2015), and is not repeated here. These two reports offer the most current version of the cultural context for the project area, including references and titles. There were minor changes and updates to the ethnographic and prehistoric context statements between 2011 and 2015. They detail prehistoric traditions, ethnographic data of the Dena'ina, Yup'ik, and Alutiiq peoples that occupied the region, and a chronology of the regional history from contact through the Russian, and then American, periods.

Comment [ACHP-JTE14]: When??

Comment [ACHP-JTE15]: Is this stating that the Corps and other federal agencies have yet to initiate Section 106 consultation? Determining the scope of the identification effort, including the APE, is at the beginning of the Section 106 review. In providing a summary of status, this section should be clear about where we are in the Section 106 review process, and when steps that have not been carried out will be completed.

Comment [ACHP-JTE16]: Not sure what this means

Comment [ACHP-JTE17]: There may be interested parties and stakeholders under NEPA, but we need to be clear about formal identification of and consultation with "consulting parties" for the purposes of Section 106.

Comment [ACHP-JTE18]: Not necessarily "valued for" context, setting, and association, per se, but those characteristics are important in facilitating the experience of the significance that is ascribed to the property

AMERICAN OVERSIGHT

3.7.2.1 Place Names

SRB&A also collected and investigated Dena'ina place name data for the Bristol Bay and Cook Inlet drainages via a number of sources published over the last several decades. The 2011 SRB&A report offers details on research methods and sources consulted for identifying place name data (SRB&A 2011). A place name database and corresponding map of known place names in the mine analysis area and ECIBSA were also developed and are included in the SRB&A reports. Place name data will be valuable when the project completes NRHP eligibility evaluations and assesses the cultural (and socioeconomic significance) of subsistence resources and use locations within the project area under the NHPA.

Comment [ACHP-JTE19]: Make active voice. Who will use place name data… This section should also specify how the federal agencies will consult with the tribes to utilize and supplement as needed the place name data and subsistence data, etc., that appears to have been gleaned from studies carried out in the past, but not necessarily focused on thisundertaking.

3.7.2.2 Previous Archaeological Research

Prior to SRB&A's surveys, the only cultural resource surveys within the PLP claim boundary occurred in the late 1980s and early 1990s. The Bureau of Land Management (BLM) conducted surveys for Cominco drill sites and proposed airstrips and campsites in 1988, within the boundaries of what would later become the PLP claim. The University of Alaska, Fairbanks (UAF) performed additional field surveys for Cominco's proposed airstrips and campsite. None of the surveys identified any cultural resource sites within the claim boundary. In addition to BLM and UAF's work, the nearest cultural resources surveys to the claim boundary were located 20 miles to the east along the Newhalen River between Newhalen, Iliamna, and Nondalton and within the communities themselves.

SRB&A's annual survey work commenced in 2004 and involved annual surveys until 2012. Initial work focused on the mine analysis area and was limited to locations within PLP's claim boundary with a few exceptions including several surveys in adjoining claim boundaries and a brief survey along a section of the Newhalen. SRB&A's first surveys within the ECIBSA occurred in 2005 and focused on proposed port site locations. SRB&A returned in 2007 to survey a revised port site location and has conducted surveys within the ECIBSA every year through 2013. However, aside from the small surveys near Amakdedori Port, the proposed port site and the Transportation Corridor have not been surveyed. Details of previous research are provided in SRBA 2011 and 2015 and include references and a narrative of previous studies throughout the region. The SRB&A reports primarily discuss archaeological compliance surveys, but also offer a discussion of historic and ethnographic sources including historic documents, ethnographic and linguistic studies, and oral interviews that help characterize the affected environment. Coupled with place name data, each area of inquiry informs archaeological and historic research and helps archaeologists form more robust interpretations and explanations of cultural resources.

[Note: RFI 26 notes that cultural resource surveys will be completed for the Amakdedori Port site and a desktop investigation will be done for the transportation corridor in summer 2018. Results of that work will be included in the next draft of this section.]

A number of these studies informed SRB&A's cultural resource studies undertaken during the 2004 through 2013 field seasons. Ethnographic works about the Dena'ina contributed models of normative behavior, subsistence food storage practices, land use traditions, place names, and many other points of data with bearing on the interpretation of the local Dena'ina's past. Other works provide information about Yup'ik practices including land use, material culture, and behavior through time. Analyses of oral history interviews, when available, are informative as they are told from the perspective of those who actually lived according to the practices being studied.

AMERICAN OVERSIGHT

3.7.3 Mine Site

The Mine Site has been the primary focus of the cultural resource investigations completed by SRB&A on behalf of PLP to date, and details regarding research, survey, and site recordation methodology are available in SBRA 2011 and 2015. The areas investigated for the reports include lands within the "claim block boundary" which was defined as mining claims owned or leased by PLP and Kaskanak, Inc. and represents a larger area than the current Mine Site location. The previous mine analysis area covered lands from Iliamna Lake in the south to the Nikabuna Lakes in the north and west from the Newhalen River towards the Mulchatna River. Background and place names research covered the entirety of this area, whereas fieldwork was targeted to where PLP had proposed ground disturbing areas.

Prior to SRB&A's archaeological surveys for PLP, the AHRS database listed only three sites in the mine analysis area: ILI-00013, ILI-00031, and ILI-00106. The first two are prehistoric sites near the Newhalen River, and ILI-00106 is a number reserved for use by the National Park Service and may not be associated with an actual site.

Since 2004, SRB&A documented an additional 52 sites (30 since 2009) in the claim block area and added them to the AHRS database. In 2011, SRB&A revisited six AHRS sites (ILI-00201, ILI-00202, ILI-00205, ILI-00219, ILI-00220, and ILI-00252) that SRB&A originally identified in 2007, 2008, and 2010. Subsequently, SRB&A recommended ILI-00201, ILI-00202, ILI-00205, ILI-00219, and ILI-00220 should not retain their AHRS designation because four of the sites were based on naturally modified stones and one site was modern in age. After site revisits in 2012, SRB&A recommended that an additional seven AHRS sites (ILI-00203, ILI-00204, ILI-00207, ILI-00208, ILI-00213, ILI-00229, and ILI-00233) that SRB&A identified in 2006, 2007 and 2009 should be removed from the AHRS because the sites are likely modern or are based on naturally modified stones. In total, 12 AHRS sites were removed from the AHRS database.

In summary there are currently 43 cultural resources sites with an AHRS designation in PLP's larger mine study area as defined in SBR&A 2011 and 2015. None of the 43 AHRS sites in the claim block area have been evaluated for NHRP eligibility. As of 2012, SRB&A has surveyed 14,912 acres within the larger mine study area and excavated 1,103 subsurface tests.

[Note: GIS data from surveys conducted at the mine site were received as part of RFI 26 and will be incorporated into the next draft of this section.]

SRB&A research also resulted in the identification of known place names in the Bristol Bay and Cook Inlet areas. However, limited work has occurred to field verify place name locales or to confirm the presence of sites identified through oral history interviews. There has not been any effort to specifically identify TCPs or other sites of religious or ceremonial importance.

Comment [ACHP-JTE20]: This should spell out what research will be done, and when

Table 3.7-1. Known Archaeology Sites near the Mine Study Area

AHRS No.	Site Name	Summarized Description	Period
ILI-00013	Newhalen Upper Rapids	Townsend observed this site, from a plane, in a grassy area with apparently no secondary growth. It seems to be situated on several terraces and is about 100 yards long.	Prehistoric
ILI-00031	Newhalen Middle Rapids	This site was observed by Townsend, form a plan, at the top of a single terrace. Four or five house pits were noted.	Prehistoric
ILI-00106	NPS Using	No Description in AHRS database	Unknown

AMERICAN OVERSIGHT

Table 3.7-1. Known Archaeology Sites near the Mine Study Area

AHRS No.	Site Name	Summarized Description	Period
ILI-00193	ILI-00193*	119 surface artifacts were collected and a 50cm x 50cm test unit on the margin of the blowout was excavated. This test unit contained 13 flakes, one used flake fragment and one possible blade in the top 10cm. Collected surface artifacts include bifaces, blade fragments, and debitage. There is cultural material in a soil context and there may be charcoal or other datable material in stratified context in the area.	Prehistoric
ILI-00194*	South Fork Koktuli River Site 4	The site consists of lithic artifacts from the surface and subsurface context. Lithic artifacts include three biface fragments and debitage.	Prehistoric
ILI-00196	ILI-00196	Site consists of an isolated artifact. Testing of the surrounding area failed to locate further cultural material.	Prehistoric
ILI-00209	Isolated Find	A possible bifacially reduced cobble was discovered on the surface. The biface was not collected and no other tools were located in the vicinity.	Prehistoric
ILI-00212	Rock Stand and Circle Site	A one meter diameter circle of cobbles with a very large cobble in the center. The rocks appear to be larger and rounder than the rocks in the surrounding area, which are fractured and heavily covered with black lichen. Nearby (50m) is a collapsed stack of similar stones.	Prehistoric / Protohistoric
ILI-00214	Wiggly Lake Camp 2	This site consists of two rock features, a deposit of rifle cartridges of two different calibers, and some antler and bone pieces. The fire ring is a circle nearly a meter in diameter with a line of rocks bisecting the circle down the center. Some burned material was visible beneath the rocks. Nearby to the southeast was an area with numerous cartridges including .223, .338 and 7mm magnum rounds and a tent ring about 12ft in diameter consisting of 5–8 cobbles resting on the surface of the tundra. Possible stakes made from antler and bone fragments are also nearby. In 2012, SRB&A conducted subsurface testing at the site and did not locate any subsurface cultural material.	Historic
ILI-00215	Wiggly Lake Camp 3	SRB&A recorded this site in 2008 as a ring of cobbles that measured approximately 12ft in diameter. When SRB&A revisited the site in 2012, the field crew mapped in the identified faunal remains, a hearth, and rifle cartridges and mapped these features using a Trimble GPS, and conducted multiple subsurface tests in the area. The field crew did not relocate the ring of cobbles. None of the subsurface tests in 2012 produced any cultural material.	Unknown
ILI-00217	Wiggly Lake Camp 5	This site is a relatively large camp that includes a tent ring approximately 20ft in diameter consisting of large cobbles. A plastic water container with bear bite marks, a kerosene can, a firewood stockpile and a stacked pile of caribou antlers were found below the esker on a flat area of tussock tundra. Nearby on the tussock flats a horseshoe pitch with horseshoes and rebar pins were found. A few fire pits were on the flats toward the lake in tussock tundra. SRB&A relocated the site in 2012 and mapped it with a Trimble GPS. Multiple subsurface tests were conducted, all of which were negative for cultural materials. However, personal communication with the makers of the horseshoes, Regent Sports Corporation, allowed SRB&A to determine that the set of horseshoes identified were made during the 1960's.	Historic / Modern
ILI-00218	Isolated Lithic Find	This site consisted of one used flake. The used flake was found on the surface of the tundra. No other artifacts were found on the surface or in test pits excavated nearby.	Prehistoric / Protohistoric

AMERICAN OVERSIGHT

Table 3.7-1. Known Archaeology Sites near the Mine Study Area

AHRS No.	Site Name	Summarized Description	Period
ILI-00221	ILI-00221	Site consists of three cultural surface depressions and intact subsurface cultural strata. The cultural surface depressions are in the SW part of the site and consist of two rectangular features measuring 3.5–4m x 2.5–3m x 0.3–0.4m and one circular feature measuring 4.5m in diameter and 50cm deep. One rectangular feature has a narrow depression off the NW corner, possible an entry tunnel. Thirty-six positive shovel tests yielded 607 flakes, five shatter, six biface fragments, one grooved stone, two used flakes, one small unidentified faunal fragment, and charcoal. Cultural material was from between 0–25cm below surface.	Prehistoric
ILI-00222	ILI-00222	Surface lithic scatter on a lag deposit. Pedestrian walkover identified less than 20 flakes, a bluish green chert scraper with some polish, and at least one incomplete biface. There is potential for buried cultural material in vegetated areas adjacent to the lag deposit. Artifacts were not collected. No tests were excavated at the site.	Prehistoric
ILI-00223	ILI-00223	Site consists of an isolated straight stemmed biface with rounded shoulders found on the surface of an exposed lag deposit. The biface is made of an opaque black cryptocrystalline material with white vein inclusions and broken transversely through the midsection. A circle of large stones, about 2m in diameter (ILI-00232), was found approx. 20m S of the biface. The broken point was collected; no tests were excavated at the site.	Prehistoric
ILI-00224	ILI-00224	Site is a lithic reduction site measuring approx.. 6.5m x 5m and consisting of at least 85 lithic artifacts. Artifacts consist of a large cobble core and flake core, one microblade fragment, one retouched flake, one used pebble, one hammerstone, and 79 pieces of debitage. Debitage consisted of 26 complete flakes, 25 broken flakes, and 28 shatter. Both cores and the debitage are of basalt. Two tests were excavated and both were negative. No artifacts were collected.	Prehistoric
ILI-00225	ILI-00225	The site consists of lithic debitage and a tool from both on and below the surface. One positive shovel test was excavated and yielded 10 flakes from 0-5cm below surface. SRB&A also identified a large biface preform and one piece of chalcedony shatter on the surface, about 20m S of the positive test. When field crews revisited the site in 2012, they mapped it with the Trimble GPS and conducted several subsurface tests, none of which located additional cultural materials.	Prehistoric
ILI-00226	ILI-00226	Site consists of lithic debitage recovered from a subsurface context. Two shovel tests yielded 13 flakes; cultural material was 0–20cm below surface. SRB&A has begun processing a bulk hearth sample collected from the 2009 testing. Processing of the bulk sample has yielded small bone fragments, one flake, and burned botanical remains.	Prehistoric
ILI-00227	ILI-00227	Site consists of lithic debitage recovered from a subsurface context. One positive shovel test yielded one flake. Cultural material was 5–10cm below surface. This site is considered an isolated find. SRB&A collected a charcoal sample from a negative test near the positive test.	Prehistoric
ILI-00228	ILI-00228	Site consists of an isolated used flake (broken into two fragments that refit) found on the surface. The used flake was identified on an exposed surface on a tussock tundra floodplain. One negative shovel test was excavated near the surface-find. The used flake was collected.	Prehistoric

AMERICAN OVERSIGHT

Table 3.7-1. Known Archaeology Sites near the Mine Study Area

AHRS No.	Site Name	Summarized Description	Period
ILI-00230	Tent Ring	ILI-00230 is a campsite which included numerous pieces of cut wood and discarded sawn antlers, possibly indicating hunting for food rather than sport. The site characterized by a large glacial erratic boulder with at least three tent rings, a fire ring, several antler piles and a caribou skull pointed towards Newhalen. A local elder, mentioned having used this particular camp site with other local Native hunters as recently as last winter, mentioning the boulder as a wind block and cover that allowed hunters to shoot caribou grazing on exposed moss on the opposite side of the lake.	Historic / Modern
ILI-00231	ILI-00231	The site consists of about eight cobbles in a vegetated, relatively flat area next to the lakeshore. ILI-00231 appears to be a deconstructed tent ring or linear array of rounded cobbles well-seated in the tundra vegetation. The linear formation may reflect the use of a tarp, rather than a tent proper, or could also represent a single event of tents being weighted against a direction of wind with the lee sides allowed to flap.	Historic
ILI-00232	ILI-00232	Site includes two separated tent rings. One tent ring consists of approx.. 8 lichen-covered rocks embedded into the tundra it also included a metal tent peg and polypropylene twine as well as a circle of rounded cobbles. SRB&A returned to the site during 2012 cultural resource fieldwork to map it in using the Trimble GPS. The field crew was not able to relocate the tent ring that was embedded into the tundra. Due to the lack of sediment, no subsurface tests were conducted in the area, although additional ground survey was conducted in an attempt to identify previously unidentified cultural materials. No new cultural materials were identified.	Historic / Modern
ILI-00234	ILI-00234	There are at least two tent rings, several pieces of cut wood and an adjacent patch of cut willow and alder stumps, and one fire ring. The fire ring, which contains carbon staining and dead vegetation, also served as a midden for cans, plastic wrappers and bottles.	Historic / Modern
ILI-00235	ILI-00235	Cobbles arranged in two circles and are well-incorporated into the surface vegetation. SRB&A tentatively interpreted the cobble circle as two tent rings and a camp stove use area, where cobbles were like used to shield and support a camp stove. SRB&A revisited the site at the end of the 2012 field season to map the site boundary with the Trimble GPS. The field crew was not able to relocate the second tent ring. No subsurface tests were conducted at this site due to the density of cobbles directly underneath the vegetated surface. Additional ground survey of the area was conducted to ensure that all cultural materials had been identified and recorded during the 2009 field season.	Historic
ILI-00236	ILI-00236	Midden of cut antler, bone, and wood was discovered in a swale. All the wood and bone showed evidence of having been cut with a saw and was well incorporated into the surface vegetation. A tent ring on the raised ground is likely connected to the midden in the swale below, although it is difficult to determine if it represents one long episode of camp supported hunting and processing of caribou or a series of events over time with the site reused for more than one harvest episode. The presence of the antlers indicates that the purpose of the hunt was meat, rather than trophies.	Historic
ILI-00237	ILI-00237	Site includes up to two tent rings located in low-lying tussock tundra. This area was likely well-sheltered from winds, but would have been a damp and uneven place to camp. No fire rings, middens, or wood caches were located near the site.	Historic
ILI-00238	ILI-00238	Site consists of about six cobbles in a circle, measuring 6m in diameter. The cobbles are small, around 10cm diameter, with one larger boulder.	Historic

AMERICAN OVERSIGHT

Table 3.7-1. Known Archaeology Sites near the Mine Study Area

AHRS No.	Site Name	Summarized Description	Period
ILI-00239	ILI-00239	This site consists of two large flat boulders, near a caribou skull, with smaller rocks lying on top of the vegetation. This configuration of rocks suggests that the rocks were purposefully stacked by humans.	Historic
ILI-00240	ILI-00240	Site consists of a knoll with exposed bedrock with fracture zones filled with clear quartz crystal to opaque or milky white material, and chalcedony geodes. SRB&A found no manufactured tools or debitage on the surface or in three subsurface tests, the site has good potential as a raw material source and as such the distribution of unused materials on the surface may reflect the selective use of the materials made by prehistoric users. One fragment resembled a possible tool in form but was left in situ.	Unknown
ILI-00241	ILI-00241	Site is a prominent knoll with bedrock outcroppings with veins of quartz and chalcedony. This site is smaller than the similar site ILI-00240, with two outcrop mounds surrounded by an area of bare bedrock. The knoll is surrounded by a litter of quartz fragments including clear, milky, and fractured pieces. This distribution of material may indicate that the site had been used by prehistoric toolmakers, with the fragments examined and the unusable ones discarded.	Unknown
ILI-00242	ILI-00242	Pile of intentionally stacked rocks of unknown purpose. The stack consists of boulder-sized rocks measuring approx. 1m in diameter and 0.5m high. The stack was not likely a "pretend person" but could have been a rock cache or claim mark. No indications of the reason for its construction were found.	Unknown
ILI-00249	ILI-00249	Site is a lithic scatter. The surface is un-vegetated rounded pebbles to cobbles with patches of tundra vegetation. Twenty large flakes and one unifacially worked piece were located on the deflated surface of the terrace and slumping down the stream bank.	Prehistoric
ILI-00250	ILI-00250	ILI-00250 is a lithic scatter. The site consists of three artifacts found on the un-vegetated cobble to pebble surface in the interstices between hummocks and patches of vegetation. The artifacts consist of two flakes and one core.	Prehistoric
ILI-00251	ILI-00251	Site consists of two flakes of green silicified mudstone on an eroded blowout surface. One flake is blade-like. The location is an excellent hunting area with game trails below the site.	Prehistoric
ILI-00252	ILI-00252	Site includes artifacts consisting of numerous small fragments of charcoal and debitage likely resulting from pressure flaking of larger pieces. The area of the cultural deposit is relatively small and consists of a distinctly colored soil deposit beneath the root mat. There was no surface indication of cultural resources deposits.	Prehistoric
ILI-00253	ILI-00253	The site consists of a single dark gray igneous flake recovered from a subsurface test, but there is potential for the recovery of further subsurface artifacts. Viewshed is excellent to the south and west. Most of the northeast tributary valley is visible from the site area. A portion of the Upper Talarik Creek valley is visible to the southwest as well.	Historic
ILI-00260	ILI-00260	SRB&A originally identified this site in 2011 based one test that yielded over 50 lithic debitage and charcoal from between 0 and 5cm. Three other subsurface tests on the landform did not reveal additional cultural materials. The position of the site suggests the site was used as a hunting lookout. In 2012, SRB&A identified two possible stone tent rings within the AHRS site boundary. Vegetation obscures more than 90 percent of both possible tent rings. The field crew mapped in the two potential features but did not conduct any testing in or near either of the possible tent rings because they are located within the site boundary.	Prehistoric

AMERICAN OVERSIGHT

Table 3.7-1. Known Archaeology Sites near the Mine Study Area

AHRS No.	Site Name	Summarized Description	Period
ILI-00261	ILI-00261	The ground surface is up to 50% percent exposed till and gravel. The cultural materials at the site consist of one piece of lithic debitage observed on the surface among the gravel. Pedestrian survey and two subsurface tests yielded no other artifacts.	Prehistoric
ILI-00268	ILI-00268	The site consists of SRB&A identified the site based on artifacts from two test that yielded 11 lithic flakes, one piece of lithic shatter, one lithic core and charcoal. The area is sparsely vegetated on the terrace with increasing vegetation near the river. The subsurface lithic materials and the charcoal were collected.	Prehistoric
ILI-00269	ILI-00269	This site consists of one stone feature. This feature consists of a collection of cobbles. These cobbles are stacked in a semi-circular pattern with the opening facing down-slope to the N. The view shed is comprised of the valley with one of the Talarik's tributaries. The stones appear to have been settling into the ground for at least 20 years.	Unknown

3.7.4 Amakdedori Port

SRB&A based the extent of the ECIBSA on information provided by PLP to characterize cultural resources in broader areas of interest in the lower Cook Inlet region. The ECIBSA spans a large section of western lower Cook Inlet and extends from Kamishak Bay area in the south to the Chinitna Bay area in the north. Background research completed by SRB&A covered the extent of the ECIBSA, with a focus on two particular areas: the Knoll Head Offshore Area and Diamond Point Area, both of which are not in the Amekdedori Port area. Specifically related to offshore cultural resources, SRB&A reviewed two online databases of shipwrecks including the National Oceanographic and Atmospheric Administration (NOAA 2011) Automated Wreck and Obstruction Information System database and the Bureau of Ocean Energy Management (2011) Alaskan Shipwreck Database, and provided data regarding the history of the S.S. Farallon shipwreck.

SRB&A's review of the AHRS database identified 58 previously documented AHRS sites within the entirety of the ECIBSA, two of which (ILI-00185 and ILI-00186) were documented by SRB&A during the 2005 field season. The 58 AHRS sites identified prior to SRB&A's 2012 surveys in the ECIBSA, as well as the three sites identified by SRB&A in 2012 total 61 documented sites across the ECIBSA.

Importantly, there are only two known sites reported in the vicinity of the Amakdedori Port facility, and only limited cultural resource surveys and place name research have occurred here. SRB&A investigated two locations for a proposed weather monitoring station near Amakdedori, and for a repeater tower on a mountain approximately seven miles inland west from the station (SBR&A 2015). One of the two sites is a historic-era shipwreck (ILI-00291) which suggests the need for additional research for the potential of marine archaeology sites that may be encountered during construction of the offshore components of the port facility, and in routing

AMERICAN OVERSIGHT

the natural gas pipeline across Cook Inlet. The site descriptions provided in Table 3.7-2 are from the AHRS database (AHRS 2018).

Additional surveys would likely result in the identification of more cultural resources. The geographic information system (GIS) analysis demarks the coastline near Amakdedori as favorable beach lands for the harvest of subsistence resources, which suggests a higher potential for site location. The place names research also focused on the northern portion of the ECIBSA, and does not extend to the port facility or the beginning of the Transportation Corridor.

AMERICAN OVERSIGHT

Table 3.7-2. Known Archaeology Sites near the Amakdedori Port

AHRS No.	Site Name	Summarized Description	Period
ILI-00044	Amakdedori Village Site	Village site consisting of five house pits of two rooms each, with connecting passages and five smaller square pits. All are located on the second and third vegetated beach ridges, which are being eroded by the creek. Testing of two house features by Reger (1980) identified historic artifacts and floor deposits dating to AD 1889-1912.	Prehistoric/ Historic
ILI-00291	AGRAM Shipwreck	Site Description: On October 12, 1923 at 8:45 am the wooden gas screw cannery tender AGRAM was washed ashore and became a total wreck on a beach between Chinik Bay and Amakdedori Native Village. The vessel was en route from Seldovia to Iniskin Bay with her captain, A. K. Thompson of Tacoma and two other crewmen aboard when they ran into a very high sea running together with the worst wind and storm ever witnessed in Cook Inlet. The accident report filed at Juneau on February 15, 1924 described the accident: Wind, high seas, rain and sleet. Constant sounding all night, anchored in 10 fathoms of water, line broke, put second anchor out (250#) also broke away and drifted on beach. This storm seems to be the worst that any living natives in Alaska know anything about. The native village of Amukadorey (sic) was entirely wiped out of existence, and the oldest residents say that nothing like this was ever heard of before, and that they think that there is not a gas boat in Alaska that would have withstood this storm. The vessel was valued at $8,000 at the time of the wreck, but only insured for $4,000. There was no cargo. The crew and passengers reached shore with nothing except the clothing they wore and subsisted on clams and porcupines until the halibut boat Jugo-Slav rescued them. The AGRAM was rated at 22 Gross and 18 Net tons. The ship was built in 1913. At the time of wrecking the vessel was owned by the Cook Inlet Packing Company and registered in Juneau. According to Doug Reger, who surveyed this stretch of the coast in 1980, no shipwreck remains were visible beyond the large amount of debris on Amakdedori beach, which is known for drift debris. The ships remains may still be present below the waterline, although the high energy environment has likely compromised the wrecks structural integrity. 3.7.5 Transportation Corridor

There are no previously identified cultural resources in the Transportation Corridor, largely due to the lack of any background research or field survey. The current corridor is south of the Transportation Corridor study area delineated and investigated for the EBD reports (SRB&A 2011 and 2015). SRB&A did limited field work in the previously defined Transportation Corridor study area, which involved examinations of land along the west side of the Newhalen River between Nondalton and Iliamna and of a drilling-core storage area in Iliamna, both visited in October 2006. These studies are not applicable to the South Access Road.

[Note: Analysis is underway to determine if previously surveyed areas overlap with any of the transportation corridor north of Iliamna Lake, particularly for the Iliamna Spur Road and north end of the Mine Access Road as it enters the Mine Site footprint.]

AMERICAN OVERSIGHT

A review of the AHRS resulted in the identification of ten cultural resource sites within roughly one mile of Transportation Corridor, but no sites within the corridor. Two of these sites are discussed in Section 3.7.4 for sites near Amakdedori Port. The remaining six sites are described below in Table 3.7-3. The remaining sites include a cluster of sites in and around Kokhanok Village near the South Ferry Terminal and along the south shore of Iliamna Lake. The other sites are more isolated.

Table 3.7-3. Known Archaeology Sites near the Transportation Corridor

AHRS No.	Site Name	Summarized Description	Period
ILI-00008	Old Kakhonak	Eskimo village, with a population of 28, listed in the 1890 census. The site was apparently abandoned as residents moved to the present village during the 1940–1950s. Yarborough, in two surveys, noted two or three graves, upright poles from an apparent cache, the remains of a 4m x 5m log cabin, a 2m x 1.1m x .6m deep depression, and a shallow 2m x 5m rectangular feature. Site is near south ferry terminal.	Historic
ILI-00009	Napaimute	Former Eskimo village or camp reported in the 1890 Census as "Napaimiut," with a population of 11. Sue Woods, who owns an allotment on the S side of Lake Illiamna, reported graves at this locality. Graves would tend to confirm this as the location of a village. Site is near south ferry terminal.	Historic
ILI-00025	Saints Peter and Paul Chapel, Kakhonak	Russian Orthodox church built about 1940. Consists of a 25'-6" x 15' nave and sanctuary and an attached 8'-1" x 9'-2" vestibule. The exterior is shingle and corrugated metal. A 2011 survey by THRC stated that the condition of the church was "dilapidated" and a new church has been built (1984) to the SE. [NATREG] Russian Orthodox Church built about 1940. Consists of a 25'6"x 15' nave and sanctuary and an attached 8'1"x 9'2" vestibule. The exterior is shingle and corrugated metal. Site is in Kakhonak Village near south ferry terminal.	Historic
ILI-00056	Gibraltar Lake Village	BIA investigators noted some 12–15 house pits within a 70m x 120m site area on the north bank of the outlet of Gibraltar Lake. The pits, which are poorly defined, appear to cluster on two adjacent mounds, separated by about 45m. A shovel test in the westernmost loci revealed cultural material (beneath the sod and a thin layer of Katmai Ash) consisting of burnt bone, charcoal, and fire cracked rock in a sandy silt matrix, to a depth of about 75cm. A single basalt flake was noted and a C14 date of BP 860+/-60 was obtained. On the north end of Gibraltar Lake, near the south access road.	Prehistoric
ILI-00128	Stone Tools, Possible AsST	No Description	N/A
ILI-00218	Isolated Lithic Find	This site consisted of one possible microblade or blade core. The core was found on the surface of the tundra. No other lithics were found on the surface or in test pits excavated nearby. Near mine access road.	Prehistoric/ Protohistoric
ILI-00241	ILI-00241	Site is a prominent knoll with bedrock outcroppings of flysch material, with veins of quartz and chalcedony interbedded with the host material. This site is smaller than the similar site ILI-240, with two outcrop mounds surrounded by an area of bare bedrock in the form of fractured slate material. The knoll is surrounded by a litter of quarts fragments including clear, milky, and fractured pieces. This distribution of material may indicate that the site had been used by prehistoric tool makers, with the fragments examined and the unusable ones discarded.	N/A

AMERICAN OVERSIGHT

Table 3.7-3. Known Archaeology Sites near the Transportation Corridor

AHRS No.	Site Name	Summarized Description	Period
ILI-00261	ILI-00261	Site is on a glacial ridge. The ground surface is up to 50 percent exposed till and gravel. The cultural materials at the site consist of one piece of lithic debitage observed on the surface among the gravel. Two subsurface tests conducted on the ridge did not result in the identification of a subsurface component at the site. Site is east of the mine access road.	Prehistoric
ILI-00262	Kokhanok BIA School	The building is currently a single-story frame building measuring 68ft x 18ft in plan, a ridgeline at 11ft and a very low-slope roof, with a satellite dish abutting the W facade. Built ca. 1957 the Kokhanok BIA building served as a school from the late 1950s into at least the 1980s. The building contains basic attributes found in some period BIA schools in Alaska, but has undergone substantial alterations since 1973. Comparison of the 1973 building with the current makes evident an addition built on to the original N end as well as the removal of some of the original fenestration and removal of the original siding. The building currently houses administrative offices.	Historic
ILI-00269	PGCO4 2012-3	On the slope of a small ridge, this feature consists of a collection of cobbles. These cobbles are stacked in a semi-circular pattern with the opening facing down-slope to the N. The view shed is comprised of the valley with one of the Talarik's tributaries. The stones appear to have been settled for at least 20 years.	N/A

3.7.6 Natural Gas Pipeline Corridor

While the natural gas pipeline represents a distinct project component, the proposed route from Amakdedori Port to the Mine Site falls within the Transportation Corridor. The affected environment discussion for the Transportation Corridor applies to this portion of the Natural Gas Pipeline Corridor. However, no work has been done regarding marine archaeology or historic maritime archaeology for the Iliamna Lake crossing, so there is currently no information regarding the affected environment for this portion of the Natural Gas Pipeline route. The onshore gas line project area on the east side of Cook Inlet will rely on existing infrastructure, and not part of the construction plans for this project. There are no sites currently listed in the AHRS within the pipeline corridor between Happy Valley and near Anchor point where the route crosses Cook Inlet.

3.8 HISTORIC PROPERTIES

Comment [ACHP-JTE1]: Change this section to active voice to make it clear who is responsible to carry out the identification effort.

As noted in Section 3.7, Cultural Resources, Historic Properties is specifically defined in 36 CFR 800.16 (l)(1) as "any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places maintained by the secretary of the interior. This term includes artifacts, records, and remains that are related to and located within such properties. The term includes properties of traditional religious and cultural importance to an Indian tribe or Native Hawaiian organization and that meet the National Register criteria."

There are no previously identified historic properties in the Mine Site, Transportation Corridor, Amakdedori Port, or Natural Gas Pipeline components of the project. The studies completed by SRB&A for the Pebble Limited Partnership Environmental Baseline Documents were scoped and completed as "Identification Phase" surveys per the standards and guidelines issued by the Office of History and Archaeology, which summarily aim to determine the presence or absence of sites, but do not involve completing significance evaluations. Further National Register of Historic Places evaluations would be required to advance the project's permitting process in accordance with the requirements of Section 106 of the National Historic Preservation Act and to fully assess direct and indirect impacts under the National Environmental Policy Act. Even though there are currently no known historic properties in the project footprint, indirect effects on historic properties within the Area of Potential Effect (APE) will need to be considered, and the APE may include lands surrounding the footprint where known sites have been identified. Consultation among the State Historic Preservation Office, the U.S. Army Corps of Engineers, and other consulting and interested parties, will finalize the APE and offer direction for completing NRHP eligibility recommendations.

Comment [ACHP-JTE2]: As the APE and the scope of the identification effort have yet to be delineated in consultation with SHPO and other consulting parties, including tribes, and informed by the information that other stakeholders can provide, the identification effort is barely begun.

Comment [ACHP-JTE3]: If TCPs, cultural landscapes, etc., encompass portions of the footprint of the project, then, potential effects to such properties might also be direct.

Comment [ACHP-JTE4]: This chapter should clarify the IDENTIFICATION efforts that still need to be carried out in the APE in consultation with SHPO, Tribes, and other consulting parties. Eligibility recommendations are not the only steps lacking. What about ethnographic studies/ TCP studies, etc.

AMERICAN OVERSIGHT

Preserving America's Heritage

July 5, 2018

Ms. Sheila Newman
Program Manager-Large Projects
USACE-Regional Regulatory Division
Alaska District, U.S. Army Corps of Engineers
P.O. Box 6898
JBER, AK 99506-0898

Ref: ACHP comments on pre-draft sub-Chapter 3.7 and sub-Chapter 3.8, Pebbles Mine Project EIS
DA permit application POA-2017-271
Lake and Peninsula Borough, Kenai Peninsula Borough, Alaska

Dear Ms. Newman:

The Advisory Council on Historic Preservation (ACHP) is providing initial comments on the pre-draft versions of sub-Chapter 3.7: *Cultural Resources* and sub-Chapter 3.8: *Historic Properties* of Chapter 3: *Affected Environment* for the Environmental Impact Statement (EIS) being developed by the Corps of Engineers, Alaska District (Corps) for the Pebbles Mine Project in Alaska. The ACHP has made comments and edits in red-line strike-out in the text (enclosed). We also provide a summary of our comments in this letter. Overall, it is our opinion that the pre-drafts of sub-Chapters 3.7 and 3.8 are preliminary and need significant revisions and additions.

General comments

The Corps should convert most of the text to utilize an active voice, which will clarify what agency or entity has completed or will carry out aspects of the identification and evaluation of effects to cultural resources and historic properties. The current version of sub-Chapter 3.7 appears to conflate cultural resources as defined in the National Environmental Policy Act (NEPA) and historic properties as defined in Section 106 of the National Historic Preservation Act (NHPA) (54 U.S.C. § 300101 et seq.) and its implementing regulations, "Protection of Historic Properties" (36 C.F.R. Part 800). This chapter should more clearly differentiate historic properties under Section 106 from cultural resources under NEPA. It should also clearly articulate the requirements of federal and state statutes and regulations. Sub-Chapter 3.8 has minimal content. This chapter should clarify the identification efforts that still need to be carried out in the broader Area of Potential Effects (APE) once it is delineated in consultation with SHPO, tribes, and other consulting parties, as well as the sufficiency of the identification effort already carried out in the footprint of specific project components. The Corps should also outline how it will determine the eligibility of identified properties and assess effects on eligible properties in consultation with consulting parties.

AMERICAN OVERSIGHT

Section 106

In referencing the requirements of Section 106, the Corps should clearly describe the four-step Section 106 review process that is set forth in the Section 106 regulations. As noted above, the chapters should clearly differentiate between NEPA's cultural resources and NHPA's historic properties, as the latter is defined in the Section 106 implementing regulations.

The Corps needs to clearly state the current status of the Section 106 review process and provide a timeline for when the various steps in the Section 106 review will be initiated or completed. The Corps needs to specify when and how the federal agencies will delineate the APE and the scope of identification effort for the undertaking in consultation with the Alaska SHPO and other consulting parties including tribes who may ascribe significance to properties that may be affected.

The Corps should also accurately describe the consultation process that federal agencies must carry out with SHPOs, Tribal Historic Preservation Officers (THPOs), tribes, and other consulting parties that will inform all the steps of the Section 106 review. It should clarify when and how the federal agencies have or will identify and invite consulting parties into the Section 106 review and specify the process by which federal agencies will engage in the necessary consultation.

Tribal Consultation

As defined in 36 CFR §800.16(m), the term Indian tribes and tribes include Alaska Native Villages and Regional or Village Corporations, as those terms are defined in the Alaska Native Claims Settlement Act. Federal agencies are obligated to consult with tribes for all the steps of the Section 106 review process. Further, consultation with Indian tribes must be carried out in a manner that acknowledges the government to government relationship between federal agencies and Indian tribes.

The scope of the identification effort, determinations of eligibility and effect, and steps to resolve adverse effects must all be informed by the traditional knowledge of tribes who ascribe significance to such properties, as gathered from ethnohistoric data, oral history, and other types of research. This chapter should reference the process the federal agencies will use to insure they have actively sought the information necessary to meet the reasonable and good faith standard for the identification effort in the Section 106 regulations. This chapter should also specify how the federal agencies will consult with the tribes to utilize and supplement as needed the place name data and subsistence data, etc., that appears to have been gleaned from studies carried out in the past, but not necessarily focused on this undertaking.

This chapter should also reference the responsibility of federal agencies to address tribal concerns about confidentiality. The Corps, other federal agencies, the project proponent, and its consultants must be sensitive to concerns of the tribes regarding the confidentiality of information they share about properties of religious and cultural significance.

Conclusion

The federal agencies and their contractors developing the drafts of the EIS should refer to *NEPA and NHPA: A Handbook for Integrating NEPA and Section 106* issued by the ACHP and CEQ in March

AMERICAN OVERSIGHT

2013 for guidance regarding how to better integrate the requirements of Section 106 and the NEPA review process. It is available at: http://www.achp.gov/nepa106.html.

The ACHP provides these comments to assist the Corps, other federal agencies, the Alaska SHPO, Indian tribes, and other consulting parties in the development of the EIS and compliance with Section 106 for the Pebbles Mine project. Should you have any questions or wish to discuss the comments we have provided, please contact John T. Eddins, PhD at 202-517-0211, or by e-mail at jeddins@achp.gov.

Sincerely,

Charlene Dwin Vaughn, AICP
Assistant Director
Federal Permitting, Licensing, and Assistance Section
Office of Federal Agency Programs

Subject: RE: Site visit August 28; please respond by July 30

Hi Shane,
Yes, I would like to send state representative(s) on this trip. I've had some internal discussions about who would be best to send. If there are two seats available, we would like to send one representative from our Lands Section and one from our Mining Section. If more seats are available we may have one other person to send. Can you confirm the per person cost estimates and the number of seats that might be available for state representatives on this trip?

Also, Would you be able to confirm with me which transportation corridors you would be looking at on this trip? I assume you would be flying the route proposed by PLP in their application and the Pedro Bay route, but if my assumption is incorrect, or if you are possibly looking at more than those two routes, it would be helpful to know that ahead of time. Thanks for inviting us on the trip and I look forward to working out the details with you.

Take care,
Kyle Moselle
Associate Director
Alaska Department of Natural Resources

Subject: Site visit August 28; please respond by July 30

All,
We contacted Maritime and they are available the week of the August 26; the 28th is best for the Corps and are proposing to fly that day. Low tide is approximately 10:30, and I would like to see the coast as de watered as possible. We will be landing at the Amakdadori site and flying at least two transportation corridors. That being said, we will need confirmation that representative(s) from your agency will want to participate soon. Please respond by July30, so that we can start coordinating.

Approximate cost will be $1300 / hour, plus fuel at cost Approximately 38 gallons/ hour at $4-$5/gallon

[A four hour flight would cost approx. $2060, an 8 hour flight would cost approx.. $2820.]

VR

Subject: ACHP Coop Agency Scoping Comments and Comments on Preliminar Scoping Issues Report
Attachments: ACHP Scoping Comments for Pebble Mine 20180629 rjn vh rev03.docx

All
Attached are ACHP's general scoping comments and also comments on the Preliminary Scoping Issues Report.
John

AMERICAN OVERSIGHT

The Advisory Council on Historic Preservation (ACHP) is providing comments on the Preliminary Scoping Issues Report (PSR) which summarizes stakeholder comments submitted to the Corps of Engineers, Alaska District (Corps) between April 1, 2018 and May 15, 2018, during the Corps' scoping for the review of Department of the Army permit application POA-2017-271, submitted by Pebble Limited Partnership (83 FR 13483; pages 13483-13484). The Corps is lead agency for development of a Draft Environmental Impact Statement (EIS) for the proposed Pebble Mine Project for compliance with the National Environmental Policy Act (NEPA). In this submission, we also provide, as a cooperating agency in the NEPA process, our general Agency Scoping Comments regarding the proposed undertaking.

The Undertaking is development of the Pebble copper-gold-molybdenum-porphyry deposit as an open-pit mine, with associated infrastructure, in southwest Alaska, north of Iliamna Lake. The Corps is carrying out scoping to assist in determining the scope of analysis, significant issues, and alternatives to be analyzed in depth in the Draft EIS in compliance with the requirements of the NEPA. ACHP provides its comments here, with an emphasis on the obligation of federal agencies to comply with Section 106 of the National Historic Preservation Act (54 U.S.C. § 306108), and its implementing regulations, "Protection of Historic Properties" (36 C.F.R. part 800). In this submission, we also provide, as a cooperating agency in the NEPA process, our general Agency Scoping Comments regarding the proposed undertaking.

Comments on the Preliminary Scoping Issues Report (PSR)

In reviewing the PSR, the ACHP notes that stakeholders have submitted a range of comments regarding different types of resources that can also relate to historic properties. The Corps should keep these comments in mind as the Corps carries out compliance with Section 106 of the NHPA.

Stakeholder comments focus on socioeconomics, subsistence activities, traditional lifeways, archaeological and cultural resources, visual resources, and areas with wilderness qualities. In their comments, stakeholders have specifically referenced the Corps' responsibility to consider effects to traditional native or cultural sites, burial grounds, camp sites, rock art sites, and other cultural resources within the mine and utility corridors. Stakeholders have indicated concerns about the development process, the operation of the mine, the subsequent closure and cleanup, the associated increase in noise, people, heavy equipment, traffic, contamination from spills and run-off, and the potential for effects on ancestral hunting and fishing areas, and other traditional land use areas, as well as effects on subsistence activities, and resultant effects on traditional culture and ways of life.

Stakeholders have stressed the need for the Corps to:

1) study and be informed by traditional ecological knowledge;
2) consider the pristine and wilderness quality of many areas that may be impacted by the project, including: the Koktuli, Nushagak and its tributaries, Upper/Lower Talarik Creeks, the Gibraltar River, the Kvichak River, and other tributaries of Iliamna Lake;
3) consider effects to the setting and visual resources and the experience of visitors and residents in the areas affected;
4) carefully consider long term and cumulative effects, keeping in mind the potential long duration of the project and the potential that this project may facilitate and encourage 20 other large-scale active mining claims in the Bristol Bay watershed by providing transportation and power infrastructure that they can utilize.

AMERICAN OVERSIGHT

ACHP General Cooperating Agency Scoping Comments

In complying with Section 106 of the NHPA, the Corps is required to make a reasonable and good faith effort to identify historic properties that may be affected by the undertaking. The scope of the identification effort should be developed in consultation with the Alaska State Historic Preservation Officer (SHPO), Indian tribes, which, for purposes of Section 106, includes Alaska Native Villages, Regional or Village Corporations, as those terms are defined in the Alaska Native Claims Settlement Act, the proponent, and other consulting parties. Consultation with Indian tribes must be carried out in a manner that acknowledges the government to government relationship between federal agencies and Indian tribes.

The Corps should require appropriate inventory surveys for the broad range of historic property types that may be present within the APE, including:

1) Archaeological sites and archaeological districts;
2) Properties of cultural and religious significance to Indian tribes;
3) Traditional cultural properties, including landscapes;
4) Standing structures;
5) Historic Districts.

It is important that the Corps identify and consult with any Indian tribes that ascribe cultural and religious significance to historic properties that may be affected by the undertaking, and work with them to determine an appropriate scope for the identification effort. Determinations of eligibility and effect, and appropriate steps to resolve adverse effects must be informed by the traditional knowledge of Indian tribes who ascribe significance to such properties, as gathered from ethnohistoric data, oral history, and other types of research.

The Corps, other federal agencies, the project proponent, and its consultants must be sensitive to concerns of the Indian tribes regarding the confidentiality of information they share about properties of religious and cultural significance. Further, as noted in our comments on the PSR, the scope of the Corps identification effort should be informed by many of the concerns expressed in the stakeholder scoping comments, even if they don't specifically reference Section 106.

ACHP looks forward to assisting the Corps, other federal agencies, SHPO, Indian tribes, and other consulting parties in review of the Pebbles Mine project under NEPA and Section 106 of the NHPA. Should you have any questions or wish to discuss this matter further, please contact John T. Eddins, PhD at 202-517-0211, or by e-mail at jeddins@achp.gov.

Subject: August 22 Cooperating Agency meeting notes and future agency meeting notes

Dear Shane –

We were surprised to see that notes from the August 22, 2018 Cooperating Agency Meeting on Alternatives Screening were posted to the Corps' Pebble EIS public website. It was our understanding that the Corps would not be making notes from Cooperating Agency meetings publicly available. This understanding came from the January 18, 2018 Cooperating Agency meeting, where Sheila Newman indicated that the Corps did not plan to record interagency conversations unless they are part of a specific decision-making meeting. We were not informed that the August 22nd meeting was a "decision-making meeting," and did not view it as such. Rather we saw it as our first opportunity to hear from the Corps and AECOM how they were specifically conducting alternatives screening and as a brainstorming and Q&A meeting to discuss the alternatives process and preliminary rationale for alternatives considered or dismissed.

In addition, we note that the Cooperating Agency Coordination Plan (6/1/18 version) states "*CAs are encouraged to engage in robust discussion and debate during CA meetings and topical discussions on affected resources. These meetings ensure that all cooperating voices are heard throughout the EIS process and that multiple views can be*

AMERICAN OVERSIGHT

thoroughly discussed. The USACE will not use the exchange that occurs within these meetings as a substitute for agency position or comments." By posting the meeting notes on the public website under the heading "Cooperating Agency Scoping Documents," the discussion from the meeting is being presented as agency comments. While the meeting discussion entailed questions and observations from us, it was not reflective of formal agency comments on alternatives. In fact, before submitting written comments, we specifically requested more details related to the rationale for how certain alternatives were developed (or not) and for some alternatives that were dismissed.

We are also concerned that the notes were finalized and made public without an opportunity for Cooperating Agencies to review a draft version of the notes. It is standard practice for NEPA Cooperating Agency meeting notes to be circulated in draft form to meeting participants, and for corrections to be made prior to finalization for the file. For example, we note several omissions from and edits to the meeting notes posted to the website, which we would have provided if given the chance to review. These include:

- A robust discussion from the early part of the meeting regarding how the Corps determined a threshold for economic practicability in the absence of an economic feasibility study, as well as how environmental impact trade-offs were considered, was not included in the notes.
- Regarding Mine Locations and Layout Options, we have the following edits:
    - LOC-001 through LOC-003: Patty McGrath suggested a figure to illustrate and additional discussion to explain why these options have been selected. Patty also asked why the alternatives considered do not include mining of Pebble East, the high-grade underground deposit. Bill noted that the analysis does not include a larger mine as an alternative, but does analyze it as a cumulative effect.
    - Patty also recommended a figure to illustrate the mine layout options and location options for waste and tailings storage (as was done for the access options) and additional discussion explaining why these particular locations and layouts were identified and dismissed.
    - Patty asked what happens with pyritic tails in the full build-out scenario. Bill noted that an RFAI is pending with Pebble on this question, and they are also looking at EPA's BBWA.
- Regarding Throughput Options, we have the following edits:
    - Patty suggested need for more information backing-up statements about financial return, including for example why 50,000 tpd does not provide "positive financial return".
- Regarding Concentrate Transport, we have the following addition:
    - There was also a request to look at the NPDES New Source Performance Standards no discharge of process waste water requirements and exemptions which would limit the ability to discharge filtered concentrate water.
- Regarding Tailings, we have the following edit:
    - Patty suggested reviewing the ongoing EIS process for the Resolution copper/molybdenum mine in Arizona regarding tailings management techniques and alternatives.

In the future, we respectfully request that the Corps:

(1) inform Cooperating Agencies in advance when meetings are being regarded as "decision-making" and notes will be recorded and made publicly available on the project website; and,
(2) provide the Cooperating Agencies with an opportunity to review and comment on a draft version of the notes, prior to finalization, any time "official" Cooperating Agency meeting notes are recorded for the file, regardless of whether or not they will be posted to the website.

We are committed to accomplishing a review of draft meeting notes quickly. We think that these steps will ensure a common understanding of meeting purposes and the most accurate representation of our statements in the meeting notes.

Please feel free to call if you wish to discuss.

Best regards-
Patty

AMERICAN OVERSIGHT

The Advisory Council on Historic Preservation (ACHP) has reviewed the Draft Scoping Report (dated July 25, 2018) summarizing stakeholder comments submitted to the Corps of Engineers, Alaska District (Corps) between April 1, 2018, and May 15, 2018, during the Corps' scoping for the review of Department of the Army permit application POA-2017-271, submitted by Pebble Limited Partnership (83 FR 13483; pages 13483-13484). The Corps is lead agency for development of a Draft Environmental Impact Statement (DEIS) for the proposed Pebble Mine Project for compliance with the National Environmental Policy Act (NEPA). On July 5, 2018, ACHP commented on the Preliminary Scoping Issues Report (PSR). As before, the ACHP provides its comments here, with an emphasis on the obligation of federal agencies to comply with Section 106 of the National Historic Preservation Act (54 U.S.C. § 306108), and its implementing regulations, "Protection of Historic Properties" (36 C.F.R. part 800).

In reviewing the Draft Scoping Report, the ACHP wishes to reiterate its comments on the PSR. As noted, stakeholders have submitted a range of comments regarding different types of resources that can also relate to historic properties. We again advise that the Corps should keep these comments in mind as the Corps carries out compliance with Section 106 of the NHPA.

Stakeholders have stressed the need for the Corps to:

1) study and be informed by traditional ecological knowledge;
2) consider the pristine and wilderness quality of many areas that may be impacted by the project;
3) consider effects to the setting and visual resources and the experience of visitors and residents in the areas affected;
4) carefully consider long term and cumulative effects, keeping in mind the potential long duration of the project, potential expansions of the project beyond what is currently proposed for permit review, and the potential that this project may facilitate and encourage a number of other large-scale active mining claims in the Bristol Bay watershed by providing transportation and power infrastructure that they can utilize.

The Corps should require appropriate inventory surveys for the broad range of historic property types that may be present within the APE. The Corps should also clarify in the DEIS where it is in the Section 106 review and when the proponent will be carrying out the needed inventory surveys for identification of historic properties that may be affected by the undertaking. As noted in our comments on the PSR, determinations of eligibility and effect, and appropriate steps to resolve adverse effects must be informed by the traditional knowledge of Indian tribes who ascribe significance to such properties, as gathered from ethnohistoric data, oral history, and other types of research. Finally, as we noted in our comments on the PSR, the Corps, other federal agencies, and the proponent must be sensitive to concerns of the Indian tribes regarding the confidentiality of information they share about properties of religious and cultural significance.

ACHP looks forward to assisting the Corps, other federal agencies, SHPO, Indian tribes, and other consulting parties in review of the Pebbles Mine project under NEPA and Section 106 of the NHPA. Should you have any questions or wish to discuss this matter further, please contact John T. Eddins, PhD at 202-517-0211, or by e-mail at jeddins@achp.gov.

Hi Patty – thanks so much for your review. I made some minor edits to the comments, and added a few of my own. I know you said you didn't need to review my revisions before sending to the Corps, but if you do have time to take a look at what I've added (in track changes) please do, and let me know if you have any questions/concerns on my comments. I'll plan to send this to Shane by Wednesday afternoon. Jill has said she does not need to review.
Thanks,
Molly

Hi Barb and Cindi-
I have not had an opportunity to review this memo yet, but plan to do so tomorrow. If you have time, can you also review and send Molly and I any comments that you have by COB 10/22? If you do not have time, please let me know. I have reviewed dry stack analyses for other EISs so I am pretty comfortable with this, but would also appreciate a second (or third!) set of eyes.
This memo will be discussed at a meeting with the Corps and other agencies on October 24. We have not decided whether to submit written comments - that will depend on our review.
Thanks -
Patty

Hello Ashley,
The draft scoping letter is now ready for your review. This is actually a little early compared to the original schedule. I understand that at the BB Check-in meeting last week, which I missed, David asked us to try to compress the review schedule if possible. I don't know if this is ultimately going to be possible overall, but we are a few days ahead at this point at least!

So, if possible, please send me your edits by COB Friday (the 18th). (If this won't work and we need to revert to the original deadline of the 23rd, please let me know.)

Thank you,
Molly

Subject: FW: Pebble scoping letter heads-up

Hi Patty – Two things on scoping.

First – I have shown my lack of technical savvy by forgetting to use the Sharepoint site to coordinate drafting and review of the scoping letter. I've moved the draft to the sharepoint site, so if you didn't already begin editing and want to do so on sharepoint, here it is (I am also fine with combining multiple versions, I've been doing it that way for years!):

Internal website / Ex. 6

Second – Per Chris Eckley's email below – if you think there will be a need for his input, I recommend sending him the current draft so he can review before leaving on vacation. Please let me know your recommendation.

Thanks,
Molly

Subject: Pebble scoping letter heads-up

Good morning Cindi, Chris and Tim,
I wanted to give you an update and heads-up regarding the scoping comments for Pebble. As you know, we have a short time window for preparation of the comments, and a large percentage of that will be allotted for the internal review process. Patty and I are currently working on the comments, and plan to have a completed draft by Monday (4/9). At that point I would like to send it to you for your review and input. If Patty and I identify specific areas where more site-specific detail is needed in the scoping letter, I will flag that for you. Otherwise the request will just be to review the portions of the letter related to your area of expertise, and make sure you are okay with the content.

In order to stay on schedule, I will need your input by the 11th. I apologize in advance for the very short turnaround. Please let me know if you will have availability early next week to look over the letter.

Subject: Pebble Scoping Comments - Please review/edit

Good Morning Jay and Karl,
As you know, we are in the process of drafting scoping comments for the Pebble Project, with a short comment window. I have a very aggressive schedule to get the letter ready for management review. I have completed a first draft of the letter, but would like your input on the air quality scoping comments. I believe you are also aware that the Corps has declined our repeated requests to extend our areas of "special expertise" for cooperating agency involvement beyond the 404 nexus. This means that we only have three opportunities for input on AQ issues – Scoping, DEIS and FEIS. Consequently, I want to make sure the AQ comments are as thorough as we can be at this stage, given what we know about the project.

I've attached the current draft of the comment letter. For easy reference I've also provided a link below to the project description on the sharepoint site. The final attachment is the scoping comments on Donlin gold – this letter overall used a much longer format than we are using for this scoping letter, but may provide some ideas of other things to include, if appropriate/necessary.

In order to stick to the letter writing schedule, I will need any comments/edits/additions you have by COB 4/11. If a conference call to discuss would be helpful, please let me know and I will set one up.

Subject: REVIEW REQUEST - Pebble Preliminary Ch. 4 Sections

Hello All,
The Corps has distributed some very preliminary draft sections of Chapter 4 for Cooperating Agency review. These documents do not contain the actual project analysis, but appear to be more of a framework to work from in completing the analysis and EIS text. The sections include heading, some introductory-type text, and some blank tables. The Corps did not provide detailed instructions for review, but I recommend that we review from the perspective of determining whether the skeleton of the analysis presented here appears that it will address the key issues for review, and provide recommendations for inclusion of any issues that appear to have been overlooked in the current structure.

Here are the specific section assignments, similar to last time:
- 4.1 Intro – Molly
- 4.5 Recreation – Molly
- 4.11 Aesthetics – Molly
- 4.14 Soils – Mark/Palmer
- 4.16 Surface Water Hydrology – Tim/Mark/Palmer/Muluken
- 4.17 Hydrogeology – Tim/Mark/Palmer/Muluken
- 4.18 Water and Sediment Quality – Cindi/Tim/Chris
- 4.22 Wetlands/ Special Aquatic Sites – Mark/Palmer
- 4.26 Vegetation – Mark/Palmer

The Corps has requested a quick turnaround for review, therefore please send me any comments you may have on these sections by COB 7/24. I am hoping, given the brevity of these documents, that this timeframe will be achievable, but please let me know as soon as possible if it will not.

Please provide your comments in the attached comment table format.

It may be helpful to look back at the issues we recommended for analysis in our scoping comments - I have saved the final version of that letter on the Sharepoint Site here:

Internal website / Ex. 6

Thank you,
Molly

Hi Patty,
Here is a first draft of the Pebble letter, for your review and for our conversation in a few minutes. I've attached it as a Word doc rather than OneDrive, because there have been some issues with OneDrive links lately.
Thanks,
Molly

Hi Patty,

Personal Matters / Ex. 6

When you have time, would you please follow up with Shane regarding whether a conference line will in fact be available for the scoping meetings in the smaller communities? If the answer is yes, I've attached a document where you, Neverley and I can pick which days we are available to call in.

Personal Matters / Ex. 6

Thanks,
Molly

Subject: Hot Topic - Pebble Scoping

Hi Patty – Jill asked me to write up a Hot Topic on Pebble for OERA, and I know AOO management will want one as well. But, I thought I'd better check in with you before sending it up. Here's what I've got so far – please let me know if you have any edits, or if you've already sent up a Hot Topic for the scoping.

The U.S. Army Corps of Engineers has announced a 30-day public scoping period for the Pebble Project, to run April 1-30, 2018. The Pebble Limited Partnership proposes to mine a large copper-gold-molybdenum deposit located 200 miles southwest of Anchorage on State land. The project includes a large open-pit mine, processing facility, and tailings disposal facilities at the mine site as well as access roads, natural gas pipeline, and port sites on Lake Iliamna and Cook Inlet. EPA is a cooperating agency for development of the EIS. (Contact Patty McGrath 3-6113)

Subject: REVIEW REQUEST - Pebble Preliminary Ch. 4 Sections

Hello All,
The Corps has distributed some very preliminary draft sections of Chapter 4 for Cooperating Agency review. These documents do not contain the actual project analysis, but appear to be more of a framework to work from in completing the analysis and EIS text. The sections include heading, some introductory-type text, and some blank tables. The Corps did not provide detailed instructions for review, but I recommend that we review from the perspective of determining whether the skeleton of the analysis presented here appears that it will address the key issues for review, and provide recommendations for inclusion of any issues that appear to have been overlooked in the current structure.

Here are the specific section assignments, similar to last time:
- 4.1 Intro – Molly
- 4.5 Recreation – Molly
- 4.11 Aesthetics – Molly
- 4.14 Soils – Mark/Palmer
- 4.16 Surface Water Hydrology – Tim/Mark/Palmer/Muluken
- 4.17 Hydrogeology – Tim/Mark/Palmer/Muluken
- 4.18 Water and Sediment Quality – Cindi/Tim/Chris
- 4.22 Wetlands/ Special Aquatic Sites – Mark/Palmer
- 4.26 Vegetation – Mark/Palmer

The Corps has requested a quick turnaround for review, therefore please send me any comments you may have on these sections by COB 7/24. I am hoping, given the brevity of these documents, that this timeframe will be achievable, but please let me know as soon as possible if it will not.

Please provide your comments in the attached comment table format.

It may be helpful to look back at the issues we recommended for analysis in our scoping comments - I have saved the final version of that letter on the Sharepoint Site here:

Internal website / Ex. 6

Thank you,
Molly

Hi Patty – I meant to cc you on this email, so that you too would have the clean version ready for next week's meetings.

From: Vaughan, Molly
Sent: Monday, April 09, 2018 2:18 PM
To: Wake, Neverley <wake.neverley@epa.gov>
Subject: Pebble scoping meeting talking points

Hi Neverley,
Here are the talking points I received from Patty, with input from Ashley Palomaki.

Introductory Talking Points:

- EPA is a cooperating agency in assisting the Corps in developing the EIS.
- The Corps has specifically requested that we provide input into issues related to the CWA 404(b)(1) guidelines.
- EPA has put together a technical team to provide this assistance and review EIS documents.

If asked how the Proposed Determination or Bristol Bay Watershed Assessment influences the EIS process:

- The BBWA is a three-year, twice peer-reviewed study that provides technical and scientific information about the watershed and the impacts of mining the Pebble deposit. We will use the Assessment, along with other available information, to inform our input into the EIS.

- The Proposed Determination, which has not been finalized, contains proposed restrictions for mining the Pebble deposit. It is not a veto of all mining. Pursuant to the terms of a settlement agreement with the Pebble Limited Partnership, EPA cannot move forward with its Section 404(c) process, should such a decision be made, until a Final EIS is noticed for the project or until May of 2021, whichever is sooner.

I'll be teleworking tomorrow, but will give you a call sometime before the meeting to share anything relevant that I learn in participating in the meeting tonight.

Thanks,
Molly

Hi Ashley-
Assuming that the Corps establishes a conference line, Molly, Neverly, and I will be calling into the Pebble EIS scoping meetings.
It is not clear if we will be introduced or be asked to speak and I don't expect that there will be Q&A.

However, in preparation we are preparing talking points. I would appreciate your review of these, particularly what we say (only if asked) about the BBWA.
Feel free to give me a call if you want to discuss.
Thanks –
Patty

Hello Megan,
Attached please find Region 10's draft Scoping letter for the Pebble Project. This letter has already undergone legal and management review here in the Region, and is now ready for headquarters review. We would appreciate your identification of any major issues or concerns with the comments. In addition to OFA/NCD review, please also coordinate with OGC and OWOW. Heidi Nalven and Palmer Hough are the contacts and are standing by to coordinate review within their offices.

We would appreciate receiving any comments by COB on June 12. We would also appreciate if you could compile all HQ comments in a single track changes version of the document. We do have a Sharepoint site for this project, so please let me know if it would be helpful to save the document there so each reviewer can add their comments to the same document.

Please let me know if you have any questions, and thank you for your review.

Molly,
Thank you for sharing the draft comments on preliminary chapter 4 sections that we reviewed in our role as a cooperating agency for EIS development. I appreciate the work that you, Patty, and associate reviewers have put into making recommendations for bolstering the chapter and the EIS. I'm attaching the version on which I have made some suggested edits/wording changes. I also have a few questions about things we might want to add/recommend – although if we have a chance to talk before this is sent out, it could help me to understand whether those points are covered elsewhere or not needed. If any time opens up on my calendar for tomorrow, I will let you know. I could talk on Thursday morning before 9am Pacific time, or if next week would be better, we could schedule time to talk while I'm in DC. If there's not a good time to talk about it, I would appreciate seeing our table of comments again briefly before it goes out, to know which suggestions were incorporated.

Thanks! Jill

Attachments: Pebble Project Scoping 050818 draft.docx

Hi Patty,
The (almost) completed draft scoping letter is attached for your review. Although today was my deadline to get it to you, I had hoped to get it to you sooner. However, I have been held up waiting for associate reviewer input on the section on Marine Environment impact (especially dredging and disposal). Unfortunately, as of the time I need to leave today, I still have not received any comments from Chris Meade on that section. I have been in contact with Jill Nogi, and if Chris is not able to devote time to this today, she will ask someone else in the unit to take a look (though Justine won't have the local/project-specific knowledge that Chris has). I have asked for feedback from ERSMU by Monday **Personal Matters / Personal Matters** and I can incorporate it into the letter at the same time I address your edits – and will also share that section with you again at that time to make sure you don't have any further edits.

Please respond with your edits/comments by Monday morning, so that I can make the needed changes and get the letter to ORC before the Mining Team retreat.

Thank you,
Molly

Will get it to you as soon as we hear back. My hasty thoughts in redline below in terms of considerations/questions to try to help you process the new language or provide something for Joel. Mostly technical or policy, but I'd think we want to be sensitive to how clear the examples are in terms of providing useful information to decisionmakers. Happy to discuss, as always.

From: Barnhart, Megan
Sent: Thursday, June 21, 2018 10:28 AM

Tom,

See below. I am hoping to see the changes from your FO today so I can then work with Joel to finalize this language. Reading through the recent NOAA report you sent me, the NCA, and EPA's tools SLR appears to be less of an issue in this area. I am having our intern do some additional research.

Hi Jill,
The Pebble letter is ready for your review. I will be working until approximately 2:30 or 3pm Alaska time today. If you complete your review before then, I can accept edits and send to David and Tami for their review. If it is not completed in time, please send to them directly as we have discussed.
Thank you,
Molly

Hi Jill,
As we discussed earlier, here are the draft comments on the preliminary chapter 4 sections of the Pebble EIS we received for review. Comments are not officially due until August 31, but Patty and I would prefer to send these to the Corps as expediently as reasonable. Please let me know if you have any comments or edits – you can make your edits directly on this OneDrive version or a separate copy, whichever you prefer.
Thank you,
Molly

Subject: RE: Pebble scoping letter - responses to OFA and OW edits

Jill – My recommendation is that this edit (accepting the changes to the text on pg. 19, but simply keeping in the footnote with the citation) would not need to go back through OFA. If you disagree, please let me know and I will circle back with Megan on that edit.
Thanks,
Molly

Subject: Pebble scoping letter - responses to OFA and OW edits

Hi All,
I had a chance to talk through the OFA edits with Megan Barnhart yesterday afternoon, and have responded to all of the edits received from OFA and OW staff – in the linked document version. **Personal Matters / Ex. 6**
Personal so feel free to call if you want to discuss. I'll accept the edits and clean it up after hearing back from you with concurrence or any additional changes. There was one new comment on Climate which I realize may need to change again after we get final OGC edits back, but I've attempted to address it for now, based on direction from Megan yesterday.
Thanks,
Molly

Hi Ashley. At OFA the review will start at the staff level, as we haven't shared the draft letter with them yet.
Heidi – whichever timing makes most sense to you or works better with your schedule is fine, I was just noting the option of the later review time.
Thanks,
Molly

Hi Ashley and Heidi. I think if I receive the edits by Tuesday afternoon, I can still make things work. Thanks so much for being willing to work with the revised schedule.
Heidi, if it helps, I also wanted to note that after we complete R10 review, we will be sending the letter to OFA/OWOW for review 6/4-6/12, and OGC could also review at that time.
Thanks,
Molly

Hello Ashley,
The draft scoping letter is now ready for your review. This is actually a little early compared to the original schedule. I understand that at the BB Check-in meeting last week, which I missed, David asked us to try to compress the review schedule if possible. I don't know if this is ultimately going to be possible overall, but we are a few days ahead at this point at least!

So, if possible, please send me your edits by COB Friday (the 18th). (If this won't work and we need to revert to the original deadline of the 23rd, please let me know.)

Thank you,
Molly

Hi Patty,

As I had previously committed, I have rewritten the cover letter to, I think, better (but briefly) highlight the key issues of concern for EPA. I have attached it here in case you want to get an early start on reviewing this portion of the letter. I will begin consolidating revisions to the detailed comments from the associate reviewers tomorrow, and will have the complete revised letter to you for review early next week.

Thanks,

Molly

Hi Ashley -
The Corps did send us, and other cooperating agencies, an early version of the draft scoping report. We submitted comments to the Corps on the draft scoping report. I have not reviewed the final to see if/how our comments were incorporated.
Please let Molly or I know if there are further questions.
Patty

Subject: RE: USACE pebble scoping released last week

Hi Heidi -

All that the Corps released on Friday was the scoping report, which summarizes the comments that the Corps received during the public comment period for scoping. Patty let everyone know that this was coming, but I have not heard any questions about it from her/others. The report is meant to inform what the Corps puts in the EIS - and, as you know, we have very limited involvement in that. Not sure there's anything to discuss.

Here's a copy of the report:

AMERICAN OVERSIGHT

https://s3.amazonaws.com/arc-wordpress-client-uploads/adn/wp-content/uploads/2018/08/31043446/Scoping-Report_20180831-1.pdf

It's pretty high level and there has been some critical press as a result. I have not reviewed aside from a quick scan.

I am about to head to a mediation but we can chat more tomorrow if that's helpful.

Ashley

Hello Shane-

Per our last conversation, I just want to remind you that four of us from EPA will be visiting the Pebble project site on July 31. Our hydrogeologist, geochemist, and myself will be traveling from Seattle and will be available the afternoon of July 30 and the morning of August 1 and could meet with the Corps and AECOM's technical folks during those times. I know that you are planning technical meetings for later in August, but wanted you to be aware of this opportunity as well in case it makes sense to meet sooner in person. Please let me know if you would like to do that.

Thanks –
Patty

CC: Molly Vaughan (Vaughan.Molly@epa.gov) [Vaughan.Molly@epa.gov]
Subject: Pebble EIS - EPA subject matter points of contact

Hi Shane-
At the cooperating agency meeting last week you requested that we identify leads for the resource sections where the Corps has requested our review. Below is that list.

- 3.1 Intro – Molly Vaughan
- 3.5 Recreation – Molly Vaughan
- 3.11 Aesthetics – Molly Vaughan
- 3.14 Soils – Mark Douglas
- 3.16 Surface Water Hydrology – Tim Maley
- 3.17 Groundwater Hydrology – Tim Maley
- 3.18 Water and Sediment Quality – Cindi Godsey
- 3.22 Wetlands/ Special Aquatic Sites – Mark Douglas
- 3.26 Vegetation – Mark Douglas

Contact Information for technical leads:
Mark Douglas, Douglas.mark@epa.gov, 907-271-1217
Cindi Godsey, Godsey.cindi@epa.gov, 206-553-1676
Tim Maley, Maley.timothy@epa.gov, 206-553-1210
Molly Vaughan, Vaughan.molly@epa.gov, 907-271-1215

Please cc Molly and I on communications to our resource leads from the Corps or AECOM. There are other EPA folks involved in providing input to the resource sections and we need to be aware of communications to efficiently coordinate. For example, our hydrology and water quality reviewers includes a geochemist and modeler in addition to the identified resource leads. Molly and I will be the points of contact for alternatives.

As I mentioned during the meeting last week, we also have a fisheries biologist with applicable expertise if the Corps would like our assistance in that area.

Best regards-

Patty

Subject: Pebble preliminary alternatives review

Hi Palmer, Barb, and Kate –

Based on the alternatives discussion at todays cooperating agency (CA) meeting, the Corps and AECOM will be developing a revised version of the 8/17 preliminary alternatives memo. The Corps said that CAs do not need to send written comments on the memo, but could wait and send comments on the revised version (expected around 9/1). Therefore, you do not need to send Molly written comments on the 8/17 version by the end of this week. We will send you the revised version for comment when it is available.

Thanks for your reviews to-date and the discussion today. Most of the points were discussed during the CA meeting. Stay tuned for the next version of the memo and in the meantime, feel free to call if you have questions.

Best regards-
Patty

Hi Mary Anne-
You had asked about the Pebble EIS scoping comments.
Matt and Palmer are leads on developing the comments from the 404 program. We assumed that they would reach out to others in the 404 program, as needed. Attached is the latest email from Palmer.
If you want to add or revise comments, please work from this draft and send revisions to Molly (see Molly's original email below).

I will be out of the office next week, Monday – Thursday, so please contact Molly with questions.

Thanks - Patty

Subject: RE: Pebble - Wetlands Scoping Comments

Molly

Yesterday I was able to access and read your "standard" NEPA scoping language for aquatic resources in the sharepoint file you sent and I think it is a good starting point.

I tried to log in and edit it today but am unable to access the file. I think it needs to be supplemented to reflect some of the specific areas of focus from our previous work on this case. I've taken a first cut at what needs to be added to your standard text in the attached. It has three sections: direct and secondary effects, cumulative effects, and accidents and failures.

I will be out of the office on annual leave April 4-9. I look forward to continuing to work with you on this letter when I return.

I'm cc'ing Ashley and Heidi as they will likely recognize some of this language from the PD.

Please let me know if you have any questions regarding my suggestions.

Thanks, Palmer

Subject: Pebble - Wetlands Scoping Comments

Hello Matt and Palmer,
As I know you are very aware, our timeline for preparing scoping comments is very tight. Because there are a lot of project-specific concerns with regard to what would constitute an appropriate wetland impact analysis in the Draft EIS, I want to give you as much time as possible to help develop the wetland scoping comments. I have attached some "standard" NEPA scoping language for aquatic resources as a starting point. Please edit, expand, etc. as appropriate to convey the needed information for Pebble.

In order to meet the April 30th deadline, we have to meet a very aggressive letter writing schedule. Please provide your edits/additions to this scoping language **by COB April 9.**

I will begin working simultaneously on the remainder of the letter, so apologize that I don't have that for you to see now for context. My schedule for preparing the scoping comments is to have a first draft of the rest of the letter by COB on the 5th, and I'll share it with you at that time.

If you have any questions or concerns about the scoping comments or the timeline, please let me know.

Thank you,
Molly

Molly,
Thank you for sharing the draft comments on preliminary chapter 4 sections that we reviewed in our role as a cooperating agency for EIS development. I appreciate the work that you, Patty, and associate reviewers have put into making recommendations for bolstering the chapter and the EIS. I'm attaching the version on which I have made some suggested edits/wording changes. I also have a few questions about things we might want to add/recommend – although if we have a chance to talk before this is sent out, it could help me to understand whether those points are covered elsewhere or not needed. If any time opens up on my calendar for tomorrow, I will let you know. I could talk on Thursday morning before 9am Pacific time, or if next week would be better, we could schedule time to talk while I'm in DC. If there's not a good time to talk about it, I would appreciate seeing our table of comments again briefly before it goes out, to know which suggestions were incorporated.

Thanks! Jill

Subject: Pebble PDEIS sections extension request

Hi Sheila-

Thanks for the conversation this morning.
Our schedule extension request is for sections of chapter 3, chapter 4, and appendix K and chapter 5 in areas of our assigned special expertise (soils, surface water hydrology, hydrogeology, water & sediment quality, vegetation) and we are requesting until December 31 to submit comments. We think this request is reasonable due to the late submittal of some of the section figures, the content of the sections, and the reliance of these sections on a significant volume of reference documents that we are also reviewing.
Please let me know if you have further questions.

Best regards-
Patty

Subject: RE: Pebble Scoping - First Draft
Attachments: 18-0002-COE Pebble Project Scoping 040418 draft-pm.docx

Hi Molly-
Here are my comments on most of the letter. I did not have time to review the cover letter or the last two sections. Now that we have more time to work on the letter, I would like to add another review cycle for me to look at the letter after all the technical input is received.
Thanks-
Patty

All-

The Corps has issued a special public notice extending the Pebble EIS scoping period an additional 60 days to end on June 29, 2018 (see link in the email below).
Molly had developed a schedule for our scoping letter based on the original 30 day comment period and was working with many of you on drafting an initial letter. A revised schedule will be developed based on the extended time period. This will give us all more time to provide technical, legal, and management input into our scoping letter.

Also, the Corps has added an additional public scoping meeting in New Stuyahok on April 13. This information can be found on the Corps' Pebble EIS website.

Patty

Hello NEPA/PO Team,
A huge thank you to all of you for your assistance with putting together the scoping letter. It was a big effort, and your input helped make it a thorough and technically sound comment letter. From David Allnutt: "Please accept and pass on my gratitude for the truly above and beyond efforts to see this over the finish line. There's a lot to feel good about in here."
The final letter is attached for your reference.
Thank you,
Molly

Subject: RE: Please Review - Pebble Preliminary Ch 4 comments

Molly,
Thank you for sharing the draft comments on preliminary chapter 4 sections that we reviewed in our role as a cooperating agency for EIS development. I appreciate the work that you, Patty, and associate reviewers have put into making recommendations for bolstering the chapter and the EIS. I'm attaching the version on which I have made some suggested edits/wording changes. I also have a few questions about things we might want to add/recommend – although if we have a chance to talk before this is sent out, it could help me to understand whether those points are covered elsewhere or not needed. If any time opens up on my calendar for tomorrow, I will let you know. I could talk on Thursday morning before 9am Pacific time, or if next week would be better, we could schedule time to talk while I'm in DC. If there's not a good time to talk about it, I would appreciate seeing our table of comments again briefly before it goes out, to know which suggestions were incorporated.

Thanks! Jill

Hi Jill,
As we discussed earlier, here are the draft comments on the preliminary chapter 4 sections of the Pebble EIS we received for review. Comments are not officially due until August 31, but Patty and I would prefer to send these to the Corps as expediently as reasonable. Please let me know if you have any comments or edits – you can make your edits directly on this OneDrive version or a separate copy, whichever you prefer.
Thank you,
Molly

Subject: FW: revised climate language for Pebble scoping

Hi Patty,
To avoid any further delays next week, I shared the revised text for the climate section back with HQ for OFA/OGC review, to make sure we were hitting the mark, and received the edits/comments below. The attached version contains my clarifying edits in response. I wanted to check if you have anything further to add before I send this back to Megan? She plans next to share it with Joel Scheraga, the Senior Advisor for Climate Adaptation and in the Office of Policy.
Thanks,
Molly

Will get it to you as soon as we hear back. My hasty thoughts in redline below in terms of considerations/questions to try to help you process the new language or provide something for Joel. Mostly technical or policy, but I'd think we want to be sensitive to how clear the examples are in terms of providing useful information to decisionmakers. Happy to discuss, as always.

Subject: FW: revised climate language for Pebble scoping

Tom,

AMERICAN OVERSIGHT

See below. I am hoping to see the changes from your FO today so I can then work with Joel to finalize this language. Reading through the recent NOAA report you sent me, the NCA, and EPA's tools SLR appears to be less of an issue in this area. I am having our intern do some additional research.

Megan

Hi Megan,
In the interest of time **Personal Matters / Ex. 6** I went ahead and made some additions to the climate section to address the comment we discussed yesterday. The expanded text is below. Please let me know if this addresses the concern, and share with Tom if appropriate.

Subject: pebble eis alternatives

Hello Shane-
I appreciate the information shared at the cooperating agency meeting regarding the alternatives that would be analyzed in the draft EIS. We still have some outstanding questions about the TSF liner and dry stack options. Would it be possible to have an in-person focused meeting the week of Nov 5 with you and the appropriate AECOM technical folks to discuss the tailings alternatives? I will be in Anchorage that week and have some open times.
Thanks –
Patty

Hello Shane-
Thanks for sharing this information.
I have a request for the upcoming cooperating agency meeting. Would it be possible to have an overview presentation of the updates to the project described in the May 11 memo from Pebble?
Have these changes been reflected in the DA application on the website?
Thanks -
Patty

All,
Attached are some of the documents for your agencies review. I will continue forwarding information including an agenda and location, draft scoping report, draft Chapter 2 and draft chapter and other materials, so your team has a chance to review and provide you with items to bring up at the managers meeting. Please also note the project website will have this info on it as soon as possible.

I will send all of the information received to date, not requesting comments, but rather for visibility for all. It will be in several emails.

VR,

Shane

All – attached is the final Pebble scoping letter that I signed this afternoon. Patty is submitting electronically to the Corps today.

To's – first, please accept and pass on my gratitude for the truly above and beyond efforts to see this over the finish line. There's a lot to feel good about in here. Second, please distribute to the (many) others whose efforts contributed to the final product (or to one of the many intermediate products). I started trying to address to all, but knew that I'd never come up with a complete list.

Cc's – thanks for your support on this.

Erik and Patty – please set aside at least 20 minutes of our Tuesday team meeting agenda to discuss the letter and to begin discussing lessons learned.

Subject: Pebble EIS outline - EPA input

Hi Shane –

Based on discussions at our last agency meeting and our understanding of EPA's cooperating agency role, we looked at the Pebble EIS outline and request that we be involved in early review as a cooperating agency of the following EIS sections:

Chapter 2 – Alternatives
Chapter 3 – Existing Environment
- Sec 3.1 – Introduction
- Sec 3.6 Recreational and Commercial Fisheries
- Sec 3.9 – Food and Fiber Production (Subsistence)
- Sec 3.11 – Aesthetics
- Sec. 3.14 – Soils
- Sec 3.16 – Surface Water Hydrology
- Sec 3.17 - Groundwater Hydrology
- Sec 3.18 - Water and Sediment Quality
- Sec 3.21 – Spill Risk
- Sec 3.22 – Wetlands/Special Aquatic Sites
- Sec 3.24 – Fish Values
- Sec 3.26 – Vegetation

Chapter 4 – Environmental Consequences
- Same subsections as noted for Chapter 3

Appendix F – Draft CWA 404(b)(1) analysis
Appendix J - PJC

We are willing to provide early input into development of other sections of the EIS as well, but feel that those noted above are consistent with the Corps request that EPA be involved in providing support on 404(b)(1) related issues. Please feel free to give me a call if you would like to discuss.

Thanks - Patty

All-

The Corps has issued a special public notice extending the Pebble EIS scoping period an additional 60 days to end on June 29, 2018 (see link in the email below).
Molly had developed a schedule for our scoping letter based on the original 30 day comment period and was working with many of you on drafting an initial letter. A revised schedule will be developed based on the extended time period. This will give us all more time to provide technical, legal, and management input into our scoping letter.

Also, the Corps has added an additional public scoping meeting in New Stuyahok on April 13. This information can be found on the Corps' Pebble EIS website.

Patty

AMERICAN OVERSIGHT

All –
I talked to Chris late yesterday, it sounds like he will be sending me the revised letter with his comments this morning. I need the letter by 9:30 am so that I can spend the day reviewing and get my changes to Molly in time.
Please let me know if that will be a problem.

Personal Matters / Ex. 6 He was invaluable to the region and the mining team on Kensington and other projects (including some of the Canadian mines and transboundary reviews). I personally learned a lot about the 404 program from working with him and was looking forward to working with him on Pebble.

Patty

Subject: URGENT Please Review Pebble Scoping Comments

Importance: High

Good Morning, Chris. I still have not received any comments from you on the Pebble scoping letter. I do specifically need your expertise with reviewing the draft comments, to make sure they are accurate with regard to the impacts of dredging and disposal. The deadline for associate reviewers was yesterday, and I need to turn the letter around quickly and get it to Patty to keep on schedule with all of the internal reviews. Can you review and send me your comments as soon as possible today? Here again is the link to the letter on the sharepoint site:

Subject: REVIEW REQUEST - Pebble Preliminary Ch. 4 Sections

Hello All,
The Corps has distributed some very preliminary draft sections of Chapter 4 for Cooperating Agency review. These documents do not contain the actual project analysis, but appear to be more of a framework to work from in completing the analysis and EIS text. The sections include heading, some introductory-type text, and some blank tables. The Corps did not provide detailed instructions for review, but I recommend that we review from the perspective of determining whether the skeleton of the analysis presented here appears that it will address the key issues for review, and provide recommendations for inclusion of any issues that appear to have been overlooked in the current structure.

Here are the specific section assignments, similar to last time:

- 4.1 Intro – Molly
- 4.5 Recreation – Molly
- 4.11 Aesthetics – Molly
- 4.14 Soils – Mark/Palmer
- 4.16 Surface Water Hydrology – Tim/Mark/Palmer/Muluken
- 4.17 Hydrogeology – Tim/Mark/Palmer/Muluken
- 4.18 Water and Sediment Quality – Cindi/Tim/Chris
- 4.22 Wetlands/ Special Aquatic Sites – Mark/Palmer
- 4.26 Vegetation – Mark/Palmer

The Corps has requested a quick turnaround for review, therefore please send me any comments you may have on these sections by COB 7/24. I am hoping, given the brevity of these documents, that this timeframe will be achievable, but please let me know as soon as possible if it will not.

Please provide your comments in the attached comment table format.

It may be helpful to look back at the issues we recommended for analysis in our scoping comments - I have saved the final version of that letter on the Sharepoint Site here:

Hi Jill,
In case it is helpful, I've attached the current version of the letter. I thought perhaps you might want to start looking at it now, and then you would only have to look through to see what ORC changed next week? If this option sounds like it would help, it will not be a problem for me to address your edits and ORCs together.
Thanks,
Molly

> Molly let's try to make it work. I'll make a note on my calendar to block time between the 22nd-24th to look at the scoping letter. On the 24th, I'll likely be working with Mark to finalize the Donlin letter, so to the extent that I can do my scoping letter review beforehand, I will focus on that. Thanks for working with Ashley. If it would help to reiterate that OGC can also be looking the following week along with OFA and OW, I can do that (or you can!)

In order to stick with the accelerated review plan, I would need to receive your edits by next Thursday afternoon, to be able to address them and send the letter to David/Tam **Personal Matters / Ex. 6** If they send me the letter COB Tuesday, that would mean just 1.5 days for your review. Do you think this is doable, or should I work on alternate solutions?

Hi Molly –

Thanks for getting this to me early. I sent the letter to Heidi as well (cc'd here). Unfortunately, I am out for the mining retreat today, have a couple other documents that I need to review for OERA tomorrow, and then **Personal Matters / Ex. 6**

We'll try to complete review early, but I don't think I can do much better than COB Tuesday if that works for Heidi. Sorry.

Subject: Pebble Scoping Letter - for ORC Review

Hello Ashley,
The draft scoping letter is now ready for your review. This is actually a little early compared to the original schedule. I understand that at the BB Check-in meeting last week, which I missed, David asked us to try to compress the review schedule if possible. I don't know if this is ultimately going to be possible overall, but we are a few days ahead at this point at least!

So, if possible, please send me your edits by COB Friday (the 18th). (If this won't work and we need to revert to the original deadline of the 23rd, please let me know.)

Thank you,
Molly

All –
I talked to Chris late yesterday, it sounds like he will be sending me the revised letter with his comments this morning. I need the letter by 9:30 am so that I can spend the day reviewing and get my changes to Molly in time.
Please let me know if that will be a problem.

AMERICAN OVERSIGHT

Personal Matters / Ex. 6 He was invaluable to the region and the mining team on Kensington and other projects (including some of the Canadian mines and transboundary reviews). I personally learned a lot about the 404 program from working with him and was looking forward to working with him on Pebble.

Hi Justin,

Sorry for the delayed response. I don't think there's much to discuss at this point. The Corps' scoping report summarizes the comments it received during the public comment period. I checked in the Region and I don't think there's an immediate to do at this point but we will let you know if anything changes.

Thanks,
Heidi

Subject: Hot Topic - Pebble Scoping

Hi Patty – Jill asked me to write up a Hot Topic on Pebble for OERA, and I know AOO management will want one as well. But, I thought I'd better check in with you before sending it up. Here's what I've got so far – please let me know if you have any edits, or if you've already sent up a Hot Topic for the scoping.

The U.S. Army Corps of Engineers has announced a 30-day public scoping period for the Pebble Project, to run April 1-30, 2018. The Pebble Limited Partnership proposes to mine a large copper-gold-molybdenum deposit located 200 miles southwest of Anchorage on State land. The project includes a large open-pit mine, processing facility, and tailings disposal facilities at the mine site as well as access roads, natural gas pipeline, and port sites on Lake Iliamna and Cook Inlet. EPA is a cooperating agency for development of the EIS. (Contact Patty McGrath 3-6113)

Good news. The Corps extended the scoping period. It now ends on 6/29/18. We don' t have a revised schedule yet for comments, but I'm hoping that the group has a kickoff meeting so that we can most efficiently work through this.

All-

The Corps has issued a special public notice extending the Pebble EIS scoping period an additional 60 days to end on June 29, 2018 (see link in the email below).
Molly had developed a schedule for our scoping letter based on the original 30 day comment period and was working with many of you on drafting an initial letter. A revised schedule will be developed based on the extended time period. This will give us all more time to provide technical, legal, and management input into our scoping letter.

Also, the Corps has added an additional public scoping meeting in New Stuyahok on April 13. This information can be found on the Corps' Pebble EIS website.

Patty

Subject: FW: Pebble Scoping Letter for HQ Review

Chris – at Michelle's request, I'm sending you the latest version of the Pebble scoping letter that I have access to. This version has already undergone legal and management review here in R10 and was sent to HQ (OW, OP, and OGC) for their consolidated review one week ago. We expect to get written comments back today or tomorrow. Based on conversations I've had with HQ staff, I don't anticipate that the HQ comments will be very extensive or substantive.

In response to some of the questions that Michelle asked me, I can report that Lee has asked to see a near-final version of the letter before it's sent; he has declined the offer of a briefing. I'm not certain whether he's seen a draft yet. This draft was shared with Drew Feeley (a political appointee in OP); he has not requested a briefing. I'm not as certain of

AMERICAN OVERSIGHT

the status within OGC (many of our ORC and OGC attorneys are out of the office this week – Allyn may have heard something).

Overall, I feel quite good about this letter – it's thorough without being overbearing and should help the Corps and its contractors appropriately scope their environmental review.

Subject: Pebble Scoping Letter for HQ Review

Hello Megan,
Attached please find Region 10's draft Scoping letter for the Pebble Project. This letter has already undergone legal and management review here in the Region, and is now ready for headquarters review. We would appreciate your identification of any major issues or concerns with the comments. In addition to OFA/NCD review, please also coordinate with OGC and OWOW. Heidi Nalven and Palmer Hough are the contacts and are standing by to coordinate review within their offices.

We would appreciate receiving any comments by COB on June 12. We would also appreciate if you could compile all HQ comments in a single track changes version of the document. We do have a Sharepoint site for this project, so please let me know if it would be helpful to save the document there so each reviewer can add their comments to the same document.

Please let me know if you have any questions, and thank you for your review.

They've agreed to add OGC management (through Carrie) to the HQ management review.

Subject: RE: Pebble Scoping Letter Schedule

My understanding is that the HQ review is management review. Jill mentioned OW and OFA specifically. I (of course ☺) brought up OGC. I'm working on an email to Jill now (she's the manager of the NEPA unit in the Region) – I'll ask that they include OGC management in the "HQ Review: 4/19 – 4/25."

Fingers crossed that the Corps extends this scoping period…

Subject: RE: Pebble Scoping Letter Schedule

Do you have any info about who will be included in HQ review? I assume that will be management review? I know Carrie wanted to flag this for David Fotouhi when we had clarity on the exact timing.

AMERICAN OVERSIGHT

That's the current 404 section – I'll let you know if I see a different version that's a lot longer. Attorney Client Privil

Attorney Client Privilege/Deliberative Process Privilege / Ex. 5

I'll add another placeholder for the 16th as well so we can discuss feedback.

Also – based on a discussion with our NEPA attorney in the Region, I'm going to request that the attorneys get the letter back as part of the "final tweaks and signature" that's currently scheduled from 4/25-4/30, but we'll only be able to review for accuracy after edits.

Subject: RE: Pebble Scoping Letter Schedule

Thanks for the heads up Ashley. (Personal Matters / Ex. 6 I will be back in the office on the 16th and will block off time on my calendar to review. And perhaps we should set up a placeholder call that day to discuss as well. The last version I saw (from Palmer) was three pages. That seems doable in a day. Can you let me know if it expands significantly?

Subject: Pebble Scoping Letter Schedule

Hi Jill and Patty,
I have put together a schedule for preparing the Pebble scoping letter that accommodates a need for HQ review and follows the basic plan Patty and I developed last week. When you back out how much time that leaves for actually drafting the comments, it seems almost impossible, but I'll make it work! For your planning purposes, here is what I propose:

Molly draft initial letter: now – 4/5
Patty review and letter revision: 4/5 – 4/9
Reach out to associate reviewers as needed for additional project-specific language: 4/9 - 4/11 (with the exception of Matt, Palmer and Chris who I am already coordinating with)
ORC Review: 4/12-4/16
R10 Management Review: 4/16-4/18
HQ Review: 4/19 – 4/25
Final tweaks and signature: 4/25-4/30

Please let me know if you would like me to make any revisions to this schedule.

Thank you,
Molly

Hi Stef,

I wanted check in to see if you have any time Tues-Thurs this week to get any thoughts you may have on the Pebble scoping letter given your experience with Spruce. I checked calendars and you looked to be tied up most of this week and next week. The letter is due on the 29th. I can send it your way today but if you don't think you have time, I was going to spare you the email ☺.

Thanks!

Hi David,

I have completed a resolution/compilation of the edits received to date. There are a very limited number of places where I did not accept edits yet, and have left for your consideration (with explanatory comments). I do not think any of the remaining edits are intolerable, but felt they were ones that warranted bringing to your attention. Please let me know if there is anything else I can do to assist with finalizing this letter.

Regards,

Molly

Terrific. Thanks. I saw a message from Heidi. Looks like they will send Justin an email. I just wanted to avoid a lot of written back and forth if we could save time and just have a conversation - but if his calendar is booked and an email will work, that is fine with me.

Hi Karin -

See Ashley's analysis of Justin's issues below. I know calendars might be full but we have a hard deadline of Friday. I was told Rob Tomiak contacted the Corps inquiring about an extension and got an earful. I'm hoping we can quickly resolve Justin's issues if we can get an opportunity to talk with him - even briefly.

Hi Heidi –

I think the only ones that I can help with are 2 and 8 (highlighted below).

Allyn suggested that we have a call with Justin to go through this.

Attorney Client / Ex. 5

AMERICAN OVERSIGHT

Here is what I would propose as a response:

Attorney Client / Ex. 5

AMERICAN OVERSIGHT

I have to run, but that's my two cents with the time I have. I'm happy to be on a call with Justin about this tomorrow if that's helpful.

Subject: Please Review - Pebble Pre-DEIS Sections
Importance: High

Hello Pebble NEPA Team,

AMERICAN OVERSIGHT

We have received several additional sections of the preliminary Draft EIS for review. We have also received many sections as an FYI for which our review is not requested. I have loaded everything I've received to date into the Sharepoint Folder: Preliminary Draft EIS Sections Oct-Nov 2018.

As a reminder, our input at this stage is only requested on the specific sections we were assigned to in the Cooperating Agency plan. Therefore, if your name doesn't appear below with a specific assignment, no review is necessary at this time. However, feel free to take a look at the sections pertaining to your subject matter on the Sharepoint Site if you wish.

Here are the assignments for specific sections where I would appreciate your review. Note that each subject area includes a section for Chapter 3 (affected environment), Chapter 4 (environmental consequences), as well as one or two supporting technical appendices. Please use the attached comment spreadsheet to assemble your comments, and please send them to me by the date noted for each section below.

- 3.11/4.11/K4.11 Aesthetics – Molly
- 3.14/4.14/K3.14 Soils – Mark/Palmer – due COB 11/27
- 3.16/4.16/K3.16 Surface Water Hydrology – Tim/Mark/Palmer/Muluken/Justine – due COB 11/27
- 3.26/4.26/K3.26 Vegetation – Mark/Palmer – due COB 11/27
- 3.17/4.17/K3.17 Hydrogeology – Tim/Mark/Palmer/Muluken – due COB 11/29
- 3.18/4.18/K3.18/K4.18 Water and Sediment Quality – Cindi/Tim/Chris – due COB 11/29
- (note, we have not yet received the Wetlands sections, which are anticipated to arrive approximately 11/21)

I apologize for the short time available for review, especially given the Thanksgiving holiday in the middle. If this schedule will be impossible for you, please let me know as soon as possible. Also, if you have any questions about the sections you are reviewing or where to focus your review, please don't hesitate to call.

Thank you,
Molly

Hi Ashley,
I believe that the Wetlands will be the last section. There aren't any others assigned to us in the Cooperating Agency Workplan that we haven't received yet.

As an update regarding Chapter 2… I apologize that I will not get those comments to you by this afternoon as I had hoped, but will definitely send them before noon tomorrow. I believe you said you were blocking time Thursday afternoon to review, so I hope that won't be a problem!

Thanks,
Molly

Hi Molly –

Thank you!! I really appreciate the schedule.

You noted below in the email to the team that we haven't received the wetlands section yet. Is that the only additional section we are anticipating reviewing? Or are there others as well? Just curious for my schedule in December.

Thanks again,

Ashley

Hi Jill, Patty and Ashley,
Here is a schedule for your reviews of the Pebble sections received for review, as I've talked about with each of you. Thanks to each of you for your understanding regarding the short timeframe available for review.

Chapter 2 Alternatives:
- Ashley 11/15-11/16
- Jill and Patty 11/19-11/20

Soils, Surface Water and Vegetation:
- Patty 11/29-11/30
- Ashley 12/3-12/4
- Jill 12/6-12/7

Hydrogeology and water and sediment quality:
- Patty 12/3-12/4
- Ashley 12/5-12/6
- Jill 12/10-12/11

Thanks,
Molly

Subject: Pebble Cooperating Agency Meeting
Location: Atwood Conference Center Room 106, 550 W 7th Avenue, Anchorage

Start: 10/24/2018 8:30:00 PM
End: 10/25/2018 12:30:00 AM
Show Time As: Tentative

Recurrence: (none)

Shane will be providing additional information on the meeting next week but asked that I send the teleconference and WebEx information. Additional materials/handouts will be distributed before the meeting for those calling in.

Draft Agenda:
1. Review of alternatives to be analyzed in detail
2. Format and level of detail for Chapter 2
3. Update on Appendix B (addressing USACE/CA comments, next version will be Draft EIS)
4. Review of select alternatives:

a. Filtered tailings (dry stack)
c. Other mine locations
d. Underground mining

Hi Molly,

I'm working from home on Monday, so thought I'd spend that day reading up on these. But, I just tried to access the folder and the following screen came up:

When I clicked on the Sharepoint Icon, it said I don't have access. So, I have clicked on request access. I'm not sure though if that's access to the folder, or something else so wanted to email you in case there's something different I should do.

Thanks!
Barb

Subject: FYI- Pre-Draft Chapters 1 and 2 of Pebble EIS

Hello All,
I have created a new folder on the Sharepoint Site where I will begin storing all of the sections of the preliminary Draft EIS as we receive them: "Preliminary Draft EIS Sections Oct-Nov 2018"

AMERICAN OVERSIGHT

In addition to the documents previously shared (the Revised Project Description and powerpoint presentation on Alternatives), this folder now contains the draft text of Chapter 1 and Chapter 2 (with additional folder containing figures). Comments are not requested on these sections, however, they have been provided for our review as context for review of the analysis in Chapter 3 and 4, so I do recommend reading when you get a chance.

As previously mentioned, we will be receiving the sections of Ch. 3 and 4 on a rolling basis between now and the first week of November. A few sections (the intros to 3 and 4 as well as Recreation sections) have already been received and are also available in the new folder.

Thank you,
Molly

Subject: Pebble site visit

Hello Shane-

Per our last conversation, I just want to remind you that four of us from EPA will be visiting the Pebble project site on July 31. Our hydrogeologist, geochemist, and myself will be traveling from Seattle and will be available the afternoon of July 30 and the morning of August 1 and could meet with the Corps and AECOM's technical folks during those times. I know that you are planning technical meetings for later in August, but wanted you to be aware of this opportunity as well in case it makes sense to meet sooner in person. Please let me know if you would like to do that.

Thanks –
Patty

Hi Patty and Molly,

Deliberative Process / Ex. 5

I've attached some specific comments.

Deliberative Process / Ex. 5

I hope these comments are helpful and please let me know if you have any questions.

Thanks,
Barb

Ps. So you're aware, I will be out of the office the 24th through the 31st.

Subject: FW: Dry Stack Alternative - no do outs (UNCLASSIFIED)

Hi Barb and Cindi-
I have not had an opportunity to review this memo yet, but plan to do so tomorrow. If you have time, can you also review and send Molly and I any comments that you have by COB 10/22? If you do not have time, please let me know. I have reviewed dry stack analyses for other EISs so I am pretty comfortable with this, but would also appreciate a second (or third!) set of eyes.
This memo will be discussed at a meeting with the Corps and other agencies on October 24. We have not decided whether to submit written comments - that will depend on our review.
Thanks -
Patty

Subject: Dry Stack Alternative - no do outs (UNCLASSIFIED)

CLASSIFICATION: UNCLASSIFIED

All,
Per comments from several CAs and comments received during scoping, we are considering a Dry Stack Alternative for the TSF. Attached is a memo describing the process and rationale used to evaluate that alternative. This is for consideration and comment if you so desire, or we can discuss it on the 24th.

To: POA Special Projects [poaspecialprojects@usace.army.mil]
CC: Vaughan, Molly [Vaughan.Molly@epa.gov]
Subject: Pebble EIS - EPA subject matter points of contact

Hi Shane-
At the cooperating agency meeting last week you requested that we identify leads for the resource sections where the Corps has requested our review. Below is that list.

- 3.1 Intro – Molly Vaughan
- 3.5 Recreation – Molly Vaughan
- 3.11 Aesthetics – Molly Vaughan
- 3.14 Soils – Mark Douglas
- 3.16 Surface Water Hydrology – Tim Maley
- 3.17 Groundwater Hydrology – Tim Maley
- 3.18 Water and Sediment Quality – Cindi Godsey
- 3.22 Wetlands/ Special Aquatic Sites – Mark Douglas
- 3.26 Vegetation – Mark Douglas

Contact Information for technical leads:
Mark Douglas, Douglas.mark@epa.gov, 907-271-1217
Cindi Godsey, Godsey.cindi@epa.gov, 206-553-1676
Tim Maley, Maley.timothy@epa.gov, 206-553-1210
Molly Vaughan, Vaughan.molly@epa.gov, 907-271-1215

Please cc Molly and I on communications to our resource leads from the Corps or AECOM. There are other EPA folks involved in providing input to the resource sections and we need to be aware of communications to efficiently coordinate. For example, our hydrology and water quality reviewers includes a geochemist and modeler in addition to the identified resource leads. Molly and I will be the points of contact for alternatives.

As I mentioned during the meeting last week, we also have a fisheries biologist with applicable expertise if the Corps would like our assistance in that area.

Best regards-

Patty

Hello Shane-
Thanks for sharing this information.
I have a request for the upcoming cooperating agency meeting. Would it be possible to have an overview presentation of the updates to the project described in the May 11 memo from Pebble?
Have these changes been reflected in the DA application on the website?
Thanks -
Patty

All,
Attached are some of the documents for your agencies review. I will continue forwarding information including an agenda and location, draft scoping report, draft Chapter 2 and draft chapter and other materials, so your team has a chance to review and provide you with items to bring up at the managers meeting. Please also note the project website will have this info on it as soon as possible.

I will send all of the information received to date, not requesting comments, but rather for visibility for all. It will be in several emails.

VR,

Shane

Hi, Molly.

My apologies, I was traveling yesterday. Here is the link to the document that I asked JR, Michelle, and Tami to view and provide comments on directly. I'm scanning my email and will forward anything that was emailed directly to me.

Respectuflly,
Neverley

<!--[endif]-->

Matt,

This reads well and I had only one (tiny) edit. Molly, you have an enormous job ahead in editing all the parts but the letter is well-documented and thorough, and you have my sincere admiration for how you have pulled everyone together thus far. Please let me know how I can help.

Mary Anne

Subject: Revised Scoping Letter Text

Molly,

I excerpted and revised text from the first part of the scoping comment letter. I tried to make things flow a little more smoothly and reduce duplication in these sections. I may have partly succeeded, but will allow you to be the judge. Where I inserted or edited text within the General Components of NEPA Analysis section, I highlighted the text. I didn't highlight the text in the Aquatic Resources section because I re-worked most of this text. If you have any questions, I will be in the office tomorrow.

Thanks,

Subject: Pebble EIS outline - EPA input

Hi Shane –

Based on discussions at our last agency meeting and our understanding of EPA's cooperating agency role, we looked at the Pebble EIS outline and request that we be involved in early review as a cooperating agency of the following EIS sections:

Chapter 2 – Alternatives
Chapter 3 – Existing Environment
- Sec 3.1 – Introduction
- Sec 3.6 Recreational and Commercial Fisheries
- Sec 3.9 – Food and Fiber Production (Subsistence)
- Sec 3.11 – Aesthetics
- Sec. 3.14 – Soils
- Sec 3.16 – Surface Water Hydrology
- Sec 3.17 - Groundwater Hydrology
- Sec 3.18 - Water and Sediment Quality
- Sec 3.21 – Spill Risk
- Sec 3.22 – Wetlands/Special Aquatic Sites
- Sec 3.24 – Fish Values
- Sec 3.26 – Vegetation

Chapter 4 – Environmental Consequences
- Same subsections as noted for Chapter 3

Appendix F – Draft CWA 404(b)(1) analysis
Appendix J - PJC

We are willing to provide early input into development of other sections of the EIS as well, but feel that those noted above are consistent with the Corps request that EPA be involved in providing support on 404(b)(1) related issues. Please feel free to give me a call if you would like to discuss.

