Becker: As noted earlier, a multilayered approach of laboratory testing, point-of-care diagnostics, and self-administered ("at-home") tests is critical to alleviating the testing burden and providing information on community transmission. These tests must be based in sound science and have performance data that support their use. Further, such tests should also have a reporting component, so public health agencies can determine community transmission rates and can utilize these data for public health actions.

TFAH: New monies within the federal pandemic recovery packages have been dedicated to lab building and renovation. Is it enough?

Becker: The American Rescue Plan Act has provided funding to public health laboratories for COVID-19 testing and surveillance, for expanding and sustaining a stronger workforce, for genomic sequencing and analytics, for global health security beyond just COVID-19, and for supporting the Data Modernization Initiative and more.

MS-DOH-21-1816-A-000749

While this funding is much needed and appreciated, public health laboratories have been chronically underfunded. This is a great boost, especially at a time when they need it most, but these laboratories need a consistent increase in funding to be able to keep up with changing technologies and threats. Federal funding to significantly improve public health data management operations at the state and local levels of government requires an additional $7.8 billion over the next five years, and state and local public health laboratory construction needs are likely to be around $5 billion over that same time frame.

TFAH: How does the overall modernizing of the public health data systems and the strengthening of lab systems work together?

Becker: Like many aspects of public health, the effective, efficient movement of public health data has been chronically underfunded, resulting in a fragmented and obsolete national information technology system. This issue has limited the ability of the nation's public health system to make actionable decisions. The perpetual funding issue, combined with a sharp increase in data production from new laboratory techniques, such as sequencing, have added great volumes of data to an already overburdened system.

On the positive side, Congress has allocated over $1 billion through the Coronavirus Aid, Relief, and Economic Security (CARES) Act (P.L. 116-136), the American Rescue Plan Act (P.L. 117-2), and annual appropriations to continue public health data modernization activities. Within this funding CDC received $500 million to advance surveillance and analytics infrastructure. In August 2021, CDC announced plans to use some of this funding for a forecasting center to better track emerging biological threats.

TFAH: It seems like Omicron identification is moving at a faster pace than earlier detection. Is that accurate? What accounts for the improved performance?

Becker: If you are comparing the pace with the detection of the Alpha variant (or B.1.1.7), which emerged in December 2020, then yes, the pace is faster. However, the pace with which we've detected other emerging variants like the Delta variant has been strong for many months. This is almost entirely because of the investments and improvements to genomic-sequencing capability and capacity in the U.S. public health system. Public health laboratories as well as other key laboratory partners are a critical part of the CDC-led National SARS-CoV-2 Strain Surveillance (NS3) program. In January 2021, the network was publishing between 3,000 and 5,000 sequences to public databases every week. Today, the network consistently publishes between 15,000 and 20,000 specimens per week. In November 2021 alone, 190,000 SARS-CoV-2 sequences were published across the U.S. public health system. This significant increase in capacity positions us to quickly detect emerging variants, even when circulating at low levels.

Editor's note: this interview was conducted in December 2021.

MS-DOH-21-1816-A-000750

Assessing State Preparedness

Every state needs to be prepared to respond to a variety of potential public health emergencies; such readiness requires understanding an individual state's preparedness strengths, risks, and vulnerabilities. To help states assess readiness, and to highlight a checklist of top-priority concerns and action areas, this report examines a set of 10 select indicators. The indicators, overwhelmingly consistent from year to year, draw heavily on the National Health Security Preparedness Index (NHSPI), a joint initiative of the Robert Wood Johnson Foundation, the University of Kentucky, and the University of Colorado. They capture core elements of emergency preparedness. Based on states' standing across the 10 indicators (see "Appendix B: Methodology" for scoring details) and TFAH analysis, the states were placed into three performance tiers: high, middle, and low. (See Table 3.)

Importantly, the implications of this assessment, and responsibility for continuously improving, extend beyond any one state or local agency. Such improvement typically requires sustained engagement and coordination by a broad range of policymakers and administrators. Moreover, some indicators are under the direct control of federal and state lawmakers, whereas improvement in other indicators requires multisector, statewide efforts, including by residents.

TABLE 3: State Public Health Emergency Preparedness
State performance, by scoring tier, 2021

Performance Tier	States	Number of States
High Tier	AL, CO, CT, DC, FL, IA, IL, KS, MA, MD, NJ, OH, PA, SC, UT, VA, VT, WA	17 states and DC
Middle Tier	AZ, CA, DE, GA, ID, ME, MI, MO, MS, NC, ND, NE, NH, NM, NY, OK, RI, TN, TX, WI	20 states
Low Tier	AK, AR, HI, IN, KY, LA, MN, MT, NV, OR, SD, WV, WY	13 states

Note: See "Appendix B: Methodology" for scoring details. Complete data were not available for U.S. territories.

MS-DOH-21-1816-A-000751

INDICATOR 1: ADOPTION OF NURSE LICENSURE COMPACT

KEY FINDING: 37 states participate in the Nurse Licensure Compact.

Workforce shortages can impair a state's ability to effectively manage disasters or disease outbreaks, potentially resulting in poorer health outcomes for those affected. This reality has been on display during the COVID-19 pandemic, as healthcare capacity in most parts of the country has at times been pushed to the brink amid regional waves of infections and hospitalizations. In an event like a pandemic, the ability to quickly surge qualified medical personnel by bringing in healthcare workers from out of state is a key component of healthcare readiness.

This indicator examines whether states have adopted legislation to participate in the Nurse Licensure Compact (NLC). Launched in 2000 by the National Council of State Boards of Nursing, the NLC permits registered nurses and licensed practical nurses to practice with a single multistate license—physically or remotely—in any state that has joined the compact. The NLC provides standing reciprocity, with no requirement that an emergency be formally declared.

The COVID-19 pandemic has placed extraordinary pressure on hospitals across the country when surging infections send admissions soaring, primarily among unvaccinated people. States that were members of the NLC were well positioned to bring in nurses from other member states, without harmful delays, or to send nurses to other member states that were experiencing acute shortages. "I think the COVID-19 [pandemic] is going to cause the states that are not in the compact now to really take a second look at it," said NLC Director Jim Puente in June 2020. "If the NLC was expanded to all 50 states, none of the guesswork with emergency orders would be necessary because nurses could travel to other states where they are needed. No applications, fees, or background checks would be necessary."[45]

As of November 2021, 37 states had adopted the NLC, with Ohio, Pennsylvania, and Vermont being the most recent adopters.[46] This was a net increase of 11 since 2017.

When Lisa M. Boscola, a state senator in Pennsylvania who represents a district bordering Allentown's east side,[47] first learned of the NLC, she recalls contacting her staff immediately and saying, "get bills introduced ASAP."[48] Sen. Boscola believes "the pandemic has only shown us more proof as to why we need these compacts in the medical field." As she puts it: "As the country several times saw geographic swells with positive COVID cases and surges, the nurses and doctors nationally were able to respond to this. If the Northeast was struggling and the Midwest was not, then thousands and thousands of doctors and nurses came to the Northeast to help in the response. And when that changed in the other direction, we were able to send physicians and nurses to the areas of greater impact. In our state, because we were not in the nurse compact, the governor had to issue emergency waivers to permit out-of-state licensed nurses and doctors to come in and help with the surges."

Noah Logan of the Pennsylvania State Nurses Association agrees. "COVID definitely had a huge impact on us," he says. "We needed to be able to move nurses around quickly. All the things that were going through the nurses' minds in March, April, and May [2020]; those were rough months. Having to deal with the hassle of licensing, especially during that time, was an unneeded stressor."[49]

MS-DOH-21-1816-A-000752

TABLE 4: 37 States Participate in the Nurse Licensure Compact

Participants and nonparticipants, 2021

Participants			Nonparticipants	
Alabama	Maine	Pennsylvania	Alaska	Michigan
Arizona	Maryland	South Carolina	California	Minnesota
Arkansas	Mississippi	South Dakota	Connecticut	Nevada
Colorado	Missouri	Tennessee	District of Columbia	New York
Delaware	Montana	Texas	Hawaii	Oregon
Florida	Nebraska	Utah	Illinois	Rhode Island
Georgia	New Hampshire	Vermont	Massachusetts	Washington
Idaho	New Jersey	Virginia		
Indiana	New Mexico	West Virginia		
Iowa	North Carolina	Wisconsin		
Kansas	North Dakota	Wyoming		
Kentucky	Ohio			
Louisiana	Oklahoma			

Note: Ohio, Pennsylvania, and Vermont joined the NLC in 2021. Ohio's and Vermont's planned implementation dates are January 1, 2023, and February 1, 2022, respectively. Pennsylvania had not set a date for implementation as of November 2021.

MS-DOH-21-1816-A-000753

INDICATOR 2: COMPREHENSIVE PUBLIC HEALTH SYSTEMS

KEY FINDING: Only about half of the U.S. population—a state average of 45 percent—is served by a comprehensive public health system. Comprehensive public health systems have been shown to contribute cost-effectively to residents' health and safety. At the state level, in 2018, the share of residents served by such a system ranged from more than two-thirds in the District of Columbia (86 percent), New York (77 percent), Arizona (67 percent), and Pennsylvania (67 percent) to fewer than one-third in Arkansas (31 percent), South Dakota (28 percent), and Indiana (25 percent).

The 2022 edition of the Ready or Not *report introduces a new indicator, measuring the percentage of state populations served by a comprehensive public health system, based on survey responses from a representative sample of local health departments. This new indicator replaces a previous indicator tracking the percentage of hospitals participating in healthcare coalitions. The move to this new indicator was made because (1) The National Health Security Preparedness Index (NHSPI) has not recently updated data on coalition participation (NHSPI provides data for several indictors used in this report), and (2) public health system comprehensiveness is a proven measure of a jurisdiction's overall health outcomes and public health emergency preparedness.*

Since 1998, a team of researchers who are now part of Systems for Action, a joint initiative of the Robert Wood Johnson Foundation and the Colorado School of Public Health, have periodically administered the National Longitudinal Survey of Public Health Systems to a nationally representative cohort of U.S. communities.[51] Through the survey, they estimate the percentage of the U.S. population who reside in communities with a comprehensive public health system, defined as a place in which "a broad array of the recommended public health activities are available in the community, AND in which a relatively broad range of organizations contribute to implementing these activities, AND/OR in which the local public health agency contributes [a] relatively large share of the effort to implement these activities."[52]

The survey asks local public health officials whether their agencies or community partners:[53]

1. Conduct community needs assessments that systematically describe the prevailing health status in the community.
2. Survey the population for behavioral risk factors.
3. Conduct on an ongoing basis timely investigations of adverse health events, including communicable disease outbreaks and environmental health hazards.
4. Make necessary laboratory services available to support investigations of adverse health events and meet routine diagnostic and surveillance needs.
5. Complete periodic analyses of the determinants of and contributing factors to priority health needs, the adequacy of existing health resources, and the population groups most effected.
6. Complete periodic analyses of age-specific participation in preventive and screening services.
7. Cultivate a network of support and communication relationships that includes health-related organizations, the media, and the general public.
8. Make formal efforts at least annually to inform public officials about the potential public health impact of decisions under their consideration.
9. Periodically prioritize community health needs based on a community needs assessment.
10. Implement community health initiatives that are consistent with priorities established from a community health needs assessment.
11. Develop and periodically update a community health action plan with community participation to address community health needs.
12. Develop and periodically update plans to allocate resources in a manner consistent with community health action plans.
13. Deploy resources as necessary to address priority health needs identified in the community health needs assessment.

MS-DOH-21-1816-A-000754

14. Periodically conduct an organizational assessment of the public health agency.

15. Address age-specific priority health needs through the provision of or linkage to appropriate services.

16. Regularly evaluate the effects of public health services on community health status.

17. Regularly use professionally recognized process and outcome measures to monitor public health programs and to redirect resources as appropriate.

18. Regularly make public information about current health status, health care needs, health behaviors, and health care policy issues.

19. Regularly report to media on health issues affecting the community.

20. Implement mandated public health programs or services as required by state or local law, ordinance, or regulation.

For each activity, surveyors ask respondents how well the measure is being performed (five-point Likert scale), the proportion of effort contributed by the local public health agency, and which types of other organizations (state health agency; other federal, state, or local agencies; faith-based organizations; hospitals; health insurers; employers/business groups; physician practices; community health centers; other nonprofits; k-12 schools; colleges/universities; tribal organizations; or others) are also involved, among other questions. It also asks how respondents would rate their agencies' effectiveness at assuring the conditions in which their residents can be healthy, and how they would rate the overall health of their jurisdictions' people.[54]

The researchers aggregate respondents' answers to determine whether a comprehensive public health system is serving a jurisdiction; that is, one in which there is high availability of recommended activities, a high level of organizational contributions, and/or a high level of local health agency effort. There is evidence that when localities improve from having a noncomprehensive system to a comprehensive one, they enjoy significant reductions in premature mortality rates from potentially preventable conditions, such as infant mortality, cardiovascular disease, diabetes, and cancer.[55] Moreover, these places tend to be more cost-effective, using relatively fewer resources despite supporting a broader array of public health activities.[56]

Since 1998, when the survey began, the estimated percentage of U.S. residents who are served by a comprehensive public health system has increased markedly, from 25 percent[57] to 49 percent in 2020.[58] Still, the survey documented much of that improvement during its early years, as the percentage hasn't increased since 2006.[59] In 2018, the latest year for which state-level estimates were available, the states where a comprehensive public health system served the greatest percentage of residents were the District of Columbia (86 percent), New York (77 percent), Arizona (67 percent), and Pennsylvania (67 percent), compared with Indiana (25 percent), South Dakota (28 percent), and Arkansas (31 percent). (No data were available for Hawaii and Rhode Island.)

This wide range demonstrates that the capacities of a person's local health department, a meaningful contributor to one's health and safety, depends significantly on where the person lives. Of note, there seems to be a persistent and expanding gap between rural and urban jurisdictions, with rural areas providing fewer recommended public health activities and engaging narrower networks of partners compared with their urban counterparts.[60] Researchers suggest that these disparities are due to several factors, including rural departments having relatively lower levels of funding and staffing, as well as marketplace and policy dynamics such as a greater prevalence of hospital closures and health insurer consolidations in rural areas and greater health insurance coverage gains recently in urban areas.

TABLE 5: Only About Half of the U.S. Population Has a Comprehensive Public Health System

Percent population served by a comprehensive public health system, 2018

States	Percent of Residents
DC	86%
NY	77%
AZ, PA	67%
MA	63%
AK	62%
CA	59%
NV, UT	55%
FL, WA	49%
IL, MN, NJ	47%
MI	46%
ME, VT, WV	45%
CO, LA, NC, NE, SC, VA	44%
GA, MD, MO	43%
DE, OR, WI	42%
ID, OK	39%
IA, KS, NH, TX	38%
CT, KY, NM, OH	37%
MT, TN, WY	36%
AL, MS	35%
ND	34%
AR	31%
SD	28%
IN	25%

Note: No data were available for Hawaii or Rhode Island. The District of Columbia's value was imputed by Systems for Action.

MS-DOH-21-1816-A-000755

INDICATORS 3 AND 4: ACCREDITATION

KEY FINDING: Most states are accredited by one or both of two well-regarded bodies—the Public Health Accreditation Board and the Emergency Management Accreditation Program—but eight are not accredited by either.

The Public Health Accreditation Board (PHAB), a nonprofit organization that administers the national public health accreditation program, advances quality within public health departments by providing a framework and a set of evidence-based standards against which they can measure their performance. Among standards with direct relevance to emergency preparedness are assurances of laboratory, epidemiologic, and environmental expertise to investigate and contain serious public health problems, policies, and procedures for urgent communications, and maintenance of an all-hazards emergency operations plan.[62] Through the process of accreditation, health departments identify their strengths and weaknesses, increase their accountability and transparency, and improve their management processes, which all promote continuous quality improvement.[63]

Emergency management, as defined by the Emergency Management Accreditation Program (EMAP), encompasses all organizations in a given jurisdiction with emergency or disaster functions, which may include prevention, mitigation, preparedness, response, and recovery. The EMAP helps applicants ensure—through self-assessment, documentation, and peer review—that they meet national standards for emergency response capabilities.[64]

The PHAB and the EMAP each provide important mechanisms for improving evaluation and accountability. Accreditation and reaccreditation by these entities demonstrate that a state's public health and emergency management systems are capable of effectively responding to a range of health threats. The priority capabilities that the PHAB and the EMAP test include identification, investigation, and mitigation of health hazards; a robust and competent workforce; incident, resource, and logistics management; and communications and community-engagement plans.[65,66] States sometimes aim to meet applicable standards but do not pursue accreditation.

As of November 2021, 32 states and the District of Columbia were accredited by both the PHAB and the EMAP—a net increase of three since December 2020. South Carolina and Virginia joined this group after gaining accreditation from the PHAB; Maryland rejoined the group after being reaccredited by the EMAP; Washington joined after receiving its first accreditation from EMAP; New Mexico's EMAP accreditation lapsed. Indiana is now accredited by the PHAB, alongside an additional nine states that have received accreditation from just one of the two. (See Table 6.)

After receiving accreditation from the PHAB in February 2021, Dr. Edward Simmer, MD, MPH, DFAPA, the director of the South Carolina Department of Health and Environmental Control (DHEC), said, "At a time in our nation's history when public health has been thrusted into the spotlight, DHEC hopes that achieving national accreditation will help reaffirm our commitment to putting people and their needs first."[67] PHAB President and CEO Paul Kuehnert, DNP, RN, FAAN, said of the achievement: "People living and working in communities served by these health departments can be assured that their health department is strong and has the capacity to protect and promote their health. Just going through the accreditation process itself helps health departments pinpoint the areas that are critical to improving the work they do for their communities."

MS-DOH-21-1816-A-000756

Just eight states (Alaska, Hawaii, Kentucky, New Hampshire, South Dakota, Texas, West Virginia, and Wyoming) received no accreditation from either body. A state without an accreditation has not necessarily been denied; the state may not have pursued one or may still be in the process of seeking accreditation. It is also important to note that this analysis includes state-level accreditation only. It does not include local or tribal health departments that may be accredited.

TABLE 6: 42 States and the District of Columbia Accredited by the PHAB and/or EMAP
Accreditation status by state, November 2021

PHAB and EMAP			PHAB only	EMAP only	No Accreditation
Alabama	Illinois	North Dakota	Indiana	Michigan	Alaska
Arizona	Iowa	Ohio	Maine	Nevada	Hawaii
Arkansas	Kansas	Oklahoma	Minnesota	North Carolina	Kentucky
California	Louisiana	Pennsylvania	Montana	Tennessee	New Hampshire
Colorado	Maryland	Rhode Island	New Mexico		South Dakota
Connecticut	Massachusetts	South Carolina	Oregon		Texas
Delaware	Mississippi	Utah			West Virginia
District of Columbia	Missouri	Vermont			Wyoming
Florida	Nebraska	Virginia			
Georgia	New Jersey	Washington			
Idaho	New York	Wisconsin			
32 states + DC			**6 states**	**4 states**	**8 states**

Note: These indicators track accreditation by the PHAB and the EMAP. TFAH classified states with conditional or pending accreditation at the time of data collection as having no accreditation. States sometimes aim to meet applicable standards but do not pursue accreditation. This analysis includes state-level accreditations only, it does not include accredited local or tribal health departments. In some instances, local public health departments have an accreditation in states that do not.

Sources: PHAB[68] and EMAP.[69]

MS-DOH-21-1816-A-000757

INDICATOR 5: STATE PUBLIC HEALTH FUNDING TRENDS

Key Finding: A majority of states held their public health funding steady or increased it in FY 2021, but at least 15 reduced funding. (Data were not available for five states.)

The COVID-19 pandemic showed how sufficient and sustained funding for a comprehensive public health system is integral to preparedness and response, including the ability to detect, prevent, and control disease outbreaks and mitigate the health consequences of disasters. General public health capabilities—such as those pertaining to epidemiology, environmental hazard detection and control, infectious disease prevention and control, and risk communications—and targeted emergency response resources are necessary to ensure that officials maintain routine capabilities and that surge capacity is readily available for emergencies. A trained and standing-ready public health workforce, and one that knows its community, is critical to the surge capacity that is so often necessary during an emergency.

According to the Public Health Activities and Services Tracking project at the University of Washington, state public health programming and services span six core areas:[70]

1. **Communicable disease control.** Public health services related to communicable disease epidemiology, hepatitis, HIV/AIDS, immunization, sexually transmitted diseases, tuberculosis, etc.
2. **Chronic disease prevention.** Public health services related to asthma, cancer, cardiovascular disease, diabetes, obesity, tobacco use, etc.
3. **Injury prevention.** Public health services related to firearms, motor vehicles, occupational injuries, senior fall prevention, substance-use disorder, other intentional and unintentional injuries, etc.
4. **Environmental public health.** Public health services related to air and water quality, fish and shellfish, food safety, hazardous substances and sites, lead, onsite wastewater, solid and hazardous waste, zoonotic diseases, etc.
5. **Maternal, child, and family health.** Public health services related to the coordination of services; direct service; family planning; newborn screening; population-based maternal, child, and family health; supplemental nutrition; etc.
6. **Access to and linkage with clinical care.** Public health services related to beneficiary eligibility determination, provider or facility licensing, etc.

The overall infrastructure of public health supports states' ability to promote health equity, build resilience in the population, and carry out emergency response activities. But public health funding is typically discretionary, making it vulnerable to neglect or retrenchment, especially when times are tight. This can undermine emergency preparedness activities and weaken response and recovery efforts. State investment in public health is important for the operations of health agencies: about 28 percent of state and territorial health department revenues are from state sources,[71] while 21 percent of local health department revenue is from state sources, on average.[72]

Fortunately, at least 30 states and the District of Columbia maintained or increased public health funding in FY 2021. (See Table 7.) But at least 15 states reduced the money they directed to these vital activities, increasing the likelihood that they will be less prepared and less responsive in the moments that

MS-DOH-21-1816-A-000758

matter most. (This indicator does not assess the adequacy of states' public health funding. It should also be noted that due to inflation and population growth, stable funding is in some cases a funding reduction.)

From FY 2019 to FY 2020, and again from FY 2020 to FY 2021, some states experienced sizeable fluctuations in the state-supported funding allotted to public health services, owing to a host of pandemic-related funding actions. For example, in some cases, a temporary infusion of state-supported funds might have been appropriated for just one year. In other cases, state-supported funding might have been temporarily cut and replaced by pandemic-related federal aid. Importantly, states are asked to report to TFAH only their state-supported funding.

TABLE 7: State Public Health Funding Held Stable or Increased in at Least 30 States and DC

Public health funding, by state, FY 2020 to 2021

State	Percentage Change
Alabama	12%
Alaska	-58%
Arizona	-36%
Arkansas	-6%
California	-49%
Colorado	1%
Connecticut	7%
Delaware	Not reported
District of Columbia	3%
Florida	1%
Georgia	12%
Hawaii	-4%
Idaho	-3%
Illinois	3%
Indiana	3%
Iowa	9%
Kansas	Not reported
Kentucky	-17%
Louisiana	58%
Maine	32%
Maryland	1%
Massachusetts	8%
Michigan	10%
Minnesota	-14%
Mississippi	-1%
Missouri	-7%
Montana	-2%
Nebraska	-1%
Nevada	13%
New Hampshire	4%
New Jersey	4%
New Mexico	6%
New York	7%
North Carolina	-1%
North Dakota	0%
Ohio	20%
Oklahoma	168%
Oregon	2%
Pennsylvania	15%
Rhode Island	Not reported
South Carolina	0%
South Dakota	4%
Tennessee	28%
Texas	10%
Utah	Not reported
Vermont	7%
Virginia	7%
Washington	88%
West Virginia	Not reported
Wisconsin	-1%
Wyoming	-5%

Note: In Alaska, at the beginning of the COVID-19 pandemic, the state established a dedicated supplemental fund for related activities, as necessary. As federal aid became available, it supplanted the state funds, creating the appearance of a major reduction in FY 2021. In New Jersey, the end of FY 2020 was extended by three months and the beginning of FY 2021 was delayed by three months.

Because of differences in organizational responsibilities and budgeting, funding data are not necessarily comparable across states. Owing to the significant and persistent demands on the time of state public health officials that responding to the COVID-19 pandemic has necessitated, five states (Delaware, Kansas, Rhode Island, Utah, and West Virginia) were unable to provide TFAH with public health funding data for FY 2021.

See "Appendix B: Methodology" for a description of TFAH's data-collection process, including its definition of public health funding.

Source: TFAH analysis of states' publicly available funding data.

MS-DOH-21-1816-A-000759

INDICATOR 6: COMMUNITY WATER SYSTEM SAFETY

KEY FINDING: Few Americans drink from community water systems that are in violation of applicable health-based standards required by the Safe Drinking Water Act. But room for improvement remains.

Access to safe water is essential for consumption, sanitation, hygiene, and the efficient operation of the healthcare system and other critical infrastructure. In the United States, the vast majority of the population gets water from a public water system,[73] and the U.S. Environmental Protection Agency (EPA) sets legal limits on contaminants in drinking water, including microorganisms, disinfectants, and their byproducts, other chemicals, and radionuclides.[74] The EPA also requires states to periodically report drinking-water quality information from public water systems in their jurisdictions.[75] Water systems must report any violations, such as failing to follow established monitoring and reporting schedules, failing to comply with mandated treatment techniques, violating any maximum contaminant levels, and failing to meet customer-notification requirements.[76]

The United States has one of the safest public drinking-water supplies in the world, but some communities, particularly low-income communities, do not have constant access to safe water. When water safety issues occur, it can require a multisector emergency response, as well as a long-term public health response. The most prominent water-contamination crisis in recent years occurred in Flint, Michigan, where a 2014 change in water source caused distribution pipes to corrode and to leach lead and other contaminants into the drinking water. Tens of thousands of residents, including young children, were exposed to high levels of lead and other contaminants.[77] In 2019, residents of Newark, New Jersey, had to rely on bottled water due to high levels of lead in their tap water, though nearly all of the city's 23,000 lead service lines have since been replaced with pipes, and in July 2021 the state enacted laws requiring public water systems to inventory and replace lead service lines within 10 years.[78,79] In children, even low levels of lead exposure can damage the nervous system and contribute to developmental delays, learning disabilities, and weight and hearing loss.[80] These incidents could have long-term consequences on the health and brain development of children, as well as the mental health and trust of the community.

As climate change contributes to more frequent wildfires, a residual danger is the release of toxic chemicals into community water systems. For example, months after the deadly Camp Fire in Paradise, California, in 2018, experts still advised residents not to drink or cook with the water due to concerns about benzene contamination.[81,82] Long-term exposure to unsafe levels of benzene can lead to numerous adverse health outcomes, including anemia and excessive bleeding, and can impair the immune system. Exposure to high levels increases the risk for leukemia.[83]

Major storms, which are made more frequent and more intense by climate change,[84] can damage water infrastructure and lead to power outages, sometimes causing potable water to become inaccessible or tainted. When Hurricane Ida devastated coastal Louisiana in August 2021, pumps and treatment plants serving hundreds of thousands of residents were left without power.[85] In Jefferson Parish to the west and south of New Orleans, the state's second-largest parish,[86] most residents either had dry taps or were under boil advisories. Power outages are a particular concern in rural areas where smaller utilities may not have enough

backup power to meet the demands of the water and sewage services. Water shortages can have a particularly dire impact on healthcare systems, which rely on clean water for many procedures and hygiene practices.

Other water-related hazards in the United States include harmful algal blooms that cause algal toxins and the emerging presence of per- and polyfluoroalkyl substances (PFAS) from industrial chemicals.[87]

CDC data indicate waterborne pathogens cause nearly 7,000 deaths, 7 million illnesses, and more than $3 billion in healthcare costs each year. The risks from contaminated drinking water disproportionately threaten communities of color, highlighting the impact that structural racism can have on a critical resource most Americans consider a basic service. In some areas, redlining has kept peri-urban communities of color, tribal lands, and rural agricultural areas out of municipal water systems, thereby increasing their potential exposure to waterborne illness. In addition, older buildings are more vulnerable to waterborne pathogens in their pipes.[88]

Encouragingly, the federal Infrastructure Investment and Jobs Act, enacted in November 2021, took several significant steps toward expanding access to safe drinking water. Among its provisions were $24 billion in grants to states under the existing Clean Water Act (focused on regulating pollution and protecting surface water quality[89]) and the Safe Drinking Water Act (focused on protecting waters actually or potentially designed for drinking[90]); $15 billion to replace lead pipes and service lines; $9 billion to address emerging contaminants (PFAS); and a number of initiatives to provide dedicated assistance to small, disadvantaged, low-income, rural, and/or tribal communities.[91,92]

According to the EPA, across the nation, 5 percent of state residents on average used a community water system in 2019 (the most recent year for which data were available) that failed to meet all applicable health-based standards, down from 7 percent in 2018.[93] That share was actually or effectively 0 percent in Hawaii, Maryland, Minnesota, Nevada, North Dakota, Vermont, and Washington. (See Table 8.) But in four states (New Jersey, New York, Oregon, and West Virginia), more than 15 percent of residents used a community water system with health-based violations.

It is also important to note that approximately 13 million U.S. households get their drinking water from private wells. The data reported by this indicator do not include water quality for those households.[94]

TABLE 8: Few Americans Used Contaminated Community Water Systems

Percent of state populations who used a community water system in violation of health-based standards, 2019

States	Percent of Population
HI, MD, MN, ND, NV, VT, WA	0%
CA, ID, IL, IN, ME, OH	1%
AL, CO, DE, MI, NC, NE, NH, WY	2%
CT, FL, SC, VA	3%
AK, IA, KY, RI, SD, TN, TX,	4%
AZ, DC, KS, UT, WI	5%
NM	6%
GA, MA	7%
AR, MS, MT	8%
MO, PA	9%
LA	13%
OK	15%
NJ, OR, WV	16%
NY	45%

Note: The EPA estimates that more than 13 million U.S. households get their drinking water from private wells.[95] The data reported by this indicator do not reflect the water quality of those households, though they are included in population percentage calculations. Only regulated contaminants are measured. These data do not include water safety on Indian reservations. According to health officials in New York, a drinking-water system in New York City is in violation due to an uncovered reservoir, but it has no current violations with respect to contaminants.

MS-DOH-21-1816-A-000761

INDICATOR 7: USE OF PAID TIME OFF

KEY FINDING: Just over half of workers in states, on average, used some type of paid time off—sick leave, vacation, holidays—in a one-month sample. Most states were closely clustered to that midpoint, with few outliers.

Note: The specification of this indicator has been adjusted slightly in recent years from a measure of those who received paid time off to a measure of those who used it. Additionally, these figures reflect a one-month snapshot, intended to show relative usage across states, not a measure of the total percentage of workers who used paid time off during the entire year.

The need for paid time off has been evident during the pandemic, as frontline and essential workers—people whose jobs do not permit them to work remotely—have often been compelled to work when sick themselves, caring for a sick family member, or experiencing temporary side effects immediately after vaccination. Black and Hispanic workers typically have less access to paid sick leave and are overrepresented in groups of frontline workers.[97]

When workers without paid leave get sick, they face the choice of going to work and potentially infecting others or staying home and losing pay—or even their jobs. They encounter similarly impossible decisions when a child or another dependent family member gets sick. Therefore, access and the ability to use job-protected paid time off, especially dedicated paid sick leave, can strengthen infection control and resilience in communities by reducing the spread of contagious diseases and bolstering workers' financial security. This is particularly important for industries and occupations that require frequent contact with the public. For example, people working in the food-service, older adult and nursing care facilities, and childcare industries commonly have no paid sick leave.[98] Low-wage workers[99] and workers of color are also less likely to have access to paid leave compared with white and higher-earning workers.[100] This often leads employees to work throughout an illness or return to work before their symptoms have fully subsided, when time off could have dramatically reduced the potential of workplace infections.[101,102]

The public health benefit is clear: at a societal level, flu rates have been shown to be lower in cities and states that mandate paid sick leave.[103,104] When employees who previously did not have access are granted paid or unpaid sick leave, rates of flu infections decrease.[105]

Paid time off also increases access to preventive care among workers and their families, including routine checkups, screenings, and immunizations. Delaying or skipping such care can result in poor health outcomes and can ultimately lead to costlier treatments. Workers without paid sick days are less likely to get a flu shot, and their children are less likely to receive routine checkups, dental care, and flu shots.[106]

During the COVID-19 pandemic, studies have shown that access to paid sick leave helped slow the spread of the virus.[107] The Families First Coronavirus Response Act, enacted in March 2020, helped temporarily address this issue for employers with fewer than 500 employees and certain public employers, temporarily requiring employees to be provided with paid sick leave under certain conditions. This helped reduce the spread of the virus in workplaces and communities by removing a barrier to employees staying home when necessary. However, these protections expired on December 31, 2020, despite the ongoing need for the use of paid leave to control the pandemic; instead, Congress provided a tax credit for qualifying employers

MS-DOH-21-1816-A-000762

to offer paid sick leave from January 1, 2021, to September 30, 2021.[108,109] State and local paid leave laws helped fill in some of the gap, but most states and localities do not have them.[110]

Importantly, the United States could join numerous countries across the world in establishing a national minimum standard of paid family or medical leave if the Build Back Better Act, which the U.S. House of Representatives passed in November 2021, becomes law. The Act includes a requirement that, starting in 2024, employers provide four weeks of partially paid leave to employees who need time off after the birth of a child, to recover from a serious illness, or to care for a family member.[111,112]

In March 2020, 55 percent of all workers in states, on average, took some type of paid time off—the same percentage as in March 2019 and March 2018—according to the Current Population Survey, which is sponsored jointly by the U.S. Census Bureau and the U.S. Bureau of Labor Statistics.[113] Alaska (63 percent), Iowa (62 percent), Mississippi (65 percent), Oregon (61 percent), and Texas (65 percent) stood out as states where relatively high percentages of workers used such benefits, whereas fewer workers used them in Arkansas (48 percent), Kentucky (49 percent), Pennsylvania (47 percent), South Dakota (44 percent), and Wyoming (47 percent).[114] (See Table 9.)

TABLE 9: 55 Percent of Workers, On Average, Used Paid Time Off
Percent of employed population that took paid time off, March 2020

States	Percent of Workers
MS, TX	**65%**
AK	**63%**
IA	**62%**
OR	**61%**
DC, MA, NY	**60%**

SD	**44%**

Note: Paid time off includes sick leave, vacations, and holidays. The data are measured based on a survey of a sample of the general population. The specification of this indicator has been adjusted slightly from a measure of those who received paid time off to a measure of those who used it. Additionally, these figures reflect a one-month snapshot, intended to show relative usage across states, not a measure of the total percentage of workers who used paid time off during the entire year.

Source: NHSPI analysis of data from the Annual Social and Economic Supplement of the Current Population Survey.[115]

MS-DOH-21-1816-A-000763

INDICATOR 8: FLU VACCINATION RATE

KEY FINDING: Flu vaccination coverage held at a relatively high level for the second consecutive year during the 2020–2021 season, with an especially high rate for older adults. Overall, 52 percent of U.S. residents ages 6 months and older received vaccinations—still well below the overall target level of 70 percent of the population vaccinated annually.

CDC recommends that, with few exceptions, everyone ages 6 months and older get vaccinated for seasonal influenza annually; yet, year after year, even with a steady increase among adults over the past three decades,[116] coverage estimates indicate that just over half of Americans do. *Healthy People 2030* set federal 10-year benchmarks for improving the health of all Americans, including an overall seasonal influenza vaccination-rate target of 70 percent annually.[117]

Vaccination is the long-standing best prevention against the seasonal flu, particularly for people at high risk of severe flu-related outcomes, including people with certain chronic health conditions and older adults, groups that are also at higher risk from COVID-19. In addition to protecting Americans from the seasonal flu, establishing a cultural norm of vaccination, building vaccination infrastructure, and establishing policies that support vaccinations can all help prevent or limit other illnesses for which there is a vaccine, including COVID-19. A major concern as the 2020–2021 flu season opened was that a high incidence of seasonal flu coupled with the amount of illness caused by the pandemic would overwhelm health systems. Fortunately, that scenario was avoided, as COVID-related mitigation measures also helped to tamp down transmission of seasonal flu,[118] but experts fear that the 2021–2022 season could be worse, in part because of looser mitigation measures and the dominance of a particularly virulent strain.[119,120]

Under the Affordable Care Act, all routine vaccines recommended by the Advisory Committee on Immunization

MS-DOH-21-1816-A-000764

Practices, including flu vaccines, are fully covered when provided by in-network providers, except in states that have not expanded their Medicaid programs in accordance with the law. Some barriers to flu vaccination may include a belief that the vaccine does not work very well; misconceptions about the safety of the vaccine;[121] or a belief that the flu does not carry serious risks.[122]

There are a number of policy options available to states and localities seeking to increase vaccination levels. To help increase access, states can expand the number of qualified healthcare workers who can administer vaccines. There is evidence, for example, that pharmacists can play a key role in facilitating broader access and controlling epidemics and their costly consequences.[123] States and localities can also target residents at high-risk (e.g., people in long-term care facilities, older adults, young children, and people with chronic conditions) and promote vaccination through public information campaigns.[124]

According to the National Conference of State Legislatures, states have recently taken creative steps to broaden the scope of qualified vaccine administrators. For example, Indiana recently began allowing pharmacy technicians to administer flu vaccines, and New Hampshire and West Virginia permit qualified pharmacy interns to do so. Ohio even allows podiatrists to administer flu vaccines. Virginia requires certified long-term care facilities to provide or arrange for vaccination for their residents, and New Mexico requires hospitals to offer the influenza vaccine to patients over 65 on discharge.

During the 2020–2021 flu season, 52 percent of U.S. residents ages 6 months and older were vaccinated, according to CDC, tying the 2019–2020 season for the highest rate in at least a decade. This was a notable and welcome uptick from 42 percent during the 2017–2018 flu season. Massachusetts (67 percent), Rhode Island (66 percent), and Connecticut (62 percent) had the highest coverage, while vaccination rates were lowest in Florida (42 percent), Mississippi (42 percent), Wyoming (43 percent), Nevada (43 percent), and Georgia (43 percent). (See Table 10.)

Children, particularly young children, were more likely to receive vaccinations than were adults. Nearly 59 percent of those ages 6 months to 17 years received flu vaccinations in 2020–2021, compared with 50 percent of adults. The most highly vaccinated age group was people ages 65 or over at 75 percent.[125]

TABLE 10: Just Over Half of U.S. Residents Received a Seasonal Flu Vaccination
States' seasonal flu vaccination rates for people ages 6 months and older, 2020–2021

State	Vaccination Rate, Ages 6 Months or Older
Massachusetts	66.5
Rhode Island	66.4
Connecticut	62.3
New Hampshire	60.7
Vermont	59.9
Nebraska	58.7
Maryland	58.5
Pennsylvania	58.5
Iowa	58.4
Delaware	58.3

MS-DOH-21-1816-A-00765

INDICATOR 9: PATIENT SAFETY IN HOSPITALS

KEY FINDING: On average, 28 percent of hospitals received an "A" grade in the fall 2021 hospital safety assessment administered by the Leapfrog Group, a nonprofit advocate for safety, quality, and transparency in hospitals.

Every year, hundreds of thousands of people die from hospital errors, injuries, accidents, and infections, collectively making such incidents a leading cause of death in the United States.[127,128] Keeping hospital patients safe from preventable harm is an important element of preparedness; those hospitals that excel in safety are less likely to cause or contribute to a public health emergency and are better positioned to handle any emergencies that put routine quality standards to the test.

During the COVID-19 pandemic, hospitals, were one of numerous settings for viral transmission, threatening the safety of patients, staff, and visitors. The pandemic also discouraged people in need of urgent or emergency care from going to the emergency department, likely contributing to overall excess mortality.[129] Universal masking and availability and proper use of personal protective equipment (PPE)—in addition to other steps, such as adequate ventilation, limiting the sharing of patient rooms, and universal hand hygiene—proved to be critical in preventing outbreaks in hospitals. Still, hospital crowding from regional waves of infection during the pandemic has been shown to contribute to adverse outcomes, such as increased medical errors and reduced quality of care as well as delays in treatment, medication error, longer patient stays, poorer outcomes, and increased mortality.[130]

The Leapfrog Group calculates its hospital safety score by using more than two dozen evidence-based metrics that measure the success of healthcare processes and outcomes. The measures track such issues as healthcare-associated infection rates, the number of available beds and qualified staff in intensive-care units, patients' assessments of staff communications and responsiveness, and a hospital's overall culture of error prevention.[131] These measures are especially critical for health systems' readiness for emergencies and outbreak prevention and control, which include workforce training and availability, surge capacity, and infection-control practices.

In the Leapfrog Group's fall 2021 assessment, 28 percent of general acute-care hospitals across the United States, on average, met the requirements for an "A" grade—a slight decrease from fall 2020, when the share was 31 percent. But results varied widely from state to state, with no hospitals in Delaware, the District of Columbia, and North Dakota receiving the top score, to a majority of hospitals doing so in Virginia (56 percent), North Carolina (55 percent), Idaho (54 percent), and Massachusetts (52 percent). (See Table 11.)

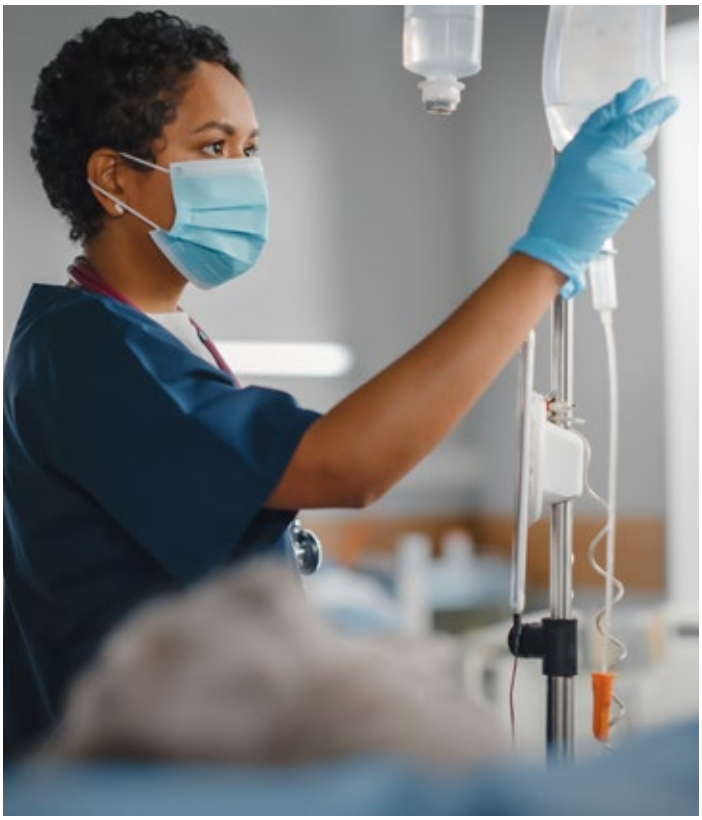

TABLE 11: Hospital Patient Safety Scores Vary Significantly by State

MS-DOH-21-1816-A-000767

INDICATOR 10: STATE PUBLIC HEALTH LABORATORY SURGE CAPACITY

KEY FINDING: Only the District of Columbia reported not having a plan in 2021 for a six-to-eight week surge in laboratory-testing capacity to respond to an outbreak or other public health event.

Public health laboratories have been essential to emergency response and effective disease surveillance systems throughout the pandemic. They help detect and diagnose health threats as they emerge, and they track and monitor the spread of those threats, which can help public health officials learn how to control them. Public health labs exist in every state and territory and are the backbone of the Laboratory Response Network (LRN), a national network of laboratories that provide the infrastructure and capacity to respond to public health emergencies.[133]

When a disaster or disease outbreak strikes, public health laboratories must be able to surge to meet increased demand, just like hospitals and other responders. The Association of Public Health Laboratories defines internal surge capacity as a "sudden and sustained increase in the volume of testing that a LRN reference laboratory can perform in an emergency situation, implementing substantial operational changes as defined in laboratory emergency response plans and using all resources available within the laboratory."[134] Surging capacity can require staff movement or reassignment, extra shifts, and hiring. Labs also have to plan for infrastructure factors, such as sufficient biological safety cabinets and chemical fume hoods; amount and type of supplies; space for intake, processing, and storage of samples; versatility and capacity of analytical equipment and instruments; availability of PPE; and power supply.[135] It should also be noted that while the existence of surge plans are important, these plans have to be funded, tested, and regularly updated.

State public health laboratories have been critical assets throughout the COVID-19 pandemic, especially in early 2020, when they were the only laboratories outside CDC authorized to conduct testing.[136] Despite early challenges in the tests rolled out to states, at least one public health laboratory in every state, DC, Puerto Rico, and Guam was able to test for COVID-19 as of June 2020.[137] Testing capacity increased over time, as private labs received authorization and ramped up capacity, and as a variety of rapid antigen tests were manufactured and approved for use at home; but the processing of CDC's 2019-nCoV Real-Time RT-PCR Diagnostic Panel assisted officials with monitoring throughout the course of the pandemic.

In Minnesota, for instance, once officials recognized in spring 2020 that their normal sample receiving area would not be able to handle the exploding number of COVID-19-related specimens on top of added social distancing and other safety restrictions, they converted the state's training laboratory into a triage unit. In days, leaders held walk-through meetings to organize the space, collaborated with state technology staff to procure necessary equipment, and set up supplies (racks, proper waste bins, transport containers). The site was up and running as the state's primary public COVID-19 testing facility within two weeks.[138]

In addition, public health laboratories are studying the genomic sequencing of the COVID-19 virus to identify variants. Such genomic surveillance is critical to understanding and preventing the

MS-DOH-21-1816-A-000768

spread of the virus,[139] and proved critical during the emergence of the Delta and Omicron variants, which were each more transmissible than earlier strains.[140] Throughout 2021, the scale of sequencing increased dramatically from fewer than 3,000 samples per week in January to about 80,000 samples per week by early December,[141] an increase that coincided with a $2 billion increase in federal investments, much of which was made possible by the American Rescue Plan Act.[142,143] However, the slow rollout of data modernization funding, the need to update these systems after years of underfunding, and a dwindling public health workforce continued to hamper rapid surveillance efforts at the end of 2021.[144]

Going forward, challenges to the effectiveness of public health laboratory preparedness include funding gaps to invest in infrastructure and modernization; a lack of standardized platforms to exchange data electronically; a limited ability to detect radiological, nuclear, and chemical threats; and perhaps most significantly, workforce shortages.[145] California, for example, has long been losing public health lab staff—as of November 2021, the state operated 29 labs, down from nearly 40 before the Great Recession—and this trend has accelerated over the past year as lab workers join a broader exodus of experienced public health officials.[146,147]

In 2021, the District of Columbia was the only jurisdiction that reported to the Association of Public Health Laboratories that it did not have a plan for a six- to eight-week surge in testing capacity. (See Table 12.) Massachusetts and Oklahoma did not indicate whether they had such a plan, though each reported having one in 2020.[148] The District of Columbia reported being in the process of developing a discrete plan for its laboratory surge capacity.

MS-DOH-21-1816-A-000769

TABLE 12: Nearly Every State Planned for a Laboratory Surge

State public health laboratories with a plan for a six- to eight-week surge in testing capacity, 2021

Had a Plan			No Plan
Alabama	Kentucky	North Dakota	District of Columbia
Alaska	Louisiana	Ohio	
Arkansas	Maine	Oregon	
Arizona	Maryland	Pennsylvania	
California	Michigan	Rhode Island	
Colorado	Minnesota	South Carolina	
Connecticut	Mississippi	South Dakota	
Delaware	Missouri	Tennessee	
Florida	Montana	Texas	
Georgia	Nebraska	Utah	
Hawaii	Nevada	Vermont	
Idaho	New Hampshire	Virginia	
Illinois	New Jersey	Washington	
Indiana	New Mexico	West Virginia	
Iowa	New York	Wisconsin	
Kansas	North Carolina	Wyoming	

Note: Massachusetts and Oklahoma did not indicate whether they had a plan, though each reported having one in 2020. The District of Columbia reported not having a current plan, indicating that it was in the process of updating its Continuity of Operations Plans and developing a discrete plan for laboratory surges. This indicator tracks only the existence of a plan, not its quality or comprehensiveness, or the frequency in which it is used or tested.

Only regulated contaminants are measured. Paid time off includes sick leave, vacations, and holidays. The patient safety measure captures only general acute-care hospitals. Data were not available in 2021 to verify the existence of a laboratory surge plan in Massachusetts or Oklahoma, so a response of "yes" was imputed for both, given that each had a plan in 2020. While the District of Columbia reported having a plan in 2020, it indicated that in 2021 it was in the process of replacing it.

MS-DOH-21-1816-A-00772

Recommendations for Federal and State Policy Actions

The nation's struggle to emerge from the COVID-19 pandemic is a reminder of the need for urgent action to prepare for the next public health emergency. Policymakers must recognize and address the lessons of the pandemic through science-based leadership and investment in equity-based health security for all communities. Without significant and sustained attention to the nation's preparedness and response capabilities, Americans will enter the next public health crisis with the same lack of readiness they experienced during the early stages of the COVID-19 pandemic.

TFAH based the following policy recommendations on research and analysis, consultation with experts, and a review of gaps in federal and state preparedness, and makes the following recommendations for federal, state, local, tribal, and territorial policymakers and other stakeholders to improve public health emergency readiness. They are intended to strengthen the nation's preparedness for possible future pandemics and to build a stronger foundation on which to respond to a range of public health emergencies.

Priority Area 1: Provide Stable, Flexible, and Sufficient Funding for Domestic and Global Public Health Security

The chronic underfunding of the nation's public health capacity at all levels has had deadly consequences. On top of over 900,000 lives lost in the United States alone, the pandemic has contributed to a disproportionate health, economic, and mental health toll on people of color, low-income people, people with disabilities, LGBTQ people, and other underserved groups.[150] Health departments have never received the funding needed to modernize, address health inequities, and prepare for emerging health threats. The Staffing Up project estimates an additional 90,000 full-time equivalent positions—an 80 percent increase—are needed in state and local health departments to comprise an adequate infrastructure and provide minimum public health services.[151] And disinvestment in health departments is often the most severe in places with larger populations of people of color.[152] Finally, short-term investments made through COVID-response funding legislation cannot fill the gaps left by ongoing public health funding shortfalls. Short-term resources do not allow for sustaining the public health workforce, nor can they address underlying health inequities that are making the nation less resilient.

MS-DOH-21-1816-A-000773

RECOMMENDATIONS FOR FEDERAL GOVERNMENT:

- **Rebuild and modernize the public health infrastructure, including by investing $4.5 billion per year to support foundational public health capabilities at the federal, state, tribal, local, and territorial levels.** The chronic underfunding of public health, combined with siloed funding tied to specific diseases and categories, has prevented health departments across the country from developing and maintaining strong foundational capabilities. Congress should invest in cross-cutting public health capacities, such as those proposed in the Public Health Infrastructure Saves Lives Act.[153] While mandatory funding would ensure sustainability and predictability, if that is not feasible, Congress should provide a robust annual investment in public health infrastructure through the appropriations process.

- **Increase funding for Public Health Emergency Preparedness and Hospital Preparedness Programs (HPP).** Funding for the Public Health Emergency Preparedness cooperative agreement, a critical source of funding for health departments to build capabilities to effectively respond to a range of public health threats, has been cut by nearly a third since FY 2003, or by about half, after adjusting for inflation.[154] The HPP, the primary federal source of funding to help the healthcare delivery system prepare for and respond to disasters, has been cut by nearly half over the same time period, or by nearly two-thirds, after adjusting for inflation. These state and local preparedness programs have demonstrated their value by establishing a foundation for national healthcare readiness, improving the speed and quality of response during emergencies, promoting a focus on patient outcomes during emergencies, and ensuring that local authorities can adequately respond to most local health emergencies and outbreaks without federal assistance. Congress should provide additional funding to modernize public health and response functions at CDC and ASPR and ensure the programs have the capacity to respond to any event.

- **Invest in continuous public health data modernization.** Sustained investment in public health data systems at the federal, state, and local levels is imperative. CDC is the world's premier public health agency, yet years of inadequate funding has meant that the agency and the public health partners that it supports are reliant on archaic data systems. Americans have felt the pain of delayed and disjointed disease surveillance throughout the pandemic, as the public health surveillance infrastructure relied on antiquated, disconnected, and slow systems and methods for tracking and responding to diseases. Congress has begun investing in public health data through the Coronavirus Aid, Relief, and Economic Security Act (P.L. 116-136), the American Rescue Plan Act (P.L. 117-2), and annual appropriations. These investments will help build the foundations for data sharing across public health, modernize CDC's services and systems, leverage new data sources, and ensure public health can act on innovative data analytics. However, these advancements must be augmented and sustained, making up for decades of neglect. Congress should build on these initial investments with at least $250 million per year to CDC's data modernization initiative to modernize and sustain these systems.

- **Ensure complete, disaggregated demographic data collection and reporting, especially during public health emergencies.** The gaps in COVID-19 data reporting by race, ethnicity, income, sexual identity, gender identity, primary language, disability status, pregnancy status, the intersections of these demographics, and other factors hindered the response and masked the true breadth of inequities during the pandemic. These gaps exposed long-standing shortcomings in demographic data collection and reporting in healthcare and public health. Consistent data on demographics and social determinants that influence health outcomes would enable a more effective, equitable response to public health emergencies. In addition to continued investment in data modernization, when implementing this initiative, CDC and public health departments should ensure that health equity and demographic data collection are central to these efforts, including prioritizing funding for under-resourced communities and ensuring sustained community engagement in decisions around public health data system design and use.[155] In addition, the U.S. Department of Health and Human Services (HHS) should stand up a task force—including but not limited to, Office of the Assistant Secretary for Planning and Evaluation, CDC, Office of the National Coordinator on Health Information Technology, Office of Minority Health, Centers for Medicare & Medicaid Services (CMS), the Substance Abuse and Mental Health Services Administration, and the Agency for Healthcare Research and Quality, in consultation with state, local, territorial,

MS-DOH-21-1816-A-00774

and tribal agencies, community leaders, and private-sector stakeholders—to identify and address barriers to the collection and regular reporting of disaggregated, detailed demographic data during the pandemic and beyond. If needed, Congress should provide HHS agencies the authority to require jurisdictions and healthcare facilities to report race and ethnicity during public health emergencies.[156]

- **Fund the recruitment and training of public health personnel.** The health security enterprise requires trained, experienced personnel. Federal, state, and local governments must prioritize stable, long-term funding for recruitment and retention of a diverse workforce, including one with experience in public health informatics, laboratory science, health equity, epidemiology, and other foundational public health capacities. Congress should also invest in public health workforce development and retention programs, such as the proposed Public Health Workforce Loan Repayment Act and other incentives to serve in governmental public health, fellowships that increase workforce diversity, and recruitment in underserved areas and populations. Public health schools should incorporate health equity, data equity, and cultural competency into their curricula and training programs.

- **Accelerate crisis responses through a standing public health emergency response fund and faster supplemental funding.** In addition to stable core funding, the federal government needs readily available funds on hand to enable a rapid response while Congress assesses the necessity for supplemental funding. Congress should continue a no-year infusion of funds into the Public Health Emergency Rapid Response Fund and/or the Infectious Disease Rapid Response Reserve Fund to serve as available funding that would provide a temporary bridge between preparedness and supplemental emergency funds. Congress should replenish such funding on an annual basis, and funding should not come from existing preparedness resources, as response capacity cannot substitute for adequate readiness. The HHS secretary should only use such funding for acute emergencies that require a rapid response to save lives and protect the public.

- **Demonstrate a long-term commitment to global health security.** The United States should continue to strengthen partnerships with international bodies such as the World Health Organization (WHO), while working with bilateral foreign country partners to strengthen core public health capabilities. Congress should solidify America's role as a global health leader by committing sufficient resources to successfully implement the U.S. Government Global Health Security Strategy[157] and by investing in proven initiatives such as the Field Epidemiology Training and Global Laboratory Leadership Programs, Public Health Emergency Operations Centers, and National Public Health Institutes. Success will require sustained annual funding for global health security programs at CDC. Congress should fund and CDC should implement the modernization of the U.S. quarantine system, including IT systems, quarantine stations, regulatory framework, and traveler engagement and information.

MS-DOH-21-1816-A-000775

Priority Area 2: Prevent Outbreaks and Pandemics

The COVID-19 pandemic will not be the last infectious disease outbreak to threaten the country's health and economic security. Emerging infectious diseases have been increasing over the past five decades.[158] At the same time, the increasing polarization and misinformation around COVID-19 vaccines and nonpharmaceutical interventions could affect the prevention and control of more common outbreaks, such as seasonal influenza, vaccine-preventable diseases, and antibiotic resistance. The United States must be able to prevent and respond to both major pandemics and localized outbreaks.

RECOMMENDATIONS FOR FEDERAL GOVERNMENT, HEALTHCARE, AND AGRICULTURE:

- **Support the vaccine infrastructure.** CDC's Section 317 Immunization Program supports state and local immunization systems to increase vaccination rates among uninsured and underinsured adults and children, respond to outbreaks, educate the public, target populations experiencing disadvantage, improve vaccine confidence, establish partnerships, and improve information systems. Yet, funding has not kept up with needs, as states have to spend immunization dollars to respond to outbreaks,[159] deal with increases in the numbers of residents who lack health insurance,[160] and attempt to manage the impact of vaccine underutilization. Health departments depended on this underfunded infrastructure to distribute and dispense the COVID-19 vaccines, with new money not available until January 2021, leading to a slow and chaotic vaccination rollout early in 2021. Congress should increase annual funding for CDC's immunization program as well as the seasonal influenza program and post-licensure vaccine safety monitoring. Congress should also provide annual appropriations to HHS to study and address the causes of vaccine resistance, improve community engagement, and to educate clinical providers on methods for improving vaccine acceptance, such as those included in the recently enacted VACCINES Act.[161]

- **Fund CDC to support state and local public health laboratories.** Congress should substantially increase annual funding for the Epidemiology and Laboratory Capacity cooperative agreement to support state and local public health laboratories. Prior to the pandemic, the Epidemiology and Laboratory Capacity grant was only funding approximately half of what laboratories and health department epidemiologists nationwide requested to combat infectious disease outbreaks. In addition, increasing the Public Health Emergency Preparedness cooperative agreement will allow LRN labs to improve protection of communities across a range of health threats.

- **Ensure first-dollar coverage for recommended vaccines under Medicaid, Medicare, and commercial insurance.** Public and private payers should ensure that all vaccines recommended by the Advisory Committee on Immunization Practices (ACIP) are fully covered with no out of pocket payment by the consumer, as cost-sharing, such as co-pays, can be a significant barrier to vaccination.[162] Congress should require zero cost-sharing in Medicare Part D and B plans, and CMS should incentivize Part D plans to eliminate cost-sharing and increase receipt of vaccines.[163] An example of legislation that takes steps to improve older adult vaccination rates is the Protecting Seniors Through Immunization Act.

- **Significantly increase investments in public health initiatives to combat antibiotic resistance (AR).** Congress should increase funding for innovative prevention methods of detecting and containing outbreaks supported by the Antibiotic Resistance Solutions Initiative at CDC including its One Health program approach to surveillance and prevention. CDC is investing in prevention measures in every state to strengthen lab capacity, track infections across healthcare systems, detect new threats, disrupt pathogens, coordinate prevention strategies, educate healthcare providers on appropriate antibiotic use, and advocate for other innovations. To fully address the scope of AR spread, particularly in healthcare

settings, Congress should increase funding for the National Healthcare Safety Network and healthcare associated infection/antibiotic resistance programs and activities at state and local health departments. In addition, increases in funding and significant global coordination, as recommended by the National Academies, are necessary to build global capacity to prevent and detect resistant infections and to combat the threat to national security.[164]

- **Create incentives for new-product discovery to fight resistant infections.** The antibiotic development pipeline has failed, leaving patients at risk for antimicrobial-resistant infections. It is extremely challenging for companies to earn a return on their investments for the development of new antibiotics: (1) antibiotics are typically given for a short duration and do not return profits; (2) the most highly resistant infections are still relatively rare; and (3) new antibiotics must be used judiciously to preserve their effectiveness. These factors have resulted in nearly all major pharmaceutical companies exiting the antibiotics market, leaving the critical innovation domain of discovering and developing new antibiotics to small biotech companies that have struggled to survive. Legislation that includes development incentives that are de-linked from sales and strong stewardship and surveillance provisions, such as the PASTEUR Act, would strengthen the market for antibiotic developers, improving patient access for those who need it most.

- **Eliminate overuse of antibiotics in agriculture.** The Food and Drug Administration (FDA) should enforce rules regarding the judicious use of antibiotics in food animals, ensure data collection and publication, promote antibiotic stewardship programs, and track the impact of these policies on resistance patterns. Farmers and the food industry should stop using medically important antibiotics to promote growth and prevent disease in healthy animals, as recommended by WHO,[165] and they should invest in research to develop and adopt husbandry practices that reduce the need for routine antibiotics.

- **Decrease over prescription of antibiotics through implementation of antibiotic stewardship and antibiotic-use reporting.** CDC estimates that improving prescribing practices and preventing infections could save 37,000 lives over five years.[166] CMS should enforce stewardship requirements for hospitals and work with public health stakeholders to track progress in prescribing rates and resistance patterns.[167] CMS should also advance policies to improve outpatient antibiotic prescribing, such as through quality measures and value-based reimbursement programs. All relevant facilities must drastically improve their reporting of antibiotic use and resistance through the National Healthcare Safety Network and should adopt stewardship programs that meet CDC's Core Elements.[168]

MS-DOH-21-1816-A-000777

RECOMMENDATIONS FOR FEDERAL AND STATE GOVERNMENT:

- **Provide job-protected paid leave.** The pandemic has called attention to the fact that paid family, sick, and medical leave are important infection-control measures, protecting both workers and customers, in addition to creating economic security. Workers are unable to adhere to public health guidance to isolate if they risk losing their jobs or paychecks. While Congress temporarily expanded access to paid leave during the pandemic, a permanent fix is needed. Congress should enact a permanent federal paid family and medical leave policy and dedicated paid sick days protections, and states should ensure effective implementation by passing paid leave laws and/or removing preemption exemptions.
- **Minimize state vaccine exemptions for schoolchildren and increase vaccination of healthcare workers.** States should enact or strengthen policies that enable universal childhood vaccinations to ensure children, educators and other school personnel, and the general public are protected from vaccine-preventable diseases. This includes eliminating nonmedical exemptions and opposing legislation to expand exemptions.[169] States should require healthcare personnel to receive all ACIP-recommended vaccinations to protect staff and patients and achieve necessary healthcare infection control. Healthcare facilities should ensure access and education to vaccines for all staff and contractors, and they should remove any barriers to staff receiving vaccines. Healthcare facilities should also report healthcare worker vaccination status, such as for seasonal flu and COVID-19, to CDC's National Healthcare Safety Network.

MS-DOH-21-1816-A-00078

Priority Area 3: Build Resilient Communities and Promote Health Equity in Preparedness

Social, economic, and structural drivers of health inequities mean that some populations experience a disproportionate impact of disasters, receive fewer resources during the response, and take longer to recover. These same drivers were exacerbated by the pandemic, with communities of color experiencing more severe economic and health impacts. When the intersectionality of factors, such as homelessness, incarceration, disability, age, employment, LGBTQ+ status, and immigration status are taken into consideration, the inequities are compounded. The pandemic will have had both acute and cascading impacts on mental health and wellbeing for years to come. More than 140,000 children have lost caregivers.[170] Increases in mental health concerns have already been documented,[171] including substance use[172] and drug overdoses.[173,174] Rates of suicide among people ages 25 to 34 overall, among males 25 to 34, and among Hispanic males overall, increased significantly.[175] The recent response to the pandemic in some areas has demonstrated that there can be progress in reducing disparities if concerted attention is paid to equity. For example, racial and ethnic gaps in COVID-19 vaccination rates largely closed by the end of 2021.[176]

Addressing underlying inequities and intentionally and meaningfully engaging with the people and communities most likely to be disproportionately impacted throughout the emergency planning and response process are critical to promoting community resilience and ensuring that all receive appropriate services, regardless of circumstance. Equity must be an explicit and foundational principle in all emergency planning, response, and recovery.

RECOMMENDATIONS FOR FEDERAL, STATE, AND LOCAL GOVERNMENT:

- **Strengthen leadership for health equity and incorporate lessons learned into future preparedness and response capabilities.** The White House, Congress, and relevant federal, state, local, tribal, and territorial agencies should implement the recommendations of the COVID-19 Health Equity Task Force. [See box on pg. 14.] The White House should create a permanent health equity infrastructure to implement and ensure accountability for these recommendations and bolster equity leadership and coordination for future health crises.

- **Invest in policies and capacity to address the social determinants of health (SDOH):** People at highest risk during disasters and those who have the hardest time recovering are often those with unstable or unhealthy housing, those with limited access to transportation, and those who live in low-socioeconomic-status communities,[177] all of which bore out during the COVID-19 pandemic. Addressing SDOH can improve resilience, but it must be a cross-sector effort to increase healthy, affordable housing; improve transportation access; advance economic opportunity and fight poverty; and implement other policies proven to advance health. Congress should fund a public health approach to address SDOH, such as the approach proposed in the Improving Social Determinants of Health Act and in the President's FY 2022 CDC budget request. The legislation would strengthen SDOH capacity at CDC and enable grants to public health agencies to build cross-sector partnerships and develop community solutions to SDOH. For further discussion on policy options to address SDOH, see TFAH's Blueprint and Leveraging Evidence-Based Policies to Improve Health, Control Costs, and Create Equity reports.[178,179]

- **Provide resources and technical assistance to communities to enhance equity and resilience before, during, and after an event.** Rather than a top-down approach to promote equity and resilience, policymakers should support an asset-based approach that relies on communities identifying and leveraging their assets. Congress and federal agencies should direct targeted resources to community-based organizations and existing community health networks that focus on the health of communities of color, older adults, people with disabilities, and other groups that bear a disproportionate burden during disasters. Grants should support evidence-based, culturally relevant, and linguistically appropriate public health campaigns that address prevention and treatment, providing community leaders the opportunity to fully participate in planning activities, allowing organizations to hire and engage community members so emergency plans better reflect the community, as well as improving data collection and sharing. Federal and other grant makers and states should ensure that existing grants and sub-awards reach the grassroots level and communities most in need.

MS-DOH-21-1816-A-000779

- **Public health agencies should strengthen their health equity leadership and adopt strategies and accountability metrics to incorporate equity into preparedness.** Equity must not be considered separate from preparedness activities but must serve as the foundation for a more resilient community. Ensuring equity is central to all preparedness activities and requires integrating equity accountability measures into all elements of emergency response. Before an event occurs, public health and partner organizations—such as schools, agencies on aging, healthcare and behavioral health facilities, homeless service organizations, and community-based organizations—must plan together to identify and plan with communities at higher risk. HHS, CDC, and state, local, tribal, and territorial governments, including health departments, should build up internal infrastructure to drive equity, including by identifying a chief health equity officer who has a leadership role in the emergency operations center and/or incident command structure for all-hazards events and who is engaged in every emergency operation center activation with sufficient resources and authority. Health equity and emergency preparedness officials should work across programs to incorporate equity issues and goals into preparedness policies and plans;[180] to improve staff capacity to understand how the legacies of discrimination, current-day racial trauma, and other structural inequities affect disaster resilience and recovery; develop and disseminate communications materials that are culturally and linguistically tailored; and to collect and leverage data to identify unique community assets and measures of well-being and to advance equity before and during events. All jurisdictions should establish metrics and procedures for ensuring responses are equitable and for addressing inequities as they occur.

RECOMMENDATIONS FOR STATE AND LOCAL GOVERNMENT AND COMMUNITY LEADERS:

- **Plan with communities, not for them, and empower their involvement with resources.** Emergency planners must conduct meaningful engagement, partnerships, and listening efforts as well as ongoing inclusion and local hiring (especially from communities typically at higher risk in disasters) in emergency planning and response. Officials should establish relationships with services and organizations that serve these populations before emergencies take place, and government should fund community leaders and community-based organizations to participate in preparedness efforts. Health departments and emergency management agencies should rely on the expertise, community trust, and networks of those who may bear a disproportionate risk, such as older adults, people with disabilities, and individuals with chronic health conditions to ensure emergency plans, procedures, and evacuation shelters meet the needs of all in the community.

- **Address mental health and substance use gaps, bolster crisis resources, and incorporate mental health first-aid and long-term treatment into disaster response and recovery strategies.** All jurisdictions should assess existing mental health and substance use resources and gaps before the next emergency, strengthen partnerships across sectors, and incorporate these assets into preparedness planning. Policymakers must consider in advance what waivers may be needed to ensure continuity of care for people in treatment. Policymakers should also incorporate behavioral health needs into disaster planning, as required by the Pandemic and All-Hazards Preparedness and Advancing Innovation Act. For additional discussion of strengthening prevention of alcohol, drug, and suicide deaths, see TFAH's *Pain in the Nation* report series.

Priority Area 4: Ensure Effective Leadership and Coordination

Political polarization, interference and threats against public health officials, and contradictory messaging at different points throughout the pandemic has contributed to a wide variation in how individuals and communities have responded. The undermining of public health at all levels has made the nation less secure. At the state level, as of May 2021, 15 legislatures have passed or are considering measures to limit the legal authority of health agencies to protect the public health,[181] and more than 100 of these laws have been approved.[182] These laws could have deadly consequences during COVID-19 and future public health emergencies. At the same time, public health officials at the state and local level have been subjected to threats and career reprisals. More than 500 top health officials have left their positions in the past two years,[183] which will have ramifications beyond the pandemic.

RECOMMENDATIONS FOR FEDERAL, STATE, AND LOCAL GOVERNMENT:

- **Strengthen federal leadership, guidance, and regulatory authorities for public health emergencies.** During the COVID-19 pandemic, authority and decision-making over the response was ceded to states to an unprecedented degree. This diffusion of responsibility meant wide variation in policy and response decisions regarding business closures, mask mandates, testing strategies, and other tactics. CDC must be empowered to lead the public health response during a pandemic and issue clear, feasible guidance and regulations for state, local, tribal, and territorial officials and to the public to minimize variation and public confusion across jurisdictions.
- **Create a COVID-19 commission to examine the pandemic and make recommendations to Congress.** Congress should authorize an independent commission to investigate the preparedness and response to the pandemic and make concrete recommendations for addressing gaps and missteps. A comprehensive, congressionally authorized commission would help inform future policymaking and pandemic preparedness and response. The commission should recommend ways to strengthen public health and healthcare system preparedness, health equity, medical countermeasures, PPE development and deployment, messaging and

MS-DOH-21-1816-A-000781

communications, and workforce before the next public health emergency.

- **Rebuild trust in public health agencies and leaders.** The COVID-19 pandemic has damaged faith in federal agencies, including public health agencies such as CDC and FDA. Policy decisions from the federal to the local levels should be based on the best available science, led by public health experts, and free from any real or perceived political interference. The president, the HHS secretary, and the leadership of federal public health and emergency response agencies, including CDC, Office of the Assistant Secretary for Preparedness and Response, U.S. Department of Homeland Security, Federal Emergency Management Agency, and FDA, must conduct a thorough review on the independence and performance of these agencies during the pandemic. Federal health agencies need to build capacity for more rapid response during a health emergency. Leaders should establish procedures and policies to ensure the scientific integrity and independence of their agencies, without political interference, and they must identify and correct any errors made during the COVID-19 response. At the same time, elected leaders at all levels must publicly support public health to rebuild confidence in those agencies and officials.

Meinzahn

- **Strengthen public health protections.** Governors and legislatures should reject laws that weaken public health powers, including such basic public health protections as vaccinations and quarantine.
- **Invest in public health communications.** Congress must make a significant investment in effective public health communications, including research into best practices for different audiences. CDC and other federal, state, and local public health agencies should engage with a diverse group of stakeholders to research and test effective public health messaging, translating complicated concepts to a lay audience, using social media, and countering misinformation and disinformation. While the substance of communications should be consistent, messages must acknowledge the historical context of distrust and be linguistically and culturally tailored for different populations, and trusted, nongovernmental messengers should receive funding to help deliver messages.

MS-DOH-21-1816-A-000782

Priority Area 5: Accelerate Development and Distribution of Medical Countermeasures

Robust Assistant Secretary for Preparedness and Response (ASPR) coordination of the multi-sector partners of the Public Health Emergency Medical Countermeasures Enterprise (PHEMCE)[184] could improve medical countermeasure (MCM) development and negate a range of health threats. However, developed drugs or vaccines are only effective if they reach anyone who needs them, when they need them. Medical countermeasures are FDA-regulated products that could be used in the event of a public health emergency, such as vaccines, treatments, drugs, personal protective equipment (PPE) and devices.[185] The challenges faced in distributing scarce medical resources during the pandemic as well as the deployment of COVID-19 vaccine demonstrate the urgency of the right-product/right-time equation. Congress has made significant investments in research and development, but investments must match the size and scope of the threat.

RECOMMENDATIONS FOR FEDERAL GOVERNMENT:

- **Provide significant, long-term funding for the entire MCM enterprise.** The MCM enterprise involves multisector partners that share capabilities such as: research, regulation, manufacturing, surveillance, distribution, dispensing, delivery, stockpiling, training, and monitoring. Long-term coordinated and transparent funding to the Biomedical Advance Research and Development Authority, Strategic National Stockpile, CDC, FDA, National Institutes of Health, and other components of the PHEMCE would offer more certainty to the biotechnology industry and researchers, would strengthen public-private partnerships, and would enable the purchase of ancillary medical supplies, such as PPE. The United States should grow its investment in innovative, flexible technologies and platforms that will enable faster production of products for a range of threats, rather than focusing on products for a single pathogen.[186]
- **Prioritize the distribution and dispensing of MCMs.** It is important that MCMs reach the right person at the right time during emergencies; the challenges in mass vaccination were predicted by CDC's MCM Operational Readiness Review.[187,188] HHS, along with state, local, tribal, and territorial health departments should be properly resourced and require integration of private-sector healthcare supply distributors and supply-chain partners into planning, exercises, and emergency responses to better leverage existing systems and resources. Once the COVID-19 vaccination campaign is complete, HHS should assess and address gaps in vaccine development, procurement, maintenance, deployment, and equitable administration.

MS-DOH-21-1816-A-000783

- **Clarify and strengthen PHEMCE leadership of MCM and supply-chain management for emergencies.** HHS should reinvigorate interagency PHEMCE coordination,[189] including regular interagency meetings; engagement with private-sector supply-chain partners; and improved transparency and communication with state, local, tribal, and territorial agencies and collaborative long-term planning and evaluation. These agencies should be included in planning and decision-making. HHS should take steps to minimize political interference with its decision-making and ensure transparency and communication with stakeholders. The HHS Secretary and ASPR should leverage its advisory board for strategic and policy advice. Federal agencies should also explore all available authorities, such as through the Defense Production Act, and communicate strategies with stakeholders to bolster the supply chain during emergencies. HHS should clarify roles and responsibilities for supply-chain management, in consultation with private-sector and public health partners, and should develop and disseminate best practices for supply management.[190]

RECOMMENDATIONS FOR FEDERAL, STATE, AND LOCAL GOVERNMENTS AND PARTNERS:

- **Improve MCM guidance and communications for groups at higher risk during an event.** HHS, including CDC, should consult with experts and work with healthcare professionals and state, local, and tribal public health partners to develop standardized guidance for dispensing MCMs to groups such as children, pregnant women, older adults, people with disabilities, and people who are homebound. And HHS and state, local, and tribal agencies should work with organizations that reach the public, especially communities at disproportionate risk—such as groups representing older adults, people with disabilities, and limited-English-proficient communities—to improve communications around MCM issues before an event. Communities need to be engaged before an outbreak or event to ensure their understanding of the risks, benefits, and distribution challenges of introducing a medical product to a large portion of the population and ultimately improving acceptance and access to MCMs. It is important to provide clear and accurate guidance to the public in multiple formats and languages, via trusted sources and multiple communications channels, including formats that are accessible to people with low literacy and hearing or vision loss.

MS-DOH-21-1816-A-000784

Priority Area 6: Ready the Healthcare System to Respond and Recover

Access to healthcare is a critical component of a resilient population and effective emergency response. In addition to harming day-to-day health of Americans, the Global Health Security Index found that failure to guarantee Americans' access to healthcare hurts the nation's ability to rapidly contain an outbreak.[191] The pandemic has illustrated the way compounding crises—including COVID-19 infections, delays in prevention and treatment of other health conditions, natural disasters, and a severe mental health burden among healthcare workers and the public—can strain the healthcare system beyond its level of preparedness. For several years, TFAH has warned that medical surge capacity for a pandemic remained a major gap in the nation's preparedness. This gap has been evident throughout the healthcare delivery system, from outpatient settings to long-term care to acute care hospitals, with troubling impacts on patients' outcomes.[192] In some areas, healthcare coalitions supported by the national HPP served a critical role in allocating resources, such as PPE and ventilators.[193,194] However, overstretched facilities, exhausted workforces, disruptions in the supply chain, interruptions in primary and preventive care, and lack of information-sharing and situational awareness have been among the significant challenges to the nation's healthcare system during the pandemic. There was also wide variation in implementation of crisis standards of care, with some states providing very little information to providers about legal and clinical issues when making triage decisions. The NHSPI has consistently found that healthcare delivery readiness scores are lowest among preparedness domains, with little progress in the past five years.[195] Policymakers need to strengthen existing systems and consider long-term mechanisms to create sustainable healthcare readiness across systems and geographic borders.

RECOMMENDATIONS FOR FEDERAL GOVERNMENT AND HEALTHCARE:

- **Strengthen the Hospital Preparedness Program and fund regional coordination.** HPP can help build strong healthcare coalitions capable of engaging and supporting members during disaster responses, but the program has been severely underfunded. Congress must provide more robust annual funding—which it has cut in half over the past decade. HHS should assess the role of HPP in the COVID-19 response and address funding gaps in the program.[196] HHS and the recipients should ensure healthcare leaders take the lead on HPP planning and implementation to the extent possible, with support and coordination from public health, emergency management, and others, and recipients should ensure as much funding as possible is reaching healthcare coalitions. Healthcare administrators should ensure their facilities have tools and support for meaningful participation in healthcare coalitions, including the ability to share information and resources across the coalition and with public health agencies. Congress should provide additional funding to the Regional Disaster Health Response System to coordinate across coalitions and states,[197] to map specialized disaster care (such as burn or pediatric care) across the country, and to leverage those assets in a coordinated way.[198]
- **Create incentives and ramifications to build sustainable preparedness and surge capacity across healthcare systems.** The shortages of beds, healthcare personnel, and equipment during the pandemic underscores the need for cooperation among healthcare entities, across systems, and across geographic borders. Although there has been progress in developing healthcare coalitions in many regions and progress in meeting CMS and other accreditation preparedness standards by individual healthcare facilities, these existing mechanisms have not provided enough incentive for many healthcare facilities to create meaningful surge capacity and cooperation across competing entities.

MS-DOH-21-1816-A-000785

In addition to strengthening existing systems, Congress and HHS should consider long-term sustainability for building healthcare readiness across the system, including meaningful incentives and disincentives, such as:

- An external self-regulatory body, in alignment with federal policy goals, could set, validate, and enforce standards for healthcare facility readiness, stratified by facility type, with authority for financial ramifications.[199]
- Payment incentives could sustain preparedness, surge capacity, regional disaster partnerships, and reward facilities that maintain specialized disaster care.

- **Expand access to healthcare.** Access to healthcare is always important for promoting health and well-being and particularly so during a pandemic or disaster. Federal and state governments must ensure every person has access to healthcare, including robust insurance coverage. Millions of Americans still lack insurance coverage, and disparities by race, ethnicity, sexual or gender identity, disability status, and other factors have been exacerbated by the pandemic-related job loss.[200] Congress and the Administration should strengthen incentives for states to expand Medicaid, make marketplace overage more affordable, and improve outreach and marketing for enrollment.[201]

- **Assess impact of CMS Preparedness Standards and improve transparency.** An external review by the Government Accountability Office or a similar entity should assess how CMS preparedness standards have affected overall healthcare readiness, and HHS should begin tracking progress on preparedness measures over time. CMS should also strengthen preparedness standards by adding medical surge capacity and other capabilities, including infection prevention and control, stratified by facility type, as a necessary requirement within the next iteration of the rule.[202]

RECOMMENDATIONS FOR STATE GOVERNMENT AND HEALTHCARE:

- **Integrate healthcare delivery into emergency preparedness and response.** Jurisdictions should continue and increase engagement and integration of the healthcare sector into emergency planning and responses, including plugging healthcare coalitions and other entities representing private healthcare and the healthcare supply chain into emergency planning and response and incident command. Health systems, healthcare coalitions, and public health should develop memoranda of understanding ahead of disasters to improve situational awareness across healthcare and to enable movement of patients, personnel, and supplies. Private-sector healthcare leadership should prioritize preparedness moving forward, including training and workforce protections, surveillance for emerging threats, stockpiling of supplies ahead of disasters, and full engagement in regional collaborations and coalitions.

- **Strengthen state policies regarding disaster healthcare delivery.** States should review credentialing standards to ensure healthcare facilities can call on providers from outside their states, and health systems should ensure they can receive outside providers quickly during a surge response. States should also adopt policies that promote healthcare readiness and ease the ability to surge care and services, such as the NLC, the Interstate Medical License Compact, the Recognition of EMS Personnel Licensure Interstate CompAct,[203] the Uniform Emergency Volunteer Health Practitioners Act,[204] emergency prescription refill laws and protocols, and implementation and education of providers regarding crisis standards of care guidelines.[205,206] State and healthcare leaders must take crisis standards of care planning and implementation seriously and ensure transparency for healthcare providers who must make decisions in constrained conditions. Jurisdictions must ensure equitable application of crisis standards of care so as not to create or exacerbate disparities.

Priority Area 7: Prepare for Environmental Threats and Extreme Weather

Climate change, environmental hazards, and extreme weather pose serious and growing threats to human health. According to a December 2020 report by TFAH and the Johns Hopkins Bloomberg School of Public Health, many of the states most at risk from climate change are also the least ready to deal with it. Environmental health involves detecting and protecting communities from hazardous conditions in air, water, food, and other settings, and it is therefore a critical component of the nation's health security. Environmental hazards like climate change and pollution impact communities differently and exacerbate disparities. People living in poverty, people of color, people with underlying health conditions or disabilities, and children and older people are all at higher risk for exposure to and impacts from environmental threats.[207,208,209]

RECOMMENDATIONS FOR FEDERAL AND STATE GOVERNMENT:

- **Enact legislation requiring a national strategic plan.** The United States urgently needs a strategic action plan to address the health impacts of climate change. Policymakers should enact legislation requiring HHS to develop such a plan and to fund development and ongoing maintenance of health system capacity specifically for this purpose.
- **Support climate and health, environmental health equity and environmental justice efforts.** Congress should fund the HHS Office of Climate Change and Health Equity[210] to expand its work to address the health effects of climate change, especially on those who are experiencing higher risks.
- **Support public health climate-adaptation efforts.** Funding for CDC's Climate and Health program stands at $10 million per year, while the annual health costs of climate change events were estimated to be more than $14 billion in 2008.[211] Climate-informed health interventions include identifying likely climate impacts, potential health effects associated with these impacts, and the most at-risk populations and locations.[212] Congress should increase funding for environmental health programs, including CDC's Climate and Health program and the National Environmental Public Health Tracking Network to conduct surveillance and target interventions.
- **Develop sustainable state and local vector-control programs.** As the threat and geographic distribution of mosquitos, ticks, and other vectors changes, Congress should expand funding for the vector-borne disease program at CDC to support state and local capacity to prevent and detect vector-borne diseases, such as Zika, West Nile Virus, and Lyme disease.
- **Guarantee clean water for all U.S. residents, including after disasters.** The Administration and Congress should restore the Clean Water Rule, which includes measures to protect a safe water supply, such as addressing the ongoing problem of lead, per- and polyfluoroalkyl substances, and algal toxins in drinking water; taking steps to reduce the potential for waterborne illnesses; and increasing protection against potential acts of terrorism on America's drinking and agricultural water systems. All states should include water security and wastewater management in their preparedness plans, and they should build relationships among health departments and local environmental and water agencies. CDC should include national guidance and metrics for planning for a range of water-related crises.

MS-DOH-21-1816-A-000787

RECOMMENDATIONS FOR STATE GOVERNMENT:

- **Every state should have a comprehensive climate vulnerability assessment and adaptation plan that incorporates public health.** Public health and environmental agencies should work together to track concerns, coordinate risk-management and communications, and prioritize necessary capabilities to reduce and address threats. States and localities should investigate what additional capacities are necessary and identify vulnerable populations and communities. State and local public health officials should incorporate environmental health into emergency operations planning and incident command.

- **Complete all steps of CDC's Building Resilience Against Climate Effects, or "BRACE," framework, and continuously work to enhance and refine preparations for climate change.** State agencies must conduct and facilitate rigorous vulnerability assessments at the state and local levels. The assessments should focus especially on populations at highest risk and the health threats most pertinent to them. States must also push ahead to complete all steps of the framework, including identifying and implementing evidence-based interventions to protect residents. Finally, as agencies implement interventions, they should continually evaluate effectiveness and strive for quality improvement.

MS-DOH-21-1816-A-000788

Year in Review: Overview of 2021's Major Public Health Emergencies, Threats, and Reports

Infectious Disease Outbreaks and Control

COVID-19 PANDEMIC

COVID-19 deaths

Deaths due to the COVID-19 pandemic neared 6 million globally and surpassed 900,000 in the United States as this report was being prepared for publication.[213]

In December 2020 and through spring 2021, COVID-19 was the leading cause of death in the United States, surpassing cancer and heart disease.[214] The impact of the COVID-19 vaccine being widely available was perhaps most noticeable in July as pandemic related deaths dropped to the seventh leading cause of death in the United States. But the Delta variant caused cases, hospitalizations, and deaths to increase in the late summer and fall.[215] In early December, the first U.S. case of an infection due to the Omicron variant was reported.[216] By the end of the month, COVID-19 infections were surging in many parts of the country further stressing the healthcare system.

Throughout the pandemic, communities of color were disproportionately affected in large part due to the ways in which structural racism contributes to underlying health inequities, as well as access to healthcare and COVID-19 services. According to CDC, as of November 2021, nationwide American Indians and Alaska Natives died at a rate that was 2.2 times higher than whites. Hispanic and Latino people died at a rate that was 2.1 times higher than whites. Black people died from COVID-19 at a rate that was 1.9 times higher than the rates of deaths among whites. Asian Americans died at a rate that was 0.9 times higher than whites.[217] [218]

The majority of COVID-19 deaths in the summer and fall of 2021 were in people who had not been vaccinated.[219]

Disruptions to other healthcare delivery; impact on life expectancy

According to WHO, prevention and treatment for noncommunicable diseases, including cancer and heart disease, were "severely disrupted" during the pandemic.[220] A study published in PubMed, found that in Canada, COVID-19 caused "significant healthcare service disruptions" that the authors believed could have led to delayed diagnoses and increased mortality.[221]

In December 2021, CDC released new data showing that U.S. life expectancy decreased by 1.8 years in 2020 to 77.[222]

MS-DOH-21-1816-A-000789

Vaccines and treatments

In December 2020, two vaccines, one manufactured by Pfizer-BioNTech and the other by Moderna, received emergency-use authorization from FDA. In February, a vaccine manufactured by the Johnson & Johnson Company received its emergency-use authorization. The Pfizer and Moderna vaccines are two-shot doses, the J&J vaccine a one-shot dose. The vaccines were initially made available for healthcare workers, people living and working in long-term care facilities, and other emergency responders. Availability then opened to older adults and people at heightened risk due to underlying medical conditions, and then opened to a phased approach by age. By year's end, the vaccine was recommended for everyone ages 5 and older.

On August 23, FDA issued full approval to the Pfizer-BioNtech COVID-19 vaccine, now known as Comirnaty, for people 16 years of age and older.[223] The vaccine continues to be administered for people 5 to 15 years of age under the emergency-use authorization.

By the fall, as the Delta variant caused cases, hospitalizations, and deaths to increase, booster doses of the vaccine were recommended for all adults ages 18 and older. In December, the Delta variant remained the cause of most new infections, and the Omicron variant was being studied.[224] Early data suggested that Omicron was highly contagious but might cause less serious illness.[225]

At year's end, 71 percent of the U.S. population had received at least one dose of a COVID vaccine, and 62 percent were fully vaccinated.[226] As this report was being prepared, the United States ranked 58th out of 180 countries worldwide for vaccination rate.[227] Native Hawaiian and Pacific Islanders had the highest fully vaccinated rate among all race/ethnic groups at 74.3 percent, 55 percent of the American Indian/Alaska Native population were fully vaccinated, 48 percent of Asian Americans were fully vaccinated, 45 percent of Hispanic Americans were fully vaccinated, 42 percent of the white population were fully vaccinated, and 36 percent of Black Americans were fully vaccinated.[228] In addition, vaccination rates were lagging in rural communities. According to CDC data reported in May 2021, 38.9 percent of residents in rural communities were vaccinated, while 45.7 percent of residents in urban communities were vaccinated.[229] By year's end, thanks to concerted efforts by the Biden Administration, states, and stakeholder groups, the gap between vaccination rates among population groups had narrowed.[230]

During the year, COVID-19 treatments in the form of monoclonal antibodies treatments were developed, and by January 2022, four were approved for emergency use by FDA.[231] Monoclonal antibodies treatments work by mimicking a person's immune system function to block the COVID-19 virus from entering cells or to help clear cells already infected.[232] These treatments lessen symptoms and speed recovery.

Editor's note: On January 25, 2022, the FDA stopped use of two COVID-19 antibody treatments, drugs manufactured by Regeneron and Eli Lilly, because they weren't effective against the Omicron variant. If the drugs prove effective against additional variants their use could be reauthorized, FDA said.[233]

COVID-19 and trends in deaths of despair

The COVID-19 pandemic had well-documented impacts on Americans' physical health and economic security. The pandemic also had significant impacts on mental health leading to increases in mental health distress, substance misuse, drug overdoses, and, in some population groups, an increase in suicide.[234] While one report found a tripling of reported symptoms of anxiety or depression in American adults between March 2020 and March 2021,[235] a February 2021 Milliman report found reduced utilization of mental and behavioral healthcare during 2020.[236]

Provisional data from CDC shows a rapid increase in drug overdose deaths since the beginning of the pandemic. Data from May 2020 through April 2021 shows 97,990 drug overdoses deaths compared with 77,007 between May 2019 and April 2020.[237]

According to the December 2021 U.S. Surgeon General's advisory, *Protecting Youth Mental Health*, rates of depression and anxiety among youths doubled during the pandemic, with 25 percent of youths reporting that they were experiencing depressive symptoms and 20 percent reporting they were experiencing anxiety. Compared with 2019, emergency room visits for suspected suicide attempts rose 51 percent for adolescent girls in early 2021. For boys, the rate of suspected suicide attempts rose by 4 percent.[238]

MS-DOH-21-1816-A-00790

Antimicrobial Resistance

According to CDC, more than 2.8 million antibiotic-resistant infections occur in the United States annually, leading to about 35,000 deaths.[239] In December, CDC announced two new programs and $22 million in awards funding to identify and prevent antimicrobial-resistant infections: The Global Action in Healthcare Network and the Global Antimicrobial Resistance Laboratory and Response Network.[240]

Childhood Immunizations

According to CDC data released in October 2021, routine vaccination among children remained high between 2018–2020. According to the latest National Immunization Survey-Child (NIS-Child), during 2018–2020, over 90 percent of children were fully vaccinated against measles, mumps, and rubella, polio, hepatitis B, and varicella by age 24 months. However, there are disparities in vaccination coverage based on health insurance status, race/ethnicity, poverty level, and jurisdiction, and the COVID-19 pandemic may increase these disparities.[241]

Foodborne Illness

During 2021, CDC and FDA released advisories concerning foodborne illness associated with soft cheeses (listeria and salmonella), alkaline water (non-viral hepatitis illness), shrimp and other seafood (salmonella), salad (salmonella and listeria), onions (salmonella), and spinach (e-coli).[242] In December, FDA released a Foodborne Outbreak Response Improvement Plan to modernize the agency's response to foodborne disease.[243]

Hepatitis A

Since outbreaks of hepatitis A were first identified in 2016, 43,084 cases have been reported in 37 states. People in the highest-risk category for contracting hepatitis A virus infection are people who use drugs, people experiencing unstable housing or homelessness, men who have sex with men, people who are currently or were recently incarcerated, and people with chronic liver disease including cirrhosis and hepatitis B and C.[244]

HIV/AIDS

An estimated 37.7 million people are living with HIV across the globe, over two-thirds of whom live in Africa. The majority of all new infections occurred in sub-Saharan Africa. In 2020, an estimated 680,000 people worldwide died due to HIV/AIDS.[245] In 2019, there were approximately 1.2 million people living with HIV in the United States and approximately 34,800 new infections in the United States, an 8 percent decrease in the infection rate since 2015.[246] People living with HIV experienced more severe outcomes and have higher comorbidities from COVID-19 than most people without HIV.[247]

Lyme Disease

Lyme Disease is the most common vector-borne disease in the United States. It is transmitted to humans through bites of blacklegged ticks. CDC estimates that approximately 476,000 people in the United States are diagnosed and treated for Lyme Disease annually.[248]

Measles.

Measles outbreaks, United States. In 2021, U.S. measles cases remained relatively low: 49 measles cases reported by five jurisdictions as of January 3, 2022. Although this is an increase from the 13 individual measles cases confirmed in 2020, the number of reported cases is still well below the 1,282 cases of measles in 2019. Measles is a highly contagious disease; outbreaks in the United States have been linked to sustained spread in U.S. communities, with pockets of unvaccinated people and/or an increase in the number of travelers who get measles abroad.[249]

Measles outbreaks, global. WHO reported that during 2019, there were more measles cases reported worldwide than in any year since 1996: 869,770 confirmed cases, leading to an estimated 207,500 deaths. The number of confirmed cases worldwide in 2020 and 2021 was much lower, although Nigeria, Pakistan, and Somalia reported high numbers and there were ongoing outbreaks in several other nations.

Almost 41 countries paused or considered pausing their measles campaigns for 2020 or 2021 due to the COVID-19 pandemic, which increases the risk of bigger outbreaks around the world and in the United States.[250] New data showed that 22 million children worldwide missed their first measles vaccine during 2020 and just 70 percent of children who were due for their second vaccination shot in 2021 received it. WHO and CDC officials are concerned that these low vaccination rates could lead to a global measles outbreak.[251]

Malaria Control and Prevention

According to a March 2021 CDC report, approximately 2,000 cases of malaria are diagnosed in the United States each year, reaching a high of 2,161 cases in 2017. Worldwide, the 2017 data continues a decades-long increase in malaria cases. The disease remains endemic in many countries, and global travel increases its spread.[252]

MS-DOH-21-1816-A-000791

Polio

The United States continues to be polio (poliovirus) free (no cases have originated in the United States) thanks to the polio vaccine.[253] However, polio continues to be a threat in some countries, including Afghanistan, Pakistan, China, Iran, and numerous African nations.[254]

Seasonal Flu

Season influenza cases and deaths were sharply down during the 2020–2021 flu season, likely due to the public health measures in place to combat COVID-19. Estimates suggest influenza vaccination during the 2021–2022 season was similar to the prior year, with a record number of influenza vaccines (193.8 million doses) distributed. However, at the time this report was being produced (winter 2022), influenza surveillance was showing the return of influenza activity, which was expected to continue to increase.[255]

Tuberculosis

WHO revealed in October that for the first time in over a decade, tuberculosis (TB) deaths had increased worldwide, with fewer people being diagnosed and treated and more deaths, due to the impact of the global pandemic on prevention and treatment efforts.[256] Kenya is one of the 30 countries with the majority (at least 83 percent) of TB cases. Last year, an estimated 140,000 people in Kenya were estimated to have TB, according to the country's Ministry of Health. COVID-19 also meant that the number of people with TB who go undetected increased. Nearly half of people with TB in Kenya last year were likely to have missed out on diagnosis and treatment. An estimated 15 percent reduction in case finding was "largely attributable to the pandemic," according to the Ministry of Health's national tuberculosis, leprosy, and lung disease program annual report.[257]

West Nile Virus

West Nile Virus is the leading cause of mosquito-borne disease in the United States. There were 2,695 reported cases of West Nile Virus in 2021, the majority of those (1,645) in Arizona.[258]

MS-DOH-21-1816-A-000792

Severe Weather and Natural Disasters

Drought Conditions

Nine states: California, Arizona, Nevada, Oregon, Washington, Idaho, Utah, Montana, and North Dakota experienced severe drought conditions during 2021. In October, 52 percent of the western states' land area was classified as experiencing extreme or exceptional drought.[259]

Most of California experienced extreme drought conditions throughout 2021, and May and June were the state's warmest months on record since 1896. The state's water shortages have been called "immediate and dire" by state officials, and water-use limitations have been imposed. Capacity of numerous critical water sources, such as Lake Oroville, the Sacramento-Sand Joaquin Delta, and the Russian River, are at greatly reduced capacity.[260]

Extreme Heat

A June heatwave broke all-time records for high temperatures across the western United States with multiple days of 100-plus-degree weather in many places. Between June 15–20, all-time-high temperatures were recorded in seven states: California, Arizona, New Mexico, Utah, Colorado, Wyoming, and Montana.[261]

High heat, drought, and increased risk for wildfires are strongly interrelated.

Flooding

By September, 116 people had died due to flooding in the United States, the highest number since 2017. Hurricane Ida caused extensive damage as it made landfall in Louisiana and tracked its way up the East Coast, including with deaths in Tennessee, New Jersey, New York City, Pennsylvania, and Connecticut. Additional deaths associated with other storms occurred in Arizona (10 deaths), New Mexico (six deaths), and Texas (six deaths).[262]

Hurricanes

The 2021 Atlantic hurricane season counted 21 named storms, including seven hurricanes. 2021 was the third most active hurricane year for named storms and was the sixth consecutive above-normal Atlantic hurricane season.[263]

Hurricane Ida made landfall in Louisiana in August 2021 as a Category 4 storm. It was the second most damaging hurricane to make landfall in the state. As of September 2021, a total of 115 deaths had been associated with Ida, including 95 in the United States. The storm caused approximately $65 billion in property damage.[264]

Tornadoes

During 2021, 1,376 tornados were reported, causing 101 deaths. The reported number of storms in 2020 was 1,075.[265]

On December 11 and 12, a massive storm spurned 41 tornados, including at the EF-3 and EF-2 levels, across eight states reaching from Mississippi to Illinois. Kentucky was hardest hit with whole communities leveled. December tornados are highly unusual, and the number and strength of these twisters was unprecedented. In Kentucky, one twister traveled over 200 miles destroying virtually everything in its path. In total, the tornados caused 90 deaths in five states, including 77 in Kentucky.[266]

Wildfires

In August, more than 100 wildfires were burning throughout the western United States with more than a dozen burning in northern California. Climate researchers believe that higher temperatures are increasing the length of the fire season and the number of places where wildfires can happen.[267]

The Dixie Fire, which burned in Northern California throughout the summer, was the second largest in the state's history and burned nearly 1 million acres.[268]

The Caldor Fire burned nearly 222,000 areas across three California counties: El Dorado, Amador, and Alpine. It burned for 67 days starting in mid-August and destroyed over 1,000 structures.[269]

MS-DOH-21-1816-A-000793

Reports, Risk Assessment Tools, and Convenings

The National Risk Index released in January 2021, is an online tool created by the Federal Emergency Management Agency to identify communities most at risk for 18 natural hazards.[270]

In April, the Group of Friends on Tackling AMR released a Call to Action on Antimicrobial Resilience (AMR) 2021. The call to action calls demands a strengthened global effort to decrease AMR through increased research and investment and improved antimicrobial stewardship. As of December 2021, 113 member states were signatories to the Call to Action, including the United States.[271]

In October, the de Beaumont Foundation and the Public Health National Center for Innovations, a division of the Public Health Accreditation Board, released a brief, Staffing up: Investing to improve public health services and protections, which reported that public health departments need an increase in full-time staff members of about 80 precent to meet their communities' basic public health needs. According to the brief, the staffing gap has been created by years of budget cuts.[272]

Also in October, the Global Health Security Agenda Annual Report, *Strengthening Health Security Across the Globe: Progress and Impact of United States Government Investments in the Global Health Security Agenda,* was released. The report details the U.S. government's impact in helping countries across the world build their health security capacity.[273]

In August and October, TFAH released a two-part case studies series as a follow-up to its December 2020 report *Climate Change & Health: Assessing State Preparedness* produced with the Johns Hopkins Bloomberg School of Public Health. The case-studies series identifies and reports on states and localities' efforts to implement climate change adaptation strategies that center on equity. The first case study features programs that advance procedural equity in climate adaptation. The second in the series features programs that advance distributional equity in climate adaptation.

In October, the Bipartisan Commission on Biodefense released its report *Saving Sisyphus: Advanced Biodetection for the 21st Century.* The report, released 20 years after the 2001 anthrax attacks, detailed "critical failures" in the nation's bio-detection program and makes recommendations for congressional action.[274]

The National Commission to Transform Public Health Data Systems, created by the Robert Wood Johnson Foundation, was established to review how public health data is collected, shared, and used and to make recommendations to ensure that such data is comprehensive and creates a blueprint for health equity. Among the recommendations included in its October 2021 report was to ensure the public health measurement captures and addresses structural racism and other inequities.[275]

In November, the Biden Administration's COVID-19 Health Equity Task Force released its report, including recommendations to the President for mitigating the health inequities caused by or exacerbated by the pandemic.[276] (See side bar on pg. 14.)

The Bipartisan Policy Center's December 2021 report *Public Health Forward: Modernizing the U.S Public Health System* described the ways the COVID-19 pandemic exposed weaknesses in the nation's public health system and pervasive disparities that affect Americans' health. The report outlined a five-year vision and action framework for how states, territorial, and local elected and public health officials can strengthen their jurisdiction's public health infrastructure.[277]

2021 Global Health Security Index, released in December, reported that no country is better prepared to respond to pandemics and epidemics than they were in 2019, the year of the initial index report. The Index, produced by NTI and the Johns Hopkins Bloomberg School of Public Health Center for Health Security, found that 90 percent of all countries worldwide had no plan for distributing vaccines or medications during an emergency, and 70 percent lack the amount of healthcare capacity that would be needed in an emergency. The United States ranked first in the index with a score of 75.9 out of 100, but the report found that high levels of mistrust in government hampered the U.S. pandemic response.[278]

MS-DOH-21-1816-A-00794

Appendix B: Methodology

TFAH made major refinements to its methodology for *Ready or Not* in 2018. For more information, see the 2019 edition of the series, Appendix A: Methodology.[279]

To meet TFAH's criteria, each indicator must be:

- **Significant.** The indicator needed to be a meaningful measure of states' public health emergency preparedness. The NHSPI first measured significance by using a multistage Delphi process with a panel of experts and then again by TFAH through interviews with additional experts.
- **Broadly relevant and accessible.** The indicator needed to be relevant—and timely data needed to be accessible—for every state and the District of Columbia.
- **Timely.** Data for the indicator needed to be updated regularly.
- **Scientifically valid.** Data supporting the indicator needed to be credible and rigorously constructed.
- **Nonpartisan.** The indicator, and data supporting the indicator, could not be rooted in or seen as rooted in any political goals.

Using these criteria, TFAH aims to select a broad set of actionable indicators with which it—and other stakeholders, including states themselves—can continue to track states' progress. (Complete data were not available for U.S. territories.) TFAH will strive to retain most of these indicators for multiple years to assist states in tracking their progress against each measure.

TFAH seeks measures that are incorporated in the NHSPI and that most closely meet TFAH's criteria. There is one exception: a measure of state public health funding-level trends that the NHSPI does not track.

Indicator Data Collection

The NHSPI provided TFAH with data for every indicator except five (those data tied to the NLC, public health funding, flu vaccination, hospital patient safety, and laboratory surge capacity). In cases where newer data were available than those modeled in the 2021 edition of the NHSPI, TFAH collected and verified figures from their original sources.

Public Health Funding Data Collection and Verification

To collect public health funding data for this report, TFAH surveyed state officials. Informed by the Public Health Activities and Services Tracking project at the University of Washington, TFAH defines public health programming and services as inclusive of communicable disease control; chronic disease prevention; injury prevention; environmental public health; maternal, child, and family health; and access to and linkage with clinical care. Specifically, this definition includes:

- **Communicable disease control.** Public health services related to communicable disease epidemiology, hepatitis, HIV/AIDS, immunization, sexually transmitted diseases, tuberculosis, etc.

MS-DOH-21-1816-A-000795

- **Chronic disease prevention.** Public health services related to asthma, cancer, cardiovascular disease, diabetes, obesity, tobacco, etc.
- **Injury prevention.** Public health services related to firearms, motor vehicles, occupational injuries, senior falls prevention, substance-use disorder, other intentional and unintentional injuries, etc.
- **Environmental public health.** Public health services related to air and water quality, fish and shellfish, food safety, hazardous substances and sites, lead, onsite wastewater, solid and hazardous waste, zoonotic diseases, etc.
- **Maternal, child, and family health.** Public health services related to the coordination of services; direct service; family planning; newborn screening; population-based maternal, child, and family health; supplemental nutrition; etc.
- **Access to and linkage with clinical care.** Public health services related to beneficiary eligibility determination, provider or facility licensing, etc.

TFAH excludes from its definition insurance coverage programs, such as Medicaid or the Children's Health Insurance Program, as well as inpatient clinical facilities.

TFAH, under the guidance of state respondents, revised data for the base year. (In this report, that was FY 2020.) For some states, this was necessary to improve comparability between the two years when a reorganization of departmental responsibilities had occurred over the period.

All states and the District of Columbia verified earlier funding data and provided new funding data, with five exceptions: Delaware, Kansas, Rhode Island, Utah, and West Virginia.

Scoring and Tier Placements

TFAH grouped states based on their performances across the 10 indicators, and TFAH gave partial credit for some indicators to draw finer distinctions among states and within states over time. TFAH placed states into three tiers—high tier, middle tier, and low tier—based on their relative performance across the indicators.

Specifically, TFAH scored each indicator as follows:

- Adoption of the NLC: 0.5 point. No adoption: 0 points.
- Percent of the state's population served by a comprehensive public health system, as determined through administration of the National Longitudinal Survey of Public Health Systems.
  - More than one standard deviation above the mean: 1 point.
  - Within one standard deviation above the mean: 0.75 point.
  - Within one standard deviation below the mean: 0.5 point.
  - More than one standard deviation below the mean: 0.25 point.
  - A score of .625—halfway between .25 point and 1 point—was assigned to Hawaii and Rhode Island, for which data were not available.
- Accreditation by the PHAB: 0.5 point. Not accredited: 0 points.
- Accreditation by the EMAP: 0.5 point. Not accredited: 0 points.
- Size of state public health budget compared with the past year (nominally, not inflation-adjusted).
  - No change or funding increase: 0.5 point.
  - Funding decrease: 0 points.
  - A score of .25—halfway between 0 points and .5 point—was assigned to Delaware, Kansas, Rhode Island, Utah, and West Virginia, which were not able to provide data for FY 2021.
- Percent of population who used a community water system that failed to meet all applicable health-based standards: TFAH scored states according to the number of standard deviations above or below the mean of state results.
  - Within one standard deviation above the mean (and states with 0 percent of residents who used a noncompliant community system): 1 point.
  - Within one standard deviation below the mean: 0.75 point.
  - Between one and two standard deviations below the mean: 0.5 point.
  - Between two and three standard deviations below the mean: 0.25 point.
  - More than three standard deviations below the mean: 0 points.
- Percent of employed population who used paid time off in March 2020: TFAH scored states according to the number of standard deviations above or below the mean of state results.
  - More than one standard deviation above the mean: 1 point.
  - Within one standard deviation above the mean: 0.75 point.
  - Within one standard deviation below the mean: 0.5 point.
  - More than one standard deviation below the mean: 0.25 point.
- Percent of people ages 6 months or older who received a seasonal flu vaccination: TFAH scored states according to the number of standard deviations above or below the mean of state results.

MS-DOH-21-1816-A-000796

- More than one standard deviation above the mean: 1 point.
- Within one standard deviation above the mean: 0.75 point.
- Within one standard deviation below the mean: 0.5 point.
- More than one standard deviation below the mean: 0.25 point.

- Percent of hospitals with a top-quality ranking ("A" grade) on the Leapfrog Hospital Safety Grade. TFAH scored states according to the number of standard deviations above or below the mean of state results.
  - More than one standard deviation above the mean: 1 point.
  - Within one standard deviation above the mean: 0.75 point.
  - Within one standard deviation below the mean: 0.5 point.
  - Positive number, more than one standard deviation below the mean: 0.25 point.
  - No hospitals with a top-quality ranking ("A" grade): 0 points.
- Public health laboratory has a plan for a six- to eight-week surge in testing capacity: 0.5 point. Did not report having a plan: 0 points.

The highest possible score a state could receive was 7.5 points.

TFAH placed states whose scores ranked among the top 17 in the high-performance tier. TFAH placed states whose scores ranked between the 18th-highest and 34th-highest in the middle tier. TFAH placed states with scores ranked between the 35th-highest and 51st-highest in the low-performance tier. (Ties in states' scores can prevent an even distribution across the tiers.)

This year, states in the high tier had scores ranging from 5.75 to 6.75; states in the middle tier had scores ranging from 5 to 5.625; and states in the low tier had scores ranking from 3.25 to 4.75.

Assuring data quality

TFAH conducted several rigorous phases of quality assurance to strengthen the integrity of the data and to improve and deepen TFAH's understanding of states' performance, especially that of outliers on specific indicators. During collection of state public health funding data, researchers systematically inspected every verified data file to identify incomplete responses, inconsistencies, and apparent data entry errors. Following this inspection, TFAH contacted respondents and gave them the opportunity to complete or correct their funding data.

New Report: Fewer States Placed in Top Performance Tier for Public Health Preparedness in 2021

COVID-19 Pandemic Continues to Illustrate the Critical Need to Invest in Public Health Infrastructure and the Social Determinants of Health

(Washington, DC – March 10, 2022) – As the nation enters its third year of the COVID-19 pandemic, a new report calls for urgent investment to create a public health system able to protect all Americans' health during emergencies. The report, released today by Trust for America's Health, measures states' performance on 10 key emergency preparedness indicators and identifies gaps in states' readiness to respond to emergencies. The report includes policy recommendations for strengthening the nation's health security.

The report, *Ready or Not 2022: Protecting the Public's Health from Diseases, Disasters and Bioterrorism,* measures states' degree of preparedness to respond to a wide spectrum of health emergencies and to provide ongoing public health services, including disease surveillance, seasonal flu vaccination, safe water, and expanded healthcare services during emergencies. It tiers states and the District of Columbia into three performance levels: high, middle and low, placing **17 states and DC in the high-performance tier, 20 states in the middle performance tier, and 13 states in the low performance tier.** The 2021 report placed, 20 states and the District of Columbia in the high-performance tier.

States' Performance by Tiers

Performance Tier	States	Number of States
High Tier	AL, CO, CT, DC, FL, IL, IA, KS, MD, MA, NJ, OH, PA, SC, UT, VA, VT, WA	17 states and DC
Middle Tier	AZ, CA, DE, GA, ID, ME, MI, MO, MS, NE, NH, NM, NY, NC, ND, OK, RI, TN, TX, WI	20 states
Low Tier	AK, AR, HI, IN, KY, LA, MN, MT, NV, OR, SD, WV, WY	13 states

This year’s report found that 12 states improved their performance while 16 states slipped in their ranking. All states’ performance is relative to that of other states.

Three states, Ohio, Pennsylvania and South Carolina, improved their performance by two tiers.

Nine states improved by one tier: Alabama, Arizona, Florida, Illinois, Iowa, Missouri, New Hampshire, New Jersey, and New York.

Sixteen states fell one tier: Delaware, Georgia, Idaho, Kentucky, Louisiana, Maine, Minnesota, Mississippi, Montana, Nebraska, New Mexico, North Carolina, Oklahoma, Oregon, Rhode Island, and Wisconsin.

In addition, the report found:

- A majority of states had plans in place to expand healthcare and public health laboratory capabilities in an emergency.
- Most states are accredited in the areas of public health, emergency management or both.
- A large majority of Americans who receive their household water through a community water system had access to safe water.
- Only about half of the U.S. population is served by a comprehensive local public health system.
- Seasonal flu vaccination rates have risen significantly in recent years but are still lower than the goal set by *Healthy People 2030*.
- Just over half of workers used some kind of paid time-off in a one-month sample. The need for paid time off has become particularly apparent during the pandemic, as many workers became ill or needed to care for a sick family member.
- Only 28 percent of hospitals, on average, earned a top-quality patient safety grade during the year, down from 31 percent the year prior.

"The major takeaway of this report is that underinvestment in the nation's public health system, and attacks on its authority, have had deadly consequences during the COVID-19 pandemic. Action and investment are urgently needed. This report's findings can help federal and state officials identify gaps in public health preparedness and the steps needed to better protect lives and the economy during the next health emergency," said J. Nadine Gracia, MSCE, President and CEO of Trust for America's Health.

The report measured states’ performance during a year that presented intense demands on the nation’s public health system. In addition to the ongoing COVID-19 pandemic, 2021 saw record heat in many places, extensive flooding, wildfires throughout the Western U.S., a highly active hurricane season, and unusual and deadly December tornados in eight states. At the same time, hundreds of public health officials

having experienced burn-out, threats to their safety, and attempts to limit their public health authorities have resigned, retired, or been fired.

While critical progress was made in fighting COVID-19 during 2021, particularly through the widespread availability of vaccines and a more coordinated federal response, the pandemic continued to illuminate the ways in which health inequities put communities of color and low-income communities at heightened risk for worse health outcomes during an emergency.

“Social, economic, and health inequities undermine a community’s ability to prepare for, respond to, and recover from a public health emergency. If we enter the next public health crisis with the same magnitude of health inequities in our communities as has been evident during this pandemic, the impact will be similar: preventable loss of life, disproportionate impact on communities of color and low-income communities, and widespread social and economic disruption. It is impossible to separate strong public health emergency preparedness and health equity,” said Dr. Gracia.

Among the report’s policy recommendations:

- Congress and states should provide stable, flexible, and sufficient funding for public health, including for infrastructure, data systems, and the public health workforce.
- Congress should create a COVID-19 Commission to review and address gaps in the pandemic response, and leaders at all levels of government should reject attempts to weaken public health authorities.
- Policymakers should take steps to prevent disease outbreaks by investing in vaccination infrastructure, antibiotic resistance programs, and by providing paid leave for all workers.
- Congress should create programs to help build resilient communities by investing in health equity and the social determinants of health, including anti-poverty programs and programs that build financial security for families.
- Congress should invest in the development and distribution of medical countermeasures to enable rapid development and effective deployment of life-saving products during emergencies and federal and state policymakers and healthcare systems leaders should work together to prioritize effective coordination and communication during emergencies.
- The White House, Congress, and states should develop plans and provide funding to minimize the health impacts of climate change and do so in ways that address health equity.

ARPA Gives States Opportunities to Support Behavioral Health for Children and Youth

ARPA Provides States with Funds to Address Mental Health in Schools
• The American Rescue Plan Act (ARPA) allocates $122.8 billion to state and local education agencies to support students returning to school, including school mental health systems.

New State Option for Funding Mobile Crisis Intervention Services
• ARPA creates a new state option for funding MCIS through Medicaid. States can leverage this opportunity and design their policies to support MCIS for children and youth, whose behavioral health needs have increased during the pandemic.
State Grant Applications Due August 13, 2021.

2021 State Legislative Session Recap on States' Efforts to Lower Drug Costs

• During the 2021 legislative session, 20 states enacted 43 laws to address rising drug costs.

• Enacted state laws include establishing a prescription drug affordability board (PDAB), limiting patients' out-of-pocket insulin costs, regulating pharmacy benefit managers (PBMs), and requiring prescription drug price transparency. Read more.

New + Notable

SARS-COV-2 Variants

Multiple variants of the virus that causes COVID-19 are circulating globally and within the United States. To date, four variants have been classified as a variant of concern (VOC). The variant of the virus that caused the first U.S. COVID-19 cases in January 2020 no longer circulates in the country. As new variants of the virus emerge and others fade away, the proportion of variants circulating in the United States will continue to rise and fall. Nationally, the proportion of cases attributed to the new VOCs are:

- B.1.617.2 (Delta) is predicted to increase to 51.7%, becoming the predominant lineage in the U.S.
- B.1.1.7 (Alpha) proportion is predicted to decrease to 28.7%.
- P.1 (Gamma) proportion is predicted to decrease to 8.9%.
- B.1.351 (Beta) is predicted to decrease slightly to 0.2%.
- B.1.617.2 (Delta) will increase in all HHS regions and be more than 70% in regions 7 and 8.
- B.1.1.7 (Alpha) is predicted to be less than 50% in all HHS regions.
- P.1 (Gamma) is predicted to be more than 10% in regions 1, 4, 5, 9, and 10.
- B.1.351 (Beta) is predicted to be less than or equal to 0.5% in all HHS regions.

Introducing Vira, the Vax Chatbot

COVID-19 vaccination is lagging in young adults nationally. Vira, the Vax Chatbot is designed to support and meet young people where they are with simple answers to common COVID-19 vaccine questions. Vira is adaptive, learning by listening to your questions and feedback to help scientists respond to emerging questions.

Vira was developed by the International Vaccine Access Center at the Johns Hopkins Bloomberg School of Public Health with experts from the Bloomberg School's Department of International Health and Johns Hopkins Whiting School of Engineering. Vira's knowledge base from Johns Hopkins vaccine scientists was developed with support from the COVID-19 Training Initiative, with funding from Bloomberg Philanthropies.

VaxChat, powered by IBM, was inspired by previous research that showed automated chatbots using AI can effectively communicate credible information and support health behavior changes.

Vira can help health workers or anyone who seeks help fielding questions from family and friends about the COVID-19 vaccines. Check out Vira, a vax chatbot that's here to help you and your loved ones make an informed decision. Explore at VaxChat.org. This information is provided by Johns Hopkins.

Vaccine Updates

A Needle Today Helps Keep COVID Away

The highly transmissible B.1.617.2 (Delta) variant continues to spread across the United States at a rapid pace. Early data suggest that B.1.617.2 now makes up more than 50% of COVID-19 cases. In some parts of the country, this percentage is even higher, especially in areas with low vaccination rates. This rapid rise is concerning and threatens the progress the United States has made toward ending the pandemic.

- As of July 8, 2021, 183.2 million people, or 55.2% of the total U.S. population, have received at least one dose of a COVID-19 vaccine. About 158.3 million people, or 47.7% of the total U.S. population, have been fully vaccinated.* However, cases and hospitalizations are on the rise in areas with low vaccination coverage. Data from recent weeks show that adults ages 18–49 account for more than 40% of COVID-19-associated hospitalizations.
- Fortunately, we have safe and effective vaccines that prevent severe disease, hospitalization, and death. People who are fully vaccinated are protected from B.1.617.2. We are turning the corner on the pandemic and starting to get back to normal. However, stopping the spread of B.1.617.2 requires all of us doing our part.

For more information, please see the current COVID Tracker Weekly Review and/or sign up for the newsletter.

* People are considered fully vaccinated 2 weeks after their second dose in a 2-dose series (such as the Pfizer or Moderna vaccines), or 2 weeks after a single-dose vaccine (such as Johnson & Johnson's Janssen vaccine).

Transfer of Vaccine Outside the U.S.

Additional information is often requested on the transfer of vaccine across international borders. Here are some key points for addressing this issue within your region, state, or community. Currently, it is not possible for states or awardees to transfer COVID-19 vaccine across international borders for the following reasons:

- Vaccine contracts with manufacturers prohibit the use, or authorization of use, of vaccines outside the U.S. and its territories (excluding Departments of Defense and State foreign compounds) which are covered under the PREP Act. Sharing of vaccine internationally would violate these contracts.
- USG limits donations of federal pharmaceutical assets to products that allow the U.S. to maintain pedigree knowledge to attest to the proper storage and handling of the vaccine. Even though COVID-19 vaccine is in state possession, it is still considered a federal asset (similar to vaccine in the VFC program).
- Countries are hesitant to accept vaccine that has been maintained outside of federally monitored storage and handling guidelines. Direct distribution of vaccine from USG helps ensure the safety of vaccine to foreign governments and limits liability to states.

CDC is working tirelessly to assist the U.S. Government with transfer and distribution of vaccine to foreign governments directly from federal depots. Through this channel of vaccine supply chain management, the global distribution of vaccine is both efficient and safe. Although contributing to this effort is desirable, the CDC appreciates your adherence to the policy at this time.

The Advisory Committee on Immunization Practices will meet next Wednesday, July 22 from 11:00 to 4:00 PM EST. Draft agenda can be found here.

Toward a New Strategic Public Health Science for Policy, Practice, Impact, and Health Equity

Rebecca Bunnell, PhD, MEd, Juliet Ryan, MPH, Charlotte Kent, PhD, and the CDC Office of Science and CDC Excellence in Science Committee

The COVID-19 pandemic and its social and health impact have underscored the need for a new strategic science agenda for public health. To optimize public health impact, high-quality strategic science addresses scientific gaps that inform policy and guide practice.

At least 6 scientific gaps emerge from the US experience with COVID-19: health equity science, data science and modernization, communication science, policy analysis and translation, scientific collaboration, and climate science. Addressing these areas within a strategic public health science agenda will accelerate achievement of public health goals.

Public health leadership and scientists have an unprecedented opportunity to use strategic science to guide a new era of improved and equitable public health. (*Am J Public Health*. Published online ahead of print July 1, 2021:e1–e8. https://doi.org/10.2105/AJPH.2021.306355)

COVID-19 has exposed major unmet needs in our nation's public health system related to workforce, diagnostics, preparedness, health disparities, information systems, and response capacity. While there have been numerous calls for creating and sustaining a robust public health infrastructure and for prioritizing science, antiscience sentiments have also been widespread. Without a thoughtful, strategic approach to scientific research; rigorous evaluation of programs; and development of evidence-based public health policy and communication strategies, the United States will be underprepared again when the next pandemic occurs. Ensuring impactful science as the bedrock for decision-making will set a sound foundation for the future, and lessons from COVID-19 can provide direction for a strategic approach to public health science.[1]

Public health has a mandate to reduce morbidity and mortality and advance health equity at the population level. Metrics and frameworks used to rank the impact and value of public health science vary, often reflecting stakeholder perspectives. They frequently include a focus on tangible health benefits, concern about return on investment, interest in specific diseases, or prioritization of bibliometrics and scientometrics.[2,3] Retrospective metrics alone are insufficient to guide strategic science; effective action requires a prospective approach. We believe strategic science begins with a public health goal in mind, systematically identifies and then builds an evidence base to inform practice and policy, and ultimately results in improvement in health and equity outcomes. To optimize public health impact, high-quality strategic science addresses scientific gaps that inform policy and guide practice.

A prioritized strategic science agenda can help guide use of limited public health scientific resources to fill the evidence gaps that will have the largest impact on population health. Many examples of the impact of strategic science exist,[4] ranging from counterbioterrorism efforts informed by the smallpox research agenda,[5] smoke-free policies that protect millions based on research documenting adverse effects of second-hand smoke exposure,[6] increased vaccine coverage following implementation research, coordinated evidence-based actions to reduce antimicrobial resistance informed by surveillance,[7] and millions of lives saved by HIV antiretroviral therapy resulting from applied research on effective delivery

AJPH Published online ahead of print July 1, 2021

strategies. A strategic pursuit of public health science that provides direction, has delineated measurable goals, and provides opportunities for stakeholders and affected communities to engage is needed more than ever. Developing and implementing an effective strategy is crucial for a new public health era.

The COVID-19 pandemic has illuminated at least 6 key themes that are central to a science strategy for improving public health: health equity science; data science and modernization; communication science; policy analysis and translation; scientific, including laboratory, collaboration; and climate science. With a US domestic focus, for each of these 6 themes, we first summarize related COVID-19 lessons. Second, we discuss their implications to help inform a strategic public health science agenda for a new era (Box 1).

HEALTH EQUITY SCIENCE

Structural racism, long-standing injustices, and neglect of factors that cause health inequities in the United States have worsened the consequences of the COVID-19 pandemic and resulted in substantial disparities in COVID-19 incidence, hospitalization, and mortality. Social determinants of health (SDOH) and vital conditions such as employment settings lacking employee protections and insecure or crowded housing have impeded the use of mitigation measures like social distancing and mask wearing. These factors contributed to 1.4- to 1.8-times-higher COVID-19 incidence, 2- to 3-times-higher hospitalization, and 3- to 5-times-higher mortality rates among Black and Hispanic/Latino persons compared with White persons.[8] In addition to elevated environmental exposure risk, racial/ethnic minority populations have less access to health care and higher prevalence of uncontrolled chronic lung, heart, kidney, liver, and metabolic conditions associated with more severe COVID-19 outcomes.[9] Race and ethnicity data have been incomplete, particularly in the beginning of the epidemic, and SDOH data were not widely leveraged, leaving the effects of structural racism, environmental injustice, and other socioeconomic factors largely unexplored. In addition, adverse impacts of the pandemic on employment, education, and other determinants of health could widen future disparities as well because Black, Hispanic/Latino, older, rural, and underinsured populations were more likely to experience unemployment and education setbacks.[10,11]

Future strategic scientific work can advance health equity by both building on existing recommendations and identifying new effective program and policy interventions. Rigorous evaluations of clinical, community, environmental, and policy interventions that link social determinants with health outcomes and assess impact on health inequities are essential.[12] To expand the evidence base, evaluation of real-world impact and the effect of interlocking contextual systems will be important to supplement experimental efficacy studies.[12] Expanding use of validated methods to document SDOH and assess social and environmental factors will be fundamental to this work.[13] This work can also elucidate how failure to address health disparities leads to less-effective preparedness and how health disparities can be exacerbated during a crisis. Research is needed to identify ways in which better data from modernization and innovation can be used to accelerate health equity.[14] Given how SDOH, structural racism, and health disparities contributed to the impact of this pandemic, implementation science should inform preparedness approaches that recognize health equity as a core pillar of future pandemic preparedness efforts.

DATA SCIENCE AND MODERNIZATION

Existing surveillance and data systems have proven inadequate for COVID-19 response efforts. Public health data systems have been historically undersupported and were unable to acquire, share, and transmit data efficiently. The lack of systematic data collection and automated linkages between laboratory-derived data, clinical data, and case investigation data has impeded COVID-19 response speed. Outdated policies and regulatory processes inhibit data collection and sharing at local, state, national, and international levels. Interconnectivity across a vast array of public–private sector systems in the United States has been nascent, slowing utilization of electronic health records in response efforts. While contact tracing can be an important public health tool to interrupt disease transmission, its application for COVID-19, particularly in the initial months of the pandemic and during spike periods, was largely inadequate. Data science could have greatly improved contact-tracing efforts by providing real-time information to those exposed to reduce transmission. Finally, the public health workforce has had limited expertise and access to new tools, policies, and approaches to data visualization, methods, and analytics including epidemiological modeling and disease forecasting as a routine part of pandemic planning and response.[15]

As public health strives to keep pace with rapidly advancing technologic innovation, scientists are poised to

AJPH Published online ahead of print July 1, 2021

MS-DOH-21-1816-A-000826

BOX 1— COVID-19 Lessons and Implications for Strategic Public Health Science

Themes	COVID-19 Lessons	Public Health Science Opportunities
Health equity science	• COVID-19 magnified and widened health disparities and other inequities. • Incomplete data on race, ethnicity, and SDOH limited some analyses. • Race/ethnicity interacted with causal SDOH factors and historical inequities. • Historic neglect of factors that cause health disparities resulted in worse pandemic outcomes.	• Assess how addressing health disparities is part of pandemic preparedness. • Document SDOH, including how they intersect to magnify risk. • Build evidence on intervention effectiveness. • Generate health equity evidence needed by policymakers. • Research how data modernization and innovation can accelerate health equity.
Data science and modernization	• Public health data systems were unable to acquire, share, and transmit data efficiently. • Lack of systematic linkages among laboratory, clinical, and case investigation data impeded response speed. • Outdated policies and regulatory frameworks inhibited data sharing at local, state, national, and international levels. • Public health workforce expertise was insufficient for data linkages and new analytic methods. • Public- and private-sector partnerships were nascent, slowing progress.	• Accelerate modernization to make public health science current. • Expand methods for use of multisectoral data sources, including environmental and climate, community SDOH, geospatial, genomic, and biomarker data. • Evaluate new surveillance and outbreak signal approaches. • Equip public health workforce with data science, genomics, informatics, and analytic skills. • Provide scientific leadership using public health data.
Communication science	• A COVID-19 "infodemic" occurred together with more than 90 million Facebook misinformation warnings • Misinformation and disinformation undermined public health messaging and response efforts. • Public trust in scientific integrity was undermined during COVID-19.	• Evaluate approaches to counter misinformation, such as engaging online influencers. • Expand communication science; assess impact of new technologies and social media. • Strengthen communication strategy as part of research planning. • Evaluate effective methods to amplify research dissemination. • Accelerate pace of science dissemination.
Policy analysis and translation	• Need for universal access to free testing, treatment, and vaccination for COVID-19 was evident. • COVID-19 made intersection of health and other sectors visible, raising plethora of policy issues (e.g., employment, housing, transportation). • Policy barriers hindered consistent mitigation approaches across jurisdictions, (e.g., mask, restaurant, and business opening policies). • Clear, consistent messaging was needed across all levels of policymakers. • COVID-19's postacute health effects (cardiovascular, pulmonary, mental health, and neurologic) raised policy issues in other health care domains. • Telehealth expansion demonstrated both feasibility and need for attention to equitable access.	• Expand use of policy analyses to assess public health impacts. • Utilize strongest methods possible for public health policy research, including randomized and nonrandomized designs. • Leverage partnerships to accelerate dissemination and implementation of evidence-based policy options. • Assess core capacities, policies, and systems, and ethical frameworks needed for future preparedness and resource distribution during public health threats. • Assess incidence, duration, severity, and societal impact of long-term sequelae. • Evaluate approaches to address policy and resource barriers that ensure equitable access as telework expands.
Scientific collaboration	• SARS-CoV-2 sequence was published online in 72 h, setting precedent. • Proliferation of COVID-19 preprints and rapid publications accelerated pace of dissemination. • Community engagement was critical to build trust and mitigation adherence. • Data from multiple sectors and disciplines helped to identify risks and assess mitigation feasibility and effectiveness, including political science, behavioral science, and data science.	• Implement transdisciplinary and convergence research studies. • Pursue research innovation; develop novel methods, such as improving specimen collection or using host genomics to explain health outcomes and responses to treatments and vaccines. • Conduct community participatory research; use tools of collaborative implementation science to enhance public health outcomes. • Facilitate rapid sharing of applied laboratory advances.
Climate science	• Air pollution can aggravate underlying respiratory conditions that lead to more severe COVID-19 outcomes. • Extreme heat, fire, and severe weather complicated COVID-19 mitigation efforts. • New COVID-19 guidance was needed for climate-related emergency response. • Lockdowns and reduced mobility and travel rapidly improved air quality.	• Implement research focused on climate-vulnerable populations. • Leverage predictive analytics to forecast adverse climate effects and intervention needs. • Expand methods and routinely incorporate a climate lens into public health research. • Evaluate effectiveness and impact of interventions designed to mitigate climate change to build evidence base.

Note. SARS-CoV-2 = severe acute respiratory syndrome coronavirus 2; SDOH = social determinants of health.

AJPH Published online ahead of print July 1, 2021

AJPH Published online ahead of print July 1, 2021

benefit from advanced data analytic skills, including those for conducting natural language processing and leveraging machine learning and artificial intelligence. Strategic public health science coupled with innovative use of technology could help transform contact tracing methods for the future. Furthermore, development of, building consensus around, and utilization of new and nimble regulatory, legislative, and ethical frameworks for data collection, sharing, quality, and privacy are needed to reduce risks and maximize benefits associated with rapid modernization. Strategic public health science will require expanded scientific methods and analytic approaches for multisectoral data sources, including community SDOH, environmental and climate, genomic and bioinformatics, social media, and geospatial data. As transdisciplinary data scientists increasingly use public health data, public health scientific leadership is needed to establish core method, analytic, ethical, and policy approaches.

COMMUNICATION SCIENCE

The COVID-19 pandemic has called attention to the cultural, structural, and technological barriers that hamper dissemination and acceptance of accurate messages informed by science. Misinformation and disinformation have spread rapidly in social media. Facebook, for example, reported placing warning labels on more than 90 million pieces of content deemed COVID-19 misinformation.[16] COVID-19 misinformation undermined accurate public health messaging; greater exposure to misinformation was associated with lower compliance with mask wearing and social distancing guidelines.[17]

Disinformation, defined as deliberately misleading or biased information, has been used to intentionally fuel anti-science views and sentiments, particularly among targeted subpopulations.[18] In addition, the sheer volume of evidence-based information and the speed and frequency with which information evolved made consistent and effective risk communication more challenging and led the World Health Organization (WHO) to declare an "infodemic" around COVID-19 in May 2020.[19] The inconsistency of clear COVID-19 messaging across public-sector authorities at local, national, and global levels further undercut mitigation efforts.

Strategic science can leverage community engagement, behavioral economics, and communications science to study the impact of new technologies and strategies to counter misinformation and antiscience disinformation, including engagement of online influencers and trusted messengers to provide a steady flow of evidence-based information.[20] Research to identify effective interventions can assist both health organizations and social media platforms as they work to counter mis- and disinformation.[21] Planning for strategic dissemination, monitoring audience knowledge and sentiment, and countering misinformation are standard practices for all public health scientists to incorporate into daily practice. Coupled with proactive, consistent messaging that employs sound risk communication principles, strategic science can help rebuild trust in public health.[22–24]

POLICY ANALYSIS AND TRANSLATION

COVID-19 has illuminated the potential of policy as a public health tool and impediment. For example, policy decisions to reduce economic barriers for vaccination and testing increased uptake.[25] COVID-19 has also raised a plethora of multisectoral policy challenges that have an impact on transmission risk, including workplace safety, housing density, and transportation. Inconsistent mitigation policies have hindered the response across sectors and jurisdictions, including mask mandates and restaurant, bar, and other business operating policies. Furthermore, the public has often been confused by inconsistent communications about the importance of mitigation policies. COVID-19 has had numerous collateral and lasting impacts, both at the societal and individual level. Public- and private-sector entities will be confronted with potentially millions of people with long-term cardiovascular, pulmonary, mental health, and neurological sequelae,[26] raising policy needs across health care domains.[27] One success has been the rapid expansion of telehealth[28]; policies to ensure equitable access going forward will be needed.[29]

Assessment of the positive and negative impacts of policies and use of mathematical modeling to predict future impacts are key tools for scientific inquiry. A component of this work will be the identification of the core capacities, policies, and systems needed for preparedness. This includes advance assessment of the epidemiological and ethical implications of policy approaches to distribute resources during public health emergencies. Characterizing overall COVID-19 collateral impacts will be an important research area to inform broader health care policy, starting with assessment and monitoring of the incidence, duration, severity, and societal impact of long-term sequelae.

MS-DOH-21-1816-A-000828

Translational science, which includes both implementation and dissemination approaches and moves knowledge to action by ensuring effective and widespread use of evidence-based policies, can leverage policy analysis and implementation research to accelerate action.[30] For example, policy analysis can be used to identify effective mitigation interventions to support those experiencing long-term impacts, assess SDOH, and achieve widespread impact by applying findings through implementation and dissemination strategies. Success of this policy research will depend on utilization of the strongest designs possible, including both randomized and nonrandomized methods.[12]

SCIENTIFIC COLLABORATION

Within 72 hours of the Chinese and WHO announcement of a novel coronavirus, Chinese researchers shared the full sequence for SARS-CoV-2 online, spurring a global effort toward vaccine and therapeutics development.[31] UNESCO accelerated Open Science efforts with 122 nations[32]; the Open COVID Pledge engaged patent holders and the private sector[33]; and more than 150 scientific institutions and journals reaffirmed their commitment to share data and expand open access during the public health emergency.[34] Peer-review timelines have shortened dramatically for COVID-19 scientific information, with rapid review processes and preprint postings.[35] Dissemination of COVID-19–related information exploded; more than 16 000 scientific publications, including greater than 6000 on preprint servers, were posted in just 4 months. Online and digital technologies supported low-cost and timely remote scientific collaborations.[36] Collaborative scientific innovation on mRNA technology greatly accelerated vaccine development,[37] and scientists in multiple settings worked rapidly to build the evidence base on the effectiveness of masking for both source control and user protection. The pandemic accelerated scientific collaboration and promoted new norms around transparency and sharing.

Sustaining a culture of scientific collaboration positions public health science to be enriched with innovation and cross-sectoral expertise, including with sectors outside of health.[38] Concerted effort by scientists will be needed to implement transdisciplinary and convergence research[39]; advance applied laboratory science; conduct community participatory research; pursue research innovation and develop novel methods, such as transdisciplinary environmental health disparities research[40]; and host transparent genomics studies to explain health outcomes and vaccine response.[41] Creative public health practice and academic linkages as well as transdisciplinary team-based research approaches could help drive innovation going forward, including laboratory advancements.[42,43] Improved laboratory capacities are foundational to enhanced public health science, including not only laboratory quality and safety but also advancements in specimen collection, pathogen inactivation, transport, and rapid characterization; multipathogen and point-of-care assays; and biomarker-based diagnostics. Collaborative sequence-based pathogen surveillance reinforced by a global network of reference laboratories can more swiftly identify new and emerging pathogens. Scientists can improve processes for rapidly posting sequences and early findings to accelerate evidence generation for diagnostics, program implementation, and policy development. Modeling the costs and benefits of reducing chronic disease burden before the next infectious disease outbreak could inform a new paradigm for preparedness. Scientists are poised to continue greater collaboration, which could be enhanced with local, national, and global leadership.

CLIMATE SCIENCE

Health threats from climate change are well-documented,[44] and the interplay between COVID-19 and climate and environmental factors is multifaceted.[40] Environmental determinants of health, including deforestation and increasing human presence in wildlife habitats, have fueled both climate change and emergence of zoonotic infections.[45] Climate change, especially changes in temperature and precipitation, can result in changes in the distribution, seasonality, and prevalence of infectious diseases.[46] Air pollution can aggravate underlying respiratory conditions that lead to more severe COVID-19 outcomes.[47] Extreme weather events, including fires and storms, complicated COVID-19 mitigation efforts[48]; in turn, COVID-19 complicated responses to these disasters.[49] COVID-19 also complicated the ability of local health departments to run climate-relevant congregate facilities, such as cooling centers and disaster shelters.[50,51] Lockdowns and reduced mobility and travel improved air quality, but these positive impacts rapidly eroded as mobility increased again.[52] Our collective response to COVID-19 has been described as "a rapid learning experiment about how to cope with climate change."[53] Indeed, COVID-19 and climate change mitigation share similar policy challenges, including the

AJPH Published online ahead of print July 1, 2021

importance of speedy and decisive action to avoid global financial and public health impact, the difficulties of gaining public support for stringent mitigation policies given politicization of the issues, and the need to address health disparities and counter misinformation.[54]

A strategic public health science agenda creates the opportunity to identify effective approaches for these shared policy challenges. Other key priorities include expanding research on the relationship between climate and health outcomes and emerging pandemic threats and improving surveillance for climate-sensitive pathogens and vectors that identify locations and populations at greatest risk. In addition, use of predictive analytics and forecasting can help build an evidence base for early warning systems and for interventions that effectively counter adverse climate effects, particularly for populations experiencing environmental injustice,[55] such as migrant and refugee populations.[56] Given that climate impacts span across public health, from environmental health to chronic and infectious disease and mental health, an interdisciplinary approach can support scientists to expand methods and demonstrate the value of new mandates to routinely incorporate a climate lens in public health research.[57,58]

A NEW ERA OF PUBLIC HEALTH STRATEGIC SCIENCE

The COVID-19 pandemic and its impacts continue to grow, fueling the imperative to create a new era of public health guided by strategic science. The 6 themes emerging from COVID-19 experience discussed here—health equity science, data science and modernization, communication science, policy analysis and translation, scientific collaboration, and climate science—can help formulate a strategic public health science agenda that accelerates achievement of future public health goals (Box 1). To succeed, public health science should be grounded in scientific integrity and supported by a larger, sustained, well-trained, and innovative workforce. Workforce expansion, diversification, and development will be needed at multiple levels, including for epidemiologists, data scientists, and leadership.[59] This enhanced public health workforce could help break the cycle of panic and neglect that has characterized public health attention and resources for decades.[60] Given the impact of COVID-19, it is possible that public health will remain prominent, especially as vaccination coverage expands, other efforts to reduce community transmission continue, and researchers learn more about COVID-19's long-term effects. Public health leader and scientists have an unprecedented opportunity to use strategic science to guide and implement a new era of improved and equitable public health. AJPH

ABOUT THE AUTHORS

Rebecca Bunnell and Juliet Ryan are with the Office of Science, Centers for Disease Control and Prevention (CDC), Atlanta, GA. Charlotte Kent is with *Morbidity and Mortality Weekly Report,* Center for Surveillance, Epidemiology, and Laboratory Services, CDC.

Note. The findings and conclusions in this report are those of the authors and do not necessarily represent the views of the CDC or the Agency for Toxic Substances and Disease Registry.

CORRESPONDENCE

Correspondence should be sent to Rebecca E. Bunnell, PhD, MEd, Centers for Disease Control and Prevention, Atlanta, GA 30333 (e-mail: rrb7@cdc.gov). Reprints can be ordered at http://www.ajph.org by clicking the "Reprints" link.

SUPPLEMENT ARTICLE

Evidence, Experience, Expertise, and the US Coronavirus Disease 2019 Public Health Response

Neela D. Goswami, Anthony E. Fiore, and Henry T. Walke

Centers for Disease Control and Prevention, Atlanta, Georgia, USA

The U.S. Centers for Disease Control and Prevention (CDC), state, tribal, and local health departments assess available and promising interventions and individual and population health outcomes when crafting public health recommendations. This supplement provides a snapshot of some of the science, experience, and expertise supporting the COVID-19 response.

Keywords. COVID-19; CDC; public health; guidelines; transmission.

The United States (US) response to the coronavirus disease 2019 (COVID-19) pandemic underscores the need for evidence-based approaches to public health and clinical interventions. Charged with providing public health guidance and responding wherever the need is urgent, the US Centers for Disease Control and Prevention (CDC) and state, tribal, local, and territorial health departments assess individual- and population-level health outcomes, available and promising interventions, and downstream consequences when crafting public health recommendations and interventions. Over the past year, this pandemic response has demonstrated that a transparent, collaborative, and science-based approach that adapts to complex and rapidly evolving conditions is and will continue to be critical to bringing an end to the pandemic.

Data-driven guidance begins with clear terminology characterizing the evidence. National reports have demonstrated that the numbers of COVID-19 cases involving hospitalization and death have directly correlated with overall reported severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) infections [1]. As we look forward, particularly with increased vaccine and treatment availability, SARS-CoV-2 infection will lead to varying clinical outcomes, and the correlation with severe COVID-19 disease will not be as straightforward. As US COVID-19 hospitalizations and deaths decrease, reported mild or asymptomatic SARS-CoV-2 infections might not decrease at the same pace in all communities. Adapting the current case definition of COVID-19 [2], which assigns the same importance to mildly symptomatic infection as severe disease, to the appropriate context, with more rigorous delineation between asymptomatic or mildly symptomatic viral infection and a severe clinical syndrome, can facilitate informed clinician–patient conversations, targeted clinical and epidemiologic studies, evidence-based recommendations and policy, and effective resource allocation. We should consistently understand this distinction in every setting and subpopulation where we apply evidence and experience. This is analogous to the evolution of new nomenclature and disease classification that occurred as more was understood about human immunodeficiency virus (HIV) infection being clinically distinct from AIDS or latent tuberculosis (TB) infection as distinct from TB disease. Precision in how we characterize the epidemiology of infections at the local level will be critical for sustaining control of transmission and accelerating recovery.

In this supplement, we provide a snapshot of some of the science, experience, and experts supporting the response. We touch on 5 major topics with these articles: clinical sequelae of SARS-CoV-2 infection, SARS-CoV-2 testing, COVID-19's interaction with other infectious diseases, COVID-19 and disproportionately affected persons, and SARS-CoV-2 transmission.

CLINICAL SEQUELAE OF SARS-COV-2 INFECTIONS

The impact on patients and healthcare burden of minimally symptomatic SARS-CoV-2 infection is unequivocally different from the burden of severe COVID-19. Chevinsky et al demonstrate that the timing and type of post–COVID-19 sequelae differ between hospitalized inpatients and outpatients compared to control patients without COVID-19 [3]. This cohort study of over 25,000 inpatients and over 40,000 outpatients diagnosed with COVID-19 and matched to control patients without COVID-19 through a 4-month follow-up period, using electronic health record data and propensity score matching, demonstrates differences in long-term outcomes in patients diagnosed with COVID-19 compared to control patients without COVID-19, stratified by setting at diagnosis.

In addition to setting and severity of SARS-CoV-2 infection at diagnosis, many underlying medical conditions affect progression

to severe disease; pregnancy is one of the most common comorbid conditions in our population. Two studies in this supplement look exclusively at pregnant women with COVID-19. Using CDC's Surveillance for Emerging Threats to Mothers and Babies Network (SET-NET), Galang et al found that among 7950 pregnant women identified with SARS-CoV-2 infection, certain risk factors, such as pregestational diabetes, age 25 years and older, and healthcare occupation, were associated with moderate-to-severe COVID-19 [4]. Using data from over 400,000 delivery hospitalizations, Ko et al expand upon these findings, showing that a documented COVID-19 diagnosis at delivery hospitalization was associated with increased risk for sepsis, shock, acute renal failure, thromboembolic disease, adverse cardiac events/outcomes, intensive care unit admission, preterm labor with preterm delivery, and death, independent of race or ethnicity [5].

The goal of preventing hospitalization and death for those at highest risk of acquiring SARS-CoV-2 infection and progressing to severe COVID-19 directly informed vaccination program planning efforts in the US, with Advisory Committee on Immunization Practices (ACIP) recommendations targeting early vaccination distribution to persons in long-term care facilities, persons aged ≥65 years, frontline essential workers, and persons aged 16–64 years with high-risk medical conditions [6]. Sami et al demonstrate that in a sample of hospitalized patients from 14 academic centers in the US, more than 90% met ≥1 of these risk factors for severe COVID-19 [7]. These findings support continued emphasis on promoting vaccination for persons with higher-risk medical conditions, even as vaccines are widely available.

SARS-COV-2 TESTING

Alongside vaccine rollout, this year also witnessed the launch of more detailed CDC recommendations for SARS-CoV-2 testing [8], and more widespread SARS-CoV-2 testing across a variety of settings. Testing brings both opportunity and complexity. Fox et al demonstrate how, prior to vaccine availability, testing facilitated implementation of shortened quarantine protocols on college campuses, and reduced time lost from classroom and other campus commitments [9]. These data provided support for CDC's initial recommendations to reduce quarantine duration using diagnostic testing [10]. College student and staff vaccination are changing the campus landscape even further. Recognizing the importance of maintaining essential public health services during the pandemic even prior to vaccine availability, Laws et al describe the Ugandan Ministry of Health supplementing prevention measures with SARS-CoV-2 universal testing and isolation of persons with positive tests to continue an in-person HIV public health training activity [11].

Testing alone, however, has not been sufficient to prevent SARS-CoV-2 outbreaks. Moreno et al describe more than 30 confirmed secondary cases that occurred within a university athletics program after the index patient attended a meeting while infectious, despite a negative antigen test on the day of the meeting [12]. Clearly now, vaccination, regardless of any testing strategy, is essential to reduce transmission.

Interpreting a positive or negative SARS-CoV-2 test result requires consideration of multiple contextual factors. Test type, body site of specimen collection, how and why the specimen is collected and vaccination status, are all important to consider. Shah et al's evaluation of the BinaxNOW antigen test in an unvaccinated community setting in Wisconsin, found 99% concordance on repeat testing despite different testers and readers, showing reproducibility and supporting use of this platform in broader sectors [13]. Choice of specimen for testing also matters. In the study by Gable et al evaluating less invasive specimen types, investigators compared matched oropharyngeal swabs, anterior nasal swabs (ANS), and saliva collected from each unvaccinated participant across the course of their infections [14]. Saliva yielded more reverse-transcription polymerase chain reaction (RT-PCR) positives at later time points, suggesting that saliva-based diagnostics may lead to more unnecessary infection control actions by identifying RT-PCR–positive individuals who are potentially no longer infectious. ANS yielded the most RT-PCR positives at earlier time points and culturable virus more often than oropharyngeal specimens, suggesting that test positivity with this specimen may be a better indicator of infectivity. Finally, with goals of increasing patient acceptance and conserving healthcare resources, Marx et al evaluated self-collected saliva or ANS for SARS-CoV-2, compared with clinician-collected nasopharyngeal swabs in Denver, Colorado [15]. Sensitivity for SARS-CoV-2 detection by rRT-PCR in self-collected specimens was higher among unvaccinated symptomatic participants than among those without symptoms (94% vs. 29% for saliva; 87% vs. 50% for ANS) in this study. These data suggest self-collection offers many practical advantages and may be most useful for unvaccinated symptomatic patients patients.

COVID-19'S INTERACTION WITH OTHER INFECTIOUS DISEASES

Widespread testing and the overwhelming presence of COVID-19 in medical systems has the potential to lead clinical and public health practitioners astray, particularly when other infectious diseases are present. Narita et al describe a few clear examples from Seattle, Washington, where patients with risk factors for TB were repeatedly tested only for SARS-CoV-2 upon presentation to care, many tests later to be diagnosed with late-stage, infectious TB, including 1 death from TB [16]. Conversely, Schrodt et al characterize a long-term-care facility outbreak where, based on initial rapid testing, there appeared to be concurrent outbreaks of influenza and SARS-CoV-2; however, the influenza tests were all later found to be false positives [17]. Use of a rapid antigen test for influenza distracted the facility from focusing solely on a SARS-CoV-2 outbreak. These articles highlight that even during a pandemic, infectious disease and public health

expertise from the pre–COVID-19 era and careful consideration of the overall clinical context remain critical to appropriate interpretation of SARS-CoV-2 test results.

COVID-19 AND DISPROPORTIONATELY AFFECTED PERSONS

Many groups who have been marginalized depend on their employers to align with national or local guidance, and workplace-specific challenges may prevent prompt detection, intervention, and prevention of COVID-19 outbreaks [18]; this may foreshadow similar challenges for vaccination efforts. Beyond the direct impact of COVID-19 itself, other consequences of the pandemic have resulted in a disproportionate burden on persons at risk of other diseases. Based on National Emergency Medical Services Information System data describing 911 emergency medical services (EMS) activations in 2020, EMS activations as a percentage of total activations increased during the early pandemic period for cardiac arrest, on-scene death, and opioid-related events, remaining above baseline levels through the end of the year [19].

In response, there has been focused national attention on disproportionately affected persons in many aspects of the pandemic. Marks et al characterized the potential for Health Resources and Services Administration (HRSA) Health Center Program service delivery sites to deliver COVID-19 vaccines to up to 30 million patients. With the exception of non-Hispanic black and American Indian/Alaska Native persons, there were more health center influenza vaccinations among racial/ethnic minorities, particularly among Hispanics, in comparison with county racial/ethnic demographics [20]. In April 2021, HRSA and CDC invited all HRSA-funded health centers to participate in a direct COVID-19 vaccine allocation program (Ensuring Equity in COVID-19 Vaccine Distribution: Engaging Federally Qualified Health Centers, https://www.hrsa.gov/coronavirus/health-center-program). Furthermore, Wilson et al describe the implementation of the Infection Prevention and Control (IPC) Global Webinar Series to bring together subject-matter experts and IPC professionals to share guidance and implementation examples across healthcare communities who no longer, or previously did not, have access to traditional modes of knowledge dissemination [21].

SARS-COV-2 TRANSMISSION

Finally, in regards to both COVID-19 and other upper respiratory viral diseases, 2 studies provide support for CDC recommendations on mitigation measures essential for control of SARS-CoV-2 as well as other upper respiratory viral infections during periods of widespread community transmission. Carter et al describe multistate SARS-CoV-2 transmission among approximately 462 000 unvaccinated persons attending a variety of outdoor and indoor activities at a national motorcycle rally held in South Dakota in August 2020 [22]. COVID-19 was diagnosed in participants not only in South Dakota, but also in Minnesota, Montana, North Dakota, Nebraska, and Wyoming, confirming increased risk of widespread SARS-CoV-2 transmission from mass gatherings where unvaccinated attendees traveled from outside the local area.

Basic nonpharmaceutical interventions have implications for respiratory viruses beyond SARS-CoV-2. Rodgers et al describe findings from an analysis of emergency department visits reported to the National Syndromic Surveillance Program according to chief complaints and diagnosis codes, excluding visits with diagnosed SARS-CoV-2 infections [23]. For each week during 1 March–31 December 2020, percentage positivity for influenza virus, respiratory syncytial virus, human parainfluenza virus, adenoviruses, and human metapneumovirus were lower in 2020 than 2019, suggesting that nonpharmaceutical interventions to mitigate spread of SARS-CoV-2 likely also reduced transmission of other pathogens.

In conclusion, the US public health response has required a coalition of federal, state, and local public health officials as well as researchers, academics, pharmaceutical partners, and clinicians working tirelessly to apply evidence, experience, and expertise in the development, implementation, and evaluation of national COVID-19 recommendations. The studies in this supplement provide insights into some of the most important aspects of the pandemic—who is at highest risk for which severe outcomes, how we can accurately track SARS-CoV-2 infections while maintaining awareness of other concurrent or mimicking illnesses, and opportunities for public health and clinical medicine to bring expertise and experience together to combat one of the largest threats to health of the past century. While in the US, deaths from the pandemic have reached more than half a million in the past year, through steady vaccination rollout and consistent implementation of evidence-based interventions, we are finally passing from darkness into the dawn.

cdc.gov/coronavirus

From: Polk, Jennifer (OS/ASPR/SIIM)
Subject: HHS COVID-19 Update - 3/31
Date: Thursday, April 1, 2021 7:53:48 AM

From: Baker, Michael (OS/IEA) <Michael.Baker@hhs.gov>
Sent: Wednesday, March 31, 2021 8:26 PM
Subject: HHS COVID-19 Update - 3/31

Dear Partner:

HHS Office of Intergovernmental and External Affairs COVID-19 update for March 31, 2021:

Highlights from the White House COVID-19 Response Team briefing:

Andy Slavitt:

- **Increasing Vaccination Sites:** The President committed to opening at least 12 more federally run mass vaccination sites, adding to the existing total of 25 sites. Three new sites will open next week in Memphis, Tennessee, Milwaukee, Wisconsin, and Greenbelt, Maryland, in addition to the two we announced on Monday in St. Louis, Missouri, and Gary, Indiana. Each of these sites is the first federally run mass vaccination site in its respective state, and each can administer 3,000 vaccinations a day.
- **Mask Mandates:** We need every governor, mayor, and local leader to maintain or reinstate mask mandates. And we need every American to do their part so that we can win this race and save lives.

Dr. Walensky:

- **Case Update:** CDC's most recent data show that the seven-day average of new cases is slightly less than 62,000 cases per day. We continue to see an increase, and this is almost a 12 percent increase from the seven-day period prior. Hospitalizations also continue to increase. The most recent seven-day average — about 4,900 admissions per day — is up from 4,600 admissions per day in the prior seven-day period. The seven-day average of deaths remains slightly above 900 deaths per day.
- **Inequities in COVID-19 Deaths:** COVID-19 deaths were highest for older adults and males, and were higher, as we previously saw, among American Indian and Alaska Natives, Hispanics, non-Hispanic Blacks, and non-Hispanic Native Hawaiian and Pacific Islander persons compared to non-Hispanic whites. In fact, among nearly all these ethnic and racial minority groups, the COVID-19-related deaths were more than double the death rate of non-Hispanic white persons. Based on the current state of the pandemic, these impacts have remained in 2021, where we continue to see that communities of color account for an outsize portion of these deaths.
- **Number of People Vaccinated:** This week, we will reach 100 million people who have received at least one dose of the COVID-19 vaccine in the United States — a remarkable feat in such a short period of time. Further, over 70 percent of people over age 65, our most vulnerable group, have received at least one vaccine dose. In addition to increasing the number of mass vaccination sites across the country with FEMA, expanding the Federal

Retail Pharmacy Program, and ensuring that all Americans have a vaccine site within five miles of their home, we are also activating mobile vaccination units and clinics. CDC is also excited to partner with the Administration for Community Living to support their efforts to get older, at-risk adults and those with disabilities vaccinated.

- **Guidance for Adult Day Service Centers:** CDC updated COVID-19 guidance for adult day service centers. These populations are at high risk for severe COVID-19 disease, and this guidance will help center administrators and staff protect themselves and adults receiving their services by promoting and engaging in preventive behaviors that reduce COVID-19 spread and help maintain healthy operations and environments of these facilities.
- **B.1.1.7 Variant:** We now have B.1.1.7 (U.K. variant) as 26 percent of the circulating variant across the United states, and it is the predominant strain in at least five regions of the United States. The variant is more transmissible – somewhere between 50 and 70 percent more transmissible than the wild-type strain. Therefore, to the extent that people are not practicing those standard mitigation strategies, we do think that more infections will result because of B.1.1.7. We believe that the current mitigation strategies of masking and distancing would work just as well against the current, the wild-type strain, as they do the B.1.1.7 strain.

Dr. Fauci:

- **Importance of Getting Vaccinated:** We are seeing now immune protection against COVID-19 variants when individuals are vaccinated against the wild-type strain, namely the common virus in society, on two mechanisms: the antibody response that has a spillover effect and the cross-reactivity. Vaccination is not only going to protect us against the common COVID-19 virus in society, but it has the potential, to a greater or lesser degree, to also protect against a range of variants. So, when vaccination becomes available, get vaccinated.

Vaccine Updates

Federal Retail Pharmacy Program: CDC updated their general information on the Federal Retail Pharmacy Program for COVID-19 Vaccination. As the program expands and supply becomes more readily available, the allocation may be adjusted to reflect partner size (number of store locations nationwide), reach (percent of the total US population living within 5 miles of a store location), and ability to vaccinate (throughput). The program, which will scale up to eventually include COVID-19 vaccination at all 40,000+ retail locations, will make it easier for individuals to access free COVID-19 vaccine at a pharmacy in their community, and improve vaccine uptake while decreasing the logistical and operations burden on state, local, and territorial health departments.

Johnson & Johnson Janssen Vaccine: CDC updated their general information on the Johnson & Johnson Vaccine. The J&J/Janssen vaccine is recommended for people aged 18 years and older. Learn more about how CDC is making COVID-19 vaccine recommendations and CDC's vaccine rollout recommendations.

FEMA Vaccination Sites: FEMA announced that it will open a COVID-19 vaccination site in Greenbelt, Maryland on April 7th. The center's capacity is expected to be up to 3,000 shots per day.

