Re: Freedom of Information Act Request No. EPA-HQ-2019-008587, Interim Response

Dear Mr. Evers:

This letter concerns the above referenced Freedom of Information Act (FOIA) request, received by the U.S. Environmental Protection Agency (EPA or Agency) on September 3, 2019.

I. Previously Released Information

EPA has recently processed a FOIA request related to Bristol Bay that, among other topics, seeks records about the NEPA Process and communications with Pebble Partnership. Portions of this request may also be responsive to your request.

To date, 29 interim responses have been provided to this requester. These records may be accessed at the link below or by searching for FOIA request EPA-R10-2019-000135.

https://foiaonline.gov/foiaonline/action/public/submissionDetails?trackingNumber=EPA-R10-2019-000135&type=request

II. Next Steps

Please review the records provided. If these records satisfy your request, please let us know promptly so that we can close the request. We will continue to process your FOIA request.

If you would like to discuss your request and the records further, please email or call Denise Walker at 202-564-6520 or walker.denise@epa.gov to set up a time.

AMERICAN OVERSIGHT

If you wish to request information connected to this request in the future, please reference the FOIA request number.

Additionally, you may seek assistance from EPA's FOIA Public Liaison at hq.foia@epa.gov or (202) 566-1667, or from the Office of Government Information Services (OGIS). You may contact OGIS in any of the following ways: by mail, Office of Government Information Services, National Archives and Records Administration, Room 2510, 8610 Adelphi Road, College Park, MD 20740-6001; email, ogis@nara.gov; telephone, (202) 741-5770 or (877) 684- 6448 or fax, (202) 741-5769.

Sincerely,

s/s Denise A. Walker

Denise A. Walker

I thought it would be helpful for folks to talk through David's comments. Sorry for the lunch time meeting. I couldn't find any other time to get a critical mass and I know not everyone is available. If there are critical folks that can't make this time, just let me know. Also, let me know if you think there are others that should be added.

Moving so that Carrie Wehling can join.

Hi –

We were originally planning on talking about the interaction between the PD and the scoping letter tomorrow during the biweekly. But, talked to Palmer after talking to MaryAnne and then Cara today, and we think a separate meeting on this is best. Heidi likely can't call in tomorrow and also I think we may want a full hour. Schedules are busy so this is the first available.

Conference Line/Code / Ex. 6

Hopefully this works.

Thanks,

Ashley

David,

I was on a phone call with ORC, OGC, Palmer and members of the regional team in which this was discussed. If you have a moment, I am hoping to be able to share our thoughts with you. I saw that there may be other opportunities, if this does not work for you. I don't imagine it will take long. Thanks.

Hi David,
I have completed a resolution/compilation of the edits received to date. There are a very limited number of places where I did not accept edits yet, and have left for your consideration (with explanatory comments). I do not think any of the remaining edits are intolerable, but felt they were ones that warranted bringing to your attention. Please let me know if there is anything else I can do to assist with finalizing this letter.
Regards,
Molly

It is my understanding that there are 2 versions of the scoping letter. There is one version that has incorporated OFA and OW comments that Molly has. The version that OGC commented on is not the latest version.
It is not clear whether Molly or David is consolidating these two versions.
Can we discuss?

Jill and David-

The Corps today issued its NOI to prepare an EIS and its scoping schedule. See links below.
The scoping period runs from April 1 to 30.
I had hoped that the Corps would extend the schedule based on letters that have already come in, including the attached letter from the DNR commissioner.
I recommend that we write a short letter also requesting an extension of the scoping period. If you agree, I will work with Molly on a letter.

Thanks - Patty

Interested parties are hereby notified that a Department of the Army permit application has been received for work in waters of the United States.

SPECIAL PUBLIC NOTICE DATE: March 30, 2018

IDENTIFICATION NUMBER: POA-2017-271

APPLICANT: Pebble Limited Partnership

LOCATION: The project would be located in the Iliamna region of southwest Alaska, approximately 200 miles southwest of Anchorage and 60 miles west of Cook Inlet. The closest communities are the villages of Iliamna, Newhalen, and Nondalton, each approximately 17 miles from the Pebble Deposit.

CONTACT:
For information regarding the proposed project plans and construction, please contact the applicant at:
Pebble Limited Partnership
3201 C Street, Suite 505
Anchorage, Alaska 99503.

For additional information regarding the EIS process (including scoping) please contact:
Mr. Shane McCoy
Program Manager, Regulatory Division
US Army Corps of Engineers, Alaska District CEPOA-RD Post Office Box 6898 JBER, Alaska 99506-0898

Also, please visit our project website at www.PebbleProjectEIS.com.

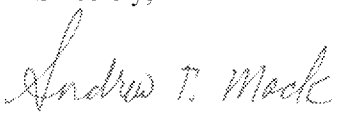
Col. Michael Brooks
Commander
U.S. Army Corps of Engineers – Alaska District
Post Office Box 6898
JBER, Alaska 99506-0898
michael.s.brooks@usace.army.mil

Dear Colonel Brooks,

I write regarding the anticipated publication of the US Army Corps of Engineers' (USACE) Notice of Intent (NOI) to Prepare an Environmental Impact Statement (EIS) set to be published in the Federal Register this week. It is the State of Alaska's understanding that the USACE intends to announce a 30-day scoping period for the proposed Pebble Project. For a variety of reasons, explained below, the Alaska Department of Natural Resources (DNR) requests that the USACE extend the scoping period to at least 90-120 days for the proposed Pebble Project EIS.

The Code of Federal Regulations defines scoping as an "early and open process for determining the scope of issues to be addressed and for identifying the significant issues related to a proposed action" (40 CFR 1501.7). Although the USACE has conducted some outreach with tribes and stakeholders, including DNR, following receipt of Pebble Limited Partnership's 404 application, and proactively posted the application along with draft scoping materials on-line ahead of the NOI, it does not relieve the USACE from offering a scoping period commensurate of the scale and importance of the Pebble Project.

The proposed Pebble Project envisions an open pit mine, a mile across, near the headwaters of the most prolific salmon fishery in the world. The region supports villages and subsistence activities year-round. Due to the size and potential impact of the proposed mine, a 30-day scoping process is likely insufficient for the public to identify, and the USACE to address, issues of concern, studies that are needed, and alternatives to be examined.



The scoping process will rightfully include several public meetings with those affected by the proposed project. Western Alaska is not always easily accessible because travel is often affected by weather and distance. With multiple meetings scheduled across the state, should just one scoping meeting be delayed it could jeopardize the Corps' 30-day scoping process. Thus, from a practical standpoint, USACE should consider a longer scoping period.

The scoping period for the proposed Donlin mine included a National Environmental Policy Act (NEPA) review, was led by the USACE, and lasted from December 14, 2012 to March 29, 2013, a total of 105 days. In that scoping process, the USACE conducted 14 public meetings across Western Alaska, one nearly each week of the entire scoping period. The State of Alaska requests that the USACE follow a similar scoping process to that of the Donlin mine.

AMERICAN OVERSIGHT

The scoping process will be extremely important to a thorough evaluation of environmental impacts from the proposed Pebble Project. We encourage the USACE to take every opportunity to accept comments and suggestions from the public as this project moves forward. The most effective way to achieve this is by ensuring a sufficient scoping period.

Sincerely,

Andrew T. Mack,
Commissioner

Pebble EIS Preliminary Draft Chapter 1 and 2
EPA Comments
11/21/18

Thank you for the opportunity to review the preliminary drafts of Chapters 1 and 2 of the Pebble EIS, in accordance with our role as a Cooperating Agency. We do not have any comments to provide on Chapter 1 at this time. Our comments on Chapter 2 are provided in table format below.

We have a number of comments requesting more detail in the description of Alternative 1 (the proposed action) and the other alternatives. In addition, we have significant concerns regarding the rationale for the range of alternatives and lack of inclusion of a tailings dry stack alternative and bulk TSF liner alternative. We have previously provided comments related to our recommendations to analyze these alternatives in the Draft EIS to the Corps in our review of the Draft Appendix B Alternatives Development Process and review of AECOM's dry stack memo. At the October 24, 2018 Cooperating Agency meeting, the Corps and AECOM presented the range of alternatives proposed for analysis in the EIS. At that meeting, we expressed our concerns with lack of both a dry stack alternative and TSF liner alternative included in the EIS, and we requested a follow-up conversation with the Corps and AECOM technical experts to discuss our concerns. The Corps agreed to hold this meeting but has not yet scheduled it. We note that establishing a robust range of alternatives is a foundational issue for NEPA compliance as it effects the scope and scale of other sections of the EIS. Per the Cooperating Agency plan, we would like to collaborate with the Corps to try and resolve our concerns prior to release of the Draft EIS. We therefore reiterate our request for a technical meeting to discuss these tailings storage options. We recommend that along with the EPA, the Corps and AECOM, other cooperating agency experts be invited to participate.

Due to the limited time available for review of Chapter 2 and uncertainty regarding how the Corps intends to address the comments that we have previously provided on Appendix B, our public comments on the Draft EIS may include additional concerns or recommendations.

Page	Section	Existing text (if applicable)	Recommendation
1	2.0	The alternatives development process for the proposed Pebble Project (the project) considers a broad range of alternatives in sufficient detail to address both NEPA and CWA Section 404(b)(1) requirements.	We recommend providing additional explanation regarding the process for evaluating alternatives to comply with the CWA Section 404(b)(1) guidelines. We note that the current alternatives evaluation does not enable comparison of the alternatives for the purpose of compliance with the 404(b)(1) guidelines and to identify the potential least environmentally damaging practicable alternative (LEDPA) for 404 permitting purposes because, for example, there is insufficient information about how all practicable steps have been taken to avoid and minimize aquatic impacts. We understand that the 404(b)(1) guidelines analysis will be included in an appendix, and we request an opportunity to review and provide comments on that appendix prior to release of the Draft EIS.

AMERICAN OVERSIGHT

Page	Section	Existing text (if applicable)	Recommendation
2	2.2	Alternatives Carried Forward for Detailed Analysis – General comment on identification of preferred alternative	We recommend that the Draft EIS note that the NEPA regulations require that agencies identify the preferred alternative in the DEIS if one exists and disclose whether the action agencies have identified that alternative and if not, why not. The three action alternatives proposed to be carried forward for detailed analysis combine various alternative project elements into three discrete alternative packages, and include variants to those alternatives. We note that this approach can be confusing to agency reviewers and members of the public, who may not understand that separate elements/variants can also be combined into a new alternative at the Final EIS or Record of Decision. In addition, we note that it can be difficult for decision makers to understand the environmental trade-offs of various elements when packaged in this way. We recommend that the Corps ensure that the Draft EIS clearly explains the process for packaging alternative elements/variants into complete alternatives and for ultimately selecting a preferred alternative, including explaining that the final preferred alternative could include a combination of the alternatives and variants analyzed in the EIS for the different project components. In addition, we recommend that the analysis of environmental consequences clearly analyze each project element separately, rather than summarizing impacts for an alternative as a whole (e.g., analyze the impacts of the downstream TSF compared to the proposed action, separate from consideration of impacts from North Access Road). This information will be critical to decision makers in alternative selection.
6	2.2.2	"…employ approximately 850 to 2,000 personnel for operations and construction, respectively."	We recommend clarifying that 2,000 personnel would be employed for 4 years of construction and 850 personnel would be employed for 20 years of operation. In addition, we recommend that the EIS clarify whether these numbers are annual or total estimates for each period.
6	2.2.2	"An 84-mile transportation…" "A 29-mile private two-lane…" "A 37-mile private…" "A 187-mile gas pipeline…"	We recommend verifying the miles provided for each of these project components, as what is stated here differs slightly from the miles given in the updated project description on pages 1 and 2.
6, 7, and 12	2.2.2		We note that the tons of material to be mined and placed in the Tailings Storage Facility varies throughout the document and recommend confirming the correct quantity prior to the release of the DEIS.
7	2.2.2.1	"Fine and coarse-grained soils would be stored southwest of the pit and north	We recommend clarifying how and where these soils/sediments would be stored and managed to ensure they are not mobilized over the 20-year period of the

AMERICAN OVERSIGHT

Page	Section	Existing text (if applicable)	Recommendation
		of the TSF embankments and would be used for reclamation during mine closure."	mine life. We also recommend that the EIS clarify whether these storage areas are the same as or different from those labeled as the growth media areas in Fig 2-3.
7	2.2.2.1	During this period, 1,300 million tons of mineralized rock and 150 million tons of waste rock and overburden would be mined	We note that the total here is 1.45 billion tons, whereas in other places the total is stated as 1.4 billion tons or 1.3 billion tons. We recommend verifying the correct amount and clarifying where values may be summing a subset of the material.
7	2.2.2.1	Non-potentially acid-generating (NPAG) waste rock would be used in construction of the tailings embankments.	We recommend that the EIS provide the criteria that will be used to distinguish NPAG and non-metal leaching (ML) waste from PAG and ML waste and discuss how the NPAG/PAG determinations will be made during active mining. These details are typically provided in EISs for mining projects and are necessary to evaluate the effectiveness of the NPAG/PAG separation and potential environmental impacts from tailings and waste management.
8	Fig 2-3		We recommend adding text to the document that explains what quarries are and why they are needed (Quarries A, B, C are shown in Fig 2-3, but are not mentioned anywhere in the text).
9	Fig 2-4		We recommend improving the digital simulation to better clarify which features are part of the mine vs. which are natural features (e.g., gray shading for lakes and mine components may be confusing to the readers of the EIS). We also recommend expanding the scale of Fig 2-4 to encompass all components shown in Fig 2-3 (e.g., Quarry B is not included in Fig 2-4).
11	2.2.2.1	"Material would be stockpiled within the pit footprint, or in designated stockpiles, as appropriate."	We recommend providing additional detail regarding where mineralized material would be stockpiled, as well as showing the locations in Figure 2-3. Figure 2-3 indicates stockpile locations for overburden but does not show mineralized material stockpile locations.
11	2.2.2.1	In the grinding plant, it would be reduced to the consistency of very fine sand. The next step is froth flotation, in which the copper and molybdenum minerals are separated from the remaining material to produce concentrates… See Figure 2-6 showing the process flow diagram.	We recommend that the EIS state here that water and chemicals (reagents) are added during mineral processing and refer to the table that provides the list of reagents that would be used. We recommend expanding Figure 2-6 to show points in the process where water and reagents are added. In addition, this figure shows that some gold will be extracted by gravity separation, but the text never mentions this process, nor does it say how it will be handled. We recommend that the gold extracted in the gravity separation process be accounted for in the description of handling of products leaving the mine site.

AMERICAN OVERSIGHT

Page	Section	Existing text (if applicable)	Recommendation
11	2.2.2.1	[1] Bulk tailings are comprised of relatively inert, non-acid-generating fine-grained ground waste rock that remains after economic minerals and pyritic materials have been extracted through ore processing at the mine site. See also pyritic tailings. Pyritic tailings are comprised of potentially acid-generating fine-grained ground waste rock containing the naturally occurring mineral pyrite.	We recommend revising the definitions to remove the term "waste rock" so as not to confuse tailings with waste rock that is extracted during mining. For example, the term "waste material" is often used instead of waste rock since tailings also contain process reagents and water.
11	2.2.2.1	The TSFs would be designed to meet or exceed the standards of the updated 2017 Guidelines for Cooperation with the Alaska Dam Safety Program (ADSP) prepared by the Alaska Department of Natural Resources (ADNR).	Further information is necessary to support this statement. We recommend that the DEIS provide a table that lists the ADSP standards that are being referred to in this sentence. For each standard that is applicable to the project, the EIS should provide information specific to the bulk TSF, pyritic TSF, and water management pond designs and operations that clearly demonstrate that they meet or exceed the state ADSP standards. In addition, given the size of the dams and importance of downstream aquatic resources, and for the bulk TSF, centerline dam construction methodology (which is not as stable as downstream construction), we recommend that: (1) a Failure Modes Effect Analysis (FMEA) or other type of formal risk assessment be conducted for the dam designs; and (2) the Corps require that the tailings dam designs be independently reviewed per 33 CFR 325.1. FMEA/risk assessment and independent review are recommended best practices from both the Independent Expert Engineering investigation and Review Panel Report on Mount Polley Tailings Storage Facility Breach (2014) and the International Council on Mining and Metals Review of Tailings Management Guidelines and Recommendations for Improvement (Golder 2016) for evaluating safety and stability of tailings dams. Mitigation measures arising out of the risk assessment and independent reviews should be identified and required of the final designs and operating plans. We recommend that the FMEA/risk assessment and independent review occur now so that the results can be disclosed in the DEIS to support the Corps' hard look, as required by NEPA, at tailings dam stability and safety.
14	2.2.2.1	The main embankment of the bulk TSF would function as a permeable structure to maintain a depressed zone of	We recommend that the EIS describe how the main embankment would be designed, constructed, and operated to maintain both permeability and stability. We also recommend that the document discuss whether

AMERICAN OVERSIGHT

Page	Section	Existing text (if applicable)	Recommendation
		saturation in the embankment, and tailings mass in proximity to the embankment.	100% of the water flowing through the embankment would be captured and how it would be captured.
14	2.2.2.1	A basin underdrain system would be constructed at various locations throughout the bulk TSF basin to provide preferred drainage paths for seepage flows.	We recommend describing whether the underdrain system would be designed to capture 100% of the TSF seepage. We also recommend providing a figure that shows the number of underdrains and alignment of the underdrain system below the TSF. These details are necessary to evaluate effectiveness of the system and potential groundwater impacts.
14	2.2.2.1	The pyritic TSF would be a fully lined facility.	We recommend that the EIS describe the type of liner that would be used (material and thickness) as well as the construction and waste rock and tailings placement techniques that would occur to ensure liner integrity.
18	2.2.2.1	The south Bulk TSF embankment would be constructed using the downstream construction method to facilitate lining of the upstream face	We recommend clarifying why this particular embankment would be lined and the others in the same TSF would not be.
18	2.2.2.1	The embankments would be constructed using select borrow materials, and include a liner bedding layer, overlain by a liner, on the upstream slope and over the entire internal basin	We recommend that the EIS clarify whether the pyritic TSF will have a drainage system under the liner.
18	2.2.2.1	TSF embankments would be constructed in stages throughout the life of the project, with each stage providing the required capacity until the next stage is completed.	We recommend adding a table or figure that provides the rate of rise for the TSF dams.
18	2.2.2.1	It would be a fully lined facility and would be constructed using quarried rockfill materials. The embankment would be approximately	We recommend disclosing the type of liner that would be used under the water management pond.
11-18	2.2.2.1	General comment on description of tailings management and TSFs	The discussion on tailings management is missing several key elements, which we recommend be added to the description, including: (1) how dust and erosion of the TSF buttresses and beaches will be managed and mitigated; (2) the stability, seepage, and environmental monitoring that would occur to determine whether the dams are performing as designed, and actions that would be taken if they are not; and (3) the emergency action plans that would be developed and how notification would occur in the event of an emergency.

AMERICAN OVERSIGHT

Page	Section	Existing text (if applicable)	Recommendation
21	2.2.2.1	Table 2-2. Grinding Media, Reagents, and Miscellaneous Supplies	We recommend providing, in Table 2-2, the annual quantity of each of the mineral processing reagents that appear in Table 2-1 (e.g., as was done in for fuel and ammonium nitrate). We also note that "Grinding Media" does not appear in Table 2-1 and recommend that these materials be listed in both tables. In addition, please provide the estimated quantities of chemicals that would be used in the water treatment plants.
21	2.2.2.1		In the section for material management and supply, lubricants and diesel fuel are discussed as being stored in secondary containment. We recommend that the document also discuss that multiple chemicals to be used (at the main mine site for water treatment plants and processing and for the port WTP) also require secondary containment (and some will require freeze protection). It will be important for agency decision makers and the public to understand all of the specific chemicals that will be stored using secondary containment.
21	2.2.2.1	The project would develop a comprehensive water management plan that strategically discharges surplus treated water to downgradient streams in a manner that reduces the effect of stream flow fluctuations and minimizes impacts to fish habitat.	We recommend that the water management plan referred to in the text be included in the DEIS, and that Cooperating Agencies have an opportunity to review this plan prior to public release of the DEIS, to allow for evaluation of the effectiveness of the stream flow reduction and fish habitat impact minimization measures. Understanding the effectiveness of these measures is a key factor in evaluating impacts to groundwater, surface water, and aquatic resources. In addition, we recommend that the goal of water management be to manage discharges to match the natural flow regime as much as possible, in addition to reducing the effect of stream flow fluctuations.
22	2.2.2.1	Prior to the operations WTPs being brought on-line, modular WTPs would be used to treat contact water that does not meet discharge requirements.	We recommend describing the water treatment processes that would be used prior to the operations plants being brought on-line, similar to the information disclosed regarding the operations water treatment plants.
23	2.2.2.1	Production Phase Water Treatment	We recommend providing the following additional information in order to evaluate the effectiveness of water treatment and discharge: (1) design capacity of the mine area WTPs in comparison to expected and reasonable worst-case flows; (2) additional detail regarding the "multiple independent treatment trains"; (3) discharge (outfall) locations for each of the WTPs; and (4) as mentioned in previous comments, more information on the discharge timing (seasonal or

AMERICAN OVERSIGHT

Page	Section	Existing text (if applicable)	Recommendation
			year-around; specifically, how flows will be distributed among the outfalls).
23	2.2.2.1	• The pyritic TSF and associated seepage collection ponds would be reclaimed, and surface water runoff from the area discharged to the downstream environment. • The main WMP would be reclaimed, and surface water runoff from the area discharged to the downstream environment.	We recommend that the following be added to these two requirements: "once the runoff has been demonstrated to meet water quality criteria." A similar statement is found on the next page as a requirement prior to discharge from the reclaimed bulk TSF
24	2.2.2.1		There is no discussion of waste tire disposal during operations, which are notably mentioned on page 2-2 (2-19) as a primary material. We suggest that the discussion in the Updated Project Plan be added here as well for clarity. The Updated Project Description discusses used or damaged parts (Section 3.7 on PDF page 52) as "Used tires and rubber products will be reused to the extent practicable. Additional used tires, along with other damaged parts and worn pipes, will be packaged and back-loaded into empty containers for shipment and disposal off site."
24	2.2.2.1	Closure/Post-Closure Phase Water Management Plan	We recommend providing the following additional information related to closure/post-closure water treatment: (1) Describe the type of water treatment that would occur at closure, as was done for the operations Water Treatment Plants; (2) Closure WTP design capacity in comparison to predicted flows; (3) Estimated quantities of WTP chemicals needed during closure; (4) Discuss where WTP sludge would be disposed and estimated sludge quantities produced annually; and (5) Describe closure WTP outfall location(s) and whether discharges would occur year-around, seasonally, or otherwise be timed.
24	2.2.2.1	"Water quality would be closely monitored, and changes and adjustments to	We recommend expanding on this point to explain how water quality will be monitored (how often, by whom) and how adjustments will be made.

AMERICAN OVERSIGHT

Page	Section	Existing text (if applicable)	Recommendation
		the treatment process would be made as needed."	
21-23	2.2.2.1	General comment on water management description	We recommend providing the following additional information related to water management: (1) Surface water diversions are cited as key BMPs to minimize contact water. Provide figures that show where the surface water diversions will be located in relation to the mine site layout during construction, operations, and closure. (2) Describe the location of each treated water APDES outfall and describe the outfall structure/diffuser. (3) WTP sludges and residuals will be disposed in the pyritic tailings TSF. Discuss how much WTP sludge will be generated and how it will be disposed.
25	2.2.2.1	"Inert mine site materials, such as geomembrane material, piping, and pumps, would be drained and cleaned, as appropriate, and placed into a facility that would be permitted within the submerged waste rock dump in the pit or within the footprint of the reclaimed pyritic tailings facility." "Material that has residual value or is not suitable for onsite disposal would be hauled offsite for disposal (PLP 2018-RFI 055a)."	In Section 6.1 (PDF page 77-78) of the Updated Project Description, there is discussion of disposal of inert materials from dismantling and removal of site mine features during physical reclamation being "disposed of in an on-site monofill that will be sited within the disturbed footprint, while others will be shipped off site for disposal as appropriate." The Updated Project Description does not mention any disposal of these types of waste materials into the pit, but it is presented in RFI 055a. The RFI is dated prior to the Updated Project Description file. We suggest clarifying what materials would be disposed of in the pit at closure that could influence how the water is treated prior to release after closure.
25	2.2.2.1	Reclamation and closure of the project falls under the jurisdiction of the ADNR Division of Mining, Land, and Water, and the Alaska Department of Environmental Conservation.	The list of permits and approvals in Appendix N (Table 7-1) does not appear to include reclamation and closure. We recommend that the required permits and approvals for reclamation and closure be added to the table.
	Figure 2-10 and Figure 2-11	"habitat conditioning"	This term is not defined or explained in the text. We recommend that the EIS describe what it involves.
	Figure 2-11	"Waste sludge to tailings storage facility"	We recommend clarifying whether this is the pyritic TSF or the bulk TSF.
	Figure 2-11		We recommend that it would be helpful to the reader if the line between the RO unit and the biological reactor was red instead of blue, to indicate that it is the RO reject being treated. We note that this is not described in the text of the chapter (but is in the Updated Project Description).

AMERICAN OVERSIGHT

Page	Section	Existing text (if applicable)	Recommendation
	Figures 2-10 and 2-11		We recommend explaining in the EIS why the rejects from the RO are being treated differently at the two treatment plants, and how reject will be treated at the port.
28		"Once the level of the pit lake has risen to about 890 feet in elevation, water would be pumped from the pit, treated as required, and discharged to the environment."	We recommend that the EIS discuss the treatment steps for this process. We also recommend including a discussion of how the pit water would be managed to minimize its anticipated acidity and metal/metalloid load, which would minimize long-term treatment requirements.
25-28	2.2.2.1	General comment on mine site reclamation and closure	We recommend that the following additional information be provided. This information is typically included in mining EISs since reclamation and closure activities should be described in a sufficient level of detail to predict long-term environmental impacts: (1) As discussed above, provide more details on closure water treatment (WTP process flowsheet, estimated design flow, discharge outfall location and discharge timing, WTP sludge management); (2) List reclamation standards and objectives and describe the monitoring that would occur to demonstrate that objectives are met; (3) Provide a reclamation schedule that describes when key reclamation actions would occur (e.g., timing for physical reclamation, tailings consolidation, pit filling, and discharge, etc.); and (4) Most jurisdictions require a temporary closure plan that describe actions that would occur in the event the mine ceases operations prior to completion of mining. A temporary closure plan should be provided that describes how mine facilities would be closed in the event of pre-mature or temporary closure. This is particularly relevant for the TSFs, open pit, and for water management.
29	2.2.2.1	Financial Assurance	As discussed in our scoping comments, we recommend that the DEIS disclose the estimated financial assurance amount. This information is necessary to assess the effectiveness of reclamation and closure activities, which is critical to the assessment of environmental consequences of the project at and beyond closure.
29	2.2.2.2	"…whether the streams are fish-bearing….88 culverts; of these, 35 are designated as fish passage culverts."	We recommend that the EIS clarify whether this means any fish, or anadromous fish specifically, and provide data to support this statement. We note that only 35 of 88 crossed streams having fish seems very low.
	2.2.2.1	General comment on description of Alternative 1 - quarries	The description of the mine site does not discuss the quarries. We recommend that this information be added to section 2.2.2.1, similar to what was included for the material sites along the transportation corridor. Please provide the estimated size of the quarries (acres and

AMERICAN OVERSIGHT

Page	Section	Existing text (if applicable)	Recommendation
			depth), the amount of material that would be mined, testing that would occur, location of where the material will be placed, and how the quarries would be closed.
30	2.2.2.2	Culverts at streams with fish would be designed and sized for fish passage in accordance with ADOT&PF and Alaska Department of Fish and Game (ADF&G) standards.	We recommend that the EIS include a discussion or table that lists the specific standards referred to in this sentence.
38	2.2.2.2	A custom-designed ferry would transit Iliamna Lake between the north and south ferry terminals, carrying inbound supplies from Amakdedori port to the mine site, and returning with copper-gold and molybdenum concentrates, backhauled waste, and empty shipping containers.	We recommend that the document describe the method of personnel transport to and from the site.
38	2.2.2.2	Bilge water would be pumped through oil/water separation equipment installed on the vessel, and then discharged back to Iliamna Lake.	The ferry would require coverage under EPA's Vessel General Permit for discharges such as bilge water. Please see https://www.epa.gov/npdes/vessels-vgp for the current requirements for various sized vessels.
46	Table 2-3		We recommend clarifying whether material usage for the Kokhanok spur road is included in the material site quantities estimates for the port access road or provide a separate listing in the table as was done for the Iliamna spur road.
		All material site tables	We recommend adding supporting information that discusses the methodology for choosing the sites for material source, including: location within the landscape, type and amount of wetland impacts, and individual location analysis for avoidance and minimization of impacts.
47	2.2.2.2	Water Extraction Sites section	We recommend that the document include information on where the water extraction sites are located (e.g., show on maps as done with material sites, or list drainages/specific water bodies in table).
		All water extraction tables	We recommend adding supporting information that discusses how the water withdrawals would impact downstream receiving water quality and quantity, if any impacts are anticipated, and discusses the identification process used to avoid and minimize water quality and quantity issues resulting from the withdrawals.
48	2.2.2.2	"These camps would remain in place until the natural gas	We recommend that the EIS include an estimate for how long these camps would be in place, and the number of people they would be supporting.

AMERICAN OVERSIGHT

Page	Section	Existing text (if applicable)	Recommendation
		line construction is complete."	
58	2.2.2.3	"Copper-gold concentrate would be transported from the mine site to Amakdedori port by truck…"	We recommend clarifying that ferry transport will also be needed to get concentrate to the port.
58	2.2.2.3	The empty containers would be cleaned of any residue on the outside while at the port, and then returned to the laydown pad	We recommend clarifying how this will be accomplished and if there is potential for contaminated wash water to be discharged.
60	2.2.2.3	Port WTP	We recommend describing the WTP design capacity as compared to expected flows and describe the location of the WTP discharge outfall.
60	2.2.2.3	The treated water would be suitable for discharge.	Please clarify that any discharge needs to be authorized by an APDES permit.
60	2.2.2.4	Natural Gas Pipeline	We recommend clarifying whether the pipeline will be a common carrier and whether the four nearby villages have the ability to transport gas for their own use through the line.
60	2.2.2.4	Natural gas pipeline description	The description says the pipeline will be laid on the seafloor crossing the Inlet but also states that the pipeline crossing Iliamna Lake will be buried similar to Cook Inlet Crossing. Please provide clarification and additional detail regarding the method of pipeline installation for crossing of Cook Inlet and Iliamna Lake.
60	2.2.2.4	The pipeline would come ashore at Amakdedori port,	We recommend clarifying whether horizontal directional drilling would be utilized for the pipeline to come onshore at the port. If HDD would not be used, we recommend discussing how it will be ensured that the pipeline would not be a navigational hazard to vessels using the port.
		General comment on description of Alternative 1 - monitoring	The description of Alternative 1 mentions monitoring in several locations but does not provide any details. A monitoring plan is typically provided as part of a mine plan of operations to support EIS development and described in Chapter 2 of the EIS (since it is part of the project description). We recommend that a monitoring plan be included in the Alternative 1 description or provided in an appendix. The monitoring plan should include a sufficient level of detail to demonstrate that it can measure environmental effects and trends. In addition, the monitoring plan should have an adaptive management component and describe changes that would be made to the project design or operations should impacts be different than predicted or if standards are exceeded. The monitoring plan should describe the process and environmental monitoring that would occur during construction, operations, and closure for all project components and include monitoring locations, parameters, frequency, and

AMERICAN OVERSIGHT

Page	Section	Existing text (if applicable)	Recommendation
			objectives. Please see our scoping comments related to monitoring.
66	2.2.2.5	"Concentrate would be stored at the port site during the winter months."	It is not clear why concentrate would need to be stored at the port site. Please explain/clarify this in the EIS.
66	2.2.2.5		Please clarify if this variant would also require increased storage of other supplies during winter months (e.g., fuel).
68	2.2.2.6	"A total of 8 waterbodies would be crossed."	Please clarify if this refers to streams only, or if this also considers other waterbodies (ponds, wetlands).
73	2.2.3	Action Alternative 2 – North Road and Ferry	We recommend that the title of this alternative be revised to include mention of the downstream TSF, so that it is clear to agency decision makers and the public that the road and ferry are not the only changes that distinguish this alternative from Alternative 1.
88	2.2.3.3	Any remaining dredged material and any material from maintenance dredging would be disposed of on-shore in a bermed facility on uplands west of the dock site	We recommend that this section also describe the APDES and any other permits that would be required for the discharge of the drainage from the on-shore dredge pile.
95	2.2.3.5	"…storage of concentrate would be needed during the winter months…"	It is not clear why concentrate would need to be stored along the transportation corridor. Please clarify.
95	2.2.3.5		We recommend that the EIS clarify if this variant would also require increased storage of other supplies during winter months (e.g., fuel).
104	2.2.4.5	Alternative 3 – Concentrate Pipeline Variant	We recommend that the description of this variant specifically disclose the reduction of truck traffic with use of the pipeline (number of truck as compared to Alternative 1).
105	2.2.4.2	Manual isolation and drain valves would be spaced at intervals no greater than 20 miles apart	It is unclear why manual isolation valves would be used for the concentrate pipeline, rather than automatic valves as would be used for the fuel lines. We are concerned that the longer response time associated with manual valves could lead to larger spills of concentrate or process water. Please provide additional detail on the isolation valves that would be used and the ability for timely response to a potential spill event.
109	2.2.4.2	The water quality characteristics of the slurry filtrate water and port area stormwater streams are expected to exceed discharge criteria for pH and metals concentrations to marine waters.	We recommend that the requirements of 40 CFR 440 Subpart J be discussed in the EIS when putting forth this alternative. The slurry filtrate water is process water under these regulations, and as such, it cannot be discharged except under certain circumstances where process water is comingled with wastewater that is allowed to be discharged and only that allowable volume can be authorized.

AMERICAN OVERSIGHT

Page	Section	Existing text (if applicable)	Recommendation
		General	For all of the alternatives, we recommend including maps of the water extraction sites.
	2.3	Alternatives Eliminated from Further Consideration – Request that additional alternatives be considered	This section refers to Appendix B for the rationale for dismissal of options. The EPA reviewed a draft Appendix B in September 2018 and submitted comments to the Corps on October 3, 2018. We also submitted follow-up comments related to the dry stack tailings option on October 24, 2018. We have not seen a revised version of Appendix B or a response to the comments that we have previously submitted. We participated in the October 24, 2018 Cooperating Agency meeting where the Corps and AECOM presented the alternatives proposed to be carried forward for detailed analysis in the EIS. However, the meeting did not include a substantive discussion of, or response to, comments that had been submitted. At the end of the Cooperating Agency meeting, we requested a follow-up meeting with the Corps and AECOM technical experts to discuss our outstanding concerns related to several of the tailings options. The meeting has yet to be scheduled. Based on the information presented in Section 2.3, and without a revised version of Appendix B that is responsive to our comments, we continue to have significant concerns about several aspects of the alternatives screening and range of mine site layout and tailings alternatives. For example: Mine site layout and TSF location alternatives - See our October 3, 2018 comments requesting additional discussion in the EIS to support the basis for the proposed mine site layout design and lack of alternatives related to the mine site layout. This is particularly relevant for TSF siting options since Appendix N states that PLP considered more than 35 tailings disposal sites, yet Table 2-21 identified only one possible alternative location for the pyritic TSF. We again request that the Corps evaluate the TSF locations previously considered by PLP against the smaller mine plan – we recommend listing these locations in Appendix B (and showing them on maps) and assessing whether and which of the 35 alternative locations are reasonable and could result in reduced impacts. This information would better support the Corps' hard look at alternative TSF locations as required by NEPA. Dry stack tailings alternative (TSF-004) – Please see our October 24, 2018 comments on AECOM's analysis of the dry stack option. Absent a revised analysis of the dry stack option that is responsive to our comments, we continue to recommend that this option be considered as

AMERICAN OVERSIGHT

Page	Section	Existing text (if applicable)	Recommendation
			an alternative in the DEIS for the reasons discussed previously. TSF liner (TSF-015) – Please see our October 3, 2018 comments related to the bulk TSF liner option. We continue to recommend that a liner option be considered as an alternative for the bulk TSF as we have not been convinced that the TSF dam and impoundment could not be engineered accordingly. We understand that including a liner may result in the need for a revised (water-retaining) embankment design. Seepage from the bulk TSF is predicted to exceed water quality standards for some parameters. The proposed action requires long-term post-closure collection and treatment of seepage from the bulk TSF. No alternatives are proposed to minimize seepage or reliance on long-term management of seepage. No information has been provided to demonstrate that the proposed seepage control system for the TSF would collect all of the seepage, which could otherwise impact groundwater. Due to the potential for long-term groundwater impacts from uncollected seepage and the desire to reduce reliance on long term water management and treatment of TSF seepage, we continue to recommend that a liner be included. The Corps recently permitted the placement of a liner for the Donlin Gold Mine TSF, which is of similar size. Effluent outfall locations - It is not clear from the proposed project description that the outfall locations have been optimized to minimize impacts of dewatering. In fact, the project description does not describe the timing or quantities of water that would be discharged at each outfall. Therefore, we continue to recommend that this information be provided and that alternative outfall locations be assessed. See our October 3, 2018 comments. Throughput scenarios - Only one option smaller than the proposed throughput of 180,000 tons per day was considered, and it was dismissed as not reasonable because it would not provide a reasonable return on investment. We recommend that mine sizes between 50,000 tpd and 180,000 tpd be assessed to determine if there are other smaller mine throughputs that could still be practicable while also resulting in reduced impacts. In addition, where indicators such as "positive net present value" or "reasonable return on investment" are being used to screen out alternatives, we recommend that this same information be provided for the proposed action. We also recommend providing more information that defines: (1) the thresholds for positive net present

AMERICAN OVERSIGHT

Page	Section	Existing text (if applicable)	Recommendation
			value and reasonable return on investment; (2) the net present value and return on investment for the proposed action; and (3) the estimated net present value and return on investment for options that are eliminated based on these factors.
114	2.3	Others were not carried forward as options because they were more properly characterized as potential mitigating measures. Mitigation measures are addressed in Chapter 5, Mitigation. and Tables 2-12 through 2-23, Options Eliminated from Further Consideration	The text of this section states that some of the options were carried forward as mitigating measures. However, the tables do not identify that any of the options were carried forward. We recommend that the option descriptions be revised for those options that were carried forward as either mitigating measures or RFFAs (LAY-006).

AMERICAN OVERSIGHT

Pebble EIS Draft Sections 3.1, 3.5, 4.1, 4.5
EPA Comments
11/9/18

Thank you for the opportunity to review draft Sections 3.1, 3.5, 4.1 and 4.5 of the Pebble EIS, in accordance with our role as a Cooperating Agency. Our comments are provided in table format below. Due to the absence of a complete document to review as a whole for context, our ability to accurately and adequately comment is limited and our public comments on the Draft EIS may include additional concerns or recommendations.

Page	Section	Text from Draft Section	Comment
	3.1	**Affected Environment - Introduction**	
General	3.1		The introduction to the affected environment focuses on the proposed action (e.g., Section 3.1.1 Project Components and Section 3.1.4 Project Physical Setting). It is important that the affected environment characterize the potential area of impact for all alternatives. We recommend revising the text in Section 3.1 such that it does not focus solely on the proposed action. Please also ensure that the information in each resource section of Chapter 3 appropriately characterizes the affected environment for the potential impact area of the full range of alternatives carried forward for analysis. In addition, we recommend that each resource section include a subsection that summarizes the data gap analysis that was performed and clearly identifies any data gaps for the impact area of the proposed action and alternatives.
	3.5	**Affected Environment - Recreation**	
General	3.5		No comments.
	4.1	**Environmental Consequences - Introduction**	
4.1-2	4.1.3	"Actions are considered reasonably foreseeable if they are proximate to the project area and are anticipated to enter the permitting process in the next 5 years, are identified in planning documents as scheduled for development, or if significant resources have been committed to the proposed action."	The 5-year timeframe presented here appears to conflict with a statement later in this section that "the USACE has determined that expansion of the Pebble Project to develop 55 percent of its reserves over a 78-year period, as outlined in the Wardrop 2011 Preliminary Assessment Technical Report, will be analyzed under the cumulative effects analysis (see Table 4.1-1 for further discussion). Therefore, other reasonably foreseeable future activities that may occur in the 78-year time period will also be considered" (pg. 4.1-4). Based on our review, it appears that the 78-year timeframe was used in assessing RFFAs, which is reasonable because it aligns the analysis of potential cumulative impacts with the reasonably foreseeable future impacts of the Pebble Project. We recommend that the document clarify throughout the document that a

AMERICAN OVERSIGHT

			78-year timeframe is used for consideration of reasonably foreseeable future actions.
4.1-3	4.1.3.1	Commercial and Subsistence Harvest of Fish and Wildlife: "However, fish and wildlife resources are managed by the Alaska Department of Fish and Game (ADF&G) and federal land managers to maintain sustainable populations, and there are no long-term adverse effects or trends affecting the resource."	We recommend adding a reference to documents reviewed or other information/analysis that discusses how the authors reached this conclusion.
4.1-3	4.1.3.1	Mining Exploration Activities: "In the immediate area of the project, there has been no mineral production activity that has had lingering adverse effects on the environment."	We recommend adding a reference to documents reviewed or other information/analysis that discusses how the authors reached this conclusion.
4.1-3	4.1.3.1	Mining Exploration Activities paragraph	Given the extensive amount of exploration work conducted at the Pebble site, we recommend that more information be supplied to support the conclusions of this paragraph. Specifically, we recommend that the draft EIS: (1) summarize the amount and type of exploration work that has occurred (number of drill holes, acreage of surface disturbance, number of years of exploration activity, etc.); (2) explain the best management practices and reclamation actions that occurred; and (3) discuss whether this has resulted in impacts to wetlands, surface water, and ground water.
4.1-4 to 4.1-5	4.1.3.2	Parameters used to identify potential reasonably foreseeable future activities for the cumulative effects analysis	We recommend that the EIS provide additional explanation of how the six parameters listed in the bullets on pages 4.1-4 to 4.1-5 were applied to identify potential reasonably foreseeable future activities. For example, please clarify how many of these factors need to be met, whether all factors are equally weighted, and whether there is a sequence in which the factors are applied.
4.1-5	4.1.3.2	"The question of whether development of the project would facilitate development of other nearby mineral deposits depends in part on proximity to the project and ability to use project infrastructure… While the access road would be privately funded on State land, the State of Alaska would likely require allowing access to other mineral deposit owners if an agreement could be reached with PLP regarding operation and maintenance costs,	We recommend that the document provide additional information regarding how the future potential use of the road is being analyzed in the EIS. As provided in the EPA's scoping comments, we recommend that the analysis of indirect effects in the EIS consider the extent to which it is reasonably foreseeable that the proposed transportation corridor and natural gas pipeline may be made accessible to the public and may stimulate additional reasonably foreseeable mining exploration and development projects in the area, and potential environmental effects associated with that induced mining.

AMERICAN OVERSIGHT

		based on the precedent set in state permit conditions for granting Pogo Mine Access (S. Buckley, personal communication 2018)."	
4.1-6	Table 4.1-1	Description of Pebble Project Expansion	To ensure a complete description, we recommend that the description of the Pebble Project Expansion reasonably foreseeable future action also include a waste rock storage facility and an underground mine component. In addition, we note that our scoping comments recommended that the Corps consider evaluating the expansion and continued operation of the currently proposed project as a reasonably foreseeable indirect effect of the proposed action under NEPA.
4.1-6	Table 4.1-1	Potential Mineral Deposits in Southwest and Southcentral Alaska	The table lists a number of potential mineral development projects in southwest and southcentral Alaska (Pebble South through Copper Joe) and makes decisions about whether these projects are RFFAs for exploration and/or development. We recommend that more information be provided for projects that are determined not to be reasonably foreseeable development projects, so that the basis for these determinations are strongly supported. For example, Groundhog will be considered an RFFA for further exploration but not for development since "Resource delineation has not progressed sufficiently, is not subject to development permitting or in a planning document and is not considered reasonably foreseeable in the 78-year time frame." Please describe which of these factors was key to determining that development of Groundhog is not reasonably foreseeable and describe the basis for that determination. We recommend that the document describe the basis for the statement that resource delineation has not progressed sufficiently and provide reference to any documents or websites that were reviewed to support this determination. We recommend a similar discussion be provided for each of the development projects listed.
4.1-6	Table 4.1-1	"Note: Because claims are currently owned by NDM Ltd., if future drilling and resource delineation indicate that it is feasible to develop the project, it is possible that construction and operations could access and utilize the Pebble Project transportation system."	The entries for Pebble South and other potential projects listed say "No" to development and production but include this Note. We recommend clarifying in the table that a separate NEPA analysis would have to be done for these future projects.
4.1-10	Table 4.1-1	Whistler Deposit	The table includes Copper Joe, a porphyry copper deposit "located significantly north of the Pebble Project, in close proximity to the Whistler Deposit,"

AMERICAN OVERSIGHT

			but does not include the Whistler Deposit itself. Please clarify why the Whistler Deposit is not listed as a potential mineral deposit.
4.1-18	4.1.7	Incidental or induced mortality of fish and wildlife resulting from project construction and operations, as well as any reduction in habitat value, could result in localized irretrievable commitment of these resources during the life of the project	We recommend revising this statement to acknowledge that impacts to fish, wildlife, or habitat may exist beyond the life of the project.
4.1-19	4.1.8	Financial Assurance and Bonding	As discussed in our scoping comments, we recommend that the draft EIS disclose the estimated financial assurance costs to reclaim and close the site, including long term water treatment costs. We believe that this information is necessary to evaluate the effectiveness of reclamation and closure, which is a key component in determining the environmental impacts of the Pebble project. Our scoping comments provide recommendations on the level of detail to include.
	4.5	**Environmental Consequences - Recreation**	
4.5-4	4.5.2.3	"Boat traffic to and from the port would be minimal: up to 27 concentrate vessels and 33 supply barges per year during operations."	Regarding potential recreation impacts at Amakdedori Port, the draft document notes the number of concentrate vessels and supply barges anticipated per year but does not discuss the amount of time these vessels would remain in port. We continue to recommend including this information, because it is relevant to the level of impact at the port location and the time in port may differ among alternatives or variations. This information would also be relevant to consider for other resource sections in addition to Recreation, including fish and wildlife impacts.

The Corps has issued an extension of the Pebble EIS scoping period through Friday June 29, 2018 - an additional 60 days. I wanted to make sure that you knew about the extension and that we'll be revising our internal schedule as to when a draft letter would be ready for HQ review.
Thanks,
Jill

Subject: FW: POA-2017-271, Special Public Notice scoping extension

All-

The Corps has issued a special public notice extending the Pebble EIS scoping period an additional 60 days to end on June 29, 2018 (see link in the email below).
Molly had developed a schedule for our scoping letter based on the original 30 day comment period and was working with many of you on drafting an initial letter. A revised schedule will be developed based on the extended time period. This will give us all more time to provide technical, legal, and management input into our scoping letter.

Also, the Corps has added an additional public scoping meeting in New Stuyahok on April 13. This information can be found on the Corps' Pebble EIS website.

Patty

I just spoke to Karin. We agreed since this is mostly NEPA CCILO would take the lead. We also agreed we should bring with copies (we are making them) of *yesterday's* version of the comments (as some of today's comments were more for internal team deliberation) and walk through them with David and Justin, so the team can present how we considered their comments and ways of addressing them. See you there.

AMERICAN OVERSIGHT

My understanding is that Joel in the AO's office has reviewed this language. OFA reviewed this language and did not have any comments.

Joel is the career Agency's Senior Climate Resilience Adviser in OP. Note that Samantha supported Agency-wide climate resilience work, including an Agency-wide Climate Resilience Working Group with Regional representation. The Agency's 2019 budget submission included climate resilience work, albeit focused on non-fed partners (States, Tribes, local gov'ts, and communities) as I recall.

FYI – this article refers to another statement from Collier

https://www.platts.com/latest-news/metals/anchorage-alaska/northern-dynasty-says-confident-will-secure-new-10448937

Northern Dynasty says confident will secure new partner for Alaska Pebble Mine

Anchorage, Alaska (Platts)--29 May 2018 510 pm EDT/2110 GMT

Northern Dynasty Minerals is confident it will secure a new partner for its contested undeveloped Pebble copper/gold project in Alaska following the announcement Friday that First Quantum Minerals will not exercise an option for a share in the project.

"I believe we will secure the necessary funding to continue the permitting and review process for Pebble under the National Environmental Policy Act," said Tom Collier, CEO of Pebble Partnership, in a statement Monday. "This will result in an Environmental Impact Statement for Pebble."

Pebble Partnership is Northern Dynasty's operating subsidiary for Pebble.

"Pebble remains one of the nation's most important undeveloped mineral resources," Collier said. "It is on state land and is an important economic asset for Alaska. Our project is well defined and we are going to continue communicating with Alaskans about why we believe in the opportunity it represents."

AMERICAN OVERSIGHT

First Quantum was not available Tuesday to comment on the reason for its decision. However, opposition groups including tribal entities from the Bristol Bay region and the Natural Resource Defense Council, a major US conservation organization, mounted an intense lobbying campaign on First Quantum's management to exit the project and also attended a recent shareholder meeting, according to the NRDC.

The groups also meet with management at BlackRock, an equity investment group holding a major stake in First Quantum. BlackRock has been touting a new "sustainable" investment strategy, and the NRDC playing on that in meetings with BlackRock, it said.

Pebble has reduced its project scope by about 50%, although exact have not been released. The company submitted permit applications to the Corps of Engineers late last year. The Corps has deemed the application complete and has initiated the draft EIS process. If built, the mine would be connected by road to a new port on the west side of Lower Cook Inlet from where ore concentrates would be shipped.

Opponents to the mine were quick to celebrate First Quantum's decision.

"No project is worth more than a culture or a way of life" that would be jeopardized if the mine affected Bristol Bay's rich salmon fisheries, said Robert Heyano, board president of the United Tribes of Bristol Bay, a Native American opposition group in the region, said Monday.

While many Bristol Bay residents see the mine as a threat to fisheries, Collier said previously that the Pebble project, if built, will also provide high-paying, year-round jobs in villages in the region and much-needed tax base to the Lake and Peninsula Borough, an economically depressed region.

Collier's statement, per the Associated Press (can't find the original release): https://www.apnews.com/819344129426428bbfa952ae5a1a9b58

Pebble Limited Partnership CEO, Tom Collier, vowed to continue the project in a statement released after the news that the framework agreement between Northern Dynasty Minerals and First Quantum Minerals had been terminated.

In a statement, he said Friday was "business as usual" for him, and that developers are "continuing to press forward."

He said he believes Pebble will secure the funding necessary to continue the permitting process.

Collier stated, "Pebble remains one of the nation's most important undeveloped mineral resources. It is on state land and is an important economic asset for Alaska. Our project is well defined and we are going to continue communicating with Alaskans about why we believe in the opportunity it represents."

Subject: Re: Pebble PDEIS Update

Thanks, Molly. I had a chance to connect with Kelly this morning about the PDEIS update. With the request for letterhead, and with the high visibility on Pebble, she felt that HQ will want to see what we develop. I said that I would talk with David next week and get back to her. I think that it makes sense for a manager to sign the comment letter. We'll talk more soon.

Hi Jill,

Can I get an update on the timing for our letter?

Did I hear right that the Corps extended the comment deadline?

Thanks!
Suzanne

> Vancouver – Northern Dynasty Minerals Ltd. (TSX: NDM; NYSE American: NAK) ("Northern Dynasty" or the "Company") advises that Northern Dynasty and First Quantum Minerals Ltd. ("First Quantum") (TSX: FM) have been unable to reach agreement on the option and partnership transaction contemplated in the December 15, 2017 framework agreement (the "Framework Agreement") between the parties. As such, the Framework Agreement has been terminated in accordance with its terms. About Northern Dynasty Minerals Ltd. Northern Dynasty is a mineral exploration and development company based in Vancouver, Canada. Northern Dynasty's principal asset, owned through its wholly-owned Alaska-based US subsidiary Pebble Limited Partnership and other wholly-owned subsidiaries, is a 100% interest in a contiguous block of 2,402 mineral claims in southwest Alaska, including the Pebble deposit. The Pebble Partnership is the proponent of the Pebble Project, an initiative to develop one of the world's most important mineral resources. For further details on Northern Dynasty and the Pebble Project, please visit the Company's website at www.northerndynastyminerals.com or contact Investor services at (604) 684-6365 or within North America at 1-800-667-2114. Review Canadian public filings at www.sedar.com and US public filings at www.sec.gov. Ronald W. Thiessen President & CEO

Collier's statement, per the Associated Press (can't find the original release): https://www.apnews.com/819344129426428bbfa952ae5a1a9b58

> Pebble Limited Partnership CEO, Tom Collier, vowed to continue the project in a statement released after the news that the framework agreement between Northern Dynasty Minerals and First Quantum Minerals had been terminated.

AMERICAN OVERSIGHT

In a statement, he said Friday was “business as usual” for him, and that developers are “continuing to press forward.”

He said he believes Pebble will secure the funding necessary to continue the permitting process.

Collier stated, “Pebble remains one of the nation’s most important undeveloped mineral resources. It is on state land and is an important economic asset for Alaska. Our project is well defined and we are going to continue communicating with Alaskans about why we believe in the opportunity it represents.”

Bristol Bay, not Pebble Mine, is the sound investment

- Author: Jonas Kron

Our investment firm is in the business of recognizing, understanding and pricing risk. It's a job that often demands difficult judgment calls, but this one is a no-brainer: Pebble Mine is a bad bet. That's one reason why the governor of Alaska recently called for a hold on mine permitting.

Today's smart investors don't just look at the bottom line. We look for opportunities to promote good corporate behavior through long-term investment strategies that consider social and environmental well-being: in other words, sustainable economic growth that will deliver returns over the long term.

The Pebble Mine, a vast gold and copper mine proposed in the headwaters of southwest Alaska's Bristol Bay, is the type of project that runs counter to sustainable economic growth. The mine jeopardizes a vast renewable resource –one that provides 14,000 jobs and an abundant source of healthy seafood that helps feed the world.

Ecosystem degradation is of serious concern to investors. That is why my company, along with 28 other investors, has taken a public position against the Pebble Mine.

Alaska's Bristol Bay is one of the great ecological resources of the world. It is the site of the largest remaining run of wild sockeye salmon, and it produces roughly half of the world's commercial supply of wild sockeye. While many global fisheries are in serious trouble, the Bristol Bay fishery generated a nearly record-setting return of 62 million wild salmon in 2018.

The great risk posed by this mine is not only reflected in science and the views of the people of Bristol Bay, but by the market as well. Northern Dynasty, the small Canadian company behind the project, has been promising the sun and moon with this project. Yet four major mining companies have walked away from the Pebble project, including some of the world's largest mining companies. Mitsubishi withdrew in 2011. Anglo American pulled out in 2013 after spending more than $540 million and citing a desire to focus on projects with the "highest value and lowest risks." Rio Tinto walked away in 2014, donating all of its shares to two Alaskan charitable foundations. First Quantum left in May 2018 after sinking nearly $40 million into the project.

This is an unprecedented response that speaks volumes about the risks associated with this project. It also leaves Northern Dynasty with a bleak financial outlook. Its 2018 quarterly financial statement claims that the securities of Northern Dynasty are "highly speculative," and that it needs substantial additional capital, but it has no arrangements in place for this funding.

Investor firms are increasingly looking at social opposition as a major consideration for large mining projects, and Pebble fares poorly on that count as well. The governor of Alaska, Bristol Bay Native tribes and corporations, commercial fishing companies, restaurants, supermarkets, churches, outfitters and jewelers have all declared their opposition to the mine. They recognize that the economic engine for the region is the salmon fishery, and the science has repeatedly shown Pebble will have unacceptable consequences for salmon.

AMERICAN OVERSIGHT

As importantly, Pebble has failed to provide a prefeasibility study to demonstrate that its current mine proposal is economically viable. These studies, normally published before the permit application, provide data to support the company's claims that the mine will be profitable. Every other large mine in Alaska has done so at this point in the permitting process, but not Pebble.

The state of Alaska is right in calling for a hold on permitting until the company demonstrates that Pebble is feasible. The federal government should not be wasting public resources on a lemon, and an incredibly destructive lemon at that. Responsible resource development is critical to all economic, environmental and cultural stakeholders. The sound investment is in protecting Bristol Bay's incomparable ecological resources.

Jonas Kron *is a senior vice president at Trillium Asset Management, an investment firm that focuses on sustainable and responsible investing.*

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

April 25, 2018

VIA ELECTRONIC MAIL

The Honorable Scott Pruitt
Administrator
U.S. Environmental Protection Agency
1200 Pennsylvania Avenue, NW
Washington, DC 20460

Re: EPA's Continued Reliance on the Bristol Bay Watershed Assessment

Dear Administrator Pruitt,

I am writing in response to your decision in January to suspend the withdrawal of the Proposed Determination to restrict the discharge of dredged or fill material in Alaska's Bristol Bay watershed related to the Pebble deposit. Your decision was surprising and disappointing, especially in light of your public statements during your confirmation hearing affirming that preemptive federal vetoes – which the Proposed Determination unquestionably is – "could undermine both the administrative process and rule of law."[1] But even more concerning is the fact that your decision is based entirely and misguidedly upon the Bristol Bay Watershed Assessment ("BBWA"), a flawed and biased study that remains EPA's only attempt to evaluate the environmental impacts of a potential Pebble mine. Despite what some in EPA may have led you to believe, it is highly inaccurate to conclude "that any mining projects in the region will likely pose a risk to [Bristol Bay's] abundant natural resources."[2] That conclusion was in fact the starting point for the previous Administration's approach to the Pebble matter, and the BBWA was merely a tool to fulfill it. The document is the result of an unfair, pre-determined process and shoddy scientific work by "scientists" of questionable reputation determined to kill the Pebble mine at all costs. As the attached materials demonstrate in even greater detail, the BBWA is the ultimate example of bad science, and I encourage you to carefully examine EPA's record and consider allowing the normal legal permit application process to unfold without the cloud cast by a study as woefully inadequate as the BBWA.

The BBWA Sprung from Early EPA Efforts to Veto Pebble

Although EPA has repeatedly touted a petition purportedly submitted by six Alaska Native Tribes as the impetus for action in Bristol Bay, that petition was in fact the result of collusion between an EPA employee and the Tribes' attorney. That employee, Phil North, had

THE pebble PARTNERSHIP

been vocally advocating within EPA for a veto of the Pebble mine as early as 2009, and by 2010 had recruited at least two high-ranking EPA Region 10 officials to his cause. Officials in the region began drafting policy memoranda and budgets preparing for a veto and even convinced U.S. Fish and Wildlife Service employees to join the efforts. By the time the tribal petition was submitted in June 2010, which EPA's Inspector General concluded was the result of a "possible misuse of position," the Agency already had a running start on its veto efforts.

The BBWA Process Was Designed from the Start to Justify a Pebble Veto

The BBWA was never meant to be an objective study of the effects of copper mining on Bristol Bay. All of EPA's words and actions prove this. A 2010 memorandum outlined steps EPA could take to provide the appearance of public involvement to "deflect political backlash" and "derail opposition." Knowing that it needed a scientific record but unwilling to engage in a comprehensive and statutorily-required environmental impact statement upon Pebble's submission of a permit application, EPA instead developed a plan for its own "information gathering and analysis…in order to support a decision to formally initiate…404(c)." And when Senator Lisa Murkowski of Alaska suggested that EPA's decision to conduct the BBWA in February 2011 meant no pre-emptive action would occur until all the science had been evaluated, an EPA official stated "her statement would suggest no 404(c) would be done until all the science is in (EIS?). Obviously, that's not what we have in mind…"

EPA's close collaboration with environmental activists further demonstrate its bias. EPA officials communicated hundreds of times with anti-Pebble activists and scientists to share information, technical studies, and public relations strategies. One EPA employee even shared an outline of the BBWA with an anti-Pebble scientist a year before it was even announced. In particular, EPA became obsessed with a biased risk assessment conducted by The Nature Conservancy and scheduled several briefings to determine how that study could support EPA's efforts. All these communications stand in stark contrast to EPA's treatment of Pebble, as then-Administrator Lisa Jackson repeatedly refused to meet with Alaska Native interests close to the proposed mine that support due process for the project.

The BBWA Evaluates Fake, Unpermittable Mines to Bolster EPA's Case against Pebble

The BBWA analyzed hypothetical and implausible mine designs that did not reflect modern engineering or environmental standards. EPA knew that doing so would result in exaggerated environmental impacts and overstated risks, ensuring it could justify its preordained pre-emptive action. For example, any mine of Pebble's size would necessarily involve compensatory mitigation, which EPA's hypothetical mines conspicuously omitted. Peer reviewers noted this weakness, stating that the overall utility of the BBWA was "questionable" because of the inherent uncertainty involved with studying hypothetical design plans.

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

The BBWA is Rife with Fake Science

EPA stacked the BBWA deck with anti-Pebble personnel and material. Richard Parkin, who not only admitted under oath to favoring a preemptive Pebble veto but also stated in a public meeting that politics were "as big or [a] bigger factor" than science in a Pebble decision, was installed as BBWA team leader. Phil North, fresh off his secret collusion that resulted in the tribal petition, was the BBWA's "technical lead." From outside EPA, the Agency brought in several other anti-Pebble extremists, most notably Ann Maest, who admitted in litigation related to the infamous *Chevron* case in Ecuador to having falsified scientific reports to fit her preferred, anti-development agenda. In perhaps its most brazen move, EPA carefully selected seven vehemently anti-Pebble studies and subjected them to an unannounced peer review so that their conclusions could be included in the BBWA.

Not surprisingly, these selections led to biased results, which peer reviewers repeatedly questioned, even concluding that the BBWA's conclusions were "not appropriate for a document that is intended to provide a scientific and technical foundation for future decision making." To further the bias of the BBWA's contents, EPA completely ignored the comprehensive environmental baseline studies that Pebble had conducted, the result of eight years of evaluation by 35 professional organizations and comprising about 27,000 pages and $150 million in investment.

EPA Even Tried to Short-Circuit the BBWA's Peer Review to Conceal its Flaws

EPA designed a peer review process that was contrary to its own regulations and guidelines so the many flaws in its BBWA study would remain hidden. For example, EPA officials had excessive contact with peer reviewers during the review period and limited oral and written submissions during public peer review meetings. When the second draft of the BBWA expanded from 339 pages to 618, and included an entirely new hypothetical mine scenario, EPA ignored requests that it conduct a full peer review of the new document. Several peer reviewers complained that the time given to review the Assessment was far too short to enable them to reach sound conclusions.

* * *

It is thus no surprise that virtually every independent investigation of EPA's conduct with respect to Pebble and the BBWA has concluded that there was wrongdoing. The U.S. House Committee on Oversight and Government Reform concluded that "EPA employees had inappropriate contact with outside groups and failed to conduct an impartial, fact-based review of the proposed Pebble mine" and that the pre-emptive veto was "without legal basis." Former U.S. Senator and Secretary of Defense William Cohen determined that the circumstances "raise serious concerns as to whether EPA orchestrated the process to reach a predetermined outcome; had inappropriately close relationships with anti-mine advocates; and was candid about its

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

decision-making process." A federal court in Alaska granted a preliminary injunction halting all EPA work on the 404(c) veto after seeing just a fraction of the evidence of EPA misconduct. And the U.S. House Committee on Science, Space, and Technology found EPA's actions rife with misconduct and "determined that the pre-emptive action taken for the Pebble Mine Project was unprecedented under the Clean Water Act and was justified by a questionable assessment that relied on predetermined conclusions developed by EPA officials."

In addition to the BBWA's obvious flaws, the use of a preemptive veto under Section 404(c) of the Clean Water Act sets a dangerous precedent. In the history of the Clean Water Act, EPA has only exercised its veto authority 13 times. In each instance, EPA invoked Section 404(c) only after receipt of a permit application that described the scope and details of the project being proposed, the anticipated environmental impact, and techniques to be employed to mitigate or control that impact. EPA's campaign against Pebble throws that entire process into uncertainty, unsettling the legitimate business expectations of potential developers. By going its own way, EPA has sent the message, in the words of the National Mining Association, that "it can do whatever it wants. If it can decide to (preemptively veto a project) for this industry, there is no reason it can't ignore the legal process and preempt other projects from going forward."

In light of this overwhelming record and potentially catastrophic precedent, I strongly urge you to reconsider your reliance on such an obviously flawed study. You have not been shy to point out the errors made in the previous Administration's environmental policies and overreach. This is another opportunity for you to restore the rule of law and sound scientific analysis into environmental decision-making.

Sincerely,

Thomas C. Collier
CEO

Hi David,
I have completed a resolution/compilation of the edits received to date. There are a very limited number of places where I did not accept edits yet, and have left for your consideration (with explanatory comments). I do not think any of the remaining edits are intolerable, but felt they were ones that warranted bringing to your attention. Please let me know if there is anything else I can do to assist with finalizing this letter.
Regards,
Molly

AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

April 24, 2018

The Honorable Scott Pruitt
Administrator
United States Environmental Protection Agency
1200 Pennsylvania Avenue, NW
Washington, DC 20460

Dear Administrator Pruitt:

It is our understanding that you appeared before a group of non-governmental organizations and others last Wednesday, April 11, 2018. During the course of that meeting, you responded to a question about your decision to leave in place the Obama-era regulatory overreach and unprecedented preemptive 404(c) veto imposed on the Pebble mine.

We heard from several people who attended that meeting, who are very concerned about the EPA's use of a 404(c) preemptive veto, about your comments on Pebble and suspending the withdrawal of the "Proposed Determination."

According to participants, you also said we could bring new information about the mine to you. We appreciate your willingness to listen and respectfully request a meeting to do so. We will contact your staff to set up such a meeting. In advance of that discussion, we believe it is important to provide you with accurate information and provide our perspective on some of the issues you cited.

Flawed and Biased Science Was Created by Obama EPA to Justify Unprecedented 404(c) Action.

You noted that the decision was based on the data before you. You stated that the mine was in an area with two rivers, and that the mine could impact millions of fish. We assume that in making these statements, you are relying on the Bristol Bay Watershed Assessment ("BBWA"). That report was developed by the Obama Administration to support a predetermined decision to veto the Pebble Mine through an unprecedented

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

process before a permit application – containing an actual mine plan and other important aspects, such as proposed mitigation – had even been submitted for review. This discredited Obama EPA science is wholly insufficient to support making any regulatory decision, especially one of this significance, and that point was made by a number of EPA's own peer reviewers of the BBWA.

Moreover, The BBWA is an outdated, severely flawed study that used hypothetical mine plans in assessing potential impacts to the region. When EPA prepared the BBWA, it is important to remember that Pebble had never filed a mine plan or a Section 404 permit application. The BBWA assumed we would be in two river systems. As our permit application makes clear, major mining operations are only in one watershed. Pebble Project, Department of the Army, Application for Permit, POA-2017-271, p. 31, found at https://pebbleprojecteis.com/documents/background.

Former Senator and Secretary of Defense William Cohen undertook an independent review of EPA's actions. Among other things, he found that "EPA relied upon the BBWA in its Proposed Determination but acknowledged that there were significant gaps in its assessment and that it was not designed to duplicate or replace the Permit/NEPA Process." http://files.cohengroup.net/Final/Final-Report-with-Appendices-compressed.pdf.

The U.S. House of Representative's Committee on Science, Space, and Technology extensively reviewed the process used to veto the mine and the so-called science developed to support that process. The Chairman of the Committee wrote: "EPA employees colluded with third party Pebble Mine opponents. They sought to deliberately establish a record that pointed to one outcome: the Pebble Mine will be excluded from the regular permitting process and should be stopped." https://science.house.gov/sites/republicans.science.house.gov/files/documents/HHRG-114-SY-WState-S000583-20160428.pdf. The Committee also "determined that the pre-emptive action taken for the Pebble Mine Project was unprecedented under the Clean Water Act and was justified by a questionable assessment that relied on predetermined conclusions developed by EPA officials." https://science.house.gov/sites/republicans.science.house.gov/files/documents/02.22.17%20SST%20Letter%20to%20EPA%20Administrator%20Pruitt.pdf. Finally, the Committee found "that EPA employees inappropriately assisted outside groups in petitioning the

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

agency to change the way they operate and use Section 404(c) to stop this project." https://science.house.gov/sites/republicans.science.house.gov/files/documents/02.22.17%20SST%20Letter%20to%20EPA%20Administrator%20Pruitt.pdf. The U.S. House Committee on Oversight and Government Reform came to a similar conclusion, stating in a November 2015 report "that EPA employees had inappropriate contact with outside groups and failed to conduct an impartial, fact-based review of the proposed Pebble mine." https://oversight.house.gov/wp-content/uploads/2015/11/Bristol-Bay-Pebble-Mine-Staff-Findings-Nov-2015-Final.pdf.

The Actual Pebble Mine Plan, Designed for Sustainability.

As our permit application sets out, "[t]he layout was designed to consolidate the majority of the site infrastructure in a single drainage, the North Fork Koktuli, and avoid the placement of waste rock or tailings in the Upper Talarik Creek drainage." Pebble Project, Department of the Army, Application for Permit, POA-2017-271, p. 31, found at https://pebbleprojecteis.com/documents/background. I took those steps explicitly for sustainability purposes, because the Upper Talarik Creek supports significantly greater numbers of salmon than does the North Fork Koktuli. However, your statement that "millions of salmon" occupy this area is simply incorrect. The average escapement of salmon (*i.e.*, those that return to these streams to spawn) for the years 2004-2009 is about 65,000 salmon/year.

This single point most perfectly exemplifies why this veto raises such serious concerns. President Obama's EPA initiated a preemptive veto, and the decision to leave it in place is evidently based on "facts" that our permit application and other data show are simply not true.

No Consultation with Project Proponent.

We understand that you stated that you sent "political advisers" to the area to investigate. While these Agency employees did attend public hearings, they did not speak with anyone from Pebble while in the state. It seems that if they wanted to get a comprehensive understanding of the issues involved, a meeting with the project proponent would have been advisable. We would have, of course, welcomed such a meeting.

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

Withdrawal of Proposed Veto is Clearly a Discretionary Action.

We understand the concern that you could be sued if you withdrew the Obama-era proposed preemptive veto by a suit alleging that your decision was arbitrary and capricious under the Administrative Procedure Act. Such suits are common, and we understand why you would be concerned about such a suit. Such a case has no merit and would likely be thrown out by any court. The decision to initiate a veto or not to do so is entirely in your discretion. The case law on such actions is solid – they are not reviewable. In addition to being entirely within your discretion, a decision to withdraw the veto would not be final agency action, and therefore not subject to review by courts. We have attached a memorandum that addresses this issue. *See*, Attachment 1.

If you are concerned about any mining in the area, as some meeting participants indicated to us, it is important to remember that the Obama EPA acknowledged in the BBWA that a mine smaller than their .25 hypothetical mine would be allowed to go through the permitting process. Therefore, even the Obama Administration is on record as stating that some mine in the area could be approved.

Continued Denial of Due Process.

Just because Pebble can go through permitting, that does not mean that the project has due process. While the U.S. Army Corps of Engineers is reviewing our permit application, it cannot issue a permit while the proposed veto is still pending because the regulations prevent them from doing so. *See*, 33 CFR Sec. 323.6(b). This "overhang" represents a clear denial of due process and does not reflect the rule of law. We should not be subject to a requirement that a veto must be withdrawn before we can receive a permit. That was clearly not the way Congress designed the Clean Water Act, nor was it the intent of the settlement agreement we have with the Agency.

An Adverse Precedent for Resource Development in the U.S.

Many of your ardent supporters understand that the precedent purposely left in place can and likely will be cited by future administrations as justification for action on other projects. Environmentalists understand that it may take only a proposed, preemptive veto to stop a development project, thus weaponizing the 404(c) veto process. Such administrations could use the 404(c) authority to initiate one, or dozens, or hundreds of

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

proposed preemptive vetoes. These vetoes could prevent permits from ever being issued whether EPA finalizes those vetoes or not. Because proposed vetoes are not final agency actions, project proponents would not be able to obtain judicial review of those proposed preemptive vetoes. EPA will have created a 'Catch 22' that could effectively stymie development. This seems inconsistent with your successful record of regulatory reform at the EPA.

This action also is completely inconsistent with the policy position articulated by President Trump on EPA's appropriate role on such matters. As you know, in the recent proposal to Congress concerning infrastructure financing and project streamlining, President Trump has proposed to repeal Section 404(c) of the Clean Water Act in its entirety.

Pebble Did Legally Challenge EPA's Authority.

Participants report that you said Pebble had not sued the Agency attacking EPA's authority to issue a preemptive veto. In fact, we did attack in court the statutory authority to issue such vetoes. The court dismissed the suit as not ripe because there was no final agency action. Interestingly, the Federal judge in Alaska hearing the three cases we filed requested briefing on both the merits and on the ripeness issue simultaneously. *See,* Attachment 2. We believe that the argument that the Agency lacks statutory authority to promulgate a preemptive veto is strong, and we commend these arguments to your attention.

The "proposed determination" left in place is exactly the same preemptive veto proposed by the Obama Administration. It is NOT based on an examination of our proposed mine plan, nor does it have a robust environmental impact statement to support it. Withdrawing this flawed preemptive veto does not prevent you from initiating a new one at the proper point in the process if you choose to do so, based on a full administrative record. Continuing with the Obama-era flawed veto, based on a discredited Bristol Bay Assessment, is to continue a preemptive veto.

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

We look forward to discussing these issues with you further, and will be pleased to fully describe the mine plan that we have submitted for review, when we meet.

Sincerely,

Tom Collier
CEO

AMERICAN OVERSIGHT

Attachment 1

AMERICAN OVERSIGHT

Judicial Review of Withdrawal of Proposed Determination

- EPA would likely prevail on an APA or citizen suit challenging its decision to withdraw the Proposed Determination without reviewing public comments.

    - Under either APA, or CWA's citizen suit provision, a plaintiff seeking to challenge the withdrawal of EPA's Proposed Determination has to demonstrate that it is challenging a *nondiscretionary* duty. *See* 5 U.S.C. 701(a) (APA grants a court jurisdiction to review actions taken by an agency except to the extent "agency action is committed to agency discretion by law"); 33 U.S.C. § 1365 (citizen suits may be brought where there is an alleged "failure … to perform any act or duty under this Act which is not discretionary with the Administrator").

    - We have not found any case challenging EPA's decision to withdraw a Proposed Determination. However, several courts have dismissed suits claiming that EPA improperly failed to exercise its Section 404(c) authority, holding that such authority is committed to the discretion of the agency. The reasoning of these cases is persuasive here.

        - In *Preserve Endangered Areas of Cobb's History, Inc. v. United States Army Corps of Engineers*, 87 F.3d 1242, 1249-50 (11th Cir.1996), plaintiffs brought a CWA citizen suit against EPA for failing to veto the Corps' issuance of a 404 permit. The court dismissed the claim, holding that EPA's authority to veto a section 404 permit is discretionary. The court summarized the various reasons why Section 404(c) is best viewed as discretionary, including the statute's use of the word "authorized" in Section 404(c). *See* 33 U.S.C. § 1344(c) (the "Administrator is authorized to prohibit . . . and authorized to deny or restrict the use of any defined area for specification . . . ."). The court found that the use of the term "authorized" (as opposed to "shall") suggests a discretionary function. The court also pointed out that the discretionary nature of the EPA's veto authority is also the interpretation adopted by the agency, as seen in its regulations, which use the permissive "may," as opposed to the mandatory "must" or "shall." *See* 40 C.F.R. § 231.1(a) ("Under section 404(c), the Administrator may exercise a veto over the specification by the U.S. Army Corps of Engineers or by a state of a site for the discharge of dredged or fill material.").

        - Numerous courts have agreed with this reasoning. *See also Hill v. Boy*, 144 F.3d 1446, 1449 n. 7 (11th Cir. 1998) (upholding dismissal of citizen suit against EPA and the Corps for failing to use their authority to veto the Corps' issuance of a section 404 permit because authority to veto a section 404 permit is discretionary); *City of Olmstead Falls v. EPA*, 266 F. Supp. 2d 718, 722-23 (N.D. Ohio 2003) (court lacked jurisdiction under APA to review EPA's decision not to veto the Corps' decision to issue a Section

AMERICAN OVERSIGHT

404 permit because the EPA's "veto power as set forth in Section 404(c) is discretionary").

- Other courts have also noted in dicta that the use of Section 404(c) is discretionary. *See Mingo Logan Coal Co. v. EPA*, 70 F. Supp. 3d 151, 166 (D.D.C. 2014) (noting "section 404(c) contains *permissive, discretionary* language") (emphasis added); *Ctr. for Biological Diversity v. United States Army Corps of Engineers*, No. CV 14-1667, 2015 U.S. Dist. LEXIS 76653 at *8 (C.D. Cal. Feb. 4, 2015) (EPA "has the *discretionary* authority to veto that decision if it makes certain findings regarding the adverse effects of the permitted action.") (emphasis added).

- Despite this case law, two courts have permitted suits against EPA where the agency chose not to initiate a veto.

    - Relying on a Fourth Circuit case that held generally that EPA's ultimate responsibility for the protection of wetlands under the CWA was a non-discretionary duty, *Nat'l Wildlife Fed'n v. Hanson*, 859 F.2d 313 (4th Cir. 1988), one district court held that a plaintiff can maintain a suit where the "Administrator fails to exercise the duty of oversight imposed by" Section 404(c). *See South Carolina Coastal Conservation League v. United States Army Corps of Engineers*, No. 2:07-3802-PMD, 2008 U.S. Dist. LEXIS 69499 (D. S.C. Sept. 11, 2008).

    - In *Alliance to Save the Mattaponi v. United States Army Corps of Engineers*, 515 F. Supp. 2d 1 (D.D.C. 2007), the district court dismissed plaintiff's citizen suit alleging that EPA failed to veto a Corps permit, holding that "this veto power … is discretionary." However, it concluded that plaintiff's APA claim survived because the CWA provides a standard by which to judge EPA's discretion – whether the discharge will have an unacceptable adverse effect. Because in this case EPA had not based its decision on this standard, the court ultimately found that EPA had acted arbitrarily and capriciously, *Alliance to Save the Mattaponi v. United States Army Corps of Engineers*, 606 F. Supp. 2d 121 (D.D.C. 2009).

IN THE UNITED STATES DISTRICT COURT

FOR THE DISTRICT OF ALASKA

PEBBLE LIMITED PARTNERSHIP and ALASKA PENINSULA CORPORATION,

Plaintiffs,

and

STATE OF ALASKA,

Intervenor-Plaintiff,

vs.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY, and DENNIS J. McLERRAN, in his official capacity as Regional Administrator of EPA Region 10,

Defendants.

No. 3:14-CV-0097-HRH

ORDER

Case Status

A status and scheduling conference was held in this case on July 11, 2014.

The court minutes of the foregoing conference are supplemented as follows for purposes of scheduling clarity.

Plaintiffs moved for reconsideration[1] of the court's order of July 7, 2014,[2] granting UTBB's motion to intervene. Plaintiff has responded to the motion for reconsideration.[3]

[1]Docket No. 71.

[2]Docket No. 69.

[3]Docket No. 72.

AMERICAN OVERSIGHT

EPA-0135-0000380

Reconsideration is granted. The court's July 7, 2014, order granting intervention is vacated. The court will entertain opposition to UTBB's motion to intervene if filed on or before July 18, 2014. Any reply shall be served and filed on or before July 23, 2014.

Nunamta Aulukestai has moved to intervene.[4] Any opposition to that motion shall be served and filed on or before July 18, 2014. Replies may be served and filed on or before July 23, 2014.

The defendants propose to file a motion to dismiss. That motion shall also be served and filed on or before August 11, 2014. Usual response and reply times shall be observed.

Defendants' response to plaintiffs' motion for preliminary injunction is currently due July 28, 2014.[5] A second motion for preliminary injunction by intervenor-plaintiff State of Alaska has been filed.[6] The time for defendants to respond to both motions for preliminary injunction is extended to August 11, 2014. Usual reply times shall be observed.

Defendants' response to the two motions for preliminary injunction may be consolidated, but the defendants' proposed motion to dismiss shall be separately briefed.

After consultation with counsel, the court has determined to invoke the provisions of Rule 65(a)(2), Federal Rules of Civil Procedure, which permits a court to consolidate proceedings on the merits of a case with proceedings on motion for preliminary injunction. That is, the court intends taking up first defendants' motion to dismiss and then the construction of § 404(c) of the Clean Water Act, 33 U.S.C. § 1344(c), and the State of Alaska's arguments based upon the Alaska Statehood Act, Pub. L. No. 85-508, 72 Stat. 339 (1958). The defendants' response to the motions for preliminary injunctions, as well as replies on those motions, should focus upon these legal issues. It is the court's perception that if the defendants' motion to dismiss is not dispositive of the case, a decision on the merits of the

Subject: Pebble Scoping Letter for HQ Review by COB June 12th

Hi David – Attached is Region 10's draft NEPA scoping letter. I think the key discussions appear on pages 3-10. We are still considering whether we will have any staff level edits/comments to suggest but we wanted to get this to you so you have an opportunity to review by the Tuesday COB deadline.

Thanks,
Heidi

Hi David,
I have completed a resolution/compilation of the edits received to date. There are a very limited number of places where I did not accept edits yet, and have left for your consideration (with explanatory comments). I do not think any of the remaining edits are intolerable, but felt they were ones that warranted bringing to your attention. Please let me know if there is anything else I can do to assist with finalizing this letter.
Regards,
Molly

Where: AECOM - 500 G Street Suite 500, Anchorage or Teleconference

All,
Please plan on an informational 2 hour meeting August 22, 2018 so that we may present the Chapter 2 Alternatives currently being identified. The draft scoping report should be available by 8/17 or earlier, so it won't be enough time for your agency to process the information and inform alternatives identified in the scoping process. Plan on having a follow up in middle September after screening criteria for the alternatives have been used and the alternatives to be carried forward for analysis are identified.

VR
Shane McCoy

Hello All,
The Corps has just distributed Chapter 5 Mitigation for review as well, and I have loaded it onto the Sharepoint site. When reviewing the analysis of Environmental Consequences for each resource, please also take a look at the mitigation measures that have been proposed for that resource, and provide any additional recommendations where mitigation is not sufficient, including revisions to proposed mitigation language or additional measures recommended.
Thank you,
Molly

Subject: Please Review - Pebble Pre-DEIS Sections
Importance: High

Hello Pebble NEPA Team,

AMERICAN OVERSIGHT

We have received several additional sections of the preliminary Draft EIS for review. We have also received many sections as an FYI for which our review is not requested. I have loaded everything I've received to date into the Sharepoint Folder: Preliminary Draft EIS Sections Oct-Nov 2018.

As a reminder, our input at this stage is only requested on the specific sections we were assigned to in the Cooperating Agency plan. Therefore, if your name doesn't appear below with a specific assignment, no review is necessary at this time. However, feel free to take a look at the sections pertaining to your subject matter on the Sharepoint Site if you wish.

Here are the assignments for specific sections where I would appreciate your review. Note that each subject area includes a section for Chapter 3 (affected environment), Chapter 4 (environmental consequences), as well as one or two supporting technical appendices. Please use the attached comment spreadsheet to assemble your comments, and please send them to me by the date noted for each section below.

- 3.11/4.11/K4.11 Aesthetics – Molly
- 3.14/4.14/K3.14 Soils – Mark/Palmer – due COB 11/27
- 3.16/4.16/K3.16 Surface Water Hydrology – Tim/Mark/Palmer/Muluken/Justine – due COB 11/27
- 3.26/4.26/K3.26 Vegetation – Mark/Palmer – due COB 11/27
- 3.17/4.17/K3.17 Hydrogeology – Tim/Mark/Palmer/Muluken – due COB 11/29
- 3.18/4.18/K3.18/K4.18 Water and Sediment Quality – Cindi/Tim/Chris – due COB 11/29
- (note, we have not yet received the Wetlands sections, which are anticipated to arrive approximately 11/21)

I apologize for the short time available for review, especially given the Thanksgiving holiday in the middle. If this schedule will be impossible for you, please let me know as soon as possible. Also, if you have any questions about the sections you are reviewing or where to focus your review, please don't hesitate to call.

Thank you,
Molly

Hi Muluken – Thanks again for bringing to my attention that the Section 4.16 figures were not available. I just received these figures from the project manager and loaded them onto the Sharepoint site. In the folder 'Pre Ch 4 Figures"
I do not believe any of the other Chapter 4 sections are missing figures, but if you find that another one is, please let me know as soon as possible and I will request it from the Corps.
Thanks,
Molly

Subject: Please Review - Pebble Pre-DEIS Sections
Importance: High

Hello Pebble NEPA Team,

We have received several additional sections of the preliminary Draft EIS for review. We have also received many sections as an FYI for which our review is not requested. I have loaded everything I've received to date into the Sharepoint Folder: Preliminary Draft EIS Sections Oct-Nov 2018.

As a reminder, our input at this stage is only requested on the specific sections we were assigned to in the Cooperating Agency plan. Therefore, if your name doesn't appear below with a specific assignment, no review is necessary at this time. However, feel free to take a look at the sections pertaining to your subject matter on the Sharepoint Site if you wish.

Here are the assignments for specific sections where I would appreciate your review. Note that each subject area includes a section for Chapter 3 (affected environment), Chapter 4 (environmental consequences), as well as one or two supporting technical appendices. Please use the attached comment spreadsheet to assemble your comments, and please send them to me by the date noted for each section below.

- 3.11/4.11/K4.11 Aesthetics – Molly
- 3.14/4.14/K3.14 Soils – Mark/Palmer – due COB 11/27
- 3.16/4.16/K3.16 Surface Water Hydrology – Tim/Mark/Palmer/Muluken/Justine – due COB 11/27
- 3.26/4.26/K3.26 Vegetation – Mark/Palmer – due COB 11/27
- 3.17/4.17/K3.17 Hydrogeology – Tim/Mark/Palmer/Muluken – due COB 11/29
- 3.18/4.18/K3.18/K4.18 Water and Sediment Quality – Cindi/Tim/Chris – due COB 11/29
- (note, we have not yet received the Wetlands sections, which are anticipated to arrive approximately 11/21)

I apologize for the short time available for review, especially given the Thanksgiving holiday in the middle. If this schedule will be impossible for you, please let me know as soon as possible. Also, if you have any questions about the sections you are reviewing or where to focus your review, please don't hesitate to call.

Thank you,

AMERICAN OVERSIGHT

Hi Molly,

Attached are my Chapter 2 comments. In addition to the specific comments in the spreadsheet, a few general points

Deliberative Process / Ex. 5

Please let me know if you have questions or need anything else.

Thanks!
Kate

Subject: Please Review -- Pebble Ch 2 Alternatives

Hello All,
I previously provided the draft Chapter 2 as an FYI, but the Corps has now said they will be accepting comments on this chapter, with a due date of 11/23. As you have been assisting in review of the various alternatives screening documents, I would appreciate your review of this section as well. In order to meet the comment deadline including time required for internal management review of the comments, please send me any comments you may have on Chapter 2 **by COB Friday 11/9**. (I apologize that this is a quick turnaround, but hope that you may have already begun looking over the document.)

Chapter 2 and the associated figures are available on the Sharepoint site, but please let me know if you are not able to access them or have any questions.
Thank you,
Molly

Hi Molly,

My comments are attached. I don't have all of them formed as recommendations in the last column, as some are questions and some are things that need to be kept in mind. Please feel free to use anything as you wish, and let me know if you have any questions.

A question: is Chapter 5 (Mitigation) one that EPA will be able to review and comment on?

Thanks,
Barb

Good speaking with you today Mark –

Attached is our gear list. The third tab lists the basic personal gear we carry with us out in the field on a daily basis. Also attached is a copy of our project specific health and safety plan for reference.

Please let me know if you have any additional questions.

Thanks,
Zach

AMERICAN OVERSIGHT

PART 1 – SITE-SPECIFIC SH&E PLAN

1.0 INTRODUCTION

1.1 Plan Development and Approval

The purpose of this Site-Specific SH&E Plan (Plan) is to define measures to be implemented to address worker safety, health, and the protection of the environment for field work associated with the 2018 Pebble Limited Partnership (PLP) wetlands fieldwork.

A copy of this Plan will be posted at the jobsite and/or maintained in project vehicles.

Prepared By: Zachary Halstead Date: June 12, 2018

Approved By: Paul McLarnon Date:

Project Manager Acknowledgment: Anna Kohl Date: June 14, 2018

1.2 Modification Log

This Plan will be revised as applicable to address any changes in site conditions, assignments, and/or anticipated hazards, or when new information surfaces from a procedural failure or incident investigation. Revisions to this Plan will be distributed to affected parties through site safety meetings.

Change Number	Effective Date	Description of Change	Approval

AMERICAN OVERSIGHT

1.3 SH&E Meetings and Briefings

1.3.1 Orientation

The contents of this Plan will be transmitted to field team members (including subcontractors and client representatives as applicable) via verbal discussion at a documented project kick-off/orientation meeting prior to initial field work. New hires and transfers who join the team after this meeting must be provided this same orientation before going to the field. Documentation of all orientation meetings shall be included in the project file (see attached Project Safety Orientation Form).

1.3.2 Daily Safety Meetings/Briefings

The field team lead shall conduct daily safety briefings at the project site at the beginning of each shift. Documentation of daily briefings (see attached Job-Site SH&E Meeting Form) shall include the names of employees present and the topics discussed which could include the following:

- Assigned duties and tasks for the day
- Anticipated site conditions (access, weather, etc.)
- Anticipated site hazards and control measures
- Lessons learned from reported near miss and injury/illness incidents from this project or from any other projects that may be beneficial or applicable to this project
- Revisions/updates to the Site-Specific SH&E Plan and/or safe work procedures

In the event that field team members are unable to attend the briefing, the SH&E Representative shall conduct a separate briefing with these personnel before they will be allowed to begin work.

AMERICAN OVERSIGHT

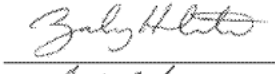
PROJECT SAFETY, HEALTH, AND ENVIRONMENTAL ORIENTATION FORM

Project: Pebble Project, Wetlands and Vegetation Field Verification 2018

Date: 6/13/2018

Location: HDR

Attendees: Zachary Halstead, Mac Salway, Ashley Hovis, Trent Parks, Mike Witter (phone), Mike Duffy (sub), Anna Kohl (PM)



Topics

- ❑ Review assigned duties and tasks
- ❑ Discuss anticipated site conditions (access, weather, etc.)
- ❑ Review the Site-Specific SH&E Plan and Job Hazard Analysis (JHA) forms
- ❑ Confirm training, equipment/supplies, medical clearance, and vaccinations have been acquired for all field team members
- ❑ Review emergency procedures and reporting and investigation procedures for near miss, injury/illness, damage, and environmental incidents
- ❑ Discuss environmentally safe work practices (spill/release management, hazardous waste, solid waste, protected ecological/cultural resources, etc.)

Notes/Comments

Team Member Signatures:

I have been briefed on and understand and agree to follow the requirements of the Site-Specific SH&E Plan and JHAs for this project.

ZH for Mike Duffy

AMERICAN OVERSIGHT

JOB-SITE SAFETY, HEALTH, AND ENVIRONMENTAL MEETING FORM

Project: _____

Task: _____

Date: _____ Time: _____

Location/Work Area: _____

Attendees: _____

Topics (check off list as completed):

- ❑ Review assigned duties and tasks for the day
- ❑ Discuss anticipated site conditions (access, weather, etc.)
- ❑ Review the Project-Specific SH&E Plan and Job Hazard Analysis (JHA) forms for the day's work
- ❑ Confirm team roles (on-site SH&E Representative, first aid/CPR responders, Short Service Employee mentors)
- ❑ Discuss emergency procedures and equipment (satellite phone, whistles, horns, etc.)
- ❑ Identify necessary medications and individual team member's medical situations/precautions (if staff is willing to share with team)
- ❑ Review lessons learned from any reported incidents and the status of any corrective actions
- ❑ Confirm everyone is comfortable with daily plan of action

AMERICAN OVERSIGHT

2.0 SCOPE OF WORK AND PROJECT SCHEDULE

The overall objective of the wetlands and vegetation study is to collect baseline data necessary to update the Preliminary Jurisdictional Determination (PJD) report previously submitted to USACE in 2017, and to prepare additional wetland mapping and reporting to support the project's alternatives analysis. Please see the project 2018 Wetlands and Vegetation Field Study Plan for detailed methods. Specific objectives of the study are to:

- Field verify wetland/upland status of previously mapped mosaics
- Field verify unmapped areas of questionable wetland/non-wetland status and areas with photo-signatures that cannot be correlated with previously collected data
- Collect data to support final mapping
- Record incidental observations of rare plants tracked by the Alaska Natural Heritage Program

The following study areas will be included in the 2018 field effort (Figure 1):

- Areas previously identified as mosaic complexes within the proposed mine project footprint
- Areas previously identified as mosaic complexes within the Northern Transportation Corridor along the north side of Iliamna Lake from the mine site to Williamsport except for areas located within Pedro Bay Corporation (PBC) lands (alternatives analysis)
- Unmapped Southwest Transportation Corridor around the west and south sides of Iliamna Lake (alternatives analysis)
- Unmapped Eagle Bay Spur Road (alternatives analysis)
- Unmapped natural gas pipeline tie-in on the Kenai Peninsula

A total of six field trips will be conducted to identify wetlands and other waterbodies within the PLP study areas during the summer 2018 field season. Each field team will be made up of two HDR wetland scientists, at least one of which will have previous PLP wetlands-related field experience, or experience on the Kenai Peninsula as appropriate. PLP will provide a bear guard to accompany each field team when working remotely, observers when on native owned lands, and helicopter support as needed. A breakdown of the trip dates and number of teams in each trip is provided in Table 1. Travel days for preparation, mobilization, and demobilization at the beginning and end of each trip have been included.

Table 1. Wetlands and Vegetation Summer 2018 Field Trip Details

Trip Number	Target Area	Start Date	End Date	Number of Teams
1	Mosaics within Proposed Mine Footprint	6/18	6/25	3
2		7/6	7/14	3
3		7/19	7/25	2
4	Mosaics within Northern Transportation Corridor Eagle Bay Spur	8/1	8/7*	3
5	Southwest Transportation Corridor	8/13	8/21	2

AMERICAN OVERSIGHT

6	Kenai Peninsula Natural Gas Pipeline Area	8/27	8/27	1

*Two teams will continue until 8/8 to complete Eagle Bay Spur.

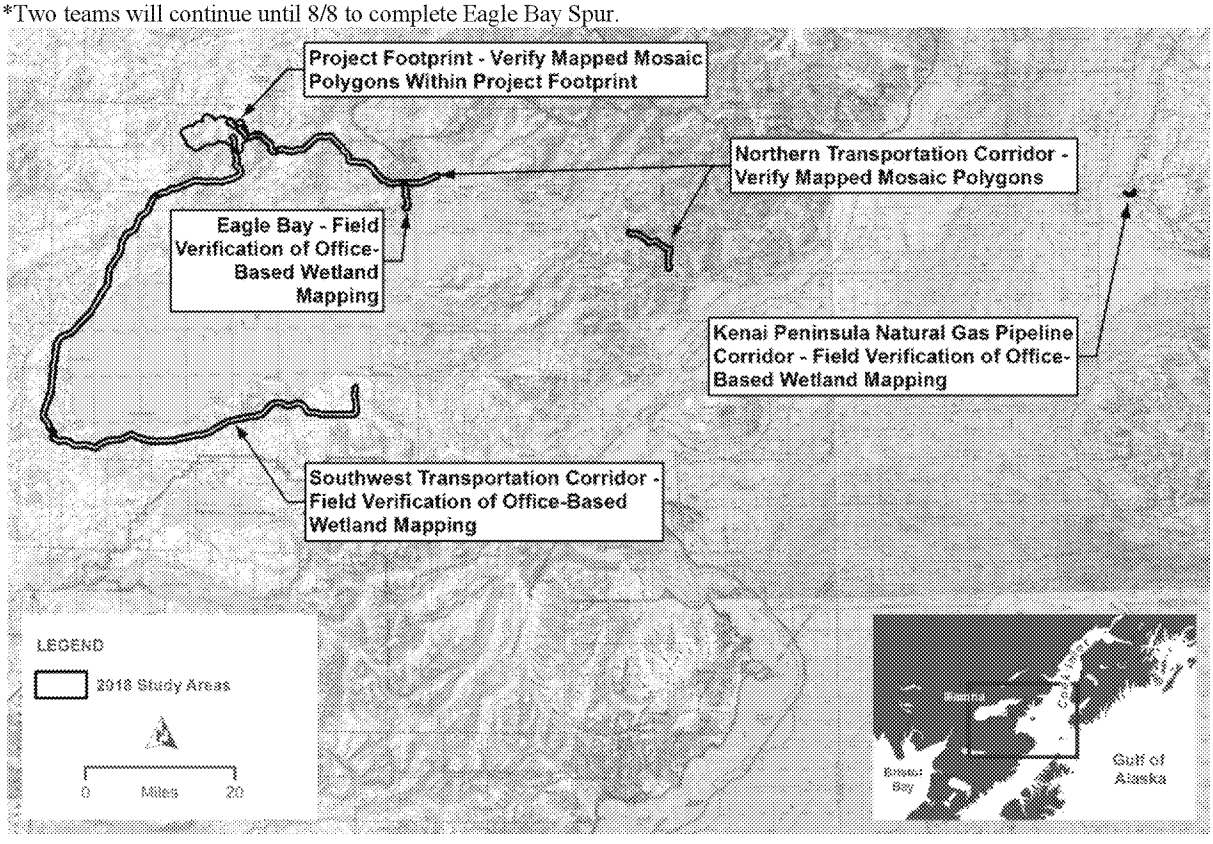

Figure 1. 2018 Wetlands Field Study Area

2.1 Project Location and Site History

2.1.1 Trips 1, 2, and 3 – Mosaics within Proposed Mine Footprint

Three field trips, each consisting of two-to-three field teams, will focus on revisiting previously mapped mosaics in the proposed mine footprint (Figure 2). HDR will field verify 10 percent of the approximately 2,500 polygons (2,000 acres) currently mapped as wetland or upland mosaics within the footprint, pending negotiations with USACE. These areas will be either verified as true wetland/upland mosaics, categorized as either entirely wetland or upland, or divided into smaller entirely wetland or upland areas. Teams will be based out of Iliamna for these field events and will access the study area daily through use of one dedicated helicopter for each trip. USACE will be conducting a field trip in this area in early July; HDR field teams will maintain flexibility to ensure proper coordination and review of this plan and JHAs with USACE prior to and during this timeframe.

2.1.2 Trip 4 – Mosaics within Northern Transportation Corridor, Eagle Bay Spur

One field trip, consisting of three teams, will focus on revisiting previously mapped mosaics within the Northern Transportation Corridor except for areas within PBC lands (Figure 2). Similar to the proposed mine footprint, HDR will field verify 10 percent of the approximately 570 polygons that comprise the

AMERICAN OVERSIGHT

440 acres currently mapped as mosaics within accessible sections of the corridor. Teams will be based out of Iliamna and will access the study area daily through use of one dedicated helicopter.

Two teams will stay one additional day to focus on identifying wetlands and waterbodies along the unmapped Eagle Bay Spur corridor (Figure 2). The area to be investigated includes a 2,000 feet wide corridor along approximately 3.5 miles of alignment which totals approximately 850 acres.

2.1.3 Trip 5 – Southwest Transportation Corridor

One field trip, consisting of two teams, will focus on identifying wetlands and waterbodies within the unmapped Southwest Transportation Corridor (Figure 2). The corridor starts at the limits of the existing mine area mapping and runs around the west and south sides of Iliamna Lake to its terminus near Kokhanok. The area to be investigated includes a 2,000-foot wide corridor along approximately 81 miles of alignment; totaling approximately 19,600 acres. Teams will be based out of Iliamna or Kokhanok (depending on site logistics to be determined by PLP) and will access the study area daily through use of one dedicated helicopter.

2.1.4 Trip 6 – Kenai Peninsula Natural Gas Pipeline Area

One field trip, consisting of one team, will focus on identifying wetlands and waterbodies within the unmapped Kenai Natural Gas Pipeline tie-in area on the Kenai Peninsula (Figure 3). The location of the study area has not been finalized but is assumed to be 20 acres. It is anticipated that the field work will be completed in one day. The team will access the study area by road using an HDR supplied automobile. Bear guards are not required for this trip.

2.2 Site Logistics

2.2.1 Site Access and Security

Field teams will fly from Anchorage to Iliamna, where they will meet PLP staff. PLP will provide helicopters for accessing the study area, and will arrange for access to or will provide direction to avoid any private properties within the study area. PLP will also coordinate to have necessary liaisons to accompany field teams on private property as needed. PLP will provide all necessary lodging, meals, and ground transportation while on-site, as well as two-way handheld radios for communication with helicopter pilots. Upon arrival in Iliamna, PLP will provide site orientation and site-specific safety briefing.

Photographs taken while on-site should not be shared or posted on social media in order to meet client's needs for confidentiality. All project-related activities observed during the field event, including project-related discussions, are to remain confidential. All staff, including HDR subcontractors, must sign the project's Non-Disclosure Agreement (NDA) prior to conducting any work on the project. Please see the project NDA for additional details.

2.2.2 Drinking Water and Sanitary Provisions

On-site PLP representatives will provide direction regarding safe drinking water, disposal of trash, and other sanitary provisions.

AMERICAN OVERSIGHT

2.2.3 On-Site Documentation and Postings

A copy of this Plan, including emergency contacts, WorkCare contact information, route maps to emergency and non-emergency medical facilities, Job Hazard Analysis (JHA) forms, and chemical safety data sheets (SDSs) will be kept on-hand with each field team. Field teams will verify the locations of emergency and non-emergency medical facilities with PLP staff upon arrival at the site.

Figure 5. Iliamna Lake Vicinity Study Areas

2.2.4 Drugs and Alcohol

The manufacture, distribution, possession, use, or being under the influence of drugs is prohibited while performing work for HDR. This includes the use or possession of prescription medications without a valid prescription.

Employees whom HDR management/supervision reasonably believes directly or indirectly caused a work-related injury or property damage will be required to undergo drug and alcohol impairment testing. Such testing will be conducted as soon as practicable, but not later than 32 hours after the incident for drugs and not later than six hours for alcohol.

3.0 FIELD WORK IMPLEMENTATION

3.1 Key Personnel

The following personnel have principal responsibility for the implementation and maintenance of health and safety measures during field work.

- Zach Halstead – Field Team Lead and Fieldwork Task Manager
- Mac Salway – Field Team Lead
- Mike Witter – Field Team Lead
- Hannah Griego – Field Team Lead
- Simon Wigren – Field Team Lead
- Alena Gerlek – Field Team Lead

3.2 Responsibilities and Lines of Authority

3.2.1 Project Manager and On-Site SH&E Representative

The Project Manager serves as the primary point of contact and is responsible for SH&E implementation and enforcement of safe work practices. When the Project Manager is not on-site, he/she will delegate an on-site SH&E Representative to take on the following responsibilities. If the SH&E Representative needs to leave the site or is not available, the Project Manager will assign an alternate HDR team member to fill the role (any field team member competent in the responsibilities below can serve as the SH&E Representative).

- Oversee SH&E implementation in the field and enforce safe work practices.
- Conduct and document daily safety briefings.
- Monitor on-site hazards and conditions and document safety inspections.
- Enforce safe work practices.
- Ensure availability and use of PPE.

AMERICAN OVERSIGHT

- Maintain SH&E equipment/instrument operation manuals and records of use and calibration.
- Monitor field team for heat and cold stress.
- Confirm employees' suitability for work based on physician recommendations for assignments requiring medical clearance (for example, hazardous waste work, rope access, exposure to noise, asbestos).
- Ensure reporting of all incidents in accordance with HDR reporting procedures, including contact to WorkCare for non-emergency injuries/illnesses and submittal of incident reports in the IndustrySafe reporting system (*https://industrysafe.com/hdrinc*).
- Provide oversight for site access for visitors and conducting visitor orientations.
- Serve as the facilitator of communications in emergencies.
- Immediately contact the Director of SH&E regarding any regulatory visits, audits, or inspections (for example, OSHA inspections).

3.2.2 Field Team Members

Field team members must be continually conscious of safety hazards and are expected to:

- Plan, organize, and perform each facet of work in the safest manner possible.
- Be constantly alert and report any unsafe act or condition, injury, incident, and safety infraction to a supervisor, the Project Manager, or the SH&E Representative so treatment can be obtained and/or corrective action taken them immediately.
- Actively participate in all safety training programs relevant to the work which they are performing
- Attend and actively participate in HDR trainings, meetings, and briefings.
- Use and maintain assigned equipment in a safe and responsible manner.
- Follow the procedures and processes specified in this Plan.

3.3 Stop Work Authority

Personal safety takes priority over all project deadlines, demands, and any other considerations. At all times and on all sites, it is HDR's policy, practice, and responsibility to provide a place of employment where HDR employees can conduct project-related activities in a safe and healthy environment. HDR strives to ensure the health and safety of its employees by identifying and mitigating recognized hazards to avoid or eliminate potential for injury or illness.

HDR employees need to be conscious for the safety of other project personnel and are expected to promote safe work habits. HDR employees are encouraged and empowered by HDR to maintain a safe workplace and only work when the hazards have been removed, controlled, or mitigated. No HDR employee is expected or obligated to perform work they consider unsafe or damaging to the environment.

Employees are to immediately report safety, health, and environmental (SH&E) concerns to their local Safety Coordinator, supervisor, and/or Project Manager. In addition, **Stop Work Authority (SWA) allows any HDR employee to stop work conducted by HDR or HDR subcontractors where there is a serious hazard or imminent danger**. Once invoked, the activity in question will be stopped and reviewed by those performing the work and their immediate supervisors. Work will not resume until all

AMERICAN OVERSIGHT

stop work issues and concerns have been adequately addressed. There will be no retribution for invoking SWA.

3.4 Unsafe Condition Reporting

Although HDR is not responsible for the health and safety or means and methods of other employer's work, when HDR employees (or HDR subcontractors) could be exposed to unsafe conditions/practices created by another contractor, or when observed unsafe conditions/practices pose a risk of serious injury or death to those exposed (regardless of company affiliation), the observing employee is obligated to notify someone who can take appropriate corrective action.

3.4.1 Exposure to Others (Non-HDR Employees/Non-HDR Subcontractors)

If an HDR employee observes an unsafe condition/practice by another contractor (not contracted with HDR) to which HDR/HDR subcontractors are not exposed but, in the employee's judgment, poses a serious hazard or imminent danger to others that could be exposed, the employee is to:

- Immediately warn those in imminent danger, regardless of company affiliation.
- Immediately notify HDR supervision for reporting to the creating/controlling contractor's senior management.
- When describing the serious hazard or imminent danger observation, do not provide any means or methods or specific remedies for correction. Our obligation is strictly limited to informing site supervision of the observation.
- Make it clear that our notification is advisory only and should not be construed as a direction or a stop-work order - the non-HDR contractor is solely responsible for determining and implementing the necessary corrective action.
- Document the notification in the project field logbook, daily report, or other records based on contract requirements.

3.5 Regulatory Inspection Protocols

It is our expectation that all employees will follow the requirements set forth in this Plan as well as all regulations that apply to their work location. HDR is committed to cooperating with regulatory and/or compliance inspection personnel as applicable on our project sites. HDR does not authorize any HDR employee to prohibit a properly identified representative from prompt admittance to any work area. Therefore, we will not require warrants for occupational SH&E officials' entry into any project location where HDR is engaged. We will cooperate with all inspectors in accordance with local regulatory requirements.

Guidelines for HDR actions during the inspection are summarized as follows.

Activity	HDR Action
Arrival of Inspector(s)	HDR project personnel are to contact their Regional SH&E Manager if an occupational SH&E inspector appears onsite to conduct an investigation involving HDR personnel.
Meeting with Site Representative	All HDR project sites require designation of an on-site SH&E Representative. The SH&E Representative is responsible for interaction with the inspector(s) and must be summoned immediately upon arrival of an inspector(s) at the site.

AMERICAN OVERSIGHT

Activity	HDR Action
Credential Verification	Immediately upon arrival of the inspector(s), the SH&E Representative is to request and document the inspector's identification. If the Inspector is missing his/her Identification card, or the identity of the inspector(s) is in question, a call to his/her home office is an acceptable practice to verify authenticity of credentials and inspection authorization.
Inspection	The SH&E Representative is to accompany the Inspector(s) at all times during the visit. HDR should attempt to replicate all photos, samples, or notes collected by the inspector(s), paying special attention to where the Inspector(s) goes, who is talked to, what sampling is done, which instruments are used, and any specific comments that are made. Site personnel are to conduct themselves in a professional manner when interacting with regulatory officials. The following guidelines should be adhered to during the inspection. • Keep all responses short and to the point without elaboration. Personnel should not volunteer information not specifically asked for by the inspector and should avoid statements that might be construed as an admission of noncompliance. • Do not demonstrate any operations for the Inspector(s) that are not part of the daily normal planned activities. • If possible, immediately remedy any alleged violation(s) identified by the Inspector(s). If an employee violates a work rule during an inspection, the same remedial/disciplinary action will be taken as if the Inspector(s) was not present. Failure to correct a violation noticed during the inspection may itself result in a citation. • Regulations may require the maintenance of certain safety and health records. If the Inspector(s) requests to review records, grant access to the documents.

3.6 Disciplinary Action

Should an employee commit a SH&E violation (any act contrary to the SH&E requirements set forth in this manual or those established by a client or governmental regulations), intentional or not, disciplinary action may result. Depending on the severity of the violation, the employee will typically be retrained to reinstruct the employee on the proper conduct expected. This retraining, and the circumstances necessitating it, will be documented and retained in the employee's personnel file.

For serious first time violations and repeat violations in which an offending employee continues to exhibit a disregard for the same or similar SH&E procedures after retraining, the responsible manager shall consult with the Director of SH&E and the Director of Employee Relations. As appropriate to the situation, actions could include any one, or a combination, of the following forms of disciplinary action: verbal warning; written warning; probation; suspension; and/or discharge. This is not an all-inclusive list and, because HDR is an at-will employer, it reserves the right to terminate at will without prior disciplinary action.

4.0 JOB SITE INSPECTIONS, AUDITS, AND OBSERVATIONS

4.1 Self-Audit/Take 5

A self audit/Take 5 is a proactive safety process used by employees to confirm they are prepared and confident in their ability to do an assigned task before they begin (they have the necessary training, knowledge, equipment, resources, etc.). The process involves employees "taking 5" (spending

AMERICAN OVERSIGHT

approximately 5 minutes) to review the task hazards, associated risks, and control measures prior to exposure.

Field staff will incorporate this self-audit practice into their work through daily morning safety meetings. The JHA form may be used as a facilitation tool for these meetings, but new issues that may not have been captured in the initial JHA creation should be addressed as well.

4.2 Job Site Inspections

The SH&E Representative is responsible for conducting and documenting regular job site inspections to confirm compliance with the Site-Specific SH&E Plan and proper identification of site hazards and conditions.

During the daily morning safety meetings, the SH&E Representative, and other field team members, should consider the changing environment and any potential hazards that may be encountered in that day's fieldwork. If these hazards are not already captured in the JHA form, they should be noted along with any ways that the teams will mitigate for the hazards.

4.3 Corporate SH&E Field Audits

Corporate SH&E is responsible for conducting field audits. Sites selected for audit are based on a project's scope and duration, anticipated hazards/exposures, potential for environmental impact, and the frequency and complexity of the work being performed. PMs can contact a Regional SH&E Manager to request a formal audit by a qualified safety professional at any time.

4.4 Behavior Based Safety Observations

For projects performed by offices participating in HDR's BBS program, all personnel on the project are to care for the safety of their fellow coworkers by being cognizant of their observed behaviors and documenting them in IndustrySafe (*https://industrysafe.com/hdrinc*). See the *SH&E portal* for more information on BBS implementation and expectations.

5.0 INCIDENT REPORTING AND INVESTIGATION

In the event of an incident, the most important immediate action is to provide medical assistance to those that may need it and to ensure the safety of others that may be affected.

5.1 Incident Reporting

All work-related near miss, injury, illness, damage, environmental, and security incidents involving HDR employees, subcontractors, and/or other parties at HDR work sites must be reported and investigated as soon as possible following occurrence.

Employees involved in or witness to an incident:

1. All Incidents
    a. Notify Supervisor to arrange for post-incident drug and alcohol testing (if applicable)
    b. Notify Project Manager for client reporting
    c. Submit Incident Report in IndustrySafe
2. Non-Emergency Injury/Illness Incidents
    a. Contact WorkCare (888-449-7787) for medical consultation

AMERICAN OVERSIGHT

3. Serious Incidents (incidents involving death, hospitalization, amputation, loss of an eye, significant damage, and/or environmental impact)
    a. Notify Director of SH&E or Regional SH&E Manage for regulatory reporting
    b. Notify Project Manager for client reporting

5.2 Incident Investigation

All incidents will be investigated by the Regional SH&E Manager with assistance from the on-site SH&E representative, project manager, and/or local safety coordinator and documented in IndustySafe.

6.0 EMERGENCY ACTION PLAN

This Emergency Action Plan has been prepared to define the responsibilities, resources and actions necessary to respond to incidents and emergency situations.

6.1 Communication Methods

The following communication methods will be used by the field teams:

☐ Cellular Phone (in camp)	☐ 2-Way Radio	☐ CB
☐ Satellite Phone	☐ Verbal	☐ Hand Signals
☐ Smoke / Flares	☐ Air Horn	☐ Siren
☐ Other:	☐ Other:	☐ Other:

6.2 Contact Numbers

Contact	Name/Address	Phone Number
Emergency Contacts		
Medical, Fire, and Police Emergency		911[a]
Medical Facility for Emergency Care	Iliamna Clinic, Roadhouse Strip Road Kokhanok Clinic, Clinic Drive	907-571-1818 907-282-2203
Non-Emergency Contacts		
WorkCare[c] (non-emergency injury/illness consultation)		888-449-7787
Medical Facility for Non-Emergency Care[d]	Same as Emergency	Same as Emergency
HDR Project Management and SH&E Contacts		
Project Manager	Anna Kohl	907-644-2008 office 907-727-9436 cell

AMERICAN OVERSIGHT

Local Safety Coordinator	Paul McLarnon	907-644-2020 office 907-250-8182 cell
SH&E Regional Manager	Dave Clemens	907-947-3431
Director of SH&E	Jeff Kleinfelter	760-450-6497
On-Site PLP Camp Manager/Technical Operations		
	Chasity Anelon	907-571-1788 office 907-360-4460 cell
	Dan Gallagher	907-571-1788 office 907-315-3995 cell
First Aid/CPR Trained Responders[e]	**Expiration**	**Phone Number**
Zach Halstead	6/2020	907-355-7637
Malcolm Salway	6/2020	907-301-4305
Alena Gerlek	6/2020	907-310-0387
Simon Wigren	6/2020	907-980-1901
Ashley Hovis	6/2020	907-764-2619
Mike Witter	First Aid 5/2020	206-909-7187
Hannah Griego		650-464-7642
Erin Cunningham	6/2020	907-602-7422
Maki Dalzell	First Aid 5/2020	425-691-7870

[a] The emergency number "911" is not applicable in all areas. Confirm based on the project location and replace as appropriate with the correct emergency contact numbers.

[b] If the project site includes public highway-rail grade crossings, identify the railroad emergency notification number posted on or near the crossing sign or single equipment. Use this phone number to report problems at the crossing (malfunctions, stalled vehicles on tracks, etc.) so the dispatcher can intercept trains or equipment approaching the crossing. If there is an immediate threat to life, call 911.

[c] Contact the WorkCare Incident Intervention hotline for non-emergency injuries/illnesses. WorkCare is available 24/7 for evaluation of self-care treatment options or referral to a designated occupational health facility.

[d] Select a facility from HDR's list of Designated Occupational Health Facilities when practical. If there is not a facility in near proximity, contact Amber Lyles in Corporate SH&E to find an acceptable alternative.

[e] If the job site is more than 15 minutes (3 minutes for sites where serious accidents such as those involving falls, suffocation, electrocution, or amputation are possible), there must be at least one person at the job site with current certification in first aid/CPR. At remote sites (a site that is isolated from normal human activities or not easily accessible by emergency services), at least two first-aid providers must be present at the job site.

6.3 Medical Facility Maps and Driving Directions

The Iliamna Clinic is located on Roadhouse Strip Road. Field teams will get directions to the clinic before commencing field work when based in Iliamna.

AMERICAN OVERSIGHT

Kokhanok Clinic is located on Clinic Drive. Field teams will get directions to the clinic before commencing field work when based in Kokhanok.

6.4 Emergency Equipment

- First Aid Kits
  - Each team will carry a field first aid kit.
  - First aid kits will be checked by the PM (or designee) before being sent out on the project and at least weekly thereafter during field operations to ensure they are full, in good condition, and that contents that have expiration dates have not expired.
- Overnight Supply Kits
  - Each team will be equipped with an overnight supply kit which will include a 3-season tent, sleeping bags, sleeping pads, and either a water filter or iodine drops
  - Team members will need to bring enough extra food and clothing to keep them fed and warm in the event that they are stranded away from base for one to two nights.

6.5 Evacuation Routes/Procedures

In the event the project needs to be evacuated, employees shall gather in the areas designated by PLP staff.

6.6 Inclement Weather

Inclement weather may occur while on the project site or during travel to and from the project. The on-site SH&E Representative will monitor the weather and weather forecasts while in Iliamna or Kokhanok for conditions that may require the field team to stop work or evacuate the site (high winds, heavy rain, lightning, fog, snow/ice, etc.). Daily meetings/briefings led by the SH&E Representative will include discussion of any anticipated inclement weather conditions that may impact the field team and the proper actions to take if facing these conditions. As appropriate, these discussions will include stop work and communication procedures, evacuation routes and shelter locations in the case of remote project work, etc. Field team leads will maintain communication with PLP base and helicopter pilots throughout the fieldwork to monitor weather and alert the pilot if they anticipate early extraction may be needed due to weather.

6.7 Safe Driving and Journey Management

Vehicle drivers must complete HDR's Safe Driving course on HDR University and must meet the driver eligibility criteria specified in HDR's Vehicle Use Policy and Procedures. Vehicles must meet the insurance, use, and maintenance requirements specified in HDR's Vehicle Use Policy and Procedures.

7.0 FIELD HAZARD ANALYSIS AND RISK ASSESSMENT

7.1 Job Hazard Analysis Forms

All field team members and subcontractors are responsible for being actively involved in the HDR hazard analysis and risk assessment process, which involves the identification, assessment, and prioritization of risks and measures to eliminate, minimize, monitor, and/or control them. Consideration is given to the safety, health, and security of workers, the public, and the environment.

AMERICAN OVERSIGHT

Job hazard analysis (JHA) forms are used to document the process and identify the sequence of work, specific hazards anticipated, and control measures to be implemented to eliminate or minimize each hazard. The JHA form also lists the necessary equipment and training required to perform the task safely.

Initial JHAs for tasks associated with this field work effort are included in Part 2. Prior to initiating a task, the field team must confirm the JHA is complete and adequately identifies and controls associated hazard. If there is a change in the scope of the work, if work conditions change, if new hazards are identified, or the controls prove inadequate or ineffective, the field team must revise the JHA as necessary, review with the team, and have each team member sign it before any work is conducted. Revisions can be handwritten on the form.

7.2 JHA Record Retention

All HDR field team members involved in the task must sign the JHA form in the field to acknowledge completion of the review and concurrence with the job steps, hazards, and controls described in the JHA. The SH&E Representative shall keep completed JHAs in a binder at the job site until the work is complete. After the work is complete, the electronic version of the initial JHA will be updated to include improvements that were identified in the field to assure better planning and a safer work experience the next time the task is performed. A copy will be forwarded to Corporate SH&E for inclusion in the JHA library.

8.0 HAZARD CONTROL

Methods to control hazards include hazard analysis of specific work tasks, safe work procedures, training, personal protective equipment (PPE), medical surveillance, and exposure monitoring.

8.1 Safe Work Procedures

Safe work procedures for the hazards/exposures associated with this project are included in Part 3.

8.2 SH&E Training

Confirm that all training listed on the task-specific JHAs and in the Safe Work Procedures is included here (and vice-versa as applicable).See the training catalog on the *SH&E portal* to help identify applicable requirements. Use the Safety Training Tracker on the *SH&E portal* to view HDR employee training records and verify training completion.

Table 2. SH&E Training Assignments and Completion Dates

Training	Field Team Member Date of Training – Trip 1					
	Zach Halstead	Malcolm Salway	Ashley Hovis	Mike Witter	Trent Parks	Mike Duffy

8.3 SH&E Equipment and Supplies

8.3.1 Personal Protective Equipment (PPE)

- High-visibility safety vests will be worn while conducting fieldwork.
- Appropriate footwear (X-tra Tuff or Muck-brand type boots) shall be worn while conducting fieldwork.
- Hearing protection shall be worn when flying in helicopters and employees shall be enrolled in HDR's Hearing Conservation Program as applicable. See the *SH&E portal* for information regarding enrollment.
- Safety glasses shall be worn when flying in and loading/unloading helicopters.
- Gloves appropriate to the task shall be worn.
- Appropriate clothing (long pants, rain wear, non-cotton, etc.) shall be worn for all field work.

8.3.2 Other Equipment and Supplies

Biological Hazards Protection

- ☐ Insect Repellent
- ☐ Mosquito Head Net

Communication Equipment

- ☐ Two-Way Radios
- ☐ Satellite Phone

Emergency Response Equipment and Supplies

- ☐ First Aid Kit
- ☐ Compass, map, GPS receiver
- ☐ Lighting (flashlight, extra batteries)
- ☐ Food/Water
- ☐ Survival Gear
- ☐ Tool kit

See the *SH&E Portal* for examples)

AMERICAN OVERSIGHT

PART 3 – SAFE WORK PROCEDURES

AMERICAN OVERSIGHT

A. BIOLOGICAL HAZARDS - INSECTS AND ARACHNIDS

A.1 Description

Insects and arachnids (including spiders, scorpions, mites, and ticks) will be encountered in a variety of outdoor project settings. Table 3 presents descriptions and habitat information for various types of stinging and biting insects and arachnids.

Table 3. Stinging and Biting Insects and Arachnids

Organism	Description	Habitat	Problem	Severity	Protection
INSECTS					
Bed Bugs	Small, oval, brownish insects. Adult bedbugs have flat bodies about the size of an apple seed. After feeding, however, their bodies swell and are a reddish color.	Enter homes/hotels on luggage, clothing, used beds and couches, etc. Live in groups in mattresses, box springs, bed frames, and headboards where they have easy access to people to bite in the night.	**Bites.** Lives on the blood of animals and humans.	Most bedbug bites are painless at first but later turn into itchy welts. They do not transmit diseases.	Inspect bed and upholstered furniture and alert hotel staff If you spot a bed bug Keep bags closed and zipped. Never lay luggage, backpacks or clothes on bed or on the floor.
Bees	Variable in size and color, many species ranging in size from microscopic to Bumblebee. European Honey Bee most familiar. Has two pair of wings.	Hollow logs, underground nest, and old buildings.	**Stings** when annoyed. Honey Bee leaves venom sac in victim. The ripping away of the venom sac kills the individual bee.	If person is allergic, nausea, shock, and constriction of the airway can result. Death may result.	Cover exposed skin. Avoid areas where bees are swarming. Avoid wearing sweet fragrances and bright clothing. Move slowly or stand still when swarming about you.

AMERICAN OVERSIGHT

Organism	Description	Habitat	Problem	Severity	Protection
Flies	One pair of wings; variable in size and color; some species microscopic (biting Midges), others (Horse flies) bumblebee size.	Variable, may range far from wetland breeding areas. Common around rural farmlands, swamps.	**Bites. Bloodsucking.** Black Flies, Horse flies and Yellow Flies, in particular, can be vicious biters.	Very painful bites. Often more inhibiting during daytime lowland work than mosquitoes.	Wear thick protective clothing. Use plenty of insect repellant.
Hornets	One inch long with some body hair. Abdomen is mostly black.	Round, paper like nest hanging from trees, shrubs, or under eaves of buildings.	**Stings**. One nest may contain up to 100,000 hornets, which may attack in force at the slightest provocation.	Severe pain, allergic reactions similar to bees. Can be fatal.	Do not come near or disturb nest. If a hornet investigates you, do not move.
Mosquitos	Small, dark, fragile body with transparent wings.	Wherever water is available for breeding.	**Bites. Bloodsucking.** Itching and swelling result.	Can transmit diseases (**see Table 4**).	Use insect repellant and wear gloves. Stay in windy areas.
Wasps	Very thin waist. Color can be black, yellow or orange with stripes.	Underground nest; also paper-like honeycomb nest in abandoned buildings, hollow trees, etc.	**Stings**. Some species will attack en masse if you disturb or even closely approach the nest.	Severe pain, allergic reactions similar to bees. Can be fatal.	Avoid nests. Do not swat at them.

Table 4. Mosquito-Borne Diseases

Disease	Symptoms	Geographic Distribution
Zika virus	Common symptoms of Zika virus begin 2-7 days after transmission and include fever, rash, joint pain, and red eyes. Other symptoms include myalgia (muscle pain) and headache. Note besides transmission from the bite of a mosquito, Zika virus can also be transmitted through direct contact with a Zika infected person's blood or other body fluids or from a pregnant woman to her fetus. Zika virus has been linked to a serious birth defect of the brain called microcephaly in babies of mothers who had Zika virus while pregnant.	http://www.cdc.gov/zika/geo/index.html
West Nile virus	Most people infected with West Nile virus will not have any	http://www.cdc.gov/westnile/

AMERICAN OVERSIGHT

	symptoms. About 1 in 5 people who are infected will develop a fever and other symptoms. Less than 1% of those infected develop a serious, sometimes fatal, neurologic illness.	*statsmaps/index.html*

A.2 Hazard Control

In addition to the protection measures listed in **Error! Reference source not found.**, the following actions are recommended to prevent insect and arachnid bites and stings:

- General
  - Do not wear perfumes or colognes when performing field activities as they often attract stinging insects.
  - Workers with a history of severe allergic reactions to insect bites or stings should carry an epinephrine auto injector (EpiPen) and should wear a medical identification bracelet or necklace stating their allergy.
- Mosquitos/Ticks
  - Check the Center for Disease Control and Prevention website for travel notices and updated maps of areas with mosquito and tick-borne disease transmission.
    - *http://www.cdc.gov/niosh/topics/outdoor/mosquito-borne/other.html*
    - *http://www.cdc.gov/ticks/index.html*
  - Use insect/mosquito repellents containing 20 -30% DEET on exposed skin in accordance with product label instructions and reapply as directed.
  - If DEET cannot be used for some reason (such as a personal sensitivity or the potential for cross-contamination when conducting environmental sampling), select an alternative EPA-registered product.
    - *https://www.epa.gov/insect-repellents/regulation-skin-applied-repellents*
  - Apply sunscreen prior to applying insect repellent.
  - Treat clothing and gear with permethrin (see HDR catalog) or purchase permethrin-treated items.
  - Wear light-colored long-sleeved shirts and long pants so you can easily see ticks on your clothing; tuck your pants into your socks to form a barrier.
  - Wear hats with mosquito netting to protect the face and neck.
  - Avoid non-essential outdoor activities at sunrise, sunset, and early evening when mosquitoes are most active.
  - Avoid high grass if possible and walk in the center of trails to avoid ticks in overhanging grass and brush.
  - Check your body, gear, and clothing for ticks, paying close attention to the head, armpits, and groin area. A daily total-body skin inspection greatly reduces the risk of infection since ticks may take several hours to two days to attach to the skin and feed.
  - Put your clothes in a dryer on high heat for an hour to kill any remaining ticks.

AMERICAN OVERSIGHT

A.3 Post-Exposure Incident Response

A.3.1 All Insect/Arachnid Bites and Stings

Risks from bites and stings include allergic reaction, infection, and transfer of disease-causing agents such as parasites, bacteria, and viruses. General guidelines are as follows:

- Wash the area around the bite/sting with soap and water.
- For bee stings, remove the stinger by gently scraping it out with a blunt-edged object, such as a credit card or dull knife. Don't try to pull it out as this may release more venom.
- If you have any symptoms of an allergic reaction, infection, or illness following a bite or sting occurring at work, regardless of how minor, immediately notify your supervisor and call WorkCare at (888) 449-7787.
- If you have a serious reaction involving any of the following symptoms, seek immediate medical care:
  - Swelling of the throat
  - Abnormal breathing
  - Tightness in throat or chest
  - Fainting
- Report all incidents in IndustrySafe (*https://www.industrysafe.com/hdrinc*).

A.4 Training

Prior to field work, HDR personnel must complete the following training or an equivalent substitute.

- Review and confirm understanding of HDR SH&E Procedure #034, Biological Hazards
- HDR University eLearning – *Biological Hazards: Insects*
- HDR University eLearning – *Biological Hazards: Arachnids*

B. BIOLOGICAL HAZARDS - MAMMALS

B.1 Description

Black and brown (grizzly) bears are common within the project area. Additionally; moose, wolves, caribou and other wildlife may be encountered during fieldwork.

Encounters with mammals are potentially dangerous either from traumatic injury due to direct contact or from infectious diseases that are carried by them or their parasites (see Section 10.0 for details on rabies, hantavirus, and histoplasmosis). Animal species that could be encountered depend on geography and will vary in size and ferocity. Mammals most likely to attack humans in North America are feral animals, bears, mountain lions, and moose.

B.2 Hazard Control

General precautions are as follows:

AMERICAN OVERSIGHT

- Be aware of the appearance and habitat of animals you are likely to encounter and plan accordingly based on the danger these animals pose.
- Complete the HDR University eLearning – *Biological Hazards: Mammals*
- Do not setup near obvious animal nests or burrows.
- Keep food and garbage stored in sealed containers.
- Minimize the amount of time you use lights after dark because light may attract animals.
- Don't touch rodents or other mammals, dead or alive.
- Do not attempt to feed animals.

B.2.1 Feral Animals

Employees conducting work at landfills, abandoned buildings, or urban project locations may encounter feral animals. A feral animal is any formerly domesticated animal that is now living as a wild animal. They are particularly dangerous because their appearance as a familiar pet causes people to assume they will act like one and, former association with people often causes feral animals to act without fear of humans. Feral dogs can become pack oriented, very aggressive, and represent serious risk of harm to unprotected workers.

- Do not feed, chase, act threatening or call to these animals or try to pet them.
- If the animal acts in a threatening manner, back away while facing the animal.

B.2.2 Bears

All species of bears are dangerous and should be avoided if possible. Brown (including Grizzlies) and black bears are the two species of bears expected to be encountered most often by HDR employees while working in Alaska, Canada, and northern and western regions of the United States. Employees required to work in these regions must be trained to work safely in bear country and be positively protected against a bear attack by either (a) the presence of a third party bear guard or (b) carrying an industry accepted chemical bear deterrent (such as bear spray). Under no circumstances, should an HDR employee work alone in bear prone areas.

The method of positive protection selected for each project will vary depending on the project location, type of work, bear population and risk of attacks, project logistics, and client requirements. The method of protection must be chosen prior to the project start and all associated requirements communicated to team members and the client to ensure awareness and concurrence by affected employees.

B.2.2.1 Bear Guards

A bear guard (an independent third party or the client) should be assigned to accompany a group of workers for any field work performed in medium to high density bear areas where the number of workers and/or the worker experience is not adequate to provide the positive protection needed. The designation of bear guard is assigned only to trained individuals whose sole responsibility is to provide positive protection against bears for the group of workers they are accompanying.

The project manager or team leader is responsible for verifying that the assigned bear guard is competent to perform the job duties through completion of a required firearm safety course

AMERICAN OVERSIGHT

and any additional training course completion, past experience or certification by an independent third party.

Bear guards carrying firearms shall provide the project manager documentation of the following:

- Completion record of a formal training class (and refresher training, as required) on firearm safety sponsored by the National Safety Council, National Rifle Association or other nationally recognized safety organization.
- Completion record of a formal training class on bear awareness and response sponsored by a recognized organization in the field of bear safety. Note: participants completing the LTR Training Systems Learn to Return Wilderness Safety Leader (Bear Guard) course must receive a minimum rating of 3 to serve as bear guard for HDR.
- Record of a passing pre-employment drug and alcohol test and enrollment in their employer's random drug and alcohol testing program.

B.2.2.2 Bear Spray

HDR encourages each individual to carry a bear deterrent such as pepper spray when working in bear prone areas. The spray canister should be carried in a holster on a belt, shoulder strap or pack to allow quick response if needed.

Caution must be used when discharging the spray to make sure that the individual is upwind from the spray to avoid exposure to the irritating and possibly disabling effects of the deterrent. Training for the use of bear spray should be obtained through bear safety classes or live training presented by experienced HDR employees.

Bear spray products are considered hazardous materials for ground and air common carrier transport. Each product should be handled according to applicable regulations and transportation providers should be alerted about its presence. Prior to shipping, contact Corporate SH&E for manifest preparation. Privately commissioned air transport does not fall under the air common carrier regulations and therefore does not require a formal manifest.

B.2.2.3 Personal Protective Equipment

Employees are to wear orange or orange/yellow vests when working alongside a bear guard carrying a firearm and during any hunting seasons that are occurring near the project area.

B.2.3 Moose

In North America, the moose range includes almost all of Canada (excluding the arctic and Vancouver Island), most of Alaska, northern New England and upstate New York, the upper Rocky Mountains, northern Minnesota, Michigan's Upper Peninsula, and Isle Royale in Lake Superior.

If you encounter a moose:

- If it hasn't detected you, move away from it. Give the moose plenty of space.
- If it knows you're there, talk to it softly and move away slowly.
- Don't be aggressive - you want to convince the moose that you aren't a threat.

AMERICAN OVERSIGHT

- If you think the moose is going to charge you, take cover or run away.
- Try to get behind a tree or a car if a moose charges.
- Never get between a mother moose and her calves.

B.3 Training

Prior to field work, HDR personnel must complete the following training or an equivalent substitute.

- Review and confirm understanding of HDR SH&E Procedure #034, Biological Hazards
- HDR University eLearning – *Biological Hazards: Mammals*
- Bear Safety Training

C. BLOODBORNE PATHOGENS

C.1 Description

Bloodborne Pathogens (BBP) are disease-causing microorganisms present in human blood and bodily fluids. The most prevalent of these pathogens are Hepatitis B Virus (HBV) and Human Immunodeficiency Virus (HIV). HDR has developed an exposure control plan for employees who have the potential to come into contact with potentially infectious material as part of their expected job duties (see HDR SH&E Procedure #008, Bloodborne Pathogens Exposure Control Plan. Job duties with potential for exposure on this project include:

- First aid/CPR responders

C.2 Hazard Control

To prevent potential exposure to infectious pathogens when administering first aid/CPR, HDR employees will employ the medical-care concept of “Universal Precautions” whenever working with injured personnel. “Universal Precautions” literally means that every person is assumed to be infected with bloodborne pathogens. All blood or other bodily fluids will be considered infectious regardless of the perceived status of the victim. To prevent transmission of these infectious agents, the following actions will be implemented:

a. Avoid all contact with blood or other bodily fluids (i.e., vomit or saliva).

b. Wear latex style (latex-free if allergic) gloves or equivalent when there is potential contact with potentially infectious materials.

c. Warn nearby personnel not to contact any potentially infectious materials.

d. Provide appropriate first aid, if trained to do so.

e. Report all BBP exposure incidents to your supervisor.

f. Dispose of, or decontaminate all PPE, equipment, and surfaces contaminated with blood or other body fluids.

g. Employees exposed to potentially contaminated materials shall wash-up immediately following the exposure.

AMERICAN OVERSIGHT

Decontamination of areas will be necessary if surfaces or equipment come into contact with blood/other bodily fluids. BBP decontamination will be accomplished as follows:

a. Wash with a ten percent bleach solution (one part bleach, nine parts water). Decontaminated materials are no longer considered regulated waste for disposal purposes;

b. Rinse with clear water until all visible blood/body fluids have been cleaned up;

c. Dispose of water generated during the decontamination process in the sanitary sewer or absorb on paper towels for normal refuse disposal;

d. Following thorough decontamination, solid materials may be disposed of as ordinary refuse. In the unlikely event that decontamination cannot be performed, call Corporate Safety for instructions.

C.3 Medical Monitoring/Vaccinations

HDR employees who have been identified as having the potential for exposure to blood or other potentially infectious materials (typically assigned tasks listed above) will be offered the Hepatitis B vaccine, at no cost to the employee. The current HBV vaccine process consists of three shots and takes six months to complete. The vaccine is for immunization against Hepatitis B only.

After receiving information on the hazards of Hepatitis B and the vaccine procedure, HDR employees may voluntarily choose to either accept or decline the vaccination. If accepted, the vaccination can be obtained either from the employee's personal physician or from a medical facility included in HDR's medical monitoring program. If declined, the employee must sign a ***Hepatitis B Vaccination Declination Form*** to document that the vaccination was offered by HDR but not accepted by the employee. Any employee who initially declines the vaccination may voluntarily elect to receive it at a later date, at no cost to the employee, during the employment period of exposure.

C.4 Training

Prior to field work, HDR personnel assigned tasks with the potential for BBP exposure must complete the following training or an equivalent substitute.

- Review and confirm understanding of HDR SHE& Procedure #008, Bloodborne Pathogens Exposure Control Plan
- HDR University eLearning – *Bloodborne Pathogens*

C.5 Applicable Forms

The ***Hepatitis B Vaccination Declination Form*** must be signed by employees who elect not to receive the Hepatitis B vaccination.

D. HELICOPTER AND SMALL AIRCRAFT SAFETY

D.1 Description

The project area will be accessed via helicopter.

HDR personnel utilizing helicopters and small aircraft are exposed to many serious hazards during flight, when approaching or exiting the aircraft, and when working near the landing zone of the aircraft.

AMERICAN OVERSIGHT

Helicopter and small aircraft travel is most commonly used when performing services such as surveying and environmental investigations, or transporting equipment/personnel into remote areas.

While helicopter and small aircraft travel is not considered a high risk activity, in the event of an accident, the potential for serious personal injury is great. Therefore, it is incumbent that all HDR employees follow the guidance presented in HDR SH&E Procedure #042, Helicopter and Small Fixed Wing Aircraft Safety when traveling by or working near helicopters and small fixed wing aircraft.

D.2 Hazard Control

Travel on small contracted aircraft (non-commercial) for work assignments may expose employees to noise levels that exceed occupational exposure limits. In accordance with HDR SH&E Procedure #026, Noise and Hearing Conservation, prior to working near or traveling on helicopters or small aircraft, the following employee actions are required:

Step 1. Notify SC of scheduled flights.

Employees must notify their SC of all travel plans involving contracted aircraft.

Step 2. Complete Flight Detail Tracking Form.

Documentation of flight details (including flight duration and type of aircraft) must be submitted on the ***Contracted Aircraft Flight Tracking Form*** on the *SH&E portal* within two weeks of completed travel. This information is critical for complying with OSHA regulations and will be used by Corporate SH&E to determine the need for enrollment in HDR's Hearing Conservation Program (HCP).

Step 3. Enroll in HDR's Hearing Conservation Program if applicable.

If the flight duration is long enough that OSHA's occupational noise action level (as specified in OSHA 29 CFR 1910.95) could be exceeded, exposed employees will be enrolled in HDR's HCP. Enrollment may occur prior to the employee's first flight or could occur following the flight (OSHA allows up to 6 months from an employee's first exposure at or above the action level for completion of a baseline audiogram).

Table 5 summarizes predicted flight durations that could exceed OSHA's action level and thus require enrollment in HDR's HCP.

Table 5. Flight Durations for a Single Work Shift Requiring Enrollment in HDR's HCP

	Type of Aircraft			
	Float Planes	**Fixed Wing Aircraft Other than Float Planes**	**Rotary (Helicopter) Aircraft**	**Flights in Multiple Aircraft**
Predicted Flight Durations that Could Exceed OSHA's Action Level[1,2]	Greater than 1-hour	Greater than 3-hours	Greater than 4-hours	Contact Corporate SH&E to Calculate

[1] If aircraft-specific monitoring has been conducted and indicates exposure levels are below the OSHA action level, enrollment in HDR's HCP is not required. Contact Corporate SH&E to review and confirm the adequacy of such monitoring.

[2] These durations were determined through noise monitoring conducted by Corporate SH&E. We will continue to measure exposures on future flights and will update and communicate any

AMERICAN OVERSIGHT

changes to these values if additional data indicate this is warranted.

Step 4. Complete HDR's Noise and Hearing Conservation training.

This self-directed online training is available on HDR University and is required for all employees traveling on contracted aircraft. Employees enrolled in HDR's HCP must repeat the training annually.

Step 5. Wear assigned hearing protection.

Regardless of flight duration, when in contracted aircraft with the engine running, employees must wear inflight communication ear muffs provided by the carrier. In addition, on fixed wing aircraft and float planes, employees must also wear disposable ear plugs with a Noise Reduction Rating of 25 or higher. These must be worn in combination with the inflight communication ear muffs provided by the carrier.

D.3 Personal Protective Equipment (PPE)

Personal protective equipment includes eye and hearing protection and may also include head protection, flash fire protection, and personal flotation devices for over-water flights. Employees traveling in remote areas must also be equipped with the appropriate level of survival gear should they become stranded.

- Eye Protection is required for the prevention of eye injuries caused by flying particles, such as dust and debris, generated by rotating aircraft propellers. Protective eyewear should meet the specifications cited in ANSI Z87.1 (2010 or latest edition).
- Hearing Protection is required when working near or traveling on helicopter or small aircraft for a duration that causes an exposure exceeding 85 dBA time-weighted average (TWA) or 100 dBA maximum noise level.
- Fire Retardant Suits may be required by the air conveyance pilot. HDR personnel will comply with the pilot's requirements and wear fire retardant suits if required.
- Helmets must be worn to provide protection from potential head injuries that could be incurred during any emergency landing. HDR personnel will comply with all helmet requirements set forth by the air travel provider or pilot.
- Survival Gear may be necessary when traveling to remote areas where emergency landings and weather may ground the aircraft for an extended period of time. HDR personnel must be prepared for exposure to the natural elements, including sustained high or low ambient temperatures, winds, blizzards, and/or precipitation for several days until rescued or flights can resume. Shelter provisions, extra food, and water, and several layers of warm, moisture wicking clothing, hats, and gloves should be carried during travel.

D.4 Training

Prior to field work, HDR personnel must complete the following training or an equivalent substitute.

- Review and confirm understanding of HDR SH&E Procedure #042, Helicopter and Small Fixed Wing Aircraft Safety
- Aircraft Briefing - The pilot is required to give passengers a briefing concerning the safety features of the aircraft and expected passenger behavior. This briefing should include at a minimum:

AMERICAN OVERSIGHT

- Normal Procedures
  - Proper Entry and Exit procedures
  - Proper seating in aircraft
  - Passengers must exit the aircraft and remain at least 50 feet away during refueling
  - No smoking
  - Loading and unloading tools and equipment
  - Proper use of PPE, for example, securing hardhat or helmet with chinstrap
- Emergency Procedures
  - Location of first-aid kit and survival equipment
  - Operation and location of fire extinguisher
  - Emergency electrical and fuel shut-off
  - Operation of doors and seat belts
  - Exit and rendezvous
  - General emergency procedures

- Sling Load Training - Sling loads should always be prepared by helicopter pilots or others who have been properly trained. HDR personnel should not take the responsibility for preparing sling loads unless there is no other alternative and they have been properly trained. Improper sling loading can alter a craft's balance, takeoff and flight ability. In the event that a team has to prepare a sling load, sling load training must include:
  - Viewing the video, Keep Your Eyes on the Hook – Helicopter External Load Operations – Ground Crew Safety, Minster of Transport, Canada
  - Successful completion of a quiz based on the information in the video
  - Hands-on instruction from the pilot will be identified and provided.

D.5 Applicable Forms

Flight details (including flight duration and type of aircraft) must be submitted on the ***Contracted Aircraft Flight Tracking Form*** on the *SH&E portal* within two weeks of completed travel. This information is critical for complying with OSHA regulations and will be used by Corporate SH&E to determine the need for enrollment in HDR's Hearing Conservation Program (HCP).

E. NOISE (HEARING CONSERVATION)

E.1 Description

Daily helicopter use presents a noise hazard during these field events.

HDR employees must recognize and avoid noise hazards encountered at the project site. Exposure to prolonged excessive levels of noise can result in a permanent loss of hearing acuity, development of

AMERICAN OVERSIGHT

tinnitus (i.e., ringing of the ears), a possible increase in blood pressure, and stress-related problems. Noise may also cause difficulty in communicating or working effectively and safely.

E.2 Hazard Control

The three ways to reduce employee noise exposure are through the use of (1) engineering controls (best option), (2) administrative controls (good option), and/or (3) hearing protectors (worn when other controls fail). Unfortunately, HDR is rarely able to implement engineering controls such as equipment substitution, alteration, or isolation to reduce noise generation, since we do not own the facility/equipment.

Our best option when confronted with excessively loud noise sources is to move away from it. Moving away works, as noise dispersal generally acts on the inverse square law – for any doubling of the distance from the noise source, the noise level received decreases by six decibels. Also, conversing in a normal tone with another worker at a distance of three feet may be used as a guide that you are in a safe noise environment.

If any HDR employee is, or is expected to be, routinely occupationally exposed to continuous noise at or above OSHA's time-weighted average Action Level of 85 dBA (regardless of whether hearing protection is worn), the employee shall be enrolled in HDR's Hearing Conservation Program, which includes:

- Annual education on the health effects of noise exposure and instructions on how to fit and wear hearing protectors;
- A baseline audiogram and annual follow-up audiometric testing.

To enroll in the HDR HCP, contact your Regional SH&E Manager.

E.3 Personal Protective Equipment (PPE)

Hearing protectors should only be used as a last resort when engineering and administrative measures are infeasible or have been implemented as possible and further protection is still needed. Hearing protection must be worn by HDR personnel when the workplace noise levels are greater than the Action Level(s) shown in Table 1 of HDR SH&E Procedure #026, Noise.

The most common hearing protectors are earplugs and earmuffs, and each model is assigned its own numerical noise reduction rating (NRR) value. The higher the number, the more noise the protector is predicted to attenuate as long as it is well fitted and used as recommended by the manufacturer. The project safety coordinator will determine the level of protection needed for the job site and assist with the selection of hearing protectors for each team member.

E.4 Training

Prior to field work, HDR personnel who will potentially be exposed to noise above occupational exposure limits must complete the following training or an equivalent substitute.

- Review and confirm understanding of HDR SH&E Procedure #026, Noise (Hearing Conservation)
- HDR University eLearning – *Noise and Hearing Conservation* (annual requirement)

AMERICAN OVERSIGHT

E.5 Applicable Forms

For travel in helicopters or small fixed-wing aircraft, flight details (including flight duration and type of aircraft) must be submitted on the ***Contracted Aircraft Flight Tracking Form*** on the *SH&E portal* within two weeks of completed travel. This information will be used by Corporate SH&E to determine the need for enrollment in HDR's Hearing Conservation Program (HCP).

F. REMOTE SITE SAFETY

F.1 Description

The entire project area is considered “remote”, and is accessible only by helicopter or small aircraft.

F.2 Hazard Control

HDR considers a site "remote" if it is isolated from normal human activities or if travel over unmarked roads or off-road is required to reach it. The primary hazards associated with working in remote locations are:

1. Isolation of employees from public rescue services
2. Limited means of communication
3. Exposure of employees to adverse severe weather
4. Danger to employees from crime

In addition to the general hazard controls presented in the following subsections, procedures and protocols for the following have been established:

- Journey Management – A travel safety form detailing the travel plans, emergency contact information for each team member, and the nightly check-in schedule and contact person will be completed and distributed to the appropriate staff prior to departure for the field.
- Emergency Planning (see Section 6.0)
- Communication Protocol (see Section 6.1)

F.2.1 Strangers

Avoid contact with strangers at remote locations. Maintain an adequate “personal space” between yourself and the stranger. If contact (verbal or physical) cannot be avoided, be wary of the intentions of unknown persons. If you are in a secluded area and stranger approaches, move immediately to a highly visible area before conversing. If you feel uncomfortable by the presence of a stranger, leave the site.

F.2.2 Rough Terrain

Occasionally, HDR employees are required to perform surveys or inspections in areas that are wooded and/or mountainous, which could reasonably pose a physical hazard to employees due to the terrain of the area, the altitude, or the possibility of becoming lost.

- Know the physical limitations of each member of your team, especially if any member has a predisposing medical condition that could possibly require immediate care while on the trip

AMERICAN OVERSIGHT

(e.g. diabetics and persons with heart conditions). Among your considerations should be the altitude acclimatization of each team member, and the comfort level of party members when working near steep ridges.

- Do not attempt to make any steep rock climbs without the use of appropriate equipment. Remember that descending the same pitch will be much more difficult than the ascent. In ascending, the foot placements are easily visible somewhere between the feet and waist level and one never has to look down. In descending, the foot placements are now below the feet, perhaps six to eight feet below the eyes and are not easily discernable. Additionally, in order to find those footholds, the climber must look down, which could cause the climber to panic, or undergo an adrenaline rush resulting in accelerated fatigue.
- Be aware of and avoid ledges or other fall hazards and take special care to avoid slip, trip, and fall hazards. Even a minor injury is magnified if a great deal of effort is required to obtain treatment or to get to a safe area.
- Keep the team together at all times.
- If lost, remain where you are. With employment of the communication system described in Section 6, even if the cell phone is inoperative, your office will have a good idea of the approximate area where you are, unless you begin to wander, in an attempt to walk out.

F.2.3 Nature and Weather

Hazards from outdoor elements can be avoided by having an understanding of the hazards and by proper planning and preparation. Remain cognizant of the weather and look for clues that it is about to change. The key to safety during a potential thunderstorm is to know the most likely point where lightning might strike. General guidance to avoid a lightning strike is as follows:

- Stay away from isolated or large trees. If the tree is isolated, stay farther from isolated trees than the height of the tree.
- When on an exposed talus or scree (rock fields with no tree protection), stay nearer the smaller rocks.
- In open areas, seek a low place such as a ravine or valley, but be alert for flash floods.
- In all cases, stay away from sources of water (e.g. streams, lakes, puddles or even small pools of water collected on rocks). Water is an excellent conductor of electricity.
- The optimal location would be sheltered by small trees in a ravine, away from water and rock overhangs. As an electrical charge traveling along the ground reaches an overhang, it will very likely arc across to your body and travel through it rather than along the rock.
- If your team is a large group of people, spread out as much as possible to reduce the risk of multiple casualties.
- If you take shelter in a cave, stay away from the entrance. As the lightning passes through the ground, it will travel near the opening of the cave and will use a body as a bridge to pass from one side of the entrance to the other.
- Avoid body positions that would allow the charge to pass through the body. Whenever possible, drop to your knees and bend forward putting your hands on your knees. Try not to place your hands on the ground, as this would increase the chance of entry and exit points resulting at opposite extremes. NEVER lie flat on the ground. Occupy the smallest area possible.

AMERICAN OVERSIGHT

- At all times, wear shoes and stay on something insulated such as dry clothing, packs, ropes, or tree branches. When there is a hazard of lightning, remove all exposed metal objects from your clothes. These objects become hazardous not only because they present a possible target for a direct strike but also because they will heat up significantly and fuse clothing or flesh as the current passes through the body on an indirect strike.
- When you see a bolt of lightning, count how long it takes for you to hear the thunder and divide by 5. The result is your distance, in miles, from the lightning.

F.3 Lone Workers

It is strongly encouraged that more than one employee ("buddy system") be assigned to complete tasks at remote sites. Before allowing an employee to work alone at a remote site, PMs must evaluate site conditions to determine if such assignment is appropriate. Factors to consider include:

- Availability of cell phone coverage
- Access to emergency services
- Whether the site is in a high crime area
- If there is a potential for acute chemical exposure
- If there is a high potential for physical hazards such as high voltage or other electrical hazards, working at heights, confined spaces, heavy lifting, heavy equipment operations, etc.

If an employee is allowed to work as a lone worker, they must have cell phone or satellite phone and must develop a communication protocol that includes a check in/check out schedule with someone in the office. The schedule must include check in at a minimum of two agreed upon times each day (morning, afternoon) with a designated office contact and check out confirmation upon leaving the site and/or upon arriving at the final destination for the day (office/home/hotel, etc.)).

F.4 Personal Protective Equipment (PPE)

In addition to a cell phone or satellite phone, the following equipment, depending on the degree of isolation, the climate, and the topography, should be considered:

- Global Positioning System (GPS) and/or U.S. Geological Survey Topographic Map and Magnetic Compass
- Weather Radio
- Flashlight (with extra batteries and bulb).
- Extra clothing (including mittens, hat, jacket and rain gear).
- Sunglasses/safety glasses
- Extra Food and Water
- Waterproof Matches in Waterproof Container
- Candle/Fire Starter
- Pocket Knife
- First Aid Kit
- Insect repellents and medications to treat exposure to biological hazards such as insect bites, poison ivy, etc.
- Space blanket or two large heavy-duty trash bags

AMERICAN OVERSIGHT

F.5 Training

Prior to departure for field activities in remote areas, HDR personnel must complete the following training or an equivalent substitute.

- Review and confirm understanding of HDR SH&E Procedure #038, Remote Site Safety
- HDR University eLearning – *Remote Site Safety*
- At least two members of the field team at remote sites must be certified in first aid/CPR

G. SLIP, TRIP, & FALL PREVENTION

G.1 Description

Slips, trips, and falls (S/T/F) result from encountering an unexpected change in the walking surface (change in frictional resistance or level) resulting in a loss of balance. Most of these accidents are preventable through proper housekeeping, correct walking surfaces/footwear, and simple precautions.