Thanks - Patty

Good morning Cindi, Chris and Tim,
I wanted to give you an update and heads-up regarding the scoping comments for Pebble. As you know, we have a short time window for preparation of the comments, and a large percentage of that will be allotted for the internal review process. Patty and I are currently working on the comments, and plan to have a completed draft by Monday (4/9). At that point I would like to send it to you for your review and input. If Patty and I identify specific areas where more site-specific detail is needed in the scoping letter, I will flag that for you. Otherwise the request will just be to review the portions of the letter related to your area of expertise, and make sure you are okay with the content.

In order to stay on schedule, I will need your input by the 11th. I apologize in advance for the very short turnaround. Please let me know if you will have availability early next week to look over the letter.

Thank you,
Molly

Subject: REVIEW REQUEST - Pebble Preliminary Ch. 4 Sections

Hello All,
The Corps has distributed some very preliminary draft sections of Chapter 4 for Cooperating Agency review. These documents do not contain the actual project analysis, but appear to be more of a framework to work from in completing the analysis and EIS text. The sections include heading, some introductory-type text, and some blank tables. The Corps did not provide detailed instructions for review, but I recommend that we review from the perspective of determining whether the skeleton of the analysis presented here appears that it will address the key issues for review, and provide recommendations for inclusion of any issues that appear to have been overlooked in the current structure.

Here are the specific section assignments, similar to last time:

- 4.1 Intro - Molly
- 4.5 Recreation - Molly
- 4.11 Aesthetics - Molly
- 4.14 Soils - Mark/Palmer
- 4.16 Surface Water Hydrology - Tim/Mark/Palmer/Muluken
- 4.17 Hydrogeology - Tim/Mark/Palmer/Muluken
- 4.18 Water and Sediment Quality - Cindi/Tim/Chris
- 4.22 Wetlands/ Special Aquatic Sites - Mark/Palmer

AMERICAN OVERSIGHT

· 4.26 Vegetation – Mark/Palmer

The Corps has requested a quick turnaround for review, therefore please send me any comments you may have on these sections by COB 7/24. I am hoping, given the brevity of these documents, that this timeframe will be achievable, but please let me know as soon as possible if it will not.

Please provide your comments in the attached comment table format.

It may be helpful to look back at the issues we recommended for analysis in our scoping comments - I have saved the final version of that letter on the Sharepoint Site here:

Hi Ashley,
I have revised the schedule for preparing the scoping letter, to account for the extension of the deadline. I now have ORC review scheduled for 5/16-5/23. There will also be a final Region 10 review after we receive comments from HQ, and we will work with ORC again during that time range of 6/21-6/29. Please let me know if this timing will work for your schedule.
Thank you,
Molly

Subject: RE: Pebble Scoping Letter Schedule

Thanks, Ashley. When David and I are looking at the letter, according to this schedule, we have 2 days between 4/16-4/18. Then HQ has it from 4/19-4/25. I believe that Molly is going to be tracking the letter and managing version control, and I think that OGC management could be reviewing it at the same time as OFA and OW managers at HQ. We will have to let all 3 offices at HQ know that we anticipate receiving suggestions from everyone involved by COB 4/25. That gives the Region 3 days to finalize once we get it back. If ORC can work with OERA over those last 3 days, that would be helpful. I do not anticipate including OGC at that time. I currently anticipate signing the scoping letter on the 30th and OERA will get it out prior to the end of the day, unless we hear that an extension has been granted.
Thanks,
Jill

Thanks, Jill. I appreciate knowing ahead of time so Heidi (OGC staff attorney) and I can block time off on our calendars for review. We've both done that now.

I think that the attorneys should also get the document back during the "Final tweaks and signature: 4/25-4/30"? We'd only be reviewing for accuracy after edits but we generally help with that. Do you agree?

Also – I know that OGC management are going to be interested in seeing this letter as well. Carrie Wehling (manager in the WLO was going to flag for David Fotouhi). Can you include Carrie in the HQ management review and then she can forward on as appropriate?

Thanks.

Subject: Pebble Scoping Letter Schedule

Hi Jill and Patty,
I have put together a schedule for preparing the Pebble scoping letter that accommodates a need for HQ review and follows the basic plan Patty and I developed last week. When you back out how much time that leaves for actually drafting the comments, it seems almost impossible, but I'll make it work! For your planning purposes, here is what I propose:

Molly draft initial letter: now – 4/5
Patty review and letter revision: 4/5 – 4/9
Reach out to associate reviewers as needed for additional project-specific language: 4/9 - 4/11 (with the exception of Matt, Palmer and Chris who I am already coordinating with)
ORC Review: 4/12-4/16
R10 Management Review: 4/16-4/18
HQ Review: 4/19 – 4/25
Final tweaks and signature: 4/25-4/30

Please let me know if you would like me to make any revisions to this schedule.

Thank you,
Molly

Subject: Pebble scoping meeting talking points

Hi Neverley,
Here are the talking points I received from Patty, with input from Ashley Palomaki.

Introductory Talking Points:

- EPA is a cooperating agency in assisting the Corps in developing the EIS.
- The Corps has specifically requested that we provide input into issues related to the CWA 404(b)(1) guidelines.
- EPA has put together a technical team to provide this assistance and review EIS documents.

If asked how the Proposed Determination or Bristol Bay Watershed Assessment influences the EIS process:

- The BBWA is a three-year, twice peer-reviewed study that provides technical and scientific information about the watershed and the impacts of mining the Pebble deposit. We will use the Assessment, along with other available information, to inform our input into the EIS.

- The Proposed Determination, which has not been finalized, contains proposed restrictions for mining the Pebble deposit. It is not a veto of all mining. Pursuant to the terms of a settlement agreement with the Pebble Limited Partnership, EPA cannot move forward with its Section 404(c) process, should such a decision be made, until a Final EIS is noticed for the project or until May of 2021, whichever is sooner.

I'll be teleworking tomorrow, but will give you a call sometime before the meeting to share anything relevant that I learn in participating in the meeting tonight.

Thanks,
Molly

Hello Dave,

As we mentioned earlier this week, the Pebble letter is ready for your review. I think that Molly and Jay did a great job. I would really appreciate your review to make sure Jay and I are not missing anything.

The link to the site with the letter is below here in Molly's April 11 email.

At your earliest opportunity, please let us know if you think any changes need to be made to the letter.

Thank you

Molly and Karl,

AMERICAN OVERSIGHT

In response to our call earlier this week I have made some edits to the Pebble scoping letter air quality section, namely:

Deliberative Process / Ex. 5

I believe I have covered the main points we discussed in the call, but I failed to keep adequate notes and my memory is failing me. I'll sleep on it and may have further edits/additions tomorrow. But, if you can recall any other main points we discussed on the call, I would appreciate if you could please refresh my memory!

Thank you,
Jay

Subject: Pebble Scoping Letter - Review Requested

Hello Associate Reviewers,

I have completed a first draft of a scoping comment letter for the Pebble Project, which is now loaded onto the Sharepoint Site in the Documents>Scoping folder, at:

Internal Website / Ex. 6

Please review the draft letter, in particular the portions of the detailed comments that relate to your areas of expertise. This letter has been drafted based off of ERSMU's standard scoping language and language used in other recent letters for similar projects (including mining, road, pipeline, and port development projects). Some tweaks have already been made to reflect the specific considerations for this project, but there is likely to be more room for project-specific tailoring of the comments. Please review and provide:

(1) any edits necessary for technical accuracy, and

(2) any additional site-specific or project-specific technical information/concerns/recommendations you think necessary to convey to the Corps during this scoping period.

Please provide your edits in "track changes" format. If it is not too cumbersome, please make your edits directly in the document on the Sharepoint site (titled "Pebble Project Scoping 041118 draft"), to reduce the number of separate

AMERICAN OVERSIGHT

versions of the letter. If this format doesn't work for you, you can also save your edits as a separate version and I will work to consolidate them.

Please complete your review by **COB Wednesday May 2**. If you have any questions or think a meeting to discuss the comments on your subject area would be helpful, please let me know.

Thank you,
Molly

Hi Neverley,
I don't believe anyone not on the Pebble Project NEPA Team will be able to open the link below, since they don't have access to the Sharepoint site. However, here is a new link to the draft scoping letter, which I believe will work for anyone with an EPA account to be able to view and edit the document:

Internal website/ ex. 6

Alternatively, you can just collect all of the edits from those you are coordinating with in a Word doc and email it to me, and I'll consolidate with other edits.

Thank you,
Molly

Subject: Media contact for Pebble Anchorage public scoping meeting tonight

Hello Marianne,
I will be attending the USACE public scoping meeting here in Anchorage for the Pebble Project this evening, beginning at 5pm. EPA does not have a speaking role, and I expect to be solely observing the proceedings as a member of the public. However, in the event that I receive any press inquiries, who shall I direct them to? I realize that this will be very late Seattle time, though the Corps is not offering a public speaking format (attendees can provide their input on computers or one-on-one to a court reporter) so I don't expect to stay very long into the evening.
Thank you,
Molly

Subject: Pebble preliminary alternatives review

Hi Palmer, Barb, and Kate –

Based on the alternatives discussion at todays cooperating agency (CA) meeting, the Corps and AECOM will be developing a revised version of the 8/17 preliminary alternatives memo. The Corps said that CAs do not need to send written comments on the memo, but could wait and send comments on the revised version (expected around 9/1). Therefore, you do not need to send Molly written comments on the 8/17 version by the end of this week. We will send you the revised version for comment when it is available.

Thanks for your reviews to-date and the discussion today. Most of the points were discussed during the CA meeting. Stay tuned for the next version of the memo and in the meantime, feel free to call if you have questions.

Subject: Pebble scoping letter heads-up

Good morning Cindi, Chris and Tim,
I wanted to give you an update and heads-up regarding the scoping comments for Pebble. As you know, we have a short time window for preparation of the comments, and a large percentage of that will be allotted for the internal review process. Patty and I are currently working on the comments, and plan to have a completed draft by Monday (4/9). At that point I would like to send it to you for your review and input. If Patty and I identify specific areas where more site-specific detail is needed in the scoping letter, I will flag that for you. Otherwise the request will just be to review the portions of the letter related to your area of expertise, and make sure you are okay with the content.

In order to stay on schedule, I will need your input by the 11th. I apologize in advance for the very short turnaround. Please let me know if you will have availability early next week to look over the letter.

Thank you,
Molly

Subject: pebble eis alternatives

Hello Shane-
I appreciate the information shared at the cooperating agency meeting regarding the alternatives that would be analyzed in the draft EIS. We still have some outstanding questions about the TSF liner and dry stack options. Would it be possible to have an in-person focused meeting the week of Nov 5 with you and the appropriate AECOM technical folks to discuss the tailings alternatives? I will be in Anchorage that week and have some open times.
Thanks –
Patty

Subject: Pebble Scoping Letter for HQ Review

Hello Megan,
Attached please find Region 10's draft Scoping letter for the Pebble Project. This letter has already undergone legal and management review here in the Region, and is now ready for headquarters review. We would appreciate your identification of any major issues or concerns with the comments. In addition to OFA/NCD review, please also coordinate with OGC and OWOW. Heidi Nalven and Palmer Hough are the contacts and are standing by to coordinate review within their offices.

We would appreciate receiving any comments by COB on June 12. We would also appreciate if you could compile all HQ comments in a single track changes version of the document. We do have a Sharepoint site for this project, so please let me know if it would be helpful to save the document there so each reviewer can add their comments to the same document.

Please let me know if you have any questions, and thank you for your review.

Subject: RE: Pebble - scoping letter schedule

Hi Molly – Thanks! I really appreciate the heads up.

Jill and David actually flagged this for me yesterday and I've already reached out to my OGC counterpart (Heidi Nalven). We'll review together and send back consolidated comments, and we've blocked time off on our calendars to review and discuss.

Personal Matters / Ex. 6 and so it's tight, but doable.

Subject: Pebble - scoping letter schedule

Good morning Ashley,
As I know you are aware, I have a very aggressive schedule for drafting the Pebble scoping letter, to allow adequate time for all of the internal R10 and HQ reviews that will need to occur. I have time allotted for an ORC review from 4/12 (I'll get you the letter by COB on that day, hopefully earlier) to 4/16 COB. I realize this really only gives you 2 business days, but it's the best I could figure out. Will this plan work with your schedule?
Thanks,
Molly

Hello All,
The Corps has distributed some very preliminary draft sections of Chapter 4 for Cooperating Agency review. These documents do not contain the actual project analysis, but appear to be more of a framework to work from in completing the analysis and EIS text. The sections include heading, some introductory-type text, and some blank tables. The Corps did not provide detailed instructions for review, but I recommend that we review from the perspective of determining whether the skeleton of the analysis presented here appears that it will address the key issues for review, and provide recommendations for inclusion of any issues that appear to have been overlooked in the current structure.

Here are the specific section assignments, similar to last time:

- 4.1 Intro – Molly
- 4.5 Recreation – Molly
- 4.11 Aesthetics – Molly
- 4.14 Soils – Mark/Palmer
- 4.16 Surface Water Hydrology – Tim/Mark/Palmer/Muluken
- 4.17 Hydrogeology – Tim/Mark/Palmer/Muluken
- 4.18 Water and Sediment Quality – Cindi/Tim/Chris
- 4.22 Wetlands/ Special Aquatic Sites – Mark/Palmer
- 4.26 Vegetation – Mark/Palmer

The Corps has requested a quick turnaround for review, therefore please send me any comments you may have on these sections by COB 7/24. I am hoping, given the brevity of these documents, that this timeframe will be achievable, but please let me know as soon as possible if it will not.

Please provide your comments in the attached comment table format.

It may be helpful to look back at the issues we recommended for analysis in our scoping comments - I have saved the final version of that letter on the Sharepoint Site here:

Ex. 6 -- Internal Website

Thank you,
Molly

All,
Per comments from several CAs and comments received during scoping, we are considering a Dry Stack Alternative for the TSF. Attached is a memo describing the process and rationale used to evaluate that alternative. This is for consideration and comment if you so desire, or we can discuss it on the 24th.

Subject: Final Pebble Scoping Letter

Hello NEPA/PO Team,
A huge thank you to all of you for your assistance with putting together the scoping letter. It was a big effort, and your input helped make it a thorough and technically sound comment letter. From David Allnutt: “Please accept and pass on my gratitude for the truly above and beyond efforts to see this over the finish line. There’s a lot to feel good about in here.”
The final letter is attached for your reference.
Thank you,
Molly

Tom,

See below. I am hoping to see the changes from your FO today so I can then work with Joel to finalize this language. Reading through the recent NOAA report you sent me, the NCA, and EPA's tools SLR appears to be less of an issue in this area. I am having our intern do some additional research.

Subject: REVIEW REQUEST - Pebble Preliminary Ch. 4 Sections

Hello All,
The Corps has distributed some very preliminary draft sections of Chapter 4 for Cooperating Agency review. These documents do not contain the actual project analysis, but appear to be more of a framework to work from in completing the analysis and EIS text. The sections include heading, some introductory-type text, and some blank tables. The Corps did not provide detailed instructions for review, but I recommend that we review from the perspective of determining whether the skeleton of the analysis presented here appears that it will address the key issues for review, and provide recommendations for inclusion of any issues that appear to have been overlooked in the current structure.

Here are the specific section assignments, similar to last time:
- 4.1 Intro – Molly
- 4.5 Recreation – Molly
- 4.11 Aesthetics – Molly
- 4.14 Soils – Mark/Palmer
- 4.16 Surface Water Hydrology – Tim/Mark/Palmer/Muluken
- 4.17 Hydrogeology – Tim/Mark/Palmer/Muluken
- 4.18 Water and Sediment Quality – Cindi/Tim/Chris
- 4.22 Wetlands/ Special Aquatic Sites – Mark/Palmer
- 4.26 Vegetation – Mark/Palmer

The Corps has requested a quick turnaround for review, therefore please send me any comments you may have on these sections by COB 7/24. I am hoping, given the brevity of these documents, that this timeframe will be achievable, but please let me know as soon as possible if it will not.

Please provide your comments in the attached comment table format.

It may be helpful to look back at the issues we recommended for analysis in our scoping comments - I have saved the final version of that letter on the Sharepoint Site here:

Internal Website / Ex. 6

Thank you,
Molly

Subject: Media contact for Pebble Anchorage public scoping meeting tonight

Hello Marianne,
I will be attending the USACE public scoping meeting here in Anchorage for the Pebble Project this evening, beginning at 5pm. EPA does not have a speaking role, and I expect to be solely observing the proceedings as a member of the public. However, in the event that I receive any press inquiries, who shall I direct them to? I realize that this will be very late Seattle time, though the Corps is not offering a public speaking format (attendees can provide their input on computers or one-on-one to a court reporter) so I don't expect to stay very long into the evening.
Thank you,
Molly

AMERICAN OVERSIGHT

Talking Points for Pebble Scoping Meetings

Introductory Talking Points:

- EPA is a cooperating agency in assisting the Corps in developing the EIS.
- The Corps has specifically requested that we provide input into issues related to the CWA 404(b)(1) guidelines.
- EPA has put together a technical team to provide this assistance and review EIS documents.

If asked how the Proposed Determination or Bristol Bay Watershed Assessment influences the EIS process:

- The BBWA is a three-year, twice peer-reviewed study that provides technical and scientific information about the watershed and the impacts of mining the Pebble deposit. We will use the Assessment, along with other available information, to inform our input into the EIS.

- The Proposed Determination, which has not been finalized, contains proposed restrictions for mining the Pebble deposit. It is not a veto of all mining. Pursuant to the terms of a settlement agreement with the Pebble Limited Partnership, EPA cannot move forward with its Section 404(c) process, should such a decision be made, until a Final EIS is noticed for the project or until May of 2021, whichever is sooner.

Subject: Final scoping letter

All – attached is the final Pebble scoping letter that I signed this afternoon. Patty is submitting electronically to the Corps today.

AMERICAN OVERSIGHT

To's – first, please accept and pass on my gratitude for the truly above and beyond efforts to see this over the finish line. There's a lot to feel good about in here. Second, please distribute to the (many) others whose efforts contributed to the final product (or to one of the many intermediate products). I started trying to address to all, but knew that I'd never come up with a complete list.

Cc's – thanks for your support on this.

Erik and Patty – please set aside at least 20 minutes of our Tuesday team meeting agenda to discuss the letter and to begin discussing lessons learned.

Given the extra time for preparing scoping comments, and following an excellent suggestion from Ashley, I propose a strategy conversation regarding how to address potential indirect/cumulative effects of a future expanded mine or opening up the area to other developers in the scoping letter.

Hello All,
The Corps has just distributed Chapter 5 Mitigation for review as well, and I have loaded it onto the Sharepoint site. When reviewing the analysis of Environmental Consequences for each resource, please also take a look at the mitigation measures that have been proposed for that resource, and provide any additional recommendations where mitigation is not sufficient, including revisions to proposed mitigation language or additional measures recommended.
Thank you,
Molly

Subject: Please Review - Pebble Pre-DEIS Sections
Importance: High

Hello Pebble NEPA Team,

We have received several additional sections of the preliminary Draft EIS for review. We have also received many sections as an FYI for which our review is not requested. I have loaded everything I've received to date into the Sharepoint Folder: Preliminary Draft EIS Sections Oct-Nov 2018.

As a reminder, our input at this stage is only requested on the specific sections we were assigned to in the Cooperating Agency plan. Therefore, if your name doesn't appear below with a specific assignment, no review is necessary at this time. However, feel free to take a look at the sections pertaining to your subject matter on the Sharepoint Site if you wish.

Here are the assignments for specific sections where I would appreciate your review. Note that each subject area includes a section for Chapter 3 (affected environment), Chapter 4 (environmental consequences), as well as one or two supporting technical appendices. Please use the attached comment spreadsheet to assemble your comments, and please send them to me by the date noted for each section below.

- 3.11/4.11/K4.11 Aesthetics – Molly
- 3.14/4.14/K3.14 Soils – Mark/Palmer – due COB 11/27
- 3.16/4.16/K3.16 Surface Water Hydrology – Tim/Mark/Palmer/Muluken/Justine – due COB 11/27
- 3.26/4.26/K3.26 Vegetation – Mark/Palmer – due COB 11/27
- 3.17/4.17/K3.17 Hydrogeology – Tim/Mark/Palmer/Muluken – due COB 11/29
- 3.18/4.18/K3.18/K4.18 Water and Sediment Quality – Cindi/Tim/Chris – due COB 11/29
- (note, we have not yet received the Wetlands sections, which are anticipated to arrive approximately 11/21)

I apologize for the short time available for review, especially given the Thanksgiving holiday in the middle. If this schedule will be impossible for you, please let me know as soon as possible. Also, if you have any questions about the sections you are reviewing or where to focus your review, please don't hesitate to call.

Thank you,
Molly

Molly/Patty:

AMERICAN OVERSIGHT

As I mentioned yesterday, I shared the draft scoping letter with Joe Ebersole and Kate Schofield. Attached are comments from Kate. Your draft letter incorporated all of the input that I provided earlier in the development process but I have a few additional suggestions that I added on top of Kate's comments.

Have a great weekend.

-Palmer

Subject: Pebble Scoping Letter - Review Requested

Hello Associate Reviewers,

I have completed a first draft of a scoping comment letter for the Pebble Project, which is now loaded onto the Sharepoint Site in the Documents>Scoping folder, at:

Internal Website / Ex. 6

Please review the draft letter, in particular the portions of the detailed comments that relate to your areas of expertise. This letter has been drafted based off of ERSMU's standard scoping language and language used in other recent letters for similar projects (including mining, road, pipeline, and port development projects). Some tweaks have already been made to reflect the specific considerations for this project, but there is likely to be more room for project-specific tailoring of the comments. Please review and provide:

(1) any edits necessary for technical accuracy, and

(2) any additional site-specific or project-specific technical information/concerns/recommendations you think necessary to convey to the Corps during this scoping period.

Please provide your edits in "track changes" format. If it is not too cumbersome, please make your edits directly in the document on the Sharepoint site (titled "Pebble Project Scoping 041118 draft"), to reduce the number of separate versions of the letter. If this format doesn't work for you, you can also save your edits as a separate version and I will work to consolidate them.

Please complete your review by **COB Wednesday May 2**. If you have any questions or think a meeting to discuss the comments on your subject area would be helpful, please let me know.

Thank you,
Molly

Hi Molly,
I just finished going over the document….only a few minor suggestions, feel free to include or remove my suggested edits at your discretion.
Let me know if you have any questions.
Thanks,
Chris

Subject: Pebble Scoping Letter - Review Requested

Hello Associate Reviewers,

I have completed a first draft of a scoping comment letter for the Pebble Project, which is now loaded onto the Sharepoint Site in the Documents>Scoping folder, at:

Internal Website / Ex. 6

Please review the draft letter, in particular the portions of the detailed comments that relate to your areas of expertise. This letter has been drafted based off of ERSMU's standard scoping language and language used in other recent letters for similar projects (including mining, road, pipeline, and port development projects). Some tweaks have already been made to reflect the specific considerations for this project, but there is likely to be more room for project-specific tailoring of the comments. Please review and provide:

(1) any edits necessary for technical accuracy, and

(2) any additional site-specific or project-specific technical information/concerns/recommendations you think necessary to convey to the Corps during this scoping period.

Please provide your edits in "track changes" format. If it is not too cumbersome, please make your edits directly in the document on the Sharepoint site (titled "Pebble Project Scoping 041118 draft"), to reduce the number of separate

AMERICAN OVERSIGHT

versions of the letter. If this format doesn't work for you, you can also save your edits as a separate version and I will work to consolidate them.

Please complete your review by **COB Wednesday May 2**. If you have any questions or think a meeting to discuss the comments on your subject area would be helpful, please let me know.

Thank you,
Molly

Hello Dave,

As we mentioned earlier this week, the Pebble letter is ready for your review. I think that Molly and Jay did a great job. I would really appreciate your review to make sure Jay and I are not missing anything.

The link to the site with the letter is below here in Molly's April 11 email.

At your earliest opportunity, please let us know if you think any changes need to be made to the letter.

Thank you

Molly and Karl,

In response to our call earlier this week I have made some edits to the Pebble scoping letter air quality section, namely:

[Deliberative Process / Ex. 5]

I believe I have covered the main points we discussed in the call, but I failed to keep adequate notes and my memory is failing me. I'll sleep on it and may have further edits/additions tomorrow. But, if you can recall any other main points we discussed on the call, I would appreciate if you could please refresh my memory!

Thank you,
Jay

Subject: Pebble - scoping letter schedule

Good morning Ashley,
As I know you are aware, I have a very aggressive schedule for drafting the Pebble scoping letter, to allow adequate time for all of the internal R10 and HQ reviews that will need to occur. I have time allotted for an ORC review from 4/12 (I'll get you the letter by COB on that day, hopefully earlier) to 4/16 COB. I realize this really only gives you 2 business days, but it's the best I could figure out. Will this plan work with your schedule?
Thanks,
Molly

18-0002-COE Pebble Project Scoping 040418 draft.docx

<!--[endif]-->

Good Morning Jay and Karl,
As you know, we are in the process of drafting scoping comments for the Pebble Project, with a short comment window. I have a very aggressive schedule to get the letter ready for management review. I have completed a first draft of the letter, but would like your input on the air quality scoping comments. I believe you are also aware that the Corps has declined our repeated requests to extend our areas of "special expertise" for cooperating agency involvement beyond the 404 nexus. This means that we only have three opportunities for input on AQ issues – Scoping, DEIS and FEIS. Consequently, I want to make sure the AQ comments are as thorough as we can be at this stage, given what we know about the project.

I've attached the current draft of the comment letter. For easy reference I've also provided a link below to the project description on the sharepoint site. The final attachment is the scoping comments on Donlin gold – this letter overall used a much longer format than we are using for this scoping letter, but may provide some ideas of other things to include, if appropriate/necessary.

In order to stick to the letter writing schedule, I will need any comments/edits/additions you have by COB 4/11. If a conference call to discuss would be helpful, please let me know and I will set one up.

Regulatory Division
Post Office Box 6898
Joint Base Elmendorf Richardson, Alaska 99506-0898

Re: The Donlin Gold Project Scoping Comments. EPA Region 10 Project No.12-0057-COE

Dear Mr. Kuhle;

The U.S. Environmental Protection Agency has reviewed the December 14, 2012, Notice of Intent to prepare an Environmental Impact Statement for the proposed Donlin Gold Project. Our scoping comments are provided pursuant to the National Environmental Policy Act, Section 309 of the Clean Air Act, the Clean Water Act, and our responsibilities as a cooperating agency.

The CAA §309 specifically directs the EPA to review and comment in writing on the environmental impacts associated with all major federal actions. Our review of the Draft EIS will consider the expected environmental impacts and the adequacy of the EIS in meeting the procedural and public disclosure requirements of NEPA. The EPA's review criteria for rating EISs are available on our website http://www.epa.gov/compliance/nepa/comments/ratings.html.

The NOI indicates that Donlin Gold, LLC, is proposing the development of an open pit, hardrock gold mine in Southwest Alaska, ten miles north of Crooked Creek. The proposed project would include a waste rock facility, tailings storage facility, a mill processing facility, mine camp, and other ancillary facilities, such as a natural gas-fired power plant supplied by a 313-mile long, 14-inch diameter buried pipeline from the west side of Cook Inlet. Transportation infrastructure would include a 27-mile long access road, a 5,000-ft long airstrip, port faculties at Jungjuk and Bethel, and a 40 million gallon diesel fuel storage facility.

The EPA highlights the importance of establishing and disclosing the details of financial assurance for post-closure, reclamation, and long-term water management. We recommend that the EIS provide a detailed level of information to ensure that there will be adequate financial assurance to cover the costs of implementing closure and reclamation plans, monitoring, contingency measures, and long-term water management to avoid unacceptable adverse environmental impacts. Financial assurance information should be provided for public review and comment.

We encourage the Corps to evaluate the CWA §404 permit application concurrently with the NEPA process and the National Historic Preservation Act Section 106 coordination process. We recommend the Corps identify a preferred alternative at the Draft EIS stage, and include a draft CWA §404(b)(1) Guidelines analysis. We believe this would result in a more streamlined and consistent agency decision, enhanced public disclosure, and predictability for the project proponent.

AMERICAN OVERSIGHT

In addition to evaluating the environmental consequences from the construction and operation of the proposed Donlin Gold project, we recommend that the EIS evaluate unanticipated, but reasonably foreseeable mine failure scenarios within the scope of NEPA analysis. There are inherent environmental and human health risks associated with the development of a new mine project that may not be anticipated or expected during the early project planning stages. Accidental fuel and chemical releases and spills do occur despite precautions to manage for those risks. An evaluation of the environmental effects resulting from the failure of the mine facilities, such as the tailings storage facility dam and liner, is also important as alternatives are developed for siting, design, closure, and financial assurance.

Finally, the proposed project may result in significant environmental and human health impacts to over 60 Alaska Native and other rural communities in the Yukon-Kuskokwim region. The release of acid rock mine drainage and metal leaching of pollutants, such as mercury, arsenic, and cyanide into the adjacent wetlands and waterbodies could affect traditional cultural practices including hunting; fishing and gathering of subsistence foods and drinking water sources relied upon by the local native communities. The transportation of diesel fuel and other chemicals on the Kuskokwim River represents a potential spill risk and conflict with local uses. The EIS should fully disclose the potential direct, indirect and cumulative impacts of these project-related activities on their traditional way of life.

As a cooperating agency, the EPA appreciates the opportunity for early involvement in the NEPA planning process by providing comments on the proposed Donlin Gold Project. The detailed comments (Enclosure 1) reflect the scope and range of issues, and potential impacts that we believe warrant consideration in the EIS.

Please do not hesitate to contact me at (907) 271-3411 or by electronic mail at jen.mark@epa.gov, if you have any questions regarding our comments. We look forward to working with your office, the applicant, and the other cooperating agencies and tribes to advance this important Alaska resource project.

Sincerely,

//s//

Mark S. Jen, Project Manager
Environmental Review and Sediment Management Unit

cc: Donlin Gold, LLC

Enclosures

AMERICAN OVERSIGHT

Enclosure 1

EPA Detailed Scoping Comments on the Donlin Gold Project
Region 10 Project No. 12-0057-COE

Purpose and Need

The EIS should present a clear and concise statement of the underlying purpose and need for the proposed project consistent with the implementing regulations for NEPA (40 CFR 1502.13). This statement should be framed broadly enough as to allow for the analysis of a range of reasonable alternatives.

Recommendations:

- The EIS should reflect not only the project proponent's and the Corps' purpose and need, but also the broader public interest and need based on the scoping comments; and
- The purpose and need statement for the EIS should be developed in coordination with the cooperating tribes and agencies.

Range of Alternatives

The EIS should evaluate a range of reasonable alternatives to meet the project purpose and need that are responsive to the issues identified during the public and agency scoping process and through tribal government-to-government consultation. A range of reasonable alternatives will ensure that the EIS provides the public and the agency decision-makers with information that sharply defines the issues and identifies a clear basis for choice among the alternatives, as required by NEPA. The Council of Environmental Quality recommends that all reasonable alternatives be considered, even if some of them could be outside the capability or the jurisdiction of the lead federal agency preparing the EIS for the proposed action.

Recommendations:

Criteria Development

- Develop criteria that would be used to (1) identify a range of reasonable alternatives; (2) eliminate alternatives from further consideration (3) identify the environmentally preferred alternative , and (4) identify the least environmentally damaging practicable alternative;
- Criteria could be based on the conservation of important aquatic and terrestrial habitats, maintaining wildlife and fish passage, maintaining subsistence and socio-cultural resources, practicability (e.g., logistics, technology, and costs), regulatory requirements, etc.;
- Comments identified during public and agency scoping, and tribal consultation should be used to develop alternatives criteria;
- Describe the process, the rationale, and the basis for how these criteria were developed; and
- The alternatives criteria should be developed in coordination with the cooperating tribes and agencies.

Range of Reasonable Alternatives

- Evaluate the unanticipated but reasonably foreseeable mine failure scenarios, which may include the potential failure of the tailings storage facility dam and liner, as well as other accidental chemical releases and spills associated with the mine site, the natural gas pipeline, and the transportation logistics;
- Evaluate alternative energy sources, such as wind, diesel, solar, hydroelectric, and geothermal;
- Evaluate alternative pipeline and road alignment routes and options;

AMERICAN OVERSIGHT

- Evaluate the use of winter ice roads and snow roads for (1) transportation of cargo and fuel to the mine site, and (2) logistic associated with construction activities;
- Evaluate alternative locations for the proposed port facilities;
- Evaluate alternative configurations for the mine and camp facilities, facility designs;
- Evaluate alternative mine processes, best available technologies, physical-chemical treatment options, alternatives to cyanide for gold ore processing, etc.; and
- Compare environmental impacts between the proposed project and alternatives analyzed in detail.

Cost Benefit Analysis

- For each alternative analyzed in the EIS, develop a general life cycle economic cost analysis; and
- Cost of the project would be used to determine the practicability of the proposed project under Clean Water Act (CWA) §404(b)(1) Guidelines.

Agency Preferred Alternative(s)

The Draft EIS should include an agency preferred alternative, if one or more exists. This would provide the public, the tribes, and the agencies with an opportunity to conduct a more detailed review and comment of the environmental consequences associated with the preferred alternative.

Recommendations:

- Concurrent review and analysis under the National Environmental Policy Act, CWA §404, and Section 106 National Historic Preservation Act;
- A draft CWA §404(b)(1) compliance determination for the preferred alternative should be included in the Draft EIS as an Appendix; and
- The Least Environmentally Damaging Practicable Alternative identified as the preferred alternative in the Draft EIS.

Financial Assurance – Reclamation, Post-Closure Monitoring, Long-Term Management NEPA provides for the disclosure to the public, the tribes, and the decision-makers regarding information concerning environmental consequences of a proposed action before the decisions are made and before actions are taken. A key component in determining the environmental impacts of a proposed mine is the effectiveness of closure and reclamation planning and activities, including long-term water management. The amount and viability of financial assurance are critical factors in determining the success of reclamation and closure activities and, therefore, the significance of the environmental impacts.

The EIS should disclose the costs associated with implementing the closure and reclamation plan, as well as the contingency measures to address the reasonably foreseeable but not specifically predictable project outcomes. This is necessary to inform the public, the tribes, and the decision-makers of the financial risk to the public posed by the conditions at the site. Financial assurances should be in a form that protects the public interest in the event that a company is unable to implement contingency measures or perform long-term operation and maintenance at a closed mine site. The EPA has expertise in this area and would be available to work with the Corps, the State of Alaska, and the project proponent to develop appropriate cost estimates and funding criteria.

The level of information that should be included for financial assurance is outlined in our recommendations below for site reclamation and long term-term site maintenance. We have also enclosed an example of a narrative description for financial assurance cost categories (Enclosure 2) and a cost estimate spreadsheet (Enclosure 3).

AMERICAN OVERSIGHT

Recommendations:

Site Reclamation (e.g., facility closure, earth moving/stabilization, revegetation, etc.):

- Estimate the cost (+/- percent) to reclaim and close the site in a manner that achieves reclamation goals and post-mining land use objectives;
- Identify criteria for determining success of reclamation activities for bond release;
- Estimate the direct costs for site reclamation, monitoring, long term management, maintenance, and contingencies, including removal of structures and facilities, and revegetation; and
- Include the costs associated with implementing contingency measures to address reasonably foreseeable but not specifically predicted outcomes.

Long-Term Site Management (e.g., post-closure water treatment, mitigation of aquatic resources, site maintenance, and monitoring):

- Itemize the cost estimates (including reasonable contingencies) and appropriate economic variables to calculate the net present value of future expenses, including the time period to complete long term treatment, monitoring and maintenance; and
- Describe the "mechanics" of the financial assurance mechanism for the site, for example, if a trust is being used, include such details as:
  - Requirements for timing of payments into the trust fund and for "true-ups";
  - Discount rate used, if any, including assumptions for inflation, management fees, and tax rates;
  - Acceptable investment instruments;
  - Tax status of the trust fund and how management fees and taxes are paid; and
  - Identification of the trust fund beneficiaries.

To ensure that financial assurance for both site reclamation and long-term maintenance are adequate, the agency should also:

- Reevaluate financial assurance cost estimates every three to five years or whenever a major change to the mine operations has occurred;
- Identify the responsible party for any post-closure clean up actions, should they be necessary. The financial assurance should not depend on the continued financial health of the mine operator or its parent company;
- Disclose detailed information about the process used to develop and secure financial assurance, including, but not limited to, costs, calculations, models, assumptions, inflation adjustments and rates, rates of return, contingencies, labor rates, net present value to consider costs many years into the future;
- To minimize the amount of financial assurance required, consider removal of the tailings material and potentially acid generating material off-site;
- Base the financial Assurance estimates on the reasonable spill or failure scenarios, such as the largest disturbances and material volume, water treatment, soil amendments, and hazardous materials;
- Identify the responsible party for any post-closure clean up actions, should they be necessary. The financial assurance should not depend on the continued financial health of the mine operator or its parent company;
- Disclose detailed information about the process used to develop and secure financial assurance, including, but not limited to, costs, calculations, models, assumptions, inflation adjustments and rates, rates of return, contingencies, labor rates, net present value to consider costs many years into the future;
- Estimate the indirect costs, such as mobilization and demobilization, contingencies, engineering design, etc.; and

AMERICAN OVERSIGHT

- Evaluate the indirect and cumulative costs associated with the long-term impacts to subsistence and water resources.

Acid Rock Drainage/Metal Leaching

Site Analogs

The geology and geochemistry of the project area may be unique or may exhibit similar features and characteristics as other gold mines in the State. Site analogs may be a way of comparing and evaluating acid mine drainage and metal leaching potential, and can be used to predict future site conditions. The EIS should include information regarding other historic and/or present gold mining projects and claims as a basis of comparing the environmental effects of the proposed project.

Recommendations:

- Discuss the regional mineralization and existing gold deposits and mine project in Alaska as site analogs for evaluating the proposed project geology and geochemistry;
- Compare the ore, waste rock, and tailings characterization (e.g., chemical/physical composition, metals leachability and acid-generating potential) of the proposed project mine site to other existing gold mines in Alaska (e.g., Fort Knox, Pogo, Nixon Fork, Kensington, etc.); and
- Identify and describe historic, present and proposed gold mining claims, and activities in the region.

Mine Site

In order to evaluate the effects of acid rock drainage/metal leaching, the geology and geochemistry of the mine site should be fully characterized. There is a potential for acid rock drainage/metal leaching to occur from surface runoff and from the ore, waste rock facility, and infiltration/seepage from the tailings storage facility. The EIS should include a characterization of the ore and waste rock and mine tailings for potential acid rock drainage/metal leaching. This characterization should be conducted prior to mine construction and operations, and throughout the 27 year mine life, as well as during mine closure and reclamation.

Recommendations:

- Characterize the ore and waste rock, and tailings, including the chemical/physical composition, metals leachability, and acid-generating potential;
- Develop a detailed acid rock drainage and metal leaching testing plan and include a schedule and timeframe. The open pit mine lithologies should be tested regularly during the active life of the mine operations for potential acid rock drainage/metal leaching, as well as during closure and reclamation;
- Identify measures and options to minimize the release of acid rock drainage/metal leaching. It is presumed that all waste rock from the mine site will generate acid. This must be accounted for and managed in perpetuity;
- Evaluate and model potential rates and volumes of infiltration/seepage from mining facilities into groundwater and surface waters;
- Identify the constituents and pollutants in the infiltration/seepage stream. Evaluate how unintended and/or unmitigated releases of seepage from facilities would affect surface/groundwater quality;
- Evaluate the feasibility of adding a thicker, denser impoundment cap to the tailings pile to reduce oxygen flux, slow down oxidation of the tailings, and reduce hydraulic conductivity and water movement down through the tailings;

AMERICAN OVERSIGHT

- Evaluate the feasibility of mixing amendments to the tailings to reduce the potential of acid rock drainage/metal leaching;
- Evaluate the use of a geomembrane liner for the waste rock facility to minimize infiltration/seepage; and
- Identify monitoring plans to test for acid rock drainage/metal leaching in the adjacent groundwater and surface waters. Discuss the process for treatment of water impacted by acid rock drainage/metal leaching.

Pipeline Corridor

The proposed pipeline corridor would extend over 300 miles and cross the rugged Alaska Range. The proposed pipeline would be buried and would require trenching in mineralized areas of the state. Analysis should be conducted along the proposed buried pipeline corridor to determine whether trenching could result in acid rock drainage/metal leaching into adjacent surface waters and groundwaters.

Recommendations:

- Characterize the bedrock for acid rock drainage/metal leaching potential (including neutral or high pH metal leaching);
- Use site analogs for comparison of acid rock drainage/metal leaching with other minerized areas and historic and present gold mines;
- Develop detailed acid rock drainage/metal leaching testing and monitoring plans during trenching activities; and
- Identify measures to reduce and/or capture runoff of acid rock drainage/metal leaching into adjacent surface and groundwaters.

Mercury (Air Emissions)

Point Source Emissions

On December 16, 2010, the EPA promulgated National Emissions Standards for Hazardous Air Pollutants for gold ore processing and production facilities to regulate mercury air emissions, which is the seventh largest source of mercury emission in the United States.[1] The final rule establishes mercury emission limits for four types of processes found at gold production facilities: ore-pretreatment processes (primarily heating processes used to prepare ore for gold extraction); carbon processes with mercury retorts; carbon processes without mercury retorts; and non-carbon concentrate processes. Table 1 identifies the final mercury air emission limits for new sources.

Table 1

Affected Source	Existing Sources	New Sources	Units
Ore pretreatment processes	127	84	lb/million tons of ore
Carbon processes with mercury retorts	2.2	0.8	lb/ton of concentrate
Carbon processes without mercury retorts	0.17	0.14	lb/ton of concentrate
Non-carbon concentrate processes	0.2	0.1	lb/ton of concentrate

The final rule also establishes requirements for monitoring, which include annual mercury emissions tests at all emissions stacks. The EIS should describe how this proposed project would meet the new

[1] National Emission Standards for Hazardous Air Pollutants (NESHAP): Gold Mine Ore Processing and Production Area Source Category. Final Rule 40 CFR Parts 9 and 63.

AMERICAN OVERSIGHT

mercury air emission limits and monitoring requirements associated with the types of gold ore processing and production facility at the Donlin mine.

Recommendations:

- Characterize the amount of mercury in the ore.
- Describe the mercury abatement process and the type of control technologies (e.g., mercury scrubbers, condensers, carbon absorbers, etc.) that would be implemented to meet the new mercury air emission limits;
- Discuss the efficiency of the mercury capture system and estimate the expected amount of mercury air emissions from the mill exhaust stack;
- Describe the predicted speciation of mercury emissions in order to identify if releases will be deposited locally or enter the global pool;
- Provide an estimate of the amount of mercury that would included in the tailings effluent stream and stored in the tailing storage facility;
- Describe the amount and the physical/chemical form of mercury captured, and how this mercury would be contained and stored. Discuss transportation of the mercury if sold to lower 48 markets as recycled mercury. Identify the names of the authorized mercury recyclers, if any;
- Describe the type and method of monitoring, frequency and schedule for monitoring, and mercury emission testing at emission stacks to ensure control technologies are effective;
- Provide a process flow diagram identifying the location of the control technologies, where monitoring of mercury emissions would occur, how much mercury would be captured, and how much mercury would be released from the mill exhaust stack; and
- Describe any corrective actions that would be taken if mercury air emissions exceed the allowable limits;

Nonpoint Source Emissions

Studies have demonstrated that mercury associated with solid material or dissolved in an aqueous solution can volatize directly to the atmosphere. Often only a relatively small percent of the solid/liquid associated mercury volatizes; however if the solid or solution concentrations are high (as they often are at mines in geologically enriched mercury areas) and/or cover a large surface area (also often the case at major mine operations), then there is potential for significant amounts of mercury to be released from nonpoint sources. Previous studies from Nevada gold mine areas indicate that surface volatilization can range from 10 to over 100 kg/year per mine—depending on many different mine characteristics (study details available upon request). A general mercury assessment and bioaccumulation study should be conducted for this project based on evaluation of the point and nonpoint sources of mercury emissions, identification of mercury receptors in the environment, and the pathways for environmental and human exposure.

Recommendations:

- In order to have a full understanding of mercury air emissions from a mine operation, these nonpoint sources will need to be identified and quantified. Prior to the development of the mine, these emissions can be estimated based on anticipated mercury concentrations of the different mine surfaces;
- Surface-air fluxes are not unique to mining areas. They can also occur from natural landscapes—with landscapes containing geologically enriched mercury having larger emissions. To help contextualize the emissions from a proposed mine, there may be utility in first quantifying the baseline mercury emissions from the natural landscape;

AMERICAN OVERSIGHT

- Apart from volatilization, particulate bound mercury can be mobilized through wind erosion, which may be deposited locally. The potential for wind erosion of mercury enriched particles should be discussed in the EIS; and
- Identify and quantify the mercury receptors in the environment. The potential for this mercury to be deposited to local wetlands and other surface waters, and methylated should also be described.

Mercury Methylation (Water)

The impact of mercury on aquatic systems may be dependent on the amount that is methylated. Mercury methylation requires inorganic mercury and methylating bacteria. The predominant (though not exclusive) methylators of mercury are sulfate reducing bacteria, which require anoxic conditions, sulfate, and an organic carbon source. Therefore, any landscape alterations that affect the activity of SRB can have a large effect on methylmercury concentrations in aquatic biota. As such, in evaluating the impacts of the proposed mine, it is not adequate to look at just releases of inorganic mercury. The EIS should discuss how the mining activity influences the methylation potential of mercury. The pathways for environmental and human exposure to methylmercury should also be described.

Recommendations:

- In 2007, measurements of methylmercury were added to the mercury baseline study. These measurements focused on stream/river sediments. While measuring sediments may have the benefit of being less temporally variable than water; the water measurements may be more representative of the methylmercury available for accumulation in the food web. It is likely that mercury methylation in the area is mainly occurring in wetlands. The export of methylmercury from these wetlands is likely in the dissolved phase. Therefore, it may be the case that sediment methylmercury concentrations are not representative of water methylmercury concentrations. The export of methylmercury from wetlands is likely highly temporally variable and would be dependent on hydrological connectivity between the wetlands and streams. An efficient way to identify the baseline methylation potential of the ecosystem is to collect measurements directly from the wetlands;
- Numerous studies have shown that methylmercury concentrations in water have large seasonal variability—with the highest concentrations in the late summer/early fall. Over the winter, methylmercury typically decreases, resulting in lower spring time concentrations. As such, to understand the maximum amount of methylmercury being produced, measurements should be made in the late summer or early fall;
- The EIS should discs the potential for methylation to occur downstream from the mine site and the role that export of dissolved organic carbon, sulfate, and inorganic mercury may have on facilitating downstream methylation;
- Releases of mercury or methylmercury associated with the mine need to be contextualized with the releases from Red Devil and other mines upstream, and naturally occurring background levels to understand any cumulative impacts of releases; and
- Discuss the potential pathways for environmental and human exposure to methylmercury, and the potential for methylmercury to bioaccumulating in fish and other subsistence foods relied upon by the local communities.

Cyanide

The proposed gold extraction process would require the use of cyanide, which may pose a risk to human health and the environment if released in large quantities. Accidental spills of cyanide at gold mine processing facilities do occur. For example, the Fort Knox Gold Mine north of Fairbanks had spill

AMERICAN OVERSIGHT

releases of 300,000 gallons of cyanide containing water (May 2010) and 45,000 gallons as a result of a bulldozer breaching the supply line (August 2012).

The transportation, storage, and disposal of cyanide present potential risks and many opportunities for accidental spills and releases of cyanide. As proposed, cyanide would be transported to the mine site using marine cargo vessels, river tug/barges, and trucks on a gravel road. In transit, the cyanide would be stored at the Bethel and Jungjuk ports. Considerations should be made to minimize transportation and multiple transfer points for cyanide.

Furthermore, recent studies have shown that residual cyanide in mine tailings can cause persistent release of toxic metals (e.g., mercury) into groundwater and surface waters. Potential steps should be considered to detoxify, remediate, and remove cyanide from the tailings effluent. Wildlife, particularly birds, can also be exposed to residual cyanide in tailings ponds. The EIS should include a cyanide management plan and a discussion on the environmental and human health impacts associated with cyanide exposure and strategies aimed at reducing exposure to resident and/or migratory wildlife.

Recommendations:

- Discuss the transportation and storage of cyanide. Identify opportunities to minimize transit times and multiple transfer points. Explain how cyanide would be properly stored and contained during transit and at the mine site. An alternative should include the use of air cargo to transport cyanide directly to the mine site;
- Develop a plan to manage cyanide during transpiration and at the mine facility and how to respond to accidental releases of cyanide;
- Evaluate control technologies and/or additives to detoxify, remediate and/or remove cyanide from the mining process effluent. Any cyanide removed should be properly disposed at an approved faculty;
- Provide an estimate of the amount of cyanide that would included in the tailings effluent stream and stored in the tailing storage facility; and
- Evaluate the environmental fate and pathways for human and wildlife exposure to cyanide.

Arsenic

Arsenic is a naturally occurring element in the earth's crust and widespread throughout Alaska. The proposed project activities would expose the aquatic environment to arsenic and potentially result in subsequent exposure to humans by drinking contaminated water and/or eating contaminated foods. The EIS should include an arsenic assessment and determine potential impacts to human health.

Recommendations:

- Identify the sources and the amounts of arsenic potentially released from this project. Identify the receptors of arsenic in the environment. Describe the potential pathways for human exposure. Provide the toxic exposure limits for arsenic to humans and wildlife;
- The mobility and toxicity of arsenic vary depending on the form (e.g. arsenite, arsenate) and is heavily influenced by oxidation/reduction conditions. The EIS needs to include a discussion of predicted arsenic speciation in the context of potential changing redox conditions and how this influences the potential environmental transport and impacts;
- Identify any control technologies that would be implemented to detoxify, remediate, remove and/or treat arsenic from the mining process effluent. For any arsenic removed, identify the proper disposal facility; and

AMERICAN OVERSIGHT

- Provide an estimate of the amount of arsenic in the tailings effluent stream and in the tailings storage facility.

Air Quality Assessment

The temporary short-term and long-term air emissions from the proposed project may result in direct, indirect, and cumulative impacts on the environment and human health. Concerns have been expressed regarding mercury, arsenic, and cyanide emissions into the atmosphere resulting from gold ore processing. The EIS should include an air quality assessment for comparing the existing baseline air quality conditions with the air quality during project construction, operations, maintenance, and reclamation/closure. Winter and summer conditions should be considered in the assessment. The air quality data should meet the EPA's Prevention of Significant Deterioration collection requirements.

Recommendations:

Background Information

- Identify the physical, climatological, meteorological, and visibility characteristics of the project area, which are important to understanding air pollution and transport. Include the representative climate data in the vicinity of the project, including mixing height information, a discussion on whether the data is representative enough to characterize movement of the air mass in the area of interest, and a discussion of variables that affect air pollution and the fate and transport of pollutants, including air dispersion patterns, complex terrain interactions, extreme temperature affects, seasonal variations, and presence of other atmospheric phenomena;
- Discuss surrounding topography, pollutant transport and dispersion, and potential secondary formation of air pollutants;
- During the scoping meetings, local knowledge and wisdom were shared regarding local wind patterns. This information should be included in the air quality assessment;
- Provide existing baseline air quality data, including on a map the locations and terrain elevation of all past and present air quality and meteorological data collections stations, methods and frequency of monitoring, criteria air pollutants (e.g. SO_2, NO_2, CO, O_3, PM_{10}, $PM_{2.5}$. and Pb), measured maximum, minimum, and average concentrations, data quality assurance and quality control;
- Describe the natural resources, ecosystems and human communities that may be adversely affected by any additional air emissions, including critical habitat areas or sensitive areas, wildlife refuges or sanctuaries, sensitive wetlands and waterbodies, threatened and/or endangered species or species of special concern, water resources, or archeological or cultural resources;
- Class I Areas - In Alaska, there are four federal land units identified as a Class I area under the Clean Air Act to protect and improve visibility. These areas include the Denali National Park, the Bering Sea Wilderness Area, the Simeonof Wilderness Area, and the Tuxedni Wilderness Area. Evaluate whether there would be any adverse effects to these Class I areas and develop mitigation measures to minimize impacts;
- Discuss project area air quality designations (i.e., attainment, non-attainment or unclassified), if any and the need to conduct conformity analysis;
- Discuss and provide a map showing the project definition of ambient air; and
- Summarize and discuss the representativeness of the measured air quality data used for background levels.

Air Emissions Inventory

- Develop an air emissions inventory to provide a comprehensive accounting of the sources and the total quantities of air pollutant emissions from all aspects of the proposed project and alternatives. Emission sources considered should include support activities, such as site

AMERICAN OVERSIGHT

preparation, project construction and start-up, as well as operations, maintenance, reclamation and closure activities. An emissions inventory should cover all potential pollutant releases and cover a specific geographic area for a certain timeframe. Include scaled schematics and process flow diagrams that identify product flow and emission-generating activities and points. Fugitive emission points, emission leaks, gas flaring, and ancillary activities that have the potential to generate air emissions should also be included;

- Provide emission inventories of all project combustion and non-combustion, mobile and stationary sources. This would include sources of emissions during the construction and operation phases, and the total quantity of air pollutants emitted (e.g., diesel engines, turbines, mobile sources, aircraft, marine vessels and river tugs/barges, pipeline, and fugitive road dust);
- Identify sources of potential gas flaring and describe the gas flaring system for the proposed pipeline. Evaluate the air emissions associated with the source of gas flaring.
- Identify any nearby sensitive receptors (i.e., schools, hospitals, churches, etc.) and vulnerable populations (i.e., children, elderly, asthmatics, pregnant women, etc.). Consider various pathways of exposure, such as direct contact, inhalation of particles or gaseous pollutants and potential impacts to receptors as a result of pathway exposure;
- Identify and discuss applicable air quality laws, regulations, standards, and guidance. Verify the data meets the National Ambient Air Quality Standards and/or State standards, increments and thresholds. Provide date(s) for any monitoring data that indicates an air quality violation. Identify and discuss required air quality permits;
- Include a plot plan/facility layout showing the ambient air boundary, location of all emission sources, buildings, structures, north arrow and scale;
- Provide tables summarizing the data and model results, and graphics/isopleths to display the locations of predicted concentration. This applies to both a project only analysis and a cumulative analysis; and
- There should be reference sections for sources of assumptions, information and data.

<u>Air Modelling</u>

- Identify the type of modeling used to predict changes in ambient air quality associated with the propose action and alternatives;
- Conduct air quality modeling to determine whether or not emissions from the proposed project activities will cause adverse environmental impacts. Models are selected for their ability to predict changes in ambient air quality and any significant pollutant deposition associated with the preferred action and alternatives being considered. Identify the type of air quality modeling necessary to consider air quality impacts;
- Provide and discuss the calculation methodologies and assumptions of all emission rates, both short term (g/sec, lbs/hr, lbs/dy) and long term (tns/yr). This would include operating hours, fuels, heat input, etc.);
- Provide stack parameters for point sources (height, temperature, exit velocity and diameter), and dimensions for area and volume sources;
- Conduct and provide a Good Engineering Practice stack height analysis i.e., Building Profile Input Program for PRIME;
- Discuss and provide a map showing project modeling domain. This would include ambient air boundary, near field, far field, sensitive receptor locations, map scale and north arrow;
- Identify the representative meteorological data that will be used with the EPA guideline or non-guideline model(s) to predict project concentration impacts during construction, start-up/shutdown, and operation phases;
- Identify the EPA guideline or non-guideline that will be used to predict project compliance with air standards, increments, and *de minimus* levels. In addition, identify any options selected that

AMERICAN OVERSIGHT

are not regulatory defaults. (Note: If a non-guideline model is proposed to predict concentrations in complex terrain, please inform the EPA as soon as possible. This approach will require a Section 3.2.2.e demonstration pursuant to Appendix W in 40 CFR Part 51);
- Conduct an Air Quality Related Value analysis consistent with Bureau of Land Management requirements; and
- Address secondary formation of O_3 and $PM_{2.5}$ (i.e., sulfates, nitrates and VOCs). The latter three should be included with primary $PM_{2.5}$ to determine compliance with air standards.

Hazardous Air Pollutants
- Hazardous Air Pollutants - Include a list of project specific HAPS emitted, estimated quantity, and the mobile (e.g., trucks, vehicles, heavy equipment, tugs/barges and marine vessels, airplanes) and stationary (e.g., mine processing facility, power generator) sources;
- Compare the emissions to the National Emissions Standards for Hazardous Air Pollutants. Discuss whether the standards are achieved or explain why the standards have been exceeded;
- Identify mitigation measures, and control technologies that would be implemented to minimize the emission of HAPs. Mitigation measures could include the use of natural gas to power heavy equipment and vehicles during project construction and operations; and
- Any pollutants not considered in the analysis, there should be a discussion for their omission and an explanation why omitted pollutants are not expected to contribute to reasonable significant impacts.

Fugitive Dust (Particulate Matter)
- In the emissions inventory, include estimates of $PM_{2.5}$ and PM_{10} (particulate matter) emissions from project sources during construction, operation, and reclamation/closure, such as the mine site, gravel roads and pads, gravel source sites, etc.;
- Evaluate the magnitude and significance of fugitive dust emissions (e.g., ore processing operations, gravel roads and pads, construction activates, etc.) and impacts on human health and sensitive populations (e.g., children and elderly);
- Identify mitigation measures, such as wetting the source material, installing barriers to prevent dust from leaving the source area, and halting operations during high wind events; and
- Provide monitoring of fugitive dust during construction, operations, maintenance, and closure/reclamation to ensure effectiveness of mitigation measures.

Water Resources

Water Quality Assessment

The proposed project may contribute in potential adverse direct, indirect, and cumulative impacts to water quality in the region. Water quality impacts to wetlands, rivers, streams, lakes and other surface waters could result from storm water discharges from construction, operation, and reclamation and closure of the mine and camp facilities, the access road, the pipeline, and other support facilities. Accidental releases of fuel and chemicals into adjacent waterbodies could also be a source of water quality pollution. The EIS should include a framework for comparing the baseline water quality to the water quality monitored during construction and operations of the proposed project.

Recommendations:

Baseline Water Quality Information
- Collect baseline water quality information in the project area. Identify the period of record of the collected water quality data. List the water quality parameters for which data has been collected (if certain parameters have been dropped, specify the basis);
- The QA/QC should be maintained at adequately low detection levels;

AMERICAN OVERSIGHT

- Include maps showing the locations and terrain elevation of all past and present data collection stations (explain any that have been dropped or location changed);
- Identify and discuss applicable national and state water quality regulations, standards, and guidance;
- Identify and discuss required wastewater permits;
- Include a plot plan/facility layout showing affected watershed boundaries with location of all discharge points, buildings, structures, north arrow and scale;
- Describe proposed water treatment options and alternatives;
- Provide estimates of the mine effluent water quality – type of pollutants and quantities, etc;
- A draft Alaska Pollutant Discharge Elimination System permit should be included as an appendix to the EIS. This would be beneficial for the public, local and tribal governments, and agency decision-makers; and
- There should be a reference section for the sources of assumptions, information and data.

303(d) Listed Waterbodies

Clean Water Act §303(d) requires States to identify water bodies that do not meet water quality standards and to develop water quality restoration plans to meet established water quality criteria and associated beneficial uses. The list of Alaska's impaired waters (2010) can be obtained on line at: http://www.dec.state.ak.us/water/wqsar/Docs/2010impairedwaters.pdf.

Impaired waterbodies listed in the project area include the Kuskowkim River and the Red Devil Creek (at the confluence of the two rivers), which are both Category 5 and therefore, requires the development of a Total Maximum Daily Load. The Kuskokwim River (AK ID No. 30501-002) and the Red Devil Creek (AK ID No. 30501-002) are listed for exceeding water quality standards for antimony, arsenic, and mercury associated with mining activities, including the Red Devil Mine. The EIS should evaluate the direct, indirect, and cumulative impacts on any impaired waterbodies in the project area.

Recommendations:

- Identify and evaluate impacts to any listed impaired waterbodies in and adjacent to the project area that is on the current EPA approved §303(d) list. Specify the pollutant(s), source(s) and the water quality standard(s) exceeded that was the basis for its listing. Identify whether a water body recovery plan and/or a Total Maximum Daily Load has been developed and/or implemented;
- Describe any enhancement efforts for those impaired waters, and how the proposed project would coordinate with on-going protection efforts, if any,
- Identify mitigation measures to minimize further degradation of impaired waters in the project area; and
- Identify the monitoring efforts to ensure that mitigation measures are effective in achieving water quality standards.

Source Water Protection Areas

The proposed project may impact potable drinking water sources and/or their source areas utilized by the community. Construction of the buried natural gas pipeline would require trenching, excavation, and water withdrawal. Mine construction and operations could result in other impacts to source water areas. The EIS should describe potential direct, indirect, and cumulative impacts to source water protection areas associated with this project.

AMERICAN OVERSIGHT

Recommendations:

- Identify and map the location of known public drinking water supplies and their sources, surface and groundwaters, aquifers, recharge zones, natural springs, etc. within the project area;
- Identify the local traditional drinking water sources, which may include rain barrels, melting ice in the winter, etc. Discuss impacts to these sources from dust and other contaminants;
- Identify the location of known water supply wells in the project area. The Alaska Department of Natural Resources maintains a well log tracking system database that provides information on reported sources of drinking water;
- Identify project construction and/or operational activities that could potentially impact known source water areas;
- Identify potential contaminants that may impact known source waters through infiltration/seepage;
- Distinguish the effects that any current or historic activities, including mining activities, have had on source waters of the project area; and
- Identify mitigation measures and monitoring activities to protect known source water areas.

Storm Water Management

The CWA requires any construction site resulting in the disturbance of one or more acres to have authorization under the construction storm water discharge permit for industrial activities, as part of the APDES permit program. The EIS should evaluate the direct, indirect, and cumulative impacts from storm water discharges.

Recommendations:

- The EIS should disclose that this project would meet the requirements of ADEC's APDES permit program, including development of SWPPPs, submittal of NOIs, reporting, and monitoring; and
- Identify specific best management practices, erosion and sediment control, and other mitigation measures to minimize impacts.

Water Body Crossings

Numerous rivers, streams, lakes and wetlands would be crossed for the construction of the natural gas pipeline, the gravel access road, and other mine related facilities. Different types of water body crossing construction methods and techniques would be implemented, including, but not limited to culverting, bridging, horizontal directional drilling, etc. HDD should be considered for all waterbody crossings. The EIS should evaluate the impacts associated with these construction methods. A water body crossing plan should be developed and included in the EIS.

Recommendations:

- Characterize all proposed the water body crossings, and summarize the information for width, depth, streamflow, presence/absence of fish, fish species, etc.;
- For each water body crossing, identify the type of construction methods (open cut – dry or wet, trenching, HDD, etc.) and/or structures (bridges, culverts, etc.) that would be implemented;
- Identify mitigation measures, such as maintaining no disturbance buffers, in water timing restrictions for fish migration and spawning, etc.; and
- Identify monitoring provisions to ensure effectiveness of mitigation measures.

AMERICAN OVERSIGHT

Water Withdrawal

The proposed project would require large volumes (millions of gallons) of water for construction of permanent and temporary gravel roads, facility pads, hydrostatic testing of the pipeline, HDD, and other mine operations. The EIS should include an evaluation of the water resources of the project area.

Recommendations:

- Identify existing and potential surface water locations where water withdrawal for project construction and operation would occur. Provide the water withdrawal locations on a map;
- Characterize each water resource and identify its surface area, maximum depths, available volume of water, volume of proposed withdrawal, and presence/absence of resident and/or anadromous fish species;
- Identify the maximum water requirements for project construction and operation;
- Identify any mitigation measures/commitments, such as establishing water withdrawal rates, timing of water withdrawal, and screening to avoid impacts to fish; and
- Identify monitoring activities to ensure that fisheries resources are protected.

Mine Site Water Management

The proposed water management objectives for the Donlin Gold Mine are: (1) no discharge of process water during operations, (2) ensure sufficient supply of water during operations, and (3) minimize the amount of water that has to be treated. The EIS should evaluate plans, contingencies and options to ensure that these water management objectives are achieved throughout the 27 year mine life, as well as during mine closure, reclamation, and long-term site management.

Water Balance

The mine site water balance should be estimated for each phase of the mine development (e.g., construction, operations, closure, reclamation periods, and post-closure), and cover a range of hydrological conditions (extreme and average) and potential variations or disruptions in process flow (e.g., temporary suspension of operations as well as closure). The mine site water balance should be described in detail in the EIS.

Recommendations:

- Characterize all potential water source(s) (e.g., surface water, ground water, snow, precipitation, run off, etc.) and estimate the amount of water from each source;
- Specify the volume of water needed for construction and operation of the mine facility;
- Estimate peak flood flows, precipitation, and duration and intensity of storm events on a seasonal basis;
- Estimate changes in water flow patterns for surface drainage modifications, groundwater aquifer dewatering, surface water dewatering, water use, water storage and discharge, and for different seasons;
- Identify the location of meteorological stations and water monitoring stations, length of monitoring and data collection;
- Provide a detailed water balance evaluation at the mine facilities during the full lifecycle– water flow patterns for surface water, water use, land application and discharge systems, pond storage and discharge, seasonal changes, etc. during steady state and peak flow conditions; and
- Provide a detailed schematic diagram depicting the water balance changes throughout the mine life cycle - construction, start up, operations, closure, reclamation and post-closure and monitoring.

AMERICAN OVERSIGHT

Water Treatment

The EIS should provide detailed information regarding the proposed water treatment and long-term treatment and monitoring for the proposed mine facility. An effective water treatment system would ensure that impacts to water quality of the adjacent surface and groundwaters are minimized.

Recommendations:

- Describe in detail the water treatment systems, type of filtration and removal system – active or passive, type of pollutants to be removed. Evaluate the effectiveness of the waste water treatment measures;
- Provide a detailed schematic diagram depicting treatment schemes through mine construction, start up, operations, closure, reclamation and post-closure and monitoring;
- Discuss effectiveness of the water treatment systems during seasonal and high flow events, and during pit dewatering;
- Identify back up options, as needed to address water management concerns throughout the mine lifecycle. For example, during high water periods, can the excess water be managed or stored beyond the capacity of the proposed treatment system. In predicting the water treatment capacity needs, does this account for climate change effects; and
- Provide estimates of the quantities and composition of process solutions, tailings water, runoff waters, mine drainage, and treated effluent at the proposed operation.

Watershed Characterization – American and Anaconda Creeks

The proposed mine facility is located within the two adjacent watersheds – the American and Anaconda creeks. Both creeks provide source water to Crooked Creek, which drains into the Kuskokwim River. The proposed waste rock facility would permanently impact American Creek. The proposed tailings storage facility would permanently impact Anaconda Creek. The EIS should evaluate the direct, indirect, and cumulative impacts to American and Anaconda creeks. The watershed characteristics of both drainages should be evaluated in detail.

Recommendations:

- Conduct a watershed characterization of American and Anaconda creeks;
- Analyze the watershed geomorphological and other characteristics, such as basin shape, slope, vegetation cover, soil type and land use conditions;
- Evaluate the seasonal water levels, flow regimes, and channel morphology (i.e., channel bed and bank erosion and sediment transport capacity), and impacts caused by stream diversions, channelization, and altered drainage patterns;
- Evaluate the types of resident and anadromous fish resources;
- Demonstrate how construction of the proposed mine and its associated facilities might alter runoff responses to both average and extreme precipitation events;
- Evaluate the downriver effects to Crooked Creek and the Kuskokwim River, such as reduction in seasonal and annual water flow, sediment and nutrient transport, etc.; and
- Evaluate the effects of surface water discharge, and impacts to adjacent wetlands or stream reaches from mine dewatering activities.

Mine Closure and Reclamation

Long-term contamination of the mine site and adjacent areas should be minimized by implementing appropriately engineered methods and plans for closure and reclamation. A major goal is to ensure that residual fluids and soluble metal complexes from the tailings storage facility and other mine facilities are neutralized or permanently contained. Otherwise, seepage of metals-laden acidic or cyanide-rich

AMERICAN OVERSIGHT

fluids into adjacent groundwater and surface waters could result. The EIS should include a detailed mine closure and reclamation plan that describes the closure procedures and methods for stabilizing all contaminated material, decommissioning and reclaiming all process facilities, and ensuring long-term water management and treatment.

Recommendations:

- Describe the methods that would be implement to lower the risk of long-term contamination from the waste rock and tailing storage facilities, such as low permeable caps, covers, and capillary barriers following recontouring;
- Describe any land treatments, such as grading, recontouring of facility slopes to reduce the potential for erosion, slope failure, and sedimentation in surface waters. Describe the type and methods for revegetation or reseeding, using native plants, that would aid in reducing erosion and evapotranspiration of water from surface layers;
- Discuss any additional best management practices that would be employed to minimize long-term contamination; and
- Discuss the long-term monitoring program that would be implemented to ensure that water quality of surface and groundwaters would be maintained.

Wetlands, Aquatic Resources, and Riparian Areas

The proposed project would contribute to the direct loss or degradation of wetlands, aquatic resources, and riparian areas for the construction of permanent and temporary facilities. For example, American Creek and Anaconda Creek would be permanently altered from the construction and operation of the waste rock facility and tailing storage facility, respectively. The EIS should quantify and disclose the direct, indirect, and cumulative wetland impacts associated with construction of the mine site and support facilities, the pipeline, the access road, and the port facilities.

Recommendations:

- Describe the appropriate and practicable steps taken to avoid, minimize, and compensate for unavoidable impacts to wetlands, aquatic resources, and riparian areas. Alternatives should consider options for avoiding and minimizing wetland impacts;
- Integrate NEPA process with the CWA §404 permitting process, such as including a draft 404(b)(1) analysis in the Draft EIS as an Appendix;
- Characterize acreages, habitat types and quantify areas of wetlands and aquatic resources within the project area – include their location and information on aerial photograph maps;
- For the proposed natural gas pipeline, jurisdictional Waters of the United States should be mapped using aerial photo interpretation within a minimum 1,000 feet corridor. Field delineation of wetlands should be conducted within a minimum 300-ft wide corridor, as agreed to for other Alaska pipeline projects;
- Describe mitigation measures/commitments to minimize the unavoidable impacts to wetlands; and
- Develop a monitoring plan for wetlands, aquatic resources, and riparian areas to ensure implementation of mitigation measures and their effectiveness. The monitoring plan should also specify any corrective measures.

<u>Function and Condition Assessment</u>

In order to evaluate the function and conditions of the wetlands, aquatic resources, and riparian areas, a functional assessment should be conducted in the project area. A functional assessment would provide an estimate of the quantity and types of wetlands that would be impacted based on their ecological

AMERICAN OVERSIGHT

functions in the landscape. The function and condition assessment would be used to evaluate compensatory mitigation under CWA §404.

Recommendations:

- Identify the condition and functional assessment methodology to evaluate the project area wetlands, riparian areas, drainages, and other aquatic resources;
- In particular, a functional assessment for Anaconda Creek and American creek watersheds should be conducted; and
- Provide the functions and conditions of wetlands on a map and include information, such as the acreage, habitat or vegetation type, percent cover in the project area, etc.

Compensatory Mitigation

On April 10, 2008, the EPA and Corps issued final regulations governing compensatory mitigation for authorized impacts to wetlands, streams, and other waters of the United States.[2] The regulations establish the performance standards and criteria for the use of permittee-responsible compensatory mitigation, mitigation banks, and in-lieu fee programs to improve the quality and success of compensatory mitigation projects.

Recommendations:

- To compensate for the unavoidable impacts to wetlands and other aquatic resources, the EIS should identify the appropriate compensatory mitigation type – permittee responsible, mitigation banks, in-lieu fee programs that would be utilized for this project;
- Compensatory mitigation must be based on the functional assessment of wetlands and aquatic resources and replacement of those functions lost according to an ecologically appropriate mitigation ratio; and
- The project proponent should consider establishing a mitigation bank for this project to compensate for the wetland impacts. A combination of compensatory mitigation options, such as in-lieu fees, mitigation bank, and/or permittee responsible mitigation should be evaluated in the EIS.

The Kuskokwim River

The Kuskokwim River is an important aquatic resource for the native communities of the region. The Alaska Department of Fish and Game considers the Kuskokwim River a significant salmon fishery and serves as the running grounds for Chinook, chum, sockeye, pink, and coho salmon. The Kuskokwim River is one of the biggest subsistence fisheries in the state with more than 1,500 households currently fishing. Approximately 38 communities live within the Kuskokwim River drainage, representing 4,600 households. The direct, indirect, and cumulative impacts to this important aquatic resource may be significant, particularly to the traditional subsistence way of life. The potential project impacts could result from the daily tug and barge transportation (open water season) of fuel, cargo, and cyanide, which may contribute to the risk of fuel and chemical spills, increase river traffic, conflicts with navigability and other river users, and erosion of the riverbanks.

Recommendations:

Riverbank Erosion and Wakes

[2] EPA and Department of Defense, U.S. Army Corps of Engineers (2008). *Compensatory Mitigation for Losses of Aquatic Resources, Final Rule; Federal Register Vol. 73, No. 70.*

AMERICAN OVERSIGHT

- Conduct a geomorphology study for the Kuskokwim River. Evaluate the historic bank erosion rates and quantify the loss of river bank along the reach of the river between Bethel and the proposed Jungjuk port site;
- Conduct a boat wake study using modeling techniques to evaluate the magnitude in which boat traffic and wakes contribute to bank erosion along the Kuskokwim River;
- Evaluate mitigation measures to minimize wake and riverbank erosion, such as establishing a maximum tug/boat speed and load limits, and reconfiguration of the tug/barge, which may minimize boat wakes; and
- Monitor the effectiveness of these measures by evaluating the annual river bank loss.

Navigation, Traffic, and User Conflicts

The tug and barge transportation of cargo and fuel on the Kuskokwim River may result in potential navigation challenges, boat traffic, and conflicts with multiple user groups. Subsistence and commercial fishing activities on the Kuskokwim River could include the use of boats, set and drift gillnets, seines, fish wheels, long lines, and dip nets, which may result in conflicts with tug and barge transportation. The EIS should evaluate the potential impacts resulting from navigational challenges, traffic, and user conflicts on the Kuskokwim River.

Recommendations:

- Evaluate alternatives to tug/barge transport of cargo and fuel, such as winter transportation over land using ice and/or snow roads and trails between the Bethel port and the mine site. This option could reduce the tug and barge traffic on the Kuskokwim River during the open water season;
- Identify the multiple user groups on the Kuskokwim River and estimates the number and type of each user group;
- Evaluate the carrying capacity of the Kuskokwim River to support navigation, tug, barge, and commercial and subsistence boat traffic, etc.;
- Identify where the user groups are located and their number and frequency, type of equipment used (e.g., set nets, fish wheels, etc.);
- Identify existing and historic fish camps, cultural sites, etc. Such information may be proprietary and sensitive. Precautions should be made to ensure the confidentiality of the information;
- Establish mitigation measures/commitments to avoid and minimize potential conflicts with these user groups, such as agreements to reduce the frequency of barge traffic during King salmon openings, etc.; and
- Monitor the effectiveness of the mitigation measures to avoid/minimize river traffic conflicts.

Sediment Dredging and Disposal

Tug and barges would transport fuel and cargo on the Kuskowim River from Bethel to the proposed Jungjuk Port site during the open water season. Concerns have been raised regarding the navigability of barges up the Kuskokwim River during the open water season. Water levels may be lower and certain reaches of the river may be shallower, preventing certain draft tugs/barges from navigating up the river. The EIS should discuss potential problems associated with tug and barge navigation along the Kuskokwim River. If navigational dredging would be required as part of this project, the direct, indirect and cumulative environmental impacts should be evaluated. A navigational dredging plan should also be developed and included in the EIS.

Recommendations:

- Evaluate the need to conduct navigational dredging of the Kuskowkim River;

AMERICAN OVERSIGHT

- Evaluate the open water season past and current water levels, depths, seasonal changes, etc. along the Kuskokim River between Bethel and Jungjuk port site;
- Specify the size, weight, and draft limits for the proposed river barges. Specify the minimum clearance to the river bottom required for the tugs and barges;
- If dredging is required, identify the location of dredging along the Kuskowkim River and the quantity (cubic yards), surface area and depth to be dredged; and
- Identify the location of where the dredged material would be properly disposed of on upland locations.

Waste Material and Fluids

Drilling Muds and Cuttings

HDD for the natural gas pipeline is being proposed for a number of river body crossings. The HDD process typically requires the use of drilling muds to install the pipeline underneath the waterbody. Soil cuttings and other drilling fluid additives are mixed with the drilling muds. Potential releases of drilling muds, cuttings, and additives into adjacent wetlands and waterbodies could adversely impact resident and/or anadromous fish species. A drilling mud plan should be developed and incorporated into the EIS.

Recommendations:

- Describe how drilling muds and cuttings, fluid additives, etc. would be managed, stored, transported, and properly disposed of;
- Describe the types of drilling fluid additives that would be used and their potential impacts on the aquatic environment; and
- Describe potential environmental impacts, proposed mitigation measures, monitoring procedures and contingency planning for accidental releases of drilling fluids, muds and cuttings during HDD construction activities.

Hydrostatic Test Water

The proposed natural gas pipeline would require hydrostatic testing to ensure pipeline integrity during construction. Hydrostatic testing may require large volumes of water, which may be heat treated and/or added with freeze depressants if construction is during the winter season. The EIS should provide information to evaluate the direct, indirect, and cumulative environmental impacts associated with the discharge of hydrostatic test water into adjacent lands, wetlands, and waterbodies containing resident and/or anadromous fish. A pipeline hydrostatic test water plan should be developed and incorporated into the EIS.

Recommendations:

- Describe the location of water sources, volume of water, and withdrawal rates that would be required for hydrostatic testing of the natural gas pipeline;
- Identify the discharge locations to land and/or surface waters, and discharge methods;
- For winter hydrostatic testing, identify the use of any chemical additives, such as anti-freeze or freeze depressants, and how these chemicals would be treated prior to discharging;
- Avoid discharging hydrostatic test water into surface waters containing resident and/or anadromous fish; and
- Describe mitigation measures/commitment and control devices that would be implemented to minimize environmental impacts associated with discharging hydrostatic test water.

AMERICAN OVERSIGHT

Blasting Plan
During project construction, blasting would be required for the open pit mine, and for certain areas along the pipeline corridor route and ancillary facilities. Blasting would result in increased noise levels and related effects to residents, and disruption and displacement of local birds and wildlife. A blasting management plan should be developed and incorporated into the EIS.

Recommendations:
- In the project area, identify the location of proposed blasting, and describe the blasting methods that would be used;
- Specify how blasting effects, such as noise, and wildlife displacement would be controlled and mitigated. A table with this summary information and a map identifying the blasting locations should be provided in the EIS; and
- Noise levels in the project area should be quantified. The threshold levels of noise impacts should be described and the effects of blasting to human health, birds and wildlife should be evaluated.

Material Source Sites
The Donlin Gold project will require large volumes of gravel material for construction of permanent and temporary access roads and development pads, and other project related facilities. The EIS should evaluate the direct, indirect, and cumulative impacts associated with the development of material source sites to cultural and historic resources, wetlands, and other resources.

Recommendations:
- Estimate the total volume (cubic yards) of gravel material that would be required for construction of this project, including the mine facility, access roads, natural gas pipeline, port facilities, airplane runway, camp, etc.;
- Identify the location of any existing and proposed new material source sites on a map; and
- Summarize in a table the information regarding each material source site, such as the location, surface area impacts, quantity of material available, land ownership, permit status, etc.

Fuel Management and Response Planning
The storage and management of petroleum products is regulated by the EPA under 40 CFR Part 112. The applicant will be required to develop Spill Prevention Control and Countermeasures plans and Facility Response Plans and submit these plans to the EPA for review. The EIS should discuss the implementation of these plans.

Recommendations:
- Identify and fully analyze the risks associated with potential fuel spills and other emergency response scenarios along the Kuskokwim River;
- Evaluate the risks of fuel spills from multiple fuel transfer and storage points at Dutch Harbor, Bethel, and Jungjuk port sites;
- Describe the proposed project fuel planning, transportation, storage and containment, and spill planning and response; and
- Identify impacts to area users, as well as any strategies employed to communicate risks or actual emergencies to those users.

AMERICAN OVERSIGHT

Hazardous and Solid Waste Materials Planning

Over the lifetime of the proposed project, large quantities of hazardous and solid waste material would be generated during construction, operation, maintenance, closure and reclamation. The EIS should address the potential direct, indirect, and cumulative environmental impacts of hazardous and solid waste from the proposed project. A hazardous and solid waste material handling, storage, management, and disposal plan should be developed and incorporated into the EIS.

Recommendations:

- Identify the sources, types, and volumes of hazardous and solid waste material;
- Discuss how the hazardous and solid waste material would be properly handled, stored, and disposed at the camp and/or mine sites or at an offsite facility;
- Identify whether an on-site lined solid waste landfill would be constructed to dispose of solid waste material from the camp and mine activities. Specify whether on site burning of solid waste would be proposed;
- For clean solid waste material, develop and implement a recycling and/or composting program. Consider backhauling recyclable material offsite and incorporating the composting material on site;
- For hazardous waste materials, identify any facilities where the material would be properly disposed. The facility should be approved and certified to accept hazardous waste material;
- As an alternative to disposing of hazardous waste, an onsite underground injection control well should be considered to handle hazardous waste material disposal. The EIS should evaluate this alternative; and
- Identify other hazardous material sites within the adjacent project area and determine the potential cumulative impacts from the proposed project (e.g. the Red Devil Mine and other abandoned or historical mines).

Marine Vessel Traffic

The proposed project would result in the increase of marine fuel tanker traffic between the Pacific West Coast and Dutch Harbor, Alaska. Fuel would then be stored in Dutch Harbor until transported onto barges to the Port of Bethel. Additionally, marine cargo would be transported to Bethel from the West Coast. The EIS should evaluate the marine cargo and fuel transportation system and analyze their potential direct, indirect and cumulative impacts on the marine environment, including marine mammals, threatened and endangered species, critical habitats, and subsistence resources. A marine barge and tanker traffic plan should be corporate into the EIS.

Recommendations:

- Evaluate potential environmental impacts associated with marine fuel tanker and cargo barge traffic between the Pacific West Coast Ports to Dutch Harbor and Bethel on marine mammals, threatened and endangered species, and subsistence resources;
- Identify the marine barge/tanker classes, timing and frequency of travel, volume handled, and marine transportation routes to address potential environmental impacts;
- Identify the seasonal migration routes and timing for marine mammals, threatened and endangered species, and subsistence resource harvesting along the marine navigation routes and evaluate any potential conflicts between barge/vessel traffic and marine resources and uses; and
- Identify mitigation measures to minimize impacts to marine resources and monitoring efforts to ensure that marine resources are protected.

AMERICAN OVERSIGHT

Invasive Species
Executive Order 13112 Invasive *Species* (February 3, 1999) requires that federal agencies take actions to prevent the introduction of invasive species, provide for their control, and minimize the economic, ecological, and human health impacts that invasive species may cause.

Vegetation
Construction activities which disturb the ground may potentially expose areas and facilitate propagation of non-native invasive species. Climate change resulting in warmer temperatures may encourage invasive species growth which may not normally occur at this climate zone. An invasive species management plan should be developed and incorporated into the EIS.

Recommendations:
- Conduct an invasive non-indigenous plant study (pre- and post- project construction);
- Identify mitigation and control measures to minimize the establishment of noxious invasive plant species. Conduct monitoring activities during and after project construction to ensure that non-native invasive species are not establishing in the area; and
- Utilize native plants and grasses for restoration and reclamation of disturbed areas after project construction and during mine closure activities.

Ballast Water
Ballast water from marine barges and vessels serves as a conduit for the introduction of non-native invasive organisms into the marine ecosystem. Non-indigenous species may compete with or prey upon native species of marine algae, fish, and wildlife, may reduce biodiversity of species inhabiting coastal waters, may carry diseases or parasites that affect native species, and may disrupt the aquatic environment and economy of affected nearshore area.

Concerns have been raised that aquatic nuisance species may be transported and introduced into the Kuskokwim River, as well as the marine and intertidal waters by cargo and fuel tankers and river barges. The EIS should evaluate the potential impacts associated with non-native invasive species introduced from marine cargo and fuel barge ballast water.

The National Invasive Species Act of 1996 provides for ballast water management to prevent the introduction and spread of nonindigenous aquatic species into the waters of the United States. A ballast water management plan should be developed and incorporated into the EIS.

Recommendations:
- Include a commitment to use commercial marine vessels and river barges that operate with a ballast water management plan; and
- Include a commitment to use marine vessels and river barges that have onboard ballast water treatment systems to prevent invasive species into the Kuskokwim River.

Permafrost and Vegetation
The proposed project may result in the melting of permafrost as the overlying vegetation is removed or disturbed, gravel fill material is placed on the surface for access roads and facility pads, or the area is excavated and trenched to install the buried natural gas pipeline. Thawing permafrost may destabilize the ground that supports proposed project roads, buried pipelines, and other facilities. In addition, methane and carbon dioxide gas would be released, contributing to greenhouse gas emissions and

AMERICAN OVERSIGHT

climate change. As baseline information for this project, the EIS should include a permafrost and vegetation mapping analysis.

Recommendations:

- Evaluate surface disturbance activities to permafrost and vegetation resulting from the removal of vegetation, the placement of gravel for permanent and temporary access roads, pads, work areas, airstrips, mine facilities, etc.; and
- Identify mitigation measures to minimize impacts to permafrost and vegetation resulting from the construction and operation of this project.

Seismic and other Risks

Seismic activities in tectonically active areas of the region may affect the structural integrity of the tailing storage facility dam, the buried natural gas pipeline, secondary containment for the fuel storage tanks, and other related facilities. The EIS should include a seismic hazard study and evaluate the risks and potential impacts associated with earthquakes and other geologic activities in the project area.

Recommendations:

- Conduct a seismic hazard study for the project area;
- Identify the seismically active areas, geological faults, tectonic activity, etc. in the project area. Include this information on a map;
- Describe the potential risks associated with seismic activities and the effects to project related facilities and structures;
- Appropriate seismic design and construction standards and practices should be implemented for all proposed facilities;
- Identify mitigation measures/commitments to minimize impacts from seismic activities; and
- Describe how the seismically active areas will be monitored and managed to respond to structural failures of facilities.

Terrain Mapping

Terrain mapping is a classification system that describes the characteristics and spatial distribution of surficial materials, landforms, and geomorphological processes. This mapping approach should be used to identify areas of geological, landslide, and avalanche hazards, glacial terrains, soil stability, erosion problems, etc. for the proposed pipeline route. The EIS should evaluate the proposed pipeline route based on terrain mapping information.

Recommendations:

- Use terrain mapping to identify, classify, and map soil, rock, and geomorphic and seismic features; and
- Identify areas of potential geological and landscape hazards, such as erosion, slope instability, ground freezing, glacial terrain, thawing of permafrost, landslides, avalanches, etc.

Protected Species

The proposed project may impact protected species listed under the Endangered Species Act and the Marine Mammal Protection Act, their habitats, as well as Bureau of Land Management and the State of Alaska sensitive species. The EIS should include identification of endangered, threatened, and candidate species under ESA and MMPA, and other sensitive species within the project corridor and surrounding areas and the impacts of the project to these protected species.

AMERICAN OVERSIGHT

Recommendations:

- Identify all listed species – endangered, threatened, and candidate species, within the project area;
- Describe the critical habitat for these species and their migratory range, breeding and feeding areas, etc.;
- Include the Biological Assessments and description of the outcomes under ESA Section 7 consultations with the federal resource agencies; and
- Federal actions should promote the recovery of declining populations of species and protection of their habitat.

Climate Change and Greenhouse Gas Emissions

On February 18, 2010, CEQ issued draft guidance on analyzing the effects of climate change and greenhouse gas emissions.[3] Greenhouse gas includes carbon dioxide, methane, nitrous oxides, hydrofluorocarbons, per fluorocarbons, and sulfur hexafluoride.[4] The EIS should evaluate and disclose GHG emissions and climate change effects resulting from the proposed project, including all phases of development (e.g., mobilization, staging, construction, operation, monitoring and maintenance, and closure and reclamation), and all components, such as the mine and associated facilities, the natural gas pipeline, marine and river, air, and ground cargo/fuel transportation, etc. Please refer to the CEQ guidance for information on quantifying GHG emissions.

Recommendations:

- Develop a GHG emission inventory that includes baseline emissions, direct and indirect projected related emissions, and emissions from reasonably foreseeable activities over the life of this project. Identify the sources of GHG emissions and evaluate their contributions;
- Characterize and quantify the expected annual and cumulative emissions due to construction and operation of the mine and ancillary facilities, and the pipeline using CO2-equivalent as a metric for comparing the different types of GHG emitted over the life of the project, including post mine reclamation and closure;
- Evaluate future needs and capacity of the open pit mine and ancillary facilities, and the natural gas pipeline to adapt to project climate change effects;
- Establish reasonable spatial and temporal boundaries for this analysis;
- Disclose the differences between GHG emissions associated with each alternative analyzed in detail;
- Describe the link between GHG and climate change, and the potential impacts of climate change on the structural integrity of the proposed project, such as impacts to the TSF liner and dam, and the melting of permafrost on gravel pads and roads, etc.;
- Consider impacts of climate change on vulnerable communities, such as to Alaska Native communities and their traditional way of life;
- Estimate the extent that melting permafrost associated with this project would contribute to GHG emissions;
- Discuss options for minimizing project related emissions, including consideration of mitigation measures and reasonable alternatives; and
- Describe efforts to monitor for GHG emissions and climate change impacts throughout the lifecycle of this project.

---

[3] CEQ (February 18, 2010), Draft Guidance on Consideration of the Effects of Climate Change and Greenhouse Gas Emissions.

[4] CEQ defines "GHGs" in accordance with Section 19(i) of Executive Order 13514

AMERICAN OVERSIGHT

Cumulative Impacts

Cumulative impacts on the natural and human environment results from the incremental impact of the proposed action when added to other past, present, and reasonably foreseeable future actions regardless of which agency (federal or non-federal) or person undertakes such actions. The EIS should evaluate the past, present, and reasonably foreseeable projects and actions in the proposed project area. Where significant cumulative impacts may exist, the EIS should disclose the parties that would be responsible for avoiding, minimizing, and mitigating for those adverse impacts. Refer to CEQ's *Considering Cumulative Effects under the National Environmental Policy Act*[5] for information regarding methods, tools, and techniques for the cumulative effects analysis.

Recommendations:

- Evaluate the proposed project impacts along with other past, present, and reasonably foreseeable future projects and actions, and considering their cumulative impacts in their entirety;
- Identify the geographic scope and timeframe for the CEA;
- Describe the CEA methodology and explain any assumptions and models used in the analysis;
- Identify the current condition of the resource as a measure of past impacts. For example, the percentage of species habitat lost to date;
- Identify the trend in the condition of the resource as a measure of present impacts. For example, the health of the resources is improving, declining, or in stasis;
- Identify the future condition of the resource based on an analysis of the cumulative impacts of reasonably foreseeable projects or actions added to existing conditions and current trends. For example, what will the future condition of the watershed be?
- Assess the cumulative impacts contribution of the proposed alternatives to the long-term health of the resource, and provide a specific measure for the projected impact from the proposed alternatives; and
- Identify opportunities to avoid and minimize impacts, including working with other federal and state agencies, Alaska Native Regional and Village Corporations, regional and health non-profit organizations, and local and tribal governments and communities.

Past and Present Actions

- Identify and evaluate existing, and abandoned mining projects and mining claims in the region, such as the abandoned Tuluksak River Mine, and Kolmakof Mine (near Napaimute), and placer mines north of Tuluksak;
- Evaluate the Red Devil Mine, an abandoned mercury mine upriver from the proposed project. Discuss the efforts of BLM and other agencies to evaluate the impacts and potential remedial activities; and
- Evaluate the Nixon Fork Mine and existing operational mine near McGrath, Alaska.

Reasonably Foreseeable Future Actions

- Evaluate the proposed future projects, such as the Chikuminuk Lake Hydroproject (Nuvista Light and Electric), the road between the Yukon River and Kuskokwim River; Susitna Watana Hydroelectric project; Neumont Mining (exploration near Napaimute); NYAC Gold (exploration near Tuluksak); Holitna Basin natural gas (mid Kuskokwim exploration).

Mitigation and Monitoring

On January 14, 2011, CEQ issued final guidance on the Appropriate Use of Mitigation and Monitoring on establishing, implementing, and monitoring mitigation commitments identified

[5] Council on Environmental Quality (January 1997). Considering Cumulative Effects under the National Environmental Policy Act.

AMERICAN OVERSIGHT

and analyzed during the NEPA process.[6] This guidance enables agencies to create successful mitigation planning and implementation procedures with robust public involvement and monitoring programs. Mitigation mechanisms may include avoidance, minimization, rectifying, reducing or eliminating, and compensation.

A monitoring program should be designed to assess impacts from the project activities and the effectiveness of mitigation commitments being implemented. The level of effort afforded monitoring should be commensurate with the complexity of the project and the risk to and sensitivity of the affected environment. The public and tribes should have an opportunity to participate in the monitoring efforts for this project.

Recommendations:

- Develop a project mitigation plan for each the project lifecycle (e.g. pre-construction, construction, operations, maintenance, rehabilitation and closure) to assess mitigation needs, identify mitigation measures/commitments, best management practices, etc., and evaluate their effectiveness;
- Involve the tribes and the public in mitigation planning, and monitoring;
- Ensure mitigation measures/commitments are implemented and documented;
- Provide estimates of the timeframes for each mitigation measure to ensure a start date and duration for implementation. This would avoid and minimize impacts associated with tribal subsistence activities;
- Evaluate whether proposed project mitigation measures would result in additional environmental impacts;
- Describe any corrective actions that would remedy failed mitigation or ineffective mitigation measures;
- Develop an overall monitoring strategy for the project - define the goals and objectives of monitoring, provide summary information on monitoring (including a list of measurement parameters, methods, locations, and frequency, etc.) data analysis, and reporting;
- Specify terms of measurable performance standards or expected outcomes to establish clear performance expectations;
- Identify the source of funding to implement mitigation and monitoring measures, and disclose the lack of funding. Assess the resultant environmental effects; and
- Identify who is responsible for mitigation implementation and monitoring – lead agency, cooperating agency, project proponent, and third party.

Disclosure of Uncertainty

For all predictions of effects, regardless of whether they are qualitative or quantitative, the NEPA analysis should disclose the limitations of the predictions, and the associated uncertainty. It should also disclose uncertainty or risk associated with implementation of mitigation measures Sources and magnitude of uncertainty should be discussed. Understanding of uncertainties and risks are absolutely necessary for informed decision-making. If uncertainty cannot be reduced by data collection or analysis, it may be possible to mitigate for some uncertainty by developing an alternative or imposing mitigation measures that include monitoring, and contingency planning (see discussion below).

---

[6] Council on Environmental Quality (January 14, 2011). Memorandum for Heads of Federal Department and Agencies, Appropriate Use of Mitigation and Monitoring and Clarifying the Appropriate Use of Mitigated Findings of No Significant Impact.

AMERICAN OVERSIGHT

Adaptive Management Planning

The NEPA analysis should describe the strategy for responding to unforeseen circumstances at the project site. Adaptive management and contingency planning are particularly important aspects that carry a high level of uncertainty in predictions of environmental consequences. The strategy should include "trigger levels" (e.g., exceedance of ecological benchmarks) or observations (e.g., statistically significant trends in indicators, permit violations, water balance problems, changes in discharge or chemistry of springs/seeps) that would set in motion a follow-up action. An adaptive management strategy or plan should be described so that reviewers may comment on its adequacy. This type of plan when coupled with the monitoring program is necessary to mitigate for uncertainties and risks associated with predictions of environmental outcomes. Such plans are necessary to ensure that post-mining land use objectives can be achieved and sustained in the future.

Recommendations:

- Develop an adaptive management and contingency strategy to respond to an unforeseen and unexpected worst case/mine failure conditions. This plan should be discussed in the EIS; and
- Identify project situations and scenarios where additional corrective actions and response activities should be established, such as the failure of the TSF liner and dam, accidental spills of cyanide, etc.

Consultation with Federally-Recognized Tribal Governments

Executive Order 13175 *Consultation and Coordination with Indian Tribal Governments* (November 9, 2000) directs each Federal agency to establish regular and meaningful consultation and collaboration with tribal officials in the development of federal policies that have implications on tribes. The proposed project may potentially affect traditional subsistence and cultural practices, access to subsistence areas, and resources of certain tribal members in the project areas. In addition, there is a potential for those who obtain subsistence resources, and other traditional and cultural resources through barter and trade to be adversely impacted. Tribal governments, whose members or traditional resources may be impacted, either directly and indirectly, by this proposed project, should be invited to consult on a government-to-government basis consistent with E.O. 13175. The EIS should document these consultation activities, as well as any actions taken to address the concerns identified by the tribal governments. The EPA offers our experience and special expertise working with Tribal governments to assist the Corps in fulfilling our tribal consultation and coordination responsibilities for this project. The EPA has developed Region 10 Tribal Consultation and Coordination Procedures which may be helpful in developing this plan.[7]

Recommendations:

Consultation Plan

- Develop a Tribal government-to-government Consultation Plan which would outline the process for working effectively with tribal governments during the EIS development process. The G2G Plan should include a schedule with agreed upon timelines and milestones for consolation, meetings, and decision points;
- The G2G Plan should determine the best timing for conducting the consultation meetings which would avoid conflict with Alaska Native Village subsistence, cultural and religious seasons, which varies with each community; and
- The G2G Plan should be developed in collaboration with the affected and/or interested tribal governments. Tribes should have the opportunity to review, provide comments and concurrence with the G2G Plan.

[7] The EPA Region 10 Tribal Consultation and Coordination Procedures can be found at the following website: http://www.epa.gov/region10/pdf/tribal/consultation/r10_tribal_consultation_and_coordination_procedures.pdf

AMERICAN OVERSIGHT

Consultation and Coordination Process

- Tribal government-to-government consultation and coordination should be open, meaningful, and occur throughout the EIS process until the Record of Decision is issued;
- Discussion how tribal government concerns and issues raised during government-to-government consultation meetings will be recorded, whether or not the tribe wishes that information to be made publicly available and an opportunity to correct any information prior to it being included in the record should be discussed and agreed up front for each meeting. Some tribes may wish to have their comments entered into the record or wish the meeting to be held confidentially as it is a government-to-government consultation. Therefore discussing this up front prior to the meeting is critical;
- The EIS should document the tribal consultation and coordination process by providing a chronology with the dates and locations of meetings with tribal governments, and results of the meeting.
- The EIS should discussion of how the tribal governments 'comments were addressed through changes in the project design, evaluation of alternatives and impacts, and development of mitigation measures;
- Meetings, milestones, and decision points in the EIS process should avoid conflicts with subsistence, cultural, religious, and other traditional activities, whenever possible;
- Tribes should be notified of the key decision points and milestones in the EIS process.
- The consultation and coordination process should be used as an opportunity to provide educational outreach and technical exchange of information regarding the project. Fact sheets and workshops (either in person, teleconference, or webinar) should be provided to Tribes throughout the NEPA process; and
- The consultation and coordination process should be used as an opportunity to gather Traditional Ecological Knowledge and Wisdom from the local tribal members who may be affected by this project. This should be done in partnership and close consultation with the federally recognized tribal governments.

Traditional Ecological Knowledge and Wisdom

There are over 60 Alaska Native communities who may be affected by this proposed project. Individual tribal members engage in traditional subsistence activities and have knowledge and experience with their land, wildlife, wetlands, fish, birds, plants and other resources of the region. Traditional Ecological Knowledge and Wisdom in coordination with empirical scientific data should be used to develop and evaluate alternatives, assess environmental and human health impacts, and identify mitigation measures. The identification, inclusion, and integration of TEKW into the EIS analysis would result in a more robust agency decision making document. The cooperating agencies, including the EPA, the State of Alaska (Department of Fish and Game, Subsistence Division), the cooperating tribal governments, and the Kuskokwim River Watershed Council could potentially provide expertise for developing the TEKW studies. Additionally, through government-to-government consultation, tribes can help design an appropriate study.

Recommendations:

- Coordinate with the communities in the region to identify special habitat areas, migration corridors and seasonal patterns, current and historical traditional and cultural uses, timelines and schedules for subsistence, hunting, fishing, harvesting, trapping, recreation, etc. and their way of life;
- Review current information available from previous EISs and databases regarding subsistence resources. Identify TEKW data gaps, and conduct additional TEKW studies as necessary to

AMERICAN OVERSIGHT

clearly identify concerns and potential impacts, including cumulative, from the proposed project and proposed alternatives;

- TEKW should be incorporated into the EIS to evaluate project modifications, alternatives, environmental and human health impacts, and to develop mitigation and monitoring measures; and
- In working with the communities to document and incorporate TEKW into the EIS, it is important to acknowledge up front appropriate tribal protocols for how this information could be used and how to ensure that sensitive information is protected. The Alaska Native Science Commission has principles that were developed in regards to appropriately working with TEKW, http://nativescience.org/issues/tk.htm.

Environmental Justice and Public Participation

Executive Order 12898 *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations* (February 11, 1994) requires each Federal agency to identify and address disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations, low-income populations, and Native American tribes. The EPA also considers children, the disabled, the elderly, and those of limited English proficiency to be potential Environmental Justice communities due to their unique vulnerabilities.

Additionally, per the Executive Order 12898, "Federal Agencies, whenever practicable and appropriate, shall collect, maintain, and analyze information on the consumption patterns of populations who principally rely on fish and/or wildlife for subsistence. Federal Agencies shall communicate to the public the risks of those consumption patterns." Tribes have expressed concerns regarding declining Chinook salmon stocks, climate change impacts, barge traffic and erosion, mercury and other contaminants in the Yukon Kuskokwim Region. It is particularly important that human health exposure and pathways for contaminants and other impacts from the proposed project be fully discussed and mitigation measures developed in close consultation and coordination with the communities. This should include a discussion regarding any human health or cultural impacts from the proposed project, as well as any risk from accidents or failures along the transportation corridor and at the proposed mine site. This discussion will require enhanced communication efforts throughout the process of developing the EIS.

Clearly the impacts to subsistence are not just lost food sources, but loss of healthy subsistence life ways, loss of practices, loss of cultural connections to the past, loss of connection to specific places, loss of teaching and learning, loss of sharing networks, loss of individual, community, and cultural identity, among others should be considered in the EIS. The cultural, social, psychological, and spiritual aspects of subsistence livelihoods should also be considered in addition in the socio-economic, environmental justice and human health impact assessments. For more information, refer to the EPA website, "Environmental Justice Considerations in the NEPA Process" http://www.epa.gov/compliance/nepa/nepaej/index.html.

According to the CEQ Environmental Justice Guidance under the National Environmental Policy Act (1977), when determining whether environmental effects are disproportionately high and adverse, agencies should consider the following factors: [8]

[8]Council on Environmental Quality (December 10, 1997). *Environmental Justice Guidance Under the National Environmental Policy Act.* Available online at http://ceq.hss.doe.gov/nepa/regs/ej/justice.pdf

AMERICAN OVERSIGHT

1. Whether environmental effects are or may be having an adverse impact on minority populations, low-income populations, or Indian tribes that appreciably exceeds or is likely to appreciably exceed those on the general population or other appropriate comparison group; and
2. Whether the disproportionate impacts occur or would occur in a minority population, low-income population, or Indian tribe affected by cumulative or multiple adverse exposures from environmental hazards.

In addition, we emphasize the EJ analysis address the following:

Demographic Analysis. Gather geographic and demographic data about the area affected by the proposed action to determine whether minority populations, low-income populations, or Indian tribes are present, and if so whether there may be disproportionately high and adverse human health or environmental effects on these populations.

Baseline Conditions. Consult relevant public health data and industry data to establish the potential for multiple or cumulative exposure to human health or environmental hazards in the affected population and historical patterns of exposure to environmental hazards, to the extent such information is reasonably available.

Characterization. Describe the direct, indirect, and cumulative effects of the proposed action within this context: Recognize the interrelated cultural, social, occupational, historical, or economic factors that may amplify the natural and physical environmental effects of the proposed agency action. These factors should include the physical sensitivity of the community or population to particular impacts; the effect of any disruption on the community structure associated with the proposed action; and the nature and degree of impact on the physical and social structure of the community.

Effective Public Participation Strategies. Agencies should, as appropriate, acknowledge and seek to overcome linguistic, cultural, institutional, geographic, and other barriers to meaningful participation, and should incorporate active outreach to affected groups. Strategies include using notices, mailings, fact sheets, briefings, presentations, exhibits, tours, news releases, translations, newsletters, reports, community interviews, surveys, canvassing, telephone hotlines, question and answer sessions, stakeholder meetings, and on scene information.

Meaningful Community Representation. Agencies should endeavor to have complete representation of the community as a whole and should be aware that community participation must occur as early as possible if it is to be meaningful. The EIS should describe what was done to inform the communities about the project and the potential impacts it will have on their communities, what input was received from the communities, and how that input was utilized in the decisions that were made regarding the project.

Tribal Representation. Seek tribal representation in the process that is consistent with the government-to-government relationship between the United States and tribal governments, and the federal government's trust responsibility to federally-recognized tribes.