President Biden also committed to opening sites in Memphis, TN and Milwaukee, WI. These sites join many new FEMA vaccination sites recently announced, including in Boston, Massachusetts; Essex, New Jersey; Norfolk, Virginia; and Yakima, Washington, all of which open today. In the next week, federal communication vaccination center pilot sites in Gary, Indiana and St. Louis, Missouri are scheduled to open, as well. The agency has provided more than $4.47 billion for expenses related to COVID-19 vaccination at 100% federal cost share.

Peace Corps Assistance in COVID-19 Response: FEMA and the Peace Corps announced a historic partnership to combat the COVID-19 pandemic, marking only the second time in the Peace Corp's history where volunteers will serve a domestic deployment. The Peace Corps will soon begin recruiting for the special domestic deployment through Peace Corps Response, a program that sends in individuals with specialized experienced to short-term service assignment of up to 12 months. Assignments will focus on urgent needs as identified by FEMA and on communities that have been traditionally under-served.

Evaluating Moderna COVID-19 Variant Vaccine: An investigational vaccine designed to protect against the B.1.351 SARS-CoV-2 variant has been administered as part of a new Phase 1 clinical trial evaluating the vaccine candidate's safety and immunogenicity in adult volunteers. The vaccine, known as mRNA-1273.351, was developed by the biotechnology company ModernaTX, Inc., based in Cambridge, Massachusetts. The trial is led and funded by the National Institute of Allergy and Infectious Diseases (NIAID), part of the National Institutes of Health. The trial will enroll approximately 210 healthy adult volunteers at four clinical research sites in the United States that are part of the NIAID-funded Infectious Diseases Clinical Research Consortium (IDCRC).

HHS Podcast: HHS's new podcast, *COVID-19 Immunity in Our Community*, features top medical experts to answer questions on COVID-19 vaccines. Today's episode, "Building Vaccine Trust Within the Black Community," discusses how we can start to rebuild the Black community's trust in the vaccines, in order to achieve herd immunity and, hopefully, regain some sense of normalcy in our everyday lives.

Testing and Treatment

Covid-19 Precautions: CDC updated their COVID-19 page, reiterating that it is critical to keep taking precautions to prevent COVID-19. Learn more about how to protect yourself and others from CDC's recommendations.

COVID-19 Self Testing: CDC and NIH launched an innovative community health initiative called "Say Yes! COVID Test" starting in two locales, Pitt County, North Carolina, and coming soon to Chattanooga/Hamilton County, Tennessee. As many as 160,000 residents across the two communities will have access to free, rapid antigen tests that they can administer themselves to use three times a week for one month. NIH will provide the tests (also called a home-test or at-home test) and evaluate the effectiveness of the initiative, which aims to determine if frequent self-administered COVID-19 testing helps residents reduce community transmission of SARS-CoV-2, the virus that causes COVID-19 disease.

$147 Million to Expand Production of Swabs: DOD and HHS awarded $146.7 million to Puritan Medical Products on March 26 for renovations in the company's Orlinda, Tenn. facility to increase production capacity of foam tip swabs used in COVID-19 diagnostic tests. Funded through HCEA, the award will help the company boost total production capacity of the swabs to 250 million per month by February 2022.

Monoclonal Antibody Treatments: 3 EUAs for monoclonal antibody (mAb) treatments for mild-to-moderate COVID-19 in at-risk patients: bamlanivimab, casirivimab/imdevimab, and bamlanivimab/etesevimab. Learn more about FDA-authorized monoclonal treatments that can help at-risk patients fight the disease.

HHS Innovative Challenge for Masks: The U.S. Department of Health and Human Services launches $500,000 innovation challenge competition today encouraging American inventors to aid the nation's COVID-19 response by designing effective, comfortable face masks for personal use that resolve the common complaints people have about wearing masks. The contest taps into the nation's creativity and entrepreneurial spirit to help curb the spread of SARS-CoV-2, the virus that causes COVID-19.

Information for Specific Populations

Healthcare Workers: CDC updated their guidance for managing patients with COVID-19, including clinical guidance, home and hospital care, care for special populations, disease severity, and more.

Guidance for Adult Day Services Centers: CDC released guidance for administrators and staff to prevent the spread of COVID-19. Adult Day Services Centers (ADSCs) provide social or health services to community-dwelling adults aged 65 and over and adults of any age living with disability. Older adults and persons with disabilities are at highest risk for severe illness from COVID-19 including hospitalization, intensive care, and death. ADSC administrators and staff can help protect themselves and program participants (that is, adults attending ADSCs) from COVID-19 by promoting and engaging in preventive behaviors that reduce spread and maintain healthy operations and environments at ADSC facilities. This guidance is meant to supplement — not replace — any Federal, state, tribal, local, or territorial public health and safety laws, rules, and regulations with which adult day services center programs must comply. CDC has also developed recommendations for participants at ADSCs and their caregivers.

Suggestions for Youth and Summer Camps: CDC offers suggestions for ways in which camp administrators can help protect campers, staff, and communication, and prevent the spread of COVID-19. Camp administrators can determine, in collaboration with state and local health officials, whether and how to implement these considerations, making adjustments to meet the unique needs and circumstances of the local community. Implementation should be guided by what is feasible, practical, acceptable, and tailored to the needs of each community. These suggestions are meant to supplement— not replace —any state, local, territorial, or tribal health and safety laws, rules, and regulations with which camps must comply.

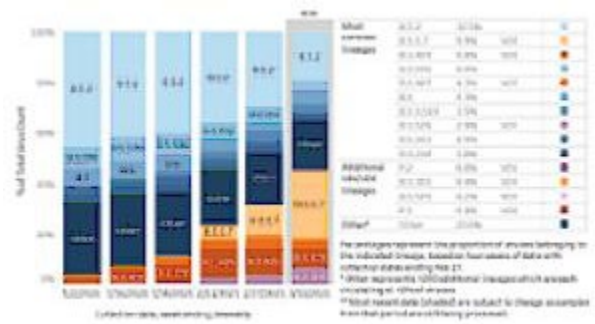
Essential Services for Malaria: CDC updated their key considerations for continuing essential malaria prevention and control activities safely and effectively. These considerations should supplement country Ministry of Health guidance.

CMS Updates

Medicare Fee-for-Service Billing: CMS updated their COVID-19 Frequently Asked Questions on Medicare Fee-for-Service (FFS) Billing. The policies set out in this FAQ are effective for the duration of the public health emergency unless superseded by future legislation. The FAQs in this document supplement the previously released FAQs, 1135 Waiver FAQs.

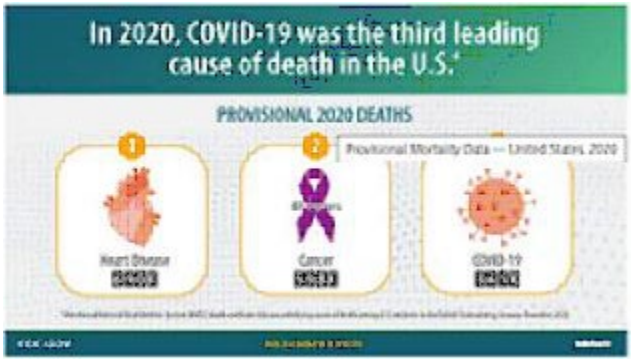
Research

Variant Proportions in the U.S: CDC's national genomic surveillance program identifies new and emerging SARS-CoV-2 variants to determine implications for COVID-19 diagnostics, treatments, or vaccines authorized for use in the United States. Monitoring the spread of emerging variants in the United States relies on widespread, rapid sequencing. To accelerate sequencing in the United States, CDC has contracted with commercial diagnostic laboratories, and, in partnership with the Association of Public Health Laboratories (APHL), has implemented the National SARS-CoV-2 Strain Surveillance (NS3) program to provide a comprehensive and population-based US surveillance system. This data, along with data from many other sources, are used to inform national and state public health actions related to variants.



COVID-19 2020 Mortality Surveillance: The Morbidity and Mortality Weekly Report (*MMWR*) on death certificate-based ICD-10 diagnosis codes for COVID-19 mortality surveillance addresses that among the 378,048 death certificates from 2020 listing COVID-19, 5.5% listed COVID-19 without codes for any other conditions. Among 357,133 death certificates with at least one other condition, 97% had a co-occurring diagnosis of a plausible chain-of-event condition (e.g., pneumonia or respiratory failure), or a significant contributing condition (e.g., hypertension or diabetes), or both. These findings support the accuracy of COVID-19 mortality surveillance in the United States using official death certificates. High-quality documentation of death certificate diagnoses is essential for an authoritative public record.

Provisional 2020 Mortality Data: The Morbidity and Mortality Weekly Report (*MMWR*) on provisional mortality data in the United States in 2020 addresses that the age-adjusted death rate increased by 15.9% in 2020. Overall death rates were highest among non-Hispanic Black persons and non-Hispanic American Indian or Alaska Native persons. COVID-19 was the third leading cause of death, and the COVID-19 death rate was highest among Hispanics. Provisional death estimates provide an early indication of shifts in mortality trends. Timely and actionable data can guide public health policies and interventions for populations experiencing higher numbers of deaths that are directly or indirectly associated with the COVID-19 pandemic.



Case Forecasts: This week's national ensemble predicts that the number of newly reported COVID-19 cases will remain stable or have an uncertain trend over the next 4 weeks, with 223,000 to 723,000 new cases likely reported in the week ending April 24, 2021. The state- and territory-level ensemble forecasts predict that over the next 4 weeks, the number of new reported cases per week will likely decrease in 4 jurisdictions, which are indicated in the forecast plots below. Trends in numbers of future reported cases are uncertain or predicted to remain stable in the other states and territories. View previous case forecasts.

Hospitalization Forecasts: This week's national ensemble predicts that the number of new daily confirmed COVID-19 hospital admissions will remain stable or have an uncertain trend over the next 4 weeks, with 2,300 to 8,700 new confirmed COVID-19 hospital admissions likely reported on April 26, 2021. The state- and territory-level ensemble forecasts predict that over the next 4 weeks, the number of daily confirmed COVID-19 hospital admissions will likely increase in 6 jurisdictions and decrease in 12 jurisdictions, which are indicated in the forecast plots below. Trends in numbers of future reported hospital admissions are uncertain or predicted to remain stable in the other states and territories. View previous hospitalization forecasts.

Death Forecasts: This week's national ensemble predicts that the number of newly reported COVID-19 deaths will remain stable or have an uncertain trend over the next 4 weeks, with 3,100 to 10,200 new deaths likely reported in the week ending April 24, 2021. The national ensemble predicts that a total of 565,000 to 585,000 COVID-19 deaths will be reported by this date. The state- and territory-level ensemble forecasts predict that over the next 4 weeks, the number of newly reported deaths per week will likely decrease in 8 jurisdictions, which are indicated in the forecast plots below. Trends in numbers of future reported deaths are uncertain or predicted to remain stable in the other states and territories. View previous death forecasts.

Office of Intergovernmental and External Affairs
U.S. Department of Health and Human Services
Washington, D.C.

From: Baker, Michael (OS/IEA)
Subject: HHS COVID-19 Update - 3/31
Date: Wednesday, March 31, 2021 7:24:43 PM

Dear Partner:

HHS Office of Intergovernmental and External Affairs COVID-19 update for March 31, 2021:

Highlights from the White House COVID-19 Response Team briefing:

Andy Slavitt:

- **Increasing Vaccination Sites:** The President committed to opening at least 12 more federally run mass vaccination sites, adding to the existing total of 25 sites. Three new sites will open next week in Memphis, Tennessee, Milwaukee, Wisconsin, and Greenbelt, Maryland, in addition to the two we announced on Monday in St. Louis, Missouri, and Gary, Indiana. Each of these sites is the first federally run mass vaccination site in its respective state, and each can administer 3,000 vaccinations a day.
- **Mask Mandates:** We need every governor, mayor, and local leader to maintain or reinstate mask mandates. And we need every American to do their part so that we can win this race and save lives.

Dr. Walensky:

- **Case Update:** CDC's most recent data show that the seven-day average of new cases is slightly less than 62,000 cases per day. We continue to see an increase, and this is almost a 12 percent increase from the seven-day period prior. Hospitalizations also continue to increase. The most recent seven-day average — about 4,900 admissions per day — is up from 4,600 admissions per day in the prior seven-day period. The seven-day average of deaths remains slightly above 900 deaths per day.
- **Inequities in COVID-19 Deaths:** COVID-19 deaths were highest for older adults and males, and were higher, as we previously saw, among American Indian and Alaska Natives, Hispanics, non-Hispanic Blacks, and non-Hispanic Native Hawaiian and Pacific Islander persons compared to non-Hispanic whites. In fact, among nearly all these ethnic and racial minority groups, the COVID-19-related deaths were more than double the death rate of non-Hispanic white persons. Based on the current state of the pandemic, these impacts have remained in 2021, where we continue to see that communities of color account for an outsize portion of these deaths.
- **Number of People Vaccinated:** This week, we will reach 100 million people who have received at least one dose of the COVID-19 vaccine in the United States — a remarkable feat in such a short period of time. Further, over 70 percent of people over age 65, our most vulnerable group, have received at least one vaccine dose. In addition to increasing the number of mass vaccination sites across the country with FEMA, expanding the Federal Retail Pharmacy Program, and ensuring that all Americans have a vaccine site within five miles of their home, we are also activating mobile vaccination units and clinics. CDC is also excited to partner with the Administration for Community Living to support their efforts to get older, at-risk adults and those with disabilities vaccinated.
- **Guidance for Adult Day Service Centers:** CDC updated COVID-19 guidance for adult day

service centers. These populations are at high risk for severe COVID-19 disease, and this guidance will help center administrators and staff protect themselves and adults receiving their services by promoting and engaging in preventive behaviors that reduce COVID-19 spread and help maintain healthy operations and environments of these facilities.

- **B.1.1.7 Variant:** We now have B.1.1.7 (U.K. variant) as 26 percent of the circulating variant across the United states, and it is the predominant strain in at least five regions of the United States. The variant is more transmissible – somewhere between 50 and 70 percent more transmissible than the wild-type strain. Therefore, to the extent that people are not practicing those standard mitigation strategies, we do think that more infections will result because of B.1.1.7. We believe that the current mitigation strategies of masking and distancing would work just as well against the current, the wild-type strain, as they do the B.1.1.7 strain.

Dr. Fauci:

- **Importance of Getting Vaccinated:** We are seeing now immune protection against COVID-19 variants when individuals are vaccinated against the wild-type strain, namely the common virus in society, on two mechanisms: the antibody response that has a spillover effect and the cross-reactivity. Vaccination is not only going to protect us against the common COVID-19 virus in society, but it has the potential, to a greater or lesser degree, to also protect against a range of variants. So, when vaccination becomes available, get vaccinated.

Vaccine Updates

Federal Retail Pharmacy Program: CDC updated their general information on the Federal Retail Pharmacy Program for COVID-19 Vaccination. As the program expands and supply becomes more readily available, the allocation may be adjusted to reflect partner size (number of store locations nationwide), reach (percent of the total US population living within 5 miles of a store location), and ability to vaccinate (throughput). The program, which will scale up to eventually include COVID-19 vaccination at all 40,000+ retail locations, will make it easier for individuals to access free COVID-19 vaccine at a pharmacy in their community, and improve vaccine uptake while decreasing the logistical and operations burden on state, local, and territorial health departments.

Johnson & Johnson Janssen Vaccine: CDC updated their general information on the Johnson & Johnson Vaccine. The J&J/Janssen vaccine is recommended for people aged 18 years and older. Learn more about how CDC is making COVID-19 vaccine recommendations and CDC's vaccine rollout recommendations.

FEMA Vaccination Sites: FEMA announced that it will open a COVID-19 vaccination site in Greenbelt, Maryland on April 7th. The center's capacity is expected to be up to 3,000 shots per day. President Biden also committed to opening sites in Memphis, TN and Milwaukee, WI. These sites join many new FEMA vaccination sites recently announced, including in Boston, Massachusetts; Essex, New Jersey; Norfolk, Virginia; and Yakima, Washington, all of which open today. In the next week, federal communication vaccination center pilot sites in Gary, Indiana and St. Louis, Missouri are scheduled to open, as well. The agency has provided more than $4.47 billion for expenses

related to COVID-19 vaccination at 100% federal cost share.

Peace Corps Assistance in COVID-19 Response: FEMA and the Peace Corps announced a historic partnership to combat the COVID-19 pandemic, marking only the second time in the Peace Corp's history where volunteers will serve a domestic deployment. The Peace Corps will soon begin recruiting for the special domestic deployment through Peace Corps Response, a program that sends in individuals with specialized experienced to short-term service assignment of up to 12 months. Assignments will focus on urgent needs as identified by FEMA and on communities that have been traditionally under-served.

Evaluating Moderna COVID-19 Variant Vaccine: An investigational vaccine designed to protect against the B.1.351 SARS-CoV-2 variant has been administered as part of a new Phase 1 clinical trial evaluating the vaccine candidate's safety and immunogenicity in adult volunteers. The vaccine, known as mRNA-1273.351, was developed by the biotechnology company ModernaTX, Inc., based in Cambridge, Massachusetts. The trial is led and funded by the National Institute of Allergy and Infectious Diseases (NIAID), part of the National Institutes of Health. The trial will enroll approximately 210 healthy adult volunteers at four clinical research sites in the United States that are part of the NIAID-funded Infectious Diseases Clinical Research Consortium (IDCRC).

HHS Podcast: HHS's new podcast, *COVID-19 Immunity in Our Community*, features top medical experts to answer questions on COVID-19 vaccines. Today's episode, "Building Vaccine Trust Within the Black Community," discusses how we can start to rebuild the Black community's trust in the vaccines, in order to achieve herd immunity and, hopefully, regain some sense of normalcy in our everyday lives.

Testing and Treatment

Covid-19 Precautions: CDC updated their COVID-19 page, reiterating that it is critical to keep taking precautions to prevent COVID-19. Learn more about how to protect yourself and others from CDC's recommendations.

COVID-19 Self Testing: CDC and NIH launched an innovative community health initiative called "Say

Yes! COVID Test" starting in two locales, Pitt County, North Carolina, and coming soon to Chattanooga/Hamilton County, Tennessee. As many as 160,000 residents across the two communities will have access to free, rapid antigen tests that they can administer themselves to use three times a week for one month. NIH will provide the tests (also called a home-test or at-home test) and evaluate the effectiveness of the initiative, which aims to determine if frequent self-administered COVID-19 testing helps residents reduce community transmission of SARS-CoV-2, the virus that causes COVID-19 disease.

$147 Million to Expand Production of Swabs: DOD and HHS awarded $146.7 million to Puritan Medical Products on March 26 for renovations in the company's Orlinda, Tenn. facility to increase production capacity of foam tip swabs used in COVID-19 diagnostic tests. Funded through HCEA, the award will help the company boost total production capacity of the swabs to 250 million per month by February 2022.

Monoclonal Antibody Treatments: 3 EUAs for monoclonal antibody (mAb) treatments for mild-to-moderate COVID-19 in at-risk patients: bamlanivimab, casirivimab/imdevimab, and bamlanivimab/etesevimab. Learn more about FDA-authorized monoclonal treatments that can help at-risk patients fight the disease.

HHS Innovative Challenge for Masks: The U.S. Department of Health and Human Services launches $500,000 innovation challenge competition today encouraging American inventors to aid the nation's COVID-19 response by designing effective, comfortable face masks for personal use that resolve the common complaints people have about wearing masks. The contest taps into the nation's creativity and entrepreneurial spirit to help curb the spread of SARS-CoV-2, the virus that causes COVID-19.

Information for Specific Populations

Healthcare Workers: CDC updated their guidance for managing patients with COVID-19, including clinical guidance, home and hospital care, care for special populations, disease severity, and more.

Guidance for Adult Day Services Centers: CDC released guidance for administrators and staff to prevent the spread of COVID-19. Adult Day Services Centers (ADSCs) provide social or health services to community-dwelling adults aged 65 and over and adults of any age living with disability. Older

adults and persons with disabilities are at highest risk for severe illness from COVID-19 including hospitalization, intensive care, and death. ADSC administrators and staff can help protect themselves and program participants (that is, adults attending ADSCs) from COVID-19 by promoting and engaging in preventive behaviors that reduce spread and maintain healthy operations and environments at ADSC facilities. This guidance is meant to supplement — not replace — any Federal, state, tribal, local, or territorial public health and safety laws, rules, and regulations with which adult day services center programs must comply. CDC has also developed recommendations for participants at ADSCs and their caregivers.

Suggestions for Youth and Summer Camps: CDC offers suggestions for ways in which camp administrators can help protect campers, staff, and communication, and prevent the spread of COVID-19. Camp administrators can determine, in collaboration with state and local health officials, whether and how to implement these considerations, making adjustments to meet the unique needs and circumstances of the local community. Implementation should be guided by what is feasible, practical, acceptable, and tailored to the needs of each community. These suggestions are meant to supplement— not replace —any state, local, territorial, or tribal health and safety laws, rules, and regulations with which camps must comply.

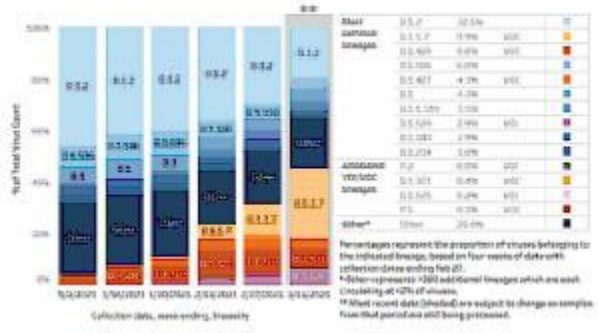
Essential Services for Malaria: CDC updated their key considerations for continuing essential malaria prevention and control activities safely and effectively. These considerations should supplement country Ministry of Health guidance.

CMS Updates

Medicare Fee-for-Service Billing: CMS updated their COVID-19 Frequently Asked Questions on Medicare Fee-for-Service (FFS) Billing. The policies set out in this FAQ are effective for the duration of the public health emergency unless superseded by future legislation. The FAQs in this document supplement the previously released FAQs, 1135 Waiver FAQs.

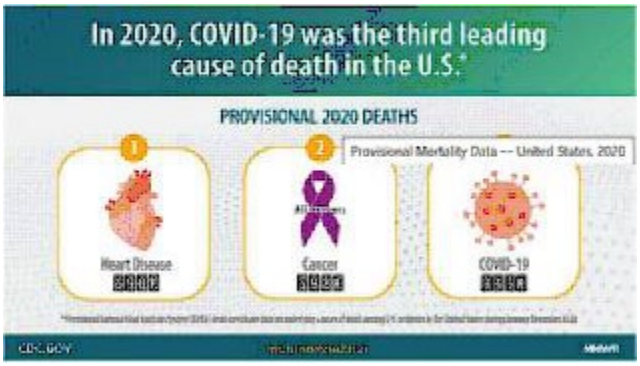
Research

Variant Proportions in the U.S: CDC's national genomic surveillance program identifies new and emerging SARS-CoV-2 variants to determine implications for COVID-19 diagnostics, treatments, or vaccines authorized for use in the United States. Monitoring the spread of emerging variants in the United States relies on widespread, rapid sequencing. To accelerate sequencing in the United States, CDC has contracted with commercial diagnostic laboratories, and, in partnership with the Association of Public Health Laboratories (APHL), has implemented the National SARS-CoV-2 Strain Surveillance (NS3) program to provide a comprehensive and population-based US surveillance system. This data, along with data from many other sources, are used to inform national and state public health actions related to variants.



COVID-19 2020 Mortality Surveillance: The Morbidity and Mortality Weekly Report (*MMWR*) on death certificate-based ICD-10 diagnosis codes for COVID-19 mortality surveillance addresses that among the 378,048 death certificates from 2020 listing COVID-19, 5.5% listed COVID-19 without codes for any other conditions. Among 357,133 death certificates with at least one other condition, 97% had a co-occurring diagnosis of a plausible chain-of-event condition (e.g., pneumonia or respiratory failure), or a significant contributing condition (e.g., hypertension or diabetes), or both. These findings support the accuracy of COVID-19 mortality surveillance in the United States using official death certificates. High-quality documentation of death certificate diagnoses is essential for an authoritative public record.

Provisional 2020 Mortality Data: The Morbidity and Mortality Weekly Report (*MMWR*) on provisional mortality data in the United States in 2020 addresses that the age-adjusted death rate increased by 15.9% in 2020. Overall death rates were highest among non-Hispanic Black persons and non-Hispanic American Indian or Alaska Native persons. COVID-19 was the third leading cause of death, and the COVID-19 death rate was highest among Hispanics. Provisional death estimates provide an early indication of shifts in mortality trends. Timely and actionable data can guide public health policies and interventions for populations experiencing higher numbers of deaths that are directly or indirectly associated with the COVID-19 pandemic.



Case Forecasts: This week's national ensemble predicts that the number of newly reported COVID-19 cases will remain stable or have an uncertain trend over the next 4 weeks, with 223,000 to 723,000 new cases likely reported in the week ending April 24, 2021. The state- and territory-level ensemble forecasts predict that over the next 4 weeks, the number of new reported cases per week will likely decrease in 4 jurisdictions, which are indicated in the forecast plots below. Trends in numbers of future reported cases are uncertain or predicted to remain stable in the other states and territories. View previous case forecasts.

Hospitalization Forecasts: This week's national ensemble predicts that the number of new daily confirmed COVID-19 hospital admissions will remain stable or have an uncertain trend over the next 4 weeks, with 2,300 to 8,700 new confirmed COVID-19 hospital admissions likely reported on April 26, 2021. The state- and territory-level ensemble forecasts predict that over the next 4 weeks, the number of daily confirmed COVID-19 hospital admissions will likely increase in 6 jurisdictions and decrease in 12 jurisdictions, which are indicated in the forecast plots below. Trends in numbers of future reported hospital admissions are uncertain or predicted to remain stable in the other states and territories. View previous hospitalization forecasts.

Death Forecasts: This week's national ensemble predicts that the number of newly reported COVID-19 deaths will remain stable or have an uncertain trend over the next 4 weeks, with 3,100 to 10,200 new deaths likely reported in the week ending April 24, 2021. The national ensemble predicts that a total of 565,000 to 585,000 COVID-19 deaths will be reported by this date. The state- and territory-level ensemble forecasts predict that over the next 4 weeks, the number of newly reported deaths per week will likely decrease in 8 jurisdictions, which are indicated in the forecast plots below. Trends in numbers of future reported deaths are uncertain or predicted to remain stable in the other states and territories. View previous death forecasts.

From: Baker, Michael (OS/IEA)
To: Baker, Michael (OS/IEA)
Subject: HHS COVID-19 Update - 4/19
Date: Monday, April 19, 2021 6:23:24 PM

Dear Partner:

HHS Office of Intergovernmental and External Affairs COVID-19 update for April 19, 2021:

Renewal of Determination That a Public Health Emergency Exists: As a result of the continued consequences of the Coronavirus Disease 2019 (COVID-19) pandemic, on this date (April 15, 2021) and after consultation with public health officials as necessary, I, Xavier Becerra, Secretary of Health and Human Services, pursuant to the authority vested in me under section 319 of the Public Health Service Act, do hereby renew, effective April 21, 2021, the January 31, 2020, determination by former Secretary Alex M. Azar II, that he previously renewed on April 21, 2020, July 23, 2020, October 2, 2020, and January 7, 2021, that a public health emergency exists and has existed since January 27, 2020, nationwide.

Highlights from Friday and Monday's White House COVID-19 Response Team Briefing

Andy Slavitt

- **Vaccine Availability:** Over 80 percent of seniors have had at least their first shot. Fifty percent of adults in the U.S. have had at least one shot. We now have one thing on our mind: making sure that the other 50 percent know how easy it is to get a shot. If you still think it's too difficult your vaccine, here's what you need to know: the lack of supply, the shortage of locations, the confusing rules are all in the past. That cannot be said enough. There are thousands of more people ready to help you get vaccinated. There are now millions more vaccine doses available and waiting. There are now more than 60,000 safe and convenient places for you to get your shot.
- **Expanded Vaccine Eligibility:** If you are 16 or over, it is your turn to get vaccinated no matter where you live. There's a nine out of ten chance that you are located within five miles of your vaccine shot. For those of you who can't get to a vaccine site, we're helping community-based organizations connect vulnerable Americans with shots. And now, to get resources to healthcare providers serving at-risk populations and to promote equitable distribution of vaccines, today HHS is making $150 million available to community-based healthcare providers to strengthen their efforts to get shots in arms and care for patients with COVID-19.
- **Get Vaccinated:** Join the more than 130 million Americans who have already gotten at least one shot, that's half of all adults. Here's my direct plea to everyone listening: If you haven't already made an appointment to get vaccinated, make one right now. You are eligible. Then, reach out to your family, friends, and neighbors to make sure they can make an appointment too. See what help you can offer them to help those who might need extra assistance.
- **American Rescue Plan:** We are announcing a $1.7 billion investment to bolster the ability of the CDC and state and local public health departments to monitor, track, and defeat emerging threats — whether it's COVID-19 variants today or other viruses in the future — through a process known as genomic sequencing. This significant investment, which is made

possible due to the American Rescue Plan President Biden signed into law last month, is critical in our fight against the new and potentially dangerous variants of COVID-19. Right now, these variants account for nearly half of all COVID-19 cases in the United States, and we need more capacity in our public health system to identify and track these mutations. This funding will enable CDC and states to do more genomic sequencing as we activate the nation's great research capabilities to detect variants earlier and increase our visibility into emerging threats. This investment will give public health officials the chance to react more quickly to prevent and stop the spread. Today's investment also builds on the major investments in testing and genomic sequencing that we made earlier this year. That includes $10 billion of American Rescue Plan funding to support COVID-19 testing in schools, another $2.5 billion to help state and local public health agencies increase testing capacity in underserved and high-risk communities, and nearly $200 million to begin to increase genomic sequencing capacity that this investment comes on top of.

Dr. Walensky

- **Case Update:** Yesterday, CDC reported nearly 60,950 cases of COVID-19. Our seven-day average is up to over 67,440 per day. For context, one month ago, our seven-day average of cases was just over 53,000 per day. The seven-day average of hospital admissions is about 5,460. Sadly, the seven-day average of daily deaths are now increasing, with six consecutive days of increases, to about 695 deaths per day. Sunday, we again saw almost 700 deaths in a single day.
- **Vaccination Update:** So far, we have administered 209 million vaccine doses, with an average daily administration of more than 3 million doses. This brings us to 192.8 million doses in the first 100 days — 96 percent of our goal in 88 days. This means that almost 40 percent of the total population has received at least one dose of a COVID-19 vaccine, and one out of every four people is fully vaccinated. More than 65 percent of people age 65 and older and more than 25 percent of people are fully vaccinated.
- **Vaccine Effectiveness:** First, among nearly 4,000 healthcare personnel, first responders, and essential workers who received the Pfizer and Moderna vaccines, the risk of any infection, asymptomatic and symptomatic, was reduced by 90 percent after receiving the two recommended doses of the vaccine. This study was yet additional evidence that these vaccines are working. The efficacy we saw in clinical trials is now being shown in the real world. Second, last week, we released data on the number of so-called "breakthrough infections," of people who, despite being vaccinated, still tested positive for COVID-19 more than 14 days after they're getting their second vaccine dose. With any vaccine, we expect such rare cases. But so far, out of more than 84 million people who are fully vaccinated, we have only received reports of less than 6,000 breakthrough cases. Although this number is from 43 states and territories and likely an underestimate, it still makes a really important point: These vaccines are working. Of the nearly 6,000 cases, approximately 30 percent had no symptoms at all. Based on these data, here's the bottom line: Getting a vaccine will help protect you, it will help protect others, and it will help us end this pandemic.
- **Rising Cases and Variants:** Some of these increases are as a result of relaxed prevention efforts in states across the country, such as relaxed mask mandates or loosened restrictions on indoor restaurant seating. Another reason for these increases is the continued spread of highly transmissible variants — more than 50 to 70 percent more transmissible — which

makes the race to stop the transmission even more challenging and threatens to overwhelm our healthcare system again in parts of this country. CDC data show that the B117 variant — the variant originally identified in the United Kingdom — represents 44 percent of the virus circulating during the week of March 27th.

- **Johnson & Johnson Update:** After the press briefing on Wednesday (4/14), the Advisory Committee on Immunization Practices — or ACIP — met to discuss the six cases and provide recommendations. I want to thank the ACIP for their thoughtful discussion and their commitment to the science. The recommendation from this group of independent experts for a continued pause will allow additional time to review any additional cases that might come in, and for them to conduct a complete risk assessment and to evaluate the emerging science. ACIP will meet again this Friday, April 23rd, from 11:00 to 5:00 to provide further recommendations.

Dr. Fauci

- **Vaccine Efficacy in Clinical Trials:** This is work that has been done in tens of thousands of people in clinical trials, has been peer reviewed independently, and published in scientific journals. Pfizer and Moderna's efficacy are shown in the New England Journal of Medicine papers. The same holds true for J&J. All three are highly efficacious in clinical trials.
- **Vaccine Efficacy in Real-World Settings:** In over 23,000 employees at the University of Texas, the infection rate was miniscule among vaccinated employees: 0.05 percent. The CDC — looking, again, at the real-world effectiveness — showed that in almost 80,000 person-days with full immunization, 0.04 per 1,000 person-days.
- **Vaccine Safety:** We have an extraordinary capability to monitor safety, as an extremely rare adverse event of 6 individuals among 7,000 was picked up by the surveillance system. Those surveillance systems include ones that follow up on clinical trials, monitoring systems by the CDC, by the FDA, and other monitoring systems. When we say a vaccine is safe, you're talking about an exquisitely sensitive monitoring system.
- **NIH-sponsored Coronavirus Disease 2019 Treatment Guidelines Panel:** This is a panel of individuals co-chaired by Dr. Cliff Lane, who is the Deputy Director of NIAID, but also the Clinical Director of the Institute; Henry Masur, who is the Director of the Critical Care Medicine Unit at NIH; and Roy "Trip" Gulik, who is the Chief of Infectious Diseases at Weill Cornell Medicine in New York City. This panel was established to be able to work, literally in real time, updating guidelines for clinicians and healthcare providers throughout the country and the world on the latest information.

Dr. Murthy

- **American Indians and Alaska Natives:** According to a recent CDC report, American Indians and Alaska Natives were 3.5 times more likely to get COVID than a non-Hispanic, white population. Native people are also more than four times likely to be hospitalized as a result of COVID-19. Despite these challenges, our colleagues working in the Indian health system have heroically administered more than 1 million doses of COVID-19 vaccines. That is a remarkable achievement and a testament to their dedication. Today, the Biden administration is doubling down on this critical work with a — with a $4 billion investment from the American Rescue Plan to the Indian Health Service Tribal and urban Indian health programs. Specifically, these funds will support the following: expanded COVID-19

vaccinations, including mobile efforts, large-scale vaccination events, and public education and outreach campaigns; expanded testing, contact tracing, PPE access, and treatment; increased preventive health services for those at higher risk for COVID-19; and increased support for telehealth, the healthcare workforce, and the broader Indian healthcare system, which has been a hard hit during the pandemic due to lost reimbursements for care for both public and private insurance.

- **Increasing Access and Increasing Confidence:** The more people see those around and get vaccinated, particularly family and friends, the more comfortable they become with getting vaccinated themselves. The easier we make it to get vaccinated, the more people will get vaccinated, and that means more people around them would feel comfortable with getting vaccine themselves. That's why access and confidence go hand in hand, and so does safety. This brings me to the second topic. This week you've heard a lot from us about the pause with administering the Johnson & Johnson COVID-19 vaccine. These decisions are never simple, and this one was taken after a very careful assessment of the risks and benefits of calling for such a pause. However, the actions taken by CDC and the FDA this week should give Americans confidence that our safety system is working for them. For some members of the public, uncertainty about getting vaccinated stems from questions about how safe the vaccines are. This week is a reminder that safety is our top priority. Even when an extremely rare safety occurs, our scientific agencies will act with thoroughness and transparency so people can remain confident in the vaccines that are recommended to them.

Vaccine Updates

Vaccine Eligibility: CDC updated the following COVID-19 information pages to include that everyone 16 years of age and older is now eligible to get a COVID-19 vaccine: Vaccine FAQs, How Vaccines Get to You, Key Things to Know, and Vaccine Rollout Recommendations. CDC also updated the following information pages for specific communities to include the expanded eligibility of the COVID-19

vaccine: persons with disabilities, essential workers, healthcare personnel, older adults, and those high risk for severe illness. Get a COVID-19 vaccine as soon as you can. Moreover, CDC updated their general vaccination resources, including information on preparing for your vaccine.

Moderna Vaccine Update: The FDA updated their Moderna COVID-19 Vaccine Frequently Asked Questions page. On December 18, 2020, the U.S. Food and Drug Administration issued an emergency use authorization for the second vaccine for the prevention of coronavirus disease 2019 caused by severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2). The emergency use authorization allows Moderna COVID-19 Vaccine to be distributed in the U.S for use in individuals 18 years of age and older.

Johnson & Johnson Update: On April 13, 2021, CDC and FDA recommended a pause in the use of Johnson & Johnson's Janssen COVID-19 Vaccine. Of the nearly 7 million doses administered so far in the United States, a small number of reports of a rare and severe type of blood clot have been reported in people after receiving the J&J/Janssen COVID-19 Vaccine. All reports occurred among women between the ages of 18 and 48, and symptoms occurred six to 13 days after vaccination. As of April 13, 2021, of the more than 180 million doses administered so far of the Pfizer-BioNTech or Moderna vaccines, no reports matching those associated with the J&J/Janssen vaccine have been received.

FEMA's J&J Update: In alignment with the recommendation from the CDC and FDA to pause the use of the Johnson & Johnson vaccine, FEMA immediately ceased administration of these doses at our federal community vaccination center pilot sites and mobile vaccine units. This pause will continue until further guidance is received from CDC and FDA. We are working with our state partners to determine the path forward and find alternative vaccine options for these sites.

FEMA Vaccination Sites: There are 31 active or temporarily closed federal community vaccination center pilot sites and 20 mobile pop-up sites in 22 states. Additionally, there are 10 mobile vaccination units deployed to eight states. These centers and units have administered more than 3.4 million vaccinations. Working with state governments FEMA will open additional federal community vaccination center pilot sites, which include federal support and supplemental vaccine allocation: this week, federal community vaccination center pilot sites are scheduled to open in Bessemer, Alabama; Tulsa, Oklahoma; and Central Point, Oregon. Last week, FEMA transitioned management

of the federal community vaccination center pilot sites in Los Angeles and Oakland to the state. FEMA continues to support both sites with federal personnel. Additionally, FEMA has obligated more than $936 million to support the state's vaccination efforts. These sites administered more than 671,000 shots since they opened on Feb. 16. FEMA mobile vaccination units have begun operations. These vehicles can bring vaccinations to hard-to-reach and high-risk populations who cannot access services from fixed sites. Ten mobile vaccination units are currently deployed to Connecticut, Maine, Maryland, Nebraska, Nevada, New Mexico, Oregon and South Dakota.

DoD Response to J&J Pause: In a press briefing on Friday, Pentagon Press Secretary John F. Kirby stated that while the DoD intended to use the Johnson & Johnson vaccine to support overseas personnel and their families, the vaccine distribution planners on our COVID task force developed a plan to reallocate doses of the Moderna vaccine to our overseas commands. Each service will now direct a total of approximately 30,000 additional doses of Moderna throughout the month of May. That's around roughly 10,000 per week, beginning May 10th, to overseas locations in European Command, Indo-Pacific Command and Central Command. This will help keep the vaccination efforts right on pace to provide initial doses to over 70 percent of our overseas personnel and their families by the end of May.

COVID-19 Illness After Vaccination: CDC released information regarding what you should know about the possibility of COVID-19 illness after vaccination. COVID-19 vaccines are effective. However, a small percentage of people who are fully vaccinated will still get COVID-19 if they are exposed to the virus that causes it. These are called "vaccine breakthrough cases." This means that while people who have been vaccinated are much less likely to get sick, it may still happen. Experts continue to study how common these cases are.

CDC Weekly Review: On Friday, CDC released their weekly review on the COVID-19 pandemic, including updated numbers of reported cases, SARA-CoV-2 variants, testing, vaccinations, hospitalizations, and deaths. Nationally, COVID-19-related emergency department visits as well as both hospital admissions and current hospitalizations have risen among patients ages 18 to 64 years in recent weeks. The good news is that emergency department visits and hospitalizations among people ages 65 years and older have decreased, likely demonstrating the important role vaccination plays in protecting against COVID-19. As access to vaccines for all Americans increases, we have reason to be hopeful. However, until more of the U.S. population is fully vaccinated, consistent use of prevention strategies, such as universal and correct use of masks, social distancing, and hand washing, will help to limit the spread of SARS-CoV-2, the virus that causes COVID-19. Even if you have been fully vaccinated against COVID-19, you should keep taking these everyday precautions in public places. For more information, view the CDC's data on vaccinations, vaccination demographics, and vaccination trends.

Operational Considerations for Jurisdictions Planning to Operate COVID-19 Vaccination Clinics: CDC released guidance for jurisdictions planning to operate COVID-19 vaccinations clinics. Safe and effective COVID-19 vaccines have been developed and authorized and are being manufactured. Jurisdictions are presently vaccinating people in their target populations. Currently, vaccine is available in growing quantities, with even more vaccine slated to become available soon. Most jurisdictions can provide access to vaccination using a combination of usual vaccination providers

(pharmacies and medical providers/community health centers) and a limited number of public health clinics. Many jurisdictions are planning for and operating multiple, temporary, large- and small-scale vaccination sites, both fixed location and mobile, as strategies to vaccinate more of the population rapidly. The Federal Emergency Management Agency (FEMA) is working with jurisdictions to establish Community Vaccination Centers (CVCs). These CVCs can be established as fixed facilities, drive-through facilities, or as mobile vaccination clinics based on a jurisdiction's needs.

ACIP Jurisdictions Estimated Worker Population: CDC updated their information from the Advisory Committee on Immunization Practices (ACIP) regarding vaccination data among different worker populations.

Testing and Treatment

FDA Revokes EUA for Monoclonal Antibody Bamlanivimab: On Friday, the FDA revoked the emergency use authorization (EUA) that allowed for the investigational monoclonal antibody therapy bamlanivimab, when administered alone, to be used for the treatment of mild-to-moderate COVID-19 in adults and certain pediatric patients. Based on its ongoing analysis of emerging scientific data, specifically the sustained increase of SARS-CoV-2 viral variants that are resistant to bamlanivimab alone resulting in the increased risk for treatment failure, the FDA has determined that the known and potential benefits of bamlanivimab, when administered alone, no longer outweigh the known and potential risks for its authorized use. Therefore, the agency determined that the criteria for issuance of an authorization are no longer met and has revoked the EUA. Instead of administering Bamlanivimab alone, health care providers should consider using the other authorized monoclonal antibody therapies expected to retain activity against the viral variants: Casirivimab and imdevimab, administered together, and Bamlanivimab and etesevimab, administered together.

FDA Testing Update: As of Friday, 363 tests and sample collection devices are authorized by the FDA under emergency use authorizations (EUAs). These include 266 molecular tests and sample collection devices, 75 antibody and other immune response tests, and 22 antigen tests. There are 46 molecular authorizations and one antibody authorization that can be used with home-collected samples. There is one molecular prescription at-home test, two antigen prescription at-home tests, four over-the-counter (OTC) at-home antigen tests, and two OTC molecular tests. The FDA has authorized 7 antigen tests and 2 molecular tests for serial screening programs. The FDA has also authorized 457 revisions to EUA authorizations.

Funding

$150 Million from ARP to Support Community-Based Health Care Providers: HHS announced the availability of nearly $150 million to community-based health care providers to aid their response to COVID-19. These funds will support approximately 100 Health Center Program look-alikes to respond to and mitigate the spread of COVID-19, strengthen vaccination efforts, and enhance health care services and infrastructure in communities across the country. Health center look-alikes (LALs) are community-based health care providers that provide essential primary care services to underserved communities and vulnerable populations but are not Health Center Program grantees. This funding

will be made available through the Health Resources and Services Administration (HRSA) and is part of President Biden's commitment to ensuring equity in the nation's COVID-19 response and vaccination efforts.

Biden Administration Announces $1.7 Billion Investment to Fight COVID-19 Variants: In order to improve the detection, monitoring, and mitigation of COVID-19 variants, the Biden Administration is rapidly investing $1.7 billion from the American Rescue Plan to help states and other jurisdictions more effectively fight these mutations. An essential component of the response to the emerging COVID-19 variants is increasing the country's genomic sequencing — the process by which COVID DNA is decoded and potentially deadly mutations in the virus are detected. With this funding, allocated through the Centers for Disease Control and Prevention (CDC), will help the CDC, states, and other jurisdictions more effectively detect and track variants by scaling genomic sequencing efforts. With the information from sequencing, the CDC and state and local public health leaders can implement known prevention measures to stop the spread.

Biden Administration Invests $4 Billion in ARP Funding to Combat COVID-19 in Indian Country: As part of President Biden's continued efforts to ensure the pandemic response reaches all people and all communities, the Biden Administration is announcing it will invest more than $4 billion to combat COVID-19 in Indian Country. The funding, from the American Rescue Plan, will expand COVID-19 vaccinations, testing, and treatment; increase preventive health services to American Indians and Alaska Natives at higher risk for COVID-19; expand hospitals' and health clinics' ability to serve their communities during the pandemic and beyond; and provide the Indian Health Service (IHS), tribal health programs, and urban Indian health programs with needed funding to make up for lost reimbursements experienced during the pandemic.

FEMA Funeral Assistance Funding: As of today, FEMA has received more than 101,000 funeral assistance applications. Applicants may apply by calling 844-684-6333 (TTY: 800-462-7585) from 9 a.m. to 9 p.m. ET, Monday through Friday. Multilingual services are available. Callers who use a relay

service, videophone or captioned telephones should provide their specific number assigned to that service. It is important that FEMA is able to contact applicants. Please note, phone calls from FEMA may come from an unidentified number. FEMA will not contact anyone until they have called FEMA or have applied for assistance.

Reopening Guidance

Personal and Social Activities: CDC updated their information on engaging in personal and social activities. COVID-19 cases, hospitalizations, and deaths are extremely high across the United States. To decrease your chance of getting and spreading COVID-19, CDC recommends that you do not gather with people who do not live with you at this time. Attending events and gatherings increases your risk of getting and spreading COVID-19. Stay home to protect yourself and others from COVID-19.

Travel Health Notices: CDC updated their travel health notices to provide current risk assessment levels for COVID-19 in different countries.

Considerations for Casinos and Gaming Operations: As some casinos and gaming operations resume in some areas of the United States, CDC offers the following considerations for ways in which casino and gaming operators can help protect staff and customers and slow the spread of COVID-19. Casinos and gaming operations can determine, in collaboration with local, state, territorial, federal, or tribal health officials, whether and how to implement these considerations, making adjustments to meet the needs and circumstances of the local community. Implementation should be guided by what is feasible, practical, acceptable, and tailored to the needs of each community. For more information on bars and restaurants within casinos, please see CDC's Considerations for Restaurants and Bars. These considerations are meant to supplement—not replace—any local, state, territorial, federal, or tribal safety laws, rules, or regulations with which businesses must comply.

Community-Based Organizations: CDC updated their guidance for community-based organizations (CBOs). As some CBOs begin to resume or increase their level of activities, CDC offers considerations for ways these organizations can help protect individuals and communities and slow the spread of coronavirus disease 2019 (COVID-19). COVID-19 cases, hospitalizations, and deaths are extremely high across the United States. To decrease your chance of getting and spreading COVID-19, CDC recommends that you do not gather with people who do not live with you at this time. Attending events and gatherings increases your risk of getting and spreading COVID-19. Stay home to protect yourself and others from COVID-19.

Considerations for Institutions of Higher Education: CDC updated their guidance for institutions of higher education (IHEs). As some IHEs prepare to re-open or keep open in-person learning in the United States, IHEs are faced with the challenge of keeping students, faculty, staff, and volunteers safe due to the coronavirus disease 2019 (COVID-19) pandemic. CDC offers the following considerations for ways that IHEs can help protect students and employees (e.g., faculty, staff, and administrators) and slow the spread of COVID-19. This document refers only to risks related to COVID-19. IHEs may consider implementing several strategies to maintain healthy environments.

Information for Specific Populations

USDA Activities to Contain the COVID-19 Pandemic: The United States Department of Agriculture (USDA) updated their fact sheet on activities to contain the COVID-19 pandemic. USDA has deployed 1,064 disaster, public health specialists to assist with federal response.

Guidance for Large or Extended Families Living in the Same Home: CDC released guidance for large or extended families living in the same home. If you or someone in your household is at increased risk for severe illness from COVID-19, then all family members should act as if they are at increased risk. This can be difficult if space is limited for large or extended families living together. While avoiding close contact with others and isolating someone who is sick can feel lonely, these actions are necessary to reduce the spread of COVID-19 and protect yourself and your household.

DoD Force Health Protection Guidance: On Friday, the Department of Defense released the memorandum for Force Health Protection Guidance (Supplement 20) – Department of Defense Guidance for Personnel Traveling During the Coronavirus Disease 2019 Pandemic. This memorandum applies to official and unofficial travel and proves updated pre- and post-travel guidance for purposes of force health protection (FHP) for Service members, DoD family members, DoD civilian employees, and DoD contractor personnel, as well as fully vaccinated individuals.

Staffing Resources: CDC updated their staffing resources and guidance to strengthen the public health workforce. CDC updated their information regarding the number of CDC COVID-19 response staff deployed across America.

Cleaning, Disinfecting, and Ventilation: CDC updated their resources for cleaning, disinfecting, and ventilation, including an updated toolkit for school administrators on cleaning, disinfection, and hand hygiene. Reducing the risk of exposure to SARS-CoV-2, the virus that causes COVID-19, by cleaning and disinfection is an integral part of opening schools that will require careful planning.

Childhood Vaccination Toolkit for Clinicians: CDC released a toolkit for clinicians on getting children caught up on receiving recommended vaccinations. COVID-19 disrupted both in-person learning and routine well-child visits for many children over the last year. As a result, too many children have fallen behind on receiving recommended vaccines. Children need to get caught up now so that they are protected as they go back to in-person learning and summer camps. Healthcare providers can identify families whose children have missed doses and contact them to schedule appointments. Providers can also let families know what precautions are in place for safe delivery of in-person services.

Health Departments and Public Safety Partners: CDC updated their information for health departments and public health partners to help educate communities and promote COVID-19 vaccination.

Manufacturing Workers & Employers: CDC and the Occupational Safety and Health Administration (OSHA) updated their guidance for manufacturing workers and employers.

Acute Care Delivery at Home Tip Sheet: HHS ASPR Technical Resources, Assistance Center, and Information Exchange (TRACIE) released a tip sheet providing an overview of characteristics of various types of acute care delivery at home programs to help healthcare providers better understand this care model. Some healthcare providers and systems have been providing hospital-level care in patient's homes for years; others have implemented acute care delivery at home models in response to overcrowding at hospitals due to COVID-19.

COVID-19 and Healthcare Professional Stress and Resilience: HHS ASPR Technical Resources, Assistance Center, and Information Exchange (TRACIE) released Issue 12 of The Exchange, which examines the impact of COVID-19 on healthcare professionals. The issue focuses on three categories: understanding acute and chronic stressors in the healthcare worker population, identifying at-risk employees, and promising practices in building resilience.

COVID-19 Healthcare Delivery Impacts: HHS ASPR Technical Resources, Assistance Center, and Information Exchange (TRACIE) updated their tip sheet to help healthcare system planners prepare to mitigate potential healthcare delivery impacts.

Strategies to Help Combat the Coronavirus Blues: The COVID-19 Schools Task Force, FEMA Region VII, and HHS Region 7 released a document summarizing the contents of the Mind Over Matter Resource Guide. This guide can be used to support messaging for college and university campus communities to help combat COVID-19 fatigue and promote general wellness, both during and after the pandemic.

Temporary Halt in Residential Evictions to Prevent the Further Spread of COVID-19: On April 2, 2021, the CDC released a declaration determining that the eviction of tenants could be detrimental to public health control measures to slow the spread of COVID-19. View the posted order, as well as eviction protection declaration forms in English and Spanish. Please visit HUD's COVID-19 Emergency Information for Housing Counselors for additional resources and information.

United States Coast Guard Vaccine FAQs: The United States Coast Guard updated their Frequently Asked Questions page about the vaccine, and specific questions related to Coast Guard administered vaccines.

Older Adults: CDC updated their information for older adults, who are at a greater risk of hospitalization or dying if diagnosed with COVID-19. The risk for severe illness with COVID-19 increases with age, with older adults at highest risk. If you have a family member or friend who lives in a nursing home, assisted living facility, or other type of senior living or retirement community, you may be concerned about COVID-19. To protect friends and family members who live in these communities, CDC has issued updated recommendations for visitations at post-acute facilities. These recommendations align with the Centers for Medicare and Medicaid Services (CMS) guidance for visitations under various circumstances.

Caring for Someone Sick: CDC updated their guidance for caregivers in non-healthcare settings. Cleaning with a household cleaner that contains soap or detergent reduces the amount of germs on

surfaces and objects and decreases risk of infection from surfaces. In most situations, cleaning alone removes most virus particles on surfaces.

People at Increased Risk: CDC updated their resources available for people at increased risk, and for other people who need to take extra precautions.

Non-Emergency Transportation for Tribal Communities: CDC updated their guidance on non-emergency transportation for tribal communities. Tribal community members may need to regularly share personal vehicles with members outside of their own households. They may also need to use personal vehicles to transport people who are visibly sick. In addition, tribal organizations may provide medical transportation to their community members using non-emergency vehicles (cars or vans, for example). CDC outlines precautions that can be considered to minimize risk of spreading COVID-19 when sharing personal vehicles.

Implementing Screening and Treatment of Unhealthy Alcohol Use During COVID-19: The Agency for Healthcare Research and Quality (AHRQ) posted an article on implementing screening and treatment of unhealthy alcohol use during COVID-19. Since the onset of the COVID-19 pandemic in March 2020, alcohol sales have increased dramatically in many States across the country and rates of unhealthy alcohol use are rising in parallel. Unhealthy alcohol use, which refers to the full spectrum of alcohol misuse from risky or hazardous drinking to alcohol use disorder, is associated with adverse consequences, including poorer physical and mental health outcomes as well as negative socioeconomic effects. AHRQ's EvidenceNow: Managing Unhealthy Alcohol Use Initiative represents an important opportunity to help clinicians support many patients receive the appropriate diagnosis, counseling, and treatment for unhealthy alcohol use by implementing the best patient-centered outcomes research findings available to improve health.

Sprayers Safety Precautions: CDC updated their information regarding how to select cleaners, disinfectants, and application methods for use in facilities, businesses, and public indoor spaces to ensure that you can clean and disinfect safely and effectively. In most situations, cleaning surfaces (using soap or detergent) is enough to reduce SAR-CoV-2, the virus that causes COVID-19. Clean surfaces before disinfecting.

CMS Updates

Encouraging Latino Consumers to Enroll in Health Insurance Coverage: Today, HHS Secretary Xavier Becerra announced commitments from national organizations to support Latino outreach and enrollment efforts during the current Special Enrollment Period (SEP) made available on HealthCare.gov by President Biden due to the COVID-19 Public Health Emergency (English | Spanish). As part of the Latino Week of Action April 18 - 24, these organizations and HHS will share information with Latino consumers and use social media to encourage them to enroll in affordable, quality health plans through HealthCare.gov. Access to affordable health coverage and care is particularly important for Latinos in the US because 22% of non-elderly Latinos are uninsured, a rate almost 2.5 times that of White Americans. During this week and beyond, HHS and many organizations will send targeted messages, participate in earned media opportunities, and amplify the SEP through social media channels to raise awareness about the coverage options available

through HealthCare.gov for the Latino community. The Centers for Medicare & Medicaid Services (CMS) has also launched an outreach and an educational campaign, which includes broadcast and digital advertising and educates through email and text messages in both Spanish and English.

PPE

Guidance for Wearing Masks: CDC updated their guidance for wearing masks. Masks are a simple barrier to help prevent your respiratory droplets from reaching others. Studies show that masks reduce the spray of droplets when worn over the nose and mouth. CDC also updated their information on the different types of masks. CDC recommends that N95 respirators should be prioritized for protection against COVID-19 in healthcare settings. Essential workers and workers who routinely wore respirators before the pandemic should continue wearing N95 respirators. As N95s become available they can be worn in non-healthcare settings.

Research

Large Clinical Trial to Study Repurposed Drugs to Treat COVID-19 Symptoms: The NIH will fund a large, randomized, placebo-controlled Phase 3 clinical trial to test several existing prescription and over-the-counter medications for people to self-administer to treat symptoms of COVID-19. Part of the Accelerating COVID-19 Therapeutic Interventions and Vaccines (ACTIV) public–private partnership, the ACTIV-6 trial aims to provide evidence-based treatment options for the majority of adult patients with COVID-19 who have mild-to-moderate symptoms and are not sick enough to be hospitalized. NIH will provide an initial investment of $155 million in funding for the trial.

Experimental Antiviral for COVID-19 Effective in Hamster Study: The experimental antiviral drug MK-4482 significantly decreased levels of virus and disease damage in the lungs of hamsters treated for SARS-CoV-2 infection, according to a new study from NIH scientists. SARS-CoV-2 is the virus that causes COVID-19. MK-4482, delivered orally, is now in human clinical trials. Remdesivir, an antiviral drug already approved by the U.S. Food and Drug Administration for use against COVID-19, must be provided intravenously, making its use primarily limited to clinical settings. In their study, published in the journal *Nature Communications*, the scientists found MK-4482 treatment effective when provided up to 12 hours before or 12 hours after infecting the hamsters with SARS-CoV-2. These data suggest that MK-4482 treatment potentially could mitigate high-risk exposures to SARS-CoV-2 and might be used to treat established SARS-CoV-2 infection alone or possibly in combination with other agents.

Public Health Investigations of COVID-19 Vaccine Breakthrough Cases: CDC released a case investigation protocol on public health investigations of COVID-19 vaccine breakthrough cases. The U.S. Food and Drug Administration (FDA) has issued Emergency Use Authorization (EUA) for three COVID-19 vaccines. In large, randomized controlled trials, each vaccine was safe and efficacious for preventing symptomatic, laboratory-confirmed COVID-19 disease. There were no statistically significant differences in efficacy by age, gender, race, or comorbidities. Despite the high level of efficacy, a small number of breakthrough cases occurred. The phase 3 studies have not yet identified risk factors for vaccine breakthrough cases; however, approximately 44,000 people received the FDA-authorized vaccines during the clinical trials and follow-up is ongoing. This protocol can be used

to guide public health investigations of COVID-19 vaccine breakthrough cases. We aim to capture both symptomatic and asymptomatic infections. Characterization of vaccine breakthrough cases could provide the first indication that a vaccine is less effective in certain demographic groups or that vaccine-induced immunity is waning, and booster doses may be needed. Clustering of cases among vaccinated persons by time, geographic area, or lot could help identify an issue in manufacturing, shipping, handling, or administration. Evaluating SARS-CoV-2 strains that cause vaccine breakthrough cases provides one way to monitor for variant strains that could result in lower vaccine efficacy.

COVID-19 and the Changing Healthcare Delivery Landscape: HHS ASPR Technical Resources, Assistance Center, and Information Exchange (TRACIE) released a study highlighting the impact of COVID-19 on healthcare delivery. The study examines supply chain, patients delaying emergency care, the delay of elective procedures, and financial impacts to the healthcare system.

COVID-19 Science Update: CDC released their weekly COVID-19 Science Update. This week's issue includes, but is not limited to, research on the following: the association of sociodemographic factors and blood group type with risk of COVID-19, increased household secondary attack rates with variants of concern**,** and the epidemiologic evidence for airborne transmission of SARS-CoV-2 during church singing.

Hospitalization and Death by Race/Ethnicity: CDC updated their information on hospitalization and death rates by race/ethnicity. Race and ethnicity are risk markers for other underlying conditions that affect health including socioeconomic status, access to health care, and exposure to the virus related to occupation, e.g., frontline, essential, and critical infrastructure workers.

Marvin Figueroa, Director
Office of Intergovernmental and External Affairs
U.S. Department of Health and Human Services
Washington, D.C.

From: HHS IEA (OS/IEA)
To: HHS IEA (OS/IEA)
Subject: HHS COVID-19 Update - 8/5
Date: Thursday, August 5, 2021 9:08:37 PM

Dear Partner:

HHS Office of Intergovernmental and External Affairs COVID-19 update for August 5, 2021:

Highlights from President Biden's August 3rd Remarks on Fighting the COVID-19 Pandemic

- **Delta Variant and Transmissibility:** President Biden stated that because the Delta variant is highly transmissible, it is causing a new wave of cases, accounting for over 80% of cases in the United States today, with a likelihood of an increase in cases in the future. Biden states that the predicted increase is "a largely preventable tragedy that will get worse before it gets better."
- **COVID-19 and Vaccines:** Biden stated that the best way to protect yourself from COVID-19 is to get vaccinated; if vaccinated, it is highly unlikely to get COVID-19 and, if you contract the virus, you will likely experience mild symptoms if any. The data shows that the vast majority of cases, hospitalizations, and deaths due to COVID-19 are from the unvaccinated population. Biden commented, "The best line of defense against the virus is the vaccine… We have a pandemic of the unvaccinated."
- **Data of Increased Vaccination:** Biden reported a 55 percent increase in the average number of new people getting vaccinated every day in the past two weeks, and the highest seven-day total in a month. The eight states with the highest current case rates have seen a doubling of the number of people newly vaccinated each day. Biden declared that "we have to continue our aggressive efforts to vaccinate the unvaccinated."
- **Federal Steps to Incentivize Vaccination:** Biden outlined steps taken by his administration and other government-affiliated organizations to increase vaccinations. Places that have offered $100 to get vaccinated have seen an uptick of 25 percent of daily vaccination rates. Biden reiterated his plan to reimburse small- and medium-sized businesses who give paid time off to their employees to get vaccinated, to work with the Pentagon on adding COVID-19 to required vaccines for troops, and to require healthcare workers in the Department of Veterans Affairs to be vaccinated. Biden stated that these restrictions are "tough, unpopular steps to keep people safe and our economy strong."
- **States' Lack of Action on COVID:** President Biden stated that many states' harmful laws on mask mandates is disappointing and harmful; seven states have both banned mask mandates statewide and in schools while many students are not yet eligible to be vaccinated. The president cited these measures and accompanying low vaccination rates as the cause of the rise of cases, citing Florida and Texas as accounting for a third of all new cases. Biden declared that "COVID-19 is a national challenge, and we must come together — we have to come together — all of us together, as a country, to solve it."
- **Vaccination Abroad:** Biden stated that a global attack on the virus is in the United States' national interest. New, potentially more dangerous variants (such as the Delta variant) can mutate outside of the United States and threaten the country if a global approach is not taken. Biden highlighted American action in global vaccination, announcing that he will

purchase and donate 500 million doses from Pfizer; he also stated that the U.S. has domestically manufactured 110 million doses for global vaccination. Biden reiterated that he's "been very clear-eyed that we need to attack this virus globally, not just at home, because it's in America's self-interest to do so."

Highlights from the White House COVID-19 Response Team Briefing

Jeff Zients

- **Update on Progress in the Fight Against COVID:** Mr. Zients highlighted how, driven by the Delta variant, cases are continuing to rise, especially among the unvaccinated. Zients states that over the past seven days, seven states — among the leaders in unvaccinated percentage — accounted for half of the new cases and hospitalizations despite holding less than a quarter of US population; vaccines are the best way to protect against COVID. Vaccinations are on the rise; the past 24 hours served as the greatest number of vaccinations in a single day since July 3 and the daily average of vaccinations has increased for the fourth week in a row. Zients said that "clearly Americans are seeing the impact of being unvaccinated and unprotected and they respond by doing their part, rolling up their sleeve, and getting vaccinated."
- **Action on Vaccination Requirements:** Mr. Zients reiterated President Biden's call for federal workers and contractors to get vaccinated and notes the further requests for similar requirements in the private sector. Zients stated that over 650 colleges and universities are requiring students and staff on campus to be vaccinated and nationwide, over 100 hospitals and healthcare systems are requiring healthcare professionals to be vaccinated. "America's businesses, large and small, universities and medical schools, and many other institutions are stepping up on vaccination requirements and our message is quite simple: we support these vaccination requirements to protect workers, communities, and the country," Zients said.
- **COVID-19 Surge Response Teams:** Mr. Zients stated that the COVID-19 Surge Response Teams are in 16 states and addressing each state's specific needs, whether that is increased testing, mobile vaccination clinics, or hospital capacity. Zients noted the hundreds of federal employees deployed to the states that are assisting in combatting COVID. "Our whole of government response," Zients said, "will continue its relentless efforts to end this pandemic and deliver progress each and every day."

Dr. Walensky

- **COVID-19 Case Update:** Dr. Walensky stated that on August 3, the CDC reported 103,455 new cases of COVID with a 7-day average of about 89,463 cases per day, representing an increase of 43.3% from last week. Hospitalizations and deaths from this week compared to the last increased significantly; deaths rose 39.3 percent. Walensky stated that 83% of counties within the United States are experiencing moderate or high transmission. Those at high risk remain people who have not yet been vaccinated. Walensky said that "now is the time to get vaccinated. We know these vaccines are working and we know that they save lives."

Dr. Fauci

- **Vaccine Hesitancy and Concern Over Development Speed:** In response to Americans

worried about the speed of the development of the vaccine, Dr. Fauci outlined the various ways in which the vaccine is safe and not rushed: the investment of logistics and resources, the decades of prior research (both in platform technology and immunogen), the non-sequential investment in vaccine development, and the reuse of clinical trial sites originally built for HIV and influenza further sped the development. Fauci said that the vaccine "did not go too fast; it was a major investment both in the logistics, the resources, and the clinical and basic research."

Dr. Murthy

- **Vaccine Efficacy:** Dr. Murthy stated that the COVID-19 vaccines protect against the Delta variant, both at reducing the risk of infection and the severity if infected. Murthy said that "breakthrough infections of vaccinated people are the exception, not the rule."
- **Meeting of Living Surgeons General:** Yesterday, Dr. Murthy met with the living former surgeons general to discuss the vaccination effort with equity being at the forefront. The meeting covered health misinformation, ensuring that communities of color and rural areas are not left behind, and engaging with trusted community messengers. Murthy stated that "this gathering of surgeons general reflected the diversity of our nation, and it was emblematic of what we have to do together to defeat the virus."

Testing and Treatment

FDA Testing Updates: As of August 3, 398 tests and sample collection devices are authorized by the FDA under emergency use authorizations (EUAs). These include 279 molecular tests and sample collection devices, 87 antibody and other immune response tests and 32 antigen tests. There are 53 molecular authorizations and one antibody authorization that can be used with home-collected samples. There is one molecular prescription at-home test, three antigen prescription at-home tests, six antigen over-the-counter (OTC) at-home tests and two molecular OTC at-home tests. The FDA has authorized 13 antigen tests and eight molecular tests for serial screening programs. The FDA has also authorized 595 revisions to EUA authorizations.

Funding

FEMA COVID-19 Funeral Assistance Tops $888 Million: FEMA announced that COVID-19 funeral assistance has now increased to over $888 million to more than 135,000 people to assist with COVID-19-related funeral costs for deaths occurring on or after Jan. 20, 2020. The assistance, easing financial stress, comes from the Coronavirus Response and Relief Supplemental Appropriations Act of 2021 and the American Rescue Plan Act of 2021. Eligibility determinations are not driven by state/location; instead, they are based on when the applicant submits all required documentation.

Information for Specific Populations

CDC Issues Eviction Order in Areas of Substantial and High Transmission: CDC announced that Director Dr. Rochelle Walensky signed an order on August 3rd determining the evictions of tenants for failure to make rent or housing payments could be detrimental to public health control measures to slow the spread of SARS-CoV-2, the virus that causes COVID-19. This order will expire on October 3, 2021 and applies in United States counties experiencing substantial and high levels of community

transmission levels of SARS-CoV-2: This temporary protection from eviction in counties with heightened levels of community transmission exists in order to respond to recent, unexpected developments in the trajectory of the COVID-19 pandemic, including the rise of the Delta variant. It is intended to target specific areas of the country where cases are rapidly increasing, which likely would be exacerbated by mass evictions.

CDC Extends Order at the Southern and Northern Land Borders: The Centers for Disease Control and Prevention (CDC) has issued an order under Sections 362 and 365 of the Public Health Service Act, and associated implementing regulations, that temporarily suspends the introduction of certain noncitizens. The order is based on the Director's determination that introduction of such noncitizens, regardless of their country of origin, migrating through Canada and Mexico into the United States creates a serious danger of the introduction of COVID-19 into the United States, and the danger is so increased by the introduction of such noncitizens that a temporary suspension is necessary to protect the public health. Unaccompanied noncitizen children already excepted under a July 16, 2021, order, remain excepted from the order's coverage.

Readout of the Sixth Covid-19 Health Equity Task Force Meeting: HHS released a readout on Friday, July 30's, sixth COVID-19 Health Equity Task Force meeting to consider interim recommendations addressing future pandemic preparedness. Task Force Members discussed and voted favorably on interim recommendations, including but not limited to exploring strategies that meet local and regional staffing needs during pandemic response, expanding adequate and evidence-based healthcare access and funding infrastructure to treat patients in congregate settings, establishing and adjusting national standards as well as strategically target funding for water, sewage, and air quality to where it's needed, based on data from reliable equity indicators.

What to Consider When Planning to Operate a COVID-19 Vaccine Clinic: CDC released information regarding what to consider when planning to operate a COVID-19 vaccine clinic. The informational sheet provides guidance to conduct a gap analysis to determine specific geographic areas and specific populations that may benefit from additional sites to improve access to vaccination, work with community leaders and trusted members of the community to help with the success of vaccination clinics, and assess the optimal time to activate a vaccination site and consider the benefits of focused vaccination efforts. The page also page also provides a checklist of best practices for vaccination clinics held at satellite, temporary, or off-site locations.

Know What to Expect at Your Child's K- 12 School or Child Care Program: CDC released information for parents on what to expect for K-12 school or childcare programs. The page provides information for factors that a child's school or care program may consider, prevention strategies for these programs, and vaccination and masking.

CMS Updates

Fiscal Year (FY) 2022 Medicare Hospital Inpatient Prospective Payment System (IPPS) and Long Term Care Hospital (LTCH) Rates Final Rule (CMS-1752-F): CMS announced that, on August 2, 2021, it issued the final rule for fiscal year (FY) 2022 Medicare Hospital Inpatient Prospective Payment System (IPPS) and Long-Term Care Hospital (LTCH) Prospective Payment System (PPS). The final rule

updates Medicare payment policies and rates for operating and capital-related costs of acute care hospitals and for certain hospitals and hospital units excluded from the IPPS for FY 2022. The policies in this IPPS and LTCH PPS final rule build on key priorities to close health care equity gaps and support greater access to life-saving diagnostics and therapies during the COVID-19 public health emergency (PHE) and beyond. To continue to mitigate potential financial disincentives for hospitals to provide new COVID-19 treatments and to minimize any potential payment disruption immediately following the end of the PHE, CMS is extending the New COVID-19 Treatment Add-on Payment for eligible COVID-19 products through the end of the fiscal year in which the PHE ends.

Research

Outbreak of SARS-CoV-2 Infections, Including COVID-19 Vaccine Breakthrough Infections, Associated with Large Public Gatherings: CDC released an *MMWR* on the outbreak of SARS-CoV-2 infections, including COVID-19 vaccine breakthrough infections, associated with large public gatherings in Barnstable County, Massachusetts in July, 2021. This report was released as an *MMWR* Early Release on July 30. Variants of SARS-CoV-2 continue to emerge. The B.1.617.2 (Delta) variant is highly transmissible. In July 2021, following multiple large public events in a Barnstable County, Massachusetts, town, 469 COVID-19 cases were identified among Massachusetts residents who had traveled to the town during July 3–17; 346 (74%) occurred in fully vaccinated persons. Testing identified the Delta variant in 90% of specimens from 133 patients. Cycle threshold values were similar among specimens from patients who were fully vaccinated and those who were not. Jurisdictions might consider expanded prevention strategies, including universal masking in indoor public settings, particularly for large public gatherings that include travelers from many areas with differing levels of SARS-CoV-2 transmission. CDC Director Rachelle Walensky, MD, MPH, released an accompanying statement on the MMWR.

COVID-19 Vaccine Safety in Adolescents Aged 12–17: CDC released an *MMWR* on COVID-19 vaccine safety in adolescents aged 12–17 in the United States from December 14, 2020 - July 16, 2021. This report was released as an *MMWR* Early Release on July 30. In preauthorization trials of the Pfizer-BioNTech COVID-19 vaccine, adolescents aged 12–17 years reported local and systemic mild and moderate reactions. Myocarditis has been observed after vaccination with mRNA vaccines in post authorization monitoring. Local and systemic reactions after vaccination with Pfizer-BioNTech vaccine were commonly reported by adolescents aged 12–17 years to U.S. vaccine safety monitoring systems, especially after dose 2. A small proportion of these reactions are consistent with myocarditis. Mild local and systemic reactions are common among adolescents following Pfizer-BioNTech vaccine, and serious adverse events are rare. The Advisory Committee on Immunization Practices conducted a risk-benefit assessment and continues to recommend the Pfizer-BioNTech COVID-19 vaccine for all persons aged ≥12 years.

Full-dose Blood Thinners Reduce the Need for Organ Support in Moderately Ill COVID-19 Patients, but Not in Critically Ill Patients: NIH released a report on full-dose blood thinners reducing the need for organ support in moderately ill COVID-19 patients, but not critically ill patients. In April 2020, hospitalized COVID-19 patients received either a low or full dose of heparin, a blood thinner, for up to 14 days after enrollment. By December 2020, interim results indicated that full-dose anticoagulation did not reduce the need for organ support and may even cause harm in critically ill

patients. However, one month later, interim results indicated that full doses of heparin likely benefited moderately ill patients. The full study can be viewed here.

Long-Term Study of Brain Development Records Pandemic Life: NIH released a report on the analysis of adolescent brains to examine the long-term health impacts caused by the COVID-19 pandemic and shutdowns. Through surveys and tests, the study, from Adolescent Brain Cognitive Development (ABCD) Study and funded by NIH, is capturing the impact of the COVID-19 pandemic on children using an MRI.

Case Forecasts: This week's national ensemble predicts that 350,000 to 1,800,000 new cases will likely be reported in the week ending August 28, 2021. Over the last several weeks, more reported cases have fallen outside of the forecasted prediction intervals than expected. This suggests that current forecast prediction intervals may not capture the full range of uncertainty. Because of this, case forecasts for the coming weeks should be interpreted with caution. View previous case forecasts.

Hospitalization Forecasts: This week's national ensemble predicts that the number of new daily confirmed COVID-19 hospital admissions will likely increase over the next 4 weeks, with 6,700 to 24,000 new confirmed COVID-19 hospital admissions likely reported on August 30, 2021. The state- and territory-level ensemble forecasts predict that over the next 4 weeks, the number of daily confirmed COVID-19 hospital admissions will likely increase in 38 jurisdictions, which are indicated in the forecast plots below. Trends in numbers of future reported hospital admissions are uncertain or predicted to remain stable in the other states and territories. View previous hospitalization forecasts.

Death Forecasts: This week's national ensemble predicts that the number of newly reported COVID-19 deaths will likely increase over the next 4 weeks, with 2,300 to 9,100 new deaths likely reported in the week ending August 28, 2021. The national ensemble predicts that a total of 624,000 to 642,000 COVID-19 deaths will be reported by this date. The state- and territory-level ensemble forecasts predict that over the next 4 weeks, the number of newly reported deaths per week will likely increase in 17 jurisdictions, which are indicated in the forecast plots below. Trends in numbers of future reported deaths are uncertain or predicted to remain stable in the other states and territories. View previous death forecasts.

Top Military Medical Doctor Predicts Coronavirus Longevity: DoD released a report on the analysis of COVID-19 longevity according to director of Defense Health Agency, Army Lt. Gen. Ronald J. Place. Place stated his belief that COVID-19 and other such coronaviruses likely will stay in the environment and continue to mutate. Vaccines serve as the way to protect oneself from this lingering threat.

Marvin Figueroa, Director
Office of Intergovernmental and External Affairs
U.S. Department of Health and Human Services

Daily Update Brief

As of 10/8/2020 4:54 AM

Delta Reminder:
During a power outage, ATMs & credit card machines will not work. Include extra cash (small bills) in your emergency kit...because you can pretty much count on power outages during hurricanes.

Daily Update Brief

As of 11/9/2020 4:57 AM

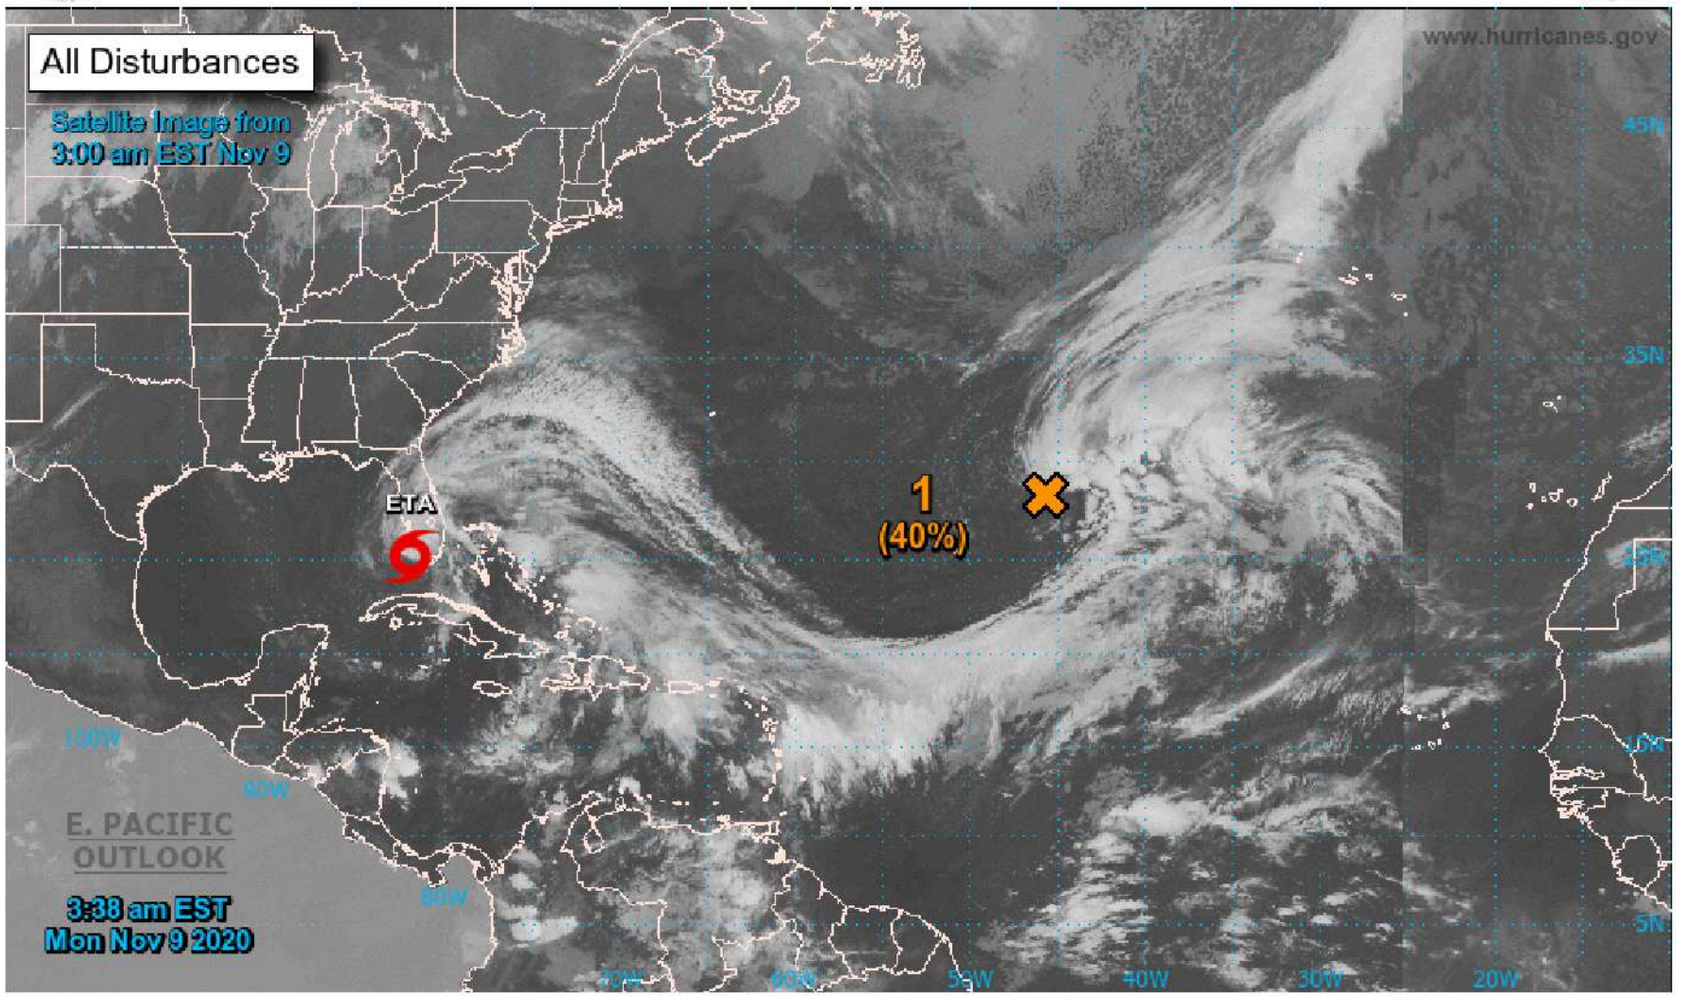
Tropical – Two-Day Outlook *(See NHC for the latest information)*

Tropical Storm Eta Advisory Number 36
400 AM EST Mon Nov 09 2020

1. Heavy rainfall from Eta will continue across portions of Cuba, Jamaica, the Bahamas, and southern Florida and spread north into central Florida. Life-threatening flash flooding will be possible across inundated urban areas of southeast Florida today. Flash and urban flooding will also be possible for Cuba, Jamaica, the Bahamas and the remainder of southern Florida, along with potential minor river flooding in central Florida.
2. Tropical storm conditions will continue across portions of the Florida Keys, and south and central Florida today.
3. Water levels will gradually recede along portions of the southern coast of the Florida peninsula and Keys. Residents in these areas should follow any advice given by local officials.
4. Eta could approach the Florida Gulf Coast later this week as a tropical storm, and possibly bring impacts from rain, wind, and storm surge. Interests in this area should monitor the progress of Eta and updates to the forecast this week.

Two-Day Graphical Tropical Weather Outlook
National Hurricane Center Miami, Florida



Current Disturbances and Two-Day Cyclone Formation Chance: < 40% 40-60% > 60%
Tropical or Sub-Tropical Cyclone: Depression Storm Hurricane
Post-Tropical Cyclone or Remnants

Daily Update Brief

As of 11/9/2020 4:57 AM

Tropical – Five-Day Outlook (See NHC for the latest information)

For the North Atlantic...Caribbean Sea and the Gulf of Mexico:

2. A tropical wave is forecast to move over the central Caribbean Sea, where an area of low pressure could form in a couple of days. Environmental conditions are forecast to be conducive for development, and a tropical depression could form late this week or over the weekend while the system moves slowly westward.

* Formation chance through 48 hours...low...near 0 percent.

* Formation chance through 5 days...medium...50 percent.

Mississippi News of Interest

Gulfport celebration for Biden-Harris more than just about a victory for Democrats

A celebration in downtown Gulfport on Sunday wasn't just about the historic victory by President-elect Joe Biden and Vice President-elect Kamala Harris. In fact, it could well have happened, even if the Democrats had lost the presidential election.

U.S. Senator Roger Wicker: Honoring America's Veterans

Each year on November 11th, our nation honors those who have served in the U.S. military. We show our appreciation through parades, ceremonies, and simple words of thanks. The opportunity to cast ballots in the recent election is one reason to be…

52nd Fall Street Festival brings much needed business to Picayune

Crowds of people took in the 52nd year of the Picayune Fall Street Festival while organizers praise the two-day event. The festival was a much-needed event after a very impactful year for South Mississippians.

Piney Woods School added to National Register of Historic Places

Piney Woods Country Life School, one of the nation's oldest independent Black boarding schools, has been listed in the National Register of Historic Places.

Voters narrowly approve keeping Confederate statue in place

A referendum on the monument was placed on the Nov. 3 ballot after the Forrest County Board of Supervisors couldn't agree on what to do with the monument in June, The Hattiesburg American reports.

Several leadership roles shuffled in Mississippi Senate

Several members of the Mississippi Senate are receiving new leadership roles, weeks ahead of the next legislative session that begins in January.

Aberdeen residents looks to revive old sports complex

People of Aberdeen volunteered their time on Saturday to rejuvenate the old sports complex on Sharpley Bottom Drive. Residents helped put together bleachers and clean up the area.

Emergency Management News

Eta strikes Florida Keys; expected to become hurricane

Florida officials closed beaches, ports and COVID testing sites, shut down public transportation and urged residents to stay off the street. Florida officials closed beaches, ports and COVID testing sites, shut down public transportation and urged residents…

State-by-state face mask mandates vary but mostly require coverage in indoor public spaces

Because scientists and medical experts overwhelmingly recommend masks as an effective way to limit the spread of COVID19, I am placing the entire state of Utah under a mask mandate until further notice 128 Businesses must require employees to wear…

More COVID-19 hospitalizations among these workers

Construction workers are almost five times more likely to be hospitalized for the coronavirus compared to non-construction workers, according to a study from researchers with The University of Texas at Austin.

Election Security 2020: Why Did Things Go Right This Time?

In the weeks leading up to the 2020 presidential election, the U.S. government and technology companies took several steps to safeguard election security in cyberspace, focusing their efforts on disinformation and cyberattacks.

How to Follow CDC Holiday Party Advice

With the holiday season already well underway (at least when you look at the store shelves and displays), it is understandable that employers might want to give a little boost to morale by holding something like a traditional office Christmas party.

How to Prepare for Hurricane Dangers

OSHA requires firms with over 10 employees to adopt an emergency action plan. After many years of mild hurricane seasons, 2020 has proven to be extraordinarily active, resulting in widespread damage, deaths and injuries.

Proposed troop drawdown in Germany complicates plans to hand back military land

A directive from President Donald Trump to withdraw some 12,000 U.S. troops from Germany and move numerous units elsewhere in Europe or to the U.S. has further complicated the plan, which was first announced by the Pentagon in 2015.

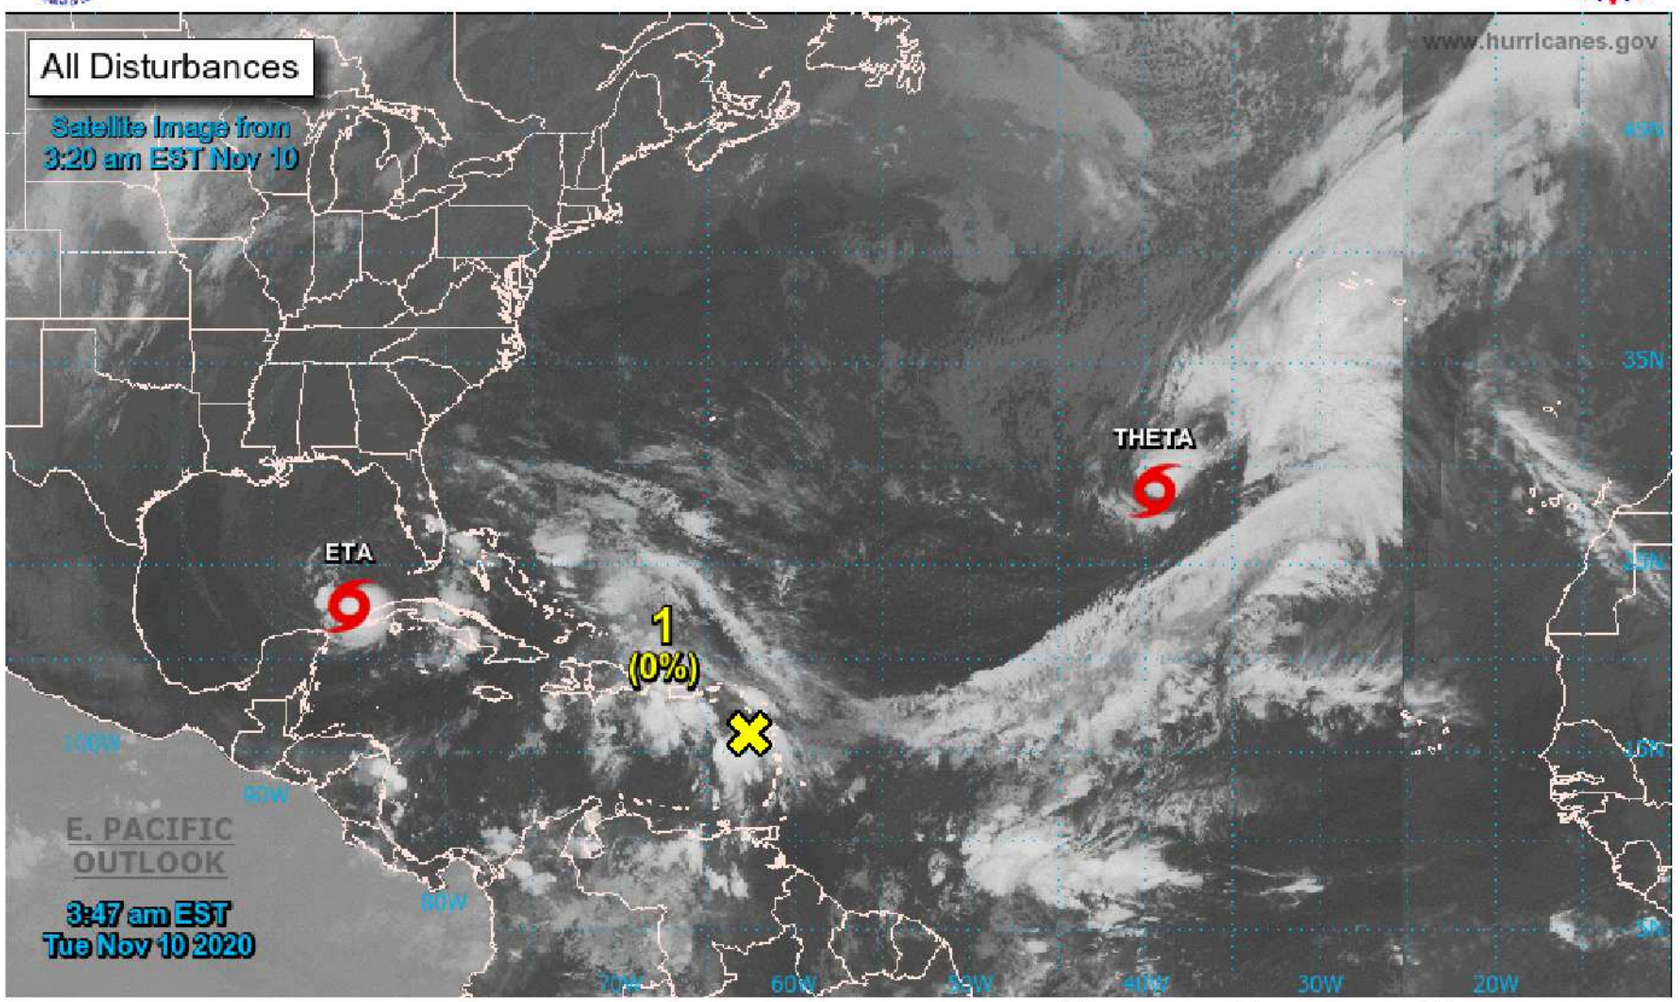
Tropical – Two-Day Outlook *(See NHC for the latest information)*

Tropical Storm Eta Advisory Number 40
300 AM CST Tue Nov 10 2020

1. Heavy rainfall from Eta will continue across portions of Cuba, the Bahamas, and southern Florida and spread north into central Florida. Additional flash and urban flooding, especially across previously inundated areas, will be possible in South Florida tonight. Flash and urban flooding will also be possible for Cuba, the Bahamas and the remainder of southern Florida over the next several days.

2. Eta could approach the Florida Gulf Coast later this week as a tropical storm, and possibly bring impacts from rain, wind, and storm surge. Interests in this area should continue to monitor the progress of Eta and updates to the forecast this week.

Two-Day Graphical Tropical Weather Outlook
National Hurricane Center Miami, Florida



Current Disturbances and Two-Day Cyclone Formation Chance: < 40% 40-60% > 60%
Tropical or Sub-Tropical Cyclone: Depression Storm Hurricane
Post-Tropical Cyclone or Remnants

MS-DOH-21-1816-A-000921

Daily Update Brief

As of 11/10/2020 4:59 AM

Tropical – Five-Day Outlook (See NHC for the latest information)

For the North Atlantic...Caribbean Sea and the Gulf of Mexico:

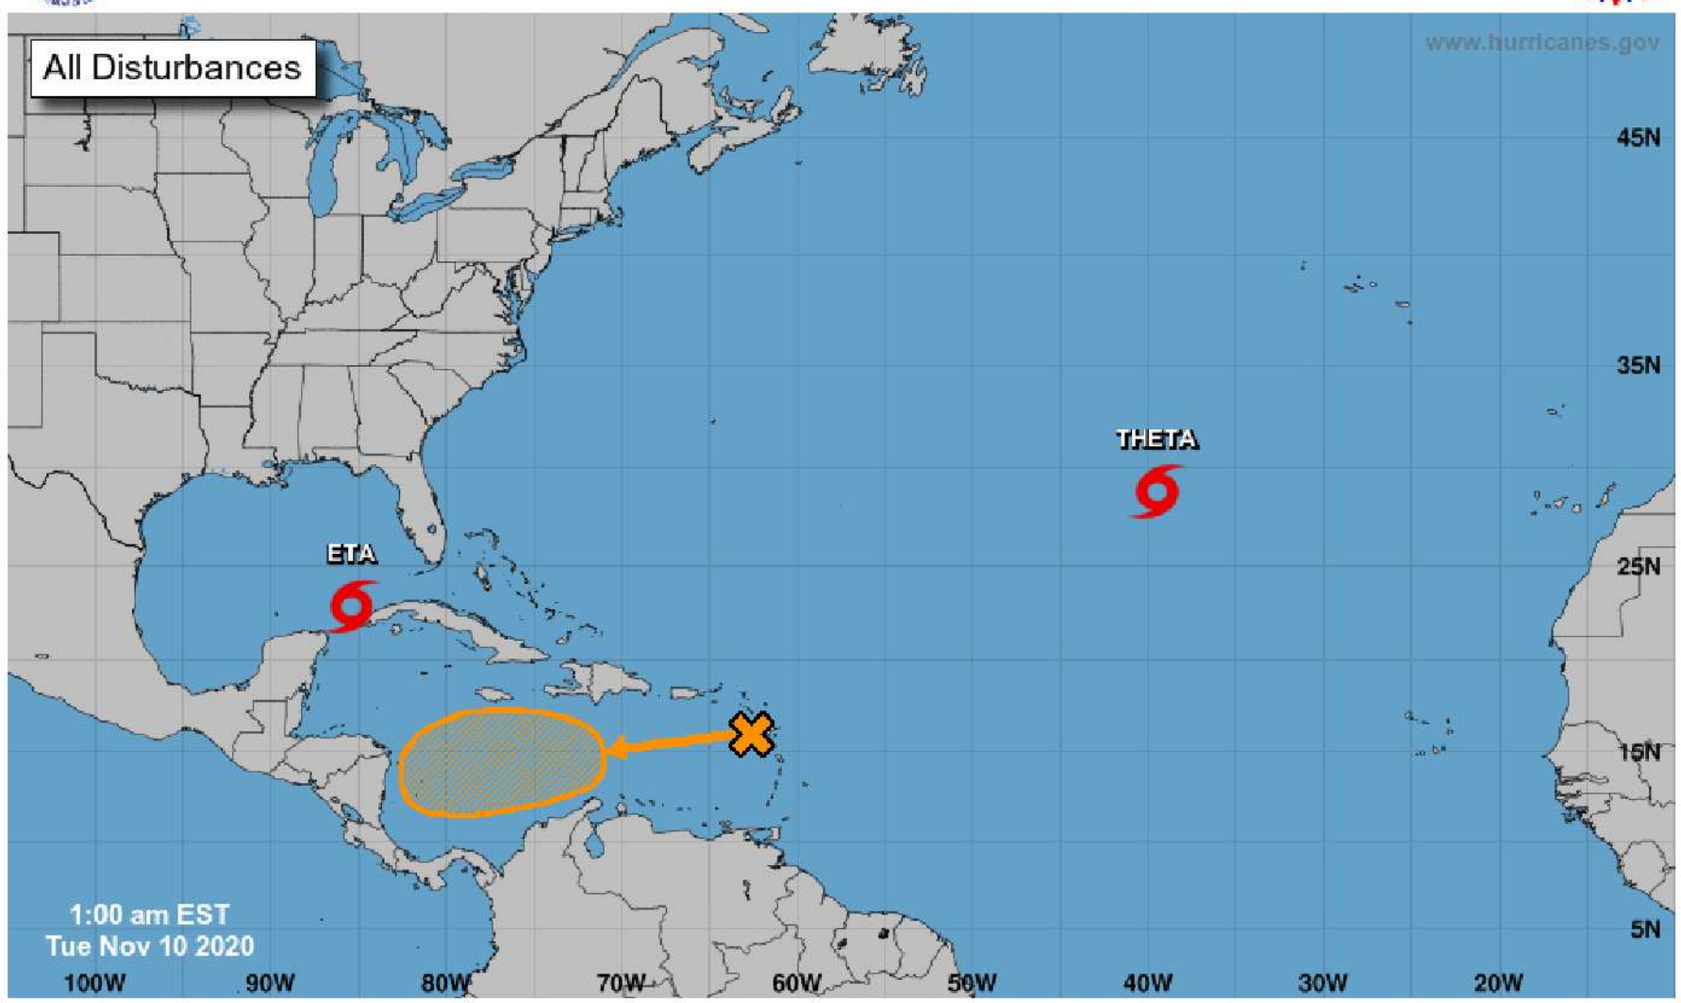
1. A tropical wave located over the eastern Caribbean Sea is producing disorganized showers and thunderstorms. This wave is expected to move westward into more conducive environmental conditions, and a tropical depression could form late this week or this weekend when the wave reaches the central or western Caribbean Sea.

* Formation chance through 48 hours...low...near 0 percent.

* Formation chance through 5 days...medium...60 percent.

Five-Day Graphical Tropical Weather Outlook

National Hurricane Center Miami, Florida



Current Disturbances and Five-Day Cyclone Formation Chance: < 40% 40-60% > 60%

Tropical or Sub-Tropical Cyclone: Depression Storm Hurricane

Post-Tropical Cyclone or Remnants

Daily Update Brief

As of 11/10/2020 4:59 AM

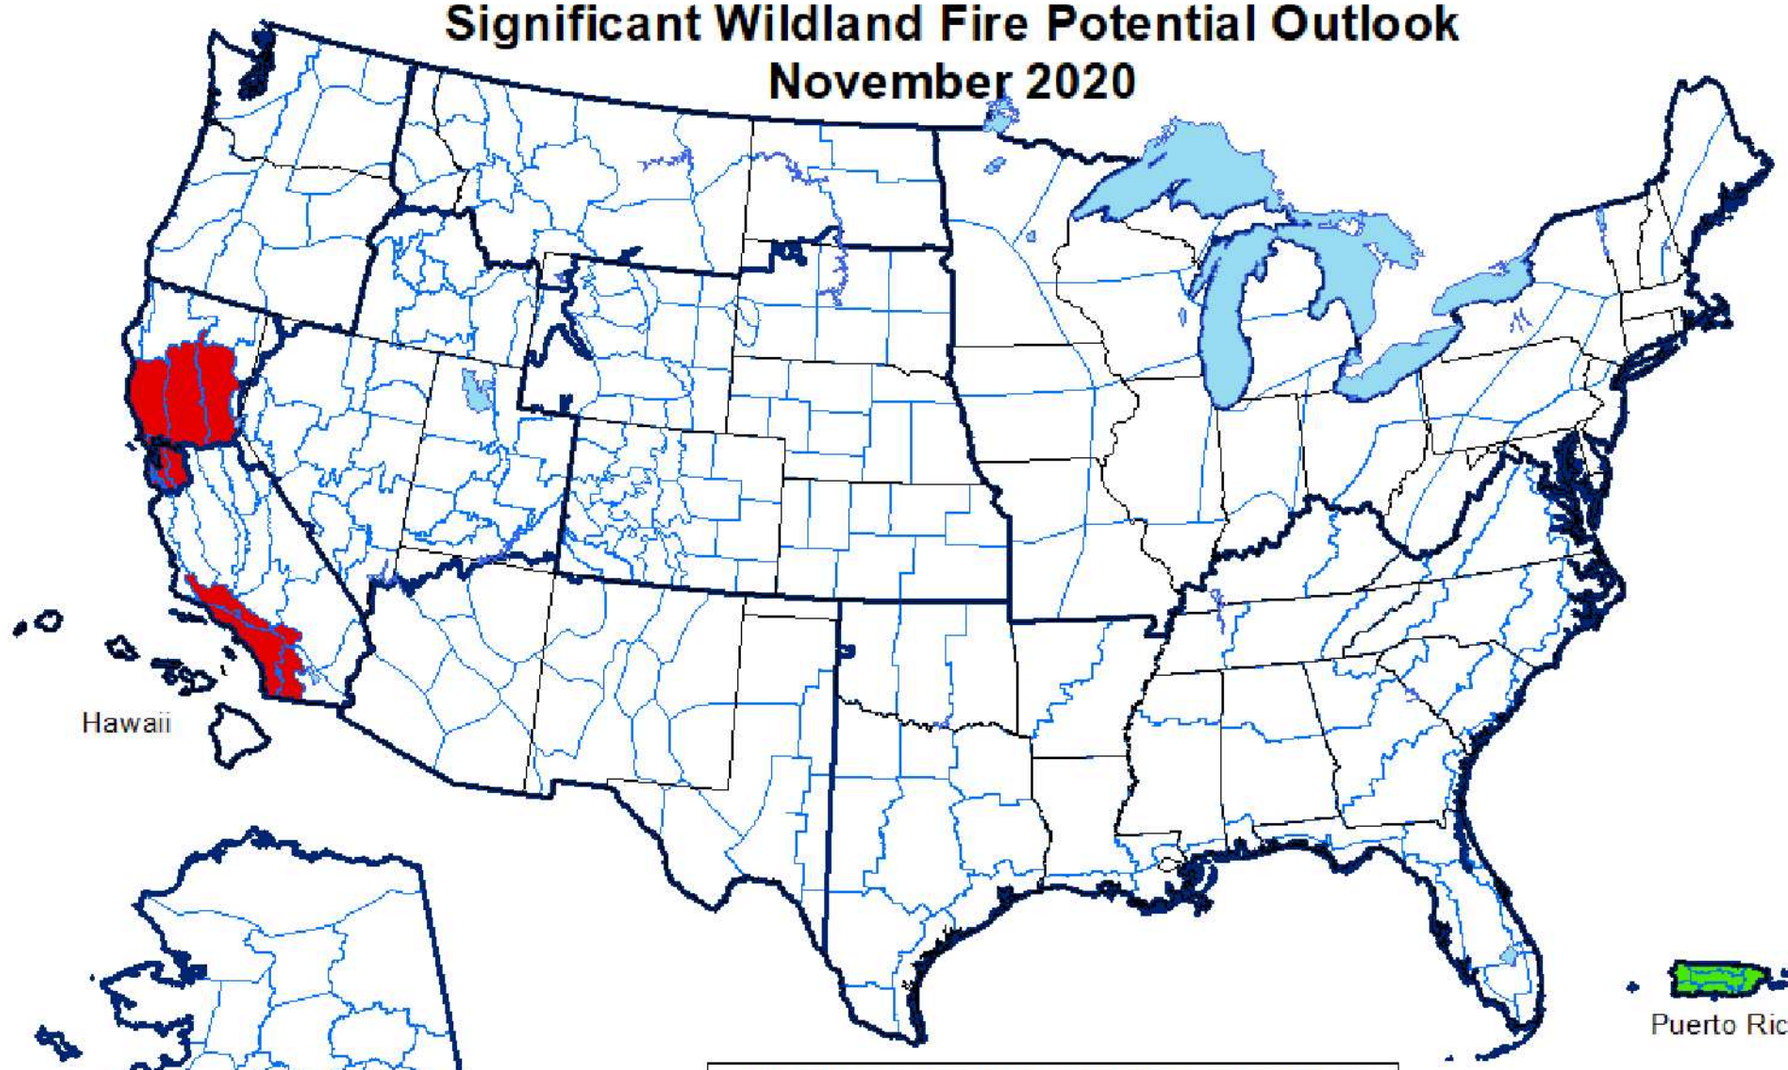
Significant Wildland Fire Potential Outlook
November 2020



Significant Wildland Fire Potential

- Above Normal
- Below Normal
- Normal
- Geographic Area Boundary
- Predictive Services Area Boundary
- State Border

Above normal significant wildland fire potential indicates a greater than usual likelihood that significant wildland fires will occur.
Significant wildland fires should be expected at typical times and intervals during normal significant wildland fire potential conditions.
Significant wildland fires are still possible but less likely than usual during forecasted below normal periods.

From: [redacted]
To: Dobbs, Thomas E
Subject: Just got this from CDC
Date: Wednesday, December 8, 2021 12:25:54 PM
Attachments: PART+VI+FORMS+and+ATTACHMENTS.pdf
FY22+CDC+BAA+Solicitation+Posting+75D301-22-R-72097.pdf

Dr. Dobbs,
Thanks so much again for coming to our Rotary Club meeting. Hope you enjoyed it as much as the Rotarians did! I just attended a Zoom meeting with CDC in regards to Covid-19 Molecular Surveillance and these documents were distributed. Please feel free to share at will inside MSHD.
I am about to send the email out to Mrs. Fanning asking for the support to have my Orientation and the first 3 days through telework given the traveling circumstances.
Best and kind regards,
NA.

CENTERS FOR DISEASE CONTROL AND PREVENTION (CDC)

BROAD AGENCY ANNOUNCEMENT (BAA)

75D301-22-R-72097

"Applied Research to Address Emerging Public Health Priorities"

ISSUANCE DATE:	**December 6, 2021**
CLOSING DATE:	**January 14, 2021**

MS-DOH-21-1816-A-000934

TABLE OF CONTENT

PART I - INTRODUCTION 5

Authority 5

Process 5

Step 1 - E-mail Contact (Technical Dialogue) 5
Step 2 - Informal White Paper (Technical Dialogue) 8
Step 3 - Submission of Formal Research Proposal 9
Step 4 - Contract Award for Selected Projects 9

Government Obligation 9

BAA Points of Contact 9

PART II CDC RESEARCH INTERESTS 10

OVERVIEW 10

Topic 1: Exploring best strategies to interrupt poliovirus transmission in outbreak-affected countries (CGH) 10

Topic 2: Public Health Communication Approaches to Increase Trust in Public Health Emergency Preparedness (CPR) 10

Topic 3: Address critical gaps in knowledge regarding personal protective equipment (PPE) standards in a laboratory setting (CPR) 12

Topic 4: Address Critical Knowledge Gaps related to Emerging and Re-emerging Infectious Diseases During Pregnancy and the Risks, Benefits and Acceptance of Prevention and Treatment Strategies (NCBDDD) 13

Topic 5: Expand the portfolio of effective interventions to prevent or delay type 2 diabetes and manage diabetes among populations who are underserved (NCCDPHP) 14

Topic 6: Wastewater Surveillance (NCEZID) 16

Topic 7: Genomic sequencing of SARS-CoV-2 to investigate viral evolution, and emergence and spread of variants in communities and populations. (NCEZID) 17

Topic 8: Strengthening emerging, re-emerging, and biothreat infectious disease surveillance, detection, and preparedness (NCEZID) 18

Topic 9: Address gaps in direct detection diagnostic assays for Lyme borreliosis (NCEZID) 18

Topic 10: Address critical gaps in human tick bite prevention (NCEZID) 19

Topic 11. Novel prevention methods to reduce transmission of Rickettsia rickettsii by brown dog ticks (NCEZID) 19

Topic 12: Evaluation of novel Aedes aegypti control tools (NCEZID) 20

Topic 13: Novel Assays for Dengue Vaccine Evaluation (NCEZID) 20

Topic 14: Implementation of Wolbachia-based strategies for dengue control in Central America (NCEZID) 21

Topic 15: Towards dengue elimination: enhanced vector control and surveillance in Puerto Rico (NCEZID) 22

Topic 16: Research to inform optimal approaches to environmental sampling and understanding of the prevalence and distribution of pathogenic fungi in healthcare settings (NCEZID) 23

Topic 17: Understanding the impact of climate change and other predictors on the distribution and severity of fungal diseases (NCEZID) 23

Topic 18: Development of rapid point-of-care (POC) syphilis diagnostic tests (NCHHSTP) 23

Topic 19: Decreasing disparities in the incidence, morbidity, and mortality associated with HIV, viral hepatitis, other sexually transmitted infections (STIs), tuberculosis and adolescent health (NCHHSTP)…25

Topic 20: Influenza and Other Acute Respiratory Infections (NCIRD)……..….25

Topic 21: SARS-CoV-2 (COVID-19) and Children (NCIRD)…….……..28

Topic 22: Bacterial Respiratory and Vaccine-Preventable Diseases (NCIRD)..……..32

PART I - INTRODUCTION

Authority

The Centers for Disease Control and Prevention (CDC), the Office of Science (OS) issues this Broad Agency Announcement (BAA) under the provisions of FAR 35.016 and FAR 6.102(d)(2) which provides for the competitive selection of research proposals. Contracts that are awarded based on responses to this BAA are as a result of full and open competition and therefore in full compliance with the provisions of PL 98-369, "The Competition in Contracting Act of 1984."

The CDC may award contracts with educational institutions, nonprofit organizations, not for profit organizations, state and local government, and private industry for research and development (R&D) in those areas covered in Part II of this BAA.

Within the meaning of FAR 6.102 and 35.016, this announcement constitutes the government's solicitation for this effort. There will be no other solicitation issued in regard to this requirement. Offerors should be alert for any BAA amendments that may be posted on beta.SAM.gov.

Process

Funding of research within CDC will be determined by funding constraints and research priorities set during each fiscal year. Therefore, those contemplating submission of a white paper are encouraged to contact the CDC BAA technical point of contact as noted below to determine whether the research warrants further inquiry. If the research warrants further inquiry and if funding is available, then submission of a white paper/proposal will be entertained. **For all email inquiries to the Subject Matter Expert Technical POC, please copy the CDC BAA Technical Coordinator as well.**

The following four-step sequence is established for offerors contemplating submission of a white paper or a proposal under this BAA. This sequence allows for an early determination of the potential for interest based on technical merit, applicability to CDC and projected funding. This process is designed to limit offeror and Government expenditure of effort to prepare and review formal proposals for research that may have little chance of being funded.

Step 1 – Email Contact (Technical Dialogue)

Once the BAA is issued, technical dialogue can began. Technical dialogue between the Government and the potential offeror is the first step. The initial point of contact may direct offerors to a specific scientific/technical point of contact based on the topic area and specifics of the proposed research project. The initial contact points for each area of research interest identified in Part II is listed below.

Research Interests	Point of Contact (POC)	POC e-mail address
Topic 1. Exploring best strategies to interrupt poliovirus transmission in outbreak-affected countries (CGH)		
1.1. Modeling to inform effective polio outbreak response strategies	Gabe AnayaCGH Extramural Research Program Office	gda1@cdc.gov cgherpo@cdc.gov
Topic 2. Public Health Communication Approaches to Increase Trust in Public Health Emergency Preparedness (CPR)		
2.1 Public Health Communication Approaches to Increase Trust in Public Health Emergency Preparedness	Kimberly Leeks	kleeks@cdc.gov
Topic 3. Address critical gaps in knowledge regarding personal protective equipment (PPE) standards in a laboratory setting (CPR)		
3.1. Comparison of PPE used in the United States and globally in terms of physical and barrier resistance using standardized performance tests (e.g., water resistance, viral penetration tests)	Christy Ottendorfer Selcen Kilinc-Balci	uyk0@cdc.gov jcq8@cdc.gov

3.2. Effects of chemical decontamination on the durability and reliability of PPE in standardized performance tests (e.g., water resistance, viral penetration tests)	Christy Ottendorfer Selcen Kilinc-Balci	uyk0@cdc.gov jcq8@cdc.gov
3.3. Effects of reuse of PPE in standardized performance tests (e.g., viral penetration tests)	Christy Ottendorfer Selcen Kilinc-Balci	uyk0@cdc.gov jcq8@cdc.gov
Topic 4. Address Critical Knowledge Gaps related to Emerging and Re-emerging Infectious Diseases During Pregnancy and the Risks, Benefits and Acceptance of Prevention and Treatment Strategies (NCBDDD)		
4.1. Mother-baby linked longitudinal cohort studies to examine the impact of emerging and re-emerging infectious diseases and prevention and treatment strategies on pregnancy, birth, and early childhood outcomes	Suzanne Gilboa Dana Meaney-Delman Van Tong Kara Polen	suz0@cdc.gov vmo0@cdc.gov vct2@cdc.gov fvc1@cdc.gov
Topic 5: Expand the portfolio of effective interventions to prevent or delay type 2 diabetes and manage diabetes among populations who are underserved (NCCDPHP)		
5.1. Identify, test, implement, and evaluate innovative evidence-based interventions, strategies, programs, or policies that reduce health inequities in type 2 diabetes prevention.	Bryce Smith	Bsmith6@cdc.gov
5.2. Identify, test, implement, and evaluate innovative evidence-based interventions, strategies, programs, or policies that reduce health inequities in diabetes management.	Bryce Smith	Bsmith6@cdc.gov
5.3. Study the effectiveness of various approaches/supports currently used by recognized organizations in the National Diabetes Prevention Program (National DPP) to eliminate or reduce barriers to enrollment and retention in the National DPP lifestyle change program related to the social determinants of health (e.g., food insecurity/limited access to healthy foods, lack of reliable transportation or internet access, lack of safe places to get physical activity, others). Determine which approaches are effective in addressing these barriers for populations currently underrepresented in the program.	Bryce Smith	Bsmith6@cdc.gov
Topic 6. Wastewater Surveillance (NCEZID)		
6.1. Detection and typing of disease targets from wastewater	Rory Welsh	Mpo6@cdc.gov
6.2. Fecal shedding of SARS-CoV-2 RNA	Amy Kirby	Agk1@cdc.gov
Topic 7. Genomic sequencing of SARS-CoV-2 to investigate viral evolution, and emergence and spread of variants in communities and populations. (NCEZID)		
7.1. Incorporate viral genomic data, clinical and demographic data to better predict poor outcomes of SARS-CoV-2 infection, increased likelihood of reinfection and risk factors for vaccine breakthrough.	Ellie Click Duncan MacCannell	Eoc9@cdc.gov fms2@cdc.gov
7.2. Conduct studies that compare SARS-CoV-2 sequence diversity and viral phylodynamics within and between regions with different public health response timelines and strategies, especially studies that evaluate changes in viral diversity in the context of vaccination campaigns.	Ellie Click Duncan MacCannell	Eoc9@cdc.gov fms2@cdc.gov
7.3. Adapt and optimize sequencing instrumentation, reagents and workflows for the specific needs of public health infectious disease laboratories and field activities.	Ellie Click Duncan MacCannell	Eoc9@cdc.gov Fms2@cdc.gov
7.4. Develop or enhance open source bioinformatic tools, databases and visualization software that improve the availability, utility, integration and interpretation of genomic data from SARS-CoV-2 and other pathogens of public health concern.	Ellie Click Duncan MacCannell	Eoc9@cdc.gov Fms2@cdc.gov
Topic 8. Strengthening emerging, re-emerging, and biothreat infectious disease surveillance, detection, and preparedness (NCEZID)		
8.1. Strengthening emerging, re-emerging, and biothreat infectious disease surveillance, detection, and preparedness by distributing assays through the Laboratory Response Network (LRN)	Julie Villanueva	Jfv3@cdc.gov
Topic 9. Address gaps in direct detection diagnostic assays for Lyme borreliosis (NCEZID)		
9.1 Investigations to discover chemoattractants for B. burgdorferi in tick saliva for development of a xenodiagnostic-like assay for direct detection of the Lyme spirochete in infected individuals	Bob Gilmore	rbg9@cdc.gov
Topic 10. Address critical gaps in human tick bite prevention (NCEZID)		

10.1. Development and evaluation of human tick bite prevention methods	Lars Eisen	evp4@cdc.gov
10.2. Killing of ticks that go undetected while biting humans	Lars Eisen	evp4@cdc.gov
Topic 11. Novel prevention methods to reduce transmission of Rickettsia rickettsii by brown dog ticks(NCEZID)		
11.1 Development of a canine vaccine against *Rickettsia rickettsii*	William Nicholson	wan6@cdc.gov
Topic 12. Evaluation of novel Aedes aegypti control tools (NCEZID)		
12.1 Evaluate effectiveness of dried attractive bait stations to control Aedes aegypti, the main vector of dengue viruses	Ryan Hemme	rhemme@cdc.gov
Topic 13. Novel Assays for Dengue Vaccine Evaluation (NCEZID)		
13.1. Correlates of protective immunity against dengue	Jorge L. Munoz-Jordan	ckq2@cdc.gov
13.2. Measurement of dengue type-specific antibody binding	Jorge L. Munoz-Jordan	ckq2@cdc.gov
13.3. Assessments of dengue vaccine immunogenicity	Jorge L. Munoz-Jordan	ckq2@cdc.gov
13.4. Dengue immunoassay development or optimization	Jorge L. Munoz-Jordan	ckq2@cdc.gov
13.5. Sample collections for test development or validation	Jorge L. Munoz-Jordan	ckq2@cdc.gov
Topic 14. Implementation of Wolbachia-based strategies for dengue control in Central America (NCEZID)		
14.1. Establish surveillance systems to track climate-sensitive mosquito-borne diseases and monitor if they are increasing or shifting over time**.**	Gabriela Paz-Bailey	gmb5@cdc.gov
14.2. Evaluate the implementation and sustainability of *Wolbachia* replacement intervention in Central America	Gabriela Paz-Bailey	gmb5@cdc.gov
14.3. Develop the evidence base for *Wolbachia* replacement implementation in international settings to support implementation of effective strategies in the United States and help reduce risk of importation of vector borne diseases to the U.S.	Gabriela Paz-Bailey	gmb5@cdc.gov
Topic 15. Towards dengue elimination: enhanced vector control and surveillance in Puerto Rico (NCEZID)		
15.1. Develop and implement methods for enhanced surveillance and response to dengue hotspots in Puerto Rico	Gabriela Paz-Bailey	gmb5@cdc.gov
15.2. Evaluate the effectiveness of hotspot responses in preventing additional disease spread	Gabriela Paz-Bailey	gmb5@cdc.gov
Topic 16. Research to inform optimal approaches to environmental sampling and understanding of the prevalence and distribution of pathogenic fungi in healthcare settings (NCEZID)		
16.1. Develop innovative methods for detection and surveillance of pathogenic fungi in healthcare environments	Ana Litvintseva, Jeremy Gold Joe Sexton	frq8@cdc.gov leo3@cdc.gov ogi3@cdc.gov
16.2. Quantify baseline levels of pathogenic fungi within healthcare environments	Ana Litvintseva, Jeremy Gold Joe Sexton	frq8@cdc.gov leo3@cdc.gov ogi3@cdc.gov
16.3. Correlate fungal quantitative data with episodes of fungal infections or transmission in patients.	Ana Litvintseva, Jeremy Gold Joe Sexton	frq8@cdc.gov leo3@cdc.gov ogi3@cdc.gov
16.4. Pilot early detection and surveillance methods for invasive mold and other fungi in patients and in the environment to guide public health efforts.	Ana Litvintseva, Jeremy Gold Joe Sexton	frq8@cdc.gov leo3@cdc.gov ogi3@cdc.gov
16.5. Evaluate the feasibility and utility of different environmental sampling approaches for pathogenic fungi in healthcare environments.	Ana Litvintseva, Jeremy Gold Joe Sexton	frq8@cdc.gov leo3@cdc.gov ogi3@cdc.gov
Topic 17. Understanding the impact of climate change and other predictors on the distribution and severity of fungal diseases (NCEZID)		
17.1. Evaluate the influence of climate on diversity and abundance of human-pathogenic fungi in the environment -	Brendan Jackson Mitsuru Toda	iyn0@cdc.gov, nrk7@cdc.gov
17.2. Model geographic spread of fungal diseases based on predicted and observed climate changes	Brendan Jackson Mitsuru Toda	iyn0@cdc.gov, nrk7@cdc.gov
17.3. Understand the effect of severe weather events on the incidence of fungal infections	Brendan Jackson Mitsuru Toda	iyn0@cdc.gov, nrk7@cdc.gov
17.4. Assess role of social factors (e.g., health disparities) in determining severity of fungal diseases.	Brendan Jackson Mitsuru Toda	iyn0@cdc.gov, nrk7@cdc.gov
17.5. Assess role of host factors on determining severity of fungal diseases.	Brendan Jackson Mitsuru Toda	iyn0@cdc.gov, nrk7@cdc.gov
Topic 18. Development of rapid point-of-care (POC) syphilis diagnostic tests (NCHHSTP)		

18.1 Development of a rapid point-of-care combo treponemal/ nontreponemal antibody test for active syphilis diagnosis	Mayur Shukla Kim Kitzler	Iun9@cdc.gov nin1@cdc.gov
18.2 Development of a direct detection test for *T. pallidum,* ideally for all stages of syphilis	Allan Pillay Kim Kitzler	ajp7@cdc.gov nin1@cdc.gov
Topic 19. Decreasing disparities in the incidence, morbidity, and mortality associated with HIV, viral hepatitis, other sexually transmitted infections (STIs), tuberculosis and adolescent health (NCHHSTP).		
19.1 Develop, implement, and/or evaluate innovative evidence-based interventions to reduce population-level disparities in the incidence, morbidity and mortality associated with HIV, viral hepatitis, STIs, or tuberculosis.	Kirk Henny Harrell Chesson	KHenny@cdc.gov HChesson@cdc.gov
Topic 20. Influenza and Other Acute Respiratory Infections (NCIRD)		
20.1. CRISPR-Based Diagnostic Assays for Multi-Pathogen and Multi-Analyte Detection	Marie K. Kirby	pbi0@cdc.gov
20.2. Assessing the role of non-pharmaceutical interventions (NPI) in preventing influenza	Sonja Olsen	sco2@cdc.gov
Topic 21. SARS-CoV-2 (COVID-19) and Children (NCIRD)		
21.1. Describing respiratory virus transmission in educational settings.	Hannah Kirking	hrj7@cdc.gov
21.2 Evaluating COVID-19 vaccine effectiveness in schools.	Hannah Kirking	hrj7@cdc.gov
21.3. Children 5-17 years: Evaluating the duration of immune protection following COVID-19 vaccination	Hannah Kirking	hrj7@cdc.gov
21.4. Children 0-17 years: Estimating COVID-19 vaccine effectiveness in ambulatory healthcare settings	Leora Feldstein	nqw5@cdc.gov
21.5. COVID-19 and Multisystem Inflammatory Syndrome in Children (MIS-C)	Angela Campbell	app4@cdc.gov
21.6. COVID-19 and Acute Otitis Media (AOM)	Katherine Fleming-Dutra	ftu2@cdc.gov
Topic 22. Bacterial Respiratory and Vaccine-Preventable Diseases (NCIRD)		
22.1. Assessing the molecular epidemiology of group A Streptococcus (GAS) isolates among children.	Katherine Fleming-Dutra	ftu2@cdc.gov
22.2. Understanding the spectrum of clinical pertussis.	Susan Hariri	bse4@cdc.gov
22.3. Understanding immune response to pertussis infection.	Susan Hariri	bse4@cdc.gov

Step 2 – Submission of Informal White Paper (Technical Dialogue)

This step is a continuation of the technical dialogue for projects of interest. Submission of a white paper **does not require an explicit request or invitation from CDC**. Offerors may submit a white paper even if there was no technical dialogue with the SME. Additionally, from time to time, the scientific point of contact may request that an offeror submit an informal white paper. The white paper can be **no more than 4 pages in length, all inclusive.** The purpose of the white paper is to facilitate the SME's understanding of the scientific and technical aspects of the proposed research project. Use of the white paper is intended to determine which efforts are of sufficient scientific and technical merit prior to submission of a formal research proposal as described in Part IV; therefore, informal white papers should not be so lengthy or detailed as to constitute a formal proposal (see Part IV). Informal white papers should contain a Rough Order of Magnitude (ROM) (e.g. "Estimated Cost"). A ROM **is NOT** a full blown business proposal. Instead, it is merely a "statement or a range" that provides a high level estimate of what the offeror believes the project will cost.

NOTE: CDC cannot discuss budget estimates or number of awards expected and cannot review draft white papers prior to submission.

Please note that the Government may use non-Government participants during the white paper review process (See Part III – Use of Non-Government Personnel).

All submitted white papers will undergo an initial review for technical merit and program applicability. **See Part III for specific evaluation criteria.**

NOTE: Once white papers are submitted technical dialogue STOPS!

Step 3 - Submission of Formal Research Proposal

If there is sufficient interest in a proposed research project, the Contracting Officer will invite the offeror to submit a formal research proposal (see Part IV). **During the preparation of the offeror's proposal, technical dialogue may resume.** The purpose of the technical dialogue is to facilitate the Government's understanding of the scientific and technical aspects of the proposed research project. **However, once proposals are submitted, communication between scientific personnel and the technical review team STOPS!**

Please note that the Government may use non-Government participants during the evaluation of the proposals technical section (See Part III – Use of Non-Government Personnel).

Step 4 - Contract Award for Selected Projects

All proposals will receive an initial review (see Part V) and the Contracting Officer will notify the offeror, in writing, whether the proposal will be processed for award. The primary basis for selecting proposals for award shall be scientific/technical merit, importance to agency programs, corporate capabilities, and personnel. Cost realism, reasonableness and fund availability will also be considered to the extent appropriate. Past performance will also be considered. **Any contract resulting from this process will include all standard FAR clauses or the appropriate alternates applicable to the contract type for the proposed project and offeror institution. See Part V for specific evaluation criteria.** The Government has the right to make multiple awards.

NOTE: Projects will be funded as contracts, NOT GRANTS.

Government obligation

Persons submitting white papers and proposals are cautioned that only a Contracting Officer may obligate the Government to any contract involving expenditure of Government funds. **The Government is under no obligation to pay for the cost of for the development of white papers or proposals. Furthermore, there is no commitment on behalf of the Government to fund any proposal.** Contractors are caution that the submission of a white paper and a proposal is submitted strictly on a voluntary bases.

BAA POINTS OF CONTACT

CDC's BAA Technical Coordinator and point of contact is Diana Bartlett, MPH, MPP who may be reached by email at dbartlett@cdc.gov.

Based on the research topic area, CDC has multiple contractual points of contact. The POCs and the research areas they are responsible for is listed below.

Name	Research Topic Area	Email
Mr. Timothy Barnes	1	krz3@cdc.gov
Mr. Tray Burch	5, 6	vwa8@cdc.gov
Elizabeth Cole Greenblatt William O'Bryan	3	qst7@cdc.gov rvq0@cdc.gov
Ms. Latoya Hill	7, 8, 9	mdx7@cdc.gov
Mr. Kristopher Lemaster	10	ene3@cdc.gov
Ms. Marva D. Lewis	2	knn5@cdc.gov
Mr. Marty Nemec	18, 19	oga2@cdc.gov
Ms. Jasmine Powell	11, 12, 13	qes1@cdc.gov
Ms. Denedra Threatt	4	qfa5@cdc.gov
Mr. Ronnie Williams	14, 15, 16, 17	oga3@cdc.gov
Mr. Tim Williams	20, 21, 22	tpw8@cdc.gov

PART II - CDC RESEARCH INTERESTS

Overview

The Centers for Disease Control and Prevention (CDC) works to protect the U.S. from health, safety and security threats, both foreign and domestic. Specifically, CDC works with its partners to monitor health, detect and investigate health problems, conduct research to enhance and implement prevention strategies, develop and promote sound public health policies, promote healthy behaviors, foster safe and healthful environments, respond to current and emerging threats, and CDC's role as the nation's health protection agency is to operate 24/7 in order to keep people healthy and safe. The agency accomplishes this goal by working to: detect and respond to new and emerging health threats; address the biggest health problems causing death and disability; move science and advanced technology into actions to prevent disease; promote health and safe behaviors, communities and environments; develop leaders by training the public health workforce; and understand the health pulse of the nation.

For this announcement, CDC is requesting white papers for the following areas, which are further described below:

Topic 1. Exploring best strategies to interrupt poliovirus transmission in outbreak-affected countries (CGH)

1.1. Modeling to inform effective polio outbreak response strategies

Wild poliovirus type 2 was declared eradicated in 2015 and thereafter in April of 2016, routine immunization (RI) programs across the globe switched ("global switch") from the trivalent oral poliovirus vaccine (tOPV; contains types 1, 2, and 3) to the bivalent vaccine OPV (bOPV; contains types 1 and 3). In addition, a single dose of the trivalent inactivated poliovirus vaccine (IPV) was introduced into routine immunization programs to provide protection against type 2 paralysis which does not lead to intestinal immunity necessary to stop virus transmission like OPV. A second dose is being introduced into routine immunization programs in OPV-using low and lower-middle income countries to increase the proportion protected. Outbreaks of circulating vaccine-derived poliovirus (cVDPV) result from use of OPV in under-immunized and unimmunized populations, permitting the vaccine virus to spread among susceptible individuals for prolonged periods, increasing the chance for the virus to revert and re-acquire the ability to cause paralysis. Despite intentions to boost type 2 intestinal immunity ahead of the global switch in 2016, pockets of susceptible children remained in countries with chronically low polio vaccination coverage. The increasing number of susceptible cohorts of infants without type 2 intestinal immunity increases the risk and spread of virus. As of 14 October 2021, cVDPV2 outbreaks have been detected in 19 countries, affecting 333 individuals. Responding to cVDPV2 outbreaks requires the use of monovalent Sabin strain oral poliovirus vaccine type 2 (mOPV2) in Supplementary Immunization Activities (SIAs) to quickly increase type 2 population intestinal immunity and halt the spread of the virus. When high quality SIAs are not achieved, the mOPV2 virus continues to spread unabated, increasing the potential for emergence of a new VDPV, and transmission of the originally detected cVDPV2 continues.

To respond to cVDPV2 outbreaks effectively, policy makers must weigh response scenarios to inform optimal response strategies to quickly interrupt virus transmission. For example, the promptness in which SIAs are conducted (i.e., time between initial virus detection and first SIA), quality of the SIAs (i.e., true coverage effectiveness vis-á-vis performance indicators assessing vaccine coverage), number of SIA rounds, vaccine choice, geographic scope of SIAs, and age group targeted for SIAs. Modeling is one approach that can be used to inform outbreak responses.

CDC seeks to identify effective strategies to hasten the end of poliovirus transmission in cVDPV2 outbreak-affected countries. Key to this will be the development of an infectious disease model that can

serve as the testing environment for different response strategies. Evaluation will include the identification of strategies that result in 1) no breakthrough cases (i.e., no cases occur after the standard operating procedure recommended initial number of outbreak response SIAs); 2) interrupt virus transmission with the fewest number of vaccination campaigns; 3) interrupt virus transmission in the least amount of time; and 4) lead to the fewest overall number of cases of paralysis.

Topic 2. Public Health Communication Approaches to Increase Trust in Public Health Emergency Preparedness (CPR)

2.1 Public Health Communication Approaches to Increase Trust in Public Health Emergency Preparedness

Public trust in science is of heightened importance during a public health emergency, which is further compounded by the need for clear, correct, and targeted messages to effectively garner public health trust. Johns Hopkins University surveyed 1,468 adults in the US and found that about half (54%) trusted science "a lot" with 46% split across other response categories ("some", "not much", and "not at all"). Public trust in science is essential when the risks and benefits of new policies and practices are not well understood because the public must rely on the decision-makers to make informed judgments, as demonstrated during the COVID-19 pandemic. For example, the public may not adhere to mitigation strategies if they do not know, understand, or trust the evidence supporting the strategy. There are a number of plausible explanations for the decline in the trust of science including the politicization of scientific issues. CDC and other key stakeholders, including the public, would benefit from the development of evidence-based knowledge about the state of the public's current knowledge of and attitudes towards public health emergency preparedness and response (PHEPR) science. This evidence-based knowledge will allow us to develop effective strategies to establish and maintain public confidence and trust in PHEPR science.

Communication approaches have been effectively used to change public perceptions standard marketing for products such as food or automobiles as well as health messages related to smoking, exercise, preventive care, and medication adherence. Effective communication approaches that promote public health preparedness and response awareness, dialogue, trust-building, and knowledge, while also combating misperceptions and complacency, particularly about the scientific underpinnings of public health recommendations and how science evolves are urgently needed.

With a focus on risk communication, white papers should describe communication approaches or interventions that use an existing (e.g., mass media, small media, social media, application) or innovative channel and are supported by formative research (either completed prior to or as part of the contract), process evaluation, and outcome evaluation. Formative research can identify and prioritize needs, desires, and values of the target audience and test message frames. Determining the theoretical conceptual foundation and examining the prospective target audience's their behavior(s) and the factors which influence their behavior(s) are also key to successful messaging. Overall, white papers should include a description of the problem, market research, a defined market strategy, newly developed communication approaches, and evaluation of the communication approaches.

The objectives are to:

- Develop, implement, and evaluate communication approaches to increase trust in PHEPR science in subpopulations, jurisdictions, or the entire United States and its territories
- Build public health trust around PHEPR and various types of emergencies, hazards, and public health crises
- Increase the evidence-base, skills, and capacities of the state, tribal, local, and territory (STLT) health departments and communities

Priority will be given to offerors who:

- Have a successful track record of development, implementation, and evaluation of similar intervention activities

- Have the capacity to enroll and maintain large cohorts that include diversity in sociodemographic characteristics while minimizing selection and participation biases
- Experience in PHEPR research and evaluation
- Experience in conducting inclusive and population appropriate research
- Capacity to collect and manage the data required by this effort
- Can initiate and implement the study in a timely manner
- Are or work in partnership with an academic institution
- Are or work in partnership with STLT health departments
- Provide a plan to scale the approach as well as a sustainability plan (if the studied communication approach is effective)
- Be designed to increase trust in people who are traditionally underserved and underrepresented in the US
- Not focus on single issues, but more broadly on science or the scientific process (e.g., COVID-19, vaccines)
- Include measurement outcomes that address general awareness and knowledge about PHEPR; increased understanding of how to prepare for various types of emergencies; an overall increase in public trust, particularly during a public health crisis; and an increase in intentions to follow future public health guidance during public health emergencies
- Include knowledge, translation, and dissemination into practice products (for example, how to implement an approach determined to be effective) or messages (for example, translating the results into a webinar for practitioners) to share information to large audiences.

Topic 3. Address critical gaps in knowledge regarding personal protective equipment (PPE) standards in a laboratory setting (CPR)

CDC seeks to investigate the performance of personal protective equipment (PPE) manufactured domestically and globally (and met certain local and global standards) for impact penetration, tensile strength, tear resistance, and viral penetration with a simulated laboratory environment and the effects of chemical decontamination and reuse on PPE efficacy. PPE serves a critical function in protecting laboratory workers from biohazards with enhanced PPE providing an increasingly important line of defense for poliovirus post-eradication. Although new research has become available since the COVID-19 pandemic, most information is focused on healthcare settings and may not have comparable characteristics to poliovirus, a 20-30 nm non-enveloped virus resistant to many disinfectants, and common laboratory matrices that may impact surface tension properties important in PPE testing standards. This effort will: 1) evaluate national and international standards that assess performance requirements for PPE manufactured domestically and globally such as: impact penetration, tensile strength, tear resistance, viral penetration analyzed with and without the introduction of a chemical disinfectant (i.e. sodium hypochlorite or alcohol) and/or reuse in a simulated laboratory environment, 2) conduct standard test methods for PPE based on PPE commonly used in a laboratory setting using a poliovirus or surrogate virus, common laboratory matrices, with and without chemical decontamination and/or reuse for articles of PPE (e.g., gloves, gowns, coveralls), 3) develop evidence-based guidance on selection of PPE for biohazardous agents in a laboratory setting that consider chemical decontamination and reuse of articles of PPE, and 4) investigation of leakage through glove and protective clothing interface and the impact of mitigation methods (e.g. taping).

3.1. Comparison of PPE used in the United States and globally in terms of physical and barrier resistance using standardized performance tests (e.g., water resistance, viral penetration tests)
3.2. Effects of chemical decontamination on the durability and reliability of PPE in standardized performance tests (e.g., water resistance, viral penetration tests)
3.3. Effects of reuse of PPE in standardized performance tests (e.g., viral penetration tests)

Priority will be given to offerors who:

- Have a successful track record in conducting standardized testing methods for PPE
- Have demonstrated experience and capacity to perform virological studies

- Are interested and motivated to collaborate with CDC on testing projects and timely dissemination of the scientific data; and
- Are interested and motivated to use these data to inform public health and laboratory biosafety practice

Topic 4. Address Critical Knowledge Gaps related to Emerging and Re-emerging Infectious Diseases During Pregnancy and the Risks, Benefits and Acceptance of Prevention and Treatment Strategies (NCBDDD)

Current research about infectious diseases during pregnancy and their impact on pregnant individuals and infants is limited for several reasons. First, pregnancy status is not routinely captured in electronic health records and there are no standard data linkages in clinical or administrative datasets to capture the mother-infant dyad. Second, pregnant people are often excluded from randomized clinical trials of preventive therapies or treatment for infectious diseases leaving pregnant people and their health care providers to rely on small non-comparative cohort studies to make clinical decisions about these therapies. Finally, many studies do not capture a diverse group of pregnant people and infants. As part of this BAA focused on data modernization and health equity, CDC is seeking white papers to address research questions related to the primary objectives below, around the pregnancy, birth, and early childhood outcomes associated with emerging and reemerging infectious diseases in pregnancy and the risks and benefits of preventive and treatment strategies for these infectious diseases and their sequelae.

Given the period of performance for the contracts developed under this BAA mechanism, the most competitive applicants are those with existing cohorts in which data about the pregnant person and the infant are already linked (i.e., mother-baby linked longitudinal cohort). These data can include linked clinical data, administrative data, or other sources. Cohorts with existing protocols, procedures and institutional review board (IRB) approvals with existing infrastructure to address research questions may be most competitive, and able to accomplish the objectives within the period of performance of the contract. Using the pregnancy and infant cohort along with the appropriate comparison group(s), the research should assess the impact of infectious disease on mothers, infants and young children, as well as the acceptance of and use of applicable preventive strategies (e.g., masking, social distancing, routine testing, vaccination, mosquito repellent use, hand washing and other infection control practices, prophylactic medications) and treatments (e.g. antivirals, antimicrobials, novel therapeutics, intensive care). Existing protocols, including linked electronic datasets are encouraged to include the appropriate comparison cohort(s) (e.g., pregnant and/or non-pregnant; unexposed pregnancies and infants). Proposed target subpopulations of interest are also encouraged to include pregnant people from diverse racial/ethnic minority groups and sociodemographic backgrounds.

4.1. Mother-baby linked longitudinal cohort studies to examine the impact of emerging and re-emerging infectious diseases and prevention and treatment strategies on pregnancy, birth, and early childhood outcomes

Objectives of analyses of the electronic mother-baby linked longitudinal cohort may include the following:

- Examine susceptibility to the infectious disease by comparing the incidence of selected emerging and reemerging infectious diseases among pregnant and non-pregnant people.
- Compare the clinical severity of infection during pregnancy to the clinical severity of infection among non-pregnant people and describe risk factors and characteristics that increase the risk of severe disease.
- Estimate the risk of adverse outcomes associated with emerging and reemerging infectious disease during pregnancy, including, but not limited to early pregnancy loss, stillbirth, preterm delivery, preeclampsia, fetal distress perinatal transmission of infection, congenital infection, birth defects, and neonatal and post-neonatal morbidity and mortality. To understand the risks of these outcomes with untreated infection requires an appropriate comparison group of uninfected pregnant people matched for potential confounding characteristics.
- Estimate the risks and benefits of prevention and treatment strategies by comparing maternal, fetal, neonatal, and infant outcomes and other clinical parameters between pregnant people receiving and not receiving timely and appropriate prevention and/or treatment for the disease.

To address secondary objectives, ancillary quantitative or qualitative data collection (e.g., focus groups and surveys) of subpopulations within the cohort are encouraged to assess the uptake and acceptance of prevention (e.g., vaccine) and treatment (e.g., antivirals) strategies during pregnancy, and any barriers and challenges to acceptance among healthcare providers and patients. For the ancillary quantitative and qualitative data collection, proposed target subpopulations of interest would include pregnant people from diverse racial/ethnic minority groups and sociodemographic backgrounds as well as diversity in the healthcare provider population caring for pregnant people and infants in the main cohort and in the comparison groups. Assessment of uptake and acceptance of prevention and treatment strategies are encouraged to include but healthcare providers of various racial and ethnic backgrounds, those in private and academic clinical practice, and those with different medical specialties (e.g., obstetrics and gynecology, midwifery, family medicine, infectious disease, pediatrics, neonatology).

Objectives of ancillary data collections (e.g., focus groups and surveys) include:

- Compare acceptance of preventive and treatment strategies by pregnancy status using a cohort of pregnant and similar-aged non-pregnant people.
- Compare acceptance of preventive and treatment strategies for pregnant people based on racial/ethnic diversity and other sociodemographic characteristics and clinical factors such as prior pregnancy status and prior acceptance of preventive strategies (e.g., vaccines and prophylactic medications) and treatments (e.g., antivirals and antimicrobials).
- Assess acceptance of preventive and treatment strategies by provider type, provider characteristics, practice type, provider age and other factors and monitor over time.
- Elicit barriers and challenges to acceptance of preventive and treatment during pregnancy (e.g., availability of medications/vaccines, accessibility, and the role of myths and misinformation).

This announcement is not restricted to any specific infectious diseases; however, the emerging and re-emerging infectious diseases in pregnancy monitored and tracked by the Centers for Disease Control and Prevention, and specifically those included in the Surveillance for Emerging Threats to Mothers and Babies Network (SET-NET) are of particular interest https://www.cdc.gov/ncbddd/aboutus/pregnancy/emerging-threats.html.

Priority will be given to applicants who

- Have an established history of successful implementation of similar activities with cohorts of pregnant people, infants, and appropriate comparators;
- Demonstrate experience designing and implementing electronic cohorts with defined, appropriate analytic questions;
- Demonstrate capacity to collect, manage, analyze, and publish the data required by this effort with a focus on data modernization and health equity;
- Are most likely to initiate and implement the study in a timely manner using innovative methodology;
- Are interested and motivated to collaborate with CDC on analytic projects and timely dissemination of the scientific data; and
- Are interested and motivated to use these data to inform public health and clinical practice.

Topic 5: Expand the portfolio of effective interventions to prevent or delay type 2 diabetes and manage diabetes among populations who are underserved (NCCDPHP)

CDC currently has one evidence-based intervention [the National Diabetes Prevention Program (DPP)'s lifestyle change program (LCP)] that has been shown to reduce or delay the onset of type 2 diabetes and a limited number of evidence-based interventions (i.e., diabetes self-management education and support services, clinical efforts to improve detection of chronic kidney disease (CKD), screening for diabetic retinopathy) that have been shown to improve outcomes for those living with diabetes. CDC seeks to expand this portfolio to support other evidence-based interventions, strategies, programs, or policies to achieve these goals. CDC is particularly interested in white papers that reduce health inequities through interventions, strategies, programs, or policies that are targeted to populations who are historically underserved by these interventions (Black or African

American persons, Hispanic or Latino persons, Asian and Pacific Islander persons, persons with disabilities, men, young adults, and others).

5.1. Identify, test, implement, and evaluate innovative evidence-based interventions, strategies, programs, or policies that reduce health inequities in type 2 diabetes prevention.
Issues to consider:

- Scalability: CDC seeks to support interventions, strategies, programs, or policies that can demonstrate a feasible path to scaling beyond the context in which they are tested, but interventions should still be tailored to reach populations who are underserved.
- Sustainability: To expand access interventions, strategies, programs, or policies need to be easy to access for the population being served. Interventions, strategies, programs, or policies should not place a consider burden on the recipient/participant.
- All interventions, strategies, programs, or policies for type 2 diabetes prevention should be targeted to persons living with prediabetes [as determined by the CDC risk test (https://www.cdc.gov/prediabetes/takethetest/) or a HbA1c of 5.7-6.4].
- Outcomes for type 2 diabetes prevention interventions could include one of the following: reduction of weight by 5%-7%, or reduction of HbA1c by 0.2% coupled with weight loss of 4%.
- CDC is also interested in intermediate implementation improvement strategies (e.g., acceptability, adoption, length, cost, etc.).

Use of the National DPP LCP curriculum is not required, but not disallowed. Alternative versions of the LCP (e.g., difference in length, unique tailoring to specific audiences, other delivery mode or implementation modifications) are eligible for consideration but not required. Two alternate versions that are already developed but not required include the Road to Health (https://www.cdc.gov/diabetes/professional-info/toolkits/road-to-health.html) and On Your Way (https://www.cdc.gov/diabetes/prevent-type-2/guide-prevent-type2-diabetes.html).

Place-based or venue-based (e.g., Federally Qualified Health Center, faith-based institutions, employers, community-based organizations) interventions, strategies, programs, or policies are encouraged.

5.2. Identify, test, implement, and evaluate innovative evidence-based interventions, strategies, programs, or policies that reduce health inequities in diabetes management.

Issues to consider:

- Scalability: CDC seeks to support interventions, strategies, programs, or policies that can demonstrate a feasible path to scaling beyond the context in which they are tested, but interventions should be tailored to reach populations who are underserved.
- Sustainability: To expand access interventions, strategies, programs, or policies need to be easy to access for the population being served. Interventions, strategies, programs, or policies should not place a consider burden on the recipient/participant.
- All interventions, strategies, programs, or policies for diabetes management should be targeted to persons living with diabetes
- Outcomes for diabetes management interventions can include clinical changes (e.g., HbA1c, blood pressure, cholesterol, weight), behavioral changes (e.g., self-care behaviors, physical activity), awareness of **diabetes** self-management education and support (**DSMES**) and when to go, or others.

5.3. Study the effectiveness of various approaches/supports currently used by recognized organizations in the National Diabetes Prevention Program (National DPP) to eliminate or reduce barriers to enrollment and retention in the National DPP lifestyle change program related to the social determinants of health (e.g., food insecurity/limited access to healthy foods, lack of reliable transportation or internet access, lack of safe places to get physical activity, others). Determine which approaches are effective in addressing these barriers for populations currently underrepresented in the program.

The CDC-led National Diabetes Prevention Program (National DPP: http://www.cdc.gov/diabetes/prevention/index.html) is a public/private partnership working to scale and sustain an evidence-based lifestyle change program (LCP) for people with prediabetes to prevent or delay onset of type 2 diabetes. The LCP is founded on the Diabetes Prevention Program research study and subsequent translation studies which showed that making achievable behavior changes helped participants lose 5% to 7% of their body weight and reduced the risk of developing type 2 diabetes by 58% (by 71% for people 60 years and older). The National DPP LCP consists of a minimum of 16 weekly, then a minimum of six monthly group sessions conducted over a year. A trained lifestyle coach facilitates the sessions to guide people in changing their lifestyle by eating healthier, increasing physical activity, managing stress, and maintaining these healthier behaviors over time to lose weight and ultimately reduce risk for type 2 diabetes.

Priority will be given to offerors who establish:
• A track record of successful implementation of similar research or evaluation activities with populations who are underserved, including established partnerships with organizations/institutions serving populations who are undeserved.
• Capacity to conduct rigorous scientific studies to determine effectiveness based on selected outcomes;
• Capacity to collect, manage, and analyze the data required by this effort;
• The overall likelihood that they can initiate and implement the study in a timely manner.

Topic 6. Wastewater Surveillance (NCEZID)
6.1. Detection and typing of disease targets from wastewater

Wastewater testing can provide a complimentary and independent surveillance system to traditional disease-based pathogen surveillance. Most disease surveillance programs are linked to clinical care, but clinical surveillance is impacted by healthcare-seeking behaviors and can be biased towards symptomatic and severe infections. Wastewater surveillance can provide systematic data to mitigate such biases, reflecting the total infection burden at the community level. It can also be used to help address health equity issues by providing infection data where clinical testing is limited or absent. However, the sample matrix, the laboratory methods, and bioinformatics approaches can impact detection and molecular typing of pathogen and antibiotic resistance (AR) targets from wastewater.

CDC seeks projects that evaluate multiple methods with respect to the ability to recover spiked controls and mock communities under various concentration and background nucleic acid scenarios for liquid wastewater and sludge. The well-characterized spiked control material should include clinically relevant viral, bacterial, fungal, and antibiotic resistance targets (e.g. norovirus, foodborne bacteria, *Candida auris*, *Cryptosporidium*, and carbapenem and colistin-resistance genes and other high consequence AR threats described in the CDC 2019 AR Threats Report). CDC is specifically interested in quantitative detection and subtyping of pathogens from wastewater and characterization of sequencing performance for quantitative detection of multiple health targets from liquid wastewater and primary sludge. Innovative methods will also be considered. Methods that can provide information on multiple targets in a single run are preferred.

6.2. Fecal shedding of SARS-CoV-2 RNA

Understanding fecal shedding of SARS-CoV-2 RNA is important for interpreting COVID-19 wastewater surveillance data. Quantitative measurements in stool over the full time-course of infection, from individuals representing a range of demographic profiles, and illness severities, could help map wastewater measurements to community infection burden and help understand the potential for wastewater measurements to lead other COVID-19 surveillance indicators, like reported cases and syndromic surveillance. However, few quantitative fecal shedding data are published, and capturing fecal shedding dynamics over the full course of infection is challenging. CDC seeks a study that provides quantitative data on SARS-CoV-2 RNA levels in human stool over the full time-course of infection, including stool from individuals representing a range of demographic profiles, vaccination status, and illness severities. A study that measures RNA quantities per unit stool using molecular tools is preferred. Quantitative sample and laboratory controls, including matrix recovery controls and

endogenous fecal microbial controls, are encouraged. In particular, data between the period of infection and illness onset, and data from asymptomatic individuals, are desired, as well as viral variant data. Projects that characterize the stool composition, including solids content, and that use archived samples will be prioritized.

Topic 7. Genomic sequencing of SARS-CoV-2 to investigate viral evolution, and emergence and spread of variants in communities and populations. (NCEZID)

7.1. Incorporate viral genomic data, clinical and demographic data to better predict poor outcomes of SARS-

CoV-2 infection, increased likelihood of reinfection and risk factors for vaccine breakthrough.
The clinical picture of SARS-CoV-2 infection is often complicated by a range of viral, host and environmental factors. White papers for this subtopic, might include studies of SARS-CoV-2 infection that include both viral genomic and detailed host profiling (e.g., host genetic, immunologic, clinical data) to identify biomarkers that predict poor outcomes of SARS-CoV-2 infection, vaccine or therapeutic failure (e.g., clinically severe disease, multi-system inflammatory disease, breakthrough infection).

7.2. Conduct studies that compare SARS-CoV-2 sequence diversity and viral phylodynamics within and between regions with different public health response timelines and strategies, especially studies that evaluate changes in viral diversity in the context of vaccination campaigns.

As states implement safe re-open strategies and proceed with large-scale vaccination campaigns, monitoring circulating viruses and patterns of transmission will help adjust the timing and nature of public health prevention and mitigation efforts. Studies that establish sustainable, population-based surveillance of circulating SARS-CoV-2 sequence variants within a state or region, and assess patterns of regional introductions and transmission over time, are of particular interest. Studies that assess changes in circulating viral diversity and characteristics, particularly in the context of vaccine roll-out are also strongly encouraged. Additional consideration will be given to white papers that plan to engage state or local public health departments, to better apply new data and insights to public health decision-making.

7.3. Adapt and optimize sequencing instrumentation, reagents and workflows for the specific needs of public health infectious disease laboratories and field activities.

Over the course of the past several years, many laboratories have developed specific workflows to support SARS-CoV-2 sequencing efforts in different scales and contexts. This topic area is intended to help translate these new and optimized sequencing strategies and package them for routine public health use. Interested respondents may propose projects related to: 1) the miniturization of sequencing reactions and workflows; 2) efforts to streamline automation, decrease workflow complexity and limit overall consumable requirements of sequencing; 3) strategies to improve overall sequencing throughput, while reducing per-sample cost; 4) tools to simplify CLIA-compliant microbial sequencing in regulated laboratory settings; 5) the development and optimization of laboratory and bioinformatic methods for the analysis and deconvolution of complex surveillance samples, such as pooled testing, wastewater and environmental; and 6) the development and standardization of robust, field-deployable systems for surveillance support and outbreak response. While this white paper topic is meant to encourage innovation in laboratory protocols and technology, proposed solutions could include open-source software (e.g., for use with mobile devices) or mobile sequencing tools that provide rapid turn-around with high quality data.

7.4. Develop or enhance open source bioinformatic tools, databases and visualization software that improve the availability, utility, integration and interpretation of genomic data from SARS-CoV-2 and other pathogens of public health concern.

With the advent of rapid, open sequence data sharing for SARS-CoV-2 and other pathogens, there is a growing wealth of data available to help guide state and local infectious disease surveillance and public health response. CDC is soliciting white papers for the development or enhancement of open source tools, databases, standards and curation efforts that improve the overall accessibility, quality and usefulness of publicly-shared sequence data in public repositories. Data visualization and dashboarding tools that improve the interpretation and

reporting of public domain/public access sequence data are encouraged, as are those that facilitate the linking and deduplication of sequence records across public repositories, enable linkage to other surveillance data sources (e.g., case reports, wastewater surveillance data, etc.) or simplify standardized analysis and electronic laboratory reporting or improve linkage to medical records systems.

Priority will be given to projects that facilitate and enable the use of molecular epidemiologic data for state and local investigations and response activities. As such, projects for this subtopic could also include tools that may be used by public health departments for field applications (e.g., contact investigation), with an emphasis on field-deployable open solutions for use by front-line public health workers.

Topic 8. Strengthening emerging, re-emerging, and biothreat infectious disease surveillance, detection, and preparedness (NCEZID)

8.1. Strengthening emerging, re-emerging, and biothreat infectious disease surveillance, detection, and preparedness by distributing assays through the Laboratory Response Network (LRN)

With more than 120 national, state, and local laboratories, the Laboratory Response Network (LRN) is an integral part of the National Response Framework. The LRN ensures consistent, high confidence results by developing and distributing laboratory assays, offering specialized training, and supporting secure data reporting. In the 20 years since its creation, the LRN has played an instrumental role in boosting laboratory capacity and building a domestic public health infrastructure for response.

In order to maintain response readiness, and to support day-to-day critical, time-sensitive emerging infectious disease (EID) testing needs, the LRN is pursuing cutting edge technologies that can strengthen, expand or enhance the LRN's existing capabilities and inform public health policies and decisions. Whether a single suspect case of a novel EID or a public health emergency, authorities need to know what pathogen is causing illness for a fast response. Rapid, accurate laboratory identification and characterization of pathogens from clinical specimens or environmental samples provides public health authorities the data necessary to deploy subject matter experts, provide appropriate medical countermeasures, facilitate rapid evaluation and tracing of potentially exposed contacts, and communicate potentially lifesaving information to the public as well as decision makers.

CDC is interested in the development and evaluation of innovative methods, tools, and strategies for deployment to the LRN for detection and characterization of existing and novel pathogens that are associated with a biothreat event or could cause a novel EID outbreak and/or public health emergency.
Solutions should include a framework for data reporting and analytics necessary for determination of public health action. In addition, the white paper should provide plans associated with analytical verification and deployment.

Topic 9. Address gaps in direct detection diagnostic assays for Lyme borreliosis (NCEZID)
Human infection by the tick-borne spirochete, *Borrelia burgdorferi* results in Lyme borreliosis, a disease that often initially presents with a skin lesion termed erythema migrans accompanied by viral-like symptoms e.g., malaise, fatigue, headache, arthralgias, myalgias, fever and regional lymphadenopathy. The infection can progress to more severe manifestations (arthritis, carditis, neurologic) if not accurately diagnosed and treated properly with antibiotics.

B. burgdorferi exists in an enzootic life cycle of obligate symbiosis consisting of reservoir hosts, primarily rodents and birds, and *Ixodes* spp. ticks that serve as vectors to transmit the pathogen to other hosts including humans. In vertebrate hosts, *B. burgdorferi* disseminates to tissues and organs but does not produce sustained, high density spirochetemia thereby rendering direct detection (e.g. culture isolation) of the organism difficult if not impossible. Therefore, laboratory diagnosis currently is dependent mainly upon serological testing which has limitations, particularly for detection of early infection. In addition, there are not laboratory tests to indicate cleared infections or for the possibility of latent infection in patients with Post-treatment Lyme disease syndrome (PTLDS) or antibiotic-refractory arthritis. These examples represent gaps in diagnostic testing for

Lyme borreliosis that could be alleviated by development of new direct detection assays for *B. burgdorferi* in infected patients.

B. burgdorferi is highly motile by virtue of a structure of bundled periplasmic flagella and chemotaxis proteins that are recognized as virulence factors essential for infection. Motility and chemotaxis are important factors enabling *B. burgdorferi* to i) move from tick midgut to salivary glands in preparation for deposition into the host, ii) disseminate within the host to distal organs and tissues, and iii) migrate from within the host to a newly feeding tick.

The acquisition of *B. burgdorferi* by ticks feeding on infected individuals is the principle behind xenodiagnosis, a sensitive approach to determine the infection status of a host suspected of harboring an organism. Xenodiagnosis has been used as a method to detect *B. burgdorferi* in animals and has been modeled as a potential direct detection tool to determine latent or active *B. burgdorferi* infections in humans. The mechanisms responsible for signaling borreliae from disseminated tissues to an attached tick are largely unknown although undoubtedly involves the chemotactic and motility machinery of the spirochete responding to substances from tick saliva.

9.1. Development of a xenodiagnostic-like assay for direct detection of the Lyme spirochete in infected individuals.
CDC seeks creative investigations for direct detection assays based on chemoattractant capabilities of tick saliva components that act as signals for *B. burgdorferi* to migrate to the tick attachment site. The objectives are to:

i. Create a mouse model of infection to assess *B. burgdorferi* migration from tissues to chemoattractant inoculation site
ii. Identify components of tick saliva with chemoattractant properties (jointly with SME laboratory)
iii. Develop technical process for chemoattractant inoculation
iv. Generate successful endpoint to determine *B. burgdorferi* migration to chemoattractant inoculation site

Topic 10. Address critical gaps in human tick bite prevention (NCEZID)

10.1. Development and evaluation of human tick bite prevention methods
10.2. Killing of ticks that go undetected while biting humans

Personal protection measures aiming to prevent human tick encounters from resulting in bites are widely recommended as the first line of defense against health impacts associated with ticks (tick-borne diseases, tick paralysis, and Alpha-gal syndrome/red meat allergy). Despite well-documented use by the public of personal protection measures to prevent tick bites, there are major knowledge gaps for the effectiveness of these measures to prevent tick bites and tick-borne infections when they are used by the public in their daily lives. Additionally, as evidenced by Lyme disease patients often not being aware of a tick bite prior to symptom onset, some proportion of tick bites go undetected. Novel methods to kill ticks that go undetected while biting humans therefore would be of value to public health.