G.2 Hazard Control

Common project site sources of S/T/F hazards are:

- Stepping out of vehicles onto uneven terrain/loose gravel/ice – realize you are shifting your weight from a sitting to a standing posture, and transferring this weight onto the new surface. Do this carefully, especially in winter in a parking lot. Initially reduce stride and assess.
- Carrying items while walking. This has several dangers – holding any items reduces your ability to use your hands/arms to recover from a momentary loss of balance, and carrying a large item, such as a box, impedes your view of the walking path in front of you.
- Embarking/disembarking from boats. Very common source of injury. Docks are stationary and at a higher elevation, while boat floors are rocking with wave action, and have clutter/seats, etc. in them, reducing the targeted landing spot for feet. Shifting your weight to leave a dock and embark into a small boat is especially dangerous. Performing a one minute stretch (hamstrings, hips, knee bends, low back) for increased flexibility (aids in balance) is a very good idea before embarking.
- Climbing ladders and walking on elevated grating-type (expanded metal) surfaces. These freeze easily and hide the presence of ice.

Most S/T/F accidents can be avoided through:

- Awareness – recognize trouble spots/uneven terrain and avoid where possible. Watch your pathway while you walk.
- Housekeeping – do not stack materials/cords in walkways, close file drawers, apply de-icer, or manually remove on walking and climbing surfaces – don't create a S/T/F hazard!
- Wear proper footwear – many serious injuries result from ankle turns. Wear over-the-ankle boots, laced up snugly. Select soles that offer good traction (lugged, not smooth) and are made from high frictional resistance materials (rubber-like compounds). These two characteristics will prevent many falls and injuries, due to uneven terrain.

AMERICAN OVERSIGHT

- Stride dynamics – Slips generally happen when an employee walks across one surface with a higher frictional resistance (e.g., carpet), which sets his/her stride at a fast pace, and then steps with that same stride onto a new surface with a lower resistance (marble, wet floor). Reduce the distance of your stride (space between steps) and slow your pace when first encountering a new walking surface – almost walk gingerly, until you have ascertained what pace the surface friction will support. Keep toes pointed a little outwards to enhance stability; make wide turns around corners. The ultimate stride goal in slick conditions is to keep your center of gravity directly between your legs, and your legs as close to vertical under your trunk.
- Avoid jumping or running on project sites – both actions increase both the likelihood of, and the extent of injury suffered as a result of, a S/T/F.

G.3 Training

Prior to field work, HDR personnel must complete the following training or an equivalent substitute.

- Review and confirm understanding of HDR SH&E Procedure #003, Slip, Trip, and Fall Prevention
- HDR University eLearning – *Slip, Trip, and Fall Prevention*

Hi Molly,

Here are my comments on the alternatives document.

Please let me know if you have any questions.

Thanks,
Barb

Subject: FW: Correct version of the Alternatives memo

Hello All,
The Corps has distributed the updated, more detail, discussion on Alternatives development for cooperating agency review. Per the below email, comments are welcome if we would like to provide any. I would appreciate your review of the attached, if you have time (I realize this is later than originally anticipated). If you do have any comments, please send them to me by COB Wednesday 9/26.
Thank you,
Molly

All-
Per our discussion today, Figure 1.1 in the attached document (Pebble Project Operations Water Management Plan) shows the current project layout.
This document was submitted to the Corps and AECOM in response to a request for additional information related to water management. This document is also available on the Corps' Pebble EIS website under RFI 019.

Subject: Please Review: Pebble EIS: Preliminary Alternatives Screening

Hello Kate, Barb and Palmer,
We have received a preliminary list of alternatives and description of screening criteria used in developing alternatives for the Pebble EIS. Given your experience in developing mine scenarios for the Watershed Assessment, we would appreciate if you can review this preliminary document. We would appreciate any input you may have by COB Friday, so that we can compile all comments in time to meet the Corps deadline. I will also follow this email with an invite to discuss later this week. Please don't hesitate to call if you have any questions about this document or the review request prior to the scheduled conference call.
Thank you,
Molly

AMERICAN OVERSIGHT

1.0 INTRODUCTION

1.1 PEBBLE PROJECT OVERVIEW

The Pebble Project (the Project) is a proposed mining development of a copper-gold-molybdenum deposit located approximately 238 miles southwest of Anchorage, Alaska, and 17 miles northwest of the village of Iliamna. The deposit is situated on a drainage divide at the headwaters of three waterways, with the Upper Talarik (UT) draining to the east, and the North Fork Koktuli (NFK) and South Fork Koktuli (SFK) draining to the west and southwest, respectively.

The deposit will be mined by open pit methods feeding an associated process plant with a throughput capacity of 180,000 tons per day (tpd), over an operating life of 20 years. The milling process produces two streams of tailings; a bulk tailings stream and a pyritic tailings stream. The Bulk Tailings Storage Facility (Bulk TSF) will manage non potentially acid generating tailings (bulk tailings), and the Pyritic Tailings Storage Facility (Pyritic TSF) will manage pyritic tailings, which are assumed to be Potentially Acid Generating (PAG), and PAG waste rock from the mining activities.

The Project includes the following key water management facilities: fresh water diversion channels, the Open Pit Water Management Pond (OP WMP), the Main Water Management Pond (Main WMP), the Bulk and Pyritic TSF's, the Bulk TSF Main Embankment Seepage Collection Pond (Bulk TSF Main SCP), seepage collection and recycle ponds, sediment ponds, and two water treatment plants (WTP#1 and WTP#2). The Project general arrangement, showing the locations of the TSF's and water management facilities, is presented on Figure 1.1.

The Bulk TSF will manage approximately 1.1 billion tons of bulk tailings solids. The main embankment of the Bulk TSF is proposed to operate as a drained facility to promote long term drainage of the bulk tailings mass. The Bulk TSF Main SCP, which is located downstream of the main embankment of the Bulk TSF, will collect seepage that passes through the main embankment. Water collected in the Bulk TSF Main SCP will be pumped to the Main WMP. The Bulk TSF south embankment is proposed to include a hydraulic barrier, consisting of a HDPE liner or a low permeability core zone, and a grout curtain installed in the weathered bedrock of the foundation. A seepage collection pond will be located downstream of the south embankment to collect any potential seepage and embankment runoff. A seepage collection pond will also be constructed along the east side of the Bulk TSF to collect potential seepage and runoff from the east side of the facility. Water collected in the seepage collection ponds to the south and east of the Bulk TSF will be pumped back to the Bulk TSF.

The Pyritic TSF will manage approximately 150 million tons of pyritic tailings and 126 million tons of PAG waste rock, stored sub-aqueously. The Pyritic TSF is a lined facility and will include an underdrain to convey groundwater and potential seepage from the facility to a seepage collection pond at the north end of the facility. Water (groundwater, seepage and surface runoff) collected in the seepage collection pond will be pumped to the Main WMP.

Construction materials are proposed to be primarily sourced from three quarries located around the Bulk TSF, as shown on Figure 1.1. Construction materials for the various embankments will be sourced from

AMERICAN OVERSIGHT
EPA-0135-0000496

Quarry A, Quarry B and Quarry C, with additional non-PAG materials sourced from Open Pit stripping activities, as available. Quarry A will be active during the pre-mining phase (construction) and during operations until the tailings level in the Bulk TSF inundates the quarry. Ongoing construction materials will be sourced from Quarry B, Quarry C, and Open Pit stripping (as required) throughout operations.

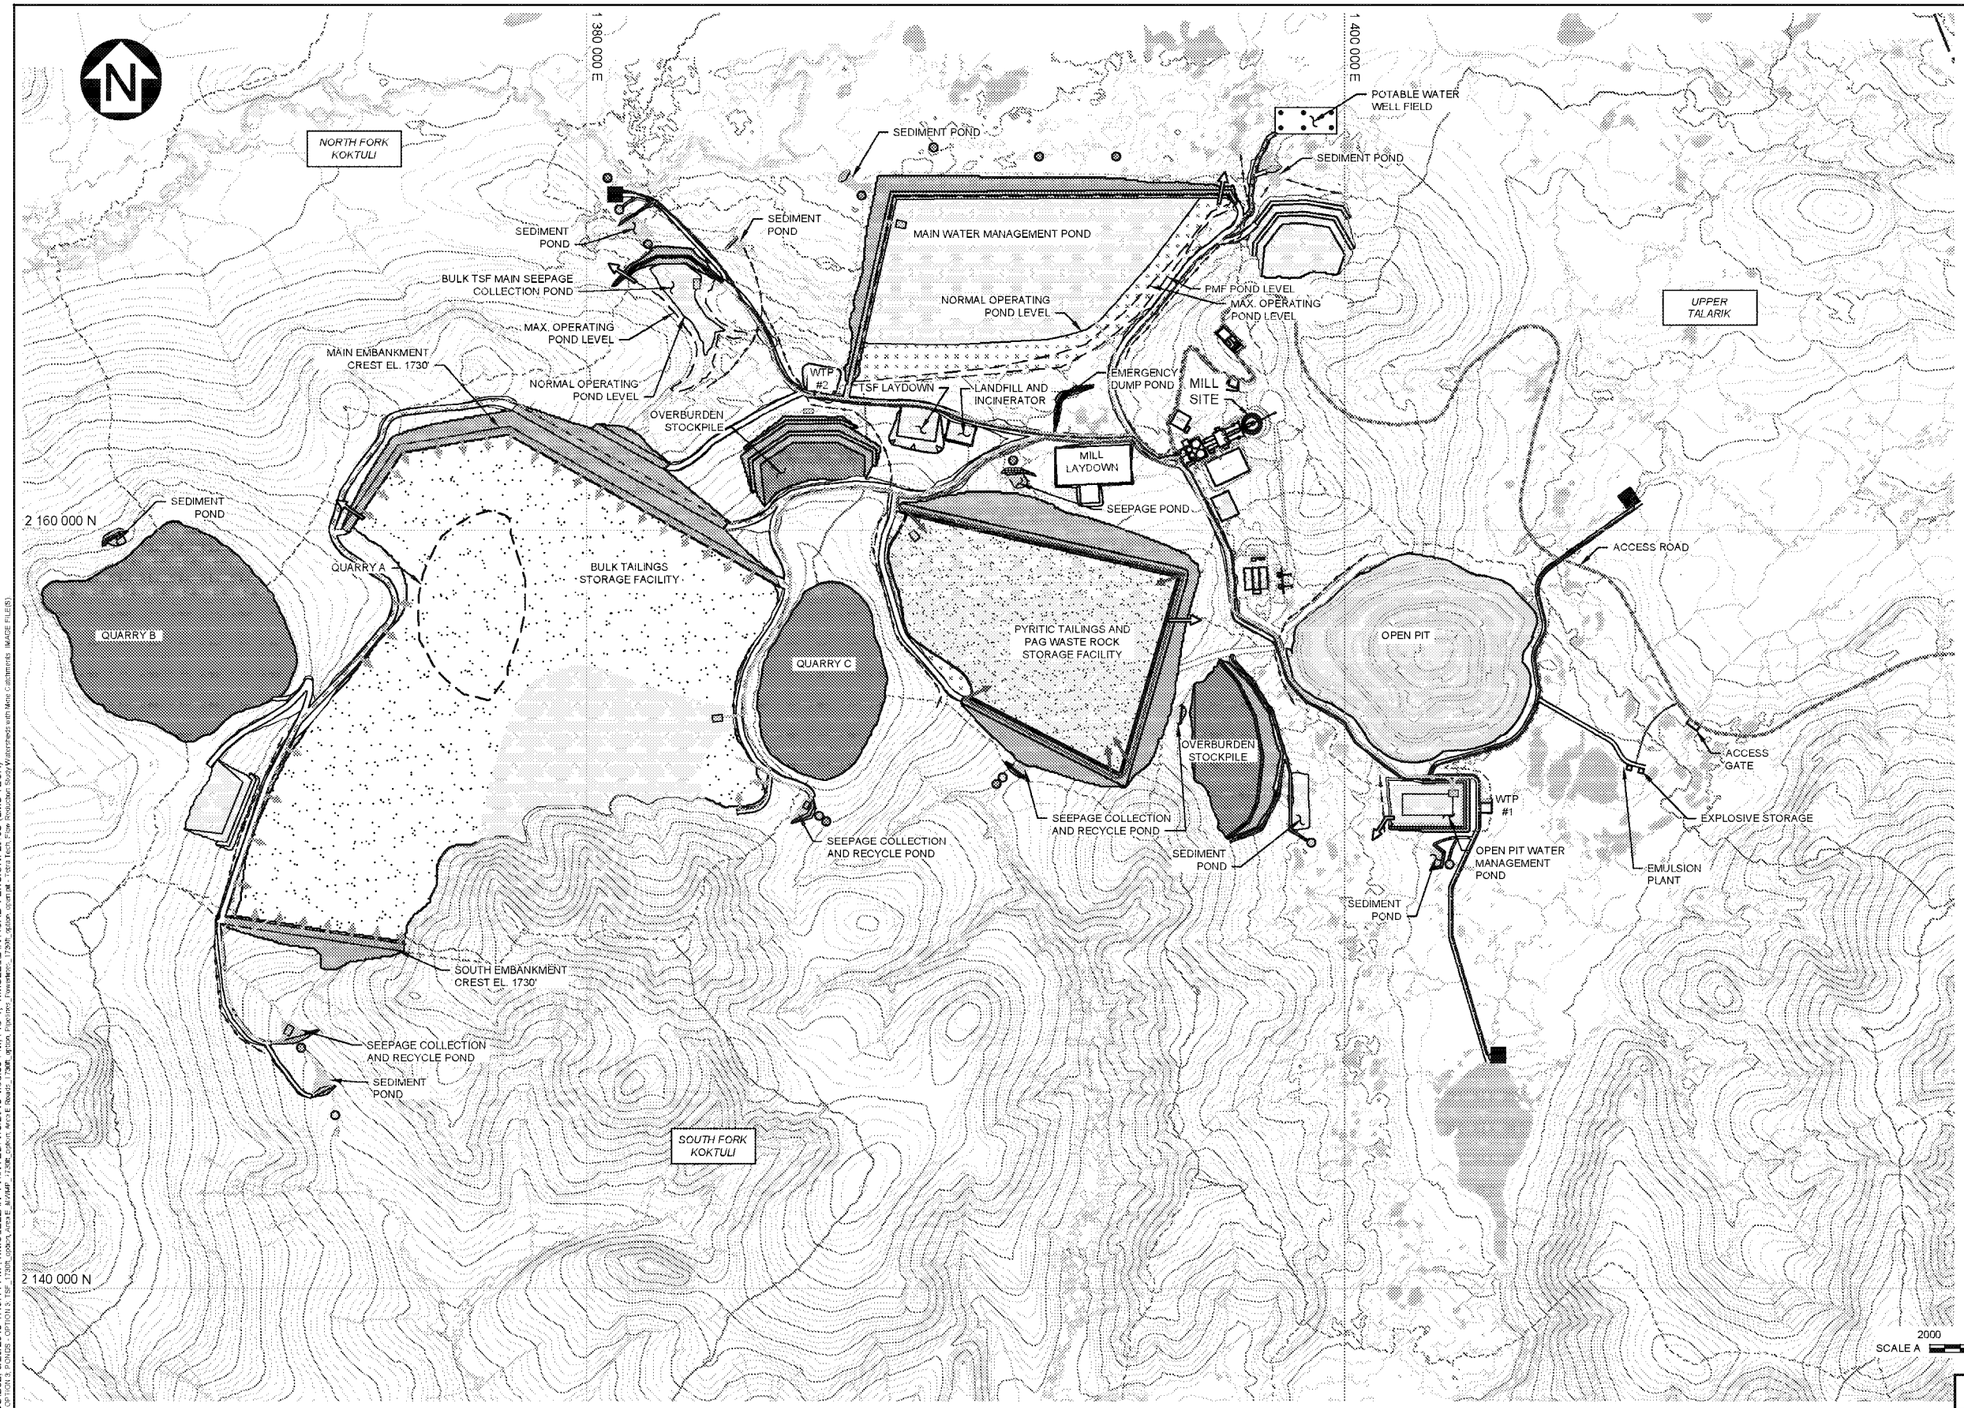
Hydraulic confinement of the Bulk TSF will be achieved and maintained using a series of seepage control measures including grout cut-off walls and seepage pump-back systems. Confinement will be monitored based on groundwater levels and quality in installed wells. The quarries developed on the perimeter of the TSF will be designed to maintain a groundwater level above the elevation of the supernatant pond, thereby preventing the seepage of pond water into the quarries.

Surplus water collected within the Project footprint (surface runoff and groundwater) that is not required to supply the milling process will be treated and released. Water stored in the Main WMP will be used to supply the process during prolonged dry periods. Discharge locations for treated water are proposed in the NFK, SFK and UT catchments, as shown on Figure 1.1. Two water treatment plants will treat surplus water from the Project site; WTP#1 is located near the Open Pit and will treat water from the OP WMP, and WTP#2 is located near the Main WMP and will treat surplus water from the Main WMP. The water treatment plants will each include pumping and piping systems configured to convey flows to all three of the discharge locations.

1.2 SCOPE OF REPORT

The purpose of this report is to describe the water management plan for the mine site area during operations when all of the project facilities (e.g. processing mill, water treatment plants, etc.) are operating. Normal operating conditions included consideration of climate variability scenarios. In addition to climate variability, allowances for storm storage and freeboard have been provided for all ponds and water management facilities.

A summary of the hydrometeorological and groundwater characteristics for the Pebble Project are provided within this report. A full description of the hydrometeorological conditions will be provided in the hydrometeorology report (currently in progress). A full description of the baseline groundwater conditions is presented in the 2015 Groundwater SEBD Chapter 8 (Groundwater Hydrology) and SEBD Chapter 9 (Water Quality) reports (PLP 2015a; 2015b). A description of the predicted groundwater conditions during and after mine operation will be provided in the groundwater modelling report (currently in progress). The geochemical parameters used for the development of the water quality model were provided by SRK and are summarized in their geochemical source term report (SRK 2018).



This water management report includes the following:

- Characterization of the hydrometeorological and hydrogeological setting for the mine site
- Description of how mine drainage and stormwater will be managed at the mine site
- Demonstration of adequate storage and supply of makeup water to the Process Plant over a full range of potential climate conditions, including prolonged dry and wet periods
- Identification of the surplus flows available for treatment and discharge, and

AMERICAN OVERSIGHT
EPA-0135-0000497

- Provision of water quality predictions for the major water management facilities and water treatment plants.

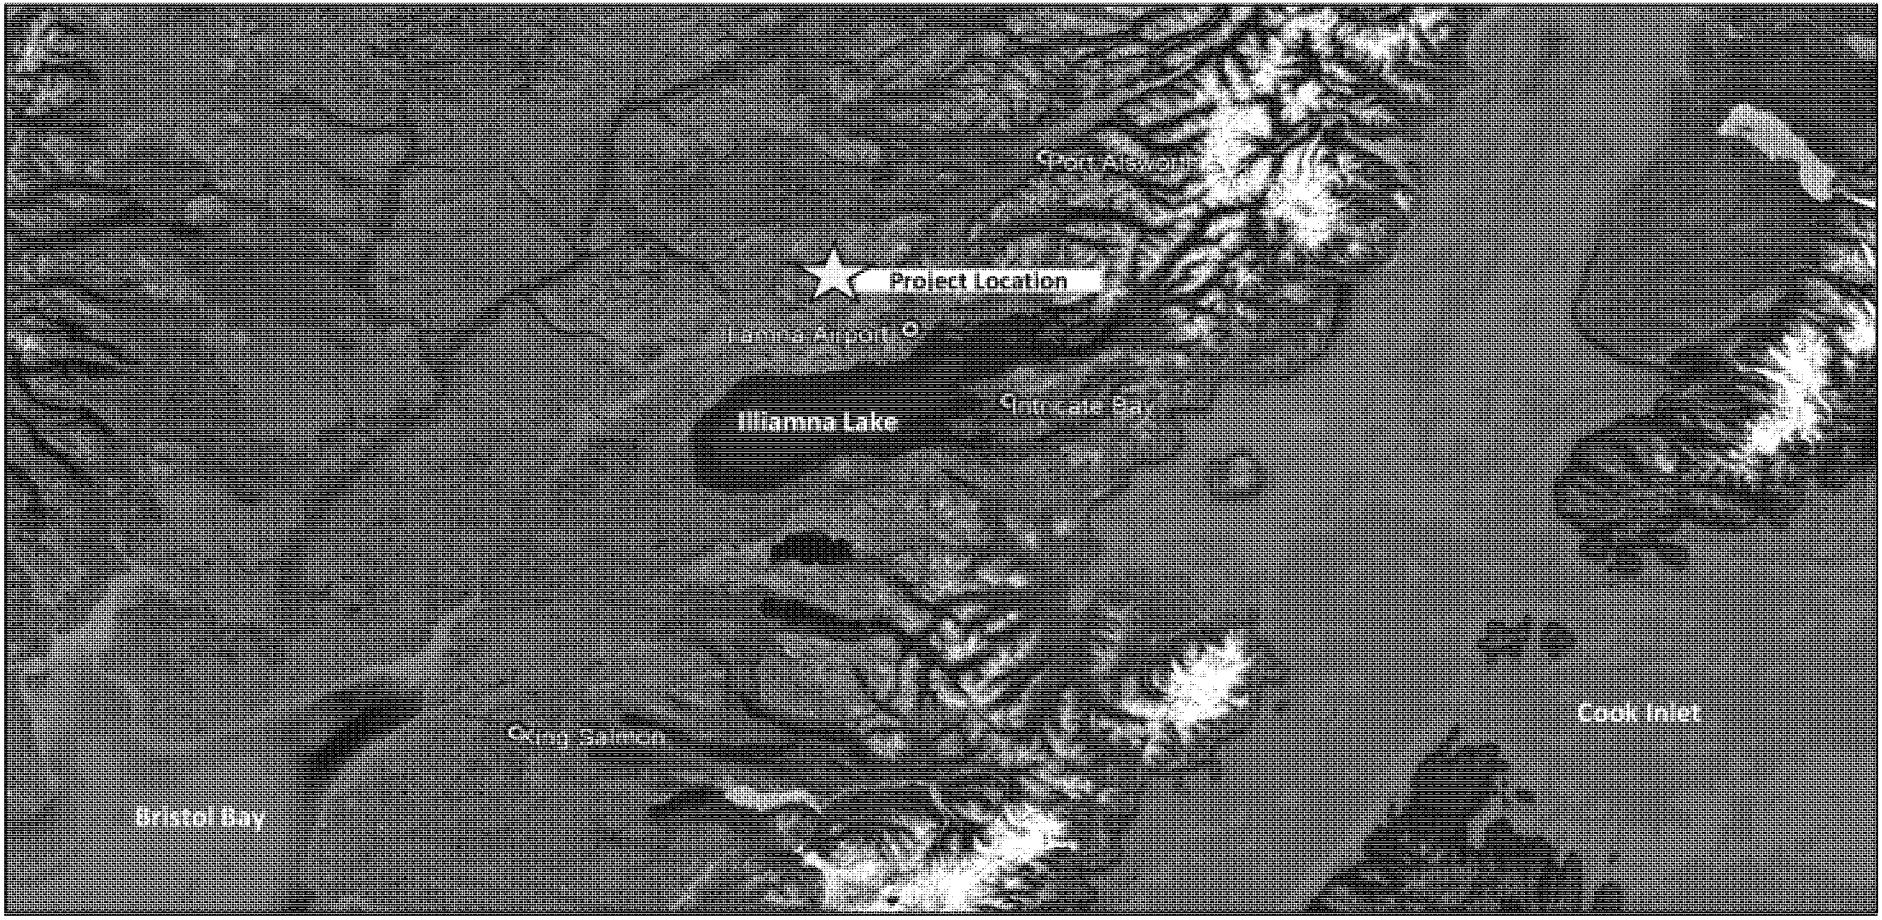
2.0 HYDROMETEOROLOGICAL CHARACTERISTICS

2.1 OVERVIEW

The Project location and regional setting are shown on Figure 2.1. The position of the Project site relative to the three main local drainage basins (NFK, SFK, and UTC) is shown on Figure 2.2.

The locations of hydrometeorological stations in the Project area are shown on Figure 2.2. These include meteorological stations, which are discussed in Section 2.2, and streamflow gaging stations, which are discussed in Section 2.3. A spreadsheet model, referred to as the Pebble Project Watershed Module (described below), was developed to relate meteorological inputs to groundwater and surface water responses in the project. Long-term regional climate records, which were adjusted for site specific conditions, were used as input to the Watershed Module to generate long-term estimates of groundwater and streamflow conditions.

The Pebble Project Watershed Module is a numerical, semi-distributed, spreadsheet-based precipitation-runoff model that incorporates the key components of the hydrologic cycle including precipitation as rain and snow, evaporation, sublimation, runoff, surface storage, and groundwater recharge, discharge and storage.



2.2 CLIMATE CHARACTERISTICS

2.2.1 SETTING

The Project is located in a transitional climatic zone with strong maritime influences. Summer temperatures are moderated by the open waters of Iliamna Lake, the Bering Sea, and Cook Inlet. Winter temperatures are more continental because of the presence of ice on Iliamna Lake and Bristol Bay during the coldest months of the year. Winter weather systems typically travel into the region from the Bering Sea to the west, from along the Aleutian Islands chain to the southwest, and from the Gulf of Alaska to the south; as a result, winter temperatures are less influenced by Cook Inlet than summer temperatures. These weather systems consist of cool to cold air that is saturated with moisture, resulting in frequent clouds, rain, and snow. Less frequent wintertime incursions of frigid, stable arctic air masses bring shorter periods of clear and very cold conditions to the region. Incursions of very warm air masses from the interior of Alaska can cause atmospheric instability in the summer months, which results in the development of cumulus clouds and thunderstorm activity.

The mean annual temperature in the Project area is just below freezing, with freezing temperatures generally persisting from October through April, and conditions are quite wet, with mean annual precipitation varying throughout the project area but generally ranging from 45 in. to 55 in.

2.2.2 METEOROLOGICAL STATIONS

Meteorological data have been collected at six monitoring stations in the Project area. The station locations, data collection methods, and the data collected up until 2008 are presented in the Environmental Baseline Data Report (PLP 2011). The station with the longest period of record, and that which is considered most representative of conditions in the mine development area, is Pebble 1 (2005-2013, and re-started in 2017). The Pebble 1 station is situated west of the deposit at an elevation of 1,560 ft. Data collected at Pebble 1 were used for modelling long-term climatic conditions in the mine study area. Temperature and precipitation data recorded at Pebble 1 were correlated with records collected by the US National Weather Service (NWS) at Iliamna Airport, which is situated 17 miles southeast of the Project at an elevation of 190 ft. The derived relationships were used to generate a long-term synthetic series of monthly temperature and precipitation for Pebble 1, for the period 1942-2017 (i.e. for the period of record at Iliamna Airport). Details of the procedures used to generate the long-term temperature and precipitation series are presented in the 2018 Hydrometeorology Report (in progress).

The locations of the Pebble meteorology stations are shown on Figure 2.1. The locations of Iliamna Airport and three other regional meteorology stations are shown on Figure 2.2. Records from the other three regional stations (Port Alsworth, King Salmon, and Intricate Bay) were used to infill gaps in the Iliamna Airport temperature and precipitation records. A regional regression model was developed and used to estimate missing values in the Iliamna Airport record, based on derived scaling relationships and the strength of correlation between stations.

2.2.3 LONG-TERM MONTHLY TEMPERATURES AND PRECIPITATION AT PEBBLE 1

The long-term mean monthly temperature and precipitation values for the Iliamna Airport are presented on Figure 2.3 and Figure 2.4, respectively, and with the corresponding synthetic values developed for Pebble 1.

AMERICAN OVERSIGHT

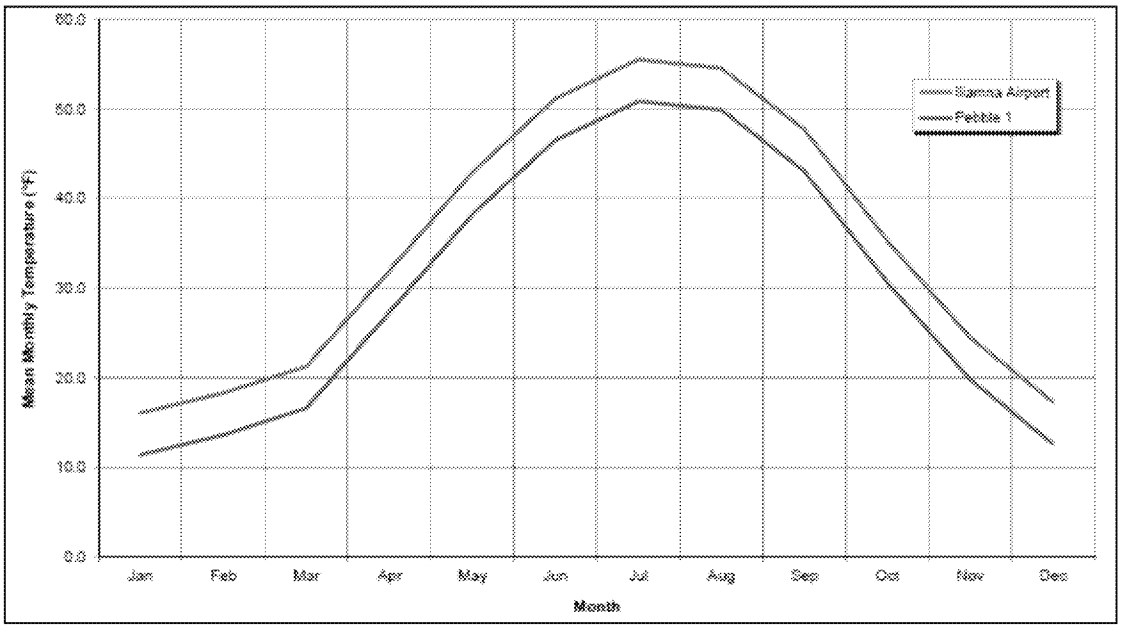

Figure 2.3 Mean Monthly Temperatures for Iliamna Airport and Pebble 1

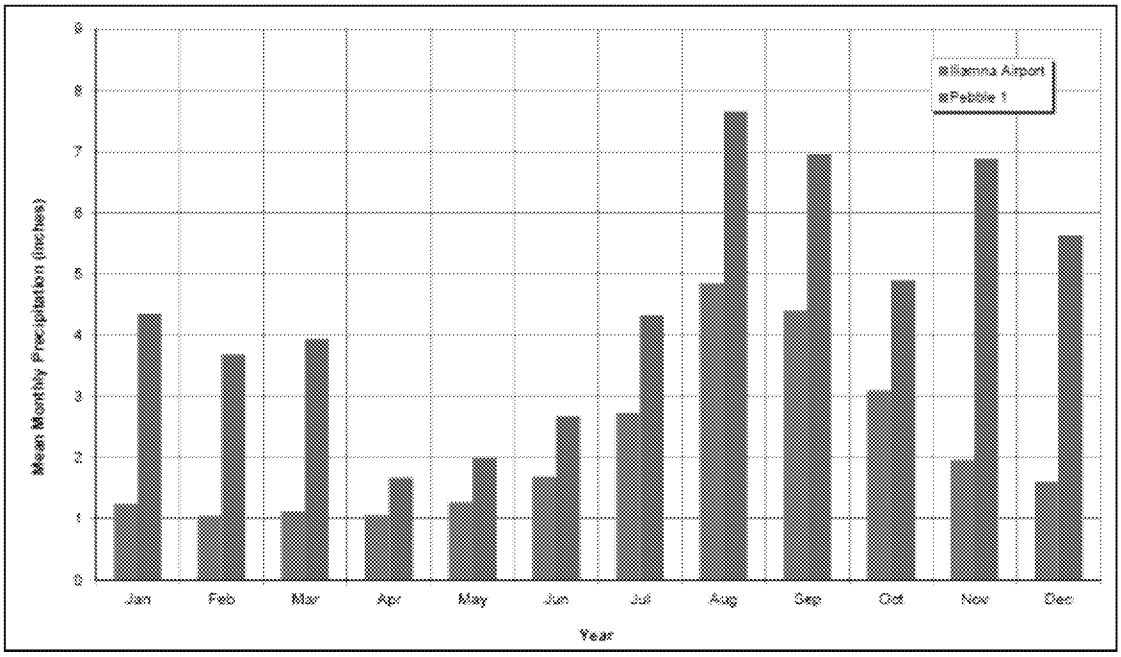

Figure 2.4 Mean Monthly Total Precipitation for Iliamna Airport and Pebble 1

The estimated long-term mean annual temperature at Pebble 1 is 30.1 °F, which is 4.7 °F colder than at Iliamna Airport (34.8 °F), as shown in Table 2.1. The coldest and warmest months at Pebble 1 are January and July, with estimated long-term mean monthly temperatures of 11.4°F and 50.8°F, respectively.

The estimated long-term mean annual precipitation at Pebble 1 is 54.6 in., which is approximately two times greater than the mean annual precipitation recorded at Iliamna Airport (26.0 in.), as shown in Table 2.2. The wettest and driest seasons at Pebble 1 are late summer and early autumn (wettest) and spring (driest), with estimated long-term mean monthly precipitation values ranging from 7.7 in. in August to 1.7 in. in April.

2.2.4 SPATIAL DISTRIBUTION OF TEMPERATURES AND PRECIPITATION

Monthly temperature and precipitation values were estimated for various locations throughout the Project area by adjusting the Pebble 1 values according to the following factors:

- Temperature was scaled using a lapse rate of -3.4 °F per 1,000 ft rise in elevation, and
- Precipitation was scaled using a combination of orographic and location factors that were derived from the calibration of the Pebble Project Watershed Module.

The orographic scaling factors for precipitation differ between winter months (defined as November through March) and non-winter months (defined as April through October), as described below:

- Winter: 34% increase per 1,000 ft rise in elevation, and
- Non-winter: 19% increase per 1,000 ft rise in elevation.

The different orographic factors reflect the differences between the meteorological conditions that prevail in winter and non-winter periods, as discussed in Section 2.2.1.

The location factors reflect other sources of spatial variability in precipitation and effective precipitation, including proximity to adjacent high-elevation terrain, windward/leeward effects, inter-basin snow drifting, and inter-basin groundwater flow.

AMERICAN OVERSIGHT
EPA-0135-0000506

The orographic and location scaling factors were estimated based on comparisons of streamflow station flow records, and then were adjusted as part of Watershed Module calibration to achieve a balance between meteorological inputs and corresponding groundwater and surface water values. The resulting spatial distribution of estimated long-term mean annual precipitation in the Project area is presented on Figure 2.2.

2.2.5 TEMPORAL VARIABILITY OF TEMPERATURE AND PRECIPITATION

The long-term synthetic series of annual precipitation for Pebble 1 is presented on Figure 2.5, and the cumulative departure of annual precipitation from the long-term mean is shown on Figure 2.6.

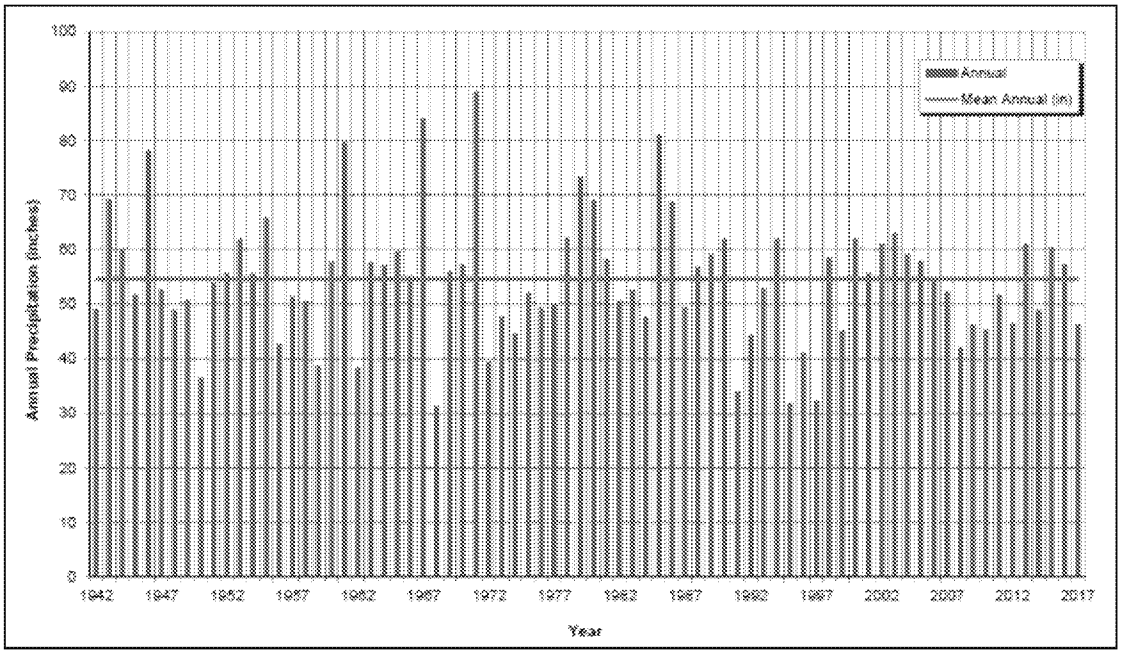

Figure 2.5 Annual Precipitation (estimated) for Pebble 1

AMERICAN OVERSIGHT
EPA-0135-0000507

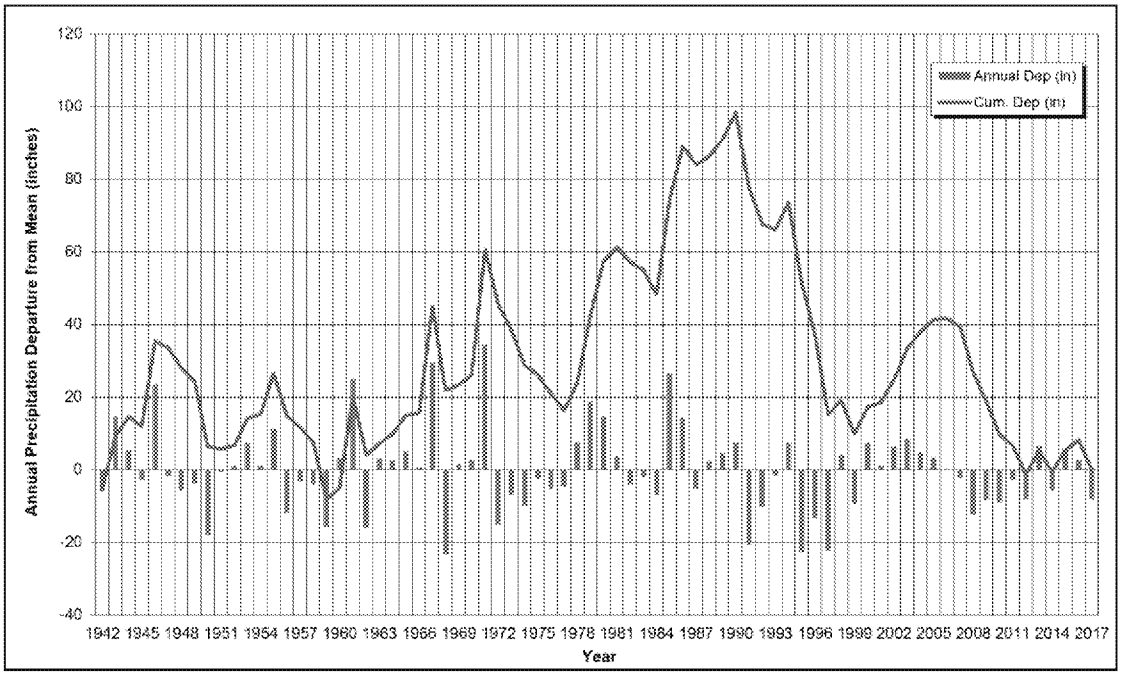

Figure 2.6 Annual Precipitation Departure from Mean Precipitation Conditions for Pebble 1

It is evident on Figure 2.6 that annual precipitation varies quite dramatically in the Project area, with many extended periods of wet and dry conditions. For instance:

- In the 1940s and 1950s, a few years of above average precipitation were followed by a few years of below average precipitation.
- From the 1960s onward, the cycles of high and then low precipitation were typically a little longer.
  - Annual precipitation was predominantly above average from 1960 to 1971, then predominantly below average from 1972-1977.
  - Annual precipitation was predominantly above average from 1978 to 1990, then predominantly below average from 1991 to 1999.
  - Annual precipitation was dominantly above average from 2000 to 2006, then dominantly below average from 2007 to 2012.
- Three of the four largest annual precipitation amounts occurred between the early 1960s and early 1970s; each of these years was followed by below-average precipitation the following year (i.e. dry years tend to occur even within decadal scale periods of dominantly above average annual precipitation).
- The greatest increase in cumulative departure of annual precipitation occurred between approximately 1978 and 1990 (i.e. this was the most pronounced period of predominantly above average precipitation).
- The greatest decrease in cumulative departure of annual precipitation occurred between 1991 and 1999 (i.e. this was the most pronounced period of predominantly below average precipitation).

AMERICAN OVERSIGHT

2.2.6 EXTREME PRECIPITATION

Extreme precipitation intensity-duration-frequency curves were generated for the Pebble 1 station location and presented in the 2012 Hydrometeorology Report (KP, 2012). The IDF curves were generated according to the NOAA Atlas 14 Volume 7: Precipitation-Frequency Atlas of the United States, Alaska (NOAA, 2012), with adjustments for specific location and orographic effects. The IDF curves are based on annual extreme precipitation data, which includes both rainfall and snowfall.

2.3 SURFACE WATER HYDROLOGY CHARACTERISTICS

2.3.1 OVERVIEW

The Project straddles the headwater areas of the drainage basins of the North Fork Koktuli River (NFK), the South Fork Koktuli River (SFK), and Upper Talarik Creek (UTC), as shown on Figure 2.2.

The NFK and SFK join to form the Koktuli River mainstem approximately 17 miles west of the Project site. The Koktuli River flows into the Mulchatna River, which in turn flows into the Nushagak River. UTC flows into Iliamna Lake, which is drained by the Kvichak River. The NFK, SFK, and UTC drainage basins encompass a combined area of 347 square miles above the lowermost gaging station on each watercourse.

The study area topography is comprised of a series of hills interspersed with wide valleys infilled with glacial fluvial deposits, with elevations ranging from around 2,500 feet on hill peaks to 46 feet at Iliamna Lake. Weathered bedrock is exposed on upland surfaces, while thick sediment deposits are found in bedrock valleys (Hamilton and Klieforth, 2010). Glacial and fluvial sediments of varying thickness cover most of the Project area at elevations below about 1,400 feet and play an important role in surface water runoff and groundwater storage and exchange. Subsurface flows follow former pre-glacial surface drainage pathways in several areas that have since been buried by subsequent sediment deposits, resulting in some cross-basin transfers relative to the current surface topography.

2.3.2 STREAMFLOW GAGING STATIONS

Streamflow gaging stations were operated at 26 locations within the Project area for various periods between summer 2004 and autumn 2015. Three of the gaging stations were operated by the United States Geological Survey (USGS), and the remainder were operated by PLP. The station locations are shown on Figure 2.2. The USGS stations are NK100A, SK100B, and UT100B.

The three USGS gaging stations were operated from August 2004 until September 2015. Station SK100B was re-initiated in 2017. Flows at many PLP stations were found to be well correlated with flows at the USGS stations, allowing gaps in the PLP station records to be infilled using regression analysis. As a result, complete daily records of measured and synthesized flows could be developed for all stations for the period of 2004-2015. This period is referred to as the PLP streamflow gaging period.

The Pebble Project Watershed Module was used to generate long-term monthly streamflow values for each gaging station using climatic inputs from Iliamna Airport (KP 2018a). The streamflow series extend from 1942 to 2017, which is the period of record for the Iliamna Airport climate station.

AMERICAN OVERSIGHT

2.3.3 STREAMFLOW RECORDS

The streamflow records collected in the Project area are summarized in Table 2.3, which presents mean annual discharge (cfs), mean annual unit discharge (cfs/mi^2), and mean annual unit runoff depth (in./yr.) for each station. The table indicates a huge range of unit runoff values, from 16.8 in/yr at SK100C to 98.1 in/yr at UT119A, which reflects the substantial role that groundwater plays in the runoff at certain gages.

Table 2.3 Mean Seasonal Flow Distribution (2004 – 2015)

Drainage	Station	Drainage Area (mi^2)	Mean Annual Discharge (cfs)	Mean Annual Unit Discharge (cfs/mi^2)	Mean Annual Unit Runoff (in/yr)

To illustrate the year to year variability of flows in the Project area, daily discharge hydrographs for station NK119A are shown on Figure 2.11 for the driest year (2011), the wettest year (2013), and the average for the period of gage record.

AMERICAN OVERSIGHT

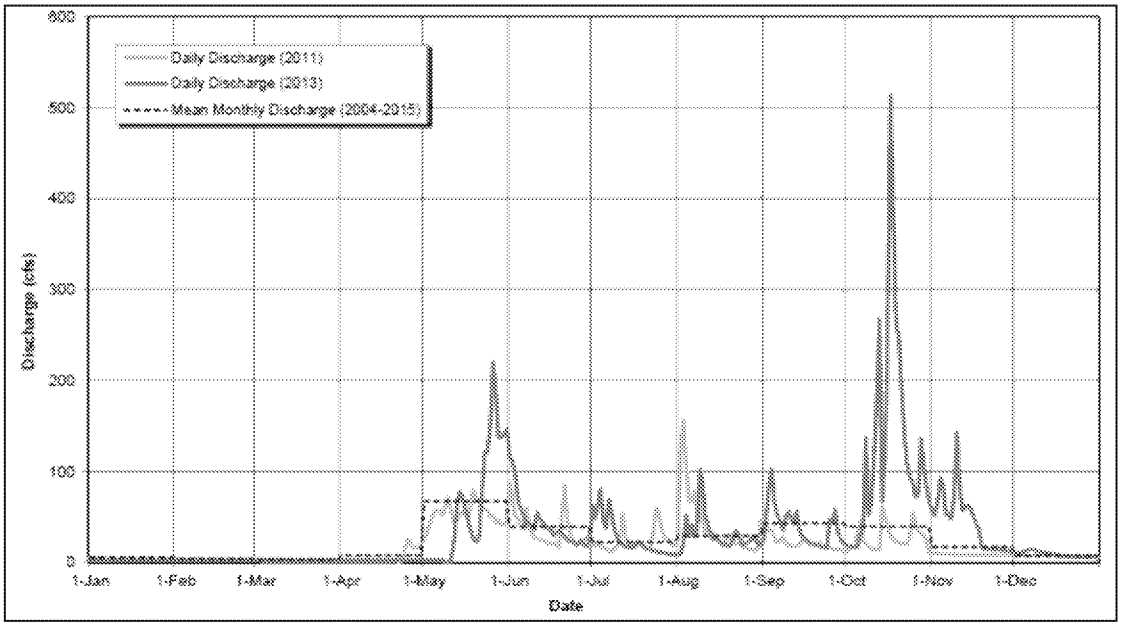

Figure 2.11 Daily Discharge Hydrographs for NK119A for Driest Year (2011) and Wettest Year (2013) on Record

2.3.4 SPATIAL AND TEMPORAL STREAMFLOW PATTERNS

The annual pattern of streamflows in the mine study area is characterized by:

- High flows in spring due to snowmelt
- Lower flows in early to mid-summer
- Another high-flow period in late summer and autumn due to frequent frontal rain storms, and
- Lowest flows in winter when most precipitation falls as snow and streams are fed almost exclusively by groundwater.

These seasonal patterns are apparent on the hydrograph figures presented above (Figure 2.7 through Figure 2.11) and in Table 2.4, which presents the distribution of streamflow by seasons for each gaging station.

At the lowermost gaging stations on the SFK, NFK, and UTC, the mean annual unit runoff was similar at all three stations, at around 2.3 to 2.4 cfs/mi^2. This equates to 31 to 33 in. of runoff depth at each station. The annual unit runoff for the other locations varied from gage to gage because of catchment topography and precipitation, cross-drainage transfers of groundwater, surface and subsurface flow exchanges along stream channels, and seasonal redistribution of snow by wind. In the upland tributaries gaged at NK119A and SK119A, the mean annual unit runoff values were 3.1 cfs/mi^2 and 3.2 cfs/mi^2, respectively, or 41 to 43 in. of runoff depth at each station. The higher unit runoff values at NK119A and SK119A, as compared to the lowermost gaging stations on the SFK, NFK, and UTC, are attributable mainly to catchment elevation and the orographic influence on precipitation.

AMERICAN OVERSIGHT

Table 2.4 Mean Seasonal Flow Distribution (2004 – 2015)

Drainage	Station	Drainage Area (mi^2)	Mean Seasonal Flow Distribution (% of Annual Volume)

AMERICAN OVERSIGHT

2.3.5 PEAK FLOWS

Peak flow curves were generated for mainstem river channels and upland tributaries in the mine study area and presented in the 2012 Hydrometeorology Report (KP, 2012). The peak flow curves were generated based on streamflow gaging records available at that time, combined with regional regression equations generated by the USGS, in accordance with USGS peak flow estimation procedures specified by Curran et al (2003).

2.4 GROUNDWATER CHARACTERISTICS

Baseline groundwater hydrology and groundwater quality studies for the Project area were undertaken between 2004 and 2013. Data for parameters that are subject to seasonal variation, such as water levels and water quality, were collected year round. Data for other parameters that are independent of the seasons, such as aquifer properties, were collected between May and October of each year.

The study included the following elements:

- Collection of surface and subsurface geologic data.
- Examination of drilling logs including an assessment of the consistency to interpreted groundwater conditions.
- Installation of monitoring wells and standpipe piezometers, including multi-level well completions.
- Installation and testing of pumping wells.
- Measurement of hydrogeological parameters such as water levels and hydraulic conductivity
- Characterization of the flow and water quality of seeps.
- Delineation of groundwater recharge and discharge zones.
- Evaluation of sub-basin drainage areas, channel lengths, annual precipitation, topographic relief, flow regimes and stream characteristics.
- Characterization of groundwater quality in the overburden and bedrock groundwater systems.

Details and results of the groundwater hydrology and groundwater quality studies are presented in the 2015 Groundwater SEBD Chapter 8 (Groundwater Hydrology) and SEBD Chapter 9 (Water Quality) reports (PLP 2015a; 2015b). The groundwater conditions as described in PLP (2015a; 2015b) are summarized below.

Bedrock in the study area includes Jurassic and Cretaceous sedimentary and volcanic rocks, intruded by Cretaceous granodiorite to monzonite, and overlain by Tertiary sedimentary and volcanic rocks. Below the upper bedrock zone (upper 50 feet), the hydraulic conductivity generally decreases with depth but includes some elevated-permeability zones that are typically associated with faults. The available data suggest that many of the faults act as flow barriers perpendicular to their strike, while some of the structures demonstrate an enhanced permeability in the direction of strike. The pattern of faulting has resulted in the formation of groundwater compartments in bedrock at depth.

The upper slopes and ridges of the study area include exposures of highly fractured bedrock, talus, rubble, and solifluction deposits. The highly fractured bedrock provides a pathway for elevated rates of groundwater recharge beneath the bedrock ridges. High rates of water return during air-rotary drilling indicate that the

AMERICAN OVERSIGHT

hydraulic conductivity is usually relatively high in the upper bedrock due to weathering and frost disturbance. The weathered and disturbed zone is typically up to about 50-ft thick.

The lower slopes and valley bottoms are infilled primarily with glacial deposits, with some over-riding alluvial deposits. Several glacial periods have resulted in glacial advances and retreats within the study area. The glacial deposits in the study area were mostly formed during the Kvichak Stade of the Wisconsin Brooks Lake Glaciation and include end, lateral, and recessional moraines, ground moraines, outwash sands and gravels, and glacio-lacustrine deposits. Outwash sands and gravels are typically observed to have the highest hydraulic conductivity. The disturbed and weathered bedrock, up to 50-ft thick, has been documented under the lower slopes and valley bottoms throughout the Project area. The evidence includes intense fracturing observed in drill core, water return during air rotary drilling and hydrogeological testing.

Three permeable and extensive glacial sand and gravel deposits are of particular note in the valley fill sequence. These are:

- Along the SFK River south of Frying Pan Lake ("South Fork Koktuli Flats"). These deposits include a sand and gravel moraine, and sand and gravel outwash deposits.
- In the NFK River Valley downstream of the Kvichak Stade terminal moraines.
- East of UT Creek where there is extensive outwash and glacial contact sand and gravels.

Extensive low-permeability lacustrine deposits underlie the glacial Frying Pan Lake basin. Consistent with this low permeability, the lacustrine deposits are overlain by marshes. Similar low-permeability lacustrine deposits are present within the NFK River and UT Creek drainages.

The groundwater flow system in the study area is generally characterized as follows:

- Most groundwater flow in the study area occurs along local and/or intermediate flow paths. There is limited regional groundwater flow to the surrounding lowlands.
- The overall groundwater flow pattern across the study area is dominated by flow in approximately the upper 50-ft of the bedrock from the margins of the valley towards the valley floor, and groundwater underflow in a downstream direction along the axis of the valley, predominantly within permeable gravels where present and in the disturbed bedrock where overburden is dominated by fine grained deposits.
- Except for some cross-catchment flow between SFK River and UT Creek, the current assessment indicates that the majority of water that recharges the groundwater system within each of the three main drainages discharges within that drainage.
- To varying degrees, continuous permeable overburden units fill the bedrock valleys along each of the three main drainages. In most of the valley reaches, the majority of groundwater flow occurs within the overburden deposits. Groundwater underflow down the valley is much less where lower permeability deposits (silts and clays) are predominate in the alluvium. In these areas, the groundwater system tends to discharge to surface water, leading to gaining streamflow reaches. Conversely, where the alluvial deposits become more permeable downstream, or where the profile of the valley widens, the surface water system tends to infiltrate to groundwater, leading to losing stream reaches. The main reaches of streamflow losses and gains were characterized as part of the baseline study.
- The upper reaches of tributaries tend to have limited groundwater storage capacity, and therefore streamflows in the upper reaches are typically flashy, and late winter baseflows are relatively low.

AMERICAN OVERSIGHT

- Further downstream, the sustained winter baseflows for the main stems in most parts of the Project area indicate considerable groundwater is contained in storage within the main part of the valleys. Baseflows are mostly higher where a substantial thickness of permeable alluvium is present upstream. The overall nature of the baseflow patterns tends to indicate that most of the groundwater storage on site occurs within the alluvium, and that most bedrock units demonstrate limited groundwater storage potential.
- Within each of the drainages, the surficial geology varies from low-permeability glaciolacustrine deposits to high-permeability glacial outwash and ice-contact deposits. The large differences in the permeability, coupled with variations in the topographic gradient, results in variability in the estimated localized recharge rates within each drainage.

The groundwater quality within the mine study area was assessed based on the collection of samples from 80 groundwater monitoring wells with depths up to about 200-ft and samples collected at drillhole DH-8417 at depths from 640 to 4,050-ft. The results of the groundwater sampling were compared to the most stringent criteria as defined in the Alaska Water Quality Criteria Manual for Toxic and Other Deleterious Organic and Inorganic Substance by The Alaska Department of Environmental Conservation and Effluent Limitation Guidelines by the EPA. A summary from the water quality assessment by PLP (2015b) is below.

- Median total dissolved solids (TDS) of less than 80 mg/L for 60% of the wells, 80 to 300 mg/L for 35% of the wells and 400 to 500 mg/L for 5% of the wells.
- Median pH ranged between 5.8 and 9.6 in 79 out of 80 wells.
- Dissolved oxygen greater than 8 mg/L in 50% of the wells and less than 1 mg/L in 25% of the wells.
- Trace element concentrations were within water quality criteria in most cases and most wells with concentrations exceeding the respective criterion were located in proximity to the general deposit area.
- The groundwater was divided into three general classes based on TDS: high TDS close to the general deposit area, intermediate TDS at intermediate distances from the general deposit area, and low TDS at greater distances from the general deposit area.
- The wells with the highest proportion of sulfate were typically located closest to the general deposit area, suggesting the groundwater in this area is influenced by sulfide oxidation, which is typical near copper sulfide deposits.
- Trace element concentrations were generally higher in bedrock than in overburden. Seasonal variations in major ion concentration were observed in 16 wells, most of which were completed at more shallow depths.
- The TDS of deep groundwater samples collected from drillhole DH-8417 at depth intervals ranging from 640 to 4,050 feet increased with depth. Most of the samples collected at greater depths were of type sodium-calcium-sulfate and reached a TDS of 2,000 mg/L. The concentrations of some constituents in the overburden and shallow bedrock ground water wells were similar to the concentrations of the deep bedrock groundwater samples.

AMERICAN OVERSIGHT

3.0 OPERATIONS WATER MANAGEMENT PLAN

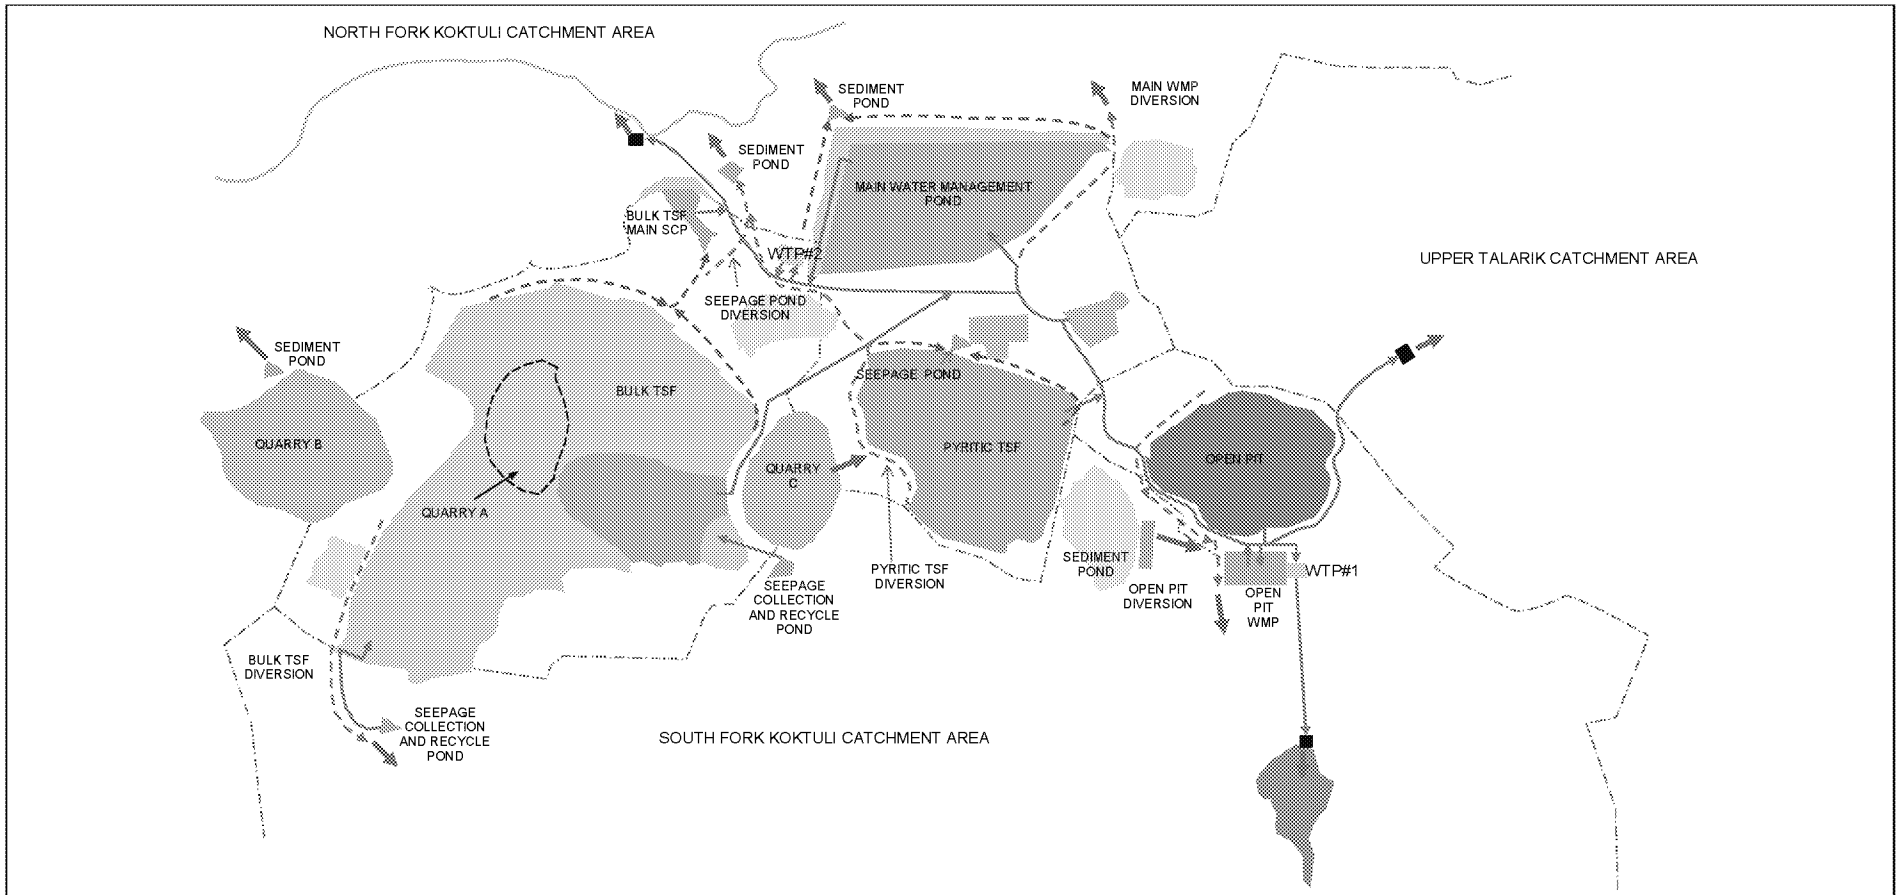
3.1 GENERAL

Groundwater and surface water runoff within the Project mine site footprint has been characterized into the following groups:

- Fresh water: water that has not come into direct contact with mining infrastructure and may be discharged to the environment without treatment in the water treatment plants (WTPs).
- Stormwater: runoff from facilities that does not come into direct contact with mining infrastructure, or is otherwise not classified as mine drainage, and therefore only requires treatment for sediment to meet discharge water quality standards prior to discharge to the environment. Stormwater is defined in 40 CFR 122.26 (b) (13) as "Stormwater runoff, snow melt runoff, and surface runoff and drainage". Stormwater will be discharged under general APDES Stormwater Permits.
- Mine drainage: groundwater or surface runoff that has come into direct contact with mining infrastructure and requires treatment at the water treatment plants to meet discharge water quality standards prior to discharge to the environment.
- Process water: wastewater generated from the Process Plant operations. Process wastewater is defined in 40 CFR 122.2 as "any water which during manufacturing or processing, comes into direct contact with or results from the production or use of any raw material, intermediate product, finished product, by-product, or waste product." Process wastewater will include water in the tailings slurry that is discharged to the Bulk TSF and the Pyritic TSF.

A simplified operational water management plan layout, which includes the main water management facilities, is shown on Figure 3.1. The management plan for fresh water, stormwater, mine drainage water, and process water is described in the sections below.

3.2 FRESH WATER AND STORMWATER MANAGEMENT



Diversion channels will direct fresh water around the mining infrastructure, where possible, and directly discharge it to the downstream environment. This will reduce the amount of water collected within the mine site footprint.

Stormwater runoff from the overburden stockpiles, the growth medium stockpiles, the quarries, and the downstream slopes of the OP WMP embankment, the Bulk TSF Main SCP embankment, and the Main WMP embankment, is assumed to not be contaminated and will be collected and treated locally at sediment ponds prior to release to the environment. Quarry A is located within the Bulk TSF impoundment area and will primarily be active during the initial construction of the Bulk TSF. Runoff from Quarry A during the early operations phase of the Project, prior to the quarry being submerged by the bulk tailings, will be collected and managed as part of the Bulk TSF supernatant pond. Surface runoff from Quarry B and Quarry C will be collected and treated within sediment ponds prior to release to the downstream environment. Quarry B

AMERICAN OVERSIGHT

will drain to a sediment pond that will discharge runoff towards the NFK, while Quarry C will drain to a pond that will discharge to the Pyritic TSF diversion channel, which in turn discharges to the NFK.

AMERICAN OVERSIGHT

3.3 MINE DRAINAGE AND PROCESS WATER MANAGEMENT

The mine drainage and process water management strategy for the various water sources is presented in this section. Mine drainage and process water from around the Project site will be collected and managed using various water management facilities, which are further described in Section 3.4.

Groundwater and surface runoff collected in the Open Pit and surrounding area will be directed to the OP WMP, prior to being treated at WTP#1. Treated water from WTP#1 will be released to the environment downstream of the Project mine site.

Mine drainage water and process water from outside of the Open Pit and surrounding area, including surface runoff from the process plant site and power plant site, TSF seepage water, and surplus supernatant water on the TSFs, will be directed to the Main WMP.

The Main WMP will provide surge capacity for runoff from the mine site. Surplus mine drainage and process water from the TSFs, seepage, groundwater, and runoff from the Bulk TSF Main SCP and the seepage pond at the north end of the Pyritic TSF, will be pumped to the Main WMP to minimize the volume of water stored within these facilities. The operating capacity of the Main WMP was sized to manage surplus water from the mine site and to supply water to the process over the full range of historic climate conditions.

Surplus water from the Main WMP will be treated at WTP#2. A small portion of the treated water will be used to satisfy the clean water requirements for the process and power plant, while the remainder will be discharged downstream of the mine site. No fresh water from outside of the mine site footprint will be used to satisfy the processing requirements.

The capacities of the water treatment plants were determined by balancing the storage capacity and the water management ponds with the water treatment rates to provide a reliable source of process water during dry climate conditions and the ability to manage surplus water during wet climate conditions. The maximum treatment capacity of WTP#1 was determined to be 14 cfs, and the maximum treatment capacity of WTP#2 was determined to be 38 cfs.

3.3.1 OPEN PIT DEWATERING

Dewatering of the Open Pit will be required to initiate and maintain mining activities. The development of the ultimate pit dewatering design will be based on a series of interim pit phases that reflect successive deepening and cutback of the pit. The interim pit phases will use perimeter and in-pit wells to collect groundwater. This phased approach will allow the ultimate pit dewatering approach to be based on the operational performance of each preceding phase. Mine dewatering and control of the pore pressures in the pit slopes are interrelated and will therefore be developed coincidently.

Groundwater collected from the Open Pit will be directed toward the OP WMP for temporary storage and then treatment prior to discharge to the environment downstream of the Project mine site. Runoff from areas upslope of active mining areas will be intercepted and diverted around the Open Pit perimeter where possible. Runoff and snowmelt from the Open Pit walls will be collected and pumped using in-pit pumps to the OP WMP for storage and treatment prior to discharge to the environment downstream of the Project

AMERICAN OVERSIGHT
EPA-0135-0000521

mine site. The pumping capacity of the dewatering system will be designed to keep active mining areas dry during normal operating conditions, with contingency measures in place to handle periods with higher flow.

3.4 WATER MANAGEMENT FACILITIES

The following sections describe the major water management facilities proposed to execute the water management plan for the Project. The design criteria for the water management structures are outlined in Table 3.1. The maximum operating pond volume and minimum operating pond volume (where applicable) were determined with the climate variable water balance.

AMERICAN OVERSIGHT

Table 3.1 Design Criteria Table for the Water Management Structures

Water Management Structure	Design Criteria
Fresh Water Diversion Channels	Convey undisturbed surface water runoff around the mine site facilities to the downstream environment.
OP WMP	Maximum operating pond volume of 40 Mft^3 (920 ac-ft) to manage dewatering from the Open Pit. Water in excess of this capacity will be pumped to the Main WMP for management. Storm storage freeboard allowance for the required IDF and a spillway to safely pass larger events with additional freeboard[1]
Main WMP	Minimum operating pond volume of 300 Mft^3 (6,900 ac-ft) to ensure that there is sufficient water available for the process during dry climate conditions. Maximum operating pond volume of 2,450 Mft^3 (56,250 ac-ft) to manage surplus water from the Project mine site during wet climate conditions. Storm storage freeboard allowance for the required IDF with additional freeboard[1]
Bulk TSF	Maximum operating pond volume varies by embankment stage and mine development, but is constrained by the need to maintain a minimum 2,000 ft beach length. Storm storage freeboard allowance for the required IDF without release from the facility with additional freeboard[1]
Bulk TSF Main SCP	Maximum operating pond volume of 130 Mft^3 (3,000 ac-ft) to manage seepage and runoff from the main embankment of the Bulk TSF. Storm storage freeboard allowance for the IDF and a spillway to safely pass larger events with additional freeboard[1]
Pyritic TSF	Minimum operating pond volume varies by embankment stage and mine development, but is constrained by the requirement to maintain a water cover to promote geochemical stability of the pyritic tailings and PAG waste rock. Storm storage freeboard allowance for the required IDF and a spillway to safely pass larger events with additional freeboard[1]
Seepage Collection and Recycle Ponds	Ponds are to be operated with the minimum pond volume required by the pump systems. Storm storage freeboard allowance for the required IDF and a spillway to safely pass larger events with additional freeboard[1]
Sediment Ponds	Treat sediment for all inflows resulting from the 1 in 10-year, 24-hour rainfall event, with no flow passing over the spillway. Spillway to safely pass the peak outflows resulting from the 1 in 200-year, 24-hour rainfall event, with the starting pond level at the spillway invert. Additional freeboard provided.[1]

NOTES:

1. EACH WATER MANAGEMENT POND WILL INCLUDE AN ADDITIONAL FREEBOARD ALLOWANCE FOR WIND-GENERATED WAVE HEIGHT AND POTENTIAL SEISMIC DEFORMATION.
2. IDF: INFLOW DESIGN FLOOD.
3. THE REQUIRED IDF FOR EACH WATER MANAGEMENT POND WILL BE DETERMINED THROUGH THE ALASKA DAM SAFETY PROGRAM (ADSP).

AMERICAN OVERSIGHT

3.4.1 FRESH WATER DIVERSION CHANNELS

Fresh water diversion channels are proposed to collect and convey surface water runoff from undisturbed ground and directly discharge it to downstream waterways. The channels will be sized to convey the specified design storm and will be constructed at a gradient to promote free-drainage and minimize ponding. The channels will be lined where required to minimize the potential for erosion and sediment entrainment. The assumed efficiency of the channels is 50% for channels situated at elevations above 1,400 fasl, and 80% for channels situation at elevations below 1,400 fasl. The proposed fresh water diversion channels are shown on Figure 3.1 and include the following:

- An Open Pit diversion channel to divert undisturbed runoff from areas north and west of the Open Pit southward to the SFK.
- A Pyritic TSF diversion channel to divert undisturbed runoff from areas west of the Pyritc TSF northward to the NFK.
- A Bulk TSF diversion channel to divert undisturbed runoff from areas southwest of the Bulk TSF southward to the SFK.
- A Bulk TSF Main SCP diversion channel to divert undisturbed runoff from areas east of the Bulk TSF Main SCP northward to the NFK.
- A Main WMP diversion channel to divert undisturbed runoff from areas east of the Main WMP northward to the NFK.

Flows collected in the fresh water diversion channels will be conveyed directly to the downstream waterways. These flows are expected to follow a similar pattern to the pre-mine hydrograph, with high flows occurring during the spring snowmelt season and fall rainy season, and low flows occurring during the late summer period. Minimal flows are expected during the winter when precipitation will mostly fall as snow.

3.4.2 OPEN PIT WATER MANAGEMENT POND

The OP WMP will be a lined facility. The maximum operating pond volume and freeboard criteria for the OP WMP are outlined in Table 3.1. The storm storage freeboard allowance will be provided in addition to the maximum operating pond volume, and the emergency spillway will be set at an elevation above the IDF freeboard and will direct flows towards the SFK. Water in excess of the maximum operating pond volume will be directed to the Main WMP. Collection ditches along the toe of the embankments will direct stormwater runoff to a sediment control pond for treatment prior to release to downstream waterways. Water collected within the OP WMP will be treated for discharge at WTP#1.

3.4.3 MAIN WATER MANAGEMENT POND

The Main WMP will provide water storage surge capacity for the mine site and is a key component of the water management strategy. Water collected in all of the other water management ponds, excluding the OP WMP, will be directed to the Main WMP to minimize the storage requirements of these ponds. The Main WMP will be a lined facility, with underdrains installed below the liner to direct groundwater drainage under the facility and towards the sediment control pond. Collection ditches along the toe of the embankments

AMERICAN OVERSIGHT
EPA-0135-0000524

will direct stormwater runoff from the embankments to a sediment control pond for treatment prior to release to the downstream environment.

The operating capacity of the Main WMP was sized using the climate variability water balance model, for purposes of safely managing the surplus water from the mine site and supplying water to the process under the full range of climate conditions. The minimum and maximum pond volumes and freeboard criteria for the Main WMP are outlined in Table 3.1.

Excess water accumulation within the pond that would infringe upon the storm storage requirements, and which is not a result of the IDF inflow, will be directed to the Open Pit for temporary storage. The Main WMP will include an emergency spillway designed to safely convey the peak discharge from the IDF, and will direct flows to the NFK.

3.4.4 BULK TAILINGS STORAGE FACILITY

The Bulk TSF will be used to manage bulk tailings solids and supernatant water prior to pumping surplus water to the Main WMP. The Bulk TSF will provide sufficient storage capacity for the tailings, the operating pond, and a freeboard allowance as outlined in Table 3.1, without release to the downstream environment. The water management strategy for the Bulk TSF is to maintain a minimum supernatant pond with maximum beaches by pumping surplus water to the Main WMP via the reclaim water pumping system.

The main embankment of the Bulk TSF is proposed to operate as a drained facility to promote long-term drainage of the bulk tailings mass. The Bulk TSF Main SCP, located downstream of the main embankment of the Bulk TSF, will collect seepage that drains through the main embankment. Water collected in the Bulk TSF Main SCP will be pumped to the Main WMP. The Bulk TSF south embankment is proposed to include a hydraulic barrier, consisting of a HDPE liner or a low permeability core zone, and a grout curtain installed in the weathered bedrock. A seepage collection pond will be located downstream of the south embankment to collect any potential seepage and embankment runoff. A seepage collection pond will also be constructed on the east side of the Bulk TSF to collect potential seepage and runoff from the east side of the facility. Water collected in the south and east seepage collection ponds will be pumped back into the Bulk TSF.

3.4.5 BULK TSF MAIN EMBANKMENT SEEPAGE COLLECTION POND

The Bulk TSF Main SCP is the main seepage collection system for the Bulk TSF and will be used to manage seepage and runoff flows from Bulk TSF main embankment. Water collected in the Bulk TSF Main SCP will be pumped to the Main WMP. The maximum operating pond volume, storm storage, freeboard, and spillway criteria for the seepage pond are outlined in Table 3.1. Collection ditches along the toe of the Bulk TSF Main SCP embankment will direct stormwater runoff to a sediment control pond for treatment prior to release to the downstream environment.

An emergency spillway will be set at an elevation above the IDF freeboard and will direct discharges towards the NFK.

3.4.6 PYRITIC TAILINGS AND PAG WASTE ROCK STORAGE FACILITY

AMERICAN OVERSIGHT

The Pyritic TSF will manage pyritic tailings solids, PAG waste rock and supernatant water. The Pyritic TSF will be lined and is a water retaining facility, and will provide sufficient storage capacity for the tailings, PAG waste rock, operating pond, and freeboard allowance as outlined in Table 3.1. The water management strategy for the Pyritic TSF is to maintain a water cover over the surface of the tailings and waste rock to maintain geochemical stability. Surplus water will be directed to the Main WMP via the reclaim water pumping system.

The Pyritic TSF will contain the IDF without release to the downstream environment, and an emergency spillway will be included in the design.

Underdrains will be included below the facility to direct groundwater and seepage to a collection pond downstream of the main Pyritic TSF embankment. The seepage collection pond will also collect stormwater from the main embankment. Water collected in the seepage collection pond will be pumped to the Main WMP. Additional seepage collection and recycle ponds will be constructed around the Pyritic TSF. Flows collected within these facilities will be recycled back into the Pyritic TSF.

3.4.7 SEEPAGE COLLECTION AND RECYCLE PONDS

Seepage collection and recycle ponds will be located downstream of the Bulk TSF south embankment, the Bulk TSF east side, and the Pyritic TSF south embankment.

The operating criteria, storm storage and spillway criteria for the seepage collection and recycle ponds are outlined in Table 3.1. Seepage flows will be pumped back to each respective TSF, as required.

3.4.8 SEDIMENT PONDS

Sediment ponds will be located downstream of various embankment structures throughout the mine site to collect and treat non-mine drainage stormwater from these facilities. Sediment ponds will be located downstream of the overburden stockpiles, growth medium stockpiles, the OP WMP, the Bulk TSF Main SCP, the Main WMP embankments, and the quarries. The operating criteria, storm storage, and spillway criteria for the sediment ponds are outlined in Table 3.1. Releases from the sediment ponds are expected to follow a similar pattern to the pre-mine hydrograph with high flows occurring during the spring snowmelt and fall rainy seasons, and low flows occurring during the late summer period. Minimal flows are expected during the winter when most of the precipitation will fall as snow.

3.4.9 WATER TREATMENT PLANTS

There are two water treatment plants proposed for the project to treat surplus water: WTP#1, which is located near the OP WMP, and WTP#2, which is located near the Main WMP. Variable water treatment rates were required to manage the surplus water from the mine site under the full range of historic climate conditions. Higher water treatment rates will be required during extended wet periods and reduced water treatment rates will be required during extended dry periods. The treatment rates for WTP#1 and WTP#2 are dictated by the volumes of water stored in the OP WMP and the Main WMP, respectively. Trigger volumes in the water management ponds correspond to treatment rates at the water treatment plants, as defined in Table 3.2 for WTP#1 and the OP WMP, and in Table 3.3 for WTP#2 and the Main MWP.

AMERICAN OVERSIGHT
EPA-0135-0000526

Table 3.2 WTP#1 Operational Strategy – Open Pit WMP Trigger Volumes and WTP#1 Rates

Case	Open Pit WMP Trigger Volume		WTP#1 Inflow Rate	Description
	(Mft^3)	(ac-ft)	(cfs)	
Low	< 4	< 90	4.7	1 train (33% of total treatment capacity)
Average	4 to 8	90 to 185	9.3	2 trains (66% of total treatment capacity)
High	> 8	> 185	14.0	3 trains (100% of total treatment capacity)

NOTES:
1. SOURCE FOR THE NUMBER OF WATER TREATMENT TRAINS IS HDR (2018A).

Table 3.3 WTP#2 Operational Strategy – Main WMP Trigger Volumes and WTP#2 Rates

Case	Main WMP Trigger Volume		WTP#2 Inflow Rate	Description
	(Mft^3)	(ac-ft)	(cfs)	
Low-Low	< 300	< 6,900	9.5	1 train (25% of total treatment capacity)
Low	300 to 1,200	6,900 to 27,500	19.0	2 trains (50% of total treatment capacity)
High	1,200 to 1,500	27,500 to 34,400	28.5	3 trains (75% of total treatment capacity)
Maximum	> 1,670	38,300	38.0	4 trains (100% of total treatment capacity)

NOTES:
1. SOURCE FOR THE NUMBER OF WATER TREATMENT TRAINS IS HDR (2018A).

The water treatment plants will produce reject sludge. The reject sludge flow rate is assumed to be 0.1% of the inflow rate to the water treatment plants (HDR 2018a). In addition, WTP#2 has an RO reject rate of 2.3% of the inflow rate to WTP#2 (HDR 2018a). The reject sludge and RO reject will be pumped to the mill and will be added to the pyritic tailings slurry pipeline to be disposed of within the Pyritic TSF.

Treated water from WTP#1 and WTP#2 that is not required at the process plant or the power plant will be discharged. Treated water discharge locations are proposed in the NFK, SFK and UT catchments, as shown on Figure 1.1.

AMERICAN OVERSIGHT
EPA-0135-0000527

4.0 OPERATIONS WATER BALANCE MODEL

4.1 INTRODUCTION

A water balance model for the operations period of the mine was developed for the Project. The water balance is comprised of three modules: the Watershed Module, the Groundwater Module, and the Mine Plan Module. This section describes the Mine Plan Module (the model) of the water balance and presents the associated inputs, assumptions, and results. The Mine Plan Module is representative of the movement of water within the mine system, and it uses inputs from the Watershed Module and the Groundwater Module. The Mine Plan Module estimates the amount of water to be managed at the mine site during the full operating period of the mine under a full range of historic climate conditions.

4.2 INPUTS AND ASSUMPTIONS

The Mine Plan Module was completed on a monthly basis using GoldSim® software, and was based on the conceptual 20-year life of mine footprint shown on Figure 1.1 and the water management strategy described within this report. The water management strategy incorporated into the Mine Plan Module is shown as a flow schematic on Figure A.1 in Appendix A. The model assumes a constant nominal milling rate of 180,000 tpd and that the maximum mine footprint is applicable to every year of operations.

Climate variability was incorporated into the model by utilizing the 76-year synthetic time-series of monthly temperature and precipitation values developed for the Project site. The time-series data were incrementally stepped by year within the model, for the planned life of the Project, thereby preserving the inherent cyclical nature of the climate record. The model generated 76 unique sets of results of water flow and storage for each month of each year of the model.

Additional inputs and assumptions for the model include:

- The ore, concentrate and tailings properties are as follows (Ausenco 2017a):
  - Ore has a 3% water content and a specific gravity (SG) of 2.6.
  - Concentrate is classified into two types:
    - Copper concentrate with an 8% water content and an SG of 3.1.
    - Molybdenum concentrate with a 12% water content and an SG of 3.2.
  - Bulk tailings has an SG of 2.6.
  - Pyritic tailings has an SG of 2.9.
- The bulk tailings dry density is assumed to be 90 pcf.
- The pyritic tailings dry density is assumed to be 100 pcf.
- The flow-through rate of the Bulk TSF main embankment is assumed to be a constant rate of 8 cfs during operations (KP 2018b).
- A total tonnage of approximately 126 million short tons of PAG waste rock is stored in the Pyritic TSF during operations (approximate volume of 500 million ft3 assuming a density of 120 pcf).

AMERICAN OVERSIGHT
EPA-0135-0000528

- Groundwater inflow to the Open Pit is at a constant rate of 2,700 gpm (6 cfs), as provided by Piteau Associates.
- Approximately 3 cfs of treated water from the water treatment plants is required at the mill for processing, (Ausenco 2017b).
- Approximately 3 cfs of treated water from the water treatment plants is required at the power plant cooling towers, and approximately 265 gpm (0.6 cfs) of blow-down water will be directed to the Main WMP (WorleyParsons 2017).
- Treated water to the mill and power plant is sourced from WTP#2.
- WTP#1, which is located near the Open Pit, has a maximum treatment rate of 14 cfs provided by three trains of equal treatment capacity (HDR 2018a). The reject sludge from WTP#1 is assumed to be directed to the Pyritic TSF through the pyritic tailings line.
- WTP#2, which is located near the mill, has a maximum treatment rate of 38 cfs, provided by four trains of equal treatment capacity (HDR 2018a). The reject sludge and reject flow from WTP#2 will be directed to the Pyritic TSF through the pyritic tailings line.

4.3 MINE PLAN MODULE WATER BALANCE RESULTS

4.3.1 ANNUAL AVERAGE BALANCE

The module schematic and corresponding average annual flows are shown on Figure A.1 and in Table A.1, in Appendix A. The values include the average annual inflows and outflows for the water management facilities for three unique model runs (realizations), which were selected from the entire set of 76 model realizations. These selections represent relatively dry, average, and relatively wet conditions, and illustrate the range of potential flows for the mine site. The realizations all have similar average precipitation values, but differ in how the precipitation varies from year to year. The realizations selected are:

- Realization #36 was selected to represent relatively dry conditions because it contains a period that results in low environmental discharge releases. The average annual precipitation for realization #36 is 56 in., but the annual precipitation in the final year of operations is 33 in.
- Realization #5 was selected to represent average conditions because it results in relatively constant environmental discharge releases. The average annual precipitation for realization #5 is 57 in. and the annual precipitation for the final year of operations is 58 in.
- Realization #10 was selected to represent relatively wet conditions because it contains a period that results in high environmental discharge releases. The average annual precipitation for realization #10 is 57 in., but the annual precipitation for the final year of operations is 93 in.

The volume of fresh water, stormwater, and mine drainage water that is managed within the Project mine site is a function of the climate. More water will be collected and managed during wet climate conditions compared to during dry climate conditions. The relatively wet condition (realization #10) in Table A.2 corresponds to more runoff and direct precipitation being collected within the water management facilities than the relatively dry condition (realization #36). The amount of process water managed during the three realizations is the same because this is a function of the processing throughput rate and the tailings

AMERICAN OVERSIGHT
EPA-0135-0000529

properties (e.g. the throughput rate and percent solids in the tailings streams dictate the amount of water in the tailings slurries), and is independent of the climate conditions.

Water losses (or water that is not available for the process or for treatment and discharge) include evaporation from the surfaces of the water management ponds and the cooling towers of the Power Plant, water that is lost or trapped in the Bulk tailings voids stored in the Bulk TSF and the Pyritic tailings voids and PAG waste rock voids stored in the Pyritic TSF, and a small amount of water that leaves with the concentrate. The losses are independent of the climate conditions and are a function of the processing throughput rate, the tailings and waste rock properties, and the Power Plant design. The losses are therefore similar under all climatic conditions.

The amount of surplus water at the site is a function of the total amount of water entering the site and the total water losses. The amount of surplus water increases during wet climate conditions since the amount of inflow increases, but the amount of losses are the same as during dry climate conditions. The total site surplus water for the realizations selected to represent relatively dry, average, and relatively wet conditions are summarized in Table 4.1. The site surplus water for the Project will be stored within the water management ponds and then treated and released downstream of the mine site.

Table 4.1 Average Annual Site Wide Surplus Flow for Individual Realizations Representing Relatively Dry, Average, and Relatively Wet Conditions

		Average Annual Flows (cfs)		
		Relatively Dry Conditions (Realization #36)	Average Conditions (Realization #5)	Relatively Wet Conditions (Realization #10)
Inflows				
	Water in Ore	2	2	2
	Groundwater to Open Pit	6	6	6
	Mine Drainage	21	44	81
	Total Inflows	**29**	**52**	**89**
Losses				
	Concentrate	<1	<1	<1
	Tailings Voids	20	20	20
	Pond Evaporation	3	3	3
	Power Plant Evaporation	2	2	2
	Dust Control	<1	<1	<1
	Total Losses	**25**	**25**	**25**
Site Surplus (Inflows - Losses)		**4**	**27**	**64**

NOTES:

1. THE SURPLUS FLOW IS AN INDICATION OF THE AMOUNT OF WATER THAT IS COLLECTED AND MANAGED WITHIN THE PROJECT MINE SITE. THE SURPLUS FLOW IS NOT DIRECTLY RELATED TO THE AMOUNT OF WATER TREATED AND RELEASED DOWNSTREAM OF THE PROJECT SITE AT ANY ONE TIME SINCE THE SITE SURPLUS DOES NOT TAKE INTO ACCOUNT THE CHANGE IN WATER STORED WITHIN THE WATER MANAGEMENT PONDS.

4.3.2 MAIN WMP VOLUMES

Estimated pond volumes for the Main WMP, provided in terms of monthly 1st, 10th, 50th, 90th, and 99th percentile values, are shown on Figure 4.1. These results indicate that the Main WMP will operate below

AMERICAN OVERSIGHT

the maximum operating pond capacity at all times, and that there is sufficient water available in the pond to satisfy the process reclaim water requirements (the pond does not go dry), even during prolonged dry periods.

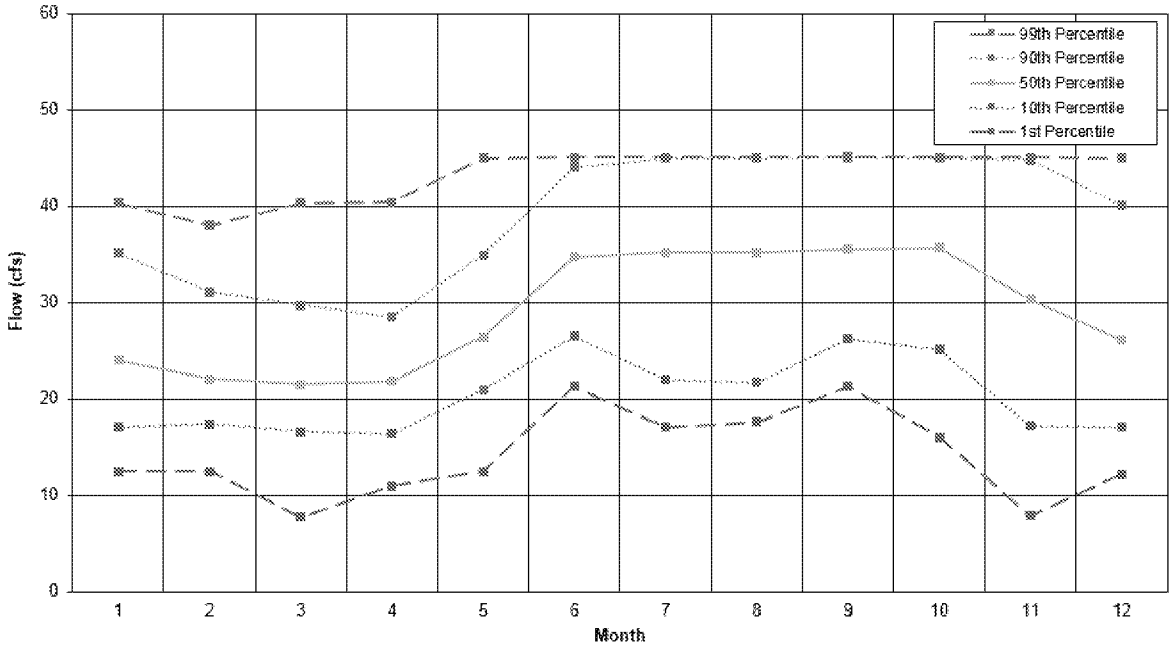

Figure 4.1 Main WMP Volumes Results and Operating Capacity – 1st, 10th, 50th, 90th, and 99th Percentiles

4.3.3 TOTAL RELEASE FROM THE WATER TREATMENT PLANTS

The total flows released downstream of the Project mine site are a combination of fresh water from the diversion channels and quarry runoff, and treated water from the water treatment plants. The water treatment plant flows are expected to vary based on the amount of water captured at the mine site, whereas the flows from the fresh water diversions are expected to vary according to natural flow patterns, with higher flows during the spring melt and fall rainy periods, and lower flows during the late summer and winter months. The total water released from the water treatment plants will be a function of the site surplus water and the change in water management pond storage. During drier climate conditions, the amount of water stored within the water management ponds will decrease, while during wetter climate conditions, the amount of water stored within the water management ponds will increase.

The 1st, 10th, 50th, 90th, and 99th percentile values of total water released from the water treatment plants are summarized on a monthly basis in Table 4.2 and on Figure 4.2. These results, which are based on model inputs of 76 different series of paired monthly temperature and precipitation values over the 20-year mine life, indicate that the total flow releases from the water treatment plants can vary from lows of 8 cfs during the mid and late winter months (1st percentile results) to highs of 45 cfs for much of the year (99th percentile results). The total flow releases from the water treatment plants increase in the spring melt season (approximately April through June) in response to increased runoff throughout the mine site, which

AMERICAN OVERSIGHT
EPA-0135-0000531

triggers the requirement to treat and release more water. The total flow releases from the water treatment plants decrease during the winter months (October through March) for all percentiles and during the summer low flow periods (July through September) for the 1st and 10th percentiles.

Table 4.2 Total Release from the Water Treatment Plants to Downstream of the Mine Site - 1st, 10th, 50th, 90th, and 99th Percentiles

NOTES:

1. TOTAL RELEASE FROM WTP IS THE SUM OF THE FLOWS AVAILABLE FOR RELEASE FROM WTP#1 AND WTP#2 AFTER TREATED FLOW REQUIREMENTS TO THE PROCESS ARE SATISFIED.

AMERICAN OVERSIGHT

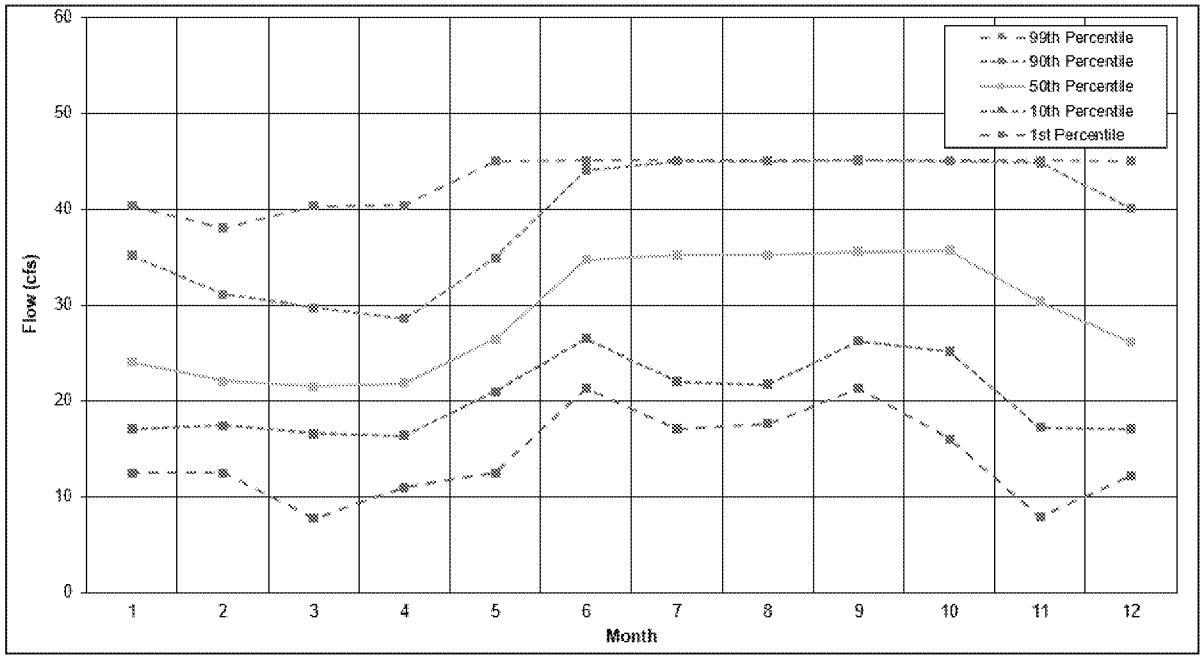

Figure 4.2 Total Flow Releases from the Water Treatment Plants to Points Downstream of the Mine Site: 1st, 10th, 50th, 90th, and 99th Percentile Results

The percentile results shown in Table 4.2 and on Figure 4.2 were calculated based on the full set of 76 model realizations, and do not specifically represent any one individual model realization. Three individual model realizations were selected to show the potential variation in water treatment plant flow releases. These realizations were not selected to match the percentile results shown in Table 4.2 and on Figure 4.2, but rather to represent relatively dry, average, and relatively wet annual climate conditions.

The total flow releases from the water treatment plants for the final years of operations for the three selected realizations are summarized on a monthly basis in Table 4.3 and on Figure 4.3. These results indicate that the total flow releases are similar during the low-flow period from January through April for all three climate scenarios; however, differences in the timing and magnitude of the spring snowmelt runoff dictate that flow releases from the water treatment plants differ during the spring (May through June). For instance, the releases are higher in May for the relatively dry scenario (realization #36) than for both the average (realization #5) and relatively wet scenarios (realization #10), but then the relative differences in flows change according to how the climate and runoff conditions vary throughout the year. On an annual basis, however, the average and relatively wet scenarios had higher total releases from the water treatment plants than the relatively dry scenario.

5.0 WATER QUALITY MODEL

5.1 GENERAL

A water quality model (WQ model) was developed to predict the influent water quality to the water treatment plants and the water quality within the water management ponds using a mass balance approach. The WQ model developed using Goldsim® and was built on the foundation of the Mine Plan Module, which provided the inflows, outflows, and storage volumes for each pond. Water quality predictions are provided for the following:

- WTP#1
- WTP#2
- OP WMP
- Main WMP
- Bulk TSF
- Bulk TSF Main SCP, and
- Pyritic TSF.

The water quality standards at each of the proposed discharge locations are summarized in Table 5.1. The water treatment plants will be designed to meet the specified discharge water quality standards.

5.2 METHODOLOGY

The mass balance calculations factor in the inflow loads (e.g., undisturbed runoff load, load transfer from other facilities, etc.) and outflow loads (e.g., load transfer to other facilities, loads trapped in the tailings voids, etc.) from the water management ponds. The monthly concentrations are a function of the constituent loads and the flow volumes associated with the inflow, outflow and storage components of the system, and based on the integration of the following:

- The monthly constituent concentrations within a pond are equal to the sum of the previous month's stored load and the current monthly loading divided by the previous month's stored volume plus the current month's inflow volume minus the evaporation.
- Loads removed from each facility by either pumping or seepage losses are determined using the monthly concentrations multiplied by the volumes of water being removed during each time step.
- The stored load for each monthly time step is the sum of the previous month's load and the incoming load minus the outgoing load.

\\KPL\VA-Prj$\1\01\00176\57\A\Report\4 - Water Management Report\Rev 1\Tables\[Estimated Discharge Criteria.xlsx]Table 5.1_WTP_Limits

NOTES:

1. Water quality based effluent limits (WQBELs) are taken from *Alaska Water Quality Criteria Manual for Toxic and Other Deleterious Organic and Inorganic Substances* dated December 2008.
2. Water quality standards (WQS) are taken from *Alaska Water Quality Standards* (18 AAC 70) dated April 6, 2018.
3. Technology based effluent limits are take from *Effluent Limitation Guidelines, Subpart J* (40 CFR 440.104) for the Copper, Lead, Zinc, Gold, Silver, and Molybdenum subcategory.
4. Water quality standards for dissolved oxygen, turbidity, and pH are mandatory. Estimated limits are the most stringent of water supply, recreation, or growth and propagation standards. Temperature limits are also required, but dependent on habitat and seasonal considerations.
5. Hardness-dependent criteria (cadmium, copper, chromium III, lead, nickel, silver, zinc) are calculated using the estimated 15th percentile conditions for the receiving streams. The most stringent of the three proposed discharge locations is included in the table.
6. The acute selenium standard is based on the selenite/selenate fraction and was not calculated for this estimate. The chronic standard is used instead.
7. Ammonia: acute criterion is pH dependent; chronic criterion is temperature and pH dependent. Estimate based on pH 7.5 and temperature 14 C. Temperatures below 14C do not change the criterion.
8. The criteria in the table are the applicable regulatory criteria. More stringent discharge criteria may be used by the Pebble Partnership.
9. Based on the lowest 15th percentile hardness of the three proposed discharge locations.

5.3 WQ MODEL INPUTS AND ASSUMPTIONS

The following inputs and assumptions were used to develop the water quality model;

- Complete mixing under steady state conditions (i.e., no reactions or degradation occurs) for all facilities and flow streams except for the concentrations in the tailings slurry leaving the process plant and the concentrations in the Bulk TSF and Pyritic TSF, as directed by SRK and described below:
  - Solubility limits were applied to the Bulk TSF and Pyritic TSF in the WQ model as a load capping mechanism, whereby loads in excess of constraining solubility concentrations were removed from the available monthly stored loads in the facility and assumed to precipitate out of the solution and therefore no longer be available as an outgoing load.
  - Solubility limits were applied to aluminum, copper, iron, manganese, and sulphate concentrations leaving the process plant and to concentrations in the Bulk TSF and Pyritic TSF. Solubility limits were applied based on the following:
    - If the calculated concentration leaving the process plant, or the concentrations in the TSF supernatant pond, were greater than the solubility limits, then the solubility limits were applied; otherwise, the concentrations were calculated based on the influent load and flow.
    - For all other parameters, the outflow concentrations were calculated based on the influent load and flow.
- 95th percentile source terms were provided by SRK as parameter concentrations or loadings (SRK 2018). The source terms and source term assumptions are outlined in Table B1.1 and Table B1.2 in Appendix B1.
- Nitrate, Nitrite and Ammonia concentrations for the source terms were calculated based on the following equations:
  - Nitrate (ion) = 4.43 x Nitrate concentration (mg/L as N)
  - Nitrite = 0.02 x Nitrate (ion) concentration (mg/L), and
  - Ammonia = 0.01 x Nitrite concentration (mg/L).
- Total dissolved solids (TDS) values were calculated as the sum of alkalinity, chloride, fluoride, sulphate, calcium, magnesium, potassium, sodium and silica.
- Total hardness values were calculated based on the following equation:

$$TH = 2.5 \times Ca + 4.1 \times Mg$$

- Where, TH = total hardness concentration (mg/L as $CaCO_3$)
- Ca = calcium concentration (mg/L)
- Mg = magnesium concentration (mg/L)
- pH values were based on the range of pH indicated in the geochemical source terms (SRK 2018).
- The model assumes that the loading from the PAG waste rock in the Pyritic TSF is flushing term (SRK 2018)
- The following source terms were assumed for the Open Pit wall runoff:
  - Winter months: pre-tertiary non-potential acid generating load, and
  - Summer months: 1.75 Mft^2 area of the Open Pit was assumed as in-pit stockpile load and the remaining as pre-tertiary non-potential acid generating load.
- The water quality predictions represent conditions during the final year of operations.

AMERICAN OVERSIGHT
EPA-0135-0000537

- The outflow concentrations from the WTPs are defined in Table B1.3 in Appendix B1.

5.4 WQ MODEL RESULTS AND DISCUSSION

The maximum monthly predicted concentrations for the 50th percentile flow values – in combination with the 95th percentile source term concentrations or leadings – for flows to the water treatment plants and in each facility, for the final year of operations, are shown on Table B2.1 in Appendix B2.

The water quality feeding to the water treatment plants is defined by the OP WMP concentrations for WTP#1 and the Main WMP concentrations for WTP#2. The water quality predications for WTP#1 are dominated by the loading from the Open Pit dewatering activities. The maximum predicted concentrations within the OP WMP occur during the summer months because of the in-pit stockpile loads from the Open Pit.

The Main WMP is the main facility for managing the surplus water from the mine site, and the majority of the loading to the Main WMP is a function of the loading from the Bulk TSF and the Pyritic TSF. The maximum predicted concentrations in the Main WMP are, however, less than in the Bulk TSF and the Pyritic TSF because of the continuous removal of loads from the Main WMP via the reclaim water that is directed to the process and to WTP#2.

The bulk tailings slurry water from the process drives the loading within the Bulk TSF supernatant pond. Similarly, the pyritic tailings slurry water from the process drives the majority of the loading in the Pyritic TSF, with both the sludge reject and RO reject flows from the water treatment plants contributing to the loading. The flushing load from the PAG waste rock into the Pyritic TSF provides loading to the Pyritic TSF supernatant pond; however, the load from the PAG waste rock is not as great as that from the tailings slurry water.

The water treatment plants are being designed by others based on the flow rate results of the water balance model and the water quality predictions from the WQ model. The proposed operations of the water treatment plants and the estimated effluent water quality are not provided as part of this report, and will be completed by others.

AMERICAN OVERSIGHT

6.0 SUMMARY

The key points presented in this report are summarized as follows:

- The mean annual temperature in the Project area is just below freezing, with freezing temperatures generally persisting from October through April, and conditions are quite wet, with mean annual precipitation varying throughout the project area but generally ranging from 45 in. to 55 in.
- Precipitation and runoff conditions in the Project area vary substantially throughout the year, and from year to year. The Project area experiences extended periods of wet and dry conditions related to climate cycles.
- Groundwater plays a prominent role in the flow patterns of all the creeks and rivers in the Project area.
- The primary objectives of the water management plan are:
  - To minimize mine drainage water by diverting freshwater and stormwater as much as possible.
  - To describe how water will be managed to assure integrity of impoundments in all conditions.
  - To assure adequate water for operation of the Process Plant and associated support facilities.
  - To treat stormwater for sediment to meet effluent limitations.
  - To capture all mine drainage and process water and treat it in water treatment plants to meet water quality standards in the receiving water body.
- Large water management ponds and variable water treatment rates will be used to ensure that the water management objectives can be achieved under the full range of possible climate and runoff conditions.
- All water management facilities will have provisions in place to handle IDF flows either through storage or spillways.
- Treated water in excess of process requirements will be released to the environment at three points downstream of the mine footprint, one each in the NFK River, SFK River, and UT Creek watersheds.

NOTES:

1. FLOW PATH NUMBER CORRESPONDS TO FLOW SCHEMATIC PRESENTED ON FIGURE A.1.
2. CHANGE IS STORAGE WITHIN THE PONDS ARE A FUNCTION OF THE WATER MANAGEMENT OPERATING CRITERIA. A CHANGE IN STORAGE INDICATES IF THE POND HAS ACCUMULATED OR DECREASED POND VOLUME FROM THE START OF THE YEAR.

WATER QUALITY SOURCE TERMS AND ASSUMPTIONS
SOURCE TERM ASSUMPTIONS

7/6/2018 9:08

Flow Path	Description	Assigned Water Quality	Ratios	Source
		Open Pit		
1 and 5	Direct Precipitation and Additional Snowblow	Wall Runoff (Pre-Tertiary-Non-Acidic) during winter months, In pit Stockpile (Non-Acidic) during summer months (1.75 Mft^2) and remaining area Pre-Tertiary-Non-Acidic	-	PLP- June 28, 2018
2	Undisturbed Surface Runoff	Non-Contact Surface Water (SFK SK100F)	100%	SRK - June 20, 2018
3	Diversion Channel Leakage	Non-Contact Surface Water (SFK SK100F)	100%	SRK - June 20, 2018
4	Groundwater	Groundwater (Pit area)	100%	SRK - June 20, 2018
		Open Pit Water Management Pond		
7	Direct Precipitation	Direct Precipitation	100%	SRK - June 20, 2018
9	Evaporation	None	100%	-
8	Undisturbed Surface Runoff	Non-Contact Surface Water (SFK SK100F)	100%	SRK - June 20, 2018
10	Dust Suppression	Concentration in the Open Pit Water Management Pond	100%	GoldSim Model Calculation
6	Dewatering from Open Pit	Concentration in the Open Pit	100%	GoldSim Model Calculation
		Water Treatment Plant #1 (WTP#1)		
12	Surplus to WTP#1	Concentration in the Open Water Management Pond	100%	GoldSim Model Calculation
55	Reject Flows	WTP#1 - Sludge and Reject Concentrations	100%	HDR - January 4,2018
		Mill Site		
14	Treated Water	Outflow Concentration from WTP	100%	HDR - January 4,2018
13	Water in Ore	Ore (Entrained Moisture)	100%	SRK - June 20, 2018
16	Water in Concentrate	Combined Concentrations after applying Tailings Pond Adjustment (Pond)	100%	SRK - June 20, 2018
15	Reclaim Water from Main WMP	Concentration in the Main Water Management Pond	100%	GoldSim Model Calculation
		Bulk Tailings Management Facility (Bulk TSF)		
30	Direct Precipitation on Supernatant Pond	Direct Precipitation	100%	SRK - June 20, 2018
35	Evaporation	None	100%	-
31	Undisturbed Surface Runoff	Non-Contact Surface Water (NFK (NK119A))	100%	SRK - June 20, 2018
32	Diversion Channel Leakage	Non-Contact Surface Water (NFK (NK119A))	100%	SRK - June 20, 2018
17	Bulk Tailings Slurry Water	Calculated Concentrations in the Mill after applying Tailings Pond Adjustment (Pond)	100%	GoldSim Model Calculation
36	Bulk Tailings Void Losses	Calculated Concentrations in the Mill after applying Tailings Pond Adjustment (Pond)	100%	GoldSim Model Calculation
34	Bulk Tailings Beach Runoff	Rougher Tailings (Runoff)	100%	SRK - June 20, 2018
33	Recycle from Seepage Collection Pond Recycle	Concentration in the Seepage Collection Pond	100%	GoldSim Model Calculation
		Bulk TSF South Embankment Seepage Collection Pond		
45	Undisturbed Runoff	Non-Contact Surface Water (NFK (NK119A))	100%	SRK - June 20, 2018
46	Diversion Channel Leakage	Non-Contact Surface Water (NFK (NK119A))	100%	SRK - June 20, 2018
5	Seepage	Concentration in the Bulk TSF	100%	GoldSim Model Calculation
47	Bulk TSF South Embankment Runoff	Quarried Rock Fill (Dams) (Non-Acidic)	100%	SRK - June 20, 2018
		Bulk TSF Main Embankment Seepage Collection Pond (Bulk TSF Main SCP)		
39	Direct Precipitation	Direct Precipitation	100%	SRK - June 20, 2018
2	Evaporation	None	100%	-
40	Undisturbed Surface Runoff	Non-Contact Surface Water (NFK (NK119A))	100%	SRK - June 20, 2018
41	Diversion Channel Leakage	Non-Contact Surface Water (NFK (NK119A))	100%	SRK - June 20, 2018
37	Seepage through main Embankment	Rougher Tailings Sand Wedge (Seepage)	100%	SRK - June 20, 2018
42	Bulk TSF Main Embankment Runoff	Quarried Rock Fill (Dams) (Non-Acidic)	100%	SRK - June 20, 2018
		Pyritic Tailings and PAG Waste Rock Management Facility (Pyritic TSF)		
22	Direct Precipitation	Direct Precipitation	100%	SRK - June 20, 2018
26	Evaporation	None	100%	
23	Undisturbed Surface Runoff	Non-Contact Surface Water (NFK (NK119A))	100%	SRK - June 20, 2018
24	Diversion Channel Leakage	Non-Contact Surface Water (NFK (NK119A))	100%	SRK - June 20, 2018
18	Pyritic Tailings Slurry Water	Calculated Concentrations after applying Tailings Pond Adjustment (Pond) to the Pyritic Slurry and WTP Sludge/Rejects	100%	GoldSim Model Calculation
	PAG Waste Rock	PAG WR 17% of Facility Area	100%	SRK - June 20, 2018
55+57	Reject Flows from WTP's	WTP's - Sludge and Reject Concentrations	100%	HDR - January 4,2018
27	Pyritic Tailings Void Losses	Calculated Concentrations in the Mill after applying Tailings Pond Adjustment (Pond) to the Pyritic Slurry and WTP Rejects	100%	GoldSim Model Calculation
28	PAG Waste Rock Voids	Calculated Concentrations in the Mill after applying Tailings Pond Adjustment (Pond) to the Pyritic Slurry and WTP Rejects	100%	GoldSim Model Calculation
		Main Water Management Pond (Main WMP)		
48	Direct Precipitation	Direct Precipitation	100%	SRK - June 20, 2018
53	Evaporation	None	100%	-
49	Undisturbed Surface Runoff	Non-Contact Surface Water (NFK (NK119A))	100%	SRK - June 20, 2018
50	Diversion Channel Leakage	Non-Contact Surface Water (NFK (NK119A))	100%	SRK - June 20, 2018
38	Surplus from Bulk TSF	Concentration in Bulk TSF	100%	GoldSim Model Calculation
29	Surplus from Pyritic TSF	Concentration in Pyritic TSF	100%	GoldSim Model Calculation
44	Surplus Water from Bulk TSF Main SCP	Concentration in the Main Embankment Seepage Collection Pond	100%	GoldSim Model Calculation
21	Blow Down Water to Main WMP	Outflow Concentration from WTP#2	100%	HDR - January 4,2018
51	Mill Site Runoff	Quarried Rock Fill (Dams) (Non Acidic)	100%	SRK - June 20, 2018
52	Pyritic TSF Main Embankment Runoff	Quarried Rock Fill (Dams) (Non-Acidic)	100%	SRK - June 20, 2018
11	Surplus from OP WMP	Concentration in the Open Pit Water Management Pond	100%	GoldSim Model Calculation
		Power Plant		
20	Evaporation	None	100%	-
19	Cooling Tower Evaporation	Outflow Concentration from WTP#2	100%	HDR - January 4,2018
		Water Treatment Plant # 2 (WTP#2)		
54	Surplus Water from Main WMP	Concentration in the Main Water Management Pond	100%	GoldSim Model Calculation
55	Reject Flows	WTP#2 - Sludge and Reject Concentrations	100%	HDR - January 4,2018
		To Environment		
58 and 56	Treated Water to Environment	Outflow Concentration from WTP#1 and WTP#2	100%	HDR - January 4,2018
61	Diversion Channel to Environment	Non-Contact Surface Water (NFK (NK119A)/SFK (SK100F))	100%	SRK - June 20, 2018
59+60	Quarry Diversions to Environment	Quarried Rock Fill (Dams) (Non Acidic)	100%	SRK - June 20, 2018

M:\1\01\00176\57\A\Report\4 - Water Management Report\Rev 0\Appendix B - Water Quality Model Inputs and Results\[Appendix B2.xlsx]Table1_Preliminary_WQ

NOTES:

1. MODEL INPUT CONCENTRATIONS PROVIDED BY SRK CONSULTING (DATED 20 JUNE. 2018).
2. TAILINGS POND ADJUSTMENT VALUES WERE APPLIED FOR Al, SO4, Fe, Cu and Mn IN THE BULK TSF AND PYRITIC TSF.
3. TDS VALUES WERE CALCULATED BY SUMMING ALKALINITY, Cl, F, SO_4, Ca, Mg, K, Na AND Si.
4. MODEL ASSUMES RETURN OF SLUDGE AND REJECT FLOWS FROM WTP#1 AND WTP#2 TO THE PYRITIC TSF VIA THE PYRITIC TAILINGS LINE.
5. WTP EFFLUENT, SLUDGE AND REJECT CONCENTRATIONS WERE PROVIDED BY HDR (DATED 4 JANUARY. 2018).
6. HARDNESS VALUES WERE CALCULATED BASED ON THE EQUATION
   HARDNESS ($CaCO_3$) = CALCIUM CONCENTRATION (mg/L)*2.497+MAGNESSIUM CONCENTRATION (mg/L)*4.118
7. THE PERCENTILE RESULTS BASED ON 76 REALIZATIONS OF MODEL SIMULATIONS.
8. MODEL ASSUMES THE LOADING FROM THE PAG WASTE ROCK IN THE PYRITIC TSF AS A FLUSHING TERM PROVIDED BY SRK CONSULTING (DATED 20 JUNE. 2018).
9. MODEL ASSUMES ADDITIONAL LOADING FROM INPIT STOCKIPLE IN THE OPEN PIT DURING THE SUMMER MONTHS.
10. pH WAS NOT MODELLED AND pH VALUES ARE BASED ON THE RANGE OF pH SOURCE TERMS PROVIDED BY SRK (DATED 20 JUNE. 2018).

Subject: Final scoping letter

All – attached is the final Pebble scoping letter that I signed this afternoon. Patty is submitting electronically to the Corps today.

To's – first, please accept and pass on my gratitude for the truly above and beyond efforts to see this over the finish line. There's a lot to feel good about in here. Second, please distribute to the (many) others whose efforts contributed to the final product (or to one of the many intermediate products). I started trying to address to all, but knew that I'd never come up with a complete list.

Cc's – thanks for your support on this.

Erik and Patty – please set aside at least 20 minutes of our Tuesday team meeting agenda to discuss the letter and to begin discussing lessons learned.

All,
Please plan on an informational 2 hour meeting August 22, 2018 so that we may present the Chapter 2 Alternatives currently being identified. The draft scoping report should be available by 8/17 or earlier, so it won't be enough time for your agency to process the information and inform alternatives identified in the scoping process. Plan on having a follow up in middle September after screening criteria for the alternatives have been used and the alternatives to be carried forward for analysis are identified.

Subject: REVIEW REQUEST - Pebble Preliminary Ch. 4 Sections

Hello All,
The Corps has distributed some very preliminary draft sections of Chapter 4 for Cooperating Agency review. These documents do not contain the actual project analysis, but appear to be more of a framework to work from in completing the analysis and EIS text. The sections include heading, some introductory-type text, and some blank tables. The Corps did not provide detailed instructions for review, but I recommend that we review from the perspective of determining whether the skeleton of the analysis presented here appears that it will address the key issues for review, and provide recommendations for inclusion of any issues that appear to have been overlooked in the current structure.

Here are the specific section assignments, similar to last time:

- 4.1 Intro – Molly
- 4.5 Recreation – Molly
- 4.11 Aesthetics – Molly
- 4.14 Soils – Mark/Palmer
- 4.16 Surface Water Hydrology – Tim/Mark/Palmer/Muluken
- 4.17 Hydrogeology – Tim/Mark/Palmer/Muluken
- 4.18 Water and Sediment Quality – Cindi/Tim/Chris
- 4.22 Wetlands/ Special Aquatic Sites – Mark/Palmer
- 4.26 Vegetation – Mark/Palmer

The Corps has requested a quick turnaround for review, therefore please send me any comments you may have on these sections by COB 7/24. I am hoping, given the brevity of these documents, that this timeframe will be achievable, but please let me know as soon as possible if it will not.

Please provide your comments in the attached comment table format.

It may be helpful to look back at the issues we recommended for analysis in our scoping comments - I have saved the final version of that letter on the Sharepoint Site here:

Internal Web Address / Ex. 6

Thank you,
Molly

Katie,

In an effort to get my calendar in order I reached out to Ellen and found out she returns August 1. I have it in my notes that she seemed to think the week of August 20-24 may work for a joint NS trip. Is that the same week you are anticipating? It also appears a Pebble meeting has been set up for Wednesday August 22nd.

Thanks,

Mark Douglas

Subject: Please Review - Pebble Pre-DEIS Sections
Importance: High

Hello Pebble NEPA Team,

AMERICAN OVERSIGHT

We have received several additional sections of the preliminary Draft EIS for review. We have also received many sections as an FYI for which our review is not requested. I have loaded everything I've received to date into the Sharepoint Folder: Preliminary Draft EIS Sections Oct-Nov 2018.

As a reminder, our input at this stage is only requested on the specific sections we were assigned to in the Cooperating Agency plan. Therefore, if your name doesn't appear below with a specific assignment, no review is necessary at this time. However, feel free to take a look at the sections pertaining to your subject matter on the Sharepoint Site if you wish.

Here are the assignments for specific sections where I would appreciate your review. Note that each subject area includes a section for Chapter 3 (affected environment), Chapter 4 (environmental consequences), as well as one or two supporting technical appendices. Please use the attached comment spreadsheet to assemble your comments, and please send them to me by the date noted for each section below.

- 3.11/4.11/K4.11 Aesthetics – Molly
- 3.14/4.14/K3.14 Soils – Mark/Palmer – due COB 11/27
- 3.16/4.16/K3.16 Surface Water Hydrology – Tim/Mark/Palmer/Muluken/Justine – due COB 11/27
- 3.26/4.26/K3.26 Vegetation – Mark/Palmer – due COB 11/27
- 3.17/4.17/K3.17 Hydrogeology – Tim/Mark/Palmer/Muluken – due COB 11/29
- 3.18/4.18/K3.18/K4.18 Water and Sediment Quality – Cindi/Tim/Chris – due COB 11/29
- (note, we have not yet received the Wetlands sections, which are anticipated to arrive approximately 11/21)

I apologize for the short time available for review, especially given the Thanksgiving holiday in the middle. If this schedule will be impossible for you, please let me know as soon as possible. Also, if you have any questions about the sections you are reviewing or where to focus your review, please don't hesitate to call.

Thank you,
Molly

Hi Justin,

Sorry for the delayed response. I don't think there's much to discuss at this point. The Corps' scoping report summarizes the comments it received during the public comment period. I checked in the Region and I don't think there's an immediate to do at this point but we will let you know if anything changes.

Thanks,
Heidi

1.0 INTRODUCTION

This Scoping Report has been developed for the U.S. Army Corps of Engineers (USACE) to share the types of issues that were received during the scoping period from the general public and the cooperating agencies. It documents outreach efforts during the scoping period and summarizes the primary issues of concern and suggested alternatives from the public. The Scoping Report will be used to develop alternatives for the Environmental Impact Statement (EIS) and identifies issues that are important to the public and should be considered in the analysis of the EIS.

2.0 PROJECT OVERVIEW AND SCOPING PROCESS

2.1 BACKGROUND

The USACE, Alaska District, intends to prepare a Draft EIS to assess the potential social, economic, and environmental impacts associated with the proposed Pebble Project. The EIS will assess potential effects of a range of alternatives.

Pebble Limited Partnership (PLP) is proposing to develop the Pebble copper gold-molybdenum porphyry deposit as an open-pit mine, with associated infrastructure, in southwest Alaska, north of Iliamna Lake. The proposed project would require a natural gas-fired power plant supplied by a natural gas pipeline to the Mine Site, and transportation infrastructure including a road from the Mine Site to a ferry terminal on the north shore of Iliamna Lake, an ice-breaking ferry crossing to a terminal on the south shore of Iliamna Lake, and a road to the proposed Amakdedori Port on Cook Inlet.

2.2 NOTICE OF INTENT

An application for a Department of the Army permit was submitted by PLP pursuant to Section 404 of the Clean Water Act (33 United States Code [U.S.C.] 1344) and Section 10 of the Rivers and Harbors Act of 1899 (33 U.S.C. 403) on December 22, 2017. The application was deemed complete, and was advertised in a Public Notice, Pacific Operations Area (POA) POA–2017–271, on January 5, 2018. On March 29, 2018, the USACE issued a Notice of Intent in the Federal Register to prepare an EIS for the proposed project. The Notice of Intent is included in Appendix A, and the Public Notice is included in Appendix B.

2.3 SCOPING PROCESS

2.3.1 Scoping Process Overview

The scoping period began on April 1, 2018. On March 30, 2018, the USACE issued a press release to announce the opening of the 30-day comment period and to provide information for how to submit comments. On April 6, 2018, their second press release extended the scoping period by 60 days to continue through June 29, 2018. See Appendix B for both press releases.

Scoping is conducted to assist in determining the breadth of analysis, significant issues, and alternatives to be analyzed in depth in the Draft EIS. The Council on Environmental Quality defines scoping as an "early and open process for determining the scope of issues to be addressed and for identifying the significant issues related to a proposed action" (40 Code of Federal Regulation 1501.7). The scoping process provides an opportunity for people potentially

AMERICAN OVERSIGHT

affected by the project to express their views and concerns and to contribute to the completeness of the EIS.

2.3.2 Public Notice, Press Releases, and Other Media

Prior to the scoping period start, the USACE began organizing public meetings and developing materials related to scoping that were provided to the public.

The project website (www.PebbleProjectEIS.com) went live on March 19, 2018. The website includes information about the project, EIS process, and scoping. The USACE uses the website to disseminate important information to the public, such as the scoping meeting schedule. The website also included a form for the public to submit scoping comments; this online comment form included a map where commenters could mark a point that related to their comment. Comments that have been submitted are available for the public to view. Some individual comments to the website contain multiple documents. Screenshots of the website (dated May 7, 2018) are in Appendix B.

On March 20, 2018, the USACE mailed hardcopies of a Scoping Package to 35 identified Alaska Native Tribal Organizations in the project area. The complete Scoping Package (in Appendix B) was also made available on the project website and includes:

- Information about the scoping process
- A description of the project
- The process for developing alternatives
- A list of resources to be analyzed in the EIS
- Information on the National Environmental Policy Act (NEPA)
- Roles of the various participating organizations
- An EIS schedule and outline
- Information on submitting comments
- A comment form.

To help advertise the scoping period, the USACE began mailing the project's Newsletter #1 on March 29, 2018. The newsletter provided details on the public meeting schedule as well as information on how to submit comments; it was sent to every post office box in 33 communities, and to 140 other organizations and individuals on a mailing list. A total of 3,670 newsletters were mailed. The USACE also ran announcements in the Bristol Bay Times, the Homer News, and the Anchorage Daily News a week prior to relevant meetings. Finally, a flyer was emailed to communities where scoping meetings were scheduled for distribution on April 6, 2018. Newsletter #1, newspaper affidavits, and the flyer can be found in Appendix B.

2.4 PUBLIC SCOPING MEETINGS

Public scoping meetings were held in nine communities, including Anchorage. A total of 914 participants signed in at the public meetings (see Appendix C for sign-in sheets). The primary purpose of the public meetings was to present a project overview, give the public a forum for submitting verbal and electronic comments, and provide an opportunity to talk to the USACE about the EIS and the Department of the Army permit application process. Table 1 shows the meeting locations and the number of people who signed in.

AMERICAN OVERSIGHT

Table 1: Scoping Meetings

Date	Community	Location and Time	Number Signed In
April 9, 2018	Naknek	Naknek School, 3:30-7:30 PM	45
April 10, 2018	Kokhanok	Community Hall, 3:30-7:30 PM	68
April 11, 2018	Homer	Homer High School, 5:00-9:00 PM	223
April 12, 2018	Newhalen	Newhalen School, 3:30-7:30 PM	47
April 13, 2018	New Stuyahok	Community Building, 1:00-4:30 PM	65
April 16, 2018	Nondalton	Tribal Center, 3:30-7:30 PM	46
April 17, 2018	Dillingham	Middle School, 5:00-9:00 PM	88
April 18, 2018	Igiugig	Community Building, 3:30-7:30 PM	47
April 19, 2018	Anchorage	Dena'ina Center, 11:00 AM-9:00 PM	285

2.4.1 Meeting Description

The format of the public meetings varied depending on the location. A sign-in station with hardcopies of supporting material was set up at all locations. The sign-in sheet was used to update the project mailing list.

In general, a brief introduction by the USACE was given. A 17-minute video describing the project was shown (or was available to be watched), and the public were given multiple ways to comment. Time was allotted for members of the public and media to speak directly with USACE staff, State of Alaska staff, or in some locations, other cooperating agency staff. AECOM (the third party NEPA contractor) staff were also present.

In Naknek, Kokhanok, Newhalen, New Stuyahok, Nondalton, and Igiugig, the USACE provided a microphone ("hot mic") where participants could speak their comments out loud in front of other meeting attendees. Comments were transcribed by a court reporter, either during the hot mic session or individually after the session. In Homer, Dillingham, and Anchorage, two court reporters were available to take comments one-on-one; therefore, no hot mic was provided.

At all meetings, laptop computers were provided for the public to submit comments electronically to the project website. Paper comment forms were available for handwritten or typed comments, which could be submitted to the USACE at a meeting or mailed later.

2.4.2 Meeting Materials Description

The USACE requested that the PLP create a video describing their proposed project and mining process. The resulting 17-minute video gives an introduction to the surrounding environment, project components and footprint, water management and mining process, and reclamation. At some meetings this video was shown after the USACE introduction, and at others it was shown on a repeating loop.

Ten posters prepared by the PLP to describe the project, the mining process, and reclamation were also displayed. The USACE created additional posters describing the NEPA process and how to write effective comments. The Anchorage meeting also included posters on the scoping process, the EIS outline, resources to be discussed in the EIS, and roles of cooperating agencies.

AMERICAN OVERSIGHT

The USACE also provided the Scoping Package, paper comment forms, and a handout from the Bureau of Safety and Environmental Enforcement (BSEE), a cooperating agency. A screenshot of the video, as well as all posters and handouts, are in Appendix D.

2.4.3 Additional Agency Involvement

A kickoff meeting for cooperating agencies was held on June 6, 2018, where the roles of cooperating agencies for this EIS were discussed. Cooperating agencies will have opportunity to provide input throughout the process, including alternatives development, providing technical expertise for analysis, and suggesting mitigation. In addition, the State of Alaska, BSEE, and the Pipeline and Hazardous Materials Safety Administration attended some scoping meetings to answer questions about their role and expertise.

2.4.4 Government-to-Government Consultation

Federal agencies are charged with engaging in regular and meaningful consultation and collaboration with tribal officials in the development of federal policies that have tribal implications pursuant to Executive Order 13175 on Consultation and Coordination with Indian Tribal Governments (November 6, 2000). The USACE Tribal Consultation Policy (2013) states that "Commands will ensure that all Tribes with an interest in a particular activity that has the potential to significantly affect protected tribal resources, tribal rights (including treaty rights) and Indian lands are contacted and their comments taken into consideration". As the lead federal agency for the development of the EIS, USACE is responsible for government-to-government consultation and coordination with federally recognized tribes that may be impacted by the proposed project.

The government-to-government consultation process for the Pebble Project EIS is designed to provide federally recognized tribes in Alaska that may potentially be impacted by the proposed project with opportunities for meaningful participation in the federal permitting process. Tribes and other Alaska Native stakeholders will have several opportunities throughout the environmental review process to participate and provide input. USACE has developed a list of 35 federally recognized tribes that could be potentially impacted by the proposed project. USACE notified and invited these tribes into government-to-government consultation early in the process. The consultation process was coordinated with the NEPA scoping effort to the extent possible. Information learned through tribal consultation will inform the EIS, as appropriate.

An initial letter was sent to the tribes on the list, including basic project information, how tribes may participate in the development of the EIS and an invitation to formal government-to-government consultation. It is expected that not all tribes will request formal consultation, but USACE will continue to offer opportunities to tribes to participate throughout the project review. Informal consultation will consist of the two-way sharing of information through mailings, teleconferences, and regional meetings with tribes during the NEPA process that are held separate from the public meetings.

2.4.5 Next Steps in the NEPA Process

Scoping is the first opportunity for public involvement under the NEPA process. An additional opportunity for public comment will follow the release of the Draft EIS scheduled for early 2019. A Notice of Availability will be published in the Federal Register informing stakeholders and other members of the public that the Draft EIS is available for comment. The Draft EIS comment period will include public meetings in the same communities where scoping meetings were held. The project website will be updated throughout the EIS process.

AMERICAN OVERSIGHT

Public comments shape the NEPA process by identifying project-related questions and issues of concern. Typically questions are in reference to the project, existing environment, extent of temporal and spatial impacts, or potential consequences to the human environment from the proposed action. Substantive questions and issues of concern, which can inform the scope of analysis and alternatives to be considered in the EIS, are grouped by subject matter in this Scoping Report. This information is used in the alternatives development process, the study of the affected environment, and in the process to analyze environmental consequences (or impacts). Documents that are received from the public during the scoping process via the project website, mail, and email are referred to as submissions during analysis. Each submission can contain many coded comments which are then used to inform the scope of the analysis. Submissions without substantive comments that are not specific to a particular issue are considered non-substantive. These comments did not inform our analytical framework during the scoping period, and include comments in support of or in opposition to the applicant's proposed project without providing rationale.

AMERICAN OVERSIGHT

3.0 SCOPING COMMENT SUMMARY

This section contains a description of the scoping comment analysis process and a summary of the public scoping comments received. Due to the large number of comments submitted as part of scoping for an EIS, it can be challenging for the EIS preparation team, as well as the general public, to read all the comments and understand all of the issues raised. Standard practice has been to code and enter comments into a database program that captures and summarizes issues and recommendations from scoping comments. However, the EIS team and the general public will continue to have access to comments submitted on the website for reference purposes.

The public comment summary includes the following:

- Description of the scoping comment analysis process (description of the comment database, development of the coding structure, identification and coding of comments, comment summary process).
- A summary of issues identified, categorized by physical environment, biological environment, social environment, or NEPA process.

3.1 SCOPING CONTENT ANALYSIS PROCESS

Public and agency comments submitted by the close of the scoping period were analyzed and categorized using a process called "content analysis." The analysis process included:

1. Import and organization of all comments/submission content into a comment database.
2. Development of a coding structure to analyze the comments.
3. Review of submissions to assign codes to comments.
4. Preparation of a Scoping Report with analysis results.

The goals of the content analysis process are to:

1. Ensure that every submission (every received set of comments, submitted by any means, is defined as a "submission") is considered.
2. Identify the concerns raised by commenters.
3. Represent the breadth and depth of the public's viewpoints and concerns as fairly as possible.
4. Present those concerns in a way that facilitates consideration of comments and conveys the issues raised during scoping.

All comments were treated equally. Emphasis was on the content of a comment, rather than who wrote it or the number of submissions in agreement.

3.1.1 Scoping Comment Database

Names, contact information, and comment text for commenters who submitted comments were entered into an electronic database. Many comments were submitted to the USACE in electronic format through the project website comment form. A large volume of comments were received by the USACE via email and/or postal service. As comments were received, they were made available for the public to view on the project website. Hardcopy comments, including those delivered by postal service or submitted in person at public meetings, were scanned and entered into the database, and also posted to the project website.

AMERICAN OVERSIGHT

The content of the comments was filtered using various database queries and identifying potential form letters (see form letter discussion below). Any submission identified as having the same commenter information and content, regardless of delivery format (e.g., hardcopy letter, email) or date, was counted as one submission.

3.1.2 Form Letters

Form letters are defined as multiple submissions with the same content. Electronic comments were pre-screened in the database, using various queries to identify similar content and thus potential form letters. If consistent content was identified, a form letter record with that content was created in the database and additional submissions with the same content were placed into that form letter category.

3.1.3 Coding Structure Development

Submission content was sorted into categories to represent commenters' concerns and rationale through a coding structure. Codes provide an efficient and accurate grouping of similar comments; coded concerns are referred to as "comments" in this report.

The aim of the coding structure is to identify applicable Pebble Project facilities and components, environmental resources, and planning processes in submissions. An initial coding structure was developed based on expected issues and concerns; this structure was continuously refined as more submissions were received to identify any additional concerns.

3.1.4 Comment Identification and Coding

Submissions were reviewed to identify substantive comments that will be used to formulate the issues and analysis conducted in the EIS process. Individual statements within a submission were identified as a comment(s) and then assigned to categories/topics.

Submissions may contain more than one comment, each coded based on the issue and the specific rationale. This form of analysis allows for specific comments to be captured and then grouped under the umbrella of a general resource issue. The NEPA process considers the substance of issues but does not consider who wrote the comment or the number of similar comments (like votes).

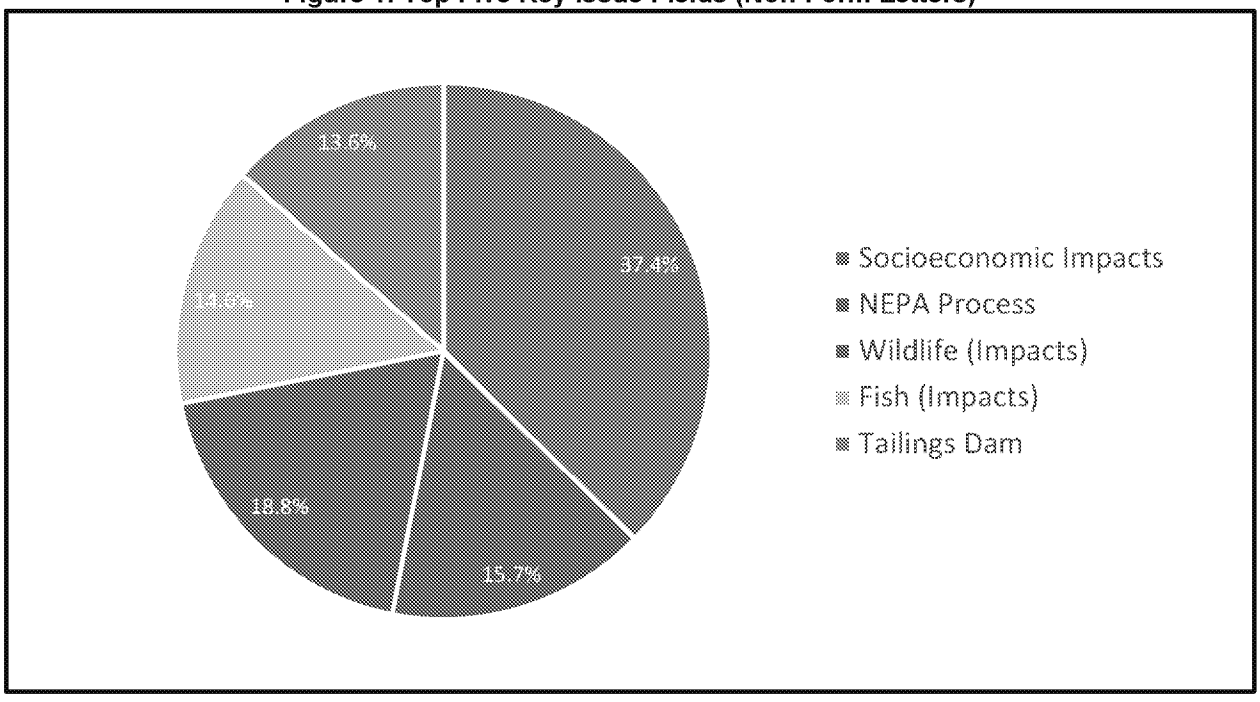
3.2 PUBLIC COMMENT SUBMISSION SUMMARY

3.2.1 Submissions Received

In total, 174,889 submissions were received through June 29, 2018. A total of 3,653 of these submissions were considered non-form letters. There were several variations of form letters that were received, with a total of 171,236 form letters. The USACE received five petitions with a total of 295,721 signatures that were considered as non-form letter submissions. The validity of these petition signatures has not been verified. Submissions with substantive comments were analyzed for key issues. The top five substantive key issue fields for non-form letters and form letters are shown in Figure 1 and Figure 2.

AMERICAN OVERSIGHT

Figure 1. Top Five Key Issue Fields (Non-Form Letters)



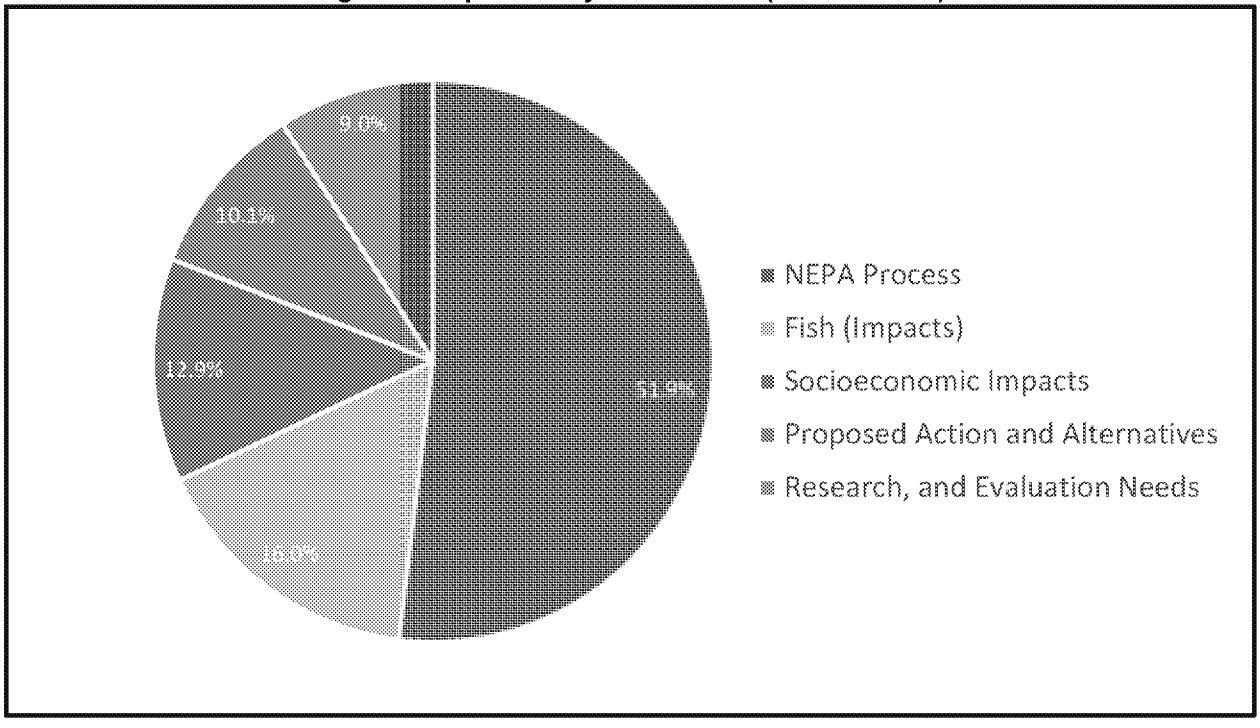


Figure 2. Top Five Key Issue Fields (Form Letters)

AMERICAN OVERSIGHT

A total of 5,616 substantive comments were received from non-form letter submissions, and 334,351 substantive comments were received from form letters.

3.3 COMMENT SUMMARY PROCESS

The intent of this Scoping Report is to provide representative summaries that capture, with a minimum of repetition, major topic areas or concerns expressed during the public scoping period. The topic areas or concerns contained in the summary of public comment will be used to develop the issues, alternatives, and mitigation strategies that will be analyzed in the EIS process. It will also inform the public of issues that were raised from their scoping comments.

In writing this summary, comment analysts reviewed coded comments to understand the overall content of the comment and to identify topic areas or concerns in similar comments from different respondents. Similar comments were summarized into concise narrative statements and organized by the key issues.

Comments are organized in two broad categories below:

- **Resource Topics**. This section provides issues identified in scoping comments organized by resource topic. Resource-specific comments are grouped, such as comments concerning fish and wildlife habitat loss, loss of recreational access, or dust and emissions along the access roads and at the Mine Site. These topics are divided by the physical environment, the biological environment, and the social environment.
- **NEPA Process and Regulatory Compliance**. This section provides a summary of public comments on the NEPA process and alternatives to the proposed project. Topics include the public involvement process, project purpose and need, other laws and regulations, tribal consultation, cooperating agencies, and the no action alternative. Public comment suggestions for proposed action alternatives and mitigation measures are also included.

3.4 SUMMARY OF PUBLIC COMMENT –RESOURCE TOPICS

3.4.1 General Resources

A variety of general comments were received indicating that the EIS should analyze the direct, indirect, and cumulative impacts on general resources or the environment in the project area.

3.4.2 Physical Resources

Comments indicated that the EIS should analyze the direct, indirect, and cumulative impacts on specific physical resources, including:

- Air quality
- Climate change
- Geology and seismic activity
- Surface and groundwater hydrology impacts
- Noise impacts
- Spill risks and release
- Hazardous materials stored and transported to and from the mine site
- Natural gas supply and pipeline safety
- Tailings dam

AMERICAN OVERSIGHT

- Water resources – quality and quantity.

3.4.2.1 Air Quality

Comments were received on impacts to air quality as a result of project construction and mining operations.

- Comments were received regarding impacts to air quality from construction, fugitive dust emissions, vehicle equipment emissions, and mining activities.
- Concerns were made regarding fugitive dust pollution from the mine and roads, and what chemicals may be used to control dust.
- Impacts to air quality including impacts from transporting ore and materials, or loading and shipping ore and concentrate.
- Impacts from air pollutants emitted during mine operations and contribution to greenhouse gas (GHG) emissions from the power plant.
- Address both air quality and air quality related values (e.g., visibility) in the analysis of potential project impacts.
- Characterize existing conditions to set the context for evaluating project impacts, including regional climate and meteorology, air quality and air quality related values, and identification of sensitive receptors in the vicinity.
- Provide an emissions inventory of criteria pollutants, greenhouse gas emissions, and significant hazardous air pollutant (HAP) emissions for all project components and phases.
- Disclose the air quality regulations and permit requirements that apply to the project.

3.4.2.2 Climate Change

Comments were received about the impacts of climate change to the environment and how climate change trends may interact with effects of the proposed project.

- Look at the carbon and GHG additions to the atmosphere from the proposed project.
- Provide a comprehensive emissions inventory of criteria pollutants, GHG emissions, and significant hazardous air pollutant emissions for all project components and phases.
- Create a report and use comparisons to make the units of measure understandable to the public.

3.4.2.3 Geology and Seismic Activity

Comments were received regarding impacts to the geology of the project area, including concerns that major faults occur in the proposed project area and may affect project facilities.

- Include detailed information about seismically active areas, geological faults and tectonic activity, and corresponding design features.
- Analyze impacts to bedrock, surface geology, gravel resources, paleontological resources, and landforms from all proposed project components.
- Describe how the proposed project facilities would withstand earthquakes, particularly the tailings storage facility (TSF).
- Analyze impacts from volcanic activity, especially at Amakdedori Port and along the pipeline from the Augustine Island volcano.

AMERICAN OVERSIGHT

3.4.2.4 Surface and Groundwater Hydrology

Comments were received on impacts to groundwater systems and aquifers, transportation of groundwater, and how it moves underground. A thorough understanding of the groundwater and surface water hydrology and how they relate to each other should be demonstrated.

- Characterize existing groundwater, surface water, springs, and wetland resources within the area of both the project and alternatives, including groundwater levels, flow direction and gradients.
- Evaluate changes in water volume in the stream areas impacted, as well as changes in the downstream reaches of the watershed resulting from losses of upstream contributions of water. Include seasonal changes to the different stream segments.
- Evaluate flow changes in the impacted stream reaches, both from pit dewatering as well as any proposed in-stream discharge points. Areas of stream incision as a result of flow changes should be identified, as well as losses of connectivity to floodplains and riparian wetlands currently.
- Address earthquake impacts on hydrology characteristics.
- Explain the water balance model of the project. A complete water management plan based on recent data should be provided before impacts can be assessed.
- Develop of conceptual site models to aid in understanding and predictions of changes to water quantity and quality. Include maps, baseline data, underground sources of drinking water, and a detailed water balance model.

3.4.2.5 Noise

Comments were received on impacts of noise pollution as a result of project construction and mining operations.

- Discuss noise impacts of blasting in the project area, and describe the blasting methods that would be used.
- Consider noise in the water created by the proposed icebreaker ferry and the impacts to fish, bears, and other wildlife.

3.4.2.6 Spill Risks and Releases

Comments were received about the potential for fuel and oil spills or accidental releases from various aspects of the project, including adequate response capacity to clean up spills in various conditions, and potential impacts to natural resources or environment from spills or release.

- Analyze impacts of spills of diesel and natural gas to every resource discussed in the EIS.
- An earthquake could rupture the gas pipeline under the lake when salmon are migrating and impact fish and wildlife.
- Explain who is responsible for spill response on Cook Inlet and Iliamna Lake. Response plans should be developed for all parts of the project.
- The wetlands that surround the mine site would make it difficult to contain contaminated waters if any of the storage or processing sites at the mine or along the transportation corridor were to leak or fail. Therefore, it is essential to ensure that this infrastructure has no possibility of failure during the life of the mine or for decades to centuries after the mine is closed down.

AMERICAN OVERSIGHT

- There is concern about the number of times the ore slurry/concentrate, fuel, and other supplies must be transferred. Each transfer increases the risk of a spill or release.

3.4.2.7 Hazardous Materials

Comments were received about the potential for hazardous material storage, spills, and impacts to resources or the environment; in particular, to address chemicals associated with mine process and storage of materials (such as arsenic or acids).

- The revised mine plan calls for no cyanide to be brought in to the region.
- Address impacts of hazardous and solid waste generated from the proposed project. A hazardous and solid waste material handling, storage, management, and disposal plan should be developed and evaluated into the Draft EIS.
- Describe how blasting agents would be transported and managed, and how much would be used.
- During the copper extraction process, an alcohol is added during the flotation along with a collector chemical called potassium amyl xanthate (or the potassium salt of an alkyl dithiocarbonate), which can be toxic.
- The process chemicals described in the permit application appear to be generic descriptions, rather than descriptions of the specific chemicals to be used. A more complete description of the ore processing is needed. A complete list of process chemicals, by manufacturer, as well as the annual amount to be used, is also required.
- List any herbicides, pesticides, or road de-icing compounds.
- The EIS should describe emergency measures that would be implemented should there be a release of hazardous substances and how potential adverse impacts may be mitigated.

3.4.2.8 Natural Gas: Pipeline and Gas Supply

Comments were received on the impacts of the proposed project on the supply, demand and cost of natural gas in the proposed project area and Cook Inlet.

- There could be lower costs of fuel in rural Alaska as result of potential new gas supply and spur/distribution systems.
- The supply of available natural gas in Cook Inlet may not be sufficient to provide power to the proposed project.
- Explain if the use of natural gas by PLP would affect existing Alaska Railbelt supply and users.

Comments were received on the design, route, construction, and safety and reliability of the natural gas pipeline crossing Cook Inlet and Iliamna Lake.

- That part of Alaska has exceptionally high tides – routinely greater than 20 feet. Please consider this when analyzing an underwater gas pipeline.
- There are safe and secure methods to construct a pipeline that would cross existing submarine cables. The pipeline owner/operators should enter into a cable crossing agreement to ensure the safety and security of both the fiber cables and the gas pipeline.
- There are not any pipelines in Cook Inlet this long. A commenter noted that in Nikiski, the seabed can change rapidly. This can cause unforeseen problems in maintenance.

AMERICAN OVERSIGHT

While lower Cook Inlet and Kamishak Bay do not have ice or currents to the same extent as the upper Cook Inlet, Lower Cook Inlet is not nearly as protected as the waters of upper Cook Inlet, and Kamishak Bay experiences challenging winter sea conditions.

- At Iliamna Lake, maintenance could be difficult when the lake is frozen.
- The route for this pipeline would be near the base of Augustine Volcano, which is the most active volcano in Cook Inlet and has erupted eight times since 1812.
- Cook Inlet has huge tides, glacial silt, ice flows, and strong currents and is corrosive to almost everything. Explain who will pay for the maintenance and repair of this pipeline.
- The eastern end of the proposed pipeline route runs along a soft, sandy bluff north of Anchor Point. The bluffs are eroding an average of 1.1 feet/year.

3.4.2.9 Tailings Dam

Comments were received regarding concern for the stability of the tailings dam, potential for tailings dam failure, and impacts of such a failure.

- Describe how the tailings facility and dams are designed and how they would be operated, closed, and monitored to ensure stability. Describe how the tailings dams would comply with state dam safety criteria.
- Describe the impacts of dam failure and recognize the public concern of the stability of the tailings dam. Specifically, consider the impacts to biological and social environments of a dam failure as a result of an earthquake.
- Look at examples of other tailings dam failures (in Spain, Canada, Australia, and others in the United States).
- Analyze impacts from tailings leaks and leaching, not just failures.
- Tailings dam engineering has improved considerably over the decades. Pebble's tailings dam design will have to be approved to adequately protect the environment before the project would be permitted.
- Analyze impacts from rainfall causing overtopping of the tailings dam. Alaska has a propensity for large storms and with climate change and warming effects, risk for large storms is increased.
- It is recommended that large tailings dams use dynamic rather than pseudostatic analysis for potential dam failure under earthquake loading.
- A risk assessment such as a Failure Modes Effects Analysis should be conducted with results summarized in the EIS.
- The EIS should describe how the tailings dams would comply with state dam safety criteria.

3.4.2.10 Water Quality and Quantity

Comments were received concerning a detailed analysis and discussion of the physical and chemical impacts on all water resources.

- Analyze impacts to water quality and quantity from construction, operation, and post-closure.
- Analyze pit water and tailings dam management.

AMERICAN OVERSIGHT

- Identify potential changes to nutrient levels, turbidity, and dissolved oxygen, particularly with respect to seasonal patterns in the downstream reaches.
- Analyze erosion, turbidity, temperature changes.
- Ferry crossing concerns, including changes in shoreline erosion and turbidity, and pollution from the proposed ferry.
- Composition of the (potential) contaminants from all project sources, including blasting.
- Prevailing winds will create water surface waves on the pyritic tailings facility which will allow oxidation of the tailings.
- Risks associated with acid rock drainage from mine project components, including the waste rock facility, leaching, and pathways for acid rock drainage. Acid rock drainage was noted as a potential source of impact on many resources, such as water quality, wetlands, fish, and subsistence food resources.
- Describe how acid rock drainage, tailings, and metals leaching would be tested, monitored, and treated during mining and post-closure.
- Analyze the potential for wastewater to enter streams and rivers.
- Project components should be designed for 500-year events, given predictions for wetter spring and summers in this area.
- The EIS should identify the Alaska Pollutant Discharge Elimination System discharge locations, identify applicable water quality standards, and analyze the likelihood of discharges to meet standards.
- The EIS should identify and describe the location of water sources for hydrostatic testing.
- Characterize the existing groundwater and surface water quality.
- Predict concentrations of contaminants of concern in surface and groundwater that reflect a range in climatic settings and compare to water quality criteria and standards.
- Consideration of downstream impacts and potential for changes in metal speciation and bioavailability.
- To provide reliable predictions of water quality and impacts to surface water and groundwater due to wastewater and mine waste management, the physical and chemical characteristics of the ore, pit walls, waste rock, and tailings should be determined and disclosed in the EIS.
- Evaluation of surface water and groundwater use, including maps and source identification of water supply wells or intakes.

3.4.3 Biological Resources

Comments indicated that the EIS should analyze the direct, indirect, and cumulative impacts on specific biological resources, including:

- Vegetation and ecosystems.
- Fish and aquatic resources.
- Wetlands and special aquatic sites.
- Wildlife and non-threatened and endangered species birds and mammals.
- Threatened and endangered species.

AMERICAN OVERSIGHT

3.4.3.1 Vegetation and Ecosystems

Comments were received concerning potential for disturbance from project construction and operations, and from invasive species. Comments were also received concerning terrestrial, lake, and marine habitat impacts from project construction and operations.

- Analyze the potential direct, indirect, and cumulative effects of all components and all phases (including reclamation and restoration) of the proposed project on terrestrial, marine, and freshwater ecosystems.
- Analyze impacts to rare and sensitive plants (including removal).
- Address how fugitive dust would affect vegetation within the project area and beyond.
- Address risk for invasive (non-native) species introduction by marine barges and the ferry; include ballast water management.
- Analyze ecosystems as unique in the Bristol Bay area, in the degree to which they remain unaffected by commercial development and other human technologies. Evaluate how the proposed project could alter the biological and human ecosystems and landscape.