Recommendations:

- Encourage meaningful engagement and participation by the community, particularly communicating in the regional native Yup'ik language;
- EJ analysis should be conducted in consultation and coordination with communities;

AMERICAN OVERSIGHT

- Scheduling meetings and decision points in the EIS process should avoid conflicts with subsistence and other traditional activities whenever possible;
- Attention should be given to consideration of the dependence of local communities on local and regional subsistence resources, access to those resources, and perception of the quality of those resources;
- Provide more frequent opportunities to involve the tribal governments and the public (between the Scoping and the Draft EIS stage);
- Prepare and disseminate fact sheets on technical aspects of the project;
- Conduct educational workshops on various subjects that would bring in the Traditional Ecological Knowledge and Wisdom and local knowledge of the people of the region (e.g., information to help shape the NHPA Section106 process, the emergency response planning, characterizing impacts from potential failure scenarios, impacts to subsistence resources, and timing of the subsistence calendar and any special habitat areas for wildlife. The location, schedule, and agenda for these workshops should be coordinated with the local communities;
- In addressing potential adverse impacts, measures for avoidance or minimization of those impacts should be considered before resorting to mitigation measures. Where avoidance or minimization is not possible, develop appropriate mitigation measures and agreements. These should be developed with input from the affected population in a consensus-based process. Agreements should be developed between the project proponent and the EJ communities; and
- Include in the EIS a summary conclusion or an EJ determination which concisely expresses whether impacts have been appropriately avoided, minimized and/or mitigated.

Health Risk or Impact Analysis

Screening Analysis

The proposed project may contribute to adverse impacts to human health of individuals and communities in the Kuskowkim River region. In particular, attention should be given to vulnerable populations, such as the elderly, young children, and pregnant women, who may be more susceptible to exposure. In 2009, the Alaska Department of Health and Social Services issued a fish consumption advisory for children, pregnant women, and women of child-bearing age to limit intake of large pike (>2 feet long) in the lower Kuskokwim River. In 2011, preliminary consumption guidelines were issued for women of child-bearing age and children in the middle region of Kuskokwim River who eat pike and burbot.

Local residents have expressed concerns regarding potential contaminant exposure from the Red Devil Mine. The majority of residents in the region practice a subsistence lifestyle to provide for their families. Local residents may trap for fish in Red Devil Creek, net fish in the Kuskokwim River, and harvest berries from the site for their families. There have been concerns expressed regarding the higher cancer rates in former mine workers at the Red Devil Mine site.

We understand that ADHSS and the Yukon-Kuskokwim Health Corporation are undertaking a health screening process in the project area. Depending on the results of this screening analysis, additional evaluation of health effects, such as a Health Risk Assessment or Health Impact Assessment may be required to evaluate the direct, indirect, and cumulative impacts to human health and the environment resulting from this project. We look forward to reviewing and commenting on the draft screening analysis for this project. The final health screening analysis should be included as an appendix to the Draft EIS.

AMERICAN OVERSIGHT

Recommendations:

- Complete screening analysis to determine which aspects of human health (including, but not limited to public, environmental, mental, social, cultural health, etc.) could be impacted;
- Consider historical impacts to health and overall cultural well-being;
- Identify human health exposure pathways related to environmental impacts and subsistence resource;
- Identify potential contaminants that may persist and bioaccumulate in the environment and up the food chain (e.g., consumption of berries, fish, drinking water, etc.); and
- When conducting a screening, we recommend using the "Standard for the screening stage" from the North American HIA Practice Standards Working Group document "Minimum Elements and Practice Standards for Health Impact Assessment (November 2010, Version 2).[9]

Scope of the Health Assessment

Human health effects from development projects are often more far-reaching than is commonly recognized. Contaminant exposure or cancer risks are common in areas for impact assessment. However, numerous other health impacts that could occur as a result of a new project are often overlooked. For example, the EIS should look for information that can be used to assess the project's effects by looking at how income from new jobs can have positive and negative health impacts. Income from new jobs has also been associated with increased rates of alcohol and drug use, and domestic violence and child abuse due to rapid social and community change, particularly in rural areas, and disrupted family structure due to unusual work schedules. During the scoping meetings we heard concerns specifically about this and whether or not there would also be an increase in infrastructure within the community to address these impacts, such as increased village safety police officers, health programs, etc. Increased income can also result in increased ownership of motorized vehicles, which often results in less physical activity, particularly in the village setting. Although such health impacts have been documented for other projects on numerous occasions, they are rarely addressed in project development or permitting.

Recommendations:

- Determine which health impacts to evaluate in the EIS based on the screening analysis;
- Identify and discuss the methods and process for developing the HIA analysis and the sources of information. Discuss how local communities and tribes would be involved; and
- Include a workplan and schedule for completing the health assessment;

Assessment and Data Collection

In order to appropriately evaluate human health, specific health data are required that may not be routinely collected as part of the EIS scoping process. In order to ensure that the necessary data are available for this evaluation, it is important to involve public health professionals early in the NEPA process.

Public health data and expertise for prospective health impact analysis or for providing input on health issues may be available from local and state health departments, tribal agencies, or federal public health agencies, such as the U.S. Centers for Disease Control and Prevention's National Center for Environmental Health, U.S. Agency for Toxic Substances and Disease Registry, or Indian Health Service. We are encouraged that the ADHSS and YKTHC are partnering to conduct the screening analysis and HIA for the Donlin Gold Project.

---

[9] R. Bhatia et al. *Minimum Elements and Practice Standards for Health Impact Assessment, Version 2* (North American HIA Practice Standards Working Group, 2010), 3 – 4.

AMERICAN OVERSIGHT

Recommendations:

- Include a profile of existing health conditions of the region and identify the sources of this information;
- Evaluate the potential health impacts of individuals and communities in the region; and
- Include the HIA as an appendix in the Final EIS.

Guides and Resources

The Health Impact Assessment framework is a combination of procedures, methods and tools that enables systematic analysis of the potential positive or negative effects of a policy, plan, program or project on the health of a population and the distribution of those effects within the population. HIA identifies appropriate actions to manage or mitigate negative effects. HIA is currently the only widely accepted methodology or framework used to provide decision-makers with information about how a specific policy, project, or program may affect human health.

The World Health Organization and the U.S. Centers for Disease Control and Prevention support the use of HIA as a tool to address health impacts when policies, programs, or projects are being developed. Many other countries have successfully used HIA for these purposes. The International Finance Corporation, a member of the World Bank Group, has adopted HIA as the standard for evaluating health and requires it of any projects for which it provides funding.

Guides for conducting HIA are available from various sources. While the EPA does not endorse or recommend use of any single or particular guidance on HIA, these references are provided to assist with identifying additional resources on HIA.

- World Health Organization – *Health Impact Assessment Short Guides*;[10]
- International Finance Corporation – *Introduction to Health Impact Assessment (2009)*;[11]
- CDC – *Healthy Places, Health Impact Assessment*;[12]
- Human Impact Partners – *A Health Impact Assessment Tool Kit: A Handbook for Conducting HIA, 3rd Edition (2011) and Health Impact Assessment: A Guide for Practice (2011).*[13]

Mitigation Strategies

In order to minimize the potential identified adverse health effects resulting from this project, mitigation strategies should be developed and included in the EIS. For example, the Bureau of Land Management prepared the 2008 Northeast National Petroleum Reserve-Alaska Final Integrated Activity Plan/Environmental Impact Statement which identified public health mitigation on 'social determinants of health.[14]

Recommendations:

- Identify strategies to manage identified adverse health impacts;

[14] See Appendix G: Examples of Public Health Mitigation Strategies in the BLM's 2008 Northeast National Petroleum Reserve-Alaska FEIS.

AMERICAN OVERSIGHT

- Involve communities and tribal governments in developing health strategies and mitigation measures. Prepare a plan to monitor the health of individuals and the community during construction, operations and closure/reclamation; and
- Communicate the findings of the HIA to the tribes, communities, and the public.

Children's Health and Safety

Executive Order 13045 *Protection of Children from Environmental Health Risk and Safety Risks* (April 21, 1997) directs each Federal agency to make it a priority to identify and assess environmental health and safety risks that may disproportionately affect children. Analysis and disclosure of these potential effects is appropriate because some physiological and behavioral traits of children render them more susceptible and vulnerable than adults to health and safety risks.

Recommendations:

- Address potential direct, indirect, and cumulative impacts of the proposed project on children's health, including consideration of prenatal exposures;
- Assess children's potential exposures, pathways, and susceptibilities to the pollutants of concern;
- Identify pollutants of concern and their sources that represent health and safety risks to children;
- Conduct an exposure assessment for children – air, water, subsistence foods, noise, etc.; and
- Identify the children's baseline health conditions.

Social-Cultural Impacts

While it is anticipated that this proposed project will result in employment opportunities for Alaska Native residents, there would also be local and corporate revenues generated from this project in the region. While employment opportunities and local revenues generally increase a community's standard of living, there can also be negative impacts to families, communities, and cultures, especially in areas where residents are participating in traditional cultural practices. Noise and physical structures may disturb and/or displace subsistence wildlife from the project area. Other project impacts may also affect a community's ability to access traditional and accustomed subsistence use areas. The sociocultural impacts associated with this project should be fully evaluated and disclosed in the EIS.

Reports and Resources

There are a number of technical reports and other Environmental Impact Statements that have been completed throughout Alaska which consider impacts from resource extraction projects on Alaska Native communities. These resources should be reviewed and included, as appropriate, as references for considering the full range of impacts to Alaska Native communities and their way of life. While the EPA does not endorse or recommend use of any single or particular documents, these references are provided to assist with evaluating impacts on socio-cultural resources:

Recommendations:

Socioeconomic Impacts

- Evaluate impacts to families, communities, and cultures associated with transitioning from a subsistence economy to a cash economy; and
- Evaluate a post-mining scenario and the potential decline in the economy of the region.

Accessibility of Traditional Use Areas

- Identify community traditional use areas for subsistence, harvesting, hunting and trapping, fishing, travelling, etc.;
- Describe the access limitations to these traditional use areas and their impacts to local communities; and
- Coordinate with the community on options for mitigating impacts associated with accessibility to traditional and accustomed use areas.

Compatibility of Traditional Use Areas

9. Identify project activities that may conflict with traditional and accustomed uses (e.g. barge traffic on the Kuskokwim River conflicts with subsistence fishing and other traditional and cultural activities); and
10. Coordinate with the community to identify mitigation options for avoiding and minimizing conflicts between traditional and accustomed subsistence uses with the construction and operation of this project.

Historical and Cultural Resources

Section 106 National Historic Preservation Act of 1966 requires Federal agencies to analyze the effects of their actions on historic properties. Since the Donlin Gold project area represents a frequent and accustomed use area by the Alaska Native tribal governments for subsistence fishing, hunting, trapping, and harvesting, cultural activities, and migration routes, the Alaska State Historic Preservation Officer would need to be consulted. The 1992 amendments to the NHPA placed major emphasis on consolation with tribal governments. Consultation should respect tribal sovereignty and the government-to-government relationship between the Federal and tribal governments. Tribal governments must be consulted about actions on or affecting their lands or resources on the same basis, and in addition to the SHPO. Potential impacts to resources of concern to the tribes may include, but are not limited to, impacts to cultural resource areas, archaeological sites, traditional cultural properties of landscape, sacred sites, and environments with cultural resource significance. The tribal government(s) must be specifically engaged and consulted with in accordance with Section 106 of the NHPA. An additional resource in the Yukon Kuskokwim Region is the Association of Village Council Presidents as they have a department that focuses on protection and mitigation of impacts to cultural sites. We are encouraged that the Bureau of Land Management has started coordinating with AVCP.

AMERICAN OVERSIGHT

To determine whether the area of potential effect would be eligible for the National Register of Historic Places, the perspectives of the tribal government(s) should be considered. Such considerations should include significant events that may have taken place in the past (tribal wars, establishment of trade routes, etc.)

The Section 106 consultation process should be run concurrent with the Federal permitting and NEPA processes. If adverse effects to traditional cultural properties, sacred sites, or other areas of cultural resource concerns are identified, any Memorandum of Agreement developed to resolve these concerns under Section 106 should be addressed in the Record of Decision for this EIS. Unless there is a compelling reason to do otherwise, the Section 106 MOA should be fully executed before the ROD is issued, and the ROD should provide for implementation of the terms of the MOA.

Recommendations:

- NHPA Section 106 consultation should be conducted with tribal governments, local governments, the public, in addition to SHPO;
- Evaluate the Alaskan historical and traditional significance of the project area, the importance of ethnobotany, hunting, fishing, and gathering uses of the area by Alaska Natives, any long term traditional ecological management of the area, and any significant historic events that took place in the area;
- The scope of impacts to these resources should include the direct, indirect, and cumulative impacts to sacred sites; traditional cultural properties or landscapes; hunting, fishing, gathering areas; access to traditional and current hunting, fishing, and gathering areas and species; changes in hydrology or ecological composition of springs, seeps, wetlands, and streams, that could be considered sacred or have traditional resource use association; historical and currently used travel and migration routes; and historic properties, districts or landscapes; and
- Conduct the Section106 NHPA consultation process concurrent with the EIS process. The Section 106 process should be completed prior to issuing the ROD, which would provide for the implementation of the MOA terms.

AMERICAN OVERSIGHT

Enclosure 2
Narrative Description for Financial Assurance Cost Categories

EIS Alternative
Reclamation and Closure Costs

1.0 INTRODUCTION

This estimation of a financial assurance amount (bond) for the reclamation of the X Project is intended to generally follow guidelines presented in the USFS Training Guide for Reclamation Bond Estimation and Administration (USFS, 2004). This estimate utilizes information and format from an initial cost estimate compiled by X.

The agency bond calculation includes a separate itemization of indirect costs based on Forest Service standards and that reflect Region 4's experience with mine reclamation at other sites.

The reclamation cost estimate is broken into the following cost categories:

Direct Costs:

- Interim Operations and Maintenance
- Hazardous Materials Disposal
- Water Treatment
- Demolition and Disposal (structures, equipment and materials)
- Site Works
- Revegetation
- Groundwater capture
- Post Closure Operation, Maintenance and Monitoring
- Post Closure Water Treatment

Indirect Costs:

- Engineering
- Mobilization
- Contract Administration
- Insurance
- Bond performance and payment
- Contractor profit
- Contingency

2.0 BASIS AND ASSUMPTIONS

The basis for each cost category is discussed below. Unit costs for some specific items were provided by XXX from RS Means cost data books, other cost data sources, or from site specific vendor quotes. These unit costs were reviewed and checked, but have generally been retained. XXX's notes and EIS team notes on additional cost items are included in the cost estimate.

SAMPLE

AMERICAN OVERSIGHT

Enclosure 2
Narrative Description for Financial Assurance Cost Categories

2.1 Interim Operations and Maintenance

This category includes the activities needed to maintain the integrity of the project facilities during an unexpected shutdown or following closure until reclamation activities begin and contains three general subcategories: public safety; access and utilities; and water management. Public safety includes fencing and warning signs for the portals, removal of explosives, and site security personnel. Access and utilities include road maintenance, snow removal, and electricity for lights and basic facilities. Water management includes periodic inspection of ponds, wells, pipelines, and drainage works. Water pumping and treatment from the mine and the water management ponds are included in the water treatment cost item. For the purposes of this estimate it is assumed that an interim shutdown period would last up to one year.

2.2 Hazardous Materials

XXX will keep have hazardous materials on site and this category estimates costs for sampling, analysis, handling, transport, and disposal at the US Ecology RCRA Subtitle C landfill in Grand View, ID (250 miles from the site). It is assumed that 40 barrels would be sufficient for removal of all hazardous materials from the lab and mill facilities, based on the expected size of the operations. On-site fuels storage will remain for use at reclamation or be reclaimed by vendors. Fluids in the mill circuit are assumed to be processed through the water treatment plant.

2.3 Water Treatment

Water treatment costs for the agency preferred alternative and assume a conventional precipitation and solids removal system that produces a dewatered cake as the primary waste. It is assumed that one full time operator and a part time assistant would be required to run the plant. The water treatment costs are calculated on an annual basis and one-year of water treatment is included in the interim shutdown category. A separate category for post-closure water treatment is included and for the purposes of the financial assurance, it is assumed that water treatment would continue for 100 years following mine closure. The agency estimate includes costs for offsite disposal of post closure water treatment wastes.

2.4 Demolition

XXX assumed that facility equipment and the tram would be salvaged at no cost due to the salvage value of the equipment. This is not in accord with USFS guidelines and the agency estimate assumes that there would be demolition and disposal costs for the mill, buildings, tram and mining equipment. This estimate includes a cost (as a percentage of capital cost) for hauling and disposing of mine site materials even though some of these items would likely have some salvage value. Concrete foundations would be buried on-site, all other debris will be shipped to the nearest off-site RCRA Subtitle D landfill. Pipelines are assumed to be abandoned in-place. Powerlines would be removed. Roads would be regraded to approximate original topography and revegetated except for those roads that would be left following closure for access for private parties and USFS.

AMERICAN OVERSIGHT

2.5 Site Works

Site works includes regrading, recontouring, TWSF cap placement and topsoil replacement related to roads and facilities. The following sub-categories are included in this category:

- Borrow Site (including the topsoil stockpile)
- Portals
- Roads
- TWSF
- Water Management Pond
- Millsite and Tram

Unit earthwork costs are based on equipment production (CAT Handbook) and site specific hourly costs. Material volumes for the TWSF and water management pond are based on the expected amount of regrading required and the volume of cover and growth media required by the preferred alternative. Material volumes for road reclamation are based on a unit volume/linear foot of road based on site specific road construction volumes. The overall length of road reclamation was based on the total length of on-site and off-site roads as described in the EIS alternative analysis.

2.6 Revegetation

This category includes all initial reclamation revegetation work consistent with the preferred alternative. The revegetation category assumes one replanting of the site to achieve successful revegetation. Growth media placement (earthwork) is included in the Site Works category. Post-reclamation revegetation monitoring and maintenance is included in Post Closure O & M category.

2.7 Groundwater Capture

Groundwater capture may be required post closure to maintain groundwater or surface water quality. Capture would include wells or an alluvial pumpback system and pumping to the water treatment plant.

2.8 Post Closure Opeations & Maintenance

Post closure operation and maintenance would include maintenance of facilities roads, long term water treatment facilities, water management facilities, etc. This task also includes reclamation performance monitoring and maintenance of the TWSF cover construction and revegetation and environmental monitoring.

The reclamation cost estimate includes costs for reclamation monitoring (water quality, revegetation, and cover stability), reporting/documentation of monitoring data, costs for periodic maintenance of the TWSF reclamation cover, maintenance of water control BMP's and annual weed control. Long-term water treatment costs are included in a separate category. A five-year time frame was used for this O&M category.

SAMPLE
AMERICAN OVERSIGHT

2.9 Post Closure Water Treatment

Post closure water treatment may or may not be required for this site. A post-closure water treatment cost for 100 years of operation is included to protect the public from having to assume treatment costs if water treatment is required. The calculation of a net present value of the 100 years of treatment costs requires the assumption of interest and inflation values. The inflation rate value selected (3.66%) is the 2000 to 2005 five year average of the Construction Cost Index from the Engineering News Record and the interest rate (4.85%) is the October 2006 average 30 US Treasury bond rate.

2.10 Indirect Costs

Indirect costs are based on guidance in USFS Manual (USFS, 2004) and USFS Region 4. Engineering redesign costs are based on a percentage of the site works costs only. Mobilization and demobilization costs are based on a percentage of the demolition, site works and revegetation costs only. A contingency of 20% of direct costs is consistent with general engineering practice.

Subject: Revised Scoping Letter Text

Molly,

I excerpted and revised text from the first part of the scoping comment letter. I tried to make things flow a little more smoothly and reduce duplication in these sections. I may have partly succeeded, but will allow you to be the judge. Where I inserted or edited text within the General Components of NEPA Analysis section, I highlighted the text. I didn't highlight the text in the Aquatic Resources section because I re-worked most of this text. If you have any questions, I will be in the office tomorrow.

Thanks,

Hi Matt – Thanks so much for the edited text for the letter, and for taking on the huge tasks of consolidating comments. It sounds great, and I am working through it now to try to understand the changes and how it incorporates the many edits from other reviewers. I didn't see the text Mary Anne had suggested in the attached. Though not sure if you incorporated bits and pieces, or determined it was not appropriate to include at this time? Please let me know if this should still be added in.
Thanks,
Molly

DRAFT CONFIDENTIAL –DELIBERATIVE AND PREDECISIONAL

Matt, Palmer, Heather,

I took a look at the scoping comment draft comments. You guys have given it a pretty thorough look—unbelievable given the original turnaround; my congratulations.

I suggested some language in the early part of the draft scoping comments up front. Deliberative Process / Ex. 5

Deliberative Process / Ex. 5

Deliberative Process / Ex. 5 Anyway, I thought it would be helpful to spell out very specifically what we wanted them to look at up front.

Thanks.

Subject: Please Review -- Pebble Ch 2 Alternatives

Hello All,
I previously provided the draft Chapter 2 as an FYI, but the Corps has now said they will be accepting comments on this chapter, with a due date of 11/23. As you have been assisting in review of the various alternatives screening documents, I would appreciate your review of this section as well. In order to meet the comment deadline including time required for internal management review of the comments, please send me any comments you may have on Chapter 2 **by COB Friday 11/9**. (I apologize that this is a quick turnaround, but hope that you may have already begun looking over the document.)

Chapter 2 and the associated figures are available on the Sharepoint site, but please let me know if you are not able to access them or have any questions.
Thank you,
Molly

Subject: RE: FYI- Pre-Draft Chapters 1 and 2 of Pebble EIS

Hi Molly,

I'm working from home on Monday, so thought I'd spend that day reading up on these. But, I just tried to access the folder and the following screen came up:

When I clicked on the Sharepoint Icon, it said I don't have access. So, I have clicked on request access. I'm not sure though if that's access to the folder, or something else so wanted to email you in case there's something different I should do.

Thanks!
Barb

Subject: FYI- Pre-Draft Chapters 1 and 2 of Pebble EIS

Hello All,
I have created a new folder on the Sharepoint Site where I will begin storing all of the sections of the preliminary Draft EIS as we receive them: "Preliminary Draft EIS Sections Oct-Nov 2018"

AMERICAN OVERSIGHT

In addition to the documents previously shared (the Revised Project Description and powerpoint presentation on Alternatives), this folder now contains the draft text of Chapter 1 and Chapter 2 (with additional folder containing figures). Comments are not requested on these sections, however, they have been provided for our review as context for review of the analysis in Chapter 3 and 4, so I do recommend reading when you get a chance.

As previously mentioned, we will be receiving the sections of Ch. 3 and 4 on a rolling basis between now and the first week of November. A few sections (the intros to 3 and 4 as well as Recreation sections) have already been received and are also available in the new folder.

Thank you,
Molly

Hello All,
The Corps has distributed the updated, more detail, discussion on Alternatives development for cooperating agency review. Per the below email, comments are welcome if we would like to provide any. I would appreciate your review of the attached, if you have time (I realize this is later than originally anticipated). If you do have any comments, please send them to me by COB Wednesday 9/26.

Subject: Correct version of the Alternatives memo

All,
Attached is the correct version. My apologies for sending previous email.

Attached is the more robust discussion on alternatives. We are not requesting comments, however if your agency has comments and can provide them NO LATER THAN Close of Business October 3, we will incorporate as much as possible. Comments received after October 3 will be considered after the release of the draft EIS.

Thanks

Subject: Heads up about Pebble preliminary draft EIS chapter review
Attachments: Pebble EIS Outline_2018.3.19 (002).docx

Hi Carrie – I wanted to flag Region 10's heads up about preliminary draft EIS chapters currently at (and coming to) EPA for review. Ashley talked to Allyn and they wanted to see if I would be willing to review. I told her I would do what I could depending on the schedule.

Ashley's email has more detail about the content of the draft chapters. Attached is a draft table of contents. It looks like chapters 3 and 4 are the bulk of the draft EIS. Ashley asked me to what extent others in OGC need to be involved. Region 10 has 28 days from the date a chapter was received to provide comments and I am guessing that a chapter wouldn't come to HQ until the middle (or maybe end) of that time. If you are available for Tuesday's BB call, it might be worth joining to hear the status/timing and provide any thoughts you may have on our internal process.

Thanks,
Heidi

Subject: FW: FYI- Pre-Draft Chapters 1 and 2 of Pebble EIS

Hi Heidi –

I talked to Molly briefly (she's at training) and the most recent table of contents is attached. This was circulated a while ago and may have changed but it's the most recent one that we have.

It looks like our comments are being requested on Chapters 3 and 4 so those are the sections that we will be getting over the next couple of weeks or so. As you decide what you want to review and Dave works through OFA review, we can set up a schedule. We get 28 days to review from the date received.

The sections will be deposited in the folder below.

Currently, Molly has sent me her comments on 3.1, 3.5, 4.1, and 4.5 (attached). She is asking for my review by tomorrow because Jill is out the rest of the week. I am going to chat with Kim this afternoon (our NEPA attorney) but will cc you on my comments to her.

Molly

I've been slammed and will not be able to turn to this until next week (which is a two-day week for me). I would greatly appreciate being able to look through what is in the sharepoint site and provide any comments I have by COB 11/30. Is that possible?

I'm particularly interested in looking at draft sections on the sharepoint site that deal with the following:

AMERICAN OVERSIGHT

1) Characterization of the wetlands, streams, and other aquatic resources, including fishery resources, in the project area;
2) Characterization of the likely direct, secondary (indirect), and cumulative impacts to these resources; and
3) Proposed compensatory mitigation for unavoidable impacts to these resources.

Thanks, Palmer

Subject: Please Review - Pebble Pre-DEIS Sections
Importance: High

Hello Pebble NEPA Team,

We have received several additional sections of the preliminary Draft EIS for review. We have also received many sections as an FYI for which our review is not requested. I have loaded everything I've received to date into the Sharepoint Folder: Preliminary Draft EIS Sections Oct-Nov 2018.

As a reminder, our input at this stage is only requested on the specific sections we were assigned to in the Cooperating Agency plan. Therefore, if your name doesn't appear below with a specific assignment, no review is necessary at this time. However, feel free to take a look at the sections pertaining to your subject matter on the Sharepoint Site if you wish.

Here are the assignments for specific sections where I would appreciate your review. Note that each subject area includes a section for Chapter 3 (affected environment), Chapter 4 (environmental consequences), as well as one or two supporting technical appendices. Please use the attached comment spreadsheet to assemble your comments, and please send them to me by the date noted for each section below.

- 3.11/4.11/K4.11 Aesthetics – Molly
- 3.14/4.14/K3.14 Soils – Mark/Palmer – due COB 11/27
- 3.16/4.16/K3.16 Surface Water Hydrology – Tim/Mark/Palmer/Muluken/Justine – due COB 11/27
- 3.26/4.26/K3.26 Vegetation – Mark/Palmer – due COB 11/27
- 3.17/4.17/K3.17 Hydrogeology – Tim/Mark/Palmer/Muluken – due COB 11/29
- 3.18/4.18/K3.18/K4.18 Water and Sediment Quality – Cindi/Tim/Chris – due COB 11/29
- (note, we have not yet received the Wetlands sections, which are anticipated to arrive approximately 11/21)

I apologize for the short time available for review, especially given the Thanksgiving holiday in the middle. If this schedule will be impossible for you, please let me know as soon as possible. Also, if you have any questions about the sections you are reviewing or where to focus your review, please don't hesitate to call.

Thank you,
Molly

AMERICAN OVERSIGHT

Individuals are required to self-report any arrests, charges or convictions that would keep the individual from obtaining or maintaining a favorable suitability or fitness determination. Programs impacted are referenced within the 42 U.S. Code § 13041 and include impacted individuals such as employees, DoD contractors, providers, adults residing in a family child care home, volunteers, and others with regular reoccurring contact with children.

Affected Public: Individuals or Households.

Annual Burden Hours: 1,250.

Number of Respondents: 5,000.

Responses per Respondent: 1.

Annual Responses: 5,000.

Average Burden per Response: 15 minutes.

Frequency: On occasion.

Respondents are DoD contractors, family child care providers, family child care adult family members residing in the home, and specified volunteers who provide child care services for children under age 18. This form will be initiated by DoD staff and will be maintained in the initiating DoD offices and/or appropriate Human Resources or Security Offices.

Dated: March 23, 2018.

Aaron T. Siegel,

Alternate OSD Federal Register Liaison Officer, Department of Defense.

DEPARTMENT OF DEFENSE

Department of the Army, Corps of Engineers

Intent To Prepare an Environmental Impact Statement (EIS) for the Pebble Project

AGENCY: U.S. Army Corps of Engineers, Department of Defense.

ACTION: Notice of intent.

SUMMARY: The Alaska District, U.S. Army Corps of Engineers (the Corps) intends to prepare a Draft Environmental Impact Statement (DEIS) to assess the potential social, economic, and environmental impacts associated with the proposed Pebble open pit mine in wetlands, streams and Ocean near Cook Inlet. The EIS will assess potential effects of a range of alternatives.

DATES: Public scoping meetings are tentatively scheduled in Anchorage, Homer, Dillingham, King Salmon (Naknek), Iliamna (Newhalen), Nondalton, and Kokhanok (Iguigig) will occur in mid-April 2018. Information about these meetings and meeting dates will be published locally, posted at *http://www.pebbleprojecteis.com,* and available by contacting the Corps.

ADDRESSES: U.S. Army Corps of Engineers, P.O. Box 6898, Joint Base Elmendorf Richardson, AK 99506–0898.

FOR FURTHER INFORMATION CONTACT: Questions about the proposed action and the Draft EIS should be referred to: Mr. Shane McCoy, Regulatory Division, *telephone:* (907) 753–2715 at *http://www.pebbleprojecteis.com* or by mail to the above address. To be added to the project mailing list and for additional information, please visit the following website: *http://www.pebbleprojecteis.com.*

SUPPLEMENTARY INFORMATION: An application for a Department of the Army permit was submitted by the Pebble Limited Partnership pursuant Section 404 of the Clean Water Act (33 U.S.C. 1344) and Section 10 of the Rivers and Harbors Act of 1899 (33 U.S.C. 403) on December 22, 2017, and was advertised in a Public Notice, POA–2017–271, on January 5, 2018. The public notice is available on Alaska District's public website at: *http://www.poa.usace.army.mil//Portals/34/docs/regulatory/publicnotices/2018/POA-2017-271%20Pebble_PN.pdf?ver=2018-01-05-153755-640.*

1. Description of the Proposed Project. Pebble Limited Partnership (PLP) is proposing to develop the Pebble copper-gold-molybdenum porphyry deposit as an open-pit mine, with associated infrastructure, in southwest Alaska, north of Lake Iliamna. The proposed project would require approximately four years to construct, with a projected mine life of approximately 20 years. Major project components include excavation of an open pit, that ultimately would be approximately 6,500 feet long by 5,500 feet wide, with depths between 1,330 and 1,750 feet; a tailings impoundment with 1.1 billion tons storage volume; a low grade ore stockpile with the capacity to store up to 330 million tons; an open pit overburden stockpile; a mill facility processing approximately 160,000 tons of ore per day; a natural gas-fired power plant with a total connected load of 230 mega-watt (MW), supplied by a 188-mile, 10 to 12-inch diameter, natural gas pipeline across Cook Inlet and Iliamna Lake to the Mine Site; and transportation infrastructure including a 30-mile road from the Mine Site to a ferry terminal on the north shore of Iliamna Lake, an 18-mile crossing with an ice-breaking ferry to a terminal on the south shore of Iliamna Lake, and a 35-mile road to the proposed Amakdedori Port on Cook Inlet. The proposed mine and related facilities would have a total footprint of approximately 5.9 square miles.

The pipeline route would originate on the Kenai Peninsula, connecting to the existing gas pipeline infrastructure near Happy Valley. A metering station would be constructed at the off-take point and the pipeline would then follow south along the Sterling Highway for 9 miles to a gas-fired compressor station north of Anchor Point. The compressor station would feed a 94-mile subsea pipeline from the east shore of Cook Inlet to Amakdedori Port on the west shore. A second gas-fired compressor station would be located at the port site. The pipeline route would then follow a 30-mile mine access road to the south shore of Iliamna Lake, where the pipeline would enter Iliamna Lake for approximately 18 miles. The pipeline would come ashore at on the north shore of the lake, where it would follow the mine access road to the Mine Site.

2. *Alternatives.* A range of alternatives of the proposed action will be identified, and those found to be reasonable and practicable will be fully evaluated in the DEIS, including: the no action alternative, the applicant's proposed alternative, alternative mine locations and mine plans, alternative mining methods and processes, alternatives that may result in avoidance and minimization of impacts, and mitigation measures not in the proposed action. However, this list is not exclusive and additional alternatives may be considered for inclusion.

3. *Scoping Process and Public Involvement.* The scoping period will extend from April 1, 2018, through April 30, 2018. Scoping is conducted to assist in determining the scope of analysis, significant issues and alternatives to be analyzed in depth in the DEIS. Comments should be as specific as possible. Additional public involvement will be sought through the implementation of the public involvement plan and the agency coordination team.

4. *Significant Issues.* Numerous issues will be analyzed in depth in the DEIS related to the effects of the proposed Pebble mine and associated infrastructure construction, operation, and closure. These issues will include, but will not be limited to, the following: wetlands, water quality, air quality, hazardous materials, fish and wildlife, vegetation, cultural resources, food production, land use, needs and welfare of the people (socioeconomics including commercial fishing and tourism), recreation, general environmental

AMERICAN OVERSIGHT

concerns, historic properties, navigation, and safety.

5. *Additional Review and Consultation.* Additional review and consultation which will be incorporated into the preparation of the DEIS will include, but are not necessarily limited to coordination under Section 401 of the Clean Water Act, Essential Fish Habitat coordination; consultation under Section 7 of the Endangered Species Act; and consultation under the National Historic Preservation Act

Shelia Newman,

Deputy Chief, Regional Regulatory Division, U.S. Army Corps of Engineers, Alaska District.

DEPARTMENT OF EDUCATION

[Docket No.: ED–2018–ICCD–0030]

Agency Information Collection Activities; Comment Request; Expanding Opportunity Through Quality Charter Schools Program: Technical Assistance To Support Monitoring, Evaluation, Data Collection, and Dissemination of Best Practices

AGENCY: Office of Innovation and Improvement (OII), Department of Education (ED).

ACTION: Notice.

SUMMARY: In accordance with the Paperwork Reduction Act of 1995, ED is proposing an extension of an existing information collection.

DATES: Interested persons are invited to submit comments on or before May 29, 2018.

ADDRESSES: To access and review all the documents related to the information collection listed in this notice, please use *http://www.regulations.gov* by searching the Docket ID number ED–2018–ICCD–0030. Comments submitted in response to this notice should be submitted electronically through the Federal eRulemaking Portal at *http://www.regulations.gov* by selecting the Docket ID number or via postal mail, commercial delivery, or hand delivery. *Please note that comments submitted by fax or email and those submitted after the comment period will not be accepted.* Written requests for information or comments submitted by postal mail or delivery should be addressed to the Director of the Information Collection Clearance Division, U.S. Department of Education, 400 Maryland Avenue SW, LBJ, Room 216–44, Washington, DC 20202–4537.

FOR FURTHER INFORMATION CONTACT: For specific questions related to collection activities, please contact Patricia Kilby-Robb, 202–260–2225.

SUPPLEMENTARY INFORMATION: The Department of Education (ED), in accordance with the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3506(c)(2)(A)), provides the general public and Federal agencies with an opportunity to comment on proposed, revised, and continuing collections of information. This helps the Department assess the impact of its information collection requirements and minimize the public's reporting burden. It also helps the public understand the Department's information collection requirements and provide the requested data in the desired format. ED is soliciting comments on the proposed information collection request (ICR) that is described below. The Department of Education is especially interested in public comment addressing the following issues: (1) Is this collection necessary to the proper functions of the Department; (2) will this information be processed and used in a timely manner; (3) is the estimate of burden accurate; (4) how might the Department enhance the quality, utility, and clarity of the information to be collected; and (5) how might the Department minimize the burden of this collection on the respondents, including through the use of information technology. Please note that written comments received in response to this notice will be considered public records.

Title of Collection: Expanding Opportunity through Quality Charter Schools Program: Technical Assistance to Support Monitoring, Evaluation, Data Collection, and Dissemination of Best Practices.

OMB Control Number: 1855–0016.

Type of Review: An extension of an existing information collection.

Respondents/Affected Public: State, Local, and Tribal Governments.

Total Estimated Number of Annual Responses: 102.

Total Estimated Number of Annual Burden Hours: 136.

Abstract: This request is for an extension of OMB approval to collect data for the Expanding Opportunity through Quality Charter Schools Program: Technical Assistance to Support Monitoring, Evaluation, Data Collection, and Dissemination of Best Practices formerly titled Charter Schools Program (CSP) Grant Awards Database. This current data collection is being coordinated with the EDFacts Initiative to reduce respondent burden and fully utilize data submitted by States and available to the U.S. Department of Education (ED). Specifically, under the current data collection, ED collects CSP grant award information from grantees (State agencies, charter management organizations, and some schools) to create a new database of current CSP-funded charter schools. Together, these data allow ED to monitor CSP grant performance and analyze data related to accountability for academic purposes, financial integrity, and program effectiveness.

Dated: March 23, 2018.

Tomakie Washington,

Acting Director, Information Collection Clearance Division, Office of the Chief Privacy Officer, Office of Management.

BILLING CODE 4000–01–P

FEDERAL COMMUNICATIONS COMMISSION

[OMB 3060–0819]

Information Collection Being Reviewed by the Federal Communications Commission

AGENCY: Federal Communications Commission.

ACTION: Notice and request for comments.

SUMMARY: As part of its continuing effort to reduce paperwork burdens, and as required by the Paperwork Reduction Act (PRA) of 1995, the Federal Communications Commission (FCC or the Commission) invites the general public and other Federal agencies to take this opportunity to comment on the following information collection. Comments are requested concerning: whether the proposed collection of information is necessary for the proper performance of the functions of the Commission, including whether the information shall have practical utility; the accuracy of the Commission's burden estimate; ways to enhance the quality, utility, and clarity of the information collected; ways to minimize the burden of the collection of information on the respondents, including the use of automated collection techniques or other forms of information technology; and ways to further reduce the information collection burden on small business concerns with fewer than 25 employees. The FCC may not conduct or sponsor a collection of information unless it displays a currently valid control number. No person shall be subject to any penalty for failing to comply with a collection of information subject to the

Agenda

404(c) Team

Congressional responses (Palmer)

- Western Caucus (Gosar et al) – newly OW-approved, not issued
- DeFazio and Carper – just revised, based on newly OW-approved, not issued Western Caucus response
- Lamar Smith – just drafted, based on newly OW-approved, not issued Western Caucus response

FOIA (Ashley)

- E&E News – new request for unredacted copies
- McKeever FOIA Lawsuit – next steps
- NRDC and CNN – working with the AOs office
- Trustees for Alaska – options for Justin Schwab review
- Trustees for Alaska 2 – new FOIA
- Back-up (Erik)

External Correspondence (Erik)

- Recent activity and approach

Permit Oversight/ NEPA Review Team

Timing a Brittany Bolen briefing?

Site Visits

- July 9 – 11: CWA 404 field verification was completed by Mark Douglas
- July 31: Site visit with some of our NEPA team (Patty, Molly, Tim, Chris) to view the mine site, proposed Lake Iliamna port sites, and portions of the proposed roads

NEPA/EIS document reviews - completed

- Scoping Document: In August we submitted comments on the draft scoping document that describes the significant issues raised in scoping. The final scoping document is available on the Corp's Pebble EIS website.
- Preliminary EIS Sections: In July and August, we reviewed and commented on specific portions of chapter 3 (affected environment) and chapter 4 (environmental consequences) that pertain to our areas of special

AMERICAN OVERSIGHT

expertise as identified by the Corps which includes: aesthetics, surface water hydrology, groundwater hydrology, water and sediment quality, wetlands, vegetation)
    - The documents have many placeholders since there have been changes to the proposed action, alternatives have yet to be finalized, and there are numerous substantial requests for additional information where the Corps is awaiting response from PLP.
- Alternatives: On October 3, we submitted comments on draft Appendix B (Alternatives Development Process). Previously we participated in a cooperating agency meeting and provided verbal input on the alternatives development process and some of the potential alternatives.

NEPA/EIS document reviews – upcoming

- The Corps has indicated that they will be sending us draft DEIS sections on 11/9 with comments due by 11/21. We have requested more time for review (30 days review period).

Schedule

- The Corps Pebble EIS website identifies estimated dates for a draft EIS in January 2019 and a final EIS in late 2019.

Agenda

404(c) Team

Congressional responses (Palmer)

- Western Caucus (Gosar et al) – newly OW-approved, not issued
- DeFazio and Carper – just revised, based on newly OW-approved, not issued Western Caucus response
- Lamar Smith – just drafted, based on newly OW-approved, not issued Western Caucus response

FOIA (Ashley)

- E&E News – new request for unredacted copies
- McKeever FOIA Lawsuit – next steps
- NRDC and CNN – working with the AOs office
- Trustees for Alaska – options for Justin Schwab review
- Trustees for Alaska 2 – new FOIA
- Back-up (Erik)

External Correspondence (Erik)

- Recent activity and approach

Permit Oversight/ NEPA Review Team

Timing a Brittany Bolen briefing?

Site Visits

- July 9 – 11: CWA 404 field verification was completed by Mark Douglas
- July 31: Site visit with some of our NEPA team (Patty, Molly, Tim, Chris) to view the mine site, proposed Lake Iliamna port sites, and portions of the proposed roads

NEPA/EIS document reviews - completed

AMERICAN OVERSIGHT

- Scoping Document: In August we submitted comments on the draft scoping document that describes the significant issues raised in scoping. The final scoping document is available on the Corp's Pebble EIS website.
- Preliminary EIS Sections: In July and August, we reviewed and commented on specific portions of chapter 3 (affected environment) and chapter 4 (environmental consequences) that pertain to our areas of special expertise as identified by the Corps which includes: aesthetics, surface water hydrology, groundwater hydrology, water and sediment quality, wetlands, vegetation)
    - The documents have many placeholders since there have been changes to the proposed action, alternatives have yet to be finalized, and there are numerous substantial requests for additional information where the Corps is awaiting response from PLP.
- Alternatives: On October 3, we submitted comments on draft Appendix B (Alternatives Development Process). Previously we participated in a cooperating agency meeting and provided verbal input on the alternatives development process and some of the potential alternatives.

NEPA/EIS document reviews – upcoming

- The Corps has indicated that they will be sending us draft DEIS sections on 11/9 with comments due by 11/21. We have requested more time for review (30 days review period).

Schedule

- The Corps Pebble EIS website identifies estimated dates for a draft EIS in January 2019 and a final EIS in late 2019.

Dunleavy announces environmental, health commissioners

- Monday, November 26, 2018 6:20pm

AMERICAN OVERSIGHT

Alaska Gov.-elect Mike Dunleavy's pick to lead the Department of Environmental Conservation has a resource development background. His pick for health commissioner is a workforce development company executive.

Dunleavy, a Republican former state senator, in a statement said the status quo "came to a screeching halt" with his election. He said his appointees with help deliver state services in "innovative ways.

Dunleavy takes office Dec. 3. Among the appointments he announced Monday were Jason Brune as Environmental Conservation commissioner and Adam Crum as health commissioner.

Brune is a former executive director of the Resource Development Council who worked in public affairs for a former partner in the Pebble Mine project. He most recently has worked for the Alaska Native corporation Cook Inlet Region, Inc., as senior director of land and resources.

Crum's bio, released by Dunleavy's transition, says he has degrees in psychology and public health. Crum told The Associated Press he is not a "health care policy guy" but is experienced in putting together and leading teams and working on projects.

He said there are talented people working in the state Department of Health and Social Services.

Crum, who said he applied for the job, is executive vice president with Northern Industrial Training LLC.

In his new role, he said a focus will be on "people, not programs," to make sure services are provided to those who need them most. Dunleavy has said he wants to review the state's Medicaid program to see if it's sustainable.

Becky Hultberg, president and CEO of the Alaska State Hospital and Nursing Home Association, said it's a bit unusual to hire someone who hasn't worked directly in the industry. But she said the department is big and complex and requires a leader with strong management skills. If Crum has those skills and surrounds himself with people who understand the complexities of health care, she said he could be a strong leader.

"I think we need to give him the benefit of the doubt," said Hultberg, a former state commissioner of Administration who remembers being called inexperienced. She said her agency got things done because of the talent on her team.

Dunleavy named Jonathan Quick his pick for commissioner of the Department of Administration and Donna Arduin as his budget director.

Arduin has worked with other Republican governors across the country, including as budget director for former Florida Gov. Jeb Bush.

The three commissioner picks are subject to legislative confirmation.

This is an Associated Press article by Becky Bohrer.

Not sure if David will want/need to participate in this 2nd briefing preparation meeting. Just getting it on our calendars for now. Agenda TBD based on 1st meeting.

My suggestion is that we use the following briefings folder to collaborate.

Bristol Bay - Briefings Folder

AMERICAN OVERSIGHT

Appointment

From: Peterson, Erik [Peterson.Erik@epa.gov]
Sent: 11/21/2018 11:27:27 PM
To: Allnutt, David [Allnutt.David@epa.gov]; Hough, Palmer [Hough.Palmer@epa.gov]; Palomaki, Ashley [Palomaki.Ashley@epa.gov]; McGrath, Patricia [mcgrath.patricia@epa.gov]

Subject: Bristol Bay - High Level Briefing Preparation
Location: David's Office and on the phone

Start: 11/28/2018 7:15:00 PM
End: 11/28/2018 8:00:00 PM
Show Time As: Tentative

Agenda

- Reason for briefing
- For whom
- Main topics
- Timing
- Next steps

I've created a folder to compile relevant information. If you have useful documents (like briefing papers), scripts or previous presentations etc., then I suggest adding them to the briefings folder at the link below. Ok for it to be too many or imperfect for now, goal is to get relevant source material in one place. We'll organize it better as we go along.

Subject: OERA shout out

Sent bcc to
all OERA staff

OERA – After a strong start last spring, Linda and I have been delinquent recently in sharing individual and team shout outs with the office.

To help get us back on track, I wanted to share with the office my gratitude (previously expressed orally to the team) for the Bristol Bay NEPA team's efforts earlier this year. In particular, I wanted to call out the group of folks who worked together on the Pebble Mine NEPA scoping letter that EPA submitted this past summer to the Corps of Engineers.

In May and June, the team worked tirelessly to develop the Region's recommendations at this very early stage in the NEPA process on a range of technical- and policy-related topics including water quality, air quality, aquatic resource protections, traditional ecological knowledge, tribal consultation, climate adaptation, financial assurance, mining geochemistry, seismic stability, dredged material management, and much more. This was a high-profile letter, and the team did a great job pulling together, refining, and defending two dozen pages of technically sound comments for this very complex project. Kudos to OERA's own Molly Vaughan, Tim Maley, Chris Eckley, Mark Douglas, Mary Anne Thiesing, Chris Meade, Justine Barton, and Jill Nogi. Others on the team whose technical, policy, legal, and communications expertise helped shape the letter include colleagues outside of OERA: Patty McGrath, Jay McAlpine, Ashley Palomaki, Suzanne Skadowski, Heidi Nalven (OGC), and Palmer Hough (OW). Thanks to all of you for helping to ensure that the environmental review for this project will be robust and based on sound science!

Now that I'm back on track, be on the lookout for additional shout outs in the coming weeks and months.

Subject: Bristol Bay Check-in Agenda - 8/1/18

Hello,

Tomorrow at 10 am PST, 8/1/18, we will have a Bristol Bay check-in with Linda Anderson-Carnahan. Linda is acting for David Allnutt while he is out.

The purpose of these bi-weekly meetings is for the two Bristol Bay Teams - the Permit Oversight/NEPA Review Team and the 404(c) Team – to check-in with each other and with regional management. Agenda items are listed below.

Agenda

Site visit

Review of preliminary EIS deliverables

Congressman De fazio and Senator Carter CMS

AOO Director Briefing

Henry Darwin Briefing

Gosar et al./Western Caucus Response

PLP legal memo OGC project

Subject: Lessons from the Donlin Review
Attachments: A **Deliberative Process / Ex. 5**

David and Molly,

Good evening. I am planning to talk through the attached document during tomorrow's Bristol Bay check-in. David, I hope this is somewhat close to what you had in mind. This discussion can take five minutes or much longer, depending on how deep we want to get into the individual issues, and the time allocated. It should, at a minimum, be useful for stimulating follow-up discussions. I was hoping to share the document earlier today, but circumstances prevented me from finishing it until just now. Until tomorrow.

Thanks,

Subject: Bristol Bay Check-in 9/25/18 - Cancel?

David,

I propose we cancel the check-in for 9/25 because there aren't pressing major updates for either team beyond what is in the 9/7 update I sent before (enclosed) and several key staff are out (myself and Palmer) tentative (Ashley), or just returning from leave (Patty). It seems like a more well attended check-in two weeks later could be more valuable.

What do you think? I'm working until about 6 pm and am currently thinking to cancel based on the reasons above before the end of the day. I'll wait until 5:30 before doing so in case you disagree and would like to have the check-in.

Subject: Bristol Bay Check-in 9/11/18 - Cancellation and Update

Hello,

Welcome back David! Given that you are out on September 11, we are canceling the check-in and the Bristol Bay Teams have the following update for you. We plan on having the Bristol Bay Check-in on September 25th at 9:00 am PST.

Updates

Permit Oversight/ NEPA Review Team

Scoping Document

- EPA reviewed and commented on the draft scoping document that describes the significant issues raised in scoping. The final scoping document is available on the Corp's Pebble EIS website.

Preliminary EIS review

- EPA reviewed and commented on specific portions of chapter 3 (affected environment) and chapter 4 (environmental consequences) that pertain to our areas of special expertise as identified by the Corps which includes: aesthetics, surface water hydrology, groundwater hydrology, water and sediment quality, wetlands, vegetation
- The documents have many placeholders since there have been changes to the proposed action, alternatives have yet to be developed, and there are numerous substantial requests for additional information where the Corps is awaiting response from PLP.
- **Deliberative Process / Ex. 5**

Alternatives

- The Corps is developing the range of alternatives to be analyzed in the EIS. We participated in a cooperating agency meeting and provided input. During the week of Sept 10, the Corps is to submit a detailed discussion of the alternatives selected for EIS review and rationale for those dismissed.

Site Visits

- July 9 – 11: CWA 404 field verification was completed by Mark Douglas

AMERICAN OVERSIGHT

- July 31: Site visit with some of our NEPA team (Patty, Molly, Tim, Chris) to view the mine site, proposed Lake Iliamna port sites, and portions of the proposed roads.

Schedule
- The Corps Pebble EIS website identifies a draft EIS in January 2019 and a final EIS in late 2019.

404(c) Team

FOIA
- NRDC and CNN FOIA: extended until end 9/28/18 as we work on ex-Administrator's office employee non-email electronic records. Making progress.
- Trustees for Alaska FOIA: interim release of Corps equities documents on 8/31 and deadline extended until 10/31/18 to facilitate coordination between R10 and HQ on the remaining documents.

Representative DeFazio and Senator Carper letter response
- This July 2018 letter asks for Wheeler to revoke the June 2018 memo issued by Pruitt, describe his view of proper use of 404(c) and the Mingo Logan case, and, describe current and planned EPA actions regarding Pebble.
- EPA's response was uploaded to CMS for Lee F's signature on 8/27

Interest group letter to EPA
- This 9/6/18 letter to EPA from 15 interest groups (including, for example, the Competitive Enterprise Institute) urges Wheeler to rescind the proposed determination and applauds the June 2018 memo issued by Pruitt.
- If this letter is controlled for a response, HQ will share a draft with R10.

External Meetings
- Henry Darwin met with Pebble representatives the week of 8/2/18. The 404(c) Team uploaded a note of this meeting to our external meetings folder on share point.
- We want to emphasize our interest for external meetings at all levels to be recorded with: topic, date, attendees, agenda and notes.

PLP letter, memo to file
- An OGC clerk has completed a summary of court decisions on challenges to agencies withdrawing proposals.

Subject: BB check-in

Hi David-

Personal Matters / Ex. 6 Molly will be providing NEPA/permitting input into the check-in call on Wednesday.

Highlights for this week include:

- Corps extended scoping period to now end on June 29
- Suzanne posted a blurb on our BB site about the EIS and link to Corps' Pebble website. I informed the Corps of this.
- Additional scoping meeting added in New Stuyahok.
- Most cooperating agencies are not participating in the scoping meetings. Exception is the State who will be at the meetings next week. BSEE is attending the Homer and Anchorage meeting. The Corps is providing a conference line. Molly, Neverly, or myself will be calling into the scoping meetings to listen in (except for Homer, Anchorage, and Dillingham). Molly will attend the Anchorage meeting.
- Molly and I had a call with ORD this week. I expect we will get assistance from ORD on fisheries, transportation, and hydrology (though need to verify with hydrologists)
- Molly is off to a good start on our scoping letter
- Based on a call with the Corps today, we will be setting up a 404 strategy meeting between EPA and Corps in May. I will work on that (attendees, agenda, timing, internal strategy) when I return.

Have a good week.
Patty

Subject: RE: ORD support for Pebble EIS
Attachments: FW: NHEERL support for Pebble EIS

Thank you Susan;

We very much appreciate your timely response and inreach within ORD on our high priority regional request. I have copied Patty McGrath (Lead), David Allnutt (Office Director) and Jill Nogi (Unit Manager) in our Office of Environmental Review and Assessment.

Patty, Jill, and David;

- Paul Ringold would like to (see attachment):
  Develop fairly formal quarterly progress meetings or discussions to make sure that the work requested and performed is on track and continues to function within the boundaries of our original agreements.

  Discuss the possibility of regional funding to assist ORD technical experts in keeping engaged with the EIS process. This may be particularly important as the experts will be spending only a small fraction of their time on this effort. Having someone to stay engaged with the EIS and with the science requirements and issues involved on their behalf could facilitate the efficient and effective use of their time and effort.

- Although no hydrologist has been identified, Steve Kraemer (NERL) has been suggested as a possible option.

- Additionally, Barb Butler, an author of the Bristol Bay assessment, is willing to assist in areas not mentioned in the original request that might come up in the future, including reviews of water quality data (groundwater or surface water), mining materials testing data (e.g., kinetic and static leaching tests), sampling/analysis design, and mitigation/treatment options for control of water quality (e.g., management of wastes to minimize leaching/seepage issues, fate and transport of constituents in water if mine drainage is formed, and treatment of drainage).

- ORD indicated they do not have travel funds for their staff for this effort.

Let me know if I can be of further help.

Bruce

Subject: FW: ORD support for Pebble EIS
Importance: High

Hi Bruce,

Valerie shared this request with me last week, and I've worked with ORD's Program Support Coordinators to identify ORD staff available to work with R10 on the Pebble Mine EIS. As you know, R10 requested specific people and expertise for the project. I'm happy to report that Joe Ebersole, Michael Kravitz, and Kate Schofield are all available for this effort. Unfortunately, we were not able to identify anyone with the requested hydrology expertise. The hydrologists who worked on the Bristol Bay assessment are no longer with ORD (Jim Wiggington retired and Jason Todd is now with OCSPP).

Additionally, Barb Butler, an author of the Bristol Bay assessment, is willing to assist in other areas (aka, areas not mentioned in the original request) that might come up in the future with respect to this mine site, including reviews of water quality data (groundwater or surface water), mining materials testing data (e.g., kinetic and static leaching tests), sampling/analysis design, and mitigation/treatment options for control of water quality (e.g., management of wastes to minimize leaching/seepage issues, fate and transport of constituents in water if mine drainage is formed, and treatment of drainage).

Finally, Paul Ringold, Joe Ebersole's branch chief, has asked for a follow up conversation with Patty McGrath (or R10's lead on the Pebble Mine EIS, if it is not Patty) to discuss Joe's participation. Paul's specific requests are in the attached email. Also, please note that the attached email chain indicates that Joe is available for up to 10% of his time for two years.

I'm assuming that you'll pass this information onto Patty. Please let me know if you need anything else from me.

Thanks,

Susan

Subject: ORD support for Pebble EIS

AMERICAN OVERSIGHT

Hello Bruce-

Last week I spoke with Scot Hagerthey regarding ORD support for our cooperating agency participation in the Pebble EIS. He acknowledged that ORD folks are interested and available and requested that I send the request for ORD support through you. Can you let me know how you like to see these requests. Is an email from me sufficient? Following is the support that is needed.

Request for ORD Support for Pebble Environmental Impact Statement

The US Army Corps of Engineers is the lead agency in developing an EIS for the Pebble Mine Project in Alaska. The Corps invited EPA to be a cooperating agency to assist the Corps in developing sections of the EIS. In addition, EPA is responsible for reviewing the Draft EIS and the public notice for the CWA 404 permit application. EPA Region 10 has put together a team to accomplish these responsibilities. There are several areas where EPA is requesting support from ORD to bolster EPA's review team and also benefit from ORD's past work in the Bristol Bay watershed where the mine project is located. From 2011 to 2014, EPA Region 10 and EPA's Office of Water worked with ORD in developing the Bristol Bay Watershed Assessment. ORD's experience and understanding of the watershed and potential impacts that could occur during mining will provide needed support to EPA Region 10's NEPA/permit review team in several key areas.

The key areas where we are requesting support are identified below.

Specialty	**Summary of Assistance Requested**	**ORD staff requested**
Fisheries	Provide advice to EPA's team on fisheries issues Provide input into EIS scoping letter Review baseline data Recommend aquatic resources impact assessment methodologies Participate in fisheries technical working group Review and provide comments on fisheries sections of the EIS	Joe Ebersole
Hydrology	Provide advice to EPA's team on hydrology issues Review groundwater and surface water hydrology baseline data Recommend impact assessment methodologies and modelling approaches and review results Participate in hydrology technical working group Review and provide comments on hydrology sections of the EIS	The ORD hydrologist that assisted with the Bristol Bay watershed assessment has retired. We do need support in this area and request that ORD identify individuals that can assist.
Transportation	Provide advice to EPA's team on transportation issues Review and provide comments on transportation sections of the EIS	Michael Kravitz
Coordination	Participate in monthly Pebble NEPA/permit team to assist with coordinating ORD support Potentially review sections of the EIS	Kate Schofield

In terms of timing, we are requesting ORDs immediate assistance to help with baseline data review and development of EPA's EIS scoping letter. We expect that assistance will be needed throughout the EIS process, with times of intense activity when documents are being reviewed and times with very little activity. The EIS process will take at least two years. There may be additional areas where we need support as the EIS process moves forward.

Please let me know if you need additional information.
Thanks-

Patty

Subject: FW: NHEERL support for Pebble EIS

Importance: High

Hi Susan,

I wanted to follow up on some fine points associated with our offer to make Joe available to assist with the Pebble mine EIS.

The first is that I would hope that we could agree with R10 on fairly formal quarterly progress meetings or discussions to make sure that the work requested and performed is on track and continues to function within the boundaries of our original agreements.

The second is to inquire as to the possibility of providing funds that could be used to assist the multiple ORD technical experts in keeping engaged with the EIS process. This may be particularly important as they will be spending only a small fraction of their time on this effort. Having someone to stay engaged with the EIS and with the science requirements and issues involved on their behalf could facilitate the efficient and effective use of the time and effort of the ORD experts.

If you could convey these queries directly the R10 or identify someone in the Region with whom I could consult on these queries, I would be most appreciative.

Thanks for your assistance, Susan.

Susan,
I'm pleased to confirm that Dr. Ebersole, his Branch Chief, and Division Director have approved Joe's participation in the Pebble Mine EIS activity for up to 10% of his time for up to two years.

Should the demand for his time exceed this, Drs. Ringold and Thornhill would like to re-evaluate the demand to ensure that Joe is not overcommitted.

This commitment does not include travel funds. Should travel be required, alternative sources of travel funds will be needed.

Thank you for the opportunity to have NHEERL staff contribute to this important work of the Agency.

Joe would appreciate receiving any supplemental info on Pebble Mine germane to the EIS.

Best regards,
~Barb

Hi all,

As we discussed yesterday, attached is the R10 request for ORD technical support on the Pebble Mine EIS. Information about the EIS and the anticipated workload can be found in the attached file. The attached file also includes the type of expertise needed, which is copy and pasted below. Please note that R10 has requested specific ORD people for specific areas of expertise.

Please let me know if the requested ORD people are available for this project, or if there are other technical experts available by COB, May 3. This is a high-priority for R10, and we would like to get a response to R10 by the end of next week.

Please let me know if you have any questions. Thank you!

Specialty	Summary of Assistance Requested	ORD staff requested
Fisheries	Provide advice to EPA's team on fisheries issues Provide input into EIS scoping letter Review baseline data Recommend aquatic resources impact assessment methodologies Participate in fisheries technical working group Review and provide comments on fisheries sections of the EIS	**Joe Ebersole**
Hydrology	Provide advice to EPA's team on hydrology issues Review groundwater and surface water hydrology baseline data Recommend impact assessment methodologies and modelling approaches and review results Participate in hydrology technical working group Review and provide comments on hydrology sections of the EIS	The ORD hydrologist that assisted with the Bristol Bay watershed assessment has retired. We do need support in this area and request that ORD identify individuals that can assist. Note from Susan: Jason Todd and Jim Wigington worked on the hydrology part. Jason is now with OCSPP and Jim has retired. Perhaps Steve Kraemer (NERL) would be a good option.
Transportation	Provide advice to EPA's team on transportation issues Review and provide comments on transportation sections of the EIS	Michael Kravitz

There are several areas where EPA is requesting support from ORD to bolster EPA's review team and also benefit from ORD's past work in the Bristol Bay watershed where the mine project is located. From 2011 to 2014, EPA Region 10 and EPA's Office of Water worked with ORD in developing the Bristol Bay Watershed Assessment. ORD's experience and understanding of the watershed and potential impacts that could occur during mining will provide needed support to EPA Region 10's NEPA/permit review team in several key areas.

The key areas where we are requesting support are identified below.

Specialty	Summary of Assistance Requested	ORD staff requested
Fisheries	Provide advice to EPA's team on fisheries issues Provide input into EIS scoping letter Review baseline data Recommend aquatic resources impact assessment methodologies Participate in fisheries technical working group	Joe Ebersole

AMERICAN OVERSIGHT

	Review and provide comments on fisheries sections of the EIS	
Hydrology	Provide advice to EPA's team on hydrology issues Review groundwater and surface water hydrology baseline data Recommend impact assessment methodologies and modelling approaches and review results Participate in hydrology technical working group Review and provide comments on hydrology sections of the EIS	The ORD hydrologist that assisted with the Bristol Bay watershed assessment has retired. We do need support in this area and request that ORD identify individuals that can assist.
Transportation	Provide advice to EPA's team on transportation issues Review and provide comments on transportation sections of the EIS	Michael Kravitz
Coordination	Participate in monthly Pebble NEPA/permit team to assist with coordinating ORD support Potentially review sections of the EIS	Kate Schofield

In terms of timing, we are requesting ORDs immediate assistance to help with baseline data review and development of EPA's EIS scoping letter. We expect that assistance will be needed throughout the EIS process, with times of intense activity when documents are being reviewed and times with very little activity. The EIS process will take at least two years. There may be additional areas where we need support as the EIS process moves forward.

Please let me know if you need additional information.
Thanks-

Patty

Hi David,
Sorry I missed you. Thursday meeting is with Tom Collier from Pebble, Chris and you. Michelle Pirzadeh is the one who said I should add you to the invite. I know Tom is in Seattle attending other meetings and I do not know if anyone else is accompanying him. If there's someone else, EPA, I should invite please let me know.

Hi David-
Taking into account suggested changes from Molly, Jill and Eric, below is the recommended blurb related to the EIS for EPA's Bristol Bay website.
Please let me know if you have additional edits.
thanks
Patty

Environmental Impact Statement Process

The U.S. Army Corps of Engineers received a Department of Army permit application and project description from the Pebble Limited Partnership on December 22, 2017 and has determined that an Environmental Impact Statement (EIS) under the National Environmental Policy Act (NEPA) is needed before it makes a decision on the permit application. The Corps is the lead agency in managing the NEPA process and developing the EIS. EPA is a cooperating agency in the EIS process, at the invitation of the Corps. The EIS will describe the proposed project and project alternatives, evaluate the potential impacts of the project and alternatives on the physical, biological, and social environment, and discuss measures to mitigate impacts. The purpose of the NEPA process is to help public officials make informed decisions that

AMERICAN OVERSIGHT

are based on an understanding of environmental consequences and take federal agency actions that protect, restore, and enhance the environment.

The Corps initiated public scoping of the EIS on April 1, 2018. Below is a link to the Corps EIS website for more information and documents pertaining to the Department of Army permit application and the EIS process.

Hello,

I'm writing to cancel the 7/18 Bristol Bay Check-in on behalf of the EPA Bristol Bay 404(c) Team and Permit Oversight/NEPA Review Team. See the updates below for awareness of our ongoing Bristol Bay related activities.

Updates

Linda Anderson-Carnahan is acting w **Personal Matters / Ex. 6** We will continue Bristol Bay Check-ins with Linda during this time period. Our next scheduled check-in with Linda is for 30 minutes starting at 10 am PST on August 1st.

The 404(c) team is managing equity reviews and preparing non-equities documents for release for the Trustees for Alaska FOIA.

The Permit Oversight/NEPA Review team is reviewing preliminary EIS documents.

An EPA staff visit to the Pebble mine site is planned for 7/30 and 7/31.

A Pebble overview briefing for the new Alaska Operations Office Director, Sue Detwiler, is scheduled for July 23rd in Seattle.

All-

Just FYI that the Corps continues to add documents to the Pebble EIS website.
For example, public scoping comments are being loaded (so far there are 487 comments).

https://pebbleprojecteis.com/publiccomments/list

The Project Library section includes the Pebble EBD, preliminary JD, the BB Assessment and other information.

Folks

Lee F met with some BB folks today (Norm Van Vactor and Robin Samuelsen, BBEDC). The notes are attached. The most noteworthy point is that Lee indicated that the Acting Administrator has recused himself from the decision-making process re Pebble and that action will be overseen by Henry Darwin.

I was not aware of this.

EPA Deputy AA Meeting with BBEDC
Topic: Bristol Bay
Meeting Date: Sep 12, 2018
Location: EPA HQ (Washington, DC)
List of Third Party Attendees (including affiliation): • Mathew Paxton, Adams & Reese • Norm Van Vactor, BBEDC • Robin Samuelsen, BBEDC
Did EPA decide which third parties would attend?: No.
List of EPA Attendees: • Lee Forsgren • Russ Kaiser
Agenda: Bristol Bay EIS Status and Next Steps Forward
Did EPA/Third Party Set the Agenda?: Third Party, Mathew Paxton
Did EPA/Third Party Run the Meeting: Meeting ran as a conversation
Notes from Discussion (including individual advice/feedback provided to Agency): • Lee opened and indicated that we are staying on course and there are no actions for EPA at this time related to the (c) action. Will need to determine at a later date when to request public comment on the proposed action and what that will look like. Not there yet. • Lee indicated that we were supporting the Corps in developing the DEIS, when requested by Corps. • Lee noted that the Acting Administrator has recused himself from the decision-making process and that action will be overseen by Henry Darwin. • The group will plan to brief Mr. Darwin on the action in March-April of next year; they will also invite both the Acting Administrator and Mr. Darwin to visit the region so that they can explain the project and identify potential environmental consequences. • Lee also discussed broader AK initiatives, including the mitigation memo and the flexibilities that exist in the rule.
Next Steps/Follow-up Discussed: None.

Hi David,
This is FYI – Molly called me that she hasn't heard anything from Chris and all the other reviewers have previously provided input. She's been waiting for him to respond and hasn't heard anything, so she asked me to try and see if I can get him to respond to her today. Sharing what I just sent to him… thanks! Jill

Importance: High

Chris,
I hope that you are doing well. Molly called this morning with her concern that she needs to keep the scoping letter moving through the internal review process as it needs to go to Patty McGrath today. As per her message below, she needs you to review the section related to dredged material management (pages 13-15) and provide any necessary edits, as well as adding a few sentences to the letter regarding upland disposal. The review schedule is tight and I anticipate that you only need to take about 30 minutes today to assist Molly with this. I know that you have been great about sharing your concerns with the team over the phone, so it should be a pretty easy task for you to complete your contributions to the scoping letter today. If Molly hasn't heard from you by 2pm today, I will need to reach out to Justine to see if she can make the time to provide input related to dredged material management. Justine doesn't have the background with this project however – so she would need to hear from you all about your involvement to date – which could take more time than having you edit it and send it back to Molly.

Please make responding to Molly your first priority when you get in to the office today, and take care of this as soon as you are able.
Thank you!
Jill

Hi Chris,
I have to leave for the day and didn't see any edits from you yet on the Sharepoint site version. So, so make things go more quickly, here is the current version of the document on my OneDrive. I need to send this to Patty ASAP when I come in tomorrow. Please make any edits directly in this document using track changes. As a reminder, the specific section for your review is titled "Marine Environment". It begins in the middle of Page 13 of this version, and ends top of page 15. In particular, please add the appropriate text we've discussed in place of the italicized text on page 14.

AMERICAN OVERSIGHT

If you've already begun edits on another version, no need to switch gears now, just send those to me and I will consolidate in the morning.

Thank you,
Molly

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION 10
1200 Sixth Avenue, Suite 155
Seattle, WA 98101-3140

OFFICE OF
ENVIRONMENTAL REVIEW
AND ASSESSMENT

June 29, 2018

Mr. Shane McCoy, Project Manager
U.S. Army Corps of Engineers
Regulatory Division
P.O. Box 6898
JBER, Alaska 99506-0898

Dear Mr. McCoy:

The U.S. Environmental Protection Agency has reviewed the U.S. Army Corps of Engineers' March 29, 2018, Notice of Intent initiating the scoping process for the proposed Pebble Project Environmental Impact Statement development (EPA Region 10 Project Number 18-0002-COE). We have also reviewed the additional project information available on the Corps website. The EPA is providing comments for your consideration pursuant to the National Environmental Policy Act, Council on Environmental Quality regulations (40 C.F.R. §§ 1500-1508) and Section 309 of the Clean Air Act. The EPA is also supporting the Corps in EIS development as a cooperating agency, due to our special expertise. We appreciate the opportunity to provide early input in the analysis of the Pebble Project.

The Pebble Limited Partnership (PLP) is proposing to develop the Pebble deposit in southwest Alaska, containing copper, gold, and molybdenum. The proposed project includes an open-pit mine, tailings storage facility, a low-grade ore stockpile, an overburden stockpile, a mill facility, a natural gas-fired power plant, and other mine site facilities. The anticipated throughput at the mill facility is 160,000 tons of ore per day, and the proposed mine operating life is 20 years. The proposed project also includes development of a 188-mile natural gas pipeline across Cook Inlet and Lake Iliamna and two compressor stations used to transport natural gas from the Kenai Peninsula to the mine site. The proposed transportation network includes 65 miles of roads, ferry terminals on the north and south shores of Lake Iliamna for use by an ice-breaking ferry, and the Amakdedori Port on Cook Inlet (including dredging and disposal of up to 20 million cubic yards of dredged material).

The scoping comments that follow are provided to inform the Corps of issues the EPA believes are significant and warrant explicit treatment in the EIS, based on current information. Overall, the EPA encourages the development of an EIS that evaluates and compares a full range of reasonable alternatives and comprehensively discusses the reasonably foreseeable direct, indirect, and cumulative impacts of the proposed action.

The EPA has significant concerns regarding the potential impacts of mining activities near the world-class fisheries of the Bristol Bay Watershed.[1] Many of these concerns have been previously documented in the EPA's 2014 Bristol Bay Watershed Assessment, which evaluated the potential impacts of large-scale mining on the region's fish resources, and in the Agency's 2014 Proposed Determination under

[1] See https://www.epa.gov/bristolbay for more information.

AMERICAN OVERSIGHT

Section 404 of the Clean Water Act. This Proposed Determination proposed restrictions on the discharge of dredged or fill material to waters of the U.S. to protect waters that support fishery areas in and near the Pebble deposit area. Because the Watershed Assessment and the Proposed Determination were completed before PLP submitted its permit application to the Corps, these assessments did not consider and were not based on the specific parameters of PLP's pending proposal. The EIS should thoroughly analyze the potential impacts of PLP's proposal to aquatic and other resources, including the anticipated direct impacts of the proposed action, and the reasonably foreseeable indirect and cumulative impacts. We note that the geographic extent of the proposed project infrastructure is not limited to the Bristol Bay watershed, and we recommend that the EIS analyze all areas of impact from the project, including Cook Inlet.

We appreciate the information provided in the Corps' scoping package, including the list of resources to be analyzed in the EIS, and we agree that the suite of issues presented are appropriate to analyze in detail in the EIS. Our enclosed scoping comments provide our recommendations for analysis of key areas that will be the focus of our review of the project, including natural resource impacts, as well as human health and impacts to communities and federally recognized tribes. Our scoping comments also include recommendations related to: risk analysis and hazardous materials management, including geotechnical stability; analytical tools and methodologies, including predictive modeling of impacts to water, air, fish, and other aquatic resources; mitigation and monitoring; and financial assurance. Identification of these key issues and recommendations is based on the EPA's knowledge of the proposed project as well as our experience with mining projects in Alaska and other Region 10 states.

We appreciate the opportunity to participate early in the planning process for this project and are looking forward to working with you as you develop the EIS. Should you have any questions regarding our comments, please contact Patty McGrath, EPA Region 10 Mining Advisor at (206) 553-6113 or mcgrath.patricia@epa.gov.

Sincerely,

R. David Allnutt
Director

Enclosure:

1. U.S. Environmental Protection Agency Detailed Scoping Comments for the Pebble Project EIS

AMERICAN OVERSIGHT

EPA Region 10 Detailed Scoping Comments for the
Pebble Project Environmental Impact Statement

General Components of NEPA Analysis

Purpose and Need

We recommend that the EIS include a clear and concise statement of the underlying purpose and need for the proposed project, consistent with the implementing regulations for NEPA[2] and the Clean Water Act Section 404(b)(1) Guidelines (Guidelines).[3] In presenting the purpose and need, the EIS should reflect not only the Corps' purpose in responding to the permit application, but also the broader public interest and need for this project. An appropriately defined purpose and need statement is of critical importance to setting up the analysis of a range of reasonable and practicable alternatives in the EIS that will meet the requirements of both NEPA and the Guidelines.

Range of Alternatives

We recommend that the EIS include a range of reasonable alternatives that meet the stated purpose and need for the project, are responsive to the issues identified during the scoping process and through tribal consultation, and include options for avoiding significant environmental impacts. This will ensure that the NEPA analysis provides agency decision makers and the public with information that defines the issues and identifies a clear basis for the choices made among the range of alternatives, as required by NEPA. The EIS should clearly outline the physical design of current and proposed facilities and alternatives (including ore storage sites, waste rock disposal areas, tailings areas, water storage and conveyance facilities, and supporting infrastructure including the transportation corridor, port site, and pipeline).

The EIS should "rigorously explore and objectively evaluate all reasonable alternatives"[4] even if some of them are outside the capability or the jurisdiction of the agency preparing the EIS for the proposed action.[5] This includes identifying the specific criteria that were used to (1) develop the range of reasonable alternatives, (2) eliminate certain alternatives, and (3) identify the agency preferred alternative, as appropriate. In addition, we recommend the EIS provide a clear discussion of the reasons for the elimination of alternatives that are not evaluated in detail.

While NEPA requires the evaluation of *reasonable* alternatives to the proposed action, the Guidelines require the analysis of *practicable*[6] alternatives in order to identify the least environmentally damaging

---

[2] 40 C.F.R. § 1502.13.
[3] Within the context of the Guidelines, practicable alternatives to the proposed discharge of fill or dredged material are identified "in light of overall project purposes," which is also termed "the basic purpose of the proposed activity." 40 C.F.R. § 230.10(a)(2).
[4] 40 C.F.R. § 1502.14(a).
[5] 40 C.F.R. § 1502.14(c).
[6] An alternative is practicable if it is available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes. 40 C.F.R. § 230.10(a)(2).

AMERICAN OVERSIGHT

practicable alternative (LEDPA), which is the only alternative that can be permitted.[7] The analysis of alternatives for NEPA can provide the information for evaluation of alternatives under the Guidelines.[8] We recommend that the EIS range of alternatives include the practicable alternatives developed for the Guidelines analysis.

In evaluating the proposed project and alternatives, the analysis should include an evaluation of performance and effectiveness, as well as the planned monitoring to ensure efficacy of proposed design features, environmental protection measures, and mitigation.[9]

Regarding mitigation for purposes of NEPA, we recommend that the alternatives analysis include appropriate mitigation measures not already included in the proposed action or alternatives.[10] The EIS should evaluate reasonable alternatives, including mitigation measures, to reduce or minimize adverse impacts to environmental resources. We recommend that, in conducting such an evaluation, the Corps consider:

- The disturbance footprint;
- Habitat value, cultural significance, and risks in siting project components for the proposed mine site components, as well as the port site, transportation corridor, and pipeline components;
- Source control measures (effective management of waste rock and tailings to prevent acid generation and metal leaching) and containment (liners and covers);
- Measures to reduce contact between mine waste materials and surface water and groundwater (such as surface water diversions and liners and covers as recommended above);
- Impacts of pit dewatering on groundwater and stream flows;
- Treatment to promote compliance with water quality standards;
- The physical stability of structures (e.g., pit walls, ore storage and waste rock facilities, tailings facility) during operations and closure, such as considering dry stack tailings;
- Impacts along the pipeline route and transportation corridor, including to Lake Iliamna;
- Impacts from dredged material disposal;
- Impacts to the marine environment at the Amakdedori Port site;
- Air pollutant emissions; and
- Impacts to traditional and cultural uses and resources, including key subsistence species and sites.

Indirect Impacts

We recommend that the EIS include consideration of all reasonably foreseeable indirect effects caused by the action but that may occur later in time or farther removed in distance.[11] The indirect effects analysis "may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural

---

[7] 40 C.F.R. § 230.10(a)
[8] 40 C.F.R. § 230.10(a)(4).
[9] The term mitigation included in this "Range of Alternatives" section is referring to the general term as it applies to NEPA. Compensatory mitigation for purposes under CWA section 404 cannot be used to reduce environmental impacts in the evaluation of the least environmentally damaging practicable alternatives for the purposes of requirements under Section 40 C.F.R. § 230.10(a). *See* 1990 Memorandum of Agreement between Army and EPA concerning the determination of mitigation under CWA section 404(b)(1) Guidelines.
[10] 40 C.F.R. § 1502.14(f).
[11] 40 C.F.R. § 1508.8(b).

AMERICAN OVERSIGHT

systems, including ecosystems."[12] While NEPA does not require agencies to engage in speculation, "[t]he EIS must identify all of the indirect effects that are known, and make a good faith effort to explain the effects that are not known but are reasonably foreseeable."[13]

We therefore recommend that the EIS evaluate the expansion and continued operation of the currently proposed project to the extent that the Corps considers it to be a reasonably foreseeable indirect effect of the proposed action. The current proposed Pebble Project description includes mining of approximately 1.1 billion tons of mineralized material, while the 2011 Preliminary Assessment Technical Report[14] estimated that the total Pebble mineral resource may be 11.9 billion tons. It may be reasonable to predict that a mine at the Pebble deposit will eventually operate for longer than 20 years and recover and process additional ore based on the size of the deposit, the significant infrastructure that will be developed under the current project description, and statements made by the Pebble Limited Partnership regarding the potential to examine expanding the mine once initial production has begun on the current proposal.[15] Accordingly, we recommend that the EIS consider the potential impacts associated with reasonably foreseeable mine expansion scenarios, including up to 11.9 billion tons.

In addition, we recommend that the EIS consider the extent to which it is reasonably foreseeable that the proposed transportation corridor and natural gas pipeline may be made accessible to the public and may stimulate additional reasonably foreseeable mining projects in the area, and potential environmental effects associated with that induced mining. Although PLP's current proposal only includes private access to the infrastructure components, public access may be granted in the future. This potential may be different for the different infrastructure elements. For example, if the pipeline is regulated as a common carrier, then public access could be allowed if capacity permits. We recommend that the EIS discuss any reasonably foreseeable future public access to the project's infrastructure components and analyze any reasonably foreseeable indirect effects of this action.

Construction and operation of the project would result in increased vessel traffic in Cook Inlet and on Lake Iliamna because vessels will bring supplies to the site and transport products off-site. In addition to evaluating the direct effects of the increased transportation, we recommend that, if it is reasonably foreseeable that the ports and ferry landings will become available for public use, then any reasonably foreseeable future use of these components should be assessed in the EIS as indirect or cumulative effects. Should the port and ferry terminals remain open following mining, this infrastructure may result in increased use and vessel traffic beyond what PLP is currently proposing.

Indirect project impacts under NEPA can include secondary effects, which are defined by the Guidelines as "effects on the aquatic ecosystem that are associated with the discharge of dredged or fill materials, but do not result from the actual placement of the dredged or fill material."[16] The consideration of secondary effects is necessary for the Guidelines analysis, and examples of potential secondary effects are discussed in the section on aquatic resources below.

[15] e.g., see http://www.alaskajournal.com/2018-01-10/permit-application-reveals-size-scaled-down-pebble-project. "Collier has acknowledged the company might look to expand after initial production commences but contends growing the project would require additional rounds of environmental reviews and permitting that would be independent from any approvals Pebble already had."

[16] 40 C.F.R. § 230.11(h).

AMERICAN OVERSIGHT

Cumulative Impacts

In accordance with NEPA, the cumulative impacts analysis should identify how resources, ecosystems, and communities in the vicinity of the project have already been, or will be affected by, past, present, or reasonably foreseeable future activities in the project area, "regardless of what agency (federal or non-federal) or person undertakes such other actions."[17]

The Guidelines also fundamentally require consideration of reasonably foreseeable cumulative effects in determining whether a project complies with the significant degradation prohibition and to ensure that discharges will not have an unacceptable adverse impact either individually or in combination with known and/or probable impacts of other activities affecting the ecosystems of concern.[18] Cumulative effects are "the changes in an aquatic ecosystem that are attributable to the collective effect of a number of individual discharges of dredged or fill material," which individually may be minor, but cumulatively may result in a "major impairment of the water resources and interfere with the productivity and water quality of existing aquatic ecosystems."[19]

For the cumulative impacts assessment, we recommend that the EIS delineate appropriate geographic boundaries, including natural ecological boundaries whenever possible, as well as consider an appropriate time period for the project's effects. We recommend that resources be characterized in terms of their response to change and capacity to withstand stresses. Trends data should be used to establish a baseline for the affected resources, to evaluate the significance of any historical degradation (e.g., due to exploration activities), and to predict the environmental effects of the project components.

Past, present, and reasonably foreseeable future activities that should be considered in the cumulative impact assessment will vary across the geographic scope of the various mine-site and infrastructure components. Please refer to CEQ's "Considering Cumulative Effects Under the National Environmental Policy Act"[20] and the EPA's "Consideration of Cumulative Impacts in EPA Review of NEPA Documents"[21] for assistance with identifying appropriate boundaries and identifying appropriate past, present, and reasonably foreseeable future projects to include in the analysis.

In particular, we recommend that the cumulative effects analysis consider, but not be limited to, the following activities:

- Past and current exploration activities conducted by PLP and others at the Pebble site;
- Current exploration activities occurring in the Bristol Bay watershed region;
- Reasonably foreseeable expansion and continued operation of the currently proposed project (while this is an indirect effect under NEPA, as discussed above, it is a cumulative effect under the Guidelines);
- Reasonably foreseeable future use of project infrastructure (road, port, pipeline); and,
- Reasonably foreseeable development of additional mining projects as a result of increased exploration activity in the region. Even if those activities are not determined to be indirect effects of the proposed action (as discussed above), they are still reasonably foreseeable.

AMERICAN OVERSIGHT

ENVIRONMENTAL RESOURCE IMPACTS

Aquatic Resources, Including Wetlands, Streams, and Fish

Evaluating Compliance with the Clean Water Act Section 404(b)(1) Guidelines

The Corps' potential CWA Section 404 permitting action is triggering preparation of the EIS. We recommend that the Corps' permitting regulations and the Guidelines therefore provide the context for identifying relevant issues and evaluating alternatives in the EIS.

The Guidelines are the substantive environmental criteria for the evaluation of proposed discharges of dredged or fill material, and applicants must demonstrate compliance with the Guidelines.[22] The EIS is a significant component of the administrative record for the District's permit decision, which can and should provide sufficient information to address compliance with the Guidelines and the Corps' public interest review.[23] Although it is not mandatory, we support the Corps' decision to include of the public interest review factors into the list of issues to be considered in the EIS. This will enable the expected benefits to be balanced against reasonably foreseeable detriments, and all relevant public interest factors to be weighed.

We recommend that the organization of the EIS facilitate the evaluation of the proposed project's compliance with the Guidelines. Issues relevant to compliance with the Guidelines should be addressed explicitly in the EIS where possible. Alternatively, a stand-alone Section 404(b)(1) analysis could be included as its own section of, or appendix to, the EIS. As mentioned above, we recommend that the range of alternatives evaluated in the EIS be sufficient to identify the LEDPA. In addition, we recommend that the final EIS identify which alternative is the LEDPA.

The Guidelines prohibit, for example, the authorization of a proposed discharge that would cause or contribute to the violation of an applicable water quality or toxic effluent standard, jeopardize a listed threatened or endangered species, or impact a marine sanctuary.[24] We recommend that these criteria be used to evaluate and compare alternatives.

The Guidelines also prohibit the authorization of a proposed discharge which will cause or contribute to significant degradation of the aquatic ecosystem.[25] Findings of significant degradation must be based upon specific factual determinations, evaluations, and tests identified in the Guidelines. These include the evaluation of the direct, secondary, and cumulative effects of the proposed discharge and alternatives on specific resources including fish, wildlife, and special aquatic sites. The significant degradation findings must also evaluate the effects to resource characteristics including aquatic ecosystem diversity, productivity, and stability. Evaluating the potential for significant degradation also requires the consideration of effects to human uses or values, including recreational, aesthetic, and economic values. With regard to fisheries, the Guidelines require, for example, an evaluation of effects to all forms and life stages of aquatic organisms in the food web, including fish and the plants and animals on which they feed and depend upon for their needs.[26] The Guidelines also require an evaluation of effects to

---

[22] 40 C.F.R. § 230.12(a)(3)(iv).
[23] See 33 C.F.R. § 320.4.
[24] 40 C.F.R. § 230.10(b).
[25] 40 C.F.R. § 230.10(c).
[26] 40 C.F.R. § 230.31.

AMERICAN OVERSIGHT

recreational and commercial fisheries, which includes harvestable fish, crustaceans, shellfish, and other aquatic organisms used by man.[27] The Corps has proposed including a number of these evaluations in the EIS. We recommend that as many of the specific factual determinations, evaluations, and tests required by the Guidelines as possible be included in the EIS, and be used to evaluate and compare alternatives.

The Guidelines also prohibit any proposed discharge that does not include all appropriate and practicable measures to minimize potential harm to the aquatic ecosystem.[28] Subpart H of the Guidelines identifies numerous possible steps to minimize impacts, including reducing the footprint of the project, using co-location of facilities whenever possible, implementation of best management practices to reduce environmental impacts, configuring the project footprint to reduce or eliminate impacts to higher functioning aquatic resources and other appropriate and practicable measures. Also, as previously discussed, we recommend that the EIS include appropriate minimization measures both as part of the action alternatives and relative to the affected environment. The discussion of minimization measures should include assessment of their likely effectiveness.

Compensatory Mitigation

For unavoidable impacts to wetlands, streams, and other aquatic resources, the Guidelines require appropriate and practicable compensatory mitigation to offset unavoidable environmental impacts associated with discharges permitted under CWA Section 404. We recommend that the EIS consider potential mechanisms to offset likely unavoidable aquatic resource impacts. We also recommend that the EIS include the applicant's proposed compensatory mitigation plan. Compensatory mitigation requirements, including the components of a compensatory mitigation plan, are described in Subpart J of the Guidelines. Pursuant to the Guidelines, the level of detail in the compensatory mitigation plan should be commensurate with the scale and scope of the impacts.

Compensatory mitigation may be provided through purchase of credits from an approved mitigation bank, purchase of credits from an approved in-lieu fee mitigation program, and/or completion of a permittee-responsible compensatory mitigation project(s). Final compensatory mitigation requirements must be commensurate with the amount and type of impact that is associated with a particular Section 404 permit.[29] Compensatory mitigation required by the Guidelines is separate from, and may be in addition to, proposed project impact mitigation under NEPA.

Characterizing the Affected Environment

We recommend that the EIS describe aquatic habitats in the affected environment by resource type using the data sources and classification approaches that provide the greatest resolution possible. For example, if wetlands are mapped using a Cowardin classification, that mapping should be to the smallest identifiable map unit. Likewise, streams should be classified and mapped accordingly. The baseline information for aquatic resources should include their functional condition and integrity. We also recommend that the EIS evaluate the characteristics of the potentially affected aquatic resources, how those characteristics provide fish habitat, and how such habitat could be adversely impacted by the proposed project. Wetlands and streams perform different functions at different rates, and capturing this information is critical for evaluating the potential environmental impacts of the proposed action, alternatives, and reasonably foreseeable actions (exploration and mining) on these resources.

---

[27] 40 C.F.R. § 230.51.
[28] 40 C.F.R. § 230.10(d).
[29] 40 C.F.R. § 230.93(a)(1).

AMERICAN OVERSIGHT

Characterizing the distribution of resident and anadromous fish in potentially affected streams and other aquatic resources is also important, and we recommend the use of data sources such as the Anadromous Waters Catalog[30] and the Alaska Freshwater Fish Inventory[31] to help with this characterization.

Aquatic Resource Impacts Analysis

We recommend that the areal extent (i.e., acreage) of impacts to aquatic resources be quantified in the EIS for both direct and secondary effects. The acreage values for the direct and secondary impact footprints should include the acreage for streams as well as for wetlands, ponds, lakes, mudflats, and other waters. In other words, reported acreage losses should represent the total loss of jurisdictional waters. For streams, the loss of channel length should also be quantified by linear feet and/or miles. Channel length values are a more intuitive metric for some, and facilitate different types of analyses than the acreage values. In addition to the areal or linear extent, impacts to aquatic resources should also be quantified by the expected change in the function these resources perform, including fishery support functions, or change in the condition of the resource.

Direct effects are impacts on aquatic resources within the footprint of the discharge of dredged or fill material. Direct effects at the mine site would include stream and other aquatic resource losses within the footprints of the tailings storage facility, the ore and overburden storage sites, the mine pit, and other mine site facilities described in the permit application. Construction of the transportation and pipeline corridors and port facility will likely involve such discharges as well.

Secondary effects, as defined by the Guidelines, are associated with the discharge of dredged or fill material, but do not result from actual placement of this material. These effects are also considered indirect impacts under NEPA. Examples of secondary effects that should be evaluated in the EIS include the following:

- Elimination of streams and wetlands due to drowning by the tailings impoundment and other mine components;
- Dewatering of streams and other aquatic resources due to pumping of groundwater during open pit mining and filling during closure;
- Fragmentation of aquatic resources due to the placement of the mine pit, ore storage sites, tailings storage facility, and other mine components;
- Degradation of downstream fish habitat due to streamflow alterations resulting from water capture, withdrawal, storage, treatment, or release at the mine site;
- Degradation of downstream fish habitat due to water quality impacts associated with mine construction and operation;
- Degradation of downstream fish habitat due to the loss of important inputs such as nutrients and groundwater from upstream sources;
- Degradation of aquatic resources due to dust deposition from mining and transportation activities.

The evaluation of the proposed project's impacts and alternatives should fully consider the physical, chemical, and biological effects of each of the direct and secondary effects, and should consider incremental changes from these impacts along each stream segment downstream of the impact site.

[30] See https://www.adfg.alaska.gov/sf/SARR/AWC/.
[31] See http://www.adfg.alaska.gov/index.cfm?adfg=ffinventory.main.

AMERICAN OVERSIGHT

Considering the value of the region's commercial, subsistence, and recreational fishery resources, we recommend that the EIS focus on quantifying direct, indirect, and cumulative impacts on resident and anadromous fish and their habitat resulting from losses of streams with documented fish occurrences; losses of headwater source areas of these streams; losses of wetlands, lakes, and ponds; and streamflow alterations. We appreciate that the Corps has made the EPA's 2014 Bristol Bay Watershed Assessment available on the Pebble Project website, and we also recommend that this document be referenced in preparing the EIS.[32]

The losses of stream reaches and adjacent wetlands from dewatering, as well as changes to downstream reaches and adjacent wetlands, may result in physical, chemical, and biological changes which would impact fishery habitat and habitat support. We recommend that the EIS model and consider these impacts compared to baseline conditions, including but not limited to:

- Evaluate changes in water volume in the stream areas of impact, as well as changes in the downstream reaches of the watershed resulting from losses of upstream contributions of water. We recommend that the analysis address seasonal changes to the different stream segment hydrographs, including changes to seasonal temperatures, dissolved oxygen levels, sediment transport capabilities, and any associated changes to sediment grain sizes in the different stream segments;
- Evaluate flow changes in the impacted stream reaches, both from pit dewatering as well as any proposed in-stream discharge points, to assess any potential changes to stream profile, form, and pattern, and to identify any areas of accretion and/or scouring which may reasonably be anticipated. We also recommend that areas of stream incision as a result of flow changes be identified, as well as losses of connectivity to floodplains and riparian wetlands currently connected to the downstream reaches;
- Identify potential changes to nutrient levels, turbidity, and dissolved oxygen, particularly with respect to seasonal patterns in the downstream reaches. We further recommend that both the direct losses of both autochthonous and allochthonous inputs from upstream reaches lost and/or disconnected from wetland and other riparian habitats, as well as the incremental reductions in those inputs in downstream segments throughout the stream reaches and their effects on system-wide primary, secondary, and tertiary production, be evaluated. These analyses should consider the direct changes to downstream habitats as well as changes to fisheries support in the different stream reaches;
- Evaluate decreases in anticipated invertebrate transport and production in downstream segments and those effects on fish production; and
- Evaluate the effects of disconnecting any off-channel habitat both near the areas of direct impact and throughout the downstream reaches, both for losses of allochthonous inputs and also for potential losses of nursery habitat.

We recommend that the direct, indirect, and cumulative impacts of any of these potential physical, chemical, and biological alterations be examined for how they may result in the loss and/or degradation of fish habitat, including alterations with respect to spawning, overwintering, nursery, and migration. Habitat losses that may result from freeze-through or seasonal warming of fish production areas should also be evaluated.

[32] See https://www.epa.gov/bristolbay/bristol-bay-assessment-final-report-2014.

AMERICAN OVERSIGHT

Water Quality and Quantity

Evaluating Impacts to Surface Water and Groundwater Quality and Quantity

Water quality is one of the EPA's principal concerns at mine facilities due to the potential for acid-generating and metal-leaching waste materials (ore, waste rock, tailings, pit walls) that are exposed to the environment and require management over long periods of time. In addition, road construction and operation have the potential to contribute a significant quantity of sediment to streams. We recommend that the EIS characterize baseline surface water and groundwater quality, quantity, and interactions, and evaluate the impacts of all aspects of the proposed operations and alternatives (including pit dewatering and backfilling, tailings management and disposal, water management, and port-site and transportation aspects) on these hydrologic components and describe mitigation for adverse impacts.

Given the potential impacts of the proposed Pebble Project, the EPA recommends that the Corps specifically include in the water resources analysis for the EIS (see also our recommendations for Analysis Tools and Methodologies):

- Characterization of existing groundwater, surface water, springs, and wetland resources within the area of both the project and all potential alternatives, including groundwater levels, flow direction and gradients, and chemistry;
- Development of a hydrogeologic conceptual site model, including:
    - Maps of groundwater, surface water, springs, and wetland resources in the area to be developed or affected;
    - Baseline data on the extent and quality of groundwater, surface water, springs and wetlands;
    - Information on the quantity and location of all aquifers, including Underground Sources of Drinking Water, recharge zones and source water protection areas;
    - Identification of any CWA § 303(d) listed waterbodies and any existing restoration efforts for these waters;
    - Identification and description of all wetlands and surface waters that could be affected by the project and alternatives; where applicable, acreages, channel lengths, habitat types, values and functions of these waters should be identified;
    - Identification and description of hydrologic pathways (e.g., the connectivity of springs or groundwater to surface waters; the connectivity of all streams to each other and to wetlands); and
    - A detailed water balance for the proposed action and each alternative.
- Assessment of which waters may be impacted, the sources and nature of potential impacts (both quality and quantity), specific pollutants likely to impact those waters and a comparison to applicable environmental standards (e.g., surface water and drinking water quality standards);
- Consideration of downstream impacts and potential for changes in metal speciation and bioavailability (in particular, the impacts of copper, which can have adverse effects on salmon at very low concentrations);
- Evaluation of surface water and groundwater use, including maps and source identification of agricultural, domestic, and public water supply wells or intakes; and
- Consideration of effects of seasonality on water quantity and quality impact assessment, including predictions for all phases of the project (construction, operations, and closure).

Anti-degradation

The anti-degradation provisions of the CWA apply to those waterbodies where water quality standards are currently being met. In certain high-quality waters, the anti-degradation provisions prohibit

AMERICAN OVERSIGHT

degrading water quality unless it is determined that allowing lower water quality is necessary to accommodate important economic or social development in the area in which the waters are located.[33] We recommend that the EIS discuss whether and how the CWA anti-degradation requirements could be met.

Water Management and Treatment

We recommend that the EIS describe the plans for water management, treatment, and discharge during all phases of the project (construction, operations, and closure), including plans for long-term water treatment. The EIS should evaluate and disclose the adequacy, reliability, effectiveness, and operational uncertainty associated with proposed operation and closure (long-term) water management and treatment techniques, taking into account seasonality and potential changes associated with future climate scenarios. We also recommend that the analysis characterize chemical compositions and quantities of process waters, mine drainage, storm water, and treated and untreated effluent. This information should be supported by the results of treatability testing. Assumptions used in the analysis should be disclosed and be reasonably conservative. If long-term water treatment is needed, we recommend that the EIS include modeling of predicted stream concentrations of contaminants of concern, both with and without treatment, to evaluate the potential impacts to water quality if the treatment system is not working properly.

The EIS should also identify the Alaska Pollutant Discharge Elimination System (APDES) discharge locations, identify applicable water quality standards, and analyze the likelihood and ability of all discharges to meet applicable standards and the direct, indirect, and cumulative impacts of such discharges to the receiving waters. We recommend that any applicable water quality variance requests, site-specific criteria proposals, and/or any other planned or potential requests for water quality standard revisions also be disclosed in the EIS.

Sediment Management and Stormwater Runoff

Since the project has the potential to cause or contribute to erosion of soils and subsequent sediment loading to nearby surface waters, we recommend that the EIS evaluate construction design and operation practices that will be used to minimize erosion and control stormwater runoff from the mine site, port sites, transportation corridor, and pipeline route. We recommend that the EIS discuss specific mitigation measures that may be necessary or beneficial in preventing and minimizing adverse impacts to water quality and disclose the effectiveness of such measures. We suggest that the Corps consider the Best Management Practices identified by the EPA for mining facilities[34] and specify those that would be suitable and likely implemented at the Pebble Project. We also recommend that the EIS document the project's consistency with applicable APDES stormwater permitting requirements.

Hydrostatic Test Water

Hydrostatic testing will likely be utilized to verify pipeline integrity. We recommend that the EIS identify and describe the location of the water sources required for hydrostatic testing, in terms of surface area, depth, volume, withdrawal rate, and project requirements. For each water source, we recommend that the EIS discuss the presence of any anadromous and/or resident fish species, including discussion of any direct and cumulative impacts to fisheries resources. In addition, we recommend that locations and methods of discharges to land and/or surface waters be specified in the EIS. Emphasis should be placed on minimizing inter-basin transfers of water to the maximum extent practicable, to

[33] 40 C.F.R. § 131.12.

[34] https://www3.epa.gov/npdes/pubs/sector_g_metalmining.pdf.

AMERICAN OVERSIGHT

minimize the risk of mobilizing invasive species. We recommend that the EIS describe the mitigation measures and control devices that would be implemented to minimize environmental impacts.

Marine Environment and Freshwater Lakes

Port Construction and Dredging Impacts

According to the Permit Application Appendix D – Project Description, the Amakdedori Port will require dredging of a channel and turning basin for shipping access to berths. According to the application, annual maintenance dredging will be necessary throughout the life of the port facility. Dredging activities potentially affect habitats and key ecological functions that support recruitment and sustainability of estuarine and marine organisms. We recommend that the EIS:

- Characterize the marine benthic environment and organisms, sediment composition and grain size, etc.;
- Identify any biologically important areas, such as migratory routes, benthic communities, and subsistence areas;
- Evaluate marine dredging, dewatering, transloading (from water to land), placement methods and options (summer and winter), and disposal sites (offshore, nearshore, upland, and open-water), as well as beneficial uses of the dredged material;
- Include and evaluate a sampling and analysis plan, as well as a marine dredging and disposal plan;
- Evaluate the following potential impacts of dredging activities on species and their habitats:
  - Substrate removal and any resulting habitat and species removal (entrainment);
  - Potential changes to estuarine bathymetry, fluvial and tidal energy, and substrate roughness, and any attendant impacts to salinity structure and estuarine circulation;
  - Potential changes to sediment transport processes, including effects on adjacent shorelines;
  - Alteration of sediment composition in and around the dredging site (including changes to the nature and diversity of benthic communities);
  - Local resuspension of sediments and any turbidity increases;
  - Spread of sediments (and any associated contaminants) into the area surrounding the dredging site;
  - Release of sediment-associated nutrients, potential increases in eutrophication and resulting decreases in dissolved oxygen concentrations;
  - Decreased primary production due to reduced transparency of the water column and/or smothering, particularly at in-water disposal sites; and
  - Enhanced bioavailability and ecotoxicological risk of background contaminants and/or chemical or biochemical changes of contaminants;
- Consider implementation of effective mitigation measures to ensure that marine resources and habitats are adequately protected; and
- Incorporate a monitoring plan for marine protected resources and associated habitats to ensure effectiveness of mitigation measures.

Because of the magnitude of the proposal, dredging and disposal operations will need to be carefully planned and scheduled to avoid and minimize impacts to sensitive marine mammals, fish, shellfish, and their habitat at critical spawning and migration periods.

Dredged Material Disposal

According to the Permit Application Appendix D, dredged material will be used to construct the jetty, causeway, and/or the main terminal patio area, if suitable. Excess dredged material will be stockpiled in

AMERICAN OVERSIGHT

an upland location adjacent to the port facilities. The EPA recommends an on-the-ground wetland delineation at the proposed dredged material disposal site to verify whether there are any jurisdictional waters of the United States at this location.

The proposed discharge of dredged material effluent from the confined disposal facility into Kamishak Bay is subject to regulation under Section 404 of the CWA. Thus, the EIS should include sufficient information to support making the required determinations and findings under the Guidelines. For example, Subpart G of the Guidelines includes general evaluation procedures and specific testing procedures to reach the determinations required by 40 C.F.R. § 230.11. The Inland Testing Manual[35] also provides detailed technical guidance on how to evaluate and test dredged material consistent with the Guidelines. In particular, the EPA recommends using the ITM Appendix B, "Guidance for Evaluation of Effluent Discharges from Confined Disposal Facilities."

To support disposal decisions, we recommend that the EIS provide an inventory of the physical and chemical characteristics of the dredged material and an assessment of disposal alternatives. We recommend that the range of dredged material management alternatives include: no action; the proposed action; beneficial uses such as beach nourishment or construction material; a disposal site in internal waters, landward of the Kamishak Bay closing line (regulated under the CWA); and an ocean disposal site seaward of the Kamishak Bay closing line (regulated under the Marine Protection, Research and Sanctuaries Act).

Potential for Ocean Disposal of Dredged Material

Under Section 102 of the MPRSA, the EPA is responsible for designating and managing ocean dumping sites for all materials, including dredged material. The EPA designates ocean disposal sites through rulemaking and sites are published at 40 C.F.R. § 228.15. The EPA bases the designation of an ocean disposal site on environmental studies of a proposed site, studies of regions adjacent to the site, and historical knowledge of the impact of disposal on areas similar to the site in physical, chemical, and biological characteristics. All studies for the evaluation and potential selection of dredged material disposal sites should be conducted in accordance with the criteria for the selection of disposal sites for ocean dumping published in 40 C.F.R. §§ 228.5 and 228.6. The minimum requirements for baseline assessment surveys are found in 40 C.F.R. § 228.13.

The evaluation process includes conducting oceanographic studies to establish the environmental conditions at all alternative locations being considered as potential sites, as well as the area or region encompassing the alternative sites. Results from oceanographic studies and other sources are used to model likely dispersion and deposition of material disposed at the alternative sites and evaluate potential impacts. If there are no practicable alternatives to ocean dumping that will have a less adverse impact on the environment, this information is used to select the best ocean site proposed for designation.

If ocean disposal is to be considered as an alternative, we encourage the Corps to engage early and actively with the EPA to ensure that site selection activities are consistent with the MPRSA and the ocean disposal criteria. The EIS must be adequate for the EPA to ensure that use of the site selected for designation will not likely cause unreasonable degradation to the surrounding marine environment. In addition, only dredged material that is authorized for disposal under the MPRSA and 40 C.F.R. Part 227 may be disposed in an EPA-designated ocean dredged material disposal site.

[35] See https://www.epa.gov/cwa-404/inland-testing-manual.

AMERICAN OVERSIGHT

Impacts of Vessel Traffic

Marine traffic, including barges and other vessels associated with construction and operation of the proposed project, may also result in impacts to the marine environment. For example, vessel traffic may result in potential impacts to marine mammals, including threatened and/or endangered species, and their migration patterns and routes; subsistence, commercial, and recreational fisheries; and other vessel use. We recommend the EIS describe the vessel traffic schedule in Cook Inlet; patterns and marine transportation routes; subsistence, commercial, and recreational fishery resources; and the migration period, patterns, and routes of potentially affected marine mammals, including Cook Inlet Belugas. The direct, indirect and cumulative impacts from vessel traffic on marine mammals, threatened and endangered species, critical habitats, and fishery resources should be analyzed in the EIS, and the EIS should discuss the mitigation measures that would be implemented to minimize such impacts.