The objectives consequently are to:
1) Develop novel methods to prevent human tick bites and evaluate the effectiveness of existing tick bite prevention methods to reduce human tick bites and tick-borne infections
2) Develop novel methods capable of killing biting ticks that go undetected while feeding on humans

Topic 11. Novel prevention methods to reduce transmission of *Rickettsia rickettsii* by brown dog ticks(NCEZID)

11.1 Development of a canine vaccine against *Rickettsia rickettsii*

Rocky Mountain spotted fever (RMSF) is a severe disease caused by the tick-borne pathogen, *Rickettsia rickettsii*. Over the last 20 years, epidemic levels of RMSF have been observed in Northern Mexico and among tribal communities in the Southwestern U.S., with the incidence of spotted fever in some tribal communities being 150 times the national average. In these settings, *R. rickettsii* is transmitted by the brown dog tick, which is maintained by the local dog populations. Prevention of RMSF in these areas has been shown to be possible by application of tick preventives to dogs, acaricide application to homes, spay/neuter campaigns, and community education. A potential new prevention tool would be a vaccine given to dogs that prevents the acquisition of *Rickettsia rickettsii* by ticks. This broad agency announcement solicits white papers for the production and initial evaluation of a prototype vaccine aimed at the immunization of dogs to reduce the human risk for Rocky Mountain spotted fever. The prototype vaccine should elicit broad immunity to *Rickettsia rickettsii* in canines and be able to prevent acquisition of rickettsia from immunized dogs by feeding ticks.

The specific objectives are:
1) Create a prototype vaccine that could be a whole cell vaccine, a subunit recombinant DNA vaccine, an mRNA vaccine, or other novel vaccine.
2) Test the vaccine in canines to demonstrate safety and the production of an immune response against *Rickettsia rickettsii.* Data on both humoral and cellular immunity are desired.
3) Demonstrate the effect of canine vaccination on acquisition of *Rickettsia rickettsii* by brown dog ticks.
4) Demonstrate the effect of canine vaccination on disease in dogs infected with *Rickettsia rickettsii* post-vaccination.

Topic 12. Evaluation of novel Aedes aegypti control tools (NCEZID)
12.1 Evaluate effectiveness of dried attractive bait stations to control *Aedes aegypti*, the main vector of dengue viruses
Aedes aegypti is the primary vector of dengue virus and other *Aede*s mosquito transmitted arboviruses including chikungunya and Zika. Approximately 95% of locally acquired dengue cases in the U.S. occur in Puerto Rico, causing a high burden of disease in the population. The threat of arbovirus transmission in Puerto Rico is exacerbated by the rapid evolution of insecticide resistance in *Ae. aegypti* and the loss of an effective control measures. New, effective, and sustainable mosquito control strategies are needed to reduce the morbidity and mortality caused by these diseases. Attractive Toxic Sugar Baits (ATSBs) control mosquito populations by exploiting nectar-seeking behaviors. ATSBs attract female and male mosquitoes to aromatic natural sugar sources, which are comprised of an attractant, and a toxicant like boric acid. ATSBs are delivered to mosquitoes by foliar spraying methods or bait-stations. Dried attractive toxic sugar bait stations (DABs) are an innovative modification of ATSBs and differ in that they use both visual and olfactory cues to attract mosquitoes and can be used inside of homes where *Ae. aegypti* are most often found. Because of these characteristics, DABs minimize exposure to non-target insects (e.g., pollinators) and maximizes potential exposure to *Ae. aegypti*. DABs are a low-cost and noninvasive intervention that can be scaled in low resource settings and do not require a strong and expensive infrastructure or trained personnel, supplies, and logistics. Current research has shown the DABs are effective in semi-field environments and the next step would be to optimize the intervention in full field studies with entomological endpoints. If successful, a much needed new intervention to control Ae. aegypti will be added to our toolbox of vector control strategies.

CDC seeks to support research projects that implement and evaluate the effectiveness of DABs at the community level to control *Ae. aegypti* in Puerto Rico by (1) monitoring entomological endpoints in intervention and non-intervention communities, (2) determining the optimal number and locations of DABS needed at each house to successfully reduce mosquito abundance in intervention communities and (3) understand the acceptability of DABs from residents that have them deployed in their homes.

Topic 13. Novel Assays for Dengue Vaccine Evaluation (NCEZID)
Dengue is a growing public health threat, with increasing numbers globally and regular outbreaks in dengue-endemic areas in the United States. One of the most important risk factors for severe dengue is second infection with a different dengue virus serotype, as antibody-dependent enhancement can lead to increased viral uptake, higher levels of viremia, and poor outcomes after a secondary dengue infection. Achieving balanced, protective immunity for the four dengue virus serotypes has been challenging for the development of effective tetravalent

dengue vaccines, as there are no reliable correlates of protection against dengue. The only FDA approved dengue vaccine and other vaccines in the pipeline show uneven serotype-specific protection. In addition, these vaccines show enhanced protection in pre-exposed individuals. Therefore, it is critical to assess the level of protective immunity to the four dengue virus serotypes through laboratory testing of individuals and communities in endemic areas to determine previous infection, balanced protection against future dengue infection after vaccination, and potential risks for post-vaccination infections.

Quantification of total neutralizing antibody titers through tissue culture-based methodologies, such as plaque reduction neutralization tests currently used to measure vaccine immunogenicity, are not accurate correlates of protection and are impractical and difficult to standardize. Additionally, they do not contribute to our understanding of the specificity, strength, and duration of subsets of serotype-specific protective antibodies. Infection with other flaviviruses like Zika virus create an additional challenge in detecting serotype-specific antibodies, which may cause false positive results in current dengue serological tests.

This announcement addresses the compelling need to identify reliable immune correlates of protection after dengue infection or vaccination by encouraging research to detect serotype-specific antibody responses. The proposed research should have the following objectives: (1) Demonstrate serotype specificity of antibody binding for relevant, serotype-specific antigenic virus epitopes, assessments of natural or vaccine-induced monotypic antibody responses, or depletion of cross-reactive antibodies to improve specificity of immunoassays; (2) Establish sample-sparing, high-throughput tissue culture-free methods for the detection of dengue serotype-specific antibody binding to selected virus epitopes; (3) Thought should be given to implementation of testing for serotype-specific immunity in existing cohorts or populations following implementation of dengue vaccines with the aim of documenting acquired immunity over time. (4) Assembling panels of sera from participants with confirmed monotypic and multitypic immunity should assist stakeholders in evaluating and implementing these or similar assays. Tests developed for detection of dengue serotype-specific antibodies that correlate with protective immunity should show minimal or no cross-reactivity with ZIKV antibodies. The availability of these methods could help determine pre- and post-vaccination serostatus and balanced immunity against all dengue serotypes after vaccination. This work can guide vaccine developers to achieve balanced protection with next generation vaccines or facilitate implementing vaccines that may not require natural pre-exposure and therefore benefit children in endemic countries who are mostly DENV naïve. Thus, the work will support novel discoveries to drive innovation and positively influence the development and efficacy of dengue vaccine strategies.

13.1. Correlates of protective immunity against dengue
13.2. Measurement of dengue type-specific antibody binding
13.3. Assessments of dengue vaccine immunogenicity
13.4. Dengue immunoassay development or optimization
13.5. Sample collections for test development or validation

Topic 14. Implementation of Wolbachia-based strategies for dengue control in Central America (NCEZID)

As climate change increases the geographic spread of competent arboviral disease vectors, globally and in the continental United States, there is a need to develop an evidence base around novel vector control strategies. Developing the evidence base in international settings will help reduce risk of importation to the US, and rapidly eliminate disease spread when importation does occur to minimize the impact of tropical arboviral diseases in the US. Central America is a region endemic for dengue, with abundant populations of *Aedes aegypti*, and similar ecology to the U.S. territories and U.S. Southern States. Working in Central America where there is a high dengue incidence and transmission is endemic will provide opportunities to evaluate the implementation of vaccination and vector control and establish model surveillance approaches. It will also create an opportunity for meaningful collaboration with international partners and reducing current disease burden in parts of the world and populations disproportionately affected by both arboviral diseases and the impact of climate change. One of the most promising new methods for arboviral disease reduction is introduction of *Wolbachia*-infected mosquitoes. *Wolbachia* is a naturally occurring bacteria present in 60% of insect species, and have been shown to pose no risk to humans or the environment. When *Aedes* mosquitoes are infected with *Wolbachia*, it reduces

their ability to transmit arboviruses, including dengue, chikungunya, and Zika viruses. *Wolbachia* replacement is a strategy where *Wolbachia*-infected mosquitoes are introduced into wild mosquito populations. Because the bacteria are passed on when mosquitoes mate, the wild mosquito population is slowly replaced by *Wolbachia*-infected mosquitoes with a limited ability to transmit viruses. *Wolbachia* replacement has been studied in at least 11 countries globally and was shown to significantly reduce dengue incidence by 77% in a large randomized controlled trial in Indonesia.

CDC seeks to support research projects that implement *Wolbachia*-replacement in one or two countries in Central America, including the following activities: 1) Evaluate the viability of Wolbachia-infected mosquitoes in the local mosquito population;2) Release *Wolbachia*-infected mosquitoes in controlled sites in Central America; 3) Monitor the presence and spread of *Wolbachia*-infected mosquitoes; 4) Work with public health officials to evaluate the impact of *Wolbachia* replacement on arboviral incidence in treated areas; 5) Document the evidence base and lessons learned to support regulatory approval and implementation of *Wolbachia* replacement in US territories where dengue is endemic.

14.1 Establish surveillance systems to track climate-sensitive mosquito-borne diseases and monitor if they are increasing or shifting over time**.**
14.2 Evaluate the implementation and sustainability of *Wolbachia* replacement intervention in Central America
14.3 Develop the evidence base for *Wolbachia* replacement implementation in international settings to support implementation of effective strategies in the United States and help reduce risk of importation of vector borne diseases to the U.S.

Topic 15. Towards dengue elimination: enhanced vector control and surveillance in Puerto Rico (NCEZID)

Puerto Rico faces endemic and epidemic cycles of dengue and other *Aedes* mosquito transmitted diseases, causing significant morbidity and mortality. The burden of dengue among Americans falls disproportionately on residents of Puerto Rico and other U.S. territories, further exacerbating disparities in health linked to socioeconomic status, environmental factors, healthcare spending and access to care, and natural disasters. With recent approval of a dengue vaccine for children, promising mosquito control technologies, and advancements in field-based data systems, there is an opportunity to eliminate dengue from Puerto Rico in the next decade. A key component of dengue elimination is the ability suppress dengue transmission in hotspots and enhance mosquito-based dengue surveillance to detect new introductions of dengue and complement human-based disease surveillance. However, there are no evidence-based methods for how to stop re-introduction or further spread of dengue in areas at risk for outbreaks by responding to focal hotspots.

CDC seeks to support research projects that develop, implement, and evaluate the effectiveness of vector control techniques and enhanced mosquito surveillance in known and emerging dengue hotspots in Puerto Rico. Hotspots are urban areas where: A) an introduced case could lead to an epidemic of an emerging or re-emerging arbovirus, B) historical records show high incidence and persistence of cases, or C) concentrations of people can act as arbovirus “super-spreaders”, such as schools. This effort will support research in 1) developing and implementing mosquito surveillance programs with geographic representativeness across areas of known dengue transmission, 2) modernizing data systems and mapping to measure mosquito surveillance activities in real-time, 3) implementing evidence-based, comprehensive vector control strategies in known and emerging dengue hotspots, 4) supplementing vector control strategies with community-based education to ensure community buy-in and encourage prevention activities, 5) measuring and evaluating activities 1-4 to determine their impact on mosquito populations, human dengue incidence, and timeliness in responding to dengue hotspots and suppressing mosquito populations, and lastly 6) developing cross-cutting communication channels among a range of stakeholders to facilitate situational awareness, project sustainability, and capacity development.

In addition to the objectives described above, projects are encouraged to place a special emphasis on maximizing the impact of the proposed research on reducing health disparities within Puerto Rico associated with socioeconomic status and environmental/housing factors that put certain communities at greater risk of dengue transmission and morbidity.

15.1. Develop and implement methods for enhanced surveillance and response to dengue hotspots in Puerto Rico

15.2. Evaluate the effectiveness of hotspot responses in preventing additional disease spread

Topic 16. Research to inform optimal approaches to environmental sampling and understanding of the prevalence and distribution of pathogenic fungi in healthcare settings (NCEZID)
Healthcare-associated invasive fungal infections (HA-IFIs), including invasive aspergillosis, mucormycosis, and candidiasis, cause devastating morbidity and mortality. The utility of environmental sampling to prevent and respond to fungal infections and outbreaks is limited by the lack of established threshold values or regulatory levels for these pathogens in the healthcare setting and the lack of widely accepted industry qualification or practice standards for assessment and remediation of healthcare sources of fungal diseases. This effort would close key knowledge gaps regarding expected mold and other fungi concentrations in healthcare settings. Further, this effort would help determine optimal approaches to performing environmental sampling for both mold and yeasts with the ultimate goal of preventing HA-IFIs.

16.1. Develop innovative methods for detection and surveillance of pathogenic fungi in healthcare environments

16.2. Quantify baseline levels of pathogenic fungi within healthcare environments

16.3. Correlate fungal quantitative data with episodes of fungal infections or transmission in patients.

16.4. Pilot early detection and surveillance methods for invasive mold and other fungi in patients and in the environment to guide public health efforts.

16.5. Evaluate the feasibility and utility of different environmental sampling approaches for pathogenic fungi in healthcare environments.

Topic 17. Understanding the impact of climate change and other predictors on the distribution and severity of fungal diseases (NCEZID)
Climate change is an urgent public health threat. The environmental disturbances created by climate change will change the impact of fungal pathogens on human health, especially for fungi with environmental habitats. Several tools, including environmental sampling techniques, complex modeling (e. g. machine learning) may help researchers understand how climate change will impact the abundance and pathogenicity of fungi found in the environment. This topic is aimed at soliciting white papers that will help us to prepare for and mitigate climate change-induced fungal disease threats, whether by examining changes in geographic distribution of previously geographic-restricted fungi, evaluating disease risk from fungal spores, like those abundant in wildfire smoke (which is becoming more common with climate change), or better understanding the influence of specific environmental factors on pathogens in the environment.
17.1. Evaluate the influence of climate on diversity and abundance of human-pathogenic fungi in the environment –

17.2. Model geographic spread of fungal diseases based on predicted and observed climate changes

17.3. Understand the effect of severe weather events on the incidence of fungal infections

17.4. Assess role of social factors (e.g., health disparities) in determining severity of fungal diseases.

17.5. Assess role of host factors on determining severity of fungal diseases.

Topic 18. Development of rapid point-of-care (POC) syphilis diagnostic tests (NCHHSTP)
The resurgence of syphilis, an infection caused by the bacterium **Treponema pallidum subspecies** pallidum (*T. pallidum*), in the last two decades is a major public health concern in the United States (US). In 2019, US health

departments reported 129,813 cases of syphilis, an increase of more than 70% since 2015. Congenital syphilis has increased a staggering 279 percent since 2015. In 2019 alone, there were nearly 2,000 cases of congenital syphilis reported, including 128 deaths.

Serological tests that detect treponemal and nontreponemal antibodies remain the mainstay for routine laboratory diagnosis of active syphilis infection. A treponemal test is specific for detection of *T. pallidum* antibodies. They usually remain detectable for life, even after successful treatment. Therefore, such tests cannot distinguish between active or past infection. The nontreponemal antibody test detects antibodies against lipoidal antigens released as a consequence of cell damage from the infection. The nontreponemal titer, in conjunction with clinical signs and symptoms, can help identify acute infection and a reduction in the titer relative to baseline post-treatment usually signals response to therapy. Two current FDA-cleared rapid POC serological tests for syphilis, based on the detection of only total treponemal antibodies, cannot distinguish between active and past/treated syphilis. The WHO convened a panel of diagnostics experts to develop and publish target product profiles of point-of-care serological syphilis tests with potential to advance the field. Minimal and optimal criteria were developed. Results of the consult are publicly available TPPs_STIPOCT_MAY2021_draft (who.int).

However, Serology tests are not ideal because up to 46% of patients with primary syphilis do not have detectable antibodies and because in later stages of syphilis, titers may be low. In addition, persons with treated syphilis also have antibodies, making detection of active infection difficult. For a more targeted approach, polymerase chain reaction (PCR) and other nucleic acid amplification tests (NAATs) have been developed to directly detect *T. pallidum*. However, the sensitivity of NAATs decreases among individuals in later syphilis stages and in specimen sources other than lesion exudate because the lesions resolve. FDA-cleared molecular tests are still not available. Commercial molecular laboratory developed tests (LDTs) for *T. pallidum* are used in the US but not widely available. These assays require specialized laboratory equipment, highly trained staff and have a long turnaround time.

Innovative assays, be it serological or based on direct detection of genetic materials or antigens, that can rapidly and accurately detect active syphilis infection at the point-of-care are urgently needed.

18.1 Development of a rapid point-of-care combo treponemal/ nontreponemal antibody test for active syphilis diagnosis

Objective: CDC seeks white papers to develop a rapid combo treponemal/nontreponemal antibodies test for active syphilis diagnosis. The objectives are to:

1. Develop a rapid combo treponemal/nontreponemal antibodies diagnostic test: The developed POC test will simultaneously screen for the presence and quantitation (optional) of nontreponemal antibodies and confirm syphilis by the detection of antibodies to *T. pallidum*. This configuration of the test must allow for differentiation between current and historic (or treated) infections.
2. Design and perform clinical studies to validate the sensitivity and specificity of the developed dual rapid test using clinical syphilis reactive and nonreactive specimens. The initiation of clinical studies and data collection should proceed in accordance with FDA requirements for Premarket Approval (PMA) application.

18.2 Development of a direct detection test for *T. pallidum,* ideally for all stages of syphilis

Objective: CDC seeks to support the development and evaluation of a diagnostic assay for direct detection of *T. pallidum,* ideally for all stages of syphilis. Such an assay could be very useful for early diagnosis of syphilis to allow timely treatment and prevent horizontal and vertical (mother to infant) syphilis transmission. The expectation is that applicants will develop a POC NAAT or antigen assay for the direct detection of *T. pallidum* in mucocutaneous lesions and non-lesion samples from anatomical sites where lesions may not be apparent (anorectal, mouth) in primary and secondary syphilis, or whole blood specimens from different stages of

syphilis, or other accessible specimens, validate the sensitivity and specificity of the assay for diagnosing syphilis infection, and optimize assay performance for different specimen types and clinical stages.

Topic 19. Decreasing disparities in the incidence, morbidity, and mortality associated with HIV, viral hepatitis, other sexually transmitted infections (STIs), tuberculosis and adolescent health (NCHHSTP)

19.1 Develop, implement, and/or evaluate innovative evidence-based interventions to reduce population-level disparities in the incidence, morbidity and mortality associated with HIV, viral hepatitis, STIs, or tuberculosis.

There are stark disparities in the incidence, morbidity and mortality associated with HIV, viral hepatitis, other STIs, tuberculosis and adolescent health in the United States. CDC seeks to eliminate disparities in health and in all of its determinants through public health programs and policies that address the social and structural factors contributing to population-level disparities in HIV, viral hepatitis, STIs, and tuberculosis among adults and adolescents. Social and structural factors encompass the conditions in which people are born, grow, live, work, and age, as well as the complex interrelated social structures and economic systems that shape these conditions, including aspects of the social environment (e.g., discrimination, income, education level, and marital status), the physical environment (e.g., place of residence, crowding conditions, buildings, spaces, transportation systems, and products that are created or modified by people), and health services (e.g., access to care, quality of care, and insurance status).

The evidence to promote health equity is robust. However, there is a dearth of evidence-based interventions and strategies that are specifically designed to reduce population-level disparities in the incidence, morbidity, and mortality associated with the infections and diseases addressed by our Center. The goal of this announcement is to address that gap. Specifically, CDC seeks to develop, implement, and/or evaluate evidence-based interventions that can reduce population-level disparities in the incidence, morbidity, and mortality associated with HIV, viral hepatitis, STIs, tuberculosis, and adolescent health in the United States. We define evaluation as the systematic method for collecting, analyzing, and using data to examine the effectiveness and efficiency of public health interventions, and to contribute to continuous intervention improvement to address public health actions.
Priority will be given to:

- Offerors who intend to use both absolute and relative health disparity measures to measure reductions in disparities.
- Offerors with experience in screening, prevention, treatment, and care of HIV, viral hepatitis, STIs, or tuberculosis in disproportionately affected populations.
- Interventions that include multi-sector involvement (i.e., health, housing, labor, correctional, and other non-health sectors).
- Interventions that can be scaled up and sustained to achieve significant public health impact.
- Interventions that are focused on reducing disparities in screening, prevention, treatment, and care of HIV, viral hepatitis, STDs, or tuberculosis in large areas of the country with a disproportionate burden of one or more of the indicated diseases and infections.
- Interventions that are focused on addressing the social and structural factors (i.e., changing the conditions in which people are born, grow, live, work and age as described above) that contribute to population-level disparities in the incidence, morbidity, and mortality associated with HIV, viral hepatitis, STIs, tuberculosis, and adolescent health.

Topic 20. Influenza and Other Acute Respiratory Infections (NCIRD)

Influenza (flu) is a contagious respiratory illness caused by influenza viruses that infect the nose, throat, and lungs. Some people, such as older people, young children, and people with certain health conditions, are at higher risk of serious flu complications. There are two main types of influenza (flu) viruses: Types A and B. The influenza A and B viruses that routinely spread in people (human influenza viruses) are responsible for

seasonal flu epidemics each year. The best way to reduce the risk of flu and its potentially serious complications is by getting vaccinated each year.

This area of interest involves two (2) focus areas.
1. Diagnostics
2. Prevention

The current gold-standard tool for detection and surveillance of pathogens is real time reverse transcription polymerase chain reaction (rRT-PCR) due to its high level of accuracy and sensitivity. However, there are sometimes limitations in using rRT-PCR as the primary tool for detection and further characterization of pathogens. For example, while rRT-PCR assays can be multiplexed to allow for detection of multiple pathogens simultaneously, the scalability of this multiplexed approach is limited by the filter options on the real time instruments, and typically only four to five targets can be detected within one multiplex design. Furthermore, scenarios can arise in which there is a genomic aberration of interest in a pathogen genome but in a region of the pathogen genome in which an rRT-PCR design is not feasible due to the surrounding sequence. There can also be situations in which it is difficult to design a single rRT-PCR design that can capture and detect the diversity within a specific pathogen (e.g., H5 influenza). Finally, in situations in which a pathogen is evolving rapidly during an outbreak, it would be beneficial to have access to additional diagnostic platforms beyond rRT-PCR that have the ability for a modular approach for design and approval, which could lead to quick implementation of widespread testing if needed. Clustered regularly interspaced short palindromic repeats (CRISPR) and CRISPR-associated endonuclease (Cas) systems function in nature as an immune mechanism in prokaryotes to detect and degrade foreign genetic material. This biological system has been recently leveraged to create CRISPR-based diagnostics due to its ability for rapid, sensitive nucleic acid detection with single-base specificity.

20.1. CRISPR-Based Diagnostic Assays for Multi-Pathogen and Multi-Analyte Detection

NCIRD's Influenza Division (ID) seeks to enhance its diagnostic repertoire towards respiratory pathogens, beyond rRT-PCR, through development of CRISPR-based diagnostics to allow for multi-pathogen and multi-analyte detection:

1) Implement a panel of CRISPR-based diagnostic assays that target common respiratory pathogens, which can be used for identification and surveillance purposes during outbreaks of respiratory disease.:
    - Create CRISPR-based diagnostic assays that target a variety of respiratory pathogens.
    - Demonstrate specificity of CRISPR-based diagnostics through inclusivity and exclusivity experiments.
    - Demonstrate relative sensitivity of CRISPR-based diagnostics to rRT-PCR in single infection and co-infection scenarios.
2) Establish a CRISPR-based diagnostic assays that can be used in a reflexive manner once a pathogen has been detected to gain more granular details around subtype or substitutions of interest within the identified pathogen. Establish CRISPR-based diagnostic assays that can be used in a reflexive manner once a pathogen has been detected to gain more granular details around subtype or substitutions of interest within the identified pathogen, and create a subpanel of CRISPR-based diagnostic assays that can:
    - Distinguish influenza virus subtypes of interest.
    - Detect substitutions relating to treatment-resistance within influenza viruses.
    - Detect substitutions within the SARS-CoV-2 genome predicted to affect transmission, diagnostics, therapeutics, or immune escape.
3) Evolve the CRISPR-based diagnostics into a portable version that can be used directly in-field at points of outbreak. Objectives include developing a method for testing CRISPR-based diagnostics in field with minimal equipment/reagent requirements.

Priority will be given to offerors who establish:

1) Experience in CRISPR-based diagnostic design and data analysis.
2) Access to viral materials necessary to evaluate and verify designs.
3) Skill in evolving laboratory-based testing into portable versions that can be implemented in the field.

The COVID-19 pandemic and the response have changed the landscape of influenza. Global circulation of influenza viruses has been universally disrupted and virus transmission has been at historic lows. Although surveillance systems for respiratory illness were severely disrupted in many places, there are now enough data to indicate these decreases in influenza were real and not an artifact of surveillance disruptions. This situation is likely time limited, and influenza is expected to return as measures are lifted and the population returns to pre-COVID behavioral patterns. Indeed, in some tropical countries we have already observed influenza epidemics. This short window of substantial change offers a unique opportunity to better understand the role of non-pharmaceutical interventions (NPIs, including school closures, workplace closures, cancelling public events, restrictions on gatherings, closing public transportation, stay at home requirements, restrictions on internal movements, international travel controls, physical distancing when gathered, hand washing, case isolation, contact tracing, improvements to ventilation, public information campaigns, and mask mandates) on influenza circulation.

NPIs are most effective when they are used in a layered approach, so it can be difficult to tease out which NPIs have or will work best to interrupt influenza circulation. However, knowing this could help us understand what is the least disruptive collection of NPIs that could effectively decrease influenza transmission among a diverse set of sociodemographic groups. Various global data sources exist to explore these questions. For instance, the Oxford School of Government developed the Oxford Stringency Index, which collected systematic data on measures taken by countries to address the threat of COVID-19. In addition, there is a global source for influenza data from routine surveillance systems. Countries report weekly influenza data (specimens tested and specimens testing positive for influenza viruses) to WHO through FluNet. Other, more granular country-specific data (including for the United States) exist on these and other variables of interest that could help explore NPI impact and factors that confound or modify that impact. Creative approaches are needed to explore the separate contribution of various NPIs and their adherence) on influenza circulation, both retrospectively and prospectively as NPI policies are modified. Comparisons to other infections or conditions may be necessary to ensure associations identified with influenza are robust.

20.2. Assessing the role of non-pharmaceutical interventions (NPI) in preventing influenza

NCIRD's Influenza Division (ID) seeks to estimate the separate and joint impact of COVID-19 NPI's and their adherence on influenza circulation to identify which measures were most effective in decreasing influenza transmission through creative and innovative methods to:

1) Estimate the separate and joint effects of layered NPIs on the timing and impact (e.g., reductions in cases, hospitalizations, and deaths) of influenza circulation, both domestically and/or internationally
2) Assess the equitability of NPI impact across a diverse set of sociodemographic groups

The period of interest to CDC is June 2022 to August 2025. Each year, an assessment by CDC will be made as to the utility to move forward, taking several factors into account, including the current level of influenza virus circulation.

Priority will be given to offerors who establish:

1) Track record of similar evaluation activities for COVID-19 or seasonal and pandemic influenza;
2) Track record of using multiple diverse data sources, including those not routinely used in PHh;
3) Experience with or knowledge of surveillance systems to identify acute illness and influenza;
4) Capacity to collect, manage, and analyze the data required by this effort, including data that measure observed or reported behaviors related to NPI policies (e.g., measures of adherence);

5) Estimate NPI effects among diverse sociodemographic groups to assess drivers of inequity;
6) Ability to quantify the preventive value of alternative non-pharmaceutical interventions;
7) Assessments conducted in multiple countries, including the United States.

Topic 21. SARS-CoV-2 (COVID-19) and Children (NCIRD)
School-aged children are exposed to significant respiratory virus transmission in schools, after-school programs, and other community settings. SARS-CoV-2 causes a significant burden of mild disease in children, but the extent of asymptomatic infection and transmission in educational settings remains under studied.

As children and adolescents return to in-person learning mitigation measures to prevent the spread of SARS-CoV-2 are critical. Mitigation measures such as frequent testing, distancing, and mask use have been shown to decrease school-associated SARS-CoV-2 infection; however, COVID-19 vaccination for children is another crucial measure necessary to preventing SARS-CoV-2 transmission.

In December 2020, the Food and Drug Administration (FDA) issued an emergency use authorization (EUA) for the use of COVID-19 Pfizer BioNTech mRNA vaccines in adolescents 16 years and older and expanded this to children 12 years and older in May 2021. Approvals for this same vaccine in children aged 5-11 years occurred in October and other COVID-19 vaccines for children will likely follow. This area of interest involves three (3) focus areas.
1. Transmission
2. Vaccine Effectiveness (VE)
3. Impact

CDC is hoping to leverage existing SARS-CoV-2 school-based testing programs to learn more about SARS-CoV-2 and other respiratory virus transmission in school settings, and to evaluate the effectiveness of COVID-19 vaccines among children and adolescents at varying levels of transmission intensity within schools. Further study of the transmission dynamics of other respiratory pathogens including influenza, and RSV, could also be prioritized from this collaboration to further inform mitigation strategies and improve understanding of best practices for transmission reduction in educational settings.

21.1. Describing respiratory virus transmission in educational settings

NCIRD's Division of Viral Diseases (DVD) seeks to expand the current knowledge base of respiratory virus transmission in schools.

Objectives include:
1) Documenting the proportion of children infected with priority viral respiratory pathogens including SARS-CoV-2, influenza, RSV and others such as parainfluenza, seasonal coronaviruses, human metapneumovirus annually through regular multi-pathogen testing of both symptomatic and asymptomatic children;
2) Estimating the proportion of respiratory virus infections that are symptomatic;
3) Estimating the duration of test positivity for different respiratory viruses;
4) Evaluating the impact of mitigation strategies on the proportion of children infection with priority viral respiratory pathogens;
5) Based on testing results and additional epidemiologic information, determining and/or describing likelihood of in-school transmission.

Priority will be given to offerors who establish:

1) Track record of collaboration with large or multiple school districts (ideally >10,000 children);

2) Capacity to enroll and maintain participation of children aged 5-11 years and adolescents aged 12-17 years in regular (preferably weekly) PCR-based testing of both vaccinated and unvaccinated children while minimizing selection and participation biases;
3) Capacity to document prior history of SARS-CoV-2 infection in enrolled children;
4) Capacity to document the presence or absence of symptoms at the time of testing;
5) Capacity to document the date and product of all COVID-19 doses and influenza vaccines received on or since 12/2020;
6) Capacity to collect and manage data required for this effort.

21.2. Evaluating COVID-19 vaccine effectiveness in schools

NCIRD's Division of Viral Diseases (DVD) seeks to expand the current knowledge base of COVID-19 vaccine effectiveness in educational settings.

Objectives include:

1) Estimating COVID-19 vaccine effectiveness against symptomatic SARS-CoV-2 infection in children aged 5-11 years and adolescents aged 12-17 years;
2) Estimating COVID-19 vaccine effectiveness against asymptomatic SARS-CoV-2 infection in children aged 5-11 years and adolescents aged 12-17 years;
3) Evaluating product-specific COVID-19 vaccine effectiveness by age group, time since second dose, and intensity of transmission within the school setting.

The implementation of SARS-CoV-2 vaccines in the United States has greatly reduced SARS-CoV-2 transmission but with the emergence of highly transmissible variants of concern, such as delta, and the reopening of schools and early care and educations programs, estimating vaccine effectiveness (VE) of COVID-19 among children is vital. While there are several existing pediatric study platforms that estimate VE against hospitalization, VE against asymptomatic infection, and VE against symptomatic infection from urgent care and emergency department settings, these platforms cannot assess VE in the ambulatory care setting and concurrently assess correlates of protection along with long-term follow-up.

A large scale platform is needed to concurrently 1) estimate VE against symptomatic infection among children 0-17 years attending the full range of ambulatory healthcare settings, including pediatrician offices, and identify factors that may modify VE 2) have capacity to collect and test respiratory specimens to report VE by variant and blood specimens to assess correlates of protection, and 3) conduct long-term follow-up to assess persistent symptoms and disruption of education. In addition to estimating VE, collecting this type of data, including genetic sequencing of the viruses, will provide early indicators for the next SARS-CoV-2 surge, emergence of new variants of concern, or different respiratory viruses of pandemic potential. With anticipated expansion of pediatric COVID vaccines to younger age groups, CDC seeks to estimate SARS-CoV-2 VE among children in ambulatory healthcare settings at multiple sites representative of the pediatric population in the US.

21.3. Children 5-17 years: Evaluating the duration of immune protection following COVID-19 vaccination

NCIRD's Division of Viral Diseases (DVD) seeks to evaluate the duration of immune protection in children 5-17 years old following COVID-19 vaccination.

Objectives include:

1) Estimating immune protection following vaccination for 5-11 years and adolescents aged 12-17 years using serologic testing/presence of antibodies;
2) Estimating immune protection following vaccination for 5-11 years and adolescents aged 12-17 years using epidemiologic outcomes, i.e. describing duration of protection from time of vaccination without incident infection at the individual level;
3) Conducting ecological analysis at the age-group (5-11 years or 12-17 years), classroom, and/or school level that quantifies the relationship between vaccine coverage and numbers of incident infections.

21.4. Children 0-17 years: Estimating COVID-19 vaccine effectiveness in ambulatory healthcare settings

NCIRD's Division of Viral Diseases (DVD) seeks to estimate SARS-CoV-2 vaccine effectiveness among children 0-17 years in ambulatory healthcare settings at multiple sites that are representative of the pediatric population in the US, including geographic regions with diverse racial/ethnic and socioeconomic groups.

Objectives include:

1) Determining vaccine effectiveness against symptomatic laboratory-confirmed SARS-Cov-2 among children 0-17 years in ambulatory healthcare settings
2) Determining duration of overall vaccine effectiveness and by variant among children 5-17 years in ambulatory healthcare settings
3) Estimating vaccine effectiveness against persistent symptoms and disruption of education among children 0-17 years attending ambulatory healthcare settings
4) Determining vaccine effectiveness of booster doses or heterologous vaccine schedules among children 0-17 years attending ambulatory healthcare settings
5) Genetically characterize SARS-CoV-2 viruses causing infection in children 0-17 years in ambulatory healthcare settings
6) Assessing correlates of protection against symptomatic SARS-CoV-2 infection among children 0-17 years in ambulatory healthcare settings
7) Identifying demographic and clinical factors that modify the effectiveness of COVID-19 vaccines in preventing SARS-CoV-2 infection among children 0-17 years
8) Estimating incidence of symptomatic laboratory-confirmed SARS-Cov-2 and other respiratory viruses of pandemic potential among children 0-17 years in ambulatory healthcare settings
9) Estimating the incidence of co-infection with SARS-CoV-2 virus and other respiratory viruses of pandemic potential in children 0-17 years
10) Estimating incidence of SARS-CoV-2 reinfection based on self-report history of a positive test and/or access to testing results

Priority will be given to offerors who establish:

1) Track record of successful implementation of similar evaluation activities among pediatric populations;
2) Experience designing and implementing surveillance systems in ambulatory healthcare settings;
3) Capacity to collect respiratory specimens and sera from participants and conduct all steps of specimen processing, management, testing, and sequencing;
4) Capacity to collect, manage, and analyze the data required by this effort.

21.5. COVID-19 and Multisystem Inflammatory Syndrome in Children (MIS-C)
Multisystem inflammatory syndrome in children (MIS-C) is a rare but severe condition in children and adolescents infected with SARS-CoV-2. The mechanisms of MIS-C are not well understood but include a dysregulated immune response to SARS-CoV-2 infection. The risk of recurrence of the same hyperinflammatory response following reinfection of SARS-CoV-2 or in response to COVID-19 vaccination among people with a history of MIS-C is unknown. Interim clinical considerations on the CDC website have suggested that people with a history of MIS-C should consider delaying vaccination until they have recovered from their illness and for 90 days after the date of diagnosis of MIS-C, recognizing that the risk of reinfection and, therefore, the benefit from vaccination, might increase with time following initial infection. Data are needed in inform vaccination recommendations for persons who have had MIS-C. Because of the concern of a robust hyperimmune response in children with a history of MIS-C when they receive COVID-19 vaccination, evaluation of the immune response and data regarding safety and timing of COVID-19 vaccination after MIS-C are critically important for recommendations and decision-making about the use of COVID-19 vaccines in this population.

NCIRD's Division of Viral Diseases (DVD) aims to evaluate clinical and immune responses among children receiving COVID-19 vaccination after multisystem inflammatory syndrome in children (MIS-C).

Objectives include:

1) Conducting a systematic and prospective evaluation of the immunologic response to COVID-19 vaccination in children <21 years with a history of hospitalization for MIS-C and children in comparator groups, including humoral, T-cell, and innate immunity before and after COVID-19 vaccination.
2) Documenting adverse events by product and dose among children with a history of MIS-C who then receive COVID-19 vaccines.
3) Comparing clinical and immune responses after COVID-19 vaccination among children with a history of MIS-C to those of children in comparator groups. Comparator groups may include children with a history of other inflammatory syndromes (e.g., acute COVID-19, Kawasaki Disease, and Toxic Shock Syndrome) and previously healthy control children without history of an inflammatory/infectious syndrome, as feasible.
4) Identifying potential genetic polymorphisms associated with unique or aberrant immune response to COVID-19 vaccination among children with MIS-C and among children in the comparator groups.
5) Determining if the immune response to COVID-19 vaccination among children who have had MIS-C differs according to MIS-C treatment received (e.g., IVIG + corticosteroids, IVIG alone, corticosteroids alone, tocilizumab, etc.).
6) Describing clinical signs and symptoms associated with SARS-CoV-2 re-infection in persons with a history of MIS-C and COVID-19 vaccination.

Priority will be given to offerors who establish:

1) Past experience designing and implementing longitudinal surveillance of children who have had COVID-19 infection or MIS-C, and capacity to enroll adequate sample size for analysis by age stratification (e.g., ages 16-20, ages 12-15, ages 5-11, and younger as vaccination is authorized).
2) Capacity to perform laboratory testing including inflammatory markers and to collect prospective sera and whole blood samples for peripheral blood mononuclear cells from participants and conduct all steps of specimen processing and management, to include a pre-vaccination draw ideally within 2 weeks prior to COVID-19 vaccination and post-vaccination draws at time points after vaccination (e.g., at 1-2 weeks, 1 month, and every 1-2 months thereafter for 6-12 months.
3) Capacity to collect standardized questionnaires at the time of blood draws to record clinical signs and symptoms and any specific adverse reactions to COVID-19 vaccination (to include recurrence of an MIS-C-like illness, myocarditis, and other events), as well as to assess frequency and clinical manifestations associated with SARS-CoV-2 reinfections.
4) Capacity to perform chart abstraction for initial MIS-C hospitalization and subsequent acute care visits (e.g., clinic, urgent care, emergency department) and hospitalizations, as well as all SARS-CoV-2 laboratory testing to document potential SARS-CoV-2 reinfection through 12 months post-vaccination, as feasible.
5) Capacity to collect specimens and perform similar laboratory testing and questionnaire administration from enrolled comparison groups, including children who have had COVID-19 (or Kawasaki Disease or Toxic Shock Syndrome) and receive COVID-19 vaccination, and children without a history of inflammatory or infectious illness who receive COVID-19 vaccination.
6) Capacity to perform whole genome sequencing for a subset of children in the MIS-C and control groups.
7) Capacity to collect and manage the data required by this effort.
8) The overall likelihood that they can initiate and implement the study in a timely manner.

9) Offerors should describe the outcomes they propose will best evaluate the immunologic response to COVID-19 vaccination in children with a history of MIS-C, including evaluation in comparator group(s).

21.6. COVID-19 and Acute Otitis Media (AOM)

Otitis media is a group of inflammatory diseases of the middle ear. Acute otitis media (AOM) is an infection of rapid onset that usually presents with ear pain. The cause of AOM is related to childhood anatomy and immune function. Either bacteria or viruses may be involved. Risk factors include exposure to smoke, use of pacifiers, and attending daycare. AOM is the most common reason children receive antibiotics in the United States. Streptococcus pneumoniae, Haemophilus influenzae, and Moxerella catarrhalis are the three most common bacteria that cause AOM. New higher valency pneumococcal conjugate vaccines are expected to be licensed in the next few years and have the potential to reduce incidence of pneumococcal AOM, including disease resistant to commonly prescribed antibiotics. Understanding of the vaccine preventable burden of AOM is important to inform vaccine policy decisions. Understanding the impact of the COVID-19 pandemic on nasopharyngeal carriage of common otopathogens and on the etiology of AOM is important to inform treatment guidelines and vaccine policy in the coming years.

NCIRD's Division of Bacterial Diseases (DBD) Respiratory Diseases Branch (RDB) seeks white papers to assess the prevalence of nasopharyngeal carriage of Streptococcus pneumoniae in children and etiology of AOM during the COVID-19 pandemic in populations that have been disproportionately affected by pneumococcal disease.

Topic 22. Bacterial Respiratory and Vaccine-Preventable Diseases (NCIRD)

CDC aims to improve detection, prevention, and control of respiratory and related invasive bacterial pathogens and accelerate development, introduction, and monitoring of bacterial vaccines domestically and globally.

This area of interest involves two (2) focus areas.
1. Group A Streptococcus (GAS)
2. Pertussis Disease

Group A Streptococcus (GAS) is a persistent public health problem worldwide. GAS causes infections such as strep throat and impetigo. These bacteria also cause approximately 11,000–24,000 cases of severe (invasive) GAS disease, such as necrotizing fasciitis, in the United States each year. Each year, about 1,200–1,900 people die due to invasive GAS disease. The disease burden in developing countries, especially due to rheumatic heart disease, is much greater.

22.1. Assessing the molecular epidemiology of group A Streptococcus (GAS) isolates among children.

NCIRD's Division of Bacterial Diseases (DBD) Respiratory Diseases Branch (RDB) is seeking Offeror's to assess the molecular epidemiology of group A Streptococcus (GAS) isolates among children with pharyngitis and asymptomatic GAS carriage in geographically diverse sites and assess the relationship of these non-invasive GAS isolates to invasive GAS isolates from the Active Bacterial Core surveillance program.

Pertussis, also known as whooping cough, is a highly contagious respiratory disease. It is caused by the bacterium Bordetella pertussis. Pertussis is known for uncontrollable, violent coughing which often makes it hard to breathe. After cough fits, someone with pertussis often needs to take deep breaths, which result in a "whooping" sound. Pertussis can affect people of all ages, but can be very serious, even deadly, for babies less than a year old. Pertussis is a persistent public health problem in the United States despite sustained high vaccination rates, partly because vaccine-induced immunity wanes as demonstrated in numerous studies. Failure of current acellular pertussis vaccines to reduce disease transmission as suggested by animal studies and

differences in the immune response to acellular vs. whole-cell pertussis vaccines may also be drivers of the inability to bring pertussis under better control. The reasons that long-term immunity is not acquired after natural infection or vaccination remains unclear however, due to longstanding gaps in knowledge of the pathogenesis, infectivity, and the immune response to pertussis.

Controlled Human Infection Model (CHIM) studies have emerged as an important tool in the development of a variety of new drugs and vaccines and are suitable for study of pertussis given the infection can be eradicated when antibiotics are administered early in the course of infection. The PERtussIS Correlates Of Protection Europe (PERISCOPE) Consortium has developed a human pertussis colonization model in the United Kingdom and demonstrated that experimental infection with B. pertussis is safe. Because the type of pertussis vaccine used for the primary series has been shown to influence on the subsequent immune profile, pertussis CHIM studies in populations that received acellular vaccines for the childhood series are needed to better understand the immune response to early clinical disease for developing next-generation vaccines in the United States. Additionally, identifying biomarkers that correlate with clinical endpoints is a priority to accelerate FDA licensure of next-generation pertussis vaccines. This topic focuses on the use of a Controlled Human Infection Model platform to accelerate development and licensure of next-generation pertussis vaccines in the United States.

22.2. Understanding the spectrum of clinical pertussis.

NCIRD's Division of Bacterial Diseases (DBD) Meningitis and Vaccine Preventable Diseases Branch (MVPDB) seeks to expand understanding of the spectrum of clinical pertussis disease (through the catarrhal stage), influence of pre-existing vaccine-induced cellular immunity on disease progression, and predictors of symptomatic disease using a controlled human challenge model.

22.3. Understanding immune response to pertussis infection.

NCIRD's Division of Bacterial Diseases (DBD) Meningitis and Vaccine Preventable Diseases Branch (MVPDB) seeks to gain mechanistic insight into the innate and adaptive human immune response to pertussis infection and to identify immune biomarkers of protection using a systems immunology approach with samples from participants in a pertussis colonization trial.

PART III - WHITE PAPER SUBMISSION

Steps 1 and 2 provide for technical interchange prior to the submission of a formal proposal. Any questions or clarification of project objectives or methods may be directly discussed between the Government technical representatives and the potential offerors during the Technical Dialogue. The purpose of the Technical Dialogue is to obviate excessive expenditure of resources for projects that do not warrant consideration based on insufficient technical merits or funding limitations.

Use of Non-Government Personnel

Offerors are hereby notified that non-Government participants may have access to the offerors' white papers and that providing a white paper shall constitute consent to the disclosure of proprietary information to all non-Government participants in the white paper review process. The non-Government participants are employees of commercial firms under contract to the Government and they will be authorized access to only those portions of the white paper and discussions that are necessary to enable them to provide specific technical advice on specialized matters or on particular problems, and for tracking and recording purposes. All non-Government participants have executed a Certificate of Non-Disclosure.

WHITE PAPER EVALUATION CRITERIA

White papers will be reviewed to determine if the proposed effort supports the research interest identified in Part II of this BAA. White papers will be evaluated by a technical review team using the following criteria:

- Technical Merit (Novelty, Impact, Scientific Rigor)
- Program Applicability (Priority, Gap)
- Timeframe Feasibility (Risk, Experience, Resource)

Offerors receiving a **favorable review** of their white paper will be requested to submit a formal proposal. Offerors receiving an **unfavorable review** of their white paper will not receive a request to submit a formal proposal. To be eligible for award a white paper must be submitted.

Upon completion of white paper evaluations, offerors will be notified whether or not their white paper was favorably received. Favorable review of a white paper does not constitute selection of the proposed effort for contract award and will not establish a binding commitment for the Government to fund the effort in whole or in part.

The Government will not offer debriefs to offerors whose white papers are deemed unfavorable.

WHITE PAPER FORMAT AND CONTENT

Each white paper must adhere to all of the following requirements and should be no more than 4 pages (all inclusive) in length per subtopic area. The email subject line for the white paper shall include research topic number and subtopic title.

1. **Format**
   - Font size: 12-point, unreduced
   - Single-spaced and Printed only on one side
   - Paper size: 8.5 by 11 inches
   - Page Margin Size: One inch
   - Descriptive Title of the Proposed Project
   - BAA Number

2. **Inclusions:**
   - FORM 1: White Paper Cover Page and Checklist
   - Administrative point of contact and Subject Matter point of contact
   - Project Description addressing in sufficient detail the characteristics identified in Part II
   - Estimated Timeline to complete the project
   - Rough Order of Magnitude (ROM) /high level estimate of what the project will cost

   As applicable:
   - Select Agent Approvals for projects involving hazardous materials or select agents.
   - Public Health Service (PHS) Assurance number and expiration date along with AAALAC accreditation number and renewal date, and United States Department of Agriculture registration number (if applicable) for projects involving live vertebrate animals.
   - Institutional Review Board (IRB) number for projects involving human subjects or data collection.
   - Description of any proposed IT or IT systems development, including whether or not:
     - Investment uses cloud-based solution or modern technology to meet the defined business need
     - Investment provides re-usable functionality and/or data
     - Investment leverages existing solutions, services, or data available at CDC
     - Investment results in data or system modernization (e.g., improves sustainability, mitigates the risk/cost of inaction, uses modern technology and processes)
     -

- White paper submissions shall be unclassified.

- Project description addressing in sufficient detail the characteristics identified in **Part II.** The offeror may submit an individual white paper for any or all of the topic areas under Part II.

WHITE PAPER SUBMISSION

This BAA is open and in effect for 39 days from the date of release **(December 6, 2021 through January 14, 2022). THIS IS AN IMMEDIATE CALL FOR WHITE PAPERS.** Prior to submission of a white paper offerors are strongly encouraged to contact the CDC BAA technical point of contact for the research topic/subtopic of interest. White papers must be received electronically by 3:00 PM EST for **January 14, 2022** in order to be considered for further evaluation. White papers should be submitted electronically to the mailbox at oadsbaaprojects@cdc.gov with a copy to the BAA Technical Coordinator, Diana Bartlett at dbartlett@cdc.gov.

****Please allow adequate time for your submission to get through the CDC firewall. We highly recommend allowing 5 or more minutes for this process. All white papers received after the 3:00 p.m. deadline will not be considered for review****

To ensure your submission is received and processed in a timely manner, the subject line of your email must include the **BAA number**, **topic number** and the name of your **Organization**.

Once white papers are submitted technical dialogue STOPS!

PART IV - PROPOSAL PREPARATION AND SUBMISSION

General Information

This section is intended to provide information needed in preparing research proposals for submission to CDC. Proposals submitted under this BAA must contain technical, administrative, cost, and other supporting information as described below.

Most of the information needed to prepare a proposal will be found within this section. Blank proposal forms are included in Part VI and are designed to provide the required information needed for contracting purposes. Use of the enclosed proposal forms will expedite award of the research contract.

All proposals should include the information specified in this announcement in order to avoid delays in evaluation.

CDC encourages nonprofit organizations, educational institutions, small business, small disadvantaged business concerns, HubZones, Service-Disabled Veteran-Owned Small Businesses (SDVOSBS) and Woman Owned Small Businesses (WOSB) concerns to submit white papers for consideration.

This announcement is an expression of interest only and does not commit the Government to reimburse any proposal preparation cost for responding. The cost of the proposal preparation in response to this announcement is not considered an allowable expense to the normal bid and proposal indirect costs as specified in FAR 31.205-18. Any request for white paper or submission of a full proposal does not guarantee award. The Government reserves the right to cancel this requirement at any time and shall not be liable for any cost of proposal preparation or submission.

Any contractual questions concerning the preparation or content of the research proposal should be directed to:

Name	Research Topic Area	Email
Mr. Timothy Barnes	1	krz3@cdc.gov
Mr. Tray Burch	5, 6	vwa8@cdc.gov
Elizabeth Cole Greenblatt William O'Bryan	3	qst7@cdc.gov rvq0@cdc.gov
Ms. Latoya Hill	7, 8, 9	mdx7@cdc.gov
Mr. Kristopher Lemaster	10	ene3@cdc.gov
Ms. Marva D. Lewis	2	knn5@cdc.gov
Mr. Marty Nemec	18, 19	oga2@cdc.gov
Ms. Jasmine Powell	11, 12, 13	qes1@cdc.gov
Ms. Denedra Threatt	4	qfa5@cdc.gov
Mr. Ronnie Williams	14, 15, 16, 17	oga3@cdc.gov
Mr. Tim Williams	20, 21, 22	tpw8@cdc.gov

Eligibility

To be eligible for award of a contract, a prospective contractor (except other Governments, including State and Local Governments) must meet certain minimum standards pertaining to financial resources, ability to comply with the performance schedule, prior record of performance, integrity, organization, experience, operational controls, technical skills, facilities, and equipment.

Post-Employment Conflict of Interest

There are certain post-employment restrictions on former federal officers and employees, including special Government employees (Section 207 of Title 18, United States Code). If a prospective offeror believes that a

conflict of interest may exist, the situation should be brought to the attention of the Contracting Officer before time and effort is expended in preparing a proposal.

Restrictive Markings on Proposals

Offerors that include in their proposals data that they do not want disclosed to the public for any purpose, or used by the Government except for evaluation purposes shall:

(a) Mark the title page with the following legend: "This proposal includes data that shall not be disclosed outside the Government and shall not be duplicated, used, or disclosed -- in whole or in part -- for any purpose other than to evaluate this proposal. If, however, a contract is awarded to this offeror as a result of -- or in connection with -- the submission of this data, the Government shall have the right to duplicate, use, or disclose the data to the extent provided in the resulting contract. This restriction does not limit the Government's right to use information contained in this data if it is obtained from another source without restriction. The data subject to this restriction are contained in sheets [insert numbers or other identification of sheets];" and

(b) Mark each sheet of data it wishes to restrict with the following legend: "Use or disclosure of data contained on this sheet is subject to the restriction on the title page of this proposal."

All offerors should also complete the Research Proposal Cover Page Attachment (1) and should complete the statements of Attachment (2) indicating their preference for release of information contained in proposals and their understanding of the policy regarding evaluation of the proposals.

The offeror is cautioned, however, that portions of the proposal may be subject to release pursuant to the Freedom of Information Act, 5 U.S.C. 552, as amended.

Reporting Requirements

The contractor will provide a quarterly summary of monthly conference calls. Quarterly Progress reports should include detailed descriptions of activities conducted during the previous quarter, planned activities for the upcoming next three months, and a section on challenges or barriers to meeting timelines and completing tasks, and how the contractor has already or plans to overcome these challenges.

Non-U.S. Citizen Participation

If the proposed research (or a portion of the proposed research) requires access to critical technology, sensitive unclassified information, For Official Use Only material, or intelligence material, non-U.S. citizens may participate in the resultant contract (or portion of the resultant contract) **only** if special written permission is granted by the Contracting Officer. The Contracting Officer will require the review and concurrence of the CDC Foreign Disclosure Officer (FDO) before granting this permission.

If the proposed research (or a portion of the proposed research) requires access to classified information (i.e., confidential or secret), non-U.S. citizens may participate in the resultant contract (or portion of the resultant contract) only if a Limited Access Authorization (LAA) is granted. A LAA can be granted only in the event that there are no U.S. citizens that can perform the effort. Granting of LAAs is not anticipated under this Broad Agency Announcement.

If any non-U.S. citizen requires access to CDC buildings, or other Government facilities, special written permission must be requested and obtained from the Contracting Officer and Security Officer through the resultant contract's Technical Point of Contact. Requests shall specify purpose, duration, frequency, and location (specific room, lab, etc.).

Period of Performance

The period of performance will be based on the research project. This BAA will include a proposed period of performance which may be negotiated later. In the past, projects have had a period of performance of 12- 24 months or have included options.

Contract Types

For this BAA, offerors can propose firm-fixed price or cost reimbursement [cost plus fixed fee, cost (no fee)].

The contract type should be based on the offerors risk associated with performing the research. As a reminder, per FAR 16.301-3(a)(3), offerors proposing a cost type contracts must have an approved accounting and purchasing system in order to receive a cost contract award. As a result, if proposing a cost type contract, please submit documentation of the approved accounting system along with the proposal.

Cost Certification

Per FAR 15.403-4, certified cost and pricing data are required for offers exceeding $750,000.00 total value. As a result, a Certificate of Current Cost or Pricing Data, in the format specified in FAR 15406-2, shall be submitted along with the offeror's proposal if the work is projected to exceed $750,000.00.

Funding

- Fiscal Year Funds: 2022
- Approximate Total Funding: $75,000,000.00 (This amount is an estimate, it is not intended to be a ceiling, and is subject to availability of funds.)
- Anticipated Award Date: July/August, 2021
- Period of Performance: TBD (Based on the research project)
- Estimated number of awards: Multiple

Proposal Submission

To be considered for award, an offeror must have submitted a white paper which was favorably reviewed by CDC. Offeror will then be formally notified by the Contracting Officer to submit a formal proposal. The Request for Proposal (RFP) will identify a due date for submitting the proposal. The offeror must follow the proposal submission guideline as identified in this section and the Request for Proposal (RFP) letter.

Follow-On Contracts

A proposal for continuation of a given research project will be considered on the same basis as proposals for new research. The proposal should be submitted sufficiently in advance of the termination of the existing contract so that if it is accepted, contract performance may be continued without interruption.

Proposal Copies

Offerors shall submit copies of their proposal as follows:

Proposal Section	Electronic
Technical Proposal	One
Administrative Proposal	One
Timeline and Cost Proposal	One

All electronic documents electronic must be in a format compatible with Microsoft Office 2016.

PROPOSAL PREPARATION INSTRUCTIONS

The proposal is the only vehicle available to the offeror for receiving consideration for award. The proposal must stand on its own merit; only information provided in the proposal can be used in the evaluation process leading to an award. The proposal shall be prepared simply and economically, providing straightforward, concise delineation of capabilities necessary to perform the proposed work. The technical proposal must be accompanied by a fully supported cost proposal as cost and technical considerations are reviewed simultaneously.

Each proposal shall be submitted under cover of Attachment (1) and shall contain three distinct sections. The first section shall contain the technical approach. The second section shall contain contractual information, certifications, and other documentation. The last section shall contain a breakdown of the anticipated costs.

Section I - Technical Section Contents

The nature of the effort to be performed will determine its acceptability for award under this BAA. Proposed efforts shall be scientific in nature and explore innovative public health practicing concepts. The Technical Section shall contain the following:

Technical Proposal – Limited to 10 Pages

a. **Cover Page**: The cover page shall include the BAA Number, research topic and reference number, name and telephone number for the principal points of contact (both technical and contractual), and any other information that identifies the proposal. The cover page shall also contain the proprietary data disclosure statement, if applicable. **The cover page shall not count as part of your technical proposal page limit.**

b. **Table of Content:** It is highly recommended that the Offeror prepares a table of contents and use it for a final quality-control checklist. **The table of content shall not count as part of your technical proposal page limit.**

c. **List of Illustrations/Tables:** This list is a quick reference of charts, graphs, and other important information. A separate list of Tables is recommended. **List of illustrations/tables shall not count as part of your technical proposal page limit.**

d. **Executive Summary:** The executive summary allows the offeror to present briefly and concisely the important aspects of its proposal to key management personnel. The summary shall present an organized progression of the work to be accomplished, without the technical details, such that the reader can grasp the core issues of the proposed program. **The Executive Summary shall not exceed two pages and shall not count as a part of your technical proposal page limit**.

e. **Technical Approach:** In this section, the Offeror shall provide as much technical detail and analysis as is necessary or useful to support the technical approach they are proposing. One must clearly identify the core of the intended approach. It is not effective to address a variety of possible solutions to the technology methodological problems.

(1) **Technical Discussion:** No technical approach is without its limitations or shortcomings. Every issue shall be identified and compared with the successes/failures of previous approaches. A tradeoff analysis is a good way to make this comparison and shall be supported by theory, modeling, experimental data, or other sound scientific practices. If the offeror has a "new and creative" solution to the problem(s), that solution shall be developed and analyzed in this section. The preferred technical

approach shall be described in as much detail as is necessary or useful to establish confidence in the approach.

(2) **Technical Program Summary:** This section summarizes the above technical discussion in an orderly progression through the program, emphasizing the strong points of the proposed technical approach.

(3) **Potential Contribution:** Discuss the potential contribution to research programs relating to CDC initiatives, including the topic areas of interest

***In addition to the information above, your response in this area shall also focus on the information provided in Part II of this BAA.**

(4) **Risk Analysis and Alternatives:** Every technical approach has its limitations and shortcomings. The proposal evaluator(s) will formulate a risk assessment and it is in the best interest of the Offeror to have its own understanding of the risk factors presented. Critical approaches shall be identified along with their impact on the overall program as well as fallback positions that could still improve on existing approaches.

(5) **References**: Any good technical discussion must present the basis for and reference the findings cited in the literature.

f. **Special Technical Factors:** In this section, the Offeror shall describe any capabilities it has that are uniquely supportive of the topic areas described in Part II of this BAA. The following subparagraphs are offered as possible areas to be addressed:

(1) Capabilities and Relevant Experience of the staff
(2) Previous or Current Relevant Public Health Practices
(3) Identification of well-defined statistical principles and methods as applied to prediction and modeling techniques for public health, and
(4) Information on facilities/resources that will be used to accomplish the proposed effort and an explanation of why they are adequate to conduct a successful program.

g. **Schedule**: The schedule represents the Offeror' s commitment to perform the program tasks in an orderly, timely manner.

(1) **Time Line Chart by Task:** Each major task identified in the SOW must appear as a separate line on the program schedule. Planned meetings, such as kick-off, presentations (including final), Technical Interchange Meetings, etc., must be included in the time line. The time line must also indicate the anticipated meeting site.

h. **Program Organization:** In this paragraph, the Offeror shall present its organization's ability to conduct difficult technical programs. Any pertinent or useful information may be included in this paragraph, but a minimum recommended response shall address the following subparagraphs:

(1) **Organizational Chart(s) with Key Personnel**: Include prime contractor and subcontractor organization charts, principal investigator (PI), and additional key staff who are involved in this project

(2) **Management and Technical Team:** This shall specifically identify what tasks will be performed by which party and why each subcontractor, if any, was selected to perform its task(s).

(a) Prime Contractor Responsibilities
(b) Subcontractor(s) Responsibilities
(c) Consultant(s) Responsibilities

(3) **Resumes of Key Personnel:** Key personnel are those skilled, experienced, professional and technical personnel essential for successful accomplishment of the proposal objectives, such as the principal investigator, team leader, etc. Information regarding the qualifications, capabilities, and experience of the proposed key personnel shall be addressed. Include the resumes of the prime contractor, subcontractor, and consultant personnel to include the names, brief biography, and list of recent publications of the offeror's key personnel. Documentation of previous work or experience in the field of the proposer is especially important. **Resumes shall not exceed 2 pages and shall not count as a part of your technical proposal page limit**

i. **Appendix(es):** Appendices may include technical reports, published papers, and referenced material. A listing of these reports/papers with short descriptions of the subject matter is usually adequate. Do not provide commercial product advertising brochures; these are unwanted.

Offeror's Statement of Work (SOW)- No page limit

a. It is the intent of the Government to use the Offeror' s SOW, as written, provided that the Offeror' s SOW accurately describes the work to be performed, is enforceable, and is void of inconsistencies. If, in the Government's opinion, the Offeror's SOW does not reflect these requirements, the Government will prepare a SOW using information available in the offeror's proposal; this process may delay the award.

b. **The SOW shall be a separate word document that is a distinct part of the proposal. Do not include any proprietary information in the SOW. To ensure all technical proposals receive proper consideration, the Government requires that the SOW format below be strictly adhered to.**

c. Below is the required format for the SOW. Begin this section on a new page with the Title of the Project at the top of the page. Start your SOW at Paragraph C.1.

STATEMENT OF WORK

C.1 Background and Need – (*Describes the requirements in general, non-technical terms. This section should explain why the acquisition is being pursued and how it relates to past, current, or future projects. Include a summary of statutory program authority and any regulations that are applicable. If any of the techniques have been found to be tried and been found to be effective, they should be included here.)*

C.2 Project Objective – (*A succinct statement of the purpose of the acquisition. It should outline results that the Government expects and may also identify the benefits to the program that is contemplated.)*

C.3 Scope of Work – (*An overall, non-technical description of the work to be performed. It expands on the projected objectives, but does not attempt to detail all of the work required. It must be consistent with the detailed requirements.)*

C.4 Technical Requirements – (*Spells out precisely what is expected of the contractor in the performance of the work.*

- *Describes the specific tasks and phases of the work*
- *Deliverables to be generated from the described tasks must be clearly defined*
- *Specifies the total effort each task or phase is to receive*
- *Considerations that may guide the contractor in its analysis, design, or experimentation on the designated problems*
- *Identifies the requirements and indicates the scope of each)*

C.5 Reporting Schedule – *(Describes any reporting requirements including content and format.)*

C.6 Special Considerations – *(Information that does not fit neatly or logically into one of the other sections. For example, it may be used to explain any special relationships between the contractor and other contractors working for the government.)*

C.7 Government Furnished Property – *Issuance of GFP shall be determined by the CDC Contracting Officer Representative (COR). Access to CDC IT systems and facilities is not anticipated. If it is determined that GFP or access is required, it will be controlled through use of CDC-issued HSPD-12 compliant ID badge.*

C.8 Travel – *Describes any travel that is projected to take place during the period of performance. Travel may include in-person kick-off meetings or final meetings, attendance at conferences, travel to present deliverables, etc.*

C.9 References – *(Describes any reference materials that may be relevant to the work being performed.)*

Deliverables – *(Defines and describes the deliverables, the quantity required, the recipient(s), and the schedule should be attached to the SOW. A sample of the tabs that should be included in the deliverable table are included below.*
NOTE: Deliverables included in Deliverables table must correspond to the tasks outlined under "Technical Requirements"

Task/Subtask	**Purpose**	**Deliverable Description**	**Quantity / Frequency**	**Deliverable Due Date**	**Deliver To Whom**

Section II - Administrative Section Contents – No page limit

This portion of the proposal shall contain the completed certifications and applicable forms contained in this BAA and shall include the following:

Contract Type

Identify the type of completion contract proposed. (**Note**: Offers proposed on a cost-reimbursement basis **MUST** contain evidence that the offeror' s accounting system is approved for such type contracting; i.e., provide identification of audit agency and dates last accounting and estimating system audits were performed. If approval was not obtained before submission of the proposal, the proposal shall address how the offeror will obtain the required approvals. Evidence of an approved accounting system **MUST** be obtained prior to contract award.)

Environmental Considerations

Discuss all applicable environmental and energy conservation objectives associated with the acquisition (see FAR Part 23), the applicability of an environmental assessment or environmental impact statement (see 40 CFR 1502), the proposed resolution of environmental issues, and any environmentally-related requirements to be included in the resultant contract.

Organizational Conflicts of Interest

Identify any members of the offeror's organization or team with potential conflicts of interest. Possible conflicts of interest include any people with prior federal employment, including employment of the Principal Investigator as a special Government employee (duties, agency with whom employed, dates of employment) within two years from the date of proposal submission. If none, so state.

Disclosure Requirement

Completion of Attachment (2) is prerequisite for evaluation of the proposal under this BAA.

Understanding of Evaluation Policy

Completion of Attachment (2) is prerequisite for evaluation of the proposal under this BAA.

Representations, Certifications and Other Statements of Offerors

Attachment (3) is provided for **information only**. Each offeror is required to complete the Online Representations and Certifications prior to submission of proposal and verification/validation is a prerequisite to award under this BAA. (**Note**: Online Representations and Certifications Applications (ORCA), an e-Government initiative has replaced the paper based Representations and Certifications (Reps and Certs) process. The ORCA site can be found by going to http://www.sam.gov/SAM and clicking on "Online Reps and Certs Application" on the left side of the screen.)

Contractors' Performance Assessment Reporting System (CPARS) Ratings

Completion of Attachment (4) is prerequisite for evaluation of the proposal under this BAA.

Past/Present Performance Reference Questionnaire

Completion of Attachment (5) is prerequisite for evaluation of the proposal under this BAA.

Subcontracting Plan (Only Applicable to Large Businesses)

In accordance with FAR 19.702, if the total amount of the proposal exceeds $750,000 and the offeror is a large business, the offeror shall prepare and submit a Small, Small Disadvantaged and Women-Owned Small Business Subcontracting Plan. A mutually agreeable Subcontracting Plan will be included in and made a part of the resultant contract. The contract cannot be executed unless the Contracting Officer determines that the Subcontracting Plan provides the maximum practicable opportunity for small, small disadvantaged and women-owned small business concerns to participate in the performance of the contract.

As stated in 15 U.S.C. 637(d) (8), any contractor or subcontractor failing to comply in good faith with the requirements of the subcontracting plan is in material breach of its contract. Further, 15 U.S.C. 637(d) (4) (f) directs that a contractor's failure to make a good faith effort to comply with the requirements of the subcontracting plan shall result in the imposition of liquidated damages.

Title to Equipment

Title to equipment or other tangible property purchased with contract funds will be disposed of in accordance with Contracting Officer instructions at the time of contract completion.

Section III - Cost Section Contents – No page limit

In accordance with FAR 15.403-3 (under FAR 15.408 Table 15.2 when submission of Cost or Pricing Data is required), a detailed cost proposal shall be submitted with the research proposal and shall include, as a minimum, the following information (contractor's format is acceptable):

Period of Performance

Identify the proposed duration of the effort.

Direct Labor

Provide a list of participants, by category (and name, if appropriate), showing the hours and labor rates to be charged for each and the total amount per year proposed to be paid for each. Do not propose labor costs as percentages of time over the duration of the period of performance. Labor costs should be calculated by multiplying each proposed employee's labor rate by the amount of labor hours that they will work. Please disclose and explain the basis of any potential escalation factors utilized. Please refer to Attachment 9 for clarity.

Materials

Provide an itemized list of permanent equipment showing the cost of each item and the basis for the proposed cost. Provide a general description and total estimated cost of expendable equipment and supplies. Permanent equipment is any article of non-expendable tangible personal property having a useful life of more than two (2) years and an acquisition cost of $500 or more per unit. Permanent equipment costs shall not be fee/profit bearing.

Other Direct Costs

Travel

Include contemplated expenditures for travel with explanations for each trip and its proposed length and number of participants. The breakdown of these costs shall show the airfare, per diem rates, car rental rate, and any other travel expenses (such as parking fees, etc.) and shall be in accordance with the Joint Travel Regulations (JTR).

Subcontracts

Subcontractor cost proposals shall meet all of the requirements stated herein for the prime contractor. Subcontractor cost breakdowns may be submitted under separate cover.

Consultants

Provide a breakdown of any costs for consulting services showing number of days, daily rates, and estimated travel/per diem costs to the level of detail described in the travel narrative above. The need for consulting services must be explained and the basis for the daily rates must be provided.

Miscellaneous

Miscellaneous costs may include such items as publication charges, copying, subscriptions, photography, graphics, etc., only if they are consistent with and allowable under the offeror' s cost accounting system.

Indirect Costs

Indirect rates (overhead, G&A, etc.) utilized must be disclosed. Indicate whether any indirect rates used are fixed or provisional and the time frames to which they are applicable (e.g., a fixed rate may apply until a specified date, after which the rate becomes provisional). Proposals for contracts subject to FAR Subpart 31.2 shall complete Attachment (4). Facilities capital cost of money (FCCM) will not be an allowable cost in any resulting contract if the offeror's proposal fails to identify or propose FCCM (see FAR 15.408(i)).

Fee/Profit

The offeror must explain their proposed fee or profit, if any, which the organization proposes to assess the research project and how the fee/profit was derived. Reminder: Permanent equipment costs and the cost of facilities when purchased for the account of the Government (i.e., charged as a direct cost) shall not be fee/profit bearing.

PART V - PROPOSAL EVALUATION

INITIAL REVIEW

Upon receipt of a proposal, the Government will perform an initial review of the proposal's scientific/technical merit and potential contribution to CDC's mission. The Government will also determine if funds are expected to be available based on the proposed cost for the effort. Proposals not considered having sufficient scientific/technical merit or relevance to the CDC's mission or those in areas for which funds are not expected to be available, may be declined without being subject to the detailed scientific review described below. Scientific/technical merit, relevance to the research to CDC's mission, and availability of funding are of equal importance.

SCIENTIFIC REVIEW

Formal proposals not declined as a result of the initial review will be subject to a detailed extensive scientific review by highly qualified personnel.

Proposals submitted in response to this BAA will be evaluated in accordance with the following criteria:

Proposed Research

The overall scientific and/or technical merits of the proposed research, including the adequacy and effectiveness of any analysis and/or testing required to substantiate the methodology being developed.

Potential Contribution

The potential contributions of the effort to the CDC's mission and the extent to which the research effort will contribute to balancing the overall CDC's Research.

Offeror's Qualifications

The offeror's capabilities, related experience, facilities, techniques, or the unique combinations of any of these qualifications are integral factors for achieving the proposal objectives.

Personnel

The qualifications, capabilities, and experience of the proposed key personnel, such as the contractor manager, team leader, etc. Key personnel are those skilled, experienced, professional and technical personnel essential for successful accomplishment of the proposal objectives.

Cost Realism

In accordance with FAR 15.404-1 Proposal analysis techniques, the Government will evaluate the reasonableness and realism of proposed costs.

Administrative Proposal

The Contracting Officer will review the administrative section of the proposal for compliance.

PROPOSAL COMPARISONS

Each proposal will be evaluated based on the merit and relevance of the specific research proposed as it relates to the overall CDC mission rather than against other proposals for research in the same general area.

PART VI - FORMS & ATTACHMENTS

(See Attached Document)

PART VI - FORMS AND ATTACHMENTS

The following forms are required for all White Paper submissions:

	Page Number	Page Qty
FORM 1: White Paper Cover Page and Checklist	**2**	**1**

The following forms are required for all Proposal submissions:

FORM 2: Research Proposal Cover Page and Checklist	**3**	**1**
FORM 3: Representations, Certifications and Statements of Understanding	**4**	**17**
FORM 4: Contract Clearances	**21**	**1**
FORM 5: Past /Present Performance Questionnaire	**22**	**3**
FORM 6: ACH Vendor /Miscellaneous Payment Enrollment Form _ CDC 0.4433	**25**	**1**

The following attachments are for informational purposes only:

ATTACHMENT 1: Contract Clauses	**26**	**10**
ATTACHMENT 2: Contractor Performance Assessment Reporting System (CPARS)	**36**	**4**
ATTACHMENT 3: SAMPLE Statement ofWork (SOW)	**40**	**1**
ATTACHMENT 4: SAMPLE Cost Proposal Format	**41**	**1**

FORM 1: WHITE PAPER COVER PAGE and CHECKLIST

This document must accompany all white paper submissions.

52.230-1	COST ACCOUNTING STANDARDS NOTICES AND CERTIFICATION	14
The following provisions must be completed ONLY if the proposed contract type is FIRM FIXED PRICE		
52.203-2	Certificate of Independent Price Determination(APR 1985)	16
2.4 CONCURRENCE AND SIGNATURE		**17**

STATEMENTS, CERTIFICATIONS AND STATEMENT OF DISCLOSURE PREFERENCE AND UNDERSTANDING OF EVALUATION POLICY

CDC has a continuing interest in receiving and evaluating proposals containing new ideas, suggestions for researching ways to enhance the state-of-the-art in public health. However, Government personnel and contractors are constantly engaged in R&D activities, and the substance of your proposal may already be known to Government employees or contractors, or may even be in the public domain. For such reasons it is desirable, when receiving proposals for evaluation, to insure that the persons submitting them are aware of the conditions under which the CDC will consider them.

It must be understood that the receipt and evaluation of the proposal by CDC does not imply a promise to pay, recognition of novelty or originality, or any relationship, which might require the Government to pay for use of information to which it is otherwise lawfully entitled.

Due care will be exercised to ensure that, in addition to technical design or concept data submitted, administrative and cost data will not be used by the Government for any purpose other than evaluation of the proposal. Administrative and cost data will not be disclosed to non-Government participants. Additionally, such data will not be disclosed outside the Government or be duplicated, used or disclosed in whole or in part by the Government, except for tracking and record purposes or to evaluate the proposal. This restriction does not limit the Government's right to use information contained in such data if it is obtained from another source, or is in the public domain.

All research proposals will be treated as privileged information before award and contents will only be disclosed for purposes of evaluation. Your voluntary submission will be handled in accordance with established Government procedures for safeguarding such articles or information against unauthorized disclosure. All Government reviewers will be made aware that proposals sent to them are not to be duplicated, used, or disclosed in whole or in part for any purpose other than to evaluate the proposal, without the written permission of the offeror.

You should be aware that, despite all precautions, we may be able to protect the confidentiality of proposal only to the extent that it is exempt from disclosure under the Freedom of Information Act (see FAR Subpart 24.2). Upon receipt, your proposal will be submitted to the appropriate technical experts for evaluation. Your proposal will undergo initial review within one hundred and twenty (120) days after receipt. If additional time for this review is required, you will be notified in writing. Processing of proposals not declined as a result of the initial review may require as much as 180 days.

Having read and understood the above policy, please execute the following statements:

2.1 STATEMENT OF DISCLOSURE PREFERENCE

☐ This proposal includes data that shall not be disclosed outside the Government and shall not be duplicated, used, or disclosed -- in whole or in part -- for any purpose other than to evaluate this proposal. If, however, a contract is awarded to this offeror as a result of – or in connection with -- the submission of this data, the Government shall have the right to duplicate, use, or disclose the data to the extent provided in the resulting contract. This restriction does not limit the Government's right to use information contained in this data if it is obtained from another source without restriction.

- ☐ The data subject to this restriction are contained in sheets: _____
- ☐ All data contained in this proposal are subject to this restriction.

☐ Permission is hereby granted to CDC to evaluate this proposal, which may include evaluation by evaluators both within and outside the Government, with the understanding that written agreement not to disclose this information shall be obtained from any non-Government evaluator.

2.2 STATEMENT OF UNDERSTANDING OF EVALUATION POLICY

☐ It is understood that CDC has accepted the above proposal for the purpose of evaluating it and advising of any possible interest. It is further understood that such acceptance does not imply or create a promise to pay; an obligation to give up any legal right or to assume any duty; a recognition of novelty, originality or priority; or any relationship, contractual or otherwise, such as would render the Government liable to pay for or give up any legal right or assume any obligation for disclosure or use of any information in the proposal to which the Government would otherwise lawfully be entitled.

2.3 REPRESENTATIONS, CERTIFICATIONS AND OTHER STATEMENTS OF OFFERORS OR QUOTERS

The following FAR provisions must be completed by ALL offerors.

52.203-11 CERTIFICATION AND DISCLOSURE REGARDING PAYMENTS TO INFLUENCE CERTAIN FEDERAL TRANSACTIONS (SEP 2007)

(a) *Definitions.* As used in this provision—"Lobbying contact" has the meaning provided at 2 U.S.C. 1602(8). The terms "agency," "influencing or attempting to influence," "officer or employee of an agency," "person," "reasonable compensation," and "regularly employed" are defined in the FAR clause of this solicitation entitled "Limitation on Payments to Influence Certain Federal Transactions" (52.203-12).

(b) *Prohibition.* The prohibition and exceptions contained in the FAR clause of this solicitation entitled "Limitation on Payments to Influence Certain Federal Transactions" (52.203-12) are hereby incorporated by reference it his provision.

(c) *Certification.* The offeror, by signing its offer, hereby certifies to the best of its knowledge and belief that no Federal appropriated funds have been paid or will be paid to any person for influencing or attempting to influence an officer or employee of any agency, a Member of Congress, an officer or employee of Congress, or an employee of a Member of Congress on its behalf in connection with the awarding of this contract.

(d) *Disclosure.* If any registrants under the Lobbying Disclosure Act of 1995 have made a lobbying contact on behalf of the offeror with respect to this contract, the offeror shall complete and submit, with its offer, OMB Standard Form LLL, Disclosure of Lobbying Activities, to provide the name of the registrants. The offeror need not report regularly employed officers or employees of the offeror to whom payments of reasonable compensation were made.

(e) *Penalty.* Submission of this certification and disclosure is a prerequisite for making or entering into this contract imposed by 31 U.S.C. 1352. Any person who makes an expenditure prohibited under this provision or who fails to file or amend the disclosure required to be filed or amended by this provision, shall be subject to a civil penalty of not less than $10,000, and not more than $100,000, for each such failure.

(End of Provision)

52.204-3 TAXPAYER IDENTIFICATION (OCT 1998)

(a) Definitions.
Common parent, as used in this provision, means that corporate entity that owns or controls an affiliated group of corporations that files its Federal income tax returns on a consolidated basis, and of which the offeror is a member.
Taxpayer Identification Number (TIN), as used in this provision, means the number required by the Internal Revenue Service (IRS) to be used by the offeror in reporting income tax and other returns. The TIN may be either a Social Security Number or an Employer Identification Number.

(b) All offerors must submit the information required in paragraphs (d) through (f) of this provision to comply with debt collection requirements of 31 U.S.C.7701(c) and 3325(d), reporting requirements of 26 U.S.C.6041, 6041A, and 6050M, and implementing regulations issued by the IRS. If the resulting contract is subject to the payment reporting requirements described in Federal Acquisition Regulation (FAR) 4.904, the failure or refusal by the offeror to furnish the information may result in a 31 percent reduction of payments otherwise due under the contract.

(c) The TIN may be used by the Government to collect and report on any delinquent amounts arising out of the offeror's relationship with the Government (31 U.S.C.7701(c) (3)). If the resulting contract is subject to the payment reporting requirements described in FAR 4.904, the TIN provided hereunder may be matched with IRS records to verify the accuracy of the offeror' s TIN.

(d) Taxpayer Identification Number (TIN).

☐ TIN: _____ ☐ TIN has been applied for.

☐ TIN is not required because: _____

☐ Offeror is a nonresident alien, foreign corporation, or foreign partnership that does not have income effectively connected with the conduct of a trade or business in the United States and does not have an office or place of business or a fiscal paying agent in the United States;

☐ Offeror is an agency or instrumentality of a foreign government;

☐ Offeror is an agency or instrumentality of the Federal Government.

(e) Type of organization.

☐ Sole proprietorship ☐ Partnership ☐ Corporate entity (not tax-exempt)

☐ Corporate entity (tax-exempt) ☐ Government entity (Federal, State, or local)

☐ Foreign government ☐ International organization per 26 CFR 1.6049-4

☐ Other _____

(f) Common parent.

☐ Offeror is not owned or controlled by a common parent as defined in paragraph (a) of this provision.

☐ Name and TIN of common parent:

Name _____ TIN _____

{End of provision}

52.204-5 WOMEN-OWNED BUSINESS (OTHER THAN SMALL BUSINESS) (OCT 2014)

a) Definition. "Women-owned business concern," as used in this provision, means a concern that is at least 51 percent owned by one or more women; or in the case of any publicly owned business, at least 51 percent of its stock is owned by one or more women; and whose management and daily business operations are controlled by one or more women.

(b) Representation. [*Complete only if the offeror is a women-owned business concern and has not represented itself as a small business concern in paragraph (c)(1) of FAR 52.219-1, Small Business Program Representation, of this solicitation*.]

☐ The offeror represents that it is a women-owned business concern.

(End of Provision)

52.204-6 UNIQUE ENTITY IDENTIFER (OCT 2016)

(a) Definitions. As used in this provision—

"*Electronic Funds Transfer (EFT) indicator*" means a four-character suffix to the unique entity identifier. The suffix is assigned at the discretion of the commercial, nonprofit, or Government entity to establish additional System for Award Management records for identifying alternative EFT accounts (see subpart 32.11) for the same entity.

"*Unique entity identifier*" means a number or other identifier used to identify a specific commercial, nonprofit, or Government entity. See www.sam.gov for the designated entity for establishing unique entity identifiers.

(b) The Offeror shall enter, in the block with its name and address on the cover page of its offer, the annotation "Unique Entity Identifier" followed by the unique entity identifier that identifies the Offeror's name and address exactly as stated in the offer. The Offeror also shall enter its EFT indicator, if applicable.

(c) If the Offeror does not have a unique entity identifier, it should contact the entity designated at www.sam.gov for establishment of the unique entity identifier directly to obtain one. The Offeror should be prepared to provide the following information:

(1) Company legal business name.
(2) Tradestyle, doing business, or other name by which your entity is commonly recognized.
(3) Company physical street address, city, state and Zip Code.
(4) Company mailing address, city, state and Zip Code (if separate from physical).
(5) Company telephone number.
(6) Date the company was started.
(7) Number of employees at your location.
(8) Chief executive officer/key manager.
(9) Line of business (industry).
(10) Company headquarters name and address (reporting relationship within your entity).

(End of Provision)

52.204-24 REPRESENTATION REGARDING CERTAIN TELECOMMUNICATIONS AND VIDEO SURVEILLANCE SERVICES OR EQUIPMENT.

As prescribed in 4.2105(a), insert the following provision:

Representation Regarding Certain Telecommunications and Video Surveillance Services or Equipment (OCT 2020)

The Offeror shall not complete the representation at paragraph (d)(1) of this provision if the Offeror has represented that it "does not provide covered telecommunications equipment or services as a part of its offered products or services to the Government in the performance of any contract, subcontract, or other contractual instrument" in paragraph (c)(1) in the provision at 52.204-26, Covered Telecommunications Equipment or Services—Representation, or in paragraph (v)(2)(i) of the provision at 52.212-3, Offeror Representations and Certifications-Commercial Items. The Offeror shall not complete the representation in paragraph (d)(2) of this provision if the Offeror has represented that it "does not use covered telecommunications equipment or services, or any equipment, system, or service that uses covered telecommunications equipment or services" in paragraph (c)(2) of the provision at 52.204-26, or in paragraph (v)(2)(ii) of the provision at 52.212-3.

(a) **Definitions.** As used in this provision—Backhaul, covered telecommunications equipment or services, critical technology, interconnection arrangements, reasonable inquiry, roaming, and substantial or essential component have the meanings provided in the clause 52.204-25, Prohibition on Contracting for Certain Telecommunications and Video Surveillance Services or Equipment.

(b) **Prohibition**.
(1) Section 889(a)(1)(A) of the John S. McCain National Defense Authorization Act for Fiscal Year 2019 (Pub. L. 115-232) prohibits the head of an executive agency on or after August 13, 2019, from procuring or obtaining, or extending or renewing a contract to procure or obtain, any equipment, system, or service that uses covered telecommunications equipment or services as a substantial or essential component of any system, or as critical technology as part of any system. Nothing in the prohibition shall be construed to—
(i) Prohibit the head of an executive agency from procuring with an entity to provide a service that connects to the facilities of a third-party, such as backhaul, roaming, or interconnection arrangements; or
(ii) Cover telecommunications equipment that cannot route or redirect user data traffic or cannot permit visibility into any user data or packets that such equipment transmits or otherwise handles.

(2) Section 889(a)(1)(B) of the John S. McCain National Defense Authorization Act for Fiscal Year 2019 (Pub. L. 115-232) prohibits the head of an executive agency on or after August 13, 2020, from entering into a contract or extending or renewing a contract with an entity that uses any equipment, system, or service that uses covered telecommunications equipment or services as a substantial or essential component of any system, or as critical technology as part of any system. This prohibition applies to the use of covered telecommunications equipment or services, regardless of whether that use is in performance of work under a Federal contract. Nothing in the prohibition shall be construed to—
(i) Prohibit the head of an executive agency from procuring with an entity to provide a service that connects to the facilities of a third-party, such as backhaul, roaming, or interconnection arrangements; or
(ii) Cover telecommunications equipment that cannot route or redirect user data traffic or cannot permit visibility into any user data or packets that such equipment transmits or otherwise handles.

(c) **Procedures.** The Offeror shall review the list of excluded parties in the System for Award Management (SAM) (https://www.sam.gov) for entities excluded from receiving federal awards for "covered telecommunications equipment or services".

(d) **Representation.** The Offeror represents that—
(1) It ☐ will, ☐ will not provide covered telecommunications equipment or services to the Government in the performance of any contract, subcontract or other contractual instrument resulting from this solicitation. The Offeror shall provide the additional disclosure information required at paragraph (e)(1) of this section if the Offeror responds "will" in paragraph (d)(1) of this section; and

(2) After conducting a reasonable inquiry, for purposes of this representation, the Offeror represents that—
It ☐ does, ☐ does not use covered telecommunications equipment or services, or use any equipment, system, or service that uses covered telecommunications equipment or services. The Offeror shall provide the additional disclosure information required at paragraph (e)(2) of this section if the Offeror responds "does" in paragraph (d)(2) of this section.

(e) **Disclosures.**
(1) Disclosure for the representation in paragraph (d)(1) of this provision. If the Offeror has responded "will" in the representation in paragraph (d)(1) of this provision, the Offeror shall provide the following information as part of the offer:
(i) For covered equipment—
(A) The entity that produced the covered telecommunications equipment (include entity name, unique entity identifier, CAGE code, and whether the entity was the original equipment manufacturer (OEM) or a distributor, if known);
(B) A description of all covered telecommunications equipment offered (include brand; model number, such as OEM number, manufacturer part number, or wholesaler number; and item description, as applicable); and
(C) Explanation of the proposed use of covered telecommunications equipment and any factors relevant to determining if such use would be permissible under the prohibition in paragraph (b)(1) of this provision.

(ii) For covered services—
(A) If the service is related to item maintenance: A description of all covered telecommunications services offered (include on the item being maintained: Brand; model number, such as OEM number, manufacturer part number, or wholesaler number; and item description, as applicable); or
(B) If not associated with maintenance, the Product Service Code (PSC) of the service being provided; and explanation of the proposed use of covered telecommunications services and any factors relevant to determining if such use would be permissible under the prohibition in paragraph (b)(1) of this provision.

(2) Disclosure for the representation in paragraph (d)(2) of this provision. If the Offeror has responded "does" in the representation in paragraph (d)(2) of this provision, the Offeror shall provide the following information as part of the offer:
(i) For covered equipment—
(A) The entity that produced the covered telecommunications equipment (include entity name, unique entity identifier, CAGE code, and whether the entity was the OEM or a distributor, if known);
(B) A description of all covered telecommunications equipment offered (include brand; model number, such as OEM number, manufacturer part number, or wholesaler number; and item description, as applicable); and
(C) Explanation of the proposed use of covered telecommunications equipment and any factors relevant to determining if such use would be permissible under the prohibition in paragraph (b)(2) of this provision.

(ii) For covered services—
(A) If the service is related to item maintenance: A description of all covered telecommunications services offered (include on the item being maintained: Brand; model number, such as OEM number, manufacturer part number, or wholesaler number; and item description, as applicable); or
(B) If not associated with maintenance, the PSC of the service being provided; and explanation of the proposed use of covered telecommunications services and any factors relevant to determining if such use would be permissible under the prohibition in paragraph (b)(2) of this provision.

(End of provision)

52.204-25 PROHIBITION ON CONTRACTING FOR CERTAIN TELECOMMUNICATIONS AND VIDEO SURVEILLANCE SERVICES OR EQUIPMENT.

As prescribed in 4.2105(b), insert the following clause:

Prohibition on Contracting for Certain Telecommunications and Video Surveillance Services or Equipment (Aug 2020)

(a) **Definitions.** As used in this clause—

Backhaul means intermediate links between the core network, or backbone network, and the small subnetworks at the edge of the network (**e.g.**, connecting cell phones/towers to the core telephone network). Backhaul can be wireless (e.g., microwave) or wired (**e.g.**, fiber optic, coaxial cable, Ethernet).

Covered foreign country means The People's Republic of China.

Covered telecommunications equipment or services means–
(1) Telecommunications equipment produced by Huawei Technologies Company or ZTE Corporation (or any subsidiary or affiliate of such entities);
(2) For the purpose of public safety, security of Government facilities, physical security surveillance of critical infrastructure, and other national security purposes, video surveillance and telecommunications equipment produced by Hytera Communications Corporation, Hangzhou Hikvision Digital Technology Company, or Dahua Technology Company (or any subsidiary or affiliate of such entities);
(3) Telecommunications or video surveillance services provided by such entities or using such equipment; or
(4) Telecommunications or video surveillance equipment or services produced or provided by an entity that the Secretary of Defense, in consultation with the Director of National Intelligence or the Director of the Federal Bureau of Investigation, reasonably believes to be an entity owned or controlled by, or otherwise connected to, the government of a covered foreign country.

Critical technology means–
(1) Defense articles or defense services included on the United States Munitions List set forth in the International Traffic in Arms Regulations under subchapter M of chapter I of title 22, Code of Federal Regulations;
(2) Items included on the Commerce Control List set forth in Supplement No. 1 to part 774 of the Export Administration Regulations under subchapter C of chapter VII of title 15, Code of Federal Regulations, and controlled-
(i) Pursuant to multilateral regimes, including for reasons relating to national security, chemical and biological weapons proliferation, nuclear nonproliferation, or missile technology; or
(ii) For reasons relating to regional stability or surreptitious listening;
(3) Specially designed and prepared nuclear equipment, parts and components, materials, software, and technology covered by part 810 of title 10, Code of Federal Regulations (relating to assistance to foreign atomic energy activities);
(4) Nuclear facilities, equipment, and material covered by part 110 of title 10, Code of Federal Regulations (relating to export and import of nuclear equipment and material);
(5) Select agents and toxins covered by part 331 of title 7, Code of Federal Regulations, part 121 of title 9 of such Code, or part 73 of title 42 of such Code; or
(6) Emerging and foundational technologies controlled pursuant to section 1758 of the Export Control Reform Act of 2018 (50 U.S.C. 4817).

Interconnection arrangements means arrangements governing the physical connection of two or more networks to allow the use of another's network to hand off traffic where it is ultimately delivered (**e.g.**, connection of a customer of telephone provider A to a customer of telephone company B) or sharing data and other information resources.

Reasonable inquiry means an inquiry designed to uncover any information in the entity's possession about the identity of the producer or provider of covered telecommunications equipment or services used by the entity that excludes the need to include an internal or third-party audit.

Roaming means cellular communications services (**e.g.**, voice, video, data) received from a visited network when unable to connect to the facilities of the home network either because signal coverage is too weak or because traffic is too high.

Substantial or essential component means any component necessary for the proper function or performance of a piece of equipment, system, or service.

(b) **Prohibition**.

(1) Section 889(a)(1)(A) of the John S. McCain National Defense Authorization Act for Fiscal Year 2019 (Pub. L. 115-232) prohibits the head of an executive agency on or after August 13, 2019, from procuring or obtaining, or extending or renewing a contract to procure or obtain, any equipment, system, or service that uses covered telecommunications equipment or services as a substantial or essential component of any system, or as critical technology as part of any system. The Contractor is prohibited from providing to the Government any equipment, system, or service that uses covered telecommunications equipment or services as a substantial or essential component of any system, or as critical technology as part of any system, unless an exception at paragraph (c) of this clause applies or the covered telecommunication equipment or services are covered by a waiver described in FAR 4.2104.

(2) Section 889(a)(1)(B) of the John S. McCain National Defense Authorization Act for Fiscal Year 2019 (Pub. L. 115-232) prohibits the head of an executive agency on or after August 13, 2020, from entering into a contract, or extending or renewing a contract, with an entity that uses any equipment, system, or service that uses covered telecommunications equipment or services as a substantial or essential component of any system, or as critical technology as part of any system, unless an exception at paragraph (c) of this clause applies or the covered telecommunication equipment or services are covered by a waiver described in FAR 4.2104. This prohibition applies to the use of covered telecommunications equipment or services, regardless of whether that use is in performance of work under a Federal contract.

(c) **Exceptions.** This clause does not prohibit contractors from providing—

(1) A service that connects to the facilities of a third-party, such as backhaul, roaming, or interconnection arrangements; or

(2) Telecommunications equipment that cannot route or redirect user data traffic or permit visibility into any user data or packets that such equipment transmits or otherwise handles.

(d) **Reporting requirement.**

(1) In the event the Contractor identifies covered telecommunications equipment or services used as a substantial or essential component of any system, or as critical technology as part of any system, during contract performance, or the Contractor is notified of such by a subcontractor at any tier or by any other source, the Contractor shall report the information in paragraph (d)(2) of this clause to the Contracting Officer, unless elsewhere in this contract are established procedures for reporting the information; in the case of the Department of Defense, the Contractor shall report to the website at https://dibnet.dod.mil. For indefinite delivery contracts, the Contractor shall report to the Contracting Officer for the indefinite delivery contract and the Contracting Officer(s) for any affected order or, in the case of the Department of Defense, identify both the indefinite delivery contract and any affected orders in the report provided at https://dibnet.dod.mil.

(2) The Contractor shall report the following information pursuant to paragraph (d)(1) of this clause

(i) Within one business day from the date of such identification or notification: the contract number; the order number(s), if applicable; supplier name; supplier unique entity identifier (if known); supplier Commercial and Government Entity (CAGE) code (if known); brand; model number (original equipment manufacturer number, manufacturer part number, or wholesaler number); item description; and any readily available information about mitigation actions undertaken or recommended.

(ii) Within 10 business days of submitting the information in paragraph (d)(2)(i) of this clause: any further available information about mitigation actions undertaken or recommended. In addition, the Contractor shall describe the efforts it undertook to prevent use or submission of covered telecommunications equipment or services, and any additional efforts that will be incorporated to prevent future use or submission of covered telecommunications equipment or services.

(e) **Subcontracts.** The Contractor shall insert the substance of this clause, including this paragraph (e) and excluding paragraph (b)(2), in all subcontracts and other contractual instruments, including subcontracts for the acquisition of commercial items.

(End of clause)

52.209-5 CERTIFICATION REGARDING OTHER RESPONSIBILITY MATTERS

As prescribed in 9.104-7(a), insert the following provision:

Certification Regarding Responsibility Matters (Aug 2020)

(a)

(1) The Offeror certifies, to the best of its knowledge and belief, that—

(i) The Offeror and/or any of its Principals–

(A) Are ☐ are not ☐ presently debarred, suspended, proposed for debarment, or declared ineligible for the award of contracts by any Federal agency;

(B) Have ☐ have not ☐ within a three-year period preceding this offer, been convicted of or had a civil judgment rendered against them for: commission of fraud or a criminal offense in connection with obtaining, attempting to obtain, or performing a public (Federal, State, or local) contract or subcontract; violation of Federal or State antitrust statutes relating to the submission of offers; or commission of embezzlement, theft, forgery, bribery, falsification or destruction of records, making false statements, tax evasion, violating Federal criminal tax laws, or receiving stolen property (if offeror checks "have", the offeror shall also see 52.209-7, if included in this solicitation);

(C) Are ☐ are not ☐ presently indicted for, or otherwise criminally or civilly charged by a governmental entity with, commission of any of the offenses enumerated in paragraph (a)(1)(i)(B) of this provision;

(D) Have ☐ have not ☐ within a three-year period preceding this offer, been notified of any delinquent Federal taxes in an amount that exceeds the threshold at 9.104-5(a)(2) for which the liability remains unsatisfied.

(1) Federal taxes are considered delinquent if both of the following criteria apply:

(i) **The tax liability is finally determined**. The liability is finally determined if it has been assessed. A liability is not finally determined if there is a pending administrative or judicial challenge. In the case of a judicial challenge to the liability, the liability is not finally determined until all judicial appeal rights have been exhausted.

(ii) **The taxpayer is delinquent in making payment**. A taxpayer is delinquent if the taxpayer has failed to pay the tax liability when full payment was due and required. A taxpayer is not delinquent in cases where enforced collection action is precluded.

(2) **Examples**.

(i) The taxpayer has received a statutory notice of deficiency, under I.R.C. § 6212, which entitles the taxpayer to seek Tax Court review of a proposed tax deficiency. This is not a delinquent tax because it is not a final tax liability. Should the taxpayer seek Tax Court review, this will not be a final tax liability until the taxpayer has exercised all judicial appeal rights.

(ii) The IRS has filed a notice of Federal tax lien with respect to an assessed tax liability, and the taxpayer has been issued a notice under I.R.C. § 6320 entitling the taxpayer to request a hearing with the IRS Office of Appeals contesting the lien filing, and to further appeal to the Tax Court if the IRS determines to sustain the lien filing. In the course of the hearing, the taxpayer is entitled to contest the underlying tax liability because the taxpayer has had no prior opportunity to contest the liability. This is not a delinquent tax because it is not a final tax liability. Should the taxpayer seek tax court review, this will not be a final tax liability until the taxpayer has exercised all judicial appeal rights.

(iii) The taxpayer has entered into an installment agreement pursuant to I.R.C. § 6159. The taxpayer is making timely payments and is in full compliance with the agreement terms. The taxpayer is not delinquent because the taxpayer is not currently required to make full payment.

(iv) The taxpayer has filed for bankruptcy protection. The taxpayer is not delinquent because enforced collection action is stayed under 11 U.S.C. 362 (the Bankruptcy Code).

(ii) The Offeror has □ has not □, within a three-year period preceding this offer, had one or more contracts terminated for default by any Federal agency.

(2) "Principal," for the purposes of this certification, means an officer, director, owner, partner, or a person having primary management or supervisory responsibilities within a business entity (**e.g.**, general manager; plant manager; head of a division or business segment; and similar positions).

This Certification Concerns a Matter Within the Jurisdiction of an Agency of the United States and the Making of a False, Fictitious, or Fraudulent Certification May Render the Maker Subject to Prosecution Under Section 1001, Title 18, United States Code.

(b) The Offeror shall provide immediate written notice to the Contracting Officer if, at any time prior to contract award, the Offeror learns that its certification was erroneous when submitted or has become erroneous by reason of changed circumstances.

(c) A certification that any of the items in paragraph (a) of this provision exists will not necessarily result in withholding of an award under this solicitation. However, the certification will be considered in connection with a determination of the Offeror's responsibility. Failure of the Offeror to furnish a certification or provide such additional information as requested by the Contracting Officer may render the Offeror nonresponsible.

(d) Nothing contained in the foregoing shall be construed to require establishment of a system of records in order to render, in good faith, the certification required by paragraph (a) of this provision. The knowledge and information of an Offeror is not required to exceed that which is normally possessed by a prudent person in the ordinary course of business dealings.

(e) The certification in paragraph (a) of this provision is a material representation of fact upon which reliance was placed when making award. If it is later determined that the Offeror knowingly rendered an erroneous certification, in addition to other remedies available to the Government, the Contracting Officer may terminate the contract resulting from this solicitation for default.

(End of provision)

52.209-11 REPRESENTATION BY CORPORATIONS REGARDING DELINQUENT TAX LIABILITY OR A FELONY CONVICTION UNDER ANY FEDERAL LAW. (FEB 2016)

As prescribed in 9.104-7 (d), insert the following provision:

Representation by Corporations Regarding Delinquent Tax Liability or a Felony Conviction under any Federal Law (Feb 2016)

(a) As required by sections 744 and 745 of Division E of the Consolidated and Further Continuing Appropriations Act, 2015 (Pub. L. 113-235), and similar provisions, if contained in subsequent appropriations acts, the Government will not enter into a contract with any corporation that–
   (1) Has any unpaid Federal tax liability that has been assessed, for which all judicial and administrative remedies have been exhausted or have lapsed, and that is not being paid in a timely manner pursuant to an agreement with the authority responsible for collecting the tax liability, where the awarding agency is aware of the unpaid tax liability, unless an agency has considered suspension or debarment of the corporation and made a determination that suspension or debarment is not necessary to protect the interests of the Government; or
   (2) Was convicted of a felony criminal violation under any Federal law within the preceding 24 months, where the awarding agency is aware of the conviction, unless an agency has considered suspension or debarment of the corporation and made a determination that this action is not necessary to protect the interests of the Government.

(b) The Offeror represents that–

   (1) It is ☐ is not ☐ a corporation that has any unpaid Federal tax liability that has been assessed, for which all judicial and administrative remedies have been exhausted or have lapsed, and that is not being paid in a timely manner pursuant to an agreement with the authority responsible for collecting the tax liability; and
   (2) It is ☐ is not ☐ a corporation that was convicted of a felony criminal violation under a Federal law within the preceding 24 months.

(End of provision)

52.215-6 PLACE OF PERFORMANCE (OCT 1997)

(a) The offeror or respondent, in the performance of any contract resulting from this solicitation, ☐ intends, ☐ does not intend [check applicable block] to use one or more plants or facilities located at a different address from the address of the offeror or respondent as indicated in this proposal or response to request for information.

(b) If the offeror or respondent checks "intends" in paragraph (a) of this provision, it shall insert in the following spaces the required information:

Place of performance (Street address, City, County, State, Zip code)	Name and address of owner and operator of the plant or facility if other than offeror or quoter

(End of provision)

52.219-1 SMALL BUSINESS PROGRAM REPRESENTATIONS

As prescribed in 19.309(a)(1), insert the following provision:

Small Business Program Representations (Nov 2020)

(a) **Definitions**. As used in this provision- "Economically disadvantaged women-owned small business (EDWOSB) concern" means a small business concern that is at least 51 percent directly and unconditionally owned by, and the management and daily business operations of which are controlled by, one or more women who are citizens of the United States and who are economically disadvantaged in accordance with 13 CFR part 127. It automatically qualifies as a women-owned small business concern eligible under the WOSB Program.

Service-disabled veteran-owned small business concern-
(1) Means a small business concern-
(i) Not less than 51 percent of which is owned by one or more service-disabled veterans or, in the case of any publicly owned business, not less than 51 percent of the stock of which is owned by one or more service-disabled veterans; and
(ii) The management and daily business operations of which are controlled by one or more service-disabled veterans or, in the case of a service-disabled veteran with permanent and severe disability, the spouse or permanent caregiver of such veteran.
(2) "Service-disabled veteran" means a veteran, as defined in 38 U.S.C.101(2), with a disability that is service-connected, as defined in 38 U.S.C.101(16).

Small business concern—
(1) Means a concern, including its affiliates, that is independently owned and operated, not dominant in the field of operation in which it is bidding on Government contracts, and qualified as a small business under the criteria in 13 CFR part 121 and the size standard in paragraph (b) of this provision.
(2) Affiliates**,** as used in this definition, means business concerns, one of whom directly or indirectly controls or has the power to control the others, or a third party or parties control or have the power to control the others. In determining whether affiliation exists, consideration is given to all appropriate factors including common ownership, common management, and contractual relationships. SBA determines affiliation based on the factors set forth at 13 CFR 121.103.

Small disadvantaged business concern, consistent with 13 CFR 124.1002, means a small business concern under the size standard applicable to the acquisition, that-
(1) Is at least 51 percent unconditionally and directly owned (as defined at 13 CFR 124.105) by-
(i) One or more socially disadvantaged (as defined at 13 CFR 124.103) and economically disadvantaged (as defined at 13 CFR 124.104) individuals who are citizens of the United States, and
(ii) Each individual claiming economic disadvantage has a net worth not exceeding $750,000 after taking into account the applicable exclusions set forth at 13 CFR 124.104(c)(2); and
(2) The management and daily business operations of which are controlled (as defined at 13 CFR 124.106) by individuals who meet the criteria in paragraphs (1)(i) and (ii) of this definition.

"Veteran-owned small business concern" means a small business concern-
(1) Not less than 51 percent of which is owned by one or more veterans (as defined at 38 U.S.C.101(2)) or, in the case of any publicly owned business, not less than 51 percent of the stock of which is owned by one or more veterans; and
(2) The management and daily business operations of which are controlled by one or more veterans.

"Women-owned small business concern" means a small business concern-

(1) That is at least 51 percent owned by one or more women; or, in the case of any publicly owned business, at least 51 percent of the stock of which is owned by one or more women; and
(2) Whose management and daily business operations are controlled by one or more women.

"Women-owned small business (WOSB) concern eligible under the WOSB Program" (in accordance with 13 CFR part 127), means a small business concern that is at least 51 percent directly and unconditionally owned by, and the management and daily business operations of which are controlled by, one or more women who are citizens of the United States.

(b)
(1) The North American Industry Classification System (NAICS) code for this acquisition is– ***541715***.
(2) The small business size standard is ***1000***.
(3) The small business size standard for a concern which submits an offer in its own name, other than on a construction or service contract, but which proposes to furnish a product which it did not itself manufacture (i.e., nonmanufacturer), is 500 employees.

(c) Representations.
(1) The offeror represents as part of its offer that it □ is, □ is not a small business concern.

(2) [*Complete only if the offeror represented itself as a small business concern in paragraph (c)(1) of this provision.]*

The offeror represents that It ☐ is, ☐ is not, a small disadvantaged business concern as defined in 13 CFR 124.1002.

(3) [*Complete only if the offeror represented itself as a small business concern in paragraph (c)(1) of this provision.]*

The offeror represents as part of its offer that It ☐ is, ☐ is not a women-owned small business concern.

(4) Women-owned small business (WOSB) concern eligible under the WOSB Program. [*Complete only if the offeror represented itself as a women-owned small business concern in paragraph (c)(3) of this provision.]*

The offeror represents as part of its offer that-
(i) It ☐ is, ☐ is not a WOSB concern eligible under the WOSB Program, has provided all the required documents to the WOSB Repository, and no change in circumstances or adverse decisions have been issued that affects its eligibility; and

(ii) It ☐ is, ☐ is not a joint venture that complies with the requirements of 13 CFR part 127, and the representation in paragraph (c)(4)(i) of this provision is accurate for each WOSB concern eligible under the WOSB Program participating in the joint venture. [*The offeror shall enter the name or names of the WOSB concern eligible under the WOSB Program and other small businesses that are participating in the joint venture: _____.]* Each WOSB concern eligible under the WOSB Program participating in the joint venture shall submit a separate signed copy of the WOSB representation.

(5) Economically disadvantaged women-owned small business (EDWOSB) concern. [*Complete only if the offeror represented itself as a women-owned small business concern eligible under the WOSB Program in (c)(4) of this provision.*] The offeror represents as part of its offer that-
(i) It ☐ is, ☐ is not an EDWOSB concern eligible under the WOSB Program, has provided all the required documents to the WOSB Repository, and no change in circumstances or adverse decisions have been issued that affects its eligibility; and

(ii) It ☐ is, ☐ is not a joint venture that complies with the requirements of 13 CFR part 127, and the representation in paragraph (c)(5)(i) of this provision is accurate for each EDWOSB concern participating in the joint venture. [*The offeror shall enter the name or names of the EDWOSB concern and other small businesses that are participating in the joint venture: _____.]* Each EDWOSB concern participating in the joint venture shall submit a separate signed copy of the EDWOSB representation.

(6) [*Complete only if the offeror represented itself as a small business concern in paragraph (c)(1) of this provision.]*

The offeror represents as part of its offer that it It ☐ is, ☐ is not a veteran-owned small business concern.

(7) [*Complete only if the offeror represented itself as a veteran-owned small business concern in paragraph (c)(6) of this provision.]*

The offeror represents as part of its offer that It ☐ is, ☐ is not a service-disabled veteran-owned small business concern.

(8) [*Complete only if the offeror represented itself as a small business concern in paragraph (c)(1) of this provision.]*

The offeror represents, as part of its offer, that-

(i) It ☐ is, ☐ is not a HUBZone small business concern listed, on the date of this representation, on the List of Qualified HUBZone Small Business Concerns maintained by the Small Business Administration, and no material changes in ownership and control, principal office, or HUBZone employee percentage have occurred since it was certified in accordance with 13 CFR Part 126; and

(ii) It ☐ is, ☐ is not a HUBZone joint venture that complies with the requirements of 13 CFR Part 126, and the representation in paragraph (c)(8)(i) of this provision is accurate for each HUBZone small business concern participating in the HUBZone joint venture. [*The offeror shall enter the names of each of the HUBZone small business concerns participating in the HUBZone joint venture: _____.]* Each HUBZone small business concern participating in the HUBZone joint venture shall submit a separate signed copy of the HUBZone representation.

(d) Under 15 U.S.C.645(d), any person who misrepresents a firm's status as a business concern that is small, HUBZone small, small disadvantaged, service-disabled veteran-owned small, economically disadvantaged women-owned small, or women-owned small eligible under the WOSB Program in order to obtain a contract to be awarded under the preference programs established pursuant to section 8, 9, 15, 31, and 36 of the Small Business Act or any other provision of Federal law that specifically references section 8(d) for a definition of program eligibility, shall-

(1) Be punished by imposition of fine, imprisonment, or both;

(2) Be subject to administrative remedies, including suspension and debarment; and

(3) Be ineligible for participation in programs conducted under the authority of the Act.

(End of provision)

Alternate I (Sep 2015). As prescribed in **19.309**(a)(2), add the following paragraph (c)(9) to the basic provision:

(9) [*Complete if offeror represented itself as disadvantaged in paragraph (c)(2) of this provision.*] The offeror shall check the category in which its ownership falls:

☐ Black American ☐ Hispanic American

☐ Native American (American Indians, Eskimos, Aleuts, or Native Hawaiians)

☐ Asian-Pacific American (persons with origins from Burma, Thailand, Malaysia, Indonesia, Singapore, Brunei, Japan, China, Taiwan, Laos, Cambodia (Kampuchea), Vietnam, Korea, The Philippines, Republic of Palau, Republic of the Marshall Islands, Federated States of Micronesia, the Commonwealth of the Northern Mariana Islands, Guam, Samoa, Macao, Hong Kong, Fiji, Tonga, Kiribati, Tuvalu, or Nauru)

☐ Subcontinent Asian (Asian-Indian) American (persons with origins from India, Pakistan, Bangladesh, Sri Lanka, Bhutan, the Maldives Islands, or Nepal)

☐ Individual/concern, other than one of the preceding

52.222-22 PREVIOUS CONTRACTS AND COMPLIANCE REPORTS (FEB 1999)

The offeror represents that –

(a) It ☐ has, ☐ has not participated in a previous contract or subcontract subject to the Equal Opportunity clause of this solicitation;

(b) It ☐ has, ☐ has not filed all required compliance reports; and

(c) Representations indicating submission of required compliance reports, signed by proposed subcontractors, will be obtained before subcontract awards.16.

(End of provision)

52.222-25 AFFIRMATIVE ACTION COMPLIANCE (APR 1984)

The offeror represents that (a) it ☐ has developed and has on file, ☐ has not developed and does not have on file, at each establishment, affirmative action programs required by the rules and regulations of the Secretary of Labor (41 CFR 60-1 and 60-2), or (b) it ☐ has not previously had contracts subject to the written affirmative action programs requirement of the rules and regulations of the Secretary of Labor.

(End of provision)

52.226-2 HISTORICALLY BLACK COLLEGE OR UNIVERSITY AND MINORITY INSTITUTION REPRESENTATION (OCT 2014)

(a) *Definitions*. As used in this provision --

"Historically Black College or University" means an institution determined by the Secretary of Education to meet the requirements of 34 CFR 608.2.

"Minority Institution" means an institution of higher education meeting the requirements of Section 365(3) of the Higher Education Act of 1965 (20 U.S.C. 1067k, including a Hispanic-serving institution of higher education, as defined in Section 502(a) of the Act (20 U.S.C. 1101a).

(b) *Representation*. The offeror represents that it --

It ☐ is, ☐ is not a historically black college or university;

It ☐ is, ☐ is not a minority institution.

(End of Provision)

52.227-6 ROYALTY INFORMATION (APR 1984)

(a) *Cost or charges for royalties.* When the response to this solicitation contains costs or charges for royalties totaling more than $250, the following information shall be included in the response relating to each separate item of royalty or license fee:
(1) Name and address of licensor.
(2) Date of license agreement.
(3) Patent numbers, patent application serial numbers, or other basis on which the royalty is payable.
(4) Brief description, including any part or model numbers of each contract item or component on which the royalty is payable.
(5) Percentage or dollar rate of royalty per unit.
(6) Unit price of contract item.
(7) Number of units.
(8) Total dollar amount of royalties.

(b) *Copies of current licenses.* In addition, if specifically requested by the Contracting Officer before execution of the contract, the offeror shall furnish a copy of the current license agreement and an identification of applicable claims of specific patents.

(End of Provision)

52.230-1 COST ACCOUNTING STANDARDS NOTICES AND CERTIFICATION

As prescribed in 30.201-3 (a), insert the following provision:

Cost Accounting Standards Notices and Certification (Jun 2020)

Note: This notice does not apply to small businesses or foreign governments. This notice is in three parts, identified by Roman numerals I through III. Offerors shall examine each part and provide the requested information in order to determine Cost Accounting Standards (CAS) requirements applicable to any resultant contract.

If the offeror is an educational institution, Part II does not apply unless the contemplated contract will be subject to full or modified CAS coverage pursuant to 48 CFR 9903.201-2(c)(5) or 9903.201-2(c)(6), respectively.

I. Disclosure Statement-Cost Accounting Practices and Certification

(a) Any contract in excess of the lower CAS threshold specified in Federal Acquisition Regulation (FAR) 30.201-4(b) resulting from this solicitation will be subject to the requirements of the Cost Accounting Standards Board (48 CFR chapter 99), except for those contracts which are exempt as specified in 48 CFR 9903.201-1.

(b) Any offeror submitting a proposal which, if accepted, will result in a contract subject to the requirements of 48 CFR chapter 99must, as a condition of contracting, submit a Disclosure Statement as required by 48 CFR 9903.202. When required, the Disclosure Statement must be submitted as a part of the offeror's proposal under this solicitation unless the offeror has already submitted a Disclosure Statement disclosing the practices used in connection with the pricing of this proposal. If an applicable Disclosure Statement has already been submitted, the offeror may satisfy the requirement for submission by providing the information requested in paragraph (c) of Part I of this provision.

Caution: In the absence of specific regulations or agreement, a practice disclosed in a Disclosure Statement shall not, by virtue of such disclosure, be deemed to be a proper, approved, or agreed-to practice for pricing proposals or accumulating and reporting contract performance cost data.

(c) Check the appropriate box below:

(1) ☐ **Certificate of Concurrent Submission of Disclosure Statement**. The offeror hereby certifies that, as a part of the offer, copies of the Disclosure Statement have been submitted as follows:

(i) Original and one copy to the cognizant Administrative Contracting Officer (ACO) or cognizant Federal agency official authorized to act in that capacity (Federal official), as applicable; and

(ii) One copy to the cognizant Federal auditor.
(Disclosure must be on Form No. CASB DS-1 or CASB DS-2, as applicable. Forms may be obtained from the cognizant ACO or Federal official.)

Date of Disclosure Statement: _____

Name and Address of Cognizant ACO or Federal Official Where Filed:
_____

The offeror further certifies that the practices used in estimating costs in pricing this proposal are consistent with the cost accounting practices disclosed in the Disclosure Statement.

(2) ☐ **Certificate of Previously Submitted Disclosure Statement**. The offeror hereby certifies that the required Disclosure Statement was filed as follows:

Date of Disclosure Statement: _____

Name and Address of Cognizant ACO or Federal Official Where Filed:
_____

The offeror further certifies that the practices used in estimating costs in pricing this proposal are consistent with the cost accounting practices disclosed in the applicable Disclosure Statement.

(3) ☐ **Certificate of Monetary Exemption**. The offeror hereby certifies that the offeror, together with all divisions, subsidiaries, and affiliates under common control, did not receive net awards of negotiated prime contracts and subcontracts subject to CAS totaling $50 million or more in the cost accounting period immediately preceding the period in which this proposal was submitted. The offeror further certifies that if such status changes before an award resulting from this proposal, the offeror will advise the Contracting Officer immediately.

(4) ☐ **Certificate of Interim Exemption**. The offeror hereby certifies that (i) the offeror first exceeded the monetary exemption for disclosure, as defined in (3) of this subsection, in the cost accounting period immediately preceding the period in which this offer was submitted and (ii) in accordance with 48 CFR 9903.202-1, the offeror is not yet required to submit a Disclosure Statement. The offeror further certifies that if an award resulting from this proposal has not been made within 90 days after the end of that period, the offeror will immediately submit a revised certificate to the Contracting Officer, in the form specified under paragraph (c)(1) or (c)(2) of PartI of this provision, as appropriate, to verify submission of a completed Disclosure Statement.

Caution: Offerors currently required to disclose because they were awarded a CAS-covered prime contract or subcontract of $50 million or more in the current cost accounting period may not claim this exemption (4). Further, the exemption applies only in connection with proposals submitted before expiration of the 90-day period following the cost accounting period in which the monetary exemption was exceeded.

II. Cost Accounting Standards-Eligibility for Modified Contract Coverage

If the offeror is eligible to use the modified provisions of 48 CFR 9903.201-2(b) and elects to do so, the offeror shall indicate by checking the box below. Checking the box below shall mean that the resultant contract is subject to the Disclosure and Consistency of Cost Accounting Practices clause in lieu of the Cost Accounting Standards clause.

☐ The offeror hereby claims an exemption from the Cost Accounting Standards clause under the provisions of 48 CFR 9903.201-2(b) and certifies that the offeror is eligible for use of the Disclosure and Consistency of Cost Accounting Practices clause because during the cost accounting period immediately preceding the period in which this proposal was submitted, the offeror received less than $50 million in awards of CAS-covered prime contracts and subcontracts. The offeror further certifies that if such status changes before an award resulting from this proposal, the offeror will advise the Contracting Officer immediately.

Caution: An offeror may not claim the above eligibility for modified contract coverage if this proposal is expected to result in the award of a CAS-covered contract of $50 million or more or if, during its current cost accounting period, the offeror has been awarded a single CAS-covered prime contract or subcontract of $50 million or more.

III. Additional Cost Accounting Standards Applicable to Existing Contracts

The offeror shall indicate below whether award of the contemplated contract would, in accordance with paragraph (a)(3) of the Cost Accounting Standards clause, require a change in established cost accounting practices affecting existing contracts and subcontracts.

☐ Yes ☐ No

(End of provision)

A. The following FAR provision must be completed ONLY if the proposed contract type is Firm Fixed Price:

52.203-2 <u>CERTIFICATE OF INDEPENDENT PRICE DETERMINATION (APR 1985)</u>

(a) The offeror certifies that
  (1) The prices in this offer have been arrived at independently, without, for the purpose of restricting competition, any consultation, communication, or agreement with any other offeror or competitor relating to (i) those prices, (ii) the intention to submit an offer, or (iii) the methods or factors used to calculate the prices offered;
  (2) The prices in this offer have not been and will not be knowingly disclosed by the offeror, directly or indirectly, to any other offeror or competitor before bid opening (in the case of a sealed bid solicitation) or contract award (in the case of a negotiated solicitation) unless otherwise required by law; and
  (3) No attempt has been made or will be made by the offeror to induce any other concern to submit or not to submit an offer for the purpose of restricting competition.

(b) Each signature on the offer is considered to be a certification by the signatory that the signatory
  (1) Is the person in the offeror' s organization responsible for determining the prices being offered in this bid or proposal, and that the signatory has not participated and will not participate in any action contrary to subparagraphs (a)(1) through (a)(3) above; or

(2) (i) Has been authorized, in writing, to act as agent for the following principals in certifying that those principals have not participated, and will not participate in any action contrary to subparagraphs (a)(1) through (a)(3) above (*insert full name of person(s) in the offeror's organization responsible for determining the prices offered in this bid or proposal, and the title of his or her position in the offeror's organization*); (ii) As an authorized agent, does certify that the principals named in subdivision (b)(2)(i) above have not participated, and will not participate, in any action contrary to subparagraphs (a)(1) through (a)(3) above; and (iii) As an agent, has not personally participated, and will not participate, in any action contrary to subparagraphs (a) (1) through (a) (3) above.

(c) If the offeror deletes or modifies subparagraph (a) (2) above, the offeror must furnish with its offer a signed statement setting forth in detail the circumstances of the disclosure.

{End of provision}

2.4 CONCURRENCE AND SIGNATURE

By signing below, the offeror hereby certifies the information provided, including the offerors response(s) to the *STATEMENT OF DISCLOSURE PREFERENCE* under section 2.1, the *STATEMENT OF UNDERSTANDING OF EVALUATION POLICY* under section 2.2 and each of the *FAR PROVISIONS* under section 2.3.

FORM 4: CONTRACT CLEARANCE

Please check the box(es) below to assist CDC in determining clearance requirements for the proposed research. (check all that apply):

☐ The proposed research includes activities involving the use of hazardous materials or select agents.

☐ The proposed research includes activities involving the use of live vertebrate animals.

☐ The proposed research involves the collection or creation of data; purchase of data, information or samples; development of IT (including mobile apps) or IT solutions; and/or equipment that directly interface with IT or collects data.

COMMON CLEARANCES: The most common required clearance for procurement of services and supplies, as set forth in the Federal Acquisitions Regulations (FAR), Code of Federal Regulations (CFR) and Department of Health and Human Services (HHS) policies, are listed below.

1. **Human Subjects:** This clearance is required all service contracts and contracts for the procurement of data, information or samples (Reference HHSAR 370.301 and 45 CFR 46.103).

   The purpose of this clearance is to make sure that Center for Disease Control and Prevention is in compliance with the Department of Health and Human Services (HHS) policy. The policy is that the contracting officer shall not award a contract involving human subjects until the prospective contractor provides assurance that the activity will undergo initial and continuing review by an appropriate Institutional Review Board (IRB) in accordance with HHS regulations at 45 CFR 46.103. The contracting officer shall require a Federal-wide assurance (FWA), approved by the HHS Office for Human Research Protections (OHRP), of each contractor, subcontractor, or institution engaged in human subjects research in performance of a contract. OHRP administers the assurance covering all HHS-supported or HHS-conducted activities involving human subjects.

2. **Regulatory Compliance for proposals involving vertebrate animals:** Animal use conducted under this contract shall be in compliance with the Public Health Service (PHS) Policy on Humane Care and Use of Laboratory Animals, the current edition of the "Guide for the Care and Use of Laboratory Animals (the Guide), the Animal Welfare Act and Regulations (Title 9 Code of Federal Regulations part 1), and all applicable local, state, or other federal regulations.

   The Offeror and any subcontractors shall have an approved, current Animal Welfare Assurance on file with the Office of Laboratory Animal Welfare (OLAW), at the time of contract award.

   Accreditation of the Offeror and any subcontractors by the Association for the Assessment and Accreditation of Laboratory Animal Care International (AAALAC) is preferred.

   If animal species regulated by the United States Department of Agriculture (USDA) are involved in a contract, the Offeror and any subcontractors shall be registered with the Secretary of Agriculture of the United States in accordance with the following Federal regulations 7 U.S.C 2136 and 9 CFR sections 2.25-2.28 respectively.

   The Offeror and/or subcontractors must address the following items in their submitted proposal as required by the Public Health Service Policy on Humane Care and Use of Laboratory Animals (section IV.D.1.):
   a. identification of the species and approximate number of animals to be used;
   b. rationale for involving animals, and for the appropriateness of the species and numbers used;
   c. a complete description of the proposed use of the animals;
   d. a description of procedures designed to assure that discomfort and injury to animals will be limited to that which is unavoidable in the conduct of scientifically valuable research, and that analgesic, anesthetic, and tranquilizing drugs will be used where indicated and appropriate to minimize discomfort and pain to animals; and
   e. a description of any euthanasia method to be used.

3. **Paperwork Reduction**: This clearance is required for all service contracts and contracts for the procurement of data, information or samples (Reference HHSAR 352.211-3 and 5 CFR 1320).

   The purpose of this clearance is to ensure that the Center for Disease Control and Prevention (CDC) is in compliance with the Paperwork Reduction Act of 1995. In addition, it helps determines the applicability for proposed projects.

4. **Section 508**: This clearance is required for all information, communication and technology (ICT) contracts. (Reference HHSAR 339.2) In compliance with the Department of Health and Human Services (HHS) policy. (a) Electronic and information technology (EIT) supplies and services must comply with Section 508 of the Rehabilitation Act (the Act) of 1973 (29 U.S.C. 794d), as amended by the Workforce Investment Act of 1998, and the Architectural and Transportation Barriers Compliance Board (Access Board) Electronic and Information Accessibility Standards (36 CFR part 1194). Requiring activities must consult with their Section 508 Official or designee to determine if the contractor should be responsible for compliance with EIT accessibility standards which apply to website content and communications material.
   (1) When conducting a procurement and employing the best value continuum, the solicitation shall include a separate technical evaluation factor developed by the contracting officer, requiring activity, and the Operating Division (OPDIV) Section 508 Official or designee.
   (2) At a minimum, solicitations for supplies and services shall require the submission of a Section 508 Product Assessment Template (See http://www.hhs.gov/web/508 for the template). Solicitations for services shall include any other pertinent information that the contracting officer deems necessary to evaluate the offeror's ability to meet the applicable Section 508 accessibility standards.

5. **Information Security and Privacy:** This clearance is required for all contracts (Reference FAR 39.101(d)) The purpose of this clearance is to determine if the acquisition requires information security, involves personal identifiable information, and is subject to the privacy act.

6. **Safety and Health:** This clearance is required for all contracts that involve hazardous materials or hazardous operations, including services or products; research, development or test projects; transportation of hazardous materials; and construction. (Reference FAR 36.513 and 52.236-13)

FORM 5: PAST /PRESENT PERFORMANCE REFERENCE INSTRUCTIONS

Reference Information Table: OFFEROR should complete the Reference Information Table BEFORE sending this questionnaire to the customers to ensure the accuracy of the information being provided. Send the completed Reference Information Table and blank questionnaire to each customer with a cover letter that 1) authorizes the selected customers to discuss the offeror' s performance under the applicable contract with the contracting officer; 2) requests the customer complete the questionnaire; and 3) instructs the customer to return the completed questionnaire by email to: oadsbaaprojects@cdc.gov. Submit a copy of the customer's cover letter with your business proposal to ensure receipt of questionnaires' responses.

Past /Present Performance Questionnaire: Customer /reference responses will be rated using the following scale:

Rating	**Rating Code**	**Description**
Unsatisfactory	P/U	Does not meet minimum acceptable standards in one or more areas; remedial action required in one or more areas; deficiencies in one or more areas which adversely affect overall performance.
Satisfactory	S	Meets or slightly exceeds minimum acceptable standards; adequate results; reportable deficiencies with identifiable, but not substantial, effects on overall performance.
Good	G	Effective performance; fully responsive to contract requirements; reportable deficiencies, but with little identifiable effect on overall performance.
Very Good	VG	Very effective performance; fully responsive to contract requirements; contract requirements accomplished in a timely, efficient, and economical manner for the most part; only minor deficiencies with minimal effect on overall performance.
Excellent	E	Of exceptional merit; exemplary performance in a timely, efficient, and economical manner; very minor (if any) deficiencies with no adverse effect on overall performance.
Neutral	N	No record of relevant past performance or past performance information is not available

Reference Information Table (to be completed by the Offeror): Send the completed Table and blank questionnaire to each customer with a cover letter that 1) authorizes the selected customers to discuss the offeror's performance under the applicable contract with the contracting officer; 2) requests the customer complete the questionnaire; and 3) instructs the customer to return the completed questionnaire by email to: oadsbaaprojects@cdc.gov

ATTACHMENT 1: CONTRACT CLAUSES

Section H- Special Requirement Clauses

H.1 PUBLIC ACCESS TO ARCHIVED PUBLICATIONS RESULTING FROM CDC FUNDED RESEARCH (Nov 2018)

All CDC-funded investigators shall submit to the National Institutes of Health Manuscript Submission System the electronic version of the author's final manuscript, upon acceptance for publication, of any peer-reviewed scientific publications resulting from research supported in whole or in part with Federal funds from the Department of Health and Human Services, Centers for Disease Control and Prevention. CDC defines the author's final manuscript as the final version accepted for journal publication, and includes all modifications from the publishing peer review process. The CDC Stacks and National Library of Medicine's (NLM) PubMed Central (PMC) archives will preserve permanently these manuscripts for use by the public, health care providers, educators, scientists, and CDC.

H.2 Certificates of Confidentiality (Nov 2018)
Section 301(d) of the Public Health Service (PHS) Act, as amended by Section 2012 of the 21st Century Cures Act, P.L. 114-255 (42 U.S.C. 241(d)), states that the Secretary shall issue Certificates of Confidentiality (Certificates) to persons engaged in biomedical, behavioral, clinical, or other research activities in which identifiable, sensitive information is collected. Consistent with the statute, research commenced or ongoing after December 13, 2016 and in which identifiable, sensitive information is collected, as defined by Section 301(d), is deemed issued a Certificate.

Consistent with the statute, CDC considers research in which identifiable, sensitive information is collected or used, to include:

- Human subjects research as defined in the Federal Policy for the Protection of Human Subjects (45 CFR Part 46), including exempt research except for human subjects research that is determined to be exempt from all or some of the requirements of 45 CFR 46 if the information obtained is recorded in such a manner that human subjects cannot be identified or the identity of the human subjects cannot readily be ascertained, directly or through identifiers linked to the subjects;
- Research involving the collection or use of biospecimens that are identifiable to an individual or for which there is at least a very small risk that some combination of the biospecimen, a request for the biospecimen, and other available data sources could be used to deduce the identity of an individual;
- Research that involves the generation of individual level, human genomic data from biospecimens, or the use of such data, regardless of whether the data is recorded in such a manner that human subjects can be identified or the identity of the human subjects can readily be ascertained as defined in the Federal Policy for the Protection of Human Subjects (45 CFR Part 46); or
- Any other research that involves information about an individual for which there is at least a very small risk, as determined by current scientific practices or statistical methods, that some combination of the information, a request for the information, and other available data sources could be used to deduce the identity of an individual, as defined in subsection 301(d) of the Public Health Service Act.

For research covered by a Certificate and consistent with the statute, Contractor shall not:

- Disclose or provide, in any Federal, State, or local civil, criminal, administrative, legislative, or other proceeding, the name of such individual or any such information, document, or biospecimen that contains identifiable, sensitive information about the individual and that was created or compiled for purposes of the research, unless such disclosure or use is made with the consent of the individual to whom the information, document, or biospecimen pertains; or
- Disclose or provide to any other person not connected with the research the name of such an individual or any information, document, or biospecimen that contains identifiable, sensitive information about such an individual and that was created or compiled for purposes of the research.

Consistent with the statute, disclosure is permitted only in the below circumstances:

- Required by Federal, State, or local laws (e.g., as required by the Federal Food, Drug, and Cosmetic Act, or state laws requiring the reporting of communicable diseases to State and local health departments), excluding instances of disclosure in any Federal, State, or local civil, criminal, administrative, legislative, or other proceeding;
- Necessary for the medical treatment of the individual to whom the information, document, or biospecimen pertains and made with the consent of such individual;
- Made with the consent of the individual to whom the information, document, or biospecimen pertains; or

- Made for the purposes of other scientific research that is in compliance with applicable Federal regulations governing the protection of human subjects in research.

Contractor shall keep records of when such disclosures are made and, upon request by CDC, shall make such information available to CDC.

Contractor shall comply with FAR Part 31, Contract Cost Principles and Procedures, as applicable, and maintain effective internal controls that provide reasonable assurance that the contract is managed in compliance with Federal statutes and regulations. Contractors conducting research covered by a Certificate shall ensure that any company/institution/individual not funded by CDC who receives a copy of identifiable, sensitive information protected by a Certificate is aware of the requirements of subsection 301(d) of the Public Health Service Act with respect to such information. The Contractor will secure an agreement with such company/institution/individual to ensure compliance with the requirements of the Certificate. In addition, Contractor shall ensure that all its employees and subcontractor employees working on this contract are informed of the substance of the abovementioned requirements and agree to comply with subsection 301(d) of the Public Health Service Act.

H.3 PUBLIC ACCESS TO CDC FUNDED DIGITAL PUBLIC HEALTH DATA (Nov 2018)
Public Health Data

Definition: Public Health data means digitally recorded factual material commonly accepted in the scientific community as a basis for public health findings, conclusions, and implementation

When CDC is funding, in whole or in part, via a contract as defined in FAR 2.101, with respect to public health data, a CDC-approved Data Management Plan (DMP) – a plan for digital data management, sharing, and preservation is required prior to commencing any related services or work. For contracts where public health data collection or generation activities may become necessary during the period of performance (e.g. via contract modification), a DMP will be required to be submitted and evaluated during the period of performance. The DMP is a deliverable and a living document that should be updated throughout the life cycle of data. A final DMP is required at the end of the contract performance that shows where the data are deposited and how they are being made accessible or justification provided for not doing so.

Data Management Plan
A DMP for each collection and/or generation of public health data should include the following information:

- A description of the public health data to be collected or generated in the contract period of performance;
- Standards to be used for the collected or generated public health data;
- Mechanisms for or limitations to providing access to and sharing of the data (include a description of provisions for the protection of privacy, confidentiality, security, intellectual property, or other rights) or justification for why data cannot be made accessible. This section should address access to identifiable and de-identified data (see below for additional information about access);
- Statement of the use of data standards that ensure all released data have appropriate documentation that describes the method of collection, what the data represent, and potential limitations for use; and
- Plans for archiving and long-term preservation of the data, or explanation of why long-term preservation and access are not justified. This section should address archiving and preservation of identifiable and de-identified data (see below for additional information regarding archiving).

  Examples of Data Management Plan Templates and Tools:
  University of California: https://www.cdlib.org/services/uc3/dmpt.html
  USGS: http://www.usgs.gov/datamanagement/plan/dmplans.php

Access to and Archiving of the Data
To the extent that is feasible, contractors should make public health data accessible. Rights in Data clauses (FAR 52.227-14 Rights in Data – General, 52.227-16, Additional Data Requirements, FAR 52.227-17 Rights in Data – Special Works, or FAR 52.227-18 Rights in Data-Existing Works), may be applicable and incorporated into contracts, depending on the Statement of Work involved. The data rights clauses give the government "unlimited rights" in data first produced (when funded by government solely) in the performance of a contract. "Unlimited rights" is an unlimited license to use, disclose or reproduce the data; it does not give the government ownership of the data. Unlimited rights in data would allow the government to archive and make public non-proprietary data first produced in contract performance.

Contracts that do not include terms for submittal of public health data to CDC, are expected to plan and prepare for providing access to, and archiving/long-term preservation of, collected and/or generated data within the contract period of performance, as set forth below. The final version of a collected and/or generated data set intended for release or sharing should be made available within thirty (30) months after the end of the data collection or generation, except surveillance data, which should be made accessible within a year of the end of a collection cycle. For public use de-identified (removal of sensitive identifiable or potentially identifiable information) datasets, an accompanying data dictionary, and other documentation relevant to use of the data set should be deposited in a sustainable repository to provide access to the data. Data that cannot be de-identified can be provided as restricted data upon request under a data-use agreement or onsite controlled use.

For data underlying a scientific publication, the contractor shall make the data available coincident with publication of the paper, at a minimum a machine-readable version of the data tables shown in the paper, unless the data set is already available via a release or sharing mechanism. In addition, contractors should ensure the quality of data they make accessible and seek to provide the data in a machine readable and nonproprietary format. Contractors who fail to release public health data in a timely fashion may be subject to procedures normally used to address failure to comply with the terms and conditions of the contract and may be grounds for the Contracting Officer to terminate the contract for default. Irrespective of whether the data are made accessible or not, Public health data of value should be preserved long-term.

A final DMP is required at the end of the contract performance. The final DMP will indicate the location of the deposited data and the manner of access granted to the data. There needs to be an adequate justification for not making data accessible and this justification must be documented in the DMP and approved by the Contracting Officer's Representative.

Additional information is available at https://www.hhs.gov/open/publicaccess/index.html

Section I Clauses

CLAUSES INCORPORATED BY REFERENCE FAR 52.252-2 (FEB 1998): This contract incorporates one or more clauses by reference, with the same force and effect as if they were given in full text. Upon request, the Contracting Officer will make their full text available. The full text of a clause may be accessed electronically at http://farsite.hill.af.mil/

The following clauses pertain to ALL contract types

NUMBER	TITLE	DATE
52.202-1	Definitions	NOV 2013
52.203-3	Gratuities	APR 1984
52.203-5	Covenant Against Contingent Fees	MAY 2014
52.203-6	Restrictions on Subcontractor Sales to the Government	SEP 2006
52.203-7	Anti-Kickback Procedures	MAY 2014
52.203-8	Cancellation, Rescission, and Recovery of Funds for Illegal or Improper Activity	MAY 2014
52.203-10	Price or Fee Adjustment for Illegal or Improper Activity	MAY 2014
52.203-12	Limitation on Payments to Influence Certain Federal Transactions	OCT 2010
52.203-13	Contractor Code of Business Ethics and Conduct	OCT 2015
52.203-14	Display of Hotline Poster(s)	OCT 2015
52.203-15	Whistleblower Protections Under the American Recovery and Reinvestment Act of 2009	JUN 2010
52.203-16	Preventing Personal Conflicts of Interest	DEC 2011
52.203-17	Contractor Employee Whistleblower Rights and Requirement to Inform Employees of Whistleblower Rights	APR 2014
52.204-2	Security Requirements	AUG 1996
52.204-4	Printed or Copied Double-Sided on Recycled Paper	MAY 2011
52.204-7	System for Award Management	JUL 2013
52.204-9	Personal Identity Verification of Contractor Personnel	JAN 2011
52.204-19	Incorporation by Reference of Representations and Certifications	DEC 2014
52.204-10	Reporting Executive Compensation and First-Tier Subcontract Awards	OCT 2015

52.204-13	System for Award Management Maintenance	JUL 2013
52.209-6	Protecting the Government's Interest When Subcontracting with Contractors Debarred, Suspended, or Proposed for Debarment	OCT 2015
52.209-10	Prohibition on Contracting with Inverted Domestic Corporation	NOV 2015
52.210-1	Market Research	APR 2011
52.211-11	Liquidated Damages – Supplies, Services, or Research and Development	SEP 2000
52.215-2	Audit and Records – Negotiation	OCT 2010
52.215-8	Order of Precedence – Uniform Contract Format	OCT 1997
52.215-11	Price Reduction for Defective Cost or Pricing Data – Modifications	AUG 2011
52.215-13	Subcontractor Cost or Pricing Data – Modifications	OCT 2010
52.215-14	Integrity of Unit Prices	OCT 2010
52.215-21	Requirements for Cost or Pricing Data or Information Other Than Cost or Pricing Data – Modifications – Alternate IV	OCT 2010
52.215-22	Limitations on Pass-Through Charges—Identification of Subcontract Effort	OCT 2009
52.215-23	Limitations on Pass-Through Charges	OCT 2009
52.217-8	Option to Extend Services	NOV 1999
52.219-1	Small Business Program Representations	OCT 2014
52.219-8	Utilization of Small Business Concerns	OCT 2014
52.219-9	Small Business Subcontracting Plan	JAN 2017
52.219-16	Liquidated Damages – Subcontracting Plan	JAN 1999
52,219-28	Post Award Small Business Program Representation	JUL 2013
52.222-3	Convict Labor	JUN 2003
52.222-21	Prohibition of Segregated Facilities	APR 2015
52.222-26	Equal Opportunity	APR 2015
52.222-35	Equal Opportunity for Veterans	OCT 2015
52.222-36	Affirmative Action for Workers with Disabilities	JUL 2014
52.222-37	Employment Reports Veterans	FEB 2016
52.222-38	Compliance with Veterans' Employment Reporting Requirements	FEB 2016
52.222-40	Notification of Employee Rights Under the National Labor Relations Act	DEC 2010
52.222-50	Combating Trafficking in Persons	MAR 2015
52.222-54	Employment Eligibility Verification	OCT 2015
52.223-6	Drug-Free Workplace	MAY 2001
52.223-18	Encouraging Contractor Policies to Ban Text Messaging While Driving	AUG 2011
52.224-1	Privacy Act Notification	APR 1984
52.224-2	Privacy Act	APR 1984
52.225-13	Restrictions on Certain Foreign Purchases	JUN 2008
52.225-25	Prohibition on Contracting with Entities in Certain Activities or Transactions Relating to Iran – Representations and Certifications	Oct 2015
52.226-1	Utilization of Indian Organizations and Indian-Owned Economic Enterprises	JUN 2000
52.227-1	Authorization and Consent – Alternate I	APR 1984
52.227-2	Notice and Assistance Regarding Patent and Copyright Infringement	DEC 2007
52.227-11	Patent Rights-Ownership by The Contractor	MAY 2014
52.227-14	Rights in Data – General	MAY 2014
52.227-14	Rights in Data – General *Alternative IV*	DEC 2007
52.227-17	Rights in Data – Special Works	DEC 2007
52.232-17	Interest	MAY 2014
52.232-18	Availability of Funds	APR 1984
52.232-19	Availability of Funds for the Next Fiscal Year	APR 1984
52.232-23	Assignment of Claims	MAY 2014
52.232-25	Prompt payment	JUL 2013

52.232-33	Payment by Electronic Funds Transfer – System for Award Management	JUL 2013
52.232-39	Unenforceability of Unauthorized Obligations	JUN 2013
52.232-40	Providing Accelerated Payments to Small Business Subcontractors	DEC 2013
52.233-1	Disputes	MAY 2014
52.233-2	Service of Protest	SEP 2006
52.233-3	Protest after Award	AUG 1996
52.233-4	Applicable Law for Breach of Contract Claim	OCT 2004
52.239-1	Privacy or Security Safeguards	AUG 1996
52.242-1	Notice of Intent to Disallow Costs	APR 1984
52.242-13	Bankruptcy	JUL 1995
52.243-7	Notification of Changes	APR 1984
52.244-2	Subcontracts	OCT 2010
52.244-5	Competition in Subcontracting	DEC 1996
52.244-6	Subcontracts for Commercial Items	JUN 2016
52.246-25	Limitation of Liability - Services	FEB 1997
52.249-5	Termination For Convenience of the Government (Educational & Other Nonprofit Institutions	AUG 2016
52.252-4	Alterations in Contract	APR 1984
52.253-1	Computer Generated Forms	JAN 1991

The following clauses pertain to FIRM-FIXED PRICE Contracts only (as applicable):

NUMBER	TITLE	DATE
52.203-6	Restrictions on Subcontractor Sales to the Government	SEP 2006
52.228-5	Insurance - Work on a Government Installation	JAN 1997
52.229-3	Federal, State, and Local Taxes	FEB 2013
52.230-3	Disclosure and Consistency of Cost Accounting Practices	OCT 2015
52.230-6	Administration of Cost Accounting Standards	JUN 2010
52.232-1	Payments	APR 1984
52.232-8	Discount for Prompt Payment	FEB 2002
52.232-11	Extras	APR 1984
52.232-28	Invitation to Propose Performance-Based Payments	MAR 2000
52.232-32	Performance-Based Payments	APR 2012
52.233-3	Protest after Award	AUG 1996
52.243-1	Changes - Fixed-Price – Alternate V	AUG 1984
52.249-9	Default (Research and Development)	APR 1984

The following clauses pertain to COST-REIMBURSABLE Contracts only (as applicable):

NUMBER	TITLE	DATE
52.216-7	Allowable Cost and Payment	AUG 2018
52.233-3	Protest after Award	AUG 1996
52.242-3	Penalties for Unallowable Costs	MAY 2014
52.242-4	Certification of Final Indirect Costs	JAN 1997
52.243-2	Changes—Cost Reimbursement.	AUG 1987
52.249-6	Termination (Cost Reimbursement)	MAY 2004
52.249-14	Excusable Delays	APR 1984

DEPARTMENT OF HEALTH AND HUMAN SERVICES ACQUISITION REGULATIONS (HHSAR)

NUMBER	TITLE	DATE
352.211-2	Conference Sponsorship Requests and Conference Materials Disclaimer	DEC 2015
352.215-70	Late Proposals and Revisions	DEC 2015
352.216-70	Additional Cost Principles	DEC 2015
352.223-70	Safety and Health	DEC 2015
352.232-70	Incremental Funding	DEC 2015
352.233-71	Litigation and Claims	DEC 2015
352.239-73	Electronic and Information Technology Accessibility	DEC 2015

Section K Clauses

K.1 52.252-1 Solicitation Provisions Incorporated by Reference (Feb 1998): This solicitation incorporates one or more solicitation provisions by reference, with the same force and effect as if they were given in full text. Upon request, the Contracting Officer will make their full text available. The offeror is cautioned that the listed provisions may include blocks that must be completed by the offeror and submitted with its quotation or offer. In lieu of submitting the full text of those provisions, the offeror may identify the provision by paragraph identifier and provide the appropriate information with its quotation or offer. The full text of a solicitation provision may be accessed electronically at http://www.acquisition.gov and http://farsite.hill.af.mil

(End of Provision)

FAR SOURCE	TITLE AND DATE
52.204-17	Ownership or Control of Offeror (Nov 2014)
52.204-19	Incorporation by Reference of Representations and Certifications (Dec 2014)

K.2 FAR 52.204-8 Annual Representations and Certifications (MAR 2020)

(a)

(1) The North American Industry classification System (NAICS) code for this acquisition is **541715**.
(2) The small business size standard is **1000**.
(3) The small business size standard for a concern which submits an offer in its own name, other than on a construction or service contract, but which proposes to furnish a product which it did not itself manufacture, is 500 employees.

(b)

(1) If the provision at 52.204-7, System for Award Management, is included in this solicitation, paragraph (d) of this provision applies.
(2) If the provision at 52.204-7, System for Award Management, is not included in this solicitation, and the Offeror has an active registration in the System for Award Management (SAM), the Offeror may choose to use paragraph (d) of this provision instead of completing the corresponding individual representations and certifications in the solicitation. The Offeror shall indicate which option applies by checking one of the following boxes:

☐ (i) Paragraph (d) applies.

☐ (ii) Paragraph (d) does not apply and the offeror has completed the individual representations and certifications in the solicitation.

(c)

(1) The following representations or certifications in SAM are applicable to this solicitation as indicated:
(i) 52.203-2, Certificate of Independent Price Determination. This provision applies to solicitations when a firm-fixed-price contract or fixed-price contract with economic price adjustment is contemplated, unless—
(A) The acquisition is to be made under the simplified acquisition procedures in Part 13;
(B) The solicitation is a request for technical proposals under two-step sealed bidding procedures; or
(C) The solicitation is for utility services for which rates are set by law or regulation.
(ii) 52.203-11, Certification and Disclosure Regarding Payments to Influence Certain Federal Transactions. This provision applies to solicitations expected to exceed $150,000.
(iii) 52.203-18, Prohibition on Contracting with Entities that Require Certain Internal Confidentiality Agreements or Statements—Representation. This provision applies to all solicitations.
(iv) 52.204-3, Taxpayer Identification. This provision applies to solicitations that do not include the provision at 52.204-7, System for Award Management.
(v) 52.204-5, Women-Owned Business (Other Than Small Business). This provision applies to solicitations that—
(A) Are not set aside for small business concerns;
(B) Exceed the simplified acquisition threshold; and
(C) Are for contracts that will be performed in the United States or its outlying areas.
(vi) 52.204-6, Covered Telecommunications Equipment or Services-Representation. This provision applies to all solicitations.
(vii) 52.209-2, Prohibition on Contracting with Inverted Domestic Corporations—Representation.
(viii) 52.209-5; Certification Regarding Responsibility Matters. This provision applies to solicitations where the contract value is expected to exceed the simplified acquisition threshold.

(ix) 52.209-11, Representation by Corporations Regarding Delinquent Tax Liability or a Felony Conviction under any Federal Law. This provision applies to all solicitations.
(x) 52.214-14, Place of Performance--Sealed Bidding. This provision applies to invitations for bids except those in which the place of performance is specified by the Government.
(xi) 52.215-6, Place of Performance. This provision applies to solicitations unless the place of performance is specified by the Government.
(xii) 52.219-1, Small Business Program Representations (Basic & Alternate I). This provision applies to solicitations when the contract will be performed in the United States or its outlying areas.
(A) The basic provision applies when the solicitations are issued by other than DoD, NASA, and the Coast Guard.
(B) The provision with its Alternate I applies to solicitations issued by DoD, NASA, or the Coast Guard.
(C) The provision with its Alternate II applies to solicitations that will result in a multiple-award contract with more than one NAICS code assigned.
(xiii) 52.219-2, Equal Low Bids. This provision applies to solicitations when contracting by sealed bidding and the contract will be performed in the United States or its outlying areas.
(xiv) 52.222-22, Previous Contracts and Compliance Reports. This provision applies to solicitations that include the clause at 52.222-26, Equal Opportunity.
(xv) 52.222-25, Affirmative Action Compliance. This provision applies to solicitations, other than those for construction, when the solicitation includes the clause at 52.222-26, Equal Opportunity.
(xvi) 52.222-38, Compliance with Veterans' Employment Reporting Requirements. This provision applies to solicitations when it is anticipated the contract award will exceed the simplified acquisition threshold and the contract is not for acquisition of commercial items.
(xvii) 52.223-1, Biobased Product Certification. This provision applies to solicitations that require the delivery or specify the use of USDA-designated items; or include the clause at 52.223-2, Affirmative Procurement of Biobased Products Under Service and Construction Contracts.
(xviii) 52.223-4, Recovered Material Certification. This provision applies to solicitations that are for, or specify the use of, EPA- designated items.
(xix) 52.223-22, Public Disclosure of Greenhouse Gas Emissions and Reduction Goals—Representation. This provision applies to solicitations that include the clause at 52.204-7.
(xx) 52.225-2, Buy American Certificate. This provision applies to solicitations containing the clause at 52.225-1.
(xxi) 52.225-4, Buy American--Free Trade Agreements--Israeli Trade Act Certificate. (Basic, Alternates I, II, and III.) This provision applies to solicitations containing the clause at 52.225- 3.
(A) If the acquisition value is less than $25,000, the basic provision applies.
(B) If the acquisition value is $25,000 or more but is less than $50,000, the provision with its Alternate I applies.
(C) If the acquisition value is $50,000 or more but is less than $83,099, the provision with its Alternate II applies.
(D) If the acquisition value is $83,099 or more but is less than $100,000, the provision with its Alternate III applies.
(xxii) 52.225-6, Trade Agreements Certificate. This provision applies to solicitations containing the clause at 52.225-5.
(xxiii) 52.225-20, Prohibition on Conducting Restricted Business Operations in Sudan--Certification. This provision applies to all solicitations.
(xxiv) 52.225-25, Prohibition on Contracting with Entities Engaging in Certain Activities or Transactions Relating to Iran—Representation and Certification. This provision applies to all solicitations.
(xxv) 52.226-2, Historically Black College or University and Minority Institution Representation. This provision applies to solicitations for research, studies, supplies, or services of the type normally acquired from higher educational institutions.

(2) The following representations or certifications are applicable as indicated by the Contracting Officer: [Contracting Officer check as appropriate.]

☐ (i) 52.204-17, Ownership or Control of Offeror.
☐ (ii) 52.204-20, Predecessor of Offeror.
☐ (iii) 52.222-18, Certification Regarding Knowledge of Child Labor for Listed End Products.
☐ (iv) 52.222-48, Exemption from Application of the Service Contract Labor Standards to Contracts for Maintenance, Calibration, or Repair of Certain Equipment--Certification.

☐ (v) 52.222-52 Exemption from Application of the Service Contract Labor Standards to Contracts for Certain Services--Certification.
☐ (vi) 52.223-9, with its Alternate I, Estimate of Percentage of Recovered Material Content for EPA-Designated Products (Alternate I only).
☐ (vii) 52.227-6, Royalty Information.
☐ (A) Basic.
☐ (B) Alternate I.
☐ (viii) 52.227-15, Representation of Limited Rights Data and Restricted Computer Software.

(d) The Offeror has completed the annual representations and certifications electronically in SAM accessed through https://www.sam.gov. After reviewing the SAM information, the Offeror verifies by submission of the offer that the representations and certifications currently posted electronically that apply to this solicitation as indicated in paragraph (c) of this provision have been entered or updated within the last 12 months, are current, accurate, complete, and applicable to this solicitation (including the business size standard applicable to the NAICS code referenced for this solicitation), as of the date of this offer and are incorporated in this offer by reference (see FAR 4.1201); except for the changes identified below [offeror to insert changes, identifying change by clause number, title, date]. These amended representation(s) and/or certification(s) are also incorporated in this offer and are current, accurate, and complete as of the date of this offer.

FAR Clause	Title	Date	Change

Any changes provided by the offeror are applicable to this solicitation only, and do not result in an update to the representations and certifications posted on SAM.

(End of Provision)

K.3 FAR 52.209-7 Information Regarding Responsibility Matters (OCT 2018)

(a) *Definitions*. As used in this provision—

"Administrative proceeding" means a non-judicial process that is adjudicatory in nature in order to make a determination of fault or liability (*e.g.*, Securities and Exchange Commission Administrative Proceedings, Civilian Board of Contract Appeals Proceedings, and Armed Services Board of Contract Appeals Proceedings). This includes administrative proceeding at the Federal and State level but only in connection with performance of a Federal contract or grant. It does not include agency actions such as contract audits, site visits, corrective plans, or inspection of deliverables.

"Federal contracts and grants with total value greater than $10,000,000" means—
(1) The total value of all current, active contracts and grants, including all priced options; and
(2) The total value of all current, active orders including all priced options under indefinite-delivery, indefinite-quantity, 8(a), or requirements contracts (including task and delivery and multiple-award Schedules).

"Principal" means an officer, director, owner, partner, or a person having primary management or supervisory responsibilities within a business entity (*e.g.*, general manager; plant manager; head of a division or business segment; and similar positions).

(b) The offeror ☐ has ☐ does not have current active Federal contracts and grants with total value greater than $10,000,000.

(c) If the offeror checked "has" in paragraph (b) of this provision, the offeror represents, by submission of this offer, that the information it has entered in the Federal Awardee Performance and Integrity Information System (FAPIIS) is current, accurate, and complete as of the date of submission of this offer with regard to the following information:

(1) Whether the offeror, and/or any of its principals, has or has not, within the last five years, in connection with the award to or performance by the offeror of a Federal contract or grant, been the subject of a proceeding, at the Federal or State level that resulted in any of the following dispositions:
(i) In a criminal proceeding, a conviction.
(ii) In a civil proceeding, a finding of fault and liability that results in the payment of a monetary fine, penalty, reimbursement, restitution, or damages of $5,000 or more.
(iii) In an administrative proceeding, a finding of fault and liability that results in—
(A) The payment of a monetary fine or penalty of $5,000 or more; or
(B) The payment of a reimbursement, restitution, or damages in excess of $100,000.
(iv) In a criminal, civil, or administrative proceeding, a disposition of the matter by consent or compromise with an acknowledgment of fault by the Contractor if the proceeding could have led to any of the outcomes specified in paragraphs (c)(1)(i), (c)(1)(ii), or (c)(1)(iii) of this provision.
(2) If the offeror has been involved in the last five years in any of the occurrences listed in (c)(1) of this provision, whether the offeror has provided the requested information with regard to each occurrence.
(d) The offeror shall post the information in paragraphs (c)(1)(i) through (c)(1)(iv) of this provision in FAPIIS as required through maintaining an active registration in the System for Award Management via https://www.sam.gov (see 52.204-7).

(End of provision)

K.4 Implementation of Executive Order (EO) 13224 Terrorist Financing: The Contractor is reminded that US Executive Orders and US law prohibit transactions with, and the provision of resources and support to, individuals and organizations associated with terrorism. It is the legal responsibility to ensure compliance with these Executive Orders.

(End of Provision)

K.5 Contact for Negotiation/Administration (May 1998): Designate a person we may contact for contract administration in the event your firm receives a contract as a result of this solicitation:

Name: _____ Title: _____

Address: (Street) _____ (City) _____ (State) _____ (Zip Code)

Area Code: _____ Telephone: _____

Bidder/Offeror is located in Congressional District:

(Street) _____ (City) _____ (State) _____ (Zip Code)

Contract will be performed in Congressional District:

(Street) _____ (City) _____ (State) _____ (Zip Code)

(End of Provision)

K.6 Certification (May 1998): TO BE COMPLETED BY THE OFFEROR: (The Offeror must check or complete all appropriate boxes or blanks in the Representations and Certifications contained herein). The Representations and Certifications must be executed below, by an individual authorized to bind the offeror.

The offeror makes the forgoing Representations and Certifications as a part of its proposal.