3.4.3.2 Fish and Aquatic Resources

Comments were received related to potential impacts to fish (King Salmon, Sockeye Salmon, Silver Salmon, Pink Salmon, Chum Salmon, Dolly Varden/Arctic char, Rainbow Trout, and Grayling) populations, abundance, diversity, migratory patterns, contamination, and potential for displacement from project components.

- Address effects of ferry traffic on resident and migrating fish in Iliamna Lake: the potential for the ferry to cause erosion of the lake shoreline and the effect of that on fish; the effect of the ferry on salmon spawning and rearing habitat; the effect of increased noise on salmon productivity; the potential for increased turbidity and its effect on salmon; the potential for ferry traffic to cause wave action that could harm the fry on their way to the ocean; the potential for ferry propellers to entrap fish and cause mortality; and the potential for fish to avoid the area around the ferry and not come back to the area.
- Address effects of gravel pits on stream hydrology and fisheries.
- The USACE should understand that a disruption of habitat could affect the nutrients returned to the ecosystem by the salmon when they return to these watersheds.
- Water withdrawal and capture, storage, treatment and release of wastewater associated with the mine could impair the fish habitat functions of streams, wetlands, and aquatic resources.
- Address the potential for fish to become contaminated from sedimentation, metals, toxins, mining chemicals or fuel spills.
- Evaluate how the proposed project road to Iliamna Lake would impact fish species as road traffic will create dust that may contain copper and other heavy metals that could enter the watershed and affect resident aquatic organisms including salmon.
- Dredging off Amakdedori Beach may affect schooling of salmon and/or Dolly Varden before they run up Chenik Creek, McNeil River and Mikfik Creek.
- Analyze the impact of anthropogenic erosion on fish gills from construction and mining. Anthropogenic turbidity has severe impacts on newly emergent fry. Address the effects of constructing the Amakdedori Port and maintenance dredging would have on Cook Inlet herring spawning habitat in Kamishak Bay.

AMERICAN OVERSIGHT

- The proposed port site has the potential to hinder the recovery of populations that are depressed, such as Tanner, red king, and Dungeness crab species, and to impact crab and weathervane scallop habitats.
- The area that makes up the "headwaters" is full of underwater streams in which small fry/fingerlings swim as they emerge. They sometimes swim into lakes and ponds of the region and often get too big to get out; they are called land-locked salmon.
- The EIS should discuss the species listed and proposed as threatened or endangered under the Endangered Species Act and Essential Fish Habitat within the project area for all components. The EIS should discuss the activities proposed to avoid, minimize, mitigate, and monitor listed and proposed species and Essential Fish Habitat. A biological assessment to evaluate impacts to listed and proposed endangered species and essential fish habitat should be included in the EIS.

Comments were received regarding the impacts of the mine access road crossing streams and anadromous waters, and the impacts of those stream crossings on fish.

- The EIS must include and present all the waters documented in the Alaska Department of Fish and Game Anadromous Waters Catalog at a minimum; however, it should be recognized that the Catalog under-represents waters that actually support anadromous fish on the order of 20 to 40 percent.
- Current plans will impact more than 5 miles of anadromous streams.
- The construction process would build an 80-mile road system with 200 stream crossings impacts that should be analyzed.
- Analyze bridge and culvert impacts to fish, including fish passage and habitat condition change. The proposed 75-mile-long road system would include 222 culverts, 149 of which are not designed for fish passage.
- The proposed road corridor has been designed to minimize impact on wetlands, minimize stream crossings and avoid areas of known for subsistence and recreational use.
- Describe how state protocols regarding fish-bearing streams would be enforced.
- An independent third party needs to verify which streams along the road corridor are fish-bearing. History has shown that PLP and their consultants may have underestimated the number of streams containing fish.

Comments were received regarding the impacts to aquatic resources, including introduction of invasive species.

- Shipping from foreign ports may result in ballast water transporting invasive species such as green crab, which would have a devastating impact on the ecosystem and commercial shellfishery.
- The potential or known effects of a disrupted winter ice regime, lack of ice cover on resident species of fish, birds, and mammals should be investigated. These changes may have contributed to the most recent Kvichak sockeye run decrease. Partial or reduced ice cover may have affected planktonic production, hence food for salmon that may have caused salmon to smolt early.

3.4.3.3 Wetlands and Special Aquatic Sites

Comments were received on filling of wetlands and alternations of wetlands habitat, fragmentation, and loss of wetland habitat as a result of project activities.

- Include delineation of all wetlands that could be affected by the proposed project.

AMERICAN OVERSIGHT

- The estimated mine site would fill 3,190 acres of wetlands and water bodies, nearly three times the maximum set by the Environmental Protection Agency (EPA) for Bristol Bay in 2014.
- Analyze impacts to wetlands dewatering and hydrological changes, pollution to wetlands, impacts on wetlands functions, clearing and removal of wetland vegetation, degrading wetland vegetation from all proposed Pebble project components and during construction, operation, and closure phases.
- Given the extent of streams, wetlands, lakes and ponds both overlying the Pebble deposit and within adjacent watersheds, excavation of a massive mine pit and construction of large tailing impoundments and waste rock piles would result in discharge of dredged or fill material into these waters.
- Quantify impacts to aquatic resources both in terms of the areal or linear extent of impact and by the expected change in the function these resources perform, including fishery support functions, or change in the condition of the resource.
- Consider both direct and secondary effects, as defined by the CWA 404(b)(1) Guidelines.
- Model and consider how losses of stream reaches and adjacent wetlands from dewatering, as well as changes to downstream reaches and adjacent wetlands, may result in physical, chemical, and biological changes which would impact fishery habitat and habitat support.

3.4.3.4 Wildlife and Non-Threatened and Endangered Birds and Mammals

Comments were received related to potential impacts to wildlife (including terrestrial and marine mammals), and on potential impacts to migratory birds and waterfowl populations; abundance, diversity, migratory patterns and potential for displacement; and attraction of birds to tailing ponds.

- Assess how wildlife can acclimate to construction and operation impacts.
- Analyze how noise levels from construction or large vessel traffic may deter bears from coming to McNeil River Falls, or could affect bear behavior and change or end the use of McNeil River by bears.
- The proposed road and Amakdedori Port could change brown bear migration and result in brown bear mortalities.
- Analyze impacts that habitat fragmentation from Amakdedori Port and the mine access road would have on bear movements.
- Examine how increased contact between bears that use the McNeil River and humans could result in food conditioning of bears or direct bear mortality by humans.
- The proposed ferry could strike marine mammals (seals) in Iliamna Lake, which would congregate in the open water created by the icebreaking ferry. The seals have been considered in the past for Endangered Species Act status.
- Ferries could impact the migration patterns of wildlife.
- The USACE should incorporate traditional knowledge on freshwater seals in Iliamna Lake into the EIS and be aware that there is a Freshwater Seal Commission.
- The transportation of mining materials across Cook Inlet and Iliamna Lake could have potentially negative effects for local marine mammals, particularly underwater noise pollution that impacts marine mammals.

AMERICAN OVERSIGHT

- The Bristol Bay watershed is unique in that it provides habitat for more than 190 birds. Additionally, there are more than 40 species of water birds here and confirmed breeding sites for more than 22 species.
- There are no Bristol Bay Tribal Multi-Species Conservation and Management Plans for Iliamna Lake, the Nushagak River, Nushagak Bay, Kvichak Bay, and Alaska Peninsula. The USACE should mandate these tribal marine multi-species conservation plans be completed before issuing a permit.
- Describe what steps the developers propose to keep tailings ponds/lakes free from pollutants or physically restrict birds from trying to land on them.
- Analyze impacts from noise, blasting, and other human interference to birds.
- Blast control can mitigate noise impacts to birds, like they do with birds at the airport.
- Address effects of the project on birds and migratory waterfowl.
- Kamishak Bay is home to a large seabird nesting colony that would be impacted by disturbance generated from industrial development at Amakdedori Creek.
- Bald eagles nest and feed along the coast and along all of the major salmon spawning rivers in the Bristol Bay and Cook Inlet regions, with a relatively high number of golden eagles also found here.
- Calving grounds for the Mulchatna caribou herd are in the proposed project area and the EIS should include an analysis of the impact of both mine construction and mine operations on caribou calving in the region.
- Exploration activities at the site have caused caribou to avoid the area.

3.4.3.5 Threatened and Endangered Species

Comments were received on impacts to threatened and endangered species as a result of project construction and operations.

- The proposed port site is designated Critical Habitat for the endangered Cook Inlet beluga whale and the threatened northern sea otter.
- Federally listed threatened northern sea otters and threatened Steller's eiders occur in the waters of Cook Inlet, including Kamishak Bay.

3.4.4 Social Resources

Comments indicated that the EIS should analyze the direct, indirect, and cumulative impacts on specific social resources, including:

- Socioeconomics
- Subsistence
- Traditional way of life
- Archaeological and cultural resources
- Land ownership, management, and use
- Transportation and navigation
- Recreation
- Environmental justice
- Public health and safety
- Visual resources
- Wilderness characteristics.

AMERICAN OVERSIGHT

3.4.4.1 Socioeconomic Impacts

Comments were received regarding the economic impacts to local communities, regional economy, and national economy.

- PLP should give the USACE an independently prepared economic feasibility analysis, which is usually done for other mines like Donlin. Without it, the USACE will be unable to take a hard look at all reasonable alternatives in the draft EIS.
- The Pebble Mine would bring much needed economic opportunity to a region by creating jobs during construction and operation. The Lake and Peninsula Borough has an unemployment rate of 16.6 percent. Presently commercial fishing has a very limited effect on some communities' local economy.
- Residents are moving closer to much larger metropolitan regions to seek opportunities that do not currently exist near their homes in the region. New job opportunities could reduce out-migration, which could help maintain rural schools and allow people in the region to participate in subsistence activities.
- Consider that the project would create a boom and bust economic cycle that would ultimately leave people without jobs.
- The mining company will bring their own workers and not train local people to work at the mine.
- The population would increase during construction and heavily impact local communities.
- Consider the socioeconomic impacts to Bristol Bay's recreational fisheries. More than 37,000 angling trips are taken to Bristol Bay each year, which supports dozens of businesses, and a $91 million annual economy. The project could also damage the Bristol Bay wild salmon brand because the watershed would no longer be pristine.
- The commercial salmon fishing economy sustains 20,000 jobs; 20,000 jobs will be lost if this mine goes forward.
- Construction and operation of the Amakdedori Port has the potential to conflict with commercial salmon fishing activities in this area. The EIS should also assess potential impacts of marine traffic into and out of the port that may affect access to fishing grounds, impede fishing operations, and jeopardize fishing gear for some species, including pot fishing for Pacific cod, longline fishing for halibut, and non-commercial fishing with pot gear for Tanner crab.
- The EIS should consider that the currently undisturbed proposed port site could be an important herring fishery in the future.
- Consider that the Kennicott Copper Mine was located in the watershed of the Copper River which did not affect the value of the salmon fishery in that region.
- The impact of the use of Iliamna Lake and the proposed transportation corridors/pipelines on sport fishing and the sport fishing-related economy should be evaluated.
- Analyze impacts on the bear viewing industry near the proposed Amakdedori Port.
- Consider that fish taxes are important to the finances of the Bristol Bay Borough.
- Consider that PLP would not pay its fair share of equity to the state. The actual federal and state income royalty or tax on the production would be 3 to 5 percent of that production's value. In comparison to oil, this is inadequate.
- Review social benefits such as education opportunities, and potential reduction in the high cost of living in the region due to transportation improvements.

AMERICAN OVERSIGHT

- PLP should consider using regional Native corporations that are already in the pipeline construction and maintenance industry.
- Examine the economic costs and benefits specific to the state of Alaska including scenarios where no environmental disaster occurs and also the worst disaster happens.
- There were inquiries made in comments if there would be compensation to commercial fishermen if there is a disaster and fish prices go down, similar to what was done with Exxon Valdez.
- The risks to the people and environment would outweigh the short-term benefits.
- Examine the potential impacts to the Homer Electric Association ratepayers.
- The socioeconomic analysis in the EIS should include first order losses from habitat, second order losses, and public perception losses. Existence values have been acknowledged as real and quantifiable and should be used.
- The EIS should use a dynamic net economic benefit approach wherever possible in assessing the socioeconomic impact. One commenter noted that discounting future values can be a highly useful tool for comparing economic benefits over time but that this method may also be misapplied. The USACE should consider that a great deal of work has since been performed on existence values.

3.4.4.2 Subsistence

Comments were received related to potential impacts to subsistence resources like harvest, sharing, and traditional use areas. Comments were also received on contamination concerns and/or avoidance of subsistence resources.

- The USACE should study the direct, indirect, and cumulative effects of construction, operation, and closure at all stages of the mine and relating infrastructure to all activities relating to fishing, hunting, and other subsistence practices for the Native Village of Tyonek, the Native Village of Port Graham, the Native Village of Seldovia, the Kenaitze Tribe, the Ninilchik Tribe, the Chikaloon Tribe, and all others near in and around the Cook Inlet regions.
- Consider the importance of the salmon fishery to subsistence and the heavy reliance on fish for all users in the area.
- Analyze impacts on subsistence resources including wildlife migration, habitat for growing food, traditional use areas, fisheries, berries and other edible plants, and the cumulative effects from other mining activity. Consider that impacts to any subsistence resource (e.g., fish, wildlife, vegetation) would impact subsistence as well.
- Analyze impacts of potential contaminants entering into the air or water and affecting subsistence resources, including effects on subsistence resources due to potential accidental spills, and bioaccumulation of toxins in subsistence resources, and effects.
- Consider the impacts to the residents along Iliamna Lake who rely on access to small islands for the harvest of bird eggs in the spring.
- We are in fear for our subsistence way of life. Leave our dinner table alone!
- Helicopter traffic during exploration disrupted subsistence activities and this would occur during construction and operations of the mine. Particularly, helicopter traffic impacts spring waterfowl hunting (geese), displaces caribou, and impacts the Koktuli River.

AMERICAN OVERSIGHT

- Many species of fish are used for subsistence harvest, not just salmon.
- Analyze potential beneficial impacts to subsistence as cash income earned from jobs could support subsistence activities. Cash income could be available to fund the boats, motors, fuel, and nets necessary to maintain subsistence activities.
- A sudden influx of noise, people, and heavy equipment over ancestral hunting and fishing lands would have an effect on the intangible resources the sustainable subsistence culture has to offer.
- There could be an influx of workers to construct, run, and remove the mine that would want to have fishing and hunting access to the same resources as the local subsistence communities and will generate user conflict.
- The mine and roads might also facilitate access to previously lightly used areas increasing hunting, fishing berry picking and other pressures.
- Be sure to include Kodiak Island to your analysis, as it has important subsistence areas that could be impacted by the project.
- Over 80 edible and medicinal plants grow and are harvested in the project area including several species of berries, wild peas, wild onions, ferns, cow parsnip, rosehips, and many others.

Comments were received on impacts to important locations for subsistence activity from the project, including:

- The road corridor would go through our winter moose hunting area in the Talarik Creek watershed.
- The Nushagak, Mulchatna, and Koktuli watersheds are the hunting and fishing areas for people of New Stuyahok.
- The Amakdedori area has been historically used for early subsistence activities, including salmon harvest.
- The mountain behind Nondalton is traditional subsistence area.
- The Frying Pan Lake area is important to Nondalton people and shared with other neighboring people.
- The people in Seldovia have a long tradition of subsistence fishing for herring in Kamishak Bay. The herring also support other animals that we subsist on.

3.4.4.3 Traditional Culture and Way of Life

Comments were received related to potential cultural impacts and the desire to maintain traditional practices. Includes comments related to traditional land use areas (cultural continuity), and Traditional Ecological Knowledge.

- There are concerns that the mine would be detrimental to the culture, way of life, and history to the people that live in the area, and have been there for centuries.
- Fully disclose the potential impacts of project-related activities on local Alaska Native traditional ways of life. Local culture and environment has already changed from what it was historically, and this may affect the ability to pass values on to future generations.
- Traditional Ecological Knowledge should be studied and incorporated into the Draft EIS. Individual tribal members engage in traditional subsistence activities and have knowledge and experience with their land, wildlife, wetlands, fish, birds, plants, and other resources of the region.

AMERICAN OVERSIGHT

- The profit from the mine and "benefits" are not long term, while preserving Native heritage and leaving a legacy for future generations is a cause that is worthy of consideration.
- The EIS must identify and describe the cultural and spiritual uses of water by the human communities of the region.
- The Amakdedori Port area has been used as a site for a cultural camp, subsistence use areas, and school field trips.
- EIS should look at the long term social impacts, such as trapping and lifestyle change impacts. The project will kill the hearts and souls of the people; our subsistence way of life has more than monetary value.

3.4.4.4 Archeological and Cultural Resources

Concerns were expressed about impacts to archaeological and cultural resources subject to Section 106 of the National Historic Preservation Act.

- Analyze impacts to cultural resources (historical and pre-historical sites) and direct destruction of cultural resources from all project components.
- The USACE should study and be informed by traditional ecological knowledge.
- The USACE should require appropriate inventory surveys for the broad range of historic property types that may be present within the Area of Potential Effect. The USACE should also clarify in the Draft EIS where it is in the Section 106 review and when the proponent will be carrying out the needed inventory surveys for identification of historic properties that may be affected by the undertaking.
- Determinations of eligibility and effect, and appropriate steps to resolve adverse effects must be informed by the traditional knowledge of Indian tribes who ascribe significance to such properties, as gathered from ethnohistoric data, oral history, and other types of research.
- The project proponent must be sensitive to concerns of the Indian tribes regarding the confidentiality of information they share about properties of religious and cultural significance.
- Review any traditional native or cultural sites within the mine and utility corridors, and provide mitigation for same.
- There are ancestral burial grounds at/near the proposed Amakdedori Port, along the road route on the south side of Iliamna Lake, and on the road route to the south ferry dock.
- Analyze impacts to irreplaceable Native Alaskan rock art sites. This region of Alaska contains several recorded rock art (petroglyph) sites. No doubt more such sites remain to be discovered. Many of the rock art panels are on shorelines and only visible during low tide; thus, it is easy for archaeological surveys to miss these important cultural resources.

3.4.4.5 Land Ownership, Management and Use

Comments were received about land status (ownership), land management, and land use for the project area.

- The proposed mine site and many project components including the port site and a majority of the transportation corridor are proposed on state-owned lands. Mine

AMERICAN OVERSIGHT

construction, operation, and closure would limit any access to these lands and transportation corridor to private entities only.

- Ensure that activities are consistent with land use plans and goals of all landowners, including the State of Alaska, and Alaska Native corporations.
- The Pebble Mine will be built on state land set aside decades ago in Western Alaska specifically for mining.
- Although the area is classified in the State's area plan as "mineral," a classification is nothing more than recognition of the resource reasonably believed to exist in a particular management unit. The management intent is neutral as to whether mineral development should occur in these units.
- Disclose any impacts to Native Allotments and Native Corporation lands in the project area.
- A pattern of land use change would occur in the region that could be a long-term pattern with additional mining deposits explored for development.
- Analyze the effect of project components on the public use of the surrounding area with regards to trails and waterfront usage.
- Explain the security status of the ferry terminals, the mine access road, and Amakdedori Port, including when and how the public may or may not access or cross project facilities.
- Explain if local Tribal governments have included the mine access road in their Indian Reservation Roads Program that would make it public, versus private roads as stated by PLP.

3.4.4.6 Transportation and Navigation

Comments were received regarding the impacts to transportation systems, including airports, roads, rivers, and trails as a result of the project.

- Evaluate the potential impacts resulting from navigational challenges, traffic, and user conflicts at Iliamna Lake, Kamishak Bay, and Cook Inlet. The Draft EIS should evaluate how the ferry crossing and vessel traffic could disrupt schedules, local access and local boaters.
- An ice-breaking ferry across Iliamna Lake would create difficulties and hazardous situations for people travelling across the ferry route on snowmachines.
- No depths are recorded on navigation charts for Iliamna Lake. Some rocks on the chart do not exist; others are not where the charts show them to be. Some are not on the charts at all. There are places where the depth goes from 400 feet to 30 feet.
- Consider the impact of travel restrictions from road and ferry and who is benefiting.
- The wind has pushed ice on the north shore of Iliamna Lake in piles as high as 50 feet and could damage the proposed ferry terminal.
- The east winds on Iliamna Lake are strong and generate large waves that would make the proposed ferry unreliable and dangerous; winds can reach 100 mph.
- A disabled ferry could be blown by the wind onto the shoreline such as at Eagle Bluffs.
- The Amakdedori Port location experiences very strong onshore winds that could be hazardous. It is also in an area that could be impacted by a tsunami.
- It will be difficult to maintain the Amakdedori Port dredged channel due to sediment transport in that area.

AMERICAN OVERSIGHT

- The plans for the Amakdedori Port have been changed since the original permit application. The change may reduce maintenance and operation cost, however barge lightering of concentrate to the bulk cargo ships may increase risk and safety in the poor weather conditions Kamishak Bay is famous for.
- The port site may present a variety of fishing hazards to the commercial fishing fleet, including port related marine traffic, the natural gas pipeline landfall, navigational markers, the 2,000-foot earthen causeway, as well as ore loading infrastructure.
- Analyze impacts from increased air traffic during all project phases.
- Concerns were expressed about additional traffic on the Sterling Highway.
- The mine access road would ascend a mountain pass before descending to Iliamna Lake. Has PLP submitted a design and specific route for the road? For perspective on what this road will look like, consider the Pile Bay-Williamsport road where rock slides and falling boulders are a constant threat.

3.4.4.7 Recreation

Comments were received on impacts to recreation and tourism; recreational hunting and fishing usage near the mine, along river systems, and in transportation/pipeline corridor during construction and operation. This includes comments on disruption of recreational experiences (bear viewing, sport fishing).

- Consider the effects of project components on recreational hunting and existing guided hunting operations (e.g., changes to access, disturbance of wildlife from helicopters or vehicle traffic).
- Concerns about impacts to fish, and how impacts to species could be detrimental to the sport fishing community and businesses.
- The proposed project would bring an influx of the number of people in the Iliamna area that would want to recreate, sport fish and hunt, including mine employees and support industry personnel.
- Displacement of wildlife would impact the experience of people, throughout the proposed project area but would specifically impact the recreationists at McNeil State Game Refuge.
- The mine itself and the proposed tailings dam could not be in a worse location to threaten the trophy rainbow fishing that the many fly-out lodges rely on. The lodges provide long term employment for many in the Iliamna and Lake Clark areas.

3.4.4.8 Environmental Justice

Comments were received relating to disproportionate, adverse impacts to low income and minority communities as result of the proposed project.

- Identify low income, minority, and Alaska Native communities that may be impacted by the project.
- Analyze impacts related to environmental justice include food security and subsistence resources, health impacts from pollution and exposure to increased industrial activities and noises, increased risk of injury and exposure to hazardous materials, increased exposure to outsiders and the cascading social and psychological problems that brings.
- The economic benefits will not be for the people of the region but the impacts will.
- The environmental justice risk outweighs the benefits.

AMERICAN OVERSIGHT

- Describe efforts that have been or will be taken to meaningfully involve and inform affected communities about project decisions and impacts.
- Concisely explain how environmental justice impacts have been avoided, minimized, and/or mitigated.

3.4.4.9 Public Health

Comments were received on impacts to local communities' public health and infrastructure as a result of the project (disease, contaminants, lifestyle changes, behavioral health, and physical health), as per EO 12898.

- An analysis of health effects, such as a Health Risk Assessment or Health Impact Assessment, may be needed to determine the direct, indirect, and cumulative impacts to health.
- Analyze public health concerns related to development and infrastructure development in rural communities.
- Discuss the cancer and non-cancer health effects associated with air toxics and diesel particulate matter, and identify sensitive receptor populations that may be exposed to these emissions.
- The short- and long-term impacts from all stages of the project include increased risks of accidents and injuries, exposure to hazardous materials, negative impacts on food, nutrition, and subsistence, increased potential for infectious diseases, and risks to health and human services from population-stressed infrastructure and services
- It is important for the EIS to consider the social and psychological impacts the stress of this project has already put on people and the communities who live in the project area.
- Evaluate the potential impacts of development on indigenous women, and increased rate of violence as a result.
- Fully discuss the potential that the proposed project could be associated with behavioral health impacts, such as increased use of drugs and alcohol. More disposable income in communities may increase the use of alcohol and drugs.
- An influx of people could bring diseases to an area with minimal healthcare available that may not be able to handle large capacities of patients.
- Potential health impacts to local communities or other project area users should be identified, as well as any strategies employed to communicate risks or actual emergencies.

3.4.4.10 Visual Resources and Aesthetics

Comments were received on visual impacts that included:

- Consider visual impacts of the mine, roads, and Amakdedori Port to recreation, and secondary industries like flightseeing operators and wildlife viewing guides.
- The project will have permanent and significant impacts on the appearance of the landscape as viewed from key observation points, planes, etc. and will in turn impact use and enjoyment of the area by many.

3.4.4.11 Wilderness Characteristics

Comments were received related to wilderness characteristics and values.

AMERICAN OVERSIGHT

EPA-0135-0000602

- This area has wilderness characteristics, and is adjacent to a national park.
- The potential impact on the Koktuli and Nushagak rivers and tributaries, Upper/Lower Talarik Creeks, the Gibraltar River, the Kvichak River, and other tributaries of Iliamna Lake have an undeniable wilderness quality that could be impacted by the proposed project. Impacts to the Gibraltar, Talarik, and Koktuli drainages should be considered and, when possible, quantified
- The project would mean the loss of pristine wilderness throughout the area.

3.5 SUMMARY OF PUBLIC COMMENT—NEPA PROCESS AND REGULATORY COMPLIANCE

Comments were received on the NEPA process and need for compliance with regulations including:

- The general NEPA process
- The purpose and need of the proposed project
- The proposed action and project alternatives
- Cumulative effects analysis
- Mitigation measures
- Monitoring and adaptive management
- Bonding and reclamation
- Data and available information
- Research and evaluation needs.

3.5.1 The NEPA and EIS Process

Comments were received about the overall NEPA and EIS process, the permit application to the USACE, due process, and the scoping meetings. These types of comments generally do not inform preparation of the EIS as to the project purpose and need, resources/level of impacts to be analyzed, or alternatives to the proposed action that should be considered. A summary of the general NEPA process comments includes the following:

- The Pebble Mine application is incomplete. The USACE should suspend its NEPA process/ not release a Draft EIS without more information from PLP. Foundational information for major parts of Pebble's proposal, including the proposed transportation corridor, port or use of Iliamna Lake, are lacking from their application. The data PLP supplied is more than 10 years old and thus is not reliable for analyzing project impacts.
- The Pebble Mine application is not incomplete. The Pebble Mine plan and application has recently been revised to satisfy EPA guidelines.
- There should be opportunities at each public hearing for oral comments in an open public forum. Everyone should have the opportunity to hear the comments of fellow concerned citizens. Open oral comments provide new information and learning opportunities not only for USACE and their contractors, but for all attendees. Please change your scoping format for future meetings to include an opportunity to express concerns through an open oral comment period.
- The limited number of scoping hearings and failure to host scoping hearings in communities within the Nushagak and Kvichak River drainages means that the opinions and voices of local populations have not been accounted for.

AMERICAN OVERSIGHT

- Consider additional scoping meetings in Washington and Oregon.
- Extend the scoping period beyond 30 days. Tribes in Bristol Bay are requesting at least 120 days for this scoping period.
- A 30 day scoping process is sufficient. Few projects have been talked about for as long and with such passion as the Pebble Mine and at this point, no new information about possible adverse effects will come to light.
- Changing the mining plan in the middle of the scoping period means the scoping comment period should be extended and new meetings held.
- The USACE should compare PLP's plans to the EPA's analysis before moving forward with permitting.
- PLP should get a fair permitting process.
- The EIS process is being rushed; the USACE took more time to prepare the Donlin Gold EIS. The USACE cannot take the 'hard look' required by NEPA in this timeframe.
- With the loss of funding, the USACE should reject this application as insufficient, since this is no longer a financially viable project.
- The Pebble Project has changed some of their plans to accommodate concerns of Alaskans. The State of Alaska has a strong track record of regulating responsible mineral development for projects of all sizes and complexities. The Pebble Project will be no exception.
- The USACE evaluation should include the already defined types of authorizations required for a mine like Pebble and the proven scientific and technical information required to support these decisions.
- To manage the high volume of public comments the USACE should consider using software that uses Near-Duplicate Detection.
- The scope of the EIS should include impacts to federally protected units near the project site, including National Parks and National Wildlife Refuge units.

Comments were received that the USACE should initiate formal consultation and coordination with tribal governments. This includes comments on formal consultation and coordination under EO 13175.

Coordination with other agencies is an important part of the NEPA process. Comments were received on how the USACE should seek and promote full- and broad-scope participation by federal and state resource agencies and tribal government entities as cooperating agencies, and undergo comprehensive formal consultation with appropriate entities (for example, consulting with the National Marine Fisheries Service regarding Essential Fish Habitat). Comments were also received on how the USACE should extend cooperating agency invitations to interested tribal governments, as well as local, state, and federal agencies with special expertise and involve cooperating agencies on the full scope of the proposed Pebble Project.

3.5.2 Purpose and Need of the Action and USACE Permits

Comments were received regarding the purpose and need of the action, and the public interest of the project for the purpose of USACE permitting.

- The Pebble EIS should present a clear and concise statement of the underlying purpose and need for the proposed project consistent with the implementing

AMERICAN OVERSIGHT

regulations for NEPA. This statement should be framed broadly enough as to allow for the analysis of a range of reasonable alternatives.

- Explain how an EIS process can proceed without more commitment from financial backers.
- PLP says their project would help with mineral independence but they will export all of the mined minerals.
- The USACE should accept the purpose and need statement contained in the permit application from PLP.
- The Draft EIS should reflect not only the purpose and need of the project proponent, and the USACE, but also the broader public interest and need based on the scoping comments.
- Describe the permit process. Specifically note if there is a time limit for the applicant to act on a permit before it becomes invalid.
- The lack of a feasibility analysis makes the project as planned un-practicable in regards to NEPA requirements.
- Wrong mine, wrong place.

3.5.3 Proposed Action and Alternatives

Comments requested more detailed information on the proposed project plans, such as the water management plan, transportation plans, and spill response plans.

- The design and operational plans for the proposed project and alternatives should be evaluated. This should include the water management plans and cover all phases of the project. The EIS should evaluate the adequacy, reliability, effectiveness, and operational uncertainty of the plans.
- Because PLP changed their plans in the middle of the scoping period, the project design is still fluctuating and is not ready for an environmental review.
- The proposed project design and the modern environmental safeguards it incorporates, as well as the significant economic potential it represents for the State of Alaska, should be fairly considered and incorporated into the EIS based solely on the scientific data presented to the USACE in this proposal.

Commenters suggested that a wide range of alternatives should be analyzed for mine pit and tailings locations, types of tailings facilities, tailings dam construction, mine rate and strip ratio, waste rock segregation methods, gold recovery methods, support facility locations, energy sources, pipeline routes, water discharge locations, road alignments, types of water crossings, and ferry routes. Specific alternatives to the proposed project that were suggested include:

- The EIS range of alternatives should include the practicable alternatives developed for the CWA 404(b)(1) Guidelines analysis.
- The USACE must look at a range of alternatives beyond Pebble's mine site and include alternatives for mining copper and gold somewhere other than Bristol Bay.
- The USACE does not need to explore alternatives to Pebble's proposed mine site as being somewhere other than Bristol Bay because it already 100 miles from the bay and should be deemed a reasonable distance.
- Apply a realistic scope to assess mine impacts. The timeframe of analysis is small at 20 years; the applicant's website notes that the mine can operate for 200 years and could have 11 billion tons of ore. The USACE should consider alternatives to permit 50 percent or 100 percent of the current known resources to be mined.

AMERICAN OVERSIGHT

- There should be an alternative that restricts the size of the mine to what the EPA found appropriate in its Watershed Assessment.
- All of the pyritic tailings should be removed and not stored on the land in perpetuity.
- There should be an alternative that includes full treatment of pyritic tailings at the time of mine closure, before or instead of dumping them in the mine pit.
- Tailings would be thickened, possibly to 55 percent solids. Alternatives (slurry, thickened tails, paste tails) need to be analyzed in the EIS.
- The EIS needs to provide an alternative that uses dry stack tailings. Dismissal of such an alternative needs to provide examples of where dry stack is currently used successfully and why this can or cannot be replicated.
- As an alternative to a tailings ponds dam for waste storage, all waste should be trucked to Canada and stored in Canada, since the company is Canadian.
- Measures to reduce contact between mine waste materials and surface water and groundwater should be considered, such as diversions and liners.
- Different covers for the reclaimed tailings area, including "store and release" and impermeable covers, need to be assessed as alternatives in the EIS.
- Consider an alternative where the tailings pond is constructed at a location that will not impair surface waters, block fish passage, or have the potential to contaminate ground or surface waters.
- The EIS needs to include alternatives that provide water storage areas where excess water can be moved out of the TSF and out of the seepage pond in the event of extreme precipitation.
- The EIS should produce an alternative in which all embankments except the internal one are downstream construction.
- Modern pro-active mine design suggestions, including not placing tailings dams where a failure would put sensitive habitat at risk, should be assessed as alternatives in the EIS.
- Consider including a combination of simultaneous open pit and underground mining, a larger open pit mine, or a longer lived open pit mine. It may be possible to mine with open pits for the shallower portions, and mine by underground mining the deeper or eastern portions of the Pebble Deposit.
- The USACE should consider finding an alternative location to take the ore for processing.
- The EIS needs to analyze whether gravity concentration as a recovery method for gold recovery is viable at this deposit. This appears to be a method used in placer deposits.
- The USACE should consider the possibility of having cyanide processing at the mine site and transporting cyanide by truck or pipeline North and West toward the Nushagak Hills where pits would be out of range of the creeks and rivers flowing into the salmon spawning areas.
- An alternative of running mining operations and ore trucks on natural gas or electricity needs to be included in the EIS.
- The EIS should examine an alternative that treats water for discharge to meet the water quality of the natural receiving waters, if they are of higher quality than Alaska most stringent criteria. Studies have shown that where natural waters are very low in copper and cadmium, discharges above those background levels can have potentially toxic effects.

AMERICAN OVERSIGHT

- The EIS needs to include an alternative for water treatment that will result in zero discharge of metals to the watershed.
- In order to contain gases that may contain acid rock drainage from getting into the air in the project area, the USACE should develop an alternative that covers the development with an air tight structure and the fumes should be cleaned before release into the atmosphere.
- The previous plan for a road along the northeastern side of Iliamna Lake, and the new proposed roads and a ferry across Iliamna Lake both put different communities at risk.
- The EIS should consider identifying alternative ferry terminal locations if the proposed sites are found to contain valuable spawning and/or rearing habitats for sockeye salmon.
- The two ferry terminal locations are both at the mouths of blue ribbon trout streams (Upper Talarik Creek and Gibraltar River). Alternative sites closer to populated areas should be considered if possible. The village of Kokhanok airstrip would be an alternative on the south side; a location closer to Newhalen, but away from the mouth of the river is an alternative on the north side.
- The mine access road would follow a branch of Upper Talarik Creek. An alternative that places a dock in Iliamna and uses the proposed Iliamna Spur Road to access the mine needs to be considered in the EIS to reduce potential impacts on Upper Talarik Creek.
- A better alternative is to use the existing road and resources at Pile Bay and Williamsport.
- Running an ore concentrate pipeline around Iliamna Lake to the existing road between Pile Bay and Williamsport is a safer alternative to ferrying ore concentrate across Iliamna Lake in the winter to address concerns about the potential for contamination of surface water in Iliamna Lake.
- Consider having only seasonal (summer) barge transport across Iliamna Lake to avoid impacts to winter transportation options for residents of nearby villages.
- As an alternative to the Iliamna Lake crossing, consider a haul road that would stay north of this lake, then head south from Pedro Bay to the Amakdedori port.
- The road system would cross numerous anadromous streams. It would be best to require bridges at all of these crossings. Oregon and Washington states have been working for many years to bring back their salmon runs. Recreating salmon habitat including headwaters has proven to be extremely hard.
- A port at Diamond Point in Iliamna Bay should be evaluated against the proposed Amakdedori Port.
- Alternative port sites should be evaluated due to the potential ecological impact from the project.
- There is no need to dredge the proposed port to -50 feet; a shallower depth should be evaluated.
- The EIS should assess the whole breadth of dredging activities when determining the possible impacts to aquatic organisms and consider practicable alternatives that would avoid and minimize impacts.
- The range of dredged material management alternatives should include beneficial uses such as beach nourishment or construction material, a disposal site in internal

AMERICAN OVERSIGHT

waters landward of the Kamishak Bay closing line, and an ocean disposal site seaward of the Kamishak Bay closing line.

- The EIS should consider alternative methods for delivering natural gas to the project area, given the risk of natural gas entering the marine environment, the impact it would have on marine resources, and how gas line leaks or ruptures would be contained.
- The EIS should review potential alternative alignments for the pipeline route, such as an alignment north of Augustine Island.
- Include an alternative pipeline route that goes north to connect with the planned natural gas pipeline to support the development and operation of the Donlin Mine.
- Alternative fuel sources should be evaluated in an effort to eliminate the potential long term consequences that a subsea pipeline can have on the environment.
- Alternative energy sources should be examined. Many of the minerals to be mined will go into solar panels, wind turbines, and hydro turbines. The PLP could support the industries they will be supplying by utilizing alternative, renewable energy sources.
- The EIS should consider alternatives to laying the pipeline directly on the seafloor bottom (unburied) and evaluate the effects of an unburied pipeline's impact on crab movements, access to important habitat, and direct mortality.
- The EIS should evaluate practicable alternatives for reducing the amount of natural gas pipeline that is installed in the Sterling Highway right-of-way, which is managed by the Alaska Department of Transportation and Public Facilities.

3.5.4 Cumulative Effects Analysis Process

Comments were received on how the cumulative effects analysis should be thorough, well-defined, and complete.

- Describe how the Draft EIS process considers cumulative effects, and identify the geographic scope and timeframe for the cumulative effects analysis.
- The cumulative effects analysis should consider past and current exploration activities conducted at the Pebble project site and current and future exploration activities occurring the watershed region.
- Consider long term and cumulative effects, keeping in mind the potential long duration of the project, potential expansions of the project beyond what is currently proposed for permit review, and the potential that this project may facilitate and encourage a number of other largescale active mining claims in the Bristol Bay watershed by providing transportation and power infrastructure that they can utilize.
- The USACE needs to acknowledge that the current permit application could be the initial phase in a much broader mine development plan. Pebble Limited Partnership has repeatedly said, as recently as September 2017, their project is, "a multi-generational opportunity. Its size and scale will lead to a very, very long life mine." Based on statements such as this, and official records indicating they plan to mine up to 11 billion tons of ore, it is reasonably foreseeable that Pebble intends to expand its mine far beyond what is currently proposed. Reviewing just phase one of the project unlawfully segments environmental review, shortchanges the public interest, and risks untold impacts to the Bristol Bay region's world-class fisheries.
- There are 20 large-scale active mining claims in the Bristol Bay watershed that this project could encourage by providing the transportation and power infrastructure. The

AMERICAN OVERSIGHT

EIS scope should include looking at the impacts of the potential of creating a mining district in the area.

- The EIS needs a cumulative effects analysis on culture.
- Additional large-scale landscape and infrastructure development, facilitated by the initial road, pipeline, and barge and ferry ports is a reasonably foreseeable impact. The EIS should discuss any reasonably foreseeable future public access to the project's infrastructure components and analyze any reasonably foreseeable indirect effects of this action.
- The EIS should include an assessment of the extensive mitigation measures that Pebble has built into the new proposed plan to address environmental and stakeholder concerns.
- The EIS should include a discussion of reasonably foreseeable effects that changes in the climate may have on the proposed project and the project area, including its long term infrastructure.

3.5.5 Mitigation Measures

Comments were received related to the need for project mitigation, and suggestions for mitigation measures.

- EIS should identify the type of activities that would require mitigation measures during the construction, operation, and closure phases of this project. Identify whether implementation of each measure is required by the USACE or any other governmental entity and which entity will be responsible for implementing the measure.
- Use scientific data that details what damage is anticipated and determines whether and how such damage can be mitigated, including whether such mitigation is even possible.
- Tribes and the public should be involved in the mitigation planning, and monitoring of the proposed project.
- Review any traditional native or cultural sites within the mine and utility corridors, and provide mitigation for same.
- Consider and recognize the extensive mitigation measures that Pebble has built into the new proposed plan to address environmental and stakeholder concerns.
- The measures suggested by PLP will not work.
- PLP has not given any mitigation plans for sociocultural impacts; sociocultural impacts cannot be mitigated.
- PLP has not provided a plan for compensatory mitigation. The Draft EIS should describe such a plan and reasonable alternatives to it. The USACE should consider mitigation banks, or at a minimum, in-lieu fee programs, not less reliable permittee-responsible mitigation.
- Water takes the path of least resistance, so rainfall will attempt to make its way to the river bodies, but this can be mitigated with runoff ponds and filtrated release.
- Consider bilge water treatment that is capable of more than oil-water separation to protect Iliamna Lake's ecology.
- Require that the tailings pond be lined in such a way as to prevent any interaction between tailings waste and groundwater.

AMERICAN OVERSIGHT

- This EIS should address the timing of ferry traffic across Iliamna Lake with regard to the movement of commercial fishing boats across the lake, both before and after the salmon season, and during salmon spawning.
- The ice-breaker ferry should be constructed and assembled at an alternate location to allow for naval architectural oversight and engineering support.
- Construct the natural gas pipeline in the winter to reduce environmental impacts.
- Suggested mitigation measures for the road corridor include chip sealing, winter maintenance plans, monitoring culverts, plans for vehicle emergency response, clear policy on use of the road by non-mining personnel.
- All culverts should be required to be designed for fish passage at all times, and monitored and corrected to ensure fish passage for the lifespan of the project and closure.
- The culverts should be designed with software that can better predict stress and deflection in heavily-loaded, complex soil structures interaction dependent culvert structures.
- All upland water crossings should be designed for all impacts above the 1.5 times stream width at ordinary high water.
- Take measures to decrease whale strikes by ships.
- Measures should be implemented to minimize the aesthetic impacts as much as is reasonably possible.
- There should be no fly zones, to address caribou hunting impacts.
- Consider measures to reduce or minimize adverse impacts to environmental resources in development of alternatives.

3.5.6 Monitoring and Adaptive Management

Comments were received in regards to the need for monitoring plans during operations and after closure of the mine.

- The history of multiple open pit mining sites has shown that the open reservoirs put in place to hold contaminated water and processing liquids have routinely been compromised by leaking and/or by drastic failure of containment levees. While they highlight the measures taken to put these toxins in containment, they fail to address the long term maintenance and mitigation of the toxins to make them inert.
- Explain what oversight and monitoring would be applied to meet minimum detrimental environmental conditions, by whom, and under what authority.
- Explain if there would be a fund for additional environmental monitoring while the project is ongoing.
- Describe how and by whom the tailings dam will be monitored during project operations and then at the end of the mining period.
- The EIS should utilize adaptive management and contingency planning to describe the strategy for responding to unforeseen circumstances at the site. The strategy should include ecological benchmarks or observations that would set follow-up actions into motion. This strategy or plan should be described so that reviewers may comment on its adequacy.

AMERICAN OVERSIGHT

3.5.7 Bonding and Reclamation

Comments were received related to reclamation activities, bonding, and setting up an escrow fund for restoration. Comments asked the USACE to explain in the EIS the mechanisms for treatment in perpetuity and post-closure (i.e., plan for permanent water treatment, the entity that would pay post closure costs and secure financing in perpetuity).

- Alaska regulatory requirements require a financial assurance to cover the costs of premature closure of the mine and the costs of post-closure water treatment. Calculating this cost is an essential part of the economic analysis EIS.
- Local communities would be hooked up to the gas line, as well as a maintenance crew watching over the hazardous tailing piles and dams. Describe bonding to cover these costs if something happens to PLP.
- The reclamation bond amount needs to be enough to fix any damage. This needs to be a permanent interest bearing fund that will supply enough funds in perpetuity, to cover unexpected future disasters, not just planned monitoring and reclamation.
- The project should have the ability to self-fund, and/or any third-party financial assurance mechanisms, should be disclosed. Disclosure of the financial assurance amount and mechanism is particularly important for this project given that the proposal includes long term water management and treatment.

3.5.8 Data and Available Information

Comments were received that suggested specific, documents, articles, or other information that should be utilized when developing the Draft EIS.

- Review research on fiber optics cable placement on tundra by Rorik Peterson at the University of Alaska Fairbanks. In addition, the USACE should review mapping provided by GCI regarding fiber optic cable placement of the TERRA-Southwest and Kodiak Kenai Fiber Link cable crossings in Cook Inlet and Iliamna Lake that would intersect with the proposed natural gas pipeline.
- Acknowledge how Traditional Ecological Knowledge information may be used and how to ensure that sensitive information is protected and follow a set of protocols for use of this information.
- Regarding impacts to shellfish populations, review the following:
  - Alaska Department of Environmental Conservation: Cook Inlet Subarea Contingency Plan (CISCP) sensitive areas section. Available from https://dec.alaska.gov/spar/ppr/plans/scp_ci/CISCP_DSensitive_Areas_Jan2017.pdf.

- Bristol Bay Seasonal Subsistence Gathering Cycle. (Attached to comment submitted by Curyung Tribal Council).

3.5.9 Research and Evaluation Needs

Comments were received regarding the lack of baseline research, monitoring, and evaluation needs, or data gaps for the project.

- The USACE should suspend its NEPA process until the PLP presents sufficient environmental baseline and economic data about its proposal so as to reasonably inform the NEPA process.
- No new baseline documents or data were submitted with PLP's application to the USACE in December 2017. The only publicly available baseline documents compiled by PLP are now more than a decade old, with data collected from 2004 to 2008. Those baseline studies failed to include newly proposed project components such as the transportation corridor, Iliamna Lake, and the proposed port site.
- Study the Montana mining industry (e.g., Berkeley Mine) and how often that state has experienced a negative environmental pollution outcome from a mine which was not cleaned up properly.
- There is a lack of baseline studies on newly added mine components for an informed permit process, such as wastewater discharges to Frying Pan Lake.
- An ecotoxicology assessment needs to be conducted for the pit lake, and it needs to be conducted when the pit first rebounds to its full level, and where pit lake stratification turns over and pit lake water mixes.
- Predictive modeling be used, based on a site-specific conceptual model that describes the system boundaries, spatial and temporal scales, hydraulic and chemical characteristics, and the mathematical relationships used to describe processes. The water quality model, in particular, should be capable of predicting both whole water and dissolved fractions of metals/metalloids.

AMERICAN OVERSIGHT

- Baseline data for the proposed Amakdedori Port and Kamishak Bay may be lacking in terms of what is known about water currents, shifting sands/silts and ice and how these physical conditions may affect trenching. The mud at Amakdedori Bay provides and important ecological function and habitat.
- No baseline data exists for the proposed port and use of Iliamna Lake, or the 83-mile transportation corridor making it impossible to analyze the potential impacts these activities would have on sensitive salmon habitat, tributaries, and adjacent wetlands.
- There are no relevant studies of Iliamna Lake. Frissell and Shaftel's spawning data are more than 7 years old.
- The Alaska Department of Fish and Game lacks assessment tools for the shellfish that live in Cook Inlet. Current baseline studies for these species do not exist. In light of the possible increase in sediment deposition rate resulting from dredging in the area of the Pebble Project, the USACE should require a shellfish population baseline assessment and impact statement regarding the dredging project prior to any dredging work beginning in Amakdedori Bay.
- An extensive and thorough baseline study on bear populations including numbers, movement, diet, and feeding areas should be done.
- More studies are needed to understand freshwater seals and all other animals in the Iliamna Lake area.
- There needs to be more baseline data on all species in the Bristol Bay river mouths and estuaries and the species in the Amakdedori Port area of Kamishak Bay.
- Require appropriate inventory survey for the broad range of historic property types that may be present in the Area of Potential Effect, including archeological sites/districts, properties of cultural and religious significance to Tribes, cultural landscapes, standing structures, and Historic Districts.
- Stream courses should be accurately documented using best available technology. The application relies largely on National Hydrography Dataset which is outdated and overlooks important tributary habitat.
- Evaluate all streams crossed by the road corridor for fish presence (including documentation of species, life stages, and abundance).
- Quantify salmon populations in the North Fork Koktuli, South Fork Koktuli, Upper Talarik Creek, and their tributaries, as well as all stream crossings in the transportation corridor, with at least five years of data.
- The effects of ice breaking on winter lake ecology are not known; study is required to determine the width of the ice-free corridor and the impacts of changes in light, current, and lake surface albedo on spring melt date, phyto- and zooplankton bloom timing, and lake food webs.

3.5.10 Non-Substantive Comment

Submissions without substantive comment that are not specific to a particular issue or do not inform the analysis conducted in the EIS are considered non-substantive. These include comments in support of, or in opposition to, the applicant's proposed project.

AMERICAN OVERSIGHT

APPENDIX A – NOTICE OF INTENT

AMERICAN OVERSIGHT

Individuals are required to self-report any arrests, charges or convictions that would keep the individual from obtaining or maintaining a favorable suitability or fitness determination. Programs impacted are referenced within the 42 U.S. Code § 13041 and include impacted individuals such as employees, DoD contractors, providers, adults residing in a family child care home, volunteers, and others with regular reoccurring contact with children.

Affected Public: Individuals or Households.

Annual Burden Hours: 1,250.

Number of Respondents: 5,000.

Responses per Respondent: 1.

Annual Responses: 5,000.

Average Burden per Response: 15 minutes.

Frequency: On occasion.

Respondents are DoD contractors, family child care providers, family child care adult family members residing in the home, and specified volunteers who provide child care services for children under age 18. This form will be initiated by DoD staff and will be maintained in the initiating DoD offices and/or appropriate Human Resources or Security Offices.

Dated: March 23, 2018.

Aaron T. Siegel,

Alternate OSD Federal Register Liaison Officer, Department of Defense.

[FR Doc. 2018–06284 Filed 3–28–18; 8:45 am]

BILLING CODE 5001–06–P

DEPARTMENT OF DEFENSE

Department of the Army, Corps of Engineers

Intent To Prepare an Environmental Impact Statement (EIS) for the Pebble Project

AGENCY: U.S. Army Corps of Engineers, Department of Defense.

ACTION: Notice of intent.

SUMMARY: The Alaska District, U.S. Army Corps of Engineers (the Corps) intends to prepare a Draft Environmental Impact Statement (DEIS) to assess the potential social, economic, and environmental impacts associated with the proposed Pebble open pit mine in wetlands, streams and Ocean near Cook Inlet. The EIS will assess potential effects of a range of alternatives.

DATES: Public scoping meetings are tentatively scheduled in Anchorage, Homer, Dillingham, King Salmon (Naknek), Iliamna (Newhalen), Nondalton, and Kokhanok (Iguigig) will occur in mid-April 2018. Information about these meetings and meeting dates will be published locally, posted at *http://www.pebbleprojecteis.com,* and available by contacting the Corps.

ADDRESSES: U.S. Army Corps of Engineers, P.O. Box 6898, Joint Base Elmendorf Richardson, AK 99506–0898.

FOR FURTHER INFORMATION CONTACT: Questions about the proposed action and the Draft EIS should be referred to: Mr. Shane McCoy, Regulatory Division, *telephone:* (907) 753–2715 at *http://www.pebbleprojecteis.com* or by mail to the above address. To be added to the project mailing list and for additional information, please visit the following website: *http://www.pebbleprojecteis.com.*

SUPPLEMENTARY INFORMATION: An application for a Department of the Army permit was submitted by the Pebble Limited Partnership pursuant Section 404 of the Clean Water Act (33 U.S.C. 1344) and Section 10 of the Rivers and Harbors Act of 1899 (33 U.S.C. 403) on December 22, 2017, and was advertised in a Public Notice, POA–2017–271, on January 5, 2018. The public notice is available on Alaska District's public website at: *http://www.poa.usace.army.mil//Portals/34/docs/regulatory/publicnotices/2018/POA-2017-271%20Pebble_PN.pdf?ver=2018-01-05-153755-640.*

1. *Description of the Proposed Project.* Pebble Limited Partnership (PLP) is proposing to develop the Pebble copper-gold-molybdenum porphyry deposit as an open-pit mine, with associated infrastructure, in southwest Alaska, north of Lake Iliamna. The proposed project would require approximately four years to construct, with a projected mine life of approximately 20 years. Major project components include excavation of an open pit, that ultimately would be approximately 6,500 feet long by 5,500 feet wide, with depths between 1,330 and 1,750 feet; a tailings impoundment with 1.1 billion tons storage volume; a low grade ore stockpile with the capacity to store up to 330 million tons; an open pit overburden stockpile; a mill facility processing approximately 160,000 tons of ore per day; a natural gas-fired power plant with a total connected load of 230 mega-watt (MW), supplied by a 188-mile, 10 to 12-inch diameter, natural gas pipeline across Cook Inlet and Iliamna Lake to the Mine Site; and transportation infrastructure including a 30-mile road from the Mine Site to a ferry terminal on the north shore of Iliamna Lake, an 18-mile crossing with an ice-breaking ferry to a terminal on the south shore of Iliamna Lake, and a 35-mile road to the proposed Amakdedori Port on Cook Inlet. The proposed mine and related facilities would have a total footprint of approximately 5.9 square miles.

The pipeline route would originate on the Kenai Peninsula, connecting to the existing gas pipeline infrastructure near Happy Valley. A metering station would be constructed at the off-take point and the pipeline would then follow south along the Sterling Highway for 9 miles to a gas-fired compressor station north of Anchor Point. The compressor station would feed a 94-mile subsea pipeline from the east shore of Cook Inlet to Amakdedori Port on the west shore. A second gas-fired compressor station would be located at the port site. The pipeline route would then follow a 30-mile mine access road to the south shore of Iliamna Lake, where the pipeline would enter Iliamna Lake for approximately 18 miles. The pipeline would come ashore at on the north shore of the lake, where it would follow the mine access road to the Mine Site.

2. *Alternatives.* A range of alternatives of the proposed action will be identified, and those found to be reasonable and practicable will be fully evaluated in the DEIS, including: the no action alternative, the applicant's proposed alternative, alternative mine locations and mine plans, alternative mining methods and processes, alternatives that may result in avoidance and minimization of impacts, and mitigation measures not in the proposed action. However, this list is not exclusive and additional alternatives may be considered for inclusion.

3. *Scoping Process and Public Involvement.* The scoping period will extend from April 1, 2018, through April 30, 2018. Scoping is conducted to assist in determining the scope of analysis, significant issues and alternatives to be analyzed in depth in the DEIS. Comments should be as specific as possible. Additional public involvement will be sought through the implementation of the public involvement plan and the agency coordination team.

4. *Significant Issues.* Numerous issues will be analyzed in depth in the DEIS related to the effects of the proposed Pebble mine and associated infrastructure construction, operation, and closure. These issues will include, but will not be limited to, the following: wetlands, water quality, air quality, hazardous materials, fish and wildlife, vegetation, cultural resources, food production, land use, needs and welfare of the people (socioeconomics including commercial fishing and tourism), recreation, general environmental

AMERICAN OVERSIGHT

concerns, historic properties, navigation, and safety.

5. *Additional Review and Consultation.* Additional review and consultation which will be incorporated into the preparation of the DEIS will include, but are not necessarily limited to coordination under Section 401 of the Clean Water Act, Essential Fish Habitat coordination; consultation under Section 7 of the Endangered Species Act; and consultation under the National Historic Preservation Act

Shelia Newman,

Deputy Chief, Regional Regulatory Division, U.S. Army Corps of Engineers, Alaska District.

BILLING CODE 3720–58–P

DEPARTMENT OF EDUCATION

[Docket No.: ED–2018–ICCD–0030]

Agency Information Collection Activities; Comment Request; Expanding Opportunity Through Quality Charter Schools Program: Technical Assistance To Support Monitoring, Evaluation, Data Collection, and Dissemination of Best Practices

AGENCY: Office of Innovation and Improvement (OII), Department of Education (ED).

ACTION: Notice.

SUMMARY: In accordance with the Paperwork Reduction Act of 1995, ED is proposing an extension of an existing information collection.

DATES: Interested persons are invited to submit comments on or before May 29, 2018.

ADDRESSES: To access and review all the documents related to the information collection listed in this notice, please use *http://www.regulations.gov* by searching the Docket ID number ED–2018–ICCD–0030. Comments submitted in response to this notice should be submitted electronically through the Federal eRulemaking Portal at *http://www.regulations.gov* by selecting the Docket ID number or via postal mail, commercial delivery, or hand delivery. *Please note that comments submitted by fax or email and those submitted after the comment period will not be accepted.* Written requests for information or comments submitted by postal mail or delivery should be addressed to the Director of the Information Collection Clearance Division, U.S. Department of Education, 400 Maryland Avenue SW, LBJ, Room 216–44, Washington, DC 20202–4537.

FOR FURTHER INFORMATION CONTACT: For specific questions related to collection activities, please contact Patricia Kilby-Robb, 202–260–2225.

SUPPLEMENTARY INFORMATION: The Department of Education (ED), in accordance with the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3506(c)(2)(A)), provides the general public and Federal agencies with an opportunity to comment on proposed, revised, and continuing collections of information. This helps the Department assess the impact of its information collection requirements and minimize the public's reporting burden. It also helps the public understand the Department's information collection requirements and provide the requested data in the desired format. ED is soliciting comments on the proposed information collection request (ICR) that is described below. The Department of Education is especially interested in public comment addressing the following issues: (1) Is this collection necessary to the proper functions of the Department; (2) will this information be processed and used in a timely manner; (3) is the estimate of burden accurate; (4) how might the Department enhance the quality, utility, and clarity of the information to be collected; and (5) how might the Department minimize the burden of this collection on the respondents, including through the use of information technology. Please note that written comments received in response to this notice will be considered public records.

Title of Collection: Expanding Opportunity through Quality Charter Schools Program: Technical Assistance to Support Monitoring, Evaluation, Data Collection, and Dissemination of Best Practices.

OMB Control Number: 1855–0016.

Type of Review: An extension of an existing information collection.

Respondents/Affected Public: State, Local, and Tribal Governments.

Total Estimated Number of Annual Responses: 102.

Total Estimated Number of Annual Burden Hours: 136.

Abstract: This request is for an extension of OMB approval to collect data for the Expanding Opportunity through Quality Charter Schools Program: Technical Assistance to Support Monitoring, Evaluation, Data Collection, and Dissemination of Best Practices formerly titled Charter Schools Program (CSP) Grant Awards Database. This current data collection is being coordinated with the EDFacts Initiative to reduce respondent burden and fully utilize data submitted by States and available to the U.S. Department of Education (ED). Specifically, under the current data collection, ED collects CSP grant award information from grantees (State agencies, charter management organizations, and some schools) to create a new database of current CSP-funded charter schools. Together, these data allow ED to monitor CSP grant performance and analyze data related to accountability for academic purposes, financial integrity, and program effectiveness.

Dated: March 23, 2018.

Tomakie Washington,

Acting Director, Information Collection Clearance Division, Office of the Chief Privacy Officer, Office of Management.

BILLING CODE 4000–01–P

FEDERAL COMMUNICATIONS COMMISSION

[OMB 3060–0819]

Information Collection Being Reviewed by the Federal Communications Commission

AGENCY: Federal Communications Commission.

ACTION: Notice and request for comments.

SUMMARY: As part of its continuing effort to reduce paperwork burdens, and as required by the Paperwork Reduction Act (PRA) of 1995, the Federal Communications Commission (FCC or the Commission) invites the general public and other Federal agencies to take this opportunity to comment on the following information collection. Comments are requested concerning: whether the proposed collection of information is necessary for the proper performance of the functions of the Commission, including whether the information shall have practical utility; the accuracy of the Commission's burden estimate; ways to enhance the quality, utility, and clarity of the information collected; ways to minimize the burden of the collection of information on the respondents, including the use of automated collection techniques or other forms of information technology; and ways to further reduce the information collection burden on small business concerns with fewer than 25 employees. The FCC may not conduct or sponsor a collection of information unless it displays a currently valid control number. No person shall be subject to any penalty for failing to comply with a collection of information subject to the

Public Notice of Application for Permit

PUBLIC NOTICE DATE: January 5, 2018

REFERENCE NUMBER: POA-2017-271

WATERWAY: Multiple

An application has been received in this office from Pebble Limited Partnership (applicant) to discharge fill material into and perform work within waters of the United States. The project site is located in Southwest Alaska near Iliamna Lake, primarily within the Lake and Peninsula Borough with a portion of the supporting infrastructure in the Kenai Peninsula Borough. The project consists of four primary project elements: a mine site, a port at Amakdedori, transportation corridor, and natural gas pipeline. The submitted application is available on the Corps website at www.poa.usace.army.mil/Missions/Regulatory/Permitting-Section-Homepage/Department of the Army Permit Application POA-2017-271 submitted by Pebble Limited Partnership.

The Corps has determined and notified the applicant that an environmental impact statement level of analysis will be required for the review of the Department of the Army Permit application. As such, the Corps will conduct public scoping after publishing a Notice of Intent to develop an EIS in the federal register. The Notice of Intent will include a list of public scoping locations. Times and dates for these locations will subsequently be advertised via Corps Public Notice and website as well as local media outlets.

Please contact Sheila Newman, Regulatory Division Program Manager at (907) 753-2712, toll free from within Alaska at (800) 478-2712, by fax at (907) 753-5567, or by email at poaspecialprojects@usace.army.mil if further information is desired concerning this notice.

Scoping for Department of the Army Permit Application 2017-271-Pebble Limited Partnership, Environmental Impact Statement

JOINT BASE ELMENDORF-RICHARDSON – The U.S. Army Corps of Engineers – Alaska District requests public input regarding the scope of the environmental impact statement level of analysis for Department of the Army permit application POA-2017-271 submitted by Pebble Limited Partnership.

The Pebble Project has been in the public eye for many years and there have been multiple public input and comment opportunities from other agencies. This public body of information has helped to inform the Corps' preliminary scope for the environmental impact analysis.

The Corps is now asking the public for any additional information to help inform the scope of analysis as it specifically relates to the Pebble Limited Partnership's submitted permit application to include potentially affected resources, alternative options, analytical methodology, and potential mitigation measures.

Since Jan.5, the permit application has been publically available on the Alaska District's website. On Jan.12, the application was mailed via CD to 35 federally recognized Alaska Native Tribes alongside invitations for government-to-government consultation throughout the entire evaluation process including the EIS. The Corps maintains the application as well as additional scoping information at www.pebbleprojecteis.com.

Scoping input can be submitted by mail to:

U.S. Army Corps of Engineers, Alaska District
Program Manager, Regulatory Division
ATTN: DA Permit Application 2017-271, Pebble Limited Partnership
P.O. Box 6898
Joint Base Elmendorf-Richardson, Alaska, 99506-0898

Beginning April 1, scoping input can be entered directly into the project website at www.pebbeprojecteis.com.

Also, scoping input can be submitted in person at public meetings via directly into the provided computers, handing in written comments, or speaking to a court reporter.

AMERICAN OVERSIGHT

Please note that public scoping meetings are not public hearings. The Corps has chosen to arrange meetings to provide the public with an easy forum to provide input. All information received will become part of the public record upon receipt.

Meeting locations and times are indicated below. A video explaining major project components will be available for viewing. The Corps will have representatives available to answer questions regarding the Department of the Army permit application review process. Individuals may come in at any time during open hours and to provide scoping input. A Yupik translator will be available at the meetings.

Corps extends public scoping period for Department of Army permit application 2017-271 Pebble Limited Partnership, Environmental Impact Statement

JOINT BASE ELMENDORF-RICHARDSON – The U.S. Army Corps of Engineers – Alaska District has allotted more time for the public scoping period for the environmental impact statement level of analysis for Department of Army permit application 2017-271 submitted by Pebble Limited Partnership.

An additional 60 days has been added to the original 30-day public scoping period that began on April 1. Therefore, interested parties that would like to provide scoping input have until June 29 to submit.

The Corps is asking the public for any additional information to help inform the scope of analysis as it specifically relates to the Pebble Limited Partnership's submitted permit application to include potentially affected resources, alternative options, analytical methodology, and potential mitigation measures. The permit application is available on the project website at www.pebbleprojecteis.com.

Scoping input can be submitted by mail to:

U.S. Army Corps of Engineers, Alaska District
Program Manager, Regulatory Division
ATTN: DA Permit Application 2017-271, Pebble Limited Partnership
P.O. Box 6898
Joint Base Elmendorf-Richardson, Alaska 99506-0898

###

AMERICAN OVERSIGHT

Welcome

The U.S. Army Corps of Engineers invites you to participate in the Pebble Project Environmental Impact Statement (EIS) process. Pebble Limited Partnership proposes to develop the Pebble copper-gold-molybdenum porphyry deposit (Pebble Deposit) as an open-pit mine, with associated infrastructure, in southwest Alaska, approximately 17 miles west/northwest of the villages of Iliamna, Newhalen, and Nondalton. A 188-mile natural gas pipeline from the Kenai Peninsula across Cook Inlet to the Kline Site is proposed as the energy source for the mine. The Transportation Corridor includes an 18-mile crossing of Lake Iliamna and an Amakdedori Port facility on the western shore of Cook Inlet.

The proposed mine requires many federal and state permits. The EIS provides the basis for the U.S. Army Corps of Engineers and other federal agencies to evaluate federal permit applications.

Your input can make a real difference in understanding:

- Issues and concerns that should be addressed in the EIS
- The way in which land and resources might be affected by the project
- Ideas on alternatives and ways to minimize impacts

We hope this website will answer your questions and make it easy for you to participate. Please add your name to our mailing list if you would like to be mailed our newsletters. If you have any questions that are not answered on the website, please contact us.

This site is being continually updated. Check back often for updates.

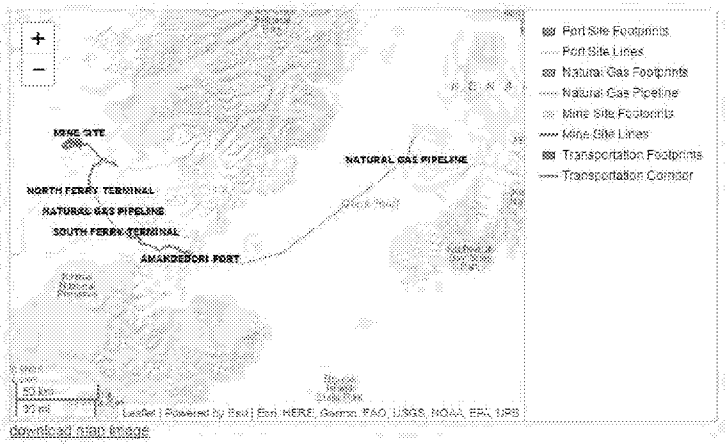
AMERICAN OVERSIGHT

Project Overview | Mine Site | Transportation Corridor | Amakdedori Port | Natural Gas Pipeline | Applicant Video

Project Overview

Pebble Limited Partnership (Applicant) has applied for permits to develop the Pebble copper-gold-molybdenum porphyry deposit (Pebble Deposit) as an open-pit mine, with associated infrastructure. The Pebble Deposit is located under rolling, permafrost-free terrain in the Iliamna region of southwest Alaska, approximately 200 miles southwest of Anchorage and 60 miles west of Cook Inlet. The closest communities are the villages of Iliamna, Newhalen, and Nondalton, each approximately 17 miles from the Pebble Deposit. In addition to the Mine Site, the project would have three other major components: Transportation Corridor, Amakdedori Port, and Natural Gas Pipeline.



The Pebble Deposit lies within a 417-square-mile claim block held by subsidiaries of the applicant and by a subsidiary of the applicant's parent company, Northern Dynasty. Neither the applicant nor Northern Dynasty currently owns surface rights associated with these mineral claims. All lands within the claim block are owned by the State of Alaska. Rights to develop on State of Alaska land may be acquired when necessary locations for mine development have been determined and permits awarded. The Transportation Corridor crosses both state land and land patented under the Alaska Native Claims Settlement Act.

The proposed project would have a mine life of approximately 20 years. During that time, there would be:

- a total of 1.2 billion tons of material mined over the life of the project;
- mining rate up to 90 million tons per year;
- milling rate up to 58 million tons per year;
- annual copper-gold concentrate production of 600,000 tons; and
- annual molybdenum concentrate production of 15,000 tons.

The project would have an operating schedule of two 12-hour shifts per day for 365 days per year, and employ approximately 2,000 personnel for construction and 850 for operations.

A more detailed project description from the the applicant to the U.S. Army Corps of Engineers can be found here.

Documents

To download a document, click on its title below. Before you download a file, please be aware of your connection speed and note the size of the file you want. Some files are very large and may take a long time to download, depending on the speed of your internet connection.

For example, at a minimal dial-up modem speed of 56 Kbps, a 2 MB document will take about 5 minutes to download; a 25 MB file will take about an hour. With a high speed connection of 10 Mbps, files of both these example sizes would download in less than 30 seconds.

⚠ Documents not produced by the U.S. Army Corps of Engineers may not be in compliance with the Americans with Disabilities Act Section 508, and documents that are produced by the U.S. Army Corps of Engineers may not be fully compliant. Please contact us if you require assistance and we will try to accommodate your needs. This may include providing the information to you in an alternative format.

Scoping Meeting Schedule

The U.S. Army Corps of Engineers hosted public meetings in nine communities to give a presentation on USACE's role in permitting for the Project and the Environmental Impact Statement (EIS) process. The purpose was to inform communities about the EIS and gather comments from the public about concerns. Full transcripts are located here. You can view all comments as they are submitted here.

Community	Date & Time	Location
Naknek	Monday, April 9, 2018 3:30 PM - 7:30 PM	Naknek School
Kokhanok	Tuesday, April 10, 2018 3:30 PM - 7:30 PM	Community Hall
Homer	Wednesday, April 11, 2018 5:00 PM - 9:00 PM	Homer High School
Newhalen	Thursday, April 12, 2018 3:30 PM - 7:30 PM	Newhalen School

Nondalton	Monday, April 16, 2018 3:30 PM - 7:30 PM	Tribal Center
Dillingham	Tuesday, April 17, 2018 5:00 PM - 9:00 PM	Middle School
Igiugig	Wednesday, April 18, 2018 3:30 PM - 7:30 PM	Community Building
Anchorage	Thursday, April 19, 2018 11:00 AM - 5:00 PM	Denali'ca Center

Providing ample opportunities for the public to submit scoping comments on the Pebble Project EIS is of utmost importance to the USACE. Public comments during this scoping phase will be accepted during the scoping period, scheduled to run from April 4, 2018 to June 29, 2018.

Submit your comment

There will be an additional public comment period in January 2019 when the Draft EIS is released.

Public Scoping for the Pebble Project EIS

The US Army Corps of Engineers (USACE) is preparing an Environmental Impact Statement (EIS) to analyze the impacts of issuing permits for an open pit, copper-gold-molybdenum porphyry deposit, with associated infrastructure, as proposed by the Pebble Limited Partnership. The EIS scoping period begins April 1, 2018 and ends June 29, 2018.

At the beginning of developing an EIS, USACE reaches out through scoping to involve members of the public. The scoping period provides opportunities for people who could be affected by the proposed action to express their views and concerns, and to offer suggestions on the scope of analysis. Public input may include ideas for alternatives to the proposed action that could have lesser environmental impacts.

The EIS will identify potential impacts on the physical, biological, and social environment from all phases of the proposed project, including construction, mine operation, closure, and post-closure. The EIS will also look at mitigation methods—ways in which potential negative impacts could be avoided or lessened.

Public meetings will tentatively be held during the scoping period of April 1st to June 29th, 2018, in the following communities:

- Anchorage*
- Dillingham*
- Homer*
- Igiugig
- Kokhanok
- Naknek
- Newhalen
- New Stuyahok
- Nondalton

* To avoid long wait times, an open public testimony format will not be used.

Please check our website for the current meeting schedule.

During the scoping period, USACE will work with the public to identify issues and concerns to thoroughly analyze the potential effects of the proposed project. USACE will use the scientific literature, alongside traditional knowledge and observations provided by the public.

We welcome your comments and information on the resources that are important to you. For example, many communities will be concerned about potential impacts to fish, subsistence resources, and traditional land uses during project construction, operations, and closure.

To Participate...

Providing ample opportunities for the public to submit scoping comments on the Pebble Project EIS is of utmost importance to the USACE. A good way to get involved is to come to a scoping meeting and give your comment orally to a dedicated court reporter, or electronically submit using one of a number of dedicated laptop computers. You can also bring written comments to a meeting, use the comment form on the project website (www.PebbleProjectEIS.com), or send them to:

Program Manager, Regulatory Division
US Army Corps of Engineers
PO Box 6898
Joint Base Elmendorf Richardson,
AK 99506-0898

Let us know what aspects of the proposed project are important to you!

Scoping comments can be submitted through June 29, 2018.

*Comments received/postmarked after June 29 will be considered, but may not be included in the scoping report. Comments will be reviewed and incorporated into the Draft EIS.

AMERICAN OVERSIGHT

PEBBLE PROJECT DESCRIPTION

Pebble Limited Partnership (PLP), proposes to develop the Pebble copper-gold-molybdenum porphyry deposit (Pebble Deposit) as an open-pit mine, with associated infrastructure, in southwest Alaska. The Pebble Deposit is located approximately 200 miles southwest of Anchorage and 60 miles west of Cook Inlet. The closest communities are the villages of Iliamna, Newhalen, and Nondalton, each approximately 17 miles from the Pebble Deposit, and Kokhanok, which is located 3 miles to the northeast of the proposed road from the port site to the south ferry terminal on Lake Iliamna (see Figure 1).

PEBBLE PROJECT COMPONENTS

The Pebble Project as proposed consists of four facility and operations components:

Mine Site and Associated Facilities (see Figure 2)

- **Open pit mine**, developed in stages, with each stage expanding the area and deepening the previous stage. Final dimensions of the open pit would be approximately 6,500 feet long and 5,500 feet wide, with depths between 1,330 and 1,750 feet.
- **Mine site mineral processing facilities** include a crushing plant, coarse ore stockpile, grinding plant, froth flotation circuits to produce concentrates, and concentrate filters to remove moisture before shipment.
- **Copper-gold concentrate** would be loaded into covered bulk shipping containers and transported by truck to the Amakdedori Port. **Molybdenum concentrate** would be bagged and containerized before shipping to Amakdedori Port.
- **Tailings Storage Facility** located within the North Fork Koktuli watershed:
  - 1.1 billion tons storage volume.
  - separate cells for bulk and pyritic (lined) tailings.
  - four embankments: main (600 feet high), south (350 feet high), and east (60 feet high) perimeter embankments and an internal embankment (420 feet high) separating the bulk and pyritic tailings cells.
- **Low Grade Ore Stockpile** up to 330 million tons of mineralized material, segregated by relative value, and PAG waste rock, placed on an engineered liner to control seepage losses through the stockpile.
- **Waste rock** – Non-potentially acid generating (NPAG) waste rock would be used to construct various mine site structures, including the TSF embankments and mine site roads. PAG waste rock would be stored within the LGO stockpile until mine closure, and then back-hauled into the open pit.
- **Overburden Stockpile** segregated to the southwest of the open pit, and surrounded by a berm of non-mineralized rock to contain the material and increase stability.
- **Water Supply, Management and Treatment** consists of five components:
  - potable water well field and treatment plant.
  - two water management ponds (open pit and LGO/main).
  - sediment ponds.
  - three seepage ponds (south, west, and main embankment).
  - two water treatment plant/three discharge locations (north, south and east).

AMERICAN OVERSIGHT

- **Personnel camps** include a main construction camp to accommodate 1,700 workers, later refurbished for 850 rooms for operations.
- **Power generation** capacity and distribution infrastructure: 230 megawatt delivery capacity fired by natural gas and a 69-kilovolt distribution system.

Amakdedori Port Site (See Figure 3)

- **Ore carrier vessels** up to 40,000 dead weight tons and 700 feet in length, up to **25 Handysize ships will be required annually** to transport concentrate.
- Up to **30 marine line-haul barge loads of supplies and consumables** will be required annually. **Two ice-breaking tug boats** will be used to support marine facility operations.
- **2000 foot earthen access causeway** extending out to a marine jetty located in 15 feet of natural water depth.
- **Access channel and turning basin,** dredged to 50 foot depth.
- **Shore-based facilities** to receive and store containers and fuel, two, 2-MW natural gas power generators with an emergency diesel generator, a natural gas compressor station, maintenance facilities, employee accommodations, and offices.
- **Fuel storage** consisting of four 1.25 million gallon tanks inside a lined and bermed area

Transportation Corridor (see Figure 3)

Road System Connecting Amakdedori Port to the Mine Site

- **Private, double-lane road extending 30 miles south from the Mine Site to North ferry terminal** on the north shore of Iliamna Lake.
- **Private, double-lane road extending 35 miles southeast from the South Ferry Terminal to the Amakdedori Port** on Cook Inlet.
- **Eight bridges**, six of which would be single-span, two-lane bridges that range in length from approximately 90 to 170 feet. There would be one large (550 feet) multi-span, two-lane bridge across the Newhalen River and one large (455 feet) multi-span, two-lane bridge across the Gibraltar River.
- Daily transportation of concentrate, fuel, reagents and consumables would require **up to 35 truck round trips per day for each leg of the road**, including three loads of fuel per day.
- **Village surface road connections** from the Transportation Corridor to Iliamna, Newhalen, and Kokhanok.

Ferry Service and Terminals on Lake Iliamna

- **18 mile ferry crossing of Lake Iliamna.**
- **All-season icebreaking ferry** with 12 crew members.
- **Inbound supplies from the Amakdedori Port to the Mine Site** and **outbound copper-gold and molybdenum concentrates, backhauled waste, and empty containers.**
- **Average of one round trip ferry per day.**
- **Two ferry terminals** with 40 foot rock/aggregate causeway, container handling and storage facilities, office and maintenance buildings, and local power supply.

AMERICAN OVERSIGHT

Natural Gas Pipeline System (see Figure 1)

- **188 mile 10-12 inch diameter natural gas pipeline**, buried 3 feet deep onshore, in five segments:
  - starts on the eastern shore of Cook Inlet at Happy Valley near Anchor Point along the Sterling Highway.
  - 94 mile subsea pipeline crosses Cook Inlet to the Amakdedori Port Site.
  - 35 mile buried pipeline adjacent to the road from port site to south ferry terminal.
  - 18 mile pipeline across Lake Iliamna.
  - 30 mile buried pipeline adjacent to the road from north ferry terminal to Mine Site.
- **Two gas fired compression stations**, one on the eastern end at Anchor Point, and one at the Amakdedori Port.
- **Buried fiber optic cable** adjacent to pipeline.

PROJECT CONSTRUCTION

- **The project would take approximately four years to construct,** on four main project components – Mine Site, Amakdedori Port, Transportation Corridor, and Pipeline.
- **Transportation infrastructure to access the site is the first step**, along with Pre-production Phase environmental protection systems and temporary facilities that support construction crews (camps at port site, mine site, ferry terminals).
- **Initial access to the mine site within one year,** followed by earthworks, plant facilities, tailings storage embankments, stockpile foundations/liners, and water treatment facilities.
- **Natural gas line installation** will occur during the second and third construction years.
- **Completion of Pre-production Open Pit, power plant and processing facilities** in year 4.
- **Construction employment** estimated at 2,000 workers.

PROJECT OPERATIONS

- **Project operating life of 20 years**, **three mining phases** – pre-production, production and stockpile reclaim.
- **Conventional open pit mine** – drill, blast, truck and shovel operation.
- **Blasting events** – once to twice a day.
- **Tailings Storage Facility water management** – Control, collection, and recovery of tailings water for recycling or treatment prior to discharge; seepage collection system below impoundment structures; freeboard to contain inflow design flood.
- **Total material mined** – 1.2 billion tons over the life of the project.
- **Mining rate** up to 90 million tons per year, **milling rate** up to 58 million tons per year.
- **Annual concentrate production** – 600,000 tons copper gold, 15,000 tons molybdenum.
- **Operations employment** estimated at 850 workers, two shifts per day, 365 days/year.

AMERICAN OVERSIGHT

PROJECT CLOSURE

- **Reclamation and closure jurisdiction** – Alaska Department of Natural Resources Division of Mining, Land, and Water, and Alaska Department of Environmental Conservation.
- **Design for Closure** – early consideration of requirements for Closure and post-Closure site management.
- **Segregation of the bulk and pyritic tailings storage cells** to facilitate Tailings Storage Facility closure.
- **Potentially Acid Generating waste rock** backhauled to mine pit for subaqueous storage.
- **Comprehensive water management plan** that strategically discharges surplus treated water to downgradient streams in a manner that reduces the effect of flow changes on stream flow and fish habitat.
- **Removal of mill and other infrastructure** not required for closure and reclamation.
- **Reclamation of disturbed areas** through grading, use of top soil as need and revegetated.
- **Road system retained** as needed for post-Closure activities and monitoring.
- **Pit lake water quality will be monitored;** water will be treated and discharged before levels approach elevation where groundwater flows outward from the open pit.

For more details, see Attachment D Project Description, Department of Army Application for Permit (POA-2017-271) on www.PebbleProjectEIS.com.

How Alternatives will be Developed for the Pebble Project Environmental Impact Statement (EIS)

1. Identify need to which the United States Army Corps of Engineers (USACE) – Alaska District is responding and identify the overall project purpose. State the applicant's objectives for the project.
2. Compile a range of alternatives to be considered that meet the overall project purpose with consideration of the applicant's objectives. The alternatives compilation will include the no action alternative, any alternatives considered by the applicant, and alternatives suggested during the scoping process.
3. Determine whether identified alternatives are reasonable in accordance with the National Environmental Policy Act.
    a. Reasonable is based on the consideration of the overall project purpose including stated objectives as well as technology, economics, and common sense.
    b. Determine whether an alternative meets the overall project purpose inclusive of objectives.
        i. Alternatives that do not meet the overall project purpose will be eliminated at this stage.
        ii. Alternatives that meet the overall purpose will move forward.
    c. Alternatives that meet the overall project purpose will be reviewed to determine whether the alternative was available to the applicant during project planning (past 10 years).
        i. Alternatives identified as reasonable but were not available to the applicant will be removed at this time.
        ii. Alternatives that were available will move forward.
    d. Alternatives will be reviewed for technical feasibility (can these alternatives be accomplished using existing technology and equipment?).
        i. Alternatives determined to not be technically feasible will be removed at this stage.
        ii. Alternatives determined to be technically feasible will move forward.
    e. Alternatives will be reviewed for economic feasibility.
        i. Any alternative claimed to not be economically feasible by the applicant will require an economic analysis to support statement.
        ii. An alternative proven to not be economically feasible will be removed at this time.
        iii. Alternatives determined to be economically feasible will move forward.
    f. Alternatives will be reviewed using common sense.
        i. Alternatives that increase adverse environmental impacts will be removed at this time.
        ii. Alternatives will also be reviewed for logistical feasibility. Alternatives that are not logistically feasible will be removed at this time.

Identified REASONABLE ALTERNATIVES with significantly LESSER impacts will be evaluated in the EIS along with the NO ACTION alternative and the applicant's PROPOSED alternative.

AMERICAN OVERSIGHT

How Alternatives are Screened for Practicability

Due to the USACE specific authorities, alternatives must also be screened for practicability. The practicability determination is described below. Ultimately, the USACE must identify the **least environmentally damaging practicable alternative (LEDPA)** in the Record of Decision prior to making a decision under Section 404 of the Clean Water Act.

1. From the identified reasonable alternatives, further identify practicable alternatives in accordance with Clean Water Act Section 404(b)(1) of the Clean Water Act (the Guidelines). The Guidelines state practicable means the project is available and capable of being done after taking into consideration **cost**, **existing technology** and/or **logistics** in light of the overall project purpose including the applicant's objectives. Logistics and existing technology have at this point been screened in our determination of reasonable alternatives and are included below only for completeness and explanatory purposes. *An alternative needs to fail only one practicability factor to be determined not practicable*.
    a. Costs – Cost is analyzed in the context of the overall scope/cost of the project and whether it is unreasonably expensive. This determination is typically made in relation to comparable costs for similar actions in the region or analogous markets. Cost is to be based on an objective, industry-neutral inquiry that does not consider an individual applicant's financial standing. The data used for any cost must be current with respect to the time of the alternatives analysis. Because one alternative costs more than another does not mean that the more expensive alternative is impracticable. It is important to note that in the context of this definition, cost does not include economics.
    b. Existing Technology – The alternatives examined should consider the limitations of existing technology yet incorporate the most efficient/least-impacting construction methods currently available.
    c. Logistics – The alternatives evaluated may incorporate an examination of various logistics associated with the project (e.g., placement of facilities within a specified distance to major thoroughfares, utilization of existing storage or staging areas, and/or safety concerns that cannot be overcome).
    d. Availability – The Guidelines state that if an alternative is otherwise practicable, an area not presently owned by the applicant that could reasonably be obtained, utilized, expanded, or managed in order to fulfill the overall purpose of the proposed activity can still be considered a practicable alternative. In other words, the fact that an applicant does not own an alternative parcel, does not preclude that parcel from being considered as a practicable alternative. This factor is normally a consideration as a logistics and possibly cost limitation.
    e. Two tests are specified in the Guidelines for alternatives when the basic purpose of a project does not require siting within special aquatic sites such as wetlands. The basic purpose of this project is mining. The type of mining proposed (transitional metal-copper, gold, molybdenum) does not require siting within special aquatic sites. Therefore:
        i. It is presumed that alternatives that do not affect special aquatic sites such as wetlands are available

AMERICAN OVERSIGHT

ii. It is presumed that alternatives in sites that are not special aquatic sites will have a LESSER ADVERSE impact on the aquatic ecosystem

Once an otherwise practicable alternative has been identified, the applicant (Pebble Limited Partnership) will be required to clearly demonstrate to the USACE that both of these presumptions have been rebutted or the alternative will be considered in the determination of the LEDPA.

**All practicable alternatives are also reasonable alternatives.

2. The final step in developing alternatives is to construct detailed descriptions for the reasonable alternatives that have been retained and carried forward for evaluation in the EIS.

How the Public Can Provide Useful Guidance on Alternatives that should be Considered in the EIS

The purpose of scoping is to determine the alternatives that should be considered in the analysis and determine the extent and nature of issues by which each alternative should be evaluated.

Scoping is an important opportunity for all citizens to provide specific suggestions for alternatives that should be considered in preparing the EIS, and issues that should be addressed in that process. The following guidelines may be useful in submitting comments during the scoping period (*examples shown in italics*):

1. Keep in mind the reasonable alternative screening criteria described above – any suggestions should fulfill the overall project purpose in consideration of the applicant's objectives with a focus on reducing potential adverse environmental impacts.
2. You can suggest alternatives specific to components for developing the mine (*mining methods, water treatment, tailings management*), the port site, the transportation corridor and modes (*rail*), and the natural gas pipeline.
3. You can suggest changes in location of project components (*road, port site, mine components*).
4. You can suggest potential mitigation measures and conditions of development that may reduce environmental impacts.
5. Be as specific as possible and provide the reason for making your suggestions (*construction of a rail connection may eliminate truck traffic and reduce dust levels*).

The USACE will make the results of the scoping process publically available by publishing the Scoping Report on the project website (pebbleprojecteis.com) and will also communicate information for newsletters.

How Alternatives will be evaluated in this EIS

Once reasonable alternatives have been identified for evaluation as above, the USACE will evaluate each alternative in relation to the following:

- Conservation
- Economics
- Aesthetics

AMERICAN OVERSIGHT

- General environmental concerns
- Wetlands
- Historic properties (inclusive of sacred sites or areas of community and/or spiritual significance)
- Fish and wildlife values (inclusive of endangered species, marine mammals, fisheries and wildlife)
- Flood hazards
- Floodplain values
- Land use (inclusive of transportation corridors)
- Navigation
- Shore erosion and accretion
- Recreation
- Water supply and conservation
- Water quality
- Energy needs
- Safety
- Food and fiber production (this would include subsistence activities)
- Mineral needs
- Considerations of property ownership
- The needs and welfare of the people

In the EIS, we will develop a framework to analyze each of these issues with emphasis on issues that rise to the highest level of importance.

During scoping, we are also asking you to help us determine which of these factors are of highest concern to you, to provide information of specific concern regarding any factor listed, and to identify any other specific issues that are not listed. As with your comments related to alternatives, please be as specific as possible when identifying other issues or expanding on issues identified above. This will help us develop the analytical framework moving forward.

For alternatives identified as practicable, the USACE will ultimately make the following determinations:

1) Whether the alternative is the least environmentally damaging practicable alternative,

2) Whether the LEDPA will cause or contribute to the violation of applicable state or federal laws, such as water quality standards or the Endangered Species Act,

3) Whether the LEDPA will result in significant degradation of waters of the United States

4) Whether the LEDPA includes appropriate and practicable steps have been taken to minimize the adverse impacts of the project on wetlands and other waters.

AMERICAN OVERSIGHT

What Resources will be Analyzed in the EIS?

Using the analysis in the Environmental Impact Statement (EIS), The U.S. Army Corps of Engineers (USACE) will evaluate the environmental and related social and economic effects of the proposed project. The analysis will include direct and indirect impacts, cumulative effects, and potential spill and tailings dam failure scenarios. Comments received during the scoping period will likely result in additional resources to be considered in the analysis.

Social Environment

- Cultural Resources
- Historic Properties
- Land use and management
- Subsistence
- Transportation and Navigation
- Aesthetics
- Recreational and Commercial Fisheries
- Recreation
- Needs and Welfare of the People
- Environmental Justice
- Health and Safety

Physical Environment

- Geohazards
- Geology
- Soils
- Surface Water Hydrology including flood plains and flood hazards
- Groundwater Hydrology
- Water Quality
- Noise
- Air Quality
- Climate Change

Biological Environment

- Wetlands/Special Aquatic Sites
- Vegetation
- Birds
- Terrestrial Wildlife
- Fisheries and Aquatic Resources
- Marine Wildlife
- Threatened and Endangered Species

Direct impacts occur through direct interaction of an activity with an environmental, social, or economic component.
For example: pollutant discharge from a source could directly result in lowered water quality.

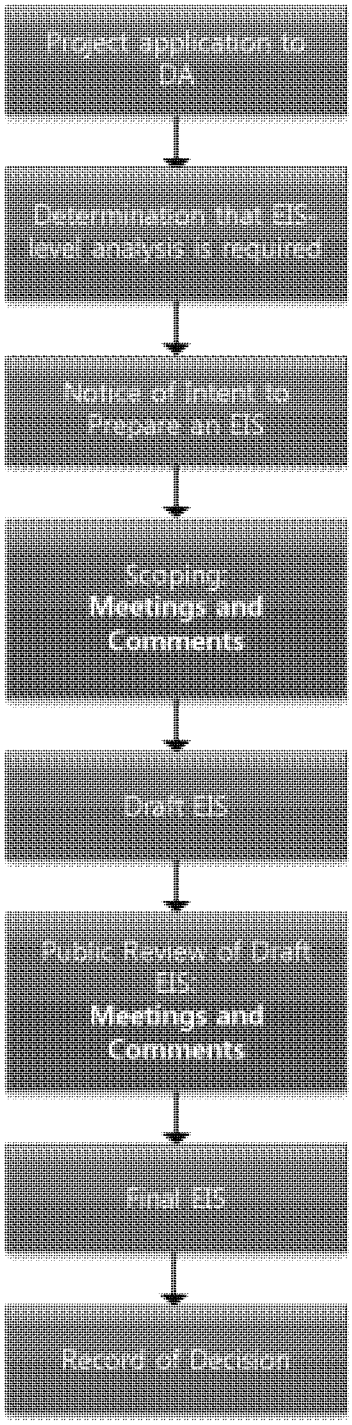
Indirect impacts on the environment are not a direct result of the project, but often a result of a complex impact pathway.
For example: pollutants in the air from a source could land on vegetation, indirectly causing acidic soils.

Cumulative impacts occur when the incremental impact of the project is combined with the effects of other past, present and reasonably foreseeable future projects.
For example: wetland fill from one project, combined with the wetland fill from a separate project.

AMERICAN OVERSIGHT

What is NEPA?

The national commitment to the environment was formalized through the passage of the National Environmental Policy Act (NEPA) of 1969. NEPA's goal is to help the federal government make decisions with full understanding of the potential environmental consequences associated with federal projects or authorizations. A thorough understanding of consequences allows us to identify potential actions that can be taken to protect, restore, or enhance the environment.



As the USACE prepares to review the submitted permit application, it must conduct a detailed study of:

- how the project will be built,
- the consequences of the project (good or bad) on the environment and for communities,
- alternative ways to develop the project that still meet the project's purpose and needs while better protecting people and the environment, and
- measures that can be taken to avoid or lessen any harmful impacts of the project.

Transparency

Before a decision is made and throughout its analysis, the federal government must ask citizens to voice concerns and suggest alternatives to ensure decisions on federal actions are well informed.

Steps in the EIS Process

AMERICAN OVERSIGHT

Roles and Responsibilities

When the Pebble Limited Partnership (Applicant) submitted an application on December 22, 2017, the US Army Corps of Engineers, Alaska District (USACE) was compelled to begin processing the permit application in accordance with 33 CFR 320. The USACE determined that review of the application would require an environmental impact statement (EIS) level of anlaysis in compliance with the National Environmental Policy Act. The USACE is the lead federal agency for developing the EIS

Role of the Corps

The USACE, as the lead agency, is responsible for reviewing the permit application submitted by the applicant, and analyzing the potential environmental impacts from the proposed project. As lead agency, the USACE is responsible for identifying, inviting, and assigning roles to cooperating agencies including agencies that also have permitting decisions to make for the proposed project. The USACE will lead the effort to take a hard look at reasonable and practicable alternatives and evaluate the impacts of the proposed project utilizing an interdisiplinary team. At the completion of the environmental impact analysis, the USACE, will issue a Record of Decision related to USACE's authorities under Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act.

Role of the 3rd Party Contractor

AECOM (a consulting firm) has been hired to provide the interdisciplinary team that will develop a fact-based independent analysis of the Pebble Project as proposed and evaluate identified reasonable alternatives. AECOM will work solely under the direction of the USACE and will be the primary developers of the EIS. AECOM will also provide support to the USACE for scoping and public involvement, development of alternatives to the proposed action, assessment of potential impacts, developing the Draft and Final EIS, and distribution. The AECOM team is made up of specialists and scientists in the biological environment, the physical environment, and the social environment.

Role of the Applicant

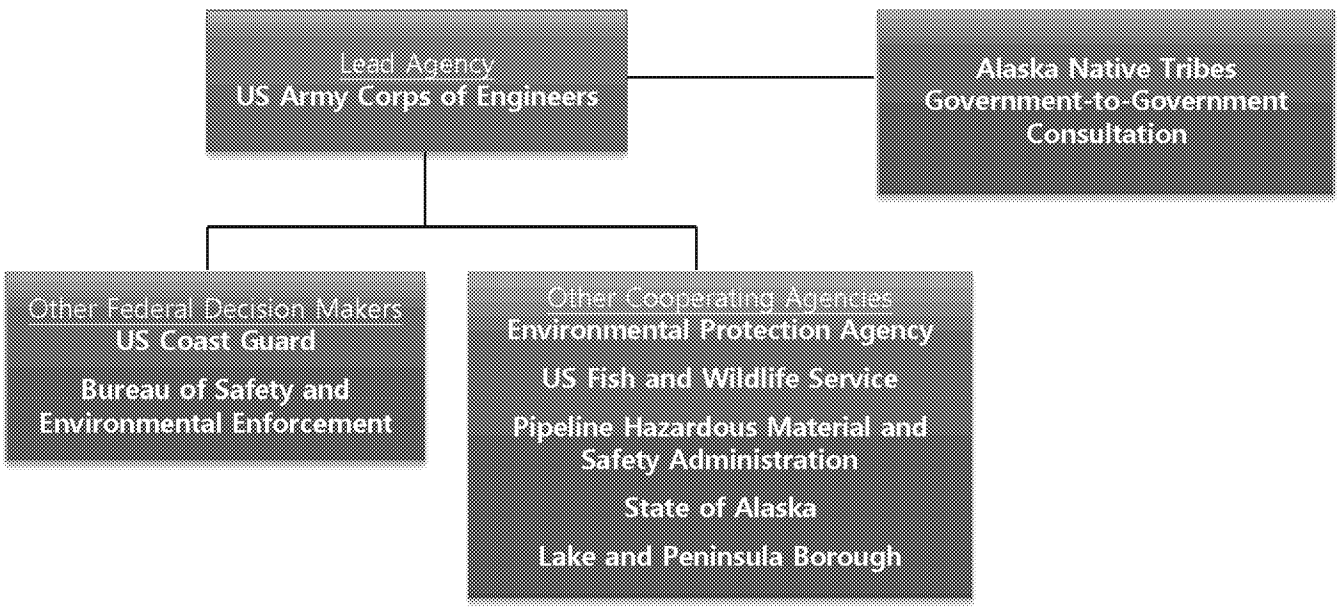
As the applicant is required to provide information to the USACE related to their proposed project. This includes:

- description of the proposed project,
- background material, completed research, and site information,
- data for the development of maps and figures, and
- other information that may be identified as necessary during preparation of the EIS.

The applicant will not be involved in the development of the EIS beyond this limited scope.

Role of Cooperating Agencies

Several cooperating agencies have been invited to provide technical support to the lead agency, the USACE. Cooperating agencies will be actively engaged in scoping and alternatives development and will then be assigned to technical teams based on the specific reasons they were invited to become cooperating agencies. Although cooperating agencies are involved in preparation and writing of certain portions of the EIS and cooperators may use the EIS for their own decisions, the USACE has final authority on the EIS content.



AMERICAN OVERSIGHT

Role of Alaska Native Tribes

The USACE has invited 35 federally recognized Alaska Native Tribes to consult throughout the entirity of the federal decision making process, including the development of the environmental impact statement. Federally recognized Alaska Native Tribes that the USACE has extended government-to-government consultation invitations to are:

- Aleknagik Traditional Council
- Chignik Bay Tribal Council
- Chignik Lagoon Village Council
- Chignik Lake Traditional Council
- Clarks Point Village Council
- Curyung Tribal Council
- Egegik Village Council
- Ekuk Village Council
- Ekwok Village Council
- Igiugig Village Council
- Iliamna Village Council
- Ivanof Bay Tribal Council
- King Salmon Tribal Council
- Kokhanok Village Council
- Levelock Village Council
- Manokotak Village Council
- Naknek Village Council
- Nanwalek IRA Council
- Native Tribe of Kanatak
- Native Village of Perryville
- New Koliganek Village Council
- New Stuyahok Traditional Council
- Newhalen Tribal Council
- Ninilchik Traditional Council
- Nondalton Tribal Council
- Pedro Bay Village Council
- Pilot Point Tribal Council
- Port Graham Tribal Council
- Port Heiden Village Council
- Portage Creek Village Council
- Seldovia Village Tribal Council
- South Naknek Vilage Council
- Traditional Council of Togiak
- Twin Hills Village Council
- Ugashik Traditional Council

Lead and Cooperating Agencies

AMERICAN OVERSIGHT

EIS Schedule

Preparation of the Pebble Project Environmental Impact Statement (EIS) level of analysis began in December 2017, when the US Army Corps of Engineers (USACE) received a permit application from the Pebble Limited Partnership (Applicant). The EIS process will take several months to complete a Draft EIS for public review, with a Final EIS expected within 24 months. The estimated schedule for the EIS is below.

Steps in the EIS Process

Notice of Intent to Prepare an EIS
March 2018

The USACE released a Notice of Intent to the United States Federal Register in March 2018. This initiated the process to prepare an EIS and began the scoping process.

Scoping: Meetings and Comments
April 2018

The 30 day scoping process kicks off on April 1, 2018. Public meetings will be held at specific locations within the Bristol Bay region, and in Homer and Anchorage in April. Scoping offers a chance for the public to comment on the proposed project and alternatives.

Draft EIS
Estimated Jan. 2019

Determining the alternatives to analyze, and then preparing the Draft EIS will happen immediately following the scoping period. The Draft EIS is anticipated to be released for public review and comment in 2019.

Public Review of Draft EIS: Meetings and Comments
Estimated early 2019

After the Draft EIS is released, the public will have a minimum of 45 days to submit comments. During that time, the USACE will plan public meetings, in the same locations that occurred during scoping, estimated for 2019.

Final EIS
Estimated late 2019

The USACE will assess all public comments submitted on the Draft EIS, and incorporate changes into the Final EIS before release in 2019.

Record of Decision
Estimated early 2020

The Record of Decision will lay out USACE's decision on the application submitted by the Applicant. Three decisions are possible: issue a permit, issue a permit with conditions, or denial of the application. This is estimated to be released in 2020.

AMERICAN OVERSIGHT

EIS Outline

How the Draft and Final EIS will be Organized

The Environmental Impact Statement (EIS) will analyze the potential impacts to the biological, physical, and social environments. The EIS will be organized into chapters to address the specific requirements in the National Environmental Policy Act (NEPA). By understanding the layout of the document ahead of time, readers can more easily find the specific sections they may be interested in reviewing and providing comments.

Executive Summary – Provides overview of the Draft and Final EIS, summarizes draft findings of potential impacts, and serves as a guide for where to find details.

The purpose and need of a project is essential in establishing a basis for developing the range of reasonable alternatives required in an EIS and identifying and selecting a preferred alternative.

Chapter 1. Purpose and Need – Describes the purpose of the proposed project to inform the range of alternatives analyzed in the EIS.

Chapter 2. Alternatives – Describes alternatives to be analyzed, including a No Action Alternative, the Proposed Action (as designed by the Pebble Limited Partnership), and reasonable and practicable alternatives to address issues raised during scoping and the EIS process, such as, but not limited to, tailings and mine water management, alternate pipeline routes, surface access to the mine site and vehicle traffic levels, and port/ferry facilities, location, and traffic levels.

Chapter 3. Affected Environment – Describes the baseline conditions of key resource topics in the proposed project environment (such as fish and wildlife, water quality, economics, food production, commercial fishing, and recreation).

Chapter 4. Environmental Consiquences of Action – Analyzes the potential direct, indirect, and cumulative impacts, as well as potential mitigation measures relevant to each of the resources from the proposed action and each alternative.

Chapter 5. List of Preparers – Presents the list of contributors to the preparation of the EIS, including their affiliation, project role, educational background, and years of experience. Cooperating agency roles and responsibilities are also described in Chapter 5.

Chapter 6. List of Agencies, Organizations, and Persons to Whom Copies of the Statement Have Been Sent – Describes the distribution of the Draft and Final EIS documents for informational purposes and to identify public locations where the document is available.

Chapter 7. References – Presents the references used in preparing the EIS.

Chapter 8. Appendices – Presents the in-depth analyses, comments/response to comments, coordination, consultations, mailing lists and other information used in the analysis of the applicant's project.

AMERICAN OVERSIGHT

How to Comment

Public participation is an important part of developing an Environmental Impact Statement (EIS) under the National Environmental Policy Act (NEPA). Submitting substantive and concise comments during the scoping period is an important role the public plays in the NEPA process, and can influence the scope of analysis for the EIS.

General recommendations

- **Become familiar with the proposed project** — Review the project or agency website, read the project description, monitor local newspapers, and attend public meetings. The website for the Pebble Project EIS is www.PebbleProjectEIS.com.
- **Learn about the steps in the NEPA process** and opportunities for submitting to the U.S. Army Corps of Engineers (USACE). Public comment periods are during scoping, and at the draft EIS.
- **Keep your comments focused and as specific as possible** on the proposed project under consideration, what you think the EIS analysis needs to address and why.
- **Submit your comments within the timeframes announced** to ensure that your concerns are considered and addressed during the drafting of the EIS; the Scoping Comment period is from April 1 through April 30.

Comments on the project are not counted as votes; they are used to determine the appropriate scope of issues analyzed and contents of the EIS and to ensure that the impacts are adequately disclosed before the USACE makes a final decision on the permit application. Avoid simply agreeing or disagreeing with the proposed project. It is more important to identify specific relevant issues, alternatives, mitigation measures/conditions of permitting, and analytic tools so they can be used to inform the EIS analysis. The more clear, concise, and relevant your comments are, the more effective they will be in shaping the development of the EIS. For a citizen's guide to NEPA, visit https://ceq.doe.gov/get-involved/citizens_guide_to_nepa.html.

Tips for Writing Effective Comments

- **Be specific**. For example, if you are concerned about wildlife, focus on a particular problem or issue, such as a species that you feel should be analyzed, instead of making a broad statement such as "I am concerned about the impacts to wildlife."
- **Support your statements** with explanations, facts, and references, as appropriate.
- **Make suggestions,** including resources that should be analyzed, new data or analytic tools that should be used, and substantially different alternatives that should be evaluated in the EIS.

AMERICAN OVERSIGHT

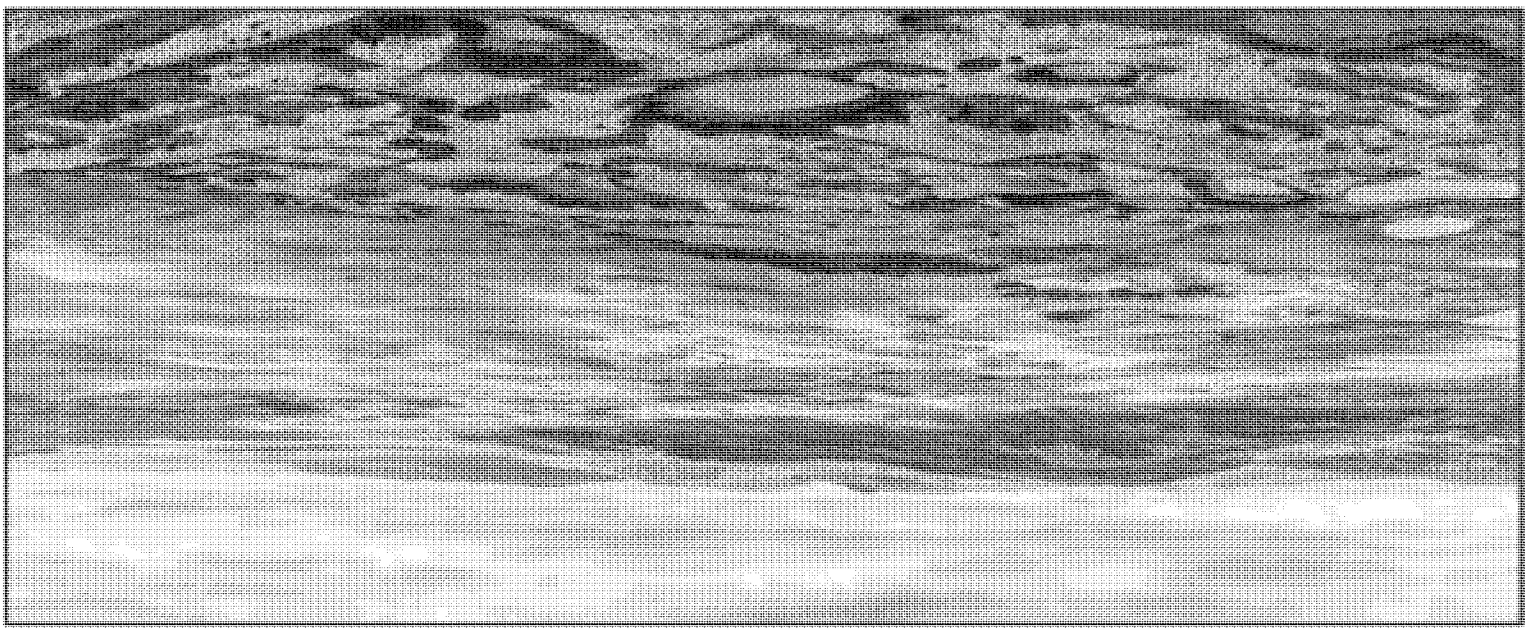
Pebble Project EIS Comment Form

You can submit comments using the form on the website (www.PebbleProjectEIS.com), to a court reporter at a public scoping meeting, or in writing (using computers available at a meeting or by mail). We will not be taking public testimony at large meetings in Anchorage, Homer, and Dillingham. If you'd like to mail your comments or submit them at a meeting, please feel free to use this form and attach additional sheets as needed. Write your comments, questions, and suggestions below, then fold this page in thirds so that the mailing address is visible. Remember to affix first-class postage before putting it in the mail, postmarked by the comment deadline of June 29, 2018.

The following questions may help:

- What are your specific concerns about this project and how should they be addressed in the EIS?
- Are there particular fish and wildlife resources, subsistence activities/use areas, or other places that you use and how might they be affected by the project?
- Are there alternative ways of developing any of the components of the Pebble Project that should be considered in preparing the EIS?

Please note that all public comments, including names and addesses of of individuals and organizations, are publically available as part of documenting public involvement in preparing the EIS. The US Army Corps of Engineers intends to place public comments received during scoping on the project website.



AMERICAN OVERSIGHT

Frequently Asked Questions

What is the U.S. Army Corps of Engineers' relationship with the applicant?

The U.S. Army Corps of Engineers (USACE) has no relationship with the applicant and is neither for or against the project. The USACE has a responsibility to review the applicant's proposed project with the same objectivity as it would any permit application and make a permit decision under the USACE statutory authorities.

Is the Pebble Project already approved and going to be built?

No.

What is the USACE's role in reviewing this project?

The applicant has applied for authorization under Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act. It is the USACE's responsibility to evaluate their application and ultimately make permit decisions (approval or denial) under the USACE's Clean Water Act and Rivers and Harbors authorities.

Why is the USACE conducting an EIS for this project?

The National Environmental Policy Act (NEPA) mandates an EIS-level of analysis should be conducted for review of any potential federal authorizations that could "significantly affect the quality of the human environment." The USACE has reviewed the permit application and has determined that the proposed project could "significantly affect the quality of the human environment."

Are any other federal decisions required based on the applicant's submittal of the permit application?

Two additional federal agencies have federal decision making authority: the U.S. Department of the Interior Bureau of Safety and Environmental Enforcement, and the U.S. Coast Guard.

Will the USACE seriously consider the No Action Alternative and what factors might lead to its selection?

The USACE cannot be pre-decisional, therefore, the process will be required to analyze and consider the No Action Alternative. In the context of USACE's evaluation, the No Action Alternative constitutes an action that would not include the discharge of fill material into waters of the United States.

What is the role of cooperating agencies that do not have federal decisions to make?

The role of cooperators invited due to specific expertise is to support the lead agency in developing the environmental analysis and providing technical assistance at the request of the lead agency.

AMERICAN OVERSIGHT

What is the role of federally recognized Alaska Native Tribes in the EIS process?

Thirty five federally recognized Alaska Native Tribes have been asked to consult directly with the USACE as lead agency throughout the entire decision making process to include the development of the environmental impact statement.

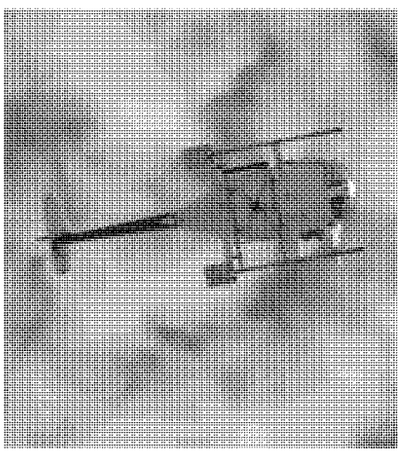
When and how will my comments be considered in preparing the EIS?

Public comments can be submitted at any time during the preparation of an EIS. Formal requests for comment occur during two important phases of an EIS:

- During the Scoping Period, the public is asked to comment on the issues and potential impacts that should be addressed in the EIS. The public is also asked to suggest alternatives to the proposed action that should be considered for evaluation in the EIS.
- Once the Draft EIS is released for public review and comment, the public is given the opportunity to submit comments in written form via the project website and orally at public meetings on the Draft EIS.
- All comments submitted will be put into the record, analyzed, and considered in determining the scope and potential impacts within the EIS and in making changes to the Draft EIS during the preparation of the Final EIS.
- The USACE is required to prepare responses to comments submitted on the Draft EIS; comments submitted and response will be included in the Final EIS.

AMERICAN OVERSIGHT

Pebble Project EIS



NEWSLETTER 1 | April 2018 | www.PebbleProjectEIS.com

US Army Corps of Engineers

Scoping Notice

The U.S. Army Corps of Engineers (USACE) Alaska District is conducting an Environmental Impact Statement (EIS) level of analysis to evaluate Department of the Army permit application POA-2017-271 submitted by Pebble Limited Partnership (PLP). PLP's application states the purpose of discharges of dredged and/or fill material into jurisdictional waters of the United States is for the purpose of developing a copper-gold-molybdenum porphyry deposit as an open-pit mine, with associated infrastructure, in southwest Alaska. The EIS scoping period begins April 1 and ends April 30, 2018.

The scoping period provides opportunities for any person interested in the proposed project to share information that can help shape the scope of analysis of the EIS. This may include ideas for alternatives to the applicant's proposed action as identified in the permit application (publically available at pebbleprojecteis.com) that could have lesser environmental impacts and identifying areas and/or issues of particular concern.

SCOPING PROCESS BEGINS

About PLP's Permit Application

PLP is proposing to develop the Pebble Deposit which is located under rolling, permafrost-free terrain in the Iliamna region of southwest Alaska, approximately 200 miles southwest of Anchorage and 60 miles west of Cook Inlet. The closest communities are the villages of Iliamna, Newhalen, and Nondalton, each approximately 17 miles from the Pebble Deposit. Portions of the proposed project lie within the Lake and Peninsula and Kenai Peninsula boroughs. Development of the Pebble Deposit would require federal permits from the USACE, The United States Coast Guard, and the Bureau of Safety and Environmental Enforcement for various aspects of the major project components. These three federal agencies are required to comply with the National Environmental Policy Act and thus will be using the EIS to inform their respective federal decisions. The major project components are briefly described here followed by an overview of the EIS process.

Major Project Components

Mine Site. The fully developed Mine Site would include the open pit mine, a tailings storage facility, a low grade ore stockpile, overburden stockpiles, material sites, water management ponds, milling and processing facilities, and supporting infrastructure such as a power plant, water treatment plants, camp facilities, and fuel and material storage facilities.

Transportation Corridor. The Transportation Corridor would connect the Mine Site to the Amakdedori Port on the west side of Cook Inlet. It has three main components:

1. A private, double-lane road extending 30 miles south from the Mine Site to a ferry terminal on the north shore of Iliamna Lake.

2. An ice-breaking ferry to transport materials, equipment, and ore concentrates 18 miles across Iliamna Lake between ferry terminals on the north and south shores of the lake.

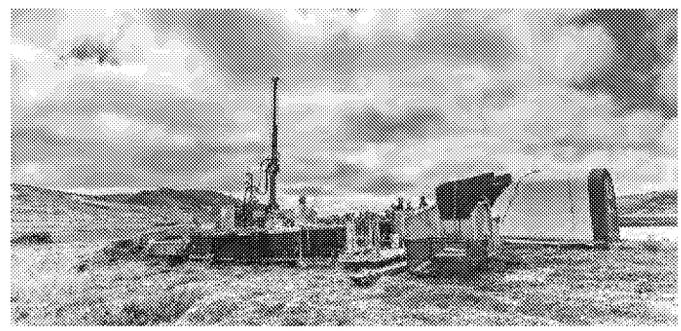
3. A private, double-lane road extending 35 miles southeast from the South Ferry Terminal near the community of Kokhanok, to the Amakdedori Port on the west side of Cook Inlet.

Amakdedori Port. The Amakdedori Port would be located near Amakdedori Creek on the western shore of Cook Inlet, approximately 190 miles southwest of Anchorage and approximately 95 miles southwest of Homer. It would include shore-based and marine facilities for the shipment of ore concentrates, freight, and fuel for the project. A 1300-foot earthen causeway with a 700-foot wharf would connect the port site with the docking facility. A 50-foot deep turning basin would be dredged adjacent to the docking facility, along with a 50-foot deep access channel. Other facilities would include fuel storage and transfer facilities, power generation and distribution facilities, maintenance facilities, employee accommodations, and offices.

AMERICAN OVERSIGHT

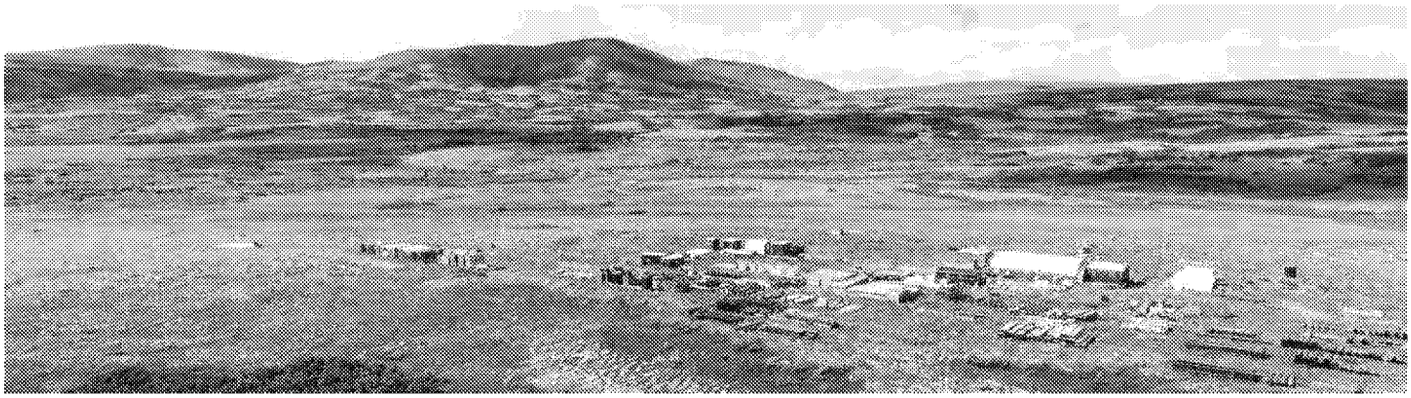
EPA-0135-0000657

Natural Gas Pipeline. Natural gas, sourced from the existing natural gas supply infrastructure for the Cook Inlet area, would supply power generation for the Pebble Project, and would require the construction of a 188-mile pipe. The gas pipeline alignment would connect to existing infrastructure near Happy Valley on the Kenai Peninsula and travel south, paralleling the Sterling Highway for 9 miles to a compressor station near Anchor Point. From the compressor station, the pipeline would head southwest across Cook Inlet for 60 miles, before turning west for 35 miles to a landfall at the Amakdedori Port. A second compressor station and offtake point would be located at the port site. The pipeline would then follow the transportation corridor from the port to the mine site, including crossing Iliamna Lake on the lakebed.



ABOUT THE EIS

The USACE is serving as the lead federal agency for this EIS. The Bureau of Safety and Environment Enforcement and the United States Coast Guard have federal decision-making authority over portions of the applicant's proposed project and will serve as cooperating agencies. The U.S. Fish and Wildlife Service, Advisory Council on Historic Preservation, the State of Alaska (multiple divisions), the Lake and Peninsula Borough, the Pipeline and Hazardous Materials and Safety Administration, and the U.S. Environmental Protection Agency will serve as cooperating agencies to provide technical assistance for specifically identified special expertise. Thirty-five federally recognized tribal governments have been invited to participate directly through government-to-government consultation.



The EIS will identify potential impacts and potential benefits of the proposed project and reasonable altenatives on the physical, biological, and social environment from all phases of the project, including construction, operations, and post-closure. The EIS will also look at mitigation methods—ways in which potential negative impacts could be lessened. The USACE will use available scientific literature and subsequent data collected, alongside traditional knowledge and observations provided by the public.

We welcome your comments and information on the resources that are important to you. For example, many communities will be concerned about potential impacts to subsistence resources and land uses during project construction, operations, and closure. The EIS will address long-term cumulative effects, consider a reasonable range of alternatives, and analyze a range of practical mitigation and monitoring measures for protecting public health, water quality, wildlife, and subsistence resources.

AMERICAN OVERSIGHT

EPA-0135-0000658

Participate!

All interested parties are invited to participate in the EIS process. The goals of the public scoping process are to:

- Gather comments and suggestions from interested parties to help determine issues and concerns that are relevant to the analysis of potential impacts
- Help define a reasonable range of alternatives to evaluate in the EIS
- Capture information that will lead to the development of good mitigation and monitoring measures

Public Scoping Meetings

USACE has chosen to conduct scoping in multiple ways including scoping meetings in addition to our newsletters, website, and other communication methods. The scoping schedule includes meetings across the project area, as well as in Anchorage and Homer. The public meeting schedule is listed below.

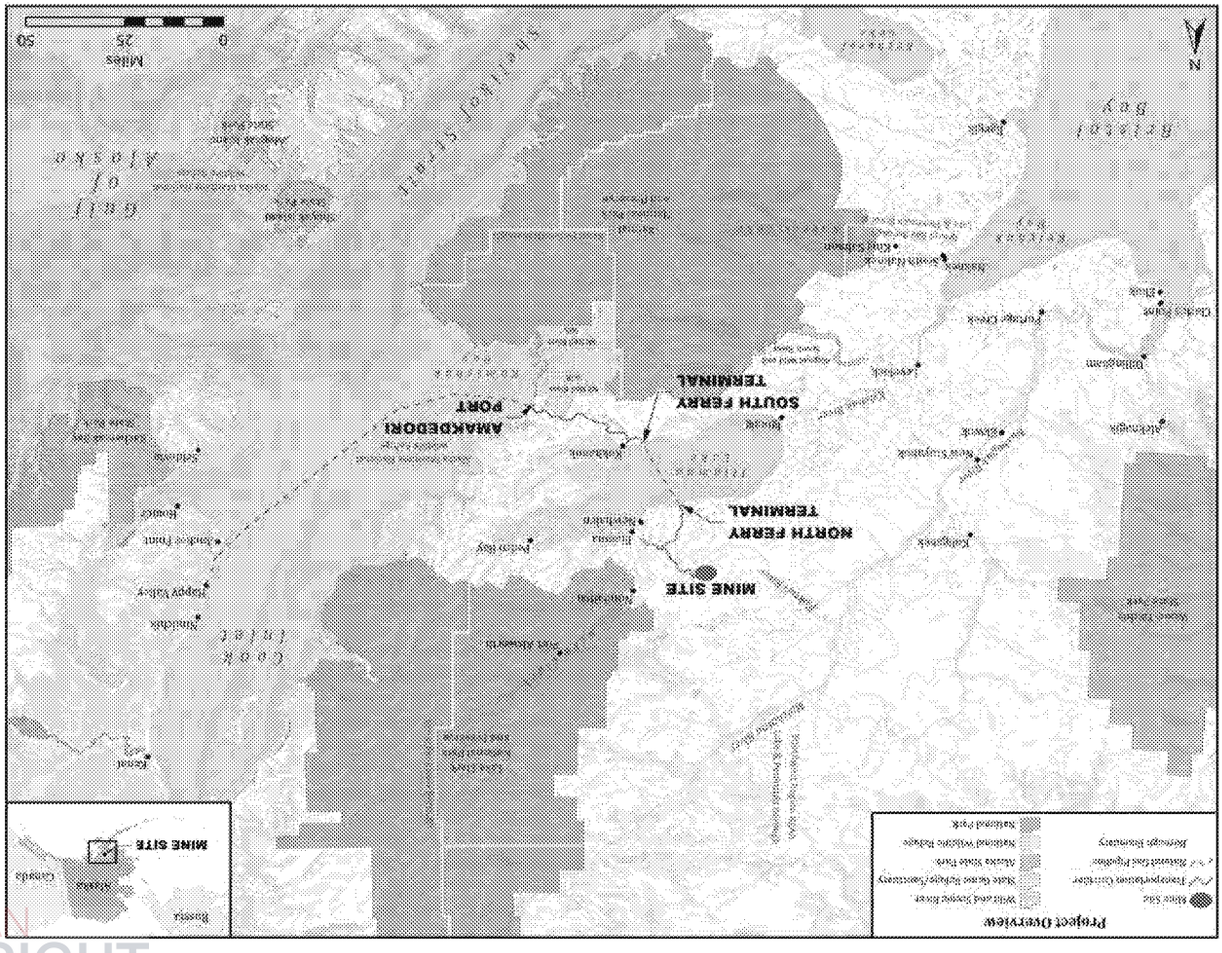
COMMUNITY	DATE AND TIME	LOCATION
Naknek	April 9, 2018, 3:30 pm	Naknek School
Kokhanok	April 10, 2018, 3:30 pm	Tribal Hall
Homer*	April 11, 2018, 5:30 pm	High School
Newhalen	April 12, 2018, 3:30 pm	Newhalen School
Nondalton	April 16, 2018, 3:30 pm	Tribal Center
Dillingham*	April 17, 2018, 5:00 pm	Middle School
Iguigig	April 18, 2018, 3:30 pm	Community Building
Anchorage*	April 19, 2018, 5:00 pm	Dena'ina Center

**To avoid long wait times, a hot mic format will not be used.*

TO PARTICIPATE...

Providing ample opportunities for the public to submit scoping comments on the Pebble Project EIS is of utmost importance to the USACE. Come to scoping meetings and share your thoughts regarding project impacts and benefits and ideas for alternatives. Give your comment orally to a dedicated court reporter, or electronically submit using one of a number of dedicated laptop computers. You can also bring written comments to a meeting, use the comment form on the project website (www.PebbleProjectEIS.com), or send them to:

Program Manager, Regulatory Division
US Army Corps of Engineers
PO Box 6898
Joint Base Elmendorf Richardson,
AK 99506-0898



Let us know what aspects of the proposed project are important to you!

Written scoping comments can be submitted through April 30, 2018.
Comments received/postmarked after April 30 will be considered, but may not be included in the scoping report.
Comments will be reviewed and incorporated into the Draft EIS, as appropriate

Pebble Project EIS

Pebble Project EIS – Notice of Public Meetings

The Alaska District, U.S. Army Corps of Engineers (USACE) invites the public to attend public scoping meetings for the Environmental Impact Statement (EIS) analysis for the proposed Pebble Project, which would be located 17 miles west/northwest of the villages of Iliamna, Newhalen, and Nondalton, Alaska.

The EIS will analyze potential impacts from the proposed mine that would produce copper, gold, and molybdenum from the Pebble porphyry deposit. The proposed project also includes a 188-mile natural gas pipeline from the Kenai Peninsula across Cook Inlet to the Mine Site, an Amakdedori Port facility on the western shore of Cook Inlet, and an 83 mile transportation corridor that includes an 18-mile ferry crossing of Lake Iliamna.

These meetings are an opportunity for members of the public to provide comments and suggestions to help determine important issues and help define a reasonable range of alternatives to evaluate in the EIS. Please note that public scoping meetings are not public hearings. Scoping input can be submitted in person at public meetings via directly into the provided computers, handing in written comments, or speaking to a court reporter.

To learn more about scoping and the EIS, please visit the web site: www.PebbleProjectEIS.com.

APPENDIX D – MEETING MATERIALS

AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

THE PEBBLE PROJECT

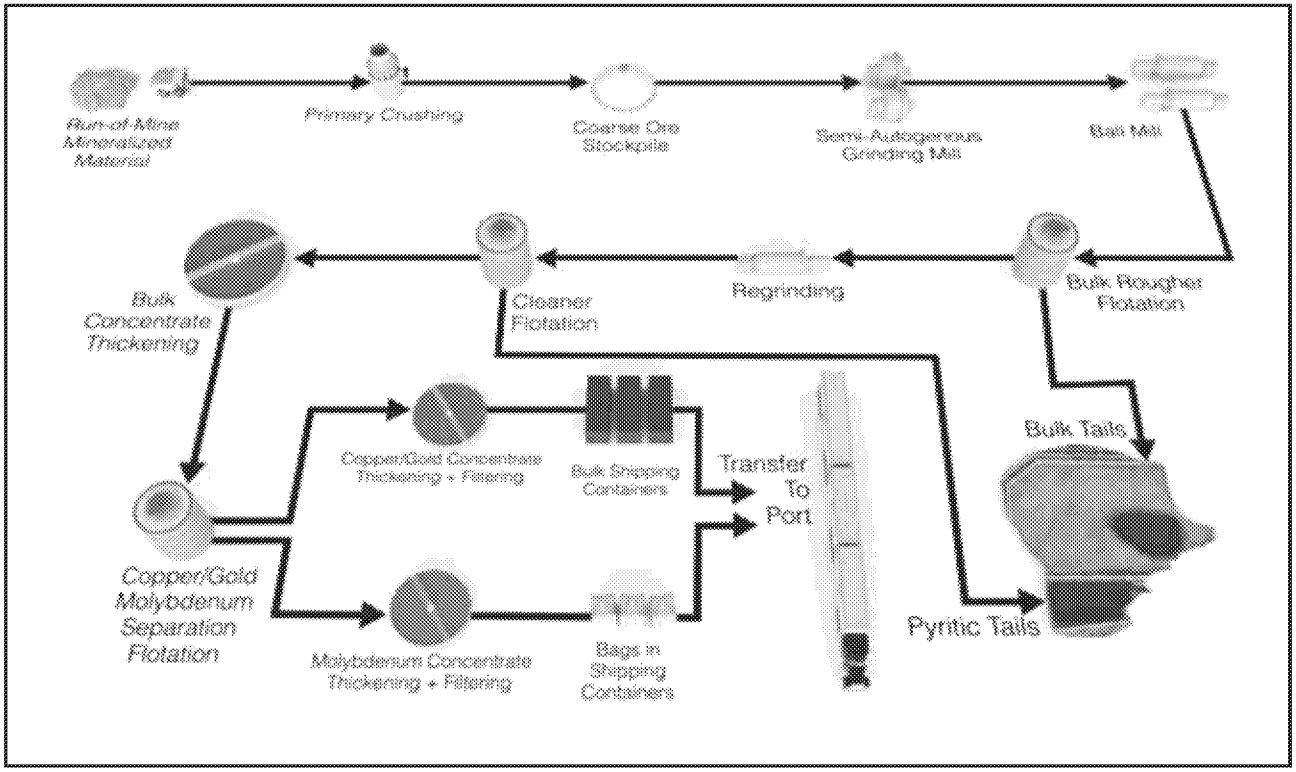
1 OVERVIEW

Pebble Limited Partnership (PLP) is proposing to develop the Pebble copper-gold-molybdenum porphyry deposit (Pebble Deposit) in southwest Alaska as an open-pit mine, with associated infrastructure.

PROJECT DESCRIPTION DETAILS

SUMMARY INFORMATION

- Located on state of Alaska land
- Project operating life of 20 years
- Employment of 2,000 people for construction and 850 for operation
- Gas pipeline from Anchor Point and gas-fired power plant at site
- Road and lake ferry to Cook Inlet
- Segregated storage of bulk and pyritic tailings



THE pebble PARTNERSHIP

AMERICAN OVERSIGHT

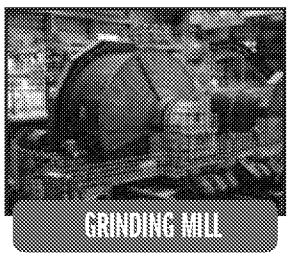
MINING & PROCESSING

The Project will mine approximately 1.1 billion tons of mineralized material throughout the 20-year mine life.



AN OVERVIEW OF MINERAL PROCESSING

OPEN PIT RENDERING

DRILLING & BLASTING

HEAVY EQUIPMENT

GRINDING MILL

SUMMARY INFORMATION

- Mining rate up to 90 million tons per year
- Milling rate up to 58 million tons per year
- Annual copper/gold concentrate production of 600,000 tons
- Annual molybdenum concentrate production of 15,000 tons

THE pebble PARTNERSHIP

AMERICAN OVERSIGHT

TAILINGS STORAGE

③ TAILINGS

Pebble Limited Partnership (PLP) conducted a multiyear, multidisciplinary evaluation to select a Tailings Storage Facility (TSF) location that meets all engineering and environmental goals. It will store ground-up material after minerals have been extracted.

TAILINGS STORAGE FACILITY

SUMMARY INFORMATION

- Designed to meet Alaska Dam Safety Program standards
- Separate cells for bulk and pyritic tailings
- Minimize water storage in bulk tailings to keep water away from embankment
- Fully-lined cell for pyritic tailings with water cover
- Rock-filled embankments (600' high at main embankment)
- Seepage collection facilities for all embankments

THE pebble PARTNERSHIP

AMERICAN OVERSIGHT

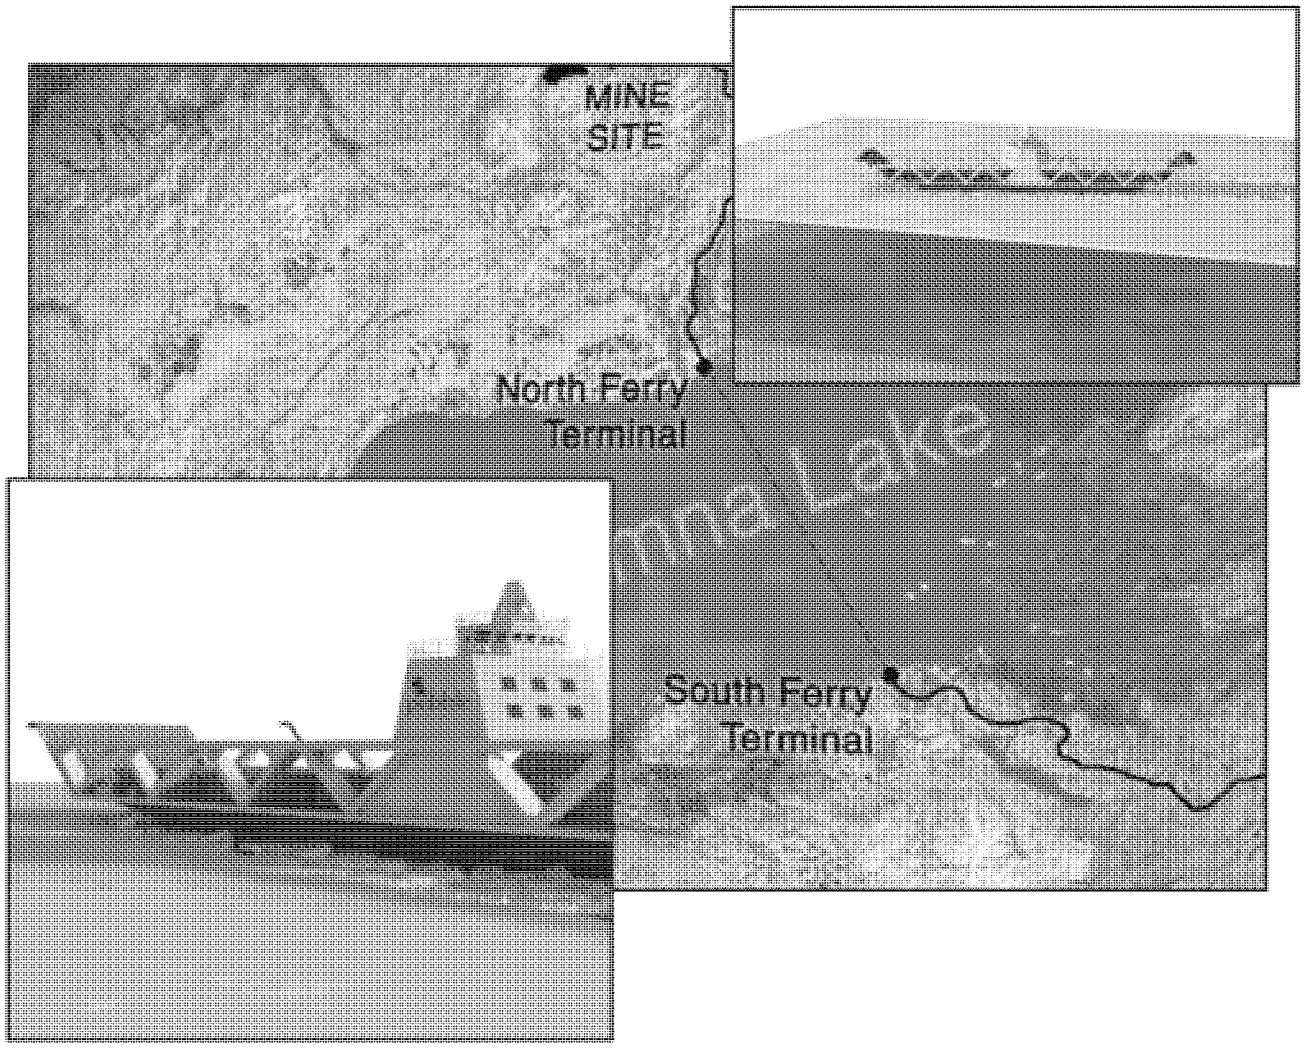
AMERICAN
OVERSIGHT



AMERICAN
OVERSIGHT

AMERICAN
OVERSIGHT

FERRY & TERMINALS

A custom-built ice breaking ferry will transit Iliamna Lake year round, carrying inbound supplies from the Amakdedori Port to the mine site and returning with copper-gold and molybdenum concentrates.

ILIAMNA LAKE CROSSING

SUMMARY INFORMATION

- The one-way ferry trip across Iliamna Lake is about 18 miles
- An average of one round trip per day will be required
- Vessel is designed to operate year-round, in all ice conditions
- Symmetrical forward and aft with two ice-breaking bows
- 12 crew members may be accommodated on the ferry

THE pebble PARTNERSHIP

AMERICAN OVERSIGHT

AMAKDEDORI PORT

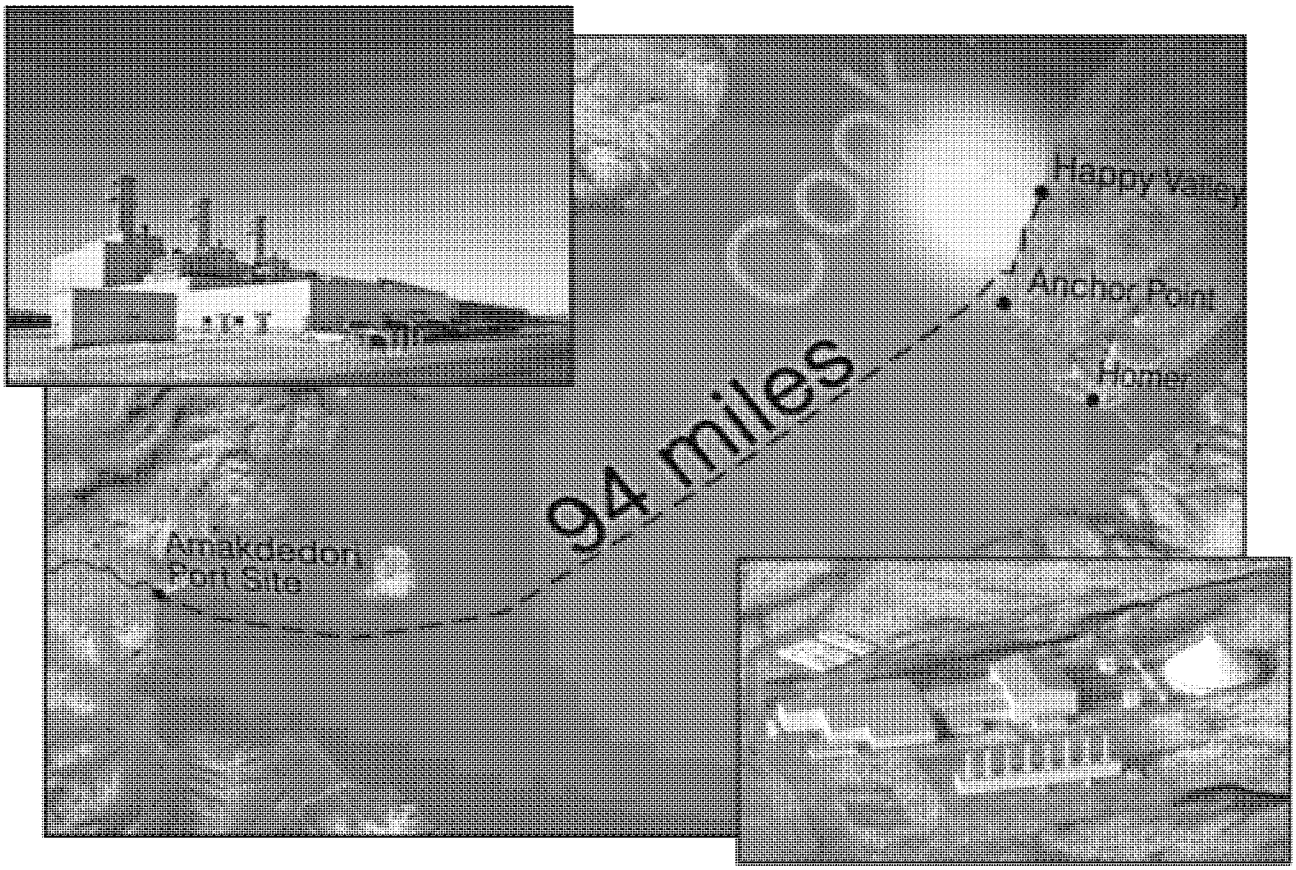
PORT

Incoming supplies such as equipment, reagents, and fuel will be barged to the Amakdedori Port and then transported by truck to the mine site.

DESIGN & OPERATIONS

SUMMARY INFORMATION

- 50-foot deep channel dredged to provide access for Handysize bulk carriers
- Mineral concentrate will be direct-loaded from the containers onto the vessels
- Equipment and supplies delivered by barge
- Shore-based facilities will receive and store containers and fuel
- Up to 25 concentrate shipments annually
- Up to 30 marine barge loads annually



THE pebble PARTNERSHIP

AMERICAN OVERSIGHT

POWER GENERATION

The power plant will be sized to meet the anticipated load of 230 megawatts using high-efficiency turbine or reciprocating engine generators operating in a combined-cycle configuration.

NATURAL GAS PIPELINE + POWER PLANT

SUMMARY INFORMATION

- Pipeline will connect to existing gas supply infrastructure near Happy Valley
- Buried pipe will transport gas to a compressor station near Anchor Point
- 94-mile subsea pipeline across Cook Inlet will come ashore near port site, follow road to site, and cross the bed of Iliamna Lake
- Gross flow rate of 50 million standard cubic feet per day
- 10" pipeline on land, 12" pipeline for water crossings
- Emergency backup power provided by diesel generators

THE pebble PARTNERSHIP

AMERICAN OVERSIGHT

CLOSURE & RECLAMATION

10 CLOSURE

Pebble Limited Partnership (PLP) is committed to conducting all mining operations, including reclamation and closure, in accordance with all local, state, and federal regulations.

PEBBLE: DESIGNED FOR CLOSURE

RECLAMATION

AFTER...

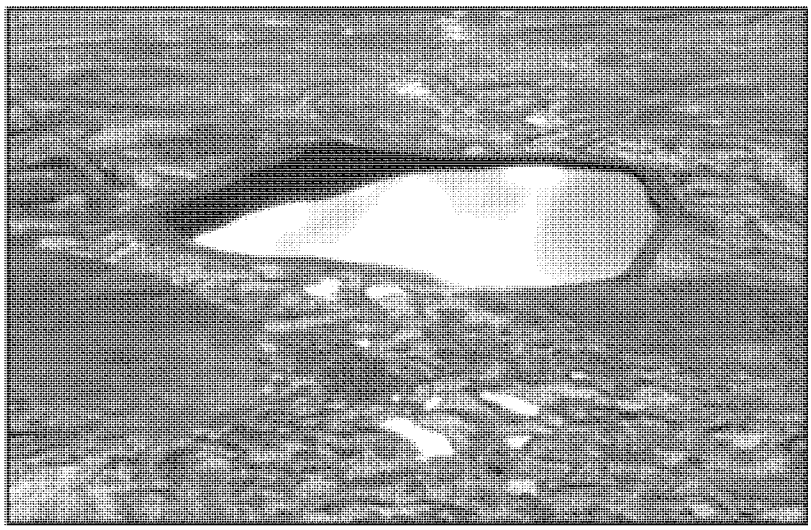
5 YEARS

Most buildings removed

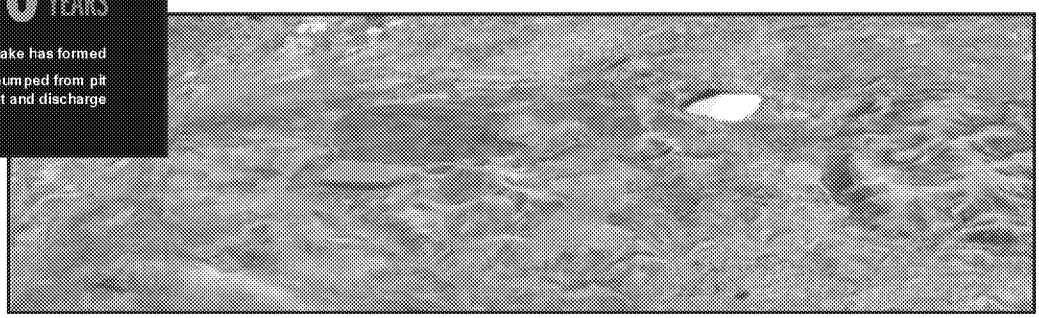
Terrain resculpted

Native plants resown

20 YEARS



Vegetation well-established in reclaimed areas



Pit continues to fill with water

30 YEARS

Pit lake has formed

Water is pumped from pit for treatment and discharge

SUMMARY INFORMATION

- Removal of mill and other facilities not used after closure
- Hauling of PAG waste rock into the open pit for under water storage
- Recontouring and placement of overburden for revegetation
- Plan and infrastructure for long term water management and treatment
- Financial assurance for closure and long term site management is required before construction

THE pebble PARTNERSHIP

AMERICAN OVERSIGHT

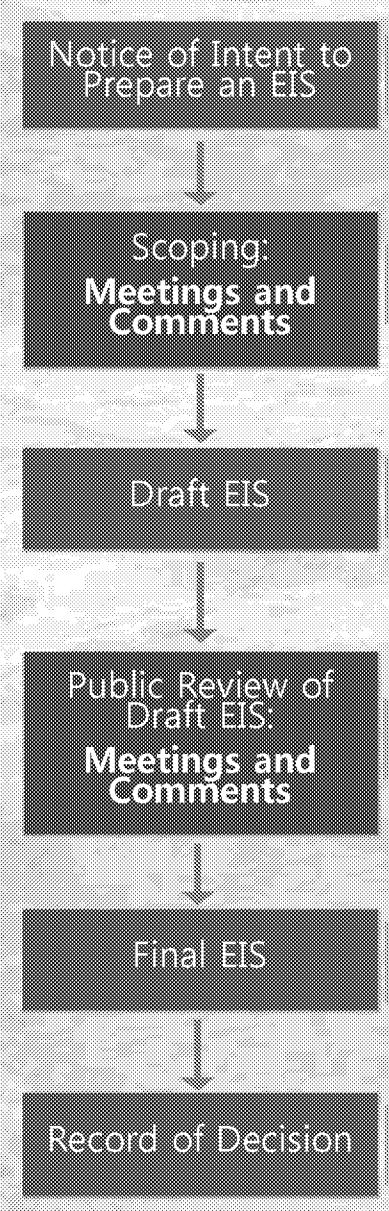
Tips for Writing Effective Comments

Public participation is an important part of developing an Environmental Impact Statement (EIS) under the National Environmental Policy Act (NEPA). Submitting substantive and concise comments during the scoping period is an important role the public plays in the NEPA process, and can influence the scope of analysis for the EIS.

- **Become familiar with the proposed project** — Review the project or agency website, read the project description, monitor local newspapers, and attend public meetings.
- **Learn about the steps in the NEPA process** and opportunities for submitting comments to the U.S. Army Corps of Engineers.
- **Keep your comments focused and as specific as possible** on the proposed project under consideration, what you think the EIS analysis needs to address and why.
- **Submit your comments within the timeframes announced** to ensure that your concerns are considered and addressed during the drafting of the EIS; the Scoping Comment period is from April 1 through June 29.
- **Be specific**. For example, if you are concerned about wildlife, focus on a particular problem or issue, such as a species that you feel should be analyzed, instead of making a broad statement such as "I am concerned about the impacts to wildlife."
- **Make suggestions,** including resources that should be analyzed, new data or analytic tools that should be used, and substantially different alternatives that should be evaluated in the EIS.



Comments on the project are not counted as votes; they are used to determine the appropriate scope of issues analyzed and contents of the EIS and to ensure that the impacts are adequately disclosed. Avoid simply agreeing or disagreeing with the proposed project. It is more important to identify specific relevant issues, alternatives, mitigation measures/conditions of permitting, and analytic tools so they can be used to inform the EIS analysis. The more clear, concise, and relevant your comments are, the more effective they will be in shaping the development of the EIS.

AMERICAN OVERSIGHT

The National Environmental Policy Act

Preparation of the Pebble Project Environmental Impact Statement (EIS) level of analysis began when the US Army Corps of Engineers (USACE) received a permit application from the Pebble Limited Partnership. The EIS process will take several months to complete a Draft EIS for public review, and several months to incorporate public comments into the draft to develop the Final EIS.

Steps in the EIS Process

The USACE released a Notice of Intent to the United States Federal Register. This initiated the process to prepare an EIS and began the scoping process.

The scoping process kicks off on April 1, 2018. Scoping offers a chance for the public to comment on the proposed project and alternatives.

Determining the alternatives to analyze, and then preparing the Draft EIS will happen immediately following the scoping period.

After the Draft EIS is released, the public will have a chance to submit comments. During that time, the USACE will plan public meetings to collect comments.

The USACE will assess all public comments submitted on the Draft EIS, and incorporate changes into the Final EIS before release.

The Record of Decision will lay out USACE's decision on the application submitted by the Applicant. Three decisions are possible: issue a permit, issue a permit with conditions, or denial of the application.

AMERICAN OVERSIGHT

How the Draft and Final EIS will be Organized

The Environmental Impact Statement (EIS) will analyze the potential impacts to the biological, physical, and social environments. By understanding the layout of the document ahead of time, readers can more easily find the specific sections they may be interested in reviewing and commenting on.

Executive Summary – Provides overview of the Draft and Final EIS, summarizes draft findings of potential impacts, and serves as a guide for where to find details.

Chapter 1. Purpose and Need – Describes the purpose of the proposed project to inform the range of alternatives analyzed in the EIS.

Chapter 2. Alternatives – Describes alternatives to be analyzed, including a No Action Alternative, the Proposed Action (as designed by the Pebble Limited Partnership), and reasonable and practicable alternatives to address issues raised during scoping and the EIS process, such as, but not limited to, tailings and mine water management, alternate pipeline routes, surface access to the mine site and vehicle traffic levels, and port/ferry facilities, location, and traffic levels.

The purpose and need of a project is essential in establishing a basis for developing the range of reasonable alternatives required in an EIS and identifying and selecting a preferred alternative.

Chapter 3. Affected Environment – Describes the baseline conditions of key resource topics in the proposed project environment (such as fish and wildlife, water quality, economics, food production, commercial fishing, and recreation).

Chapter 4. Environmental Consequences of Action – Analyzes the potential direct, indirect, and cumulative impacts, as well as potential mitigation measures relevant to each of the resources from the proposed action and each alternative.

Chapter 5. List of Preparers – Presents the list of contributors to the preparation of the EIS, including their affiliation, project role, educational background, and years of experience. Cooperating agency roles and responsibilities are also described in Chapter 5.

Chapter 6. List of Agencies, Organizations, and Persons to Whom copies of the Statement Have Been Sent – Describes the distribution of the Draft and Final EIS documents for informational purposes and to identify public locations where the document is available.

Chapter 7. References – Presents the references used in preparing the EIS.

Chapter 8. Appendices – Presents the in-depth analyses, comments/response to comments, coordination, consultations, mailing lists and other information used in the analysis of the applicant's project.

AMERICAN OVERSIGHT

What Resources will be Analyzed in the EIS?

Using the analysis in the Environmental Impact Statement (EIS), The U.S. Army Corps of Engineers (USACE) will evaluate the environmental and related social and economic effects of the proposed project. The analysis will include direct and indirect impacts, cumulative effects, and potential spill and tailings dam failure scenarios. Comments received during the scoping period will likely result in additional resources to be considered in the analysis.

Social Environment

- Cultural Resources
- Historic Properties
- Land use and management
- Subsistence
- Transportation and Navigation
- Aesthetics
- Recreational and Commercial Fisheries
- Recreation
- Needs and Welfare of the People
- Environmental Justice
- Health and Safety

Physical Environment

- Geohazards
- Geology
- Soils
- Surface Water Hydrology including flood plains and flood hazards
- Groundwater Hydrology
- Water Quality
- Noise
- Air Quality
- Climate Change

Biological Environment

- Wetlands/Special Aquatic Sites
- Vegetation
- Birds
- Terrestrial Wildlife
- Fisheries and Aquatic Resources
- Marine Wildlife
- Threatened and Endangered Species

Direct impacts occur through direct interaction of an activity with an environmental, social, or economic component.

For example: pollutant discharge from a source could directly result in lowered water quality.

Indirect impacts on the environment are not a direct result of the project, but often a result of a complex impact pathway.

For example: pollutants in the air from a source could land on vegetation, indirectly causing acidic soils.

Cumulative impacts occur when the incremental impact of the project is combined with the effects of other past, present and reasonably foreseeable future projects. For example: wetland fill from one projects.

For example: wetland fill from one project, combined with the wetland fill from a separate project.

AMERICAN OVERSIGHT

Roles and Responsibilities

When the Pebble Limited Partnership (Applicant) submitted an application on December 22, 2017, the US Army Corps of Engineers, Alaska District (USACE) was compelled to begin processing the permit application in accordance with 33 CFR 320. The USACE determined that review of the application would require an environmental impact statement (EIS) level of analysis in compliance with the National Environmental Policy Act. The USACE is the lead federal agency for developing the EIS.