Use of the proposed ice-breaking ferry on Lake Iliamna may result in similar impacts to the freshwater lake environment, including the potential for wake impacts to the shoreline. We recommend the EIS analyze the direct, indirect, and cumulative impacts of the year-round use of the lake proposed by the applicant on threatened and/or endangered species, fishery resources, and other lake user groups, and discuss mitigation measures to minimize impacts.

Air Quality

The EPA recommends that the EIS evaluate how the construction and operation of the proposed project and alternatives could affect air quality and what measures may be needed to mitigate potentially significant impacts. Such an evaluation is necessary to ensure compliance with state and federal air quality regulations, and to disclose the potential impacts from temporary or cumulative degradation of air quality. To address potential air quality impacts, the EIS should consider whether the direct, indirect, or cumulative impacts of project-related air emissions would result in any adverse impact on air quality or air quality-related values.

Potential air pollutant concerns for the proposed project include:

- Operation of heavy machinery and equipment, including marine vessels, during construction and operations that result in the emission of fossil fuel combustion exhausts. Such exhausts will include oxides of nitrogen, oxides of sulfur, carbon monoxide, and particulates. The significance of the contribution of project emissions to the formation of secondary particulate matter ($PM_{2.5}$) and ozone should also be evaluated;
- Fugitive dust emissions may be generated from construction and operation of the mine, ancillary facilities, and supporting infrastructure. In addition to human health effects, dust blown from the roadway can settle onto wetlands, vegetation, or waterbodies, impairing their health as well; and
- Hazardous air pollutants may result from fuel combustion and ore processing. The *National Air Toxics Assessment* asserts that numerous human epidemiology studies show increased lung cancer rates associated with diesel exhaust and significant potential for non-cancer health effects (see http://www.epa.gov/ttn/atw/nata). Also, the Control of Emissions of Hazardous Air Pollutants from Mobile Sources Final Rule (66 Fed. Reg. 17,230, March 29, 2001) lists 21 compounds emitted from motor vehicles that are known or suspected to cause cancer or other serious health effects. The EPA recommends the EIS disclose whether hazardous air pollutant emissions would result from project construction and operations, discuss the cancer and non-cancer health effects associated with air toxics and diesel particulate matter, and identify sensitive receptor populations and individuals likely to be exposed to these emissions.

AMERICAN OVERSIGHT

We recommend the following steps for the EIS air quality analysis:

- Characterize the existing conditions to set the context for evaluating project impacts, including:
  - Regional climate and meteorology,
  - Air quality and air quality related values (e.g., visibility),
  - Identification of sensitive receptors in the vicinity;
- Review air quality regulations and any air permitting requirements that apply to the air pollutant sources associated with the project;
- Provide a comprehensive emissions inventory of criteria pollutants (in tons per year), greenhouse gas emissions (in metric tons CO_2 equivalents per year), and significant HAP emissions for all project components (mine site, transportation corridor, port, and pipeline) and project phases; and
- If projected emissions are significant, conduct near-field and far-field air quality modeling to assess project-related air quality and visibility impacts. Also, see our recommendations related to Predictive Modeling, later in this document.

We recommend that the Corps evaluate and incorporate best management practices and mitigation measures into the EIS to reduce emissions of criteria pollutants and HAPs, which also have co-benefits of reducing GHGs. We recommend that the EIS include a comprehensive fugitive dust control plan as well as a construction air pollutant emissions control plan to address reduction of engine emissions.

These recommendations are separate and distinct from, and are not intended as a substitute for compliance with, any additional obligations of the Corps and the project proponent to comply with the federal Clean Air Act and any applicable state or tribal air pollution laws, which may require, among other things, obtaining pre-construction permits and operating permits, compliance with new source performance standards and/or national emission standards for hazardous air pollutants, as well as any applicable state implementation plan (SIP) requirements, including, as applicable to the Corps, the requirements under Section 176 of the Clean Air Act regarding conformity of federal activities to implementation plans approved or promulgated under section 110 of the Clean Air Act.

Climate Adaptation

The EPA recommends that the EIS include a discussion of reasonably foreseeable effects that changes in the climate may have on the proposed project and the project area, including its long term infrastructure. This could help inform the development of measures to improve the resilience of the proposed project. If projected changes could notably exacerbate the environmental impacts of the project, the EPA recommends these impacts also be considered as part of the NEPA analysis.

Fish and Wildlife, including Endangered Species and Essential Fish Habitat

The EPA recommends that the EIS evaluate impacts to fish and wildlife from the proposed project and alternatives. The aquatic resources section above also provides recommendations related to fisheries.

Special consideration should be given to listed and proposed species under the Endangered Species Act and Essential Fish Habitat under the Magnuson Stevens Fishery Conservation and Management Act. NEPA regulations require that, to the fullest extent possible, the EIS be prepared concurrently with

AMERICAN OVERSIGHT

environmental analyses required by the ESA and other environmental laws.[36] Magnuson Stevens Act and ESA implementing regulations also encourage coordination with other environmental reviews.[37, 38]

We recommend that the EIS discuss the species listed and proposed as threatened or endangered under the ESA and the essential fish habitat within the project area (including the pipeline, roads, and port site) and the potentially impacted area surrounding the project. The EIS should describe impacts to ESA species and EFH and discuss the activities proposed to avoid, minimize, mitigate, and monitor listed and proposed species and EFH. We understand that the Corps will develop a biological assessment to evaluate impacts to listed and proposed endangered species and EFH, and recommend that it be included with the draft EIS. We also recommend that the federal action agencies work together to ensure that a single biological assessment is developed that meets all agencies' needs.

National Historic Preservation Act

Section 106 of the National Historic Preservation Act of 1966 requires federal agencies to consider the effects of their actions on historic properties, including those of traditional religious and cultural importance, following regulations in 36 C.F.R. Part 800. The NHPA requires a federal agency, upon determining that activities under its control could affect historic properties, to consult with the appropriate State Historic Preservation Officer /Tribal Historic Preservation Officer. We support the Corps' early engagement with the Advisory Council on Historic Preservation, and we recommend that the EIS discuss any potential impacts to historic properties, including any tribal, cultural, or other treaty resources that are historic properties or traditional cultural properties. In addition, the EIS should identify alternatives and mitigation to avoid significant impacts. Recommendations related to traditional uses and resources that are not historic properties are discussed further below.

Invasive Species

We know that ballast water from barges or vessels can be a major source of non-native species into marine ecosystems. Non-native species can adversely impact the economy and the environment and cause harm to human health. Impacts may include reduction of biodiversity of species inhabiting coastal waters due to competition between non-native and native species for food and resources. We recommend that the EIS discuss potential impacts from non-native invasive species associated with ballast water in vessels that will be utilizing the Amakdedori Port associated with this project and identify mitigation measures to minimize adverse impacts to the marine environment and human health.

SAFETY, RISK ANALYSIS, AND HAZARDOUS MATERIALS MANAGEMENT

Accidents and Failures

An array of spills, accidents, and failures can occur at mining sites. We recommend that the EIS describe the control measures that will be in place to prevent these events from occurring during construction, operations, and closure. To identify these events, we recommend that the Corps evaluate the proposed design and management of the tailings facility, dams, and other structures and evaluate PLP's waste and water management and reclamation plans to determine the project-specific likelihood of different types of accidents and failures. Designs and management plans for the pipeline and transportation components

[36] 40 C.F.R. § 1502.25.
[37] 50 C.F.R. § 600.92 (c), (f).
[38] 50 C.F.R. § 402.06.

AMERICAN OVERSIGHT

(road, ports, shipping) should also be evaluated to determine the probability of accidents and failures. We recommend that the results of these evaluations be documented in the EIS. For those events that are determined to be of low probability but high consequence, we recommend that the EIS evaluate the potential effects of such events on aquatic ecosystems, particularly fishery resources, and other resources. The EIS should also discuss mitigation measures that could minimize the risk or damages of such events.

Physical Stability of Structures

The EIS should assess the likelihood of earthquakes in the region and describe the geotechnical stability of the tailings and waste storage facilities and open pit walls during operations and closure. We recommend including a description of how these facilities are designed and how they would be operated, closed, and monitored to ensure stability. In addition, we recommend that a risk assessment, such as a Failure Modes Effects Analysis, (FMEA) be conducted on each of the tailings dams with the results summarized in the EIS. An FMEA considers potential failure modes and identifies the relative likelihood and consequences of the failure modes, which are key considerations for impact assessment. We recommend that the EIS incorporate mitigation or alternatives to improve stability should the FMEA identify failure modes that are anything other than a tolerable risk.

For the tailings impoundment in particular, we recommend that the Corps require a demonstration that the structure complies with state dam safety criteria and has been designed by qualified persons. In addition, we recommend that the Corps require that the dam be independently reviewed (and modified if indicated by the review)[39]. Given the proposed size of the dams associated with the Pebble project and value of the downstream resources, we believe that an independent review of the dam structure is appropriate. We recommend that the results of the independent review be documented in the EIS in order to support the assessment of geotechnical stability.

As mentioned above in the Range of Alternatives section, we recommend that the Corps consider alternatives to improve physical stability of the tailings, including consideration of filtered tailings (dry stack). We note that consideration of a filtered tailings alternative and assessment of safety and stability via a FMEA and independent review panel are consistent with recommendations of *The Independent Expert Engineering Investigation and Review Panel Report on Mount Polley Tailings Storage Facility Breach* (January 30, 2015). In addition to investigating the cause of the Mount Polley tailings storage facility failure, the Review Panel made recommendations on actions that could be taken to ensure that similar failure does not occur at other mines. We recommend that the Corps consider the Review Panel Report and, in particular, the recommendations related to best available technology for new impoundments, design commitments to support permit applications, and actions to validate the safety of tailings storage facilities.

Hazardous Materials

We recommend that the EIS address the potential direct, indirect, and cumulative impacts of hazardous materials/wastes management and storage from the construction and operation of the proposed project and alternatives. Mining activities may involve the transport of hazardous materials, and we recommend that the EIS disclose the types and amounts of materials that will be used at each step of mining operations. In addition, we recommend that the EIS describe measures that will be taken to minimize the

[39] 33 C.F.R. § 325.1.

AMERICAN OVERSIGHT

chances of an accidental release, emergency measures that will be implemented should such an event occur, and how potential adverse impacts from spills may be mitigated by effective containment and cleanup operations.

We also recommend that potential health impacts to local communities or other project area users be identified, as well as any strategies employed to communicate risks or actual emergencies. As part of this analysis, we recommend that the EIS use scientific and traditional ecological knowledge to describe potential health effects from exposure to hazardous materials and the effects on the palatability of eating potentially contaminated foods.

HUMAN HEALTH AND IMPACTS TO COMMUNITIES

Sociocultural Impacts

It is anticipated that the proposed project will result in employment opportunities for Alaska Native residents, as well as generate local and corporate revenues in the region. While employment opportunities and local revenues generally increase a community's standard of living, there can also be impacts to families, communities, and cultures, especially in areas where residents are participating in traditional cultural practices. Noise and physical structures may disturb and/or displace subsistence wildlife from the project area. Other project impacts may affect a community's ability to access traditional and accustomed subsistence use areas. We recommend that the EIS identify the specific communities, federally recognized tribes, and corporations that could be impacted, both positively and negatively, which will help agency decision makers and the public understand the scope of the potential sociocultural impacts.

We recommend that the sociocultural impacts associated with this project and alternatives be fully evaluated and disclosed in the EIS and include, but not be limited to, the following:

- Socioeconomic Impacts
    - Evaluate potential changes to the region's economy as a result of the mine construction and operation (e.g., changes to commercial fishery, recreational fishery, and tourism sectors).
    - Evaluate impacts associated with economic changes to families, communities, and cultures, including potential changes to those aspects of the area's economy that are currently subsistence-based;
    - Evaluate the potential decline in the region's economy following mine closure; and
    - Evaluate replacement costs of traditional foods if access or availability are impacted by the proposed project.
- Accessibility of Traditional Use Areas
    - Identify community traditional use areas for subsistence, harvesting, hunting and trapping, fishing, travelling, camping, berry picking, and other uses;
    - Describe the potential access limitations to these traditional use areas and their impacts to local communities; and
    - Coordinate with the tribes and communities on options for mitigating impacts associated with accessibility to traditional and accustomed use areas.
- Compatibility of Traditional Use Areas
    - Identify project activities that may conflict with traditional and accustomed uses; and

AMERICAN OVERSIGHT

- Coordinate with the affected tribes and communities to identify mitigation options for avoiding and minimizing conflicts between traditional and accustomed subsistence uses and the construction and operation of this project.

Environmental Justice and Impacted Communities

In compliance with NEPA and Executive Order 12898 on Environmental Justice, actions should be taken to conduct adequate public outreach and participation that ensures that the public and Native American tribes understand possible impacts to their communities and trust resources.

Executive Order 12898 requires each federal agency to identify and address disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations, low-income populations, and Native American tribes.[40] The EPA also considers children, the disabled, the elderly, and those of limited English proficiency to be uniquely vulnerable populations that may be impacted.

The CEQ has developed guidance concerning how to address Environmental Justice in the environmental review process.[41] In accordance with this guidance, the EPA recommends that the EIS address the following points:

- Identify low income, minority, and Alaska Native communities that may be impacted by the project;
- Describe the efforts that have been or will be taken to meaningfully involve and inform affected communities about project decisions and impacts;
- Disclose the results of meaningful involvement efforts, such as community identified impacts;
- Evaluate identified project impacts for their potential to disproportionately impact low income, minority, or Alaska Native communities, relative to a reference community;
- Disclose how potential disproportionate impacts and environmental justice issues have been or will be addressed by the Corps' decision making process;
- Propose mitigation for unavoidable impacts that will or are likely to occur; and
- Include a summary conclusion, sometimes referred to as an "environmental justice determination" that concisely expresses how environmental justice impacts have been appropriately avoided, minimized, or mitigated.

We also recommend that particular attention be given to consideration of the dependence of local communities on local and regional subsistence resources, access to those resources, and perception of the quality of those resources. Additional information and tools for environmental justice analysis can be found on the EPA's website at: https://www.epa.gov/environmentaljustice.

Health Risk or Impact Analysis

The EPA recommends that the Corps undertake a screening process to determine which aspects of health (including but not limited to public, environmental, mental, social, and cultural) could be impacted by the proposed project. Depending on the screening results, an analysis of health effects, such

---

[40] EO 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-income Populations. February 11, 1994.

[41] http://ceq.hss.doe.gov/nepa/regs/ej/justice.pdf.

AMERICAN OVERSIGHT

as a health risk assessment or Health Impact Assessment, may be needed to determine the direct, indirect, and cumulative impacts to health. This analysis may need as much time to complete as the Draft EIS, therefore we recommend that early screening is essential to ensuring a timely analysis. We further recommend that the Corps partner directly with local, state, tribal, and federal health officials to determine the type of analysis needed to assess health impacts and conduct the analysis, and to determine appropriate and effective mitigation of potential health impacts.

Scope of Health Assessment in EIS

In terms of the scope of the health assessment, we recommend that the potential for contaminant exposure and resulting risks be evaluated. In addition, we recommend that the EIS consider how income from new jobs can result in positive or negative health impacts, for example by increasing socioeconomic status or by generating rapid social and community change. We also recommend considering the health impacts of potential changes to traditional way of life from the project, including reduced reliance on a traditional diet due to lack of access and corresponding increased reliance on substitutes.

Data Collection

To appropriately evaluate health impacts, we recommend that specific health data that may not be routinely collected as part of the scoping process may be required. To ensure that the necessary data are available for this evaluation, the Corps may want to involve public health professionals early in the NEPA process. Public health data and expertise for prospective health impact analysis, or for providing input on health issues, may be available from local health departments, tribal health agencies, the Alaska Department of Health and Social Services, or federal public health agencies such as the U.S. Centers for Substances and Disease Registry, or the Indian Health Service.

Methods and Tools

The Health Impact Assessment methodology is a common tool that can be used to assess potential health impacts. HIA is a combination of procedures, methods, and tools that enables systematic analysis of potential positive or negative effects of a policy, plan, program, or project on the health of a population, as well as the distribution of those effects within the population.[42] Depending on available data and potential effects, there are different levels of HIA analysis, and we recommend that the Corps' involve public health professionals in determining the appropriate level of analysis. In addition to evaluating impacts, we recommend that the HIA identify the appropriate actions to manage or mitigate health effects from the proposed project.

Guidelines for conducting an HIA are available from various sources.[43] The World Health Organization has links to many guides.[44] The International Finance Corporation has also developed detailed guidelines for conducting an HIA.[45] In addition, the State of Alaska has developed *Technical Guidance for Health Impact Assessment*, also known as the "Alaska HIA Toolkit".[46]

---

[42] This definition is from the International Association for Impact Assessment (IAIA), which is modified from the World Health Organization's Gothenberg consensus statement (1999).

[43] The EPA does not endorse or recommend use of any single or particular guidance on HIA. These references are provided as general information and to assist permitting agencies with identifying additional resources on HIA.

AMERICAN OVERSIGHT

CONSULTATION AND COORDINATION WITH TRIBAL GOVERNMENTS

Executive Order 13175, Consultation and Coordination with Indian Tribal Governments (November 6, 2000), was issued to establish regular and meaningful consultation and collaboration with tribal officials in the development of federal policies that have tribal implications, and to strengthen the United States' government-to-government relationships with Indian tribes. In addition, pursuant to Public Law 108-119, 118 Stat. 452, as amended by Public Law 108-4217, 188 Stat. 3267, federal agencies are required to consult with Alaska Native Claims Settlement Act corporations on the same basis as Indian tribes under Executive Order 13175. We recommend that the EIS describe the process and outcome of any government-to-government and/or government-to-corporation consultations regarding the Pebble Project, issues that were raised during the tribal consultations and how those issues were addressed.

Cooperating agency involvement establishes a mechanism for addressing intergovernmental issues throughout the EIS development process, and we support the Corps' inclusion of two tribal governments as cooperating agencies. We recommend that the Corps remain open to including other potentially affected tribal governments that have the resources and interest in serving as cooperating agencies for EIS development, consistent with the July 28, 1999, memorandum from CEQ to the heads of federal agencies.

ANALYSIS TOOLS AND METHODOLOGIES

Baseline Data Adequacy

We suggest categorizing and synthesizing existing data to ensure pertinent information is available for review and use in the EIS analysis. We understand that the Corps intends to establish focused workgroups during development of the EIS. We support this approach and recommend that the workgroups include cooperating agency subject matter experts for key areas (air, water, wetlands, fisheries, etc.) to review baseline data for completeness, identify data gaps, and recommend approaches toward resolving those gaps in a timely manner. For example, additional analysis or collection of additional data may be required to characterize the accuracy of best available baseline estimates of resources such as fish populations, groundwater elevations, or wetland extents. Such information will be critical for designing and developing a robust monitoring framework and for assessing impacts during and after project development and comparing those to the baseline.

Geochemistry/Characterization of Ore, Waste Rock, and Tailings

To provide reliable predictions of water quality and impacts to surface water and groundwater due to wastewater and mine waste management, we recommend that the physical and chemical characteristics of the ore, pit walls, waste rock, and tailings should be determined and disclosed in the EIS. Environmental samples used to support projections should represent a range of conditions that currently occur and that could occur in the future as a result of the project, including under potentially altered future climate conditions. Waste materials (ore, waste rock, tailings) used for environmental projections should be representative of the material to be mined and related to the mine plan and proposed processing methods. Physical and chemical characterization should be conducted in a manner that provides environmentally conservative estimates of impacts.

AMERICAN OVERSIGHT

It may be helpful to consider EPA Region 10's Sourcebook for Hardrock Mining for recommendations related to the NEPA analyses of mining projects.[47] We recommend that the following information be utilized to characterize geologic and mineralogy setting/aqueous geochemistry in the baseline environment and impact prediction sections of the EIS:

- Whole rock analysis;
- Mineralogy;
- Drill core descriptions;
- Block model or similar model (a computerized estimate of the quantity and characteristics of ore and waste);
- Available literature on the ore deposit;
- Mineral occurrences (e.g., on fracture surfaces, in groundmass, using hand specimens and thin section) with an emphasis on sulfides and carbonates;
- Acid-base accounting;
- Long-term kinetic testing (including possible startup of test pads if sufficient material and access to site are available);
- Baseline surface and ground water quality and flows (including springs);
- Potentiometric surface for groundwater;
- Hydraulic properties (e.g., hydraulic conductivity, porosity, permeability) of soil, vadose zone, and groundwater aquifers, especially under proposed locations of mine facilities; and
- Hydrogeochemical models for prediction of water quality.

Predictive Modeling

We recommend that predictive modeling be based on a site-specific conceptual model that describes the system boundaries, spatial and temporal scales, hydraulic (for water modeling) and chemical characteristics, sources of data and data gaps, and the mathematical relationships used to describe processes. We also recommend that our suggestions be applied to any environmental and predictive modeling used for assessing impacts in the EIS. The water quality model, in particular, should be capable of predicting both whole water and dissolved fractions of metals/metalloids and should provide temporal predictions that are consistent with the time-steps in applicable water quality criteria.

Any modeling documentation should include:

- Tables of parameter values used in the model;
- Tables and graphs of results;
- Uncertainty and sensitivity analyses;
- Errors associated with both measured and assumed data; and
- Recommendations for further analysis, if applicable.

We recommend that discussions on modeling include a clear statement of the management objectives intended to be achieved by the modeling, the level of analysis required to meet the objectives, and uncertainties associated with modeled outcomes. For your reference, please refer to EPA's guidance that provides recommendations for the effective development, evaluation, and use of models in

[47]U.S. EPA Region 10. 2003. EPA and Hardrock Mining: A Source Book for Industry in the Northwest and Alaska January 2003.

AMERICAN OVERSIGHT

environmental decision making.[48]

We recommend that the EIS use caution in describing absolute outcomes based on modeling. Mathematical modeling used for describing the physical and chemical characteristics of the project site and potential impacts includes a level of uncertainty; understanding these uncertainties and associated risks is necessary for informed decision making. We recommend that the study plan for modeling analysis clearly state the purpose, questions of concern, method, data, and limitations of the model to generate valuable interpretations. We also strongly recommend an appropriately conservative approach be taken with modeling and a range of predictive outcomes be discussed (e.g., most likely case, reasonable worst-case, and reasonable best-case scenarios) that reflect a range of climatic settings and critical input values. Inclusion of a reasonable range of outcomes allows the agencies to make better informed plans for mitigation, adaptive management, and contingencies to respond to reasonably foreseeable adverse impacts.

Traditional Ecological Knowledge

Due to the location of the proposed project and traditional uses of the area, we recommend the identification, inclusion, and integration of traditional ecological knowledge into the EIS analysis, as appropriate. Such anthropological work can include the collection of local and traditional knowledge concerning the affected environment, anticipated impacts from the project, and traditional hunting and land use patterns in the area. We recommend that, in addition to reviewing any pertinent traditional ecological knowledge currently available, additional studies be conducted as necessary to clearly identify concerns and potential impacts, including cumulative impacts, from the proposed project and project alternatives. This information should be reviewed and included in the EIS to the extent possible and utilized in the analysis of potential impacts.

MITIGATION, MONITORING, AND ADAPTIVE MANAGEMENT

Mitigation

CEQ regulations at 40 C.F.R. § 1508.20 define mitigation to include five categories of actions to address impacts. Briefly stated, these are: avoiding, minimizing, rectifying, reducing, and compensating. The regulations at 40 C.F.R. § 1502.14(f), 1502.16(h), and 1508.25 indicate that appropriate mitigation measures should be addressed in an EIS both as part of the analysis of alternatives and in discussions of environmental consequences.

Mitigation is also relevant to evaluating compliance with the Guidelines, which prohibit discharges of dredged or fill material that will cause or contribute to significant degradation of the waters of the United States, and prohibit all discharges *"unless appropriate and practicable steps have been taken which will minimize potential adverse impacts of the discharge on the aquatic ecosystem."*[49] The Guidelines identify numerous types of actions to mitigate potential adverse impacts, which include

---

[48] Guidance Document on the Development, Evaluation and Application of Environmental Models (PDF). EPA/100/K-09/003. March 2009. http://www.epa.gov/crem/cremlib.html.

[49] 40 C.F.R. § 230.10(d).

AMERICAN OVERSIGHT

measures to avoid, minimize, and compensate for impacts. Avoidance, minimization, and compensation form a "mitigation sequence" that must be followed in order to comply with the Guidelines' requirement that all appropriate and practicable steps be taken to mitigate impacts to aquatic resources.[50] Compensatory mitigation considerations under the Guidelines are discussed further in the section on aquatic resources above.

The EPA recommends that the EIS identify the type of activities that would require mitigation measures during the construction, operation, and closure phases of this project. In addition, we recommend identifying whether implementation of each measure is required by the Corps or any other governmental entity and which entity will be responsible for implementing the measure. To the extent possible, mitigation goals and measurable performance standards should be identified in the EIS to reduce impacts to a particular level or adopted to achieve an environmentally preferable outcome. CEQ guidance on the Appropriate Use of Mitigation and Monitoring seeks to enable agencies to create successful mitigation planning and implementation procedures with robust public involvement and monitoring programs.[51]

Monitoring

Environmental monitoring programs should be designed to assess both impacts from the project and whether implemented mitigation measures are effective. We recommend that the monitoring programs:

- Define the monitoring goals and objectives;
- Provide details to demonstrate that goals and objectives will be achieved such as the parameters to be monitored, monitoring locations and frequency, data analysis, and reporting;
- Discuss actions (contingencies, triggers, adaptive management, corrective actions, etc.) that will be taken based on monitoring results;
- Identify and incorporate controls and pre-project data with quantified bias and precision to enable detection of impacts, success of BMPs, and ability to distinguish these from natural variation; and
- Require regular analysis and reporting of data to oversight agencies, including submittal of a sampling and quality assurance plan for agency approval.

We recommend that the monitoring programs be described in the EIS and that the EIS also discuss public participation, and how the public can get information on mitigation effectiveness and monitoring results.

Adaptive Management Planning

We recommend that the EIS utilize adaptive management and contingency planning to describe the strategy for responding to unforeseen circumstances at the site. The strategy should include "trigger levels" (e.g., exceedance of ecological benchmarks) or observations (e.g., statistically significant trends in indicators, permit violations, water balance problems, changes in discharge or chemistry of springs/seeps) that would set follow-up actions into motion. This strategy or plan should be described so that reviewers may comment on its adequacy. This type of plan, when coupled with the monitoring program, is necessary to mitigate for uncertainties and risks associated with predictions of

[50] 40 C.F.R. § 230.10(a), (d); *See* Memorandum of Agreement between U.S. Department of Army and the Environmental Protection Agency on the Determination of Mitigation Under the Clean Water Act Section 404(b)(1) Guidelines.
[51] https://ceq.doe.gov/docs/ceq-regulations-and-guidance/Mitigation_and_Monitoring_Guidance_14Jan2011.pdf.

AMERICAN OVERSIGHT

environmental outcomes, and will provide an early warning system of unexpected outcomes.

FINANCIAL ASSURANCE

NEPA provides for the disclosure of all information concerning the environmental consequences of a proposed action to agency decision makers and the public before decisions are made and actions are taken. A key component in determining the environmental impacts of a mining project is the effectiveness of the closure and reclamation activities, including long-term water management. In turn, whether any closure and reclamation activities that may be necessary will be adequately funded is key to determining whether those activities will be effective. We therefore recommend that the project's ability to self-fund, and/or any third-party financial assurance mechanisms, be disclosed. Disclosure of the financial assurance amount and mechanism is particularly important for this project given that PLP's proposal includes long term water management and treatment.

We recommend that the draft EIS disclose the estimated costs to reclaim and close the site in a manner that achieves reclamation goals and post-mining land use objectives. The EPA recommends that the final EIS identify proposed financial assurance mechanisms and demonstrate that these mechanisms would ensure that necessary reclamation work is completed.

The EPA is available for further conversations about the level of detail to include in the document. Below are the main elements that we believe should be disclosed in the EIS:

1. Site Reclamation (facility closure, earth moving/stabilization, revegetation, etc.):

- Phases of reclamation;
- Estimated cost (+/- percent) to reclaim and close the site in a manner that achieves reclamation goals and post-mining land use objectives;
- Criteria for determining success of reclamation activities for financial assurance release; and
- Costs associated with implementing contingency measures to address reasonably foreseeable but not specifically predicted outcomes.

2. Long-Term Site Management (post-closure water treatment, mitigation of impacts to aquatic resources, site maintenance, and monitoring):

- Itemized cost estimate (including reasonable contingencies) and appropriate economic variables to calculate the net present value of future expenses; and
- If a trust fund is utilized, address the "mechanics" of the fund, including:
    - Trust fund mechanism (e.g., current value trust, net present value trust, etc.);
    - Requirements for timing of payments into the trust fund;
    - How the Corps would ensure that the trust fund or other financial assurance could not be claimed by a creditor in the case of bankruptcy;
    - Acceptable financial instruments;
    - How trust management fees and taxes will be paid;
    - Identity of the trust fund beneficiaries; and
    - Identity of the operator with responsibility/liability for financial assurance.

EPA Deputy AA Meeting with PLP
Topic: Bristol Bay
Meeting Date: Nov 14, 2018
Location: EPA HQ (Washington, DC)
List of Third Party Attendees (including affiliation): • Abe Williams, The Pebble Partnership (PLP) • Chasity Anelon, PLP • Rhiannon Nanabook, PLP • Ventura Sumanigo, Kijik • Brad Angasan, ADC • Krista Williams, BBNC Shareholder • Shannon Johnson-Nanabook, Iliamna
Did EPA decide which third parties would attend?: No.
List of EPA Attendees: • Lee Forsgren • Brian Frazer • Russ Kaiser
Agenda: Status of Bristol Bay PD
Did EPA/Third Party Set the Agenda?: Third Party, Abe Williams
Did EPA/Third Party Run the Meeting: Meeting ran as a conversation
Notes from Discussion (including individual advice/feedback provided to Agency): EPA Notes (Forsegren): • We will stay on current path, noting there are no immediate actions for EPA to take with respect to the (c) action. • We will remain engaged in the NEPA process as it relates to our mission. • We will continue to be transparent and listen to views from interested parties. • We will use the NEPA document findings and latest science to inform our ultimate decision on the (c) action - we will use facts to support our decision. • We don't know what the final decision will be at this time and reminded them that there is no pre-judged outcome for the action. • Lee will be the lead for OW, and it is not clear at this time if the Acting Administrator or Henry Darwin will be the decision-maker. Third Party Summary Notes: • Requested EPA to please remove the pending (c) action as it is creating investor uncertainties, which is creating a lower growth rate in needed jobs in the area and likely eliminating future jobs as a consequence of not taking an action. Also, potentially causing other community issues. • Looming veto inhibits Corps from completing NEPA process. Lee F clarified that (c) action only prevents Corps from making final permit decision. They can complete NEPA ROD. • Salmon initiative failed … need to consider that in your findings. • BBNC doesn't represent all positions for the AK Natives.
Next Steps/Follow-up Discussed: Request for Lee to convey meeting summary highlights with decision-makers. Lee indicated he would do so when he had the opportunity to do so.

Hi Patty,
Thanks for sharing the plan to add a few sentences to the EPA BB website. I also agree with the suggestion to use the sentence Erik suggests (I've added some language to what was proposed) – "The purpose of the NEPA process is to help public officials make informed decisions that are based on an understanding of environmental consequences and take federal agency actions that protect, restore, and enhance the environment." That could come after the sentence (I have added some language) "The EIS will describe the proposed project, evaluate the potential impacts of the project on the physical, biological, and social environment, and discuss the mitigation measures necessary to reduce those impacts."

Jill

AMERICAN OVERSIGHT

Patty,

Sounds good to me to put this on EPA's BB website.

My suggestions on the language:

- Consider spelling out Environmental Impact Statement
- Edit the sentence "The EIS is to evaluate potential impacts of the project on the physical, biological, and social environment". Deliberative Process / Ex. 5

Deliberative Process / Ex. 5

- Edit "Below is link" to "Below is a link…"

Thank you Patty!

I think it is a good idea to add some helpful info on the current permit process. I also suggested this to the BB team a while ago.

Your wording looks fine to me, thanks.

Subject: BB website - EIS info

Hi Molly, Jill, Tami, and David-

Suzanne and I talked briefly about adding a few sentences to EPA's Bristol Bay website about our role in the EIS process and a link to the Corps EIS website.

I think that will help direct folks that are used to looking to EPA for information to the Corps website, particularly now that scoping has begun.

Following is some suggested language. Please let me know if you agree that we should include this on our website and if you have any recommended edits to the language. I have also attached the Corps' Newsletter #1 that was recently posted, FYI.

Environmental Impact Statement Process

The U.S. Army Corps of Engineers received a Department of Army permit application and project description from the Pebble Limited Partnership on December 22, 2017 and has determined that an EIS under the National Environmental Policy Act is needed before it makes a decision on the permit application. The Corps is the lead agency in managing the EIS process and developing the EIS. EPA is a cooperating agency in the EIS process, at the invitation of the Corps. The EIS is to evaluate potential impacts of the project on the physical, biological, and social environment.
The Corps initiated public scoping of the EIS on April 1, 2018. Below is link to the Corps EIS website for more information and documents pertaining to the Department of Army permit application and EIS process.

All,
The attached QFR(s) has been forwarded for your review, feedback and/or concurrence. Please use one of the following reply options:

1) No comments/feedback (single or multiple QFR's) – Select the **Comment icon** and simply type **concur;**
2) Comment(s) to a single question– Use **Track Changes** and/or **Comment icon** to insert all comments and feedback into the Word document.
3) Combined set of questions - Within the same document, please select the **Comment icon** to **concur**; and use **Track Changes** and/or **Comment icon** to insert all comments and feedback – see example below

Responses are due by **cob, May 22, 2018**. Please forward all Word documents to RMO's Budget team: Shanita Logan (logan.shanita@epa.gov) and Talitha Lindo (lindo.talitha@epa.gov) .
Thanks.
Shanita Logan
202-564-0227

Example

Question: Please outline in detail the costs to close these facilities and how EPA expects to absorb these costs within the proposed budget, including both the real estate costs of facility closure and the costs of personnel separations.
Answer: The FY 2018 budget request does not propose to close any EPAEnvironmental Protection Agency regional offices.

Commented [LS1]: Example Needs more work.....xxxx

Question: How would EPA manage an immediate disaster response to a natural disaster, industrial accident, or terrorist attack affecting our environment that adequately and rapidly coordinates federal, state and local first responders, environmental agencies, law enforcement and others, in the total absence of a nearby regional EPA office?
Answer: The FY 2018 budget request does not propose to close any EPA regional offices.

Commented [LS2]: Concur

Importance: High

Dear Maggie and Val,

Please find attached the Region 10 technical support request form for assistance. This is a high priority for R10 and we look forward to support starting as soon as possible. Our Regional Mining Advisor has been discussing the specifics with ORD Scientists already so this will not come as a surprise. Let me know of any next steps and how I can assist with the support request.

Bruce

Subject: ORD support for Pebble EIS

Hello Bruce-

Last week I spoke with Scot Hagerthey regarding ORD support for our cooperating agency participation in the Pebble EIS. He acknowledged that ORD folks are interested and available and requested that I send the request for ORD support through you. Can you let me know how you like to see these requests. Is an email from me sufficient? Following is the support that is needed.

Request for ORD Support for Pebble Environmental Impact Statement

The US Army Corps of Engineers is the lead agency in developing an EIS for the Pebble Mine Project in Alaska. The Corps invited EPA to be a cooperating agency to assist the Corps in developing sections of the EIS. In addition, EPA is responsible for reviewing the Draft EIS and the public notice for the CWA 404 permit application. EPA Region 10 has put together a team to accomplish these responsibilities. There are several areas where EPA is requesting support from ORD to bolster EPA's review team and also benefit from ORD's past work in the Bristol Bay watershed where the mine project is located. From 2011 to 2014, EPA Region 10 and EPA's Office of Water worked with ORD in developing the Bristol Bay Watershed Assessment. ORD's experience and understanding of the watershed and potential impacts that could occur during mining will provide needed support to EPA Region 10's NEPA/permit review team in several key areas.

The key areas where we are requesting support are identified below.

Specialty	Summary of Assistance Requested	ORD staff requested
Fisheries	Provide advice to EPA's team on fisheries issues Provide input into EIS scoping letter Review baseline data Recommend aquatic resources impact assessment methodologies Participate in fisheries technical working group Review and provide comments on fisheries sections of the EIS	Joe Ebersole
Hydrology	Provide advice to EPA's team on hydrology issues Review groundwater and surface water hydrology baseline data Recommend impact assessment methodologies and modelling approaches and review results Participate in hydrology technical working group Review and provide comments on hydrology sections of the EIS	The ORD hydrologist that assisted with the Bristol Bay watershed assessment has retired. We do need support in this area and request that ORD identify individuals that can assist.
Transportation	Provide advice to EPA's team on transportation issues Review and provide comments on transportation sections of the EIS	Michael Kravitz
Coordination	Participate in monthly Pebble NEPA/permit team to assist with coordinating ORD support Potentially review sections of the EIS	Kate Schofield

In terms of timing, we are requesting ORDs immediate assistance to help with baseline data review and development of EPA's EIS scoping letter. We expect that assistance will be needed throughout the EIS process, with times of intense activity when documents are being reviewed and times with very little activity. The EIS process will take at least two years. There may be additional areas where we need support as the EIS process moves forward.

AMERICAN OVERSIGHT

Please let me know if you need additional information.
Thanks-

Patty

Contact Information Name: Patty McGrath Phone Number: (206) 553-6113 Email: mcgrath.patricia@epa.gov	
Project Title ORD Support for Pebble Mine Project Environmental Impact Statement	
Type of Scientific Support Requested X Consultative advice X Workgroup/seminar/committee participation X Document review Other (please specify)	
Description of Science Need – One-time request Background & Problem. The US Army Corps of Engineers is the lead agency in developing an EIS for the Pebble Mine Project in Alaska. The Corps invited EPA to be a cooperating agency to assist the Corps in developing sections of the EIS. In addition, EPA is responsible for reviewing the Draft EIS and aspects of the CWA 404 permit process. EPA Region 10 has put together a team to accomplish these responsibilities. The Pebble Mine Project is located in the Bristol Bay watershed. This is a high priority project for Region 10 due to the size of the project and ecological setting and past work EPA has undertaken. From 2011 to 2014, EPA Region 10 and EPA's Office of Water worked with ORD in developing the Bristol Bay Watershed Assessment. Below is a link to EPA's Bristol Bay website. https://www.epa.gov/bristolbay Assistance Needed/Research Steps There are several areas where EPA is requesting support from ORD to bolster EPA's EIS/permitting review team and also benefit from ORD's past work in the Bristol Bay watershed. The key areas where we are requesting support include fisheries, hydrology, transportation, and coordination. See "Type of expertise needed" for more details.	
Project Milestones and Due Date EPA scoping comments – 6/29/2018 Contributions to technical working groups Draft EIS chapters – summer/fall 2018 Draft EIS comments – early 2019 Final EIS comments – end 2019/early 2020	

AMERICAN OVERSIGHT

Estimated number of hours required to complete request

☐ 1 – 4 hours ☐ 8 – 16 hours

☐ 4 – 8 hours x >16 hours

If >16, please provide an estimate of the hours needed

The number of hours is difficult to estimate due to the nature of the work. There will be times of intense activity during document review and preparation of comments and times where there will be no activity.
For the fisheries and hydrology expertise, estimate each at 100 to 180 hours per year for 2 years.
For transportation expertise, estimate at 50 to 80 hours per year for next 2 years.

Type of expertise needed (e.g., human health risk assessment, aquatic toxicology)

Fisheries - provide advice to EPA's team on fisheries issues, provide input into EPA's EIS scoping letter, review fisheries baseline data, recommend aquatic resources impact assessment methodologies, participate in fisheries technical working group, review and provide comments on fisheries sections of the EIS. Requesting Joe Ebersole due to his work on the Bristol Bay Assessment.

Hydrology - provide advice to EPA's team on hydrology issues, provide input into EPA's EIS scoping letter, review groundwater and surface water hydrology baseline data, recommend impact assessment and hydrologic modeling methodologies and review results, participate in hydrology technical working group, review and provide comments on hydrology sections of the EIS

Transportation – provide advice to EPA's team on transportation issues, review and provide comments on transportation sections of the EIS. Requesting Michael Kravitz due to his work on the Bristol Bay Watershed Assessment.

Coordination - participate in monthly Pebble EIS/permit team meetings to assist with coordinating ORD support and potentially review sections of the EIS. Requesting Kate Schofield due to her work on the Bristol Bay Watershed Assessment.

Have you worked with ORD scientists on this project previously?

x Yes ☐ No

If yes, please list the names of the scientists.

Barbara Butler, Joe Ebersole, Jeff Frithsen, Michael Kravitz, Kate Schofield, Glenn Sutter, Jason Todd, Michael Griffith, Michael McManus, Caroline Ridley

Regional Priority (To be completed by Regional Science Liaison – Bruce Duncan)

x High ☐ Medium ☐ Low

Attachments: Pebble EIS Newsletter No. 1.pdf

Hi Molly, Jill, Tami, and David-

Suzanne and I talked briefly about adding a few sentences to EPA's Bristol Bay website about our role in the EIS process and a link to the Corps EIS website.

I think that will help direct folks that are used to looking to EPA for information to the Corps website, particularly now that scoping has begun.

Following is some suggested language. Please let me know if you agree that we should include this on our website and if you have any recommended edits to the language. I have also attached the Corps' Newsletter #1 that was recently posted, FYI.

Environmental Impact Statement Process

The U.S. Army Corps of Engineers received a Department of Army permit application and project description from the Pebble Limited Partnership on December 22, 2017 and has determined that an EIS under the National Environmental Policy Act is needed before it makes a decision on the permit application. The Corps is the lead agency in managing the EIS process and developing the EIS. EPA is a cooperating agency in the EIS process, at the invitation of the Corps. The EIS is to evaluate potential impacts of the project on the physical, biological, and social environment.
The Corps initiated public scoping of the EIS on April 1, 2018. Below is link to the Corps EIS website for more information and documents pertaining to the Department of Army permit application and EIS process.

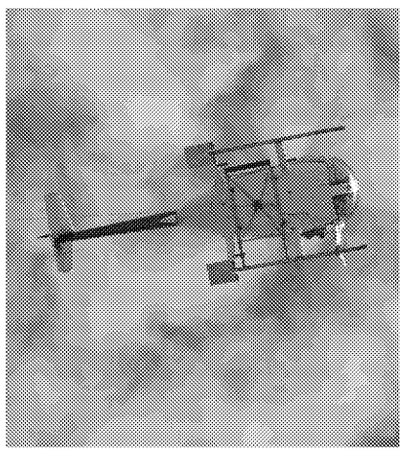
Pebble Project EIS



NEWSLETTER 1 | April 2018 | www.PebbleProjectEIS.com

US Army Corps of Engineers

Scoping Notice

The U.S. Army Corps of Engineers (USACE) Alaska District is conducting an Environmental Impact Statement (EIS) level of analysis to evaluate Department of the Army permit application POA-2017-271 submitted by Pebble Limited Partnership (PLP). PLP's application states the purpose of discharges of dredged and/or fill material into jurisdictional waters of the United States is for the purpose of developing a copper-gold-molybdenum porphyry deposit as an open-pit mine, with associated infrastructure, in southwest Alaska. The EIS scoping period begins April 1 and ends April 30, 2018.

The scoping period provides opportunities for any person interested in the proposed project to share information that can help shape the scope of analysis of the EIS. This may include ideas for alternatives to the applicant's proposed action as identified in the permit application (publically available at pebbleprojecteis.com) that could have lesser environmental impacts and identifying areas and/or issues of particular concern.

SCOPING PROCESS BEGINS

About PLP's Permit Application

PLP is proposing to develop the Pebble Deposit which is located under rolling, permafrost-free terrain in the Iliamna region of southwest Alaska, approximately 200 miles southwest of Anchorage and 60 miles west of Cook Inlet. The closest communities are the villages of Iliamna, Newhalen, and Nondalton, each approximately 17 miles from the Pebble Deposit. Portions of the proposed project lie within the Lake and Peninsula and Kenai Peninsula boroughs. Development of the Pebble Deposit would require federal permits from the USACE, The United States Coast Guard, and the Bureau of Safety and Environmental Enforcement for various aspects of the major project components. These three federal agencies are required to comply with the National Environmental Policy Act and thus will be using the EIS to inform their respective federal decisions. The major project components are briefly described here followed by an overview of the EIS process.

Major Project Components

Mine Site. The fully developed Mine Site would include the open pit mine, a tailings storage facility, a low grade ore stockpile, overburden stockpiles, material sites, water management ponds, milling and processing facilities, and supporting infrastructure such as a power plant, water treatment plants, camp facilities, and fuel and material storage facilities.

Transportation Corridor. The Transportation Corridor would connect the Mine Site to the Amakdedori Port on the west side of Cook Inlet. It has three main components:

1. A private, double-lane road extending 30 miles south from the Mine Site to a ferry terminal on the north shore of Iliamna Lake.

2. An ice-breaking ferry to transport materials, equipment, and ore concentrates 18 miles across Iliamna Lake between ferry terminals on the north and south shores of the lake.

3. A private, double-lane road extending 35 miles southeast from the South Ferry Terminal near the community of Kokhanok, to the Amakdedori Port on the west side of Cook Inlet.

Amakdedori Port. The Amakdedori Port would be located near Amakdedori Creek on the western shore of Cook Inlet, approximately 190 miles southwest of Anchorage and approximately 95 miles southwest of Homer. It would include shore-based and marine facilities for the shipment of ore concentrates, freight, and fuel for the project. A 1300-foot earthen causeway with a 700-foot wharf would connect the port site with the docking facility. A 50-foot deep turning basin would be dredged adjacent to the docking facility, along with a 50-foot deep access channel. Other facilities would include fuel storage and transfer facilities, power generation and distribution facilities, maintenance facilities, employee accommodations, and offices.

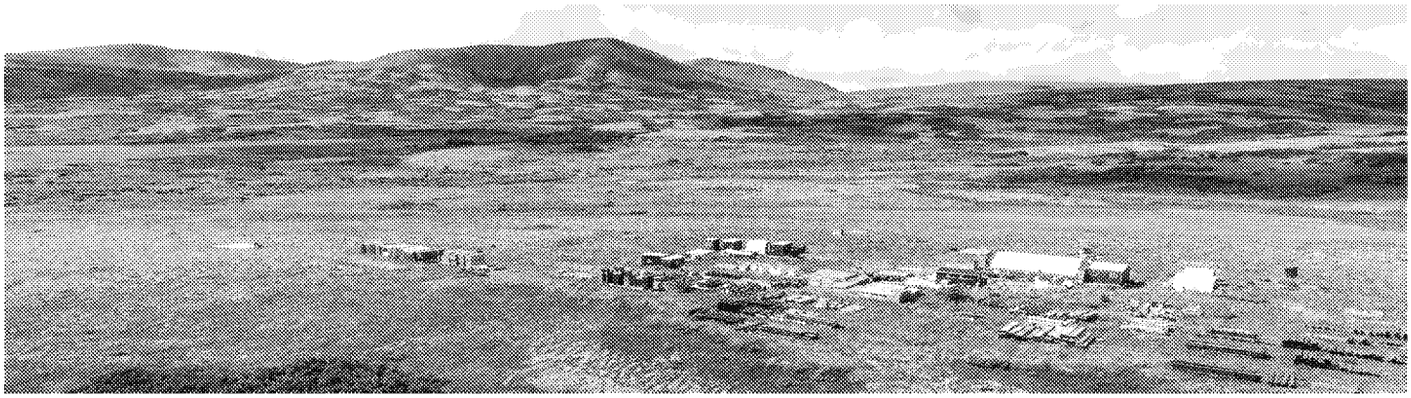
AMERICAN OVERSIGHT

EPA-0135-0004357

Natural Gas Pipeline. Natural gas, sourced from the existing natural gas supply infrastructure for the Cook Inlet area, would supply power generation for the Pebble Project, and would require the construction of a 188-mile pipe. The gas pipeline alignment would connect to existing infrastructure near Happy Valley on the Kenai Peninsula and travel south, paralleling the Sterling Highway for 9 miles to a compressor station near Anchor Point. From the compressor station, the pipeline would head southwest across Cook Inlet for 60 miles, before turning west for 35 miles to a landfall at the Amakdedori Port. A second compressor station and offtake point would be located at the port site. The pipeline would then follow the transportation corridor from the port to the mine site, including crossing Iliamna Lake on the lakebed.

ABOUT THE EIS

The USACE is serving as the lead federal agency for this EIS. The Bureau of Safety and Environment Enforcement and the United States Coast Guard have federal decision-making authority over portions of the applicant's proposed project and will serve as cooperating agencies. The U.S. Fish and Wildlife Service, Advisory Council on Historic Preservation, the State of Alaska (multiple divisions), the Lake and Peninsula Borough, the Pipeline and Hazardous Materials and Safety Administration, and the U.S. Environmental Protection Agency will serve as cooperating agencies to provide technical assistance for specifically identified special expertise. Thirty-five federally recognized tribal governments have been invited to participate directly through government-to-government consultation.



The EIS will identify potential impacts and potential benefits of the proposed project and reasonable altenatives on the physical, biological, and social environment from all phases of the project, including construction, operations, and post-closure. The EIS will also look at mitigation methods—ways in which potential negative impacts could be lessened. The USACE will use available scientific literature and subsequent data collected, alongside traditional knowledge and observations provided by the public.

We welcome your comments and information on the resources that are important to you. For example, many communities will be concerned about potential impacts to subsistence resources and land uses during project construction, operations, and closure. The EIS will address long-term cumulative effects, consider a reasonable range of alternatives, and analyze a range of practical mitigation and monitoring measures for protecting public health, water quality, wildlife, and subsistence resources.

AMERICAN OVERSIGHT

EPA-0135-0004357

Participate!

All interested parties are invited to participate in the EIS process. The goals of the public scoping process are to:

- Gather comments and suggestions from interested parties to help determine issues and concerns that are relevant to the analysis of potential impacts
- Help define a reasonable range of alternatives to evaluate in the EIS
- Capture information that will lead to the development of good mitigation and monitoring measures

Public Scoping Meetings

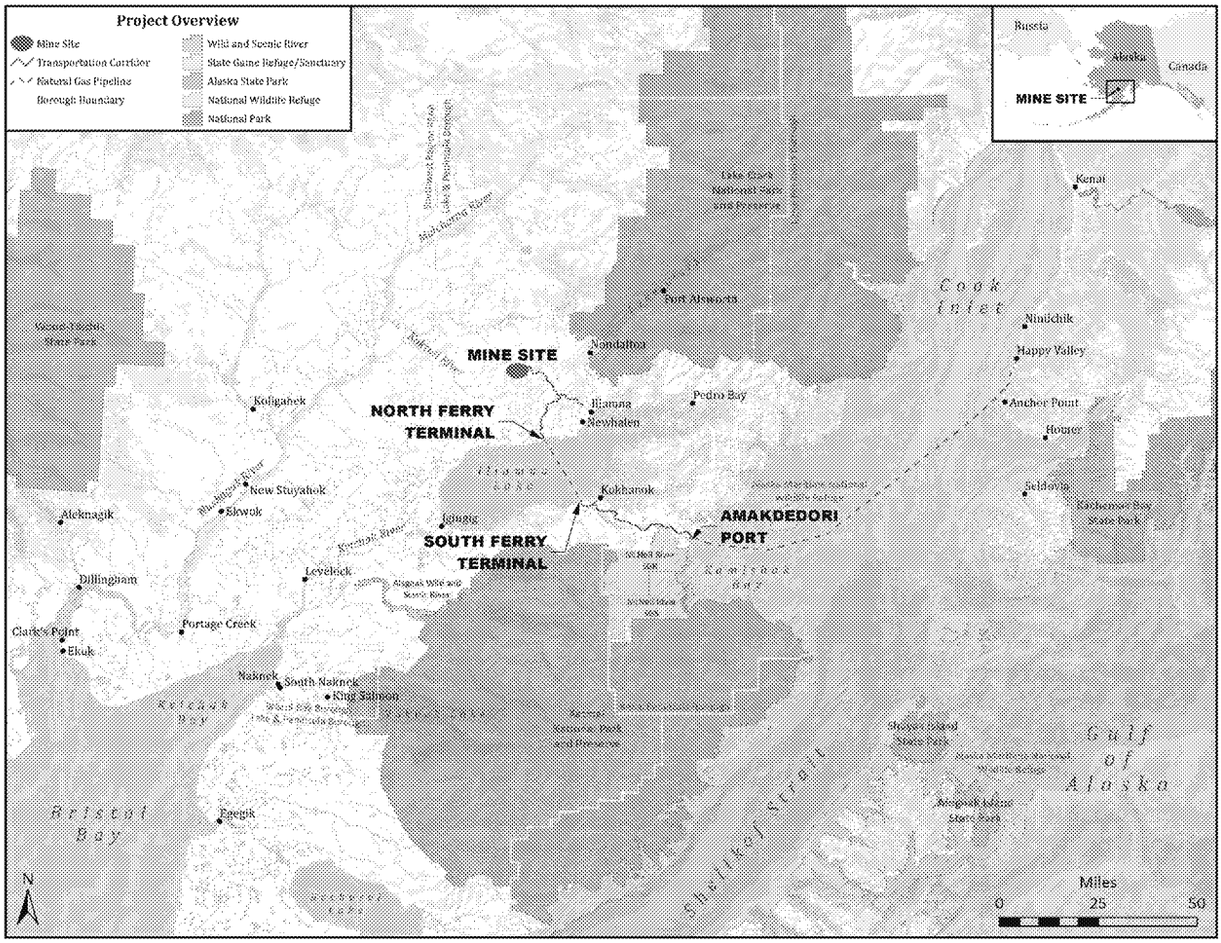
USACE has chosen to conduct scoping in multiple ways including scoping meetings in addition to our newsletters, website, and other communication methods. The scoping schedule includes meetings across the project area, as well as in Anchorage and Homer. The public meeting schedule is listed below.

COMMUNITY	DATE AND TIME	LOCATION
Naknek	April 9, 2018, 3:30 pm	Naknek School
Kokhanok	April 10, 2018, 3:30 pm	Tribal Hall
Homer*	April 11, 2018, 5:30 pm	High School
Newhalen	April 12, 2018, 3:30 pm	Newhalen School
Nondalton	April 16, 2018, 3:30 pm	Tribal Center
Dillingham*	April 17, 2018, 5:00 pm	Middle School
Iguigig	April 18, 2018, 3:30 pm	Community Building
Anchorage*	April 19, 2018, 5:00 pm	Dena'ina Center

**To avoid long wait times, a hot mic format will not be used.*

TO PARTICIPATE...

Providing ample opportunities for the public to submit scoping comments on the Pebble Project EIS is of utmost importance to the USACE. Come to scoping meetings and share your thoughts regarding project impacts and benefits and ideas for alternatives. Give your comment orally to a dedicated court reporter, or electronically submit using one of a number of dedicated laptop computers. You can also bring written comments to a meeting, use the comment form on the project website (www.PebbleProjectEIS.com), or send them to:



Program Manager, Regulatory Division
US Army Corps of Engineers
PO Box 6898
Joint Base Elmendorf Richardson,
AK 99506-0898

Let us know what aspects of the proposed project are important to you!

Written scoping comments can be submitted through April 30, 2018.
Comments received/postmarked after April 30 will be considered, but may not be included in the scoping report.
Comments will be reviewed and incorporated into the Draft EIS, as appropriate

Hi David,
Sorry I missed you. Thursday meeting is with Tom Collier from Pebble, Chris and you. Michelle Pirzadeh is the one who said I should add you to the invite. I know Tom is in Seattle attending other meetings and I do not know if anyone else is accompanying him. If there's someone else, EPA, I should invite please let me know.

Subject: Need your help: Chris speaks to Northwest Environmental Business Council next Thursday. Need some bits of content from you
Importance: High

Hello Folks:

You may have heard that Chris is scheduled to speak to the Cascade Chapter of the Northwest Environmental Business Council next Thursday at the WAC. This will be his first time talking with this group. Dennis spoke with them several times.

We've agreed with the organizers that this will be a somewhat informal and a chance for Chris to introduce himself to the group and for them to tell him about their organization, what their members are working on, etc. More of a dialogue, than a long speech. I'm shooting for 15 mins. for his remarks.

I've attached a draft of his remarks. It's written in more the style I've seen Chris speak – less formally, more conversational.

We want him to spend a few minutes on his current priorities. **This is where you come in.** On pages four and five in the attachment I have a list of priorities and a few words on each. I need you to help me put a bit more meat into this content with two – three sentences max. about Chris'/our focus on these topics in the near term. Should be easy, I think. ***If you could just send me an email with your suggested text for the bullets relevant to your program, that would be great. If you could send them to me by COB Thursday, I will then get a final draft ready for Chris' review Monday.***

Michelle, I need your overall "once over" plus a close look at the section on internal stuff…If you prefer to mark up a hard copy, Michelle, I can make your edits on Monday.

Also, below I need David and Sheryl to help provide some fodder for the questions/topics suggested by the NEBC members (one on Pebble and one on Portland Harbor/Duwamish lessons learned). We need to give Chris some suggestions for those two (bolded at the end of the list below). Again, an email with your contributions would be best and I'll plug them in.

Thanks all!

Topics NEBC members are interested in:

-Policy as driver for environmental business.

-Insights and thoughts on the future of EPA.

-Modernization of EPA. Perception is that it's an antiquated bureaucracy.

-Region 10 environmental issues / priorities.

-Pebble Mine / Mining – can we mine copper and "rare earth" elements responsibly?

-Lessons learned from Portland Harbor applied to Duwamish Cleanup.

OGC's current (final?) comments. Not sure who in the region, if anyone has seen this. Rob is discussing with OP's politicals later this morning and will be calling me back. Let's not do anything with these edits until those conversations have occurred.

AMERICAN OVERSIGHT

And I would be remiss if I did not point out the following sentence from Administrator Pruitt's memo of yesterday on the 404(c) process:

"I believe that it is critical for the agency to participate in the EIS process [for the Pebble project] and review the final EIS in detail before determining whether to proceed with the section 404(c) process in this case."

Non-Responsive – Material Unrelated to Bristol Bay/Pebble Mine

AMERICAN OVERSIGHT

If Chris really doesn't get comments to Molly today on Pebble, I think we have to move forward with what we have and keep to the schedule. **Personal Matters / Ex. 6** and the letter is supposed to be with Patty. Molly mentioned that she's coming to Seattle next week (for Tribal I guess?) and is giving Ashley a few days to review before it comes to me around the end of next week.

- Sounds good.

Talk with you tomorrow – feel free to let me know if there's anything you would do differently related to these couple of updates. Thanks! Jill

Patty,

I think it would be very useful for Mark to go on this trip, if there are funds to support it. He will be the 404 program person responsible for helping to bring this EIS and associated permit process to completion, so it would be useful for those purposes to have eyes on the ground. We typically do go when the Corps invites us on wetland/aquatic resource delineation visits, and since there is a different footprint proposed than any of the pre-app footprints or the footprints proposed by Pebble in their SEC filing, I think it becomes even more important for our evaluation, comments and the record to be informed about what is on the ground.

Subject: field verification visit

All-
Mark and I are seeking your advice on whether Mark should participate in the field verification visit with the USACE at the Pebble site. The trip is scheduled for July 9 – 11.

AMERICAN OVERSIGHT

During the previous agency meetings we had discussed our possible interest in this trip, but were notified only yesterday of the dates. The flight to Illiamna on July 9 is full, so if Mark does go he will need to travel a day early or later.

I did not see that Matt had included this trip in ARE travel, though it looks like we do have the funds to cover it.

I am planning a separate overview visit for some of the NEPA team that would benefit and have not previously been to the site.

I see this as an ARU decision as field verification would be to support the 404 delineations. Would we typically participate in a verification site visit? Please let Mark and I know if he should plan for this trip. We would need to initiate planning asap.

Thanks -Patty

Okay – can you take notes? Or have someone else take them?

We have just been taking hand-written notes and then filling in the templates afterwards. The templates are the same, but there is one on the 404c sharepoint and one on the NEPA sharepoint, in part b/c there isn't complete overlap between the teams. If the meeting ends up clearly being for both, we can just put it both places:

AMERICAN OVERSIGHT

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION 10
1200 Sixth Avenue, Suite 155
Seattle, WA 98101-3140

OFFICE OF
ENVIRONMENTAL REVIEW
AND ASSESSMENT

June 29, 2018

Mr. Shane McCoy, Project Manager
U.S. Army Corps of Engineers
Regulatory Division
P.O. Box 6898
JBER, Alaska 99506-0898

Dear Mr. McCoy:

The U.S. Environmental Protection Agency has reviewed the U.S. Army Corps of Engineers' March 29, 2018, Notice of Intent initiating the scoping process for the proposed Pebble Project Environmental Impact Statement development (EPA Region 10 Project Number 18-0002-COE). We have also reviewed the additional project information available on the Corps website. The EPA is providing comments for your consideration pursuant to the National Environmental Policy Act, Council on Environmental Quality regulations (40 C.F.R. §§ 1500-1508) and Section 309 of the Clean Air Act. The EPA is also supporting the Corps in EIS development as a cooperating agency, due to our special expertise. We appreciate the opportunity to provide early input in the analysis of the Pebble Project.

The Pebble Limited Partnership (PLP) is proposing to develop the Pebble deposit in southwest Alaska, containing copper, gold, and molybdenum. The proposed project includes an open-pit mine, tailings storage facility, a low-grade ore stockpile, an overburden stockpile, a mill facility, a natural gas-fired power plant, and other mine site facilities. The anticipated throughput at the mill facility is 160,000 tons of ore per day, and the proposed mine operating life is 20 years. The proposed project also includes development of a 188-mile natural gas pipeline across Cook Inlet and Lake Iliamna and two compressor stations used to transport natural gas from the Kenai Peninsula to the mine site. The proposed transportation network includes 65 miles of roads, ferry terminals on the north and south shores of Lake Iliamna for use by an ice-breaking ferry, and the Amakdedori Port on Cook Inlet (including dredging and disposal of up to 20 million cubic yards of dredged material).

The scoping comments that follow are provided to inform the Corps of issues the EPA believes are significant and warrant explicit treatment in the EIS, based on current information. Overall, the EPA encourages the development of an EIS that evaluates and compares a full range of reasonable alternatives and comprehensively discusses the reasonably foreseeable direct, indirect, and cumulative impacts of the proposed action.

The EPA has significant concerns regarding the potential impacts of mining activities near the world-class fisheries of the Bristol Bay Watershed.[1] Many of these concerns have been previously documented in the EPA's 2014 Bristol Bay Watershed Assessment, which evaluated the potential impacts of large-scale mining on the region's fish resources, and in the Agency's 2014 Proposed Determination under

[1] See https://www.epa.gov/bristolbay for more information.

AMERICAN OVERSIGHT

Section 404 of the Clean Water Act. This Proposed Determination proposed restrictions on the discharge of dredged or fill material to waters of the U.S. to protect waters that support fishery areas in and near the Pebble deposit area. Because the Watershed Assessment and the Proposed Determination were completed before PLP submitted its permit application to the Corps, these assessments did not consider and were not based on the specific parameters of PLP's pending proposal. The EIS should thoroughly analyze the potential impacts of PLP's proposal to aquatic and other resources, including the anticipated direct impacts of the proposed action, and the reasonably foreseeable indirect and cumulative impacts. We note that the geographic extent of the proposed project infrastructure is not limited to the Bristol Bay watershed, and we recommend that the EIS analyze all areas of impact from the project, including Cook Inlet.

We appreciate the information provided in the Corps' scoping package, including the list of resources to be analyzed in the EIS, and we agree that the suite of issues presented are appropriate to analyze in detail in the EIS. Our enclosed scoping comments provide our recommendations for analysis of key areas that will be the focus of our review of the project, including natural resource impacts, as well as human health and impacts to communities and federally recognized tribes. Our scoping comments also include recommendations related to: risk analysis and hazardous materials management, including geotechnical stability; analytical tools and methodologies, including predictive modeling of impacts to water, air, fish, and other aquatic resources; mitigation and monitoring; and financial assurance. Identification of these key issues and recommendations is based on the EPA's knowledge of the proposed project as well as our experience with mining projects in Alaska and other Region 10 states.

We appreciate the opportunity to participate early in the planning process for this project and are looking forward to working with you as you develop the EIS. Should you have any questions regarding our comments, please contact Patty McGrath, EPA Region 10 Mining Advisor at (206) 553-6113 or mcgrath.patricia@epa.gov.

Sincerely,

R. David Allnutt
Director

Enclosure:

1. U.S. Environmental Protection Agency Detailed Scoping Comments for the Pebble Project EIS

AMERICAN OVERSIGHT

EPA Region 10 Detailed Scoping Comments for the Pebble Project Environmental Impact Statement

General Components of NEPA Analysis

Purpose and Need

We recommend that the EIS include a clear and concise statement of the underlying purpose and need for the proposed project, consistent with the implementing regulations for NEPA[2] and the Clean Water Act Section 404(b)(1) Guidelines (Guidelines).[3] In presenting the purpose and need, the EIS should reflect not only the Corps' purpose in responding to the permit application, but also the broader public interest and need for this project. An appropriately defined purpose and need statement is of critical importance to setting up the analysis of a range of reasonable and practicable alternatives in the EIS that will meet the requirements of both NEPA and the Guidelines.

Range of Alternatives

We recommend that the EIS include a range of reasonable alternatives that meet the stated purpose and need for the project, are responsive to the issues identified during the scoping process and through tribal consultation, and include options for avoiding significant environmental impacts. This will ensure that the NEPA analysis provides agency decision makers and the public with information that defines the issues and identifies a clear basis for the choices made among the range of alternatives, as required by NEPA. The EIS should clearly outline the physical design of current and proposed facilities and alternatives (including ore storage sites, waste rock disposal areas, tailings areas, water storage and conveyance facilities, and supporting infrastructure including the transportation corridor, port site, and pipeline).

The EIS should "rigorously explore and objectively evaluate all reasonable alternatives"[4] even if some of them are outside the capability or the jurisdiction of the agency preparing the EIS for the proposed action.[5] This includes identifying the specific criteria that were used to (1) develop the range of reasonable alternatives, (2) eliminate certain alternatives, and (3) identify the agency preferred alternative, as appropriate. In addition, we recommend the EIS provide a clear discussion of the reasons for the elimination of alternatives that are not evaluated in detail.

While NEPA requires the evaluation of *reasonable* alternatives to the proposed action, the Guidelines require the analysis of *practicable*[6] alternatives in order to identify the least environmentally damaging

---

[2] 40 C.F.R. § 1502.13.
[3] Within the context of the Guidelines, practicable alternatives to the proposed discharge of fill or dredged material are identified "in light of overall project purposes," which is also termed "the basic purpose of the proposed activity." 40 C.F.R. § 230.10(a)(2).
[4] 40 C.F.R. § 1502.14(a).
[5] 40 C.F.R. § 1502.14(c).
[6] An alternative is practicable if it is available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes. 40 C.F.R. § 230.10(a)(2).

AMERICAN OVERSIGHT

practicable alternative (LEDPA), which is the only alternative that can be permitted.[7] The analysis of alternatives for NEPA can provide the information for evaluation of alternatives under the Guidelines.[8] We recommend that the EIS range of alternatives include the practicable alternatives developed for the Guidelines analysis.

In evaluating the proposed project and alternatives, the analysis should include an evaluation of performance and effectiveness, as well as the planned monitoring to ensure efficacy of proposed design features, environmental protection measures, and mitigation.[9]

Regarding mitigation for purposes of NEPA, we recommend that the alternatives analysis include appropriate mitigation measures not already included in the proposed action or alternatives.[10] The EIS should evaluate reasonable alternatives, including mitigation measures, to reduce or minimize adverse impacts to environmental resources. We recommend that, in conducting such an evaluation, the Corps consider:

- The disturbance footprint;
- Habitat value, cultural significance, and risks in siting project components for the proposed mine site components, as well as the port site, transportation corridor, and pipeline components;
- Source control measures (effective management of waste rock and tailings to prevent acid generation and metal leaching) and containment (liners and covers);
- Measures to reduce contact between mine waste materials and surface water and groundwater (such as surface water diversions and liners and covers as recommended above);
- Impacts of pit dewatering on groundwater and stream flows;
- Treatment to promote compliance with water quality standards;
- The physical stability of structures (e.g., pit walls, ore storage and waste rock facilities, tailings facility) during operations and closure, such as considering dry stack tailings;
- Impacts along the pipeline route and transportation corridor, including to Lake Iliamna;
- Impacts from dredged material disposal;
- Impacts to the marine environment at the Amakdedori Port site;
- Air pollutant emissions; and
- Impacts to traditional and cultural uses and resources, including key subsistence species and sites.

Indirect Impacts

We recommend that the EIS include consideration of all reasonably foreseeable indirect effects caused by the action but that may occur later in time or farther removed in distance.[11] The indirect effects analysis "may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural

---

[7] 40 C.F.R. § 230.10(a)
[8] 40 C.F.R. § 230.10(a)(4).
[9] The term mitigation included in this "Range of Alternatives" section is referring to the general term as it applies to NEPA. Compensatory mitigation for purposes under CWA section 404 cannot be used to reduce environmental impacts in the evaluation of the least environmentally damaging practicable alternatives for the purposes of requirements under Section 40 C.F.R. § 230.10(a). *See* 1990 Memorandum of Agreement between Army and EPA concerning the determination of mitigation under CWA section 404(b)(1) Guidelines.
[10] 40 C.F.R. § 1502.14(f).
[11] 40 C.F.R. § 1508.8(b).

AMERICAN OVERSIGHT

systems, including ecosystems."[12] While NEPA does not require agencies to engage in speculation, "[t]he EIS must identify all of the indirect effects that are known, and make a good faith effort to explain the effects that are not known but are reasonably foreseeable."[13]

We therefore recommend that the EIS evaluate the expansion and continued operation of the currently proposed project to the extent that the Corps considers it to be a reasonably foreseeable indirect effect of the proposed action. The current proposed Pebble Project description includes mining of approximately 1.1 billion tons of mineralized material, while the 2011 Preliminary Assessment Technical Report[14] estimated that the total Pebble mineral resource may be 11.9 billion tons. It may be reasonable to predict that a mine at the Pebble deposit will eventually operate for longer than 20 years and recover and process additional ore based on the size of the deposit, the significant infrastructure that will be developed under the current project description, and statements made by the Pebble Limited Partnership regarding the potential to examine expanding the mine once initial production has begun on the current proposal.[15] Accordingly, we recommend that the EIS consider the potential impacts associated with reasonably foreseeable mine expansion scenarios, including up to 11.9 billion tons.

In addition, we recommend that the EIS consider the extent to which it is reasonably foreseeable that the proposed transportation corridor and natural gas pipeline may be made accessible to the public and may stimulate additional reasonably foreseeable mining projects in the area, and potential environmental effects associated with that induced mining. Although PLP's current proposal only includes private access to the infrastructure components, public access may be granted in the future. This potential may be different for the different infrastructure elements. For example, if the pipeline is regulated as a common carrier, then public access could be allowed if capacity permits. We recommend that the EIS discuss any reasonably foreseeable future public access to the project's infrastructure components and analyze any reasonably foreseeable indirect effects of this action.

Construction and operation of the project would result in increased vessel traffic in Cook Inlet and on Lake Iliamna because vessels will bring supplies to the site and transport products off-site. In addition to evaluating the direct effects of the increased transportation, we recommend that, if it is reasonably foreseeable that the ports and ferry landings will become available for public use, then any reasonably foreseeable future use of these components should be assessed in the EIS as indirect or cumulative effects. Should the port and ferry terminals remain open following mining, this infrastructure may result in increased use and vessel traffic beyond what PLP is currently proposing.

Indirect project impacts under NEPA can include secondary effects, which are defined by the Guidelines as "effects on the aquatic ecosystem that are associated with the discharge of dredged or fill materials, but do not result from the actual placement of the dredged or fill material."[16] The consideration of secondary effects is necessary for the Guidelines analysis, and examples of potential secondary effects are discussed in the section on aquatic resources below.

[15] e.g., see http://www.alaskajournal.com/2018-01-10/permit-application-reveals-size-scaled-down-pebble-project. "Collier has acknowledged the company might look to expand after initial production commences but contends growing the project would require additional rounds of environmental reviews and permitting that would be independent from any approvals Pebble already had."

[16] 40 C.F.R. § 230.11(h).

AMERICAN OVERSIGHT

Cumulative Impacts

In accordance with NEPA, the cumulative impacts analysis should identify how resources, ecosystems, and communities in the vicinity of the project have already been, or will be affected by, past, present, or reasonably foreseeable future activities in the project area, "regardless of what agency (federal or non-federal) or person undertakes such other actions."[17]

The Guidelines also fundamentally require consideration of reasonably foreseeable cumulative effects in determining whether a project complies with the significant degradation prohibition and to ensure that discharges will not have an unacceptable adverse impact either individually or in combination with known and/or probable impacts of other activities affecting the ecosystems of concern.[18] Cumulative effects are "the changes in an aquatic ecosystem that are attributable to the collective effect of a number of individual discharges of dredged or fill material," which individually may be minor, but cumulatively may result in a "major impairment of the water resources and interfere with the productivity and water quality of existing aquatic ecosystems."[19]

For the cumulative impacts assessment, we recommend that the EIS delineate appropriate geographic boundaries, including natural ecological boundaries whenever possible, as well as consider an appropriate time period for the project's effects. We recommend that resources be characterized in terms of their response to change and capacity to withstand stresses. Trends data should be used to establish a baseline for the affected resources, to evaluate the significance of any historical degradation (e.g., due to exploration activities), and to predict the environmental effects of the project components.

Past, present, and reasonably foreseeable future activities that should be considered in the cumulative impact assessment will vary across the geographic scope of the various mine-site and infrastructure components. Please refer to CEQ's "Considering Cumulative Effects Under the National Environmental Policy Act"[20] and the EPA's "Consideration of Cumulative Impacts in EPA Review of NEPA Documents"[21] for assistance with identifying appropriate boundaries and identifying appropriate past, present, and reasonably foreseeable future projects to include in the analysis.

In particular, we recommend that the cumulative effects analysis consider, but not be limited to, the following activities:

- Past and current exploration activities conducted by PLP and others at the Pebble site;
- Current exploration activities occurring in the Bristol Bay watershed region;
- Reasonably foreseeable expansion and continued operation of the currently proposed project (while this is an indirect effect under NEPA, as discussed above, it is a cumulative effect under the Guidelines);
- Reasonably foreseeable future use of project infrastructure (road, port, pipeline); and,
- Reasonably foreseeable development of additional mining projects as a result of increased exploration activity in the region. Even if those activities are not determined to be indirect effects of the proposed action (as discussed above), they are still reasonably foreseeable.

AMERICAN OVERSIGHT

ENVIRONMENTAL RESOURCE IMPACTS

Aquatic Resources, Including Wetlands, Streams, and Fish

Evaluating Compliance with the Clean Water Act Section 404(b)(1) Guidelines

The Corps' potential CWA Section 404 permitting action is triggering preparation of the EIS. We recommend that the Corps' permitting regulations and the Guidelines therefore provide the context for identifying relevant issues and evaluating alternatives in the EIS.

The Guidelines are the substantive environmental criteria for the evaluation of proposed discharges of dredged or fill material, and applicants must demonstrate compliance with the Guidelines.[22] The EIS is a significant component of the administrative record for the District's permit decision, which can and should provide sufficient information to address compliance with the Guidelines and the Corps' public interest review.[23] Although it is not mandatory, we support the Corps' decision to include of the public interest review factors into the list of issues to be considered in the EIS. This will enable the expected benefits to be balanced against reasonably foreseeable detriments, and all relevant public interest factors to be weighed.

We recommend that the organization of the EIS facilitate the evaluation of the proposed project's compliance with the Guidelines. Issues relevant to compliance with the Guidelines should be addressed explicitly in the EIS where possible. Alternatively, a stand-alone Section 404(b)(1) analysis could be included as its own section of, or appendix to, the EIS. As mentioned above, we recommend that the range of alternatives evaluated in the EIS be sufficient to identify the LEDPA. In addition, we recommend that the final EIS identify which alternative is the LEDPA.

The Guidelines prohibit, for example, the authorization of a proposed discharge that would cause or contribute to the violation of an applicable water quality or toxic effluent standard, jeopardize a listed threatened or endangered species, or impact a marine sanctuary.[24] We recommend that these criteria be used to evaluate and compare alternatives.

The Guidelines also prohibit the authorization of a proposed discharge which will cause or contribute to significant degradation of the aquatic ecosystem.[25] Findings of significant degradation must be based upon specific factual determinations, evaluations, and tests identified in the Guidelines. These include the evaluation of the direct, secondary, and cumulative effects of the proposed discharge and alternatives on specific resources including fish, wildlife, and special aquatic sites. The significant degradation findings must also evaluate the effects to resource characteristics including aquatic ecosystem diversity, productivity, and stability. Evaluating the potential for significant degradation also requires the consideration of effects to human uses or values, including recreational, aesthetic, and economic values. With regard to fisheries, the Guidelines require, for example, an evaluation of effects to all forms and life stages of aquatic organisms in the food web, including fish and the plants and animals on which they feed and depend upon for their needs.[26] The Guidelines also require an evaluation of effects to

---

[22] 40 C.F.R. § 230.12(a)(3)(iv).
[23] See 33 C.F.R. § 320.4.
[24] 40 C.F.R. § 230.10(b).
[25] 40 C.F.R. § 230.10(c).
[26] 40 C.F.R. § 230.31.

AMERICAN OVERSIGHT

recreational and commercial fisheries, which includes harvestable fish, crustaceans, shellfish, and other aquatic organisms used by man.[27] The Corps has proposed including a number of these evaluations in the EIS. We recommend that as many of the specific factual determinations, evaluations, and tests required by the Guidelines as possible be included in the EIS, and be used to evaluate and compare alternatives.

The Guidelines also prohibit any proposed discharge that does not include all appropriate and practicable measures to minimize potential harm to the aquatic ecosystem.[28] Subpart H of the Guidelines identifies numerous possible steps to minimize impacts, including reducing the footprint of the project, using co-location of facilities whenever possible, implementation of best management practices to reduce environmental impacts, configuring the project footprint to reduce or eliminate impacts to higher functioning aquatic resources and other appropriate and practicable measures. Also, as previously discussed, we recommend that the EIS include appropriate minimization measures both as part of the action alternatives and relative to the affected environment. The discussion of minimization measures should include assessment of their likely effectiveness.

Compensatory Mitigation

For unavoidable impacts to wetlands, streams, and other aquatic resources, the Guidelines require appropriate and practicable compensatory mitigation to offset unavoidable environmental impacts associated with discharges permitted under CWA Section 404. We recommend that the EIS consider potential mechanisms to offset likely unavoidable aquatic resource impacts. We also recommend that the EIS include the applicant's proposed compensatory mitigation plan. Compensatory mitigation requirements, including the components of a compensatory mitigation plan, are described in Subpart J of the Guidelines. Pursuant to the Guidelines, the level of detail in the compensatory mitigation plan should be commensurate with the scale and scope of the impacts.

Compensatory mitigation may be provided through purchase of credits from an approved mitigation bank, purchase of credits from an approved in-lieu fee mitigation program, and/or completion of a permittee-responsible compensatory mitigation project(s). Final compensatory mitigation requirements must be commensurate with the amount and type of impact that is associated with a particular Section 404 permit.[29] Compensatory mitigation required by the Guidelines is separate from, and may be in addition to, proposed project impact mitigation under NEPA.

Characterizing the Affected Environment

We recommend that the EIS describe aquatic habitats in the affected environment by resource type using the data sources and classification approaches that provide the greatest resolution possible. For example, if wetlands are mapped using a Cowardin classification, that mapping should be to the smallest identifiable map unit. Likewise, streams should be classified and mapped accordingly. The baseline information for aquatic resources should include their functional condition and integrity. We also recommend that the EIS evaluate the characteristics of the potentially affected aquatic resources, how those characteristics provide fish habitat, and how such habitat could be adversely impacted by the proposed project. Wetlands and streams perform different functions at different rates, and capturing this information is critical for evaluating the potential environmental impacts of the proposed action, alternatives, and reasonably foreseeable actions (exploration and mining) on these resources.

---

[27] 40 C.F.R. § 230.51.
[28] 40 C.F.R. § 230.10(d).
[29] 40 C.F.R. § 230.93(a)(1).

AMERICAN OVERSIGHT

Characterizing the distribution of resident and anadromous fish in potentially affected streams and other aquatic resources is also important, and we recommend the use of data sources such as the Anadromous Waters Catalog[30] and the Alaska Freshwater Fish Inventory[31] to help with this characterization.

Aquatic Resource Impacts Analysis

We recommend that the areal extent (i.e., acreage) of impacts to aquatic resources be quantified in the EIS for both direct and secondary effects. The acreage values for the direct and secondary impact footprints should include the acreage for streams as well as for wetlands, ponds, lakes, mudflats, and other waters. In other words, reported acreage losses should represent the total loss of jurisdictional waters. For streams, the loss of channel length should also be quantified by linear feet and/or miles. Channel length values are a more intuitive metric for some, and facilitate different types of analyses than the acreage values. In addition to the areal or linear extent, impacts to aquatic resources should also be quantified by the expected change in the function these resources perform, including fishery support functions, or change in the condition of the resource.

Direct effects are impacts on aquatic resources within the footprint of the discharge of dredged or fill material. Direct effects at the mine site would include stream and other aquatic resource losses within the footprints of the tailings storage facility, the ore and overburden storage sites, the mine pit, and other mine site facilities described in the permit application. Construction of the transportation and pipeline corridors and port facility will likely involve such discharges as well.

Secondary effects, as defined by the Guidelines, are associated with the discharge of dredged or fill material, but do not result from actual placement of this material. These effects are also considered indirect impacts under NEPA. Examples of secondary effects that should be evaluated in the EIS include the following:

- Elimination of streams and wetlands due to drowning by the tailings impoundment and other mine components;
- Dewatering of streams and other aquatic resources due to pumping of groundwater during open pit mining and filling during closure;
- Fragmentation of aquatic resources due to the placement of the mine pit, ore storage sites, tailings storage facility, and other mine components;
- Degradation of downstream fish habitat due to streamflow alterations resulting from water capture, withdrawal, storage, treatment, or release at the mine site;
- Degradation of downstream fish habitat due to water quality impacts associated with mine construction and operation;
- Degradation of downstream fish habitat due to the loss of important inputs such as nutrients and groundwater from upstream sources;
- Degradation of aquatic resources due to dust deposition from mining and transportation activities.

The evaluation of the proposed project's impacts and alternatives should fully consider the physical, chemical, and biological effects of each of the direct and secondary effects, and should consider incremental changes from these impacts along each stream segment downstream of the impact site.

[30] See https://www.adfg.alaska.gov/sf/SARR/AWC/.
[31] See http://www.adfg.alaska.gov/index.cfm?adfg=ffinventory.main.

AMERICAN OVERSIGHT

Considering the value of the region's commercial, subsistence, and recreational fishery resources, we recommend that the EIS focus on quantifying direct, indirect, and cumulative impacts on resident and anadromous fish and their habitat resulting from losses of streams with documented fish occurrences; losses of headwater source areas of these streams; losses of wetlands, lakes, and ponds; and streamflow alterations. We appreciate that the Corps has made the EPA's 2014 Bristol Bay Watershed Assessment available on the Pebble Project website, and we also recommend that this document be referenced in preparing the EIS.[32]

The losses of stream reaches and adjacent wetlands from dewatering, as well as changes to downstream reaches and adjacent wetlands, may result in physical, chemical, and biological changes which would impact fishery habitat and habitat support. We recommend that the EIS model and consider these impacts compared to baseline conditions, including but not limited to:

- Evaluate changes in water volume in the stream areas of impact, as well as changes in the downstream reaches of the watershed resulting from losses of upstream contributions of water. We recommend that the analysis address seasonal changes to the different stream segment hydrographs, including changes to seasonal temperatures, dissolved oxygen levels, sediment transport capabilities, and any associated changes to sediment grain sizes in the different stream segments;
- Evaluate flow changes in the impacted stream reaches, both from pit dewatering as well as any proposed in-stream discharge points, to assess any potential changes to stream profile, form, and pattern, and to identify any areas of accretion and/or scouring which may reasonably be anticipated. We also recommend that areas of stream incision as a result of flow changes be identified, as well as losses of connectivity to floodplains and riparian wetlands currently connected to the downstream reaches;
- Identify potential changes to nutrient levels, turbidity, and dissolved oxygen, particularly with respect to seasonal patterns in the downstream reaches. We further recommend that both the direct losses of both autochthonous and allochthonous inputs from upstream reaches lost and/or disconnected from wetland and other riparian habitats, as well as the incremental reductions in those inputs in downstream segments throughout the stream reaches and their effects on system-wide primary, secondary, and tertiary production, be evaluated. These analyses should consider the direct changes to downstream habitats as well as changes to fisheries support in the different stream reaches;
- Evaluate decreases in anticipated invertebrate transport and production in downstream segments and those effects on fish production; and
- Evaluate the effects of disconnecting any off-channel habitat both near the areas of direct impact and throughout the downstream reaches, both for losses of allochthonous inputs and also for potential losses of nursery habitat.

We recommend that the direct, indirect, and cumulative impacts of any of these potential physical, chemical, and biological alterations be examined for how they may result in the loss and/or degradation of fish habitat, including alterations with respect to spawning, overwintering, nursery, and migration. Habitat losses that may result from freeze-through or seasonal warming of fish production areas should also be evaluated.

[32] See https://www.epa.gov/bristolbay/bristol-bay-assessment-final-report-2014.

AMERICAN OVERSIGHT

Water Quality and Quantity

Evaluating Impacts to Surface Water and Groundwater Quality and Quantity

Water quality is one of the EPA's principal concerns at mine facilities due to the potential for acid-generating and metal-leaching waste materials (ore, waste rock, tailings, pit walls) that are exposed to the environment and require management over long periods of time. In addition, road construction and operation have the potential to contribute a significant quantity of sediment to streams. We recommend that the EIS characterize baseline surface water and groundwater quality, quantity, and interactions, and evaluate the impacts of all aspects of the proposed operations and alternatives (including pit dewatering and backfilling, tailings management and disposal, water management, and port-site and transportation aspects) on these hydrologic components and describe mitigation for adverse impacts.

Given the potential impacts of the proposed Pebble Project, the EPA recommends that the Corps specifically include in the water resources analysis for the EIS (see also our recommendations for Analysis Tools and Methodologies):

- Characterization of existing groundwater, surface water, springs, and wetland resources within the area of both the project and all potential alternatives, including groundwater levels, flow direction and gradients, and chemistry;
- Development of a hydrogeologic conceptual site model, including:
    - Maps of groundwater, surface water, springs, and wetland resources in the area to be developed or affected;
    - Baseline data on the extent and quality of groundwater, surface water, springs and wetlands;
    - Information on the quantity and location of all aquifers, including Underground Sources of Drinking Water, recharge zones and source water protection areas;
    - Identification of any CWA § 303(d) listed waterbodies and any existing restoration efforts for these waters;
    - Identification and description of all wetlands and surface waters that could be affected by the project and alternatives; where applicable, acreages, channel lengths, habitat types, values and functions of these waters should be identified;
    - Identification and description of hydrologic pathways (e.g., the connectivity of springs or groundwater to surface waters; the connectivity of all streams to each other and to wetlands); and
    - A detailed water balance for the proposed action and each alternative.
- Assessment of which waters may be impacted, the sources and nature of potential impacts (both quality and quantity), specific pollutants likely to impact those waters and a comparison to applicable environmental standards (e.g., surface water and drinking water quality standards);
- Consideration of downstream impacts and potential for changes in metal speciation and bioavailability (in particular, the impacts of copper, which can have adverse effects on salmon at very low concentrations);
- Evaluation of surface water and groundwater use, including maps and source identification of agricultural, domestic, and public water supply wells or intakes; and
- Consideration of effects of seasonality on water quantity and quality impact assessment, including predictions for all phases of the project (construction, operations, and closure).

Anti-degradation

The anti-degradation provisions of the CWA apply to those waterbodies where water quality standards are currently being met. In certain high-quality waters, the anti-degradation provisions prohibit

AMERICAN OVERSIGHT

degrading water quality unless it is determined that allowing lower water quality is necessary to accommodate important economic or social development in the area in which the waters are located.[33] We recommend that the EIS discuss whether and how the CWA anti-degradation requirements could be met.

Water Management and Treatment

We recommend that the EIS describe the plans for water management, treatment, and discharge during all phases of the project (construction, operations, and closure), including plans for long-term water treatment. The EIS should evaluate and disclose the adequacy, reliability, effectiveness, and operational uncertainty associated with proposed operation and closure (long-term) water management and treatment techniques, taking into account seasonality and potential changes associated with future climate scenarios. We also recommend that the analysis characterize chemical compositions and quantities of process waters, mine drainage, storm water, and treated and untreated effluent. This information should be supported by the results of treatability testing. Assumptions used in the analysis should be disclosed and be reasonably conservative. If long-term water treatment is needed, we recommend that the EIS include modeling of predicted stream concentrations of contaminants of concern, both with and without treatment, to evaluate the potential impacts to water quality if the treatment system is not working properly.

The EIS should also identify the Alaska Pollutant Discharge Elimination System (APDES) discharge locations, identify applicable water quality standards, and analyze the likelihood and ability of all discharges to meet applicable standards and the direct, indirect, and cumulative impacts of such discharges to the receiving waters. We recommend that any applicable water quality variance requests, site-specific criteria proposals, and/or any other planned or potential requests for water quality standard revisions also be disclosed in the EIS.

Sediment Management and Stormwater Runoff

Since the project has the potential to cause or contribute to erosion of soils and subsequent sediment loading to nearby surface waters, we recommend that the EIS evaluate construction design and operation practices that will be used to minimize erosion and control stormwater runoff from the mine site, port sites, transportation corridor, and pipeline route. We recommend that the EIS discuss specific mitigation measures that may be necessary or beneficial in preventing and minimizing adverse impacts to water quality and disclose the effectiveness of such measures. We suggest that the Corps consider the Best Management Practices identified by the EPA for mining facilities[34] and specify those that would be suitable and likely implemented at the Pebble Project. We also recommend that the EIS document the project's consistency with applicable APDES stormwater permitting requirements.

Hydrostatic Test Water

Hydrostatic testing will likely be utilized to verify pipeline integrity. We recommend that the EIS identify and describe the location of the water sources required for hydrostatic testing, in terms of surface area, depth, volume, withdrawal rate, and project requirements. For each water source, we recommend that the EIS discuss the presence of any anadromous and/or resident fish species, including discussion of any direct and cumulative impacts to fisheries resources. In addition, we recommend that locations and methods of discharges to land and/or surface waters be specified in the EIS. Emphasis should be placed on minimizing inter-basin transfers of water to the maximum extent practicable, to

[33] 40 C.F.R. § 131.12.

[34] https://www3.epa.gov/npdes/pubs/sector_g_metalmining.pdf.

AMERICAN OVERSIGHT

minimize the risk of mobilizing invasive species. We recommend that the EIS describe the mitigation measures and control devices that would be implemented to minimize environmental impacts.

Marine Environment and Freshwater Lakes

Port Construction and Dredging Impacts

According to the Permit Application Appendix D – Project Description, the Amakdedori Port will require dredging of a channel and turning basin for shipping access to berths. According to the application, annual maintenance dredging will be necessary throughout the life of the port facility. Dredging activities potentially affect habitats and key ecological functions that support recruitment and sustainability of estuarine and marine organisms. We recommend that the EIS:

- Characterize the marine benthic environment and organisms, sediment composition and grain size, etc.;
- Identify any biologically important areas, such as migratory routes, benthic communities, and subsistence areas;
- Evaluate marine dredging, dewatering, transloading (from water to land), placement methods and options (summer and winter), and disposal sites (offshore, nearshore, upland, and open-water), as well as beneficial uses of the dredged material;
- Include and evaluate a sampling and analysis plan, as well as a marine dredging and disposal plan;
- Evaluate the following potential impacts of dredging activities on species and their habitats:
  - Substrate removal and any resulting habitat and species removal (entrainment);
  - Potential changes to estuarine bathymetry, fluvial and tidal energy, and substrate roughness, and any attendant impacts to salinity structure and estuarine circulation;
  - Potential changes to sediment transport processes, including effects on adjacent shorelines;
  - Alteration of sediment composition in and around the dredging site (including changes to the nature and diversity of benthic communities);
  - Local resuspension of sediments and any turbidity increases;
  - Spread of sediments (and any associated contaminants) into the area surrounding the dredging site;
  - Release of sediment-associated nutrients, potential increases in eutrophication and resulting decreases in dissolved oxygen concentrations;
  - Decreased primary production due to reduced transparency of the water column and/or smothering, particularly at in-water disposal sites; and
  - Enhanced bioavailability and ecotoxicological risk of background contaminants and/or chemical or biochemical changes of contaminants;
- Consider implementation of effective mitigation measures to ensure that marine resources and habitats are adequately protected; and
- Incorporate a monitoring plan for marine protected resources and associated habitats to ensure effectiveness of mitigation measures.

Because of the magnitude of the proposal, dredging and disposal operations will need to be carefully planned and scheduled to avoid and minimize impacts to sensitive marine mammals, fish, shellfish, and their habitat at critical spawning and migration periods.

Dredged Material Disposal

According to the Permit Application Appendix D, dredged material will be used to construct the jetty, causeway, and/or the main terminal patio area, if suitable. Excess dredged material will be stockpiled in

AMERICAN OVERSIGHT

an upland location adjacent to the port facilities. The EPA recommends an on-the-ground wetland delineation at the proposed dredged material disposal site to verify whether there are any jurisdictional waters of the United States at this location.

The proposed discharge of dredged material effluent from the confined disposal facility into Kamishak Bay is subject to regulation under Section 404 of the CWA. Thus, the EIS should include sufficient information to support making the required determinations and findings under the Guidelines. For example, Subpart G of the Guidelines includes general evaluation procedures and specific testing procedures to reach the determinations required by 40 C.F.R. § 230.11. The Inland Testing Manual[35] also provides detailed technical guidance on how to evaluate and test dredged material consistent with the Guidelines. In particular, the EPA recommends using the ITM Appendix B, "Guidance for Evaluation of Effluent Discharges from Confined Disposal Facilities."

To support disposal decisions, we recommend that the EIS provide an inventory of the physical and chemical characteristics of the dredged material and an assessment of disposal alternatives. We recommend that the range of dredged material management alternatives include: no action; the proposed action; beneficial uses such as beach nourishment or construction material; a disposal site in internal waters, landward of the Kamishak Bay closing line (regulated under the CWA); and an ocean disposal site seaward of the Kamishak Bay closing line (regulated under the Marine Protection, Research and Sanctuaries Act).

Potential for Ocean Disposal of Dredged Material

Under Section 102 of the MPRSA, the EPA is responsible for designating and managing ocean dumping sites for all materials, including dredged material. The EPA designates ocean disposal sites through rulemaking and sites are published at 40 C.F.R. § 228.15. The EPA bases the designation of an ocean disposal site on environmental studies of a proposed site, studies of regions adjacent to the site, and historical knowledge of the impact of disposal on areas similar to the site in physical, chemical, and biological characteristics. All studies for the evaluation and potential selection of dredged material disposal sites should be conducted in accordance with the criteria for the selection of disposal sites for ocean dumping published in 40 C.F.R. §§ 228.5 and 228.6. The minimum requirements for baseline assessment surveys are found in 40 C.F.R. § 228.13.

The evaluation process includes conducting oceanographic studies to establish the environmental conditions at all alternative locations being considered as potential sites, as well as the area or region encompassing the alternative sites. Results from oceanographic studies and other sources are used to model likely dispersion and deposition of material disposed at the alternative sites and evaluate potential impacts. If there are no practicable alternatives to ocean dumping that will have a less adverse impact on the environment, this information is used to select the best ocean site proposed for designation.

If ocean disposal is to be considered as an alternative, we encourage the Corps to engage early and actively with the EPA to ensure that site selection activities are consistent with the MPRSA and the ocean disposal criteria. The EIS must be adequate for the EPA to ensure that use of the site selected for designation will not likely cause unreasonable degradation to the surrounding marine environment. In addition, only dredged material that is authorized for disposal under the MPRSA and 40 C.F.R. Part 227 may be disposed in an EPA-designated ocean dredged material disposal site.

[35] See https://www.epa.gov/cwa-404/inland-testing-manual.

AMERICAN OVERSIGHT

Impacts of Vessel Traffic

Marine traffic, including barges and other vessels associated with construction and operation of the proposed project, may also result in impacts to the marine environment. For example, vessel traffic may result in potential impacts to marine mammals, including threatened and/or endangered species, and their migration patterns and routes; subsistence, commercial, and recreational fisheries; and other vessel use. We recommend the EIS describe the vessel traffic schedule in Cook Inlet; patterns and marine transportation routes; subsistence, commercial, and recreational fishery resources; and the migration period, patterns, and routes of potentially affected marine mammals, including Cook Inlet Belugas. The direct, indirect and cumulative impacts from vessel traffic on marine mammals, threatened and endangered species, critical habitats, and fishery resources should be analyzed in the EIS, and the EIS should discuss the mitigation measures that would be implemented to minimize such impacts.

Use of the proposed ice-breaking ferry on Lake Iliamna may result in similar impacts to the freshwater lake environment, including the potential for wake impacts to the shoreline. We recommend the EIS analyze the direct, indirect, and cumulative impacts of the year-round use of the lake proposed by the applicant on threatened and/or endangered species, fishery resources, and other lake user groups, and discuss mitigation measures to minimize impacts.

Air Quality

The EPA recommends that the EIS evaluate how the construction and operation of the proposed project and alternatives could affect air quality and what measures may be needed to mitigate potentially significant impacts. Such an evaluation is necessary to ensure compliance with state and federal air quality regulations, and to disclose the potential impacts from temporary or cumulative degradation of air quality. To address potential air quality impacts, the EIS should consider whether the direct, indirect, or cumulative impacts of project-related air emissions would result in any adverse impact on air quality or air quality-related values.

Potential air pollutant concerns for the proposed project include:

- Operation of heavy machinery and equipment, including marine vessels, during construction and operations that result in the emission of fossil fuel combustion exhausts. Such exhausts will include oxides of nitrogen, oxides of sulfur, carbon monoxide, and particulates. The significance of the contribution of project emissions to the formation of secondary particulate matter ($PM_{2.5}$) and ozone should also be evaluated;
- Fugitive dust emissions may be generated from construction and operation of the mine, ancillary facilities, and supporting infrastructure. In addition to human health effects, dust blown from the roadway can settle onto wetlands, vegetation, or waterbodies, impairing their health as well; and
- Hazardous air pollutants may result from fuel combustion and ore processing. The *National Air Toxics Assessment* asserts that numerous human epidemiology studies show increased lung cancer rates associated with diesel exhaust and significant potential for non-cancer health effects (see http://www.epa.gov/ttn/atw/nata). Also, the Control of Emissions of Hazardous Air Pollutants from Mobile Sources Final Rule (66 Fed. Reg. 17,230, March 29, 2001) lists 21 compounds emitted from motor vehicles that are known or suspected to cause cancer or other serious health effects. The EPA recommends the EIS disclose whether hazardous air pollutant emissions would result from project construction and operations, discuss the cancer and non-cancer health effects associated with air toxics and diesel particulate matter, and identify sensitive receptor populations and individuals likely to be exposed to these emissions.

AMERICAN OVERSIGHT

We recommend the following steps for the EIS air quality analysis:

- Characterize the existing conditions to set the context for evaluating project impacts, including:
  - Regional climate and meteorology,
  - Air quality and air quality related values (e.g., visibility),
  - Identification of sensitive receptors in the vicinity;
- Review air quality regulations and any air permitting requirements that apply to the air pollutant sources associated with the project;
- Provide a comprehensive emissions inventory of criteria pollutants (in tons per year), greenhouse gas emissions (in metric tons CO_2 equivalents per year), and significant HAP emissions for all project components (mine site, transportation corridor, port, and pipeline) and project phases; and
- If projected emissions are significant, conduct near-field and far-field air quality modeling to assess project-related air quality and visibility impacts. Also, see our recommendations related to Predictive Modeling, later in this document.

We recommend that the Corps evaluate and incorporate best management practices and mitigation measures into the EIS to reduce emissions of criteria pollutants and HAPs, which also have co-benefits of reducing GHGs. We recommend that the EIS include a comprehensive fugitive dust control plan as well as a construction air pollutant emissions control plan to address reduction of engine emissions.

These recommendations are separate and distinct from, and are not intended as a substitute for compliance with, any additional obligations of the Corps and the project proponent to comply with the federal Clean Air Act and any applicable state or tribal air pollution laws, which may require, among other things, obtaining pre-construction permits and operating permits, compliance with new source performance standards and/or national emission standards for hazardous air pollutants, as well as any applicable state implementation plan (SIP) requirements, including, as applicable to the Corps, the requirements under Section 176 of the Clean Air Act regarding conformity of federal activities to implementation plans approved or promulgated under section 110 of the Clean Air Act.

Climate Adaptation

The EPA recommends that the EIS include a discussion of reasonably foreseeable effects that changes in the climate may have on the proposed project and the project area, including its long term infrastructure. This could help inform the development of measures to improve the resilience of the proposed project. If projected changes could notably exacerbate the environmental impacts of the project, the EPA recommends these impacts also be considered as part of the NEPA analysis.

Fish and Wildlife, including Endangered Species and Essential Fish Habitat

The EPA recommends that the EIS evaluate impacts to fish and wildlife from the proposed project and alternatives. The aquatic resources section above also provides recommendations related to fisheries.

Special consideration should be given to listed and proposed species under the Endangered Species Act and Essential Fish Habitat under the Magnuson Stevens Fishery Conservation and Management Act. NEPA regulations require that, to the fullest extent possible, the EIS be prepared concurrently with

AMERICAN OVERSIGHT

environmental analyses required by the ESA and other environmental laws.[36] Magnuson Stevens Act and ESA implementing regulations also encourage coordination with other environmental reviews.[37, 38]

We recommend that the EIS discuss the species listed and proposed as threatened or endangered under the ESA and the essential fish habitat within the project area (including the pipeline, roads, and port site) and the potentially impacted area surrounding the project. The EIS should describe impacts to ESA species and EFH and discuss the activities proposed to avoid, minimize, mitigate, and monitor listed and proposed species and EFH. We understand that the Corps will develop a biological assessment to evaluate impacts to listed and proposed endangered species and EFH, and recommend that it be included with the draft EIS. We also recommend that the federal action agencies work together to ensure that a single biological assessment is developed that meets all agencies' needs.

National Historic Preservation Act

Section 106 of the National Historic Preservation Act of 1966 requires federal agencies to consider the effects of their actions on historic properties, including those of traditional religious and cultural importance, following regulations in 36 C.F.R. Part 800. The NHPA requires a federal agency, upon determining that activities under its control could affect historic properties, to consult with the appropriate State Historic Preservation Officer /Tribal Historic Preservation Officer. We support the Corps' early engagement with the Advisory Council on Historic Preservation, and we recommend that the EIS discuss any potential impacts to historic properties, including any tribal, cultural, or other treaty resources that are historic properties or traditional cultural properties. In addition, the EIS should identify alternatives and mitigation to avoid significant impacts. Recommendations related to traditional uses and resources that are not historic properties are discussed further below.

Invasive Species

We know that ballast water from barges or vessels can be a major source of non-native species into marine ecosystems. Non-native species can adversely impact the economy and the environment and cause harm to human health. Impacts may include reduction of biodiversity of species inhabiting coastal waters due to competition between non-native and native species for food and resources. We recommend that the EIS discuss potential impacts from non-native invasive species associated with ballast water in vessels that will be utilizing the Amakdedori Port associated with this project and identify mitigation measures to minimize adverse impacts to the marine environment and human health.

SAFETY, RISK ANALYSIS, AND HAZARDOUS MATERIALS MANAGEMENT

Accidents and Failures

An array of spills, accidents, and failures can occur at mining sites. We recommend that the EIS describe the control measures that will be in place to prevent these events from occurring during construction, operations, and closure. To identify these events, we recommend that the Corps evaluate the proposed design and management of the tailings facility, dams, and other structures and evaluate PLP's waste and water management and reclamation plans to determine the project-specific likelihood of different types of accidents and failures. Designs and management plans for the pipeline and transportation components

[36] 40 C.F.R. § 1502.25.
[37] 50 C.F.R. § 600.92 (c), (f).
[38] 50 C.F.R. § 402.06.

AMERICAN OVERSIGHT

(road, ports, shipping) should also be evaluated to determine the probability of accidents and failures. We recommend that the results of these evaluations be documented in the EIS. For those events that are determined to be of low probability but high consequence, we recommend that the EIS evaluate the potential effects of such events on aquatic ecosystems, particularly fishery resources, and other resources. The EIS should also discuss mitigation measures that could minimize the risk or damages of such events.