_____ _____
(Name of offeror) (Solicitation Number)

_____ _____
(Signature of Authorized Individual) (Date)

_____
(Typed Name of Authorized Individual)

Note: The penalty for making false statements in offerors is prescribed in 18 U.S.C. 1001.

(End of Provision)

K.7 Contractor Performance Assessment Reporting System (CPARS) Requirements (Apr 2013): In accordance with FAR 42.15, the Centers for Disease Control and Prevention (CDC) will review and evaluate contract performance. FAR 42.1502 and 42.1503 requires agencies to prepare evaluations of contractor performance and submit them to the Past Performance Information Retrieval System (PPIRS). The CDC utilizes the Department of Defense (DOD) web-based Contractor Performance Assessment Reporting System (CPARS) to prepare and report these contractor performance evaluations. All information contained in these assessments may be used by the Government, within the limitations of FAR 42.15, for future source selections in accordance with FAR 15.304 where past performance is an evaluation factor.

The CPARS system requires a contractor representative to be assigned so that the contractor has appropriate input into the performance evaluation process. The CPARS contractor representative will be given access to CPARS and will be given the opportunity to concur or not-concur with performance evaluations before the evaluations are complete. The CPARS contractor representative will also have the opportunity to add comments to performance evaluations.

The assessment is not subject to the Disputes clause of the contract, nor is it subject to appeal beyond the review and comment procedures described in the guides on the CPARS website. Refer to: www.cpars.gov for details and additional information related to CPARS, CPARS user access, how contract performance assessments are conducted, and how Contractors participate. Access and training for all persons responsible for the preparation and review of performance assessments is also available at the CPARS website.

The contractor must provide the CDC contracting office with the name, e-mail address, and phone number of their designated CPARS representative who will be responsible for logging into CPARS and reviewing and commenting on performance evaluations. The contractor must maintain a current representative to serve as the contractor representative in CPARS. It is the contractor's responsibility to notify the CDC contracting office, in writing (letter or email), when their CPARS representative information needs to be changed or updated. Failure to maintain current CPARS contractor representative information will result in the loss of an opportunity to review and comment on performance evaluations.

Provide the current CPARS representative information below.

_____	_____
PRINT OR TYPE NAME	EMAIL ADDRESS AND PHONE NUMBER

(End of Provision)

K.8 Point of Contact: The Contractor shall designate a senior person from the key personnel as the point of contact during normal business hours. This person shall be available for on-site meetings during normal business hours. Should the person be unavailable when scheduled to be on-site, the Contractor shall notify the COR of the name of the designated alternate point of contact. The designated person shall have the authority of the Program Manager to direct personnel and shall be accountable to the directions of the COR. The Contractor shall provide to the COR a contact and backup contact who shall be on-call to make decisions as required during non-business hours.

Name: _____ Title: _____

Address: (Street) _____ (City) _____ (State) _____ (Zip Code)

Area Code: _____ Telephone: _____

(End of Provision)

ATTACHMENT 2: CONTRACTORS' PERFORMANCE ASSESSMENT REPORTING SYSTEM (CPARS)

This assessment will be performed electronically at least annually or as required by www.cpars.gov

Block 18a Quality of Product or Service: Assess the contractor's conformance to contract requirements, specifications and standards of good workmanship (e.g. commonly accepted technical, professional, environmental, or safety and health standards).

For example: Are reports/data accurate? Does the product or service provided meet the specifications of the contract? Does the contractor's work measure up to commonly accepted technical or professional standards? Assess the degree of Government technical direction required to solve problems that arise during performance.

For Operations Support: Assess how successfully the contractor meets program quality objectives such as ability to produce, reliability, maintainability and ability to inspect. The Assessing Official must be flexible in how contractor success is measured (e.g. using data from field reliability and maintainability and failure reports, user comments and acceptance rates, and scrap and rework rates). These quantitative indicators may be useful later, for example, in source selection evaluations, in demonstrating continuous improvement, quality and reliability leadership that reflects progress in total quality management. Assess the contractor's control of the overall production process to include material control, shop planning and control, and status.

Block 18b Schedule: Assess the timeliness of the contractor against the completion of the contract, task orders, milestones, delivery schedules, and administrative requirements (e.g. efforts that contribute to or effect the schedule variance). This assessment of the contractor's adherence to the required delivery schedule should include the contractor's efforts during the assessment period that contributes to or effect the schedule variance. This element applies to contract closeout activities as well as contract performance. Instances of adverse actions such as the assessment of liquidated damages, or issuance of Cure Notices, Show Cause Notices, and Delinquency Notices are indicators of problems which may have resulted in variance to the contract schedule and should therefore be noted in the evaluation.

Block 18c Cost Control *Not required for Firm Fixed Price or Firm Fixed Price with Economic Price Adjustment*

Block 18d Business Relations: Assess the integration and coordination of all activity needed to execute the contract, specifically the timeliness, completeness and quality of problem identification, corrective action plans, proposal submittals, the contractor's history of reasonable and cooperative behavior (to include timely identification of issues in controversy), customer satisfaction, timely award and management of subcontracts. Include, as applicable, information on the following:

- Is the contractor oriented toward the customer?
- Is interaction between the contractor and the government satisfactory or does it need improvement?
- Include the adequacy of the contractor's accounting, billing, and estimating systems and the contractor's management of Government Property (GFP) if a substantial amount of GFP has been provided to the contractor under the contract.
- Address the timeliness of awards to subcontractors and management of subcontractors, including subcontract costs. Consider efforts taken to ensure early identification of subcontract problems and the timely application of corporate resources to preclude subcontract problems from impacting overall prime contractor performance.
- Assess the prime contractor's effort devoted to managing subcontracts and whether subcontractors were an integral part of the contractor's team.

Block 18e Management of Key Personnel *For Services and Information Technology Business Sectors only: A*ssess the contractor's performance in selecting, retaining, supporting, and replacing, when necessary, key personnel.

For example: How well did the contractor match the qualifications of the key position, as described in the contract, with the person who filled the key position? Did the contractor support key personnel so they were able to work effectively? If a key person did not perform well, what action was taken by the contractor to correct this? If a replacement of a key person was necessary, did the replacement meet or exceed the qualifications of the position as described in the contract schedule?

Block 18f Utilization of Small Business: FAR Subpart 19.7 and 15 U.S.C. 637 contains statutory requirements for complying with the Small Business Subcontracting Program. Assess whether the contractor provided maximum practicable opportunity for Small Business (including Alaska Native Corporations (ANCs) and Indian Tribes) (including Small Disadvantaged Businesses (which also includes ANCs and Indian Tribes), Women Owned Small Businesses, HUBZone, Veteran Owned, Service Disabled Veteran Owned Small Business, Historically Black Colleges and Minority Institutions and ANCs and Indian Tribes that are not Small Disadvantaged Businesses or Small Businesses) to participate in contract performance consistent with efficient performance of the contract.

Assess compliance with all terms and conditions in the contract relating to Small Business participation (including FAR 52.219-8, Utilization of Small Businesses and FAR 52.219-9, Small Business Subcontracting Plan (when required)). Assess any small business participation goals which are stated separately in the contract. Assess achievement on each individual goal stated within the contract or subcontracting plan including good faith effort if the goal was not achieved.

It may be necessary to seek input from the Small Business specialist, ACO or PCO in regards to the contractor's compliance with these criteria. For contracts subject to a commercial subcontracting plan, the Utilization of Small Business factor should be rated "satisfactory" as long as an approved plan remains in place, unless liquidated damages have been assessed by the contracting officer who approved the commercial plan (see FAR 19.705-7(h)). In such case, the Utilization of Small Business area must be rated "unsatisfactory." This area must be rated for all contracts and task orders that contain a small business subcontracting goal. Ratings for the Utilization of Small Business evaluation area will be in accordance with the definitions described below. Ratings for the other CPAR evaluation areas will be in accordance with the ratings described in Block 18 Evaluation Areas.

In accordance FAR 19.705-2(e) a contract may have no more than one subcontracting plan. Evaluations of the Utilization of Small Business are required for contracts and orders placed against basic ordering agreement (BOA) and blanket purchase agreement (BPA) if a subcontracting plan is required. Evaluations of Utilization of Small Business for single-agency task orders and delivery orders (to include FSS) are not required and shall not be accomplished unless the contracting officer determines that such evaluations would produce more useful past performance information for source selection officials than that contained in the overall contract evaluation. Execution of any subcontracting plan may be addressed in block 20.

Block 18g Other Areas: Specify additional evaluation areas that are unique to the contract, or that cannot be captured elsewhere on the form. More than one type of entry may be included, but should be separately labeled. If extra space is needed, use Block 20. If the contract contains an award fee provision, enter "award fee" in the "Other Areas" block (18g). The Assessing Official should translate the award fee earned to adjective ratings, which could prove more useful for using past performance to assess future performance risk in upcoming source selections. If award fee information is included in the CPAR, use block 20 to provide a description for each award fee. Include the scope of the award fee by describing the extent to which it covers the total range of contract performance activities, or is restricted to certain elements of the contract. If any other type of contract incentive is included in the contract (excluding contract shareline incentives on fixed price or cost-type contracts), it should be reported in a manner similar to the procedures described above for award fee. Use Block 18g in those instances where the Assessing Official believes strongly, either positively or negatively, regarding an aspect of the contractor's performance, but cannot fit that aspect into any of the other blocks on the form.

CPARS RATINGS

Exceptional: Exceeded all negotiated subcontracting goals or exceeded at least one goal and met all of the other negotiated subcontracting goals for the current period. Had exceptional success with initiatives to assist, promote, and utilize small business (SB), small disadvantaged business (SDB), women-owned small business (WOSB), HUBZone small business, veteran-owned small business (VOSB) and service disabled veteran owned small business (SDVOSB). Complied with FAR 52.219-8, Utilization of Small Business Concerns. Exceeded any other small business participation requirements incorporated in the contract, including the use of small businesses in mission critical aspects of the program. Went above and beyond the required elements of the subcontracting plan and other small business requirements of the contract. Completed and submitted Individual Subcontract Reports and/or Summary Subcontract Reports in an accurate and timely manner.

NOTE: To justify an Exceptional rating, identify multiple significant events and state how they were a benefit to small business utilization. A singular benefit, however, could be of such magnitude that it constitutes an Exceptional rating. Ensure that small businesses are given meaningful, innovative work directly related to the project, rather than peripheral work, such as cleaning offices, supplies, landscaping, etc. Also, there should have been no significant weaknesses identified.

Very Good: Met all of the negotiated subcontracting goals in the traditional socio-economic categories (SB, SDB and WOSB) and met at least one of the other socio-economic goals (HUBZone, VOSB, SDVOSB) for the current period. Had significant success with initiatives to assist, promote and utilize SB, SDB, WOSB, HUBZone, VOSB, and SDVOSB. Complied with FAR 52.219-8, Utilization of Small Business Concerns. Met or exceeded any other small business participation requirements incorporated in the contract, including the use of small businesses in mission critical aspects of the program. Endeavored to go above and beyond the required elements of the subcontracting plan. Completed and submitted Individual Subcontract Reports and/or Summary Subcontract Reports in an accurate and timely manner.

NOTE: To justify a Very Good rating, identify a significant event and state how they were a benefit to small business utilization. Ensure that small businesses are given meaningful, innovative work directly related to the project, rather than peripheral work, such as cleaning offices, supplies, landscaping, etc. There should be no significant weaknesses identified.

Satisfactory: Demonstrated a good faith effort to meet all of the negotiated subcontracting goals in the various socio-economic categories for the current period. Complied with FAR 52.219-8, Utilization of Small Business Concerns. Met any other small business participation requirements included in the contract. Fulfilled the requirements of the subcontracting plan included in the contract. Completed and submitted Individual Subcontract Reports and/or Summary Subcontract Reports in an accurate and timely manner.

NOTE: To justify a Satisfactory rating, there should have been only minor problems, or major problems the contractor has addressed or taken corrective action. There should have been no significant weaknesses identified. A fundamental principle of assigning ratings is that contractors will not be assessed a rating lower than Satisfactory solely for not performing beyond the requirements of the contract.

Marginal: Deficient in meeting key subcontracting plan elements. Deficient in complying with FAR 52.219-8, Utilization of Small Business Concerns, and any other small business participation requirements in the contract. Did not submit Individual Subcontract Reports and/or Summary Subcontract Reports in an accurate or timely manner. Failed to satisfy one or more requirements of a corrective action plan currently in place; however, does show an interest in bringing performance to a satisfactory level and has demonstrated a commitment to apply the necessary resources to do so. Required a corrective action plan.

NOTE: To justify Marginal performance, identify a significant event that the contractor had trouble overcoming and how it impacted small business utilization. A Marginal rating should be supported by referencing the actions taken by the government that notified the contractor of the contractual deficiency.

Unsatisfactory: Noncompliant with FAR 52.219-8 and 52.219-9 and any other small business participation requirements in the contract. Did not submit Individual Subcontract Reports and/or Summary Subcontract Reports in an accurate or timely manner. Showed little interest in bringing performance to a satisfactory level or is generally uncooperative. Required a corrective action plan.

NOTE: To justify an Unsatisfactory rating, identify multiple significant events that the contractor had trouble overcoming and state how it impacted small business utilization. A singular problem, however, could be of such serious magnitude that it alone constitutes an Unsatisfactory rating. An Unsatisfactory rating should be supported by referencing the actions taken by the government to notify the contractor of the deficiencies. When an Unsatisfactory rating is justified, the contracting officer must consider whether the contractor made a good faith effort to comply with the requirements of the subcontracting plan required by FAR 52.219-9 and follow the procedures outlined in FAR 52.219-16, Liquidated Damages-Subcontracting Plan.

NOTE: Plus or minus signs may be used to indicate an improving (+) or worsening (-) trend insufficient to change assessment status.

NOTE: Generally, zero percent is not a goal unless the Contracting Officer determined when negotiating the subcontracting plan that no subcontracting opportunities exist in a particular socio-economic category. In such cases, the contractor shall be considered to have met the goal for any socio-economic category where the goal negotiated in the plan was zero.

ATTACHMENT 3: SAMPLE STATEMENT OF WORK (SOW)

This template is designed to provide guidance to offerors in developing a detailed statement of work.

Offeror's statement of work must follow this format

Project Title: *Enter the project title*

Project ID: *Enter the Project ID shown in your Notification Letter*

C.1 Background and Need: *Describe the requirements in general, non-technical terms. This section should explain why the acquisition is being pursued and how it relates to past, current, or future projects. Include a summary of statutory program authority and any regulations that are applicable. If any of the techniques have been found to be tried and been found to be effective, they should be included here.*

C.2 Project Objective: *Provide a succinct statement of the purpose of the acquisition. It should outline results that the Government expects and may also identify the benefits to the program that is contemplated.*

C.3 Scope of Work: *Provide an overall, non-technical description of the work to be performed. It expands on the projected objectives, but does not attempt to detail all of the work required. It must be consistent with the detailed requirements.*

C.4 Technical Requirements: *Spell out precisely what is expected of the contractor in the performance of the work.*

- *Describe the specific tasks and phases of the work*
- *Deliverables to be generated from the described tasks must be clearly defined*
- *Specify the total effort each task or phase is to receive*
- *Considerations that may guide the contractor in its analysis and design on the designated problems*
- *Identify the requirements and indicates the scope of each*

C.5 Reporting Schedule: The contractor will provide a quarterly summary of monthly meetings and conference calls. Progress reports will include detailed descriptions of activities conducted during the previous quarter, planned activities for the upcoming quarter, and a section on challenges or barriers to meeting timelines and completing tasks, and how the contractor has already or plans to overcome these challenges.

C.6 Special Considerations: *Include any information that does not fit neatly or logically into one of the other sections. For example, it may be used to explain any special relationships between the contractor and other contractors working for the government.*

C.7 Period and Place of Performance: *Describe when and where the work shall be performed. If the project includes options or option periods, they should be included.*

C.8 Government Furnished Property (GFP): Issuance of GFP shall be determined by the CDC Contracting Officer Representative (COR). Access to CDC IT systems and facilities is not anticipated. If it is determined that GFP or access is required, it will be controlled through use of CDC-issued HSPD-12 compliant ID badge.

C.9 Travel: *Describe any travel that is projected to take place during the period of performance. Travel may include in-person kick-off meetings or final meetings, attendance at conferences, travel to present deliverables, etc.*

C.10 References: *Describe any reference materials that may be relevant to the work being performed.*

C.11 Deliverables: *Define and describe the deliverables, quantity required, the recipient(s), and the schedule should be attached to the SOW. Deliverables included in Deliverables table must correspond to the tasks outlined under "C.4 Technical Requirements"*

Deliverable	Description	Date	Deliver To

ATTACHMENT 4: SAMPLE COST PROPOSAL

This sample format is designed to provide guidance to offerors in developing a detailed cost proposal.

Cost proposals must be tailored to support the individual Business Proposal(s).

ALL costs must be substantiated in sufficient detail to support the hours, rates and costs described in the individual Business Proposal in order to ensure the Government's understanding of how these costs will support the work required for the proposed research project.

Proposals that do not include cost information presented in sufficient detail will not be evaluated.

DIRECT COSTS

Labor by Category		Hours		Rate		Total	Formula
Project Manager			x	$0.00	=	$0.00	*Equals Hours x Rate*
Principal Investigator			x	$0.00	=	$0.00	*Equals Hours x Rate*
Total Direct Labor					(a)	**$0.00**	*Sum of all Labor*
Overhead Rate	(b)	0.0%			(c)	$0.00	*Equals (a) x (b)*
Total Direct Labor + Overhead					(d)	**$0.00**	*Sum of (a) + (c)*

NOTE: For positions covered under the Service Contract Act, itemize the fringe rate to identify the H&W component.

Fringe Rate	(e)	0.0%	(f)	$0.00	*Equals (a) x (e)*
Total Direct Labor + Overhead + Fringe			(g)	**$0.00**	*Sum of (d) + (f)*

OTHER DIRECT COSTS (ODC)

Travel and Per Diem *(in accordance with FJTR)*				$0.00	
Consultants/Subcontractor				$0.00	
Materials				$0.00	
TOTAL Other Direct Costs			(i)	**$0.00**	*Sum of all ODC*
SubTotal ALL Costs			(j)	**$0.00**	*Sum of (g) + (i)*
G&A	(k)	0.0%	(l)	$0.00	*Equals (j) x (k)*
Subtotal Cost (Before Profit)			(m)	**$0.00**	*Sum of (j) + (i)*
Profit	(n)	0.0%	(o)	$0.00	*Equals (m) x (n)*
TOTAL COST				**$0.00**	*Sum of (m) + (o)*

When applicable, this format can be used to report the base period, option years, and a composite for all periods.

Use of face masks cuts COVID-19 transmission risk in half, review suggests

Bloomberg (11/18, Fourcade) reports “donning a face mask more than halves the risk of getting COVID,” as well as hand-washing, “according to a review of eight studies published in the British Medical Journal.” Furthermore, physical distancing “cuts the risk by a quarter.”

ABSTRACT

OBJECTIVE

To review the evidence on the effectiveness of public health measures in reducing the incidence of covid-19, SARS-CoV-2 transmission, and covid-19 mortality.

DESIGN

Systematic review and meta-analysis.

DATA SOURCES

Medline, Embase, CINAHL, Biosis, Joanna Briggs, Global Health, and World Health Organization COVID-19 database (preprints).

ELIGIBILITY CRITERIA FOR STUDY SELECTION

Observational and interventional studies that assessed the effectiveness of public health measures in reducing the incidence of covid-19, SARS-CoV-2 transmission, and covid-19 mortality.

MAIN OUTCOME MEASURES

The main outcome measure was incidence of covid-19. Secondary outcomes included SARS-CoV-2 transmission and covid-19 mortality.

DATA SYNTHESIS

DerSimonian Laird random effects meta-analysis was performed to investigate the effect of mask wearing, handwashing, and physical distancing measures on incidence of covid-19. Pooled effect estimates with corresponding 95% confidence intervals were computed, and heterogeneity among studies was assessed using Cochran's Q test and the I^2 metrics, with two tailed P values.

RESULTS

72 studies met the inclusion criteria, of which 35 evaluated individual public health measures and 37 assessed multiple public health measures as a "package of interventions." Eight of 35 studies were included in the meta-analysis, which indicated a reduction in incidence of covid-19 associated with handwashing (relative risk 0.47, 95% confidence interval 0.19 to 1.12, I^2=12%), mask wearing (0.47, 0.29 to 0.75, I^2=84%), and physical distancing (0.75, 0.59 to 0.95, I^2=87%). Owing to heterogeneity of the studies, meta-analysis was not possible for the outcomes of quarantine and isolation, universal lockdowns, and closures of borders, schools, and workplaces. The effects of these interventions were synthesised descriptively.

CONCLUSIONS

This systematic review and meta-analysis suggests that several personal protective and social measures, including handwashing, mask wearing, and physical distancing are associated with reductions in the incidence covid-19. Public health efforts to implement public health measures should consider community health and sociocultural needs, and future research is needed to better understand the effectiveness of public health measures in the context of covid-19 vaccination.

SYSTEMATIC REVIEW REGISTRATION

PROSPERO CRD42020178692.

WHAT IS ALREADY KNOWN ON THIS TOPIC

Public health measures have been identified as a preventive strategy for influenza pandemics

The effectiveness of such interventions in reducing the transmission of SARS-CoV-2 is unknown

WHAT THIS STUDY ADDS

The findings of this review suggest that personal and social measures, including handwashing, mask wearing, and physical distancing are effective at reducing the incidence of covid-19

More stringent measures, such as lockdowns and closures of borders, schools, and workplaces need to be carefully assessed by weighing the potential negative effects of these measures on general populations

Further research is needed to assess the effectiveness of public health measures after adequate vaccination coverage

Introduction

The impact of SARS-CoV-2 on global public health and economies has been profound.[1] As of 14 October 2021, there were 239 007 759 million cases of confirmed covid-19 and 4 871 841 million deaths with covid-19 worldwide.[2]

A variety of containment and mitigation strategies have been adopted to adequately respond to covid-19, with the intention of deferring major surges of patients in hospitals and protecting the most vulnerable people from infection, including elderly people and those with comorbidities.[3] Strategies to achieve these goals are diverse, commonly based on national risk assessments that include estimation of numbers of patients requiring hospital admission and availability of hospital beds and ventilation support.

Globally, vaccination programmes have proved to be safe and effective and save lives.[4 5] Yet most vaccines do not confer 100% protection, and it is not known how vaccines will prevent future transmission of SARS-CoV-2,[6] given emerging variants.[7-9] The proportion of the population that must be vaccinated against covid-19 to reach herd immunity depends

greatly on current and future variants.[10] This vaccination threshold varies according to the country and population's response, types of vaccines, groups prioritised for vaccination, and viral mutations, among other factors.[6] Until herd immunity to covid-19 is reached, regardless of the already proven high vaccination rates,[11] public health preventive strategies are likely to remain as first choice measures in disease prevention,[12] particularly in places with a low uptake of covid-19 vaccination. Measures such as lockdown (local and national variant), physical distancing, mandatory use of face masks, and hand hygiene have been implemented as primary preventive strategies to curb the covid-19 pandemic.[13]

Public health (or non-pharmaceutical) interventions have been shown to be beneficial in fighting respiratory infections transmitted through contact, droplets, and aerosols.[14 15] Given that SARS-CoV-2 is highly transmissible, it is a challenge to determine which measures might be more effective and sustainable for further prevention.

Substantial benefits in reducing mortality were observed in countries with universal lockdowns in place, such as Australia, New Zealand, Singapore, and China. Universal lockdowns are not, however, sustainable, and more tailored interventions need to be considered; the ones that maintain social lives and keep economies functional while protecting high risk individuals.[16 17] Substantial variation exists in how different countries and governments have applied public health measures,[18] and it has proved a challenge for assessing the effectiveness of individual public health measures, particularly in policy decision making.[19]

Previous systematic reviews on the effectiveness of public health measures to treat covid-19 lacked the inclusion of analytical studies,[20] a comprehensive approach to data synthesis (focusing only on one measure),[21] a rigorous assessment of effectiveness of public health measures,[22] an assessment of the certainty of the evidence,[23] and robust methods for comparative analysis.[24] To tackle these gaps, we performed a systematic review of the evidence on the effectiveness of both individual and multiple public health measures in reducing the incidence of covid-19, SARS-CoV-2 transmission, and covid-19 mortality. When feasible we also did a critical appraisal of the evidence and meta-analysis.

Methods

This systematic review and meta-analysis were conducted in accordance with PRISMA[25] (supplementary material 1, table 1) and with PROSPERO (supplementary material 1, table 2).

Eligibility criteria

Articles that met the population, intervention, comparison, outcome, and study design criteria were eligible for inclusion in this systematic review (supplementary material 1, table 3). Specifically, preventive public health measures that were tested independently were included in the main analysis. Multiple measures, which generally contain a "package of interventions", were included as supplementary material owing to the inability to report on the individual effectiveness of measures and comparisons on which package led to enhanced outcomes. The public health measures were identified from published World Health Organization sources that reported on the effectiveness of such measures on a range of communicable diseases, mostly respiratory infections, such as influenza.

Given that the scientific community is concerned about the ability of the numerous mathematical models, which are based on assumptions, to predict the course of virus transmission or effectiveness of interventions,[26] this review focused only on empirical studies. We excluded case reports and case studies, modelling and simulation studies, studies that provided a graphical summary of measures without clear statistical assessments or outputs, ecological studies that provided a descriptive summary of the measures without assessing linearity or having comparators, non-empirical studies (eg, commentaries, editorials, government reports), other reviews, articles involving only individuals exposed to other pathogens that can cause respiratory infections, such as severe acute respiratory syndrome or Middle East respiratory syndrome, and articles in a language other than English.

Information sources

We carried out electronic searches of Medline, Embase, CINAHL (Cumulative Index to Nursing and

MS-DOH-21-1816-A-001026

Allied Health Literature, Ebsco), Global Health, Biosis, Joanna Briggs, and the WHO COVID-19 database (for preprints). A clinical epidemiologist (ST) developed the initial search strategy, which was validated by two senior medical librarians (LR and MD) (supplementary material 1, table 4). The updated search strategy was last performed on 7 June 2021. All citations identified from the database searches were uploaded to Covidence, an online software designed for managing systematic reviews,[27] for study selection.

Study selection

Authors ST, DG, SS, AM, ET, JR, XL, WX, IME, and XZ independently screened the titles and abstracts and excluded studies that did not match the inclusion criteria. Discrepancies were resolved in discussion with the main author (ST). The same authors retrieved full text articles and determined whether to include or exclude studies on the basis of predetermined selection criteria. Using a pilot tested data extraction form, authors ST, SS, AM, JR, XL, WX, AM, IME, and XZ independently extracted data on study design, intervention, effect measures, outcomes, results, and limitations. ST, SS, AM, and HW verified the extracted data. Table 5 in supplementary material 1 provides the specific criteria used to assess study designs. Given the heterogeneity and diversity in how studies defined public health measures, we took a common approach to summarise evidence of these interventions (supplementary material 1, table 6).

Risk of bias within individual studies

SS, JR, XL, WX, IME, and XZ independently assessed risk of bias for each study, which was cross checked by ST and HW. For non-interventional observational studies, a ROBINS-I (risk of bias in non-randomised studies of interventions) risk of bias tool was used.[28] For interventional studies, a revised tool for assessing risk of bias in randomised trials (RoB 2) tool was used.[29] Reviewers rated each domain for overall risk of bias as low, moderate, high, or serious/critical.

Data synthesis

The DerSimonian and Laird method was used for random effects meta-analysis, in which the standard error of the study specific estimates was adjusted to incorporate a measure of the extent of variation, or heterogeneity, among the effects observed for public health measures across different studies. It was assumed that the differences between studies are a result of different, yet related, intervention effects being estimated. If fewer than five studies were included in meta-analysis, we applied a recommended modified Hartung-Knapp-Sidik-Jonkman method.[30]

Statistical analysis

Because of the differences in the effect metrics reported by the included studies, we could only perform quantitative data synthesis for three interventions: handwashing, face mask wearing, and physical distancing. Odds ratios or relative risks with corresponding 95% confidence intervals were reported for the associations between the public health measures and incidence of covid-19. When necessary, we transformed effect metrics derived from different studies to allow pooled analysis. We used the Dersimonian Laird random effects model to estimate pooled effect estimates along with corresponding 95% confidence intervals for each measure. Heterogeneity among individual studies was assessed using the Cochran Q test and the I^2 test.[31] All statistical analyses were conducted in R (version 4.0.3) and all P values were two tailed, with P=0.05 considered to be significant. For the remaining studies, when meta-analysis was not feasible, we reported the results in a narrative synthesis.

Public and patient involvement

No patients or members of the public were directly involved in this study as no primary data were collected. A member of the public was, however, asked to read the manuscript after submission.

Results

A total of 36 729 studies were initially screened, of which 36 079 were considered irrelevent. After exclusions, 650 studies were eligible for full text review and 72 met the inclusion criteria. Of these studies, 35 assessed individual interventions and were included in the final synthesis of results (fig 1) and 37 assessed multiple interventions as a package and are included in supplementary material 3, tables 2 and 3. The included studies comprised 34 observational studies and one interventional study, eight of which were included in the meta-analysis.

Risk of bias

According to the ROBINS-I tool,[28] the risk of bias was rated as low in three studies,[32-34] moderate in 24 studies,[35-58] and high to serious in seven studies.[59-65] One important source of serious or critical risk of bias in most of the included studies was major confounding, which was difficult to control for because of the novel nature of the pandemic (ie, natural settings in which multiple interventions might have been enforced at once, different levels of enforcement across regions, and uncaptured individual level interventions such as increased personal hygiene). Variations in testing capacity and coverage, changes to diagnostic criteria, and access to accurate and reliable outcome data on covid-19 incidence and covid-19 mortality, was a source of measurement bias for numerous studies (fig 2). These limitations were particularly prominent early in the pandemic, and in low income environments.[47 52 62 63 65] The randomised controlled trial[66] was rated as moderate risk of bias according to the ROB-2 tool. Missing data, losses to follow-up, lack of blinding, and low adherence to intervention all contributed to the reported moderate risk. Tables 1 and 2 in supplementary material 2 summarise the risk of bias assessment for each study assessing individual measures.

Study characteristics

Studies assessing individual measures

Thirty five studies provided estimates on the effectiveness of an individual public health measures. The studies were conducted in Asia (n=11), the United States (n=9), Europe (n=7), the Middle East (n=3), Africa (n=3), South America (n=1), and Australia (n=1). Thirty four of the studies were observational and one was a randomised controlled trial. The study designs of the observational studies comprised natural experiments (n=11), quasi-experiments (n=3), a prospective cohort (n=1), retrospective cohorts (n=8), case-control (n=2), and cross sectional (n=9). Twenty six studies assessed social measures,[32 34 35 37-42 44 46-48 52 53 55-59 61 63-65 67 68] 12 studies assessed personal protective measures,[36 43 45 49 50 57 58 63 66 68 69] three studies assessed travel related measures,[54 58 62] and one study assessed environmental measures[57] (some interventions overlapped across studies). The most commonly measured outcome was incidence of covid-19 (n=18), followed by SARS-CoV-2 transmission, measured as reproductive number, growth number, or epidemic doubling time (n=13), and covid-19 mortality (n=8). Table 1 in supplementary material 3 provides detailed information on each study.

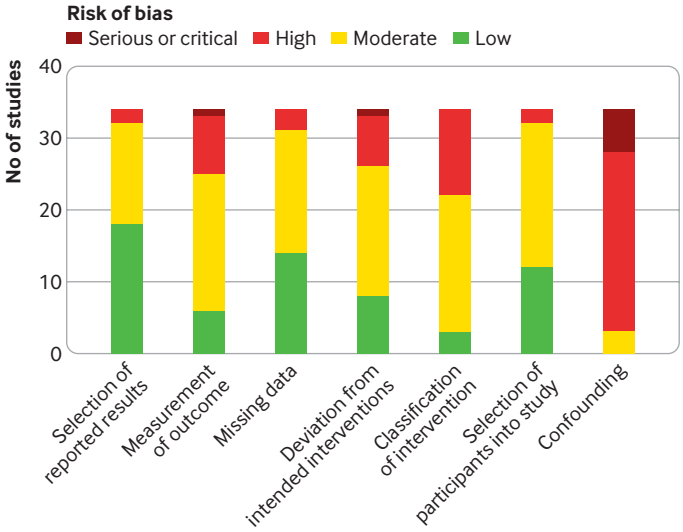

Fig 2 | Summary of risk of bias across studies assessing individual measures using risk of bias in non-randomised studies of interventions (ROBINS-I) tool

Effects of interventions

Personal protective measures

Handwashing and covid-19 incidence—Three studies with a total of 292 people infected with SARS-CoV-2 and 10 345 participants were included in the analysis of the effect of handwashing on incidence of covid-19.[36 63 68] Overall pooled analysis suggested an estimated 53% non-statistically significant reduction in covid-19 incidence (relative risk 0.47, 95% confidence interval 0.19 to 1.12, I^2=12%) (fig 3). A sensitivity analysis without adjustment showed a significant reduction in covid-19 incidence (0.49, 0.33 to 0.72, I^2=12%) (fig 4). Risk of bias across the three studies ranged from moderate[36 60] to serious or critical[63] (fig 2).

Mask wearing and covid-19 incidence—Six studies with a total of 2627 people with covid-19 and 389 228 participants were included in the analysis examining the effect of mask wearing on incidence of covid-19 (table 1).[36 43 57 60 63 66] Overall pooled analysis showed a 53% reduction in covid-19 incidence (0.47, 0.29 to 0.75), although heterogeneity between studies was substantial (I^2=84%) (fig 5). Risk of bias across the six studies ranged from moderate[36 57 60 66] to serious or critical[43 63] (fig 2).

Mask wearing and transmission of SARS-CoV-2, covid-19 incidence, and covid-19 mortality—The results of additional studies that assessed mask wearing (not included in the meta-analysis because of substantial differences in the assessed outcomes) indicate a reduction in covid-19 incidence, SARS-CoV-2 transmission, and covid-19 mortality. Specifically, a natural experiment across 200 countries showed 45.7% fewer covid-19 related mortality in countries where mask wearing was mandatory (table 1).[49] Another natural experiment study in the US reported a 29% reduction in SARS-CoV-2 transmission (measured as the time varying reproductive number Rt) (risk ratio 0.71, 95% confidence interval 0.58 to 0.75) in states where mask wearing was mandatory.[58]

A comparative study in the Hong Kong Special Administrative Region reported a statistically

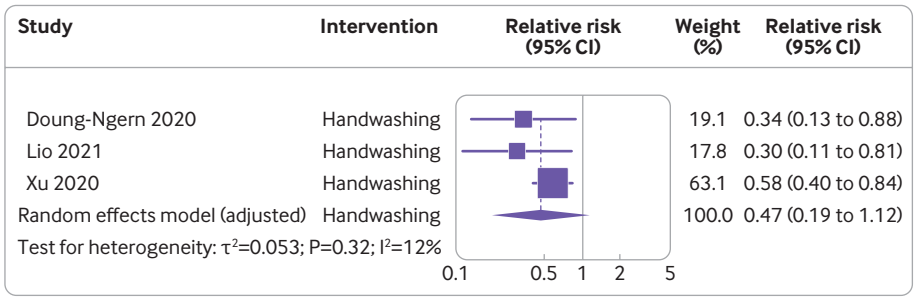

Fig 3 | Meta-analysis of evidence on association between handwashing and incidence of covid-19 using modified Hartung-Knapp-Sidik-Jonkman adjusted random effect model

significant lower cumulative incidence of covid-19 associated with mask wearing than in selected countries where mask wearing was not mandatory (table 1).[69] Similarly, another natural experiment involving 15 US states reported a 2% statistically significant daily decrease in covid-19 transmission (measured as case growth rate) at ≥21 days after mask wearing became mandatory,[50] whereas a cross sectional study reported that a 10% increase in self-reported mask wearing was associated with greater odds for control of SARS-CoV-2 transmission (adjusted odds ratio 3.53, 95% confidence interval 2.03 to 6.43).[45] The five studies were rated at moderate risk of bias (fig 2).

Environmental measures

Disinfection in household and covid-19 incidence

Only one study, from China, reported the association between disinfection of surfaces and risk of secondary transmission of SARS-CoV-2 within households (table 1).[57] The study assessed disinfection retrospectively by asking participants about their "daily use of chlorine or ethanol-based disinfectant in households," and observed that use of disinfectant was 77% effective at reducing SARS-CoV-2 transmission (odds ratio 0.23, 95% confidence interval 0.07 to 0.84). The study did not collect data on the concentration of the disinfectant used by participants and was rated at moderate risk of bias (fig 2).

Social measures

Physical distancing and covid-19 incidence

Five studies with a total of 2727 people with SARS-CoV-2 and 108 933 participants were included in the analysis that examined the effect of physical distancing on the incidence of covid-19.[37 53 57 60 63] Overall pooled analysis indicated a 25% reduction in incidence of covid-19 (relative risk 0.75, 95% confidence interval 0.59 to 0.95, I^2=87%) (fig 6). Heterogeneity among studies was substantial, and risk of bias ranged from moderate[37 53 57 60] to serious or critical[63] (fig 2).

Physical distancing and transmission of SARS-CoV-2 and covid-19 mortality

Studies that assessed physical distancing but were not included in the meta-analysis because of substantial differences in outcomes assessed, generally reported a positive effect of physical distancing (table 2). A natural experiment from the US reported a 12% decrease in SARS-CoV-2 transmission (relative risk 0.88, 95% confidence interval 0.86 to 0.89),[40] and a quasi-experimental study from Iran reported a reduction in covid-19 related mortality (β −0.07, 95% confidence interval −0.05 to −0.10; P<0.001).[47] Another comparative study in Kenya also reported a reduction in transmission of SARS-CoV-2 after physical distancing was implemented, reporting 62% reduction in overall physical contacts (reproductive number pre-intervention was 2.64 and post-intervention was 0.60 (interquartile range 0.50 to 0.68)).[61] These three studies were rated at moderate risk of bias[40 61] to serious or critical risk of bias[47] (fig 2).

Stay at home or isolation and transmission of SARS-CoV-2

All the studies that assessed stay at home or isolation measures reported reductions in transmission of SARS-CoV-2 (table 2). A retrospective cohort study from the US reported a significant reduction in the odds of having

Table 1 | Study characteristics and main results from studies that assessed individual personal protective and environmental measures

Reference, country	Study design	Public health measure	Sample size	Outcome measure	Study duration	Effect estimates: conclusions	Risk of bias
Doung-Ngern et al,[63] Thailand	Case-control	Handwashing	211 cases, 839 controls	Incidence	1-31 Mar 2020	Regular handwashing: adjusted odds ratio 0.34 (95% confidence interval 0.13 to 0.87): associated with lower risk of SARS-CoV-2*	Serious or critical
Lio et al,[36] China	Case-control	Handwashing	24 cases, 1113 controls	Incidence	17 Mar-15 Apr 2020	Adjusted odds ratio 0.30 (95% confidence interval 0.11 to 0.80): reduction in odds of becoming infectious*	Moderate
Xu et al,[68] China	Cross sectional comparative	Handwashing	n=8158	Incidence	22 Feb-5 Mar 2020	Relative risk 3.53 (95% confidence interval 1.53 to 8.15): significantly increased risk of infection with no handwashing*	Moderate
Bundgaard et al,[66] Denmark	Randomised controlled	Mask wearing	2392 cases, 2470 controls	Incidence	Apr and May 2020	Odds ratio 0.82 (95% confidence interval 0.54 to 1.23): 46% reduction to 23% increase in infection*	Moderate
Doung-Ngern et al,[63] Thailand	Case-control	Mask wearing	211 cases, 839 controls	Incidence	1-31 Mar 2020	Adjusted odds ratio 0.23 (95% confidence interval 0.09 to 1.60): associated with lower risk of SARS-CoV-2 infection*	Serious or critical
Lio et al,[36] China	Case-control	Mask wearing	24 cases, 1113 controls	Incidence	17 Mar-15 Apr 2020	Odds ratio 0.30 (95% confidence interval 0.10 to 0.86): 70% risk reduction*	Moderate
Xu et al,[68] China	Cross sectional comparative	Mask wearing	8158 people	Incidence	22 Feb-5 Mar 2020	Relative risk 12.38 (95% confidence interval 5.81 to 26.36): significantly increased risk of infection*	Moderate
Krishnamachari et al,[43] US	Natural experiment	Mask wearing	50 states	Incidence (cumulative rate)	Apr 2020	3-6 months, adjusted odds ratio 1.61 (95% confidence interval 1.23 to 2.10): >6 months, 2.16 (1.64 to 2.88): higher incidence rate with later mask mandate than with mask mandate in first month*	Serious or critical
Wang et al,[57] China	Retrospective cohort	Mask wearing	335 people	Incidence (assessed as attack rate†)	28 Feb-27 Mar 2020	Odds ratio 0.21 (95% confidence interval 0.06 to 0.79): 79% reduction in transmission of SARS-CoV-2*	Moderate
Cheng et al,[69] China	Longitudinal comparative	Mask wearing (South Korea *v* HKSAR)	961 cases (HKSAR), average control not available	Incidence	31 Dec 2019-8 Apr 2020	Incidence rate 49.6% (South Korea) *v* 11.8% (HKSAR) P <0.001: 37.8% less SARS-CoV-2 cases*	Moderate
Leffler et al,[49] US	Natural experiment	Mask wearing	200 countries	Mortality (per capita)	Jan-9 May 2020	No masks: mortality rate 61.9% (95% confidence interval 37.0% to 91.0%); masks: 16.2% (−14.4% to 57.4%): 45.7% fewer mortality*	Moderate
Lyu et al,[50] US	Natural experiment	Mask wearing	15 states	Case growth rate	31 Mar-22 May 2020	Mandatory mask wearing: case growth rate 2%: 2% decrease in daily covid-19 growth rate at ≥21 days (P<0.05)*	Moderate
Rader et al,[45] US	Cross sectional	Mask wearing	378 207 people	R0	3 Jun-27 Jul	Adjusted odds ratio 3.53 (95% confidence interval 2.03 to 6.43): 10% increase in self-reported mask wearing was associated with an increased odds of transmission control*	Moderate
Liu et al,[58] US	Natural experiment	Mask wearing	50 states	Rt	21 Jan-31 May 2020	Risk ratio 0.71 (95% confidence interval 0.58 to 0.75): 29% reduction in Rt*	Moderate
Wang et al,[57] China	Retrospective cohort	Chlorine or ethanol based disinfectant	335 people	Incidence (attack rate†)	28 Feb-27 Mar 2020	Odds ratio 0.23 (95% confidence interval 0.07 to 0.84): 77% reduction in transmission of SARS-CoV-2*	Moderate

HKSAR=Hong Kong Special Administrative Region of China; R0=reproductive number; Rt=time varying reproductive number.
*Interpretation of findings as reported in the original manuscript.
†Percentage of individuals who tested positive over a specified period.

a positive reproductive number (R0) result (odds ratio 0.07, 95% confidence interval 0.01 to 0.37),[41] and a natural experiment reported a 51% reduction in time varying reproductive number (Rt) (risk ratio 0.49, 95% confidence interval 0.43 to 0.54).[58]

A study from the UK reported a 74% reduction in the average daily number of contacts observed for each participant and estimated a decrease in reproductive number: the reproductive number pre-intervention was 3.6 and post-intervention was 0.60 (95% confidence interval 0.37 to 0.89).[65] Similarly, an Iranian study projected the reproductive number using serial interval distribution and the number of incidence cases and found a significant decrease: the reproductive number pre-intervention was 2.70 and post-intervention was 1.13 (95% confidence interval 1.03 to 1.25).[55] Three of the studies were rated at moderate to serious or critical risk of bias,[55 58 65] and one study was rated at low risk of bias[41] (fig 2).

Quarantine and incidence and transmission of SARS-CoV-2

Quarantine was assessed in two studies (table 2).[34 59] A prospective cohort study from Saudi Arabia reported

MS-DOH-21-1816-A-001030

BMJ: first published as 10.1136/bmj-2021-068302 on 17 November 2021. Downloaded from http://www.bmj.com/ on 18 November 2021 at Univ Of Mississippi Med Ctr Rowland Medical Library. Protected by copyright.

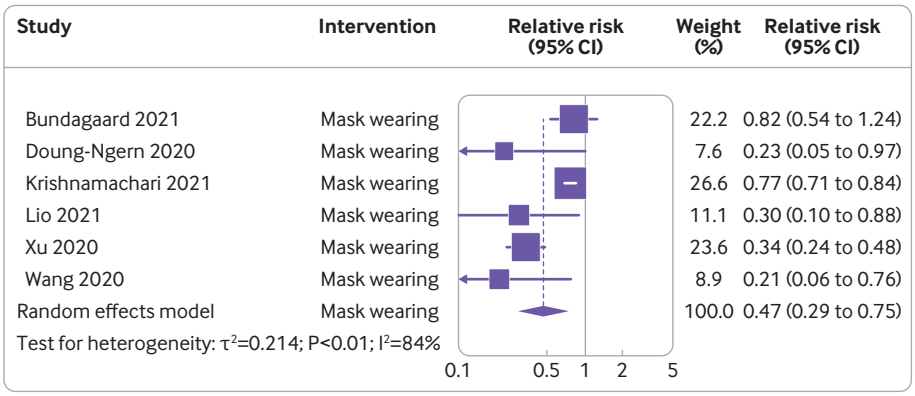

Fig 5 | Meta-analysis of evidence on association between mask wearing and incidence of covid-19 using unadjusted random effect model

a 4.9% decrease in the incidence of covid-19 at eight weeks after the implementation of quarantine.[34] This study was rated at low risk of bias (fig 2). A retrospective cohort study from India reported a 14 times higher risk of SARS-CoV-2 transmission associated with no quarantine compared with strict quarantine (odds ratio 14.44, 95% confidence interval 2.42 to 86.17).[59] This study was rated at moderate risk of bias (fig 2).

School closures and covid-19 incidence and covid-19 mortality

Two studies assessed the effectiveness of school closures on transmission of SARS-CoV-2, incidence of covid-19, or covid-19 mortality (table 2).[44 48] A US population based longitudinal study reported on the effectiveness of state-wide closure of primary and secondary schools and observed a 62% decrease (95% confidence interval −49% to −71%) in incidence of covid-19 and a 58% decrease (−46% to−68%) in covid-19 mortality.[48] Conversely, a natural experiment from Japan reported no effect of school closures on incidence of covid-19 (α coefficient 0.08, 95% confidence interval −0.36 to 0.65).[44] Both studies were rated at moderate risk of bias (fig 2).

School closures and transmission of SARS-CoV-2

Two natural experiments from the US reported a reduction in transmission (ie, reproductive number); with one study reporting a reduction of 13% (relative risk 0.87, 95% confidence interval 0.86 to 0.89)[40] and another reporting a 10% (0.90, 0.86 to 0.93) reduction (table 2).[58] A Swedish study reported an association between school closures and a small increase in confirmed SARS-CoV-2 infections in parents (odds ratio 1.17, 95% confidence interval 1.03 to 1.32), but observed that teachers in lower secondary schools were twice as likely to become infected than teachers in upper secondary schools (2.01, 1.52 to 2.67).[32] All three studies were rated at moderate risk of bias (fig 2).

Business closures and transmission of SARS-CoV-2

Two natural experiment studies assessed business closures across 50 US states and reported reductions in transmission of SARS-CoV-2 (table 2).[40 58] One of the studies observed a significant reduction in transmission of 12% (relative risk 0.88, 95% confidence interval 0.86 to 0.89)[40] and the other reported a significant 16% (risk ratio 0.84, 0.79 to 0.90) reduction.[58] Both studies were rated at moderate risk of bias (fig 2).

Lockdown and incidence of covid-19

A natural experiment involving 202 countries suggested that countries that implemented universal lockdown had fewer new cases of covid-19 than countries that did not (β coefficient −235.8 (standard error −11.04), P<0.01) (table 2).[52] An Indian quasi-experimental study reported a 10.8% reduction in incidence of covid-19 post-lockdown,[56] whereas a South African

retrospective cohort study observed a 14.1% reduction in risk after implementation of universal lockdown (table 2).[46] These studies were rated at high risk of bias[52] and moderate risk of bias[46 56] (fig 2).

Lockdown and covid-19 mortality

The three studies that assessed universal lockdown and covid-19 mortality generally reported a decrease in mortality (table 2).[35 38 42] A natural experiment study involving 45 US states reported a decrease in covid-19 related mortality of 2.0% (95% confidence interval −3.0% to 0.9%) daily after lockdown had been made mandatory.[35] A Brazilian quasi-experimental study reported a 27.4% average difference in covid-19 related mortality rates in the first 25 days of lockdown.[42] In addition, a natural experiment study reported about 30% and 60% reductions in covid-19 related mortality post-lockdown in Italy and Spain over four weeks post-intervention, respectively.[38] All three studies were rated at moderate risk of bias (fig 2).

Lockdown and transmission of SARS-CoV-2

Four studies assessed universal lockdown and transmission of SARS-CoV-2 during the first few months of the pandemic (table 2). The decrease in reproductive number (R0) ranged from 1.27 in Italy (pre-intervention 2.03, post-intervention 0.76)[39] to 2.09 in India (pre-intervention 3.36, post-intervention 1.27),[64] and 3.97 in China (pre-intervention 4.95, post-intervention 0.98).[33] A natural experiment from the US reported that lockdown was associated with an 11% reduction in transmission of SARS-CoV-2 (relative risk 0.89, 95% confidence interval 0.88 to 0.91).[40] All the studies were rated at low risk of bias[33 39] to moderate risk[40 64] (fig 2).

Travel related measures

Restricted travel and border closures

Border closure was assessed in one natural experiment study involving nine African countries (table 3).[62] Overall, the countries recorded an increase in the incidence of covid-19 after border closure. These studies concluded that the implementation of border closures within African countries had minimal effect on the incidence of covid-19. The study had important limitations and was rated at serious or critical risk of bias. In the US, a natural experiment study reported that restrictions on travel between states contributed about 11% to a reduction in SARS-CoV-2 transmission (table 3).[36] The study was rated at moderate risk of bias (fig 2).

Entry and exit screening (virus or symptom screening)

One retrospective cohort study assessed screening of symptoms, which involved testing 65 000 people for fever (table 3).[54] The study found that screening for fever lacked sensitivity (ranging from 18% to 24%) in detecting people with SARS-CoV-2 infection. This translated to 86% of the population with SARS-CoV-2 remaining undetected when screening for fever. The study was rated at moderate risk of bias (fig 2).

Multiple public health measures

Study characteristics

Overall, 37 studies provided estimates on the effectiveness of multiple public health measures, assessed as a collective group. Studies were mostly conducted in Asia (n=15), the US (n=11), Europe (n=6), Africa (n=4), and South America (n=1). All the studies were observational. The most commonly measured outcome was transmission of disease (ie, measured as reproductive number, growth number, or epidemic doubling time) (n=23), followed by covid-19 incidence (n=19) and covid-19 mortality (n=8). This review attempted to assess the overall effectiveness of the public health intervention packages by reporting the percentage difference in outcome before and after implementation of measures or between regions or countries studied. Eleven of the 37 included studies noted a difference of between 26% and 50% in transmission of SARS-CoV-2 and incidence of covid-19,[71-81] nine noted a difference of between 51% and 75% in SARS-CoV-2 transmission, covid-19 incidence, and covid-19 mortality,[82-90] and 14 noted a difference of more than 75% in transmission of SARS-CoV-2, covid-19 incidence and covid-19 mortality.[80 81 90-101] For the remaining studies, the overall effectiveness was not assessed owing to a lack of comparators (see supplementary material 3, table 3). Two studies that assessed universal lockdown and physical distancing reported a decrease of between 0% and 25% in SARS-CoV-2 transmission and covid-19 incidence.[80 102] Studies that included school and workplace closures,[92 96 97] isolation or stay at home measures,[81 95] or a combination of both[80 90 94 98-100] reported decreases of more than 75% in SARS-CoV-2 transmission. Supplementary material 3, table 2 provides detailed information on each study.

Discussion

Worldwide, government and public health organisations are mitigating the spread of SARS-CoV-2 by implementing various public health measures. This systematic review identified a statistically significant reduction in the incidence of covid-19 through the implementation of mask wearing and physical distancing. Handwashing interventions also indicated a substantial reduction in covid-19 incidence, albeit not statistically significant in the adjusted model. As the random effects model tends to underestimate confidence intervals when a meta-analysis includes a small number of individual studies (<5), the adjusted model for handwashing showed a statistically non-significant association in reducing the incidence of covid-19 compared with the unadjusted model.

Overall effectiveness of these interventions was affected by clinical heterogeneity and methodological limitations, such as confounding and measurement bias. It was not possible to evaluate the impact of type of face maks (eg, surgical, fabric, N95 respirators) and compliance and frequency of wearing masks owing to a lack of data. Similarly, it was not feasible to assess the differences in effect that different recommendations for physical distancing (ie, 1.5 m, 2m, or 3 m) have as preventive strategies.

The effectiveness of measures such as universal lockdowns and closures of businesses and schools for the containment of covid-19 have largely been effective, but depended on early implementation when incidence rates of covid-19 were still low.[42 52 58] Only Japan reported no decrease in covid-19 incidence after school closures,[44] and other studies found that different public health measures were sometimes implemented simultaneously or soon after one another, thus the results should be interpreted with caution.[32 46 56]

Isolation or stay at home was an effective measure in reducing the transmission of SARS-CoV-2, but the included studies used results for mobility to assess stay at home or isolation and therefore could have been limited by potential flaws in publicly available phone data,[41 58 103] and variations in the enforcement of public health measures in different states or regions were not assessed.[55 58 103] Quarantine was found to be as effective in reducing the incidence of covid-19 and transmission of SARS-CoV-2, yet variation in testing and case detection in low income environments was substantial.[59 97 99] Another study reported that quarantine was effective in reducing the transmission of SARS-CoV-2 in a cohort with a low prevalence of the virus, yet it is unknown if the same effect would be observed with higher prevalence.[34]

It was not possible to draw conclusions about the effectiveness of restricted travel and full border closures because the number of empirical studies was insufficient. Single studies identified that border closure in Africa had a minimal effect in reducing SARS-CoV-2 transmission, but the study was assessed as being at high risk of bias.[62] Screening for fever was also identified to be ineffective, with only 24% of positive cases being captured by screening.[54]

Comparison with other studies

Previous literature reviews have identified mask wearing as an effective measure for the containment of SARS-CoV-2[104]; the caveat being that more high level evidence is required to provide unequivocal support for the effectiveness of the universal use of face masks.[105 106] Additional empirical evidence from a recent randomised controlled trial (originally published as a preprint) indicates that mask wearing achieved a 9.3% reduction in seroprevalence of symptomatic SARS-CoV-2 infection and an 11.9% reduction in the prevalence of covid-19-like symptoms.[107] Another systematic review showed stronger effectiveness with the use of N95, or similar, respirators than disposable surgical masks,[108] and a study evaluating the protection offered by 18 different types of fabric masks found substantial heterogeneity in protection, with the most effective mask being multilayered and tight fitting.[109] However, transmission of SARS-CoV-2 largely arises in hospital settings in which full personal protective measures are in place, which suggests that when viral load is at its highest, even the best performing face masks might not provide adequate protection.[51] Additionally, most studies that assessed mask wearing were prone to important confounding bias, which might have altered the conclusions drawn from this review (ie, effect estimates might have been underestimated or overestimated or can be related to other measures that were in place at the time the studies were conducted). Thus, the extent of such limitations on the conclusions drawn remain unknown.

A 2020 rapid review concluded that quarantine is largely effective in reducing the incidence of covid-19 and covid-19 mortality. However, uncertainty over the magnitude of such an effect still remains,[110] with enhanced management of quality quarantine facilities for improved effective control of the epidemics urgently needed.[111] In addition, findings on the application of school and workplace closures are still inconclusive. Policy makers should be aware of the ambiguous evidence when considering school closures, as other potentially less disruptive physical distancing interventions might be more appropriate.[21] Numerous findings from studies on the efficacy of school closures showed that the risk of transmission within the educational environment often strongly depends on the incidence of covid-19 in the community, and that school closures are most successfully associated with control of SARS-CoV-2 transmission when other mitigation strategies are in place in the community.[112-118] School closures have been reported to be disruptive to students globally and are likely to impair children's social, psychological, and educational development[119 120] and to result in loss of income and productivity in adults who cannot work because of childcare responsibilities.[121]

Speculation remains as how best to implement physical distancing measures.[122] Studies that assess physical distancing measures might interchangeably study physical distancing with lockdown[35 52 56 64] and other measures and thus direct associations are difficult to assess.

Empirical evidence from restricted travel and full border closures is also limited, as it is almost impossible to study these strategies as single measures. Current evidence from a recent narrative literature review suggested that control of movement, along with mandated quarantine, travel restrictions, and restricting nationals from entering areas of high infection, are effective measures, but only with good compliance.[123] A narrative literature review of travel bans, partial lockdowns, and quarantine also suggested effectiveness of these measures,[124] and another rapid review further supported travel restrictions and cross border restrictions to stop the spread of SARS-CoV-2.[125] It was impossible to make such observations in the current review because of limited evidence. A German review, however, suggested that entry, exit, and symptom screening measures to prevent transmission of SARS-CoV-2 are not effective at detecting a meaningful proportion of cases,[130] and another review using real world data from multiple countries found that border closures had minimal impact on the control of covid-19.[126]

Although universal lockdowns have shown a protective effect in lowering the incidence of covid-19, SARS-CoV-2 transmission, and covid-19 mortality, these measures are also disruptive to the psychosocial and mental health of children and adolescents,[127] global economies,[128] and societies.[129] Partial lockdowns could be an alternative, as the associated effectiveness can be high,[130] especially when implemented early in an outbreak,[86] and such measures would be less disruptive to the general population.

It is important to also consider numerous sociopolitical and socioeconomic factors that have been shown to increase SARS-CoV-2 infection[131 132] and covid-19 mortality.[133] Immigration status,[83] economic status,[82 102] and poverty and rurality[99] can influence individual and community compliance with public health measures. Poverty can impact the ability of communities to physically distance,[134] especially in crowded living environments,[135 136] as well as reduce access to personal protective measures.[135 136] A recent study highlights that "a one size fits all" approach to public health measures might not be effective at reducing the spread of SARS-CoV-2 in vulnerable communities[137] and could exacerbate social and economic inequalities.[136 138] As such, a more nuanced and community specific approach might be required. Even though screening is highly recommended by WHO[139] because a proportion of patients with covid-19 can be asymptomatic,[139] screening for symptoms might miss a larger proportion of the population with covid-19. Hence, temperature screening technologies might need to be reconsidered and evaluated for cost effectiveness, given such measures are largely depended on symptomatic fever cases.

Strengths and limitations of this review

The main strength of this systematic review was the use of a comprehensive search strategy to identify and select studies for review and thereby minimise selection bias. A clinical epidemiologist developed the search

MS-DOH-21-1816-A-001035

BMJ: first published as 10.1136/bmj-2021-068302 on 17 November 2021. Downloaded from http://www.bmj.com/ on 18 November 2021 at Univ Of Mississippi Med Ctr Rowland Medical Library. Protected by copyright.

strategy, which was validated by two senior medical librarians. This review followed a comprehensive appraisal process that is recommended by the Cochrane Collaboration[31] to assess the effectiveness of public health measures, with specifically validated tools used to independently and individually assess the risk of bias in each study by study design.

This review has some limitations. Firstly, high quality evidence on SARS CoV-2 and the effectiveness of public health measures is still limited, with most studies having different underlying target variables. Secondly, information provided in this review is based on current evidence, so will be modified as additional data become available, especially from more prospective and randomised studies. Also, we excluded studies that did not provide certainty over the effect measure, which might have introduced selection bias and limited the interpretation of effectiveness. Thirdly, numerous studies measured interventions only once and others multiple times over short time frames (days *v* month, or no timeframe). Additionally, the meta-analytical portion of this study was limited by significant heterogeneity observed across studies, which could neither be explored nor explained by subgroup analyses or meta-regression. Finally, we quantitatively assessed only publications that reported individual measures; studies that assessed multiple measures simultaneously were narratively analysed with a broader level of effectiveness (see supplementary material 3, table 3). Also, we excluded studies in languages other than English.

Methodological limitations of studies included in the review

Several studies failed to define and assess for potential confounders, which made it difficult for our review to draw a one directional or causal conclusion. This problem was mainly because we were unable to study only one intervention, given that many countries implemented several public health measures simultaneously; thus it is a challenge to disentangle the impact of individual interventions (ie, physical distancing when other interventions could be contributing to the effect). Additionally, studies measured different primary outcomes and in varied ways, which limited the ability to statistically analyse other measures and compare effectiveness.

Further pragmatic randomised controlled trials and natural experiment studies are needed to better inform the evidence and guide the future implementation of public health measures. Given that most measures depend on a population's adherence and compliance, it is important to understand and consider how these might be affected by factors. A lack of data in the assessed studies meant it was not possible to understand or determine the level of compliance and adherence to any of the measures.

Conclusions and policy implications

Current evidence from quantitative analyses indicates a benefit associated with handwashing, mask wearing, and physical distancing in reducing the incidence of covid-19. The narrative results of this review indicate an effectiveness of both individual or packages of public health measures on the transmission of SARS-CoV-2 and incidence of covid-19. Some of the public health measures seem to be more stringent than others and have a greater impact on economies and the health of populations. When implementing public health measures, it is important to consider specific health and sociocultural needs of the communities and to weigh the potential negative effects of the public health measures against the positive effects for general populations. Further research is needed to assess the effectiveness of public health measures after adequate vaccination coverage has been achieved. It is likely that further control of the covid-19 pandemic depends not only on high vaccination coverage and its effectiveness but also on ongoing adherence to effective and sustainable public health measures.

We thank medical subject librarians Lorena Romero (LR) and Marshall Dozier (MD) for their expert advice and assistance with the study search strategy.

Contributors: ST, DG, DI, DL, and ZA conceived and designed the study. ST, DG, SS, AM, HW, WX, JR, ET, AM, XL, XZ, and IME collected and screened the data. ST, DG, and DI acquired, analysed, or interpreted the data. ST, HW, and SS drafted the manuscript. All authors critically revised the manuscript for important intellectual content.. XL and ST did the statistical analysis. NA obtained funding. LR and MD provided administrative, technical, or material support. ST and DI supervised the study. ST and DI had full access to all the data in the study and take responsibility for the integrity of the data and the accuracy of the data analysis. ST is the guarantor. The corresponding author attests that all listed authors meet authorship criteria and that no others meeting the criteria have been omitted.

Funding: No funding was available for this research. ET is supported by a Cancer Research UK Career Development Fellowship (grant No C31250/A22804). XZ is supported by The Darwin Trust of Edinburgh.

Competing interests: All authors have completed the ICMJE uniform disclosure form at www.icmje.org/disclosure-of-interest/and declare: ET is supported by a Cancer Research UK Career Development Fellowship and XZ is supported by The Darwin Trust of Edinburgh; no financial relationships with any organisations that might have an interest in the submitted work in the previous three years; and no other relationships or activities that could appear to have influenced the submitted work.

Ethical approval: Not required.

Data sharing: No additional data available.

The lead author (ST) affirms that the manuscript is an honest, accurate, and transparent account of the study reported; no important aspects of the study have been omitted. Dissemination to participants and related patient and public communities: It is anticipated to disseminate the results of this research to wider community via press release and social media platforms.

Provenance and peer review: Not commissioned; externally peer reviewed.

PUBLIC HEALTH AUTHORITY TO PREVENT AND CONTROL THE SPREAD OF COMMUNICABLE AND INFECTIOUS DISEASE

POSITION

The Association of State and Territorial Health Officials (ASTHO) supports the establishment of robust public health legal authorities to facilitate the timely and adequate response to communicable and infectious disease outbreaks. These legal authorities are often exercised without the need of an emergency declaration and may allow, among other things, the abatement of nuisances, investigation of the causes of disease, institution of quarantine measures, ordering individuals or groups to isolate, conducting contact tracing and case investigations, collecting data, temporarily limiting or canceling public events, temporarily restricting or closing venues, and requiring vaccination verification for certain conduct and activities (e.g., school attendance). Beyond their use in the response to the historic pandemic caused by the novel coronavirus, in the past, these powers have been routinely exercised for more commonly experienced disease outbreaks, such as mumps and measles. Additionally, other societal sectors, such as business, education, cultural, and religion often depend on public health to stop the spread of infectious disease, prevent widespread disruptions, and quell public anxiety and fear. Maintaining these state and territorial legal authorities are key to being prepared for communicable and infectious disease outbreaks both now and in the future.

Summary of Recommendations:

- Public health legal authority that facilitates a skillful response to disease outbreaks without undue delay.
- Public health authorities that are guided by data and science.
- Ensure that public health authority balances individual rights with the responsibility to protect the public's well-being.
- Support public health authority that is reasonable and aligned with disease prevention and control activities.
- Public health legal authority that is able and sufficient to respond to future disease

BACKGROUND

Establishing and using legal authority to control the spread of infectious disease dates to before the founding of the country. For example, colonial governments implemented isolation and quarantine precautions for incoming ships to prevent the introduction and spread of smallpox and other contagions.[1] These powers and activities were seen not only as a way of protecting the health of the local communities but also protective of trade and commerce.[2] As the scientific understanding of communicable and infectious disease grew, new tools such as contact tracing, disease investigation, data collection, and vaccines were added to public health's legal authority and practice. During the current pandemic public health authority has been used, with evidenced benefit, to slow the spread of the coronavirus by limiting the size of gatherings, encouraging social distancing, temporarily closing high-risk venues, and requiring the use of face coverings in certain places.[3,4,5,6,7,8,9]

Despite the successes in exercising public health authority, grave questions and negative perceptions about the role and use of public health powers in response to the pandemic and, by implication, future infectious disease outbreaks have arisen. Over the last year, the critical attitude toward the pandemic response has led to the rolling back of public health authority in several jurisdictions.[10] The reductions in public health legal authority will conceivably make it more difficult to respond to future disease outbreaks. As state and territorial policy makers

continue to address the many issues related to the current pandemic, they are encouraged to consider these potential impacts and costs.

RECOMMENDATIONS

With regards to state and territorial public health authority to prevent and control the spread of communicable and infectious disease, ASTHO recommends:

- Maintaining public health's ability to implement non-medical and medical interventions (e.g., social distancing and distribution of vaccines) swiftly and adeptly by resisting the establishment of administrative burdens that delay public health action, endangers the public and leaves our community vulnerable to infectious disease outbreaks.
- Support evidence-based laws and policies related to the identification, prevention, and control of communicable and infectious diseases.
- Ensure that public health legal authority properly and adequately balances the rights of individuals with the responsibility and obligation to protect the public's health and well-being. Law and policy that undermines and encumbers public health decision making or arbitrarily limits the scope of public health authority, can impede the ability to prevent and control the spread of disease.
- Maintain public health legal authority that is reasonable and aligned with the preventing and controlling the spread of infectious disease. For example, individuals subject to isolation or quarantine should be guaranteed the right to due process, allowed to petition a court to review the government's action, and ensured of reducing any economic, social, or emotional harm. Additionally, public health authority should be able to align with disease it is confronted and allowed to be exercised in a way to address the identifiable characteristics of the disease.
- Ensure public health legal authorities that are appropriate and necessary for the prevention and control of future communicable and infectious disease outbreaks. Other airborne, highly contagious illnesses, like measles, can be effectively contained by implementing public health measures similar to those that have been questioned during the pandemic. Furthermore, the next major public health threat may spread in other ways meaning public health authority must be able to respond to novel, unknown diseases.

APPROVAL DATES

Prevention Policy Committee Approval:
Board of Directors Approval:
Policy Expires:

ASTHO membership supported the development of this policy, which was subsequently approved by the ASTHO Board of Directors. Be advised that the statements are approved as a general framework on the issue at a point in time. Any given state or territorial health official must interpret the issue within the current context of his/her jurisdiction and therefore may not adhere to all aspects of this Policy Statement.

Preparing for the Next Pandemic/Public Health Crisis: Lessons from the Last Decade and Beyond

- Audience: those developing/enacting policy and those implementing those policies

Core concepts/Needs:

- Strong and ever-ready public health core infrastructure
- Ready and available funding sources
- Public health must demonstrate credibility, depoliticize response(s), and champion health literacy.

Background

ASTHO will describe how programs, policy, and partnerships adapted and evolved during the COVID-19 pandemic response and propose approaches to sustain gains and/or respond in areas where gaps were identified. ASTHO will draw from peer networks, policy committees, and other stakeholders to collect lessons learned. The white paper will provide recommendations for policymakers for future responses. The background will include a summary of the:

- Historical context of public health crises during the last decade+
    - H1N1
    - Ebola
    - Zika
    - COVID

- Impact of public health crises on highlighting health disparities and inequities
- The need to support ongoing health literacy improvements nationally

<u>Barriers/Challenges, Solutions, and Lessons Learned</u>

Depoliticization of public health

- Public health principles and recommendations were challenged by many of our elected officials during the COVID-19 response. Public health must secure protection and support from leaders for future responses.
- Roles for state and federal public health and elected officials must be further clarified to allow for clearer crisis response.
    - There is a need for federal officials to initiate a review process to define more clearly the respective roles and responsibilities of public health officials at the federal, state, and local levels during a global pandemic.[1]
- Public health must practice good communication before, during, and after a crisis. Misinformation about the COVID-19 pandemic caused confusion, substandard uptake of COVID-19 vaccines, some in the public rejecting public health measures, and has led to harassment and violence against public health, health, and other frontline workers.[2]

- Improve communication will help to build support for public health for the future.[3]
- Governments can:
    - Convene partner organizations
    - Increase investment in research on misinformation
    - Continue to modernize public health communications
    - Increase resources and technical assistance to state and local public health agencies
    - Expand efforts to build long-term resilience to misinformation.[2]

Advancing Health Equity

- **Communities play a critical role in supporting the clinical response to the pandemic.**
    - Inadequate community engagement can lead to fear, mistrust, and a lack of compliance to public health measures by communities. Communities played a critical role in surveillance, testing, and contact tracing efforts.[4]
    - Communities must be central in the pandemic preparedness and response. Community engagement is not a one-time effort. Risk communication is necessary but not sufficient for successful community engagement and embracing a community resilience approach is needed for future pandemic response.[4]
- **The COVID-19 pandemic disproportionately impacted under-resourced and historically marginalized communities, who have faced both poorer health and economic outcomes.**
    - Social determinants of health have historically prevented populations from having fair opportunities for economic, physical, and emotional health, and the pandemic has exacerbated these factors.[7]

Sustainable, Consistent, Flexible and Available Funding

- **Funding should not be overly restricted or prescriptive.**
    - Federal funding is often overly prescriptive, and there is a growing need for more flexible funding to maintain capabilities before and between crises. Funding priorities should be made based on input from state/locals who understand their communities.
    - Funding should always support long-term resiliency and preparedness.
    - The federal funding strategy for public health primarily has favored a crisis-response approach over robust, sustained investment; and fiscal challenges at the state and local levels have further compounded the pressures on health departments nationwide.[5]
    - Strong pre-existing infrastructure is critical and requires steady and flexible federal funding
        - Infrastructure should include collaborations with healthcare, education, etc. and be flexible enough to respond with whatever information is available at the time and change as needed throughout the response.
- **Sometimes state public health must act before guidance is available.**
    - State/Local public health needs to be in a perpetual state of readiness with clear and available sources or emergency funding. This is essential.

- Key among the issues are workforce-related. Diminished funding has resulted in health departments being unable to attract, recruit, and retain the number of professionals with skills needed to respond to health threats.[7]

Conclusion

- Significant funding has provided opportunities for public health to respond to the current crisis, but more is still needed to continue to demonstrate the credibility of public health, depoliticize future responses, protect vulnerable members of society, and plan for the future.

Medicaid News & Updates

Mississippi lawmakers hear from doctors on what they'd

like to see in next Medicaid tech bill

October 12, WLBT, Courtney Ann Jackson - While Medicaid expansion wasn't brought up by lawmakers, the president of the state medical association ended his remarks with this request. "Inexcusably, we have forgone billions in federal assistance that would've helped our most vulnerable citizens," said Dr. Mark Horne. "We ask the legislature to act on expanding coverage in the upcoming session." The Mississippi Health Advocacy Program points to Medicaid expansion gaining new ground in other states that previously rejected it. "COVID 19 has caused us to re-evaluate our healthcare policies and choices," said Roy Mitchell, MHAP Executive Director. "So, it's time we re-evaluate our position on Medicaid expansion as well. Medicaid expansion has proven to save lives. We've got so far to go in correcting all the health inequities of this state. Let's start with Medicaid expansion."

Health care law on line at court, but is it likely to fall?

October 13, 2020, Associated Press, Jessica Gresko and Mark Sherman - The case before the court this year stems from Congress' decision in 2017 to eliminate the law's unpopular fines for not having health insurance. Despite repealing the fines, lawmakers left in place the law's requirement that virtually all Americans have coverage. Texas and other conservative-led states argue that the change makes the requirement unconstitutional and also dooms the rest of the law because the mandate was so central to it. But the court could simply "sever" the mandate from the law and leave the rest of the law alone. Many observers see that as a likely outcome and note the upheaval that would result across the American healthcare system if the law were to be struck down in its entirety. Before the Supreme Court's term began in October, Paul Clement, who argued in the 2012 Affordable Care Act case, said he wasn't sure that the addition of a new justice would change the outcome of the case. He suggested that it is unlikely that the whole statute will fall.

Mississippi Health Department makes free COVID-19 rapid testing available

October 12, 2020, The Clarion Ledger, Alissa Zhu - The Mississippi State Department of Health is making free rapid testing available at its drive-through community test sites, State Health Officer Dr. Thomas Dobbs announced Monday. Rapid test results will be returned within 15 minutes, but it's unclear how accurate they will be, Dobbs said. Rapid tests are done in the "front of the nose," as opposed to the deeper PCR tests MSDH has been using, he said. If people choose to take the rapid test, they will also receive a PCR test, the results of which will be returned within a few days, he said. They can also choose to take the PCR test only.

Almost two weeks without mask mandate, COVID-19 indicators trend in "wrong direction"

October 13, 2020, Mississippi Today, Alex Rozier - The seven-day average for new COVID-19 cases in Mississippi is now at 646, a 24% rise in the last week alone, and a 25% increase since Gov. Tate Reeves lifted the statewide mask mandate on Sept. 30.

Even as the Economy Grew, More Children Lost Health Insurance

October 9, The New York Times, Margot Sanger-Katz and Abby Goodnough - The share of children with health coverage in the United States fell for the third consecutive year in 2019, according to census data, after decades of increases. The decline occurred during a period of economic growth — before the coronavirus pandemic caused broad job losses that might have cost many more Americans their health insurance. A report Friday by the Georgetown Center for Children and Families found that the ranks of uninsured children grew the most in Texas and Florida, and that Latino children were disproportionately affected. Nationally, the number of children without health insurance rose by 320,000 last year alone, to a total of nearly 4.4 million children, the report found.

Cities and counties continue mask mandates as statewide order expires

October 8, 2020, MPB News, Kobee Vance - New coronavirus cases and hospitalizations have increased this week in Mississippi, and health officials have concerns about residents not wearing masks in public. The Governor chose not to extend his mask mandate last week, but some local officials have extended orders in their jurisdiction. Tupelo Mayor Jason Shelton has mandated face coverings be worn in public until November 11th. He says he's following recommendations of local health experts and says he's concerned that leaders like the President are discouraging mask usage. "The President kinda came across as anti-mask. That was [at] the debate on Tuesday. The next day you see his acolyte, Governor Reeves, do away with the mask requirement in the state of Mississippi," says Mayor Shelton. "That leads to people in the city of Tupelo refusing to wear a mask, and they're going to end up in the hospital or even worse."

Mississippi will not mandate masks at the polls ahead of Nov. 3 election

October 7, 2020, Daily Journal, Mississippi Center for Investigative Reporting, Jerry Mitchell - In Mississippi, those entering a school, a Wendy's or a Walmart must wear masks to prevent the spread of COVID-19. But those entering packed polling places don't have to don one."This is absolute insanity," said Dr. Claude Earl Fox III, a Mississippi native and former head of public health in Alabama. "What's to be gained by a no-mask requirement on Election Day?" Mississippi Secretary of State Michael Watson says masks can't be mandated at the polls this November because it's a federal election.
Assistant Secretary of State Kendra James explained that while their office recommends wearing masks, "the governor, nor anyone else, may impose requirements on voting. No entity other than Congress, the Mississippi Legislature or a validly enacted constitutional amendment may place requirements, such as wearing a mask, on voters."

Dr. Dobbs Warns Of COVID Surge, as State Fair Opens Without Mask Mandate

October 7, 2020, Jackson Free Press, Nick Judin - Only a week after Gov. Tate Reeves lifted the state's mask mandate, Mississippi's coronavirus numbers have reversed course, showing the first consistent signs of a new surge in what would be the third spike in the pandemic in the Magnolia State. The Mississippi State Department of Health announced 975 new cases of COVID-19 late last night, the highest single-day total since Aug. 19.

For-profit nursing homes in Mississippi had 3 times more COVID-19 deaths, analysis shows

October 7, 2020, The Clarion Ledger, Jerry Mitchell, Jayme Fraser and Kristine De Leon, Mississippi Center For Investigative Reporting - Twice as many residents caught COVID-19 at Mississippi's for-profit nursing homes, and nearly three times more died there, an analysis of health data by the Mississippi Center for Investigative Reporting shows. The average number of confirmed COVID-19 cases in these for-profit homes? Four in 10 residents. One possible factor: 80% of Mississippi's nursing homes had already been cited for infection-control problems before the pandemic hit. Charlene Harrington, a professor emeritus at the University of California at San Francisco who discovered similar results in a just-released study of nursing homes in California, said the current pandemic is exposing problems that have persisted for decades. "We've just looked the other way for 30 years," she said.

Mask Use Dropping Rapidly After Mississippi Mandate Ends, Dr. Dobbs Warns

October 6, 2020, Jackson Free Press, Julian Mills and Nick Judin - State Health Officer Dr. Thomas Dobbs is sounding the alarm, warning that mask usage is declining in Mississippi immediately after the governor lifted the statewide mask requirement. "Listen to the secret of Sweden's COVID response," Dobbs tweeted on Sunday, Oct. 4. "Near universal, voluntary compliance with public health guidance. Please mask up. Discouraging to see mask use dropping off so rapidly after mandate lifted."

Coalition calls for Medicaid expansion

October 2, 2020, MPB, Kobee Vance - Members of Southerners for Medicaid Expansion are holding a vigil honoring the more than 200,000 people who have died from the Coronavirus in the US. The coalition believes by not expanding the healthcare program, it has hurt the south's response to the coronavirus pandemic, especially for essential workers who's jobs are low pay. Dr. Charlene Collier with the state Department of Health says the coronavirus only made health disparities worse. "One of those being not having health insurance and access to adequate healthcare so even when you're thinking you're sick you don't have a doctor to start your care with, and then once you do finally get coverage, it's often for something that's more catastrophic, so not getting that early preventive care," says Dr. Collier.

Resource of the Week

Children's Uninsured Rate Rises by Largest Annual Jump in More Than a Decade

October 8, 2020, Georgetown University, Joan Alker and Alexandra Corcoran - For many years, the United States was on a positive trajectory in reducing the number and rate of uninsured children; in 2016, the nation attained a historic low of 3.6 million uninsured children. This progress occurred as a result of expansions of public coverage—primarily Medicaid and the Children's Health Insurance Program (CHIP)—and was accelerated by the implementation of the Affordable Care Act's (ACA) major coverage expansions in 2014. As employer-sponsored insurance became increasingly unaffordable for dependents, public coverage ameliorated the impacts of private coverage losses for children. However, the number of uninsured children began to increase in 2017 as Medicaid enrollment began to decline, and as Figure 1 shows, reached 4.4 million in 2019. This represents an increase of 726,000 children during this three-year period. The rate of uninsured children rose a full percentage point from 4.7 percent to 5.7 percent. Much of the gain in coverage that children made as a consequence of the ACA's major coverage expansions has now been eliminated. Moreover, the most recent year of data (2018 to 2019) shows the biggest one-year loss in children's coverage during this time period, with 320,000 more children becoming uninsured. These coverage losses occurred in a healthy economy with the lowest unemployment rate in decades prior to the economic shocks and job loss associated with the COVID-19 pandemic.

Public Health Forward: Modernizing the U.S. Public Health System

December 2021

MS-DOH-21-1816-A-001055

TASK FORCE MEMBERS

Mike Beebe, JD
Former Governor, Arkansas

Mary Ann Borgeson
Commissioner, Douglas County, Nebraska

Michael Curry, Esq.
President and CEO, Massachusetts League of Community Health Centers & Member, National Board of Directors, NAACP

Matt Eyles, MS
President and CEO, America's Health Insurance Plans

Charlotte Haberaecker
President and CEO, Lutheran Services in America

James Madara, MD
CEO and Executive Vice President, American Medical Association

Sly James, JD
Former Mayor, Kansas City, Missouri

John Kasich
Former Governor, Ohio

Ron Nirenberg
Mayor, San Antonio, Texas

Phyllis J. Randall
Chair At-Large, Loudoun County Board of Supervisors, Virginia

Michael Rell
Mayor, Town of Wethersfield, Connecticut

Kristen Silverberg, JD
Executive Vice President for Policy, Business Roundtable

Jonathan Singer, MSW
Former State Representative, Colorado

Deb Soholt, MSN
Former State Senator, South Dakota

PUBLIC HEALTH ADVISORY GROUP

John Agwunobi, MD, MBA, MPH
Chairman and CEO, Herbalife Nutrition

Oxiris Barbot, MD
Senior Fellow for Public Health and Social Justice, The JPB Foundation & Former Commissioner, New York City Department of Health and Mental Hygiene

Scott Becker, MS
CEO, Association of Public Health Laboratories

Kaye Bender, PhD, RN, FAAN
President, American Public Health Association

Georges C. Benjamin, MD
Executive Director, American Public Health Association

Gary Cox, JD
Professor and Associate Dean for Public Health Practice, University of Oklahoma Hudson College of Public Health

Bruce Dart, PhD
Executive Director, Tulsa Health Department

Karen DeSalvo, MD, MPH, MSc
Chief Health Officer, Google Health

David Fleming, MD
Distinguished Visiting Fellow, Trust for America's Health

Howard Frumkin, MD, MPH, DrPH
Professor Emeritus, University of Washington School of Public Health

Joxel Garcia, MD, MBA
CEO, Ambitna

Bruce Goldberg, MD
Professor, Oregon Health and Science University-Portland State University School of Public Health

J. Nadine Gracia, MD, MSCE
President and CEO, Trust for America's Health

Kevin Wu, MPP
Former Staff, BPC

ACKNOWLEDGMENTS

The Bipartisan Policy Center would like to recognize and thank the other members of the Public Health Forward coalition for their guidance and support: the Association of State and Territorial Health Officials; the Big Cities Health Coalition; the CDC Foundation; the de Beaumont Foundation; the Kresge Foundation; the National Association of County and City Health Officials; the Pew Charitable Trusts; the Public Health Accreditation Board; and the Sunflower Foundation. BPC would also like to thank the more than 100 experts and thought leaders who participated in six roundtables for their valuable input, as well as the participants of focus groups and town hall meetings, including Tribal Nation leaders and practitioners. In addition, BPC thanks the Johns Hopkins Bloomberg School of Public Health for its contributions to this project.

Call to Action for State, Territorial, and Local Policymakers to Move Public Health Forward

THE OPPORTUNITY

COVID-19 exposed numerous, long-standing, and deep fractures in our public health system and highlighted pervasive disparities among communities regarding factors that affect an individual's physical and mental health – access to affordable and nutritious food options, safe and affordable housing, financial security, and quality, affordable medical care. The infusion of federal relief funds presents policymakers with a historic opportunity to correct these problems and set a new course for health in the United States that advances health equity and enables each person to achieve their best health.

Public health serves a critical yet often invisible role in health. Although a disproportionate amount of attention is placed on medical care and the treatment of diseases, illnesses, and injuries, public health takes a community-wide approach to improving health and the social factors that contribute to good health. Healthy behaviors, social and economic factors, the physical environment, and other issues account for 80% of health outcomes, while clinical care is responsible for only 20%.[1] Through such activities as promoting healthy eating and active living, controlling infectious disease outbreaks, and preventing injuries, public health efforts allow Americans to live longer, healthier lives and is essential to the viability and prosperity of communities across the country. However, many Americans do not recognize the value that public health systems bring to their communities until these systems are most needed.

Public Health Forward: Modernizing the U.S. Public Health System defines a vision for health in the 21st century and provides a practical, prioritized, bipartisan set of actions for policymakers and public health officials to guide strategic investments and decision-making to achieve this vision. These actions are informed by evidence, build on previous consensus frameworks and objectives, and represent work by national thought leaders that has the support of public health practitioners across the country. **The nation's safety, security, and economic prosperity depends on a strong public health system.** ***We respectfully urge state and local policymakers to act now to fully realize the potential of this unique moment and secure the future of the public's health.***

THE VISION

In 2026, the United States is becoming a healthier nation because elected and public health officials seized the historic opportunity to invest in new and transformative ways to modernize the governmental public health system. The system is prepared to respond to a range of public health challenges, including a pandemic, obesity, mental illness, substance abuse, and climate change. In a healthier America:

- **Advances in health equity continue to be made** because public health departments partner with various sectors (e.g., housing, food, transportation), stakeholders (e.g., businesses, faith-based organizations, community-based organizations (CBOs), health care), and community members, and also engage in Tribal consultation, toward the shared goal of providing a fair and just opportunity for all to achieve good health and well-being.
- **Sufficient, predictable, and flexible public health funding supports the public health system** to sustain healthy communities. States, territories, and localities act quickly to protect the public from expected and unexpected health issues. This means that all public health departments have the necessary resources to support nationally agreed-upon core programs and cross-cutting skills and to meet national public health practice standards.
- **A robust, modern, interoperable, and secure public health information system delivers real-time, accurate, and actionable data** to help public health officials detect new or growing threats, identify groups that may be at risk, and respond quickly with tailored policy, practice, and program interventions. Public health departments also translate and share data with policymakers and other stakeholders in a timely manner.
- **Modernized laws, policies, and statutes** protect and promote the public's health in a manner that reflects ongoing threats and challenges, enables public health officials to make decisions without political influence, and ensures public health responsibilities remain intact and protected.
- **A highly skilled, trained, and diverse public health workforce** provides evidence-informed programs and services that address community health needs, encourage healthy behaviors, and act swiftly to respond to emerging threats. Staff feel valued and incentives exist to pursue long careers in governmental public health.

RECOMMENDED ACTIONS FOR STATE, TERRITORIAL, AND LOCAL POLICYMAKERS

Financing

1. **Provide flexible funding and maximize existing assets to support public health services and capabilities, including those needed to address health inequities.**

    A. Request assessments on the state of public health systems, specifically nationally agreed-upon core programs and cross-cutting skills needed to support public health everywhere.

        i. Devote funds for conducting these assessments, developing and implementing strategies to fill the gaps, engaging in continual quality improvement, and otherwise working toward meeting national public health practice standards.

    B. Direct appropriate agencies to work together and support this alignment by co-funding programs and strategies to improve health, based on routine needs assessments and improvement plans.

    C. Develop, advocate, and support budgetary mechanisms to facilitate blending and braiding funds from multiple sources, as well as accompanying measures to ensure transparency and accountability.

    D. Allocate funding for health departments to hire and retain a health equity leader who will have direct accountability to state, territorial, and local health directors, and develop measures that demonstrate health equity practices and their achievements.

2. **Evaluate the social and economic impact of public health programs and strategies.**

    A. Invest in public health system evaluation to illustrate the effects of allocations and investments at the state, territorial, and local levels.

Data and Information Technology

1. **Strengthen the collection of timely and actionable public health data to guide programs, respond to emergencies, and address health inequities.**

    A. Invest in modern, efficient, and interoperable information technology that equips state, territorial, and local health departments to:

        i. Collect, analyze, and share timely, accurate, subcounty data on health and health-related issues disaggregated by race, ethnicity, and other key sociodemographic characteristics.

MS-DOH-21-1816-A-001062

ii. Work with partners to ensure that data submitted are complete and of high quality.

B. Require that public health data are reported to agencies at all levels of government using interoperable electronic mechanisms.

2. **Invest in data sharing between public health departments and health care entities.**

A. Remove or support the removal of technical and legal barriers to data system interoperability with health care systems and Tribal health entities while ensuring that sufficient security safeguards are in place to achieve compliance with the Health Insurance Portability and Accountability Act (HIPAA).

B. Ensure that data sharing regulations are secure without being onerous.

i. Proactively support and incentivize partnerships that utilize official Memorandum of Agreement (MOU) documents to guide their collaboration.

C. Through legislation, require adherence to standards of the Office of the National Coordinator for Health Information Technology and the Centers for Disease Control and Prevention (CDC) for the collection and sharing of common data points.

Workforce

1. **Invest in the recruitment and retention of a diverse and inclusive governmental public health workforce.**

A. In partnership with local health departments, perform a statewide public health workforce needs assessment and fund public health department assessments of organizational culture.

B. Establish or promote robust and equitable employment programs on the state, territorial, and local levels to recruit, hire, and retain the next generation of public health practitioners, with a particular focus on individuals from communities experiencing health inequities.

2. **Improve hiring and promotion policies and processes to ensure high-quality public health services.**

A. Modernize existing civil service requirements and institute competitive pay structures to accommodate roles and responsibilities specific or unique to public health.

B. Approve budgets that ensure:

i. The training and professional development of the public health workforce involved with implementing core programs and applying

all necessary cross-cutting skills.

ii. Salary structures that are commensurate with roles and responsibilities and that are competitive with salaries for similar positions in nongovernmental agencies.

Public Health Laws and Governance

1. **Review, evaluate, and modernize public health governance structures and statutory responsibilities.**

   A. Conduct or promote a bipartisan, comprehensive review of existing policies and revise as needed to reflect the current roles and responsibilities of government in protecting and promoting health, including the ability of public health departments to make decisions without undue political influence.

      i. Work across various levels of government to determine the proper federal, state, territorial, and local framework for preemption, establishing minimum and maximum requirements, particularly in light of recent state action to roll back public health powers and place limits on local elected officials.

      ii. Consider how structures, processes, roles, and responsibilities should remain the same or change during a public health emergency; this task should include ensuring flexibility in personnel and procurement processes.

      iii. Examine whether existing funding streams are sufficient to support the revised public health governance structures and statutory authorities; elevate funding needs to relevant appropriators to fill gaps.

      iv. Ensure the law as written promotes trust through the removal of stigmatizing language, particularly as it relates to populations experiencing health inequities.

   B. For policymakers in jurisdictions adjacent to or containing sovereign Tribal Nations and health systems, review lines of communication and opportunities for formalized partnerships.

   C. Ensure that public health department leaders are empowered to make decisions without inappropriate political influence and have access to counsel with expertise in public health law.

2. **Support and clearly communicate the roles of public health departments to the public.**

   A. Invest in evidence-informed messaging and effective communication by health departments, using multiple platforms.

MS-DOH-21-1816-A-001064

i. Use all media outlets, including online and social media vehicles.

ii. Use media outlets serving subpopulations, including those in different languages.

B. Coordinate messaging with and across public health departments, both during emergency and non-emergency situations.

i. Ensure messaging is culturally competent.

ii. Use language that elicits a sense of trust in government.

C. Engage with constituents during public health emergencies to correct misinformation and explain the role of public health departments.

D. Provide forums for stakeholders in public health, the business community, and health care to identify shared goals and strategies that reflect public health authorities, public health protection, and a strong and stable economy.

Partnerships

1. **Incentivize partnerships between public health departments and other sectors (e.g., housing, food, transportation) and stakeholders (e.g., business, faith-based organizations, health care).**

   A. Allocate funding to support the development and maintenance of partnerships that aim to provide a fair and just opportunity for all to achieve good health and well-being.

2. **Establish a dedicated body charged with routinely monitoring, assessing, and influencing the implications for health in all government sector policy discussions.**

   A. Establish and participate in an advisory board that integrates and articulates health considerations into policymaking across all government sectors to improve the health of people and communities.

   B. Conduct health impact assessments on legislation to identify potential connections between health and factors that affect health (e.g., housing, affordable and nutritious food options, employment, and environment).

Community Engagement

1. **Invest in long-term relationship-building and partnership development with residents and community-based organizations (particularly those serving communities experiencing health inequities) and in Tribal consultation.**

A. Allocate funds to public health departments for community collaboration and develop output measures that account for progress toward building trust and working in partnership.

B. Engage in routine Tribal consultation to support intergovernmental public health planning that recognizes Tribal authority, autonomy, and self-governance.

C. Act as liaisons between public health departments and citizen representatives, especially from communities historically experiencing health inequities, who can elevate on-the-ground concerns and offer their input on public health issues.

2. **Invest in increasing the capacity of community-based organizations (CBOs) and provide resources to support collaboration with public health departments.**

   A. Allocate funds to support the capacity-building of CBOs.

   B. Lead regular town halls and forums with CBOs and public health officials to present evidence-based information that deepens understanding of health inequities, their causes, and their consequences.

Call to Action for State, Territorial, and Local Public Health Departments to Move Public Health Forward

THE OPPORTUNITY

COVID-19 exposed numerous, long-standing, and deep fractures in our public health system and highlighted pervasive disparities among communities regarding factors that affect an individual's physical and mental health – access to affordable and nutritious food options, safe and affordable housing, financial security, and quality, affordable medical care. The infusion of federal relief funds presents policymakers with a historic opportunity to correct these problems and set a new course for health in the United States that advances health equity and enables each person to achieve their best health.

Public health serves a critical yet often invisible role in health. Although a disproportionate amount of attention is placed on medical care and the treatment of diseases, illnesses, and injuries, public health takes a community-wide approach to improving health and the social factors that contribute to good health. Healthy behaviors, social and economic factors, the physical environment, and other issues account for 80% of health outcomes, while clinical care is responsible for only 20%.[2] Through such activities as promoting healthy eating and active living, controlling infectious disease outbreaks, and preventing injuries, public health efforts allow Americans to live longer, healthier lives and is essential to the viability and prosperity of communities across the country. However, many Americans do not recognize the value that public health systems bring to their communities until these systems are most needed.

Public Health Forward: Modernizing the U.S. Public Health System defines a vision for health in the 21st century and provides a practical, prioritized, bipartisan set of actions for policymakers and public health officials to guide strategic investments and decision-making to achieve this vision. These actions are informed by evidence, build on previous consensus frameworks and objectives, and represent work by national thought leaders that has the support of public health practitioners across the country. **The nation's safety, security, and economic prosperity depends on a strong public health system.** ***We respectfully urge state and local public health officials to act now to fully realize the potential of this unique moment and secure the future of the public's health.***

THE VISION

In 2026, the United States is becoming a healthier nation because elected and public health officials seized the historic opportunity to invest in new and transformative ways to modernize the governmental public health system. The system is prepared to respond to a range of public health challenges, including a pandemic, obesity, mental illness, substance abuse, and climate change. In a healthier America:

- **Advances in health equity continue to be made** because public health departments partner with various sectors (e.g., housing, food, transportation), stakeholders (e.g., businesses, faith-based organizations, community-based organizations (CBOs), health care), and community members, and also engage in Tribal consultation, toward the shared goal of providing a fair and just opportunity for all to achieve good health and well-being.
- **Sufficient, predictable, and flexible public health funding supports the public health system** to sustain healthy communities. States, territories, and localities act quickly to protect the public from expected and unexpected health issues. This means that all public health departments have the necessary resources to support nationally agreed-upon core programs and cross-cutting skills and to meet national public health practice standards.
- **A robust, modern, interoperable, and secure public health information system delivers real-time, accurate, and actionable data** to help public health officials detect new or growing threats, identify groups that may be at risk, and respond quickly with tailored policy, practice, and program interventions. Public health departments also translate and share data with policymakers and other stakeholders in a timely manner.
- **Modernized laws, policies, and statutes** protect and promote the public's health in a manner that reflects ongoing threats and challenges, enables public health officials to make decisions without political influence, and ensures public health responsibilities remain intact and protected.
- **A highly skilled, trained, and diverse public health workforce** provides evidence-informed programs and services that address community health needs, encourage healthy behaviors, and act swiftly to respond to emerging threats. Staff feel valued and incentives exist to pursue long careers in governmental public health.

MS-DOH-21-1816-A-001068

RECOMMENDED ACTIONS FOR PUBLIC HEALTH DEPARTMENTS

Financing

1. **Provide flexible funding and maximize existing assets to support public health services and capabilities, including those needed to address health inequities.**

   A. Develop accountability measures for all funding streams.

   B. Assess public health systems, including evaluating current investments and capacity, identifying gaps in core programs and cross-cutting skills, and analyzing whether they meet national public health standards.

   C. Embed principles of health equity in core programs and cross-cutting skills and dedicate resources as needed to ensure they are operational.

   D. Collaborate with the state Medicaid agency to identify opportunities to co-fund health initiatives targeting communities experiencing health inequities.

   E. As appropriate, explore resource sharing arrangements with neighboring departments to fill in gaps or increase effectiveness and efficiency of foundational public health services.

2. **Evaluate the social and economic impact of public health programs and strategies.**

   A. Develop a dashboard to track high-level expenditures and progress toward meeting shared goals and targets.

Data and Information Technology

1. **Strengthen the collection of timely and actionable public health data to guide programs, respond to emergencies, and address health inequities.**

   A. Consistently collect data needed to identify, document, and address health inequities in local communities.

   B. Work with partners to submit data to public health departments that is timely, accurate, and complete.

   C. Share and display this data in real time, with user-friendly data dashboards available to other governmental agencies and the public.

2. **Invest in data sharing between public health departments and health care entities.**

A. Develop and implement policies and procedures that adhere to the standards of the Office of the National Coordinator for Health Information Technology (ONC) and the Centers for Disease Control and Prevention (ONC/CDC).

B. Ensure that those reporting data are adhering to ONC/CDC standards.

C. Enter into data-sharing agreements with Medicaid agencies.

Workforce

1. **Invest in the recruitment and retention of a diverse and inclusive governmental public health workforce.**

   A. Determine the number and type of staff needed to provide public health services.

   B. Formalize partnerships and programs with academic institutions including Historically Black Colleges and Universities, Hispanic-Serving Agricultural Colleges and Universities, and Tribal Colleges and Universities—local boards of health, and technical training programs to build a cross-disciplinary workforce and provide students with experiential opportunities in public health.

   C. Work with partners to expand internships, fellowships, workforce pipeline, loan-repayment, and other career on-ramp programs.

      i. Provide tailored opportunities to individuals in under-represented populations.

   D. Hire outreach workers who live in communities experiencing health inequities to assist with building trusting relationships and engaging community members.

   E. Assess organizational culture and make changes as needed to ensure the workplace is culturally competent and supportive of all staff.

2. **Improve hiring and promotion policies and processes to ensure high-quality public health services.**

   A. Partner with leaders in government reform to update merit systems, civil service requirements, position descriptions, and human resources systems.

   B. Provide professional development opportunities, giving public health workers the skills and knowledge needed to meet modern public health challenges (e.g., change management, data science skills, and cultural and linguistic competencies).

   C. Work to secure a full complement of health supports to prevent burnout and turnover, including mental health services and comprehensive paid leave.

Public Health Laws and Governance

1. **Review, evaluate, and modernize public health governance structures and statutory responsibilities.**

    A. Direct counsel with public health law expertise to review existing regulations and ensure they are relevant, provide the ability to protect the health of the public, and are legally sound.

    B. Ensure that opportunities for public input in rule-making processes are widely publicized, transparent, and easily accessible.

        i. Specifically solicit feedback from those who will be most affected by new rules.

2. **Support and clearly communicate the roles of public health departments to the public.**

    A. Develop and maintain ongoing relationships with local and statewide media.

    B. Develop, routinely update, and implement a communications plan that articulates public health responsibilities.

    C. Maintain the expertise to develop and implement a risk communications strategy.

Partnerships

1. **Incentivize partnerships between public health departments and other sectors (e.g., housing, food, transportation) and stakeholders (e.g., business, faith-based organizations, health care).**

    A. Clearly delineate shared goals, respective responsibilities, and collaboration guidelines for decision-making, conflict resolution, and data sharing; use this as a foundation for sustainable collaborations.

2. **Establish a dedicated body charged with routinely monitoring, assessing, and influencing the implications for health in all government sector policy discussions**

    A. Provide examples and evidence-informed practices to support health impact assessments and policy discussions.

Community Engagement

1. **Invest in long-term relationship-building and partnership development with residents and community-based organizations, particularly those serving communities experiencing health inequities, and engage in Tribal consultation.**

A. Dedicate staff time to long-term community engagement efforts.

B. Compensate community members and organizations for their time and expertise on planning and implementing health improvement strategies and actions.

C. Invest in and formalize consultation practices between state and local health departments and Tribal health departments to address community-wide health planning and decision-making.

2. **Invest in the capacity of community-based organizations (CBOs) and provide resources to support collaboration with public health departments.**

   A. Formalize public health planning and processes that rely on input from, and share decision-making with, CBOs and the people they serve.

   B. Work with CBOs to identify opportunities to strengthen their organizational capacity and dedicate staff time and funds to mentor and train on topics such as grant writing, grant reporting, data collection and analysis, project evaluation, and publishing academic papers.

Introduction

COVID-19 has made clear that the nation's safety, health, and economic prosperity depend on its ability to minimize the effects of devastating public health threats. Even in the absence of an emergency, a robust governmental public health system is needed to ensure conditions in which all people can achieve their fullest potential for health and well-being. Although clinical health care plays an important role in treating disease, public health plays an equally important but largely invisible role in keeping people healthy.

Public health seeks to protect the health of entire populations through the promotion of healthy lifestyles; the research and applied practice of disease and injury prevention; and the detection and prevention of, as well as response to, infectious diseases.[3] In the 20th century, the average lifespan in the United States increased by 30 years, with 25 of those years attributable to public health advances.[4] These advances included safer food and water, improvements in motor vehicle safety due to the addition of features such as seat belts and changes in highway design, and widespread vaccinations, which have drastically reduced the rate of many diseases, especially for children. And yet, decades of decreased funding for public health has hampered its ability to make meaningful advances in tackling challenges such as the obesity and opioid epidemics. Chronic underfunding also means that most public health departments do not have the bandwidth to support a growing crisis in mental health or sufficiently prepare for anticipated health crises related to climate change.

Pervasive health inequities, driven by socioeconomic differences in urban, rural, and Tribal communities that have existed for much of the country's history, were also illuminated during the pandemic. These inequities prevent the United States from meeting its full potential, not only as it relates to the health of affected individuals but also to the estimated $93 billion in excess medical care costs and $42 billion in lost productivity per year attributed to health disparities.[5] Because 80% of a person's health can be attributed to socioeconomic factors such as access to nutritious food, quality education, and a safe physical environment,[6] public health should partner with other sectors and government agencies to address these sources of health and reduce inequities.

In addition, the pandemic has worsened behavioral health, with individuals reporting higher levels of stress and more disorders, including depression and anxiety. Traditionally, the health care system has taken a clinical approach to help such individuals. A public health approach to behavioral health as pioneered by cities such as New York and Philadelphia offers promise by strengthening community-based services to meet behavioral needs along a

continuum, not just those requiring clinical intervention, and emphasizing prevention and early intervention.[7]

Compounding all of these challenges, it is an unfortunate reality that public health also has a deep trust problem. Polls conducted in the spring of 2020 showed great support for public health, with 85% of Republicans and 74% of Democrats rating public health officials such as those at the CDC as "doing an excellent/good job responding to the coronavirus outbreak."[8] And yet, an RWJF/Harvard poll conducted from mid-February to mid-March 2021 found something markedly different: Only 44% of respondents trusted the recommendations of their local health department a great deal or quite a lot, and 41% trusted those from their state health department a great deal or quite a lot, leaving the remainder only somewhat trusting them or not trusting them at all.[9] Politicization, misinformation, and mixed communication initiatives are some of the factors responsible for these findings. The lack of trust undermines public safety and the purpose of public health now and in the future.

Public Health Forward: Modernizing the U.S. Public Health System defines a vision for a modernized public health system in the 21st century and provides a framework of practical, prioritized, and bipartisan actions for policymakers and public health officials to guide strategic investments and decision-making to help translate the vision into a reality with a focus on equity. The federal government continues to provide critical leadership and funding to navigate the current pandemic and has a responsibility to make significant investments and changes in public health for the post-pandemic future. Long-term, increased, sustainable funding and policy leadership from the federal government will be crucial to support this five-year vision, framework, and set of actions, as most public health departments are concerned over their funding levels, notwithstanding the recent infusion of money.[10]

Researchers have estimated that it would cost $10.94 billion in additional resources annually, or $34.20 per capita, to fund what experts consider a minimum package of public health services for each state and local public health department.[11] Separate from this project, the Bipartisan Policy Center recently published a report that called for Congress to pass $4.5 billion in permanent annual funding to be distributed to states, localities, tribes, and territories to support foundational public health capabilities, and to reform the existing Prevention and Public Health Fund and increase its annual funding to $4 billion to support public health programs and meet local needs. Departments and agencies with jurisdiction over public health such as the CDC, U.S. Department of Agriculture, and U.S. Department of Health and Human Services (HHS) all make meaningful contributions through the development of regulations, standards, and effective public health messaging and guidance. However, this report's focus is on governmental public health systems at the state, territorial, and local levels, where most public health policy is enacted and

MS-DOH-21-1816-A-001074

critical decisions are made regarding the stewardship and allocation of federal funds. While Tribal health systems and public health departments are critical to community health, this report is not intended to provide recommendations to support the modernization of these systems. The report does include recommendations to improve consultation and collaboration between U.S. and Tribal governments to support shared public health priorities. Policymakers and public health leaders must embrace this unique moment and strategically plan and implement a well-resourced, modern public health system that builds capacity at all levels of government and in every state, territory, and locality.

THE OPPORTUNITY

The infusion of federal COVID-19 relief funds is an opportunity to strategically invest in and modernize the public health system. Legislation to improve the sustainability of public health departments includes $7.4 billion for the recruitment and hiring of public health workers and $2.45 billion for emergency preparedness and response purposes. In addition, some of the COVID-19 relief funding packages can be invested in public health departments to provide long-term benefits by supporting public health science, policy, systems, and infrastructure. (See Appendix 1: Federal Investments in Public Health in COVID-19 Relief Legislation for additional details.) Policymakers should use the growing awareness of the importance of the public health field to set a new course for health in the United States, while also fostering greater trust in government and science.

Public Health Forward provides recommended actions to policymakers and public health leaders to steward the use of this one-time infusion to provide long-term strategic benefits to state, territorial, and local public health systems. As noted above, greater, sustained, and less siloed funding will be necessary in the near future to ensure these benefits continue.

The report's recommendations build on several national public health frameworks and reports which articulate the foundational requirements for optimal public health systems. These reports include the following:

- *Public Health 3.0* describes the role of public health departments in the 21st century and calls on public health leaders to serve as Chief Health Strategists for their communities and departments to engage in cross-sector partnerships; upgrade and monitor data systems with an emphasis on hyper-local data; hire a diverse and inclusive workforce; and provide foundational public health capabilities.[12]
- *Foundational Public Health Services* defines the cross-cutting skills and capabilities, as well as the core programs, needed in all health departments to fulfill their responsibilities.[13]

- *Public Health COVID-19 Impact Assessment* examines how public health departments fared during the pandemic, including their key contributions and challenges faced, and identifies "priority areas and policy considerations" for policymakers to develop a 21st century public health system.[14]
- Recommendations by the Robert Wood Johnson Foundation's National Commission to Transform Public Health Data Systems are targeted at government at all levels, businesses, CBOs, philanthropy, and other parties to "reimagine how data are collected, shared, and used, and identify the investments needed to improve health equity."[15]
- CDC's Data Modernization Initiative presents a vision of what the modernization strategy was created to do, guides decisions for allocating resources, and provides a structure to track progress and success along the way.[16]
- The National Consortium for Public Health Workforce Development's report, *Building Skills for a More Strategic Public Health Workforce: A Call to Action*, provides a common framework for modernizing the state, local, territorial, and Tribal public health workforce through recruitment, hiring, and retention priorities.[17]

Additionally, a number of states, including Indiana,[18] Kentucky,[19] Ohio,[20] Oregon,[21] Washington,[22] and others[23] have modernized their public health systems or are in the process of modernizing. These states' efforts are a natural learning laboratory and provide examples of this report's recommendations in action.

In short, we already know what needs to be done, and we urge policymakers and public health officials to seize this unique moment and take action.

METHODOLOGY

The *Public Health Forward* project team was led by a Steering Committee representing national philanthropic foundations, public health membership associations, the Bipartisan Policy Center, and two public health practice consultants. An Advisory Board of national high-level public health leaders and experts also provided valuable input. A research team from the Johns Hopkins Bloomberg School of Public Health reviewed literature on public health frameworks in several focus areas (see Appendix 2) and supported several qualitative research activities to ensure that the project reflected the needs and recommendations from the perspective of public health leaders, practitioners, and community members who have experienced health inequities.

The project team conducted an inclusive mixed methods outreach process that included project oversight, guidance, and key input from critical stakeholders in alignment with the *Public Health Forward* project goals. This mixed-methods

MS-DOH-21-1816-A-001076

process was designed to capture real-time perspectives from high-level decision-makers, experts, and front-line practitioners on needs, challenges, and best practices to support public health responsiveness, improved health outcomes for all populations, and performance improvement and innovation. The project's Steering Committee, a Public Health Advisory Board of national public health leaders, and a bipartisan task force representing former elected officials, health care, businesses, and faith-based leaders provided general oversight and guidance to the project team to inform the project goals and recommendations. The team received additional input and feedback throughout the project via:

- Roundtable discussions with experts in each of the six priority areas.
- Listening sessions and town halls with state and local public health officials and staff members (including those in rural areas and big cities); Tribal public health stakeholders; and community-based organizations.
- Follow-up one-on-one interviews to gather additional information on health equity, data transformation, and public health funding challenges.
- An online survey using the Qualtrics XM platform to gather feedback from more than 650 public health stakeholders to understand public health priorities, public health practice opportunities and challenges, and COVID-19 considerations affecting public health system modernization.
- An online survey to gather feedback from roundtable participants on the final actions and recommendations.

All meetings, roundtables, listening sessions, and town halls were conducted and recorded via Zoom. The survey results and session transcripts were analyzed to thematically categorize the responses.

The Vision

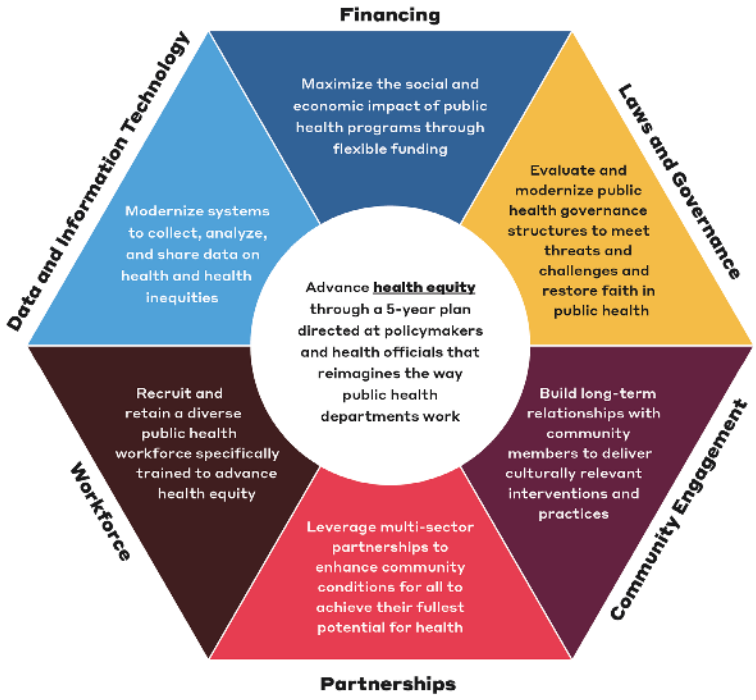
In 2026, the United States is becoming a healthier nation because elected and public health officials seized the historic opportunity to invest in new and transformative ways to modernize the governmental public health system. The system is prepared to respond to a range of public health challenges, including a pandemic, obesity, mental illness, substance abuse, and climate change. In a healthier America:

- **Advances in health equity continue to be made** because public health departments partner with various sectors (e.g., housing, food, transportation), stakeholders (e.g., businesses, faith-based organizations, community-based organizations (CBOs), health care), and community members, and also engage in Tribal consultation, toward the shared goal of providing a fair and just opportunity for all to achieve good health and well-being.
- **Sufficient, predictable, and flexible public health funding supports the public health system** to sustain healthy communities. States, territories, and localities act quickly to protect the public from expected and unexpected health issues. This means that all public health departments have the necessary resources to support nationally agreed-upon core programs and cross-cutting skills and to meet national public health practice standards.
- **A robust, modern, interoperable, and secure public health information system delivers real-time, accurate, and actionable data** to help public health officials detect new or growing threats, identify groups that may be at risk, and respond quickly with tailored policy, practice, and program interventions. Public health departments also translate and share data with policymakers and other stakeholders in a timely manner.
- **Modernized laws, policies, and statutes** protect and promote the public's health in a manner that reflects ongoing threats and challenges, enables public health officials to make decisions without political influence, and ensures public health responsibilities remain intact and protected.
- **A highly skilled, trained, and diverse public health workforce** provides evidence-informed programs and services that address community health needs, encourage healthy behaviors, and act swiftly to respond to emerging threats. Staff feel valued and incentives exist to pursue long careers in governmental public health.

MS-DOH-21-1816-A-001078

Framework for a 21st Century Public Health System

The country faces tremendous public health challenges beyond the pandemic, including the growing prevalence of obesity and chronic health conditions such as diabetes, mental illness and substance abuse, and the emerging effects of climate change. The mission is daunting but identifying key actions for state and local policymakers and public health officials will enable the United States to prioritize and take the necessary steps in the next five years to plan and implement a system to address these and future, unknown challenges. To manifest its vision of a 21st century public health system, the task force proposes the following framework that consists of action in six core areas.



This framework is designed for elected and public health officials to implement together, and the actions are intended to be tailored to meet the unique needs and realities of each community. This framework, and the actions it supports, is intentionally centered on health equity, which requires addressing the conditions necessary for all people to achieve their fullest potential for health and well-being. These actions, as part of a public health transformation, will drive tangible improvements in health outcomes such as infant mortality, the prevalence of chronic diseases that are the leading cause of death and disability, and mental wellness, and will enable the country to better prevent and address pandemics, natural disasters, lead contamination of water, and other major incidents.

Recommended Actions

Because of federalism, funding resources are directed in most cases to states and territories, where public health policy typically resides. Therefore, this report's focus is the state/territory and its subdivisions. That said, big cities in particular retain many authorities through statute or federal or local funding mechanisms that can lead to implementation of different policies and practices than their state counterparts. The public health system in each state or territory consists of policymakers and public health departments at all levels of government (including, in some places, Tribal Nations), the health care sector, community-based organizations, and others who contribute to the public's health and well-being. In this document, we call on elected policymakers to enact policies that will transform the public health system in their state, and we urge public health department leaders to take specific actions critical to fully implementing policies.

FINANCING

Vision: Sufficient, predictable, and flexible funding supports the public health system *and enables it to sustain healthy communities across the country and act quickly to protect the public from expected and unexpected health issues. All public health departments need the resources, support, and skills to provide core programs, address challenges unique to their jurisdictions, and meet national public health practice standards.*

For many years, public health departments have been forced to rely on limited and inconsistent funding—often in the form of state and federal grants that are restricted to addressing specific diseases and health conditions—to do their work.[24] This siloed approach makes it nearly impossible for public health departments to build the cross-cutting competencies and skills needed to address challenges and health inequities experienced by low-income, rural, Tribal Nations, and communities of color. Accordingly, restrictive funding sources inhibit public health departments by reducing their nimbleness to respond to emerging problems and limiting their ability to address priority issues specific to their jurisdiction and advance health equity. Finally, budget cuts over the past two decades have further hampered the ability of many public health departments to offer basic public health services, not only for COVID-19 and other infectious diseases but for all public health threats and conditions.

Basic public health services, comprising core programs and the skills needed to implement them, are detailed in Foundational Public Health Services, a

MS-DOH-21-1816-A-001080

framework developed by national thought leaders and embraced by public health practitioners. Public health departments need sufficient, predictable, and flexible funding to support these core programs and skills – not only in the pandemic's immediate aftermath but also in the long term. Flexible funding refers to multisource funding that gives recipients latitude in usage, particularly to meet local needs that may vary by community, and it stands in contrast to restricted funding. Sound accountability mechanisms are also necessary. Achieving public health accreditation, or being on a pathway to accreditation, is one way for public health departments to demonstrate their adherence to national standards (which include sound fiscal practices). Funding should also incorporate the supports needed for public health departments to participate in the accreditation process.

Resource sharing offers another potential strategy for enhancing the financing of public health departments. By pooling resources and sharing staff, expertise, funds, and programs, local public health departments often accomplish more together than they could alone. Cross-agency resource-sharing agreements take many different forms (in terms of precisely what is shared and how activities are governed) and are driven by what the partners want to achieve. When established by willing partners and developed in a thoughtful and comprehensive manner, sharing arrangements can improve the efficiency and effectiveness of programs and strategies, and thus may merit consideration in some circumstances.[25]

Finally, a solid understanding of the social and economic value of the public health system would well serve the public and policymakers. Many public health functions are invisible and taken for granted; for example, the public typically sees tap water and food as safe for consumption. Sadly, public health programs and services become visible only when a problem arises, for example when inspections identify contamination, or departments issue public warnings and address hazards. More evidence about the effect of public health interventions would provide further accountability and additional justification about the importance of investing in public health.

Action #1: Provide flexible funding and maximize existing assets to support public health services and capabilities, including those needed to address health inequities.

A clear need exists to redesign how funds are allocated and appropriated. We encourage policymakers to blend and braid funds from multiple sources to provide a single pool of funding that supports core programs and cross-cutting skills for all state and local jurisdictions. Accountability mechanisms should be built in to track how funding from each source is spent and what was achieved, with greater focus on outcomes and less focus on reporting. Also, where

appropriate, policymakers can support cross-agency service sharing (following best practices and adapting models developed by the Center for Sharing Public Health Services[26]) as another way of ensuring that jurisdictions are served by core programs and cross-cutting skills in an effective and efficient manner.

Although this report's focus is on short-term activities, long-term funding strategies are needed to sustain a robust public health system. Implementing the recommendations will establish the foundation needed to build a modern public health system that is equipped to meet health challenges while providing a structure to be supported in the long-term by sustainable funding mechanisms.

1. Request assessments on the state of public health systems, specifically nationally agreed-upon core programs and cross-cutting skills needed to support public health everywhere.
    A. Devote funds for conducting these assessments, developing and implementing strategies to fill the gaps, engaging in continual quality improvement, and otherwise working toward meeting national public health practice standards.
2. Direct appropriate agencies to work together and support this alignment by co-funding programs and strategies to improve health, based on routine needs assessments and improvement plans.
3. Develop, advocate, and support budgetary mechanisms to facilitate blending and braiding funds from multiple sources, as well as accompanying measures to ensure transparency and accountability.
4. Allocate funding for health departments to hire and retain a health equity leader who will have direct accountability to state, territorial, and local health directors, and develop measures that demonstrate health equity practices and their achievements.

1. Develop accountability measures for all funding streams.
2. Assess public health systems, including evaluating current investments and capacity, identifying gaps in core programs and cross-cutting skills, and analyzing whether they meet national public health standards.
3. Embed principles of health equity in core programs and cross-cutting skills and dedicate resources as needed to ensure they are operational.
4. Collaborate with the state Medicaid agency to identify opportunities to co-fund health initiatives targeting communities experiencing health inequities.

5. As appropriate, explore resource sharing arrangements with neighboring departments to fill in gaps or increase effectiveness and efficiency of foundational public health services.

Action #2: Evaluate the social and economic impact of public health programs and strategies.

The social and economic value of public health is often underestimated and misunderstood, despite the numerous studies that find huge cost savings and gains in the 20th century and the first decade of the 21st century from public health improvements. A systematic review of public health interventions in high-income countries, including the United States, Australia, and the United Kingdom, found that the median return on investment for all public health interventions was 14 to 1.[27]

More recent public health accomplishments include healthier newborns, greater prevention of cardiovascular diseases, and greater occupational safety.[28] Because it may not always be possible to quantitively assess certain public health programs and strategies, evaluations should be holistic in determining the impact on population health, reflecting changes to health outcomes, community feedback, and qualitative analysis.

1. Invest in public health system evaluation to illustrate the effects of allocations and investments at the state, territorial, and local levels.

1. Develop a dashboard to track high-level expenditures and progress toward meeting shared goals and targets.

DATA AND INFORMATION TECHNOLOGY

Vision: A robust, modern, interoperable, and secure public health information system delivers real-time, accurate, and actionable data *to policymakers, public health departments, and other stakeholders to help public health officials detect new or growing threats, identify groups that may be at risk, and respond quickly with well-targeted policies and programs.*

Data-driven decision-making, critical to public health practice, requires accurate and real-time information about disease prevalence and diagnoses, potential threats, and disparities in health outcomes, particularly for communities experiencing health inequities. Because data provide the basis for improving community health outcomes and evaluating public health programs, high-quality data are central to ensuring transparency and accountability. However, many public health departments rely on non-existent or obsolete and siloed information technology systems.[31] Additionally, much of the data sent to public health agencies is transmitted in outdated ways, such as by fax or the U.S. Postal Service. Moreover, the quality of data sent is often poor due to incomplete information.

These deficiencies were very apparent during the pandemic, reinforcing the decades-old need to significantly upgrade and modernize data and information technology systems in public health departments and to make them interoperable with health care providers.

Action #1: Strengthen the collection of timely and actionable public health data to guide programs, respond to emergencies, and address health inequities.

As a first step, it is critical to establish data and information technology systems that facilitate the collection of high-quality data in a timely fashion. Data need to consistently include age, race, ethnicity, disability status, and other indicators that characterize populations experiencing health inequities. As these systems are established and improved, the workforce needs to be trained to fully realize their potential.

1. Invest in modern, efficient, and interoperable information technology that equips state, territorial, and local health departments to:

    A. Collect, analyze, and share timely, accurate, subcounty data on health and health-related issues disaggregated by race, ethnicity, and other key sociodemographic characteristics.

B. Work with partners to ensure that data submitted are complete and of high quality.

2. Require that public health data are reported to agencies at all levels of government using interoperable electronic mechanisms.

1. Consistently collect data needed to identify, document, and address health inequities in local communities.
2. Work with partners to submit data to public health departments that is timely, accurate, and complete.
3. Share and display this data in real time, with user-friendly data dashboards available to other governmental agencies and the public.

Action #2: Invest in data sharing between public health departments and health care entities.

State and local public health departments currently operate a mismatched network of siloed public health information systems – most of which do not talk to each other, other government agencies, or the health care delivery sector.[32] This patchwork is particularly challenging in areas with restricted internet access, such as some rural communities and Tribal nations. Common data points collected by public health and health care systems, as well as shared using electronic case reporting, are needed for the automated exchange of clinical information. In addition, separate data systems need to be shared, linked, and synthesized in real time, while protecting data security and individual privacy. This interoperability between systems is crucial if health departments are going to be able to address urgent health threats to address urgent health threats. Success with interoperability will also aid subsequent efforts to develop interoperable systems with other partners, such as community-based organizations.

1. Remove or support the removal of technical and legal barriers to data system interoperability with health care systems and Tribal health entities while ensuring that sufficient security safeguards are in place to achieve compliance with the Health Insurance Portability and Accountability Act (HIPAA).
2. Ensure that data sharing regulations are secure without being onerous.

   A. Proactively support and incentivize partnerships that utilize official Memorandum of Agreement (MOU) documents to guide their collaboration.

3. Through legislation, require adherence to standards of the Office of the National Coordinator for Health Information Technology and the Centers for Disease Control and Prevention (CDC) for the collection and sharing of common data points.

1. Develop and implement policies and procedures that adhere to the standards of the Office of the National Coordinator for Health Information Technology (ONC) and the Centers for Disease Control and Prevention (ONC/CDC).
2. Ensure that those reporting data are adhering to ONC/CDC standards.
3. Enter into data-sharing agreements with Medicaid agencies.

WORKFORCE

Vision: A highly skilled, trained, and diverse public health workforce *provides evidence-informed programs and services that address community health needs, encourage healthy behaviors, and act swiftly to respond to emerging threats. Staff feel supported and are incentivized to pursue long careers in governmental public health.*

The governmental public health workforce has been declining for more than a decade, a direct reflection of funding cuts to health departments, an aging workforce, burnout, and high rates of turnover. According to a new analysis, the nation needs an additional 80,000 full-time equivalent positions in state and local health departments—an 80% increase in the current workforce—just to provide the core programs that every community needs.[35] Clearly, state and local public departments entered the pandemic with a staffing deficit, impeding their ability to deliver their core capabilities, much less to quickly and comprehensively address the most significant public health crisis of the century.

MS-DOH-21-1816-A-001086

As the pandemic has ground on, the ongoing firings, resignations, and personal safety threats to public health officials due to criticism of pandemic lockdowns and mask mandates have deepened the staffing challenges. A lack of competitive salaries and cumbersome, bureaucratic hiring processes further hamper efforts to recruit, hire, and retain staff. Public officials have used much of the supplemental funding allocated to states, territories, and localities to hire temporary staff and meet pressing needs.[36]

The public health workforce is essential to advancing health equity. A workforce representative of various life experiences, whether Black, Indigenous, or other people of color; residents of rural or urban communities; LGBTQ+ people; immigrants; people with disabilities; people with low incomes; and others who face unique public health challenges have unique insights into ways of achieving health and the opportunity to thrive. A diverse workforce also signals to the public that the department is a welcoming place and facilitates trust among populations that may otherwise be distrustful or feel like outsiders.

Rural communities, which are navigating significant health challenges, are especially underfunded and understaffed. Residents often have to travel long distances to access health care, as they struggle with recruitment and retention of providers.[37] The same is true for Tribal health departments, which face significant challenges in their efforts to meet the needs of Native American communities in both rural and urban areas, while struggling to recruit and retain staff, especially in remote locations.[38]

As the nation continues to navigate the pandemic and build the long-term infrastructure needed to sustain public health, public health departments must:

- Employ a sufficient number of staff to deliver the full range of public health services in their jurisdiction;
- Hire a workforce that reflects the diversity of the community served;
- Build robust and equitable pathways to employment and advancement; and
- Cultivate working environments that foster inclusive and supportive cultures to support retention.

Action #1: Invest in the recruitment and retention of a diverse and inclusive governmental public health workforce.

To build up to optimal staffing levels, public health departments need to be able to recruit from a diverse pool of people who are aware of governmental public health, interested in joining the workforce, and equipped with the knowledge, capabilities, experience, and commitment to health equity to partner effectively with communities. There is a particular need to expand opportunities and reduce barriers for Black and Indigenous communities, people of color,

and people with differing abilities, all of whom are under-represented in governmental public health, particularly in leadership positions.[39]

Many who enter the public health field do so through direct experience working in a health department (e.g., through an internship or fellowship). People who might otherwise be interested in joining the field do not have enough exposure to governmental public health to spark their interest, or they may have poor perceptions of governmental public health jobs and a lack of understanding about the work. Moreover, public health education and training is expensive and not all internships are paid, making these opportunities inaccessible to people from lower-income backgrounds. A number of institutions play important roles in building awareness and training potential health department staff: Historically Black Colleges and Universities; Hispanic-Serving Agricultural Colleges and Universities; Tribal colleges and universities; other minority serving institutions; community colleges; and rural-serving institutions.[40]

Finally, managers/supervisors should devote time to creating inclusive, engaging work environments that incentivize staff to stay and thrive. Policymakers could contribute to staff morale by touring public health departments in their jurisdiction – and in the process, they would gain valuable insights on the day-to-day operations of public health.

1. In partnership with local health departments, perform a statewide public health workforce needs assessment and fund public health department assessments of organizational culture.
2. Establish or promote robust and equitable employment programs on the state, territorial, and local levels to recruit, hire, and retain the next generation of public health practitioners, with a particular focus on individuals from communities experiencing health inequities.

1. Determine the number and type of staff needed to provide public health services.
2. Formalize partnerships and programs with academic institutions—including Historically Black Colleges and Universities, Hispanic-Serving Agricultural Colleges and Universities, and Tribal colleges and universities—local boards of health, and technical training programs to build a cross-disciplinary workforce and provide students with experiential opportunities in public health.
3. Work with partners to expand internships, fellowships, and workforce pipeline, loan-repayment, and other career on-ramp programs.
    A. Provide tailored opportunities to individuals in under-represented populations.

4. Hire outreach workers who live in communities experiencing health inequities to assist with building trusting relationships and engaging community members.
5. Assess organizational culture and make changes as needed to ensure the workplace is culturally competent and supportive of all staff.

Action #2: Improve hiring and promotion policies and processes to ensure high-quality public health services.

Numerous issues pose barriers to the hiring and advancement of the public health workforce, including lengthy and cumbersome hiring processes, outdated job descriptions and job requirements, low salaries (making it exceptionally difficult to attract candidates with student loan debt), limited student loan forgiveness programs, and professional growth opportunities that do not keep pace with the expectations of today's workers. In addition, the elimination of entry-level jobs due to budget cuts has made it difficult for early-career professionals to enter the field.[41] Recruiters also need to recognize that academic degrees and prior work experience in specific programmatic areas are not the only qualifications to consider; rather, a variety of skills and experiences, even in the absence of post-high school degrees, equip candidates to support communities with advancing health equity. All these barriers and issues must be addressed when officials seek to recruit the public health workforce of the future.

1. Modernize existing civil service requirements and institute competitive pay structures to accommodate roles and responsibilities specific or unique to public health.
2. Approve budgets that ensure:
    A. The training and professional development of the public health workforce involved with implementing core programs and applying all necessary cross-cutting skills.
    B. Salary structures that are commensurate with roles and responsibilities and that are competitive with salaries for similar positions in nongovernmental agencies.

1. Partner with leaders in government reform to update merit systems, civil service requirements, position descriptions, and human resources systems.
2. Provide professional development opportunities, giving public health

workers the skills and knowledge needed to meet modern public health challenges (e.g., change management, data science skills, and cultural and linguistic competencies).

3. Work to secure a full complement of health supports to prevent burnout and turnover, including mental health services and comprehensive paid leave.

PUBLIC HEALTH LAWS AND GOVERNANCE

Vision: Modernized laws, policies, and statutes *to protect and promote the public's health in a manner that reflects ongoing threats and challenges and ensures public health authority remains intact and protected.*

Public health laws vary by state, and governance of public health ranges from centralized to decentralized systems. As a result, public health roles vary, as do the related interactions between the state and local levels. Perhaps not surprisingly, there also is wide variation among communities in support and willingness to finance public health functions and services, and the willingness of potential public health partners to collaborate on mutually beneficial goals related to improved health outcomes.

Public health departments need a consistent set of legal responsibilities, given by policymakers, to be able to provide core programs and implement all actions in this report. The public health system has a legal responsibility that it cannot abandon, as most of what it does is through policy, rules, and laws.

Action #1: Review, evaluate, and modernize public health governance structures and statutory responsibilities.

Variation in decision-making structures and resources available to health departments across the nation has led to stark differences in outcomes between jurisdictions, both before and during the pandemic.[43] Moreover, many public health governance structures are outdated and were designed and developed

MS-DOH-21-1816-A-001090

generations ago. This makes it difficult for them to address the challenges and opportunities of the 21st century, including health equity, social determinants of health (SDOH), technological advances, and emergency response challenges.[44,45] Similarly, antiquated public health laws require modernization.

In 2021, more than half of all states considered bills to limit state and local public health powers, and 10 states have enacted laws doing so. Most of these laws shift power from local public health experts to state politicians (who typically do not have public health expertise), which not only limits localities' ability to implement tailored, effective actions to stop the spread of COVID-19 but also has long-term negative consequences, including the deepening of mistrust of public health officials.[46] These laws and other factors, such as the sharp increase in personal threats and the pressures of the pandemic, have led to more than 300 state and local public health officials to resign, retire, or be fired since April of 2020.[47] The long-term consequences associated with further limiting the authority of the public health system to deliver services is an ongoing threat to the safety, economic prosperity, and security of the United States.

1. Conduct or promote a bipartisan, comprehensive review of existing policies and revise as needed to reflect the current roles and responsibilities of government in protecting and promoting health, including the ability of public health departments to make decisions without undue political influence.

    A. Work across various levels of government to determine the proper federal, state, territorial, and local framework for preemption, establishing minimum and maximum requirements, particularly in light of recent state action to roll back public health powers and place limits on local elected officials.

    B. Consider how structures, processes, roles, and responsibilities should remain the same or change during a public health emergency; this task should include ensuring flexibility in personnel and procurement processes.

    C. Examine whether existing funding streams are sufficient to support the revised public health governance structures and statutory authorities; elevate funding needs to relevant appropriators to fill gaps.

    D. Ensure the law as written promotes trust through the removal of stigmatizing language, particularly as it relates to populations experiencing health inequities.

2. For policymakers in jurisdictions adjacent to or containing sovereign Tribal Nations and health systems, review lines of communication and opportunities for formalized partnerships.

3. Ensure that public health department leaders are empowered to make decisions without inappropriate political influence and have access to counsel with expertise in public health law.

1. Direct counsel with public health law expertise to review existing regulations and ensure they are relevant, provide the ability to protect the health of the public, and are legally sound.
2. Ensure that opportunities for public input in rule-making processes are widely publicized, transparent, and easily accessible.
    A. Specifically solicit feedback from those who will be most affected by new rules.

Action #2: Support and clearly communicate the roles of public health departments to the public.

Although recognition of and support for public health is high in many states and localities, in some places the reverse is true. Public health measures instituted to protect against further spread of COVID-19 have generated harassment of public health officials, legal challenges to emergency powers and measures, and refusal to follow mask mandates and vaccination recommendations.[48] These displays of opposition not only have caused local disruptions but also have contributed to the nationwide difficulties to end the pandemic.

1. Invest in evidence-informed messaging and effective communication by health departments, using multiple platforms.
    A. Use all media outlets, including online and social media vehicles.
    B. Use media outlets serving subpopulations, including those in different languages.
2. Coordinate messaging with and across public health departments, both during emergency and non-emergency situations.
    A. Ensure messaging is culturally competent.
    B. Use language that elicits a sense of trust in government.
3. Engage with constituents during public health emergencies to correct misinformation and explain the role of public health departments.
4. Provide forums for stakeholders in public health, the business community, and health care to identify shared goals and strategies that reflect public health authorities, public health protection, and a strong and stable economy.

MS-DOH-21-1816-A-001092

1. Develop and maintain ongoing relationships with local and statewide media.
2. Develop, routinely update, and implement a communications plan that articulates public health responsibilities.
3. Maintain the expertise to develop and implement a risk communications strategy.

PARTNERSHIPS

Vision: Public health departments partner with various sectors (e.g., housing, food, transportation) and stakeholders *(e.g., business, faith-based organizations, health care) toward the shared goal of providing a fair and just opportunity for all to achieve good health and well-being.*

A community's health is like a building—it depends on a strong and stable foundation. Quality education, accessible and nutritious food options, safe and affordable housing, access to health care, and employment opportunities enable positive health outcomes for everyone in important ways.[50] Building thriving communities requires that many sectors—not only health—work closely to construct a solid foundation that supports long-lasting good health for everyone. This foundation comprises both programs and policies, and thus requires partnerships with different sectors in the community and different government sectors.

Providing fair and just opportunities requires the work of those in business, education, health care, community development, faith communities, community-based organizations, social services, and many other sectors—neither public health nor any other sector can do this alone. Therefore, cross-sector partnerships that identify collaborative solutions to community health challenges and advance health equity are essential. Partnerships can be especially critical in areas with workforce shortages, e.g., by leveraging staff time and expertise to achieve shared goals and by collaborating on recruitment efforts. Building partnerships, coalitions, and other collaborative relationships requires continuous effort, but all too often public health departments lack the

means—the funding, necessary time, resources, and capacity—to sustain these partnerships.[51]

Government sectors also need to work together to ensure policies enhance health and the conditions that support health, and at the very least do not inadvertently cause harm. Public health departments can provide data, evidence-informed strategies and practices, and other insights to discussions regarding the impact of policies on the community's health and well-being.

Action #1: Incentivize partnerships between public health departments and other sectors (e.g., housing, food, transportation) and stakeholders (e.g., business, faith-based organizations, health care).

Through partnerships with a multitude of sectors, health departments are best equipped to access real-time data collected by others to track and monitor health impacts, gain a complete picture of the jurisdiction's needs and assets, inform and guide resource allocation, identify shared priorities, and forge collaborative and collective solutions to advance them.[52] Through partnerships, public health departments can support and further efforts to address health issues that may not fall directly within their responsibilities, e.g., addressing mental and behavioral health issues and preventing or lessening the effects of climate change. Flexible funding for cross-sector partnership development (as opposed to categorial disease-specific funding) enables partners and coalitions to work on a range of issues specific to their jurisdictions' health and well-being, a departure from the typical current funding practices that are often short term and disease-specific.

1. Allocate funding to support the development and maintenance of partnerships that aim to provide a fair and just opportunity for all to achieve good health and well-being.

1. Clearly delineate shared goals, respective responsibilities, and collaboration guidelines for decision-making, conflict resolution, and data sharing; use this body of work as a foundation for sustainable collaborations.

Action #2: Establish a dedicated body charged with routinely monitoring, assessing, and influencing the implications for health in all government sector policy discussions

Integrating health considerations into policy and decision-making across all government sectors can help secure a government-wide commitment to public health.[53] This approach recognizes that health is created by numerous factors

beyond public health departments and the health care sector, leverages all government sectors' interests and resources to achieve mutually beneficial goals, and helps to avoid adverse health effects inadvertently resulting from a policy generated by any sector. This partnership can take the form of a special council or board; alternatively, an existing body can add the impact of health in all policies to its agenda on a regular basis.

1. Establish and participate in an advisory board that integrates and articulates health considerations into policymaking across all government sectors to improve the health of people and communities.
2. Conduct health impact assessments on legislation to identify potential connections between health and factors that affect health (e.g., housing, affordable and nutritious food options, employment, and environment).

1. Provide examples and evidence-informed practices to support health impact assessments and policy discussions.

COMMUNITY ENGAGEMENT

Vision: Public health departments partner with community members *toward the shared goal of providing a fair and just opportunity for all to achieve good health and well-being.*

Community engagement is vital to public health's mission. Effective community engagement drives public health to prioritize the *right* interventions, policies, practices, and approaches to community-driven health priorities with community-driven approaches, which can and should be informed by people who have experienced health inequities and by communities that may not have been consulted in the planning of public health activities. Working alongside community members and sharing decision-making with them to collect data, design and implement programs, and evaluate public health's effectiveness enhances public health practice and outcomes.

Action #1: Invest in long-term relationship-building and partnership development with residents and community-based organizations (particularly those serving communities experiencing health inequities) and in Tribal consultation.

Establishing trust is a prerequisite to successful partnerships and collaborations. Therefore, public health departments must consistently expend time and effort to build the trusted relationships needed for authentic community engagement. Performative, halfhearted, and time-limited community outreach efforts not only damage trust but also can do more harm than good. Routine contacts and meetings are required to facilitate deep and sustained community participation in public health programming. Meetings need to be held in communities to make it easier for residents to participate; in the process, health departments will also demonstrate their commitment to eliciting input and centering the community's voice in identifying priorities and shaping program strategies. Moreover, CBOs and the people they serve should be appropriately compensated for the time, effort, and unique expertise they devote to improving public health efforts.

While sovereign and autonomous, Tribal Nation leaders and public health departments are critical partners in the U.S. governmental public health system. Through their authority and self-governed resources, Tribal public health systems often consult and collaborate with U.S. public health departments to provide needed services, such as response and recovery from natural disasters and supporting low-capacity U.S. health departments during the COVID-19 pandemic. However, consultation practices are not uniform, and U.S. policymakers and public health leaders must ensure practices that respectfully honor the public health authorities of Tribal Nations.

MS-DOH-21-1816-A-001096

1. Allocate funds to public health departments for community collaboration and develop output measures that account for progress toward building trust and working in partnership.
2. Engage in routine Tribal consultation to support intergovernmental public health planning that recognize Tribal authority, autonomy, and self-governance.
3. Act as liaisons between public health departments and citizen representatives, especially from communities historically experiencing health inequities, who can elevate on-the-ground concerns and offer their input on public health issues.

1. Dedicate staff time to long-term community engagement efforts.
2. Compensate community members and organizations for their time and expertise on planning and implementing health improvement strategies and actions.
3. Invest in and formalize consultation practices between state and local health departments and Tribal health departments to address community-wide health planning and decision-making.

Action #2: Invest in the capacity of CBOs and provide resources to support collaboration with public health departments.

All too often community-based organizations that serve communities experiencing health inequities are under-resourced; as a result, they do not achieve their full potential and thus their influence and potential impact are often underappreciated. As an example, CBOs may not have the capacity to participate in meetings due to other demands. Moreover, the input of CBOs often is ignored or minimized in favor of opinions by people from well-resourced organizations that brought an executive team member to the table. And sometimes greater weight is put on input from people with advanced academic credentials as opposed to those with the most experience with the population being served or the health issue being addressed.

Given that improved population health outcomes largely depend on reducing health disparities,[55] the value of strengthening the ability of CBOs that serve communities experiencing health inequities to meet their missions and simultaneously engage as equal players in health improvement collaborations cannot be understated. As such, CBOs should share in decision-making and receive help to expand their capacity.

1. Allocate funds to support the capacity-building of CBOs.
2. Lead regular town halls and forums with CBOs and public health officials to present evidence-based information that deepens understanding of health inequities, their causes, and their consequences.

1. Formalize public health planning and processes that rely on input from, and share decision-making with, CBOs and the people they serve.
2. Work with CBOs to identify opportunities to strengthen their organizational capacity and dedicate staff time and funds to mentor and train on topics such as grant writing, grant reporting, data collection and analysis, project evaluation, and publishing academic papers.

Conclusion

The pandemic has had a devastating and lasting impact. More than 740,000 Americans have died and unknown thousands continue to suffer from long-term symptoms after recovery from the virus.[57] About 66 million eligible Americans are unvaccinated, at the time of publication,[58] and misinformation on the virus and vaccines is rampant in some areas of the country.

The federal government made substantial investments to bolster public health deficiencies and respond to the pandemic. Despite the funding influx, some states and localities have legally and politically undermined public health departments trying to carry out their mission to combat COVID-19 and meet other public health challenges.[59]

The vision, framework, and actions laid out in this report are a guide so that elected and health officials can prepare their communities for the next pandemic or public health challenge and improve the quality of life of their neighbors.

We cannot learn the wrong lessons from the pandemic. This moment is an opportunity for elected and health officials to reimagine public health in a bipartisan fashion, with the goal of an equitable, effective, and sustainable public health system.

Appendix 1: Federal Investments in Public Health in COVID-19 Relief Legislation

Congress provided $305.6 billion through five COVID-19 relief bills to the Public Health Services Agencies and the Public Health and Social Service Emergencies Fund (PHSSEF)[60].

Allocations include:

- $280 billion to PHSSEF, an account controlled by the Health and Human Services secretary that receives annual appropriations to operate some HHS offices, including the Office of the HHS Assistant Secretary for Preparedness and Response, but often for one time or short-term funding.

  Within this amount, $53.4 billion is allocated to medical countermeasures and boosting surge capacity:

  - At least $24.2 billion for the Biomedical Advanced Research and Development Authority.
  - Up to $19.25 billion for the Strategic National Stockpile, which stores medicines and medical supplies for distribution to jurisdictions during public health emergencies.

- $15.3 billion for the CDC.

  - Broadly available funding:

    - At least $2.45 billion for grants to state, local, territorial, and tribal governments "to carry out surveillance, epidemiology, laboratory capacity, infection control, mitigation, communications, and other preparedness and response activities."
    - $800 million for global disease detection and emergency response.
    - $600 million for the Infectious Disease Rapid Response Reserve Fund (IDRRRF).
    - $500 million for "public health data surveillance and analytics infrastructure modernization."

  - $1 billion to expand and improve COVID-19 testing.

MS-DOH-21-1816-A-001100

    - $8.75 billion for vaccine-related funding, $4.5 billion of which must go toward state, local, territorial and tribal grants.

- $4.7 billion for the Substance Abuse and Mental Health Services Administration.
- $3 billion for the National Institutes of Health (NIH).
- $1.3 billion for the Health Resources and Services Administration.
- $1.1 billion for the Indian Health Service.
- $196 million for the Food and Drug Administration.
- $12.5 million for the Agency for Toxic Substances and Disease Registry (headed by the CDC director).
    - $7.5 million for the Geospatial Research, Analysis and Services Program "to support spatial analysis and Geographic Information System mapping of infectious disease hot spots, including cruise ships."
    - $5 million to Pediatric Environmental Health Specialty Units and state health departments "to provide guidance and outreach on safe practices for disinfection for home, school, and daycare facilities."

Note: The American Rescue Plan provided substantial mandatory funding for a long list of public health activities. This departure from regular order is expected to be temporary. The appropriations committees will resume their role overseeing public health funding in the appropriations bills that will be worked on in summer of 2022.

The American Rescue Plan[61] provided additional public health funding of nearly $90 billion.

Allocations include:

- Vaccines/therapeutics: ($15.05 billion).
    - $7.5 billion to the CDC for COVID-19 vaccine activities.
    - $1 billion to the CDC for vaccine confidence activities.
    - $6.05 billion for research and development, manufacturing, and purchase of vaccines, therapeutics and other medical supplies for COVID and other pandemics.
    - $500 million to FDA to evaluate continued effectiveness of COVID-19 products.
- Testing and data: ($50.8 billion).
    - $47.8 billion to HHS for testing, contact tracing, surveillance, and mitigation activities.
    - $1.75 billion to HHS/CDC for genomic sequencing.

- $750 million to HHS/CDC to combat COVID-19 globally.
- $500 million to HHS/CDC for data infrastructure modernization.

- Workforce: ($7.76 billion).
  - $7.66 billion to HHS for public health workforce.
  - $100 million for Medical Reserve Corps.

- Other public health investments: ($8.98 billion).
  - $7.6 billion to HHS for community health centers for COVID-19 mitigation.
  - $800 million to HHS for National Health Service Corps (loan repayment).
  - $200 million to HHS for Nurse Corps (loan repayment).
  - $330 million to HHS for medical education and training--expanding primary care programs, maintaining existing staff, boosting federal response to public health emergencies.
  - $50 million to HHS for family planning grants.

- Mental health/substance use disorders: ($3.88 billion).
  - $1.5 billion to HHS for community mental health grants.
  - $1.5 billion to HHS for substance use prevention and treatment.
  - $80 million to HHS and HRSA for MH and SUD training in rural/ underserved areas.
  - $20 million to HHS/CDC for wellness campaign for health care professionals.
  - $40 million to HHS/HRSA for grants to promote mental health among health workforce.
  - $30 million to HHS for local SUD services.
  - $50 million to HHS for local behavioral health services.
  - $10 million to HHS for national child traumatic stress network.
  - $30 million to HHS for advancing wellness in education.
  - $20 million to HHS for youth suicide prevention.
  - $100 million to HHS for behavioral health workforce training.
  - $80 million to HHS for pediatric mental health care telehealth access programs.
  - $420 million to HHS for community behavioral health clinics.

Appendix 2: Public Health Focus Area Background

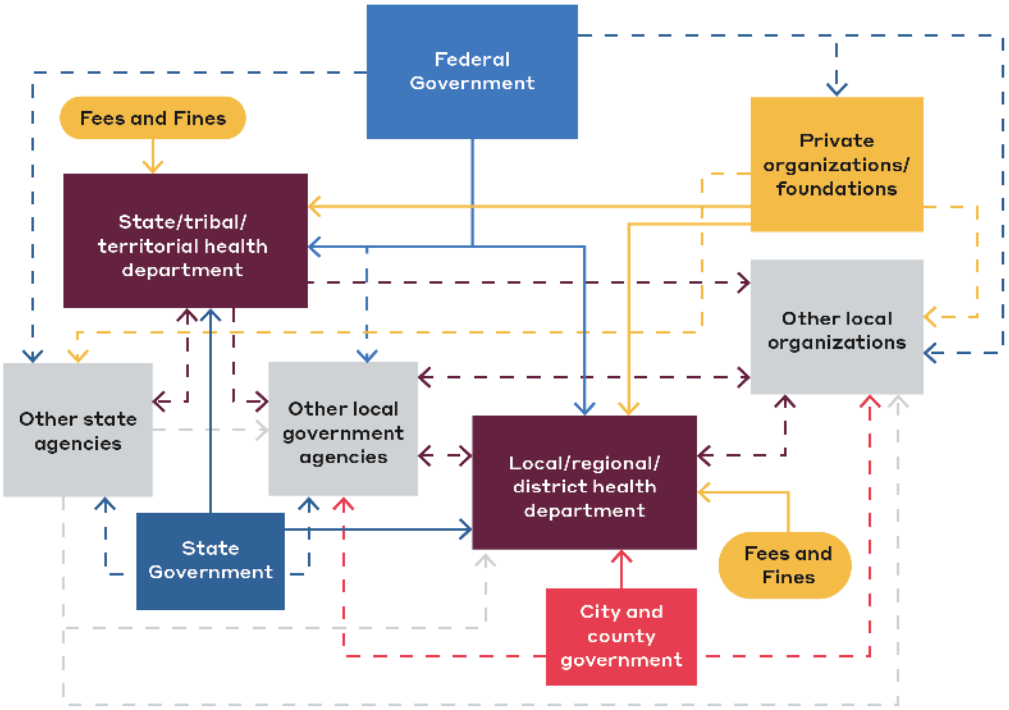
Prepared by the Johns Hopkins Bloomberg School of Public Health

PUBLIC HEALTH FINANCE

The Importance of Public Health Finance

Public health finance includes the acquisition, utilization, and management of public health resources,[62] including those required to deliver public health services to populations. It also includes the impact of resources on the health and health equity of those populations.[63] As depicted below, resources for public health come from a range of sources with the bulk of funding provided by federal and state governments. Funds typically flow from federal to state, territorial and tribal health departments, and then to local governments.

Figure 1. Public Health Funding Flows
Adapted from Institute of Medicine. 2012. *For the Public's Health: Investing in a Healthier Future*. Washington, DC: The National Academies Press. https://doi.org/10.17226/13268.



Core Issues:

- A long-standing neglect of and reduction in public health funding at all levels of government, despite increases in the scope of public health services and needs,[64,65,66] has resulted in reduced state, regional, and local capacity. Communities nationwide are not able to deliver needed public health services and to respond to the COVID-19 pandemic and other public health emergencies.
- The structure, organization, and delivery of public health services varies widely. When coupled with differences in state and local investments and funding disbursements, these variances have resulted in a patchwork system with a wide range of public health spending per capita, from a low of $7 to a high of $140 in 2019.[67]
- Many public health funding streams are **"categorical,"** restricted to specific priority areas (e.g., chronic disease prevention), limiting funds to basic public health system needs (e.g., data systems, staffing) or to ramp up surge capacity in response to emergencies.
- Flexible funding streams allow for the shifting of money as needed, but such flexible streams (e.g., block grants[68] or the Prevention and Public Health Fund[69]) have been vulnerable to funding cuts or reallocation to cover non-health priorities (e.g., tax cuts[70]).
- Leaders in the field have proposed uniform standards and accounting measures to monitor resources and evaluate capacity for delivery of a basic set of public health services; however, without dedicated, long-term funding for such measures, adoption has been limited.[71]

Gaps:

There has been inadequate recognition of:

- Structural variations (e.g., budgeting cycles and practices) across state and local governments which hampers accurate costs estimates; lack of transparency in state and local resource allocations; and little accountability for where and how public health funds are spent;
- Needed additional resources and financial flexibility to address systemic inequities and upstream SDOH through cross-sector partnerships and community engagement in local communities;
- Governance and policy considerations that affect funding; resource allocation laws; and policies and practices dictating the use and distribution of funds to state and local government agencies, communities, and other organizations.

Public Health Finance: Challenges and Opportunities for Action Going Forward

Insufficient and inconsistent ("boom-bust") funding leaves the public health system unprepared to:

- Adequately protect communities from public health emergencies and ongoing public health challenges, such as violence, substance use, and climate change;
- Address health inequities and disparities through equitable provision of services, resources, and supports to communities;
- Adopt a broad vision of public health to foster cross-sector partnerships and community engagement to address upstream determinants of health such as housing, transportation, and employment.

- Assure a basic level of public health service delivery in each community;
- Enable nimbleness so agencies can respond to public health emergencies and crises as needed;
- Sustain the ability of public health agencies to collaborate across sectors to address upstream drivers of health and promote health equity and improved health;
- Standardize tracking and monitoring over time to assess and ensure funding is being used to its full capacity and impact in local communities;
- Foster a scale-up of effective resource allocation and distribution practices to local communities;
- Improve data systems and health information to track and address communicable disease outbreaks and public health emergencies, such as extreme weather events and substance use crises in a more timely and targeted manner.

The Importance of Data and Information Technology

Data and information technology encompasses not only the collection, usage, and storage of data but also the platforms, software, and hardware to support individual and population-level public health surveillance. This technology enables the public health system to undertake interventions and monitor and communicate public health outcomes. As demonstrated during the COVID-19 pandemic, all aspects of the nation's data and information technology systems are critical to a well-functioning public health system.

Core Issues:

The following are essential to an effective public health system:

- **Modern technology** and **cybersecurity** measures.
- **Staff capacity** to collect, disaggregate, analyze, interpret, report, and communicate data.
- **Data sharing** across health and public health systems and geographic jurisdictions.
- **Access to timely, quality, and meaningful data** (e.g., accurate case counts, disaggregated data), to respond to public health emergencies, evaluate health outcomes, implement accountability measures, and identify health disparities and inequities.
- **Standardized data measures, capacity, and reporting practices** for consistent and comparable reporting, monitoring, and communication across states and local communities.

Gaps:

Key gaps in prior discussions on public health data and information technology modernization include:

Primary focus on a specific component(s) of the system (e.g., interoperability or privacy concerns) rather than the entire system.

- **Exclusion of nontraditional data sources** (e.g., community input, lived experiences, etc.).
- Need for expanded **focus beyond data** to translation of data to benefit impacted communities.
- Need for **partnerships and community engagement** to establish data measures, information systems, and communications that measure, communicate, and advance cross-sector efforts to address the social determinants of health.

Data and Information Technology: Challenges and Opportunities for Action

- Lack of interoperable data platforms across sectors and jurisdictions results in fragmented and inefficient data exchange and hinders effective public health responses and improved health outcomes;[72,73]
- Use of obsolete technology platforms creates data integrity and quality challenges and leads to delays in real time reporting and response;[72,73]
- Insufficient and ineffective collection and disaggregation of data (e.g., by race, ethnicity, geographic locations) stymies efforts to track, monitor, and reduce health disparities and address the social determinants of health;[72,74]
- Lack of funding and support for data modernization initiatives at the federal, state, and local levels hinders capacity, interoperability, and data access and communications.[72,74,75]

- Broaden information access and coordination across sectors, public and private entities, and communities to address the social determinants of health;[72,73,76] and
- Improve public health surveillance to better monitor, investigate, prevent, and control disease outbreaks and emerging public health threats.[75,77]

PUBLIC HEALTH WORKFORCE

The Importance of the Public Health Workforce

A strong governmental public health workforce (state, local, and territories) is representative of the communities it serves; has effective leaders; is sufficiently staffed to meet the public's needs; and has the competencies, tools, and skills necessary to respond quickly to emerging public health challenges.[76,78,79,80]
A well-trained public health workforce is the country's first line of defense to prevent disease, advance the health and well-being of all populations, and keep people safe.

The Public Health Workforce: Core Issues and Gaps

A skilled and diverse public health workforce requires:[76,78,79,80,81]

- A competent **workforce with effective leadership that reflects the population served;**
- Training and education that **incorporate a broad base of skills and competencies,** including technical, strategic, and leadership skills;
- More equitable pathways to successful public health careers, including **recruitment, retention, and career advancement opportunities;**
- Creating a workforce **culture of accountability, inclusiveness, quality improvement, and lifelong learning;** and
- **Cultivating partnerships with schools and programs of public health** to build a pipeline for the future workforce.

There has been inadequate recognition of:

- Public health professionals and institutions do not serve communities equitably and are insufficiently **equipped to address structural inequalities.**
- Inadequate attention to individual employee **career paths and goals poses** challenges for recruitment, retention, and morale.
- **Workforce learning, training, and professional development** lacks sustained financial support, access is limited, and content is often siloed and driven by funding availability;
- **Relationships between health departments and partner organizations** (e.g., academia, health, education, business) are often not optimized due to funding and other organizational constraints. This limits the effectiveness of training, and departments are losing out on recruitment and partnership opportunities.
- Burdensome human resource policies and practices in health departments (e.g., noncompetitive salaries; inadequate facilities and equipment; limited recruitment pools, especially in more rural/remote locations; and bureaucratic and lengthy hiring practices) are barriers to **recruiting and retaining top talent.**
- Discussion is needed as to how best to leverage available mechanisms to bolster the public health workforce such as nongovernmental fast track hires and employee unions.
- Inadequate attention has been given to supporting the **well-being, mental health, and safety** of the **public health workforce** as fundamental to the mission of public health.