Role of the Corps

The USACE, as the lead agency, is responsible for reviewing the permit application submitted by the applicant, and analyzing the potential environmental impacts from the proposed project. The USACE will lead the effort to take a hard look at reasonable and practicable alternatives and evaluate the impacts of the proposed project utilizing an interdisciplinary team. At the completion of the environmental impact analysis, the USACE, will issue a Record of Decision related to USACE's authorities under Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act.

Role of the 3rd Party Contractor

AECOM (a consulting firm) has been hired to provide an interdisciplinary team to develop a fact-based independent analysis of the Pebble Project as proposed and evaluate identified reasonable alternatives. AECOM will work solely under the direction of the USACE and will be the primary developers of the EIS. AECOM will also provide support to the USACE for scoping and public involvement, development of alternatives to the proposed action, assessment of potential impacts, and distribution. The AECOM team is made up of specialists and scientists in the biological environment, the physical environment, and the social environment.

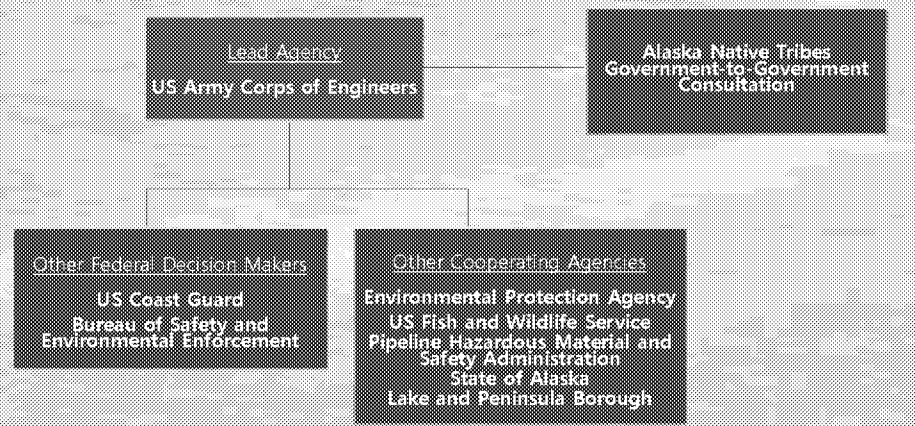
Role of Alaska Native Tribes

The USACE has invited 35 federally recognized Alaska Native Tribes to consult throughout the entirety of the federal decision making process, including the development of the environmental impact statement. Federally recognized Alaska Native Tribes that the USACE has extended government-to-government consultation invitations to are:

- Aleknagik Traditional Council
- Chignik Bay Tribal Council
- Chignik Lagoon Village Council
- Chignik Lake Traditional Council
- Clarks Point Village Council
- Curyung Tribal Council
- Egegik Village Council
- Ekuk Village Council
- Ekwok Village Council
- Igiugig Village Council
- Iliamna Village Council
- Ivanof Bay Tribal Council
- King Salmon Tribal Council
- Kokhanok Village Council
- Levelock Village Council
- Manokotak Village Council
- Naknek Village Council
- Nanwalek IRA Council
- Native Tribe of Kanatak
- Native Village of Perryville
- New Koliganek Village Council
- New Stuyahok Traditional Council
- Newhalen Tribal Council
- Ninilchik Traditional Council
- Nondalton Tribal Council
- Pedro Bay Village Council
- Pilot Point Tribal Council
- Port Graham Tribal Council
- Port Heiden Village Council
- Portage Creek Village Council
- Seldovia Village Tribal Council
- South Naknek Vilage Council
- Traditional Council of Togiak
- Twin Hills Village Council
- Ugashik Traditional Council

Role of the Applicant

As the applicant is required to provide information to the USACE related to their proposed project. This includes:



- description of the proposed project,
- background material, completed research, and site information,
- data for the development of maps and figures, and
- other information that may be identified as necessary during preparation of the EIS.

The applicant will not be involved in the development of the EIS beyond this limited scope.

Role of Cooperating Agencies

Several cooperating agencies have been invited to provide technical support to the lead agency, the USACE. Cooperating agencies will be actively engaged in scoping and alternatives development and will then be assigned to technical teams based on the specific reasons they were invited to become cooperating agencies. Although cooperating agencies are involved in preparation and writing of certain portions of the EIS and cooperators may use the EIS for their own decisions, the USACE has final authority on the EIS content.

Lead and Cooperating Agencies

AMERICAN OVERSIGHT

Public Scoping for the Pebble Project EIS

The US Army Corps of Engineers (USACE) is preparing an Environmental Impact Statement (EIS) to analyze the impacts of issuing permits for an open pit, copper-gold-molybdenum porphyry deposit, with associated infrastructure, as proposed by the Pebble Limited Partnership. The EIS scoping period begins April 1, 2018 and ends June 29, 2018.

At the beginning of developing an EIS, USACE reaches out through scoping to involve members of the public. The scoping period provides opportunities for people who could be affected by the proposed action that could have lesser environmental impacts.

In addition to Anchorage, Public meetings were held in April in the following communities:

- Naknek
- Kokhanok
- Homer
- Newhalen
- New Stuyahok
- Nondalton
- Dillingham
- Igiugig

The EIS will identify potential impacts on the physical, biological, and social environment from all phases of the proposed project, including construction, mine operation, closure, and post-closure. The EIS will also look at mitigation methods-ways in which potential negative impacts could be avoided or lessened.

During the scoping period, USACE will work with the public to identify issues and concerns to thoroughly analyze the potential effects of the proposed project. USACE will use the scientific literature, alongside traditional knowledge and observations provided by the public.

We welcome your comments and information on the resources that are important to you. For example, many communities will be concerned about potential impacts to fish, subsistence resources, and traditional land uses during project construction, operations, and closure.

To Participate...

Let us know what aspects of the proposed project are important to you!

Providing ample opportunities for the public to submit scoping comments on the Pebble Project EIS is of utmost importance to the USACE. A good way to get involved is to give your comment orally to a dedicated court reporter or electronically submit using one of the dedicated laptop computers. You can also submit hand-written comments, use the comment form on the project website (www.PebbleProjectEIS.com), or send them to:

Program Manager, Regulatory Division
US Army Corps of Engineers
PO Box 6898
Joint Base Elmendorf Richardson
AK 99506-0898

Scoping comments can be submitted through June 29, 2018.

AMERICAN OVERSIGHT

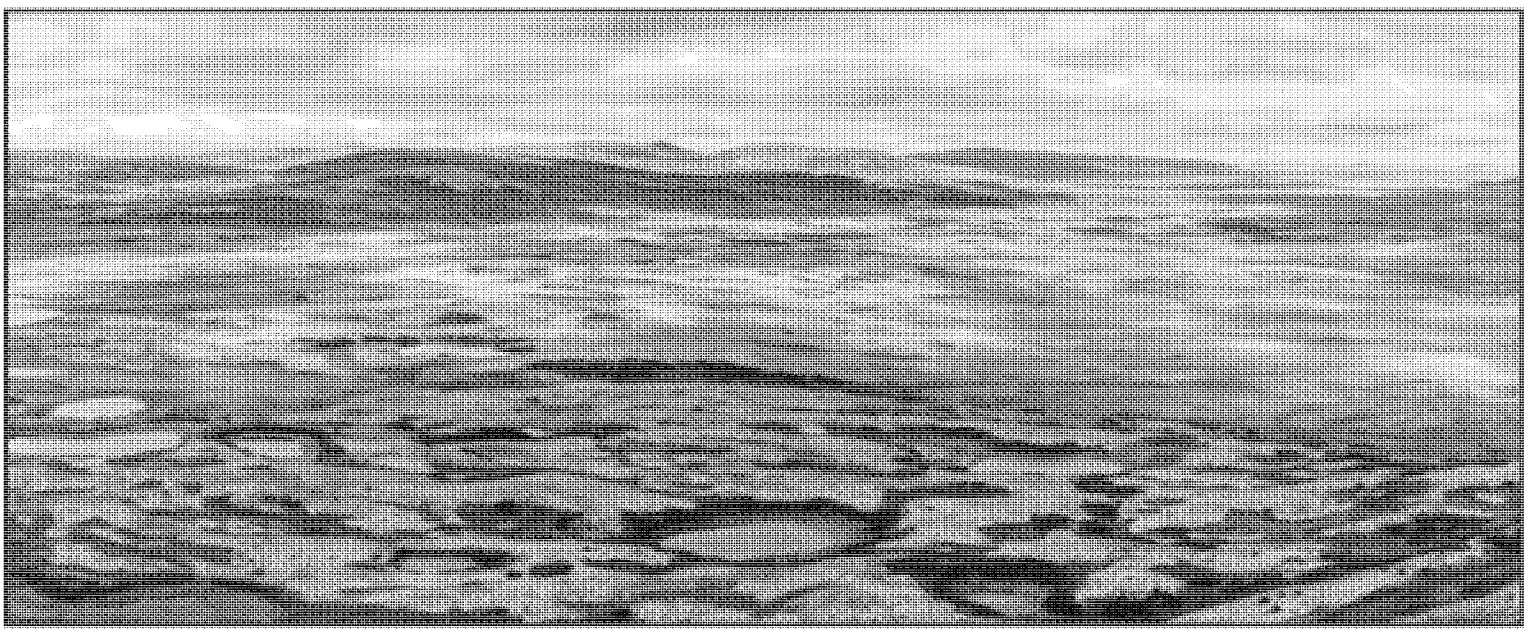
Pebble Project EIS Comment Form

You can submit comments using the form on the website (www.PebbleProjectEIS.com), to a court reporter at a public scoping meeting, or in writing (using computers available at a meeting or by mail). We will not be taking public testimony at large meetings in Anchorage, Homer, and Dillingham. If you'd like to mail your comments or submit them at a meeting, please feel free to use this form and attach additional sheets as needed. Write your comments, questions, and suggestions below, then fold this page in thirds so that the mailing address is visible. Remember to affix first-class postage before putting it in the mail, postmarked by the comment deadline of June 29.



The following questions may help:

- What are your specific concerns about this project and how should they be addressed in the EIS?
- Are there particular fish and wildlife resources, subsistence activities/use areas, or other places that you use and how might they be affected by the project?
- Are there alternative ways of developing any of the components of the Pebble Project that should be considered in preparing the EIS?

Please note that all public comments, including names and addesses of of individuals and organizations, are publicaly available as part of documenting public involvement in preparing the EIS. The US Army Corps of Engineers intends to place public comments received during scoping on the project website.

FACT SHEET

Pebble Limited Partnership Project Proposed Natural Gas Pipeline

Background

The Bureau of Safety and Environmental Enforcement (BSEE) is a cooperating agency on the Environmental Impact Statement that the United States Army Corps of Engineers, Alaska District, is preparing for the Pebble Limited Partnership project.

The Pebble Limited Partnership is proposing to develop the Pebble copper-gold-molybdenum porphyry deposit as an open-pit mine, with associated infrastructure, in southwest Alaska. The proposed project infrastructure will include an approximately 230-megawatt power plant that will be fueled using natural gas. Natural gas would be supplied to the site using a roughly 190-mile pipeline that would connect to the project site from a tie-in on the Kenai Peninsula near Happy Valley.

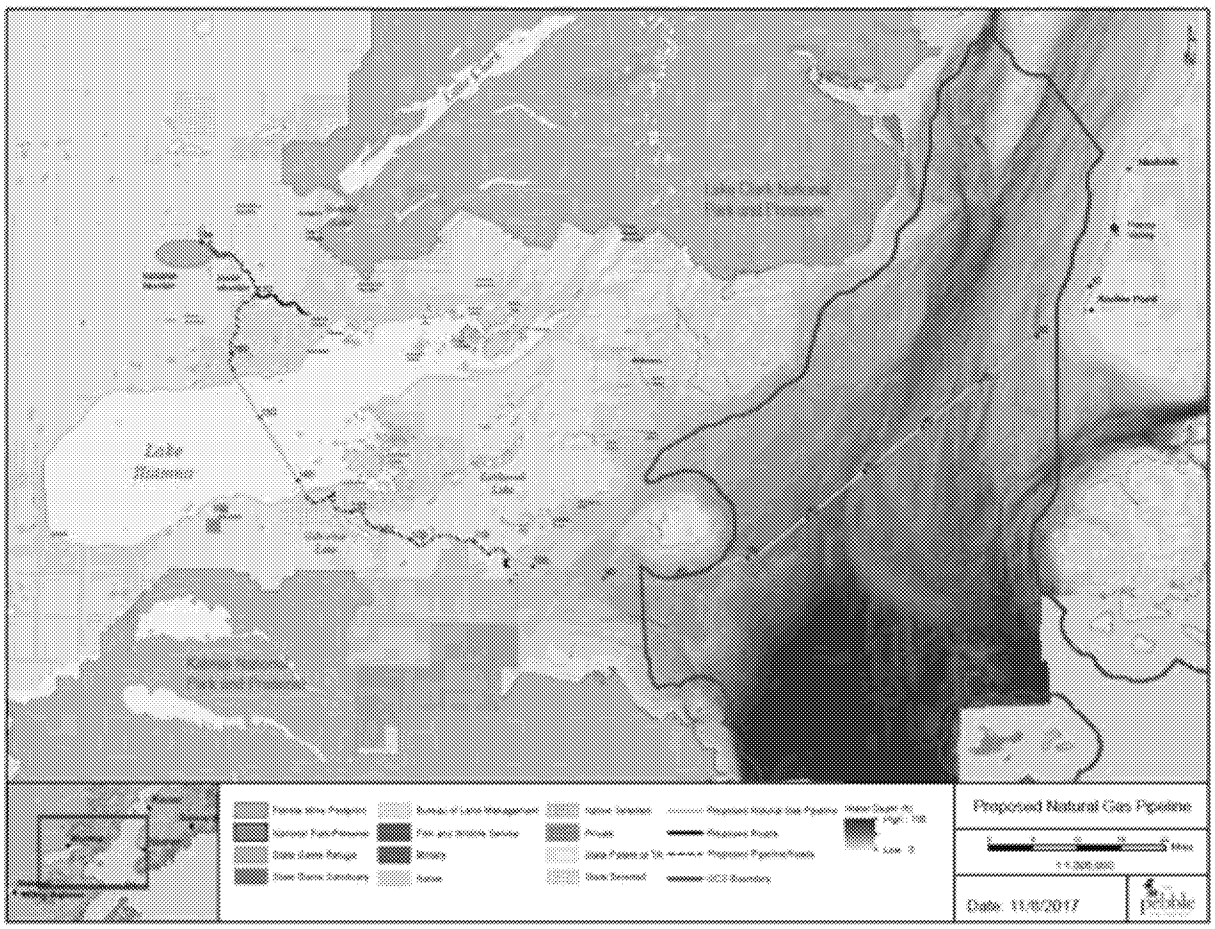
While BSEE has no regulatory oversight of onshore mining, our role will include a Pipeline Right-of-Way grant approval process for the proposed pipeline crossing federal waters of the Outer Continental Shelf in Cook Inlet.

Proposed Pipeline

The gas pipeline alignment, as currently proposed, would start near Happy Valley on the Kenai Peninsula and travel south paralleling the Sterling Highway for approximately 9 miles to a compressor station. From the compressor station, the pipeline heads southwest across Cook Inlet for 60 miles, before turning west for 35 miles to a landfall at the proposed Pebble port site near the mouth of Amakdedori Creek. A second compressor station and offtake point is located at the port site. The pipeline then follows the proposed road alignment from the port to the mine site, including crossing Iliamna Lake on the lake bed for approximately 18 miles. BSEE's jurisdiction for the proposed pipeline will likely only cover 63 miles, the portion that crosses federal waters of Cook Inlet.

The pipeline, as currently proposed, would be constructed of steel and designed to have a gross flow rate of 50 million standard cubic feet of natural gas per day. The onshore portions of the pipeline would be 10-inch diameter, while the offshore portion would be constructed using heavy wall 12-inch diameter pipe with negative buoyancy. All appropriate federal regulations would be followed in the design, construction, and operation of the pipeline.

Right-of-Way Decision Process



Pipeline right-of-way requirements for permitting are detailed in the 30 Federal Code of Regulations Part 250—Oil And Gas And Sulphur Operations In The Outer Continental Shelf Subpart J—Pipelines and Pipeline Rights-of-Way.

AMERICAN OVERSIGHT

Applications for permits must be submitted to the BSEE Regional Supervisor and will include detailed information about the right of way, including consideration of effects from water currents, storm or ice scouring, soft bottoms, mudslides, earthquakes, permafrost, and other relevant environmental factors.

While the pipeline in this case will ultimately be regulated by the U.S. Department of Transportation, Pipeline and Hazardous Materials Safety Administration, BSEE's interest is to have the requisite level of information that enables a well-informed right-of-way decision process, with the knowledge that environmental and safety factors have been considered and addressed.

Pebble Project Proposed Natural Gas Pipeline

John/Brian/Russ

OWOW, OGC, and OFA have been provided R10's draft scoping letter (2-page cover letter plus 25 pages of detailed comments) for concurrent review by all three HQ offices with a June 12 deadline to provide comments back to R10.

We have a few staff here in OWOW who are reviewing the letter. We plan to have our staff review completed by Friday and can report up to you our thoughts, comments on the draft letter. That gives you until June 12 to conclude your review and decide how to coordinate with Lee. I'm assuming Lee would just want to know your reaction and that we are fulfilling our public commitment to work with the Corps to ensure a robust NEPA process.

Let me know if you have questions.

Thanks, Palmer

Good Morning,

I set up a OneDrive File with the scoping letter to facilitate version control and sending the Region all of HQ comments on a single track change document. I have granted access to everyone on this email. If there are others that should be included, let me know and I will send invites. Please provide your comments on the OneDrive File using track changes.

The deadline for scoping comments is June 29th. The comments require additional review from management at both the Regional and HQ level, so we have a tight deadline to get our comments back to the Region by COB June 12th.

Please feel free to contact me with any questions.

Regards,

Megan

Importance: High

John/Brian/Russ

Please follow-up with Lee ASAP to secure his comments on the Pebble EIS scoping letter. R10 is trying to finalize the letter as it is due this week.

I reminded Lee about his comments last Wednesday night in Anchorage and he said he is still working on them – but R10 really needs to wrap this letter up now.

Looping in Megan Barnhart from OFA who is shepherding getting HQ comments back to R10

Hello Megan,
Attached please find Region 10's draft Scoping letter for the Pebble Project. This letter has already undergone legal and management review here in the Region, and is now ready for headquarters review. We would appreciate your identification of any major issues or concerns with the comments. In addition to OFA/NCD review, please also coordinate with OGC and OWOW. Heidi Nalven and Palmer Hough are the contacts and are standing by to coordinate review within their offices.

AMERICAN OVERSIGHT

We would appreciate receiving any comments by COB on June 12. We would also appreciate if you could compile all HQ comments in a single track changes version of the document. We do have a Sharepoint site for this project, so please let me know if it would be helpful to save the document there so each reviewer can add their comments to the same document.

Please let me know if you have any questions, and thank you for your review.

Subject: Schedule for OFA/OWOW review of draft Pebble EIS Scoping letter

Folks:

R10 has indicated that the internal review schedule for the draft Pebble EIS scoping letter has OFA/OWOW review scheduled for 6/4-6/12. The current version of the letter has a 2-page cover letter and approximately 23 pages of detailed comments organized by major topic areas.

Based on my role in the BBWA and the PD, I provided comments on an early draft. ORD staff who worked on the BBWA and PD were also consulted on early drafts of the letter.

Let me know if you have any questions or concerns.

Thanks, Palmer

> Chris – at Michelle's request, I'm sending you the latest version of the Pebble scoping letter that I have access to. This version has already undergone legal and management review here in R10 and was sent to HQ (OW, OP, and OGC) for their consolidated review one week ago. We expect to get written comments back today or tomorrow. Based on conversations I've had with HQ staff, I don't anticipate that the HQ comments will be very extensive or substantive.
>
> In response to some of the questions that Michelle asked me, I can report that Lee has asked to see a near-final version of the letter before it's sent; he has declined the offer of a briefing. I'm not certain whether he's seen a draft yet. This draft was shared with Drew Feeley (a political appointee in OP); he has not requested a briefing. I'm not as certain of the status within OGC (many of our ORC and OGC attorneys are out of the office this week – Allyn may have heard something).

Hello Megan,
Attached please find Region 10's draft Scoping letter for the Pebble Project. This letter has already undergone legal and management review here in the Region, and is now ready for headquarters review. We would appreciate your identification of any major issues or concerns with the comments. In addition to OFA/NCD review, please also coordinate with OGC and OWOW. Heidi Nalven and Palmer Hough are the contacts and are standing by to coordinate review within their offices.

We would appreciate receiving any comments by COB on June 12. We would also appreciate if you could compile all HQ comments in a single track changes version of the document. We do have a Sharepoint site for this project, so please let me know if it would be helpful to save the document there so each reviewer can add their comments to the same document.

Please let me know if you have any questions, and thank you for your review.

Subject: Pebble Scoping Letter - Review Requested

Hello Associate Reviewers,

I have completed a first draft of a scoping comment letter for the Pebble Project, which is now loaded onto the Sharepoint Site in the Documents>Scoping folder, at:
https://usepa.sharepoint.com/sites/R10_Work/pebble_project_po_nr_team/Shared%20Documents/Forms/AllItems.aspx?RootFolder=%2Fsites%2FR10%5FWork%2Fpebble%5Fproject%5Fpo%5Fnr%5Fteam%2FShared%20Documents%2FSco

AMERICAN OVERSIGHT

ping&FolderCTID=0x012000ED283061EF40A24EA7CBACD185680DDD&View=%7B42B3A007%2D064D%2D4BFE%2D9EA9%2DC93CF3F5EBE7%7D

Please review the draft letter, in particular the portions of the detailed comments that relate to your areas of expertise. This letter has been drafted based off of ERSMU's standard scoping language and language used in other recent letters for similar projects (including mining, road, pipeline, and port development projects). Some tweaks have already been made to reflect the specific considerations for this project, but there is likely to be more room for project-specific tailoring of the comments. Please review and provide:

(1) any edits necessary for technical accuracy, and

(2) any additional site-specific or project-specific technical information/concerns/recommendations you think necessary to convey to the Corps during this scoping period.

Please provide your edits in "track changes" format. If it is not too cumbersome, please make your edits directly in the document on the Sharepoint site (titled "Pebble Project Scoping 041118 draft"), to reduce the number of separate versions of the letter. If this format doesn't work for you, you can also save your edits as a separate version and I will work to consolidate them.

Please complete your review by **COB Wednesday May 2**. If you have any questions or think a meeting to discuss the comments on your subject area would be helpful, please let me know.

Thank you,
Molly

Hello Megan,
Attached please find Region 10's draft Scoping letter for the Pebble Project. This letter has already undergone legal and management review here in the Region, and is now ready for headquarters review. We would appreciate your identification of any major issues or concerns with the comments. In addition to OFA/NCD review, please also coordinate with OGC and OWOW. Heidi Nalven and Palmer Hough are the contacts and are standing by to coordinate review within their offices.

We would appreciate receiving any comments by COB on June 12. We would also appreciate if you could compile all HQ comments in a single track changes version of the document. We do have a Sharepoint site for this project, so please let me know if it would be helpful to save the document there so each reviewer can add their comments to the same document.

Please let me know if you have any questions, and thank you for your review.

John/Brian/Russ

Please follow-up with Lee ASAP to secure his comments on the Pebble EIS scoping letter. R10 is trying to finalize the letter as it is due this week.

I reminded Lee about his comments last Wednesday night in Anchorage and he said he is still working on them – but R10 really needs to wrap this letter up now.

Looping in Megan Barnhart from OFA who is shepherding getting HQ comments back to R10

Subject: REVIEW REQUEST - Pebble Preliminary Ch. 4 Sections

Hello All,
The Corps has distributed some very preliminary draft sections of Chapter 4 for Cooperating Agency review. These documents do not contain the actual project analysis, but appear to be more of a framework to work from in completing the analysis and EIS text. The sections include heading, some introductory-type text, and some blank tables. The Corps did not provide detailed instructions for review, but I recommend that we review from the perspective of determining whether the skeleton of the analysis presented here appears that it will address the key issues for review, and provide recommendations for inclusion of any issues that appear to have been overlooked in the current structure.

Here are the specific section assignments, similar to last time:

- 4.1 Intro - Molly
- 4.5 Recreation - Molly
- 4.11 Aesthetics - Molly
- 4.14 Soils - Mark/Palmer
- 4.16 Surface Water Hydrology - Tim/Mark/Palmer/Muluken
- 4.17 Hydrogeology - Tim/Mark/Palmer/Muluken
- 4.18 Water and Sediment Quality - Cindi/Tim/Chris
- 4.22 Wetlands/ Special Aquatic Sites - Mark/Palmer
- 4.26 Vegetation - Mark/Palmer

The Corps has requested a quick turnaround for review, therefore please send me any comments you may have on these sections by COB 7/24. I am hoping, given the brevity of these documents, that this timeframe will be achievable, but please let me know as soon as possible if it will not.

Please provide your comments in the attached comment table format.

It may be helpful to look back at the issues we recommended for analysis in our scoping comments - I have saved the final version of that letter on the Sharepoint Site here:
https://usepa.sharepoint.com/sites/R10_Work/pebble_project_po_nr_team/Shared%20Documents/Scoping/Pebble.062918.Scoping%20Letter%20FINAL.pdf

Thank you,
Molly

Joe/Kate

I hope you both are well. I've been working with the R10 NEPA shop to develop its EIS scoping letter for the Pebble EIS process. Scoping letters are our opportunity to lay out what kind of information and analysis we feel should be in an EIS.

Attached is the latest draft of the Pebble EIS scoping letter. You might recognize some language in the Cumulative Impacts and the Direct and Secondary Effects sections from the PD. If you have the time I would be very grateful for any thoughts you might have regarding edits to this letter. In particular I was wondering if you have thoughts on the question I raise on page 7 regarding suggesting collection of additional fishery related data.

My deadline for providing comments is May 2. Please call if you have questions.

Thanks, Palmer

Subject: Pebble Scoping Letter - Review Requested

AMERICAN OVERSIGHT

Hello Associate Reviewers,

I have completed a first draft of a scoping comment letter for the Pebble Project, which is now loaded onto the Sharepoint Site in the Documents>Scoping folder, at:
https://usepa.sharepoint.com/sites/R10_Work/pebble_project_po_nr_team/Shared%20Documents/Forms/AllItems.aspx?RootFolder=%2Fsites%2FR10%5FWork%2Fpebble%5Fproject%5Fpo%5Fnr%5Fteam%2FShared%20Documents%2FScoping&FolderCTID=0x012000ED283061EF40A24EA7CBACD185680DDD&View=%7B42B3A007%2D064D%2D4BFE%2D9EA9%2DC93CF3F5EBE7%7D

Please review the draft letter, in particular the portions of the detailed comments that relate to your areas of expertise. This letter has been drafted based off of ERSMU's standard scoping language and language used in other recent letters for similar projects (including mining, road, pipeline, and port development projects). Some tweaks have already been made to reflect the specific considerations for this project, but there is likely to be more room for project-specific tailoring of the comments. Please review and provide:

(1) any edits necessary for technical accuracy, and

(2) any additional site-specific or project-specific technical information/concerns/recommendations you think necessary to convey to the Corps during this scoping period.

Please provide your edits in "track changes" format. If it is not too cumbersome, please make your edits directly in the document on the Sharepoint site (titled "Pebble Project Scoping 041118 draft"), to reduce the number of separate versions of the letter. If this format doesn't work for you, you can also save your edits as a separate version and I will work to consolidate them.

Please complete your review by **COB Wednesday May 2**. If you have any questions or think a meeting to discuss the comments on your subject area would be helpful, please let me know.

Thank you,
Molly

Attachments: Pebble Project Scoping 051418 draft.docx

Hello Megan and Palmer. Thank you for your replies, I am glad the schedule will work out. In response to Palmer's question on the current form of the letter, it has changed a bit since the first draft, including quite a bit of reorganization of the aquatic resources section. I have attached the most current draft here in case either of you want to take a look, to get a sense of how it is shaping up. This letter is undergoing R10 management review now, so will likely change further before I send it to you for review. I am not seeking any edits from you at this time. Though, if you have any major concerns or questions, feel free to give me a call.
Thank you,
Molly

Subject: RE: Bristol Bay 404(c) Team Meeting - No meeting 9/11/18

Hello BB 404(c) Team,

I propose we cancel for 9/11. And, I would like to meet on 9/18.

As an update, I'm sharing the Bristol Bay Teams update for David Allnutt that Patty McGrath and I sent him and the BB check-in list today. See below.

Erik Peterson, NEPA Reviewer
U.S. EPA, Region 10
1200 Sixth Avenue, Suite 155
Seattle, Washington 98101-3140
(206) 553-6382

Hello,

Welcome back David! Given that you are out on September 11, we are canceling the check-in and the Bristol Bay Teams have the following update for you. We plan on having the Bristol Bay Check-in on September 25th at 9:00 am PST.

Updates

Permit Oversight/ NEPA Review Team

Scoping Document

- EPA reviewed and commented on the draft scoping document that describes the significant issues raised in scoping. The final scoping document is available on the Corp's Pebble EIS website.

Preliminary EIS review

- EPA reviewed and commented on specific portions of chapter 3 (affected environment) and chapter 4 (environmental consequences) that pertain to our areas of special expertise as identified by the Corps which includes: aesthetics, surface water hydrology, groundwater hydrology, water and sediment quality, wetlands, vegetation
- The documents have many placeholders since there have been changes to the proposed action, alternatives have yet to be developed, and there are numerous substantial requests for additional information where the Corps is awaiting response from PLP.
- It is not clear whether we will be provided with another opportunity to review these chapters before the draft EIS. The Corps has indicated that there will be technical meetings in October/November to discuss comments and the impact assessment.

Alternatives

AMERICAN OVERSIGHT

- The Corps is developing the range of alternatives to be analyzed in the EIS. We participated in a cooperating agency meeting and provided input. During the week of Sept 10, the Corps is to submit a detailed discussion of the alternatives selected for EIS review and rationale for those dismissed.

Site Visits

- July 9 – 11: CWA 404 field verification was completed by Mark Douglas
- July 31: Site visit with some of our NEPA team (Patty, Molly, Tim, Chris) to view the mine site, proposed Lake Iliamna port sites, and portions of the proposed roads.

Schedule

- The Corps Pebble EIS website identifies a draft EIS in January 2019 and a final EIS in late 2019.

404(c) Team

FOIA

- NRDC and CNN FOIA: extended until end 9/28/18 as we work on ex-Administrator's office employee non-email electronic records. Making progress.
- Trustees for Alaska FOIA: interim release of Corps equities documents on 8/31 and deadline extended until 10/31/18 to facilitate coordination between R10 and HQ on the remaining documents.

Representative DeFazio and Senator Carper letter response

- This July 2018 letter asks for Wheeler to revoke the June 2018 memo issued by Pruitt, describe his view of proper use of 404(c) and the Mingo Logan case, and, describe current and planned EPA actions regarding Pebble.
- EPA's response was uploaded to CMS for Lee F's signature on 8/27

Interest group letter to EPA

- This 9/6/18 letter to EPA from 15 interest groups (including, for example, the Competitive Enterprise Institute) urges Wheeler to rescind the proposed determination and applauds the June 2018 memo issued by Pruitt.
- If this letter is controlled for a response, HQ will share a draft with R10.

External Meetings

- Henry Darwin met with Pebble representatives the week of 8/2/18. The 404(c) Team uploaded a note of this meeting to our external meetings folder on share point.
- We want to emphasize our interest for external meetings at all levels to be recorded with: topic, date, attendees, agenda and notes.

PLP letter, memo to file

- An OGC clerk has completed a summary of court decisions on challenges to agencies withdrawing proposals.

Subject: Final scoping letter

All – attached is the final Pebble scoping letter that I signed this afternoon. Patty is submitting electronically to the Corps today.

To's – first, please accept and pass on my gratitude for the truly above and beyond efforts to see this over the finish line. There's a lot to feel good about in here. Second, please distribute to the (many) others whose efforts contributed to the final product (or to one of the many intermediate products). I started trying to address to all, but knew that I'd never come up with a complete list.

AMERICAN OVERSIGHT

Cc's – thanks for your support on this.

Erik and Patty – please set aside at least 20 minutes of our Tuesday team meeting agenda to discuss the letter and to begin discussing lessons learned.

Start: 5/2/2018 8:00:00 PM
End: 5/2/2018 9:00:00 PM
Show Time As: Tentative

Moving so that Carrie Wehling can join.

Hi –

We were originally planning on talking about the interaction between the PD and the scoping letter tomorrow during the biweekly. But, talked to Palmer after talking to MaryAnne and then Cara today, and we think a separate meeting on this is best. Heidi likely can't call in tomorrow and also I think we may want a full hour. Schedules are busy so this is the first available.

Conference Line/Code /

Hopefully this works.

Thanks,

Ashley

We categorized mine expansion (and development of other deposits) as a NEPA indirect effect. NEPA doesn't define secondary impacts – that's a b1 guidelines term.

AMERICAN OVERSIGHT

Attorney Client / Ex. 5

(b) Indirect effects, which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable. Indirect effects may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems.

Effects and impacts as used in these regulations are synonymous. Effects includes ecological (such as the effects on natural resources and on the components, structures, and functioning of affected ecosystems), aesthetic, historic, cultural, economic, social, or health, whether direct, indirect, or cumulative. Effects may also include those resulting from actions which may have both beneficial and detrimental effects, even if on balance the agency believes that the effect will be beneficial.

Attorney Client / Ex. 5

This issue should be elevated to OA. Is it required under current regs/guidance? CEQ has withdrawn its guidance on this issue.
My understanding is that Joel in the AO's office has reviewed this language. OFA reviewed this language and did not have any comments.
Joel is the career Agency's Senior Climate Resilience Adviser in OP. Note that Samantha supported Agency-wide climate resilience work, including an Agency-wide Climate Resilience Working Group with Regional representation. The Agency's 2019 budget submission included climate resilience work, albeit focused on non-fed partners (States, Tribes, local gov'ts, and communities) as I recall.

Hello Associate Reviewers,
As noted in Patty's email below, I have re-worked the schedule for completing the scoping letter based on the extension to the comment period. This has included extending time for each stage of the drafting and review of the letter. I now expect to have a first draft of the letter ready to share with you by the middle to end of this week, and will be able to provide approximately 3 weeks for your technical input into the letter. I appreciate your assistance with the scoping letter, and am glad that we will now have sufficient time for thoughtful and complete comments.
Thank you,
Molly

Subject: FW: POA-2017-271, Special Public Notice scoping extension

All-

The Corps has issued a special public notice extending the Pebble EIS scoping period an additional 60 days to end on June 29, 2018 (see link in the email below).
Molly had developed a schedule for our scoping letter based on the original 30 day comment period and was working with many of you on drafting an initial letter. A revised schedule will be developed based on the extended time period. This will give us all more time to provide technical, legal, and management input into our scoping letter.

Also, the Corps has added an additional public scoping meeting in New Stuyahok on April 13. This information can be found on the Corps' Pebble EIS website.

Patty

Interested parties are hereby notified that a Department of the Army permit application has been received for work in waters of the United States.

SPECIAL PUBLIC NOTICE DATE: April 6, 2018

IDENTIFICATION NUMBER: POA-2017-271

APPLICANT: Pebble Limited Partnership

CONTACT: For information regarding the proposed project plans and construction, please contact the applicant at:
Pebble Limited Partnership
3201 C Street, Suite 505
Anchorage, Alaska 99503.

For additional information regarding the EIS process (including scoping) please contact:
Mr. Shane McCoy

Subject: Pebble preliminary alternatives review

Hi Palmer, Barb, and Kate –

Based on the alternatives discussion at todays cooperating agency (CA) meeting, the Corps and AECOM will be developing a revised version of the 8/17 preliminary alternatives memo. The Corps said that CAs do not need to send written comments on the memo, but could wait and send comments on the revised version (expected around 9/1). Therefore, you do not need to send Molly written comments on the 8/17 version by the end of this week. We will send you the revised version for comment when it is available.

Thanks for your reviews to-date and the discussion today. Most of the points were discussed during the CA meeting. Stay tuned for the next version of the memo and in the meantime, feel free to call if you have questions.

Best regards-
Patty

AMERICAN OVERSIGHT

2005, Koerner et al. 2011). In general, longer lifespans are expected at lower temperatures and exposures to light (Rowe 2005, Koerner et al. 2011). Breakdown of the liner material and punctures by equipment or rocks may limit the effective life of liners (Rowe 2005). Overly steep slopes also may put stresses on geomembranes and cause them to fail. Service life data for other types of geomembranes are anecdotal and based on field performance, since no laboratory studies have been conducted (Koerner et al. 2011).

If seepage is expected or observed, mitigation or remedial measures such as interception trenches or seepage recovery wells can be installed around the perimeter and downstream of the TSF to capture water and redirect it to a treatment facility. Precipitation runoff from catchment areas up-gradient of the TSF is typically diverted away from the impoundment to reduce the volume of stored liquid.

Dry stack tailings management, in which tailings are filtered and "stacked" for long-term storage, is a newer, less commonly used tailings disposal method. Dry stacked tailings require a smaller footprint, are easier to reclaim, and have lower potential for structural failure and environmental impacts (Martin et al. 2002) (Box 4-7). Dry stack technology has found greatest acceptance in arid regions where water is scarce or expensive, although dry stacks are also used in wet climates or in cold regions where water handling is difficult (Martin et al. 2002). Currently, the only mines in Alaska that use dry stack tailings disposal are underground mines with high-grade ore and relatively low quantities of tailings (e.g., Greens Creek, a lead, silver, zinc mine in southeast Alaska; Pogo, a gold mine in eastern interior Alaska; and Nixon Fork, a gold mine in west-central Alaska).

BOX 4-7. DRY STACK TAILINGS MANAGEMENT

In a dry stacking operation, tailings are dried using filter presses or vacuum technologies such that water content typically falls below 20%. The dewatered tailings are either loaded into trucks or transported by conveyer to the tailings storage facility (TSF), where they are spread in lifts and compacted, similar to a traditional earth-moving operation.

The compacted tailings have a higher in-place bulk density than tailings placed using more conventional slurry methods. We estimate that dry stacking would reduce the required volume for tailings storage by approximately 15%. The lower water content of dry stack tailings means that less water is captured in the void spaces between solid tailings particles, reducing the amount of water "lost" to the TSF by approximately one-third. The additional water that is not captured in the TSF is available for treatment and release, potentially reducing streamflow losses in local streams. The higher density and lower water content of the tailings also increase their stability. In many cases, the need for a confining embankment and the risk of a tailings dam failure and tailings liquefaction can be eliminated with dry stack management.

The additional capital costs for dewatering equipment and the high energy cost of dewatering have often been barriers to adopting dry stack tailings management for low-grade ores such as porphyry copper. However, higher production costs may be at least partially offset by cost savings in other areas. For example, the increased stability of a dry stacked TSF may reduce closure costs, post-closure monitoring costs, and post-closure financial assurance requirements.

Dry stacked tailings are typically placed in unsaturated conditions, which can increase the exposure of tailings to oxygen. Thus, this type of storage may be less appropriate for potentially acid-generating tailings or may require additional engineering controls to limit, collect, or treat acid drainage. Where TSFs are typically used to store water as well as tailings, the use of dry stack tailings may not eliminate the need for construction and operation of a separate water impoundment facility.

AMERICAN OVERSIGHT

EPA-0135-0000964

VAN ZYL RESPONSE: The author agrees that from a regulatory perspective "best management practices" (BMPs) is typically used for non-point source runoff. However, the term is also in much broader use in practice to refer to other activities and this is somewhat recognized. Addition of Box 4-1 helps to clarify this point.

EPA FINAL RESPONSE: No response required.

Mine scenarios. The executive summary indicates (p. ES-11): "The mine scenario includes minimum and maximum mine sizes, based on the amount of ore processed (2 billion metric tons vs. 6.5 billion metric tons), and approximately corresponding mine life spans of 25 to 78 years, respectively". This seems to indicate that the mine life cycle in the first case consists of 25 years of operational life followed by closure and, similarly for the second case, 78 years of operational life followed by closure. However, a careful review of the water management section (section 4.3.7) indicates that this is not the case. The EPA water balance calculations are simplified to a set of deterministic values in Table 4-5 for four water management stages during the overall mine life cycle: start-up, operations minimum mine (25 years), operations maximum mine (78 years), and post-closure. For post-closure, only the 78-year mine life numbers are used. It therefore seems that EPA is not considering that the 25-year mine will close, but that its life will automatically be extended to 78 years. Does this mean that the EPA really does not evaluate the minimum mine size completely, i.e. the 25-year mine life followed by closure? It is important that this be clarified as it would be inconsistent not to evaluate closure of the 25-year mine. It is possible that additional evaluations, or at least additional explanations, will be required to clarify this.

EPA RESPONSE: The reviewer is correct. Our water balance calculations only explicitly present the closure of the Pebble 6.5 scenario. The water balance for the Pebble 0.25 and the Pebble 2.0 scenarios would be similar, but in those scenarios there would be no water captured in TSF 2 or TSF 3 and the amounts captured in the pit would be proportionally smaller, as they are in the operating scenarios. While the pit is filling in each of the three scenarios, the total amount of water captured is slightly less than the amount captured during operations, and about 35% to 45% of the water captured is available for reintroduction to the streams. Once the pit is full, the amount captured at the nine pit area drops substantially and 100% of the captured water is reintroduced. Post closure flows for the three mine scenarios are presented in Table 6-8.

Tailings management technologies. Ongoing technology development has resulted in a broader range of tailings management options than only slurry tailings disposal. Filtered dry stack tailings can be considered as a realistic option, even for mines with higher production rates. Flotation of remaining sulfides in the tailings before deposition is also a realistic option for mines; it has been done successfully at the Thompson Creek Mine in Idaho for the last 18 plus years. While these technologies are mentioned, they are not selected for reasons such as technology not being appropriate for the climatic conditions and concerns with disposal of pyrite waste. Both of these are not insurmountable technical issues and adopting such management options will reduce failure probabilities and potential impacts following a failure. The failure mode of a filtered dry stack facility not containing sulfides will be completely different from a slurry impoundment and the potential environmental impacts of these other tailings management options will definitely be far smaller than those for the selected mine scenario using slurry tailings disposal.

AMERICAN OVERSIGHT
EPA-0135-0000965

*EPA RESPONSE: Selective flotation to lower the pyrite content has been added to the discussion of processing in Chapter 4 and referenced in Chapter 6 as being done in the assessment scenarios. How tailings are managed within the impoundment can affect water chemistry and a dry stack with sulfides removed may produce the best water quality results after reclamation if the fate of the sulfide tailings is never considered. According to Ghaffari et al. (2011), 14% of the tailings produced would be pyritic (with the selective flotation method used), which equates to an average of 28,000 tons/day in a 200,000 tons/day mining operation, or over 255 million tons during a 25-year estimated lifetime for that scenario. These tailings need to be managed in such a manner that oxidation does not lead to acidic drainage and the most effective way is to deposit them subaqueously. Additionally, a "rule of thumb" for design of dry stack tailings is to allot 25 acres for every thousand dry tons of tailings per day over the life of a 20-year operation (SME Mining Engineering Handbook 1973). Assuming our scenario of 200,000 tons per day processed and that 99% of this material was waste tailings, this would amount to 4900 acres (25 *200,000 *.99/1000) or 19.8 km^2 over 20 years. This exceeds the internal surface area taken up by the TSF for tailings deposited over 25 years for the same mass of material processed per day by 5.6 km^2; thus, even if there were not a risk of the PAG tailings acidic leaching potential, dry stack tailings disposal at this site would create additional surface area loss versus the scenario's traditional dam.*

VAN ZYL RESPONSE: The response refers to a "rule of thumb" from the SME Mining Engineering Handbook (1973) about allotment of space for dry tailings. The author is not aware of any hard rock dry tailings management projects in the 1970's, these really came to being in the 1980's and 1990's. It is therefore not clear what experience base was used to establish this "rule of thumb". The author has not reviewed the reference, however assuming 100 pcf density for the dry tailings the rule indicates a height of tailings stack of about 130 ft. This clearly is dependent on the topography and there is no reason not to construct stacks that are higher. There is no reason why the overall area covered by dry tailings should be larger than the footprint of a slurry tailings deposit as the dry density of placed and compacted tailings will be higher than that of slurry tailings. The statement that "*dry stack tailings disposal at this site would create additional surface area loss versus the scenario's traditional dam*" contained in the present response is not correct and should be reconsidered as a reason to dismiss this option.

Please also note that the comments in the responses are inconsistent with that in the Second Draft on p. 4-18:

> **Dry stack tailings management in which tailings are filtered and "stacked" for long-term storage, is a newer, less commonly used tailings disposal method. Dry stacked tailings require a smaller footprint, are easier to reclaim, and have lower potential for structural failure and environmental impacts (Martin et al. 2002). However, the high-energy cost of dry stack technology remains a barrier for mining low-grade ores such as porphyry copper. In addition, this type of storage is inappropriate for acid-generating tailings and is less feasible in larger operations, where tailings impoundments serve to store water as well as tailings. It is most applicable in arid regions, although dry stacks are also used in wet climates or in cold regions where water handling is difficult (Martin et al. 2002). Currently, the only mines in Alaska that use dry stack disposal of tailings**

AMERICAN OVERSIGHT
EPA-0135-0000966

are underground mines with high-grade ore and relatively low quantities of tailings (e.g. Greens Creek, a lead, silver, zinc mine in southeast Alaska; and Pogo, a gold mine in eastern interior Alaska).

It should also be noted that it is not only higher energy costs but also capital and other operating costs that make this technology more expensive. However, if this tailings management method results in lower environmental risks then it should be seriously considered and potentially included in project considerations, even if only to enumerate the lower risks, e.g., the tailings failure scenario will not occur because there is no fluid stored and all surface water can be diverted. This issue of acid drainage can also be addressed in the design of the facility, note that acid drainage collection and treatment from the tailings impoundment is included in the present assessment.

EPA FINAL RESPONSE: We agree with the commenter that the statement "dry stack tailings disposal at this site would create additional surface area loss versus the scenario's traditional dam" is not correct and should be removed from our initial response. Information on dry stack tailings management has been expanded in the final assessment (Box 4-7), and this information clarifies that dry stack tailings management would not result in a larger tailings storage footprint.

Waste rock management. The waste rock management plan on p. 4-13 calls for the potentially acid generating (PAG) waste rock to be separated from the rest of the waste rock and states that the "PAG waste rock might be placed in the open pit at closure to minimize oxidation of sulfide minerals and generation of acid drainage". However, on p. 4-33 it is stated that: "PAG waste rock will be processed through the flotation mill prior to mine closure, with tailings placed into the TSF (tailings storage facility) or the mine pit." These two alternatives represent completely different management, economic and environmental conditions and are not consistent. Milling the PAG waste rock represents a higher cost than placing the PAG rock in the pit and placing the PAG waste rock tailings in the TSF will increase the size of the TSF. Placing the PAG tailings in the pit will set up a completely different management scenario than placing the PAG waste rock in the pit. The EPA should clarify which option or range of options they select for evaluation and use that consistently in the assessment.

EPA RESPONSE: These statements have been made consistent. The revised assessment scenarios include processing the PAG waste rock over the course of operations to minimize the length of time a PAG waste rock pile would be on the surface, and thus minimize its potential for oxidation and subsequent release of acidic leachate. There is no longer mention of PAG rock being disposed in the pit at closure (Section 6.3.3).

Water balance and management – waste rock. Mine site water balance and management is a very complex issue as recognized by the EPA on p. 4-27: "…water balance development is challenging and requires a number of assumptions". Because of these uncertainties, complex probabilistic dynamic models are employed at mines where the site details are better defined than that of the EPA hypothetical mine scenario. The information in Box 4-2 indicates that the "captured flows include water captured at the mine site and the TSFs (Table 4-5). The total amount of water captured at the mine site includes net precipitation (precipitation minus evapotranspiration [footnote: during operations most of these areas will not be covered with vegetation and the correct terminology here is

AMERICAN OVERSIGHT
EPA-0135-0000967

Mitigation: Complete Tailings Storage Facility (TSF) Failure. In some ways, some of the failures reviewed herein are not really subject to mitigation. For example, if a Tailings Storage Facility (TSF) completely fails, options for mitigation become limited very quickly. With a complete failure, it is "game over", with toxic sediments flowing into the Nushagak River all the way to Bristol Bay, thereby destroying the entirety of salmonid spawning habitat in this river by redirecting the channel and inundating the gravel/cobble steam bed with sediment (meters in depth). Mitigation under these circumstances is impossible, in my view. Given this scenario, I was surprised that the impacts were only assessed 30 km downstream of the TSF failure; is this realistic? I think not, given what we know of other mines.

EPA RESPONSE: We acknowledge the limitations of the hydrologic modeling. We now emphasize more clearly the potential for the effects of TSF failure to extend to Bristol Bay. The potential for remediation (and associated risks) are discussed in Section 9.7.

The amount of text dedicated to a TSF failure is large (36 pages) as compared to other failures. I suggest this section be shortened to bring it more in line with other sections. Briefly summarizing impacts would focus the text and help the reader appreciate what it would mean to have a TSF failure without having to wade through so much text.

EPA RESPONSE: We have revised this section of the assessment. However, given its importance to stakeholders, local communities, and decision makers, it was not significantly shortened. Other accidents and failures are now addressed in more detail.

Dry Stacking Mine Tailings: Appendix I, page 9. Given the horrific impact of a TSF dam failure, should mine operators consider a relatively new technique incorporating "paste tailings technology"? Here, tailings are thickened by water removal (down to 20% water) and filtering; tailings are then dry stacked onto a lined disposal site. These stacks "have a lower potential for structural failure and environmental impacts" (Martin et al. 2002). I would encourage the authors to argue for this substitute for the more traditional TSF for this solves at least two problems: 1) eliminates the possibility of a TSF failure (a huge gain!) and 2) reduces the amount of monitoring and maintenance of the waste tailings "In Perpetuity" (another major gain). Finally, what does "Best Management Practices" have to say about these two approaches to the storage of tailings waste?

EPA RESPONSE: We agree that dry stack storage and paste storage are options for mine proponents to consider. Although the option of using paste tailings is one that might be explored, the type of tailings disposal that operators propose is generally based on two things: the type of mine and the quantity of tailings. A balance would need to be considered between the low risk/high impact of a tailings dam failure and the certainty of increased area of disposal and the increased cost of tailings handling for paste tailings. A "rule of thumb" for design of dry stack tailings is to allot 25 acres for every thousand dry tons of tailings per day over the life of a 20 year operation (SME Mining Engineering Handbook 1973). This would amount to 4,900 acres (25 *200000 *.99/1000). Since paste tailings are more voluminous than dry and the scenario contains a 25 year mine life rather than 20 years, the area of a paste tailings facility would exceed the calculated amount resulting in over a 1/3 increase in the area occupied by tailings than

AMERICAN OVERSIGHT

contemplated in the current mine scenario. With a paste tailings facility, the monitoring and maintenance of a large dam is removed but that is replaced by the monitoring and perhaps treatment of the leachate draining through the tailings pile (that contains 20% water) as well as the long-term maintenance of the cap that is placed over the tailings at the end of the mine life. The choice of a tailings disposal methodology may be affected by the need to avoid or minimize effects to wetlands or the technical feasibility of constructing the structural components of the project.

Mitigation: Partial TSF Failure. If a TSF partially fails or is discovered beginning to fail, then I believe mine operators have a chance to save the dam and thereby protect the river, but only if: 1) the appropriate Standard Operating Procedures (SOP) for an emergency response are in place, 2) the necessary equipment (my presumption here is that heavy, earth-moving equipment would be required), materials, and supplies are onsite near the facility, and 3) trained personnel (meaning that they have practiced these repair SOPs in the preparation for such an event) are available for immediate action. One might argue that these procedures are more proactive than mitigating and I would agree, reflecting the near impossibility of invoking any mitigation measures associated with TSF failure.

EPA RESPONSE: Our scenarios presuppose that there are mitigation measures in place, but examines the effects of a failure of those measures. EPA agrees that SOPs are part of a mining operation and plan; however, inclusion of SOPs and details for emergency responses to a failing dam were outside the scope of this assessment. No change suggested or required.

Dredging: Post TSF Failure. In the text (pages 6-1 to 6-2), a reference is made to dredging materials out of the river post spill. I can't imagine this would mitigate any losses of spawning substrate for salmon. Indeed, because only 5% fines in gravel substrates compromise salmon reproductive success (and perhaps even selection of these areas for spawning in the first place), removal of meters of sediment with a dredge doesn't seem to be a solution. Whereas dredging might, in a best-case scenario, reduce the time to recovery of the substrate, I don't believe it will hasten recovery significantly. Dredging also serves to bring toxic sediments up into the water column perhaps compromising all organisms in the system. By not dredging, we allow the natural system to recover, which, in my view, would be preferable to any sort of "dredging mitigation". Some reflection by the authors on this issue would be valuable.

EPA RESPONSE: Agreed. Adverse effects of dredging are discussed in Section 9.7.

Mitigation: Pipeline Failure. With automatic shut-off valves stationed along all four pipelines, we would expect to know precisely just how much effluent will be spilled during any single event. With this information in hand, mine operators can easily anticipate spill size, toxicant characteristics and thereby judge what equipment, materials, and supplies would be necessary for mitigating any spill. As with the TSF failure, mine operators should have in place: 1) the appropriate Standard Operating Procedures (SOP) for an emergency response, 2) the necessary equipment, materials, and supplies onsite near the pipeline (given the length of the road, these items should be cached at several locations along the road, such that response time is minimized), and 3) trained personnel (meaning that they have practiced these mitigation SOPs in the preparation for such an event) are available for

DRAFT CONFIDENTIAL –DELIBERATIVE AND PREDECISIONAL

Matt, Palmer, Heather,

I took a look at the scoping comment draft comments. You guys have given it a pretty thorough look—unbelievable given the original turnaround; my congratulations.

I suggested some language in the early part of the draft scoping comments up front. I would appreciate the opportunity to talk to you about this before we make this final. Deliberative Process / Ex. 5

Hi Mary Anne-
You had asked about the Pebble EIS scoping comments.
Matt and Palmer are leads on developing the comments from the 404 program. We assumed that they would reach out to others in the 404 program, as needed. Attached is the latest email from Palmer.
If you want to add or revise comments, please work from this draft and send revisions to Molly (see Molly's original email below).

I will be out of the office next week, Monday – Thursday, so please contact Molly with questions.

Thanks - Patty

Molly

Yesterday I was able to access and read your "standard" NEPA scoping language for aquatic resources in the sharepoint file you sent and I think it is a good starting point.

I tried to log in and edit it today but am unable to access the file. I think it needs to be supplemented to reflect some of the specific areas of focus from our previous work on this case. I've taken a first cut at what needs to be added to your standard text in the attached. It has three sections: direct and secondary effects, cumulative effects, and accidents and failures.

Personal Matters / Ex. 6 I look forward to continuing to work with you on this letter when I return.

I'm cc'ing Ashley and Heidi as they will likely recognize some of this language from the PD.

Please let me know if you have any questions regarding my suggestions.

Thanks, Palmer

Hello Matt and Palmer,
As I know you are very aware, our timeline for preparing scoping comments is very tight. Because there are a lot of project-specific concerns with regard to what would constitute an appropriate wetland impact analysis in the Draft EIS, I want to give you as much time as possible to help develop the wetland scoping comments. I have attached some "standard" NEPA scoping language for aquatic resources as a starting point. Please edit, expand, etc. as appropriate to convey the needed information for Pebble.

In order to meet the April 30th deadline, we have to meet a very aggressive letter writing schedule. Please provide your edits/additions to this scoping language **by COB April 9.**

I will begin working simultaneously on the remainder of the letter, so apologize that I don't have that for you to see now for context. My schedule for preparing the scoping comments is to have a first draft of the rest of the letter by COB on the 5th, and I'll share it with you at that time.

If you have any questions or concerns about the scoping comments or the timeline, please let me know.

Thank you,
Molly

Hi Palmer,
Thank you so much for your work on the scoping comments, and sorry the OneDrive link is not working correctly. (There have seemed to be a lot of issues OneDrive lately). I've attached the "standard" language here as a Word doc in case that is helpful for you or others on this email chain.
Thanks,
Molly

Yesterday I was able to access and read your "standard" NEPA scoping language for aquatic resources in the sharepoint file you sent and I think it is a good starting point.

I tried to log in and edit it today but am unable to access the file. I think it needs to be supplemented to reflect some of the specific areas of focus from our previous work on this case. I've taken a first cut at what needs to be added to your

AMERICAN OVERSIGHT

standard text in the attached. It has three sections: direct and secondary effects, cumulative effects, and accidents and failures.

Personal Matters / Ex. 6 I look forward to continuing to work with you on this letter when I return.

I'm cc'ing Ashley and Heidi as they will likely recognize some of this language from the PD.

Please let me know if you have any questions regarding my suggestions.

Thanks, Palmer

Subject: FW: Pebble Scoping Letter - Review Requested

Joe/Kate

I hope you both are well. I've been working with the R10 NEPA shop to develop its EIS scoping letter for the Pebble EIS process. Scoping letters are our opportunity to lay out what kind of information and analysis we feel should be in an EIS.

Attached is the latest draft of the Pebble EIS scoping letter. You might recognize some language in the Cumulative Impacts and the Direct and Secondary Effects sections from the PD. If you have the time I would be very grateful for any thoughts you might have regarding edits to this letter. In particular I was wondering if you have thoughts on the question I raise on page 7 regarding suggesting collection of additional fishery related data.

My deadline for providing comments is May 2. Please call if you have questions.

Thanks, Palmer

Subject: Pebble Scoping Letter - Review Requested

Hello Associate Reviewers,

I have completed a first draft of a scoping comment letter for the Pebble Project, which is now loaded onto the Sharepoint Site in the Documents>Scoping folder, at:
https://usepa.sharepoint.com/sites/R10_Work/pebble_project_po_nr_team/Shared%20Documents/Forms/AllItems.aspx?RootFolder=%2Fsites%2FR10%5FWork%2Fpebble%5Fproject%5Fpo%5Fnr%5Fteam%2FShared%20Documents%2FScoping&FolderCTID=0x012000ED283061EF40A24EA7CBACD185680DDD&View=%7B42B3A007%2D064D%2D4BFE%2D9EA9%2DC93CF3F5EBE7%7D

Please review the draft letter, in particular the portions of the detailed comments that relate to your areas of expertise. This letter has been drafted based off of ERSMU's standard scoping language and language used in other recent letters for similar projects (including mining, road, pipeline, and port development projects). Some tweaks have already been made to reflect the specific considerations for this project, but there is likely to be more room for project-specific tailoring of the comments. Please review and provide:

(1) any edits necessary for technical accuracy, and

(2) any additional site-specific or project-specific technical information/concerns/recommendations you think necessary to convey to the Corps during this scoping period.

Please provide your edits in "track changes" format. If it is not too cumbersome, please make your edits directly in the document on the Sharepoint site (titled "Pebble Project Scoping 041118 draft"), to reduce the number of separate versions of the letter. If this format doesn't work for you, you can also save your edits as a separate version and I will work to consolidate them.

AMERICAN OVERSIGHT

Please complete your review by **COB Wednesday May 2**. If you have any questions or think a meeting to discuss the comments on your subject area would be helpful, please let me know.

Thank you,
Molly

That would be great. When you send the onedrive file of the Pebble scoping letter can you include the folks cc'ed on this email (I also may add one more person tomorrow)?

I will ask for the OWOW folks to include their comments in the file by NLT noon on Friday, so that we have time to brief up the chain in OWOW before our 6/12 deadline for getting comments back to Region 10.

Thanks, Palmer

Hello Megan,
Attached please find Region 10's draft Scoping letter for the Pebble Project. This letter has already undergone legal and management review here in the Region, and is now ready for headquarters review. We would appreciate your identification of any major issues or concerns with the comments. In addition to OFA/NCD review, please also coordinate with OGC and OWOW. Heidi Nalven and Palmer Hough are the contacts and are standing by to coordinate review within their offices.

AMERICAN OVERSIGHT

We would appreciate receiving any comments by COB on June 12. We would also appreciate if you could compile all HQ comments in a single track changes version of the document. We do have a Sharepoint site for this project, so please let me know if it would be helpful to save the document there so each reviewer can add their comments to the same document.

Please let me know if you have any questions, and thank you for your review.

Subject: Please Review: Pebble EIS: Preliminary Alternatives Screening

Hello Kate, Barb and Palmer,
We have received a preliminary list of alternatives and description of screening criteria used in developing alternatives for the Pebble EIS. Given your experience in developing mine scenarios for the Watershed Assessment, we would appreciate if you can review this preliminary document. We would appreciate any input you may have by COB Friday, so that we can compile all comments in time to meet the Corps deadline. I will also follow this email with an invite to discuss later this week. Please don't hesitate to call if you have any questions about this document or the review request prior to the scheduled conference call.
Thank you,
Molly

Subject: Pebble Scoping Letter for HQ Review

Hello Megan,
Attached please find Region 10's draft Scoping letter for the Pebble Project. This letter has already undergone legal and management review here in the Region, and is now ready for headquarters review. We would appreciate your identification of any major issues or concerns with the comments. In addition to OFA/NCD review, please also coordinate with OGC and OWOW. Heidi Nalven and Palmer Hough are the contacts and are standing by to coordinate review within their offices.

We would appreciate receiving any comments by COB on June 12. We would also appreciate if you could compile all HQ comments in a single track changes version of the document. We do have a Sharepoint site for this project, so please let me know if it would be helpful to save the document there so each reviewer can add their comments to the same document.

Please let me know if you have any questions, and thank you for your review.

Subject: FYI- Pre-Draft Chapters 1 and 2 of Pebble EIS

Hello All,
I have created a new folder on the Sharepoint Site where I will begin storing all of the sections of the preliminary Draft EIS as we receive them: "Preliminary Draft EIS Sections Oct-Nov 2018"

In addition to the documents previously shared (the Revised Project Description and powerpoint presentation on Alternatives), this folder now contains the draft text of Chapter 1 and Chapter 2 (with additional folder containing figures). Comments are not requested on these sections, however, they have been provided for our review as context for review of the analysis in Chapter 3 and 4, so I do recommend reading when you get a chance.

As previously mentioned, we will be receiving the sections of Ch. 3 and 4 on a rolling basis between now and the first week of November. A few sections (the intros to 3 and 4 as well as Recreation sections) have already been received and are also available in the new folder.

Thank you,
Molly

Subject: Pebble Scoping Letter - Review Requested

Hello Associate Reviewers,

I have completed a first draft of a scoping comment letter for the Pebble Project, which is now loaded onto the Sharepoint Site in the Documents>Scoping folder, at:

Internal Website / Ex. 6

Please review the draft letter, in particular the portions of the detailed comments that relate to your areas of expertise. This letter has been drafted based off of ERSMU's standard scoping language and language used in other recent letters for similar projects (including mining, road, pipeline, and port development projects). Some tweaks have already been made to reflect the specific considerations for this project, but there is likely to be more room for project-specific tailoring of the comments. Please review and provide:

(1) any edits necessary for technical accuracy, and

(2) any additional site-specific or project-specific technical information/concerns/recommendations you think necessary to convey to the Corps during this scoping period.

Please provide your edits in "track changes" format. If it is not too cumbersome, please make your edits directly in the document on the Sharepoint site (titled "Pebble Project Scoping 041118 draft"), to reduce the number of separate versions of the letter. If this format doesn't work for you, you can also save your edits as a separate version and I will work to consolidate them.

Please complete your review by **COB Wednesday May 2**. If you have any questions or think a meeting to discuss the comments on your subject area would be helpful, please let me know.

Thank you,
Molly

Joe/Kate

I hope you both are well. I've been working with the R10 NEPA shop to develop its EIS scoping letter for the Pebble EIS process. Scoping letters are our opportunity to lay out what kind of information and analysis we feel should be in an EIS.

Attached is the latest draft of the Pebble EIS scoping letter. You might recognize some language in the Cumulative Impacts and the Direct and Secondary Effects sections from the PD. If you have the time I would be very grateful for any thoughts you might have regarding edits to this letter. In particular I was wondering if you have thoughts on the question I raise on page 7 regarding suggesting collection of additional fishery related data.

My deadline for providing comments is May 2. Please call if you have questions.

Thanks, Palmer

Attachments: Additions to aquatic resources section of NEPA scoping letter.docx

Molly

Yesterday I was able to access and read your "standard" NEPA scoping language for aquatic resources in the sharepoint file you sent and I think it is a good starting point.

I tried to log in and edit it today but am unable to access the file. I think it needs to be supplemented to reflect some of the specific areas of focus from our previous work on this case. I've taken a first cut at what needs to be added to your standard text in the attached. It has three sections: direct and secondary effects, cumulative effects, and accidents and failures.

Personal Matters / Ex. 6 I look forward to continuing to work with you on this letter when I return.

I'm cc'ing Ashley and Heidi as they will likely recognize some of this language from the PD.

Please let me know if you have any questions regarding my suggestions.

Thanks, Palmer

Subject: Pebble - Wetlands Scoping Comments

Hello Matt and Palmer,
As I know you are very aware, our timeline for preparing scoping comments is very tight. Because there are a lot of project-specific concerns with regard to what would constitute an appropriate wetland impact analysis in the Draft EIS, I want to give you as much time as possible to help develop the wetland scoping comments. I have attached some "standard" NEPA scoping language for aquatic resources as a starting point. Please edit, expand, etc. as appropriate to convey the needed information for Pebble.

In order to meet the April 30th deadline, we have to meet a very aggressive letter writing schedule. Please provide your edits/additions to this scoping language **by COB April 9.**

I will begin working simultaneously on the remainder of the letter, so apologize that I don't have that for you to see now for context. My schedule for preparing the scoping comments is to have a first draft of the rest of the letter by COB on the 5th, and I'll share it with you at that time.

If you have any questions or concerns about the scoping comments or the timeline, please let me know.

Thank you,

AMERICAN OVERSIGHT

Subject: RE: Alaska North Slope Permitting Initiative
Importance: High

Good morning Russ, can you advice the EPA Region to reach out and discuss these ideas with the Alaska District directly? It seems our suggestion to have the Region work directly with the District is not getting traction and I don't understand why. The big group discussion proposed below may not work for the purpose of further fleshing out these ideas in preparation for briefings to leadership. Before any further engagement we'd like to see the Region and the District working together on this effort based on a mutually agreed scheduled. The Alaska District POC has her hands full with the Pebble Mine project, so setting time aside for this discussion needs to be coordinated directly with her. Therefore, I cannot guarantee that she will be available for the meeting tomorrow.

Please give me a call if you would like to discuss or have questions on my request above.

Thanks
Myrna

Attached are the updated option papers for RGP and Pre-application reflecting all comments received and including the notes from Corps. Myrna - thanks for consolidating and sending comments yesterday. Thanks also for the context on Corps processing times for permits, that will be helpful shaping the conversation going up the chain.

I have also attached a brief context setting introduction / background paper OFA put together, which depending on the final use may want to include more of the existing resources identified on the RIBITS site for the Alaska District - Assessment Tools - Watershed-Plans/Tools.

AMERICAN OVERSIGHT

Please review the following for discussion on Thursday:

* Pre-App Option
* RGP Option
* Watershed Plans (option 6) from Corps shared yesterday
* Updated options 1-5 coming soon from Matt
* Intro-Background Paper

And remember we are looking for everyone's final comments and thoughts by Friday.

Thanks,

Brian

Allison,

Please note that the version OGC was working from is not the region's most recent draft which includes OW comments and a change of tone in places in response to Lee. Since David was not working off the SharePoint document which included OW comments, there are additional changes not in this draft. The region knows they will have to merge the two, but an FYI.

Apologies for the multiple versions, but we also just closed a loop on a separate question from Drew Feeley about the air quality section starting on page 15 and ARLO gave us some incredibly speedy feedback. The version attached here incorporates some clarification on the distinction between air quality considerations for NEPA purposes and what the project may ultimately be subject to under the CAA. I've pulled out the relevant section below:

Rob,

Since we did not meet with Brittany last Friday, we didn't have the opportunity to ask about the Pebble letter. We anticipate getting OGC's consolidated comments back by COB today, and we understand that Lee Forsgren will also be providing comments. Megan is responsible for consolidating all HQ comments and need to know if we should be expecting anything from the OP front office.

Please advise.

Thanks

Drew, can we all meet at 1? That will give us a bit of time this morning to receive some general feedback on the issues that OGC are looking at. Also, Kelly has a conflict at 11:30, so 1 would work better for both of us.

Thanks, Rob

That's fine. Is there a recent draft that I could look at to see what's been done so far?

Recommend that you just work off of the copy you have. Version control has gone out the window as comments from HQ have been tardy in getting to the region and they have been trying to incorporate the changes on a piecemeal basis.

Subject: Pebble Cooperating Agency Meeting
Attachments: 20181024 Cooperating Agency Meeting.pdf
Location: Atwood Conference Center Room 106, 550 W 7th Avenue, Anchorage

Start: 10/24/2018 8:30:00 PM
End: 10/25/2018 12:30:00 AM
Show Time As: Busy

Recurrence: (none)

Attached are slides for today's cooperating agency meeting.

Shane will be providing additional information on the meeting next week but asked that I send the teleconference and WebEx information. Additional materials/handouts will be distributed before the meeting for those calling in.

Draft Agenda:
1. Review of alternatives to be analyzed in detail
2. Format and level of detail for Chapter 2
3. Update on Appendix B (addressing USACE/CA comments, next version will be Draft EIS)
4. Review of select alternatives:

a. Filtered tailings (dry stack)
c. Other mine locations
d. Underground mining

AMERICAN OVERSIGHT

INTRODUCTION

This document describes the roles and responsibilities of the various cooperating agencies (CA) in order to establish a protocol for communication, early identification and resolution of issues, and to resolve issues that could delay completion of the environmental impact statement (EIS) and respective records of decision (ROD) for action agencies

LEAD AGENCY

The U.S. Army Corps of Engineers (USACE) is the lead federal agency for completion of the EIS. The responsibility of the lead agency is to ensure compliance with applicable laws and regulations (i.e. National Environmental Policy Act (NEPA), Clean Water Act (CWA), etc.). USACE is responsible for managing the process, schedule, and final content of the EIS; identifying and selecting CA; and involving the public in the process. USACE will select a third party contractor in accordance with Regulatory Guidance Letter No. 05-08 for preparation of the EIS. The Council of Environmental Quality (CEQ) regulations for the implementation of the NEPA govern the CA relationship for all Federal agencies preparing EISs under the NEPA. The USACE's regulations and policies regarding CA are in agreement with those of CEQ.

DETERMINATION OF ELIGIBILITY FOR COOPERATING AGENCY STATUS

State agencies, local governments, Tribal governments, and other Federal agencies may be eligible to serve as CA. Other than its provisions for Tribes (see subsection Eligibility of Tribes), CEQ regulations recognize two criteria for CA status: jurisdiction by law and special expertise.

DEFINING ELIGIBILITY 40 CFR 1508.5 (CEQ)

"Cooperating Agency" means any federal agency other than a lead agency, which has "jurisdiction by law" or "special expertise" with respect to any environmental impact involved in a proposal (or a reasonable alternative) for legislation or other major federal action significantly affecting the quality of the human environment.

…A state or local agency of similar qualifications or, when the effects are on a reservation, an Indian tribe, may by agreement with the lead agency become a cooperating agency.

JURISDICTION BY LAW 40 CFR 1508.15 (CEQ)

"Jurisdiction by law" means agency authority to approve, veto, or finance all or part of the proposal.

Jurisdiction by law offers a very specific basis for CA status and clearly states its statutory obligation to assist in EIS development and implementation. Special expertise 40 CFR 1508.26 (CEQ)

"Special expertise" means statutory responsibility, agency mission, or related program experience.

Special expertise provides a broader window for CA status, emphasizing the relevant capabilities or knowledge that a Federal, Tribal, State, or local governmental entity can contribute to the EIS stemming from its statutory responsibilities or agency mission.

AMERICAN OVERSIGHT

ELIGIBILITY OF TRIBES 40 CFR 1508.5 (CEQ)

The CEQ regulations specify that a Tribe is eligible for CA status "when the effects [of an undertaking] are on a reservation". No Tribe has been identified with jurisdiction by law nor has any land ownership associated with the proposed action. Subsequent CEQ guidance indicates that inviting Tribes for specific purposes may be appropriate if the Tribe has special expertise identified by the lead agency as needed to help meet their statutory responsibility.

IDENTIFYING AND INVITING POTENTIAL CA

CEQ regulations permit a lead agency to invite other eligible agencies and governments to assume a CA role "at the earliest possible time" (40 CFR 1501.6). Project Managers are expected to make a reasonable effort to identify Federal, Tribal, State and local entities possessing jurisdiction by law or special expertise concerning the area potentially affected by the project. Conversely, when a government entity requests CA status, the request must be evaluated against CA eligibility criteria. If either of the criteria (jurisdiction by law or special expertise) is met, CA status can be granted at the discretion of the Lead Agency.

USACE will identify and invite agencies in accordance with the above definitions. The proposed project is located on state owned and privately owned land. USACE has identified four federal agencies (USACE, US Coast Guard (USCG), US Bureau of Safety and Environmental Enforcement (BSEE), Pipeline and Hazardous Materials Safety Administration (PHMSA) that have jurisdiction by law and are required to produce records of decision for activities associated with the proposed project, two federal agencies that have jurisdiction by law with required consultations (National Marine Fisheries Service (NMFS) and US Fish and Wildlife Service (USFWS)), and two federal agencies that have been invited for specific special expertise (US Environmental Protection Agency (USEPA) and the Advisory Council on Historic Preservation (ACHP)). In addition USACE has invited the State of Alaska for multiple approval authorities and special expertise, and the Lake and Peninsula Borough because of jurisdiction by law. Two Tribes, Nondalton and Curyung, have expressed interest in CA status. USACE, as lead agency, has determined that the Tribes have special expertise in subsistence practices and land uses with regard to their specific region and cultural resources specific to their Tribe, and as such have been invited to participate as a CA.

> [The CA relationship is not a replacement or substitution for the government to government relationship with a Tribal government. The USACE has responsibilities under other laws, regulations, and policies to consult with Tribes when privately proposed projects requiring federal authorization affect resources important to Tribes. The USACE has extended government to government consultation invitations to 35 federally recognized tribes. Additional information about the Tribal consultation process for the projects requiring DA authorization under the regulatory program can be found in the Tribal Consultation Plan.]

To establish Federal, State, and local CA status, the USACE will send a Letter of Invitation to the eligible government entity. The Letter of Invitation will include a brief outline of the role(s) of the specific CA in the EIS and invite the agency to an agency scoping meeting prior to the agency providing response to the invitation. To establish the formal CA relationship, the eligible Federal, State, or local government entity will send a written response back to the USACE stating their intent to serve as a CA in the EIS along with their ability to fulfill responsibilities identified in the USACE invitation letter.

USACE will systematically identify other entities that may bring special expertise to the EIS analysis and will invite those entities based on identified need.

AMERICAN OVERSIGHT

SEE APPENDIX A FOR COOPERATING AGENCY IDENTIFICATION AND SPECIFIC ROLES IDENTIFIED IN COOPERATING AGENCY INVITATION LETTERS

ROLES AND RESPONSIBILITIES OF LEAD AND CA

The CEQ regulations call for early and significant involvement by CA in the preparation of an EIS. Both lead and CA assume significant obligations in offering and accepting the CA relationship. As the lead agency, the USACE is expected to use the analysis and proposals of a CA "to the maximum extent possible consistent with its responsibility" (40 CFR 1501.6 (a) (2)).

CAs agree to contribute staff to the CA team, develop analyses for which they have particular expertise, and fund their own participation. Once becoming a CA partner, the agency remains a CA throughout the entire NEPA process, unless they withdraw due to exhausted resources or funding.

ROLES OF LEAD AND CA 40 CFR 1501.6 (CEQ)

a) The lead agency shall:

1. Request the participation of each CA in the NEPA process at the earliest possible time.
2. Use the environmental analysis and proposals of CA with "jurisdiction by law" or "special expertise," to the maximum extent possible consistent with its responsibility as lead agency.
3. Meet with a CA at the latter's request as deemed necessary.

b) Each CA shall:

1. Participate in the NEPA process at the earliest possible time.
2. Participate in the scoping process.
3. Agencies with "jurisdiction by law" will provide their agency's required screening criteria for alternatives development.
4. On request of the lead agency, assume responsibility for developing or providing information and preparing environmental analyses for the portions of the EIS of which the CA has "special expertise", and provide specific jurisdiction language to be included in the sections of EIS regarding their authorities, as applicable.
5. Make available staff support at the lead agency's request to enhance the latter's interdisciplinary capability (Normally use its own funds).

The roles and responsibilities for each CA will be formalized when the CA team is formed, scoping is completed, and the team is aware of potential gaps in CA team knowledge.

USACE's intent is to involve CA early and identify specific roles to be fulfilled by cooperators to allow for the agency to focus their efforts, keep relevant information familiar, and assist in timely work product and reviews.

The USACE will provide reasonable timelines for CAs to complete their responsibilities, and USACE may approve extensions to specific timelines upon reasonable request of a CA where sufficient justification is provided by the CA. It will be the responsibility of each CA to inform USACE in writing if their respective agency does not

AMERICAN OVERSIGHT

have adequate resources to participate in the process, produce requested analysis, and/or meet the required review periods.

GENERAL COOPERATING AGENCY EXPECTATIONS

THE FOLLOWING INFORMATION IS DESIGNED TO GIVE AN OVERVIEW OF EXPECTATIONS OF CA FROM EIS INITIATION THROUGH COMPLETION.

EIS INITIATION. The USACE will compile all relevant scientific research and ecological models that exist, develop a preliminary scope for the EIS, draft our agency purpose and need statement (why USACE is required to develop EIS) and develop a set of communication tools (website, meeting points). At this stage of the process, informal discussions with potential CA will occur, followed by an agency scoping meeting, and formal invitations for CA status.

***Roles for CAs**:* Determine agency capabilities to enter into CA relationship. Appoint a member (and potentially alternate) to serve on the CA management team and coordinate all internal resource efforts specific to the agency.

See Appendix B for agency designated personnel to serve as point of contact for this project.

DEFINE PURPOSE AND NEED & ASSESS THE AFFECTED ENVIRONMENT

This phase includes all activities required to initiate preparation and development of an EIS. It includes notifying the public of the project by publishing a Notice of Intent in the Federal Register and initiating the public scoping process; defining the project purpose, need, and objectives statements through public scoping meetings for incorporation into the draft EIS; developing a conceptual ecological model; and succinctly describing the existing environmental conditions and resource baselines in the Affected Environment Section of the draft EIS.

Roles for CAs: Federal agencies required to develop a record of decision should identify the specific purpose and need to which the agency is responding (Agency is required to make X permit decision under Y authority). These agencies should also identify any required alternatives screening criteria. For example, USACE has screening criteria associated with Practicability and the Guidelines. All CA will be asked to participate in identifying the NEPA purpose and need for the proposed project; participate in scoping and collaborate in assessing scoping comments; participate in identifying data needs, along with providing data and technical analyses within CA's expertise; and to provide information (such as local monitoring and baseline data) for affected resource modeling and draft affected environment section of the EIS and help interpret model results as appropriate.

CONSIDER ALTERNATIVES WITH SCOPING (PUBLIC) INPUT

The EIS lead and CA team will utilize public input to formulate a suite of reasonable alternatives to achieve the purpose and need of the proposed project. The information gathered during this phase will be used to prepare the Alternatives Chapter of the draft EIS.

Roles for CAs: Review alternatives proposed by public and suggest potential alternatives. For agencies with jurisdiction by law, ensure proposed alternatives take into consideration agency required screening criteria.

ANALYZE IMPACTS

CAs will be assigned to technical teams based on special expertise and jurisdiction by law. The CA will assist in analyzing the impacts (adverse and beneficial) and the significance of impacts on the environment

AMERICAN OVERSIGHT

of the area(s) to be affected or created by the alternatives under consideration. These impacts will be documented in the Environmental Consequences Chapter of the draft EIS.

Roles for CAs: Suggest models and methods for impact analyses. Provide effects analysis within CA's expertise; identifying direct, indirect, and cumulative effects within CA's expertise. Suggest mitigation measures for adverse effects.

WRITE/REVIEW/COMMENT/RESOLVE

This phase will consist of consolidating all prepared draft chapters and appendices into a complete draft EIS and release of the document to all interested parties. Public hearings will be conducted and comments will be solicited.

Roles for CAs: Collaborate with the USACE in evaluating alternatives. Provide information for draft EIS. Resolve agency comments within jurisdiction by law or special expertise prior to public release of draft. Participate in hearings. Work with the USACE to understand and evaluate public comments.

Dispute Resolution:

Should significant differences exist between the USACE and any CA regarding EIS content, process or procedures, every effort will be made to resolve these differences, including using available approaches to dispute resolution. Issues that cannot be resolved at the staff level may be elevated to the Regional Regulatory Division Chief and appropriate level for CA (GS-15 or equivalent). The Regional Regulatory Division Chief will render final decisions on all elements of USACE's EIS. If the Regional Regulatory Division Chief's decision is contrary to the position of a CA, the USACE will determine if the differing positions can be clearly presented in the EIS. If so, the differing positions will be included in the EIS for the public to review and comment.

CONSIDER COMMENTS AND FINALIZE EIS

This phase includes all the activities necessary to consider and respond to comments received on the draft EIS; revise (especially changes to alternatives or impact analysis conclusions) and finalize EIS; prepare the document for printing and print the required copies; and prepare and publish a Notice of Availability for the final EIS.

Roles for CAs: Review comments and assist with interpreting, and understanding public comments that relate to the agency jurisdictions or special expertise and assist USACE in preparing responses. Suggest changes to alternatives or analysis as appropriate when comments dictate.

Please see Appendix C for specific Coordination Points, Information Requirements, and Responsibilities for this project.

NOTE: There is no expectation that any CA will participate in review outside of agency jurisdiction by law or special expertise. Agencies that would like to comment more broadly should anticipate doing so during the scheduled public review and comment.

The schedule will include major EIS milestones consistent with statutory and regulatory requirements, in order to encompass the full environmental review process. The USACE will provide details in the schedule that are applicable to CA responsibilities. The USACE will use its discretion as lead agency in deciding the level of detail for the CA schedule with the objective of communicating clear expectations for the overall effort. The USACE will provide reasonable timelines for CAs to complete their responsibilities. A draft schedule has been provided to facilitate discussion. A final schedule will not be produced until after public scoping has occurred and the agencies have had opportunity to identify data gaps and any additional requirements identified as a result of scoping.

AMERICAN OVERSIGHT

AGENCY WRITING AND REVIEW TIME

Agencies will be actively involved in the development of the Draft EIS within their respective areas jurisdiction by law or special expertise. Specific development and revision periods will be identified in the project schedule.

The CA will identify their point of contact(s) for the technical analysis for the areas of special expertise or jurisdiction by law identified below. The third party contractor' team lead will form the analytical framework for the analysis and will engage the CA's when needed to perform the analysis and writing of the relevant sections.

CA have been invited to participate in the development of the analysis for the applicant's proposed project because that agency has been identified as having jurisdiction by law and/or special expertise. Accepting the role of a CA has inherent responsibilities associated with the development of the unbiased, scientifically defensible analysis of their specific jurisdiction or expertise, as defined in the invitation to participate as a CA. During the development of the analysis, the applicant's current information shall be used as the primary basis for the analysis. It is understood that during the analysis, additional data may be needed to inform the EIS. When additional data is determined to be needed, USACE will submit requests for additional information to the applicant.

ALL PUBLIC REVIEW AND CIRCULATION PERIODS WILL BE IDENTIFIED IN THE PROJECT SCHEDULE AND WILL BE CONSISTENT WITH NEPA REQUIREMENTS.

COOPERATING AGENCY GUIDANCE ON PROJECT COMMUNICATIONS

CAs are encouraged to engage in robust discussion and debate during CA meetings and topical discussions on affected resources. These meetings ensure that all cooperating voices are heard throughout the EIS process and that multiple views can be thoroughly discussed. The USACE will not use the exchange that occurs within these meetings as a substitute for agency position or comments. The USACE requires that formal CA comments on work products of the EIS be submitted on agency letterhead, signed by the agency's designated official, within the time frames agreed upon in the approved project schedule; a lack of response by an agency by the required date will be presumed that the agency has no comment/questions. All correspondence submitted electronically should be sent to the designated project email address: poaspecialprojects@usace.army.mil.

All agency correspondence will be made part of the public record upon receipt.

APPENDIX A – ENTITIES IDENTIFIED TO PARTICIPATE IN THE EIS PROCESS AND SENT COOPERATING AGENCY INVITATION LETTERS

Unless specified, listed agencies were invited and accepted Cooperating Agency Status by USACE

Federal Lead Agency and agencies invited to participate due to Federal Decision Making Authority.

PERMIT: Discharge of Fill Material in Wetlands
USACE Environmental Impact Statement used to inform Agency Record of Decision (Yes/No): Yes
Decision Agency: United States Army Corps of Engineers (Lead Agency)
Authority: Section 404 of the CWA

AMERICAN OVERSIGHT

PERMIT: Activities in Navigable Waters
USACE Environmental Impact Statement used to inform Agency Record of Decision (Yes/No): Yes
Decision Agency: United States Army Corps of Engineers (Lead Agency)
Authority: Section 10 of the Rivers and Harbors Appropriation Act of 1899
PERMIT: Bridge or Pipeline Crossing Navigable Waters
USACE Environmental Impact Statement used to inform Agency Record of Decision (Yes/No): Yes
Decision Agency: United States Coast Guard
Authority: General Bridge Act of 1946 as amended by 33 USC 525-533
RIGHT OF WAY: Natural Gas Pipeline through outer Continental Shelf
USACE Environmental Impact Statement used to inform Agency Record of Decision (Yes/No): Yes
Decision Agency: United States Bureau of Safety and Environmental Enforcement
Authority: 30 CFR 250 Subpart J

Federal Agencies Invited due to jurisdiction by law with required consultations and special expertise:

Endangered Species Act (Section 7 Consultation-Terrestrial Species)
Consulting Agency: United States Fish and Wildlife Service
Biological Assessment(s) to be included in EIS: Yes
Section 9 Permit required: Unknown at this time
Species:
Authority: Endangered Species Act of 1973 (16 U.S.C. 1531 et seq.)
Special Expertise requested: Fish and Wildlife Resources
Endangered Species Act (Section 7 Consultation-Marine Species)
Consulting Agency: National Marine Fisheries Service
Biological Assessment(s) to be included in EIS: Yes
Section 9 Permit required: Unknown at this time
Species:
Authority: Endangered Species Act of 1973 (16 U.S.C. 1531 et seq.)

AMERICAN OVERSIGHT

Special Expertise requested: Marine Mammals, Fisheries
Magnuson-Stevens Fishery Conservation and Management Act
Essential Fish Habitat
Consulting Agency: National Marine Fisheries Service
Essential Fish Habitat Assessment to be included in EIS: Yes
National Historic Preservation Act of 1966 (16 U.S.C. 470 et seq.)
Advising Agency: Advisory Council on Historic Preservation
Draft Programmatic Agreement to be included in EIS: Yes
Special Expertise requested: Historic Properties, Section 106 compliance
Consulting Agency: Alaska State Historic Preservation Office
Fish and Wildlife Coordination Act (16 U.S.C. 661 et seq.)
Consulting Agencies: Fish and Wildlife Service, National Marine Fisheries Service (Declined Cooperating Agency Status), Alaska Department of Fish and Game
United States Department of Transportation Pipeline and Hazardous Materials Safety Administration
SPECIAL PERMIT: variations from current regulations for pipeline design/construction. NOT PROPOSED AT THIS TIME, however will participate as a CA.

State of Alaska and Local Governments Invited due to jurisdiction by law and special expertise (abbreviated due to extent of involvement)

Alaska Department of Environmental Conservation
Wastewater discharge, CWA Sections 401 and 402 permits, air quality permit jurisdiction
Alaska Department of Fish and Game
Title 16 Fish Habitat Permitting (any activity occurring below the ordinary high water mark in an anadromous fish stream or any fresh waterbody with the potential to block fish passage, emergency permits, and field permits) Hazing permits Special Area Permits/assessments Fish Collection Permits for monitoring.

AMERICAN OVERSIGHT

Alaska Department of Natural Resources State Historic Preservation Office
Cultural Resources, Historic Properties, Section 106 consultation
Alaska Department of Natural Resources Department of Mine, Lands, and Water
Mine Permitting (reclamation & closure and Plan of Operations approvals, mill site lease, upland mining lease, material sales, certificate to construct a dam, certificate to operate a dam, mining license, miscellaneous land use permit, right-of-way, tideland lease, general mine design, temporary water use authorization, permit to appropriate water)
Alaska Department of Health and Social Services
Needs and welfare of the people, health risk assessment
Alaska Department of Natural Resources State Pipeline Coordinator's Office
Pipeline Right of Way
Lake and Peninsula Borough
Special Expertise: Needs and Welfare of the People of the Lake and Peninsula Borough, Economics, and Land Use
Local Government Land Use Permit

Agencies and government entities invited for Special Expertise

United States Environmental Protection Agency
Special Expertise: 404(b)(1)guidelines of Section 404 CWA
Curyung Tribal Council
Special Expertise: Subsistence Practices and Land use within the Nushagak River Drainage
Nondalton Tribal Council
Special Expertise: Subsistence Practices and Land use within the Kvichak River Drainage

AMERICAN OVERSIGHT

National Marine Fisheries Service declined CA invitation on February 9, 2018, due to lack of resources.
Other government entities to be invited at the discretion of USACE as the need for special expertise is identified.

APPENDIX C. COORDINATION POINTS, INFORMATION REQUIREMENTS AND RESPONSIBILITIES

The following coordination points are key meeting collaboration points to ensure an efficient process.

Coordination Point	Meeting Purpose	Deliverables	Agency Involvement
Notice of Intent EIS	Send CA a copy of the NOI; Invite agencies to agency scoping meeting		USACE
Agency Scoping Meeting	Overview of project; Draft purpose and need and applicant prepared alternatives; CA Coordination Plan	Agencies Respond to Cooperating Request within specified timeframe	Each invited Agency to provide response
Conduct Public Scoping	Solicit public input on Project, Alternatives, socio and environmental concerns	Any Agency Scoping Comments due at same time as public comments	All Agency
Post Scoping Collaboration			

AMERICAN OVERSIGHT

	Purpose and Need	Agency Purpose and Need Statement/Purpose and Need for development of EIS	Action Agencies/all agencies
	Develop Alternatives Screening Criteria	Criteria for Reasonable Criteria for Practicable	All Agencies
	Breadth of Environmental Resources to be analyzed	List of environmental resources. Finalize EIS outline	All Agencies
Collaboration on impact assessment methodologies	Technical expertise by topic to determine the appropriate context and method for evaluating impacts to specific environmental resources	Report out from each group	Agencies as assigned based on jurisdiction and special expertise
Review of Environmental Baseline and Consequences	Review comments by agencies with technical experts	Resolve agency comments on document sections	Agencies as assigned based on jurisdiction and special expertise
Post Circulation of DEIS	Review public comments within assigned areas	Address/Resolve Public Comments	Agencies as assigned based on jurisdiction and special expertise
I.D. the Applicant's Preferred Alternative iaw AppB	Agencies with Federal actions – identify preferred alternative and identify differences based on program authorities	USACE in accordance with Appendix B, PHMSA as fits their agency.	Action Agencies
I.D. LEDPA	Review all relevant information to LEDPA determination	Preliminary LEDPA	USACE/USEPA
Circulation of FEIS	Agency involvement closeout	Document	USACE

Hi Patty – I plan to have a first take at a scoping letter to you by the end of today. I'd like to take a few minutes to go over the letter and next steps, as well as check in on anything else we need to before you are out next week (such as expectations for scoping meeting participation).
Thanks,
Molly

EPA Cooperating Agency Review Comments
Pebble Project EIS Preliminary Draft Chapter 3
Sections 3.16 and 3.26
7/24/18

Thank you for the opportunity to review the early versions of Sections 3.16 Surface Water Resources and 3.26 Vegetation, in accordance with our defined role as a Cooperating Agency for the Pebble Project EIS. If you have any questions regarding the EPA's comments below, please contact Molly Vaughan at 907-271-1215 or vaughan.molly@epa.gov, and she can provide clarity or put you in touch with the appropriate technical expert for that comment as needed.

We look forward to working with you on updates to Chapter 3.

3.16 Surface Water Resources

Section 3.16, General: This section mentions mine facility features that may not be part of the current project description (e.g., low grade ore stockpile) or may be at different locations (e.g., the pyritic tailings storage facility). We assume that revisions to this section and figures will be made consistent with the current project description.

Section 3.16, General: The section provides existing surface water hydrologic resource conditions, within approximately the past decade, for areas directly impacted by the project which are the Mine Site, Amakdedori Port, Iliamna Lake, Transportation Corridor, and Natural Gas Pipeline Corridor. Because of the scale of the project and the potential for indirect and cumulative impacts, we recommend that Section 3.16 also provide existing condition information for the broader Bristol Bay watershed to encompass potential areas of indirect and cumulative impacts. We recognize that it would not be feasible to provide detailed information for each gauging station within the watershed, but recommend providing representative or summary information to allow characterization of existing surface water resource conditions.

Section 3.16, General: We recommend that the EIS discuss of the representativeness of the approximately decadal historical assessment of water resources, and whether the data are sufficient to characterize existing baseline surface water quality and quantity.

Page 3, Section 3.16.1.2, Streamflow: The document provides the conclusion that, "subsurface flows follow former pre-glacial surface drainage pathways that were eventually buried by sediment deposits, resulting in cross-drainage transfer of subsurface flow relative to surface topography." We recommend inclusion of a figure displaying these features.

Page 3, Section 3.16.1.3, Gaging Stations and Figure 3.16-3, Surface Water Hydrology Stations: We recommend that Section 3.16.1.3 discuss which of the stations in Figure 3.16-3 would be most affected by the mine operations, including whether there are any stations located immediate adjacent to proposed mine components (e.g., open pit or wastewater discharge locations). In addition, we recommend that the figure identify the party responsible for monitoring each of the stations (e.g., by utilizing a different symbol to differentiate between USGS and PLP monitoring stations).

Page 5, Table 3.16-2: The table includes a column displaying the years of stream flow estimated by regression. We recommend that the EIS provide the regression equation used to estimate the flow, as

AMERICAN OVERSIGHT

well as discuss the reason for using this equation versus other available methods, and any uncertainties associated with the estimates.

Pages 7-15, Table 3.16-3 and Table 3.16-4: Tables 3.16-3 and 3.16-4 report both discharge (cfs) and unit runoff (cfs/mi^2), and annual discharge by water year (cfs) and annual unit runoff by water year (cfs/mi^2), respectively. We note that it would be sufficient to report discharge and annual discharge by water year, as long as drainage area is provided, and recommend that this would reduce crowding in the tables.

Page 18, Section 3.16.1.4, Meteorological Inputs to Water Balance Modeling: The document mentions development of surface water and groundwater balance models, however, it does not provide a detailed summary of the models. We recommend that the EIS provide the details of the model and important equations, which are crucial to reviewing the merits of the model. We also recommend discussing how calibration and validation years were determined. We note that calibration usually accounts for the seasonal and annual variability of streamflow to address low, average, and peak flow periods or dry, average, and wet years, and recommend that these conditions be used in the model and discussed in the EIS. Please also provide additional explanation for the statement, "changes in storage calculated by the water balance model were consistent with the observed changes in groundwater elevation."

See also our comments on section 3.17.1.3/4 related to water modeling including recommendations that the EIS discuss the sufficiency of the models to meet objectives (characterization of baseline and use for predicting changes) and any limitations and uncertainties associated with model input parameters, assumptions, and outcomes.

Page 19, Section 3.16.1.5 Surface Water Use: According to the document, some residents of local communities "likely collect surface water for personal use" within and near the mine site. We recommend that the EIS include additional information, to the extent available, characterizing the areas of frequent surface water use. Other cooperating agencies, including the Curyung Tribal Council, Nondalton Tribal Council, or Lake and Peninsular Borough may have local knowledge to assist.

Page 20, Section 3.16.1.6, Flood Magnitude and Frequency: We recommend that this section include possible flood predictions related to the project at different scenarios, such as minimal, average, and maximum impacts.

Page 21, Section 3.16.2.5, Marine Water: The document states that, "Because site-specific meteorological and oceanographic information pertinent to Amakdedori was not included in either EBD [environmental baseline data] or SEBD [supplemental environmental baseline data], the following discussion was developed based on data available in publicly available sources, as well as relevant anecdotal descriptions provided by residents and others who have personal familiarity with the region." Given the potential for significant impacts to the marine environment from construction of the proposed Amakdedori Port, we strongly recommend the collection of site-specific information for inclusion in the EIS to ensure accurate modeling and analysis. Additional detailed comments follow pertaining to specific sub-sections.

Page 21, Section 3.16.2.5, Marine Water – Meteorology and Wave Climate: Regarding available information, the document states that "Data provided from this station are well-suited for evaluating Amakdedori's exposure to winds from the northeast and east, but not to exposure to winds from the southeast," and "The extent to which waves would affect the immediate vicinity of the Amakdedori Port

AMERICAN OVERSIGHT

site will require a detailed analysis of wave interaction with the complex seabed topography, as well as refractive effects of Augustine Island and the southern shore of Kamishak Bay. A more detailed statistical analysis of data from both NOAA buoys would provide an evaluation of probabilities and consequent risks associated with extreme conditions of wind and waves." As noted above, we recommend that this information be collected prior to completion of the EIS, to ensure an adequate and complete analysis of potential impacts.

In addition, the document includes a statement from Mr. Chester Passic (Commander in the U.S. Coast Guard) regarding the conditions of Kamishak Bay, which could present a challenge to maintaining navigation aids for vessel traffic. We recommend that the document include additional data on Kamishak Bay to enable analysis of the safety considerations.

Page 23, Section 3.16.2.5, Marine Water – Marine Water Properties: The document provides some general statements on likely seabed and turbidity conditions based on limited available information, but states that, "Further inferences cannot be reliably made without knowledge of seabed composition at the proposed site." Site-specific information on the seabed composition is necessary for accurate characterization of baseline conditions and analysis of potential impacts. As the EIS states, "the amount of suspended solids and accompanying turbidity in waters adjacent to the proposed Amakdedori Port site would be a function of seabed composition." We note that suspended solids could also result from materials (e.g., fill) used in construction of the port, which would likely impact hard habitat types more severely when they settle out. We recommend that the EIS discuss the types of habitat that could be impacted in the vicinity of the port. We recommend that site-specific information be collected using bathymetry or sediment profile imaging camera techniques, and that subsequent modeling be conducted to determine how far afield turbidity will extend and the depth of potential settled solids.

Pages 26-27, 3.16.3.3, Lake Water Properties: The document discusses collection of water samples from five "deeper-water" stations in the lake, and lists water quality, sediment, and zooplankton parameters analyzed; however, no measurement results are provided here or in Section 3.18 Water Quality. We recommend that the EIS provide a summary table including data for all measured parameters in Section 3.18, and refer to that table in this section. In addition, we recommend that the document provide addition explanation supporting the statement that, "only only a few ions (copper, lead, aluminum, iron, manganese, and alkalinity) had concentrations outside benchmarks established by the ADEC for freshwater."

Page 30, Section 3.16.4.2, Streamflow: Regarding "The Mine Access Road would cross multiple small tributaries…" and "Drainages in the project area south of Iliamna Lake have not been the focus of any known hydrologic studies to date…" We recommend that the EIS state how many tributuaries will be crossed by each of the access roads (the tributaries could be listed in a table) and provide any available data. In addition, this section should desribe whether additional data collection will occur to ensure sufficient baseline characterization for assessing impacts due to road use.

Page 30, Section 3.16.4.2, Streamflow: We recommend that subsections be added to describe any streams and surface water hydrology in the areas of the north and south Lake Illiamna ferry terminals.

Page 31, Section 3.16.4.3, Surface Water Use: The document notes that "the Kohkanok Water System extracts surface water from Iliamna Lake for drinking water supplies." We recommend that the document discuss existing quality (in Section 3.18) and quantity of water extracted for the Kokhanok

AMERICAN OVERSIGHT

Water System, as well as show the location of the drinking water intake, and source water protection area if applicable, on a figure as it relates to the proposed project infrastructure.

Page 31, Section 3.16.4.4, Surface Water Extraction Sites: We recommend that the EIS include a map/figure showing where surface water is being used near the proposed project area.

3.26 Vegetation

Figures 3.26-2 to 3.26-6: We found it difficult to distinguish vegetation types in the figures at the current map scale. We recommend increasing the scale of the maps depicting to the vegetation type. This may result in multiple maps for each area of the project, or an appendix of detailed maps, to supplement or replace the current single-sheet maps.

Page 3.26-2, Section 2.36.1 Analysis Methodology: We recommend providing additional explanation of the methodology used to group the 48 vegetation types in the mapping area into 10 vegetation structure types for mapping, including addressing whether the groupings considered predominant occurrence in wetlands versus uplands.

Page 4, Table 3.26-1: We recommend providing additional detail to the definition of the vegetation types in the table, to provide clarity and context for interpreting the figures and information presented in this section.

Page 20, Table 3.26-8: The column headings for the common and scientific name appear to be transposed. We recommend correcting this error and confirming the accuracy of the information in the table.

EPA Cooperating Agency Review Comments
Pebble Project EIS Preliminary Draft Chapter 4
Sections 4.1, 4.5, 4.11, 4.14, 4.16, 4.17, 4.18, 4.22, 4.26
8/15/18

Thank you for the opportunity to review early versions of Sections 4.1 Introduction, 4.5 Recreation, 4.11 Aesthetics and Visual Resources, 4.14 Soils, 4.16 Surface Water Resources, 4.17 Hydrogeology, 4.18 Water Quality and Geochemistry, 4.22 Wetlands / Special Aquatic Sites and Waterbodies, and 4.26 Vegetation of the Preliminary Draft Chapter 4, in accordance with our defined role as a Cooperating Agency for the Pebble Project EIS. Our comments are provided for each section in the table below. We note that these versions include many placeholders that indicate that text will be updated following receipt of additional information from the Project Applicant. In addition, these versions do not include analysis of impacts of action alternatives to the Applicant's project or discussion of cumulative effects. In order to provide additional detailed input to the Corps within our area of special expertise, we request the opportunity to review revised, more complete, versions of these sections that incorporate the additional information and alternatives.

If you have any questions regarding the EPA's comments below, please contact Molly Vaughan at 907-271-1215 or vaughan.molly@epa.gov, and she can provide clarity or put you in touch with the appropriate technical expert for that comment as needed.

We look forward to working with you on updates to Chapter 4.

AMERICAN OVERSIGHT

Page	Section	Existing text (if applicable)	Recommendation
4.1 Introduction			
4.1-2	4.1.1.1	For this analysis, reasonably foreseeable future actions (RFFAs)…to occur in the next 30 years.	We recommend adding a brief explanation of the basis for the 30-year outlook.
4.5 Recreation			
4.5-2	4.5.2.1	Project-related noise and activities would not be likely to affect recreational settings or activities in Lake Clark National Park and Preserve, the nearest regional recreation destination and known recreation use area to the Mine Site.	We recommend adding text to this sentence or an additional sentence that provides the distance from the mine site to Lake Clark National Park.
4.5-3	4.5.2.2	Boat traffic to and from the port would be minimal: up to 27 concentrate vessels and 33 supply barges per year during operations. Therefore, activities at Amakdedori Port would result in minimal adverse impacts on recreational boat traffic, and thus, on boating experiences and opportunities around the port site and in Cook Inlet.	We recommend that the EIS provide information on how long the concentrate vessels and supply barges would stay at the port during loading/unloading. While the number of vessels may seem low, the amount of time that they spend at the port site should be factored into the impact assessment.
4.5-3	4.5.2.3	The volume of recreation use is likely low in numbers along the north and south mine access road corridors, the Kokhanok Airport spur road, and the Iliamna spur road.	We recommend that the EIS provide a basis for the "likely low" volume determination, including whether it is based on a survey of recreational users or other information.
4.14 Soils			
4.14-1	4.14.2	Evaluation of soil impacts assumes … that proposed earthwork would sufficiently meet necessary conditions required for approval of an ADEC Clean Water Act Section 402 Stormwater Construction and Operation Permit and a Stormwater Discharge Pollution Prevention Plan prior to construction.	We recommend adding a section discussing the minimum requirements included in ADEC's 402 NPDES Stormwater permit. In addition, we recommend that the EIS include the Applicant's plans for stormwater control strategies, best management practices and the Pollution Prevention Plan in appendices or as reference documents in order to support the assumption that the proposed earthwork would meet permit and Plan conditions. It will be useful for agency decision makers and the public to understand the specific BMPs and control strategies that would be used (and the locations where they would be used).
4.14-2	4.14.2.1	Bulleted section	We recommend listing additional soil types in this section, if present. As written, the text leads the reader to believe there are only two soil types within the entire mine site footprint.
4.14-2	4.14.2.1	Bulleted section	We recommend adding the percent composition of soil types for context as provided in other project components, such as Table 3.14-1.

AMERICAN OVERSIGHT

4.14-3	4.14.2.1	Second full paragraph	We recommend adding a discussion of the minimum required reclamation standards and additional potential practices, if any. These could include BMPs, success criteria, and adaptive management efforts that are going to be included in the project design and operation.
4.14-3	4.14.2.1	… each would be reclaimed to conform to designated post-mining land use, as administered by the ADNR.	There are multiple references to post-mining land use in the document. We recommend disclosing the plans for post-mining land use, if known, or discussing acceptable uses for the area, as established by ADNR, in the EIS.
4.14-3	4.14.2.1	Paragraph beginning with 'The intensity…'	We recommend adding discussion of maximum disturbance in each watershed.
4.14-4 4.14-7 4.14-9	4.14.2.1 4.14.2.2 4.14.2.3	Dust Deposition on Soils	Pending response to RFI 009 and information provided, we recommend also adding the results of deposition modeling to Section 4.22 Wetlands and Section 4.26 Vegetation. We recommend that the discussion of the results include figures that show the geographic extent of both direct impacts and indirect impacts (i.e., fugitive dust deposition) for all project components (i.e., mine, port, transportation corridor, etc.).
4.14-4	4.14/4.18	General	Based on information provided in this section regarding fugitive dust and runoff concerns, we recommend that Section 4.18 Water Quality include a discussion of potential water quality issues, if any, from the resulting total suspended solids loading. This discussion and analysis would appropriately include localized stream impacts and the removal of vegetation as well as wetland flood and nutrient abatement functions resulting from the project.
4.14-6	4.14.2.1	The Mine Site would be reclaimed per an ADNR-approved reclamation plan that establishes requirements for designated post-mining land use.	There are references to reclamation efforts and what is presumed organic soil segregation throughout Section 4.14. Please discuss if the organic soils will be segregated for reclamation and provide references to studies, if any, which demonstrate the particular type of soils found on site and the success of removal, mixing, stockpiling for life of the proposed project, and reapplying for vegetative growth. We recommend that a draft reclamation plan be provided in the EIS or as an appendix or that it is referenced such that stakeholders can review it. It will be important that the reclamation commitments are understood by decision makers and the public.
4.14-9	4.14.2.3	Bulleted list of project components	We recommend adding maps and tables providing additional information of bulleted

AMERICAN OVERSIGHT

			project components, including the size/length of each component, for context. The material sites could also display the amount of fill excavated from each site.
4.14-12	4.14.2.3	Table 3.14-1	Please provide a description of soil type HY4.
	4.14	General	We recommend adding a discussion of the potential maximum ground disturbance during construction and operations (a table would be helpful) and, as mentioned above, the specific BMPs that would be put in place to minimize impacts from ground disturbance.
4.16 Surface Water			
4.16-1	4.16	Planned mitigation may not be specified but is considered typical or standard engineering practice. In cases where planned mitigation is unknown, unclear, or an uncommon situation is encountered, mitigation recommendations are provided.	The meaning of this statement is unclear to the reader, and we recommend revising for clarity in the EIS. If "planned mitigation" is not specified in a project plan submitted by the Applicant then it is not certain that it is indeed "planned." In accordance with NEPA, we recommend that mitigation measures to address potential adverse impacts be disclosed and analyzed in the EIS. We also recommend that appropriate mitigation measures necessary to reduce anticipated adverse impacts be incorporated into the project design and implemented. We recommend that the EIS clearly describe the specific mitigation that is planned/proposed by the Applicant, additional mitigation that would be required by agencies (e.g., in permits or project approvals), and any other mitigation that is recommended as a result of the NEPA process to reduce adverse impacts.
4.16-2	4.16.2.1	… all water not meeting water quality standards would be treated before release.	We recommend that the EIS provide details regarding how the water not meeting State of Alaska water quality standards will be treated before release to ensure that standards are met, and how water quality will be monitored over time to ensure that standards are being met into the future. Any discharge to waters of the U.S. from a point source will need to be authorized by the state through an APDES permit, and the terms and conditions of the permit regarding concentrations in the discharge and monitoring requirements must be met.
4.16-3	4.16.2.1	"The average annual water surplus during the maximum Mine Site footprint is estimated to be 39 cubic feet per second (cfs)…"	Here and/or elsewhere in the EIS, we recommend adding a discussion that describes the basis for the 39 cfs estimated, including the range of uncertainty around the estimate.

AMERICAN OVERSIGHT

4.16-4	4.16.2.1	Underdrains would be constructed beneath the entire TSF to convey seepage flow to collection and recycling systems below each embankment, and to help minimize water buildup behind the main embankment	We recommend the EIS include additional information regarding the seepage recycling pond embankments below the TSF, including how and where low-permeability core zones and grout curtains will be incorporated to control seepage and enhance embankment stability. We recommend that the EIS assess the success of these measures in collecting and conveying seepage and discuss whether there would be discharges to groundwater.
4.16-5	4.16.2.1	This temporary, fully lined stockpile would be located in an unnamed tributary east of Tributary 1.190.	We recommend that the EIS discuss what provisions will be made to assure that this temporary stockpile will not leak, and how any runoff from the stockpile will be monitored.
	4.16.2.1	General Comment	Section 4.16.2.1 summarizes aspects of the project description related to water management and tailings and waste storage. We recommend that the description in this section be included earlier in the EIS in Chapter 2 and referenced here, so that section 4.16.2.1 focuses on impact assessment. Our review finds that there is no discussion of estimated impacts to stream hydrology due to mining activities (or access corridor in 4.16.2.4). We understand that this information is under development and request the opportunity to review an updated version that includes predicted impacts to stream flow due to mine site and transportation activities during construction, operations, and closure. We recommend that figures be added that depict the extent of changes to hydrology during operations and closure.
4.16-5	4.16.2.2	Port infrastructure would be built above the 100-year floodplain of Amakdedori Creek, although the floodplain is not well defined in current literature.	We recommend that the EIS clarify how the Corps will ensure that the port infrastructure is built is above the 100-year floodplain, including obtaining additional site-specific information if needed.
4.16-6	4.16.2.2	No detailed hydrologic data or stream gauge data are available for Amakdedori Creek. The estimated average flow is some 400 cfs in summer and 35 cfs in winter.	We recommend that a stream gauge be established to collect hydrologic data for Amakdedori Creek. If actual gauge data is not used then in this section, or earlier in Section 3.16, we recommend that the EIS describe the basis for these flow estimates (given the lack of stream gauge data).
4.16-6	4.16.2.2	A detailed analysis of the impact on streamflow or the streambed caused by the annual extraction of 5 million	We recommend that additional information be provided in the EIS to support the conclusion that streamflow reduction may not be measurable,

AMERICAN OVERSIGHT

		gallons from Amakdedori Creek is not practical, because the streamflow reduction may not be measurable and the impact would likely be of low intensity and temporary	given the plans to extract 5 million gallons annually. We note that the last sentence of the paragraph seems to refer to extraction from the creek during winter months/ low-flow conditions. Please also clarify in the EIS exactly when stream flow extraction would occur.
4.16-6	4.16.2.2	Before water extraction, PLP would be required to demonstrate that proposed water extraction volumes and rates are within permissible limits.	Please describe how PLP will demonstrate that proposed water extraction volumes and rates are within permissible limits. For example, if there is a permit authorization required, the EIS should discuss that permit.
4.16-6	4.16.2.2	During placement of fill material for causeway construction, increased concentrations of suspended sediment would occur in Kamishak Bay for the duration of construction, and would persist for days to weeks after completion. The duration of increased suspended sediment concentrations would depend on the amount of fine sediment in the fill material. Suspended sediment would be transported within Kamishak Bay under the influence of tidal and wind-driven currents before settling on the seabed. The duration and geographic extent of suspended sediment plumes can be estimated when the grain size distribution of fill material is made available.	We recommend that the EIS include details regarding the type and volume of materials that are proposed for use in causeway construction, as well as include a modeling analysis to demonstrate the anticipated impact of suspended sediment (duration, geographic extent, depth).
4.16-7	4.16.2.2	Removal of the causeway at the end of the project would cause substantial increases in suspended sediment in Kamishak Bay that would persist for days to weeks after decommissioning is completed.	We recommend that the EIS disclose the volume of material that would need to be removed, where the material would be disposed of, and include modeling analysis of the anticipated water quality impacts of suspended sediment during the decommissioning process.
4.16-7	4.16.2.3	Establishment of suitable BMPs for ferry operations should be sufficient to avoid or minimize adverse impacts; namely, BMPs should include specifications for management of ferry speed (minimizing wakes) and engine power settings (minimizing bottom erosive stress) during approach and departure from the terminals.	We recommend that the EIS clarify whether these BMPs are included in the Applicant's plans and, if so, provide reference to the particular plan(s) where this information can be found.
4.16-8	4.16.2.3	Section on Offshore Anchoring and Concentrate Transfer and text	We recommend that specific mitigation measures be developed in the EIS and required

AMERICAN OVERSIGHT

		"Although some damage to seabed flora and fauna could result from each ship anchoring, a BMP could be developed to avoid excessive damage by directing ship masters not to anchor in the same location(s) each time."	as part of the project operating plan to avoid and/or minimize the excessive damage to seabed flora and fauna as a result from each ship anchoring. Note: It appears this text may be incorrectly inserted in Section 4.16.2.3 and would be more appropriately located in 4.16.2.2.
4.16-11	4.16.2.4	With only limited hydrologic data estimates available on other water bodies across the Transportation Corridor, determining the consequences of water extraction is not practicable at this time.	We recommend that hydrologic data on the water bodies that will be used for water extraction within the Transportation Corridor be obtained and disclosed/analyzed to help enable analysis and discussion of impacts of the water extraction activities for inclusion in the EIS.
4.16-12	4.16.2.5	General Comment	We recommend that this section include additional discussion of potential impacts to watersheds intersected by the pipeline corridor during project construction, operations and closure.
4.16-12	4.16.2.5	Surface water extraction during pipeline construction would likely have consequences to watersheds intersected by the pipeline corridor	We recommend that the EIS provide information that describes the nature and extent of consequences to watersheds during surface water extraction pipeline construction.
4.17 Hydrogeology			
4.17-2	4.17.2.1	Groundwater discharge to seeps, springs, streams, ponds, or lakes in or adjacent to the proposed pit may cease or be reduced, resulting in lower surface water base flows or pond or lake levels. Some stream segments, ponds, or lakes in the immediate pit area may be eliminated as the water table is lowered in the immediate pit area during construction and mining operation.	We understand that groundwater modeling results will be included in a revised version of this section. We support additional analysis, including modeling, to better define the potential for elimination of streams and ponds during both operations and closure/post-closure. We recommend that figures be added to depict these changes. If elimination is anticipated, we recommend the inclusion of mitigation measures as part of the range of alternatives to help reduce this adverse impact.
4.17-2	4.17.2.1	It would likely take tens of years for the groundwater in the pit to attain the level at which the groundwater would then be maintained to create a permanent groundwater sink to prevent potentially acidic pit lake water from discharging to the environment. The presence of a permanent groundwater sink at the pit would locally influence groundwater flow in the immediate vicinity of the pit.	We note that these statements imply that a negative gradient of pit level water would be maintained in perpetuity, which would result in permanent impacts to hydrology in the area. We recommend that the potential impacts of this design feature be described in detail in the EIS, with discussion of mitigation measures to address the anticipated impacts.

AMERICAN OVERSIGHT

4.17-3	4.17.2.1	The WMPs are expected to have no adverse impact on groundwater flow, because they would be lined to prevent leakage of water to the subsurface.	We recommend that the EIS discuss the type of liner that would be used for the WMPs and describe how the WMPs will be monitored to detect potential leakage. We also recommend modeling and discussion of potential leakage scenarios and inclusion of contingency plans as mitigation in the event of unanticipated leakage.
4.17-3	4.17.2.1	The WMPs may help restore downgradient groundwater flow to existing conditions as surplus water is treated and discharged downstream of the Mine Site.	We recommend that additional information be provided to describe the extent to which treated water that is discharged to streams (as described in the Project Description) would result in changes to groundwater flow.
4.17-3	4.17.2.1	Construction of the TSF would locally impact surface water features at the site, and potentially impact groundwater/surface water interactions; this impact is expected to be small in extent (e.g., near the vicinity of TSF) but permanent.	We recommend that the EIS include additional detailed analysis that provides a basis for this conclusion.
4.17-3	4.17.2.1	Although the underdrain system is expected to minimize vertical seepage into native materials below the TSF, the largest potential impact to groundwater beneath the TSF would result from tailings seepage with elevated constituent concentrations that is not captured, and is released to the underlying groundwater, thereby impacting local groundwater quality.	We recommend that the EIS provide additional analysis of the potential impacts to the underlying aquifer, and discuss monitoring and mitigation measures that will be implemented to avoid or minimize those impacts.
	4.17.2.1	General Comment	This section discusses impacts to hydrogeology due to certain mine site activities (pit dewatering, drinking water use, WMPs, and TSF). The use of surface water diversions around mine site features could also potentially impact groundwater flow. We recommend adding a subsection that discusses the use of diversions.
4.17-4	4.17.2.4	Potential contamination of groundwater could occur during pipeline construction, when heavy machinery and trenching equipment would likely be operating in close proximity to the water table.	We recommend that potential contamination be discussed in Section 4.18 (Water Quality) and that the EIS include, in an appendix, a draft Spill Prevention Control and Countermeasures Plan that describes steps that would be taken to prevent and respond to potential spills and releases during construction and operations.
4.18 Water and Sediment Quality			
General			We recommend that Section 4.18 discuss potential impacts to the public and private drinking water sources identified in Chapter 3,

AMERICAN OVERSIGHT

			including groundwater and surface water sources.
4.18-1	4.18.1	Background water and sediment quality in the vicinity of the Mine Site would not change, and would still contain certain constituents in amounts exceeding regulatory levels because of natural mineralization and geochemical weathering processes.	Please disclose in the EIS whether site-specific background levels have been established by the state and incorporated into the groundwater and/or surface water quality standards. If not, we recommend that the EIS explain how site-specific background levels will be established and utilized throughout site performance monitoring in order to determine if those levels are being exceeded due to operations.
4.18-1	4.18.2.1	Non-acid-generating waste rock would be used in construction of the tailings embankments and Mine Site roads.	We recommend that the EIS discuss how waste rock will be evaluated to assure that it is non-acid generating and suitable for construction of embankments and roads. The EIS should also discuss the criteria that would be used to distinguish between acid generating and non-acid generating waste and plans for management of acid generating waste rock during life of mine operations and beyond.
4.18-1	4.18.2.1	A primary design consideration is to ensure that all contact water requiring treatment before release to the environment would be effectively managed.	We recommend that details on management of contact waters be included in the Water Management Plan and provided in the EIS to assess how water diversion, collection, reuse, and treatment will be implemented during the construction, operations, and closure phases. We recommend that the EIS include figures that depict the water balance (flowlines, mine site features, quantities, etc.) for each phase. Please also define the term "contact water".
4.18-2	4.18.2.1	Water collected from the pit dewatering wells would be discharged to the environment if it meets water quality criteria; otherwise, this water would be treated in a modular water treatment plant (WTP) before discharge.	We recommend that the EIS clarify that this discharge would need an APDES permit, and would therefore have to meet permit requirements, which would prescribe limits, and monitoring and reporting requirements. Also, please describe the type of water treatment and discharge locations.
4.18-2	4.18.2.1	Runoff and associated sediment control measures would be managed with BMPs and adaptive management control strategies.	We recommend that the specific BMPs and Adaptive Management Plans that will be employed to prevent adverse impacts from sediment runoff be disclosed in the EIS and that the EIS discuss the effectiveness of the BMPs.
4.18-3	4.18.2.1	Bulk and pyritic tailings slurry from the mill would be directed to the bulk tailings storage facility (TSF) and the pyritic TSF, respectively.	We have not received Chapter 2 for review. We recommend that the Chapter 2 description of the Applicant's Proposed Alternative define what is meant by bulk tailings and, either here or in Chapter 2, describe the geochemical testing that has occurred on simulated tailings.

AMERICAN OVERSIGHT

			We also recommend that the EIS clarify in this discussion that the bulk TSF would be unlined and the pyritic TSF would be lined. We recommend that a liner for the Bulk tailing facility be considered as a mitigation measure and incorporated into the discussion of alternatives if the geochemical testing and water quality models predict adverse impacts from TSF seepage.
4.18-3	4.18.2.1	Water collecting in the bulk TSF would flow through the embankment to the main embankment's seepage collection pond. From there, water would be directed either to the main WMP for use in the mill or to the main WTP for treatment and discharge. Excess surface water in the bulk TSF would be similarly managed.	We recommend that the discussion of water management associated with the bulk and pyritic TSF be clarified. A figure or flowsheet would be helpful to show management of water associated with the surface ponds on the bulk and pyritic TSFs and management of water that flows through the embankments. We also recommend that the TSF pond sizes be discussed and compared to freeboard to prevent overtopping. We recommend that the probability of spills or overtopping be estimated and a discussion of whether the collection pond would be sized/managed to handle such occurrences.
4.18-3	4.18.2.1	A water surplus is anticipated during the operations phase under normal and wetter than normal climatic conditions.	Please provide a reference to the document or chapter where definitions/calculations of normal and wetter than normal climatic conditions are explained.
4.18-3	4.18.2.1	The volume of water available for discharge would be less than pre-mine flows within the mine footprint, because some water would be consumed in the tailings voids and some would be lost to evaporation and other minor uses.	We recommend revising this sentence to provide additional key details as follows: "The volume of water available for discharge would be X% less than pre-mine flows within the mine footprint, because X% would be consumed in the tailings voids and X% would be lost to evaporation and other minor uses (Reference to document or chapter with these calculations)."
4.18-3	4.18.2.1	The annual average surplus is estimated at approximately 39 cubic feet per second for the maximum mine footprint. Surplus water would be treated and discharged throughout the year.	Please also disclose the pre-mine flow in cfs, to enable comparison of how much water is getting to the downstream reaches. Also discuss how the 39 cfs was determined or provide a reference to the document that provides the information.
4.18-3	4.18.2.1	Runoff from excavation for site infrastructure such as the process plant, camps, power plant, or storage areas would be routed to settling ponds before release.	Please note that some or all these discharges may require authorization from ADEC under the APDES Mine Site General Permit for Stormwater, and we recommend that the EIS explain the applicable permit coverage, including the terms and conditions of the authorization and any monitoring requirements.

AMERICAN OVERSIGHT

4.18-3	4.18.2.1	During the production phase, the Mine Site would have two WTPs: the main WTP and the open pit WTP.	We recommend that the EIS discuss how these units will be monitored, as well as discuss contingency plans that will be implemented should an exceedance occur.
4.18-4	4.18.2.1	Main Water Treatment Plant and Open Pit Water Treatment Plant sections.	It would be helpful to provide references of examples where the same WTP technology has been used at other mine sites, particularly when it comes to the removal of more difficult constituents, like selenium. We also recommend that the EIS document whether the WTP technology being used is new or has been widely utilized in other similar situations.
4.18-4	4.18.2.1	To prevent overloading the mine water balance with sulfate, some sulfate must be removed from the reject before its disposal in the TSF. Sulfate would be removed with a multi-stage calcium sulfate precipitation process. Precipitated calcium sulfate solids would be disposed of in the TSF.	We recommend that the EIS provide additional explanation of this process. It seems that sulfate will be removed from the reject, and then disposed of in the same place as the reject, which is confusing if the goal is to prevent overloading the mine water with sulfate. We recommend that the EIS evaluate the disposal of water treatment residuals and whether redissolution of these residuals would occur and could compromise water treatment.
4.18-5		Water from the sulfide reaction tanks would be filtered to remove precipitated metals. The filtered water would be suitable for discharge.	It would seem that a pH adjustment step might be necessary or an "alkalinity adjustment" as is stated on the previous page. Please describe all appropriate steps in the process in the EIS in order to evaluate the impacts and provide the appropriate mitigation where necessary. We additionally recommend that the EIS discuss the requirements that would be used to determine that the filtered water is suitable for discharge, i.e., meets state water quality standards prior to discharge.
4.18-5	4.18.2.1	"…until the runoff is determined to be suitable for direct discharge."	Please include in the EIS the time-frame over which this suitability for direct discharge is predicted to occur.
4.18-5	4.18.2.1	Surface runoff into the pit lake could cause metals to leach from the pit walls. Water quality in the pit lake would be expected to be acidic, with elevated concentrations of some metals caused by the oxidation of sulfide compounds in the pit walls and the natural concentrations of metals found in the mineralized rock.	We recommend that the EIS provide the details of specific metals and concentrations that exceed water quality criteria.
4.18-5	4.18.2.1	Once the level of the pit lake has risen to about 890 feet above mean sea level, water would be pumped from the pit,	We recommend that the EIS describe how long it will take for the pit to fill to 890 feet and the

AMERICAN OVERSIGHT

		treated as required, and discharged to the environment.	basis for that estimate. Also, please provide the location of the treated water discharge.
4.18-5	4.18.2.1	Process-related (contact) water would not be considered waters of the United States or subject to the Alaska Pollutant Discharge Elimination System (APDES) permitting program while such water is retained within the water management facilities.	We recommend that the EIS further explain this statement, and its meaning in terms of handling of contact water.
4.18-5	4.18.2.1	Contact water would be treated to ensure compliance with the most stringent applicable water quality standards before being discharged.	Please also discuss any applicable APDES permit limits and monitoring requirements on the authorization of this discharge.
	4.18.2.1	General comment	We note that water will be treated to meet water quality standards, but will still need to be compared to baseline (background conditions). We recommend that this section: - identify the water quality constituents of concern at the mine site (metals, sulfate, nitrates, pH,TSS, etc.) during each phase; - include tables that provide the predicted concentrations of these constituents in the TSF pond, WMPs, and open pit dewatering water during operations and the pit lake water at post-closure; -include tables that provide the predicted concentrations after water is treated (operations and closure); - include a discussion how these water quality predications were made and uncertainties; -describe where the treated water would be discharged and describe changes to surface water quality due to these discharges (during construction, operations, and closure); -discuss impacts of contaminated groundwater (see comments below) on surface water quality, where groundwater contributes to surface water flows; and -discuss impacts of fugitive dust at the mine site on surface water quality and plans proposed by the Applicant to mitigate impacts.
4.18-6	4.18.2.1	With an effective water management and water treatment program, impacts on groundwater quality would be limited to discrete portions of the project area.	This statement implies that contaminants would be released to groundwater regardless of efforts to avoid/minimize impacts. We recommend that the EIS include additional details regarding potential impacts, including predicted concentrations of constituents in seepage from the TSF, WMPs, and open pit, discussion of how these predictions were made, comparison to baseline conditions and regulatory standards,

AMERICAN OVERSIGHT

			and geographic extent (lateral and vertical) of impact on groundwater. As recommended above, the use of tables and figures will be helpful to aid in the reader's understanding.
4.18-6	4.18.2.1	Groundwater that could be contaminated by vertical seepage from the unlined bulk TSF would flow north down the North Fork Koktuli River (NFK) west drainage and would be captured by the main embankment seepage collection pond.	We recommend providing a reference to the details regarding this groundwater flow and capture. Information on the depth of groundwater captured by the seepage pond should be included in the EIS as well as information on the specific metal concentrations predicted.
4.18-6	4.18	The spatial extent of these impacts is expected to be limited to shallow groundwater between the TSFs and seepage collection facilities.	We recommend that the EIS discuss the potential presence of underlying fractured bedrock and whether any fractures could result in greater extent of groundwater impacts.
4.18-6	4.18	The TSFs and PAG storage facilities are not expected to result in impacts on downgradient groundwater quality outside of the Mine Site, based on understanding of current seepage collection design features.	We recommend that the EIS discuss the specific seepage design features and discuss how the effectiveness in reducing impacts to downgradient groundwater quality was determined.
4.18-6	4.18	However, impacts on local groundwater could be sufficient to exceed water quality regulatory criteria, and could persist through the life of the mine and well into post-closure, until monitoring at seepage collection systems indicates that water quality meets the approved criteria for discharge. Inputs of contaminated water from the pit to groundwater after the cessation of pit depressurization could potentially exceed regulatory limits for water quality. Impacts on groundwater quality from Mine Site activities proposed under Alternative 1 would likely be limited to effects on local groundwater in the near vicinity of mine facilities and would remain within the Mine Site boundaries.	Again, a release of contaminants impacting groundwater quality is implied by these statements. We recommend that the EIS further characterize this potential and discuss monitoring, mitigation, and contingency plans to detect and prevent impacts.
4.18-7	4.18.2.1	The redox state of the overburden is not expected to change during mine operations	We recommend that the EIS provide text that would clarify if the drawdown of groundwater would result in a change in the overburden redox conditions within the footprint of the dewatered area. Switching from saturated to unsaturated conditions would likely affect redox conditions.

AMERICAN OVERSIGHT

4.18-7	4.18.2.1	However, concentrations of metals in shallow groundwater may increase because of disruption of wetlands and increased sedimentation.	We recommend that the EIS provide additional explanation of these impacts. Specifically, please provide details on the cause of the increase in metal concentrations due to wetland disruption, information on the mechanism by which this disruption increases metals, and information on the cause of the increased sedimentation.
4.18-7	4.18.2.2	Port infrastructure should be built above the 100-year floodplain of Amakdedori Creek, although the floodplain is not well defined.	As mentioned above, we recommend that the EIS clarify how it will be ensured that the infrastructure is above the 100-year floodplain, including obtaining additional site-specific information if needed.
4.18-7	4.18.2.2	The WTP at Amakdedori Port	We recommend that the EIS include information on the expected sources of contamination at the Port and list the constituents of concern. Please also describe the location of the WTP discharge. We also recommend that the EIS address whether similar sources of contamination would also be present at the two ferry terminals on Lake Iliamna. This water treatment facility design is different from the others that are on-site. We recommend that the EIS discuss the different WTP designs and how they were determined to fit the specific contaminant characteristics of the three sites, to make the differences clear for decision makers and the public.
4.18-8	4.18.2.2	The solids removed would be thickened and disposed of appropriately.	We recommend that the EIS provide additional detail on how and where the solids would be disposed.
4.18-8	4.18.2.2	…however, such impacts could be mitigated, and possibly eliminated, by implementing BMPs to prevent the dust from entering the water. The nature and extent of dust-related impacts at the port site, and the efficacy of proposed mitigation measures will be analyzed in greater detail as more information becomes available.	We recommend that the EIS provide specific details on which BMPs will be utilized to prevent dust/metals entering Cook Inlet, and that information necessary for selection of mitigation measures be included in the EIS analysis.
4.18-8	4.18.2.2	No impacts on groundwater quality are expected to occur at the port site.	Please provide additional discussion to support this statement, including addressing whether there will be monitoring to assure that impacts do not occur.
4.18-8	4.18.2.2	Sediments in waterbodies at the port site could potentially be affected by erosion, dust deposition, and overland runoff, especially during construction.	We recommend that the EIS list the waterbodies that could be affected and the extent of potential effects. As recommended above, please also list the BMPs that would be used to avoid or

AMERICAN OVERSIGHT

		BMPs would be in place to avoid or minimize the effects of construction of the port facilities.	minimize impacts and reference the Applicant plans that include the specific BMPs as they are considered to help avoid or minimize impacts, and should be part of the environmental review process.
4.18-8	4.18.2.3	Impacts on surface water quality in the Transportation Corridor could result from occasional barge/tug-induced suspended sediment, or from erosion effects at construction sites.	Please provide information for the potential of high concentration copper and molybdenum (and other metals found in the concentrates) dust on the trucks using the transportation corridor to impact the surrounding environment, including waterways, and the mitigation measures that would be put in place to prevent and address surface water contamination from the corridor.
4.18-8	4.18.2.3	If PAG is identified during the site evaluation before use, the material site would not be used.	We recommend including a mitigation measure requiring appropriate reclamation of the site, in the event that PAG rock is not identified until it has been exposed during project construction.
4.18-8	4.18.2.3	Erosion and sedimentation would continue for the life of the unpaved roads.	For clarity, please discuss the anticipated life of the unpaved roads in this section. Please also describe the BMPs that would be used and discuss the effectiveness of the BMPs in reducing environmental impacts.
4.18-9	4.18.2.4	Isolated occurrences of impacts above this standard could occur (e.g., during high-precipitation periods along summer construction segments), but are expected to be reduced within a short time frame because of planned redundancies in BMPs, erosion and sediment control measures, and reclamation/cleanup crew functions.	We recommend that the EIS provide additional detail to characterize potential impacts to surface water quality during natural gas pipeline construction, and provide the specific BMPs and other mitigation measures that will be employed to prevent adverse impacts.
4.22 Wetlands			
4.22-1	4.22	Bulleted list	We recommend adding “placement of fill in wetlands” and “conversion of wetland type” to the list of potential direct and indirect effects to wetlands.
4.22-1	4.22	Magnitude would be less for disturbance areas below five percent, and would be greater for disturbance areas above five percent, with greatest intensity for disturbance areas above 25 percent.	We recommend discussing and citing the scientific research that provides the basis for the 5% disturbance area threshold for determining the magnitude/intensity of impacts to wetlands.
4.22-1	4.22	The duration of impacts would be temporary, meaning wetland functions would be reduced during the construction phase;	We recommend discussing the length of time over which impacts would be considered temporary.
4.22-1	4.22	To assess the relative magnitude and extent of impacts, the relative proportion of	It is EPA’s understanding that the Applicant is currently having consultants perform field work to re-verify wetlands in the field. We recommend

AMERICAN OVERSIGHT

		common wetland types in each watershed was estimated.	that this site specific, field verified information be included in the EIS to avoid using estimates once the site-specific information is available.
4.22-2	4.22	Vegetation classes mapped in the watersheds were assigned to one of the following types in a crosswalk for comparison with wetlands mapped for the project: upland, forested wetland, shrub wetland, herbaceous wetland, aquatic bed wetland, or waterbody.	We recommend that these same vegetation grouping types are also listed and discussed in the Chapter 3 vegetation section.
4.22-2	4.22.2.1	Throughout	The discussion primarily relies on overall number of impacts within the footprint and % of impacts within the watershed. We recommend that the document also provide the context of the interconnected ecosystem within the watershed and footprint area, in addition to the adjacent areas. We also recommend that the document analyze the results of the localization of impacts resulting from the direct placement of fill, altering of hydrology and segmenting of ecosystems. If these impacts are to be analyzed in the wetland functional assessment, we recommend that the discussion of these impacts be incorporated in this section rather than referenced.
4.22-2	4.22.2.1	Bulleted List	We recommend adding "altering hydrology" and "segmenting of ecosystem" to the list of primary direct construction-related impacts to wetlands, and addressing these impacts in the analysis.
4.22-3	4.22.2.1	Second full paragraph starting with Excavation…	We recommend summarizing the relevant discussion points regarding surface water hydrology impacts in this section, rather than referencing Section 4.16.
4.22-3	4.22.2.1	Third full paragraph staring with Construction…	If the potentially impacted wetlands also provide habitat, we recommend adding a habitat discussion here or in a separate paragraph (before the overall watershed impact % discussion).
4.22-3	4.22.2.1	Last 2 paragraphs	As recommended above, please include the scientific rationale for the % threshold discussion and its relevance for this project when analyzing localized and watershed impacts.
4.22-6	4.22.2.1	Table 4.22-1	We recommend updating this table with the most accurate available information resulting from the ongoing wetlands field work.
4.22-7	4.22.2.1	Reclamation discussion "During the permitting phase, a reclamation plan would be developed that would include reclamation of wetlands	Because of the conceptual nature of the reclamation discussion, it is difficult to discern which areas would be reclaimed as wetlands, methods that would be used for such

AMERICAN OVERSIGHT

		where feasible. The discussion below is based on generally accepted wetland reclamation practices for mine sites in Alaska. PLP has also provided some conceptual-level information on reclamation in its application." "Material sites constructed in valley bottoms or lowland sites are candidates to be reclaimed to create new ponds with emergent wetlands where sufficient water quality and hydrology are available."	reclamation, and the criteria/monitoring that would be used to measure reclamation success. We recommend that more specific information on reclamation (e.g., a draft reclamation plan) be provided so that it is clear how much of the site will be reclaimed as wetlands during mining (concurrent reclamation) and post mining. We also recommend that the EIS assess the effectiveness of the specific reclamation methods proposed.
4.22-8	4.22.2.1	3rd full paragraph starting with "The pit lake….	Based on the information provided in this section, we recommend the impact analysis include direct and indirect impacts during construction, operation and reclamation/closure phases, since this paragraph states that the hydrologic equilibrium may take decades to occur, post closure. We recommend that the EIS include the results of hydrologic modeling of the area, including a discussion of the potential impacts to wetlands outside of the mine footprint resulting from the alteration of flow from the watershed and surrounding wetlands to fill the created pit lake. We additionally recommend that the EIS discuss the downstream impacts resulting from this alteration of flow while the pit lake is filling for decades. Finally, to enhance readability, we recommend that the EIS incorporate the discussions from 4.17 rather than referencing them here.
General	4.22	All reclamation discussions	Please identify if and where the applicant plans to segregate soils for reclamation purposes.
4.26 Vegetation			
	4.26	General	We recommend including an overall vegetation reclamation discussion in this section providing required minimums, success criteria and adaptive management.
4.26-1	4.26	Bullet list	We recommend also including conversion of vegetation, if any, in the analysis.
4.26-2	4.26.2.1	Vegetation Removal - General	We recommend adding a discussion of what happens to the removed vegetation (e.g., grubbed, burned, etc.)
4.26-2	4.26.2.1	Last paragraph	We recommend adding additional information to the discussion of vegetation succession for context, including proposed reclamation efforts

AMERICAN OVERSIGHT

			and potential length of time for succession based on vegetation type present and soils.
4.26-5 4.26-9	4.26.2.2 4.26.2.6	Fugitive Dust Discussion	We recommend discussing source and type of material used for roadbed contributing to fugitive dust.
4.26-5 4.26-8 4.26-9	4.26.2.2 4.26.2.4 4.26.2.6	Fugitive Dust Discussion for all project components	We recommend adding discussion and analysis of factors contributing to fugitive dust including activities that contribute to fugitive dust (ore crushing, transportation, loading/unloading, etc.) and for road-related activities, length of roads traveled, number of trips per day, type of vehicles, etc.
4.26-5 4.26-8 4.26-9	4.26.2.2 4.26.2.4 4.26.2.6	Fugitive Dust Discussion for all project components	We recommend adding discussion of the maximum extent of fugitive dust impact areas near each source. This could include the anticipated modeling discussed in Section 4.14.
4.26-5 4.26-8 4.26-9	4.26.2.2 4.26.2.4 4.26.2.6	Fugitive Dust Discussion throughout the section	We recommend that the EIS discuss the potential different types of effects that the fugitive dust will have on the diverse vegetative communities within the mine site and other project components. Additionally, we recommend the document provide an analysis and discussion quantifying the amount of impacts to the various vegetation communities resulting from fugitive dust.

No he hasn't. Perhaps we will see that section when we see the Wetlands section, as there is a note in Ch 5 that they are still waiting on the Compensatory Mitigation Plan. It does appear in the schedule of deliverables, so I think that means we will be receiving it at some point.

Hello All,
The Corps has just distributed Chapter 5 Mitigation for review as well, and I have loaded it onto the Sharepoint site. When reviewing the analysis of Environmental Consequences for each resource, please also take a look at the mitigation measures that have been proposed for that resource, and provide any additional recommendations where mitigation is not sufficient, including revisions to proposed mitigation language or additional measures recommended.
Thank you,
Molly

Subject: Please Review - Pebble Pre-DEIS Sections
Importance: High

AMERICAN OVERSIGHT

Hello Pebble NEPA Team,

We have received several additional sections of the preliminary Draft EIS for review. We have also received many sections as an FYI for which our review is not requested. I have loaded everything I've received to date into the Sharepoint Folder: Preliminary Draft EIS Sections Oct-Nov 2018.

As a reminder, our input at this stage is only requested on the specific sections we were assigned to in the Cooperating Agency plan. Therefore, if your name doesn't appear below with a specific assignment, no review is necessary at this time. However, feel free to take a look at the sections pertaining to your subject matter on the Sharepoint Site if you wish.

Here are the assignments for specific sections where I would appreciate your review. Note that each subject area includes a section for Chapter 3 (affected environment), Chapter 4 (environmental consequences), as well as one or two supporting technical appendices. Please use the attached comment spreadsheet to assemble your comments, and please send them to me by the date noted for each section below.

- 3.11/4.11/K4.11 Aesthetics – Molly
- 3.14/4.14/K3.14 Soils – Mark/Palmer – due COB 11/27
- 3.16/4.16/K3.16 Surface Water Hydrology – Tim/Mark/Palmer/Muluken/Justine – due COB 11/27
- 3.26/4.26/K3.26 Vegetation – Mark/Palmer – due COB 11/27
- 3.17/4.17/K3.17 Hydrogeology – Tim/Mark/Palmer/Muluken – due COB 11/29
- 3.18/4.18/K3.18/K4.18 Water and Sediment Quality – Cindi/Tim/Chris – due COB 11/29
- (note, we have not yet received the Wetlands sections, which are anticipated to arrive approximately 11/21)

I apologize for the short time available for review, especially given the Thanksgiving holiday in the middle. If this schedule will be impossible for you, please let me know as soon as possible. Also, if you have any questions about the sections you are reviewing or where to focus your review, please don't hesitate to call.

Thank you,
Molly

Subject: RE: Dry Stack Alternative - no do outs (UNCLASSIFIED)

Hi Patty - I think that Barb raises a lot of good points, and don't have any further comments to add. I will defer to your expertise as to whether these comments warrant submitting something in writing, versus discussing at the meeting on the 24th, so please let me know if I should work to finalize these comments for submission to the Corps.

Deliberative Process / Ex. 5

Thanks,
Molly

Subject: FW: Dry Stack Alternative - no do outs (UNCLASSIFIED)

Hi Barb and Cindi-
I have not had an opportunity to review this memo yet, but plan to do so tomorrow. If you have time, can you also review and send Molly and I any comments that you have by COB 10/22? If you do not have time, please let me know. I have reviewed dry stack analyses for other EISs so I am pretty comfortable with this, but would also appreciate a second (or third!) set of eyes.
This memo will be discussed at a meeting with the Corps and other agencies on October 24. We have not decided whether to submit written comments - that will depend on our review.
Thanks -
Patty

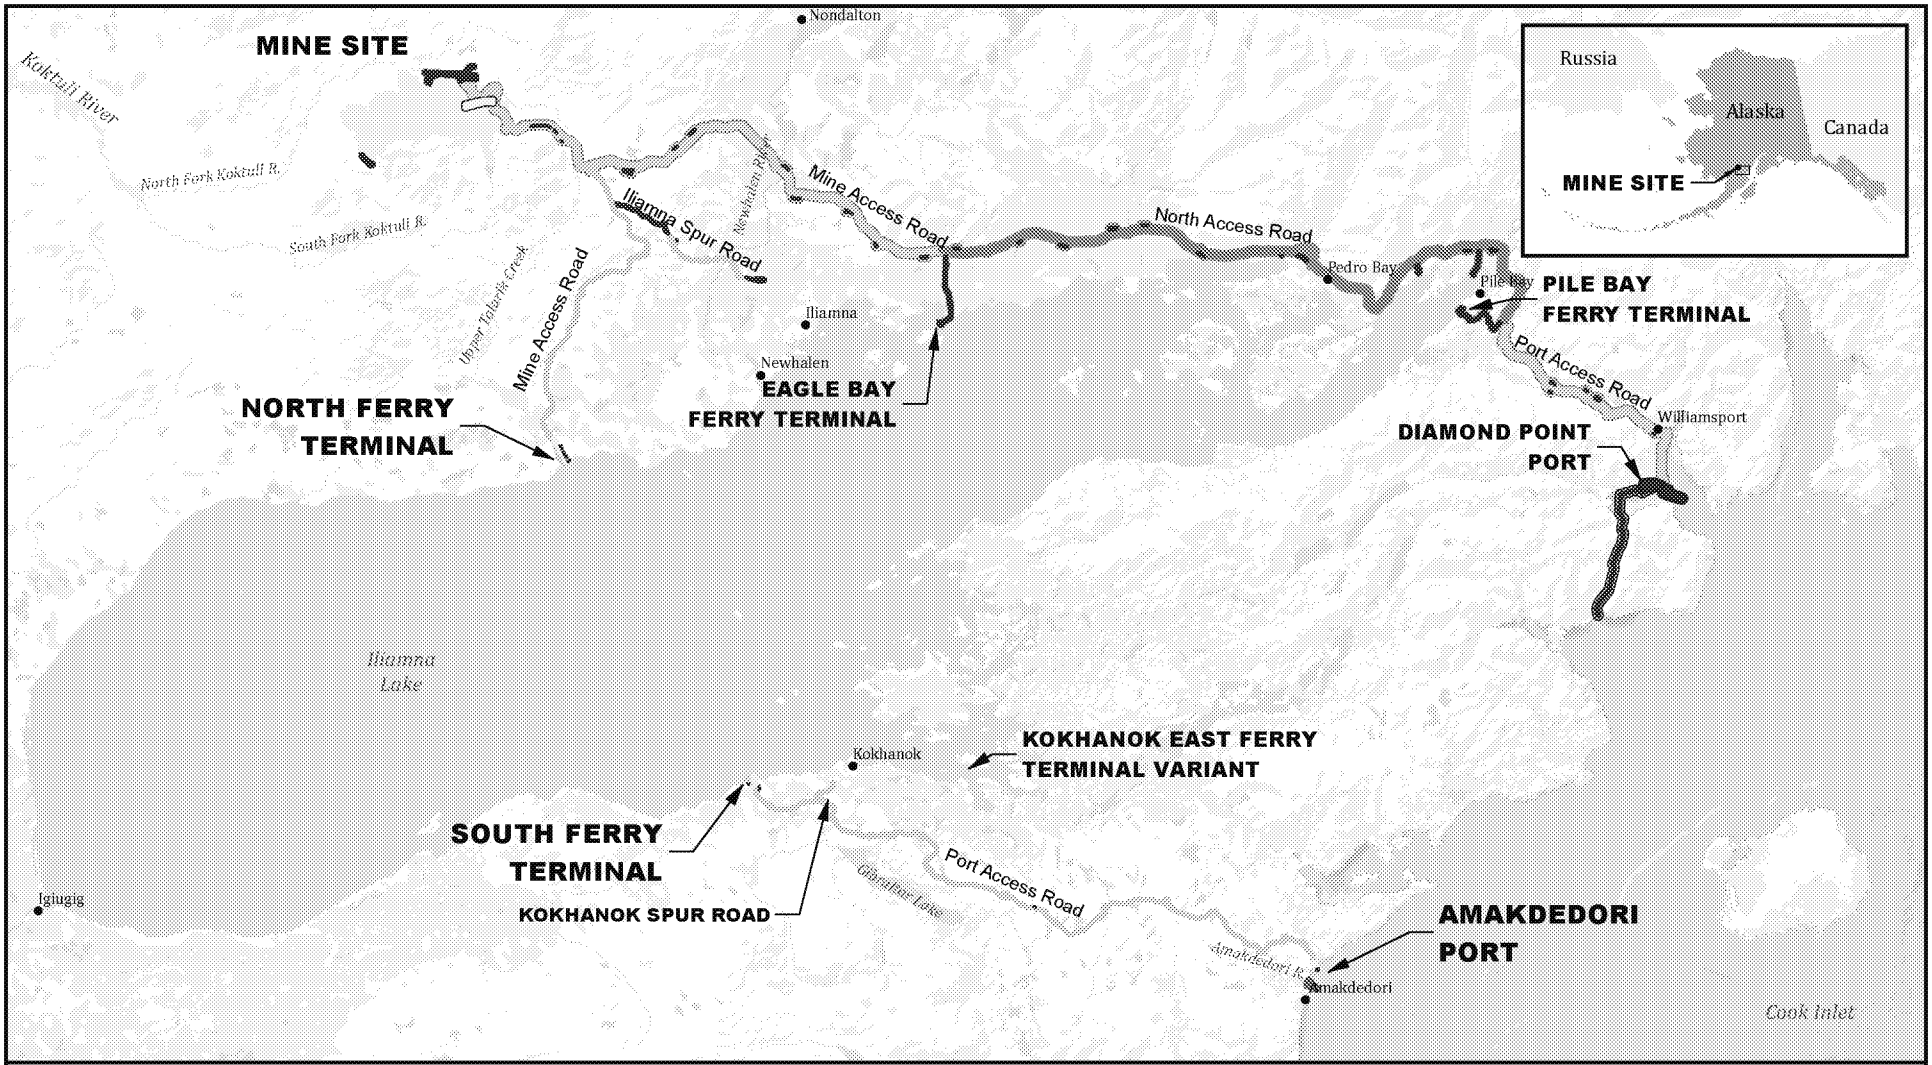
Good Morning,

Attached are the review drafts for Sec3.22 and Sec4.22, Wetlands. There are no technical appendices with these sections.

Sec 3.22 has one standalone PDF figure (attached) and 7 embedded figures. Sec 4.22 has three standalone PDF figures (attached).

Cooperating agencies with special expertise on this section are USACE and EPA. Suspense date for comments will be provided on Monday.



v/r,

Katie McCafferty

3.22 WETLANDS/SPECIAL AQUATIC SITES

The affected environment for wetlands and waterbodies includes vegetated wetlands, ponds, lakes, streams, rivers and marine and estuarine waters that may be directly or indirectly affected by all project alternatives and components. The EIS analysis area collectively includes areas for all four components (mine site, transportation corridor, ports, and natural gas pipeline). The analysis area for the mine site includes a 330-foot buffer around the direct disturbance footprint and potential drawdown zone from the open pit. The analysis area for the transportation corridor and ports includes a 330-foot buffer around the direct disturbance footprint. The analysis area for the stand-alone sections of the natural gas pipeline is a 30-foot corridor through Cook Inlet and Iliamna Lake, and a 100-foot corridor through overland areas. The analysis areas includes potential direct and indirect impacts from construction and operations. See Figure 3.26-1 in Section 3.26, Vegetation, for a general overview of the analysis area for wetlands/special aquatic sites, which is similar to that of vegetation.

Wetlands and waterbodies are described in terms of the extent and characteristics of predominant types found in the analysis area. The descriptions are primarily based on information provided in Chapters 14 and 39 of the Environmental Baseline Document (EBD) (3PPI and HDR 2011, HDR and 3PPI 2011), as well as more recent information provided in the Preliminary Jurisdictional Determination (PJD) Report (HDR 2018) and the associated Geographic Information System (GIS) database, which reflects changes in the project area since publication of the EBD.

3.22.1 Wetland/Special Aquatic Site and Waterbody Terms

Wetlands and other special aquatic sites are regulated by the US Army Corps of Engineers (USACE) under Section 404 of the Clean Water Act (CWA) (33 US Code [USC] 1344). Pebble Limited Partnership (PLP) has prepared a PJD report (HDR 2018) for Alternative 1 identifying wetlands and other waters of the US (WOUS) under the USACE's regulatory jurisdiction; the USACE signed Department of the Army PJD is provided in Appendix J.

Special Aquatic Sites – Special aquatic sites are a subset of jurisdictional WOUS, which are large or small areas possessing special ecological characteristics of productivity, habitat, wildlife protection, or other important and easily disrupted ecological values (40 CFR 230.3). Special aquatic sites present in the analysis area include mudflats, vegetated shallows, and riffle and pool complexes.

Sanctuaries and Refuges – There are no sanctuaries and refuges that occur in the analysis area. See Section 3.2, Land Ownership, Management, and Use, for details on land ownership and land designations in the analysis area.

Wetlands – Wetlands are WOUS defined as "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" (33 CFR 328.3[b]). Wetlands are transitional between terrestrial and aquatic ecosystems. Unvegetated areas such as streams, ponds, and lakes are not considered "wetlands" under this definition. Wetlands in the project area occur on a variety of mineral and organic soil substrates. Information on soils is provided in Section 3.14, Soils.

Wetland determinations followed guidance from the USACE. Wetland determinations from 2004 through 2008 were based on the 1987 Wetland Delineation Manual (USACE 1987), while determinations after 2013 were based on the 1987 Manual in conjunction with the 2007 Alaska Regional Supplement (USACE 2007). Detailed descriptions of the field indicators used for

AMERICAN OVERSIGHT

wetland determinations in the project area are provided in Chapters 14 and 39 of the EBD (3PPI and HDR 2011, HDR and 3PPI 2011), and in the PJD Report (HDR 2018).