Physical Stability of Structures

The EIS should assess the likelihood of earthquakes in the region and describe the geotechnical stability of the tailings and waste storage facilities and open pit walls during operations and closure. We recommend including a description of how these facilities are designed and how they would be operated, closed, and monitored to ensure stability. In addition, we recommend that a risk assessment, such as a Failure Modes Effects Analysis, (FMEA) be conducted on each of the tailings dams with the results summarized in the EIS. An FMEA considers potential failure modes and identifies the relative likelihood and consequences of the failure modes, which are key considerations for impact assessment. We recommend that the EIS incorporate mitigation or alternatives to improve stability should the FMEA identify failure modes that are anything other than a tolerable risk.

For the tailings impoundment in particular, we recommend that the Corps require a demonstration that the structure complies with state dam safety criteria and has been designed by qualified persons. In addition, we recommend that the Corps require that the dam be independently reviewed (and modified if indicated by the review)[39]. Given the proposed size of the dams associated with the Pebble project and value of the downstream resources, we believe that an independent review of the dam structure is appropriate. We recommend that the results of the independent review be documented in the EIS in order to support the assessment of geotechnical stability.

As mentioned above in the Range of Alternatives section, we recommend that the Corps consider alternatives to improve physical stability of the tailings, including consideration of filtered tailings (dry stack). We note that consideration of a filtered tailings alternative and assessment of safety and stability via a FMEA and independent review panel are consistent with recommendations of *The Independent Expert Engineering Investigation and Review Panel Report on Mount Polley Tailings Storage Facility Breach* (January 30, 2015). In addition to investigating the cause of the Mount Polley tailings storage facility failure, the Review Panel made recommendations on actions that could be taken to ensure that similar failure does not occur at other mines. We recommend that the Corps consider the Review Panel Report and, in particular, the recommendations related to best available technology for new impoundments, design commitments to support permit applications, and actions to validate the safety of tailings storage facilities.

Hazardous Materials

We recommend that the EIS address the potential direct, indirect, and cumulative impacts of hazardous materials/wastes management and storage from the construction and operation of the proposed project and alternatives. Mining activities may involve the transport of hazardous materials, and we recommend that the EIS disclose the types and amounts of materials that will be used at each step of mining operations. In addition, we recommend that the EIS describe measures that will be taken to minimize the

[39] 33 C.F.R. § 325.1.

AMERICAN OVERSIGHT

chances of an accidental release, emergency measures that will be implemented should such an event occur, and how potential adverse impacts from spills may be mitigated by effective containment and cleanup operations.

We also recommend that potential health impacts to local communities or other project area users be identified, as well as any strategies employed to communicate risks or actual emergencies. As part of this analysis, we recommend that the EIS use scientific and traditional ecological knowledge to describe potential health effects from exposure to hazardous materials and the effects on the palatability of eating potentially contaminated foods.

HUMAN HEALTH AND IMPACTS TO COMMUNITIES

Sociocultural Impacts

It is anticipated that the proposed project will result in employment opportunities for Alaska Native residents, as well as generate local and corporate revenues in the region. While employment opportunities and local revenues generally increase a community's standard of living, there can also be impacts to families, communities, and cultures, especially in areas where residents are participating in traditional cultural practices. Noise and physical structures may disturb and/or displace subsistence wildlife from the project area. Other project impacts may affect a community's ability to access traditional and accustomed subsistence use areas. We recommend that the EIS identify the specific communities, federally recognized tribes, and corporations that could be impacted, both positively and negatively, which will help agency decision makers and the public understand the scope of the potential sociocultural impacts.

We recommend that the sociocultural impacts associated with this project and alternatives be fully evaluated and disclosed in the EIS and include, but not be limited to, the following:

- Socioeconomic Impacts
    - Evaluate potential changes to the region's economy as a result of the mine construction and operation (e.g., changes to commercial fishery, recreational fishery, and tourism sectors).
    - Evaluate impacts associated with economic changes to families, communities, and cultures, including potential changes to those aspects of the area's economy that are currently subsistence-based;
    - Evaluate the potential decline in the region's economy following mine closure; and
    - Evaluate replacement costs of traditional foods if access or availability are impacted by the proposed project.
- Accessibility of Traditional Use Areas
    - Identify community traditional use areas for subsistence, harvesting, hunting and trapping, fishing, travelling, camping, berry picking, and other uses;
    - Describe the potential access limitations to these traditional use areas and their impacts to local communities; and
    - Coordinate with the tribes and communities on options for mitigating impacts associated with accessibility to traditional and accustomed use areas.
- Compatibility of Traditional Use Areas
    - Identify project activities that may conflict with traditional and accustomed uses; and

AMERICAN OVERSIGHT

- Coordinate with the affected tribes and communities to identify mitigation options for avoiding and minimizing conflicts between traditional and accustomed subsistence uses and the construction and operation of this project.

Environmental Justice and Impacted Communities

In compliance with NEPA and Executive Order 12898 on Environmental Justice, actions should be taken to conduct adequate public outreach and participation that ensures that the public and Native American tribes understand possible impacts to their communities and trust resources.

Executive Order 12898 requires each federal agency to identify and address disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations, low-income populations, and Native American tribes.[40] The EPA also considers children, the disabled, the elderly, and those of limited English proficiency to be uniquely vulnerable populations that may be impacted.

The CEQ has developed guidance concerning how to address Environmental Justice in the environmental review process.[41] In accordance with this guidance, the EPA recommends that the EIS address the following points:

- Identify low income, minority, and Alaska Native communities that may be impacted by the project;
- Describe the efforts that have been or will be taken to meaningfully involve and inform affected communities about project decisions and impacts;
- Disclose the results of meaningful involvement efforts, such as community identified impacts;
- Evaluate identified project impacts for their potential to disproportionately impact low income, minority, or Alaska Native communities, relative to a reference community;
- Disclose how potential disproportionate impacts and environmental justice issues have been or will be addressed by the Corps' decision making process;
- Propose mitigation for unavoidable impacts that will or are likely to occur; and
- Include a summary conclusion, sometimes referred to as an "environmental justice determination" that concisely expresses how environmental justice impacts have been appropriately avoided, minimized, or mitigated.

We also recommend that particular attention be given to consideration of the dependence of local communities on local and regional subsistence resources, access to those resources, and perception of the quality of those resources. Additional information and tools for environmental justice analysis can be found on the EPA's website at: https://www.epa.gov/environmentaljustice.

Health Risk or Impact Analysis

The EPA recommends that the Corps undertake a screening process to determine which aspects of health (including but not limited to public, environmental, mental, social, and cultural) could be impacted by the proposed project. Depending on the screening results, an analysis of health effects, such

[40] EO 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-income Populations. February 11, 1994.
[41] http://ceq.hss.doe.gov/nepa/regs/ej/justice.pdf.

AMERICAN OVERSIGHT

as a health risk assessment or Health Impact Assessment, may be needed to determine the direct, indirect, and cumulative impacts to health. This analysis may need as much time to complete as the Draft EIS, therefore we recommend that early screening is essential to ensuring a timely analysis. We further recommend that the Corps partner directly with local, state, tribal, and federal health officials to determine the type of analysis needed to assess health impacts and conduct the analysis, and to determine appropriate and effective mitigation of potential health impacts.

Scope of Health Assessment in EIS

In terms of the scope of the health assessment, we recommend that the potential for contaminant exposure and resulting risks be evaluated. In addition, we recommend that the EIS consider how income from new jobs can result in positive or negative health impacts, for example by increasing socioeconomic status or by generating rapid social and community change. We also recommend considering the health impacts of potential changes to traditional way of life from the project, including reduced reliance on a traditional diet due to lack of access and corresponding increased reliance on substitutes.

Data Collection

To appropriately evaluate health impacts, we recommend that specific health data that may not be routinely collected as part of the scoping process may be required. To ensure that the necessary data are available for this evaluation, the Corps may want to involve public health professionals early in the NEPA process. Public health data and expertise for prospective health impact analysis, or for providing input on health issues, may be available from local health departments, tribal health agencies, the Alaska Department of Health and Social Services, or federal public health agencies such as the U.S. Centers for Substances and Disease Registry, or the Indian Health Service.

Methods and Tools

The Health Impact Assessment methodology is a common tool that can be used to assess potential health impacts. HIA is a combination of procedures, methods, and tools that enables systematic analysis of potential positive or negative effects of a policy, plan, program, or project on the health of a population, as well as the distribution of those effects within the population.[42] Depending on available data and potential effects, there are different levels of HIA analysis, and we recommend that the Corps' involve public health professionals in determining the appropriate level of analysis. In addition to evaluating impacts, we recommend that the HIA identify the appropriate actions to manage or mitigate health effects from the proposed project.

Guidelines for conducting an HIA are available from various sources.[43] The World Health Organization has links to many guides.[44] The International Finance Corporation has also developed detailed guidelines for conducting an HIA.[45] In addition, the State of Alaska has developed *Technical Guidance for Health Impact Assessment*, also known as the "Alaska HIA Toolkit".[46]

---

[42] This definition is from the International Association for Impact Assessment (IAIA), which is modified from the World Health Organization's Gothenberg consensus statement (1999).

[43] The EPA does not endorse or recommend use of any single or particular guidance on HIA. These references are provided as general information and to assist permitting agencies with identifying additional resources on HIA.

AMERICAN OVERSIGHT

CONSULTATION AND COORDINATION WITH TRIBAL GOVERNMENTS

Executive Order 13175, Consultation and Coordination with Indian Tribal Governments (November 6, 2000), was issued to establish regular and meaningful consultation and collaboration with tribal officials in the development of federal policies that have tribal implications, and to strengthen the United States' government-to-government relationships with Indian tribes. In addition, pursuant to Public Law 108-119, 118 Stat. 452, as amended by Public Law 108-4217, 188 Stat. 3267, federal agencies are required to consult with Alaska Native Claims Settlement Act corporations on the same basis as Indian tribes under Executive Order 13175. We recommend that the EIS describe the process and outcome of any government-to-government and/or government-to-corporation consultations regarding the Pebble Project, issues that were raised during the tribal consultations and how those issues were addressed.

Cooperating agency involvement establishes a mechanism for addressing intergovernmental issues throughout the EIS development process, and we support the Corps' inclusion of two tribal governments as cooperating agencies. We recommend that the Corps remain open to including other potentially affected tribal governments that have the resources and interest in serving as cooperating agencies for EIS development, consistent with the July 28, 1999, memorandum from CEQ to the heads of federal agencies.

ANALYSIS TOOLS AND METHODOLOGIES

Baseline Data Adequacy

We suggest categorizing and synthesizing existing data to ensure pertinent information is available for review and use in the EIS analysis. We understand that the Corps intends to establish focused workgroups during development of the EIS. We support this approach and recommend that the workgroups include cooperating agency subject matter experts for key areas (air, water, wetlands, fisheries, etc.) to review baseline data for completeness, identify data gaps, and recommend approaches toward resolving those gaps in a timely manner. For example, additional analysis or collection of additional data may be required to characterize the accuracy of best available baseline estimates of resources such as fish populations, groundwater elevations, or wetland extents. Such information will be critical for designing and developing a robust monitoring framework and for assessing impacts during and after project development and comparing those to the baseline.

Geochemistry/Characterization of Ore, Waste Rock, and Tailings

To provide reliable predictions of water quality and impacts to surface water and groundwater due to wastewater and mine waste management, we recommend that the physical and chemical characteristics of the ore, pit walls, waste rock, and tailings should be determined and disclosed in the EIS. Environmental samples used to support projections should represent a range of conditions that currently occur and that could occur in the future as a result of the project, including under potentially altered future climate conditions. Waste materials (ore, waste rock, tailings) used for environmental projections should be representative of the material to be mined and related to the mine plan and proposed processing methods. Physical and chemical characterization should be conducted in a manner that provides environmentally conservative estimates of impacts.

AMERICAN OVERSIGHT

It may be helpful to consider EPA Region 10's Sourcebook for Hardrock Mining for recommendations related to the NEPA analyses of mining projects.[47] We recommend that the following information be utilized to characterize geologic and mineralogy setting/aqueous geochemistry in the baseline environment and impact prediction sections of the EIS:

- Whole rock analysis;
- Mineralogy;
- Drill core descriptions;
- Block model or similar model (a computerized estimate of the quantity and characteristics of ore and waste);
- Available literature on the ore deposit;
- Mineral occurrences (e.g., on fracture surfaces, in groundmass, using hand specimens and thin section) with an emphasis on sulfides and carbonates;
- Acid-base accounting;
- Long-term kinetic testing (including possible startup of test pads if sufficient material and access to site are available);
- Baseline surface and ground water quality and flows (including springs);
- Potentiometric surface for groundwater;
- Hydraulic properties (e.g., hydraulic conductivity, porosity, permeability) of soil, vadose zone, and groundwater aquifers, especially under proposed locations of mine facilities; and
- Hydrogeochemical models for prediction of water quality.

Predictive Modeling

We recommend that predictive modeling be based on a site-specific conceptual model that describes the system boundaries, spatial and temporal scales, hydraulic (for water modeling) and chemical characteristics, sources of data and data gaps, and the mathematical relationships used to describe processes. We also recommend that our suggestions be applied to any environmental and predictive modeling used for assessing impacts in the EIS. The water quality model, in particular, should be capable of predicting both whole water and dissolved fractions of metals/metalloids and should provide temporal predictions that are consistent with the time-steps in applicable water quality criteria.

Any modeling documentation should include:

- Tables of parameter values used in the model;
- Tables and graphs of results;
- Uncertainty and sensitivity analyses;
- Errors associated with both measured and assumed data; and
- Recommendations for further analysis, if applicable.

We recommend that discussions on modeling include a clear statement of the management objectives intended to be achieved by the modeling, the level of analysis required to meet the objectives, and uncertainties associated with modeled outcomes. For your reference, please refer to EPA's guidance that provides recommendations for the effective development, evaluation, and use of models in

[47]U.S. EPA Region 10. 2003. EPA and Hardrock Mining: A Source Book for Industry in the Northwest and Alaska January 2003.

AMERICAN OVERSIGHT

environmental decision making.[48]

We recommend that the EIS use caution in describing absolute outcomes based on modeling. Mathematical modeling used for describing the physical and chemical characteristics of the project site and potential impacts includes a level of uncertainty; understanding these uncertainties and associated risks is necessary for informed decision making. We recommend that the study plan for modeling analysis clearly state the purpose, questions of concern, method, data, and limitations of the model to generate valuable interpretations. We also strongly recommend an appropriately conservative approach be taken with modeling and a range of predictive outcomes be discussed (e.g., most likely case, reasonable worst-case, and reasonable best-case scenarios) that reflect a range of climatic settings and critical input values. Inclusion of a reasonable range of outcomes allows the agencies to make better informed plans for mitigation, adaptive management, and contingencies to respond to reasonably foreseeable adverse impacts.

Traditional Ecological Knowledge

Due to the location of the proposed project and traditional uses of the area, we recommend the identification, inclusion, and integration of traditional ecological knowledge into the EIS analysis, as appropriate. Such anthropological work can include the collection of local and traditional knowledge concerning the affected environment, anticipated impacts from the project, and traditional hunting and land use patterns in the area. We recommend that, in addition to reviewing any pertinent traditional ecological knowledge currently available, additional studies be conducted as necessary to clearly identify concerns and potential impacts, including cumulative impacts, from the proposed project and project alternatives. This information should be reviewed and included in the EIS to the extent possible and utilized in the analysis of potential impacts.

MITIGATION, MONITORING, AND ADAPTIVE MANAGEMENT

Mitigation

CEQ regulations at 40 C.F.R. § 1508.20 define mitigation to include five categories of actions to address impacts. Briefly stated, these are: avoiding, minimizing, rectifying, reducing, and compensating. The regulations at 40 C.F.R. § 1502.14(f), 1502.16(h), and 1508.25 indicate that appropriate mitigation measures should be addressed in an EIS both as part of the analysis of alternatives and in discussions of environmental consequences.

Mitigation is also relevant to evaluating compliance with the Guidelines, which prohibit discharges of dredged or fill material that will cause or contribute to significant degradation of the waters of the United States, and prohibit all discharges *"unless appropriate and practicable steps have been taken which will minimize potential adverse impacts of the discharge on the aquatic ecosystem."*[49] The Guidelines identify numerous types of actions to mitigate potential adverse impacts, which include

---

[48] Guidance Document on the Development, Evaluation and Application of Environmental Models (PDF). EPA/100/K-09/003. March 2009. http://www.epa.gov/crem/cremlib.html.

[49] 40 C.F.R. § 230.10(d).

AMERICAN OVERSIGHT

measures to avoid, minimize, and compensate for impacts. Avoidance, minimization, and compensation form a "mitigation sequence" that must be followed in order to comply with the Guidelines' requirement that all appropriate and practicable steps be taken to mitigate impacts to aquatic resources.[50] Compensatory mitigation considerations under the Guidelines are discussed further in the section on aquatic resources above.

The EPA recommends that the EIS identify the type of activities that would require mitigation measures during the construction, operation, and closure phases of this project. In addition, we recommend identifying whether implementation of each measure is required by the Corps or any other governmental entity and which entity will be responsible for implementing the measure. To the extent possible, mitigation goals and measurable performance standards should be identified in the EIS to reduce impacts to a particular level or adopted to achieve an environmentally preferable outcome. CEQ guidance on the Appropriate Use of Mitigation and Monitoring seeks to enable agencies to create successful mitigation planning and implementation procedures with robust public involvement and monitoring programs.[51]

Monitoring

Environmental monitoring programs should be designed to assess both impacts from the project and whether implemented mitigation measures are effective. We recommend that the monitoring programs:

- Define the monitoring goals and objectives;
- Provide details to demonstrate that goals and objectives will be achieved such as the parameters to be monitored, monitoring locations and frequency, data analysis, and reporting;
- Discuss actions (contingencies, triggers, adaptive management, corrective actions, etc.) that will be taken based on monitoring results;
- Identify and incorporate controls and pre-project data with quantified bias and precision to enable detection of impacts, success of BMPs, and ability to distinguish these from natural variation; and
- Require regular analysis and reporting of data to oversight agencies, including submittal of a sampling and quality assurance plan for agency approval.

We recommend that the monitoring programs be described in the EIS and that the EIS also discuss public participation, and how the public can get information on mitigation effectiveness and monitoring results.

Adaptive Management Planning

We recommend that the EIS utilize adaptive management and contingency planning to describe the strategy for responding to unforeseen circumstances at the site. The strategy should include "trigger levels" (e.g., exceedance of ecological benchmarks) or observations (e.g., statistically significant trends in indicators, permit violations, water balance problems, changes in discharge or chemistry of springs/seeps) that would set follow-up actions into motion. This strategy or plan should be described so that reviewers may comment on its adequacy. This type of plan, when coupled with the monitoring program, is necessary to mitigate for uncertainties and risks associated with predictions of

[50] 40 C.F.R. § 230.10(a), (d); *See* Memorandum of Agreement between U.S. Department of Army and the Environmental Protection Agency on the Determination of Mitigation Under the Clean Water Act Section 404(b)(1) Guidelines.
[51] https://ceq.doe.gov/docs/ceq-regulations-and-guidance/Mitigation_and_Monitoring_Guidance_14Jan2011.pdf.

AMERICAN OVERSIGHT

environmental outcomes, and will provide an early warning system of unexpected outcomes.

FINANCIAL ASSURANCE

NEPA provides for the disclosure of all information concerning the environmental consequences of a proposed action to agency decision makers and the public before decisions are made and actions are taken. A key component in determining the environmental impacts of a mining project is the effectiveness of the closure and reclamation activities, including long-term water management. In turn, whether any closure and reclamation activities that may be necessary will be adequately funded is key to determining whether those activities will be effective. We therefore recommend that the project's ability to self-fund, and/or any third-party financial assurance mechanisms, be disclosed. Disclosure of the financial assurance amount and mechanism is particularly important for this project given that PLP's proposal includes long term water management and treatment.

We recommend that the draft EIS disclose the estimated costs to reclaim and close the site in a manner that achieves reclamation goals and post-mining land use objectives. The EPA recommends that the final EIS identify proposed financial assurance mechanisms and demonstrate that these mechanisms would ensure that necessary reclamation work is completed.

The EPA is available for further conversations about the level of detail to include in the document. Below are the main elements that we believe should be disclosed in the EIS:

1. Site Reclamation (facility closure, earth moving/stabilization, revegetation, etc.):

- Phases of reclamation;
- Estimated cost (+/- percent) to reclaim and close the site in a manner that achieves reclamation goals and post-mining land use objectives;
- Criteria for determining success of reclamation activities for financial assurance release; and
- Costs associated with implementing contingency measures to address reasonably foreseeable but not specifically predicted outcomes.

2. Long-Term Site Management (post-closure water treatment, mitigation of impacts to aquatic resources, site maintenance, and monitoring):

- Itemized cost estimate (including reasonable contingencies) and appropriate economic variables to calculate the net present value of future expenses; and
- If a trust fund is utilized, address the "mechanics" of the fund, including:
    - Trust fund mechanism (e.g., current value trust, net present value trust, etc.);
    - Requirements for timing of payments into the trust fund;
    - How the Corps would ensure that the trust fund or other financial assurance could not be claimed by a creditor in the case of bankruptcy;
    - Acceptable financial instruments;
    - How trust management fees and taxes will be paid;
    - Identity of the trust fund beneficiaries; and
    - Identity of the operator with responsibility/liability for financial assurance.

It is different from (but similar to) the language attached to Drew's message of last night, but am presuming that it is final and approved and inserting into the letter. Approaching COB, so please let me know if direction is otherwise.

Climate Adaptation

EPA recommends that the EIS include a discussion of reasonably foreseeable effects that changes in the climate may have on the proposed project and the project area, including its long term infrastructure. This could help inform the development of measures to improve the resilience of the proposed project. If projected changes could notably exacerbate the environmental impacts of the project, EPA recommends these impacts also be considered as part of the NEPA analysis.

AMERICAN OVERSIGHT

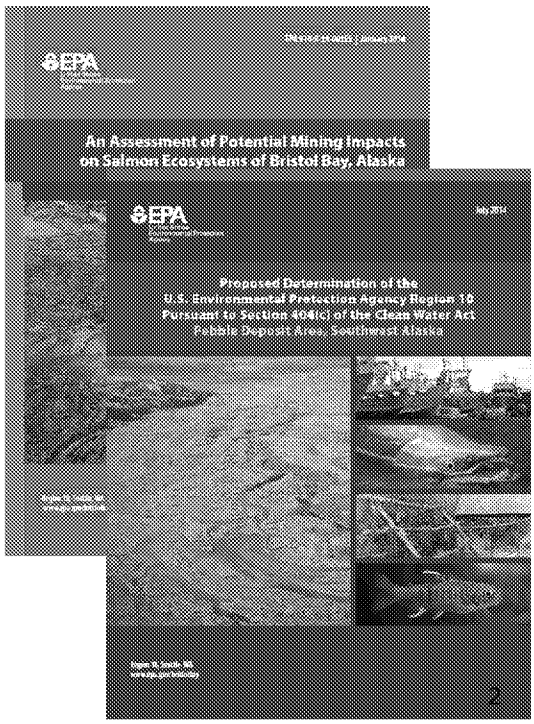
DRAFT

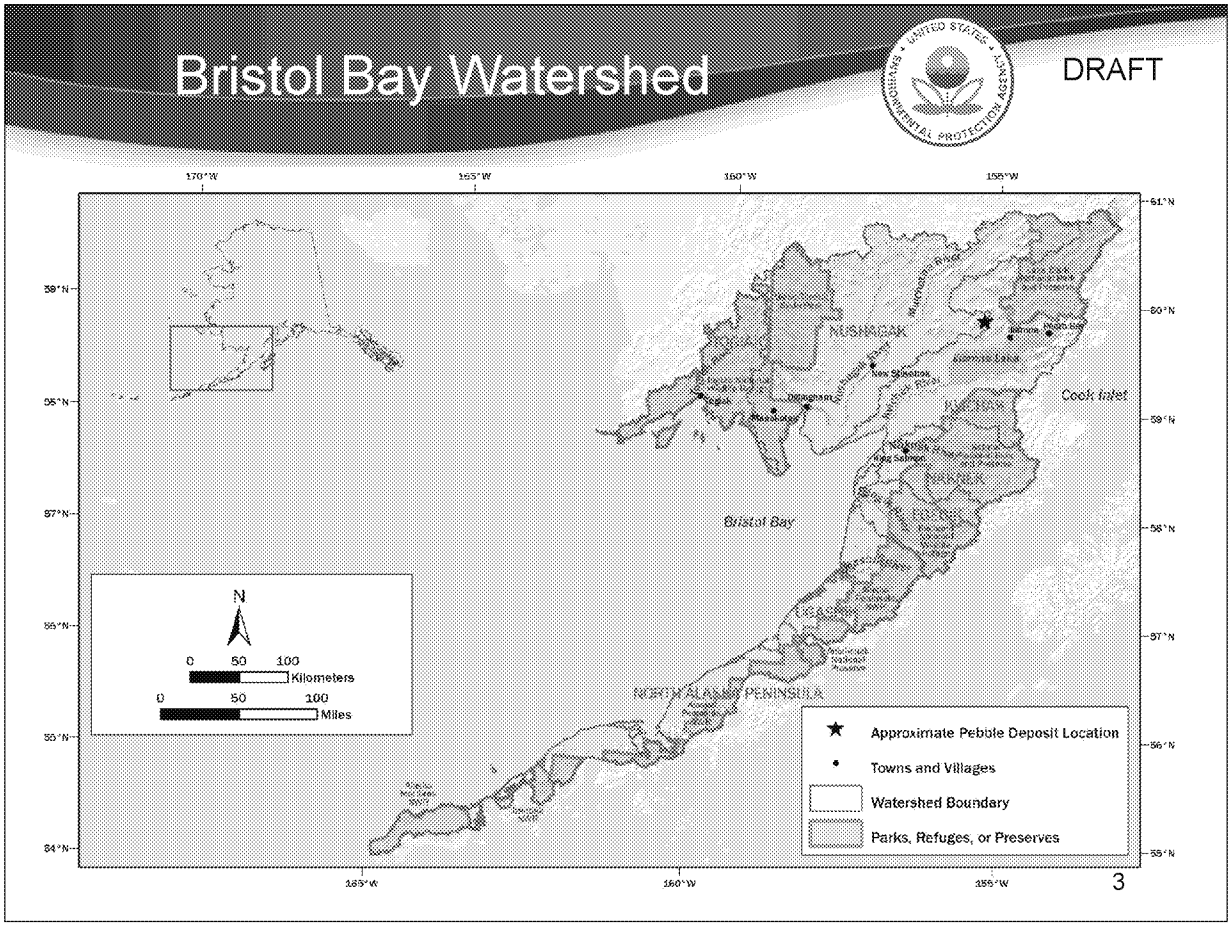
EPA's Work in the Bristol Bay Watershed

Presentation for Office of Federal Activities



January 31, 2018

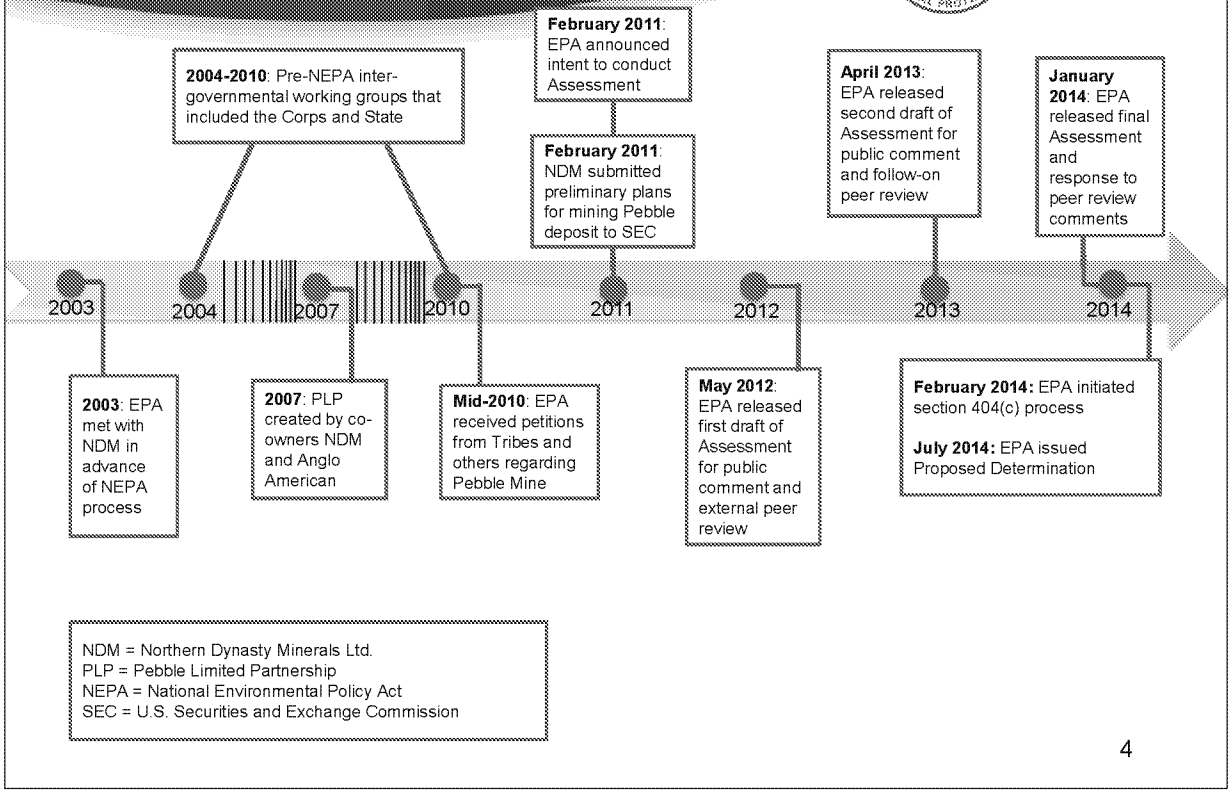
AMERICAN OVERSIGHT



Overview

DRAFT

- EPA's Involvement History
- Science
- Section 404(c) Regulatory Response
- Section 404 Permitting and NEPA

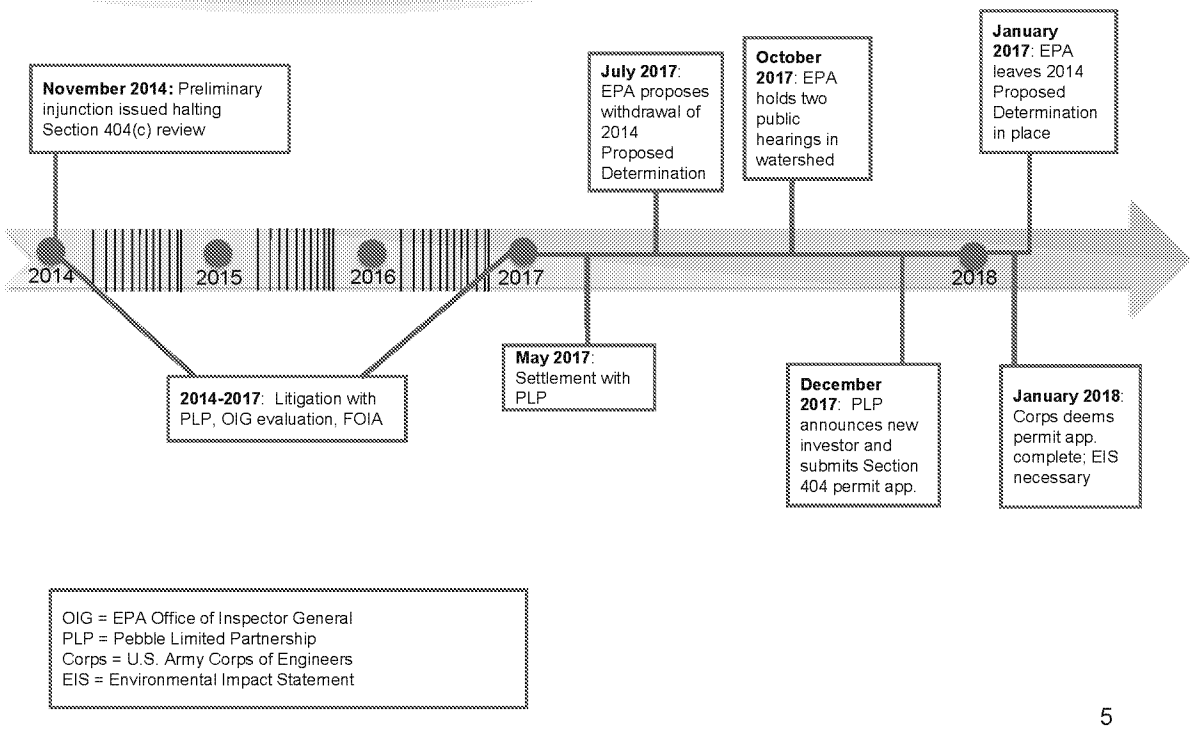


AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

Timeline 2003 - 2014

DRAFT

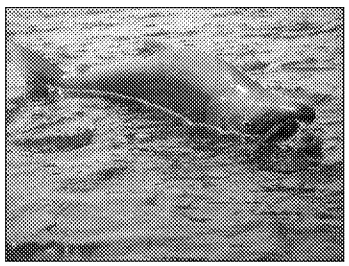


NDM = Northern Dynasty Minerals Ltd.
PLP = Pebble Limited Partnership
NEPA = National Environmental Policy Act
SEC = U.S. Securities and Exchange Commission

AMERICAN OVERSIGHT

Timeline 2014 - Present

DRAFT



OIG = EPA Office of Inspector General
PLP = Pebble Limited Partnership
Corps = U.S. Army Corps of Engineers
EIS = Environmental Impact Statement

AMERICAN OVERSIGHT

Bristol Bay Watershed Assessment

DRAFT

- Purpose:
  - Characterize the biological and mineral resources of the Bristol Bay watershed
  - Increase understanding of the potential impacts of large-scale mining on the region's fish resources
  - Inform future decision-making
- Scientific Ecological Risk Assessment evaluating potential impacts associated with:
  - Large-scale mine construction and operation
  - Accidents and failures

- Three-year scientific assessment effort
  - Independent external peer review
  - Stakeholder and public engagement
    - 8 public meetings
    - 2 rounds of public comment – over 1.1 million comments
  - Tribal consultations

AMERICAN OVERSIGHT

Bristol Bay Watershed Resources

DRAFT

Biological Resources:

- Bristol Bay produces almost half of world's sockeye salmon
- Kvichak watershed world's largest producer of sockeye salmon
- Nushagak watershed frequently at or near world's largest producer of Chinook salmon

Biological Resources Support:

- 14,000 jobs, generates $480 million annually in direct economic expenditures and sales
  - Salmon fishery valued at $1.5 billion annually
- 4,000-year-old subsistence fishery for Alaska Natives

Geological Resources:

- At least 10 claims with more than minimal exploration, including Pebble.
- Pebble deposit: low-grade, with copper, gold, and molybdenum
- According to NDM, Pebble could:
  - Be largest mine of its type in North America
  - Produce 3,000 jobs in AK
  - Contribute $2.7 billion to US GDP annually
- Economics of mining the Pebble deposit are speculative
- Since 2001, four major mining companies have walked away from Pebble project

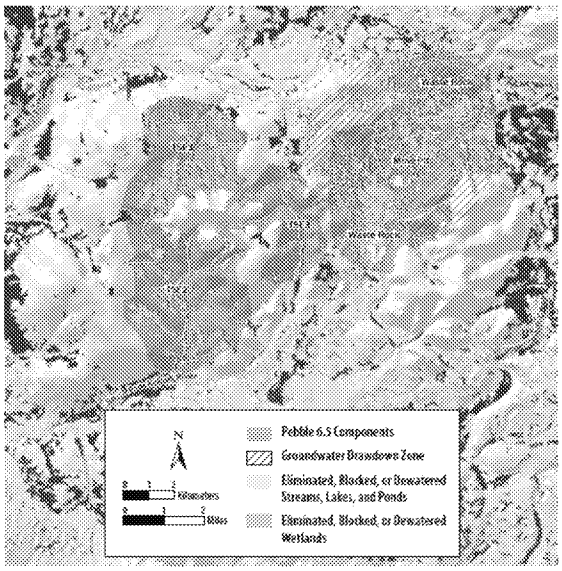
AMERICAN OVERSIGHT

Bristol Bay Watershed Assessment

- Mining scenarios informed by NDM plans submitted to U.S. Securities and Exchange Commission (SEC) in 2011
- Uses 3 potential stages of mine development at Pebble deposit
  - 0.25-billion-ton mine (worldwide median size porphyry copper deposit)
  - 2.0-billion-ton mine (smallest mine size proposed by NDM to SEC)
  - 6.5-billion-ton mine (largest mine size proposed by NDM to SEC)
- NDM says deposit is nearly 12 billion tons

AMERICAN OVERSIGHT

Bristol Bay Watershed Assessment



DRAFT

Mine Footprint Impacts:

- 24-94 miles of salmon-supporting streams destroyed
- 1,300-5,350 acres of wetlands, ponds, lakes destroyed
- 9-33 miles of salmon-supporting streams with altered streamflow likely to affect ecosystem structure and function

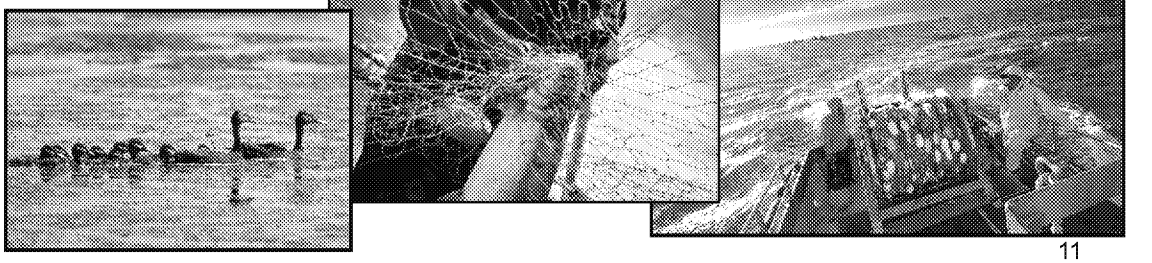
Other Impacts:

- Tailings dams need maintenance in perpetuity
- Routine operations and accidents would increase impacts on salmon habitat quality, both at the mining site and along the 86-mile transportation corridor.

AMERICAN OVERSIGHT

Clean Water Act Section 404

DRAFT



- § 404(a) authorizes the Secretary of the Army to issue **permits**
  - For the discharge of dredged or fill material into waters of the U.S. at specified disposal sites
- § 404(b) directs the Secretary of the Army to apply **environmental criteria** developed by EPA when specifying disposal sites
  - § 404(b)(1) Guidelines [40 CFR Part 230]
- § 404(c) authorizes EPA to prohibit, deny or restrict (withdraw) the placement of dredged or fill material at defined sites in waters of the U.S.

AMERICAN OVERSIGHT

Limits of Section 404(c)

DRAFT

- **Whenever** it determines, after notice and opportunity for public hearing, that the discharge of such materials into such area will have an **unacceptable adverse effect(s)** on:
  - Municipal water supplies; or
  - Shellfish beds and **fishery areas**; or
  - Wildlife; or
  - Recreation areas.

AMERICAN OVERSIGHT

Pebble Deposit 404(c) Process

DRAFT

Step 1

- 2/28/14: **Initiation by EPA Region 10 – "15-day letter"**
- Consulted with Corps, NDM/PLP, and State

Step 2

- 7/18/14: **Proposed Determination** released (PD) by EPA Region 10
- 8/12-15/14: 7 public hearings in Alaska
- > 670,000 written comments; > 99% (86% unique) supported Proposed Determination

Step 3

- EPA Region 10 will review the public comments
- EPA Region 10 will withdraw PD *or* prepare **Recommended Determination** (RD)

Step 4

- **Final Determination (FD) by EPA Assistant Administrator for Water**
- Consult again with Corps, NDM/PLP, and State
- Within 60 days of receipt of RD, issue FD affirming, modifying, or rescinding RD

AMERICAN OVERSIGHT

What Are the Proposed Restrictions?

DRAFT

Restrict the discharge of dredged or fill material related to mining the Pebble deposit into waters of the U.S. that would, individually or collectively, result in the following:

1. **Loss of Streams.**
   a. The loss of 5 or more linear miles of streams with documented anadromous fish occurrence; **or**
   b. The loss of 19 or more linear miles of streams where anadromous fish are not currently documented, but that are tributaries of streams with documented anadromous fish occurrence; **or**

2. **Loss of Wetlands, Lakes, and Ponds.** The loss of 1,100 or more acres of wetlands, lakes, and ponds contiguous with either streams with documented anadromous fish occurrence or tributaries of those streams; **or**

3. **Streamflow Alterations.** Streamflow alterations greater than 20% of daily flow in 9 or more linear miles of streams with documented anadromous fish occurrence

AMERICAN OVERSIGHT

Response to Section 404(c) Proceeding

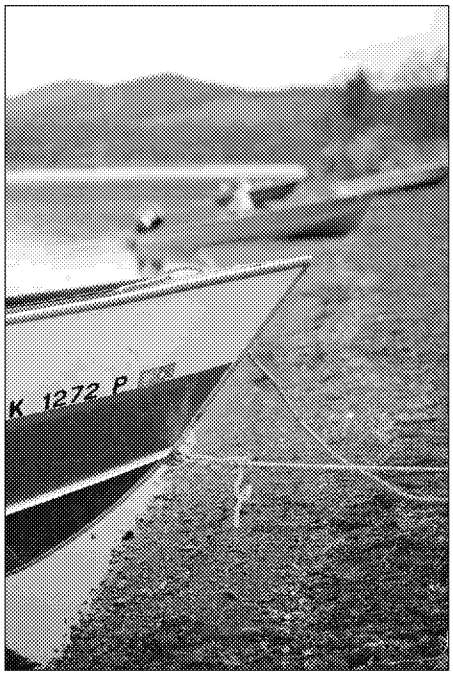
DRAFT

- Office of Inspector General (OIG) Review
  - 17-month in-depth evaluation found no evidence of bias or a pre-determined outcome
  - Possible misuse of position for retired Region 10 employee noted
- PLP broad Freedom of Information Act (FOIA) requests
  - Approximately 18,000 documents produced
- PLP filed three lawsuits in 2014
  - Administrative Procedure Act (APA) challenge to initiation of 404(c) process
  - FOIA litigation
  - Federal Advisory Committee Act (FACA) litigation
- May 2017 settlement agreement
  - Resolved FOIA and FACA litigation and PLP's outstanding FOIA requests

AMERICAN OVERSIGHT

Settlement Agreement

DRAFT



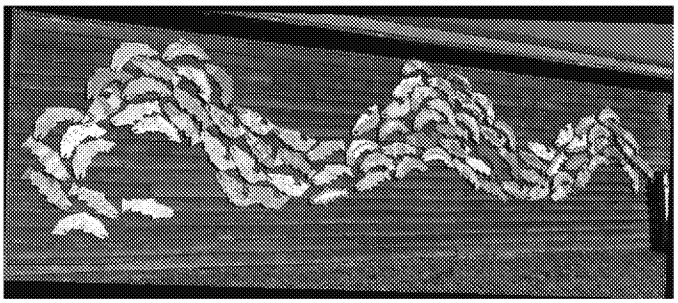
- Key terms of the May 11, 2017 settlement agreement between PLP and EPA:
  - EPA may use its Bristol Bay Watershed Assessment without limitation
  - EPA agrees to initiate a process to propose to withdraw its 2014 Proposed Determination by July 11, 2017
  - EPA agrees not to forward a Recommended Determination (the next step in the 404(c) review process) to EPA HQ until a Final EIS is noticed for the project or May 11, 2021, whichever is earlier
  - PLP drops remaining lawsuits and fee requests against EPA and agrees to file no new FOIA requests during the 2.5- to 4-year hiatus period

AMERICAN OVERSIGHT

Proposal to Withdraw 2014 Proposed Determination

DRAFT

- July 2017: Withdrawal proposed based on policy rationale
  - EPA did not solicit comment on the proposed restrictions or on science or technical information underlying the Proposed Determination
- Outreach and Consultation
  - Proposal generated >1 million comments (~99% opposed)
  - 2 public hearings in watershed
  - Tribal and ANCSA Consultation
    - 16 tribal governments and 1 ANCSA Regional Corp. opposed
    - 1 tribal government and 2 ANCSA Village Corps. supported



AMERICAN OVERSIGHT

Section 404(c) Next Steps

DRAFT

- EPA decided not to withdraw and suspended Section 404(c) process pending further review

- Settlement agreement obligations
  - EPA can issue a new/modified Proposed Determination at any time
  - EPA Region 10 cannot forward a Recommended Determination to EPA HQ until May of 2021 or until a final EIS is noticed, whichever comes first

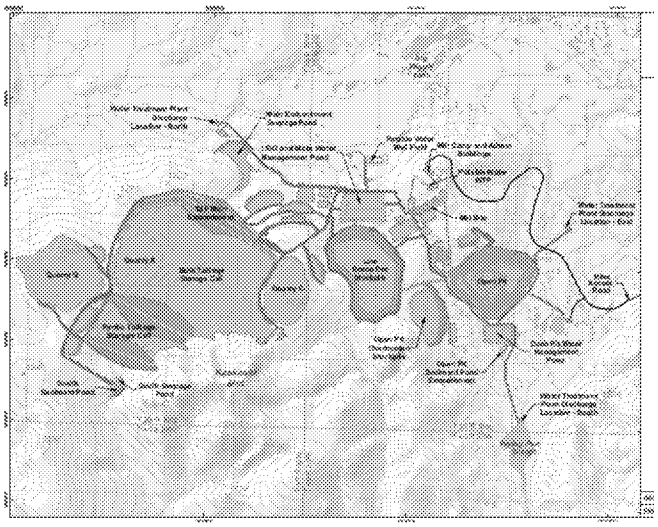
AMERICAN OVERSIGHT

2017 Permit Application

DRAFT

- PLP filed Department of Army (DA) permit application to the Corps in December 2017
  - Includes CWA 404 and RHA Section 10
  - Includes Project Description: mine, power supply, transportation
- Corps deemed application sufficient to begin NEPA

Pebble deposit area



AMERICAN OVERSIGHT

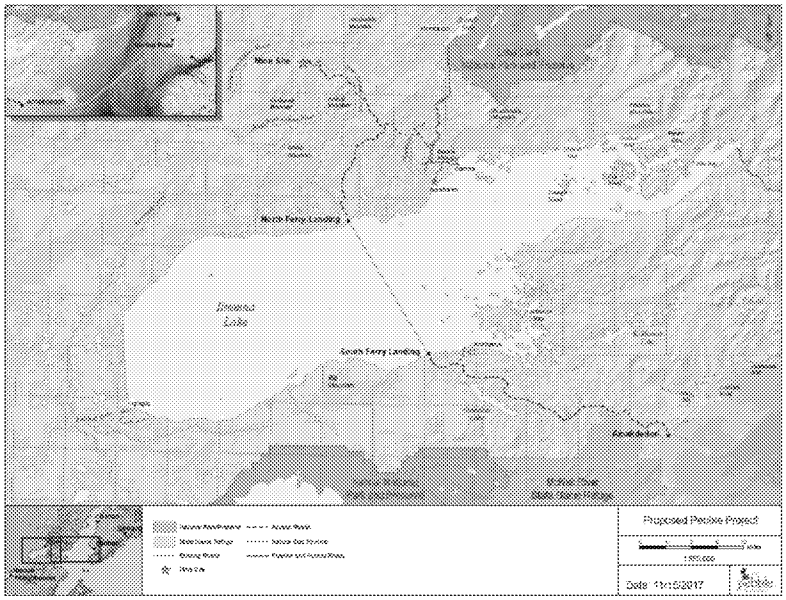
Project Description

DRAFT

Mine Site

- 1.1 billion tons of ore mined over 20 years
- 160,000 tons/day of ore processed to produce:
  - Copper concentrate
  - Molybdenum concentrate
  - Gold via gravity separation
- Open pit mine, ore storage pile, 2 tailings impoundments
- 2 water treatment plants and 3 discharge outfalls
- Closure
  - PAG waste rock backfilled into open pit
  - Dry closure of tailings
  - Long-term water treatment

AMERICAN OVERSIGHT



Project Description

Power

- 230 MW power plant at mine site
- 188 mile natural gas pipeline

Transportation

- 65 miles of roads
- Ferry across Lake Illiamna
- Cook Inlet port site & dredge disposal site

AMERICAN OVERSIGHT

Project Description

DRAFT

- Proposed mine is:
  - Smaller than 2011 Preliminary Assessment to SEC
  - Larger than the EPA Assessment's 0.25 billion ton mine scenario, which is the basis for the 2014 Proposed Determination

2014 Proposed Determinations
Loss of 5 or more miles of streams with anadromous fish; or
Loss of 19 or more miles of streams that are tributaries of anadromous fish streams; or
Loss of 1100 or more acres of wetlands, lakes and ponds contiguous with streams or tributaries to streams that have anadromous fish; or
Stream flow alteration > 20% of daily flow in 9 or more miles of streams with anadromous fish

2017 DA Application	
component	**wetlands filled**
Mine site	3190
Transportation (roads, ferry terminals, port)	480
Pipeline	408
TOTAL	4078

- Differences from 2011 Preliminary Assessment and EPA's Assessment:
  - Less waste rock mined
  - No cyanide leaching
  - Liners (pyritic tailings and low grade ore stockpile)
  - Advanced water treatment and "Physical Habitat Simulation System" to mitigate dewatering
  - Compensatory mitigation - TBD
- Project description could evolve during EIS and 404 review

AMERICAN OVERSIGHT

Initial Corps Process

DRAFT

- Corps issued informational Public Notice of application (January 5, 2018)
  - Did not request public comment at this time
- Corps invited EPA to be EIS cooperating agency
  - Currently proposing to limit EPA's involvement to Section 404(b)(1) issues
  - Framework for coordination is atypical
  - EPA requested higher-level meeting to discuss
- Proposed schedule
  - Notice of Intent/EIS scoping in spring 2018
  - Final EIS by end of 2020
  - DA Application (CWA 404) public notice with Draft or Final EIS
  - FAST-41 considerations

AMERICAN OVERSIGHT

Potential NEPA Cooperating Agencies

DRAFT

- Federal
  - DOT Pipeline and Hazardous Materials Safety Administration (TBD)
  - US Coast Guard
  - DOI Bureau of Safety and Environmental Enforcement
  - US Fish and Wildlife Service
  - National Marine Fisheries Service
  - EPA
- State
  - Alaska Department of Natural Resources Office of Project Management and Permitting coordinates state agencies (ADNR, ADEC, ADFG, SHPO)
- Local Governments
  - Lake & Peninsula Borough & Kenai Peninsula Borough
- Tribes
  - Corps sent consultation letters to 35 tribal governments
  - Corps has not yet solicited tribes interest in participating as cooperating agency

AMERICAN OVERSIGHT

EPA Response to Permit Application

DRAFT

- EPA Role
  - NEPA
    - Potentially a cooperating agency
    - CAA 309 review of the Draft EIS
  - Clean Water Act
    - CWA 404 permit application & 404(b)(1) review
    - Oversight of State CWA 402 Alaska Pollutant Discharge Elimination System Permit
  - Clean Air Act
    - Oversight of State Air Quality Permit
- EPA has developed a cross-programmatic, multi-disciplinary team
- Next Steps
  - Resolve cooperating agency status
  - EIS scoping

AMERICAN OVERSIGHT

Questions

DRAFT

Upper Talarik Creek, one of three streams flowing from the Pebble deposit site

Chris – an early preview of a briefing paper for you to prep for next Friday's conversation with Colonel Borders. You should not feel compelled to review now; we can discuss during our meeting scheduled for 1pm tomorrow, and I'll make sure that a final version is included in the packet you take to Alaska next week.

I understand that Sue is accompanying you to the meeting with the Colonel. Am cc'ing her and have invited her to join our discussion tomorrow.

Sent: Monday, December 18, 2017 4:12 PM
To: R10-OERA <R10-OERA@epa.gov>
Subject: RA briefing updates

OERA – at last week's all-staff meeting, we discussed the ongoing efforts to get our new Regional Administrator informed about our office and the numerous issues pending before us. The purpose of this email is to pass on some of the materials related to this effort.

You may have seen the InfoPage announcement that the briefing book that we prepared for the incoming RA is now posted on the Office of Regional Administrator's SharePoint site. I've also attached it to this message. Thanks to all who helped me compile and update the content in the OERA section of the book. I think the book came out well, and I may use all or portions of it in the future to introduce Region 10 or our office to external parties.

As I mentioned at the all-staff, I've participated in three introductory RA briefings so far: an introduction to OERA; an overview of the CWA § 404 program; and an overview of EPA's work to protect the Bristol Bay watershed from the impacts of large-scale mining. This week I'm scheduled to participate in RA briefings on Waters of the U.S./Puget Sound High Tide Line and EPA's Scientific Integrity Policy. Attached to this email is the presentation I used for the OERA office

Bristol Bay Watershed Assessment

DRAFT

- Purpose:
  - Characterize the biological and mineral resources of the Bristol Bay watershed
  - Increase understanding of the potential impacts of large-scale mining on the region's fish resources
  - Inform future decision-making
- Scientific Ecological Risk Assessment evaluating potential impacts associated with:
  - Large-scale mine construction and operation
  - Accidents and failures

- Three-year scientific assessment effort
  - Independent external peer review
  - Stakeholder and public engagement
    - 8 public meetings
    - 2 rounds of public comment – over 1.1 million comments
  - Tribal consultations

AMERICAN OVERSIGHT

Bristol Bay Watershed Resources

DRAFT

Biological Resources:

- Bristol Bay produces almost half of world's sockeye salmon
- Kvichak watershed world's largest producer of sockeye salmon
- Nushagak watershed frequently at or near world's largest producer of Chinook salmon

Biological Resources Support:

- 14,000 jobs, generates $480 million annually in direct economic expenditures and sales
  - Salmon fishery valued at $1.5 billion annually
- 4,000-year-old subsistence fishery for Alaska Natives

Geological Resources:

- At least 10 claims with more than minimal exploration, including Pebble.
- Pebble deposit: low-grade, with copper, gold, and molybdenum
- According to NDM, Pebble could:
  - Be largest mine of its type in North America
  - Produce 3,000 jobs in AK
  - Contribute $2.7 billion to US GDP annually
- Economics of mining the Pebble deposit are speculative
- Since 2001, four major mining companies have walked away from Pebble project

AMERICAN OVERSIGHT

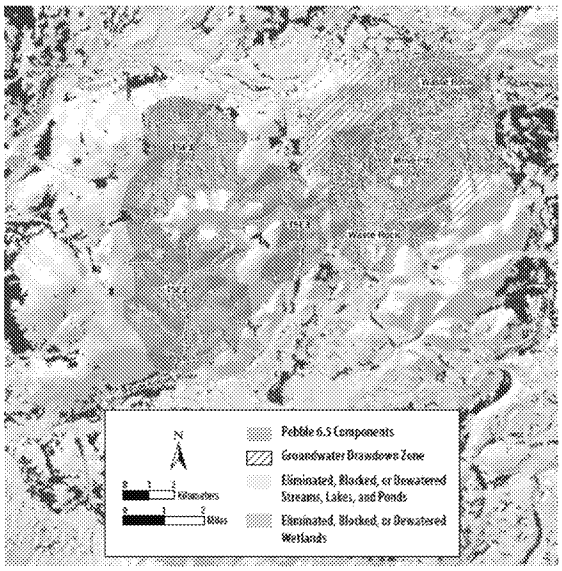
Bristol Bay Watershed Assessment



DRAFT

Mine Footprint Impacts:

- 24-94 miles of salmon-supporting streams destroyed
- 1,300-5,350 acres of wetlands, ponds, lakes destroyed
- 9-33 miles of salmon-supporting streams with altered streamflow likely to affect ecosystem structure and function

Other Impacts:

- Tailings dams need maintenance in perpetuity
- Routine operations and accidents would increase impacts on salmon habitat quality, both at the mining site and along the 86-mile transportation corridor.

AMERICAN OVERSIGHT

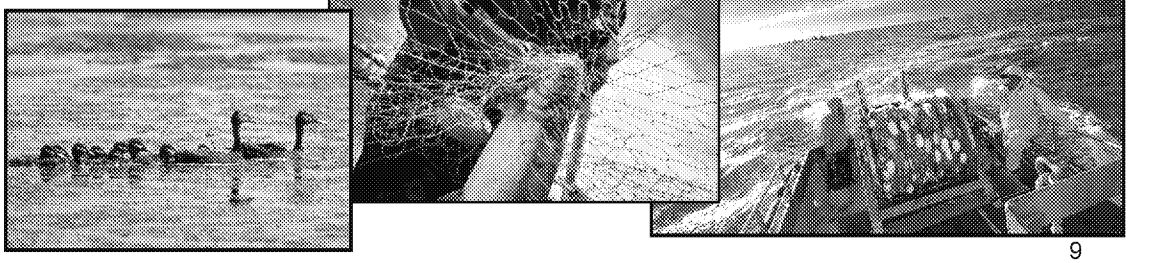
Clean Water Act Section 404

DRAFT



- § 404(a) authorizes the Secretary of the Army to issue **permits**
  - For the discharge of dredged or fill material into waters of the U.S. at specified disposal sites
- § 404(b) directs the Secretary of the Army to apply **environmental criteria** developed by EPA when specifying disposal sites
  - § 404(b)(1) Guidelines [40 CFR Part 230]
- § 404(c) authorizes EPA to prohibit, deny or restrict (withdraw) the placement of dredged or fill material at defined sites in waters of the U.S.

AMERICAN OVERSIGHT

Limits of Section 404(c)

DRAFT

- **Whenever** it determines, after notice and opportunity for public hearing, that the discharge of such materials into such area will have an **unacceptable adverse effect(s)** on:
  - Municipal water supplies; or
  - Shellfish beds and **fishery areas**; or
  - Wildlife; or
  - Recreation areas.

AMERICAN OVERSIGHT

Pebble Deposit 404(c) Process

DRAFT

Step 1

- 2/28/14: **Initiation by EPA Region 10 – "15-day letter"**
- Consulted with Corps, NDM/PLP, and State

Step 2

- 7/18/14: **Proposed Determination** released (PD) by EPA Region 10
- 8/12-15/14: 7 public hearings in Alaska
- Comment period closed 9/19/14

STOP

Step 3

- EPA Region 10 will review the public comments
- EPA Region 10 will withdraw PD *or* prepare **Recommended Determination** (RD)

Step 4

- **Final Determination (FD) by EPA Assistant Administrator for Water**
- Consult again with Corps, NDM/PLP, and State
- Within 60 days of receipt of RD, issue FD affirming, modifying, or rescinding RD

AMERICAN OVERSIGHT

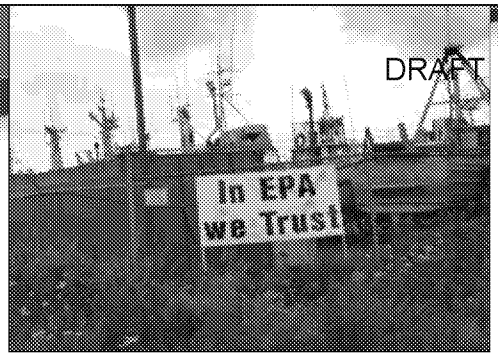
What Are the Proposed Restrictions?

DRAFT

Restrict the discharge of dredged or fill material related to mining the Pebble deposit into waters of the U.S. that would, individually or collectively, result in the following:

1. **Loss of Streams.**
   a. The loss of 5 or more linear miles of streams with documented anadromous fish occurrence; **or**
   b. The loss of 19 or more linear miles of streams where anadromous fish are not currently documented, but that are tributaries of streams with documented anadromous fish occurrence; **or**

2. **Loss of Wetlands, Lakes, and Ponds.** The loss of 1,100 or more acres of wetlands, lakes, and ponds contiguous with either streams with documented anadromous fish occurrence or tributaries of those streams; **or**



3. **Streamflow Alterations.** Streamflow alterations greater than 20% of daily flow in 9 or more linear miles of streams with documented anadromous fish occurrence

AMERICAN OVERSIGHT

Public Input on Proposed Determination

DRAFT

- EPA received:
  - > 670,000 total written public comments, > 99% supported the PD
  - > 4,000 total unique comments, > 86% supported the PD

Dillingham, August 2014

EPA Public Hearings – August 12-15, 2014

		77.6%	22.4%
Bristol Bay Region Only		**82.7%**	**17.3%**

AMERICAN OVERSIGHT

Response to Section 404(c) Proceeding

DRAFT

- Office of Inspector General (OIG) Review
  - 17-month in-depth evaluation found no evidence of bias or a pre-determined outcome
  - Possible misuse of position for retired Region 10 employee noted
- PLP broad Freedom of Information Act (FOIA) requests
  - Approximately 18,000 documents produced
- PLP filed three lawsuits in 2014
  - Administrative Procedure Act (APA) challenge to initiation of 404(c) process
  - FOIA litigation
  - Federal Advisory Committee Act (FACA) litigation
- May 2017 settlement agreement
  - Resolved FOIA and FACA litigation and PLP's outstanding FOIA requests

AMERICAN OVERSIGHT

Settlement Agreement

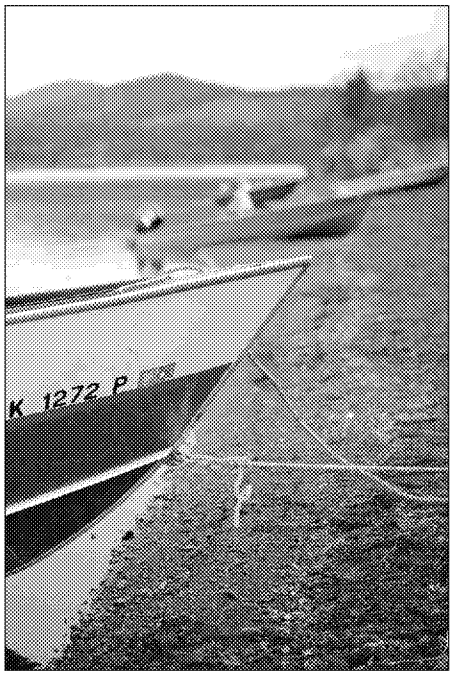
DRAFT

- Key terms of the May 11, 2017 settlement agreement between PLP and EPA:
  - EPA may use its Bristol Bay Watershed Assessment without limitation
  - EPA agrees to initiate a process to propose to withdraw its 2014 Proposed Determination by July 11, 2017
  - If PLP submits a 404 permit application to the Army Corps by November 11, 2019, EPA agrees not to forward a Recommended Determination (the next step in the 404(c) review process) to EPA HQ until a Final EIS is noticed for the project or May 11, 2021, whichever is earlier
  - PLP drops remaining lawsuits and fee requests against EPA and agrees to file no new FOIA requests during the 2.5- to 4-year hiatus period

AMERICAN OVERSIGHT

Proposal to Withdraw Proposed Determination

DRAFT



- July 11, 2017 – Withdrawal proposal released with following rationale:
  - Reflecting "the Administrator's decision to provide PLP with additional time to submit a permit application to the Army Corps and potentially allow the Army Corps permitting process to initiate without having an open and unresolved Section 404(c) review"
  - Removing "any uncertainty, real or perceived, about PLP's ability to submit a permit application and have that permit application reviewed"
  - Allowing "the factual record regarding any forthcoming permit application to develop"
  - Retaining "discretion to act [under Section 404(c)] prior to any potential Army Corps authorization"

AMERICAN OVERSIGHT

Response to Settlement and Withdrawal Proposal

DRAFT

- Broad FOIA requests from news outlets and environmental groups
  - Region 10 is the lead with support from HQ
- Significant email campaigns to the Administrator and Acting Regional Administrator against withdrawal
- Substantial and sustained media attention

AMERICAN OVERSIGHT

Proposal to Withdraw - Engagement

DRAFT

- Public Comment Period
  - >1 million comments
- Consultation and Coordination
  - EPA met with 18 Tribes, 3 ANCSA Corporations, and 1 Tribal Association
- Two public hearings in the watershed
  - ~200 participants

Personal Matters / Ex. 6

AMERICAN OVERSIGHT

Potential Pebble Mine – Next Steps

DRAFT

- Impacts from past exploration and site activities?
- In October of 2017, PLP publicly described a smaller mine concept
- Corps has indicated that PLP plans to file a permit application on December 22
  - Interagency pre-application meeting scheduled for December 21
  - EPA would be involved in 404 and NEPA review

Pebble deposit area.

Key Challenges and Opportunities

Non-Responsive: Unrelated to Bristol Bay/Pebble Mine

Bristol Bay/Pebble Mine

Mine would sit at headwaters of world's largest commercial salmon fishery; significant opposition to mine from native, commercial fishing, and environmental interests; EPA's CWA 404 program would play a significant role in permitting process.

Tribal

Pebble Mine: The Pebble Limited Partnership proposes to extract the extremely large, low grade Pebble copper deposit in Alaska's Bristol Bay watershed, but has not yet submitted a permit application. In July 2014, based in part on EPA's January 2014 "Bristol Bay Watershed Assessment," EPA issued a Proposed Determination under CWA §404(c) to restrict the use of certain waters in the Bristol Bay watershed as a disposal site. Under a May 2017 settlement agreement, EPA agreed to propose to withdraw the proposed determination. On July 11, EPA initiated that process, and received over 1 million comments during a 90-day public comment period and concurrent tribal consultation period.

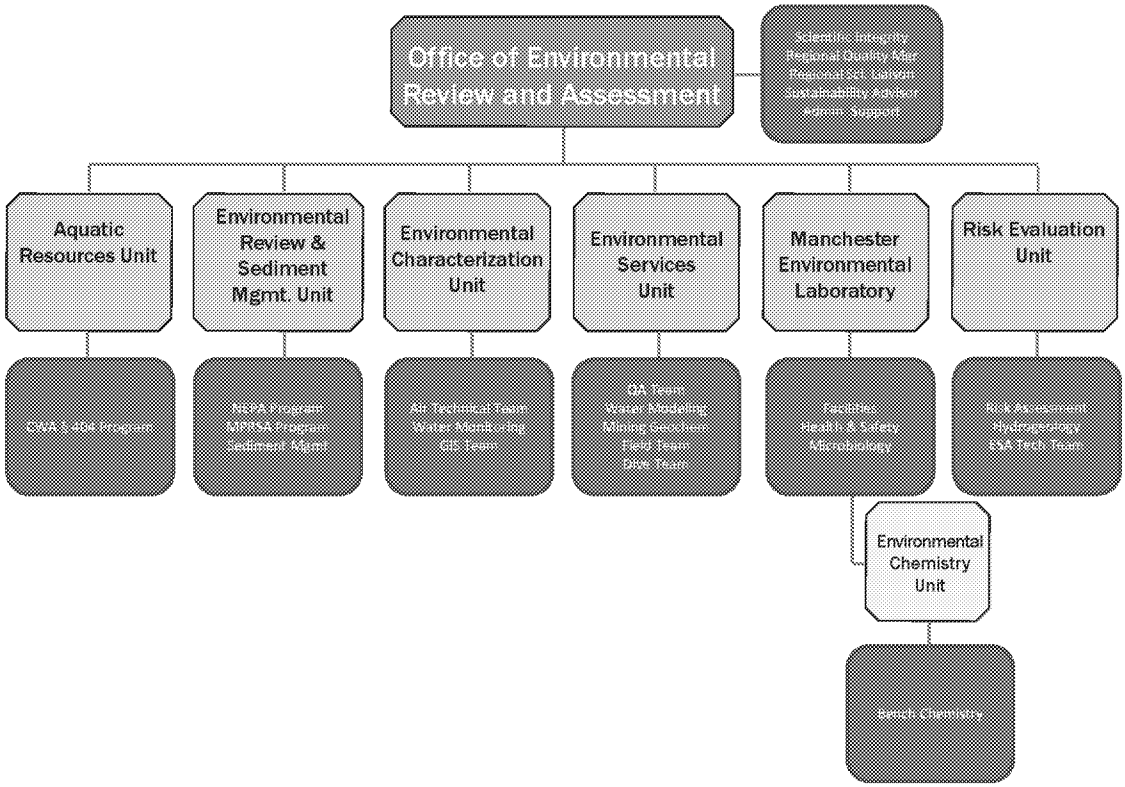
DRAFT



Office of Environmental Review and Assessment Region 10

Overview for Regional Administrator Hladick

December 6, 2017

AMERICAN OVERSIGHT

OFFICE OF ENVIRONMENTAL REVIEW AND ASSESSMENT
ORGANIZATIONAL STRUCTURE

AMERICAN OVERSIGHT

OFFICE OF ENVIRONMENTAL REVIEW AND ASSESSMENT
MAJOR AREAS OF RESPONSIBILITY

Clean Water Act § 404 Program (discharges of "dredged or fill material" to "waters of the U.S.")

- CWA Jurisdiction/WOTUS
- Corps permit review and oversight
- Wetland Program Development Grants
- Mitigation banking
- Water quality certification
- Enforcement technical support

Marine Protection, Research and Sanctuaries Act (Ocean Dumping Act) Program

- Ocean disposal site designation and surveys
- MPRSA ocean dumping permits
- Ocean Policy (e.g., MRAC, West Coast RPB)

National Environmental Policy Act/Clean Air Act § 309 Program

- NEPA compliance
- NEPA review
- Cooperating Agency/FAST-41

AMERICAN OVERSIGHT

OFFICE OF ENVIRONMENTAL REVIEW AND ASSESSMENT
MAJOR AREAS OF RESPONSIBILITY

Scientific and Technical Support Functions

- Quality assurance (QA)
- Air, surface water, and wetland monitoring
- Air and water modelling
- Hydrogeology
- Ecological and human health risk assessment
- Geographic information systems (GIS)
- Sediment management review
- Endangered Species Act (ESA) technical support
- Field support
- Scientific Dive Team

Manchester Environmental Laboratory

- Analytical support to programs
- Lab certification, auditing
- Facility sharing agreement with Dept. of Ecology
- ESAT contract

David,
I believe you reviewed a version of this CMS response on March 28. Do you and/or any others here need to look at this version approved by Lee Forsgren? The response is overdue, so OCIR is looking for a reply soon.
--Cindy, x. 1815

Subject: Check-in on Smith/Bishop/Gosar letter re: Bristol Bay

Hi Cindy, I'm running the traps on a Bristol Bay letter (AL-18-000-5435)—you might have worked with Denis Borum on this one but he is out of the office this week so I'm doing my best to get it wrapped up. In any event, it looks like we have an approved response in CMS but it's not entirely clear if you all in the Region have been involved and reviewed this letter? If so, that's great and I will proceed to run this through our front office before closing it out. At you

AMERICAN OVERSIGHT

earliest convenience please let me know if you all are okay with this response. Incoming and draft response (with Lee Forsgren's approval) attached.
Thanks!
Elizabeth

Non-Responsive – Material Unrelated to Bristol Bay/Pebble Mine

> Pebble Mine Project: On March 29 the Army Corps of Engineers published a Notice of Intent in the Federal Register initiating the formal scoping process for the Pebble EIS. The 30-day scoping period began on April 1 and will include nine public meetings. Numerous requests have already been submitted to the Corps requesting an extension to the scoping period. EPA's Pebble NEPA team will be developing scoping comments.

Attachments: Pebble-Bristol Bay 404(c)_Options for additional public comment_3-2-18_final.docx; BB Presentation_1282018_pm_ACP.PPTX; ATT73739; ATT37248; ATT00111; ATT18253

Chris – I found the two attached documents useful in beginning to wrap my head around the questions surrounding next steps for our Pebble 404(c) determination.

The Word document is the paper we used to brief you, Lee, and David Fotouhi last March regarding how to implement Administrator Pruitt's commitment to hold an additional public comment period on the proposal to withdraw the PD. It

Deliberative Process / Ex. 5

The PowerPoint document is the most recent (Feb. 2018) version of the background materials used for leadership briefings. (You and Lee saw earlier versions of this presentation in 2017) **Deliberative Process / Ex. 5**

Deliberative Process / Ex. 5

The options I think we'd present would be:

Deliberative Process / Ex. 5

Attachments: Pebble-Bristol Bay 404(c)_Options for additional public comment_3-2-18_final.docx; BB Presentation_1282018_pm_ACP.PPTX; ATT95142; ATT52498; ATT20480; ATT37785

Chris – I found the two attached documents useful in beginning to wrap my head around the questions surrounding next steps for our Pebble 404(c) determination.

The Word document is the paper we used to brief you, Lee, and David Fotouhi last March regarding how to implement Administrator Pruitt's commitment to hold an additional public comment period on the proposal to withdraw the PD. It

Deliberative Process / Ex. 5

The PowerPoint document is the most recent (Feb. 2018) version of the background materials used for leadership briefings on Bristol Bay. (You and Lee saw earlier versions of this presentation in 2017).

Deliberative Process / Ex. 5

Deliberative Process / Ex. 5

The options I think we'd present would be:

Meeting of ET Mining Subgroup
Agenda to be sent out before the meeting

Dear ET Mining Subgroup-
Attached is the mining update for August. Areas highlighted in the update are those that I propose discussing during our meeting tomorrow, which include:

- [Nonresponsive: Unrelated to Bristol Bay/Pebble Mine."]
- Project-specific updates – Pebble, Stibnite, Kensington, Triumph
- [illegible]

Nonresponsive: Unrelated to Bristol Bay/Pebble Mine."

Agenda

404(c) Team

Congressional responses (Palmer)

- Western Caucus (Gosar et al) – newly OW-approved, not issued
- DeFazio and Carper – just revised, based on newly OW-approved, not issued Western Caucus response
- Lamar Smith – just drafted, based on newly OW-approved, not issued Western Caucus response

FOIA (Ashley)

- E&E News – new request for unredacted copies
- McKeever FOIA Lawsuit – next steps
- NRDC and CNN – working with the AOs office
- Trustees for Alaska – options for Justin Schwab review
- Trustees for Alaska 2 – new FOIA
- Back-up (Erik)

External Correspondence (Erik)

- Recent activity and approach

Permit Oversight/ NEPA Review Team

Timing a Brittany Bolen briefing?

Site Visits

- July 9 – 11: CWA 404 field verification was completed by Mark Douglas
- July 31: Site visit with some of our NEPA team (Patty, Molly, Tim, Chris) to view the mine site, proposed Lake Iliamna port sites, and portions of the proposed roads

NEPA/EIS document reviews - completed

- Scoping Document: In August we submitted comments on the draft scoping document that describes the significant issues raised in scoping. The final scoping document is available on the Corp's Pebble EIS website.
- Preliminary EIS Sections: In July and August, we reviewed and commented on specific portions of chapter 3 (affected environment) and chapter 4 (environmental consequences) that pertain to our areas of special

AMERICAN OVERSIGHT

expertise as identified by the Corps which includes: aesthetics, surface water hydrology, groundwater hydrology, water and sediment quality, wetlands, vegetation)
    - The documents have many placeholders since there have been changes to the proposed action, alternatives have yet to be finalized, and there are numerous substantial requests for additional information where the Corps is awaiting response from PLP.
- Alternatives: On October 3, we submitted comments on draft Appendix B (Alternatives Development Process). Previously we participated in a cooperating agency meeting and provided verbal input on the alternatives development process and some of the potential alternatives.

NEPA/EIS document reviews – upcoming

- The Corps has indicated that they will be sending us draft DEIS sections on 11/9 with comments due by 11/21. We have requested more time for review (30 days review period).

Schedule

- The Corps Pebble EIS website identifies estimated dates for a draft EIS in January 2019 and a final EIS in late 2019.

COE not intending to send EPA a complete preliminary draft EIS. State will review but not likely help write the document. Cooperating Agency Plan asked for agencies to help develop sections based on expertise rather than just reviewing. Joint State agency 23 pg. comment letter on fish, tailings (look at dry tailings option), water quality, and climate change (similar to ours but we also mentioned the modeling and human health impacts). State cooperating agency comment letter expressed concern about the schedule. Governor wants the company to demonstrate financial viability of the project before the process proceeds. COE will need more information on feasibility but will continue the process unless the permit is withdrawn. We will use the usual process and coordinate with HQ at the staff level on the DEIS when it's out in Jan Feb 2019 (Pebble saying spring or summer). Need to determine how best to give HQ senior leadership the context moving to the next step in the process. As of yesterday, EPA comments not posted on the COE website (letter speaks for itself). ACHP letter asked for reasonable effort with consultations under Historic Preservation Act. We are currently submitting comments to the COE on hydrology, water quality, wetlands (baseline rather than impact section). Molly and Patty to be cc'd on comments sent to COE staff. Big meeting of COE and cooperating agencies moved from July to Aug. **Deliberative Process / Ex. 5**

Deliberative Process / Ex. 5

Site visits next week with Mark Douglas (field verification with the COE). July 31 site visit by Patty, Chris E, Mark J, Molly; COE did not respond on request to coordinate with them and other agencies, so coordinating directly with Pebble on the site visit. **Deliberative Process / Ex. 5**

Deliberative Process / Ex. 5

HQ 404(c) memo has a section on Pebble; need to participate fully in the EIS process.
Western Congressional Caucus with Forsgren for signature. House Appropriations Committee response with OMB.

- There are a lot of ongoing mine proposals in Ak that present significant 404 issues.
  - Probably the most significant is Pebble. I'm sure you've heard that the 404c proposed determination was left in place after we received lots of public comment. Deliberative Process / Ex. 5 Deliberative Process / Ex. 5 Deliberative Process / Ex. 5 We're currently looking at the application under the NEPA review process. We have 90 days to submit NEPA scoping comments. COE has informed EPA they will only consider comments regarding compliance with NEPA guidelines.

AMERICAN OVERSIGHT

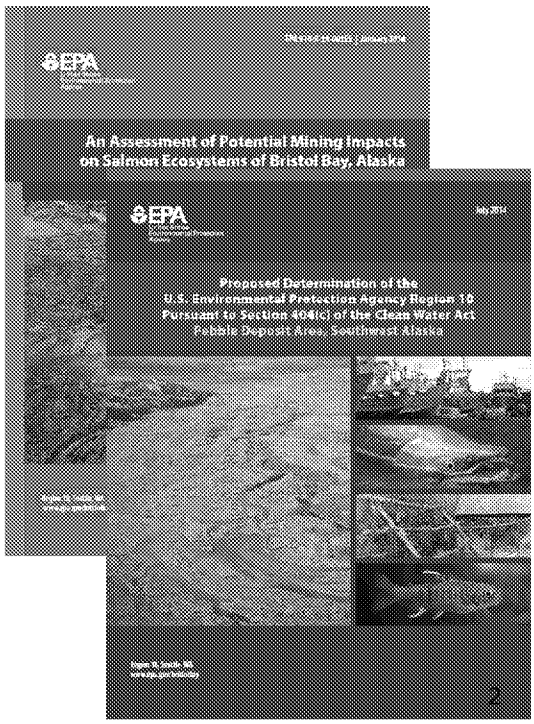
DRAFT

EPA's Work in the Bristol Bay Watershed

Presentation for Alaska Operations Office Director

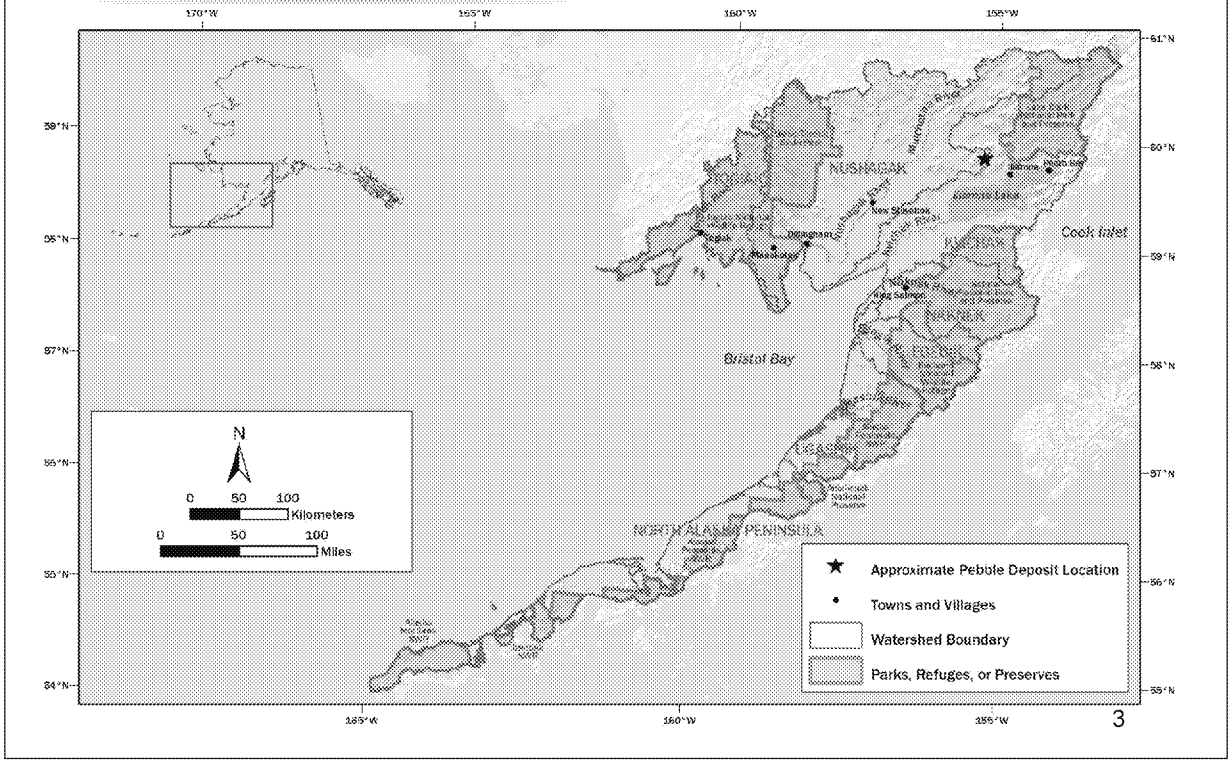


July 23, 2018

AMERICAN OVERSIGHT

Overview

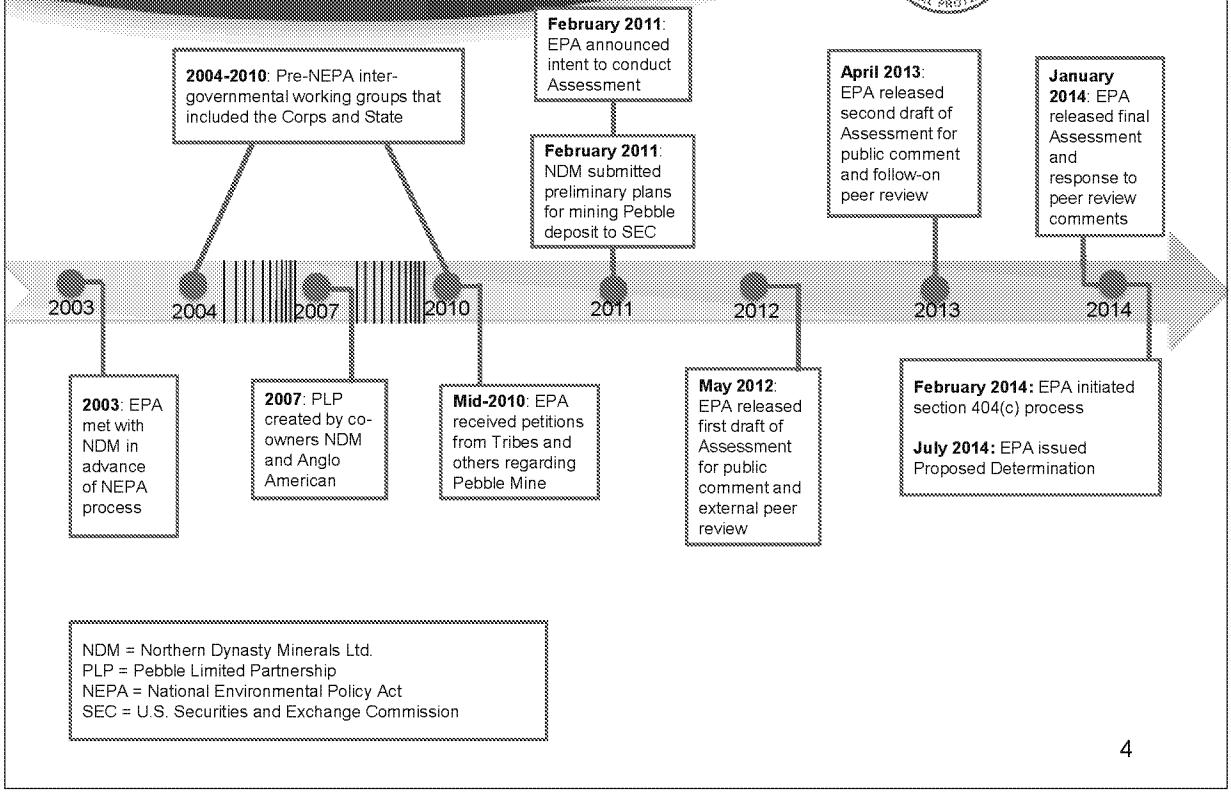
DRAFT



- EPA's Involvement History
- Science
- Section 404(c) Regulatory Response
- Section 404 Permitting and NEPA

AMERICAN OVERSIGHT

Bristol Bay Watershed

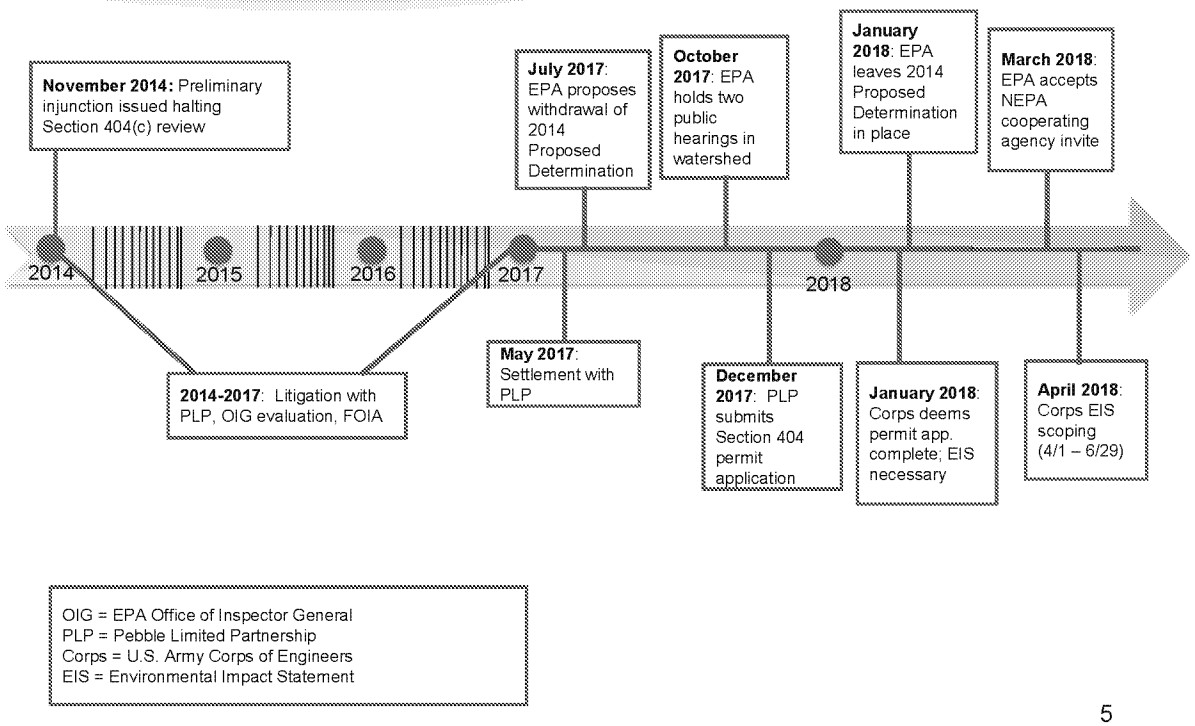


DRAFT

AMERICAN OVERSIGHT

Timeline 2003 - 2014

DRAFT

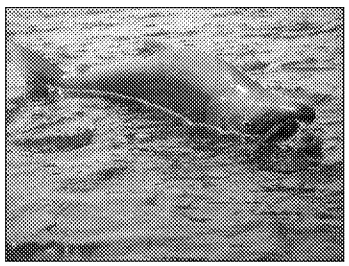


NDM = Northern Dynasty Minerals Ltd.
PLP = Pebble Limited Partnership
NEPA = National Environmental Policy Act
SEC = U.S. Securities and Exchange Commission

AMERICAN OVERSIGHT

Timeline 2014 - Present

DRAFT



OIG = EPA Office of Inspector General
PLP = Pebble Limited Partnership
Corps = U.S. Army Corps of Engineers
EIS = Environmental Impact Statement

AMERICAN OVERSIGHT

Bristol Bay Watershed Assessment

DRAFT

- Purpose:
  - Characterize the biological and mineral resources of the Bristol Bay watershed
  - Increase understanding of the potential impacts of large-scale mining on the region's fish resources
  - Inform future decision-making
- Scientific Ecological Risk Assessment evaluating potential impacts associated with:
  - Large-scale mine construction and operation
  - Accidents and failures

- Three-year scientific assessment effort
  - Independent external peer review
  - Stakeholder and public engagement
    - 8 public meetings
    - 2 rounds of public comment – over 1.1 million comments
  - Tribal consultations

AMERICAN OVERSIGHT

Bristol Bay Watershed Resources

DRAFT

Biological Resources:

- Bristol Bay produces almost half of world's sockeye salmon
- Kvichak watershed world's largest producer of sockeye salmon
- Nushagak watershed frequently at or near world's largest producer of Chinook salmon

Biological Resources Support:

- 14,000 jobs, generates $480 million annually in direct economic expenditures and sales
  - Salmon fishery valued at $1.5 billion annually
- 4,000-year-old subsistence fishery for Alaska Natives

Geological Resources:

- At least 10 claims with more than minimal exploration, including Pebble.
- Pebble deposit: low-grade, with copper, gold, and molybdenum
- According to NDM, Pebble could:
  - Be largest mine of its type in North America
  - Produce 3,000 jobs in AK
  - Contribute $2.7 billion to US GDP annually
- Economics of mining the Pebble deposit are speculative
- Since 2001, five major mining companies have walked away from Pebble project

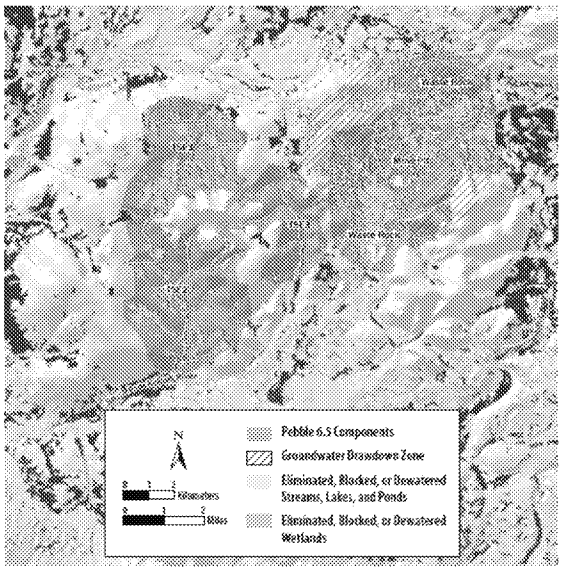
AMERICAN OVERSIGHT

Bristol Bay Watershed Assessment

- Mining scenarios informed by NDM plans submitted to U.S. Securities and Exchange Commission (SEC) in 2011
- Uses 3 potential stages of mine development at Pebble deposit
  - 0.25-billion-ton mine (worldwide median size porphyry copper deposit)
  - 2.0-billion-ton mine (smallest mine size proposed by NDM to SEC)
  - 6.5-billion-ton mine (largest mine size proposed by NDM to SEC)
- NDM says deposit is nearly 12 billion tons

AMERICAN OVERSIGHT

Bristol Bay Watershed Assessment



DRAFT

Mine Footprint Impacts:

- 24-94 miles of salmon-supporting streams destroyed
- 1,300-5,350 acres of wetlands, ponds, lakes destroyed
- 9-33 miles of salmon-supporting streams with altered streamflow likely to affect ecosystem structure and function

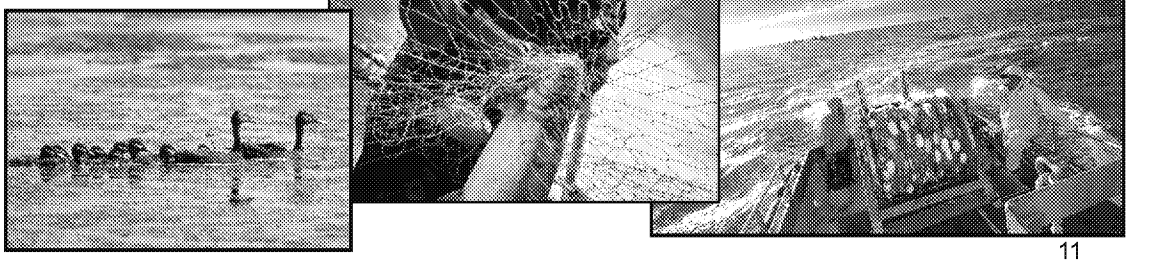
Other Impacts:

- Tailings dams need maintenance in perpetuity
- Routine operations and accidents would increase impacts on salmon habitat quality, both at the mining site and along the 86-mile transportation corridor.

AMERICAN OVERSIGHT

Clean Water Act Section 404

DRAFT



- § 404(a) authorizes the Secretary of the Army to issue **permits**
  - For the discharge of dredged or fill material into waters of the U.S. at specified disposal sites
- § 404(b) directs the Secretary of the Army to apply **environmental criteria** developed by EPA when specifying disposal sites
  - § 404(b)(1) Guidelines [40 CFR Part 230]
- § 404(c) authorizes EPA to prohibit, deny or restrict (withdraw) the placement of dredged or fill material at defined sites in waters of the U.S.

AMERICAN OVERSIGHT

Limits of Section 404(c)

DRAFT

- **Whenever** it determines, after notice and opportunity for public hearing, that the discharge of such materials into such area will have an **unacceptable adverse effect(s)** on:
  - Municipal water supplies; or
  - Shellfish beds and **fishery areas**; or
  - Wildlife; or
  - Recreation areas.

AMERICAN OVERSIGHT

Pebble Deposit 404(c) Process

DRAFT

Step 1

- 2/28/14: **Initiation by EPA Region 10 – "15-day letter"**
- Consulted with Corps, NDM/PLP, and State

Step 2

- 7/18/14: **Proposed Determination** released (PD) by EPA Region 10
- 8/12-15/14: 7 public hearings in Alaska
- > 670,000 written comments; > 99% (86% unique) supported Proposed Determination

Step 3

- EPA Region 10 will review the public comments
- EPA Region 10 will withdraw PD *or* prepare **Recommended Determination** (RD)

Step 4

- **Final Determination (FD) by EPA Assistant Administrator for Water**
- Consult again with Corps, NDM/PLP, and State
- Within 60 days of receipt of RD, issue FD affirming, modifying, or rescinding RD

AMERICAN OVERSIGHT

What Are the Proposed Restrictions?

DRAFT

Restrict the discharge of dredged or fill material related to mining the Pebble deposit into waters of the U.S. that would, individually or collectively, result in the following:

1. **Loss of Streams.**
   a. The loss of 5 or more linear miles of streams with documented anadromous fish occurrence; **or**
   b. The loss of 19 or more linear miles of streams where anadromous fish are not currently documented, but that are tributaries of streams with documented anadromous fish occurrence; **or**

2. **Loss of Wetlands, Lakes, and Ponds.** The loss of 1,100 or more acres of wetlands, lakes, and ponds contiguous with either streams with documented anadromous fish occurrence or tributaries of those streams; **or**

3. **Streamflow Alterations.** Streamflow alterations greater than 20% of daily flow in 9 or more linear miles of streams with documented anadromous fish occurrence

AMERICAN OVERSIGHT

Response to Section 404(c) Proceeding

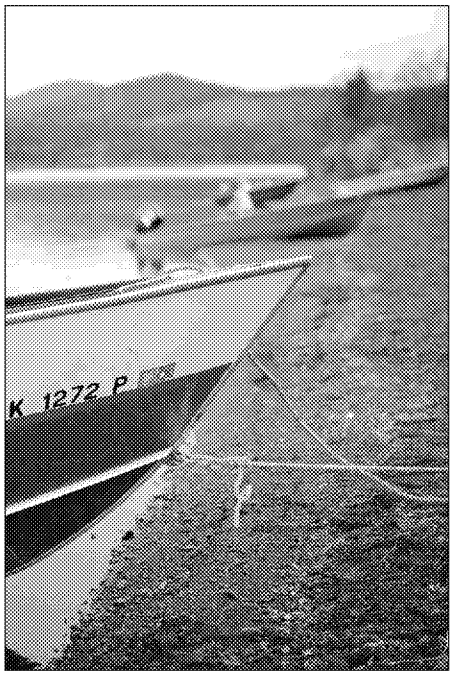
DRAFT

- Office of Inspector General (OIG) Review
  - 17-month in-depth evaluation found no evidence of bias or a pre-determined outcome
  - Possible misuse of position for retired Region 10 employee noted
- PLP broad Freedom of Information Act (FOIA) requests
  - Approximately 18,000 documents produced
- PLP filed three lawsuits in 2014
  - Administrative Procedure Act (APA) challenge to initiation of 404(c) process
  - FOIA litigation
  - Federal Advisory Committee Act (FACA) litigation
- May 2017 settlement agreement
  - Resolved FOIA and FACA litigation and PLP's outstanding FOIA requests

AMERICAN OVERSIGHT

Settlement Agreement

DRAFT



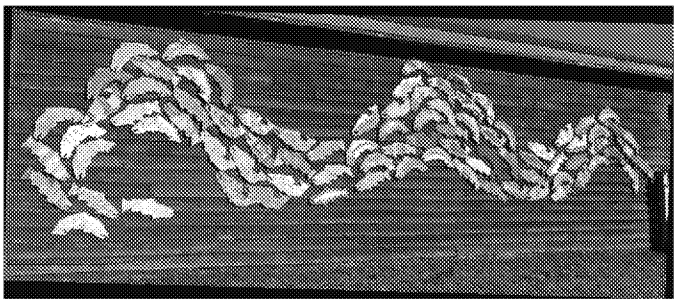
- Key terms of the May 11, 2017 settlement agreement between PLP and EPA:
  - EPA may use its Bristol Bay Watershed Assessment without limitation
  - EPA agrees to initiate a process to propose to withdraw its 2014 Proposed Determination by July 11, 2017
  - EPA agrees not to forward a Recommended Determination (the next step in the 404(c) review process) to EPA HQ until a Final EIS is noticed for the project or May 11, 2021, whichever is earlier
  - PLP drops remaining lawsuits and fee requests against EPA and agrees to file no new FOIA requests during the 2.5- to 4-year hiatus period

AMERICAN OVERSIGHT

Proposal to Withdraw 2014 Proposed Determination

DRAFT

- July 2017: Withdrawal proposed based on policy rationale
  - EPA did not solicit comment on the proposed restrictions or on science or technical information underlying the Proposed Determination
- Outreach and Consultation
  - Proposal generated >1 million comments (~99% opposed)
  - 2 public hearings in watershed
  - Tribal and ANCSA Consultation
    - 16 tribal governments and 1 ANCSA Regional Corp. opposed
    - 1 tribal government and 2 ANCSA Village Corps. supported



AMERICAN OVERSIGHT

Section 404(c) Next Steps

DRAFT

- In January 2018 EPA decided not to withdraw and suspended Section 404(c) process pending further review

- Settlement agreement obligations
  - EPA can issue a new/modified Proposed Determination at any time
  - EPA Region 10 cannot forward a Recommended Determination to EPA HQ until May of 2021 or until a final EIS is noticed, whichever comes first

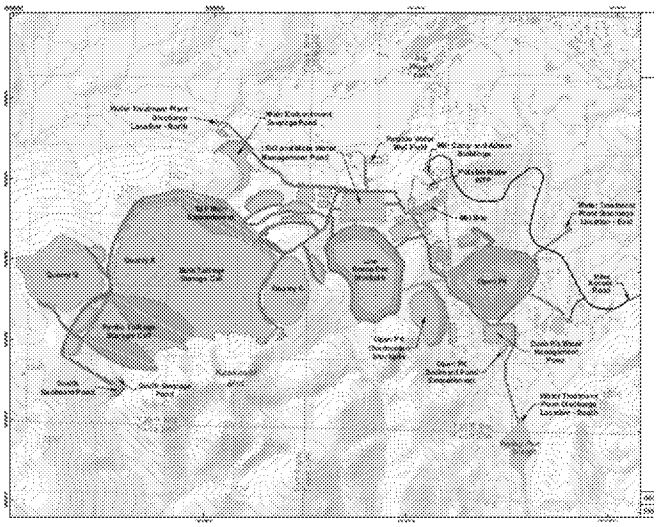
AMERICAN OVERSIGHT

2017 Permit Application

DRAFT

- PLP filed Department of Army (DA) permit application to the Corps in December 2017
  - Includes CWA 404 and RHA Section 10
  - Includes Project Description: mine, power supply, transportation
- Corps deemed application sufficient to begin NEPA

Pebble deposit area



AMERICAN OVERSIGHT

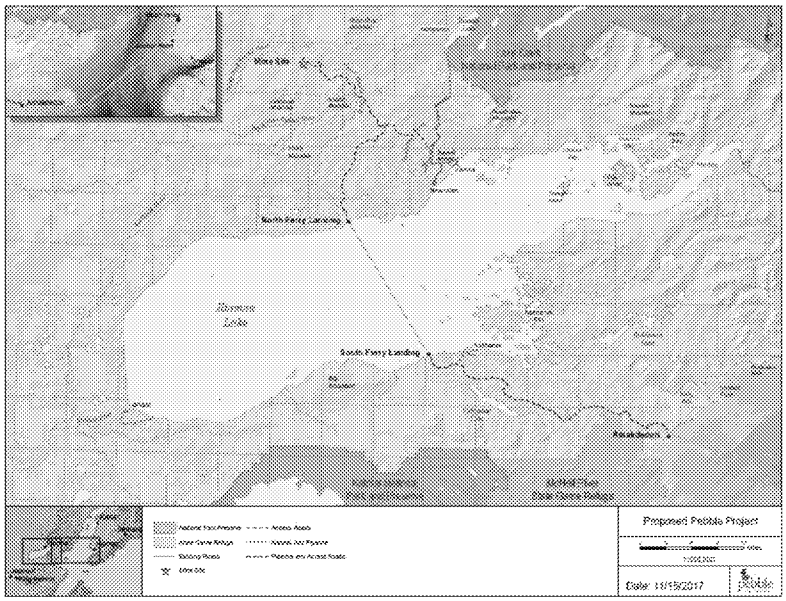
Project Description

DRAFT

Mine Site

- 1.3 billion tons of ore mined over 20 years
- 160,000 tons/day of ore processed to produce:
  - Copper concentrate
  - Molybdenum concentrate
  - Gold via gravity separation
- Open pit mine, ore storage pile, 2 tailings impoundments
- 2 water treatment plants and 3 discharge outfalls
- Closure
  - PAG waste rock & pyritic tailings backfilled into open pit
  - Dry closure of bulk tailings
  - Long-term water treatment

AMERICAN OVERSIGHT



Project Description

Power

- 230 - 270 MW power plant at mine site
- 188 mile natural gas pipeline

Transportation

- 65 miles of roads
- Ferry across Lake Illiamna
- Cook Inlet port site

AMERICAN OVERSIGHT

Project Description

DRAFT

- Proposed mine is:
  - Smaller than 2011 Preliminary Assessment to SEC
  - Larger than the EPA Assessment's 0.25 billion ton mine scenario, which is the basis for the 2014 Proposed Determination

2014 Proposed Determination
Loss of 5 or more miles of streams with anadromous fish; or
Loss of 19 or more miles of streams that are tributaries of anadromous fish streams; or
Loss of 1100 or more acres of wetlands, lakes and ponds contiguous with streams or tributaries to streams that have anadromous fish; or
Stream flow alteration > 20% of daily flow in 9 or more miles of streams with anadromous fish

2017 DA Application	
component	**wetlands filled**
Mine site	3190
Transportation (roads, ferry terminals, port)	480
Pipeline	408
TOTAL	4078

- Differences from 2011 Preliminary Assessment and EPA's Assessment:
  - Less waste rock mined
  - No cyanide leaching
  - Liners (pyritic tailings)
  - Advanced water treatment and "Physical Habitat Simulation System" to mitigate dewatering
  - Compensatory mitigation - TBD
- Project description could evolve during EIS and 404 review

AMERICAN OVERSIGHT

Initial Corps NEPA & 404 Process

DRAFT

- Corps issued informational Public Notice of application (January 5, 2018)
  - Did not request public comment at this time
- Corps Cooperating Agency Plan specifies agency involvement.
  - EPA's cooperating agency involvement is limited to Section 404(b)(1) issues
- EIS scoping occurred April 1 through June 29
  - EPA submitted scoping letter
- Corps is developing preliminary EIS sections
  - EPA reviewing and providing comments where requested

AMERICAN OVERSIGHT

Corps NEPA Schedule

DRAFT

- Corps EIS schedule:
  - Draft EIS – January 2019
  - Final EIS – late 2019
  - Record of Decision – early 2020
- PLP has requested inclusion of the project in FAST 41 infrastructure & critical minerals streamlining

Corps' Pebble website

ARU and WWEU Team,

I know you all are super busy and this is one more thing so I am sorry … I spoke with Linda AC about briefing her before she attends the National Wetland meeting and she would really appreciate that so she can go in prepared. Please look at the attached agenda and let me know what topics you would like to brief her on and how long you think you would need by Thursday COB. I will follow up with her and we can set up some times to talk with her.