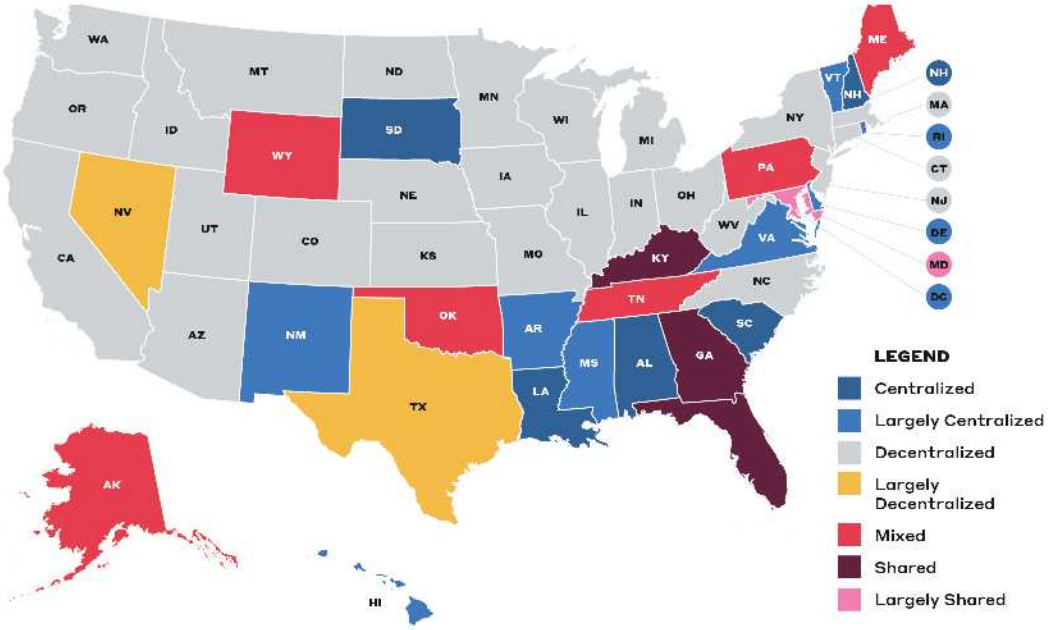
Public Health Workforce: Challenges and Opportunities for Action Going Forward

- Throughout the previous decade, 66,000 state and local public health jobs were lost. Retirements, burnout, firings, harassment, and threats accelerated the exodus during the pandemic. This loss challenges health departments' abilities to maintain the current workforce.[76,80]
- Nearly half of those working in public health are considering leaving the field within five years, either through retirement or plans to leave public health entirely.[76,80]
- Most employees join public health agencies without formal training or education in public health, requiring time and resources to train new staff.[80]
- In response to the pandemic, the public health workforce expanded dramatically, but often through temporary positions, thus focusing on the short term rather than addressing long-term workforce needs.[76]

- Adopt interdisciplinary leadership models to build new partnerships and cross-cutting collaborative opportunities.[76,78,79]
- Continue to invest in the development, improvement, and coordination of training in "strategic skills" that equip health departments to meet the complex needs of contemporary public health and an operational focus on improving health outcomes and health equity.[82]
- Broaden recruitment opportunities by fostering new partnerships with hiring organizations and academic institutions, including Historically Black Colleges and Universities, as well as with Hispanic-serving, Tribal, and other minority-serving institutions. Develop training programs focused on public health competencies and real-world experience through service learning, work practicum, and internship opportunities.[76,79,80]
- Target recruitment efforts in local communities, with a focus on building a public health workforce pipeline for people with lived experience from all cultural and economic backgrounds.[76,79]
- Focus resources and systems changes to advance recruitment, retention, and succession planning within the current workforce, including efforts to create advancement and leadership opportunities, improve job satisfaction, and increase low pay.[76,79,80]

The Importance of Public Health Governance and Law

U.S. public health governance is the legal authority and responsibility to protect and promote the health of populations. Governance and laws set the structure and boundaries in which public health interventions and policies are developed, implemented, and evaluated. As depicted below, structures vary among states and across localities within a state. In a centralized governance structure, the state maintains authority over most local level public health operations. In a decentralized structure, local governments maintain authority over most local public health operations. During the response to COVID-19, governance variations resulted in differing policies, interventions, and messaging across states and local jurisdictions.



Source: ASTHO Profile of State and Territorial Public Health

Public Health Governance and Law: Core Issues and Gaps

Core Issues:

Core public health governance and law issues include:

- Public health is governed by a **complex and fragmented system** of federal, state, territorial, tribal, and local health agencies, all with missions to advance and protect the public's health;

- Public health operations, interventions, and outcomes are **anchored at the local level,** allowing the local context to inform delivery of public health services to communities;
- **Authority granted by public health laws** are used by public health and elected officials at all governmental levels to declare public health emergencies and institute disease prevention measures; and
- It is imperative to **affirm the mandate** for public health through accountability and coordination across state and local health departments.[76,79,80,81]

Gaps in public health law and governance include:

- Inadequate acknowledgment of public health laws and governance as an important underlying factor in:
- **Health outcomes and health disparities;**
- **Public health system structure and function,** such as resource allocation, workforce capacity, laws and responsibilities, data collection, and reporting;
- **Politicization of public health actions,** often resulting from conflicts across levels of government (e.g., federal preemption over state laws), and conflicts between the executive branch, of which public health agencies are a part, and the legislative branch, which grants authority to public health agencies (e.g., legislative efforts to take away authority from public health officials and prohibit use of public health protections in response to COVID-19);
- Inequitable **application and enforcement of public health laws and interventions.**

Public Health Governance and Law: Challenges and Opportunities for Action Going Forward

- Delegation of authority from federal to state to local during the pandemic fueled tension and distrust of public health officials, ambiguity about decision-making authority, and inconsistency in decisions and communications; [76,80]
- Inconsistent governance and laws contributed to narratives that public health officials were operating outside their scope of authority; this sowed a polarized public health climate, eroded trust in public health expertise, and spurred legislative efforts to roll back public health authority;[76,80]

- Current governance structures were designed and developed generations ago and often are outdated. As made clear in the COVID-19 response, the current structures often do not lend themselves to addressing public health challenges in the 21st century.

- Improved **clarity in governance and law can:**
- Create consistent opportunities for accountability (e.g., national health department accreditation); [76,78,80]
- Harmonize statutory authority across jurisdictions;[76]
- Encourage collaboration, consistency, and coordination between and across jurisdictions;[76,80]
- Reduce redundancy and optimize local health department performance;[76]
- Clarify scope of health department authority to foster shared accountability with key governmental and nongovernmental partners.[76]

CROSS-SECTOR PARTNERSHIPS AND COMMUNITY ENGAGEMENT

The Importance of Cross-Sector Partnerships and Community Engagement

Cross-sector partnerships and community engagement are foundational components for improved community health and are critical to advancing health, health equity, effective communication, and nimble responses to public health emergencies and challenges. Although they often overlap, partnerships and community engagement are distinct:

- Cross-sector partnerships focus on coordinating multisector changes to address the social determinants of health.
- Community engagement focuses on building relationships and trust with communities served and affected by the public health system.

Cross-Sector Partnerships and Community Engagement: Core Issues and Gaps

Effective cross-sector partnerships include:

- Developing and maintaining **multisector coalitions**, which include, but are not limited to, community groups or organizations; private businesses; health-related organizations; policymakers; tribal entities; health and non-health government agencies;[76,78,79,80,81]
- Engaging authentically with community partners to identify and develop **structured processes and strategies** (e.g., community health improvement plan) for identifying and aligning priorities, activities, and resources.[76,78,79,80,81]

Effective community engagement includes:

Establishing mechanisms for multidirectional communication to increase learning and sharing among all stakeholders;[76,79,80,81]

Cultivating and maintaining trust with community members and organizers. [76,78,79,80,81]

Gaps in partnerships and community engagement include:

- **No clear distinction** between partnership and engagement opportunities and challenges;
- Inconsistent **focus on equity;**
- Insufficient emphasis in partnerships and community engagement around **consensus-building, action, and impact;**
- No discussion of **"in-name-only" partnerships and engagement** that tokenizes, rather than authentically engages, stakeholders;
- **The focus on health departments** as anchors for partnerships and engagement opportunities as opposed to empowering communities;
- Insufficient consideration of **additional staff time and other resources required** for partnership development and engagement in trust- and community- building.

Partnerships and Engagement Challenges and Opportunities for Going Forward

Cross-sector partnership barriers include:

- Insufficient and inconsistent financing and turnover contribute to inadequate staff capacity in building cross-sector partnerships;[76,80]
- Consensus-building with stakeholders with differing agendas;[81]
- Lengthy governmental bureaucratic processes and approvals that hinder timely sharing of information;[78]
- Funding and programming restrictions that limit the scope of work to specific issues and outcomes;[78,80]
- Silo culture for programs and partnerships (e.g., housing viewed within the

lens of housing only and not considered a public health issue).[80]

Community engagement barriers include:

- Insufficient and inconsistent funding for nonspecific work such as "coalition-building" or "community engagement and outreach";[76,78,79,80]
- Disparate access to higher education in public health for racial and ethnic minorities, reducing diversity in the public health workforce;[79,80]
- Finding an appropriate balance between community engagement and internal agency limitations (e.g., community priorities may not align with agency funding availability);[76]
- Localizing community engagement to align with different levels of government (e.g., local health department engagement differs from state or tribal agency engagement).[76]

Partnerships offer opportunity to:

- Address the social determinants of health and underlying causes of conditions such as racism and poverty;[78]
- Promote racial equity in public health programs while recognizing cultural differences;[76]
- Coordinate activities, leverage funding, and promote collective action to maximize resources;[76,78,80]
- Establish shared visions for strategic and non-program specific actions;[78]
- Establish pathways for workforce recruitment and development.

Community engagement offers opportunities to:

- Center affected communities in decision-making;[76,78,79]
- Enhance community resiliency and ameliorate historical harms;[78]
- Increase nimbleness in public health responses to emergencies;[76]
- Broaden networks for timely communication of health information to affected populations.[76,80]

HEALTH EQUITY

The Importance of Health Equity

Health equity is the cornerstone of an effective public health system and

promotes a "state in which everyone has the opportunity to achieve their full health potential."[80] Aligning public health efforts with systemic social justice issues, such as racism, oppression, and poverty, is central to improving health and generating more effective health care spending, a more productive workforce, and more stable, economically viable and resilient communities.

Equity: Core Issues and Gaps

Health equity is a key domain[80] of public health and includes:[76,78,79,80,81]

- Identifying and measuring **system-level health and social disparities** (e.g., racial, cultural, geographical, economic) within communities;
- **Collaborating with community stakeholders** to identify and support culturally appropriate interventions; and
- Ensuring mechanisms for a **diverse public health workforce** that reflects the communities being served.

Gaps in discussions of equity in public health include:

- Inconsistent approaches to **equity** across national public health initiatives (e.g., some stakeholders position equity as a core operational principle while others include it as a general concept to consider);
- Minimal discussion of equity issues **beyond racial and socioeconomic status;**
- Lack of consideration of **additional staff time and resources required** for equity-specific community building work;
- **Focusing on health departments** for community-based health equity work as opposed to empowering communities; and
- Lack of consideration of the **need for consensus-building** with stakeholders on equity priorities and approaches.

Health Equity: Challenges and Opportunities for Action

Barriers are persistent and common at all levels of government and include:

- Insufficient and inconsistent financing for efforts to improve health equity and address the social determinants of health;[76,78,79,80]
- Inadequate staff capacity due to turnover and insufficient and unstable resources;[76,80]
- Challenges with timely and consistent data collection and reporting of disparities (e.g., data broken out by race, ethnicity, and other socioeconomic

demographics);[76,79]

- Disparate access to higher education in public health for racial and ethnic minorities, leading to challenges in workforce diversity;[79,80]
- Mistrust of public health communication and interventions due to historical and current systemic injustices;[76,79"]
- Inconsistent enforcement of public health laws and regulations across communities and populations;[76]
- Funding restrictions that do not allow funds to be used for community-building activities to advance health equity;[78,80]

Health equity work focuses on addressing:

- Disparate outcomes in population health (e.g., violence, infections, hospitalizations, mortality;)[76,79]
- Racial, socioeconomic, geographic, and other inequities that lead to poor health outcomes through policy interventions;[76,79]
- Barriers to health care access (e.g., transportation, financial costs, cultural barriers, medical mistrust);[79,80]
- Multidirectional communication with communities to develop meaningful, culturally resonant messaging and educational products;[79]
- Training and mentoring programs to increase diversity in the public health workforce;[79,80]
- Viable and sustainable cross-sector partnerships for "creating health, equity, and resilience in communities;[76,79,80,81]
- Timely, reliable, and granular data to monitor health disparities and improve social determinants of health;[78,79,81]
- Holistic approaches that advance beyond disease-specific programs to address upstream SDOH;[78]
- Strategic planning and implementation for health equity across all programs within a health department;[81]
- Historical divisions between public health and social services for broader system-level change.[76]

OFFICE OF EMERGENCY PLANNING AND RESPONSE
DAILY SITUATION REPORT
30 July 2020

Today's Local Noteworthy Topics:

- Airlines still struggling to fill seats as pandemic continues
- Report: 71 of 82 Mississippi counties deemed coronavirus "red zones"
- Rankin County schools announce mask mandates, dress codes
- Travel Warning: Americans from 34 states should stay home, per Harvard's COVID-19 tracking site
- First 2020 cases of West Nile Virus reported in state
- Unknown seeds from China end up in Mississippi couple's mailbox
- Mental health experts in Flowood see uptick of depression patients
- Poverty and the pandemic in Mississippi
- Medical marijuana headed to Mississippi ballots in November
- Pearl school leaders prepare for students to return with COVID-19 precautions in place
- Governor Reeves weighs "life or death" school reopening options
- Mississippi Department of Human Services offers childcare support for front-line workers
- Statewide COVID-19 new cases: 1,505; total cases: 55,804; deaths: 20; statewide total deaths: 1,563.

Key Leadership Locations:

OHP: Jim Craig - NSTR
OEPR: Christy Craft-Berry – Capitol City Testing Site: Farmer's Market - Jackson, MS
FINANCE: Twyla Jennings – NSTR
OPS/LOGS: Marshall Horn - NSTR

RAD HEALTH: BJ Smith - NSTR
ACS: David Hall - NSTR
EMS: Alisa Williams – MEMA

Daily Battle Rhythm:

PHCC: Epidemiology - COVID-19 Response Efforts
MEMA: COVID-19 Response Efforts
FEMA: COVID-19 Response Efforts

Response Status Summary:

Level 1: Any disaster or emergency that requires full state response where the state and local governments clearly are overwhelmed.
Level 2: Involves an emergency or disaster that requires full state response and possible federal response and recovery assistance.
Level 3: Involves any emergency or pending disaster that is likely to require the involvement of several ESFs.
Level 4: Virtual activation of the PHCC and/or SEOC/MEMA
Level 5: Normal day-to-day operational activities.

- PHCC: Level 3
- SEOC/MEMA: Level 2 (Partial Activation)

- OPS/LGS: Level 2

Emergency Support Function (ESF) Readiness:

- **ESF – 8 Resources**
  - SMAT **(Deployable)**
  - METTS **(Staged @ UMMC)**
  - Field Hospitals
    - MRTS 42 **(Deployable @ OEPR Warehouse)**
    - MRTS 43 **(Deployed @ UMMC - Jackson)**
    - MRTS 47 **(Staged @ UMMC Grenada)**
  - State & Regional Medical Needs Shelters
    - **11 Pre-Designated Sites (Ready)**
    - **2 FMS Sites (Ready)**

Emergency Support Function Activation:

- Federal: **Activated / COVID-19 Response**
- SEOC: **Partially Activated / Level 2 / COVID-19 Response**
- ESF – 6 Department of Health and Human ServicesMass Care: **Activated / Level 3** - **COVID-19**
- ESF – 8 Health and Medical Response: **Activated / Level 3 / COVID-19**

Recovery Support Function (RSF – 6):

- Louisville, North MS Tornado DR #4175
  - Counties affected: Itawamba, Jones, Leake, Lee, Lowndes, Newton, Rankin, Wayne, Winston
- Holly Springs, North MS Tornado DR #4248:

    - Counties affected: Statewide
- Easter Tornado DR #4536
    - Counties affected: Bolivar, Calhoun, Carroll, Chickasaw, Choctaw, Clay, Coahoma, Covington, Grenada, Holmes, Jasper, Jefferson Davis, Jones, Lafayette, Lawrence, Leake, Montgomery, Noxubee, Panola, Quitman
- Pearl River Flooding DR #4538
    - Counties affected: Attala, Carroll, Claiborne, Clay, Copiah, Grenada, Hinds, Holmes, Issaquena, Leflore, Marion, Sharkey, Warren, Wilkinson, Yazoo
- April 2020 Tornadoes - Federal Declaration requested
    - Counties affected: Amite, Claiborne, Covington, George, Jefferson Davis, Jones, Lawrence, Pike, Simpson, Smith, Wayne
- Tropical Storm Cristobal – Federal Declaration requested
    - Counties affected: Hancock, Harrison, Jackson.

Mitigation

Hazard Mitigation is any action taken to reduce or eliminate long term risk to people and property from natural disasters. Mitigation grant funds are available after a federally declared disaster under the Hazard Mitigation Grant Program. Eligible applicants include state agencies, local governments, private non-profits, and federally-recognized tribes.

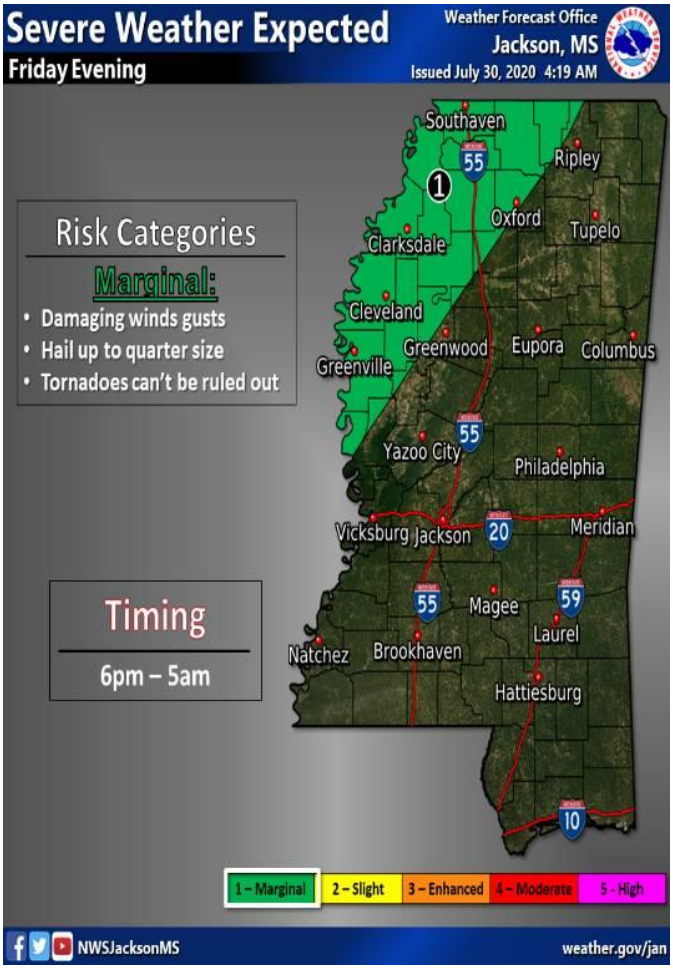
Wiggins Medical Needs
Shelter Project GS#522-046

WEATHER:

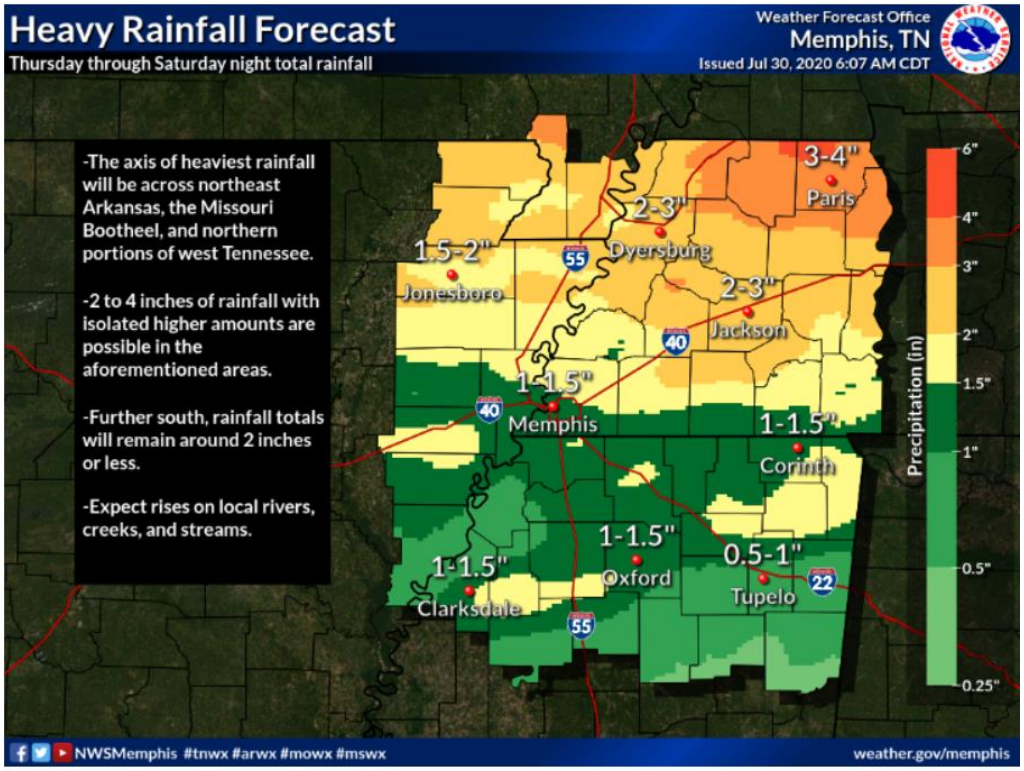
July 30, 2020

Severe Weather Outlook:

North & Central:

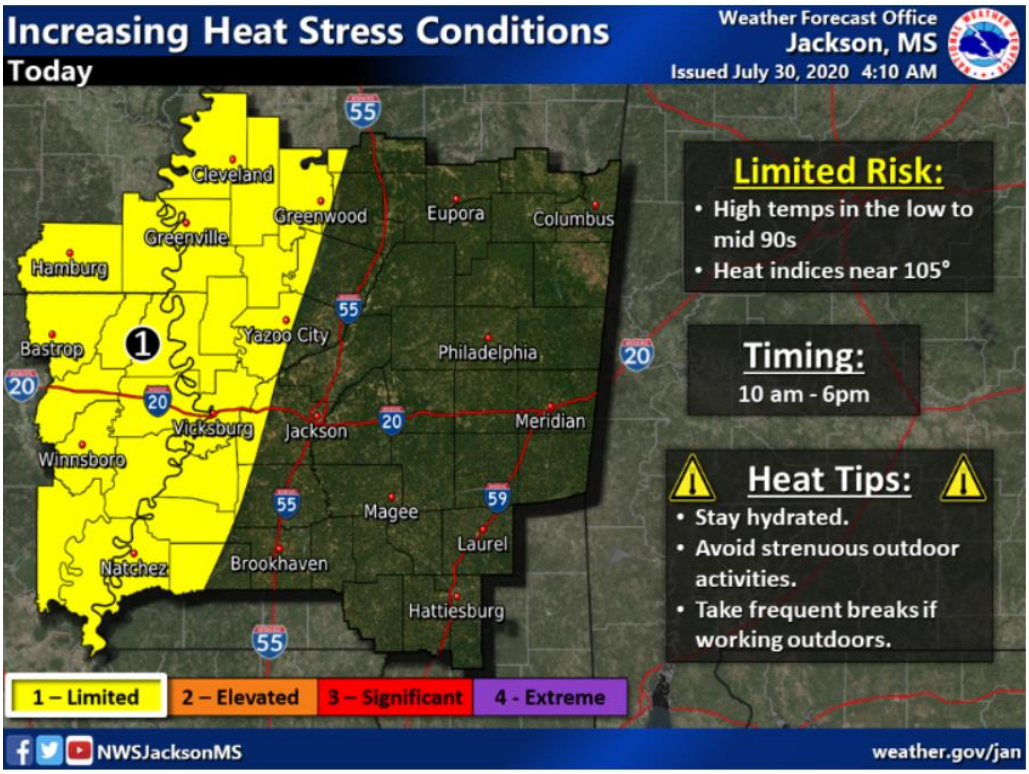


Isolated severe storms capable of damaging wind gusts and hail to the size of quarters is possible Friday night into Saturday morning. A tornado cannot be ruled out.



North

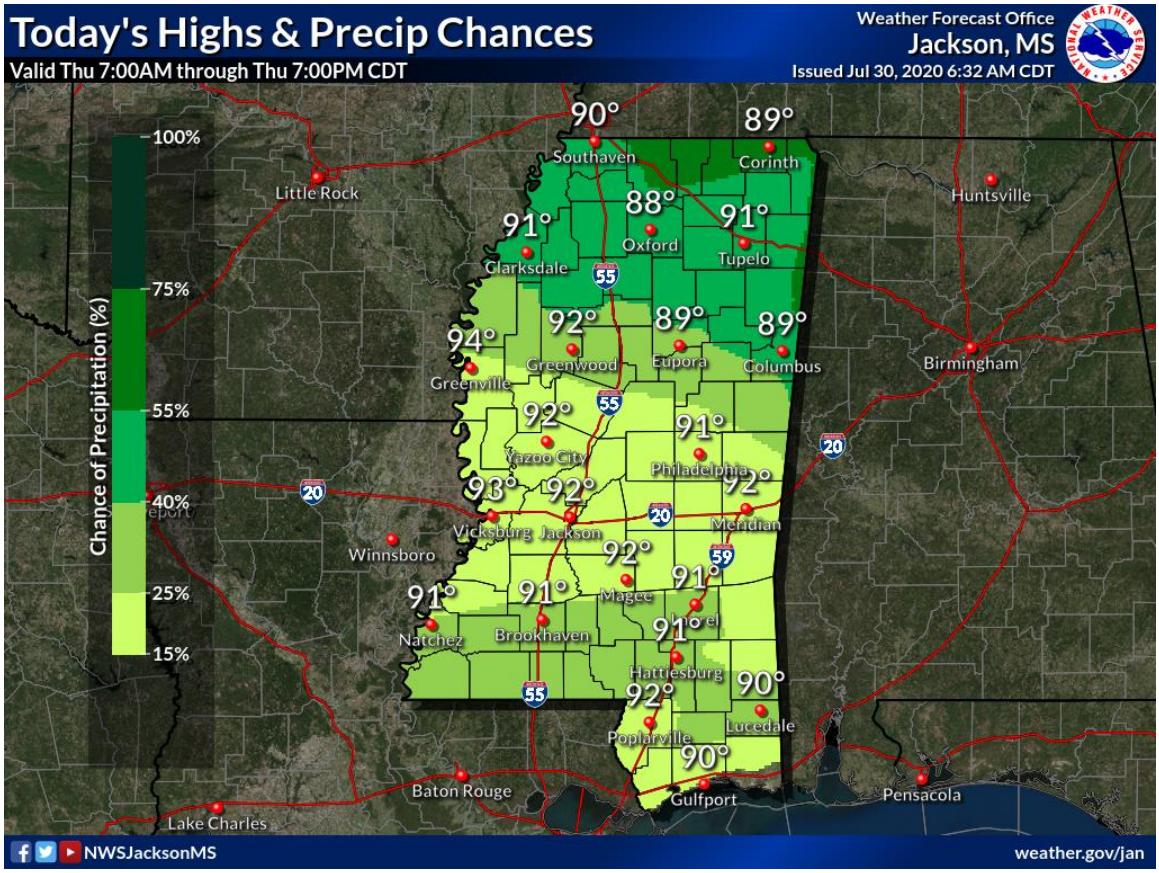
Multiple rounds of heavy rainfall are expected to begin early Thursday morning and continue through late Saturday night. Expect 1 to 2 inches of rainfall over these areas with isolated 3+ inches possible. A more robust system will arrive Friday into Saturday with an additional 1 to 3 inches of widespread rainfall possible. In addition, a few strong storms will be possible Thursday, Friday, and Saturday. The main threat will be damaging winds.



Central

High temperatures in the low to mid 90s will combine with high humidity to produce heat indices near 105 degrees.

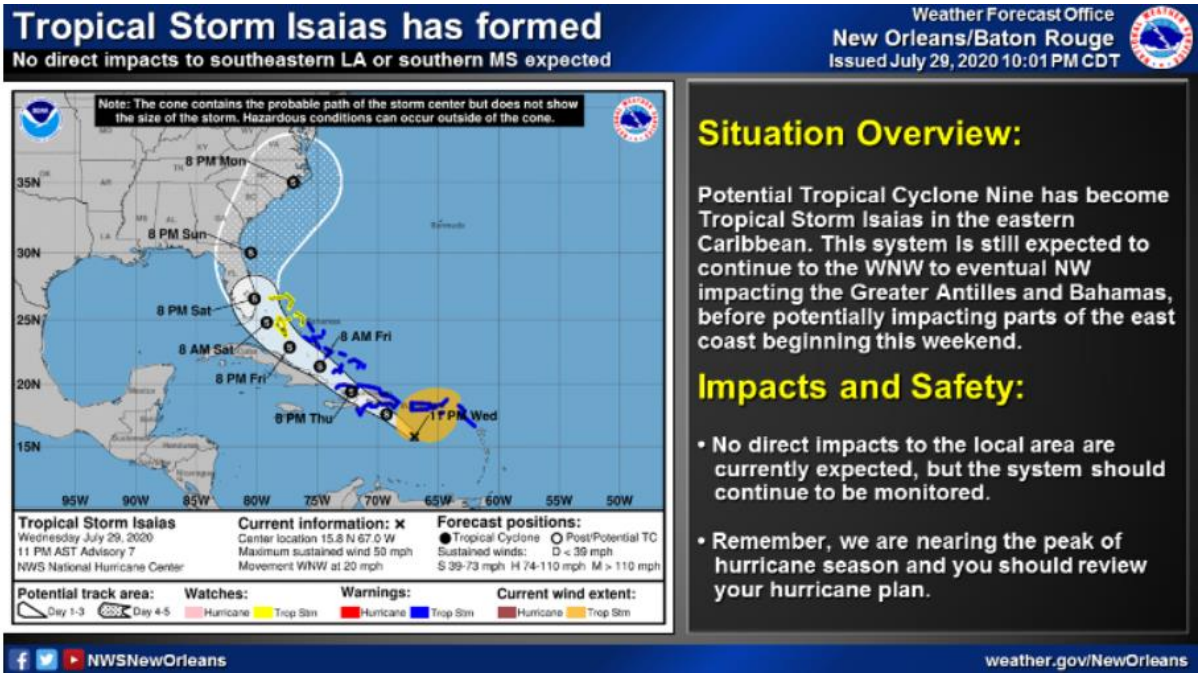
Forecast / Tropics:

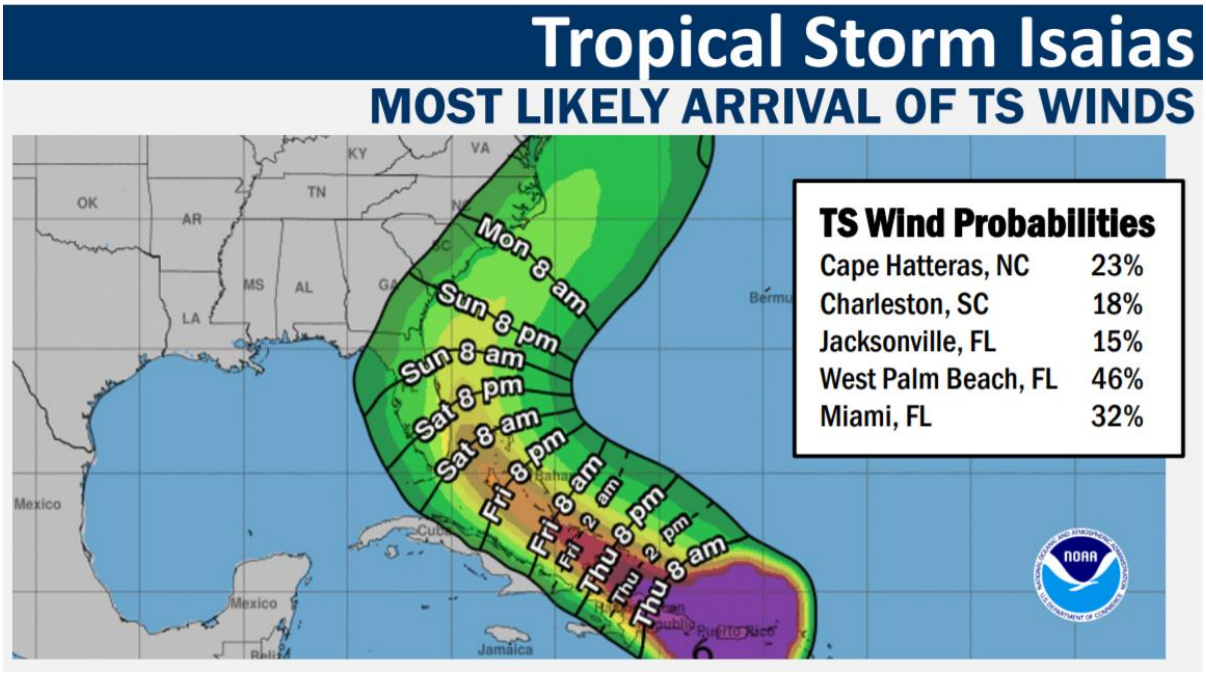


NORTH: TODAY... MOSTLY CLOUDY, CHANCE OF THUNDERSTORMS. TONIGHT...CHANCE OF SHOWERS AND THUNDERSTORMS. FRIDAY...PARTLY SUNNY, CHANCE OF SHOWERS AND T-STORMS. FRIDAY NIGHT... CLOUDY, CHANCE OF SHOWERS AND T-STORMS.

CENTRAL: TODAY...PARTLY SUNNY, CHANCE OF SHOWERS AND T-STORMS.TONIGHT...MOSTLY CLEAR, CHANCE OF SHOWERS AND T-STORMS. FRIDAY...MOSTLY SUNNY, CHANCE OF SHOWERS AND T-STORMS. FRIDAY NIGHT...CHANCE OF SHOWERS AND THUNDERSTORMS.

SOUTH: TODAY... SLIGHT CHANCE OF SHOWERS AND THUNDERSTORMS. TONIGHT...MOSTLY CLEAR, LOWS IN THE LOWER TO MD 70S. FRIDAY...MOSTLY SUNNY. CHANCE OF SHOWERS AND T-STORMS. FRIDAY NIGHT...CLEAR, SLIGHT CHANCE OF RAIN AND T-STORMS.





10PM July 29th update on Tropical Storm Isaias: This system continues to show some slow organization in the eastern Caribbean, with steady west-northwest motion and slow strengthening expected through late week and into the weekend. No direct impacts expected across southeastern Louisiana and southern Mississippi, however we will continue to closely monitor this system.

Tropical – Five-Day Outlook (See NHC for the latest information)

Assault on Public Health Authority to Act for the Collective Good: Confronting the Danger — A Special Town Hall

This Town Hall at the close of the 2021 Virtual Public Health Law Conference will discuss the current climate of threats to public health officials, and to the legal infrastructure and public health's authority to act to protect the health of communities. After a brief introduction to current aspects of this challenge, Town Hall attendees will participate to share experiences: concerns and successes; strategies to address these threats; legal resources and research needs; and coordination of effort. Learn more and register.

Law & Policy Insights

The Network's Harm Reduction Legal Project Recognizes International Overdose Awareness Day

Like many others, the Network recently recognized the 20th International Overdose Awareness Day, an especially somber occasion

Image

given that more people have died from preventable overdose this past year than at any other time. Despite the seemingly endless stream of drug overdose deaths, restrictive laws and policies all too often increase, rather than decrease, the risk of overdose and other drug-related harm.

Image

Improving Childhood Health: The Unrealized Potential of Medicaid's EPSDT Program

In the United States, millions of children live in poverty and are at a much greater risk of experiencing adverse health outcomes compared to their contemporaries in higher income households. Medicaid's Early and Periodic Screening, Diagnostic and Treatment (EPSDT) service was created to provide essential health screenings for at risk children. Despite requirements that states provide timely screenings for the majority of those eligible, the program consistently falls short of meeting these goals.

Image

Drought: It Doesn't Have to Leave Us High and Dry (and Unhealthy)

Nearly half of the United States is experiencing abnormally dry conditions this year. The public health implications of drought cannot be underestimated: drought can lead to a lack of clean drinking water, food insecurity, poor air quality, water-borne diseases, mental health concerns, wildfire, and poor sanitation. Solutions that prevent non-essential uses of water, increase natural storage of water in the soil and aquifers, or maintain water and lake levels, may help limit the public health impacts of future droughts by increasing the overall supply of useable water.

Public Health Law News Round-Up

Some of the public health law and policy issues in the headlines in recent weeks include Texas' new abortion law, the Supreme Court's decision on the federal eviction moratorium and states' responses; challenges to Florida Governor's ban on mask mandates; gaps in data concerning COVID-19 cases; accessibility of mental health care; and the growing suicide rate among communities of color.

Back-to-School Legal Trends and Challenges Related to COVID-19

K–12 schools and parents of K–12 students are facing numerous challenges and uncertainties with the widespread return of in-person learning for the 2021–22 school year. While the return of in-person learning is generally positive, the continued pervasive presence of COVID-19 implicates public health concerns related to the spread of the virus. This fact sheet offers a broad-level overview of issues associated with the return to in-person learning during the COVID-19 pandemic. It also serves as a starting point and initial resource for individuals seeking information on what actions can be taken to protect K–12 students, as well as school faculty and staff, from COVID-19 in a school setting.

Webinars

Image

Voting & Health: Opportunities to Expand Inclusion

September 15, 2021 | 2:00 - 3:00 p.m. ET

This webinar, co-sponsored by the Network, APHA, Vot-ER, Healthy Democracy Healthy People, and Roundtable on Population Improvement will review policies and approaches that impact voter registration, outline the current landscape of challenges and opportunities in registering the hardest-to-reach populations and explore innovative ways to promote voter registration, such as automatic voter registration specifically through state Medicaid programs.

Worth Sharing

Commentary: Legal Interventions to Counter COVID-19 Denialism

James G, Hodge, director, Jennifer L. Piatt, deputy director, and Leila Barraza, senior consultant at the Network's Western Region Office have coauthored this commentary published in the *Journal Of Law, Medicine & Ethics* assessing a series of legal challenges and pathways under consideration or

in use to counter state-based legal efforts to limit or prohibit the use of known, effective public health powers in response to the continued spread of the Delta variant of COVID-19.

Public Health Law: Concepts and Case Studies

The Network's Donna Levin, Peter Jacobson, Denise Chrysler, James Hodge, Jennifer Piatt, and Corey Davis are among the contributing authors to the recently published book, *Public Health Law - Concepts and Case Studies*. The book aims to make law more accessible, empowering students, public health practitioners, and researchers to see law as simply another tool in their toolbox—just like epidemiology, surveillance, biostatistics, and other traditional public health tools.

Summary: Cases exhale infectious viral aerosols. SARS-CoV-2 evolution favors more efficient aerosol generation. Loose-fitting masks moderately reduce viral RNA aerosol. Ventilation, filtration, UV air sanitation, and tight-fitting masks are needed to protect vulnerable people in public-facing jobs and indoor spaces.

Abstract

Background: SARS-CoV-2 epidemiology implicates airborne transmission; aerosol infectiousness and impacts of masks and variants on aerosol shedding are not well understood.

Methods: We recruited COVID-19 cases to give blood, saliva, mid-turbinate and fomite (phone) swabs, and 30-minute breath samples while vocalizing into a Gesundheit-II, with and without masks at up to two visits two days apart. We quantified and sequenced viral RNA, cultured virus, and assayed sera for anti-spike and anti-receptor binding domain antibodies.

Results: We enrolled 49 seronegative cases (mean days post onset 3.8 ±2.1), May 2020 through April 2021. We detected SARS-CoV-2 RNA in 45% of fine (≤5 µm), 31% of coarse (>5 µm) aerosols, and 65% of fomite samples overall and in all samples from four alpha-variant cases. Masks reduced viral RNA by 48% (95% confidence interval [CI], 3 to 72%) in fine and by 77% (95% CI, 51 to 89%) in coarse aerosols; cloth and surgical masks were not significantly different. The alpha variant was associated with a 43-fold (95% CI, 6.6 to 280-fold) increase in fine aerosol viral RNA, compared with earlier viruses, that remained a significant 18-fold (95% CI, 3.4 to 92-fold) increase adjusting for viral RNA in saliva, swabs, and other potential confounders. Two fine aerosol samples, collected while participants wore masks, were culture-positive.

Conclusion: SARS-CoV-2 is evolving toward more efficient aerosol generation and loose-fitting masks provide significant but only modest source control. Therefore, until vaccination rates are very high, continued layered controls and tight-fitting masks and respirators will be necessary.

Key words: SARS-CoV-2; exhaled breath aerosol; face masks; airborne infection; SARS-CoV-2 variants

Introduction

The World Health Organization[1] and U.S. Centers for Disease Control and Prevention[2] recently acknowledged the growing scientific consensus that inhalation exposure is an important route of SARS-CoV-2 transmission[3,4]. The totality of evidence from epidemiologic and outbreak investigations, combined with data on the size distribution of exhaled aerosols and corresponding quantitative models, is compelling[4]. However, culture of the virus from exhaled aerosols, and direct measures of the efficacy of face masks as source control when worn by actual patients have been lacking. Previous reports of infectious virus[5,6] and viral RNA concentrations in room air[7,8] do not provide a clear picture of how much virus infected persons shed into the air. These gaps lead to uncertainty in estimates of exposure, derived from retrospective analysis of outbreaks[9]. New variants also appear more transmissible, but more quantitative data is needed to discern what that means for implementing effective non-pharmaceutical interventions – still a mainstay of infection protection.

We collected exhaled breath aerosol samples from polymerase chain reaction (PCR)-confirmed COVID-19 cases infected with SARS-CoV-2, including alpha and earlier variants, circulating in a university campus community using a Gesundheit-II (G-II) exhaled breath sampler[10,11]. We measured concentrations of SARS-CoV-2 RNA and recovered infectious virus from respiratory swabs, saliva, and aerosols, analyzed the effectiveness of face masks as source control, and examined the impact of the alpha variant on aerosol shedding.

Materials and Methods

This study was approved by the University of Maryland Institutional Review Board and the Human Research Protection Office of the Department of the Navy. Electronically signed informed consent was obtained and questionnaire data were collected and stored with REDCap[12].

We recruited participants with active infection (defined as positive qRT-PCR for SARS-CoV-2 in respiratory swab or saliva samples) May 2020 through April 2021 from the University of Maryland College Park campus and community though a) daily symptom reporting and weekly pooled saliva testing cohort of 238 volunteers, b) direct recruiting of recently diagnosed cases from local clinics and campus, and c) frequent testing of close contacts of cases for two weeks following last contact. Cases and contacts completed online consents and a questionnaire (see Supplemental Methods) before in-person confirmation of consent and specimen collection at the University of Maryland School of Public Health. For contacts, we collected a blood specimen at the first visit and measured oral temperature, blood oxygen saturation (SpO_2), and collected a mid-turbinate swab (MTS) from each nostril and a saliva sample, at approximately two-day intervals.

Accepted Manuscript

Cohort members with a positive saliva sample, recently-diagnosed cases, and contacts with a positive test during follow-up were invited for viral shedding assessment visits on two days separated by one day. Venous blood was collected at the first visit; MTS, saliva, phone/tablet swab, and 30-minute G-II exhaled breath samples were collected at each visit[10,11]. To test the effectiveness of masks as source control, we asked participants to provide paired breath samples at each visit, first while wearing a mask and then without[13]. We provided a surgical mask at one visit and, to test masks in general use by the public, we tested the mask brought by the participant at the other; order of mask type was randomized to avoid bias. Cases studied before September 2020 were asked to repeat the alphabet three times within the 30-minute sampling period, as previously described [13]. Subsequent cases were asked to shout "Go Terps" 30 times and sing "Happy Birthday" loudly three times at 5, 15, and 25 minutes into each 30-minute sampling period. Participants with more severe symptoms sometimes opted to give only one 30-minute breath sample; for these participants, sampling without a face mask was given priority.

Symptom evaluation

Symptoms were self-reported and measured on a scale of 0-3 and composite scores were sums of individual symptom scores for systemic, gastrointestinal, lower respiratory, and upper respiratory symptoms as previously described[10], see Supplementary Information [SI] for additional details.

Sample preparation

MTS and phone/tablet swabs were eluted in 1 mL of Universal Transport Media (BD). MTS from both nostrils were combined. G-II coarse and fine aerosol samples were concentrated, resulting in a 1-mL final sample volume as previously described.[10] One aliquot each of MTS and saliva samples were kept at 4 °C for immediate qRT-PCR. All other samples were stored at −80 °C until further analysis.

Laboratory analyses

Specific laboratory analysis details can be found in the SI. Cohort saliva was processed using the SalivaDirect method[14]. For all other samples, nucleic acids were extracted with MagMax Pathogen RNA/DNA Kit (Applied Biosystems) on KingFisher Duo Prime (Thermo Scientific), following manufacturer protocols specific to sample type. Viral RNA was detected and quantified using the TaqPath COVID-19 Real Time PCR Assay Multiplex and coinfection of samples was determined using the TaqMan Array Card (both Thermo Scientific). RNA copy numbers are reported per mL for saliva and per sample for all other sample types. The limit of detection (LOD) was 75 copies/sample and the limit of quantification (LOQ) was 250 copies/sample (SI).

Viral infectivity was measured by first propagating virus on Vero E6 cells stably expressing TMPRSS2[15] then transferring the media to A549 cells stably expressing human ACE2 (A549-ACE2, from BEI NR-53522 and a gift from Dr. Adolfo Garcia Sastre). Infected A549-ACE2 cells were quantified using immunofluorescence staining with anti-SARS-CoV-2 nucleocapsid antibody (Sino

Accepted Manuscript

Biological 40143-R004) and Hoechst 33342 (Invitrogen H3570), and imaging with a Celigo Imaging Cytometer (Nexcelom) (Figures S1, S2). Plasma was analyzed for IgG, IgM, and IgA antibodies to SARS-CoV-2 using a modified protocol described by Stadlbauer et al., 2020[16]. MTS and saliva samples were sequenced at the Walter Reed Army Institute for Research or the University of Maryland Institute for Genome Sciences. SARS-CoV-2 lineages and mutations were determined using PANGOLIN and Nextstrain tools[17,18].

Statistical analysis

We included analysis of all actively infected cases recruited from the campus and surrounding community over the course of one year. To ensure comparability of with and without mask samples in the analysis of mask efficacy, we included only paired same-day samples collected with and without a face mask from the same person and controlled for numbers of coughs during each sampling session.

Data curation, cleaning, analysis, and visualization were performed using R Studio and R (version 4.1.0)[19], with R packages lme4, lmec, and ggplot2[20]. We made group comparison between seronegative (no detectable antibody) and seropositive cases using two-sample t-test for continuous variables and Fisher's exact test for categorical variables. To handle censored observations below the limit of detection, we applied linear mixed-effect models with censored responses[21,22] and included nested random effects of subject and sample nested within subjects. The geometric means and standard deviations of viral RNA copy numbers for all sample types and the effect of the predictors of viral RNA shedding were estimated from the model. Deidentified data and code for the accepted manuscript will be made available on github.

Results

Sixty-one people with active SARS-CoV-2 infection (recent onset and positive PCR for MTS or saliva) were enrolled in breath testing: 3 from a weekly saliva testing cohort, 43 from 55 recently diagnosed COVID-19 cases, and 15 from among 62 contacts of cases followed to detect early onset of infection (Figure S3). Eight people (13%) with active infection had either IgM or IgG antibodies to SARS-CoV-2 spike protein at the first breath testing visit and four were unable to give a venous blood sample.

The 57 participants with known serologic status at the time of breath sampling (49 seronegative, 8 seropositive) were enrolled from zero to 12 days post onset of symptoms or first positive test (Table 1, Figure S4). All cases were asymptomatic or mild at the time of study. The seronegative cases included all participants with singing experience and alpha-variant infection – there were no other significant differences based on serologic status. No volunteer was taking antiviral medication at the time of breath sample collection and no co-infections were identified.

Accepted Manuscript

Seronegative cases

Among seronegative participants, 4 (8%) were infected with the alpha and none with delta or other variants associated with increased transmissibility[23] (Table S1). Symptoms tended to be more pronounced at the first shedding visit, two participants were febrile at the second shedding visit (Figures S5-S6), and three were asymptomatic. Each of the 4 seronegative alpha variant cases had detectable concentrations of viral RNA in all MTS, saliva, fomite, and aerosol samples (Table 2). Among the remaining seronegative participants, we detected viral RNA in all MTS, 99% of saliva, 49% of fomite, 19% of coarse-, and 31% of fine-aerosol samples. The geometric mean concentrations of viral RNA were significantly greater for all sample types collected from alpha variant cases.

Exhaled breath viral RNA from seronegative cases without masks

Viral RNA content of 30-minute breath aerosol samples was similar to the amount of RNA recovered from participants' mobile phones (Table 2). The frequency of detection of viral RNA in aerosols was greatest 2-5 days post onset of symptoms or first positive test (Figure S7) but was not a significant predictor of the quantity of viral RNA in the aerosols (Table 3). Viral RNA in MTS and saliva were moderately correlated (Figure S8: ρ=0.46) but only RNA in MTS was a strong predictor of viral load in aerosols (Table 3, Figures S9, S10). The quantity of viral RNA in the fine-aerosol fraction was 1.9-fold (95% confidence interval [CI] 1.2 to 2.9-fold) greater than in the coarse-aerosol fraction (not shown).

Effect of alpha variant infection on viral RNA shedding from seronegative cases

Alpha variant infection was associated with significantly greater amounts of viral RNA shedding than infection with earlier strains and variants. In bivariate analyses of samples collected without masks (Tables 3 and S3), the alpha variant was associated with significantly greater viral RNA shedding than wild-type and other variants not associated with increased transmissibility. Fine-aerosol shedding remained significantly greater for alpha variant infections (18-fold, 95% CI, 3.4 to 92-fold) after adjusting for the increased viral RNA in MTS and saliva, the number of coughs during sampling sessions, and symptoms (Table 3). We also analyzed the impact of alpha variants on shedding using the larger data set, including samples collected with and without masks. After controlling for the effect of masks and numbers of coughs during sampling, alpha variant infection was associated with a 100-fold (95% CI, 16 to 650-fold) increase in coarse- and a 73-fold (95% CI, 15 to 350-fold) increase in fine-aerosol RNA shedding (Table 3).

Effect of masks on viral RNA shedding from seronegative cases

We observed statistically significant reductions in aerosol shedding regardless of mask type after adjusting for number of coughs during sampling sessions: 77% (95% CI, 51% to 89%) reduction for coarse and 48% (95% CI, 3% to 72%) for fine aerosols (Figure 1). Surgical masks did not perform significantly differently than others (Table S5), and mask performance was not significantly different for alpha variant infections (Table 3). The types of face masks brought by participants varied and progressed from single-layer homemade cloth masks to more substantial double-layer cloth masks, surgical masks, double masks, and a KN95 over the course of the year (Table S4).

Seropositive cases

Eight participants had antibodies to SARS-CoV-2 spike protein at the time of breath sample collection. Seropositive cases tended to cough more than seronegative cases (Table 1) but none of the exhaled aerosol samples from seropositive cases had detectable viral RNA (Table S6).

Virus cultures

Among samples subjected to virus culture, we detected infectious virus (Figure S2) in 50 (68%) of 73 MTS and 20 (32%) of 62 saliva samples from seronegative participants (Figure 2, Table S2a). The RNA concentration associated with a 50% probability of a positive culture was 7.8×10^5 for MTS and 5.2×10^6 for saliva (Figure S11, Table S7). None of the 75 fine-aerosol samples collected while not wearing face masks were culture-positive. Two (3%) of the 66 fine-aerosol samples collected from participants while wearing face masks were culture-positive, including one from a person infected with the alpha variant 2 days post onset and one from a person with a Nextstrain clade 20G virus 3 days post onset. Fomite and coarse-aerosol samples subjected to culture were negative.

Discussion

Alpha variant infection yielded one to two orders of magnitude more viral RNA in exhaled breath when compared with earlier strains and variants not associated with increased transmissibility. Our observation of increased aerosol shedding, even after controlling for the increased amounts of viral RNA in the nose and mouth, suggests that evolutionary pressure is selecting for SARS-CoV-2 capable of more efficient aerosol generation.

We recovered infectious virus from two exhaled breath fine-aerosol samples, approximately two-thirds of MTS, and one-third of saliva samples. Logistic regression analysis of the MTS and saliva samples suggests that there is a small but measurable probability that each RNA copy represents an infectious viral particle consistent with previous dose-response models of infectious viruses[24]. The probability of detecting infectious virus in our cell culture system may be as high as 10^{-4} per RNA copy in saliva samples with 10^2 copies. We recovered infectious virus from one of the two fine-aerosol samples with $>10^4$ RNA copies per sample, where the estimated probability of a positive culture was 8% per sample, based on the regression model. The other culture-positive aerosol sample was one of 98 aerosol samples below the 75-copy limit of detection for RNA. This observation is consistent with a previous report of infectious SARS-CoV-2 in an aerosol sample with very low RNA copy numbers[5], and may suggest that virus particles in respiratory aerosols contain fewer defective virions than MTS, or that the fluid is less likely to interfere with viral cell attachment and entry than are nasal secretions and saliva. It is likely that human airway epithelium is more susceptible to infection than laboratory cell cultures[25].

Loose-fitting face masks, including surgical masks and those in daily use by the study participants, produced significant, albeit modest, reductions in the amount of viral RNA in exhaled breath, supporting their use as source control. Consistent with previous studies of influenza, SARS-CoV-2 viral RNA was shed more abundantly in fine than coarse aerosol and masks were more effective at

Accepted Manuscript

blocking release of coarse aerosol[10,13,26,27]. The effectiveness of face masks for blocking release of fine aerosol (1.9-fold) was similar to the effectiveness we previously reported for influenza (2.8-fold). However, the 4.3-fold (or 77%) reduction in coarse aerosol was significantly less than the 25-fold reduction previously observed for influenza shedding[13]. This discrepancy likely arose because the more vigorous and extended vocalizations in the current study would be expected to maximize leakage around loose-fitting face masks. Face masks worked equally well for containing alpha variant and "wild-type" aerosol shedding.

Viral RNA aerosol collected from 22 COVID-19 patients in Singapore using a G-II measured similar RNA copy numbers and overall rates of positive breath samples (59% versus 51% here) during singing and loud talking as observed here[28]. A majority (68%) of the cases studied in Singapore were infected by variants associated with increased transmissibility, while 18% of infections were not variants of concern or interest, and each case was sampled on only one day. By comparison, our sample included more "wild-type" infections and sampling days per person allowing analysis of the impact of variants on shedding. One delta variant was studied in Singapore and none in this study. The shedding rates detected using the G-II in both studies, however, were lower than those reported by Ma et al. using a sampler that requires subjects to blow through a narrow straw[29]. Ma et al. and our data are in agreement that among persons infected with "wild-type" strains, a minority (26% and 31%, respectively) shed detectable levels of viral RNA into aerosols. However, our data on alpha variant infections and the data from Singapore suggest that this is changing and most cases may now be shedding viral aerosols more frequently. We have yet to enroll cases with the delta variant and study them using the Maryland protocol to test the expectation, based on our current findings, that delta will be associated with an additional large increase in aerosol shedding.

Our study had several limitations. Although we attempted to identify and test cases early through weekly testing of a cohort and intensive follow-up of close contacts, most cases were still studied several days after onset of symptoms or first positive test. This likely resulted in missing the most contagious period[30–33]. Furthermore, all cases were mild at the time of testing and only two went on to have moderate severity and require hospitalization. As a result, our data may not represent the upper end of the spectrum of shedding. The types of face masks worn by participants changed over the course of the study, as did the quality of surgical masks that we could purchase. Therefore, we cannot report on the efficacy of specific loose-fitting masks. This work does, however, provide information on the average amount of source control provided by community masking. Finally, logistical considerations required that we freeze samples between collection and culture, with potential loss of infectiousness[34], especially for dilute aerosol specimens.

Overall, our results demonstrate that people with mild or asymptomatic SARS-CoV-2 infections released infectious aerosols in their exhaled breath. Face masks provided significant source control suggesting that community-wide masking even with loose-fitting masks can reduce viral aerosols in indoor air by half, making a significant contribution to reducing the spread of COVID-19. Our data also suggest that the virus is evolving toward more effective dissemination through aerosols and

demonstrate that infectious virus can escape from loose-fitting masks. With the dominance of newer, more contagious variants than those we studied, increased attention to improved ventilation, filtration, air sanitation, and use of high-quality tight-fitting face masks or respirators (e.g., tight-fitting ASTM F3502-21 level-2 face-coverings or respirators) for respiratory protection will be increasingly important for controlling the pandemic. This will be especially true where vaccination rates are low, vaccine is not available, and for people with poor immune responses or waning immunity. Therefore, our data support community mask mandates and tight-fitting masks or respirators for workers in healthcare but also in all workplaces where people are sharing indoor air or have frequent public contact.

BMI, Body mass index; IQR, Interquartile range;

[a] Group comparisons were made between antibody negative and positive cases using two-sample t-test for continuous variables and Fisher's exact test for categorical variables.

[b] 57 volunteers provided breath samples and sera at the initial shedding assessment visit; 34 of them provided exhaled breath samples at the 2nd shedding assessment visit approximately 2 days later; four volunteers who did not provide sera at the first visit were excluded.

[c] Chronic respiratory illness = volunteers with any Chronic obstructive pulmonary disease, Asthma, Other lung diseases.

[d] Days since start of symptoms or first positive test if asymptomatic or presymptomatic to first breath sample; 3 subjects reported no symptoms.

[e] Symptoms at the time of each sample collection visit. Sixteen symptoms were rated from 0 to 3 with a maximum possible composite score of 15 for upper respiratory, 9 for lower respiratory, 12 for systemic symptoms and 12 for gastrointestinal symptoms.

[a] Participants with a mid-turbinate or saliva samples positive for SARS-CoV-2 viral RNA by qRT-PCR and seronegative for SARS-CoV-2 spike protein antibody at enrollment and who provided at least one 30-minute sample of exhaled breath.

[b] Number of participants with at least one sample ≥ limit of detection (LOD) or ≥ limit of quantification (LOQ) (Supplementary.

[c] Samples positive and ≥LOD had at least one replicate with confirmed amplification after inspection and quality control (LOD ~75 RNA copies with 95% probability of detection) and ≥LOQ if the mean of replicate assays was ≥250 RNA copies.

[d] GM = geometric mean. The GMs were computed, accounting for samples below the LOD, using a linear mixed-effects model for censored responses (R Project LMEC package) using data for all samples of each sample type with nested random effects of samples within study participant.

[e] The largest quantity of RNA copies detected based on the mean of replicates qRT-PCR aliquots.

Accepted Manuscript

Downloaded from https://academic.oup.com/cid/advance-article/doi/10.1093/cid/ciab797/6370149 by IDSA Member Access user on 04 October 2021

Table 3. Predictors of viral RNA shedding among seronegative participants

	Coarse Aerosol (>5 µm)			Fine Aerosol (≤5 µm)

FIGURES LEGENDS

Figure 1. Viral RNA shedding in paired with and without face mask samples. Viral RNA measured during 69 same-day paired sampling events with and without mask from 46 seronegative cases. Samples with no detected viral RNA were assigned a copy number value of one. Exhaled breath aerosols were obtained in 30-minute sampling durations. "+mask" = sample collected while wearing a face mask. MTS = mid-turbinate swab, Fomite = swab of participant's mobile phone.

Figure 2. Viral RNA content and culture results of samples from all sampling events for seronegative cases. Samples with no detected viral RNA were assigned a copy number value of one. Exhaled breath aerosols were obtained during 30-minute sampling events and included unpaired with and without face mask samples. Five fine aerosol samples with face mask and three fomite samples were not available for culture. A subset of MTS, saliva, and coarse aerosol samples were subjected to culture. MTS = mid-turbinate swab, Fomite = swab of participant's mobile phone.

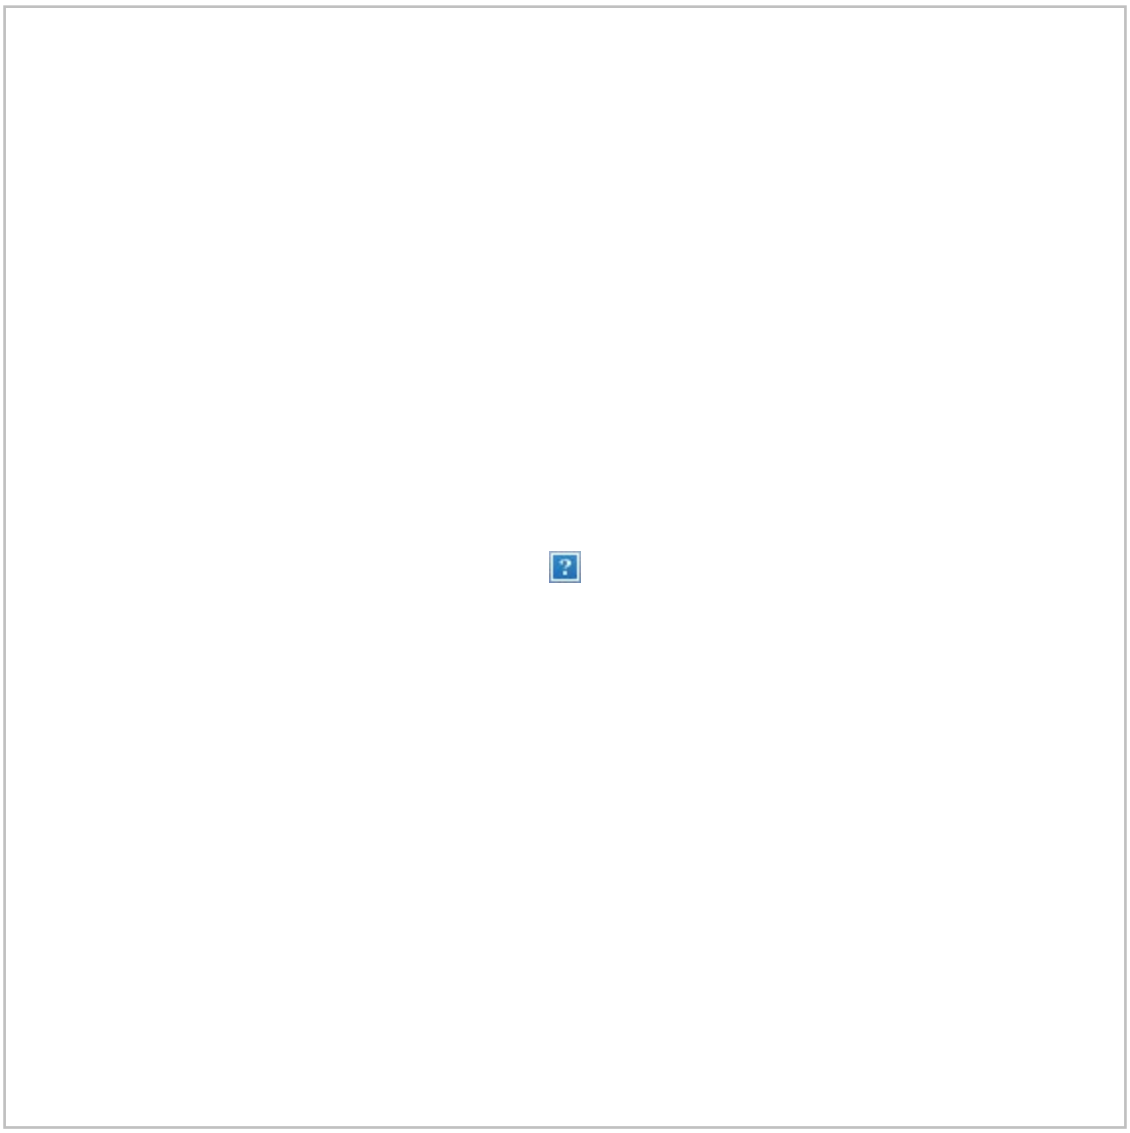
February 25, 2021

Dear Colleague,

One year ago today, based on analysis by experts from around the world at Resolve to Save Lives, we and others predicted, sadly, that a Covid pandemic was inevitable.

In this past year, our team helped the world better understand and more effectively respond to the Covid pandemic that has, tragically, taken so many lives. Covid revealed stark and unacceptable gaps in our public health and primary care systems, and also validated Resolve's approach to help close these gaps.



None of this would be possible without our colleagues at Vital Strategies and the support of our donors. Bloomberg Philanthropies, the Bill and Melinda Gates Foundation, Gates Philanthropy Partners, which is funded with support from the Chan Zuckerberg Foundation, #StartSmall, the CDC Foundation, and the Stavros Niarchos Foundation all provided fast, flexible, and generous support.

Here are nine ways we've worked with partners to meet our goal of improving health using an approach centered on simplicity, speed, and scale.

1. Using 'Science' as a verb.

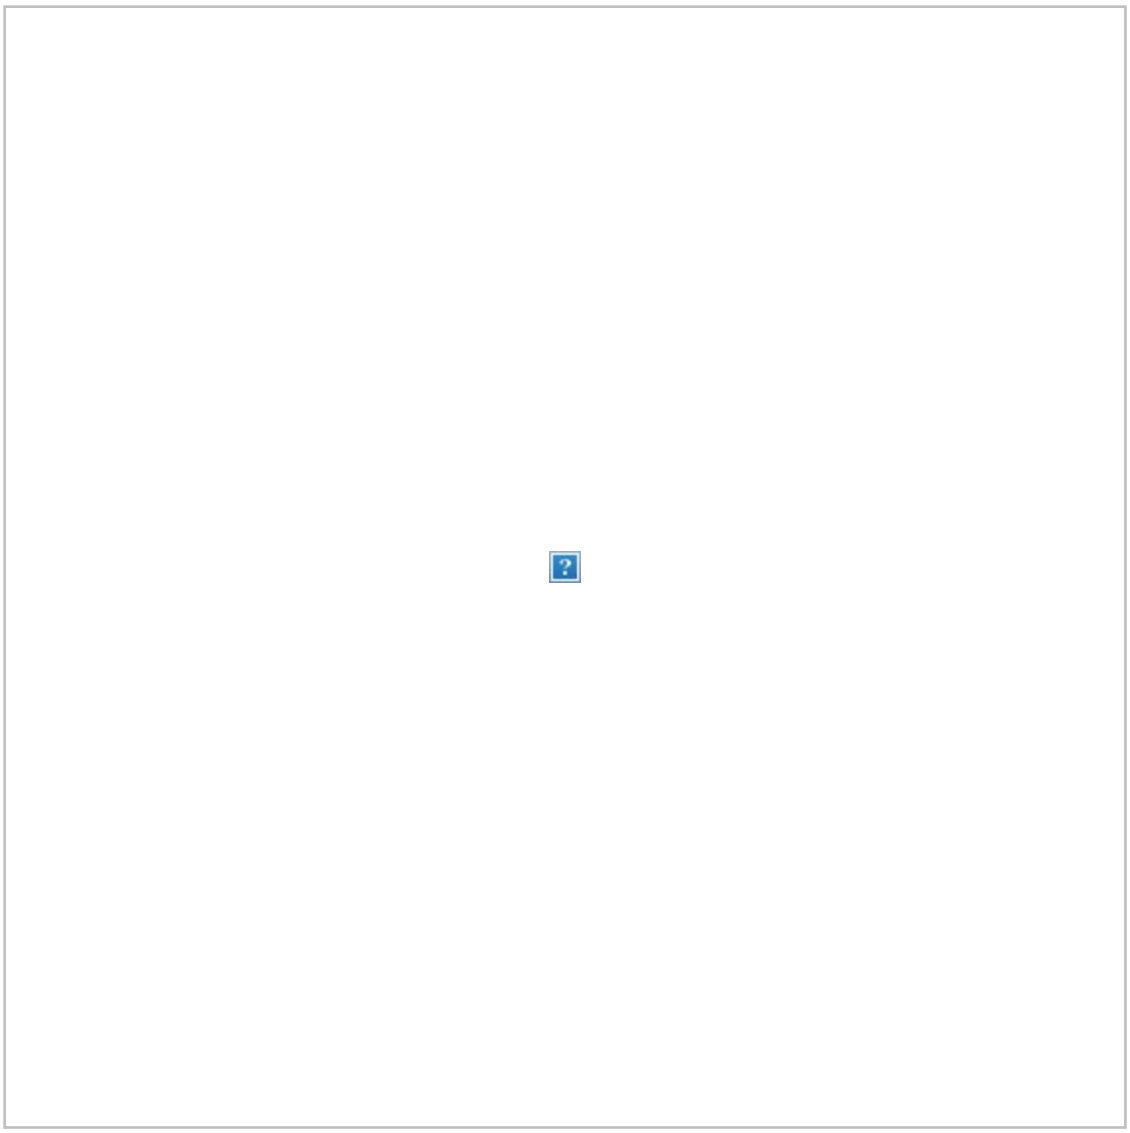
In "*The Martian*," Matt Damon plays a botanist stranded on Mars. He realizes that to get

back home, he's going to have to "science the s--- out of" the problem. Resolve's team of epidemiologists and public health specialists have been learning every day. As the evidence has changed, our approach has not – always base our recommendations on the best available science.

Governments across the United States and throughout the world adopted many of our evidence-based strategies to control the pandemic, including:

- Using an adaptive response to the pandemic, which we released more than a year ago and updated regularly as more information became available. The concept, and most of the details on phased reopening guidance, were adopted by the White House, although unfortunately the strategy wasn't followed.
- Best practice reports on the impact of public health and social measures led to wider adoption of these measures.
- Boxing in the virus to prevent explosive spread and reopen society as soon and as safely as possible.
- Establishing alert level systems to provide a framework to support clear decision-making, improve accountability, and better communicate with the public. Many states and countries adopt this tool, and we partnered with the *New York Times* to make a consistent system across the U.S. available to all.
- Reopening schools while prioritizing the safety of students and their families, teachers and staff, and the entire community.
- Communicating the importance of wearing masks and implementing mask mandates to prevent viral transmission and slow community spread.
- Measuring and reporting essential Covid indicators.
- Implementing, along with our Vital Strategies colleagues, rapid mortality surveillance to better track the pandemic.

Our Prevent Epidemics website had more than a million visits in the past year; our work continues to set the agenda for strong public health systems during and beyond the Covid response.



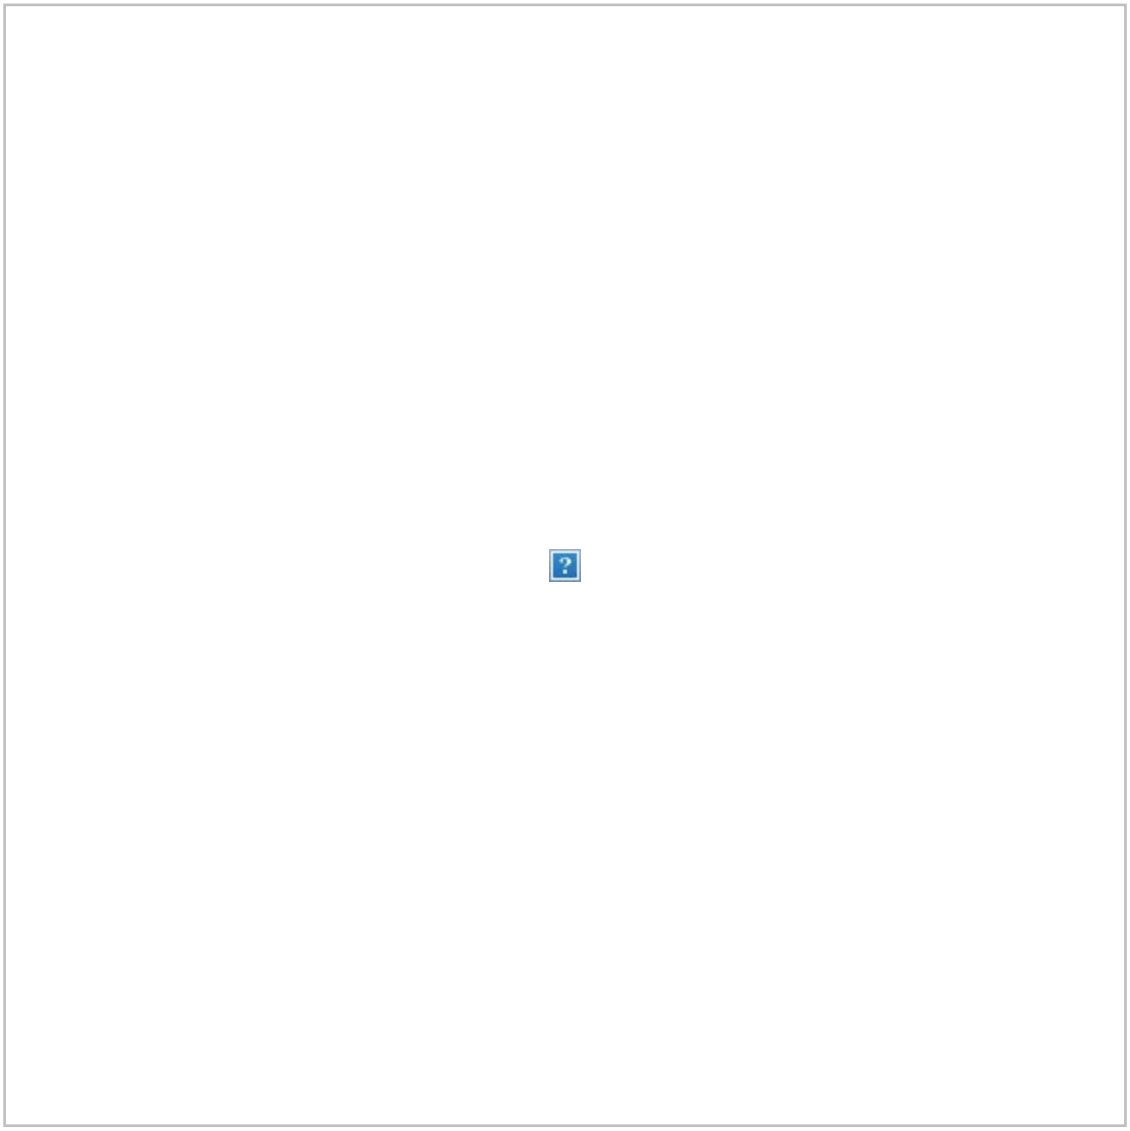
Partnership with the New York Times.

2. Funding to stop outbreaks – provided quickly.

Before and during the Covid pandemic, Resolve provided rapid response funds **to more than two dozen countries in Africa and elsewhere.** A systematic analysis in Nigeria found that time to outbreak response decreased from six to two days after the fund was implemented. Stopping an outbreak in a few days can cost a tiny fraction of what it would cost if allowed to spread for weeks or months. In Nigeria and other countries, these funds are now replenished by government funds.

We established “acceleration teams” of epidemiologists, veterinarians, evaluation experts, and other specialists that helped several African countries use national resources and World Bank funding better. In Uganda, preliminary data suggests that, with our support, the government resolved major weaknesses in epidemic preparedness; it would be the first

country on the continent outside of North Africa to have done so. In Nigeria and Liberia, these teams helped more than double World Bank disbursements within a year.



COVID-19 test preparations in Ogun, Nigeria. Rapid Response Teams in Nigeria were supported by Resolve to Save Lives.

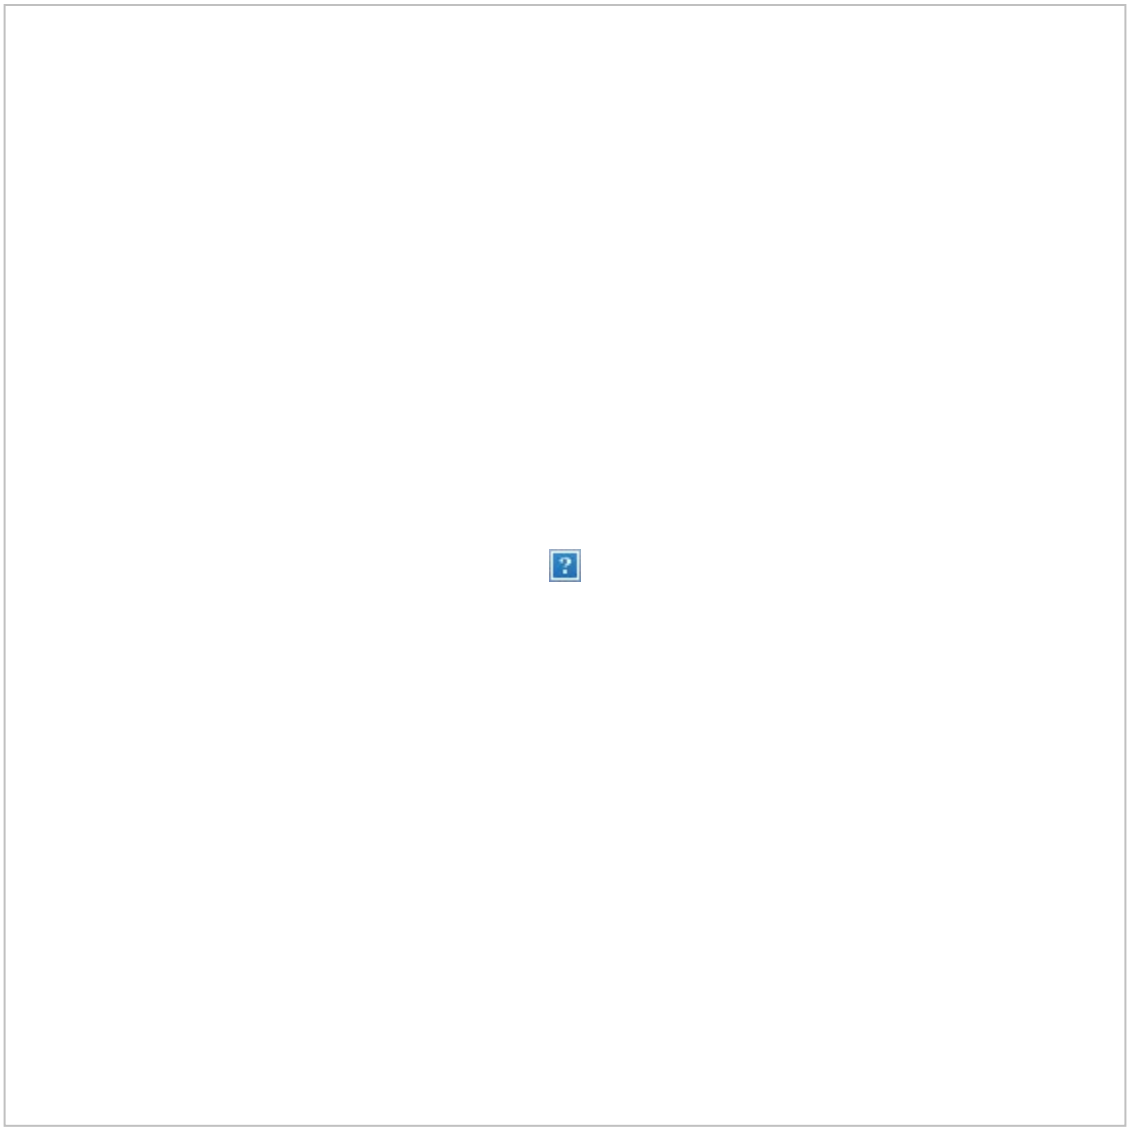
3. Working alongside partners to build capacity.

Collaboration is essential to protect health sustainably. In 2019, our training course, Program Management for Epidemic Preparedness, graduated 25 mid-level managers representing seven countries in Africa. This investment paid off during the Covid pandemic as these individuals and their teams were able to rapidly improve detection and response. Our second training program, planned before and conducted during the pandemic, was held in the Democratic Republic of Congo and helped to align ministry officials and World Bank staff to enable the timely and effective use of $150 million in

World Bank funds for epidemic preparedness.

Our global legal and advocacy teams issued guidance and provided detailed legal consultation to equip cities and countries to rapidly review existing legal frameworks, fill gaps, and ensure that public health and social measures to address Covid were in accordance with legal and ethical best practices.

With input from health departments in the US, we leveraged technology**, applying lessons learned from our successful** Simple app**.** Our digital team developed tools to improve case management and contact tracing for Covid. We supported the Africa Centres for Disease Control and Prevention to improve laboratory systems in Africa, launch a dashboardtracking the pandemic, and more.



Left: Contact tracing team from the Ethiopian Public Health Institute (EPHI) conducting contact tracing at Addis Ketema sub-city.

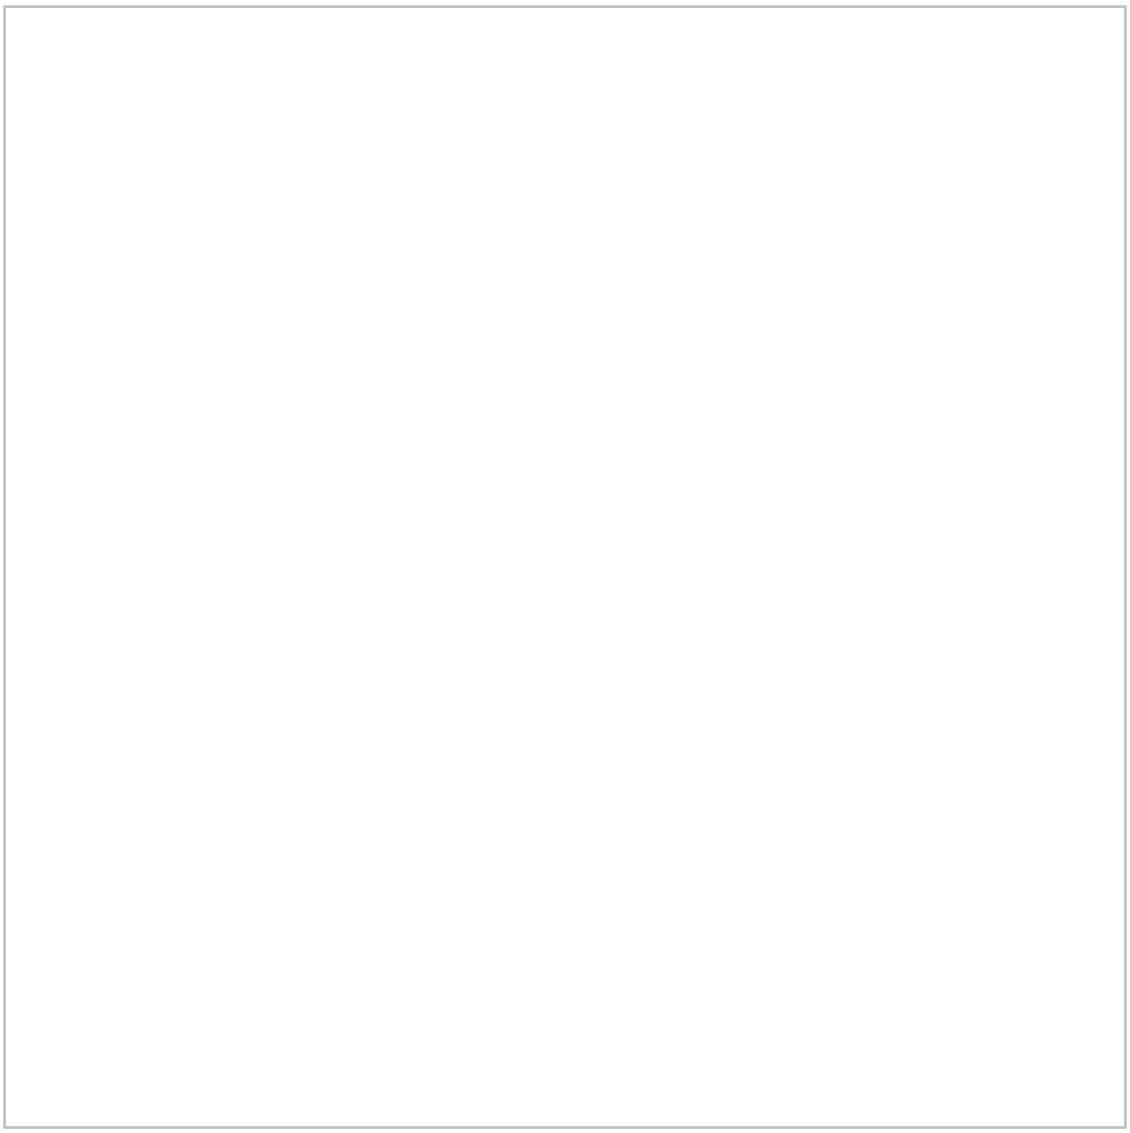
Right: Health workers perform contact tracing in Malaba, Uganda. Resolve to Save Lives supported COVID-19 response activities in Uganda.

---

4. Fighting Covid in the U.S. – especially among vulnerable populations.

We started work in the U.S., creating a US Covid Response **team.** Our staff worked with public health departments across the country to strengthen prevention strategies, testing, isolation and quarantine, contact tracing, vaccination, and community engagement, all with a focus on equity. We also joined with other national public health organizations to advocate for improved funding and policies to address this pandemic and prevent the next.

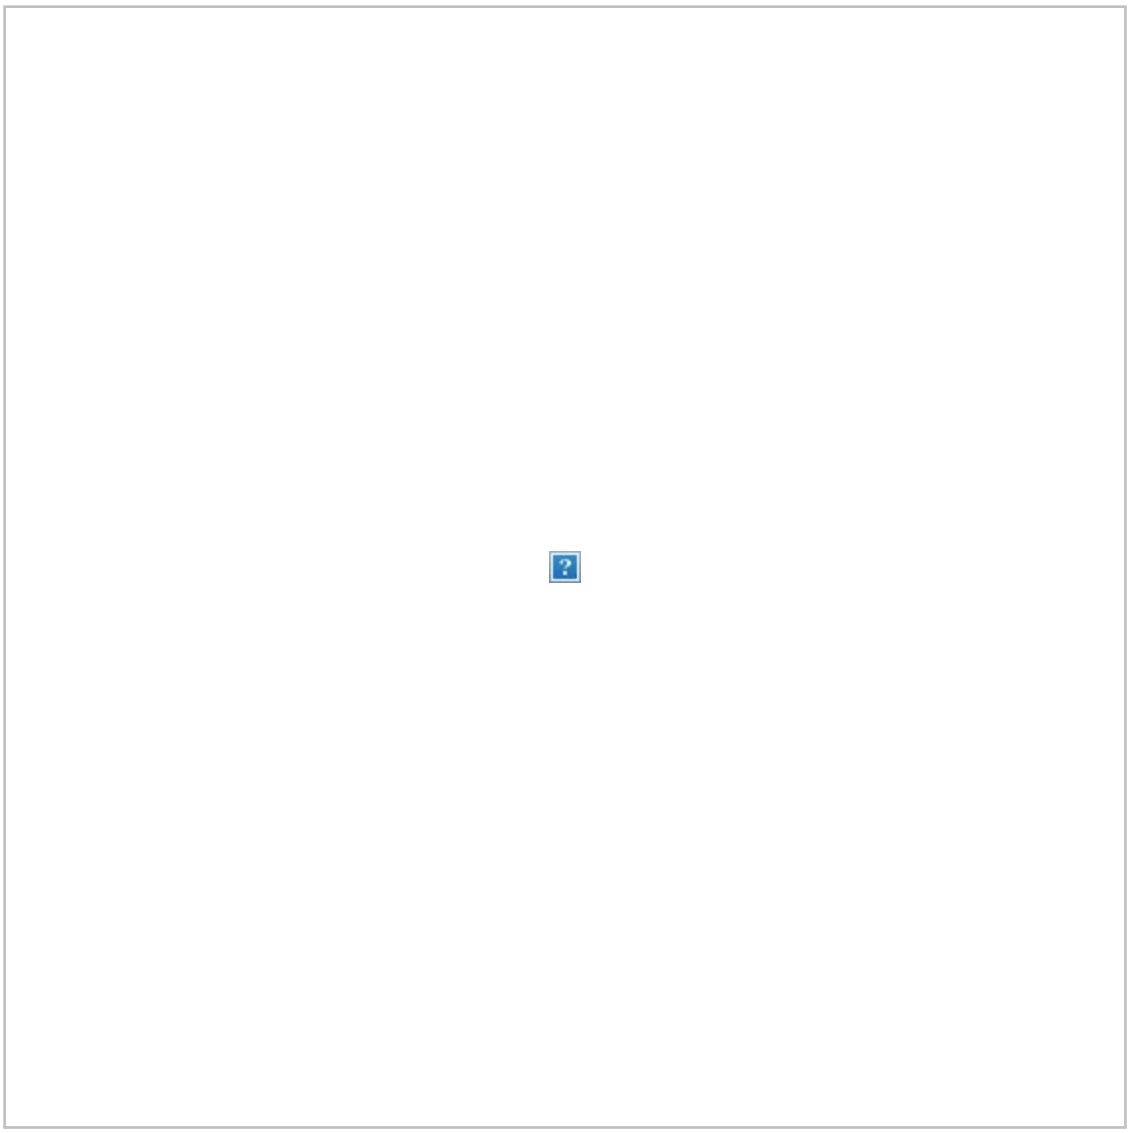
Recognizing the importance of reaching Black communities through faith leaders, we supported launch of the Black Clergy Choose Healthy Life Action Plan, a multi-city initiative to raise awareness of Covid, test those at highest risk, provide services for contact tracing, isolation, and quarantine, promote access to vaccination, and strengthen the infrastructure within the Black church network to end health disparities.



Resolve's Program Advisor in Marion County, Indiana, working at the county's first COVID-19 vaccine distribution center

5. Honoring our health care heroes by protecting them.

As soon as the pandemic hit, we established on-the-ground health care worker training focused on infection prevention and control. Our training was used by more than two dozen partners to train more than 35,000 staff in 7,000 facilities throughout Africa, facilitating safe screening of more than 4 million patients. Learning from this experience, in January 2021, we led a coalition of 17 organizations to publish a report that highlights the risks health care workers face every day and provides recommendations to protect them – and their patients – by making health facilities safer.



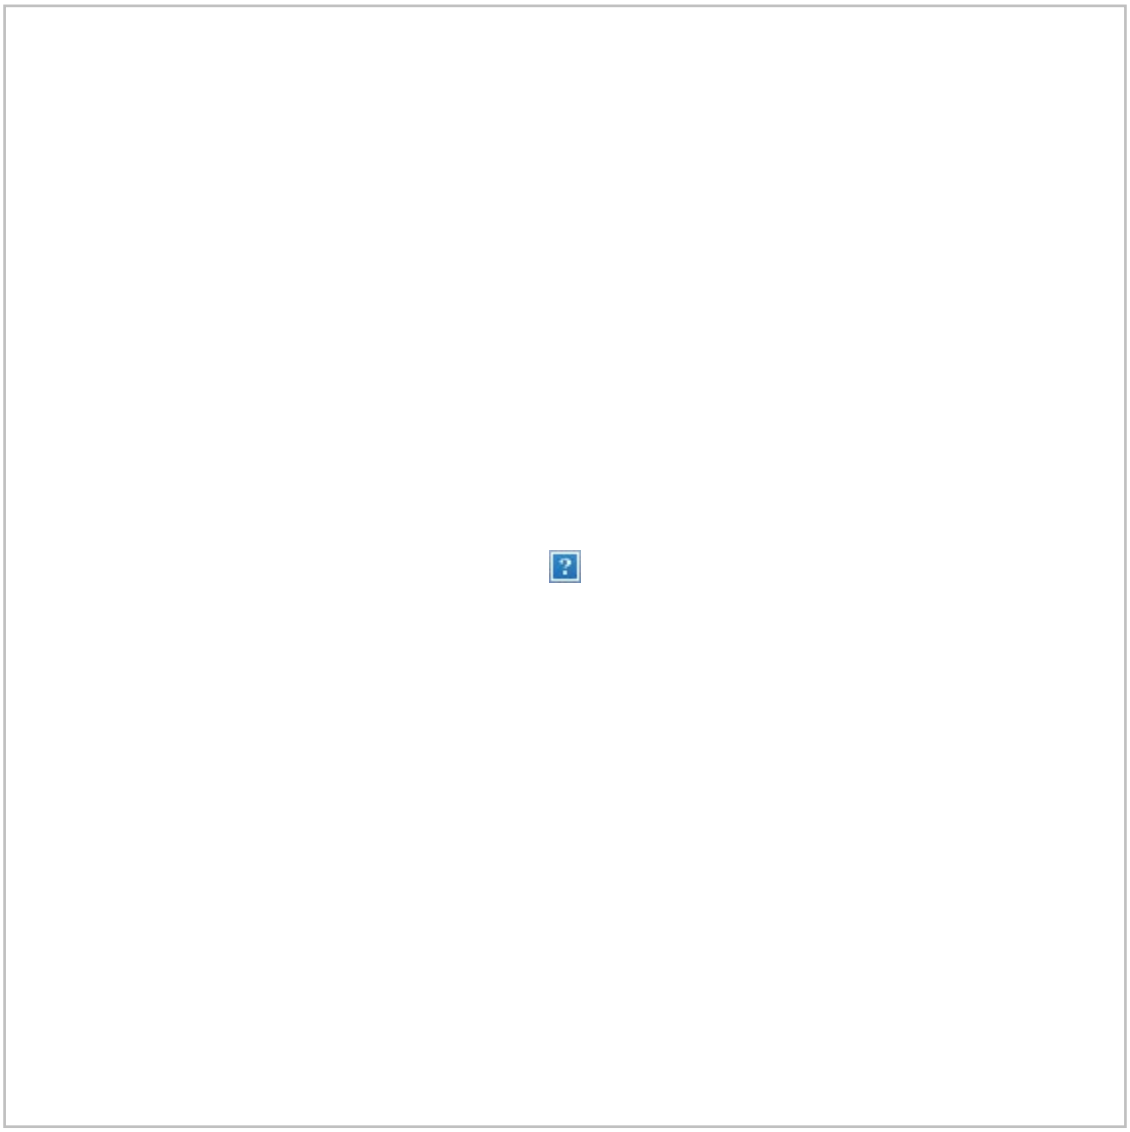
Personal Protective Equipment training in Ethiopia, supported by Resolve to Save Lives. Illustration from the Resolve to Save Lives and partner report Protecting Health Care Workers: A Need for Urgent Action launched January 13, 2021.

6. Basing action on evidence.

We spearheaded development of the Partnership for Evidence-Based Response **to Covid, a public-private partnership that supports evidence-based measures to reduce the impact of the pandemic on African Union Member States**. The partnership collected and analyzed social, economic, epidemiological, population movement, and security data from 20 countries to help determine the impact of public health and social measures.

Our report revealed that while effective in reducing disease spread, the Covid control measures quickly implemented by many member states caused severe secondary

impacts. Many communities across Africa reported difficulties accessing critical health services due to the extra burden placed on health systems, interruptions to medical supply chains, and restrictions on movement. People also reported being hesitant to seek care due to actual or perceived risk of transmission or inability to pay for care. This data led to policy changes to better balance control of Covid with protecting communities' social and economic stability.



Partnership for Evidence-Based Response report launched May 2020.

7. Primary care is primary.

Perhaps the key lesson from the Covid pandemic is the need for primary care to be at the center of health systems. Non-communicable diseases continue to be the leading global causes of death, and we must continue life-saving preventive care and treatment during the pandemic; in addition to saving lives today, this will promote community

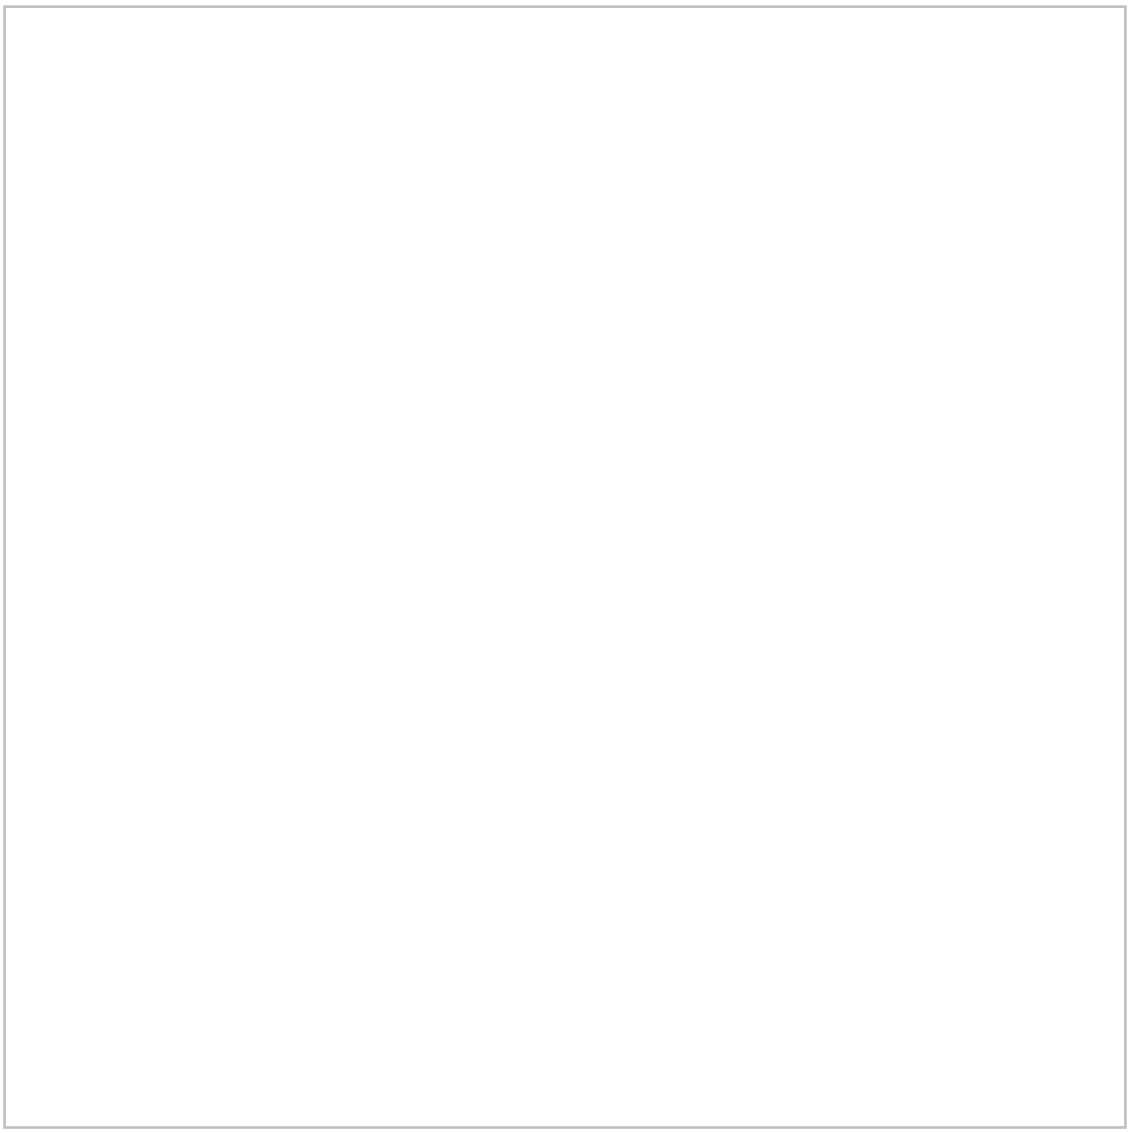
resilience against Covid and future health threats.

Resolve to Save Lives' cardiovascular health team developed guidance on how health systems can maintain life-saving hypertension care and leverage technology in the context of the Covid pandemic. The team produced fact sheets for patients and primary health care providers on how to reduce the risk of Covid transmission, which were translated into more than 15 languages and disseminated by partners around the world.

In countries across the globe, we also promoted simple but innovative patient-centered approaches to increase patient and provider safety during the pandemic:

- Dispensing 3-6 month prescriptions, such as hypertension medications, for stable patients.
- Delivering medications directly to patients.
- Increasing the use of telemedicine and other virtual technologies including phone, email, and text messaging.
- Treating and monitoring at convenient locations in the community.

More than 1.5 million individuals have received hypertension care and treatment through programs supported by Resolve's work. New programs were launched in the Philippines, Ethiopia, Mexico, and Nigeria.

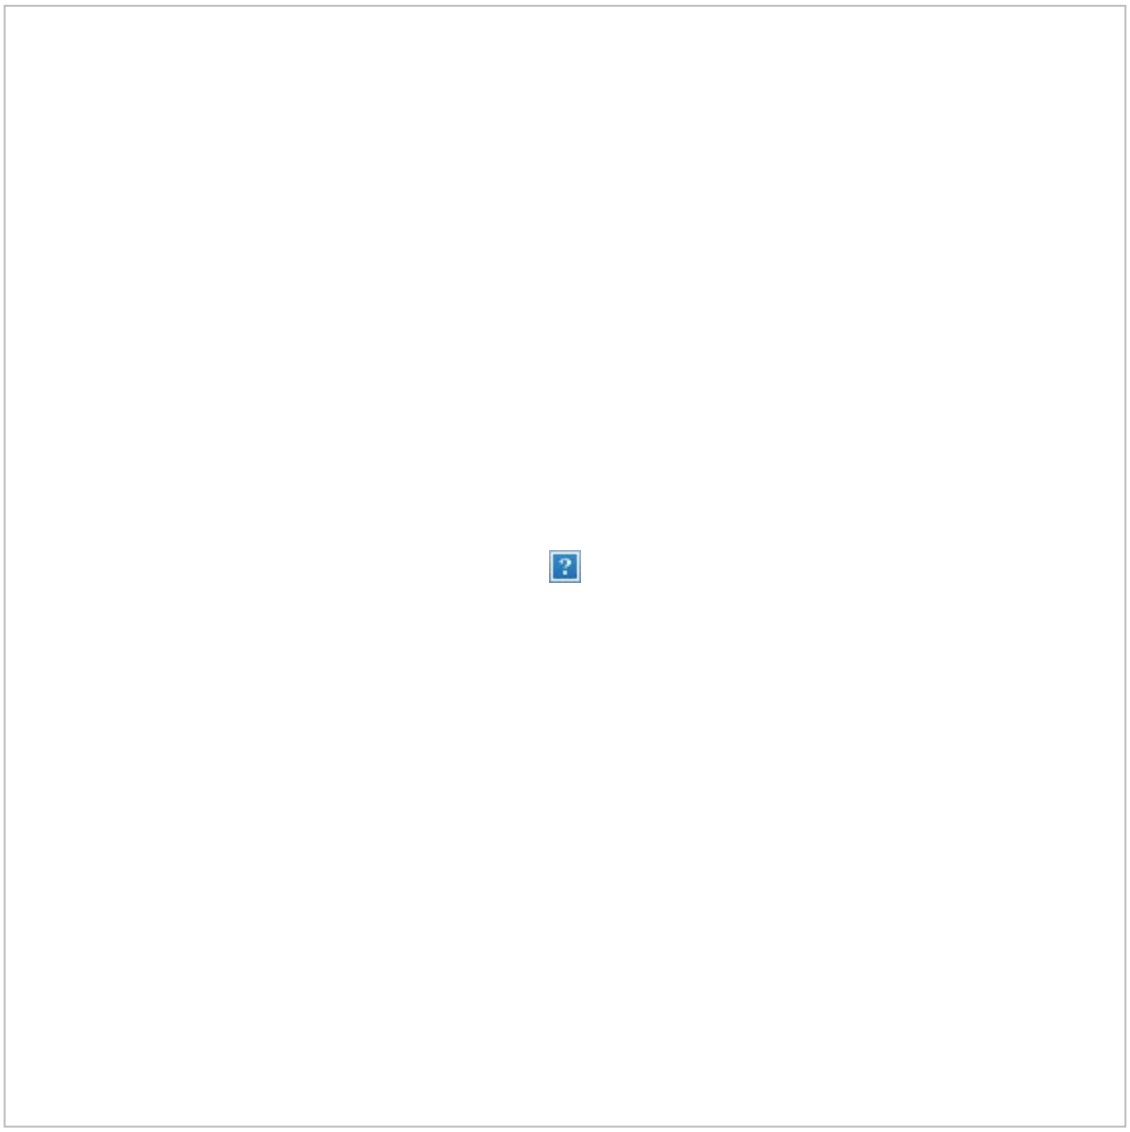


Left: Blood pressure measurement in Thailand before the COVID-19 pandemic.
Right: Community health workers in India deliver medications to hypertension patients.

8. Using policy to save lives.

We continued to advance policy actions to address cardiovascular disease. Global momentum to eliminate trans fat is growing, including an earlier win in Thailand and recent bold action by India to eliminate trans fat by 2022, a stunning victory for healthy nutrition. Turkey and Paraguay also acted to eliminate trans fat, and Nigeria, Bangladesh and the Philippines are now poised to do so. We partnered with the World Health Organization to launch the second annual progress report for the REPLACE initiative to eliminate artificial trans fat. Although 58 countries have introduced laws that will protect 3.2 billion people from trans fat by the end of 2021, more than 100 countries still need to take action to remove this toxic substance from their food supply.

Our team identified seven priority interventions to reduce sodium intake and save lives, including front-of-pack warnings, restrictions on food marketing to children, and taxes on high-sodium foods. We joined WHO to release a policy action framework on public procurement of healthy food, and helped launch four new projects to develop and implement policies on healthy public food procurement in Uganda, Togo, Nepal, and the Philippines. Our partners in Viet Nam and Ethiopia debuted each country's first national mass media campaign designed to encourage people to reduce their salt intake. We are sponsoring studies in China, India, Ethiopia and Thailand to determine the most effective front-of-pack label in order to provide evidence for policy change.



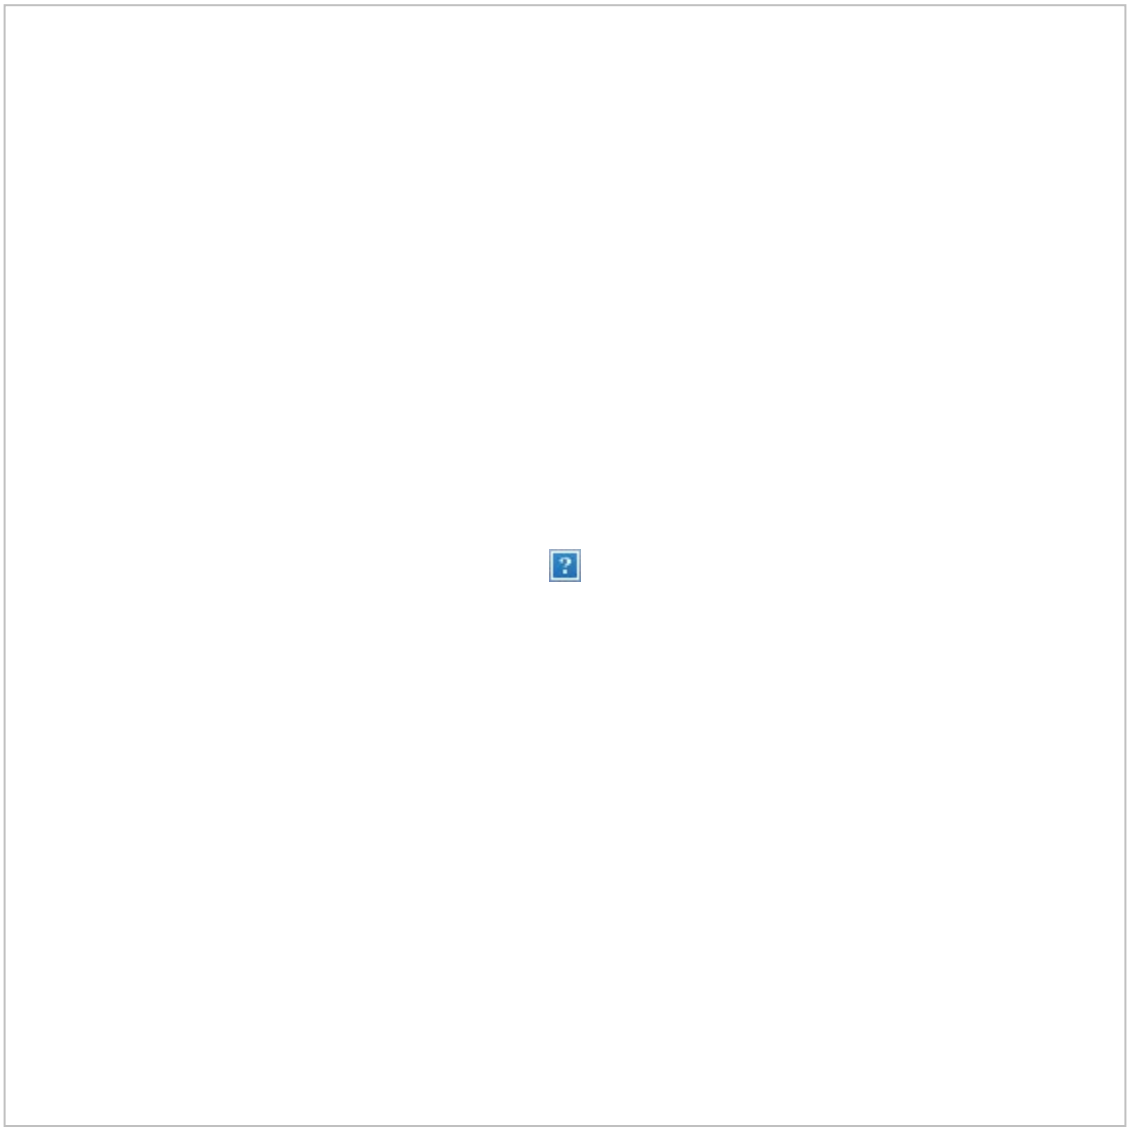
In countries without trans fat regulations, fried foods are a common source of the deadly additive.

9. Spreading truth.

The Covid pandemic was accompanied by an epidemic of competing and often inaccurate information spreading rapidly throughout the world. Our communications team filled a need for real-time, credible public health information by producing high-quality, evidence-based communications materials for diverse audiences.

We produced more than 400 communications products in 25 languages and supported 22 countries and 44 cities with mass media campaigns and the development of effective risk communications strategies. We shared our public health expertise in thousands of media interviews and dozens of peer-reviewed medical journal articles and op-ed pieces in leading global media outlets, and we were mentioned more than 25,000 times in news stories around the world.

Our "3 Ws" strategy – Wear a mask, Watch your distance, and Wash your hands – was disseminated by media outlets and partners worldwide and continues to be at the core of strategies to prevent disease transmission.



The '3-Ws' translated into French.

This moment brings a once-in-a-century opportunity. It's now or never.

Working together, we will take a giant step toward being able to find, stop, and prevent health threats faster in every country through public health systems that are understood, supported, and celebrated. This starts with expanding equitable access to vaccines to end the Covid pandemic. It's both ethically unacceptable and epidemiologically perilous that so much of the world is so far from having vaccine access. Uncontrolled spread anywhere threatens to prolong the pandemic everywhere, and we must scale up not only vaccine access but also vaccine manufacturing capacity in low- and middle-income countries. Beyond Covid, we need a public health renaissance so health threats are detected rapidly by accurate and sensitive tracking systems and laboratory networks, stopped quickly by trained epidemiologists and rapid response teams, and prevented wherever possible, including through ongoing vaccination programs and action to make our environment safer.

Working together, we will partner with governments, health systems, and civil society to make policy and program changes centered on improving equity that increase our personal and community resilience and promote heart and brain health so we live longer, healthier, more productive lives. We will help more countries follow India's trans fat elimination best practices. We will accelerate progress toward Resolve's goal of preventing 100 million deaths from cardiovascular disease in 30 years and achieve the Sustainable Development Goal of a one third reduction in today's leading killers by 2030.

Working together, we will make primary care central to our health systems – building teams, supporting patients, and holding all accountable for achieving the health that health care can deliver and for ending health disparities. By establishing accessible, responsive care systems, we'll find health problems when they emerge, prevent illness, injury, disability, and premature death, and accelerate a virtuous cycle toward healthier and more productive societies.

We resolve to work with partners to strengthen the hands of public health and primary care around the world so that, together, we build this healthier future.

Thank you for joining us.

Empowering Communitites with Data.pdf
NNPHI-E2A-Kresge-Report-Web.pdf

Natalie,

Thanks very much for sending the information that we discussed Tuesday.

Dr. Dobbs and Dr. Edney, at the risk you feeling bombarded with information, I want to share 2 additional documents that are directly relevant to the conversation. The first is focused on the importance of sharing data with communities and it really gets to the critical aspects of how and why we should share information. The second is a very recent document prepared by the National Network of Public Health Institutes (NNPHI) with support from the Kresge Foundation that includes a description of public health data systems in the context of opportunities to strengthen public health infrastructure.

Thanks very much and have a great weekend.

Subject: MSPHI Data Conversation Follow Up

Hi Dr. Dobbs and Dr. Edney,

Thank you for your time on Tuesday. I really appreciate the space you gave us to present the whole context of our idea. I'm attaching **the longer plan document** we developed with the steering committee and a **2 pager** pulled from the longer document. I appreciate your input and feedback around demonstrating this idea into more concrete terms before moving forward.

In pursuit of that, I'm sending along two examples of data visualization website. The first website is a local resource, Gulf Coast Community Exchange, funded through the REACH grant in Gulf Coast MS counties. It leverages some local and national datasets. The second website is known as CHORDS. This website utilizes FQHC data and mapping to demonstrate prevalence in the Denver metro area. Our vision for a website encompasses ideas demonstrated in both examples. We want to leverage local data as CHORDS has done successfully but utilizing newer technology for updating data closer to real-time. Additionally, we want a dynamic website interface that is easily utilized by non-experts. Our plan for incorporating these ideas into our own platform is detailed on pages 11 and 12 in the longer document.

Other good examples we would draw from: Arizona's Environmental Public Health Tracker (love the county-level reports with easy to understand explanations), Hope Rising's Substance Use Website (trove of local resources and personal touches), and Tri-County Health Department (issue-by-issue breakdowns).

Essentially, our project is investing in a data resource for community members. The other facets of the project, data literacy education and partnerships with larger health organizations, are part of our larger framework and strategy to address health issues in Mississippi by supporting individuals planning their own community-level projects. This principle of transparent data and distribution is essential in empowering local initiatives especially for marginalized people who are not in positions of power.

In our vision and approach, we are matching up with CDC's Data Modernization Initiative. In their Strategic Implementation Plan (p. 4), the first objective of priority 1 is "Develop a shared vision." Hopefully, that's what we're doing right

now!

Take a look at these documents, explore these website, and let us know next steps!

ABSTRACT

Data have significant potential to address current societal problems not only at the federal and state levels, but also in smaller communities, in neighborhoods, and in the lives of individuals. While the proposition for this potential is that data are and will be shared with and reused by and for communities at different levels, not all data are not systematically or routinely shared for reuse with communities due to social, structural and technical infrastructure barriers. Data intermediary organizations can play a significant role in removing existing barriers while unlocking the potential of data for all, particularly for communities with limited human or financial resources, limited access to existing data infrastructures, and underserved populations. Considering the significance of the data intermediary organizations on local communities, this study aims to explore the role of intermediaries that usually facilitate community members/organizations' data utilization. The findings of this study reveal that data intermediary organizations play four major roles that are crucial in communities' data utilization: (1) democratizing data, (2) adding value to existing data, (3) enhancing communities' data literacy, and (4) building communities' data capacity. This study has several important implications to offer a solution to overcome the challenges of data reuse at the local level.

KEYWORDS

Data reuse, open data, data infrastructure, data intermediaries, data curation

INTRODUCTION

Data have significant potential to address current societal problems (e.g., education, health, economic development, and the environment) not only at the federal and state levels, but also in smaller communities, in neighborhoods, and in the lives of individuals. Many have argued that data have value as a source for community economic development, disaster planning, and decision-making in citizens' daily lives (Kassen, 2013; Levin & Schneir, 2015). In the report *A World that Counts, Mobilizing the Data Revolution*, the United Nations Secretary-General's Independent Expert Advisory Group (IEAG, 2014) underscored the significance of data particularly for underdeveloped countries or neighborhoods, arguing that "data are the lifeblood of decision-making" (p. 4) and that the recent data revolution has created opportunities to design, monitor and evaluate effective policies for communities.

While the proposition for this potential is that data are and will be shared with and reused by and for communities at different levels, much data—including, particularly, data collected by university and research institutes—are not systematically or routinely shared for reuse with communities (Research Data Alliance [RDA] Data for Development Interest Group, n.d.; Urquilla & Shelton, 2015). Government data are traditionally shared with citizens, and while recent open data initiatives accelerate this tradition, Douglass et al. (2014) pointed out that there are still structural and technical infrastructure barriers to be overcome for data to be fully accessible and easily usable. Research data are usually shared within scientists' own communities of practice, although researchers often share data interpretations to support community development. The IEAG (2014) pointed out that unequal access and use of data limit the role that data can play in the realization of sustainable development and argued that it is critical for all stakeholders (e.g., government, regional institutions, public/private data producers, academics, and citizens) to work to create a more equitable data ecosystem.

Data intermediary organizations can play a significant role in removing existing barriers while unlocking the potential of data for all, particularly for communities with limited human or financial resources, limited access to existing data infrastructures, and underserved populations. Van Schalkwyk, Canares, Chattapdhyay, and Andrason (2016) emphasized the importance of these data intermediaries in open data ecosystems, as they can connect different stakeholders and facilitate the flow of data. However, despite the significance of the role and impact of data intermediary organizations on local communities, these groups have been paid little attention in scholarly works, and little is known about how data are utilized among local communities and at the neighbourhood level (Van Schalkwyk et al., 2016).

This study aims to explore the role of data intermediary organizations that usually connect community members/organizations

MS-DOH-21-1816-A-001188

with data sources and provide partnerships and consultations to support communities' data utilization (Yoon, 2017). We adopt our definition of data intermediary organizations from Van Schalkwyk et al. (2016), broadly defining such groups as agents positioned between two other agents in a data supply–demand chain and that facilitate the use/reuse of data. By uncovering the role of data intermediary organizations and analyzing the services they provide to the populations they serve, this study contributes to our understanding of how local communities utilized data to have meaningful impacts on their communities. The findings of this study have several important implications to offer a solution to overcome the challenges of data reuse at the local level.

LITERATURE REVIEW

A growing body of literature discusses the power and value of data to enhance data-enriched citizen and public engagement in policy- and decision-making relevant to citizens' daily lives (Gurstein, 2011; Kassen, 2013; Levin & Schneir, 2015). Keserű and Chan (2015) argued that open data not only impact economic development, but also increase state or institutional responsiveness, reduce levels of corruption, build new democratic spaces for citizens, empower local and disadvantaged voices, and enhance service delivery and effective service utilization. Levin and Schneir (2015) also underscored the importance of making reliable public data accessible to anyone, anytime, for any purpose, as such data have the power to help citizens make better decisions for their communities.

In the U.S. context, several cases demonstrate the potential of data reuse for community members. Chicago's open data portal driven by open government data initiatives resulted in several citizen-initiated projects that developed tools to serve Chicago's diverse community by improving the transparency of local governments' political processes (e.g., chicagolobbyists.org) and maintaining local neighborhoods as safe, open, and healthy green spaces for the local community (e.g., Mi Parquet Project; Kassen, 2013). Often, local organizations lead these projects. For example, the Green and Healthy Homes Initiative (GHHI) in Baltimore utilized health and housing data to provide healthy homes for communities and advocate for increased efforts to prevent lead poisoning (Urquilla & Shelton, 2015). These cases show how different community members (e.g., city planners, local government officers, economic developers, non-profit educational consultants, foundations and corporate organizations, and the public, including parents with concerns about childcare and school systems) can utilize or reuse data on regional areas and population groups collected by the private and public sectors to better understand the factors influencing their communities.

This emerging interest in using data for the community has sparked several discussions regarding how to make data open and sharable, many of which call for action on the part of the public sector. However, the movement to make data fully accessible and easily usable still faces several challenges, such as structural and technical infrastructure barriers (Douglass et al., 2014). In this context, several studies have explored the concept of intermediaries as agents capable of removing some of these barriers (e.g. Van Schalkwyk et al., 2016). The concept of Intermediaries was first discussed in the context of information and communication technology (ICT) as bridging or support organizations that link different agents by transmitting information from one to another (Brown & Kalegaonkar, 2002; Sapsed et al., 2007). They were later explored in different organizational contexts, such as business and e-government, as agents for diffusing services (Janssen & Zuiderwijk, 2014; Sein & Furoholt, 2010). In the context of open data, Van Schalkwyk, Willmers, and Czerniewicz (2014) reported that data intermediaries play several possible roles, such as increasing data accessibility and utility, serving as 'keystone species' in data ecosystems, and democratizing the impacts and use of open data. Several other studies have echoed the potential and significance of intermediaries in the contexts of government data (Chattapadhyay, 2014), developing countries (Davies, 2014; Van Schalkwyk et al., 2014), and broadly in ICT (Diaz Andrade, & Urquhart, 2010) and demonstrated intermediaries' crucial role in linking different agents in open data supply chains, including grassroots communities (Van Schalkwyk et al., 2016).

While the interest in and need for data intermediaries is growing, little empirical research has been conducted to understand their roles and the processes of data diffusion and utilization in local communities. By empirically investigating the roles and functions of data intermediary organizations, this study contributes to understand one facet of data utilization at local communities.

METHODS

This study takes qualitative approach to explore the role of data intermediaries. We broadly define a data intermediary as an organization that facilitates the (re)use of data to impact communities. The project team interviewed one to three key staff at nine data intermediary organizations across the U.S. We used several strategies to identify data intermediary organizations in different U.S. cities. As previous research has suggested that community research centers often help community members/organizations with their data needs—and, thus, serve as a form of data intermediaries (Yoon, 2017)—we first conducted a Google search using several key words, such as *community research center* and *community research institute*. Using this strategy, we identified approximately 50 community research centers that existed as non-profit organizations or were affiliated with universities. We also reviewed the 42 partner organizations across 30 cities included in the National Neighborhood Indicators Partnership (NNIP, http://www.neighborhoodindicators.org/), a collaborative effort by the Urban Institute (http://www.urban.org/)

and local partners to further the development and use of neighborhood information systems in local policy-making and community building. We carefully reviewed each organization's website for information regarding their missions, services offered, and past projects. After assessing each organization's fit for this study, we then chose data intermediary organizations in small, medium, and large cities (e.g., Grand Rapids, MI; San Antonio, TX; and Boston, MA) that agreed to participate in the study. Since one organization dropped out during the interview process, we interviewed a total of 15 staff members (one to three per organization) from a total of nine organizations.

We conducted a semi-structured phone interview with our participants following pre-developed interview protocols. The interview questions covered the organizations' missions, the role of the staff, types of services to support communities' data utilization, the interviewees' experiences working with community members/organizations, and challenges associated with support communities' data work. All interviews were audio-recorded and fully transcribed by professionals. The sample sets of data were inductively analyzed to develop a set of codes representing emerging themes. Then, the rest of the data were deductively coded following the developed coding scheme. A qualitative data analysis tool, Nvivo, was used to code the transcripts and analyze the data. The inter-coder reliability among the project team members was 93%, and we had more than 90% agreement for all codes except one, which still achieved an acceptable 86% agreement rate. As this study aims to "understand and describe as accurately as possible the phenomena" (Groenewald, 2004, p. 5), we followed a phenomenological and interpretive analysis approach (Smith, Flowers, & Larkin, 2009).

RESULTS

The nine participating organizations were drawn from small, medium, and large cities across the U.S. (Dallas, TX; Columbus, OH; Boston, MA; San Antonio, TX; Grand Rapids, MI; New Haven, CT; Indianapolis, IN; Milwaukee, WI; and Providence, RI). Four were independent non-profit organizations, and five were university-affiliated organizations. Six organizations were part of the NNIP network. The sizes of the organizations varied from 7 to 30 staff members, with average staff of 15. Of the 15 staff who were interviewed for this study, 4 were male and 10 were female. Their ages ranged from 30s to 60s. Table 1 provides basic demographic information about the participants, including their education levels and years of experience at the organizations. In the following section, we present the participating organizations' primary missions and services, as well as some of the challenges they have faced in fulfilling their missions.

Organization	Staff	Age	Gender	Position	Years at the Organization	Level of Education
O1	S11	30s	F	Program management	2.5	MS
	S12	30s	F	Co-director	5	PhD

Table 1. Demographic information

Organizational Missions and Serving Communities

An organization's mission is crucial in justifying its existence, differentiating it from other organizations, facilitating organizational innovation, and helping it achieve intended performance (McDonald, 2007). The ways in which the staff explained their organizational missions reflected the ways in which they perceived these missions in relation to their job responsibilities. From their descriptions of the missions, we found that data were either explicitly or implicitly related to the intermediary organizations' overall missions. Staff from most intermediaries related that their mission was to "strengthen communities with data" by "connecting the communities with data" (e.g., easy access, data aggregation, and analysis) and/or by "helping the communities to make a better decision with data" (O2, O5, O6, O7, O8, O9). Staff from two organization specifically stated that they contributed to "the democratization of data" through different types of data services for public use (O8, O9). Other staff emphasized how their organizations bridged communities and different partners (e.g., academics, business, etc.) by promoting collaborations and community research (O1, O3, O4). One staff member from O4 underscored the organization's mission to support community development by serving as "an information resource for community members." Although these three organizations (O1, O3, O4) did not explicitly mention data in their missions, data were inherently associated with their projects and community services. For instance, S11 discussed the significance of data in all projects, noting that data helps

MS-DOH-21-1816-A-001190

community organizations gain a better understanding of their communities at large.

Most organizations tended to focus their services on their regional geographic areas, such as their neighborhoods, counties, and cities; however, some stated that they also served other cities in and out of the state. Their clients or partners were predominantly non-profits (e.g., community foundations, advocacy organizations, community service organizations like the YMCA, etc.) and local government or quasi-government entities, but they also occasionally worked for business associations and individual companies, "although that's less common" (S41).

Emerging Data Needs for Communities

The staff interviewed for this study experienced emerging data needs with their targeted communities. To meet these needs, they interacted with and used a wide range of data. Many reported working with publicly available data published by various government organizations, such as the Department of Education, the Department of Health, and the Bureau of Labor Statistics. Census data and the American Community Survey were among the sources commonly mentioned, but the interviewed staff also utilized data from local agencies to learn more about health, economic indicators (income, unemployment, etc.), housing, education, and business. Though the majority relied on open data, several requested private, proprietary data for specific community projects.

From the staff members' perspectives, one reason for communities to utilize data is to understand their neighborhoods in order to "make community decisions based on data" (S22), such as developing community-specific programs or services. Data are "important in looking at trends and opportunities" (S91) because data "help [community organizations] understand what the needs of their constituencies are and how best to position themselves for the future" (S41). Several echoed the need for data "to set new goals for [community] programs" (S91) or "to start a new initiative" (S51). These initiatives pointed to community efforts to make decisions based on data. Data were also crucial in "adjust[ing] some of [the community organizations'] services if [the communities] have determined that the data show that they're really not having the same impact that they anticipated" (S91). Often, this need was tied to the organizations' program evaluation or outcome measures, since understanding the impacts of their programs guided the organizations to change what they had been working on and how.

Communities' data needs were also highly associated with communities' efforts to apply for grants and secure funding. Staff from almost all intermediaries mentioned the importance of grants for community organizations, most of which are small, non-profit, and in great need of financial support. Data provided evidence of the impact of the community organizations' proposed projects; therefore, community organizations increasingly tried to "visualize these data or to create data tables that they can use for grant applications" (S91). S91 further explained that grant agencies require data for project/program measures, meaning that community members "are asked to be very data fluent in not only their grant applications, but also their grant reporting. […] They're being asked to demonstrate their impacts in terms of quantitative outcomes." Sometimes, funders required community organizations "to do an external evaluation […] to prove that the program is working" (S61), creating another strong data demand on the community side.

Community Data Services

To meet their communities' various data needs, the surveyed intermediary organizations provided different types of data services. The depth and breadth of the services they offered varied depending the intermediary organizations' missions and scales.

Support Data Reuse

Supporting communities' use of secondary data was one of major areas in which most data intermediary organizations offered services, which could be fee-based or pro bono, depending on the scale of the work and the intermediary's service model. One way of supporting data reuse was to simply help "citizens, non-profits, [and] government agencies have easy access to data and knowledge that comes from that data" (S22). Staff from the majority of intermediaries noted that community members occasionally knew what data they needed and wanted, but more often were "not so familiar with pulling secondary data" (S22) and did not know where to search.

The data intermediaries also offered more sophisticated levels of service to support data reuse through data aggregation or integration. Many intermediaries either compiled or aggregated publicly available data by importing or integrating the data into their own system, which S71 described as an activity "adding value" to enhance data utilization. S21 said "a lot of people [from the community] were intimidated" when using secondary data because, even though such data are publicly available, "they are not necessarily publicly available in a ready to use format" (S71). Intermediary organizations took data from various sources, re-organized datasets to meet communities' needs (e.g., by geography or neighborhood), broke geographic data down into smaller geographies, made the data clear and easy to explore, and dug down into the neighborhood level for local stakeholders. S61 described this process as transforming data "from nothing to useful for something," noting that publicly available raw data are often not user-friendly to community members.

Data tools were essential in supporting communities' data reuse. Several intermediaries developed data tools from their data aggregation and integration efforts to facilitate communities' data utilization. S71 said that "provid[ing] tools to community members to help them really compile the information that's of interest to them […] is a very important" piece of a data intermediary's work. While the functions of such tools differed across the intermediaries, common features included interactivity and the capability to present the data at the local level. Using the tools, community members "could select interested indicators as well as geographies and instantly map relevant information" (S22), functionalities that significantly supported the communities' data utilization. The tools also allowed communities to break data down to the neighborhood level, allowing community members to "build an index and look at comparisons between neighborhoods and trends over time" (S51). Being able to dig into data at the local level was crucial for communities' data reuse, as data at the state and federal level were often too general to accurately represent communities' current situations. Intermediary organizations also offered free training sessions to "teach people how to utilize those tools" (S51, S71) to maximize the benefits to the communities.

Collect Local Data

Several intermediaries were actively involved in collecting local data that accurately represented their communities, largely due to the lack of existing secondary data at the local level. S41 pointed out the "deficiencies in the [existing] data," stating this was why intermediary organizations had to "go out and [collect] primary data." S61 echoed that "often you can't get that granularity of data [at local level] from a government agency." The fact that publicly available data rarely provided enough information on a small scale was one of challenges hindering communities' data utilization. S81 said that the lack of data representing local communities was the major issue in supporting communities' data work, leading intermediaries to collect data to complement existing data.

Help with Analysis and Interpretation

While some intermediaries stated that they "don't do analysis" (S51), several others engaged with the analysis and interpretation process when asked to do so by their clients (i.e. community members). S91 said, "most of the smaller [community] organizations, […] they just don't have the capacity to analyze [data] themselves." When the intermediaries analyzed data for the communities, they typically did more than simply share the numbers in written reports. Instead, they "visualize [the data] or map [the results] for [the organizational needs] so that [the community organizations] can then take that output and use [it right away]" (S81). S71 described the analysis process as "a partnership, where we don't just interpret the data and send it back to [the clients], but there's multiple sessions where they're talking about what the questions are, and then a preliminary data analysis is presented, and so it is an interactive process, and there's a lot of collaboration." Further, O7 described "working with [the clients] to understand their needs and their culture, and everything that would go into forming whatever final data project they need" (S71). These reflections show that the intermediaries actively communicated with their clients throughout the analysis process to make sure the clients accurately interpreted and understood the data for their purposes.

Promote Data Sharing and Share Data with Communities

A few intermediary organizations also contributed to the data-sharing landscape by supporting community organizations' data-sharing practices. S91 said that O9 had been working with different organizations that wanted to share data-driven information with members of the community and had "been […] creating data-sharing relationship agencies [that currently do not share their data] to obtain new data sets." Using the data from these agencies, O9 was "linking the data and sharing back out the aggregate to them" as part of its data reuse support. The intermediary organizations also shared the data they collected with the communities. S61 said, "[regarding] our own data, our goal is to make everything public. […] There's some data we released more in an unidentified format or in its original and raw format. […] Pretty much everything we [collect], we make public."

While intermediary organizations occasionally shared raw data, including both secondary data they acquired and primary data they collected, several intermediaries shared data in more "processed" forms, considering the community members' different levels of data literacy and different abilities to search, understand, and interpret data. The most common form of "processed" data was "data reports" with tables and infographics on important indicators that of communities' interests. Often these reports were included in the clients' requests. For instance, they might "compare how [the city] is doing compared to other peer cities on a variety of indicators, such as poverty levels, educational levels, housing, things like that," and were "shared around the community a lot" (S22) through the clients. In other cases, intermediaries produced data reports for general community members or citizens so that any stakeholder could learn about the community and different topics/indicators and use the data for their own purposes. Not all of the intermediaries tracked who accessed and used these reports, but some had a clear understanding of their users, including legislators, community advocates, government officials, and the general public.

Improve Communities' Data Practices

Although it was not common, two intermediaries helped community organizations improve their internal data practices. Community organizations often needed to collect internal data for program evaluation and outcome measures for grant reporting, but not all implemented best practices. S51 ran into "a lot of issues where organizations don't support their own data or don't

MS-DOH-21-1816-A-001192

keep [the data] in the same format all the time," generating "more process concerns." O9 helped these community organizations implement the best data organization method to "do or plan out their evaluation plan [early] so that they're not caught at the end of their grant cycle to figure out how demonstrate what their impact was in anything more than an anecdotal fashion" (S91). O1 was more actively involved in community organizations' internal data practices, helping them "curate the data they collect, and the method by which they collect, and the methods by which they store, and their quality assurance and improvement of that, […] and [track] longitudinal patterns" (S13). This was one of the most active forms of data support that intermediary organizations provided communities.

Foster Community Research

A small number of intermediaries actively participated in community research either by independently conducting research "to understand specifically what's going on in [the county]" (S11) or through partnerships with research institutions and community organizations. S61 called this effort "community-engaged research," which could take the form of a survey study "in conduction with the foundations, or hospitals, or health departments, or city offices" to answer community-specific research questions. These community research projects usually produced valuable data specific to the local context and helped to overcome some of the limitations of using secondary data.

Challenges to Support Communities' Data Work

While data intermediary organizations supported communities' data utilization through the various services described above, they also experienced different challenges doing their work. These challenges were associated with several different factors, such as a lack of organizational resources, a lack of local data, a lack of data literacy among community members, and difficulties building a partnership between communities and academic institutions.

Lack of Organizational Resources

Despite growing community demands for data utilization, not all data intermediary organizations were equipped with sufficient financial and human resources to either maintain current services or extend/develop new services for communities. Financial resources were crucial to the intermediary organizations' sustainability, and several mentioned that their business model was "100% self-funded" with no state support (and, thus, fully funded by projects). This limited opportunities for community organizations that could not afford a service fee, although some intermediaries noted that they did smaller-scale "pro bono work" (S21) for smaller communities. Limited financial resources could also limit the development of a new service or the extension of an existing service. As S71 mentioned, these "resource constraints prevent us from working on [new area because] we don't have the funding to [do all the work]." For smaller intermediaries, a lack of human resources was the factor limiting their community data support, as no single staff member can have all different types of expertise and data skills. S61 said, "the staff time and staff level of expertise" also mattered for collecting and working with complex data.

Lack of Local (Neighborhood) Data

While data intermediary organizations shared some common challenges relating to data reuse, such as difficulties accessing secondary data, difficulties aggregating data due to interoperability issues, and difficulties working with sensitive data (Lucero et al., 2015; Yoon, 2016), one notable challenge that staff from all intermediaries identified was a lack of data representing local areas or neighborhoods. Although all staff utilized publicly available data for community data work, they agreed that "the public data are fairly general, and usually the scope is fairly large (S41)." Many noted that there were no data available on particular topics (e.g., health data, unemployment data) at the neighborhood or small-town level. Alternatively, they used or let communities use "data at a zip code level to portray what's going on in their neighborhood," even though such reports are "just basically generally wrong" (S81) because "zip codes are not necessarily related to neighborhood[s]" (S21). S21 said this made community members really "angry […] and the people in a particular neighborhood within that zip code are like, 'that's so not true' because their shared daily experience is different than what the data suggested, and so they're freaking out." This was the major challenge the intermediaries faced when supporting communities' data work, and it was also why data intermediaries needed "to figure out a way to develop our own [data]" (S41). In addition, publicly available data were "notoriously old, [and] it was really common to find data that would be six years old [or] a couple-year lag" (S42). Usually, communities needed current, up-to-date data representing current community problems; in such cases, old data were not particularly useful.

Community Members' Data Literacy Skills

One critical issue relating to interactions with communities was differences in community members' data literacy skills. Many intermediary staff mentioned that different levels of data literacy influenced how they communicated with both their clients and the general public. S72 said, "general citizens are probably not being very accurate in terms of interpreting [data]," which can be a challenge when working with them. Intermediary organizations shared the results of data analyses and/or interpretations in formats "designed to be digestible" (S61). Data reports also aligned with these efforts. Still, a lack of data literacy could hinder intermediaries' communication processes. As S11 shared, "it's hard for [community members] to understand what goes into analyzing and cleaning data. Our community partners get frustrated when they have a request and they don't understand

MS-DOH-21-1816-A-001193

why we can't generate it that second, why it might take a few days."

Building a Partnership between Academic Institutions and Communities

For those intermediaries that had tried to build or already built a partnership between communities and academic institutions to support communities' data work or community research, a distance between the two entities often posed a challenge. A partnership with university researchers can have great benefits for communities' data work because academic researchers are experts in topical areas or domains. S42 described one case in which he was "a little suspicious about the motivation for doing the community need assessment [requested by one community organization]." When he consulted with experts from a local university, one of them "flat out said, 'It's a fad, and this is what's going on politically' because they had done years of research on the area." He said the researchers immensely helped to clarify where to look for data sources while crystalizing the real problems to address using the clients' data sources. However, there was still a degree of distance between communities and academic institutions because the two parties tended to have different motivations and needs. Academic researchers tended to focus on education and research; thus, "they push a publication, research design […] that would be required and understandable in [an academic] environment" (S81). By contrast, communities "may not see much value in research itself […] They may be struggling with day-to-day challenges […] and don't see any short-term or immediate benefits from [academic research]" (S31). S81 also found that, "sometimes, data people [from academia] are not very respectful of the [community members]." When academic researchers lacked a deeper understanding of communities' needs, community members found their collaboration intrusive.

DISCUSSIONS

This study explored data utilization at the local community level through the work of data intermediary organizations. The findings of this study reveal that data intermediary organizations play four major roles that are crucial in communities' data utilization: (1) democratizing data, (2) adding value to existing data, (3) enhancing communities' data literacy, and (4) building communities' data capacity.

Democratizing Data

Data democratization involves helping all citizens access and understand data. Although only two intermediary organizations in this study identified data democratization as one of their missions, all intermediaries contributed to democratizing data in practice. Easy access to data when needed at any given moment is an important first step towards data democratization, as previous research has suggested that access to data is the single most important component of successful data reuse (Yoon, 2016). Most intermediaries tried to improve communities' access to data. However, democratizing data means more than just ensuring easy access. Intermediary organizations were actively involved in helping communities make sense of data, ensuring that data could be easily understood and interpreted for the purpose of the communities' data utilization. Aggregating different data sources, breaking data down into desired units (e.g., neighborhood, county), developing self-service data tools for analysis and reuse, and visualizing data were all initiatives in which intermediary organizations engaged to support communities' understanding of data. These efforts align well with the goal of data democratization, which is to expedite decision-making processes, eliminate barriers to accessing or understanding data, and uncover opportunities for organizations (Marr, 2017).

Adding Value to Existing Data

A second critical role that intermediary organizations play is adding value to existing data. Not all of the intermediaries seemed to be aware of this role, though S71 acknowledged that their work added value to data and data utilization. However, whether intermediaries are aware of this role or not, adding value to existing data significantly contributes to open data curation. Value-adding activities are the hallmark of data curation and perhaps the most meaningful and uniquely necessary step in supporting data reuse and utilization. The Digital Curation Center (DCC, n.d.) defined digital (data) curation as the effort to "maintain, preserving and adding value to digital data throughout its lifecycle," as well as to "enhance the long-term value of existing data by making it available" for current and future use. Data intermediary organizations may not contribute to curation of the complete data lifecycle, for example, as the interviewees rarely mentioned long-term data preservation or data sustainability. However, they notably contribute to several other curation components, particularly relating to maximizing access and data preparation. In the context of intermediaries' support of communities' data access, access does not simply mean connecting communities with data by identifying appropriate data sources. The studied intermediaries were also involved in the discovery process, during which they requested data on behalf of communities, suggested potentially good sources, and consulted with local domain experts to find good data sources. Further, much of the intermediaries' work was related to enhancing accessibility and understandability through thorough data preparation. Data preparation is known to be one of most difficult, time-consuming, and knowledge-intensive challenges in data curation. When obtaining data from different sources, the intermediaries had to address issues of interoperability, as well as to clean, merge, aggregate, and integrate data with their data system to make the data more accessible, easily retrievable, and understandable. Such steps enriched the data for communities' further use and analysis. When community members accessed data through their intermediaries' systems, the data were well-prepared for consumption and contained complete and self-explanatory information. Since the ultimate goal of data curation is to support

MS-DOH-21-1816-A-001194

current and future use/reuse of data, the role that intermediaries play in curation cannot be underestimated.

Enhancing Communities' Data Literacy

Data literacy is known to be fundamentally important for extensively using data for decision-making (Cruosoe, 2016). In the context of communities' and individuals' data utilization, data literacy is generally understood as "the knowledge of what data are, how they are collected, analyzed, visualized, and shared, and the understanding of how data are applied for benefits or detriments" (Crusoe, 2016, p. 27). Staff from the intermediaries noted that it was important to have a certain level of data literacy to ensure smooth communication during the process of working with communities. Often, a lack of such skills was a barrier to data utilization. Data literacy skills were also critical for communities because they needed to interpret data "based on their understanding of their community" (S71). Due to the importance of data literacy for both the intermediary organizations and the communities themselves, many intermediaries either directly or indirectly educated communities on data literacy. For example, they asked about communities' data needs and perspectives on data, which helped them understand the process of data utilization, and debriefed them on the data analysis and the results, thereby helping communities understand the data and draw accurate conclusions for decision making. Many staff discussed how this process was iterative and collaborative. Several intermediaries also offered the training sessions relevant to data, including training on the data tools they had developed and, less commonly, trainings on secondary data. Since general citizens and community members had few opportunities to develop their data knowledge and skills, intermediaries' contributions to data literacy education are critical and a good fit for the niche.

Building Community's Data Capacity

Overall, data intermediary organizations significantly contribute to building communities' data capacity. In a way, the simple existence of data intermediaries helped communities be less intimidated by data utilization. This represents one important step in introducing communities to the power of data. By using the data services offered by data intermediaries, communities can become more comfortable with data and perhaps become aware of the need to develop further data literacy skills to fully benefit from data. Further, some data intermediaries were aware of their communities' lack of capacity to use and interpret data, and they sought to address these issues. This approach was reflected in both the collaborative nature of intermediaries' work with communities and their efforts relating to data education. The intermediaries' intentions to build community capacity is illustrated in the following statement:

> S71: "we don't wanna just do things for [the community] and walk away. We want to be showing them how to do it. Obviously, some people, they're not interested in knowing the whole thing, but you have to be interested […] our goal is to increase their ability to do similar things in the future, or at least a few steps forward and maybe adapt to just being more experienced in [data work."

Greater community capacity for data utilization would be a great asset for society, as it would enhance communities' ability to utilize data to empower communities. Ultimately, such capacity will support the goal of open data and data reuse in the community context, which will improve the lives of communities and individuals.

Despite the multifaceted roles that data intermediaries play in helping with communities' data work, the findings also illustrated that there are still many barriers to be improved for intermediaries to support communities and make data really useful for communities. It is worth noting that data intermediaries are not and should not be the only player in communities' data work, and collaboration and/or partnership with other data infrastructures is necessary to overcome some of the barriers and generate synergy to support communities' data utilization. Intermediaries were limited to existing financial and human resources, which made them unable to serve as many community as they wanted. This could include smaller communities that may not be able to afford the service fees, although intermediaries offer a pro-bono service for these organizations. In addition, the need to educate community members about data literacy skills emerged in this study; not all intermediaries had enough capacity to provide a formalized training session to the communities. Educational institutions (e.g., local universities) and local information organizations (e.g., public libraries) can share some of the responsibilities of educating communities about data literacy, and can help with communities' interaction with data, considering their expertise in education, community engagement and services. These collaborations and partnerships will complement the services provided by data intermediary organizations while meeting the needs of communities that intermediaries cannot fully afford. The best method and model for these partnerships should be investigated further by considering each entity's capacity.

CONCLUSION

As the findings demonstrate, data intermediary organizations pay several important roles that affect communities' data utilization. By democratizing data, adding value to existing data, enhancing communities' data literacy, and building communities' data capacity, data intermediaries contribute to empowering communities with data, particularly regarding the communities' decision making relating to important community problems and improving community members' everyday lives.

MS-DOH-21-1816-A-001195

While this study reports new findings about the role of data intermediaries and data utilization at the local community level, it also has several limitations. First, because the study focused exclusively on intermediaries, the findings reflect only intermediaries' perspectives regarding communities' data utilization. Most of the staff who participated in this study were highly skilled in the realm of data. Speaking directly to community members, who would have much more diverse backgrounds and levels of data skills, is necessary to fully understand how data are used and what kinds of challenges communities face in using data to make a real impact.

ACKNOWLEDGMENTS

This research is supported by the Institution of Museum and Library Services (IMLS) through the National Leadership Grant for Libraries program (#LG-96-17-0184-17), "Data Reuse for Local Community." The project team would also like to thank the nine data intermediary organizations and the staff who participated in our study.

Challenges and Opportunities for Strengthening the US Public Health Infrastructure

Findings from the Scan of the Literature

MAY 2021

National Network of Public Health Institutes

MS-DOH-21-1816-A-001200

ABOUT NNPHI

Mobilizing more than 40 public health institutes throughout 32 states along with ten university-based regional training centers and 40 training affiliates, the National Network of Public Health Institutes (NNPHI) supports national public health system initiatives and strengthens public health institutes to promote multi-sector activities resulting in measurable improvements of public health structures, systems, and outcomes. NNPHI also serves as the National Coordinating Center for Public Health Training – NCCPHT. To learn more about NNPHI, visit www.nnphi.org.

ABOUT THIS REPORT

The US public health system's infrastructure serves as the foundation for planning, delivering, evaluating, and improving public health. Public health services depend on basic infrastructure such as up-to-date information systems, health professionals who are competent in cross-cutting and technical skills, and public health organizations with the capacity to assess and respond to community health needs. This summary report was completed to better understand current weaknesses and challenges that are impacting the US public health system's infrastructure and to identify opportunities for addressing these issues.

ACKNOWLEDGMENTS

This project would not be possible without support from the Kresge Foundation (Grant #R-2008-289837) and the public health experts who participated as key informants and members of the Technical Expert Panel (TEP). NNPHI staff who contribute to this work, include: Randhika Aturaliya, Oscar Espinosa, Vincent Lafronza, Montrece Ransom, and Julia Bleser.

MS-DOH-21-1816-A-001201

FOREWORD

As COVID-19 continues turning our world upside down, never before in recent history have our public health efforts been more needed, more relevant, and more important. At the same time, we must recognize that we are not only fighting a pathogen – we are also experiencing myriad impacts of systemic racism that increasingly drive health and racial inequalities. History will show that we are indeed living in a time of tremendous social change.

The pandemic is shining a light on the inequities we have known for our lifetimes. And for so many in the US and around the globe, this pandemic has shattered lives, and continues to rip apart families, increase food and housing insecurity, exacerbate behavioral health challenges, and cause many other hardships that impact morbidity and premature mortality.

There are also some positive social changes unfolding in response to our experiences, including a deeper public awareness of how structural racism results in shorter life expectancy and increased violence against people of color.

The lessons we are learning from a global pandemic pose many important questions. What are the strengths and weaknesses of our public health system? How do we build our agencies and communities back better? What are the best roles and functions of governmental public health? How can the private, nonprofit sector best be leveraged to support public health improvements and extend reach of government's impact? How do we achieve a healthy balance between the right to protect health while respecting individual freedoms? What changes in public health law are needed to ensure adequate protections in every community, tribe and territory exist? What innovations in public health policy and practice will best advance health and racial equity? How do we strengthen, support, and grow our public health workforce? How do we support a new generation of public health leaders?

We must also consider that while new funding approved by Congress in 2021 is sorely needed, we simply cannot fund our way out of the conundrum we face as a nation increasingly hostile to public health intervention. We must find new ways of engaging individuals and communities from all walks of life so that we begin to build back better by planting new seeds that will grow in greater of support of healthy human development. ***Government alone cannot do this work; it must be a multisector approach that engages all aspects of society.***

I. INTRODUCTION

This report summarizes the findings of a scan of peer reviewed and gray literature which was completed to better understand current weaknesses and challenges that are impacting the US public health system's infrastructure and to identify opportunities for addressing these issues. In the report, public health infrastructure is defined as the foundation for planning, delivering, evaluating, and improving public health. We acknowledge that all public health services depend on basic infrastructure given that they require up-to-date information systems, health professionals who are competent in cross-cutting and technical skills, and public health organizations with the capacity to assess and respond to community health needs (Turnock, 2004). Federal agencies, for instance, rely on the presence of solid public health infrastructure at all levels to support the implementation of public health programs and policies and to respond to health threats, including those from other countries. We also acknowledge that while a strong infrastructure depends on many organizations, health departments are considered to be the main players.

The search for publications was initiated by first conducting a total of five interviews with key informants in the public health field to better understand how infrastructure is defined, to identify key challenges, to obtain citations and leads for the search, and to collect recommendations of experts in each of the domains to potentially serve on the Technical Expert Panel (TEP). Appendix A includes the list of key informants who participated in the interviews. From these conversations, we identified eight domains that collectively make up the system's infrastructure. We started with traditional domains such as workforce, financial resources, data, and cross-sector partnerships.

We expanded the domains to accommodate the ever-changing landscape of public health and added laboratories, technology, public health law, and health equity. Exhibit 1 illustrates the eight domains that were identified and used to organize our search for literature.

Within each of the eight infrastructure domains, we searched for national and regional needs assessments that were completed within the last six years (starting with 2015). Our strategy was to identify and review needs assessments that were completed at the national and regional levels first. Subsequently, we searched for local needs assessments and literature that addressed key challenges that were referenced by key informants as well as the needs assessments. The challenges and solutions were then categorized by infrastructure domains.

The findings presented below are not meant to serve as a comprehensive list of challenges or weaknesses and solutions but do represent the most commonly cited and most urgent challenges identified by key informants, the TEP, and the literature.

EXHIBIT 1: Key Domains Representing the US Public Health Infrastructure

MS-DOH-21-1816-A-001205

II. FINDINGS

Public Health Workforce

There is a severe and consistent shortage of public health workers and the deficits are growing due to high turnover rates and losing workers to retirement. Nearly half of public health workers are considering leaving their organization within the next five years, including individuals who will retire and individuals who will completely leave the public health field. Since 2014, there has been a 41% increase in public health workers planning on leaving their jobs (de Beaumont Foundation et al., n.d.). The public health sector also faces shortages in several career fields including epidemiologists, public health nurses, public health physicians, laboratory scientists and technicians, and environmental health workers (Perlino, 2006). These shortages are due, in part, to high turnover rates caused by lack of advancement, workplace environment, job satisfaction, lack of support, and inadequate pay (Perlino, 2006). Other reasons for leaving include threats and attacks against workers (Mello et al., 2020) and stress from overwhelming responsibilities (Bogaert et al., 2019).

The most cited reason for leaving is the lack of satisfaction with pay. This is the largest barrier as budget constraints for public health limit the number of positions and opportunities for competitive salaries (Bogaert et al., 2019). Exacerbating these shortages in personnel is that the average age of the public health sector is 47 years old and 45% of the workforce is eligible for retirement (Bogaert et al., 2019).

RELEVANT POLICY

THE PUBLIC HEALTH WORKFORCE LOAN REPAYMENT PROGRAM *established by the Secretary for Health and Human Services promotes the recruitment of public health professionals at local, state, and tribal agencies. $100 million was appropriated for the program in FY2020. This policy encouraged more students to pursue public health by providing loan forgiveness opportunities.*

Many public health professionals lack degrees in public health and have entered the workforce with little or no training specific to public health. Only 14% of the public health workforce has formal public health training and less than 1 in 4 public health managers and executives have formal training. Additionally, 4.2% of employees in local and state health departments have degrees in public health (Erwin et al., 2019). Thus, most employees working in public health entered the field with little experience in the field. The low-level of training and education limits health departments' capacity and capability in conducting public health work (Erwin et al., 2019) and requires time and resources to be redirected to training public health professionals.

Health departments have made efforts to provide training programs for their staff, but health departments lack funds to provide professional training and lack coverage for staff members to attend trainings during work hours. Staff members are further discouraged from pursuing training programs due to long travel distances, lack of free time, and limited Internet access to online training. These barriers have discouraged health department leaders from providing professional development and training given the difficulty of managing busy schedules and increasing work demands which show a small return on their investments (*Strengthening New York's Public Health System for the 21st Century: Report of the Public Health Infrastructure Work Group to the Public Health Council, 2004*). With a small percentage of public health staff entering the field with proper training and education in the field, they are at a disadvantage in implementing effective and impactful public health programs.

Staff members are further discouraged from pursuing training programs due to **long travel distances, lack of free time, and limited Internet access to online training.**

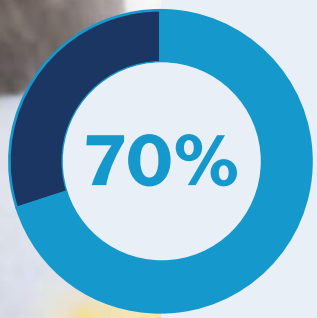
MS-DOH-21-1816-A-001207

HIGHLIGHT

THE MENTAL HEALTH PARITY AND ADDICTION EQUITY ACT OF 2008 is a federal law that prevents group health plans and health insurance plans from imposing limitations on those who seek care for mental health conditions and substance use disorder. This policy improved access to mental health care, but there are still limitations in access to care.

Severe and chronic shortages of public health mental healthcare providers who specialize in the treatment of children has forced parents into long wait lists and to pay out of pocket for mental health care. Most mental health disorders appear during adolescence, but they are often first detected later in life (Patel et al., 2007). Identifying mental health disorders early will ensure that adolescents receive the treatment they need. However, more than half of children in the United States with a treatable mental health disorder do not receive treatment from a medical professional as the need for child psychiatrists has gone unmet due to provider shortages and because many mental health professionals require out of pocket payments. Seventy percent of counties in the United States do not have a single child psychiatrist. The limited supply of child psychiatrists is unable to keep up with the demand for mental healthcare. Historically, there has been a shortage of child psychiatrists among racial and ethnic minorities as well as youth living in impoverished or rural areas (McBain et al., 2019).

The shortage of providers stems from the significant amount of time it takes to train for child and adolescent psychiatry. After medical school, a candidate studies 4 years for general psychiatry and moves onto a 2-year fellowship in child and adolescent psychiatry. Medical students are less motivated to pursue child psychiatry due to the limited funding for fellowships and the exclusion of CAP in loan forgiveness programs (Schaff, 2016).



of counties in the United States do not have a single child psychiatrist.

MS-DOH-21-1816-A-001208

Community health workers are an underutilized source of medical care for disadvantaged populations who are not properly integrated into the healthcare system, limiting their effectiveness in improving healthcare outcomes at the community level. Community health workers (CHWs) are a valuable asset to the healthcare system. They work in their own communities to combat ethnic and racial disparities in healthcare (Phalen & Paradis, 2015). CHW programs face implementation barriers which decrease the impact CHWs have on the healthcare system. The standards for CHW training vary from state to state and only a few states require CHWs to attend a state-certified training program. Many CHWs receive informal, on the job training while others take CHW courses at community colleges and community-based agencies (American Public Health Association, 2014). The lack of well-defined guidelines and variance in standards across states can result in high rates of turnover. In a Harlem Regional Stroke CHW program, one third of CHW candidates dropped out during the 6-month training (Kangovi et al., 2015).

CHW services are often delivered by community-based programs such as church-based programs which are not integrated within the healthcare system (Kangovi et al., 2015). Without formal connections to clinical providers, community health workers face limitations in their care and their disease-specific interventions. Additionally, community health workers receive unstable categorical grant funding which further limits their work (Kangovi et al., 2015).

Teaching public health in middle and high school can expose students to public health early, increasing the chances that a career in public health is contemplated, understood, and ultimately adopted.

Students in middle and high school are typically not exposed to the field of public health and may be misinformed about the role of it plays in their lives. Adding public health curricula can teach students about the importance of public health so they can begin to form a potential future career option that many do not consider until well into their academic careers (McClamroch & Montgomery, 2009).

A high school summer enrichment program, Telluride Association Sophomore Seminar (TASS) was offered at the University of Michigan and Indiana University. The goal of the program was to strengthen skills for a college environment and the curriculum included infectious disease epidemiology. Of the 16 students that participated in the program, a total of 10 reported adding public health to their future career plans (McClamroch & Montgomery, 2009). Also, the Robert Wood Johnson Foundation (RWJF) implemented a Young Epidemiology Scholars (YES) program for high school students which allowed them to conduct

MS-DOH-21-1816-A-001209

research projects on public health challenges and then present their research to a panel of judges (Bracken, 2014). The majority of participants (74%) indicated that their experience in the YES program influenced their career plans and were planning on pursuing work in public health (Tsukamaki, 2007).

Additionally, the CDC has created a fellowship aimed at high school STEM teachers to train them to bring public health sciences to middle school and high school classrooms. One of the Science Ambassador fellows partnered with the Broad Institute of Harvard and MIT to pilot a learning module for students called Operation Outbreak (CDC). The learning module was used to create pandemic simulations, which was implemented in middle schools and high schools across the nation (Centers for Disease Control and Prevention, 2019). The learning module helped illustrate key players in pandemics such as the government, military, and the media and taught students' skills used by CDC disease detectives such as rapid decision making, teamwork, and communication (Mecham, 2019). Training teachers in public health would foster engaging initiatives and activities for students, educating and inspiring them to pursue careers in public health.

74%

of high school students that participated in the Young Epidemiology Scholars (YES) program indicated that their experience influenced their career plans and were planning on pursuing work in public health.

MS-DOH-21-1816-A-001210

Community colleges offer fertile ground to influence a motivated, racially and ethnically diverse group of students to pursue public health related training and education which could lead to public health work. Community colleges serve recent high school graduates who utilize community college to identify a potential career and 4-year-degree, students who seek associate degrees to prepare for entry level jobs, and individuals of all ages who resume their studies after or while working to enhance their skills through certification programs at more affordable tuition rates than traditional colleges and universities (Riegelman & Wilson, 2014). In addition, community colleges tend to serve a higher percentage of minority students (de los Santos, 2016).

The Society for Public Health Education (SOPHE) partnered with community colleges to create a health education certificate for transfer students with associate degrees to pursue a bachelor's degree program in health education and health administration, and public health and Health Navigator certificate programs for individuals already in the workforce. The certificates provide students with experiential learning experiences at health agencies and health departments which can provide opportunities for students to pursue internship and careers. The certificate makes the transfer process easier for community college students, equipping them with the skills needed for an undergraduate education. Creating public health programs at the community college level encourages more students to pursue the public health field, which can amplify the flow of graduates pursuing public health degrees (Riegelman & Wilson, 2014).

> *Engaging students at the college level through applied experience and mentorship opportunities with local health department workers is vital to creating a public health workforce pipeline and addressing shortages.*

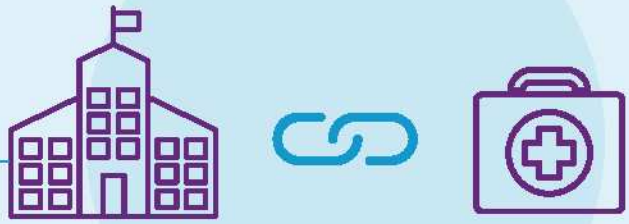
Work practicums and mentorship programs that expose students to careers in public health are effective strategies to create and maintain a strong and stable public health workforce.