Mudflats – Mudflats occur in certain intertidal portions of Cook Inlet. They are composed of fine sediments and organic material, and are either unvegetated or vegetated only by algal mats. They have not been documented in the project area for Alternative 1, as the intertidal zone is composed mostly of sand and gravel. They have been identified in upper Iliamna Bay near the project area for Alternatives 2 and 3. The extent of mudflats in this area was determined to include tidal waters below mean higher high water and above mean lower low water.

Vegetated Shallows – Vegetated shallows are permanently inundated areas that support rooted aquatic vegetation. They include some of the aquatic bed types defined by the National Wetland Inventory (NWI) system (described below) occurring in freshwater ponds and lake margins. These are of very limited extent in the analysis area, and are described together with other vegetated wetlands. Eelgrass beds are a relatively common type of vegetated shallows that do occur in parts of the nearshore environment of Cook Inlet. Eelgrass is known to occur in patchy beds in Iliamna and Cottonwood bays, as well as south of the project area around reefs associated with Nordyke Island and Chenik Head, but outside of the analysis area for Alternatives 2 and 3.

Coral Reefs – There are no coral reefs identified in the analysis area.

Riffle and Pool Complexes – Riffle and pool complexes occur in steep gradient sections of streams in the analysis area. Riffles are defined by rapid flow over a coarse substrate that produces high levels of dissolved oxygen in the water. Pools are deeper, slower sections of water with a finer substrate. Major streams in the analysis area have been characterized for habitat types, including riffle and pool habitats and associated fish resources (R2 Resource Consultants et al. 2011). Baseline mapping of streams did not specifically identify riffle and pool complexes in the project area. Streams were characterized mainly by flow regime (lower perennial, upper perennial, and intermittent). Riffle and pool complexes would be expected to occur most frequently in the upper perennial and intermittent zones where stream beds are predominantly gravel or coarser. Stream morphology and associated fish habitat in the analysis area is addressed in Section 3.24, Fish Values; surface water quality is addressed in Section 3.18, Water and Sediment Quality.

Waterbodies – Waterbodies, as used in this section, include all non-wetland waters. Most of these areas are deepwater habitats characterized by permanent water and non-soil substrates. In the analysis area, these include marine waters, both subtidal (continuously submerged) and intertidal (exposed during low tides), lakes, ponds, and streams. Streams are characterized as either perennial or intermittent. Perennial streams are further subdivided as either upper perennial or lower perennial. Upper perennial streams tend to have higher gradients, faster flows, coarser substrates, and little floodplain development compared to lower perennial streams (Cowardin et al. 1979).

Intermittent streams are present in headwater positions in the project area, and typically have flow during the spring snowmelt period (May to June), then may go dry or subsurface during July and August until sufficient rainfall begins again in September. Flow again gradually declines during winter as snow accumulates. These streams are typically dry during February to early April (Knight Piésold et al. 2011). The duration of flow in these streams is related to catchment area and characteristics, and to the relative contribution of groundwater to base flows.

Intermittent streams are differentiated from ephemeral streams based on duration, timing and sources of flow, which may vary year to year. Ephemeral streams flow for brief periods (hours to a few days) during and immediately after rainfall events, and do not receive groundwater inputs.

AMERICAN OVERSIGHT

Intermittent streams flow seasonally (several weeks or more), with inputs from groundwater, snow melt, and rainfall. According to the baseline stream mapping, all non-perennial streams have been classified as intermittent (3PPI and HDR 2011).

Navigable waters of the US (NWUS) are regulated by the USACE under Section 10 of the Rivers and Harbors Act of 1899 (RHA) (33 USC 403); the USACE maintains a list of navigable waters in Alaska that have been determined to be NWUS by the district engineer. All waters that are subject to the ebb and flow of the tide are also considered NWUS. Navigable waters in the analysis area that are regulated under Section 10 of the RHA include Iliamna Lake and Cook Inlet. Navigable waters of the state are addressed in Section 3.12, Transportation and Navigation.

3.22.2 Wetland Mapping and Classification

A GIS database was constructed for the project's environmental baseline study program that incorporated existing NWI data, USGS topographic data, land use and land cover data, existing vegetation data, soil survey data from the Natural Resources Conservation Service (NRCS), and several sources of aerial and Light Detection and Ranging (LIDAR) imagery.

Field surveys were conducted over several growing seasons (2004 to 2008, 2013, and 2017). A total of 684 wetland determination field plots were surveyed. Detailed information on vegetation, soils, and hydrology was collected at each plot. Additional photo and data points were collected at waterbodies and stream crossings. Mapping was digitized on aerial photography at a scale between 1:1,200 and 1:1,500 for wetlands, and 1:400 for open water. Additional data was collected in 2018 as part of PLP's summer field 2018 program.

Wetland mapping included interpretation of "photographic signatures" associated with vegetation types (see Appendix C in HDR 2018) and interpretation of topography. Topographic depressions, toe slopes, and flat areas were often associated with wetlands, while convex slopes were indicative of potential uplands. Topography was also used to assess potential hydrologic connections between wetlands and surface waters, and to determine potential locations of groundwater seeps.

Many of the wetland polygons mapped for the project contain inclusions of uplands. These "mosaics" occur in landscapes with often complex microtopography where wetland and upland components are too closely associated to be easily mapped separately (USACE 2007). Wetland scientists estimated the proportion of wetland versus upland in each mosaic polygon, ranging from 10 to 90 percent wetland. Approximately half of the wetland polygon area in the analysis area was mapped as mosaics. Scrub-shrub and forested wetlands were more often mapped as mosaics compared to emergent wetlands. For this analysis, all mosaics have been calculated as 100 percent wetland.

Each mapped wetland and waterbody polygon was further characterized using vegetation and wetland classification systems. All polygons were first assigned a vegetation type based on the Alaska Vegetation Classification (Viereck et al. 1992), supplemented by Wibbenmeyer et al. (1982); see Section 3.26, Vegetation, for detailed vegetation classification information. Wetland and waterbody polygons were then classified by NWI class (Cowardin et al. 1979) and assigned a hydrogeomorphic (HGM) class (Brinson 1993).

Wetland Data Gaps – For Alternative 1, project-specific wetland mapping through 2018 covers the entire project footprint except for the pipeline crossing of Cook Inlet, and the 0.5-mile pipeline corridor and compressor station near Anchor Point on the Kenai Peninsula. For these areas, the Cook Inlet Lowlands wetland project prepared by the Kenai Watershed Forum (Gracz 2013) was applied. Wetland and waterbody data was confirmed in the PJD (see Appendix J).

AMERICAN OVERSIGHT

The analysis area for the Kokhanok east ferry terminal variant of Alternative 1 also lacks project-specific mapping, and NWI data is not available for this area. Wetland mapping for this area was obtained from publically available synthetic aperture radar satellite data (the Advanced Land Observing Satellite Phased Array type L-band Synthetic Aperture Radar, also referred to as ALOS PALSAR) (Clewley et al. 2015). Wetlands were mapped at 100-meter resolution. This data provides a coarse estimate of wetland boundaries compared to either project-specific mapping or NWI mapping.

The analysis areas for Alternatives 2 and 3 include areas that lack complete project-specific wetland mapping. These include the natural gas pipeline corridor from Ursus Bay to Diamond Point, most of the area of the Diamond Point port site, sections of the Williamsport-Pile Bay road, the Pile Bay ferry terminal and access road, and the Eagle Bay ferry terminal and access road. For these areas, NWI data was analyzed (NWI 2018). The NWI maps provide a reconnaissance-level depiction of the location, type, and size of wetlands; NWI data do not provide the level of detail of project-specific mapping. For purposes of this analysis, NWI wetland types have been grouped to match the project units used for the environmental baseline study program.

[Note: A wetlands mapbook of the project-specific wetlands mapping, incorporating any wetlands data updates that are received prior to production of the draft EIS, will be included as technical appendix K3.22 to the draft EIS].

3.22.3 Wetland Functions and Values

This section provides a qualitative overview of wetland functions in the analysis area based on the NWI classifications, and a description of high quality wetlands. High quality wetlands provide a variety of ecosystem functions for various resources. Most of the wetlands and their basins have very little to no anthropogenic disturbance to reduce function or quality. Wetland function varies based on position in the watershed and linkages to other habitats, so a particular wetland polygon of a given class may not provide the same level of functions as others in the same class.

3.22.3.1 NWI Classes

Primary wetland functions generally associated with each NWI wetland class are described below.

Forested Wetlands – depending on their position in the landscape and water regime, they provide modification of flood flows, shoreline stabilization, water quality improvement, organic matter production and export, wildlife cover and browse, and fish habitat through cover and shade. Forests are mostly confined to well-drained lowland areas, and forested wetlands are relatively scarce, especially at the mine site (Carlson et al. 2018).

Scrub-Shrub Wetlands – tall shrubs provide water quality and shoreline stabilization functions similar to forested wetlands, and high quality wildlife browse (willows [*Salix* spp.]) for moose and beavers. Small and dwarf shrub wetlands provide fewer habitat functions, but are relatively abundant in the analysis area. Most scrub-shrub wetlands in the analysis area are on slopes and have a saturate water regime. Seasonally flooded tall shrub wetlands occur in floodplains and depressions.

Emergent and Aquatic Bed Wetlands – persistent herbaceous vegetation provides removal of sediments and nutrients, production and export of organic matter, and habitat for aquatic invertebrates, fish, waterfowl and wetland-associated mammals (e.g., beavers and river otters). Bird species of concern associated with these wetlands include tundra swan, long-tailed duck,

AMERICAN OVERSIGHT

harlequin duck, common loon, and others (ABR 2011a). Many of these wetlands are seasonally to semi-permanently flooded or ponded. Aquatic bed wetlands are relatively scarce in the analysis area.

3.22.3.2 High Quality Wetlands

High quality or high-functioning wetlands in the analysis area are considered to be associated with the following characteristics:

- Providing habitat for sensitive or regionally important fish, wildlife, birds, or plant species. For example, many riparian or riverine wetlands provide critical habitat functions for ecologically, economically and culturally important anadromous and resident fish species in the analysis area. Most of these functions are related to the contribution of the woody riparian canopy, through inputs of coarse woody debris and nitrogen (alders); sediment and streambank stabilization; provision of shading and cover; and food chain support. Therefore, riparian wetlands with forest or shrub vegetation classes are considered high quality wetlands for purposes of analyzing environmental consequences of the project in Chapter 4, Environmental Consequences. Riparian herbaceous wetlands are also considered high quality due to their relatively high species richness. (ABR 2011a).
- Regional scarcity, or rare and high quality, within a given region. For example, forested wetlands cover a very small portion of the analysis area, but provide important food and cover for wildlife such as beavers and moose, and woody inputs important for fish habitat and stream dynamics. Aquatic bed wetlands also cover a very small portion of the analysis area, but provide important habitat for wildlife such as wood frogs.
- Undisturbed and difficult or impossible to replace, such as bogs or fens. Some bog types have relatively high species richness for bird and mammals species of concern (ABR 2011a). Bogs have also been shown to contribute substantially to stream base flows (Gracz 2017), and are sensitive to disturbance.
- In addition to the ecosystem functions provided by wetlands, certain wetland types and locations are valued by Alaska Natives for their subsistence value (Hall et al. 1994; Jernigan n.d.). Some culturally important plants found mainly in wetlands include blueberries (*Vaccinium* spp.), cranberries (*Vaccinium* or *Oxycoccus* spp., Labrador tea (*Ledum* spp.), and willows.

3.22.4 Waterbody Functions and Values

Non-wetland aquatic habitats in the analysis area also provide numerous ecosystem functions, including support for a wide array of anadromous and resident fish, aquatic invertebrates, birds, and mammals. Detailed assessments are provided in the baseline reports (ABR 2011a; R2 Resource Consultants et al. 201l) and Section 3.23, Wildlife, Section 3.24, Fish Values, and Section 3.25 Threatened and Endangered Species.

Marine/Estuarine Waters – Cook Inlet provides habitat for many marine mammals, including Steller's sea lion, harbor seal, northern sea otter, beluga whale, and gray whale; and various bird species (see Section 3.23, Wildlife and Section 3.25, Threatened and Endangered Species, for details on marine mammals and birds analysis area). Nearshore and estuarine habitats have been investigated in the vicinity of the analysis area (Pentec Environmental/Hart Crowser 2011a, 2011b). Several habitat types including mudflats were identified, which provide resources for varying life stages of numerous fish and invertebrate species. Intertidal waters represent a small portion of marine waters in the analysis area.

AMERICAN OVERSIGHT

Lakes/Ponds – Waterbodies in the analysis area range from very small ponds to large lakes (approximately 150 acres) and Iliamna Lake 1,000 square miles). The majority of waterbodies in the analysis area are less than 2.5 acres in size (ABR 2011a). There is a great variety in depth and hydrologic regime, shoreline complexity, and connectivity to drainages, all of which influence functions and values.

In general, these habitats have been identified as having relatively high species richness for bird and mammal species of concern (ABR 2011a). Some species associated with these habitats include tundra swan, long-tailed duck, common loon, arctic tern, river otter, and moose. Iliamna Lake also provides habitat for harbor seals. The wood frog is the only amphibian that occurs within the analysis area, and is highly associated with deeper lakes and ponds (>5 feet). Some of the larger lakes provide spawning habitat for sockeye salmon. Water impounded by lakes and ponds is also important for maintaining summer flows and downstream aquatic habitat (R2 Resource Consultants et al. 2011).

Rivers/Streams – Functions and values of these habitats very greatly in the analysis area depending on hydrologic regimes, bed and bank structure, floodplain interactions and other fluvial processes. Rivers in the analysis area support five species of anadromous Pacific salmon, at least four species of non-anadromous salmonids, and numerous non-salmonid fishes (R2 Resource Consultants et al. 2011). These habitats also have high value for bird and mammal species of concern including harlequin duck, bald eagle, arctic tern, river otter, brown bear, and beaver.

3.22.5 Action Alternative 1 – Applicant's Proposed Alternative

WOUS, including wetlands, comprise 32 percent of the Alternative 1 analysis area. A description by major project components is provided below.

3.22.5.1 Mine Site

The mine site analysis area occurs within the upper watersheds of both the North Fork and South Fork Koktuli River, which flows into Bristol Bay via the Mulchatna and Nushagak rivers. It also includes a small portion of the Upper Talarik Creek watershed. The analysis area is composed of glaciated, volcanic-ash influenced, hills and valleys free of permafrost. Given the complexity of the mine site area, a figure depicting project-specific mapping is provided for reference (Figure 3.22-1).

Over half (59 percent) of the mine site analysis area is comprised of uplands and the remaining (41 percent) is comprised of WOUS (Figure 3.22-2). Wetlands represent 39 percent of the WOUS in the analysis area. The dominant NWI wetland type is broad leaved deciduous shrub (PSS1) (30 percent). These occur predominantly on slopes with both mineral and organic soils. The water regime is usually saturated, but also includes shallow flooding or ponding on very gradual slopes and in small swales and depressions located on the slopes. Shrub wetlands also occur along the north and south forks of the Koktuli River and their floodplains, as well as several smaller streams. Although dominated by a deciduous shrub layer (willows, birches (*Betula* spp.), blueberries), they can also include small evergreen shrubs, with or without herbaceous wetland species. Bogs and fens co-dominated by ericaceous shrubs occur on slopes and organic flats. Based on project vegetation mapping, these shrub wetlands comprise approximately 5 percent of the analysis area.

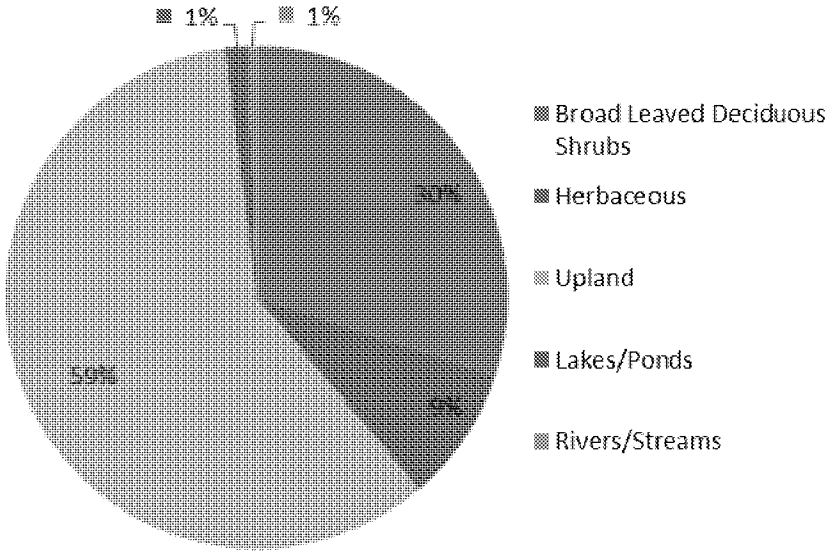
Herbaceous wetlands (PEM1) make up approximately 9 percent of the mine site analysis area. These occur in seasonally to semi-permanently flooded depressions and shorelines, and on wetter positions of slopes and flats. Some 30 species of wetland sedges were observed in the mine site area and provide the dominant cover. Some of these sedges, along with

AMERICAN OVERSIGHT

cottongrasses (*Eriophorum sp.*), form pronounced tussocks communities. Bluejoint reedgrass (*Calamagrostis canadensis*) and horsetails (*Equisetum sp.*) are other locally common herbaceous wetland species.

Aquatic bed wetlands occurred in depressions and ponded areas of slopes, accounting for less than 0.1 percent of the analysis area. Forested wetlands are absent at the mine site.

Waterbodies make up 2 percent of the mine site analysis area. Waterbodies include both perennial and intermittent stream channels, lakes, and ponds. Streams make up of the analysis area Most streams at the mine site are perennial. Lakes and ponds combined make up 1 percent of the analysis area.



Human-caused soil or vegetation disturbance in the mine site area was minimal and appears to be limited to four-wheeler trails or campsites (3PPI and HDR 2011). Drill pads and other temporary disturbance from project exploration were not observed to alter wetland status or characteristics (AECOM 2018h).

AMERICAN OVERSIGHT

Figure 3.22-1: Map of Wetlands and Waterbodies at the Mine Site

AMERICAN OVERSIGHT

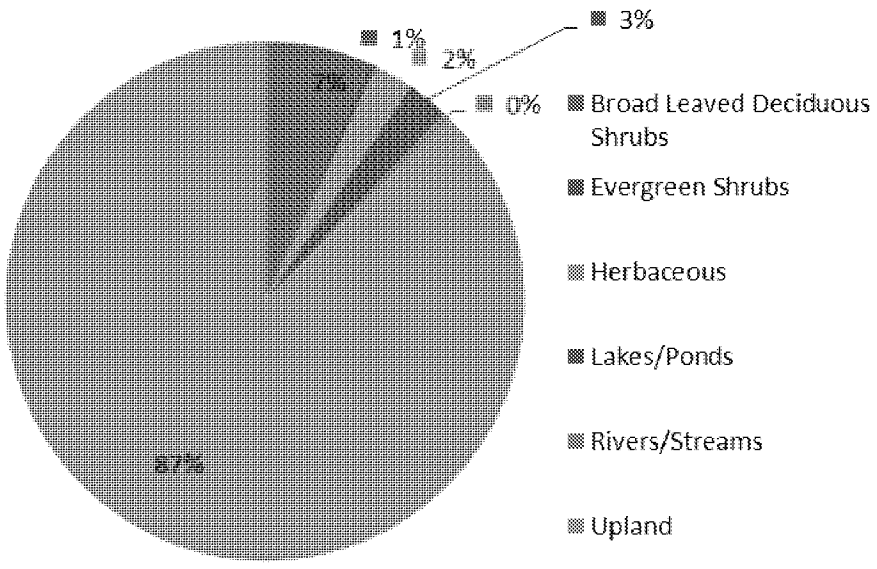
Figure 3.22-2: NWI Wetland and Waterbody Groups at the Mine Site Analysis Area

3.22.5.2 Transportation Corridor

The transportation corridor analysis area crosses the Bristol Bay and Cook Inlet drainage basins. The major Bristol Bay watersheds include Upper Talarik Creek (UTC), Newhalen River on the northern side of Iliamna Lake, Gibraltar Lake on the southern side, and Iliamna Lake watershed on both sides of the lake. The Amakdedori Creek-Kamishak Bay watershed is the only major watershed in Cook Inlet drainage basin crossed by the transportation corridor. The transportation corridor area is dominated by glaciated, volcanic ash-influenced, mountains, hills, plains and valleys that are free of permafrost.

Uplands dominate the transportation corridor analysis area (87 percent) and the remaining (13 percent) is comprised of WOUS. Wetlands comprise 10 percent of the WOUS in the analysis area. The dominant NWI wetland type is broad leaved deciduous shrub (PSS1) (7 percent) (Figure 3.22-3). These occur predominantly on slopes with both mineral and organic soils. The water regime is usually saturated, but also includes shallow flooding or ponding on very gradual slopes and in small swales and depressions located on the slopes. Seasonally flooded shrub wetlands also occur along stream channels, primarily UTC and Newhalen River and their floodplains. Bogs and fens co-dominated by ericaceous shrubs occur on slopes and organic flats.

Herbaceous wetlands (PEM1) comprise 2 percent of the analysis area. These occur in seasonally to semi-permanently flooded depressions and shorelines, and on wetter positions on slopes and flats. Some 30 species of wetland sedges were observed in the area and provide the dominant cover. Some of these sedges, along with cottongrasses, form pronounced tussocks communities. Bluejoint and horsetails are other locally common herbaceous wetland species.



Forested wetlands and aquatic bed wetlands each accounted for less than 0.1 percent of the analysis area.

Waterbodies account for 3 percent of the transportation corridor analysis area. Perennial and intermittent stream channels combined account for less than 1 percent of the area. Most of these streams are upper perennial (R3). Lakes and ponds combined account for approximately 3 percent of the area.

AMERICAN OVERSIGHT

Human-caused soil or vegetation disturbance in the transportation corridor area was minimal and appeared to be limited to ATV trails, roads and building pads near the village of Iliamna, Kokhanok Airport, and the shore of Iliamna Lake.

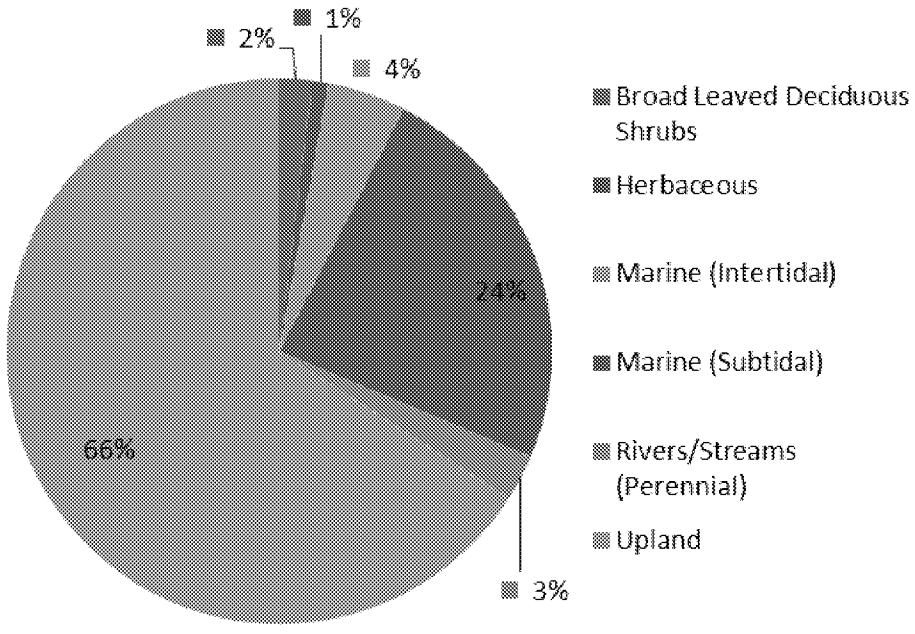
Figure 3.22-3: NWI Wetland and Waterbody Groups at the Alternative 1 Transportation Corridor Analysis Area

Kokhanok East Ferry Terminal Variant

Project-specific wetland mapping is not available for this area, as described above. ALOS PALSAR data (Clewley et al. 2015) was used for the variant portion of the analysis area for this variant.

Within the area of the variant, the dominant NWI wetland type is herbaceous.

[Note: It is expected that project-specific mapping data would be acquired in field season 2019, and included in a final EIS].



3.22.5.3 Amakdedori Port

The Amakdedori port analysis area is located on the shore of Kamishak Bay, Cook Inlet, near Amakdedori Creek. Uplands account for over half (66 percent) of the analysis area with the remaining area (34 percent) composed of WOUS. Wetlands comprise 3 percent of the WOUS in the analysis area. NWI wetland types include herbaceous (PEM1) (1 percent) and broad leaved deciduous shrub (PSS1) (2 percent) (Figure 3.22-4). Both types occur almost exclusively on slopes.

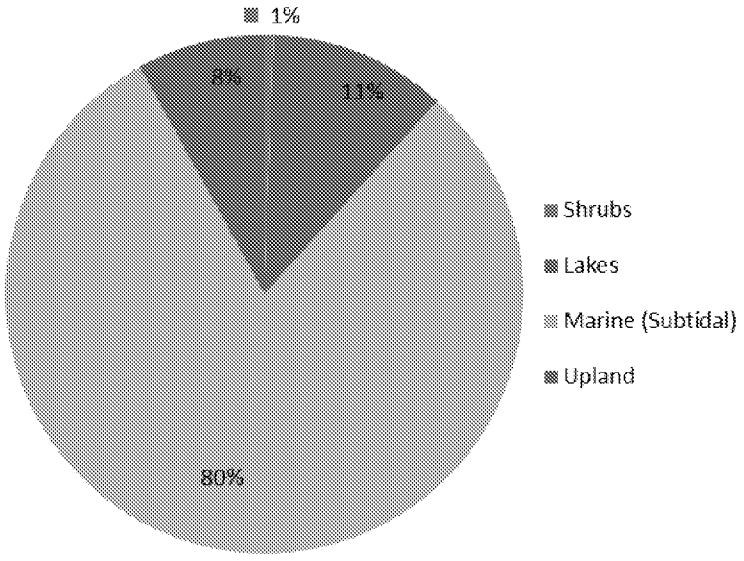
Waterbodies comprise 34 percent of the WOUS in the analysis area. The majority of the area (23 percent) is marine subtidal waters (M1). Marine intertidal waters (M2) comprise 5 percent of the area. Most of these intertidal waters have cobble or gravel substrates that are exposed at low tide. Lower perennial streams (R2) comprise approximately 3 percent of the analysis area. Lakes or ponds are not present in the area.

AMERICAN OVERSIGHT

Figure 3.22-4: NWI Wetland and Waterbody Groups at the Alternative 1 Port Analysis Area

3.22.5.4 Natural Gas Pipeline Corridor

The natural gas pipeline corridor analysis area includes segments of the natural gas pipeline that do not follow the transportation corridor as described above. These include the segment from the compressor station near Anchor Point on the Kenai Peninsula, across Cook Inlet to Amakdedori port, and the segment across Iliamna Lake.



WOUS dominate the natural gas pipeline analysis area (92 percent) and the remaining area (8 percent) is composed of uplands. Wetlands account for 1 percent of the WOUS in the analysis area (Figure 3.22-5). NWI wetland types include deciduous shrubs (PSS1), evergreen shrubs (PSS3) and herbaceous (PEM) occurring in depressions and on slopes.

Waterbodies comprise 91 percent of the WOUS in the analysis area. The majority of the area (80 percent) is marine subtidal waters (M1) in Cook Inlet. Marine intertidal waters (M2) account for less than 1 percent of the area. The natural gas pipeline corridor across Cook Inlet is approximately 104 miles long. Cook Inlet is characterized by nearshore and deep water habitats with unconsolidated sediments on a smooth bottom and strong tidal currents. Numerous tributary basins with active glaciers contribute to high suspended sediment load in portions of Cook Inlet. The natural gas pipeline corridor area occurs predominantly in subtidal waters with an unconsolidated cobble-gravel bottom (M1UBL).

Iliamna Lake accounts for 11 percent of the WOUS in the analysis area. This is almost entirely deepwater habitat with an unconsolidated bottom (L1UBH). The natural gas pipeline corridor across the lake is approximately 18 miles long.

AMERICAN OVERSIGHT

Figure 3.22-5: NWI Wetland and Waterbody Groups at the Alternative 1 Natural Gas Pipeline Analysis Area

3.22.6 Action Alternative 2 – North Road and Ferry

WOUS, including wetlands, comprise 33 percent of the Alternative 2 analysis area. A description by major project components is provided below.

3.22.6.1 Mine Site

The mine site analysis area is the same for all alternatives. See description above under Alternative 1.

3.22.6.2 Transportation Corridor

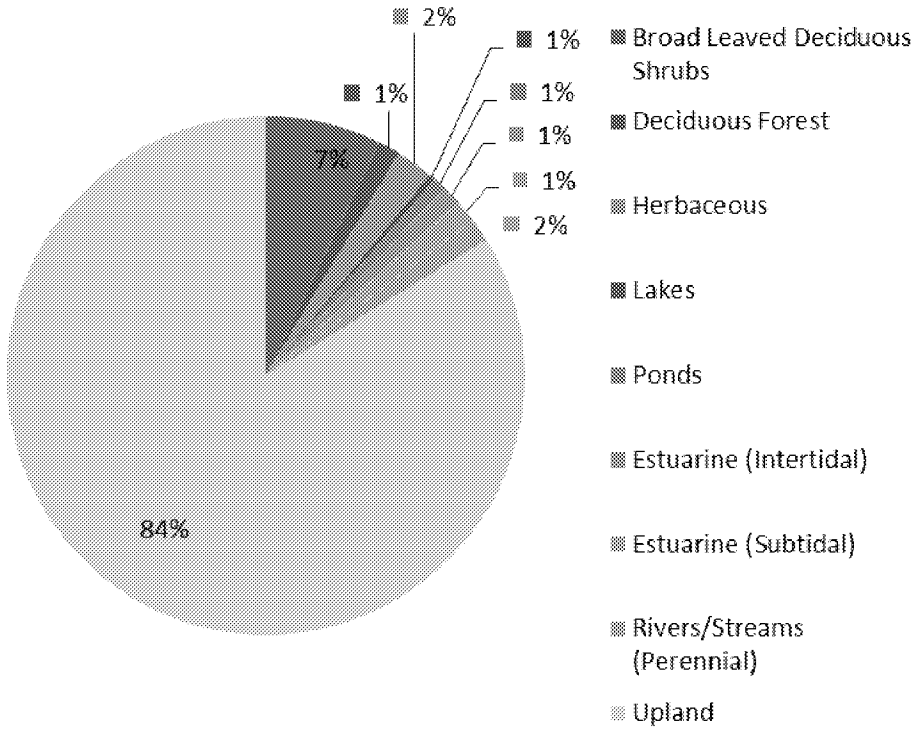
The analysis area for the Alternative 2 transportation corridor includes 31 miles of the mine access road (5 miles of this road falls in the mine site analysis area) from the mine site to the Eagle Bay ferry terminal, a 29-mile crossing of the lake to the Pile Bay ferry terminal, and the port access road (18 miles) between the lake and Diamond Point port on Cook Inlet. The transportation corridor analysis area includes segments of the natural gas pipeline that fall within the transportation corridor. Project-specific mapping is available for approximately 78 percent of the analysis area.

The transportation corridor analysis area is characterized by uplands (84 percent). Approximately 16 percent of the transportation corridor analysis area is WOUS. Wetlands comprise 11 percent of the analysis area. The dominant NWI wetland type is broad leaved deciduous shrub (PSS1) (7 percent) (Figure 3.22-6). These occur predominantly on slopes with both mineral and organic soils. The water regime is usually saturated, but also includes shallow flooding or ponding on very gradual slopes and in small swales and depressions located on the slopes. Seasonally flooded shrub wetlands also occur along stream channels, primarily in the Iliamna River and Newhalen River watersheds. Bogs and fens co-dominated by ericaceous shrubs occur on slopes and organic flats. Evergreen shrub wetlands (PSS4) account for less than 1 percent of the analysis area.

Herbaceous wetlands (PEM1) comprise 2 percent of the analysis area. These occur primarily on wetter positions on slopes, and in seasonally to semi-permanently flooded depressions in

AMERICAN OVERSIGHT

floodplains. Numerous species of wetland sedges were observed in the project area and provide the dominant cover. Some of these sedges, along with cottongrasses, form pronounced tussocks communities. Bluejoint and horsetails are other locally common herbaceous wetland species.



Deciduous forested wetlands (PFO1) comprise 1 percent of the analysis area. They occur equally on seasonally saturated slopes and in seasonally flooded areas along streams and adjacent floodplains. The tree canopies are generally open, and consist of alders, birches, willows, and cottonwoods, with or without black or white spruce.

Aquatic bed wetlands account for less than 0.1 percent of the analysis area.

Waterbodies account for 5 percent of the transportation corridor analysis area. Lakes and ponds combined account for approximately 1 percent of the area. Lakes are primarily deepwater habitats (L1UBH). Streams comprise approximately 1 percent of the area, and are primarily mapped as upper perennial systems (R3).

Estuarine waters are mapped in Iliamna and Cottonwood bays (Cook Inlet), and comprise approximately 3 percent of the analysis area. These include both subtidal (E1UBL) (2 percent) and intertidal (E2USN, E2USP) (1 percent) waters. Approximately 3 percent of the intertidal waters are vegetated wetlands (E2EM1P). These areas are dominated by mostly open stands of salt-tolerant herbs that are inundated by high tides at least a few times per month.

Figure 3.22-6: NWI Wetland and Waterbody Groups at the Alternative 2 Transportation Corridor Analysis Area

3.22.6.3 Diamond Point Port

The Diamond Point port analysis area is located along Iliamna and Cottonwood bays in Cook Inlet. Project-specific wetland mapping is not available for the majority of this area, as described above. NWI mapping was used for the entire analysis area for this component (NWI 2018).

AMERICAN OVERSIGHT

Approximately 65 percent of the analysis area is WOUS. Estuarine waters comprise approximately 65 percent of the analysis area. Subtidal waters (E1) represent most of this area (60 percent). Perennial rivers make up <1 percent of the analysis area.

[Note: It is expected that project-specific mapping data would be acquired in field season 2019, and included in a final EIS].

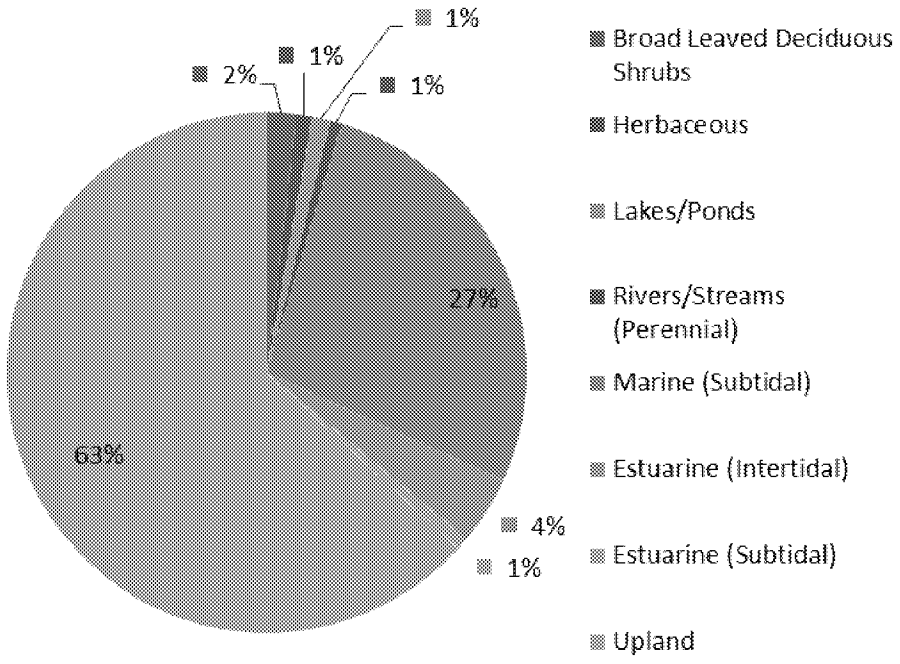
3.22.6.4 Natural Gas Pipeline Corridor

The analysis area for the Alternative 2 natural gas pipeline is comprised of segments of the natural gas pipeline that do not follow the transportation corridor: from the mine access road cut-off to Eagle Bay to the port access road cut-off to Pile Bay; from the Diamond Point port to Ursus Cove; and from Ursus Cove across the Cook Inlet to the compressor station near Anchor Point on the Kenai Peninsula. The analysis area also encompasses construction access roads to the natural gas pipeline corridor on the north side of Iliamna Lake. Segments of the natural gas pipeline adjacent to access roads are addressed under the transportation corridor analysis area. Project-specific mapping was available for approximately 53 percent of the onshore portion of this component.

Approximately 37 percent of the analysis area is a WOUS. Wetlands comprise 3 percent of the analysis area. The dominant NWI wetland type is broad leaved deciduous shrub (PSS1) (2 percent) (Figure 3.22-7). These occur predominantly on slopes with both mineral and organic soils. The water regime is usually saturated, but also includes shallow flooding or ponding on very gradual slopes and in small swales and depressions located on the slopes. Seasonally flooded shrub wetlands also occur along stream channels and their floodplains. Bogs and fens co-dominated by ericaceous shrubs occur on slopes and organic flats.

Herbaceous wetlands (PEM1) comprise 1 percent of the analysis area. These occur in seasonally to semi-permanently flooded depressions and shorelines, and on wetter positions on slopes and flats. Some 30 species of wetland sedges were observed in the area and provide the dominant cover. Some of these sedges, along with cottongrasses, form pronounced tussocks communities. Bluejoint and horsetails are other locally common herbaceous wetland species.

Deciduous forested wetlands accounted for less than 1 percent of the analysis area.



WOUS make up 34 percent of the analysis area. The majority of the area (27 percent) is marine subtidal waters (M1) in Cook Inlet. Marine intertidal waters (M2) make up <1 percent of the area. The natural gas pipeline corridor across Cook Inlet is approximately 104 miles long. Cook Inlet is characterized by nearshore and deep water habitats with unconsolidated sediments on a smooth bottom and strong tidal currents. Numerous tributary basins with active glaciers contribute to high suspended sediment load in portions of Cook Inlet. The natural gas pipeline corridor area occurs predominantly in subtidal waters with an unconsolidated cobble-gravel bottom (M1UBL).

The analysis area includes portions of Iliamna and Cottonwood bays which are mapped as estuarine habitats. This includes intertidal (4 percent) percent) and subtidal (1 percent) habitats. The intertidal zone is characterized as unconsolidated shore. It is more or less equivalent to mudflats, which are a special aquatic site according to the CWA.

Freshwater aquatic habitats in the analysis area include lakes and ponds (1 percent) and upper perennial rivers (1 percent).

AMERICAN OVERSIGHT

Figure 3.22-7: NWI Wetland and Waterbody Groups at the Alternative 2 Natural Gas Pipeline Corridor Analysis Area

3.22.7 Action Alternative 3 – North Road Only

WOUS, including wetlands, comprise 30 percent of the Alternative 3 analysis area. A description by major project components is provided below.

3.22.7.1 Mine Site

The mine site analysis area is the same for all alternatives. See description above under Alternative 1.

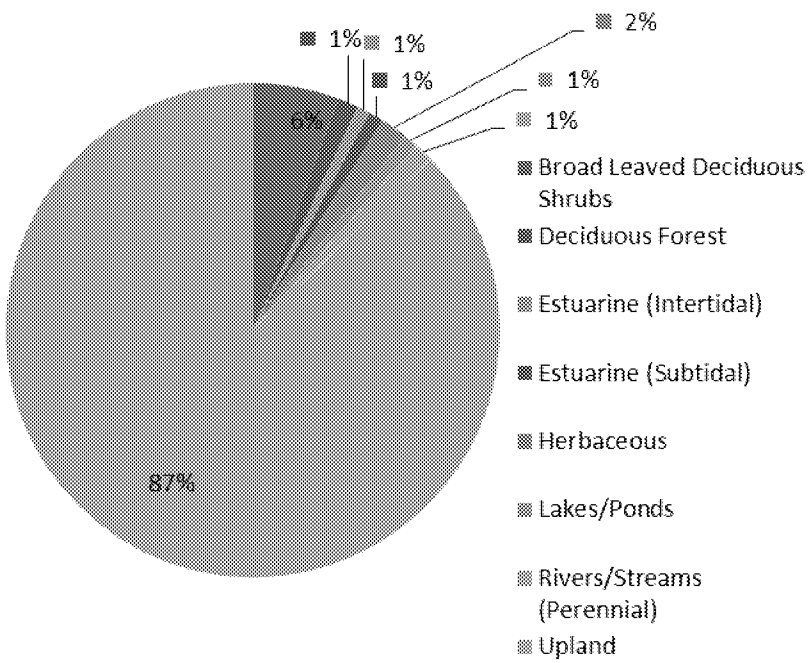
3.22.7.2 Transportation Corridor

The analysis area for the Alternative 3 transportation corridor includes 77 miles of the north access road (5 miles of this road falls in the mine site project area), from the mine site to the Diamond Point Port on Cook Inlet. The analysis area includes segments of the natural gas pipeline that fall within the transportation corridor. Project-specific mapping is available for approximately 92 percent of the analysis area.

The transportation corridor crosses numerous streams that feed into Iliamna Lake, which is connected to Bristol Bay via the Kvichak River. The major Bristol Bay watersheds include UTC, Newhalen River, Chekok Creek, Pile River, Iliamna River, and Iliamna Lake. The major watershed draining to Cook Inlet is the Chinitna River-Frontal Cook Inlet. The transportation corridor analysis area is dominated by glaciated, volcanic ash-influenced, mountains, hills, and valleys that are free of permafrost.

Uplands are common in the analysis area, comprising 87 percent of the area. Approximately 13 percent of the analysis area is WOUS. Wetlands comprise 9 percent of the analysis area. The dominant NWI wetland type is broad leaved deciduous shrub wetlands (PSS1) (6 percent) (Figure 3.22-8), occurring predominantly on slopes, but also in river valleys and on flats. Bogs

AMERICAN OVERSIGHT



and fens co-dominated by ericaceous shrubs occur on slopes and organic flats. Evergreen shrub wetlands (PSS4) account for less than 1 percent of the analysis area.

Herbaceous wetlands (PEM1) account for 2 percent of the analysis area. These occur primarily on wetter positions on slopes, and in seasonally to semi-permanently flooded depressions in floodplains.

Deciduous forested wetlands (PFO1) comprise 1 percent of the analysis area. They occur equally on slope and riverine HGM classes. The riverine stands occur mainly in the Iliamna and Newhalen River valleys. The tree canopies are generally open, and consist of alders, birches, willows and cottonwoods, with or without black or white spruce.

Waterbodies account for approximately 4 percent of the analysis area. Lakes and ponds combined account for 1 percent of the area. Perennial streams comprise 1 percent of the area. Estuarine waters are included along Iliamna Bay; these include intertidal (1 percent) and subtidal (1 percent) waters. A very small proportion of the intertidal waters are vegetated (E2EM1P). These areas are dominated by mostly open stands of salt-tolerant herbs that are inundated by high tides at least a few times per month. Unvegetated portions of the intertidal waters are considered mudflats.

Figure 3.22-8: NWI Wetland and Waterbody Groups at the Alternative 3 Transportation Corridor Analysis Area

3.22.7.3 Diamond Point Port

The Diamond Point port analysis area is the same for alternatives 2 and 3. See description above under Alternative 2.

3.22.7.4 Natural Gas Pipeline Corridor

The analysis area for the Alternative 3 natural gas pipeline comprises segments of the natural gas pipeline that do not follow the access road corridors: from the Diamond Point port to Ursus Cove; and from Ursus Cove across the Cook Inlet to the compressor station near Anchor Point on the Kenai Peninsula. Segments of the natural gas pipeline adjacent to access roads are

AMERICAN OVERSIGHT

addressed under the transportation corridor analysis area. Project-specific mapping was available for less than 5 percent of the onshore portion of the analysis area, as described above, so a pie chart is not provided. NWI mapping was used (NWI 2018).

Approximately 62 percent of the analysis area is WOUS. Wetlands comprise 1 percent of the analysis area. The dominant NWI wetland type is broad leaved deciduous shrub wetlands (PSS1) (1 percent). Evergreen shrub wetlands (PSS3) and herbaceous wetlands (PEM1) each account for less than 1 percent of the analysis area.

Estuarine waters are mapped in Cottonwood Bay. These include intertidal (8 percent) and subtidal (1 percent) waters. Marine subtidal waters (51 percent) account for almost all of the Cook Inlet crossing. Marine intertidal is less than 1 percent. Ponds and perennial streams each account for less than 1 percent of the analysis area.

[Note: It is expected that project-specific mapping data would be acquired in field season 2019, and included in a final EIS].

3.22.8 Climate Change

Climate change is currently affecting vegetation and wetlands in the EIS analysis area. Current and future effects on wetlands are tied to changes in physical resources and vegetation. Changes in wetland trends observed in the Bristol Bay region due to warmer and wetter conditions include rapid tree growth and expansion and new coastal wetlands. Over the past few decades, the tundra and shrub environment in the vicinity of the project area has been replaced by alder and willow trees.

Climate models predict that the Bristol Bay region will experience rapid ecological change during the next 100 years. Computer models for climate change consider future "cliomes," areas where temperature and precipitation reflect certain kinds of wildlife and vegetation. Bristol Bay's current cliome "boreal forest with coastal influence and intermixed grass and tundra," is expected to shift north and largely disappear by 2090 (ANTHC 2018). It may be replaced by "prairie and grasslands," a cliome that does not currently occur in Alaska, and is characteristic of southeastern Alberta in Canada (SNAP and EWHALE 2012).

Impacts associated with climate change would be similar for all three action alternatives. Potential effects of climate change on wetlands in the EIS analysis area include changes in wetland quality or quantity. With predicted climate change effects discussed above, vegetation types or wetlands may not have the same composition, structure, or function compared to current conditions. An overall warming/drying trend would tend to convert some wetlands to uplands and tend to increase the cover of shrubs and trees in previously open areas. Higher transpiration, less available water, and a lower albedo caused by woody vegetation increase contributes to a drier landscape with fewer or smaller waterbodies compared to current conditions. Large scale hydrological changes may occur throughout the landscape.

AMERICAN OVERSIGHT

4.22 WETLANDS/SPECIAL AQUATIC SITES

The project has the potential to result in the following direct and indirect impacts to wetlands/ special aquatic sites and waterbodies:

- Direct impacts from:
  - Clearing and removal of wetland vegetation
  - Excavation or removal of soil and vegetation
  - Placement of fill materials
  - Dredging and discharges of dredged materials
  - Alteration of stream channels
- Indirect impacts from:
  - Disruption of wetland hydrology
  - Conversion of wetland type
  - Water quality and quantity changes
  - Erosion and sedimentation
  - Fugitive dust

Impacts to Waters of the United States (WOUS) are assessed here from a NEPA perspective, which may differ from how they are treated under the Clean Water Act (CWA) Section 404(b)(1) guidelines. The USACE Section 404(b)(1) Analysis, included in Appendix F, accounts for impacts from the CWA perspective.

The magnitude of impacts to wetlands and waterbodies was assessed relative to their perceived importance and extent within a watershed. The disturbance area thresholds used here are similar to those used for other recent Environmental Impact Statements (EISs) in Alaska (Donlin Gold Project EIS 2018 [USACE 2018], Point Thomson Project EIS 2012 [USACE 2012]). Impacts to high value wetlands, such as riverine wetlands, were deemed to be of greater magnitude even when a relatively small proportion (greater than 5 percent) of these wetlands would be disturbed within a particular watershed. Impacts to less than 1 percent of high-value wetlands would be considered minimal magnitude, and impacts to 1 to 5 percent would be considered intermediate. Conversely, a higher proportion (greater than 25 percent) of non-high value wetlands, such as most deciduous shrub wetlands, would need to be disturbed within a watershed to be considered a greater magnitude impact. Impacts to these wetlands are considered to be of lesser magnitude when they represent less than 5 percent of the watershed, and of an intermediate magnitude when they represent 5 to 25 percent of the watershed.

Impacts were also assessed in terms of duration, as some wetlands or waterbodies would be partially or fully reclaimed during or after the construction phase and others would not. The duration of impacts is considered temporary when wetland or aquatic functions would be reduced during the construction phase only and the area would be restored to pre-construction contours. The total construction phase is expected to last for 4 years, but individual temporary impacts are likely to last for only one or two growing seasons. Reduction or elimination of wetland or aquatic functions occurring after the construction phase, through the operations and into the closure and post-closure phases, would be considered permanent.

[Note: It is expected that a detailed reclamation and closure plan would be developed for the project after the publication of the draft EIS with details on reclamation location, type, and success metrics; at this time the duration (temporary or permanent) of disturbance would be further assessed].

AMERICAN OVERSIGHT

The extent of impacts would be limited to areas of the project area where wetlands or waterbodies would be removed or disturbed, or would affect wetlands outside of the project area in one or more HUC 10 watersheds (Figure 4.22-1).

To assess the relative magnitude and extent of impacts within an ecological context, project impacts were compared to the relative proportion of common wetland types in each watershed. US Geological Survey Hydrologic Unit Code Tenth Level (HUC 10) watersheds were used for this purpose. Impacts were assessed from the perspective of regional wetland types and extents.

The EIS analysis area collectively includes areas for all four components (mine site, transportation corridor, ports, and natural gas pipeline). The analysis area for the mine site includes a 330-foot buffer around the direct disturbance footprint and potential drawdown zone from the open pit. The analysis area for the transportation corridor and ports includes a 330-foot buffer around the direct disturbance footprint. The analysis area for the stand-alone sections of the natural gas pipeline is a 30-foot corridor through Cook Inlet and Iliamna Lake, and a 100-foot corridor through overland areas. The analysis area includes potential direct and indirect impacts from construction and operations. See Figure 3.26-1 in Section 3.26, Vegetation, for a general overview of the analysis area for vegetation, which is similar to that for wetlands/special aquatic sites.

Project wetland mapping areas only cover a small proportion of each watershed. The National Wetland Inventory (NWI) mapping covers only about one-fourth of some of the watersheds, and was therefore not sufficient for this effort. The uniform vegetation mapping provided by the Alaska Center for Conservation Science (ACCS) provided the best available spatial data for estimating wetland coverage for the HUC 10 watersheds. Vegetation class descriptions from the Vegetation Map and Classification guidebooks (Boggs et al. 2016) were reviewed. Vegetation classes mapped in the watersheds were assigned to one of the following types in a crosswalk for comparison with wetlands mapped for the project: upland, forested wetland, shrub wetland, herbaceous wetland, aquatic bed wetland, or waterbody.

The descriptions of herbaceous vegetation classes included wetland status; therefore, these vegetation classes were directly crosswalked to herbaceous wetland or upland. The woody vegetation classes lacked wetland status, so it was not possible to directly crosswalk types. Forest and shrub vegetation classes were assigned to wetland or upland based on a review of environmental site characteristics described for each map unit. Facultative tree and shrub species were common to several vegetation types, meaning that these species/communities may occur in both wetlands and uplands. The dwarf shrub vegetation class, for instance, can occur on both wet and dry sites, but is not differentiated in the mapping. Because of this, the acreages and percentages of wetland types for each watershed should be considered an approximation for comparison purposes only.

AMERICAN OVERSIGHT

Figure 4.22-1: HUC 10 Watersheds

AMERICAN OVERSIGHT

4.22.1 No Action Alternative

Under the No Action Alternative, the development of the project as proposed would not be authorized. Any existing or new land use activities at the mine site, such as exploration or cessation of field activities, would occur in accordance with the requirements of the State of Alaska as the landowner. Such activities may result in a reversion of use (i.e., cessation of activity) or continuation of the existing use (i.e., exploration). Land ownership and management of the mine site, Amakdedori port, transportation corridor, and natural gas pipeline corridor would remain the same. Because the project would not be implemented, the No Action Alternative would have no additional impacts on wetlands/special aquatic sites beyond activities that would be permitted.

4.22.2 Action Alternative 1 – Applicant's Proposed Alternative

Alternative 1 would permanently discharge dredged or fill material into 3,562 acres of WOUS and temporarily discharge dredged or fill material into 515 acres of WOUS. An additional 1,837 acres of WOUS would be indirectly impacted by fugitive dust, and 448 acres of WOUS would be indirectly impacted by dewatering from the mine pit. The discharge would permanently impact 3,445 acres of wetlands, 66 acres of open waters, and 50 acres of streams along 32.5 miles of stream channels. The discharge would temporarily impact 51 acres of wetlands, 462 acres of open waters, and 3 acres of streams along 2.7 miles of stream channels. Figures showing impacts for all project components are in Appendix K4.22.

Navigable waters of the US (NWUS) permanently affected by the Alternative 1 include Iliamna Lake and Cook Inlet. Alternative 1 includes a port with a causeway and wharf, which combined is 1,900 feet long by a maximum of 500 feet wide, below the high tide line (HTL) of Cook Inlet. The project would also include two lighted navigation buoys, and two 1,700 by 2,300 feet mooring spreads in approximately 80 feet of water, each consisting of 10 anchors and six mooring buoys.

The south ferry terminal on Iliamna Lake includes a landing ramp that is 155 feet long with a maximum of 115 feet in width and 10 feet thick below the ordinary high water mark (OHWM) of the lake. The north ferry terminal would be 105 feet long by a maximum of 85 feet wide and 10 feet thick below the OHWM of Iliamna Lake. The project would also include two mooring buoys attached to anchors at both the north and south ferry terminals; and a 200 feet wide by 160 feet long and up to 2 feet thick wide ferry construction ramp with five launching rails, each 15 inches high and extending 36 feet waterward of the OHWM, and to a water depth of up to 35 feet in Iliamna Lake. A total of approximately 13 acres of NWUS would be permanently filled for the port and ferry terminals.

Special aquatic sites that would be permanently or temporarily impacted include mudflats, vegetated shallows, and riffle and pool complexes. These habitats were not specifically mapped during the environmental baseline study program. Mudflats may occur in the impacted Marine Intertidal waters (1 acre permanent and 1 acre temporary impacts). Vegetated shallows are similar to aquatic bed wetlands (less than 1 acre permanent and temporary impacts). Eelgrass beds are not known to occur in the impact area. Riffle and pool complexes occur in an undetermined portion of the upper perennial and intermittent riverine channels. Permanent and temporary impacts to these channels total 44 acres and 2 acres, respectively.

[Note: A wetlands mapbook of the project impacts, incorporating any wetlands data updates that are received prior to production of the draft EIS, will be included as technical appendix K4.22 to the draft EIS. Stream miles for this version were calculated using NHD data for perennial streams, and project mapping for intermittent streams. This will be revised for the draft EIS to incorporate project mapping for perennial streams].

AMERICAN OVERSIGHT

4.22.2.1 Mine Site

Most project-related direct impacts to WOUS would be initiated during the construction phase and would result in temporary or permanent loss of wetlands or alteration in wetland functions. Facilities would be sited to avoid and minimize wetland impacts where possible, and allow efficient reclamation of disturbed areas.

Primary direct construction-related impacts to wetlands and waterbodies would include:

- Clearing and removal of wetland vegetation
- Placement of fill in wetlands and waterbodies
- Excavation that eliminates wetlands and waterbodies
- Altering hydrology of wetlands and waterbodies
- Compaction, rutting, and mixing of wetland soils

Excavation of the open pit, quarries, and sediment ponds and filling in the tailings storage facility (TSF) and stockpiles would occur throughout the active life of the mine. The maximum extents of all surface disturbance impacts were used to evaluate direct wetlands impacts for the mine site. All impacts in the direct disturbance footprint were considered permanent, although some wetland reclamation would begin shortly after the start of construction and would continue throughout operations and closure.

A total of 3,458 acres of WOUS would be directly affected by the proposed mine site facilities (Table 4.22-1) (Figure 4.22-2). The maximum extents of all surface disturbance impacts were used to evaluate direct wetlands impacts for the mine site. The greatest impacts would occur from the bulk TSF cell (1,562 acres), Area E embankment, tailings and waste rock storage facility (560 acres), the TSF and associated facilities (363 acres), and the open pit and associated facilities (346 acres).

In the mine site, almost all of the WOUS direct impacts (3,450 acres) would occur in one of the HUC 10 watersheds, the Headwaters Koktuli River watershed. Only 9 acres of impacts would occur in the Upper Talarik Creek (UTC) Watershed (Table 4.22-1). Approximately 3,364 acres of wetlands would be directly impacted, consisting primarily of broad leaved deciduous shrub wetlands (2,671 acres) and herbaceous wetlands (693 acres). These occur predominantly on slopes. A total of 94 acres of waterbodies would be impacted, primarily ponds (47 acres) and perennial streams (47 acres). A total of 24.1 miles of perennial stream channel would be directly impacted.

Excavation, filling, and clearing of wetlands would alter or remove their capacity to provide hydrologic, biogeochemical, and biological functions. Construction-related disturbances may alter wetland modification of groundwater functions (recharge and discharge), and would decrease stormwater and floodwater storage and modification of streamflow functions by decreasing the wetlands' potential to dissipate energy and reduce peak flows. These altered hydrologic functions would extend to the streams connected to or downstream from the affected wetlands. See Section 4.16, Surface Water Hydrology, for a discussion of surface water hydrology impacts.

Construction on or through wetlands would decrease or remove the wetlands' potential to improve water quality by preventing erosion and settling sediments. Sediment barriers and erosion control planning would mitigate the loss of this wetland function. Vegetation clearing with no soil disturbance reduces wetlands' ability to modify water quality and contribution to the abundance and diversity of wetland fauna. It also may reduce the export of detritus and contribution to the abundance and diversity of wetland flora functions, depending on the extent of vegetation being cleared.

AMERICAN OVERSIGHT

Figure 4.22-2: Mine Site Impacts

AMERICAN OVERSIGHT

Construction on or through wetlands would result in habitat loss, fragmentation, and degradation. Temporary and permanent habitat modifications would occur as existing vegetation is disturbed or removed and replaced with mine site facilities and infrastructure. See Section 4.23, Wildlife Values, Section 4.24, Fish Values, and Section 4.26, Vegetation, for discussion of habitat-related impacts.

The headwaters of the Koktuli River watershed are approximately 171,000 acres. Based on vegetation mapping, the headwaters are estimated to contain approximately 56,000 acres of WOUS, which is roughly 33 percent of the watershed. Approximately 45,000 acres (26 percent of the watershed) are shrub wetlands, and 9,000 acres (5 percent) are herbaceous wetlands. Forested wetlands (39 acres) and aquatic bed wetlands (132 acres) each cover less than 1 percent of the watershed. Mine site activities would directly affect 2,665 acres of shrub wetlands and 691 acres of herbaceous wetlands within the headwaters Koktuli River watershed (Table 4.22-1). This represents approximately 6 percent and 8 percent, respectively, of shrub and herbaceous wetlands in the watershed. No forested wetlands and less than 0.1 acre of aquatic bed wetlands would be affected.

Riverine wetlands are considered high-value in the watershed based on their connections to important fish and wildlife species. A total of 236 acres of riverine HGM class wetlands in the Koktuli River watershed would be directly affected by activities at the mine site. The extent of riverine wetlands in the watershed is not known. They account for approximately 3 percent of the mine site analysis area. Using this percentage for the entire watershed, there would be roughly 5,000 acres of riverine wetlands. Therefore, the extent of impacts to riverine wetlands from mine site activities would represent approximately 5 percent of all riverine wetlands in the watershed. Less than 1 acre of riverine HGM class wetlands in the UTC watershed would be affected by activities at the mine site.

Based on vegetation and wetland mapping for the project, 378 acres of bog vegetation would be directly affected by activities at the mine site in the headwaters Koktuli River watershed. The extent of bog vegetation in the watershed is not known. Approximately 485 acres of bog vegetation was mapped in the analysis area for this watershed, which represents 5 percent of the analysis area. Assuming 5 percent of the entire watershed has bog vegetation, this would be roughly 8,500 acres. Therefore, the 378 acres of impacts would represent roughly 4 percent of all bog vegetation in the watershed.

Summer-Only Ferry Operations Variant

This variant would add to the mine site direct footprint for a container yard and sewage storage tank. The increased footprint would directly impact 6 acres of deciduous shrub wetlands, and 1 acre of herbaceous wetlands.

Reclamation

Pebble Limited Partnership (PLP) has incorporated requirements for mine closure and long-term water management into the design of the project. During the permitting phase, a reclamation plan would be developed that would include reclamation of wetlands where feasible. The discussion below is based on generally accepted wetland reclamation practices for mine sites in Alaska. Additionally, PLP has provided some conceptual-level information on reclamation in its application.

PLP has identified some of the design elements that would facilitate successful reclamation during and after the closure phase (PLP 2017, PLP 2018-RFI 024):

- Quarried and waste rock would be geochemically tested prior to being used in construction to avoid the potential for contaminated drainage during operations and post-closure.
- Topsoil and overburden would be salvaged during construction for use as growth medium during reclamation.
- TSF embankment slopes would be designed to provide long-term stability and facilitate the placement of growth medium.
- The overall project footprint would be minimized to facilitate physical closure and post-closure water management.

Material sites constructed in valley bottoms or lowland sites are candidates to be reclaimed to create new ponds with emergent wetlands where sufficient water quality and surface hydrology are available. Final contouring around created ponds could focus on providing habitat at the water's edge and a complex interspersion between wetland and upland vegetation. Moderate to steeply sloping wetland or upland mosaics with wetland inclusions would be less feasible to restore to wetlands because of the marginal hydrology, and some fills may not be removed in these areas. Marginal wetland hydrology would be expected in areas where excavations and road cuts through colluvium and rock have reduced overland sheet flow.

AMERICAN OVERSIGHT

Shrub wetland successional processes, generally initiated by natural disturbances such as wildland fires, gradually reestablish typical vegetation and eventually hydrologic characteristics. When construction disturbs wetlands, successional processes may be prolonged or may not occur. Construction disturbances differ from natural disturbances in that the organic mat and organic soil horizons are often removed completely, which removes seedbeds, and reduces surface and subsurface water storage capacity. The timing and extent of recovery likely depend on the intensity, extent, and duration of the disturbance. The time required for wetlands to return to pre-disturbance soil moisture and original vegetation cover has not been well documented in western Alaska.

Development of self-sustaining wetland plant communities on previously disturbed Alaska wetlands may occur in 10 to 30 year duration, but may be slowed in gravelly or sandy soils, or during years with failed seedling establishment or seed production. Revegetation success may be enhanced by conducting careful planning and management; minimizing disturbance; segregating and protecting materials to be used during reclamation; using the appropriate seed mixture and seeding rates; and monitoring for erosion and revegetation success.

Reclamation of wetland conditions may be complicated in areas where less permeable layers have been breached or removed. This would alter surface hydrology, causing previous wetland areas to drain. In these situations, restored wetlands are likely to differ in type and functional capacity from the original wetlands for decades to centuries, if reestablishment is possible.

Surface water resources available to wetlands would continue to be altered in distribution and abundance, with a return of an undetermined percentage of pre-development streamflows at the downstream end of the mine development (see Section 4.16, Surface Water Hydrology). These changes in surface water distribution and abundance could cause some wetlands to dry up, while others would be inundated or become wetter.

The pit lake would continue to fill for a period of several decades post-closure. Once the water level reaches elevation 890 feet, water would be pumped from the pit. This elevation is at least 50 feet below the elevation at which groundwater flow would be directed outward from the open pit. As a result, a new equilibrium groundwater level would become established around the pit. Wetlands and streams above the pit lake level would potentially lose groundwater to the cone of depression created by the pit lake. This may result in long-term wetland and streamflow effects. Groundwater modeling would be used to assess potential wetland and stream dewatering, and to identify those wetlands and functions that are likely to be affected (see Section 4.17, Groundwater Hydrology, for details).

Summary of Direct Impacts at the Mine Site

The mine site will directly and permanently impact 3,458 acres of WOUS during construction and operations. During closure, WOUS would be reestablished wherever practicable. Direct and indirect effects would occur in two HUC 10 watersheds. The majority of the impacts (3,450 acres) would be in the Headwaters Koktuli River watershed. Most impacts would be to regionally common shrub and herbaceous wetland types. The direct impacts represent roughly 6 percent of shrub wetlands and 8 percent of herbaceous wetlands in the watershed. No forested wetlands and less than 0.1 acre of aquatic bed wetlands would be impacted. Approximately 236 acres of riverine wetlands, identified as high-quality wetlands, would be directly impacted by the mine site. This represents roughly 5 percent of the riverine wetlands within the watershed. Approximately 378 acres of bog vegetation would be directly impacted, which represents roughly 4 percent of bog vegetation in the watershed.

AMERICAN OVERSIGHT

Fugitive Dust

Fugitive dust emissions are a byproduct of construction and operations activities. Dust would be caused by vehicle travel on the mine roads and other unpaved surfaces in the mine, as well as by mining activities at the pit. This dust has the potential to collect on vegetation in the vicinity of the dust sources. Windblown dust could affect wetland vegetation well beyond the source, but the effect diminishes with distance and is influenced by prevailing winds and topography. Dust deposition impacts wetlands primarily by reducing vegetation productivity and altering species composition. Fugitive dust impacts to vegetation are described in Section 4.26, Vegetation; impacts to soils are described in Section 4.14, Soils.

A dust dispersion model was developed to predict air quality impacts of particulate matter (PM_{10}) from mine site operations and construction activities (PLP, October 2018). Prevailing winds are to the northwest and southeast at the mine site. Maximum annual modeled PM_{10} deposition was 1.5 grams/m^2/year due to construction. Deposition values as high as 30 g/m^2/year were recorded near the mine site ambient air quality boundary (see Figure 4.14 in Section 4.14, Soils).

Research on dust emissions and its impact on vegetation in Alaska has shown that most dust generated from mining operations and roads is deposited within 330 feet (Petavratzi et al. 2005; Walker and Everett 1987). Therefore, a potential indirect impact area was calculated using a 330-foot buffer on all direct disturbance footprints. This follows methods used by recent EISs in Alaska (Donlin Gold 2018 [USACE 2018]; Point Thompson 2012 [USACE 2012]). A total of 957 acres of wetlands and waterbodies are anticipated to be affected by dust deposition at the mine site during the construction and operations phases. The dust would primarily affect deciduous shrub (641 acres) and herbaceous (258 acres) wetlands. The greatest effects on wetland functions are expected to occur within 33 feet of the disturbance. Note that there is overlap between the WOUS indirectly impacted by dust, and the WOUS affected by groundwater drawdown from the open pit.

A fugitive dust control plan would be developed for the project and the project would use Best Available Control Technology (BACT) and Best Management Practices (BMPs) for fugitive dust management (see Chapter 5, Mitigation).

Dewatering

Hydrology of wetlands and waterbodies at the mine site would be altered in the drawdown cone associated with dewatering of the open pit during mining operations. To predict the area of wetlands and waterbodies potentially affected by lowering of the groundwater, a model was developed that incorporates groundwater flow, wetland HGM class, and surficial geology permeability (PLP 2018-RFI 009a). Impacts were calculated for the end of mine phase, when drawdown is at its maximum extent, and for the post-closure phase, when the pit lake has reached its long-term, maximum level. Impacts to wetlands were characterized in the model as either high, meaning wetland hydrology would be lost; or moderate, meaning hydrology would be altered, but not enough to eliminate wetland functions.

At the end of operations, approximately 154 acres of wetlands and waterbodies would be highly impacted by the groundwater drawdown at the open pit; this includes 55 acres of shrub wetlands, 34 acres of herbaceous wetlands, and 65 acres of lakes and ponds. Another 294 acres would be moderately impacted; this includes 187 acres of shrub wetlands, 65 acres of herbaceous wetlands, and 41 acres of ponds.

At the post-closure phase, approximately 48 acres of the highly impacted wetlands would be expected to recover wetland hydrology. The remaining 106 acres of highly impacted wetlands

AMERICAN OVERSIGHT

are not expected to recover. Likewise, approximately 121 acres of the moderately impacted wetlands would be expected to recover, leaving 173 acres of wetlands that would remain moderately impaired.

4.22.2.2 Transportation Corridor

Construction of the transportation corridor from Amakdedori port to the mine site would directly and permanently affect 88 acres of WOUS (Table 4.22-2), including 76 acres of wetlands and 11 acres of waterbodies. The south (port) access road between the port and the south ferry terminal at Iliamna Lake would affect 44 acres of WOUS. The mine access road from the north ferry terminal to the mine site would affect 39 acres of WOUS. The remaining 5 acres of impacts would be from the Iliamna and Kokhanok Airport spur roads, material sites, and ferry landings.

Impacts would be permanent in duration since the road would remain to facilitate long-term post-closure water treatment and monitoring. Previous disturbance to wetlands in this area is minimal. The corridor has been sited to avoid and minimize wetland impacts and allow for efficient reclamation of disturbed areas.

A total of 4.6 miles of streams would be directly affected by construction, including 0.6 miles of perennial streams and 4.0 miles of intermittent streams (Table 4.22-2). The larger streams with a width at ordinary high water (OHW) of 16 feet or greater would be bridged. Site-specific designs have been developed for bridges. Smaller stream crossings would use a series of standardized, conceptual culvert design categories based on stream width and fish presence. See Section 4.16, Surface Water Hydrology, for a discussion of surface water hydrology impacts.

Within the transportation corridor, the natural gas pipeline would follow the access road and is accounted for in the direct impacts for the access roads; except for the Iliamna Lake crossing where it would be would be installed in a trench out into waters that are deep enough to avoid navigation hazards and then laid on the lake bottom, and anchored or supported as required.

Construction impacts to wetlands outside of the permanent road footprint would be avoided or minimized where possible. However, to account for temporary construction-related impacts, a 30-foot zone on either side of the permanent road footprint was assumed to be temporarily impacted. These impacts are anticipated to be restored within 2 years of construction (PLP 2018-RFI082). Temporary impacts would affect approximately 65 acres of WOUS within the transportation corridor, including 51 acres of wetlands, and 14 acres of waterbodies.

Impacts associated with the natural gas pipeline not adjacent to a road footprint are discussed below.

Activities in the transportation corridor would permanently affect WOUS in five HUC 10 watersheds. The highest number of acres impacted (39 acres) would occur in the UTC watershed (Table 4.22-2). Direct impacts in this watershed would affect primarily deciduous shrub wetlands (33 acres), primarily on slopes.

The UTC watershed is approximately 88,000 acres. Based on vegetation mapping, it is estimated to contain approximately 34,000 acres of WOUS, which is roughly 39 percent of the watershed. Approximately 31,000 acres (35 percent of the watershed), are shrub wetlands and 1,200 acres (1 percent) are herbaceous wetlands. Forested wetlands (636 acres) and aquatic bed wetlands (8 acres) each cover less than one percent. Activities in the transportation corridor and in a small portion of the mine site would affect 39 acres of shrub wetlands and 6 acres of herbaceous wetlands in the UTC watershed. This represents less than 1 percent of all shrub and herbaceous wetlands in the watershed. No forested or aquatic bed wetlands would be affected.

AMERICAN OVERSIGHT

Riverine wetlands are considered high value in the watersheds based on their connections to important fish and wildlife species. A total of 6 acres of riverine HGM class wetlands in the Koktuli River watershed would be directly affected by activities in the transportation corridor and a small part of the mine site. The extent of riverine wetlands in the watershed is not known. They account for approximately 2 percent of the transportation corridor analysis area. Using this percentage for the entire watershed, there would be roughly 1,760 acres of riverine wetlands. Therefore, the area of impacts to riverine wetlands from transportation corridor and mine site activities would represent less than 1 percent of all riverine wetlands in the watershed.

Based on vegetation and wetland mapping for the project, 8 acres of bog vegetation would be affected by activities in the transportation corridor and the small portion of the mine site within the UTC watershed. The extent of bog vegetation in the watershed is not known. Approximately 61 acres of bog vegetation were mapped in the analysis area for this watershed, which represented 2 percent of the analysis area. Assuming 2 percent of the entire watershed has bog vegetation, this would be roughly 1,760 acres. Therefore, the 8 acres of impacts would represent less than 1 percent of all bog vegetation in the watershed.

Wetland and waterbody impacts in the other four watersheds would be relatively low from a watershed perspective. The Iliamna Lake watershed, excluding the lake itself, has an estimated 180,000 acres of wetlands and waterbodies (33 percent of the watershed). The project would result in direct impacts on 11 acres of shrub wetlands and 8 acres of herbaceous wetlands (Table 4.22-2). The Newhalen River watershed has an estimated 35,000 acres of wetlands and waterbodies (29 percent of the watershed); 1 acre of shrub wetlands would be directly affected. The Gibraltar Lake watershed has an estimated 34,000 acres of wetlands and waterbodies (41 percent of the watershed); 5 acres of shrub wetlands and 3 acres of herbaceous wetlands would be directly affected. The Amakdedori Creek-Frontal Kamishak Bay watershed has an estimated 77,000 acres of wetlands and waterbodies (44 percent of the watershed); 6 acres of shrub wetlands and 5 acres of herbaceous wetlands would be directly affected (Table 4.22-2). The transportation corridor does enter the Paint River watershed for a very short distance, but no wetland or waterbody impacts are anticipated.

Kokhanok East Ferry Terminal Variant

This variant would replace a portion of the regular Alternative 1 transportation corridor. The net change in direct permanent impacts would be an additional 6 acres of shrub wetlands and 42 acres of herbaceous wetlands. Two acres of lakes and ponds would not be impacted. The net change in temporary impacts would be an additional 3 acres of shrub wetlands and 16 acres of herbaceous wetlands. The net change in indirect impacts from dust would be an additional 5 acres of shrub wetlands and 145 acres of herbaceous wetlands. There would be 79 acres of fewer dust impacts to lakes and ponds.

Reclamation

The road system would be retained as long as required for the transport of bulk supplies needed for long-term post-closure water treatment and monitoring. Once no longer needed, the road system would be reclaimed. Disturbed areas would be recontoured, graded, ripped, and scarified. Topsoil and growth media would be placed as needed, and surfaces would be seeded for revegetation. The Iliamna Lake ferry facilities would be removed during closure. Once energy is no longer required at mine site, the pipeline would be pigged and cleaned and either abandoned in place or removed, subject to regulatory review and approval at the decommissioning stage of the project. Surface facilities associated with the pipeline would be removed and reclaimed. During closure and post-closure, wetlands would be reestablished wherever practicable.

[1]Includes 5 acres of uplands in the Headwaters Koktuli River Watershed

Summary of Direct Impacts in the Transportation Corridor

The Alternative 1 transportation corridor will directly and permanently impact 88 acres of WOUS during construction. Impacts would be permanent because the road would remain to facilitate long-term post-closure water treatment and monitoring. Direct and indirect effects would occur within 5 HUC 10 watersheds. The majority of the impacts (39 acres) would be within the UTC watershed. Most impacts would be to regionally common shrub and herbaceous wetland types. The direct impacts represent less than 1 percent of shrub and herbaceous wetlands in the watershed. No forested or aquatic bed wetlands would be impacted. Approximately 6 acres of riverine wetlands, identified as high-quality wetlands, would be directly impacted by the transportation corridor. This represents less than 1 percent of the riverine wetlands within the watershed. Approximately 8 acres of bog vegetation would be directly impacted, which represents less than 1 percent of bog vegetation in the watershed.

Fugitive Dust

Fugitive dust emissions would be caused by road construction and vehicle travel on unpaved surfaces. This dust has the potential to collect on vegetation in the vicinity of the dust sources. Windblown dust could affect wetland vegetation well beyond the source, but the effect diminishes with distance and is influenced by prevailing winds and topography. The heaviest dust deposition would be anticipated to occur within 35 feet of the road (Walker and Everett

AMERICAN OVERSIGHT

1987); however, dust has been documented at distances of 330 feet from the most heavily traveled roads in Prudhoe Bay (Walker et al. 1987a). Dust deposition impacts wetlands primarily by reducing vegetation productivity and altering species composition. Fugitive dust impacts to vegetation are described in Section 4.26, Vegetation; impacts to soils are described in Section 4.14, Soils.

With application of a 330-foot buffer on all permanent road footprints (as previously described), a total of 877 acres of WOUS would potentially be affected by dust deposition. The dust would primarily affect shrub (49 acres) and herbaceous (164 acres) wetlands. The greatest effects on wetland functions are expected to occur within 33 feet of the roads. Note that there is overlap between the 330-foot dust zone, and the 30-foot temporary construction impact zone within the transportation corridor.

A fugitive dust control plan would be developed for the project and the project would use BACT and BMPs for fugitive dust management (see Chapter 5, Mitigation).

4.22.2.3 Amakdedori Port

Construction of Amakdedori port would permanently and directly affect 11 acres of marine waters in the Amakdedori Creek-Frontal Kamishak Bay watershed (Table 4.22-3). The port terminal and associated facilities would be sited and designed to avoid all almost all vegetated wetlands and other waters. Temporary construction-related impacts would affect 4 acres of marine waters. Fugitive dust impacts from construction would potentially affect 3 acres of wetlands. Previous disturbance to wetlands or waterbodies in this area is minimal.

The Amakdedori port facilities would be removed during closure, except for those required to support shallow draft tug and barge access to the dock for the transfer of bulk supplies. Disturbed areas would be recontoured, graded, ripped, and scarified. Topsoil and growth media would be placed as needed, and surfaces would be seeded for revegetation.

Table 4.22-3: Alternative 1 Port WOUS Direct Impacts

Wetlands Totals	<1
Wetlands (%)	<1%
Waterbodies Totals	11
Waterbodies (%)	37%

Summer-Only Operations Variant

This variant would have roughly the same area of direct permanent and temporary impacts to WOUS. The area of wetlands potentially affected by fugitive dust is slightly more (6 acres) compared to the regular port.

AMERICAN OVERSIGHT

Pile Supported Dock Variant

Under this variant, the total offshore footprint of the port would be reduced substantially. There would be less than 1 acre of permanent direct impacts to marine waters.

4.22.2.4 Natural Gas Pipeline Corridor

Impacts for stand-alone sections of the natural gas pipeline are assessed here. Where the pipeline is being constructed adjacent to roads in the transportation corridor, impacts are assessed above. Stand-alone sections include primarily the 94-mile crossing of Cook Inlet, between Anchor Point and Amakdedori port, and the 18-mile crossing of Iliamna Lake. Onshore areas include the compressor station and pipeline near Anchor Point (Kenai Peninsula), access roads, and smaller sections where the pipeline leaves the transportation corridor.

For onshore sections of the stand-alone natural gas pipeline, a 100-foot wide impact corridor has been assessed: 40 feet to account for the trench and side-cast material, and 60 feet for construction access. All of this area is being considered permanent impacts at this time, since a restoration plan has yet to be developed. It is likely that much of this area would be restored within 2 years of construction.

The onshore sections of the natural gas pipeline would permanently impact approximately 5 acres of WOUS. The impacts are broken out in Table 4.22-4 by "Fill" and "No Fill." "Fill" refers to the 40-foot section of the corridor that includes the trench and side-cast material. Approximately 2 acres of WOUS would be filled for the pipeline. "No Fill" refers to the 60-foot section of the corridor that will be impacted for construction access. Approximately 3 acres of WOUS would be impacted. Temporary mats would be placed in wetlands to facilitate construction access. No direct fill in WOUS would be anticipated in these areas.

Impacts from offshore sections of the pipeline would be considered temporary. A 30-foot wide construction corridor is used to assess these impacts. Approximately 378 acres of marine (subtidal) waters in Cook Inlet would be temporarily impacted. Approximately 68 acres of Iliamna Lake would be temporarily impacted.

Table 4.22-4: Alternative 1 Natural Gas Pipeline WOUS Direct Permanent Impacts (Acres)

Kokhanok East Ferry Terminal Variant

Changes in the natural gas pipeline corridor for this variant would result in a net addition of 11 acres of permanent impacts to shrub wetlands, and 6 acres of temporary impacts to Iliamna Lake waters.

4.22.3 Action Alternative 2 – North Road and Ferry

Alternative 2 would permanently discharge dredged or fill material into 3,714 acres of WOUS and temporarily discharge dredged or fill material into 403 acres of WOUS. An additional 1,890 acres of WOUS would be indirectly impacted by fugitive dust, and 448 acres of WOUS would be indirectly impacted by dewatering from the mine pit. The discharge would permanently impact 3,451 acres of wetlands, 148 acres of open waters, and 54 acres of streams along 35.4 miles of stream channels. The discharge would temporarily impact 49 acres of wetlands, 348 acres of open waters, and 4 acres of streams along 2.0 miles of stream channels. Maps showing impacts for all project components can be found in Appendix K 4.22.

NWUS permanently affected by Alternative 2 include Iliamna Bay (Cook Inlet) and Iliamna Lake. Alternative 2 includes a port at Diamond Point with a causeway extending out to a marine jetty, which combined would be 2,100 feet long by a maximum of 200 feet wide, below the HTL of Cook Inlet. The shallow approach at this port site would require dredging. The dredge footprint would be approximately 5,500 feet long by a maximum width of 900 feet wide, below the HTL of Cook Inlet. The south ferry terminal at Pile Bay includes a landing ramp that is 140 feet long by a maximum of 120 feet wide below the OHWM of the Iliamna Lake. The north ferry terminal at Eagle Bay would be 190 feet long by a maximum of 80 feet wide below the OHWM of Iliamna Lake. A total of approximately 71 acres of NWUS would be permanently impacted for the port and ferry terminals. Another 21 acres of NWUS in Iliamna Bay would be permanently impacted by the Alternative 2 transportation corridor.

Special aquatic sites that would be permanently or temporarily impacted include mudflats, vegetated shallows, and riffle and pool complexes. These habitats were not specifically mapped during the environmental baseline study program. Mudflats occur within the estuarine intertidal waters of Iliamna Bay and Cottonwood Bay (23 acres permanent and 48 acres temporary impacts). Vegetated shallows are similar to aquatic bed wetlands (less than 1 acre permanent and temporary impacts). Eelgrass beds are not known to occur in the impact area. Riffle and pool complexes occur in an undetermined portion of the upper perennial and intermittent stream channels. Permanent and temporary impacts to these channels total 53 acres and 4 acres, respectively.

AMERICAN OVERSIGHT

4.22.3.1 Mine Site

Direct impacts would be the same as in Alternative 1, except that there would be an additional 60 acres of direct impacts to wetlands associated with a bulk tailings storage cell, embankments, and haul road. Impacted wetlands include 49 acres of deciduous shrub wetlands, and 11 acres of herbaceous wetlands, almost all on slopes. Fugitive dust and dewatering impacts would be the same as in Alternative 1.

Summer-Only Ferry Operations Variant

Impacts would be the same as described for this variant in Alternative 1.

4.22.3.2 Transportation Corridor

Construction of the transportation corridor from Diamond Point port to the Pile Bay ferry terminal, and from the Eagle Bay ferry terminal to the mine site, would directly and permanently affect 101 acres of WOUS (Table 4.22-5), including 67 acres of wetlands and 34 acres of waterbodies. Impacts would be permanent because the road would remain to facilitate long-term post-closure water treatment and monitoring. Previous disturbance to wetlands in this area is minimal. The corridor has been sited to avoid and minimize wetland impacts and allow for efficient reclamation of disturbed areas.

A total of 4.7 miles of streams would be directly affected by construction, including 2.3 miles of perennial streams and 2.4 miles of intermittent streams (Table 4.22-3). The larger streams with a width at OHW of 16 feet or greater would be bridged. Site-specific designs have been developed for bridges. Smaller stream crossings would use a series of standardized, conceptual culvert design categories based on stream width and fish presence. See Section 4.16, Surface Water Hydrology, for a discussion of surface water hydrology impacts.

Within the transportation corridor, the natural gas pipeline would follow the access road and is accounted for in the direct impacts for the access roads. Impacts associated with the natural gas pipeline outside of the transportation corridor are discussed below.

Construction impacts to wetlands outside of the permanent road footprint would be avoided or minimized where possible. However, to account for temporary construction-related impacts, a 30-foot zone on either side of the permanent road footprint was assumed to be temporarily impacted. These impacts would be anticipated to be restored within 2 years of construction (PLP 2018-RFI082). Temporary impacts would affect approximately 64 acres of WOUS within the transportation corridor, including 46 acres of wetlands, and 18 acres of waterbodies.

Activities in the transportation corridor would permanently affect WOUS in five HUC 10 watersheds. The highest number of acres impacted (33 acres) would occur in the UTC watershed (Table 4.22-3). Direct impacts in this watershed would affect primarily deciduous shrub wetlands (27 acres), primarily on slopes. The UTC watershed is approximately 88,000 acres. Based on vegetation mapping, it is estimated to contain approximately 34,000 acres of WOUS, which is roughly 39 percent of the watershed. Approximately 31,000 acres (35 percent of the watershed), are shrub wetlands and 1,200 acres (1 percent) are herbaceous wetlands. Forested wetlands (636 acres) and aquatic bed wetlands (8 acres) each cover less than 1 percent. Activities in the transportation corridor and in a small portion of the mine site would affect 33 acres of shrub wetlands and 6 acres of herbaceous wetlands in the UTC watershed. This represents less than 1 percent of all shrub and herbaceous wetlands in the watershed. No forested or aquatic bed wetlands would be affected.

Approximately 27 acres of WOUS would be permanently impacted in the Chinitna River-Frontal Cook Inlet watershed. Almost all of this area is in estuarine waters. Direct impacts to estuarine

AMERICAN OVERSIGHT

intertidal waters total 20 acres. This impact is within Iliamna Bay (Cook Inlet). This area is also considered a special aquatic site (mudflats). This habitat is relatively scarce in the project vicinity, and provides multiple habitat functions for marine and terrestrial fish and wildlife. For these reasons, estuarine intertidal waters are considered high-quality for purposes of the environmental effects determination. Based on NWI mapping of Iliamna Bay, Estuarine intertidal waters cover 543 acres of the bay. The project impacts of 20 acres represent roughly 4 percent of intertidal waters in the bay.

Wetland and waterbody impacts in the other four watersheds would be relatively low from a watershed perspective. The Iliamna Lake watershed, excluding the lake itself, has an estimated 180,000 acres of wetlands and waterbodies (33 percent of the watershed). The Alternative 2 transportation corridor would result in direct impacts on 3 acres of shrub wetlands and 4 acres of forested wetlands (Table 4.22-3). The Newhalen River watershed has an estimated 35,000 acres of wetlands and waterbodies (29 percent of the watershed); 13 acres of shrub wetlands, 3 acres of forested wetlands, and 1 acre of herbaceous wetlands would be directly affected. Approximately 11 acres of wetlands would be impacted within the Iliamna River watershed, including 5 acres of shrub wetlands, 4 acres of herbaceous wetlands, and 2 acres of forested wetlands (Table 4.22-3).

Riverine wetlands are considered high value in the watersheds based on their connections to important fish and wildlife species. Since the entire Alternative 2 transportation corridor does not have project mapping with HGM classification, it is not possible to determine the exact area of riverine wetlands that will be directly impacted. For the 82 percent of the impact area with project mapping, there are a total of 10 acres of impacts to riverine wetlands across all watersheds (5 acres in Iliamna River watershed; 3 acres in Newhalen River watershed; and 2 acres in UTC watershed).

A relatively small area of bog vegetation would be directly impacted across all watersheds. Most of the impacts would be within the UTC and Newhalen River watersheds. For the 82 percent of the impact area with project vegetation mapping, there are 5 acres of impacts to bog vegetation.

[1]Includes 5 acres of uplands in the Headwaters Koktuli River Watershed

Summer-Only Ferry Operations Variant

This variant would include the addition of a container storage yard at Williamsport, north of Diamond Point port. This would result in 9 acres of additional direct permanent impacts to estuarine intertidal waters in Iliamna Bay.

Summary of Direct Impacts in the Transportation Corridor

The Alternative 2 transportation corridor will directly and permanently impact 101 acres of WOUS during construction. Impacts would be permanent because the road would remain to facilitate long-term post-closure water treatment and monitoring. Direct and indirect effects would occur within 5 HUC 10 watersheds. The majority of the impacts would be within two watersheds. Most impacts would be to regionally common shrub and herbaceous wetland types.

In the UTC watershed, 33 acres of shrub and 6 acres of herbaceous wetlands would be directly impacted. The direct impacts represent less than 1 percent of shrub and herbaceous wetlands within the watershed. No forested or aquatic bed wetlands would be impacted.

Within the Chinitna River-Frontal Cook Inlet watershed, 27 acres of estuarine waters would be directly impacted. Approximately 20 acres of these waters are in the intertidal zone of Iliamna Bay, and would be considered mud flats, a special aquatic site. This impact represents roughly 4 percent of the estuarine intertidal waters within Iliamna Bay.

Fugitive Dust

Fugitive dust emissions would be caused by road construction and vehicle travel on unpaved surfaces. This dust has the potential to collect on vegetation in the vicinity of the dust sources. Windblown dust could affect wetland vegetation well beyond the source, but the effect diminishes with distance and is influenced by prevailing winds and topography. Dust deposition impacts wetlands primarily by reducing vegetation productivity and altering species composition. Fugitive dust impacts to vegetation are described in Section 4.26, Vegetation; impacts to soils are described in Section 4.14, Soils.

Research on dust emissions and its impact on vegetation in Alaska has shown that most dust generated from roads is deposited within 330 feet (Petavratzi et al. 2005; Walker and Everett 1987). Therefore, a potential indirect impact area was calculated using a 330-foot buffer on all permanent road footprints. This follows methods used by recent EISs in Alaska (Donlin Gold

AMERICAN OVERSIGHT

2018; Point Thompson 2012). A total of 875 acres of WOUS would potentially be affected by dust deposition. The dust would primarily affect deciduous shrub (384 acres), herbaceous (127 acres), and deciduous forest (75 acres) wetlands. The greatest effects on wetland functions are expected to occur within 33 feet of the roads. Note that there is overlap between the 330-foot dust zone, and the 30-foot temporary construction impact zone within the transportation corridor.

A fugitive dust control plan would be developed for the project and the project would use BACT and BMPs for fugitive dust management (see Chapter 5, Mitigation).

4.22.3.3 Diamond Point Port

Construction of Diamond Point port would directly and permanently affect 71 acres of estuarine waters (Table 4.22-6). Most impacts are to subtidal waters (68 acres) within Iliamna Bay (Cook Inlet). The port terminal and associated facilities would be sited and designed to avoid direct and indirect impacts to wetlands, streams and ponds. Construction would temporarily impact 13 acres of estuarine subtidal waters, and 2 acres of estuarine intertidal waters.

The Diamond Point port facilities would be removed during closure, except for those required to support shallow draft tug and barge access to the dock for the transfer of bulk supplies. Disturbed areas would be recontoured, graded, ripped, and scarified. Topsoil and growth media would be placed as needed, and surfaces would be seeded for revegetation.

Wetlands Totals	0
Wetlands (%)	0
Waterbodies Totals	<1
Waterbodies (%)	<1

Pile Supported Dock Variant

Under this variant, the total offshore footprint of the port would be reduced significantly. There would be less than 1 acre of permanent direct impacts to marine waters.

4.22.3.4 Natural Gas Pipeline Corridor

Impacts for stand-alone sections of the natural gas pipeline are assessed here. Where the pipeline is being constructed adjacent to roads within the transportation corridor, impacts are assessed above.

AMERICAN OVERSIGHT

The onshore sections of the natural gas pipeline would permanently impact a total of 24 acres of WOUS (Table 4.22-7). Approximately 11 acres of WOUS would be filled for the pipeline. Another 13 acres of WOUS would be impacted for construction access.

Impacts from offshore sections of the pipeline, between Anchor Point and Ursus Cove, and across Cottonwood Bay, are considered to be temporary. A 30-foot wide construction corridor is used to assess these impacts. Approximately 271 acres of marine (subtidal) waters in Cook Inlet would be temporarily impacted. The pipeline corridor across Cottonwood Bay would impact 39 acres of estuarine intertidal waters, and 11 acres of estuarine subtidal waters. An additional 3 acres of wetlands would be temporarily impacted for construction access roads. Fugitive dust from roads and material sites would potentially affect 23 acres of deciduous shrub and herbaceous wetlands.

Table 4.22-7: Alternative 2 Natural Gas Pipeline WOUS Direct Permanent Impacts (acres)

Waterbodies (%)									<1	1
Perennial Streams (Miles)									0.5	0.7
Intermittent Streams (Miles)									0.7	0.9

4.22.4 Action Alternative 3 – North Road Only

Alternative 3 would permanently discharge dredged or fill material into 3,645 acres of WOUS and temporarily discharge dredged or fill material into 403 acres of WOUS. An additional 2,017 acres of WOUS would be indirectly impacted by fugitive dust, and 448 acres of WOUS would be indirectly impacted by dewatering from the mine pit. The discharge would permanently impact 3,445 acres of wetlands, 146 acres of open waters, and 54 acres of streams along 35.5 miles of stream channels. The discharge would temporarily impact 50 acres of wetlands, 347 acres of open waters, and 4 acres of streams along 3.8 miles of stream channels.

Because Alternative 3 does not include a ferry crossing of Iliamna Lake, the only NWUS permanently affected by this alternative would be Cook Inlet. Alternative 3 includes the same port location (Diamond Point) and design as Alternative 2, with a total of approximately 71 acres

AMERICAN OVERSIGHT

of NWUS permanently impacted. Another 24 acres of NWUS in Iliamna Bay would be permanently impacted by the Alternative 3 transportation corridor.

Special aquatic sites that would be permanently or temporarily impacted include mudflats, vegetated shallows, and riffle and pool complexes. These habitats were not specifically mapped during the environmental baseline study program. Mudflats occur within the estuarine intertidal waters of Iliamna Bay and Cottonwood Bay (23 acres permanent and 48 acres temporary impacts). Vegetated shallows are similar to aquatic bed wetlands (less than 1 acre permanent and temporary impacts). Eelgrass beds are not known to occur in the impact area. Riffle and pool complexes occur in an undetermined portion of the upper perennial and intermittent stream channels. Permanent and temporary impacts to these channels total 52 acres and 4 acres, respectively.

4.22.4.1 Mine Site

Under Alternative 3, the mine site footprint would be the same as Alternative 1, described above. Therefore, both direct and indirect effects would be the same.

Concentrate Pipeline Variant

No additional impacts to WOUS would be associated with this variant.

4.22.4.2 Transportation Corridor

Construction of the Alternative 3 transportation corridor from Diamond Point port to the mine site would directly and permanently affect 108 acres of WOUS (Table 4.22-8), including 75 acres of wetlands and 33 acres of waterbodies. Impacts would be permanent because the road would remain to facilitate long-term post-closure water treatment and monitoring. Previous disturbance to wetlands in this area is minimal. The corridor has been sited to avoid and minimize wetland impacts and allow for efficient reclamation of disturbed areas.

[Note: WOUS impacts may be underestimated in the Alternative 2 transportation corridor, as project-specific mapping in this area appears to have missed numerous stream channels and possibly other WOUS. It is expected that project-specific mapping data would be acquired in field season 2019 to collect additional data in these areas, and included in a final EIS].

A total of 7.5 miles of streams would be directly affected by construction, including 3.3 miles of perennial streams and 4.2 miles of intermittent streams (Table 4.22-8). The larger streams with a width at OHW of 16 feet or greater would be bridged. Site-specific designs have been developed for bridges. Smaller stream crossings would use a series of standardized, conceptual culvert design categories based on stream width and fish presence. See Section 4.16, Surface Water Hydrology, for a discussion of surface water hydrology impacts.

Within the transportation corridor, the natural gas pipeline would follow the access road and is accounted for in the direct impacts for the access roads. Impacts associated with the natural gas pipeline outside of the transportation corridor are discussed below.

Construction impacts to wetlands outside of the permanent road footprint would be avoided or minimized where possible. However, to account for temporary construction-related impacts, a 30-foot zone on either side of the permanent road footprint was assumed to be temporarily impacted. These impacts would be anticipated to be restored within 2 years of construction (PLP 2018-RFI082). Temporary impacts would affect approximately 68 acres of WOUS in the transportation corridor, including 50 acres of wetlands, and 17 acres of waterbodies. Wetland impacts are primarily to shrub wetlands (34 acres). Waterbody impacts are primarily to estuarine waters (12 acres).

AMERICAN OVERSIGHT

Activities in the transportation corridor would permanently affect WOUS in five HUC 10 watersheds. The highest number of acres impacted (33 acres) would occur in the UTC watershed (Table 4.22-8). Direct impacts in this watershed would affect primarily deciduous shrub wetlands (27 acres), primarily on slopes. The UTC watershed is approximately 88,000 acres. Based on vegetation mapping, it is estimated to contain approximately 34,000 acres of WOUS, which is roughly 39 percent of the watershed. Approximately 31,000 acres (35 percent of the watershed), are shrub wetlands and 1,200 acres (1 percent) are herbaceous wetlands. Forested wetlands (636 acres) and aquatic bed wetlands (8 acres) each cover less than one percent. Activities in the transportation corridor and in a small portion of the mine site would affect 33 acres of shrub wetlands and 6 acres of herbaceous wetlands in the UTC watershed. This represents less than 1 percent of all shrub and herbaceous wetlands in the watershed. No forested or aquatic bed wetlands would be affected.

Approximately 27 acres of WOUS would be permanently impacted in the Chinitna River-Frontal Cook Inlet watershed. Almost all of this area is in estuarine waters. Direct impacts to estuarine intertidal waters total 20 acres; this impact is in Iliamna Bay (Cook Inlet). This area is also considered a special aquatic site (mudflats). This habitat is relatively scarce in the project vicinity and provides multiple habitat functions for marine and terrestrial fish, as well as wildlife. For these reasons, estuarine intertidal waters are considered high quality for purposes of the environmental effects determination. Based on NWI mapping of Iliamna Bay, estuarine intertidal waters cover 543 acres of the bay. The project impacts of 20 acres represent roughly 4 percent of intertidal waters in the bay.

Wetland and waterbody impacts in the other four watersheds would be relatively low from a watershed perspective. The Iliamna Lake watershed, excluding the lake itself, has an estimated 180,000 acres of wetlands and waterbodies (33 percent of the watershed). The Alternative 3 transportation corridor would result in direct impacts on 6 acres of shrub wetlands, 8 acres of forested wetlands, and 1 acre of herbaceous wetlands (Table 4.22-8). The Newhalen River watershed has an estimated 35,000 acres of wetlands and waterbodies (29 percent of the watershed); 13 acres of shrub wetlands, 3 acres of forested wetlands, and 1 acre of herbaceous wetlands would be directly affected. Approximately 9 acres of wetlands would be impacted within the Iliamna River watershed, including 5 acres of shrub wetlands, 3 acres of herbaceous wetlands, and 2 acres of forested wetlands (Table 4.22-8).

Riverine wetlands are considered high-value in the watersheds based on their connections to important fish and wildlife species. Since the entire Alternative 3 transportation corridor does not have project mapping with HGM classification, it is not possible to determine the exact area of riverine wetlands that will be directly impacted. For the 92 percent of the direct impact area with project mapping, there is a total of 11 acres of impacts to riverine wetlands across all watersheds (2 acres in Iliamna Lake watershed, 3 acres in Iliamna River watershed; 3 acres in Newhalen River watershed; and 2 acres in UTC watershed).

A relatively small area of bog vegetation would be directly impacted across all watersheds. Most of the impacts would be in the UTC and Newhalen River watersheds. For the 92 percent of the impact area with project vegetation mapping, there are 6 acres of impacts to bog vegetation.

[1]Includes 5 acres of uplands in the Headwaters Koktuli River Watershed, 62 acres of uplands in the Chekok Creek watershed, and 74 acres of uplands in the Pile River watershed.

Summary of Impacts in the Transportation Corridor

The Alternative 3 transportation corridor will directly and permanently impact 108 acres of WOUS during construction. Impacts would be permanent because the road would remain to facilitate long-term post-closure water treatment and monitoring. Direct and indirect effects would occur within 5 HUC 10 watersheds. The majority of the impacts would be in two watersheds. Most impacts would be to regionally common shrub and herbaceous wetland types.

Within the UTC watershed, 33 acres of shrub and 6 acres of herbaceous wetlands would be directly impacted. The direct impacts represent less than 1 percent of shrub and herbaceous wetlands within the watershed. No forested or aquatic bed wetlands would be impacted.

In the Chinitna River-Frontal Cook Inlet watershed, 27 acres of estuarine waters would be directly impacted. Approximately 20 acres of these waters are in the intertidal zone of Iliamna Bay, and would be considered mud flats, a special aquatic site. This impact represents roughly 4 percent of the estuarine intertidal waters in Iliamna Bay.

Fugitive Dust

Fugitive dust emissions would be caused by road construction and vehicle travel on unpaved surfaces. This dust has the potential to collect on vegetation in the vicinity of the dust sources.

AMERICAN OVERSIGHT

Windblown dust could affect wetland vegetation well beyond the source, but the effect diminishes with distance and is influenced by prevailing winds and topography. Dust deposition impacts wetlands primarily by reducing vegetation productivity and altering species composition. Specific effects are described in Section 4.26, Vegetation, and Section 4.14, Soils.

With application of a 330-foot buffer on all permanent road footprints (as previously described), a total of 1,044 acres of WOUS would potentially be affected by dust deposition, including 716 acres of wetlands. The dust would primarily affect shrub (455 acres), herbaceous (151 acres), and forested (111) wetlands. The greatest effects on wetland functions are expected to occur within 33 feet of the roads. Note that there is overlap between the 330-foot dust zone, and the 30-foot temporary construction impact zone within the transportation corridor.

A fugitive dust control plan would be developed for the project and the project would use BACT and BMPs for fugitive dust management (see Chapter 5, Mitigation).

Concentrate Pipeline Variant

No additional impacts to WOUS would be associated with this variant.

4.22.4.3 Diamond Point Port

Under Alternative 3, the Diamond Point port footprint would be the same as Alternative 2, described above. Therefore, both direct and indirect effects would be the same. Note that Alternative 3 does not include a pile-supported dock variant.

4.22.4.4 Natural Gas Pipeline Corridor

Impacts for stand-alone sections of the natural gas pipeline are assessed here. Where the pipeline is being constructed adjacent to roads within the transportation corridor, impacts are assessed above. Refer to the previous discussion, above, for a description of how impacts were assessed for the pipeline corridor.

The onshore sections of the natural gas pipeline would permanently impact a total of 8 acres of WOUS (Table 4.22-9). Approximately 4 acres of WOUS would be filled for the pipeline. Another 4 acres of WOUS would be impacted for construction access.

Impacts from offshore sections of the pipeline, between Anchor Point and Ursus Cove, and across Cottonwood Bay, are considered to be temporary. A 30-foot wide construction corridor is used to assess these impacts. Approximately 271 acres of marine (subtidal) waters in Cook Inlet would be temporarily impacted. The pipeline corridor across Cottonwood Bay would impact 39 acres of estuarine intertidal waters, and 11 acres of estuarine subtidal waters.

Fugitive Dust	Onshore section of pipeline is mostly associated with transportation corridor, so few pipeline-only dust impacts.	Impacts to 58 acres of WOUS from construction access and material sites mainly during construction.	Impacts to 16 acres of WOUS from material sites mainly during construction.

[1]There is some overlap at the mine site between WOUS potentially impacted by dust and those impacted by dewatering.

4.22.6 Cumulative Effects

The cumulative effects analysis area for wetlands encompasses the nine HUC 10 watersheds that could be directly or indirectly affected by the project, with a total area of approximately 6,420,000 acres (see Figure 4.22-1). Potential cumulative impacts to wetlands include incremental loss of wetlands, fragmentation of habitat, changes in wetland types, and loss or degradation of wetland functions.

Past, present, and reasonably foreseeable future actions (RFFAs) in the cumulative impact analysis area have the potential to contribute cumulatively to impacts on wetlands. Section 4.1 details the past, present, and RFFAs considered for evaluation. Several of the RFFAs detailed in Section 4.1, Introduction to Environmental Consequences, are considered to have no potential for cumulatively impacting wetlands in the analysis area. These would include off-shore based developments such as oil and gas lease sales and non-industrialized point source activities that are unlikely to result in any appreciable impact beyond a temporary basis (e.g., tourism, recreation, fishing, and hunting). Other RFFAs removed from further consideration include those outside the analysis area (e.g., Donlin Gold, Copper Joe).

RFFAs that could contribute cumulatively to wetland impacts, and are therefore considered in this analysis, are those activities that would occur in the analysis area. The following were identified in Section 4.1, Introduction to Environmental Consequences, carried forward in this analysis based on their potential to impact wetlands in the analysis area:

- Pebble project buildout – develop 55 percent of the resource over 78-year period
- Pebble South/PEB*
- Big Chunk South*
- Big Chunk North*
- Fog Lake*
- Groundhog*
- Diamond Point Rock Quarry
- Lake and Peninsula Transportation and Infrastructure

**Indicates exploration activities only.*

AMERICAN OVERSIGHT

4.22.6.1 Past and Present Actions

Past and present actions that have, or are currently, affecting wetlands in the analysis area are minimal. Current development consists of a small number of towns, villages and roads. Present activities include mining exploration and non-mining related projects, such as transportation, oil and gas development, or community development actions. These actions have resulted in a loss of some wetlands. While these actions affected localized areas, they are additive to other actions, increasing the total acreage of wetlands affected. Dust effects can also be additive, as more dust-producing actions are implemented a greater area of wetlands can be affected.

4.22.6.2 Reasonably Foreseeable Future Actions

Pebble Mine Expanded Development Scenario – An expanded development scenario for this project would include an additional 58 years of mine life and involve a substantially larger mine site footprint. The mine site footprint would have a larger open pit and new facilities to store tailings and waste rock (Figure 4.22-3). An additional compressor station at Amakdedori port and concentrate and diesel pipelines from the mine site to a deep water loading facility in Iniskin Bay would also be developed under this scenario. This development may or may not include a road access to Diamond Point, which would increase the amount of wetlands impacted. It is expected that the two pipelines would be of similar length and parallel the transportation corridor as described under alternative 1. Similar wetland types are expected to be affected by the new pipeline corridors.

The Pebble mine expanded development scenario project footprint would impact approximately 34,790 acres compared to 12,371 acres under Alternative 1. The total number of wetlands potentially affected under this scenario would amount to an additional 9,415 acres[1]. This calculation assumes that 42 percent of the new affected area (22,419 acres) is wetlands based on the alternative 1 wetlands analysis. This additional 9,415 acres of potential wetlands disturbance represents 0.3 percent of the estimated 2,696,000 acres of wetlands in the analysis area. Predominate wetland types potentially impacted under this scenario include herbaceous and broad leafed shrubs.

Project construction activities would continue to disturb soil, alter surface water flow and physically injure wetland vegetation. In areas of high proportion of wetlands or during the construction of new mine site facilities and pipelines, wetlands could be excavated or filled. Excavation, filling, and clearing of wetlands would alter or remove their capacity to provide hydrologic, biogeochemical, and biological functions. Construction on or through wetlands would result in increased habitat loss, fragmentation, and degradation. The placement of gravel to construct project facilities could alter local hydrologic regimes resulting in adverse effects on wetlands. Erosion from construction activities could result in sedimentation of wetland communities and alter functional capacity. These impacts would be additive to those of the proposed project. The expansion would increase the magnitude, duration and geographic extent of the wetland impacts described under Alternative 1.

Exploration Projects – Mineral exploration is likely to continue in the analysis area. Exploration activities would result in small areas of wetlands disturbance related to core sampling and exploration facilities. Impacts to wetlands are expected to be limited in extent and minor in magnitude.

[1] Wetland calculations assume 42 percent of the area is wetlands. This assumption is based on wetland mapping and field delineation data for Alternative 1 in the analysis area and the Alaska Wetlands Initiative Summary Report (EPA 1994).

AMERICAN OVERSIGHT

Community Development Projects – Anticipated road improvement projects in the region include new transportation corridors currently being studied in the Lake and Peninsula Borough, such as the Williamsport-Pile Bay road upgrade, Nondalton-Iliamna River Road Corridor and Bridge, and the Kaskanak Road/Cook Inlet to Bristol Bay. The latter two projects have been identified as concepts, but there are no plans, funding, or permit applications that make them reasonably foreseeable. The strategic plan for Iliamna includes a road connection to all villages in lake area for safer travel. Roads affect wetlands through direct removal and fill, and indirectly through dust deposition and potential disruption of wetland hydrology. The construction of linear features, such as gravel roads perpendicular to the predominant hydraulic gradient, has a greater potential to alter or impound sheet flow and water moving through the active layer. Sedimentation could alter or destroy wetlands, thus reducing functional capacity.

Additional RFFAs that have the potential to affect wetlands in the region include mineral and oil and gas exploration and development, energy and utility projects, the Diamond Point rock quarry, and various village infrastructure development projects. Depending on final design and permitting, these projects could impact wetlands, which when added to the past and present wetland loss, increases the total acreage affected.

4.22.6.3 Cumulative Effects Summary

The effects of the project on wetlands would be additive to the similar effects of past, present, and RFFAs. The proposed project would be distant from other developments, so its effects would be mostly in watersheds that have seen little other disturbance, and affected areas would generally not overlap with areas already affected by developments. The areal extent of impacts to wetlands from these actions is a small proportion compared to the distribution of wetlands in the analysis area and even smaller at the regional level. The ongoing or future similar activities would likely induce little overall change to regional wetland types in the EIS analysis area. Climate change may result in large-scale biome shifts to wetlands, including a loss of wetlands and changes in wetland functions. Impacts to wetlands from these development activities are regulated by Section 404 of the CWA, which provides an avenue for continued avoidance, minimization, and compensation of unavoidable impacts on a project-by-project basis. Permits issued for wetland fill activities would generally require restoration of the affected site and revegetation efforts, or other means of compensatory mitigation.

Overall, the cumulative impacts on wetlands from the project and the past, present and RFFAs are expected to be measureable, but geographically limited.

Hello All,
The Corps has distributed the updated, more detail, discussion on Alternatives development for cooperating agency review. Per the below email, comments are welcome if we would like to provide any. I would appreciate your review of the attached, if you have time (I realize this is later than originally anticipated). If you do have any comments, please send them to me by COB Wednesday 9/26.
Thank you,
Molly

Subject: Please Review - Pebble Pre-DEIS Sections
Importance: High

Hello Pebble NEPA Team,

We have received several additional sections of the preliminary Draft EIS for review. We have also received many sections as an FYI for which our review is not requested. I have loaded everything I've received to date into the Sharepoint Folder: Preliminary Draft EIS Sections Oct-Nov 2018.

As a reminder, our input at this stage is only requested on the specific sections we were assigned to in the Cooperating Agency plan. Therefore, if your name doesn't appear below with a specific assignment, no review is necessary at this time. However, feel free to take a look at the sections pertaining to your subject matter on the Sharepoint Site if you wish.

Here are the assignments for specific sections where I would appreciate your review. Note that each subject area includes a section for Chapter 3 (affected environment), Chapter 4 (environmental consequences), as well as one or two supporting technical appendices. Please use the attached comment spreadsheet to assemble your comments, and please send them to me by the date noted for each section below.

- 3.11/4.11/K4.11 Aesthetics – Molly
- 3.14/4.14/K3.14 Soils – Mark/Palmer – due COB 11/27
- 3.16/4.16/K3.16 Surface Water Hydrology – Tim/Mark/Palmer/Muluken/Justine – due COB 11/27
- 3.26/4.26/K3.26 Vegetation – Mark/Palmer – due COB 11/27
- 3.17/4.17/K3.17 Hydrogeology – Tim/Mark/Palmer/Muluken – due COB 11/29
- 3.18/4.18/K3.18/K4.18 Water and Sediment Quality – Cindi/Tim/Chris – due COB 11/29
- (note, we have not yet received the Wetlands sections, which are anticipated to arrive approximately 11/21)

I apologize for the short time available for review, especially given the Thanksgiving holiday in the middle. If this schedule will be impossible for you, please let me know as soon as possible. Also, if you have any questions about the sections you are reviewing or where to focus your review, please don't hesitate to call.

Thank you,
Molly

Attachments: Comments Sections 3.1_3.5_4.1_4.5 Draft 103118_ACP.docx

Hi Molly –

Thanks for the opportunity to review. My calendar was full on Thursday and I was at a conference on Friday so I started to review yesterday.

Attorney Client / Deliberative/Ex. 5

Thanks,

Ashley

Subject: Please Review - Draft comments on first installment of Pebble Pre-DEIS

Hi Ashley,
As we discussed, here are our draft comments on the first round of Pre-DEIS sections distributed by the Corps for our review. I would appreciate if you can review and send me any comments or edits by Tuesday 11/6. Please also feel free to call with any questions about these comments.
Thank you,
Molly

AMERICAN OVERSIGHT

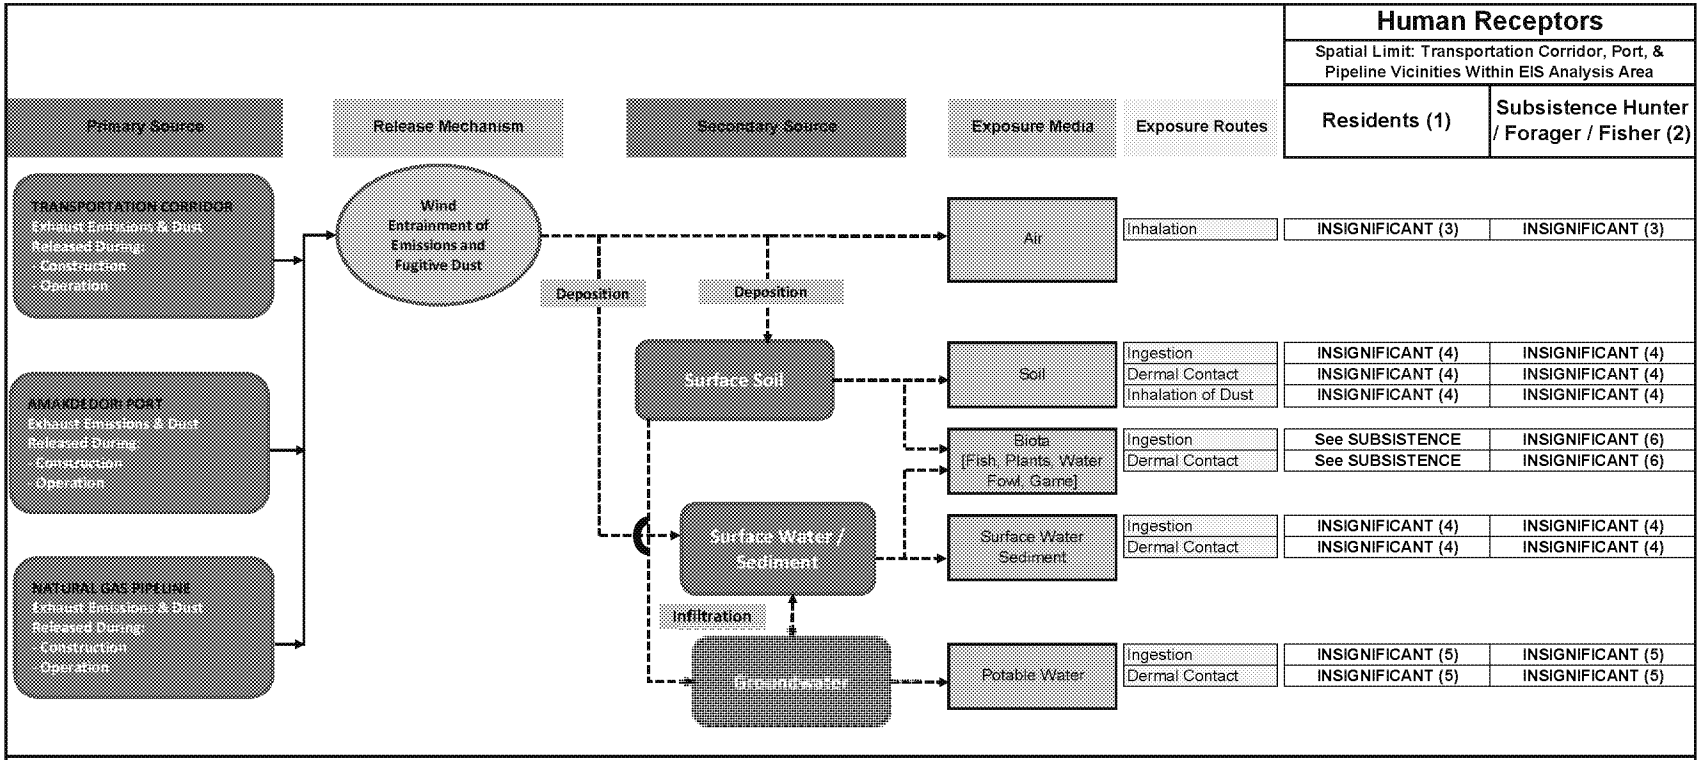
LEGEND

The CSM is based on Alternative 1 and does not evaluate exposure pathways based on unanticipated scenarios (accidents, spills, or failures of mitigation measures) or health impacts to the project-related workforce at the mine site.

Exposure Pathways: "Complete" refers to a potential exposure pathway resulting in receptor exposure of project related hazardous constituents in various media during any of the project phases.
"Incomplete" refers to a potential exposure pathway with a break in the path that prevents receptors from exposure to project related hazardous constituents.

Transport Pathway is incomplete
Transport pathway is complete, but insignificant
Transport pathway is complete



Notes:

(1) The closest communities to the mine site are Iliamna, Newhalen, and Nondalton (within the Lake and Peninsula Borough), each of which are approximately 17 miles from the deposit. An additional five Lake and Peninsula Borough communities are within the EIS analysis area but are further from the mine site (Kokhanok, Port Alsworth, Pedro Bay, Levelock, and Igiugig). In addition, three Nushagak/Bristol Bay communities in the Dillingham Census Area were also identified as geographically close to the of the EIS analysis area (New Stuyahok, Koliganek, and Ekwok). Residential exposure to harvested biota shared by subsistence users is captured and evaluated under subsistence receptors. Likewise, residential direct exposure during recreational activities is captured and evaluated under direct media exposure for subsistence receptors.
(2) Twenty communities, including the eight in Lake and Peninsula Borough and two in Nushagak/Bristol Bay (Ekwok data insufficient), are known to use the EIS analysis area for subsistence (see Section 3.9, Subsistence).
(3) Mine site construction and operations emissions would be in compliance with permitting requirements and air quality standards. Total annual HAPs for all phases would be below Title V permit thresholds. During closure, fugitive PM emissions would be expected to meet air quality standards. In addition, mitigation measures would be used to limit vehicle idling and control dust generation. (i.e., insignificant)
(4) Mine site overland flow would not occur, non-contact and contact water would be captured and sent to the Water Treatment Plant (WTP) for appropriate treatment (i.e., incomplete).
(5) Mine site dust deposition modeling and estimated media (soil, sediment, surface water) impacts indicate that increases would be negligible, with increases of < 3.2% for antimony and < 1% for all other metals. Therefore, risks/hazards would be expected to be indistinguishable from baseline (i.e., incremental increase insignificant).
(6) Mine site non-contact and contact water would be treated at the WTP and effluent would meet permitting requirements prior to discharge (i.e., insignificant).
(7) During the life of the mine, mine site operations and tailings impacts to groundwater would remain within the mine site boundaries (i.e., incomplete). During post-closure, once groundwater monitoring indicates water quality criteria are met, then direct discharge would occur (i.e., insignificant).
(8) Mine site dust deposition modeling and estimated soil concentrations at the boundary are less than migration to groundwater criteria (i.e., insignificant).
(9) Since soil, sediment, and surface water impacts from mine site dust deposition would be negligible relative to baseline (see Note 5), impacts to wild foods would similarly be expected to be negligible to slight relative to baseline. Therefore, risk/hazards from ingesting impacted wild foods would be expected to be indistinguishable from baseline (i.e., insignificant).
(10) There would be a potential for waterfowl to be exposed to mine site standing water bodies (i.e., TSF, ponds, open pit lake), be impacted by contamination, and then harvested and ingested by the affected communities. However, waterfowl and shorebirds are not likely to be attracted to these features because they are not anticipated to provide vegetated cover or food resources and would be characterized by mining activities during operations. PLP would implement mitigation measures to deter wildlife use of the mine site standing water features. Therefore, substantive exposure to wildlife would not be expected (i.e., insignificant).

Mine Site Conceptual Site Model

Figure K4.10-1

AMERICAN OVERSIGHT

LEGEND

The CSM is based on Alternative 1 and does not evaluate exposure pathways based on unanticipated scenarios (accidents, spills, or failures of mitigation measures) or health impacts to the project-related workforce at the mine site.

Exposure Pathways: "Complete" refers to a potential exposure pathway resulting in receptor exposure of project related hazardous constituents in various media during any of the project phases.
"Incomplete" refers to a potential exposure pathway with a break in the path that prevents receptors from exposure to project related hazardous constituents.

- Transport Pathway is incomplete
- Transport pathway is complete, but insignificant
- Transport pathway is complete

Notes:

(1) The same eleven affected communities evaluated for mine site were evaluated for these components given geographic proximity to the EIS analysis area (see Figure K4.10-1). The eight Lake and Peninsula Borough communities are closest to the transportation corridor, while Kokhanok is the closest community to Amakdedori port (25 miles away). Residential exposure to harvested biota shared by subsistence users is captured and evaluated under subsistence receptors. Likewise, residential direct exposure during recreational activities is captured and evaluated under direct media exposure for subsistence receptors.

(2) Twenty communities are known to use the EIS analysis area for subsistence, including ten of the affected communities evaluated for residential impacts (Ekwok data insufficient) (see Section 3.9, Subsistence).

(3) The transportation corridor ferry terminals, the Amakdedori port, and the natural gas pipeline compressor station on the Kenai Peninsula operational emissions would be in compliance with permitting requirements and air quality standards. Total annual HAPs for all phases would be below Title V permit thresholds. Fugitive PM emissions would be expected to meet air quality standards. In addition, mitigation measures would be used to limit vehicle idling and control dust generation (i.e., insignificant), but a 35-foot buffer on both sides of the transportation corridor would be impacted by snow plow spray, gravel spray, and road dust. Based on distance from these features, the air inhalation exposure pathway would be expected to be insignificant for residents and subsistence receptors .

(4) Transportation corridor, Amakdedori port, and the natural gas pipeline activities could result in dust deposition onto soil, surface water, sediment, and vegetation. Since baseline soils would be disturbed during construction and local rock sources would be used for construction of the roadways, dust deposition would not be expected to increase metal concentrations above baseline conditions. Therefore, any potential impacts would be expected to be indistinguishable from baseline (i.e., insignificant).

(5) Since dust depostion would not be expected to increase metals concentrations above baseline (see Note 4), any subsequent leaching to groundwater would not be expected to result in concentrations above baseline (i.e., insignificant).

(6) Since air emissions would be expected to meet permit requirements and/or air quality standards (Note 3) and dust deposition would not be expected to increase metals concentrations above baseline (see Note 4), impacts to wild foods above baseline would not be expected (i.e., insignificant).

Transportation Corridor, Amakdedori Port, & Pipeline Conceptual Site Model

Hello Shane-

Per our last conversation, I just want to remind you that four of us from EPA will be visiting the Pebble project site on July 31. Our hydrogeologist, geochemist, and myself will be traveling from Seattle and will be available the afternoon of July 30 and the morning of August 1 and could meet with the Corps and AECOM's technical folks during those times. I know that you are planning technical meetings for later in August, but wanted you to be aware of this opportunity as well in case it makes sense to meet sooner in person. Please let me know if you would like to do that.

Thanks –

Patty

This email is to inform you of a recent change in the Pebble project website: pebbleprojecteis.com. I had received a request to add a function to the site that would allow notification when the information is added to the site. As of Tuesday, that option has been created. You may add an email address and begin receiving weekly updates regarding the site, as appropriate. You will find the registration site at: Blockedhttps://www.pebbleprojecteis.com/emailnotifications

I hope this feature is helpful.

Subject: [Non-DoD Source] EPA's Pebble tribal coordinator

Hi Shane-

As you know EPA has put together a team of folks to accomplish our cooperating agency and permit review and oversight responsibilities. Neverley Wake is the EPA tribal coordinator assigned to our Pebble team. We think it would be beneficial for Neverley to meet with the Corps' tribal coordinator/advisor. I am assuming that is Amanda. The purpose would be to meet & greet so that Amanda knows she can chat with Neverley as needed or if questions come up related to tribal issues. Are you okay with Neverley reaching out to Amanda or vice versa? I believe that Neverley will be attending at least part of the Anchorage scoping meeting.

Below is Neverley' s contact information and she is cced on this email.

Wake.neverley@epa.gov

(907) 271-3206

Thanks-

Patty

Subject: Site visit Late August

All,
The Corps is planning on a helicopter site visit to the port area and the transportation corridor(s) in late August 2018. I am coordinating with PLP to determine when cultural surveys will be completed, when work is planned, etc., but if your agency would like to participate, I know we all need lead time. Please let me know if we need to consider additional personnel for our logistics. We intend on a one day visit.

Subject: Dry Stack Alternative - no do outs (UNCLASSIFIED)
Attachments: 10_11_2018_Pebble_EIS_Dry Stack_Memo.pdf

CLASSIFICATION: UNCLASSIFIED

All,
Per comments from several CAs and comments received during scoping, we are considering a Dry Stack Alternative for the TSF. Attached is a memo describing the process and rationale used to evaluate that alternative. This is for consideration and comment if you so desire, or we can discuss it on the 24th.

Subject: **Pebble Project – RFI 054 Technical Report Review**

1.0 INTRODUCTION

The Pebble Limited Partnership (PLP) plans to produce tailings at a throughput of 180,000 tons per day (tpd) at the proposed Pebble Mine. Approximately 86 percent of the tailings (155,000 tpd) will be relatively inert bulk tailings, the remainder will be pyritic tailings. The Proposed Action for bulk tailings is to produce and store thickened tailings with solids content of approximately 55 percent. Thickened tailings are drier than conventional slurry tailings that have solids contents of 20 to 40 percent.

A bulk tailings option is being considered to produce filtered (dry stack) tailings using filtration dewatering technology. The pyritic tailings are not considered for filtration because they need to remain inundated to reduce the potential for acid rock drainage. Bulk tailings filtration would require filter presses to mechanically dewater the tailings to a solids content of 80 to 85 percent.

This technical memorandum (memo) summarizes our review of the PLP technical report on the filtered (dry stack) tailings deposition option. Specifically, the memo addresses several technical considerations. In AECOM's professional opinion, filtered (dry stack) tailings is not practicable, both technically and economically, for the Pebble Project for the reasons described below.

2.0 INFORMATION REVIEWED

The following PLP reports/documents were reviewed for this technical memo and are attached:

- PLP RFI 054 dated September 5, 2018.
- PLP RFI 076 dated September 11, 2018.

3.0 TECHNICAL CONSIDERATIONS

3.1 TAILINGS GRADATION IMPACT

The nature of the ore, particle sizes, and mineralogy are important when considering filtered and dry stack of tailings operations. High percentages of clay minerals and clay-size particles can create challenges for the filtration plant operations. Filter clogging necessitating shutdown, separate or emergency storage area(s) during down time, and additional filter units can occur. The center of filter cakes can also become wet, sloppy and sticky, which can result in transportation difficulties of the "dry" tailing. The filter process is generally more efficient when the clay content is low. High specific gravity and lower "active" clay minerals are better for filtration.

AMERICAN OVERSIGHT

The thickening and filtration performance of dry stack tailings is mostly directly related to the tailings fines content, or specifically the clay content. The clay content for the Pebble tailings has been determined to be mostly in the form of aluminosilicate which is a colorless crystalline mineral that is a combination of silicate and aluminate, also known as kaolin or china clay. The aluminosilicate groups represent approximately 30% of the samples on average which is very high for tailings filtration. The Pebble bulk tailings will have a relatively high clay content for a successful tailings filtration application because of the following reasons:

- The Pebble tailings product produced by the grinding circuit test work shows a cumulative 80 percent passing (P80) size of 135 microns. The approximate tailings grind sizes are as follows:
  - 60 percent passing 74 microns (fines content)
  - 50 percent passing 50 microns
  - 33 percent passing 20 microns
  - 13 percent passing 2 microns (clay-size fraction)
- The Pebble filtered tailings production rate of 155,000 tpd is 4.4 times higher than that of Karara Mine, an iron ore mine in arid Western Australia, which produces 35,000 tpd of filtered tailings. Karara is the largest filtered tailings producer in the world. Tailings production was challenged by higher than expected fractions of fine tailings that could not be filtered because of insufficient dewatering capacity.
- The Pebble filtered tailings production rate of 155,000 tpd is roughly 10 times higher than that of La Coipa Mine, a copper mine in the Atacama Desert of Chile that operated at a capacity of 16,500 to 20,000 tpd. In 2010, a high concentration of clay in the La Coipa ore blend resulted in a complete overhaul of the filter plant.
- The proposed Pebble tailings grind has a relatively high fines content and clay-size fraction for copper tailings and could result in filter clogging, necessitating mill and / or filter plant operations shutdown and / or the need for an emergency bulk TSF.
- The relatively high fines content and clay fraction of the bulk tailings may also result in the filter cakes becoming wet and sticky, which could result in difficulties in transporting and stacking the “dry” tailings.

3.2 CONSUMABLES ESTIMATE

Bulk tailings filtration would require an unprecedented number of filter presses in parallel to mechanically dewater the tailings to a solids content of 80 to 85 percent. The estimates of consumables such as fuel, natural gas, flocculant, filter cloths, piping, valves, etc., provided by PLP for the filter and dry stack operations appear to be reasonable as follows:

- The bulk tailings production rate of 155,000 tpd is beyond precedent for a filtered tailings project as shown by the largest worldwide dry stack operations being 35,000 tpd at Karara Mine and 20,000 tpd at La Coipa Mine, both in arid climates.
- Maintaining a consistent production of suitable filtered tailings for dry stack is unprecedented as shown by the Karara and La Coipa project histories and might not be possible especially in the wet climate at Pebble.
- No known project, proposed or operating, has been designed using eight lines of eight filters each, for a total of 64 filters.
- Hudbay’s proposed Rosemont Project in Arizona is currently (as of 2017) planning a tailings production rate of 90,000 tpd using a total of 20 filters (AFP IV automatic filter

AMERICAN OVERSIGHT

presses) with additional space allowed for the installation of four additional filters, if necessary.

- It has never been proven that even a planned filtered tailings production rate of 90,000 tpd is attainable and sustainable, let alone a rate of 155,000 tpd as planned at Pebble.
- PLP estimated an average electrical load of 19 to 23 megawatts and additional natural gas consumption for power generation of 5,000 million cubic feet per day. This represents an approximate heat rate 9,000 Btu per kilowatt hour, which is reasonable.
- The PLP estimates of diesel and natural gas consumption for plant support equipment and HVAC seems reasonable for a 155,000 tpd dry stack operation.

3.3 PERSONNEL REQUIREMENTS

PLP has estimated that the operating crew for the filter plant would number 250 personnel and that 400 personnel would be required for the filtered tailings distribution. This estimate of personnel to operate and maintain the filter plant and to operate the dry stack appears to be reasonable.

3.4 FILTER PLANT UTILIZATION

The PLP assumption of 75 percent utilization for the filter plant (Section 1.2 of RFI 054) is reasonable when considering the following worldwide dry stack operations experience:

- The Karara filter and dry stack operation was challenged by higher than expected fractions of fine tailings that could not be filtered because of insufficient dewatering capacity, requiring a back-up slurry TSF. Ongoing dewatering limitations resulted in filter refurbishment, a backup slurry TSF, and thickener and cyclone installations.
- The high concentration of clay in the La Coipa ore blend resulted in a complete overhaul of the filter plant. In 2013, the facility was closed; it is no longer operating. La Coipa's TSF consisted of two storage areas: a dry stack TSF; and an emergency slurry TSF for when the filter plant or mobile stacker were not working effectively.
- At Pogo Mine in Alaska, filtered tailings placement fell below 80 percent of the target tailings design density during winter. It is reasonable to expect a greater target deficiency at Pebble because the Pebble operation is so much larger than Pogo.

3.5 ADDITIONAL SLURRY TSF NEED

For the filtered and dry stack tailings option, PLP has assumed a filter plant utilization of 75 percent to allow for maintenance, downtime, filter cloth replacement, and/or filtration issues with the high clay content bulk tailing, and to mitigate the impacts of inclement weather. This assumption will require that the bulk tailings be disposed of as slurry tailings in a separate conventional tailings storage facility (TSF) during the 25 percent utilization loss of the filter plant. It is reasonable to assume that the tailings would need to be directed to a conventional TSF 25 percent of the time for the following reasons:

- Typical Alaska wet conditions will prevail each year during the spring freshet (1 to 2 months) and late summer to autumn rainy season (3 to 4 months). This can create a

AMERICAN OVERSIGHT

challenge for achieving filtered tailings placement and compaction because of trafficability issues that will impact haul trucks and support equipment access.

- This challenge has been managed at Greens Creek Mine in Alaska by use of a temporary covered tailings storage area near the ore processing facility during wet weather to minimize additional moisture absorption from rain and snow, and during warm weather to minimize excess drying. The tailings are then spread and compacted when weather conditions allow. Greens Creek produces about 2,200 tpd of total tailings, which are split with roughly half, or 1,100 tpd, being filtered tailings for the dry stack, and the other half being used as underground mine backfill.
- Filtered moisture and tailings density targets will be challenging to achieve during sub-zero winters due to surface freezing, and snow becoming embedded in the compacted tailings, further reducing their compacted density. This challenge has been managed at Pogo Mine in Alaska where filtered tailings placement fell below 80 percent of the target tailings design density during winter. The Pogo Mine produces about 2,600 tpd of total tailings, that are roughly split with about half, or 1,300 tpd, being filtered tailings for the dry stack, and half being used as underground mine backfill.
- Karara tailings production was challenged by higher than expected fractions of fine tailings that could not be filtered because of insufficient dewatering capacity, requiring a backup slurry TSFand adding a thickener and cyclones.
- The La Coipa TSF consisted of two storage areas: a dry stack area (Rahco), and an emergency storage area (Rakito) for when the filter plant or mobile stacker were not working effectively. About 100 million tons of tailings exist at the site.
- The challenges of precipitation and winter conditions at the significantly smaller Greens Creek and Pogo dry stack operations, along with fine tailings and dewatering challenges at the larger Karara and La Coipa dry stack operations, justify the assumption of some of the Pebble bulk tailings needing to be directed to a slurry TSF, which would need to be built in addition to a dry stack TSF.
- It is reasonable to assume the Pebble tailings would need to be directed to a slurry TSF 25 percent of the time.

3.6 DRY STACK OPERATIONS LAYOUT

Directing bulk tailings 25 percent of the time to a slurry TSF would require a dry stack TSF and a slurry TSF for 116,250 tpd and 38,750 tpd, respectively. PLP presented two alternate scenarios: Scenario 1 is the dry stack TSF at Site G (current bulk TSF site) and slurry TSF at Site K (northeast of Main Water Management Pond {WMP} site); Scenario 2 is reversed with the dry stack TSF at Site K and the slurry TSF at Site G. Both conceptual layouts are reasonable. The PLP conceptual layout of facilities appears to be reasonable and necessary. The facilities as shown do not appear to be oversized. Justifications for this conclusion are as follows:

- The dry stack TSF and slurry TSF would store 75 percent and 25 percent of the bulk tailing, respectively. Site K is flatter than Site G. Therefore, the Scenario 1 Site G dry stack TSF and Site K slurry TSF would have similar footprint areas despite the difference in storage capacities. However, the Scenario 2 Site K dry stack TSF would have a much larger footprint than the Site G slurry TSF. Both sites would require ancillary facilities and infrastructure.

AMERICAN OVERSIGHT

- The dry stack TSF would also require perimeter embankments to enhance stability, but the embankments would not need to be as high and robust as for a slurry TSF. Site G embankments for a Scenario 1 dry stack TSF or for a Scenario 2 slurry TSF would be at the existing south and main embankments locations. Site K embankments would be along three sides of a Scenario 1 slurry TSF and five sides of a Scenario 2 dry stack TSF.
- A slurry TSF would be required to store 25 percent of the bulk tailings during filter plant unavailability and when tailings cannot be filtered. These events will not be able to be predicted except for planned preventative maintenance, so the mill and operations personnel will need to continually coordinate and be prepared around the clock to change from a dry stack operation to a slurry operation.
- An additional slurry TSF would have embankments that would need to be raised as the tailings and water levels rise in the TSF, and would require support facilities including tailings conveyance pipelines and discharge spigots/cyclones, supernatant water decant and return systems, seepage collection and return systems, diversion ditches, access roads, etc.
- Special care will be needed in maintaining a slurry TSF in operations mode at all times during the dry stack operations, especially in winter when deposition pipeline and spigot/cyclone components that are not being used could freeze, thereby rendering them inoperable when suddenly they might be needed with no warning. Special insulation techniques and monitoring will be needed to ensure the slurry TSF components are kept operational at all times.
- A separate water management pond (WMP) would be required to store runoff and seepage from the dry stack TSF. This pond would be larger than the current proposed main WMP because there would be no water storage available in the dry stack TSF and it would have a much smaller supernatant pond than in the slurry TSF. An alternative would be to increase the size of the current proposed main WMP.
- Water trucks would be required to suppress dust from the exposed dry stack tailings. Bulldozers, loaders, and trucks will be required for clearing snow off the exposed dry stack tailings. This snow would be considered as mine contact water and would be managed by stockpiling and treatment. This snow could be dumped in the pyritic TSF, but not in the main WMP (due to the fact that it will contain soil and rock particles), and not in the slurry TSF with inert tailings.
- Seepage from the dry stack TSF and slurry TSF would need to be collected and routed to seepage collection ponds, located downstream of each TSF embankment. The collected seepage and runoff would need to be pumped to the main WMP for recycle to the mill, or for treatment and release.
- A TSF in Site K would require more seepage controls than in Site G because of the additional challenges posed by the Site K topography. Site K seepage control measures could require a lined TSF basin and/or a slurry cutoff wall downstream of the TSF. Seepage and runoff collection ponds would be required north and south of Site K to reduce the potential for the discharge of contact water to the North Fork Koktuli and Upper Talarik drainage areas.

AMERICAN OVERSIGHT

- Dry stack TSFs in Site G and Site K would allow for ongoing concurrent reclamation of the dry stack downstream faces and shell zones during operations. The slurry TSF reclamation strategy would be consistent with the currently proposed strategy.
- The total volume of water managed for a dry stack TSF would be similar to, but more complex than, the current proposed bulk TSF. The current bulk TSF will entrain transient water in the TSF as tailings settle and water seeps through the main embankment. Dry stack transient water will immediately report to the water management system. Therefore, the WMP would be larger than the current WMP to accommodate this transient water and store the supernatant water in the current TSF. Dry stack tailings at Site K would require additional WMPs to the north and south.
- The conceptual Scenario 1 and 2 layouts of facilities appear to be reasonable; all of the facilities that are shown in the Scenario 1 and 2 layouts are needed and appear to be reasonable in size at this conceptual level of alternatives analysis.

3.7 DRY STACK OPERATIONS REQUIREMENTS

PLP appears to have assumed and estimated an appropriate amount and mix of equipment, operating hours, diesel consumption, and labor to haul and place the filtered tailings into a dry stack TSF.

- PLP specified 100-ton trucks for hauling filtered tailings. It is assumed these would be rigid frame trucks similar to a Caterpillar model 777. These trucks are commonly used in mining and earthmoving applications, though their ability to negotiate poor ground conditions is limited. 60-ton articulated trucks have lower ground pressure and may be more suitable for the application, though more trucks would be needed to handle the anticipated volume of tailings and therefore, cost would increase.
- The center of the disposal sites is about a four-mile haul from the mill. Depending on grade, road condition, loading time, and tailings stack surface conditions, trucks would be expected to make one to two round-trips per hour. PLP's estimate of 70 trucks, including spares, represents the one trip per hour case and thus is in the reasonable range for truck productivity.
- The estimate of fuel consumption by PLP is consistent with the use of a 70 truck fleet and a haul productivity of one round-trip per hour.
- The mix of support equipment for spreading, compacting and maintaining the dry stack facility appears reasonable.
- About 50 to 60 truck drivers will be needed for the hauling operation using a fleet of 70 haul trucks. Assuming there will be four crews rotating in and out of the mine, 200 to 240 truck drivers will be needed. PLP's estimate of 400 employees to cover operation of support equipment, maintenance, supervision and technical / administrative positions appears reasonable.

3.8 CAPITAL AND OPERATING COST ESTIMATES

The approximate capital and operating cost estimates developed by PLP as presented in Table 1.1 and Table 1.2 appear to be reasonable.

- The costs, factors, and fuel usage in Table 1.1 and Table 1.2 appear reasonable.

AMERICAN OVERSIGHT

- The general nature of the disposal facilities appears reasonable and appropriate for the disposal task.
- The equipment compliment and cost estimates provided by PLP appear to be on the upper end of the range to be expected for transport of the estimated volume of filtered tailings.
- In general, the PLP estimates appear to be conservative and reasonable.

4.0 FILTERED TAILINGS (DRY STACK) ASSESSMENT SUMMARY

In AECOM's professional opinion, filtered (dry stack) tailings is not practicable, both technically and economically, for the Pebble Project for the following reasons.

- The proposed bulk tailings high fines content and clay-size fraction could result in filter clogging necessitating mill and / or filter plant operations shutdown and / or the need for emergency tailings storage areas.
- The fine bulk tailings gradation may also result in the filter cakes becoming wet and sticky, which could result in transportation and placement difficulties of the "dry" tailings.
- The planned bulk tailings production rate is both unprecedented and unproven, and is significantly higher than the world's largest dry stack operations which have experienced operation difficulties resulting in the need for backup slurry TSFs.
- Filtration and dry stack operations are generally utilized when arid region water supply challenges drive the economic requirements. Most dry stack operations are located in arid climates or regions. Two relatively small Alaska dry stack operations were selected because of site-specific reasons.
- In high precipitation and cold environments, the "dry" tailings may become overly moist or wet; necessitating additional efforts (with related costs) to transport, place, and compact the tailings in the surface disposal facility. Mitigation during operations could reduce throughput and slow production.
- Filtered tailings may require additional pre- and post-processing beyond that required for the Proposed Action of thickened tailings to achieve desired moisture contents. This can include thickening prior to filtration, or reworking the tailings post deposition.
- Due to cold temperatures during the winter, operations may need to be curtailed if the tailings become overly wet and freeze, as has and is continuing to occur at the two current Alaska relatively small dry stack operations.
- Wet or sloppy tailings from process upset conditions will require separate or emergency areas for slurry tailings deposition which would include a slurry TSF and its associated tailings discharge, water return, seepage collection, etc. facilities.
- Filtered tailings operations typically have high capital and operating costs. The estimates PLP provides for the incremental increases in capital and operating costs appear reasonable and make it clear the dry stack method would render the project uneconomic.

AMERICAN OVERSIGHT

5.0 STATEMENT OF PROFESSIONAL RESPONSIBILITY

Assessment comments on the feasibility of the filtered (dry stack) tailings alternative for the Pebble Project are presented in this memo. They are based partly on the evaluation of technical information provided by PLP, and partly on the understanding of the characteristics of the planned mine facilities, tailings properties, and site conditions in the area. The comments expressed are limited by the information available and the inherent limitations of existing investigations and analyses used to evaluate proposed tailings dewatering technologies. AECOM does not guarantee the performance of the project in any respect, only that our engineering work and judgments rendered meet the standard of care of the profession.

AECOM represents that our services are performed within the limits prescribed by the client, in a manner consistent with the level of care and skill ordinarily exercised by other professional consultants under similar circumstances. No other representation to Client, expressed or implied, and no warranty or guarantee are included to intended.

AMERICAN OVERSIGHT

RFI 054
Pebble Project EIS

Request for Information

Title/Subject:	**Dry Stack Tailings**
Requestor:	**Bill Craig/Nancy Darigo/Cecil Urlich, AECOM**
Date Transmitted:	**7/9/18**
Recipient:	**Pebble Limited Partnership**
Response Requested by:	**7/20/18**
Rationale:	**Scoping comments raised concern that the tailings storage facility dams could fail. To address the concern for dam failures, some commenters suggested that a "dry stack" tailings disposal alternative should be analyzed and recent mining NEPA documents such as Donlin Gold EIS analyzed dry stack as a reasonable alternative. Additionally, the Mount Polley Panel Report suggests surface storage using filtered tailings technology (dry stack) is a prime candidate for best available tailings technology.** **Additional information is needed to evaluate the technical and economic feasibility of this option for NEPA purposes. The information will be used to develop and screen a reasonable range of alternatives for Chapter 2 of the EIS.**

AMERICAN OVERSIGHT

THE pebble PARTNERSHIP

From: James Fueg, Pebble Limited Partnership

To: Shane McCoy, US Army Corps of Engineers

Date: September 5th, 2018

PLP staff and consultants have prepared the following responses to the AECOM Request for Information (RFI) 054 on the Environmental Impact Statement (EIS) for the Pebble Project (Pebble).

A summary of RFI 054 is presented below:

Rationale: *Scoping comments raised concern that the tailings storage facility dams could fail. To address the concern for dam failures, some commenters suggested that a "dry stack" tailings disposal alternative should be analyzed and recent mining NEPA documents such as Donlin Gold EIS analyzed dry stack as a reasonable alternative. Additionally, the Mount Polley Panel Report suggests surface storage using filtered tailings technology (dry stack) is a prime candidate for best available tailings technology.*

Additional information is needed to evaluate the technical and economic feasibility of this option for NEPA purposes. The information will be used to develop and screen a reasonable range of alternatives for Chapter 2 of the EIS.

Information Requested and Level of Detail:

1. *What equipment and energy input would be needed to filter the processed tailings at the proposed Pebble throughput rate of 180,000 tons per day?*
2. *What would the confidence be in maintaining continuous dry stack operations year round in consideration of filtering, handling and disposal, given seasonal weather and possible clay content changes?*
3. *Would there be fine tailings with high clay content that might not be efficiently filterable; what percentage of the total would these be; and where would they be disposed?*
4. *Would there be different issues with filtering, handling, and disposal of the bulk vs pyritic tailings?*
5. *What major support facility and operation additions would need to be considered under a dry stack scenario (e.g., embankments, water retention ponds, back-up slurry tailings storage facility, seepage collection systems, dust control, ongoing reclamation)?*
6. *What would be the ultimate volume differences: 1) between dry stack tailings and the currently proposed bulk and pyritic tailings; and 2) between onsite water storage requirements of a dry stack scenario and the currently proposed water management ponds?*
7. *What would be the type/quantity of mobile equipment and/or conveyors needed to transport and place tailings in a dry stack? How would material handling change during winter versus summer?*
8. *How would waste rock storage be different under a dry stack scenario than the currently proposed plan?*

AMERICAN OVERSIGHT

9. *How would interim reclamation and final closure be different than the currently proposed plan under a dry stack scenario?*
10. *How would the dry stack cost compare with the current plan in terms of full life cycle through to closure and post-closure including design, construction, operations, maintenance and surveillance?*

AMERICAN OVERSIGHT

1.0 RFI RESPONSE

1.1 RFI 054 – 1

"What equipment and energy input would be needed to filter the processed tailings at the proposed Pebble throughput rate of 180,000 tons per day."

Tailings will be produced at the Pebble Project at a throughput of 180,000 tons per day (tpd). Approximately 86% (~155,000 tpd) of tailings will be produced as bulk tailings, with the remainder being produced as pyritic tailings. Only the bulk tailings have been considered eligible for filtration due to the high percentage of fines and geochemical properties of the pyritic tailings.

Filtration of the bulk tailings would require a number of filter presses working in parallel to mechanically dewater the tailings to the desired solids content (assumed 80-85% solids content by material weight).

Only commercially available filter presses have been assumed for filtered tailings operations at Pebble for the purposes of this RFI. Figure 1.1 compares Pebble to a range of operational filtered tailings projects and studies. Operations with production rates less than 30,000 tpd and those in cold climates typically use trucking and placement to dispose of filtered tailings rather than conveyors. High throughput operations in warmer climates such as La Coipa and Karara use mobile stacking equipment (i.e. conveyors) to reduce the operating cost.

Filtered tailings stacks are in operation at cold region mines including Pogo and Greens Creek in Alaska and Raglan in Quebec. Filtered tailings stacks at Minto and Bellekeno in the Yukon are in closure.

High throughput filtration and studies currently in development include Peñasquito, Kisladag and Rosemont. These large-scale operations are in warm climates and use mobile stacking conveyors, spreaders and trippers to place material within the filtered tailings facility. Filtered tailings will be co-disposed with coarse waste rock at Peñasquito, while Kisladag and Rosemont filtered tailings will be placed and compacted, and subsequently contained within coarse waste rock buttresses. Dozers are used to spread the filtered tailings as required.

AMERICAN OVERSIGHT

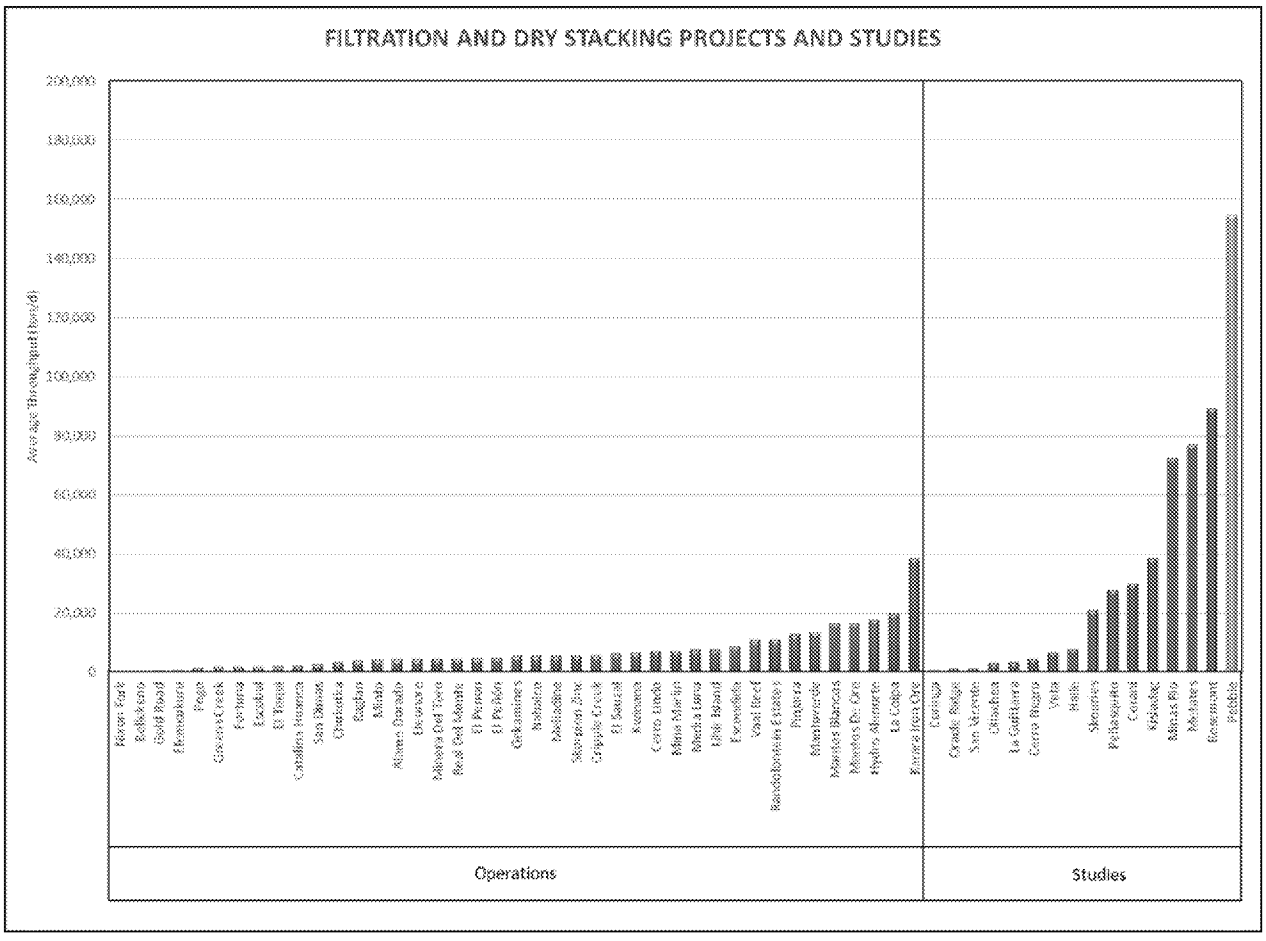

Figure 1.1 Filtered Tailings Operational Projects and Proposed Projects

Thickening and filtration performance is typically directly related to the aluminosilicate content. Figure 1.2 presents the mineralogy for the Pebble West samples. The aluminosilicate groups represent approximately 30% of the samples on average which is very high for a tailings filtration application.