Thank you so much,

Krista

Subject: FW: AOO director briefing materials

Folks:

AMERICAN OVERSIGHT

I just wanted to give you a heads-up that the materials that you used to brief the new AOO will be used tomorrow to brief Henry Darwin, EPA's chief of operations.

It is my understanding that Lee Forsgren will be leading the briefing and John Goodin and Brian Frazer from OWOW will be present as well. Brian indicated that Chris Hladick has also been invited but it is not clear that he has accepted this invite.

That is basically all I know about this briefing.

Me:

Nonresponsive: Unrelated to Bristol Bay/Pebble Mine

- Pebble-related items:
  - Last Wednesday's Memo from Pruitt directing OW to propose a rule modifying EPA's 404(c) procedures
    - Included discussion of Pebble with the following quote:
      - "It is critical for the agency to participate in the EIS process and review the final EIS"
  - Last Friday's deadline to submit scoping comments to the Corps on the Pebble project EIS
    - R10 submitted two-page letter and 24-page enclosure on Friday. Recommendations include analyzing:
      - Aquatic resource impacts
        - And compensatory mitigation for unavoidable impacts
      - Potential for ocean disposal of dredged material
      - Reasonably foreseeable cumulative and indirect effects resulting from transportation infrastructure
      - Air quality impacts
      - Climate-adaptation
      - Financial assurance

Subject: Bristol Bay Check-in 9/11/18 - Cancellation and Update

Hello,

Welcome back David! Given that you are out on September 11, we are canceling the check-in and the Bristol Bay Teams have the following update for you. We plan on having the Bristol Bay Check-in on September 25th at 9:00 am PST.

Updates

Permit Oversight/ NEPA Review Team

Scoping Document

- EPA reviewed and commented on the draft scoping document that describes the significant issues raised in scoping. The final scoping document is available on the Corp's Pebble EIS website.

Preliminary EIS review

- EPA reviewed and commented on specific portions of chapter 3 (affected environment) and chapter 4 (environmental consequences) that pertain to our areas of special expertise as identified by the Corps which includes: aesthetics, surface water hydrology, groundwater hydrology, water and sediment quality, wetlands, vegetation

AMERICAN OVERSIGHT

- The documents have many placeholders since there have been changes to the proposed action, alternatives have yet to be developed, and there are numerous substantial requests for additional information where the Corps is awaiting response from PLP.

Deliberative Process / Ex. 5

Alternatives

- The Corps is developing the range of alternatives to be analyzed in the EIS. We participated in a cooperating agency meeting and provided input. During the week of Sept 10, the Corps is to submit a detailed discussion of the alternatives selected for EIS review and rationale for those dismissed.

Site Visits

- July 9 – 11: CWA 404 field verification was completed by Mark Douglas
- July 31: Site visit with some of our NEPA team (Patty, Molly, Tim, Chris) to view the mine site, proposed Lake Iliamna port sites, and portions of the proposed roads.

Schedule

- The Corps Pebble EIS website identifies a draft EIS in January 2019 and a final EIS in late 2019.

404(c) Team

FOIA

- NRDC and CNN FOIA: extended until end 9/28/18 as we work on ex-Administrator's office employee non-email electronic records. Making progress.
- Trustees for Alaska FOIA: interim release of Corps equities documents on 8/31 and deadline extended until 10/31/18 to facilitate coordination between R10 and HQ on the remaining documents.

Representative DeFazio and Senator Carper letter response

- This July 2018 letter asks for Wheeler to revoke the June 2018 memo issued by Pruitt, describe his view of proper use of 404(c) and the Mingo Logan case, and, describe current and planned EPA actions regarding Pebble.
- EPA's response was uploaded to CMS for Lee F's signature on 8/27

Interest group letter to EPA

- This 9/6/18 letter to EPA from 15 interest groups (including, for example, the Competitive Enterprise Institute) urges Wheeler to rescind the proposed determination and applauds the June 2018 memo issued by Pruitt.
- If this letter is controlled for a response, HQ will share a draft with R10.

External Meetings

- Henry Darwin met with Pebble representatives the week of 8/2/18. The 404(c) Team uploaded a note of this meeting to our external meetings folder on share point.
- We want to emphasize our interest for external meetings at all levels to be recorded with: topic, date, attendees, agenda and notes.

PLP letter, memo to file

AMERICAN OVERSIGHT

Hi Chris and Michelle-
Palmer informed us of a briefing tomorrow related to Pebble. The briefing materials are those used to brief Sue Detwiler on Monday.
It looks like Chris has been invited. Will you be able to participate? Please let me know if you need any support or have questions.
Patty

Subject: FW: AOO director briefing materials

Folks:

I just wanted to give you a heads-up that the materials that you used to brief the new AOO will be used tomorrow to brief Henry Darwin, EPA's chief of operations.

It is my understanding that Lee Forsgren will be leading the briefing and John Goodin and Brian Frazer from OWOW will be present as well. Brian indicated that Chris Hladick has also been invited but it is not clear that he has accepted this invite.

That is basically all I know about this briefing.

Show Time As: Tentative

Hi –

Attached is the most recent Bristol Bay presentation and script (this was used for OFA in January). The section on Pebble's permit application will need to be updated and we'll need to figure out who's doing what.

Conference Line/Code / Ex. 6

Thanks,

Ashley

Agenda

404(c) Team

Congressional responses (Palmer)

- Western Caucus (Gosar et al) – newly OW-approved, not issued
- DeFazio and Carper – just revised, based on newly OW-approved, not issued Western Caucus response
- Lamar Smith – just drafted, based on newly OW-approved, not issued Western Caucus response

FOIA (Ashley)

- E&E News – new request for unredacted copies
- McKeever FOIA Lawsuit – next steps
- NRDC and CNN – working with the AOs office
- Trustees for Alaska – options for Justin Schwab review
- Trustees for Alaska 2 – new FOIA
- Back-up (Erik)

External Correspondence (Erik)

- Recent activity and approach

Permit Oversight/ NEPA Review Team

Timing a Brittany Bolen briefing?

Site Visits

- July 9 – 11: CWA 404 field verification was completed by Mark Douglas
- July 31: Site visit with some of our NEPA team (Patty, Molly, Tim, Chris) to view the mine site, proposed Lake Iliamna port sites, and portions of the proposed roads

NEPA/EIS document reviews - completed

- Scoping Document: In August we submitted comments on the draft scoping document that describes the significant issues raised in scoping. The final scoping document is available on the Corp's Pebble EIS website.
- Preliminary EIS Sections: In July and August, we reviewed and commented on specific portions of chapter 3 (affected environment) and chapter 4 (environmental consequences) that pertain to our areas of special

AMERICAN OVERSIGHT

expertise as identified by the Corps which includes: aesthetics, surface water hydrology, groundwater hydrology, water and sediment quality, wetlands, vegetation)
    - The documents have many placeholders since there have been changes to the proposed action, alternatives have yet to be finalized, and there are numerous substantial requests for additional information where the Corps is awaiting response from PLP.
- Alternatives: On October 3, we submitted comments on draft Appendix B (Alternatives Development Process). Previously we participated in a cooperating agency meeting and provided verbal input on the alternatives development process and some of the potential alternatives.

NEPA/EIS document reviews – upcoming

- The Corps has indicated that they will be sending us draft DEIS sections on 11/9 with comments due by 11/21. We have requested more time for review (30 days review period).

Schedule

- The Corps Pebble EIS website identifies estimated dates for a draft EIS in January 2019 and a final EIS in late 2019.

Subject: REVIEW REQUEST and additional documents loaded to Sharepoint

Hello Team,
The Corps distributed some additional information to cooperating agencies related to yesterday's Cooperating Agency meeting here in Anchorage, and I have added these materials to the Sharepoint site, in the "Materials for 6-6-18 Cooperating Agency Meeting" folder. Most of the information is for awareness only, but our review has been requested on two items:

1) the Preliminary Scoping Report

Internal Website / Ex. 6

2) selected sections of Pre-Draft Chapter 3

Internal Website / Ex. 6

Your review is being requested on specific materials (listed below), but feel free to also review the remainder of the materials if you wish.

- Preliminary Scoping Report: **Molly/Patty** – comments due to Molly **June 20**
  This document addresses scoping comments received to date, but will be updated following the close of the public scoping period.

- Pre-Draft Chapter 3 Sections – comments due to Molly **June 25** (specific section assignments below)
  These documents are first drafts of each resource section Affected Environment, and will also be updated following the close of public scoping and based on cooperating agency input. It is not clear whether cooperators will have an opportunity to review a second iteration prior to publication of the Draft EIS, so a thorough review at this stage is critical.

AMERICAN OVERSIGHT

The Corps has requested that our review focus on what is missing or any inaccuracies (don't worry about formatting, grammar, etc.). Where we identify something missing/innacurate, we are asked to be very specific in our recommendation. If you identify missing information in your review, first check the RFIs and Responses to Date

Internal Website / Ex. 6

If there is a RFI/response that addresses your concern, then please note that in your comment. If not, then please include in your comment: (1) the information gap, (2) a reference where additional information can be found, and (3) what from that reference should be added, with as much specificity as possible – suggested text would be helpful.

Please identify the sub-section and page number for each of your comments.

Here are specific assignments for the review request. Most sections include a word document as well as some associated figures in pdf form.

- 3.1 Intro – **Molly**
- 3.5 Recreation – **Mark/Palmer/Molly**
- 3.11 Aesthetics – **Mark/Palmer/Molly**
- 3.14 Soils – **Mark/Palmer**
- 3.16 Surface Water Hydrology (note, we received figures but not text, and are following up) – **Tim/Mark/Palmer/Muluken**
- 3.17 Groundwater Hydrology – **Tim/Mark/Palmer/Muluken**
- 3.18 Water and Sediment Quality – **Cindi/Tim/Chris**
- 3.22 Wetlands/ Special Aquatic Sites – **Mark/Palmer**
- 3.26 Vegetation (note, we received figures but not text, and are following up) – **Mark/Palmer**

Please let me know if you have any questions. Thank you for your assistance with this review.
Regards,
Molly

Subject: Pebble NEPA/permitting team - documents for awareness review

Pebble NEPA/permitting team –

The Corps has started sending us, and other cooperating agencies, information generated by PLP and the third-party EIS contractor (AECOM). This information includes AECOM's requests (to PLP) for additional information (RFAIs) and PLP's responses. The Corps has begun adding theses RFAIs to the public EIS website. Molly and I will add this information to our SharePoint site as well.
The Corps has submitted this information to us and requested an awareness review, but is not requesting written comments.

For now, I want to bring your attention to two documents, attached:
1 – PLP Updates to the Proposed Project - PLP has made some updates to the project description. Please review this document so that you are aware of the changes. Some of these changes could impact parts of our scoping letter (e.g., use of lightering and elimination of dredging).
2 – PLP Technical Note on Project Options and Screening Criteria – This document summarizes screening criteria and options used by PLP to develop its current project description. I expect the Corps will consider this information during alternatives development. Please review this document for awareness.

We will discuss these documents during our next team meeting on May 24, and I can provide more context. In the meantime, please let me know if you have questions.

Thanks-
Patty

Subject: July 9-11 Pebble site visit

Krista and all,

I am putting in a TA for the proposed site visit as we wait for the ethics response.

There are several unknowns including available flights to and from and cost of helicopter.

Cost estimates are as follows:
High estimate for flights between Anchorage and Iliamna: $500
High estimate for seat on helicopter: $2,500
Lodging $150 per night: $300 total
MI&E: $88 per total: $220

Total high estimate: $3,520.

Thanks to Patty I'm anticipating a call from the company with additional details today or tomorrow.

Jennifer,

I don't recall Gayle or myself developing a justification for helicopter use from the Nanushuk site visit.

I haven't done a justification for helicopter travel since the Chuitna days. You may want to check with Mark Douglas. He and Gayle Martin participated in a Nanushuk site visit using helicopter services provided by Armstrong.

Hi All-
I am preparing an email to ORC regarding upcoming site travel to Pebble. As has been done in the past, we would be invoived by Pebble for helicopter time.
I understand that Jennifer (or Hanh?) had developed similar justifications/emails for O&G site travel.
Could you send me an example of this so I don't have to reinvent the wheel and could also point to these other examples?
Thanks-
Patty

Hi Ashley,
I am so sorry for the delay in getting these comments to you for review. If you will no longer be able to complete your review Friday, please let me know. I also apologize that some of the comments (particularly the last couple pages) are still a bit rough. So, please don't feel that you have to edit grammar, punctuation, etc., as I will do another read-through for that before sending this to Jill.

Patty – I've copied you here as well, so you can decide if you would prefer to do your final review of the compiled comments now, or at the same time as Jill's review.

Thank you very much in advance for your review!

Estrella:

I have attached the site services request form that our operations staff need to finalize your arrangements. I went ahead and filled out most. Please review and add your phone number (cell phone preferably) and whether anyone has any food allergies or special needs. You can send the completed form back to me and I will submit it to site. I have requested individual rooms for each of you.

Meals are cafeteria style. For your arrival day, it will be easiest if you can bring your lunch with you. For the remaining days you will make a bag lunch at breakfast to bring with you to the field.

We will provide in-town transportation to/from the airport each day in one of our vehicles. Work days are 12 hours, with 10 in the field and one hour on either end for muster, briefings, etc. Crews normally do not return to base during the work day unless weather limits flight operations. Low clouds and/or high winds are typically the only conditions that will restrict helicopter travel.

No firearms are permitted at any Pebble facility or in helicopters. Trained bear guards will be provided with each crew. Guards are in constant radio contact with site operations. Alcohol is prohibited at any Pebble facility.

Safety training and site orientation will take place as soon as you arrive. That should take about an hour, followed by a 20-minute helicopter safety briefing. We provide basic PPE (safety goggles, high visibility vest, hearing protection). You are welcome to bring your own as long as the operations manager approves. Field gear requirements are what you would normally bring.

Accommodations are 150/person/day. We will invoice you after your trip. Our site staff does not have the ability to accept payments. Helicopter time will likewise be invoiced to you based on the per seat cost and number of flight hours logged. Cost may vary depending on which helicopter is available.

Please let me know if you have any other questions.

Thanks,
Tim

Hi Tim,

I think I left a voice mail and I am wondering if you received it.

In any case, please let me review with you our itinerary:
Arrival time @ Iliamna: July 9 (Monday) at 0900.
Departure time: July 11 @ 4:30 p.m.

Corps will disburse your company directly for hotel/helicopter costs.
Hotel:
Check in July 9th
Check out July 11th

Meals:
July 9th (lunch brown bag - Diner)
July 10th (all meals)
July11th (breakfast & lunch).

Helicopter: as per time-usage logs (coordination field work with HDR at this point).

Truck Rental: We will take your offer of picking us up at the airport on Monday July 9th.

You mentioned we will have safety training upon arrival on July 9th before heading to the field. Please let us know if there is anything else we need to be aware of.

Thank you very much for your help,

Estrella

Subject: Please Review -- Pebble Ch 2 Alternatives

Hello All,
I previously provided the draft Chapter 2 as an FYI, but the Corps has now said they will be accepting comments on this chapter, with a due date of 11/23. As you have been assisting in review of the various alternatives screening documents, I would appreciate your review of this section as well. In order to meet the comment deadline including time required for internal management review of the comments, please send me any comments you may have on Chapter 2 **by COB Friday 11/9**. (I apologize that this is a quick turnaround, but hope that you may have already begun looking over the document.)

Chapter 2 and the associated figures are available on the Sharepoint site, but please let me know if you are not able to access them or have any questions.
Thank you,
Molly

Subject: PLEASE UPDATE THIS BRIEFING DOC!!! Chu, Rebecca shared "R10 ORA Briefing Paper and Talking Points Chris Meet and Greet with Col Borders" with you.

Importance: High

Hi All

Now that we are coordinating on TWO briefing docs for the RA- reminder that the One Drive doc below needs to be updated with the NEPA info by COB today. Please let me know if you don't have access to this doc. As a reminder- these talking points are being drafted for the RA for:

11-16-18 Meeting of Chris H, RA and Col. Borders, DE, Alaska District, Corps of Engineers

Purpose of the meeting: it's a meet-and-greet between the two senior leaders. Topics to cover: EPA and the Army MOA for Alaska District & Large NEPA Projects (ID'd in Jill's email below- Nanushuk, Pebble, Ambler, Willow and Coastal Plain)

Talking Point Need:
AK MOU Talking Points: The current draft talking points came from a discussion with David Allnutt. *Mark, Matt and Mary Anne:* please review and edit for accuracy. *Jennifer/Molly/Erik*- we also identified specific ongoing project where we'd like more coordination with the Corps on to support our "one federal decision" and aggressive timelines. Feel free to review those and edit for NEPA accuracy!
Large NEPA Projects Talking Points: NEPA team- we need your help in getting these sorted out. An idea- maybe you can use our last "MOU Talking Point" of wanting more coordination to support our "one federal decision" as a way to describe the specific large projects so it ties together?

Process and Timeline to Complete the Talking Points:
We need to have the talking points to the RA's office by 11-13. To meet this timeline:

- ***Staff input on draft talking points- pretty much need this by COB today or 11/5 AM at the latest***
- HQ Coordination on programmatic level (for 404 program, Mary Anne lead; for NEPA, ???)- 11/5ish
- Jill/Rebecca Review- 11/5-11/6
- David and Linda review & edit - 11/7-11/9
- David/Linda submit to RA's office by 11/13

Please let me know if I have missed any steps in the review process.

Thanks!!

Subject: RE: Chu, Rebecca shared "R10 ORA Briefing Paper and Talking Points Chris Meet and Greet with Col Borders" with you.

Hi Becky,
David and I talked on Friday about having bullet points ready for Chris to bring up with the Colonel regarding our efforts/thinking on Nanushuk, Pebble, Ambler, Willow and Coastal Plain – a number of the big NEPA projects in AK. The Corps is the lead on Pebble and Nanushuk and will be coordinating/collaborating with us regarding our 404/aquatic resource related comments on the BLM-led projects on the list. Jennifer Curtis is the lead point of contact for NEPA for Nanushuk and Molly Vaughan is the lead point of contact on the other projects. David had mentioned that he wanted to talk with Chris about everything we pull together prior to the 16th. If we've set 11/6 as the deadline to get it to David and Linda, I would ask that the NEPA leads please have bullet points/talking points ready for me to take a look by Friday 11/2 – and I can help add points to this as well, if needed, by the 6th.

Please also share your one drive link with Molly and Jennifer – Erik is working on the 404(c) team effort but isn't working on the NEPA EIS review, which would be separate talking points for Chris, if we wanted to bring up both. Thanks everyone – we'll be in good shape getting everything together in plenty of time! Your help in developing this is much appreciated. I'm still home sick – so won't be in on Monday but can catch up with folks (hopefully) Tuesday or later.

Jill

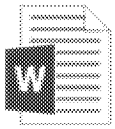
Subject: Chu, Rebecca shared "R10 ORA Briefing Paper and Talking Points Chris Meet and Greet with Col Borders" with you.



All

The RA is meeting with the new District Engineer at the Alaska District on 11-16. David has asked us to put together some talking points for the RA, and we're going to get these to David and Linda by 11-6. I understand that David spoke with Jill re: talking points specific to Bristol Bay. So including Jill and Eric if they'd like to join ARU in what we're putting together for Linda/David and the RA.

Matt & Mary Anne- my notes are from our discussions. Feel free to reframe and clean up.

This link only works for the direct recipients of this message.

Subject: REVIEW REQUEST and additional documents loaded to Sharepoint

Hello Team,
The Corps distributed some additional information to cooperating agencies related to yesterday's Cooperating Agency meeting here in Anchorage, and I have added these materials to the Sharepoint site, in the "Materials for 6-6-18 Cooperating Agency Meeting" folder. Most of the information is for awareness only, but our review has been requested on two items:

1) the Preliminary Scoping Report

Internal Website / Ex. 6

2) selected sections of Pre-Draft Chapter 3

Internal Website / Ex. 6

AMERICAN OVERSIGHT

Your review is being requested on specific materials (listed below), but feel free to also review the remainder of the materials if you wish.

- Preliminary Scoping Report: **Molly/Patty** – comments due to Molly **June 20**
  This document addresses scoping comments received to date, but will be updated following the close of the public scoping period.

- Pre-Draft Chapter 3 Sections – comments due to Molly **June 25** (specific section assignments below)
  These documents are first drafts of each resource section Affected Environment, and will also be updated following the close of public scoping and based on cooperating agency input. It is not clear whether cooperators will have an opportunity to review a second iteration prior to publication of the Draft EIS, so a thorough review at this stage is critical.

  The Corps has requested that our review focus on what is missing or any inaccuracies (don't worry about formatting, grammar, etc.). Where we identify something missing/innacurate, we are asked to be very specific in our recommendation. If you identify missing information in your review, first check the RFIs and Responses to Date

  Internal Website / Ex. 6

  If there is a RFI/response that addresses your concern, then please note that in your comment. If not, then please include in your comment: (1) the information gap, (2) a reference where additional information can be found, and (3) what from that reference should be added, with as much specificity as possible – suggested text would be helpful.

  Please identify the sub-section and page number for each of your comments.

  Here are specific assignments for the review request. Most sections include a word document as well as some associated figures in pdf form.

- 3.1 Intro – **Molly**
- 3.5 Recreation – **Mark/Palmer/Molly**
- 3.11 Aesthetics – **Mark/Palmer/Molly**
- 3.14 Soils – **Mark/Palmer**
- 3.16 Surface Water Hydrology (note, we received figures but not text, and are following up) – **Tim/Mark/Palmer/Muluken**
- 3.17 Groundwater Hydrology – **Tim/Mark/Palmer/Muluken**
- 3.18 Water and Sediment Quality – **Cindi/Tim/Chris**
- 3.22 Wetlands/ Special Aquatic Sites – **Mark/Palmer**
- 3.26 Vegetation (note, we received figures but not text, and are following up) – **Mark/Palmer**

Please let me know if you have any questions. Thank you for your assistance with this review.
Regards,
Molly

Subject: Pebble NEPA/permitting team - documents for awareness review

Pebble NEPA/permitting team –

The Corps has started sending us, and other cooperating agencies, information generated by PLP and the third-party EIS contractor (AECOM). This information includes AECOM's requests (to PLP) for additional information (RFAIs) and PLP's responses. The Corps has begun adding theses RFAIs to the public EIS website. Molly and I will add this information to our SharePoint site as well.
The Corps has submitted this information to us and requested an awareness review, but is not requesting written comments.

For now, I want to bring your attention to two documents, attached:
1 – PLP Updates to the Proposed Project - PLP has made some updates to the project description. Please review this document so that you are aware of the changes. Some of these changes could impact parts of our scoping letter (e.g., use of lightering and elimination of dredging).
2 – PLP Technical Note on Project Options and Screening Criteria – This document summarizes screening criteria and options used by PLP to develop its current project description. I expect the Corps will consider this information during alternatives development. Please review this document for awareness.

We will discuss these documents during our next team meeting on May 24, and I can provide more context. In the meantime, please let me know if you have questions.

Subject: Pebble Chapter 3.16 and 3.26 now on Sharepoint site

Good morning,
The Corps has finally sent us the missing word documents for Section 3.16 Surface Water Hydrology and 3.26 Vegetation, and I have added those documents to the sharepoint site. They did not provide a new due date for these delayed sections, but have requested comments as soon as possible. I will try to confirm a deadline by our team meeting tomorrow. But, in the meantime, please begin your review as soon as you are able.
Thank you,
Molly

Subject: REVIEW REQUEST and additional documents loaded to Sharepoint

Hello Team,
The Corps distributed some additional information to cooperating agencies related to yesterday's Cooperating Agency meeting here in Anchorage, and I have added these materials to the Sharepoint site, in the "Materials for 6-6-18 Cooperating Agency Meeting" folder. Most of the information is for awareness only, but our review has been requested on two items:

1) the Preliminary Scoping Report

Internal Website / Ex. 6

2) selected sections of Pre-Draft Chapter 3

Internal Website / Ex. 6

AMERICAN OVERSIGHT

Your review is being requested on specific materials (listed below), but feel free to also review the remainder of the materials if you wish.

- Preliminary Scoping Report: **Molly/Patty** – comments due to Molly **June 20**
  This document addresses scoping comments received to date, but will be updated following the close of the public scoping period.

- Pre-Draft Chapter 3 Sections – comments due to Molly **June 25** (specific section assignments below)
  These documents are first drafts of each resource section Affected Environment, and will also be updated following the close of public scoping and based on cooperating agency input. It is not clear whether cooperators will have an opportunity to review a second iteration prior to publication of the Draft EIS, so a thorough review at this stage is critical.

  The Corps has requested that our review focus on what is missing or any inaccuracies (don't worry about formatting, grammar, etc.). Where we identify something missing/innacurate, we are asked to be very specific in our recommendation. If you identify missing information in your review, first check the RFIs and Responses to Date

  Internal Website / Ex. 6

  If there is a RFI/response that addresses your concern, then please note that in your comment. If not, then please include in your comment: (1) the information gap, (2) a reference where additional information can be found, and (3) what from that reference should be added, with as much specificity as possible – suggested text would be helpful.

  Please identify the sub-section and page number for each of your comments.

  Here are specific assignments for the review request. Most sections include a word document as well as some associated figures in pdf form.

- 3.1 Intro – **Molly**
- 3.5 Recreation – **Mark/Palmer/Molly**
- 3.11 Aesthetics – **Mark/Palmer/Molly**
- 3.14 Soils – **Mark/Palmer**
- 3.16 Surface Water Hydrology (note, we received figures but not text, and are following up) – **Tim/Mark/Palmer/Muluken**
- 3.17 Groundwater Hydrology – **Tim/Mark/Palmer/Muluken**
- 3.18 Water and Sediment Quality – **Cindi/Tim/Chris**
- 3.22 Wetlands/ Special Aquatic Sites – **Mark/Palmer**
- 3.26 Vegetation (note, we received figures but not text, and are following up) – **Mark/Palmer**

Please let me know if you have any questions. Thank you for your assistance with this review.
Regards,
Molly

Subject: Pebble NEPA/permitting team - documents for awareness review

Pebble NEPA/permitting team –

The Corps has started sending us, and other cooperating agencies, information generated by PLP and the third-party EIS contractor (AECOM). This information includes AECOM's requests (to PLP) for additional information (RFAIs) and PLP's responses. The Corps has begun adding theses RFAIs to the public EIS website. Molly and I will add this information to our SharePoint site as well.
The Corps has submitted this information to us and requested an awareness review, but is not requesting written comments.

For now, I want to bring your attention to two documents, attached:
1 – PLP Updates to the Proposed Project - PLP has made some updates to the project description. Please review this document so that you are aware of the changes. Some of these changes could impact parts of our scoping letter (e.g., use of lightering and elimination of dredging).
2 – PLP Technical Note on Project Options and Screening Criteria – This document summarizes screening criteria and options used by PLP to develop its current project description. I expect the Corps will consider this information during alternatives development. Please review this document for awareness.

We will discuss these documents during our next team meeting on May 24, and I can provide more context. In the meantime, please let me know if you have questions.

Hi Cindi and Mark-

We have another short turn around review on a draft section of the Pebble EIS.

Attached is draft Section 4.1, which is the introduction to the Environmental Consequences section. The Corps has requested comments by 10/31. This section identifies past, present, and reasonably foreseeable future actions that will be considered in the cumulative effects analysis in subsequent chapters. We especially appreciate your review of the actions identified and whether there are others that could be missing.

The Corps has requested comments by 10/31. In order to meet this deadline and have management review, if you have time to look at this section, then please send Molly and I comments by COB 10/24.

Let us know if you have questions.

Thanks - Patty

Subject: REVIEW REQUEST - Pebble Preliminary Ch. 4 Sections
Attachments: Sec4.18_Water&SedQual_FINAL.docx; Sec4.22_Wetlands_FINAL.docx; Sec4.26_Vegetation_FINAL.docx; Sec4.1_Intro_FINAL.docx; Sec4.5_Recreation_FINAL.docx; Sec4.11_Aesthetics_FINAL.docx; Sec4.14_Soils_FINAL.docx; Sec4.16_SurfaceWater_FINAL.docx; Sec4.17 Hydrogeology_FINAL.docx; Comment spreadsheet.docx

Hello All,
The Corps has distributed some very preliminary draft sections of Chapter 4 for Cooperating Agency review. These documents do not contain the actual project analysis, but appear to be more of a framework to work from in completing the analysis and EIS text. The sections include heading, some introductory-type text, and some blank tables. The Corps did not provide detailed instructions for review, but I recommend that we review from the perspective of determining whether the skeleton of the analysis presented here appears that it will address the key issues for review, and provide recommendations for inclusion of any issues that appear to have been overlooked in the current structure.

Here are the specific section assignments, similar to last time:

- 4.1 Intro - Molly
- 4.5 Recreation - Molly
- 4.11 Aesthetics - Molly
- 4.14 Soils - Mark/Palmer
- 4.16 Surface Water Hydrology - Tim/Mark/Palmer/Muluken
- 4.17 Hydrogeology - Tim/Mark/Palmer/Muluken
- 4.18 Water and Sediment Quality - Cindi/Tim/Chris
- 4.22 Wetlands/ Special Aquatic Sites - Mark/Palmer
- 4.26 Vegetation - Mark/Palmer

The Corps has requested a quick turnaround for review, therefore please send me any comments you may have on these sections by COB 7/24. I am hoping, given the brevity of these documents, that this timeframe will be achievable, but please let me know as soon as possible if it will not.

Please provide your comments in the attached comment table format.

It may be helpful to look back at the issues we recommended for analysis in our scoping comments - I have saved the final version of that letter on the Sharepoint Site here:

Internal Web Address / Ex. 6

Thank you,
Molly

AMERICAN OVERSIGHT

Note to Reviewers

This section is an early stage preliminary draft, and has been prepared prior to the completion of scoping for the purpose of setting analytical direction and facilitating the project schedule for completing the EIS.

As an initial draft, it is incomplete in many ways, and contains numerous placeholders to be addressed as more information becomes available. The Scoping Comment Period has not closed, Alternatives to the Proposed Action have not been formally identified, information needed to complete the analysis is not yet fully available and in the process of being requested from the applicant, and the approach for topics such as spills/dam failures, traditional knowledge and cumulative effects has not been settled. In addition, supporting analysis and logic for determination of potential environmental consequences have not been fully developed. This draft is intended to frame the eventual section, and in doing so, allow USACE to see the intended topics and content for the eventual completed sections. Notes are included in many sections to identify where the analysis is incomplete.

4.0 ENVIRONMENTAL CONSEQUENCES

4.1 APPROACH TO ENVIRONMENTAL ANALYSIS

Chapter 4 describes the potential impacts on the environmental resources addressed in Chapter 3 that would occur under the No Action Alternative, the Applicant's Proposed Alternative, and other action alternatives.

4.1.1 Impact Characterization

Adverse and beneficial effects of the project were evaluated and described for each of the 25 resources. Each resource section provides context for analyzing impacts by considering them generally in relation to four dimensions:

- Magnitude, or the intensity of the impact
- Duration, or how long the impact would be expected to occur or last
- Geographic extent, or where the impact would be expected to occur
- Potential, or how likely the impact is to occur.

Not every resource considers every dimension, and the level of quantified or qualified information presented is appropriate to the context of the resource. In each of the resource subsections, the methods used for analysis are described.

Project component values, such as road lengths and pad acreage, are approximations based on best available data. Due to differences in data processing systems (e.g., Geographic Information System [GIS]) and methodologies (e.g., number rounding), the values presented in the Environmental Impact Statement (EIS) may differ slightly from values presented in other project-related documents, such as permit drawings. These differences have been reviewed, and were determined to be insignificant to the analysis, as well as to the overall permitting process.

4.1.1.1 Types of Effects Considered

The National Environmental Policy Act (NEPA) requires three types of impacts to be evaluated—direct, indirect, and cumulative—as defined below:

AMERICAN OVERSIGHT

Direct Effects: Effects caused by the action and occurring at the same time and place (40 Code of Federal Regulations [CFR] 1508.8). Limited to the proposed action and alternatives.

Indirect Effects: Effects that are "caused by an action and are later in time or farther removed in distance but are still reasonably likely. Indirect impacts may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems" (40 CFR 1508.8). Indirect effects are caused by the project, but do not occur at the same time or place as the direct effects. Limited to the proposed action and alternatives.

Cumulative Effects: Additive or interactive effects that would result from the incremental impact of the proposed action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such other actions (40 CFR 1508.7). This includes incremental impacts of the proposed action and alternatives when added to other past, present, and reasonably foreseeable future actions. Interactive effects may be either greater or less than the sum of the individual effects; therefore, the action's contribution to the cumulative case could increase or decrease the net effects. For this analysis, reasonably foreseeable future actions (RFFAs) are existing plans, permit applications, and fiscal appropriations that are external to the proposed action, and likely (or reasonably certain) to occur in the next 30 years.

[Note: RFFAs are being developed and will be added at a later time.]

4.1.1.2 Time Periods for the Impact Assessment

Impacts on some resources may vary depending on the phase of the proposed project. Accordingly, the impact assessment was divided into three time periods:

- Construction phase
- Operations phase
- Closure or post-closure phase.

Although division of analysis into these three time periods works well for most resources, it is less relevant for some resources, such as Needs and Welfare of the People (Socioeconomics), or Recreation.

4.1.2 Issues Selected for Analysis

The U.S. Army Corps of Engineers (USACE) and cooperating agencies selected substantive impact topics for further analysis, and eliminated others from evaluation. Based on scoping comments, issues were selected for analysis, and are organized by physical, biological, or social environment.

The site of the proposed project and the nature of open-pit mining activity would lead to a complex interaction between groundwater, surface water, and a number of water-related resources. The proposed project would also lead to a complex interaction between water-related resources and fish and aquatic resources. This section provides an overview of the water-related resources, and fish and aquatic resources, and their interactions with groundwater. In this document, *water-related resources* include:

- Wetlands, streams, and other Waters of the U.S. (WOUS)
- Aquatic habitat and resources
- Groundwater and surface water quality and water supplies

AMERICAN OVERSIGHT

- Floodplains
- Riparian communities
- Terrestrial resources.

[Note: Issues will be further developed at a later time.]

4.1.3 Financial Assurances and Bonding

This section describes the concepts of financial assurances and bonding in the mining and metals industry; the requirements for bonding under the State of Alaska; and Pebble Limited Partnership's (PLP) proposal for financial assurances.

[Note: This section will be further developed at a later time.]

4.1.4 Evaluation of Potential Failures

[Note: This section will be further developed at a later time.]

Note to Reviewers

This section is an early stage preliminary draft, and has been prepared prior to the completion of scoping for the purpose of setting analytical direction and facilitating the project schedule for completing the EIS.

As an initial draft, it is incomplete in many ways, and contains numerous placeholders to be addressed as more information becomes available. The Scoping Comment Period has not closed, Alternatives to the Proposed Action have not been formally identified, information needed to complete the analysis is not yet fully available and in the process of being requested from the applicant, and the approach for topics such as spills/dam failures, traditional knowledge and cumulative effects has not been settled. In addition, supporting analysis and logic for determination of potential environmental consequences have not been fully developed. This draft is intended to frame the eventual section, and in doing so, allow USACE to see the intended topics and content for the eventual completed sections. Notes are included in many sections to identify where the analysis is incomplete.

4.5 RECREATION

For the purposes of this section, the region around the project site is defined as the area from Lake Clark National Park and Preserve south to Katmai National Park and Preserve, and from the Mulchatna River east to the western Kenai Peninsula. See Figure 3.2-1 for generalized land status.

4.5.1 No Action Alternative

Under the No Action Alternative, the Pebble Project would not be developed. No construction, operation, or closure activities would occur at the Mine Site or Amakdedori Port, or in the Transportation Corridor or Natural Gas Pipeline Corridor. Therefore, no future direct or indirect effects on recreation resources would be expected. Exploration activities currently associated with the project would cease. Helicopter traffic related to these exploration activities would likely decrease. Although recreation use of the Mine Site is minimal, such a decrease in helicopter traffic would be noticeable to recreation users of the Newhalen River and the northern shoreline of Iliamna Lake near Iliamna.

4.5.2 Action Alternative 1 – Applicant's Proposed Alternative

The following sections describe anticipated recreation impacts from the project's four major components: the Mine Site, Amakdedori Port, the Transportation Corridor, and the Natural Gas Pipeline Corridor. For economic impacts related to commercial and recreational fishing, see Section 4.6, Recreational and Commercial Fisheries.

4.5.2.1 Mine Site

Recreation use at the Mine Site is minimal, consisting of some sport hunting and fishing and occasional snowmachine use. Flights taking recreationists to various destinations in the region may also pass over the Mine Site.

Construction, operation, and closure at the Mine Site may affect sport hunting and fishing on state lands surrounding the project area. Project-related activities, such as blasting and operation of heavy equipment and helicopters, would adversely affect the recreational experience for hunters and anglers by changing the setting from a quiet wilderness area to a developed industrial area within visual and auditory distance of the Mine Site. The noise generated by these activities would also displace wildlife from the immediate Mine Site area,

AMERICAN OVERSIGHT

and likely from lands immediately surrounding the project area, thus reducing the likelihood of hunting success close to project components. Therefore, hunters, anglers, or guides who currently use the immediate vicinity would likely stop using these areas and would be displaced to other areas during construction, operation, and closure activities.

Given the low estimated use of the Mine Site and immediate surrounding area for sport hunting and fishing, project-related noise and activities at the Mine Site would result in minimal displacement of sport hunting and fishing use, likely to other state lands in the area with similar habitat. However, project-related noise and aircraft traffic that would be noticeable to recreation users on the Newhalen River, Upper Talarik Creek, and the upper North and South Forks of the Koktuli River would detract from the quality of the recreation experience, potentially resulting in some displacement of activities to other areas. For further analysis, see Section 4.11, Aesthetics; Section 4.19, Noise; Section 4.23, Wildlife Values; and Section 4.24, Fish Values.

Project construction, operation, and closure at the Mine Site would also physically remove acreage available for recreation. However, given the likely low use of the site for recreation, the loss of 6,874 acres (Mine Site footprint) for recreation would likely result in minimal displacement of recreation use to other nearby state lands where similar recreation opportunities and settings exist.

Project-related noise and activities would not be likely to affect recreational settings or activities in Lake Clark National Park and Preserve, the nearest regional recreation destination and known recreation use area to the Mine Site. As stated in Section 4.11, Aesthetics, the Mine Site would/would not be visible from this park unit; and as described in Section 4.19, Noise, Mine Site construction and operational noise would not affect sensitive receptors there.

[Note: This paragraph will be updated with information about visibility of the Mine Site from recreation areas when the results of RFI 34 (viewshed analysis) are received.]

Activities at the Mine Site would be visible and potentially audible to visitors flying over the Mine Site to reach regional recreation destinations such as Lake Clark National Park and Preserve or nearby lodges, fishing the Upper Talarik Creek, and accessing the North Fork and South Fork Koktuli River for recreational river floating purposes. The presence of the mine, a large industrial use in an otherwise generally primitive area, may adversely affect the recreation experience for visitors flying over the Mine Site by causing a change in the recreation setting. Because of the Mine Site's location relative to nearby lodges and airstrips/airports, only a few flight paths cross the Mine Site; thus, visitors flying into the area would be affected by the presence of the project. The recreation experience for visitors on these flights would be adversely affected during project construction, operations, and closure.

Recreation by construction and operation staff would be expected to occur elsewhere (i.e., beyond the Mine Site), because site rules would prohibit hunting, fishing, or gathering on-site to minimize impacts on local subsistence resources. The mine would operate on a fly-in, fly-out basis. Therefore, non-resident staff members would not likely contribute to an increase in recreation use, although some may occasionally stay in the area for recreational trips to nearby destinations. As described in Section 4.3, Needs and Welfare of the People—Socioeconomics, operation of the mine is not expected to generate a large increase in the number of full-time residents.

4.5.2.2 Amakdedori Port

The Amakdedori Port site is located on state lands designated for habitat use by the Kenai Area Plan (ADNR 2001). The Kenai Area Plan does not mention recreation use, although there may be recreational boating, overflights, hunting, fishing and incidental wildlife viewing near the port

AMERICAN OVERSIGHT

site. Boat traffic to and from the port would be minimal: up to 27 concentrate vessels and 33 supply barges per year during operations. Therefore, activities at Amakdedori Port would result in minimal adverse impacts on recreational boat traffic, and thus, on boating experiences and opportunities around the port site and in Cook Inlet. The visual impacts of the port would affect the recreation setting for boaters.

The project may affect incidental wildlife viewing, hunting, and fishing opportunities at the port site, to the extent that they occur. Noise and activities would displace wildlife and fish from the area, thus adversely affecting wildlife viewing, hunting, and fishing opportunities and experiences by reducing the likelihood of seeing wildlife or catching fish.

In addition, project-related noise and activities during construction, operation, and closure at Amakdedori Port would adversely affect the recreational experiences of visitors within visual and auditory distance of the port site because of the change from a quiet, undeveloped area to a developed site with visible facilities, generators, and in-water facilities. The adverse effects would displace from this area those visitors who prefer a quiet, undisturbed recreation setting, or who participate in recreation opportunities such as wildlife viewing, hunting and fishing, which typically require a quiet, undisturbed recreation setting.

Overall, because recreational use of the Amakdedori Port site is low even during the peak summer season, project-related wildlife and fish displacement, noise, and activities would result in minimal displacement of wildlife viewing and fishing uses to other nearby shoreline areas.

The port site, including construction, operation, and closure activities, would be visible from flights over the site to regional recreation destinations such as Katmai National Park and Preserve or towns farther west such as King Salmon or Naknek. Although the recreation use of McNeil River State Game Refuge is limited by permit numbers, and the use of Augustine Island and nearby shoreline areas is low, on-water sightseeing and/or wildlife viewing may occur in these locations. Construction, operation, and closure at Amakdedori Port could adversely affect the recreation experience for visitors participating in sightseeing or wildlife viewing opportunities in these surrounding areas, by causing a change in the recreation setting to a more developed and less remote, primitive area. However, given the distance of the port site from these areas, which would reduce the port's visibility, and the likely low level of recreation use at these nearby locations, impacts on recreation experiences would be limited.

[Note: This paragraph will be updated with information about visibility of Amakdedori Port from recreation areas when the results of RFI 34 (viewshed analysis) are received.]

The project would not result in changes in access to McNeil River State Game Refuge or Sanctuary. Visitors fly into the sanctuary, where the main recreation use areas are located. McNeil Camp, the main access point to the sanctuary and refuge, is located 12 miles south of the Amakdedori Port site.

4.5.2.3 Transportation Corridor

The volume of recreation use is likely low in numbers along the north and south mine access road corridors, the Kokhanok Airport spur road, and the Iliamna spur road. However, many consider recreation use opportunities to be of extremely high quality in these areas, particularly along the Newhalen River and Upper Talarik Creek by the north access road, and in the Gibraltar River and Lake portions of the south access road corridor, which some local lodges advertise as offering guided fishing, hunting, and sightseeing trip options (Haugen et al. 2003). Recreational sport hunting or snowmachine use may occur occasionally within these road corridors. See Section 4.12 Transportation and Navigation for impacts to snowmachine use for travel. Some boating takes place at Iliamna Lake and could be affected by the ferry. Both

AMERICAN OVERSIGHT

motorized and non-motorized boating may occur, either as activities in themselves and as a means of accessing other recreation opportunities, primarily fishing. Fishing is the main recreation opportunity at Iliamna Lake.

Noise and activities along the Transportation Corridor during project construction, operation, and closure would affect the quality of sport hunting, fishing, and other recreation activities on state lands and along creeks in and surrounding the project area by generating potential noise and visual impacts. Impacts on sport hunting and fishing opportunities and experiences would be similar to those described above for the Mine Site.

Similar to the Mine Site, project-related noise and activities would not likely affect recreational settings or activities in Lake Clark National Park and Preserve. As stated in Section 4.11, Aesthetics, the Transportation Corridor would/would not be visible from this park unit; and as described in Section 4.19, Noise, Transportation Corridor construction and operational noise would not affect sensitive receptors there.

[Note: This paragraph will be updated with information about visibility of the Mine Site from recreation areas when the results of RFI 34 (viewshed analysis) are received.]

Activities in the road and ferry terminal portions of the Transportation Corridor would also physically remove acreage available for recreation during project construction, operation, and closure. However, given the likely low use of these portions of the corridor for recreation, the loss of 1,128 acres for recreation would likely result in minimal displacement of recreation use to other state lands in the general area with similar habitat.

As stated in Section 4.3, Needs and Welfare of the People—Socioeconomics, limited access to the roadways and ferry terminal would be available to local residents and businesses only, even after closure of the mine, and would be provided only in scheduled, escorted convoys. Therefore, the Transportation Corridor facilities would not induce recreation or expose previously inaccessible areas to public access and use (RFI 27).

Activities in the Transportation Corridor may be partially visible to and potentially audible for visitors flying over the corridor to reach regional recreation destinations such as Lake Clark National Park and Preserve, float trip destinations (on the Mulchatna, Gibraltar, and other rivers), or nearby lodges. The presence of roads, ferry terminals, and ferry in an otherwise generally primitive area may adversely affect the recreation experience for visitors flying over the Transportation Corridor because of the change in the recreation setting from remote and primitive to more developed and seemingly accessible. Because of the narrow road corridor and vegetation along the roadways and the size of the ferry terminals, the corridor would likely be visible to most visitors only briefly. The recreation experience for visitors on these flights could be adversely affected.

The Transportation Corridor, including construction, operation, and closure activities at the site, would/would not be intermittently visible from the northern edges of Katmai National Park and Preserve and the McNeil River State Game Refuge, depending on the elevation of the viewpoint.

[Note: This paragraph will be updated with information about visibility of the Transportation Corridor from recreation areas when the results of RFI 34 (viewshed analysis) are received.]

The project would also affect incidental wildlife viewing along the Transportation Corridor; the primary recreation use in these areas is likely from other activities, such as fishing. Movement and distribution of bears and other terrestrial mammals through the Transportation Corridor to the McNeil River State Game Refuge and Katmai National Park and Preserve would be disrupted, thus construction and operational activities in the south access corridor would have

AMERICAN OVERSIGHT

some adverse impacts on wildlife viewing in both of those recreation areas. See Section 4.23, Wildlife Values, for more information on impacts to bear movement and distribution.

Iliamna Lake provides opportunities for wildlife viewing, although there are no known opportunities specific to the proposed ferry terminal locations, ferry route, or pipeline route. Fishing is the primary recreational use of the lake, and extensive opportunities for fishing are available given the lake's size. The project would likely displace wildlife and fish from the locations of the ferry terminals and ferry route during all phases, thus reducing the likelihood of viewing any wildlife or catching fish in and immediately adjacent to the project area. Project noise would also change the recreation setting of the terminal sites from quiet and remote to developed and active. Therefore, all project phases would adversely affect wildlife viewing and fishing experiences and opportunities around the Iliamna Lake portions of the Transportation Corridor. Other locations around the lake would be available for displaced wildlife viewing and fishing use.

Project-related noise and activities during construction, operation, and closure could adversely affect boating on Iliamna Lake. Construction of the pipeline and ferry terminals and operation of the ferry would likely displace boaters from the area immediately surrounding the equipment, ferries, and facilities. Boaters would likely be displaced to other areas of the lake during construction, operation, and closure to avoid the noise and hazards presented by the equipment and activities. Project-related noise and equipment would particularly affect non-motorized boating use, a generally quieter activity that requires more time and effort to circumnavigate in-water obstructions. One ferry trip per day would occur during operations, which would not be expected to contribute considerably to boat traffic on the lake. Although recreational lake boat traffic may slow down and avoid the ferry, alternative open water would be available for boating use during ferry operations. See Section 4.12, Transportation and Navigation, for impacts to non-recreational lake traffic.

4.5.2.4 Natural Gas Pipeline Corridor

From the Amakdedori Port site to the Mine Site, the Natural Gas Pipeline Corridor is adjacent to the Transportation Corridor, and potential impacts on recreation have been described above. Existing recreation use along the pipeline alignment in Cook Inlet and on the Kenai Peninsula consists of boating on the inlet and recreation use on the peninsula. Boating on Cook Inlet is both an activity in itself and a means of accessing other recreation opportunities such as fishing, wildlife viewing, birdwatching, and beachcombing.

[Note: This paragraph will be updated when the updated GIS data for the project footprint are received.]

Equipment present on Cook Inlet during project construction and closure would be visible and audible to recreational boaters within a certain distance, and would likely temporarily displace any boating and fishing use from the area immediately surrounding the equipment and construction activity; however, alternate open water is available for use by displaced boaters or anglers. Recreation experiences for non-motorized boaters would also be temporarily adversely affected by noise and activity by equipment used during construction or closure, which would affect the recreation setting of the state recreation area for these users.

[Note: This paragraph will be updated when the updated GIS data for the project footprint are received.]

Noise and activities during project construction and closure may also temporarily adversely affect recreation experiences for other visitors to Anchor River State Recreation Area. Visitors participating in camping, picnicking, and hiking may also be adversely affected by the change in

AMERICAN OVERSIGHT

the recreation setting caused by the noise and project activities, thus adversely affecting their recreation experiences. Some visitors may be displaced from the site temporarily because of the change in recreation setting to other state parks or locally managed recreation sites along the Kenai Peninsula.

The pipeline would be located south of Augustine Island in Cook Inlet. Although no recreation occurs on the island itself, some sightseeing of the island's volcano and wildlife occurs from the water. Therefore, equipment and noise associated with construction and closure may temporarily adversely affect sightseeing opportunities and experiences along the south side of the island. However, displaced boats would be able to view the island from other locations around the island that were not affected by project equipment and noise.

The pipeline would not be visible above ground (it would be located below ground, on the seafloor, or below the seafloor in the inlet) and would not remove any acreage from use for recreation opportunities. Recreation experiences for on-water or state park unit visitors may be temporarily affected during pipeline operations because of the presence of boat traffic during pipeline maintenance.

4.5.2.5 Cumulative Effects

[Note: This section will be updated at a later time.]

Note to Reviewers

This section is an early stage preliminary draft, and has been prepared prior to the completion of scoping for the purpose of setting analytical direction and facilitating the project schedule for completing the EIS.

As an initial draft, it is incomplete in many ways, and contains numerous placeholders to be addressed as more information becomes available. The Scoping Comment Period has not closed, Alternatives to the Proposed Action have not been formally identified, information needed to complete the analysis is not yet fully available and in the process of being requested from the applicant, and the approach for topics such as spills/dam failures, traditional knowledge and cumulative effects has not been settled. In addition, supporting analysis and logic for determination of potential environmental consequences have not been fully developed. This draft is intended to frame the eventual section, and in doing so, allow USACE to see the intended topics and content for the eventual completed sections. Notes are included in many sections to identify where the analysis is incomplete.

4.11 AESTHETICS

4.11.1 Methods

Potential impacts on aesthetics and visual resources were assessed by determining the overall change in landscape character and scenic integrity based on an assessment of visual contrast, scale dominance, and viewer experience as perceived from various Key Viewing Areas (KVAs).

The mechanisms by which effects on visual resources were assessed include:

- The *magnitude or intensity* of effects on visual resources was measured by the level of visual contrast created by the project. Magnitude or intensity was also informed by the scale of contrasting features relative to the existing landscape, and by the anticipated exposure of viewers to these features, including the angle from which a viewer is exposed to an effect (viewer geometry).
- The *duration* of the effects was measured by the anticipated temporal extent of effects (temporary, long-term, or permanent).
- The *extent* of the effects was measured by the extent of moderate to strong visual contrast, and was summarized as localized, extended, or regional.

The context of the effects was considered, and measured by the perceived sensitivity of viewers and the potential for the effects to alter the human experience of the landscape.

As described above, the magnitude of the impact was determined by assessing visual contrast and scale dominance in the context of the prevailing viewer experience. These metrics were assessed as follows:

- *Visual Contrast:* The Bureau of Land Management (BLM) Contrast Rating Procedure was used to determine visual contrast that could result from the construction and operation of the project (BLM 1986). The project would not directly affect federal land; however, the BLM Contrast Rating Procedure is an established and developed methodology commonly used to assess visual impacts. This method assumes that the extent to which a project results in adverse effects on visual resources is a function of the visual contrast between the project components and the existing landscape character. Levels of contrast are defined as follows:
    - *None* – The element contrast is not visible or perceived.

AMERICAN OVERSIGHT

- *Weak* – The element contrast can be seen but does not attract attention.
- *Moderate* – The element contrast begins to attract attention and begins to dominate the characteristic landscape.
- *Strong* – The element contrast demands attention, would not be overlooked, and is dominant in the landscape.

- *Scale Dominance:* The contrast created by a project is directly related to its size and scale as compared to the surroundings in which it is placed. Scale dominance refers to the scale of an object relative to the visible expanse of the landscape that forms its setting (BLM 1986). A dominant feature of a landscape tends to attract attention to it and becomes the focal point of the view. Where two or more features both attract attention and have generally equal visual influence over the landscape, they are considered co-dominant. An object or feature that is easily overlooked or absorbed by the surrounding landscape is considered subordinate. Scale dominance was classified using the following metrics:
  - Not Visually Evident (NVE)
  - Visually Subordinate (VS)
  - Visually Evident (VE)
  - Dominant (D)
- Viewer experience was assessed by considering viewer duration, viewer geometry, and distance:
  - *Viewer Duration:* Viewer duration or exposure refers to the length of time project features may be in view. This description discloses whether expected viewer exposure would be limited to a short duration and/or small number of viewpoints, or would be of a prolonged duration and/or experienced from multiple viewpoints.
  - *Viewer Geometry:* Viewer geometry refers to the spatial relationship of the observer to the viewed object (i.e., the project), including both the vertical and horizontal angles of view (USDOI 2013). The vertical angle of view refers to the observer's elevation relative to the viewed object. The horizontal angle of view refers to the compass direction of the view from the observer to the object. Visibility is typically greater for observers whose viewing angle is directed toward a project feature than for those with a lateral view.
  - *Distance:* The degree of perceived visual contrast and scale dominance of an object is influenced by the object's distance from the viewer. As viewing distance increases, the project appears smaller and less dominant. Likewise, as distance increases, the apparent contrast of color decreases (BLM 1986). Distance from project components is classified as follows:
    - Immediate foreground (less than 3 miles)
    - Foreground–middle ground (3–5 miles)
    - Background (5–15 miles)
    - Seldom seen (beyond 15 miles).

4.11.2 No Action Alternative

Under the No Action alternative, the project would not be constructed, and would not have any new effects on aesthetics.

AMERICAN OVERSIGHT

4.11.3 Action Alternative 1 – Applicant's Proposed Alternative

4.11.3.1 Mine Site

Mine Site activities would vary in scale. Collectively, these activities would be expected to result in strong visual contrasts, given the scale of the disturbance. Geographic extent would be extended, with moderate to strong visual contrast. Direct effects from the construction and operation of the Mine Site would be of high intensity when viewed from these locations.

Viewer duration would be intermittent to prolonged, depending on the activity of the viewer. The duration of impacts would be long term, extending beyond the life of the project.

[Note: Visual contrast, other potential visual effects, viewer groups from KVAs (Table 4.11-1) will be developed based on visual simulations, and the geographic extent of impacts will be determined by viewshed models, following the receipt of RFI 34.]

Table 4.11-1: Impact Metrics for the Mine Site from Key Viewing Areas

Key Viewing Areas	Project Component	Viewer Group	Magnitude				
			Visual Contrast	Scale Dominance	Viewer Duration	Viewer Geometry	Viewer Distance

4.11.3.2 Amakdedori Port

Amakdedori Port would be located near the mouth of the McNeil River in Kamishak Bay and near Augustine Island. Development of the port would change the configuration of the shoreline and create an industrial feature in an otherwise natural landscape in Kamishak Bay and has the potential to dominate the viewer experience.

The port facilities and associated components would result in strong visual contrast against the surrounding landscape. Visual contrast would be strongest when viewed from Kamishak Bay. It would also be visible to regional residents who might access the site overland from the west, for the purposes of subsistence activities. Increased project-related boat traffic on Kamishak Bay within Cook Inlet would be visually evident from the foreground, middle ground, and background distance zones. The port would/would not be visible from the Alaska Maritime National Wildlife Refuge and the shoreline near the mouth of McNeil River at the edge of McNeil State Game Refuge. [Note: This paragraph will be edited following the receipt of the viewshed analysis from RFI 34.]

The Amakdedori Port would have high visual contrast against the existing landscape (Table 4.11-2). The vertically erect, geometric facilities would appear dominant and contrast against the low marshlands, with the backdrop of the rolling hills and mountains. Indirect effects on recreation and tourism could result if the natural character of the landscape were compromised in this localized area.

The duration of direct impacts would be long term, as an agreement with the landowner would leave the port facilities in place for use as an industrial port.

[Note: Visual contrast from KVAs (Table 4.11-2) will be developed based on visual simulations, and the geographic extent of impacts will be determined by viewshed models, following the receipt of RFI 34.]

AMERICAN OVERSIGHT

Table 4.11-2: Impact Metrics for Amakdedori Port from Key Viewing Areas

Key Viewing Areas	Project Component	Viewer Group	Magnitude				
			Visual Contrast	Scale Dominance	Viewer Duration	Viewer Geometry	Viewer Distance

4.11.3.3 Transportation Corridor

The Transportation Corridor could be viewed by local residents, visitors, subsistence users, and mine workers. A strong line would be caused by the construction of the road system, contrasting with the native structure of the landscape. This line would be evident when intermittently viewed by air travelers, overland visitors pursuing sports fish and other recreation pursuits in the vicinity of the corridor, and regional residents who might access the site overland from the west, for the purposes of subsistence activities.

Visual contrast in the Transportation Corridor would be expected to result from the construction and operation of roads and ferry terminal infrastructure (Table 4.11-3), which would include daily truck and ferry vessel traffic. The ferry terminals would appear distinct against the shoreline of Iliamna Lake, as the form and line of the structures would contrast with the natural character of the surrounding landscape.

Visibility of new access roads would be visually limited when viewed from land-based positions, as existing vegetation and topography would block views of these features. The visual contrast of the road system would be most evident from superior viewer positions (such as higher elevations) and/or by aircraft. The geographic extent of impacts would be localized.

Viewer exposure would be intermittent to prolonged, depending on the activity of the viewer. The duration of impacts would be long term, extending beyond the life of the project.

[Note: Visual contrast from KVAs (Table 4.11-3) will be developed based on visual simulations, and the geographic extent of impacts will be determined by viewshed models, following the receipt of RFI 34.]

Table 4.11-3: Impact Metrics for the Transportation Corridor from Key Viewing Areas

Key Viewing Areas	Project Component	Viewer Group	Magnitude				
			Visual Contrast	Scale Dominance	Viewer Duration	Viewer Geometry	Viewer Distance

4.11.3.4 Natural Gas Pipeline Corridor

Because the Natural Gas Pipeline Corridor would follow the Transportation Corridor, it is not expected to be visually evident, as it would be absorbed within the impact area and viewed as a component of the Transportation Corridor.

On the Kenai Peninsula, the compressor station would create a weak visual contrast against the surrounding landscape. [Note: This paragraph will be edited following the receipt of the updated project footprint.]

AMERICAN OVERSIGHT

[Note: Visual contrast from KVAs (Table 4.11-4) will be developed based on visual simulations, and the geographic extent of impacts will be determined by viewshed models, following the receipt of RFI 34.]

Note to Reviewers

This section is an early stage preliminary draft, and has been prepared prior to the completion of scoping for the purpose of setting analytical direction and facilitating the project schedule for completing the EIS.

As an initial draft, it is incomplete in many ways, and contains numerous placeholders to be addressed as more information becomes available. The Scoping Comment Period has not closed, Alternatives to the Proposed Action have not been formally identified, information needed to complete the analysis is not yet fully available and in the process of being requested from the applicant, and the approach for topics such as spills/dam failures, traditional knowledge and cumulative effects has not been settled. In addition, supporting analysis and logic for determination of potential environmental consequences have not been fully developed. This draft is intended to frame the eventual section, and in doing so, allow USACE to see the intended topics and content for the eventual completed sections. Notes are included in many sections to identify where the analysis is incomplete.

4.14 SOILS

This section describes potential impacts on soils resulting from each project component. Mitigation and control measures would incorporate structural and non-structural best management practices (BMPs) to address erosion and stormwater runoff. The evaluation also assumes that activities would be performed in accordance with prepared water management and sediment control plans, and necessary Alaska Department of Environmental Conservation (ADEC) permits and stormwater pollution prevention plans (SWPPPs). This includes typical or standard practice activities and BMPs when none are specified in project documents.

4.14.1 No Action Alternative

Under the No Action alternative, the project would not be constructed, and would not have any new effects on soils.

4.14.2 Action Alternative 1 – Applicant's Proposed Alternative

Impacts to soil resources from the Alternative 1 include those related to soil disturbance and erosion. Soil quality is also evaluated for the Mine Site due to potential fugitive dust impacts from sources of concern. Factors used to evaluate soil impacts include soil type and area of disturbance; erosion based on BMPs and foreseeable control measures using common industry practices; planned reclamation and objectives; and anticipated effects on soil quality based on planned project activities.

Evaluation of soil impacts assumes that sediment control measures, BMPs, and adaptive control strategies would be established in a water management and sediment control plan prepared prior to construction and operation; and that proposed earthwork would sufficiently meet necessary conditions required for approval of an ADEC Clean Water Act Section 402 Stormwater Construction and Operation Permit and a Stormwater Discharge Pollution Prevention Plan prior to construction. Other agencies that may require additional considerations related to upland soils include the Alaska Department of Natural Resources (ADNR) for an Approved Pipeline Right-of-Way (ROW) Permit; the Alaska Department of Transportation (ADOTPF) for a Utility Permit on ROW; Kenai Peninsula Borough (KPB); and U.S. Army Corps of Engineers (USACE) Section 404/10 Permit.

AMERICAN OVERSIGHT

4.14.2.1 Mine Site

This section describes potential effects on soils at the Mine Site from construction through reclamation and post-closure management.

Soil Disturbance

Varying degrees of soil disturbances would occur at the Mine Site throughout construction to post-closure. Disturbances would range from the complete removal or permanent burial of pre-existing soil conditions, to reclaimed surfaces following Mine Site operations. Soils impacted at the Mine Site would include surface or very shallow soils (less than 20 inches), shallow soils (10 to 20 inches), moderately deep soils (20 to 40 inches), and deep soils (40 to 60 inches). Soils generally considered most valued and sensitive to disturbances from an ecological perspective are the productive, organic-rich materials in very shallow to moderately deep soils. None of the soils in the project footprint are considered suitable for agricultural purposes.

Principal components associated with soil map units at the Mine Site that would be disturbed (Figure 3.14-1) include:

- IA7: typically less than 20 inches of black and reddish-brown fine thixotropic volcanic ash over gravelly glacial till
- IA9: thin surface mat of partly decomposed plant litter mixed with volcanic ash, with loamy volcanic ash extending up to 30 inches above glacial till or bedrock (Exploratory Soil Survey of Alaska [ESS], Rieger et al., 1979).

The ESS while useful as a general soils map, does not provide site-specific interpretations. For this reason, deviations or variations from these soil descriptors at the Mine Site likely exist.

Soil disturbances can also impart adverse impacts to supporting vegetation and ecological communities. For this reason, salvage of organic-rich growth media and select overburden having growth media attributes is a significant component in the restoration of impacts through reclamation. Additional discussion regarding productivity losses and impacts to wetlands and vegetation are provided in Sections 4.22, Wetlands/Special Aquatic Sites, and 4.26, Vegetation. Additional discussion regarding overburden and disturbances to surficial geology is also provided in Section 4.13, Geology.

The total acreage of soil disturbance that would potentially occur at the Mine Site is approximately 6,875 acres. Most of the disturbances would occur in soils associated with soil map unit IA9 (4,960 acres), with the remaining disturbance associated with soil map unit IA7. The total acreage of soil disturbances includes major earthworks over the four-year construction period, and Mine Site operation up to closure. The total acreage estimate does not include reclamation of various Mine Site infrastructure that would partially restore or reduce soil disturbances during the closure period.

Mine Site facilities not required for post-closure activities would be reclaimed in accordance with State of Alaska requirements. Facilities that would be reclaimed include the potentially acid-generating (PAG) waste and pyritic tails storage facility; the bulk Tailings Storage Facility (TSF); overburden stockpiles; milling and processing facilities; and non-essential roads. Progressive reclamation of the seepage recovery systems, main water management pond, and treatment plants would be performed in post-closure as water recovery rates diminish (e.g., from the bulk TSF) and water quality becomes suitable for discharge to downstream drainages. With the exception of overburden stockpiles, all reclamation would occur after operations. Mine Site infrastructure that would not undergo reclamation includes the open pit (820 acres); mine water treatment plant; power generation facilities; inert monofill in the disturbed footprint; quarry sites;

AMERICAN OVERSIGHT

and limited camp, storage facilities, and access roads. These components would result in permanent disturbances to existing soil conditions.

[Note: Acreages in above text will be revised following receipt of updated project footprint reflecting changes to Mine Site facilities, as described in PLP 2018.]

Overburden would be salvaged as growth media or re-purposed as construction material. Overburden removal would start during construction and continue through operation to support pit expansion. Segregated non-growth media overburden would be stockpiled at a dedicated location southwest of the open pit. The overburden stockpile would be contained in a prepared berm constructed of non-mineralized rock. Surface soils and overburden with growth media attributes would be stockpiled at various locations throughout the Mine Site for future reclamation use. Any waste rock used for construction purposes would be geochemically tested prior to use to avoid adverse impacts to soil and water during operation and closure.

Reclamation would include the dismantling and removal of infrastructure; in situ demolition of impermeable concrete pads and foundations; and disposal of inert materials in an on-site monofill. Disturbed areas would be graded and contoured to conform to the landscape and direct surface water runoff. Scarification or ripping of ground surfaces would promote water infiltration and reduce erosional runoff. Salvaged growth media would be applied, in addition to natural revegetation, soil amendments, or application of proposed reclamation seed mixtures.

Although soil conditions underlying the TSF footprints would result in permanent soil disturbances, each would be reclaimed to conform to designated post-mining land use, as administered by the ADNR. The pyritic tailings and PAG waste would be placed in the pit lake. The liner below the pyritic tailings and PAG waste facility would be removed, and bermed structures leveled. This would be followed by application of salvaged growth media and surface restoration. The bulk TSF would remain in place after controlled dewatering and dry closure, resulting in a permanent landform. The bulk TSF surface would be graded and contoured as needed for drainage control. Growth media would be added for seeding and revegetation, including the embankments.

The intensity of impacts to soil from ground disturbances at the Mine Site would range from noticeable compaction and stress on supporting ecological communities (e.g., vegetation), to acute or obvious changes due to complete burial or removal. Reclamation during closure would minimize soil disturbance to large portions of the site; however, irreversible changes would result from permanent infrastructure required throughout post–closure as well as the remaining pit (pit lake). Soil disturbance would extend across watersheds, but would remain within Mine Site footprint and project boundaries. The context of impacts would disturb surface soil types considered usual or ordinary resources that are widely distributed in the region.

Soil Quality

Potential soil quality impairments at the Mine Site could result from wet or dry atmospheric deposition of fugitive dust derived from orebody sources. These include ore deposit mining operations (e.g., drilling and blasting); ore transport, storage, processing, and handling (including concentrate); and wind erosion of exposed bulk tailings. The cumulative deposition of dust throughout the construction and operation periods could result in adverse changes to surface soil chemistry. Impacts could include elevating concentrations of chemical constituents (e.g., metals) found in orebody materials above those found in existing soils.

Fugitive Dust Constituents of Concern

AMERICAN OVERSIGHT

[Note: This section will be developed following receipt of RFI 007 response regarding fugitive dust emissions. Text will summarize air quality evaluations, metals concentrations in fugitive dust sources, and dispersion modeling inputs.]

Dust Deposition on Soils

[Note: This section will be developed following receipt of RFI 009 response regarding fugitive dust deposition modelling. Text will include dispersion and deposition modeling results, and predicted distribution and accumulation rates in shallow soils at the end of mine life.]

Reasonable Maximum Exposure Concentrations

[Note: This section will be developed following receipt of RFI 009 response regarding fugitive dust deposition modelling. Text will include statistical evaluation of baseline and predicted dust concentrations for constituents of concern (e.g., selected metals).]

Dust Control

The project design incorporates a number of measures to minimize fugitive dust. Coarse ore would be stockpiled in a covered steel-frame building to minimize dust emissions. Baghouse-type dust collectors would be present at each conveyor-fed ore transfer point between the coarse ore stockpile and semi-autogenous grinding ("ball") (SAG) mills. Water would be added for dust suppression purposes at the SAG mill to alleviate additional baghouse infrastructure. Specialized bulk cargo containers equipped with removable locking lids would contain thickened concentrates for delivery to Amakdedori Port.

The pyritic tailings and PAG waste would be completely inundated with water during operations. This removes the potential for wind erosion and dust dispersion from sources with elevated metals concentrations. The tailings associated with the bulk TSF cell would have tailings beaches, which would be susceptible to wind erosion and fugitive dust emissions throughout operations. The bulk TSF cell would eventually be reclaimed through contouring of surfaces and application of growth media for revegetation and surface stabilization, eliminating the beaches as a dust source following closure activities.

Summary of Soil Quality Impacts

[Note: Text pending, awaiting RFI responses].

Erosion

Varying extents of hydraulic and wind erosion would occur throughout all phases of the project at the Mine Site. Without applied mitigation and control measures, erosion can result in adverse water quality and physical impacts to soils, waterbodies (e.g., lakes and streams), wetlands, and ecological communities. Depending on the magnitude and frequency of unmitigated erosion, sediment or particulate transport can extend well beyond the source. Planned activities at the Mine Site would incorporate structural and non-structural BMPs to address erosion and stormwater runoff (PLP 2017). The evaluation of erosion at the Mine Site assumes that all applicable activities would be performed in accordance with prepared water management and sediment control plans, and necessary ADEC permits and SWPPPs.

The greatest potential for hydraulic erosion under planned conditions at the Mine Site would likely occur during the year-round construction phase, coinciding with the longest period of soil disturbances. Removal of vegetative matting would expose fine-grained silty loam, volcanic ash mixtures in shallow surface soils (less than 30 inches deep) that are less tolerant of water and wind erosion. Deeper soils consisting of coarser-grained glacial till and colluvium mixtures would

AMERICAN OVERSIGHT

be comparatively less susceptible to erosional processes. Much of the finer-grained (i.e., shallow) soil mixtures exposed during construction would be removed due to undesirable engineering properties (e.g., loading and compaction) required for infrastructure construction, and placed in salvaged growth media stockpiles.

Insignificant wind and hydraulic erosion is anticipated when soils are frozen during winter months. Consistent frozen soil conditions generally range from four to five months between the fall and spring shoulder seasons (HCG 2011). The greatest potential for erosion would most likely be during rainfall events that typically occur during the fall months. Such events have been documented to result in erosional losses on the Kenai Peninsula and Pile Bay-Williamsport Road . Precipitation and runoff associated with spring breakup and snowmelt would also provide a mechanism for hydraulic erosion.

Wind-induced erosion would be comparatively less than hydraulically driven processes in the construction phase, due to seasonal meteorological conditions and cohesive forces associated with soil moisture. Soil susceptibility to wind erosion is influenced by moisture and particle size. A soil matrix composed of larger grains is less capable of retaining moisture, but less susceptible to wind transport. Although finer-grained soils are generally less tolerant to wind erosion, they are more capable of retaining cohesive moisture. Moisture is anticipated to minimize wind erosion of finer-grained surface soils for most of the year; however, the potential would be greatest during drier periods lasting 1 to 2 months during the summer. Wind erosion could be mitigated through dust control watering as needed during summer construction months.

Vegetation clearing, grubbing, and overburden excavation using heavy equipment (e.g., loaders excavators, dozers, dumptrucks, graders) would occur during the construction phase. Initial construction would include establishing temporary facilities that would be incorporated into the operational footprint. This would be followed by construction of long-term infrastructure such as the TSFs, mill sites, water/sediment ponds and treatment facilities, power generation, access roads, pit, and other long-term or permanent infrastructure. Destabilization of interim soil surfaces would be vulnerable to erosion if not stabilized or covered by infrastructure. Interim soil stabilization and erosion control measures would be necessary during construction to prevent or mitigate erosional issues. Furthermore, construction would not start without an ADEC-approved discharge permit and coverage under an SWPPP (PLP 2017).

Select Mine Site infrastructure that would have inherent design characteristics to minimize or control erosion during construction and operations is discussed below.

Waste Rock and Overburden

Waste rock would be used to construct large portions of Mine Site infrastructure, including TSF embankments, water management pond (WMP) embankments, and roads. The geochemical composition of all non-PAG construction waste rock would be determined in advance to segregate PAG sources. Initial materials used to construct TSF embankments would also be sourced from two quarries at the Mine Site. The coarse-grained rock used to construct the TSF and other Mine Site infrastructure is considered to have a low susceptibility to hydraulic and wind erosion.

Excavated overburden would be stockpiled at a designated location southwest of the open pit, and contained in a non-mineralized rock berm impoundment for stabilization. Suitable overburden would also be used for construction as needed. Fine- and coarse-grained soils salvaged for future growth media would also be stockpiled at various locations throughout the Mine Site. Stockpile surfaces would be stabilized to minimize erosion potential. Typical stabilization measures may include engineered contouring of slope angles and drainages;

AMERICAN OVERSIGHT

rolling and compaction of exposed surfaces; interim seeding and revegetation; silt fencing; and impoundments or sedimentation ponds.

Water Management

All runoff water that comes in contact with Mine Site facilities or is derived from the open pit would be captured. This would also include any entrained sediment in runoff from erosion. A Water Management Plan is currently under development that would include water treatment options and strategic discharges of treated water. A sediment control plan during construction would also address runoff and associated sediment control measures, BMPs, and adaptive control strategies. Collected water would be treated prior to discharge if it could not be diverted.

[Note: This section will be revised following receipt of Water Management Plan in response to RFI 019.]

Water management structures (e.g., berms, channels, collection ditches) would be designed to accommodate a 100-year, 24-hour rainfall event. Sediment control ponds would be designed to treat a 10-year, 24-hour rain event, and safely accommodate a 200-year, 24-hour rainfall event.

Runoff upgradient of the TSFs during construction would be intercepted by a cofferdam and released at a discharge point downgradient of all construction activities in the same watershed. Runoff from the TSF embankments during construction would also be captured. Similarly, runoff from larger excavations associated with the construction of long-term infrastructure (e.g., process plant, camps, power plant, storage areas) would be routed to settling ponds prior to discharge.

Comparatively less soil erosion from water would occur during operations due to a diminished need for soil removal. Completed construction of most long-term infrastructure would coincide with established water management and sediment control plan measures. Although water and sediment control during the operations phase would emphasize contact water minimization and management, runoff and sediment control measures would continue to be managed through BMPs and adaptive control strategies per the SWPPP. With the exception of overburden stockpiles, no mine site infrastructure would be progressively reclaimed during operations.

A greater potential for wind erosion is anticipated during operations, when the bulk TSF is susceptible to this process. Bulk tailings would be pumped and discharged through spigots along the interior of the perimeter cell, with the slurry preferentially discharged to maintain a tailings beach between the TSF embankment and supernatant pond. Although this approach minimizes potential risks associated with seepage effects on embankment stability, the fine tailings (e.g., beaches) would be susceptible to wind erosion when dried. Additional information regarding fugitive dust derived from the bulk TSF is presented in the Soil Quality discussion for the Mine Site.

The Mine Site would be reclaimed per an ADNR-approved reclamation plan that establishes requirements for designated post-mining land use. The reclamation plan would supplement or describe measures to control and mitigate erosion at the Mine Site through the post-operations period. Erosion during closure would be less than during construction, but likely greater than during operations. Large areas of destabilized soil surfaces from demolition activities and application of growth media would likely result in erosion until surface stabilization is achieved. At a minimum, similar measures established in the sediment control plan during construction would address runoff through sediment controls and BMPs. Additional measures may include future developments in available technologies or practices, and refined adaptive control strategies acquired throughout operations. Removal and reclamation of long-term water management infrastructure would progressively coincide with surface stabilization objectives.

AMERICAN OVERSIGHT

The potential for erosion during reclamation from destabilized surfaces would likely continue for several years beyond closure. Prescribed design standards for reclaimed infrastructure and monitoring requirements would be established in the reclamation plan. Continued monitoring would be required to implement any erosional control maintenance or adaptive control measures. Prescribed monitoring would likely occur on an annual basis until surface conditions are stabilized to meet land use objectives. Indefinite monitoring would be incorporated into permanent infrastructure maintenance requirements (e.g., at the pit WTP) as needed. Although reclaimed infrastructure would be designed to withstand anomalous storm events (e.g., 100-year, 24-hour rain event), monitoring would be necessary immediately after any occurrence.

Applied erosion control and water management practices at the Mine Site during all project phases would likely maintain the intensity of impacts to within planned project design and approved monitoring and maintenance program requirements. The duration of impacts would last from completion of the activity (e.g., infrastructure construction) to months or years afterwards until stabilization criteria are met (e.g., closure revegetation). At a minimum, pre-activity levels of soil stabilization would be anticipated within 100 years after project completion. The extent of impacts would likely remain within Mine Site footprint and project boundaries.

4.14.2.2 Amakdedori Port

This section describes potential effects on shore-based, upland soils at the Amakdedori Port during construction through closure. Offshore sediment impacts resulting from intertidal and open-water construction, operations, and closure of marine facilities are discussed in Section 4.18, Water Quality.

Soil Disturbance

No current development exists at the Amakdedori Port site. Shore-based soil disturbances would mostly be attributed to construction of the terminal. The total acreage of soil disturbances at Amakdedori Port is 26 acres. Acreages of currently known soil disturbance associated with various port facilities include:

- Amakdedori Port Terminal – 23.4 acres
- Shore-based range markers – 0.7 acres
- Temporary port airstrip – 1.6 acres.

Acreages associated with soil disturbance during road construction at the port are included under Transportation Corridor. Temporary port infrastructure includes an airstrip and temporary camp. The location of the camp would coincide with other footprints retained throughout operation. [Note: Above acreages to be revised following receipt of revised footprint.]

The terminal would be constructed on engineered fill overlying nearshore beach and marine terrace deposits that extend eastward to the gravel beach high tide line. Fill would likely be derived from either road material sites or imported sources (RFI 005). The amount of dredging required for the current concept of a high-tide-only dock (PLP 2018), characterization of potential dredge material, and the location of potential dredge material disposal or reuse is under development. Although the use of lightering vessels eliminates the need for deep-water channel maintenance dredging and a large onshore dredge material stockpile, it is likely that some quantity of dredge spoils would be generated throughout the life of the port on an as-needed-basis. [Note: Above text to be revised following receipt of updated footprint, RFI 033 response, and results of summer 2018 field studies.]

AMERICAN OVERSIGHT

Most soil disturbances at the port would result in direct impacts during the construction period, including the complete removal of soil cover at the airstrip and terminal, and placement of engineered fill over pre-existing subsurface soil conditions at the terminal. Because no additional construction would be required during operations, any subsequent disturbances to soil would likely be limited. With the exception of necessary infrastructure to support shallow draft tug and barge access to the dock, onshore port facilities would be removed during closure. No additional soil disturbances are anticipated during closure, and restoration of post-disturbance soil conditions would occur through reclamation activities (e.g., scarification, growth media, contouring, seeding).

Soil impacts at the port would largely depend on whether plans for dredging (currently under development) would use onshore disposal, and whether such materials would be removed during closure. Impact intensity could range from the noticeable burial of existing soils, to potential acute or obvious changes associated with any stockpiled marine sediment in an upland environment. The intensity and duration of effects may be reduced pending the similarity of any dredge spoils to pre-existing soil conditions. The duration of impacts could range from long-term (lasting until reclamation targets are met in closure) to extending beyond the life of the project, pending the volume and nature of potential stockpiled dredge materials. The extent of soil disturbances would be limited to the footprint of the port site. [Note: Above conclusions to be revised following receipt of updated footprint, RFI 033 response, Summer 2018 field studies.]

Erosion

Water- and wind-induced erosion would occur at the port site throughout construction, and to a limited extent during operation and closure. The potential for soil erosion would be greatest during the initial construction phase. The most invasive period of initial disturbance to pre-existing soil conditions would occur during ice-free (e.g., Cook Inlet) construction months when ground surfaces are more susceptible to erosive processes. Construction activities that would result in erosion include:

- Clearing and removal of surface cover during development of the camp, terminal, and airport
- Excavation, handling, and storage of additional overburden considered unsuitable for port design criteria
- Placement of engineered fill, and potential stockpile of dredge materials and associated drainage infrastructure.

[Note: Above text to be revised following receipt of revised footprint and RFI 033 response.]

Although limited information is available regarding specific soil characteristics at the port, the absence of ponded water and appreciable wetlands beneath the footprint is indicative of well-drained soils. Nearshore beach environment substrates reportedly consist of gravel and sand. These materials are commonly associated with soil types that have lower potentials for erosion by water and wind. The nearly level topography at the port also reduces the potential for surface runoff, scouring, and sediment transport.

Earthwork during construction would incorporate erosion control measures specified in an approved SWPPP. Typical measures may include silt fences, hay bales, temporary sedimentation basins; and repurposed brush for berms and watering for dust suppression. BMPs may include crowning or in-sloping of running surfaces; and temporary drainage channels, berms, and catchment basins.

Hydraulic erosion during operations would be comparatively less than during construction due to little additional soil removal and established SWPPP design features (e.g., culverts, swales).

AMERICAN OVERSIGHT

Hydraulic erosion of any dredge materials that may be stockpiled could be mitigated through proper impoundment and drainage design. The potential for wind erosion could be greater during operations than construction in the event that onshore dredge disposal is planned. Variables that could influence the susceptibility to stockpile wind erosion, if planned, include the physical attributes of dredge materials (particle size distribution and cohesion); interim surface stabilization measures; constructed dimensions; and frequency and magnitude of coastal and seasonal winds. Physical conditions that are considered less susceptible to wind erosion include high moisture contents or frozen conditions, larger particle sizes, presence of surface cover, and lower slope angles to reduce wind shear. Mitigation measures that may reduce the potential for wind erosion include wind breaks, snow fencing, reduced slope angles, or watering during increased periods of susceptibility. [Note: Above text to be revised following receipt of revised footprint, RFI 033 response, and summer 2018 field study results indicating characteristics of any dredge material proposed for onshore disposal.]

Erosion during closure would be less than during construction, but likely greater than during operation. Exposed ground surfaces below removed infrastructure not required for post-closure would be susceptible to wind and water erosion for an interim period until reclamation and restoration activities are completed. The potential for erosion would be mitigated using measures similar to those described during construction. Removed infrastructure would be reclaimed in accordance with State of Alaska requirements. Gravel pads and areas of engineered fill would be contoured to conform to the natural landscape, and would promote natural runoff drainage. Ripping and scarification would be conducted to promote surface water infiltration and reduce surface water runoff and subsequent erosion. Reclamation may also include application of salvaged growth media, wetland or upland seed mixtures (e.g., broadcast), or soil amendments (e.g., fertilizers).

If onshore dredge disposal is considered, final closure of the stockpile would include drainage and surface stabilization. Typical measures that could facilitate stockpile surface stabilization include slope and top cover engineering, tracking (rolling), and seeding. [Note: Above text to be revised following receipt of revised footprint and RFI 033 response.]

Although the potential for erosion impacts at the port exists, the design of planned infrastructure and availability of successful mitigation and reclamation measures would minimize erosion. Impacts are expected to be of low intensity, assuming structural BMPs and erosion control measures, restoration at closure, and limited monitoring and maintenance through post-closure occur. The duration of effects may extend several years into the post-closure period. The extent of effects would be limited to the immediate vicinity of individual infrastructure footprints.

4.14.2.3 Transportation Corridor

This section describes potential effects on soils along the Transportation Corridor, from initial construction through closure and post-closure. Impacts associated with the natural gas pipeline and fiber optic cable run are also included in this section, because both are buried in road-prism engineered fill from Amakdedori Port to the Mine Site.

Soil Disturbance

Soil disturbance acreages associated with the proposed Transportation Corridor infrastructure (including co-located portion of the pipeline) include the following:

- South Access Road – 401 acres
- Kokhanok Airport Spur Road – 15 acres
- Mine Access Road – 345 acres

AMERICAN OVERSIGHT

- Iliamna Spur Road – 93 acres
- North Ferry Terminal – 4 acres
- South Ferry Terminal – 23 acres
- Material sites – 247 acres total.

Access Roads

Where practicable, access road routes have been selected to minimize disturbances to wetlands and waterbody crossings, and optimize existing geotechnical and soil conditions. The top driving surface of the main access road would be 30 feet wide. The base of the roadbed prism requiring excavation and/or placement of engineered fill over soils would typically be 60 feet wide, using fill embankment construction for most segments. Along some segments of the South Access Road, the roadbed prism and slope cuts would extend approximately 75 feet wide to accommodate cut-and-fill construction methods through rough terrain. The pipeline and fiber optic cable would be buried 20 feet from the road centerline in the shoulder of the road prism.

Disturbances resulting from access road construction would include direct burial of soils, or complete removal for fill placement or cross-slope contouring. Disturbances are considered permanent, because the access roads would be required to support post-closure activities. Soil types that would be impacted along project access roads are shown on Figure 3.14-1.

Ferry Terminals

Shore-based infrastructure at the South Ferry Terminal includes a 6-acre terminal facility with a container stockyard, and an 18-acre ferry construction and laydown area. The significantly smaller shore-based infrastructure at the 4-acre North Ferry Terminal is predominantly associated with a container stockyard. Most soil disturbances at the terminals would occur during construction, which would require either direct burial of surface soils, or complete removal to accommodate placement of engineered fill materials. Where possible, overburden consisting of organic-rich materials or suitable mineral soils would be salvaged as growth medium for future reclamation at closure. No additional planned disturbances are anticipated during operations.

Both ferry facilities would be removed at closure. Restoration of post-disturbance soil conditions would occur through reclamation activities. Depending on the nature of the engineered surface or foundation, this would include removal or in-place demolition. Restoration would include grading and surface contouring; scarification or ripping to promote surface water infiltration and vegetation growth; application of salvaged growth media; and seeding with proposed mixtures as needed.

Material Sites

Fill material for Transportation Corridor construction would be acquired from 18 different material sites, including 8 along the South Access Road, 7 along the Mine Access Road, and 3 along the Iliamna Spur Road. Either overburden aggregate or blasted shot-rock fill would be sourced from the material sites. Aggregate (e.g., gravel) would be sourced from eight of the material sites, shot-rock from six of the material sites, and both from four of the material sites (RFI 035). Disturbances would include the complete removal and segregation of surface soils and overburden materials considered unsuitable for construction purposes. These materials would be salvaged for future reclamation as a growth medium. Portions of sites no longer used for material extraction would be progressively reclaimed. This would mostly occur after the construction phase, once the bulk demand for materials has been met with infrastructure completion (e.g., roads). Material sites and access roads would continue to be used throughout

AMERICAN OVERSIGHT

operations for maintenance of project infrastructure, as needed. Comparatively less soil disturbance would occur than during construction, but it would include excavation or blasting of materials on an as-needed basis. A need for materials would also persist throughout the post-closure period for continued road maintenance and other limited post-closure needs. For these reasons, incremental reclamation of disturbance impacts at materials sites would be required. Typical reclamation at gravel material sites would likely include grading and contouring of sidewall slopes; scarification or ripping to promote surface water infiltration and vegetation growth; application of salvaged growth media; and seeding with proposed mixtures as needed. No sidewall reclamation would be conducted at shot-rock material sites with 20-foot bench heights on exposed rock walls.

In summary, the intensity of impacts to soils from ground disturbances along the Transportation Corridor would result in obvious changes in soil resources from permanent fill placement, road cuts, or material site needs throughout post-closure. However, the intensity would be minimized by complete or incremental reclamation at non-permanent infrastructure (e.g., ferry terminals, portions of material sites). The duration of soil disturbances for the access roads (and to a limited extent, material sites) would be permanent and irreversible, due to continued road use for post-closure monitoring and maintenance needs. Although the extent of impacts would span multiple watersheds, impacts would be limited to areas in the footprints of individual infrastructure components (i.e., road prism, material sites).

Erosion

Similar to all other project components, stormwater and erosion mitigation and control measures would incorporate structural and non-structural BMPs (PLP 2017).

Wind Erosion

Wind-induced erosion would be comparatively less than hydraulically driven processes throughout all phases of the project along the Transportation Corridor, due to seasonal meteorological conditions, physical attributes associated with soil types present, infrastructure configuration and construction methods, and planned mitigation. Soils capable of retaining moisture in the project area are generally considered to have a low susceptibility to wind erosion due inherent moisture content from periodic precipitation or snowmelt throughout the year. For this reason, the potential for wind erosion would be greatest during drier periods lasting one to two months during the summer. If necessary, wind erosion can be mitigated through dust control watering as needed during summer months.

Similar to the Mine Site, insignificant wind and hydraulic erosion is also anticipated when soils are frozen during winter months. Furthermore, the susceptibility of completed or reclaimed surfaces during project operations and closure from wind erosion is considered insignificant. This is based on the coarse-grained characteristics of engineered fill materials used to construct Transportation Corridor infrastructure.

Where present, soils considered most susceptible to wind erosion along the Transportation Corridor include finer-grained silt and loess mixtures that are generally overlain by organic surface cover of varying thicknesses. These conditions, which are most prevalent along the South Access Road, include fine-grained, loamy, volcanic ash components associated with soil map unit IA17 (Table 4.14.-1).

Dust from truck traffic and wind erosion of road bed aggregate is considered to have a low potential for changing chemical concentrations in soils along the access roads. Material sites along the roads are well outside the Pebble Deposit, and surface soil conditions associated with the Transportation Corridor are chemically consistent with those described for the Mine Site

AMERICAN OVERSIGHT

study area (SLR Alaska Inc. et al. 2011a). Field review has not identified PAG rock at any of the road material sites. If PAG were to be identified at a site evaluation prior to use, the material site would be moved (RFI 035). Therefore, the material sources are not expected to introduce chemical impairments to soil. Transportation of concentrates from the Mine Site would be in sealed containers with locking lids, and therefore are not expected to be a source of fugitive dust along the roads.

Hydraulic Erosion

The potential for hydraulic erosion exists throughout the entire project lifecycle along the Transportation Corridor. This is evident based on erosion assessments conducted on the Pile Bay-Williamsport Road, approximately 30 miles northeast of the South Access Road (USACE 2007; KPB 2014). Although topographic variability and cross-slope conditions associated with the South Access Road are less than those traversed by the Pile Bay-Williamsport Road, periods of heavy precipitation have resulted in significant hydraulic erosion losses. Precipitation events resulting in the greatest erosional losses from surface runoff and flooding generally occur from late September through November. Specific conditions that resulted in impassable erosion washout at multiple points along the Pile Bay-Williamsport Road in the fall of 2003 included culvert and bridge crossings, and surface water drainages aligned adjacent (e.g., swale or ditch) to the road (USACE 2007).

Gently sloping or level transportation infrastructure would be less susceptible to erosional processes. These would include the ferry terminal sites and access roads constructed over glacial fluvial and moraine soil types (Table 4.14-1). Physical conditions more susceptible to hydraulic erosion along the Transportation Corridor include poorly drained, fine-grained loess or colluvium on sloped topography, waterbody crossings, road prism drainages (e.g., swales), higher-gradient slopes, and sidehill cuts. Approximate access road lengths traversing moderate and rough terrain requiring rock cuts are detailed in Table 4.14-1.

Table 3.14-1: Approximate Lengths of Access Road Terrain and Soil Types

Road Segment	Gentle Terrain	Moderate Terrain	Rough Terrain	Approximate Percent Soil Map Unit
South Access Road	3.9 miles (10%)	9.8 miles (26%)	23.6 miles (63%)	20% (IA7[2]), 80% (IA17[3])
Mine Access Road	26.7 miles (92%)	2.3 miles (8%)	None (0%)	59% (IA7), 37% (IA9[4]), 4% (HY4)
Iliamna Spur Road	2.9 miles (41%)	4.1 miles (59%)	None (0%)	47% (IA7), 53% (IA9)
Percent Total Access Roads Terrain Type[1]	46%	22%	32%	

Notes:

1. Kokhanok Airport Spur Road is not included in the evaluation due to the comparatively short road length and similar conditions to other project access roads.

2. IA7: Typic Cryandepts – Very gravelly, nearly level to rolling association.

3. IA17: Dystric Lithic Crandepts – Loamy, hilly to steep association.

4. IA9: Typic Cryandepts – Very gravelly, hilly to steep association.

Source: Rieger et al. (1979); PLP (2017)

Transportation Corridor construction and year-round construction season would result in soil disturbances considered most susceptible to hydraulic erosion. Initial construction would start in

AMERICAN OVERSIGHT

the spring, with development of beach heads at Amakdedori Port, followed by ferry terminal locations at Iliamna Lake. The South Access Road would continue inland from Amakdedori Port to the eastern bank of the Gibraltar River through year one. Simultaneous construction of other road segments would also include preliminary Mine Access Road completion by Year One. Contiguous road access from Amakdedori Port to the South Ferry Terminal would be established after completion of the Gibraltar River Bridge during year two of construction. Concurrent development of materials sites would occur along each road segment as accessed.

Construction phase activities that would potentially create or contribute to erosion include:

- Removal and clearing of vegetation during pre-development access road alignments, material sites, and terminal facilities;
- Overburden clearing and vegetative mat removal for cut and/or fill placement of engineered materials (e.g., aggregate, substrates);
- Overburden management that would include stockpiles or windrows of organic-rich materials and vegetation, or excavated substrates considered unsuitable for infrastructure construction; and
- Development of material sites and material site access roads.

The intensity of erosion during construction would vary along project road segments depending on soil types and physical conditions present, seasonal conditions, and construction requirements. Potential erosion may be localized at susceptible locations, such as waterbody drainages and crossings (e.g., culverts, bridges, and swales), wetlands, or intermittent sloped topography. Broader areas considered more susceptible to runoff and erosion would include continuous segments of road through rough terrain; and to a lesser extent, moderate terrain. These conditions would require steeper roadbed grades and sidehill cuts that could result in greater erosion potential from runoff (e.g., energy) and slope failure. Terrain and substrates along the South Access Road correspond with conditions that are considered most susceptible to erosion along the corridor. About 63 percent of the South Access Road would be predominantly constructed over rough, variable terrain (Table 4.14-1), where fine-grained soil types reportedly overlie shallow bedrock. Although conditions along the South Access Road appear most vulnerable to hydraulic erosion processes, the evaluation is based on generalized soil descriptions provided in the ESS, and do not account for local variations in soil conditions, or bedrock outcroppings where no soil horizon may exist.

No rough terrain requiring rock cuts is present along the Iliamna Spur Road or the Mine Access Road; however, each traverses approximately 59 percent and 8 percent of moderate terrain, respectively. The Mine Access Road would be least susceptible to hydraulic erosion, based on terrain types traversed and soil conditions. Construction methods along the Mine Access Road would require less backslope cuts (i.e., layback), foreslope contouring, and variation in roadbed grade, compared to other access roads. Furthermore, surficial glacial deposits and gravel fractions in existing soils along the Mine Access Road and Iliamna Spur Road would be less susceptible to hydraulic erosion, compared to the South Access Road.

Similar to access roads, the potential for hydraulic erosion at material sites would also vary based on source material competency (e.g., shot bedrock or aggregate) and conditions unique to each borrow site location. Construction of material sites and Transportation Corridor infrastructure would use structural and non-structural BMPs, and employ erosion control measures adequate to satisfy appropriate ADEC discharge permit requirements and coverage under an SWPPP (PLP 2017).

Ground disturbances would be progressively restored throughout construction until stabilization and restoration are achieved. Most disturbances would likely be stabilized during construction,

AMERICAN OVERSIGHT

or several years thereafter, at locations considered less susceptible. Common industry practices used to mitigate and control erosion under a variety of scenarios applicable to the Transportation Corridor access roads and infrastructure include those described in above, and the following:

- Staging of overburden materials in unused material sites or designated areas engineered to control and mitigate surface water runoff
- Spoils placement on upslope surfaces relative to resources of concern (e.g., waterbodies), with adequate setback distances.

The least amount of erosion would likely occur during operations, when stabilization of disturbed surfaces would be achieved through natural recovery, applied restoration measures, and long-term or permanent stabilization measures. Material sites and access roads would be progressively reclaimed. Typical reclamation BMPs at material sites include benching or sloping of sidewalls to suitable grades, based on material types (e.g., aggregate or bedrock); distribution of salvaged overburden growth media on pit floors and slopes; and tracking and seeding.

Continuous feedback from truck traffic during operations and/or prescribed follow-up inspections would identify areas of acute or persistent erosion. Areas of concern would be identified, and additional or more robust measures applied to meet local site-specific conditions. This would most likely be required along rough terrain associated with the South Access Road, and/or areas requiring permanent drainage controls (e.g., culverts, bridges, swales).

Erosion during closure and post-closure would likely be greater than during operations. Some erosion may be derived from the removal and reclamation of long-term facilities (e.g., ferry terminals) before complete restoration and surface stabilization objectives are met; however, most would likely be associated with permanent roads to the Mine Site. Monitoring frequencies in post-closure would typically be less than during operations, and there would be reduced access to equipment and resources. Required permanent Transportation Corridor access would result in an indefinite potential for erosion monitoring and maintenance.

In summary, varying degrees of erosion would be associated with most Transportation Corridor infrastructure during construction, operations, and post-closure. Erosion impact intensity for most transportation components would be reduced or mitigated through typical control measures, BMPs, and restoration activities, assuming that conditions required through discharge permits and prescribed SWPPP activities are met. However, soil conditions and rough terrain along the South Access Road may require enhanced design and mitigation measures. Without such measures, erosion during extreme fall storm events could result in impassable road conditions from washout on an episodic basis. Erosional susceptibilities potentially exist along other access road features, as well (e.g., culverts, swales, bridges). The duration of erosion would vary from completion of the activity (e.g., construction or reclamation), to an indefinite period in post-closure along permanent access roads. The extent of erosion effects would be mostly limited to the immediate vicinity of individual infrastructure footprints and watershed occurrence.

4.14.2.4 Natural Gas Pipeline Corridor

This section describes potential effects on shore-based upland soils from pipeline infrastructure on the eastern side of Cook Inlet north of Anchor Point. Pipeline impacts for segments of the pipeline coincident with the Transportation Corridor are addressed above. Pipeline activities resulting in disturbances to wetlands and submerged ocean and lake sediment are detailed in Sections 4.22, Wetlands, and 4.18, Water Quality, respectively.

AMERICAN OVERSIGHT

Soil Disturbance

The cumulative total acreage of shore-based soil disturbances from pipeline infrastructure on the eastern side of Cook Inlet is approximately 5.1 acres. This would include the compressor station, laydown area, access road, metering pad, and horizontal directional drilling (HDD) work area.

HDD activities would occur during the second year of construction, followed by completion of the Anchor Point compressor station facility during year three. Construction would include clearing of vegetation and unsuitable substrates for access road installation, drilling pad preparation, and compressor facility installation. Most soil restoration measures would be conducted during and immediately after construction; however, follow-up measures may be required on a limited basis, pending winter construction activities.

Surface disturbances not associated with long-term infrastructure are expected to recover immediately after or within the first few years following construction. Soil disturbances during operations would be significantly less than during construction, because no other disturbances are planned or anticipated.

If the compressor facility is retained, and usage re-appropriated to other stakeholders after Mine Site closure, the 5.1 acres of soil disturbance would be indefinite. However, if there is no future need for the pipeline infrastructure, soil disturbances would be minimized through facility demolition and subsequent reclamation. Reclamation may include in-place abandonment of subsurface pipe; grading and contouring of ground surfaces; ripping and scarification to promote water infiltration and reduce surface water runoff and subsequent erosion; and application of seed mixtures (e.g., broadcast) or soil amendments (e.g., fertilizers).

The intensity and extent of soil disturbance effects would be greatest during construction, but would be limited to a 5.1-acre area. The duration of disturbance would be indefinite if the infrastructure is re-appropriated to another entity (stakeholder). Disturbances are expected to return to pre-activity levels within several years after closure if reclamation is performed.

Erosion

Similar to other project components, mitigation and control measures would incorporate structural and non-structural BMPs to address erosion and stormwater runoff (PLP 2017).

The topography associated with the pipeline infrastructure on the eastern side of Cook Inlet is gently sloping or nearly level. Silty loam soils associated with these conditions are considered to have a low hazard of erosion by water, and severe hazard of erosion by wind, assuming the top cover is removed. Use of HDD would provide a sufficiently wide setback distance between the project footprint and Cook Inlet bluff (about 200 feet), so that project activities are not expected to contribute to ongoing natural erosion in this area (Section 3.15, Geohazards).

Construction activities and sources that could contribute to erosion include vegetation clearing and brush removal; rutting or tearing of surface cover from equipment; excavation and trenching; and overburden management (i.e., spoils and snow). Given the limited acreage associated with infrastructure on the eastern side of Cook Inlet and available erosion control measures described above, effective hydraulic and wind erosion management is anticipated during the construction process until stabilization is achieved shortly thereafter. Little to no erosion is anticipated during operations, because no other disturbances are planned or anticipated. Similarly, stabilization of ground surfaces is expected to occur within several years after closure if reclamation is performed. Less erosion would be expected following Mine Site closure if the infrastructure is retained, and re-appropriated to another operator or entity.

AMERICAN OVERSIGHT

In summary, the intensity of soil erosion from the limited acreage of pipeline infrastructure on the eastern side of Cook Inlet would be minimized through BMPs and erosion control measures. Surfaces would stabilize to pre-activity levels shortly after construction, and extents would be limited to areas within or bordering the disturbance footprint, and would not appreciably contribute to other naturally occurring erosional processes.

4.14.2.5 Cumulative Effects

Note to Reviewers

This section is an early stage preliminary draft, and has been prepared prior to the completion of scoping for the purpose of setting analytical direction and facilitating the project schedule for completing the EIS.

As an initial draft, it is incomplete in many ways, and contains numerous placeholders to be addressed as more information becomes available. The Scoping Comment Period has not closed, Alternatives to the Proposed Action have not been formally identified, information needed to complete the analysis is not yet fully available and in the process of being requested from the applicant, and the approach for topics such as spills/dam failures, traditional knowledge and cumulative effects has not been settled. In addition, supporting analysis and logic for determination of potential environmental consequences have not been fully developed. This draft is intended to frame the eventual section, and in doing so, allow USACE to see the intended topics and content for the eventual completed sections. Notes are included in many sections to identify where the analysis is incomplete.

4.16 SURFACE WATER HYDROLOGY

This section describes the potential impacts of the project on surface water hydrology. Planned mitigation related to surface water hydrology (including a water management plan) is considered part of the project description, and would be based on Pebble Limited Partnership (PLP) plan documents and engineering reports, as well as the impact analysis.

Planned mitigation may not be specified but is considered typical or standard engineering practice. In cases where planned mitigation is unknown, unclear, or an uncommon situation is encountered, mitigation recommendations are provided. Water quality is addressed in Section 4.18, Water and Sediment Quality.

[Note: Impacts on surface water hydrology will be analyzed in detail and results presented following receipt of response to RFI 019, including a water management plan, and receipt of the revised project footprint, as described in PLP (2018).]

4.16.1 No Action Alternative

Under the No Action alternative, the project would not be constructed, and would not have any new effects on surface water hydrology.

4.16.2 Alternative 1 – Applicant's Proposed Alternative

[Note: This section has been prepared in advance of response to RFI 019, Water Balance, Groundwater Model, Streamflow Reduction, Water Management Plan and the updated project footprint, as described in PLP (2018). The text will be revised following receipt of this information.]

4.16.2.1 Mine Site

The quantity and distribution of surface water in the upper tributaries of the North Fork Koktuli River (NFK) and South Fork Koktuli River (SFK) and Upper Talarik Creek watersheds would be disrupted during all or parts of the project phases. The water management plan would address strategies for surface water management during all phases of the project. Changes to surface water drainage in affected watersheds would result from construction of access roads and related drainage structures, camp and airstrip facilities, and mine tailing, waste rock storage,

AMERICAN OVERSIGHT

and water storage impoundments; and from excavation of the mine pit and associated dewatering activities.

The main objective of water management at the Mine Site would be to manage surface water originating in the project area, and to maintain the process water supply during operations. A primary design requirement would include water treatment processes for all contact water to meet water quality criteria before discharge to the environment (RFI 020). Water balance models would be developed for each phase of the project to estimate fresh water requirements, pond storage volumes, water treatment requirements, and surface water flow rates. A description of baseline water balance input parameters and calibration is presented in Section 3.16 in Chapter 3. Expected water management plans and procedures during all project phases are described in detail in Chapter 2, Alternatives, and summarized below.

Water Management Plan – Construction Phase

Water management during construction would include the following activities:

- Water diversion, collection, and treatment systems would be installed around the Mine Site for managing runoff during construction
- Water management and sediment control best management practices (BMPs), including temporary settling basins and silt fencing, would be installed during initial construction at the Mine Site
- Water management structures would be constructed. Structures would include diversion and runoff collection ditches for minimizing contact with disturbed surfaces, and sediment control measures such as settling ponds to prevent sediment from reaching downstream waters. Energy dissipation structures would be included where necessary to reduce erosion at the outlets of diversion channels and collection ditches
- The design criterion for diversion channels, berms, and collection ditches would be the 100-year, 24-hour rainfall event
- Sediment control ponds would be sized to treat a 10-year, 24-hour rainfall event and safely manage a 200-year, 24-hour rainfall event
- An open pit dewatering system would be installed and operational to provide sufficient time to draw down the water table
- Before completion of the tailings storage facility (TSF) embankments and water management structures, all water not meeting water quality standards would be treated before release. This includes water from construction pit dewatering, water that accumulates in the open pit during construction mining, runoff captured during construction of the TSF embankments, and runoff captured during construction of Mine Site infrastructure
- Temporary, modular water treatment plants (WTPs) would be used to treat contact water before construction and operations phase WTPs.