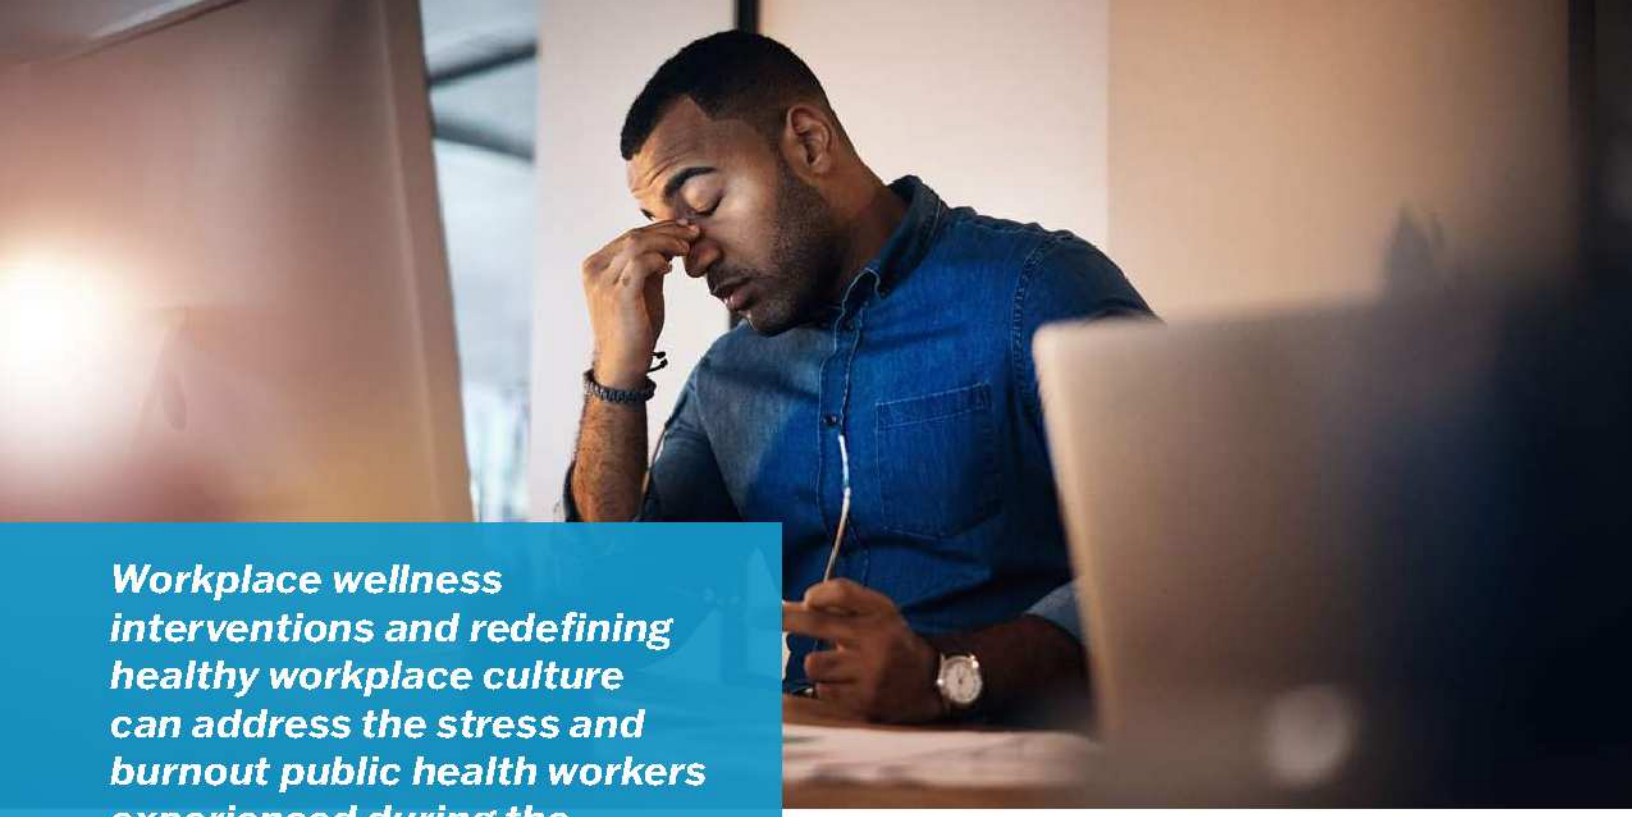
Academic institutions have created pipeline programs to encourage students to pursue the epidemiology field. Through partnerships with local and state health departments, students are placed to assist with outbreak investigations and other short term public health projects. Placements provide surge capacity to health departments and provides practical experience for students. Participation in pipeline programs expose students to the benefits of working as an epidemiologist and provides opportunities for networking and mentorship with public health workers in local health departments (Erwin et al., 2019). Engaging students at the college level through applied experience and mentorship opportunities with local health department workers is vital to creating a public health workforce pipeline and addressing shortages.

MS-DOH-21-1816-A-001211

Establishing partnerships between universities and local health departments could provide the workforce with broader continuing education opportunities (Bouye et al., 2016).

Local health departments and universities have partnered together to support continuing education. The New York Department of Health established a Memorandum of Understanding with the State University of New York at Albany School of Public Health to create education opportunities for their staff. These included a public health course, an environmental health course for sanitarians, and a Surveillance Academy that trains the state public health work force employed to conduct hospital and nursing home surveillance (*Strengthening New York's Public Health System for the 21st Century: Report of the Public Health Infrastructure Work Group to the Public Health Council*, 2004). Expanding these partnerships will allow for more health department staff to return to school and to receive formal public health training and degrees. Collaborating with universities makes these opportunities more readily accessible for health department staff.





Workplace wellness interventions and redefining healthy workplace culture can address the stress and burnout public health workers experienced during the COVID-19 pandemic.

Burnout is a work-related stress syndrome resulting from chronic exposure to job stress. Healthcare workers are at particular risk for burnout due to the increased work that resulted from the COVID-19 pandemic as well as severe public health workforce shortages. This has significant negative personal (substance abuse, broken relationships, and even suicide), but also important professional consequences such as lower patient satisfaction, impaired quality of care, and medical errors (Shanafelt et al., 2010; West et al., 2006). The development of adequate coping personal and organizational strategies is essential in dealing with this important problem in contemporary healthcare and requires intentional redefining a health workplace culture for public health workers. Public health organizations can foster a positive environment for their staff by offering staff the ability to influence their work environment, make decisions, and control their work schedules. Work policies that allow for flexible scheduling, childcare, and remote work options have shown to increase employee wellbeing (De Hert, 2020).

Workplaces that provide support to their workers can help reduce burnout and promote better achieve better work outcomes. Mindfulness in Motion is a mindfulness based intervention (MBI) that has been adopted by an ICU facility to bring awareness and relaxation to the work environment. The intervention had a 97% retention rate and increased the resiliency and engagement in work by staff. Social cohesion programs also serve to improve wellness among workers. The Vanderbilt Medical Student Wellness program pairs students with faculty for mentoring, arranges wellness retreats, and puts students together in committees (Global Forum on Innovation in Health Professional Education et al., 2019). Fostering relationships with colleagues can provide emotional support and shared understanding of experiences. Public health leaders can implement wellness interventions which better support their staff and provide them with resources and tools to help ameliorate the stress they face from their job.

Work policies that allow for **flexible scheduling, childcare, and remote work options** have shown to increase employee wellbeing.

MS-DOH-21-1816-A-001213

Financial Resources

Public health's invisible role in protecting the nation has resulted in chronic underfunding which has negatively impacted its workforce, data systems, technology, community partnerships, and leadership.

Public health has been underfunded and undervalued at the local, state, and federal levels. Public health cares for the general population by providing clean air and clean water initiatives, sanitation, vaccines, and other methods of controlling against environmental threats and diseases. However, the role that public health plays is hidden compared to the healthcare system that cares for patients individually or advertises new drugs and medical devices. The invisible role public health plays has caused public health to receive little attention, recognition or funding except when there is an urgent public health crisis (Rovner, 2020).

Since 2010, federal funding has dropped to 16% for state health departments and 18% for local health departments. During the last ten years, local health departments have lost 56,260 staff positions due to the constant budget cuts (Weber et al., 2020). Without adequate pay, workers leave the field in search of other opportunities as they struggle to pay back their student loans. Without proper investment, public health will not be able to carry out its core responsibilities to keep the nation safe and healthy.

At the federal level, the Centers for Disease Control and Prevention (CDC) has lacked the funds to adequately support the public health system. The CDC is the nation's leading public health agency. Its mission is to protect Americans from disease outbreaks, disasters, and unsafe food and water, and to reduce the incidence of leading causes of Americans' deaths. To help accomplish its objectives, the CDC supports states, localities, tribes, territories, and community organizations in addressing leading health threats in their communities. Indeed, more than half of its program funding is redistributed to these partners.

The CDC also lacks sufficient dedicated funding to adequately support the cross-cutting, foundational capabilities that form the backbone of comprehensive public health systems at the federal, state, and local levels.

The CDC's budget has not kept pace with the nation's growing public health needs and emerging threats, particularly the rise in substance misuse and weather-related emergencies. The agency has expanded its substance misuse efforts in the past few years, but more resources are needed to address underlying causes. For example, the CDC's State Physical Activity and Nutrition (SPAN) program has been successful in improving nutrition and encouraging physical activity through early care and education. However, the SPAN program only has sufficient funding to be implemented in 16 states (Faberman et al., 2020). The CDC also lacks sufficient dedicated funding to adequately support the cross-cutting, foundational capabilities that form the backbone of comprehensive public health systems at the federal, state, and local levels. Fiscal Year (FY) 2019 program funding for the CDC, as enacted in September 2018, is $7.3 billion. After accounting for interagency transfers and one-time funding, this reflects a $143 million (2 percent) increase over FY2018 — or flat funding in inflation-adjusted dollars (Trust For America's Health, 2020).

It is not just the lack of funding available to public health but the manner in which funds are made available that limits its ability to address new and emerging needs such as updating information systems and policy analysis.

Since 2010 non-defense discretionary funding (NDD) has been declining and in 2019 it reached a record low of 3.1% of the gross domestic product (Center on Budget and Policy Priorities, 2020). NDD funding supports services such as education, public health, medical care for veterans, and medical research. NDD funding has been limited by statutory caps that were set by the Budget Control Act of 2011. Federal appropriations for CDC fell 7% between 2010 and 2021. These reductions have limited CDC's ability to fund state and local health departments (Reich & Windham, 2021). Consistent limited funding from the federal government has left public health chronically underfunded. In addition, categorical funding has led to silos that reduce health department's ability to fund a wide range of needs such as information systems or policy analysis (Committee on Public Health Strategies to Improve Health, 2012).

Federal appropriations for CDC

fell 7 percent

between 2010 and 2021. These reductions have limited CDC's ability to fund state and local health departments.

MS-DOH-21-1816-A-001215

A common workaround to chronic underfunding has been cross-jurisdictional sharing (CJS) which allows health departments to pool resources in order to offer an expanded array of services.

Several states have established CJS arrangements for public health functions to address health populations in areas with limited financial resources, staff, and equipment. Only 38% of local health departments (LHDs) have an epidemiologist and only 33% of LHDs have an information specialist. Through CJS, LHDs that lack funding to staff these positions are able to access their expertise (Shah et al., 2016). In Kansas, emergency preparedness regions, multicounty health departments, and other CJS arrangements among different counties have been established (Hartsig, 2017). The most commonly shared services among LHDs were all hazards and response, communications and community partnership development, policy development, and health equity and social determinants of health organizational competencies (Hartsig, 2017). CJS offers a way for LHDs to counteract the limited funding they receive by working with other LHDs to gain the resources that they need to do their job.

Improving communication on the value of public health will allow public health workers and their supporters to better advocate for policies and funding. With the general public and different sectors not fully aware of what public health does or achieves, it is increasingly important for public health officials to effectively communicate the value and role public health plays. Leaders in business, housing, and other sectors associate public health with impractical research and bureaucracy (L'Hôte et al., 2019). Public health officials must share stories of the impact their work has and illustrate the value that public health brings to people's lives. Public health has made several achievements in the past 21st century from the creation of new vaccinations, improved sanitation which has led to a sharp decline in infant and child mortality, among many others (Association of State and Territorial Health Officials, 2016). The impact of public health work is not as immediate and evident as new scientific discoveries, but it is important, nonetheless. This is why public health must document and communicate the ways that public health improves lives and communities (Illinois Strategic Communication Leadership Project, 2016). Public Health Reaching Across Sectors (PHRASES), an initiative of the de Beaumont Foundation, has created a toolkit to help public health workers to better communicate about public health with other sectors (*Motivating The Public To Support Public Health: A Toolkit For Communicating With Non-Experts*, 2020). Utilizing toolkits like PHRASES and creating workshops to improve communication will better equip public health officials with the skills needed to advocate for public health. Communicating and publicizing the role of public health will help the federal government see the importance in properly funding public health.

MS-DOH-21-1816-A-001216

Cross-Sector Partnerships

Public health workers are siloed in their work, culture, and language which prohibits them from strategically interacting with other sectors to prevent and solve social problems that result in poor health outcomes. Public health workers often do not work (and do not know how to communicate with) with partners in sectors other than public health (Rudolph et al., 2013). Although public health has an important role in hospitals and private clinics, criminal justice, public schools, and emergency services most health professionals do not have a clear understanding of their counterpart's roles and responsibilities. Open communication, collaboration, information exchange, and consultation between the sectors are of utmost importance in creating effective and trusting relationships.

Public health and criminal justice have often acted independently of one another. However, public health issues are inherent in various aspects of the criminal justice system (Gideon, 2013). Prisoners face a myriad of health problems including elevated rates of mental disorders, substance abuse, as well as airborne and bloodborne viruses (Kinner & Young, 2018). Public health operates on a prevention approach which could be applied to criminal justice research and policy. Early identification of health issues in prisoners and outbreaks and treatment in prison can improve health outcomes and reduce harm to communities when prisoners are released. Working alongside criminal justice to provide services would greatly improve the health status of the populations at-risk and can prevent health issues from spreading to the larger community (Kinner & Young, 2018).

School settings have a great impact on child and adolescent health. Schools provide regular physical activity required for children and adolescents, promote healthy nutrition, and provide health education for risky behaviors. School nurses and counselors also prevent, detect, and treat physical and mental health problems. Schools are already overwhelmed with the breadth of responsibilities that they must take on and require the help of public health workers to increase the effectiveness of school programs to promote health in children and adolescents. The public health workforce must conduct school health research and development and provide professional services to sustain and improve school health programs within their own districts (Kolbe, 2019).

MS-DOH-21-1816-A-001217

Local health departments struggle to establish and maintain cross-sector partnerships. Health departments lack the staff, resources, and funding to maintain cross-sector partnerships. Health department staff members are often overworked with the overwhelming needs of serving the local population and struggle to find the adequate time to establish meaningful relationships. Staff members are met with competing priorities and are not able to fully commit to partnership development and maintenance. Public health leaders have noted that they struggled to find the time to build relationships and struggle to participate in community meetings or calls necessary for the development and maintenance of partnerships. High staff turnover is a barrier to maintain long-term partnerships. When organizational points of contact change, organizational priorities soon follow (Ransom et al., 2019). Public health leaders are then left with a loosely defined partnership that requires rebuilding and redefining relationships (Carlin & Peterman, 2019).

Resource limitations were the most commonly cited barrier to cross-sector partnerships. Without sufficient funding, services and programs are not adequately supported and partnerships cannot be sustained over a long period of time. Siloed funding for public health also prevents organizations from investing in cross-sector partnerships as they will focus on maintaining their funding mechanism (Center for Sharing Public Health Services & Public Health National Center for Innovations, 2019).

Health departments lack the staff, resources, and funding to maintain cross-sector partnerships.

MS-DOH-21-1816-A-001218

Training public health staff on the development of community partnerships could increase their efficacy in establishing partnerships and expand the occurrence of cross-sector partnerships. Expanding training programs for community partnerships would provide public health workers with the skills needed to establish and maintain partnerships. One of the barriers to increasing partnerships between public health and other sectors of society is that there are communication challenges and gaps in knowledge between public health experts and leaders in other sectors. Leaders in other sectors do not fully understand the role of public health and define health differently than public health professionals (L'Hôte et al., 2019). To bridge the gaps between the sectors, training public health workers in effective communication would enable them to forge these partnerships. The de Beaumont Foundation has created a toolkit, Public Health Reaching Across Sectors (PHRASES), which provides best practices for communication, to help public health experts better describe their work to leaders in other sectors (*Motivating The Public To Support Public Health: A Toolkit For Communicating With Non-Experts*, 2020)

Embracing non-traditional partnerships will allow public health to gain resources, experts, and champions. Collaborations with non-traditional partners such as businesses, faith institutions, universities, hospitals, nonprofits, philanthropy, and schools create opportunities for public health to further their impact in the community and to promote better health outcomes. Partnerships with business provides public health with financial resources, products, staff time, knowledge exports, and property. Additionally, businesses can provide funding towards public health goals and help support community initiatives (Bipartisan Policy Center & de Beaumont Foundation, 2019). Universities and hospitals are anchor institutions which have significant influence and economic and social impacts in their surrounding communities. They are uniquely positioned to use their knowledge and resources to improve the quality of life in their surrounding communities. Partnerships with these institutions provide an array of funding sources which greatly expands community-based efforts. Faith institutions are another key partner that are deeply embedded in the community and can be mobilized to advocate for health care services (Weinstein et al., 2017).

Collaborations with non-traditional partners such as businesses, faith institutions, universities, hospitals, nonprofits, philanthropy, and schools **create opportunities for public health to further their impact in the community and to promote better health outcomes.**

MS-DOH-21-1816-A-001219

Data

The lack of harmonization between public health information systems and healthcare has led to silos of electronic health data which hinders public health surveillance efforts. Public health agencies house data registries from healthcare providers like childhood immunization, birth defects, and death registries. Additionally, public health agencies collect information from healthcare providers for disease surveillance (Office of the National Coordinator for Health Information Technology, 2017). However, more than 4 in 10 US hospitals report that public health agencies are unable to receive full electronic data sets but only a select number of data elements from some electronic health record (EHR) systems (Holmgren et al., 2020). The lack of full data exchange results in siloed health data that must be manually exchanged for surveillance. Epidemiologists often make requests for data over the phone or through email to medical examiners or coroners and the information is then faxed to health departments for manual input (Hagan et al., 2019). Health providers are often unclear on which data elements need to be sent to health departments and the level of detail needed for proper disease surveillance (Birkhead et al., 2015), and are often not able to submit risk factors such as smoking, blood pressure, diet, exercise, and occupation which limits the scope of surveillance (Hagan et al., 2019). Finally, there is a lack of harmonization of messaging standards between public health and healthcare. Healthcare and public health use different vocabulary in data exchange (Birkhead et al., 2015), limiting real time data exchange which ultimately hinders public health's ability to track emerging threats and conduct proper disease surveillance in a timely fashion.

Lack of data standardization limits public health officials' ability to analyze data received from other systems which leads to inconsistencies in surveillance efforts. There is a significant disconnect in data standards between public health and healthcare. Healthcare systems use multiple information systems, applications, and hardware each with different data dictionaries and data transfer procedures. This complexity in systems leaves health departments with a minefield of potential error which can lead to incorrect data interpretation and an inability to make cross-system comparisons (Birkhead et al., 2015).

State and local health departments lack the capacity to analyze and provide real time data necessary to conduct surveillance work. Local and state health departments have limited capacity to manage and analyze data received from healthcare to inform policy. This is due to reduced public health budgets, outdated informatics systems and technology, and lack of informatics expertise. It has been reported that 30% of health departments do not have inoperable systems and they lack control over the hardware and software they use. Also, only 22% of health departments have implemented EHRs, only 13% conduct health information exchanges, and 69.5% have the ability to extract data from information systems. These tasks are necessary for surveillance, the documentation of immunization records, and understanding of community health. With many health departments unable to complete these tasks, the effectiveness and reach of their efforts are minimized (Drezner et al., 2016). Many of these challenges are due to health departments' lack of informatics expertise and data literacy. Only 20% of local health departments have information systems specialists on staff and many smaller health departments do not have that expertise on staff.

MS-DOH-21-1816-A-001221

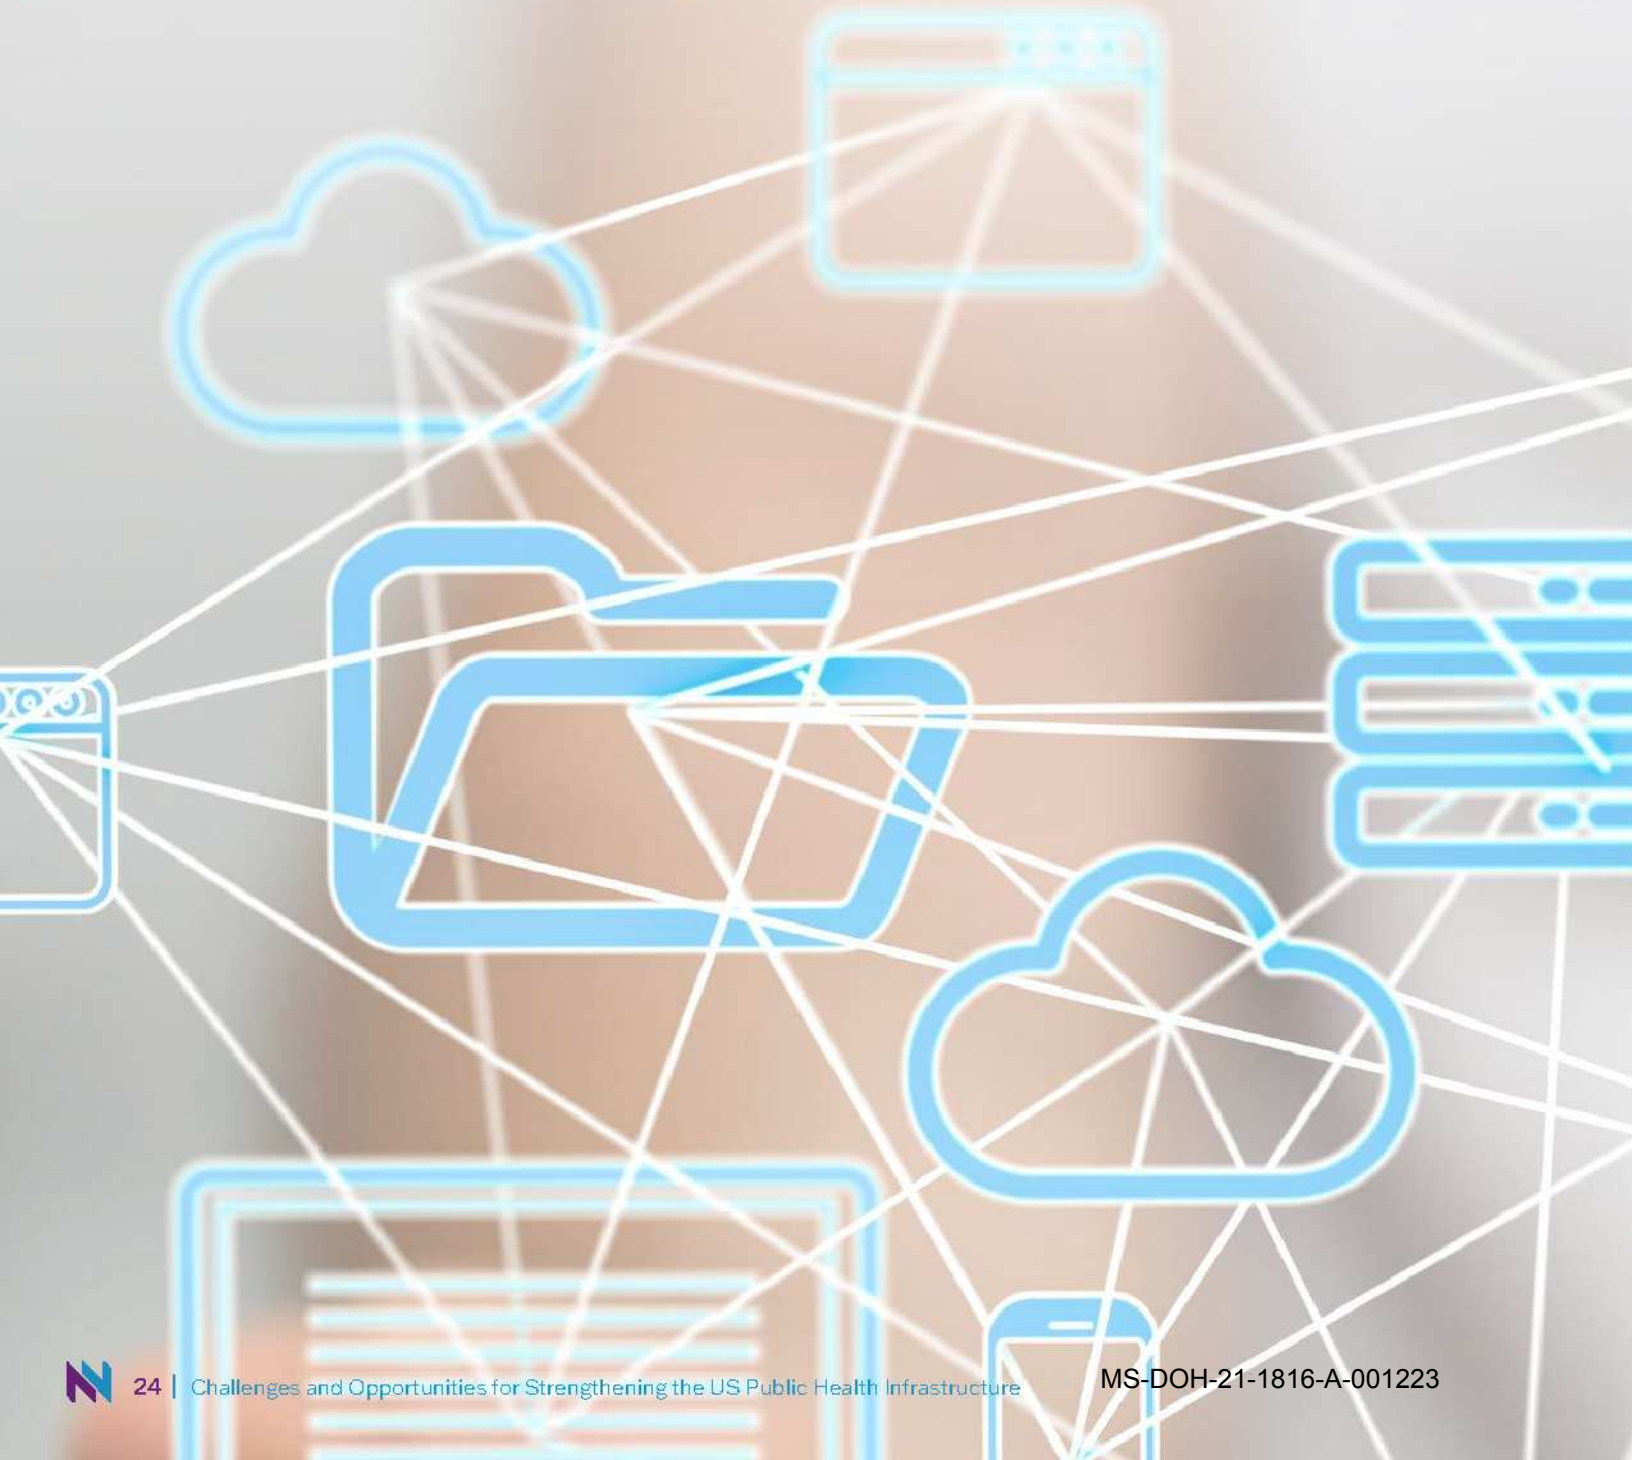
Health providers and researchers do not consistently collect data on sexual orientation and gender identity (SOGI) which leads to limited understanding of the health needs and disparities of the LGBTQ community. Researchers have struggled to operationalize the different dimensions of sexual orientation including behavior and attraction as well as gender identity (IOM Committee on Lesbian, Gay, Bisexual, and Transgender Health Issues and Research Gaps and Opportunities, 2011). Gender identity is a diverse spectrum that is difficult to categorize in surveys with a broad range of identities such as genderqueer, gender nonconforming, transgender, and agender. These identities may prefer neutral pronouns such as they/them or zie/hir (Deutsch & Buchholz, 2015). Providers often possess limited competency on LGBTQ identities and provider discomfort has been cited as a common reason for low SOGI data collection in hospitals (Streed et al., 2020).

At the federal level, most governmental data collection efforts do not include SOGI measures. In the past, the Census Bureau edited census responses for LGBTQ married couples. However, the Census has decided that "same-sex husband/wife/spouse/partner" will be included which is a step for the LGBTQ community (Velte, 2020). The federal government has also collected limited SOGI data during the COVID-19 pandemic. Few states have taken steps to collect SOGI data in the COVID-19 pandemic, with only Pennsylvania, Washington DC, Massachusetts, and Rhode Island making strides in collecting SOGI data (Cahill et al., 2020).

An underrepresented population of the LGBT are two-spirited people. Two-spirited people have often been grouped with LGBTQ identities which equates two-spirit identities to Western identities. To engage these populations in research, Indigenous only options could be listed alongside Western terms so Two-Spirit and Indigenous people can see themselves in data collection (Pruden & Salway, 2020).

The continued lack of consistent SOGI data hinders the implementation of public health interventions for vulnerable populations, limits epidemiological understanding of the LGBTQ community, and minimizes the understanding of the health disparities the LGBTQ community faces. Without proper data, researchers, public health officials, and the government will not understand what the LGBTQ community needs.

Efforts to scale up novel programs like the Digital Bridge could unify information exchange between public health and healthcare. The Digital Bridge is a partnership between the CDC and healthcare, public health, and health information technology to create a bidirectional exchange of data and to improve electronic case reporting of health data. Digital Bridge has built a national framework for electronic case reporting (eCR) to standardize tools and reporting from public health and healthcare and to make data extraction from EHRs faster and easier. The framework flags potential disease cases from data in a patient's EHR and creates a report that is electronically sent to public health. This process reduces the manual, paper-based process for healthcare providers and public health professionals, increasing the response to outbreaks (Office of Public Health Scientific Services, 2018). The Digital Bridge has been tested at seven sites in California, Houston, Kansas, Massachusetts, New York City, and Utah (Office of Public Health Scientific Services, 2018). Greater expansion would make public health surveillance seamless and more effective.



MS-DOH-21-1816-A-001223

Public Health Law

There is an overall lack of awareness of the legal basis in public health work among the general population that reduces public health's power, influence, and effectiveness. Law creates the framework for public health interventions and is the basis of every solution to public health challenges. Thus, public health officials must understand the intersection of law and public health and recognize their specific legal power to address health inequity. Laws, for instance, mandate disclosure of calories on restaurant menus; promote automobile safety; influence how public health practitioners distribute and enforce vaccination efforts, affect isolation, and quarantine orders; and are used to prohibit smoking in buildings (Leider et al., 2015).

Public health law remains one of the largest knowledge gaps in the public health workforce. Law has not been integrated into public health and as a result has left many public health officials unsure about legal capacity and left them with little legal efficacy (Burris et al., 2016). The top two self-identified areas of need for training among the workforce are how to influence law and policy development and how to understand the effects of law and policy on health. Most public health professionals receive little, if any, legal or advocacy training (Berman et al., 2019). These skills are rarely taught in law or public health schools and professionals enter the workforce unsure of how to advocate for effective policies (Berman et al., 2019).

The top two self-identified areas of need
for training among the workforce are
how to influence law and policy development
and
how to understand the effects of law and policy on health.

MS-DOH-21-1816-A-001224

The value and need for essential public health law services need to be better communicated at the local and national levels.

Public health officials play an important role in providing legal counsel for elected officials. Public health officials develop policy solutions and work with elected officials to build public support for these solutions. To develop these policy solutions, public health must establish relationships with legislative liaisons, city attorneys, and local boards of health to push these solutions forward. The 5 essential public health law services include ensuring access to evidence and expertise, designing legal solutions to address health problems, engaging communities, and building political will, enforcing and defending legal interventions, and monitoring and evaluating policy (Burris et al., 2016).

5

The 5 essential public health law services include ensuring access to evidence and expertise, designing legal solutions to address health problems, engaging communities, and building political will, enforcing and defending legal interventions, and monitoring and evaluating policy.

Establishing public health law training programs and mentorship programs will allow public health workers to enforce and apply laws to their work.

To address the deficit in law knowledge in public health professionals, trainings have been created to teach the basics of law and the intersection between policy and public health. The Public Health Law Academy was established by ChangeLab Solutions and the CDC's Public Health Law Program (PHLP) to help public health professionals better understand law and incorporate it into their job. The Academy incorporates online tools and training and a facilitator toolkit to prepare mentors. The Public Health Law Academy provides basic courses on topics such as Introduction to Public Health Law, Hot Topics in Public Health Law, and Legal Epidemiology Overview (Ransom et al., 2019). Expanding training programs and courses will teach public health professionals the basics of public health law so they can use policies and the law to improve health outcomes.

MS-DOH-21-1816-A-001225

RELEVANT POLICY

THE PUBLIC HEALTH SERVICE ACT *provides legal authority for the Department of Health and Human Services to respond to public health emergencies.*

Providing public health workers with political advocacy training and courses will help them strengthen policies and laws to improve public health outcomes and reduce disparities. Many public health workers lack opportunities to build policy and advocacy skills and do not understand the role they play in developing health policy solutions. Providing political advocacy courses in public health college curriculum and creating training workshops could increase the efficacy of the workforce. The Johns Hopkins Bloomberg School of Public Health offers a course designed to prepare public health students from different disciplines to analyze policy solutions and to determine advocacy strategies. The course offers community-based practice, classroom discussions, and opportunities for students to practice their advocacy skills to solve public health problems. Expanding political advocacy courses and making these courses mandatory will ensure that students possess policy and advocacy skills when they enter the workforce (Hearne, 2008).

The University of South Florida College of Public Health offers an educational workshop on policy aimed at building advocacy skills in public health professionals. The objectives of the workshop were to understand the relationship of federal and state governments in public health law, understanding common good vs. individual freedoms in public health law, and summarize the steps in policy development. Participants in the workshop are provided examples of how public health problems are identified and how to integrate these issues in a health policy agenda (Blenner et al., 2017).

MS-DOH-21-1816-A-001226

Laboratories

Public health laboratories (PHLs) are not able to keep up with the capacity of public health surveillance due to budget cuts, staffing vacancies, and outdated technology. PHLs are on the front lines protecting people from disease by providing diagnostic testing, disease surveillance, and research (Association of State and Territorial Health Officials, 2004). PHLs have faced numerous budget cuts which have resulted in the closure of public health labs in states such as Georgia, California, and Michigan. PHLs that are still operating have been forced to cut down on their staff and salaries (Strain & Sullivan, 2019) and have been unable to keep up with equipment upgrades (Association of State and Territorial Health Officials, 2004). Improvements have been made in the volume of testing at PHLs, but the biggest challenge faced is the dearth of laboratory specialists and staff. Thirteen states reported no doctoral-level molecular scientist on staff, and 23 states reported only one. States report that at least two doctoral-level molecular scientists are needed on staff to ensure emergency readiness and proper disease surveillance. The shortage of technology specialists hinders the state's ability to respond to emergencies and to communicate testing results (Scheck & Hing, 2020).

> *"PHLs are on the front lines protecting people from disease by providing diagnostic testing, disease surveillance, and research ... [and] have faced numerous budget cuts which have resulted in the closure of public health labs in states such as Georgia, California, and Michigan.*

MS-DOH-21-1816-A-001227

PHLs struggle to recruit staff because most trained personnel prefer to work in the private sector where they can make more money rather than work in the public sector. There is also a low level of awareness of the potential for careers in clinical laboratory science. Most science, technology, engineering, and mathematics programs geared towards adolescents focus on more common professions such as physicians and do not address clinical laboratory positions. Additionally, there are challenges in retaining trained laboratorians. About 15% of the workforce are expected to leave the workforce by 2023. The most frequently cited reasons for leaving include low salaries, limited career mobility, and lack of satisfaction with work environment.

There are testing inequities across public health departments due to testing deserts and disparities between high and low income communities.

The COVID-19 pandemic has highlighted the inequities between higher and lower income communities and more urban and more rural locations. Median travel time to COVID-19 testing sites was longer in counties with lower population density and longer in counties with a higher percent of minority and uninsured individuals, compounding the health disparities these communities face. These inequities were recently addressed an additional $2.25 billion made available to underserved communities through the American Rescue Plan, which has the additionally benefit of increasing asymptomatic testing and surveillance. Also, public health laboratory staff have lower median salary than state health agency staff, further contributing to the potential for staff dissatisfaction and turnover (Association of Public Health Laboratories, 2018).

Memorandums of Understanding (MOUs) between public health laboratories and university laboratories allow university laboratories to share human, financial, and technological resources.

In order to strengthen public health laboratories, partnering with university laboratories would provide them with the resources they need. Academic collaborations improve the data quality of public health laboratories increasing the reach, core competencies and scientific basis of public health laboratories (Erwin et al., 2019). In Hawai'i, the State Laboratories Division recognized its staff shortfalls and piloted a successful internship with local universities to support Clinical Laboratory Improvement Amendments activities (Whelen & Kitagawa, 2013). The program provided valuable insights for future iterations including offering credit through the universities and increasing the intensiveness of the internship to expand the laboratory activities students can participate in.

MS-DOH-21-1816-A-001228

Technology

Access to broadband by public health organizations is not widespread and lack of connectivity limits the scope and quality of services delivered by health departments across the country. An estimated 24 million people in the US live in "digital deserts." Areas of the country that do not have access to broadband. This includes approximately 19 million rural Americans and 1.4 million American Indian/Alaska Natives (Baurely, McCord, Hulkower, & Pepin, 2019). Health departments need consistent access to broadband to conduct their surveillance work and to provide timely and consistent services to communities. Lack of connection or low quality connection limits health departments to interact with healthcare, laboratories, registries, and hinders their ability to provide telehealth services.

An estimated

24 million

people in the US live in "digital deserts."

rural Americans and

1.4 million

American Indian/Alaska Natives.

MS-DOH-21-1816-A-001229

Health misinformation on social media platforms spreads quickly and severely impacts the effectiveness of public health messaging and health behaviors.

The Internet and social media have become a growing resource for health information with 72% of US adults using the Internet to search for health information (Swire-Thompson & Lazer, 2020). The Internet allows public health officials to share information quickly and for individuals to access information at their own leisure. However, false and misleading health information has been reported to spread more quickly than scientific knowledge, negatively affecting decision-making and health behaviors in the general public (Suarez-Lledo & Alvarez-Galvez, 2021). Health misinformation leads to the adoption of inaccurate health beliefs. This can be seen with the misconception that the measles, mumps, rubella (MMR) vaccine causes autism. This misconception has created a negative societal impact, creating distrust in public health and vaccines (Swire-Thompson & Lazer, 2020). In addition, public health officials are not receiving adequate training on health literacy and how to properly communicate with and educate the general public. Without proper health literacy and effective response by public health officials, the general public is at increased risk of believing and acting on false information.

> *False and misleading health information has been reported to spread more quickly than scientific knowledge, negatively affecting decision-making and health behaviors in the general public.*

Telemedicine improves access to care for disadvantaged populations and is a flexible option for healthcare.

Telemedicine has seen a 50% increase in use due to the COVID-19 pandemic. Telemedicine connects patients with healthcare information and communication at a low cost in the comfort of their home. It has been shown to help patients better manage chronic conditions, increase the accuracy of patient records, and enhance access to services. By reducing the amount of travel for patients and providers telemedicine encourages the use of health services by vulnerable populations who may live in a healthcare desert. It also reduces the barriers for psychiatry and increases access to services for clients who may not have been able to access before (Alvandi, 2017).

+50%

Telemedicine has seen a 50% increase in use due to the COVID-19 pandemic.

Promatores(as) de salud are an underutilized source of accurate health information for members of Spanish-speaking communities who have the tools to combat misinformation.

Promatores de salud are trusted community health workers who reside in Hispanic/Latino communities and provide health resources to community members. Their peer-to-peer approach gives them the unique advantage of addressing misinformation in a timely and personal way. *Promatores de salud* have been on the forefront of combatting misinformation on COVID-19 after noticing that the Internet and social media have been key sources for information for Hispanic/Latino communities. *Promatores* programs are demonstrating to be successful because they are able to facilitate open discussions with community members where they are not afraid to ask questions (Zamuido, 2021). Also, the discussions are not hindered by language or cultural barriers and promatoras are able to disseminate important health information in print format to residents that lack internet access (Logan & Castañeda, 2020). Expanding the *promatore* model to other vulnerable populations can serve as an effective way to combat misinformation by working with established workers who are trusted by their communities.

MS-DOH-21-1816-A-001231

Health Equity

For public health to deliver its promise to protect and improve the health of people and their communities, equity must be infused into all aspects of public health planning and delivery of services. The ultimate goal of public health is to protect and improve the health of people and their communities by promoting healthy lifestyles, researching disease and injury prevention, and detecting, preventing and responding to infectious diseases. Achieving these goals is not possible without applying an equity lens to the work. Health equity is defined as the state in which everyone has the opportunity to achieve their full health potential. Black/African Americans, American Indians/Alaska Natives, Hispanic/Latino, and Asian/Pacific Islanders face disparities in life expectancy, infant mortality rates, and chronic diseases. Health inequity in the United States results in wasteful healthcare spending, a less productive workforce, and reduces the nation's overall health status (Weinstein et al., 2017).

Public health has a responsibility to help address these disparities by creating a framework for equity. Addressing public health issues such as violence prevention, the HIV and opioid epidemics, and ending the burden of preventable chronic diseases requires public health to take a societal and collaborative approach and to understand the impact of inequity (Weinstein et al., 2017). Consistent with this approach, the American Public Health Association depicts ten essential public health services to address inequities such as racism, oppression, and poverty (Weinstein et al., 2017) and more recently centered equity as part of their overall framework.

Lack of access to the Internet limits minority groups' ability to receive quality care as well as other social services which now makes it a meta social determinant of health. Lack of access to broadband primarily affects minority populations due to financial and geographical barriers. There is a wide disparity in pricing between metropolitan and rural areas, which results in a lower adoption rate of broadband by rural communities. Additionally, rural broadband development is more challenging because of higher investment needs and certain areas are skipped over by broadband network owners through a process called "digital redlining" (Tomer et al., 2020). With minority populations having limited access to broadband, they are at a disadvantage in receiving social services that impact every social determinant of health such as economic stability, social support, and access to healthcare (Tomer et al., 2020).

HIGHLIGHT

Further expanding the implementation of mobile health units has the potential to increase access to health services for disadvantaged populations and reduce health disparities.

Mobile health clinics offer a variety of services ranging from primary care, prevention screenings, and dental services. Underserved populations face barriers to healthcare access such as transportation, financial costs, discomfort with healthcare providers, and cultural barriers. Mobile health clinics address these barriers by providing care at a client's doorstep in their community. Mobile units are able to foster trusting relationships since they provide services in environments clients feel most comfortable in (Yu, Hill, Ricks, Bennet, & Oriol, 2017). Mobile health units have been shown to increase screening rates, assist with chronic disease management, and increase self-efficacy in managing health conditions (Yu, Hill, Ricks, Bennet, & Oriol, 2017). These positive outcomes illustrate the need to further invest in mobile health units to improve healthcare outcomes for vulnerable populations.

MS-DOH-21-1816-A-001233

The public health workforce lacks diversity and is ill equipped to address the future needs of a racially and ethnically evolving nation. A diverse public health workforce is needed to adequately handle the needs of a demographically changing nation. Currently, the public health workforce is not reflective of the general population. An estimated 63% of the public health workforce is white and 28% are male (Bogaert et al., 2019). Nonwhite students accounted for 47% of public health degrees awarded. From 1992 to 2016, the percentage of Asian/Pacific Islander students awarded degrees increased from 6% to 14%, Black/African American students from 6% to 11%, and Hispanic/Latino students from 8% to 10%. The workforce is made up primarily of women with 70-73% of women receiving public health graduate degrees (Bogaert et al., 2019). The underrepresentation of certain groups in public health may be due to the financial costs of higher education. In public health, there is a scarcity of available scholarships in comparison to other fields (Leider et al., 2015). Additionally, costs associated with degree programs in the United States, particularly for graduate school, are generally high and can pose a barrier for students and disproportionately affect racial and ethnic minorities (Mays et al., 2008).

An estimated
63%
of the public health workforce is white and

Minority populations are underrepresented in research studies which limits the generalizability of research to the general population. While Black/African Americans and Hispanic/Latino make 12.4% and 15.8% of the US population, only a small percentage participate in clinical trials sponsored by the National Institutes of Health (NIH). One report has estimated that Hispanics make up 7.6% of all research participants in NIH studies. Increasing the participation of all minorities in clinical trials is critical for the production of knowledge about new therapies because having diverse research participants can improve the generalizability of medicine. Additionally, minority participation in clinical trials is an important topic in public health discussions because this representation touches on issues of equality and the elimination of disparities, which are core values of the field.

Also, there are no databases aggregating demographic data from all clinical trials—neither those sponsored by NIH nor those sponsored by the pharmaceutical industry. Examining the entire spectrum of clinical research is important because the goals of clinical trials—as well as the benefits and risks—differ according to a novel therapy's stage of development (Fisher & Kalbaugh, 2011). The low rates of participation can be a result of distrust, provider bias, and low-quality translated research materials. Minorities report high levels of distrust in research trials due to a history of exploitation. Black/African Americans are more likely to believe that physicians would not fully explain details of research participation, fear that physicians would allow them to participate in a study even if serious harm was involved, and generally mistrust physicians/researchers (Fisher & Kalbaugh, 2011). On the part of physicians, research has shown that providers are likely to be affected by biases towards minority populations which can affect the treatment minority populations receive in clinical trials (Fisher &

Minorities report high levels of distrust in research trials due to a history of exploitation.

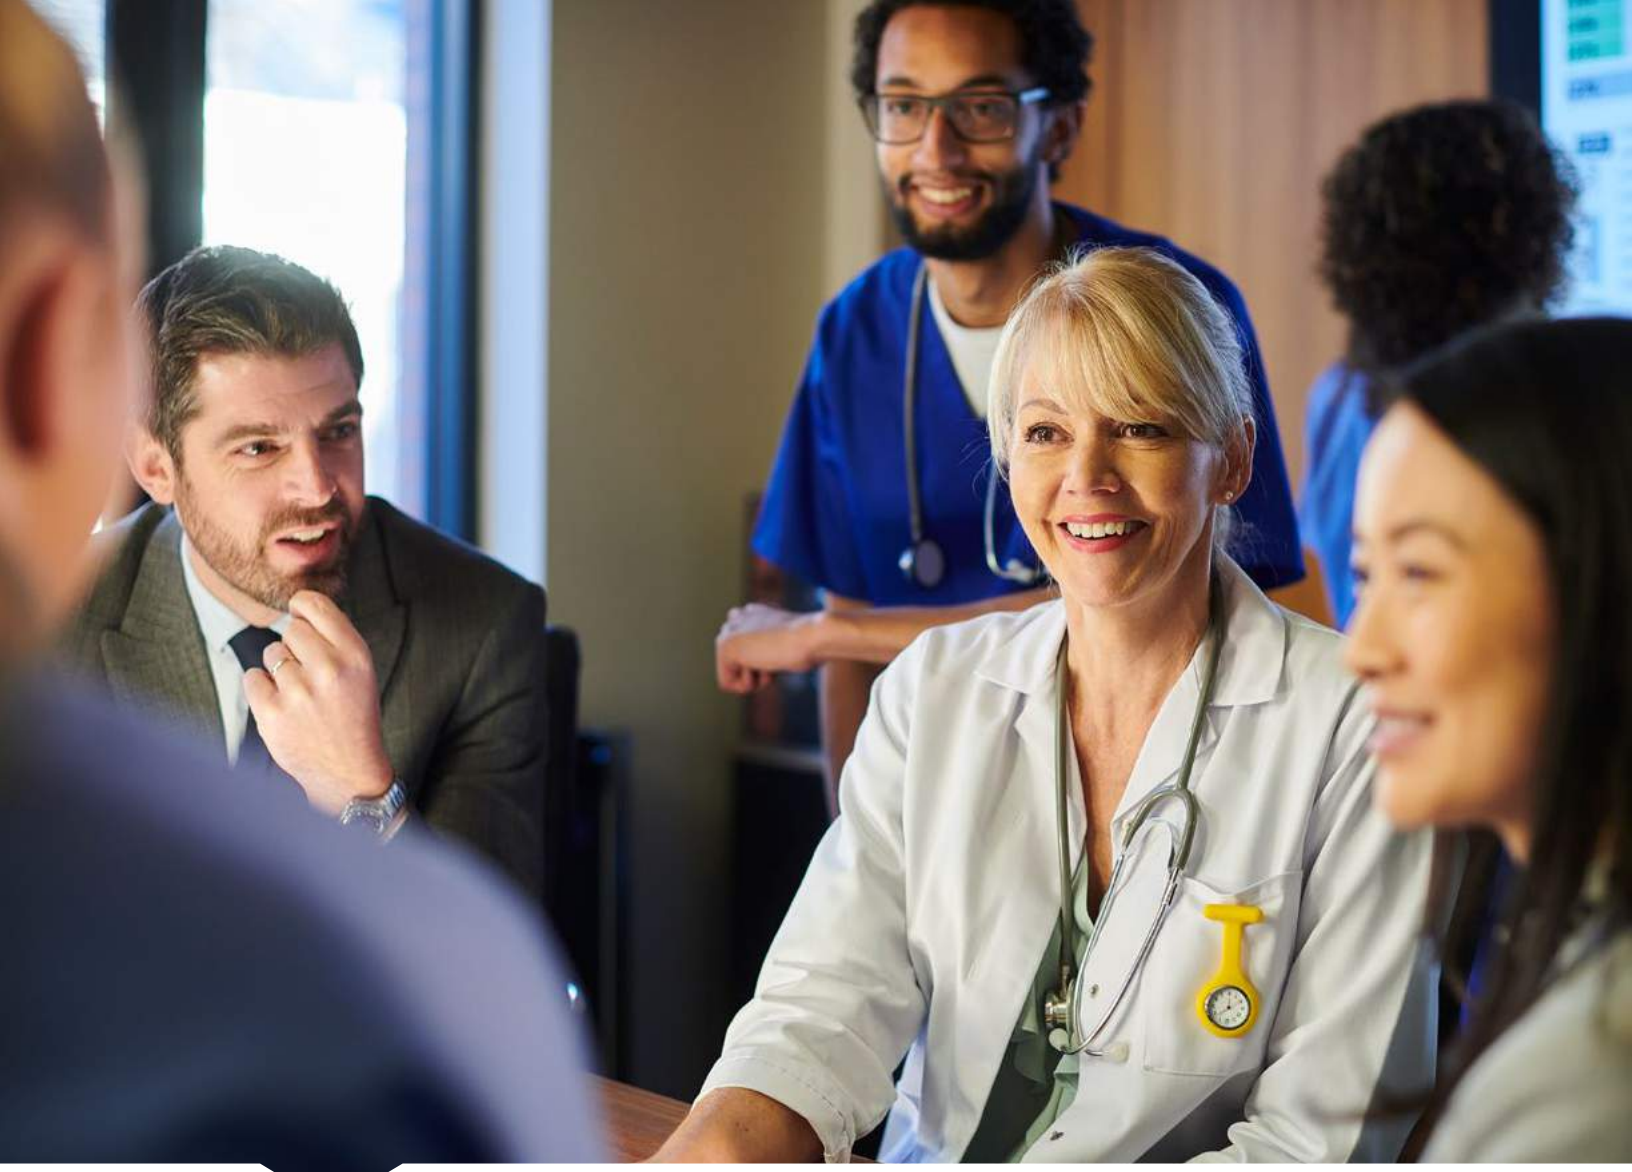
MS-DOH-21-1816-A-001235

Kalbaugh, 2011). Lastly, the translations of research materials such as informed consent forms often have errors. Translations do not take into account regional colloquialisms in languages such as Hindi, Chinese, and Spanish (Brelsford et al., 2018). Translations incorporate complex and long-winded language and the omission of phrases such as please and other clarifying language. There have also been a number of translation cases where words were imprecisely translated which resulted in altered meaning of words (Brelsford et al., 2018).

In response to the underrepresentation of minority populations, the US Department of Health and Human Service's Office of Minority Health (OMH) released fourteen national standards for culturally and linguistically appropriate services (CLAS) in 2000. These standards were issued to clinicians, organization, accreditation bodies, and state agencies. The standards encouraged services to be compatible with patient cultural beliefs and languages, a diverse workforce, and ongoing self-assessments for cultural competency. In 2016, OMH found that 32 states undertook CLAS activities and incorporated CLAS standards into their strategic planning. And only 9 states adopted CLAS-specific policies, and procedures. Despite the establishment of these standards in 2000, there has not been widespread adoption of these policies (Aggarwal et al., 2017). Implementing CLAS standards into minority recruitment practices will improve the chances that minority populations participate in clinical trials.

Cultural competency training programs for public health workers should be co-produced with community members to improve its effectiveness. In order for public health workers to effectively serve diverse populations they must be trained in cultural competency. Cultural competence training often includes understanding the role of culture in our lives and how it shapes behavior, acceptance of cultural difference, learning to utilize culturally specific practices, and the continuous development and reflection of one's personal prejudices and biases (Jongen et al., 2018). Cultural competency should not just be a onetime training, cultural competency must be fostered and reflected on during the course of a person's life. Constant reflection of cultural competency skills will build a strong workforce with a commitment to eliminating health disparities. Additionally, cultural competency should not just focus on education and knowledge, trainings should prioritize practical skills, application of skills, and assessment of skills. To make cultural competency trainings even more effective, incorporating priority populations will ensure that public health workers are able to understand the communities they work with on a deeper level.

The Health Disparities Field Experience (HDFE) is a partnership between New Mexico State University and the Fred Hutchinson Cancer Research Center to help students understand the unique disparities that exist in the US-Mexico Border area and in Native American tribal lands. Students in the program met with community members, health care providers, and visited rural health clinics and hospitals (Moralez et al., 2020). Direct engagement with the community provides deeper knowledge of cultural competency as public health workers will have greater insight on the disparities and lack of resources priority populations face.



Increasing diversity of the workforce through training programs will enable public health to better meet the needs of the nation. There are many federal agencies that have partnered with universities to offer training programs to recruit underrepresented students and to provide them with skills to enter the workforce. These training programs provide students with leadership training, professional development, and public health research and work experience. At the end of programs, students deliver oral presentations of their work and prepare final papers with the opportunity to submit papers to journals. Students additionally gain the opportunity to network and find mentors who will guide them to public health careers suitable for them and assistance with preparing for graduate programs (Horney et al., 2014). Programs have been established in Historically Black Colleges and Universities (HBCUs) to increase the presence and retention of underrepresented racial/ethnic groups in nursing and to assist students in achieving nursing certification pass rates. Programs include mentoring and academic support and help with career planning and professional development (Mayo, 2019). Training programs are an effort to recruit racial/ethnic minorities and to provide them with opportunities they would not have had before.

MS-DOH-21-1816-A-001237

Expanding the promatores(as) de salud model can help better reach medically underserved minority populations and reduce health disparities. *Promatores(as) de salud* communicate health information in a linguistic and culturally relevant way which increases the adoption and effectiveness of health interventions (Sosa et al., 2013). *Promatores* have been shown to effectively reach minority populations which resulted in increased immunization rates and cancer screening rates (Cupertino et al., 2013).

The "Mujeres Interesadas en Cambios por la Salud" is a diabetes prevention program that has been culturally tailored for Mexican American women, led by *promatoras* and aimed at promoting physical activity and healthy eating to reduce the risk of type 2 diabetes in low income populations. The work of *promatoras* helped strengthen communication among participants in the program, increased trust, knowledge, and access to community resources to help with behavior change (Sosa et al., 2013). The *promatore* model can be scaled and implemented to support public health programs in minority communities across the country.

Health equity zones (HEZ) address social determinants of health on a community scale and can help reduce health disparities. Health equity zones are an initiative implemented by the Rhode Island Department of Health. HEZ's are community collaboratives that receive funding through a "braided" funding model (ChangeLab Solutions & Rhode Island Department of Health, 2021). The braided funding stream pools multiple funding streams from the federal, local, and state government, investor, and foundation funding. HEZ's establish programs that address social determinants of health such as community gardens to increase access to healthy food and creating a program to help kids walk safely to school (Newman, 2020). A HEZ is usually implemented in economically disadvantaged areas with documented health disparities (Patriarca & Ausura, 2016). These place-based initiatives target where people live and work, improving their overall circumstances which in turn reduces the effects of social determinants of health. Addressing these disparities requires a community based effort such as HEZ community members having a say in the immediate impacts that these programs have.

MS-DOH-21-1816-A-001238

III. CONCLUSION

The development of this environmental scan afforded us the opportunity to hear from many public health experts in the field who have well-formed historical and experiential perspectives of working within the confines of the public health infrastructure. Through their feedback and confirmed by the literature we learned that the chronic underfunding of public health is only the tip of the literal iceberg in terms of what has produced and is currently fueling the challenges. The role of public health has been undermined for years resulting in little investment and funding for public health to carry out its necessary duties. This has severely impacted public health workforce pipeline and health department's ability to modernize labs, informatics, and data systems to identify disease threats. To create a new future for public health, the laws that are needed to support public health departments need to be identified, strengthened and enforced.

The politicization of public health and public health mandates has weakened the public health infrastructure and minimized public health effectiveness.

The political polarization of the COVID-19 pandemic and mask mandates has undermined the authority of public health officials and experts and their ability to keep the country safe (International Federation of Red Cross and Red Crescent Societies & United Nations Children's Fund, 2020). Political polarization of public health has been driven by income inequality, marginalization, and misinformation driven by different forms of media (Gallup, 2019). Public health interventions and public health mandates have been met with controversies due to the limitations on personal autonomy and liberty (Brown, 2010). Public health measures give public health agencies the power to regulate actions and choices in order to protect the nation's health during public health emergencies. Public health officials and governors invoke police powers to order physical distancing measures, stay-at-homes orders, business and school closures, public gathering limits, and other measures to protect the nation's health (Hall et al., 2020). However, the legal authority of public health has been challenged and limited in the courts. Cases have alleged that stay-at-home orders violate freedom and individual rights. In Wisconsin Legislature v. Palm, the Wisconsin Supreme Court struck down the states' renewed stay-at-home order, ruling that the state secretary of health had imposed it improperly. Courts in Ohio and Oregon have followed suit (Hall et al., 2020). Trust and coordination between public health professionals and public authorities is necessary in order to protect the nation's health. Missing from the national dialogue on personal freedom and individual rights is the argument that individuals have a paramount right not lose their lives by being infected by others who put their own desires ahead of others. Infectious disease is not the same as chronic disease, and the entire frame of personal freedom needs to be reconstructed so that we do not repeat the unimaginable number of preventable deaths that are still occurring.

MS-DOH-21-1816-A-001239

In conclusion, we learned that the challenges go far beyond the material, brick and mortar neglect that public health has been subjected to for the last few decades.

The physical challenges extend deep into our collective psyche. Public health has been losing a credibility battle that has been fueled by lack of awareness of public health's charge and legal duty. What is needed beyond funding is for the U.S. public to envision a new public health system for the 21st century and beyond that addresses all the challenges and weaknesses that have been brought to public view by the Pandemic of 2019. Another conclusion is that to change the public health infrastructure requires changing the way that public health is taught, and at what critical time it is communicated to young citizens. There are a number of programs described in this document that focus on raising awareness of public health among young students and making opportunities for them to contribute to the solutions that will ultimately address all the challenges that are impacting the stability of our public health system. These programs (most of which were discontinued even after showing that they were effective) have the potential to be replicated and scaled. Another ray of hope is national legislation like the reintroduction of the Public Health Infrastructure Saves Lives Act by Patty Murray. This legislation would establish a core public health infrastructure program at the CDC. The program would award grants to state, local, and territorial departments to ensure health departments have the tools and workforce to target emerging health threats. State, tribal and territorial, and local health departments would receive sustained funding to support their work. Policies and programs like the Public Health Infrastructure Saves Lives Act would pave the way for a strengthened and sustainable public health infrastructure.

APPENDIX A

Key Informants Interviewed

Gloria Addo-Ayensu, MD

Gloria Addo-Ayensu is the Director of Health at the Fairfax County Health Department in Virginia. In this capacity, she provides overall leadership and direction for public health programs in the county and serves as the official health advisor to Fairfax Board of Supervisors, Health Care Advisory Board and the Human Services Council. She has led a number of regional and state public health initiatives in the areas of health literacy, emergency preparedness, obesity prevention and health equity, as well as served on a number of national committees, including NACCHO's Public Health Preparedness Essential Services Committee and two Institute of Medicine committees on personal protective equipment for healthcare workers to prevent transmission of pandemic influenza or other viral respiratory infections. In 2016 Dr. Addo-Ayensu was a recipient of the A. Heath Onthank Memorial Award, the highest honor the county bestows upon its employees.

Georges Benjamin, MD

Georges Benjamin is the executive director of the American Public Health Association. He came to APHA from his position as secretary of the Maryland Department of Health and Mental Hygiene. Dr. Benjamin became secretary of health in Maryland in April 1999, following four years as its deputy secretary for public health services. As secretary, Dr. Benjamin oversaw the expansion and improvement of the state's Medicaid program. He is board-certified in internal medicine and a fellow of the American College of Physicians, a fellow of the National Academy of Public Administration, a fellow emeritus of the American College of Emergency Physicians and an honorary fellow of the Royal Society of Public Health. In April 2016, President Obama appointed Dr. Benjamin to the National Infrastructure Advisory Council, a council that advises the president on how best to assure the security of the nation's critical infrastructure.

MS-DOH-21-1816-A-001247

Michelle Carvalho, MPH, MCHES

Michelle Carvalho is the team Lead for the Education and Training Services Branch at the Centers for Disease Control and Prevention. Michelle has over 18 years of domestic and global community health experience. Ms. Carvalho spent 10 years as the Team Lead for the Cancer Prevention and Control Research Network (CPCRN) of the Emory Prevention Research Center. Her past work includes infectious disease research at the Centers for Disease Control and Prevention (CDC) and faith-based community work in Sao Paulo, Rio de Janeiro, and Recife, Brazil. Since 2004, she has worked on the dissemination of evidence-based approaches through national and state workgroups and local mini-grants programs to translate evidence into practice in Georgia.

Claude-Alix Jacob, MPH

Claude-Alix Jacob is the Chief Public Health Officer for the city of Cambridge, Massachusetts. He has over 20 years experience in public health and has led the operations of the Cambridge Public Health Department (CPHD) since 2007. Most recently, Mr. Jacob served as the Deputy Director of the Office of Health Promotion at the Illinois Department of Public Health. In this position, he oversaw health promotion activities related to chronic disease prevention, oral health education, children's health, and injury prevention. Previously, Mr. Jacob served as the Chief of the Bureau of Disease Prevention and Control at the Baltimore City Health Department and as the Director of Community Affairs at the Sinai Community Institute in Chicago. He has participated on a number of advisory boards including the Baltimore Schweitzer Fellows Program, the National Association of Health Services Executives (Chicago/Baltimore chapters), and Public Allies–Chicago (AmeriCorps). He is the current national chair of the Black Caucus of Health Workers of the American Public Health Association.

Montrece Ransom, JD, MPH

Montrece McNeill Ransom is the Director of the National Coordinating Center for Public Health Training. Ms. Ransom was appointed as a Presidential Management Fellow and worked at CDC for almost 20 years. For the last 10 years of her service, Ms. Ransom led CDC's public health law related training and workforce development efforts. Ms. Ransom is the ABA Health Law Section's 2019 Champion of Diversity and Inclusion Awardee, and the 2017 recipient of the American Public Health Association Jennifer Robbins Award for the Practice of Public Health Law. She is the President-Elect of the American Society for Law, Medicine, and Ethics and serves on the Advisory Committee for the Georgia Campaign for Adolescent Power and Potential.

MS-DOH-21-1816-A-001248

APPENDIX B

Technical Expert Panel (TEP) Members

Julia Adler-Milstein, PhD

Julia Adler-Milstein is an Associate Professor of Medicine and the inaugural Director of the Center for Clinical Informatics and Improvement Research (CLIIR) at the University of California – San Francisco. Her research focuses on health IT policy with an emphasis on electronic health records and interoperability. Dr. Adler-Milstein previously was on the faculty at the University of Michigan. She has testified before the US Senate Health, Education, Labor and Pensions Committee, is a member of the National Academy of Medicine, been named one of the top 10 influential women in health IT, and won numerous awards, including the New Investigator Award from the American Medical Informatics Association and the Alice S. Hersh New Investigator Award from AcademyHealth. She has served on an array of committees and boards, including the NHS National Advisory Group on Health Information Technology, the Health Care Advisory Board for Politico, and the Interoperability Committee of the National Quality Forum.

Kathleen Amos, MLIS

Kathleen Amos serves as the Director, Academic/Practice Linkages for the Public Health Foundation (PHF). Ms. Amos coordinates the Council on Linkages Between Academia and Public Health Practice and its initiatives, including the Academic Health Department Learning Community and the Core Competencies for Public Health Professionals; manages performance improvement and competency development and implementation activities; and helps to coordinate Maryland's Mid-Shore Rural Health Collaborative. Ms. Amos joined PHF in 2010 as a Learning Partnership Librarian through the Grace and Harold Sewell Memorial Fund. Prior to coming to PHF, she completed the National Library of Medicine Associate Fellowship Program, gaining specialized training in health sciences information services; engaging in research related to biomedical publishing; and supporting consumer health, health literacy, and public health informatics projects.

Scott Becker, MS

Scott Becker is the Chief Executive Officer of the Association of Public Health Laboratories (APHL), serving in that capacity since 1997. Currently he is leading development of new plans and a funding strategy for APHL's state-of-the-art AIMS platform, which provides data management and messaging services to public health and

MS-DOH-21-1816-A-001249

other data exchange partners, and also is pursuing national solutions to transfer electronic health data through extensive participation in the public-private forum Digital Bridge and the "Data: Elemental to Health" Campaign. Earlier in his career, Mr. Becker served as deputy executive director for the Association of Schools & Programs of Public Health (ASPPH). During a sabbatical from ASPPH, he directed a WHO project to integrate HIV/AIDS into health profession curricula. He chairs the Governance Working Group for the Global Laboratory Leadership Program (GLLP), a collaboration with the World Health Organization (WHO), the US CDC and others to develop a competency-based curriculum for laboratory leaders. Additionally, he is a member of the Affiliate Council of ASTHO which he formerly chaired.

Betty Bekemeier, PhD, MPH, MSN, RN, FAAN

Betty Bekemeier is the Director of the Northwest Center for Public Health Practice, where she , leads training activities, serves as content reviewer for the center's nursing trainings, and writes for the Northwest Public Health magazine, among other duties. She is the Kirby & Ellery Cramer Endowed Professor at the University of Washington School of Nursing and Adjunct Professor in the School of Public Health. She is Primary Investigator of the Public Health Activities and Services Tracking (PHAST) Study and conducts practice-based research in collaboration with state and local public health practice partners. Much of her research and leadership in advancing public health systems has been conducted through state Public Health Practice-based Research Networks (PBRN), working directly with public health leaders to provide the evidence needed to most effectively and equitably promote health in communities. Dr. Bekemeier is a Robert Wood Johnson Foundation Nurse Faculty Scholar and an active member and founding member of the Washington State Public Health Practice-Based Research Network and its Executive Committee. She is also a committee member on the Public Health Accreditation Board of Directors Research Advisory Council.

Samantha Cinnick, MPH, CPH, CHES

Samantha Cinnick is a Program Officer at the de Beaumont Foundation, providing program coordination for workforce development initiatives to equip public health professionals with the knowledge, skills, and tools to make their communities healthier. Before joining the Foundation, she was the center coordinator of the Region 2 Public Health Training Center at the Columbia University Mailman School of Public Health. Ms. Cinnick gained experience in city and local governmental public health by interning for the New York City Department of Health and Mental Hygiene's Brooklyn Breastfeeding Empowerment Zone and designing a public health workforce development plan for the US Virgin Islands Department of Health.

Nafisa Cisse Egbuonye, PhD, MPH

Nafisa Cisse Egbuonye is the director of the Black Hawk County Health Department in Iowa. She is a certified infectious disease and surveillance control specialist, who has experience in infectious disease surveillance domestically and globally. Dr. Egbuonye serves on the boards of Allen College, Delta Dental of Iowa Foundation and Grow Cedar Valley, as well as Iowa Public Health Association's Public Health Advocacy Group. She received a National Research Service Award from the National Institutes of Health and a Diversity Fellowship from the Texas A & M University. She received a 20 under 40 award from the Cedar Valley Courier. Dr. Egbuonye is a member of the third cohort of The Kresge Foundation's Emerging Leaders in Public Health initiative.

MS-DOH-21-1816-A-001250

Sarah de Guia, JD

Sarah de Guia is the Chief Executive Officer at ChangeLab Solutions. Before joining ChangeLab Solutions, Sarah worked at the California Pan-Ethnic Health Network (CPEHN), first as director of government affairs and then as executive director. Sarah's accomplishments during her tenure at CPEHN include passage of more than a dozen legislative bills to further health equity; critical administrative policy wins to incorporate health equity into land use and planning regulations; and improving the quality of health care for immigrants, patients with limited English proficiency, and communities of color. Prior to working at CPEHN, Sarah was a health program director at Latino Issues Forum and a legislative analyst at the Mexican American Legal Defense and Educational Fund. Sarah sits on the advisory committee for the Office of Health Equity at the California Department of Public Health, the advisory council of the Healthiest Cities and Counties Challenge, the editorial committee of Public Health Watch, the principles alliance stewardship council of Raising the Bar: Health Care's Transforming Role, and the board of directors of the CARESTAR Foundation.

Julian Drix, MPH

Julian Drix the co-lead of the Health Equity Institute at the Rhode Island Department of Health. He previously served as its Asthma Program Manager, where he developed, implemented and evaluated comprehensive asthma interventions that connect public health with the health care system. Mr. Drix is an alumni of the Bloomberg American Health Initiative fellowship program, in which he analyzed complex social and environmental determinants and establish initiatives to advance health equity. He is a member of the Environment Section and Environmental Justice Subcommittee of APHA and was elected by the Section as an APHA Governing Councilor. He is a member of the 2019 class of the 40 Under 40 in Public Health list by the de Beaumont Foundation. Mr. Drix is a member of the second cohort of The Kresge Foundation's Emerging Leaders in Public Health initiative.

Venus Ginés, MA, P/CHWI

Venus Ginés is a 27-year breast cancer survivor who survived cancer for the second time in 2017 after 25 years of survivorship. Ms. Ginés retired as a faculty member at Baylor College of Medicine in Houston, Texas, having taught cultural competence and health literacy as well as conducted research on Latino medical mistrust. From her personal experience with cancer and her sister's untimely death from cervical cancer 9 months after diagnosis, Ms. Ginés founded Día de la Mujer Latina (DML), Inc., in 1997, as a national non-profit organization that celebrates its signature Health Fiestas in 40 states, Puerto Rico, and the Dominican Republic and provides the medically underserved Latina community with culturally and linguistically proficient health education and early detection screening for chronic diseases.

Dawn Hunter, JD, MPH, CPH

Dawn Hunter is the is the Deputy Director of the Southeastern Region Office of the Network for Public Health law. Ms. Hunter has worked in state public health at the New Mexico Department of Health, where she started as a Robert Wood Johnson Foundation Visiting Attorney in Public Health Law through the Network. She is also experienced in training and compliance, organizational policy management, and workforce development. Ms. Hunter started her career in child protective services in Hillsborough County, Florida. She later transitioned into research and development as a microbiologist at the University of South Florida, Center for Biological Defense, with a focus on rapid detection methods for food and waterborne pathogens. She also served as the Senior Director of Policy, Strategy and Legal Services for the Foundation for a Healthy St. Petersburg.

Peter Holtgrave, MPH, MA

Peter Holtgrave is the Senior Director of Public Health Infrastructure and Systems at the NACCHO, where he oversees the organization's Performance Improvement, Workforce Development, Public Health Transformation, and Health Equity and Social Justice portfolios. He previously served as NACCHO's Director of Accreditation and Quality Improvement. Mr. Holtgrave has served as the National Health Manager at the OASIS Institute, a national nonprofit focused on healthy and productive aging, and managed the evaluation of the Healthy Kids, Healthy Communities national initiative, funded by the Robert Wood Johnson Foundation. He held multiple positions at the Boston Public Health Commission, including the Co-Director of Health Education for the Division of Child and Adolescent Health, the Director of the Boston Area Health Education Center, and the Associate Director of the Youth to Health Careers program.

Erika Miller, JD

Erika Miller is the Senior Vice President and Counsel at the Coalition for Health Funding. Ms. Miller has expertise in the intricacies of physician reimbursement and provides guidance to clients as they navigate the evolving area of alternative payment models and health care quality initiatives. She advocates before the legislative and executive branches to innovate within the health workforce programs, like Title VII, and the Medicare graduate medical education program to ensure that there is a physician workforce available to meet the health needs of Americans. Prior to CHF, Ms. Miller also worked in the HHS Office on Women's Health, where she monitored grant awards., and the office of Congressman Steve Rothman of New Jersey, a member of the House Appropriations Committee, where she handled immigration issues.

Denise Octavia-Smith, MBA, CHW, PN

Denise Octavia-Smith is the founding Executive Director of the National Association of Community Health Workers. Prior to NACHW, she was the led the development of the Equal Coverage to Care Coalition at the UConn Health Disparities Institute, served as the Director of Career and Education Initiatives for Central Area Health Education Center, Inc. and was the Training Coordinator for Access Health CT where she developed the statewide training, certification, consumer engagement strategies and continuing education opportunities for 400 culturally and linguistically diverse Navigators, In-Person Assisters and Certified Application Counselors during Connecticut's first open enrollment. Mrs. Smith is a 2018 Robert Wood Johnson Culture of Health Leadership Fellow and a 2016 Universal Health Care Foundation "Leaders in Action" Fellow. Her advisory appointments include the American Board of Internal Medicine, the Connecticut Office of Health Strategy and the University of Pennsylvania Perelman School of Medicine Department of Medical Ethics and Health Policy.

Myra Parker, JD, PhD, MPH

Myra Parker is the Executive Director of Seven Directions, A Center for Indigenous Public Health. She is an assistant professor in the Center for the Studies of Health and Risk Behavior in the Department of Psychiatry and Behavioral Sciences, in the University of Washington School of Medicine. She also serves as Co-Director of the Indigenous Wellness Research Institute's Tribal Protocols and Ethics Division. She is an enrolled member of the Mandan and Hidatsa tribes and has worked on tribal public health program implementation, coordination, and research with tribal communities in Arizona, Idaho, and Washington. Prior to her work in research, she worked for five years in the policy arena within Arizona state government, in tribal governments, and with tribal working groups at the state and national level. Dr. Parker serves as Co-Investigator on an ETHICS project to culturally adapt a human subjects curriculum for tribal communities; a national epidemiology research study grounded in CBPR involving twenty-five tribal colleges and universities; and a NIAAA R01 research study investigating the effectiveness of a culturally-adapted version of the BASICS intervention and a policy intervention.

MS-DOH-21-1816-A-001252

Gianfranco Pezzino, MD, MPH

Gianfranco Pezzino is a Senior Fellow at the Kansas Health Institute where he directs the Center for Sharing Public Health Services, a multi-year dollar national initiative funded by the Robert Wood Johnson Foundation. The Center provides access to tools, techniques, expertise and resources that support better collaboration across boundaries by public health departments, allowing them to do more together than they could do alone. Dr. Franco previously served as the Shawnee County, Kansas, health officer. Prior to joining KHI, he most recently served as state epidemiologist and medical director for the bioterrorism program within the Kansas Department of Health and Environment. He is a Fellow of the American College of Preventive Medicine, is board-certified in preventive medicine and public health and is certified in evaluation practice.

Larry Polsky, MD, MPH, FACOG

Larry Polsky is the Health Officer and Director of the Calvert County Health Department in Maryland. Dr. Polsky directs the health department as an agent of the Maryland State Government. With over 30 years of practice, he is a fellow of the American Congress of Obstetricians and Gynecologists. He serves on the board of directors for Calvert Healthcare Solutions, which provides primary care to uninsured Calvert County adults, care coordination for residents being treated for diabetes and high blood pressure, and direct education and enrollment efforts for expanded Medicaid and Qualified Health Products in 3 Maryland counties. Dr. Polsky is a member of the first cohort of The Kresge Foundation's Emerging Leaders in Public Health initiative.

Julie Pryde, MPH, MSW

Julie Pryde is a public health administrator for the Champaign-Urbana Public Health District (CUPHD) in Illinois. She joined CUPHD in 1995 as a Program Consultant in the Division of Social Services and as the Project Director for the IL Region 6 HIV Prevention Implementation Group. In 2001 she became the Director of the Division of HIV/STD/TB Prevention and Management. In 2008, Ms. Pryde was appointed as the first female Public Health Administrator in CUPHD's 70+ year history. CUPHD was created in 1937. Ms. Pryde served as an Investigator for the Home Access' FDA Post-Marketing Surveillance Study. Ms. Pryde has won awards from the Illinois Department of Public Health, The University of Illinois School of Social Work, The Greater Community AIDS Project, IL Public Health Association, and the IL Association of Agencies and Community Organizations for Migrant Advocacy. She currently serves on the NACCHO's Zika Advisory Council, Illinois Immunization Advisory Committee, the University of Illinois, School of Social Work's Field Advisory Committee, and the UIUC Department of Human Development and Family Studies External Advisory Committee. Ms. Pryde is a member of the third cohort of The Kresge Foundation's Emerging Leaders in Public Health initiative.

Monica Valdes Lupi, JD, MPH

Monica Valdes Lupi is the Managing Director of Health for The Kresge Foundation. Ms. Valdes Lupi most recently served as senior fellow at the de Beaumont Foundation, where she advised and led its efforts to amplify and accelerate policy initiatives aimed at developing and advancing a health agenda on critical public health issues such as tobacco control, racial justice and health equity. Ms. Valdes Lupi was also a senior advisor to the CDC Foundation in its COVID-19 efforts. In this role, she guided activities aimed at quickly identifying and supporting critical gaps and needs among state and local health departments in their response and recovery activities. Previously, she served as the executive director of the Boston Public Health Commission, the deputy commissioner for the Massachusetts Department of Public Health and was the first chief program officer for Health Systems Transformation at ASTHO. Ms. Valdes Lupi led ASTHO's work on health equity, Medicaid and public health partnerships, government relations, state health policy, and public health informatics.

Katherine Wells, MPH

Katherine Wells is the Director of Public Health for the Department of Public Health for the City of Lubbock, Texas. Ms. Wells previously worked at the Department of Health Services for the State of Texas, serving as a communicable disease program manager, manager of the Texas HIV State Pharmacy Assistance Program, and a data analyst for the Texas AIDS Drug Assistance Program. She also worked at the National Institute of Health assisting on the Surgeon General's Report on oral health in America. Ms. Wells moved to Lubbock to look at rebuilding Lubbock's public health system, which had been significantly cut back in 2012. Ms. Wells is a member of the third cohort of The Kresge Foundation's Emerging Leaders in Public Health initiative.

Hi Dr. Dobbs,

Apologies for another e-mail so soon, but I wanted to check to see if you approve my sending the IDPC agenda and this white paper draft. I also received the ***Public Health Authority to Prevent and Control the Spread of Communicable and Infectious Disease*** policy statement draft, which is attached here.

Please let me know your thoughts and I will send the materials to the IDPC for Tuesday's call.

Kate

Subject: Proposed IDPC agenda and white paper draft

Hi Dr. Dobbs,
Attached please see a proposed IDPC agenda for Tuesday and a draft of the **Preparing for the Next Pandemic/Public Health Crisis: Lessons from the Last Decade and Beyond** white paper. This is our first attempt at framing out a document to respond to the concerns you laid out in the e-mail to leadership in late September, so please do not hesitate to redirect us if we're off base. I've moved things around, so the references are out of order, but I'll wait to fix those until we get feedback on the scope of the document.
When you have a chance to review, please let me know what you think, and I'll share these materials as well as a the draft ***Public Health Authority to Prevent and Control the Spread of Communicable and Infectious Disease*** policy statement with the committee.

I'll also send a facilitator's agenda for you when the IDPC agenda is finalized.

1 Year Into COVID, Courts Face Uncertain Path To Reopening

Jury trials dropped off sharply during the pandemic, but in-person proceedings may rebound as virus cases wane and courts face pressure to address a litigation backlog, spurring concerns about how to bring people back to court safely.

A Tale Of Two Zoom Trials

The COVID-19 pandemic led most courts to postpone in-person trials or press ahead with safety precautions, but a minority are experimenting with conducting the whole trial experience via videoconference. Here, Law360 talks to two lawyers who tried their cases on Zoom about the format and what role it could play in the long run.

1 Year In, Policyholders See Hope In Virus Coverage Battles

Courts have sided with insurers in most COVID-19 business interruption coverage disputes since the pandemic brought the country to a standstill, but attorneys for policyholders have been encouraged by a growing number of rulings that coverage can be triggered by loss of use of property as well as visible damage.

COVID 1 Year In: What Employment Attys Still Don't Know

A growing number of Americans are getting vaccinated every day, and employers are thinking about what returning to workplaces may look like. Here, Law360 discusses what employment lawyers know and don't know about what's to come in the COVID-19 pandemic's second year.

The Defining Pandemic Moments For Health And Life Sci Attys

The coronavirus pandemic's first year tested America's health care and life sciences systems in unprecedented ways and set the stage for profound and lasting changes. Here, attorneys share the moments and lessons that stand out — and what they'll be watching as the pandemic enters its second year.

What COVID Taught Real Estate Attys About Force Majeure

When COVID-19 began rapidly spreading across the U.S., real estate lawyers scrambled to help clients figure out whether force majeure clauses could excuse them from certain obligations, and a year later, much has been learned about their efficacy. Here, Law360 looks at three things lawyers have discovered.

Why A Surge Of COVID Securities Suits Hasn't Happened

The first year of the worldwide reckoning with COVID-19 saw the biotech and pharmaceutical industries get hit hardest by investor actions tied to the pandemic, though the chances of the virus spawning a broader wave of securities litigation seem to be slimming.

COVID Inflamed Damaging Year For Data Breach Victims

Data breach responders are coming up for air after an onslaught of security episodes over the past year, as hackers' evolving tactics collided with unprecedented challenges for organizations responding to the COVID-19 pandemic, cybersecurity lawyers tell Law360.

WHAT IT MEANS FOR YOUR PRACTICE

How COVID Has Reshaped M&A Agreements

Nearly one year into the COVID-19 pandemic, it's clear that even merger and acquisition agreements are not immune to the novel disease, as dealmakers are negotiating more specific material adverse effect clauses and leaning more often on the use of earnouts as part of deal consideration.

Compliance Officers Stretched Thin As Remote Work Goes On

One year into the declaration of COVID-19 as a national emergency, the shift to remote work is stretching compliance officers as they struggle to keep tabs on employees and face steep learning curves with new technological tools, experts tell Law360.

Virus Vaccine Tracking To Keep Focus On Data Privacy

A year after the onset of the COVID-19 pandemic in the U.S., companies are still grappling with questions about how to handle and retain sensitive health information, and emerging efforts to monitor who's been vaccinated will only exacerbate these issues.

1 Year Into Pandemic, These Real Estate Questions Remain

Questions about the future of office space and the viability of hotels are among the unknowns for the real estate sector, one year after COVID-19 began its rapid spread across the U.S. Here, Law360 looks at three lingering questions for commercial real estate a year into the pandemic.

Key Takeaways From The Biggest COVID Real Estate Cases

Major real estate cases brought on by COVID-19 have shown courts are amenable to considering "material adverse change" clauses as means to call off M&A deals, while a pair of tenant-friendly rent dispute rulings also have landlords on high alert. Here, Law360 looks at what's been learned from four key disputes.

For 'Essential' Cannabis Businesses, Pandemic Year A Boom

The pandemic marked a turning point for the cannabis industry, which was facing its first real downturn when state officials chose it as one of the businesses that could stay open amid the closure orders designed to curb COVID-19.

REGIONAL IMPACT

Texas Judges See Lasting Benefits From Pandemic Practices

Virtual hearings are largely what has allowed Texas courts to keep the administration of justice trudging along during a year of the global pandemic, and what started as the short-term necessity of remote proceedings will have lasting impacts on court operations.

How COVID Strengthened Texas As A Bankruptcy Hub

The Southern District of Texas saw a surge in commercial bankruptcy filings during 2020, drawing a caseload second only to Delaware's during the coronavirus pandemic, which attorneys attribute to the accessibility, ingenuity and predictability of a pair of Houston judges who have spent years giving the district a high profile.

5 Pennsylvania Cases That Shaped A Year Of COVID

Pennsylvania's 2020 docket related to the COVID-19 pandemic was a series of flashpoints that reflected the tensions throughout the nation as the courts dealt with emergency shutdown orders, mask mandates and the limits of state power to enforce them.

Ill. Courts Stare Down Backlog As Jury Trials Start To Resume

Navigating COVID-19 has left Illinois courts staring down a massive jury trial backlog of both civil and criminal cases, and when trials resume in the coming weeks, state and federal courts will have a tremendous amount of work to do to clear their dockets.

How Florida's Courts Have Been Forever Changed By COVID

The technological revolution in Florida's legal industry brought on by the COVID-19 pandemic has improved efficiency and saved clients money, but the necessary shift to online interactions has made mentoring young attorneys a challenge, and delays in jury trials are expected to clog up courts in the coming years.

Ga. Probate Judges Want Relief After Year Of COVID Havoc

Georgia probate court judges and clerks, hardest hit by the coronavirus pandemic of any group in the state's legal community, feel mounting frustration over the lack of protections they've gotten from the state in the last year.

'Sorry For The Disruption': A Year Of Remote Court In The UK

It was a lawyer's star turn in a London courtroom lost to a poor internet connection. Such is the world of remote hearings, forced out of courtrooms a year ago amid the pandemic. And while the experience has improved, lawyers say hitches remain.

Lawyers Predict UK's Virtual Hearings May Outlast Pandemic

When March rolled around last year, no one using the English civil courts would have guessed the judiciary was on the verge of going digital. But many practitioners now predict some of the drastic technological changes will be here to stay.

EXPERT ANALYSIS

1 Year Into Pandemic, It's Time To Rethink Law Firm Billing

The particular tasks for which a law firm client can expect to be billed have become unpredictable in the era of COVID-19, making flat fees and other alternative fee arrangements more attractive for both in-house and outside counsel, says Jessica Hodkinson at Panasonic.

What Companies Should Know About SIGPR Oversight

Brian Miller, the special inspector general for pandemic recovery, discusses what companies and attorneys can do to avoid CARES Act fraud, how his team approaches protecting taxpayer money, and some of the challenges and successes SIGPR faced building an agency from the ground up amid a pandemic.

Subject: CDC All-State, Tribal, Local, and Territorial (STLT) Update Call
Attachments: 10.26.2021 CDC All STLT Update Call Agenda.pdf
09.27.2021 All STLT Update Call Summary.pdf

Call Purpose: CDC's 2019 Novel Coronavirus (COVID-19) response team will continue to host a national call series every Monday from 2:00 p.m. to 2:45 p.m. EST to provide state, tribal, local, and territorial (STLT) partners with the latest information on the COVID-19 outbreak and U.S. preparedness efforts.

Invited call participants include STLT preparedness directors, epidemiologists, health officials, public health laboratory directors, and nongovernmental partners.

CDC will continue to share the agendas and call notes weekly.

Participant Information: The CDC All-STLT Update Call will now be held as a Zoom webinar and requires a one-time registration. After registering, you will receive a unique participant link via email. Please note that your unique participant link will be the same for all calls in the series, through December 2021; you do not need to register for each individual call. Click here to register: <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fcdc.zoomgov.com%2Fwebinar%2Fregister%2FWN_hJfZ-YpdTHdOfOKIILDU0w&data=04%7C01%7CThomas.Dobbs%40month.ms.gov%7Cb4e8b6990de4a4e17d208d986b9cb6eb%7C5590426dc8bf94d8869c0bbf4e750cb7%7C0%7C0%7C637688826981243992%7CUnknown%7CTWFpbGZsb3dfeyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C1000&sdata=eVdtdYMt2%2BACICv+%2Bb95nfzFLXvYynklgwojr%2BLw0%3D&reserved=0> for the call series. The link can also be found here: https://cdc.zoomgov.com/webinar/register/WN_hJfZ-YpdTHdOfOKIILDU0w <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fcdc.zoomgov.com%2Fwebinar%2Fregister%2FWN_hJfZ-YpdTHdOfOKIILDU0w&data=04%7C01%7CThomas.Dobbs%40month.ms.gov%7Cb4e8b6990de4a4e17d208d986b9cb6eb%7C5590426dc8bf94d8869c0bbf4e750cb7%7C0%7C0%7C637688826981243992%7CUnknown%7CTWFpbGZsb3dfeyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C1000&sdata=eVdtdYMt2%2BACICv+%2Bb95nfzFLXvYynklgwojr%2BLw0%3D&reserved=0>.

Please do not share your participant link. After registering, the link you receive is unique to you and should not be shared. If you would like to invite a colleague to this call series, please request they email eocevent424@cdc.gov <mailto:eocevent424@cdc.gov>.

Add the link to your calendar as a reoccurring weekly event: To add this link to your calendar, select the "Add to Calendar" link within the email you receive. This will download the .ics file. Open the file and save the event to your calendar. Please ensure that you set this invitation to reoccur weekly.

All-STLT Update Call Dates 2021

The All-STLT Update Call will be on Mondays from 2 to 2:45 PM EST except for the dates below where the call will be held on a Tuesday.

* Tuesday, June 1 (Memorial Day May 31)
* Tuesday, July 6 (Independence Day July 5)
* Tuesday, September 7 (Labor Day September 6)
* Tuesday, October 12 (Columbus Day October 11)

*Daily website updates are now viewable at https://www.cdc.gov/coronavirus/2019-ncov/whats-new-all.html

Federal Emergency Management Agency (FEMA) Vaccination Distribution Updates

In a recent press release, FEMA has now obligated more than $1.2 billion to governmental partners with vaccination sites, as the agency continues its increased support in the ongoing battle against COVID-19.

That number is expected to grow in the days ahead.

Federal Funding to Accelerate State Vaccine Efforts: FEMA will provide reimbursement to state, local, tribal and territorial governments and the District of Columbia for use of their National Guard to respond to COVID-19 and other assistance, which may include support for vaccination distribution and administration, at a 100% cost share until Sept. 30, 2021.

The agency is expediting reimbursement for eligible emergency work projects to ensure resources are available to support vaccine distribution and administration. Funding covers emergency protective measures, such as:

- Supplies and commodities needed to safely store and administer the vaccine
- Transportation support and reasonable, necessary security for refrigerated trucks and support for leasing space to store and/or administer vaccines, including utilities, maintenance and security.
- Medical and support staff, including onsite infection control measures, personal protective equipment for staff, cloth face coverings for patients, temperature scanners, physical barriers and disinfection of the facility in accordance with CDC guidance.
- Dissemination of public information and communication regarding vaccinations.

The Coronavirus Response and Relief Supplemental Appropriations Act of 2021 appropriates $2 billion to FEMA to provide financial assistance to individuals and households for COVID-19-related funeral expenses at a 100% federal cost. The appropriation covers eligible funeral expenses incurred through Dec. 31, 2020. FEMA is reviewing the legislation and evaluating potential options for implementation.

Federal Coordination to Identify and Fill Resource Gaps: FEMA released "FEMA COVID-19 Vaccination Planning FAQ," a document to help assist governments with their vaccine distribution efforts and reimbursements for associated costs. The agency will work with the U.S. Department of Health and Human Services and other federal agencies to ensure a coordinated approach to using Defense Production Act authorities wherever necessary so private sector companies can increase vaccine supply and spur vaccine manufacturing.

FEMA Supporting and Establishing Vaccine Sites: FEMA will provide support to established vaccination locations, establish new community vaccination centers, and support National Guard operations to expand access to vaccines. To reach underserved and rural communities, FEMA, in collaboration with federal partners, will coordinate efforts to establish and support fixed facilities and establishing pop-up or temporary vaccination sites and mobile vaccination clinics.

Massachusetts Department of Public Health: Communications and Community Engagement for COVID-19 Vaccines

Check out this interesting and informative presentation that the Massachusetts DPH gave to the Vaccine Task Force last week, all about what has worked best when it comes to targeted community engagement strategies to promote COVID-19 vaccination. By utilizing a variety of tools such as Jamboard exercises and community focus groups, they identified themes around barriers to vaccination, vaccine hesitancy, how to increase adherence and improve community trust.

Upcoming Trainings/Meetings

- Below is a link to a series of accredited education about COVID-19 vaccine in general, safety, and administration considerations. Please distribute this information with your next regular communication with states.
    - Vaccine Courses, Broadcasts, Webcasts and Self Study Training | CDC
- Tiberius users can access the training video on submitting transfer requests at the following link: https://protect-ows.hhs.gov/workspace/compass/view/ri.compass.main.folder.c95b290c-2561-4cd1-85f7-e31dac51d34b [protect-ows.hhs.gov

Updates on the Federal Retail Pharmacy Program for COVID-19 Vaccination

The initial phased implementation of the program will begin with select retail pharmacies administering COVID-19 vaccine across the country as early as Thursday, February 11. The program will be implemented incrementally, based on the available supply of COVID-19 vaccines. As the vaccine supply increases, the program aims to expand the number of participating pharmacy locations ultimately providing COVID-19 vaccines in all 40,000 retail pharmacy locations nationwide. Allocations to support the Federal Retail Pharmacy Program are separate from weekly allocations provided to jurisdictions. What jurisdictions see in their weekly allocation will remain stable.

Eligibility Criteria for Vaccination

The Federal pharmacy partners will administer vaccine to individuals according to state-selected eligibility criteria. Pharmacy partners have developed screening questionnaires specific to each jurisdiction's criteria and will finalize them based on the survey results to help ensure eligibility prior to vaccination. After launch, immunization program managers will be able to update eligibility criteria weekly using an application in Tiberius, the centralized system used by the federal government to support vaccine distribution efforts. Information about how to use this new Tiberius application will be sent to immunization programs this week.

Program Data and Monitoring

By Friday, CDC will provide a list of the retail locations that will be providing COVID-19 vaccine in each jurisdiction as part of the initial phased implementation of the program.

All pharmacy partners enrolled in the Federal Retail Pharmacy Program are required to report inventory daily to VaccineFinder and patient administration information to the jurisdiction's IIS as well as directly to CDC's Data Clearing House. Jurisdictions will have access to patient administration data submitted by all pharmacies in their jurisdiction. Jurisdictions will also have access to information in Tiberius-specific to pharmacy programs.

Information will include details on stores that will be receiving vaccine, store-level supply information, and administration/uptake information as it becomes available. Jurisdictions will also be provided points of contacts for pharmacy partners to facilitate coordination with partners.

Communications Support

CDC has developed a **toolkit of materials** to help jurisdictions and partners describe and

communicate about the implementation of the Federal Retail Pharmacy Program. We hope these materials will assist in providing clear and consistent information about the program goals and parameters.

The toolkit includes the attached materials for your use and reference:

- Frequently Asked Questions about the Program for Jurisdictions and Pharmacy Partners
- Key communication messages for jurisdictions and pharmacy partners
- A One-Page Fact Sheet on the Federal Retail Pharmacy Program (to share with partners or members of the community)

Upcoming Trainings/Webinars/Jurisdictional Calls

- Below is a link to a series of accredited education about COVID-19 vaccine in general, safety, and administration considerations.
  - Vaccine Courses, Broadcasts, Webcasts and Self Study Training | CDC

COVID-19 Resources

- Vaccine Confidence Consultations from Vaccine Task Force
  - This email serves as an entry point to many vaccine confidence consultation options offered by CDC. Vaccine confidence and communications experts will receive emails from providers and public health professionals and then set up brief calls to understand needs, tailor support, and provide further technical assistance in data collection, creation of communication products and more to promote community vaccine confidence for COVID-19 vaccines. They can be contacted at confidenceconsults@cdc.gov
- ELC Enhancing Detection Expansion FAQ (attached)
  - Developed by the ELC Team, this FAQ answers common questions about Enhancing Detection Expansion funding for jurisdictions. More information can be found on the ELC Website.
- Factsheet: 12 Things Jurisdictions Need to Know about VAERS (attached)
  - A factsheet developed by VTF on how to report adverse events following vaccination to the Vaccine Adverse Events Reporting System (VAERS)
- The COVID State-Profiles Report (aka Governors Report) is now posted publicly at COVID Data Tracker, and will be updated weekly. As a reminder, Community Profile Report has been posted publicly since December, and is updated daily. There is also a public facing version of the Therapeutics Distribution Location Tool.
- COVID-19 Vaccination Communication Toolkits for Community- Based Organizations and Essential Workers
  - COVID-19 vaccines will be available to essential workers and other community members soon. CDC has designed two toolkits to help build confidence in this new vaccine. The toolkits will help community-based organizations (CBOs) and employers to educate community members and workers about COVID-19 vaccines, raise awareness about the benefits of vaccination, and address common questions and concerns.

Sent to State Epidemiologists, Deputy State Epidemiologists, CLUE, Infectious Disease Points of Contact, and the CSTE Executive Board

Good afternoon,

Please see below for a collection of Coronavirus Disease 2019 (COVID-19) information, gathered for your awareness:

New Information

- TODAY: Webinar - ELC Reopening Schools [Link]
  - CDC's Epidemiology and Laboratory Capacity (ELC) Program will host a webinar **TODAY**, Thursday, **April 1** at **4:00 pm EDT** regarding funding to enable and expand school-based screening testing. Attendees can expect a review of the *Reopening Schools* guidance (*attached), subject matter expert perspectives, and a Q&A session. The webinar will be recorded and a link to download will be made available afterwards, in addition to a copy of slides.
  - Call information is below:
    - Weblink: https://www.mymeetings.com/nc/join/
      Conference Number: PWXW2102397
      Direct link: https://www.mymeetings.com/nc/join.php?i=PWXW2102397&p=9125099&t=c
    - Telephone: 1-415-228-4882 or 800-369-2098
      Passcode: 9125099

HHS Press Release: "HHS to Expand Access to COVID-19 Vaccines for Older Adults and People with Disabilities" [Link]

- On **Monday, March 29**, HHS announced a partnership between CDC and the Administration for Community Living (ACL) to provide nearly $100 million in funding to help increase vaccinations among older adults and people with disabilities. From the announcement: *"With funding from CDC, ACL will issue nearly $93 million in grants to the aging and disability networks in every state and territory. These funds will help provide critical services to overcome barriers that are preventing millions of those most at risk for serious illness and death from COVID-19 from receiving vaccines. This partnership also will provide an additional $5 million in funding for national hotlines to assist older adults and people with disabilities in registering for a vaccination and to connect them with local disability and aging agencies that can provide services and supports necessary to access them."*
- The full press release is available on HHS' website here.

- NIOSH Resources: "Safe and Proper Sharps Disposal During the COVID-19 Mass Vaccination Campaign" [Attachments, Link]
  - The National Institute for Occupational Safety and Health (NIOSH) recently released a new suite of communications products aimed at preventing needlesticks at mass vaccination sites, as well as promoting proper sharps disposal. Please see attached for two printouts that can be posted for staff and office use. An accompanying webpage is available on CDC's website here.
- MMWR Early Release: "Provisional Mortality Data — United States, 2020" [Attachment, Link]
  - From the summary: *"The age-adjusted death rate increased by 15.9% in 2020. Overall death rates were highest among non-Hispanic Black persons and non-Hispanic American Indian or Alaska Native persons. COVID-19 was the third leading cause of death, and the COVID-19 death rate was highest among Hispanics."*
- MMWR Early Release: "Death Certificate–Based ICD-10 Diagnosis Codes for COVID-19 Mortality Surveillance — United States, January–December 2020" [Attachment, Link]
  - From the summary: *"Among 378,048 death certificates from 2020 listing COVID-19, 5.5% listed COVID-19 without codes for any other conditions. Among 357,133 death certificates with at least one other condition, 97% had a co-occurring diagnosis of a plausible chain-of-event condition (e.g., pneumonia or respiratory failure), or a significant contributing condition (e.g., hypertension or diabetes), or both."*

Good afternoon,

Please see below for a collection of Coronavirus Disease 2019 (COVID-19) information, gathered for your awareness:

New Information

- CDC COCA Call: Johnson & Johnson/Janssen COVID-19 Vaccine and Cerebral Venous Sinus Thrombosis with Thrombocytopenia – Update for Clinicians on Early Detection and Treatment [Attachment, Link]
    - CDC Clinician Outreach and Community Activity (COCA) will host a webinar **tomorrow**, Thursday, **April 15** at **2:00 pm EDT** to present the latest evidence on cerebral venous sinus thrombosis (CVST) with thrombocytopenia associated with the administration of the Johnson & Johnson/Janssen COVID-19 vaccine. Speakers will discuss what is known about CVST, the importance of early detection, and updated vaccine recommendations. Call information is below:
        - Weblink: https://www.zoomgov.com/j/1614336614?pwd=ZVhQUHoyaG4zVFdua2czcE9EU20wUT09

Sent to State Epidemiologists, Deputy State Epidemiologists, CLUE, Infectious Disease Points of Contact, and the CSTE Executive Board

Good afternoon,

Please see below for a collection of Coronavirus Disease 2019 (COVID-19) information, gathered for your awareness:

New Information

- ELC K-12 Reopening Schools Deliverables [Attachment]
  - Please see attached for a message from CDC's Epidemiology and Laboratory Capacity (ELC) Team. This message aims to clarify two deliverables due **Friday, April 23**:
    1. Validation/correction of the 'School District Weekly Reporting Template', pre-populated with school districts in your jurisdiction.
    2. A brief narrative of how you plan to partner and provide resources to the districts in your jurisdiction.
  - Full instructions are available in the attached PDF. From the message: *"We do not expect that every district in every jurisdiction will be ready to adopt screening testing immediately. During Phase 2/Activity 2, we will ask you to describe your plan for working with the jurisdictions in more specific terms. [...] We will be sharing FAQs in coming days to provide additional clarity; in the meantime, please don't hesitate to reach out to your ELC Project Officer or leadership with any questions or clarifications."*
- CDC ACIP Emergency Meeting [Link]
  - CDC's Advisory Committee on Immunization Practices (ACIP) will hold another virtual

emergency meeting **Friday, April 23** from **11:00 am–5:00 pm EDT** regarding safety in the use of the Johnson & Johnson (Janssen) vaccine.
    - Registration is *not* required. The meeting will be broadcast on uStream here.
- CDC Partner Update Call: Keeping Up with Critical Diabetes Care and Prevention During COVID-19 [Link]
    - CDC will host the next installment of its weekly partner call **Monday, April 26** at **3:00 pm EDT**. Dr. Kyle Bernstein will share updates on CDC's COVID-19 response, including the latest scientific information and what everyone should know about protecting themselves and others. Dr. Beth Bigman will discuss how to maintain critical diabetes care and prevention during the pandemic.
    - Registration is available here. Please email questions in advance to eocevent337@cdc.gov with "Partner Call 4/26" in the subject line. The call will be recorded and posted to CDC's website here.
- MMWR Early Release: "Postvaccination SARS-CoV-2 Infections Among Skilled Nursing Facility Residents and Staff Members — Chicago, Illinois, December 2020–March 2021" [Attachment, Link]
    - From the summary: *"Twenty-two possible breakthrough SARS-CoV-2 infections occurred among fully vaccinated persons ≥14 days after their second dose of COVID-19 vaccine. Two thirds of persons were asymptomatic. A minority of persons with breakthrough infection experienced mild to moderate COVID-19–like symptoms; two COVID-19–related hospitalizations and one death occurred. No facility-associated secondary transmission was identified."*
- MMWR Early Release: "COVID-19 Outbreak Associated with a SARS-CoV-2 R.1 Lineage Variant in a Skilled Nursing Facility After Vaccination Program — Kentucky, March 2021" [Attachment, Link]
    - From the summary: *"In a COVID-19 outbreak at a Kentucky SNF involving a newly introduced variant to the region, unvaccinated residents and health care personnel (HCP) had 3.0 and 4.1 times the risk of infection as did vaccinated residents and HCP. Vaccine was 86.5% protective against symptomatic illness among residents and 87.1% protective among HCP."*

Standing Updates

Sent to State Epidemiologists, Deputy State Epidemiologists, CLUE, Infectious Disease Points of Contact, and the CSTE Executive Board

Good afternoon,

Please see below for a collection of Coronavirus Disease 2019 (COVID-19) information, gathered for your awareness:

New Information

- MMWR Early Release: "Community Transmission of SARS-CoV-2 Associated with a Local Bar Opening Event – Illinois, February 2021" [Attachment, Link]
    - From the summary: *"Forty-six cases of COVID-19 were linked to an indoor bar opening event that occurred during February 2021 in a rural Illinois county. Event patrons were linked to secondary cases among household, long-term care facility, and school contacts, resulting in one hospitalization and one school closure affecting 650 students."*
- Partner Alert: Community of Practice webinar "School-based Screening Testing" [Link]
    - This week's CDC Community of Practice call is on **Thursday**, **April 8** at **2:00 pm ET**. The webinar will focus on the importance of the partnership between public health and education in establishing COVID-19 K-12 screening testing programs and provide information on assistance being offered to support these programs. You may join the call here or dial in using the call-in line below:
        - Zoom Dial-in: 1 646-828-7666
          Meeting ID: 161 148 9877
          Passcode: 66625007
- ELC webinar slides and recording of "Reopening Schools" held Thursday, April 1* [Attachment, Link]

On **Thursday**, **April 1**, ELC hosted a webinar regarding its newest supplemental funding package "ELC Reopening Schools" to review Reopening Schools guidance, subject matter expert perspectives, and a Q&A session. The slides from the webinar are attached, and a link to the recording is available here. ***Please note: the recording is a large file download.**

- COVID-19 Genomic Epidemiology Toolkit Follow Up & Focus Group [Link]
    - Thanks to all who have tried the **COVID-19 Genomic Epidemiology Toolkit**! The Toolkit modules, created by CDC with state and local partners, provide easy-to-use training materials for applying genomic epidemiology to SARS-CoV-2 surveillance and outbreak investigations. Please visit the COVID-19 Genomic Epidemiology Toolkit page as we continue to add new videos and resource links. In an effort to improve the Toolkit, we plan to host a **focus group** to gather feedback. We are looking for volunteers and would appreciate your participation. The focus group will entail an hour-long zoom call with other participants. The only requirements are that you have used the toolkit and are willing to discuss your feedback. To volunteer or to ask any questions, please email GenEpiToolkit@cdc.gov.
- CDC Partner Update Call: "Contact Tracing for COVID-19: Do we still need it? (You bet we do!) Ask an Expert – Q&A with a CDC Expert on Current COVID-19 Guidance" [Link]
    - CDC will host the next installment of its weekly partner call **Monday, April 12** at **3:00 pm ET**. Dr. Kyle Bernstein will share updates on CDC's COVID-19 response, including the latest scientific information and what everyone should know about protecting themselves and others. Then, Dr. Melanie Taylor will discuss contact tracing and why it is still important during the COVID-19 Response.
    - Registration is available here. Please email questions in advance to eocevent337@cdc.gov with "Partner Call 4/12" in the subject line. The call will be recorded and posted to CDC's website here.
- CDC Media Statement: "CDC Issues Next Phase of the Conditional Sail Order for Cruise Ship Operators" [Link]
    - On **Friday**, **April 2**, CDC issued the next phase of technical guidance under the Framework for Conditional Sailing Order (CSO). From the statement: *[this phase requires]* "cruise lines to establish agreements at ports where they intend to operate, implement routine testing of crew, and develop plans incorporating vaccination strategies to reduce the risk of introduction and spread of COVID-19 by crew and passengers. Read the full statement here.

Standing Updates

- Webinar: White House COVID-19 Response Team w/ State & Local Health Officials [Link]
    - The White House COVID-19 Team will host a webinar **TODAY**, Tuesday, **April 6** at **6:00 pm EST**. Advance registration is required. After registering, you will receive a confirmation email with full call info.

Sent to State Epidemiologists, Deputy State Epidemiologists, CLUE, Infectious Disease Points of Contact, and the CSTE Executive Board

Good afternoon,

Please see below for a collection of Coronavirus Disease 2019 (COVID-19) information, gathered for your awareness:

New Information

- CDC Resources on COVID-19 Vaccine Breakthrough Infections [Attachment]
  - Please see below for a message from CDC's COVID-19 Vaccine Breakthrough Case Investigations Team. This information is for internal use only, and is **not for distribution**:

[redacted]

- [redacted]
- Extension: CDC Public Health Worker Mental Health Survey [Link]
    - CDC is conducting a survey intended for people who worked in STLT public health departments in 2020, in an effort to understand and address the mental health impacts and support needs of our crucial public health workforce on the frontlines of the COVID-19 response. All full-time and part-time employees, contractors, fellows and others who work at the health department are eligible to participate, and we encourage you to broadly disseminate the survey to relevant staff.
    - **The survey deadline has been extended to Friday, April 16.** The 10-15 minute anonymous survey is available here.
- Webinar: "COVID-19 Case Surveillance Public Use Data with Geography – Overview of Privacy Protections" [Attachment, Link]
    - CDC will host a webinar **Friday, April 16** at **2:00 pm EDT** to discuss privacy protections for the new COVID-19 Case Surveillance Public Use Data with Geography. Please email questions in advance to eocevent394@cdc.gov with "Question for 4/16 CDC webinar on new public use dataset" in the subject line. Call information is available below:
        - Weblink: https://cdc.zoomgov.com/j/1618567396?pwd=WE9RWitrS09pdk1KSnA5TnhNdEVjQT09
          Meeting ID: 161 856 7396

Sent to State Epidemiologists, Deputy State Epidemiologists, CLUE, Infectious Disease Points of Contact, and the CSTE Executive Board

Good afternoon,

Please see below for a collection of Coronavirus Disease 2019 (COVID-19) information, gathered for your awareness:

New Information

- Early MMWRs - Vol. 70, No. 31 [Attachments, Links]
  - The **August 6** edition of CDC's Morbidity and Mortality Weekly Report (MMWR) includes the following COVID-related articles:
    - Rapid Increase in Circulation of the SARS-CoV-2 B.1.617.2 (Delta) Variant — Mesa County, Colorado, April–June 2021COVID-19 Vaccine Administration, by Race and Ethnicity — North Carolina, December 14, 2020–April 6, 2021
    - Reduced Risk of Reinfection with SARS-CoV-2 After COVID-19 Vaccination — Kentucky, May–June 2021
    - Effectiveness of COVID-19 Vaccines in Preventing Hospitalization Among Adults Aged ≥65 Years — 13 states, COVID-NET, February–April 2021
- New CDC Study: Vaccination Offers Higher Protection than Previous COVID-19 Infection [Link]
  - In response to today's MMWR on post-vaccination COVID-19 infection rates (linked here), CDC issued a media statement, announcing in part: "*In today's MMWR, a study of COVID-19 infections in Kentucky among people who were previously infected with SAR-CoV-2 shows that unvaccinated individuals are more than twice as likely to be reinfected with COVID-19 than those who were fully vaccinated after initially*

contracting the virus. These data further indicate that COVID-19 vaccines offer better protection than natural immunity alone and that vaccines, even after prior infection, help prevent reinfections."

- Read the CDC's full media statement here.

- Updated CDC Guidance for COVID-19 Prevention in K-12 Schools [Links]
  - On **August 5**, CDC updated its Guidance for COVID-19 Prevention in K-12 Schools to align with CDC's existing guidance for fully vaccinated people and assist K-12 schools in opening for in-person instruction and remaining open. Additionally, the Considerations for Case Investigation and Contact Tracing in K-12 Schools and Institutions of Higher Education (IHEs) has been updated to align with new CDC guidance.
  - The full updated Guidance is linked here.
- CDC COCA Call: Therapeutic Options to Prevent Severe COVID-19 in Immunocompromised People [Links]
  - CDC Clinician Outreach and Community Activity (COCA) will host a webinar **Thursday, August 12** at **2:00 pm EDT** to discuss the FDA's role in issuing EUAs for certain monoclonal antibodies, options for compassionate use, the process for ordering and distributing monoclonal antibodies, and current data on using monoclonal antibodies for both non-hospitalized and immunocompromised patients. Presenters will also cover preventing, diagnosing, and treating COVID-19 in immunocompromised patients, including the role of monoclonal antibodies, serologic testing, and potential third dose of COVID-19 vaccinations.
    - Weblink: https://www.zoomgov.com/j/1612254638?pwd=SmNaNlJEUWt3YWdBMGtNRjhxRlZ1UT09
      Telephone: (646) 828-7666 or (669) 216-1590 or (551) 285-1373
      Webinar ID: 161 225 4638
      Passcode: 980771
      Access materials post-call:
      https://emergency.cdc.gov/coca/calls/2021/callinfo_081221.asp
- ELC & DOJ Webinar: Detection & Mitigation of COVID-19 in Confinement Facilities [Attachments, Link]
  - On **August 5**, CDC's Epidemiology and Laboratory Capacity for Infectious Diseases (ELC) and the Department of Justice (DOJ) hosted a webinar, "Detection & Mitigation of COVID-19 in Confinement Facilities."
  - In case you missed it, you may watch/download the full webinar here. Also attached are a transcript and summary of the Q&A portion of the webinar.
- Updated ELC Enhancing Detection Performance Measures Guidance [Attachment]
  - Today, **August 6**, CDC released an updated ELC Enhancing Detection Performance Measures Guidance document (attached) for this new budget year that started August 1, 2021.
  - This guidance provides details for all ELC Enhancing Detection performance measures including all data elements, reporting frequency, and reporting timelines.
- Updated CDC Public Health Science Priority Questions [Link]
  - The CDC's *Public Health Science Agenda* for COVID-19 articulates key areas of scientific inquiry and opportunities to guide the development of actionable, evidence-based public health guidance to limit the spread and impact of SARS-CoV-2 and ultimately end

the COVID-19 pandemic. As the evidence base and public health response to the COVID-19 pandemic continues to evolve, this Public Health Science Agenda has helped promote efforts to fill critical, time-sensitive scientific gaps and to inform evidence-based decision making.

- On **August 4**, a second update to the Priority Public Health Science Questions was released (linked here) to help achieve the objectives outlined in the Public Health Science Agenda for COVID-19. The newest update includes 15 Priority Public Health Science Questions that were systematically developed to be relevant, actionable near-term, and reflective of the evolving needs of the ongoing public health response.

Standing Updates

Sent to State Epidemiologists, Deputy State Epidemiologists, CLUE, Infectious Disease Points of Contact, and the CSTE Executive Board

Good afternoon,

Please see below for a collection of Coronavirus Disease 2019 (COVID-19) information, gathered for your awareness:

New Information

- MMWR – Vol. 70, No. 51-52 [Links, Attachment]
  - The **December 31** edition of CDC's Morbidity and Mortality Weekly Report (MMWR) includes the following COVID-related articles:
    - COVID-19 Vaccine Safety in Children Aged 5–11 Years — United States, November 3–December 19, 2021
    - Interim Estimate of Vaccine Effectiveness of BNT162b2 (Pfizer-BioNTech) Vaccine in Preventing SARS-CoV-2 Infection Among Adolescents Aged 12–17 Years — Arizona, July–December 2021
    - Characteristics and Clinical Outcomes of Children and Adolescents Aged <18 Years Hospitalized with COVID-19 — Six Hospitals, United States, July–August 2021
    - Evaluation of a Test-To-Stay Strategy in Transitional Kindergarten Through Grade 12 Schools — Los Angeles County, California, August 16–October 31, 2021
    - Evaluation of Test-To-Stay Strategy on Secondary and Tertiary Transmission of SARS-CoV-2 in K–12 Schools — Lake County, Illinois, August 9–October 29, 2021
    - Investigation of a SARS-CoV-2 B.1.1.529 (Omicron) Variant Cluster — Nebraska, November–December 2021
- HHS Update: Allocation of bam/ete and REGEN-COV therapeutics [Link, Attachment]
  - Yesterday, **December 29**, the U.S. Department of Health and Human Services (HHS) announced a pause in allocations of bamlanivimab/etesevimab and REGEN-COV COVID-

19 therapeutics to states or territories within regions of the country that have greater than 80% prevalence of the Omicron variant based on CDC NOWCAST data. The purpose of this pause is to ensure effective product is available in most sites.
    - Please see attached for the full update. You may email COVID19Therapeutics@HHS.gov with questions regarding the allocation of bam/ete and REGEN-COV.
- Reminder: CDC All-STLT Update Call Series – Register for 2022 Calls Before 1/3/22 [Link]
    - On **January 3, 2022**, CDC's weekly COVID-19 All-STLT Update call will be moving to a new Zoom link. Before that date, please register here to ensure your access to the 2022 call series. Please note that your unique participant link will be the same for all calls in the series through December 2022; you do not need to register for each individual call. Calls will be held on Mondays from 2:00–2:45 pm ET (unless otherwise notified).
    - Call registrants will also be added to CDC's partner update distribution list. Partner update emails are disseminated every Monday, Wednesday, and Friday afternoon, and are the same updates included below in our "Standing Updates" section.
- Lights, Camera, Action: The Future of Public Health Summit Series – Summit #2 [Link]
    - The CDC Foundation and other public health agencies are hosting a four-part virtual summit to advance recommendations for a modernized U.S. public health system. Registration is now open for the second summit, *Creating an Interoperable and Modern Data and Technology Infrastructure,* occurring on **January 25, 2022 at 11:00 am EST**. Speakers will include CDC's Deputy Director for Public Health Science and Surveillance, Dr. Daniel Jernigan, HHS's National Coordinator for Health Information Technology, Dr. Micky Tripathi and other prominent leaders in the field. Learn more and register for the Summit here.

Standing Updates

Good afternoon,

Please see below for a collection of Coronavirus Disease 2019 (COVID-19) information, gathered for your awareness:

New Information

- CDC Partner Alert: N95 Effectiveness as Source Control [Attachments]
  - Today, **Tuesday, January 11**, CDC issued a partner update (attached) in response to numerous questions about N95 mask effectiveness as source control. The update shared two peer reviewed publications from National Institute for Occupational Safety and Health (NIOSH) researchers (both attached) on N95 mask effectiveness, including findings that a N95 respirator was 99% effective at blocking cough aerosols.
- HHS Update: COVID-19 Allocation Projections for January [Attachments]
  - On **Friday, January 7**, the U.S. Department of Health and Human Services (HHS) issued an update with a projected calendar of allocation amounts and cadence of COVID-19 therapeutics for the remainder of January (attached). Questions may be directed to us COVID19Therapetuics@hhs.gov.
- Partner Alert: CDC Expands Booster Shot Eligibility [Attachment, Link]
  - On **Saturday, January 6**, CDC issued a partner alert (attached) adjusting its recommendation for when people can receive a booster shot, shortening the interval from 6 months to 5 months. CDC has extended this recommendation to recipients of a Moderna primary series. This means that people 12 years of age and older who initially received an mRNA vaccine series – two doses of Moderna or Pfizer-BioNTech – can now receive an mRNA booster shot 5 months after completing their initial series.

- CDC COCA Call: What Clinicians Need to Know About the New Oral Antiviral Medications for COVID-19 [Links]
    - CDC Clinician Outreach and Community Activity (COCA) will host a webinar **tomorrow, Wednesday, January 12 at 2:00 pm EST** to discuss the recent emergency use authorizations (EUAs) for new oral antiviral medications intended to decrease hospitalizations, as well as prevent severe COVID-19 and death Call information is below:
        - Weblink: https://www.zoomgov.com/j/1612974214?pwd=VitYMEorako1YWhCaXpnaWdsc2Ixdz09

Sent to State Epidemiologists, Deputy State Epidemiologists, CLUE, Infectious Disease Points of Contact, and the CSTE Executive Board

Good afternoon,

Please see below for a collection of recent Coronavirus Disease 2019 (COVID-19) information, gathered for your awareness:

- White House National Strategy for the COVID-19 Response and Pandemic Preparedness and Executive Order on a Data-Driven Response [Attachment, Link]
  - Yesterday, the White House released its National Strategy for the COVID-19 Response and Pandemic Preparedness, providing a roadmap to guide America out of the worst public health crisis in a century. An executive summary of the new National Strategy is attached, while the complete plan is linked above. A fact sheet summarizing the new National Strategy to quickly contain the COVID-19 crisis has also been released. [Link]
  - The White House also issued an executive order yesterday to ensure a "Data-Driven Response to COVID-19 and Future High-Consequence Public Health Threats." [Link]
  - White House activities – Thursday, January 21, 2021 [Link] and Friday, January 22, 2021 [Link]
- MMWR Early Release: "Allergic Reactions Including Anaphylaxis After Receipt of the First Dose of Moderna COVID-19 Vaccine — United States, December 21, 2020–January 10, 2021" [Attachment, Link]
  - From the summary: *"During December 21, 2020–January 10, 2021, monitoring by the Vaccine Adverse Event Reporting System detected 10 cases of anaphylaxis after administration of a reported 4,041,396 first doses of Moderna COVID-19 vaccine (2.5 cases per million doses administered). In nine cases, onset occurred within 15 minutes of vaccination. No anaphylaxis-related deaths were reported."*
- Reminder: CSTE Webinar: COVID-19 during Pregnancy [Link]

- CSTE will host its next COVID-19 Response Membership Webinar, "COVID-19 during Pregnancy," **Friday, January 29, 2021** at **3:00 pm EST**. CDC will present the current evidence on COVID-19 in pregnant women and their babies and provide an overview of current surveillance efforts, including successes and challenges. Massachusetts will provide a state perspective on efforts to improve identification of SARS-CoV-2 infection during pregnancy through data linkages to existing data sources.
- Call capacity is limited to 1,000 participants, and is first-come, first-served. Call information is below:
  - Weblink: https://webinar.ringcentral.com/j/1487195918
  - Telephone: (470) 860-2200 *[East]* | (773) 231-9226 *[North]* | (469) 445-0100 *[South]* | (623) 404-9000 *[West]* | (720) 902-7700 *[Central]*
  - Meeting ID: 148 719 5918
  - One-Tap Mobile: *+1(470)8692200,,1487195918# [East] |+1(773)2319226,,1487195918# [North] | +1(469)4450100,,1487195918# [US South] | +1(623)4049000,,1487195918# [US West] | +1(720)9027700,,1487195918# [US Central]*

- Reminder: CDC Partner Update Call: Engaging Faith Leaders to Advance Effective COVID-19 Response: Lessons Learned through Global-Domestic Collaborations [Link]
  - CDC will host a webinar **Monday, January 25, 2021** at **3:00 pm EST**. During the call, Dr. Cliff McDonald will share updates on CDC's COVID-19 response, including the latest scientific information and what everyone should know about protecting themselves and others. Dr. Jay Butler will give a brief status report on the pandemic and an overview of prevention with a specific emphasis on opportunities for faith-based organizations. Dr. Susan Hillis will describe successes from other countries through shared collaborative leadership between faith and government partners. Ms. Lauren Erickson-Mamane will also discuss COVID-19 resources developed for Global Faith Leaders by the International Task Force.
  - Registration is available here. Please email questions in advance to eocevent337@cdc.gov with "Partner Call 1/25" in the subject line. The call will be recorded and posted to CDC's website here.
- Reminder: COCA Call: Treating Long COVID: Clinician Experience with Post-Acute COVID-19 Care [Attachment]
  - CDC Clinician Outreach and Community Activity (COCA) will host a webinar **Thursday, January 28, 2021** at **2:00 pm EST**. During this call, presenters will share their firsthand experiences with treating long COVID, focusing on the pulmonary, neurologic, and psychological aspects. They will also describe their experiences with establishing clinics that provide care for patients with these long-term effects.

      Telephone: (669) 254 5252 or (646) 828 7666
      Webinar ID: 160 680 8037
      Passcode: 594536

Post-Event Recording:
https://emergency.cdc.gov/coca/calls/2021/callinfo_012821.asp

- CDC Media Statement: "Media Statement from CDC Director Rochelle P. Walensky, MD, MPH, on Extending the Eviction Moratorium" [Link]
  - From the statement: *"As a protective public health measure, I will extend the current order temporarily halting residential evictions until at least March 31, 2021. The COVID-19 pandemic has presented a historic threat to our nation's health. It has also triggered a housing affordability crisis that disproportionately affects some communities."*
- MMWR Release: "COVID-19 Case Investigation and Contact Tracing Efforts from Health Departments — United States, June 25–July 24, 2020" [Attachment, Link]
  - From the summary: *"An analysis of 56 health departments found wide variation in capacity and capability to conduct timely and effective case investigation and contact tracing. The study found that case interviews were less timely and fewer contacts were identified when caseloads were higher, implying that high numbers of cases compromised the prompt and complete identification of contacts."*

Good afternoon,

Please see below for a collection of Coronavirus Disease 2019 (COVID-19) information, gathered for your awareness:

New Information

- Department of Education Resources for Reopening Schools [Attachment]
    - Please see attached for information regarding:
        - The Department of Education's virtual National Safe School Reopening Summit occurring **tomorrow**, Wednesday, **March 24** (registration is available here)
        - Details on a "Safer Schools and Campuses Best Practices Clearinghouse," which includes a "Lessons from the Field" webinar series that will begin **Wednesday, March 31** (information is available here)
        - The upcoming release of Volume 2 of the K-12 COVID-19 Handbook for districts, schools, and educators
- CDC Lab Update: CMS Posts FAQ for Reporting Sequencing Results for SARS-CoV-2 Variants [Attachment, Link]
    - Please see the following message from CDC's Laboratory Outreach Communication System (LOCS):
        - *On March 19, 2021, the U.S. Centers for Medicare & Medicaid Services (CMS) posted the "CLIA SARS-CoV-2 Variant Testing Frequently Asked Question" document to provide information for facilities that perform sequencing to identify SARS- CoV-2 genetic variants. CMS will not cite CLIA-certified laboratories that perform SARS-CoV-2 genetic variant testing on identified specimens and report*

patient-specific variant results to state or local public health departments without establishing performance specifications as required by §493.1253(b)(2), provided that the laboratory only reports patient-specific results to a public health department and the results are not intended to be used for purposes of an individual's diagnosis, prevention, treatment, or health assessment. If at any time the SARS-CoV-2 genetic variant result is intended to be used for purposes of an individual's diagnosis, prevention, treatment, or health assessment, the test must be performed in a CLIA-certified laboratory and in compliance with all applicable CLIA regulations."

- The FAQ document is available on CMS' website here.

- CSTE Webinar: "Unpacking the COVID-19 Genomic Epidemiology Toolkit" [Link]
  - The next installment of CSTE's membership webinar series will take place **Thursday, March 25** at **3:00 pm EDT**. The webinar, co-hosted by CSTE and CDC's Office of Advanced Molecular Detection (AMD), will cover the recently released COVID-19 Genomic Epidemiology Toolkit. This toolkit is designed to help epidemiologists use genomic data to track and investigate SARS-CoV-2 in their jurisdictions, and consists of brief, modular video presentations with audio transcripts. During the webinar, featured presenters will showcase toolkit features and answer questions.
  - Call capacity is limited to 1,000 participants, and is first-come, first-served. Call information is below:
    - Weblink: https://webinar.ringcentral.com/j/1466093845
      Telephone: (470) 860-2200 *[East]* | (773) 231-9226 *[North]* | (469) 445-0100 *[South]* | (623) 404-9000 *[West]* | (720) 902-7700 *[Central]*
      Meeting ID: 146 609 3845
      One-Tap Mobile: +1(470)8692200,,1466093845# *[East]* |
      +1(773)2319226,,1466093845# *[North]* |
      +1(469)4450100,,1466093845# *[South]* |

      +1(720)9027700,,1466093845# *[Central]*

- CDC Call to Action: "Help Kids' Safe Return to School - Get Caught Up on Recommended Vaccines" [Attachment]
  - Please see below for a message from CDC's COVID-19 Vaccine Task Force Partnership Team:
    - *"COVID-19 disrupted both in-person learning and routine well-child visits for many children over the last year. As a result, too many children have fallen behind on receiving recommended vaccines. We all want our kids to be back in school safely, and that means getting caught up on vaccines that were missed over the last year. Please find attached a Call to Action, which outlines efforts needed to get children caught up on vaccinations. This letter will be posted on the CDC website soon and we will be hosting a partner webinar in the near future to discuss this important topic. Thank you for your continued partnership and attention to this critical issue."*
  - The referenced Call to Action is attached to this email.

- CDC Priority Science Questions [Attachment, Link]
  - Please see attached for a message from CDC's State, Tribal, Local and Territorial

Support Task Force, regarding the release of a new set of *Priority Science Questions* intended to guide prioritization of CDC's scientific research portfolio related to COVID-19, including articles published in *MMWR* and other scientific journals. These questions are in response to the objectives in CDC's *Science Agenda for COVID-19*.
    - The new set of Priority Science Questions is now available on CDC's website here.

Standing Updates

- CDC Partner Update Call: "Understanding the Role of Telehealth Usage During the COVID-19 Pandemic" [Link]
    - CDC will host the next installment of its weekly partner call **Monday, March 29** at **3:00 pm EDT**. Dr. Cynthia Ogden will share updates on CDC's COVID-19 response, including the latest scientific information and what everyone should know about protecting themselves and others. Drs Hanna B Demeke, Paramjit Sandhu, and Antoni Neri will discuss highlights on the usage of telehealth systems during the COVID-19 Response.
    - Registration is available here. Please email questions in advance to eocevent337@cdc.gov with "Partner Call 3/29" in the subject line. The call will be recorded and posted to CDC's website here.
- CDC Partner Update – March 22 [Attachment]
    - Please see attached for the latest updates from CDC's State, Tribal, Local, and Territorial (STLT) Task Force.
- HHS COVID-19 Update – March 22 [Attachment]
    - Please see attached for the latest COVID-19 updates from the HHS Office of Intergovernmental and External Affairs. Updates typically include highlights from any recent COVID-19 Response Team briefings, as well as vaccine, testing, treatment and research updates, toolkits, and resources.
- Press Briefings: White House COVID-19 Response Team and Public Health Officials [Link]
    - The White House COVID-19 Response Team holds regular press briefings during the week, typically on **Mondays, Wednesdays,** and **Fridays** at **11:00 am EDT**. *Please note:* Briefings sometimes begin after 11:00 am. Visit www.whitehouse.gov/live for the latest schedule and broadcast links. All COVID briefings are publicly available on the White House YouTube channel; past briefings may appear in this playlist link.
- CSTE COVID-19 Response Resource Repository [Link]
    - The CSTE COVID-19 Response Resource Repository and related discussion forums are available via Basecamp to encourage jurisdictional sharing of information, resources, best practices, and challenges. To sign-up and access the Basecamp, please visit this link.
- Request Form for CSTE COVID-19 Call Topics [Link]
    - CSTE encourages members to suggest topics for future COVID-19 response-related calls with CSTE members, CDC, and/or partner organizations. To submit a request, please visit this link.

[PureMessage: Suspect .eml attachment quarantined.]

Sent to State Epidemiologists, Deputy State Epidemiologists, CLUE, Infectious Disease Points of Contact, and the CSTE Executive Board

Good afternoon,

Please see below for a collection of recent Coronavirus Disease 2019 (COVID-19) information, gathered for your awareness:

- CDC Travel Planner Public Launch [Attachment]
  - Please see attached for a letter from CDC's Global Migration Task Force announcing the public-facing launch of **CDC Travel Planner**. This web portal serves as a centralized communication platform for COVID-19 travel restrictions and policies enacted by STLT governments. If you have not done so already, add your jurisdiction's information using the instructions listed in the attached letter. You can also promote the Travel Planner using marketing materials linked within.
- CDC Recommendations: "Prioritizing Case Investigations and Contact Tracing for COVID-19 in High Burden Jurisdictions" [Link]
  - Today, CDC released new recommendations for prioritizing case investigations and contact tracing to assist health departments experiencing escalating COVID-19 cases. These new recommendations further refine existing prioritization recommendations and presents new modeling data regarding timeframes to maximize the effectiveness of contact tracing activities.

CDC Guidance: "Considerations for Restaurant and Bar Operators" [Link]

- Released Wednesday, November 18

- White House National State, Local, Tribal COVID-19 Briefing Call [Link]
  - The White House Office of Intergovernmental Affairs (IGA) will host its next weekly briefing call for STLT leaders **Wednesday, December 2** at **1:00 pm EST**. RSVPs will be allocated in the order they are received. To register, click here.
- CDC COCA Call: The Impact of Telehealth on Health Equity from the Perspective of Large Healthcare Systems during the COVID-19 Pandemic [Attachment]
  - CDC Clinician Outreach and Community Activity (COCA) will host a webinar **Tuesday, December 8** at **2:00 pm EST** to discuss how telehealth has affected health equity in their patient populations before and during the COVID-19 pandemic. Presenters from Kaiser Permanente and the Veteran's Health Administration will share strategies to expand access that can reduce disparities and improve culturally responsive care to help achieve health equity within each organization. Call information is below:
    - Weblink: https://www.zoomgov.com/j/1600369650
      Telephone: (669) 254 5252 or (646) 828 7666
      Webinar ID: 160 036 9650
      Post-Event
      Recording: https://emergency.cdc.gov/coca/calls/2020/callinfo_120820.asp
- MMWR Early Release: "The Advisory Committee on Immunization Practices' Ethical Principles for Allocating Initial Supplies of COVID-19 Vaccine — United States, 2020" [Attachment, Link]
  - From the summary: *"In addition to scientific data and implementation feasibility, four ethical principles will assist ACIP in formulating recommendations for the initial allocation of COVID-19 vaccine: 1) maximizing benefits and minimizing harms; 2) promoting justice; 3) mitigating health inequities; and 4) promoting transparency."*
- MMWR Early Release: "COVID-19 Outbreak Associated with a 10-Day Motorcycle Rally in a Neighboring State — Minnesota, August–September 2020" [Attachment, Link]
  - From the summary: *"Following a 10-day motorcycle rally in South Dakota attended by approximately 460,000 persons, 51 confirmed primary event-associated cases, 21 secondary cases, and five tertiary cases were identified in Minnesota residents. An additional nine likely rally-associated secondary or tertiary cases occurred. Four patients were hospitalized, and one died. Genomic sequencing supported the associations with the motorcycle rally."*
- MMWR Early Release: "Trends in County-Level COVID-19 Incidence in Counties With and Without a Mask Mandate — Kansas, June 1–August 23, 2020" [Attachment, Link]
  - From the summary: *"The governor of Kansas issued an executive order requiring wearing masks in public spaces, effective July 3, 2020, which was subject to county authority to opt out. After July 3, COVID-19 incidence decreased in 24 counties with mask mandates but continued to increase in 81 counties without mask mandates."*
- Reminder: CDC Partner Update Call: Resilience and Mental Health for the Holidays [Link]
  - CDC will host a webinar **Monday, November 30** at **3:00 pm EST** focusing on the

upcoming holiday season. Dr. Cliff McDonald will share updates on CDC's COVID-19 response, including the latest scientific information and what everyone should know about protecting themselves and others. Additionally, Dr. Kathleen Ethier will discuss strategies for building resilience and mental health during the COVID-19 pandemic and the holiday season.
    - Registration is available here. Please email questions in advance to eocevent337@cdc.gov with "Partner Call 11/30" in the subject line. The call will be recorded and posted to CDC's website here.
- CDC Response Website Updates [Attachment]
    - for November 13–20
- CDC COVID-19 Science Update [Attachment, Link]
    - Published November 17
- Reminder: Request Form for CSTE COVID-19 Call Topics [Link]

Good afternoon,

Please see below for a collection of recent Coronavirus Disease 2019 (COVID-19) information, gathered for your awareness:

- CDC Lab Alert: FDA Issues Safety Letter about Potential for False Positive Results with Antigen Tests for Rapid Detection of SARS-CoV-2 [Attachment, Link]
  - Please see the following message from CDC's Laboratory Outreach Communication System (LOCS):
    "On November 3, 2020, the U.S. Food and Drug Administration (FDA) issued a Letter to Clinical Laboratory Staff and Health Care Providers to alert clinical laboratory staff and health care providers that false positive results can occur with antigen tests, including when users do not follow the instructions for use of antigen tests for the rapid detection of SARS-CoV-2. This letter includes important information about potential false positive results with antigen tests for rapid detection of SARS-CoV-2:
    - *Details on false positive results with antigen tests*
    - *Recommendations for health care providers and clinical laboratory staff*
    - *Actions FDA is taking*
    - *Instructions for reporting problems with a device*

    For questions about this letter, email COVID19DX@fda.hhs.gov."
- CDC Lab Advisory: CDC Updates Specimen Collection Guidelines for COVID-19 [Attachment, Link]
  - Please see the following message from CDC's Laboratory Outreach Communication

System (LOCS):
"On November 3, 2020, CDC updated the Interim Guidelines for Collecting, Handling, and Testing Clinical Specimens for COVID-19 web page. The updated guidelines provide more detailed recommendations for several methods of collecting specimens for SARS-CoV-2 testing:

- *Nasopharyngeal swabs*
- *Nasal mid-turbinate swabs*
- *Anterior nares specimen collection*
- *Saliva*

- MMWR Early Release: "Declines in SARS-CoV-2 Transmission, Hospitalizations, and Mortality After Implementation of Mitigation Measures— Delaware, March–June 2020" [Attachment, Link]
  - From the summary: *"State-mandated stay-at-home orders and public mask mandates coupled with case investigations with contact tracing contributed to an 82% reduction in COVID-19 incidence, 88% reduction in hospitalizations, and 100% reduction in mortality in Delaware during late April–June."*
- CDC Response Website Updates [Attachment]
  - for October 31–November 6
- CDC COVID-19 Science Update (November 3) [Attachment, Link]
  - The *COVID-19 Science Update* is a publication series from CDC that provides brief summaries of new COVID-19-related studies, intended for use by public health professionals responding to this pandemic. Summaries are released every Tuesday and Friday. All previous COVID-19 Science Updates are available on CDC's website here.
- Reminder: Request for CSTE COVID-19 Call Topics [Link]
  - To ensure timely and relevant information is provided to our members, CSTE has developed a topic submission form, available here. Please submit suggestions for topics (or speakers) to be discussed on future COVID-19 response-related calls with CSTE members, CDC, and/or partner organizations.

Sent to State Epidemiologists, Deputy State Epidemiologists, CLUE, Infectious Disease Points of Contact, and the CSTE Executive Board

Good afternoon,

Please see below for a collection of Coronavirus Disease 2019 (COVID-19) information, gathered for your awareness:

New Information

- CDC Lab Alert: Ellume Issues Voluntary Recall of Specific Lots of Ellume COVID-19 Home Tests [Attachment, Links]
    - Please see the following message from CDC's Laboratory Outreach Communication System (LOCS):
      *"On **October 1**, the digital diagnostics company Ellume announced a voluntary recall on specific lots of the Ellume COVID-19 Home Test, the company's rapid, self-administered COVID-19 antigen test, because there is an increased chance that tests from the affected lot numbers may give a false positive result. Ellume advises consumers to visit their website to check whether their product is part of the affected lots and, if affected, to receive further instructions."*
- MMWR Early Release: "National and State Trends in Anxiety and Depression Severity Scores Among Adults During the COVID-19 Pandemic — United States, 2020–2021" [Attachment, Link]
    - From the summary: *"Nationwide, average anxiety severity scores increased 13% from August to December 2020 and then decreased 26.8% from December 2020 to June 2021. Similar increases and decreases occurred in depression severity scores."*
- FDA Authorizes Additional OTC Home Test to Increase Access to Rapid Testing for Consumers [Attachment, Link]

On **October 4**, the U.S. Food and Drug Administration (FDA) issued an emergency use authorization (EUA) for the ACON Laboratories Flowflex COVID-19 Home Test, an over-the-counter (OTC) COVID-19 antigen test, which adds to the growing list of tests that can be used at home without a prescription. This action (linked here and attached) should significantly increase the availability of rapid, at-home tests and is expected to double rapid at-home testing capacity in the U.S. over the next several weeks. By years end, the manufacturer plans to produce more than 100 million tests per month, and this number will rise to 200 million per month by February 2022.

- CDC MasK-12 Project [Attachment]
    - CDC is partnering with schools and districts in states throughout the U.S. this fall to evaluate mask adherence in K-12 schools. CDC will train school-identified observers to collect data on mask adherence across participating schools. Observers may include high school students who are interested in science or public health, and the project offers a great opportunity for real-world public health experience. Schools can also use staff or volunteers to conduct observations.
    - Results from this investigation will be used to inform decision-making around masking in K-12 school settings, report findings to evaluate messaging and education around mask use, and to identify locations on school campuses where mask adherence can be improved. Enrollment for the MasK-12 project will occur in early October. If you are interested in participating or would like to learn more, email eocevent335@cdc.gov.

Standing Updates

- CDC Partner Update – October 4 [Attachment]
    - Please see attached for the latest updates from CDC's State, Tribal, Local, and Territorial (STLT) Task Force.
- HHS COVID-19 Update – October 4 [Attachment]
    - Please see attached for the latest COVID-19 updates from the HHS Office of Intergovernmental and External Affairs. Updates typically include highlights from any recent COVID-19 Response Team briefings, as well as vaccine, testing, treatment and research updates, toolkits, and resources.
- Press Briefings: White House COVID-19 Response Team and Public Health Officials [Link]
    - The White House COVID-19 Response Team holds regular press briefings during the week, typically on **Mondays, Wednesdays,** and **Fridays** at **11:00 am EDT**. *Please note:* Briefings sometimes begin after 11:00 am. Good afternoon,

Please see below for a collection of recent Coronavirus Disease 2019 (COVID-19) information, gathered for your awareness:

- Webinars: Abbott BinaxNOW Training [Links]
  - This week, Abbott Laboratories will hold two educational webinars in support of their BinaxNOW COVID-19 tests. These webinars are designed to reinforce the Training Toolkit and highlight key points that should be kept in mind during BinaxNOW COVID-19 and NAVICA implementation. To register for either training, please use the links below:
    - **Wednesday, October 7** at **4:00 pm EDT**: [Link]
    - **Friday, October 9** at **4:00 pm EDT**: [Link]
  - For additional training videos and documents, visit Abbott's website here.
- MMWR Early Release: "Trends in COVID-19 Incidence After Implementation of Mitigation Measures — Arizona, January 22–August 7, 2020" [Attachment, Link]
  - From the summary: *"The number of COVID-19 cases in Arizona stabilized and then decreased after sustained implementation and enforcement of statewide and locally enhanced mitigation measures, beginning approximately 2 weeks after implementation and enforcement of mask mandates and enhanced sanitations practices began on June 17; further decreases were observed during July 13–August 7, after statewide limitations and closures of certain services and businesses."*
- CDC Partner Update Call: Campus Guidebook – Slowing the Spread at US Colleges and Universities [Link]
  - CDC will host a webinar **Monday, October 19** at **3:00 pm EDT**, focusing on COVID-19 at colleges and universities. Dr. Cliff McDonald will share updates on CDC's COVID-19 response, including the latest scientific information available. Additionally, Drs. Greta

Massetti and Lisa Barrios will review CDC COVID-19 guidance for institutes of higher education.
    - Registration is available here. Please email questions in advance to eocevent337@cdc.gov with "Partner Call 10/19" in the subject line. The call will be recorded and posted to CDC's website here.
- Reminder: Request for CSTE COVID-19 Call Topics [Link]
    - To ensure timely and relevant information is provided to our members, CSTE has developed a topic submission form, available here. Please submit suggestions for topics (or speakers) to be discussed on future COVID-19 response-related calls with CSTE members, CDC, and/or partner organizations.

Thank you for joining this week's CSTE COVID-19 Response Ad Hoc Weekly All State Epi Call. The following call materials have been gathered for your awareness:

- Slides: "Science Agenda Development and Update" [Attachment]
  - Presented by Dr. Chris Braden, CDC
- Resources: Effectiveness of Community Mask Use [Links, Attachments]
  - In response to a request for additional scientific evidence regarding effectiveness of community mask use to support local mandates, please find the attached articles shared with us by Dr. McDonald and Dr. John Brooks. Dr. Brooks also recommended the October 3–9 Weekly Science Review from *Resolve to Save Lives*, available here.
  - Additionally, Dr. McDonald recommended the new *CDC COVID-19 Science Update* publication series, available on CDC's website here. Three of these updates feature either summaries or informative briefs on articles related to masks, and are attached to this email for your convenience.
- Announcement 1: NIOSH Funding Opportunity Announcement for State Occupational Safety and Health Surveillance Programs [Links]
  - The National Institute for Occupational Safety and Health (NIOSH) recently published the funding announcement for the State Occupational Safety and Health Surveillance Program. NIOSH intends to commit $40 million in total costs (direct and indirect) over a five-year period to fund about 30 applications. The letter of intent deadline is **October 30**, and the deadline to apply for this cooperative agreement is **December 16**. Full funding details can be found at grants.gov; for more information, please contact NIOSH Scientific Program Official, CAPT Linda West, at lkw0@cdc.gov.
    - You can find more information about the State Occupational Safety and Health Surveillance Program on NIOSH's website here. For more information on the

grant process, visit the NIOSH Extramural Research and Training Programs website here.

- Announcement 2: NHSN Webinars - "Reporting Results of Point of Care Testing for COVID-19 – A New NHSN Pathway" [Links]
  - CDC's National Healthcare Safety Network (NHSN) team will host two webinars this week to train attendees on its new Long Term Care Facility COVID-19 Pathway laboratory data reporting option. This option will enable nursing homes to enter point of care (POC) SARS-CoV-2 laboratory test data into the NHSN application. NHSN, in turn, will report the nursing home POC laboratory test data electronically to the public health agency—state or local—that has jurisdictional authority and responsibility to receive and use the nursing home's data. Webinar information is below:
    - **Thursday, October 22** at **11:00 am EDT**

Subscribe to the new *MMWR* podcast series
The *MMWR* Weekly COVID-19 Briefing is a weekly podcast to update readers on the latest scientific information from CDC's COVID-19 response. In each episode, *MMWR* Editor-in-Chief Dr. Charlotte Kent provides an overview of the latest scientific information published in *MMWR*. New episodes are posted every Monday. Subscribe on Apple Podcasts, Stitcher, Spotify, and Google Play.

This week, MMWR published a series of reports describing the role that young adults have played in the spread of COVID-19. This issue also looked at COVID-19 among school-aged children and CDC deployments to work with health agencies in state, tribal, local, and territorial areas.

Updates on the Federal Retail Pharmacy Program for COVID-19 Vaccination

The initial phased implementation of the program will begin with select retail pharmacies administering COVID-19 vaccine across the country as early as Thursday, February 11. The program will be implemented incrementally, based on the available supply of COVID-19 vaccines. As the vaccine supply increases, the program aims to expand the number of participating pharmacy locations ultimately providing COVID-19 vaccines in all 40,000 retail pharmacy locations nationwide. Allocations to support the Federal Retail Pharmacy Program are separate from weekly allocations provided to jurisdictions. What jurisdictions see in their weekly allocation will remain stable.

Eligibility Criteria for Vaccination

The Federal pharmacy partners will administer vaccine to individuals according to state-selected eligibility criteria. Pharmacy partners have developed screening questionnaires specific to each jurisdiction's criteria and will finalize them based on the survey results to help ensure eligibility prior to vaccination. After launch, immunization program managers will be able to update eligibility criteria weekly using an application in Tiberius, the centralized system used by the federal government to support vaccine distribution efforts. Information about how to use this new Tiberius application will be sent to immunization programs this week.

Program Data and Monitoring

By Friday, CDC will provide a list of the retail locations that will be providing COVID-19 vaccine in each jurisdiction as part of the initial phased implementation of the program.

All pharmacy partners enrolled in the Federal Retail Pharmacy Program are required to report inventory daily to VaccineFinder and patient administration information to the jurisdiction's IIS as

well as directly to CDC's Data Clearing House. Jurisdictions will have access to patient administration data submitted by all pharmacies in their jurisdiction. Jurisdictions will also have access to information in Tiberius-specific to pharmacy programs.

Information will include details on stores that will be receiving vaccine, store-level supply information, and administration/uptake information as it becomes available. Jurisdictions will also be provided points of contacts for pharmacy partners to facilitate coordination with partners.

Communications Support

CDC has developed a **toolkit of materials** to help jurisdictions and partners describe and communicate about the implementation of the Federal Retail Pharmacy Program. We hope these materials will assist in providing clear and consistent information about the program goals and parameters.

The toolkit includes the attached materials for your use and reference:

- Frequently Asked Questions about the Program for Jurisdictions and Pharmacy Partners
- Key communication messages for jurisdictions and pharmacy partners
- A One-Page Fact Sheet on the Federal Retail Pharmacy Program (to share with partners or members of the community)

Upcoming Trainings/Webinars/Jurisdictional Calls

- Below is a link to a series of accredited education about COVID-19 vaccine in general, safety, and administration considerations.
    - Vaccine Courses, Broadcasts, Webcasts and Self Study Training | CDC
- Tiberius users can access the training video on submitting transfer requests at the following link: https://protect-ows.hhs.gov/workspace/compass/view/ri.compass.main.folder.c95b290c-2561-4cd1-85f7-e31dac51d34b [protect-ows.hhs.gov

COVID-19 Resources

- Vaccine Confidence Consultations from Vaccine Task Force
  - This email serves as an entry point to many vaccine confidence consultation options offered by CDC. Vaccine confidence and communications experts will receive emails from providers and public health professionals and then set up brief calls to understand needs, tailor support, and provide further technical assistance in data collection, creation of communication products and more to promote community vaccine confidence for COVID-19 vaccines. They can be contacted at confidenceconsults@cdc.gov
- ELC Enhancing Detection Expansion FAQ (attached)
  - Developed by the ELC Team, this FAQ answers common questions about Enhancing Detection Expansion funding for jurisdictions. More information can be found on the ELC Website.
- Factsheet: 12 Things Jurisdictions Need to Know about VAERS (attached)
  - A factsheet developed by VTF on how to report adverse events following vaccination to the Vaccine Adverse Events Reporting System (VAERS)
- The COVID State-Profiles Report (aka Governors Report) is now posted publicly at COVID Data Tracker, and will be updated weekly. As a reminder, Community Profile Report has been posted publicly since December, and is updated daily. There is also a public facing version of the **T**herapeutics Distribution Location Tool**.**
- COVID-19 Vaccination Communication Toolkits for Community- Based Organizations and Essential Workers
  - COVID-19 vaccines will be available to essential workers and other community members soon. CDC has designed two toolkits to help build confidence in this new vaccine. The toolkits will help community-based organizations (CBOs) and employers to educate community members and workers about COVID-19 vaccines, raise awareness about the benefits of vaccination, and address common questions and concerns.

Thank you,

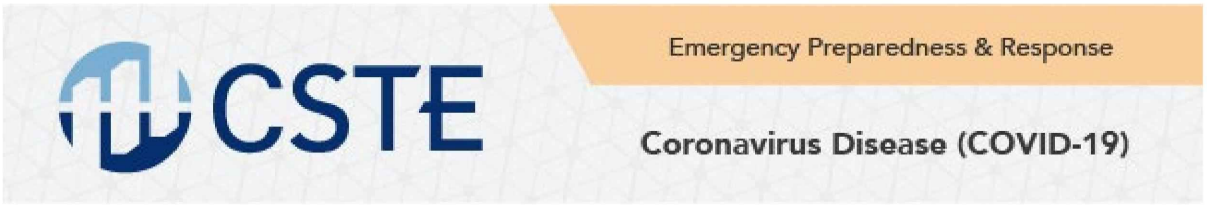
Subject: CSTE COVID-19 Response | Digest for Jan. 11 (incl. CDC Partner Alerts, HHS Update, COCA Call, and more)



Sent to State Epidemiologists, Deputy State Epidemiologists, CLUE, Infectious Disease Points of Contact, and the CSTE Executive Board

Good afternoon,

Please see below for a collection of Coronavirus Disease 2019 (COVID-19) information, gathered for your awareness:

New Information

- CDC Partner Alert: N95 Effectiveness as Source Control [Attachments]
    - Today, **Tuesday, January 11**, CDC issued a partner update (attached) in response to numerous questions about N95 mask effectiveness as source control. The update shared two peer reviewed publications from National Institute for Occupational Safety and Health (NIOSH) researchers (both attached) on N95 mask effectiveness, including findings that a N95 respirator was 99% effective at blocking cough aerosols.

HHS Update: COVID-19 Allocation Projections for January [Attachments]

- On **Friday, January 7**, the U.S. Department of Health and Human Services (HHS) issued an update with a projected calendar of allocation amounts and cadence of COVID-19 therapeutics for the remainder of January (attached). Questions may be directed to us COVID19Therapetuics@hhs.gov.

- Partner Alert: CDC Expands Booster Shot Eligibility [Attachment, Link]
  - On **Saturday, January 6**, CDC issued a partner alert (attached) adjusting its recommendation for when people can receive a booster shot, shortening the interval from 6 months to 5 months. CDC has extended this recommendation to recipients of a Moderna primary series. This means that people 12 years of age and older who initially received an mRNA vaccine series – two doses of Moderna or Pfizer-BioNTech – can now receive an mRNA booster shot 5 months after completing their initial series.
- CDC COCA Call: What Clinicians Need to Know About the New Oral Antiviral Medications for COVID-19 [Links]
  - CDC Clinician Outreach and Community Activity (COCA) will host a webinar **tomorrow, Wednesday, January 12 at 2:00 pm EST** to discuss the recent emergency use authorizations (EUAs) for new oral antiviral medications intended to decrease hospitalizations, as well as prevent severe COVID-19 and death Call information is below:
    - Weblink: https://www.zoomgov.com/j/1612974214?pwd=VitYMEorako1YWhCaXpnaWdsc2Ixdz09
      Telephone: (660) 254-5252 or (646) 828-7666 or (669) 216-1590 or (551) 285-1373
      Webinar ID: 161 297 4214
      Passcode: 180866
      Post-Event Recording:
      https://emergency.cdc.gov/coca/calls/2021/callinfo_011222.asp
- Reminder: CDC Preventive Medicine Grand Rounds: "The Public Health System of the Future – Moving Ahead in Partnership with Health Care & Other Sectors" [Link]
  - CDC will host its monthly Preventive Medicine Grand Rounds **tomorrow, Wednesday, January 12** at **1:30 pm EST**. The session will focus on the public health system of the future and the speaker is John Auerbach, Director of Intergovernmental and Strategic Affairs for CDC. Continuing education (CE) is available at no cost. Registration information is available here.

Standing Updates

- CDC Partner Update – January 10 [Attachment]
  - Please see attached for the latest updates from CDC's State, Tribal, Local, and Territorial (STLT) Task Force.
- HHS COVID-19 Update – January 10 [Link]
  - Please click here for the latest COVID-19 updates from the HHS Office of Intergovernmental and External Affairs. Updates typically include highlights from any recent COVID-19 Response Team briefings, as well as vaccine, testing, treatment and research updates, toolkits, and resources.

- Press Briefings: White House COVID-19 Response Team and Public Health Officials [Link]
    - The White House COVID-19 Response Team holds regular press briefings during the week, typically on **Mondays, Wednesdays,** and **Fridays** at **11:00 am ET**. *Please note:* Briefings sometimes begin after 11:00 am. Visit www.whitehouse.gov/live for the latest schedule and broadcast links. All COVID briefings are publicly available on the White House YouTube channel; past briefings may appear in this playlist link.
- CSTE COVID-19 Response Resource Repository [Link]
    - The CSTE COVID-19 Response Resource Repository and related discussion forums are available via Basecamp to encourage jurisdictional sharing of information, resources, best practices, and challenges. To sign-up and access the Basecamp, please visit this link.
- Request Form for CSTE COVID-19 Call Topics [Link]
    - CSTE encourages members to suggest topics for future COVID-19 response-related calls with CSTE members, CDC, and/or partner organizations. To submit a request, please visit this link.

Interesting studies on mask efficacy. Spoiler alert – while there is variability and more study needed, they work.

Good afternoon,

Please see below for a collection of Coronavirus Disease 2019 (COVID-19) information, gathered for your awareness:

New Information

- CDC Partner Alert: N95 Effectiveness as Source Control [Attachments]
  - Today, **Tuesday, January 11**, CDC issued a partner update (attached) in response to numerous questions about N95 mask effectiveness as source control. The update shared two peer reviewed publications from National Institute for Occupational Safety and Health (NIOSH) researchers (both attached) on N95 mask effectiveness, including findings that a N95 respirator was 99% effective at blocking cough aerosols.
- HHS Update: COVID-19 Allocation Projections for January [Attachments]
  - On **Friday, January 7**, the U.S. Department of Health and Human Services (HHS) issued an update with a projected calendar of allocation amounts and cadence of COVID-19 therapeutics for the remainder of January (attached). Questions may be directed to us COVID19Therapetuics@hhs.gov.
- Partner Alert: CDC Expands Booster Shot Eligibility [Attachment, Link]
  - On **Saturday, January 6**, CDC issued a partner alert (attached) adjusting its recommendation for when people can receive a booster shot, shortening the interval from 6 months to 5 months. CDC has extended this recommendation to recipients of a Moderna primary series. This means that people 12 years of age and older who initially received an mRNA vaccine series – two doses of Moderna or Pfizer-BioNTech – can now receive an mRNA booster shot 5 months after completing their initial series.
- CDC COCA Call: What Clinicians Need to Know About the New Oral Antiviral Medications for COVID-19 [Links]
  - CDC Clinician Outreach and Community Activity (COCA) will host a webinar **tomorrow, Wednesday, January 12 at 2:00 pm EST** to discuss the recent emergency use authorizations (EUAs) for new oral antiviral medications intended to decrease hospitalizations, as well as prevent severe COVID-19 and death Call information is below:
    - Weblink: https://www.zoomgov.com/j/1612974214?pwd=VitYMEorako1YWhCaXpnaWdsc2Ixdz09
      Telephone: (660) 254-5252 or (646) 828-7666 or (669) 216-1590 or (551) 285-1373
      Webinar ID: 161 297 4214
      Passcode: 180866
      Post-Event Recording:
      https://emergency.cdc.gov/coca/calls/2021/callinfo_011222.asp
- Reminder: CDC Preventive Medicine Grand Rounds: "The Public Health System of the Future – Moving Ahead in Partnership with Health Care & Other Sectors" [Link]
  - CDC will host its monthly Preventive Medicine Grand Rounds **tomorrow, Wednesday, January 12** at **1:30 pm EST**. The session will focus on the public health system of the

future and the speaker is John Auerbach, Director of Intergovernmental and Strategic Affairs for CDC. Continuing education (CE) is available at no cost. Registration information is available here.

Standing Updates

- CDC Partner Update – January 10 [Attachment]
  - Please see attached for the latest updates from CDC's State, Tribal, Local, and Territorial (STLT) Task Force.
- HHS COVID-19 Update – January 10 [Link]
  - Please click here for the latest COVID-19 updates from the HHS Office of Intergovernmental and External Affairs. Updates typically include highlights from any recent COVID-19 Response Team briefings, as well as vaccine, testing, treatment and research updates, toolkits, and resources.
- Press Briefings: White House COVID-19 Response Team and Public Health Officials [Link]
  - The White House COVID-19 Response Team holds regular press briefings during the week, typically on **Mondays, Wednesdays,** and **Fridays** at **11:00 am ET**. *Please note:* Briefings sometimes begin after 11:00 am. Visit www.whitehouse.gov/live for the latest schedule and broadcast links. All COVID briefings are publicly available on the White House YouTube channel; past briefings may appear in this playlist link.
- CSTE COVID-19 Response Resource Repository [Link]
  - The CSTE COVID-19 Response Resource Repository and related discussion forums are available via Basecamp to encourage jurisdictional sharing of information, resources, best practices, and challenges. To sign-up and access the Basecamp, please visit this link.
- Request Form for CSTE COVID-19 Call Topics [Link]
  - CSTE encourages members to suggest topics for future COVID-19 response-related calls with CSTE members, CDC, and/or partner organizations. To submit a request, please visit this link.