AMERICAN OVERSIGHT

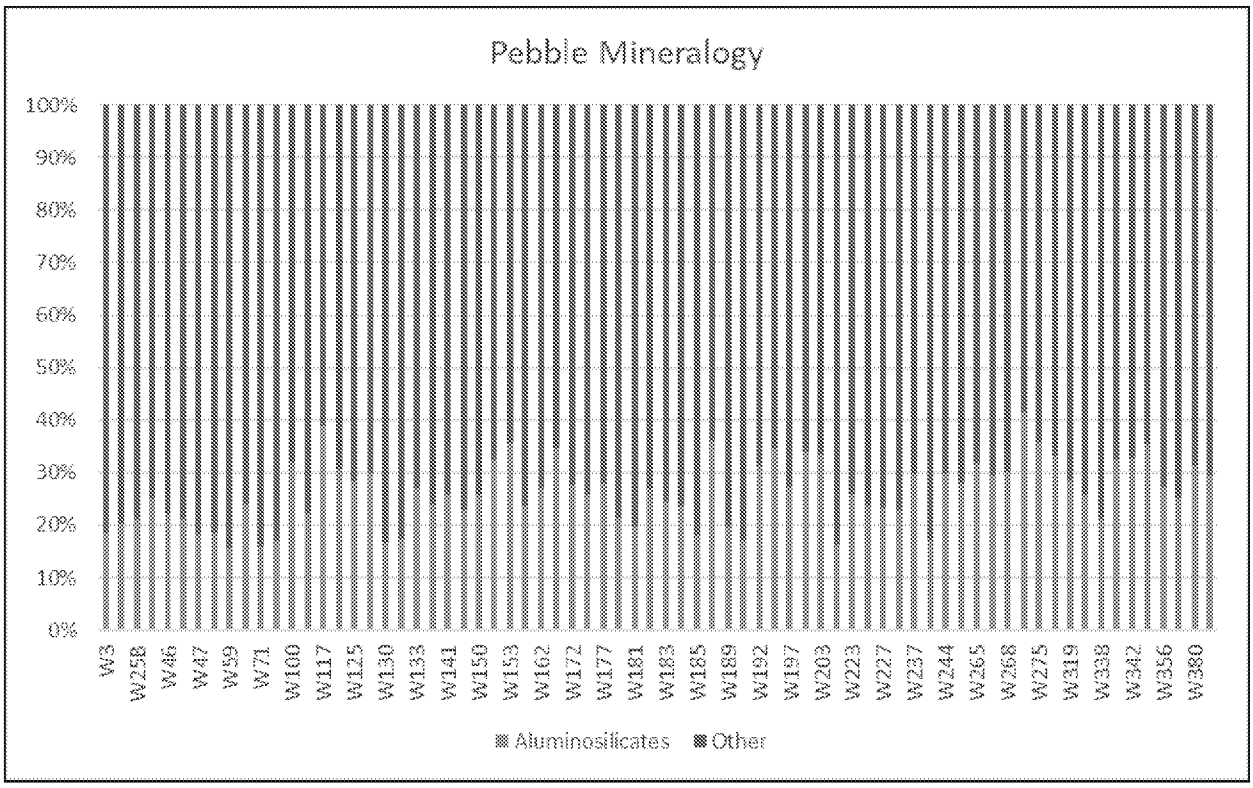

Figure 1.2 Pebble West Samples Mineralogy

Thickening the tailings as much as practicable prior to filtering provides a benefit for samples with high clay content. This leads to selecting a high compression thickener, rather than a high rate or paste thickener. Figure 1.3 presents the expected hourly filter throughput for a large, market-ready filter versus the total aluminosilicate content after thickening in a high-compression thickener. The clay content of Pebble is amongst the highest for considered filtered tailings studies. The challenges and technical risk for filtering and stacking tailings at the size and complexity of the Pebble project are unprecedented and, as such, an approach which considers filtered tailings management is impracticable for the Pebble site.

AMERICAN OVERSIGHT

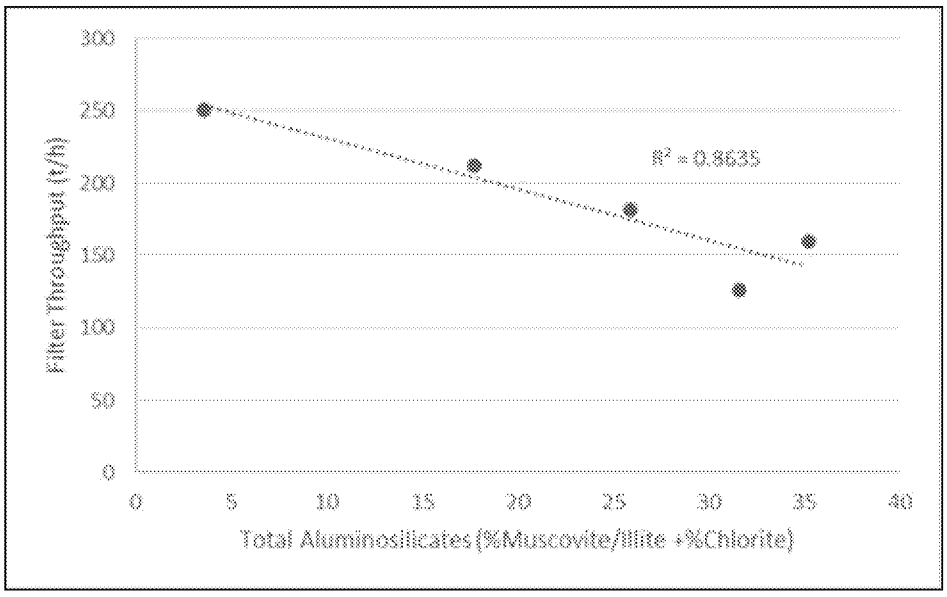

Figure 1.3 Expected Hourly Filter Throughput

The following equipment would be required to treat the average bulk filtered tailings throughput of 155,000 tpd based on the aluminosilicate content:

- 4 x 215 ft. diameter high-compression thickeners, each with duty/standby underflow pumps (in addition to the thickeners included in the current concept)
- 8 lines of 8 filters installed, each with ~10,800 ft^2 of filtration area and 1.5 – 2 inch chambers and inflatable membranes for squeezing the filter cake
- Each filter will operate at a nominal throughput of 140 t/h at an average utilization of 85%
- Each filter line will include two large filter feed tanks with 3 hours residence time (16 tanks total)
- Each filter will have a dedicated filter feed pump and discharge feeder
- Common filter services, including membrane pressing air, blowing air, filtrate return services and water services
- 4 truck loading stations with mass flow bins with an approximate residence time of 2 hours
- 4 emergency bypass systems to covered stockpiles with reclaim into the truck loading stations in the event of truck downtime

Energy consumption to thicken, filter and convey material to the storage bins is expected to be 2.5–3 kWh/t, equivalent to an average operating load of 19-23 MW. Additional heating power of approximately 10 MW will be required for the nominated buildings (e.g. mass flow bins, etc). Connected power is likely to be substantially higher than the nominal demand, at approximately 30 MW, accounting for the cyclical demand from filtration. Additional power generation facilities will be required to supply this additional demand

The thickener will consume approximately 50 g/t of flocculant on average, which equates to 9 tons of flocculant per day.

Each filter cloth is expected to last approximately 1,000 cycles, which corresponds to approximately 800 new cloths per day. This is significantly less than the industry standard of approx. 3,000 cycles and is because of the high clay content in the Pebble bulk tailings. Maintenance logistics and disposing of used cloths would be a significant logistical challenge and is not considered practicable.

AMERICAN OVERSIGHT

Other consumables include wet ends, piping, and valves. A new wet end and set of filter feed valves will be required every 2 – 3 days, on average, to keep the 64 filters operating.

Major equipment emissions are expected to be limited to front-end loaders for rehandling, dozing of stockpiles, forklifts, mobile cranes, bobcats and light vehicles. Average fuel consumption rates are anticipated to be approximately 2,500 gallons per day (gpd). The HVAC system is anticipated to require approximately 828,000 cubic feet (cf) of natural gas per day. Power generation for the tailings thickening and filtration facility will require approximately 5,000,000 cubic feet (cf) of natural gas per day. Total carbon dioxide (CO_2) emissions for the Filter Plant are estimated to be approximately 75 tpd.

The Pebble project would represent almost four times more throughput than the largest filtered tailings project currently in operation (Karara Iron Ore Mine). The scale of Pebble is also more than twice the throughput of the proposed Rosemont project, and in a more challenging environment. The Pebble tailings filtration plant would require a labour force increase in excess of 250 people to operate and maintain the filter plant. This does not include the additional labour force required for the trucking, placement, spreading and compaction of the filtered tailings in the TSF.

1.2 RFI 054 – 2

"What would the confidence be in maintaining continuous dry stack operations year round in consideration of filtering, handling and disposal, given seasonal weather and possible clay content changes?"

A Filter Plant utilization of 75% has been assumed for the filtered tailings concept, allowing for maintenance, downtime, filter cloth replacement, and/or filtration issues with high clay content materials. Bulk tailings will be disposed of in a separate conventional tailings storage facility as slurry tailings during these periods.

During spring freshet (one to two months) and the later summer, autumn rainy season (three to four months),filtered tailings placement and compaction will be challenging due to trafficability issues for haul truck and support equipment access.

This has been encountered at the Greens Creek Mine and has been managed by temporarily stockpiling tailings during wet weather to minimize additional moisture absorption during wet periods, or drying during warm periods. The tailings are then spread and compacted once the conditions allow for adequate placement and compaction of the material (ADOEC, 2003). This is only possible due to the low throughput at Greens Creek (approx. 1,150 tpd of filtered tailings production).

Tailings density targets would be challenging to achieve during winter months, when the temperatures fall below freezing, due to surface freezing of material (this issue has been encountered at the Pogo Mine where during winter months, placed filtered tailings fell below 80% of the target design density of the tailings) (Sumitomo, 2014). Further preventing snow inclusion within the compacted mass will likely prove impossible, further reducing the compacted density.

The Pebble throughput is 4 times higher than the largest operational or historic facility that has employed filtered tailings (Karara Iron Ore Mine @ 35,000 tpd).

The combined challenges of unprecedented scale, clay content, precipitation, and winter conditions point to filtered tailings being an impracticable solution for Pebble.

Figures 1.4 and 1.5 contextualize Pebble in comparison to a range of existing operational mines (Figure 1.4) and to those that employ filtered tailings (Figure 1.5).

AMERICAN OVERSIGHT

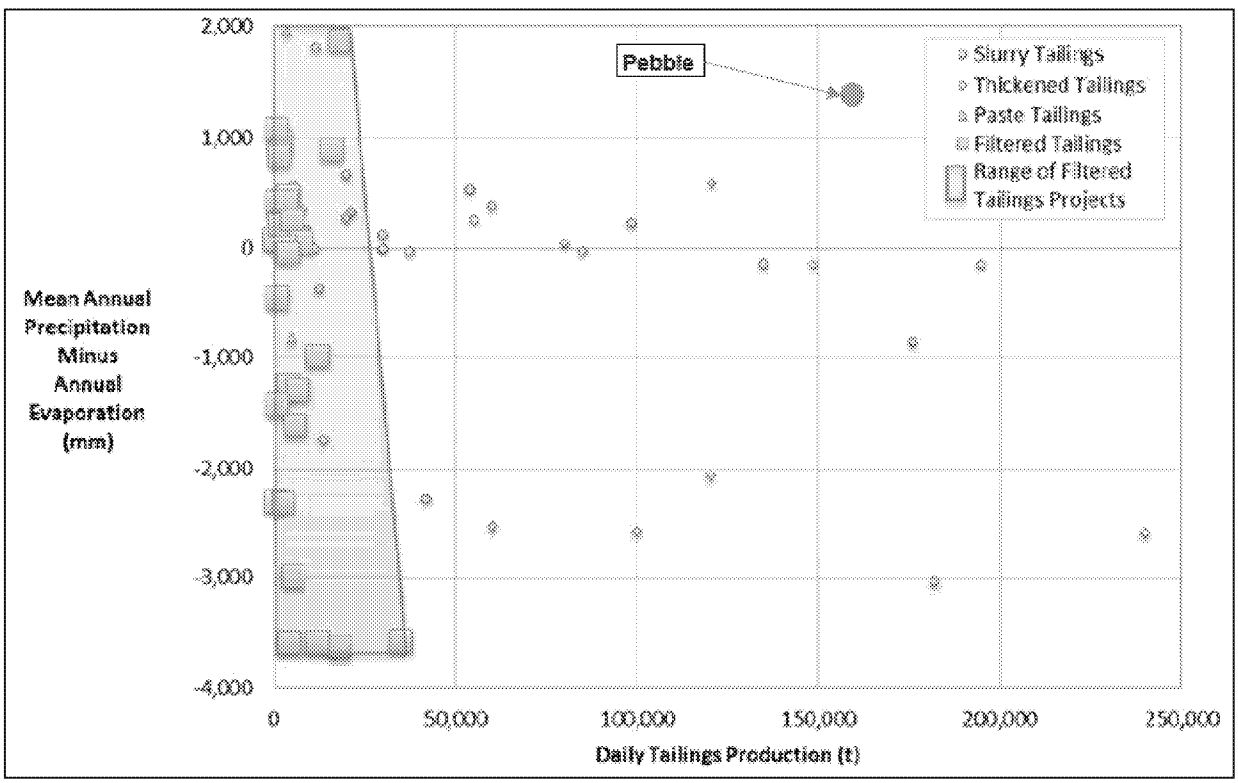

Figure 1.5 Range of Filtered Tailings Facilities in Operation (KCB, 2017)

AMERICAN OVERSIGHT

1.3 RFI 054 – 3

"Would there be fine tailings with high clay content that might not be efficiently filterable; what percentage of the total would these be; and where would they be disposed?"

Mineralogy data presented in Figure 1.2 indicate that all variability samples have a consistently high amount of aluminosilicates. Consequently, there is insufficient variation within the set of samples from Pebble West to provide an opportunity to filter only some ore types but not others. Therefore all ore types will need to be treated similarly and disposed of in the same location.

All ore types are expected to filter poorly and filtration rates are likely to be slow (as shown on Figure 1.3). Furthermore, it is a risk that the high clay content blinds the filter cloth and reduces the cloth life to significantly less than industry standards (<1,000 cycles per cloth as opposed to the nominal design life of ~3,000 cycles per cloth).

Pebble size distributions from grind establishment testwork at 180 µm are presented in Figure 1.6. The green line represents the expected size distribution for the finer grind P80 of 135 µm.

A size separation at 15 – 20 µm could be performed to improve filtration rates, which would result in 30 – 40% of the tailings material having to be stored separately in a separate TSF. A size separation at fine sizes (15 µm or less) would require thousands of very small cyclones operating at low feed solids density, has not previously been attempted at this scale anywhere in the world and is not practicable.

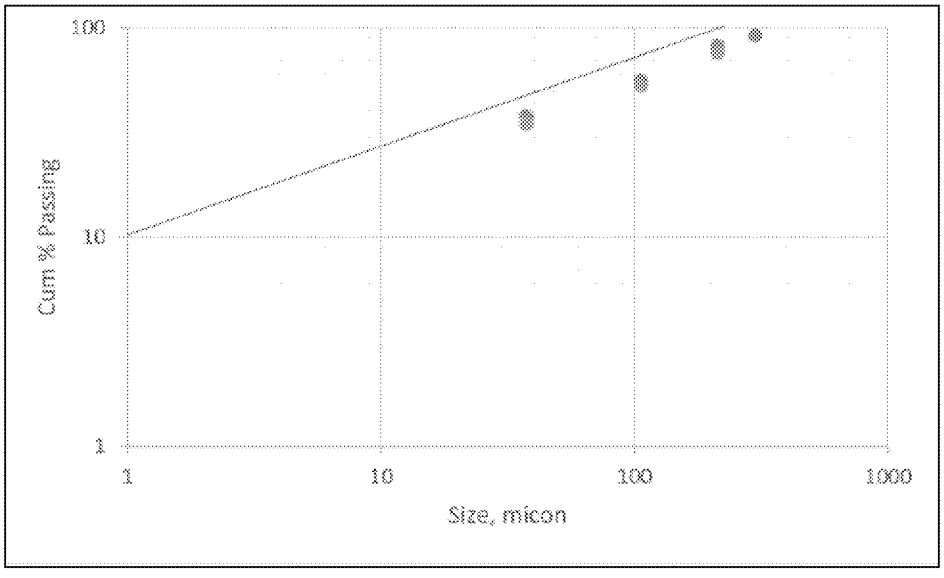

Figure 1.6 Pebble Size Distribution Data

The Filter Plant may occasionally be unable to keep up with the tailings stream due to poorer than expected filterability or filter plant maintenance (e.g. high frequency of filter cloth replacement). Tailings will be disposed of in a separate conventional slurry tailings storage facility during these periods (assumed 75% utilization of the Filter Plant).

The clay content of Pebble is amongst the highest for considered filtered tailings studies. The challenges and technical risk for filtering and stacking tailings at the size and complexity of the Pebble project are unprecedented and, as such, an approach which considers filtered tailings management is impracticable for the Pebble site.

AMERICAN OVERSIGHT

1.4 RFI 054 – 4

"Would there be different issues with filtering, handling, and disposal of the bulk vs pyritic tailings?"

Pyritic tailings are not considered eligible for filtered tailings production due to the higher ARD generation potential and higher content of clay-sized particles, therefore only bulk tailings would be considered for filtered tailings production. Further, the pyritic tailings will be returned to the pit at closure, thus alleviating the long-term stability risk for this facility.

1.5 RFI 054 – 5

"What major support facility and operation additions would need to be considered under a dry stack scenario (e.g., embankments, water retention ponds, back-up slurry tailings storage facility, seepage collection systems, dust control, ongoing reclamation)?"

Potential filtered tailings storage facilities have been identified at the NFK West location (Site G) and NFK North location (Site K) for the purposes of responding to this RFI. A filtered tailings storage facility at either Site G or Site K would require a number of ancillary facilities to enable successful operations.

Fill berms will be required to enhance stability of the filtered tailings stack. At Site G, these berms would be required at the existing locations of the south and main embankments. At Site K, likely three, or perhaps four, sides of the facility would require embankments.

A tailings storage facility (TSF) would be required to store slurry bulk tailings during periods of Filter Plant unavailability (due to maintenance or operational downtime) or tailings not eligible for filtration. Approximately 25% of the total bulk tailings (approximately 275 million tons) will either not filter to the required specification or will require separate storage during periods of Filter Plant downtime or unavailability. This additional TSF would require support facilities such as seepage collection system, diversion ditches, etc.

A separate water management pond would be required to store runoff and seepage from the filtered tailings TSF. This pond would need to be larger than the current water management pond as there would be no water storage available in the filtered tailings TSF and a much smaller supernatant pond would be present in the bulk slurry tailings TSF. An alternative would be to increase the size of the currently proposed Main Water Management Pond.

A fleet of water trucks would be required for dust suppression operations for the exposed filtered tailings. A fleet of dozers will also be required during winter months for snow clearing from the surface of the filtered tailings. This snow would be considered as mine contact water and would require management and treatment as such.

Seepage from the TSFs would be collected and routed to seepage collection ponds, located downstream of the TSF embankments or filtered tailings TSF berms. Collected seepage and runoff would be pumped from here to the Main Water Management Pond for recycle to the mill, or for treatment and release.

Tailings disposal at Site K would require additional seepage control measures as compared to tailings disposal in Site G as managing seepage in this arrangement is more challenging due to the topography of this area. Site K seepage control measures may include a lined TSF basin (HDPE liner) and/or a slurry cutoff wall downstream of the TSF. Seepage and runoff collection ponds would be required to the north and south of a proposed Site K TSF to limit discharge of mine contact water to the North Fork Koktuli and Upper Talarik drainage areas.

AMERICAN OVERSIGHT

A filtered tailings TSF in either location would allow for ongoing concurrent reclamation of the downstream face of the filtered tailings stack and downstream shell zone during operations. The slurry tailings TSF reclamation strategy would be consistent with the currently proposed strategy.

AMERICAN OVERSIGHT

1.6 RFI 054 – 6

"What would be the ultimate volume differences: 1) between dry stack tailings and the currently proposed bulk and pyritic tailings; and 2) between onsite water storage requirements of a dry stack scenario and the currently proposed water management ponds?"

1.6.1 RFI 054 – 6(1)

The current assumption for the bulk tailings is that they will have a dry density of approximately 90 pounds per cubic foot (pcf) (consolidating to approximately 100 pcf post-closure). Filtered tailings, at optimum placement and compaction, are assumed to have a dry density of approximately 100 pcf. Long-term, post-closure, there are anticipated to be no differences in ultimate volume of the filtered tailings and currently proposed conventional tailings. However, a larger volume of quarried rock would be required to construct the additional TSF required to store slurry tailings during Filter Plant downtime (25% of total bulk tailings throughput).

1.6.2 RFI 054 – 6(2)

The total volume of water managed with a filtered tailings solution will be similar to that with the current proposal but the system will be significantly more "flashy". In the proposed system, some transient water will be held in the TSF as the tailings settle and as the water seeps through the main embankment. With filtered tailings, this transient water will report immediately to the water management system. As a result the water management pond will be larger than the current arrangement to accommodate this transient water and to store the water currently sitting within the pond in the TSF.. Filtered tailings storage at Site K would require two additional water management ponds, one to the north, and one to the south.

A conceptual general arrangement for the filtered tailings TSF and water management pond is shown on Figure 1.7 for a TSF at Site G, and Figure 1.8 for a TSF at Site K.

AMERICAN OVERSIGHT

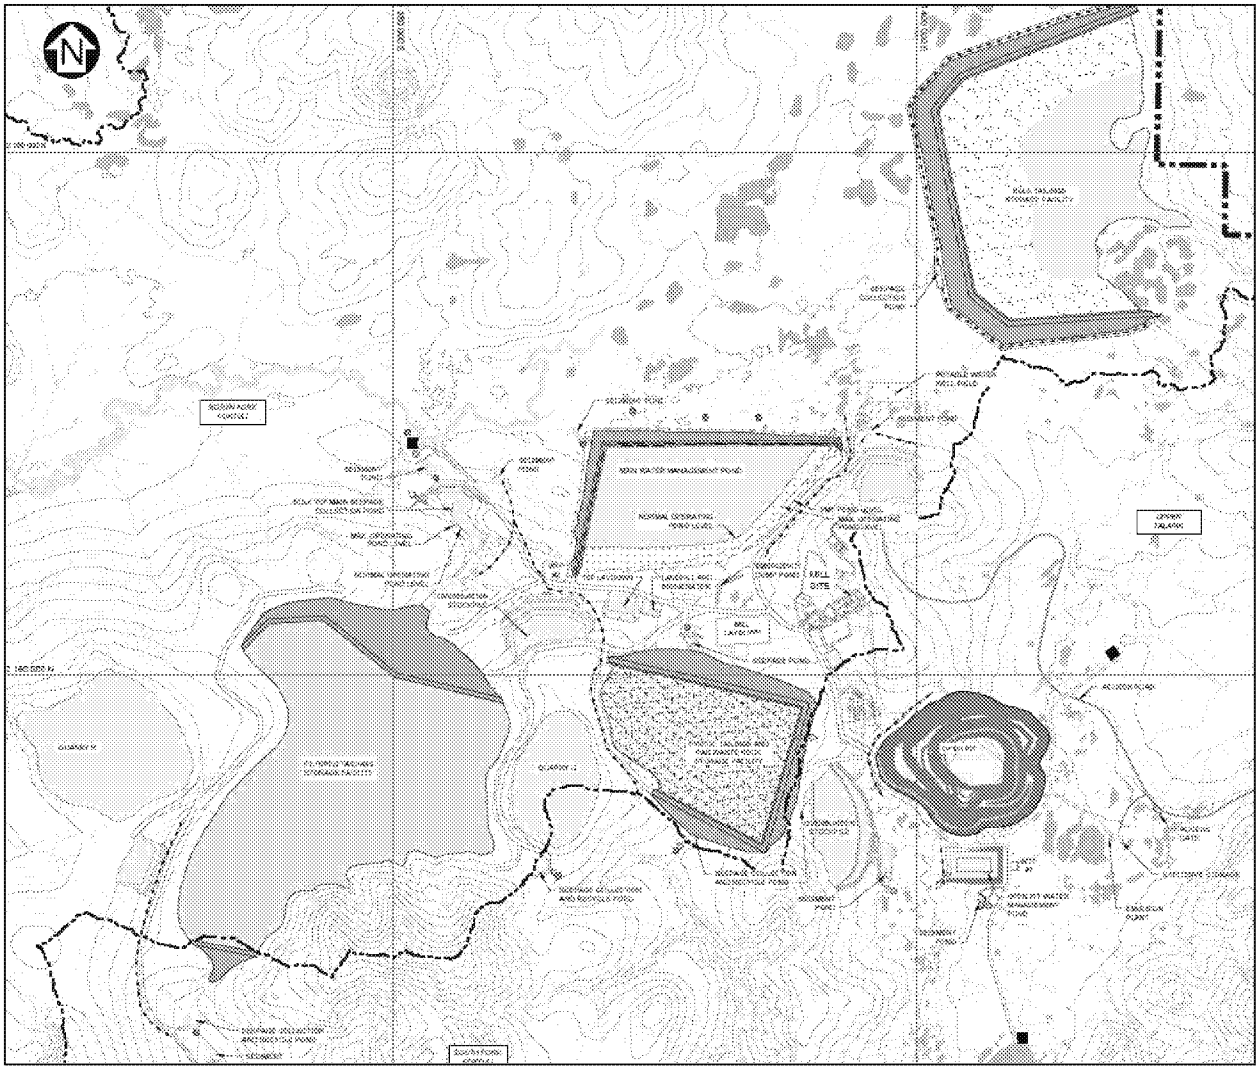

Figure 1.7 Conceptual Filtered Tailings TSF General Arrangement (Site G)

AMERICAN OVERSIGHT

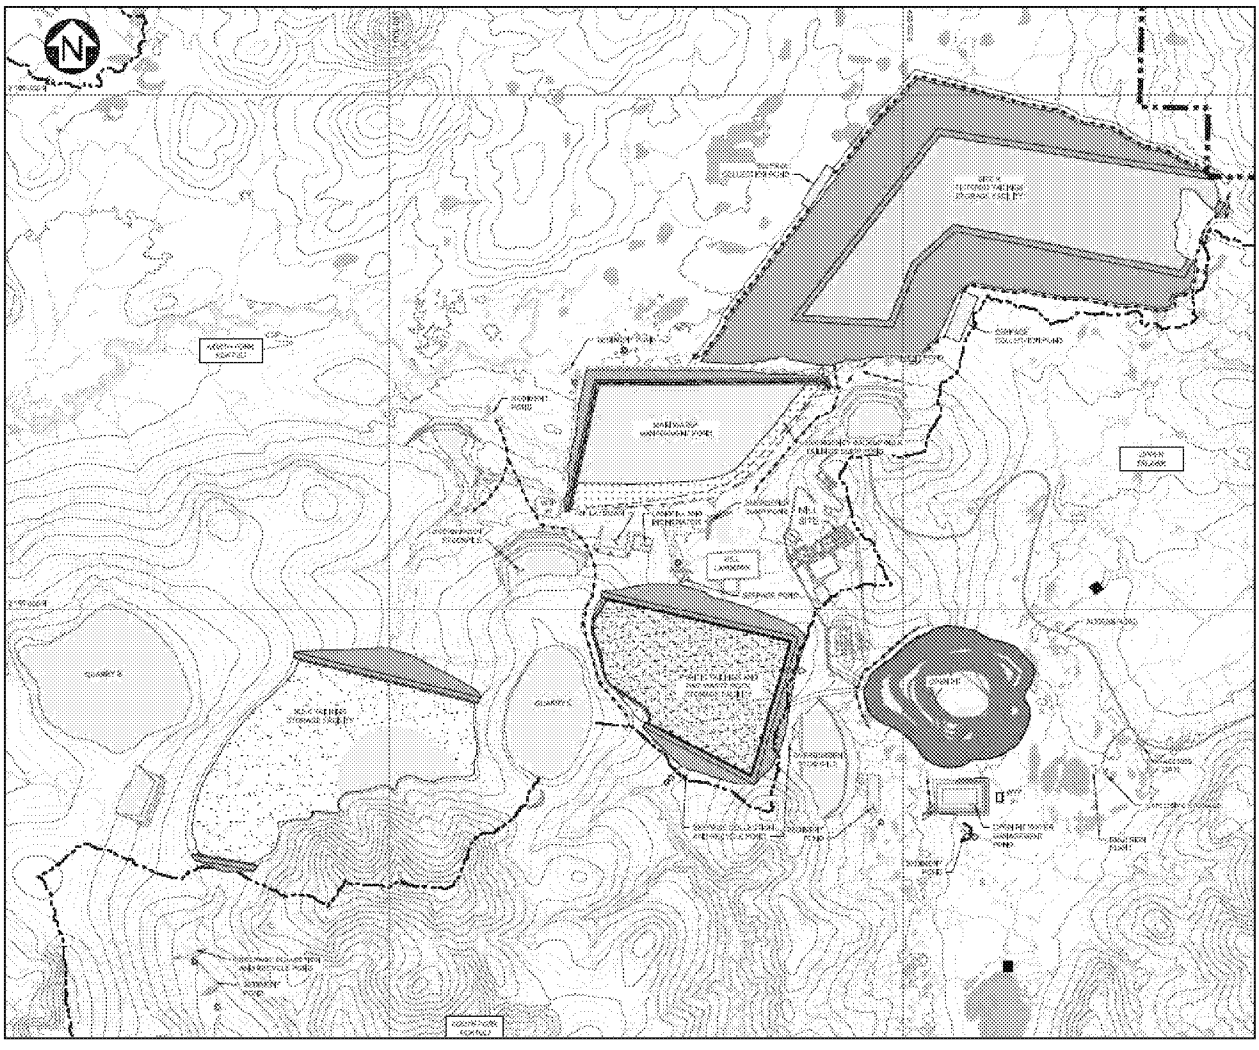

Figure 1.8 Conceptual Filtered Tailings TSF General Arrangement (Site K)

1.7 RFI 054 – 7

"What would be the type/quantity of mobile equipment and/or conveyors needed to transport and place tailings in a dry stack? How would material handling change during winter versus summer?"

Tailings would be delivered from the Filter Plant to the TSF by 100-ton conventional rear-dump haulage trucks. A fleet of approximately 70 haulage trucks will be required to meet Filter Plant production, (accounting for spare vehicles and vehicle maintenance downtime). These haul trucks would require low-bearing tires for trafficability on the surface of the filtered tailings. These haul trucks have an operating life of approx. 100,000 hrs and would require replacement after this point, i.e. once within the operational LOM.

Tailings would be spread using large tracked dozers and compacted using 15-ton vibratory compactors. Motor graders would be used as necessary to maintain the surface of the filtered tailings stack within the TSF with excavators required for reworking of material as required. Support equipment on the surface of the filtered tailings would also require low-bearing tires or tractor-type tracks. Support equipment has an operating life of 50,000 hrs and would require replacement at this point, i.e. three times within the operational LOM.

AMERICAN OVERSIGHT

Water trucks may be required to spray the exposed filtered tailings for dust management in areas where deposition is not ongoing. Tailings would be deposited towards the downstream sides of the TSF (i.e. close to the TSF berm and downstream shell) during this period, when tailings can be optimally compacted. Tailings would be deposited towards the central or upstream areas of the TSF in winter months and sustained wet periods, and compacted to the maximum practical extent. Should trafficability become an issue and tailings placement not be possible, operations may cease or temporarily halt until conditions allow for on-going placement and compaction of the filtered tailings. An alternate strategy for severe weather conditions that prevents or limits tailings placement would be to deposit tailings in the slurry tailings TSF, although this has not been considered for this concept. The slurry tailings TSF would conceptually store filtered tailings during Filter Plant downtime, and tailings which do not meet filtration requirements only (approximately 25% of total bulk tailings).

1.8 RFI 054 – 8

"How would waste rock storage be different under a dry stack scenario than the currently proposed plan?"

The waste rock management strategy for a filtered bulk tailings scenario will be unchanged from the currently proposed concept. PAG waste rock will still be co-disposed of with the pyritic tailings in the Pyritic TSF during operations, and removed to backfill storage in the mined-out Open Pit at closure.

Quarried NAG rock will be used to construct the slurry TSF embankments and the filtered TSF buttress.

1.9 RFI 054 – 9

"How would interim reclamation and final closure be different than the currently proposed plan under a dry stack scenario?"

Filtered tailings may allow for concurrent reclamation of downstream slopes on the filtered tailings TSF. The closure and reclamation plans for all other facilities would be unchanged. The slurry TSF would be reclaimed in a similar manner to the currently proposed concept.

Long-term, post-closure, there would be negligible differences between the physical characteristics of the filtered tailings TSF, and the current concept of a drained tailings mass post-closure (anticipated final dry densities are estimated to be the same for both concepts). The water management pond for the filtered tailings TSF would still be required post-closure for pumping of seepage and contact water to the water treatment plant for treatment and release, similar to the current proposed concept.

1.10 RFI 054 – 10

"How would the dry stack cost compare with the current plan in terms of full life cycle through to closure and post-closure including design, construction, operations, maintenance and surveillance?"

Incremental costs for a filtered tailings concept compared to the currently proposed concept only have been considered at this time.

Additional quarried rock would be required for a filtered tailings facility to construct both the downstream shell zone and toe berm of the filtered tailings TSF and the bulk slurry tailings TSF. A second slurry pump system will also be required for the bulk slurry tailings TSF in addition to the slurry pump system to feed the Filter Plant. Operating costs include electricity consumption for the pump system

AMERICAN OVERSIGHT

Both TSFs will require water management structures such as seepage collection ditches and water management ponds. A slurry cutoff wall and/or fully lined HDPE impoundment would be required for Site K as an additional seepage control measure to limit the potential for seepage to the North Fork Koktuli and Upper Talarik drainage areas.

Filtered tailings operations would require a Filter Plant that consists of the following components:

- Filters and ancillaries
- Additional thickeners and ancillaries
- Ore bins and Stockpile Systems
- Flocculant Plants
- Support Equipment (dozers, mobile cranes, forklifts, light vehicles, etc.)

Operating costs for the filter plant include equipment maintenance, electricity consumption, fuel consumption for mobile equipment, and labour costs.

Operating costs relating to the filtered tailings delivery include labour costs for haul truck operators, vehicle maintenance, and fuel consumption. Haul truck fuel consumption is anticipated to be approximately 24,500 gallons per day and CO_2 emissions are estimated to be approximately 270 tpd.

Operating costs relating to the filtered tailings spreading and compaction include labour costs for haul truck operators, vehicle maintenance, and fuel consumption. Support equipment fuel consumption is anticipated to be approx. 8,400 gallons per day and CO_2 emissions are estimated to be approximately 95 tpd.

The operating crew for the filter plant would number 250 people and 400 people for the for filtered tailings distribution.

Incremental life of mine costs of approximately $3.1 billion in capital costs and $5.5 billion in operating costs ($5.24 /ton) for Option 1 (filtered tailings storage at Site G with slurry tailings storage at Site K) have been assumed. This would decrease the project net present value (NPV_7) by $5.9 billion.

The Site K filtered tailings storage option would incur incremental capital costs of approximately $3.8 billion and incremental operating costs of $5.5 billion ($5.24/ton). This would decrease the project NPV_7 by $6.5 billion.

Both of these scenarios would render the project uneconomic. It should further be noted that neither of these capital estimates include contingency. For this level of study, it is not unreasonable to include contingency of 35% on the direct capital costs, which would increase the capital associated with Option 1 by up to $780 million and Option 2 by up to $950 million.

The incremental cost increases of both options are summarized on Table 1.1. Fuel consumption and total emissions are summarized on Table 1.2.

AMERICAN OVERSIGHT

Table 1.1 Incremental Cost Increase Summary

	Option 1 Filtered Tailings at Site G	Option 2 Filtered Tailings at Site K
Initial Capital	$2.02B	$2.50B
Filter Plant	$0.83B	$0.83B
Ancillary Facilities	$0.13B	$0.13B
Filtered Tailings Delivery	$0.07B	$0.07B
Filtered Tailings Spread/Compact	$0.02B	$0.02B
TSF/WMP Facility Construction	$0.94B	$1.41B
Slurry Tailings Delivery System	$0.03B	$0.03B
Sustaining Capital	$0.20B	$0.20B
Indirects[2]	$0.890B	$1.08B
Operating Costs	$5.48B	$5.48B
TOTAL LOM COSTS	**$8.59B**	**$9.26B**
NPV[1]	**$5.87B**	**$6.54B**

NOTES:
1. NPV RATE OF 7% ASSUMED FOR THE PROJECT.
2. INDIRECTS OF 40% ASSUMED FOR CAPITAL COSTS ONLY.
3. EXCLUDES ANY CONTINGENCY. TOTAL MAY NOT SUM DUE TO ROUNDING OF CATEGORIES. ALL COSTS PROVIDED IN US DOLLARS (USD$).

Table 1.2 Fuel Consumption and Emissions

Item	Diesel Fuel Consumption (gpd)	Natural Gas Consumption (cf/d)	Carbon Dioxide (CO_2) Emissions (tpd)[1]
Filter Plant Support Equipment	2,500	-	27
Filter Plant Power Generation	-	4,760,000	48
Filter Plant HVAC System	-	828,000	48
Filtered Tailings Haul Truck Delivery	24,500	-	270
Filtered Tailings Spreading and Compaction	8,400	-	95
TOTAL	**35,400**	**5,588,000**	**440**

NOTES:
1. TOTAL EMISSIONS DOES NOT INCLUDE EMISSIONS ASSOCIATED WITH ELECTRICAL POWER GENERATION FOR THE PROCESS PLANT, FILTER PLANT OR WATER MANAGEMENT PUMPING SYSTEMS.

AMERICAN OVERSIGHT

K3.26 VEGETATION

Table K 3.26-1 lists the 48 vegetation types broken out by the 10 structure types. The table includes definitions and whether the vegetation type occurs predominantly in wetlands or uplands.

AMERICAN OVERSIGHT

Table K3.26-1: Summary of Project Vegetation Types in the Project Area

Vegetation Structure Type	Project Vegetation Type	Abbreviation	Definition[1]	Predominantly Occurs in Wetlands or Uplands
Forest (≥10% cover of trees over 10 feet in height)				
Open/Closed Forest	Closed White Spruce Forest	CWSF	Closed forest dominated by white spruce trees where the canopy cover is ≥ 60 percent.	Upland
	Open White Spruce Forest	OWSF	Open forest dominated by white spruce where the canopy cover ranges from 25 to 59 percent.	Upland
	White Spruce Woodland	WSW	Woodlands dominated by white spruce. Sparse stands of white spruce trees that have a total tree cover of 10 to 24 percent. Most of the white spruce trees are taller than 10 feet. The openings between the trees may be dominated by mosses and lichens, herbs, and/or shrubs.	Upland
	Black Spruce Woodland	BSW	Woodlands dominated by black spruce. The openings between the trees may be dominated by mosses and lichens, herbs, and/or shrubs. Sparse stands of black spruce trees that have a total tree cover of 10 to 24 percent. Most of the black spruce are taller than 10 feet.	Wetland
	Closed Broadleaf Forest	CBF	Forests dominated by broadleaf tree species where tree canopy coverage is ≥ 60 percent. More than 75 percent of the total tree cover consists	Upland

AMERICAN OVERSIGHT

Vegetation Structure Type	Project Vegetation Type	Abbreviation	Definition[1]	Predominantly Occurs in Wetlands or Uplands
			of broadleaf species.	
	Open Broadleaf Forest	OBF	Forests dominated by broadleaf tree species where tree canopy coverage ranges from 25 to 59 percent. Over 75 percent of the total tree cover consists of broadleaf species.	Upland
	Broadleaf Woodland	BW	Sparse stands of broadleaf trees that have a total tree cover of 10 to 24 percent.	Wetland/Upland
	Closed Mixed Forest	CMF	Forests dominated by a mix of broadleaf and needleleaf trees where tree canopy coverage is ≥ 60 percent. Both tree types must contribute 25 to 75 percent of the total canopy cover.	Upland
	Open Mixed Forest	OMF	Forests dominated by a mix of broadleaf and needleleaf trees where tree canopy coverage ranges from 25 to 59 percent. Both tree types must contribute 25 to 75 percent of the total canopy cover.	Upland
	Mixed Forest Woodland	MFW	Sparse trees stands consisting of a mix of black and/or white spruce and broadleaf trees that have a total tree cover of 10 to 24 percent. Most of the trees are taller than 10 feet. Both tree types must contribute at least 25 percent of the total canopy cover.	Upland

AMERICAN OVERSIGHT

Table K3.26-1: Summary of Project Vegetation Types in the Project Area

Vegetation Structure Type	Project Vegetation Type	Abbreviation	Definition[1]	Predominantly Occurs in Wetlands or Uplands
	Dwarf White Spruce Scrub	DWSS	Black spruce stands where the trees are less than 10 feet tall. This vegetation type includes woodland cover (10 to 24 percent) and open cover (25 to 59 percent). If trees 10 feet or taller cover at least 10 percent of the area, the scrub class does not apply.	Upland
Scrub (<10% cover of trees over 10 feet in height, >25% shrub cover)				
Closed Tall Shrub	Closed Willow Tall Shrub	CWTS	Thickets of tall willows. These communities have a cover of willow species ≥ 75 percent. Trees provide less than 10 percent cover. The height of the willow is ≥ 5 feet. In some sites, shrub birch may be mixed with the willow.	Upland
	Closed Alder Tall Shrub	CATS	Dense stands of tall alder where the canopy cover is ≥ 75 percent and the shrub height is ≥ 5 feet. Trees provide less than 10 percent cover.	Upland
	Closed Alder-Willow Tall Shrub	CAWTS	Mixed species thickets of tall alders and willows. Dense shrub stands consisting of a mix of alder and willow where the canopy cover is ≥ 75 percent and the shrub height is ≥ 5 feet. Both shrub types must contribute 25 to 75 percent of the total shrub canopy cover. Trees provide less than 10 percent cover.	Wetland/Upland

AMERICAN OVERSIGHT

Table K3.26-1: Summary of Project Vegetation Types in the Project Area

Vegetation Structure Type	Project Vegetation Type	Abbreviation	Definition[1]	Predominantly Occurs in Wetlands or Uplands
Open Tall Shrub	Open Alder Tall Shrub	OATS	Open stands of tall alder. These communities have a shrub canopy cover of 25 to 74 percent that consists primarily of alder species. Trees provide < 10 percent cover. The height of the alder is ≥ 5 feet.	Upland
	Open Alder-Willow Tall Shrub	OAWTS	Tall, open shrub stands codominated by alder and willow. Shrub stands consisting of a mix of alder and willow where the canopy cover is ≥ 25 percent and < 75 percent. The shrub height is > 5 feet. Both shrub types must contribute 25 to 75 percent of the total shrub canopy cover. Trees provide less than 10 percent cover.	Upland
	Open Willow Tall Shrub	OWTS	Open stands of tall willow. These communities have a shrub canopy cover of 25 to 74 percent that consists primarily of willow species. In some sites, shrub birch may be mixed with the willow. Trees provide < 10 percent cover. The height of the willow is ≥ 5 feet.	Upland
Closed Low Shrub	Closed Willow Low Shrub	CWLS	Thickets of low willow. These communities have a cover of willow species ≥ 75 percent. Trees provide less than 10 percent cover. The height of the willow is ≥ 8 inches and < 5 feet. Shrubs ≥ 5 feet are	Wetland

			absent or provide less than 25 percent cover. In some sites, shrub birch may be mixed with the willow.	
	Closed Alder-Willow Low Shrub	CAWLS	Mixed-species thickets of low alder and willows. Dense shrub stands consisting of a mix of alder and willow where the canopy cover is ≥ 75 percent and the shrub height is < 5 feet. Both shrub types must contribute 25 to 75 percent of the total shrub canopy cover. Trees provide less than 10 percent cover.	Wetland/Upland
	Closed Alder Low Shrub	CALS	Thickets of low alder. Dense stands of alder where the canopy cover is ≥ 75 percent and the shrub height is < 5 feet. Trees provide less than 10 percent cover.	Upland
Open Low Shrub	Open Sweetgale-Graminoid Bog	OSGB	Bogs and fens dominated by sweetgale. These communities have 25 to 74 percent cover of shrubs ≥ 8 inches and < 5 feet. The shrubs are primarily Myrica gale. Tree canopy cover is < 10 percent. Graminoids have at least 25 percent cover. These communities occur on peat that is usually at least 8 inches thick.	Wetland
	Open Mixed Shrub-Sedge Tussock	OMSST	Tussock tundra codominated by low shrubs and tussock-forming graminoids. These communities have 25 to 74	Wetland

			percent cover of low shrubs (≥ 8 inches and < 5 feet tall) mixed with tussock-forming sedges, usually Eriophorum vaginatum, but sometimes Carex bigelowii. The tussock species have ≥ 25 percent cover. Trees are absent or very scarce.	
	Open Dwarf Birch-Ericaceous Shrub Bog	ODBESB	Bogs with abundant mosses, ericaceous shrubs, and dwarf birch. These communities have 25 to 74 percent cover of shrubs at least 8 inches tall. Tree cover is < 10 percent and tall shrubs (≥ 5 feet) provide less than 25 percent cover. Common dominants include Betula glandulosa, B. nana, Vaccinium uliginosum, V. vitis-idaea, Ledum decumbens, Empetrum nigrum, and Andromeda polifolia. The combined cover of Betula glandulosa and B. nana is ≥ 10 percent. These communities occur on peat that is at least 8 inches thick. Sphagnum spp. are abundant at most sites, but occasionally may be absent.	Wetland
	Ericaceous Shrub Bog	ESB	Bogs with abundance mosses and ericaceous shrubs, but only sparse dwarf birch. These communities are dominated by ericaceous shrubs such as Empetrum	Wetland

AMERICAN OVERSIGHT

Vegetation Structure Type	Project Vegetation Type	Abbreviation	Definition[1]	Predominantly Occurs in Wetlands or Uplands
			nigrum, Vaccinium uliginosum, V. vitis-idaea, V. oxycoccos, Andromeda polifolia, and Ledum decumbens. The shrubs have a cumulative cover ≥ 25 percent, and range in height from 8 inches to < 5 feet. Ericaceous shrub bogs occur on organic soil (thickness of peat ≥ 16 inches). Sphagnum spp. are always present and usually dominate the moss layer. Other mosses, such as feather mosses, also may be common.	
	Low Ericaceous Shrub Tundra	LEST	Treeless areas dominated by low ericaceous shrubs, including Empetrum nigrum, Vaccinium uliginosum, V. vitis-idaea, V. oxycoccos, Andromeda polifolia, Ledum decumbens, and L. groenlandicum. The sites have mineral soils (thickness of surface organic horizons < 16 inches). The shrubs have a cumulative cover ≥ 25 percent, and range in height from 8 inches to < 5 feet.	Upland
	Open Dwarf Birch Scrub	ODBS	Open shrub stands dominated by Betula nana and B. glandulosa that have a shrub cover ≥ 25 percent and < 75 percent. While most of these areas consist of low shrubs (≥ 8 inches and < 5 feet), the vegetation type should also	Wetland/Upland

AMERICAN OVERSIGHT

Vegetation Structure Type	Project Vegetation Type	Abbreviation	Definition[1]	Predominantly Occurs in Wetlands or Uplands
			be used for the occasional stand of tall (≥ 5 feet) B. glandulosa.	
	Shrub Birch-Willow	SBW	Open or dense low shrub (≥ 8 inches and < 5 feet tall) stands dominated by shrub birch and willow species. These low shrubs have 25 to 74 percent cover. Both shrub types must contribute at least 25 percent of the total shrub canopy cover.	Upland
	Open Willow Low Shrub	OWLS	Open stands of low shrub stands dominated by low willow (≥ 8 inches and < 5 feet tall) that have 25 to 74 percent cover. Shrubs 5 feet or taller provide < 25 percent cover and trees overtopping the shrubs provide < 10 percent cover. These communities usually occur on a mineral soil and are drier than Open Willow Low Shrub Fen communities.	Wetland
	Open Willow Low Shrub Fen	OWLSF	Fens characterized by open stands of shrubs dominated by low willow (≥ 8 inches and < 5 feet tall) that have 25 to 74 percent cover. These communities usually occur on peat that is at least 8 inches thick, and the sites are wetter than Open Willow Low Shrub areas. Most OWLSF areas are classified as Slope wetlands and have wetland	Wetland

			hydrology that is maintained by groundwater.	
	Open Alder-Willow Low Shrub	OAWLS	Low, open shrub stands consisting of a mix of alder and willow where the canopy cover is ≥ 25 percent and < 75 percent. The shrub height is < 5 feet. Both shrub types must contribute 25 to 75 percent of the total shrub canopy cover. Trees provide less than 10 percent cover.	Wetland
	Open Alder Low Shrub	OALS	Open stands of low alder with a shrub canopy cover of 25 to 74 percent that consists primarily of alder species. Trees provide < 10 percent cover. The height of the alder is ≥ 8 inches and < 5 feet. Shrubs ≥ 5 feet are absent or provide less than 25 percent cover.	Upland
Dwarf Shrub	Dwarf Ericaceous Shrub Tundra	DEST	Treeless areas dominated by shrubs < 8 inches in height. The shrubs are primarily ericaceous species, including Arctostaphylos spp., Vaccinium spp., Empetrum nigrum, Phyllodoce aleutica, and Cassiope spp. Lichens are often common but cover < 60 percent of the site. If lichen cover is ≥ 60 percent, the DEST vegetation type should be used.	Upland
	Dwarf Ericaceous Shrub	DEST-H	Dwarf ericaceous shrublands growing on moderate to large	Upland

AMERICAN OVERSIGHT

Table K3.26-1: Summary of Project Vegetation Types in the Project Area

Vegetation Structure Type	Project Vegetation Type	Abbreviation	Definition[1]	Predominantly Occurs in Wetlands or Uplands
	Tundra - Hummocks		hummocks (> 6 inches tall). Treeless areas dominated by shrubs < 8 inches in height. The shrubs are primarily ericaceous species, including Arctostaphylos spp., Vaccinium spp., Empetrum nigrum, Phyllodoce aleutica, and Cassiope spp. The ground surface consists mostly of moderate hummocks (5.9 to 17.7 inches) and large hummocks (> 17.7 inches).	
	Dwarf Ericaceous Shrub Tundra - Equisetum	DEST-EQ	Dwarf ericaceous shrublands with abundant horsetails (>25 percent coverage). Treeless areas dominated by shrubs < 8 inches in height. The shrubs are primarily ericaceous species, including Arctostaphylos spp., Vaccinium spp., Empetrum nigrum, Phyllodoce aleutica, and Cassiope spp. Equisetum spp. covers at least 25 percent of the area.	Upland
	Dwarf Ericaceous Shrub Tundra - Carex	DEST-C	Dwarf ericaceous shrublands with abundant sedges (>25 percent coverage). Treeless areas dominated by shrubs < 8 inches in height. The shrubs are primarily ericaceous species, including Arctostaphylos spp., Vaccinium spp., Empetrum nigrum, Phyllodoce aleutica, and Cassiope spp. Carex spp.	Upland

AMERICAN OVERSIGHT

Table K3.26-1: Summary of Project Vegetation Types in the Project Area

Vegetation Structure Type	Project Vegetation Type	Abbreviation	Definition[1]	Predominantly Occurs in Wetlands or Uplands
			covers at least 25 percent of the area.	
	Dwarf Ericaceous Shrub-Lichen Tundra	DESLT	Dwarf ericaceous shrublands on lichen dominated (>60 percent coverage) ground. Treeless areas dominated by shrubs < 8 inches in height. The shrubs are primarily ericaceous species, including Arctostaphylos spp., Vaccinium spp., Empetrum nigrum, Phyllodoce aleutica, and Cassiope spp. Lichens cover at least 60 percent of the area.	Upland
Herbaceous (<10% of tree cover and <25% of shrub cover)				
Dry to Moist Herbaceous	Halophytic Dry Graminoids	HDG	These herbaceous communities are dominated by species of the genus Leymus. They are characteristic of coastal sand dunes and the upper parts of coastal flats and beaches. Many communities grade seaward into halophytic herb communities. While the dune communities are usually no-wetlands, some Leymus communities on the upper portions of coastal flats are wetland.	Upland
	Bluejoint Tall Grass	BTG	Abundant bluejoint reedgrass; other herbs and grasses may be present but are not codominant. Bluejoint tall grass communities are dominated by bluejoint. Other	Upland

AMERICAN OVERSIGHT

Table K3.26-1: Summary of Project Vegetation Types in the Project Area

Vegetation Structure Type	Project Vegetation Type	Abbreviation	Definition[1]	Predominantly Occurs in Wetlands or Uplands
			grasses and herbs may be present but are not codominant. The canopy is usually about 2.5 to 5 feet tall. Woody plants are absent or scarce, although in some sites low or trailing shrubs may occur as a low layer below the tall bluejoint grass stratum.	
	Bluejoint-Herb	BH	Abundant bluejoint reedgrass interspersed with other low-growing species. Bluejoint herb communities are dominated by bluejoint and various herbs. Sedges and other grasses may be present in significant amounts. The canopy is usually about 2.5 to 5 feet tall. Woody plants are absent, scattered, or may occur as a low layer below the tall bluejoint herb stratum.	Upland
	Mesic Herbs	MH	Herb-dominated communities that occur on mesic sites and do not satisfy the requirements of other project vegetation types. These communities are dominated by herbs. This type is also used for drier alpine herb communities, which include a wide variety of species.	Upland

AMERICAN OVERSIGHT

Table K3.26-1: Summary of Project Vegetation Types in the Project Area

Vegetation Structure Type	Project Vegetation Type	Abbreviation	Definition[1]	Predominantly Occurs in Wetlands or Uplands
Wet Herbaceous	Subarctic Sedge-Moss Wet Meadow	SSMWM	This vegetation type is used as a lumped mapping type that includes numerous wet graminoid herbaceous communities. The lumped mapping class is used because of the difficulty in separating the specific Viereck types on aerial photography. These types include Sub-arctic Lowland Sedge-Moss Bog Meadow, Subarctic Lowland Sedge Bog Meadow, Subarctic Lowland Sedge Wet Meadow, Wet Sedge-Herb Meadow Tundra, and Sub-arctic Lowland Herb Bog Meadow. In general, the SSMWM type represents communities dominated or codominated by graminoids that occupy wet sites. Forbs may be codominant in some areas, and shrubs may be present, but provide < 25 percent cover. In some sites, low trailing shrubs may form a layer below the herbaceous layer. Dense moss is abundant on many of the sites. Soils are saturated or may have shallow surface water. Most sites have peat ≥ 8 inches in depth.	Wetland
	Fresh Sedge Marsh	FSM	Dominated by members of the sedge family (e.g., sedges, cottongrass) rooted in standing water, and often	Wetland

AMERICAN OVERSIGHT

Table K3.26-1: Summary of Project Vegetation Types in the Project Area

Vegetation Structure Type	Project Vegetation Type	Abbreviation	Definition[1]	Predominantly Occurs in Wetlands or Uplands
			near open water. This vegetation type is dominated by sedges, bulrush, spikerush, and/or rushes. The vegetation occurs in deep water (≥ 6 inches). Standing water persists throughout the growing season in most years. Trees, shrubs, and lichens are absent; aquatic mosses may be present, but are not abundant. The community is often found at the edge of ponds, lakes, and sluggish streams.	
	Fresh Herb Marsh	FHM	Dominated by emergent in persistent standing water	Wetland
	Aquatic Herbaceous	AH	These are herbaceous communities dominated by plants with leaves that float on the water surface or grow primarily below the surface of the water. In general, standing or flowing water persists throughout the growing season (permanently flooded).	Wetland
Other				
Other	Partially Vegetated	PV	This type is used for areas that have sparse vegetation cover (≥ 10 percent and < 25 percent). It is usually applied to temporarily flooded pond basins that lose water early in the growing season. These areas are unvegetated when water recedes, but develop	Upland

AMERICAN OVERSIGHT

Table K3.26-1: Summary of Project Vegetation Types in the Project Area

Vegetation Structure Type	Project Vegetation Type	Abbreviation	Definition[1]	Predominantly Occurs in Wetlands or Uplands
			sparse cover by pioneering annual plants as the growing season progresses. The type can also apply to sparsely vegetated rubble and scree fields, mountaintops, or revegetating gravel bars.	
	Barren	BARE	This type is used for areas devoid or nearly devoid of vegetation, such as unvegetated gravel bars, beaches, seasonal pond bottoms, rubble fields, and scree slopes. Vegetation cover is < 10 percent vascular plants.	Wetland / Upland
	Snow	SNOW	This type is used for areas devoid of visible vegetation and covered entirely by snow. These areas are generally snow covered for the majority or all of a given year.	Upland
Open Water	Open Water	OW	Unvegetated to very sparsely vegetated open water, including streams, rivers, lakes, and ponds.	Waters

1 Forest density classes (closed, open, woodland) are differentiated base on tree canopy coverage (>60%, 25-59%, 10-24%, respectively). Shrub density classes (closed thickets, open) are differentiated based on shrub canopy cover (>75%, 25-75%, respectively). Shrub height classes (tall, low, dwarf) are differentiated based on average shrub height (>5 feet tall, 5 feet to 8 inches tall, <8 inches tall, respectively).

TABLE OF CONTENTS

K3.26 VEGETATION 3.26-1

LIST OF TABLES

Table K3.26-1: Summary of Project Vegetation Types in the Project Area 3.26-2

AMERICAN OVERSIGHT

3.26 VEGETATION

The analysis area for vegetation is the same as that described in Section 3.22, Wetlands, Special Aquatic Sites and Waterbodies. It encompasses the nine Hydrologic Unit Code (HUC) 10 watersheds that could potentially be directly or indirectly impacted by the project, with a total area of approximately 6,420,000 acres. The description of vegetation in the project area is primarily based on information provided in Chapter 13 and Chapter 38 of the Environmental Baseline Document (EBD) (3PPI and HDR 2011, HDR and 3PPI 2011), as well as more recent information provided in the Preliminary Jurisdictional Determination Report (HDR 2018) (Appendix J) and associated geographic information system (GIS) database that reflects changes in the project area since publication of the EBD. The affected environment for vegetation overlaps with and provides support for other resources that are addressed in other sections of this Environmental Impact Statement (EIS), including Section 3.23, Wildlife Values and Section 3.25, Wetlands/Special Aquatic Sites and Waterbodies. Vegetation is also an important aspect of social environment disciplines such as Section 3.5, Recreation, and Section 3.9, Subsistence.

The affected environment for vegetation includes predominant vegetation communities and other land cover types, such as open water and barren areas, which may be directly or indirectly affected by project activities. The affected environment for vegetation is described in terms of the extent and characteristics of predominant types found in project component areas for each Alternative. Confirmed or reported populations of species on the Alaska Center for Conservation Science (ACCS) rare vascular plant species list are also addressed in this section. There are no federally listed threatened, endangered, or candidate plant species expected to occur in the project area.

3.26.1 Analysis Methodology

3.26.1.1 Environmental Baseline Study Program Vegetation Mapping

As part of the project's environmental baseline study program, researchers analyzed vegetation field data and aerial photo signatures to develop a system for describing and identifying vegetation types (3PPI and HDR 2011; HDR and 3PPI 2011). This classification system is based on the Alaska Vegetation Classification (Viereck et al. 1992), supplemented by Wibbenmeyer et al. (1982), and expanded as necessary to accommodate interpretation of available aerial imagery. Vegetation data collected included estimates of the percent cover of each plant species, site photographs, and classification of vegetation types. The vegetation classification system incorporated information on canopy cover, needleleaf versus broadleaf tree species, shrub height and density, and dominant species. Mapping was digitized on aerial photography at a scale between 1:1,200 and 1:1,500. Details on vegetation study methodology and field data collection can be found in Chapter 13 and Chapter 38 of the EBD (3PPI and HDR 2011; HDR and 3PPI 2011); a quick reference guide to the environmental baseline study classification system, including vegetation type definitions and representative photos, is in included in Appendix C of the Preliminary Jurisdictional Determination Report (HDR 2018)(Appendix J).

Project-specific vegetation mapping covers approximately 90 percent of the three alternatives. Figure 3.26-1 illustrates where project specific vegetation mapping is available. Supplemental vegetation mapping for areas not covered by project-specific data is discussed below.

Forty-eight project vegetation types were identified in the combined mapping (see Appendix K3.26, Vegetation). For clearer display on maps, the project vegetation types were aggregated

AMERICAN OVERSIGHT

into 10 vegetation structure types, based on dominant growth form (forested, shrub, or herbaceous), vegetation density (open or closed canopy), and average height (dwarf, low, or tall) (3PPI and HDR 2011; HDR and 3PPI 2011). A list of plant species from project vegetation and wetlands plots is included in Appendix B of the Preliminary Jurisdictional Determination Report (HDR 2018)(Appendix J).

3.26.1.2 Supplemental Mapping

Project-specific vegetation mapping is not complete for all project components of Alternatives 2 and 3 (see Figure 3.26-1) or for the Kokhanok East Ferry Terminal variant for Alternative 1. For those project components that fall outside the areas mapped for the project, vegetation mapping will be based on the Alaska Natural Heritage Program, ACCS, Vegetation Map and Classification for Northern, Western, and Interior Alaska (Boggs et al. 2016). ACCS landcover types were developed using best-available data derived from 18 regional landcover maps that have been developed over the last 31 years. For maps derived from satellite imagery, a 30 meter pixel size or finer was used; for maps derived from aerial photography a scale of 1:63,360 or finer was used (Boggs et al. 2016).

In order to make the data comparable to the data collected for the project, ACCS landcover types will be cross-walked into the best-corresponding grouped vegetation types based on comparison of the dominant growth forms (tree, shrub, or herb), vegetation density (open or closed canopy), and average height (tall, low, or dwarf) from each classification system. In some instances, data will be summarized at a broader scale. For example, Boggs et al. (2016) vegetation classification does not break down the Tall Shrub landcover type by "open" and "closed," so the acreages for this group will be combined to report totals for one Tall Shrub category (open-closed). NOTE TO REVIEWERS: THIS CROSS-WALK ANALYSIS WILL BE COMPLETED FOR THE DRAFT EIS.

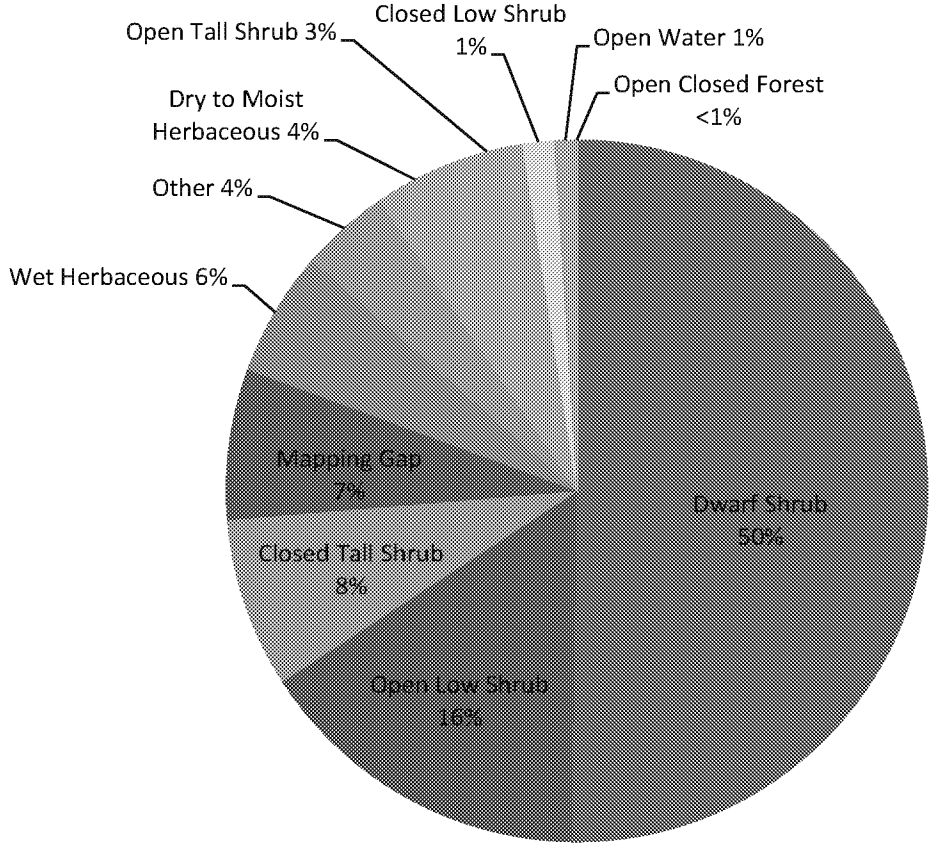
The following affected environment discussion focuses on the grouped vegetation communities, which are summarized in this section for each of the four project component mapping areas for each of the three alternatives.

AMERICAN OVERSIGHT

Figure 3.26-1: Alternatives 1, 2 and 3 Vegetation Mapping Overview

AMERICAN OVERSIGHT

3.26.2 Action Alternative 1 – Proposed Alternative



Alternative 1 is described in Chapter 2, Alternatives. A summary of vegetation communities by project components is provided below. Vegetation communities were assessed according to the analysis methodology as described above. A 300-foot buffer was applied to all project components when describing vegetation types.

Mine Site

NOTE TO REVIEWERS: VEGETATION MAPPING DATA FOR THE MINE SITE WILL BE UPDATED FOR THE DRAFT EIS BASED ON INCORPORATION OF 2018 FIELD DATA.

The mine site is characterized by a predominance of shrub types, representing approximately 80 percent of the mine site area. Figure 3.26-2 shows the percentages of grouped vegetation types in the mine site area. Human-caused soil or vegetation disturbance in the area is minimal and appeared to be limited to ATV trails or campsites (3PPI and HDR 2011).

Figure 3.26-2: Alternative 1 –Mine Site Area Vegetation Types

1 Project vegetation types were aggregated into vegetation type groups based on the dominant growth form (tree, shrub, or herb), vegetation density (open or closed canopy), and average height (tall, low, or dwarf).

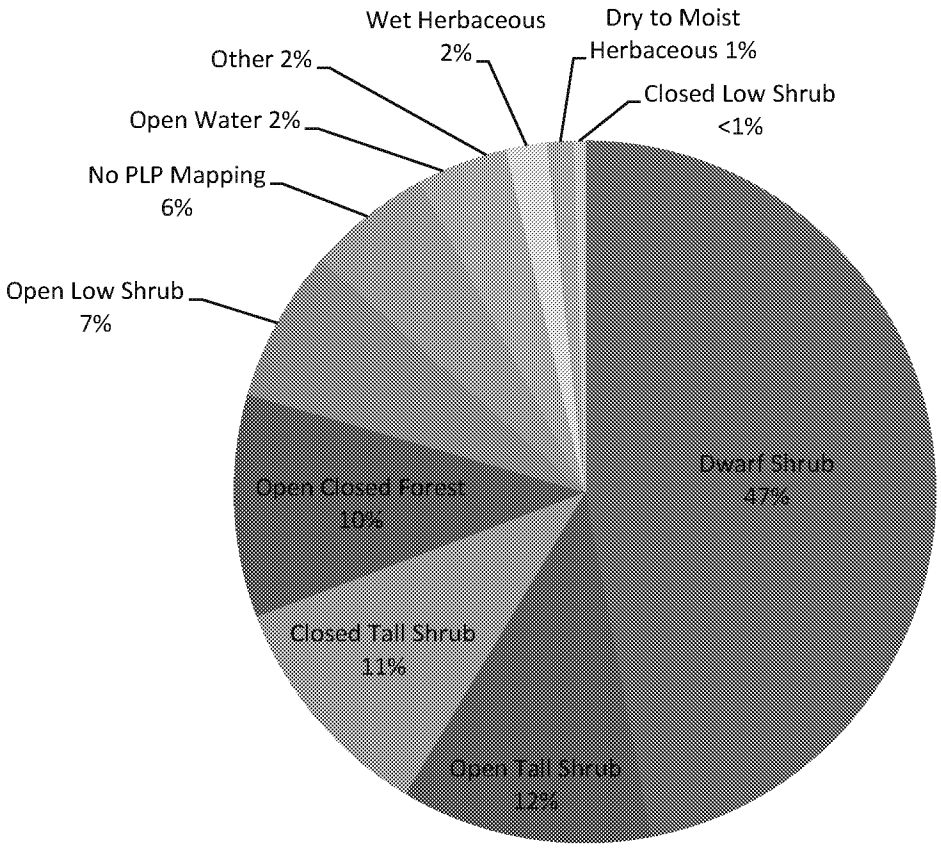
2 All numbers are rounded. Apparent inconsistencies in sums are the result of rounding.

Source: 3PPI and HDR 2011; HDR 2018.

AMERICAN OVERSIGHT

3.26.2.1 Transportation Corridor

NOTE TO REVIEWERS: PROJECT SPECIFIC VEGETATION MAPPING DATA IS CURRENTLY UNAVAILABLE FOR THE KOKHANOK EAST VARIANT (FERRY TERMINAL AND ACCESS ROAD) (FIGURE 3.26-4). DATA WILL BE UPDATED USING THE SUPPLEMENTAL MAPPING METHOD DESCRIBED IN SECTION 3.26.1.2 FOR THE DRAFT EIS.



The transportation corridor area includes the 24 miles of the mine access road (5 miles of this road falls in the mine site mapping area) from the mine site to the north ferry terminal at Iliamna Lake, an 18-mile crossing of the lake to the south ferry terminal, and the port access road (37 miles) between the lake and Amakdedori port on Cook Inlet. It also includes spur roads to Iliamna Airport and Kokhanok Airport. The transportation corridor includes segments of the natural gas pipeline that fall within the transportation corridor.

This corridor is located in three physiographic divisions: Nushagak-Big River Hills, Nushagak-Bristol Bay Lowlands, and Aleutian Range; it crosses three distinct ecological zones: Dwarf Shrub Tundra/Forest, Dwarf Shrub Tundra/Mountainous Shrubland, and Dwarf Shrub Tundra.

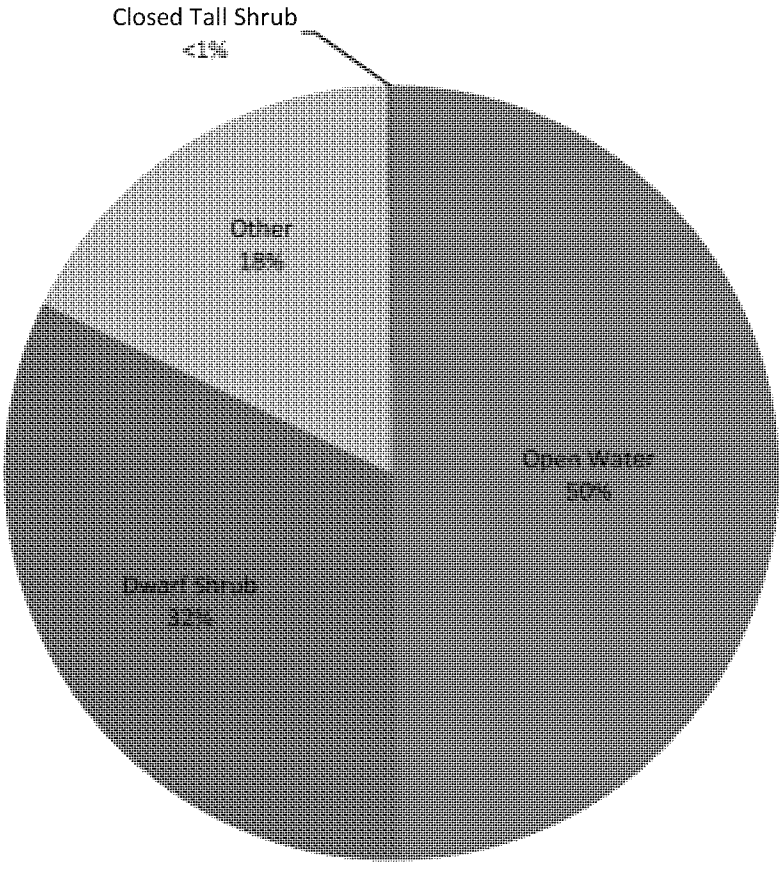
Percentage of vegetation types in the transportation corridor are shown in Figure 3.26-3. This area is characterized by a predominance of shrub types, representing approximately 78 percent coverage. Human-caused soil or vegetation disturbance in the mapping area is minimal and appears to be limited to ATV trails, roads, and building pads near the village of Iliamna, Kokhanok Airport, and the shore of Iliamna Lake (3PPI and HDR).

AMERICAN OVERSIGHT

Figure 3.26-3: Alternative 1- Transportation Corridor Vegetation Types

1 Project vegetation types were aggregated into vegetation type groups based on the dominant growth form (tree, shrub, or herb), vegetation density (open or closed canopy), and average height (tall, low, or dwarf).

2 All numbers are rounded. Apparent inconsistencies in sums are the result of rounding.



Source: 3PPI and HDR 2011; HDR and 3PPI 2011; HDR 2018.

3.26.2.2 Amakdedori Port

The Amakdedori port is in a region composed of marine, coastal, and estuarine habitats. Vegetation mapping includes an onshore area to encompass shore-based facilities at the port as well as an off-shore area for waterside structures and improvements associated with the marine facility. Percentage of vegetation types in the Amakdedori port area are shown in Figure 3.26-4. The Amakdedori port area extends into the Cook Inlet and therefore is comprised primarily of open water. Forested vegetation types are absent from this mapping area. No human-caused soil or vegetation disturbance was reported for the Amakdedori port mapping area.

AMERICAN OVERSIGHT

Figure 3.26-4: Alternative 1- Amakdedori Port Vegetation Types

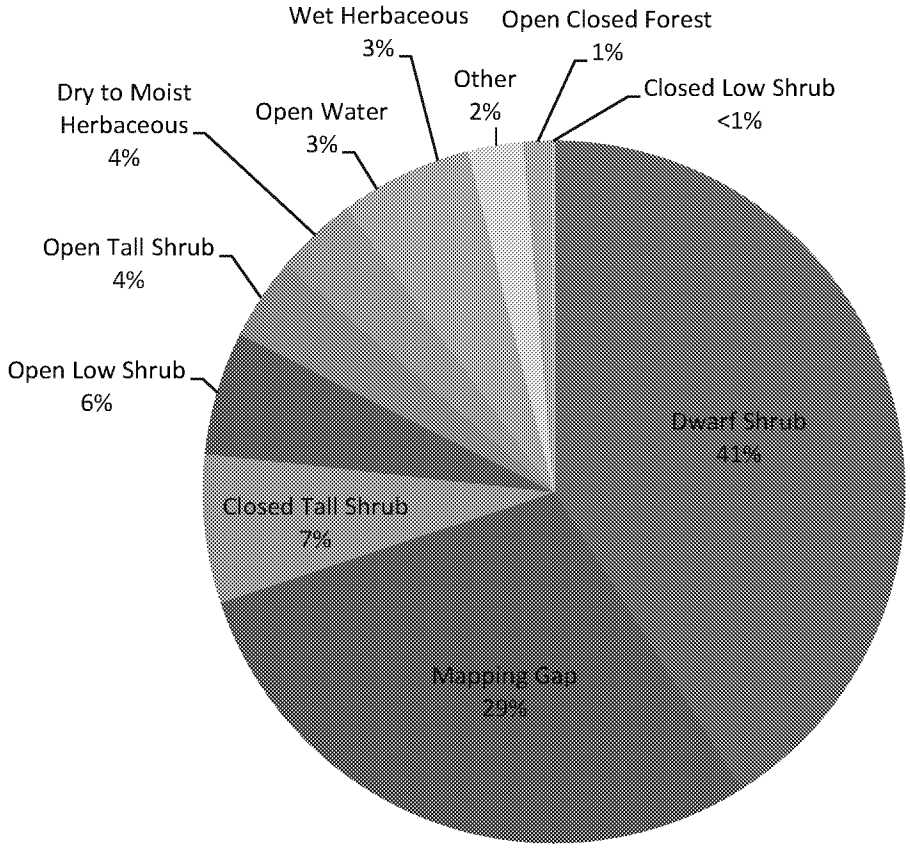
3.26.2.3 Natural Gas Pipeline Corridor

[NOTE: VEGEATION MAPPING IS CURRENTLY UNAVAILABLE FOR 67 ACRES. MAPPING WILL BE UPDATED FOR THE DRAFT EIS].



Segments of the natural gas pipeline adjacent to access roads are addressed under the transportation corridor mapping area. Segments of the natural gas pipeline that do not follow the access road corridors are described here and include: from Amakdedori port across the Cook Inlet to the compressor station near Anchor Point on the Kenai Peninsula.

This segment of the pipeline corridor was not included in the field studies and mapping prepared for the project; therefore, this analysis makes use of existing ACCS landcover classification data, as described above. The segment of the Cook Inlet pipeline crossing where there were no data was classified as open water.

The percentage of vegetation types are shown in Figure 3.26-5.

AMERICAN OVERSIGHT

Figure 3.26-5: Alternative 1- Natural Gas Pipeline Corridor Vegetation Types

1 Vegetation mapping for the Natural Gas Pipeline mapping area on the Kenai Peninsula is based on the Alaska Natural Heritage Program, Alaska Center for Conservation Science, Vegetation Map and Classification for Northern, Western, and Interior Alaska (Boggs et al. 2016). The landcover classes were cross-walked into corresponding Grouped Vegetation Types for this project based on the review of dominant growth form (tree, shrub, or herb), vegetation density (open or closed canopy), and average height (tall, low, or dwarf) from each data set. In some instances, a direct correlation was not applicable so the data is summarized using a broader scale. For example, Boggs et al. (2016) vegetation classification does not break down the Tall Shrub landcover type by "Open" and "Closed", so the acreages for this group is combined to report totals for one Tall Shrub category (Open-Closed).

2 All numbers are rounded. Apparent inconsistencies in sums are the result of rounding.

Source Boggs et al. 2016

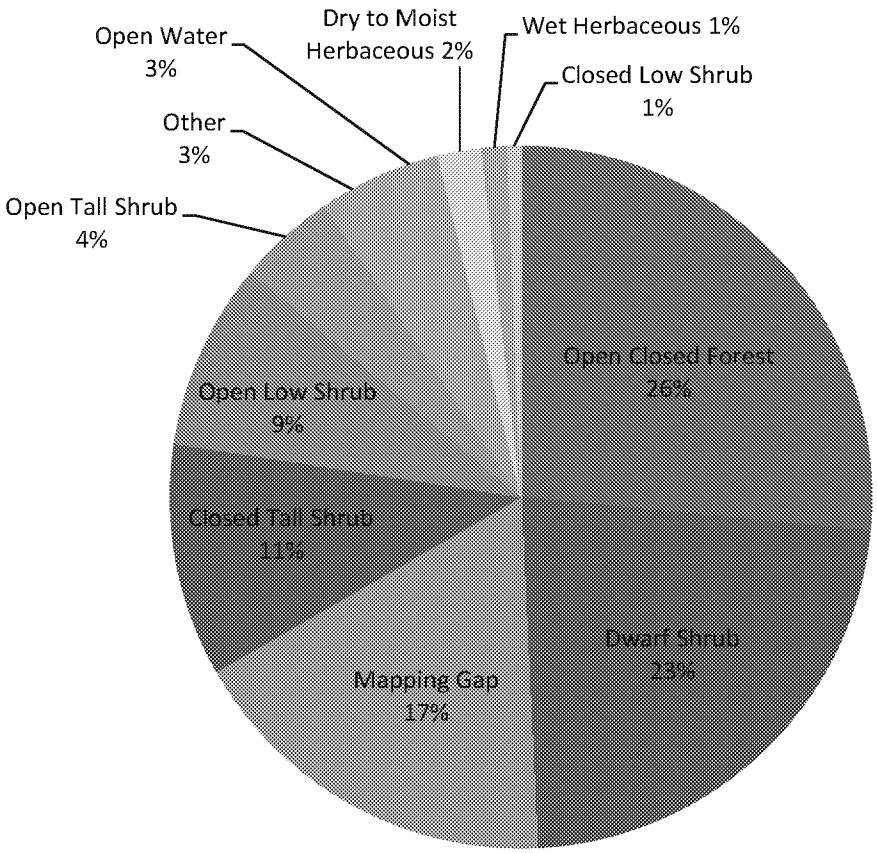
3.26.3 Action Alternative 2 – North Road and Ferry

Alternative 2 is described in Chapter 2, Alternative. There is some overlap in the mapping areas associated with alternatives (see Figure 3.26-1). A summary of vegetation communities by project components is provided below. Vegetation communities were assessed according to the analysis methodology as described above.

3.26.3.1 Mine Site

The vegetation mapping area at the mine site is the same for all alternatives. See summary under Alternative 1.

AMERICAN OVERSIGHT



3.26.3.2 Transportation Corridor

NOTE TO REVIEWERS: PROJECT VEGETATION MAPPING DATA IS CURRENTLY UNAVAILABLE FOR ALTERNATIVE 2 PILE BAY AND EAGLE BAY ROAD SEGMENTS AND THE ILIAMNA LAKE EAST AND WEST FERRY TERMINALS (FIGURE 3.26-1). DATA WILL BE UPDATED USING THE SUPPLEMENTAL MAPPING METHOD DESCRIBED IN 3.26.1.2 FOR THE DRAFT EIS.

The transportation corridor described herein includes 31 miles of the mine access road (5 miles of this road falls in the mine site mapping area) from the mine site to the Eagle Bay ferry terminal, a 29-mile crossing of the lake to the Pile Bay ferry terminal, and the port access road (18 miles) between the lake and Diamond Point port at Cook Inlet. The transportation corridor mapping area includes segments of the natural gas pipeline that fall within the transportation corridor.

The percentage of vegetation types in the Alternative 2 transportation corridor area are shown in Figure 3.26-6. The transportation corridor is characterized by a predominance of forested vegetation and dwarf shrubs.

Figure 3.26-6: Alternative 2 – Transportation Corridor Vegetation Types

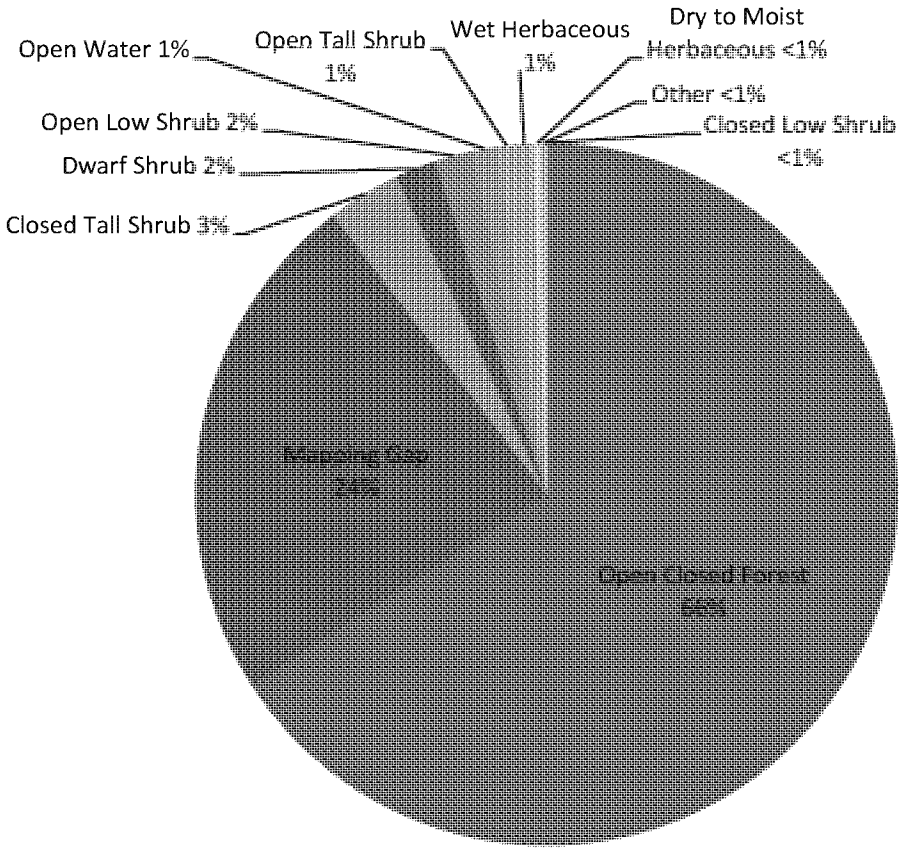
1 Project vegetation types were aggregated into vegetation type groups based on the dominant growth form (tree, shrub, or herb), vegetation density (open or closed canopy), and average height (tall, low, or dwarf).

2 All numbers are rounded. Apparent inconsistencies in sums are the result of rounding.

AMERICAN OVERSIGHT

3.26.3.3 Diamond Point Port

NOTE: PROJECT SPECIFIC VEGETATION MAPPING IS CURRENTLY UNAVAILABLE FOR THIS COMPONENT. VEGETATION TYPES WILL BE UPDATED USING THE SUPPLEMENTAL MAPPING METHOD DESCRIBED IN 3.26.1.2 FOR THE DRAFT EIS.



3.26.3.4 Natural Gas Pipeline Corridor

NOTE: VEGETATION MAPPING DATA IS CURRENTLY UNAVAILABLE FOR THE PIPELINE SEGMENT FROM URSUS COVE TO DIAMOND POINT. DATA WILL BE UPDATED USING THE SUPPLEMENTAL MAPPING METHOD DESCRIBED IN 3.26.1.2 FOR THE DRAFT EIS.

Segments of the natural gas pipeline adjacent to access roads are addressed under the transportation corridor. Segments of the natural gas pipeline that do not follow the access road corridors are described here and include: from the mine access road cut-off to Eagle Bay to the port access road cut-off to Pile Bay; from the Diamond Point port to Ursus Cove; and from Ursus Cove across the Cook Inlet to the compressor station near Anchor Point on the Kenai Peninsula. The area also encompasses construction access roads to the natural gas pipeline corridor on the north side of Iliamna Lake.

Vegetation types in the natural gas pipeline corridor area are shown in Figure 3.26-7.

Figure 3.26-7: Alternative 2 – Natural Gas Pipeline Corridor Vegetation Types

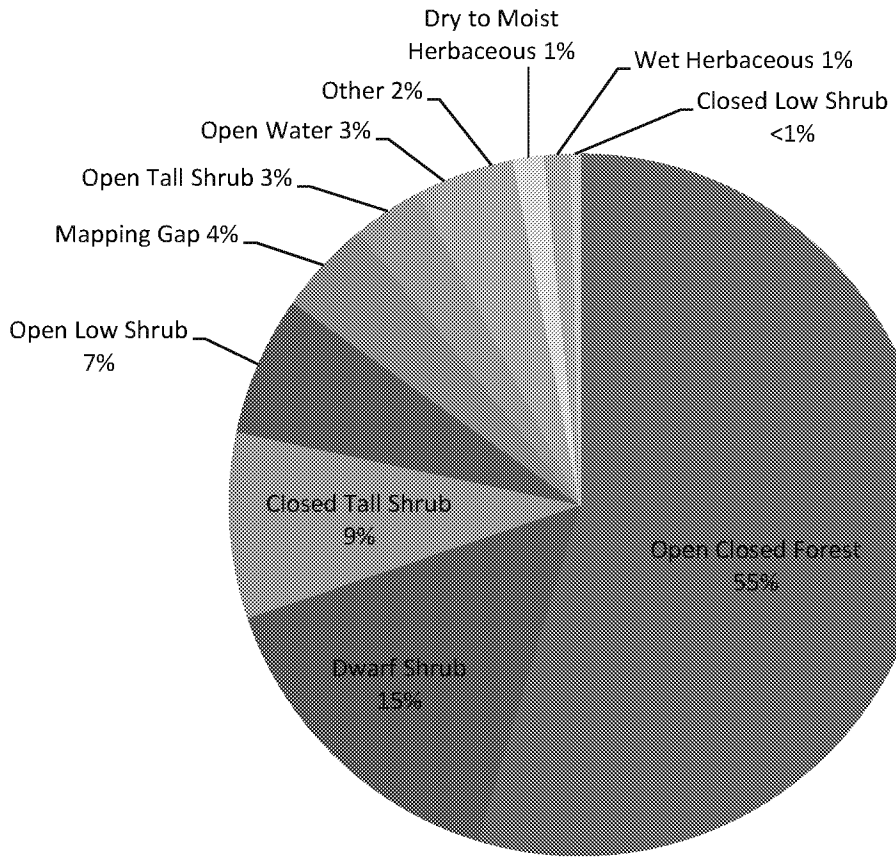
AMERICAN OVERSIGHT

3.26.4 Action Alternative 3 – North Road Only

Alternative 3 is described in Chapter 2. There is some overlap in the mapping areas associated with alternatives (see Figure 3.26-1). A summary of vegetation communities by project components is provided below. Vegetation communities were assessed according to the same analysis methodology as described above.

3.26.4.1 Mine Site

The vegetation mapping area at the mine site is the same for all alternatives. See summary under Alternative 1.



3.26.4.2 Transportation Corridor

The transportation corridor area includes 77 miles of the north access road (5 miles of this road falls in the mine site mapping area), from the mine site to the Diamond Point port on Cook Inlet. The transportation corridor area includes segments of the natural gas pipeline that fall within the transportation corridor.

Vegetation types in the Alternative 3 transportation corridor are shown in Figure 3.26-8. This area is characterized by a predominance of forest vegetation types, as compared to the same component under Alternative 1, which is dominated by shrub vegetation types.

AMERICAN OVERSIGHT

Figure 3.26-8: Alternative 3 – Transportation Corridor Vegetation Types

1 Project vegetation types were aggregated into vegetation type groups based on the dominant growth form (tree, shrub, or herb), vegetation density (open or closed canopy), and average height (tall, low, or dwarf).

2 All numbers are rounded. Apparent inconsistencies in sums are the result of rounding.

3.26.4.3 Diamond Port

[NOTE: SECTION WILL BE UPDATED WITH SUPPLEMENTAL MAPPING FOR THE DEIS]

3.26.4.4 Natural Gas Pipeline Corridor

NOTE: VEGETATION MAPPING DATA IS CURRENTLY UNAVAILABLE FOR THE PIPELINE SEGMENT FROM URSUS COVE TO DIAMOND POINT. DATA WILL BE UPDATED USING THE SUPPLEMENTAL MAPPING METHOD DESCRIBED IN 3.26.1.2 FOR THE DRAFT EIS.

See section 3.26.3.4 for a description of vegetation types for the natural gas pipeline crossing Cook Inlet to the Kenai Peninsula.

3.26.5 Rare and Sensitive Plants

The ACCS maintains a rare plant list for Alaska, tracking occurrences of over 300 rare plant species (ACCS 2018a; Nawrocki et al. 2013), some of which occur in the mapping area. However, no special statewide protections are afforded species on this list. ACCS ranks the species with a code that describes their population status on a global level (i.e., G-rank) and on a statewide level (i.e., S-rank). The status levels are ranked on a scale of one to five, where five

AMERICAN OVERSIGHT

is a common species with demonstrably secure populations, and one is a critically imperiled species whose populations are vulnerable to extirpation or extinction. Two occurrences of Chukchi primrose (*Primula tschuktschorum*) occur in the mapping area. This species is ranked S2, G2/G3. Both occurrences are in the North Fork Koktuli watershed; one approximately 2 miles west/southwest of Kaskanek Mountain, and 22 miles northwest of Iliamna, and the other 40 miles west of Iliamna.

Incidental observations of ACCS tracked vascular plant species that were recorded during project surveys included one species in the analysis area: Bering Sea dock (*Rumex beringensis*) located between Newhalen and the Upper Talarik Creek. In order to be confirmed and receive a state herbarium accession number, voucher specimens must be collected or carefully photographed for review and approval by a qualified botany expert. Researchers collected specimens in some, but not all, cases. The occurrence of Bering Sea dock was not positively confirmed, although a voucher specimen was collected. Other tracked species were observed outside the analysis area.

3.26.6 Climate Change

Climate change is currently affecting vegetation in the Project Area and throughout Alaska. Bristol Bay residents (ANTHC 2014) report changes in vegetation trends due to warmer and wetter conditions including rapid tree growth and expansion, new coastal wetlands, spread of invasive plant species, and that over the past few decades the tundra and shrub environment in the vicinity of the Project Area has been replaced by alder and willow trees. In 2013, Nondalton residents reported additional outbreaks of spruce bark beetle and aphids on the Nushagak River (ANTHC 2014).

Historically, Alaska's cold climate prevented non-native plants from becoming established, but in recent years there has been an influx of meadow hawkweed, Canada thistle, and spotted knapweed; now all have localized populations in Alaska. Other species such as reed canary grass and white sweetclover are very widespread (Carlson et al. 2007). Orange hawkweed, yellow toadflax, and oxeye daisy have been reported along the road system in Dillingham and Aleknagik by the Bristol Bay Native Association (ANTHC 2014). Species documented in Nondalton during a July 2013 site visit include Leontodon autumnalis, or fall dandelion (ANTHC 2014). Oxeye daisy has been observed in Nondalton (Bristol Bay Native Association 2014). Increasing dust and silt has been noted as a health concern in Levelock (Bristol Bay Native Association 2014).

Climate models predict that Bristol Bay region will experience rapid ecological change during the next 100 years. Computer models for climate change consider future "cliomes," areas where temperature and precipitation reflect certain kinds of wildlife and vegetation. Bristol Bay's current cliome "boreal forest with coastal influence and intermixed grass and tundra," is expected to shift north and largely disappear by 2090 (ANTHC 2014). It may be replaced by "prairie and grasslands," a cliome that does not currently occur in Alaska, and is characteristic of southeastern Alberta in Canada (Fresco et al. 2012).

LIST OF TABLES

No table of figures entries found.

AMERICAN OVERSIGHT

4.26 VEGETATION

Potential direct and indirect effects on vegetation include:

- Direct impacts from vegetation removal (including rare and sensitive species)
- Indirect impacts from invasive species introduction or spread
- Indirect impacts from fugitive dust
- Indirect impacts from dewatering

The analysis area for vegetation is the same as that described in Section 3.22, Wetlands/Special Aquatic Sites. It encompasses the nine Hydrologic Unit Code (HUC) 10 watersheds that could potentially be directly or indirectly impacted by the project, with a total area of approximately 6,420,000 acres. Impact assessments were considered, analyzed, and determined from the perspective of overall regional Alaskan vegetation affected. To contextualize project impacts, the analysis for vegetation makes use of publically available environmental data for the environmental impact statement (EIS) analysis area (the nine HUC 10 watersheds that could potentially be directly or indirectly impacted).

The magnitude of impacts to vegetation was assessed in terms of disturbance to above-ground vegetation and soil disturbance. Vegetation would be removed above the surface and include soil disturbance. Some areas of vegetation removal and soil disturbance would be reclaimed. The duration of impacts would be temporary, meaning removal and/or disturbance would occur during the construction phase; or permanent, meaning removal and/or disturbance would occur or remain after the construction phase, through the operations and into the closure and post-closure phases. The extent of impacts would be limited to areas of the project area in which vegetation would be removed/disturbed, or would affect vegetation outside of the project area, in one or more HUC 10 watersheds.

4.26.1 No Action Alternative

Under the No Action Alternative, the project would not be constructed, and would therefore have no new effects on vegetation.

4.26.2 Impacts Common to All Action Alternatives

Vegetation Removal

Shrubs, trees, understory vegetation, roots, and other obstructions such as large rocks and stumps would be cleared from construction work areas. Vegetation removal can result in changes to the surrounding environment including:

- Increased rate of soil erosion from wind or water
- Changes in water drainage patterns (increased runoff volumes)
- Sediment deposition in downslope areas
- Changes in adjacent vegetation type composition
- Changes in wildlife habitat
- Introduction or spread of invasive species

[NOTE: Project specific vegetation mapping is being updated for the DEIS; additional information and refinements may result in changes to acres reported in this review draft version].

AMERICAN OVERSIGHT

Rare or Sensitive Species

There are no occurrences of rare or sensitive plant species in any of the components or within a 1-mile radius of any of the components, therefore no direct impacts are expected.

Invasive Species

Project activities, especially construction and transportation, could cause the introduction and spread of invasive species throughout the project area. If project activities were to introduce new or spread existing invasive plant species it may adversely affect native plant populations by increasing competition and reducing biodiversity. Invasive plant species spread quickly and can displace native plants, prevent native plant growth, and create monocultures.

No invasive species have been documented in surveys or published literature in the project area. The four plant species that are considered not native to Alaska (common dandelion [*Taraxacum officinale*], lambsquarters [*Chenopodium album*], annual bluegrass [*Poa annua*], and pineapple weed [*Matricaria discoidea*] that have been documented adjacent to but outside of the analysis area are considered to be a low ecological risk (AKEPIC 2018). To reduce the risk of introducing or spreading invasive plant species, Best Management Practices (BMPs) would be applied for control of invasive species. An invasive species management strategy would describe the equipment, methodology, training, and assessment techniques that may be applied to avoid the introduction and spread of invasive species to the project area during permitted activities. Specific conditions may be described during the permitting process for specific permitted activities.

4.26.3 Action Alternative 1 – Applicant's Proposed Alternative

4.26.3.1 Mine Site

Vegetation Removal

Construction activities would require clearing, grading, and removal of vegetation in areas where the mine pit, tailings storage facility, overburden stockpiles, material sites, water management ponds, milling and processing facilities, access roads, and supporting infrastructure would be located.

A total of 7,677 acres of vegetation would be removed during construction of the mine site. Table 4.26-1 lists the acreage and percent of the vegetation types in the mine site area that would be affected by clearing, grading, and removal activities during construction. Acres of impacts to vegetation were calculated by overlaying the project footprint over mapped vegetation types in ArcGIS, and calculating the area impacted for each vegetation type per component.

In some locations, removal would be permanent (such as the mine pit that would become a pit lake, and bulk tailings storage facility that would become a new landform). In all other areas, removal would be temporary. In temporary disturbance areas, vegetation would be reestablished by reclamation, which would begin immediately after construction, and continue through to closure. In some areas, natural revegetation would be expected to occur. All road material sites would be stabilized and progressively reclaimed, but would remain active to support ongoing road maintenance requirements through operations. Mine laydown areas would be retained for use through operations. All construction roads would continue to serve as site access roads.

AMERICAN OVERSIGHT

Disturbed areas that are reclaimed would be expected to continue native vegetation success patterns over time, which would improve soil and habitat quality for wildlife. Successional species would include area native species as seeds and plant materials are dispersed and established on reclaimed sites. Vegetation reestablishment time of cleared or graded areas is variable. Trees and shrubs are expected to begin to re-establish almost immediately after construction and reclamation. Alders (*Alnus* spp.), willows (*Salix* spp.), and birch (*Betula* spp.) are generally the first trees and shrubs to re-establish. Reclamation details are discussed in greater detail in Section 3.22, Wetlands/Special Aquatic Sites.

Indirect Impacts. Areas without well-established vegetation may also be susceptible to introduction or spread of invasive plant species. In areas where vegetation is removed and is no longer present to intercept rainfall and reduce runoff, indirect effects could result from erosion of the exposed soil and sedimentation. Drainage and erosion control measures, both temporary and permanent, would be implemented at the mine site, and reclaimed areas would be reseeded. Impacts to soil are addressed in Section 4.14, Soils.

Table 4.26-1: Alternative 1* Mine Site Vegetation Removal

Vegetation Type	Acres Removed
Open Tall Shrub	288
Closed Tall Shrub	738
Open Low Shrub	1,384
Closed Low Shrub	150
Dwarf Shrub	3,968
Dry to Moist Herbaceous	298
Wet Herbaceous	483
Open Water	77
Other	291
Total	**7,677**

Source: Boggs et al. 2016 for vegetation types

*Alternative 3 has the same impacts.

Summer-Only Ferry Operations Variant

With this variant, concentrate would be stored at or near the mine site for up to 6 months per year. The mine site footprint would increase by 39 acres, the majority of which (i.e., 31 acres) is dwarf shrub.

Fugitive Dust

Fugitive dust emissions are a byproduct of construction activities. At the mine site, dust would be caused by vehicle travel on the mine roads and other unpaved surfaces in the mine, ore crushing, loading and unloading of materials, as well as by mining activities at the pit. Wind would also be expected to create dust from areas of the mine site that do not have vegetation due to vegetation removal.

The intensity of the impacts is expected to vary depending on proximity of vegetation to the source of the dust and the prevailing wind. Dust may cause variable physiological changes to vegetation depending on exposure length or level. The duration of the effects would be both seasonal, when dust is washed off during winter months (or when deciduous species lose leaves), and throughout construction. In some cases, impacts may extend beyond closure where physiological changes may occur to plants, or where vegetation community changes may

AMERICAN OVERSIGHT

take place. The geographic extent would be in areas adjacent to roads with vehicle traffic or in unpaved surface areas, and in the dust emissions areas, with the highest concentrations of dust closest to the source.

The effects of dust deposited on adjacent vegetation may include:

- Burial or elimination of vegetation in the most heavily impacted zones (Everett 1980)
- Reduction in vegetation biomass (Auerbach 1997)
- Decreased plant vitality due to reduced photosynthesis.
- Early snowmelt in roadside areas due to lower albedo (Klinger et al. 1983; Auerbach 1997)
- Early green-up of plants (Walker and Everett 1987)
- Increases in graminoid composition (Auerbach 1997),
- Decreases in sphagnum and other mosses and lichens (Walker et al. 1987a)
- Decreases in nutrient levels in soils (Auerbach 1997)
- Decreases in soil moisture
- Shallower organic horizon

Dust has the potential to collect on vegetation in the vicinity of the dust sources. Windblown dust could affect vegetation well beyond the source, but the effect diminishes with distance and is affected by prevailing winds and topography. During construction, a total of 74,504 acres could be affected by dust deposition from the mine site. The dominant vegetation types in this area are dwarf shrub and open low shrub. During operations, a total of 2,656 acres may be affected by dust deposition. The deposition of dust has also been analyzed in Section 4.14, Soils, with information on impacts to wetlands included in Section 4.22, Wetlands/Special Aquatic Sites.

A fugitive dust control plan would be developed for the project and the project, applying Best Available Control Technology (BACT) and BMPs for fugitive dust management. The plan would describe the equipment, methodology, training, and performance assessment techniques that would be used to control fugitive dust from site activities and wind erosion. PLP proposes to use covered containers to transport concentrate essentially eliminating potential for concentrate dust. While these measures are expected to reduce the amount of fugitive dust produced and dispersed, dust would still affect vegetation.

Dewatering

Groundwater lowering may reduce water availability to plant species. Response of terrestrial vegetation to reduced water availability depends on the water requirements of individual plant species, root depths, and tolerances. Plants with shallow root systems, such as paper birch (*Betula papyrifera*), Alaska blueberry (*Vaccinium alaskaense*) and bluejoint reedgrass (*Calamagrostis canadensis*), require a fairly constant supply of water and would be impacted to a greater extent than drought-tolerant or deep-rooted species. Impacts to vegetation from reduction in water availability may include stunted growth, greater susceptibility to disease (NCDENR 2009), and succession of more drought-tolerant species. Impacts would depend on the timing and location of the groundwater lowering and the tolerance of the vegetation types. Impacts to groundwater are discussed in Section 4.17, Groundwater Hydrology. Impacts to wetland vegetation are presented in Section 4.22, Wetlands/Special Aquatic Sites.

AMERICAN OVERSIGHT

4.26.3.2 Transportation and Natural Gas Pipeline Corridors

Vegetation Removal

Construction activities in the transportation and natural gas corridors would require clearing, grading, and removal of vegetation in areas where the roads, ferry terminals, laydown areas, material sites, and buried onshore pipeline would be located. During operations, periodic brushing of the revegetated pipeline corridor would occur. Segments of the natural gas pipeline adjacent to access roads are addressed in this section.

A total of 1,086 acres of vegetation would be removed. Table 4.26-2 lists the acreage and percent of the vegetation types that would be directly affected by clearing, grading, and removal activities with construction. Impacts associated some locations in these components would be temporary, because reclamation would occur shortly after installation. All temporary construction facilities would be removed after construction, and the sites, unless being used for permanent facilities, would be reclaimed. Temporary facilities associated with the transportation corridor on the western side of Cook Inlet include the camps established at the ferry landings.

The road system would be retained as long as required for the transport of bulk supplies needed for long-term post-closure water treatment and monitoring. The Iliamna Lake ferry facilities would be removed, and all closure-related supplies would be transported across the lake using a summer barging operation.

Table 4.26-2: Alternative 1 Transportation and Natural Gas Corridors Vegetation Removal

Vegetation Type	Acres Removed
Open/Closed Forest	115
Open Tall Shrub	143
Closed Tall Shrub	119
Open Low Shrub	69

Wet Herbaceous	14
Other	23
Total	**1,086**

Source: Boggs et al. 2016 for vegetation types

Kokhanok East Ferry Terminal Variant

With this variant the footprint and vegetation removal acres is expected to be similar to that of Alternative 1.

[NOTE: Project specific vegetation mapping is not currently available for this location; information and acreage will be included in the DEIS].

Fugitive Dust

Because the roads and pipeline cross several watersheds, these impacts are likely to affect a wider geographic area compared to the mine site. However, levels of dust accumulation would

AMERICAN OVERSIGHT

be lower along the roads because the dust-producing activities would be less frequent compared to the mine site (vehicles passing rather than ongoing movement of materials) and the smaller size of the unvegetated area (road width rather than entire mine site).

During project operations, daily transportation of materials (concentrate, fuel, reagents, and consumables) would require up to 35 truck round-trips per day on the road. Section 4.12, Transportation and Navigation, describes the type and amount of vehicles expected to use the roads. Vehicle traffic on gravel roads can produce dust that settles on the roadside. Dust would likely be generated during gravel placement, gravel compaction activities, and from vehicular traffic and equipment operation on gravel roads. The heaviest dust deposition would be anticipated to occur within 35 feet of the road (Walker and Everett 1987); however, dust has been documented at distances of 330 feet from the most heavily traveled roads in Prudhoe Bay (Walker et al. 1987a).

In summer, this dust can increase soil alkalinity, which reduces plant vigor in acidic tundra (Walker and Everett 1987), thus reducing the insulating effect of the vegetative cover to the underlying soil. During winter, the dust reduces the albedo of roadside snow, which initiates earlier melting and increases the cumulative heat absorption of the active layer. Snow acts as an insulator for the soil as well, and accelerated snowmelt reduces the insulating effect (Auerbach 1997). Loss of surface insulation, either by loss of vegetation or snow, causes earlier spring thaw and earlier freeze-up at the end of summer. Road grading and snowplowing may deposit gravel onto vegetation adjacent to the roads and pads. Over time, accumulation of gravel may compact or smother vegetation, reducing active layer insulation and increasing thaw. Thin deposits of dark-colored gravel may slightly reduce surface albedo, increase surface soil temperatures, and promote vegetation growth, which would better insulate the active layer. Overall, dust fallout, snow plow deposition, and other gravel spray onto the adjacent vegetation could impact a 35-foot-wide corridor of vegetation on each side of the road. Culvert maintenance and replacement would occur as needed. Potential effects due to culverts during operations would be downstream erosion and disturbance of the surface vegetation and soils in the work area.

4.26.3.3 Amakdedori Port

Vegetation Removal

Construction of the port would require clearing, grading, and removal of vegetation in areas along the access road, dredge stockpile area, and where the shore-based facilities would be located, such as facilities for receipt and storage of containers, fuel storage and transfer, power generation and distribution, maintenance, and employee accommodations.

All temporary construction facilities would be removed after construction, and the sites would be reclaimed, unless being used for permanent facilities. Temporary facilities associated with the port include the construction camp; however, this facility would be located in an area that would be used for port operations, and would not involve a separate footprint.

The Amakdedori port facilities would be removed and reclaimed after closure activities are completed, except for those required to support shallow draft tug and barge access to the dock for the transfer of bulk supplies.

A total of 14 acres of vegetation would be removed with the construction. Table 4.26-3 lists the acreage and percent of the vegetation types that would be directly affected by clearing, grading, and removal activities during construction and operation. The impacts would be the same for the Pile Supported Dock Variant.

4.26.4 Action Alternative 2 – North Road and Ferry

4.26.4.1 Mine Site

Under Alternative 2, the mine site footprint would be 119 acres larger than under Alternative 1. Indirect impacts would be similar but would occur in the larger footprint.

4.26.4.2 Transportation and Natural Gas Pipeline Corridors

Vegetation Removal

A total of 970 acres of vegetation would be removed with construction activities in the transportation corridor, and 667 acres would be removed in the natural gas pipeline corridor. Table 4.26-4 lists the acreage and percent of the vegetation types that would be directly affected by clearing, grading, and removal activities during construction in the transportation corridor. Table 4.26-5 lists the acreage and percent of the vegetation types in the natural gas pipeline corridor that would be directly affected.

Open Low Shrub	12
Dwarf Shrub	20
Dry to Moist Herbaceous	4
Wet Herbaceous	2
Other	4
Total	**667**

Source: Boggs et al. 2016 for vegetation type

Fugitive Dust

Impacts would be similar to those described in Alternative 1, but would be reduced due to the shorter road length.

4.26.4.3 Diamond Point Port

Construction activities would result in a permanent loss of 112 acres of vegetation at the Diamond Point port.

[NOTE: Project specific vegetation mapping is not currently available for this location; information will be included in the DEIS].

4.26.5 Action Alternative 3- North Road Only

4.26.5.1 Mine Site

Under Alternative 3, the mine site footprint would be the same as Alternative 1; therefore, both direct and indirect effects would be the same. See Table 4.26-1 for vegetation removal acres.

Concentrate Pipeline Variant

With this variant the mine site footprint and vegetation removal acres would be increased by approximately 1 acre.

4.26.5.2 Transportation and Natural Gas Pipeline Corridors

Vegetation Removal

Table 4.26-6 lists the acreage and percent of the grouped vegetation types in the transportation corridor that would be directly affected by clearing, grading, and removal activities during construction. Segments of the natural gas pipeline adjacent to access roads are included in these values. Table 4.26-7 lists the acreage and percent of the vegetation types in the natural gas pipeline corridor that would be directly affected. Segments of the natural gas pipeline that do not follow the access road corridors are included here (from the Diamond Point port to Ursus Cove, and from Ursus Cove across the Cook Inlet to the compressor station near Anchor Point on the Kenai Peninsula).

AMERICAN OVERSIGHT

Dry to Moist Herbaceous	3
Total	**26**

Source: Boggs et al. 2016 for vegetation type

Fugitive Dust

Impacts would be similar to those described in Alternative 2, but would be reduced due to the shorter road length.

4.26.5.3 Diamond Point Port

Under Alternative 3, the Diamond Point Port footprint would be the same as Alternative 2, described previously. Therefore, both direct and indirect effects would be the same.

4.26.5.4 Summary of Key Impacts

Depending on alternative, the project would cause the loss or conversion of 8,777 to 9,591 acres of vegetation. This represents 0.15% of the EIS analysis area.

Table 4.26-8 summaries the key issues for vegetation across all three alternatives. When possible, acreages of habitat that would be directly or indirectly impacted are included.

AMERICAN OVERSIGHT

Table 4.26-8: Summary of Vegetation Key Impacts

Impact Causing Project Component	Alternative 1 and Variants	Alternative 2 and Variants	Alternative 3 and Variants
Vegetation Removal	Permanent loss or conversion of 7,677 acres of vegetation at the mine site. Permanent loss of 1,086 acres of vegetation at the transportation corridor. Permanent loss of 14 acres of vegetation at the Amakdedori port.	Permanent loss or conversion of 7,796 acres of vegetation at the mine site, or7,716 acres under the summer-only operations variant. Permanent loss of 970 acres of vegetation along the transportation corridor. Permanent loss of 112 acres of vegetation at the Diamond Point port. Permanent loss of 667 acres of vegetation along the natural gas pipeline corridor.	Mine site – same as Alternative 1. Permanent loss of 1,657 acres of vegetation along the transportation corridor. Diamond Point port site – same as Alternative 2. Permanent loss of 26 acres of vegetation along the natural gas pipeline corridor.
Fugitive dust	Impacts to 2,656 acres of vegetation adjacent to the mine site throughout the life of the mine. Impacts to vegetation adjacent to the transportation corridor and Amakdedori port throughout the life of the mine and at the natural gas pipeline (mainly during construction).	Same as Alternative 1 except the port would be located at Diamond Point rather than Amakdedori.	Same as Alternative 2
Dewatering	Impacts to vegetation adjacent to the mine site throughout the life of the mine. No dewatering would occur at the port, or along the transportation or natural gas pipeline corridor, therefore there would be no impacts to vegetation.	Same as Alternative 1	Same as Alternative 1
Invasive species	Moderate potential for introduction and/or spread of invasive species would occur at the mine site, at the port, and along the transportation and natural gas pipeline corridors throughout the life of the mine.	Same as Alternative 1 except the port would be located at Diamond Point rather than Amakdedori and the transportation and natural gas pipelines would be along different routes.	Same as Alternative 1 except the port would be located at Diamond Point rather than Amakdedori and the transportation and natural gas pipelines would be along different routes.

4.26.5.5 Cumulative Effects

Past, present, and reasonably foreseeable future actions (RFFAs) in the cumulative impact study area have the potential to contribute cumulatively to vegetation impacts. Section 4.1 details the past, present, RFFAs considered for evaluation. Several of the RFFAs detailed in Section 4.1 are considered to have no potential for cumulatively impacting vegetation in the

AMERICAN OVERSIGHT

study area. These would include off-shore based developments such as oil and gas lease sales, in-river hydroelectric projects and non-industrialized point source activities that are unlikely to result in any appreciable impact beyond a temporary basis (e.g., tourism, recreation, fishing and hunting). Other RFFAs removed from further consideration include those sufficiently distant from the study area to eliminate infrastructure co-use by other parties (e.g., Donlin Gold, Copper Joe).

RFFAs that could contribute cumulatively to vegetation impacts, and are therefore considered in this analysis, are those activities that would occur within the analysis area. RFFAs, combined with natural events, have the potential to contribute to adverse effects on vegetation such as vegetation removal, dust impacts, changes in plant community diversity, and the risk of introduction or spread of invasive species.

The following RFFAs identified in Section 4.1 were carried forward in this analysis based on their potential to impact aquatic resources in the analysis area:

- Pebble project buildout- develop 55 percent of the resource over 78-year period
- Pebble South/PEB*
- Big Chunk South*
- Big Chunk North*
- Fog Lake*
- Groundhog*
- Diamond Point Rock Quarry
- Lake and Peninsula Transportation and Infrastructure

**Indicates exploration activities only.*

These actions have removed some vegetation and are likely to have resulted in the introduction and spread of invasive species. While these actions affected localized areas, they are additive to other vegetation removing actions, increasing the total acreage affected. As discussed previously, ground disturbing activities increases the risk of invasive plant species introduction or spread; more exposed soil means a greater risk. Dust effects can also be additive, as more dust-producing actions are implemented a greater area of vegetation is affected.

The expanded Pebble development scenario would increase the amount of vegetation removal, dust, and risk of invasive species and these impacts would be additive to those of the proposed project. The expansion would increase both the duration and geographic extent of the vegetation impacts described under the action alternatives above.

Anticipated road improvement projects in the region include new transportation corridors currently being studied in the Lake and Peninsula Borough, such as the Williamsport-Pile Bay road upgrade, Nondalton-Iliamna River Road corridor and bridge, and Kaskanak Road /Cook Inlet to Bristol Bay. The strategic plan for Illiamna includes a road connection to all villages in lake area for safer travel. As discussed previously, roads affect vegetation through direct removal and indirectly through dust deposition and increased potential for introduction and spread of invasive plant species. Road projects have high potential to cause invasive species impacts; not only during construction but also during operations as well as vehicles can easily carry seeds from one area to another. While BMPs can reduce the risk, the potential for impacts remains as long as the road is in operation.

The vegetation loss associated with these projects, when added to the past and present vegetation loss, increases the total acreage affected. Removal would be either permanent (in the case of some areas that are not planned for revegetation or reclamation, such as the pit

AMERICAN OVERSIGHT

lake), or temporary (areas that are planned for reclamation or areas in which natural revegetation is expected to occur). It is expected that some portion of the cleared areas would be replanted; however it is not likely that the area would return to its pre-disturbance vegetation type; some conversion of vegetation communities is expected.

Additional RFFAs expected to affect vegetation in the region include mineral and oil and gas exploration and development, energy and utilities projects, the Diamond Point rock quarry, and various village infrastructure development projects. These projects are anticipated to include vegetation removal resulting in a net loss of vegetation and conversion of vegetation communities, as well as dust deposition and increased risk of invasive plant species.

The effects of the project on vegetation would be additive to the similar effects of past, present, and RFFAs. Specifically, vegetation removal (as the number of vegetation-clearing activities increases), dust (increasing as more roads are built and used), and risk of invasive species (which is also being increased by climate change).The areal extent of impacts to vegetation from these actions is a small proportion compared to the distribution of vegetation types throughout region. The ongoing or future similar activities would likely induce little overall change to regional vegetation types in the EIS analysis area. Overall, the cumulative impacts on vegetation from the project and the past, present and reasonably foreseeable future actions are expected to be measureable, but geographically limited.

Hello Shane,
Thank you for the opportunity to review the draft Appendix B: Alternatives Development Process. Our comments are attached. Please let me know if you have any questions regarding EPA's recommendations.
Regards,
Molly

AMERICAN OVERSIGHT

From: James Fueg, Pebble Limited Partnership

To: Shane McCoy, US Army Corps of Engineers

Date: June 5th, 2018

Response to RFI-032 Project Options

This technical note is an initial response to RFI-032 that addresses:

1) Layout Option 3

Layout Option 3

As outlined in PLP's Technical Note of May 11th, 2018 on updates to the proposed project, the use of Layout Option 3 has been included in PLP's proposed project and will be the basis for PLP's application moving forward. Figure 1 shows the proposed layout, which also includes the changes associated with the increased mill throughput (180,000 tons per day) and increased life-of-mine tons milled (1.5 billion tons).

Relative to Layout Option 1 this results in the following changes:

1) The ultimate pit footprint has increased by approximately 8%, with the boundary of the pit and the associated perimeter road moving on the south-east side.
2) The low-grade ore stockpile has been removed and the location is now used to store pyritic tails and PAG waste rock.
3) The single, multi-cell tailings storage facility (TSF) is replaced by two separate facilities, one for bulk tails (unlined) and one for pyritic tails (lined). PAG waste will also be stored in the pyritic TSF. The bulk TSF southern embankment is moved approximately 2000 feet to the south to take better advantage of the existing terrain for the embankment construction. The main (northern) embankment of the bulk TSF remains a flow-through design to facilitate water management within the bulk TSF.
4) The main water management pond and the low-grade ore stockpile water management ponds have been replaced by the larger main water management pond. This has increased the contact water storage capacity from approximately 8,000 acre-feet to 69,000 acre-feet.

These changes result in the following:

1) Placement of PAG waste and pyritic tails back into the pit at closure. Following the cessation of operations, the pyritic tails and PAG waste will be relocated to the bottom of the open pit for

AMERICAN OVERSIGHT

permanent subaqueous storage below ground level, the pyritic TSF embankments will be breached, the liner will be removed, and the facility will be reclaimed.

a. This provides important long-term benefits:
    i. The need for perpetual maintenance and water treatment of the pyritic TSF is eliminated.
    ii. Storage of the pyritic tails below ground level eliminates all potential for downstream failure impacts associated with the pyritic tails storage after closure.
    iii. Storage of the pyritic tails and PAG waste rock below water at the bottom of the pit is the best means of preventing acid generation over the long term.

2) Embankment designs associated with the facilities are as follows:

Facility	Embankment	Design/Construction	Maximum Crest Height (ft)
Bulk TSF	Main (North)	Flow Through/Centerline	530
Bulk TSF	South	Low Permeability/Downstream	305
Bulk TSF	East	No Embankment	-
Pyritic TSF	North	Lined Facility/Downstream	405
Pyritic TSF	South	Lined Facility/Downstream	260
Pyritic TSF	East	Lined Facility/Downstream	250
Main Water Management Pond	North	Lined Pond/Downstream	195
Main Water Management Pond	West	Lined Pond/Downstream	195

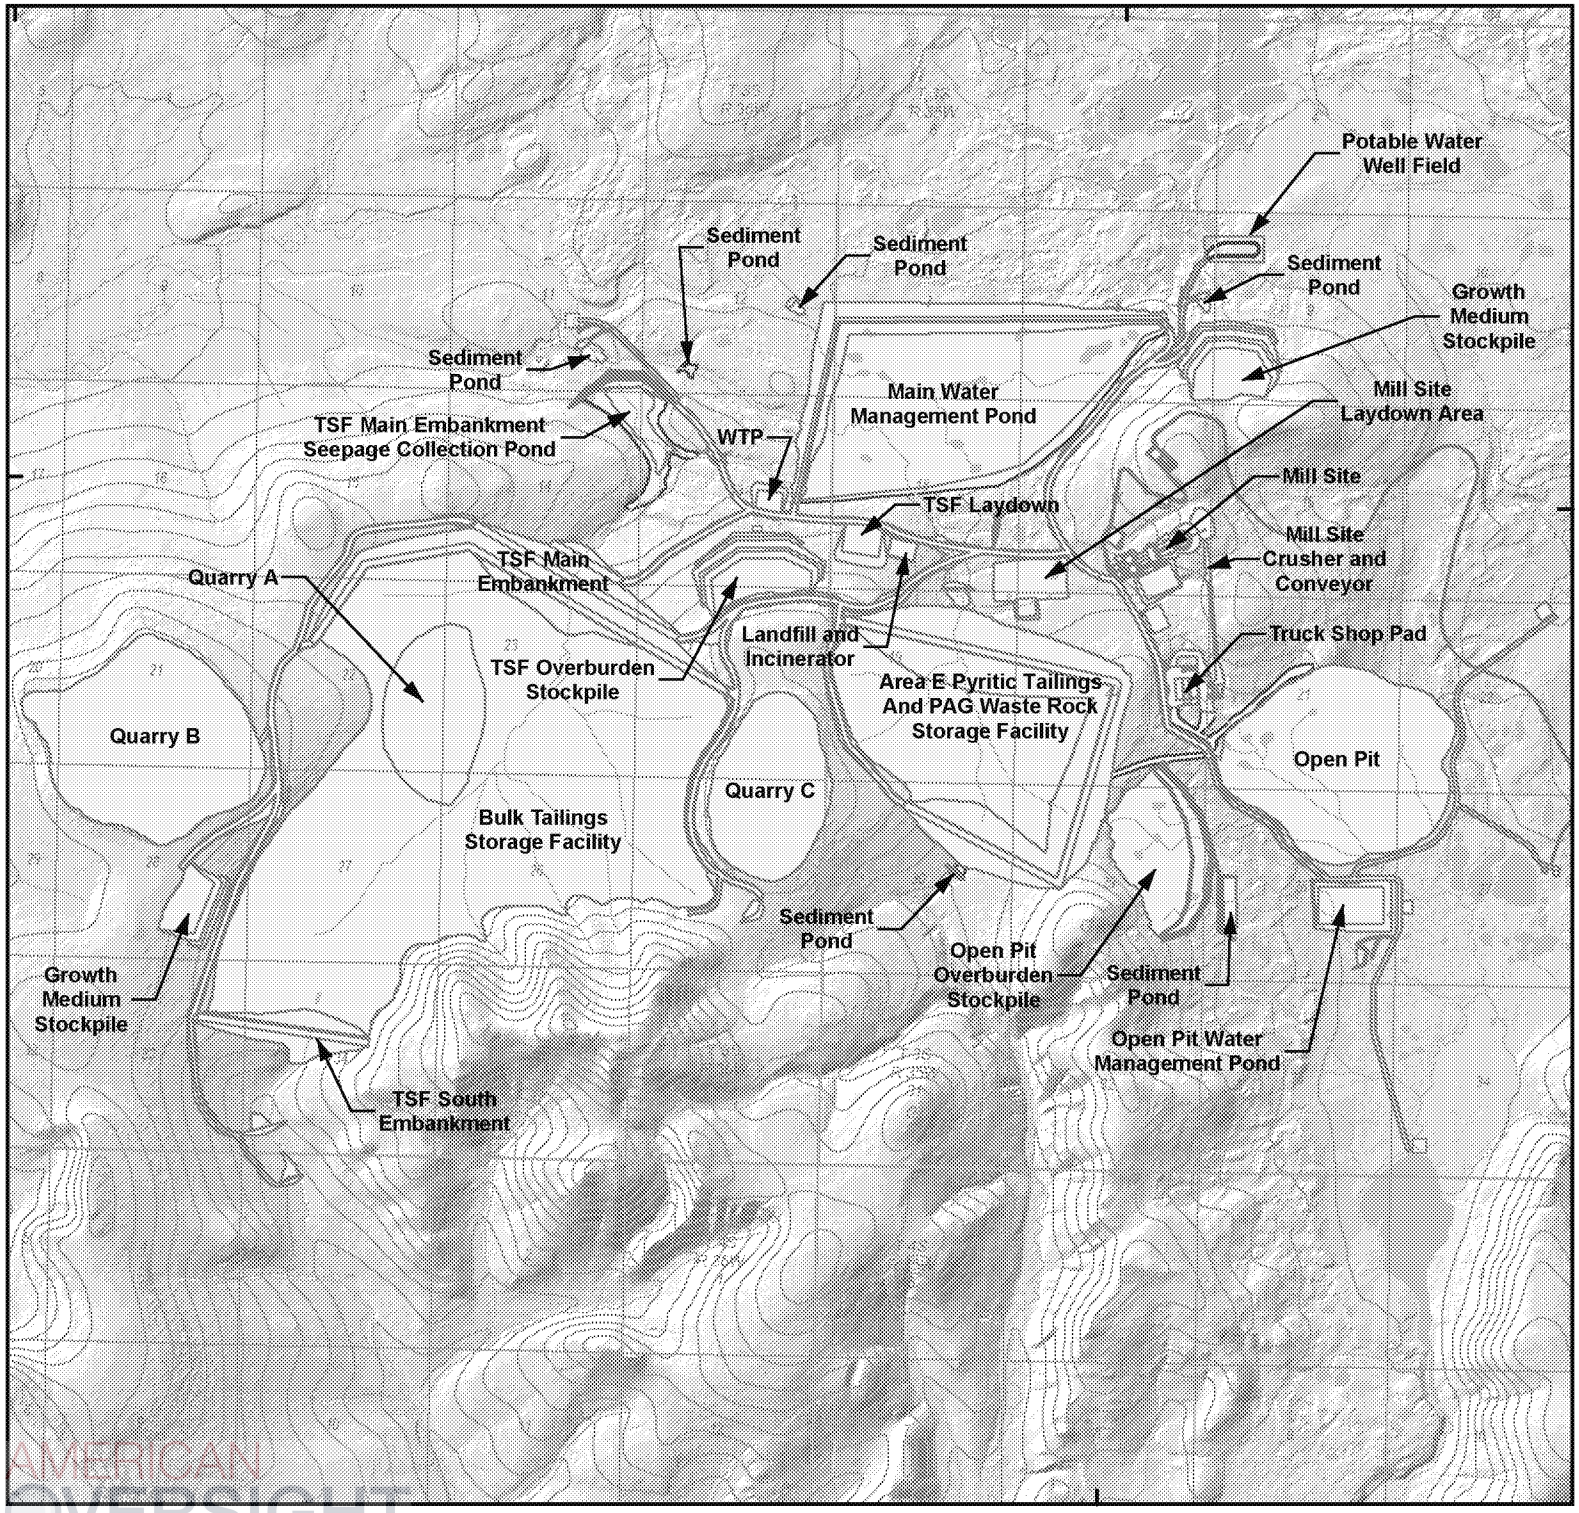

Table 1 – Embankments

3) Increased ability to store additional process contact water separate from the TSF facilities, improving the project's ability to deal with multi-year precipitation variability.
4) Additional water storage capacity in the event of water treatment facility upset conditions.
5) Additional certainty for the supply of process water during dry conditions.
6) Increased flexibility to treat and release water, and improved ability to optimize discharges and minimize downstream impacts.
7) The footprint during operations of all the major facilities (pit, tailings, waste, and water storage facilities) has increased by approximately 1030 acres with the updated layout, principally due to the increased footprint of the main water management pond. However, the long-term post closure footprint of the major facilities will decrease by approximately 50 acres due to the revised closure concept for the pyritic tails.

AMERICAN OVERSIGHT

8) Removes the requirement for perpetual post-closure management of the pyritic tails. In conjunction with the dry closure of the bulk TSF, this reduces post closure site maintenance requirements and the associated impacts (traffic, power generation, water treatment), while further reducing any potential long-term risk associated with TSF embankment failure.

RFI 062
Pebble Project EIS

Request for Information

Title/Subject:	**Scenario for Expanded Development of Pebble**
Requestor:	**Jon Isaacs, AECOM**
Date Transmitted:	**8/83/2018**
Recipient:	**Pebble Limited Partnership**
Response Requested by:	**8/2043/2018**
Rationale:	**The USACE has decided to evaluate the cumulative effects of the 78 year resource case that was presented in the Wardrop 2011 Preliminary Assessment of the Pebble Project Southwest Alaska, prepared for Northern Dynasty Minerals Ltd. The 2011 report provides some description of a 78 year buildout to include that it would develop 55 percent of the resource. While the Wardrop report presents mine pit dimensions and an excavation profile for the 78 year scenario, it does not contain a schematic of other mine site facilities, or any description of continued use of transportation facilities.** **The 2014 EPA report titled *An Assessment of Potential Mining Impacts on Salmon Ecosystems of Bristol Bay, Alaska – Volume 1* presents a Pebble 6.5 mine development scenario based on a mine size with a volume similar to the 78 year resource case presented in Wardrop 2011. The 2014 EPA report also presents a mine site layout/footprint, along with tabular data on a number of parameters associated with the Pebble 6.5 scenario. The 2014 EPA report notes that their mine scenarios were developed by the EPA for the purpose of the assessment, but relied on specifics put forth in the 2011 Wardrop report.**
Describe the Information Requested and Level of Detail:	**Please provide a conceptual mine facility layout and written description for the 78 year resource case buildout scenario. The conceptual layout and description should include graphics and the dimensions of the mine pit, tailings storage facilities, waste rock storage facilities, water management and seepage ponds, quarries, overburden storage areas, processing facilities, and any additional transportation, pipeline, or power facilities that would be needed.**

Recipient Response Form

Date Received from USACE:	Click here to enter text.

Subject: RE: Pebble PDEIS sections extension request (UNCLASSIFIED)

CLASSIFICATION: UNCLASSIFIED

Thank you Patty
It is always a pleasure to talk with you. As we discussed, I foresee the extension for EPA will be until at least 21 Dec. We will discuss internally and provide a response via phone or email on Monday. Have a wonderful Thanksgiving!
Vr
Sheila

Subject: [Non-DoD Source] Pebble PDEIS sections extension request

Hi Sheila-

Thanks for the conversation this morning.

Our schedule extension request is for sections of chapter 3, chapter 4, and appendix K and chapter 5 in areas of our assigned special expertise (soils, surface water hydrology, hydrogeology, water & sediment quality, vegetation) and we are requesting until December 31 to submit comments. We think this request is reasonable due to the late submittal of some of the section figures, the content of the sections, and the reliance of these sections on a significant volume of reference documents that we are also reviewing.

Please let me know if you have further questions.

Best regards-

Patty

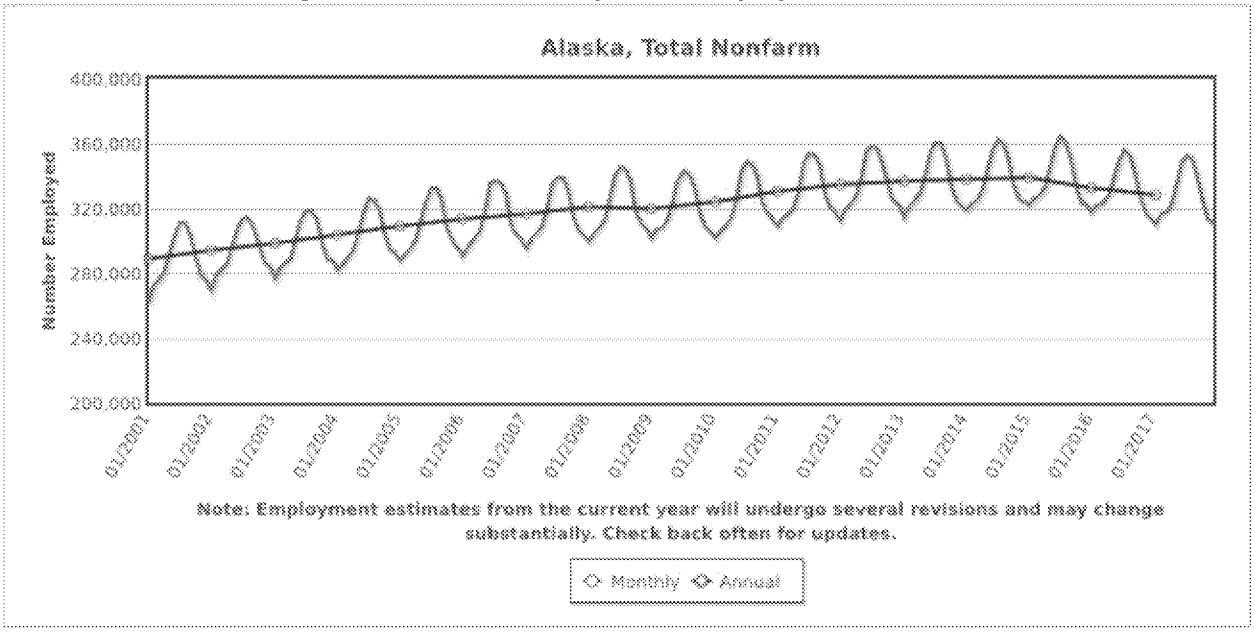
3.3 NEEDS AND WELFARE OF THE PEOPLE –SOCIOECONOMICS

This section addresses the monetized economy of the communities listed below. In addition to jobs involving labor for wages, subsistence hunting and fishing can be an important component of the socioeconomic system in rural Alaska communities. Although subsistence frequently involves no monetary exchange, the contribution of food procured by hunting and fishing can be a significant contributor to household and community welfare. Subsistence activity is discussed in Section 4.9, Subsistence.

3.3.1 Regional Setting

3.3.1.1 Overview of the Regional Economy

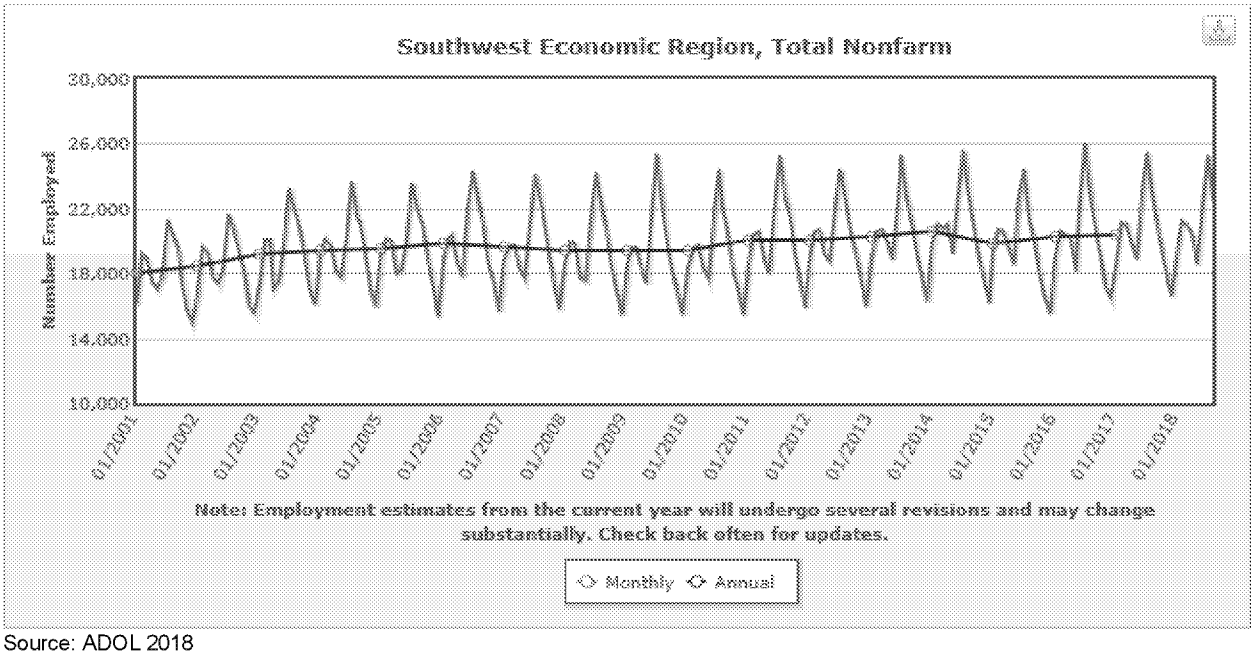
The State of Alaska relies on revenue from natural resource extraction of federal, state, and private lands as a primary source of income. Alaska collects oil and gas production taxes and royalties based on the assessed value of the gross product. The state also receives production royalty payments from production of minerals on a state mining claim or state lands; state and local governments also collect and share property tax on facilities built to support resource development.



Alaska has a long history of boom-bust cycles associated with resource extraction (e.g., oil and gold) that have impacted this tax revenue and the state economy. To help smooth revenue and investments, the State of Alaska established the Alaska Permanent Fund (APF), which was incorporated into the Alaska constitution in 1977. The APF is a permanent natural resource trust fund used to pay citizen dividends, manage inflation, and support the general fund. To support the fund, 25 percent of the State's income from mineral extraction is placed in the APF. As of August 2017, the APF had a market value of $60 billion (USDOI 2018).

While large boom-bust cycles have not occurred for the past quarter century, local communities and regions can experience boom-bust cycles related to projects that occur in their area. These cycles can occur from the influx of workers and income during the construction cycle, to the more moderate employment during operations, to the loss of a major employer in the area after closure. In Alaska, recessions have more typically been triggered by a drop in oil prices, resulting in slowdown of spending in the oil industry and a drop in state revenues. With regard to the mining industry, cyclical metal prices can affect mining industry investment. However, most of the large operating mines in Alaska have been successful in finding additional reserves adjacent to their mine, extending their operating life and postponing a potential "bust" cycle.

Regardless of any boom-bust cycles, employment in Alaska varies greatly throughout the year. Many of the jobs in Alaska are seasonal, leading to large fluctuation in employment between the summertime peaks and the wintertime lows. Figure 3.3-1 and Figure 3.3-2 show the cyclical characteristic of seasonal employment in Alaska and the Southwest Economic Region, respectively. Much of the seasonal employment is related to the commercial fishing and tourism industries. Some workers with year-round employment also participate in seasonal work activities.

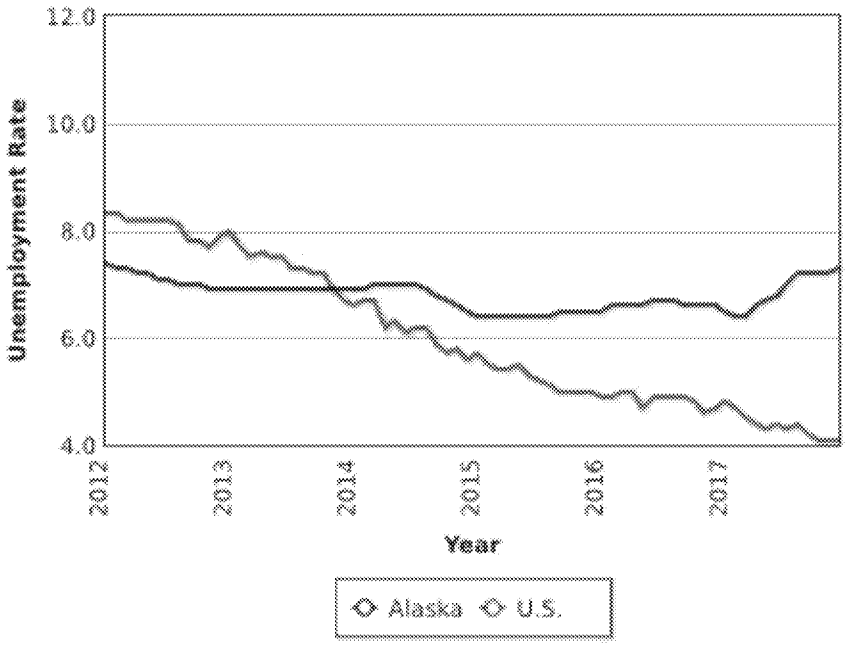


AMERICAN OVERSIGHT

Figure 3.3-1: Seasonal Impact on Employment in Alaska

Source: ADOL 2018

Figure 3.3-2: Seasonal Impact on Employment in Alaska



Source: ADOL 2018

While the unemployment rate for the United States as a whole has been decreasing for a number of years, the unemployment rate in Alaska has remained relatively steady at about 7 percent (Figure 3.3-3).

AMERICAN OVERSIGHT

Figure 3.3-3: Recent Trends in Unemployment Rate

Source: ADOL 2018

With regard to the economies of the portions of Alaska potentially affected by development of the project, there are three distinct profiles. The area on the eastern side of Cook Inlet, Anchorage and the Kenai Peninsula Borough, generally have a more diverse economy, although there is still some seasonality in employment. The lower area of the Dillingham Census Area and coastal portions of the Lake and Peninsula Borough are dominated by the commercial salmon fishery and the economic activity it generates. While communities around Iliamna Lake and upriver in the Dillingham Census Area have less participation in commercial salmon fishing, they are more typical of small roadless rural Alaskan communities, with economic activities limited to local government, Alaska Native organizations, and some support of commercial recreation and tourism. Refer to Section 3.6, Commercial and Recreational Fisheries, for more information.

Southern Kenai Peninsula Borough

In relation to most Alaskan communities, the Kenai Peninsula Borough's economy is more diverse, with a mix of emerging and established industries. The top five performing industries by total employment are health care and social services, local government, retail trade, accommodations and food services, and commercial fishing; while the top two industries by employee wages are utilities and oil, gas, and mining. In 2016, Kenai Peninsula workers earned over $3 billion in wages (KPB 2017).

While the oil and gas sector provides significant employment and revenue to the borough, non-oil and gas mining only represents a small portion of the economic activity, accounting for less than 0.2 percent of the Kenai Peninsula's total private employment and wages (KPB 2017). However, seasonal fluctuations in employment affect many of the industry sectors, including tourism and hospitality, commercial fishing, and construction.

AMERICAN OVERSIGHT

Lake and Peninsula Borough and Dillingham Census Area

As noted in the Lake and Peninsula Borough Comprehensive Plan Update (LPB 2012), there are three primary components of the economy, which are also appropriate for the area of analysis on the western side of Cook Inlet and Dillingham Census Area:

1. **Commercial Fishing.** Portions of both the Lake and Peninsula Borough and Dillingham Census Area are part of the world-renown Bristol Bay fishery. Residents living in the region participate in the fishery to a varying degree through commercial fishing, subsistence activities, as well as through support of commercial and sport fishing. Commercial fisheries permit holders residing in the region have decreased in recent years as permits have transferred out of region, but the value of permits and fish caught has held steady. Commercial fishing continues to be a major way of living for some residents in the region and constitutes over half of all self-employed workers. See Section 3.6, Commercial and Recreation Fisheries, for more information. Areas around the proposed mine site rely less on commercial fishing as an industry.
2. **Local Government.** A large percentage of employment in the Lake and Peninsula Borough is in local government, with the majority employed by the school districts. Local government also provides employment in other regional communities such as Dillingham, King Salmon, and Naknek. These jobs are important to the community because they tend to have higher pay and offer year-round employment.
3. **Other Industries and Small Businesses.** After accounting for the primary economic sectors (commercial fishing and local government), residents of the region are engaged in a range of business activities, including transportation and utilities, state government, health services, tourism, and other small businesses. The region also engages heavily in subsistence activities. While the region supports a multi-million dollar sport fishing and hunting industry, a large majority of the earnings do not go to local residents. In addition, most tourism is seasonal and the opportunities conflict with other economic sectors and activities, such as commercial fishing, construction, and subsistence.

Many communities have been exploring small business opportunities for residents to increase local employment. However, most communities in the region have too small of a population to support a single service provider, so new businesses will often have to plan for a regional market in order to be successful.

3.3.1.2 Overview of the Cost of Living

In general, the cost of living in Alaska is higher than most areas of the United States. In 2017, Alaska was ranked as the third most expensive state based on the costs of living in the four largest Alaskan cities (i.e., Anchorage, Juneau, Fairbanks, and Kodiak), which were all well above the national average. While fuel costs have been decreasing in recent years, health care premiums increased 29 percent from 2016 to 2017. Alaska has the highest health care premiums (purchased on the open market) of any state (ADOL 2017a).

While taxes tend to be lower in Alaska, the cost of transportation, food, energy, and fuel is higher. Transportation is one of the main reasons the costs of living are higher in Alaska (ADOL 2017a, ADOL 2008), which is compounded in rural areas. Getting food, fuel, and other goods to Alaska is a little more expensive than other parts of the United States, and then the items need to be transported over a large geographic area to small population clusters. In some communities, staple goods, such as food and fuel, cost over twice as much as they do in Anchorage because the items need to be transported by barge or air. Costs were found to be highest in communities served by air and seasonally by barge. In the Lake and Peninsula Borough, the cost of fuel has been historically higher in Iliamna Lake communities, and

AMERICAN OVERSIGHT

population decline is partly driven by an increasingly high cost of living in remote communities (LPB 2012).

While the cost of living can be high in rural communities, subsistence hunting and fishing often supplement the needs of families and communities. However, supporting subsistence hunting and fishing activities can be more expensive in rural communities because of the higher cost of supplies, such as fuel, ammunition, and vehicles.

3.3.1.3 Overview of the Regional Infrastructure

The following sections provide a brief overview of the infrastructure in Alaska, with a focus on the region surrounding the potential mine site.

Education

Alaska is comprised of 54 school districts (ADEED 2018), which serve about 143,000 students. For fiscal year 2015, the National Center of Education Statistics reported that Alaska has one of the highest expenditures per pupil (NCES 2018). Alaska spent $2.9 billion on education, with a per pupil expenditure of $20,191. This is about 76 percent higher than the national average of $11,454.

School closures are a serious challenge faced by rural Alaska communities around the state. Alaska state law (AS14.17.450) cuts off state funds for schools with nine or fewer students. Falling population can create a challenging cycle, in which declines in the number of residents lead to school closures, declining services, and fewer economic opportunities; these trends can lead to further population declines. Since schools are often the largest electricity customer, the closing of a school leaves fewer customers to support the electricity network and can lead to higher energy prices for the residents of the community (LPB 2012).

Opportunities for higher education in Alaska exist through a number of colleges and universities located throughout the state, including five two-year community colleges, three primary branches of the University of Alaska, and four private institutions. In addition, through the Western Undergraduate Exchange, residents of Alaska can attend colleges and universities at participating schools in 16 states and US territories and pay no more than 150 percent of the in-state tuition.

Lake and Peninsula Borough. The Lake and Peninsula Borough School District has 13 public schools, from Port Alsworth in the north to Perryville in the south. However, a number of Lake and Peninsula Borough communities are facing population loss and potential school closings; the Dena'ina school in Pedro Bay closed in November 2010 (LPB 2012). While s communities have local road systems, only Iliamna and Newhalen (and Nondalton, seasonally) are connected by road and none of the communities are connected to the rest of Alaska by roadway; all transportation is by boat or small plane (ADEED 2018).

Bristol Bay Borough. The Bristol Bay Borough School District is comprised of the elementary and middle/high school located in Naknek (total enrollment 118). While communities have local road systems, only King Salmon and Naknek are connected by road and none of the communities are connected to the rest of Alaska by roadway; all transportation is by boat or small plane (ADEED 2018).

Dillingham Census Area

The Southwest Region School District has seven public schools with a total enrollment of 705 students (SRSD 2009), from Manokotak in the south to Koliganek in the north. The Dillingham City School District had a total enrollment of 473 in 2016/2017. While communities have local

AMERICAN OVERSIGHT

road systems, only Aleknagik and Dillingham are connected by road and none of the communities are connected to the rest of Alaska by roadway; all transportation is by boat or small plane.

Transportation

While most Alaskan communities have local roads, approximately 82 percent of these communities have no connection to the contiguous road system or interregional roads (ADOT&PF 2018a). With small populations in remote, scattered locations, the per-capita costs of building and maintaining transportation infrastructure is high. Therefore, building new roads to connect the communities is unlikely and Alaska will continue to rely on a combination of air, road, and marine transportation to serve the population. Brief descriptions of these modes of transportation are provided below. See Section 3.12, Transportation, for more information on the existing transportation systems in the EIS analysis area.

Air

Large portions of Alaska are only accessible by air or water. These communities depend on aviation for access to non-subsistence foods, mail, and health care. Alaska Department of Transportation and Public Facilities (ADOT&PF) owns and operates 242 of the 400 public use airports in Alaska and has identified rural airports as "Alaska's Lifeline." In addition to the public use airports, another 300 landing facilities are registered with the Federal Aviation Administration in Alaska, and thousands of private landing facilities and lakes are not registered (ASCE 2017). The people of Alaska are eight times more likely to use aviation as transportation than people in the rest of the United States (ADOT&PF 2018a). Aviation in Alaska is a huge economic engine, contributing approximately $3.5 billion annually to the state's economy.

Most communities in the region rely on air transportation for movement of people and goods into and within the region. Iliamna Airport is the primary air transportation hub for the region near the mine site, and Dillingham is a hub for the lower river communities. Scheduled air service provides transportation of passengers to the regional hubs, while air taxis and charter service transport passengers from the hubs to local communities. For most of the year, air cargo is the only means of transporting goods to many of the communities in the area (McDowell Group et al. 2011a). In addition to serving local communities, small aircraft provide primary transportation associated with recreation and tourism activities, including sport hunting and fishing, wildlife viewing, and visitation to federal and state parks and reserves.

Road

The ADOT&PF maintains 5,609 centerline miles of highways, 3,737 miles of which are paved. The highway system provides connectivity for freight and travel from the lower 48 states through Canada into Alaska, and from Alaska's economic hub, Anchorage, to those communities that are connected to the road system, which includes the southern Kenai Peninsula portion of the area affected by the proposed Pebble Project. The highway system, although very limited in total miles compared to most states, is vital to the economic growth and development of the state (ASCE 2017). The portion of Alaska connected to the road system also includes municipal and borough maintained roadways, typically a mixture of paved and unpaved roads in Alaska's hub towns and cities. These hub towns and cities are the main population centers spread across the state where goods are typically shipped to in order to reach more remote communities by road, marine and air transportation (ASCE 2017).

Village and rural roadways consist mainly of unpaved roads, walkways, trails, and boardwalks in areas outside of Alaska's hub towns. Local roadways in rural areas are typically maintained by

AMERICAN OVERSIGHT

local village governments and regional native corporations. The roads, walkways, trails, and boardwalks are of importance to locals because they serve as routes to health care facilities, schools, and routes to subsistence hunting and fishing locations (ASCE 2017).

In the immediate study area, the Iliamna/Newhalen area has the most extensive local road system in the areas near the Mine Site. King Salmon/Naknek and Dillingham have an extensive road network for the lower river communities. Elsewhere, road systems and vehicle use are limited (McDowell Group et al. 2011a).

In addition to community-based road systems, the Williamsport-Pile Bay Road provides access between Cook Inlet and Bristol Bay, via a 15.5 mile road to Iliamna Lake and down the Kvichak River. This road allows summer season transportation of fishing vessels bound for Bristol Bay commercial fisheries, as well as some goods and supply transport to lake and river communities. The road is owned and maintained by the State of Alaska.

Marine

Ports and harbors across Alaska provide services that support critical economic activities. These facilities play a vital role in the communities they serve by providing bulk goods and services and local employment opportunities; promoting economic diversification; and meeting cultural and subsistence lifestyles. In 2015, 40.8 million tons of goods were moved out of the state and 3.4 million tons of goods into the state via marine transport. Ports and harbors are also critical to the commercial fishing industry, which support six of the top ten fishing ports by volume in the United States (ASCE 2017).

Many of the communities in the region can be accessed via water to deliver cargo, such as fuel and other objects too heavy or bulky to ship by air. Many of the regional communities are on Iliamna Lake, which can be accessed from the Kvichak River and the Williamsport-Pile Bay Road. However, Kvichak River access has been hindered due to low water levels and shoaling (McDowell Group et al. 2011a).

In addition to commercial marine traffic, personal watercraft, particularly skiffs, are a major means of travel to subsistence activities and travel between communities during the open water season on lakes and rivers. During the period when ice allows safe travel, snowmachines provide similar access. Refer to Section 3.12, Transportation and Navigation, for more information.

Health Services

Public health services are available in project area communities, but may be limited in the smaller communities.

The Bristol Bay Area Health Corporation is a regional provider that operates a hospital, sub-regional clinics, and village clinics in the Bristol Bay region. Health clinics are also supported by the boroughs. In addition, state and federal agencies have special responsibilities to support health care for Alaska Natives (McDowell Group et al. 2011a). Because of easier access to Anchorage, many of the residents in the Iliamna and Lake Clark communities receive hospital care in Anchorage. Many residents in the Bristol Bay area receive hospital care in Dillingham (McDowell Group et al. 2011a). See Section 3.10, Health and Safety, for additional information on health services.

Water, Sewer, and Solid Waste

Alaska's water and wastewater systems can be generally divided into two categories: municipal and rural. Most municipal systems that serve more densely populated areas have long term

AMERICAN OVERSIGHT

operations, maintenance staff, and funding. The state has over 280 rural communities, 31 of which have no centralized water or wastewater system. For those rural communities that have water and wastewater systems, operating and maintaining systems are challenged by the high cost of energy, lack of population to support higher than average maintenance costs, and a shortage of experienced operators to maintain the systems (ASCE 2017).

Many of the unincorporated communities have water and/or sewer systems funded through the Alaska Native Tribal Health Consortium and the State's Village Safe Water Program. The Alaska Department of Environmental Conservation administers the Village Safe Water Program, which is working with rural communities to develop sustainable sanitation facilities. Many of the water and sewer improvements depend on federal funding (KPB 2017).

In rural Alaska, community water and sewer systems are primarily comprised of four types: washeterias and central watering points; individual wells and septic systems; water and sewer truck or trailer haul systems; and piped water and sewer systems. While most of the rural communities have some form of water and sewer system, there are approximately 30 communities that are considered unserved (i.e. a community where 45 percent or less of the homes are served by a piped, septic and well, or covered haul system). There are no unserved communities in the study area (ADEC 2018).