Water Management Plan – Operations Phase

The primary goal of water management and sediment control during operations would be to minimize contact water. Runoff and associated sediment control measures would be managed with appropriate BMPs and adaptive control strategies, and where water could not be diverted before becoming contact water, it would be collected and used as process water, or treated and discharged. Water management during production would include the following activities:

AMERICAN OVERSIGHT

- Water collected from pit dewatering wells and the open pit would be pumped to the open pit water management pond (WMP) (see section 3.16, Surface Water Hydrology, for details). Water from the open pit WMP would be pumped to the open pit WTP for treatment and discharged
- Runoff from the Mine Site would be collected in the main WMP north of the pyritic TSF/potentially acid generating (PAG) storage facility and would be either used as process water or treated in the main WTP and discharged [Note: Text to be revised following receipt of updated project footprint, as described in PLP (2018).]
- Water surplus is anticipated during production under average and above-average precipitation scenarios. The water available for discharge would be less than the pre-mine flows within the mine footprint because of water lost in tailings voids, evaporation, and other minor uses. The average annual water surplus during the maximum Mine Site footprint is estimated to be 39 cubic feet per second (cfs), which would be treated and discharged throughout the year [Note: Text to be revised to address new project footprint, as described in PLP (2018).]
- Adaptive water management strategies would include the ability to provide additional water storage capacity in the bulk TSF, provide surplus storage capacity in the WMPs, and provide for expansion of the WTP rate by building excess capacity
- Additional water storage capacity would be made available under above-average precipitation conditions by directing excess water to the open pit, allowing it to flood until pumping and treatment systems restore the water stored in the system to the design level
- A comprehensive water management system would be implemented to monitor water quantity and quality. All discharge water would be monitored for compliance with state and federal permit requirements. Water released from WTPs would be strategically discharged to optimize downstream fish and aquatic habitat. Discharge locations are described in Section 3.16, Surface Water Hydrology. [Note: Text will be revised as needed following receipt of updated project footprint, as described in PLP (2018), Technical Note on Updates to PLP's Proposed Project.]

Water Management Plan – Closure and Post-Closure Phase

Water management during closure and post-closure would address both reclamation activities and long-term post-closure. The water management plan would include the following activities:

- Pit dewatering would cease once mining stops, and the water level in the open pit would begin to rise
- Surface runoff from reclaimed areas would be collected and either treated in a WTP or directed to the open pit until the runoff is determined to be suitable for direct discharge
- Free water would be pumped from the bulk TSF surface, which would eventually be graded and revegetated to direct surface runoff toward the closure spillway.
- Seepage water from embankment seepage collection systems would be collected and either treated in a WTP or directed to the pit lake until the water is determined to be suitable for direct discharge
- Water level in the mine pit would rise during closure and post-closure, forming the pit lake. Once the pit lake reaches an elevation of about 890 feet above mean sea level, water would be pumped from the pit (to maintain the water level) for treatment and discharged

AMERICAN OVERSIGHT

- The pit lake's water level would be maintained at a level at least 50 feet below the elevation at which groundwater would flow out of the open pit, to prevent unplanned discharge and allow sufficient time to address issues that might occur with the WTP during post-closure.

North Fork Koktuli River

The majority of the mine facilities would be within the NFK watershed. The bulk TSF would be within an upper NFK tributary watershed (called Tributary 1.190). Quarries A, B, and C would also be within NFK Tributary 1.190, and the final combined size of the TSF and quarries would encompass the majority of NFK Tributary 1.190. The bulk TSF capacity would be sufficient to store tailings generated for a 20-year mine life. Construction of the bulk TSF would include three embankments: the main embankment, south embankment, and east embankment. Initial TSF design components include the following:

- Starter embankments for the main and south embankments would be constructed as part of initial TSF construction, and construction of the east embankment would begin in year 10 of operations
- A temporary cofferdam would be constructed upstream of the main TSF embankment for managing water during initial construction. The cofferdam would capture undisturbed runoff from the upstream catchment that would be pumped downstream of all construction areas and released
- Each stage of embankment design would include a freeboard allowance above the maximum operating TSF pond level and tailings beach. Freeboard allowance includes containment of the inflow design flood (IDF) and wave action
- The IDF for the TSF is the Probable Maximum Flood, which is based on the 72-hour Probable Maximum Precipitation event plus the snow water equivalent for the 1-in-10-year snowpack. [Note: Text will be revised as appropriate following receipt of response to RFIs: RFI 028, TSF IDF and Freeboard. Partial response notes that the IDF volume and freeboard above the beach will be addressed in the Water Management Plan, to be provided in response to RFI 019, Water Balance, Groundwater Model, and Streamflow Reduction.]
- The design of the TSF main embankment includes a permeable flow-through facility that would minimize water buildup in the TSF and seepage pressure on the embankment, and would provide controlled flow away from the other embankments. [Note: Text to be revised as needed after receipt of response to RFI 019, Water Balance, Groundwater Model, and Streamflow Reduction.]
- The water level would be controlled below the freeboard allowance by transferring (pumping) excess water from the TSF supernatant pond to either the seepage control pond or the main WMP
- Underdrains would be constructed beneath the entire TSF to convey seepage flow to collection and recycling systems below each embankment, and to help minimize water buildup behind the main embankment
- The pyritic TSF/PAG storage facility would be a fully lined water retention facility. The water level would be controlled by pumping excess water to the bulk tailings cell or seepage control pond [Note: Text to be revised as needed after receipt of response to RFI 019, Water Balance, Groundwater Model, and Streamflow Reduction.]
- Precipitation and runoff into the bulk TSF would collect in a small operating pond. Pyritic tailings would remain fully submerged and excess water would be pumped to

AMERICAN OVERSIGHT

the bulk tailings cell. [Note: Text will be revised following receipt of response to RFI 019.]

Seepage and Sediment Ponds

Five seepage and sediment pond embankments would be located downstream of the TSF embankments and WMPs.

The seepage recycling pond embankments below the TSF would incorporate low-permeability core zones and grout curtains to control seepage and enhance embankment stability.

[RFI placeholder: The Preliminary Data Gaps Analysis included requests for design of seepage pond and sediment pond embankments related to water management during construction and operations.]

Water Management Ponds

The main WMP would be north of the pyritic TSF/PAG storage facility and the open pit WMP would be south of the open pit. [Note: Location description to be refined or confirmed following receipt of new project footprint as described by PLP (2018).] A sediment pond would be located downstream of each of the WMPs, and an emergency dump pond would be located downstream of the main WMP. Each of these facilities requires an embankment or berm with design considerations similar to those described for the TSF.

WMP berms and sediment pond embankments would be constructed using rock and earthen fill. Sediment control ponds would be designed to safely manage the 200-year, 24-hour rainfall event. [Note: Text to be revised following receipt of response to RFI 019, Water Balance, Groundwater Model, and Streamflow Reduction, as pertains to seepage and sediment ponds during construction and operation.]

Pyritic Tailings Storage Facility/Potentially Acid Generating Storage Facility

[Note: Text to be revised following receipt of response to RFI 019, Water Balance, Groundwater Model, and Streamflow Reduction.]

This temporary, fully lined stockpile would be located in an unnamed tributary east of Tributary 1.190. The south end of the pyritic TSF/PAG storage facility would be located along the watershed divide between the stockpile tributary and a tributary that drains south toward the SFK. A 100-foot berm would be constructed on the north side of the saddle to contain the pile and maintain drainage flow away from this saddle and the SFK watershed. [Note: Statements will be confirmed or modified after receipt of new project footprint as described by PLP (2018).]

4.16.2.2 Amakdedori Port

Runoff, Erosion, and Sedimentation

The port building would be constructed on an engineered fill patio, designed to be at an elevation high enough to avoid tidal surge from major storms. Port infrastructure would be built above the 100-year floodplain of Amakdedori Creek, although the floodplain is not well defined in current literature.

Port construction would likely cause a temporary increase in overland runoff, erosion, and sedimentation from the removal of vegetation, excavation/grading, and other ground-disturbing activities. The impact analysis includes consideration of erosion and sediment control BMPs. Low-intensity impacts could extend within the local watershed during the construction phase.

AMERICAN OVERSIGHT

Surface Water Use

Amakdedori Creek is a meandering stream that flows into Kamishak Bay just south of the port site, and is fed by snowmelt, rainfall, and groundwater (Glass 1999). No detailed hydrologic data or stream gauge data are available for Amakdedori Creek. The estimated average flow is some 400 cfs in summer and 35 cfs in winter. The water extraction site is near the mouth, where the creek is wide and shallow, with a stream depth of 0.5 to three feet and a width of about 400 feet (Recon 2018; RFI 022).

Limited data are available regarding estimated streamflow at Amakdedori Creek. A detailed analysis of the impact on streamflow or the streambed caused by the annual extraction of 5 million gallons from Amakdedori Creek is not practical, because the streamflow reduction may not be measurable and the impact would likely be of low intensity and temporary. [Note: This section will be updated if additional hydrologic information is developed.] Alaska Department of Fish and Game (ADF&G) permitting requirements regulate the minimum streamflow required in anadromous streams. Before water extraction, PLP would be required to demonstrate that proposed water extraction volumes and rates are within permissible limits. This is especially important for water extraction during winter months, when streams experience low-flow conditions.

Marine Water in the Port Vicinity

A 2,000-foot-long earthen causeway would extend from the shore to a jetty located in 15 ft natural water depth. One side of the jetty would include a roll-on/roll-off barge access berth.

During placement of fill material for causeway construction, increased concentrations of suspended sediment would occur in Kamishak Bay for the duration of construction, and would persist for days to weeks after completion. The duration of increased suspended sediment concentrations would depend on the amount of fine sediment in the fill material. Suspended sediment would be transported within Kamishak Bay under the influence of tidal and wind-driven currents before settling on the seabed. The duration and geographic extent of suspended sediment plumes can be estimated when the grain size distribution of fill material is made available. Assuming the causeway is constructed to include with a 40-foot-wide roadbed with side slopes of 1H:5V (horizontal:vertical) and freeboard of 10 feet, the causeway footprint on the floor of Kamishak Bay would be approximately 730,000 square feet or 17 acres.

The capability of a causeway to alter oceanographic processes is well-known and understood (e.g., Colonell et al. 1992). However, the capability of a causeway to alter the density structure of the water column is more subtle. Causeway-induced influences on the water column can be important. In some cases, water column density may become stratified, which would appear as vertical or horizontal gradients in temperature and/or salinity (such as when fresher water overlies denser saltier water). In Kamishak Bay, only small sources of fresh water enter salt water; therefore, it is very unlikely that the project causeway would cause notable variations in water density. In addition, it is very unlikely that the causeway would affect overall circulation in Kamishak Bay, given its relatively short length.

The causeway would support servicing of the lightering vessels that would transport ore concentrate to the Handysize ships moored offshore. Although ship wakes and propeller wash can contribute substantially to shoreline erosion in relatively quiescent waters, neither is expected to be an issue in Kamishak Bay. Wave forecasts for wind conditions typical of Kamishak Bay (Section 3.16) suggest that the bay already has a dynamic wave climate to which the shoreline has achieved a stable equilibrium; the bay is not likely susceptible to incrementally increased wave activity as a result of the lightering vessels' wakes. Whether the seabed at or near the causeway would be susceptible (i.e., erodible) to propeller wash would depend on the

AMERICAN OVERSIGHT

composition of the seabed materials (e.g., sand, silt, rock), and on the management of lightering vessel operations. Establishment of suitable BMPs for vessel operations should be sufficient to minimize adverse impacts; namely, BMPs should include specifications for managing ferry speed (minimizing wakes) and engine power settings (minimizing bottom erosive stress) during approach and departure from the causeway berths.

During winter, sea ice could become an operational issue. The causeway may provide shelter from ice on its leeward side, but this is likely to be variable throughout the winter because of shifts in prevailing winds.

Removal of the causeway at the end of the project would cause substantial increases in suspended sediment in Kamishak Bay that would persist for days to weeks after decommissioning is completed.

4.16.2.3 Iliamna Lake

Ferry Terminals

Ferry terminals would be built on the north and south shores of Iliamna Lake. Project description noted that planned construction of causeways consisted of rock and aggregate. Some shoreline and lakebed disturbance would be expected to occur on both sides of the lake, resulting in temporary increases in suspended sediment concentrations during construction and decommissioning. Such disturbances would be limited to the immediate vicinities of the ferry terminals. Transport of suspended sediment concentrations by wind-driven currents along shore is not expected to be of long duration or to cover a large geographic area.

Vessel Operations

Both ferry terminals would support barge/tug traffic during construction, mine development, operations, and closure for transfer of equipment, materials, and supplies. Ore concentrate would be transported across the lake via an ice-breaking ferry from the north terminal to the south terminal, for transfer to overland transport to Amakdedori Port. Vessel wakes and propeller wash can contribute to shoreline erosion in relatively quiescent waters, but neither wake nor propeller wash is expected to affect the shoreline of Iliamna Lake. Wave forecasts for wind conditions typical of Iliamna Lake (Section 3.16) suggest that the lake already has a dynamic wave climate to which the shoreline has achieved a stable equilibrium; the lake is not likely susceptible to incrementally increased wave activity caused by the ferry's wake. Whether the lake bottom at or near the ferry terminals would be susceptible (i.e., erodible) to propeller wash would depend on the lake bottom materials (e.g., silt, sand, gravel, rock), and on the management of ferry operations. Establishment of suitable BMPs for ferry operations should be sufficient to avoid or minimize adverse impacts; namely, BMPs should include specifications for management of ferry speed (minimizing wakes) and engine power settings (minimizing bottom erosive stress) during approach and departure from the terminals.

Offshore Anchoring and Concentrate Transfer

Ore concentrate in containers would be loaded onto lightering vessels (barges) at Amakdedori Port and transported to deeper water where a Handysize bulk carrier would be anchored. The ore concentrate containers would be emptied directly into the hold of the bulk carrier, using a crane mounted on the lightering vessel. Primary and alternate locations are proposed for offshore concentrate transfers:

- *Primary Transfer Location* – Approximately 12 miles due east of the proposed Amakdedori Port. Based on National Oceanic and Atmospheric Administration

AMERICAN OVERSIGHT

Chart 16440, the seabed is relatively flat and featureless with water depths of 12–14 fathoms (72–84 feet re: mean lower low water [MLLW])

- *Alternate Transfer Location* – Approximately 18 miles east-northeast of the proposed Amakdedori Port, 1–2 miles southwest of Augustine Island, between the island and the mainland. This lightering point would be used for concentrate transfer when required by sea conditions. Water depth is about 5 fathoms (30 feet re: MLLW)

Vessel Operations

Two or three lightering barges supported by tugboats would be used to move ore concentrate in containers from Amakdedori Port to the bulk carrier. Depending on which lightering point is used (i.e., 12 or 18 miles each way), about 10 trips by the lightering barges would be required to load the anchored bulk carrier over a period of 4–5 days. Transfer and unloading of concentrate would be curtailed when sea and weather conditions preclude operations.

Up to 27 Handysize shiploads would be needed to transport the expected annual concentrate production. Although some damage to seabed flora and fauna could result from each ship anchoring, a BMP could be developed to avoid excessive damage by directing ship masters not to anchor in the same location(s) each time. Sea ice in west Kamishak Bay (the alternate transfer location) could become problematic for lightering via barge/tug from early December to late March, and also for the bulk carriers at both lightering locations from mid-January to mid-March, as ice accumulates around Augustine Island (Table 3.16-9; Mulherin et al. 2001). This suggests that some ice-breaking capability between Amakdedori Port and Augustine Island could be required from December through March. Such ice-breaking capacity would be provided, including two ice-breaking tugs to support marine facility operations (PLP 2017).

4.16.2.4 Transportation Corridor

The evaluation of impacts on surface water and substrate incorporates an understanding of their probability of occurrence, and of planned mitigation in the form of engineering design and maintenance that can meaningfully reduce impacts.

Road Stream Crossings

Roads could potentially block or restrict drainage, and drainage crossings must be designed and constructed to ensure adequate streamflow. PLP's stormwater pollution prevention plan would include standard BMPs to reduce erosion and sedimentation during bridge and culvert construction. Culverts requiring fish passage would be designed based on criteria used by the Alaska Department of Transportation & Public Facilities (ADOTPF). [Note: Text will be developed to address potential impacts on drainage in the Transportation Corridor as more information becomes available. RFI 036 addresses waterbody substrate and turbidity.]

Bridge Crossings

A total of seven bridges would be constructed for the proposed project: a bridge across Upper Talarik Creek on the mine access road, a bridge across the Newhalen River on the Iliamna spur road, and five bridges along the south access road. Bridge engineering and design would vary with stream size and hydrologic properties. Instream channel work, including installation of bridge footings and embankments, would occur year-round during the first two years of construction. Table 4.16-1 lists all bridge crossings along the Transportation Corridor and relevant hydrologic data.

AMERICAN OVERSIGHT

[Note: Table 4.16-1 to be completed as hydrologic data are available.]

Table 4.16-1: Bridge Crossings along the Transportation Corridor (North to South)

Waterbody	Stream Width at Crossing	Stream Depth at Crossing	Mean Annual Stream Discharge (cfs)
Upper Talarik Creek			
Newhalen River			
Gibraltar River			
South Creek 4			
South Creek 3			
South Creek 2			
South Creek 1			

Culverts

A total of 222 culverts would be installed at drainages along the Transportation Corridor. Culverts would be used to allow proper discharge at stream crossings, to reduce erosion, and for some crossings, would be used for fish passage. Culvert design would vary by stream size and whether or not fish passage is required. Seventy-three culvert crossings would be designed to allow for fish passage; 149 would not require allowance for fish passage. Most of the culverts would be 4- or 8-foot-diameter circular passage, with the four largest culverts 12 feet tall by 20 feet wide (not circular). The length of the culverts would vary from 77 to 256 feet (PLP 2017; PLP Application Attachment B, Culvert Schedule). Culvert sizes and types would be determined to address anticipated flow, and designs would be refined during final engineering and design.

During construction of bridges and culverts, the potential exists for increased runoff, erosion, and sedimentation as a result of vegetation removal and excavation of soil, rock, and sediment. Low-intensity consequences could extend within the local watershed during the construction phase.

Surface Water Extraction

ADF&G Fish Habitat Permit requirements regulate the minimum streamflow required in anadromous streams. Before the extraction of water from anadromous streams along the road and pipeline corridors, sufficient streamflow would need to be demonstrated to permit summer/winter extraction.

Water would be extracted from 21 designated sites along the Transportation Corridor (Figure 4.16-1). Water extraction sites may be used at any time of the year, although during the winter months, low-flow conditions may limit water availability.

AMERICAN OVERSIGHT

Figure 4.16-1: Water Extraction Sites along Transportation Corridor

[Figure to be added later.]

AMERICAN OVERSIGHT

The maximum projected surface water use along the Transportation Corridor during construction would be a total of 50 million gallons: 19 million gallons along the mine access road, seven million gallons along the Iliamna spur road, and 24 million gallons along the south access road. Table 4.16-2 provides estimates of streamflow and pond volumes for the water extraction sites. A total of 16 million gallons would be extracted from two sites on Iliamna Lake and five million gallons would be extracted from the large drainage of the Newhalen River. The remaining 39 million gallons would be extracted from smaller ponds and streams. Estimated average extraction rates would range from 500 to 1,000 gallons per minute, depending on the streamflow/volume of the waterbody (Recon 2018; RFI 022). All surface water extraction would require compliance with approved state permits, stipulations, and reporting requirements.

[Note: Table 4.16-2 to be completed as hydrologic data are available.]

Table 4.16-2: Hydrologic Data from Water Extraction Sites along Transportation Corridor (South to North)

Extraction of 16 million gallons from Iliamna Lake and five million gallons from the Newhalen River would likely have no measurable consequences, given the high volumes of these waterbodies. With only limited hydrologic data estimates available on other water bodies across the Transportation Corridor, determining the consequences of water extraction is not practicable at this time. Extraction of 39 million gallons from streams and ponds along the Transportation Corridor could cause streamflow or pond volumes to be reduced in some waterbodies during construction activities. Depending on streamflow/pond volume and the extraction rate, the streamflow/pond volume reduction may not be measurable, and would likely be of low intensity.

[Note: This section will be updated with more detailed hydrologic data, if available.]

Erosion and Scour at Stream Crossings

The Transportation Corridor would cross 229 waterbodies with culverts and bridges. If not properly designed, constructed, and maintained, culverts and bridge abutments may cause constricted natural streamflow, increasing water velocity at the downstream end of the structure. This could lead to localized bank erosion and scour, or erosion around the infrastructure. Erosion and scour could modify stream morphology by deepening and widening the stream channel downstream, modifying aquatic habitat, and causing sedimentation downstream. If the infrastructure would not allow for adequate flow, water could pool up on the upstream side, leading to erosion of the roadbed. In extreme cases, improper bridge or culvert design or improper construction materials could lead to collapse of the infrastructure. Culverts and bridges may also need to be designed to allow for safe fish passage. See Section 3.24, Fish Values, for information on fish and aquatic resource impacts.

The potential for erosion and scour at stream crossings is dependent on streamflow and streambed substrate and would be mitigated through engineering design and maintenance. Freshwater fish field studies scheduled for summer 2018 will include identification of streambed substrate in fish-bearing streams along the corridor (RFI 036). [Note: Text will be updated and expanded following receipt of response to RFI 036.] Culvert and bridge design will be further evaluated during final engineering and design.

AMERICAN OVERSIGHT

4.16.2.5 Natural Gas Pipeline Corridor

Pipeline segments on land include the lengths of the mine access road and south access road. The pipeline would lie on the lake floor across Iliamna Lake, and across the seafloor of Cook Inlet. At the pipeline river crossings along the main road corridor, the pipeline and a fiber optic cable would be suspended below precast concrete decking attached to bridge infrastructure.

The 12-inch-diameter pipeline would be buried 20 feet from the road centerline, or a minimum of five feet beyond the road shoulder. Buried pipeline segments would be placed in a trench extending to a depth of 52 inches. Installation of the natural gas pipeline would involve year-round construction over a period of two years, during the second and third years of project construction.

Surface Water Extraction

Surface water extraction during pipeline construction would likely have consequences to watersheds intersected by the pipeline corridor.

Erosion and Scour at Stream Crossings

Impacts would be similar to those described for the Transportation Corridor.

4.16.2.6 Cumulative Effects

Note to Reviewers

This section is an early stage preliminary draft, and has been prepared prior to the completion of scoping for the purpose of setting analytical direction and facilitating the project schedule for completing the EIS.

As an initial draft, it is incomplete in many ways, and contains numerous placeholders to be addressed as more information becomes available. The Scoping Comment Period has not closed, Alternatives to the Proposed Action have not been formally identified, information needed to complete the analysis is not yet fully available and in the process of being requested from the applicant, and the approach for topics such as spills/dam failures, traditional knowledge and cumulative effects has not been settled. In addition, supporting analysis and logic for determination of potential environmental consequences have not been fully developed. This draft is intended to frame the eventual section, and in doing so, allow USACE to see the intended topics and content for the eventual completed sections. Notes are included in many sections to identify where the analysis is incomplete.

4.17 HYDROGEOLOGY

4.17.1 No Action Alternative

Under the No Action Alternative, the project would not be undertaken; there would be no Mine Site, Transportation Corridor, Amakdedori Port development, or Natural Gas Pipeline Corridor. Consequently, groundwater at the Mine Site would return to its pre-existing condition following cessation of exploration, monitoring, and testing activities that have been conducted in support of permitting. All drill holes would be grouted, monitoring and temporary water supply wells properly abandoned, and temporary water use permits allowed to expire. Minimal groundwater impacts would occur in the villages of Iliamna, Nondalton, and Newhalen because groundwater use for water supply would continue. Groundwater along the Transportation Corridor, Pipeline Corridor, and at the Amakdedori Port would remain in its current state. There are no known wells in the Transportation Corridor or at the Amakdedori Port site. There would be no effects on existing private wells near the Kenai Peninsula terminus of the Natural Gas Pipeline Corridor. In summary, there would no direct or indirect impacts on groundwater from implementation of the No Action Alternative.

4.17.2 Alternative 1 – Applicant's Proposed Alternative

4.17.2.1 Mine Site

Pit Dewatering

Construction of the open pit would require lowering groundwater levels in the pit area through dewatering to establish stable pit walls and provide dry working conditions. Although a specific dewatering design has not been developed at this point, dewatering is typically accomplished by placement of dewatering wells around the proposed pit perimeter; wells in the pit bottom as mining progresses; and horizontal drains along the pit walls. Dewatering results in a groundwater "cone of depression" because the water table is lowered in the pit, and extends beyond the pit extent into the adjacent bedrock, glacial, and alluvial aquifers. The cone of depression would deepen and widen as pit excavation progresses, and would last as long as the dewatering system is operated during construction and operation of the mine. The final open pit is estimated to be approximately 6,000 feet in diameter. Groundwater levels would ultimately need to be lowered below the base of the final mine pit depth, which is estimated to be up to

AMERICAN OVERSIGHT

1,750 feet below grade. The number of dewatering wells and drains required to dewater the proposed pit and the expected impacts on groundwater and surface water in the proposed pit area would be estimated using the calibrated groundwater flow model being developed for the Mine Site.

Creation of a cone of depression around the proposed pit would locally change groundwater flow patterns so that groundwater flows radially towards the pit, which acts as a groundwater "sink" while dewatering occurs. Groundwater/surface water interactions and surface water flows would also be impacted by pit dewatering. Groundwater discharge to seeps, springs, streams, ponds, or lakes in or adjacent to the proposed pit may cease or be reduced, resulting in lower surface water base flows or pond or lake levels. Some stream segments, ponds, or lakes in the immediate pit area may be eliminated as the water table is lowered in the immediate pit area during construction and mining operation.

The Pebble deposit straddles a watershed and groundwater divide between the headwaters of the Upper Talarik Creek and South Fork Koktuli River. Groundwater dewatering impacts are expected to be largely confined within the upper reaches of the South Fork Koktuli River basin, but may locally impact groundwater flow across the divide within the bedrock aquifer from the headwaters of the Upper Talarik Creek basin, depending on the extent of the cone of depression around the pit. The primary groundwater flow impacts would be in the alluvial, glacial, and bedrock aquifers in the open pit footprint. Groundwater flow in these aquifers would radially flow towards the pit, and be captured by the dewatering system. The groundwater impact would grow as mining proceeds to depth, and the cone of depression surrounding the pit becomes wider and extends to depth.

[Note: Quantitative estimates of the likely impacts of dewatering on the groundwater and surface water flow systems within the South Fork Koktuli River and Upper Talarik Creek basins will be added to the above text when the revised groundwater model results are available in response to RFI 019].

Once mining ceases, groundwater in the open pit would be allowed to slowly rise, resulting in a permanent pit lake. Groundwater flow into the pit would initially be fast, but would slow as water level rises. It would likely take tens of years for the groundwater in the pit to attain the level at which the groundwater would then be maintained to create a permanent groundwater sink to prevent potentially acidic pit lake water from discharging to the environment. The presence of a permanent groundwater sink at the pit would locally influence groundwater flow in the immediate vicinity of the pit; however, the influence on groundwater flow would be less than the pit in its fully dewatered state. [Note: Quantitative estimates of the likely impacts of the pit lake on the groundwater and surface water flow systems in post-closure will be provided when the revised groundwater model results are available in response to RFI 019.]

Drinking Water Wells

Potable water would be supplied by a series of groundwater wells north of the Mine Site, outside of the estimated cone of depression around the proposed open pit. The wells would be pumped at a rate to provide sufficient potable water for Mine Site personnel living and working at the site. The potable water supply wells would also be used for fire-fighting if needed. The potable water supply wells are expected to have much less local impact on groundwater flow, compared to the open pit dewatering. [Note: Quantitative estimates of the likely impacts of pumping the potable water supply wells on groundwater flow at the Mine Site will be provided when additional information on water supply pumping rates and revised groundwater model results are available in response to RFI 019].

AMERICAN OVERSIGHT

Water Management Ponds

Water Management Ponds (WMPs) would be constructed at the Mine Site to manage water removed during pit dewatering, manage water from the milling and concentrating operations, and manage surface water runoff from the Mine Site. These ponds would be lined to prevent leakage of water with potentially elevated particulate and constituent concentrations. Water in these ponds would be treated as needed and used in the milling operations. The water may also be used in tailings disposal operations. Surplus water would be treated to discharge standards and released downstream of the Mine Site to maintain water balances in the streams draining the mine site. The WMPs are expected to have no adverse impact on groundwater flow, because they would be lined to prevent leakage of water to the subsurface. The WMPs may help restore downgradient groundwater flow to existing conditions as surplus water is treated and discharged downstream of the Mine Site.

Tailings Storage Facilities

Non-acid generating bulk flotation tailings generated during milling operations would be stored in an unlined bulk tailings storage facility (TSF) at the Mine Site. The TSF would be constructed in the North Fork Koktuli watershed, with a series of embankments to impound the tailings and entrained and ponded water; and an underdrain system to manage seepage water draining from the tailings. The thickened bulk flotation tailings discharged to the TSF would settle, and water would be collected in a tailings decant pond. Seepage water draining from the tailings would be collected by the underdrain system, and routed to a lined seepage control pond. Water collected in the seepage control pond would be used for tailings dust control, or transferred to the water management ponds for subsequent use in milling and concentrating operations. Surplus water would be treated to discharge standards and released downstream of the Mine Site to maintain stream water balances. Construction of the TSF would locally impact surface water features at the site, and potentially impact groundwater/surface water interactions; this impact is expected to be small in extent (e.g., near the vicinity of TSF) but permanent. Although the underdrain system is expected to minimize vertical seepage into native materials below the TSF, the largest potential impact to groundwater beneath the TSF would result from tailings seepage with elevated constituent concentrations that is not captured, and is released to the underlying groundwater, thereby impacting local groundwater quality. (Impacts to groundwater quality are further discussed in Section 4.18, Water and Sediment Quality.) Tailings seepage that is not captured could create a local groundwater mound beneath the TSF that could have a local influence on groundwater flow.

The potentially acid-generating (PAG) pyritic tailings and PAG waste rock would be stored submerged in a separate lined impoundment to minimize oxidation and the potential release of acidic contact waters to the environment. Groundwater flow would be minimally impacted by the construction of this impoundment through local reduction in recharge through the liner. The pyritic tailings would be placed at the bottom of the open pit at the end of mining, and submerged in the pit lake to prevent oxidation. The pyritic tailings storage impoundment liner and embankments would be removed at closure and the site reclaimed to its approximate pre-mining state. Therefore, groundwater flow in this tributary drainage is expected to return to pre-mining conditions post-closure.

[Note: Above text to be revisited following receipt of revised project footprint and Water Balance Model in response to RFI 019.]

AMERICAN OVERSIGHT

4.17.2.2 Amakdedori Port

Shallow Groundwater Interception

Minor excavations across the port footprint may be required during construction activities. Due to the apparent high water table in the area, which is likely hydraulically connected to Amakdedori Creek, some excavations could intercept shallow groundwater. Impacts would likely be limited to within the port footprint and would occur only during construction activities.

Groundwater Use

Based on limited hydrogeologic information at the port site, shallow glacial and fluvial sediments in the area are likely to host groundwater (Glass 1999). Although no details have been provided on project-related groundwater use at the port, a well may be needed to supply potable water for port personnel and/or fresh water for operations. It is anticipated that such a well would have a local impact on groundwater flow and quantity resulting from drawdown caused by pumping. The duration of impacts would be long-term, lasting through the life of the project. Depending on location and pumping rates, the potential exists for saltwater intrusion into the well. [Note: An RFI is under development for information regarding potential groundwater use at the port; above text to be revised following receipt.]

4.17.2.3 Transportation Corridor

Shallow Groundwater Interception

The Transportation Corridor is designed to avoid wetlands and stream crossings where feasible, and its alignment would be optimized for the most favorable soil and geotechnical conditions. Local groundwater flow impacts may occur along the corridor where the roadway is constructed across wetlands that may be supported by groundwater inflow.

Some road segments would likely require road cuts to maintain proper road grade. These are represented by wide areas of the road footprint on hillslopes (PLP 2017: Figures T-001 through T-046), which are prevalent throughout much of the access and spur road corridors. Due to the likelihood of shallow groundwater being present across the road corridor, it is possible that road cuts could intersect groundwater in some areas and cause a local effect on groundwater flow as drainage controls direct potential seepage away from the road.

Water Use

Substantial surface water/groundwater interaction from project water use is likely along much of the corridor, as demonstrated farther north in the Mine Site. Approximately 50 million gallons of surface water would be extracted from 21 water extraction sites along the road corridor, mostly for use in road construction activities (RFI 022 response). This water would be extracted across the entire road corridor over months to years of construction. Due to the abundance of groundwater in the region, the extraction of surface water for road construction would not likely have measurable impact on groundwater flow or other uses.

4.17.2.4 Natural Gas Pipeline Corridor

Shallow Groundwater Interception

Although no specific studies have been conducted on hydrogeology along most of the pipeline corridor, the water table is likely close to the surface along most of the corridor, as evidenced by abundant wetlands and kettle ponds. Groundwater along the corridor is likely held in shallow

AMERICAN OVERSIGHT

aquifers of glacial sediment, as demonstrated in similar geologic terrain at the Mine Site. Therefore, a large percentage of the buried pipeline could intersect shallow groundwater.

[Note: Additional stream crossing and wetlands investigations will be completed in summer 2018 along the south corridor. This section will be revised with related hydrogeologic information, if available, following completion of field reports.]

The pipeline would be buried a minimum of 5 feet beyond the road shoulder, and placed in a trench extending to a depth of 4 feet (minimum). Potential impacts to groundwater would likely involve interception of shallow groundwater during trenching activities, which could be captured and locally routed along the trench backfill. Modifications to groundwater flow would occur mostly in the immediate vicinity of the trench. Impacts could extend beyond the life of the project, because the pipeline would be abandoned in place. Low-permeability trench plugs, considered a typical best management practice for pipeline installation (e.g., USACE 2018), would likely be installed to minimize movement of groundwater along the trench, internal erosion, and alteration of the natural flow of groundwater.

Potential contamination of groundwater could occur during pipeline construction, when heavy machinery and trenching equipment would likely be operating in close proximity to the water table. Section 4.18, Water and Sediment Quality, describes potential impacts of project activities on groundwater quality.

Horizontal Directional Drilling

On the Kenai Peninsula, the pipeline would be trenched for a short distance west of the compressor station, then installed by horizontal directional drilling (HDD) at the shoreline and into Cook Inlet from an elevation of about 200 feet to -12 feet mean lower low water (RFI 011 response). Groundwater is present in this area in aquifers in thick glacial and alluvial deposits, and Tertiary sedimentary bedrock. Although the exact depth to groundwater is unknown at the HDD location, nearby wells drilled at similar elevations to the HDD work area encountered shallow water-bearing glacial deposits at depths between 8 and 30 feet below ground surface, as well as deeper aquifers in both glacial deposits and sedimentary bedrock units between 50 and 120 feet deep (USGS 1967; Nelson and Johnson 1981; ADNR 2018). Therefore, the HDD installed pipeline segment would likely intersect these aquifers, which are used near the project footprint by private wells (Figure 3.17-12).

Plans for control of groundwater during HDD drilling are currently unknown. Typical effects might include dewatering during drilling; pressurization of the hole, forcing drilling fluids into aquifers; and discharge of pumped groundwater (e.g., TRCA 2013). Dewatering, if required, could draw down the local water table, potentially changing local flow patterns and affecting other uses. If discharge of dewatering water is necessary, impacts to surface water, wetlands, and soils could occur if discharge water is not treated effectively, or if dissipation methods are not employed to minimize erosion. These effects are expected to be temporary, recovering days or weeks after construction, and localized in the near vicinity of the footprint, depending on drawdown extent and potential discharge location. [Note: An RFI is under development regarding proposed HDD drilling practices. The above text will be revised following response. Mitigation measures may be added to Chapter 5 if warranted.]

AMERICAN OVERSIGHT

Note to Reviewers

This section is an early stage preliminary draft, and has been prepared prior to the completion of scoping for the purpose of setting analytical direction and facilitating the project schedule for completing the EIS.

As an initial draft, it is incomplete in many ways, and contains numerous placeholders to be addressed as more information becomes available. The Scoping Comment Period has not closed, Alternatives to the Proposed Action have not been formally identified, information needed to complete the analysis is not yet fully available and in the process of being requested from the applicant, and the approach for topics such as spills/dam failures, traditional knowledge and cumulative effects has not been settled. In addition, supporting analysis and logic for determination of potential environmental consequences have not been fully developed. This draft is intended to frame the eventual section, and in doing so, allow USACE to see the intended topics and content for the eventual completed sections. Notes are included in many sections to identify where the analysis is incomplete.

4.18 WATER AND SEDIMENT QUALITY

This section describes potential impacts of the project on surface water quality, groundwater quality, and sediment quality. The following discussion is based on currently available information and will be updated as further project details are available.

4.18.1 No Action Alternative

The geologic material at the Mine Site would continue to weather in place naturally. Background water and sediment quality in the vicinity of the Mine Site would not change, and would still contain certain constituents in amounts exceeding regulatory levels because of natural mineralization and geochemical weathering processes. Water quality along the Transportation and Natural Gas Pipeline corridors would continue to reflect the presence of elevated levels of some constituents as described in Chapter 3, Affected Environment. Sediment would continue to contain certain constituents (e.g., metals) at elevated levels. No project-related geochemical processes or impacts on surface water, groundwater, or sediment quality would occur under this alternative. Consequently, under the No Action alternative, the project would not be constructed, and would not have any new effects on water and sediment quality.

4.18.2 Alternative 1 – Applicant's Proposed Alternative

4.18.2.1 Mine Site

The construction phase would consist of dewatering of the pit area and removal of overburden that would be stockpiled. Dewatering would begin approximately one year before the start of operations. Approximately 1,300 million tons of mineralized rock (ore) and 200 million tons of waste rock would be excavated from the open pit (PLP 2018). Non-acid-generating waste rock would be used in construction of the tailings embankments and Mine Site roads. The pyritic tailings and potentially acid-generating (PAG) waste rock would be stored subaqueously until closure, when it would be transferred to the open pit lake.

Surface Water Quality

The main objective of water management at the Mine Site is to manage water originating in the project area in an environmentally responsible manner while providing an adequate water supply for operations. A primary design consideration is to ensure that all contact water

AMERICAN OVERSIGHT

requiring treatment before release to the environment would be effectively managed. This includes carefully assessing the layout of project facilities, process requirements, the area's topography, hydrometeorology, aquatic habitat and resources, and regulatory discharge requirements for managing surplus water.

All runoff water contacting the facilities at the Mine Site and water pumped from the open pit would be captured to protect overall downstream water quality. The final project design would incorporate a detailed analysis of water collection and management, including quantity and quality estimates, water treatment options, water management facility design, and strategic discharge of treated water. Implementation of the water management plan would enable the plant to operate without additional water from off-site sources.

Construction Phase – Water Management and Treatment

Implementation of the water management plan during the pre-production phase can be summarized as follows:

- Water diversion, collection, and treatment systems would be installed to address the effects of ground disturbance during construction.
- Water management and sediment control structure best management practices (BMPs), including temporary settling basins and silt fences, would be installed to accommodate initial construction at the Mine Site.
- Among the first permanent facilities to be constructed would be water management structures that would be maintained for use in adaptive management during operations. These structures would include diversion and runoff collection ditches to minimize water contact with disturbed surfaces, and sediment control measures such as settling ponds to prohibit sediment from reaching downstream water bodies.
- The pre-production phase could not commence until the proposed open pit dewatering system lowers the groundwater table in the area of the open pit. Lowering the groundwater table would allow the uninterrupted removal of overburden in the open pit area in preparation for production mining of mineralized material. The dewatering system comprises a series of dewatering wells drilled into and around the perimeter of the open pit. The specific number of wells and their locations would be determined by testing the overburden aquifers, and would include an allowance for wells with poor or no water yields and wells lost through sanding, equipment loss, or other interference with water production. Pump sizes for each well would be based on well-specific yields. Water collected from the pit dewatering wells would be discharged to the environment if it meets water quality criteria; otherwise, this water would be treated in a modular water treatment plant (WTP) before discharge.

Operations Phase – Water Management and Treatment

[Note: RFI placeholder: Text regarding production phase will be revised as needed based on additional project information through RFI 019, including the water management plan.]

During operations phase, implementation of the water management and sediment control plan would focus on minimizing contact water. Runoff and associated sediment control measures would be managed with BMPs and adaptive management control strategies. Where water could not be diverted, it would be collected for use in the mining process or treated and discharged.

Water collected from the pit dewatering wells and the open pit during the production phase would be pumped to the open pit water management pond (WMP). From there, water would be pumped to the open pit WTP for treatment and discharge.

AMERICAN OVERSIGHT

Bulk and pyritic tailings slurry from the mill would be directed to the bulk tailings storage facility (TSF) and the pyritic TSF, respectively. In addition, precipitation and runoff water would collect in the bulk TSF. The bulk TSF would maintain a small operating (supernatant) pond while the pyritic tailings would remain fully submerged in the pyritic TSF. Excess water from the pyritic TSF would be pumped to the bulk TSF. The main embankment at the bulk TSF would operate as a flow-through facility. Water collecting in the bulk TSF would flow through the embankment to the main embankment's seepage collection pond. From there, water would be directed either to the main WMP for use in the mill or to the main WTP for treatment and discharge. Excess surface water in the bulk TSF would be similarly managed.

Contact water would be pumped to the main WMP. Water treatment byproduct sludge and reject water (water resulting from the treatment process) would be directed to the process plant and added to the pyritic TSF via the pyritic tailings slurry line. A portion of the treated water from the main WTP would be returned for use in the process plant and power plant cooling towers.

A water surplus is anticipated during the operations phase under normal and wetter than normal climatic conditions. Although the Mine Site would have a water surplus, the volume of water available for discharge would be less than pre-mine flows within the mine footprint, because some water would be consumed in the tailings voids and some would be lost to evaporation and other minor uses. The site's water surplus would vary during operations as the mine footprint expands and additional site runoff is collected. The annual average surplus is estimated at approximately 39 cubic feet per second for the maximum mine footprint. Surplus water would be treated and discharged throughout the year.

Minimal water storage capacity would be available at the Mine Site until the completion of initial construction activities. Therefore, before the bulk TSF embankments and water management structures are completed, all water not meeting water quality standards would be treated and released. Water from the following sources and activities is expected to require treatment before release:

- Water present during pre-production phase pit dewatering. (Dewatering of the overburden aquifer near the pit may require treatment
- Water, primarily from precipitation, that accumulates in the open pit during pre-production phase mining
- Runoff from construction of TSF embankments.

Runoff from excavation for site infrastructure such as the process plant, camps, power plant, or storage areas would be routed to settling ponds before release.

Before the operations WTPs are brought online, modular WTPs would be used to treat contact water not meeting discharge requirements.

[Note: The discussion of water treatment plant flows will be revised as needed following receipt of a response to RFI 019, including the water management plan.]

[Note: The response to RFI 020 (Water Treatment) includes benchmarking studies summarizing information on typical water treatment plants using technologies proposed for the project. These studies are not specific to the current project and were used as general guidance for the following text. The text will be revised following receipt of a response to RFI 021 (Water Quality Predictions at the Mine Site) and project-specific water treatment plans.]

During the production phase, the Mine Site would have two WTPs: the main WTP and the open pit WTP. Both would be constructed with multiple, independent treatment trains, which would enable ongoing water treatment during mechanical interruption of any one train.

AMERICAN OVERSIGHT

[Note: The following summaries of WTPs are based on PLP 2017 and will be revised based on updated project plans. Text will be revised following responses to RFI 019 and RFI 021.]

Main Water Treatment Plant

The main WTP would treat water from the bulk TSF main embankment seepage pond WMP. Key treatment steps would occur in the following sequence:

1. Dissolved metals would be oxidized with air, ferric sulfate, and potassium permanganate, followed by co-precipitation with lime. Flocculators/clarifiers would be used to separate out the co-precipitated solids.
2. The clarified water would flow into a membrane feed tank, where sodium hydrogen sulfide or an organosulfide would be added to complete the precipitation process. Supplemental lime and sulfuric acid would be added as needed to maintain the water pH for optimal precipitation and membrane feed.
3. Ultrafiltration membranes would be used to filter precipitated metals and protect downstream high-pressure membranes.
4. High-pressure membranes (either nanofiltration, reverse osmosis, or a combination) would provide additional removal of metals and removal of calcium, magnesium, and sulfate. Filtrate from the high-pressure membranes may require an alkalinity adjustment before discharge.
5. Reject from the high-pressure membranes would have a high concentration of sulfate and other divalent ions. To prevent overloading the mine water balance with sulfate, some sulfate must be removed from the reject before its disposal in the TSF. Sulfate would be removed with a multi-stage calcium sulfate precipitation process. Precipitated calcium sulfate solids would be disposed of in the TSF.
6. Decant from the calcium sulfate precipitation process would contain high levels of selenium, nitrate, sodium, and potassium. It would be necessary to split the decant stream to treat selenium and nitrate separately from sodium and potassium as follows:
    A. Approximately half of the decant stream would be sent to a biological reactor to remove selenium and nitrate, followed by filtration. The filtrate would be blended with treated water from the high-pressure membranes (step 4) for discharge.
    B. The remainder of the decant stream would be sent to a multi-stage reverse osmosis system to remove sodium and potassium. Reverse osmosis filtrate would be blended with treated water from the high-pressure membranes (step 4) for discharge. Concentrated reverse osmosis reject (reject water) sent to an evaporator to remove sodium and potassium as a solid. The evaporate would be condensed and the condensate blended with treated water from the high-pressure membranes (step 4) for discharge.

Open Pit Water Treatment Plant

The open pit WTP would treat water from the open pit WMP with treatment plant processes commonly used in the mining industry around the world. Key treatment steps would occur in the following sequence:

1. Dissolved metals would be oxidized with potassium permanganate, followed by co-precipitation with ferric chloride. Sodium hydroxide and hydrochloric acid would be added as needed to maintain the water pH for optimal precipitation. Flocculators/clarifiers would be used to separate out the co-precipitated solids.

AMERICAN OVERSIGHT

2. Clarified water would then be treated with sodium hydrogen sulfide, sodium hydroxide, and ferrous sulfate to further co-precipitate remaining metals under reducing conditions.
3. Water from the sulfide reaction tanks would be filtered to remove precipitated metals. The filtered water would be suitable for discharge.
4. Clarifier solids and filter backwash would be thickened and transferred to the TSF.

Closure/Post-Closure Phase – Water Management and Treatment

Closure and post-closure water management would address both the physical closure of the site and associated reclamation activities, as well as the long-term post-closure period and associated maintenance and monitoring activities. [Note: Text describing closure/post-closure water management will be revised following receipt of a response to RFI 019 and the water management plan.]

The current water management plan for the closure and post-closure phases is generally described below.

Once mining ceases, dewatering would also stop, the groundwater level in the pit would begin to rise to create the pit lake, and site reclamation would commence. Surface runoff from the reclaimed areas would be collected and either treated in the WTPs or directed to the pit lake until the runoff is determined to be suitable for direct discharge. Free water would be pumped from the surface of the bulk TSF, which would be graded and revegetated to direct surface runoff toward the closure spillway. Pyritic tailings and PAG waste would be moved into the pit. Seepage water from the embankment seepage collection systems would be collected and either treated in the WTPs or directed to the pit lake until it is determined to be suitable for discharge.

Surface runoff into the pit lake could cause metals to leach from the pit walls. Water quality in the pit lake would be expected to be acidic, with elevated concentrations of some metals caused by the oxidation of sulfide compounds in the pit walls and the natural concentrations of metals found in the mineralized rock. Once the level of the pit lake has risen to about 890 feet above mean sea level, water would be pumped from the pit, treated as required, and discharged to the environment. With the pit water level maintained at least 50 feet below the natural groundwater level, the pit water would be retained in the pit and would not contribute (flow out) to affect the quality of the shallow groundwater. [Note: RFI Placeholder – RFI 019. Text will be revised following receipt of a response to RFI.]

Water treatment during closure/post-closure would use the existing WTPs as needed. Water quality would be monitored, and changes and adjustments to the treatment process would be made as needed. The reclamation plan and closure bond package required by the State of Alaska would include provisions for periodic replacement of water treatment facilities and ongoing treatment operating and monitoring costs over the long-term, post-closure period. [Note: RFI Placeholder – RFI 021, RFI 019, including water management plan. Text will be revised following receipt of a response to RFI.]

Process-related (contact) water would not be considered waters of the United States or subject to the Alaska Pollutant Discharge Elimination System (APDES) permitting program while such water is retained within the water management facilities. Contact water would be retained and treated as necessary to meet regulatory criteria before discharge.

Contact water collected in certain mine facilities is not expected to meet Alaska water quality criteria (18 Alaska Administrative Code 70, Water Quality Standards) (ADEC 2018) for discharge and would not be released directly to the environment. Contact water would be treated to ensure compliance with the most stringent applicable water quality standards before

AMERICAN OVERSIGHT

being discharged to the environment. The geographic extent of impacts on surface water quality attributable to contact water would be limited to the areas used for contact water storage before treatment. Because the contact water would first be treated to comply with the most stringent applicable water quality standards, the activities proposed under Alternative 1 are not expected to result in impacts on surface water quality.

Groundwater Quality

[Note: The following text is under development and will be revised following receipt of the revised groundwater model, water management plan, and water quality modelling in RFI 019 and 021 responses.]

The affected environment with respect to groundwater flow and quality is addressed in Section 3.17, Hydrogeology, and Section 3.18, Water and Sediment Quality, respectively. With an effective water management and water treatment program, impacts on groundwater quality would be limited to discrete portions of the project area. The principal mechanisms responsible for potential effects on groundwater quality at the Mine Site are currently under evaluation. A summary of a preliminary evaluation of Mine Site facility concepts is presented below.

Groundwater that could be contaminated by vertical seepage from the unlined bulk TSF would flow north down the North Fork Koktuli River (NFK) west drainage and would be captured by the main embankment seepage collection pond. Groundwater would be less likely to be contaminated beneath the pyritic TSF /PAG waste rock facility and the main WMP, because these facilities would be fully lined. Any leakage through the liners would flow north down the NFK east drainage and would be intercepted by the downgradient sediment pond or other seepage collection systems (currently under development). The spatial extent of these impacts is expected to be limited to shallow groundwater between the TSFs and seepage collection facilities. The TSFs and PAG storage facilities are not expected to result in impacts on downgradient groundwater quality outside of the Mine Site, based on understanding of current seepage collection design features. However, impacts on local groundwater could be sufficient to exceed water quality regulatory criteria, and could persist through the life of the mine and well into post-closure, until monitoring at seepage collection systems indicates that water quality meets the approved criteria for discharge.

Inputs of contaminated water from the pit to groundwater after the cessation of pit depressurization could potentially exceed regulatory limits for water quality. During the early closure period after pit depressurization ceases and the lake level rises, concentrations of several constituents of concern would be expected to increase in the groundwater surrounding the pit. These effects are expected to be localized and hydraulic containment maintained during this period, because of overall flow gradients toward the pit area. After the early closure period, groundwater would flow toward the pit lake radially from all directions, thereby limiting the extent of migration, and ultimately recapturing any pit-contaminated groundwater and restricting the spatial extent of the impact. After lake level rise, groundwater gradients toward the pit would be maintained by managing the pit lake level through pumping and treating lake water in perpetuity. [Note: The possibility of regional groundwater flow away from the pit has not been addressed in project documents to date. The above text will be revised, and anticipated changes to groundwater flow determined, upon receipt of groundwater model in RFI 019 response.]

Groundwater is abundant in the project area and would be used as a source of potable water. The proposed water supply wells would be sited on a groundwater high located upgradient, and on the north or opposite side of the NFK east drainage, which would contain seepage collection systems for the pyritic/PAG storage area and main WMP. Thus, groundwater potentially

AMERICAN OVERSIGHT

affected by Mine Site facilities would not be expected to affect sources of drinking water to be used by on-site workers.

Disruption, in-filling, and removal of wetlands could influence groundwater recharge and discharge patterns, which could affect groundwater quality in the vicinity of the Mine Site. Currently, although sulfides appear to be oxidizing in the deposit area, the groundwater is not acidic (see Section 3.18 in Chapter 3). Reducing conditions are prevalent, partly because of deposition of organic carbon from wetlands and infiltration of organic carbon during spring thaw. The redox state of the overburden is not expected to change during mine operations; however, concentrations of metals in shallow groundwater may increase because of disruption of wetlands and increased sedimentation.

Impacts on groundwater quality from Mine Site activities proposed under Alternative 1 would likely be limited to effects on local groundwater in the near vicinity of mine facilities and would remain within the Mine Site boundaries. These impacts would be such that groundwater would not meet regulatory criteria at certain discrete locations within the Mine Site (e.g., shallow groundwater beneath the TSFs and groundwater near the pit during lake level rise). Groundwater quality beneath the NFK west and NFK east drainages would likely be reduced during the life of the project, but would be expected to improve in the decades after mine closure. Groundwater entering the pit where it would mix with pit lake water would be essentially pumped and treated in perpetuity. [Note: Text to be revised following receipt of water quality and groundwater modeling results and the water management plan in RFI 019 and 021 responses.]

Sediment Quality

Processes of mining and exposing rock to chemical and physical weathering and erosion may increase the natural (pre-mine) rates of these processes, and thus release some of the constituents into the surrounding surface water and substrate. Chemical components in water can be absorbed by sediment or adsorbed onto sediment surfaces. Conversely, sediment can retain chemical constituents and slowly release them into the water. Therefore, the evaluation of impacts on sediment quality largely depends on water quality, as well as other direct sedimentation impacts (e.g., erosion, dust). Impacts to sediment quality from surface disturbances would be limited to portions of the project area through containment and implementation of BMPs.

[Note: This section will be further developed based on response to RFI 019, including the water management plan and RFI 021, Water Quality Predictions at the Mine Site].

4.18.2.2 Amakdedori Port

Amakdedori Port would be the shoreline hub for shipping, receiving, and storage of concentrate containers, fuel, reagents, and other freight for the project. The port site would include power generation and distribution facilities, maintenance facilities, employee accommodations, and personnel offices. The Port Terminal building would be constructed on an engineered fill patio, designed to be at an elevation high enough to avoid tidal surge from major storms. Port infrastructure should be built above the 100-year floodplain of Amakdedori Creek, although the floodplain is not well defined.

Surface Water Quality

The WTP at Amakdedori Port would treat surface runoff from the port facilities. The treatment process would include dissolved metal oxidation using potassium permanganate, followed by co-precipitation with ferric chloride. Water from the co-precipitated solids would flow into flocculators/clarifiers to separate out solids. The clarified water would then be treated with

AMERICAN OVERSIGHT

sodium hydrogen sulfide, sodium hydroxide, and ferrous sulfate to further co-precipitate the remaining metals under reducing conditions. The solids removed would be thickened and disposed of appropriately. The treated water would be suitable for discharge. A potable WTP and a sewage treatment plant would also be located at the port site.

Deposition of dust from concentrate handling at the port site and the offshore loading of bulk carriers has the potential to result in impacts on surface water quality in Cook Inlet; however, such impacts could be mitigated, and possibly eliminated, by implementing BMPs to prevent the dust from entering the water. The nature and extent of dust-related impacts at the port site, and the efficacy of proposed mitigation measures will be analyzed in greater detail as more information becomes available.

Groundwater Quality

No impacts on groundwater quality are expected to occur at the port site.

Sediment Quality

Sediments in waterbodies at the port site could potentially be affected by erosion, dust deposition, and overland runoff, especially during construction. BMPs would be in place to avoid or minimize the effects of construction of the port facilities.

4.18.2.3 Transportation Corridor

Surface Water Quality

Impacts on surface water quality in the Transportation Corridor could result from occasional barge/tug-induced suspended sediment, or from erosion effects at construction sites. Erosion and sedimentation would be managed by implementing BMPs. Based on the response to RFI, no material sites proposed for the project are sources of PAG material. If PAG is identified during the site evaluation before use, the material site would not be used.

Sediment Quality

Sedimentation along the Transportation Corridor is possible during construction such as vegetation removal, excavation, grading, and other ground-disturbing activities. Eroded soils and sediments may then be transported by water and wind, potentially causing sedimentation in nearby waterbodies. Sedimentation during road construction would likely be confined to the area within the construction right-of-way. See Section 3.24, Fish Values, for information on erosion impacts to fish and aquatic resources, and Section 3.26, Vegetation for information on acres of vegetation removal. [Note: This text will be updated to address results of summer 2018 substrate sampling and analysis of fish-bearing surface water bodies along the Transportation Corridor requested as RFI 036.]

Erosion and sedimentation would continue for the life of the unpaved roads. BMPs would include dust control and erosion and sedimentation control measures to avoid or minimize the potential impact on waterbody substrate during construction and operation of the roads.

Withdrawal of water from permitted waterbodies during construction and operation along the Transportation Corridor has the potential to disturb fine sediments on streambeds and lakebeds, causing increased erosion, turbidity, and sedimentation in the waterbodies and downstream. Implementing BMPs and complying with permit stipulations for water extraction methods would avoid or reduce impacts on sediment.

AMERICAN OVERSIGHT

4.18.2.4 Natural Gas Pipeline Corridor

Surface Water Quality

Under Alternative 1, the primary impacts on surface water quality within the Natural Gas Pipeline Corridor would be associated with installation of the natural gas pipeline at water crossings, and the use of local water sources for hydrostatic testing. Impacts at material sites would be the same as those described above for the Transportation Corridor.

ADEC water quality standards for fresh water streams specify that turbidity levels may not exceed five nephelometric turbidity units (NTU) above natural conditions when the natural turbidity level is 50 NTU or less. When natural turbidity is more than 50 NTU, the turbidity level may not increase by more than 10 percent, not to exceed a maximum increase of 15 NTU.

Surface water quality at stream crossings along the pipeline corridor would be expected to be within this water quality standard during construction. Isolated occurrences of impacts above this standard could occur (e.g., during high-precipitation periods along summer construction segments), but are expected to be reduced within a short time frame because of planned redundancies in BMPs, erosion and sediment control measures, and reclamation/cleanup crew functions.

The extent of potential impacts from hydrostatic testing for pipeline pressure testing would be limited because water volumes required for hydrostatic testing would be small compared to the volumes of potential sources from rivers and small lakes along the route. Impacts on surface water quality would likely be imperceptible. Discharges of hydrostatic test water would meet the requirements of the applicable APDES general permit.

Sediment Quality

Potential impacts on waterbody substrate from sedimentation and erosion would be similar to those described above for the Transportation Corridor. BMPs would be in place to control runoff and erosion during trenching and backfilling and other ground-disturbing activities; therefore, impacts would be avoided or minimized.

[Note: This text will be updated to address results of summer 2018 substrate sampling and analysis of fish-bearing surface water bodies along the Transportation Corridor requested as RFI 036.]

4.18.2.5 Cumulative Effects

Note to Reviewers

This section is an early stage preliminary draft, and has been prepared prior to the completion of scoping for the purpose of setting analytical direction and facilitating the project schedule for completing the EIS.

As an initial draft, it is incomplete in many ways, and contains numerous placeholders to be addressed as more information becomes available. The Scoping Comment Period has not closed, Alternatives to the Proposed Action have not been formally identified, information needed to complete the analysis is not yet fully available and in the process of being requested from the applicant, and the approach for topics such as spills/dam failures, traditional knowledge and cumulative effects has not been settled. In addition, supporting analysis and logic for determination of potential environmental consequences have not been fully developed. This draft is intended to frame the eventual section, and in doing so, allow USACE to see the intended topics and content for the eventual completed sections. Notes are included in many sections to identify where the analysis is incomplete.

4.22 WETLANDS/SPECIAL AQUATIC SITES

The project has the potential to result in the following direct and indirect effects to wetlands/special aquatic sites and waterbodies (henceforth, referred to as "wetlands"):

- Direct impacts from removal of wetland vegetation and soil
- Indirect impacts from:
  - Disruption of wetland hydrology
  - Alteration of surface water quantity or distribution
  - Alteration of subsurface water quantity and distribution
  - Erosion and sedimentation.

Project impacts have been assessed by watershed to place the impacts in an ecological context. U.S. Geological Survey (USGS) Hydrologic Unit Code Tenth Level (HUC10) watersheds have been used for this purpose, and define the environmental impact statement (EIS) analysis area for wetlands. Impact assessments were considered, analyzed, and determined from the perspective of overall regional Alaskan vegetation affected. To contextualize project impacts, the analysis for vegetation applied publicly available environmental data for the EIS analysis area for the nine HUC10 watersheds that could potentially be directly or indirectly affected.

The magnitude of impacts to wetlands were assessed in terms of percent of disturbance area to high-value wetlands or greater proportions of low-value wetlands in the EIS analysis area. Magnitude would be less for disturbance areas below five percent, and would be greater for disturbance areas above five percent, with greatest intensity for disturbance areas above 25 percent. Some areas of wetlands would be reclaimed, and some would not. The duration of impacts would be temporary, meaning wetland functions would be reduced during the construction phase; or permanent, meaning reduction or elimination of wetlands functions would occur after the construction phase, through the operations and into the closure and post-closure phase. The extent of impacts would be limited to areas of the project area in which wetlands would be removed or disturbed, or would affect wetlands outside of the project area, within one or more HUC 10 watersheds.

To assess the relative magnitude and extent of impacts, the relative proportion of common wetland types in each watershed was estimated. The National Wetland Inventory (NWI) mapping covers only about one-fourth of the watershed area, and was therefore not sufficient

AMERICAN OVERSIGHT

for this effort. The uniform vegetation mapping provided by the Alaska Center for Conservation Science (ACCS) provided the best available spatial data for estimating wetland coverage for the HUC10 watersheds.

Vegetation class descriptions from the Vegetation Map and Classification guidebooks (Boggs et al. 2016a, 2016b) were reviewed. Vegetation classes mapped in the watersheds were assigned to one of the following types in a crosswalk for comparison with wetlands mapped for the project: upland, forested wetland, shrub wetland, herbaceous wetland, aquatic bed wetland, or waterbody.

The descriptions of herbaceous vegetation classes included wetland status; therefore, these vegetation classes were directly crosswalked to herbaceous wetland or upland. The woody vegetation classes lacked wetland status, so it was not possible to directly crosswalk types. Because forested vegetation types were uncommon, an assignment was made for each mapped unit based on site characteristics.

Shrub vegetation classes were common; a shrub vegetation class was assigned to wetland or upland based on a review of site characteristics. The dwarf shrub class in particular was not broken out in the mapping to differentiate dry sites from wet sites. Therefore, the acreages and percentages for each watershed are used here for comparison purposes, and should be considered an approximation of the actual extent of wetlands.

4.22.1 No Action Alternative

Under the No Action Alternative the Pebble Project would not be constructed, and no new impacts to wetlands would occur.

4.22.2 Action Alternative 1 – Applicant's Proposed Alternative

4.22.2.1 Mine Site Direct Impacts

[Note: Section to be revised with updated numbers and descriptions based on updated project description.]

[Note: Temporary versus permanent impacts will be refined in all text and tables pending an updated project description].

Most project-related direct impacts to wetlands would be initiated during the construction phase and would result in temporary or permanent loss of wetlands or alteration in wetland functions. Primary direct construction-related impacts to wetlands and waterbodies would include:

- Clearing and removal of wetland vegetation
- Placement of fill in wetlands and waterbodies
- Excavation that eliminates wetlands and waterbodies
- Compaction, rutting, and mixing of wetland soils.

Excavation of the open pit, quarries, and sediment ponds and filling within the tailings storage facility (TSF) and stockpiles would occur throughout the active life of the mine. The maximum extents of all surface disturbance impacts were used to evaluate direct wetlands impacts for the Mine Site. Some wetland reclamation would begin shortly after the start of construction and would continue throughout operations and closure.

A total of 3,191 acres of wetlands and waterbodies would be directly affected by the proposed Mine Site facilities (Table 4.22-1). The greatest impacts would occur from the bulk tailings

AMERICAN OVERSIGHT

storage cell (1,083 acres), the TSF (548 acres), the open pit (178 acres), and the haul road (162 acres).

Within the Mine Site, most impacts to wetlands (XX acres) would occur within one of the HUC10 watersheds, named the "Headwaters Koktuli River watershed" (Figure 4.22-1; Table 4.22-1). Less than 10 of impacts to wetlands and waters would occur within the Upper Talarik Creek Watershed (Table 4.22-1). Direct impacts in these watersheds would affect primarily deciduous shrub wetlands on slopes (XX percent and XX percent, respectively) and herbaceous wetlands on slopes (XX percent and XX percent, respectively). Previous disturbance to wetlands in this area is minimal. Facilities have been sited to avoid and minimize wetland impacts and allow efficient reclamation of disturbed areas.

[Note: The above sections will be updated with an updated project footprint.]

Excavation, filling, and clearing of wetlands would alter or remove their capacity to provide hydrologic, biogeochemical, and biological functions. Construction-related disturbances may alter wetland modification of groundwater functions (recharge and discharge), and would decrease stormwater and floodwater storage and modification of streamflow functions by decreasing the wetlands' potential to dissipate energy and reduce peak flows. These altered hydrologic functions would extend to the streams connected to or downstream from the affected wetlands. See Section 4.16, Surface Water Hydrology, for a discussion of surface water hydrology impacts.

Construction on or through wetlands would decrease or remove the wetlands' potential to improve water quality by preventing erosion and settling sediments. Sediment barriers and erosion control planning would mitigate the loss of this wetland function. Vegetation clearing with no soil disturbance reduces the wetlands' ability to modify water quality and its contribution to the abundance and diversity of wetland fauna. It also may reduce the export of detritus and contribution to the abundance and diversity of wetland flora functions, depending on the extent of vegetation being cleared.

The Headwaters Koktuli River watershed is estimated to contain approximately 56,000 acres of wetlands and waterbodies (33 percent of the watershed). Approximately 45,000 acres (26 percent of the watershed), are shrub wetlands and 9,000 acres (five percent) are herbaceous wetlands. Forested wetlands (39 acres) and aquatic bed wetlands (132 acres) each cover less than one percent. Mine Site activities would affect 2,460 acres of shrub wetlands and 657 acres of herbaceous wetlands within the Headwaters Koktuli River watershed (Table 4.22-1). This represents approximately five percent and seven percent, respectively, of shrub and herbaceous wetlands in the watershed. No forested wetlands and one acre of aquatic bed wetlands would be affected.

[Note: Information on specifics of unique, rare, or high-value wetlands types will be added in a later version.]

Riverine wetlands are another potentially high-value wetland type because of their numerous functions, especially fish and wildlife habitat functions. A total of 176 acres of riverine HGM class wetlands in the Headwaters Koktuli River watershed would be affected by activities at the Mine Site. The extent of riverine wetlands in the watershed is not known. They account for approximately six percent of the Mine Site mapping area. The watershed contains the North Fork and South Fork Koktuli River and their numerous tributaries. It is expected that riverine wetlands would account for at least six percent of the watershed as a whole, or approximately 10,000 acres. Therefore, the area of impacts from Mine Site activities would represent approximately two percent of all riverine wetlands in the watershed. Less than one acre of

AMERICAN OVERSIGHT

riverine HGM class wetlands in the Upper Talarik Creek Watershed would be affected by activities at the Mine Site.

AMERICAN OVERSIGHT

Reclamation

Pebble Limited Partnership (PLP) has incorporated requirements for mine closure and long-term water management into the design of the project. During the permitting phase, a reclamation plan would be developed that would include reclamation of wetlands where feasible. The discussion below is based on generally accepted wetland reclamation practices for mine sites in Alaska. PLP has also provided some conceptual-level information on reclamation in its application and in subsequent responses to requests for information.

The Alaska Department of Natural Resources (ADNR) approves reclamation plans and associated financial assurances before construction. In its project description for the Department of the Army Application (December 2017), PLP has identified some of the design elements that would facilitate successful reclamation during and after the closure phase:

- Quarried and waste rock would be geochemically tested prior to being used in construction to avoid the potential for contaminated drainage during operations and post-closure.
- Topsoil and overburden would be salvaged during construction for use as growth medium during reclamation.
- TSF embankment slopes would be designed to provide long-term stability and facilitate the placement of growth medium.
- The overall project footprint would be minimized to facilitate physical closure and post-closure water management.

[Note: This section will be updated with information from RFI 024.]

Material sites constructed in valley bottoms or lowland sites are candidates to be reclaimed to create new ponds with emergent wetlands where sufficient water quality and hydrology are available. Final contouring around created ponds could focus on providing habitat at the water's edge and a complex interspersion between wetland and upland vegetation. Moderate to steeply sloping wetland or upland mosaics with wetland inclusions would be less feasible to restore to wetlands because of the marginal hydrology, and some fills may not be removed in these areas. Marginal wetland hydrology would be expected in areas where excavations and road cuts through colluvium and rock have reduced overland sheet flow.

Shrub wetland successional processes, generally initiated by natural disturbances such as wildland fires, gradually reestablish typical vegetation and eventually hydrologic characteristics. When construction disturbs wetlands, successional processes may be prolonged or may not occur. Construction disturbances differ from natural disturbances in that the organic mat and organic soil horizons are often removed completely, which removes seedbeds, and reduces surface and subsurface water storage capacity. The timing and extent of recovery likely depend on the intensity, extent, and duration of the disturbance. The time required for wetlands to return to pre-disturbance soil moisture and original vegetation cover has not been well documented in western Alaska.

Development of self-sustaining wetland plant communities on previously disturbed Alaska wetlands may occur within 10 to 30 years, but may be slowed in gravelly or sandy soils, and by years with failed seedling establishment or seed production. Revegetation success may be enhanced by conducting careful planning and management; minimizing disturbance; segregating and protecting materials to be used during reclamation; using the appropriate seed mixture and seeding rates; and monitoring for erosion and revegetation success.

Reclamation of wetland conditions may be complicated in areas where less permeable layers have been breached or removed. This would alter surface hydrology, causing previous wetland

AMERICAN OVERSIGHT

areas to drain. In these situations, restored wetlands are likely to differ in type and functional capacity from the original wetlands for decades to centuries.

Surface water resources available to wetlands would continue to be altered in distribution and abundance with an estimated return to within XX percent of predevelopment streamflows at the downstream end of the mine development (see Section 4.16, Surface Water Hydrology). These changes in surface water distribution and abundance could cause some wetlands to dry up while others would be inundated or become wetter.

The pit lake would continue to fill for a period of several decades post-closure. Once the water level reaches elevation 890 feet, water would be pumped from the pit. This elevation is at least 50 feet below the elevation at which groundwater flow would be directed outward from the open pit. As a result, a new equilibrium groundwater level would become established around the pit. Wetlands and streams above the pit lake level would potentially lose groundwater to the cone of depression created by the pit lake. This may result in long-term wetland and streamflow effects. Groundwater modeling would be used to assess potential wetland and stream dewatering, and to identify those wetlands and functions that are likely to be affected (see Section 4.17, Groundwater Hydrology, for details).

[Note: The above sections will be updated with an updated project footprint.]

4.22.2.2 Mine Site Indirect Impacts

[Note: Information on this topic to be added at a later time].

Fugitive Dust

[Note: Information on this topic to be added at a later time].

Dewatering

[Note: Information on this topic to be added at a later time].

4.22.2.3 Amakdedori Port Direct Impacts

[Note: This section to be updated with revised project description information.]

Construction of Amakdedori Port would directly affect less than one acre of intertidal waters and 109 acres of subtidal waters in the Amakdedori Creek-Frontal Kamishak Bay watershed and 271 acres of subtidal waters in the Cook Inlet watershed (Table 4.22-2). The port terminal and associated facilities would be sited and designed to avoid most wetlands. Previous disturbance to wetlands or waterbodies in this area is minimal.

The Amakdedori Port facilities would be removed during closure, except for those required to support shallow draft tug and barge access to the dock for the transfer of bulk supplies. Disturbed areas would be recontoured, graded, ripped, and scarified. Topsoil and growth media would be placed as needed, and surfaces would be seeded for revegetation.

4.22.2.5 Transportation Corridor and Natural Gas Pipeline Corridor Direct Impacts

[Note: This section to be updated with revised project description information. Temporary versus permanent impacts will be addressed at that time, and a table with direct temporary impacts for the Natural Gas Pipeline Corridor will be included.]

Locations West of Cook Inlet

Construction of the Transportation and Natural Gas Pipeline corridors from Amakdedori Port to the Mine Site would directly and permanently affect XX acres of wetlands (Table 4.22-3). The south access road between the port and the south ferry terminal at Iliamna Lake would affect XX acres. The mine access road from the north ferry terminal to the mine site would affect ## acres of wetlands and waterbodies. The remaining XX acres of impacts would be from the Iliamna and Kokhanok Airport spur roads, material sites, and ferry landings.

Impacts would be permanent because the road would remain to facilitate long-term post-closure water treatment and monitoring. Previous disturbance to wetlands in this area is minimal. The corridor has been sited to avoid and minimize wetland impacts and allow for efficient reclamation of disturbed areas.

A total of XX miles of streams would be directly affected by construction, including XX miles of perennial streams and XX miles of intermittent streams (Table 4.22-3). The larger streams with a width at ordinary high water (OHW) of 16 feet or greater would be bridged. Bridge locations are shown in Figure 4.22-2. Site-specific designs have been developed for bridges. Smaller

AMERICAN OVERSIGHT

stream crossings would use a series of standardized, conceptual culvert design categories based on stream width and fish presence. See Section 4.16, Surface Water Hydrology, for a discussion of surface water hydrology impacts.

Activities in the Transportation and Natural Gas Pipeline corridors would affect wetlands in five HUC10 watersheds. The highest number of acres impacted (XX acres) would occur in the Upper Talarik Creek watershed (Figure 4.22-2; Table 4.22-3). Direct impacts in this watershed would affect primarily deciduous shrub wetlands on slopes (XX percent) and flats (XX percent), and along streams (XX percent).

The Upper Talarik Creek watershed is estimated to contain approximately 34,000 acres of wetlands and waterbodies (39 percent of the watershed). Approximately 31,000 acres (35 percent of the watershed) are shrub wetlands, and 1,200 acres (one percent) are herbaceous wetlands. Forested wetlands (636 acres) and aquatic bed wetlands (eight acres) each cover less than 1 percent. Activities in the Transportation and Natural Gas Pipeline corridors and in a small portion of the Mine Site would affect XX acres of shrub wetlands and XX acres of herbaceous wetlands in the Upper Talarik Creek watershed, which is estimated to be less than one percent of shrub and herbaceous wetlands in the watershed. No forested or aquatic bed wetlands would be affected.

Based on vegetation and wetland mapping for the project, five acres of bog vegetation would be affected by activities in the Transportation and Natural Gas Pipeline corridors in the Upper Talarik Creek watershed. The extent of bog vegetation in the watershed is not known.

A total of XX acres of riverine wetlands would be affected by activities in the Transportation and Natural Gas Pipeline corridors in the Upper Talarik Creek watershed (Table 4.22-3). The extent of riverine wetlands in the watershed is not known. They account for approximately four percent of the Transportation and Natural Gas Pipeline corridor mapping areas. Riverine wetlands are estimated to account for approximately four percent of the watershed as a whole, or 3,500 acres. The corridor impacts, therefore, would represent less than two percent of all riverine wetlands in the watershed.

Wetland and waterbody impacts in the other four watersheds would be relatively low from a watershed perspective. The Iliamna Lake watershed, excluding the lake itself, has an estimated 180,000 acres of wetlands and waterbodies (33 percent of the watershed). The project would result in direct impacts on XX acres of slope wetlands and one acre of riverine wetlands (Table 4.22-3). The Newhalen River watershed has an estimated 35,000 acres of wetlands and waterbodies (29 percent of the watershed); one acre of slope wetlands would be directly affected. The Gibraltar Lake watershed has an estimated 34,000 acres of wetlands and waterbodies (41 percent of the watershed); nine acres of slope wetlands would be directly affected. The Amakdedori Creek–Frontal Kamishak Bay watershed has an estimated 77,000 acres of wetlands and waterbodies (44 percent of the watershed); 15 acres of slope wetlands and one acre of riverine channel would be directly affected (Table 4.22-3). The Transportation Corridor does enter the Paint River watershed for a very short distance, but no wetland or waterbody impacts are anticipated.

[Note: Table to be updated with revised project description information.]

AMERICAN OVERSIGHT

Figure 4.22-2: Upper Talarik Creek Watershed Impacts

[Note: Figure under development]

AMERICAN OVERSIGHT

Locations East of Cook Inlet

[Note: The following section to be updated with revised project description information.]

Activities in the Natural Gas Pipeline Corridor on the Kenai Peninsula would affect wetlands and waterbodies in the Stariski Creek–Frontal Cook Inlet watershed (Figure 4.22-3). Direct impacts on this watershed would affect primarily shrub wetlands.

The pipeline would cross approximately 94 miles of Cook Inlet, between Anchor Point and Amakdedori Port. Horizontal directional drilling would be used to install pipe segments from the compressor station out into waters that are deep enough to avoid navigation hazards. From this point, the pipe would be installed in a trench out to a water depth of 200 feet, and then laid on the sea floor. Direct temporary impacts on approximately 340 acres of marine subtidal waters and less than one acre of intertidal waters would occur (Table 4.22-4). The compressor station at Anchor Point would be located in an area that would avoid wetland impacts.

Reclamation

The road system would be retained as long as required for the transport of bulk supplies needed for long-term post-closure water treatment and monitoring. Once no longer needed, the road system would be reclaimed. Disturbed areas would be recontoured, graded, ripped, and scarified. Topsoil and growth media would be placed as needed, and surfaces would be seeded for revegetation. The Iliamna Lake ferry facilities would be removed during closure. Once it is no longer required to provide energy to the Mine Site, the natural gas pipeline would be pigged and cleaned before being abandoned in place. Surface facilities associated with the pipeline would be removed and reclaimed.

During closure and post-closure, wetlands would be reestablished wherever practicable. The geographic extent of direct and indirect effects would affect five HUC10 watersheds, but the majority of impacts (54 percent) would occur in the Upper Talarik Creek watershed, in the Bristol Bay basin. Most impacts throughout all watersheds would be on shrub (59 percent) and herbaceous (18 percent) wetlands on slopes, which are common throughout the region. There would be some impacts on riverine wetlands (eight acres) that are important for fish habitat, although this represents a relatively small portion of riverine wetlands across all watersheds.

[Note: Table to be updated with revised project description information.]

Note to Reviewers

This section is an early stage preliminary draft, and has been prepared prior to the completion of scoping for the purpose of setting analytical direction and facilitating the project schedule for completing the EIS.

As an initial draft, it is incomplete in many ways, and contains numerous placeholders to be addressed as more information becomes available. The Scoping Comment Period has not closed, Alternatives to the Proposed Action have not been formally identified, information needed to complete the analysis is not yet fully available and in the process of being requested from the applicant, and the approach for topics such as spills/dam failures, traditional knowledge and cumulative effects has not been settled. In addition, supporting analysis and logic for determination of potential environmental consequences have not been fully developed. This draft is intended to frame the eventual section, and in doing so, allow USACE to see the intended topics and content for the eventual completed sections. Notes are included in many sections to identify where the analysis is incomplete.

4.26 VEGETATION

Potential direct and indirect effects impacting vegetation include:

- Direct impacts from vegetation removal
- Direct impacts from removal of rare and sensitive plants; indirect impacts from habitat disturbance
- Indirect impacts from invasive species introduction or spread
- Indirect impacts from fugitive dust
- Indirect impacts from dewatering.

Impact assessments were considered, analyzed, and determined from the perspective of overall regional Alaskan vegetation affected. To contextualize project impacts, the analysis for vegetation makes use of publically available environmental data for the environmental impact statement (EIS) analysis area (the nine Hydrologic Unit Code [HUC] 10 watersheds that could potentially be directly or indirectly impacted).

The magnitude of impacts to vegetation were assessed in terms of disturbance to above-ground vegetation and soil disturbance. Vegetation would be removed above the surface, or would also involve soil disturbance. Some areas of vegetation removal and soil disturbance would be reclaimed, and some would not. The duration of impacts would be temporary, meaning removal and/or disturbance would occur during the construction phase; or permanent, meaning removal and/or disturbance would occur or remain after the construction phase, through the operations and into the closure and post-closure phase. The extent of impacts would be limited to areas of the project area in which vegetation would be removed/disturbed, or would affect vegetation outside of the project area, within one or more HUC 10 watersheds.

4.26.1 No Action Alternative

Under the No Action alternative, the project would not be constructed, and would not have any new effects on vegetation.

AMERICAN OVERSIGHT

4.26.2 Action Alternative 1 – Applicant's Proposed Alternative

4.26.2.1 Mine Site Direct Impacts

Vegetation Removal

Construction and operations of the Mine Site would require clearing, grading, and removal of vegetation in areas where the Mine Pit, Tailings Storage Facility (TSF), overburden stockpiles, material sites, water management ponds, milling and processing facilities, access roads, and supporting infrastructure would be located. Shrubs, trees, understory vegetation, roots, and other obstructions such as large rocks and stumps would be cleared from construction work areas. Vegetation removal can cause numerous changes in the surrounding environment, such as:

- Increased rate of soil erosion from wind or water
- Changes in water drainage patterns (increased runoff volumes)
- Sediment deposition in downslope areas
- Changes in adjacent vegetation type composition
- Changes in wildlife habitat
- Introduction or spread of invasive species.

Acres of direct impacts to vegetation were calculated by overlaying the project footprint over vegetation types in ArcGIS, and calculating the area impacted for each vegetation type in the project component mapping areas.

Table 4.26-1 lists the acreage and percent of the grouped vegetation types in the Mine Site mapping area that would be directly affected by clearing, grading, and removal activities during construction and operation of the Mine Site. The acreage and percent of each vegetation type affected in the relevant HUC 10 watersheds that the Mine Site mapping area falls within are also included to assess the magnitude and extent of impacts from the perspective of overall regional Alaskan vegetation affected. Figure 4.26-1 shows grouped vegetation type locations in the Mine Site project footprint.

In some locations, removal would be permanent (such as the mine pit that would become a pit lake, and bulk TSF that would become a new landform). In all other areas, removal would be temporary. In temporary disturbance areas, vegetation would be reestablished by reclamation, which would begin immediately after construction, and continue through to closure. In some areas, natural revegetation would be expected to occur. [Note: Specific areas will be included with updated project design.] All road material sites would be stabilized and progressively reclaimed, but would remain active to support ongoing road maintenance requirements through operation. Mine laydown areas would be retained for use through operations. All construction roads would continue to serve as site access roads.

Disturbed areas that are reclaimed are expected to continue vegetation succession over time, which would improve soil and habitat quality for wildlife. Successional species would likely include those found outside of the Mine Site as seeds from the surrounding areas are dispersed and establish on reclaimed sites. Vegetation reestablishment time of cleared or graded areas is variable. Trees and shrubs are expected to begin to re-establish almost immediately after construction and reclamation. Alders (*Alnus* spp.), willows (*Salix* spp.), and birch (*Betula* spp.) are generally the first trees and shrubs to re-establish. Reclamation details are provided in Section 3.26, Wetlands/Special Aquatic Sites.

AMERICAN OVERSIGHT

[Note: Section and table to be completed with updated project footprint information; reclamation details will be provided in Section 3.22, Wetlands/Special Aquatic Sites, after further development of a reclamation and closure plan and from RFI 24.]

[Note: Figure to be added later.]

AMERICAN OVERSIGHT

Rare or Sensitive Species

There are no occurrences of rare or sensitive plant species in the Mine Site.

4.26.2.2 Mine Site Indirect Impacts

Invasive Species

[Note: Additional details on Mine Site invasive species to be provided at a later time.]

Fugitive Dust

Fugitive dust emissions are a by-product of construction and operations activities. Dust would be caused by vehicle travel on the mine roads and other unpaved surfaces in the mine, as well as by mining activities at the pit. This dust has the potential to collect on vegetation in the vicinity of the dust sources. Windblown dust could affect vegetation well beyond the source, but the effect diminishes with distance and is affected by prevailing winds and topography. The deposition of dust has been analyzed in Section 4.14, Soils, with information on impacts to wetlands included in Section 4.22, Wetlands/Special Aquatic Sites.

The intensity of the impacts would be expected to vary depending on proximity of vegetation to the source of the dust. Dust may cause variable physiological changes to vegetation depending on exposure length or level. The duration of the effects would be both seasonal, when dust is washed off during winter months (or when deciduous species lose leaves), and throughout construction and operations. In some cases, impacts may last past closure where physiological changes may occur within plants, or where vegetation community changes may take place. The extent would be in areas adjacent to roads with vehicle traffic or in unpaved surface areas, and in the dust emissions areas, with highest concentrations of dust closest to the source.

Dewatering

Groundwater lowering may reduce water availability to plant species. Response of terrestrial vegetation to reduced water availability depends on the water requirements of individual plant species, root depths, and tolerances. Plants with shallow root systems that require a fairly constant supply of water would be impacted to a greater extent than drought-tolerant or deep-rooted species. Impacts on vegetation from reduction in water availability may include stunted growth, greater susceptibility to disease (NCDENR 2009), and succession of more drought-tolerant species. Impacts would depend on the actual timing and location of the groundwater lowering and the tolerance of the vegetation types. Impacts on groundwater are discussed in Section 4.17, Groundwater Hydrology. Impacts on wetland vegetation are presented in Section 4.22, Wetlands/Special Aquatic Sites.

In areas where vegetation is removed and is no longer present to intercept rainfall and reduce runoff, indirect effects could result from erosion of the exposed soil and sedimentation. Areas without well-established vegetation may also be susceptible to invasion by invasive species. Drainage and erosion control measures, both temporary and permanent, would be implemented at the Mine Site, and reclaimed areas would be reseeded for vegetation to prevent erosion of soils and potential invasion by weeds. Impacts to soil are addressed in Section 4.14, Soils.

AMERICAN OVERSIGHT

4.26.2.3 Amakdedori Port Direct Impacts

Vegetation Removal

Construction and operations of the Amakdedori Port would require clearing, grading, and removal of vegetation in areas along the access road, dredge stockpile area, and where the shore-based facilities would be located, such as facilities for receipt and storage of containers, fuel storage and transfer, power generation and distribution, maintenance, and employee accommodations.

All temporary construction facilities would be removed after construction, and the sites would be reclaimed, unless being used for permanent facilities. Temporary facilities associated with the Amakdedori Port include the construction camp; however, this facility would be located in an area that would be used for port operations, and would not involve a separate footprint.

The Amakdedori Port facilities would be removed and reclaimed after closure activities are completed, except for those required to support shallow draft tug and barge access to the dock for the transfer of bulk supplies.

Table 4.26-2 lists the acreage and percent of the grouped vegetation types in the Amakdedori Port mapping area that would be directly affected by clearing, grading, and removal activities during construction and operation of the Mine Site. Figure 4.26-2 shows grouped vegetation type locations in the Amakdedori Port component.

[Note: Section and table to be completed with updated project footprint information.]

Table 4.26-2: Amakdedori Port Vegetation Removal Impacts

Grouped Vegetation Type	Impacts in Mapping Area (Acres/Percent)	Impacts in the Analysis Area[1]	
		Headwaters Koktuli River (Acres/Percent)	Upper Talarik Creek Watershed (Acres/Percent)
Open/Closed Forest			
Open Tall Shrub			
Closed Tall Shrub			
Open Low Shrub			
Closed Low Shrub			
Dwarf Shrub			
Dry to Moist Herbaceous			
Wet Herbaceous			
Open Water			
Other			
Total			

[1]Represents the total area of the grouped vegetation type in each of the HUC 10 watersheds that comprise the Mine Site mapping area, and the percent of the vegetation type impacted per watershed.

AMERICAN OVERSIGHT

Figure 4.26-2: Vegetation Types in Amakdedori Port

[Note: Figure to be added later.]

AMERICAN OVERSIGHT

Rare or Sensitive Species

There are no occurrences of rare or sensitive plant species at the Amakdedori Port, or within a 1-mile radius.

4.26.2.4 Amakdedori Port Indirect Impacts

Invasive Species, Fugitive Dust, and Changes in Water Availability

The indirect impacts, including increased risk of invasive species introduction and spread, fugitive dust during construction and operations, and changes in water availability, would be similar to those described at the Mine Site.

4.26.2.5 Transportation and Natural Gas Pipeline Corridors Direct Impacts

Vegetation Removal

Construction and operations of the Transportation and Natural Gas Pipeline Corridor components would require clearing, grading, and removal of vegetation in areas where the roads, ferry terminals, laydown areas, material sites, and buried onshore pipeline would be located. During operations, periodic brushing of the revegetated pipeline corridor would occur.

Table 4.26-3 lists the acreage and percent of the grouped vegetation types in the Transportation and Natural Gas Pipeline Corridor that would be directly affected by clearing, grading, and removal activities during construction and operation of the Mine Site. Figures 4.26-3 and 4.26-4 show grouped vegetation type locations in the Transportation and Natural Gas Pipeline Corridor component project footprints.

The impacts associated with the natural gas pipeline would be temporary, because reclamation would occur shortly after installation. All temporary construction facilities would be removed after construction, and the sites, unless being used for permanent facilities, would be reclaimed. Temporary facilities associated with the Transportation/Natural Gas Pipeline Corridor on the western side of Cook Inlet include the camps established at the ferry landings.

The road system would be retained as long as required for the transport of bulk supplies needed for long-term post-closure water treatment and monitoring. The Iliamna Lake ferry facilities would be removed, and all closure-related supplies would be transported across the lake using a summer barging operation.

Rare or Sensitive Species

Two occurrences of one rare plant, Selkirk's violet (*Viola selkirkii*), were documented approximately 1.2 miles away from the road corridor (see rare and sensitive plant location map in Section 3.26, Vegetation). Impacts to this plant would be limited to potential indirect impacts if habitat were impacted by vegetation removal, or by indirect impacts such as fugitive dust presence.

[Note: Section and table to be completed with updated project footprint information.]

Source: Boggs et al. 2016

4.26.2.6 Transportation and Natural Gas Pipeline Corridors Indirect Impacts

Invasive Species, Fugitive Dust, and Changes in Water Availability

Indirect impacts would be similar to those described at the Mine Site. Because the roads and pipeline cross several watersheds, these impacts could affect a wider area compared to the Mine Site. Dust impacts would occur within a narrow corridor on either side of the roadways. The risk of invasive species being introduced or spread is higher for this component. The road and pipeline corridor could also cause wide-ranging changes in water availability due to the elevation of the roadway and structures necessary for water flow control adjacent to the roadways.

Pebble EIS reviewers-
As discussed during today's team meeting, attached is a 60-day schedule that shows upcoming EIS development activities and areas where cooperating agencies (CAs) will be involved. I have not received a response back from the Corps on whether we will be able to review revised sections of chapters 3 and 4 before the technical discussions that are shown on this schedule.

Subject: Please Review - Pebble Wetlands Sections

Hi Mark and Palmer,
We have received the draft wetlands sections for the Pebble EIS for review, and I have loaded the text and associated figures into the Sharepoint folders. A comment deadline has not yet been provided by the Corps, but I am expecting it to be similar to the new deadline for the other chapters. So, at this point assume that the internal deadline will be somewhere the week of Dec. 10. I will confirm a specific deadline once we hear back from the Corps. As usual, please use the attached comment table for your comments.
Thank you,
Molly

Subject: Pebble EIS wetlands sections

Hi Mark and Molly –
I just took a call from Sheila Newman, Katie McCafferty, and Elizabeth Bella (AECOM). They indicated that the wetlands sections of the PDEIS would be sent to us for review later today. The Corps and AECOM would also like to have a wetlands technical meeting with us sometime during our review period to discuss how they developed the sections and answer any technical questions that we might have based on our preliminary look at the sections. They requested that that the technical meeting be next Thursday or Friday and would be in person at the AECOM office in Anchorage (I could call in, if needed). I told them that we needed to check schedules to see if that would work. Otherwise the technical meeting would be in the following week or two. Should we also include Palmer in this meeting and therefore scheduling?

Hi All-
During the team meeting today, I mentioned the PowerPoint presentation provided during yesterday's cooperating agency meeting that provided information on the alternatives currently proposed by the Corps/AECOM for evaluation in the draft EIS. Attached is a copy of the presentation.
We still have outstanding questions/comments on some other potential alternatives (dry stack tailings, TSF liner) that we hope to work through with the Corps.
This is just FYI.

Format and Level of Detail for Chapter 2

- Section 2.1 – Alternatives Development Process, references Appendix B – 1 Page
- Section 2.2 – Alternatives Carried Forward for Detailed Analysis
  - 30 to 35 pages of text
  - 64 figures
  - 23 Tables
  - Appendix N – PLP October 10, 2018 Project Description
- Section 2.3 – Alternatives Eliminated from Further Consideration – 6 pages

AMERICAN OVERSIGHT

EPA-0135-0004637

Update on Appendix B – Alternatives Development

- August 17, 2018 – Preliminary List of Options and Screening Criteria
  - Condensed version intended to solicit feedback on list of options and screening criteria
  - Comments received from one Cooperating Agency
  - Comments were considered when preparing the next version of Appendix B

AMERICAN OVERSIGHT

EPA-0135-0004638

Update on Appendix B – Alternatives Development

- September 14, 2018 – Alternatives Development Process
  - Screening criteria modified
  - Presented the screening analysis for each alternative
  - Comments from USACE and three Cooperating Agencies
    - Currently considering comments and revising the appendix (eliminated language referring to ability of mine operator to make profit)
    - Several additional options (e.g., 115,000 tons per day throughput, Pebble East, many additional TSF locations)
    - Several options were subject to additional consideration (e.g., underground mining, in pit processing and conveying, treating tailings to make inert)
  - Next version of Appendix B will be Draft EIS

AMERICAN OVERSIGHT

EPA-0135-0004639

Review of Select Alternatives

- Filtered Tailings (Dry Stack)
  - Applies to Bulk TSF only
  - Conventional slurry typically 20 to 40 percent solids
  - PLP proposes thickened tailings – approximately 55 percent solids
  - Dry stack alternative would filter to 80 to 85 percent solids
  - PLP responded to RFIs 054 and 076
  - AECOM mining experts reviewed RFIs – September 24 Memorandum
  - Dry stack is not technically practicable

AMERICAN OVERSIGHT

EPA-0135-0004640

Review of Select Alternatives

- Other Mine Locations
  - Appendix B looked at Whistler, Pyramid, and five massive sulfide deposits
  - Pebble East has been added – RFI 094
  - Whistler and the five sulfide deposits do not meet USACE overall purpose
  - Pebble East and Pyramid still under evaluation
- Underground Mining
  - RFI 094 – received from PLP October 18, 2018
  - Currently being evaluated by AECOM mining engineers

AMERICAN OVERSIGHT

EPA-0135-0004641

APPENDIX B – ALTERNATIVES DEVELOPMENT PROCESS

AMERICAN OVERSIGHT

EPA-0135-0004642

1.0 PURPOSE OF APPENDIX

This appendix further explains the alternatives development process for the Pebble Project; summarizes each step of the process; and provides the option screening criteria and results for evaluation of a reasonable range of alternatives in the Environmental Impact Statement (EIS).

1.1 CONTEXT AND REQUIREMENTS

The federal regulations governing the National Environmental Policy Act (NEPA) state in 40 Code of Federal Regulations (CFR) 1502 that the alternatives section "is the heart of the environmental impact statement." The regulations require federal agencies to "rigorously explore and objectively evaluate all reasonable alternatives and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated." The Council on Environmental Quality (CEQ) guidance clarifies that:

> *In determining the scope of alternatives to be considered, the emphasis is on what is 'reasonable' rather than on whether the proponent or applicant likes or is itself capable of carrying out a particular alternative. Reasonable alternatives include those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant.* [1]

Alternatives screening is also pertinent to Clean Water Act (CWA) 40 CFR Part 230 Section 404(b)(1) Guidelines for Specification of Disposal Sites for Dredged or Fill Material (hereafter identified as 404(b)(1) guidelines), which require the analysis of practicable alternatives to the proposed discharge. The 404(b)(1) guidelines specify that:

> *Except as provided under Section 404(b)(2), no discharge of dredged or fill material shall be permitted if there is a practicable alternative to the proposed discharge which would have less adverse impact on the aquatic ecosystem, so long as the alternative does not have other significant adverse environmental consequences. (40 CFR 230.10(a)).*

The 404(b)(1) guidelines define a practicable alternative as one that is "available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes" (40 CFR 230.10(a)(2)).

For actions subject to NEPA, where the U.S. Army Corps of Engineers (USACE) is the permitting agency, the analysis of alternatives required for NEPA environmental documents would in most cases provide the information for the evaluation of alternatives under the 404(b)(1) guidelines. The alternatives development process for the Pebble Project considers a broad range of alternatives in sufficient detail to address both NEPA and CWA Section 404(b)(1) requirements.

1.2 OVERVIEW OF THE ALTERNATIVES DEVELOPMENT PROCESS

Scoping yielded a wide variety of comments that provide input to the alternatives development process. The EIS team used a structured alternatives development process to recognize the project's large geographic footprint, the various project components, and the substantive input in scoping by the public, stakeholders, and agencies.

[1] Council on Environmental Quality, Executive Office of the President, Memorandum to Agencies: Forty Most Asked Questions Concerning CEQ's National Environmental Policy Act Regulations. 46 Fed. Reg. 18026 (March 23, 1981) As Amended (1986).

AMERICAN OVERSIGHT

To fully consider the wide range of issues identified in the scoping comments, this alternatives development process used the concept of "options," which consist of variations of components of the proposed project. For example, an option for transporting concentrate from the mine site could be a slurry pipeline instead of using trucks. Individual pipeline route variations would also be considered as options.

The four steps followed for alternatives development are summarized below.

Step 1: Developed the criteria for screening options to the proposed action. To narrow the range of options considered in detail in the EIS, criteria were organized around four screening tests. Each option must: 1) meet the purpose and need; 2) be reasonable; 3) be practicable in light of the overall project purpose; and 4) not increase adverse environmental impacts. The screening criteria are more fully described in Section 1.4, below.

Step 2: Identified options to address scoping concerns, compiled options that were suggested during the scoping process, and identified options that were previously evaluated by Pebble Limited Partnership (PLP) when developing the proposed project design. These options represented the initial range of alternatives and are identified in Table B-1, and organized by project component.

Step 3: Applied screening criteria from Step 1 to the options developed in Step 2. The criteria were used to determine reasonable options for detailed analysis in the EIS. Results of this screening are included in Table B-1, including rationale for the options dismissed from further analysis.

Step 4: Packaged options that met all of the screening criteria into viable action alternatives for detailed analysis in the EIS (i.e., an action alternative is a complete functioning project that includes power, a port, transportation, and mine site facilities).

1.3 SCREENING CRITERIA FOR THE FULL RANGE OF ALTERNATIVES

The EIS team screened options around four criteria, described below. The criteria screening steps were followed sequentially. If an option clearly did not meet one of the test-screening criteria, it was dismissed from further consideration, and did not proceed to the subsequent screening tests.

The objective of these criteria was to guide the screening process, but not to mechanically generate outcomes that substitute for professional judgment. By nature, these criteria were not fine filters. It was not the purpose of the option screening process to judge between trade-offs or make close calls, which would instead be addressed in the analyses within the EIS.

1.3.1 Screening – Purpose and Need

The project purpose and need is a key element of alternatives development. The purpose and need statements for the project are provided in Chapter 1 of the EIS.

The overall project purpose, determined solely by USACE, is used for evaluating practicable alternatives under the 404(b)(1) guidelines, and was therefore used as the first screening test. The overall project purpose must be specific enough to define the applicant's needs, but not so restrictive as to preclude discussion of a range of alternatives. USACE has determined that the overall project purpose is to develop and operate a copper-gold-molybdenum mine in Alaska in order to meet current and future demand for commodities, including copper, gold, and molybdenum.

AMERICAN OVERSIGHT

Options that did not meet the USACE's determination of overall project purpose were dismissed from consideration as an action alternative option for evaluation in the EIS, and did not proceed to the subsequent screening test.

1.3.2 Screening – Reasonable Options

Screening criteria for reasonable options drew on the NEPA regulatory intent of reasonable alternatives, which includes those that are practical or feasible, using common sense. Options that would not pass this test of reason include:

- Those that are not practical because they would not provide a reasonable return on investment.
- Those that could not feasibly attain most of the basic objectives of the project.
- Those suggested during scoping that are not specific or are substantially similar to other options being considered.
- Those suggested during scoping that were based on a misunderstanding of the proposed project, regulations, or conclusions of other reports or studies.

This screening test for reasonable options is limited to the general factors listed above. Screening for technical, economic, and logistic considerations is included in the subsequent screening test for practicable options.

Options that were assessed as not reasonable were dismissed from consideration as an action alternative option for evaluation in the EIS, and did not proceed to the subsequent screening test.

1.3.3 Screening – Practicable Options

Only options that are determined to be practicable based on the 404(b)(1) guidelines can be considered by USACE during the permit decision process. Therefore, options that progressed through the screening criteria above were evaluated for practicability.

In terms of practicability, the 404(b)(1) guidelines provide a two-fold definition of a practicable alternative (40 CFR 230.10(a)(2)):

1. A practicable alternative is one that is available and capable of being done after taking into consideration cost, existing technology, and logistics.
2. The three practicability criteria (cost, existing technology, and logistics) apply in light of the overall project purpose.

Cost or economic practicability considers the relative cost effectiveness of technologically feasible and operationally efficient component options. If project costs of implementing an option exceed reasonable or practical limits, the option could be considered not practicable. In the screening stage, rough order-of-magnitude cost comparisons were made, because detailed engineering and costs could not reasonably be developed for each option. Where the order-of-magnitude cost review is not sufficient to decide whether an option is economically practicable, it would be advanced for additional review, and additional information would be gathered before reaching a screening conclusion.

The practicability considerations of existing technology and logistics are evaluated to minimize the risk of an option causing a component to be unable to perform its intended function efficiently. Options that make project components too complex or use unproven technology increase the risk of operational failure and accidents. Options identified for a specific project component may be subject to technical constraints that affect the workability of the option. For

AMERICAN OVERSIGHT

example, topography, resource needs, spatial relationships of one component to another, temporal sequences, operating considerations, or engineering data for a specific option may influence whether a particular option is capable of meeting the project objectives. The existing technology and logistics criteria consider the ability of each option in meeting these challenges.

Options that were assessed as clearly not practicable in terms of cost, existing technology, and logistics in light of the overall project purpose were dismissed from consideration as an action alternative option for evaluation in the EIS, and did not proceed to the subsequent screening test.

1.3.4 Screening – Environmental Impacts

The 404(b)(1) guidelines require an evaluation of both practicability and environmental effects to determine whether there are practicable alternatives to the proposed project that would have less adverse impacts on the aquatic ecosystem, so long as the alternative does not have other significant environmental consequences (40 CFR 230.10(a)). Therefore, options that progressed through the screening criteria above were evaluated and compared for their relative extent and nature of impacts on the physical, biological, and socioeconomic environments.

Based on this assessment, options that have a high potential to increase the overall adverse environmental impacts or that add no environmental benefit compared to the Proposed Action were dismissed from further consideration as an action alternative option for evaluation in the EIS. Options that have potentially greater adverse impacts to one or more resources, but potentially fewer adverse impacts to other resources (i.e., trade-off of adverse impacts but may not be an overall increase), and options that clearly provide avoidance or minimization advantages (i.e., an environmental benefit) progressed as viable options to be evaluated as components of action alternatives in the EIS. Additionally, should two feasible options be generated to avoid or minimize an impact, but one of those options was determined to have potentially greater adverse impact on the environment—the option with greater impacts may be recommended for elimination from further study.

1.4 ALTERNATIVES DEVELOPMENT RESULTS

The USACE and cooperating agencies reviewed the outputs of each step in the alternative development process. The end result was to identify a reasonable range of action alternatives for full analysis in the EIS. PLP's proposed project is the proposed action for analysis in this EIS. Table B-1 provides details on the options considered, the screening results, and the status of each option (i.e., proposed action, alternative, or dismissed). The components and subcomponents of PLP's proposed action are included in Table B-1 for comparative purposes. Figure B-1 depicts the access and pipeline alignments considered. Figure B-2 illustrates the mine layout option considered.

The options that met screening criteria and marked as alternatives in Table B-1 were packaged into action alternatives (i.e., an alternative must be a functioning project and include power, a port, transportation, and mine facilities). As a result of this alternatives development process, two action alternatives were identified for detailed analysis in the EIS. The action alternatives vary from the proposed action in key engineering design, siting, and operational features. These alternatives address concerns raised in scoping and provide a reasonable range of alternatives for comparison. Action alternatives are described in Chapter 2 of the EIS.

NEPA regulations also require that a No Action alternative be analyzed. In this case, the No Action alternative would assume that the mine, transportation facilities, port, and pipeline would neither be permitted nor constructed as currently proposed.