Subject: HHS COVID-19 Update - 3/31

Dear Partner:

HHS Office of Intergovernmental and External Affairs COVID-19 update for March 31, 2021:

Highlights from the White House COVID-19 Response Team briefing:

Andy Slavitt:

- **Increasing Vaccination Sites:** The President committed to opening at least 12 more federally run mass vaccination sites, adding to the existing total of 25 sites. Three new sites will open next week in Memphis, Tennessee, Milwaukee, Wisconsin, and Greenbelt, Maryland, in addition to the two we announced on Monday in St. Louis, Missouri, and Gary, Indiana. Each of these sites is the first federally run mass vaccination site in its respective state, and each can administer 3,000 vaccinations a day.
- **Mask Mandates:** We need every governor, mayor, and local leader to maintain or reinstate mask mandates. And we need every American to do their part so that we can win this race and save lives.

Dr. Walensky:

- **Case Update:** CDC's most recent data show that the seven-day average of new cases is slightly less than 62,000 cases per day. We continue to see an increase, and this is almost a 12 percent increase from the seven-day period prior. Hospitalizations also continue to increase. The most recent seven-day average — about 4,900 admissions per day — is up from 4,600 admissions per day in the prior seven-day period. The seven-day average of deaths remains slightly above 900 deaths per day.
- **Inequities in COVID-19 Deaths:** COVID-19 deaths were highest for older adults and males, and were higher, as we previously saw, among American Indian and Alaska Natives, Hispanics, non-Hispanic Blacks, and non-Hispanic Native Hawaiian and Pacific Islander persons compared

to non-Hispanic whites. In fact, among nearly all these ethnic and racial minority groups, the COVID-19-related deaths were more than double the death rate of non-Hispanic white persons. Based on the current state of the pandemic, these impacts have remained in 2021, where we continue to see that communities of color account for an outsize portion of these deaths.

- **Number of People Vaccinated:** This week, we will reach 100 million people who have received at least one dose of the COVID-19 vaccine in the United States — a remarkable feat in such a short period of time. Further, over 70 percent of people over age 65, our most vulnerable group, have received at least one vaccine dose. In addition to increasing the number of mass vaccination sites across the country with FEMA, expanding the Federal Retail Pharmacy Program, and ensuring that all Americans have a vaccine site within five miles of their home, we are also activating mobile vaccination units and clinics. CDC is also excited to partner with the Administration for Community Living to support their efforts to get older, at-risk adults and those with disabilities vaccinated.
- **Guidance for Adult Day Service Centers:** CDC updated COVID-19 guidance for adult day service centers. These populations are at high risk for severe COVID-19 disease, and this guidance will help center administrators and staff protect themselves and adults receiving their services by promoting and engaging in preventive behaviors that reduce COVID-19 spread and help maintain healthy operations and environments of these facilities.
- **B.1.1.7 Variant:** We now have B.1.1.7 (U.K. variant) as 26 percent of the circulating variant across the United states, and it is the predominant strain in at least five regions of the United States. The variant is more transmissible – somewhere between 50 and 70 percent more transmissible than the wild-type strain. Therefore, to the extent that people are not practicing those standard mitigation strategies, we do think that more infections will result because of B.1.1.7. We believe that the current mitigation strategies of masking and distancing would work just as well against the current, the wild-type strain, as they do the B.1.1.7 strain.

Dr. Fauci:

- **Importance of Getting Vaccinated:** We are seeing now immune protection against COVID-19 variants when individuals are vaccinated against the wild-type strain, namely the common virus in society, on two mechanisms: the antibody response that has a spillover effect and the cross-reactivity. Vaccination is not only going to protect us against the common COVID-19 virus in society, but it has the potential, to a greater or lesser degree, to also protect against a range of variants. So, when vaccination becomes available, get vaccinated.

Vaccine Updates

Federal Retail Pharmacy Program: CDC updated their general information on the Federal Retail Pharmacy Program for COVID-19 Vaccination. As the program expands and supply becomes more readily available, the allocation may be adjusted to reflect partner size (number of store locations nationwide), reach (percent of the total US population living within 5 miles of a store location), and ability to vaccinate (throughput). The program, which will scale up to eventually include COVID-19 vaccination at all 40,000+ retail locations, will make it easier for individuals to access free COVID-19 vaccine at a pharmacy in their community, and improve vaccine uptake while decreasing the

logistical and operations burden on state, local, and territorial health departments.

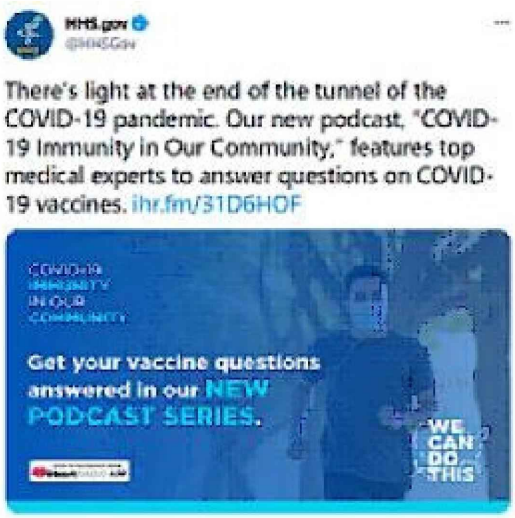
Johnson & Johnson Janssen Vaccine: CDC updated their general information on the Johnson & Johnson Vaccine. The J&J/Janssen vaccine is recommended for people aged 18 years and older. Learn more about how CDC is making COVID-19 vaccine recommendations and CDC's vaccine rollout recommendations.

FEMA Vaccination Sites: FEMA announced that it will open a COVID-19 vaccination site in Greenbelt, Maryland on April 7th. The center's capacity is expected to be up to 3,000 shots per day. President Biden also committed to opening sites in Memphis, TN and Milwaukee, WI. These sites join many new FEMA vaccination sites recently announced, including in Boston, Massachusetts; Essex, New Jersey; Norfolk, Virginia; and Yakima, Washington, all of which open today. In the next week, federal communication vaccination center pilot sites in Gary, Indiana and St. Louis, Missouri are scheduled to open, as well. The agency has provided more than $4.47 billion for expenses related to COVID-19 vaccination at 100% federal cost share.

Peace Corps Assistance in COVID-19 Response: FEMA and the Peace Corps announced a historic partnership to combat the COVID-19 pandemic, marking only the second time in the Peace Corp's history where volunteers will serve a domestic deployment. The Peace Corps will soon begin recruiting for the special domestic deployment through Peace Corps Response, a program that sends in individuals with specialized experienced to short-term service assignment of up to 12 months. Assignments will focus on urgent needs as identified by FEMA and on communities that have been traditionally under-served.

Evaluating Moderna COVID-19 Variant Vaccine: An investigational vaccine designed to protect against the B.1.351 SARS-CoV-2 variant has been administered as part of a new Phase 1 clinical trial evaluating the vaccine candidate's safety and immunogenicity in adult volunteers. The vaccine, known as mRNA-1273.351, was developed by the biotechnology company ModernaTX, Inc., based in Cambridge, Massachusetts. The trial is led and funded by the National Institute of Allergy and Infectious Diseases (NIAID), part of the National Institutes of Health. The trial will enroll approximately 210 healthy adult volunteers at four clinical research sites in the United States that are part of the NIAID-funded Infectious Diseases Clinical Research Consortium (IDCRC).

HHS Podcast: HHS's new podcast, *COVID-19 Immunity in Our Community*, features top medical experts to answer questions on COVID-19 vaccines. Today's episode, "Building Vaccine Trust Within the Black Community," discusses how we can start to rebuild the Black community's trust in the vaccines, in order to achieve herd immunity and, hopefully, regain some sense of normalcy in our everyday lives.



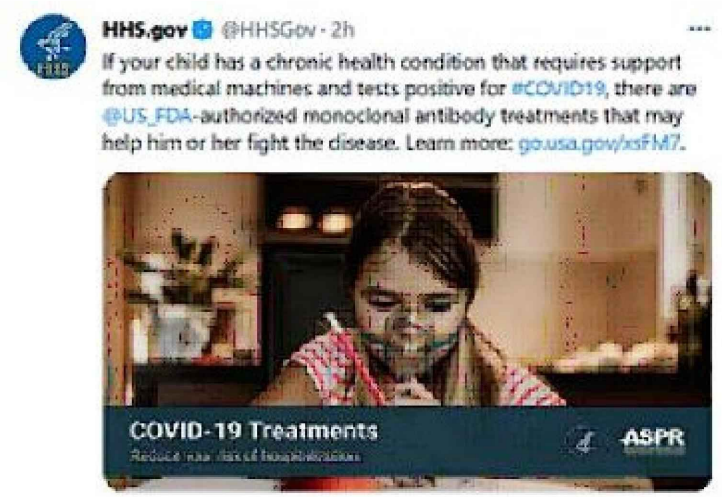
Testing and Treatment

Covid-19 Precautions: CDC updated their COVID-19 page, reiterating that it is critical to keep taking precautions to prevent COVID-19. Learn more about how to protect yourself and others from CDC's recommendations.

COVID-19 Self Testing: CDC and NIH launched an innovative community health initiative called "Say Yes! COVID Test" starting in two locales, Pitt County, North Carolina, and coming soon to Chattanooga/Hamilton County, Tennessee. As many as 160,000 residents across the two communities will have access to free, rapid antigen tests that they can administer themselves to use three times a week for one month. NIH will provide the tests (also called a home-test or at-home test) and evaluate the effectiveness of the initiative, which aims to determine if frequent self-administered COVID-19 testing helps residents reduce community transmission of SARS-CoV-2, the virus that causes COVID-19 disease.

$147 Million to Expand Production of Swabs: DOD and HHS awarded $146.7 million to Puritan Medical Products on March 26 for renovations in the company's Orlinda, Tenn. facility to increase production capacity of foam tip swabs used in COVID-19 diagnostic tests. Funded through HCEA, the award will help the company boost total production capacity of the swabs to 250 million per month by February 2022.

Monoclonal Antibody Treatments: 3 EUAs for monoclonal antibody (mAb) treatments for mild-to-moderate COVID-19 in at-risk patients: bamlanivimab, casirivimab/imdevimab, and bamlanivimab/etesevimab. Learn more about FDA-authorized monoclonal treatments that can help at-risk patients fight the disease.



HHS Innovative Challenge for Masks: The U.S. Department of Health and Human Services launches $500,000 innovation challenge competition today encouraging American inventors to aid the nation's COVID-19 response by designing effective, comfortable face masks for personal use that resolve the common complaints people have about wearing masks. The contest taps into the nation's creativity and entrepreneurial spirit to help curb the spread of SARS-CoV-2, the virus that causes COVID-19.

Information for Specific Populations

Healthcare Workers: CDC updated their guidance for managing patients with COVID-19, including clinical guidance, home and hospital care, care for special populations, disease severity, and more.

Guidance for Adult Day Services Centers: CDC released guidance for administrators and staff to prevent the spread of COVID-19. Adult Day Services Centers (ADSCs) provide social or health services to community-dwelling adults aged 65 and over and adults of any age living with disability. Older adults and persons with disabilities are at highest risk for severe illness from COVID-19 including hospitalization, intensive care, and death. ADSC administrators and staff can help protect themselves and program participants (that is, adults attending ADSCs) from COVID-19 by promoting and engaging in preventive behaviors that reduce spread and maintain healthy operations and environments at ADSC facilities. This guidance is meant to supplement — not replace — any Federal, state, tribal, local, or territorial public health and safety laws, rules, and regulations with which adult day services center programs must comply. CDC has also developed recommendations for participants at ADSCs and their caregivers.

Suggestions for Youth and Summer Camps: CDC offers suggestions for ways in which camp administrators can help protect campers, staff, and communication, and prevent the spread of COVID-19. Camp administrators can determine, in collaboration with state and local health officials, whether and how to implement these considerations, making adjustments to meet the unique needs and circumstances of the local community. Implementation should be guided by what is feasible, practical, acceptable, and tailored to the needs of each community. These suggestions are meant to supplement— not replace —any state, local, territorial, or tribal health and safety laws, rules, and regulations with which camps must comply.

Essential Services for Malaria: CDC updated their key considerations for continuing essential

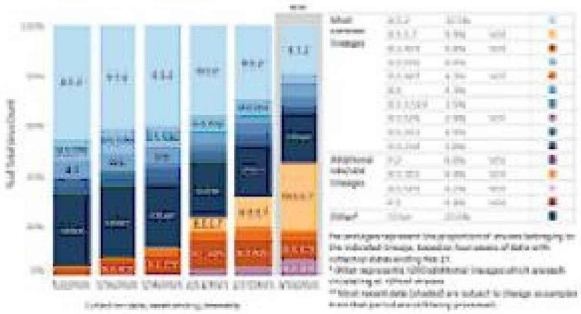
malaria prevention and control activities safely and effectively. These considerations should supplement country Ministry of Health guidance.

CMS Updates

Medicare Fee-for-Service Billing: CMS updated their COVID-19 Frequently Asked Questions on Medicare Fee-for-Service (FFS) Billing. The policies set out in this FAQ are effective for the duration of the public health emergency unless superseded by future legislation. The FAQs in this document supplement the previously released FAQs, 1135 Waiver FAQs.

Research

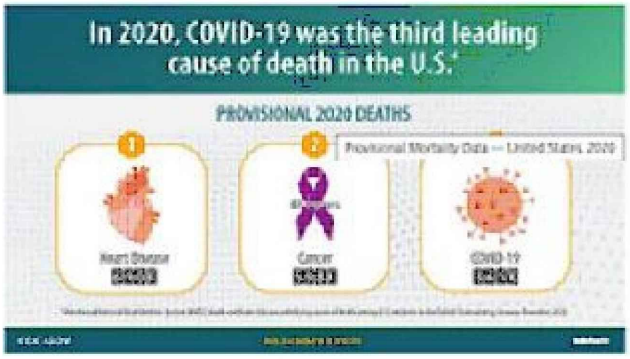
Variant Proportions in the U.S: CDC's national genomic surveillance program identifies new and emerging SARS-CoV-2 variants to determine implications for COVID-19 diagnostics, treatments, or vaccines authorized for use in the United States. Monitoring the spread of emerging variants in the United States relies on widespread, rapid sequencing. To accelerate sequencing in the United States, CDC has contracted with commercial diagnostic laboratories, and, in partnership with the Association of Public Health Laboratories (APHL), has implemented the National SARS-CoV-2 Strain Surveillance (NS3) program to provide a comprehensive and population-based US surveillance system. This data, along with data from many other sources, are used to inform national and state public health actions related to variants.



COVID-19 2020 Mortality Surveillance: The Morbidity and Mortality Weekly Report (*MMWR*) on death certificate-based ICD-10 diagnosis codes for COVID-19 mortality surveillance addresses that among the 378,048 death certificates from 2020 listing COVID-19, 5.5% listed COVID-19 without codes for any other conditions. Among 357,133 death certificates with at least one other condition, 97% had a co-occurring diagnosis of a plausible chain-of-event condition (e.g., pneumonia or respiratory failure), or a significant contributing condition (e.g., hypertension or diabetes), or both. These findings support the accuracy of COVID-19 mortality surveillance in the United States using official death certificates. High-quality documentation of death certificate diagnoses is essential for an authoritative public record.

Provisional 2020 Mortality Data: The Morbidity and Mortality Weekly Report (*MMWR*) on provisional mortality data in the United States in 2020 addresses that the age-adjusted death rate increased by 15.9% in 2020. Overall death rates were highest among non-Hispanic Black persons and non-Hispanic American Indian or Alaska Native persons. COVID-19 was the third leading cause of death, and the COVID-19 death rate was highest among Hispanics. Provisional death estimates

provide an early indication of shifts in mortality trends. Timely and actionable data can guide public health policies and interventions for populations experiencing higher numbers of deaths that are directly or indirectly associated with the COVID-19 pandemic.



Case Forecasts: This week's national ensemble predicts that the number of newly reported COVID-19 cases will remain stable or have an uncertain trend over the next 4 weeks, with 223,000 to 723,000 new cases likely reported in the week ending April 24, 2021. The state- and territory-level ensemble forecasts predict that over the next 4 weeks, the number of new reported cases per week will likely decrease in 4 jurisdictions, which are indicated in the forecast plots below. Trends in numbers of future reported cases are uncertain or predicted to remain stable in the other states and territories. View previous case forecasts.

Hospitalization Forecasts: This week's national ensemble predicts that the number of new daily confirmed COVID-19 hospital admissions will remain stable or have an uncertain trend over the next 4 weeks, with 2,300 to 8,700 new confirmed COVID-19 hospital admissions likely reported on April 26, 2021. The state- and territory-level ensemble forecasts predict that over the next 4 weeks, the number of daily confirmed COVID-19 hospital admissions will likely increase in 6 jurisdictions and decrease in 12 jurisdictions, which are indicated in the forecast plots below. Trends in numbers of future reported hospital admissions are uncertain or predicted to remain stable in the other states and territories. View previous hospitalization forecasts.

Death Forecasts: This week's national ensemble predicts that the number of newly reported COVID-19 deaths will remain stable or have an uncertain trend over the next 4 weeks, with 3,100 to 10,200 new deaths likely reported in the week ending April 24, 2021. The national ensemble predicts that a total of 565,000 to 585,000 COVID-19 deaths will be reported by this date. The state- and territory-level ensemble forecasts predict that over the next 4 weeks, the number of newly reported deaths per week will likely decrease in 8 jurisdictions, which are indicated in the forecast plots below. Trends in numbers of future reported deaths are uncertain or predicted to remain stable in the other states and territories. View previous death forecasts.

Subject: TIME SENSITIVE and EMBARGOED: TFAH's Ready or Not 2022 report on public health emergency preparedness

Dear Directors of Public Health Preparedness,

Attached is the embargoed copy, with supporting information, of the Trust for America's 2022 Health Ready or Not Preparedness Report which is **EMBARGOED UNTIL 12:01 AM, MARCH 10, 2022**.

We anticipate that this release will generate some level of national, regional, and local media coverage as well as possibly inquiries from state legislatures and/or your governors' offices, especially given ongoing response to the COVID-19 pandemic. As such, we recommend that states be prepared to share specific examples of progress, accomplishments and, yes, unmet needs, associated with all-hazards readiness, including specific recent high profile incident responses.

ASTHO has also shared this embargoed report with State and Territorial Health Officials and Senior Deputies.

Thank you,
Meredith

Field Notes

King County Monitors the Ongoing Economic, Social, and Health Effects of COVID-19

Community mitigation strategies used to slow pandemics—such as physical distancing policies, mask mandates, avoiding crowds, hand washing or using hand sanitizers, business and school closures, and travel restrictions—can reduce the spread of disease but have other effects on individual health and community well-being. As the local health jurisdiction tasked with protecting the health of its residents, Public Health—Seattle & King County (PHSKC) needed to quickly develop ways to monitor and evaluate the ongoing social and economic impacts of the COVID-19 mitigation response. The first COVID-19 case diagnosed in the United States came through the international airport in King County, Washington, in January 2020, with additional community-acquired cases

diagnosed among King County residents in February 2020. As cases began to increase, state and local governments enacted strategies designed to prevent person-to-person spread of the novel coronavirus.

In population health assessments, King County often performs better than the US average but continues to face stark health disparities by race/ethnicity, location, and income. COVID-19 is no exception. With support from CDC, PHSKC incorporated aspects of CDC's approach to evaluating COVID-19 community mitigation strategies to track various social, emotional, and economic impacts on the King County community since April 2020.

Date:	Friday, September 10, 2021 8:27:12 AM
Attachments:	image001.png IDPC meeting notes August 2021.docx

Hello, IDPC members,

Attached are the notes and suggested action items from the August IDPC call. I ask that you please not distribute the notes outside of this group.

I will send a draft of the *Public Health Authority to Prevent and Control the Spread of Communicable and Infectious Disease* policy statement when it is ready.

Given the preference for a quarterly meeting, we will plan to hold the next call on **November 16 at 12PM ET**. An Outlook invitation is forthcoming.

Thank you again and please do not hesitate to reach out with any questions or discussion items for the next call.

Good afternoon,

Thank you for participation in last week's IDPC call. Attached please see notes from the call and an updated draft of the *Public Health Authority to Prevent and Control the Spread of Communicable and Infectious Disease* policy statement.

- Since we met last week, we have been fortunate to gain a new IDPC member! **Dr. Manisha Juthani (SHO-CT)** has agreed to serve on the IDPC and plans to join us on our next call. Please join me in welcoming her to our group.
- *Public Health Authority to Prevent and Control the Spread of Communicable and Infectious Disease* policy statement: Andy incorporated edits from our call in the attached draft. **If you are interested in meeting with Andy as a small group to wordsmith the draft, please let me know and I'll work to propose a few dates and times for that conversation.**
- As I mentioned during the call, Alyssa Boyea from our staff will be also be sending a request for your feedback to the questionnaire to assess public opinion on rebuilding trust and confidence in public health after the Thanksgiving holiday.
- Additionally, CDC's National Center for HIV, Viral Hepatitis, STD, and TB Prevention (NCHHSTP) will soon be updating its Data Security and Confidentiality Guidelines. The purpose of the document is to recommend standards for all NCHHSTP programs that, when adopted, will facilitate the secure collection, storage, and use of data while maintaining confidentiality. NCHHSTP has requested that ASTHO provide concrete examples and feedback on what needs to be updated in these guidelines. Please share anything you think should be added, removed, or reframed within these guidelines with me by **December 15.**

Lastly, the next IDPC call is scheduled for **February 15, 2022 at 12PM ET**. An agenda and call-in information will be sent closer to the call. Please send any suggested agenda topics to me.

Thank you all for your continued support of the IDPC and have a wonderful Thanksgiving.

Hi Dr. Dobbs,

Attached please see the high-level notes and proposed action items from the August IDPC call. I have 2 comments in the document that I would appreciate your thoughts on before I distribute to the committee. Please let me know if you approve of the notes and any thoughts about the proposed action items.

Also, would you like to plan for the next IDPC call to be held on November 16 at 11AM CT/12PM ET? That would fit the quarterly cadence the members requested and is in the same time block as our August call. If that does not work, I will send a Doodle poll for scheduling.

Best, Kate

Subject: TFAH's Ready or Not report releasing this Wednesday - (Sent by Tim Hughes on behalf of Rhea Farberman)

Dear State Health Official,

TFAH will release its annual report *Ready or Not: Protecting the Public's Health from Diseases, Disasters, and Bioterrorism* measuring states' health emergencies preparedness on Wednesday, March 10. Not surprisingly, this year the report has a special focus on the impact of COVID-19, highlighting the need to increase resources for emergency preparedness. We clarify that our report measures all-hazards preparedness and is not a measure of any state's COVID-19 response.

As we have done in past years, we measure 10 health security indicators in each state and discuss the relationship of each to all-hazard preparedness. We placed states into one of three performance tiers (high, middle and low) based on these indicators. Twenty states and the District of Columbia placed in the high-performance tier, 15 states placed in the middle performance tier and 15 states placed in the low performance tier.

Particularly significant in this year's report is our emphasis on how the pandemic demonstrated the importance of the federal government's role in a health emergency on the scale of a pandemic, the impact of structural racism on a community's resilience during a health emergency, and, the critical need for core public health funding including workforce and infrastructure support.

The report is being shared with news media ahead of the Wednesday morning lift of the embargo. It is likely to be covered in news markets across the country. I recommend you share these materials with your communications staff today so they can prepare for any media requests.

I'd be happy to answer any questions.

Thank you,
Rhea

From: Polk, Jennifer (OS/ASPR/SIIM)
Subject: HHS COVID-19 Update - 3/31
Date: Thursday, April 1, 2021 7:53:48 AM

From: Baker, Michael (OS/IEA) <Michael.Baker@hhs.gov>
Sent: Wednesday, March 31, 2021 8:26 PM
Subject: HHS COVID-19 Update - 3/31

Dear Partner:

HHS Office of Intergovernmental and External Affairs COVID-19 update for March 31, 2021:

Highlights from the White House COVID-19 Response Team briefing:

Andy Slavitt:

- **Increasing Vaccination Sites:** The President committed to opening at least 12 more federally run mass vaccination sites, adding to the existing total of 25 sites. Three new sites will open next week in Memphis, Tennessee, Milwaukee, Wisconsin, and Greenbelt, Maryland, in addition to the two we announced on Monday in St. Louis, Missouri, and Gary, Indiana. Each of these sites is the first federally run mass vaccination site in its respective state, and each can administer 3,000 vaccinations a day.
- **Mask Mandates:** We need every governor, mayor, and local leader to maintain or reinstate mask mandates. And we need every American to do their part so that we can win this race and save lives.

Dr. Walensky:

- **Case Update:** CDC's most recent data show that the seven-day average of new cases is slightly less than 62,000 cases per day. We continue to see an increase, and this is almost a 12 percent increase from the seven-day period prior. Hospitalizations also continue to increase. The most recent seven-day average — about 4,900 admissions per day — is up from 4,600 admissions per day in the prior seven-day period. The seven-day average of deaths remains slightly above 900 deaths per day.
- **Inequities in COVID-19 Deaths:** COVID-19 deaths were highest for older adults and males, and were higher, as we previously saw, among American Indian and Alaska Natives, Hispanics, non-Hispanic Blacks, and non-Hispanic Native Hawaiian and Pacific Islander persons compared to non-Hispanic whites. In fact, among nearly all these ethnic and racial minority groups, the COVID-19-related deaths were more than double the death rate of non-Hispanic white persons. Based on the current state of the pandemic, these impacts have remained in 2021, where we continue to see that communities of color account for an outsize portion of these deaths.
- **Number of People Vaccinated:** This week, we will reach 100 million people who have received at least one dose of the COVID-19 vaccine in the United States — a remarkable feat in such a short period of time. Further, over 70 percent of people over age 65, our most vulnerable group, have received at least one vaccine dose. In addition to increasing the number of mass vaccination sites across the country with FEMA, expanding the Federal

Retail Pharmacy Program, and ensuring that all Americans have a vaccine site within five miles of their home, we are also activating mobile vaccination units and clinics. CDC is also excited to partner with the Administration for Community Living to support their efforts to get older, at-risk adults and those with disabilities vaccinated.

- **Guidance for Adult Day Service Centers:** CDC updated COVID-19 guidance for adult day service centers. These populations are at high risk for severe COVID-19 disease, and this guidance will help center administrators and staff protect themselves and adults receiving their services by promoting and engaging in preventive behaviors that reduce COVID-19 spread and help maintain healthy operations and environments of these facilities.
- **B.1.1.7 Variant:** We now have B.1.1.7 (U.K. variant) as 26 percent of the circulating variant across the United states, and it is the predominant strain in at least five regions of the United States. The variant is more transmissible – somewhere between 50 and 70 percent more transmissible than the wild-type strain. Therefore, to the extent that people are not practicing those standard mitigation strategies, we do think that more infections will result because of B.1.1.7. We believe that the current mitigation strategies of masking and distancing would work just as well against the current, the wild-type strain, as they do the B.1.1.7 strain.

Dr. Fauci:

- **Importance of Getting Vaccinated:** We are seeing now immune protection against COVID-19 variants when individuals are vaccinated against the wild-type strain, namely the common virus in society, on two mechanisms: the antibody response that has a spillover effect and the cross-reactivity. Vaccination is not only going to protect us against the common COVID-19 virus in society, but it has the potential, to a greater or lesser degree, to also protect against a range of variants. So, when vaccination becomes available, get vaccinated.

Vaccine Updates

Federal Retail Pharmacy Program: CDC updated their general information on the Federal Retail Pharmacy Program for COVID-19 Vaccination. As the program expands and supply becomes more readily available, the allocation may be adjusted to reflect partner size (number of store locations nationwide), reach (percent of the total US population living within 5 miles of a store location), and ability to vaccinate (throughput). The program, which will scale up to eventually include COVID-19 vaccination at all 40,000+ retail locations, will make it easier for individuals to access free COVID-19 vaccine at a pharmacy in their community, and improve vaccine uptake while decreasing the logistical and operations burden on state, local, and territorial health departments.

Johnson & Johnson Janssen Vaccine: CDC updated their general information on the Johnson & Johnson Vaccine. The J&J/Janssen vaccine is recommended for people aged 18 years and older. Learn more about how CDC is making COVID-19 vaccine recommendations and CDC's vaccine rollout recommendations.

FEMA Vaccination Sites: FEMA announced that it will open a COVID-19 vaccination site in Greenbelt, Maryland on April 7th. The center's capacity is expected to be up to 3,000 shots per day.

President Biden also committed to opening sites in Memphis, TN and Milwaukee, WI. These sites join many new FEMA vaccination sites recently announced, including in Boston, Massachusetts; Essex, New Jersey; Norfolk, Virginia; and Yakima, Washington, all of which open today. In the next week, federal communication vaccination center pilot sites in Gary, Indiana and St. Louis, Missouri are scheduled to open, as well. The agency has provided more than $4.47 billion for expenses related to COVID-19 vaccination at 100% federal cost share.

Peace Corps Assistance in COVID-19 Response: FEMA and the Peace Corps announced a historic partnership to combat the COVID-19 pandemic, marking only the second time in the Peace Corp's history where volunteers will serve a domestic deployment. The Peace Corps will soon begin recruiting for the special domestic deployment through Peace Corps Response, a program that sends in individuals with specialized experienced to short-term service assignment of up to 12 months. Assignments will focus on urgent needs as identified by FEMA and on communities that have been traditionally under-served.

Evaluating Moderna COVID-19 Variant Vaccine: An investigational vaccine designed to protect against the B.1.351 SARS-CoV-2 variant has been administered as part of a new Phase 1 clinical trial evaluating the vaccine candidate's safety and immunogenicity in adult volunteers. The vaccine, known as mRNA-1273.351, was developed by the biotechnology company ModernaTX, Inc., based in Cambridge, Massachusetts. The trial is led and funded by the National Institute of Allergy and Infectious Diseases (NIAID), part of the National Institutes of Health. The trial will enroll approximately 210 healthy adult volunteers at four clinical research sites in the United States that are part of the NIAID-funded Infectious Diseases Clinical Research Consortium (IDCRC).

HHS Podcast: HHS's new podcast, *COVID-19 Immunity in Our Community*, features top medical experts to answer questions on COVID-19 vaccines. Today's episode, "Building Vaccine Trust Within the Black Community," discusses how we can start to rebuild the Black community's trust in the vaccines, in order to achieve herd immunity and, hopefully, regain some sense of normalcy in our everyday lives.

Testing and Treatment

Covid-19 Precautions: CDC updated their COVID-19 page, reiterating that it is critical to keep taking precautions to prevent COVID-19. Learn more about how to protect yourself and others from CDC's recommendations.

COVID-19 Self Testing: CDC and NIH launched an innovative community health initiative called "Say Yes! COVID Test" starting in two locales, Pitt County, North Carolina, and coming soon to Chattanooga/Hamilton County, Tennessee. As many as 160,000 residents across the two communities will have access to free, rapid antigen tests that they can administer themselves to use three times a week for one month. NIH will provide the tests (also called a home-test or at-home test) and evaluate the effectiveness of the initiative, which aims to determine if frequent self-administered COVID-19 testing helps residents reduce community transmission of SARS-CoV-2, the virus that causes COVID-19 disease.

$147 Million to Expand Production of Swabs: DOD and HHS awarded $146.7 million to Puritan Medical Products on March 26 for renovations in the company's Orlinda, Tenn. facility to increase production capacity of foam tip swabs used in COVID-19 diagnostic tests. Funded through HCEA, the award will help the company boost total production capacity of the swabs to 250 million per month by February 2022.

Monoclonal Antibody Treatments: 3 EUAs for monoclonal antibody (mAb) treatments for mild-to-moderate COVID-19 in at-risk patients: bamlanivimab, casirivimab/imdevimab, and bamlanivimab/etesevimab. Learn more about FDA-authorized monoclonal treatments that can help at-risk patients fight the disease.

HHS Innovative Challenge for Masks: The U.S. Department of Health and Human Services launches $500,000 innovation challenge competition today encouraging American inventors to aid the nation's COVID-19 response by designing effective, comfortable face masks for personal use that resolve the common complaints people have about wearing masks. The contest taps into the nation's creativity and entrepreneurial spirit to help curb the spread of SARS-CoV-2, the virus that causes COVID-19.

Information for Specific Populations

Healthcare Workers: CDC updated their guidance for managing patients with COVID-19, including clinical guidance, home and hospital care, care for special populations, disease severity, and more.

Guidance for Adult Day Services Centers: CDC released guidance for administrators and staff to prevent the spread of COVID-19. Adult Day Services Centers (ADSCs) provide social or health services to community-dwelling adults aged 65 and over and adults of any age living with disability. Older adults and persons with disabilities are at highest risk for severe illness from COVID-19 including hospitalization, intensive care, and death. ADSC administrators and staff can help protect themselves and program participants (that is, adults attending ADSCs) from COVID-19 by promoting and engaging in preventive behaviors that reduce spread and maintain healthy operations and environments at ADSC facilities. This guidance is meant to supplement — not replace — any Federal, state, tribal, local, or territorial public health and safety laws, rules, and regulations with which adult day services center programs must comply. CDC has also developed recommendations for participants at ADSCs and their caregivers.

Suggestions for Youth and Summer Camps: CDC offers suggestions for ways in which camp administrators can help protect campers, staff, and communication, and prevent the spread of COVID-19. Camp administrators can determine, in collaboration with state and local health officials, whether and how to implement these considerations, making adjustments to meet the unique needs and circumstances of the local community. Implementation should be guided by what is feasible, practical, acceptable, and tailored to the needs of each community. These suggestions are meant to supplement— not replace —any state, local, territorial, or tribal health and safety laws, rules, and regulations with which camps must comply.

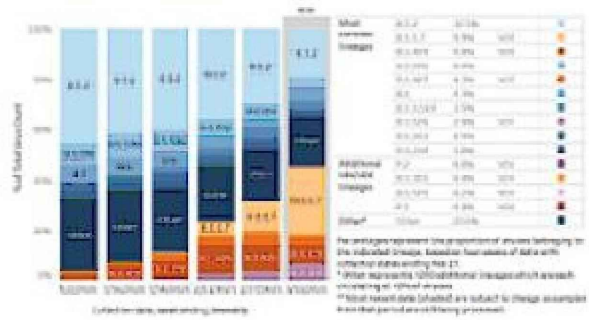
Essential Services for Malaria: CDC updated their key considerations for continuing essential malaria prevention and control activities safely and effectively. These considerations should supplement country Ministry of Health guidance.

CMS Updates

Medicare Fee-for-Service Billing: CMS updated their COVID-19 Frequently Asked Questions on Medicare Fee-for-Service (FFS) Billing. The policies set out in this FAQ are effective for the duration of the public health emergency unless superseded by future legislation. The FAQs in this document supplement the previously released FAQs, 1135 Waiver FAQs.

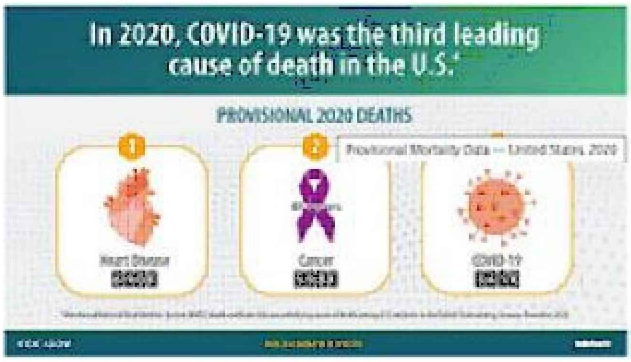
Research

Variant Proportions in the U.S: CDC's national genomic surveillance program identifies new and emerging SARS-CoV-2 variants to determine implications for COVID-19 diagnostics, treatments, or vaccines authorized for use in the United States. Monitoring the spread of emerging variants in the United States relies on widespread, rapid sequencing. To accelerate sequencing in the United States, CDC has contracted with commercial diagnostic laboratories, and, in partnership with the Association of Public Health Laboratories (APHL), has implemented the National SARS-CoV-2 Strain Surveillance (NS3) program to provide a comprehensive and population-based US surveillance system. This data, along with data from many other sources, are used to inform national and state public health actions related to variants.



COVID-19 2020 Mortality Surveillance: The Morbidity and Mortality Weekly Report (*MMWR*) on death certificate-based ICD-10 diagnosis codes for COVID-19 mortality surveillance addresses that among the 378,048 death certificates from 2020 listing COVID-19, 5.5% listed COVID-19 without codes for any other conditions. Among 357,133 death certificates with at least one other condition, 97% had a co-occurring diagnosis of a plausible chain-of-event condition (e.g., pneumonia or respiratory failure), or a significant contributing condition (e.g., hypertension or diabetes), or both. These findings support the accuracy of COVID-19 mortality surveillance in the United States using official death certificates. High-quality documentation of death certificate diagnoses is essential for an authoritative public record.

Provisional 2020 Mortality Data: The Morbidity and Mortality Weekly Report (*MMWR*) on provisional mortality data in the United States in 2020 addresses that the age-adjusted death rate increased by 15.9% in 2020. Overall death rates were highest among non-Hispanic Black persons and non-Hispanic American Indian or Alaska Native persons. COVID-19 was the third leading cause of death, and the COVID-19 death rate was highest among Hispanics. Provisional death estimates provide an early indication of shifts in mortality trends. Timely and actionable data can guide public health policies and interventions for populations experiencing higher numbers of deaths that are directly or indirectly associated with the COVID-19 pandemic.



Case Forecasts: This week's national ensemble predicts that the number of newly reported COVID-19 cases will remain stable or have an uncertain trend over the next 4 weeks, with 223,000 to 723,000 new cases likely reported in the week ending April 24, 2021. The state- and territory-level ensemble forecasts predict that over the next 4 weeks, the number of new reported cases per week will likely decrease in 4 jurisdictions, which are indicated in the forecast plots below. Trends in numbers of future reported cases are uncertain or predicted to remain stable in the other states and territories. View previous case forecasts.

Hospitalization Forecasts: This week's national ensemble predicts that the number of new daily confirmed COVID-19 hospital admissions will remain stable or have an uncertain trend over the next 4 weeks, with 2,300 to 8,700 new confirmed COVID-19 hospital admissions likely reported on April 26, 2021. The state- and territory-level ensemble forecasts predict that over the next 4 weeks, the number of daily confirmed COVID-19 hospital admissions will likely increase in 6 jurisdictions and decrease in 12 jurisdictions, which are indicated in the forecast plots below. Trends in numbers of future reported hospital admissions are uncertain or predicted to remain stable in the other states and territories. View previous hospitalization forecasts.

Death Forecasts: This week's national ensemble predicts that the number of newly reported COVID-19 deaths will remain stable or have an uncertain trend over the next 4 weeks, with 3,100 to 10,200 new deaths likely reported in the week ending April 24, 2021. The national ensemble predicts that a total of 565,000 to 585,000 COVID-19 deaths will be reported by this date. The state- and territory-level ensemble forecasts predict that over the next 4 weeks, the number of newly reported deaths per week will likely decrease in 8 jurisdictions, which are indicated in the forecast plots below. Trends in numbers of future reported deaths are uncertain or predicted to remain stable in the other states and territories. View previous death forecasts.

From: Baker, Michael (OS/IEA)
Subject: HHS COVID-19 Update - 3/31
Date: Wednesday, March 31, 2021 7:24:43 PM

Dear Partner:

HHS Office of Intergovernmental and External Affairs COVID-19 update for March 31, 2021:

Highlights from the White House COVID-19 Response Team briefing:

Andy Slavitt:

- **Increasing Vaccination Sites:** The President committed to opening at least 12 more federally run mass vaccination sites, adding to the existing total of 25 sites. Three new sites will open next week in Memphis, Tennessee, Milwaukee, Wisconsin, and Greenbelt, Maryland, in addition to the two we announced on Monday in St. Louis, Missouri, and Gary, Indiana. Each of these sites is the first federally run mass vaccination site in its respective state, and each can administer 3,000 vaccinations a day.
- **Mask Mandates:** We need every governor, mayor, and local leader to maintain or reinstate mask mandates. And we need every American to do their part so that we can win this race and save lives.

Dr. Walensky:

- **Case Update:** CDC's most recent data show that the seven-day average of new cases is slightly less than 62,000 cases per day. We continue to see an increase, and this is almost a 12 percent increase from the seven-day period prior. Hospitalizations also continue to increase. The most recent seven-day average — about 4,900 admissions per day — is up from 4,600 admissions per day in the prior seven-day period. The seven-day average of deaths remains slightly above 900 deaths per day.
- **Inequities in COVID-19 Deaths:** COVID-19 deaths were highest for older adults and males, and were higher, as we previously saw, among American Indian and Alaska Natives, Hispanics, non-Hispanic Blacks, and non-Hispanic Native Hawaiian and Pacific Islander persons compared to non-Hispanic whites. In fact, among nearly all these ethnic and racial minority groups, the COVID-19-related deaths were more than double the death rate of non-Hispanic white persons. Based on the current state of the pandemic, these impacts have remained in 2021, where we continue to see that communities of color account for an outsize portion of these deaths.
- **Number of People Vaccinated:** This week, we will reach 100 million people who have received at least one dose of the COVID-19 vaccine in the United States — a remarkable feat in such a short period of time. Further, over 70 percent of people over age 65, our most vulnerable group, have received at least one vaccine dose. In addition to increasing the number of mass vaccination sites across the country with FEMA, expanding the Federal Retail Pharmacy Program, and ensuring that all Americans have a vaccine site within five miles of their home, we are also activating mobile vaccination units and clinics. CDC is also excited to partner with the Administration for Community Living to support their efforts to get older, at-risk adults and those with disabilities vaccinated.
- **Guidance for Adult Day Service Centers:** CDC updated COVID-19 guidance for adult day

service centers. These populations are at high risk for severe COVID-19 disease, and this guidance will help center administrators and staff protect themselves and adults receiving their services by promoting and engaging in preventive behaviors that reduce COVID-19 spread and help maintain healthy operations and environments of these facilities.

- **B.1.1.7 Variant:** We now have B.1.1.7 (U.K. variant) as 26 percent of the circulating variant across the United states, and it is the predominant strain in at least five regions of the United States. The variant is more transmissible – somewhere between 50 and 70 percent more transmissible than the wild-type strain. Therefore, to the extent that people are not practicing those standard mitigation strategies, we do think that more infections will result because of B.1.1.7. We believe that the current mitigation strategies of masking and distancing would work just as well against the current, the wild-type strain, as they do the B.1.1.7 strain.

Dr. Fauci:

- **Importance of Getting Vaccinated:** We are seeing now immune protection against COVID-19 variants when individuals are vaccinated against the wild-type strain, namely the common virus in society, on two mechanisms: the antibody response that has a spillover effect and the cross-reactivity. Vaccination is not only going to protect us against the common COVID-19 virus in society, but it has the potential, to a greater or lesser degree, to also protect against a range of variants. So, when vaccination becomes available, get vaccinated.

Vaccine Updates

Federal Retail Pharmacy Program: CDC updated their general information on the Federal Retail Pharmacy Program for COVID-19 Vaccination. As the program expands and supply becomes more readily available, the allocation may be adjusted to reflect partner size (number of store locations nationwide), reach (percent of the total US population living within 5 miles of a store location), and ability to vaccinate (throughput). The program, which will scale up to eventually include COVID-19 vaccination at all 40,000+ retail locations, will make it easier for individuals to access free COVID-19 vaccine at a pharmacy in their community, and improve vaccine uptake while decreasing the logistical and operations burden on state, local, and territorial health departments.

Johnson & Johnson Janssen Vaccine: CDC updated their general information on the Johnson & Johnson Vaccine. The J&J/Janssen vaccine is recommended for people aged 18 years and older. Learn more about how CDC is making COVID-19 vaccine recommendations and CDC's vaccine rollout recommendations.

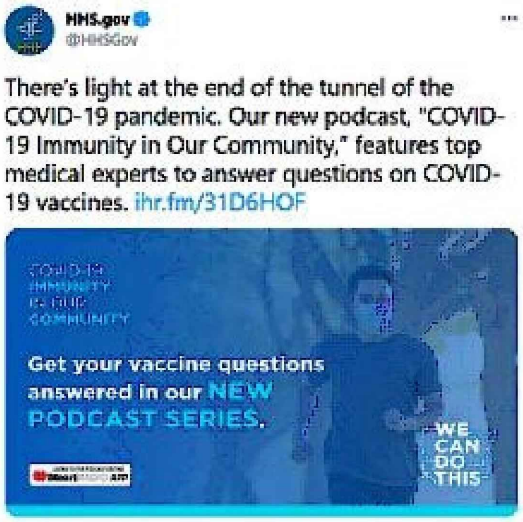
FEMA Vaccination Sites: FEMA announced that it will open a COVID-19 vaccination site in Greenbelt, Maryland on April 7th. The center's capacity is expected to be up to 3,000 shots per day. President Biden also committed to opening sites in Memphis, TN and Milwaukee, WI. These sites join many new FEMA vaccination sites recently announced, including in Boston, Massachusetts; Essex, New Jersey; Norfolk, Virginia; and Yakima, Washington, all of which open today. In the next week, federal communication vaccination center pilot sites in Gary, Indiana and St. Louis, Missouri are scheduled to open, as well. The agency has provided more than $4.47 billion for expenses

related to COVID-19 vaccination at 100% federal cost share.

Peace Corps Assistance in COVID-19 Response: FEMA and the Peace Corps announced a historic partnership to combat the COVID-19 pandemic, marking only the second time in the Peace Corp's history where volunteers will serve a domestic deployment. The Peace Corps will soon begin recruiting for the special domestic deployment through Peace Corps Response, a program that sends in individuals with specialized experienced to short-term service assignment of up to 12 months. Assignments will focus on urgent needs as identified by FEMA and on communities that have been traditionally under-served.

Evaluating Moderna COVID-19 Variant Vaccine: An investigational vaccine designed to protect against the B.1.351 SARS-CoV-2 variant has been administered as part of a new Phase 1 clinical trial evaluating the vaccine candidate's safety and immunogenicity in adult volunteers. The vaccine, known as mRNA-1273.351, was developed by the biotechnology company ModernaTX, Inc., based in Cambridge, Massachusetts. The trial is led and funded by the National Institute of Allergy and Infectious Diseases (NIAID), part of the National Institutes of Health. The trial will enroll approximately 210 healthy adult volunteers at four clinical research sites in the United States that are part of the NIAID-funded Infectious Diseases Clinical Research Consortium (IDCRC).

HHS Podcast: HHS's new podcast, *COVID-19 Immunity in Our Community*, features top medical experts to answer questions on COVID-19 vaccines. Today's episode, "Building Vaccine Trust Within the Black Community," discusses how we can start to rebuild the Black community's trust in the vaccines, in order to achieve herd immunity and, hopefully, regain some sense of normalcy in our everyday lives.



Testing and Treatment

Covid-19 Precautions: CDC updated their COVID-19 page, reiterating that it is critical to keep taking precautions to prevent COVID-19. Learn more about how to protect yourself and others from CDC's recommendations.

COVID-19 Self Testing: CDC and NIH launched an innovative community health initiative called "Say

Yes! COVID Test" starting in two locales, Pitt County, North Carolina, and coming soon to Chattanooga/Hamilton County, Tennessee. As many as 160,000 residents across the two communities will have access to free, rapid antigen tests that they can administer themselves to use three times a week for one month. NIH will provide the tests (also called a home-test or at-home test) and evaluate the effectiveness of the initiative, which aims to determine if frequent self-administered COVID-19 testing helps residents reduce community transmission of SARS-CoV-2, the virus that causes COVID-19 disease.

$147 Million to Expand Production of Swabs: DOD and HHS awarded $146.7 million to Puritan Medical Products on March 26 for renovations in the company's Orlinda, Tenn. facility to increase production capacity of foam tip swabs used in COVID-19 diagnostic tests. Funded through HCEA, the award will help the company boost total production capacity of the swabs to 250 million per month by February 2022.

Monoclonal Antibody Treatments: 3 EUAs for monoclonal antibody (mAb) treatments for mild-to-moderate COVID-19 in at-risk patients: bamlanivimab, casirivimab/imdevimab, and bamlanivimab/etesevimab. Learn more about FDA-authorized monoclonal treatments that can help at-risk patients fight the disease.

HHS Innovative Challenge for Masks: The U.S. Department of Health and Human Services launches $500,000 innovation challenge competition today encouraging American inventors to aid the nation's COVID-19 response by designing effective, comfortable face masks for personal use that resolve the common complaints people have about wearing masks. The contest taps into the nation's creativity and entrepreneurial spirit to help curb the spread of SARS-CoV-2, the virus that causes COVID-19.

Information for Specific Populations

Healthcare Workers: CDC updated their guidance for managing patients with COVID-19, including clinical guidance, home and hospital care, care for special populations, disease severity, and more.

Guidance for Adult Day Services Centers: CDC released guidance for administrators and staff to prevent the spread of COVID-19. Adult Day Services Centers (ADSCs) provide social or health services to community-dwelling adults aged 65 and over and adults of any age living with disability. Older

adults and persons with disabilities are at highest risk for severe illness from COVID-19 including hospitalization, intensive care, and death. ADSC administrators and staff can help protect themselves and program participants (that is, adults attending ADSCs) from COVID-19 by promoting and engaging in preventive behaviors that reduce spread and maintain healthy operations and environments at ADSC facilities. This guidance is meant to supplement — not replace — any Federal, state, tribal, local, or territorial public health and safety laws, rules, and regulations with which adult day services center programs must comply. CDC has also developed recommendations for participants at ADSCs and their caregivers.

Suggestions for Youth and Summer Camps: CDC offers suggestions for ways in which camp administrators can help protect campers, staff, and communication, and prevent the spread of COVID-19. Camp administrators can determine, in collaboration with state and local health officials, whether and how to implement these considerations, making adjustments to meet the unique needs and circumstances of the local community. Implementation should be guided by what is feasible, practical, acceptable, and tailored to the needs of each community. These suggestions are meant to supplement— not replace —any state, local, territorial, or tribal health and safety laws, rules, and regulations with which camps must comply.

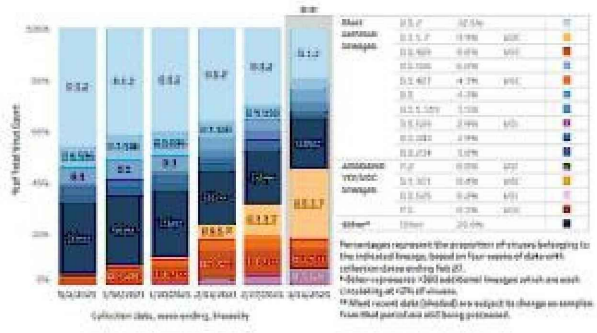
Essential Services for Malaria: CDC updated their key considerations for continuing essential malaria prevention and control activities safely and effectively. These considerations should supplement country Ministry of Health guidance.

CMS Updates

Medicare Fee-for-Service Billing: CMS updated their COVID-19 Frequently Asked Questions on Medicare Fee-for-Service (FFS) Billing. The policies set out in this FAQ are effective for the duration of the public health emergency unless superseded by future legislation. The FAQs in this document supplement the previously released FAQs, 1135 Waiver FAQs.

Research

Variant Proportions in the U.S: CDC's national genomic surveillance program identifies new and emerging SARS-CoV-2 variants to determine implications for COVID-19 diagnostics, treatments, or vaccines authorized for use in the United States. Monitoring the spread of emerging variants in the United States relies on widespread, rapid sequencing. To accelerate sequencing in the United States, CDC has contracted with commercial diagnostic laboratories, and, in partnership with the Association of Public Health Laboratories (APHL), has implemented the National SARS-CoV-2 Strain Surveillance (NS3) program to provide a comprehensive and population-based US surveillance system. This data, along with data from many other sources, are used to inform national and state public health actions related to variants.



COVID-19 2020 Mortality Surveillance: The Morbidity and Mortality Weekly Report (*MMWR*) on death certificate-based ICD-10 diagnosis codes for COVID-19 mortality surveillance addresses that among the 378,048 death certificates from 2020 listing COVID-19, 5.5% listed COVID-19 without codes for any other conditions. Among 357,133 death certificates with at least one other condition, 97% had a co-occurring diagnosis of a plausible chain-of-event condition (e.g., pneumonia or respiratory failure), or a significant contributing condition (e.g., hypertension or diabetes), or both. These findings support the accuracy of COVID-19 mortality surveillance in the United States using official death certificates. High-quality documentation of death certificate diagnoses is essential for an authoritative public record.

Provisional 2020 Mortality Data: The Morbidity and Mortality Weekly Report (*MMWR*) on provisional mortality data in the United States in 2020 addresses that the age-adjusted death rate increased by 15.9% in 2020. Subject: HHS COVID-19 Update - 4/19
Date: Monday, April 19, 2021 6:23:24 PM

Dear Partner:

HHS Office of Intergovernmental and External Affairs COVID-19 update for April 19, 2021:

Renewal of Determination That a Public Health Emergency Exists: As a result of the continued consequences of the Coronavirus Disease 2019 (COVID-19) pandemic, on this date (April 15, 2021) and after consultation with public health officials as necessary, I, Xavier Becerra, Secretary of Health and Human Services, pursuant to the authority vested in me under section 319 of the Public Health Service Act, do hereby renew, effective April 21, 2021, the January 31, 2020, determination by former Secretary Alex M. Azar II, that he previously renewed on April 21, 2020, July 23, 2020, October 2, 2020, and January 7, 2021, that a public health emergency exists and has existed since January 27, 2020, nationwide.

Highlights from Friday and Monday's White House COVID-19 Response Team Briefing

Andy Slavitt

- **Vaccine Availability:** Over 80 percent of seniors have had at least their first shot. Fifty percent of adults in the U.S. have had at least one shot. We now have one thing on our mind: making sure that the other 50 percent know how easy it is to get a shot. If you still think it's too difficult your vaccine, here's what you need to know: the lack of supply, the shortage of locations, the confusing rules are all in the past. That cannot be said enough. There are thousands of more people ready to help you get vaccinated. There are now millions more vaccine doses available and waiting. There are now more than 60,000 safe and convenient places for you to get your shot.
- **Expanded Vaccine Eligibility:** If you are 16 or over, it is your turn to get vaccinated no matter where you live. There's a nine out of ten chance that you are located within five miles of your vaccine shot. For those of you who can't get to a vaccine site, we're helping community-based organizations connect vulnerable Americans with shots. And now, to get resources to healthcare providers serving at-risk populations and to promote equitable distribution of vaccines, today HHS is making $150 million available to community-based healthcare providers to strengthen their efforts to get shots in arms and care for patients with COVID-19.
- **Get Vaccinated:** Join the more than 130 million Americans who have already gotten at least one shot, that's half of all adults. Here's my direct plea to everyone listening: If you haven't already made an appointment to get vaccinated, make one right now. You are eligible. Then, reach out to your family, friends, and neighbors to make sure they can make an appointment too. See what help you can offer them to help those who might need extra assistance.
- **American Rescue Plan:** We are announcing a $1.7 billion investment to bolster the ability of the CDC and state and local public health departments to monitor, track, and defeat emerging threats — whether it's COVID-19 variants today or other viruses in the future — through a process known as genomic sequencing. This significant investment, which is made

possible due to the American Rescue Plan President Biden signed into law last month, is critical in our fight against the new and potentially dangerous variants of COVID-19. Right now, these variants account for nearly half of all COVID-19 cases in the United States, and we need more capacity in our public health system to identify and track these mutations. This funding will enable CDC and states to do more genomic sequencing as we activate the nation's great research capabilities to detect variants earlier and increase our visibility into emerging threats. This investment will give public health officials the chance to react more quickly to prevent and stop the spread. Today's investment also builds on the major investments in testing and genomic sequencing that we made earlier this year. That includes $10 billion of American Rescue Plan funding to support COVID-19 testing in schools, another $2.5 billion to help state and local public health agencies increase testing capacity in underserved and high-risk communities, and nearly $200 million to begin to increase genomic sequencing capacity that this investment comes on top of.

Dr. Walensky

- **Case Update:** Yesterday, CDC reported nearly 60,950 cases of COVID-19. Our seven-day average is up to over 67,440 per day. For context, one month ago, our seven-day average of cases was just over 53,000 per day. The seven-day average of hospital admissions is about 5,460. Sadly, the seven-day average of daily deaths are now increasing, with six consecutive days of increases, to about 695 deaths per day. Sunday, we again saw almost 700 deaths in a single day.
- **Vaccination Update:** So far, we have administered 209 million vaccine doses, with an average daily administration of more than 3 million doses. This brings us to 192.8 million doses in the first 100 days — 96 percent of our goal in 88 days. This means that almost 40 percent of the total population has received at least one dose of a COVID-19 vaccine, and one out of every four people is fully vaccinated. More than 65 percent of people age 65 and older and more than 25 percent of people are fully vaccinated.
- **Vaccine Effectiveness:** First, among nearly 4,000 healthcare personnel, first responders, and essential workers who received the Pfizer and Moderna vaccines, the risk of any infection, asymptomatic and symptomatic, was reduced by 90 percent after receiving the two recommended doses of the vaccine. This study was yet additional evidence that these vaccines are working. The efficacy we saw in clinical trials is now being shown in the real world. Second, last week, we released data on the number of so-called "breakthrough infections," of people who, despite being vaccinated, still tested positive for COVID-19 more than 14 days after they're getting their second vaccine dose. With any vaccine, we expect such rare cases. But so far, out of more than 84 million people who are fully vaccinated, we have only received reports of less than 6,000 breakthrough cases. Although this number is from 43 states and territories and likely an underestimate, it still makes a really important point: These vaccines are working. Of the nearly 6,000 cases, approximately 30 percent had no symptoms at all. Based on these data, here's the bottom line: Getting a vaccine will help protect you, it will help protect others, and it will help us end this pandemic.
- **Rising Cases and Variants:** Some of these increases are as a result of relaxed prevention efforts in states across the country, such as relaxed mask mandates or loosened restrictions on indoor restaurant seating. Another reason for these increases is the continued spread of highly transmissible variants — more than 50 to 70 percent more transmissible — which

makes the race to stop the transmission even more challenging and threatens to overwhelm our healthcare system again in parts of this country. CDC data show that the B117 variant — the variant originally identified in the United Kingdom — represents 44 percent of the virus circulating during the week of March 27th.

- **Johnson & Johnson Update:** After the press briefing on Wednesday (4/14), the Advisory Committee on Immunization Practices — or ACIP — met to discuss the six cases and provide recommendations. I want to thank the ACIP for their thoughtful discussion and their commitment to the science. The recommendation from this group of independent experts for a continued pause will allow additional time to review any additional cases that might come in, and for them to conduct a complete risk assessment and to evaluate the emerging science. ACIP will meet again this Friday, April 23rd, from 11:00 to 5:00 to provide further recommendations.

Dr. Fauci

- **Vaccine Efficacy in Clinical Trials:** This is work that has been done in tens of thousands of people in clinical trials, has been peer reviewed independently, and published in scientific journals. Pfizer and Moderna's efficacy are shown in the New England Journal of Medicine papers. The same holds true for J&J. All three are highly efficacious in clinical trials.
- **Vaccine Efficacy in Real-World Settings:** In over 23,000 employees at the University of Texas, the infection rate was miniscule among vaccinated employees: 0.05 percent. The CDC — looking, again, at the real-world effectiveness — showed that in almost 80,000 person-days with full immunization, 0.04 per 1,000 person-days.
- **Vaccine Safety:** We have an extraordinary capability to monitor safety, as an extremely rare adverse event of 6 individuals among 7,000 was picked up by the surveillance system. Those surveillance systems include ones that follow up on clinical trials, monitoring systems by the CDC, by the FDA, and other monitoring systems. When we say a vaccine is safe, you're talking about an exquisitely sensitive monitoring system.
- **NIH-sponsored Coronavirus Disease 2019 Treatment Guidelines Panel:** This is a panel of individuals co-chaired by Dr. Cliff Lane, who is the Deputy Director of NIAID, but also the Clinical Director of the Institute; Henry Masur, who is the Director of the Critical Care Medicine Unit at NIH; and Roy "Trip" Gulik, who is the Chief of Infectious Diseases at Weill Cornell Medicine in New York City. This panel was established to be able to work, literally in real time, updating guidelines for clinicians and healthcare providers throughout the country and the world on the latest information.

Dr. Murthy

- **American Indians and Alaska Natives:** According to a recent CDC report, American Indians and Alaska Natives were 3.5 times more likely to get COVID than a non-Hispanic, white population. Native people are also more than four times likely to be hospitalized as a result of COVID-19. Despite these challenges, our colleagues working in the Indian health system have heroically administered more than 1 million doses of COVID-19 vaccines. That is a remarkable achievement and a testament to their dedication. Today, the Biden administration is doubling down on this critical work with a — with a $4 billion investment from the American Rescue Plan to the Indian Health Service Tribal and urban Indian health programs. Specifically, these funds will support the following: expanded COVID-19

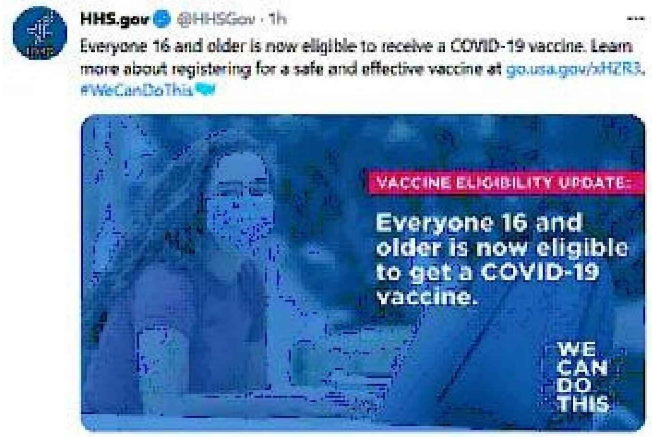
vaccinations, including mobile efforts, large-scale vaccination events, and public education and outreach campaigns; expanded testing, contact tracing, PPE access, and treatment; increased preventive health services for those at higher risk for COVID-19; and increased support for telehealth, the healthcare workforce, and the broader Indian healthcare system, which has been a hard hit during the pandemic due to lost reimbursements for care for both public and private insurance.

- **Increasing Access and Increasing Confidence:** The more people see those around and get vaccinated, particularly family and friends, the more comfortable they become with getting vaccinated themselves. The easier we make it to get vaccinated, the more people will get vaccinated, and that means more people around them would feel comfortable with getting vaccine themselves. That's why access and confidence go hand in hand, and so does safety. This brings me to the second topic. This week you've heard a lot from us about the pause with administering the Johnson & Johnson COVID-19 vaccine. These decisions are never simple, and this one was taken after a very careful assessment of the risks and benefits of calling for such a pause. However, the actions taken by CDC and the FDA this week should give Americans confidence that our safety system is working for them. For some members of the public, uncertainty about getting vaccinated stems from questions about how safe the vaccines are. This week is a reminder that safety is our top priority. Even when an extremely rare safety occurs, our scientific agencies will act with thoroughness and transparency so people can remain confident in the vaccines that are recommended to them.

Vaccine Updates

Vaccine Eligibility: CDC updated the following COVID-19 information pages to include that everyone 16 years of age and older is now eligible to get a COVID-19 vaccine: Vaccine FAQs, How Vaccines Get to You, Key Things to Know, and Vaccine Rollout Recommendations. CDC also updated the following information pages for specific communities to include the expanded eligibility of the COVID-19

vaccine: persons with disabilities, essential workers, healthcare personnel, older adults, and those high risk for severe illness. Get a COVID-19 vaccine as soon as you can. Moreover, CDC updated their general vaccination resources, including information on preparing for your vaccine.



Moderna Vaccine Update: The FDA updated their Moderna COVID-19 Vaccine Frequently Asked Questions page. On December 18, 2020, the U.S. Food and Drug Administration issued an emergency use authorization for the second vaccine for the prevention of coronavirus disease 2019 caused by severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2). The emergency use authorization allows Moderna COVID-19 Vaccine to be distributed in the U.S for use in individuals 18 years of age and older.

Johnson & Johnson Update: On April 13, 2021, CDC and FDA recommended a pause in the use of Johnson & Johnson's Janssen COVID-19 Vaccine. Of the nearly 7 million doses administered so far in the United States, a small number of reports of a rare and severe type of blood clot have been reported in people after receiving the J&J/Janssen COVID-19 Vaccine. All reports occurred among women between the ages of 18 and 48, and symptoms occurred six to 13 days after vaccination. As of April 13, 2021, of the more than 180 million doses administered so far of the Pfizer-BioNTech or Moderna vaccines, no reports matching those associated with the J&J/Janssen vaccine have been received.

FEMA's J&J Update: In alignment with the recommendation from the CDC and FDA to pause the use of the Johnson & Johnson vaccine, FEMA immediately ceased administration of these doses at our federal community vaccination center pilot sites and mobile vaccine units. This pause will continue until further guidance is received from CDC and FDA. We are working with our state partners to determine the path forward and find alternative vaccine options for these sites.

FEMA Vaccination Sites: There are 31 active or temporarily closed federal community vaccination center pilot sites and 20 mobile pop-up sites in 22 states. Additionally, there are 10 mobile vaccination units deployed to eight states. These centers and units have administered more than 3.4 million vaccinations. Working with state governments FEMA will open additional federal community vaccination center pilot sites, which include federal support and supplemental vaccine allocation: this week, federal community vaccination center pilot sites are scheduled to open in Bessemer, Alabama; Tulsa, Oklahoma; and Central Point, Oregon. Last week, FEMA transitioned management

of the federal community vaccination center pilot sites in Los Angeles and Oakland to the state. FEMA continues to support both sites with federal personnel. Additionally, FEMA has obligated more than $936 million to support the state's vaccination efforts. These sites administered more than 671,000 shots since they opened on Feb. 16. FEMA mobile vaccination units have begun operations. These vehicles can bring vaccinations to hard-to-reach and high-risk populations who cannot access services from fixed sites. Ten mobile vaccination units are currently deployed to Connecticut, Maine, Maryland, Nebraska, Nevada, New Mexico, Oregon and South Dakota.

DoD Response to J&J Pause: In a press briefing on Friday, Pentagon Press Secretary John F. Kirby stated that while the DoD intended to use the Johnson & Johnson vaccine to support overseas personnel and their families, the vaccine distribution planners on our COVID task force developed a plan to reallocate doses of the Moderna vaccine to our overseas commands. Each service will now direct a total of approximately 30,000 additional doses of Moderna throughout the month of May. That's around roughly 10,000 per week, beginning May 10th, to overseas locations in European Command, Indo-Pacific Command and Central Command. This will help keep the vaccination efforts right on pace to provide initial doses to over 70 percent of our overseas personnel and their families by the end of May.

COVID-19 Illness After Vaccination: CDC released information regarding what you should know about the possibility of COVID-19 illness after vaccination. COVID-19 vaccines are effective. However, a small percentage of people who are fully vaccinated will still get COVID-19 if they are exposed to the virus that causes it. These are called "vaccine breakthrough cases." This means that while people who have been vaccinated are much less likely to get sick, it may still happen. Experts continue to study how common these cases are.

CDC Weekly Review: On Friday, CDC released their weekly review on the COVID-19 pandemic, including updated numbers of reported cases, SARA-CoV-2 variants, testing, vaccinations, hospitalizations, and deaths. Nationally, COVID-19-related emergency department visits as well as both hospital admissions and current hospitalizations have risen among patients ages 18 to 64 years in recent weeks. The good news is that emergency department visits and hospitalizations among people ages 65 years and older have decreased, likely demonstrating the important role vaccination plays in protecting against COVID-19. As access to vaccines for all Americans increases, we have reason to be hopeful. However, until more of the U.S. population is fully vaccinated, consistent use of prevention strategies, such as universal and correct use of masks, social distancing, and hand washing, will help to limit the spread of SARS-CoV-2, the virus that causes COVID-19. Even if you have been fully vaccinated against COVID-19, you should keep taking these everyday precautions in public places. For more information, view the CDC's data on vaccinations, vaccination demographics, and vaccination trends.

Operational Considerations for Jurisdictions Planning to Operate COVID-19 Vaccination Clinics: CDC released guidance for jurisdictions planning to operate COVID-19 vaccinations clinics. Safe and effective COVID-19 vaccines have been developed and authorized and are being manufactured. Jurisdictions are presently vaccinating people in their target populations. Currently, vaccine is available in growing quantities, with even more vaccine slated to become available soon. Most jurisdictions can provide access to vaccination using a combination of usual vaccination providers

(pharmacies and medical providers/community health centers) and a limited number of public health clinics. Many jurisdictions are planning for and operating multiple, temporary, large- and small-scale vaccination sites, both fixed location and mobile, as strategies to vaccinate more of the population rapidly. The Federal Emergency Management Agency (FEMA) is working with jurisdictions to establish Community Vaccination Centers (CVCs). These CVCs can be established as fixed facilities, drive-through facilities, or as mobile vaccination clinics based on a jurisdiction's needs.

ACIP Jurisdictions Estimated Worker Population: CDC updated their information from the Advisory Committee on Immunization Practices (ACIP) regarding vaccination data among different worker populations.

Testing and Treatment

FDA Revokes EUA for Monoclonal Antibody Bamlanivimab: On Friday, the FDA revoked the emergency use authorization (EUA) that allowed for the investigational monoclonal antibody therapy bamlanivimab, when administered alone, to be used for the treatment of mild-to-moderate COVID-19 in adults and certain pediatric patients. Based on its ongoing analysis of emerging scientific data, specifically the sustained increase of SARS-CoV-2 viral variants that are resistant to bamlanivimab alone resulting in the increased risk for treatment failure, the FDA has determined that the known and potential benefits of bamlanivimab, when administered alone, no longer outweigh the known and potential risks for its authorized use. Therefore, the agency determined that the criteria for issuance of an authorization are no longer met and has revoked the EUA. Instead of administering Bamlanivimab alone, health care providers should consider using the other authorized monoclonal antibody therapies expected to retain activity against the viral variants: Casirivimab and imdevimab, administered together, and Bamlanivimab and etesevimab, administered together.

FDA Testing Update: As of Friday, 363 tests and sample collection devices are authorized by the FDA under emergency use authorizations (EUAs). These include 266 molecular tests and sample collection devices, 75 antibody and other immune response tests, and 22 antigen tests. There are 46 molecular authorizations and one antibody authorization that can be used with home-collected samples. There is one molecular prescription at-home test, two antigen prescription at-home tests, four over-the-counter (OTC) at-home antigen tests, and two OTC molecular tests. The FDA has authorized 7 antigen tests and 2 molecular tests for serial screening programs. The FDA has also authorized 457 revisions to EUA authorizations.

Funding

$150 Million from ARP to Support Community-Based Health Care Providers: HHS announced the availability of nearly $150 million to community-based health care providers to aid their response to COVID-19. These funds will support approximately 100 Health Center Program look-alikes to respond to and mitigate the spread of COVID-19, strengthen vaccination efforts, and enhance health care services and infrastructure in communities across the country. Health center look-alikes (LALs) are community-based health care providers that provide essential primary care services to underserved communities and vulnerable populations but are not Health Center Program grantees. This funding

will be made available through the Health Resources and Services Administration (HRSA) and is part of President Biden's commitment to ensuring equity in the nation's COVID-19 response and vaccination efforts.

Biden Administration Announces $1.7 Billion Investment to Fight COVID-19 Variants: In order to improve the detection, monitoring, and mitigation of COVID-19 variants, the Biden Administration is rapidly investing $1.7 billion from the American Rescue Plan to help states and other jurisdictions more effectively fight these mutations. An essential component of the response to the emerging COVID-19 variants is increasing the country's genomic sequencing — the process by which COVID DNA is decoded and potentially deadly mutations in the virus are detected. With this funding, allocated through the Centers for Disease Control and Prevention (CDC), will help the CDC, states, and other jurisdictions more effectively detect and track variants by scaling genomic sequencing efforts. With the information from sequencing, the CDC and state and local public health leaders can implement known prevention measures to stop the spread.

Biden Administration Invests $4 Billion in ARP Funding to Combat COVID-19 in Indian Country: As part of President Biden's continued efforts to ensure the pandemic response reaches all people and all communities, the Biden Administration is announcing it will invest more than $4 billion to combat COVID-19 in Indian Country. The funding, from the American Rescue Plan, will expand COVID-19 vaccinations, testing, and treatment; increase preventive health services to American Indians and Alaska Natives at higher risk for COVID-19; expand hospitals' and health clinics' ability to serve their communities during the pandemic and beyond; and provide the Indian Health Service (IHS), tribal health programs, and urban Indian health programs with needed funding to make up for lost reimbursements experienced during the pandemic.

FEMA Funeral Assistance Funding: As of today, FEMA has received more than 101,000 funeral assistance applications. Applicants may apply by calling 844-684-6333 (TTY: 800-462-7585) from 9 a.m. to 9 p.m. ET, Monday through Friday. Multilingual services are available. Callers who use a relay

service, videophone or captioned telephones should provide their specific number assigned to that service. It is important that FEMA is able to contact applicants. Please note, phone calls from FEMA may come from an unidentified number. FEMA will not contact anyone until they have called FEMA or have applied for assistance.

Reopening Guidance

Personal and Social Activities: CDC updated their information on engaging in personal and social activities. COVID-19 cases, hospitalizations, and deaths are extremely high across the United States. To decrease your chance of getting and spreading COVID-19, CDC recommends that you do not gather with people who do not live with you at this time. Attending events and gatherings increases your risk of getting and spreading COVID-19. Stay home to protect yourself and others from COVID-19.

Travel Health Notices: CDC updated their travel health notices to provide current risk assessment levels for COVID-19 in different countries.

Considerations for Casinos and Gaming Operations: As some casinos and gaming operations resume in some areas of the United States, CDC offers the following considerations for ways in which casino and gaming operators can help protect staff and customers and slow the spread of COVID-19. Casinos and gaming operations can determine, in collaboration with local, state, territorial, federal, or tribal health officials, whether and how to implement these considerations, making adjustments to meet the needs and circumstances of the local community. Implementation should be guided by what is feasible, practical, acceptable, and tailored to the needs of each community. For more information on bars and restaurants within casinos, please see CDC's Considerations for Restaurants and Bars. These considerations are meant to supplement—not replace—any local, state, territorial, federal, or tribal safety laws, rules, or regulations with which businesses must comply.

Community-Based Organizations: CDC updated their guidance for community-based organizations (CBOs). As some CBOs begin to resume or increase their level of activities, CDC offers considerations for ways these organizations can help protect individuals and communities and slow the spread of coronavirus disease 2019 (COVID-19). COVID-19 cases, hospitalizations, and deaths are extremely high across the United States. To decrease your chance of getting and spreading COVID-19, CDC recommends that you do not gather with people who do not live with you at this time. Attending events and gatherings increases your risk of getting and spreading COVID-19. Stay home to protect yourself and others from COVID-19.

Considerations for Institutions of Higher Education: CDC updated their guidance for institutions of higher education (IHEs). As some IHEs prepare to re-open or keep open in-person learning in the United States, IHEs are faced with the challenge of keeping students, faculty, staff, and volunteers safe due to the coronavirus disease 2019 (COVID-19) pandemic. CDC offers the following considerations for ways that IHEs can help protect students and employees (e.g., faculty, staff, and administrators) and slow the spread of COVID-19. This document refers only to risks related to COVID-19. IHEs may consider implementing several strategies to maintain healthy environments.

Information for Specific Populations

USDA Activities to Contain the COVID-19 Pandemic: The United States Department of Agriculture (USDA) updated their fact sheet on activities to contain the COVID-19 pandemic. USDA has deployed 1,064 disaster, public health specialists to assist with federal response.

Guidance for Large or Extended Families Living in the Same Home: CDC released guidance for large or extended families living in the same home. If you or someone in your household is at increased risk for severe illness from COVID-19, then all family members should act as if they are at increased risk. This can be difficult if space is limited for large or extended families living together. While avoiding close contact with others and isolating someone who is sick can feel lonely, these actions are necessary to reduce the spread of COVID-19 and protect yourself and your household.

DoD Force Health Protection Guidance: On Friday, the Department of Defense released the memorandum for Force Health Protection Guidance (Supplement 20) – Department of Defense Guidance for Personnel Traveling During the Coronavirus Disease 2019 Pandemic. This memorandum applies to official and unofficial travel and proves updated pre- and post-travel guidance for purposes of force health protection (FHP) for Service members, DoD family members, DoD civilian employees, and DoD contractor personnel, as well as fully vaccinated individuals.

Staffing Resources: CDC updated their staffing resources and guidance to strengthen the public health workforce. CDC updated their information regarding the number of CDC COVID-19 response staff deployed across America.

Cleaning, Disinfecting, and Ventilation: CDC updated their resources for cleaning, disinfecting, and ventilation, including an updated toolkit for school administrators on cleaning, disinfection, and hand hygiene. Reducing the risk of exposure to SARS-CoV-2, the virus that causes COVID-19, by cleaning and disinfection is an integral part of opening schools that will require careful planning.

Childhood Vaccination Toolkit for Clinicians: CDC released a toolkit for clinicians on getting children caught up on receiving recommended vaccinations. COVID-19 disrupted both in-person learning and routine well-child visits for many children over the last year. As a result, too many children have fallen behind on receiving recommended vaccines. Children need to get caught up now so that they are protected as they go back to in-person learning and summer camps. Healthcare providers can identify families whose children have missed doses and contact them to schedule appointments. Providers can also let families know what precautions are in place for safe delivery of in-person services.

Health Departments and Public Safety Partners: CDC updated their information for health departments and public health partners to help educate communities and promote COVID-19 vaccination.

Manufacturing Workers & Employers: CDC and the Occupational Safety and Health Administration (OSHA) updated their guidance for manufacturing workers and employers.

Acute Care Delivery at Home Tip Sheet: HHS ASPR Technical Resources, Assistance Center, and Information Exchange (TRACIE) released a tip sheet providing an overview of characteristics of various types of acute care delivery at home programs to help healthcare providers better understand this care model. Some healthcare providers and systems have been providing hospital-level care in patient's homes for years; others have implemented acute care delivery at home models in response to overcrowding at hospitals due to COVID-19.

COVID-19 and Healthcare Professional Stress and Resilience: HHS ASPR Technical Resources, Assistance Center, and Information Exchange (TRACIE) released Issue 12 of The Exchange, which examines the impact of COVID-19 on healthcare professionals. The issue focuses on three categories: understanding acute and chronic stressors in the healthcare worker population, identifying at-risk employees, and promising practices in building resilience.

COVID-19 Healthcare Delivery Impacts: HHS ASPR Technical Resources, Assistance Center, and Information Exchange (TRACIE) updated their tip sheet to help healthcare system planners prepare to mitigate potential healthcare delivery impacts.

Strategies to Help Combat the Coronavirus Blues: The COVID-19 Schools Task Force, FEMA Region VII, and HHS Region 7 released a document summarizing the contents of the Mind Over Matter Resource Guide. This guide can be used to support messaging for college and university campus communities to help combat COVID-19 fatigue and promote general wellness, both during and after the pandemic.

Temporary Halt in Residential Evictions to Prevent the Further Spread of COVID-19: On April 2, 2021, the CDC released a declaration determining that the eviction of tenants could be detrimental to public health control measures to slow the spread of COVID-19. View the posted order, as well as eviction protection declaration forms in English and Spanish. Please visit HUD's COVID-19 Emergency Information for Housing Counselors for additional resources and information.

United States Coast Guard Vaccine FAQs: The United States Coast Guard updated their Frequently Asked Questions page about the vaccine, and specific questions related to Coast Guard administered vaccines.

Older Adults: CDC updated their information for older adults, who are at a greater risk of hospitalization or dying if diagnosed with COVID-19. The risk for severe illness with COVID-19 increases with age, with older adults at highest risk. If you have a family member or friend who lives in a nursing home, assisted living facility, or other type of senior living or retirement community, you may be concerned about COVID-19. To protect friends and family members who live in these communities, CDC has issued updated recommendations for visitations at post-acute facilities. These recommendations align with the Centers for Medicare and Medicaid Services (CMS) guidance for visitations under various circumstances.

Caring for Someone Sick: CDC updated their guidance for caregivers in non-healthcare settings. Cleaning with a household cleaner that contains soap or detergent reduces the amount of germs on

surfaces and objects and decreases risk of infection from surfaces. In most situations, cleaning alone removes most virus particles on surfaces.

People at Increased Risk: CDC updated their resources available for people at increased risk, and for other people who need to take extra precautions.

Non-Emergency Transportation for Tribal Communities: CDC updated their guidance on non-emergency transportation for tribal communities. Tribal community members may need to regularly share personal vehicles with members outside of their own households. They may also need to use personal vehicles to transport people who are visibly sick. In addition, tribal organizations may provide medical transportation to their community members using non-emergency vehicles (cars or vans, for example). CDC outlines precautions that can be considered to minimize risk of spreading COVID-19 when sharing personal vehicles.

Implementing Screening and Treatment of Unhealthy Alcohol Use During COVID-19: The Agency for Healthcare Research and Quality (AHRQ) posted an article on implementing screening and treatment of unhealthy alcohol use during COVID-19. Since the onset of the COVID-19 pandemic in March 2020, alcohol sales have increased dramatically in many States across the country and rates of unhealthy alcohol use are rising in parallel. Unhealthy alcohol use, which refers to the full spectrum of alcohol misuse from risky or hazardous drinking to alcohol use disorder, is associated with adverse consequences, including poorer physical and mental health outcomes as well as negative socioeconomic effects. AHRQ's EvidenceNow: Managing Unhealthy Alcohol Use Initiative represents an important opportunity to help clinicians support many patients receive the appropriate diagnosis, counseling, and treatment for unhealthy alcohol use by implementing the best patient-centered outcomes research findings available to improve health.

Sprayers Safety Precautions: CDC updated their information regarding how to select cleaners, disinfectants, and application methods for use in facilities, businesses, and public indoor spaces to ensure that you can clean and disinfect safely and effectively. In most situations, cleaning surfaces (using soap or detergent) is enough to reduce SAR-CoV-2, the virus that causes COVID-19. Clean surfaces before disinfecting.

CMS Updates

Encouraging Latino Consumers to Enroll in Health Insurance Coverage: Today, HHS Secretary Xavier Becerra announced commitments from national organizations to support Latino outreach and enrollment efforts during the current Special Enrollment Period (SEP) made available on HealthCare.gov by President Biden due to the COVID-19 Public Health Emergency (English | Spanish). As part of the Latino Week of Action April 18 - 24, these organizations and HHS will share information with Latino consumers and use social media to encourage them to enroll in affordable, quality health plans through HealthCare.gov. Access to affordable health coverage and care is particularly important for Latinos in the US because 22% of non-elderly Latinos are uninsured, a rate almost 2.5 times that of White Americans. During this week and beyond, HHS and many organizations will send targeted messages, participate in earned media opportunities, and amplify the SEP through social media channels to raise awareness about the coverage options available

through HealthCare.gov for the Latino community. The Centers for Medicare & Medicaid Services (CMS) has also launched an outreach and an educational campaign, which includes broadcast and digital advertising and educates through email and text messages in both Spanish and English.

PPE

Guidance for Wearing Masks: CDC updated their guidance for wearing masks. Masks are a simple barrier to help prevent your respiratory droplets from reaching others. Studies show that masks reduce the spray of droplets when worn over the nose and mouth. CDC also updated their information on the different types of masks. CDC recommends that N95 respirators should be prioritized for protection against COVID-19 in healthcare settings. Essential workers and workers who routinely wore respirators before the pandemic should continue wearing N95 respirators. As N95s become available they can be worn in non-healthcare settings.

Research

Large Clinical Trial to Study Repurposed Drugs to Treat COVID-19 Symptoms: The NIH will fund a large, randomized, placebo-controlled Phase 3 clinical trial to test several existing prescription and over-the-counter medications for people to self-administer to treat symptoms of COVID-19. Part of the Accelerating COVID-19 Therapeutic Interventions and Vaccines (ACTIV) public–private partnership, the ACTIV-6 trial aims to provide evidence-based treatment options for the majority of adult patients with COVID-19 who have mild-to-moderate symptoms and are not sick enough to be hospitalized. NIH will provide an initial investment of $155 million in funding for the trial.

Experimental Antiviral for COVID-19 Effective in Hamster Study: The experimental antiviral drug MK-4482 significantly decreased levels of virus and disease damage in the lungs of hamsters treated for SARS-CoV-2 infection, according to a new study from NIH scientists. SARS-CoV-2 is the virus that causes COVID-19. MK-4482, delivered orally, is now in human clinical trials. Remdesivir, an antiviral drug already approved by the U.S. Food and Drug Administration for use against COVID-19, must be provided intravenously, making its use primarily limited to clinical settings. In their study, published in the journal *Nature Communications*, the scientists found MK-4482 treatment effective when provided up to 12 hours before or 12 hours after infecting the hamsters with SARS-CoV-2. These data suggest that MK-4482 treatment potentially could mitigate high-risk exposures to SARS-CoV-2 and might be used to treat established SARS-CoV-2 infection alone or possibly in combination with other agents.

Public Health Investigations of COVID-19 Vaccine Breakthrough Cases: CDC released a case investigation protocol on public health investigations of COVID-19 vaccine breakthrough cases. The U.S. Food and Drug Administration (FDA) has issued Emergency Use Authorization (EUA) for three COVID-19 vaccines. In large, randomized controlled trials, each vaccine was safe and efficacious for preventing symptomatic, laboratory-confirmed COVID-19 disease. There were no statistically significant differences in efficacy by age, gender, race, or comorbidities. Despite the high level of efficacy, a small number of breakthrough cases occurred. The phase 3 studies have not yet identified risk factors for vaccine breakthrough cases; however, approximately 44,000 people received the FDA-authorized vaccines during the clinical trials and follow-up is ongoing. This protocol can be used

to guide public health investigations of COVID-19 vaccine breakthrough cases. We aim to capture both symptomatic and asymptomatic infections. Characterization of vaccine breakthrough cases could provide the first indication that a vaccine is less effective in certain demographic groups or that vaccine-induced immunity is waning, and booster doses may be needed. Clustering of cases among vaccinated persons by time, geographic area, or lot could help identify an issue in manufacturing, shipping, handling, or administration. Evaluating SARS-CoV-2 strains that cause vaccine breakthrough cases provides one way to monitor for variant strains that could result in lower vaccine efficacy.

COVID-19 and the Changing Healthcare Delivery Landscape: HHS ASPR Technical Resources, Assistance Center, and Information Exchange (TRACIE) released a study highlighting the impact of COVID-19 on healthcare delivery. The study examines supply chain, patients delaying emergency care, the delay of elective procedures, and financial impacts to the healthcare system.

COVID-19 Science Update: CDC released their weekly COVID-19 Science Update. This week's issue includes, but is not limited to, research on the following: the association of sociodemographic factors and blood group type with risk of COVID-19, increased household secondary attack rates with variants of concern**,** and the epidemiologic evidence for airborne transmission of SARS-CoV-2 during church singing.

Hospitalization and Death by Race/Ethnicity: CDC updated their information on hospitalization and death rates by race/ethnicity. Race and ethnicity are risk markers for other underlying conditions that affect health including socioeconomic status, access to health care, and exposure to the virus related to occupation, e.g., frontline, essential, and critical infrastructure workers.

Marvin Figueroa, Director
Office of Intergovernmental and External Affairs
U.S. Department of Health and Human Services
Washington, D.C.

From: HHS IEA (OS/IEA)
To: HHS IEA (OS/IEA)
Subject: HHS COVID-19 Update - 8/5
Date: Thursday, August 5, 2021 9:08:37 PM

Dear Partner:

HHS Office of Intergovernmental and External Affairs COVID-19 update for August 5, 2021:

Highlights from President Biden's August 3rd Remarks on Fighting the COVID-19 Pandemic

- **Delta Variant and Transmissibility:** President Biden stated that because the Delta variant is highly transmissible, it is causing a new wave of cases, accounting for over 80% of cases in the United States today, with a likelihood of an increase in cases in the future. Biden states that the predicted increase is "a largely preventable tragedy that will get worse before it gets better."
- **COVID-19 and Vaccines:** Biden stated that the best way to protect yourself from COVID-19 is to get vaccinated; if vaccinated, it is highly unlikely to get COVID-19 and, if you contract the virus, you will likely experience mild symptoms if any. The data shows that the vast majority of cases, hospitalizations, and deaths due to COVID-19 are from the unvaccinated population. Biden commented, "The best line of defense against the virus is the vaccine… We have a pandemic of the unvaccinated."
- **Data of Increased Vaccination:** Biden reported a 55 percent increase in the average number of new people getting vaccinated every day in the past two weeks, and the highest seven-day total in a month. The eight states with the highest current case rates have seen a doubling of the number of people newly vaccinated each day. Biden declared that "we have to continue our aggressive efforts to vaccinate the unvaccinated."
- **Federal Steps to Incentivize Vaccination:** Biden outlined steps taken by his administration and other government-affiliated organizations to increase vaccinations. Places that have offered $100 to get vaccinated have seen an uptick of 25 percent of daily vaccination rates. Biden reiterated his plan to reimburse small- and medium-sized businesses who give paid time off to their employees to get vaccinated, to work with the Pentagon on adding COVID-19 to required vaccines for troops, and to require healthcare workers in the Department of Veterans Affairs to be vaccinated. Biden stated that these restrictions are "tough, unpopular steps to keep people safe and our economy strong."
- **States' Lack of Action on COVID:** President Biden stated that many states' harmful laws on mask mandates is disappointing and harmful; seven states have both banned mask mandates statewide and in schools while many students are not yet eligible to be vaccinated. The president cited these measures and accompanying low vaccination rates as the cause of the rise of cases, citing Florida and Texas as accounting for a third of all new cases. Biden declared that "COVID-19 is a national challenge, and we must come together — we have to come together — all of us together, as a country, to solve it."
- **Vaccination Abroad:** Biden stated that a global attack on the virus is in the United States' national interest. New, potentially more dangerous variants (such as the Delta variant) can mutate outside of the United States and threaten the country if a global approach is not taken. Biden highlighted American action in global vaccination, announcing that he will

purchase and donate 500 million doses from Pfizer; he also stated that the U.S. has domestically manufactured 110 million doses for global vaccination. Biden reiterated that he's "been very clear-eyed that we need to attack this virus globally, not just at home, because it's in America's self-interest to do so."

Highlights from the White House COVID-19 Response Team Briefing

Jeff Zients

- **Update on Progress in the Fight Against COVID:** Mr. Zients highlighted how, driven by the Delta variant, cases are continuing to rise, especially among the unvaccinated. Zients states that over the past seven days, seven states — among the leaders in unvaccinated percentage — accounted for half of the new cases and hospitalizations despite holding less than a quarter of US population; vaccines are the best way to protect against COVID. Vaccinations are on the rise; the past 24 hours served as the greatest number of vaccinations in a single day since July 3 and the daily average of vaccinations has increased for the fourth week in a row. Zients said that "clearly Americans are seeing the impact of being unvaccinated and unprotected and they respond by doing their part, rolling up their sleeve, and getting vaccinated."
- **Action on Vaccination Requirements:** Mr. Zients reiterated President Biden's call for federal workers and contractors to get vaccinated and notes the further requests for similar requirements in the private sector. Zients stated that over 650 colleges and universities are requiring students and staff on campus to be vaccinated and nationwide, over 100 hospitals and healthcare systems are requiring healthcare professionals to be vaccinated. "America's businesses, large and small, universities and medical schools, and many other institutions are stepping up on vaccination requirements and our message is quite simple: we support these vaccination requirements to protect workers, communities, and the country," Zients said.
- **COVID-19 Surge Response Teams:** Mr. Zients stated that the COVID-19 Surge Response Teams are in 16 states and addressing each state's specific needs, whether that is increased testing, mobile vaccination clinics, or hospital capacity. Zients noted the hundreds of federal employees deployed to the states that are assisting in combatting COVID. "Our whole of government response," Zients said, "will continue its relentless efforts to end this pandemic and deliver progress each and every day."

Dr. Walensky

- **COVID-19 Case Update:** Dr. Walensky stated that on August 3, the CDC reported 103,455 new cases of COVID with a 7-day average of about 89,463 cases per day, representing an increase of 43.3% from last week. Hospitalizations and deaths from this week compared to the last increased significantly; deaths rose 39.3 percent. Walensky stated that 83% of counties within the United States are experiencing moderate or high transmission. Those at high risk remain people who have not yet been vaccinated. Walensky said that "now is the time to get vaccinated. We know these vaccines are working and we know that they save lives."

Dr. Fauci

- **Vaccine Hesitancy and Concern Over Development Speed:** In response to Americans

worried about the speed of the development of the vaccine, Dr. Fauci outlined the various ways in which the vaccine is safe and not rushed: the investment of logistics and resources, the decades of prior research (both in platform technology and immunogen), the non-sequential investment in vaccine development, and the reuse of clinical trial sites originally built for HIV and influenza further sped the development. Fauci said that the vaccine "did not go too fast; it was a major investment both in the logistics, the resources, and the clinical and basic research."

Dr. Murthy

- **Vaccine Efficacy:** Dr. Murthy stated that the COVID-19 vaccines protect against the Delta variant, both at reducing the risk of infection and the severity if infected. Murthy said that "breakthrough infections of vaccinated people are the exception, not the rule."
- **Meeting of Living Surgeons General:** Yesterday, Dr. Murthy met with the living former surgeons general to discuss the vaccination effort with equity being at the forefront. The meeting covered health misinformation, ensuring that communities of color and rural areas are not left behind, and engaging with trusted community messengers. Murthy stated that "this gathering of surgeons general reflected the diversity of our nation, and it was emblematic of what we have to do together to defeat the virus."

Testing and Treatment

FDA Testing Updates: As of August 3, 398 tests and sample collection devices are authorized by the FDA under emergency use authorizations (EUAs). These include 279 molecular tests and sample collection devices, 87 antibody and other immune response tests and 32 antigen tests. There are 53 molecular authorizations and one antibody authorization that can be used with home-collected samples. There is one molecular prescription at-home test, three antigen prescription at-home tests, six antigen over-the-counter (OTC) at-home tests and two molecular OTC at-home tests. The FDA has authorized 13 antigen tests and eight molecular tests for serial screening programs. The FDA has also authorized 595 revisions to EUA authorizations.

Funding

FEMA COVID-19 Funeral Assistance Tops $888 Million: FEMA announced that COVID-19 funeral assistance has now increased to over $888 million to more than 135,000 people to assist with COVID-19-related funeral costs for deaths occurring on or after Jan. 20, 2020. The assistance, easing financial stress, comes from the Coronavirus Response and Relief Supplemental Appropriations Act of 2021 and the American Rescue Plan Act of 2021. Eligibility determinations are not driven by state/location; instead, they are based on when the applicant submits all required documentation.

Information for Specific Populations

CDC Issues Eviction Order in Areas of Substantial and High Transmission: CDC announced that Director Dr. Rochelle Walensky signed an order on August 3rd determining the evictions of tenants for failure to make rent or housing payments could be detrimental to public health control measures to slow the spread of SARS-CoV-2, the virus that causes COVID-19. This order will expire on October 3, 2021 and applies in United States counties experiencing substantial and high levels of community

transmission levels of SARS-CoV-2: This temporary protection from eviction in counties with heightened levels of community transmission exists in order to respond to recent, unexpected developments in the trajectory of the COVID-19 pandemic, including the rise of the Delta variant. It is intended to target specific areas of the country where cases are rapidly increasing, which likely would be exacerbated by mass evictions.

CDC Extends Order at the Southern and Northern Land Borders: The Centers for Disease Control and Prevention (CDC) has issued an order under Sections 362 and 365 of the Public Health Service Act, and associated implementing regulations, that temporarily suspends the introduction of certain noncitizens. The order is based on the Director's determination that introduction of such noncitizens, regardless of their country of origin, migrating through Canada and Mexico into the United States creates a serious danger of the introduction of COVID-19 into the United States, and the danger is so increased by the introduction of such noncitizens that a temporary suspension is necessary to protect the public health. Unaccompanied noncitizen children already excepted under a July 16, 2021, order, remain excepted from the order's coverage.

Readout of the Sixth Covid-19 Health Equity Task Force Meeting: HHS released a readout on Friday, July 30's, sixth COVID-19 Health Equity Task Force meeting to consider interim recommendations addressing future pandemic preparedness. Task Force Members discussed and voted favorably on interim recommendations, including but not limited to exploring strategies that meet local and regional staffing needs during pandemic response, expanding adequate and evidence-based healthcare access and funding infrastructure to treat patients in congregate settings, establishing and adjusting national standards as well as strategically target funding for water, sewage, and air quality to where it's needed, based on data from reliable equity indicators.

What to Consider When Planning to Operate a COVID-19 Vaccine Clinic: CDC released information regarding what to consider when planning to operate a COVID-19 vaccine clinic. The informational sheet provides guidance to conduct a gap analysis to determine specific geographic areas and specific populations that may benefit from additional sites to improve access to vaccination, work with community leaders and trusted members of the community to help with the success of vaccination clinics, and assess the optimal time to activate a vaccination site and consider the benefits of focused vaccination efforts. The page also page also provides a checklist of best practices for vaccination clinics held at satellite, temporary, or off-site locations.

Know What to Expect at Your Child's K- 12 School or Child Care Program: CDC released information for parents on what to expect for K-12 school or childcare programs. The page provides information for factors that a child's school or care program may consider, prevention strategies for these programs, and vaccination and masking.

CMS Updates

Fiscal Year (FY) 2022 Medicare Hospital Inpatient Prospective Payment System (IPPS) and Long Term Care Hospital (LTCH) Rates Final Rule (CMS-1752-F): CMS announced that, on August 2, 2021, it issued the final rule for fiscal year (FY) 2022 Medicare Hospital Inpatient Prospective Payment System (IPPS) and Long-Term Care Hospital (LTCH) Prospective Payment System (PPS). The final rule

updates Medicare payment policies and rates for operating and capital-related costs of acute care hospitals and for certain hospitals and hospital units excluded from the IPPS for FY 2022. The policies in this IPPS and LTCH PPS final rule build on key priorities to close health care equity gaps and support greater access to life-saving diagnostics and therapies during the COVID-19 public health emergency (PHE) and beyond. To continue to mitigate potential financial disincentives for hospitals to provide new COVID-19 treatments and to minimize any potential payment disruption immediately following the end of the PHE, CMS is extending the New COVID-19 Treatment Add-on Payment for eligible COVID-19 products through the end of the fiscal year in which the PHE ends.

Research

Outbreak of SARS-CoV-2 Infections, Including COVID-19 Vaccine Breakthrough Infections, Associated with Large Public Gatherings: CDC released an *MMWR* on the outbreak of SARS-CoV-2 infections, including COVID-19 vaccine breakthrough infections, associated with large public gatherings in Barnstable County, Massachusetts in July, 2021. This report was released as an *MMWR* Early Release on July 30. Variants of SARS-CoV-2 continue to emerge. The B.1.617.2 (Delta) variant is highly transmissible. In July 2021, following multiple large public events in a Barnstable County, Massachusetts, town, 469 COVID-19 cases were identified among Massachusetts residents who had traveled to the town during July 3–17; 346 (74%) occurred in fully vaccinated persons. Testing identified the Delta variant in 90% of specimens from 133 patients. Cycle threshold values were similar among specimens from patients who were fully vaccinated and those who were not. Jurisdictions might consider expanded prevention strategies, including universal masking in indoor public settings, particularly for large public gatherings that include travelers from many areas with differing levels of SARS-CoV-2 transmission. CDC Director Rachelle Walensky, MD, MPH, released an accompanying statement on the MMWR.

COVID-19 Vaccine Safety in Adolescents Aged 12–17: CDC released an *MMWR* on COVID-19 vaccine safety in adolescents aged 12–17 in the United States from December 14, 2020 - July 16, 2021. This report was released as an *MMWR* Early Release on July 30. In preauthorization trials of the Pfizer-BioNTech COVID-19 vaccine, adolescents aged 12–17 years reported local and systemic mild and moderate reactions. Myocarditis has been observed after vaccination with mRNA vaccines in post authorization monitoring. Local and systemic reactions after vaccination with Pfizer-BioNTech vaccine were commonly reported by adolescents aged 12–17 years to U.S. vaccine safety monitoring systems, especially after dose 2. A small proportion of these reactions are consistent with myocarditis. Mild local and systemic reactions are common among adolescents following Pfizer-BioNTech vaccine, and serious adverse events are rare. The Advisory Committee on Immunization Practices conducted a risk-benefit assessment and continues to recommend the Pfizer-BioNTech COVID-19 vaccine for all persons aged ≥12 years.

Full-dose Blood Thinners Reduce the Need for Organ Support in Moderately Ill COVID-19 Patients, but Not in Critically Ill Patients: NIH released a report on full-dose blood thinners reducing the need for organ support in moderately ill COVID-19 patients, but not critically ill patients. In April 2020, hospitalized COVID-19 patients received either a low or full dose of heparin, a blood thinner, for up to 14 days after enrollment. By December 2020, interim results indicated that full-dose anticoagulation did not reduce the need for organ support and may even cause harm in critically ill

patients. However, one month later, interim results indicated that full doses of heparin likely benefited moderately ill patients. The full study can be viewed here.

Long-Term Study of Brain Development Records Pandemic Life: NIH released a report on the analysis of adolescent brains to examine the long-term health impacts caused by the COVID-19 pandemic and shutdowns. Through surveys and tests, the study, from Adolescent Brain Cognitive Development (ABCD) Study and funded by NIH, is capturing the impact of the COVID-19 pandemic on children using an MRI.

Case Forecasts: This week's national ensemble predicts that 350,000 to 1,800,000 new cases will likely be reported in the week ending August 28, 2021. Over the last several weeks, more reported cases have fallen outside of the forecasted prediction intervals than expected. This suggests that current forecast prediction intervals may not capture the full range of uncertainty. Because of this, case forecasts for the coming weeks should be interpreted with caution. View previous case forecasts.

Hospitalization Forecasts: This week's national ensemble predicts that the number of new daily confirmed COVID-19 hospital admissions will likely increase over the next 4 weeks, with 6,700 to 24,000 new confirmed COVID-19 hospital admissions likely reported on August 30, 2021. The state- and territory-level ensemble forecasts predict that over the next 4 weeks, the number of daily confirmed COVID-19 hospital admissions will likely increase in 38 jurisdictions, which are indicated in the forecast plots below. Trends in numbers of future reported hospital admissions are uncertain or predicted to remain stable in the other states and territories. View previous hospitalization forecasts.

Death Forecasts: This week's national ensemble predicts that the number of newly reported COVID-19 deaths will likely increase over the next 4 weeks, with 2,300 to 9,100 new deaths likely reported in the week ending August 28, 2021. The national ensemble predicts that a total of 624,000 to 642,000 COVID-19 deaths will be reported by this date. The state- and territory-level ensemble forecasts predict that over the next 4 weeks, the number of newly reported deaths per week will likely increase in 17 jurisdictions, which are indicated in the forecast plots below. Trends in numbers of future reported deaths are uncertain or predicted to remain stable in the other states and territories. View previous death forecasts.

Top Military Medical Doctor Predicts Coronavirus Longevity: DoD released a report on the analysis of COVID-19 longevity according to director of Defense Health Agency, Army Lt. Gen. Ronald J. Place. Place stated his belief that COVID-19 and other such coronaviruses likely will stay in the environment and continue to mutate. Vaccines serve as the way to protect oneself from this lingering threat.

Marvin Figueroa, Director
Office of Intergovernmental and External Affairs
U.S. Department of Health and Human Services
Washington, D.C.

Dear Health Department Colleagues,

Please see this week's highlights below. We have several items of note.

Additionally, get inspired! COVID-19 responder stories tell more about these public health heroes just like you!

Is there anything specific that you would like to see featured? Please do not hesitate to email any questions and suggestions to our Health Department Section Communications Team: eocevent501@cdc.gov

Thank you for all your continuing dedication to your communities,
STLT Support Task Force, Health Department Section

New + Notable

SARS-COV-2 Variants

Multiple variants of the virus that causes COVID-19 are circulating globally and within the United States. To date, four variants have been classified as a variant of concern (VOC). The variant of the virus that caused the first U.S. COVID-19 cases in January 2020 no longer circulates in the country. As new variants of the virus emerge and others fade away, the proportion of variants circulating in the United States will continue to rise and fall. Nationally, the proportion of cases attributed to the new VOCs are:

- B.1.617.2 (Delta) is predicted to increase to 51.7%, becoming the predominant lineage in the U.S.
- B.1.1.7 (Alpha) proportion is predicted to decrease to 28.7%.
- P.1 (Gamma) proportion is predicted to decrease to 8.9%.
- B.1.351 (Beta) is predicted to decrease slightly to 0.2%.
- B.1.617.2 (Delta) will increase in all HHS regions and be more than 70% in regions 7 and 8.
- B.1.1.7 (Alpha) is predicted to be less than 50% in all HHS regions.
- P.1 (Gamma) is predicted to be more than 10% in regions 1, 4, 5, 9, and 10.
- B.1.351 (Beta) is predicted to be less than or equal to 0.5% in all HHS regions.

Introducing Vira, the Vax Chatbot

COVID-19 vaccination is lagging in young adults nationally. Vira, the Vax Chatbot is designed to support and meet young people where they are with simple answers to common COVID-19 vaccine questions. Vira is adaptive, learning by listening to your questions and feedback to help scientists respond to emerging questions.

Vira was developed by the International Vaccine Access Center at the Johns Hopkins Bloomberg School of Public Health with experts from the Bloomberg School's Department of International Health and Johns Hopkins Whiting School of Engineering. Vira's knowledge base from Johns Hopkins vaccine scientists was developed with support from the COVID-19 Training Initiative, with funding from Bloomberg Philanthropies.

VaxChat, powered by IBM, was inspired by previous research that showed automated chatbots using AI can effectively communicate credible information and support health behavior changes.

Vira can help health workers or anyone who seeks help fielding questions from family and friends about the COVID-19 vaccines. Check out Vira, a vax chatbot that's here to help you and your loved ones make an informed decision. Explore at VaxChat.org. This information is provided by Johns Hopkins.

Vaccine Updates

A Needle Today Helps Keep COVID Away

The highly transmissible B.1.617.2 (Delta) variant continues to spread across the United States at a rapid pace. Early data suggest that B.1.617.2 now makes up more than 50% of COVID-19 cases. In some parts of the country, this percentage is even higher, especially in areas with low vaccination rates. This rapid rise is concerning and threatens the progress the United States has made toward ending the pandemic.

- As of July 8, 2021, 183.2 million people, or 55.2% of the total U.S. population, have received at least one dose of a COVID-19 vaccine. About 158.3 million people, or 47.7% of the total U.S. population, have been fully vaccinated.* However, cases and hospitalizations are on the rise in areas with low vaccination coverage. Data from recent weeks show that adults ages 18–49 account for more than 40% of COVID-19-associated hospitalizations.
- Fortunately, we have safe and effective vaccines that prevent severe disease, hospitalization, and death. People who are fully vaccinated are protected from B.1.617.2. We are turning the corner on the pandemic and starting to get back to normal. However, stopping the spread of B.1.617.2 requires all of us doing our part.

For more information, please see the current COVID Tracker Weekly Review and/or sign up for the newsletter.

* People are considered fully vaccinated 2 weeks after their second dose in a 2-dose series (such as the Pfizer or Moderna vaccines), or 2 weeks after a single-dose vaccine (such as Johnson & Johnson's Janssen vaccine).

Transfer of Vaccine Outside the U.S.

Additional information is often requested on the transfer of vaccine across international borders. Here are some key points for addressing this issue within your region, state, or community. Currently, it is not possible for states or awardees to transfer COVID-19 vaccine across international borders for the following reasons:

- Vaccine contracts with manufacturers prohibit the use, or authorization of use, of vaccines outside the U.S. and its territories (excluding Departments of Defense and State foreign compounds) which are covered under the PREP Act. Sharing of vaccine internationally would violate these contracts.
- USG limits donations of federal pharmaceutical assets to products that allow the U.S. to maintain pedigree knowledge to attest to the proper storage and handling of the vaccine. Even though COVID-19 vaccine is in state possession, it is still considered a federal asset (similar to vaccine in the VFC program).
- Countries are hesitant to accept vaccine that has been maintained outside of federally monitored storage and handling guidelines. Direct distribution of vaccine from USG helps ensure the safety of vaccine to foreign governments and limits liability to states.

CDC is working tirelessly to assist the U.S. Government with transfer and distribution of vaccine to foreign governments directly from federal depots. Through this channel of vaccine supply chain management, the global distribution of vaccine is both efficient and safe. Although contributing to this effort is desirable, the CDC appreciates your adherence to the policy at this time.

The Advisory Committee on Immunization Practices will meet next Wednesday, July 22 from 11:00 to 4:00 PM EST. Draft agenda can be found here.

President Biden Participated in Press Events This Week

President Biden participated in a joint press conference with German Chancellor Angela Merkel on **Thursday**,

July 15, who visited the White House for an official working visit. Please look out for a recording of this press briefing as they discussed the COVID-19 pandemic, including their shared desire to provide access to vaccines around the world, and to shore up global health security.

A press briefing by White House COVID-19 Response Team and Public Health Officials was held at **11:00 am, July 16**. Archived press briefings can be accessed here: Press Briefings Archives | The White House

Dr. Dobbs,
Thanks so much again for coming to our Rotary Club meeting. Hope you enjoyed it as much as the Rotarians did! I just attended a Zoom meeting with CDC in regards to Covid-19 Molecular Surveillance and these documents were distributed. Please feel free to share at will inside MSHD.
I am about to send the email out to Mrs. Fanning asking for the support to have my Orientation and the first 3 days through telework given the traveling circumstances.
Best and kind regards,
NA.

Medicaid News & Updates

Mississippi lawmakers hear from doctors on what they'd

like to see in next Medicaid tech bill

October 12, WLBT, Courtney Ann Jackson - While Medicaid expansion wasn't brought up by lawmakers, the president of the state medical association ended his remarks with this request. "Inexcusably, we have forgone billions in federal assistance that would've helped our most vulnerable citizens," said Dr. Mark Horne. "We ask the legislature to act on expanding coverage in the upcoming session." The Mississippi Health Advocacy Program points to Medicaid expansion gaining new ground in other states that previously rejected it. "COVID 19 has caused us to re-evaluate our healthcare policies and choices," said Roy Mitchell, MHAP Executive Director. "So, it's time we re-evaluate our position on Medicaid expansion as well. Medicaid expansion has proven to save lives. We've got so far to go in correcting all the health inequities of this state. Let's start with Medicaid expansion."

Health care law on line at court, but is it likely to fall?

October 13, 2020, Associated Press, Jessica Gresko and Mark Sherman - The case before the court this year stems from Congress' decision in 2017 to eliminate the law's unpopular fines for not having health insurance. Despite repealing the fines, lawmakers left in place the law's requirement that virtually all Americans have coverage. Texas and other conservative-led states argue that the change makes the requirement unconstitutional and also dooms the rest of the law because the mandate was so central to it. But the court could simply "sever" the mandate from the law and leave the rest of the law alone. Many observers see that as a likely outcome and note the upheaval that would result across the American healthcare system if the law were to be struck down in its entirety. Before the Supreme Court's term began in October, Paul Clement, who argued in the 2012 Affordable Care Act case, said he wasn't sure that the addition of a new justice would change the outcome of the case. He suggested that it is unlikely that the whole statute will fall.

Mississippi Health Department makes free COVID-19 rapid testing available

October 12, 2020, The Clarion Ledger, Alissa Zhu - The Mississippi State Department of Health is making free rapid testing available at its drive-through community test sites, State Health Officer Dr. Thomas Dobbs announced Monday. Rapid test results will be returned within 15 minutes, but it's unclear how accurate they will be, Dobbs said. Rapid tests are done in the "front of the nose," as opposed to the deeper PCR tests MSDH has been using, he said. If people choose to take the rapid test, they will also receive a PCR test, the results of which will be returned within a few days, he said. They can also choose to take the PCR test only.

Almost two weeks without mask mandate, COVID-19 indicators trend in "wrong direction"

October 13, 2020, Mississippi Today, Alex Rozier - The seven-day average for new COVID-19 cases in Mississippi is now at 646, a 24% rise in the last week alone, and a 25% increase since Gov. Tate Reeves lifted the statewide mask mandate on Sept. 30.

Even as the Economy Grew, More Children Lost Health Insurance

October 9, The New York Times, Margot Sanger-Katz and Abby Goodnough - The share of children with health coverage in the United States fell for the third consecutive year in 2019, according to census data, after decades of increases. The decline occurred during a period of economic growth — before the coronavirus pandemic caused broad job losses that might have cost many more Americans their health insurance. A report Friday by the Georgetown Center for Children and Families found that the ranks of uninsured children grew the most in Texas and Florida, and that Latino children were disproportionately affected. Nationally, the number of children without health insurance rose by 320,000 last year alone, to a total of nearly 4.4 million children, the report found.

Cities and counties continue mask mandates as statewide order expires

October 8, 2020, MPB News, Kobee Vance - New coronavirus cases and hospitalizations have increased this week in Mississippi, and health officials have concerns about residents not wearing masks in public. The Governor chose not to extend his mask mandate last week, but some local officials have extended orders in their jurisdiction. Tupelo Mayor Jason Shelton has mandated face coverings be worn in public until November 11th. He says he's following recommendations of local health experts and says he's concerned that leaders like the President are discouraging mask usage. "The President kinda came across as anti-mask. That was [at] the debate on Tuesday. The next day you see his acolyte, Governor Reeves, do away with the mask requirement in the state of Mississippi," says Mayor Shelton. "That leads to people in the city of Tupelo refusing to wear a mask, and they're going to end up in the hospital or even worse."

Mississippi will not mandate masks at the polls ahead of Nov. 3 election

October 7, 2020, Daily Journal, Mississippi Center for Investigative Reporting, Jerry Mitchell - In Mississippi, those entering a school, a Wendy's or a Walmart must wear masks to prevent the spread of COVID-19. But those entering packed polling places don't have to don one."This is absolute insanity," said Dr. Claude Earl Fox III, a Mississippi native and former head of public health in Alabama. "What's to be gained by a no-mask requirement on Election Day?" Mississippi Secretary of State Michael Watson says masks can't be mandated at the polls this November because it's a federal election.
Assistant Secretary of State Kendra James explained that while their office recommends wearing masks, "the governor, nor anyone else, may impose requirements on voting. No entity other than Congress, the Mississippi Legislature or a validly enacted constitutional amendment may place requirements, such as wearing a mask, on voters."

Dr. Dobbs Warns Of COVID Surge, as State Fair Opens Without Mask Mandate

October 7, 2020, Jackson Free Press, Nick Judin - Only a week after Gov. Tate Reeves lifted the state's mask mandate, Mississippi's coronavirus numbers have reversed course, showing the first consistent signs of a new surge in what would be the third spike in the pandemic in the Magnolia State. The Mississippi State Department of Health announced 975 new cases of COVID-19 late last night, the highest single-day total since Aug. 19.

For-profit nursing homes in Mississippi had 3 times more COVID-19 deaths, analysis shows

October 7, 2020, The Clarion Ledger, Jerry Mitchell, Jayme Fraser and Kristine De Leon, Mississippi Center For Investigative Reporting - Twice as many residents caught COVID-19 at Mississippi's for-profit nursing homes, and nearly three times more died there, an analysis of health data by the Mississippi Center for Investigative Reporting shows. The average number of confirmed COVID-19 cases in these for-profit homes? Four in 10 residents. One possible factor: 80% of Mississippi's nursing homes had already been cited for infection-control problems before the pandemic hit. Charlene Harrington, a professor emeritus at the University of California at San Francisco who discovered similar results in a just-released study of nursing homes in California, said the current pandemic is exposing problems that have persisted for decades. "We've just looked the other way for 30 years," she said.

Mask Use Dropping Rapidly After Mississippi Mandate Ends, Dr. Dobbs Warns

October 6, 2020, Jackson Free Press, Julian Mills and Nick Judin - State Health Officer Dr. Thomas Dobbs is sounding the alarm, warning that mask usage is declining in Mississippi immediately after the governor lifted the statewide mask requirement. "Listen to the secret of Sweden's COVID response," Dobbs tweeted on Sunday, Oct. 4. "Near universal, voluntary compliance with public health guidance. Please mask up. Discouraging to see mask use dropping off so rapidly after mandate lifted."

Coalition calls for Medicaid expansion

October 2, 2020, MPB, Kobee Vance - Members of Southerners for Medicaid Expansion are holding a vigil honoring the more than 200,000 people who have died from the Coronavirus in the US. The coalition believes by not expanding the healthcare program, it has hurt the south's response to the coronavirus pandemic, especially for essential workers who's jobs are low pay. Dr. Charlene Collier with the state Department of Health says the coronavirus only made health disparities worse. "One of those being not having health insurance and access to adequate healthcare so even when you're thinking you're sick you don't have a doctor to start your care with, and then once you do finally get coverage, it's often for something that's more catastrophic, so not getting that early preventive care," says Dr. Collier.

Resource of the Week

Children's Uninsured Rate Rises by Largest Annual Jump in More Than a Decade

October 8, 2020, Georgetown University, Joan Alker and Alexandra Corcoran - For many years, the United States was on a positive trajectory in reducing the number and rate of uninsured children; in 2016, the nation attained a historic low of 3.6 million uninsured children. This progress occurred as a result of expansions of public coverage—primarily Medicaid and the Children's Health Insurance Program (CHIP)—and was accelerated by the implementation of the Affordable Care Act's (ACA) major coverage expansions in 2014. As employer-sponsored insurance became increasingly unaffordable for dependents, public coverage ameliorated the impacts of private coverage losses for children. However, the number of uninsured children began to increase in 2017 as Medicaid enrollment began to decline, and as Figure 1 shows, reached 4.4 million in 2019. This represents an increase of 726,000 children during this three-year period. The rate of uninsured children rose a full percentage point from 4.7 percent to 5.7 percent. Much of the gain in coverage that children made as a consequence of the ACA's major coverage expansions has now been eliminated. Moreover, the most recent year of data (2018 to 2019) shows the biggest one-year loss in children's coverage during this time period, with 320,000 more children becoming uninsured. These coverage losses occurred in a healthy economy with the lowest unemployment rate in decades prior to the economic shocks and job loss associated with the COVID-19 pandemic.

Assault on Public Health Authority to Act for the Collective Good: Confronting the Danger — A Special Town Hall

This Town Hall at the close of the 2021 Virtual Public Health Law Conference will discuss the current climate of threats to public health officials, and to the legal infrastructure and public health's authority to act to protect the health of communities. After a brief introduction to current aspects of this challenge, Town Hall attendees will participate to share experiences: concerns and successes; strategies to address these threats; legal resources and research needs; and coordination of effort. Learn more and register.

Law & Policy Insights

The Network's Harm Reduction Legal Project Recognizes International Overdose Awareness Day

Like many others, the Network recently recognized the 20th International Overdose Awareness Day, an especially somber occasion

Image

given that more people have died from preventable overdose this past year than at any other time. Despite the seemingly endless stream of drug overdose deaths, restrictive laws and policies all too often increase, rather than decrease, the risk of overdose and other drug-related harm.

Image

Improving Childhood Health: The Unrealized Potential of Medicaid's EPSDT Program

In the United States, millions of children live in poverty and are at a much greater risk of experiencing adverse health outcomes compared to their contemporaries in higher income households. Medicaid's Early and Periodic Screening, Diagnostic and Treatment (EPSDT) service was created to provide essential health screenings for at risk children. Despite requirements that states provide timely screenings for the majority of those eligible, the program consistently falls short of meeting these goals.

Image

Drought: It Doesn't Have to Leave Us High and Dry (and Unhealthy)

Nearly half of the United States is experiencing abnormally dry conditions this year. The public health implications of drought cannot be underestimated: drought can lead to a lack of clean drinking water, food insecurity, poor air quality, water-borne diseases, mental health concerns, wildfire, and poor sanitation. Solutions that prevent non-essential uses of water, increase natural storage of water in the soil and aquifers, or maintain water and lake levels, may help limit the public health impacts of future droughts by increasing the overall supply of useable water.

Public Health Law News Round-Up

Some of the public health law and policy issues in the headlines in recent weeks include Texas' new abortion law, the Supreme Court's decision on the federal eviction moratorium and states' responses; challenges to Florida Governor's ban on mask mandates; gaps in data concerning COVID-19 cases; accessibility of mental health care; and the growing suicide rate among communities of color.

Back-to-School Legal Trends and Challenges Related to COVID-19

K–12 schools and parents of K–12 students are facing numerous challenges and uncertainties with the widespread return of in-person learning for the 2021–22 school year. While the return of in-person learning is generally positive, the continued pervasive presence of COVID-19 implicates public health concerns related to the spread of the virus. This fact sheet offers a broad-level overview of issues associated with the return to in-person learning during the COVID-19 pandemic. It also serves as a starting point and initial resource for individuals seeking information on what actions can be taken to protect K–12 students, as well as school faculty and staff, from COVID-19 in a school setting.

Webinars

Image

Voting & Health: Opportunities to Expand Inclusion

September 15, 2021 | 2:00 - 3:00 p.m. ET

This webinar, co-sponsored by the Network, APHA, Vot-ER, Healthy Democracy Healthy People, and Roundtable on Population Improvement will review policies and approaches that impact voter registration, outline the current landscape of challenges and opportunities in registering the hardest-to-reach populations and explore innovative ways to promote voter registration, such as automatic voter registration specifically through state Medicaid programs.

Worth Sharing

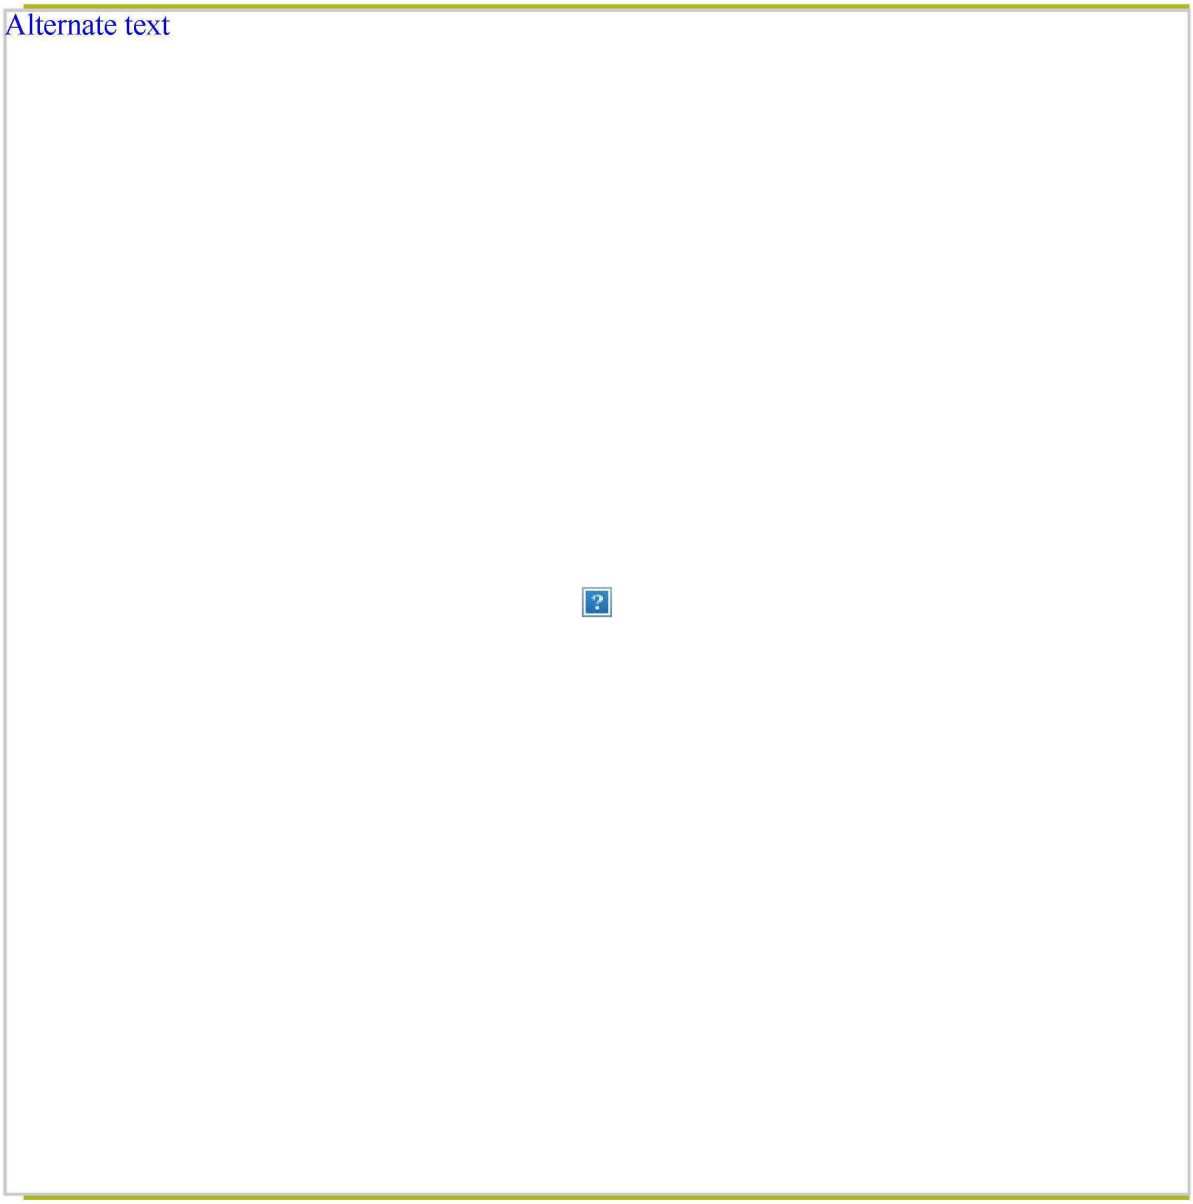
Commentary: Legal Interventions to Counter COVID-19 Denialism

James G, Hodge, director, Jennifer L. Piatt, deputy director, and Leila Barraza, senior consultant at the Network's Western Region Office have coauthored this commentary published in the *Journal Of Law, Medicine & Ethics* assessing a series of legal challenges and pathways under consideration or

in use to counter state-based legal efforts to limit or prohibit the use of known, effective public health powers in response to the continued spread of the Delta variant of COVID-19.

Public Health Law: Concepts and Case Studies

The Network's Donna Levin, Peter Jacobson, Denise Chrysler, James Hodge, Jennifer Piatt, and Corey Davis are among the contributing authors to the recently published book, *Public Health Law - Concepts and Case Studies*. The book aims to make law more accessible, empowering students, public health practitioners, and researchers to see law as simply another tool in their toolbox—just like epidemiology, surveillance, biostatistics, and other traditional public health tools.



Tell Us What You're Working On. We're Ready to Help.

Our law and policy experts can help you identify the key considerations central to your unique challenges and provide law and policy pathways you can leverage to make a difference.

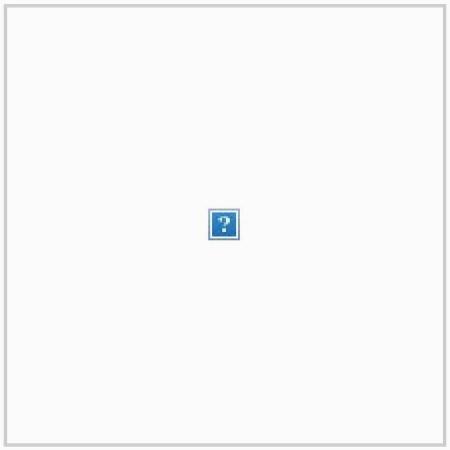
From: Dr. Tom Frieden
To: Dobbs, Thomas E
Subject: Now or Never
Date: Thursday, February 25, 2021 11:41:09 AM



February 25, 2021

Dear Colleague,

One year ago today, based on analysis by experts from around the world at Resolve to Save Lives, we and others predicted, sadly, that a Covid pandemic was inevitable.

In this past year, our team helped the world better understand and more effectively respond to the Covid pandemic that has, tragically, taken so many lives. Covid revealed stark and unacceptable gaps in our public health and primary care systems, and also validated Resolve's approach to help close these gaps.

None of this would be possible without our colleagues at Vital Strategies and the support of our donors. Bloomberg Philanthropies, the Bill and Melinda Gates Foundation, Gates Philanthropy Partners, which is funded with support from the Chan Zuckerberg Foundation, #StartSmall, the CDC Foundation, and the Stavros Niarchos Foundation all provided fast, flexible, and generous support.

Here are nine ways we've worked with partners to meet our goal of improving health using an approach centered on simplicity, speed, and scale.

1. Using 'Science' as a verb.

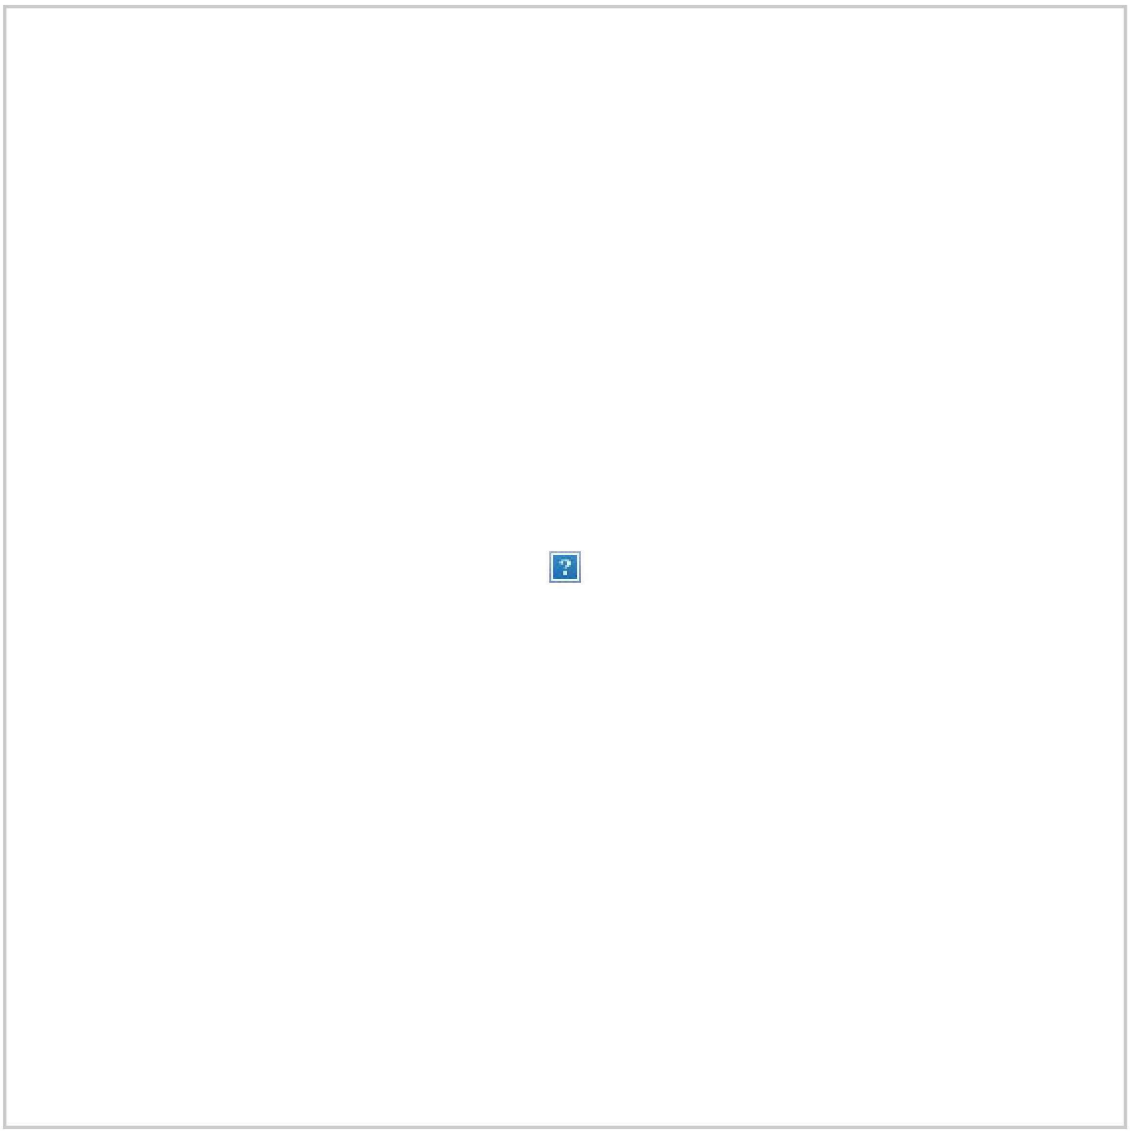
In "*The Martian*," Matt Damon plays a botanist stranded on Mars. He realizes that to get

back home, he's going to have to "science the s--- out of" the problem. Resolve's team of epidemiologists and public health specialists have been learning every day. As the evidence has changed, our approach has not – always base our recommendations on the best available science.

Governments across the United States and throughout the world adopted many of our evidence-based strategies to control the pandemic, including:

- Using an adaptive response to the pandemic, which we released more than a year ago and updated regularly as more information became available. The concept, and most of the details on phased reopening guidance, were adopted by the White House, although unfortunately the strategy wasn't followed.
- Best practice reports on the impact of public health and social measures led to wider adoption of these measures.
- Boxing in the virus to prevent explosive spread and reopen society as soon and as safely as possible.
- Establishing alert level systems to provide a framework to support clear decision-making, improve accountability, and better communicate with the public. Many states and countries adopt this tool, and we partnered with the *New York Times* to make a consistent system across the U.S. available to all.
- Reopening schools while prioritizing the safety of students and their families, teachers and staff, and the entire community.
- Communicating the importance of wearing masks and implementing mask mandates to prevent viral transmission and slow community spread.
- Measuring and reporting essential Covid indicators.
- Implementing, along with our Vital Strategies colleagues, rapid mortality surveillance to better track the pandemic.

Our Prevent Epidemics website had more than a million visits in the past year; our work continues to set the agenda for strong public health systems during and beyond the Covid response.



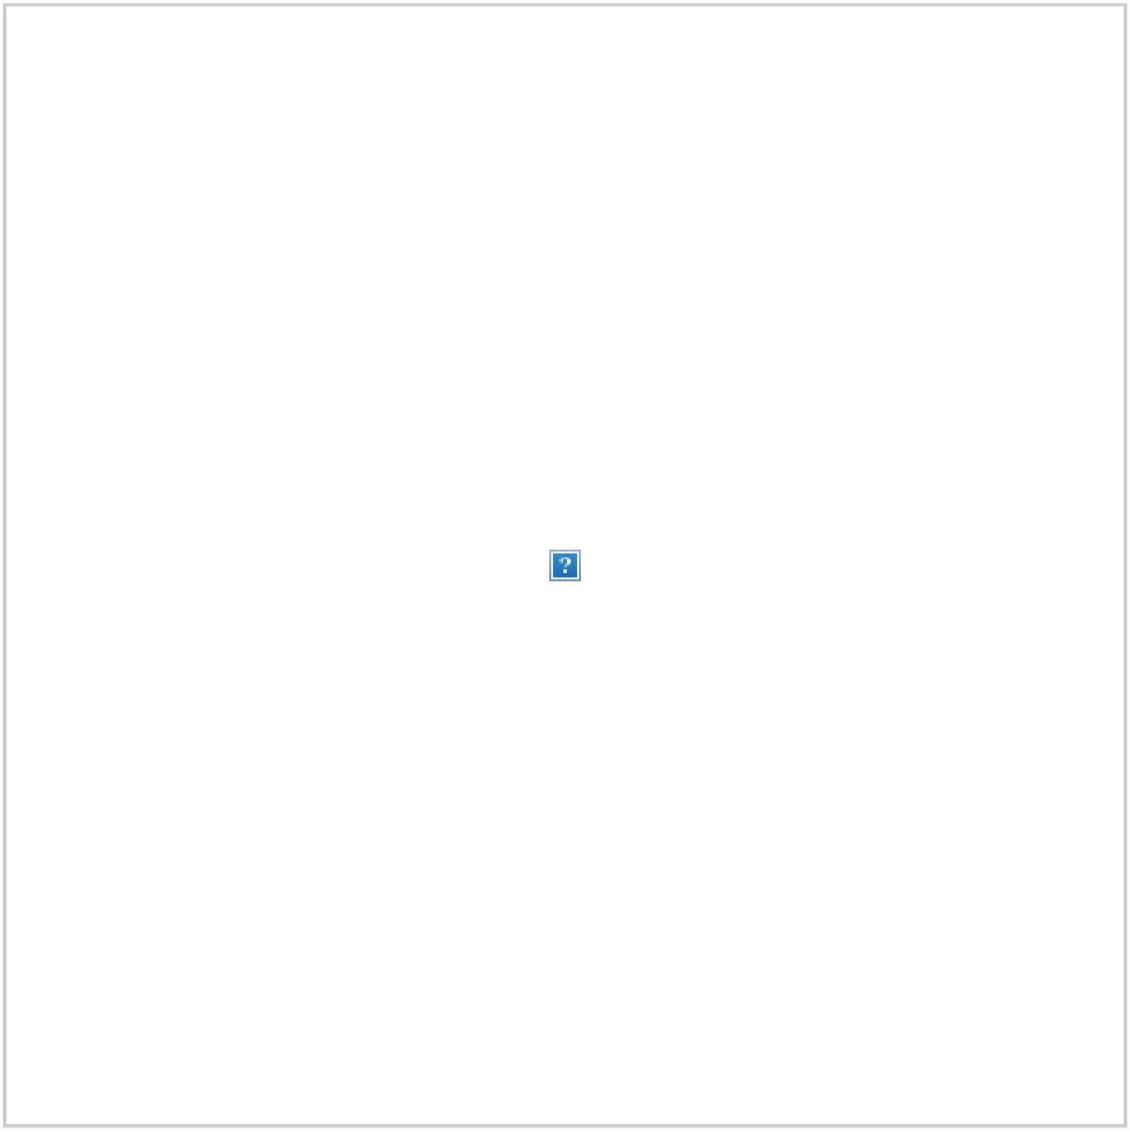
Partnership with the New York Times.

2. Funding to stop outbreaks – provided quickly.

Before and during the Covid pandemic, Resolve provided rapid response funds **to more than two dozen countries in Africa and elsewhere.** A systematic analysis in Nigeria found that time to outbreak response decreased from six to two days after the fund was implemented. Stopping an outbreak in a few days can cost a tiny fraction of what it would cost if allowed to spread for weeks or months. In Nigeria and other countries, these funds are now replenished by government funds.

We established “acceleration teams” of epidemiologists, veterinarians, evaluation experts, and other specialists that helped several African countries use national resources and World Bank funding better. In Uganda, preliminary data suggests that, with our support, the government resolved major weaknesses in epidemic preparedness; it would be the first

country on the continent outside of North Africa to have done so. In Nigeria and Liberia, these teams helped more than double World Bank disbursements within a year.



COVID-19 test preparations in Ogun, Nigeria. Rapid Response Teams in Nigeria were supported by Resolve to Save Lives.

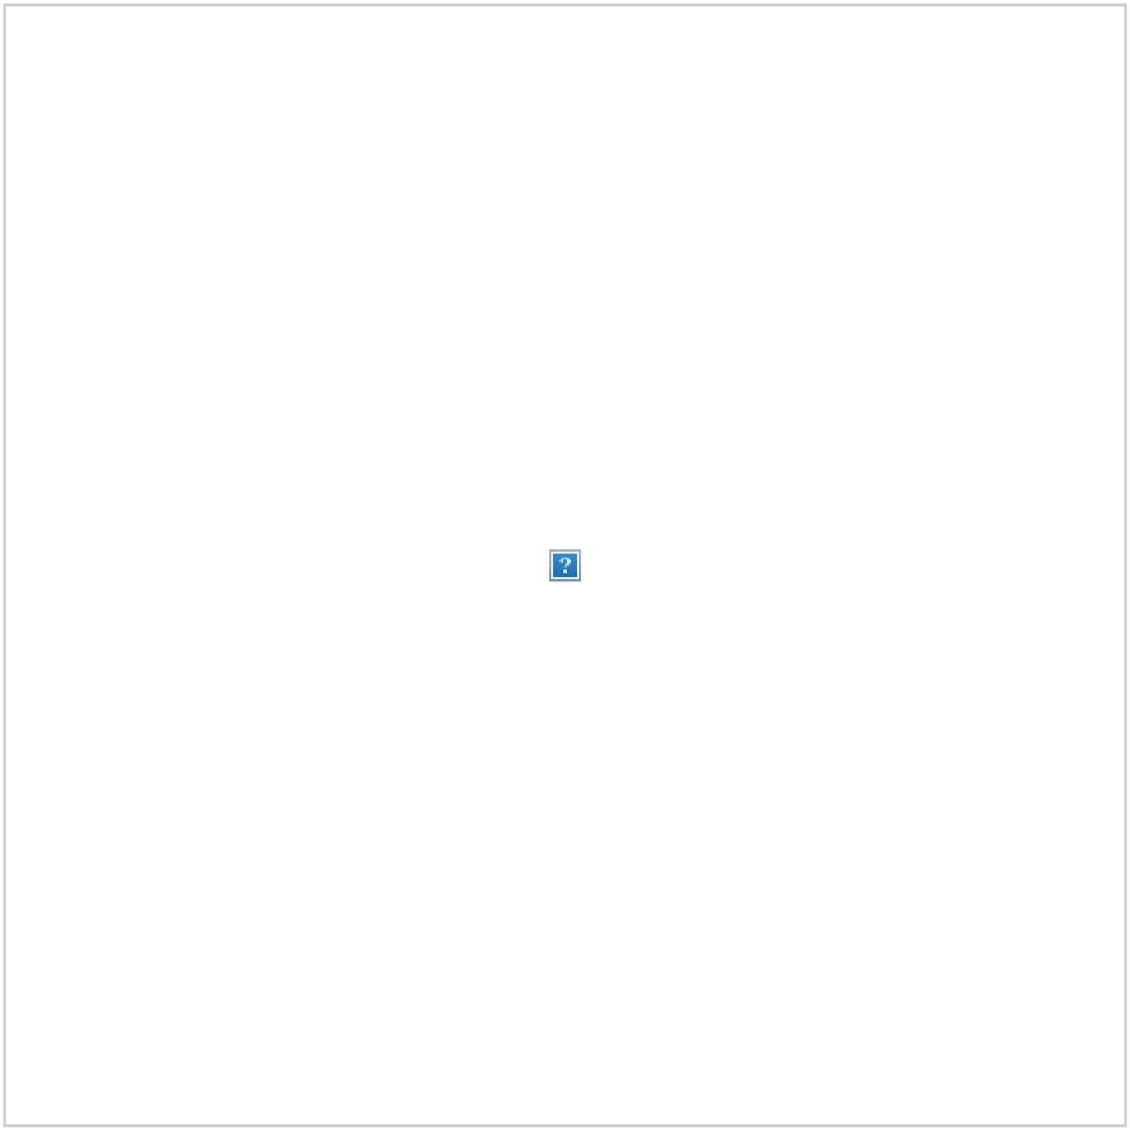
3. Working alongside partners to build capacity.

Collaboration is essential to protect health sustainably. In 2019, our training course, Program Management for Epidemic Preparedness, graduated 25 mid-level managers representing seven countries in Africa. This investment paid off during the Covid pandemic as these individuals and their teams were able to rapidly improve detection and response. Our second training program, planned before and conducted during the pandemic, was held in the Democratic Republic of Congo and helped to align ministry officials and World Bank staff to enable the timely and effective use of $150 million in

World Bank funds for epidemic preparedness.

Our global legal and advocacy teams issued guidance and provided detailed legal consultation to equip cities and countries to rapidly review existing legal frameworks, fill gaps, and ensure that public health and social measures to address Covid were in accordance with legal and ethical best practices.

With input from health departments in the US, we leveraged technology**, applying lessons learned from our successful** Simple app**.** Our digital team developed tools to improve case management and contact tracing for Covid. We supported the Africa Centres for Disease Control and Prevention to improve laboratory systems in Africa, launch a dashboardtracking the pandemic, and more.



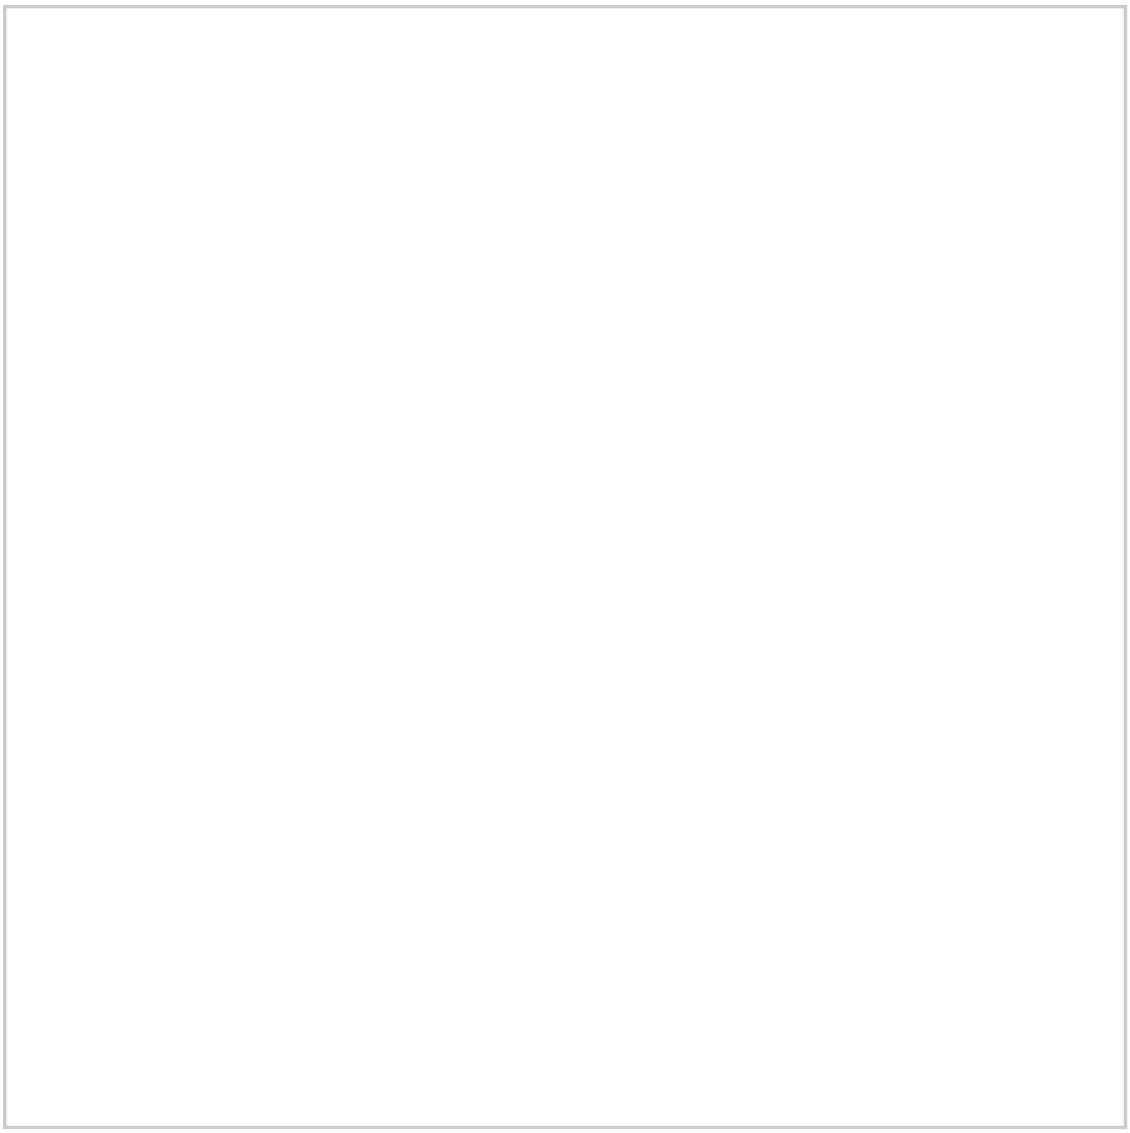
Left: Contact tracing team from the Ethiopian Public Health Institute (EPHI) conducting contact tracing at Addis Ketema sub-city.

Right: Health workers perform contact tracing in Malaba, Uganda. Resolve to Save Lives supported COVID-19 response activities in Uganda.

4. Fighting Covid in the U.S. – especially among vulnerable populations.

We started work in the U.S., creating a US Covid Response **team.** Our staff worked with public health departments across the country to strengthen prevention strategies, testing, isolation and quarantine, contact tracing, vaccination, and community engagement, all with a focus on equity. We also joined with other national public health organizations to advocate for improved funding and policies to address this pandemic and prevent the next.

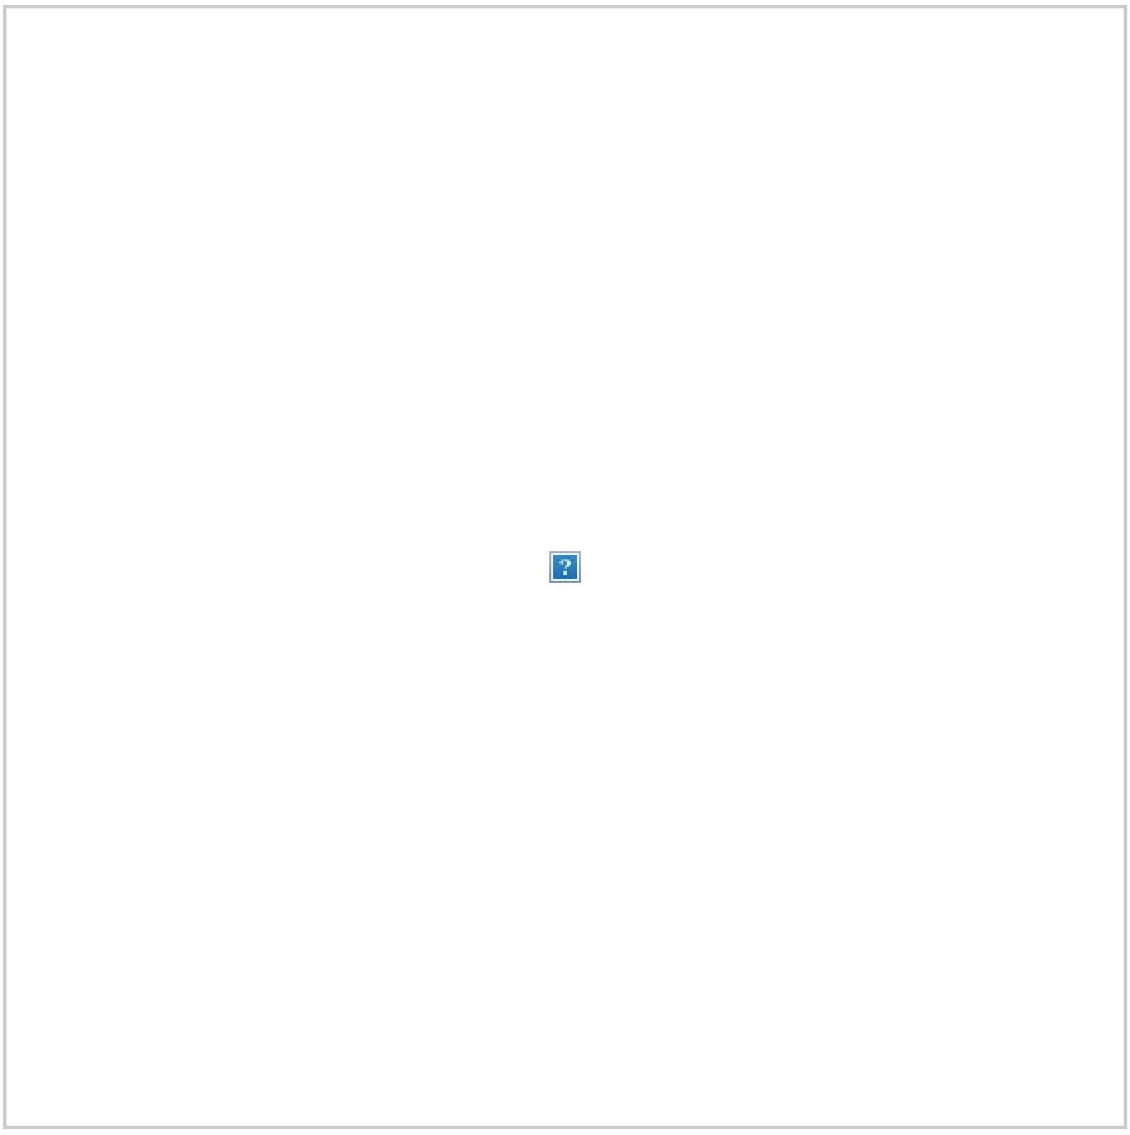
Recognizing the importance of reaching Black communities through faith leaders, we supported launch of the Black Clergy Choose Healthy Life Action Plan, a multi-city initiative to raise awareness of Covid, test those at highest risk, provide services for contact tracing, isolation, and quarantine, promote access to vaccination, and strengthen the infrastructure within the Black church network to end health disparities.



Resolve's Program Advisor in Marion County, Indiana, working at the county's first COVID-19 vaccine distribution center

5. Honoring our health care heroes by protecting them.

As soon as the pandemic hit, we established on-the-ground health care worker training focused on infection prevention and control. Our training was used by more than two dozen partners to train more than 35,000 staff in 7,000 facilities throughout Africa, facilitating safe screening of more than 4 million patients. Learning from this experience, in January 2021, we led a coalition of 17 organizations to publish a report that highlights the risks health care workers face every day and provides recommendations to protect them – and their patients – by making health facilities safer.



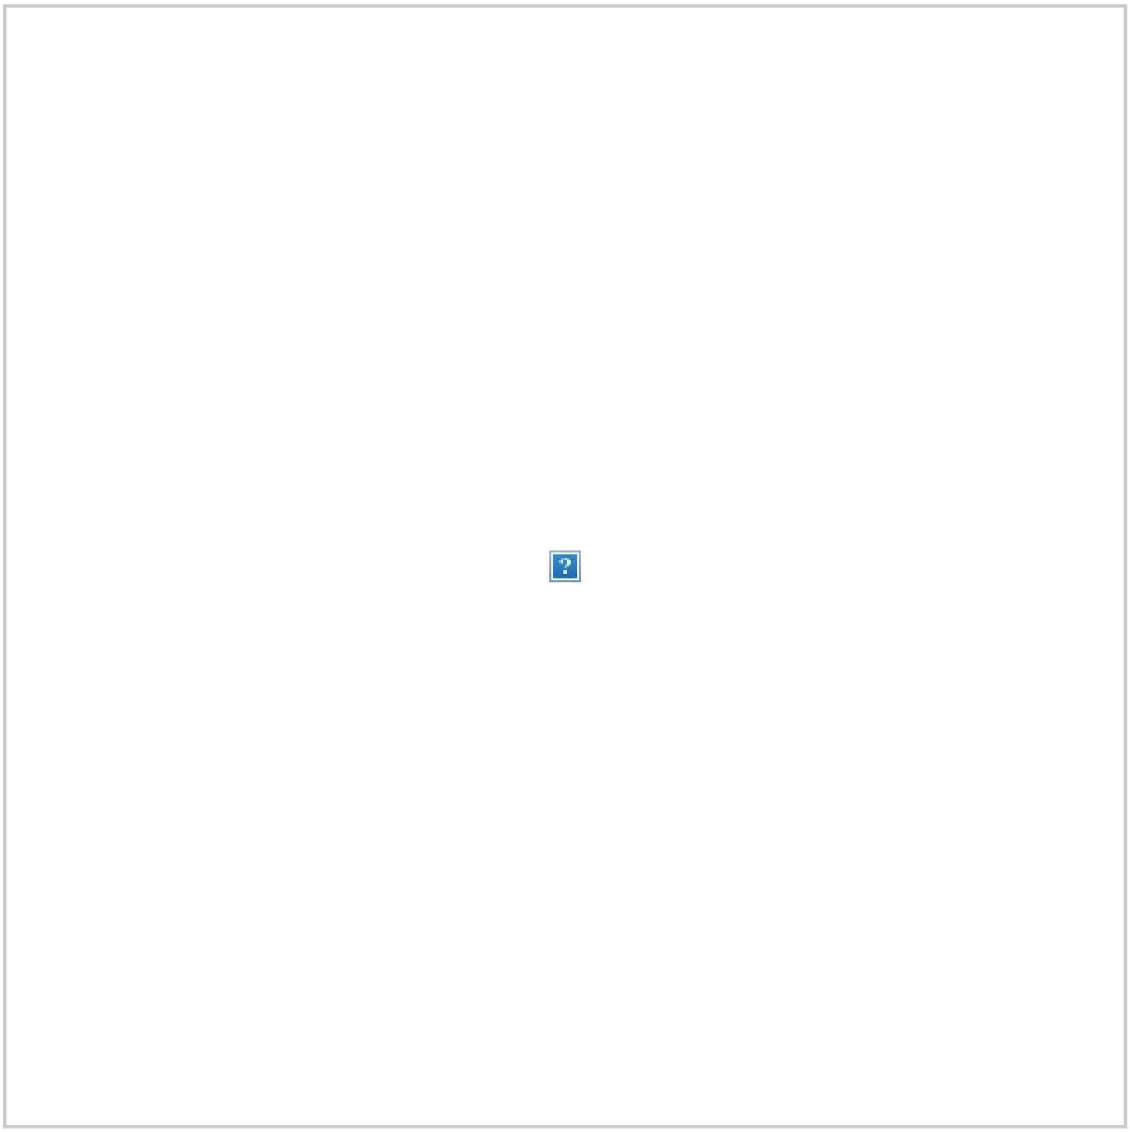
Personal Protective Equipment training in Ethiopia, supported by Resolve to Save Lives. Illustration from the Resolve to Save Lives and partner report Protecting Health Care Workers: A Need for Urgent Action launched January 13, 2021.

6. Basing action on evidence.

We spearheaded development of the Partnership for Evidence-Based Response **to Covid, a public-private partnership that supports evidence-based measures to reduce the impact of the pandemic on African Union Member States**. The partnership collected and analyzed social, economic, epidemiological, population movement, and security data from 20 countries to help determine the impact of public health and social measures.

Our report revealed that while effective in reducing disease spread, the Covid control measures quickly implemented by many member states caused severe secondary

impacts. Many communities across Africa reported difficulties accessing critical health services due to the extra burden placed on health systems, interruptions to medical supply chains, and restrictions on movement. People also reported being hesitant to seek care due to actual or perceived risk of transmission or inability to pay for care. This data led to policy changes to better balance control of Covid with protecting communities' social and economic stability.