In the project area, water systems are present in:

- Igiugig
- Iliamna
- Kokhanok
- Levelock
- Nandalton
- Newhalen
- Port Alsworth

The expanse of Alaska and limited road access make dealing with solid waste a challenge. Collecting waste from Alaska's outermost communities must be done either by air or sea, or waste must be left in the community. Many rural communities have local facilities such as landfills, incinerators, or burn boxes to handle solid waste. The Alaska Department of Environmental Conservation supports many landfill facilities (ASCE 2018).

3.3.2 Potentially Affected Communities

Construction and operation of the proposed mine would have impacts to local and regional socioeconomic conditions. This section provides information about the current socioeconomic conditions of potentially affected communities. Potentially affected communities were identified based on potential impacts from any of the major components of the proposed project. The following subsections describe the general social and economic characteristics of the potentially affected communities.

3.3.2.1 Population

Table 3.3-1 displays population characteristics of the affected communities. Many of the potentially affected communities in the Lake and Peninsula Borough (where the mine would be located) are small. While some have seen an increase in population from 2010 to 2017, others have decreased. Refer to Section 3.4, Environmental Justice, for the racial characteristics of the potentially affected communities.

AMERICAN OVERSIGHT

Table 3.3-1: Population Characteristics of Affected Communities

Area	Population[1]			Age[2]				Gender[2]	
	2010	2017	Change 2010-2017	Under 18	18-64	65 and Over	Median Age	Male	Female

Anchorage	291,826	297,483	1.9%	25%	66%	9%	32.8	51.0%	49.0%
Alaska	710,231	737,080	3.8%	26%	65%	9%	33.6	52.3%	47.7%

Source: [1]ADOL 2018, [2]USCB 2017

Table 3.3-2 shows the population projections through 2045 at the borough and state level. The population of the Lake and Peninsula Borough through 2045 is not projected to increase by much, whereas the population for Alaska is projected to increase about 22 percent by 2045. The Dillingham Census Area would see a modest increase, whereas the Bristol Bay Borough is projected to decrease by 34 percent.

Table 3.3-2: Population Projections for Study Area

Area	2017	2025	2035	2045
Lake and Peninsula Borough	1,721	1,708	1,720	1,751
Dillingham Census Area	4,925	5,289	5,556	5,984
Kenai Peninsula Borough	58,049	62,845	66,271	68,423
Bristol Bay Borough	887	790	675	581
Anchorage	297,483	318,629	330,821	339,171
State of Alaska	737,080	802,352	854,104	899,825

Notes: 2017 population is estimated population from the US Census Bureau, American Community Survey (ACS) 2012-2016.

3.3.2.2 Economy and Income

The median household income and unemployment vary across the affected communities (Table 3.3-3). Bristol Bay Borough had the highest median household income of $88,000 of the communities reviewed, while Levelock had the lowest at less than $34,000. In comparison, the median household income for Alaska is approximately $75,000, and $55,000 for the United States. The unemployment rate also varied across the affected communities, from a low of zero percent in some communities, to a high of almost 30 percent in Kokhanok. The importance of subsistence as it relates to income is discussed in Section 3.9.

Table 3.3-3: Median Household Income and Unemployment Rate of Affected Communities

Area	Median Household Income (margin of error)	Unemployment Rate (margin of error)
Lake and Peninsula Borough	$43,864 ($4,294)	11.7% (2.9%)
Igiugig	$46,875 ($30,459)	4.3% (10.3%)
Iliamna	$67,500 ($4,294)	7.0% (2.9%)
Kokhanok	$35,000 ($13,041)	29.9% (9.9%)
Levelock	$33,750 ($11,779)	10.5% (9.0%)
Newhalen	$36,250 ($22,466)	10.6% (7.4%)
Nondalton	$35,500 ($9,359)	26.2% (9.4%)
Pedro Bay	$55,625 ($10,876)	0.0% (72.5%)
Port Alsworth	$79,375 ($10,377)	1.4% (3.5%)
Dillingham Census Area	$56,055 ($3,915)	11.2% (1.8%)
Ekwok	$32,500 ($18,288)	31.3% (16.2%)
Koliganek	$55,417 ($25,090)	11.8% (10%)
New Stuyahok	$40,417 ($7,434)	31.1% (7.9%)
Kenai Peninsula Borough	$64,891 ($2,835)	8.7% (1.3%)
Bristol Bay Borough	$88,000 ($13,265)	5.7% (2.4%)
Anchorage	$80,862 ($1,295)	6.0% (0.4%)
Alaska	$74,444 ($809)	7.8% (0.3%)

Source: USCB 2017

Note: Because of the small sample size in smaller communities, the values reported by the US Census Bureau may be misleading (i.e., may show large differences between communities that may not exist). Therefore, margin of error values are presented to show the potential range of the reported values.

In many of the communities, the employment of local residents in the potentially affected communities relies heavily on the local government and education and health services industry sectors. Table 3.3-4 shows the number of employed workers and the top three employment industries in each community. The local government industry sector accounted for the greatest percentage of employees for all of the communities in the Lake and Peninsula Borough, which is where the mine would be located. State and local government jobs are particularly important to these small communities, because they are often year-round and relatively high paying. While

AMERICAN OVERSIGHT

federal government employment is not included in the table below, it represents a small percentage of the average monthly employment (i.e., less than five percent in the Lake and Peninsula Borough, and less than two percent in the Dillingham Census Area).

The commercial salmon fishery provides a large number of seasonal employment opportunities in the harvesting and processing sectors. However, these opportunities vary with location in the area potentially affected by the proposed Pebble Project, with more opportunities available in the Dillingham and Naknek areas compared to communities up the Kvichak River and on Iliamna Lake. In addition, with the outmigration of commercial salmon permits and the nature of the processing industry, some of these opportunities are filled by residents from outside the region and state. Details on commercial fishing are discussed in Section 3.6, Commercial and Recreational Fishing.

Table 3.3-4: Top Employment Sectors in Potentially Affected Communities

Source: ADOL 2018

As stated previously, a large proportion of households in the project area participate in subsistence activities and depend on the wild food resources procured by hunting and fishing. Details for each community are included in Section 3.9, Subsistence.

3.3.2.3 Housing

In the project analysis area, the housing stock consists primarily of single family detached homes, which account for over 90 percent of the housing units. As consistent with a higher density population, Anchorage has the lowest percentage of single family detached housing units (approximately 50 percent) (USCB 2017). Of the occupied housing units, approximately two-thirds of the units are owner-occupied, while the rest are rental properties (Table 3.3-5). It should be noted that throughout the project area many of the communities have a high percentage of vacant housing units, with some communities over 50 percent. This is likely due

AMERICAN OVERSIGHT

to a number of factors, including declining populations, seasonal use of housing, and the state of disrepair (LPB 2012). In comparison, across the United States, vacant units account for approximately 12 percent of the housing stock.

Table 3.3-5: Housing Units

Area	Total Housing Units (margin of error)	Occupied Housing Units (margin of error)	Vacant Housing Units	Owner-Occupied
Lake and Peninsula Borough	1,451 (52)	468 (53)	983	68%
Igiugig	24 (11)	19 (10)	5	74%
Iliamna	60 (8)	27 (11)	33	63%
Kokhanok	63 (12)	48 (12)	15	69%
Levelock	45 (10)	30 (11)	15	67%
Newhalen	52 (10)	42 (11)	10	64%
Nondalton	115 (21)	68 (20)	47	68%
Pedro Bay	23 (13)	7 (10)	16	71%
Port Alsworth	85 (11)	47 (11)	38	34%
Dillingham Census Area	2,444 (57)	1,375 (69)	1,069	61%

Bristol Bay Borough	909 (43)	360 (42)	549	55%
Anchorage	114,443 (282)	104,969 (915)	9,474	60%
Alaska	309,171 (177)	250,235 (1,399)	58,936	64%

Source: USCB 2017

Note: Because of the small sample size in smaller communities, the values reported by the US Census Bureau may be misleading (i.e., may show large differences between communities that may not exist). Therefore, margin of error values are presented to show the potential range of the reported values.

3.3.2.4 Education

Education is provided through state and local funding, through school districts in existing borough governments or areas outside those boroughs. In general, the Bristol Bay communities have a high school graduation rate above 80 percent and about 13 to 20 percent have a bachelor's degree or higher, although the high school graduation rate varies between potentially affected communities (Table 3.3-6). The graduation rates and number of those holding a bachelor's degree or higher, are higher in more densely populated areas, such as Anchorage and Kenai Peninsula Borough. In comparison, across the United States the graduation rate is approximately 87 percent, and about 30 percent have a bachelor's degree or higher. As indicated previously, declining populations threaten the ability to keep schools open in some communities, particularly in the Lake and Peninsula Borough.

AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

3.12 TRANSPORTATION AND NAVIGATION

The Environmental Impact Statement (EIS) analysis area for this section includes the transportation resources that could be affected by the proposed mine site, Amakdedori port, transportation corridor, and natural gas pipeline corridor. Local and regional land, air, and water transportation systems and activities in the EIS analysis area are included. Navigability of each element is discussed.

The major mode of transportation between communities in this region and outside of the region is by air and water. Surface transportation is most often used for travel within communities, and can include on-road and off-road transport via automobiles, trucks, snowmachines, all-terrain vehicles (ATVs), dog sleds, and horses (ADOT&PF 2016).

3.12.1 Surface Transportation

No existing roads access the current mine site directly. Surface transportation in the area of the mine site may consist of off-road transport via ATVs and snowmachines between villages and to subsistence areas (Fall et al. 2006). Using off-road vehicles with a curb weight of less than 1,500 pounds does not require a permit from Alaska Department of Natural Resources (ADNR 2011).

There is potential for overland traffic through the EIS Analysis Area to access native allotments and private lands close to the mine site. The closest native allotments to the mine site include one area approximately 25 miles to the west, and land in the community of Nondalton to the east. Privately owned land approximately 15 miles to the north exists at Nikabuna Lakes (LPB 2015). Native allotments and other private lands are shown in Figure 3.2-1.

The road system in the transportation corridor is undeveloped, with the exception of local community roads and two regional roads with limitations. Iliamna, Newhalen, and Nondalton are connected to one another, but the 15-mile road from Iliamna to Nondalton is only passable in winter (ADCCED 2018). The annual average daily traffic count for the busiest road in the Iliamna/Newhalen road system in 2017 was 424 cars per day. Nondalton roads experienced 50-60 cars per day, and Kokhanok local roads had a count of 75 per day (ADOT&PF 2018b). Figure 3.12-1 shows the existing roads near these communities.

The Williamsport-Pile Bay Road, also known as Portage Road, is a state-maintained, approximately 15-mile-long road that connects Williamsport on the Cook Inlet to Pile Bay on Iliamna Lake (NOAA 2018). This road had an average annual daily traffic count of 19 cars per day in 2017. It is assumed that the average would be doubled (38 cars per day) for the summer months and zero for the winter months, as it is used seasonally (ADOT&PF 2018b). Its current use is for transporting fishing vessels and heavy freight. Tidal fluctuations in Cook Inlet and the potential for wet and flooding road conditions determine the accessibility and degree of drivability (i.e., Williamsport is very shallow and boats can only be hauled out at a 17-foot or higher tide, after navigating through a channel) (Fast 2018, NOAA 2018). When the tide allows, one landing craft can deliver freight to Williamsport at a frequency of eight times per month. However, delivering fuel to communities by air is more economical than this method. Fuel is also transported by barge up the Kvichak River from Bristol Bay, which takes more than a week, and involves lightering (i.e., the process of transferring cargo between vessels of different sizes) through shallow areas. The Pile Bay Port is undeveloped (DOWL 2016). According to NOAA 2018, the Williamsport-Pile Bay Road continues on from Pile Bay to connect to the village of Pedro Bay, although aerial imagery from Google Earth shows only a trail that would be impassable for full-size vehicles, which terminates before reaching the end of East Bay Road in Pedro Bay. One road surveyed in Pedro Bay in 2017 experienced an average annual daily

AMERICAN OVERSIGHT

traffic count of 45 cars per day (ADOT&PF 2018b). The Williamsport-Pile Bay Road and Pedro Bay local roads are shown on Figure 3.12-2.

The Diamond Point quarry port is approximately 3 miles from Williamsport, in Iliamna Bay, but is not currently connected by road. The quarry contains 15 to 35 million cubic yards of useable rock; and with dredging, it is believed that this port could receive Handimax-sized ships (DP 2018).

Current off-road surface transportation in the EIS analysis area includes travel to and from subsistence harvest areas and neighboring villages via ATV and snowmachine. This type of travel is easiest in the colder months, when the tundra, rivers, and lakes are frozen (Fall et al. 2006; Krieg et al. 2009). Additionally, snowmachines are used to access hunting areas for freshwater seals on Iliamna Lake (Lanen 2012). Known community subsistence harvest areas are displayed in Section 3.9, Subsistence.

No existing roads provide access to the proposed Amakdedori port. Subsistence activities occur in the area, via surface and water transportation. For more information on subsistence activities near Amakdedori, see Section 3.9, Subsistence.

The proposed natural gas pipeline would connect to the Kenai Compressor Station near Anchor Point, following Bourbon Avenue west until crossing the Sterling Highway. This stretch of the Sterling Highway had annual average daily traffic volume of just fewer than 3,000 vehicles in 2017 (ADOT&PF 2018b). The Sterling Highway is the only major roadway connecting the city of Homer to the rest of the Kenai Peninsula and the Alaska road system (DCRA 2018). According to the Alaska Highway Safety Office, the Sterling Highway had three fatal motor vehicle accidents that each resulted in one death in 2016, all occurring in Soldotna. There was one fatal accident that resulted in one death in 2017, in Clam Gulch (AHSO 2018).

There were no fatal motor vehicle accidents reported for 2016 and 2017 on any existing internal community roads that would be connected to the mine site or transportation corridor (AHSO 2018). Statewide, the Alaska Highway Safety Office reported that in 2017, there were 75 fatal crashes in Alaska, totaling 79 fatalities. From 2016 to 2017, fatalities and fatal crashes decreased by 6 percent and 4 percent, respectively. In addition, fatal crashes related to alcohol dropped by 54 percent.

3.12.2 Air Transportation

Passenger and cargo transport by aircraft is common for residents, visitors, and goods in the Bristol Bay region, on a regularly scheduled and charter basis. Small charter planes, run by private guide companies, also transport sport fishermen and hunters to lodges around the Iliamna Lake and Lake Clark areas (Travel Alaska 2018).

Table 3.12-1 provides a summary of airports in the EIS analysis area that may be affected by a change in air traffic related to the Pebble Project. Included in the table are eight airports west of Cook Inlet, and three east of Cook Inlet. Regional airports are shown in Figure 3.12-3.

3.12.3 Water Transportation

3.12.3.1 Mine site

The mine site is not accessible by navigable waters. Some small watercraft use associated with recreational activities occurs on the Koktuli River downstream of the mine site. The closest navigable water with facilities to accommodate vessel traffic is Iliamna Lake.

AMERICAN OVERSIGHT

3.12.3.2 Transportation Corridor and Natural Gas Pipeline

The transportation corridor would connect the mine site with Amakdedori port, overland; with one section relying on a ferry crossing of Iliamna Lake.

Iliamna Lake is used year-round by community members to access subsistence harvest areas and resources in and surrounding the lake, traveling via watercraft in open water and by snowmachine when frozen ice permits. For example, people from Kokhanok cross the lake to access resources near the community of Iliamna and near Lake Clark National Park and Preserve (Fall et al. 2006). See Section 3.9, Subsistence, for more information on subsistence practices. There is a heavily used snowmachine route between the communities of Kokhanok and Iliamna across the lake. The communities of Pedro Bay and Iguigig also traverse the length of the lake on snowmachine, hugging the shoreline (PLP 2018 RFI-088). The local sport fishing, hunting, and tourism industries also rely on the use of Iliamna Lake for transportation and natural resources (Fall et al. 2006). Refer to Section 3.5, Recreation, for information on recreational use of Iliamna Lake; and Section 3.6, Recreation and Commercial Fisheries, for information on recreation and commercial fisheries pertaining to Iliamna Lake. Iliamna Lake is also used for inter-village travel, via boat during the open water season or by snowmachine, once ice has formed on the lake.

Fuel and other supplies are delivered to Iliamna Lake communities via barge or aircraft. Barges also use the Williamsport-Pile Bay Road for portage from Cook Inlet (Kevin Waring & Associates 2010b). Additionally, barges have traveled from Bristol Bay up the Kvichak River and into Iliamna Lake, depositing goods at the Iliamna barge landing for the communities of the area. However, low water levels and river shoals in some years make this route limited to shallow draft vessels, or infeasible (Kevin Waring & Associates 2010b).

Ice coverage can vary across Iliamna Lake, which contributes to transportation access. An aerial image analysis of lake ice coverage on Iliamna Lake from 1999 to 2018 revealed that 15 out of 19 winters had ice cover on the majority or the entire lake surface for prolonged periods. Four winters had little or no ice cover. Prevailing wind direction pushes ice to the west, creating a variance in the length of ice duration depending on location. The easternmost, narrower portion of Iliamna Lake, near Pile Bay, Pedro Bay, and Eagle Bay, had median ice duration of 88 to 100 days. Near Iliamna and Newhalen, the median ice duration was 101 to 105 days. The middle portion between east and west, north of the village of Kokhanok and south of Eagle Bay, had median ice duration of 101 to 120 days, although the portion of lake east of Kokhanok and south of Eagle Bay had median ice duration from 121 to 140 days. The longest median ice duration was observed on the western half of Iliamna Lake, topping at 140 days and gradually decreasing to 111 days at about 2 miles west of Newhalen (PLP 2018-RFI 013).

Federal jurisdiction of navigation is determined by The Rivers and Harbors Act, Sections 9 and 10. The USACE has authority of Iliamna Lake and all tidal waters, but the USCG has authority over bridges of navigable waters and the Newhalen River. See Section 3.22, Wetlands/Special Aquatic Sites and Waterbodies, for a discussion of navigable waters and other waters of the US under the jurisdiction of the USACE.

3.12.3.3 Amakdedori Port and Diamond Port

The proposed Amakdedori Port site is not currently developed for water transportation. The location of the proposed port is in Kamishak Bay, Cook Inlet, approximately 33 miles southwest of Williamsport (ADCCED 2018). The natural water depth at the proposed port site is approximately 15 feet. This is considered deep enough for barges to load and offload supplies, and travel to and from lightering locations.

AMERICAN OVERSIGHT

Cook Inlet is home to commercial, subsistence, sport, and personal-use fisheries. Aquatic farming, research, and hatcheries are also permitted (ADF&G 2018). See Section 3.9, Subsistence, for more information on subsistence uses of Cook Inlet.

Types of vessels that are present in Cook Inlet include various cargo vessels, tank ships carrying petroleum products, tugs, passenger vessels, fishing vessels, fish processing vessels, mobile drilling rigs, government vessels, and dredges, which can have typical speeds of up to 20 knots. The weather and conditions of Cook Inlet can create difficulty for vessels, because seasonal sea ice and sudden weather changes occur (Eley 2012).

The Cook Inlet Vessel Traffic Study (Eley 2012) found that in 2010, 80 percent of ship transits were made by 15 ships (to Homer, Nikiski, and Anchorage), and there were 480 ship port calls or transits total. Area ports are shown on Figure 3.12-3. Further summary of this study is presented below:

> *Each region of Cook Inlet (upper, middle and lower) experienced varying levels of activity based on the primary port and the types of vessels operating there. Kachemak Bay in lower Cook Inlet experienced the highest levels of activity in Cook Inlet, primarily due to ferry operations, or vessels awaiting a marine pilot, more favorable weather, or Coast Guard inspection. Middle Cook Inlet reflected tank ship movements in and around the Nikiski and Drift River oil terminals. Upper Cook Inlet activity was dominated by movement in and out of the Port of Anchorage. AIS data showed that the busiest times of year were the third quarter (July through September) followed by the second quarter (April through June).*

Pilotage (i.e., the process of directing the movement of a ship by visual or electronic observations of recognizable landmarks) is required for vessels traveling Cook Inlet (unless exempt), because navigation is affected by large tidal fluctuations, currents, winds, mud flats, ice flows, boulders, reefs and shoals that are not always detectable by echo sounder, lead lines, or by observing turbulence in the water (NOAA 2018). Potential hazardous obstacles may also include shipwrecks, unconsolidated sediments, glacial deposits, and volcanic debris (BSEE 2018b). Navigating Cook Inlet in the winter months requires a separate set of guidelines, and vessels are subject to inspection to ensure proper conditions (NOAA 2018).

Western Cook Inlet has more debris than eastern Cook Inlet, and experiences larger ice pans in the winter. In Kamishak Bay, there are scattered reefs within a few feet of the water surface, many of which are visible at low tide. Local knowledge is recommended for navigation of this area, especially for lower Kamishak Bay, near the Douglas River, where tide rips, currents, and strong west winds combine with the underwater obstructions of reefs, ledges, and mudflats.

Amakdedori can be approached safely just north of Amakdedori Creek, although rocky outcroppings exist near shore, and large reefs offshore. Winds in this area can pick up after mid-August to produce larger swells (NOAA 2018). Wave height can depend on wind direction and storms, and the mean wave heights in the vicinity of Amakdedori were 1.67 and 2.36 feet, based on data from two Acoustic Doppler Current Profilers, which started collecting data in March of 2018, and will continue through March 2019. Satellite imagery was reviewed of Kamishak Bay for the years 2006 through 2013 to conclude that ice coverage in the bay can form as early as early November, and can melt as late as late April (PLP 2018-RFI 039).

A bathymetry study of Amakdedori showed that the ocean bed slopes gently over 5.6 miles to a depth of 60 feet, with Amakdedori Creek's alluvial fan reaching almost 1,000 feet offshore. Rocky outcroppings were found about 2 miles north of the river outflow (PLP 2018-RFI 039). Preliminary results from additional wave height data collected March 2018 to June 2018 indicate that breaking may be occurring near the Amakdedori location. Numerical models were also run

AMERICAN OVERSIGHT

to evaluate swell and potential maximum wave heights at Amakdedori. Results confirm that a long-period swell from the Gulf of Alaska can penetrate Kamishak Bay and reach the Amakdedori site; and waves from the northeast have a slightly smaller wave height than waves coming from the southeast (PLP 2018-RFI 039).

At the end of the western arm of Iliamna Bay (called Cottonwood Bay) is Williamsport, the eastern portage point for passage to Iliamna Lake. The depth of Iliamna Bay is 6 to 8 fathoms although Williamsport is shallow and usable only at higher stages of the tide. Upper Cook Inlet ice drifts to this area in the winter (NOAA 2018). The NOAA acoustic wave profiler recorded wave height data from 2010 to 2012 outside of Iliamna Bay. These wave heights are expected to be representative of the Amakdedori port location.

Safe anchorages in this area can be dependent on season and wind. Although sometimes windy, Iniskin Bay is considered secure for anchorage of medium-sized vessels on the west side of Cook Inlet in any weather. Fishing vessels 4,000 tons or less currently use this bay for anchorage. Reefs and shoals near the water surface exist in this bay (NOAA 2018).

The *Pebble Project Ice Database 1997-2016* examined ice data at Amakdedori, Diamond Point, and Lightering Location A, and concluded that Amakdedori experienced thinner ice for a shorter duration than Diamond Point in Iliamna Bay. Diamond Point averaged 5 to 6 weeks per year surrounded by significant ice (often thick, compact, stable ice), and Amakdedori averaged 3 weeks per year of significant ice, but generally thinner. Lightering Location A showed brief irregular bursts of ice cover or no ice cover, with most (17 out of 19 seasons observed) seasons having ice cover for 2 or fewer weeks (PLP 2018-RFI 039).

Based on the available data for geography, wave, bathymetry, and ice coverage, annual access to Amakdedori may be limited due to high wave activity and periods of ice coverage in Kamishak and Iliamna bays.

AMERICAN OVERSIGHT

4.3 NEEDS AND WELFARE OF THE PEOPLE—SOCIOECONOMICS

This section addresses the direct, indirect, and cumulative effects of the No Action Alternative and action alternatives on the regional and state economy, infrastructure, cost of living, and population characteristics. Potential direct, indirect, and cumulative effects on commercial fishing and recreational tourism are discussed in Section 4.6, Commercial and Recreational Fisheries. While subsistence hunting and fishing can be an important component of community welfare in rural Alaska communities, this section addresses the monetized economy. Subsistence activities and their impact on communities are discussed in Section 4.9, Subsistence. Potential impacts to the socioeconomic environment include changes to population, economy and income, improvements in regional infrastructure, and decreased cost of living.

4.3.1 No Action Alternative

The No Action Alternative assumes that the mining operations are not undertaken. Under the No Action Alternative, the Pebble Limited Partnership (PLP) would have the same options for exploration activities that currently exist (ADNR-RFI 073). Therefore, it is anticipated that PLP would continue current activities in an effort to identify future opportunities.

4.3.1.1 Regional Setting

Regional Economy

The PLP employed around 100 and 150 local community members annually at the site during the pre-development phase of the project, which ended in 2012 (Loeffler and Schmidt 2017). Since then, PLP has had a minimal number of workers at the site for exploration and maintenance activities. Under the No Action Alternative, it is anticipated that PLP would continue current activities in an effort to identify future opportunities. As a result, the current number of direct and indirect jobs would remain the same and there would be no impact to the regional economy.

Cost of Living

The No Action Alternative is not anticipated to result in changes to the current operations of the proposed mine site or infrastructure. As a result, the No Action Alternative would have no effect on the cost of living in the potentially affected communities.

Regional Infrastructure

No impacts to the regional infrastructure would be anticipated as a result of the No Action Alternative. Because of the remoteness and small workforce, pre-development work has had little impact on the regional public infrastructure. The No Action Alternative would not affect the current or projected infrastructure, including education, health services, water, transportation, sewer, and solid waste operations.

4.3.1.2 Potentially Affected Communities

Since it is anticipated that PLP would continue current activities in an effort to identify future opportunities under the No Action Alternative, the current number of direct and indirect jobs would not be expected to change. As a result, the No Action Alternative would have no effect on the socioeconomic indicators of the potentially affected communities.

AMERICAN OVERSIGHT

4.3.2 Action Alternative 1 – Applicant's Proposed Alternative

Project construction and operations would have an impact on both the regional setting and the potentially affected communities.

4.3.2.1 Regional Setting

Regional Economy

Loeffler and Schmidt (2017) found that during the pre-development phase of the Pebble Project (2009 to 2012), community members from the region accounted for about 43 percent of the project's seasonal workforce. Since then, PLP has had a minimal number of workers at the site for exploration and maintenance activities. Under Alternative 1, the number of total direct hire project employees would increase to about 2,000 during the construction phase, and to 850 during the operations phase. PLP has stated that its objective is to maximize opportunities for local hire; first, directly to residents of the project area, or those with close ties to the area; and then to Alaska residents in general. However, it is likely that during the construction phase, significant non-Alaskan labor would be required to fill the anticipated 2,000 jobs, potentially as high as 50 percent of hires (PLP 2018-RFI 027). In addition, indirect employment would increase from the services that would be needed to support construction and operation activities (e.g., air services, goods, and supplies). These activities could potentially create a large number of direct and indirect jobs in the region, relative to the population.

Alternative 1 would provide year-round operations employment, which would help reduce the impacts of the seasonal fluctuations in employment that are prevalent in the region. Depending on the construction schedule and nature of activities, some construction employment may be seasonal in nature and/or limited in duration.

Loeffler and Schmidt (2017) also found during the pre-development phase that communities near the mine site provided a much higher percentage of local labor than more distant communities, such as those in the Dillingham Census Area or other coastal communities. In addition, opportunities and incomes from other sources of employment (e.g., commercial fishing) were greater in distant communities. Therefore, the impact on employment and income during the exploratory phase had a much higher magnitude of impact on the communities closest to the mine site than on more distant communities. It can be anticipated that the same pattern would occur during the operations phase; communities near the mine site and ferry/port terminals would see a greater employment impact than communities farther away, such as communities in the lower Bristol Bay watershed.

As most of the state's professional and business service firms, including PLP's office, are based in Anchorage, the Anchorage region would be anticipated to see an increase in jobs. However, the increase would be minor in relation to the larger and more diverse economy of Anchorage (approximately 130,000 employed workers in 2016). Similarly, services, particularly transportation and lodging that are based in Iliamna, and to a lesser extent in Homer, would also be anticipated to see an increase in jobs.

Alternative 1 includes a variant for summer-only ferry operations, in which the transportation corridor would only operate for 6 months (PLP 2018-RFI 065). As a result, more employees for truck drivers and ferry/terminal workers would be needed during summer operations, but fewer would be needed during winter operations, leading to less year-round employment opportunity and a larger number of seasonal employees.

AMERICAN OVERSIGHT

Cost of Living

As described in Section 4.12, Transportation and Navigation, Alternative 1 would result in the construction of project roads and ports. Although some components are described as private, PLP has stated that they would work with all local communities to identify the best solutions for use of the road and ferry for community transportation (PLP 2018-RFI 027). Because the higher cost of living in rural areas is primarily associated with the high transportation cost of food, fuel, and other supplies (ADOL 2017a, ADOL 2008), Alternative 1 has the potential to reduce transportation costs to the potentially affected communities near the transportation corridor should arrangements be made to allow some public use of the road. It should be noted that state and local authorizations may affect final road alignment and uses. Reduced transportation costs would likely lower the high cost of living for the communities near the transportation corridor, specifically Kokhanok, Iliamna, Newhalen, and potentially Nondalton.

Communities adjacent to the natural gas pipeline (Kokhanok, Newhalen, and Iliamna) would have the opportunity to connect to the pipeline. Natural gas would likely be less expensive than diesel heating oil, which could lower the cost of living once equipment (e.g., furnace, water heater) is converted to natural gas. However, communities would be responsible for funding the connection, lowering the likelihood.

Under the summer-only ferry operations variant, communities that would rely on the project transportation system may opt to stockpile food, fuel, and other supplies or receive shipments via air when the ferry is not operating. Overall, the variant would likely lower the high cost of living for the communities near the transportation corridor, but not to the extent of the proposed action.

Regional Infrastructure

The temporary and long-term camps housing workers would be self-contained, and operated and maintained by PLP throughout the project. The work camps would be in remote areas, and employees would not have access to services in local communities. In addition to housing facilities, the camps would be equipped with appropriate emergency medical facilities, electrical power generation, fuel storage, and facilities for sewage treatment and solid waste disposal and management. Potable water for the camps would be trucked in or sourced from on-site wells.

The direct effects of all phases of the project on public utilities in communities in the project area would not be readily noticeable, except for communities along the corridor of the natural gas pipeline that may develop infrastructure to take advantage of the supply of natural gas or reduce the costs of goods and services through access to the project transportation system.

The sections below address the direct and indirect impacts to the regional infrastructure from activities associated with Alternative 1. However, the sections do not address changes in the regional infrastructure associated with potential decisions made by Lake and Peninsula Borough (LPB) or the State of Alaska related to the use of increased tax revenues. An increase in tax revenues may lead to an increase in spending on regional infrastructure, which would improve infrastructure for the population of the region.

Education

The PLP has supported training and education programs in Alaska, such as the Alaska Native Science and Engineering Program, Teacher Industry Externship Program, and Alaska Resource Education (PLP 2018e). These activities would be anticipated to increase with Alternative 1 as the needs of the workforce expand. Conversely, some cultural education opportunities would be

AMERICAN OVERSIGHT

displaced, such as the current cultural camps that are held at the site of the proposed Amakdedori port.

While the project is not anticipated to result in an increased number of schools in the region, it may benefit the educational opportunities of some communities through PLP sponsored programs and an increased revenue stream to the LPB. Because of declining population (i.e., out-migration) in some communities, schools are at risk of closing (LPB 2012). The project could reduce or eliminate this decline, thus allowing the local schools to remain open and continue to serve the local communities. Conversely, steady employment and income may provide some families the ability to move to other areas, which may decrease the population of some communities.

Transportation

Alternative 1 would expand the transportation infrastructure in the region once the transportation corridor and ferry/port facilities are complete. Although the roads and port are described as private, PLP has stated that they would work with all local communities to identify the best solutions for use of the road and ferry for community transportation needs, which would help reduce the local cost of living (PLP 2018-RFI 027). Access to the infrastructure would be limited to local residents and businesses, and would most likely consist of escorted, scheduled convoys for private vehicle transport, and coordination with PLP on third-party commercial-haul traffic on the road. Road traffic would be coordinated with scheduled third-party transportation by the ferry.

Because many of the workers and supplies would be transported to the region by air, the Iliamna Airport and local airfields would see increased use. While no direct impacts are expected to airport infrastructure, the airport would likely see indirect impacts, such as an increase in fuel sales and maintenance activities related to increased air traffic. Section 4.12, Transportation and Navigation, describes the impacts to air, surface, and water transportation systems.

With port and ferry features removed at closure, only the roads and shallow draft barge facilities would remain for use in transporting bulk supplies associated with the closure operations, unless an agreement was reached for a third party to take over ferry operations. Access to the remaining infrastructure would likely be similar to that described above.

Health Services

The mine site would have on-site medical facilities to support workers. Many of the workers would be trained in emergency response and first aid. Most immediate care operations would be handled internally. Patients may be transported to a local clinic or airlifted to larger regional hospitals if needed. Therefore, existing health services are not anticipated to be directly impacted by the project. However, depending on the level of development associated with support services, there may be indirect impacts on these facilities. Any indirect impacts would be anticipated in the communities nearest the mine site (Iliamna and Newhalen), which may have the highest level of indirect development to support the mining operations. In addition, an increased revenue stream to the LPB could result in improvements to community health care facilities.

Water, Sewer, and Solid Waste

The project would construct temporary water and wastewater facilities at various sites used for project construction camps, and at the mine site, ferry terminals, and at Amakdedori port during operations. In addition, solid waste would be addressed on site or removed from the area. As a

AMERICAN OVERSIGHT

result, existing community water, sewer, and solid waste facilities would not be directly impacted by the project. However, depending on the level of development associated with support services, there may be indirect impacts on these facilities. Any indirect impacts would occur in the communities nearest the mine site. Similarly, an increased revenue stream to the LPB could result in improvements to community water, wastewater, and solid waste facilities.

4.3.2.2 Potentially Affected Communities

Construction and operations would have direct and indirect impacts to local and regional socioeconomic conditions. This section discusses potential impacts to the socioeconomic conditions under Alternative 1.

Population

As discussed in Section 3.3, Needs and Welfare of the People—Socioeconomics, the population of some of the potentially affected communities has been declining. Much of this decline has been associated with the lack of employment opportunities in the communities.

Alternative 1 would result in an additional estimated 2,000 direct jobs during the construction phase and 850 direct jobs during the operations phase. Some workers would be from local communities; however, the majority of workers are anticipated to be from Anchorage, larger towns in the Kenai Peninsula Borough (KPB), and other states. Workers would be transported from multiple locations, including from local communities, to the mine site via aircraft and would stay in work camps. Therefore, workers could live throughout the state and in other states and still have the ability to work at the mine. As a result, the local communities would not be anticipated to see a large increase in population from the project, particularly from in-migration. The largest impacts could occur in Iliamna, Kokhanok, Newhalen, and potentially Nondalton, which may see an increase in population related to any businesses that are developed to support the project.

While a large in-migration of population is not anticipated, Alternative 1 may lead to changing population patterns in the region. The population in some potentially affected communities has been declining (out-migration). The project could reduce or eliminate the decline because of the increase in employment opportunities and indirect effects on education and infrastructure; it could also result in some past residents returning to communities. Conversely, steady employment and income may provide some families the ability to move to other areas, which may decrease the population of some communities. Therefore, the impacts on population are difficult to anticipate.

Economy and Income

Estimating how many local community members would obtain work through the project (or would be interested in obtaining work) is difficult, but any increase in the number of jobs would help the local communities. Loeffler and Schmidt (2017) found that during the pre-development phase of the Pebble Project (2009 to 2012), community members from the region accounted for about 43 percent of the project's seasonal workforce. Communities near the mine site were found to provide a much higher percentage of local labor than more distant communities, where opportunities and incomes from other sources of employment (e.g., commercial fishing) were greater. Therefore, the impact on employment and income during the exploratory phase had a much higher magnitude of impact on the communities closest to the mine site than more distant communities.

PLP has stated that its objective is to maximize opportunities for local hire; first, directly to residents of the project area, or those with close ties to the area; and then to Alaska residents in

AMERICAN OVERSIGHT

general. However, it is likely that during the construction phase, significant local resident and non-Alaskan labor would be required to fill the anticipated 2,000 jobs required, potentially as high as 50 percent of hires (PLP 2018-RFI 027).

A majority of jobs would be taken by Alaskans during operations. PLP has estimated that 250 employees would come from the surrounding communities, with 50 of these employees coming from communities connected to the project site by road (PLP 2018-RFI 027). The majority of the remaining 600 employees would likely be from the Anchorage and Kenai areas.

The direct jobs created by the project would be attractive to many residents with the requisite skills. In general terms, developments like the proposed project provide economic benefits to individuals, families, and communities in the form of increased and steady income. Many of the communities in the region, especially those in the LPB, have a lower median household income and a higher unemployment rate than Anchorage or Alaska as a whole. Therefore, employment through the project would have an impact on the income levels in the local communities.

The exploratory phase of the project revealed that the income earned by residents employed by the project was an important part of the total income earned in local communities, especially those communities close to the mine site (Loeffler and Schmidt 2017). The income earned by residents close to the mine was greater than the income earned for commercial fishing, indicating that even the limited employment during the exploratory phase had large impacts on the communities. In communities that were located further from the mine site, commercial fishing was a larger part of total income. Indirect employment that is developed to support the construction and operations of the project would provide additional opportunities for community residents.

In general, mining jobs pay much higher than most industry categories. The average monthly wage in Alaska for the mining industrial classification in the third quarter of 2017 was $9,047, and mining support activities was $7,855, which was better than the average for Alaska of $4,414 (ADOL 2017b). Because these figures are an average of all people employed in that classification, the monthly wage includes executives, specialized experts, and low-skill positions. Not all local residents would make the average wage. However, the wages earned would likely be higher than the median household incomes of the potentially affected communities (see Section 3.3, Needs and Welfare of the People–Socioeconomics), which would be an improvement to the welfare of the community members. For example, income from mining could be double the median household income in the LPB of about $44,000.

Under the summer only ferry variant, the transportation corridor would only operate for 6 months. As a result, more employees (e.g., truck drivers, ferry/terminal workers) would be needed during summer operations, but fewer would be needed during winter operations (PLP 2018-RFI 065). This would lead to a smaller number of year-round employees and a large number of seasonal employees. Due to the small populations of the potentially affected communities, it is less likely that the communities would be able to support the increased number of seasonal employees (in addition to the year-round employees), requiring more employees to come from outside the region for the seasonal work. Therefore, the variant would likely shift some of the positions held by community members from year-round to seasonal, which would also lower the overall income that is earned by community members and stays within the region compared to year around employment under year round ferry operations.

Tax Revenue and Other Fiscal Effects

Construction and operations would generate revenues for local governments and the state of Alaska. The revenue sources would include mining license taxes, corporate income taxes, property taxes, borough severance taxes, and royalty payments. Revenues to local and state

AMERICAN OVERSIGHT

government would begin during the construction phase, and escalate during the operations phase when mining license taxes, production taxes, severance taxes, and corporate income taxes would become effective. At the time the mine ends production, and buildings, foundations, pipelines, and other infrastructure facilities are removed or reclaimed, these revenues would end, unless reuse of some of these facilities was negotiated with another party.

Mining License Tax and Corporate Income Tax

Alaska levies a mining license tax and corporate income tax on net income received in connection with mining properties and activities in the state. The collection of mining license tax and corporate income tax on project net income would have a beneficial effect on state government revenues. IHS (2013) estimates the project would generate $27 million annually in state taxes (2011) during the construction phase, and would generate an estimated $69 million annually from state corporate taxes during the operations phase. IHS estimates the operations phase would also generate $44 million annually from state mining license taxes.

Corporate income tax may increase further through the indirect and induced impacts of the mine construction and operation.

State Royalty Payments

Alaska requires holders of state mining locations to pay a production royalty on all revenues received from minerals produced on state land, per the Production Royalty Law, which applies to all revenues received from minerals produced from a state mining lease (§38.05.212). The production royalty is 3 percent of net income generated (ADNR 2015).

The collection of state royalty payments on project net income would have a beneficial effect on state government revenues. IHS (2013) estimates that the project would generate $21 million annually (2011) from state royalty payments during the operations phase.

Borough Severance Taxes

Mining operations are subject to severance taxes on resource extractions in a taxing jurisdiction, which would be the LPB. IHS (2013) estimates that the project would generate $29 million annually in severance taxes paid to LPB during the operations phase. The estimated severance tax would represent a significant increase in revenue for LPB when compared to the estimated total revenue from external sources of approximately $5 million for fiscal year 2019 (LPB 2018).

Borough Property Taxes

Real property can be subject to property taxes. The LPB does not have a property tax (LPB 2018), but the Kenai Peninsula Borough has a borough property tax of 4.7 mills ($4.7 for every $1000 of taxable assessed value), plus any other taxes assigned per the Tax Authority Group (e.g., hospital, road maintenance). While the Amakdedori port facilities would be considered real property, the infrastructure would be on state-owned property and may not be subject to Kenai Peninsula Borough property taxes.

Right-of-Way Acquisition

The right-of-way (ROW) for the 83-mile transportation corridor connecting the Amakdedori port to the mine site could be another fiscal element of the project. The State of Alaska owns 47 miles of corridor, while the remaining 42 miles of corridor are owned by the Bristol Bay Native Corporation, Alaska Peninsula Corporation (APC), and Iliamna Natives Limited. Based on costs for a similar mine ROW and the value of state lands (ADNR 2008), a preliminary estimate of the

AMERICAN OVERSIGHT

ROW costs for the transportation corridor ranged between $1 million and $1.5 million, which would be paid to the state government and to the Native corporations.

The pipeline corridor would cross state and federal waters, as well as state and APC lands. Historically, ROW costs account for approximately 7 percent of the total construction cost of a pipeline (Rui et. al. 2011). However, since the pipeline would follow the transportation corridor from Amakdedori port to the mine site, it is not likely that a separate ROW arrangement would be needed.

Housing

Staff working at the mine would be housed in on-site facilities (i.e., work camps), and would follow a fly-in/fly-out commute work arrangement. Therefore, there would not be an increase in housing demand in communities related to the direct employment of workers.

Communities closest to the mine and ferry terminals (Iliamna, Newhalen, Kokhanok, and potentially Nondalton) may see changes to the population as a result of support activities, which may lead to an increase in demand for housing. As presented in Section 3.3, Needs and Welfare of the People—Socioeconomics, these communities have a fairly high percentage of vacant housing units. Although the condition of the vacant units is not known, some of the units could accommodate at least a portion of any increase in population. Housing is also available in the larger communities in the region where workers may reside.

Education

While the project is not likely to result in substantive demographic increases that would support an increase in the number of schools in the potentially affected communities in the immediate vicinity of the project, the education programs supported by PLP could benefit the current student population in the nearest communities. In addition, the project could reduce the population decline in some communities, which could allow schools at risk of closing to remain open.

As with other mining operations in Alaska, employment at the mine would require at least a high school education or general equivalency diploma. Therefore, students may see employment opportunities provided by the mine as an incentive to complete at least a basic level of education, which could increase the high school graduation rates in the potentially affected communities.

4.3.3 Action Alternative 2 – North Road and Ferry

4.3.3.1 Regional Setting

Regional Economy

While the alignment of the transportation corridor and natural gas pipeline would change, Alternative 2 would have the same overall impacts to the regional economy as Alternative 1.

Alternative 2 includes a variant for a summer only ferry. The impacts of the variant would be the same as described in the similar Alternative 1 variant.

Cost of Living

For the region as a whole, the impacts on the cost of living of Alternative 2 would be largely the same as the impacts of Alternative 1, and would likely lower the high cost of living for the communities near the transportation corridor. However, because of the different alignments of

AMERICAN OVERSIGHT

the transportation corridor and natural gas pipeline, Pedro Bay would be beneficially impacted and Kokhanok would not be impacted.

Alternative 2 includes a variant for a summer only ferry. The impacts of the variant would be the same as described in the similar variant for Alternative 1.

Regional Infrastructure

While the alignment of the transportation corridor and natural gas pipeline would change, Alternative 2 would have the same overall impacts to the region as Alternative 1. However, Pedro Bay would be impacted and Kokhanok would not.

4.3.3.2 Potentially Affected Communities

While the alignment of the transportation corridor and natural gas pipeline would change, Alternative 2 would have the same overall impacts to the socioeconomic indicators of the potentially affected communities as Alternative 1. However, Pedro Bay would be more impacted and Kokhanok would be less impacted.

[Note to Reviewers: Land owners for ROW acquisition will be inserted here for the Draft EIS.]

Alternative 2 includes a variant for a summer only ferry. The impacts of the variant would be the same as described in the similar variant for Alternative 1.

4.3.4 Action Alternative 3 – North Road Only

4.3.4.1 Regional Setting

Regional Economy

While the alignment of the transportation corridor and natural gas pipeline would change, Alternative 3 would have the same overall impacts to the regional economy as Alternative 1.

Alternative 3 includes a variant for a concentrate pipeline. The impacts of the variant would likely be decreased employment of truck operators and increased employment at the dewatering facility. Overall, the total number of employees needed during operations would likely decrease, which would decrease overall income and employment in the region. It could potentially have greater impact on property taxes for KPB than Alternative 1, depending on final footprint and project specifics.

Cost of Living

For the region as a whole, the impacts on the cost of living for Alternative 3 would be largely the same as the impacts of Alternative 1, and would likely lower the high cost of living for the communities near the transportation corridor. However, because of the different alignments of the transportation corridor and natural gas pipeline, Kokhanok would likely experience less of a benefit, while Pedro Bay would likely experience more of a benefit.

Regional Infrastructure

While the alignment of the transportation corridor and natural gas pipeline would change, Alternative 3 would have the same overall impacts to the region as Alternative 1, with the exception of the ferry terminals. However, Kokhanok would experience fewer impacts, while Pedro Bay would experience more.

AMERICAN OVERSIGHT

Alternative 3 includes a variant for a concentrate pipeline. The impact of the variant would be the construction of the pipeline(s) and a dewatering facility near the port, which would likely be of no value and/or benefit to the potentially affected communities or the region as a whole, other than potential property tax revenue.

4.3.4.2 Potentially Affected Communities

While the alignment of the transportation corridor and natural gas pipeline would change, Alternative 3 would have the same overall impacts to the socioeconomic indicators of the potentially affected communities as Alternative 1. However, Kokhanok may experience fewer impacts, while Pedro Bay would experience greater impacts.

The revenue from the ROW acquisition would impact the same landowners as Alternative 2.

Alternative 3 includes a variant for a concentrate pipeline. The impacts of the variant would likely be decreased employment of truck operators and increased employment at the dewatering facility. Overall, the total number of employees needed during operations would likely decrease, which would decrease the overall income and employment in the potentially impacted communities.

4.3.5 Key Issues Summary

See Table 4.3-1 for a summary of key issues.

Table 4.3-1: Summary Impact Table for the Socioeconomic Environment

Project Impact	Alternative 1 (and variants)	Alternative 2 (and variants)	Alternative 3 (and variants)
Population	Communities nearest the project components (Newhalen, Iliamna, Nondalton, and Kokhanok) may see slight population increase. There would be no difference in impacts from alternative variants.	Same as Alternative 1 except that impacts would be less likely to occur to Kokhanok. There would be no difference in impacts from alternative variants.	Same as Alternative 1, except that impacts would be less likely to occur to Kokhanok and more likely to Pedro Bay. There would be no difference in impacts from alternative variants.
Economy and Income	Alternative 1 would provide year-round employment, which would help reduce the impacts of the seasonal fluctuations in employment. During construction, there would be an estimated 2,000 direct jobs, and during operations there would be an increase of direct employment by 850 people, plus indirect employment related to support services. Communities nearest the project components (Newhalen, Iliamna, Nondalton, and Kokhanok) would likely see the greatest impacts in employment and income. The summer-only ferry variant would result in less year-round employment and greater seasonal employment, with less income remaining in the potential affected communities.	Same as Alternative 1 except that impacts would be less likely to occur to Kokhanok and more likely to Pedro Bay. The impacts of the summer-only ferry variant would be the same as described for the variant for Alternative 1.	Same as Alternative 1, except that impacts would be less likely to occur to Kokhanok and more likely to Pedro Bay. The impacts of the concentrate pipeline variant would not likely impact employment and income.

AMERICAN OVERSIGHT

Table 4.3-1: Summary Impact Table for the Socioeconomic Environment

Project Impact	Alternative 1 (and variants)	Alternative 2 (and variants)	Alternative 3 (and variants)
Tax Revenue and Other Fiscal Effects	Alternative 1 would generate: • $27 million annually in state taxes (2011) during the construction • $69 million annually from state corporate taxes during the operations phase. • $21 million annually (2011) from state royalty payments during the operations phase. • $29 million annually in severance taxes for LPB • Potential annual property taxes to KPB.	Same as Alternative 1.	Same as Alternative 1. The concentrate pipeline variant could potentially have greater impact on property taxes for KPB than Alternative 1, and the total number of employees needed during operations would likely be less.
Cost of Living	Reduced transportation costs would likely lower the high cost of living for the communities near the transportation corridor (Newhalen, Iliamna, Nondalton, and Kokhanok). The natural gas pipeline would also provide opportunities for adjacent communities to lower their cost of living. The summer-only ferry variant would likely have less impact than Alternative 1.	Same as Alternative 1 except that impacts would occur to Pedro Bay and not Kokhanok. The summer-only ferry variant would likely have less impact than Alternative 1.	Same as Alternative 1, except that impacts would occur to Pedro Bay and not Kokhanok. The concentrate pipeline variant could potentially have greater impact than Alternative 1.
Regional Infrastructure	Alternative 1 would increase the infrastructure in the region. The impact of the transportation corridor depends on the access afforded to communities. Communities located along the natural gas pipeline may also benefit from the infrastructure.	Same as Alternative 1 except that impacts would be less likely to occur to Kokhanok and more likely to occur to Pedro Bay. There would be no difference in impacts from alternative variants.	Same as Alternative 1 except that impacts would be less likely to occur to Kokhanok and more likely to occur to Pedro Bay. There would be no difference in impacts from alternative variants.

4.3.6 Cumulative Effects

The geographic area for the cumulative effects consideration is the region around the potentially affected communities, and to a lesser extent, the state of Alaska. Similar to the proposed project, many large facilities located in remote areas use work camps to house employees who are transported to the site for a two-week rotation. As a result, opportunities exist for employment for people living across a broad area of Alaska.

The cumulative effects assessment took into consideration reasonably foreseeable future actions (RFFAs), as identified in Section 4.1, which could have socioeconomic impacts on the potentially affected communities. It should be mentioned that with the exception of the Donlin Project and expansion of the Pebble Mine, reasonably foreseeable activities associated with other mineral exploration projects are limited to continued exploration The potential impacts for each major category are discussed below:

AMERICAN OVERSIGHT

- Pebble Project Expansion
- Pebble South/PEB
- Big Chunk South*
- Big Chunk North*
- Fog Lake*
- Groundhog*
- Shotgun*
- Johnson Tract*
- Copper Joe*
- Donlin Gold
- Alaska Stand Alone Pipeline
- Drift River Oil Pipeline
- Cook Inlet Lease Sales*
- Alaska LNG
- Onshore Hydrocarbon Exploration*
- LPB Transportation Projects
- LPB Community Development and Capital Improvement Projects
- LPB Renewable Energy Initiatives
- Bristol Bay - Nushagak and Naknek/Kvichak State Management Districts - Salmon
- Lower Cook Inlet Management Area- Salmon and Herring
- Federal, state institutional, and private surveys and research*

**Indicates exploration and research activities only.*

The Pebble Project Expansion RFFA would extend the life of the project to recover more of the estimated reserves. Because any action would not occur during the 20-year period of the proposed project, there would be no cumulative socioeconomic impacts during that time from the RFFA. However, the Pebble Project Expansion would continue, and likely increase, the beneficial and adverse impacts that would be realized from the proposed project. Employment and income impacts, as well as tax revenue, realized from the proposed project would continue through the 78-year expansion period and could increase if operations are increased. Any impacts to population, housing, and education would be anticipated to remain the same as experienced during the operation of the proposed project.

The RFFAs related to transportation and infrastructure improvements, as well as renewable resources, could have an impact on the potentially affected communities. The projects could encourage mineral development in the area; taking advantage of the infrastructure and energy improvements. These impacts would be anticipated to be greater if the proposed project is implemented, which could increase development as support-related businesses take advantage of the additional opportunities provided by the mine.

While the proposed Donlin Gold Project could potentially create state-wide competition for skilled workers, it would also be located in a different region and would have little contribution to the regional socioeconomic effects. From a state-wide perspective, both the Donlin Gold Project and the Pebble Mine Project could create a competing need for support services and secondary/indirect jobs associated with such services.

Since community members of the potentially affected communities participate in commercial fishing activities, any changes in regulations could result in impacts. However, there would be less of an impact on the potentially affected communities than in coastal communities where commercial fishing is a much larger part of the economy.

The RFFAs related to oil and gas exploration and development would likely induce minimal cumulative effects to the socioeconomic characteristics of the potentially affected communities during the exploratory phases. If these projects are developed, it would likely be a number of years before the impacts are realized.

The RFFAs related to mining exploration and research activities would likely induce minimal cumulative effects to the socioeconomic characteristics of the potentially affected communities

AMERICAN OVERSIGHT

during the exploratory phases. If these projects are developed, it would likely be a number of years before the impacts are realized.

AMERICAN OVERSIGHT

4.12 TRANSPORTATION AND NAVIGATION

The Environmental Impact Statement (EIS) analysis area for this section includes the transportation resources that could be affected by the proposed mine site, Amakdedori port, transportation corridor, and natural gas pipeline corridor. Local and regional land, air, and water transportation systems and activities in the EIS analysis area are included. Potential impacts include:

- Vehicle traffic volume in the road-connected communities of Iliamna, Newhalen, Kokhanok, Nondalton, and Pedro Bay.
- Off-road transportation to subsistence areas.
- Flight frequency to affected airports and communities.
- Vessel traffic on Cook Inlet, with a higher volume during construction, and increased marine traffic in the port area.
- Vessel traffic on Iliamna Lake.
- Re-routes of winter over ice lake traffic on Iliamna Lake due to creation of open water.

4.12.1 No Action Alternative

Under the No Action Alternative, the project would not be constructed, and would not have any new effects on transportation and navigation. Pebble Limited Partnership (PLP) would still be permitted to perform exploratory activities and research at the site and would be expected to do so. Level of activity would be assumed to remain the same as the past 10 years.

4.12.2 Action Alternative 1 – Applicant's Proposed Alternative

4.12.2.1 Surface Transportation

Mine Site

Alternative 1 would involve the construction and use of roads in the mine site, and connection of mining areas with the locations of facilities and materials.

During project construction, operations, and closure, public access to or through the mine site would be restricted for safety. Such a restriction to public access would not be very noticeable, although there is subsistence overland travel that occurs in the area of the mine site that may require adjustments to traditional routes (PLP 2018-RFI 088). See Section 4.9, Subsistence, for impacts on access to subsistence resources.

Although project construction, operation, and closure activities would introduce new traffic in the mine site area, effects related to the displacement of existing surface transportation modes in the project area would be minimal. These changes would likely include taking alternate overland routes around the mine site, and would be most apparent during construction and operations. The magnitude of impact would decrease after mine closure, because the road system would be retained as long as required for the transport of bulk supplies needed for long-term post-closure water treatment and monitoring. The effects would be noticed locally by the nearby community members who travel through the area.

AMERICAN OVERSIGHT

Transportation Corridor

During construction, surface access roads would be constructed from the Amakdedori port site to the southern shore of Iliamna Lake and from the northern shore of Iliamna Lake to the mine site. Construction would involve using heavy equipment (for construction, excavation, and pipeline installation) and vehicles to transport personnel, fuel, and supplies during construction activities. Crews would live at the work sites in camps. A temporary airstrip would be built at Amakdedori Port to facilitate the construction phase, and Amakdedori port would be used for offloading construction equipment and supplies from air and water deliveries. Road traffic in Kokhanok would be affected during construction as project vehicles travel from the airstrip to the south access road. Similarly, road traffic in Iliamna and Newhalen would be affected during construction as project vehicles travel from the airstrip to the north access road, associated with delivering goods and services and by local employees that may travelling to construction work sites. This volume of traffic would likely decrease with the transition from construction to operations.

Until Iliamna Lake is connected to Cook Inlet through the transportation corridor at the southern ferry terminal, Williamsport–Pile Bay Road (which connects the two waterbodies at the northern end of Iliamna Lake over land) may be used to transport supplies to the beachheads on Iliamna Lake during construction (PLP 2018-RFI 037). If this route is used, the volume of traffic on Williamsport–Pile Bay Road would increase during construction; however, the road is currently used infrequently to transport commercial fishing vessels and general supplies, and is usable only between June and November (Kevin Waring & Associates 2010b).

Spur roads proposed for the transportation corridor would connect the proposed mine access road to the existing roads in the communities of Iliamna, Newhalen, and Nondalton via the proposed Iliamna spur road. Kokhanok community roads would be connected to the proposed southern access road, which would run from the proposed southern ferry terminal to Amakdedori Port. Spur roads would be gated to prevent traffic on the mine access road and south access road. Additional access would be coordinated between the State of Alaska, the Lake and Peninsula Borough, PLP, and landowners. Known trail crossings would be marked, and traffic controls would be implemented for safety (PLP 2018-RFI 027).

The current public roadway network in the EIS analysis area is minimal, limited to the vicinity of existing communities, and is used by local residents. Local roads provide important routes for overland travel, because there are no alternative roads. The airports in Iliamna and Kokhanok are outside of each town center, so traffic may increase in those areas, with a low likelihood of adding to the traffic in town.

During the winter, once snow cover on land and ice formation on Iliamna Lake are adequate, surface transportation occurs over land and Iliamna Lake for subsistence activities and inter-village travel. The new road may be elevated in areas and could act as an obstacle for overland inter-village and subsistence travel, although there would be marked crossing points for known trail crossings (PLP 2018-RFI 027).

During project operations, daily transportation of materials (concentrate, fuel, reagents, and consumables) would require up to 35 truck round trips per day on each leg of the road, including three loads of fuel per day. Personnel would be transported to the mine site via road from Iliamna, and would remain at the mine site during their 2-week work shifts, which would limit traffic on the access roads. Gates limiting unauthorized traffic would be installed on the spur roads as well. The communities of Iliamna, Newhalen, and Nondalton could see altered traffic patterns and a higher traffic volume as employees are transported from the Iliamna Airport to the mine site.

AMERICAN OVERSIGHT

Impacts on surface transportation would last through the life of the mine, and through post-closure, until the roads are no longer deemed necessary for post-closure monitoring activities.

Under the summer only ferry variant the concentrate would be stockpiled at the mine site in the winter, doubling truck trips in the summer, so that the number of round trip truck increases to 70 per day on each access road. Surface transportation would be less disrupted during the winter under this variant.

Amakdedori Port

The temporary beachhead and workforce camps set up during construction, long-term Amakdedori Port facilities, and post-closure facilities would be located in the same general area. Currently, no existing/developed surface transportation facilities exist in the vicinity of the port site. However, port construction and operation would have some effects on current surface transportation associated with the area's use for subsistence activities. Figures in Section 3.9, Subsistence, and Appendix K3.9, show some subsistence use in the areas in the vicinity of Amakdedori, but not at the port site itself. While this use appears to be infrequent, construction and operations activities at Amakdedori site as a small potential to require some alterations to traditional over land routes.

Natural Gas Pipeline Corridor

During construction of the pipeline on the Kenai Peninsula and connection of it to the compressor station near Anchor Point, traffic on the Sterling Highway would be affected by vehicles transporting materials to the site. Heavy equipment traffic turning off the highway would exist, but would be less than the usual construction traffic experienced on Sterling Highway for road maintenance during the summer months (PLP 2018-RFI 037). Because construction of the pipeline would parallel the main transportation corridor, there would be limited disruption of community roads systems associated with pipeline installation.

During operations and closure, the pipeline would have no effect on overland traffic.

4.12.2.2 Air Transportation

Existing airports in Iliamna and Kokhanok would be used to transport personnel and some supplies to and from the project area for construction and operations activities. Iliamna Airport has the capacity to facilitate the planned aircraft traffic for the project, and would not require improvements. Kokhanok Airport has a runway capable of handling the anticipated commuter flights for workers, but would require improvements to lighting and navigation, and potentially air radio service. Additional maintenance of the Kokhanok Airport would be required with an increase in traffic (PLP 2018-RFI 027b). Infrastructure improvements would remain in place after project closure. Helipads would also be built at Amakdedori Port and at the mine site. Emergency evacuation of mine personnel would have a small potential to use any these air travel facilities.

During project construction, work crews would access sites by helicopter or boat until the access road is complete. A temporary airstrip would be built at Amakdedori Port to facilitate the construction phase. Twin Otter or similar aircraft would make 20 to 40 flights per month (average of 5 to 10 flights per week) during the construction phase to Amakdedori Port, before Kokhanok can be accessed by road. Once road access to Kokhanok is established, flights to Kokhanok would be up to 10 flights by Twin Otters per week (PLP 2018-RFI 027a).

During operations, an estimated 600 employees would fly to Iliamna Airport from the Anchorage or Kenai airport, approximately 200 employees would fly to Iliamna and Kokhanok from

AMERICAN OVERSIGHT

surrounding community airports, and about 50 employees would travel by road to project locations. Employee flights would be on a 2-week rotation. Weekly employee flight requirements to Iliamna include one Twin Otter from King Salmon, one from outlying villages, two from Dillingham, four from Kenai, and two Q400 flights from Anchorage (10 total). If these airplanes are commercial carriers and not private charters, more frequent commercial flights would allow for more flight options for local residents. Kokhanok would also receive 5 to 10 employee flights per week during operations (PLP 2018-RFI 027a). Iliamna and Kokhanok airports would also receive an estimated one cargo flight per week, and six unscheduled cargo flights per year, in addition to the above passenger flights (PLP 2018-RFI 027). This would be a noticeable increase from the current annual operations (see Table 3.12-1). A small volume of helicopter traffic associated with project operations would occur between Iliamna and the mine site.

During project closure, impacts on air traffic would decline, because fewer personnel would travel to and from the project area. Additionally, instead of private charters, project personnel would most likely use commercial airlines and cargo flights (PLP 2018-RFP 027a).

4.12.2.3 Water Transportation

Mine Site

No water access would exist at the Mine Site and its facilities.

Transportation Corridor

The transportation corridor would cross Iliamna Lake, Upper Talarik Creek, and the Newhalen River, which are considerable navigable by the State of Alaska. To support construction of the north and south ferry terminals and the ferry itself, small temporary barges would cross Iliamna Lake until completion of the ferry terminals. Barges may also move freight and equipment transported during construction on the Williamsport–Pile Bay Road, potentially increasing Iliamna Lake traffic. Construction of the north ferry terminal may use facilities in Iliamna and Newhalen. Employees may be transported to work via boat during this phase. Construction would affect inter-village and subsistence travel along the shorelines and across the lake via watercraft, and commercial traffic in Iliamna, Newhalen, and Kokhanok. River traffic on larger rivers and creeks such as the Newhalen River, Gibraltar River, and Upper Talarik Creek could be disturbed or displaced during the construction of bridges.

During mine operations, the ferry would cross Iliamna Lake year-round along an 18-mile route that would take an estimated 1.5 hours in open water, or 3 hours in ice conditions. The expected frequency of one round trip per day in open water would be noticed by other lake traffic, but would not disrupt such traffic, because of the infrequency of the ferry and the size of the lake for alternate routes.

Furthermore, scoping comments noted hurricane-force winds on Iliamna Lake which could be hazardous for the ferry crossing in open water. Eagle Bluff, west of Kokhanok, would be downwind of the ferry route and could pose a hazard to the ferry in high winds if it lost power or steering. In addition, there are small islands in the lake within approximately 5 miles of the ferry route that could potentially be hazardous in a high wind situation.

When the lake is frozen, it is used as a travel way for people on snowmachines (PLP 2018-RFI 088). Open water created by the ice-breaking ferry would disrupt some cross-lake snowmachine routes and potentially create a safety hazard. PLP would work with communities (and supply funding) to provide for the marking and maintenance of snowmachine trails between communities across Iliamna Lake, when lake ice is thick enough to support such traffic (PLP 2018-RFI 071a). For the Kokhanok east ferry terminal site variant, snowmachine access to

AMERICAN OVERSIGHT

Iliamna Lake would be provided to the east of the terminal to enable access to the Sid Larson Bay area without crossing the ferry route (PLP 2018-RFI 078). Alternate, marked safe routes would help avoid the ferry path, but would have the potential to add to travel time, distance, and fuel costs. After mine closure, the ferry facilities would be removed and supplies would be transported across the lake using a summer barging operation, so there would be no impacts from ice-breaking ferries.

The Kokhanok east ferry terminal variant has thicker ice for a longer duration than the proposed South Ferry terminal. There is a substantial amount of winter traffic between Kokhanok and Sid Larson Bay (to the east of the community), and winter travel routes would cross the East Kokhanok ferry route. However, the creation of an alternate winter travel route along the Kokhanok Spur road with an access point to the lake east of the terminal would mitigate this impact by creating a route that would not cross ferry traffic. Traffic in the town of Kokhanok would see an increase in traffic between the airport and the ferry terminal site. Navigation on Iliamna Lake at the East Kokhanok ferry terminal would be more sheltered from wind and waves, but would contain more navigational hazards such as shallow water and is a longer ferry route of 27 miles (PLP 2018-RFI 078).

This alternative includes a summer-only ferry variant. If the ferry were to run only in the summer, the effects on surface water transportation traffic on Iliamna Lake and on Cook Inlet would have a higher magnitude in the summer, likely doubling if PLP used two ferries as opposed to one bigger one, and absent in the winter.

Amakdedori Port

During construction and operation, supply barges would transport materials, supplies, and equipment to Amakdedori Port, creating an increase in barge traffic on Cook Inlet. During operations, approximately 25 concentrate vessels and 30 supply barges per year would be needed for transport (an average of one vessel per week). Each concentrate vessel would require 10 trips from the lightering barge to fill. Diesel delivery to the port would involve using bulk fuel carriers with an expected maximum load of 4 million gallons to allow fewer shipments during the winter. The additional vessel traffic on Cook Inlet would be noticeable, adding approximately 110 transits or port calls (an average of about 2 per week) to the 2010 count of 480 (an average of about nine per week). Owners of those ships include state, national, and international (Eley 2012). After operations cease and the port decommissioned, impacts on traffic in Cook Inlet would cease as well. At expected speeds between 5 and 7 knots, it is not anticipated for wake heights to exceed natural waves at the shore (PLP 2018-RFI 039).

Amakdedori Port would be in Kamishak Bay, which has several identified reefs, as well as strong winds that create a funnel effect off of the surrounding mountains. Winds can be accompanied by short, choppy sea on flood currents, and can cause heavy swells. From Tignagvik Point to Cape Douglas, vessels are warned to proceed with caution (NOAA 2017). Project vessels may encounter these winds and swells during barging and lightering activities; and should they lose power or steering, could drift onto reefs, mud flats, or otherwise ground at the southern end of Kamishak Bay or near Amakdedori. The nearby Augustine volcano has potential to cause a tsunami at the port site, as it has in the past (PLP 2018-RFI 039).

Natural Gas Pipeline Corridor

Construction of the entire pipeline would take place during the second and third years of overall project construction. The installation of 94 miles of pipeline crossing Cook Inlet on the seabed would be noticeable to vessels, as would the 18-mile crossing on the bed of Iliamna Lake. This phase would involve some time spent working in and crossing a high-traffic area of Cook Inlet,

AMERICAN OVERSIGHT

and would cause navigational hazards for vessels passing nearby on Cook Inlet and Iliamna Lake (Eley 2012). The construction of the Cook Inlet crossing of the pipeline would be expected to take 30 to 40 days, and would include approximately 10 vessels, support and survey vessels included. These vessels would stay in Cook Inlet for the duration of this effort, some of which would travel to shore daily to resupply. In Iliamna Lake, pipeline construction would require one barge, and construction activities would be noticeable to existing traffic (PLP 2018-RFI 027b).

Once the pipeline is fully operational, it would have little effect on vessel traffic and anchoring in Cook Inlet or in Iliamna Lake. The 12-inch-diameter pipe would be placed in a trench deeper than the height of the installation. If the depth of water is greater than 200 feet, the pipeline would be placed atop the seabed. This pipeline would add to the multiple pipelines and other obstacles already installed and located in Cook Inlet. In Iliamna Lake and Cook Inlet, vessel operators would be notified (via a USCG-approved method) of the pipeline location. Mitigation measures would be included as permit conditions for the protection of navigation and the general public's right of navigation on the water surface, and those can include requirements to report Notice to Mariners, or to install and maintain lights or signals as prescribed by the USCG. Effects of post-operational activities would be temporary, and would result in low-intensity disturbances to vessel traffic.

4.12.3 Action Alternative 2 – North Road and Ferry

At the mine site, Alternative 2 would involve the construction and use of roads at the site, and connection of mining areas with the locations of facilities and materials. The effects would be generally be the same as Alternative 1. No effects on water transportation would exist for this alternative at the Mine Site.

4.12.3.1 Surface Transportation

Transportation Corridor

The alternative port location at Diamond Point would require a new road to be constructed to Pile Bay through Williamsport, in the vicinity of the current Williamsport-Pile Bay Road. This would have a substantial increase of traffic on the road during the busy summer months. Mine-related haul trucks would travel along with privately operated shipping vehicles and vessels being portaged, increasing the volume and density of traffic in the area. Because the current condition of the Williamsport-Pile Bay Road makes traversing it difficult, an updated road would make the corridor more economically and logistically appealing for portaging vessels and shipping supplies to villages, assuming the road were built to withstand the full capacity of current and potential future traffic. This would have the potential of increasing private vehicle traffic further, if the proposed or existing Williamsport port could accommodate the increase. These impacts would occur every season during construction and operations.

There are no existing roads in the vicinity of the road proposed to be constructed from Eagle Bay to the Mine Site, and potential effects on current surface transportation would be similar to Alternative 1 with regard to Iliamna, Newhalen, and Nondalton. However, under this alternative Kokhanok would not be connected to the road system and would therefore not be impacted by surface transportation effects near the community.

Under the summer only ferry variant, the effects on surface transportation traffic would be more disrupted by the amount of truck traffic in the summer, as the volume of mine traffic would double in intensity, and would be absent in the winter. However, it is probable that the road would not have high use by other users in the winter either.

AMERICAN OVERSIGHT

Diamond Point Port

The need for a temporary beachhead during construction may be eliminated at the Diamond Point Port site, but a construction camp may be necessary. Surface transportation infrastructure consists of what is needed for the on-site operations at the Diamond Point Port site and quarry, and are not connected by land to a road system. Port improvement and operation would have noticeable effects on surface transportation at the quarry by adding mine traffic to the quarry area, and by connecting the quarry with Williamsport and the road to Pile Bay.

Natural Gas Pipeline Corridor

Effects of construction of the Natural Gas Pipeline on the Kenai Peninsula would be the same as in Alternative 1. The crossing from Ursus Cove to Cottonwood Bay over land would not affect surface transportation because there are no roads there, and little to no subsistence travel. Construction along the road to Pile Bay would occur simultaneously with road construction and improvements, and impacts to surface transportation would be the same as discussed above. Installation of the pipeline from where it would depart from the road near Pile Bay to where it would realign north of Eagle Bay would run through Pedro Bay. This would increase traffic volume in the village as construction vehicles work their way through and near town. During operations, the pipeline ROW between the two ferry terminals may create a route for ATV or snowmachine traffic. The most likely users of this new route along the right-of-way would be the residents in the communities of Pedro Bay, Nondalton, Iliamna, and Newhalen. How the new ROW could impact access to subsistence is discussed in Section 4.9, Subsistence.

4.12.3.2 Air Transportation

Frequency of flights to and from Iliamna would be the same as Alternative 1. Construction cargo and passenger flight frequencies to an airstrip in Pile Bay would be similar to flight frequencies to Kokhanok in Alternative 1. Impacts to the Pedro Bay and Pile Bay communities would be the same as discussed for Kokhanok in Alternative 1. PLP would not construct a new airstrip at Diamond Point, but would improve the existing airstrip near Pile Bay for limited use during construction.

4.12.3.3 Water Transportation

The effects the Transportation Corridor would have on water transportation would be the same as in Alternative 1, except for the location of the ferry terminals and ferry traffic. The community of Pedro Bay would be affected in the way that Kokhanok would have been in Alternative 1. The northeastern portion of Iliamna Lake has a lower median number of days of ice than the southwestern portion, meaning that the ferry route and terminals in this alternative would have less of an effect on winter cross-lake transportation than Alternative 1. See Section 4.9, Subsistence, for disruption on access to subsistence resource use areas.

Dredging at Diamond Point and lightering at Iniskin Bay may be noticeable to the local vessel traffic in those areas, especially during inclement weather when vessels take refuge in Iniskin Bay. Disruption would occur through operations and would result in low-intensity disturbances to vessel traffic.

Effects on water transportation from the construction and operation of the natural gas pipeline would be the same as Alternative 1 in Cook Inlet, but there would be no change in effects to Iliamna Lake other than location of vessel traffic.

AMERICAN OVERSIGHT

4.12.4 Action Alternative 3 – North Road Only

At the mine site, Alternative 3 would involve the construction and use of roads at the site, and connection of mining areas with the locations of facilities and materials. The effects would be the same as Alternative 1. No ferry-related effects on water transportation would exist for this alternative at the mine site, but there could be some construction-related vessel traffic on Iliamna Lake from the Williamsport-Pile Bay Road corridor.

4.12.4.1 Surface Transportation

Effects on the Kenai Peninsula would be the same as in Alternative 1. The effects of the road from Williamsport to Pile Bay would be the same as in Alternative 2.

In this alternative, a road would be built from Diamond Point and routed around the north side of Iliamna Lake, through Pedro Bay and to the mine site. This would be the same route as the natural gas pipeline corridor from Alternative 2, and have the same effects during construction. During operations and closure, this road would increase traffic in Pedro Bay from mine operations and also from the public, because this road would connect the communities on the northern side of Iliamna Lake over land to each other and to Cook Inlet. Access would be controlled the same as in Alternative 1.

The road proposed to be constructed from Eagle Bay to the mine site would have similar effect on current land traffic in Iliamna, Newhalen, and Nondalton, as described in Alternative 1.

Effects on surface transportation at the Diamond Point port site would be the same as Alternative 2.

Installation of the natural gas pipeline along the road from the Pile Bay spur to the mine site would occur simultaneously with road construction and improvements, and have similar effects as Alternative 2.

4.12.4.2 Air and Water Transportation

Frequency of flights to and from Iliamna would be the same as Alternative 1. Flight frequencies to Pedro Bay would be similar to Alternative 2, but the connecting of Pedro Bay by road to the Cook Inlet would affect frequency of flights after construction, if the road leads to more traffic through Pedro Bay. Potential effects on Kokhanok would be limited to resident crew change flights.

The effects of Alternative 3 would be the same as Alternative 2 on water transportation at the Diamond Port site, and there would be no impacts to transportation on Iliamna Lake.

4.12.5 Summary of Key Issues

See Table 4.12-1 for a summary of key issues.

Table 4.12-1: Summary of Key Issues for Transportation and Navigation

Transportation Mode	Alternative 1 and Variants	Alternative 2 and Variants	Alternative 3 and Variants
Surface Transportation	Kokhanok, Iliamna, and Newhalen would experience an increase in volume of road traffic due to new road connections with the project area	Same as Alternative 1, except impacts from truck traffic at Kokhanok would occur at Pedro Bay instead. During operations, the	Same as Alternative 2 except that the road from Diamond Point to the mine site would be routed through Pedro Bay. During operations and closure,

AMERICAN OVERSIGHT

Table 4.12-1: Summary of Key Issues for Transportation and Navigation

Transportation Mode	Alternative 1 and Variants	Alternative 2 and Variants	Alternative 3 and Variants
	through operations.	pipeline ROW may create a route for ATV or snowmachine traffic between ferry terminals. The Williamsport-Pile Bay Road would experience a high-volume increase in traffic that would last the life of the project. Winter travel over frozen Iliamna Lake would be impacted, but this ferry route experiences fewer average days of ice than the route in Alternative 1. This effect would not take place with the summer-only ferry variant.	this road would increase traffic in Pedro Bay from mine operations and also from the public, because this road would connect the communities on the northern side of Iliamna Lake over land to each other and to Cook Inlet. Alternative 3 would have no effects on winter traffic on Iliamna Lake, because the ferry would be eliminated.
Air Transportation	Increased air traffic would affect Iliamna and Kokhanok airports. Kokhanok Airport would need updates in navigation systems and lighting.	Same as Alternative 1, except impacts on flights in Pedro Bay would be the same as discussed for Kokhanok in Alternative 1.	Same as Alternative 2.
Water Transportation	Cook Inlet would experience an increase in barge and vessel traffic during operations. Kamishak Bay has several identified reefs and strong winds, which can cause heavy swells. The summer-only ferry variant would increase ferry trips from one to two round trips per day in the summer, and zero in the winter. Winter travel over Iliamna Lake would be impacted from open water caused by the ice-breaking ferry. This effect would not take place with the summer-only ferry variant, but overland traffic would be more disrupted by truck traffic doubling from 35 to 70 round trips per day.	Same as in Alternative 1 in Cook Inlet, except Iliamna Bay would have denser vessel traffic. Summer ferry variant stockpiles the concentrate so that the year round shipping schedule can be maintained. Dredging at Diamond Point and lightering at Iniskin Bay may be noticeable to the local vessel traffic in those areas, especially during inclement weather, when vessels take refuge in Iniskin Bay. Iniskin Bay is considered secure for anchorage of medium-sized vessels. The summer-only ferry variant would increase ferry trips from one to two round trips per day in the summer, and zero in the winter.	Effects on Cook Inlet would be the same as Alternative 2.

AMERICAN OVERSIGHT

4.12.6 Cumulative Effects

Past, present, and reasonably foreseeable future activities in the cumulative impact study area have the potential to contribute cumulatively to impacts on transportation and navigation. The potential future actions are similar to the proposed project in how they impact surface, air, and water transportation and navigation during construction, operation, and closure.

The following Reasonably Foreseeable Future Actions (RFFAs) identified in Section 4.1 were carried forward in this analysis based on their potential to impact transportation and navigation in the analysis area:

- Pebble Project buildout – develop 55% of the resource over 78-year period
- Pebble South/PEB
- Big Chunk South*
- Big Chunk North*
- Fog Lake*
- Groundhog*
- Shotgun*
- Johnson Tract*
- Copper Joe*
- Donlin Gold
- Diamond Point Rock Quarry
- Alaska Stand Alone Pipeline Project
- Alaska LNG
- Drift River Oil Pipeline
- Cook Inlet Oil and Gas Lease Sales
- Hydrocarbon Exploration Licensing and Leasing Program*
- Lake and Peninsula Borough (LPB) Transportation Projects
- LPB Community Development and Capital Improvement Projects
- Rural Alaska Village Grant Program Projects
- LPB and other regional Renewable Energy Initiatives
- Nushagak Electric Cooperative Village Intertie Project
- Villages of Iliamna, Newhalen, Pedro Bay, Port Alsworth, Nondalton, Igiugig, Kokhanok, Koliganek, Levelock, New Stuyahok, King Salmon, Naknek, Aleknagik, Clarks Point, Manokotak, Dillingham, Nikiski, and Seldovia

**Indicates exploration activities only.*

The future actions included in this analysis are those that contribute to the cumulative increase in vessel traffic in Cook Inlet. There would also be an accumulating demand for regional and helicopter air transportation and logistical support, particularly if mining exploration activities or construction schedules of the proposed action, Donlin Gold, and the Diamond Point Rock Quarry were to overlap. It is likely that any increased demand for air transport could be met by adding supply, because the RFFA sites are distributed, rather than clustered with different airstrips or staging sites.

Similarly, surface transportation impacts would occur along roads leading to the communities of Iliamna, Newhalen, and Nondalton via the proposed Iliamna spur road, and Kokhanok community roads would be connected to the proposed south access road, which would run from the proposed south ferry terminal to Amakdedori Port. Cumulative impacts would occur associated with surface transportation between the communities for subsistence and recreational uses, in addition to the ongoing LPB, rural Alaska Village Grant Program, and other village projects.

AMERICAN OVERSIGHT

From June to October, vessel traffic in the Cook Inlet typically includes large deep-draft vessels, tugs, barges, and small commercial vessels. Project-generated vessel traffic in Cook Inlet would include deep-draft vessels such as concentrate transport vessels, vessels for fuel, and barges for delivery and transport of materials and supplies. The proposed action vessel and barge delivery traffic would contribute a noticeable disturbance of transportation access and traffic levels in Cook Inlet.

Furthermore, RFFAs in the immediate project vicinity could potentially extend the operation of the port facilities for an additional 78 years. The Pebble project buildout RFFA may add additional annual vessel and truck traffic, and would continue operation of the port facilities at a higher production rate. There is also the possibility of additional infrastructure. Therefore, this scenario would have a larger contribution to cumulative effects in the area.

Cumulative effects would be the same as Alternative 1 for surface, air, and water transportation and navigation under Alternatives 2 and 3.

1.0 INTRODUCTION

This Scoping Report has been developed for the U.S. Army Corps of Engineers (USACE) to share the types of issues that were received during the scoping period from the general public and the cooperating agencies. It documents outreach efforts during the scoping period and summarizes the primary issues of concern and suggested alternatives from the public. The Scoping Report will be used to develop alternatives for the Environmental Impact Statement (EIS) and identifies issues that are important to the public and should be considered in the analysis of the EIS.

2.0 PROJECT OVERVIEW AND SCOPING PROCESS

2.1 BACKGROUND

The USACE, Alaska District, intends to prepare a Draft EIS to assess the potential social, economic, and environmental impacts associated with the proposed Pebble Project. The EIS will assess potential effects of a range of alternatives.

Pebble Limited Partnership (PLP) is proposing to develop the Pebble copper gold-molybdenum porphyry deposit as an open-pit mine, with associated infrastructure, in southwest Alaska, north of Iliamna Lake. The proposed project would require a natural gas-fired power plant supplied by a natural gas pipeline to the Mine Site, and transportation infrastructure including a road from the Mine Site to a ferry terminal on the north shore of Iliamna Lake, an ice-breaking ferry crossing to a terminal on the south shore of Iliamna Lake, and a road to the proposed Amakdedori Port on Cook Inlet.

2.2 NOTICE OF INTENT

An application for a Department of the Army permit was submitted by PLP pursuant to Section 404 of the Clean Water Act (33 United States Code [U.S.C.] 1344) and Section 10 of the Rivers and Harbors Act of 1899 (33 U.S.C. 403) on December 22, 2017. The application was deemed complete, and was advertised in a Public Notice, Pacific Operations Area (POA) POA–2017–271, on January 5, 2018. On March 29, 2018, the USACE issued a Notice of Intent in the Federal Register to prepare an EIS for the proposed project. The Notice of Intent is included in Appendix A, and the Public Notice is included in Appendix B.

2.3 SCOPING PROCESS

2.3.1 Scoping Process Overview

The scoping period began on April 1, 2018. On March 30, 2018, the USACE issued a press release to announce the opening of the 30-day comment period and to provide information for how to submit comments. On April 6, 2018, their second press release extended the scoping period by 60 days to continue through June 29, 2018. See Appendix B for both press releases.

Scoping is conducted to assist in determining the breadth of analysis, significant issues, and alternatives to be analyzed in depth in the Draft EIS. The Council on Environmental Quality defines scoping as an "early and open process for determining the scope of issues to be addressed and for identifying the significant issues related to a proposed action" (40 Code of Federal Regulation 1501.7). The scoping process provides an opportunity for people potentially

AMERICAN OVERSIGHT

affected by the project to express their views and concerns and to contribute to the completeness of the EIS.

2.3.2 Public Notice, Press Releases, and Other Media

Prior to the scoping period start, the USACE began organizing public meetings and developing materials related to scoping that were provided to the public.

The project website (www.PebbleProjectEIS.com) went live on March 19, 2018. The website includes information about the project, EIS process, and scoping. The USACE uses the website to disseminate important information to the public, such as the scoping meeting schedule. The website also included a form for the public to submit scoping comments; this online comment form included a map where commenters could mark a point that related to their comment. Comments that have been submitted are available for the public to view. Some individual comments to the website contain multiple documents. Screenshots of the website (dated May 7, 2018) are in Appendix B.

On March 20, 2018, the USACE mailed hardcopies of a Scoping Package to 35 identified Alaska Native Tribal Organizations in the project area. The complete Scoping Package (in Appendix B) was also made available on the project website and includes:

- Information about the scoping process
- A description of the project
- The process for developing alternatives
- A list of resources to be analyzed in the EIS
- Information on the National Environmental Policy Act (NEPA)
- Roles of the various participating organizations
- An EIS schedule and outline
- Information on submitting comments
- A comment form.

To help advertise the scoping period, the USACE began mailing the project's Newsletter #1 on March 29, 2018. The newsletter provided details on the public meeting schedule as well as information on how to submit comments; it was sent to every post office box in 33 communities, and to 140 other organizations and individuals on a mailing list. A total of 3,670 newsletters were mailed. The USACE also ran announcements in the Bristol Bay Times, the Homer News, and the Anchorage Daily News a week prior to relevant meetings. Finally, a flyer was emailed to communities where scoping meetings were scheduled for distribution on April 6, 2018. Newsletter #1, newspaper affidavits, and the flyer can be found in Appendix B.

2.4 PUBLIC SCOPING MEETINGS

Public scoping meetings were held in nine communities, including Anchorage. A total of 914 participants signed in at the public meetings (see Appendix C for sign-in sheets). The primary purpose of the public meetings was to present a project overview, give the public a forum for submitting verbal and electronic comments, and provide an opportunity to talk to the USACE about the EIS and the Department of the Army permit application process. Table 1 shows the meeting locations and the number of people who signed in.

AMERICAN OVERSIGHT

Table 1: Scoping Meetings

Date	Community	Location and Time	Number Signed In
April 9, 2018	Naknek	Naknek School, 3:30-7:30 PM	45
April 10, 2018	Kokhanok	Community Hall, 3:30-7:30 PM	68
April 11, 2018	Homer	Homer High School, 5:00-9:00 PM	223
April 12, 2018	Newhalen	Newhalen School, 3:30-7:30 PM	47
April 13, 2018	New Stuyahok	Community Building, 1:00-4:30 PM	65
April 16, 2018	Nondalton	Tribal Center, 3:30-7:30 PM	46
April 17, 2018	Dillingham	Middle School, 5:00-9:00 PM	88
April 18, 2018	Igiugig	Community Building, 3:30-7:30 PM	47
April 19, 2018	Anchorage	Dena'ina Center, 11:00 AM-9:00 PM	285

2.4.1 Meeting Description

The format of the public meetings varied depending on the location. A sign-in station with hardcopies of supporting material was set up at all locations. The sign-in sheet was used to update the project mailing list.

In general, a brief introduction by the USACE was given. A 17-minute video describing the project was shown (or was available to be watched), and the public were given multiple ways to comment. Time was allotted for members of the public and media to speak directly with USACE staff, State of Alaska staff, or in some locations, other cooperating agency staff. AECOM (the third party NEPA contractor) staff were also present.

In Naknek, Kokhanok, Newhalen, New Stuyahok, Nondalton, and Igiugig, the USACE provided a microphone ("hot mic") where participants could speak their comments out loud in front of other meeting attendees. Comments were transcribed by a court reporter, either during the hot mic session or individually after the session. In Homer, Dillingham, and Anchorage, two court reporters were available to take comments one-on-one; therefore, no hot mic was provided.

At all meetings, laptop computers were provided for the public to submit comments electronically to the project website. Paper comment forms were available for handwritten or typed comments, which could be submitted to the USACE at a meeting or mailed later.

2.4.2 Meeting Materials Description

The USACE requested that the PLP create a video describing their proposed project and mining process. The resulting 17-minute video gives an introduction to the surrounding environment, project components and footprint, water management and mining process, and reclamation. At some meetings this video was shown after the USACE introduction, and at others it was shown on a repeating loop.

Ten posters prepared by the PLP to describe the project, the mining process, and reclamation were also displayed. The USACE created additional posters describing the NEPA process and how to write effective comments. The Anchorage meeting also included posters on the scoping process, the EIS outline, resources to be discussed in the EIS, and roles of cooperating agencies.

AMERICAN OVERSIGHT

The USACE also provided the Scoping Package, paper comment forms, and a handout from the Bureau of Safety and Environmental Enforcement (BSEE), a cooperating agency. A screenshot of the video, as well as all posters and handouts, are in Appendix D.

2.4.3 Additional Agency Involvement

A kickoff meeting for cooperating agencies was held on June 6, 2018, where the roles of cooperating agencies for this EIS were discussed. Cooperating agencies will have opportunity to provide input throughout the process, including alternatives development, providing technical expertise for analysis, and suggesting mitigation. In addition, the State of Alaska, BSEE, and the Pipeline and Hazardous Materials Safety Administration attended some scoping meetings to answer questions about their role and expertise.

2.4.4 Government-to-Government Consultation

Executive Order (EO) 13175, "Consultation and Coordination with Indian Tribal Governments," was enacted in 2000 and requires federal agencies to consult with Native Alaska tribal governments when considering policies that would impact tribal communities. Government-to-government consultation meetings began before the scoping period started and will continue throughout the EIS process.

2.4.5 Next Steps in the NEPA Process

Scoping is the first opportunity for public involvement under the NEPA process. An additional opportunity for public comment will follow the release of the Draft EIS scheduled for early 2019. A Notice of Availability will be published in the Federal Register informing stakeholders and other members of the public that the Draft EIS is available for comment. The Draft EIS comment period will include public meetings in the same communities where scoping meetings were held. The project website will be updated throughout the EIS process.

Public comments shape the NEPA process by identifying project-related questions and issues of concern. Typically questions are in reference to the project, existing environment, extent of temporal and spatial impacts, or potential consequences to the human environment from the proposed action. Substantive questions and issues of concern, which can inform the scope of analysis and alternatives to be considered in the EIS, are grouped by subject matter in this Scoping Report. This information is used in the alternatives development process, the study of the affected environment, and in the process to analyze environmental consequences (or impacts). Documents that are received from the public during the scoping process via the project website, mail, and email are referred to as submissions during analysis. Each submission can contain many coded comments which are then used to inform the scope of the analysis. Submissions without substantive comments that are not specific to a particular issue are considered non-substantive. These include comments in support of or in opposition to the applicant's proposed project.

AMERICAN OVERSIGHT

3.0 SCOPING COMMENT SUMMARY

This section contains a description of the scoping comment analysis process and a summary of the public scoping comments received. Due to the large number of comments submitted as part of scoping for an EIS, it can be challenging for the EIS preparation team, as well as the general public, to read all the comments and understand all of the issues raised. Standard practice has been to code and enter comments into a database program that captures and summarizes issues and recommendations from scoping comments. However, the EIS team and the general public will continue to have access to comments submitted on the website for reference purposes.

The public comment summary includes the following:

- Description of the scoping comment analysis process (description of the comment database, development of the coding structure, identification and coding of comments, comment summary process).
- A summary of issues identified, categorized by physical environment, biological environment, social environment, or NEPA process.

3.1 SCOPING CONTENT ANALYSIS PROCESS

Public and agency comments submitted by the close of the scoping period were analyzed and categorized using a process called "content analysis." The analysis process included:

1. Import and organization of all comments/submission content into a comment database.
2. Development of a coding structure to analyze the comments.
3. Review of submissions to assign codes to comments.
4. Preparation of a Scoping Report with analysis results.

The goals of the content analysis process are to:

1. Ensure that every submission (every received set of comments, submitted by any means, is defined as a "submission") is considered.
2. Identify the concerns raised by commenters.
3. Represent the breadth and depth of the public's viewpoints and concerns as fairly as possible.
4. Present those concerns in a way that facilitates consideration of comments and conveys the issues raised during scoping.

All comments were treated equally. Emphasis was on the content of a comment, rather than who wrote it or the number of submissions in agreement.

3.1.1 Scoping Comment Database

Names, contact information, and comment text for commenters who submitted comments were entered into an electronic database. Many comments were submitted to the USACE in electronic format through the project website comment form. A large volume of comments were received by the USACE via email and/or postal service. As comments were received, they were made available for the public to view on the project website. Hardcopy comments, including those delivered by postal service or submitted in person at public meetings, were scanned and entered into the database, and also posted to the project website.

AMERICAN OVERSIGHT

The content of the comments was filtered using various database queries and identifying potential form letters (see form letter discussion below). Any submission identified as having the same commenter information and content, regardless of delivery format (e.g., hardcopy letter, email) or date, was counted as one submission.

3.1.2 Form Letters

Form letters are defined as multiple submissions with the same content. Electronic comments were pre-screened in the database, using various queries to identify similar content and thus potential form letters. If consistent content was identified, a form letter record with that content was created in the database and additional submissions with the same content were placed into that form letter category.

3.1.3 Coding Structure Development

Submission content was sorted into categories to represent commenters' concerns and rationale through a coding structure. Codes provide an efficient and accurate grouping of similar comments; coded concerns are referred to as "comments" in this report.

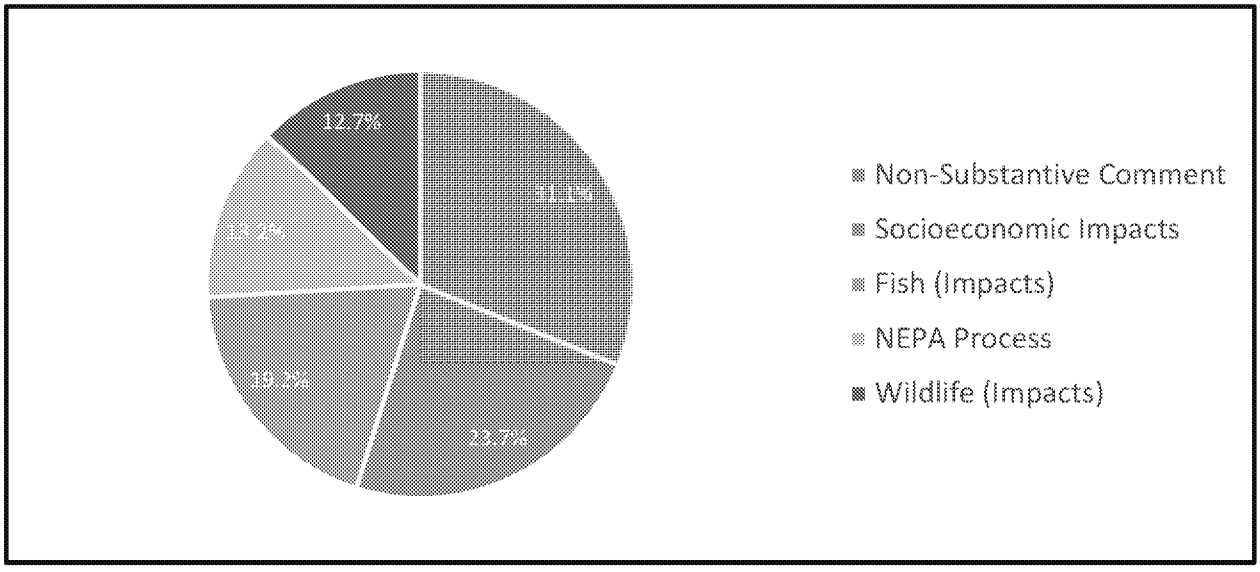
The aim of the coding structure is to identify applicable Pebble Project facilities and components, environmental resources, and planning processes in submissions. An initial coding structure was developed based on expected issues and concerns; this structure was continuously refined as more submissions were received to identify any additional concerns.

3.1.4 Comment Identification and Coding

Submissions were reviewed to identify substantive comments that will be used to formulate the issues and analysis conducted in the EIS process. Individual statements within a submission were identified as a comment(s) and then assigned to categories/topics.

Submissions may contain more than one comment, each coded based on the issue and the specific rationale. This form of analysis allows for specific comments to be captured and then grouped under the umbrella of a general resource issue. The NEPA process considers the substance of issues but does not consider who wrote the comment or the number of similar comments (like votes).

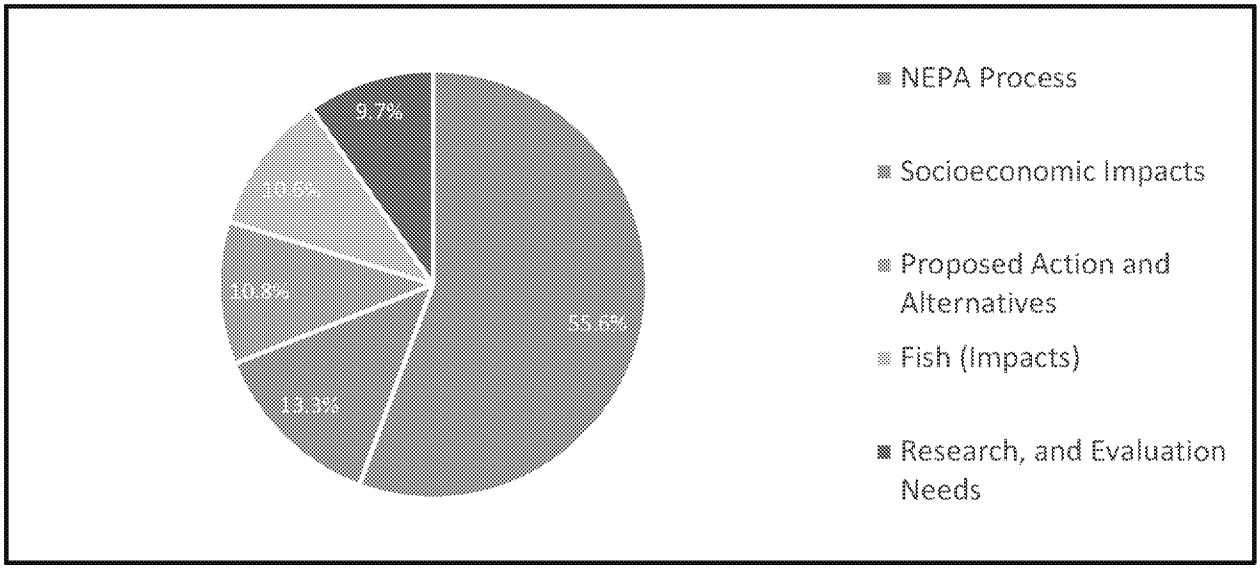
3.2 PUBLIC COMMENT SUBMISSION SUMMARY



3.2.1 Submissions Received

[Note: This section is preliminary; final comment tallies are pending and will be included in the Final Scoping Report.]

In total, 174,873 submissions were received through June 29, 2018. A total of 4,055 of these submissions were considered non-form letters. There were several variations of form letters that were received, with a total of 170,818 form letters. The USACE received five petitions with a total of 295,721 signatures that were considered as non-form letter submissions. The validity of these petition signatures has not been verified. Submissions with substantive comments were analyzed for key issues. The top five key issue fields for non-form letters and form letters are shown in Figure 1 and Figure 2.



AMERICAN OVERSIGHT

Figure 1. Top Five Key Issue Fields (Non-Form Letters)

[Note: The numbers in Figure 1 are pending final tallies.]

Figure 2. Top Five Key Issue Fields (Form Letters)

[Note: The numbers in Figure 2 are pending final tallies.]

A total of 8,866 substantive comments were received from non-form letter submissions, and 345,848 substantive comments were received from form letters.

3.3 COMMENT SUMMARY PROCESS

The intent of this Scoping Report is to provide representative summaries that capture, with a minimum of repetition, major topic areas or concerns expressed during the public scoping period. The topic areas or concerns contained in the summary of public comment will be used to develop the issues, alternatives, and mitigation strategies that will be analyzed in the EIS process. It will also inform the public of issues that were raised from their scoping comments.

AMERICAN OVERSIGHT

In writing this summary, comment analysts reviewed coded comments to understand the overall content of the comment and to identify topic areas or concerns in similar comments from different respondents. Similar comments were summarized into concise narrative statements and organized by the key issues.

Comments are organized in two broad categories below:

- **Resource Topics**. This section provides issues identified in scoping comments organized by resource topic. Resource-specific comments are grouped, such as comments concerning fish and wildlife habitat loss, loss of recreational access, or dust and emissions along the access roads and at the Mine Site. These topics are divided by the physical environment, the biological environment, and the social environment.
- **NEPA Process and Regulatory Compliance**. This section provides a summary of public comments on the NEPA process and alternatives to the proposed project. Topics include the public involvement process, project purpose and need, other laws and regulations, tribal consultation, cooperating agencies, and the no action alternative. Public comment suggestions for proposed action alternatives and mitigation measures are also included.

3.4 SUMMARY OF PUBLIC COMMENT –RESOURCE TOPICS

3.4.1 General Resources

A variety of general comments were received indicating that the EIS should analyze the direct, indirect, and cumulative impacts on general resources or the environment in the project area.

3.4.2 Physical Resources

Comments indicated that the EIS should analyze the direct, indirect, and cumulative impacts on specific physical resources, including:

- Air quality
- Climate change
- Geology and seismic activity
- Surface and groundwater hydrology impacts
- Noise impacts
- Spill risks and release
- Hazardous materials stored and transported to and from the mine site
- Natural gas supply and pipeline safety
- Tailings dam
- Water resources – quality and quantity.

3.4.2.1 Air Quality

Comments were received on impacts to air quality as a result of project construction and mining operations.

- Comments were received regarding impacts to air quality from construction, fugitive dust emissions, vehicle equipment emissions, and mining activities.

AMERICAN OVERSIGHT

- Concerns were made regarding fugitive dust pollution from the mine and roads, and what chemicals may be used to control dust.
- Impacts to air quality including impacts from transporting ore and materials, or loading and shipping ore and concentrate.
- Impacts from air pollutants emitted during mine operations and contribution to greenhouse gas (GHG) emissions from the power plant.

3.4.2.2 Climate Change

Comments were received about the impacts of climate change to the environment and how climate change trends may interact with effects of the proposed project.

- Look at the carbon and GHG additions to the atmosphere from the proposed project.
- Provide a comprehensive emissions inventory of criteria pollutants, GHG emissions, and significant hazardous air pollutant emissions for all project components and phases.
- Create a report and use comparisons to make the units of measure understandable to the public.

3.4.2.3 Geology and Seismic Activity

Comments were received regarding impacts to the geology of the project area, including concerns that major faults occur in the proposed project area and may affect project facilities.

- Include detailed information about seismically active areas, geological faults and tectonic activity, and corresponding design features.
- Analyze impacts to bedrock, surface geology, gravel resources, paleontological resources, and landforms from all proposed project components.
- Describe how the proposed project facilities would withstand earthquakes, particularly the tailings storage facility (TSF).
- Analyze impacts from volcanic activity, especially at Amakdedori Port and along the pipeline from the Augustine Island volcano.

3.4.2.4 Surface and Groundwater Hydrology

Comments were received on impacts to groundwater systems and aquifers, transportation of groundwater, and how it moves underground. A thorough understanding of the groundwater and surface water hydrology and how they relate to each other should be demonstrated.

- Evaluate changes in water volume in the stream areas impacted, as well as changes in the downstream reaches of the watershed resulting from losses of upstream contributions of water. Include seasonal changes to the different stream segments.
- Evaluate flow changes in the impacted stream reaches, both from pit dewatering as well as any proposed in-stream discharge points. Areas of stream incision as a result of flow changes should be identified, as well as losses of connectivity to floodplains and riparian wetlands currently.
- Address earthquake impacts on hydrology characteristics.
- Explain the water balance model of the project. A complete water management plan based on recent data should be provided before impacts can be assessed.

AMERICAN OVERSIGHT

3.4.2.5 Noise

Comments were received on impacts of noise pollution as a result of project construction and mining operations.

- Discuss noise impacts of blasting in the project area, and describe the blasting methods that would be used.
- Consider noise in the water created by the proposed icebreaker ferry and the impacts to fish, bears, and other wildlife.

3.4.2.6 Spill Risks and Releases

Comments were received about the potential for fuel and oil spills or accidental releases from various aspects of the project, including adequate response capacity to clean up spills in various conditions, and potential impacts to natural resources or environment from spills or release.

- Analyze impacts of spills of diesel and natural gas to every resource discussed in the EIS.
- An earthquake could rupture the gas pipeline under the lake when salmon are migrating and impact fish and wildlife.
- Explain who is responsible for spill response on Cook Inlet and Iliamna Lake. Response plans should be developed for all parts of the project.
- The wetlands that surround the mine site would make it difficult to contain contaminated waters if any of the storage or processing sites at the mine or along the transportation corridor were to leak or fail. Therefore, it is essential to ensure that this infrastructure has no possibility of failure during the life of the mine or for decades to centuries after the mine is closed down.
- There is concern about the number of times the ore slurry/concentrate, fuel, and other supplies must be transferred. Each transfer increases the risk of a spill or release.

3.4.2.7 Hazardous Materials

Comments were received about the potential for hazardous material storage, spills, and impacts to resources or the environment; in particular, to address chemicals associated with mine process and storage of materials (such as arsenic or acids).

- The revised mine plan calls for no cyanide to be brought in to the region.
- Address impacts of hazardous and solid waste generated from the proposed project. A hazardous and solid waste material handling, storage, management, and disposal plan should be developed and evaluated into the Draft EIS.
- Describe how blasting agents would be transported and managed, and how much would be used.
- During the copper extraction process, an alcohol is added during the flotation along with a collector chemical called potassium amyl xanthate (or the potassium salt of an alkyl dithiocarbonate), which can be toxic.
- The process chemicals described in the permit application appear to be generic descriptions, rather than descriptions of the specific chemicals to be used. A more complete description of the ore processing is needed. A complete list of process chemicals, by manufacturer, as well as the annual amount to be used, is also required.
- List any herbicides, pesticides, or road de-icing compounds.

AMERICAN OVERSIGHT

3.4.2.8 Natural Gas: Pipeline and Gas Supply

Comments were received on the impacts of the proposed project on the supply, demand and cost of natural gas in the proposed project area and Cook Inlet.

- There could be lower costs of fuel in rural Alaska as result of potential new gas supply and spur/distribution systems.
- The supply of available natural gas in Cook Inlet may not be sufficient to provide power to the proposed project.
- Explain if the use of natural gas by PLP would affect existing Alaska Railbelt supply and users.

Comments were received on the design, route, construction, and safety and reliability of the natural gas pipeline crossing Cook Inlet and Iliamna Lake.

- That part of Alaska has exceptionally high tides – routinely greater than 20 feet. Please consider this when analyzing an underwater gas pipeline.
- There are safe and secure methods to construct a pipeline that would cross existing submarine cables. The pipeline owner/operators should enter into a cable crossing agreement to ensure the safety and security of both the fiber cables and the gas pipeline.
- There are not any pipelines in Cook Inlet this long. A commenter noted that in Nikiski, the seabed can change rapidly. This can cause unforeseen problems in maintenance. While lower Cook Inlet and Kamishak Bay do not have ice or currents to the same extent as the upper Cook Inlet, Lower Cook Inlet is not nearly as protected as the waters of upper Cook Inlet, and Kamishak Bay experiences challenging winter sea conditions.
- At Iliamna Lake, maintenance could be difficult when the lake is frozen.
- The route for this pipeline would be near the base of Augustine Volcano, which is the most active volcano in Cook Inlet and has erupted eight times since 1812.
- Cook Inlet has huge tides, glacial silt, ice flows, and strong currents and is corrosive to almost everything. Explain who will pay for the maintenance and repair of this pipeline.
- The eastern end of the proposed pipeline route runs along a soft, sandy bluff north of Anchor Point. The bluffs are eroding an average of 1.1 feet/year.

3.4.2.9 Tailings Dam

Comments were received regarding concern for the stability of the tailings dam, potential for tailings dam failure, and impacts of such a failure.

- Describe the impacts of dam failure and recognize the public concern of the stability of the tailings dam. Specifically, consider the impacts to biological and social environments of a dam failure as a result of an earthquake.
- Look at examples of other tailings dam failures (in Spain, Canada, Australia, and others in the United States).
- Analyze impacts from tailings leaks and leaching, not just failures.
- Tailings dam engineering has improved considerably over the decades. Pebble's tailings dam design will have to be approved to adequately protect the environment before the project would be permitted.

AMERICAN OVERSIGHT

- Analyze impacts from rainfall causing overtopping of the tailings dam. Alaska has a propensity for large storms and with climate change and warming effects, risk for large storms is increased.
- It is recommended that large tailings dams use dynamic rather than pseudostatic analysis for potential dam failure under earthquake loading.

3.4.2.10 Water Quality and Quantity

Comments were received concerning a detailed analysis and discussion of the physical and chemical impacts on all water resources.

- Analyze impacts to water quality and quantity from construction, operation, and post-closure.
- Analyze pit water and tailings dam management.
- Identify potential changes to nutrient levels, turbidity, and dissolved oxygen, particularly with respect to seasonal patterns in the downstream reaches.
- Analyze erosion, turbidity, temperature changes.
- Ferry crossing concerns, including changes in shoreline erosion and turbidity, and pollution from the proposed ferry.
- Composition of the (potential) contaminants from all project sources, including blasting.
- Prevailing winds will create water surface waves on the pyritic tailings facility which will allow oxidation of the tailings.
- Risks associated with acid rock drainage from mine project components, including the waste rock facility, leaching, and pathways for acid rock drainage. Acid rock drainage was noted as a potential source of impact on many resources, such as water quality, wetlands, fish, and subsistence food resources.
- Describe how acid rock drainage, tailings, and metals leaching would be tested, monitored, and treated during mining and post-closure.
- Analyze the potential for wastewater to enter streams and rivers.
- Project components should be designed for 500-year events, given predictions for wetter spring and summers in this area.
- The EIS should identify the Alaska Pollutant Discharge Elimination System discharge locations, identify applicable water quality standards, and analyze the likelihood of discharges to meet standards.
- The EIS should identify and describe the location of water sources for hydrostatic testing.

3.4.3 Biological Resources

Comments indicated that the EIS should analyze the direct, indirect, and cumulative impacts on specific biological resources, including:

- Vegetation and ecosystems.
- Fish and aquatic resources.
- Wetlands and special aquatic sites.
- Wildlife and non-threatened and endangered species birds and mammals.
- Threatened and endangered species.

AMERICAN OVERSIGHT

3.4.3.1 Vegetation and Ecosystems

Comments were received concerning potential for disturbance from project construction and operations, and from invasive species. Comments were also received concerning terrestrial, lake, and marine habitat impacts from project construction and operations.

- Analyze the potential direct, indirect, and cumulative effects of all components and all phases (including reclamation and restoration) of the proposed project on terrestrial, marine, and freshwater ecosystems.
- Analyze impacts to rare and sensitive plants (including removal).
- Address how fugitive dust would affect vegetation within the project area and beyond.
- Address risk for invasive (non-native) species introduction by marine barges and the ferry; include ballast water management.
- Analyze ecosystems as unique in the Bristol Bay area, in the degree to which they remain unaffected by commercial development and other human technologies. Evaluate how the proposed project could alter the biological and human ecosystems and landscape.

3.4.3.2 Fish and Aquatic Resources

Comments were received related to potential impacts to fish (King Salmon, Sockeye Salmon, Silver Salmon, Pink Salmon, Chum Salmon, Dolly Varden/Arctic char, Rainbow Trout, and Grayling) populations, abundance, diversity, migratory patterns, contamination, and potential for displacement from project components.

- Address effects of ferry traffic on resident and migrating fish in Iliamna Lake: the potential for the ferry to cause erosion of the lake shoreline and the effect of that on fish; the effect of the ferry on salmon spawning and rearing habitat; the effect of increased noise on salmon productivity; the potential for increased turbidity and its effect on salmon; the potential for ferry traffic to cause wave action that could harm the fry on their way to the ocean; the potential for ferry propellers to entrap fish and cause mortality; and the potential for fish to avoid the area around the ferry and not come back to the area.
- Address effects of gravel pits on stream hydrology and fisheries.
- The USACE should understand that a disruption of habitat could affect the nutrients returned to the ecosystem by the salmon provide when they return to these watersheds.
- Water withdrawal and capture, storage, treatment and release of wastewater associated with the mine could impair the fish habitat functions of streams, wetlands, and aquatic resources.
- Address the potential for fish to become contaminated from sedimentation, metals, toxins, mining chemicals or fuel spills.
- Evaluate how the proposed project road to Iliamna Lake would impact fish species as road traffic will create dust that may contain copper and other heavy metals that could enter the watershed and affect resident aquatic organisms including salmon.
- Dredging off Amakdedori Beach may affect schooling of salmon and/or Dolly Varden before they run up Chenik Creek, McNeil River and Mikfik Creek.
- Analyze the impact of anthropogenic erosion on fish gills from construction and mining. Anthropogenic turbidity has severe impacts on newly emergent fry. Address

AMERICAN OVERSIGHT

the effects of constructing the Amakdedori Port and maintenance dredging would have on Cook Inlet herring spawning habitat in Kamishak Bay.

- The area that makes up the "headwaters" is full of underwater streams in which small fry/fingerlings swim as they emerge. They sometimes swim into lakes and ponds of the region and often get too big to get out; they are called land-locked salmon.

Comments were received regarding the impacts of the mine access road crossing streams and anadromous waters, and the impacts of those stream crossings on fish.

- The EIS must include and present all the waters documented in the Alaska Department of Fish and Game Anadromous Waters Catalog at a minimum; however, it should be recognized that the Catalog under-represents waters that actually support anadromous fish on the order of 20 to 40 percent.
- Current plans will impact more than 5 miles of anadromous streams.
- The construction process would build an 80-mile road system with 200 stream crossings impacts that should be analyzed.
- Analyze bridge and culvert impacts to fish, including fish passage and habitat condition change. The proposed 75-mile-long road system would include 222 culverts, 149 of which are not designed for fish passage.
- The proposed road corridor has been designed to minimize impact on wetlands, minimize stream crossings and avoid areas of known for subsistence and recreational use.
- Describe how state protocols regarding fish-bearing streams would be enforced.
- An independent third party needs to verify which streams along the road corridor are fish-bearing. History has shown that PLP and their consultants may have underestimated the number of streams containing fish.

Comments were received regarding the impacts to aquatic resources, including introduction of invasive species.

- Shipping from foreign ports may result in ballast water transporting invasive species such as green crab, which would have a devastating impact on the ecosystem and commercial shellfishery.
- The potential or known effects of a disrupted winter ice regime, lack of ice cover on resident species of fish, birds, and mammals should be investigated. These changes may have contributed to the most recent Kvichak sockeye run decrease. Partial or reduced ice cover may have affected planktonic production, hence food for salmon that may have caused salmon to smolt early.

3.4.3.3 Wetlands and Special Aquatic Sites

Comments were received on filling of wetlands and alternations of wetlands habitat, fragmentation, and loss of wetland habitat as a result of project activities.

- Include delineation of all wetlands that could be affected by the proposed project.
- The estimated mine site would fill 3,190 acres of wetlands and water bodies, nearly three times the maximum set by the Environmental Protection Agency (EPA) for Bristol Bay in 2014.
- Analyze impacts to wetlands dewatering and hydrological changes, pollution to wetlands, impacts on wetlands functions, clearing and removal of wetland vegetation,

AMERICAN OVERSIGHT

degrading wetland vegetation from all proposed Pebble project components and during construction, operation, and closure phases.

- Given the extent of streams, wetlands, lakes and ponds both overlying the Pebble deposit and within adjacent watersheds, excavation of a massive mine pit and construction of large tailing impoundments and waste rock piles would result in discharge of dredged or fill material into these waters.

3.4.3.4 Wildlife and Non-Threatened and Endangered Birds and Mammals

Comments were received related to potential impacts to wildlife (including terrestrial and marine mammals), and on potential impacts to migratory birds and waterfowl populations; abundance, diversity, migratory patterns and potential for displacement; and attraction of birds to tailing ponds.

- Assess how wildlife can acclimate to construction and operation impacts.
- Analyze how noise levels from construction or large vessel traffic may deter bears from coming to McNeil River Falls, or could affect bear behavior and change or end the use of McNeil River by bears.
- The proposed road and Amakdedori Port could change brown bear migration and result in brown bear mortalities.
- Analyze impacts that habitat fragmentation from Amakdedori Port and the mine access road would have on bear movements.
- Examine how increased contact between bears that use the McNeil River and humans could result in food conditioning of bears or direct bear mortality by humans.
- The proposed ferry could strike marine mammals (seals) in Iliamna Lake, which would congregate in the open water created by the icebreaking ferry. The seals have been considered in the past for Endangered Species Act status.
- Ferries could impact the migration patterns of wildlife.
- The USACE should incorporate traditional knowledge on freshwater seals in Iliamna Lake into the EIS and be aware that there is a Freshwater Seal Commission.
- The transportation of mining materials across Cook Inlet and Iliamna Lake could have potentially negative effects for local marine mammals, particularly underwater noise pollution that impacts marine mammals.
- The Bristol Bay watershed is unique in that it provides habitat for more than 190 birds. Additionally, there are more than 40 species of water birds here and confirmed breeding sites for more than 22 species.
- There are no Bristol Bay Tribal Multi-Species Conservation and Management Plans for Iliamna Lake, the Nushagak River, Nushagak Bay, Kvichak Bay, and Alaska Peninsula. The USACE should mandate these tribal marine multi-species conservation plans be completed before issuing a permit.
- Describe what steps the developers propose to keep tailings ponds/lakes free from pollutants or physically restrict birds from trying to land on them.
- Analyze impacts from noise, blasting, and other human interference to birds.
- Blast control can mitigate noise impacts to birds, like they do with birds at the airport.
- Address effects of the project on birds and migratory waterfowl.
- Kamishak Bay is home to a large seabird nesting colony that would be impacted by disturbance generated from industrial development at Amakdedori Creek.

AMERICAN OVERSIGHT

- Bald eagles nest and feed along the coast and along all of the major salmon spawning rivers in the Bristol Bay and Cook Inlet regions, with a relatively high number of golden eagles also found here.
- Calving grounds for the Mulchatna caribou herd are in the proposed project area and the EIS should include an analysis of the impact of both mine construction and mine operations on caribou calving in the region.
- Exploration activities at the site have caused caribou to avoid the area.

3.4.3.5 Threatened and Endangered Species

Comments were received on impacts to threatened and endangered species as a result of project construction and operations.

- The proposed port site is designated Critical Habitat for the endangered Cook Inlet beluga whale and the threatened northern sea otter.
- Federally listed threatened northern sea otters and threatened Steller's eiders occur in the waters of Cook Inlet, including Kamishak Bay.

3.4.4 Social Resources

Comments indicated that the EIS should analyze the direct, indirect, and cumulative impacts on specific social resources, including:

- Socioeconomics
- Subsistence
- Traditional way of life
- Archaeological and cultural resources
- Land ownership, management, and use
- Transportation and navigation
- Recreation
- Environmental justice
- Public health and safety
- Visual resources
- Wilderness characteristics.

3.4.4.1 Socioeconomic Impacts

Comments were received regarding the economic impacts to local communities, regional economy, and national economy.

- PLP should give the USACE an independently prepared economic feasibility analysis, which is usually done for other mines like Donlin. Without it, the USACE will be unable to take a hard look at all reasonable alternatives in the draft EIS.
- The Pebble Mine would bring much needed economic opportunity to a region by creating jobs during construction and operation. The Lake and Peninsula Borough has an unemployment rate of 16.6 percent. Presently commercial fishing has a very limited effect on some communities' local economy.
- Residents are moving closer to much larger metropolitan regions to seek opportunities that do not currently exist near their homes in the region. New job

AMERICAN OVERSIGHT

opportunities could reduce out-migration, which could help maintain rural schools and allow people in the region to participate in subsistence activities.

- Consider that the project would create a boom and bust economic cycle that would ultimately leave people without jobs.
- The mining company will bring their own workers and not train local people to work at the mine.
- The population would increase during construction and heavily impact local communities.
- Consider the socioeconomic impacts to Bristol Bay's recreational fisheries. More than 37,000 angling trips are taken to Bristol Bay each year, which supports dozens of businesses, and a $91 million annual economy. The project could also damage the Bristol Bay wild salmon brand because the watershed would no longer be pristine.
- The commercial salmon fishing economy sustains 20,000 jobs; 20,000 jobs will be lost if this mine goes forward.
- Consider that the Kennicott Copper Mine was located in the watershed of the Copper River which did not affect the value of the salmon fishery in that region.
- The impact of the use of Iliamna Lake and the proposed transportation corridors/pipelines on sport fishing and the sport fishing-related economy should be evaluated.
- Analyze impacts on the bear viewing industry near the proposed Amakdedori Port.
- Consider that fish taxes are important to the finances of the Bristol Bay Borough.
- Consider that PLP would not pay its fair share of equity to the state. The actual federal and state income royalty or tax on the production would be 3 to 5 percent of that production's value. In comparison to oil, this is inadequate.
- Review social benefits such as education opportunities, and potential reduction in the high cost of living in the region due to transportation improvements.
- PLP should consider using regional Native corporations that are already in the pipeline construction and maintenance industry.
- Examine the economic costs and benefits specific to the state of Alaska including scenarios where no environmental disaster occurs and also the worst disaster happens.
- There were inquiries made in comments if there would be compensation to commercial fishermen if there is a disaster and fish prices go down, similar to what was done with Exxon Valdez.
- The risks to the people and environment would outweigh the short-term benefits.
- Examine the potential impacts to the Homer Electric Association ratepayers.
- The socioeconomic analysis in the EIS should include first order losses from habitat, second order losses, and public perception losses. Existence values have been acknowledged as real and quantifiable and should be used.
- The EIS should use a dynamic net economic benefit approach wherever possible in assessing the socioeconomic impact. One commenter noted that discounting future values can be a highly useful tool for comparing economic benefits over time but that this method may also be misapplied. The USACE should consider that a great deal of work has since been performed on existence values.

AMERICAN OVERSIGHT

3.4.4.2 Food and Fiber Production – Subsistence

Comments were received related to potential impacts to subsistence resources (food and fiber production) like harvest, sharing, and traditional use areas. Comments were also received on contamination concerns and/or avoidance of subsistence resources.

- The USACE should study the direct, indirect, and cumulative effects of construction, operation, and closure at all stages of the mine and relating infrastructure to all activities relating to fishing, hunting, and other subsistence practices for the Native Village of Tyonek, the Native Village of Port Graham, the Native Village of Seldovia, the Kenaitze Tribe, the Ninilchik Tribe, the Chikaloon Tribe, and all others near in and around the Cook Inlet regions.
- Consider the importance of the salmon fishery to subsistence and the heavy reliance on fish for all users in the area.
- Analyze impacts on subsistence resources including wildlife migration, habitat for growing food, traditional use areas, fisheries, berries and other edible plants, and the cumulative effects from other mining activity. Consider that impacts to any subsistence resource (e.g., fish, wildlife, vegetation) would impact subsistence as well.
- Analyze impacts of potential contaminants entering into the air or water and affecting subsistence resources, including effects on subsistence resources due to potential accidental spills, and bioaccumulation of toxins in subsistence resources, and effects.
- Consider the impacts to the residents along Iliamna Lake who rely on access to small islands for the harvest of bird eggs in the spring.
- We are in fear for our subsistence way of life. Leave our dinner table alone!
- Helicopter traffic during exploration disrupted subsistence activities and this would occur during construction and operations of the mine. Particularly, helicopter traffic impacts spring waterfowl hunting (geese), displaces caribou, and impacts the Koktuli River.
- Many species of fish are used for subsistence harvest, not just salmon.
- Analyze potential beneficial impacts to subsistence as cash income earned from jobs could support subsistence activities. Cash income could be available to fund the boats, motors, fuel, and nets necessary to maintain subsistence activities.
- A sudden influx of noise, people, and heavy equipment over ancestral hunting and fishing lands would have an effect on the intangible resources the sustainable subsistence culture has to offer.
- There could be an influx of workers to construct, run, and remove the mine that would want to have fishing and hunting access to the same resources as the local subsistence communities and will generate user conflict.
- The mine and roads might also facilitate access to previously lightly used areas increasing hunting, fishing berry picking and other pressures.
- Be sure to include Kodiak Island to your analysis, as it has important subsistence areas that could be impacted by the project.
- Over 80 edible and medicinal plants grow and are harvested in the project area including several species of berries, wild peas, wild onions, ferns, cow parsnip, rosehips, and many others.

Comments were received on impacts to important locations for subsistence activity from the project, including:

AMERICAN OVERSIGHT

- The road corridor would go through our winter moose hunting area in the Talarik Creek watershed.
- The Nushugak, Mulchatna, and Koktuli watersheds are the hunting and fishing areas for people of New Stuyahok.
- The Amakdedori area has been historically used for early subsistence activities, including salmon harvest.
- The mountain behind Nondalton is traditional subsistence area.
- The Frying Pan Lake area is important to Nondalton people and shared with other neighboring people.
- The people in Seldovia have a long tradition of subsistence fishing for herring in Kamishak Bay. The herring also support other animals that we subsist on.

3.4.4.3 Traditional Culture and Way of Life

Comments were received related to potential cultural impacts and the desire to maintain traditional practices. Includes comments related to traditional land use areas (cultural continuity), and traditional ecological knowledge.

- There are concerns that the mine would be detrimental to the culture, way of life, and history to the people that live in the area, and have been there for centuries.
- Fully disclose the potential impacts of project-related activities on local Alaska Native traditional ways of life. Local culture and environment has already changed from what it was historically, and this may affect the ability to pass values on to future generations.
- Traditional ecological knowledge should be studied and incorporated into the Draft EIS. Individual tribal members engage in traditional subsistence activities and have knowledge and experience with their land, wildlife, wetlands, fish, birds, plants, and other resources of the region.
- The profit from the mine and "benefits" are not long term, while preserving Native heritage and leaving a legacy for future generations is a cause that is worthy of consideration.
- The EIS must identify and describe the cultural and spiritual uses of water by the human communities of the region.
- The Amakdedori Port area has been used as a site for a cultural camp, subsistence use areas, and school field trips.
- EIS should look at the long term social impacts, such as trapping and lifestyle change impacts. The project will kill the hearts and souls of the people; our subsistence way of life has more than monetary value.

3.4.4.4 Archeological and Cultural Resources

Concerns were expressed about impacts to archaeological and cultural resources subject to Section 106 of the National Historic Preservation Act.

- Analyze impacts to cultural resources (historical and pre-historical sites) and direct destruction of cultural resources from all project components.
- Review any traditional native or cultural sites within the mine and utility corridors, and provide mitigation for same.

AMERICAN OVERSIGHT

- There are ancestral burial grounds at/near the proposed Amakdedori Port, along the road route on the south side of Iliamna Lake, and on the road route to the south ferry dock.
- Analyze impacts to irreplaceable Native Alaskan rock art sites. This region of Alaska contains several recorded rock art (petroglyph) sites. No doubt more such sites remain to be discovered. Many of the rock art panels are on shorelines and only visible during low tide; thus, it is easy for archaeological surveys to miss these important cultural resources.

3.4.4.5 Land Ownership, Management and Use

Comments were received about land status (ownership), land management, and land use for the project area.

- The proposed mine site and many project components including the port site and a majority of the transportation corridor are proposed on state-owned lands. Mine construction, operation, and closure would limit any access to these lands and transportation corridor to private entities only.
- Ensure that activities are consistent with land use plans and goals of all landowners, including the State of Alaska, and Alaska Native corporations.
- The Pebble Mine will be built on state land set aside decades ago in Western Alaska specifically for mining.
- Although the area is classified in the State's area plan as "mineral," a classification is nothing more than recognition of the resource reasonably believed to exist in a particular management unit. The management intent is neutral as to whether mineral development should occur in these units.
- Disclose any impacts to Native Allotments and Native Corporation lands in the project area.
- A pattern of land use change would occur in the region that could be a long-term pattern with additional mining deposits explored for development.
- Analyze the effect of project components on the public use of the surrounding area with regards to trails and waterfront usage.
- Explain the security status of the ferry terminals, the mine access road, and Amakdedori Port, including when and how the public may or may not access or cross project facilities.
- Explain if local Tribal governments have included the mine access road in their Indian Reservation Roads Program that would make it public, versus private roads as stated by PLP.

3.4.4.6 Transportation and Navigation

Comments were received regarding the impacts to transportation systems, including airports, roads, rivers, and trails as a result of the project.

- Evaluate the potential impacts resulting from navigational challenges, traffic, and user conflicts at Iliamna Lake, Kamishak Bay, and Cook Inlet. The Draft EIS should evaluate how the ferry crossing and vessel traffic could disrupt schedules, local access and local boaters.
- An ice-breaking ferry across Iliamna Lake would create difficulties and hazardous situations for people travelling across the ferry route on snowmachines.

AMERICAN OVERSIGHT

- No depths are recorded on navigation charts for Iliamna Lake. Some rocks on the chart do not exist; others are not where the charts show them to be. Some are not on the charts at all. There are places where the depth goes from 400 feet to 30 feet.
- Consider the impact of travel restrictions from road and ferry and who is benefiting.
- The wind has pushed ice on the north shore of Iliamna Lake in piles as high as 50 feet and could damage the proposed ferry terminal.
- The east winds on Iliamna Lake are strong and generate large waves that would make the proposed ferry unreliable and dangerous; winds can reach 100 mph.
- A disabled ferry could be blown by the wind onto the shoreline such as at Eagle Bluffs.
- The Amakdedori Port location experiences very strong onshore winds that could be hazardous. It is also in an area that could be impacted by a tsunami.
- It will be difficult to maintain the Amakdedori Port dredged channel due to sediment transport in that area.
- The plans for the Amakdedori Port have been changed since the original permit application. The change may reduce maintenance and operation cost, however barge lightering of concentrate to the bulk cargo ships may increase risk and safety in the poor weather conditions Kamishak Bay is famous for.
- Analyze impacts from increased air traffic during all project phases.
- Concerns were expressed about additional traffic on the Sterling Highway.
- The mine access road would ascend a mountain pass before descending to Iliamna Lake. Has PLP submitted a design and specific route for the road? For perspective on what this road will look like, consider the Pile Bay-Williamsport road where rock slides and falling boulders are a constant threat.

3.4.4.7 Recreation

Comments were received on impacts to recreation and tourism; recreational hunting and fishing usage near the mine, along river systems, and in transportation/pipeline corridor during construction and operation. This includes comments on disruption of recreational experiences (bear viewing, sport fishing).

- Consider the effects of project components on recreational hunting and existing guided hunting operations (e.g., changes to access, disturbance of wildlife from helicopters or vehicle traffic).
- Concerns about impacts to fish, and how impacts to species could be detrimental to the sport fishing community and businesses.
- The proposed project would bring an influx of the number of people in the Iliamna area that would want to recreate, sport fish and hunt, including mine employees and support industry personnel.
- Displacement of wildlife would impact the experience of people, throughout the proposed project area but would specifically impact the recreationists at McNeil State Game Refuge.
- The mine itself and the proposed tailings dam could not be in a worse location to threaten the trophy rainbow fishing that the many fly-out lodges rely on. The lodges provide long term employment for many in the Iliamna and Lake Clark areas.

AMERICAN OVERSIGHT

3.4.4.8 Environmental Justice

Comments were received relating to disproportionate, adverse impacts to low income and minority communities as result of the proposed project.

- Analyze impacts related to environmental justice include food security and subsistence resources, health impacts from pollution and exposure to increased industrial activities and noises, increased risk of injury and exposure to hazardous materials, increased exposure to outsiders and the cascading social and psychological problems that brings.
- The economic benefits will not be for the people of the region but the impacts will.
- The environmental justice risk outweighs the benefits.

3.4.4.9 Public Health

Comments were received on impacts to local communities' public health and infrastructure as a result of the project (disease, contaminants, lifestyle changes, behavioral health, and physical health), as per EO 12898.

- An analysis of health effects, such as a Health Risk Assessment or Health Impact Assessment, may be needed to determine the direct, indirect, and cumulative impacts to health.
- Analyze public health concerns related to development and infrastructure development in rural communities.
- The short- and long-term impacts from all stages of the project include increased risks of accidents and injuries, exposure to hazardous materials, negative impacts on food, nutrition, and subsistence, increased potential for infectious diseases, and risks to health and human services from population-stressed infrastructure and services
- It is important for the EIS to consider the social and psychological impacts the stress of this project has already put on people and the communities who live in the project area.
- Evaluate the potential impacts of development on indigenous women, and increased rate of violence as a result.
- Fully discuss the potential that the proposed project could be associated with behavioral health impacts, such as increased use of drugs and alcohol. More disposable income in communities may increase the use of alcohol and drugs.
- An influx of people could bring diseases to an area with minimal healthcare available that may not be able to handle large capacities of patients.

3.4.4.10 Visual Resources and Aesthetics

Comments were received on visual impacts that included:

- Consider visual impacts of the mine, roads, and Amakdedori Port to recreation, and secondary industries like flightseeing operators and wildlife viewing guides.
- The project will have permanent and significant impacts on the appearance of the landscape as viewed from key observation points, planes, etc. and will in turn impact use and enjoyment of the area by many.

3.4.4.11 Wilderness Characteristics

Comments were received related to wilderness characteristics and values.

AMERICAN OVERSIGHT

- This area has wilderness characteristics, and is adjacent to a national park.
- The potential impact on the Koktuli and Nushagak rivers and tributaries, Upper/Lower Talarik Creeks, the Gibraltar River, the Kvichak River, and other tributaries of Iliamna Lake have an undeniable wilderness quality that could be impacted by the proposed project. Impacts to the Gibraltar, Talarik, and Koktuli drainages should be considered and, when possible, quantified
- The project would mean the loss of pristine wilderness throughout the area.

3.5 SUMMARY OF PUBLIC COMMENT—NEPA PROCESS AND REGULATORY COMPLIANCE

Comments were received on the NEPA process and need for compliance with regulations including:

- The general NEPA process
- The purpose and need of the proposed project
- The proposed action and project alternatives
- Cumulative effects analysis
- Mitigation measures
- Monitoring and adaptive management
- Bonding and reclamation
- Data and available information
- Research and evaluation needs.

3.5.1 The NEPA and EIS Process

Comments were received about the overall NEPA and EIS process, the permit application to the USACE, due process, and the scoping meetings. These types of comments generally do not inform preparation of the EIS as to the project purpose and need, resources/level of impacts to be analyzed, or alternatives to the proposed action that should be considered. A summary of the general NEPA process comments includes the following:

- The Pebble Mine application is incomplete. The USACE should suspend its NEPA process/ not release a Draft EIS without more information from PLP. Foundational information for major parts of Pebble's proposal, including the proposed transportation corridor, port or use of Iliamna Lake, are lacking from their application. The data PLP supplied is more than 10 years old and thus is not reliable for analyzing project impacts.
- The Pebble Mine application is not incomplete. The Pebble Mine plan and application has recently been revised to satisfy EPA guidelines.
- There should be opportunities at each public hearing for oral comments in an open public forum. Everyone should have the opportunity to hear the comments of fellow concerned citizens. Open oral comments provide new information and learning opportunities not only for USACE and their contractors, but for all attendees. Please change your scoping format for future meetings to include an opportunity to express concerns through an open oral comment period.
- The limited number of scoping hearings and failure to host scoping hearings in communities within the Nushugak and Kvichak River drainages means that the opinions and voices of local populations have not been accounted for.

AMERICAN OVERSIGHT

- Consider additional scoping meetings in Washington and Oregon.
- Extend the scoping period beyond 30 days. Tribes in Bristol Bay are requesting at least 120 days for this scoping period.
- A 30 day scoping process is sufficient. Few projects have been talked about for as long and with such passion as the Pebble Mine and at this point, no new information about possible adverse effects will come to light.
- Changing the mining plan in the middle of the scoping period means the scoping comment period should be extended and new meetings held.
- The USACE should compare PLP's plans to the EPA's analysis before moving forward with permitting.
- PLP should get a fair permitting process.
- The EIS process is being rushed; the USACE took more time to prepare the Donlin Gold EIS. The USACE cannot take the 'hard look' required by NEPA in this timeframe.
- With the loss of funding, the USACE should reject this application as insufficient, since this is no longer a financially viable project.
- The Pebble Project has changed some of their plans to accommodate concerns of Alaskans. The State of Alaska has a strong track record of regulating responsible mineral development for projects of all sizes and complexities. The Pebble Project will be no exception.
- The USACE evaluation should include the already defined types of authorizations required for a mine like Pebble and the proven scientific and technical information required to support these decisions.
- To manage the high volume of public comments the USACE should consider using software that uses Near-Duplicate Detection.
- The scope of the EIS should include impacts to federally protected units near the project site, including National Parks and National Wildlife Refuge units.

Comments were received that the USACE should initiate formal consultation and coordination with tribal governments. This includes comments on formal consultation and coordination under EO 13175.

Coordination with other agencies is an important part of the NEPA process. Comments were received on how the USACE should seek and promote full- and broad-scope participation by federal and state resource agencies and tribal government entities as cooperating agencies, and undergo comprehensive formal consultation with appropriate entities (for example, consulting with the National Marine Fisheries Service regarding Essential Fish Habitat). Comments were also received on how the USACE should extend cooperating agency invitations to interested tribal governments, as well as local, state, and federal agencies with special expertise and involve cooperating agencies on the full scope of the proposed Pebble Project.

3.5.2 Purpose and Need of the Action and USACE Permits

Comments were received regarding the purpose and need of the action, and the public interest of the project for the purpose of USACE permitting.

- The Pebble EIS should present a clear and concise statement of the underlying purpose and need for the proposed project consistent with the implementing

AMERICAN OVERSIGHT

regulations for NEPA. This statement should be framed broadly enough as to allow for the analysis of a range of reasonable alternatives.

- Explain how an EIS process can proceed without more commitment from financial backers.
- PLP says their project would help with mineral independence but they will export all of the mined minerals.
- The USACE should accept the purpose and need statement contained in the permit application from PLP.
- The Draft EIS should reflect not only the purpose and need of the project proponent, and the USACE, but also the broader public interest and need based on the scoping comments.
- Describe the permit process. Specifically note if there is a time limit for the applicant to act on a permit before it becomes invalid.
- The lack of a feasibility analysis makes the project as planned un-practicable in regards to NEPA requirements.
- Wrong mine, wrong place.

3.5.3 Proposed Action and Alternatives

Comments requested more detailed information on the proposed project plans, such as the water management plan, transportation plans, and spill response plans.

- The design and operational plans for the proposed project and alternatives should be evaluated.
- Because PLP changed their plans in the middle of the scoping period, the project design is still fluctuating and is not ready for an environmental review.
- The proposed project design and the modern environmental safeguards it incorporates, as well as the significant economic potential it represents for the State of Alaska, should be fairly considered and incorporated into the EIS based solely on the scientific data presented to the USACE in this proposal.

Commenters suggested that a wide range of alternatives should be analyzed for mine pit and tailings locations, types of tailings facilities, tailings dam construction, mine rate and strip ratio, waste rock segregation methods, gold recovery methods, support facility locations, energy sources, pipeline routes, water discharge locations, road alignments, types of water crossings, and ferry routes. Specific alternatives to the proposed project that were suggested include:

- The USACE must look at a range of alternatives beyond Pebble's mine site and include alternatives for mining copper and gold somewhere other than Bristol Bay.
- The USACE does not need to explore alternatives to Pebble's proposed mine site as being somewhere other than Bristol Bay because it already 100 miles from the bay and should be deemed a reasonable distance.
- Apply a realistic scope to assess mine impacts. The timeframe of analysis is small at 20 years; the applicant's website notes that the mine can operate for 200 years and could have 11 billion tons of ore. The USACE should consider alternatives to permit 50 percent or 100 percent of the current known resources to be mined.
- There should be an alternative that restricts the size of the mine to what the EPA found appropriate in its Watershed Assessment.
- All of the pyritic tailings should be removed and not stored on the land in perpetuity.

AMERICAN OVERSIGHT

- There should be an alternative that includes full treatment of pyritic tailings at the time of mine closure, before or instead of dumping them in the mine pit.
- Tailings would be thickened, possibly to 55 percent solids. Alternatives (slurry, thickened tails, paste tails) need to be analyzed in the EIS.
- The EIS needs to provide an alternative that uses dry stack tailings. Dismissal of such an alternative needs to provide examples of where dry stack is currently used successfully and why this can or cannot be replicated.
- As an alternative to a tailings ponds dam for waste storage, all waste should be trucked to Canada and stored in Canada, since the company is Canadian.
- Different covers for the reclaimed tailings area, including "store and release" and impermeable covers, need to be assessed as alternatives in the EIS.
- Consider an alternative where the tailings pond is constructed at a location that will not impair surface waters, block fish passage, or have the potential to contaminate ground or surface waters.
- The EIS needs to include alternatives that provide water storage areas where excess water can be moved out of the TSF and out of the seepage pond in the event of extreme precipitation.
- The EIS should produce an alternative in which all embankments except the internal one are downstream construction.
- Modern pro-active mine design suggestions, including not placing tailings dams where a failure would put sensitive habitat at risk, should be assessed as alternatives in the EIS.
- Consider including a combination of simultaneous open pit and underground mining, a larger open pit mine, or a longer lived open pit mine. It may be possible to mine with open pits for the shallower portions, and mine by underground mining the deeper or eastern portions of the Pebble Deposit.
- The USACE should consider finding an alternative location to take the ore for processing.
- The EIS needs to analyze whether gravity concentration as a recovery method for gold recovery is viable at this deposit. This appears to be a method used in placer deposits.
- The USACE should consider the possibility of having cyanide processing at the mine site and transporting cyanide by truck or pipeline North and West toward the Nushagak Hills where pits would be out of range of the creeks and rivers flowing into the salmon spawning areas.
- An alternative of running mining operations and ore trucks on natural gas or electricity needs to be included in the EIS.
- The EIS should examine an alternative that treats water for discharge to meet the water quality of the natural receiving waters, if they are of higher quality than Alaska most stringent criteria. Studies have shown that where natural waters are very low in copper and cadmium, discharges above those background levels can have potentially toxic effects.
- The EIS needs to include an alternative for water treatment that will result in zero discharge of metals to the watershed.
- In order to contain gases that may contain acid rock drainage from getting into the air in the project area, the USACE should develop an alternative that covers the

AMERICAN OVERSIGHT

development with an air tight structure and the fumes should be cleaned before release into the atmosphere.

- The previous plan for a road along the northeastern side of Iliamna Lake, and the new proposed roads and a ferry across Iliamna Lake both put different communities at risk.
- The EIS should consider identifying alternative ferry terminal locations if the proposed sites are found to contain valuable spawning and/or rearing habitats for sockeye salmon.
- The two ferry terminal locations are both at the mouths of blue ribbon trout streams (Upper Talarik Creek and Gibraltar River). Alternative sites closer to populated areas should be considered if possible. The village of Kokhanok airstrip would be an alternative on the south side; a location closer to Newhalen, but away from the mouth of the river is an alternative on the north side.
- The mine access road would follow a branch of Upper Talarik Creek. An alternative that places a dock in Iliamna and uses the proposed Iliamna Spur Road to access the mine needs to be considered in the EIS to reduce potential impacts on Upper Talarik Creek.
- A better alternative is to use the existing road and resources at Pile Bay and Williamsport.
- Running an ore concentrate pipeline around Iliamna Lake to the existing road between Pile Bay and Williamsport is a safer alternative to ferrying ore concentrate across Iliamna Lake in the winter to address concerns about the potential for contamination of surface water in Iliamna Lake.
- Consider having only seasonal (summer) barge transport across Lake Iliamna to avoid impacts to winter transportation options for residents of nearby villages.
- As an alternative to the Iliamna Lake crossing, consider a haul road that would stay north of this lake, then head south from Pedro Bay to the Amakdedori port.
- The road system would cross numerous anadromous streams. It would be best to require bridges at all of these crossings. Oregon and Washington states have been working for many years to bring back their salmon runs. Recreating salmon habitat including headwaters has proven to be extremely hard.
- A port at Diamond Point in Iliamna Bay should be evaluated against the proposed Amakdedori Port.
- Alternative port sites should be evaluated due to the potential ecological impact from the project.
- There is no need to dredge the proposed port to -50 feet; a shallower depth should be evaluated.
- The EIS should assess the whole breadth of dredging activities when determining the possible impacts to aquatic organisms and consider practicable alternatives that would avoid and minimize impacts.
- The range of dredged material management alternatives include should include beneficial uses such as beach nourishment or construction material, a disposal site in internal waters landward of the Kamishak Bay closing line, and an ocean disposal site seaward of the Kamishak Bay closing line.
- The EIS should consider alternative methods for delivering natural gas to the project area, given the risk of natural gas entering the marine environment, the impact it

AMERICAN OVERSIGHT

would have on marine resources, and how gas line leaks or ruptures would be contained.

- The EIS should review potential alternative alignments for the pipeline route, such as an alignment north of Augustine Island.
- Include an alternative pipeline route that goes north to connect with the planned natural gas pipeline to support the development and operation of the Donlin Mine.
- Alternative fuel sources should be evaluated in an effort to eliminate the potential long term consequences that a subsea pipeline can have on the environment.
- Alternative energy sources should be examined. Many of the minerals to be mined will go into solar panels, wind turbines, and hydro turbines. The PLP could support the industries they will be supplying by utilizing alternative, renewable energy sources.
- The EIS should consider alternatives to laying the pipeline directly on the seafloor bottom (unburied) and evaluate the effects of an unburied pipeline's impact on crab movements, access to important habitat, and direct mortality.
- The EIS should evaluate practicable alternatives for reducing the amount of natural gas pipeline that is installed in the Sterling Highway right-of-way, which is managed by the Alaska Department of Transportation and Public Facilities.

3.5.4 Cumulative Effects Analysis Process

Comments were received on how the cumulative effects analysis should be thorough, well-defined, and complete.

- Describe how the Draft EIS process considers cumulative effects, and identify the geographic scope and timeframe for the cumulative effects analysis.
- The USACE needs to acknowledge that the current permit application could be the initial phase in a much broader mine development plan. Pebble Limited Partnership has repeatedly said, as recently as September 2017, their project is, "a multi-generational opportunity. Its size and scale will lead to a very, very long life mine." Based on statements such as this, and official records indicating they plan to mine up to 11 billion tons of ore, it is reasonably foreseeable that Pebble intends to expand its mine far beyond what is currently proposed. Reviewing just phase one of the project unlawfully segments environmental review, shortchanges the public interest, and risks untold impacts to the Bristol Bay region's world-class fisheries.
- There are 20 large-scale active mining claims in the Bristol Bay watershed that this project could encourage by providing the transportation and power infrastructure. The EIS scope should include looking at the impacts of the potential of creating a mining district in the area.
- The EIS needs a cumulative effects analysis on culture.
- Additional large-scale landscape and infrastructure development, facilitated by the initial road, pipeline, and barge and ferry ports is a reasonably foreseeable impact. The EIS should discuss any reasonably foreseeable future public access to the project's infrastructure components and analyze any reasonably foreseeable indirect effects of this action.
- The EIS should include an assessment of the extensive mitigation measures that Pebble has built into the new proposed plan to address environmental and stakeholder concerns.

AMERICAN OVERSIGHT

- The EIS should include a discussion of reasonably foreseeable effects that changes in the climate may have on the proposed project and the project area, including its long term infrastructure.

3.5.5 Mitigation Measures

Comments were received related to the need for project mitigation, and suggestions for mitigation measures.

- Use scientific data that details what damage is anticipated and determines whether and how such damage can be mitigated, including whether such mitigation is even possible.
- Tribes and the public should be involved in the mitigation planning, and monitoring of the proposed project.
- Review any traditional native or cultural sites within the mine and utility corridors, and provide mitigation for same.
- Consider and recognize the extensive mitigation measures that Pebble has built into the new proposed plan to address environmental and stakeholder concerns.
- The measures suggested by PLP will not work.
- PLP has not given any mitigation plans for sociocultural impacts; sociocultural impacts cannot be mitigated.
- PLP has not provided a plan for compensatory mitigation. The Draft EIS should describe such a plan and reasonable alternatives to it. The USACE should consider mitigation banks, or at a minimum, in-lieu fee programs, not less reliable permittee-responsible mitigation.
- Water takes the path of least resistance, so rainfall will attempt to make its way to the river bodies, but this can be mitigated with runoff ponds and filtrated release.
- Consider bilge water treatment that is capable of more than oil-water separation to protect Lake Iliamna's ecology.
- Require that the tailings pond be lined in such a way as to prevent any interaction between tailings waste and groundwater.
- This EIS should address the timing of ferry traffic across Iliamna Lake with regard to the movement of commercial fishing boats across the lake, both before and after the salmon season, and during salmon spawning.
- The ice-breaker ferry should be constructed and assembled at an alternate location to allow for naval architectural oversight and engineering support.
- Construct the natural gas pipeline in the winter to reduce environmental impacts.
- Suggested mitigation measures for the road corridor include chip sealing, winter maintenance plans, monitoring culverts, plans for vehicle emergency response, clear policy on use of the road by non-mining personnel.
- All culverts should be required to be designed for fish passage at all times, and monitored and corrected to ensure fish passage for the lifespan of the project and closure.
- The culverts should be designed with software that can better predict stress and deflection in heavily-loaded, complex soil structures interaction dependent culvert structures.
- All upland water crossings should be designed for all impacts above the 1.5 times stream width at ordinary high water.

AMERICAN OVERSIGHT

- Take measures to decrease whale strikes by ships.
- Measures should be implemented to minimize the aesthetic impacts as much as is reasonably possible.
- There should be no fly zones, to address caribou hunting impacts.

3.5.6 Monitoring and Adaptive Management

Comments were received in regards to the need for monitoring plans during operations and after closure of the mine.

- The history of multiple open pit mining sites has shown that the open reservoirs put in place to hold contaminated water and processing liquids have routinely been compromised by leaking and/or by drastic failure of containment levees. While they highlight the measures taken to put these toxins in containment, they fail to address the long term maintenance and mitigation of the toxins to make them inert.
- Explain what oversight and monitoring would be applied to meet minimum detrimental environmental conditions, by whom, and under what authority.
- Explain if there would be a fund for additional environmental monitoring while the project is ongoing.
- Describe how and by whom the tailings dam will be monitored during project operations and then at the end of the mining period.

3.5.7 Bonding and Reclamation

Comments were received related to reclamation activities, bonding, and setting up an escrow fund for restoration. Comments asked the USACE to explain in the EIS the mechanisms for treatment in perpetuity and post-closure (i.e., plan for permanent water treatment, the entity that would pay post closure costs – secure financing in perpetuity).

- Alaska regulatory requirements require a financial assurance to cover the costs of premature closure of the mine and the costs of post-closure water treatment. Calculating this cost is an essential part of the economic analysis EIS.
- Local communities would be hooked up to the gas line, as well as a maintenance crew watching over the hazardous tailing piles and dams. Describe bonding to cover these costs if something happens to PLP.
- The reclamation bond amount needs to be enough to fix any damage. This needs to be a permanent interest bearing fund that will supply enough funds in perpetuity, to cover unexpected future disasters, not just planned monitoring and reclamation.

3.5.8 Data and Available Information

Comments were received that suggested specific, documents, articles, or other information that should be utilized when developing the Draft EIS.

- Review research on fiber optics cable placement on tundra by Rorik Peterson at the University of Alaska Fairbanks. In addition, the USACE should review mapping provided by GCI regarding fiber optic cable placement of the TERRA-Southwest and Kodiak Kenai Fiber Link cable crossings in Cook Inlet and Iliamna Lake that would intersect with the proposed natural gas pipeline.
- Acknowledge how Traditional Ecological Knowledge information may be used and how to ensure that sensitive information is protected and follow a set of protocols for use of this information.

AMERICAN OVERSIGHT

- Regarding impacts to shellfish populations, review the following:
  - Alaska Department of Environmental Conservation: Cook Inlet Subarea Contingency Plan (CISCP) sensitive areas section. Available from https://dec.alaska.gov/spar/ppr/plans/scp_ci/CISCP_DSensitive_Areas_Jan2017.pdf.

- Bristol Bay Seasonal Subsistence Gathering Cycle. (Attached to comment submitted by Curyung Tribal Council).

3.5.9 Research and Evaluation Needs

Comments were received regarding the lack of baseline research, monitoring, and evaluation needs, or data gaps for the project.

- The USACE should suspend its NEPA process until the PLP presents sufficient environmental baseline and economic data about its proposal so as to reasonably inform the NEPA process.

AMERICAN OVERSIGHT

- No new baseline documents or data were submitted with PLP's application to the USACE in December 2017. The only publicly available baseline documents compiled by PLP are now more than a decade old, with data collected from 2004 to 2008. Those baseline studies failed to include newly proposed project components such as the transportation corridor, Iliamna Lake, and the proposed port site.
- Study the Montana mining industry (e.g., Berkeley Mine) and how often that state has experienced a negative environmental pollution outcome from a mine which was not cleaned up properly.
- There is a lack of baseline studies on newly added mine components for an informed permit process, such as wastewater discharges to Frying Pan Lake.
- An ecotoxicology assessment needs to be conducted for the pit lake, and it needs to be conducted when the pit first rebounds to its full level, and where pit lake stratification turns over and pit lake water mixes.
- Baseline data for the proposed Amakdedori Port and Kamishak Bay may be lacking in terms of what is known about water currents, shifting sands/silts and ice and how these physical conditions may affect trenching. The mud at Amakdedori Bay provides and important ecological function and habitat.
- No baseline data exists for the proposed port and use of Iliamna Lake, or the 83-mile transportation corridor making it impossible to analyze the potential impacts these activities would have on sensitive salmon habitat, tributaries, and adjacent wetlands.
- There are no relevant studies of Iliamna Lake. Frissell and Shaftel's spawning data are more than 7 years old.
- The Alaska Department of Fish and Game lacks assessment tools for the shellfish that live in Cook Inlet. Current baseline studies for these species do not exist. In light of the possible increase in sediment deposition rate resulting from dredging in the area of the Pebble Project, the USACE should require a shellfish population baseline assessment and impact statement regarding the dredging project prior to any dredging work beginning in Amakdedori Bay.
- An extensive and thorough baseline study on bear populations including numbers, movement, diet, and feeding areas should be done.
- More studies are needed to understand freshwater seals and all other animals in the Iliamna Lake area.
- There needs to be more baseline data on all species in the Bristol Bay river mouths and estuaries and the species in the Amakdedori Port area of Kamishak Bay.
- Require appropriate inventory survey for the broad range of historic property types that may be present in the Area of Potential Effect, including archeological sites/districts, properties of cultural and religious significance to Tribes, cultural landscapes, standing structures, and Historic Districts.
- Stream courses should be accurately documented using best available technology. The application relies largely on National Hydrography Dataset which is outdated and overlooks important tributary habitat.
- Evaluate all streams crossed by the road corridor for fish presence (including documentation of species, life stages, and abundance).
- Quantify salmon populations in the North Fork Koktuli, South Fork Koktuli, Upper Talarik Creek, and their tributaries, as well as all stream crossings in the transportation corridor, with at least five years of data.