Table B-1: Preliminary List of Project Options Being Considered

Mine Location and Layout Options			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
Location – Pebble Project / Deposit	LOC-001	***Origination*** – Pebble Limited Partnership (PLP) Proposed Action ***Description*** – The proposed project involves development of a copper-gold-molybdenum porphyry deposit (Pebble Deposit) located on state land in the Bristol Bay region of southwest Alaska.	☑ Proposed ☐ Alternative ☐ Dismissed
Location – Whistler Project	LOC-002	***Origination*** – Evaluation of alternative mine location options for mining copper, gold, and molybdenum was suggested during scoping. Based on the project Purpose and Need Statement "to develop and operate a copper-gold-molybdenum mine in Alaska in order to meet current and future demand for commodities, including copper, gold, and molybdenum," potential copper-gold-molybdenum porphyry and massive sulfide deposits in Alaska that are in exploration or advanced exploration were assessed. ***Description*** – The Whistler mineral property is a gold-copper porphyry deposit located in the Yentna mining district northwest of Anchorage. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: Whistler was classified as an exploration-phase project by Giroux (2016). Exploration to date at the Whistler property has characterized 122 million tons (versus 6.5 billion tons of measured and indicated for Pebble) of resources (gold, copper, and silver) as indicated—no resources have been characterized as measured. Gold resources are estimated at 1.77 million ounces (oz), copper at 343 million pounds (lb), and silver at 6.13 million oz. To date, over 230,000 feet of core have been drilled, and exploration expenditures exceed $50 million. By comparison, exploration to date at Pebble has characterized 6.5 billion tons of measured and indicated resources; measured and indicated gold estimates are 70.6 million oz, copper at 56.9 billion lb, silver at 345 million oz, and molybdenum at 3.4 billion lb. (note that there are no molybdenum resources identified in the Whistler deposits); and PLP	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Mine Location and Layout Options			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		expenditures to date on exploring and developing the Pebble Project are over $850 million. The Whistler property is not as advanced as the Pebble Project—no environmental, social, or community studies have been undertaken for the Whistler property; capital and operating costs have not been developed; and no economic analysis has been completed (Giroux 2016). Recommendations presented by Giroux (2016) are for additional exploration drilling throughout the Whistler deposits. The existence of the resources is too speculative (uncertain) and the scale of the potential resource is substantially smaller. Based on the exponential difference in resources and expenditures, it is concluded that this option is not reasonable because it is not economically feasible for PLP to acquire and develop the Whistler property. ***Why Dismissed*** – This option is not reasonable because it would not provide a reasonable return on investment.	
Location – Pyramid Project	LOC-003	***Origination*** – Evaluation of alternative mine location options for mining copper, gold, and molybdenum was suggested during scoping. See LOC-002 regarding Purpose and Need. ***Description*** – Pyramid is a copper-gold-molybdenum porphyry deposit located on the southwestern tip of the Alaska Peninsula southwest of Anchorage. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: Pyramid was classified as an early-stage exploration project by SRK (2018). Exploration to date at the Pyramid property has characterized only inferred resources of 24.5 million tons of copper, 74 million tons of molybdenum, and 488,000 ounces of gold. Through 2017, the amount of core drilling at Pyramid was 42,100 feet, compared with over 1 million feet of core	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Mine Location and Layout Options			
Option	**Option #**	**Option Details and Screening** ❖ **Option Details: Origination, Description** ❖ **Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test** ❖ **Why Dismissed (as applicable)**	**Status**
		drilling at Pebble. Therefore, it is concluded that this option is not reasonable because resources at Pyramid are inferred (speculative), but not measured/indicated; are exponentially less than those measured/indicated at the Pebble Project; and that based on the amount of money expended to date by PLP (over $850 million) to explore and develop the Pebble Project, it is not economically feasible for PLP to acquire and develop this property. ***Why Dismissed*** – This option is not reasonable because it would not provide a reasonable return on investment.	
Location – Outside of Alaska	LOC-004	***Origination*** – Evaluation of alternative mine location options for mining copper, gold, and molybdenum was suggested during scoping. ***Description*** –This option involves acquisition, development, and operation of a copper-molybdenum massive sulfide deposit located outside of Alaska. ***Screening*** – 1. Purpose and Need Test: Does not meet the U.S. Army Corps of Engineer's (USACE's) overall project purpose to develop and operate a copper-gold-molybdenum mine in Alaska. ***Why Dismissed*** – This option does not meet the purpose and need of the project.	☐ Proposed ☐ Alternative ☑ Dismissed
Location – within Alaska	LOC-005	***Origination*** – Evaluation of alternative mine location options for mining copper, gold, and molybdenum was suggested during scoping. ***Description*** –This option involves development and operation of a multi-metals massive sulfide deposit located in of Alaska. ***Screening*** – 1. Purpose and Need Test: Meets the Purpose and Need	**Status under review**

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Mine Location and Layout Options			
Option	**Option #**	**Option Details and Screening** ❖ **Option Details: Origination, Description** ❖ **Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test** ❖ **Why Dismissed (as applicable)**	**Status**
		3. Reasonable Test: Five massive sulfide deposits in Alaska (Arctic, Delta, Niblack, Palmer, and Sun) were evaluated. Indicated resources ranged from 26 million tons (Arctic) to no indicated resources (Delta and Palmer). By contrast, for the Pebble deposit, over 12 billion tons of measured (591 million tons), indicated (6.5 billion tons), and inferred (4.9 billion tons) resources are reported. Therefore, it is concluded that this option is not reasonable because resources at the five massive sulfide deposits are at best indicated at 26 million tons, but mostly inferred (speculative); and are exponentially less than those measured/indicated at the Pebble Project. Based on the amount of money expended to date by PLP (over $850 million) to explore and develop the Pebble Project, it is not economically feasible for PLP to acquire and develop these properties. ***Why Dismissed*** – This option is not reasonable because it would not provide a reasonable return on investment.	
Layout – Mine Layout Option 3	LAY-001	***Origination*** – PLP's May 11, 2018 update changed the proposed mine layout to Mine Layout Option 3, which would be the basis for PLP's application moving forward. ***Description*** – This option is part of the Proposed Action, which is based on a mining plan that sends all ore directly to the mill. It has two separate Tailings Storage Facilities (TSFs); a lined pyritic TSF with space to store potentially acid-generating (PAG) waste in the North Fork Koktuli River (NFK) East site; and an unlined bulk tailing TSF in the NFK West site. A lined water management pond (WMP) would be situated in the NFK North site. The bulk TSF would have a dry closure. The pyritic tailings and PAG waste would be relocated to the pit lake at closure, and the pyritic TSF and WMP would be reclaimed. This option facilitates post-closure placement of PAG waste and pyritic tailings in the pit lake, and enables a higher efficiency for the storage of bulk tailings. This option removes the need to store low-grade ore and manage associated runoff, and provides greater	☑ Proposed ☐ Alternative ☐ Dismissed

AMERICAN OVERSIGHT

Mine Location and Layout Options			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		water storage capacity for upset conditions. The WMP is downgradient of impacted areas, facilitating capture and storage of extreme runoff events. This option also allows for safe, passively managed long-term storage of the pyritic tails and PAG waste in the pit lake.	
Layout – Mine Layout Option 1	LAY-002	***Origination*** – This mine layout option was PLP's Proposed Action in the December 2017 Department of the Army (DA) permit application. PLP's May 11, 2018 update changed the proposed mine layout to Option 3 (LAY-001). ***Description*** – This option is based on a mining plan that requires stockpiling capacity for lower-grade ore (LGO) that is processed late in the mine life. A single TSF with separate cells for bulk and pyritic tailings would be constructed in the NFK West site, with an internal embankment between the cells. The pyritic TSF would be lined. The bulk TSF would not be lined. PAG waste and LGO would be stored in a lined facility in the NFK East site. The main WMP would be constructed north of the NFK East site. The bulk TSF would have a dry closure. The pyritic TSF would have a wet closure. The LGO/PAG waste storage facility would be reclaimed. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: This is a reasonable mine layout option. 3. Practicable Test: This layout was originally part of PLP's proposed action, and is assumed practicable in terms of cost, existing technology, and logistics. 4. Environmental Impacts Test: This option would have a smaller WMP which would reduce the total footprint and impacts to wetlands. However, this option requires maintenance of the pyritic TSF in a subaqueous state, and seepage collection into perpetuity. The exposed LGO and PAG waste rock would also be likely to become acidic when exposed to the atmosphere, resulting in acidic drainage and increased metals leaching. There is significant public concern that	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Mine Location and Layout Options			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		tailings could flow from a dam failure, and doubt that a TSF can be maintained in a subaqueous state into perpetuity. ***Why Dismissed*** – This option would increase overall adverse impacts. Although there would be a reduction in some impacts from the smaller WMP, the need to maintain the pyritic TSF and capture and treat seepage water into perpetuity makes this option more environmentally damaging than the proposed LAY-003. Additional water quality impacts would result from storing the LGO and PAG waste rock in open stockpiles. Although mitigation in the form of collecting and treating the water could be effective, preventing the LGO and PAG waste rock from becoming acidic is preferable.	
Layout – Mine Layout Option 2	LAY-003	***Origination*** – This mine layout option was evaluated by PLP when developing the proposed project design. ***Description*** – This option is based on a mining plan that would send all ore directly to the mill. The TSF would be constructed in the NFK West site, and consist of a single cell with an internal area to store the pyritic tailings so that they remain subaqueous. A lined WMP with space to store PAG waste would be constructed in the NFK East site. The tailings would have wet closure, and the WMP would be reclaimed. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: This is a reasonable mine layout option. 3. Practicable Test: This option is practicable. It requires less fill material, because there is no internal embankment, and it requires that all tailings be maintained in a subaqueous state in perpetuity. There are no proven methods of segregating two tailings streams in one cell that would permanently keep the pyritic tailings separate from the bulk tailings during operations, while the TSF progressively increases in size, to prevent the co-mingling of the two supernatant waters, and prevent contact of the two entrained waters concurrently with maintaining the	☐ Proposed ☐ Alternative ☑ Dismissed

Option	**Option #**	**Option Details and Screening** ❖ **Option Details: Origination, Description** ❖ **Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test** ❖ **Why Dismissed (as applicable)**	**Status**
		flow-through seepage concept of the bulk TSF. 4. Environmental Impact Test: Seepage water quality for the main embankment would be impacted by the pyritic tails. Re-handling of the pyritic tails for storage in the pit lake would be precluded, and they would need to be maintained in a subaqueous state into perpetuity. The dam would need to be inspected and maintained into perpetuity to prevent dam failure and tailing flows. Removes need to store LGO and manage associated runoff. Provides greater water storage capacity for upset conditions. ***Why Dismissed*** – This option would increase overall adverse impacts from reduced seepage water quality and the requirement to maintain the TSF into perpetuity.	
Mine Size – EPA Restricted Mine Size	LAY-004	***Origination*** – An alternative suggested during scoping was to restrict the size of the mine to what the U.S. Environmental Protection Agency (EPA) found appropriate in the 2014 Watershed Assessment. ***Description*** – This option would restrict the size of the mine to what the EPA found appropriate in the 2014 Watershed Assessment. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: This option is not reasonable because EPA did not make a determination in the Watershed Assessment that any of the three mine scenarios they considered would be "appropriate." ***Why Dismissed*** – This is option is not reasonable. See LAY-005, which considers the smallest mine size scenario EPA considered. LAY-004 is dismissed because the suggestion is based on a misunderstanding of the EPA Watershed Assessment, and is likely the same—or very similar to—LAY-005.	☐ Proposed ☐ Alternative ☑ Dismissed

Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
Mine Size – Smaller Mine Pit Size	LAY-005	***Origination*** – Consideration of a smaller pit mine size was evaluated by USACE as a potential means to reduce project footprint, as well as surface, water, and other environmental impacts. ***Description*** –This option examines the Pebble 0.25 mine scenario, the smallest mine size considered by the EPA in the 2014 Watershed Assessment. Under this option, 0.23 billion metric tons of ore would be mined, with a throughput of 31,100 metric tons per day (tpd). ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: This option is not reasonable because it would not allow a profitable project, considering the investment in infrastructure that would be required. See TPD-002 for evaluation of the 50,000 tpd option. An optimization study showed that option TPD-002 would not have a positive net present value, due to the fixed infrastructure component of the costs. ***Why Dismissed*** – This option is not reasonable because it would not provide a reasonable return on investment. See also TPD-002.	☐ Proposed ☐ Alternative ☑ Dismissed
Mine Size – Larger Mine to Develop More of the Known Deposit	LAY-006	***Origination*** – Evaluation of options to maximize the potential economic benefits of developing the deposit, such as a larger and longer-lived mine, was suggested during scoping. ***Description*** –This option would increase the Mine Site and duration of operations to develop more of the known and inferred resource of the overall deposit. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: The proposed project would only develop 10 percent of the measured, indicated, and inferred resource. It is reasonable to consider if	☐ Proposed ☐ Alternative ☑ Dismissed

Material Handling – Truck and Shovel	MNG-004	***Origination*** – PLP Proposed Action ***Description*** – This option is part of the Proposed Action, which involves use of large shovels to load ore into haul trucks. The trucks would transport the ore from the pit to the crusher.	☑ Proposed ☐ Alternative ☐ Dismissed
Material Handling – In-Pit Crushing and Conveying	MNG-005	***Origination*** – In-pit crushing and conveying was evaluated by PLP when developing the proposed project design. PLP completed an engineering evaluation of in-pit crushing and conveying in response to RFI 032, which requested feasibility information for several project options. ***Description*** – This option would use in-pit crushing and conveying methods for material handling that would begin several years into the start of operations, and operate through the end of the mine life. This option would require the excavation of a dedicated crusher pocket and ramp to transport ore via a conveyor to the processing facility. The additional excavation associated with the crusher pocket and ramp would generate additional PAG waste, which would exceed the space available for PAG waste storage in the pyritic TSF, and require the development of a separate PAG waste storage facility. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: This is a reasonable material handling option. 3. Practicable Test: In-pit crushing is a practicable material handling option, but it is more commonly implemented at some point later in mine life, as the open pit is developed, and the installed crushing and conveying system can remain stationary for an extended period. 4. Environmental Impacts: This option would provide only a limited net reduction in trucking, and therefore diesel consumption and emissions; but would increase the overall impacted footprint and wetland impacts because of the crusher pocket and	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Mining			
Option	**Option #**	**Option Details and Screening** ❖ **Option Details: Origination, Description** ❖ **Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test** ❖ **Why Dismissed (as applicable)**	**Status**
		ramp infrastructure and the need to create a separate PAG waste storage facility. ***Why Dismissed*** – This option would increase overall adverse impacts, with only a limited net saving in terms of diesel fuel usage and net emissions.	
Truck Fuel – Diesel	MNG-006	***Origination*** – PLP Proposed Action ***Description*** – This option is part of the Proposed Action, in which large-haul trucks are equipped with diesel engines and would use most of the anticipated diesel supplies. This option requires the shipment of diesel to the Mine Site.	☑ Proposed ☐ Alternative ☐ Dismissed
Truck Fuel – Liquefied Natural Gas	MNG-007	***Origination*** – Liquefied natural gas (LNG) for truck fuel was evaluated by PLP when developing the proposed project design. Use of alternative truck fuel was also suggested during scoping. ***Description*** –Under this option, LNG would be produced using an on-site plant consisting of modules that could be trucked, and LNG storage tanks manufactured off site. An engineered footprint for the facility has not been developed, but it would have a footprint of approximately 1 acre, based on similar facilities reviewed. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: Using LNG haul trucks is reasonable, because equipment manufacturers such as Caterpillar have been actively working to develop commercially available LNG-powered haul trucks. 3. Practicable Test: On-site production of LNG would be feasible because there would be a natural gas pipeline to the Mine Site and LNG plants of the size required are readily available and transportable. However, LNG-powered haul trucks are not commercially available for the mining industry, and are not proven to be viable on a production basis. There are currently no trucks available in the required size range.	☐ Proposed ☐ Alternative ☑ Dismissed

Processing			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
Facility Location/ Process Type – On-site Concentrate Production	PRO-001	***Origination*** – PLP Proposed Action ***Description*** – This option is part of the Proposed Action, in which the initial processing of ore would be conducted on site to produce a concentrate that would be transported off site for smelting. PLP estimates the annual production to be approximately 660,000 tons of copper-gold concentrate, and 16,500 tons of molybdenum concentrate.	☑ Proposed ☐ Alternative ☐ Dismissed
Facility Location– Off-site Ore Processing	PRO-002	***Origination*** – Off-site ore processing was evaluated by PLP as an option when developing the proposed project design. Evaluation of alternative locations for ore processing was also suggested during scoping. ***Description*** – Off-site ore processing would involve transporting all ore away from the project area for processing. This would involve transportation of 180,000 tons of ore from the mine site to the mill site daily. This would require approximately 100 times the proposed truck, ferry, lightering barge, and ship traffic. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: It is reasonable to consider off-site transport if it would reduce the size and impact of mine site facilities such as the TSFs. 3. Practicable Test: Off-site processing presents a series of challenges in terms of cost and logistics, which likely make this option not practicable. Associated issues are as follows: • Introduces inefficiencies, because it requires the use of large amounts of energy and equipment to transport the non-mineralized portion of the ore. • Requires transportation of more than 100 tons of unprocessed rock every minute, which would require almost continuous truck traffic, 24 hours per day, every day of the year. • The increased amount of infrastructure required off site and for transportation	☐ Proposed ☐ Alternative ☑ Dismissed

Processing			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		purposes would broaden the project footprint. • Off-site processing would result in increased project costs. 4. Environmental Impact Test: There would be increased traffic and potentially additional infrastructure required to transport the rock, resulting in elevated air emissions, diesel consumption, visual impacts, noise levels, dust, wildlife impacts, and wetland impacts. Increases risk of accidents and spills caused by adverse road conditions, inclement weather, landslides, debris blockages, etc., that would require emergency vehicles, and could further impact the environment and temporarily block the transport corridor. ***Why Dismissed*** – This option would increase overall adverse impacts, and would likely not be practicable in terms of costs and logistics.	
Facility Location /Process Type – On-site Ore Processing (Metal Production)	PRO-003	***Origination*** – On-site metal processing was evaluated by PLP as an option when developing the proposed project design. ***Description*** – On-site ore processing would construct a smelter and produce metals on site (copper, gold, and molybdenum) instead of a concentrate product. On-site smelting would require additional land for the facility and disposal of smelting waste. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: It is reasonable to consider this option if it would reduce transportation impacts. 3. Practicable Test: On-site ore processing is likely feasible in terms of technology, but smelting at a large, existing, established ore-processing facility would be much less expensive. 4. Environmental Impacts Test. On-site smelting would reduce trucking and ship traffic, but increase Mine Site air emissions. Increased air emissions would result	☐ Proposed ☐ Alternative ☑ Dismissed

Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
180,000 tons per day	TPD-001	***Origination*** – PLP Proposed Action ***Description*** – This option is part of the Proposed Action, which includes mine throughput of 180,000 tpd over a 20-year mine life. It is a revision of the previously proposed 160,000-tpd throughput. A throughput of 180,000 tpd eliminates the need for a LGO/PAG storage facility, which would require 4 additional years of processing at the end of operations. This option reduces the mine footprint from the originally proposed 160,000-tpd throughput.	☑ Proposed ☐ Alternative ☐ Dismissed
50,000 tons per day	TPD-002	***Origination*** – This option was evaluated by PLP as an option when developing the proposed project design. ***Description*** – Mine throughput of 50,000 tpd, with a mine life of 71 years. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: An optimization study showed that this option does not provide a positive financial return. The small throughput of the 50,000-tpd project does not have a positive net present value, due to the fixed component of the costs. It is not reasonable to consider an option that would not provide a positive financial return. ***Why Dismissed*** – This option is not reasonable because it would not provide a reasonable return on investment .	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Throughput			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
160,000 tons per day	TPD-003	***Origination*** – This option was evaluated by PLP as an option when developing the proposed project design. ***Description*** – This throughput option of 160,000 tpd would require construction of a large, lined pad for storing PAG waste rock and LGO (PAG waste rock would be returned to the completed pit at closure and LGO would be processed during the later years of mine operations). This option was replaced by the 180,000-tpd throughput as the Proposed Action. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: It is reasonable to consider this option because it was originally proposed by PLP. 3. Practicable Test: This plant is appropriately sized to efficiently process the targeted 1.5 billion-ton ore resource using a standard processing plant design and equipment. An optimization study has demonstrated that this option produced a positive financial return. 4. Environmental Impacts Test: This throughput option is based on previous project designs to store the LGO and PAG waste rock for processing in the last 4 years of operation. This design would create additional mine facility footprint that would need to be restored at the time of closure. There would be no change in the footprint of other mine and transportation facilities compared to the 180,000-tpd option. The LGO stockpile would generate poor-quality runoff water and seepage (acid rock drainage [ARD] and metals leaching) that would need to be collected, managed, and treated. ***Why Dismissed*** – This option would increase overall adverse impacts.	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Throughput			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
320,000 tons per day	TPD-004	***Origination*** – This option was evaluated by PLP when developing the proposed project design. ***Description*** – Mine throughput of 320,000 tpd over an 11-year mine. It is assumed that this throughput option would result in the same mine pit and TSF footprint over a shorter period. Due to higher production levels, it would likely increase the size of the processing facilities; accelerate the tailings deposition rate and TSF embankments raise schedule; and increase the volume of concentrate transported over a shorter period of time. This in turn would increase the volume of truck and ferry traffic on the transportation system, and increase activities associated with the port facility, including the number of lightering and marine-ore transport vessels. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: It is reasonable to consider higher throughput rates. 3. Practicable Test: Construction and commissioning of a new plant this size would present significant execution, manpower, logistical, cost management, and other challenges that elevate project risk. It would require additional processing facilities. The significantly shorter mine life is not long enough to ensure that project operations can pass through several economic cycles and potential fluctuation in metals prices. However, it is likely practicable. 4. Environmental Impacts Test: This option would cut the life of mine operations nearly in half, reducing the time period of operational impacts. The footprint of mine pit and TSFs would remain the same, but would require addition footprint for processing facilities. This throughput level would nearly double the volume of ore processed over the Proposed Action, increasing the volume of ore concentrate truck traffic on the road and ferry systems. It would also increase the frequency of activities associated with marine transport, including lightering operations and marine-ore ship traffic.	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Gold Recovery			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
Gravity	GR-001	***Origination*** – PLP Proposed Action ***Description*** – The proposed option is to use gravity separation methods to recover gold.	☑ Proposed ☐ Alternative ☐ Dismissed
Secondary Gold Recovery	GR-002	***Origination*** – The use of a cyanide leach circuit for ore recovery was examined by PLP and recommended for consideration in scoping comments as a means to increase the efficiency of ore recovery. ***Description*** –This option involves construction of a cyanide leach circuit at the Mine Site to process the pyritic tails. A cyanide leach circuit could recover additional gold from the process. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: This is a reasonable option. 3. Practicable Test: Cyanide leaching is a common practice and would likely be technologically and economically feasible. 4. Environmental Impacts Test: Cyanide is toxic to aquatic organisms, wildlife, and humans. PLP has proposed to forgo a cyanide leach circuit and the additional gold recovery it would provide because of public concern for the use and transportation of cyanide. The leach facility would have a large footprint that would impact wetlands. ***Why Dismissed*** – This option would increase overall adverse impacts.	☐ Proposed ☐ Alternative ☑ Dismissed

Power			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
Power Source – Thermal (Burn Natural Gas)	POW-001	***Origination*** – PLP Proposed Action ***Description*** – This option is part of the Proposed Action, which involves power generation using natural gas as a fuel source. PLP is proposing to build a power plant at the Mine Site with a capacity of 270 megawatts (MW). The plant would be fueled with natural gas delivered from the Kenai Peninsula to the Mine Site.	☑ Proposed ☐ Alternative ☐ Dismissed
Power Source – Renewable Energy	POW-002	***Origination*** – Renewable energy power options were evaluated by PLP when developing the proposed project design. ***Description*** – Under this option, PLP would construct and power the mine using renewable energy resources such as wind turbines and run-of-river (ROR) hydropower. Also considered under this option is supplementing the natural gas power plant production with renewables. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: Using renewable energy is a reasonable option to consider. 3. Practicable Test: The two separate renewable options listed below were considered under this option. These options would supply power intermittently and in small quantities relative to the need, and would not eliminate the need for the proposed natural gas power plant and pipeline. These options would intermittently supply power that would decrease the demand on the proposed natural gas power plant, potentially resulting in decreased usage of natural gas. Both options would require additional access roads and ground disturbance to transmit power to the mine. • Wind – Wind energy generation is intermittent and must be paired with other energy sources or storage mechanisms to provide a stable, consistent supply. There are no identified wind energy resources in the vicinity capable of	☐ Proposed ☐ Alternative ☑ Dismissed

Power			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		providing a significant and consistent portion of the project energy. • ROR Hydropower – No suitable locations that could generate a significant amount of ROR hydropower could be identified. Additionally, in winter, rivers may freeze, making this power source intermittent, requiring additional energy sources. 4. Environmental Impacts Test: The construction of wind farms, ROR hydropower plants, and associated infrastructure would be additive to the proposed power plant and would increase the project footprint. The option likely would result in additional impacts to wetlands, wildlife, and aquatic resources, but potentially decrease emissions from burning natural gas. ***Why Dismissed*** – Although this option would potentially decrease the consumption of natural gas and associated emissions; it would not replace the need for the natural gas power plant and pipeline. The additional costs of building renewable energy systems for what would be supplemental power make the option not practicable. Also, the potential reduction in emissions does not appear to offset the likely additional impacts to wetlands, wildlife, and aquatic resources.	
Power Source – Purchase Power from Existing Grid	POW-003	***Origination*** – Purchasing power from the existing grid was evaluated by PLP when developing the proposed project design. ***Description*** – Under this option, power would be purchased from existing third-party providers and transmitted to the site via a High-Voltage Direct Current transmission. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: Purchasing power is a reasonable option to consider. 3. Practicable Test: There is no significant power-generating capacity in the Cook Inlet area in general, and on the Kenai Peninsula in particular, to service the	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Power			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		anticipated project demand. Construction of additional generation capacity would be required regardless of where it is situated. This option is not practicable. ***Why Dismissed*** – The option is not practicable; there is no excess capacity in the existing grid.	
Power Source – Use Alternative Fuel Sources/Delivery Methods	POW-004	***Origination*** – Evaluation of alternative fuel sources and delivery methods was suggested during scoping due to concern with gas line leaks or ruptures, and potential long-term consequences that a subsea pipeline can have on the environment. ***Description*** – The most likely alternative energy sources would be diesel fuel and LNG, both of which could be delivered to the proposed Amakdedori Port via barge. Transportation from the port to the Mine Site could be by truck or pipeline. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: Considering alternative energy sources is reasonable. 3. Practicable Test: Both diesel and LNG options are technologically feasible. The Donlin Gold Final EIS looked at a diesel power plant alternative and estimated that a similarly sized power plant (227 MW) would require approximately 80 million gallons of diesel per year. Use of diesel would require increased storage at the port, and a pipeline or 4,200 truck trips per year, each truck hauling three tank trailers. Diesel is readily available in Cook Inlet. Use of LNG would require a supply of LNG, a purpose-built LNG barge, and an LNG receiving terminal and storage tanks at Amakdedori. It would also require regasification at Amakdedori for transportation to the Mine Site by pipeline, or trucking LNG to a mine site storage tank where it would be regasified and fed to the power plant. The former ConocoPhillips LNG export facility in Nikiski has been sold and the	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Power			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		export permit was allowed to expire; and LNG is not currently barged in Alaska. 4. Environmental Impacts Test: Transporting an additional 80 million gallons of diesel increases the potential for spills. Emissions from the proposed power plant would be increased if diesel was used instead of natural gas. See also Section 4.21, which explains there would be few expected effects from natural gas pipeline leaks to soil or water bodies because the gas would dissipate rapidly. Use of LNG would avoid the need for the natural gas pipeline segment under Cook Inlet between the Kenai Peninsula and Amakdedori. ***Why Dismissed*** – Diesel would increase environmental impacts from spills and increased emissions. LNG is not practicable; it is not currently barged in Alaska, would require costly infrastructure; and provides no obvious benefit over the proposed natural gas pipeline, other than avoiding the segment between the Kenai Peninsula and Amakdedori. The EIS would assess the risk to the pipeline from seismic events.	
Power Plant Location – On-site	POW-005	***Origination*** – PLP Proposed Action ***Description*** – This option is part of the Proposed Action, which includes construction of a new 270-MW power plant at the Mine Site to power the mine. This option would not require the construction of high-voltage transmission lines to the Mine Site.	☑ Proposed ☐ Alternative ☐ Dismissed
Power Plant Location – Off-site with High Voltage Transmission Lines	POW-006	***Origination*** – Off-site location of the power plant was evaluated by PLP when developing the proposed project design. ***Description*** –This option would require a new power plant to be built at an alternative location such as the Kenai Peninsula or Amakdedori. High-voltage transmission lines would be constructed and used to transmit the power to the Mine Site. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: It is reasonable to consider off-site generation combined with high-voltage and transmission lines.	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Power			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		3. Practicable Test: Off-site power production is technologically feasible. If power generation was located on the Kenai Peninsula, it would require high-voltage transmission lines via underwater cables crossing both Cook Inlet and Iliamna Lake; and overhead lines on the Kenai Peninsula, from Amakdedori to a south ferry terminal, and the North Shore Ferry Terminal to the Mine Site. Underwater cables would be more costly to install and maintain than a natural gas pipeline. Overhead lines would be subject to wind and ice buildup, resulting in potential reliability risks. Undergrounding the overland portions of the transmission lines would be cost-prohibitive, because undergrounding generally costs an–order-of magnitude greater than overhead lines, and would be more costly than the gas line. In addition, transmission losses occur over long distances, making this less efficient than a gas line to provide on-site generation. If power generation was located proximate to Amakdedori, similar issues would remain, but would be lessened, given the reduced distance. However, the gas line under Cook Inlet would still be required. In addition, off-site generation would not offer sufficient redundancy in the event of a disruption to the transmission line and associated power supply. This option is likely not practicable due to cost. 4. Environmental Impacts Test: Construction and operation of high-voltage transmission lines would result in greater visual impacts than a gas line. ***Why Dismissed*** – Off-site power production, although practicable considering technology, would be much more costly and does not provide the stability and reliability benefits that would come from on-site power production. In addition, overhead transmission lines, and possibly the power plant (depending on location) would result in increased visual impacts.	

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Power			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
Gas Source – Pipeline to a Source on the Kenai Peninsula	POW-007	***Origination*** – PLP Proposed Action ***Description*** – This option is part of the Proposed Action. Under this option, the proposed pipeline (about 177 miles in length) would tie in to the existing natural gas distribution system on the Kenai Peninsula and be routed to Amakdedori, and then follow the Transportation Corridor to the Mine Site. The pipeline would be on the bottom of Cook Inlet and Iliamna Lake, and would be 12 inches in diameter.	☑ Proposed ☐ Alternative ☐ Dismissed
Gas Source – Pipeline to a Source on the West Side of Cook Inlet	POW-008	***Origination*** – This option was evaluated by PLP when developing the proposed project design. ***Description*** – This option would follow an alternative route to the north to access existing natural gas supplies such as Beluga on the western side of Cook Inlet. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: It is reasonable to consider a route that avoids crossing deep water in Cook Inlet. 3. Practicable Test: There is no accessible gas infrastructure, pipeline capacity, or available tie-in locations on the southwestern side of the Cook Inlet. A potential tie-in location on the western side would be at Beluga, approximately 170 miles to the north (requiring an approximately 250+ mile pipeline to accommodate terrain). 4. Environmental Impacts Test: Accessing existing gas supplies for this option would require crossing Lake Clark National Park; or if a subsea route, would increase the length of the pipeline route in critical habitat for the endangered Cook Inlet beluga whale and the threatened northern sea otter (compared to the proposed route). ***Why Dismissed*** – This option would increase overall adverse impacts.	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Power			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
Gas Source – Connect to Donlin Gold Gas Pipeline	POW-009	***Origination*** – Evaluation of an alternative pipeline route to connect with the natural gas pipeline for the proposed Donlin Gold Mine was suggested during scoping. ***Description*** –Under this option, the pipeline would follow an alternative route to the north, allowing it to connect to the proposed Donlin Gold natural gas supply pipeline. A tie-in route to the nearest point along the proposed Donlin Pipeline would be longer than 155 miles, and would cross at least 8 to 10 substantial rivers. Routing could avoid major mountain ranges. The proposed Donlin Gold Mine natural gas pipeline has not yet been constructed; timing for development and operation is not known. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: It is reasonable to consider connection to the proposed pipeline given that Donlin Gold recently received federal permits for construction of the pipeline. 3. Practicable Test: The Donlin Gold Pipeline is planned to be 14 inches in diameter, serving a 230-MW power plant, based on an operating flow rate of 47 million standard cubic feet per day (mmscfd), with a design capacity of up to 73.1 mmscfd. The Pebble Project proposes a 270-MW power plant, which could more than double the necessary capacity of the pipeline, which would not be practicable given its design. ***Why Dismissed*** – The Donlin Gold Pipeline, as planned, is unlikely to provide sufficient natural gas capacity to support the Pebble Project and is therefore not practicable.	☐ Proposed ☐ Alternative ☑ Dismissed
Gas Source – Northern Gas Pipeline Route to Kenai Peninsula	POW-010	***Origination*** – Evaluation of a pipeline alignment north of Augustine Island was suggested during scoping due to concern that placing the pipeline near Augustine Island/Volcano would make it vulnerable to seismic and volcanic hazards. ***Description*** –Increasing the distance from Augustine Island by routing to the north is impracticable for the Amakdedori Port, but routing the pipeline to Diamond Point to the	☐ Proposed ☑ Alternative ☐ Dismissed

Power			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
(Ursus Cove)		north would achieve the purpose of the suggested option. Access option ACC-014 considers a port at Diamond Point in Iliamna Bay; routing the pipeline to this port would achieve the goal of increasing separation from Augustine Island. The pipeline for access option ACC-014 would be routed into Ursus Cove, run overland to Cottonwood Bay, and then continue to Diamond Port. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: This is a reasonable option for the North Access Route (ACC-002). 3. Practicable Test: Practicability – The route to Ursus Cove is relatively free of seabed obstructions and rock-like features all the way into the cove, compared to a route through Iliamna Bay to a proposed Diamond Point port. Rocks, boulders, and boulder-type features in Ursus Cove only appear much closer to the shore, which makes routing and installation safer and easier, and also allows for moored installation. A route to Amakdedori north of Augustine Island would place the pipeline approximately the same distance or closer to Augustine Island/Volcano than the proposed route, and therefore is not a practicable route to achieve the goal of this option. Access Options ACC-014 and ACC-015 evaluate port sites in Iliamna Bay, more than 20 miles north of Augustine Island. It is feasible to route the natural gas pipeline to that location. 4. Environmental Impacts Test: A route to Ursus Cove and then to Diamond Point would have additional impacts from the overland portion, but would have a shorter segment in Cook Inlet. The option represents tradeoffs and is carried forward for detailed analysis.	
Gas Source –	POW-011	***Origination*** – This option was evaluated by PLP as a conceptual route directly into	☐ Proposed

Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
Northern Gas Pipeline Route to Kenai Peninsula (Direct Route to Iliamna Bay)		Iliamna Bay and Diamond Point. ***Description*** – Under this option, the pipeline route would follow a more direct route to Iliamna Bay and Diamond Point than POW-010. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: It is reasonable to consider a more direct, shorter pipeline. 3. Practicable Test: A 12-inch-diameter subsea pipeline has a specific minimum curvature radius, and therefore a limited ability to navigate areas of the seafloor with dense obstructions. A direct pipeline route into Iliamna Bay is not practicable because of boulders and rocky seabed near to and into the bay that could not be avoided with this option. RFI 063 summarizes PLP's reconnaissance data for a direct route, which indicated the presence of—and progressive increase in—rocks, boulders, and rock-like features on the seabed. The concentration of rocks and boulders reaches its maximum density at the mouth of Iliamna Bay, and continues into the bay. The rock-prone area starts approximately 13 miles from the landing point, and is consistent to the landing point. It is interpreted that the rocks and boulders are likely from a combination of glacial outwash and ice-rafted deposits. ***Why Dismissed*** – This option is not practicable due to boulders and other seabed issues.	☐ Alternative ☑ Dismissed
Gas Source – Other	POW-012	***Origination*** – Evaluation of practicable alternatives for reducing the amount of natural gas pipeline that is installed in the Sterling Highway right-of-way, which is managed by the Alaska Department of Transportation and Public Facilities, was suggested during scoping. ***Description –*** The commenter requested evaluation of alternative pipeline routes, but did not suggest specific locations.	☐ Proposed ☐ Alternative ☑ Dismissed

Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		Screening **–** 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: PLP's Proposed Action in the December 2017 DA permit application included a gas pipeline alignment that would connect to existing infrastructure near Happy Valley on the Kenai Peninsula and travel south, paralleling the Sterling Highway for 9 miles to a compressor station near Anchor Point. PLP's May 11, 2018 update changed the pipeline origin point to a compressor station north of Anchor Point, removing the requirement for the first 9 miles of pipeline construction along the Sterling Highway. Therefore, this option is no longer reasonable, because it pertains to an old project design. ***Why Dismissed*** **–** This option is not reasonable because it is based on an old design.

Option	**Option #**	**Option Details and Screening** ❖ **Option Details: Origination, Description** ❖ **Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test** ❖ **Why Dismissed (as applicable)**	**Status**
Access Road – South Access Route (Road and Ferry)	ACC-001	***Origination*** – PLP Proposed Action ***Description*** – This road and ferry route option is part of the Proposed Action, which includes the construction of two double-lane roads as the main access route to the mine for the transportation of materials, equipment, and concentrate. Road route: The mine access road would go from the Mine Site to the North Shore Ferry Terminal Site (ACC-006) on the northern shore of Iliamna Lake. As a variant of the proposed action, an alternative ferry terminal site location would be considered just to the east of the proposed ferry terminal site in the bay: the North Shore East Ferry Terminal Site (ACC-006a). On the southern shore of Iliamna Lake, the port access road would go from the Kokhanok West Ferry Terminal Site (ACC-010) to the Amakdedori Port Site (ACC-013). As a variant of the Proposed Action, the port access road would go from the Kokhanok East Ferry Terminal Site (ACC-011) to the Amakdedori Port Site (ACC-013). This option would also include an Iliamna spur road (which would include a crossing of the Newhalen River) and a Kokhanok spur road (which would include a crossing of the Gibraltar River if the Kokhanok West Ferry Terminal Site is included). Ferry route: The route would include a ferry crossing of Iliamna Lake from north to south. Natural Gas Pipeline route: The natural gas pipeline would follow the mine and port access roads and ferry route. This option would require the following: Total miles of road: 77 (Kokhanok West Ferry Terminal); 72 (Kokhanok East Ferry Terminal) Miles of road from Mine Site to the North Shore Ferry Terminal Site: 29 Total number of stream crossings: 39 (Kokhanok West Ferry Terminal site to Amakdedori Port site); 30 (with variant Kokhanok East Ferry Terminal site to Amakdedori Port site)	☑ Proposed ☐ Alternative ☐ Dismissed

Option	**Option #**	**Option Details and Screening** ❖ **Option Details: Origination, Description** ❖ **Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test** ❖ **Why Dismissed (as applicable)**	**Status**
		Total number of major river crossings: 2 (Kokhanok West Ferry Terminal site to Amakdedori Port site); 1 (with variant Kokhanok East Ferry Terminal site to Amakdedori Port site).	
Access Road – North Access Route (Road Only)	ACC-002	***Origination*** – Evaluation of an access road option north of Iliamna Lake to eliminate the need for a lake crossing was suggested during scoping. ***Description*** – This road-only route option was evaluated by PLP when developing the proposed design as an option that would not require a ferry to cross Iliamna Lake. Road route: The mine/port access road would stay north of Iliamna Lake, connect with the existing Pile-Bay Williamsport Road in the vicinity of Pile Bay, and then continue to the Diamond Point/Iliamna Bay Port Site (ACC-014) on Cook Inlet. The road would bypass all but 5 miles of the existing Pile Bay-Williamsport Road. The road would traverse approximately 1.7 miles of tidal flats between Williamsport and Diamond point. This option would eliminate the need for a spur road to Iliamna, because the route would cross an existing road that connects Iliamna with Nondalton, providing access to infrastructure at Iliamna. Ferry route: The route would not include use of a ferry. Natural Gas Pipeline route: The western portion of the natural gas pipeline would follow the road route. The eastern portion of the pipeline would follow a route overland between Cottonwood Bay and Ursus Cove. Concentrate Pipeline: A concentrate transport pipeline may be included with this option. This option would require the following: Total miles of road: 82 Number of stream crossings: 71 Number of major river crossings: 4	☐ Proposed ☑ Alternative ☐ Dismissed

Table B-1: Preliminary List of Project Options Being Considered

Access			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		Screening **–** 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: This is a route that PLP has evaluated and studied extensively and is a reasonable route. 3. Practicable Test: A road-only route provides the advantages of reliable year-round access, and minimizes the need to re-handle cargo/concentrates. The option may also allow the inclusion of a concentrate pipeline for the project. There is no need to build the associated infrastructure for a ferry. This option would provide access to Cook Inlet, which is generally accessible year-round. This option would require a large number of stream crossings. This option also crosses many wetlands. The route is also more mountainous than other access routes, traversing side slopes and crossing perpendicular to drainages, including crossings of larger streams and minor rivers. Five miles of the existing Pile Bay-Williamsport Road require improvements to accommodate large trucks. The Diamond Point/Iliamna Bay Port Site (ACC-014) and access road would be subject to tidal flat filling. The port would require some dredging to 20 feet of Mean Lower Low Water (MLLW) (RFI 063), and may require blasting for access roads. This location could not accommodate deep draft vessels, and would require lightering barges to transfer ore concentrate to deep-draft bulk ships anchored at mooring locations. 4. Environmental Impacts Test: This route would cross fewer wetland acres than a southern route (ACC-001), but more than a road and ferry northern route (ACC-003), resulting in a difference in acres of fill. The Iliamna Spur Road would be eliminated, reducing impacts along these road miles. The road portion from Pile Bay to Williamsport would require more maintenance compared to a southern

Access			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		route (ACC-001), given the steep terrain. This route would require more stream crossings than a southern route (ACC-001) or a road and ferry northern route (ACC-003). There would be less subsistence concerns and no lake navigation or transportation concerns compared to a road and ferry route (ACC-001 or ACC-003). The route would place mine traffic near Pedro Bay. The option represents tradeoffs, and is carried forward for detailed analysis. If a concentrate pipeline was also included, the footprint would be slightly larger, but there would be a decrease in truck traffic.	
Access Road – North Access (Road and Ferry)	ACC-003	***Origination*** – This road and ferry route option is a route evaluated by PLP while looking at routes that remain entirely north of Iliamna Lake. Use of the existing road and resources at Pile Bay and Williamsport was suggested during scoping. ***Description*** – Road route: The mine access road would stay north of Iliamna Lake from the Mine Site to the Eagle Bay Ferry Terminal Site (ACC-008) on the northern shore of Iliamna Lake. On the eastern shore of Iliamna Lake, the port access road would go from the Pile Bay Ferry Terminal Site (ACC-009) to the Diamond Point/Iliamna Bay Port site, using parts of the existing Pile-Bay Williamsport Road, continuing to the Diamond Point/Iliamna Bay Port Site (ACC-014) on Cook Inlet. This road would bypass all but 5 miles of the existing Pile Bay-Williamsport Road. The road would traverse approximately 1.7 miles of tidal flats between Williamsport and Diamond Point. This option would eliminate the need for a spur road to Iliamna, because the route would cross an existing road that connects Iliamna with Nondalton, providing access to infrastructure at Iliamna. Ferry route: The route would include a ferry crossing of Iliamna Lake from west to east. Natural Gas Pipeline route: The natural gas pipeline would follow the road alignment for	☐ Proposed ☑ Alternative ☐ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Access			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		ACC-002 because Iliamna Lake is too deep on the eastern side of the lake for laying the pipeline on the bottom (the steep underwater cliffs would stress the pipeline bends). The eastern portion of the pipeline would follow a route overland between Cottonwood Bay and Ursus Cove. This route was proposed as an option by PLP. This option would require the following: Total miles of road: 50 Number of stream crossings: 34 Number of major river crossings: 1 ***Screening –*** 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: This is a route that PLP has evaluated and is a reasonable route. 3. Practicable Test: Thicker lake ice on the eastern side of the lake would make ferry operation more challenging; however, feasibility has been demonstrated by the long-term operation of an ice-breaking ferry on Williston Lake in British Columbia. Water depth and lakebed topography may preclude the use of a sub-lake gas pipeline along this alignment. Five miles of the existing Pile Bay-Williamsport Road require improvements to accommodate large trucks. The Diamond Point/Iliamna Bay Port Site (ACC-014) and access road would be subject to tidal flat filling. The port would require dredging to 20 feet of MLLW (per RFI 063), and may require blasting for access roads. This location could not accommodate deep-draft vessels, and would require lightering barges to transfer ore concentrate to deep-draft bulk ships anchored at mooring locations.

Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		4. Environmental Impacts Test: This route would cross fewer wetland acres than a southern route (ACC-001) or an all-road northern route (ACC-002), resulting in fewer acres of fill. The Iliamna Spur Road would be eliminated, reducing impacts along these road miles. The road portion from Pile Bay to Williamsport would require more maintenance compared to a southern route (ACC-001), given the steep terrain. The addition of a ferry route would require construction of two ferry terminals, resulting in placement of fill, and also resulting in greater transportation and potential navigation concerns along the ferry route in the eastern portion of the lake. There would be subsistence concerns with the ferry route being in areas important for subsistence seal harvesting. The option represents tradeoffs, and is carried forward for detailed analysis. The route would place mine traffic near local communities, including Iliamna, Nondalton, Pedro Bay, and Pile Bay. Additional transfer of materials with barges increases the risk of spills or loss of fugitive material during transfer operations.	
Access Road – West Access Route	ACC-004	***Origination*** – This road option is a road-only access route evaluated by PLP when developing the proposed design as an option that would not require a ferry to cross Iliamna Lake. ***Description*** – Road route: The road would go from the Mine Site around the western end of Iliamna Lake and continue to the Amakdedori Port site on Cook Inlet. This option would also include an Iliamna spur road. Ferry route: This option would not require a ferry. Natural Gas Pipeline route: The natural gas pipeline would likely follow the road.	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		Concentrate Pipeline: A concentrate transport pipeline may be included with this option. This option would require the following: Total miles of road: 160 Total number of stream crossings: 129 Total number of major river crossings: 4 ***Screening*** **–** 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: It is reasonable to consider routing the road around the western end of Iliamna Bay. 3. Practicable Test: A road-only route provides the advantages of reliable year-round access, and minimizes the need to re-handle cargo/concentrates. The option would also allow the inclusion of a concentrate pipeline for the project. There is no need to build the associated infrastructure for a ferry. This option would provide access to Cook Inlet, which is generally accessible year-round. This option has a longer road footprint, with more wetlands and streams crossed. 4. Environmental Impacts Test: This access route has the highest occurrence of wetlands, with the highest environmental impact to wetlands. If a concentrate pipeline were also included, the footprint would be slightly larger. ***Why Dismissed*** **–** This option would increase overall adverse impacts.	
Access Road – Bristol Bay Access Route	ACC-005	***Origination*** **–** Evaluation of alternative port sites was suggested during scoping due to concerns with the potential ecological impact of the project. ***Description*** **–** This road option is a road-only access route that was evaluated by PLP	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
(Road Only)		when developing the proposed design as an option that used port sites other than Cook Inlet. Road route: The road would go from the Mine Site to a port site on Bristol Bay. Ferry route: This option would not require a ferry. ***Screening*** **–** 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: It is reasonable to consider alternative port locations. 3. Practicable Test: This would be the longest road route option. Construction of the associated port would have the potential for logistical conflicts with fishing operations in Bristol Bay. Additionally, Bristol Bay is ice-bound for a large portion of the year. Because Bristol Bay is shallow, a long trestle or causeway into the bay would be required; or alternatively, lightering to a moored bulk vessel. 4. Environmental Impacts Test: This option would have increased impacts associated with the construction of a port road, and the longest road route. Resulting impacts include increased emissions and visual impacts. The route would traverse mainly lowlands, which would have more impact to wetlands. There would be impacts to local residents in communities near the road. ***Why Dismissed*** **–** This option would increase overall adverse impacts.	
Ferry Terminal Location – North Shore Ferry Terminal	ACC-006	***Origination*** **–** PLP Proposed Action ***Description*** **–** This ferry terminal site option is part of the Proposed Action, which includes the construction of a ferry terminal on the northern shore of Iliamna Lake for an ice-breaking ferry to transport materials, equipment, and concentrate across the lake. The ferry route would be north-south. This location is associated with the South Access Route (Road and Ferry): ACC-001. As a variant to this option, an additional site slightly to the east in the same bay as the North Shore Ferry Terminal is included: the North Shore East	☑ Proposed ☐ Alternative ☐ Dismissed

AMERICAN OVERSIGHT

Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		Ferry Terminal Site variant. This option would include the following: Number of ferry miles to Kokhanok West Ferry Terminal Site (ACC-010): 19 Number of ferry miles to Kokhanok East Ferry Terminal Site (ACC-011): 25	
Ferry Terminal Location – North Shore East Ferry Terminal	ACC-006a	***Origination*** – Evaluation of this ferry terminal location was suggested during scoping. ***Description*** – This ferry terminal site option is a variant of the Proposed Action, which includes the construction of a ferry terminal on the northern shore of Iliamna Lake for an ice-breaking ferry to transport materials, equipment, and concentrate across the lake. The ferry route would be north-south. This location is associated with the South Access Route (Road and Ferry): ACC-001. The site is slightly east of the North Shore Ferry Terminal Site (ACC-006) in the same bay. ***Screening – This option is currently being evaluated.***	**Status under review**
Ferry Terminal Location – Iliamna and Kokhanok Ferry Terminals	ACC-007	***Origination*** – Evaluation of ferry terminals closer to existing infrastructure was suggested during scoping to reduce impacts to Gibraltar River and Upper Talarik Creek. ***Description*** – Under this option, the North Shore Ferry Terminal would be located in or near the communities of Newhalen and Iliamna, but away from the Newhalen River. The Iliamna spur road would therefore be the main mine access road route to connect the Mine Site to this ferry terminal. This option location could be included with South Access Route (Road and Ferry): ACC-001. The South Shore Ferry Terminal would be located north of the Kokhanok airport. The road from this ferry terminal to Amakdedori Port would follow a route similar to that described under ACC-001 for the Kokhanok East Terminal Site variant to avoid crossing the Gibraltar River. The ferry route would be north-south, and approximately 21 miles. This option location could be included with South Access Route (Road and Ferry): ACC-001.	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Access			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		Screening **–** 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: It is reasonable to consider options that have potential to avoid and minimize impacts. 3. Practicable Test: Ice conditions and water depth at Iliamna are not suitable for a ferry terminal. Existing community use of the area may not be compatible with ferry route and a terminal. 4. Environmental Impacts Test: There would be additional impacts to the communities of Iliamna, Newhalen, and Kokhanok caused by changes in vessel traffic impacting current vessel and floatplane use, and heavy mine trucks traversing through the community. This location is closer to high-use areas for subsistence seal harvesting. ***Why Dismissed*** **–** This option would increase overall adverse impacts.	
Ferry Terminal Location – Eagle Bay Ferry Terminal	ACC-008	***Origination*** **–** This ferry terminal option was evaluated by PLP when developing the proposed design as an alternative North Shore Ferry Terminal location suitable for either a north-south lake transit or an east-west transit. ***Description*** **–** Under this option, the North Shore Ferry Terminal would be located in Eagle Bay. A road would connect the Mine Site to the terminal. A spur road to Iliamna would not be included in this option because the mine access road would cross the existing road from Iliamna to Nondalton, and provide community access. This option location is associated with the North Access Route (Road and Ferry): ACC-003. The location could be included with South Access Route (Road and Ferry): ACC-001. This option would include the following:	☐ Proposed ☑ Alternative ☐ Dismissed

AMERICAN OVERSIGHT

Access			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		Number of ferry miles to Kokhanok West Ferry Terminal Site (ACC-010): 24 Number of ferry miles to Kokhanok East Ferry Terminal Site (ACC-011): 27 Number of miles to Pile Bay Ferry Terminal Site (ACC-009): 33 ***Screening*** **–** 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: This location appears to be a reasonable option, with ability to accommodate ferry traffic and road connection. 3. Practicable Test: This location is sheltered for ferry operations and protected from prevailing winds. There may be navigability issues associated with the water depth in the area. Ice in the bays is thicker and more persistent than in the open lake west of Newhalen. This option minimizes the road footprint in the Upper Talarik Creek drainage. 4. Environmental Impact Test: This site may have different or additional impacts, such as shallower water, persistent ice in Eagle Bay, and more navigational hazards.	
Ferry Terminal Location – Pile Bay Ferry Terminal	ACC-009	***Origination*** **–** This ferry terminal option was evaluated by PLP when developing the proposed design. ***Description*** **–** This option considers an eastern shore ferry terminal location suitable for use with a northern access route, and the Eagle Bay Ferry Terminal as a western ferry terminal site. This option location is associated with the North Access Route (Road and Ferry): ACC-003. This option would include the following: Number of ferry miles to Eagle Bay Ferry Terminal Site (ACC-008): 33	☐ Proposed ☑ Alternative ☐ Dismissed

AMERICAN OVERSIGHT

Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		of the Gibraltar River. ***Screening – This option is currently being evaluated.***	
Ferry Terminal Location – Utilize Alternative Ferry Terminal Sites	ACC-012	***Origination*** – Evaluation of alternative ferry terminal locations was suggested during scoping. ***Description*** – The suggested option requested consideration of alternative ferry sites and locations compared to the Proposed Action, but did not specify locations. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: The six ferry terminal options described in this table are the most feasible locations, and cover a variety of logistical and environmental considerations. This option is not reasonable to carry forward because other substantially similar—but more specific—locations are being considered, meeting the intent of the scoping comment. ***Why Dismissed*** – Several ferry terminal location options were developed and incorporated into this table. This option is not reasonable to carry forward because other substantially similar—but more specific—locations are being considered, meeting the intent of the scoping comment.	☐ Proposed ☐ Alternative ☑ Dismissed
Port Location – Amakdedori Port Site	ACC-013	***Origination*** – PLP Proposed Action ***Description*** – This port site option is part of the Proposed Action, which includes the construction of a port on Cook Inlet to transfer diesel fuel, materials, equipment, and concentrate using barges. The port location would be at Amakdedori. This option is associated with the South Access Route option (Road and Ferry): ACC-001. This port site would use the Offshore Lightering-Amakdedori option (ACC-022).	☑ Proposed ☐ Alternative ☐ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Access			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
Port Location – Diamond Point/Iliamna Bay Port Site	ACC-014	***Origination*** – Evaluation of an option for a port site at Diamond Point in Iliamna Bay was suggested during scoping. ***Description*** – This port site option was examined by PLP in the process of developing the Proposed Action. The port site would be located at Diamond Point in Iliamna Bay. This port site option is associated with the North Access Routes (ACC-002 and ACC-003). This port site would use the Offshore Lightering-Iniskin option (ACC-023). The approach at the Diamond Point port would use a channel for barges and tugs to access the loading dock, requiring dredging to a depth of 20 feet MLLW (per RFI 063). Channels are typically more prone to sedimentation, requiring maintenance dredging; therefore, greater under-keel clearance is recommended compared to the depth of 15 feet MLLW described at the Amakdedori Port Site (ACC-013). Dredged material would either be used in construction of the causeway and dock, or disposed of onshore. The total volume of dredged material for the 20 feet MLLW channel is 650,000 cubic yards, of which a minimum of 50 percent is estimated to be used in the barge dock construction, which would require approximately 615,000 cubic yards of fill for construction. Any rocks encountered in the channel would be moved to the side of the channel, or used in the dock construction. Any remaining dredged material and any material from maintenance dredging would be disposed of on-shore in a bermed facility on uplands west of the dock site. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: Diamond Point appears to be a reasonable option. 3. Practicable Test: The port location is sheltered, and access for this option could use portions of the existing Pile Bay Road. The port site and access road includes construction and placement of fill in the intertidal zone in Iliamna Bay. The port	☐ Proposed ☑ Alternative ☐ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Access			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		would require initial and maintenance dredging and blasting for access roads. This location could not accommodate deep-draft vessels, and would require lightering barges to transfer ore concentrate to deep-draft bulk ships anchored at mooring locations. 4. Environmental Impacts Test: This option uses some areas already impacted by development, and may avoid bear migration areas. Dredge and fill impacts would be greater in the intertidal zone.	
Port Location – Knoll Head/Iniskin Bay Port Site	ACC-015	***Origination*** – This port site option was examined by PLP in the process of developing the Proposed Action. ***Description*** – This port site would be located at Knoll Head in Iliamna Bay, and is associated with the North Access Routes (ACC-002 and ACC-003). This port site would use the Offshore Lightering-Iniskin option (ACC-023). ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: It is reasonable to consider alternative port locations. 3. Practicable Test: This option requires challenging access and port site construction, and would require significant earthworks with associated impacts. This option would have prohibitive road construction cost. 4. Environmental Impacts Test: Access to this port would require crossing Iliamna Bay via a causeway, and includes substantial placement of fill in the intertidal zone in Iliamna Bay and Iniskin Bay. ***Why Dismissed*** – The environmental impacts would be greater than the Proposed Action (and ACC-014 – Diamond Point).	☐ Proposed ☐ Alternative ☑ Dismissed
Port Location – Fortification	ACC-016	***Origination*** – This port site option was examined by PLP in the process of developing the	☐ Proposed ☐ Alternative

AMERICAN OVERSIGHT

Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
Bluff/Rocky Point Port Site		Proposed Action. ***Description*** – Under this option, the port location would be at Fortification Bluff/Rocky Point, which is approximately 15 miles north of Amakdedori, and would require 26 additional road miles from the port access road route to this port site, compared to the Proposed Action (ACC-001). This option is associated with the South Access Route option (Road and Ferry): ACC-001. The natural gas pipeline would not be co-located along the road, and would be routed through Amakdedori as described in ACC-001. This port site would use the Offshore Lightering-Amakdedori option (ACC-022). ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: It is reasonable to consider other port locations. 3. Practicable Test: This option requires a longer access road and more challenging port site construction than other options, which would increase the total amount of road construction for the project. Shore approach routing options for the gas pipeline are not available due to the proximity to Augustine volcano. This option has a requirement for a steep access road to the shore that poses operational safety challenges. 4. Environmental Impacts Test: Baseline data indicate that this offshore area is a more a productive habitat with higher utilization by a wider variety of species than other options. ***Why Dismissed*** – This option would increase overall adverse impacts.	☑ Dismissed
Port Location – Williamsport Port	ACC-017	***Origination*** – Use of the existing road and resources at Pile Bay and Williamsport was suggested during scoping.	☐ Proposed ☐ Alternative

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
Site		***Description*** – This port site option was examined by PLP in the process of developing the Proposed Action. The port location would be at the existing Williamsport location in Iliamna Bay. This port site option would be included with the North Access routes (ACC-002 and ACC-003) and may include the Eagle Bay Ferry Terminal Site (ACC-008) and Pile Bay Ferry Terminal Site (ACC-009) options. This option would require improvements to the existing port facilities. This port site would use the Offshore Lightering-Iniskin option (ACC-023). ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: It is reasonable to consider use of existing facilities. 3. Practicable Test: Williamsport is inaccessible by sea except for brief periods at the peak of extreme high tides, which occur a few days each month (USACE 1995). A 1995 Environmental Assessment by USACE (Navigation Channel Feasibility Report and Environmental Assessment: Williamsport) indicates that a considerable amount of initial and ongoing maintenance dredging would be required to accommodate barges between the mouth of Iliamna Bay and Williamsport. The existing sea bottom is 2 or 3 feet above MLLW near the landing, and it would be necessary to dredge 22 to 23 feet of material to obtain the desired depth of -20 feet MLLW. The dredged material would need either onshore or offshore disposal. Existing uses of Williamsport may not be compatible with the level of activity proposed by PLP. 4. Environmental Impacts Test: This option would have increased adverse environmental impacts from the dredging and disposal of the dredged material in comparison with the Proposed Action (ACC-013) or the Diamond Point option	☑ Dismissed

Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		(ACC-014). ***Why Dismissed*** – This option would increase overall adverse impacts.	
Port Location – Utilize Alternative Port Sites	ACC-018	***Origination*** – Using alternative port sites was suggested during the scoping period. ***Description –*** The commenter requested consideration of alternative port sites and locations compared to the Proposed Action, but did not suggest specific locations. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: The five port site options described in this table are the most feasible locations, and cover a variety of logistical and environmental considerations. The suggested option is not reasonable because it is not specific; however, the intent of the suggestion is fulfilled through evaluation of ACC-013 through ACC-017. ***Why Dismissed*** – Several port site options were considered (see ACC-013 through ACC-017). This non-specific option is not a reasonable option, and can therefore be dismissed in favor of the five location-specific options.	☐ Proposed ☐ Alternative ☑ Dismissed
Dock Type – Fill Dock	ACC-019	***Origination*** – PLP Proposed Action ***Description*** – PLP has proposed to construct a fill dock and sheetpile bulkhead at the port location.	☑ Proposed ☐ Alternative ☐ Dismissed
Dock Type – Pile-Supported Dock	ACC-020	***Origination*** – USACE is evaluating an option for a pile-supported dock to satisfy requirements for minimization of impacts to Waters of the U.S. ***Description*** – This option would construct a pile-supported dock rather than a fill dock at the port site. ***Screening – This option is currently being evaluated.***	**Status under review**

AMERICAN OVERSIGHT

Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
Port Operations–Shore-Side Loading	ACC-021	***Origination*** – Shore-side loading was evaluated by PLP when developing the proposed project design. ***Description*** – This type of loading was originally proposed as an option by PLP when developing the Proposed Action, but was eliminated in project design updates in May 2018. Bulk carriers would be loaded directly at the port site (rather than at lightering locations), and would require a deep draft navigation channel and turning basin of approximately 50 feet of water depth. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: This is a reasonable option. This was PLP's original proposed action, so is assumed to be economically and technologically feasible. 3. Practicable Test: This option involves loading a bulk carrier directly at the dock side, which minimizes concentrate re-handling and leads to improved safety and reliability. All locations where this could take place require dredging or causeway construction to allow for shore-side loading of bulk carriers. It is estimated that initially, 10 million cubic yards would need to be dredged, and another 10 million yards may need to be dredged over the life of the mine to maintain the design depth. Dredging operations for this option would increase impacts to Waters of the U.S., and requires the placement of dredge spoils. 4. Environmental Impacts Test: Dredging would have environmental impacts to marine habitat and shoreside habitat where dredged material would be placed; dredging would result in a higher volume of fill compared with other loading options such as lightering; maintaining the deep-draft navigation channel and turning basin would require annual maintenance dredging that would be a long-term effect. Shoreside loading would potentially lessen impacts to Endangered Species Act–listed species or habitat, including sea otter critical	☐ Proposed ☐ Alternative ☑ Dismissed

Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		habitat. ***Why Dismissed*** – This option would increase overall adverse impacts.	
Port Operations– Offshore Lightering – Amakdedori	ACC-022	***Origination*** – PLP Proposed Action ***Description*** – The lightering option is the Proposed Action developed by PLP, and requires approximately 15 feet of water depth at the dock, which can be achieved naturally at Amakdedori without dredging.	☑ Proposed ☐ Alternative ☐ Dismissed
Port Operations– Offshore Lightering – Iniskin	ACC-023	***Origination*** – The Iniskin Bay lightering option was developed as an alternative by PLP when looking at alternative port sites such as Diamond Point/Iliamna Bay (ACC-014). ***Description*** – Under this option, concentrate would be offloaded from trucks to transfer barges at port sites to be transported to lightering locations where larger transport barges would be moored. Concentrate would then be loaded to transport barges for transport across Cook Inlet. An additional mooring location from those identified in ACC-022 has been identified at Iniskin Bay, off the Iniskin Peninsula, which is closer to the Diamond Port site. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: The Iniskin Bay option has adequate water depth for the bulk carrier ships and affords good protection; it is a reasonable option. 3. Practicable Test: Similar to ACC-022. 4. Environmental Impacts Test: This option would have less environmental impact to the marine environment than a large dock facility. There would be less removal or placement of fill required. There is risk of material spills during transfer to/from lighter barges.	☐ Proposed ☑ Alternative ☐ Dismissed
Other Access Options –	ACC-024	***Origination*** – An option to require bridges at all anadromous stream crossings was suggested during scoping.	☐ Proposed ☐ Alternative

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Access			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
Mandatory Bridges at Stream Crossings		***Description*** – This option would make it mandatory for bridges to be built any time the access route crosses a stream or river that supports anadromous fish. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: Not reasonable, because Alaska Department of Fish and Game would specify the crossing requirements necessary to protect anadromous fish, which may be achieved by other means such as culverts rather than bridges. ***Why Dismissed*** – This option is not reasonable. Other forms of stream crossings such as culverts are often appropriate structures. The design and permitting process would select appropriate crossing structures to address the environmental concerns and reduce impacts.	☑ Dismissed
Other Access Options – Revised Project Alignment via Micro-Siting	ACC-025	***Origination*** – Consideration of micro-siting practices for the access roads was evaluated by USACE as a potential means to avoid environmental impacts. ***Description*** – Use micro-siting practices to avoid local impacts to wetlands, stream crossings, guiding, lodges, wildlife, visual resources, archeological, and historical resources. Avoid or minimize, or stay outside a buffer area important to resources. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: This option is not reasonable to consider as a component of an action alternative for evaluation in the EIS because it lacks specificity, and is essentially mitigation. Additionally, the intent of this option would be accomplished as impact assessment is completed for the Draft EIS, resource agencies and the public review and comment on the Draft EIS, and the Applicant is asked to revise	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		the proposed project to better avoid and minimize impacts. Additionally, micro-siting practices would be demonstrated by the Applicant when they document the steps and measures they have taken to avoid and minimize environmental impacts of their proposed action. Mitigation measures included in PLP's design, which are integral components of the proposed action, will be included in Chapter 5 of the EIS, and will be considered during the NEPA impact analysis in the EIS for the proposed action and applicable components of other action alternatives. ***Why Dismissed*** – This option is not reasonable. Dismissal of this option would not preclude future consideration of micro-siting as mitigation to avoid or minimize specific impacts identified through the NEPA impact analysis, or as required by resource agencies during project permitting as the project design and permitting advances.	
Other Access Options – Summer Only Ferry Operations	ACC-026	***Origination*** – An option to restrict ferry options to the open water season was suggested during scoping. ***Description*** – Ferry would only be allowed to operate in the open water season when no ice-breaking is necessary. There would need to be infrastructure to allow ore stockpiling, an area identified for storage, and other logistical considerations associated with ceasing ferry operations during lake-ice conditions. ***Screening – This option is currently being evaluated.***	**Status under review**

AMERICAN OVERSIGHT

Concentrate Transport			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
Concentrate Transport – Truck	CTR-001	***Origination*** – PLP Proposed Action ***Description*** – This option is part of the Proposed Action, which involves containerized transport of ore concentrate by using the road and ferry access route (South Access Route (Road and Ferry): ACC-001). This option would use trucks to carry concentrate containers from the Mine Site. Concentrate would be transported to the port location, loaded onto a ferry, and re-handled at lightering locations. This option does not allow for the inclusion of a concentrate pipeline in the proposed project. This option may also be included with the North Option Route (Road and Ferry): ACC-003.	☑ Proposed ☐ Alternative ☐ Dismissed
Concentrate Transport – Pipeline	CTR-002	***Origination*** – Evaluation of an option for an ore concentrate pipeline was suggested during scoping due to concerns with ferrying ore concentrate across Iliamna Lake. ***Description*** – This option would not require the re-handling of cargo/concentrate, and allows for the inclusion of a concentrate pipeline in the proposed project. A single, approximately 7-inch-diameter steel pipeline with appropriate corrosion protection would be used to transport the concentrate. The concentrate pipeline and the gas pipeline would be co-located in a single trench at the toe of the road embankment, which would increase the average width of the road corridor footprint by 3 to 5 feet. Pump stations would be required to move concentrate through the pipeline. This option may be applied with North Access routes and considered with the South Access routes. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: This is a reasonable option. 3. Practicable Test: This option is technologically feasible and would be an efficient way to move large volumes of material and reduce truck traffic. This option would require a water treatment plant (WTP) and a discharge permit at the port site, and would result in a small reduction (<1 cubic foot per second) in water available for discharge at the Mine Site. Treatment at the port site would remove toxic	☐ Proposed ☑ Alternative ☐ Dismissed

AMERICAN OVERSIGHT

Concentrate Transport			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		pollutants, including metals, to limits identified in an Alaska Department of Environmental Conservation (ADEC) and/or EPA discharge permit. Additionally, water depth and lake bed topography would likely preclude the use of a sub-lake gas pipeline along the South Access routes alignments or the lake portion of North Access Route 2. 4. Environmental Impacts Test: This route includes trade-offs in terms of the environmental impacts. This route would result in additional fill impacts associated with a wider corridor, but reduced trucking. This option is carried forward as an alternative to be considered in detail in the EIS.	
Concentrate Transport – Rail	CTR-003	***Origination*** – Transporting ore concentrate by rail was evaluated by PLP when developing the proposed project design. ***Description*** – This option would require the construction of a railroad from the Mine Site for the transportation of ore concentrate. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: Rail transport is a reasonable option to consider. 3. Practicable Test: Construction of a railroad to move the volume of materials necessary for the proposed project would not be efficient or cost effective. The cost to construct railroads in Alaska is about five times the cost to construct roads. Railroads grades are typically limited to grades of 1 percent or less, with longer bridges. The additional cost of the track, railroad ballast, hardware, and associated equipment is a significant investment. Railroad construction in Alaska costs roughly $9 million per mile; remote road construction costs roughly $1.7 million per mile. Railroads can provide greater efficiencies where high volumes of materials are transported daily, but the total volume of transported materials	☐ Proposed ☐ Alternative ☑ Dismissed

Concentrate Transport			
Option	**Option #**	**Option Details and Screening** ❖ **Option Details: Origination, Description** ❖ **Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test** ❖ **Why Dismissed (as applicable)**	**Status**
		projected for the Pebble Project is low compared to typical railroad operations. Transport of concentrate, fuel, reagents and consumables is estimated to be 35 truck round trips per day for the project. The high cost to construct a railroad for the relatively low volume of freight would not be cost effective. ***Why Dismissed*** – This option would increase overall adverse impacts. It may not be practicable to achieve grade requirements.	

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Reclamation and Closure Access			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
Closure – Retain Mine Road	RCA-001	***Origination*** – PLP Proposed Action ***Description*** – This option is part of the Proposed Action, which includes using and maintaining mine access roads for all mine reclamation and closure transportation needs after operations. This option uses the existing infrastructure for mine access during post-closure support activities.	☑ Proposed ☐ Alternative ☐ Dismissed
Closure – Iliamna Airport and Existing Roads	RCA-002	***Origination*** – This closure option was evaluated by PLP when developing the proposed project design. ***Description*** –This option would use existing infrastructure (Iliamna airport and Pile Bay-Williamsport Road) for all mine reclamation and closure transportation needs after operations. The mine access road would be reclaimed. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: This closure option is a reasonable option to consider. 3. Practicable Test: This option uses Iliamna airport and/or the existing Pile Bay road; however, neither have the capacity to meet the post-closure logistical requirements. The existing Pile Bay Road, if used as part of an alternative, would not by itself meet the ground transportation needs for reclamation and closure if other access roads are not maintained. The option would rely on helicopter transport of fuel, materials, WTP reagents, and supplies between the Iliamna Airport and the Mine Site. This means of transportation would be inefficient, very expensive, and less safe than trucking using the mine access road. ***Why Dismissed*** – This option is not practicable in terms of logistics because the existing infrastructure would not support the reclamation and closure transportation needs.	☐ Proposed ☐ Alternative ☑ Dismissed

Tailings Management			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
Storage Method– Thickened Tailings Storage	TSF-001	***Origination*** – PLP Proposed Action ***Description*** – Thickened tailings storage is the Proposed Action for bulk tailings. The option is not suited for pyritic tailings that need to remain saturated to prevent them from oxidizing and generation ARD and metals leaching. Thickened tailings are slurry tailings that have been mechanically dewatered, sometimes with settling additives, to create a more viscous, molasses-like material. Thickened tailings typically have a solids content (mass of solids to total mass of the combined solids and liquid mixture) of 45 to 65 percent. They are piped to the TSF by centrifugal pumps or positive displacement pumps, depending on the topography, distance, head loss, and viscosity. They still require an embankment dam for containment: either a full dam like those used for slurry tailings, or a lower dam, depending on the viscosity. These dams need to be periodically raised to hold the tailings and supernatant water. Some mines discharge thickened tailings from the dam and create a slurry tailings type of TSF with a steeper beach. Other mines discharge thickened tailings from a central tower to produce a cone-shaped TSF with a tailings surface sloped towards the dams. Thickened tailings do not segregate as much as slurry tailings, so that they have relatively consistent particle distributions across the TSF. The yield strength (applied pressure that must be exceeded to make the fluid flow) of the consolidated tailings is 0.4 to 1.6 pounds per square foot (psf), partly depending on the degree of initial thickening.	☑ Proposed ☐ Alternative ☐ Dismissed
Storage Method– Slurry Tailings Storage	TSF-002	***Origination*** – This option is the Proposed Action for the pyritic tailings, and was considered by PLP for the bulk tailings. ***Description*** – Slurry tailings are a slightly dewatered product of the milling process. The slurry is a water-like material that is moved by pipeline to the TSF. The slurry typically has a solids content of 10 to 40 percent, and can flow down-gradient by gravity, or be moved by centrifugal pumps, depending on the topography, distance, and head loss. The high water content requires that the tailings be stored behind a dam that must be periodically raised to hold the tailings and supernatant water. The tailings gradually segregate as they flow away from the discharge, with coarser particles closest to the discharge points and finer particles further away. A beach slopes away from each	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Tailings Management			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		discharge point to the supernatant pond. The tailings consolidate to a yield strength of up to 0.4 psf. The supernatant water is removed to the extent possible, and reclaimed for mill use, or treated and discharged. Some mines use cyclones to split the slurry into coarser and finer fractions, and use the coarser fraction as dam raise fill. ***Screening*** **–** 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: This is a reasonable tailing method to consider. 3. Practicable Test: Slurry tailings are the most common method of tailings disposal, and have been successfully produced and managed under a wide range of operating conditions for both bulk and pyritic tailings. The feasibility of this method is reliable, and proven at the proposed Pebble Project scale under these environmental conditions. 4. Environmental Impacts Test: Slurry TSFs entrain more water and have larger supernatant ponds than thickened tailings TSFs. Therefore, they have more potential energy than thickened tailings, and pose a greater risk to the environment should there be an operational problem or a dam failure. PLP has proposed thickened tailings to conserve water and reduce this risk (TSF-001). ***Why Dismissed*** **–** This option would increase overall adverse impacts.	
Storage Method– Paste Tailings Storage	TSF-003	***Origination*** **–** Paste tailings storage was suggested via scoping comments as a potentially efficient and effective method of storage. ***Description*** **–**This option is only applicable to the bulk tailings, and not the pyritic tailings that would need to stay saturated to prevent ARD generation and metal leaching. Paste tailings are essentially thickened tailings, thickened with high-density thickeners, cement, and other additives to a toothpaste-like material. They typically have a solids content of 60 to 75 percent, and a yield strength of 1.6 to 2.0 psf. They are typically moved by pipeline, but require positive displacement pumps. Paste tailings particles do not	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Tailings Management			
Option	**Option #**	**Option Details and Screening** ❖ **Option Details: Origination, Description** ❖ **Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test** ❖ **Why Dismissed (as applicable)**	**Status**
		segregate, so tailings characteristics would be relatively uniform throughout the TSF. However, paste tailings are mostly used as backfill in underground mine workings where transport and placement of the paste is aided by gravity, and are typically not disposed of in TSFs. ***Screening*** **–** 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: TBD. 3. Practicable Test: Paste tailings require specialized high-density thickeners, and are the least common TSF. Positive displacement pumps are usually required for transportation to the TSF site, resulting in potential plugging of pipelines with high-density tailing and increased pumping energy requirements. Producing a consistent paste would be a major challenge with the processing, because small changes in the orebody, especially clay-sized particles, can greatly influence the paste characteristics, such as yield strength and beach slope. 4. Environmental Impacts Test: Paste tailings require additional transportation infrastructure and on-site facilities for handling cement and other thickeners, which would require a large footprint and added impact to the environment. The method would produce a more stable TSF than slurry tailings, but essentially offers no more environmental benefits than the proposed thickened tailings. ***Why Dismissed*** **–** Paste tailings are mostly used in underground workings, and have minimal surface TSF history and interest. A paste TSF would provide essentially no meaningful environmental benefit above that of the Proposed Action.	
Storage Method– Dry Stack Tailings (for Bulk	TSF-004	***Origination*** **–** This storage method was evaluated by PLP when developing the proposed project design. ***Description*** **–** This option of dry-stack tailings is only suited for bulk tailings because the pyritic tailings need to stay saturated to prevent ARD generation and metal leaching.	**Status under review**

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Tailings Management			
Option	**Option #**	**Option Details and Screening** ❖ **Option Details: Origination, Description** ❖ **Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test** ❖ **Why Dismissed (as applicable)**	**Status**
Tailings only)		Filtering tailings removes water using mechanical filters, and results in tailings with 75 to 85 percent solids content, and a yield strength of over 3 psf. This creates a soil-like material or "dry cake" that is transported by conveyor or truck to a "dry stack" TSF. These TSFs do not require dams, unless possibly for perimeter berms. The tailings are placed by bulldozers and compactors, as is done in conventional earthwork construction. ***Screening – This option is currently being evaluated.***	
Storage Method– Submarine Disposal Storage	TSF-005	***Origination*** – This storage method was evaluated by PLP when developing the proposed project design. ***Description*** – This option would place the tailings and other mine waste in a water body such as in a lake or seawater to maintain a saturated condition into perpetuity. The concept is to discharge tailings by gravity to a location and depth where they are less likely to oxidize and leach out toxic metals, and where marine life is less abundant. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: This option would maintain PAG material in a saturated condition without the need for an on-land TSF and maintenance of dams and other water control features. However, there are concerns about performance histories of previous and current submarine disposal operations. It is likely not possible to obtain permits for storing tailings in an existing waterbody in or near Bristol Bay in addition to significant public opposition to the storing of bulk tailings in water bodies in general. This is not a reasonable option. ***Why Dismissed*** – This option is not reasonable.	☐ Proposed ☐ Alternative ☑ Dismissed
Storage Method– Remove or	TSF-006	***Origination*** – This method was proposed via scoping comments as a measure to reduce local environmental impacts due to tailings storage. ***Description*** –This option would involve transporting all of the tailings from the project	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Tailings Management			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
Make All Tailings Inert		area to another disposal area, or making the tailings inert to eliminate the ARD and metal leaching potential. ***Screening –*** 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: Trucking tailings away from the project area is not reasonable because it would require round-the-clock transport. The project would generate tailings at a rate that would require a truck with triple trailers to leave the Mine Site approximately every minute. This would require new roads to connect to the existing road system. The costs to transport the tails hundreds of miles would be exorbitant and cost prohibitive. Treating the tailings appears to be a reasonable option to consider. 3. Practicable Test: Treating the pyritic tailings to make them inert (the bulk tailings are considered inert) would require additional treatment facilities that would need space in the project area, and would introduce new containment structure needs. Methods of making tailings inert include separating pyritic tailings to create a larger bulk TSF and smaller pyrite TSF (this is already the proposed action); returning the pyritic tailings to the completed pit at closure to allow natural subaqueous storage (this is also already the proposed action); adding cement to create a cementitious-type material; buffering by mixing in alkaline material like crushed limestone to neutralize the acidity; and refining processes to extract more metals and reduce their metals content in the tailings. 4. Environmental Impacts Test: Treating the tailings to make them inert by separating the bulk and pyritic tailings and returning the pyritic tailings to the completed pit at closure is the Proposed Action. Adding cement or limestone to make tailings inert would require the transport of very large volumes of these additives, including possibly developing quarries; and constructing additional

Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		infrastructure and treatment facilities in the project area. Revising mining methods to extract richer ore would result in more waste rock with higher ARD and metal leaching potential. Treatment facilities and associated containment structures would require additional space, with resultant increased environmental impacts. ***Why Dismissed*** – The option to move the tailings to another area is not reasonable. Treating the pyritic tailings with cement or limestone provides no environmental benefits over the Proposed Action, which would separate the pyritic from the bulk tails and keep them inert by maintaining them during mining in a subaqueous condition, and return them to the completed pit during closure for permanent subaqueous storage.	
Storage Method– Truck Tailings to Canada	TSF-007	***Origination*** – Evaluation of an option to truck all waste to Canada was suggested during scoping. ***Description*** –This option would involve transporting all of the tailings from the project area to a disposal area in Canada. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: Trucking tailings away from the project area is not reasonable because it would require round-the-clock transport. The project would generate tailings at a rate that would require a truck with triple trailers to leave the Mine Site approximately every minute. This would require new roads to connect to the existing road system. The costs to transport the tails hundreds of miles would be exorbitant and cost prohibitive. ***Why Dismissed*** – This option is not reasonable and is cost prohibitive.	☐ Proposed ☐ Alternative ☑ Dismissed
Tailings Dam – Centerline	TSF-008	***Origination*** – PLP Proposed Action	☑ Proposed ☐ Alternative

Construction		***Description*** – This option is part of the Proposed Action, which includes the use of centerline construction for the bulk tailings TSF embankment. Centerline construction optimizes the robustness and stability advantages of downstream construction, with the efficiency advantages of upstream construction. The centerline dam begins with a starter dam, and subsequent raises are placed directly above the starter dam or previous raise, and over the downstream face, and over the tailings adjacent to the dam. The centerline of the dam crest is maintained in the same vertical plane. The outer part of the dam expands downstream as the dam is raised. The inner part of the dam has raises that stagger over the tailings with the upstream toe of each raise on the same vertical plane. A variation of the centerline method is to bend the centerline in either the upstream or downstream direction to optimize stability and cost. Centerline dams can be built out of rock, soil, and tailings.	☐ Dismissed
Tailings Dam – Downstream Construction	TSF-009	***Origination*** – This construction method was evaluated by PLP when developing the proposed project design. ***Description*** – Under this option, downstream tailings dam construction is considered only for the bulk TSF instead of the centerline method (the pyritic TSF is proposed as a downstream dam). Downstream tailings dams can be constructed using rock, soil, or tailings in various combinations. Construction starts with a starter dam in the same way as for a centerline dam. Subsequent stages (raises) are built on top of the downstream slope of the previous dam. The centerline of the dam crest moves downstream. Downstream dams are constructed in the same way as conventional water storage dams, except for being raised in stages as mining progresses, instead of all at once. ***Screening – This option is currently being evaluated.***	**Status under review**
Tailings Dam – Upstream Construction	TSF-010	***Origination*** – This construction method was evaluated by USACE. ***Description*** – Tailings dams built by the upstream method of construction are raised by using rock, soil, and tailings in various combinations as dam fill. A starter dam is first built in the same manner as a centerline or downstream dam. Trapezoidal-shaped raises are built on top of each other at an offset toe-to-crest design, moving the dam crest and	☐ Proposed ☐ Alternative ☑ Dismissed

		centerline upstream so that the upstream part of the dam is situated over tailings in the TSF. ***Screening –*** 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: It is reasonable to consider alternative dam construction methods. 3. Practicable Test: Upstream raises are the oldest and most economic type of tailings dam construction. An upstream dam contains about one-third of the fill volume of a downstream dam, and one-half the volume of a centerline dam. This would result in construction time savings conducive to the project's short construction seasons, and therefore, reduced costs. However, fill can only be placed on tailings that have had time to consolidate, and thereby provide a strong foundation for the raises. Otherwise, the underlying tailings could be saturated to the extent they could liquefy as a result of seismic activity and cause the dam to fail. A rate of tailings rise of 15 to 30 feet per year is considered to be the upper limit of allowing sufficient time for tailings consolidation to provide a stable tailings foundation for upstream raise construction. The planned rate of tailings rise for the Pebble Project is at the upper end of this range, and likely too fast to allow enough time for consolidation. Therefore, an upstream raise is likely not feasible because of the fast rate of tailings rise and liquefaction potential in a high-seismic-potential area. 4. Environmental Impacts Test: The need for less dam material means less material needs to be quarried or borrowed for dam fill, resulting in less environmental impacts. However, the higher potential for tailings liquefaction results in a higher risk of dam failure, and inundation of the land and water

Tailings Management			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		bodies by tailings. ***Why Dismissed*** – PLP is proposing a centerline dam for the bulk TSF and downstream dam for the pyritic TSF, which are considered more stable construction methods and reduce the risk of dam failure. Upstream construction is dismissed from further consideration because of potential environmental impacts from a higher risk of dam failure.	
Storage Method – Emergency Storage for TSF	TSF-011	***Origination*** – Scoping comments expressed concern regarding the stability and environmental impacts of a TSF failure due to an unexpected event such as seismic activity or unexpected water volumes. ***Description*** –This option would require an emergency storage/overflow containment area to minimize risk of tailings spills from excessive buildup of water in the TSF. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: The dam design would require that the dams accommodate a 200-year flood event when the TSF was at maximum capacity (both events at the same time). An emergency storage facility would provide redundancy, but at the expense of having to build a separate facility that would require the disturbance and use of additional land. Any redundancies that could be achieved would be more economically achieved by more robust TSF, WMP, seepage collection, and sediment pond facilities. The concerns this option are intended to address are already designed into the proposed project, so this option is not reasonable. ***Why Dismissed*** – The option is not reasonable because the suggestion is already part of the proposed project.	**Status Under Review**

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Tailings Management			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
Tailings Production – Segregated Bulk/Pyritic Tails	TSF-012	***Origination*** – PLP Proposed Action. ***Description*** – This option is part of the Proposed Action, which involves keeping both bulk and pyritic tailing streams separate. Separate tailings streams are a by-product of the mining process, so no additional steps are required. This option would require separate TSFs for bulk and pyritic tails.	☑ Proposed ☐ Alternative ☐ Dismissed
Tailings Production – Blended Bulk/Pyritic Tails	TSF-013	***Origination*** – This option was evaluated by PLP as a potential tailings production and storage method. ***Description*** – Under this option, bulk and pyritic tailings streams would be combined into one for the purpose of having a single TSF. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: This is a reasonable option to consider. 3. Practicable Test: This option requires an additional step to blend tailings streams, and maintain more water in the TSF to keep the pyritic tailings subaqueous to mitigate ARD and metal leaching potential. The entire facility would need to be managed in perpetuity to maintain the wet closure, and to collect and treat seepage. A blended facility would also need to be lined, which would hinder the flow-through design concept of the bulk TSF, and thereby prevent the bulk tailings from dewatering over time and becoming a stable landform. 4. Environmental Impacts Test: The blended tails would result in a large volume of tailings—and therefore, seepage water— that would need to be managed for potential ARD metal leaching. The wet closure would have a long-term post-closure dam failure risk higher than the proposed project. ***Why Dismissed*** – This option would increase overall adverse impacts because the	☐ Proposed ☐ Alternative ☑ Dismissed

Tailings Management			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		pyritic tails would "contaminate" the bulk tails and require subaqueous storage in perpetuity.	
Bulk Tailings Basin –Unlined	TSF-014	***Origination*** – PLP Proposed Action ***Description*** – This option is part of the Proposed Action, which would discharge thickened bulk tailings into an unlined basin, and provide TSF solids and water management in a manner that results in the TSF groundwater level sloping down towards the main embankment, and the seepage passing through a collection system built under the main embankment, and being collected by the bulk TSK main seepage collection pond.	☑ Proposed ☐ Alternative ☐ Dismissed
Bulk Tailings Basin – Lined	TSF-015	***Origination*** – This option was evaluated by PLP when developing the proposed project design. ***Description*** – This option has the bottom of the bulk TSF fully lined so that the bulk tailings would not be in contact with the ground surface. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: TBD 3. Practicable Test: It would be possible to fully line the bulk TSF although it would increase costs. However, lining of the bulk TSF would create a bathtub of water in the lower part of the TSF, because the liner would impede the planned flow-through of seepage through the tailings and main embankment. This would result in saturated lower tailings that could be susceptible to static and seismic liquefaction during operations, and through closure and post-closure, even in thickened tailings several hundred feet deep. Technologies have been evaluated to connect drains into bottom liners to enhance seepage, but they have not been proven and implemented on a similar scale.	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Tailings Management			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		4. Environmental Impacts Test: This option would result in poor consolidation of tailings that would lead to long-term saturation of the deeper tailings, and susceptibility to static and seismic liquefaction. This would defeat the drainage objective of the proposed thickened TSF. The ultimate result would be higher potential mobility of the tailings, and prevention of the tailings from consolidating over time by gradual drainage, and ultimately becoming a stable landform as proposed. ***Why Dismissed*** – This option would increase overall adverse impacts because the liner would retain water in the bulk tails and increase the risk of dam failure and tailings mobility.	
Pyritic Tailings Basin – Lined	TSF-016	***Origination*** – PLP Proposed Action ***Description*** – This option is part of the Proposed Action, which has the bottom of the pyritic tailings TSF fully lined so that the pyritic tailings would not be in contact with the ground surface. Additionally, this option allows for pyritic tailings to be stored sub-aqueously without the circulation of seepage water.	☑ Proposed ☐ Alternative ☐ Dismissed
Pyritic Tailings Basin – Unlined	TSF-017	***Origination*** – This option was evaluated by PLP when developing the proposed project design. ***Description*** – Under this option, the pyritic TSF would be unlined. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: It is reasonable to consider an unlined facility. 3. Practicable Test: It is practicable with existing technology to build an unlined TSF, and it would reduce costs. 4. Environmental Impacts Test: PLP has proposed a lined pyritic TSF to allow subaqueous storage during operations. The liner would also reduce the volume	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Tailings Management			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		of pyritic tailings–contaminated seepage from the facility that would need to be collected and treated. PLP has also proposed to move the pyritic tails and PAG waste to the completed pit at closure, and reclaim the TSF; eliminating the need for the pyritic TSF to be perpetually maintained. ***Why Dismissed*** – This option would increase overall adverse impacts.	
TSF Location – NFK West TSF Location	TSF-018	***Origination*** – PLP Proposed Action ***Description*** – This option is part of the Proposed Action, and would store the bulk tails 2 to 3 miles west of the proposed pit. The pyritic tails would be stored at the NFK East location (TSF-021).	☑ Proposed ☐ Alternative ☐ Dismissed
TSF Location – NFK North TSF Location	TSF-019	***Origination*** – This TSF location was evaluated by PLP when developing the proposed project design. ***Description*** – This option would store pyritic tailings about 2 miles north of the proposed open pit. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: This location has been studied previously and is a reasonable option to consider. 3. Practicable Test: This site is close to the process plant, has sufficient storage capacity for all tailings, and allows for the segregation of bulk and pyritic tailings. This option has the highest efficiency, making it the least costly option. 4. Environmental Impacts Test: The catchment area of the site is high, and the total anadromous stream miles impacted, as well as impacted acres of wetlands for this site, are high. ***Why Dismissed*** – This option would increase overall adverse impacts.	☐ Proposed ☐ Alternative ☑ Dismissed

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Tailings Management			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
TSF Location – NFK East TSF Location	TSF-020	***Origination*** – PLP Proposed Action ***Description*** – This location is proposed by PLP to store the pyritic tailings about 1 mile west of the proposed open pit. The bulk tailings would be stored at the NFK West location (TSF-019).	☑ Proposed ☐ Alternative ☐ Dismissed
Combined TSF and Operating Pond	TSF-021	***Origination*** – This option was evaluated by USACE to avoid impacts associated with a separate water management pond. ***Description*** – This option would add the Operating Pond (part of the main water management pond) to the bulk TSF. It would result in additional water stored in the bulk TSF, and would eliminate the need for or reduce the size of the main water management pond. The objective would be to perform all bulk tailings and water management operations at one facility, instead of two facilities. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: It is reasonable to consider options that potentially reduce the footprint. A combined pond is proposed for the Donlin Gold Mine. 3. Practicable Test: This option is compatible only with the slurry tailings disposal method (TSF-002). The option is not compatible with the thickened tailings disposal objective of ultimate drainage and consolidation of the tailings to a stable landform. Production of thickened tailings requires the dewatering of tailings as part of the milling process. The bulk TSF is planned to store thickened tailings that have been previously dewatered to the extent that they would be discharged to the bulk TSF at a solids content of 55 percent. This plan would result in a drier and more stable tailings deposit than would result from slurry tailings discharge. A combined bulk TSF/Operating Pond facility could be achieved by either not thickening the tailings, and thereby depositing slurry tailings; or building an internal embankment in the combined facility to separate	**Status under review**

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Tailings Management			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		the thickened tailings from water. 4. Environmental Impacts Test: The proposed main water management pond has a footprint of approximately 925 acres, of which about 750 acres contain the normal operating pond level, and the remaining 175 acres are for the maximum operating pond level and probable maximum flood. Much of this area is wetlands. If the bulk TSF also contained the Operating Pond, there would be a reduction in impacts to Waters of the U.S. However, a combined bulk TSF/Operating Pond facility that combined non-thickened tailings and water would be a slurry TSF that is contrary to the environmentally safer consideration of a thickened TSF; and in conflict with current global mining objectives of developing drier TSFs as best available technology, regardless of water supply factors, and moving the industry towards zero tailings dam failures. A combined bulk TSF/Operating Pond facility with separate thickened tailings and water storage areas would require a bulk TSF area and a water retention area separated by a divider dam, and would require a footprint that would be larger than the planned bulk TSF footprint, but could be similar to the combined footprints of the proposed separate bulk TSF and main water management pond facilities. ***Why Dismissed*** – The option conflicts with the objective of thickened tailings and does not offer any environmental advantages over the proposed action.

PAG Waste Rock			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		the air, and therefore would generate ARD and ML that would need to be collected and treated. Additional collection and treatment facilities and infrastructure would be needed. 4. Environmental Impacts Test: Construction of the associated infrastructure would increase wetland impacts for no environmental benefit. ***Why Dismissed*** **–** This option would increase overall adverse impacts associated with construction of a separate facility, and PAG waste rock would likely generate ARD over time.	

AMERICAN OVERSIGHT

Table B-1: Preliminary List of Project Options Being Considered

Water Treatment and Air			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
Water Treatment	WTP-001	***Origination*** – PLP Proposed Action ***Description*** – This option is part of the Proposed Action, which involves water treatment technology to meet the Alaska water quality discharge standards. To meet the water quality standards in receiving body per *Alaska Water Quality Criteria Manual*, and to meet the mine plan requirements, two WTPs would be required: WTP #1 near the Open Pit; and WTP#2 near the Main WMP. WTP #1 would use chemical precipitation and filtration for metals removal. WTP#2 would use chemical precipitation followed by Reverse Osmosis (RO) for meeting total dissolved solids (TDS)/sulfate limits, and biological selenium removal.	☑ Proposed ☐ Alternative ☐ Dismissed
Enhanced Water Treatment	WTP-002	***Origination*** – Evaluation of an option that treats water for discharge to meet the water quality of the natural receiving waters was suggested during scoping. ***Description*** –This option would require the water quality of all discharged water to be the same as receiving water. Additional water treatment steps would likely be required to achieve this. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: It appears this suggestion was made without an understanding of the regulations that apply to water discharges. PLP would be required—and has committed to achieving—applicable water quality standards at the end of pipe (i.e., no mixing zones). The standards are developed by ADEC to be protective of aquatic life; therefore, the enhanced treatment would provide no meaningful environmental benefit making this option not reasonable. ***Why Dismissed*** – PLP would be required—and has committed to achieving—applicable water quality standards at the end of pipe (i.e., no mixing zones). The	☐ Proposed ☐ Alternative ☑ Dismissed

Water Treatment and Air			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		standards are developed by ADEC to be protective of aquatic life; therefore, there is no meaningful environmental benefit of additional treatment of the water, making this option not reasonable.	
Enhanced Water Treatment – Zero Metal Discharge	WTP-003	***Origination*** – Evaluation of an option that would result in zero discharges of metals into the watershed was suggested during scoping. ***Description*** – This option would require there to be zero metal content in discharged water. To meet zero metal content, chemical precipitation followed by RO, and an additional ion exchange step would be required to completely remove the metals. The treatment system would essentially generate ultrapure water for discharge by providing a treatment that is well beyond what is required to meet the water quality standards, thereby resulting in "over treatment." This water is expected to have very low TDS or mineral content, and is likely to be "too clean" for discharge (i.e., some constituents have minimum standards). To address potential toxicity associated with this flow, addition of certain constituents is likely required to make it amenable for discharge resulting in some metal content. ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: It appears this suggestion was made without an understanding of the regulations that apply to water discharges. PLP would be required—and has committed to achieving—applicable water quality standards at the end of pipe (i.e., no mixing zones). The standards are developed by ADEC to be protective of aquatic life; therefore, the additional treatment would provide no meaningful environmental benefit making this option not reasonable. ***Why Dismissed*** –PLP would be required—and has committed to achieving—applicable water quality standards at the end of pipe (i.e., no mixing zones). The	☐ Proposed ☐ Alternative ☑ Dismissed

Water Treatment and Air			
Option	**Option #**	**Option Details and Screening** ❖ Option Details: Origination, Description ❖ Screening Criteria: 1. Purpose and Need Test, 2. Reasonable Test, 3. Practicable Test, 4. Environmental Impacts Test ❖ Why Dismissed (as applicable)	**Status**
		standards are developed by ADEC to be protective of aquatic life; therefore, there is no benefit of treating the water to make it cleaner than required, making this option not reasonable.	
Enhanced Water Treatment – Reverse Osmosis	WTP-004	***Origination*** – Evaluation of an option that would require RO for all water treatment was suggested during scoping. ***Description*** –This option would use chemical precipitation, followed by RO processing for water treatment at both WTPs (WTP#1 and WTP#2). ***Screening*** – 1. Purpose and Need Test: Meets the purpose and need. 2. Reasonable Test: PLP would be required—and has committed to—achieving applicable water quality standards at the end of pipe (i.e., no mixing zones). The standards are developed by ADEC to be protective of aquatic life; therefore, the additional treatment would provide no meaningful environmental benefit making this option not reasonable. ***Why Dismissed*** – RO-based treatment is primarily required for TDS and sulfate removal. Because both TDS and sulfate are below the discharge limits in the influent water to WTP#1, RO is not required. Chemical precipitation followed by filtration would be sufficient to meet the discharge limits for WTP#1, and RO-based treatment can be limited to just WTP#2. The option of using RO at both WTPs is not reasonable, and would unnecessarily increase the carbon footprint, facility size, and the residual solids disposal requirements.	☐ Proposed ☐ Alternative ☑ Dismissed
Airtight Structure for Emissions Collection	AIR-001	***Origination*** – Evaluation of an option that covers the development with an airtight structure to contain ARD from getting into the air was suggested during scoping. ***Description*** – This option calls for the development and construction of an airtight structure that covers the Mine Site. Any fumes or gasses would be cleaned before	☐ Proposed ☐ Alternative ☑ Dismissed

Subject: Pebble EIS Updates
Attachments: 10_10_2018_Updated_ProjectDescription.pdf

Hello All,
I have a few updates to share regarding the Pebble EIS.

First, the Corps plans to distribute preliminary drafts of the DEIS chapters for review in November. We expect to receive all chapters by 11/9/18, although sections may be received in advance on a rolling basis. Comments on all sections will be due 11/21/18. This will be a very tight timeframe for review, as management review of our comments will be required, so please plan to review within a few days of receipt – I will provide a specific due date once sections have been received. The Corps has said they will share all sections of the document for context, although our comments are still only requested on those specific sections we have been assigned in the Cooperating Agency Workplan (the same ones we have seen early drafts of so far).

Second, the Corps has distributed a revised project description developed by Pebble. My understanding is that this revised project description aligns with the updates to the project that we learned about earlier this year (e.g., use of lightering at Amakdedori Port), but I have not had time to read it in detail myself. I recommend reading when you have time, as it will help us prepare for review of the draft chapters in November.

Please let me know if you have any questions.
Thank you,
Molly

1. PROJECT OVERVIEW

Pebble Limited Partnership (PLP) is proposing to develop the Pebble copper-gold-molybdenum porphyry deposit (Pebble Deposit) as an open-pit mine, with associated infrastructure, in southwest Alaska. This project description summarizes information about the environmental setting, engineered facilities and operations for the proposed Pebble Project (Project) from initial construction through closure and reclamation. It is intended to support the National Environmental Policy Act (NEPA) review process and other permitting efforts for the Project.

1.1. PEBBLE PROJECT SUMMARY INFORMATION[1]

- Project operating life of 20 years.
- A total of 1.44 billion tons of material mined over the life of the Project.
- Final pit dimensions of 6,800 feet in length, 5,600 feet in width, and 1,970 feet in depth.
- Mining rate up to 73 million tons per year, average rate of 70 million tons per year.
- Milling rate up to 66 million tons per year.
- Average annual copper-gold concentrate production (dry concentrate) of 613,000 tons.
- Average annual molybdenum concentration production (dry concentrate) of 15,000 tons.
- Final bulk tailings storage facility (TSF) capacity of 1,140 million tons.
- Temporary storage of 155 million tons of pyritic tails in the pyritic TSF.
- Temporary storage of up to 50 million tons of Potentially Acid Generating (PAG) and/or Metal Leaching (ML) waste rock in the pyritic TSF until closure.
- Power plant generating capacity of 270 megawatts (MW).
- Project operating schedule of two 12-hour shifts per day for 365 days per year.
- An 83-mile transportation corridor from the mine site to a year-round port site located on Cook Inlet near the mouth of Amakdedori Creek consisting of:
  - A 30-mile private two-lane unpaved road from the mine site to a ferry terminal on the north shore of Iliamna Lake.
  - An 18-mile lake crossing utilizing an ice breaking ferry to a ferry terminal on the south shore of Iliamna Lake.
  - A 35-mile private two-lane unpaved road from the south ferry terminal to the Amakdedori Port.
  - Lightering of concentrate between Amakdedori Port and offshore lightering locations for loading onto bulk carriers.

[1] Design criteria as presented are approximate and have been averaged and rounded as appropriate for ease of reference.

AMERICAN OVERSIGHT

- Unpaved spur roads from the transportation corridor to the communities of Iliamna, Newhalen, and Kokhanok.
- A port facility and jetty with docking for lightering and supply barges.
  - Annual vessel traffic of up to 27 concentrate vessels and 33 supply barges.
- A 188-mile gas pipeline from the Kenai Peninsula across Cook Inlet to the Project site with a compressor station on the Kenai Peninsula.
- Employment of 850 to 2,000 personnel for operations and construction, respectively.

1.2. Background

The Project is located on land acquired by the State of Alaska in 1974 via a three-way land swap with the federal government and Cook Inlet Region, Inc. The land was selected by the state specifically for its mineral development potential. The initial discovery of the Pebble Deposit was made in 1988 by Cominco Alaska, a division of Cominco Ltd. (Cominco). Cominco (later acquired by Teck Resources Limited) discontinued work on the project in 1997, and in 2001 the Pebble claims were optioned by a subsidiary of Northern Dynasty Minerals Ltd. (Northern Dynasty).

Northern Dynasty began exploring the property, with significant success, expanding the Pebble Deposit from one billion to four billion tons by the end of 2004. An extensive environmental baseline data collection program commenced in that year, as well as geotechnical investigation and preliminary engineering studies. In 2005, Northern Dynasty exercised its option to acquire the Project and in the same year discovered a significant, higher grade eastern extension to the deposit. Over the next seven years, the Pebble Deposit was expanded through drilling.

In 2007, Northern Dynasty formed PLP with another company and placed the Project into the partnership. Over the next six years, PLP continued to advance the Project through additional drilling, environmental data collection, and engineering studies. In 2013, the other company left PLP and it reverted to a wholly owned subsidiary of Northern Dynasty.

To date, more than one million feet of drilling has been conducted on the Pebble Deposit.

Products from mining this deposit can supply important mineral resources for alternative energy and other purposes of strategic national significance. The Pebble Deposit has significant regional economic importance for southwest Alaska and the entire state through the creation of high-wage jobs and training opportunities, supply and service contracts for local businesses, and government revenue.

1.3. Project Design Considerations

Plans for the design and operation of the Project have focused on the avoidance and minimization of environmental impacts to waterbodies, wetlands, wildlife and aquatic habitat, areas of cultural significance, and areas of known subsistence use and addressing stakeholder concerns. In addition to meeting or exceeding local, state, and federal regulatory requirements, the Project incorporates the following concepts into the design:

AMERICAN OVERSIGHT

EPA-0135-0004738

- The Project plan is to mine the near-surface portion of the Pebble Deposit. This has significantly reduced the footprint of the open pit, TSF, and mine facilities, as well as eliminated the need for a permanent waste rock storage facility.
- The layout is designed to consolidate the majority of site infrastructure in a single drainage — the North Fork Koktuli River (NFK) — and avoid placing waste rock or tailings in the Upper Talarik Creek (UTC) drainage.
- The transportation corridor incorporates a ferry crossing of Iliamna Lake to connect the mine site to a marine port on Cook Inlet, significantly limiting the total access road length and associated impacts relative to a longer access road around Iliamna Lake. The road alignment was further refined to avoid areas of known subsistence and recreational use and to minimize wetland impacts.
- A natural gas pipeline and gas-fired electrical generation are being used to power the Project, thereby eliminating the need to transport and store large amounts of diesel fuel for power generation.