Partnership for Evidence-Based Response report launched May 2020.

7. Primary care is primary.

Perhaps the key lesson from the Covid pandemic is the need for primary care to be at the center of health systems. Non-communicable diseases continue to be the leading global causes of death, and we must continue life-saving preventive care and treatment during the pandemic; in addition to saving lives today, this will promote community

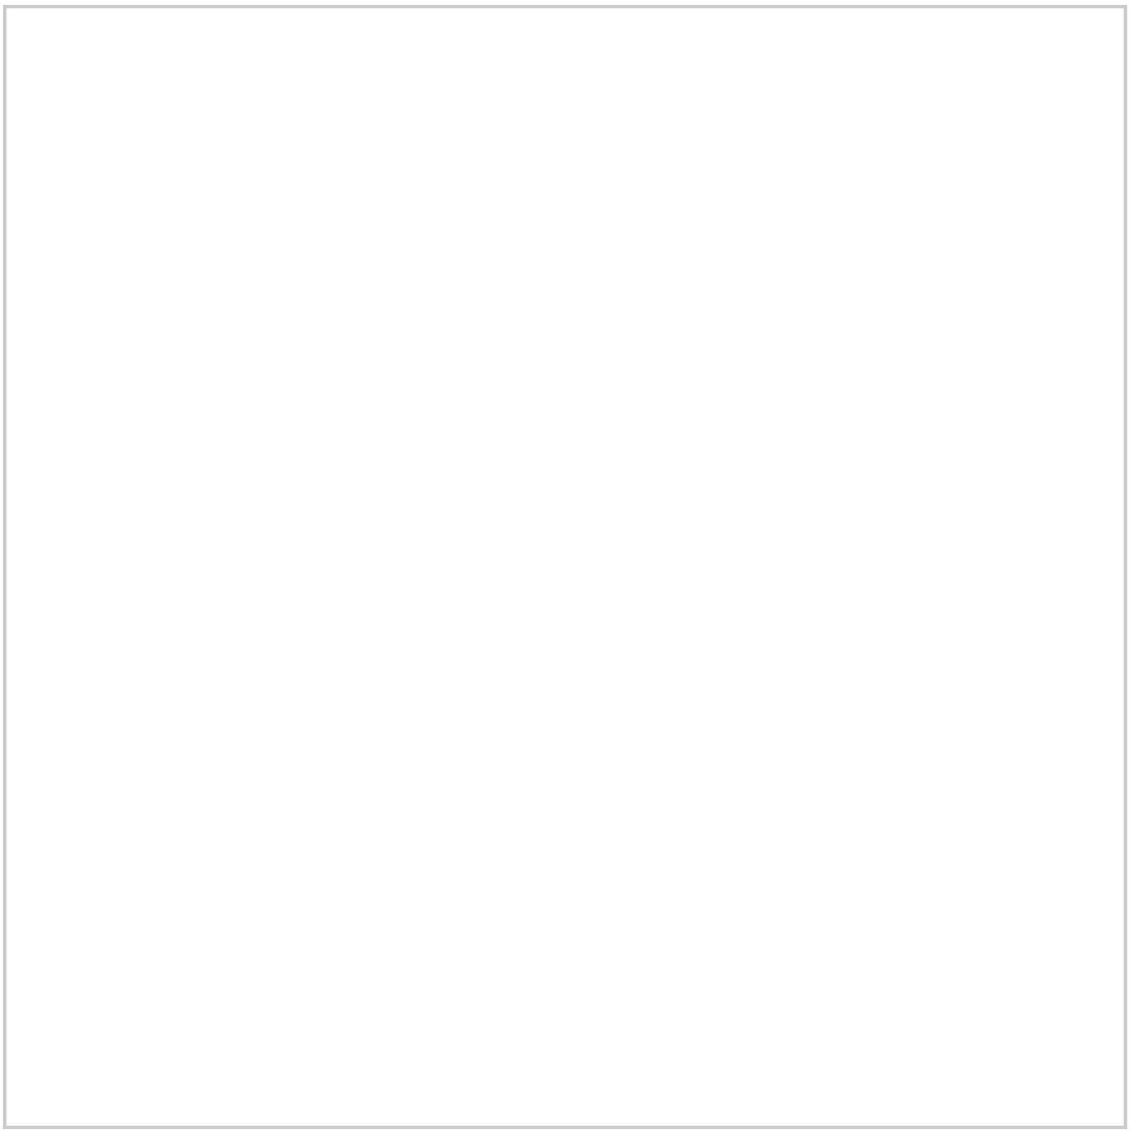
resilience against Covid and future health threats.

Resolve to Save Lives' cardiovascular health team developed guidance on how health systems can maintain life-saving hypertension care and leverage technology in the context of the Covid pandemic. The team produced fact sheets for patients and primary health care providers on how to reduce the risk of Covid transmission, which were translated into more than 15 languages and disseminated by partners around the world.

In countries across the globe, we also promoted simple but innovative patient-centered approaches to increase patient and provider safety during the pandemic:

- Dispensing 3-6 month prescriptions, such as hypertension medications, for stable patients.
- Delivering medications directly to patients.
- Increasing the use of telemedicine and other virtual technologies including phone, email, and text messaging.
- Treating and monitoring at convenient locations in the community.

More than 1.5 million individuals have received hypertension care and treatment through programs supported by Resolve's work. New programs were launched in the Philippines, Ethiopia, Mexico, and Nigeria.

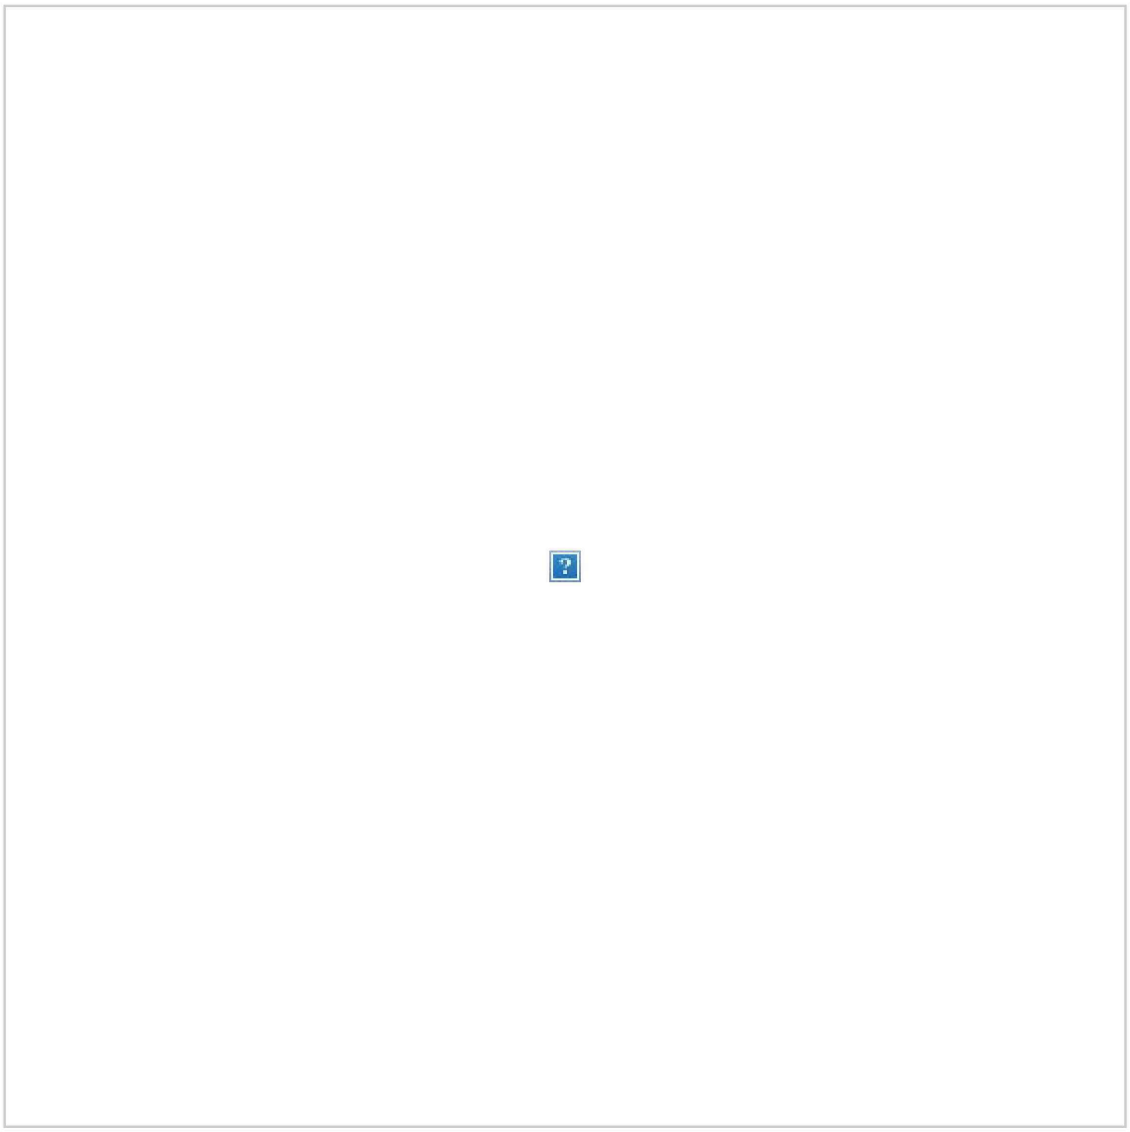


Left: Blood pressure measurement in Thailand before the COVID-19 pandemic.
Right: Community health workers in India deliver medications to hypertension patients.

8. Using policy to save lives.

We continued to advance policy actions to address cardiovascular disease. Global momentum to eliminate trans fat is growing, including an earlier win in Thailand and recent bold action by India to eliminate trans fat by 2022, a stunning victory for healthy nutrition. Turkey and Paraguay also acted to eliminate trans fat, and Nigeria, Bangladesh and the Philippines are now poised to do so. We partnered with the World Health Organization to launch the second annual progress report for the REPLACE initiative to eliminate artificial trans fat. Although 58 countries have introduced laws that will protect 3.2 billion people from trans fat by the end of 2021, more than 100 countries still need to take action to remove this toxic substance from their food supply.

Our team identified seven priority interventions to reduce sodium intake and save lives, including front-of-pack warnings, restrictions on food marketing to children, and taxes on high-sodium foods. We joined WHO to release a policy action framework on public procurement of healthy food, and helped launch four new projects to develop and implement policies on healthy public food procurement in Uganda, Togo, Nepal, and the Philippines. Our partners in Viet Nam and Ethiopia debuted each country's first national mass media campaign designed to encourage people to reduce their salt intake. We are sponsoring studies in China, India, Ethiopia and Thailand to determine the most effective front-of-pack label in order to provide evidence for policy change.



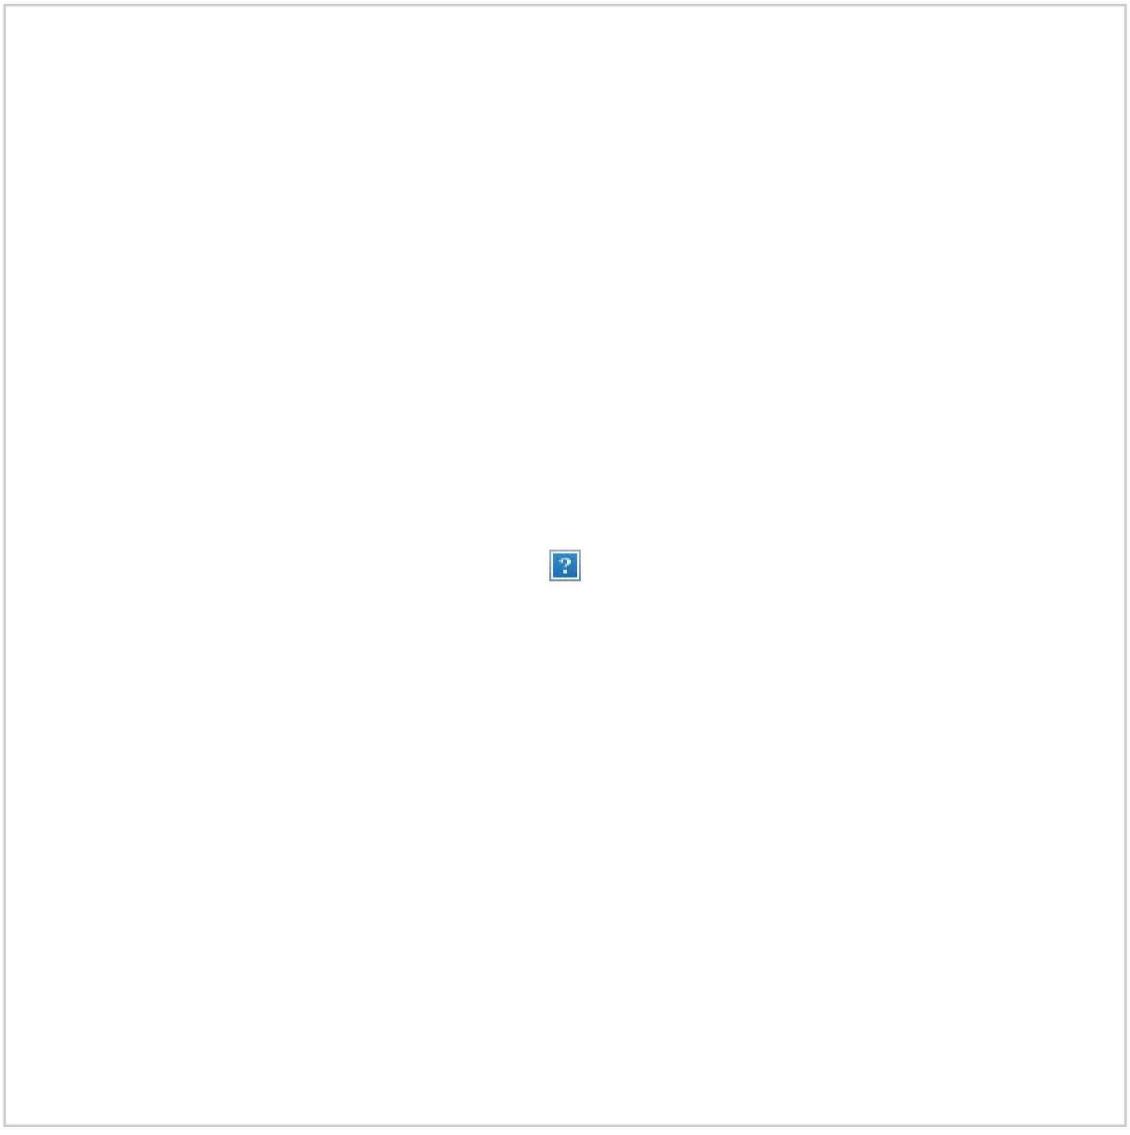
In countries without trans fat regulations, fried foods are a common source of the deadly additive.

9. Spreading truth.

The Covid pandemic was accompanied by an epidemic of competing and often inaccurate information spreading rapidly throughout the world. Our communications team filled a need for real-time, credible public health information by producing high-quality, evidence-based communications materials for diverse audiences.

We produced more than 400 communications products in 25 languages and supported 22 countries and 44 cities with mass media campaigns and the development of effective risk communications strategies. We shared our public health expertise in thousands of media interviews and dozens of peer-reviewed medical journal articles and op-ed pieces in leading global media outlets, and we were mentioned more than 25,000 times in news stories around the world.

Our "3 Ws" strategy – Wear a mask, Watch your distance, and Wash your hands – was disseminated by media outlets and partners worldwide and continues to be at the core of strategies to prevent disease transmission.



The '3-Ws' translated into French.

This moment brings a once-in-a-century opportunity. It's now or never.

Working together, we will take a giant step toward being able to find, stop, and prevent health threats faster in every country through public health systems that are understood, supported, and celebrated. This starts with expanding equitable access to vaccines to end the Covid pandemic. It's both ethically unacceptable and epidemiologically perilous that so much of the world is so far from having vaccine access. Uncontrolled spread anywhere threatens to prolong the pandemic everywhere, and we must scale up not only vaccine access but also vaccine manufacturing capacity in low- and middle-income countries. Beyond Covid, we need a public health renaissance so health threats are detected rapidly by accurate and sensitive tracking systems and laboratory networks, stopped quickly by trained epidemiologists and rapid response teams, and prevented wherever possible, including through ongoing vaccination programs and action to make our environment safer.

Working together, we will partner with governments, health systems, and civil society to make policy and program changes centered on improving equity that increase our personal and community resilience and promote heart and brain health so we live longer, healthier, more productive lives. We will help more countries follow India's trans fat elimination best practices. We will accelerate progress toward Resolve's goal of preventing 100 million deaths from cardiovascular disease in 30 years and achieve the Sustainable Development Goal of a one third reduction in today's leading killers by 2030.

Working together, we will make primary care central to our health systems – building teams, supporting patients, and holding all accountable for achieving the health that health care can deliver and for ending health disparities. By establishing accessible, responsive care systems, we'll find health problems when they emerge, prevent illness, injury, disability, and premature death, and accelerate a virtuous cycle toward healthier and more productive societies.

We resolve to work with partners to strengthen the hands of public health and primary care around the world so that, together, we build this healthier future.

Thank you for joining us.

NNPHI-E2A-Kresge-Report-Web.pdf

Natalie,

Thanks very much for sending the information that we discussed Tuesday.

Dr. Dobbs and Dr. Edney, at the risk you feeling bombarded with information, I want to share 2 additional documents that are directly relevant to the conversation. The first is focused on the importance of sharing data with communities and it really gets to the critical aspects of how and why we should share information. The second is a very recent document prepared by the National Network of Public Health Institutes (NNPHI) with support from the Kresge Foundation that includes a description of public health data systems in the context of opportunities to strengthen public health infrastructure.

Thanks very much and have a great weekend.

Subject: MSPHI Data Conversation Follow Up

Hi Dr. Dobbs and Dr. Edney,

Thank you for your time on Tuesday. I really appreciate the space you gave us to present the whole context of our idea. I'm attaching **the longer plan document** we developed with the steering committee and a **2 pager** pulled from the longer document. I appreciate your input and feedback around demonstrating this idea into more concrete terms before moving forward.

In pursuit of that, I'm sending along two examples of data visualization website. The first website is a local resource, Gulf Coast Community Exchange, funded through the REACH grant in Gulf Coast MS counties. It leverages some local and national datasets. The second website is known as CHORDS. This website utilizes FQHC data and mapping to demonstrate prevalence in the Denver metro area. Our vision for a website encompasses ideas demonstrated in both examples. We want to leverage local data as CHORDS has done successfully but utilizing newer technology for updating data closer to real-time. Additionally, we want a dynamic website interface that is easily utilized by non-experts. Our plan for incorporating these ideas into our own platform is detailed on pages 11 and 12 in the longer document.

Other good examples we would draw from: Arizona's Environmental Public Health Tracker (love the county-level reports with easy to understand explanations), Hope Rising's Substance Use Website (trove of local resources and personal touches), and Tri-County Health Department (issue-by-issue breakdowns).

Essentially, our project is investing in a data resource for community members. The other facets of the project, data literacy education and partnerships with larger health organizations, are part of our larger framework and strategy to address health issues in Mississippi by supporting individuals planning their own community-level projects. This principle of transparent data and distribution is essential in empowering local initiatives especially for marginalized people who are not in positions of power.

In our vision and approach, we are matching up with CDC's Data Modernization Initiative. In their Strategic Implementation Plan (p. 4), the first objective of priority 1 is "Develop a shared vision." Hopefully, that's what we're doing right

now!

Take a look at these documents, explore these website, and let us know next steps!

Hi Dr. Dobbs,

Apologies for another e-mail so soon, but I wanted to check to see if you approve my sending the IDPC agenda and this white paper draft. I also received the ***Public Health Authority to Prevent and Control the Spread of Communicable and Infectious Disease*** policy statement draft, which is attached here.

Please let me know your thoughts and I will send the materials to the IDPC for Tuesday's call.

Kate

Subject: Proposed IDPC agenda and white paper draft

Hi Dr. Dobbs,
Attached please see a proposed IDPC agenda for Tuesday and a draft of the **Preparing for the Next Pandemic/Public Health Crisis: Lessons from the Last Decade and Beyond** white paper. This is our first attempt at framing out a document to respond to the concerns you laid out in the e-mail to leadership in late September, so please do not hesitate to redirect us if we're off base. I've moved things around, so the references are out of order, but I'll wait to fix those until we get feedback on the scope of the document.
When you have a chance to review, please let me know what you think, and I'll share these materials as well as a the draft ***Public Health Authority to Prevent and Control the Spread of Communicable and Infectious Disease*** policy statement with the committee.

I'll also send a facilitator's agenda for you when the IDPC agenda is finalized.

Texas Judge Considers Mask Mandate Debate 'Stunning'

A Texas state judge weighed Tuesday whether Dallas County can enforce a local mask mandate despite Gov. Greg Abbott's effort to ban such requirements, calling it "stunning" that state and local officials are arguing over masks when both sides agree the devices work against the coronavirus.

From:	Tim Hughes
To:	Tim Hughes
Subject:	TFAH"s Ready or Not report releasing this Wednesday - (Sent by Tim Hughes on behalf of Rhea Farberman)
Date:	Monday, March 8, 2021 3:02:58 PM
Attachments:	New Report Measures States" Health Emergency Preparedness[1].pdf TFAH-2021-ReadyOrNot-FnlEmb.pdf

Dear State Health Official,

TFAH will release its annual report *Ready or Not: Protecting the Public's Health from Diseases, Disasters, and Bioterrorism* measuring states' health emergencies preparedness on Wednesday, March 10. Not surprisingly, this year the report has a special focus on the impact of COVID-19, highlighting the need to increase resources for emergency preparedness. We clarify that our report measures all-hazards preparedness and is not a measure of any state's COVID-19 response.

As we have done in past years, we measure 10 health security indicators in each state and discuss the relationship of each to all-hazard preparedness. We placed states into one of three performance tiers (high, middle and low) based on these indicators. Twenty states and the District of Columbia placed in the high-performance tier, 15 states placed in the middle performance tier and 15 states placed in the low performance tier.

Particularly significant in this year's report is our emphasis on how the pandemic demonstrated the importance of the federal government's role in a health emergency on the scale of a pandemic, the impact of structural racism on a community's resilience during a health emergency, and, the critical need for core public health funding including workforce and infrastructure support.

The report is being shared with news media ahead of the Wednesday morning lift of the embargo. It is likely to be covered in news markets across the country. I recommend you share these materials with your communications staff today so they can prepare for any media requests.

I'd be happy to answer any questions.

Thank you,
Rhea

Rhea K. Farberman, Director
Strategic Communications and Policy Research
Trust for America's Health

After more than a year of measures such as mask mandates and social distancing, Americans are adjusting to a reopening society. But with ongoing concerns about the pandemic's spread, disparate vaccine acceptance rates, and an uncertain future, the coronavirus pandemic continues to cast a long shadow on our mental health. In this live online Q&A, Karestan Koenen, Professor of Psychiatric Epidemiology at the Harvard T.H. Chan School of Public Health, talks with The World's Elana Gordon about well-being and mental health during this transition.

Use of face masks cuts COVID-19 transmission risk in half, review suggests

Bloomberg (11/18, Fourcade) reports "donning a face mask more than halves the risk of getting COVID," as well as hand-washing, "according to a review of eight studies published in the British Medical Journal." Furthermore, physical distancing "cuts the risk by a quarter."

1 Year Into COVID, Courts Face Uncertain Path To Reopening

Jury trials dropped off sharply during the pandemic, but in-person proceedings may rebound as virus cases wane and courts face pressure to address a litigation backlog, spurring concerns about how to bring people back to court safely.

A Tale Of Two Zoom Trials

The COVID-19 pandemic led most courts to postpone in-person trials or press ahead with safety precautions, but a minority are experimenting with conducting the whole trial experience via videoconference. Here, Law360 talks to two lawyers who tried their cases on Zoom about the format and what role it could play in the long run.

1 Year In, Policyholders See Hope In Virus Coverage Battles

Courts have sided with insurers in most COVID-19 business interruption coverage disputes since the pandemic brought the country to a standstill, but attorneys for policyholders have been encouraged by a growing number of rulings that coverage can be triggered by loss of use of property as well as visible damage.

COVID 1 Year In: What Employment Attys Still Don't Know

A growing number of Americans are getting vaccinated every day, and employers are thinking about what returning to workplaces may look like. Here, Law360 discusses what employment lawyers know and don't know about what's to come in the COVID-19 pandemic's second year.

The Defining Pandemic Moments For Health And Life Sci Attys

The coronavirus pandemic's first year tested America's health care and life sciences systems in unprecedented ways and set the stage for profound and lasting changes. Here, attorneys share the moments and lessons that stand out — and what they'll be watching as the pandemic enters its second year.

What COVID Taught Real Estate Attys About Force Majeure

When COVID-19 began rapidly spreading across the U.S., real estate lawyers scrambled to help clients figure out whether force majeure clauses could excuse them from certain obligations, and a year later, much has been learned about their efficacy. Here, Law360 looks at three things lawyers have discovered.

Why A Surge Of COVID Securities Suits Hasn't Happened

The first year of the worldwide reckoning with COVID-19 saw the biotech and pharmaceutical industries get hit hardest by investor actions tied to the pandemic, though the chances of the virus spawning a broader wave of securities litigation seem to be slimming.

COVID Inflamed Damaging Year For Data Breach Victims

Data breach responders are coming up for air after an onslaught of security episodes over the past year, as hackers' evolving tactics collided with unprecedented challenges for organizations responding to the COVID-19 pandemic, cybersecurity lawyers tell Law360.

WHAT IT MEANS FOR YOUR PRACTICE

How COVID Has Reshaped M&A Agreements

Nearly one year into the COVID-19 pandemic, it's clear that even merger and acquisition agreements are not immune to the novel disease, as dealmakers are negotiating more specific material adverse effect clauses and leaning more often on the use of earnouts as part of deal consideration.

Compliance Officers Stretched Thin As Remote Work Goes On

One year into the declaration of COVID-19 as a national emergency, the shift to remote work is stretching compliance officers as they struggle to keep tabs on employees and face steep learning curves with new technological tools, experts tell Law360.

Virus Vaccine Tracking To Keep Focus On Data Privacy

A year after the onset of the COVID-19 pandemic in the U.S., companies are still grappling with questions about how to handle and retain sensitive health information, and emerging efforts to monitor who's been vaccinated will only exacerbate these issues.

1 Year Into Pandemic, These Real Estate Questions Remain

Questions about the future of office space and the viability of hotels are among the unknowns for the real estate sector, one year after COVID-19 began its rapid spread across the U.S. Here, Law360 looks at three lingering questions for commercial real estate a year into the pandemic.

Key Takeaways From The Biggest COVID Real Estate Cases

Major real estate cases brought on by COVID-19 have shown courts are amenable to considering "material adverse change" clauses as means to call off M&A deals, while a pair of tenant-friendly rent dispute rulings also have landlords on high alert. Here, Law360 looks at what's been learned from four key disputes.

For 'Essential' Cannabis Businesses, Pandemic Year A Boom

The pandemic marked a turning point for the cannabis industry, which was facing its first real downturn when state officials chose it as one of the businesses that could stay open amid the closure orders designed to curb COVID-19.

REGIONAL IMPACT

Texas Judges See Lasting Benefits From Pandemic Practices

Virtual hearings are largely what has allowed Texas courts to keep the administration of justice trudging along during a year of the global pandemic, and what started as the short-term necessity of remote proceedings will have lasting impacts on court operations.

How COVID Strengthened Texas As A Bankruptcy Hub

The Southern District of Texas saw a surge in commercial bankruptcy filings during 2020, drawing a caseload second only to Delaware's during the coronavirus pandemic, which attorneys attribute to the accessibility, ingenuity and predictability of a pair of Houston judges who have spent years giving the district a high profile.

5 Pennsylvania Cases That Shaped A Year Of COVID

Pennsylvania's 2020 docket related to the COVID-19 pandemic was a series of flashpoints that reflected the tensions throughout the nation as the courts dealt with emergency shutdown orders, mask mandates and the limits of state power to enforce them.

Ill. Courts Stare Down Backlog As Jury Trials Start To Resume

Navigating COVID-19 has left Illinois courts staring down a massive jury trial backlog of both civil and criminal cases, and when trials resume in the coming weeks, state and federal courts will have a tremendous amount of work to do to clear their dockets.

How Florida's Courts Have Been Forever Changed By COVID

The technological revolution in Florida's legal industry brought on by the COVID-19 pandemic has improved efficiency and saved clients money, but the necessary shift to online interactions has made mentoring young attorneys a challenge, and delays in jury trials are expected to clog up courts in the coming years.

Ga. Probate Judges Want Relief After Year Of COVID Havoc

Georgia probate court judges and clerks, hardest hit by the coronavirus pandemic of any group in the state's legal community, feel mounting frustration over the lack of protections they've gotten from the state in the last year.

'Sorry For The Disruption': A Year Of Remote Court In The UK

It was a lawyer's star turn in a London courtroom lost to a poor internet connection. Such is the world of remote hearings, forced out of courtrooms a year ago amid the pandemic. And while the experience has improved, lawyers say hitches remain.

Lawyers Predict UK's Virtual Hearings May Outlast Pandemic

When March rolled around last year, no one using the English civil courts would have guessed the judiciary was on the verge of going digital. But many practitioners now predict some of the drastic technological changes will be here to stay.

EXPERT ANALYSIS

1 Year Into Pandemic, It's Time To Rethink Law Firm Billing

The particular tasks for which a law firm client can expect to be billed have become unpredictable in the era of COVID-19, making flat fees and other alternative fee arrangements more attractive for both in-house and outside counsel, says Jessica Hodkinson at Panasonic.

What Companies Should Know About SIGPR Oversight

Brian Miller, the special inspector general for pandemic recovery, discusses what companies and attorneys can do to avoid CARES Act fraud, how his team approaches protecting taxpayer money, and some of the challenges and successes SIGPR faced building an agency from the ground up amid a pandemic.

PUBLIC HEALTH AUTHORITY TO PREVENT AND CONTROL THE SPREAD OF COMMUNICABLE AND INFECTIOUS DISEASE

POSITION

The Association of State and Territorial Health Officials (ASTHO) supports the establishment of more robust public health legal authorities to facilitate the timely and targeted response to communicable and infectious disease outbreaks. These legal authorities are often exercised without the need of an emergency declaration and may allow, among other things, the abatement of nuisances, investigation of the causes of disease, institution of quarantine measures, ordering individuals or groups to isolate, conducting contact tracing and case investigations, collecting data, temporarily limiting or canceling public events, temporarily restricting or closing venues, and requiring vaccination verification for certain conduct and activities (e.g., school attendance). Beyond their use in the response to the historic pandemic caused by the novel coronavirus, in the past, these powers have been routinely exercised for more commonly experienced disease outbreaks, such as mumps and measles. Most societal sectors, such as business, education, cultural, and religion, depend on public health to stop the spread of infectious disease, prevent widespread disruptions, and reduce morbidity and mortality. Strengthening, maintaining, and, where necessary, restoring these state and territorial legal authorities are key to overcoming the COVID-19 pandemic and preparing for communicable and infectious disease outbreaks in the future.

Summary of Recommendations:

- Build and maintain sufficient public health authority to effectively respond to the ongoing pandemic and future disease outbreaks.
- Support public health authority that is guided by data and science.
- Provide for public health response capacity that protects the public's interest and well-being

BACKGROUND

Establishing and using legal authority to control the spread of infectious disease predates the founding of the country. For example, colonial governments implemented isolation and quarantine precautions for incoming ships to prevent the introduction and spread of smallpox and other contagions.[1] These powers and activities were recognized not only as a way of protecting the health of the local communities, but also as protective of trade and commerce.[2] As the scientific understanding of communicable and infectious disease grew, new tools such as contact tracing, disease investigation, data collection, and vaccines were added to public health's legal authority and practice.

Highly contagious illnesses, like measles, can be effectively contained through the public health measures and activities that are now being questioned and criticized during the COVID-19 pandemic. Public health authority to implement non-medical and medical interventions swiftly and adeptly must be maintained and, where necessary, established. The creation of administrative burdens that delay public health action endangers the public well-being and leaves communities vulnerable to infectious disease outbreaks and should be avoided. During the current pandemic, public health legal authority has been used, with evidenced benefit, to slow the spread of the coronavirus by limiting the size of gatherings, encouraging social distancing, temporarily closing high-risk venues, and requiring the use of face coverings in certain places.[3,4,5,6,7,8,9]

Despite demonstrative success of exercising public health authority during the COVID-19 response, the use of these longstanding public health powers has come under attack, hampering the response to COVID-19 and future infectious disease outbreaks. Over the last year, the critical attitude of a vocal minority and misinformation about the pandemic and public health response have contributed to the rolling back of public health authority in several jurisdictions.[10,11,12] The reductions in public health legal authority will undoubtedly make it more difficult to respond to future disease outbreaks and protect the public health.

As we approach one million American deaths from COVID-19, state and territorial policy makers are encouraged to consider the grave consequences that insufficient public health authority will have on the ability to respond to this pandemic, and the next public health threat.

RECOMMENDATIONS

- **Ensure public health legal authority that is timely and necessary for the prevention and control of future communicable and infectious disease outbreaks.** To do this, ASTHO recommends that legislatures cooperate with their jurisdiction's public health agency to ensure public health agencies can issue orders limit gatherings, require masking and social distancing, mandating ventilation improvements in public spaces, and other steps that may help to abate epidemic respiratory diseases.
- **Support evidence-based laws and policies for the identification, prevention, and control of communicable and infectious diseases and other public health emergencies.** ASTHO recommends working with and advising the legislative body on the relevant science, emphasizing that, because we are unsure how the next major disease outbreak will spread or how the next public health emergency will present, public health authorities must be ready and able to respond to future diseases and other emergencies.
- **Ensure that laws and policies that undermine and encumber a public health agency's obligations or arbitrarily limit the agency's authority are amended or overturned.** Consider working directly with community partners to promote public health education. There is value in holding daily or weekly press conferences during public health emergencies to speak directly to the public and call out those who are serving as obstacles to public health goals. Design public health authority to encourage implementation of practices to best protect the wellbeing of the public, and particularly persons who may be unable to provide for their own safety.

APPROVAL DATES

Prevention Policy Committee Approval:
Board of Directors Approval:
Policy Expires:

ASTHO membership supported the development of this policy, which was subsequently approved by the ASTHO Board of Directors. Be advised that the statements are approved as a general framework on the issue at a point in time. Any given state or territorial health official must interpret the issue within the current context of his/her jurisdiction and therefore may not adhere to all aspects of this Policy Statement.

***Preparing for the Next Pandemic* white paper**

DRAFT: February 7, 2022

Executive Summary

Pandemic and outbreak preparedness and response are foundational to governmental public health. The pandemics of the past decade and beyond have tested our nation's public health infrastructure, including our ability to implement infectious disease surveillance, prevent the emergence of infectious disease outbreaks, respond to the spread of infections, and promote overall health every day. State health departments, a key part of the governmental public health infrastructure, play a vital role in public health messaging, community education, enacting public health policies, and implementation of evidence-based interventions. A public health infrastructure that is both strong and resilient at the federal, state, and local level requires consistent, long-term investments to ensure the nation is better prepared for future pandemics.

The ongoing COVID-19 pandemic has exposed fundamental flaws and gaps in the public health's infrastructure to prepare for, respond to, and recover from crises and ensure the delivery of high-quality healthcare across the country. Furthermore, the negative outcomes from these pandemics have exacerbated deep-rooted health disparities that have been linked to race, socioeconomic status, and other social and demographic factors.

This white paper will discuss the lessons learned from the challenges public health leaders faced during the COVID pandemic and recent emergency responses and make recommendations to sustain gains and respond to gaps that were identified to strengthen the capacity of our public health infrastructure for the future.

Background

Throughout history, infectious diseases have been a companion of humans as they have migrated around the world. Over the past decade and beyond, infectious diseases such as Influenza A (H1N1), Ebola, Zika, and most recently, the COVID-19 pandemic, have challenged humanity. Beyond their toll on health, these infectious diseases have led to severe disruptions on human activity, economic dynamics, and social development.

Major consequences have emerged from the pandemics of the past decade. The ongoing COVID-19 pandemic, as of January 2022, has a death toll of 879, 971 lives in the United States thus far, and rising.[1] A total of $3.59 trillion has been spent by the federal government in response to the COVID-19 pandemic in the form of aid such as stimulus checks, supplemental legislation, and vaccine distribution.[2] Furthermore, the COVID-19 pandemic has exposed longstanding gaps in our public health infrastructure, especially in terms of health equity amongst our country's most vulnerable populations. Given the devastating outcomes that have and continue to emerge from COVID-19, public health and health security have been an increased focus of many sectors around

the world to not only respond to the current pandemic, but also learn how to better respond to the inevitability of future pandemics to ensure the health and wellbeing of humanity.

This white paper will discuss how public health leaders and policymakers can build a stronger public health infrastructure for combatting the next pandemics.

Barriers, Challenges, and Lessons Learned

The COVID-19 pandemic has shed light on barriers within the nation's public health infrastructure. While these challenges complicated the outbreak response, state and territorial health departments adapted to implement novel solutions to protect the wellbeing of their communities. Below are key areas for action to prepare for the next pandemic or crisis:

- **Ensuring Accurate and Apolitical Communication**

The COVID-19 pandemic quickly became a highly politicized crisis. Political ideologies drove many of the public health actions, behaviors, and policies when COVID-19 was first discovered in the United States. In many cases, divisions remain, and have impacted vaccine uptake, compliance with public health measures and mandates, spread of misinformation and disinformation, and challenges to public health authority. For example, as of November 2021, a Kaiser Family Foundation COVID-19 Vaccine Monitor analysis found that political partisanship is the strongest demographic factor that can predict vaccine uptake. Uptake has been slow amongst those who are or lean Republican, who make up 60% of the adult unvaccinated population.[3] This group is also more likely to believe in viewpoints that pose as challenges to further increase vaccine uptake, such as believing news that exaggerates the severity of the COVID-19 and getting vaccinated is a personal choice.[3]

A major struggle for public health leaders has been combatting the spread of misinformation and disinformation. Misinformation is false information shared by people who do not intend to mislead others, while disinformation is false information that is deliberately distributed with malicious intent.[4] As rates of cases and deaths increased and the virus spread, misinformation caused confusion, resistance to COVID-19 vaccination among some populations, rejection of public health measures, and harassment and violence against public health, health, and other frontline workers, as stated by the Surgeon General's call to action statement.[5] Misinformation has been spread through many modes, but social media has been the primary channel.[4] It has greatly impacted vaccine confidence and vaccination rates as most misinformation has focused on vaccine development, safety, and effectiveness.[5]

Many strategies have been deployed to prevent and combat the consequences of misinformation. The Centers for Disease Control developed a Rapid Community Assessment Guide, which includes steps and tools to quickly gather information to

better understand community needs and focus to better direct public health messaging for specific communities.

To be better prepared for future pandemics, S/THOs can implement tools to listen to and analyze circulating misinformation, engage with and listen to the community needs through a community assessment, share accurate, clear, and easy-to-find and access information, and use trusted messengers to improve public health credibility.[4]

Depoliticizing Public Health

Alongside the need for more control of misinformation is the need to depoliticize and increase the credibility of public health. Credibility of public health authority requires clear, concise, and frequent communication to best inform communities on evidence-based and evidence-informed practices. State health departments can convene partner organizations, increase investments in research on misinformation, continue to modernize public health communications, increase resources and technical assistance to state and local public health agencies, and expand efforts to build long-term resilience.[6]

In addition to the need to address misinformation and disinformation during an emergency response, the need exists to actively work to depoliticize public health and work across party lines to build support for and respect for public health in non-crisis times. With depoliticization of public health and clearer crisis communication comes the need for well-defined roles for political and public health officials. With the COVID-19 pandemic as one example, opportunities exist for government officials to initiate a review process to define the respective roles and responsibilities of public health officials more clearly at all levels of government during a pandemic.[7]

- **Sustainable, Flexible, and Accessible Funding**

Historically, public health and pandemic preparedness has been inconsistently and inadequately funded, which has impacted the emergency response to disease outbreaks and emergencies and disasters, requiring state health agencies to adjust the public health services provided throughout the response. A key opportunity for strengthening public health infrastructure before, during, and after a public health emergency includes establishing funding mechanisms that are sustainable, consistent, flexible, and readily accessible to improve surveillance, preparedness, and prevention to provide core public health services and respond to future infectious disease outbreaks. One strategy to accomplish this is to establish a future pandemic/disaster fund to expand infection prevention capacity, increase and strengthen the public health and clinical workforce, improve public health messaging and communication, implement measures and policies, and address health disparities and health inequities for future outbreaks.

Additionally, efforts need to be made to allow for flexibility in funding during and after emergency responses. Recent response experiences have resulted in public health

receiving significant funding at one time, which funds activities for a predetermined period, and often do not address the longer-term public health preparedness needs of a jurisdiction. Additionally, funding cycles often do not align with the public health needs during an emergency. Furthermore, significant funding prescribed to some public health efforts without flexibility to respond to the evolving needs of a response can result in inefficient spending and waste that impacts future public health funding.

Another essential requirement for future pandemic funds is availability. The federal funding strategy for infectious disease preparedness and prevention has primarily favored a crisis-response approach, rather than a robust, sustained investment; and fiscal challenges at the state and local levels have further compounded the pressures on state health departments nationwide.[8] This funding cycle also creates challenges for state health departments to manage a series of grants that are released sequentially, which not only is extremely difficult to manage, but also robs valuable staff time to administer during an ongoing public health emergency response.

A future pandemic fund should be more flexible, and funding priorities should be made based on input from state and local jurisdictions who understand the needs of their communities. These funds should always support long-term resiliency and preparedness based on the community's needs. The COVID-19 pandemic has also highlighted how much of the outbreak response has been, in part, fighting yesterday's public health battles. The public health sector experienced this during both the Zika and Ebola crises: once funding and guidance was made readily available to respond to the infectious disease outbreak, many of the emerging needs were over, causing a disconnect between the funded activities and the response needs. A future pandemic fund would support steady and sustainable investments in core infectious disease areas and include collaboration from all stakeholder voices at the table to ensure all community needs are visible and met.

State public health departments need to be in a perpetual state of readiness with clear and available sources of funding to respond to infectious disease outbreaks quickly and efficiently, and to effectively plan for attracting, recruiting, and retaining professionals with the skills need to prevent and respond to infectious disease outbreaks.[9]

- **Strong Leadership and Stakeholder Engagement**

Effective pandemic response requires strong leadership at all levels of government and among private sector partners. During the COVID-19 pandemic, public health agencies and state health departments sought support from leadership and partners to modify staffing structures, implement policy, acquire and distribute funding and resources, deliver public health messages to communities, and provide focused support to healthcare facilities.[10] Effective leadership can help state health departments maintain a sense of security and credibility during a pandemic with effective communication.[10] This not only allows for clear, accurate, timely, and consistent messaging, but also instills a level of trust with partners, stakeholders, and most importantly, the public.[11]

In addition to strong leadership is the need for clear and effective stakeholder engagement. Utilizing partner relationships could have delineated clear responsibilities within these roles, as well as created mechanisms to hire people for these positions. Effective stakeholder engagement for future pandemic responses should start with an engagement strategy, which includes having all partners having a seat at the table with a set vision that leverages their community's assets and addresses the community's needs. Clear roles and position descriptions for partners and stakeholders are vital for effective engagement.

- **Policy Solutions**

Future pandemic response requires increased prevention and response capacity. During the COVID-19 pandemic, policy changes allowed people to access some healthcare services more readily, such as telehealth services, while also waiving cost sharing, requiring reimbursement parity between telemedicine and in-person services, and coverage of audio-only services, when many facilities and patients were facing immense stress from the pandemic.[12] Future pandemic planning should consider opportunities to retain or modify policies to address an emergency environment.

State and territorial governments also made efforts to control the spread of COVID-19 through stay-at-home orders, gathering limits, face mask and vaccine protocols, and business restrictions.[13] Additionally, policy allowed for new federal funding investments that improved infection prevention and control activities across the public health and healthcare sectors, such as the $2.1 billion investment from the American Rescue Plan to strengthen state, local, and territorial health department capacity.[6] These investments bolster infection prevention capacity for a more coordinated and timely response for future outbreaks.

Administrative change is another vital tool for responding to the next pandemic. During the COVID-19 pandemic, state and territorial health officials adapted programs to triage and deliver care to patients. Key federal investments supported and propped up the nation's public health infrastructure, which provided a foundation that served a critical role in collecting and using data on COVID-19 infections and delivering test kits, personal protective equipment, laboratory reagents, and vaccines to the public.[14]Many health departments also experienced shifts in staffing and organizational responsibilities due to COVID response activities, which allowed for a more coordinated response. Administrative change, detailed by the White House' statement on pandemic preparedness, can allow for the transformation of medical defenses such as vaccines, therapeutics, and diagnostics, ensuring situational awareness, strengthening public health systems, building core capabilities, and managing the outbreak response.[15]

Workers have taken on additional roles in agencies, emphasizing the need for a trained and sustainable workforce. The pandemic has resulted in lagging skills among workers due to changes in technology, a lack of systems and data to assess and monitor

workforce needs and hiring barriers at all levels of government that prevent rapid utilization of contract or other non-state employees.

- **Emphasis on Health Equity**

Finally, the COVID-19 pandemic has exacerbated the persistent health disparities for marginalized, underserved, and vulnerable populations. Black, Latinx, American Indian and Pacific Islander communities have age-adjusted mortality rates 2 to 3 times greater than that of White communities due to COVID-19.[16] In addition, the COVID-19 pandemic's impact on other races, ethnicities, gender identities, and sexual orientations is still largely unknown due to inconsistent data collection and reporting. Social determinants of health have historically prevented populations from having fair opportunities for economic, physical, mental, and emotional health, and the pandemic has exacerbated these factors.[17] Many factors disproportionately impact these populations, such as limited access to testing and vaccination sites, mistrust in healthcare, language barriers, inadequate protective equipment to essential workers, disproportionate burden of comorbidities, etc.[18] The health disparities observed during the COVID-19 pandemic are the unfortunate consequences of deep-rooted health inequities and discrimination that have been embedded in our society for hundreds of years. Public policy addressing these gaps in data collection and reporting, barriers in access to healthcare, and the critical need for additional funding and resources at the systemic level are vital in ensuring the health and well-being of our society's most vulnerable. Health equity should be at the forefront of every public health initiative and future pandemic response.

Community engagement, with a core value of social justice, has been a cornerstone of public health. While risk communication is necessary during pandemic responses, it is not at all sufficient for sustainable and consistent community engagement. There is a critical role of communities in supporting the emergency response in pandemics to ensure health equity. Communities played a critical role in surveillance, testing, and contact tracing efforts.[19] To best serve vulnerable populations in future pandemic responses, state health departments should strive to learn, partner, work collectively, share, and advocate for the health and wellbeing of their communities.

Conclusion

Policies have allowed for essential funding to be issued to bolster pandemic responses, allowing states to increase their capacity for outbreak response activities. While these temporary funding opportunities have assisted with the pandemic response, public health professionals are preparing for a shift back into traditional underfunding patterns for the public health sector after the pandemic. S/THOs and their partners should consider leveraging lessons learned during the decade's past pandemics and use evidence-based practices to advocate for the dire need for long-term investments. Additionally, S/THOs should ensure that future public health initiatives, especially during pandemics, emphasize and prioritize health equity for our most vulnerable populations.

Preparing for the next pandemic will require a multi-faceted approach with a commitment to sustainable, long-term investments to public health infrastructure.

Subject: CDC All-State, Tribal, Local, and Territorial (STLT) Update Call
Attachments: 10.04.2021 CDC All STLT Update Call Agenda.pdf
09.27.2021 All STLT update Call Summary.pdf

Call Purpose: CDC's 2019 Novel Coronavirus (COVID-19) response team will continue to host a national call series every Monday from 2:00 p.m. to 2:45 p.m. EST to provide state, tribal, local, and territorial (STLT) partners with the latest information on the COVID-19 outbreak and U.S. preparedness efforts.

Invited call participants include STLT preparedness directors, epidemiologists, health officials, public health laboratory directors, and nongovernmental partners.

CDC will continue to share the agendas and call notes weekly.

Participant Information: The CDC All-STLT Update Call will now be held as a Zoom webinar and requires a one-time registration. After registering, you will receive a unique participant link via email. Please note that your unique participant link will be the same for all calls in the series, through December 2021; you do not need to register for each individual call. Click here to register <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fcdc.zoomgov.com%2Fwebinar%2Fregister%2FWN_hHZj-YpdTHiDHOK1ILDU0w&data=04%7C01%7CThomas.Dobbs%40msdh.ms.gov%7Cb1c40bb990dc4a1e17d208d8869c0646%7C5590424dc8bf84d869fc0fbf4c7503c7%7C0%7C0%7C637688826981243992%7CUnknown%7CTWFpbGZsb3dkeyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTGkIk1haWwiLCJXVCI6Mn0%3D%7C1000&sdata=eV4dYI1i2%2BACJCvv%2Bb95nfzFLXvVynkIgywjr%2BLvo%3D&reserved=0> for the call series. Please do not share your participant link. After registering, the link you receive is unique to you and should not be shared. If you would like to invite a colleague to this call series, please request they email eocevent424@cdc.gov <mailto:eocevent424@cdc.gov> .

Add the link to your calendar as a reoccurring weekly event: To add this link to your calendar, select the "Add to Calendar" link within the email you receive. This will download the .ics file. Open the file and save the event to your calendar. Please ensure that you set this invitation to reoccur weekly.

All-STLT Update Call Dates 2021

The All-STLT Update Call will be on Mondays from 2 to 2:45 PM EST except for the dates below where the call will be held on a Tuesday.

* Tuesday, June 1 (Memorial Day May 31)
* Tuesday, July 6 (Independence Day July 5)
* Tuesday, September 7 (Labor Day September 6)
* Tuesday, October 12 (Columbus Day October 11)

CDC All-STLT Update Call - Monday, September 27, 2021 (2:00-2:45 PM ET)

I. **Welcome and introductions:** Christine Kosmos, Senior Advisor, STLT Support Task Force (STLT TF), CDC COVID-19 Response

2. **Incident Manager's update:** Barbara Mahon, Incident Manager, CDC COVID-19 Response
   - **Epi update:**
     - National seven-day average (as of September 27): Cases decreased by 18.6%, hospital admissions decreased by 16%, COVID-19 related deaths increased by 2.1%, and case positivity decreased by 9.4%.
     - Updated variant proportions can be found on the COVID Data Tracker.
     - Vaccines administered to date can be found on the COVID Data Tracker.

3. **MMWRs for the week of September 25 – October 1, 2021:**
   - Disparities in COVID-19 Vaccination Status, Intent, and Perceived Access for Noninstitutionalized Adults, by Disability Status — National Immunization Survey Adult COVID Module, United States, May 30–June 26, 2021
   - Association Between K–12 School Mask Policies and School-Associated COVID-19 Outbreaks — Maricopa and Pima Counties, Arizona, July–August 2021
   - COVID-19–Related School Closures and Learning Modality Changes — United States, August 1–September 17, 2021
   - Pediatric COVID-19 Cases in Counties With and Without School Mask Requirements — United States, July 1–September 4, 2021
   - Safety Monitoring of an Additional Dose of COVID-19 Vaccine — United States, August 12–September 19, 2021
   - COVID-19 Outbreaks at Youth Summer Camps — Louisiana, June–July 2021
   - Multicomponent Strategies to Prevent SARS-CoV-2 Transmission — Nine Overnight Youth Summer Camps, United States, June–August 2021

4. **Other updates:**
   - **Variant classification update:** Summer Galloway, Laboratory & Testing Task Force (Lab TF), CDC COVID-19 Response, provided an overview on the new update on the SARS-CoV-2 Variant Classifications and Definitions page, which includes a new section of Variants Being Monitored (VBM).
   - **COVID-19 vaccine update:** Kimberly Fox, Vaccine Task Force (VTF), CDC COVID-19 Response, provided an update on the new CDC recommendation of the COVID-19 Vaccine booster shots for the Pfizer-BioNTech vaccine for eligible recipients who completed their initial series at least six months ago. For more information about the recommendations visit: Who Is Eligible for a COVID-19 Vaccine Booster Shot?
   - **Notes from the field: Monitoring COVID-19 Related School Disruptions, United States 2021:** Sharyn Parks Brown, STLT TF, CDC COVID-19 Response, provided an overview of a CDC report in collaboration with Johns Hopkins University Applied Physics Laboratory on school disruptions to in-person learning over the last two school years due to the COVID-19 pandemic.
   - **MMWR: Pediatric COVID-19 Cases in Counties With and Without School Mask Requirements — United States, July 1–September 4, 2021:** Sharyn Parks Brown, STLT TF, CDC COVID-19 Response, provided and overview of the newly released MMWR that assessed the impact of masking in schools on COVID-19 incidence among K–12 students across the United States.
   - **MMWR: Association Between K-12 School Mask Policies and School-Associated COVID-19 Outbreaks -- Maricopa and Pima Counties, Arizona, July-August 2021:** Lisa Barrios, STLT TF, CDC COVID-19 Response, summarized the newly released MMWR that evaluated school mask policies and school-associated COVID-19 outbreaks in K–12 public non-charter schools open for in-person learning in Maricopa and Pima Counties, Arizona, during July 15–August 31, 2021.
   - **Topic for this week's COVID-19 Community of Practice:** Christine Kosmos, Senior Advisor, STLT TF, CDC COVID-19 Response, shared that this week's Community of Practice Call topic will be, "The Role of Prevention Measures, Testing Strategies, and Vaccinations to Prevent the Spread of COVID-19 at Summer Youth Camps". The webinar will include presentations from CDC as well as state public health partners who will present best practices and lessons learned from camps during the summer

2021 session, which could inform K-12 schools' practices, policies, and procedures. For more information, please email ecoevent424@cdc.gov.

5. **Question summary:**

- **Vaccine update:**
  - Do you anticipate the CDC Clinical Considerations page being updated with booster recommendations?
  - Any discussion of mixing vaccines?
  - Have Moderna boosters been approved and are they actively being administered

  Related resources:
  - The Interim Clinical Considerations for Use of COVID-19 Vaccines Currently Approved or Authorized in the United States was updated with a new section on considerations for use of a Pfizer-BioNTech COVID-19 vaccine booster dose after completion of a Pfizer-BioNTech primary vaccine series.
  - COVID-19 vaccines are not interchangeable. If you received a Pfizer-BioNTech or Moderna COVID-19 vaccine, you should get the same product (or brand) for your second shot. You should get your second shot even if you have side effects after the first shot unless a vaccination provider or your doctor tells you not to get it.
  - What to Do if You Had an Allergic Reaction After Getting a COVID-19 Vaccine
  - Who Is Eligible for a COVID-19 Vaccine Booster Shot? | CDC
  - Getting Your COVID-19 Vaccine
  - Understanding mRNA COVID-19 Vaccines
- **Variant classification update:**
  - Is there an estimate of the degree that at-home tests are impacting our ability to estimate positivity and case rates, and to compare them now to prior surges in states or in the US?
  - People are refusing weekly testing because of the use of ethylene oxide for sterilization, and they think they are going to increase their chance of cancer. Can you please address this and reference documents that we can share to dispute misinformation?
  - Do we know if Delta variant sub-lineages AY.1 and AY.2 (Delta Plus) are more transmissible than other delta variant sub-lineages, or more resistant to monoclonal antibodies?
  - Do you know if any of the VBM's are as or more virulent than Delta?
  - Is there a SIG website we can check for updates?

  Related resources:
  - Fact Sheet For Health Care Providers Emergency Use Authorization (EUA) Of Bamlanivimab And Etesevimab 09162021 from FDA.gov
  - There is no official SIG website. CDC coordinates the SARS-CoV-2 Interagency Group. As such, relevant updates to the variant classifications are communicated through CDC's SARS-CoV-2 Variant Classifications and Definitions page.
- **Notes from the Field: Monitoring COVID-19 Related School Disruptions, United States 2021:**
  - Could you please provide an update on the test to stay pilot studies that CDC is conducting?

  Related resources:
  - COVID-19–Related School Closures and Learning Modality Changes — United States, August 1–September 17, 2021 | MMWR (cdc.gov)
- **MMWRs: COVID-19 Pediatric Case Burden in Counties with and without Mask Mandates:**
  - Many are suggesting long term health impacts or questioning safety of long-term mask wearing. Lots of publications suggesting all sorts of hazards. CDC currently has info about risk of CO2 retention on the mask page. Do you have an evidence review or other info on safety of face masks that addresses other concerns you can share?

  Related resources:
  - Studies on the effects of wearing masks have shown there is no change in oxygen or carbon dioxide levels when people wear cloth and surgical masks (Brooks et al., 2021; Samannan et al., 2021).

- Additional information is available on CDC's Your Guide to Masks: Your Guide to Masks and via Science Brief: Community Use of Cloth Masks to Control the Spread of SARS-CoV-2 | CDC
- COVID-19 Testing to Sustain In-Person Instruction and Extracurricular Activities in High Schools — Utah, November 2020–March 2021 | MMWR (cdc.gov)

CDC COVID-19 All STLT Update Call

Monday, October 4, 2021
2:00–2:45 PM ET

AGENDA

I. **Welcome and Introductions:** Chris Kosmos, Senior Advisor, STLT Support Task Force, CDC

II. **Incident Manager's Update:** Barbara Mahon, Incident Manager, CDC

III. **Other Updates:**
- CDC COVID-19 Risk Factor and Behaviors Online Assessment: Brendan Flannery, CDC
- Investigating Myocarditis Health Effects after COVID-19 Vaccination: *Tom Shimabukuro, CDC*
- MMWR: Multi-layered Mitigation Strategies to Prevent SARS-CoV-2 Transmission - Nine Overnight Summer Camps across the United States (US), June-August, 2021: *Sarah Lee, CDC*
- MMWR: Increase in Louisiana Summer Camp Outbreaks corresponding with predominance of Delta Variant– Louisiana, June to July 2021: Phillippa Chadd, CDC
- Community of Practice: *Chris Kosmos, CDC*

IV. **Question and Answer Session**
Following today's call, additional questions can be directed to: eocevent424@cdc.gov

Next ALL STLT Update Call: TUESDAY, October 12, 2021

From:	Dunajcik, Alicia (CDC/DDID/NCEZID/DPEI)
To:	Byers, Paul; Craig, Jim; Jefferson, Randy (CDC/DDID/NCHHSTP/DSTDP); Ware, Daphne; Vaughn, Wayne

Federal Emergency Management Agency (FEMA) Vaccination Distribution Updates

In a recent press release, FEMA has now obligated more than $1.2 billion to governmental partners with vaccination sites, as the agency continues its increased support in the ongoing battle against COVID-19.

That number is expected to grow in the days ahead.

Federal Funding to Accelerate State Vaccine Efforts: FEMA will provide reimbursement to state, local, tribal and territorial governments and the District of Columbia for use of their National Guard to respond to COVID-19 and other assistance, which may include support for vaccination distribution and administration, at a 100% cost share until Sept. 30, 2021.

The agency is expediting reimbursement for eligible emergency work projects to ensure resources are available to support vaccine distribution and administration. Funding covers emergency protective measures, such as:

- Supplies and commodities needed to safely store and administer the vaccine
- Transportation support and reasonable, necessary security for refrigerated trucks and support for leasing space to store and/or administer vaccines, including utilities, maintenance and security.
- Medical and support staff, including onsite infection control measures, personal protective equipment for staff, cloth face coverings for patients, temperature scanners, physical barriers and disinfection of the facility in accordance with CDC guidance.
- Dissemination of public information and communication regarding vaccinations.

The Coronavirus Response and Relief Supplemental Appropriations Act of 2021 appropriates $2 billion to FEMA to provide financial assistance to individuals and households for COVID-19-related funeral expenses at a 100% federal cost. The appropriation covers eligible funeral expenses incurred through Dec. 31, 2020. FEMA is reviewing the legislation and evaluating potential options for implementation.

Federal Coordination to Identify and Fill Resource Gaps: FEMA released "FEMA COVID-19 Vaccination Planning FAQ," a document to help assist governments with their vaccine distribution efforts and reimbursements for associated costs. The agency will work with the U.S. Department of Health and Human Services and other federal agencies to ensure a coordinated approach to using Defense Production Act authorities wherever necessary so private sector companies can increase vaccine supply and spur vaccine manufacturing.

FEMA Supporting and Establishing Vaccine Sites: FEMA will provide support to established vaccination locations, establish new community vaccination centers, and support National Guard operations to expand access to vaccines. To reach underserved and rural communities, FEMA, in collaboration with federal partners, will coordinate efforts to establish and support fixed facilities and establishing pop-up or temporary vaccination sites and mobile vaccination clinics.

Massachusetts Department of Public Health: Communications and Community Engagement for COVID-19 Vaccines

Check out this interesting and informative presentation that the Massachusetts DPH gave to the Vaccine Task Force last week, all about what has worked best when it comes to targeted community engagement strategies to promote COVID-19 vaccination. By utilizing a variety of tools such as Jamboard exercises and community focus groups, they identified themes around barriers to vaccination, vaccine hesitancy, how to increase adherence and improve community trust.

Upcoming Trainings/Meetings

- Below is a link to a series of accredited education about COVID-19 vaccine in general, safety, and administration considerations. Please distribute this information with your next regular communication with states.
    - Vaccine Courses, Broadcasts, Webcasts and Self Study Training | CDC
- Tiberius users can access the training video on submitting transfer requests at the following link: https://protect-ows.hhs.gov/workspace/compass/view/ri.compass.main.folder.c95b290c-2561-4cd1-85f7-e31dac51d34b [protect-ows.hhs.gov

Upcoming NACCHO Webinar: Tuesday, February 9 at 12 pm ET: COVID-19 Action in the Biden Era: A Fireside Chat with Dr. Fauci

Upcoming CDC Foundation Webinar: February 24 at 1:00-2:00 pm EST - Updates and Resources from CDC and Ad Council

COVID-19 Resources

- COVID-19 Vaccination Program Interim Playbook for Jurisdictions Operations Annex
    - Considerations for Increasing COVID-19 Vaccination: Reaching and Increasing Uptake in Priority Populations
- COVID-19 Vaccine Technical Key Points (attached)
- FEMA Social Listening Report (attached)
    - Includes highlights from each HHS Region concerning COVID-19 vaccine rumors, supply chain, vulnerable populations and more.
- COVID-19 Vaccination Communication Toolkits for Community- Based Organizations and Essential Workers
    - COVID-19 vaccines will be available to essential workers and other community members soon. CDC has designed two toolkits to help build confidence in this new vaccine. The toolkits will help community-based organizations (CBOs) and employers to educate community members and workers about COVID-19 vaccines, raise awareness about the benefits of vaccination, and address common questions and concerns.

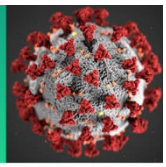
COVID-19 Science Update



From the Office of the Chief Medical Officer, CDC COVID-19 Response, and the CDC Library, Atlanta, GA.
Intended for use by public health professionals responding to the COVID-19 pandemic.

***** Available on-line at https://www.cdc.gov/library/covid19 *****

Section headings in the COVID-19 Science Update have been changed to align

with the CDC Science Agenda for COVID-19.

Prevention, Mitigation, and Intervention Strategies

PEER-REVIEWED

Mask-wearing and control of SARS-CoV-2 transmission in the USA: a cross-sectional study. Rader *et al.* Lancet Digital Health (January 19, 2021).

Key findings:

- 84.6% of respondents reported they were very likely to wear a face mask to the grocery store, 40.2% reported they did so to visit friends and family, and 4.7% reported they were not likely at all to wear a mask in either setting.
- A 10% increase in self-reported mask-wearing was associated with a significantly increased odds of community transmission control (OR 3.53, 95% CI 2.03-6.43).
- Communities with both high reported mask-wearing and physical distancing had the highest predicted probability of transmission control.
- Reported mask usage continued to increase after statewide mask mandates were introduced; however, the increases were not significant.

Methods: Self-reported mask-wearing was assessed using online survey responses from 378,207 US individuals between June 3 and July 27, 2020. Multivariate logistic regression models controlling for variables such as physical distancing and population demographics estimated the association between mask-wearing and community transmission control defined as an instantaneous reproductive number (R_t) <1. *Limitations*: Survey relies on self-reported behavior; survey bias; ecologic study design; model assumptions.

Implications: A higher proportion of mask-wearing and physical distancing was associated with a higher probability of SARS-CoV-2 transmission control; however, mask mandates alone are not sufficient to control the ongoing pandemic and additional health interventions are needed.

Airflows inside passenger cars and implications for airborne disease transmission. Mathai *et al.* Science Advances (January 1, 2021).

Key findings:

- Air changes per hour (ACH) varied based on which windows were open in the car:
  - Highest (250) when all 4 car windows were open.
  - Intermediate (approximately 150) when 3 windows were open (all 3 except the window next to the driver or the passenger respectively), *and* when only the 2 windows (front right and left rear) across from the 2 occupants were open (Figure).

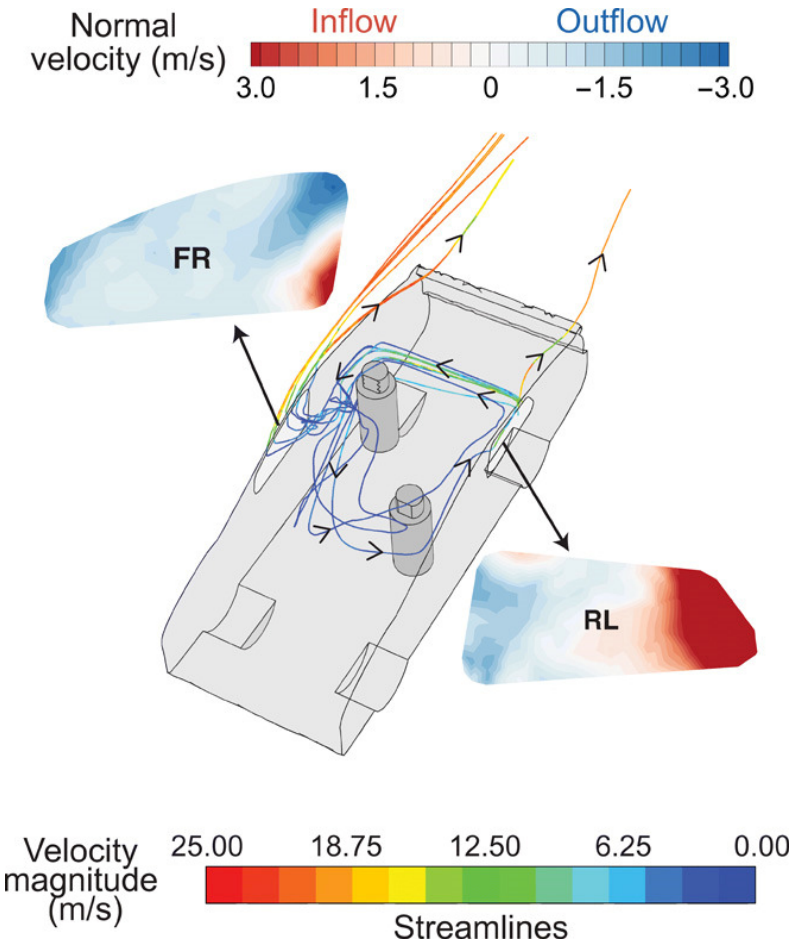
MS-DOH-21-1816-A-001518

  - Relatively low (89) when only the front left and right rear windows were open.
  - Lowest (62) when all were closed.
- When the rear left and front right windows were open, a strong incoming clean air stream from the rear left window acted as an “air curtain” that could reduce infectious particles reaching the passenger (Figure).

Methods: Calculated flow patterns associated with a range of ventilation options using 6 combinations of fully open and closed windows in a model 4-door car moving at 50 miles per hour, with 2 occupants—a driver in the front left seat and a passenger sitting in the rear right seat. ***Limitations***: Variations such as slower car speeds, larger vehicles, and open moonroofs could be associated with different airflow patterns.

Implications: Travelling with all car windows open and all occupants masked is likely the most effective way to minimize cross-contamination between car occupants. When more practical to open only some windows, choice of seat location and which windows are opened might impact air flow and transmission risk. Further study is warranted in light of the global importance of mitigation of SARS-CoV transmission in passenger cars.

Figure:



Note: Adapted from Mathai *et al*. A typical streamline pattern in the car when the rear left and front right windows are open. The streamline color indicates the flow velocity from **0.00** to **25.00 meters/second (m/s)**. Insets show the opened front right (FR) and rear left (RL) windows, colored by the normal velocity, from **-3.0** to **3.0 m/s**. A **strong air current** enters the cabin from the rear left window due to the car’s motion, travels along the back seat, turns at the closed rear right window, and most of the air exits at the front right window. Licensed under CC BY-NC 4.0.

Detection, Burden, and Impact

PEER-REVIEWED

The epidemiological and radiographical characteristics of asymptomatic infections with the novel coronavirus (COVID-19): A systematic review and meta-analysis. Chen *et al*. International Journal of Infectious Diseases (January 12, 2021).

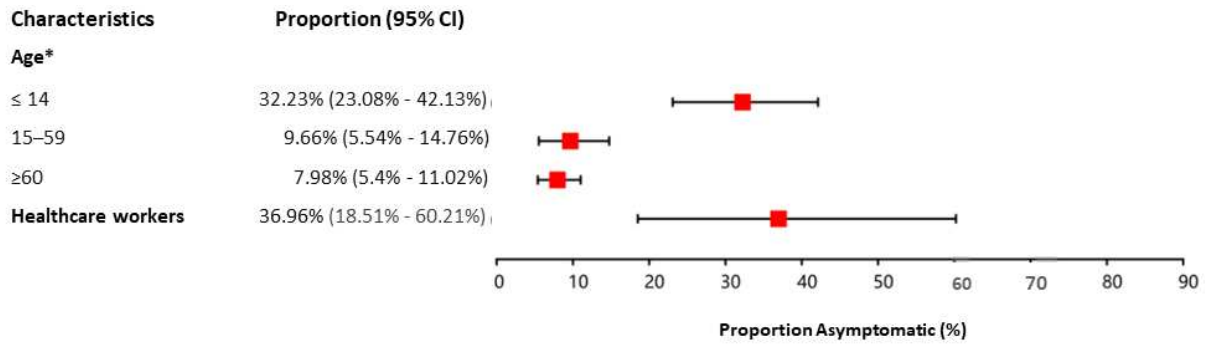
Key findings:

- 13% (95% CI 11%-16%) of all persons with COVID-19 were asymptomatic including:
  - 32% (95% CI 23%-42%) of children and 37% (95% CI 19%-60%) of healthcare workers (Figure).
- 48% (95% CI 31%-73%) of all persons with asymptomatic infection had radiographic lung abnormalities the most common being ground-glass opacities (41%, 95% CI 20%-86%), unilateral (31%, 95% CI 22%-43%), and bilateral pneumonia (27%, 95% CI 17%-43%).

Methods: A systematic literature review, of studies published between January 1 and May 13, 2020, and meta-analysis (n = 104 studies with 20,152 cases) were conducted to summarize the epidemiological and radiographical characteristics of asymptomatic SARS-CoV-2 infections. *Limitations:* Heterogeneity between studies; majority of the studies conducted in one country (China).

Implications: The findings reinforce the importance of self-isolation, mask wearing, and social distancing to prevent SARS-CoV-2 transmission, particularly among children and healthcare workers.

Figure:



Note: Adapted from Chen *et al*. Proportion of asymptomatic SARS-CoV-2 infection by characteristic. *Statistical differences between subgroups ($p < 0.05$). Licensed under CC BY-NC-ND 4.0.

Reductions in 2020 US life expectancy due to COVID-19 and the disproportionate impact on the Black and Latino populations. Andrasfay *et al*. Proceedings of the National Academy of Science of the United States of America (February 2, 2021).

Key findings:

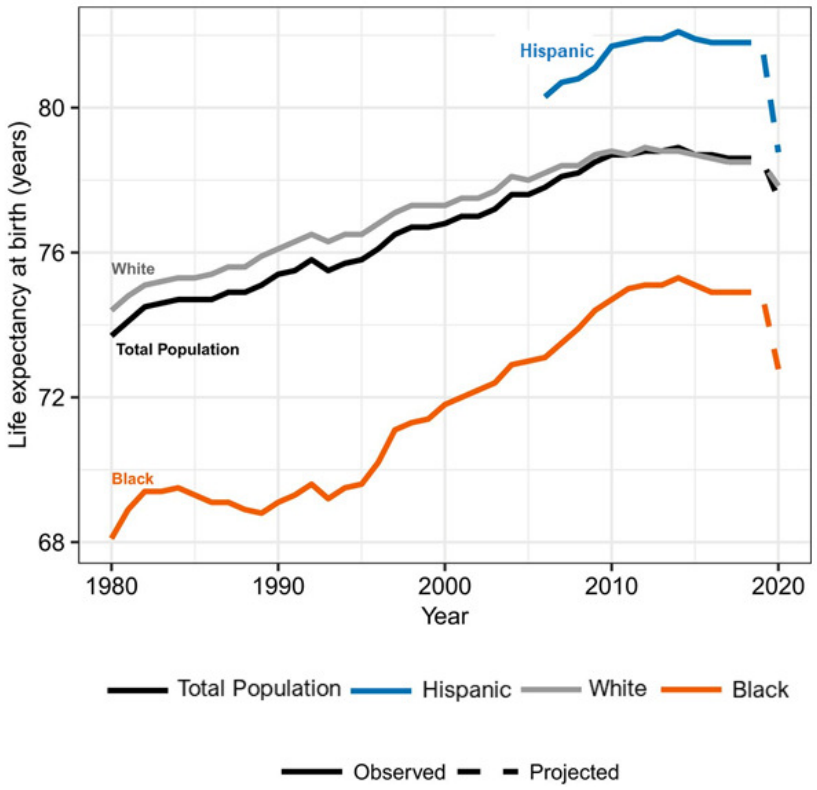
- COVID-19 is projected to reduce US life expectancy in 2020 by 1.13 years.
- Life expectancy reductions for non-Hispanic Black persons (2.10 years) and Hispanic persons (3.05 years) are projected to be 3 to 4 times higher than for non-Hispanic White persons (0.68 years) (Figure).

Methods: Life expectancy was calculated based on an Institute for Health Metrics and Evaluation (IHME) projection of 321,000 COVID-19 deaths through December 31, 2020 using 2019 population estimates. Provisional death counts due to COVID-19 by race, ethnicity, and age were obtained from the National Center for Health

Statistics through October 3, 2020. *Limitations:* Projection assumes distributions of deaths by age and race/ethnicity through October 3, 2020 will be the same through the end of the year.

Implications: The COVID-19 pandemic has reduced life expectancy and impacted progress in reducing the gap in life expectancy between Black and White persons. A rapid return to pre-pandemic life expectancy is unlikely due to the continued presence of SARS-CoV-2 and its detrimental health impacts including prolonged effects in those who recovered from the virus, deaths from other health conditions, and social and economic losses.

Figure:



Note: From Andrasfay *et al.* Trends in life expectancy at birth by race and ethnicity for **Total Population** of the US, and for **Hispanic**, **White**, and **Black** persons: 1980–2020. Note that the data for Black and White persons prior to 2006 include Hispanic persons; data for these groups from 2006 onward are for the non-Hispanic Black and non-Hispanic White persons. The projections for 2020 are based on the IHME current projection scenario (October 9, 2020 update). Copyright 2021 National Academy of Sciences.

An external exposome-wide association study of COVID-19 mortality in the United States. Hu *et al.* Science of the Total Environment (January 7, 2021).

Key findings:

- Two air toxicants, one vacant land measure, and one food environment measure were associated with COVID-19 mortality.
    - NO_2 increased mortality risk (adjusted mortality rate ratios [aMRR] 1.19, 95% CI 1.13–1.26) and benzidine decreased mortality risk (aMRR 0.92, 95% CI 0.88–0.95).
    - Greater occupancy (aMRR 0.89, 95% CI: 0.85–0.92) and greater eligibility for reduced-price student lunches (aMRR 0.90, 95% CI: 0.87–0.93) reduced mortality risk.

Methods: Adjusted associations of 337 long-term environmental exposures with COVID-19 mortality at the county-level across the US were assessed through an exposome-wide association study. The external exposome can be defined as the totality of the external environment to which an individual is exposed across the lifespan. Natural, built, and social environment data were collected before 2020 and included air quality, walkability, food, building vacancies, crime, and industry. *Limitations*: Potential ecological bias, associations don't prove causation; assumes pre-pandemic characteristics were stable during pandemic.

Implications: Environmental factors are associated with COVID-19 mortality and warrant further investigation.

Transmission

PEER-REVIEWED

Household transmission of SARS-CoV-2 and risk factors for susceptibility and infectivity in Wuhan: A retrospective observational study. Fang *et al.* Lancet Infectious Diseases (January 18, 2021).

Key findings:

- The estimated secondary attack rate for household transmission was 15.6% (95% CI 15.2-16.0).
    - Compared with adults ≥60 years old, individuals <20 years old were 66-84% less susceptible to infection and 60% more likely to infect others.
- Asymptomatic individuals were less infectious than symptomatic individuals (OR 0.21, 95% CI 0.14-0.31), and symptomatic individuals were more likely to infect others before symptom onset than after (OR 1.42, 95% CI 1.30-1.55).
- After the implementation of control measures (e.g., case isolation and quarantine of contacts) household reproductive numbers declined by 52% among primary cases and by 63% among secondary cases.

Methods: Retrospective cohort including 27,101 households of laboratory- or clinically-confirmed COVID-19 cases and laboratory-confirmed asymptomatic SARS-CoV-2 infections in Wuhan, China identified between December 2, 2019, and April 18, 2020. Transmission model to estimate household secondary attack rates, assuming mean incubation and maximum infectious period of 5 and 22 days, respectively. *Limitations*: Asymptomatic infections may be underestimated; model assumed a long (up to 22 days) infectious period, some results may not be generalizable.

Implications: While children and adolescents were less susceptible to SARS-CoV-2 infection, they were more infectious than older individuals. These findings warrant consideration when planning for school re-opening and developing interventions for reducing household transmission.

Natural History of SARS-CoV-2 Infection

PEER-REVIEWED

Evolution of antibody immunity to SARS-CoV-2. Gaebler *et al*. Nature (January 18, 2021).

Key findings:

- IgM and IgG anti-SARS-CoV-2 spike protein receptor-binding domain (RBD) antibodies and plasma neutralizing activity decreased significantly between 1.3 and 6.2 months after infection.
- Clones of memory B cells exhibited turnover after 6.2 months resulting in antibodies with the ability to evolve, increased potency, and resistance to RBD mutations.

Methods: Humoral memory response was characterized in 87 COVID-19-convalescent persons approximately 1.3 and 6.2 months after SARS-CoV-2 infection. All participants tested RT-PCR negative for SARS-CoV-2 at the 6-month study visit. *Limitations*: Small sample size.

Implications: Findings suggest that persons can mount an effective immune response that continues to evolve following recovery, reducing likelihood of re-infection by even some variant strains within 6 months after initial infection.

Protection in Healthcare and Non-Healthcare Work Settings

PREPRINTS (NOT PEER-REVIEWED)

Continued need for non-pharmaceutical interventions after COVID-19 vaccination in long-term care facilities. Love *et al.* medRxiv (January 6, 2021).

Key findings:

- The modeled number of infections, severe infections, hospitalizations, and deaths were lowest in long term care facilities (LTCF) when vaccine deployment was paired with strong adherence to nonpharmaceutical interventions (NPI).
- Prevention of deaths was higher with strategies that prioritize vaccination of residents compared with strategies that prioritize vaccination of health care workers (HCW).
- Impact of HCW vaccination was dependent on NPI adherence more so than resident vaccination.

Methods: Model to simulate disease spread in LTCF based on vaccine influence on disease dynamics and accounting for combinations of vaccination routines and levels of NPI adherence. *Limitations:* Assumed theoretical vaccine efficacy.

Implications: In addition to vaccination in LTCF, continued emphasis on NPIs is essential. Given pandemic fatigue and the associated decline in NPI adherence, limiting visitors and the interactions between residents, is essential to support vaccination efforts (Kim *et al*. Looking beyond COVID-19 vaccine phase 3 trials. Nature Medicine).

mRNA vaccine-elicited antibodies to SARS-CoV-2 and circulating variants. Wang *et al.* bioRxiv (January 19, 2021).

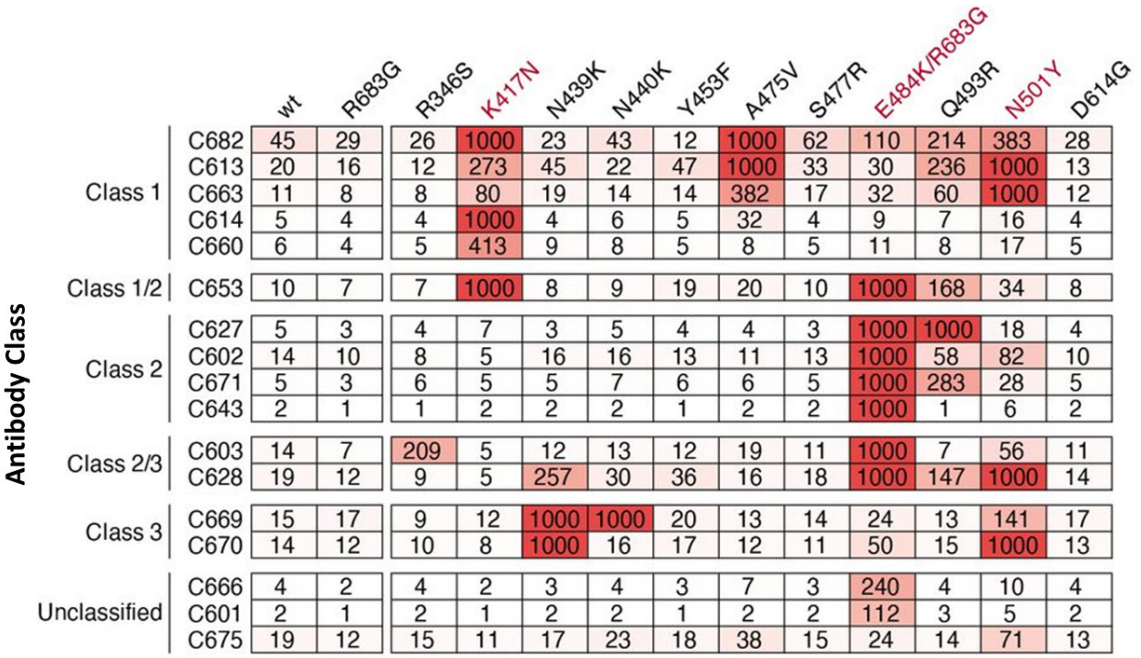
Key findings:

- While selected antibodies generated after receiving mRNA vaccines had some effect, they were overall less effective in neutralizing circulating variants with K417N, N501Y, and E484K mutations, in some cases displaying greater than ten-fold less activity (Figure).
- Presence of specific neutralizing monoclonal antibodies from vaccinated individuals selected for mutations within the receptor binding domain (RBD).

Methods: Sera and monoclonal antibodies from 20 adults without history of SARS-CoV-2 infection and who were vaccinated with either Moderna or Pfizer-BioNTech vaccines were assessed for neutralizing activity against SARS-CoV-2 spike protein and RBD mutants N501Y, K417N, E484K. *Limitations*: Small sample; not generalizable.

Implications: mRNA vaccines available in the US elicit an antibody response against SARS-CoV-2 variants but might have reduced neutralizing activity against new variants of concern with certain RBD mutations.

Figure:



Antibody Class		wt	R683G	R346S	K417N	N439K	N440K	Y453F	A475V	S477R	E484K/R683G	Q493R	N501Y	D614G

Note: Adapted from Wang *et al*. Half-maximal inhibitory concentrations [IC_{50}] for selected antibodies. Columns are wild-type (wt) and variant viruses tested. Rows are the monoclonal antibodies tested. Classes 1 and 2 antibodies bind within the receptor binding domain. Class 3 antibodies bind outside the receptor binding domain but are neutralizing. Increasing redness from white indicates reduced neutralizing capacity. The **dark red** is IC_{50} 1000 ng/mL. Used by permission of authors.

In Brief

Detection, Burden, and Impact

- Casanova *et al.* **Epidemiology of coronavirus disease 2019 in US Immigration and customs enforcement detention facilities.** JAMA Network Open (January 19, 2021). Cumulative COVID-19 case rates among persons detained by Immigration and Customs Enforcement (ICE) are higher than in the general population but may be underestimated because cases are likely underreported.

- Jering *et al.* **Clinical characteristics and outcomes of hospitalized women giving birth with and without COVID-19.** JAMA Internal Medicine (January 15, 2021). In a large US cohort, pregnant women with COVID-19 had higher rates of preterm birth, preeclampsia, thrombotic events, and death than women without COVID-19.

- Anesi *et al.* **Characteristics, outcomes, and trends of patients with COVID-19–related critical illness at a learning health system in the United States**. Annals of Internal Medicine (January 19, 2021). In a study of 468 patients with COVID-19 requiring admission to the ICU between March and May 2020, 28-day all-cause mortality decreased over time from 43.5% to 19.2% despite stable patient characteristics.

- Moreno-Perez *et al.* **Post-acute COVID-19 syndrome. incidence and risk factors: A Mediterranean cohort study.** Journal of Infection (January 11, 2021). Among a prospective cohort of 277 patients who recovered

from COVID-19 between February and April 2020, 141 (50.9%; 95% CI 45.0-56.7) had post-acute COVID-19 syndrome defined as persistence of at least one clinically relevant symptom, or abnormalities in spirometry or chest radiology on an evaluation 10-14 weeks after disease onset.

Transmission of SARS-CoV-2

- Wibmer *et al.* **SARS-CoV-2 501Y.V2 escapes neutralization by South African COVID-19 donor plasma**. bioRxiv (January 19, 2021). The new lineage of SARS-CoV-2, 501Y.V2, that emerged in South Africa in December, contains nine spike mutations and is resistant to neutralizing antibodies found in convalescent serum from patients who recovered from wild-type infection, posing a significant risk of reinfection.

- Muik *et al.* **Neutralization of SARS-CoV-2 lineage B.1.1.7 pseudovirus by BNT162b2 vaccine-elicited human sera.** bioRxiv (January 19, 2021). The B.1.1.7 lineage of SARS-CoV-2 that was detected in the United Kingdom in September 2020, is unlikely to escape protection by the BioNTech-Pfizer mRNA vaccine.

Natural History of SARS-CoV-2 Infection

- Gottlieb *et al.* **Effect of bamlanivimab as monotherapy or in combination with etesevimab on viral load in patients with mild to moderate COVID-19.** JAMA (January 21, 2021). In this randomized phase 2/3 trial at 49 centers across the US, combination therapy with bamlanivimab and etesevimab, but not bamlanivimab alone, resulted in a significant reduction in SARS-CoV-2 viral load at day 11 among non-hospitalized patients with mild to moderate COVID illness.

- Weinreich *et al.* **REGN-COV2, a neutralizing antibody cocktail, in outpatients with COVID-19.** NEJM (January 21, 2021). Randomized controlled trial of REGN-COV2, a cocktail of two monoclonal antibodies, was safe and showed reduction in viral load, especially in persons who had a high viral load at baseline or who had not yet mounted an immune response (see Editorial by Cohen *et al.* **Monoclonal antibodies to disrupt progression of early COVID-19 infection**. NEJM).

- Veiga *et al.* **Effect of tocilizumab on clinical outcomes at 15 days in patients with severe or critical coronavirus disease 2019: randomised controlled trial.** BMJ (January 20, 2021). In a randomized clinical trial of 129 patients with severe COVID-19 enrolled in Brazil between May and July 2020, tocilizumab, an anti–interleukin-6 receptor monoclonal antibody, was not superior to standard care and might increase mortality; the trial was stopped early due to an increased number of deaths at 15 days in the tocilizumab group.

- Perez *et al.* **Reported adverse drug reactions associated with the use of hydroxychloroquine and chloroquine during the COVID-19 pandemic.** Annals of Internal Medicine (January 26, 2021). Using the FDA Adverse Event Reporting System database, the authors determined that adverse drug reactions (ADRs) with hydroxychloroquine and chloroquine doubled in 2020 compared with 2018 and 2019; reported ADRs seemed to coincide with positive endorsements in the media.

Prevention, Mitigation, and Intervention Strategies

- Shimabukuro *et al.* **Allergic reactions including anaphylaxis after receipt of the first dose of Pfizer-BioNTech COVID-19 vaccine**. JAMA (January 21, 2021). Based on case reports submitted to the Vaccine Adverse Event Reporting System during December 14-23, 2020, anaphylaxis after the first dose of the Pfizer-BioNTech COVID-19 vaccine occurred at an estimated rate of 11.1 cases per million doses administered. The reports of anaphylaxis may lead to vaccine hesitancy but it is important to note that a history of severe allergies is not a contraindication to vaccination unless the allergy is to the vaccine or one of its components (Glover *et al.* **Vaccinating against COVID-19 in people who report allergies.** BMJ).

Protection in Healthcare and Non-Healthcare Work Settings

- Quilty *et al.* **Quarantine and testing strategies in contact tracing for SARS-CoV-2: A modelling study.** The Lancet Public Health (January 20, 2021). Modelling showed that testing can allow for reduced quarantine duration without substantial increases in transmission risk. Results support current CDC guidance.

Materials listed in this Science Update are selected to provide awareness of relevant public health literature. A material's inclusion and the material itself provided here in full or in part, does not necessarily represent the views of the U.S. Department of Health and Human Services or the CDC, nor does it necessarily imply endorsement of methods or findings. While much of the COVID-19 literature is open access or otherwise freely available, it is the responsibility of the third-party user to determine whether any intellectual property rights govern the use of materials in this Science Update prior to use or distribution. Findings are based on research available at the time of this publication and may be subject to change.

TOPLINE MESSAGES FOR THE WEEK (January 25)

- The current COVID-19 vaccines are safe and effective.
  - Many people don't have any side effects after COVID-19 vaccines, but some people will have pain or swelling at the injection site or fever, chills, or a headache.
  - These typically don't last long and are signs that your body is building protection.
  - As of Tuesday, January 19, there have been 15 confirmed cases of anaphylaxis after receipt of Moderna COVID-19 vaccine and 45 confirmed cases of anaphylaxis after receipt of Pfizer-BioNTech COVID-19 vaccine. Per 1 million doses administered, that's a rate of 2.1 cases for Moderna and 6.2 cases for Pfizer.
  - The observed rates of anaphylaxis are comparable to other vaccines.
  - These estimated rates may change as additional doses of COVID-19 vaccine are administered and CDC continues to collect more information.
- We know that there will be bumps in the road as the COVID-19 vaccination program is rolled out – that is to be expected. However, public health experts have extensive experience with vaccine distribution and administration and will work to quickly overcome obstacles.
- While ACIP and CDC make national recommendations, we understand that there will be a level of local adaptation.
  - The phased vaccine recommendations are meant to be fluid and not restrictive for jurisdictions.
  - It is not necessary to vaccinate all individuals in one phase before initiating the next phase; phases may overlap.
- Vaccination is a critical tool in bringing this unprecedented pandemic to an end. But until every person in the U.S. is able to get a COVID-19 vaccine, we continue to ask Americans to embrace proven public health strategies including social distancing, good hand hygiene, and wearing a mask in public to reduce the risk of transmission and protect our communities.

COVID-19 Vaccine Status 13
Miscellaneous 13

UPDATEDS (IN BLUE BELOW IN THE SECTIONS)

mRNA clinical considerations guidance

- CDC still recommends that people get their 2nd dose of COVID-19 vaccine as close to the recommended interval as possible (3 weeks for Pfizer-BioNTech, one month for Moderna).
- After posting initial guidance, we received feedback that some flexibility in our language might be helpful to reduce barriers to vaccination, especially if there are challenges around returning on a specific date or if someone's circumstances had changed (like being discharged or entering a long-term care facility).
- As always, CDC encourages people to follow our guidance around intervals and interchangeability, but we also don't want our guidance to be so rigid that it creates unintended barriers.
- CDC's updated guidance says that if it is not feasible to adhere to the recommended interval, the second dose of Pfizer-BioNTech and Moderna COVID-19 vaccines may be scheduled for administration up to 6 weeks (42 days) after the first dose.
    - The Pfizer efficacy analyses included people who received the 2nd dose up to 42 days after the first, and the majority of Moderna trial participants received their 2nd dose within this time frame as well.
    - This is also in line with the time frame endorsed by WHO as well as a few other countries, but in contrast we are not recommending this as a strategy to allow more people to get 1st doses, but rather to address feasibility issues.
- Additionally, we note that "in exceptional situations in which the first-dose vaccine product cannot be determined or is no longer available, any available mRNA COVID-19 vaccine may be administered at a minimum interval of 28 days between doses to complete the mRNA COVID-19 vaccination series."
- This guidance is intended for situations where someone received the 1st dose but does not know what product, and despite efforts, including using resources outlined in the guidance (e.g. vaccination cards, Immunization Information Systems), it still cannot be determined what product they used, we are saying that they can get the 2nd dose with either product.
    - Another example we have been hearing about is someone who got vaccinated in a LTCF and then was discharged to the community, or vice versa, and the same vaccine product not being available and there would be significant barriers to getting the right vaccine product resulting in the person only getting one dose.

IMPLEMENTATION – JURISDICTIONS

- CDC is working through existing U.S. jurisdiction programs to coordinate the distribution and administration of COVID-19 vaccines.
- After that initial distribution of vaccine, jurisdictions will order from their weekly allocations:
    - A second dose will automatically be set aside for each first dose a jurisdiction orders.
    - Jurisdictions will be prompted to order the second dose through VTrckS.
    - New allocation numbers will be posted each Tuesday in Tiberius and will be updated in VTrckS every Thursday.
    - Under the regular ordering and delivery cadence, deliveries of vaccine doses will be made Monday through Friday for all COVID-19 vaccine products.
- Jurisdictions and commercial or federal partners will place orders on behalf of providers.
- Jurisdictions must ensure that providers report vaccine administration data so that the jurisdiction can then send data to the CDC's IZ Gateway.

Background

- On September 16, CDC released the first iteration of the *COVID-19 Vaccination Program Interim Playbook for Jurisdiction Operations* that provides general interim guidance on how to plan and operationalize a vaccination response to COVID-19 within jurisdictions.
    - This playbook was updated on October 29.
    - Executive summaries of each plan may be found on the CDC website.

IMPLEMENTATION – FEDERAL ENTITY PLANNING

General

- Five federal entities receive direct allocation of COVID-19 vaccines:
  - Federal Bureau of Prisons
  - Department of Defense
  - Department of State
  - Department of Veterans Affairs
  - Indian Health Service
- Federal agencies are encouraged to implement ACIP and CDC recommendations when vaccinating staff and populations they serve.
- Federal agencies involved in the COVID-19 response but not one of the five agencies receiving direct allocations should work with immunization programs in their jurisdictions to ensure their staff is included in vaccination plans.
- Federal entities will be allocated vaccine doses on a pro rata basis according to the adult population they serve and their number of employees.
  - The allocations for federal entities are separate from the state/jurisdictional allocation and federal entities are treated as a separate jurisdiction.
  - Federal entity populations are not deducted from the state population.
  - Federal entity populations are added to the total U.S. adult population, which is used as the denominator for determining allocations, and pro-rata distribution is then determined for each jurisdiction.

Tribes

- To ensure equitable access to COVID-19 vaccines, Tribal Nations have decided on their allocation preferences—whether to receive vaccine through their jurisdiction or through the Indian Health Service (IHS).
- Tribal Health Programs and Urban Indian Health Organizations that selected to receive vaccine through the state/jurisdiction should already be included in state/jurisdiction vaccine distribution plans and will receive vaccine based on those plans.
  - The supplement is not intended to disrupt or replace existing plans, but to support vaccine distribution across the jurisdiction, including to Tribal Health Programs and Urban Indian Health Organizations.
  - Not all states/jurisdictions will receive a supplemental allocation each week because of vaccine availability.
  - However, all states/jurisdictions should continue to provide COVID-19 vaccine to Tribal Health Programs and Urban Indian Health Organizations in keeping with existing vaccine distribution plans, even in the absence of a specific supplemental allocation.

VACCINE DISTRIBUTION

- COVID-19 vaccines are being allocated pro rata by population to ensure fair and equitable distribution across the U.S.
- The latest data on vaccine distribution and administration is posted on CDC's COVID Data Tracker Monday through Friday. This includes jurisdictional data as well as data on the Federal Pharmacy Partnership for Long-Term Care Program.

Background

- In August, CDC exercised a contract option with McKesson Corporation, which will serve as the central distributor for COVID-19 vaccines and ancillary kits.
  - Pfizer vaccine is being shipped directly from the manufacture.

- Initially, jurisdictions should anticipate that allocations will be less than demand until supply can catch up. Over time, distribution strategies will change as more vaccine becomes available and more people are recommended for vaccination.
- CDC's Vaccine Tracking System (VTrckS) will be used for vaccine ordering.
    - VTrckS is a secure, web-based IT system that integrates the entire publicly funded vaccine supply chain from purchasing and ordering through distribution to participating state, local, and territorial health departments and healthcare providers.
- Pfizer vaccine doses are distributed as part of 975-dose trays. Pfizer does not recommend partial tray redistribution.
- Moderna vaccine doses are distributed as part of 100-dose trays.

PHARMACY – LONG-TERM CARE FACILITIES

- The U.S. Department of Health and Human Services has partnered with CVS, Walgreens, and Managed Health Care Associates, Inc. to offer on-site COVID-19 vaccination services for nursing homes and assisted living facilities residents.
- Long-term care settings, in particular, are high-risk locations for COVID-19 exposure and spread of the virus.
- The Pharmacy Partnership for Long-term Care (LTC) Program provides end-to-end management of the COVID-19 vaccination process, including cold-chain management, on-site vaccinations, and fulfillment of reporting requirements, to facilitate safe vaccination of this prioritized patient population, while reducing burden on facilities and jurisdictional health departments.
- This program is available for residents in all LTCF settings, including skilled nursing facilities, nursing homes, assisted living facilities, residential care homes, and adult family homes.

Background

- The allocation of vaccine for Long-Term Care Facilities as part of the Pharmacy Partnership for Long-Term Care Program is included in the pro rata population-based allocation for each jurisdiction. This is not an additional number of doses that will be allocated.
- Jurisdictions have control over when the LTC program will launch within their jurisdictions.
- This program is free of charge to LTCFs. This service will also be available in rural areas that may not have an easily accessible pharmacy.
- LTCF staff members who have not been previously vaccinated for COVID-19 will also be eligible for these services.
- CDC expects the program services to continue on-site at participating LTCFs for approximately two months. After the initial phase of vaccinations, the facility can choose to continue working with the CVS, Walgreens, or MHA partner that provided its initial on-site clinics or can choose to work with a pharmacy provider of its choice.
- Jurisdictions need to provide at least a two-week notice to begin the LTCF program.
    - This period allows federal pharmacy partners to prepare for vaccine administration and coordinate with LTCF facilities.
    - To begin the program, a jurisdiction must have an allocation of at least 50% of the required doses to cover the program within one week of providing notice.
- Jurisdictions need to select which authorized vaccine will be used to support the program in their jurisdiction. Once activated, vaccine to support the program will come from jurisdictional allocations.
- The LTCF program is split into two components:
    - In Part A, the program will perform vaccinations at skilled nursing facilities.
    - In Part B, the program will provide vaccinations at other facilities enrolled in the program such as assisted living facilities, continuing care residential facilities, etc.
- Jurisdictions can choose to start with Part A alone when activating the program or can opt to activate both Parts A and B simultaneously.

- CDC provided jurisdictions with an estimated number of doses needed to cover Part A and Part B. Allocations that are not used as part of the program will be returned to the rest of the jurisdiction's allocation.
- The official launch date of the Federal Pharmacy Partnership for Long-term Care (LTC) Program was December 21, 2020, for jurisdictions that opted to use Pfizer vaccine for the program and December 28, 2020, for jurisdictions that chose to use Moderna vaccine.
    - These launch dates were chosen to account for the time needed to ensure adequate vaccine supply is available and the time pharmacy partners will need to schedule and coordinate clinics at each facility.
    - The timing allowed pharmacies and facilities to work with residents and their families to understand the vaccines and agree to participate before the clinics begin.
- Pharmacy partners who are administering COVID-19 vaccine at long-term care facilities may require written consent from recipients before vaccination.
    - This is at the discretion of the pharmacy; written consent is not required by federal law for COVID-19 vaccination in the United States.
    - Long-term care facility administrators can request pharmacy partners email consent forms to residents' families in advance when they are serving as medical proxies. Individual providers should consult with their own legal counsel for state requirements regarding consent.

PHARMACY – RETAIL AND COMMUNITY

- The Federal Retail Pharmacy Program for COVID-19 Vaccination is a public-private partnership that involves 21 national pharmacy partners and networks of independent pharmacies representing over 40,000 retail and long-term care pharmacy locations nationwide.
- Coordination for the program is at the federal level, with the goal of increasing access to vaccine, improving vaccine uptake, and decreasing the logistical and operational burden on public health.
- Through the Federal Pharmacy Partnership Strategy for COVID-19 Vaccination, select pharmacy partners will receive a direct allocation of COVID-19 vaccine.
- Almost 90% of people live within five miles of a community pharmacy, pharmacies have unique reach and ability to provide access to COVID-19 vaccine and support broad vaccination efforts.
    - This program will provide critical vaccination services for the U.S. population, with vaccine administered at retail locations at no cost to recipients.
- The federal allocation to pharmacies will not cover every pharmacy in the United States.
- Based on their (1) size and reach, (2) capability to store vaccines and ensure cold chain management, (3) ability to meet data reporting requirements to jurisdictions and CDC, and (4) estimated daily number of doses each facility is able to administer, these partners stand ready to assist jurisdictions in COVID-19 vaccination efforts.
- Program Benefits:
    - Once we have an adequate supply of COVID-19 vaccine to support broader vaccination efforts, it will be important to swiftly increase access to COVID-19 vaccine for the general population.
    - Partnerships with retail chain pharmacies and networks of community pharmacists in the United States will increase the general population's access to COVID-19 vaccine.
    - Pharmacists can be crucial public health partners to increase access and convenience of COVID-19 vaccines.
    - Pharmacists are trained to provide vaccinations and are important immunizers in their communities.
    - Pharmacists are a trusted health resource in their communities and play a vital role in the public health response to COVID-19 by counseling patients and administering tests.
    - Pharmacies have the capability to quickly surge and meet demand nationwide because of existing infrastructure and the large number of pharmacists who can administer vaccines.

- CDC has worked extensively with pharmacy chains to improve pandemic preparedness, conduct vaccine throughput exercises, and assess store and organizational response capabilities.

VACCINE SAFETY

Vaccine Safety Monitoring

- For COVID-19 vaccines, CDC and federal partners will use a toolbox of existing and new monitoring systems for COVID-19 vaccine safety.
  - CDC will rely on existing systems that monitor the safety of vaccines every day, the Vaccine Adverse Event Reporting System (VAERS), the Vaccine Safety Datalink (VSD), and the Clinical Immunization Safety Assessment (CISA) Project.
  - CDC has also developed a new, voluntary smartphone-based tool, v-safe, that uses text messaging and web surveys to provide personalized health check-ins after patients receive a COVID-19 vaccination.
  - CDC has also expanded its collaboration with the Advisory Committee on Immunization Practices (ACIP) to include a special ACIP COVID-19 Vaccine Safety Technical Sub-Group to review available vaccine safety data.
- If potential safety issues with any COVID-19 vaccine are discovered, CDC will take the following steps:
  - Work with the Food and Drug Administration (FDA) and other vaccine safety partners to rapidly assess the potential safety issue.
  - Provide up-to-date vaccine safety information to ACIP. CDC routinely shares this kind of information for all vaccines. ACIP may recommend additional assessment and analysis, advise CDC on the balance between the benefit of COVID-19 vaccination and the risk of adverse events, or make changes to its recommendations.
  - Communicate vaccine safety information to the public in a timely and transparent manner.

Anaphylaxis

- Early monitoring of both the Moderna and the Pfizer-BioNTech COVID-19 vaccines indicate that anaphylaxis following vaccination is a rare event, and though anaphylaxis is serious, it occurs shortly after vaccination (usually within minutes), is readily diagnosed, and effective treatments are available.
  - Patients experiencing anaphylaxis after vaccination do well and recover.
- Many people don't have any side effects after COVID-19 vaccines, but some people will have pain or swelling at the injection site or fever, chills, or a headache. These typically don't last long and are signs that your body is building protection.
- As of Tuesday, January 19, there have been 15 confirmed cases of anaphylaxis after receipt of Moderna COVID-19 vaccine and 45 confirmed cases of anaphylaxis after receipt of Pfizer-BioNTech COVID-19 vaccine.
  - Per 1 million doses administered, that's a rate of 2.1 cases for Moderna and 6.2 cases for Pfizer.
  - The observed rates of anaphylaxis are comparable to other vaccines.
  - These estimated rates may change as additional doses of COVID-19 vaccine are administered and CDC continues to collect more information.
- Appropriate medical treatment for severe allergic reactions must be immediately available in the event that an acute anaphylactic reaction occurs following administration of Pfizer-BioNTech COVID-19 vaccine.
- CDC considers a history of severe allergic reaction to another vaccine (any other vaccine besides the Pfizer-BioNTech COVID-19 vaccine) or to any injectable therapy (e.g., intramuscular, intravenous, or subcutaneous) as a precaution, but not a reason to forgo, receiving the vaccine.
- CDC currently recommends that persons who receive Pfizer-BioNTech COVID-19 vaccine be observed following vaccination:
  - Persons with a history of anaphylaxis (due to any cause): 30 minutes
  - All other persons: 15 minutes

Vaccine safety response to significant reports of adverse events or clusters of adverse events
As COVID-19 vaccine is administered in the U.S., there may be significant adverse events or clusters of adverse events reported. We anticipate that these clusters could fall in one of the following categories:

- Adverse events of special interest that CDC vaccine safety monitoring systems are following,
- Adverse events that are unexpected and for which background rates are not available,
- Adverse events that are hard to define and for which background rates are not available, or
- Adverse events which may be similar to symptoms or outcomes from COVID-19 disease.

In the event that significant adverse events or clusters of adverse events following COVID-19 vaccination are identified, CDC will do the following:

1. Review the VAERS database for any similar reports following COVID-19 vaccines or other vaccines to determine counts, reporting rates, and demographics.
2. Engage the Vaccine Safety Datalink (VSD) to determine if these adverse events are occurring in VSD following COVID-19 vaccines or any other vaccine, and to quickly determine the background rates and conduct chart review, if needed.
3. Conduct CISA consults/evaluations which would include medical experts and medical record review, if needed.
4. Work with our federal partners to determine if their surveillance systems are observing adverse events following COVID-19 vaccination.
5. Initiate any investigations needed to further evaluate this adverse event or cluster of adverse events following COVID-19 vaccination.

VACCINE EFFECTIVENESS

- Two COVID-19 vaccines are currently authorized by the FDA for emergency use. CDC is studying how well the vaccines protect people against COVID-19 in real-world conditions. This is called “vaccine effectiveness.”
- Vaccine effectiveness data are important to understand the real-world impact of vaccination and is used to help inform policy decisions by public health officials
- Vaccine effectiveness differs from vaccine efficacy. Vaccine efficacy refers to vaccine protection measured in randomized control trials, usually under optimal conditions where vaccine storage and delivery are monitored. Vaccine effectiveness refers to vaccine protection measured in observational studies that include people who have been administered vaccines by different healthcare providers under real-world conditions.
- CDC has launched several vaccine effectiveness studies that will evaluate how well COVID-19 vaccines are working. Additional studies will begin as vaccines are administered across the United States among different groups.
    - These studies will use different study designs and measure protection against different outcomes. For example, some studies will examine how much vaccination reduces the risk of infection (including infection without symptoms) or of milder COVID-19 illness.
    - Others will evaluate how much vaccination protects against more serious outcomes, like how much vaccination reduces the risk of being hospitalized for COVID-19
- These real-world vaccine effectiveness studies will include a diverse set of people, like health care and other essential workers, older adults, and people living in nursing homes, as well as people with certain underlying medical conditions and people in disproportionately affected racial and ethnic minority groups.
- These studies will use both CDC systems that were already in place to study how well vaccines work and new systems developed specifically for COVID-19.
- CDC will also study the impact vaccination has on spread. For example, whether people who have been vaccinated can still spread COVID-19 to others.

- Since vaccination of priority groups with COVID-19 vaccines has only recently begun, data to determine vaccine effectiveness are being collected but are not yet available. As data on vaccine effectiveness become available, CDC will provide regular updates with that information.
- CDC will continue to conduct vaccine effectiveness studies until we have a good understanding of how vaccines are working across different populations and different outcomes.

ACIP

- While ACIP and CDC make national recommendations, we understand that there will be a level of local adaptation.
    - The phased vaccine recommendations are meant to be fluid and not restrictive for jurisdictions.
    - It is not necessary to vaccinate all individuals in one phase before initiating the next phase; phases may overlap.
- Decisions regarding transition from one phase to the next should be made at the local, state, or territorial level, and may be based on factors such as demographic and workforce characteristics, COVID-19 epidemiology within the jurisdiction, and vaccine supply and demand within the jurisdiction.
- Decisions about transitioning to subsequent phases should also depend on supply, demand, equitable vaccine distribution, and local, state, or territorial context.

Background

- The Advisory Committee on Immunization Practices (ACIP) is an independent federal advisory committee of medical and public health experts that provides advice and guidance to the CDC director on the most effective means to prevent vaccine-preventable diseases in the United States.
- ACIP develops written recommendations—subject to the CDC director's approval—for the routine administration of vaccines to both pediatric and adult populations.
- ACIP and CDC's recommendations include:
    - On December 1, ACIP voted to recommend that vaccination in the initial phase of the COVID-19 vaccination program (Phase 1a) should be offered to both 1) health care personnel (HCP) and 2) residents of long-term care facilities (LTCF).
        - It is estimated there are 21 million people working in the healthcare industry and approximately 3 million people living in long-term care facilities.
        - To date, more than 378,000 healthcare workers have contracted COVID-19 and more than 1,200 have died.
        - According to estimates, deaths in long-term care facilities account for 40% of all COVID-19 deaths nationwide.
        - These factors contributed to the committee's recommendation to prevent spread by protecting those on the front lines, healthcare workers treating COVID-19 patients, and protect the most vulnerable, those elderly persons living in long-term care facilities.
    - On December 12, ACIP voted to recommend Pfizer's COVID-19 vaccine for people 16 and older for the prevention of COVID-19.
    - On December 19, ACIP voted to recommend Moderna's COVID-19 vaccine for individuals 18 years of age and older.
    - On December 20, ACIP voted to recommend prioritizing individuals 75 and older and frontline essential workers for Phase 1b. Phase 1b includes approximately 49 million individuals who were not included in Phase 1a.
        - There are approximately 21 million people in the U.S. who are 75 and older. Approximately 2 million of these individuals were recommended for vaccination in Phase 1a (e.g. residents of long-term care facilities).
        - There are approximately 30 million frontline essential workers in the U.S. A frontline essential worker is someone in a sector essential to the functioning of society who is at substantially higher risk of exposure to SARS-CoV-2. This includes first responders, teachers,

grocery store workers, USPS employees, corrections workers, public transit employees, manufacturing workers, and employees in food and agriculture industries.
    - For Phase 1c, the committee voted to prioritize people aged 65-74 years, people aged 16-64 years with high-risk medical conditions, and other essential workers. Phase 1c adds 129 million new individuals to the groups recommended in Phases 1a and 1b.
    - About 32 million people in the U.S. are in the 65-74-year age bracket, 28 million of whom are not part of Phases 1a or 1b.
    - More than 110 million people are between the ages of 16-64 and have high-risk medical conditions, including 81 million people who are not part of the Phase 1a or 1b recommendations. There are fewer than 86 million individuals in this age group without such conditions.
    - There are approximately 57 million other essential workers, including individuals who work in transportation and logistics, food service, construction, water, and other sectors. 20 million of these essential workers were not accounted for in the Phase 1a and 1b recommendations.

Sub-Prioritization of Phase 1A Priority Groups

- Considerations for sub-prioritization of HCPs, of equal importance, include:
    - HCP with direct patient contact and thus who are unable to telework, including those who work in inpatient, outpatient, or community settings, who provide services to patients or patients' family members, or who handle infectious materials.
    - HCP working in residential care or long-term care facilities.
    - HCP with documented acute SARS-CoV-2 infection in the preceding 90 days may choose to delay vaccination until near the end of the 90 day period in order to facilitate vaccination of those HCP who remain susceptible to infection, as current evidence suggests reinfection is uncommon during this period after initial infection. Of note, previous SARS-CoV-2 infection, whether symptomatic or asymptomatic, is not considered a contraindication to vaccination and serologic testing for SARS-CoV-2 antibodies is not recommended prior to vaccination.
- Considerations for sub-prioritization among LTCF residents include:
    - Skilled nursing facilities should be prioritized among LTCFs as they provide care to the most medically vulnerable residents.
    - After skilled nursing facilities, consider broadening to LTCFs.

Post-vaccination symptoms in HCP

- Based on available data, COVID-19 vaccination is expected to elicit systemic post-vaccination symptoms, such as fever, headache, and myalgias.
- While the incidence and timing of post-vaccination symptoms will be further informed by phase III clinical trial data, strategies are needed to mitigate possible HCP absenteeism and resulting personnel shortages due to the occurrence of these symptoms. Considerations might include:
    - Staggering delivery of vaccine to HCP in the facility so that personnel from a single department or unit are not all vaccinated at the same time. Based on greater reactogenicity observed following the second vaccine dose in phase I/II clinical trials, staggering considerations may be more important following the second dose.
    - Planning for personnel to have time away from work if they develop systemic symptoms following COVID-19 vaccination.

Sub-Prioritization of Phase 1b Priority Groups

- Sub-prioritization considerations for frontline essential workers include:
    - Workers in locations where high rates of transmission and/or outbreaks have occurred
    - Workers who are at increased risk for severe illness based on age or underlying medical conditions
    - Workers who do not have a history of documented acute SARS-CoV-2 infection in the prior 90 days

ADMINISTRATION, STORAGE, AND HANDLING

- Proper COVID-19 vaccine administration is critical to ensure that vaccination is safe and effective.
    - COVID-19 vaccine specific education and training materials to facilitate storage and handling of ultra-cold vaccine based on guidance from the vaccine's manufacturer is available from the manufacture.
    - Additionally, CDC has added a COVID-19 Addendum to the *Vaccine Storage and Handling Toolkit*.
- A cold chain is a temperature-controlled supply chain that includes all vaccine-related equipment and procedures.
    - It begins with vaccine manufacturing and ends with vaccine administration.
    - Vaccines must be stored properly from the time they are manufactured until they are administered.
    - Potency is reduced every time a vaccine is exposed to an improper condition. This includes overexposure to heat, cold, or light at any step in the cold chain. Once lost, potency cannot be restored.
- Any temperature reading outside the range recommended by the manufacturer is considered a temperature excursion and requires immediate action.
    - To determine whether a vaccine is likely to still be viable, COVID-19 vaccine manufacturers will analyze information about the magnitude of the temperature excursion, including the total amount of time that temperatures were out of range.
- Expired vaccines and diluents should be removed immediately from storage units to avoid inadvertently administering them. Manufacturers may have specific guidance on how to handle expired or compromised vaccines.
- Medical waste disposal requirements are set by state environmental agencies and may vary from state to state.
- As part of the COVID-19 Vaccination Program, a minimum order size of COVID-19 vaccine, diluent, and ancillary supplies will be shipped directly to enrolled COVID-19 vaccination providers.
    - In most instances, vaccine will be delivered directly to the facility where it will be administered to maintain the vaccine cold chain.

mRNA clinical considerations guidance

- CDC still recommends that people get their 2nd dose of COVID-19 vaccine as close to the recommended interval as possible (3 weeks for Pfizer-BioNTech, one month for Moderna).
- After posting initial guidance, we received feedback that some flexibility in our language might be helpful to reduce barriers to vaccination, especially if there are challenges around returning on a specific date or if someone's circumstances had changed (like being discharged or entering a long-term care facility).
- As always, CDC encourages people to follow our guidance around intervals and interchangeability, but we also don't want our guidance to be so rigid that it creates unintended barriers.
- CDC's updated guidance says that if it is not feasible to adhere to the recommended interval, the second dose of Pfizer-BioNTech and Moderna COVID-19 vaccines may be scheduled for administration up to 6 weeks (42 days) after the first dose.
    - The Pfizer efficacy analyses included people who received the 2nd dose up to 42 days after the first, and the majority of Moderna trial participants received their 2nd dose within this time frame as well.
    - This is also in line with the time frame endorsed by WHO as well as a few other countries, but in contrast we are not recommending this as a strategy to allow more people to get 1st doses, but rather to address feasibility issues.

- Additionally, we note that "in exceptional situations in which the first-dose vaccine product cannot be determined or is no longer available, any available mRNA COVID-19 vaccine may be administered at a minimum interval of 28 days between doses to complete the mRNA COVID-19 vaccination series."
- This guidance is intended for situations where someone received the 1st dose but does not know what product, and despite efforts, including using resources outlined in the guidance (e.g. vaccination cards, Immunization Information Systems), it still cannot be determined what product they used, we are saying that they can get the 2nd dose with either product.
    - Another example we have been hearing about is someone who got vaccinated in a LTCF and then was discharged to the community, or vice versa, and the same vaccine product not being available and there would be significant barriers to getting the right vaccine product resulting in the person only getting one dose.

DATA AND MONITORING

- Integrated IT systems —both public and private, as well as new and existing—are needed to ensure successful vaccine allocation, distribution, administration, monitoring, and reporting.
- HHS and CDC have agreed to maintain the confidentiality of data received from state immunization information systems (IISs) to the fullest extent required by federal law.
- Jurisdictions who may have legal or regulatory restrictions around submitting identifiable data to CDC may submit redacted data sets and implement Privacy Preserving Record Linkage (PPRL) technology as indicated by their Data Use Agreements.

Vaccine Logistics and Administration

- Three systems support vaccine logistics and administration: the Vaccine Tracking System, Immunization Information Systems, and VaccineFinder.
- (1) The Vaccine Tracking System (VTrckS) is CDC's vaccine order management system, which supports routine vaccination with almost 80 million doses of vaccine annually.
    - CDC will use VTrckS as its platform for ordering all COVID-19 vaccines.
    - VTrckS users—the 64 state, local, and territorial public health jurisdictions and enrolled national provider organizations will use VTrckS to:
        - View vaccine allocations for each program
        - Place and manage vaccine orders for their providers
        - Generate reports throughout the vaccine distribution process, from vaccine order placement through distribution
        - Track vaccine shipments
- (2) IISs, formerly known as "immunization registries," vary by jurisdiction in their capacity to automate processes, handle large volumes of data, and capture high-quality data.
    - Vaccine recipients and enrolled providers use IISs to access people's vaccination records.
    - In addition, IISs collect data from public and private healthcare provider organizations (e.g., electronic health records), health information systems (e.g., vital statistics, state Medicaid agencies), and pharmacies. IISs share these data with the IZ Gateway, CDC, and other jurisdictions if an agreement is in place. IISs also share vaccination records with healthcare providers and individuals.
    - As part of the overall IT infrastructure to support COVID-19 vaccination IISs connect with VTrckS, VAMS (see below for details), and federal data and reporting systems.
- (3) The VaccineFinder website helps people find providers who offer select vaccines. VaccineFinder also allows healthcare providers to list their vaccination locations in a centralized, searchable database and to track vaccine supply. VaccineFinder will serve two roles in the COVID-19 vaccination program:
    - Inventory reporting (required for all COVID-19 vaccine providers): Providers will report on-hand COVID-19 vaccine inventory each day through VaccineFinder.

- Increase access to COVID-19 vaccines (optional for COVID-19 vaccine providers): Once there is enough supply, COVID-19 vaccination providers may choose to make their location visible on VaccineFinder, making it easier for the public to find provider locations that have doses available. CDC will direct the public to use VaccineFinder to find locations offering COVID-19 vaccine.
- As part of the overall IT infrastructure to support COVID-19 vaccination, VaccineFinder sends data to and receives data from the IZ Data Lake.

Vaccine Data Collection and Reporting

- The IZ Gateway is a cloud-based message routing service intended to enable data exchange between IISs, other provider systems, and the IZ Data Lake. The IZ Gateway allows:
  - IISs to report data to the CDC Data Clearinghouse
  - Cross-jurisdictional queries and data exchange
  - Multijurisdictional providers to share data with multiple IISs via a central connection
  - VAMS data to be routed to the IIS where applicable

New Systems to Support COVID-19 Vaccination Clinics and Vaccine Administration

- Vaccine Administration Management System (VAMS) is an optional web-based application that supports planning and execution for temporary, mobile, or satellite COVID-19 vaccination clinics. VAMS has modules to support four specific user groups: public health jurisdictions, healthcare providers, employers/organizations, and vaccine recipients.
- VAMS connects with IISs via federal and data reporting systems and sends data to IISs through the IZ Gateway or IZ Data Clearinghouse.

New Systems Developed for COVID-19 Vaccination Data Collection and Reporting

- (1) The IZ Data Clearinghouse is a cloud-hosted data repository that receives, deduplicates, and deidentifies COVID-19 vaccination data that are then used to populate the IZ Data Lake with deidentified data for analytics. It allows healthcare providers to search for a patient, see what brand of COVID-19 vaccine they received, and see when they received their first dose of COVID-19 vaccine to ensure dose matching and appropriate vaccination intervals to complete the vaccine series.
- (2) The IZ Data Lake is a cloud-hosted data repository to receive, store, manage, and analyze deidentified COVID-19 vaccination data. CDC, jurisdictions, federal agencies, and pharmacy partners will use the IZ Data Lake to store and process administration, coverage, logistics, inventory, ordering, distribution, and provider data. VAMS, IISs, pharmacies, VTrckS, and VaccineFinder will provide data for the IZ Data Lake.

National Healthcare Safety Network COVID-19 Vaccination Modules for Healthcare Facilities

- The National Healthcare Safety Network (NHSN) is a web-based system for monitoring healthcare-associated adverse events, healthcare worker vaccinations, and other prevention practices. It has been in operation since 2005.
- NHSN captures data from 37,000 participating facilities in all 50 states. Data that are entered into the system are available in real time. Data are used for facility-level clinical performance measurement, state- and national-level health surveillance and prevention, and public reporting of facility-specific data and Medicare reimbursement.
- NHSN's COVID-19 Vaccination Modules will allow healthcare facilities to report weekly facility-level vaccination coverage among initial priority groups.
- NHSN COVID-19 modules are optional for healthcare facilities. Reporting via these modules does not replace CDC's IIS reporting requirements.
- These modules provide the only data source for monitoring facility-level vaccination of initial priority groups. Data will not be reported at the individual level. Facilities will report cumulative vaccination numbers and can calculate coverage rates.
- NHSN can also capture data on adverse events and provide a link to VAERS.

COVID-19 VACCINE STATUS

Currently authorized vaccines

- On December 11, FDA issued an EUA for Pfizer's mRNA vaccine candidate, BNT162b2.
    - Earlier Pfizer and its partner BioNTech announced that its first interim efficacy analysis has found its vaccine candidate is more than 90% effective. The study enrolled over 43,000 participants and has not uncovered any serious safety concerns.
- On December 18, FDA issued an EUA for Moderna's mRNA vaccine candidate.
    - Per a statement from Moderna, "Out of an abundance of caution and leveraging the flexibility of our mRNA platform, we are advancing an emerging variant booster candidate against the variant first identified in the Republic of South Africa into the clinic to determine if it will be more effective to boost titers against this and potentially future variants."
    - On December 2, Moderna announced that it would soon begin testing its coronavirus vaccine in children ages 12 through 17. In a post on clinicaltrials.gov, the study plans to include 3,000 children, with half receiving two shots of vaccine four weeks apart, and half getting placebo shots of salt water.
    - Moderna announced that its first interim efficacy analysis has found its vaccine candidate is 94.5% effective. The study enrolled over 43,000 participants and has not uncovered any serious safety concerns. Moderna's trial includes 30,000 participants.
    - By the end of 2020, Moderna expected to have approximately 20 million doses ready to ship in the U.S. and remains on track to manufacture 500 million to 1 billion doses globally in 2021, including 100 million to 125 million doses in the first quarter of the year.

AstraZeneca

- AstraZeneca issued a press release reporting results from its Phase III clinical trial in Brazil and the United Kingdom indicating strong vaccine effectiveness among participants.

Janssen/Johnson & Johnson

- Janssen's ENSEMBLE COVID-19 vaccine clinical trial has fully enrolled 45,000 participants and hopes to be able to consider applying for an Emergency Use Authorization (EUA) of our vaccine FDA in February.

mRNA vaccines

- mRNA vaccines are being held to the same rigorous safety and effectiveness standards as all other types of vaccines in the United States. The only COVID-19 vaccines the Food and Drug Administration (FDA) will make available for use in the United States (by approval or emergency use authorization) are those that meet these standards. mRNA vaccines do not use the live virus that causes COVID-19. They cannot give someone COVID-19.
- mRNA never enters the nucleus of the cell, which is where our genetic material (DNA) is kept. The cell breaks down and gets rid of the mRNA soon after it is finished using the instructions.
- This means the mRNA vaccines do not affect or interact with our DNA in any way.

MISCELLANEOUS

Cost

- COVID-19 vaccine will be procured and distributed by the federal government at no cost to enrolled COVID-19 vaccination providers.
- Providers can bill for an office visit when administering COVID-19 vaccine if the visit meets the criteria for office visit coding under a recipient's plan.
- Vaccine providers will be able to charge an administration fee. However, participating vaccine providers must administer COVID-19 vaccine regardless of the vaccine recipient's ability to pay COVID-19 vaccine administration fees or coverage status, as stated in the CDC Provider Agreement.

    - Vaccine providers may seek appropriate reimbursement from a program or plan that covers COVID-19 vaccine administration fees for the vaccine recipient.
    - For uninsured patients, the vaccine provider can seek reimbursement for an administration fee from the HRSA Provider Relief Fund.
- Immunization cooperative agreement funds may be used by the awardee to pay for redistributing vaccines. However, provider organizations cannot purchase equipment or contract with a vendor for redistribution and then bill the immunization program or federal government for those costs.
- To help providers, states, and insurers prepare for vaccine administration, the Centers for Medicare & Medicaid Services (CMS) has released a set of toolkits that are designed to increase the number of vaccine-administering providers and ensure adequate Medicare reimbursement. These toolkits also make clear to private insurers and Medicaid programs that they must cover the vaccine at no charge to beneficiaries.

COVID-19 Vaccination, Pregnancy, and Breastfeeding

- People who are pregnant and part of a group recommended to receive COVID-19 vaccine, such as healthcare personnel, may choose to be vaccinated.
    - A conversation between pregnant patients and their clinicians may help them decide whether to get vaccinated with a vaccine that has been authorized for use under Emergency Use Authorization (EUA).
    - While a conversation with a healthcare provider may be helpful, it is not required prior to vaccination.
- Until findings are available from clinical trials and additional studies, only limited data are available on the safety of COVID-19 vaccines, including mRNA vaccines, administered during pregnancy:
    - Limited data are currently available from animal developmental and reproductive toxicity studies. No safety concerns were demonstrated in rats that received Moderna COVID-19 vaccine before or during pregnancy; studies of the Pfizer-BioNTech vaccine are ongoing.
    - Studies in people who are pregnant are planned.
    - Both vaccine manufacturers are monitoring people in the clinical trials who became pregnant.
- CDC and the FDA have safety monitoring systems in place to capture information about vaccination during pregnancy and will closely monitor reports.
- Based on how mRNA vaccines work, experts believe they are unlikely to pose a specific risk for people who are pregnant. However, the actual risks of mRNA vaccines to the pregnant person and her fetus are unknown because these vaccines have not been studied in pregnant women.
- There are no data on the safety of COVID-19 vaccines in lactating women or on the effects of mRNA vaccines on the breastfed infant or on milk production/excretion. mRNA vaccines are not thought to be a risk to the breastfeeding infant. People who are breastfeeding and are part of a group recommended to receive a COVID-19 vaccine, such as healthcare personnel, may choose to be vaccinated.

Vaccines and COVID-19 variants

- CDC is closely monitoring reports out of the United Kingdom of a new variant of the virus that causes COVID-19.
- Viruses constantly change through mutation, and new variants of a virus are expected to occur over time.
    - In this particular case, genetic analysis show changes to the spikes on the virus and to other parts of the virus.
    - Scientists in the UK have reported that the number of mutations detected are more than what we normally see in a virus now.
- However, based on available data to date, we do not believe the new variant will impact the effectiveness of the COVID-19 vaccines.

CDC Resources for Case Investigations and Contact Tracing

This resource is an inventory of case investigation and contact tracing resources available on the CDC COVID-19 website. The goal of this resource is to capture all case investigation and contact tracing resources in one place. Resources include guidance documents, checklists, case investigator and contact tracer scripts, training plans, fact sheets, infographics, and other communication resources.

Newly added resources will be highlighted in the gray boxes.

Table of Contents

- Case Investigations and Contact Tracing Guidance Documents
- Contact Tracing Implementation Guides and Tools for the Public Health Workforce
- Training Resources
- Contact Tracing Resources for the Public or Persons with and/or Exposed to COVID-19
- Digital Tools: Exposure Notification and Patient Monitoring Resources

If assistance is needed, please email the Contact Tracing Program Support functional mailbox: eocevent348@cdc.gov

Case Investigations and Contact Tracing Guidance Documents

Date Released/Updated	Name/Description	URL
January 7, 2021	**Improving Ventilation in Your Home** This CDC guidance gives information on how improving ventilation can help prevent virus particles from accumulating in the air in your home.	Improving Ventilation in Your Home
December 3, 2020	**Contact Tracing Webpage** CDC's information on contact tracing for consumer audiences.	Contact Tracing Webpage
December 2, 2020	**Options to Reduce Quarantine for Contacts of Persons with SARS-CoV-2 Infection Using Symptom Monitoring and Diagnostic Testing** CDC currently recommends a quarantine period of 14 days. However, based on local circumstances and resources, options to shorten quarantine are available as acceptable alternatives.	Options to Reduce Quarantine for Contacts of Persons with SARS-CoV-2 Infection Using Symptom Monitoring and Diagnostic Testing
December 1, 2020	**CDC Guidance for Expanded Screening Testing to Reduce Silent Spread of SARS-CoV-2** The updated guidance is meant to assist health departments in decision making and considerations for groups to be considered for expanded screening testing with the aim of slowing asymptomatic and presymptomatic community transmission.	CDC Guidance for Expanded Screening Testing to Reduce Silent Spread of SARS-CoV-2

Date Released/Updated	Name/Description	URL
November 23, 2020	**Prioritizing Case Investigations and Contact Tracing for COVID-19 in High Burden Jurisdictions** This new guidance further refines prioritization recommendations and presents emerging modeling data regarding timeframes for effectiveness.	Prioritizing Case Investigations and Contact Tracing for COVID-19 in High Burden Jurisdictions
November 23, 2020	**Prioritizing COVID-19 Contact Tracing – Mathematical Modeling Methods and Findings** This document presents emerging modeling data regarding timeframes for case investigation and contact tracing effectiveness.	Prioritizing COVID-19 Contact Tracing – Mathematical Modeling Methods and Findings
November 19, 2020	**Training, Evaluation, and Monitoring Guidance for Health Departments Supervisors and Leads** This document will help supervisors and training leads to effectively develop and assess case investigators' interviewing skills.	Training, Evaluation, and Monitoring Guidance for Health Departments
November 18, 2020	**Interim Guidance for Case Investigation and Contact Tracing in K-12 Schools** This guidance is intended to help administrators of K-12 schools plan for the development and implementation of COVID-19 case investigation and contact tracing efforts in their schools. This guidance highlights potential collaboration between health officials and K-12 school administrators to facilitate effective case investigation and contact tracing.	Interim Guidance for Case Investigation and Contact Tracing in K-12 Schools

Date Released/Updated	Name/Description	URL
October 22, 2020	**Case Investigation and Contact Tracing in Non-healthcare Workplaces: Information for Employers** This document provides tips and considerations for how employers can partner with state, tribal, local, or territorial (STLT) health departments and work with their employees in COVID-19 response efforts.	Case Investigation and Contact Tracing in Non-healthcare Workplaces: Information for Employers
October 22, 2020	**COVID-19 Case Investigation and Contact Tracing among Refugee, Immigrant, and Migrant (RIM) Populations: Important Considerations for Health Departments** Important considerations for health departments conducting case investigation and contact tracing among Refugee, Immigrant, and Migrant populations (RIM).	COVID-19 Case Investigation and Contact Tracing among Refugee, Immigrant, and Migrant (RIM) Populations: Important Considerations for Health Departments
October 21, 2020	**Interim Guidance for Case Investigation and Contact Tracing in Institutions of Higher Education (IHEs)** This guidance is intended to help administrators of IHEs plan for the development and implementation of COVID-19 case investigation and contact tracing efforts in their schools. This guidance highlights potential collaboration between health officials and IHE administrators to facilitate effective case investigation and contact tracing.	Interim Guidance for Case Investigation and Contact Tracing in Institutions of Higher Education (IHEs)
October 21, 2020	**Overview of Testing for SARS-CoV-2 (COVID-19)** This document provides a summary of considerations and current Centers for Disease Control and Prevention (CDC) recommendations regarding SARS-CoV-2 testing strategy. The CDC recommendations for SARS-CoV-2 testing have been developed based on what is currently known about COVID-19 and are subject to change as additional information becomes available. FEMA

COVID-19

ESF 15 - EXTERNAL AFFAIRS

SOCIAL LISTENING REPORT

WEDNESDAY, JANUARY 27, 2021

SUMMARY

- There are reports of increased skepticism regarding the vaccine among Latinx communities. There is a lack of trust in the guidance and policies being shared by the federal government and some state and local officials. This is causing some to feel more hesitant about receiving the vaccine.
- Many individuals who have received the first round of the vaccine are growing more concerned that supplies will run out before they can receive their second dose, or that they will not be able to obtain appointments for their second dose.
- There is a small amount of local news coverage regarding FEMA funeral assistance. Members of the National Funeral Directors Association report they are anxiously awaiting additional guidance from FEMA about how the program will be implemented. There has also been steady coverage in local media regarding the recent allocation of funds to bolster state vaccine administration capacity.
- There is some debate and disagreement among state lawmakers regarding what populations should be prioritized for the vaccine.
- This afternoon, traditional media has focused on the White House COVID-19 Response Team's press brief. Popular topics covered in the brief included overall action plans, infection risk following detection of new virus strains within U.S. borders, and ongoing concerns about vaccine supplies and accessibility. Today's newspaper front-page headlines covered new vaccination sites, concerns regarding new strains of the virus, and mixed public reaction to the pace of vaccine distribution and administration.

PUBLIC PERCEPTION/SENTIMENT

- Reports of inequitable vaccine distribution is becoming an increasingly hot topic among Latinx communities. (example 1, example 2)
    - Some members of these communities claim there is hesitation to get vaccinated due to a lack of official information available in Spanish and a large circulation of myths/rumors causing an overall lack of trust towards government messaging regarding the vaccine.

  - Many feel reports of inequitable vaccine are intended to be polarizing, claiming that the states being analyzed in the news reports are predominantly white anyways.
- Debate over double masking has grown significantly due to increased coverage from local news outlets. (example 1, example 2) There continue to be a large number of people who say they do not plan to wear multiple masks. These individuals often cite concern for breathing or a lack of trust in federal guidance.
- The anti-vaccine sentiment remains strong on social media. Content encouraging people to get vaccines is frequently overwhelmed by comments from accounts sharing false or negative information related to vaccines.
- A number of people are anxious and confused over how to schedule their second doses within the vaccine manufacturers recommended time frames.

RUMORS/MISINFORMATION

- Henry County, Tennessee Sheriff's Office is warning residents of a scam in which callers are requesting personal information and payment to schedule an appointment for COVID-19 vaccination. The public is advised the public not to give personal details nor payment over the phone.
- One Pennsylvania news outlet reports that 'experts' warn not to take pain relievers before getting vaccinated. However, the news article does not specify what kind of experts issued the warning.
- Following news that baseball Hall of Famer Hank Aaron died a few a weeks after taking the vaccine, those who are skeptical or against the vaccine have falsely linked his death to the COVID-19 vaccine.

FEMA

- Many news stations and elected officials are sharing the news of FEMA's allocation of funds for vaccine storage and distribution in various states and territories. (example 1, example 2, example 3)
- Elected officials in Virginia are urging the governor and FEMA to establish a mass vaccination site in Northern Virginia.
  - Officials are also are pushing for streamlining the process and developing a more transparent and equitable system for distribution.
- A few people are relieved and grateful to FEMA staff who are helping at state vaccination sites. (example 1, example 2, example 3)
- There is a low volume of local news coverage on the implementation of funeral reimbursements. A spokesperson for the National Funeral Directors Association said they are eagerly awaiting additional guidance from FEMA.

Federal Response

- There is a high volume of discussion about President Biden's press conference yesterday with many people focusing on the desire to have 300 million Americans vaccinated by the end of summer. (example 1, example 2)
    - Some people are questioning if children will be included in the 300 million.
- There continues to be a push from elected officials to speed up vaccine delivery and distribution. Many place blame on the federal government saying it is delaying the process. (example 1, example 2)
- National media outlets report the White House will reopen HealthCare.gov marketplaces, currently operating in 36 states, to give those affected by the pandemic an opportunity to sign-up. (example 1, example 2, example 3)

Vulnerable Populations

- The World Health Organization does not recommended the Moderna COVID-19 vaccine for pregnant women, unless they are at risk of high exposure.
- CDC Director vows to follow the White House's executive order to bring equality to those disproportionally burdened by the pandemic.
    - Responses to her post ask the Director to not to forget disabled people, people of color, high risk and chronically ill people living independently, homeless, immunocompromised, and intellectually disabled among others.

Public Health

- CDC issued more detailed recommendations for COVID-19 vaccine distribution to include veterinary services in Phase 1-b.
- According to CNN, a survey published by the Kaiser Family Foundation of more than 1,500 adults found that 41% want the vaccine and at least 6% have already received at least the first dose.
    - Comments under the post are mixed. Several people shared that they want the vaccine or have already received it, while just as many express adverse feelings about the vaccine.

Transportation

- International airports across the country began to implement new policies yesterday requiring all passengers entering the US to provide proof of a negative COVID-19 test.
    - Reports that the government is considering expanding this policy to domestic travel have been met with mixed emotion. Some are saying it feels unconstitutional others are pleased at the idea of additional precautions being put in place.

Community Mitigation

- CDC Morbidity and Mortality Weekly Report (MMWR) reports NFL use of wearable devices for contact tracing and strict COVID-19 mitigation protocols for high-risk contacts limited the spread of infection.

Private Sector

- Darden Restaurants, the parent company of Olive Garden and Red Lobster, will offer their employees paid time off to get the COVID-19 vaccine.

REGION ONE

Supply Chain

- In New Hampshire, people are experiencing issues scheduling their second shots within the CDC's updated recommended time frame of 4-6 weeks due limited appointments and lack of supply.
    - Some appointments are having to be set as much as almost 8 weeks after the initial dose. The state advises that appointments will be made available when more vaccines are received.

Vaccine Administration

- Starting Wednesday, January 27, in Massachusetts, residents 75 and older may schedule appointments beginning in February for a COVID-19 vaccine for the start of Phase 2.
- Some Stop and Shop locations have been approved to give the Moderna vaccine based on the state's COVID-19 vaccination plan. These locations will begin accepting appointments on February 1.
- In Massachusetts, Eastfield Mall in Springfield is preparing the old Macy's location to serve as a vaccination site. Scheduling started today, January 27 for 500 appointments.

Vulnerable Populations

- In New Hampshire, for the first time in months there are no new outbreaks to report at long term care facilities. The governor attributes this, in part, to the implementation of vaccines.
- In Massachusetts, Boston homeless shelters are encountering a high level of vaccine hesitancy, as high as 50% at one location. Health care providers also have concerns about reaching people without cell phones for their second dose.

Public Health

- Maine CDC reported two new COVID-19 outbreaks at Lisbon Public Works and the Oxford Casino, while investigating 25 cases at Maine Veterans' Home.
- In Massachusetts, the town of Ossipee commissioners (selectmen) temporarily closed their administration building due to a COVID-19 outbreak in their campus-adjoining jail.

- The Ossipee commissioners also reversed their decision to mandate masks in the town hall, despite 21 people related to town hall business contracting the virus.

Community Mitigation

- The Appalachian Trail Conservancy have asked hikers to postpone plans to cover the Appalachian Trail, which runs through 14 states from Maine to Georgia, this year due to COVID-19.
  - Hikers usually stay at shelters in close quarters along the trail which don't allow for the CDC's recommended guidelines for social distancing and washing hands often.
  - The suggestion was made because of concern that thousands of travelers entering many small towns along the trail may overwhelm local hospital systems.
- Chicago, Illinois teachers are threatening to defy a Chicago Public School's order to return to classrooms on January 27. The Chicago Teachers Union alleges the school system has failed to put in place agreed upon COVID-19 protocols necessary for in-person learning. Teachers are expected to receive their shots in mid-February.

REGION TWO

Vaccination Administration

- People in the Tri-state area are having trouble getting their second vaccine dose appointment on time, local media reported.
  - In a Twitter poll hosted by the same local media outlet: 49.5% of people who filled it out claimed to have difficulty getting an appointment for their second dose.
- In Hudson County, New Jersey, the county's executive has expressed frustration saying the county has infrastructure ready for mass vaccination but not enough doses. The county's Health Officer informed that to deal with the problem, they are not registering individuals unless they have doses available.
- New Jersey will receive about 130 thousand vaccine doses for each of the next 3 weeks, announced the governor today.
- A New Jersey hospital in Hunterdon County reportedly vaccinated wealthy donors and their relatives in December before vaccine eligibility was expanded in the state.

Vulnerable Populations

- In Long Island, New York, local leaders said that they're facing an "uphill battle" in convincing minorities to get vaccinated. They're launching new efforts to make sure the minorities have equal access to the vaccines.
- In New York City, local media reported that early vaccination data from December showed that white people received about five times as many vaccinations while making up 42% of the population. The report also showed that about 40% of recipients didn't mark down their race or ethnicity.

REGION THREE

Vaccination Administration

- The Governor of Maryland announced the state will open at least six mass vaccination sites by early February.
    - Yesterday, January 26 he also announced that Six Flags America and Baltimore Convention Center will be converted into mass vaccination sites. Six Flags is expected to be converted February 5.
- In Lehigh County, Pennsylvania a drive-thru COVID-19 vaccination clinic opened today. The clinic opened at Dorney Park and they plan to vaccinate individuals 75 and older.
- In Chesterfield County, Virginia unregistered residents showed up at a Chesterfield appointment-only vaccine clinic. The county's official government page posted a message informing residents of the issue and asking them to be patient.

Vulnerable Populations

- The Pennsylvania State Troopers Association is speaking out against the state's decision to include smokers in the high priority category, urging the state to reject the CDC's recommendation.

Community Mitigation

- In Portsmouth, Virginia the health department launched a hot line to assist those without reliable internet. The hot line helps residents navigate the COVID-19 vaccination process. They've had over 2,000 call this week alone.

REGION FOUR

Supply Chain

- Mississippi is expecting to receive around 37,000 doses of COVID-19 vaccine this week from the federal government. According to the state's Department of Health, it is the same allocation the state has received the past few weeks. While the state would like to receive an increase in their allotted vaccines, they share that they are receiving what they expect.

Vaccination Administration

- Local news in North Carolina reports that there is a discrepancy between the reported amount of administered vaccines versus actual state data. The North Carolina Department of Health and Human Services (NCDHHS) reports that it has administered 95% of all first-round doses but data shows hundreds of thousands doses have not been administered.
    - The state Association of Health Directors is critical of NCDHHS' decision to prioritize two mass vaccination events at the expense of local health departments.
    - Health directors are also upset that the rerouting of vaccines from local providers triggered thousands of cancelled appointments, which they feel is slowing down vaccine distribution.

- Alabama Department of Public Health announced a new no-reservation, first come, first serve drive-thru site for COVID-19 vaccination clinics in Baldwin County to begin on February 2.
- Alabama State University announced this week that it will serve as a COVID-19 vaccine administration site.

Public Health

- Georgia's public health commissioner expressed to state lawmakers the pandemic is a strain on the Department of Public Health, but there will not be an increase in the their budget plan, published by the Governor's office, to account for COVID-19 expenses.
    - Some officials feel that public health should be more of a priority and that more funding is needed.
- CDC highlights the need for health depts and schools to weigh the benefits of allowing high contact sports against risk for spread of virus after COVID-19 outbreak linked to two wrestling tournaments in Florida.
- A Georgia state representative was removed from Georgia's House chamber for refusing to be tested for COVID-19, which is mandatory. His refusal was due to his frustration that state lawmakers have access to regular testing while many other Americans do not.

REGION FIVE

Supply Chain

- In Wisconsin, a pharmacist charged with intentionally tampering with dozens of vials of COVID-19 vaccine in attempt to spoil them is facing 20 years in prison after pleading guilty.
    - His actions allegedly caused more than 50 people to be vaccinated with improperly stored doses.

Vaccination Administration

- In Indiana, teachers are protesting the change in vaccination priorities to people who are high risk due to age over teachers, despite CDC guidelines to treat teachers and grocery store workers as essential workers.
- The Minnesota Department of Health opened a 24-hour vaccine lottery to choose approximately 11,700 residents who are 65 and older to receive the COVID-19 vaccine.
- The Ohio Funeral Directors Association asked the Governor of Ohio to add funeral directors, embalmers and their staff in a list with group 1B.

Community Mitigation

- Wisconsin Senate has voted to repeal their governor's statewide mask mandate. Both legislative chambers have to pass the resolution, scheduled for a vote on January 28.

REGION SIX

Vaccination Administration

- In Texas, local media reported that some individuals who received their first dose, are seeing conflicting information on how to obtain an appointment for their second dose and are worried about not getting their second dose in time.
- The governor of Texas announced that the state set a new record for COVID-19 vaccinations in a single day with 114,000 shots were administered yesterday (1/26).
- The vaccine registration website from Harris County, Texas, which had technical problems earlier in the week, was fixed and over 49,000 people have registered despite the site crashing a couple times. Many residents have also been receiving busy signals when calling the county's vaccine registration phoneline.
- New Mexico Governor announced that the state has the 3rd highest rate of COVID-19 vaccine administration in the country.

Vulnerable Populations

- The Texas National Guard teams are scheduled to begin COVID-19 vaccination on Thursday (1/28) in a new State mobile vaccine pilot program that aims to reach and immunize underserved areas like Starr County and others.
- The city of Corpus Christi, Texas, is deploying its firefighters to help vaccinate homebound senior residents.

Public Health

- In Amarillo, Texas, COVID-19 hospitalizations are decreasing. Area health experts believe vaccinations and masking precautions along with a high number of recoveries are contributing to the decrease in positive cases.

Community Mitigation

- An Oklahoma lawmaker filed a bill that would require people to wear a mask in public and face fines if one fails to do so.
- In Oklahoma, students in Rector Johnson Middle School and Broken Bow High School who forget their masks will have to buy one or call their parents. The schools say that giving students masks have depleted their supplies.

REGION SEVEN

Supply Chain

- Missouri Governor Mike Parson plans to divert unused COVID-19 vaccine doses from pharmacies, designated for long-term care facilities, to mass vaccination sites operated by the National Guard to increase the vaccine distribution rate.
    - This action will not prevent CVS and Walgreens from finishing their work providing vaccinations at nursing homes.

Vaccination Administration

- Missouri launched a new COVID-19 vaccine dashboard to track administered doses. The site shows the total vaccine shots administered and the number of individuals who have received single or double doses, county and demographic information of recipient.
- University of Iowa Hospitals and Clinics (UIHC) will begin their next phase of COVID-19 vaccinations next week to include emergency responders, teachers and people 65 and older.
    - The Governor and UIHC health officials share while vaccine supply is low, they will be able to administer a steady flow of vaccinations and can handle the administration of the vaccines. Officials want residents to remain hopeful.

Staffing

- Iowa lawmakers are considering a bill that will allow dentists to administer the COVID-19 vaccine and flu shots. It would require dentists to take four hours of training and prohibit them from allowing dental hygienists or dental assistants from vaccine administration.
    - Legislatures who disapprove feel that there are enough healthcare personnel to distribute the vaccine and that the real issue is the limited supply.

Vulnerable Populations

- In Kansas, local news reports that on January 26, the first day that residents 80 and up were allowed to get the vaccine in Johnson County, they were waiting in long lines in the cold. This was due to people showing up ahead of their scheduled appointments and healthcare workers in need of their second dose. The county said it won't happen again with more staff on site today.
- Kansas state lawmakers disagree on the state's vaccine administration plan on prioritizing healthcare workers over residents who are 65 and older. Some officials feel the governor's plan makes it harder for older residents to get vaccinated.

REGION EIGHT

Vaccination Administration

- In Sioux Falls, South Dakota law enforcement and health care professionals were able to receive their second COVID-19 vaccine yesterday. Many essential workers expressed gratitude to receive a second dose and were glad to do their part in protecting themselves and others.
- Utah chose the grocery chains Smith's and Walmart to help vaccinate the general public when allowed. This is a switch from CVS and Walgreens, which are currently helping vaccinate long-term care facility staff and residents.

Vulnerable Populations

- In Denver, Colorado state and local leaders asked SCL health to work on a mass vaccination event geared toward communities of color and underserved populations. Their goal is to vaccinate at least 5,000 people on Saturday, February 6th.

Public Health

- The Governor of North Dakota announced this morning that the statewide COVID-19 risk level will be adjusted from moderate to low beginning at 8 a.m. Friday, January 29th.
- A Washington State resident was arrested last week after prosecutors say he used social media to peddle untested, injectable COVID-19 "vaccines" on social media. He sold the "vaccines" on Facebook for $400-$1,000 and now faces misdemeanor federal charges of introducing misbranded drugs into interstate commerce.

REGION NINE

Vaccination Administration

- In California, Santa Clara County health officials are withholding COVID-19 vaccines from Good Samaritan Hospital after it broke vaccination eligibility rules.
    - Los Gatos Union School District teachers were instructed, in an email from their Superintendent, to impersonate health care workers to obtain vaccine appointments, displacing eligible people over 65 and health care workers.
- In California, San Diego County is planning for two new COVID-19 mass vaccination sites in the North and East Counties, and at least five more community sites.
- In California, Riverside Convention Center is preparing to open as a mass vaccination site.

Staffing

- Local news reports that FEMA has deployed 66 personnel to Tucson, Glendale, Kingman and Prescott Valley to help accelerate their efforts at vaccine sites.

Public Health

- Nevada officials announced the COVID-19 UK variant was detected in a specimen from a Las Vegas woman. Some local officials suggest that the state should increase their prevention efforts.

Private Sector

- In California, a group of tech workers created VaccinateCA.com, a database with a map of COVID-19 vaccination sites in the state, since there was not statewide site. It is verified by a group of 200 volunteers who phone bank for information.
- In California, the annual California Strawberry Festival in Oxnard, scheduled for mid-May, is now cancelled due to the uncertainty surrounding the pandemic.

REGION TEN

Vaccination Administration

- A new pop-up drive-thru clinic opened yesterday in Piece County, Washington. Washington residents were able to fill out their paperwork and receive the vaccine without leaving their car.
- Health officials in Oregon provided drivers who were stuck on the road during a snowstorm COVID-19 vaccines. The vaccines would have been spoiled if not used.
- In Olympia, Washington a mass vaccination site opens today at the Spokane Arena. The site will be open by appointment only and the goal is to provide about 500 vaccinations every day.

Vulnerable Populations

- In Washington, the Washington Black Lives Matter Alliance is urging state legislators to take action to address inequity, including declaring racism a public health crisis.
- Local organizations in Idaho are relaying important information about COVID-19 and the vaccination process to Latinx Americans.

Public Health

- In Washington, a biologic entrepreneur was arrested last week after prosecutors say he used social media to sell untested COVID-19 "vaccines" on social media. It is unclear how many were injected.
- In Akutan, Alaska there was a coronavirus outbreak. Numerous employees tested positive for coronavirus at the Trident Seafoods processing plant.

Community Mitigation

- Local media breaks down how Idaho residents 65 and older that aren't living in long-term care facilities can get the COVID-19 vaccine. On February 1, individuals eligible for the vaccine will be able to find appointments in their area from the state website.

TRADITIONAL MEDIA

Federal Response

- National media has frequently reported on vaccine distribution plan developments shared during today's White House COVID-19 Response Team's virtual press brief.
    - Two national outlets emphasized the CDC director's estimation of 479,000 to 514,000 pandemic-related fatalities by mid-February, adding that despite virus variants present in 26 states, approved vaccines appear to successfully provide protection.
- Multiple national and local outlets highlight several federal agencies warning about vaccine fraud schemes, urging members of the public to not communicate their personal information over the phone. (example 1, example 2, example 3)
- This morning, one national news outlet highlighted FEMA's recent $216 million grant to pay for vaccine storage, transport, distribution and administration services. Congressional representatives had previously stated these areas created a 'supply-demand imbalance.'

Supply Chain

- Since Monday, coverage regarding state and local governments complaints of insufficient amount of vaccine doses remains high.
    - In response to community concerns, California's governor has announced changes to the states' current system for receiving the COVID-19 vaccination. The new plan will "simplify eligibility." The system prioritizes healthcare workers, residents aged 65 and older, teachers, childcare workers, emergency responders, and food and agriculture workers. Afterward, the state will reportedly prioritize eligible vaccine recipients by age.
    - Pennsylvania's governor is reportedly attributing vaccine accessibility difficulties to supply overpromises from the prior White House administration. The governor also states that a decentralized vaccine signup system should serve more efficiently.
- This morning, one U.S. Virgin Islands news outlet reported FEMA will reimburse the island government for costs related to storing, handling, and distributing the vaccine. The article proceeds to highlight U.S. Virgin Islands currently operates 32 territorial facilities and receives just under 3,000 vaccine doses per week.
- One national radio outlet's online platform reported N95 masks remain in short supply due to limited retailers. This report has been widely reposted by various local television outlets. The original story references the White House's invocation of Defense Production Act to boost critical medical supplies as well as urging the general public to wear masks. (example 1, example 2, example 3)

Vulnerable Populations

- In Dallas, Texas, one outlet reported Tuesday night that caretakers and family members confined to their homes remained worried about the lack of access to a vaccine. An associate medical director of Prospero Health said there has yet to be formalized plans on how to vaccinate the thousands of homebound Texans.
- In Washington state, cities and county governments are organizing vaccination teams to help those who cannot access a medical clinic for treatment. Vulnerable communities referenced include Rainier Valley, Kent, SeaTac, Covington, Maple Valley and South King counties.

Healthcare System Stress

- Ahead of North Carolina governor's press conference update this afternoon, the state's healthcare systems and county health departments are reportedly fighting to acquire limited doses. The state is also expected to receive its first federal shipment of vaccines today.
- In Washington state, Overlake Medical Center and Clinics' chief development officer, emailed donors who gave more than $10,000 to the Eastside Hospital System that they will receive 'special access' to coveted vaccine slots. The email gave the donors an access

code to register for appointments 'by invite' only. Overlake reportedly shut down online access to the invite-only clinic after getting a call from Governor Jay Inslee's staff.

Public Health

- This morning, Palm Beach County, Florida's commissioner has strongly criticized the state governor for deciding to designate Publix grocer's pharmacies as sole distributors in the county. The county's commissioners also expressed discontent of enabling the private sector instead of public health officials to vaccinate residents as well as the fear of a dose shortage after February 5th.
- This afternoon, one local outlet references CDC's recently released analysis on allergies to both Pfizer and Moderna vaccines, which concludes low anaphylaxis risk.

Private Sector

- Late this morning, Moderna has confirmed the company is discussing the possibility of delivering another 100 million vaccine doses later this year. This would bring the total commitment of vaccine dose purchases from Moderna to 300 million.
- At least one national outlet reports CVS pharmacy will start offering in-store vaccinations in "New York, Indiana and Massachusetts," expecting to deliver 25 million each month. The article references the federal government previously tapping CVS and Walgreens to help vaccinate nursing home residents.

Northeastern admin charged

Green accused of giving alcohol to minors after 8 month investigation

Mike Emery

WINCHESTER — A Northeastern Wayne Schools administrator is accused of providing alcohol to minors.

Eric Green, 44, is charged in Randolph County with two counts of furnishing alcohol to a minor. If convicted, the class A misdemeanor charges are punishable by up to 180 days in jail and/or a fine up to $5,000.

Green is an administrative assistant for the Northeastern Wayne School Corporation. Superintendent Lance Hinshaw confirmed Green was on leave after the district learned of an Indiana State Police investigation into Green. The investigation began last Feb. 12.

Hinshaw has since left the theaters after being issued an expungement by Muncie Circuit Court Judge Matthew Hinkle at the request made by the prosecutor's office.

"Mr. Hicks's predecessor took the only steps available at the time by swiftly placing Mr. Green on administrative leave to prevent his having any in-person contact with students based on the initial and ongoing allegations," said a statement issued Tuesday by Northeastern Wayne Schools.

"The statement indicates that an internal investigation continues and "appropriate action will be taken as a result" of the investigation.

Couple accused of robbing 2 men at gunpoint

Mike Emery

RICHMOND — A Richmond couple now has been charged with felonies after two men were accused of gunpoint robbery.

Tabitha Lee Hall, 31, is charged by the Wayne County Prosecutor's Office with armed robbery and aggravated armed robbery as Level 3 felonies and with Level 4 felony possession of narcotics. He remains in the Wayne County Jail on a $50,000 bond that was set when probable cause was found for his charges.

Hall's fiancé, Mikala Dunaway, 21, is charged with Level 3 felony armed robbery. She also remains in jail on a $30,000 bond.

A Level 3 felony conviction carries a standard nine year sentence with a sentencing range of three to six years as established by the Indiana legislature. A Level 4 felony conviction has only one standard

ShopRite shifts drug business to CVS

JOSEPH S. BISTEFANO
The Philadelphia Inquirer

Pharmacies in 32 ShopRite stores from Connecticut to Maryland are closing over the next month and sending customers to nearby CVS pharmacies as the drugstore business continues to consolidate into a few giant chains.

ShopRite owner Wakefern Foods Corp., based in Woodbridge Township, Middlesex County, has sold its customer files to the Rhode Island-based CVS Pharmacy drugstore chain and reassigned them to CVS locations.

For example, patients who picked up prescriptions from the ShopRite at 52nd and Parkside in West Philadelphia are being sent to the CVS at 40th and Market streets, nearly two miles away. Customers at an East Falls ShopRite are being sent to a CVS in Manayunk.

The closings include 22 in the Philadelphia area and parts of South Jersey and Delaware, according to a list provided by CVS. An additional 147 ShopRites will still have pharmacists, spokesman Daniel Emmer said.

For years, food markets aggressively added pharmacies to their stores, seeing them as drivers for customers. But the stores have badly been losing them, lacking