AMERICAN OVERSIGHT

- The effects of ice breaking on winter lake ecology are not known; study is required to determine the width of the ice-free corridor and the impacts of changes in light, current, and lake surface albedo on spring melt date, phyto- and zooplankton bloom timing, and lake food webs.

3.5.10 Non-Substantive Comment

Submissions without substantive comment that are not specific to a particular issue or do not inform the analysis conducted in the EIS are considered non-substantive. These include comments in support of, or in opposition to, the applicant's proposed project.

AMERICAN OVERSIGHT

APPENDIX A – NOTICE OF INTENT

AMERICAN OVERSIGHT

Individuals are required to self-report any arrests, charges or convictions that would keep the individual from obtaining or maintaining a favorable suitability or fitness determination. Programs impacted are referenced within the 42 U.S. Code § 13041 and include impacted individuals such as employees, DoD contractors, providers, adults residing in a family child care home, volunteers, and others with regular reoccurring contact with children.

Affected Public: Individuals or Households.

Annual Burden Hours: 1,250.

Number of Respondents: 5,000.

Responses per Respondent: 1.

Annual Responses: 5,000.

Average Burden per Response: 15 minutes.

Frequency: On occasion.

Respondents are DoD contractors, family child care providers, family child care adult family members residing in the home, and specified volunteers who provide child care services for children under age 18. This form will be initiated by DoD staff and will be maintained in the initiating DoD offices and/or appropriate Human Resources or Security Offices.

Dated: March 23, 2018.

Aaron T. Siegel,

Alternate OSD Federal Register Liaison Officer, Department of Defense.

BILLING CODE 5001–06–P

DEPARTMENT OF DEFENSE

Department of the Army, Corps of Engineers

Intent To Prepare an Environmental Impact Statement (EIS) for the Pebble Project

AGENCY: U.S. Army Corps of Engineers, Department of Defense.

ACTION: Notice of intent.

SUMMARY: The Alaska District, U.S. Army Corps of Engineers (the Corps) intends to prepare a Draft Environmental Impact Statement (DEIS) to assess the potential social, economic, and environmental impacts associated with the proposed Pebble open pit mine in wetlands, streams and Ocean near Cook Inlet. The EIS will assess potential effects of a range of alternatives.

DATES: Public scoping meetings are tentatively scheduled in Anchorage, Homer, Dillingham, King Salmon (Naknek), Iliamna (Newhalen), Nondalton, and Kokhanok (Iguigig) will occur in mid-April 2018. Information about these meetings and meeting dates will be published locally, posted at *http://www.pebbleprojecteis.com,* and available by contacting the Corps.

ADDRESSES: U.S. Army Corps of Engineers, P.O. Box 6898, Joint Base Elmendorf Richardson, AK 99506–0898.

FOR FURTHER INFORMATION CONTACT: Questions about the proposed action and the Draft EIS should be referred to: Mr. Shane McCoy, Regulatory Division, *telephone:* (907) 753–2715 at *http://www.pebbleprojecteis.com* or by mail to the above address. To be added to the project mailing list and for additional information, please visit the following website: *http://www.pebbleprojecteis.com.*

SUPPLEMENTARY INFORMATION: An application for a Department of the Army permit was submitted by the Pebble Limited Partnership pursuant Section 404 of the Clean Water Act (33 U.S.C. 1344) and Section 10 of the Rivers and Harbors Act of 1899 (33 U.S.C. 403) on December 22, 2017, and was advertised in a Public Notice, POA–2017–271, on January 5, 2018. The public notice is available on Alaska District's public website at: *http://www.poa.usace.army.mil//Portals/34/docs/regulatory/publicnotices/2018/POA-2017-271%20Pebble_PN.pdf?ver=2018-01-05-153755-640.*

1. *Description of the Proposed Project.* Pebble Limited Partnership (PLP) is proposing to develop the Pebble copper-gold-molybdenum porphyry deposit as an open-pit mine, with associated infrastructure, in southwest Alaska, north of Lake Iliamna. The proposed project would require approximately four years to construct, with a projected mine life of approximately 20 years. Major project components include excavation of an open pit, that ultimately would be approximately 6,500 feet long by 5,500 feet wide, with depths between 1,330 and 1,750 feet; a tailings impoundment with 1.1 billion tons storage volume; a low grade ore stockpile with the capacity to store up to 330 million tons; an open pit overburden stockpile; a mill facility processing approximately 160,000 tons of ore per day; a natural gas-fired power plant with a total connected load of 230 mega-watt (MW), supplied by a 188-mile, 10 to 12-inch diameter, natural gas pipeline across Cook Inlet and Iliamna Lake to the Mine Site; and transportation infrastructure including a 30-mile road from the Mine Site to a ferry terminal on the north shore of Iliamna Lake, an 18-mile crossing with an ice-breaking ferry to a terminal on the south shore of Iliamna Lake, and a 35-mile road to the proposed Amakdedori Port on Cook Inlet. The proposed mine and related facilities would have a total footprint of approximately 5.9 square miles.

The pipeline route would originate on the Kenai Peninsula, connecting to the existing gas pipeline infrastructure near Happy Valley. A metering station would be constructed at the off-take point and the pipeline would then follow south along the Sterling Highway for 9 miles to a gas-fired compressor station north of Anchor Point. The compressor station would feed a 94-mile subsea pipeline from the east shore of Cook Inlet to Amakdedori Port on the west shore. A second gas-fired compressor station would be located at the port site. The pipeline route would then follow a 30-mile mine access road to the south shore of Iliamna Lake, where the pipeline would enter Iliamna Lake for approximately 18 miles. The pipeline would come ashore at on the north shore of the lake, where it would follow the mine access road to the Mine Site.

2. *Alternatives.* A range of alternatives of the proposed action will be identified, and those found to be reasonable and practicable will be fully evaluated in the DEIS, including: the no action alternative, the applicant's proposed alternative, alternative mine locations and mine plans, alternative mining methods and processes, alternatives that may result in avoidance and minimization of impacts, and mitigation measures not in the proposed action. However, this list is not exclusive and additional alternatives may be considered for inclusion.

3. *Scoping Process and Public Involvement.* The scoping period will extend from April 1, 2018, through April 30, 2018. Scoping is conducted to assist in determining the scope of analysis, significant issues and alternatives to be analyzed in depth in the DEIS. Comments should be as specific as possible. Additional public involvement will be sought through the implementation of the public involvement plan and the agency coordination team.

4. *Significant Issues.* Numerous issues will be analyzed in depth in the DEIS related to the effects of the proposed Pebble mine and associated infrastructure construction, operation, and closure. These issues will include, but will not be limited to, the following: wetlands, water quality, air quality, hazardous materials, fish and wildlife, vegetation, cultural resources, food production, land use, needs and welfare of the people (socioeconomics including commercial fishing and tourism), recreation, general environmental

AMERICAN OVERSIGHT

concerns, historic properties, navigation, and safety.

5. *Additional Review and Consultation.* Additional review and consultation which will be incorporated into the preparation of the DEIS will include, but are not necessarily limited to coordination under Section 401 of the Clean Water Act, Essential Fish Habitat coordination; consultation under Section 7 of the Endangered Species Act; and consultation under the National Historic Preservation Act

Shelia Newman,

Deputy Chief, Regional Regulatory Division, U.S. Army Corps of Engineers, Alaska District.

DEPARTMENT OF EDUCATION

[Docket No.: ED–2018–ICCD–0030]

Agency Information Collection Activities; Comment Request; Expanding Opportunity Through Quality Charter Schools Program: Technical Assistance To Support Monitoring, Evaluation, Data Collection, and Dissemination of Best Practices

AGENCY: Office of Innovation and Improvement (OII), Department of Education (ED).

ACTION: Notice.

SUMMARY: In accordance with the Paperwork Reduction Act of 1995, ED is proposing an extension of an existing information collection.

DATES: Interested persons are invited to submit comments on or before May 29, 2018.

ADDRESSES: To access and review all the documents related to the information collection listed in this notice, please use *http://www.regulations.gov* by searching the Docket ID number ED–2018–ICCD–0030. Comments submitted in response to this notice should be submitted electronically through the Federal eRulemaking Portal at *http://www.regulations.gov* by selecting the Docket ID number or via postal mail, commercial delivery, or hand delivery. *Please note that comments submitted by fax or email and those submitted after the comment period will not be accepted.* Written requests for information or comments submitted by postal mail or delivery should be addressed to the Director of the Information Collection Clearance Division, U.S. Department of Education, 400 Maryland Avenue SW, LBJ, Room 216–44, Washington, DC 20202–4537.

FOR FURTHER INFORMATION CONTACT: For specific questions related to collection activities, please contact Patricia Kilby-Robb, 202–260–2225.

SUPPLEMENTARY INFORMATION: The Department of Education (ED), in accordance with the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3506(c)(2)(A)), provides the general public and Federal agencies with an opportunity to comment on proposed, revised, and continuing collections of information. This helps the Department assess the impact of its information collection requirements and minimize the public's reporting burden. It also helps the public understand the Department's information collection requirements and provide the requested data in the desired format. ED is soliciting comments on the proposed information collection request (ICR) that is described below. The Department of Education is especially interested in public comment addressing the following issues: (1) Is this collection necessary to the proper functions of the Department; (2) will this information be processed and used in a timely manner; (3) is the estimate of burden accurate; (4) how might the Department enhance the quality, utility, and clarity of the information to be collected; and (5) how might the Department minimize the burden of this collection on the respondents, including through the use of information technology. Please note that written comments received in response to this notice will be considered public records.

Title of Collection: Expanding Opportunity through Quality Charter Schools Program: Technical Assistance to Support Monitoring, Evaluation, Data Collection, and Dissemination of Best Practices.

OMB Control Number: 1855–0016.

Type of Review: An extension of an existing information collection.

Respondents/Affected Public: State, Local, and Tribal Governments.

Total Estimated Number of Annual Responses: 102.

Total Estimated Number of Annual Burden Hours: 136.

Abstract: This request is for an extension of OMB approval to collect data for the Expanding Opportunity through Quality Charter Schools Program: Technical Assistance to Support Monitoring, Evaluation, Data Collection, and Dissemination of Best Practices formerly titled Charter Schools Program (CSP) Grant Awards Database. This current data collection is being coordinated with the EDFacts Initiative to reduce respondent burden and fully utilize data submitted by States and available to the U.S. Department of Education (ED). Specifically, under the current data collection, ED collects CSP grant award information from grantees (State agencies, charter management organizations, and some schools) to create a new database of current CSP-funded charter schools. Together, these data allow ED to monitor CSP grant performance and analyze data related to accountability for academic purposes, financial integrity, and program effectiveness.

Dated: March 23, 2018.

Tomakie Washington,

Acting Director, Information Collection Clearance Division, Office of the Chief Privacy Officer, Office of Management.

FEDERAL COMMUNICATIONS COMMISSION

[OMB 3060–0819]

Information Collection Being Reviewed by the Federal Communications Commission

AGENCY: Federal Communications Commission.

ACTION: Notice and request for comments.

SUMMARY: As part of its continuing effort to reduce paperwork burdens, and as required by the Paperwork Reduction Act (PRA) of 1995, the Federal Communications Commission (FCC or the Commission) invites the general public and other Federal agencies to take this opportunity to comment on the following information collection. Comments are requested concerning: whether the proposed collection of information is necessary for the proper performance of the functions of the Commission, including whether the information shall have practical utility; the accuracy of the Commission's burden estimate; ways to enhance the quality, utility, and clarity of the information collected; ways to minimize the burden of the collection of information on the respondents, including the use of automated collection techniques or other forms of information technology; and ways to further reduce the information collection burden on small business concerns with fewer than 25 employees. The FCC may not conduct or sponsor a collection of information unless it displays a currently valid control number. No person shall be subject to any penalty for failing to comply with a collection of information subject to the

Public Notice of Application for Permit

PUBLIC NOTICE DATE: January 5, 2018

REFERENCE NUMBER: POA-2017-271

WATERWAY: Multiple

An application has been received in this office from Pebble Limited Partnership (applicant) to discharge fill material into and perform work within waters of the United States. The project site is located in Southwest Alaska near Iliamna Lake, primarily within the Lake and Peninsula Borough with a portion of the supporting infrastructure in the Kenai Peninsula Borough. The project consists of four primary project elements: a mine site, a port at Amakdedori, transportation corridor, and natural gas pipeline. The submitted application is available on the Corps website at www.poa.usace.army.mil/Missions/Regulatory/Permitting-Section-Homepage/Department of the Army Permit Application POA-2017-271 submitted by Pebble Limited Partnership.

The Corps has determined and notified the applicant that an environmental impact statement level of analysis will be required for the review of the Department of the Army Permit application. As such, the Corps will conduct public scoping after publishing a Notice of Intent to develop an EIS in the federal register. The Notice of Intent will include a list of public scoping locations. Times and dates for these locations will subsequently be advertised via Corps Public Notice and website as well as local media outlets.

Please contact Sheila Newman, Regulatory Division Program Manager at (907) 753-2712, toll free from within Alaska at (800) 478-2712, by fax at (907) 753-5567, or by email at poaspecialprojects@usace.army.mil if further information is desired concerning this notice.

Scoping for Department of the Army Permit Application 2017-271-Pebble Limited Partnership, Environmental Impact Statement

JOINT BASE ELMENDORF-RICHARDSON – The U.S. Army Corps of Engineers – Alaska District requests public input regarding the scope of the environmental impact statement level of analysis for Department of the Army permit application POA-2017-271 submitted by Pebble Limited Partnership.

The Pebble Project has been in the public eye for many years and there have been multiple public input and comment opportunities from other agencies. This public body of information has helped to inform the Corps' preliminary scope for the environmental impact analysis.

The Corps is now asking the public for any additional information to help inform the scope of analysis as it specifically relates to the Pebble Limited Partnership's submitted permit application to include potentially affected resources, alternative options, analytical methodology, and potential mitigation measures.

Since Jan.5, the permit application has been publically available on the Alaska District's website. On Jan.12, the application was mailed via CD to 35 federally recognized Alaska Native Tribes alongside invitations for government-to-government consultation throughout the entire evaluation process including the EIS. The Corps maintains the application as well as additional scoping information at www.pebbleprojecteis.com.

Scoping input can be submitted by mail to:

U.S. Army Corps of Engineers, Alaska District
Program Manager, Regulatory Division
ATTN: DA Permit Application 2017-271, Pebble Limited Partnership
P.O. Box 6898
Joint Base Elmendorf-Richardson, Alaska, 99506-0898

Beginning April 1, scoping input can be entered directly into the project website at www.pebbeprojecteis.com.

Also, scoping input can be submitted in person at public meetings via directly into the provided computers, handing in written comments, or speaking to a court reporter.

AMERICAN OVERSIGHT

Please note that public scoping meetings are not public hearings. The Corps has chosen to arrange meetings to provide the public with an easy forum to provide input. All information received will become part of the public record upon receipt.

Meeting locations and times are indicated below. A video explaining major project components will be available for viewing. The Corps will have representatives available to answer questions regarding the Department of the Army permit application review process. Individuals may come in at any time during open hours and to provide scoping input. A Yupik translator will be available at the meetings.

NEWS RELEASE

U.S. ARMY CORPS OF ENGINEERS **BUILDING STRONG®**

For Immediate Release:
April 6, 2018
Release No. 18-007

Contact:
John Budnik, 907-753-2615
Public.affairs3@usace.army.mil

Corps extends public scoping period for Department of Army permit application 2017-271 Pebble Limited Partnership, Environmental Impact Statement

JOINT BASE ELMENDORF-RICHARDSON – The U.S. Army Corps of Engineers – Alaska District has allotted more time for the public scoping period for the environmental impact statement level of analysis for Department of Army permit application 2017-271 submitted by Pebble Limited Partnership.

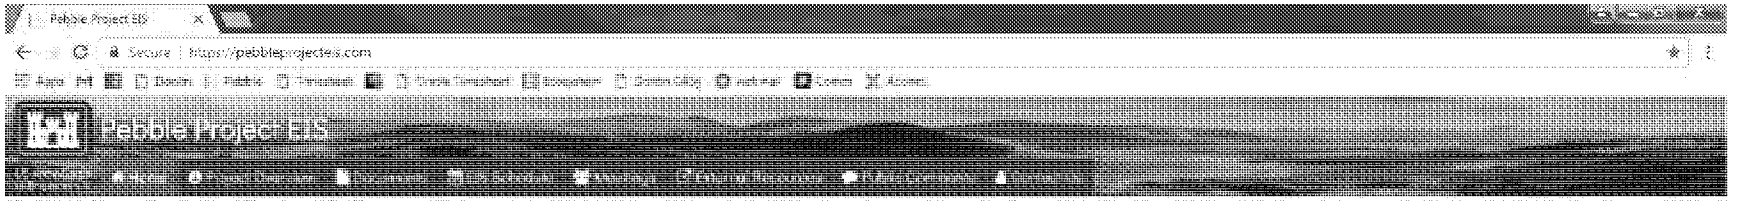
An additional 60 days has been added to the original 30-day public scoping period that began on April 1. Therefore, interested parties that would like to provide scoping input have until June 29 to submit.

The Corps is asking the public for any additional information to help inform the scope of analysis as it specifically relates to the Pebble Limited Partnership's submitted permit application to include potentially affected resources, alternative options, analytical methodology, and potential mitigation measures. The permit application is available on the project website at www.pebbleprojecteis.com.

Scoping input can be submitted by mail to:

U.S. Army Corps of Engineers, Alaska District
Program Manager, Regulatory Division
ATTN: DA Permit Application 2017-271, Pebble Limited Partnership
P.O. Box 6898
Joint Base Elmendorf-Richardson, Alaska 99506-0898

Scoping input can be entered directly into the project website at www.pebbleprojecteis.com.



Also, scoping input can be submitted in person at public meetings via directly into the provided computers, handing in written comments, or speaking to a court reporter. Please note that public scoping meetings are not public hearings. The Corps has chosen to arrange meetings to provide the public with an easy forum to provide input. All information received will become part of the public record upon receipt.

For more information regarding the evaluation of DA Permit application POA-2017-271 please visit https://www.pebbleprojecteis.com.

To learn more about the Corps' Regulatory Division and its program, visit http://www.poa.usace.army.mil/Missions/Regulatory/.

###

AMERICAN OVERSIGHT

Welcome

The U.S. Army Corps of Engineers invites you to participate in the Pebble Project Environmental Impact Statement (EIS) process. Pebble Limited Partnership proposes to develop the Pebble copper-gold-molybdenum porphyry deposit (Pebble Deposit) as an open-pit mine, with associated infrastructure, in southwest Alaska, approximately 17 miles west/northwest of the villages of Iliamna, Newhalen, and Nondalton. A 188-mile natural gas pipeline from the Kenai Peninsula across Cook Inlet to the Kime Site is proposed as the energy source for the mine. The Transportation Corridor includes an 18-mile crossing of Lake Iliamna and an Amakdedori Port facility on the western shore of Cook Inlet.

The proposed mine requires many federal and state permits. The EIS provides the basis for the U.S. Army Corps of Engineers and other federal agencies to evaluate federal permit applications.

Your input can make a real difference in understanding:

- Issues and concerns that should be addressed in the EIS
- The way in which land and resources might be affected by the project
- Ideas on alternatives and ways to minimize impacts

We hope this website will answer your questions and make it easy for you to participate. Please add your name to our mailing list if you would like to be mailed our newsletters. If you have any questions that are not answered on the website, please contact us.

This site is being continually updated. Check back often for updates.

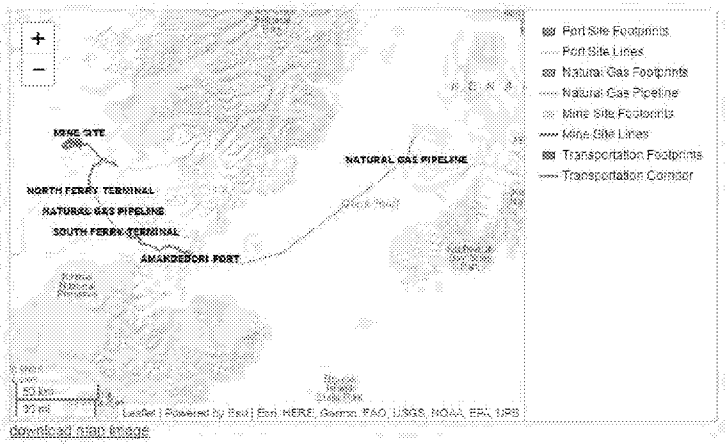
Pebble Project EIS

Pebble Project EIS

Project Overview | Mine Site | Transportation Corridor | Amakdedori Port | Natural Gas Pipeline | Applicant Video

Project Overview

Pebble Limited Partnership (Applicant) has applied for permits to develop the Pebble copper-gold-molybdenum porphyry deposit (Pebble Deposit) as an open-pit mine, with associated infrastructure. The Pebble Deposit is located under rolling, permafrost-free terrain in the Iliamna region of southwest Alaska, approximately 200 miles southwest of Anchorage and 60 miles west of Cook Inlet. The closest communities are the villages of Iliamna, Newhalen, and Nondalton, each approximately 17 miles from the Pebble Deposit. In addition to the Mine Site, the project would have three other major components: Transportation Corridor, Amakdedori Port, and Natural Gas Pipeline.



The Pebble Deposit lies within a 417-square-mile claim block held by subsidiaries of the applicant and by a subsidiary of the applicant's parent company, Northern Dynasty. Neither the applicant nor Northern Dynasty currently owns surface rights associated with these mineral claims. All lands within the claim block are owned by the State of Alaska. Rights to develop on State of Alaska land may be acquired when necessary locations for mine development have been determined and permits awarded. The Transportation Corridor crosses both state land and land patented under the Alaska Native Claims Settlement Act.

The proposed project would have a mine life of approximately 20 years. During that time, there would be:

- a total of 1.2 billion tons of material mined over the life of the project;
- mining rate up to 90 million tons per year;
- milling rate up to 58 million tons per year;
- annual copper-gold concentrate production of 600,000 tons; and
- annual molybdenum concentrate production of 15,000 tons.

The project would have an operating schedule of two 12-hour shifts per day for 365 days per year, and employ approximately 2,000 personnel for construction and 850 for operations.

A more detailed project description from the the applicant to the U.S. Army Corps of Engineers can be found here.

Documents

To download a document, click on its title below. Before you download a file, please be aware of your connection speed and note the size of the file you want. Some files are very large and may take a long time to download, depending on the speed of your internet connection.

For example, at a minimal dial-up modem speed of 56 Kbps, a 2 MB document will take about 5 minutes to download; a 25 MB file will take about an hour. With a high speed connection of 10 Mbps, files of both these example sizes would download in less than 30 seconds.

⚠ Documents not produced by the U.S. Army Corps of Engineers may not be in compliance with the Americans with Disabilities Act Section 508, and documents that are produced by the U.S. Army Corps of Engineers may not be fully compliant. Please contact us if you require assistance and we will try to accommodate your needs. This may include providing the information to you in an alternative format.

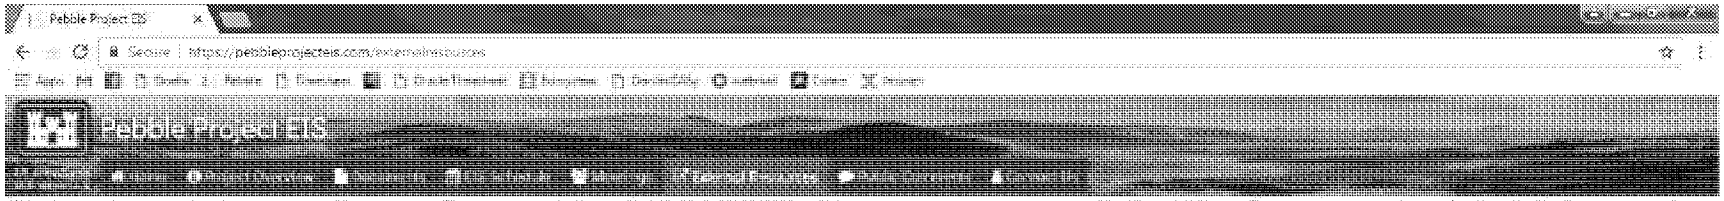
Scoping Meeting Schedule

The U.S. Army Corps of Engineers hosted public meetings in nine communities to give a presentation on USACE's role in permitting for the Project and the Environmental Impact Statement (EIS) process. The purpose was to inform communities about the EIS and gather comments from the public about concerns. Full transcripts are located here. You can view all comments as they are submitted here.

Community	Date & Time	Location
Naknek	Monday, April 9, 2018 3:30 PM - 7:30 PM	Naknek School
Kokhanok	Tuesday, April 10, 2018 3:30 PM - 7:30 PM	Community Hall
Homer	Wednesday, April 11, 2018 5:00 PM - 9:00 PM	Homer High School
Newhalen	Thursday, April 12, 2018 3:30 PM - 7:30 PM	Newhalen School
New Stuyahok	Friday, April 13, 2018 1:00 PM - 4:30 PM	Community Building
Nondalton	Monday, April 16, 2018 3:30 PM - 7:30 PM	Tribal Center
Dillingham	Tuesday, April 17, 2018 5:00 PM - 9:00 PM	Middle School
Igiugig	Wednesday, April 18, 2018 3:30 PM - 7:30 PM	Community Building
Anchorage	Thursday, April 19, 2018 11:00 AM - 5:00 PM	Denali'ina Center

Providing ample opportunities for the public to submit scoping comments on the Pebble Project EIS is of utmost importance to the USACE. Public comments during this scoping phase will be accepted during the scoping period, scheduled to run from April 1, 2018 to June 29, 2018.



Submit your comment

There will be an additional public comment period in January 2019 when the Draft EIS is released.

Public Scoping for the Pebble Project EIS

The US Army Corps of Engineers (USACE) is preparing an Environmental Impact Statement (EIS) to analyze the impacts of issuing permits for an open pit, copper-gold-molybdenum porphyry deposit, with associated infrastructure, as proposed by the Pebble Limited Partnership. The EIS scoping period begins April 1, 2018 and ends June 29, 2018.

At the beginning of developing an EIS, USACE reaches out through scoping to involve members of the public. The scoping period provides opportunities for people who could be affected by the proposed action to express their views and concerns, and to offer suggestions on the scope of analysis. Public input may include ideas for alternatives to the proposed action that could have lesser environmental impacts.

The EIS will identify potential impacts on the physical, biological, and social environment from all phases of the proposed project, including construction, mine operation, closure, and post-closure. The EIS will also look at mitigation methods—ways in which potential negative impacts could be avoided or lessened.

Public meetings will tentatively be held during the scoping period of April 1st to June 29th, 2018, in the following communities:

- Anchorage*
- Dillingham*
- Homer*
- Igiugig
- Kokhanok
- Naknek
- Newhalen
- New Stuyahok
- Nondalton

* To avoid long wait times, an open public testimony format will not be used.

Please check our website for the current meeting schedule.

During the scoping period, USACE will work with the public to identify issues and concerns to thoroughly analyze the potential effects of the proposed project. USACE will use the scientific literature, alongside traditional knowledge and observations provided by the public.

We welcome your comments and information on the resources that are important to you. For example, many communities will be concerned about potential impacts to fish, subsistence resources, and traditional land uses during project construction, operations, and closure.

To Participate...

Providing ample opportunities for the public to submit scoping comments on the Pebble Project EIS is of utmost importance to the USACE. A good way to get involved is to come to a scoping meeting and give your comment orally to a dedicated court reporter, or electronically submit using one of a number of dedicated laptop computers. You can also bring written comments to a meeting, use the comment form on the project website (www.PebbleProjectEIS.com), or send them to:

Program Manager, Regulatory Division
US Army Corps of Engineers
PO Box 6898
Joint Base Elmendorf Richardson
AK 99506-0898

Let us know what aspects of the proposed project are important to you!

Scoping comments can be submitted through June 29, 2018.

* Comments received/postmarked after June 29 will be considered but may not be included in the scoping report. Comments will be reviewed and incorporated into the Draft EIS.

AMERICAN OVERSIGHT

PEBBLE PROJECT DESCRIPTION

Pebble Limited Partnership (PLP), proposes to develop the Pebble copper-gold-molybdenum porphyry deposit (Pebble Deposit) as an open-pit mine, with associated infrastructure, in southwest Alaska. The Pebble Deposit is located approximately 200 miles southwest of Anchorage and 60 miles west of Cook Inlet. The closest communities are the villages of Iliamna, Newhalen, and Nondalton, each approximately 17 miles from the Pebble Deposit, and Kokhanok, which is located 3 miles to the northeast of the proposed road from the port site to the south ferry terminal on Lake Iliamna (see Figure 1).

PEBBLE PROJECT COMPONENTS

The Pebble Project as proposed consists of four facility and operations components:

Mine Site and Associated Facilities (see Figure 2)

- **Open pit mine**, developed in stages, with each stage expanding the area and deepening the previous stage. Final dimensions of the open pit would be approximately 6,500 feet long and 5,500 feet wide, with depths between 1,330 and 1,750 feet.
- **Mine site mineral processing facilities** include a crushing plant, coarse ore stockpile, grinding plant, froth flotation circuits to produce concentrates, and concentrate filters to remove moisture before shipment.
- **Copper-gold concentrate** would be loaded into covered bulk shipping containers and transported by truck to the Amakdedori Port. **Molybdenum concentrate** would be bagged and containerized before shipping to Amakdedori Port.
- **Tailings Storage Facility** located within the North Fork Koktuli watershed:
  - 1.1 billion tons storage volume.
  - separate cells for bulk and pyritic (lined) tailings.
  - four embankments: main (600 feet high), south (350 feet high), and east (60 feet high) perimeter embankments and an internal embankment (420 feet high) separating the bulk and pyritic tailings cells.
- **Low Grade Ore Stockpile** up to 330 million tons of mineralized material, segregated by relative value, and PAG waste rock, placed on an engineered liner to control seepage losses through the stockpile.
- **Waste rock** – Non-potentially acid generating (NPAG) waste rock would be used to construct various mine site structures, including the TSF embankments and mine site roads. PAG waste rock would be stored within the LGO stockpile until mine closure, and then back-hauled into the open pit.
- **Overburden Stockpile** segregated to the southwest of the open pit, and surrounded by a berm of non-mineralized rock to contain the material and increase stability.
- **Water Supply, Management and Treatment** consists of five components:
  - potable water well field and treatment plant.
  - two water management ponds (open pit and LGO/main).
  - sediment ponds.
  - three seepage ponds (south, west, and main embankment).
  - two water treatment plant/three discharge locations (north, south and east).

AMERICAN OVERSIGHT

- **Personnel camps** include a main construction camp to accommodate 1,700 workers, later refurbished for 850 rooms for operations.
- **Power generation** capacity and distribution infrastructure: 230 megawatt delivery capacity fired by natural gas and a 69-kilovolt distribution system.

Amakdedori Port Site (See Figure 3)

- **Ore carrier vessels** up to 40,000 dead weight tons and 700 feet in length, up to **25 Handysize ships will be required annually** to transport concentrate.
- Up to **30 marine line-haul barge loads of supplies and consumables** will be required annually. **Two ice-breaking tug boats** will be used to support marine facility operations.
- **2000 foot earthen access causeway** extending out to a marine jetty located in 15 feet of natural water depth.
- **Access channel and turning basin,** dredged to 50 foot depth.
- **Shore-based facilities** to receive and store containers and fuel, two, 2-MW natural gas power generators with an emergency diesel generator, a natural gas compressor station, maintenance facilities, employee accommodations, and offices.
- **Fuel storage** consisting of four 1.25 million gallon tanks inside a lined and bermed area

Transportation Corridor (see Figure 3)

Road System Connecting Amakdedori Port to the Mine Site

- **Private, double-lane road extending 30 miles south from the Mine Site to North ferry terminal** on the north shore of Iliamna Lake.
- **Private, double-lane road extending 35 miles southeast from the South Ferry Terminal to the Amakdedori Port** on Cook Inlet.
- **Eight bridges**, six of which would be single-span, two-lane bridges that range in length from approximately 90 to 170 feet. There would be one large (550 feet) multi-span, two-lane bridge across the Newhalen River and one large (455 feet) multi-span, two-lane bridge across the Gibraltar River.
- Daily transportation of concentrate, fuel, reagents and consumables would require **up to 35 truck round trips per day for each leg of the road**, including three loads of fuel per day.
- **Village surface road connections** from the Transportation Corridor to Iliamna, Newhalen, and Kokhanok.

Ferry Service and Terminals on Lake Iliamna

- **18 mile ferry crossing of Lake Iliamna.**
- **All-season icebreaking ferry** with 12 crew members.
- **Inbound supplies from the Amakdedori Port to the Mine Site** and **outbound copper-gold and molybdenum concentrates, backhauled waste, and empty containers.**
- **Average of one round trip ferry per day.**
- **Two ferry terminals** with 40 foot rock/aggregate causeway, container handling and storage facilities, office and maintenance buildings, and local power supply.

AMERICAN OVERSIGHT

Natural Gas Pipeline System (see Figure 1)

- **188 mile 10-12 inch diameter natural gas pipeline**, buried 3 feet deep onshore, in five segments:
  - starts on the eastern shore of Cook Inlet at Happy Valley near Anchor Point along the Sterling Highway.
  - 94 mile subsea pipeline crosses Cook Inlet to the Amakdedori Port Site.
  - 35 mile buried pipeline adjacent to the road from port site to south ferry terminal.
  - 18 mile pipeline across Lake Iliamna.
  - 30 mile buried pipeline adjacent to the road from north ferry terminal to Mine Site.
- **Two gas fired compression stations**, one on the eastern end at Anchor Point, and one at the Amakdedori Port.
- **Buried fiber optic cable** adjacent to pipeline.

PROJECT CONSTRUCTION

- **The project would take approximately four years to construct,** on four main project components – Mine Site, Amakdedori Port, Transportation Corridor, and Pipeline.
- **Transportation infrastructure to access the site is the first step**, along with Pre-production Phase environmental protection systems and temporary facilities that support construction crews (camps at port site, mine site, ferry terminals).
- **Initial access to the mine site within one year,** followed by earthworks, plant facilities, tailings storage embankments, stockpile foundations/liners, and water treatment facilities.
- **Natural gas line installation** will occur during the second and third construction years.
- **Completion of Pre-production Open Pit, power plant and processing facilities** in year 4.
- **Construction employment** estimated at 2,000 workers.

PROJECT OPERATIONS

- **Project operating life of 20 years**, **three mining phases** – pre-production, production and stockpile reclaim.
- **Conventional open pit mine** – drill, blast, truck and shovel operation.
- **Blasting events** – once to twice a day.
- **Tailings Storage Facility water management** – Control, collection, and recovery of tailings water for recycling or treatment prior to discharge; seepage collection system below impoundment structures; freeboard to contain inflow design flood.
- **Total material mined** – 1.2 billion tons over the life of the project.
- **Mining rate** up to 90 million tons per year, **milling rate** up to 58 million tons per year.
- **Annual concentrate production** – 600,000 tons copper gold, 15,000 tons molybdenum.
- **Operations employment** estimated at 850 workers, two shifts per day, 365 days/year.

AMERICAN OVERSIGHT

PROJECT CLOSURE

- **Reclamation and closure jurisdiction** – Alaska Department of Natural Resources Division of Mining, Land, and Water, and Alaska Department of Environmental Conservation.
- **Design for Closure** – early consideration of requirements for Closure and post-Closure site management.
- **Segregation of the bulk and pyritic tailings storage cells** to facilitate Tailings Storage Facility closure.
- **Potentially Acid Generating waste rock** backhauled to mine pit for subaqueous storage.
- **Comprehensive water management plan** that strategically discharges surplus treated water to downgradient streams in a manner that reduces the effect of flow changes on stream flow and fish habitat.
- **Removal of mill and other infrastructure** not required for closure and reclamation.
- **Reclamation of disturbed areas** through grading, use of top soil as need and revegetated.
- **Road system retained** as needed for post-Closure activities and monitoring.
- **Pit lake water quality will be monitored;** water will be treated and discharged before levels approach elevation where groundwater flows outward from the open pit.

For more details, see Attachment D Project Description, Department of Army Application for Permit (POA-2017-271) on www.PebbleProjectEIS.com.

How Alternatives will be Developed for the Pebble Project Environmental Impact Statement (EIS)

1. Identify need to which the United States Army Corps of Engineers (USACE) – Alaska District is responding and identify the overall project purpose. State the applicant's objectives for the project.
2. Compile a range of alternatives to be considered that meet the overall project purpose with consideration of the applicant's objectives. The alternatives compilation will include the no action alternative, any alternatives considered by the applicant, and alternatives suggested during the scoping process.
3. Determine whether identified alternatives are reasonable in accordance with the National Environmental Policy Act.
    a. Reasonable is based on the consideration of the overall project purpose including stated objectives as well as technology, economics, and common sense.
    b. Determine whether an alternative meets the overall project purpose inclusive of objectives.
        i. Alternatives that do not meet the overall project purpose will be eliminated at this stage.
        ii. Alternatives that meet the overall purpose will move forward.
    c. Alternatives that meet the overall project purpose will be reviewed to determine whether the alternative was available to the applicant during project planning (past 10 years).
        i. Alternatives identified as reasonable but were not available to the applicant will be removed at this time.
        ii. Alternatives that were available will move forward.
    d. Alternatives will be reviewed for technical feasibility (can these alternatives be accomplished using existing technology and equipment?).
        i. Alternatives determined to not be technically feasible will be removed at this stage.
        ii. Alternatives determined to be technically feasible will move forward.
    e. Alternatives will be reviewed for economic feasibility.
        i. Any alternative claimed to not be economically feasible by the applicant will require an economic analysis to support statement.
        ii. An alternative proven to not be economically feasible will be removed at this time.
        iii. Alternatives determined to be economically feasible will move forward.
    f. Alternatives will be reviewed using common sense.
        i. Alternatives that increase adverse environmental impacts will be removed at this time.
        ii. Alternatives will also be reviewed for logistical feasibility. Alternatives that are not logistically feasible will be removed at this time.

Identified REASONABLE ALTERNATIVES with significantly LESSER impacts will be evaluated in the EIS along with the NO ACTION alternative and the applicant's PROPOSED alternative.

AMERICAN OVERSIGHT

How Alternatives are Screened for Practicability

Due to the USACE specific authorities, alternatives must also be screened for practicability. The practicability determination is described below. Ultimately, the USACE must identify the **least environmentally damaging practicable alternative (LEDPA)** in the Record of Decision prior to making a decision under Section 404 of the Clean Water Act.

1. From the identified reasonable alternatives, further identify practicable alternatives in accordance with Clean Water Act Section 404(b)(1) of the Clean Water Act (the Guidelines). The Guidelines state practicable means the project is available and capable of being done after taking into consideration **cost**, **existing technology** and/or **logistics** in light of the overall project purpose including the applicant's objectives. Logistics and existing technology have at this point been screened in our determination of reasonable alternatives and are included below only for completeness and explanatory purposes. *An alternative needs to fail only one practicability factor to be determined not practicable*.
    a. Costs – Cost is analyzed in the context of the overall scope/cost of the project and whether it is unreasonably expensive. This determination is typically made in relation to comparable costs for similar actions in the region or analogous markets. Cost is to be based on an objective, industry-neutral inquiry that does not consider an individual applicant's financial standing. The data used for any cost must be current with respect to the time of the alternatives analysis. Because one alternative costs more than another does not mean that the more expensive alternative is impracticable. It is important to note that in the context of this definition, cost does not include economics.
    b. Existing Technology – The alternatives examined should consider the limitations of existing technology yet incorporate the most efficient/least-impacting construction methods currently available.
    c. Logistics – The alternatives evaluated may incorporate an examination of various logistics associated with the project (e.g., placement of facilities within a specified distance to major thoroughfares, utilization of existing storage or staging areas, and/or safety concerns that cannot be overcome).
    d. Availability – The Guidelines state that if an alternative is otherwise practicable, an area not presently owned by the applicant that could reasonably be obtained, utilized, expanded, or managed in order to fulfill the overall purpose of the proposed activity can still be considered a practicable alternative. In other words, the fact that an applicant does not own an alternative parcel, does not preclude that parcel from being considered as a practicable alternative. This factor is normally a consideration as a logistics and possibly cost limitation.
    e. Two tests are specified in the Guidelines for alternatives when the basic purpose of a project does not require siting within special aquatic sites such as wetlands. The basic purpose of this project is mining. The type of mining proposed (transitional metal-copper, gold, molybdenum) does not require siting within special aquatic sites. Therefore:
        i. It is presumed that alternatives that do not affect special aquatic sites such as wetlands are available

AMERICAN OVERSIGHT

ii. It is presumed that alternatives in sites that are not special aquatic sites will have a LESSER ADVERSE impact on the aquatic ecosystem

Once an otherwise practicable alternative has been identified, the applicant (Pebble Limited Partnership) will be required to clearly demonstrate to the USACE that both of these presumptions have been rebutted or the alternative will be considered in the determination of the LEDPA.

**All practicable alternatives are also reasonable alternatives.

2. The final step in developing alternatives is to construct detailed descriptions for the reasonable alternatives that have been retained and carried forward for evaluation in the EIS.

How the Public Can Provide Useful Guidance on Alternatives that should be Considered in the EIS

The purpose of scoping is to determine the alternatives that should be considered in the analysis and determine the extent and nature of issues by which each alternative should be evaluated.

Scoping is an important opportunity for all citizens to provide specific suggestions for alternatives that should be considered in preparing the EIS, and issues that should be addressed in that process. The following guidelines may be useful in submitting comments during the scoping period (*examples shown in italics*):

1. Keep in mind the reasonable alternative screening criteria described above – any suggestions should fulfill the overall project purpose in consideration of the applicant's objectives with a focus on reducing potential adverse environmental impacts.
2. You can suggest alternatives specific to components for developing the mine (*mining methods, water treatment, tailings management*), the port site, the transportation corridor and modes (*rail*), and the natural gas pipeline.
3. You can suggest changes in location of project components (*road, port site, mine components*).
4. You can suggest potential mitigation measures and conditions of development that may reduce environmental impacts.
5. Be as specific as possible and provide the reason for making your suggestions (*construction of a rail connection may eliminate truck traffic and reduce dust levels*).

The USACE will make the results of the scoping process publically available by publishing the Scoping Report on the project website (pebbleprojecteis.com) and will also communicate information for newsletters.

How Alternatives will be evaluated in this EIS

Once reasonable alternatives have been identified for evaluation as above, the USACE will evaluate each alternative in relation to the following:

- Conservation
- Economics
- Aesthetics

AMERICAN OVERSIGHT

- General environmental concerns
- Wetlands
- Historic properties (inclusive of sacred sites or areas of community and/or spiritual significance)
- Fish and wildlife values (inclusive of endangered species, marine mammals, fisheries and wildlife)
- Flood hazards
- Floodplain values
- Land use (inclusive of transportation corridors)
- Navigation
- Shore erosion and accretion
- Recreation
- Water supply and conservation
- Water quality
- Energy needs
- Safety
- Food and fiber production (this would include subsistence activities)
- Mineral needs
- Considerations of property ownership
- The needs and welfare of the people

In the EIS, we will develop a framework to analyze each of these issues with emphasis on issues that rise to the highest level of importance.

During scoping, we are also asking you to help us determine which of these factors are of highest concern to you, to provide information of specific concern regarding any factor listed, and to identify any other specific issues that are not listed. As with your comments related to alternatives, please be as specific as possible when identifying other issues or expanding on issues identified above. This will help us develop the analytical framework moving forward.

For alternatives identified as practicable, the USACE will ultimately make the following determinations:

1) Whether the alternative is the least environmentally damaging practicable alternative,

2) Whether the LEDPA will cause or contribute to the violation of applicable state or federal laws, such as water quality standards or the Endangered Species Act,

3) Whether the LEDPA will result in significant degradation of waters of the United States

4) Whether the LEDPA includes appropriate and practicable steps have been taken to minimize the adverse impacts of the project on wetlands and other waters.

AMERICAN OVERSIGHT

What Resources will be Analyzed in the EIS?

Using the analysis in the Environmental Impact Statement (EIS), The U.S. Army Corps of Engineers (USACE) will evaluate the environmental and related social and economic effects of the proposed project. The analysis will include direct and indirect impacts, cumulative effects, and potential spill and tailings dam failure scenarios. Comments received during the scoping period will likely result in additional resources to be considered in the analysis.

Social Environment

- Cultural Resources
- Historic Properties
- Land use and management
- Subsistence
- Transportation and Navigation
- Aesthetics
- Recreational and Commercial Fisheries
- Recreation
- Needs and Welfare of the People
- Environmental Justice
- Health and Safety

Physical Environment

- Geohazards
- Geology
- Soils
- Surface Water Hydrology including flood plains and flood hazards
- Groundwater Hydrology
- Water Quality
- Noise
- Air Quality
- Climate Change

Biological Environment

- Wetlands/Special Aquatic Sites
- Vegetation
- Birds
- Terrestrial Wildlife
- Fisheries and Aquatic Resources
- Marine Wildlife
- Threatened and Endangered Species

Direct impacts occur through direct interaction of an activity with an environmental, social, or economic component.
For example: pollutant discharge from a source could directly result in lowered water quality.

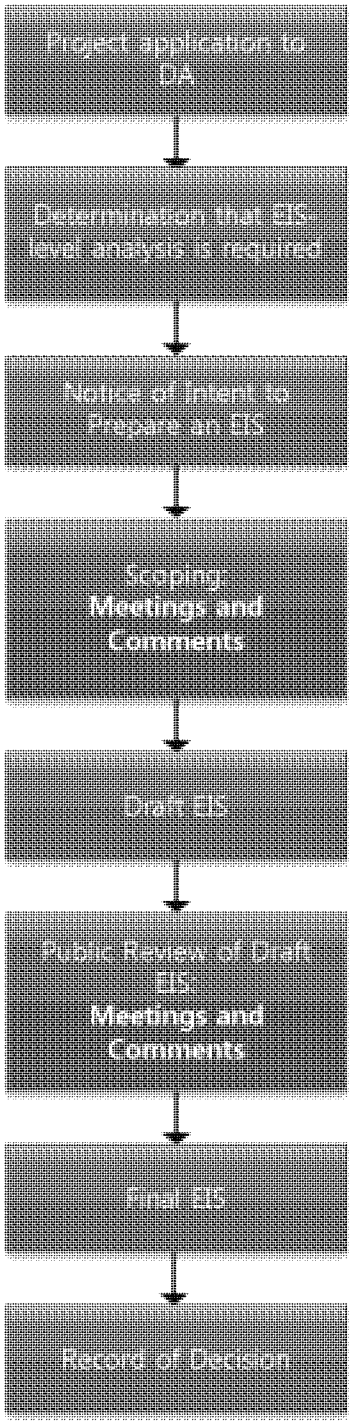
Indirect impacts on the environment are not a direct result of the project, but often a result of a complex impact pathway.
For example: pollutants in the air from a source could land on vegetation, indirectly causing acidic soils.

Cumulative impacts occur when the incremental impact of the project is combined with the effects of other past, present and reasonably foreseeable future projects.
For example: wetland fill from one project, combined with the wetland fill from a separate project.

AMERICAN OVERSIGHT

What is NEPA?

The national commitment to the environment was formalized through the passage of the National Environmental Policy Act (NEPA) of 1969. NEPA's goal is to help the federal government make decisions with full understanding of the potential environmental consequences associated with federal projects or authorizations. A thorough understanding of consequences allows us to identify potential actions that can be taken to protect, restore, or enhance the environment.



As the USACE prepares to review the submitted permit application, it must conduct a detailed study of:

- how the project will be built,
- the consequences of the project (good or bad) on the environment and for communities,
- alternative ways to develop the project that still meet the project's purpose and needs while better protecting people and the environment, and
- measures that can be taken to avoid or lessen any harmful impacts of the project.

Transparency

Before a decision is made and throughout its analysis, the federal government must ask citizens to voice concerns and suggest alternatives to ensure decisions on federal actions are well informed.

Steps in the EIS Process

AMERICAN OVERSIGHT

Roles and Responsibilities

When the Pebble Limited Partnership (Applicant) submitted an application on December 22, 2017, the US Army Corps of Engineers, Alaska District (USACE) was compelled to begin processing the permit application in accordance with 33 CFR 320. The USACE determined that review of the application would require an environmental impact statement (EIS) level of anlaysis in compliance with the National Environmental Policy Act. The USACE is the lead federal agency for developing the EIS

Role of the Corps

The USACE, as the lead agency, is responsible for reviewing the permit application submitted by the applicant, and analyzing the potential environmental impacts from the proposed project. As lead agency, the USACE is responsible for identifying, inviting, and assigning roles to cooperating agencies including agencies that also have permitting decisions to make for the proposed project. The USACE will lead the effort to take a hard look at reasonable and practicable alternatives and evaluate the impacts of the proposed project utilizing an interdisiplinary team. At the completion of the environmental impact analysis, the USACE, will issue a Record of Decision related to USACE's authorities under Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act.

Role of the 3rd Party Contractor

AECOM (a consulting firm) has been hired to provide the interdisciplinary team that will develop a fact-based independent analysis of the Pebble Project as proposed and evaluate identified reasonable alternatives. AECOM will work solely under the direction of the USACE and will be the primary developers of the EIS. AECOM will also provide support to the USACE for scoping and public involvement, development of alternatives to the proposed action, assessment of potential impacts, developing the Draft and Final EIS, and distribution. The AECOM team is made up of specialists and scientists in the biological environment, the physical environment, and the social environment.

Role of the Applicant

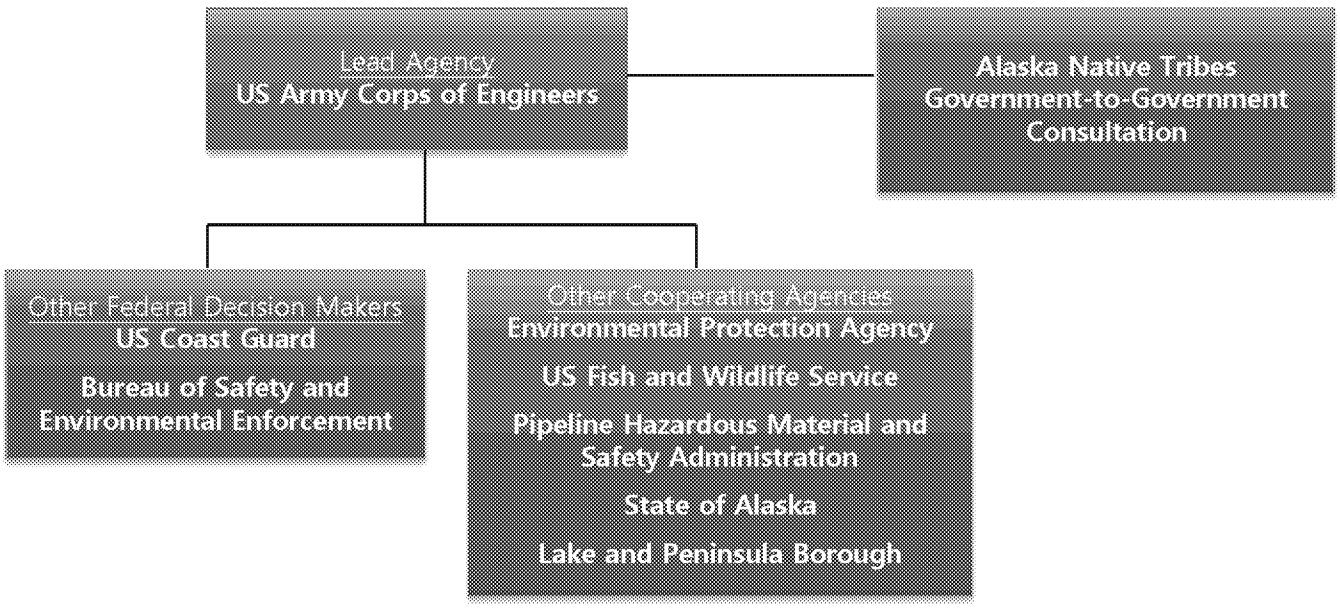
As the applicant is required to provide information to the USACE related to their proposed project. This includes:

- description of the proposed project,
- background material, completed research, and site information,
- data for the development of maps and figures, and
- other information that may be identified as necessary during preparation of the EIS.

The applicant will not be involved in the development of the EIS beyond this limited scope.

Role of Cooperating Agencies

Several cooperating agencies have been invited to provide technical support to the lead agency, the USACE. Cooperating agencies will be actively engaged in scoping and alternatives development and will then be assigned to technical teams based on the specific reasons they were invited to become cooperating agencies. Although cooperating agencies are involved in preparation and writing of certain portions of the EIS and cooperators may use the EIS for their own decisions, the USACE has final authority on the EIS content.



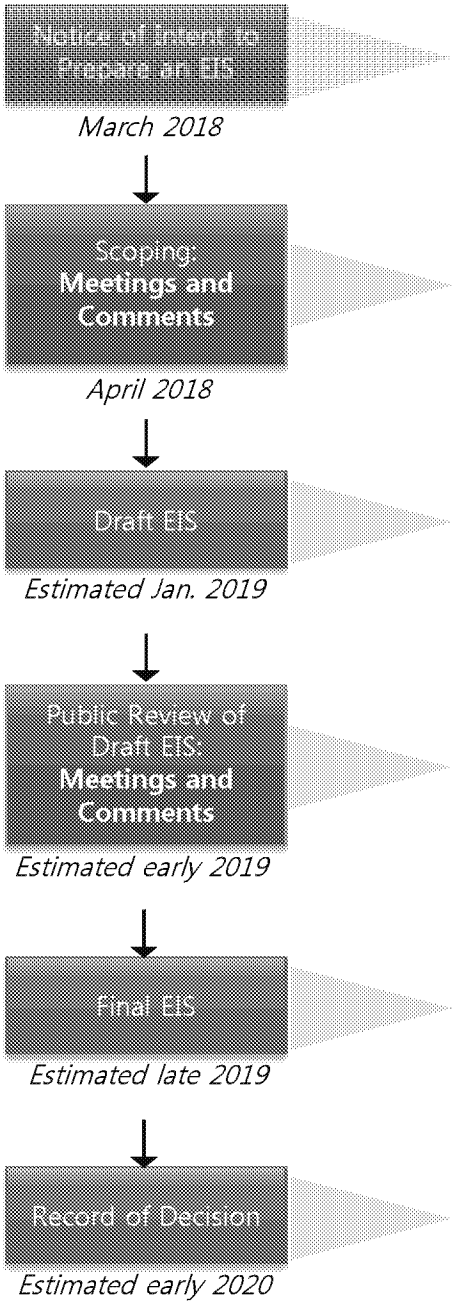
AMERICAN OVERSIGHT

Role of Alaska Native Tribes

The USACE has invited 35 federally recognized Alaska Native Tribes to consult throughout the entirity of the federal decision making process, including the development of the environmental impact statement. Federally recognized Alaska Native Tribes that the USACE has extended government-to-government consultation invitations to are:

- Aleknagik Traditional Council
- Chignik Bay Tribal Council
- Chignik Lagoon Village Council
- Chignik Lake Traditional Council
- Clarks Point Village Council
- Curyung Tribal Council
- Egegik Village Council
- Ekuk Village Council
- Ekwok Village Council
- Igiugig Village Council
- Iliamna Village Council
- Ivanof Bay Tribal Council
- King Salmon Tribal Council
- Kokhanok Village Council
- Levelock Village Council
- Manokotak Village Council
- Naknek Village Council
- Nanwalek IRA Council
- Native Tribe of Kanatak
- Native Village of Perryville
- New Koliganek Village Council
- New Stuyahok Traditional Council
- Newhalen Tribal Council
- Ninilchik Traditional Council
- Nondalton Tribal Council
- Pedro Bay Village Council
- Pilot Point Tribal Council
- Port Graham Tribal Council
- Port Heiden Village Council
- Portage Creek Village Council
- Seldovia Village Tribal Council
- South Naknek Vilage Council
- Traditional Council of Togiak
- Twin Hills Village Council
- Ugashik Traditional Council

Lead and Cooperating Agencies



AMERICAN OVERSIGHT

EIS Schedule

Preparation of the Pebble Project Environmental Impact Statement (EIS) level of analysis began in December 2017, when the US Army Corps of Engineers (USACE) received a permit application from the Pebble Limited Partnership (Applicant). The EIS process will take several months to complete a Draft EIS for public review, with a Final EIS expected within 24 months. The estimated schedule for the EIS is below.

Steps in the EIS Process

The USACE released a Notice of Intent to the United States Federal Register in March 2018. This initiated the process to prepare an EIS and began the scoping process.

The 30 day scoping process kicks off on April 1, 2018. Public meetings will be held at specific locations within the Bristol Bay region, and in Homer and Anchorage in April. Scoping offers a chance for the public to comment on the proposed project and alternatives.

Determining the alternatives to analyze, and then preparing the Draft EIS will happen immediately following the scoping period. The Draft EIS is anticipated to be released for public review and comment in 2019.

After the Draft EIS is released, the public will have a minimum of 45 days to submit comments. During that time, the USACE will plan public meetings, in the same locations that occurred during scoping, estimated for 2019.

The USACE will assess all public comments submitted on the Draft EIS, and incorporate changes into the Final EIS before release in 2019.

The Record of Decision will lay out USACE's decision on the application submitted by the Applicant. Three decisions are possible: issue a permit, issue a permit with conditions, or denial of the application. This is estimated to be released in 2020.

AMERICAN OVERSIGHT

EIS Outline

How the Draft and Final EIS will be Organized

The Environmental Impact Statement (EIS) will analyze the potential impacts to the biological, physical, and social environments. The EIS will be organized into chapters to address the specific requirements in the National Environmental Policy Act (NEPA). By understanding the layout of the document ahead of time, readers can more easily find the specific sections they may be interested in reviewing and providing comments.

Executive Summary – Provides overview of the Draft and Final EIS, summarizes draft findings of potential impacts, and serves as a guide for where to find details.

The purpose and need of a project is essential in establishing a basis for developing the range of reasonable alternatives required in an EIS and identifying and selecting a preferred alternative.

Chapter 1. Purpose and Need – Describes the purpose of the proposed project to inform the range of alternatives analyzed in the EIS.

Chapter 2. Alternatives – Describes alternatives to be analyzed, including a No Action Alternative, the Proposed Action (as designed by the Pebble Limited Partnership), and reasonable and practicable alternatives to address issues raised during scoping and the EIS process, such as, but not limited to, tailings and mine water management, alternate pipeline routes, surface access to the mine site and vehicle traffic levels, and port/ferry facilities, location, and traffic levels.

Chapter 3. Affected Environment – Describes the baseline conditions of key resource topics in the proposed project environment (such as fish and wildlife, water quality, economics, food production, commercial fishing, and recreation).

Chapter 4. Environmental Consiquences of Action – Analyzes the potential direct, indirect, and cumulative impacts, as well as potential mitigation measures relevant to each of the resources from the proposed action and each alternative.

Chapter 5. List of Preparers – Presents the list of contributors to the preparation of the EIS, including their affiliation, project role, educational background, and years of experience. Cooperating agency roles and responsibilities are also described in Chapter 5.

Chapter 6. List of Agencies, Organizations, and Persons to Whom Copies of the Statement Have Been Sent – Describes the distribution of the Draft and Final EIS documents for informational purposes and to identify public locations where the document is available.

Chapter 7. References – Presents the references used in preparing the EIS.

Chapter 8. Appendices – Presents the in-depth analyses, comments/response to comments, coordination, consultations, mailing lists and other information used in the analysis of the applicant's project.

AMERICAN OVERSIGHT

How to Comment

Public participation is an important part of developing an Environmental Impact Statement (EIS) under the National Environmental Policy Act (NEPA). Submitting substantive and concise comments during the scoping period is an important role the public plays in the NEPA process, and can influence the scope of analysis for the EIS.

General recommendations

- **Become familiar with the proposed project** — Review the project or agency website, read the project description, monitor local newspapers, and attend public meetings. The website for the Pebble Project EIS is www.PebbleProjectEIS.com.
- **Learn about the steps in the NEPA process** and opportunities for submitting to the U.S. Army Corps of Engineers (USACE). Public comment periods are during scoping, and at the draft EIS.
- **Keep your comments focused and as specific as possible** on the proposed project under consideration, what you think the EIS analysis needs to address and why.
- **Submit your comments within the timeframes announced** to ensure that your concerns are considered and addressed during the drafting of the EIS; the Scoping Comment period is from April 1 through April 30.

Comments on the project are not counted as votes; they are used to determine the appropriate scope of issues analyzed and contents of the EIS and to ensure that the impacts are adequately disclosed before the USACE makes a final decision on the permit application. Avoid simply agreeing or disagreeing with the proposed project. It is more important to identify specific relevant issues, alternatives, mitigation measures/conditions of permitting, and analytic tools so they can be used to inform the EIS analysis. The more clear, concise, and relevant your comments are, the more effective they will be in shaping the development of the EIS. For a citizen's guide to NEPA, visit https://ceq.doe.gov/get-involved/citizens_guide_to_nepa.html.

Tips for Writing Effective Comments

- **Be specific**. For example, if you are concerned about wildlife, focus on a particular problem or issue, such as a species that you feel should be analyzed, instead of making a broad statement such as "I am concerned about the impacts to wildlife."
- **Support your statements** with explanations, facts, and references, as appropriate.
- **Make suggestions,** including resources that should be analyzed, new data or analytic tools that should be used, and substantially different alternatives that should be evaluated in the EIS.

AMERICAN OVERSIGHT

Pebble Project EIS Comment Form

You can submit comments using the form on the website (www.PebbleProjectEIS.com), to a court reporter at a public scoping meeting, or in writing (using computers available at a meeting or by mail). We will not be taking public testimony at large meetings in Anchorage, Homer, and Dillingham. If you'd like to mail your comments or submit them at a meeting, please feel free to use this form and attach additional sheets as needed. Write your comments, questions, and suggestions below, then fold this page in thirds so that the mailing address is visible. Remember to affix first-class postage before putting it in the mail, postmarked by the comment deadline of June 29, 2018.

The following questions may help:

- What are your specific concerns about this project and how should they be addressed in the EIS?
- Are there particular fish and wildlife resources, subsistence activities/use areas, or other places that you use and how might they be affected by the project?
- Are there alternative ways of developing any of the components of the Pebble Project that should be considered in preparing the EIS?

Please note that all public comments, including names and addesses of of individuals and organizations, are publically available as part of documenting public involvement in preparing the EIS. The US Army Corps of Engineers intends to place public comments received during scoping on the project website.

Frequently Asked Questions

What is the U.S. Army Corps of Engineers' relationship with the applicant?

The U.S. Army Corps of Engineers (USACE) has no relationship with the applicant and is neither for or against the project. The USACE has a responsibility to review the applicant's proposed project with the same objectivity as it would any permit application and make a permit decision under the USACE statutory authorities.

Is the Pebble Project already approved and going to be built?

No.

What is the USACE's role in reviewing this project?

The applicant has applied for authorization under Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act. It is the USACE's responsibility to evaluate their application and ultimately make permit decisions (approval or denial) under the USACE's Clean Water Act and Rivers and Harbors authorities.

Why is the USACE conducting an EIS for this project?

The National Environmental Policy Act (NEPA) mandates an EIS-level of analysis should be conducted for review of any potential federal authorizations that could "significantly affect the quality of the human environment." The USACE has reviewed the permit application and has determined that the proposed project could "significantly affect the quality of the human environment."

Are any other federal decisions required based on the applicant's submittal of the permit application?

Two additional federal agencies have federal decision making authority: the U.S. Department of the Interior Bureau of Safety and Environmental Enforcement, and the U.S. Coast Guard.

Will the USACE seriously consider the No Action Alternative and what factors might lead to its selection?

The USACE cannot be pre-decisional, therefore, the process will be required to analyze and consider the No Action Alternative. In the context of USACE's evaluation, the No Action Alternative constitutes an action that would not include the discharge of fill material into waters of the United States.

What is the role of cooperating agencies that do not have federal decisions to make?

The role of cooperators invited due to specific expertise is to support the lead agency in developing the environmental analysis and providing technical assistance at the request of the lead agency.

AMERICAN OVERSIGHT

What is the role of federally recognized Alaska Native Tribes in the EIS process?

Thirty five federally recognized Alaska Native Tribes have been asked to consult directly with the USACE as lead agency throughout the entire decision making process to include the development of the environmental impact statement.

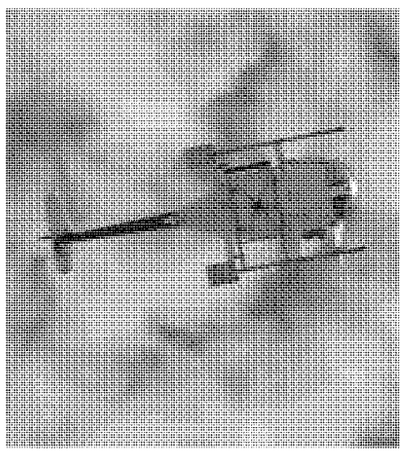
When and how will my comments be considered in preparing the EIS?

Public comments can be submitted at any time during the preparation of an EIS. Formal requests for comment occur during two important phases of an EIS:

- During the Scoping Period, the public is asked to comment on the issues and potential impacts that should be addressed in the EIS. The public is also asked to suggest alternatives to the proposed action that should be considered for evaluation in the EIS.
- Once the Draft EIS is released for public review and comment, the public is given the opportunity to submit comments in written form via the project website and orally at public meetings on the Draft EIS.
- All comments submitted will be put into the record, analyzed, and considered in determining the scope and potential impacts within the EIS and in making changes to the Draft EIS during the preparation of the Final EIS.
- The USACE is required to prepare responses to comments submitted on the Draft EIS; comments submitted and response will be included in the Final EIS.

AMERICAN OVERSIGHT

Pebble Project EIS



NEWSLETTER 1 | April 2018 | www.PebbleProjectEIS.com

US Army Corps of Engineers

Scoping Notice

The U.S. Army Corps of Engineers (USACE) Alaska District is conducting an Environmental Impact Statement (EIS) level of analysis to evaluate Department of the Army permit application POA-2017-271 submitted by Pebble Limited Partnership (PLP). PLP's application states the purpose of discharges of dredged and/or fill material into jurisdictional waters of the United States is for the purpose of developing a copper-gold-molybdenum porphyry deposit as an open-pit mine, with associated infrastructure, in southwest Alaska. The EIS scoping period begins April 1 and ends April 30, 2018.

The scoping period provides opportunities for any person interested in the proposed project to share information that can help shape the scope of analysis of the EIS. This may include ideas for alternatives to the applicant's proposed action as identified in the permit application (publically available at pebbleprojecteis.com) that could have lesser environmental impacts and identifying areas and/or issues of particular concern.

SCOPING PROCESS BEGINS

About PLP's Permit Application

PLP is proposing to develop the Pebble Deposit which is located under rolling, permafrost-free terrain in the Iliamna region of southwest Alaska, approximately 200 miles southwest of Anchorage and 60 miles west of Cook Inlet. The closest communities are the villages of Iliamna, Newhalen, and Nondalton, each approximately 17 miles from the Pebble Deposit. Portions of the proposed project lie within the Lake and Peninsula and Kenai Peninsula boroughs. Development of the Pebble Deposit would require federal permits from the USACE, The United States Coast Guard, and the Bureau of Safety and Environmental Enforcement for various aspects of the major project components. These three federal agencies are required to comply with the National Environmental Policy Act and thus will be using the EIS to inform their respective federal decisions. The major project components are briefly described here followed by an overview of the EIS process.

Major Project Components

Mine Site. The fully developed Mine Site would include the open pit mine, a tailings storage facility, a low grade ore stockpile, overburden stockpiles, material sites, water management ponds, milling and processing facilities, and supporting infrastructure such as a power plant, water treatment plants, camp facilities, and fuel and material storage facilities.

Transportation Corridor. The Transportation Corridor would connect the Mine Site to the Amakdedori Port on the west side of Cook Inlet. It has three main components:

1. A private, double-lane road extending 30 miles south from the Mine Site to a ferry terminal on the north shore of Iliamna Lake.

2. An ice-breaking ferry to transport materials, equipment, and ore concentrates 18 miles across Iliamna Lake between ferry terminals on the north and south shores of the lake.

3. A private, double-lane road extending 35 miles southeast from the South Ferry Terminal near the community of Kokhanok, to the Amakdedori Port on the west side of Cook Inlet.

Amakdedori Port. The Amakdedori Port would be located near Amakdedori Creek on the western shore of Cook Inlet, approximately 190 miles southwest of Anchorage and approximately 95 miles southwest of Homer. It would include shore-based and marine facilities for the shipment of ore concentrates, freight, and fuel for the project. A 1300-foot earthen causeway with a 700-foot wharf would connect the port site with the docking facility. A 50-foot deep turning basin would be dredged adjacent to the docking facility, along with a 50-foot deep access channel. Other facilities would include fuel storage and transfer facilities, power generation and distribution facilities, maintenance facilities, employee accommodations, and offices.

AMERICAN OVERSIGHT

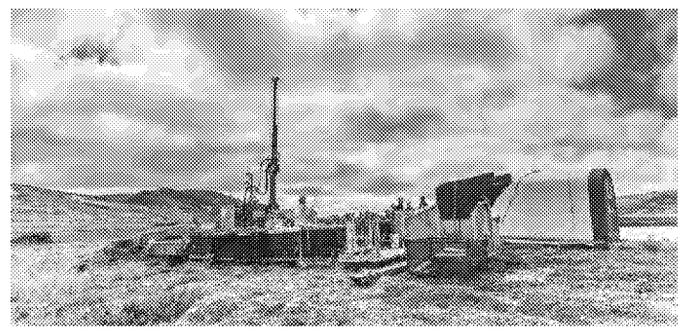
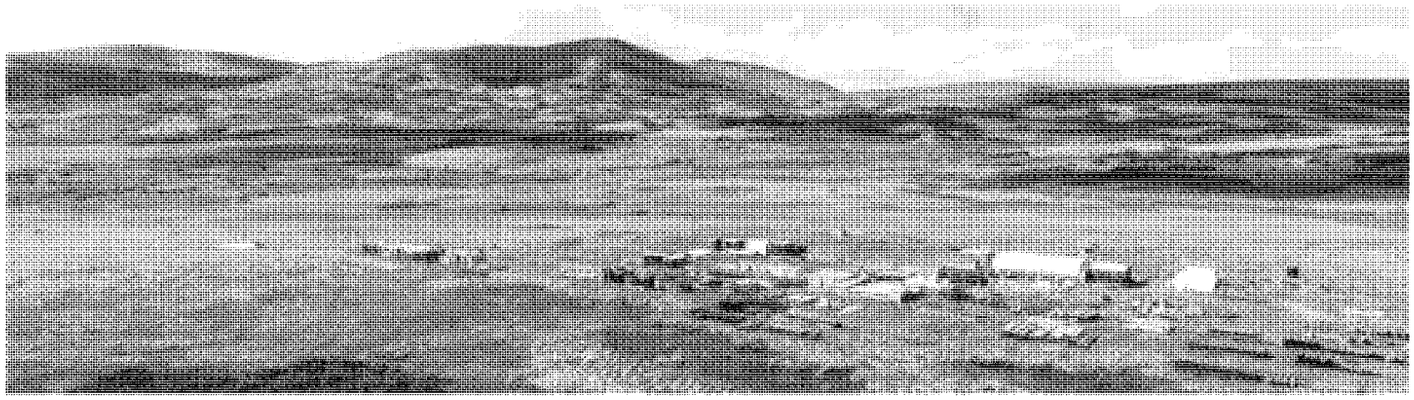
EPA-0135-0001425

Natural Gas Pipeline. Natural gas, sourced from the existing natural gas supply infrastructure for the Cook Inlet area, would supply power generation for the Pebble Project, and would require the construction of a 188-mile pipe. The gas pipeline alignment would connect to existing infrastructure near Happy Valley on the Kenai Peninsula and travel south, paralleling the Sterling Highway for 9 miles to a compressor station near Anchor Point. From the compressor station, the pipeline would head southwest across Cook Inlet for 60 miles, before turning west for 35 miles to a landfall at the Amakdedori Port. A second compressor station and offtake point would be located at the port site. The pipeline would then follow the transportation corridor from the port to the mine site, including crossing Iliamna Lake on the lakebed.



ABOUT THE EIS



The USACE is serving as the lead federal agency for this EIS. The Bureau of Safety and Environment Enforcement and the United States Coast Guard have federal decision-making authority over portions of the applicant's proposed project and will serve as cooperating agencies. The U.S. Fish and Wildlife Service, Advisory Council on Historic Preservation, the State of Alaska (multiple divisions), the Lake and Peninsula Borough, the Pipeline and Hazardous Materials and Safety Administration, and the U.S. Environmental Protection Agency will serve as cooperating agencies to provide technical assistance for specifically identified special expertise. Thirty-five federally recognized tribal governments have been invited to participate directly through government-to-government consultation.

The EIS will identify potential impacts and potential benefits of the proposed project and reasonable altenatives on the physical, biological, and social environment from all phases of the project, including construction, operations, and post-closure. The EIS will also look at mitigation methods—ways in which potential negative impacts could be lessened. The USACE will use available scientific literature and subsequent data collected, alongside traditional knowledge and observations provided by the public.

We welcome your comments and information on the resources that are important to you. For example, many communities will be concerned about potential impacts to subsistence resources and land uses during project construction, operations, and closure. The EIS will address long-term cumulative effects, consider a reasonable range of alternatives, and analyze a range of practical mitigation and monitoring measures for protecting public health, water quality, wildlife, and subsistence resources.

AMERICAN OVERSIGHT
EPA-0135-0001426

Participate!

All interested parties are invited to participate in the EIS process. The goals of the public scoping process are to:

- Gather comments and suggestions from interested parties to help determine issues and concerns that are relevant to the analysis of potential impacts
- Help define a reasonable range of alternatives to evaluate in the EIS
- Capture information that will lead to the development of good mitigation and monitoring measures

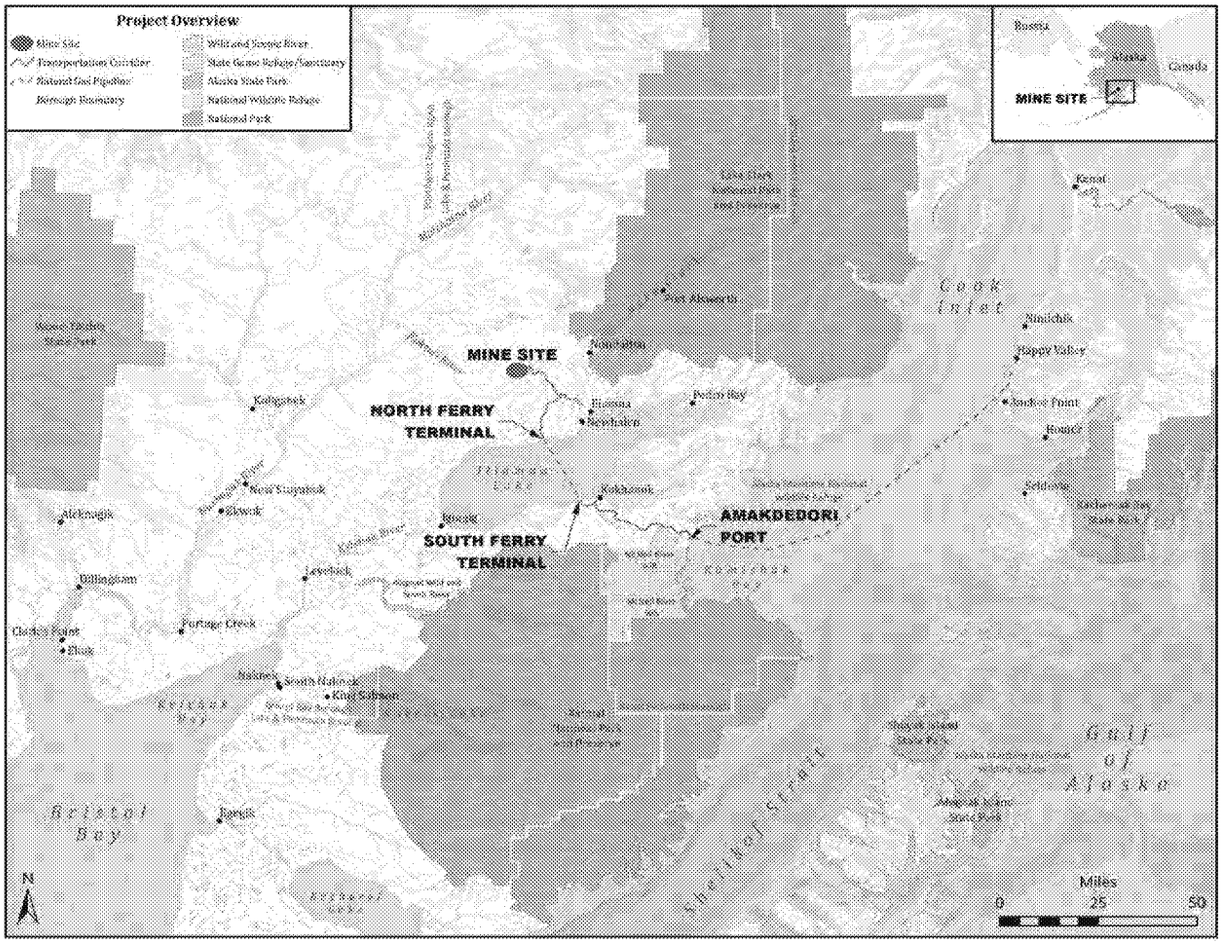
Public Scoping Meetings

USACE has chosen to conduct scoping in multiple ways including scoping meetings in addition to our newsletters, website, and other communication methods. The scoping schedule includes meetings across the project area, as well as in Anchorage and Homer. The public meeting schedule is listed below.

COMMUNITY	DATE AND TIME	LOCATION
Naknek	April 9, 2018, 3:30 pm	Naknek School
Kokhanok	April 10, 2018, 3:30 pm	Tribal Hall
Homer*	April 11, 2018, 5:30 pm	High School
Newhalen	April 12, 2018, 3:30 pm	Newhalen School
Nondalton	April 16, 2018, 3:30 pm	Tribal Center
Dillingham*	April 17, 2018, 5:00 pm	Middle School
Iguigig	April 18, 2018, 3:30 pm	Community Building
Anchorage*	April 19, 2018, 5:00 pm	Dena'ina Center

**To avoid long wait times, a hot mic format will not be used.*

TO PARTICIPATE...



Providing ample opportunities for the public to submit scoping comments on the Pebble Project EIS is of utmost importance to the USACE. Come to scoping meetings and share your thoughts regarding project impacts and benefits and ideas for alternatives. Give your comment orally to a dedicated court reporter, or electronically submit using one of a number of dedicated laptop computers. You can also bring written comments to a meeting, use the comment form on the project website (www.PebbleProjectEIS.com), or send them to:

Program Manager, Regulatory Division
US Army Corps of Engineers
PO Box 6898
Joint Base Elmendorf Richardson,
AK 99506-0898

Let us know what aspects of the proposed project are important to you!

Written scoping comments can be submitted through April 30, 2018.
Comments received/postmarked after April 30 will be considered, but may not be included in the scoping report.
Comments will be reviewed and incorporated into the Draft EIS, as appropriate

Pebble Project EIS

Pebble Project EIS – Notice of Public Meetings

The Alaska District, U.S. Army Corps of Engineers (USACE) invites the public to attend public scoping meetings for the Environmental Impact Statement (EIS) analysis for the proposed Pebble Project, which would be located 17 miles west/northwest of the villages of Iliamna, Newhalen, and Nondalton, Alaska.

The EIS will analyze potential impacts from the proposed mine that would produce copper, gold, and molybdenum from the Pebble porphyry deposit. The proposed project also includes a 188-mile natural gas pipeline from the Kenai Peninsula across Cook Inlet to the Mine Site, an Amakdedori Port facility on the western shore of Cook Inlet, and an 83 mile transportation corridor that includes an 18-mile ferry crossing of Lake Iliamna.

These meetings are an opportunity for members of the public to provide comments and suggestions to help determine important issues and help define a reasonable range of alternatives to evaluate in the EIS. Please note that public scoping meetings are not public hearings. Scoping input can be submitted in person at public meetings via directly into the provided computers, handing in written comments, or speaking to a court reporter.

To learn more about scoping and the EIS, please visit the web site: www.PebbleProjectEIS.com.

STATE OF ALASKA
THIRD JUDICIAL DISTRICT

Joleesa Stepetin
being first duly sworn on oath deposes and says that he/she is a representative of the Anchorage Daily News, a daily newspaper. That said newspaper has been approved by the Third Judicial Court, Anchorage, Alaska, and it now and has been published in the English language continually as a daily newspaper in Anchorage, Alaska, and it is now and during all said time was printed in an office maintained at the aforesaid place of publication of said newspaper. That the annexed is a copy of an advertisement as it was published in regular issues (and not in supplemental form) of said newspaper on

April 15, 2018, April 16, 2018

and that such newspaper was regularly distributed to its subscribers during all of said period. That the full amount of the fee charged for the foregoing publication is not in excess of the rate charged private individuals.

Signed Joleesa Stepetin

Pebble Project EIS

Pebble Project EIS – Notice of Public Meetings

The Alaska District, U.S. Army Corps of Engineers (USACE) invites the public to attend public scoping meetings for the Environmental Impact Statement (EIS) analysis for the proposed Pebble Project, which would be located 17 miles west/northwest of the villages of Iliamna, Newhalen, and Nondalton, Alaska.

The EIS will analyze potential impacts from the proposed mine that would produce copper, gold, and molybdenum from the Pebble porphyry deposit. The proposed project also includes a 188-mile natural gas pipeline from the Kenai Peninsula across Cook Inlet to the Mine Site, an Amakdedori Port facility on the western shore of Cook Inlet, and an 83 mile transportation corridor that includes an 18-mile ferry crossing of Lake Iliamna.

These meetings are an opportunity for members of the public to provide comments and suggestions to help determine important issues and help define a reasonable range of alternatives to evaluate in the EIS. Please note that public scoping meetings are not public hearings. Scoping input can be submitted in person at public meetings via directly into the provided computers, handing in written comments, or speaking to a court reporter.

To learn more about scoping and the EIS, please visit the web site: www.PebbleProjectEIS.com.

The Alaska District, U.S. Army Corps of Engineers (USACE) invites the public to attend public scoping meetings for the Environmental Impact Statement (EIS) analysis for the Pebble Limited Partnership's proposed project, which would be located 17 miles west/northwest of the villages of Iliamna, Newhalen, and Nondalton, Alaska.

The EIS will analyze potential impacts, benefits, and alternatives from the proposed mine that would produce copper, gold, and molybdenum from the Pebble porphyry deposit. The proposed project also includes a 188-mile natural gas pipeline from the Kenai Peninsula across Cook Inlet to the Mine Site, an Amakdedori Port facility on the western shore of Cook Inlet, and an 83 mile transportation corridor that includes an 18-mile ferry crossing of Lake Iliamna.

These meetings are an opportunity for members of the public to provide comments and suggestions to help determine important issues and help define a reasonable range of alternatives to evaluate in the EIS.

To learn more about scoping and the EIS, please visit the web site: www.PebbleProjectEIS.com.

Public comments may be submitted from April 1, 2018 through April 30, 2018 in person at one of the meetings, online at www.PebbleProjectEIS.com, or mailed to Pebble EIS Program Manager, Regulatory Division, U.S. Army Corps of Engineers, P.O. Box 6898, Joint Base Elmendorf Richardson, AK 99506-0898

Please note that public scoping meetings are not public hearings. Scoping input can be submitted in person at public meetings via directly into the provided computers, handing in written comments, or speaking to a court reporter

APPENDIX D – MEETING MATERIALS

AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

THE PEBBLE PROJECT

1 OVERVIEW

Pebble Limited Partnership (PLP) is proposing to develop the Pebble copper-gold-molybdenum porphyry deposit (Pebble Deposit) in southwest Alaska as an open-pit mine, with associated infrastructure.

PROJECT DESCRIPTION DETAILS

SUMMARY INFORMATION

- Located on state of Alaska land
- Project operating life of 20 years
- Employment of 2,000 people for construction and 850 for operation
- Gas pipeline from Anchor Point and gas-fired power plant at site
- Road and lake ferry to Cook Inlet
- Segregated storage of bulk and pyritic tailings

THE pebble PARTNERSHIP

AMERICAN OVERSIGHT

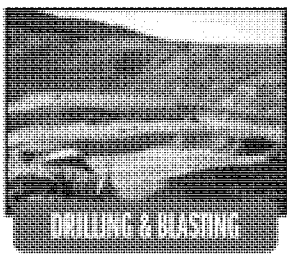
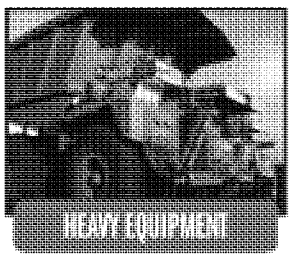
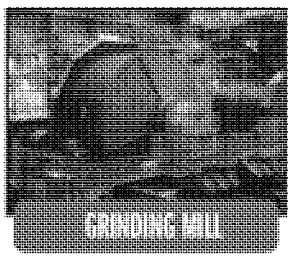
MINING & PROCESSING



2 MINING



The Project will mine approximately 1.1 billion tons of mineralized material throughout the 20-year mine life.



AN OVERVIEW OF MINERAL PROCESSING

OPEN PIT RENDERING

DRILLING & BLASTING

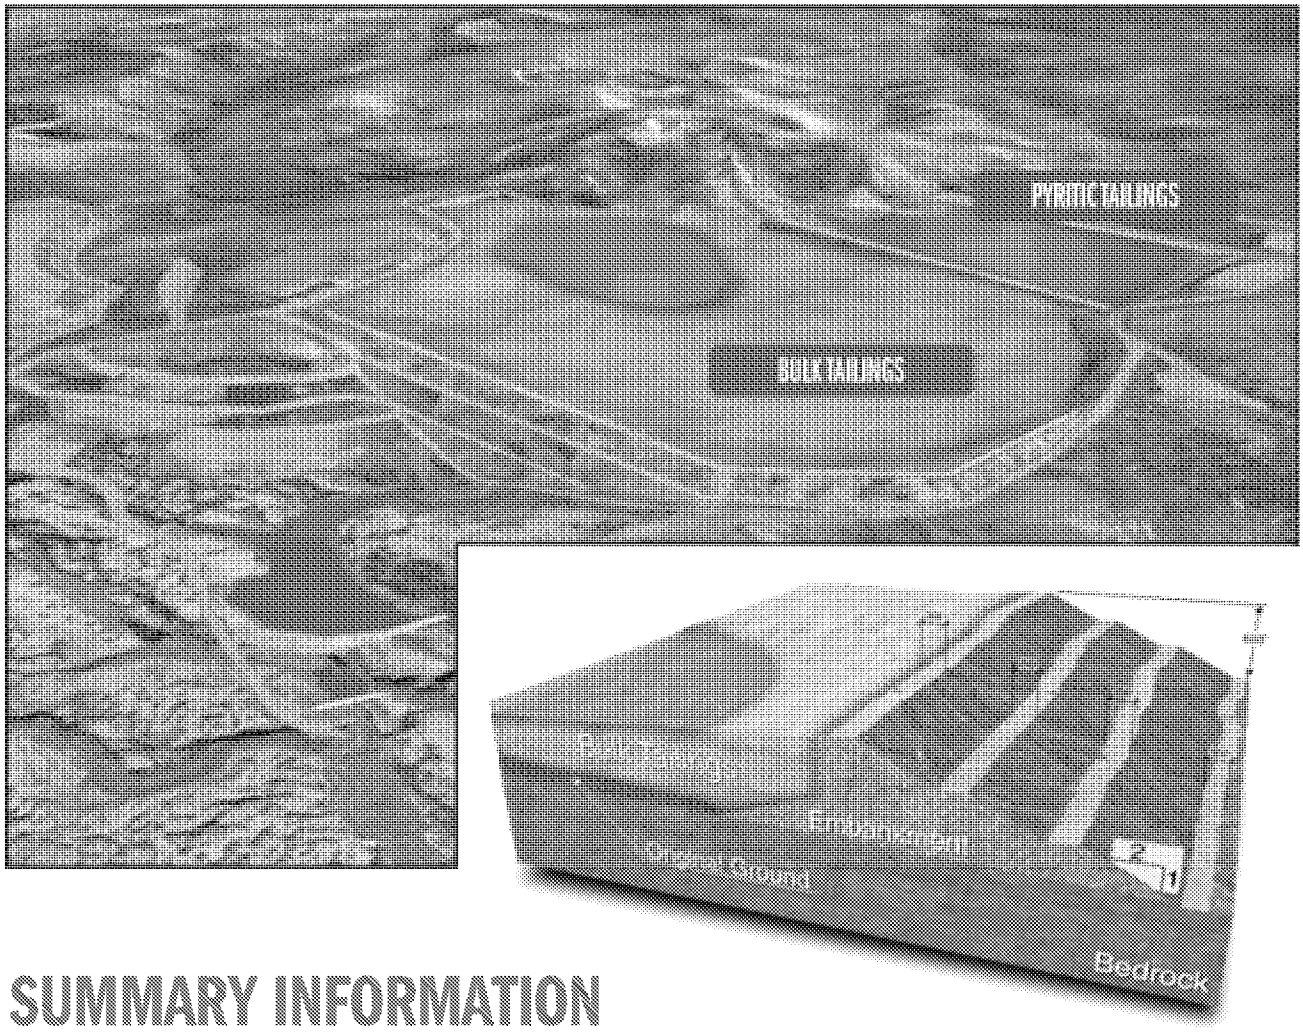
HEAVY EQUIPMENT

GRINDING MILL

SUMMARY INFORMATION

- Mining rate up to 90 million tons per year
- Milling rate up to 58 million tons per year
- Annual copper/gold concentrate production of 600,000 tons
- Annual molybdenum concentrate production of 15,000 tons

THE pebble PARTNERSHIP



AMERICAN OVERSIGHT

TAILINGS STORAGE

③ TAILINGS

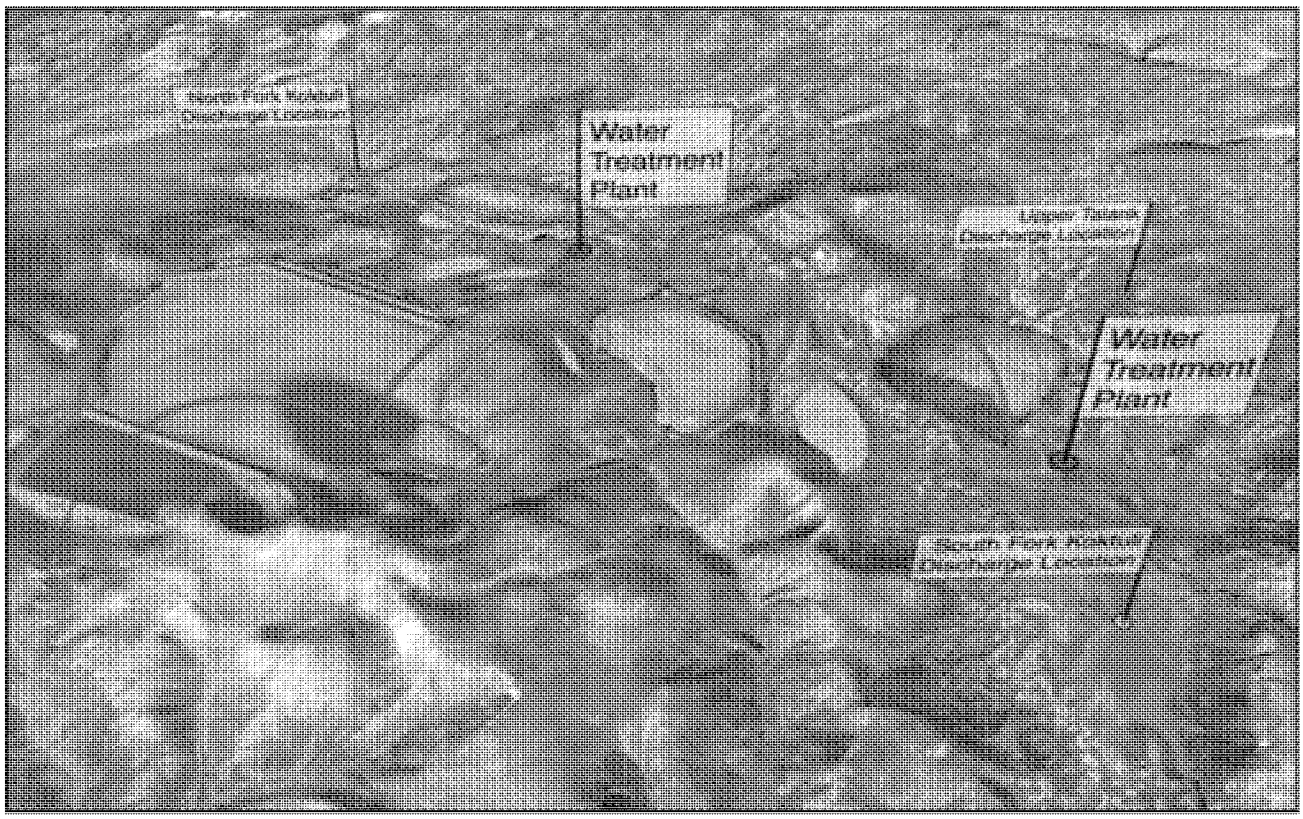
Pebble Limited Partnership (PLP) conducted a multiyear, multidisciplinary evaluation to select a Tailings Storage Facility (TSF) location that meets all engineering and environmental goals. It will store ground-up material after minerals have been extracted.

TAILINGS STORAGE FACILITY

SUMMARY INFORMATION

- Designed to meet Alaska Dam Safety Program standards
- Separate cells for bulk and pyritic tailings
- Minimize water storage in bulk tailings to keep water away from embankment
- Fully-lined cell for pyritic tailings with water cover
- Rock-filled embankments (600' high at main embankment)
- Seepage collection facilities for all embankments

THE pebble PARTNERSHIP



AMERICAN OVERSIGHT

WATER MANAGEMENT

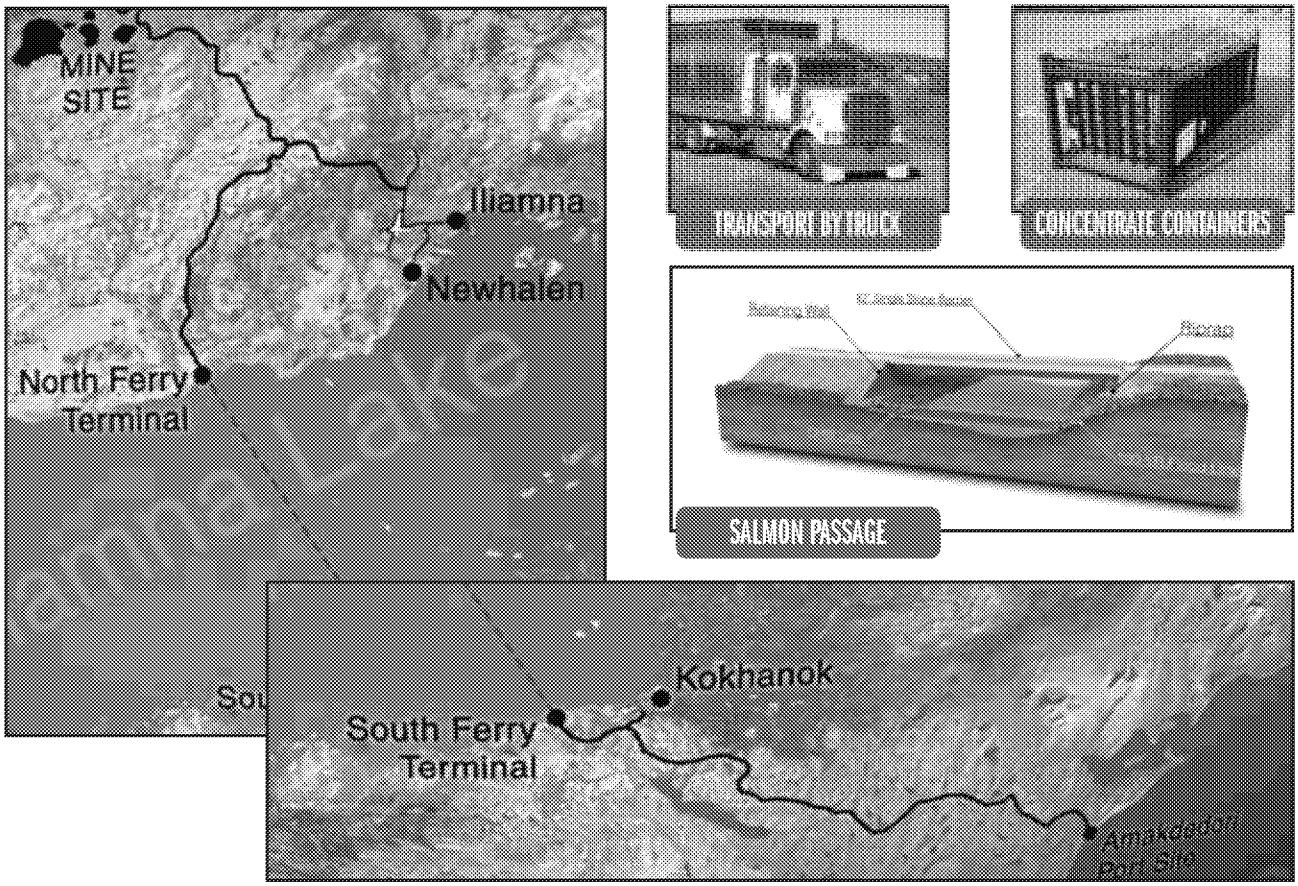
4 WATER

Pebble Limited Partnership (PLP) has designed the water management plan to minimize the volume of water diverted from natural flows and to treat and condition all water to meet quality standards before discharge.

MONITORING AND TREATMENT

SUMMARY INFORMATION

- All water is tracked and managed from rainfall to discharge
- One water treatment plant for pit-related water
- One water treatment plant for tailings, stockpile, and process contact water
- All water treated and conditioned to meet quality standards before release
- Discharge locations in each of three drainages
- No mixing zones will be required
- Discharge managed based on downstream habitat needs



THE pebble PARTNERSHIP

AMERICAN OVERSIGHT

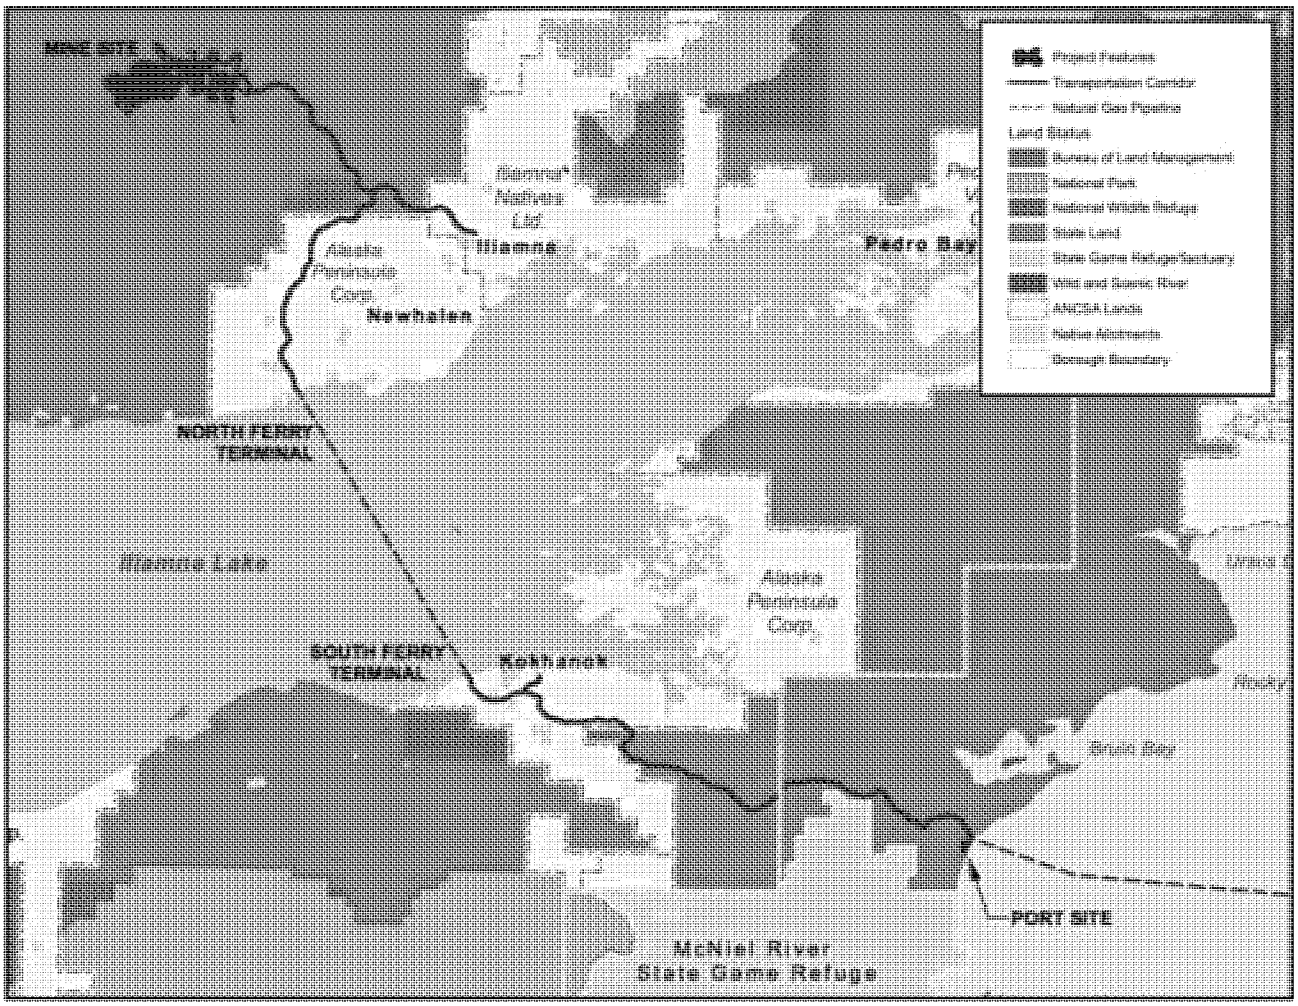
ROADS & TRANSPORT

An 83-mile transportation corridor runs from the mine site to a port site on Cook Inlet. The route was selected to minimize impact on wetlands, minimize stream crossings, and avoid area of known subsistence and recreational use.

NORTH & SOUTH ROAD SEGMENTS

SUMMARY INFORMATION

- Personnel flown to Iliamna Airport and driven to mine site
- 30-mile (north segment) and 35-mile (south segment) private roads
- Spur roads connecting to the villages of Iliamna, Newhalen, and Kokhanok
- Stream crossings designed to state of Alaska standards
- Up to 35 round trips by truck each day (one by ferry)
- Concentrate hauled in bulk containers with locking lids
- Fuel hauled in 6350-gallon sealed tank containers



THE pebble PARTNERSHIP

AMERICAN OVERSIGHT

LAND STATUS

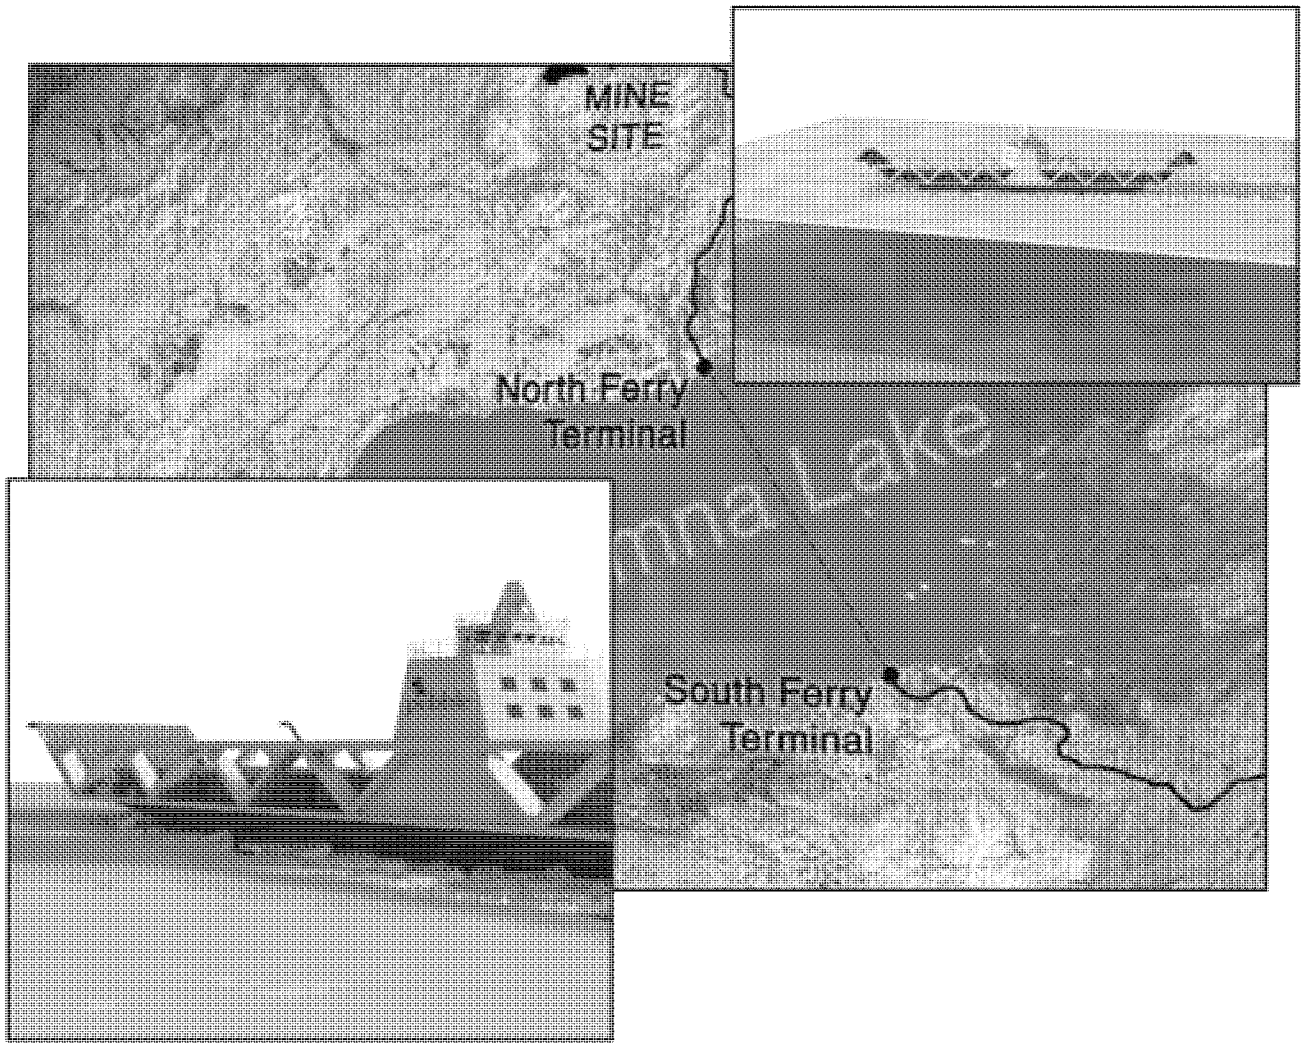
The mine site — including the pit, tailings storage, and all primary facilities — is located on state of Alaska land. The transportation corridor includes state of Alaska and ANCSA land.

MINE SITE & CORRIDOR LAND OWNERSHIP

SUMMARY INFORMATION

- Access Road = 65% state of Alaska + 35% Alaska Peninsula Corporation
- Iliamna Airport Spur = 55% state of Alaska + 45% Iliamna Natives Limited
- Iliamna Lake Crossing = 100% state of Alaska
- Kokhanok Airport Spur = 100% Alaska Peninsula Corporation

THE pebble PARTNERSHIP



AMERICAN OVERSIGHT

FERRY & TERMINALS

7 FERRY

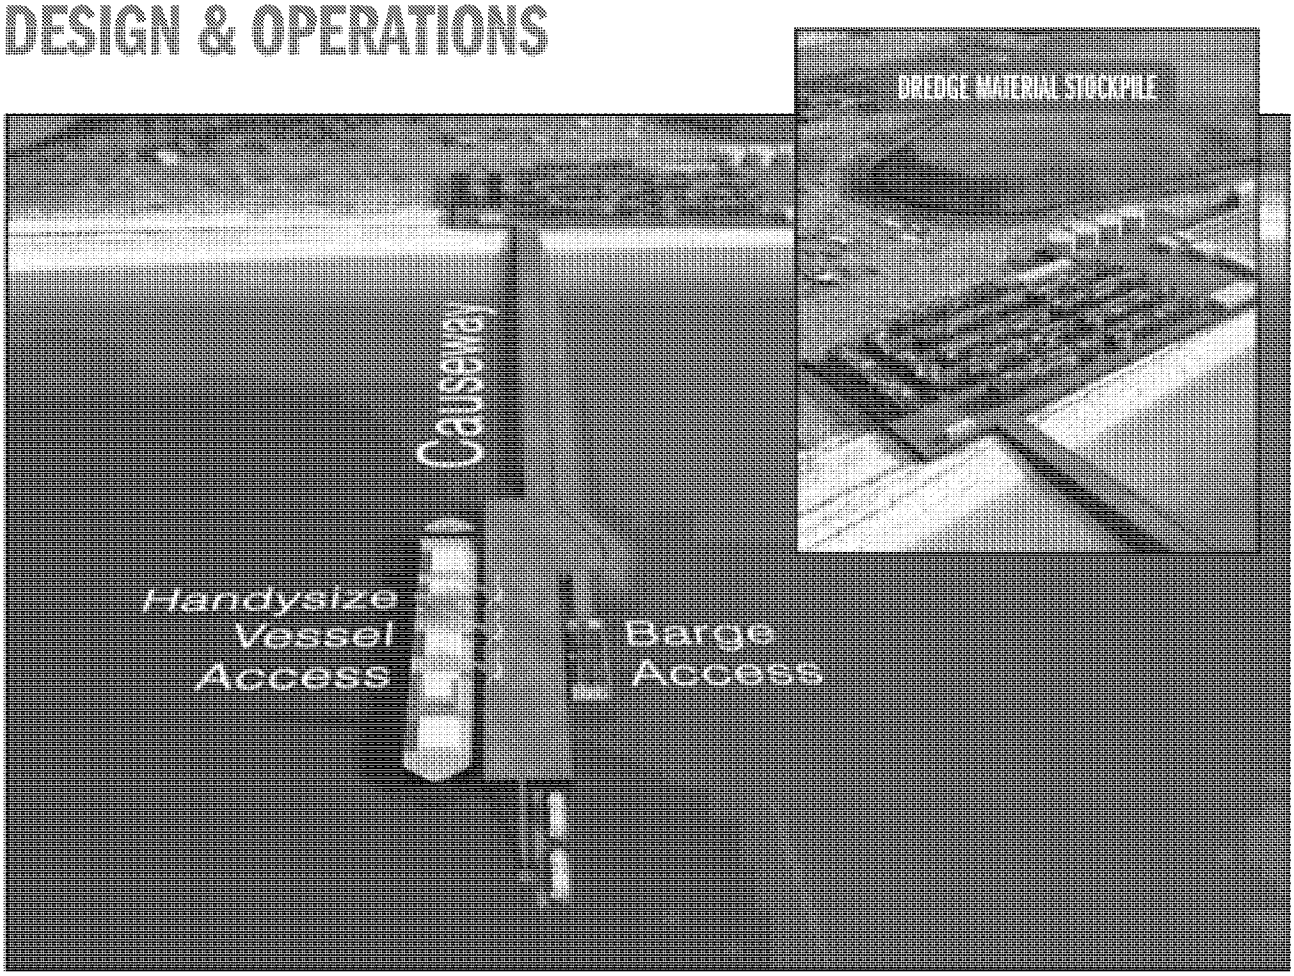
A custom-built ice breaking ferry will transit Iliamna Lake year round, carrying inbound supplies from the Amakdedori Port to the mine site and returning with copper-gold and molybdenum concentrates.

ILIAMNA LAKE CROSSING

SUMMARY INFORMATION

- The one-way ferry trip across Iliamna Lake is about 18 miles
- An average of one round trip per day will be required
- Vessel is designed to operate year-round, in all ice conditions
- Symmetrical forward and aft with two ice-breaking bows
- 12 crew members may be accommodated on the ferry

THE pebble PARTNERSHIP



AMERICAN OVERSIGHT

AMAKDEDORI PORT

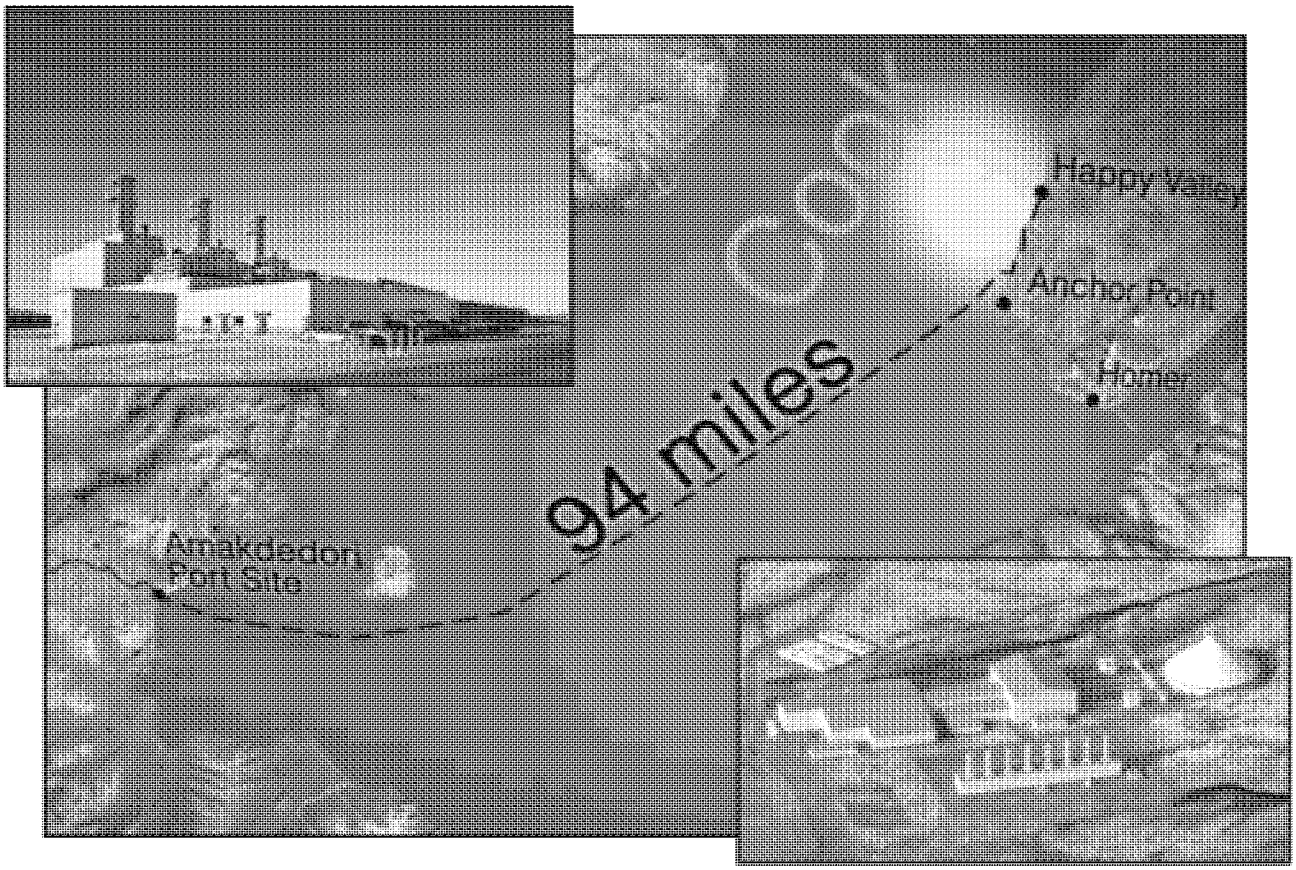
PORT

Incoming supplies such as equipment, reagents, and fuel will be barged to the Amakdedori Port and then transported by truck to the mine site.

DESIGN & OPERATIONS

SUMMARY INFORMATION

- 50-foot deep channel dredged to provide access for Handysize bulk carriers
- Mineral concentrate will be direct-loaded from the containers onto the vessels
- Equipment and supplies delivered by barge
- Shore-based facilities will receive and store containers and fuel
- Up to 25 concentrate shipments annually
- Up to 30 marine barge loads annually



THE pebble PARTNERSHIP

AMERICAN OVERSIGHT

POWER GENERATION

The power plant will be sized to meet the anticipated load of 230 megawatts using high-efficiency turbine or reciprocating engine generators operating in a combined-cycle configuration.

NATURAL GAS PIPELINE + POWER PLANT

SUMMARY INFORMATION

- Pipeline will connect to existing gas supply infrastructure near Happy Valley
- Buried pipe will transport gas to a compressor station near Anchor Point
- 94-mile subsea pipeline across Cook Inlet will come ashore near port site, follow road to site, and cross the bed of Iliamna Lake
- Gross flow rate of 50 million standard cubic feet per day
- 10" pipeline on land, 12" pipeline for water crossings
- Emergency backup power provided by diesel generators

THE pebble PARTNERSHIP

AMERICAN OVERSIGHT

CLOSURE & RECLAMATION

10 CLOSURE

Pebble Limited Partnership (PLP) is committed to conducting all mining operations, including reclamation and closure, in accordance with all local, state, and federal regulations.

PEBBLE: DESIGNED FOR CLOSURE

RECLAMATION

AFTER...

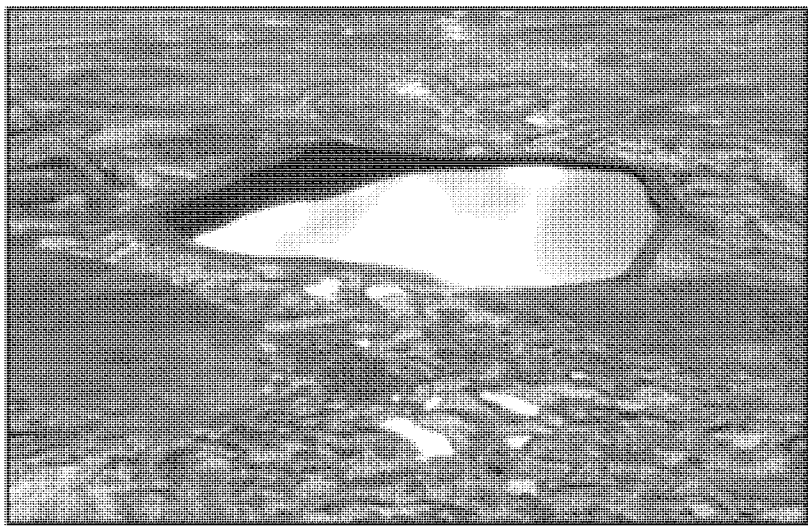
5 YEARS

Most buildings removed

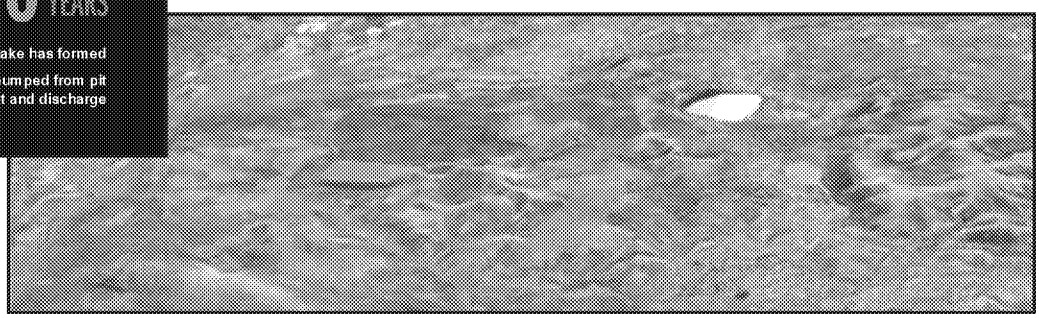
Terrain resculpted

Native plants resown

20 YEARS



Vegetation well-established in reclaimed areas



Pit continues to fill with water

30 YEARS

Pit lake has formed

Water is pumped from pit for treatment and discharge

SUMMARY INFORMATION

- Removal of mill and other facilities not used after closure
- Hauling of PAG waste rock into the open pit for under water storage
- Recontouring and placement of overburden for revegetation
- Plan and infrastructure for long term water management and treatment
- Financial assurance for closure and long term site management is required before construction

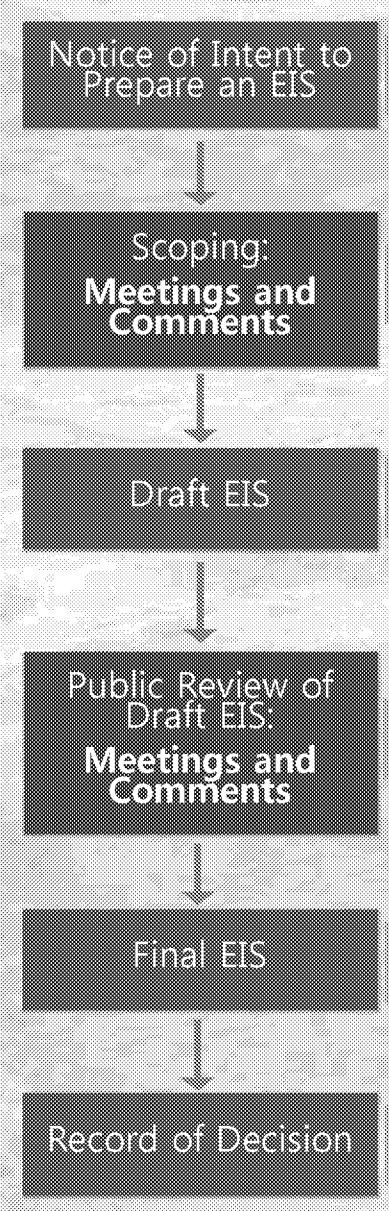
THE pebble PARTNERSHIP

AMERICAN OVERSIGHT

Tips for Writing Effective Comments

Public participation is an important part of developing an Environmental Impact Statement (EIS) under the National Environmental Policy Act (NEPA). Submitting substantive and concise comments during the scoping period is an important role the public plays in the NEPA process, and can influence the scope of analysis for the EIS.

- **Become familiar with the proposed project** — Review the project or agency website, read the project description, monitor local newspapers, and attend public meetings.
- **Learn about the steps in the NEPA process** and opportunities for submitting comments to the U.S. Army Corps of Engineers.
- **Keep your comments focused and as specific as possible** on the proposed project under consideration, what you think the EIS analysis needs to address and why.
- **Submit your comments within the timeframes announced** to ensure that your concerns are considered and addressed during the drafting of the EIS; the Scoping Comment period is from April 1 through June 29.
- **Be specific**. For example, if you are concerned about wildlife, focus on a particular problem or issue, such as a species that you feel should be analyzed, instead of making a broad statement such as "I am concerned about the impacts to wildlife."
- **Make suggestions,** including resources that should be analyzed, new data or analytic tools that should be used, and substantially different alternatives that should be evaluated in the EIS.



Comments on the project are not counted as votes; they are used to determine the appropriate scope of issues analyzed and contents of the EIS and to ensure that the impacts are adequately disclosed. Avoid simply agreeing or disagreeing with the proposed project. It is more important to identify specific relevant issues, alternatives, mitigation measures/conditions of permitting, and analytic tools so they can be used to inform the EIS analysis. The more clear, concise, and relevant your comments are, the more effective they will be in shaping the development of the EIS.

AMERICAN OVERSIGHT

The National Environmental Policy Act

Preparation of the Pebble Project Environmental Impact Statement (EIS) level of analysis began when the US Army Corps of Engineers (USACE) received a permit application from the Pebble Limited Partnership. The EIS process will take several months to complete a Draft EIS for public review, and several months to incorporate public comments into the draft to develop the Final EIS.

Steps in the EIS Process

The USACE released a Notice of Intent to the United States Federal Register. This initiated the process to prepare an EIS and began the scoping process.

The scoping process kicks off on April 1, 2018. Scoping offers a chance for the public to comment on the proposed project and alternatives.

Determining the alternatives to analyze, and then preparing the Draft EIS will happen immediately following the scoping period.

After the Draft EIS is released, the public will have a chance to submit comments. During that time, the USACE will plan public meetings to collect comments.

The USACE will assess all public comments submitted on the Draft EIS, and incorporate changes into the Final EIS before release.

The Record of Decision will lay out USACE's decision on the application submitted by the Applicant. Three decisions are possible: issue a permit, issue a permit with conditions, or denial of the application.

AMERICAN OVERSIGHT

How the Draft and Final EIS will be Organized

The Environmental Impact Statement (EIS) will analyze the potential impacts to the biological, physical, and social environments. By understanding the layout of the document ahead of time, readers can more easily find the specific sections they may be interested in reviewing and commenting on.

Executive Summary – Provides overview of the Draft and Final EIS, summarizes draft findings of potential impacts, and serves as a guide for where to find details.

Chapter 1. Purpose and Need – Describes the purpose of the proposed project to inform the range of alternatives analyzed in the EIS.

Chapter 2. Alternatives – Describes alternatives to be analyzed, including a No Action Alternative, the Proposed Action (as designed by the Pebble Limited Partnership), and reasonable and practicable alternatives to address issues raised during scoping and the EIS process, such as, but not limited to, tailings and mine water management, alternate pipeline routes, surface access to the mine site and vehicle traffic levels, and port/ferry facilities, location, and traffic levels.

The purpose and need of a project is essential in establishing a basis for developing the range of reasonable alternatives required in an EIS and identifying and selecting a preferred alternative.

Chapter 3. Affected Environment – Describes the baseline conditions of key resource topics in the proposed project environment (such as fish and wildlife, water quality, economics, food production, commercial fishing, and recreation).

Chapter 4. Environmental Consequences of Action – Analyzes the potential direct, indirect, and cumulative impacts, as well as potential mitigation measures relevant to each of the resources from the proposed action and each alternative.

Chapter 5. List of Preparers – Presents the list of contributors to the preparation of the EIS, including their affiliation, project role, educational background, and years of experience. Cooperating agency roles and responsibilities are also described in Chapter 5.

Chapter 6. List of Agencies, Organizations, and Persons to Whom copies of the Statement Have Been Sent – Describes the distribution of the Draft and Final EIS documents for informational purposes and to identify public locations where the document is available.

Chapter 7. References – Presents the references used in preparing the EIS.

Chapter 8. Appendices – Presents the in-depth analyses, comments/response to comments, coordination, consultations, mailing lists and other information used in the analysis of the applicant's project.

AMERICAN OVERSIGHT

What Resources will be Analyzed in the EIS?

Using the analysis in the Environmental Impact Statement (EIS), The U.S. Army Corps of Engineers (USACE) will evaluate the environmental and related social and economic effects of the proposed project. The analysis will include direct and indirect impacts, cumulative effects, and potential spill and tailings dam failure scenarios. Comments received during the scoping period will likely result in additional resources to be considered in the analysis.

Social Environment

- Cultural Resources
- Historic Properties
- Land use and management
- Subsistence
- Transportation and Navigation
- Aesthetics
- Recreational and Commercial Fisheries
- Recreation
- Needs and Welfare of the People
- Environmental Justice
- Health and Safety

Physical Environment

- Geohazards
- Geology
- Soils
- Surface Water Hydrology including flood plains and flood hazards
- Groundwater Hydrology
- Water Quality
- Noise
- Air Quality
- Climate Change

Biological Environment

- Wetlands/Special Aquatic Sites
- Vegetation
- Birds
- Terrestrial Wildlife
- Fisheries and Aquatic Resources
- Marine Wildlife
- Threatened and Endangered Species

Direct impacts occur through direct interaction of an activity with an environmental, social, or economic component.

For example: pollutant discharge from a source could directly result in lowered water quality.

Indirect impacts on the environment are not a direct result of the project, but often a result of a complex impact pathway.

For example: pollutants in the air from a source could land on vegetation, indirectly causing acidic soils.

Cumulative impacts occur when the incremental impact of the project is combined with the effects of other past, present and reasonably foreseeable future projects. For example: wetland fill from one projects.

For example: wetland fill from one project, combined with the wetland fill from a separate project.

AMERICAN OVERSIGHT

Roles and Responsibilities

When the Pebble Limited Partnership (Applicant) submitted an application on December 22, 2017, the US Army Corps of Engineers, Alaska District (USACE) was compelled to begin processing the permit application in accordance with 33 CFR 320. The USACE determined that review of the application would require an environmental impact statement (EIS) level of analysis in compliance with the National Environmental Policy Act. The USACE is the lead federal agency for developing the EIS.

Role of the Corps

The USACE, as the lead agency, is responsible for reviewing the permit application submitted by the applicant, and analyzing the potential environmental impacts from the proposed project. The USACE will lead the effort to take a hard look at reasonable and practicable alternatives and evaluate the impacts of the proposed project utilizing an interdisciplinary team. At the completion of the environmental impact analysis, the USACE, will issue a Record of Decision related to USACE's authorities under Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act.

Role of the 3rd Party Contractor

AECOM (a consulting firm) has been hired to provide an interdisciplinary team to develop a fact-based independent analysis of the Pebble Project as proposed and evaluate identified reasonable alternatives. AECOM will work solely under the direction of the USACE and will be the primary developers of the EIS. AECOM will also provide support to the USACE for scoping and public involvement, development of alternatives to the proposed action, assessment of potential impacts, and distribution. The AECOM team is made up of specialists and scientists in the biological environment, the physical environment, and the social environment.

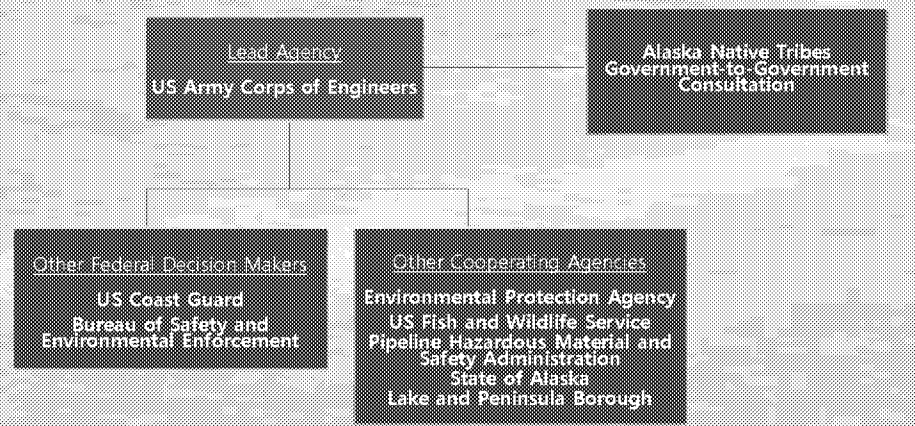
Role of Alaska Native Tribes

The USACE has invited 35 federally recognized Alaska Native Tribes to consult throughout the entirety of the federal decision making process, including the development of the environmental impact statement. Federally recognized Alaska Native Tribes that the USACE has extended government-to-government consultation invitations to are:

- Aleknagik Traditional Council
- Chignik Bay Tribal Council
- Chignik Lagoon Village Council
- Chignik Lake Traditional Council
- Clarks Point Village Council
- Curyung Tribal Council
- Egegik Village Council
- Ekuk Village Council
- Ekwok Village Council
- Igiugig Village Council
- Iliamna Village Council
- Ivanof Bay Tribal Council
- King Salmon Tribal Council
- Kokhanok Village Council
- Levelock Village Council
- Manokotak Village Council
- Naknek Village Council
- Nanwalek IRA Council
- Native Tribe of Kanatak
- Native Village of Perryville
- New Koliganek Village Council
- New Stuyahok Traditional Council
- Newhalen Tribal Council
- Ninilchik Traditional Council
- Nondalton Tribal Council
- Pedro Bay Village Council
- Pilot Point Tribal Council
- Port Graham Tribal Council
- Port Heiden Village Council
- Portage Creek Village Council
- Seldovia Village Tribal Council
- South Naknek Vilage Council
- Traditional Council of Togiak
- Twin Hills Village Council
- Ugashik Traditional Council

Role of the Applicant

As the applicant is required to provide information to the USACE related to their proposed project. This includes:



- description of the proposed project,
- background material, completed research, and site information,
- data for the development of maps and figures, and
- other information that may be identified as necessary during preparation of the EIS.

The applicant will not be involved in the development of the EIS beyond this limited scope.

Role of Cooperating Agencies

Several cooperating agencies have been invited to provide technical support to the lead agency, the USACE. Cooperating agencies will be actively engaged in scoping and alternatives development and will then be assigned to technical teams based on the specific reasons they were invited to become cooperating agencies. Although cooperating agencies are involved in preparation and writing of certain portions of the EIS and cooperators may use the EIS for their own decisions, the USACE has final authority on the EIS content.

Lead and Cooperating Agencies

AMERICAN OVERSIGHT

Public Scoping for the Pebble Project EIS

The US Army Corps of Engineers (USACE) is preparing an Environmental Impact Statement (EIS) to analyze the impacts of issuing permits for an open pit, copper-gold-molybdenum porphyry deposit, with associated infrastructure, as proposed by the Pebble Limited Partnership. The EIS scoping period begins April 1, 2018 and ends June 29, 2018.

At the beginning of developing an EIS, USACE reaches out through scoping to involve members of the public. The scoping period provides opportunities for people who could be affected by the proposed action that could have lesser environmental impacts.

In addition to Anchorage, Public meetings were held in April in the following communities:

- Naknek
- Kokhanok
- Homer
- Newhalen
- New Stuyahok
- Nondalton
- Dillingham
- Igiugig

The EIS will identify potential impacts on the physical, biological, and social environment from all phases of the proposed project, including construction, mine operation, closure, and post-closure. The EIS will also look at mitigation methods-ways in which potential negative impacts could be avoided or lessened.

During the scoping period, USACE will work with the public to identify issues and concerns to thoroughly analyze the potential effects of the proposed project. USACE will use the scientific literature, alongside traditional knowledge and observations provided by the public.

We welcome your comments and information on the resources that are important to you. For example, many communities will be concerned about potential impacts to fish, subsistence resources, and traditional land uses during project construction, operations, and closure.

To Participate...

Let us know what aspects of the proposed project are important to you!

Providing ample opportunities for the public to submit scoping comments on the Pebble Project EIS is of utmost importance to the USACE. A good way to get involved is to give your comment orally to a dedicated court reporter or electronically submit using one of the dedicated laptop computers. You can also submit hand-written comments, use the comment form on the project website (www.PebbleProjectEIS.com), or send them to:

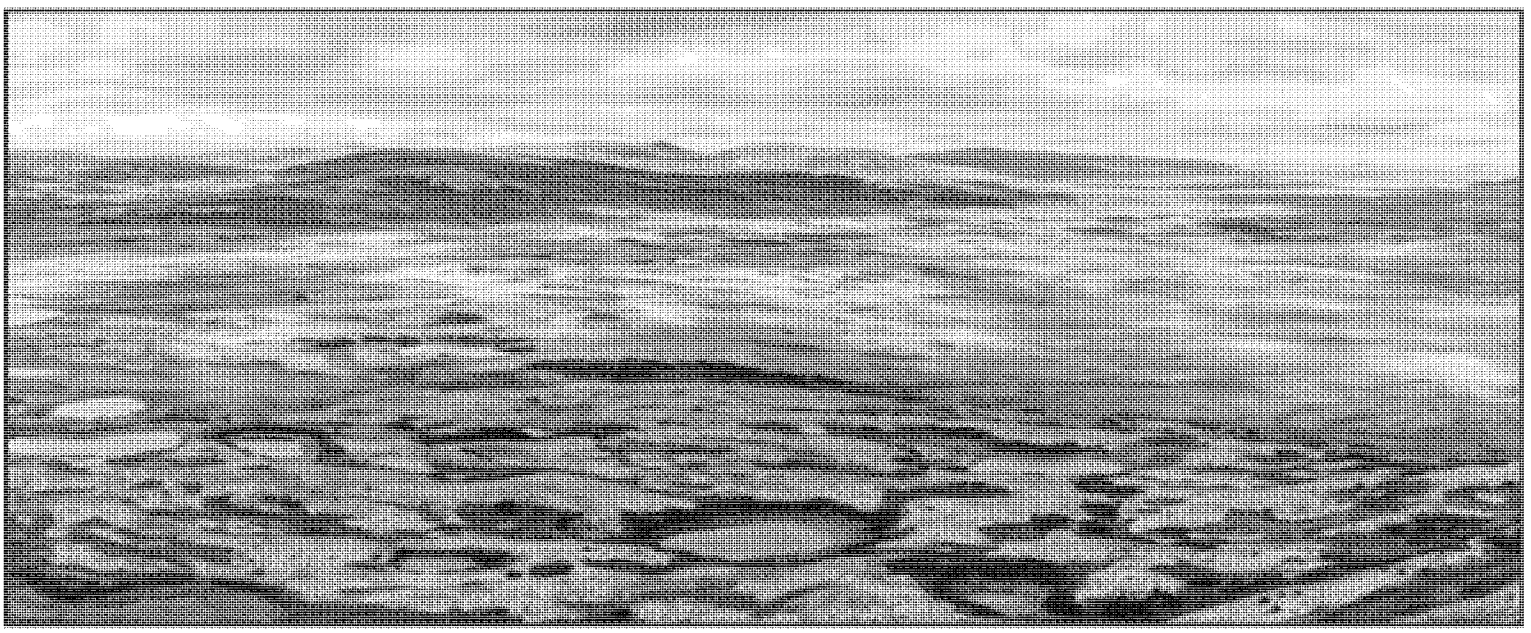
Program Manager, Regulatory Division
US Army Corps of Engineers
PO Box 6898
Joint Base Elmendorf Richardson
AK 99506-0898

Scoping comments can be submitted through June 29, 2018.

AMERICAN OVERSIGHT

Pebble Project EIS Comment Form

You can submit comments using the form on the website (www.PebbleProjectEIS.com), to a court reporter at a public scoping meeting, or in writing (using computers available at a meeting or by mail). We will not be taking public testimony at large meetings in Anchorage, Homer, and Dillingham. If you'd like to mail your comments or submit them at a meeting, please feel free to use this form and attach additional sheets as needed. Write your comments, questions, and suggestions below, then fold this page in thirds so that the mailing address is visible. Remember to affix first-class postage before putting it in the mail, postmarked by the comment deadline of June 29.



The following questions may help:

- What are your specific concerns about this project and how should they be addressed in the EIS?
- Are there particular fish and wildlife resources, subsistence activities/use areas, or other places that you use and how might they be affected by the project?
- Are there alternative ways of developing any of the components of the Pebble Project that should be considered in preparing the EIS?

Please note that all public comments, including names and addesses of of individuals and organizations, are publicaly available as part of documenting public involvement in preparing the EIS. The US Army Corps of Engineers intends to place public comments received during scoping on the project website.

FACT SHEET

Pebble Limited Partnership Project Proposed Natural Gas Pipeline

Background

The Bureau of Safety and Environmental Enforcement (BSEE) is a cooperating agency on the Environmental Impact Statement that the United States Army Corps of Engineers, Alaska District, is preparing for the Pebble Limited Partnership project.

The Pebble Limited Partnership is proposing to develop the Pebble copper-gold-molybdenum porphyry deposit as an open-pit mine, with associated infrastructure, in southwest Alaska. The proposed project infrastructure will include an approximately 230-megawatt power plant that will be fueled using natural gas. Natural gas would be supplied to the site using a roughly 190-mile pipeline that would connect to the project site from a tie-in on the Kenai Peninsula near Happy Valley.

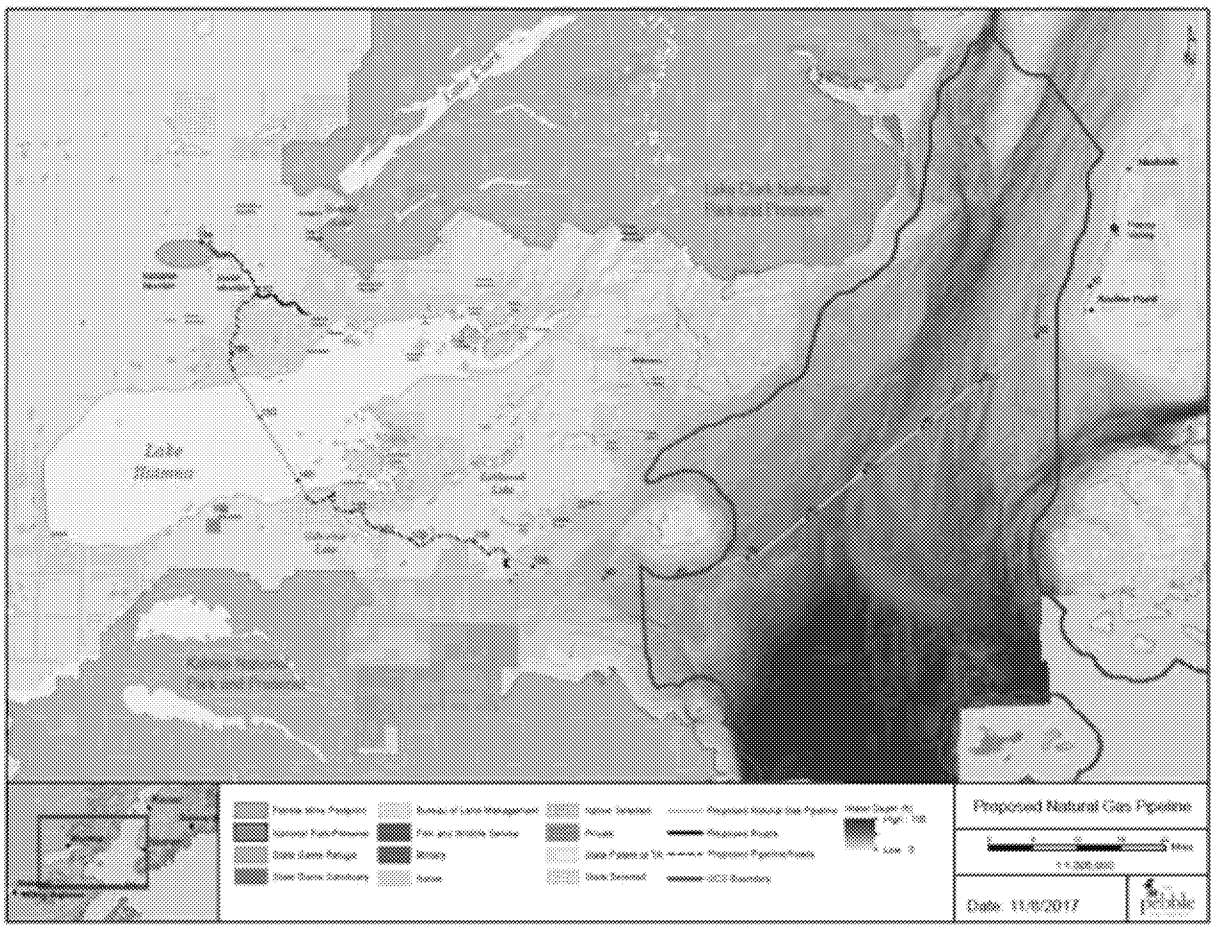
While BSEE has no regulatory oversight of onshore mining, our role will include a Pipeline Right-of-Way grant approval process for the proposed pipeline crossing federal waters of the Outer Continental Shelf in Cook Inlet.

Proposed Pipeline

The gas pipeline alignment, as currently proposed, would start near Happy Valley on the Kenai Peninsula and travel south paralleling the Sterling Highway for approximately 9 miles to a compressor station. From the compressor station, the pipeline heads southwest across Cook Inlet for 60 miles, before turning west for 35 miles to a landfall at the proposed Pebble port site near the mouth of Amakdedori Creek. A second compressor station and offtake point is located at the port site. The pipeline then follows the proposed road alignment from the port to the mine site, including crossing Iliamna Lake on the lake bed for approximately 18 miles. BSEE's jurisdiction for the proposed pipeline will likely only cover 63 miles, the portion that crosses federal waters of Cook Inlet.

The pipeline, as currently proposed, would be constructed of steel and designed to have a gross flow rate of 50 million standard cubic feet of natural gas per day. The onshore portions of the pipeline would be 10-inch diameter, while the offshore portion would be constructed using heavy wall 12-inch diameter pipe with negative buoyancy. All appropriate federal regulations would be followed in the design, construction, and operation of the pipeline.

Right-of-Way Decision Process



Pipeline right-of-way requirements for permitting are detailed in the 30 Federal Code of Regulations Part 250—Oil And Gas And Sulphur Operations In The Outer Continental Shelf Subpart J—Pipelines and Pipeline Rights-of-Way.

AMERICAN OVERSIGHT

Applications for permits must be submitted to the BSEE Regional Supervisor and will include detailed information about the right of way, including consideration of effects from water currents, storm or ice scouring, soft bottoms, mudslides, earthquakes, permafrost, and other relevant environmental factors.

While the pipeline in this case will ultimately be regulated by the U.S. Department of Transportation, Pipeline and Hazardous Materials Safety Administration, BSEE's interest is to have the requisite level of information that enables a well-informed right-of-way decision process, with the knowledge that environmental and safety factors have been considered and addressed.

Pebble Project Proposed Natural Gas Pipeline

Attached are 11 Word files and 5 PDF files, the review drafts and associated figures of:

Sec3.4/4.4 - Environmental Justice (CAs listed as ADF&G-Subsistence, ACCED, ADOL). Sec3.4 has 1 separate PDF figure.

Sec3.10/4.10/K4.10-Health and Safety (CAs listed as BSEE, PHMSA, ADHSS). Appendix K4.10 has 2 separate PDF figures.

Sec3.11/4.11/K4.11-Aesthetics (CAs listed as EPA, NPS, USACE, ADNR-DMLW, ADF&G-Wildlife Conservation, ADF&G-Sportfish). Sec3.11 has 1 separate PDF figure;

Sec3.25/4.25/K4.25-Threatened and Endangered Species (CAs listed as USACE, USFWS). Sec3.25 has 1 separate PDF figure; Sec4.25 has 2 separate PDF figures - these will be sent in a separate email.

K4.10 HEALTH AND SAFETY

As discussed in Sections 3.10 and 4.10, Health and Safety, the Alaska Department of Health and Social Services (ADHSS) (2015) defines health as "the reduction in mortality, morbidity and disability due to detectable disease or disorder and an increase in the perceived level of health." Because health is a multi-dimensional concept with physical, mental, and social aspects, the proposed project may affect aspects of health at a localized or individual level, a community level, a regional level, or a state-wide level, depending on the nature of the effect.

Human health impacts were evaluated in accordance with National Environmental Policy Act (NEPA) practice, and generally followed the ADHSS methodology. The terminology used for descriptions and rankings of health impacts in this section generally correspond to the terms and ratings used in the ADHSS Health Impact Assessment (HIA) guidance. A characteristic of this guidance is that the individual dimensions of health impacts (i.e., nature of health effect, duration, magnitude, extent, and likelihood) are each given their own descriptive terms for the estimated relative degree of occurrence; and a final consolidated health impact rating for each health metric or health effects category (HEC) is numerical (Category 1 through 4). The guidance suggests that impact ratings of 2 or higher may markedly increase or decrease illness and injury rates, and may warrant interventions, if negative (ADHSS 2015).

In accordance with NEPA practice and ADHSS (2015), the scope of this assessment is limited to affected communities "outside of the fence," (outside the mine site and other mine-related components). Accordingly, this assessment does not include a direct evaluation of the anticipated workforce safety and health issues ("inside the fence") because the project would be governed by the Occupational Safety and Health Administration (OSHA) and the Mine Safety and Health Administration (MSHA) regulations in the areas where project activities would occur. However, this assessment does consider "crossover issues" such as areas where workers are housed, or where workforce behaviors result in interactions/overlap with the affected communities.

The analysis of potential consequences to human health for the affected communities using ADHSS (2015) criteria is consistent with the principles of analysis required by NEPA. The first step is to determine the impact score, which takes into consideration four impact dimensions: severity of potential health effects (which can be positive or negative and considers the need for intervention if the impact is negative), duration, magnitude, and extent of the impact (Table K4.10 1). Each component of the impact dimension is assigned a score of 0, 1, 2, or 3 to derive the overall impact rating score.

AMERICAN OVERSIGHT

Table K4.10-1: Step 1 – Impact Dimensions

Step 1				
Impact Rating Score	**A – Health Effect (+/-)**	**B – Duration**	**C – Magnitude**	**D – Extent**
0	Effect is not perceptible	Less than 1 month	Minor	Individual cases
1	(+/-) minor benefits or risks to injury or illness patterns (no intervention needed)	Short-team: 1 to 12 months	Those impacted will: 1) be able to adapt to the impact with ease and maintain pre-impact level of health; 2) see noticeable but limited and localized improvements to health conditions.	Local: small limited impact to households
2	(+/-) moderate benefits or risks to illness or injury patterns (intervention needed, if negative)	Medium-term: 1 to 6 years	Those impacted will: 1) be able to adapt to the health impact with some difficulty and will maintain pre-impact level of health with support; or 2) experience beneficial impacts to health for specific populations; some maintenance may still be required.	Entire Potentially Affected Communities; village level
3	(+/-) severe benefits or risks: marked change in mortality and morbidity patterns (intervention needed, if negative)	Long-term: more than 6 years/life of project and beyond	Those impacted will: 1) not be able to adapt to the health impact or to maintain pre-impact level of health; or 2) see noticeable major improvements in health and overall quality of life.	Extends beyond Potentially Affected Communities; regional and state-wide levels

Next, the severity and likelihood of each type of impact is evaluated, and those ratings are used to develop an overall significance impact rating category of 1, 2, 3, or 4 (Table K4.10-2). Recommended actions for negative impacts are listed by category below:

- Category 1: Actions to reduce negative impacts are not needed.
- Category 2: Recommend that decision-makers assess whether actions to reduce negative impacts would be helpful for negative impacts.
- Category 3: Recommend that decision-makers develop and implement actions to reduce negative impacts.
- Category 4: Strongly recommend that decision-makers develop and implement actions to reduce negative impacts.

Table K4.10-2: Steps 2, 3, and 4 – Likelihood and Overall Impact Ratings

Step 2	Step 3						
Impact Severity Level (Sum Scores from Step 1 to choose range)	**Likelihood Rating**						
	Extremely Unlikely (<1%)	**Very Unlikely (1-10%)**	**Unlikely (10-33%)**	**About as likely as Not (33-66%)**	**Likely (66-90%)**	**Very Likely (90-99%)**	**Virtually Certain (>99%)**
1-3	♦	♦	♦	♦	♦♦	♦♦	♦♦

Although the framework used for the evaluation of health impacts is generally consistent with ADHSS guidance, and the data are considered sufficient for analysis in the Pebble Project Environmental Impact Statement (EIS), it is important to note that any assessment of potential impacts is subject to several types of uncertainty, as summarized below.

- Baseline data used to describe current health status and conditions vary along the spatial and temporal scales; the reported data may range from current, to several years since data were collected; some data are available at the level of individual communities, while others are regional or state-level in scale. For example, Lake and Peninsula Borough (LPB) community-level baseline data (≤ 2016) are available for leading hospitalizations by diagnosis, leading causes of non-fatal injuries, and leading causes of death (see Section 3.10, Health and Safety, HECs 2 and 7), while similar community-level data are not available for the Nushagak/Bristol Bay communities. Recent baseline data are available for these metrics and at regional or state level for other baseline data (various social determinants of health [SDH], infectious diseases, and contributing factors to chronic disease). Therefore, not all health conditions are described or evaluated at the same level of precision and timeliness.
- Health consequences related to changes in environmental conditions—such as soil quality and water quality, which can potentially lead to bioaccumulation in foods—are subject to uncertainties. Although the concentrations of chemicals in environmental media under baseline conditions may be known, future concentrations (e.g., as related to end-of-mine life and closure) are evaluated by using conservative modeling approaches that meet NEPA requirements (see Section 4.20, Air Quality; Section 4.14, Soils; and Section 4.18, Water and Sediment Quality). It is likely that these modeling approaches lead to overestimation of the potential for impacts, but do not necessarily represent "worst-case scenarios.".
